The idea was adopted; very soon a "guarantee fund," exceeding £70,000, justified the commencement of proceedings; an application was immediately made to his Royal Highness Prince Albert, who at once sanctioned and encouraged the undertaking; her Majesty the Queen accorded to it her patronage; and a public meeting was held in Manchester, at which it was resolved "to hold an exhibition of the Art Treasures of the kingdom in that city" during the spring and summer of 1857. The subscribers to the guarantee fund were appointed a council, and the Executive Committee was elected, with "full power to make all engagements, financial or otherwise, for consummating the project, subject only to the approval, by the general council, of the site and the plan of the proposed building; the council also to have the ultimate appropriation of the edifice, and the disposal of any surplus funds which might accrue." A site was selected for the proposed building, which, although distant about two miles from the heart of Manchester, possessed many and manifest advantages. Tenders were made for its erection, and ultimately a design submitted by Messrs. C. D. Young & Co., of London and Leith, was ac-

cepted, but subject to various modifications by the architect, M. E. Salomons, who was again very ably assisted by Mr. Dredge, the engineer. It is this building which now stands at "Old Trafford," and has received the Art Treasures of the United Kingdom.

We have on more than one occasion described it; it is unnecessary to occupy space by doing so now; except in so far as to state that the exterior is plain and unpromising: its dull and heavy character, however, has been somewhat lightened by a façade of red and white brick. We by no means complain that there has been no large expenditure upon the outside,—the building is, what it was designed to be, a plain edifice, calculated to "house" a collection of Art-works with as much *well* as was possible upon which to hang pictures. But it would be difficult to find any fault with the interior,—it is singularly light, elegant, and effective; the arrangements for display are eminently judicious; it is of sufficient size to convey the idea of ample space, covering altogether an area of 18,000 square yards, or upwards of three acres; its extreme length being 704 feet, its entire frontage being 416 feet. There are several well-arranged entrances. "The dimensions of the Great Hall (omitting the picture galleries which flank it on each side) give a length of 632 feet, and a width of 104 feet; while the transept, running north and south, is 200 feet by 104 feet. A row of banded columns, on each side the hall, support the roof; the space between these and the wall being 24 feet on each side; so that the clear space along the centre of the hall, between the pillars, presents a noble avenue of 56 feet. The height of the Great Hall is 56½ feet from the floor to the crown of the arch; the ridge roof of the side aisles being 31½ feet from the floor; and the coupled columns 28½ feet in height.

"The sides of the central hall are decorated with a rich maroon paper, having a neat surbase, and an elegant cornice in gold and colours, with tablets in blue, upon which are inscribed the names of the artists whose productions hang beneath. The semicircular roof is divided into panels, the divisions consisting of the iron principals, and the longitudinal ribs of timber. The compartments (picked out with a faint border-line of crimson) are an aerial grey, which blends charmingly with the sky and cloud above, as seen through the glazed roof. The ribs are in bronze, with an ornamental edging of a light cream or vellum tint, and the faces are decorated alternately with Vetrivian and Grecian ornamentation. Upon the lower edges of the principals there is a very neat rosette ornament, whilst the coupled columns are in bronze, relieved with gold, and at the top of each brace, in the centre of the floral-work brackets, is the monogram, in bright gold, 'A.T.E.'"^{*}

These decorations are the work of Mr. Crace, in whom the committee found a valuable ally.

The "Great Hall" contains the objects of *verlu*, the ancient armour, the porcelain, the gold plate, the Soulagés Collection—all, indeed, except the pictures, ancient and modern, which occupy the two side aisles, the oriental collections, and the water-colour paintings, which are contained in a suite of convenient rooms, behind, but underneath, the great organ. There are galleries at either end, one of them being small, designed, we imagine, merely to add to the graceful proportions of the structure; the other sufficiently spacious to contain the collection of engravings and that of photographs; but in these galleries are ex-

hibited several works of the modern schools of France and Belgium, which, not properly appertaining to the "Art Treasures of the Kingdom," have been kept apart from those which occupy the side aisle devoted to productions of British Art.

"A Reception Room," near the entrance, has been gracefully and tastefully decorated by Messrs. Jackson and Graham. The refreshment rooms have been fitted up very elegantly; and of this "important" department it will suffice to say, that everything is good, and at reasonable prices; quite as reasonable, indeed, as they could be found at any ordinary "house of entertainment."

The Exhibition was opened on Tuesday, the 5th of May; his Royal Highness Prince Albert honouring the ceremony by his presence. Manchester was of course in a state of great excitement; it was a universal holiday; flags and banners floated from the roofs or windows of all public buildings, and in several of the leading streets; the bells rang merrily out; balconies and temporary scaffoldings were filled with people along the whole route of the procession; the weather was fine (a merciful boon in Manchester), and the occasion appeared to be one of unmingled joy.

The doors were opened at twelve o'clock to those who had season tickets; and before one o'clock all the seats were occupied; we believe the number present, on the arrival of the Prince, approached ten thousand; it was understood that nearly nine thousand tickets had been disposed of. The scene received some "sparkle" from several court "suits" and official costumes; but especially from the dresses of the ladies; these were, as our readers will imagine, superb and costly, but very beautiful withal.

When the several guests were seated, and the momentary bustle had subsided, the effect from the gallery was exceedingly striking. The arrangements for the reception of so large a crowd must have been admirable; there was no pushing, or driving, or unseemly haste; ample accommodation had been provided for all; the "invited guests" being placed on either side of the throne chair.

The "invited guests," however, were too few; we looked in vain for those representatives of Art, Science, and Letters, whose presence would have added dignity and grace to the occasion, and given to the ceremonial an interest which it undoubtedly lacked.

The "Arts" were to some extent represented: the Presidents of the Royal Academy and the two Water-Colour Galleries were there, and three members of the Royal Academy also,—as guests, but not guests "invited." "Science" was represented by Professor Owen alone, a host in himself, but who would undoubtedly have felt more at home in the companionship of some of his fellows; while "Letters" had no representative whatever, if we except Mr. Robert Chambers. This, we humbly think, was a sad omission, and one for which there is now no remedy. A comparatively small expenditure would have obtained the attendance of all the leading Professors of Science, the principal Artists, and the most eminent of the men and women of Letters of the United Kingdom. Invitations issued to these public benefactors—for such they are, although the utilitarian spirit of the age may hesitate to recognise their claims—would have largely augmented the grace and interest of the ceremonial; and have made the day infinitely more memorable in the annals of prosperous Manchester. Nor can we doubt that the men and women who have become famous by intellectual labour, and whose labours are in many instances directly or indirectly associated with the objects which excited admiration in all the departments of the building, would have been

received by the assembled magnates and people of Manchester with a cordial welcome, as familiar friends.

As far as we can learn, Dr. Waagen was the only "invited guest" whose pen has been employed in communicating knowledge concerning Art. Without naming those—and they are many—to whom a similar courtesy might have been extended, we may allude to Mrs. Jameson, Mrs. Forster, and Mrs. Merrifield, because the catalogue refers to their writings as "authorities" in the selections of exhibited works.

At two o'clock the Prince arrived, and was at once conducted to the dais at which the proceedings commenced. His Royal Highness was attended by his immediate suite, the Mayor, aldermen, and common council of Manchester, those of Salford, the Committee of the Exhibition, a few noblemen, three or four members of Parliament, the Bishop of Manchester, and some of his clergy, the Lord Mayor and four of the aldermen of London, the Lord Mayor of Dublin, their excellencies the Belgian and American ministers, the minister for Hayti (a negro, who wore a decoration of the Legion of Honour), some deputy-lieutenants (in their scarlet coats), a few officers of the army and navy, and several of the principal gentlemen of the city.^{*} The occasion, however, was not sought to be commemorated by the attendance of remarkable and distinguished persons: the grand collection of great works was there; the *élite* of Manchester were present; and the Prince received a hearty and cordial greeting, that must have gratified him much. The chairman of the Executive Committee—following the president, Lord Overstone, who briefly expressed a welcome to the Prince, and thanks for the honour of his presence—read an address which contained a brief history of the Exhibition, to which his Royal Highness replied. This reply is, like all the addresses of the Prince, remarkable for its clearness and sound practical sense, saying just enough—in language concise, expressive, "to the point," and by no means without appropriate eloquence: it is as follows:—

"Gentlemen of the Executive Committee,—

"I thank you most sincerely for your kind address. The expressions of loyalty and attachment to the Queen which it conveys will, I feel certain, be most gratifying to her.

"I have with pleasure accepted your invitation to preside at the inaugural ceremony of an undertaking which I have watched with the deepest interest from its first conception: and I may now be allowed to congratulate you upon the success which has, so far, crowned your labours.

"The building in which we are assembled, and the wonderful collection of these treasures of Art, as you so justly term them, which it displays, reflect the highest credit upon you. They must strike the beholder with grateful admiration, not only of the wealth and spirit of enterprise of this country, but also of that generous feeling of mutual confidence and good-will between the different classes of society within it, of which it affords so gratifying a proof.

"We behold a feast which the rich, and those who possess private collections, have set before those to whom fortune has denied the higher luxuries of life—bringing forth from the innermost recesses of their private dwellings their choicest and most cherished treasures, and entrusting them to your care, in order to gratify the nation at large: and this too unhesitatingly—at your mere request—satisfied that your plans were disinterested

^{*} We have extracted these details from a publication issued weekly at Manchester, entitled "The Art-Treasures Examiner." The first part contains two admirably executed coloured prints, of the exterior and interior: the work is very neatly printed; and if it is continued as it has been commenced, it will not be among the least valuable results of the exhibition.

^{*} Perhaps the gentleman who, of the whole *cortège*, attracted most attention was that "Correspondent" of the *Times* who has won for himself a foremost and honourable place in the history of his country, as the writer of those famous "Letters from the Crimea," which rank among the most marvellous compositions ever produced, considering the circumstances under which they were written. He was in attendance, however, as the reporter for the journal with which he has the honour to be connected, and which is honoured by his service, and was in no other sense an "invited guest." It was gratifying, but not remarkable, to note the attention he everywhere received.

and well matured, and that they had the good of the country for their object.

"This is a gratifying sight, and blessed is the country in which it is witnessed! But no less so is the fact which has shown itself in this, as in other instances, that the great and noble of the land look to their Sovereign to head and lead them in such patriotic undertakings; and when they see that the Sovereign has come forward to give her countenance and assistance to the work, that they feel it a pleasure to co-operate with her, and not to leave her without their support—emulating thus, in works of peace, the chivalric spirit which animated their forefathers in the warlike times of old.

"You have done well not to aim at a mere accumulation of works of Art and objects of general interest, but to give to your collection, by a scientific and historical arrangement, an educational character,—thus not losing the opportunity of teaching the mind as well as gratifying the senses: and manifold are the lessons which it will present to us. If Art is the purest expression of the state of mental and religious culture, and of general civilisation of any age or people—an historical and chronological review, given at one glance, cannot fail to impress us with a just appreciation of the peculiar characteristics of the different periods and countries, the works of which are here exhibited to us, and of the influence which they have exercised upon each other.

"In comparing these works with those of our own age and country, while we may well be proud of the immense development of knowledge and power of production which we possess, we have reason also for humility in contemplating the refinement of feeling and intensity of thought manifested in the works of the older schools.

"I trust that you may reap, in the approbation of the public at large, and in the remunerative course of the people, the immediate reward of your labours, and that, like the Exhibition of 1851, to which you so flatteringly allude, you may thus also find the means of closing your operations without having recourse to the guarantee fund, which this district has so generously put at your disposal. Beyond this, however, I trust that the beneficial effects upon the progress of Art and taste in our country, which we may confidently look to, may be a lasting memorial of your vast enterprise."

A prayer was then delivered by the Bishop of Manchester, from which we extract the following passage:—

"Grant that this undertaking may be made available to the exalting our national character, the chastening and elevating our taste, that, in all that is good and beautiful, acknowledging Thee, the author of all good gifts, we may the more readily obey with willingness Thy laws, and walk in Thy commandments. And, as this undertaking is intended for the good of many, so may it too contribute to draw them together in mutual love and kindness,—the wealthier, who have provided here the means of instruction and improvement, uniting in seeking to promote the common good, the less favoured in estate joyfully receiving and thankfully participating in the opportunities and advantages accorded to them in this place. While we behold the various degrees and kinds of excellence which the imagination, learning, skill, or industry of men have at any time attained to, let us ever remember that all that is good is of Thee done, that, without Thee, nothing is strong, nothing is holy. 'Not unto us, O Lord, not unto us, but unto Thy name, give the praise.'"

A procession of "the authorities" was then formed, and his Royal Highness was conducted through the building. We ask our readers to accompany them on this walk, during which we shall briefly point attention to the several "departments" which make the grand whole of the Exhibition, premising that everything appeared in its right place, and in the best possible order everywhere. If there was aught unfinished or incomplete, it did not meet the eye: the pictures were all hung, the glass-enclosed cases all filled—there was, in short, nothing to induce an idea that a delay in "open-

ing" would have rendered the ceremony more perfect, or the collection more complete. This is saying much for the several gentlemen and their assistants, to whom was confided the onerous duty of being "ready in time." Possibly there was even then much to do, but it certainly was not perceptible; and if there had been any desire to find fault, it would not have been easy to point out a quarter in which there was evidence of neglect or of defect that might have been guarded against and avoided. In a word, the Exhibition seemed as *perfect* on the day of opening as it was designed to be, or hoped to be, and was thus contrasted with all the other exhibitions of the last twenty years—to the credit of Manchester, and in fortuitous confirmation of general belief in its "business habits," its practical and working energy, and its vast capabilities for carrying enterprise to a success. In following the Prince, we follow the catalogue, and enter first those galleries which contain the works of the Ancient Masters. This wonderful collection has been arranged by Mr. George Scharf: to examine it with anything like accuracy would be the labour—but a labour full of delight—of many days; it consists of more than 1000 pictures, beginning with the very earliest schools, each "a master-piece." These are, as our readers know, nearly all the property of private individuals, very few of them belong to public collections; to give a list of their "owners" would be to occupy large space; to name the more prominent works is impossible at present, although it will be our duty hereafter to direct special attention to several of them. Among the most liberal of the contributors are her Majesty and Prince Albert, whose example, indeed, influenced so many, and whose early adhesion to this cause undoubtedly led to the successful issue we are now commemorating. There are scarcely any of the great artists of any age or country omitted,—the Dutch school being thoroughly represented by the Collection of the Marquis of Hertford, which occupies a division apart from the gallery, added to those which are mixed up with examples of the Italian schools. What a walk it is through this broad avenue of the rich legacies of centuries! We pass to the opposite side of the building, and enter that other aisle, which contains an assemblage of Art Treasures scarcely less rare or valuable, and in some respects more interesting—the productions of British artists from the earliest to those of our epoch, beginning with occasional gleams when Art was an exotic, and terminating with those grand achievements of our contemporaries, the men who are living and flourishing among us, honoured in their own age, rewarded while they live, and working for "all time." The series commences with examples of the earlier masters, the pioneers of British Art; they are few, but they lead the way to a glorious display of the works of Hogarth, Reynolds, Gainsborough, and Wilson, works familiar to us by engravings, but which we here see as pictures for the first time. Every master of the English school is represented from their time downwards—Copley, Northcote, West, Thomson, Romney, Opie, Barry, Morlaud, Nasmyth, Harlow, Smirke, Stothard, Lawrence, Phillips, Hilton, Collins, Turner, Calcott, Etty, Newton, Briggs, Constable, Wilkie, Allan, Müller, Haydon, Martin, Bonington, Liversidge—all are here, and as they would desire to be, if in life, represented rightly and by the productions that best exhibit their genius and command the homage of that posterity for which they laboured.

The collection does not end here; it includes the works of all our foremost living men—Eastlake, Landseer, Mulready, Ward, Uwins, Goodall, Herbert, Webster, Dyce, Stanfield, Maclise, Roberts, Hook, Harding, Cope, Horsley, Pyne, Frith, Lee, Sant, Cooper, Hart,

Lance, Creswick, Ansdell, Philip, Danby, Redgrave, Egg, Duval, Cooke, Hunt, Millais, Harvey, Hurlstone, Stone, Dobson, Holland, Knight, Faed, Gordon, Pickersgill, Anthony, Gilbert, Maence, McCulloch, Linnell, Frost, Williams, Mrs. Carpenter, Witherington, Pearce, Baxter, Elmore, Johnstone, Bright, Leighton, Linton, M'Innes, Grant, Jones, Herring, Inskipp, Hemsley—and others whose names we may have overlooked, contribute to form this rich and varied, and really beautiful, assemblage of Art Treasures. Most of them are indeed old friends—friends with whom we made acquaintance at the several exhibitions of the metropolis, but they are not the less welcome when we meet them here associated in honour with so many glorious contemporaries. To this marvellous assemblage of national wealth we shall endeavour to do better justice hereafter.

We have as yet by no means done with Art in the higher sense of the term. A collection which yields in value to nothing within the building—which, indeed, has perhaps an interest beyond any other of its many departments—is the "British Portrait Gallery," which Mr. Peter Cunningham has arranged with admirable skill and judgment. It consists of 337 works placed in chronological order, or nearly so, beginning with a portrait of Henry IV., and closing with one of the poet Keats, whose memorable line—

"A thing of beauty is a joy for ever"—

is one of the mottoes of the Exhibition. To this assemblage, as well as that of the miniatures and enamels—arranged also by Mr. Cunningham—we must endeavour to do justice when we have larger space at command.

The collections of drawings in water-colours consist of no fewer than 965 works, about 100 of which belong to the older schools, British and Foreign; the remainder being by the artists of our own time—of these, eighty-four are the works of Turner.

The galleries of engravings are fruitful of enjoyment and instruction. These commence with the very earliest productions of the art—the works of Finiguerra—and carry us down to the Doos, the Robinsons, and the Cousins of our own times, embracing every intermediate period and style; and numbering in all 1859, including woodcuts and lithographs.

A very large collection of photographs—portraits, landscapes, buildings, Art objects, copies of drawings and paintings, &c.—occupies the gallery over the north transept. These have been carefully selected and arranged by Mr. Delamotte. The time is perhaps hardly arrived for an exhibited history of this Art; but it would have been satisfactory to have seen some of the very early specimens beside those examples of modern date which so nearly approach perfection as transcripts of nature.

Descending from the galleries, and resuming our walk through "the Great Hall," we are called upon to pause every moment and admire some fine work of sculpture—a collection lining the avenue on either side: of these there are sixty-one works, but they are all in marble, no casts having been admitted; the consequence is a failure as regards this branch of "the Art Treasures of the United Kingdom." Gibson, Baily, Calder Marshall, Spence, Sherwood, Westmacott, Theed, Durham, Munro, Hogan, the elder Westmacott, Macdonald, Wyatt, Cardwell, Thorneroff, Stephens, Thrupp, and Davis are here; but where are Foley, MacDowell, Bell, Weekes, and a dozen others, who hold high rank among British sculptors, and some of whom may compete with the best of the great masters of ancient and modern times? Èveu Marochetti is absent; and so, also, is Noble, the "pet" of Manchester, to whom go all the "commissions" by which the magnates

of the city seek to honour the living or the dead.

Those who traverse the Great Hall will be sure to stop somewhere about its centre, for here is one of its leading attractions—the collection of ancient armour, which Rouge Croix has been collecting and arranging, “with heart and soul,” for he loves his task; and trusts that even in modern Manchester, where utilities are lords paramount, his labours will be appreciated, and men will be taught to converse with steel-clad heroes, whose best friends were the armourers and the anvil. This collection is formed chiefly from the “Meyrick store;” but it has been augmented by contributions from the Tower and loans by private individuals. It is impossible to overrate the interest of this—perhaps the most attractive, as it certainly is the most original—feature of the exhibition. To enter at all into the subject would be to absorb the space to which we are of necessity limited this month; we shall recur to it, however, as to a rich source of enjoyment and instruction, the examination of which would of itself recompense a visit to Manchester.

We have left ourselves but little room to describe the remaining portions of this truly great gathering of Art Treasures—the Art Treasures of THE WORLD, although the property of British owners.

Along the central hall, on either side, are some twenty or thirty large glass cases, each filled with treasures costly enough to buy a rich manor. These have been collected and arranged under the very able superintendence of Mr. Waring, who has found a valuable coadjutor in Mr. Chaffers. These objects are so multifarious, and so varied, that, very wisely, a brief description is attached to each article; “the catalogue,” therefore, is limited to a slight but sufficient history of the art chiefly illustrated by the contents, the cases being marked so that references may be made to them.

Thus, Case A contains GLASS. The collection of Venetian glass is of amazing beauty and variety, examples of every class being here exhibited—contributed chiefly by the Duke of Buccleuch, R. Napier, Esq., Felix Slade, Esq., the Earl of Cadogan, Miss Auldjo, and G. Nicholson, Esq. The glass of Germany—of the sixteenth and seventeenth centuries—is amply represented; so also is English glass, from its earliest manufacture—in 1557—to our day.

Case B contains enamels of infinite variety.

Case C is full of rare specimens of porcelain; and case D of Oriental china. In the former are many of the finest works of Dresden and Sèvres, with the early English—the produce of the factories at Bow, Chelsea, Worcester, and Derby. Other cases contain those now famous productions of Wedgwood, which only in the present day have found their true value. A few years ago specimens might have been obtained for shillings that would now bring pounds from a hundred buyers.

The Majolica ware is contained in case E; it is a wonderful collection, of immense value.

Cases F and G contain examples of the goldsmith's art. It will be readily understood that these cases are rich in beauty and in worth. The rarest specimens possessed by public institutions, as well as by private individuals, are here exhibited.

Case H is full of works in sculpture—bronze and terra-cotta.

To the other cases we must refer even more briefly. One is filled with medallions and glyptic; another with carvings in ivory; another with jewellery and goldsmith's work; others with the “Soulages Collection,” purchased by the Committee of the Art-Treasures Exhibition; another with Majolica and Raffaele ware; others (five in number) with the loans of the British Museum and Marlborough House; an-

other with Renaissance, Mediaeval, and Oriental metal-work; another with examples of book-binding; while another contains exquisite specimens of lace-work.

Objects of attraction are, however, to be found not only in the cases—beautiful specimens of furniture, and other objects of interest and rare value, will be found judiciously scattered about the hall.

In short, the exhibition is deficient in nothing that illustrates the subject of Art, either in its higher branches or its scarcely less important character of manufacture.

Our present article, it will be seen, is designed merely as an INTRODUCTION. The several departments we shall necessarily bring under detailed review.

We cannot easily overrate the importance of this exhibition: placed in the very centre of the commercial and productive districts of England, its value is immense to the manufacturer; perhaps even more so to the artisan. “A thing of beauty” is not only “a joy for ever,”—it is a perpetual instructor, the influence of which by no means ceases with its removal from the eye. It is but a common-place truth, yet one which cannot be too often impressed—that to improve taste is to inculcate virtue—that the moral faculties and the social habits are fostered and strengthened for good by the frequent contemplation of beauty, grace, and excellence. The poet makes Adam pray in Paradise to be saved—

“From every low pursuit.”

And, of a surety, the avoidance of what is coarse and vulgar by the substitution of what is pure and beautiful, as far as possible, in every-day life, is a promotion of the truest and best interests of mankind:—

“The attentive mind,
By this harmonious action on her powers,
Becomes herself harmonious: wondrous oft
In outward things to meditate the charm
Of sacred order, soon she seeks at home
To find a kindred order, to exert
Within herself this elegance of love,
This fair inspir'd delight: her temper'd powers
Refine at length, and every passion wears
A chaster, milder, more attractive mien.”

Happily, there is now an almost universal abrogation of the old dogma of “the workers”—that “the levelling principle” was to pull down the great, and rich, and prosperous, to the standard of the lowly; while, in its stead, there is a faith—manifested by the high as well as the humble—that the object may be accomplished by raising the one class without depressing the other. In Manchester, especially, every working man who goes to his day's labour, passes by the mansion or the warehouse of some one of the many who was, not long ago, precisely as he himself is now, yet who had neither “means nor appliances” which this day-labourer is without.

Viewed in all lights, this great Exhibition is fruitful of good; and we cordially and heartily rejoice that its prospects are so promising. We have now no apprehension that so great a success can be even a commercial failure; its promoters—all of them wealthy men—would no doubt be little affected by “a call” to meet the expenses, which are large because they have been liberal. But failure in this sense would be a calamity, inasmuch as it would be evidence of insufficient response. The attractions are so immense as to be universal invitations: there is no class, from the very highest to the very lowest, that may not here obtain enjoyment and receive instruction.

We regret that our space is exhausted, for the theme is seductive; but it will be our pleasant duty to recur to the subject frequently for some months to come.

THE ROYAL PICTURES.

DOVER: THE LANDING OF PRINCE ALBERT.

W. A. Knell, Paint.

W. Miller, Sculpt.

Size of the Picture, 1 ft. 11½ in. by 1 ft. 5½ in.

OUR “tablet of memory” is not so well furnished with the dates of remarkable or interesting occurrences, as to enable us to fix the precise day on which Prince Albert of Saxe-Cobourg and Gotha arrived in England to claim the hand of his royal bride; yet, as the marriage ceremony took place on the 10th of February, 1840, it could only have been a very short time prior to this event. But we do remember—and if we had not, Mr. Knell's picture would tell us—that his Royal Highness reached the shores of his adopted country after a very stormy passage; and, possibly, if the thoughts of the Prince, as he crossed the narrow strait that separates the white cliffs of Albion from the Continent, could at such a time be diverted from the great object of his journey thither, the wild and tumultuous sea through which he then passed did remind him that the people among whom he was hereafter to dwell, and in whose future history he was destined to fill no unimportant page, regarded it as their natural element—that it was the stage of their greatest triumphs: he doubtless remembered that henceforth his lot was to be cast with the “sea-kings”—

“Whose flag had braved a thousand years
The battle and the breeze;”

that those among whom he was to be naturalised are the descendants of the men who fought and conquered with Drake and Frobisher, Blake and Albemarle, St. Vincent, Rodney, Nelson, and a host of other naval heroes, whose names are associated with the greatness and glory of England; the howling of the stormy wind, and the heavy splash and roar of the agitated waters, as they beat wildly against the sides of the royal vessel, were not inappropriate music to accompany the betrothed of a queen whose home is encircled by the sea, but whose dominions extend far, very far, beyond it.

Were we living in an age when oracles were consulted, and when the future was predicted from significant and other mysterious appearances in the heavens, and the elements were presumed to have an important influence on the destiny of men, so inauspicious a journey would have been most unfavourably interpreted; augers, and soothsayers, and diviners of every kind, would at once have determined that “it boded ill” to the royal pair,—that the strife of nature foreshadowed, at least, diversity of opinion and disunion in domestic policy. And what an error would these sages have committed; how would the future have falsified their predictions and confounded their wisdom! Never, we believe, has a royal marriage been more blessed in its results: never, certainly, did a young and noble-hearted queen unite herself with one more worthy of the respect and esteem of her subjects than Prince Albert has proved himself to be in the exalted position in which he has for many years been placed. The gleam of sunshine that burst forth as the vessel that bore his Royal Highness thither entered Dover Harbour, was a more truthful omen of the future than the dark clouds and the roaring billows under and through which the stout ship ploughed her way to her destined port.

Mr. Knell, the painter of this picture, has long been favourably known in the principal metropolitan exhibitions by his marine subjects. At the exhibition in Westminster Hall, in 1847, he received one of the second class prizes, of £100, for his picture of “The Battle off Cape St. Vincent, in 1797:” he also exhibited at the same time another large work, “The Destruction of Toulon, by Lord Hood, in 1793.” The picture here engraved was painted by express command of the Prince, through the introduction of Lord Clarence Paget, who, if we rightly remember, commanded the squadron that conveyed his Royal Highness to England. The painting was never exhibited. The artist had the honour of receiving her Majesty's commands to paint a picture of the grand naval review at Spithead, in 1853. This also has not been publicly exhibited.

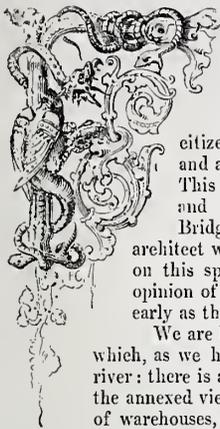

The picture of “Dover Harbour” is at Osborne.

THE BOOK OF THE THAMES,

FROM ITS RISE TO ITS FALL.

BY MR. AND MRS. S. C. HALL.

PART VI.

FOLLY BRIDGE was anciently called Grand Pont. Its modern name (modern, although dating back 200 years) is derived from the following circumstance. The tower, which stood on the bridge, and had been so long known as "Friar Bacon's Study," being much dilapidated, the city leased it to a citizen, named "Welcome," who repaired the lower part, and added to it a story, which appears in our engraving. This was called by the neighbours "Welcome's Folly," and thus the bridge acquired its new title of "Folly Bridge." The present bridge was built in 1825-7: the architect was Ebenezer Perry. The first erection of a bridge on this spot is "beyond all authentic record," but it is the opinion of our best antiquaries that here a bridge existed so early as the Saxon times.

We are below Folly Bridge, having passed through the lock, which, as we have intimated, terminates the right branch of the river: there is a fall here of about three feet. The bridge is seen in the annexed view. A tavern, situate on a sort of quay, and a block of warehouses, sufficiently mark the locality; but the latter unfortunately interrupts the passage into the street from the beautiful grounds of Christ Church. Christ Church Meadow, with its embowered "walks," has been famous for ages; it is the public promenade; and necessarily here, or at the quay alluded to, boats are always numerous, for

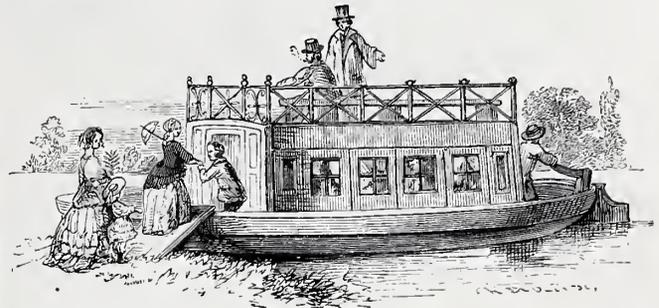

FOLLY BRIDGE.

this is almost the only place in the vicinity in which there are conveniences for boating.

As will be supposed, the boats are of all sorts and sizes, from the huge and elaborately decorated pleasure-barge to the thin light rowing boat, that looks

like a line upon the water. We must pause awhile to give some description of these conveyances upon the great highway of the Thames, for, from Oxford, the river is of value for passage and traffic. The engraving exhibits two large boats, one of which (that nearest) was originally the barge of the Stationers' Company of London;* it was sold some years ago to Exeter College Club; the other belongs to the Oxford University Boat Club, and was built expressly for them, from the design of Mr. E. G. Bruton, a distinguished architect of the city. Both are of costly workmanship, the latter being somewhat sombre in style, the former still flaunting in scarlet and gold, although age and use have somewhat tarnished its brilliancy. These "vessels" serve as floating club-houses, and are well supplied with newspapers, periodicals, and writing materials, and have dressing-rooms for members. They are not calculated for making voyages, and are rarely released from their moorings.

For smaller parties, of about twenty or thirty, Oxford is abundantly supplied with boats, such as that pictured in the accompanying engraving, and which are known by the name of "house-boats." The interior is a spacious room; while "the deck" affords opportunities for viewing the scenery and enjoying the pleasant breezes of the river—being furnished with benches for the convenience of such as prefer the open air, and having a light iron balustrade around. These boats are leisurely towed up and down the river by horses, and are, in fact, large and broad barges, within which the "house" is constructed, with its windows and gaily painted or gilded panels. Seats surround the interior, and a table, generally bountifully spread, occupies the centre.

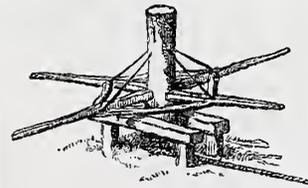

THE HOUSE-BOAT.

The traffic barges encountered in this locality are much narrower and more "shapely" than those to be met lower down; necessarily so, to pass through the locks† and weirs, and over parts where the stream is shallow.‡ The "barge-walk," or towing-path, is, as we have elsewhere intimated, a path made by the tread of horses, sometimes at one side of the river and sometimes at the other,§ according as fewer obstructions occur in the passage. The barges usually carry between thirty and forty tons, and are generally navigated by two men and a boy, a man on shore governing the horses; two horses are usually employed to draw the barge up the stream, while one suffices for the downward voyage. These barges are usually gaily painted, with a variety of colour and ornament; beside the steersman is a little cabin, in which he sleeps or cooks his food. The smoke of the fire is frequently seen ascending the small iron funnel in the roof, and occasionally the wives of the bargemen peep forth from the little room where they perform the duties of housewife; in some instances linen may be seen hanging to dry, in return boats, in the space occupied by luggage. The latter is generally protected by a canvas awning drawn over a pole along the boat. At sharp turns in the river the towing-rope is passed round a post, and the man manages the rudder so that when the turn is making the rope is slipped and the boat pulled as before. The Thames barge, such as we see it near London, is very different: this we shall describe hereafter. The tax paid by these barges in passing through a lock varies from 7s. to 10s., and there are nearly fifty such tolls to pay from London to the entrance of the Thames and Severn canal, including the weirs, for which 1s. 6d. or 2s. each is charged.

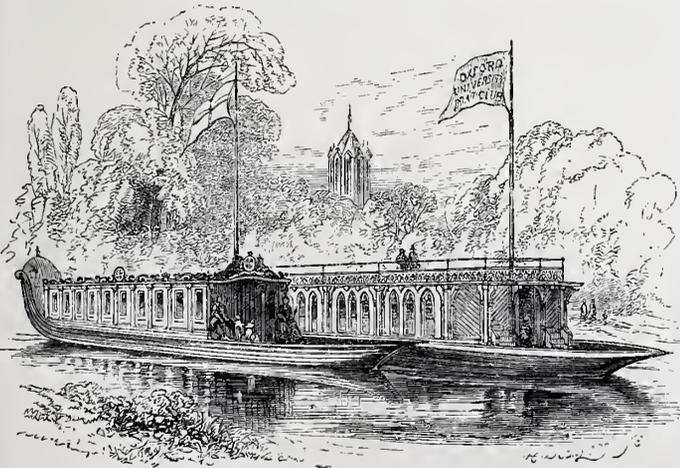

* This barge used regularly to proceed as far as Lambeth Palace on the 9th of November, when the Lord Mayor took the oaths at Westminster, and it was the custom for the Archbishop to send out wine and refreshments to the members of the Company within it. The custom originated at the beginning of the last century, when a relation of Archbishop Tenison's being the master of the Stationers' Company, thought it would be an acceptable compliment to call at the palace in full state. The archbishop sent out a pint of wine to each of the thirty-two gentlemen who came; and so originated the annual custom of calling there, and receiving sixteen bottles of wine from the palace—the Company returning the civility by the presentation of the various almanacks they publish.

† The old locks were much less navigable than those that have been constructed within the last thirty or forty years; in old times it was no uncommon case to be compelled to drag the barge through one of them, for which purpose a winch was used. These winches are still found occasionally on the banks of the river, and we thought it worth while to picture one of them. It is of rude construction, with four hands, the rope rolling round the centre as the boat progressed. We believe they are now entirely disused, and are only found in the immediate vicinity of deserted locks. They certainly add to the picturesque of the scenery, especially as they

are usually found in quiet and retired nooks on the river's banks. ‡ The larger barges, sometimes carrying ninety tons, are still used in the district above Oxford, although rarely, and are called "West-country barges;" the next size are called "trows," and average fifty or sixty tons; and the least, called "worsers," are of thirty, or rather less; these small boats were first introduced from the Oxford Canal. The antiquity of the West-country barges appears by the following extract from "The Voyage of Mr. John Eldred to Tripoli, &c., in 1583," in which he says—"Having completed all our business at Basora, I and my companion, William Shales, embarked in company with seventy barks, all laden with merchandise, every bark having fourteen men to drag it up the river, like our West-country barges on the river Thames, and we were forty-four days in going up against the stream to Bagdat." It also appears, from the Thames Acts, that the navigation upwards from Oxford had existed from time immemorial, notwithstanding the great difficulties to be encountered.

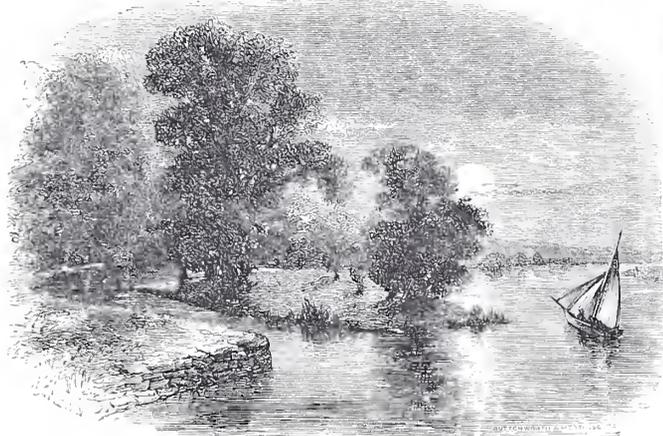

§ When the towing-path changes its side (for instance, just this side of Abingdon, at the Poplars), a ferry-boat conveys the horses to the opposite side.

STATE BARGES.

like a line upon the water. We must pause awhile to give some description of these conveyances upon the great highway of the Thames, for, from Oxford, the river is of value for passage and traffic. The engraving exhibits two large boats, one of which (that nearest) was originally the barge of the Stationers'

At the termination of Christ Church Meadow occurs the junction of the Cherwell and the Thames: the river so dear to Alma Mater has its source in the Arbury Hills, near Daventry, in Northamptonshire: it enters Oxfordshire

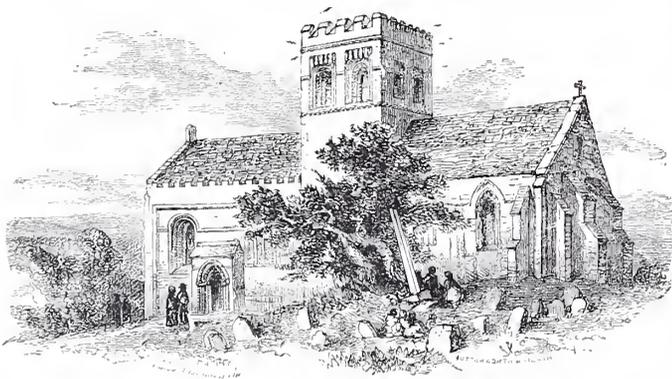

JUNCTION OF THE CHERWELL AND THE THAMES.

near Claydon, flows past the town of Banbury, through Islip and several other villages, runs its course of about forty miles (but nowhere navigable), and on its arrival at Oxford surrounds an island appertaining to Magdalen College (where it is crossed by a bridge of great beauty), whose academic walks it waters, running beside "Addison's Walk," waters the banks of the Botanic Garden, passing by the side of Christ Church Meadow and its tree-embowered walks, and loses itself in the great river in whose company it journeys to the sea.

The current carries us gently to Ifley lock, distant about two miles—rich flat meadows on either side; but the landscape receiving grace and beauty from the hills of Shotover, Bagley Wood, and the slope on which stands the fine and very venerable church. The voyager, however, will often look back, for gradually as we remove from the city, the view gains in interest; the lower houses disappear, while towers, and domes, and spires of churches and colleges rise above the trees, standing out in high relief, backed by the sky. Ifley is justly considered "one of the finest and most beautiful examples in England of an Anglo-Norman parochial church." It consists of a nave and chancel divided by a tower, forming, indeed, "an interesting school of ancient architecture," affording a series of examples of almost every age and style, and being "accepted" as high and pure "authority" by church architects.

The date of its foundation is probably as far back as the reign of King Stephen, when it was built by the monks of Kenilworth; authentic records prove it to have been in existence at the end of the twelfth century; it has endured with very little change from that far-off period to this; and many of its elaborate and beautiful decorations, exterior as well as interior, are now as perfect as they were when they left the hands of the sculptor-artisan.

The church-yard contains an aged yew-tree—so aged that no stretch of fancy is required to believe it was planted when the first stone of the sacred structure was laid.* The rectory is in admirable keeping with the church, although of a much later date: also at the adjacent weir is a venerable mill, the successor of that which flourished here so far back as the time of the first Edward.

IFLEY CHURCH.

There are consequently few places on the banks of the Thames with so many attractions for the tourist, and its value is enhanced by immediate vicinage to Oxford. The river between Oxford and Ifley is very deep, and there are dangerous eddies, where bathers have been sacrificed. It is shallower towards Nuneham; from whence it is much deeper in its course to Abingdon.

* It has been generally stated that yew-trees were planted near churches to supply bow-staves for archers, at a time when archery was much practised, and enforced by law. But the custom is now believed to be much older, and to be a relic of paganism; these trees being sacred to the dead from a very early period, and therefore especially venerated by the Druids, were adopted by the Romans and Saxons; hence "the church was brought to the tree, and not the tree to the church," for the eminent botanist; Decandolle, notes that the yews at Fountains and Crowhurst are 1200 years old, while that at Fortingale, in Scotland, is believed to be 1400 years of age.

Resuming our voyage, we pass through Sandford lock,—one of the most picturesque of the many combinations of lock, weir, and mill,—and keeping in view the mansion of Nuneham Courtenay, which crowns the summit of the nearest hill, our boat is soon moored at the pretty landing-place which the artist has here pictured.

The interest of these pretty and graceful cottages is enhanced by the knowledge that they exist for the comfort and convenience of pleasure-seekers. Nuneham Courtenay has long been a famous resort of Oxford students and Oxford citizens; and seldom does a summer-day go by without a pleasant "picnic" upon one of its slopes, amid its umbrageous woods, or within the graceful domicile, erected and furnished, literally, for "public accommodation."

There are few "homes" in England more auspiciously located; and happily it has ever been the wish of its successive lords to share, as widely as possible, with "their neighbours," the bounties which Nature and Art have here associated to bestow upon "house and lands." Long may the present estimable gentleman who owns the fair mansion and beautiful demesne find imitators in his successors; for the example of his illustrious predecessors has been continued during his honourable life: it is not too much to say that Mr. Vernon Harcourt and his lady† make, annually, tens of thousands of persons happy, and hence derive their own chief happiness.

COTTAGES AT NUNEHAM COURTENAY.

To describe the house and grounds of Nuneham Courtenay would demand a volume, and to do so is foreign to our purpose. The former is full of interesting portraits, with many fine pictures by the great old masters. The portraits are principally those of the personal friends of the Chancellor Harcourt—the poets of his time, who were his frequent guests and companions.

The house is, however, less conspicuous for architectural display than for domestic quiet. It is upon the grounds that taste and wealth have been expended; and they combine, in the happiest manner, beauty with grandeur. While Nature has been lavish of her bounties, Art has been employed everywhere to give them due effect. Open glades, solitary walks, graceful slopes, a spacious park, fruitful gardens—in short, all that can attract and charm in English scenery is here gathered; and it is scarcely too much to say, that the demesne is unsurpassed in England.‡

From the heights there is an extensive view of the adjacent country for many miles around. Oxford with its domes and spires, and the venerable church of Ifley, the woods of Blenheim, the town of Abingdon, the hills of Buckinghamshire, the green hill-downs of Berkshire, the historic Chilterns,§ Faringdon Hill, with its dark crown of trees, which gives it the local name of "Faringdon Clump;" in short, on all sides are presented objects that add value to the fair demesne, while the winding Thames is ever present to refresh the eye that, withdrawn from distance, seeks the beauty that is more immediately at hand.

† Frances, Countess of Waldegrave, the charming and accomplished daughter of the late John Braham, Esq. Mr. Harcourt, is the son of the late Archbishop of York, who succeeded to the Harcourt estates, and assumed the name of Harcourt—Vernon-Harcourt—on failure of the male line. At the domesday survey, Nuneham Courtenay belonged to Richard de Cerei; it afterwards passed to the Riparys or Redvers. Mary, youngest daughter of William de Redvers, Earl of Devon (surnamed de Vernon) married Robert de Courtenay, Baron of Okenhampton, in Devon. Probably by this marriage, the manor of Nuneham passed into the family of Courtenay. The Pollards, of Devonshire, next succeeded to the possession: from them it passed to Audley of the Court of Wards, called "the rich Audley." From him it passed to Robert Wright, Bishop of Litchfield, whose son, Calvert Wright, sold it to John Robinson, merchant of London, in the time of Oliver Cromwell. From the Robinsons it descended to David, Earl of Wemyss, who married Mary, daughter and co-heir of Sir John Robinson, Bart., of whom it was purchased, in the year 1710, by Simon, first Lord Harcourt, Lord High Chancellor of England. We have shown, in treating of Stanton Harcourt, that the seat of this ancient family was changed at the period of this purchase.

‡ In the grounds is a "new" church, built in a style semi-Greek, by no means agreeable or impressive. The old church was taken down by Simon Lord Harcourt, and the present structure erected in 1764 after a design of his own, which was slightly corrected by Stuart. "It affords a memorable instance of the taste of that age, of which it was the misfortune that those persons who were the most liberal and desirous to serve the church, and who, for their private virtues, were most worthy of praise, were precisely those who did the most mischief. The fault was that of the age, not of the individual."

§ These hills are a chalky range, which cross Buckinghamshire, and reach from Tring in Hertfordshire to Henley in Oxfordshire. The district is crown land, and the steward is consequently an officer under the crown; but the position gives neither honour nor emolument, and is assigned to members of Parliament who wish to vacate their seats. In this way the stewardship has been granted to several members in one week; and the position is understood on all sides as a legal fiction, and one of the curiosities of our old parliamentary system.

On one of the slopes that ascend directly from the river stands the ancient and far-famed "Carfax Conduit," which formerly stood as "a kind of central point" to the four principal streets of Oxford; certain alterations requiring its removal, it was, with "most perfect propriety," presented to the Earl Harcourt. It was built, in 1610, by Otho Nicholson,—a liberal and enterprising gentleman,—in order to supply the city with pure water brought from a hill above North Hinxsey; and although the conduit is removed the pipes still remain,

CARFAX CONDUIT.

and afford a partial supply, likely to be superseded by the new City Waterworks. It is an exact square, decorated in accordance with the taste of the time—mermaids "holding combs and mirrors," and dragons, antelopes, unicorns, being scattered about; while the Empress Maid is introduced riding an ox over a ford—"in allusion to the name of the city." The letters O. N., the initials of the founder, are conspicuous; while above the centres of the four arches are the cardinal virtues—Justice, Temperance, Fortitude, and Prudence.

It is, however, we repeat, from the spacious grounds of Nuneham that the visitor will derive especial enjoyment:—

"Society is all too rude
To this delicious solitude:
Where all the flowers and trees do close
To weave the garland of repose,"—

so says one of the many tablets, scattered lavishly about the park, gardens, and walks; they were written "for the occasion," chiefly by the poets Mason and Whitehead—poets famous in their day and for a day. The lines we quote, however, are borrowed from a loftier spirit—Andrew Marvel: happily, as we have intimated, the sentiment is not altogether adopted by the generous owner of these beauties; who gives liberal ingress and free egress to all comers, to whom "society" seems ever welcome when it comes on holiday from thought and toil, and who has learned from a hundred brave and honourable ancestors that the surest way to be happy is to make others happy.

The fine trees of Nuneham hang luxuriantly over the river—it is a perfect wealth of foliage piled on the rising banks. This scenery continues until we reach the modern railway bridge, when, on the right bank of the stream, Radley House is descried; another turn of the river, past this demesne, and the spire of Abingdon comes in view. Between Nuneham Courtenay and Abingdon the river winds so much, that when we reach this ancient town we are nearly opposite to Oxford, distant about eight miles.

Abingdon is one of the most ancient towns of the kingdom; it stands near the junction of the little river Ocke (which rises in the vale of White Horse)* with the Thames, and although now a place of small importance, has played a conspicuous part in many of the most stirring events of British history.

A legendary tale thus describes its origin:—"At a time when the wretched pagan Hengist hasely murdered 460 noblemen and harons at Stonhengest, or Stonehenge, Ahen, a nobleman's son, escaped into a wood, on the south side of Oxfordshire, where, leading a most holy life, the inhabitants of the country

* This vale takes its name from an enormous figure of a horse cut in the side of the chalk hills, and existing there from time immemorial. It is rude in character; but, inasmuch as that character is precisely similar to the figures of horses on ancient British coins, it is believed to be equally ancient. It has been long the custom of the peasantry to clear it of weeds, and generally to restore it, at certain seasons of the year.

flocking to him to hear the word of God, built him a dwelling-house and a chapel in honour of the Holy Virgin; but he, disliking their resort, stole away to Ireland, and from him the place where he dwelt is called Abingdon."*

DISTANT VIEW OF ABINGDON CHURCH.

The old hospital at Abingdon is founded on the site of the monastery dedicated to the Holy Cross and St. Helena, by Cisa, sister of the king of the West Saxons, in the seventh century: this religious foundation having gone to decay, a hospital was erected in its place by a rich merchant, in the reign of Henry V., named Geoffry Barhour: in the reign of Henry VIII., this and other charitable institutions in connection with the Church were forfeited to the crown; and the Abbot of Abingdon being one of the first to acknowledge the king's supremacy, was rewarded for such subserviency by the gift of the Manor of Cumnor, and a pension of £200 a year for his life. Sir John Mason, in the reign of his son, Edward VI., bestirred himself to restore the charity, and in the year 1553 it was re-endowed, and named Christ's Hospital. It then accommodated thirteen poor men and women; the number is now thirty-two.

The old almshouses partially surround the church-yard of Abingdon. They are provided with a covered cloister leading to each door. Our engraving exhibits the central entrance with the cupola above the old hall. Over this gate are a series of curious old paintings, all allusive to works of charity; and in the old hall are many curious portraits of benefactors, the principal being the youthful Edward VI. holding a charter with the great seal appended, by which the hospital was founded. There is also a painting of the building of the bridges over the Thames, which first gave Abingdon importance; as they occasioned the high road from Gloucester to London to be turned through this town. Burford bridge was near the town, and Culham bridge about half a mile to the east of it. Before they were erected, in 1416, the fords here were very dangerous, and the road turned to Wallingford to avoid them. The merchant Barhour feeling the importance of these bridges to the town, gave one hundred marks toward them; and Leland says three hundred men were employed at once upon them at the rate of a penny per day; which Hearne, the antiquary, observes was "an extraordinary price in these times, when the best wheat was sold for twelvence per quarter." Another curious picture of a local antiquity is painted on the exterior wall of the hospital, opposite the Thames; it is a view of the cross which formerly stood in the town, and was destroyed by Waller's army in May, 1644, in revenge for his repulse at Newbridge.

THE ALMSHOUSES AT ABINGDON.

Holy things are these almshouses—holy and beautiful records of the thoughtful royal heart of one who, young in years, seemed aged in wisdom and goodness. We looked on them with more than common interest; having heard of them in our childhood; they had been, indeed, long associated with one of the happiest of our "memories." In very early life we knew a kind and beautiful French woman, who, in her full soft voice—her French accent lingering round the vowels—told us a story of an inmate of

* "Abingdone (says Leland in his "Itinerary") stands on the right side of the Isis, and was of very old time called Scukesham, since Abendune."

one of those very cottages, which bound them by romance, as well as reality, to our heart.

Now this is her story:—During the reign of terror in France, one of the first lady-refugees who sought shelter in London we shall call Madame la Marquise De Riordeau. She had contrived to bring over to England a large sum in jewels and valuables as well as in money; she was neither old nor young, but handsome, and a widow. Madame la Marquise was very proud, and very benevolent; she was proud even among the proud: she could not bear to abate one jot or tittle of her state,—she exacted a deference of word and manner from all around her, which acted as a perpetual restraint on her dearest and most intimate friends. She would have servants and liveries exactly as she had them when resident in Paris; and yet she was perpetually receiving and relieving those less fortunate emigrants who had literally nothing, and many of whom on their first arrival were found fainting from hunger on the door-steps of our English homes.

Madame's hand never seemed weary of giving—it was outstretched continually and liberally; people began to speculate as to what her income really was; for to live and act *en prince*, as regarded personal expenditure, and at the same time to relieve the needy numbers who came to her for aid, required the produce of a golden mine. There were one or two of Madame's intimate friends as stately, but not as charitable, and more wise than herself, who remonstrated, and told her that in time she would be obliged either to give up her domestic expenditure, or to "cease to do good." She told them somewhat hotly, and with an increased elevation of her superb head, that she could not forget the duty she owed her buried lord; that while she bore his honoured name, she *must* maintain its dignity; and that as to giving, she could never see her countrymen in want, and not share with them the last crumb of bread she had in the world.

All her friends remembered the rebuke, save one—a little earnest, honest banker (bankers in those days *were* honest and of good repute); he placed before her in black and white the state of her affairs, telling her that if she did not give less, or expend less, she would soon be ruined—be perfectly and entirely unable to do either the one or the other. More than once, when she urged that it was from respect to her husband's memory alone she maintained her state, the straightforward man of business told her she was self-deceived, that she herself delighted in the splendid show; that it was a source of intense gratification to her; that if it were not so, she would soon change her plan; that she imagined she was devoted to *two* duties, whereas it was simply a *fancy* and a duty; that if her love of her desolate and heart-broken countrymen were sincere, she would sacrifice her pomp to a stronger and more elevated feeling. Everybody wondered how the Englishman had mustered sufficient courage to speak in such a way to Madame, and still more wondered how or why she endured it—she, so haughty, so resolved, yet so generous, so warm-hearted, so sympathising.

The cry was still, "they come!"—emigrants swarmed everywhere. Madame felt herself overwhelmed;—there were the footman, the groom of the chambers, the page—such a delicious imp! all embroidery, and satin, and curls, and perfume—so different from the boots and broadcloth of a modern "buttons"—there were the companion and the *bon père*;—all that Madame had in her own hand—*except* the *income*. She was living, and causing others to live, upon her goods and chattels. The banker entreated her to *think*;—now Madame enjoyed feeling more than thinking; but it became evident to her friends that frequently and painfully thoughts would force themselves upon her. On one side was the expenditure necessary, she honestly believed, to do honour to her husband's memory as long as she bore his name;—and there were her fellow-emigrants! It was observed that the banker called more frequently upon Madame, and Madame daily and hourly became more thoughtful. He was heard more than once, as he descended the stairs muttering to himself, "Noble woman! noble woman!" Madame's *jour de fête* was at hand; numerous presents were prepared for her, and scores of emigrants, whom she had succoured, made ready their little gifts as tokens of their gratitude and love. On the eve of the day, both the banker and the *bon père* spent many hours with Madame, and when they left, she desired to remain alone during the remainder of the evening.

My friend remembered being taken by her mother that very evening to visit her beloved countrywoman; she also remembered being sorely disappointed at not seeing her—Madame was so lavish to her young visitors of caresses and *bon-sons*. Her mother promised to take her the next morning, and that she might have the honour to present to Madame a bouquet of pure white lilies. Betimes in the morning, my old friend was up, hoping she might be the first to offer the lilies of France to her mother's countrywoman—how beautiful they looked! how delicious their perfume! how often her handsome nose was tipped with orange from the fœrua of the flowers! and how often her maunna scolded her in pure French and broken English, because she was stealing the fragrance from Madame's lilies! It was a beautiful morning towards the middle of June when they reached the corner of the street in which Madame resided; they saw a crowd on the pavement, and my friend remembered that she burst into tears, because even the milk-girl had brought a bouquet of lilies to Madame—every third or fourth hand grasped a bunch of lilies; but as they drew nearer, they saw that dismay, astonishment, and disappointment were painted on every face.

Madame was gone! they should see her no more!—nobody would see her any more. She was gone for ever! She had left all she possessed in the world—except the smallest possible sum, which some said she would soon bury with herself in a convent—to be divided among the emigrants according to the judgment of the banker and the *bon père*.

Poor lady! she could resign but not diminish her pomp. She resolved to gild her husband's name even at the last with the refined gold of charity, and when she had no longer means to keep up state, and minister to those who needed, she made her choice, leaving "all her goods to feed the poor!" It made a great sensation at the time; everything was sold—turned into gold;

and the sum so realised was something fabulous—at all events, it saved hundreds from misery, and gave them the happy feeling that one of their own people had done this!

My friend grew from a child into a girl, and was married, and, soon after the birth of a daughter, went abroad with her husband, who was killed by an accident. She returned to England, and after the lapse of five or six years married again. Her second wedding tour was taken along the banks of the Thames,—there was so much she wanted to see in her own country—Hampton Court, and Richmond, and Kew, and Windsor, and Runnymede, and Oxford; and King Edward's almshouses were more talked about, and visited, and sketched then than they are now, for the Continent at that time was closed against us. As they drove up to Abingdon, a funeral was in the very act of passing away from one of the dwellings, but it was not like the "removal" of the poor widow of an English tradesman. The coffin had neither name nor ornament, but it was covered with black velvet; there were no pall-bearers, but it was lifted into a hearse, and two very old gentlemen—old, feeble men, each tottering, yet each supporting the other—brought a host of bewildering memories to my friend, for she could not tell whence they came, or who they belonged to. The old gentlemen in elaborate mourning cloaks, and scarfs, and hat-bands, got into a mourning coach, and the hearse and its attendants disappeared among the trees. The windows of those usually calm almshouses were filled with aged faces, and all wore the expression of intense sorrow. Many were weeping bitterly. An aged woman stood at the door from which the coffin had been removed; she was dressed in well-worn mourning, and looked through floods of tears after the procession—so earnestly, that my friend asked if the departed was to be buried in the church-yard.

"No," she sobbed; "and that's one of our griefs. Not one of us who loved her so, and to whom she was as an angel, shall ever see a blade of grass, or a bud or blossom, on her grave: it would have been some consolation to know that her dust would mingle with ours, and that we should rise together: but she's gone as she came."

A few more words and the good dame invited the strangers into the house. From nothing, poor soul, could she derive consolation except sympathy; and my friend's tears and smiles ever flowed or beamed with those who wept and those who smiled.

"There's no harm in telling the truth now," said the woman, "and indeed I hope to see it on a tablet in the church some day; thank God, it's a beautiful truth to tell:—and though she *was* a Papist, there's no living soul more sorry for her this blessed day than our own parson. Poor dear lady! she would never go *inside* our church during service, but every summer Sunday, when the sun shone and the dew was not heavy on the grass, I used to carry a high chair, and place it under the shadow of the ivy, close to the window that's nearest the pulpit, and she would throw her fair white shawl over her snowy cap, and making a trumpet of her hand so—for latterly she became deaf—sit with it to her ear; and not a word that passed from our good parson's lips escaped her."

"You call her a lady—and she was a Roman Catholic, I suppose?" observed my friend; "how was that?—This foundation is for the Protestant widows of decayed tradesmen."

"I am a Protestant widow," replied the woman, "and Madame lived chiefly with me. Mr. Gresham, the banker, who knew me and mine all our lives, got me the presentation, and here I have been more than twenty-eight years. One of those gentlemen was Mr. Gresham, the other is a M. Mercier, *her clergyman*—"

"And her name," exclaimed my friend, "was Riordeau?"

"I did not tell you—how did you know?" inquired the astonished woman.

The long past was soon explained; and then the woman told how that finding she could not continue to keep up her state and exercise her benevolence, and not having sufficient courage to brave the appearance of changed fortunes, she sacrificed herself, and gave up all she possessed, except the pittance we have mentioned, to relieve the distresses of her countrymen.

"Mr. Gresham, who managed all her affairs," continued our informant, "told me that a worthy person (he did not say lady) wished for country air and quiet, and would live with me for a month or two, until arrangements could be made to enable her to go into a convent. When she came—I know what ladies are, and could see she was no 'person'—I loved to tend her, and it was wonderful how, after a week or two, her heart opened, so that everything got into it—children and old people, flowers (how she *did* love them, especially violets and lilies), birds, animals. She would have nothing to do with the gentry, except that she wished me to sell those beautiful artificial flowers and embroideries she used to make; and as fast as the money came (and the gentry would give any price she pleased to ask) it went among the poor. If her purse was empty, her spirits sank directly; if it was full, no bird on a bush was ever happier. I heard nothing of the convent, though the gentleman she called her *bon père* used to come and see her every two or three months. After having been here five or six years, she permitted our parson to call on her, and according to duty, I know, he offered to read or pray with her; and she told him haughtily she could do the one for herself, and the *bon père* attended to the other. Two or three years elapsed before he saw her again, and then they got on kindly together until the last. She never told any one who she was, or why she came here; she denied herself all earthly pomp and state, and all for charity. God bless her! Oh! how she loved these walls; she loved this little home, so mute and peaceful. She was as humble as a mole with the poor, but, dear lady, if any of the gentry came about her, she would put them away with a bend of her head as if she was an empress. She sacrificed her all to charity. She had a great idea, I think, of going back to her own land, and thought her estates would be returned; I do not know; and when this illness came on her, she would pray that she might be permitted to see her country before she died. They will carry her there I know, though I think her spirit, if it is permitted, will often wander about King Edward's Almshouses."

That is our old friend's story.

THE APPLICATIONS OF IMPROVED MACHINERY AND MATERIALS TO ART-MANUFACTURE.

No. 6.—COATING IRON WITH COPPER, BRASS, SILVER, OR GOLD.

ABOUT the same time, we find attention is directed to the production of the same result, in America, France, and England. Three patents have been secured, in these three countries, for processes by which iron may be covered with copper, brass, or the precious metals. There are many advantages beyond that of cheapness attendant upon the use of iron for ornamental purposes. The objections to its use have been its colour, and the liability to tarnish by oxidation—the protection afforded by resinous coatings being of a very uncertain character. When the electrotype processes were introduced, it was thought that iron might be readily covered with other metals; but the chemical reactions which were set up, when any salts of the metals having acid bases were used, nullified against the success of electro-metallurgy in this direction.

Most persons know that when a piece of iron is plunged into a solution of sulphate of copper (blue stone or blue vitriol), that the iron becomes covered with a coating of copper. This coating must be regarded as a substitution, for, as the iron is dissolved by the sulphuric acid of the salt, copper is precipitated; but this kind of surface cannot be made to endure any wear, owing to its pulverulent character. It was at one period thought that the instance given was an example of actual transmutation, and Agricola tells us of some waters in the neighbourhood of Newsol, in Hungary, which had the property of transmuting the iron which was put into them into copper. In the year 1673 our countryman, Dr. Brown, visited this famous copper-mine of Herr-Gründt, about seven English miles from Newsol. He tells us of two springs, called the old and new *Ziment*, which turned iron into copper. The workmen showed him a curious cup made of this transmuted iron; it was gilt with gold, had a rich piece of silver ore fastened in the middle, and the following inscription engraved on the outside:—

“Eisen ware ich, Kupfer bin ich,
Silver trag ich, Gold bedeckt mich.”*

A curious case of fraud was perpetrated at one of our naval ports some time since, which depended upon this supposed transmutation. A marine store-dealer bought, from time to time, from a shipwright a great number of copper-bolts at a very low price for copper, under the impression that the man had stolen them from the arsenal, in which he was employed, her Majesty's mark being upon each bolt. Before endeavouring to sell to some merchant his prize, the marine store-dealer, for the purpose of obliterating the government mark, attempted to melt the bolts into one homogeneous mass, and he then discovered that but a very small layer on the surface consisted of copper, the bolts being iron. The shipwright had procured from some blacksmith iron bolts; having given them an exterior of copper by placing them in a solution of the sulphate of that metal, he then stamped them with the broad arrow, and thus thoroughly deceived the dishonest dealer. In the Wicklow mines, and also in the mines of Anglesea, immense quantities of copper are saved from the waters which flow from the lodes by throwing old iron into them. It should be understood that in all these cases we have an example of chemical substitution only. The iron and sulphuric acid having a greater affinity for each other than copper and sulphuric acid have, the iron is converted into sulphate of iron, which is soluble, while the insoluble metallic copper is precipitated. If any ornamental work were treated in this manner, for the purpose of securing the advantages of a copper coating, all the fine edges would be worn off, or so weakened that they would crumble with a slight blow, consequently, some other method was sought for. Professor Wood, of Springfield, Massachusetts, claims to be the first who has successfully coated iron with copper, brass, and the other metals, by electro-metallurgy. We believe, however, that this

* “Iron I was, Copper I am, Silver I carry, Gold ornaments me.”

claim cannot be supported. We find in Mr. Shaw's “Electro-metallurgy” the following:—“In depositing copper upon iron, a solution of the cyanide or acetate of copper should be employed. The only value of these salts is, that a die or surface of iron may be immersed in their solutions without receiving injury by the corrosion consequent upon the deposition of a film of metal by chemical action.” Professor Wood's description of his processes and solutions are, however, of so much value that we quote them from the *Scientific American*. In most of his experiments he has used a Smee's battery, but for depositing brass he prefers a battery fitted up as Grove's, or rather Bunsen's, as he uses artificial graphite, obtained from the inside of broken gas-retorts, in the place of platinum. With one large cell (the zinc cylinder being 8 by 3 inches, and excited with a mixture of one part sulphuric acid, and twelve parts water, the graphite being excited with commercial nitric acid), Professor Wood says he has plated six gross of polished iron buckles with brass, and coated type and stereotype-plates with the same alloy, which he finds more durable than the copper-facing which is usually employed.

Cyanide of copper and zinc are prepared as follows:—Dissolve one ounce of sulphate of copper in one pint of hot water; for cyanide of zinc, dissolve one ounce of sulphate of zinc in one pint of the same fluid; then dissolve five ounces of cyanide of potassium in one quart of water. To the first solution add, by degrees, a small portion of the cyanide solution, until the whole of the copper or zinc is precipitated, stirring the mixture and allowing it to settle; then wash this precipitate with pure water, dry, and preserve it for use.

To prepare a solution of copper or of zinc dissolve eight troy ounces of cyanide of potassium, and three ounces of the cyanide of either copper or zinc, in one gallon of rain or distilled water. To prepare a solution of brass, dissolve one troy pound of the cyanide of potassium, two ounces of cyanide of copper, and one ounce of cyanide of zinc, in a gallon of rain or distilled water, and then add two ounces of muriate of ammonia.

Cyanide of silver is prepared by dissolving one ounce of pure silver in two ounces of nitric acid and two ounces of hot water, after which add one quart of hot water; precipitate the cyanide with cyanide of potassium as described, and dissolve it in an excess of that salt in solution. The *cyanide of gold* is prepared in the same manner, and the solution for work is made by dissolving one ounce of the cyanide of gold in four ounces of cyanide of potassium, dissolved in one gallon of rain water.

The gold solution for plating iron is to be used at a temperature of 90° Fahr., and with a battery of at least two cells. The brass solution for smooth work is to be used at a temperature of 160° Fahr., and for rough work at a temperature of from 90° Fahr. to 120°, with a compound battery of from three to twelve cells.

Professor Wood says, with regard to silver:—The electro-plater, to insure success in plating upon all metals and metallic alloys, must have two solutions of silver: the first to fix the silver to such metals as iron, steel, Britannia metal, &c.; the second to finish the work, as any amount of silver can be deposited in a reguline state from the second solution. The *first solution* is formed by dissolving two and a half pounds troy of cyanide of potassium, eight ounces of carbonate of soda, and five ounces of cyanide of silver, in one gallon of rain or distilled water. This solution should be used with a compound battery of three or ten pairs, according to the size of the work to be plated. *Second or finishing solution*:—dissolve four and a half ounces troy of cyanide of potassium, and one and a half ounce of cyanide of silver, in one gallon of rain or distilled water. This solution should be used with one large cell of Smee's battery, observing that the silver plate is placed as near the surface of the articles to be plated as possible. By using the first solution, the adhesion of silver to all kinds of brass, bronze, red cock metal, type metal, &c., may be secured, without the use of mercury, which is so injurious to the human system.

In Birmingham they have not only been covering iron with copper and brass by the electro-plating process, but they have been covering iron with brass, by a process purely metallurgical. The ornament, cast in iron, and having a surface properly prepared,

is brought up to a certain heat, and then plunged into melted brass, by which it receives a thin coating of that alloy. Although this is a process new, or nearly so, to our manufacturers, it is not a novelty to coat iron with copper.

Mr. Layard brought from one of the ruined palaces of the Assyrian monarchs, a considerable variety of bronzes which had been used for many dissimilar purposes. Among other things were some delicately wrought bronze feet, which were evidently supports of some kind, possibly of seats, or tables, or it may have been that they were the supports for ornamental objects. Some of these being presented to the Museum of Practical Geology, for the purpose of adding to the illustrations of the history of metallurgy, and being then supposed to be only bronzes, were submitted to analysis. On attempting to cut one of these, it was found that a core of iron ran through the leg of bronze—that, indeed, the bronze had been cast upon the core of iron, which must have been very carefully placed in the mould. Here the object was to obtain strength, and to secure delicacy in the casting from the ornamental metal. No more ingenious plan than this could have been adopted; and we learn from it the advanced state in which Art-manufacture was when the Prophet Nahum pronounced “the burden of Nineveh.” Some experiments have been made since this discovery; and it is found that the most perfect cohesion exists between the two metals when treated in this manner.

We have lately inspected some very beautiful examples of *brassing* iron, which were executed by a process patented by a French gentleman, and for the use of which, we believe, the Colebrook Dale Company are in treaty.

It will be understood that all the electro-plating processes by which iron can be successfully treated, require the use of an alkaline solution of the metals employed, and that the cyanides answer far better than any other salts. If it is desired to cover iron with the more expensive metals, the first coating would be of copper, and then on this the silver or gold would be precipitated. Forms of exceeding beauty may be obtained in iron, the cost of production being small. There is no reason why our manufacturers should not produce iron castings of equal delicacy to those for which Berlin has been so long celebrated. These may be treated by any of the methods above given, and hence have a surface of copper, brass, silver, or gold, as may be desired.

We do not know of any process more likely to advance Art-manufacture than this. Already in Paris it is largely employed in the production of elegant ornaments, which are sold at a low price. We hope to see it employed in this country to a large extent, as thereby Art-productions may be placed within the reach of every one, and in a short time the refining influences of the beautiful would be felt and extended.

R. HUNT.

PICTURE SALES.

ON the 7th of May, Messrs. Foster sold, at their rooms in Pall Mall, a collection of pictures formed by Mr. W. Cox, of Norwood, from the various exhibitions and the studios of many of our best artists. In the catalogue appeared the names of Sir E. Landseer, Lawrence, Etty, Hilton, Millais, Callcott, Chambers, Pyne, Lee, Paul Delaroché, Isabeau, Nasmyth, Westall, Dyce, Danby, Hayter, Poole, Stanfield, Creswick, Linnell, Uwins, &c. &c. Of the ninety-two pictures offered for sale, the following realised the highest prices:—‘The Ballad,’ F. STONE, 57 gs. (Gambart); ‘The Beach,’ a very small work by LINNELL, 42 gs. (Sampson); ‘Lear and Cordelia,’ UWINS, 47 gs.; ‘Sunset on the Gulf of Salerno,’ G. E. HERRING, 83 gs. (Sharpe); ‘View near the Isle of Wight, looking towards Lymington,’ LINNELL, 155 gs.; ‘The Gipsy's Tent,’ P. F. POOLE, 155 gs.; ‘View in North Wales,’ CRESWICK, 103 gs. (Best); ‘Cœur de Lion crossing the Desert on his way to Jerusalem,’ J. W. GLASS, 65 gs.; ‘Draft Players,’ T. FAED, 165 gs. (Best); ‘Fisherman's Wife,’ P. F. POOLE, 127 gs. (Pennell); ‘Doubtful Weather,’ CRESWICK, 230 gs.; ‘Evening Scene, with Flock of Sheep,’ LINNELL, 210 gs.; ‘The Soldier's Home,’ J. SANT, 82 gs.; ‘Viaduct of the Crumple Valley, Harrow-

gate,' J. D. HARDING, 132 gs. (McLean); 'Pembroke Castle on Down Pool, Milford Haven,' C. STANFIELD, 235 gs.; 'Dutch Fishing Craft off Fort Lillo,' E. W. COOKE, 120 gs. (Pennell); 'Triumphal Entry of Henry VI. into London, 1421,' the large drawing by E. CORBOULD, exhibited a few years ago, 90 gs.; 'Hampstead Heath, looking towards Edgware,' LINNELL, 650 gs. (Hooper and Wass).

In the same rooms was sold, on the 13th of May, a collection of about 100 water-colour drawings, the property of Mr. Greenwood, of Hampstead Heath. The catalogue included the names of very many of our leading painters, but it was especially rich in the works of Catermole, of which there were nineteen examples. Of the entire series we can only specify a few of the more important:—'Montrose after the Battle of Dunbeath,' G. CATERMOLE, 147l. (Vokins); 'The Daruley Conspirators—Murder of Rizzio,' G. CATERMOLE, 106l. (Agnew); 'The Stone Breaker,' W. HUNT, 60l. 15s. (Wallis); 'Reading the Scriptures,' G. CATERMOLE, 98l. 14s. (Gambart); 'Interior of a Convent—Monks Reading,' G. CATERMOLE, 63l. 6s. (Agnew); 'Dover—A Brisk Gale, with Luggers entering the Harbour,' C. STANFIELD, 51l. 9s. (Grundy); 'Christ Preaching in the Temple,' G. CATERMOLE, 122l. 17s. (Wallis); 'Trematon Castle' (size 16 in. by 11 in.), J. M. W. TURNER, 215l. 5s. (Ripp); 'Stamford on a Rainy Day' (size 16½ in. by 11½ in.), J. M. W. TURNER, 136l. 10s. (Wallis).

On the following day Messrs. Foster sold a number of first-class English pictures, with a few foreign works, belonging to Messrs. Lloyd, of Ludgate Hill, many of which had been purchased for the purpose of engraving; the sale of these works resulted from a dissolution of partnership in the firm. There were in all fifty-five "lots," the whole of which, with three or four exceptions, perhaps, realised excellent prices, showing no abatement of interest on the part of collectors and dealers in the productions of our artists. The appended list of the principal pictures, and the sums they sold for, will verify our statement:—'Trial of Archbishop Laud' (engraved), A. JOHNSTON, 133l. 7s. (Flatow); 'Nelson in his Cabin' (engraved), LUCY, 42l. (Lord Normanton); 'La Blanchisseuse,' E. FRERE, 73l. 10s. (Gambart); 'Fruit,' Miss MUTRIE, 26l. 5s.; 'The Battle of Camperdown,' a large picture, and one of the best works of the artist, W. A. KNELL, 92l. 8l. (Shelburn); 'Monk writing a Manuscript,' G. CATERMOLE, 44l. 2s. (Robertson); 'The Smithy,' J. F. HERRING, 97l. 13s. (Russell); 'Deer Stalking,' J. F. HERRING, 57l. 15s. (Graham); 'Brambles in the Way,' exhibited at the Royal Academy last season, J. C. HOOK, 79l. 9s. (Gambart); 'Fish-market at Honfleur,' E. ISABEY, 82l. 19s. (Benson); 'Oh, come to this heart, my own stricken deer' (engraved), D. MACLISE, 73l. 10s. (Richardson); 'Cupid,' ETTY, 77l. 14s. (Bastable); 'Christ walking on the Waters' (engraved), R. SCOTT LAUDER, 95l. 14s.; 'Spring—Sheep and Cows in a Meadow' (engraved), T. S. COOPER, 157l. 10s. (Agnew); 'The Venturesome Robin' (engraved), W. COLLINS, 279l. 6s. (Wallis); 'Robinson Crusoe reading his Bible' (engraved), C. R. LESLIE, 99l. 15s. (Richardson); 'The Sonnet,' ELMORE, 101l. 17s. (Wallis); 'Christ Healing the Withered Hand,' G. CATERMOLE, 100l. 16s. (Shelburn); 'Presbyterian Catechising,' J. PHILIP, 288l. 15s. (Wallis); 'The Farmyard' (engraved), J. F. HERRING, 241l. 10s. (Richardson); 'Comedy' and 'Tragedy' (engraved), a pair by SANT, 110l. 5s. each (Gambart); 'The Children in the Tower,' C. R. LESLIE, 132l. 6s. (Holmes); 'The Emigrant's Letter,' T. WEBSTER, 67l. 4s. (Vokins); 'Henry Warden—A scene from the "Monastery,"' WILKIE, a present from the artist to the late Mr. W. Seguin, 220l. (Wallis); 'The Rose of Seville' (engraved), C. BAXTER, 171l. 3s. (Flatow); 'The Bridal Banquet,' LANCE, 273l. (Brandon); 'The Fête du Mariage,' F. GOODALL, 278l. 5s. (Hooper and Wass); 'Christ teaching Humility,' R. SCOTT LAUDER, 204l. 15s. (Holmes); 'Alfred in the Neatherd's Hut,' WILKIE, 220l. (Wallis); 'David and the Lion,' J. LINNELL, 567l. (Wallis); 'The Playground,' T. WEBSTER, a small replica of the large picture in Lord Overstone's gallery, 254l. 2s. (Wallis); 'The Post-Office,' F. GOODALL, 745l. 10s. (Brandon); 'Clearing the Woodlands,' J. LINNELL, 540l. 15s. (Robinson).

AN ARTIST'S NOTES ON HAIR.

THERE is a beautiful kind of fair hair that is like an exceedingly thin shaving of wood: I do not mean the long corkscrew curls generally produced by the plane, but where the carpenter's hand seems to have somewhat caught and trembled, carrying off but an infinitesimal film, which travesties the peculiar ripple you see occasionally in fair hair. Such is a very exquisite and angelic kind of hair. The ripple relieves its straightness, and catches the light, but does not break up the masses. The form of the head is clearly seen through it, as through a veil, and there is a shimmer in it like metal—like gold veins in quartz:—

"O'er her white shoulders fell her yellow locks,
Like golden gleams on alabaster rocks."

There is in fine fair hair frequently a metallic lustre, which makes it very natural to apply the word "golden" to it. But this does not apply to fair hair alone—on some black hair you see quite a bright blue steel-like lustre. This remark mostly applies to the black races, where the hair has ceased to be woolly by intermarriage with other nations, when it often becomes straight, long, and abundant. I recollect such on the head of a brown West-Indian girl of mixed race. She had wonderful hair of this kind—in such weighty cold masses that it hardly seemed like a growth from a living creature. It tumbled down from her head in waves, like a black Niagara. It was wonderfully grand, and she was pardonably proud of it. The lights on it were like flashes of blue steel—intensely blue, almost ultramarine.

The mixture of white, in black hair losing its colour, is also metallic in character, like grey steel, or the fracture of iron, and is so called—iron-grey. Catlin, in his account of the North American Indians, affirms that a peculiar tribe, the Mandans, with whom he resided for some time, and whose manners and character he particularly describes, but which are now extinct, were frequently born with this kind of hair, and that he often saw children with all their young tresses perfectly grey. There is another kind of hair we call silver, because its colour resembles that metal, frosted and polished, for its tints are modified in various ways.

But there is a greater diversity in the warm tints than even in the cold, running from one end of the gamut to the other. The pale gold runs into the full gold, that into the coppery, then into the red, then into the auburn, and lastly into the dark, almost black hair, with red in it. This is the grandest kind of hair, perhaps, of all—grandier even than the black hair with bright blue lights, because it is stronger in character, richer, and more vital. It is hair one would fancy Samson had. This kind, however, is very uncommon. I have not seen it in perfection more than once or twice.

Red hair is not often the subject of praise, nevertheless, there are several kinds of it that are very beautiful. I know but one, indeed, which I cannot like, and that is the fiery, brick-dusty version which is associated with an unpleasing complexion of the sallow, pale, tallowy, or fire-burnt character. When, however, the complexion is agreeable—and it often is most charming and peachy when the hair is red—then the quality of the hair is commonly pleasing too. The delicacy of these tints, however, agrees better with the female than the male character, and therefore red hair is more agreeable in a woman than a man, in whom a certain pronounced vigour of appearance is looked for, which in red hair is apt to fall into the aforesaid brick-dusty and fiery.

The golden version of red hair is to this day especially admired in Italy, and in time gone by Titian often chose it in his pictures. It is not so great an evidence of its beauty that it is much coveted by some of the black tribes of the south-west of Africa, who use some preparation to remove the natural colour of their own black locks, and give them the desired tint; but they rarely succeed further than the production of a dusty dun, which, however, is thought preferable to the original black. The Turks, on the other hand, are more of our way of thinking, and, being proficient in the art of dyeing, generally dye their red, as well as grey, beards black. This is usually done at the baths, and it is not thought derogatory to a "grave and reverend senior" to sit for some hours with his

beard in a paste of litharge and lime, for the purpose of changing it to a glossy jet. In red-tinted hair, however, when the colour deepens and embrows into auburn, it is equally becoming to both sexes, although still, perhaps, it may be thought more appropriate to the female. Auburn is a gorgeous, glorious colour, and when of the finest kind and the hair is abundant, I have seen the light on it like the setting sun on the trunks of yew-trees, where the outer bark has peeled off somewhat. Etty, in his gorgeous Aristot-like version of Homer's syrens, has gifted the most impassioned lovely tempter and fiend with a profusion of such rich auburn hair. There seems, indeed, something peculiarly enthusiastic in auburn hair, and I do not realise any but a fervent character in union with it—at any rate, not artistically.

The colour of almost all hair is finer for having some red in it: it gives it glow, richness, and vitality. The cold browns, and the hay and clay hues, lose much by their deficiency in this respect. Even white hair is more graceful and pleasing when there is some warmth in its tint, but in this case not from the admixture of red, but from the presence of a slight degree of yellow giving it a sunny quality. I have seen occasionally, but rarely, some beautiful heads of hair of this colour; the white, too, being the result of years, and which I have admired almost as much as young hair. Indeed, in this kind there appears to me no quality of age, any more than in the hair of a white animal, or the plumage of a bird. This is not the case with grey hair, which, though often pleasing as a tint, especially in a picture, is evidently in a transition state—the dark and the white contending for mastery in a struggle, in which the white is sure to have the best of it at last.

The hair of the Albino is like floss silk, or spun glass, and mostly in itself very pretty. Our viewing it as a phenomenon is in the way of our doing it justice. Among the Indians who dwell on the banks of the Amazon, white hair is looked on as the attribute solely of extreme old age, as they retain the dark colour of their abundant long straight locks frequently to the ages of seventy or eighty. The strangest kind of hair is that of the Hottentots and Bushmen, which grows over their heads in little tight knots, like periwinkle shells, with interstices between on the scalp bare of hair. This is not very beautiful according to our ideas, although kind Providence, no doubt, represents it to them as the perfection of *chevelure*.

Altogether Nature has been wonderfully various in the ways in which she has gifted human creatures with this appendage, and a complete dissertation on its diversities would fill a book. Nowhere perhaps, however, is there a better opportunity of seeing one class of its varieties than in England, from the admixture of races that has produced our population. The Saxon and the Celt afford opposite elements of these, inasmuch that in the same family you not unfrequently observe great diversities of tint, ranging even from the very dark to the sunny gold. This chiefly occurs when the parents are of opposite complexions. It varies the domestic picture charmingly, especially when taken in conjunction with that subtle tie, family likeness, which marvellously causes the most diverse features to be recognised at first sight as akin. And this makes us think at once of a joyous circle of young people, perhaps at high games on a sunny afternoon, or round a Christmas tree, and then how the young tresses dance, and float, and glisten! What a beautiful thing is young hair! How fresh, clear, bright, and pure, when tolerably well kept, and brushed, and washed! It wants no more. How beautifully the young head adorns itself with its own growth, and how gracefully it showers down its rich veil over the white shoulders! Simple in general effect, how many are the forms and colours that the artist's eye detects amid its luxuriance!

In Art there is a wide field for treatment in its representation, both as to form and colour; and very various have been the ideas of beauty with respect to it, and as to its most graceful character of growth. In the Greek division of the head into four parts of upright measurement, one fourth was allowed for forehead, and one for hair, of which the line of growth was a regular arch from ear to ear over the forehead, making it thus look often small and low rather than expanded. The Romans went still further in this direction, and from the idea of going to the extreme from baldness, were in the habit, in their

statues and busts, of bridging the line of hair so low over the eyebrows as to produce an unpleasant and headachy effect, as in the well known and beautiful "Clytic," in the British Museum, in which, by the by, the rendering of the hair itself is exquisite. We have a natural repugnance to "foreheads villainous low," and, though we must not confuse the true height of the forehead with the comparatively accidental growth of the hair, a low growth does certainly at first sight give an impression of a low head, and one wishes the hair were off a little more, so, as it were, to give the brain more freedom to think. We are now inclined to claim for unclouded forehead a greater elevation than either the Romans or Greeks. And it may be seen in the works of the day, where beauty and dignity are sought, that considerably more than one-fourth of upright measurement is allotted to the frank uncovered forehead. This clear brow is the attribute of man, and there is a peculiar intellectuality in a clear temple; as if, indeed, those parts were especially the temples of thought, and as if, where the bone is thinnest, you recognised the brain the most. Perhaps the noblest and most intellectual character in male form is gained when the hair is somewhat sacrificed to the head, and when the forward and nohler portions have grown bare, as it were, by having been much exercised, and the hair is thus confined to the back half of the head. This was the character of Shakspeare's appearance when some thirty or five-and-thirty (for he early lost his hair), and he has some quaint railery on the subject. In the "Comedy of Errors," for instance, Dromio asks why Time is such a niggard of hair? And Antipholus answers, "Because it is a blessing that he bestows on beasts, and what he hath scant men in hair, he hath given them in wit." Newton's hair, on the other hand—that other great English mind—although it early lost the tint of youth, was retained even to advanced age, when it is described to have been of a beautiful silky whiteness, presenting the most venerable appearance possible.

In the eleventh chapter of the first epistle to the Corinthians, St. Paul characterises long hair as "a shame to a man, but a glory to a woman." This probably alluded to some especial extravagance on the part of the Corinthians, and not to men's hair hanging down only to the shoulder, as Milton characterises that of Adam, while Eve's hung down to her lovely waist. In Milton's time, during the reign of the two Charles and the Commonwealth, even the Puritans wore their hair in Adam's fashion, although they occasionally cut it much shorter than did the cavaliers, whence arose the name "crop-eared knaves." Even Cromwell wore his hair long, as his portraits testify; and his secretary, the poet of "Paradise Lost," wore his parted, and flowing in waves till it reached the shoulder, like his own Adam. In Brittany, at the present time, the hair is treated in remarkable opposition to St. Paul's injunction, as the men wear theirs very long, and the young women cut theirs quite short, and conceal what remains wholly under their frightful caps, vastly preferring these artificial erections of linen and starch to Nature's own beautiful decoration—indeed, a woman is never considered full dressed while a single tress finds its way to sight. Among the Greeks and Romans the men wore their hair short, or, at any rate, compact and confined by a fillet, and it is only in the antique busts of so-called "barbarians" that we find the hair long and flowing. The Greek women encouraged the length of their hair, but bound it up in various compact and graceful ways at the back and top of the head. The Roman women occasionally cut theirs quite short, *à la Brutus*, and dressed it in many small curls, in an artificial and unhecoming manner, as is to be observed in the otherwise beautiful statue of the "Agrippina."

The occupation of the sexes seems to point to men wearing their hair shorter than women, so as not to be in the way of their robust exercises; yet, in some tribes of the North American Indians, the warriors encourage theirs to grow to an inordinate length. Catlin mentions a certain chief, who, when on horseback and accoutred for the fight, when one would think it would have been desirable to make everything as compact as possible, wore his hair, on the contrary, streaming out behind him some five or six feet; and after a fashion, too, that could he no real ornament, as it was stuck together with a paste of ochre and gum in straight ribbon-like tails.

Among, however, these races it is the women who are the hard daily workers, and the men, in the intervals of the chase and war, have nothing to do but to sit at home or saunter about their lodges, so that the dressing and adornment of their long hair may be a great resource. Nevertheless, some tribes go to an opposite extreme, and shave their hair to a single top-knot, which, accordingly, monopolising all the nourishment, grows, as with the Chinese, to an inordinate length. These latter occasionally coil their occipital tails, thus produced, closely round on the top of their heads, in the likeness of a porter's knot; this coil becomes so substantial as to resist a sword cut; but they leave the sides and above the ears all bare and blue from close-shaving. You cannot subject a Chinese to an indignity equal to that of cutting his tail off. The Javanese men wear their abundant long black locks intact, and take much delight in combing and oiling them. Some English officers, landing for the first time, saw a party of the exquisites of the country so employed, and took them at first sight for women, till undeceived by their guide.

Among the antique busts we may remark a great variety in the hair, even among the gods. Jupiter and Hercules, Mercury and Apollo, have each their own style. Homer, who sang them all, has still another manner—at least, the beautiful bust in the Museum represents him with long thin hair, smoothed carefully forward, and confined with a fillet, so that the old man's tresses curl gracefully on either side. The thatch, so to speak, of the brain has commonly been eared for, and its absence regretted. Cæsar petitioned the senate to be allowed to wear a wreath of laurel in public, to conceal, he said, the loss of his hair, though perhaps also with a political aim—viz., to accustom the people to his wearing something like a crown; and the Emperor Tiberius wrote a treatise on the management and preservation of the hair.

THE GOVERNMENT-BUILDINGS COMPETITION, AND THE EXHIBITION OF THE DESIGNS IN WESTMINSTER HALL.

ON Monday, May the 4th, the public were admitted within Westminster Hall, there to examine and study the 218 designs which had been sent in for the competition to which the architects of all countries had been invited by our Government. On the same day there were opened for public inspection in London the Exhibitions of the Royal Academy, in Trafalgar Square, and of the French Artists, in Pall Mall; and the following day witnessed the opening ceremonial of the Art-Treasures Exhibition at Manchester. Such was the concurrence of important events, all of them bearing directly upon the present and future condition of Art amongst us, which this present year has produced, and to which, with several other exhibitions of a similar class, we are now anxious to invite the careful attention of our readers.

In its own department of Art, and in the influence which it cannot fail to exert upon the Art-feeling of the country at large, the great architectural proposition of the Government must be regarded as the most important event of modern times; since, while the buildings thus proposed to be erected are at least equal in extent to the new palaces of the legislature, in its ultimate range the present plan must necessarily affect the entire architectural character of the city of Westminster, and, indeed, of the whole metropolis. The designs sent in for this competition, accordingly, have much more depending upon them than their own special suitability for their immediate and particular objects. They must, therefore, abide a twofold ordeal—the ordeal of worthiness both for the home of the executive government of this great country, and also for constituting the type for whatever public buildings it may be necessary to erect from time to time in different parts of the kingdom. The question which this competition opens before us applies no less directly to the *style* in which these buildings shall be erected, as a national style of architecture, than it does to the suitability of the several edifices for the purposes of government

offices, and for the residences of official personages. Were it not for this matter of architectural style, plans alone would have been sought for; but both plans and designs for buildings have been required, and both have been submitted for the opinion of the public, and for the decision of the appointed judges.* We may ourselves be content to leave all the details of plans and arrangements to be dealt with by others, since it is with the architecture of the designs, as with expressions of Art, that we are directly concerned. Good architecture, however, must be understood to imply good arrangements and appropriate plans; and, in this particular instance, these matters will imperatively demand the application of architectural skill, judgment, and experience of the very highest order.

It is, and it must be admitted to be a very singular circumstance, that in this country, and at the present time, we should have to seek for a style of architecture for a great group of national edifices. Yet such is the fact. We have not already recognised any style of architecture as the national style, and therefore we have no authority to which to appeal; neither have our architectural experiments resulted in what might be termed the arguments of experience in favour of any particular style. It is notorious that, as a nation, we constitute an exceptional instance in the matter of secular public buildings: in other words, we are singular in possessing, with very few exceptions, no great and noble secular public buildings. We are ourselves conscious of this want, and we are also aware that it is well known to foreigners: and this is the true standard of nobleness in such buildings—the high estimate which foreigners may form of them. Perhaps there are no towns and cities in existence that are so utterly devoid of architectural character as our own—that are so unimpressed with the magic touch of the taste and genius of true Art, even in their most important buildings. And yet we have built very much, and very large sums have been expended by us in building. But, unhappily, there has been a grievous falling off in the expenditure of *mind* upon our buildings; and the investment of Art has been very far from commensurate with that of capital. We once were induced to follow a foreign example, and to set up a portico, and so we became familiar with columns and pediments; and a square aperture in a wall was once adopted by us as a window or as a doorway, and thus our streets came to be pierced in long, long order, with square openings for doors and windows; and we learned to set little pediments over these square openings, and to put up columns here and there, without any particular purpose, but because we wished to have some columns, and they seemed to do as well in one position as in another: and then, finding such things associated with modern columnar architecture in Italy, we made our roofs flat, or at least low, and we crested our walls with balustrades and urns; not that we thus either got rid of the old climate of our own country, or discovered any use for urns or any beauty in them, or adopted for ourselves the habit of passing much of our time upon our house-tops. And then, again, when we required ornament, we carved unmeaning scrolls and unnatural foliage and terminal figures, and so forth. And we worked hard and long at all this; but, nevertheless, we neither accomplished architectural works which might challenge a world-wide renown, nor did we determine and establish a national style of architecture.

Meanwhile there arose amongst us a few men of thoughtful, earnest minds, who were not content to rest in quietness under the dissatisfaction inseparable from such architectural aims and results. These men looked beyond the palpable and acknowledged failures that surrounded them, and they sought for success from other sources. The feeble inauties which could not command the sympathies even of their authors, they knew to be at best but exotics; and here these plants of foreign growth were evidently languishing in an uncongenial region. But our own country, while thus it refused to cherish

* The names of the following noblemen and gentlemen have been announced as commissioners, selected to act as judges of the exhibited designs:—The Duke of Buccleuch; Earl Stanhope; Lord Eversley, the late Speaker; Mr. Stirling, M.P.; Mr. D. Roberts, R.A.; Mr. Burn, a Scotch architect of eminence, and Mr. Brunel. There could not be, in our opinion, a more judicious selection.

an alien style and to recognise it as its own, once possessed civil edifices worthy to stand beside those glorious cathedrals which yet vindicate for our ecclesiastical architecture a claim for a place in the front rank of Art. And, like our cathedrals themselves, these noble civil edifices were built in the Gothic style of architecture. That style, so versatile in its faculties of application and adaptation, and so copious in the resources which, under all circumstances and for every variety of purpose, it can always command—that was the architectural style of England in the great days of our architecture, the style as well of one class of our public and important buildings as of another. We may have lost the greater number of Gothic civil buildings, and we may have come to regard the Gothic as exclusively an ecclesiastical style; such an opinion, however, can exist only in the minds of those whose knowledge of the Gothic is limited to a certain degree of familiarity with one particular class of its productions, while Westminster Hall itself—the very apartment in which these competition designs are now exhibited—at once declares how nobly and how suitably the Gothic of England can produce an English civil building, and exemplifies the true character and the national traditions of the *genius loci* of Westminster.

In taking up the question of style in the present competition, we have to raise our view to the high level of true Art—the true art of noble architecture, and also of noble English architecture; we ought, besides, to enter upon the consideration of the subject under the influence of a warm sympathy with the traditional associations rather of Westminster than of Whitehall. The Abbey and Hall of Westminster determined the architectural style of the new Palace of Parliament at Westminster; the entire group of public buildings now standing on this ground possesses an augmented power in determining the style of the proposed new palace of the Government. It would be a solecism in Art now to introduce into Westminster any other style of architecture than the Gothic; and can any other style than the Gothic at Westminster satisfy what we require from architecture as an art? The competition designs supply us with a ready reply to this inquiry. They show us how hopeless was the task which those architects imposed upon themselves who would persist in working for this competition in any other style than the Gothic. However meritorious in themselves some few designs may be, on the instant that they are brought into the atmosphere of Gothic Westminster, their very merits do but enhance their inconsistency, and give strength to their unsuitableness. And, on the other hand, the Gothic designs appear before us with a predisposition in their favour arising absolutely from the power of association, and without any reference to their own intrinsic qualities. Unhappily, an idea appears to have prevailed (notwithstanding the plain statements of the Government when inviting this competition), that the proposed new buildings would not be Gothic; and hence but few architects have entered the lists under the Gothic banner, and some even of these give tokens of that irresolution which denotes the apprehension of a hopeless enterprise. That the Gothic will stand, with the judges, at least on a level with its competitors, there can be no doubt; neither is it less certain that the general public will prefer to the nobler English Gothic the more familiar Anglo-Italian, as it has been called. But the public have not yet had either time or opportunity for judging of the Gothic upon its true merits. They do understand Westminster Hall, however; let them then see a new palace for the Government designed and created in the same spirit, and they will rapidly learn to appreciate its worthiness. The public do not yet understand the Gothic, because our architects have not yet applied the Gothic spirit, in the fulness of its power, to the requirements, and adapted it, in the excellence of its beauty, to the tastes of the present times. Perhaps the present is the first opportunity they have had for doing this. The Gothic architects are the men of the movement in architecture; they have, consequently, to meet and to struggle against the prepossessions of established usage, and of familiar experience. The more intellectual character of their art also militates against their obtaining for it a rapid and a wide-spread recognition. And yet the great majority of the non-Gothic designs in

this competition have done their best to demonstrate the inferiority of their styles, when measured with the Gothic. A close and searching examination of these designs (and they amount to nearly 200 out of the 218) will speedily strip a very large proportion of them of what at first might seem, not specious merely, but really meritorious. The poverty of conception which, at the first glance, might have been concealed under an imposing mass, soon becomes distinctly apparent; the strange and well-nigh desperate expedients* which have been adopted in the hope to achieve originality, where genuine originality was simply impossible, quickly assume their true character; and thus, with a very few honourable exceptions, the small group of Gothic designs stands clear even of apparent rivals. And the contest which thus remains is divested of all sharp and close severity. The Gothic of Westminster stands opposed either to pure Roman architecture, or to the Renaissance of Whitehall. On the one side there are ranged two or three able classic compositions in alliance with about as many equally able adaptations and extensions of the Banqueting House of Inigo Jones and of the Board of Trade of Barry, to the requirements of the new offices and official residences; and to these there is opposed the well-compacted though numerically small Gothic confederacy. We have no fear lest, in the issue, the architectural associations of English Westminster should lose at once their efficiency and their traditional characteristics.

We reserve until next month all critical remarks upon particular designs. And in conclusion we have to observe, that this competition has determined these two points,—the one, that this competition has itself proved to lie almost exclusively between English architects; and the other, that the principle of architectural competitions is unsound and ought to be peremptorily and finally abolished.

CORRESPONDENCE.

To the Editor of "THE ART-JOURNAL."

THE NIMROUD ANTIQUITIES.

SIR,—In passing through one of the "Nimroud" Galleries at the British Museum a day or two since, I noticed among other articles in a glass-case some bronze figures of lions "couchant," varying in size and design, and labelled as having probably been used as weights for the ordinary purposes of commerce. It occurred to me, however, that I had seen something not unlike them before, particularly the peculiar handle affixed to the back; and as this conjecture furnished another possible application of them, I venture to send it to you, namely, that they were intended for stretching out the large curtains which were, as most of your readers are probably aware, an indispensable appendage to the open arcades which form a prominent feature in oriental edifices of every class and period. I have a faint recollection of having seen some very similar weights applied to this purpose in the palace either at Delhi or Lahore. And as your Journal is to be found in the book-clubs of some of the regiments at those places, it is possible that a notice in your pages might elicit an instance in illustration of their present use. While on this subject, may I ask if some of our large furnishing ironmongery establishments, or scale and weight manufacturers, could not adopt the idea thus offered them by their ancient Assyrian fellow-craftsmen? Surely, our lazy British lion, who is content to loiter over a shop-front, or to mount guard at the British Museum, and to sprawl over every available inch of surface at the Westminster Palace, in the character of a wire-drawn French poodle, might, in a commercial nation, condescend even to dispense pounds of coffee and sugar, or ounces of tea and tobacco, on the shop-counter without great loss of dignity;—while our scarcely less national emblem the bull, in the guise of his winged and human-headed prototype in the Museum, might not inappropriately replace the unsightly has-reliefs in iron and black-lead, that do duty as door-weights in our dining-rooms and parlours. Such adaptations would familiarise without degrading Art, and tend to bring it home, where it is best studied—at the fire-side.

E. I. C. S.

* As, for example, in the design in which a spacious and lofty columnar portico has been placed above a group of arches of equally ample proportions.

THE MAID OF SARAGOSSA.

FROM THE STATUE BY J. BELL.

OUR "sculpture" engraving this month also, as did that of the last, carries the thoughts from the poetry of fiction, and the classical graces of allegorical composition, to the stern realities of life. The former personified a heroine, whose story, though that of a queen, is almost lost in the bygone pages of history: this month we have the sculptor's embodiment of one whose deeds are recorded in the annals of our own times: there are many now living, doubtless, who have seen the "Maid of Saragossa,"—a woman of humble origin, but the theme of poet's song, and the admiration of heroes,—walking quietly and sedately, though decorated with military honours, the reward of valour, along the streets of the city she had bravely assisted in defending against the enemies of her country: such a personage is worthy of the sculptor's marble.

In November, 1808, during the invasion of Spain by the French, a large army of the latter under Marshals Monecy and Napier, marched to recommence the siege of Saragossa, which had been raised in the summer of that year, owing to the heroic opposition of the inhabitants, under the leadership of the gallant Palafox, who, when the French general summoned him to surrender with the laconic demand,—"Capitulation," replied with an answer almost as brief,—"War to the knife." The Spaniards in the second siege were also commanded by Palafox, and it was at this time that the "Maid of Saragossa"—a name she has always since been known by—distinguished herself by her endurance and intrepidity, "manning" the batteries, and voluntarily undertaking all the duties that a veteran soldier would have been subject to: this too throughout a siege distinguished in the Peninsular war for the obstinacy with which the city was assailed, and the horrors and sufferings that surrounded the besieged. "Long after the walls of Zaragoza fell," says General Napier, whose orthography we retain, "the city itself resisted. The stern contest was continued from street to street, and from house to house. In vault and cellar, on balcony and in chamber, the deadly warfare was waged without any intermission. By the slow and sure process of the mine the assailants worked their terrific path, and daily explosions told loudly on their onward way. Meantime the bombardment was fierce and constant, and the fighting incessant. Every house was a post; the crash of falling buildings was continual. While the struggle was yet fierce and alive, came pestilence into those vaults and cellars where the aged, and the women and the children, lay sheltered from the storm of shells. They sickened in vast numbers, and died where they lay. Thus fell Zaragoza, after a resistance of sixty-one days!" It capitulated in February, 1809.

Byron, alluding to the part which the women, and especially the "Maid" of Saragossa took in this memorable siege, says, in his "Childe Harold"—

"Ye who shall marvel when you hear her tale,
Oh! had you known her in her softer hour—
Marked her dark eye that mocks the coal-black veil—
Heard her light, lively tones in lady's bower—
Seen her long locks that foil the painter's power,
Her fairy form, with more than female grace,—
Scarce would you deem that Saragossa's tower
Behold her smile in danger's Gorgon face,
Thin the closed ranks, and lead in glory's fearful chase."

Wielkie has immortalised the conduct of the Spanish maiden in one of his best historical pictures, which, as many of our readers doubtless know, is engraved. Mr. Bell has limited his subject to a single figure, which was exhibited at the Academy in 1853. The heroine is supposed to be standing on the ramparts; a cannon-ball has just killed a priest (the ecclesiastics shared nobly in the defence of the place), from whose dying hand she has snatched a crucifix, which she holds up to incite the people to further resistance: in her other hand is a lighted fusee, with which she is about to fire a cannon. At the base of the figure is the answer of Palafox, in Spanish.

We ought not to look for the "graces" of sculpture in a work of this character; what it should have it possesses—spirit, energy, firmness in expression and attitude; qualities, which, combined as they are here with picturesqueness of drapery, render the whole a composition of much interest, both artistically and historically.

THE MAID OF SARAGOSSA.

ENGRAVED BY W. ROFFE. FROM THE STATUE BY J. BELL.

ART IN THE PROVINCES.

GLASGOW.—We received last month, but too late to take any notice of it in the number of the Journal then preparing for publication, the report of the third annual meeting of the "City of Glasgow Fine Art Association." From it we ascertain that subscribers have increased from 1400 in the preceding year to 3500, a result that cannot but prove most satisfactory to all interested in the success of this infant institution. The plate issued to subscribers of the current year is "Charles I. and Bishop Juxon," engraved by Knight from the picture by Blackburn. Each subscriber of the ensuing year will be entitled to an impression of "Benjamin West's First Sketch," engraved by the late J. Carter, from the picture by E. M. Ward, R.A. This "Association" follows the plan adopted by its older sister-society, the "Art-Union of Glasgow," in selecting, through the council, the pictures distributed as prizes. Forty pictures, and fourteen groups and statuettes, were purchased and distributed at this meeting.

YORK.—The annual meeting of the York School of Art was held at the end of April; Mr. J. P. Brown Westhead, M.P., presided. We have received no account of the proceedings: and, by the way, we are not a little surprised that the officers of these provincial societies, to whom such a duty appropriately belongs, so seldom consider it worth their while to inform us of their public meetings; such an act of courtesy is only due to a Journal always ready to aid them in their efforts to give publicity to their proceedings. We find in the *Builder*, however, the report stated that the number of students who had paid fees in the school during the past year had been on an average 103, (independent of 216 free students during four months in the year), while the average of the previous year was 96. The free classes for working men have resulted in the permanent establishment of a class for mechanical drawing, which was considered to be the kind of drawing particularly suited to the needs of working men, and which has proved to be one of the most flourishing classes in the school. The balance-sheet showed a balance against the institution of about £40, and the chairman announced himself a donor of £10 in liquidation of the debt. He also promised to become an annual subscriber, and offered to pay the cost of sending some of the pupils to visit the Manchester Art-Treasures Exhibition. Mr. Swallow, the master of the school, read a statement to the meeting, giving some account of improvements he had effected, with the approval of the committee.

SHEFFIELD.—Mr. Young Mitchell, head-master of the Sheffield School of Art, delivered a lecture, on the 27th of April, in the lecture-room of the institution, on "The Uses and Advantages of Schools of Art." The address was almost exclusively of a practical character, with especial reference to the great staple productions of Sheffield; but towards the close we find, in the report forwarded us, some excellent general remarks, one of which, as confirmatory of our own experience, and of opinions we have frequently expressed, we copy:—"Art has too long been looked upon as a luxury—a pastime of the rich—an accomplishment of young ladies. I find the greatest difficulty in persuading parents in any class of life to look upon it in a serious light, or regard it as a branch of education which ought to be as common as writing. Understand me, I do not say that every man who draws ought to be an artist, any more than any man who writes ought to be an author: but I hold that every man ought at all events to be able to express his thoughts by means of drawing."

EDINBURGH.—The restoration of the Old Greyfriars' Church, one of the most interesting ecclesiastical edifices in Edinburgh, is now nearly completed; it was almost entirely destroyed by fire in 1845. In the way of decoration the most striking features in the restorations are the stained glass windows, of which there are several, executed in the establishment of Messrs. Ballantine and Allan. These examples of modern glass-painting are very favourably spoken of by those who have seen them.

ROCHESTER.—The recent destruction of the picturesque old bridge of Rochester will be matter of regret to many artists who have made that locality their sketching-ground—and it has been a favourite resort of some of our best painters, among them Turner, Callcott, &c. The view of the bridge from a short distance up the Medway, where the river takes a bend,—with the keep of the ancient castle, embosomed in a mass of noble trees, looking down upon it at one end, and the mass of irregular, dilapidated buildings at the other,—will long be remembered by the thousands to whom the scene has been one of great interest and pictorial beauty. The

railway bridge running side by side with the new bridge for "horse and man," is a sad "blot" on the landscape, entirely obstructing the view down the river. This utilitarian age pays no respect to the picturesque of Nature or of Art, when such interferences between it and its requirements.

FOURTH ANNUAL EXHIBITION OF PAINTINGS BY ARTISTS OF THE FRENCH SCHOOL.

VERY pleasant are the sentiments inseparably associated with the exhibitions of the French artists in London. They began well, at the right time, and in the right manner; and they have at once sustained their own high reputation as artists, and they have rendered traditional the agreeable sentiment with which, from the first, their exhibition was introduced. The present collection contains much of excellence, and perhaps more of promise; it harmonises well with the best of our exhibitions; and it possesses its own distinctive characteristics and peculiar excellences. The number of pictures is smaller than in past years; neither are there any such works as Paul Delarocche's "Death of the Duke of Guise," or Ary Scheffer's "Francesca di Rimini;" yet no one will leave the gallery without that wish to pay it another visit, which arises from the consciousness that, while there, genuine mental cultivation is very happily combined with refined pleasure.

Edouard Dubufe's "Portrait of Mademoiselle Rosa Bonheur" (No. 40), and the fair artist's own "Denizens of the Highlands" (No. 11), are the two pictures which seize upon the attention, and do not readily relax their hold on it. It is well to go to Bond Street, and there renew our acquaintance (or there form an acquaintance, if it exists not already) with Rosa Bonheur's great picture of the "Horse Fair," before contemplating her expressive features and noble forehead in M. Dubufe's admirable picture. Not that the portrait needs anything to enhance its own felicitous impersonation of the great painter: she is looking at us from the canvas, while she muses on her Art, and gives silent, yet eloquent, promise of what may be hoped from her in time to come. This portrait we have styled an "admirable picture," and so it is; and it is in this respect that we recommend it as a valuable study to those of our own painters of portraits, whose aim does not extend beyond a faithful rendering of feature, and form, and expression; these all are here—witness the grasp of mind that plays about those lips, and dwells in the depths of those contemplative eyes: but the picture goes further, and besides these, it has qualities of composition, and tone, and colour which gives it a place rather amidst historical works, than among portraits, in the usual acceptance of the term. The "Denizens of the Highlands" are three young animals of Mademoiselle Bonheur's favourite bovine race, and they would alone make a reputation: in this case they had to maintain a reputation, and they have done it to the life. Sharp, also, and dashing as life is the little "Wasp," Mademoiselle Bonheur's "thorough-bred Skye terrier" (No. 12). A capital picture of another class is No. 13, Breton's "Going to the Fields;" it is hot reaping in that field, and the reaper's family already feel the harvest sun. There are several good sea-pictures. Nos. 122 and 109, by Noel and Le Poitevin, are the best. No. 72, a "Coast Scene," by Gudin, is also very clever, and deserves high commendation. Ary Scheffer's "Ecce Homo" (No. 142) is a fine picture, well conceived, effective in expression, and admirable in drawing; but the colouring is cold, and there is that peculiarly German treatment of the manipulation which will never command the deepest sympathies of the English mind. Isabey's "Morning of the Chase—Time of Louis XII." (No. 90) is scarcely worthy of the artist; the buildings are very picturesque and well painted, but the figures, both in costume and grouping, have too much theatrical extravagance about them, and too little either of genuine nature or noble art. Troyon's largest picture (No. 136), "Going to Market," is his best; the sheep that have crossed the ford are admirably rendered. No. 127, "The Young Lambs," by Palizzi, is another most excellent picture of the same class; both lambs, sheep, and fowls are rendered with masterly power. Biard's three pictures are of somewhat unequal merit; "Sunday Prayers in Lapland" (No. 4) may claim the first place. There are many examples of the favourite small pictures of domestic scenes, all of them finished with an intense elaboration; and several others, also, deserve that special notice which our present space will not permit, but which we hope to assign them on another occasion.

ART-UNION OF LONDON.

THE "Little Theatre," as our grandfathers used to call the Haymarket Theatre, was filled with a large attendance of the subscribers to the Art-Union of London, on the 28th of April, to receive the Annual Report of the Secretaries, and to witness the distribution of the prizes. The Lord Montague, president of the Society, occupied, as has been his wont, the chair on this occasion. From the Report, which was read by Mr. George Godwin, F.S.A., one of the honorary secretaries, we learn the following particulars of the state and doings of the Art-Union during the year just expired:—

The subscription of the present year amounts to the sum of £13,218 9s.

Each subscriber is entitled to two engravings,—one of "The Piper," by Mr. Frederick Goodall, A.R.A.; and one of "The Clemency of Cœur-de-Lion," by Mr. Cross.

For next year a painting, by Turner, of "Bellini's Pictures conveyed to the Church of the Redentore, in Venice," has been engraved by Mr. J. T. Willmore, A.E.R.A.; and the prints will be ready for delivery in the spring.

The volume of etchings prepared for the Association by the Etching Club is completed, and will be found very interesting. Copies of it, as prizes, will form part of the present distribution.

The series of wood-cuts, illustrative of the works of deceased British painters, is being proceeded with, and will be appropriated hereafter. It comprises pictures by Sir W. Allan, Barry, Bird, Blake, Constable, Collins, Copley Fielding, Eddy, Gainsborough, Haydon, Von Holst, Lawrence, Morland, Romney, Stothard, Turner, Wilkie, and others.

The council have the satisfaction of announcing that the popular picture, "The Sands of Ramsgate," by W. P. Frith, R.A., the property of her Majesty, is being engraved by Mr. Sharpe, for the Association, and will be delivered to all subscribers of a future year. They have also arranged for the production of an engraving by Mr. Willmore, after the picture by Turner, in the National Collection, known as "Childe Harold's Pilgrimage."

Arrangements have been made with Mr. Thomas Battam for the production, in Parian statuary, of Gibson's fine group, "Venus and Cupid," with the kind concurrence of the Earl Yarborough, to whom it belongs.

In the department of bronzes, Mr. Stephens has executed for the Association a group, "Mercy on the Battle-field," and is now producing it in bronze for distribution as prizes.

The medal, commemorative of Sir William Chambers, has been completed by Mr. B. Wyon, and a certain number of examples will be allotted as prizes.

The reserved fund now amounts to the sum of £7,695.

The sum set apart for prizes will be thus allotted, viz. :—

26 works at	£10 each.
30 "	15 "
24 "	20 "
24 "	25 "
16 "	30 "
14 "	35 "
6 "	50 "
5 "	60 "
3 "	75 "
2 "	100 "
1 "	150 "
1 "	200 "

To these are added:—

- 12 Bronzes of "Her Majesty on Horseback."
- 1 Bronze of "Satan Dismayed."
- 3 Bronzes of "Mercy on the Battle-field."
- 2 Bronzes in relief of "The Duke of Wellington entering Madrid."
- 10 Vases in iron.
- 50 Porcelain Statuettes, "The Stepping-stones."
- 10 Porcelain Statuettes, "The Dancing Girl reposing."
- 10 Terra Cotta Statuettes of "Thalia."
- 20 Silver Medals of Flaxman.
- 30 Silver Medals of Sir William Chambers.
- 450 Impressions of the Lithograph, "The Supper Scene."
- 250 of the Mezzotint of "Tyndale translating the Bible;" and
- 250 Volumes of Etchings.

Making in all 1250 prizes.

The principal prizes fell to the lot of the following subscribers:—Mr. T. Mallett, Catherine Street, Lambeth, £200; Mr. Rhead, Tavistock, £150; Mr. J. Pound, Lee, Kent; and Mr. J. Sloane, Dunnington, £100 each.

ART IN CONTINENTAL STATES.

PARIS.—The principal Art attractions in Paris during the last month or two have been the exhibition of the works of Delaroche (of which we shall give an account next month), the reception of the paintings in the *Salon*, and the sale of the collection of pictures belonging to M. Patureau, of Brussels; of this last the following is the result:—'Storm Approaching,' Backhuysen, 6000 fr. (M. Fould); 'A Washer-woman,' Berghem, 5000 fr. (M. Fould); 'Interior,' Brauer, 2150 fr. (M. Fould); 'View of the Environs of Dort,' A. Cuypp, 26,000 fr.; 'Rustic Repose,' Gonzales Coques, 45,000 fr. (Lord Hertford); 'Portrait of Martin Pepin,' Vandye, 15,000 fr. (M. Etienne le Roy); 'Flowers,' David de Heem, 1361 fr.; 'Entry to a Town,' (figures by Vandevelde,) Vanderheyden, 14,5000; 'The Windmills,' Hobbema, 96,500 fr. (Museum of Berlin);* 'A Woman Sweeping,' Peter de Hooege, 3850 fr. (Duthuy); 'Flowers,' Van Huysum, 6500 fr. (Isaac Pereire); 'The Fallen Cuirassier,' 14,000 fr. (Tardieu); 'Lady Playing Music,' Metz, 2950 fr. (Duthuy); 'Young Woman at her Toilet,' F. Van Mieris, sen., 19,700 fr. (Etienne le Roy); 'Interior,' W. Mieris, 1050 fr. (Fould); 'Infant Christ Sleeping,' Murillo, 41,500 fr. (the Empress Eugenie); 'Night Scene,' Van der Neer, 1060 fr.; 'Dutch Public-house,' A. Van Ostade, 51,500 fr.; 'Interior,' A. Van Ostade, 2200 fr.; 'Hurdy-Gurdy Player,' A. Van Ostade, 18,100 fr. (Tardieu); 'Interior of a Public-house,' A. Van Ostade, 8000 fr. (Favart); 'Dutch View,' J. Van Ostade, 3200 fr. (Fould); 'The Pasturage,' Paul Potter, 15,500 fr. (Lord Hertford); 'A Rabbi,' Rembrandt, 15,100 fr. (Turmond, of Aix la Chapelle); 'Portrait of Rembrandt,' by himself, 5800 fr. (H. Didier); 'Venus Solliciting Vulcan for Arms,' Rubens, 11,200 fr. (Museum of Brussels); 'S. Theresa interceding for the Souls in Purgatory,' Rubens, 16,000 fr.; 'Head—a Study,' Rubens, 6100 fr. (Surmond); 'View of Haerlem,' J. Ruysdael, 9700 fr. (Verboen); 'View in Norway,' J. Ruysdael, 6800 fr.; 'Entrance to a Forest,' J. Ruysdael, 8000 fr.; 'Entrance to a Forest,' J. Ruysdael, 6100 fr.; 'Sick Woman,' J. Steen, 5000 fr.; 'The Female Messenger,' J. Steen, 2200 fr.; 'Guard House,' D. Teniers, jun., 20,500 fr. (Schneider); 'Temptation of S. Anthony,' D. Teniers, jun., 6900 fr.; 'Smoking House,' D. Teniers, jun., 2550 fr. (Bischofsheim); 'Ale-house,' D. Teniers, jun., 4300 fr.; 'Landscape,' D. Teniers, jun., 2000 fr. (Fould); 'Young Girl at her Toilette,' Terburg, 7800 fr.; 'Marine View,' W. Van de Velde, 9000 fr.; 'Sea—a Calm,' W. Van de Velde, 10,000 fr. (Lord Hertford); 'Landscape and Figures,' A. Van de Velde, 23,500 fr.; 'Halt of Cavaliers,' P. Wouvermans, 50,100 fr. (the Emperor); 'March of an Army,' P. Wouvermans, 12,600 fr. (the Emperor); 'Halt of Sportsmen,' P. Wouvermans; 'Landscape,' P. Wouvermans, 30,000 fr. (the Princess Matilda); 'The Sortie of the Sheepfold,' Wynants and A. Van de Velde, 7600 fr. (Meuchet); 'Landscape,' Wynants and A. Van de Velde, 4500 fr. (the Emperor); 'Spring' and 'Autumn,' Boucher, 14,500 fr. (Lord Hertford); 'Psyche,' Greuze, 27,700 fr. (Lord Hertford); 'Head of a Bacchante,' Greuze, 17,100 fr.; 'Child's Head,' Greuze, 10,900 fr.; 'Child's Head,' Greuze, 16,200 fr. (Isaac Pereire); 'Nest of Birds,' Laneret, 2000 fr.; 'Pastoral,' Laneret, 1400 fr.; 'Concert' and 'Swing,' Pater, 20,500 fr.; 'Preparing for Encampment' and 'A Camp,' Pater, 15,100 fr. (Nozzi); 'Rural Amusements,' Watteau, 6000 fr. (Rothschild); 'Sleeping Nymph,' Watteau, 2600 fr. (Bourdon); 'The Two Cousins,' Watteau, 550 fr. (Van der Hoven); two 'Sporting Pieces,' Desporte, 10,700 fr.; 'A Park and Figures,' Dietrick, 210 fr.

The mania of sales by auction is at its height at the present moment in Paris, and the most enormous prices are given for paintings, prints, old china, and articles of *virtu* generally. When the amounts realised are for articles of real value, none can complain; but it is often and generally the contrary—scarcity and caprice being principally the guides of the buyer: no doubt a severe reaction will take place. Thus, when we see 27,000 fr. given for an inferior study of a head (Psyche) by Greuze, when pictures by Rembrandt, Teniers, Vandevelde, and other great artists, brought much lower prices, we cannot help deploring the judgment and taste of the purchasers.—In a recent sale of modern artists, principally French, were sold—'Christ in the Garden of Olives,' by Delaroche, 10,000 fr.; 'Galilee,' by the same, a small delicious painting, 9000 fr.; also several studies for the *Hemieyele*, eleven in number, 5200 fr.—M. A. Martinet has been elected Member of the Academy in place of Baron Desnoyers, deceased.

* This famous picture was knocked down to M. Schulze, of Berlin, who purchased it at a cost of £3860, for, as we understood, the Museum of that city.

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY PORTRAIT GALLERY.—It is understood that arrangements are in progress for the formation of a gallery of portraits of the members of the Royal Academy; the series being commenced by that of the President, which the artist, Mr. Knight, has presented to the body. We earnestly hope to see this project effectually carried out. Such a collection cannot fail to be of the highest interest—valuable to the present, but infinitely more so to the hereafter of Art.

'THE DINNER' at the Royal Academy did not take place this year, in consequence of the death of Her Royal Highness the Duchess of Gloucester. This was a serious disappointment to many, and might, perhaps, have been postponed merely; notwithstanding that such postponement might have caused some inconvenience. The cost of the entertainment has been thus saved, but as large a sum, probably, has been expended by the Academy in cleaning and regilding the frames of the Diploma pictures contributed to the Manchester Exhibition.

THE NATIONAL ART-MUSEUMS AT SOUTH KENSINGTON.—Great progress has been made with the internal arrangements in this group of museums, so that we trust in our next Journal to be able to announce that they have been opened to the public for inspection, and to students for study. Much, however, yet remains to be done in every department, except in the Architectural Museum, which has taken the initiative in arriving at a condition of completeness in the important matter of arrangement. When completed, these museums will be more than able to maintain their own position against all assaults and cavils; there will be found in them, too, much of real worth, and they will be available for purposes far too beneficial as well as important for them to fail in commanding a favourable opinion with the public. The new building for the reception of Mr. Sheepshanks' noble gallery of pictures has arisen with Aladin-like promptness under the auspices of Captain Fowke; and here we trust that the munificent donor of this fine collection may long be permitted to observe how great a benefit he has bestowed upon his countrymen, when he gave to his country his choice assemblage of the works of British artists.

THE SOCIETY OF ARTS.—On the evening of Wednesday, May 6th, a conversazione was held at the house of the society, in the Adelphi, which was very numerously attended, and on which occasion, in addition to various other objects of attraction, a series of pictures and drawings by the late Mr. Seddon was exhibited. Mr. Ruskin directed the attention of the assembly to the peculiar merit of these compositions, and gave a pathetic sketch of the brief career of the accomplished and lamented artist. Mr. Seddon's first work—"Penelope at her Loom," was included amongst the collection, and his last picture was very particularly described by Mr. Ruskin, both from its singular character, and because a subscription had been announced for the purpose of purchasing it from the widow of Mr. Seddon, with the view of placing it in the National Gallery. This picture is of comparatively small dimensions, and was executed entirely amidst the scenes which it represents; it is characterised by the most minute elaboration of treatment, and, without doubt, may be regarded as an exact portraiture of the Valley of Jehosaphat, with Jerusalem and the Mount of Olives, precisely as those ever-memorable and most interesting localities exist at the present moment.

HERR CARL WAGNER'S WATER-COLOUR DRAWINGS, 49, PALL MALL.—We are glad to find that this accomplished artist has brought another collection of his drawings to London, and, at the same time, that he has resumed his former system of giving lessons in the beautiful and beneficent art which he practices with such success. Herr Wagner's last sketching tour has been in Spain, and he has brought from that beautiful, but still, unhappily, barbarous country, a series of characteristic pictures, especially from Barcelona and the Alhambra. The far-famed palace of the Spanish Moors, in these drawings, rises before us with the most vivid reality, and all its romantic history appears to be present to our minds—now sparkling with spirit-stirring incident, and now dim with shadowy legends: nor are the fair natural scenes which surround the gorgeous courts

of the Alhambra less truthfully, or less impressively delineated than the palace itself. Of the twenty-five drawings which constitute the group, we were particularly struck with the merits of Nos. 7, 8, 10, 13, 15, 19, 20, 22, 23, and 24, all of them representations of some court, or other part of the Alhambra. One quality in Herr Wagner's treatment of water-colour, and in his teaching also, demands especial notice, from the increasing prevalence amongst our own artists of a system of an opposite character. Herr Wagner scrupulously rejects body colour, and adheres to the simplicity of true transparent water-colours; thus securing to his works permanence of tone, combined with a purity of expression, which the opaque medium may represent, but can never really possess. The *atelier* at No. 49, Pall Mall, is fitted up after a true artistic fashion, with old carved cabinets, Venetian glass and quaint china, various armour, arms, and musical instruments; and here, in the midst of his drawings, and of photographs from them, Herr Wagner receives his pupils, and teaches them to draw and paint from living models attired in Spanish costume, and surrounded with appropriate accessories. A visit to this *atelier* will more than recompense such an appropriation of the time which it may occupy.

ARCHITECTURAL PHOTOGRAPH ASSOCIATION.—During the last month a series of meetings were held, with permission of the Council, at the apartments of the Royal Institute of British Architects, in Grosvenor Street, with the view of establishing a new society, for the special purpose of collecting and distributing amongst its members copies of architectural photographs. The peculiar value of photography as the means of obtaining representations of architectural subjects has for some time attracted much attention, and now that this marvellous art has both attained to so high a degree of perfection, and its treatment is also so generally understood, the present period appears to be most favourable for the formation of this association. Great facilities for obtaining valuable architectural photographs from various countries have, in the first instance, been placed at the disposal of the promoters of this well-conceived plan, so that the most important results may be anticipated from the operations of the society as soon as they are fairly in action. The photographic departments of the Board of Ordnance and of the East India Company are prepared to co-operate with the society, or, rather, they actually take a part in its proceedings, and a carefully organised system of general operations will speedily be at work. The provisional committee, charged with the duty of forming the association and framing its rules, consisted of Sir Charles Barry, Mr. G. G. Scott, Captain Scott, R.E., Mr. B. Ferrey, Mr. Nelson, Mr. Papworth, Rev. Charles Boutell, Mr. Edmiston, and several other gentlemen, Mr. R. Hesketh acting as honorary secretary. We shall hereafter enter more in detail into the constitution of this new society, and we shall continue to watch its proceedings with the utmost interest, since we confidently expect it will prove the means of doing far more than hitherto has been done, both with the profession and with the public at large, to advance the best interests of architecture as a great and noble art.

STATUE OF HER MAJESTY AT SALFORD.—During the visit of His Royal Highness, Prince Albert, to Manchester, the statue of the Queen, executed by Mr. Noble, and commissioned to commemorate her majesty's visit to Salford, in 1851, was inaugurated in Peel Park. Peel Park is one of three new parks which the inhabitants of Manchester have purchased and thrown open free to the public. The park extends over a surface of thirty-two acres. A bronze statue of the late Sir Robert Peel stands on a granite pedestal in front of the Museum. Her majesty visited Peel Park in 1851, and on that occasion an assemblage of 80,000 Sunday scholars and teachers assembled on the grounds to greet the Sovereign. The occasion was so interesting that it was resolved to make an enduring record of the Sovereign's visit by erecting a marble statue of her Majesty, to be placed in the most prominent part of the grounds. A subscription was accordingly set on foot among the teachers, scholars, and other inhabitants of Salford, and a commission was entrusted to Mr. Noble to execute a statue of her Majesty of heroic size. The site of the statue is a plot of ornamental ground in front of the new wing of the Museum. The work has been executed in

Sicilian marble, and is eight feet six inches in height. The pedestal is of white marble, supported on a base of Aberdeen granite. It is a correct likeness of her Majesty, and the attitude is easy and graceful. The pedestal is inscribed with the following lines:—"To commemorate the visit of Her Most Gracious Majesty, Queen Victoria, to the Peel Park, Salford, October 10, 1851: this memorial was erected by contribution, aided by public subscription, of 80,000 Sunday-school teachers and scholars who were present to welcome her Majesty on that joyful occasion."

DR. WAAGEN is in London: having been specially invited to Manchester, he has been for some days occupied in a very close examination of its Art-Treasures; with many of them he is, of course, intimately acquainted; several, however, of the most important he has here seen for the first time. It is his intention to communicate his views concerning them—and with reference to the whole subject—through the columns of the *Art-Journal*.

NEW PHOTOGRAPHIC ESTABLISHMENT AT MESSRS. COLNAGHI'S.—In addition to the other departments of their extensive and very complete establishment, Messrs. P. and D. Colnaghi have just completed the requisite arrangements for the production of photographs of the highest class and of the largest size, and also in every possible variety. This wonderful art will not fail thus to receive a new impulse towards the full development of its capabilities, and a fresh attraction will be added to the already comprehensive resources of this eminent establishment. Amongst the first of the original photographs produced under their own direction, Messrs. Colnaghi will publish a series of fac-similes of some of the gems of the Art-Treasures Exhibition at Manchester. We have been able to examine many of these photographs, and their excellence, combined with their cheapness, justifies our pronouncing their appearance as a new era in Art.

PORTRAITS OF THE STUARTS.—Amongst the extensive collections of ancient Art, and of objects illustrative of history and the manners of by-gone times, displayed last year in the national galleries at Edinburgh, in the museum formed during the meeting of the Archæological Institute in that city—a leading feature of interest was presented in the numerous portraits of the Stuart family, and especially of Mary, Queen of Scots. A very curious exemplification of the various portraits of that ill-fated queen was presented, to an extent never before contemplated, through the kind liberality of the Duke of Sutherland, Lord Napier, Mr. Stirling, of Keir, the Marquis of Ailsa, the Earl Morton, Lord Londesborough, Sir Jobu Maxwell, and many other contributors to the series. The gratification expressed on that occasion has suggested the proposal to bring together, in the apartments of the Institute in London, a choice collection of portraits of Mary, including miniatures, medals, and the rare engraved portraits by Elstrack, De Leu, and other contemporary engravers. A considerable number of valuable portraits have already been offered, and the exhibition will take place at the closing monthly meeting of the Institute, for the present season, at 26, Suffolk Street, on Friday, June 5th. The most authentic types are doubtless the original drawings by Janet, existing in Paris and in private collections in England, the painting in her Majesty's collection, attributed to the same artist, and that by Porbus, in the possession of Prince Labanoff. There are, however, numerous valuable portraits in private collections in England which would throw much light on the inquiry. Any communication on the subject will be thankfully received, and may be addressed to Mr. Albert Way, 26, Suffolk Street. Messrs. Graves, 6, Pall Mall, and Messrs. Colnaghi, Pall Mall East, have kindly consented to take charge of any portraits which may be sent for the proposed exhibition. They may also be addressed to the office of the Institute, 26, Suffolk Street.

WATER-COLOUR DRAWINGS.—It is reported, in some of the foreign journals, that M. Prévost, a Swiss artist resident near the lake of Geneva, has discovered a method of fixing water-colour drawings, so that they neither fade, nor lose their brilliancy of colouring, by exposure to the light. We should be delighted to hear that M. Prévost, or some one else, had also discovered a medium that oil-painters might employ to fix their colours; for most certainly the lapse of a few years makes sad ravages with the works of modern painters.

THE NEW READING-ROOM OF THE BRITISH MUSEUM.—Writing last month on this subject, we said that the dome is wholly constructed of iron; we have since been informed that the girders only are formed of this material, all the rest of the internal work being composed of "patent wood," a fibrous substance, invented, patented, and manufactured by Mr. BIELEFELD, the well-known manufacturer of papier-mâché works for ornamental purposes. The dome of the new Reading-room has double the area of the dome of St. Paul's, and is equal to the dome of St. Peter's, at Rome. The sizes of the panels, composed of three pieces, are 22 feet long by 11½ feet wide; each panel, in its spherical form, was raised from the ground to a height of 110 feet, and fixed in one piece to the roof. This new material is well deserving the attention of all engaged in building-operations, as a substitute for wood for flooring and panelling; it is perfectly non-combustible—we have seen a large slab on which a fire burnt for a considerable time without doing any further injury than blackening its surface; it is a non-conductor of heat or sound, is equal in density to the hardest woods, yet is easily worked with ordinary tools; bears a beautiful polish, and can be veneered, or painted to imitate any kind of marble. In a word, it possesses advantages too numerous for us to particularise, and of which the patentee has received ample confirmation from those who have used this material. A company, under the title of "The Patent Wood, or Fibrous Slab Company, Limited," is engaged in carrying out the invention of Mr. Bielefeld, whose name and material seem alike to have been left unnoticed in all the papers which have spoken of the new Reading-room; it is, however, only just he should have the merit due to him.

MESSRS. DAY AND SON, the eminent printers and publishers of works in lithography, and especially in chromo-lithography, announce a work as "in preparation" which cannot fail to be deservedly popular,—it is to represent the "Art-Treasures" now in Manchester, and to consist of one hundred prints—sufficient to render the magnificent collection ample justice; the series will embrace sculpture, the ceramic, metallic, vitreous, textile, and other decorative arts: the prints to be accompanied by historical and descriptive letter-press, by Mr. Digby Wyatt, Mr. George Scharf, Mr. J. B. Waring, and others. A very limited number of copies will be issued. This is a grand undertaking, and will be valuable long after "the Treasures" have returned to their homes.

MESSRS. COLNAGHI announce a work of a highly important character, to consist of photographic copies of many of the principal pictures, and also selections from "the Museum," contained in the building which in Manchester "houses" the Art-Treasures of the kingdom. This will be a boon of magnitude; a project so extensive cannot fail to give permanency to the value of the collection: it will thus be made practically useful to the student, the manufacturer, and the artisan, in a thousand ways, long after it is again distributed.

THE ANNUAL FESTIVAL of the subscribers and friends of the society, known as the "Artists' Benevolent Fund," was held at the Freemasons' Tavern, on the 16th of last month. Sir Robert Peel was to have presided on the occasion; but, in consequence of his absence, the cause of which, however, was unexplained, Mr. George Godwin, F.R.S., at the instance of the stewards, occupied the chair, and performed the duties devolving upon him most efficiently. As at the dinner of the "Artists' Benevolent Institution," reported in the *Art-Journal* for May, so now we must express our regret at the scanty number of those who attended the dinner, and especially of such artists as by their position would give a *prestige* to the meeting, and would at the same time encourage others to follow their example. The members of the Royal Academy who supported the chairman were, Sir C. L. Eastlake, P.R.A., Sir W. C. Ross, R.A., David Roberts, R.A., E. M. Ward, R.A., J. H. Foley, A.R.A., and J. T. Willmore, A.R.A. Sir Charles Eastlake, in returning thanks for the toast of "The Royal Academy," said very truly, and by way of apology for the thin attendance of the older members, that very many of them had reached an age when they might be expected to claim exemption from the fatigue and excitement of a public dinner, and also from any active exertions in support of a cause in which they, nevertheless, felt the greatest interest; and that it

was only fair and right the younger members of the profession should now take on their own shoulders the burden which others had borne for so long a time. We are quite of the President's opinion, and would urge on the rising artists, the Academicians and Associates of a future generation, the expediency and justice of lending efficient aid to this and other kindred institutions for the benefit of the necessitous. Mr. Godwin made an effective speech on behalf of the Society: the subscriptions at the close of the evening's entertainment were announced to have reached £500,—a considerable increase on previous years. During the past year fifty-three widows of artists received £15 each, and thirty orphan children £5 each.

SALE OF PICTURES BY THE OLD MASTERS, &c.—The sale by Messrs. Christie and Manson, on May 16th, of the pictures collected by the late Mr. David McIntosh, must not be omitted from our columns, though it occurred too late in the month to find a place with the other picture-sales we have noticed. The collection contained sixty-three works, of which the following were the principal:—"View in a Dutch Town," Van der Heyden, 460 gs.; "The Milkman," Jan Steen, 240 gs.; "A Woody Landscape, with a pool of water in front," Ruysdael, 145 gs.; "Landscape, with a group of trees on the banks of a river," Ruysdael, 121 gs.; "A small Landscape, with a wild boar in his lair," P. Potter, 155 gs.; "Landscape, with a group of trees on a mound above a sandy bank," Ruysdael, 200 gs.; "A large Landscape, with cows and sheep grazing at the edge of a stream," from the collection of Madame Cattalin, of Paris, Ruysdael, 510 gs.; "Landscape, with peasants driving cattle," Wynants, the figures by A. Van de Velde, 175 gs.; "A Woody Landscape, with a river falling in two cascades, peasants and cattle crossing a long wooden bridge, &c.," Ruysdael, 330 gs.; "Winter Scene," Van der Neer, 210 gs.; "The Prodigal Son," D. Teniers, painted on copper, 810 gs.; "Dutch Village Fair," Ostade, 25 gs.; "A Woody Landscape, cottages and trees, felled timber in the foreground, figures, &c.," Hobbema, a fine specimen of the master,—1070 gs.; "Italian Landscape," N. Berghem, 382 gs.; "Mount Parnassus," Claude, 100 gs.; "The Adoration of the Magi," Bonvicino, or Il Moretto (the latter name being that by which this scholar of Titian is best known), 160 gs.; "Coast Scene with Fisher-boys," W. Collins, R.A., 435 gs.—this picture, we have heard, was purchased by Mr. McIntosh for 300 gs.; "The Hanging Gardens of Babylon," J. Martin, 136 gs. The entire collection realised upwards of £8000.

MACHINE FOR POLISHING KNIVES.—We do not often consider ourselves called upon to notice mere utilities uninfluenced by Art; but an ingenious Frenchman, M. Dethier, having submitted to us a singularly neat, convenient, and very perfect machine, which effectually removes all necessity for the ordinary process of knife-cleaning, it is our duty to direct attention to it, and to aid him in making his patent profitable. It is small, easily managed, and avoids all the evils that usually arise from clumsiness and dust; it occupies little space, standing on the corner of any ordinary table. The process is carried on by a slight interior covering of emery and brick powder, through which the knife is made to move with sufficient rapidity to clean it in a few seconds: the peculiar ingenuity of the inventor having been exercised to polish the shaft of the knife without so augmenting the force as to cause greater proportionate wear to the thicker portions. The invention has many and obvious advantages, and cannot fail to be accepted as a household acquisition of much value.

MR. MINASI.—We thought this venerable artist, whose extraordinary pen-and-ink drawings we have repeatedly noticed, had been gathered to his fathers, as we have not seen or heard anything of him for a long time past; but we find from an advertisement in the columns of the present number that he is still living, and, we understand, though upwards of fourscore years of age, is still able to prosecute his labours with scarcely undiminished powers. We should rejoice to know that the announcement he puts forth may be the means of attracting some to his house whose patronage would avail to smooth the declining years of a worthy man, whose earliest efforts in Art go back to the days of Bartolozzi, under whom he studied.

REVIEWS.

NOTES ON SOME OF THE PRINCIPAL PICTURES EXHIBITED IN THE ROOMS OF THE ROYAL ACADEMY AND THE SOCIETY OF PAINTERS IN WATER-COLOURS, &c., No. 3, — 1857. By JOHN RUSKIN, M.A., Author of "Modern Painters," &c. Published by SMITH, ELDER, & Co., London.

Mr. Ruskin's critical pen has this year been dipped in ink which has less of wormwood in its composition than of honey, except when he employs it with reference to an artist, whom, hitherto, he has exalted to the topmost pinnacle of fame. What will Mr. Millais think of the following remarks? "For Mr. Millais there is no hope, but in a return to quiet perfectness of work. . . . The time has come when this painter must choose, and choose finally, whether the eminence he cannot abdicate is to make him conspicuous in honour, or in ruin." Will he learn wisdom from the reproving words which, in public and in private, are heard on all sides from both friends and foes? Five pages, out of about thirty-five which Mr. Ruskin devotes to his notice of the Academy, are occupied with strictures on the "Dream of the Past," and "The Escape of a Heretic," in addition to a few lines condemnatory of the "News from Home;" in short, he begins to "see with consternation that it was not the Parnassian rock which the artist was ascending, but the Tarpeian." We much fear that neither the painter, nor the guide on whose strong arm he leaned, was quite aware of the direction in which he journeyed, nor what awaited both at the end of the course. The one has at length discovered his mistake; let us hope the eyes of the other will also be opened to see rightly; each has in him what "the world will not willingly let die," if it be made worth the keeping.

At the very outset of his "Notes" Mr. Ruskin confesses that the practice he has always advocated is tending to an "inevitable calamity."—"As year by year, in the Royal Academy, the principles established by the Pre-Raphaelites are more frankly accepted, and more patiently put in practice, I observe that, notwithstanding all the substantial advantage derived from them, two results must inevitably follow, involving some disappointment to the public, and great mortification to the artist. I see that we shall have more wayside nooks, corners of green fields, pools of water-cess streams, and such like, than can, in the aggregate, contribute much to the amusement of the restless and over-excited crowd of London spectators; and I see also that there will be so high an average of perseverance and care brought to bear on every subject, that both will pass unnoticed, unless recommended by more brilliant qualities; and painters who flattered themselves that the devotion of a year's honest labour could not but make their pictures conspicuous and their names illustrious, will find, with bitter disappointment, that patience and sincerity are no longer distinctive, and that industry will soon be less notable than sloth." Now this is just the result that might have been predicted from the general tendency of Mr. Ruskin's teachings; he has argued so powerfully in favour of small things—the mere technicalities of Art—that a large class of painters has accepted his doctrines as truths, and adopted them, almost to the entire exclusion of higher purposes; is it, therefore, surprising that he has now to complain that of all the pictures in the gallery of the Society of Painters in Water-Colours, "there is not one which expresses, or summons, a serious thought?" We do not concur in this opinion; but we candidly admit that British Art, as exhibited in the various galleries this year, has made no advance—in truth, has scarcely maintained its ground. But there is another reason, and one still acting with equal force to that assigned by Mr. Ruskin, which has contributed to the result deplored by him—we mean the injudicious and indiscriminate patronage bestowed on Art at the present time. It cannot be denied that the large demand for pictures has made artists, whose names are in good repute, comparatively indifferent to what they produce. As an instance, we have heard that the painting by Millais, which has excited the severe strictures of his critic, was sold, before its completion, for *fifteen hundred guineas*, and another, from the same hand, for *one thousand*. Are not such facts—presuming, that is, our information is correct—strong temptations to labour for riches rather than for fame? Far be it from us to desire to see artists ill-paid, as, unhappily, but too many are; the labourer in any and every vineyard is worthy of his hire, yet it should bear some adequate proportion to what it costs him. Mr. Ruskin is not altogether insensible to the truth of our remark, for he says—"There must be, of course, a certain proper and healthy demand in London every

spring for pictures which mean nothing, just as there is for strawberries and asparagus. . . . All this is perfectly right and refreshing; nevertheless, a society which takes upon itself, as its sole function, the supply of these mild demands of the British public, must be prepared, ultimately, to occupy a position much more corresponding to that of the firm of Fortnum and Mason, than to any hitherto held by a body of artists; and to find their art becoming essentially a kind of Potted Art, of an agreeable flavour, supple and taxable as a patented commodity, but in no wise to be thought of or criticised as living Art. For living Art, or Art at all, properly so called, never has been, nor can be, developed in answer to a demand of this inferior kind," &c.

In noticing Mr. Ruskin's pamphlet, we have preferred to allude to his generalities rather than his specialities: with the former we entirely agree, while there is but little in the latter from which we are inclined to dissent. There is a healthier tone in his criticisms than his readers have been accustomed to see, and his language is, as it always is, eloquent and poetical. Few writers of the present day afford us greater pleasure than the "Oxford Graduate," when he lays aside his egotism and whimsical conceits.

THE HIGHLAND BRIDE'S DEPARTURE. Engraved by J. T. WILLMORE, A.R.A., from the Picture by Jacob Thompson. Published by LEGGATT, HAYWARD & Co., London.

This is a large print from a picture by Mr. Thompson, exhibited at the Royal Academy in 1851: the composition is of that character of subject which the pencil of Landseer has rendered so deservedly popular. In front of a cottage, it is presumed,—from the household paraphernalia that lie scattered about, though the building is not introduced,—the "Highland bride," mounted on a rough white pony, receives a Bible from the hands of her mother, as a last parting gift; the action and expression of the matron clearly indicate that she is inculcating on the newly-married pair—the son-in-law stands by the side of the animal—the importance of consulting the sacred volume as the rule of life. To the right of this central group is another—the bride's father, apparently explaining to an aged woman, who is seated, and whom we should call the bride's grandmother, what is passing between the others. To the left of the centre is a dark pony, laden with the bride's spinning-wheel and panniers, containing various articles of domestic use; and in the more immediate foreground are children of different sizes and ages, dogs, goats, sheep, and the ordinary "material" of Scotch rustic life; all grouped with judgment and a due regard to picturesque effect. It is an open-air scene altogether; the background consists of a range of hills more or less lofty, between which we have a peep of the sea. The story of the "Departure" could scarcely be more agreeable and impressively told by the pencil than in Mr. Thompson's work, which, as a whole, is well engraved, though there are parts that would unquestionably have been improved by a little more labour and attention to finish. A line engraving of the size of this is almost a rarity in these days; we shall be glad to see it followed by others of equal interest, both as a subject and as a work of Art.

LITHOGRAPHIC PRINTS. Published by E. GAMBART & Co., London.

It may be accepted as a proof that English Art is acquiring a favourable position abroad, when we find French artists engaged on the reproduction of the works of our painters. We have before us several large lithographic prints, executed in Paris, from paintings with which the English public are more or less well acquainted. The first is "Gillie and Deer Heads," lithographed by S. Teissier, from a drawing by F. Talyer: the dogs are capital, the gillie is well drawn and easy in his attitude, but the landscape in the distance is woolly, and the details are not well made out. "The Arrest of John Brown, of Ashford," also lithographed by Teissier, from the picture by A. Johnston—the subject of one of our illustrations of the works of this artist, published in February last—is a very clever and striking print, firmly executed, and the characters well sustained throughout. "A Letter from Papa," by A. Charpentier, after the picture by Goodall, is faithfully copied; a little more delicacy in the flesh tints would, however, have been an improvement: the texture of the draperies, and of the tapestry that covers the wall and the chair, is admirable. This print is sure to become a favourite. "The May Queen," from the picture by Mrs. E. M. Ward, exhibited at the Royal Academy last year, has had full justice at the hands of E. Desmays, by whom it

is lithographed: it is a bright and sparkling print, everywhere most carefully executed. The last we have to notice is entirely the work of French artists,—"The Luncheon," drawn by A. Sirouz, from the picture by E. Frère: it pleases us far less than any of the preceding; the subject is good, but the lithographer's work is confused and "foggy": it is difficult to define the outlines of some of the objects in the picture.

HANDEL: HIS LIFE, PERSONAL AND PROFESSIONAL, WITH THOUGHTS ON SACRED MUSIC. A Sketch. By Mrs. BRAY, Author of the "Life of Stothard," &c. &c. Published by WARD & Co., London.

Mrs. Bray has brought out her little sketch at an opportune moment, for the public are invited this month to hear the three greatest compositions of Handel produced on a scale of orchestral power which England, and, we believe, no other country, has before attempted. How far the strains of the Milton of music will lose or gain in sweetness and harmony by the assembled multitude of instruments and voices, may be a question of opinion; it is one, however, with which we have nothing to do. A love of music, as well as a knowledge of what is really good, has within the last few years so rapidly increased throughout the kingdom, that at the present time it amounts almost to an excitement; the compositions of Handel occupying, as they deserve to do from their grandeur and sublimity, the foremost place in every performance from which sacred music is not very properly excluded. Though a foreigner by birth and education, we in England consider him, as we have a right to do, almost as one of ourselves; for half a century he lived among us, and it was in England, and under English patronage, his immortal writings were composed and brought out. That he experienced much neglect at some periods of his life, and suffered from the jealousies of rivals, is mainly attributable to the times in which he lived, and a public unable fully to appreciate his extraordinary genius; it has, happily, found ample justice from those who are the posterity of his contemporaries, millions of whom associate the name of Handel with their hours of purest enjoyment, while thousands have good reason to "rise and call him blessed," as one whose works have contributed, in no measured degree, to heal the sick, clothe the naked, and feed the hungry. The charitable institutions of Great Britain owe to him a debt they can never repay. Mrs. Bray discourses about him pleasantly and unpretendingly; her subject is a popular one, and her book will scarcely be less so: there are, however, some inaccuracies of dates that ought not to have appeared.

THE PLEASURE PATHS OF TRAVEL. By EDWARD FOX. Published by T. C. NEWBY, London.

There are many far more pretending books that do not possess a tithe of the interest which diffuses itself through this little volume. Our author has travelled tolerably far in the beaten track of the English tourists, but he has looked on nature with the eyes of a poet, and he has studied man with the feelings of a philosopher. Mr. Fox journeys to Rome—visits the Tyrol—looks at Venice—spends three days at Vienna—runs down the Danube—dines at Berlin, and then finds himself "on our way back to the beloved country and home." He gossips, and gossips pleasantly, on all these and on other places. We recommend our readers to follow Mr. Fox in the "Pleasure Paths of Travel;" whether he leads them through the shades of Val-lombrosa, or over the heights of Tivoli, we can assure them they will be refreshed, as by health-renewing spring breezes, so genuine and natural is the tone of his book.

ONE—TWO, BUCKLE MY SHOE: Ten Designs drawn on Stone by E. R. B. Published by EDMONSTON & DOUGLAS, Edinburgh; HAMILTON, ADAMS, & Co., London.

We are always pleased to give a hearty welcome to amateurs who venture into the domains of Art, especially when, as in the present instance, the artist happens to be a lady, and among those amateurs who know how to handle the pencil gracefully and effectively. E. R. B. has illustrated the old nursery ballad with some very pretty and fanciful outline etchings, drawn with great correctness and considerable spirit; the words of the "poem," printed upon separate sheets, are ingeniously and tastefully designed in rustic letters.

THE ART-JOURNAL.

LONDON, JULY 1, 1857.

THE MANCHESTER
ART-TREASURES EXHIBITION.DEPARTMENTS OF EARLY AND MEDIEVAL ART,
With Examples of more recent Art-Manufactures.

CRITICAL examination into recent technical nomenclature would be found to be a very curious method of obtaining a vast amount of valuable and suggestive information.

When fresh conditions of facts or new combinations of circumstances demand new names for their results, such names almost invariably are in themselves a kind of epitome of all that they represent: such is the power of language to concentrate in a single expression, perhaps in a single word, a complex series of ideas. The term "Art-Manufactures" is a striking example of this comprehensiveness of signification. Within a few years such a phrase became necessary; it was, consequently, produced: and now, in its direct and general application, this compound word, "Art-Manufactures," has become recognised and understood. It is probable, however, that but a comparatively few persons may have considered how much meaning is conveyed by the circumstance that this expression is, strictly and exclusively, of recent origin. This is not an old form of expression revived; we have invented it in our own times: in times past it was unknown. And wherefore was the term "Art-Manufactures" unknown until now? It was unknown before because it never was needed before. And it was never needed before, because, in times past, either *all* manufactures were Art-Manufactures, or *no* manufactures were Art-Manufactures. Art once was universal in its actual application, as it always is universal in its possible applicability. Time was when the mind and the hand of man worked harmoniously together in whatsoever work was to be produced. Art then was truly great, because then it knew how to condescend to the very humblest requirements without compromising a single atom of its dignity. It was, indeed, the glory of Art to have designed whatsoever skill should produce: and thus, in their relative positions, Art would always rank higher than skill—the faculty of the mind higher than dexterity in manipulation. And so also, on the other hand, in the great days of Art, its noblest and most spiritual conceptions were never divested of practical associations; those grand efforts of the human intellect had always a relative bearing, irrespective of their intrinsic character: however lofty their aspiring, they did not lose sight of some connection with the ordinary conditions of human life. But a degenerate age was at hand. The love of Art

grew cold, and Art, in her turn, shrunk from every familiar association. Utility superseded design; workmanship took the place of work; manufactures existed without Art; and works of Art became invested with certain absolute and distinctive attributes of their own,—they were complete in themselves,—no ulterior object remained to be effected for them through association.

We may justly congratulate ourselves on having witnessed, in our own times, an earnest desire, coupled with a strenuous effort, to restore Art to her proper rank by restoring her to her proper sphere of action. Our word "Art-Manufacture" speaks volumes with reference to what we consider to be the part which Art ought to assume, and the effects which Art ought to achieve. We may even begin to look forward to the disuse of this term "Art-Manufacture," because, when our manufactures shall all have been impressed with the touch of Art, the distinctive title will have become useless, and, therefore, it will no longer need to be retained. It is the same in the case of what are distinguished as the higher expressions of Art—works in sculpture and painting, specially so designated. We are beginning to see that a statue or a group of figures then only is perfect in itself when it fulfils some condition in connection with architecture; and, notwithstanding the saying of a great master of our own country, that "a picture is finished when the artist has done with it," the opinion happily is gaining ground amongst us, that a picture will always derive fresh worth from the suitability of the position which it may occupy, and from the appropriate character of the various accessories and other works with which it may be associated.

It is the great, as it is the peculiar excellence of the Manchester Great Exhibition, that it extends over the entire range of Art; that it treats everything which Art has aided to produce, as a work of Art; and that it applies the expressive title, "Art Treasures," as well to the productions of the workers in enamel and glass and the precious metals, and steel and wood and ivory and plastic clay, as to the marble which has derived from the chisel everything but life, and to the canvas which emulates Nature's own subtleties of colour, and teaches how infinitely modified are the natural gradations of expression. So long as "Art-Manufactures" are exceptional things, differing from, as they are intellectually superior to, the bulk of our manufactures, so long will Art fail to exercise amongst us the full powers of its influence for good. In these educating times it is especially incumbent upon us to learn and to apply the lesson, that the highest standard of Art knows no limits to its diffusive range. Indeed, it is from its widest possible diffusion that Art gathers strength to soar to higher levels; and she reciprocates the benefit by communicating universally an elevating impulse. Hence, of infinite importance to the cause of Art in its loftiest forms of expression is the cultivation of Art, in all its truth and purity and energy, in the lowliest of its applications. It is, accordingly, through familiarising the many with Art, as the intellectual, and, therefore, the guiding agent in the work of their own hands, and in the appliances of their own lives, that we must seek to secure (because thus alone we can secure) for the great works of Art an adequate appreciation; and this is but to say, in other words, that thus alone Art can attain amongst us to its highest condition. And it is full time that the matter should be taken up by us in earnest. There are, on all sides, abundant evidences of a retrogression in Art, if there be not a speedy and a decided advance. Already, in the study of Art, too much distaste is apparent for the severities of discipline, coupled with too little

regard for authority, in the practice. There is too evident a leaning to the pretty,—too ready a willingness to rest content with showy trifles. If we can but render the most trifling things really good, because there is just that amount of mind and thought in them which is essential to their being really good,—if we can but apply Art to manufactures, with such effect as to enhance the most perfect workmanship through the superior excellence of design,—we thus may, as it were, compel Art to push forward in her front rank, or the artist would have to yield to the manufacturer. In the particular department of the application of Art to manufactures, the ART-TREASURES EXHIBITION has taken a step in the right direction; and not only so, but it has taken that step in the right manner. Exactly confronting itself to the notion, that artistic excellence is to be attained only through an advance into the unexplored regions of some unknown styles and some novel systems, this great collection points to what Art has accomplished in the past. It submits the highest authorities to the student. It shows what has been done, when Art was strong—when men were also strong, being humble, patient, earnest, devoted. But it does not say—"There, see these things; they were done in the great days of Art, in the days when they did not talk of 'Art-Manufactures,' but when Art had its part in every manufacture: now, do such things again; reproduce these things; bring back *those* great days of Art." Far from this. The lesson which this exhibition teaches is such as this:—"Consider the spirit which could produce such works in those earlier times; observe how carefully everything then was studied, according to the means then available; note very carefully the *Art-feeling* everywhere prevalent; see how deep was the thought, and how refined the taste which produced even the more trivial works: all these are lessons for you—lessons of incalculable value; but you must apply them aright; you must recognise in them incentives to aspire to a kindred spirit with the men of the past; you must learn to sympathise with their ardent love for the beautiful, and their self-denying pursuit of excellence; you possess facilities for action unknown to them; yours is an age of intellectual brilliancy, while their lot was cast in dim and restless times; go forward, then, and, aspiring to be greater than the greatest of the artists and Art-workers of the past, learn to surpass them even in their noblest works: you cannot be their equals merely; you must either yield to them, or they to you: if you would simply be copyists of them, this is at once to admit their absolute superiority; but if, having learned how they became great, and having discovered how truly great they were,—if thus you would take your own independent position beside them, you must in this case rise to a higher level than theirs through the very force of your superior means and opportunities." Could they have enjoyed such intellectual light as that which shines upon us, the old artists and Art-manufacturers would have far surpassed their own actual achievements; it follows, therefore, of necessity, that we must surpass them, when once we shall have realised the fulness of their spirit, and have made our own their principles of action.

The archaeologist who would not extend his view beyond the retrospect which these wonderful collections spread out before him, would fail to do justice either to the individual works which compose the collections, or to the peculiar value which now attaches to every object through the power of its present associations. Forming, indeed, a copious and a graphic history of ages which have passed away, the archaeological collections of the "Art-Treasures Exhibition" are replete with lessons of the truest wisdom for all who would elevate the

present as the means of securing for the future a magnificent pre-eminence. We propose now to indicate, as fully as our available space will admit, what "treasures" of "Medieval art" have here been brought together, that thus their power as teachers may be the better understood. It will be seen that nearly all the more excellent works were previously well known; but this circumstance will be found rather to enhance than to detract from the interest which attaches to the present collections as collections. The equal care with which Art was brought to bear upon every production; the uniform influence of a true sentiment of Art, evidently in-wrought in the minds of the actual producers through the agency of familiarity with Art, speaking to them in beauty and appropriateness of design; the facilities now afforded for an extended comparison both between various objects of the same class, and similar objects in different classes;—these, with various other advantages only to be obtained from such a collection as the present, will not fail to be duly impressed upon the thoughtful student. There is also one especial circumstance which demands particular notice in these collections—this is, that they extend downwards from an early period to our own era; they consequently take the student through the weak and meretricious periods which still leave their baneful influences but too palpably visible in many of those productions of our own times, in which we flatter ourselves that Art has taken her proper part. It is always well that warning against the prejudicial should be coupled with lessons that inculcate and exemplify the teaching of the admirable and the elevating; the student of the "Art-Treasures Exhibition" will observe how taste declined and Art sunk into helplessness, and thus the power of contrast may aid him in impressing the more deeply the lessons which comparison alone can convey. Possibly such degenerate works may be considered as scarcely worthy of a place amongst "Art Treasures" under any circumstances. This is a point upon which we may hereafter have occasion to offer a few remarks; but in the instances to which we now more particularly refer, the works are amongst the best and most characteristic of their class and period, and thus as teachers and historical exponents they may fairly rank as "treasures."

The building itself, which now contains these treasures, claims a few words of commendation. Its only defective feature is the grand front: here Art, not having been consulted (and when this front was built, being perhaps in doubt concerning the treatment she might experience within the edifice when completed), has not taken a part. Within, the building is altogether satisfactory. It is not too lofty, it is not too light, it is not too spacious, it is not a mere repetition of the Crystal Palace, nor does it sacrifice the excellences of the great type of the Paxton style to any fantastic attempts at originality. To these negative forms of approbation, which at the present time possess a peculiar value of their own, we may add that the general effect of the interior is eminently pleasing; the colouring has been carefully chosen and tells well; the light has been judiciously admitted; and the constructive members of the edifice have been made rather to improve than to impair its appearance. In a word, the interior of the Exhibition building is what it ought to be. In its southern wing are the pictures—the works of the old masters; the northern wing contains the modern pictures; in a gallery at the east end is a somewhat miscellaneous series of pictures: the portraits hang, *in ordine longo*, in the lateral aisles of the central compartment; the water-colour drawings, the miniature portraits, the photographs, and the very admirable collection of engravings, occupy galleries at the west, which extend about the

transepts: in four rows, two on either side of the main central avenue, the works in sculpture (original marbles, not casts) are arranged; and along the walls, below the portraits, and in large, well-contrived cases standing to the rear of the statues, the mediæval and ancient works are placed—additional groups or single objects being scattered here and there in rich, and yet well-ordered profusion, in other parts of the edifice. The armour, which occupies a commanding position near the transept, looks right nobly; all that is needed is more of it, that the steel suits might be continued eastwards along the lines of sculpture. We shall, on another occasion, enter minutely into a description of this fine armour; we may, therefore, now rest content with expressing our high sense of the admirable skill and the profound science which have combined to produce these groups, figures, suits of armour, groups of weapons, &c. &c. Mr. Planché ought indeed to be—nay, he verily is, in not the least distinguished sense of the title—a "king *at arms*." To the west is the orchestra, with a good organ—for here, as elsewhere, music has made good her claim for recognition in a palace of the Arts. Beyond the northern transept is the very enriens and valuable Indian and Chinese museum; and the principal refreshment department is also in this quarter, other establishments of a similar character being on the opposite side.* We now proceed to sketch out the result of our careful examination of the cases and their contents; and we commence with the second case from the principal entrance on the south side. This case is marked B, and its contents, which are ENAMELS, form a rich museum in themselves. This most beautiful art, a true Art-offspring of the gorgeous East, occupied a foremost position in the estimation of all ranks of persons in the middle ages, and it probably was transmitted to that romantic period from remote antiquity. The enamels of Europe were derived from that fertile fountain-head of the Arts, Byzantium; and those enamels for which, after the Byzantine age, other European cities attained to such high celebrity during a long period, indicate the presence of a Byzantine influence. The mosaic pictures, for which the artists of Byzantium were so famous, may have contributed to determine the distinctive character of the enamels of their city; and, indeed, this enamel system may be regarded as a species of mosaic. Distinguished by the most extraordinary delicacy in their production, the important works of the early Byzantine enamellers have very rarely been permitted to leave the ecclesiastical treasures or national museums of Eastern Europe. Case B, however, contains a characteristic example in Mr. A. J. B. Beresford Hope's pectoral cross, which was apparently executed in the tenth century, or perhaps still earlier. This style is known as *cloisonnée*, or inclosed, from the circumstance of the several colours being bordered by narrow bands of gold filigree, which stand in relief from the plate which forms the basis of the entire work. The *champlevé* enamel, the earliest form in which this art was practised at Limoges, was a modification of the former, though it differs from it in many important conditions. Here are characteristic examples of the finer, and also of the more roughly executed varieties of this art, under almost every possible form of its application. Lord Hastings contributes a very remarkable basin of the twelfth century; two very early plaques, with figures of the Saviour, will also claim special attention. An early dish, enriched with shields of arms and scroll-work; a series of very curious and beau-

* We gratefully acknowledge the excellence of the system which prevails in this by no means unimportant appendage to a "great exhibition." Everything is very good in quality and very reasonable in cost, and an air of comfort pervades the whole department.

tiful carved heads of pastoral staves; a collection of shrines and caskets; and various miscellaneous specimens of crucifixes, book-covers, reliquaries, and articles of use and decoration, illustrate this art. The translucent enamels of Italy, and the surface-painted enamels, which were carried to their highest perfection at Limoges, the scene of their development, are also exemplified in a splendid series of specimens, which lead on the student through the successive chapters in the history of this beautiful art. Here are the staff of William of Wykeham, from New College; the King's Lynn eup; the Marquis of Aylesbury's Severnake horn of tenure, with its enriched bands and belt ornaments; a noble triptych, the property of Mr. Danby Seymour, of great historical interest; and Mr. Magniac's jewelled morsers, with a host of others, make up the contents of this case. The neighbouring wall-cases, A and C, also contain other varieties of works of the same class. Amongst these are sets of apostle spoons, various domestic articles of great artistic beauty, watches, jewels, caskets; an exquisite jewel-enriched pendent ornament; Ashmole's chain, boxes of crystal, rings, seals; Cardinal Wolsey's silver-embroidered purse; the Charles Edward Stuart relics, of melancholy interest; enamelled silver book-covers; Lord Hastings' enamelled fibula of the twelfth century, and various other examples from the same extraordinary collection, including some very early shields of arms of peculiar interest, chalice, and other articles of a religious character; an exquisitely beautiful dish, the property of Mr. Rhode Hawkins, &c. &c. All these are specimens worthy of individual study, and a bare enumeration of a few of the more remarkable amongst them will serve to demonstrate the worth of the entire collection.

Case A, the first on this side, with its wall-cases, contain examples of early glass, comprising tazza, plates, cups, and basins with covers, ewers, vases, decanters, wine and liqueur glasses, and other varieties. Great as are the advances which have of late been made in glass manufacture as an art, this case will afford abundant suggestions to the genuine Art-manufacturer. The delicacy of the Venetian glass, and the essentially *vitreous feeling* which pervades these works, tell their own tale; while the lustrous hues of the coloured glass, the translucent purity of the whites, and the richness of the opal varieties, cannot be studied without practical advantage. The forms of the glass vessels are no less diversified than their ornamentation, while in every instance their contour and the adjustment of their proportions evince the most refined perception. At the same time the student will be conscious that it will be well for him to base his own general principles of design upon the teaching of an age in which Art produced forms distinguished rather for nobleness than fanciful variety; thus glass may be made to combine every most perfect quality and ornamentation of Venetian beauty, and manipulation of Venetian delicacy may be enhanced by designs of an excellence and truthfulness unknown to the best artists of Venice.

With the view to add to their intrinsic attractiveness the charm of variety, the cases lead on the observer from one style of Art to productions in other styles and different materials. Case C, accordingly, the next in the order of succession, commences the series of collections which in this exhibition so richly illustrate the Ceramic Art. The examples in this case are all European, and they comprise almost every known variety of the productions of Dresden, Sevres, Berlin, and other celebrated manufactories of comparatively modern times, including those of our own country at Chelsea, Worcester, Derby, &c. A fine series of the works of Wedgwood, now so justly estimated,

occupies the neighbouring wall-case, and the principal cases, D and E, are devoted to the illustration of oriental china and the famed majolica ware of Italy—the productions of the fifteenth and sixteenth centuries. In common with other Chinese matters, the porcelain of China is known to us only by the specimens which have been obtained by us; its history is almost a blank. Much, however, may be gathered from the works themselves, which may be made to elucidate the history of their production, more particularly when the Chinese specimens are brought into comparison with other ceramic works, as in the present instance. The contents of the oriental case exhibit this beautiful ware under its most perfect conditions, and show how keen was the perception of colour, and how admirable the manipulative skill of the artists. This, indeed, is the lesson, conveyed almost in a single word, which all these cases teach—that the works they contain were produced by *artists*. The majolica ware impresses this lesson with striking effectiveness. Here we see designs, many of them offensive, and most of them inappropriate, elevated and refined through the Art-feeling of the manufacturer. The boldness of the forms, the splendours of the colouring, the inventive versatility which is apparent in the ornamentation, notwithstanding its generally unworthy style—these are qualities which demonstrate the meaning of the term “Art-Manufactures,” and enforce upon manufacturers the necessity of being artists also. The exhibition is rich indeed in examples of majolica, and of the kindred styles, all of them of the highest excellence. In this case are many of the finest works known to be in existence, including Sir A. Rothschild’s well-known treasures; admirable specimens of Hispano-Moorish work; of the various applications of metallic lustrous glaze; of Palissy, Delft, and of every most instructive variety of this most interesting class of production. Cases F and G contain multifarious specimens of the goldsmith’s art, and metal-work. It would be vain for us to attempt to enumerate, however briefly, the mere varieties of objects here brought together; yet all have valuable teaching to convey—all add their varied testimony to the great lesson that excellence, in whatsoever production, must be sought from Art. The processes of chasing, damascening, and ornamenting by embossed-work are illustrated most nobly; the filigree process shows how delicately it can be wrought; and jewels, cameos, and other accessories, are displayed with equal taste and richness. Some enamelled vases of exquisite workmanship, some ewers and basins of open-work and rich enamel, a large Nuremberg salver, a group of hanaps and nautilus-cups, a most splendid oval tazza, which combines in itself almost every mode of elegant enrichment, with a singular and singularly beautiful double head of a pastoral staff, will attract particular attention. With these also may be specially mentioned a remarkable tazza of tortoiseshell, very large, and enriched with gold-work and jewels; a very curious reliquary; the clock given by Henry VIII. to Anne Bulleyn; an exquisitely beautiful pastoral staff-head of about A.D. 1420; and a large circular reliquary of the thirteenth century, enriched with filigree, jewels, niello, &c., and bearing a series of very curious brief early inscriptions in letters of great beauty. Case G contains a magnificent assemblage of college plate and corporate regalia, including Bishop Fox’s staff from Oxford, Archbishop Scrope’s marer cup, various fine works in the precious metals, in rock crystal, agate, &c.; the royal nautilus-cup is here, with a numerous series of similar beautiful productions, together with other works for various purposes. In the adjoining wall-case (H) are fine collections of medals in gold and silver; a very curious and interesting series of pilgrims’

tokens, discovered in the Thames; and a valuable historical series of English coins. Near these cases are some singularly bold examples of figure-carving in wood, a remarkable collection of nearly 300 pieces of carved ivory, three *couvre-feus* of latén, &c.; here also one of the iron-clustered pillars of the building stands between Cardinal Wolsey’s scarlet hat, now the property of Mr. Charles Kean, and Theed’s beautiful statue, “Ruth.”

Sculpture in bronze, terra-cotta, wood, and other materials, is exemplified in the next case, marked II. To this valuable and instructive collection her Majesty has contributed a medallion of the Emperor Maximilian, executed on stone by Albert Durer. The same great artist has here a Pietà with a canopy; there are some terra-cotta statuettes of wonderful power by Clodion, with other statuettes in amber and bronze; various examples of wood-carving of truly marvellous delicacy, particularly a Judgment of Paris; a very beautiful pastoral staff of wood, a pilgrim’s staff of similar material, and a very elaborately carved librella or jester’s wand, probably nique. These works, the productions of the greatest artists of Italy, Germany, and Flanders, from the close of the fourteenth to the eighteenth centuries, cannot be appreciated without careful study. The collections of ivories are also of rare interest and value. Works executed in this beautiful material have been in high favour amongst all Art-loving nations, and they contribute, after a very remarkable manner, to illustrate the history of the past. The incidents which were represented by carving in ivory were so various, and so great also was the variety of purposes to which carved ivory was applied, that these works in themselves constitute a treasury of information, as well bearing upon the habits, sentiments, tastes, costume, and arms, and the civilisation and religion of different epochs, from the fourth to the seventeenth centuries, as more directly illustrative of the history of Art itself. The cases of ivories have been contributed from the most important collections in England, and they nobly vindicate their title to the appellation of “Art treasures.” The four great periods—the late Roman, the Byzantine, the Mediæval proper, and the Renaissance—are copiously illustrated with examples relating to national, civic, and domestic life, religious subjects, various secular matters, particularly such as have reference to war and romance, and reproductions after the antique. The gems of the Mayer and Meyrick collections are here; and the Queen has set an example of liberal contribution which has been most loyally supported. The wall-case (which like the last case is marked with the letter I) is also filled with ivories; here is a very remarkable triptych of the middle of the fourteenth century, with various fine relievi, medallions, tablets, a crucifix of peculiar beauty, various cups, and other vessels, &c. The next cases, in the same order, contain additional specimens of porcelain, majolica, and Delft ware, glass, and similar works, together with various contributions from Mr. Mayer’s noble museum at Liverpool. Amongst the latter may be specified a magnificent series of antique bronzes from the Hertz collections; examples of ancient and mediæval glass, various enamels, three very remarkable small paintings in fresco from Pompeii and Herculaneum, a collection of watches, various Egyptian works, chiefly personal ornaments, and Etruscan productions of a similar character. One Egyptian signet of gold bears on a cartouche the name of Amenoph I., one of the Pharaohs, who reigned while the patriarch Joseph was in power. Here also are various ivories, which include a full-length statuette, sixteen inches in height, of an abess with her staff of office. The next compartment con-

tains other noble ivories from Egypt and Assyria, with others from Byzantium and Italy, including diptychs, plaques, &c.; here is a diptych of the Emperor Philip the Arab to commemorate the thousandth year of Rome (A.D. 248); also the Æsculapius diptych, c. A.D. 50; various consular works of the same kind; a most remarkable representation of the Crucifixion and the Resurrection; and a fine figure of King Henry VI. seated in royal state. A low case close at hand contains about 2000 intaglio gem-seals, with a considerable number of exquisite cameos, all from the Mayer collection. A group of Etruscan pottery next succeeds, and declares how truly and ably ante-Roman Italy can illustrate the arts of Greece; with these Etruscan works some Roman pottery is associated. The last case on the south side, the one which is next to the Meyrick armoury, is occupied with specimens of book-binding, and it shows how readily Art can adapt herself to every requirement, and how valuable her aid and co-operation are in every work.

Passing through the Meyrick armoury to the corresponding compartments on the north side of the building, which contain examples of armour and weapons from the royal collections, and leaving the oriental museum without a visit, we commence upon the second series of cases which are arranged opposite to those already noticed. The first and second of these cases contain a fine collection of goldsmith’s work, early and modern, which has been obtained chiefly through the exertions of Messrs. Hunt and Roskell, of London. In Case K are many noble specimens of richly-chased and embossed-work in church plate, dishes, vases, cups, ewers, candlesticks, caskets, and other varieties, including the shield presented to the Prince of Wales by the King of Prussia. The power of Art to enrich the most precious of the metals is here exhibited after a most impressive manner. Close at hand are some remarkable works of modern Art in silver, including the Montifore testimonial, and some other elaborate works of a similar character. Mr. Mayer has filled the next case with another most precious selection from his treasury of Art, consisting of various fine and delicate carvings, examples of enamel, gems, niellos, &c. One of the niellos is the work of Mazzo Finaguerra; it is in silver, and enriched on both sides of the metal with two subjects from sacred history: it will be remembered that from the niellos of this artist, the art of engraving, for the purpose of producing impressions, was accidentally derived. In this case is a cameo bust, in hone-stone, of Albert Durer’s wife, by Durer himself. Case L contains the Douse collection of ivories, now the property of Colonel Meyrick, which exhibits examples illustrative of this art from its earliest Christian period to the seventeenth century, and is peculiarly rich in illustration of mediæval Art, and mediæval sentiments and usages. The caskets, diptychs, mirror-case covers, coffers, book-covers, and other objects, possess the strongest claims upon the student both of History and of Art. Cases M, N, and O, which are next in the order of succession, are occupied with selections of the choicest specimens of the Soulages Collection. These celebrated examples of Renaissance works here are seen with every advantage. The best objects occupy the most prominent positions; the grouping is good and effective, and each case derives an accession of interest from its own immediate companions, as also from the kindred groups which are assembled around it in every direction. We may here observe that the Soulages furniture has been skilfully grouped with corresponding contributions by her Majesty and other distinguished collectors, and placed, with excellent effect, in

different parts of the edifice. A fine collection of locks and keys, with various other works, beautifully executed in steel and iron, a rich series of niellos, some small mosaics, and curious inlaid coral-work, occupy wall-case M. Wall-cases P and R contain other examples of Ceramic Art of various kinds; some illuminated MSS. in rich bindings; with Worcester enamels, and the Duke of Portland's beautiful Sevres porcelain. Lord Hastings has filled case P with specimens of majolica, Palissy, Raffaele, French, and Flemish wares, and thus has enabled the student to extend the range of his researches with great advantage. The varied nature of the examples in this case, and the lustrous splendour of their colouring, will repay a very careful examination. The true value of these productions, as teachers to us to render our manufactures works of Art, is signally exemplified in this fine group. The same lesson receives further powerful corroboration from the next five cases, which, with two other wall-cases, complete the collections. These five cases have been contributed by the Government from the national collections—a circumstance which we record with especial satisfaction, as an expressive indication of the interest taken by those in power in such an attempt as the present exhibition, to instil a taste for true Art, and to cultivate Art as a great public teacher. These cases afford most gratifying evidence of the richness of the national museums in ceramic works, glass, ivories, and works in metal of various classes. Many of the finest specimens are from the British Museum, and the rest chiefly from the Bernal Collection, which now has its home in the new museum buildings at South Kensington. Adjoining these highly-interesting collections, which are second in value to none in the Exhibition, are several very fine cabinets variously enriched, and with them are grouped many remarkable clocks, the Marquis of Westminster's "Medici coffer," some fine bronzes, and equally fine china, and many other Art-manufactures of great beauty and interest. The wall-case S contains, in its three compartments, various small cabinets, chiefly in metal, inlaid and enriched with damascene-work, and a large and very admirable series of Wedgwood's beautiful wares, contributed by Mr. Mayer; and in wall-case U the same gentleman has placed the unique "treasures" of his Anglo-Saxon Faussett Collection, in company with many other relics scarcely, if at all, inferior to them in archaeological interest, and in their faculty of historical illustration. These early British, Celtic, and Saxon remains bear a touching though silent testimony to the energy with which the lamented John Kemble entered upon his labour of love; and they declare how surely, had he been spared to complete his work, he would have rendered this department of the Exhibition absolutely perfect. As it is, this one case will more than repay a visit to Manchester, to every one whose mind leads him to inquire into what the earliest days of our national history have left to us of visible and tangible evidence. The evidence here collected throws a gleam of light over that hitherto darkened period, and we may rejoice to recognise Art as a cherished ministrant to the Briton, the Celt, and the Anglo-Saxon. Arms and ornaments, those primary requirements of mankind in every condition of civilisation, here are seen under most characteristic forms:—the pure gold torque, the jewelled morse, the skilfully-adjusted celt, the finely-formed sword-blade and spear-head, the fibula in such universal request, beads of varied forms and hues, armillæ, and various other productions of early Art, here are exemplified. The singular beauty of the earliest of the ornaments, and the skill evinced in their construction, will be studied

with deep interest; and the care with which the various weapons and implements have been formed, will be noticed with equal attention. The very remarkable bell-case, and the pastoral staff, both probably of the seventh or eighth century, and severally contributed by Dr. Tod and Cardinal Wiseman, are amongst the objects of the greatest curiosity and rarity; they illustrate the earliest forms of Irish Christian Art, which exercised an important influence on the ornamental art of all the northern nations. The celebrated relics disclosed by the "Fairford Graves" are here, and near them are the Rev. Thomas Hugo's celts, and other early specimens. Here also are the wonderful gold torque-armillæ found, in 1829, at Malpas, a Danish waist-torque, with various rings, bits, and spurs of immense size.

Such is a brief sketch of what this noble Exhibition has to show the visitor in the various departments of Art applied to manufactures. Possibly we may hereafter place before our readers more detailed and minute descriptions of some of the finest, the most beautiful, and the most suggestive specimens; now we have said more than enough to corroborate our advice, that all who can by any means visit and study in this unrivalled school of Art should exert every effort to accomplish so important an object. There remains, however, one remark to be made upon this great collection, as it appears while we now are writing,—in itself it declares beyond question the ability and the zeal, the munificence and the confident trust which have combined to produce it, and it demands the warmest expressions of admiring gratitude to be addressed as well to those who have sought, and, having sought, have obtained and classified these diversified works of Art, as to the noble-hearted possessors of these "Art Treasures," who have thus freely and liberally contributed them: but then this collection also appeals for such a plain, simple, yet masterly explanation as may render it intelligible to every class of visitor, and may make its all-valuable teaching appreciated through being understood;—*and this yet remains to be done.* The collections have but this one imperfection—they are too perfect, too noble, too elevated to be felt without the very clearest and most attractive of interpreters. We hope, before these lines are read, that much will have been accomplished in this all-important matter. There is ample time to do it, but there is no time to lose. Let the various collections be made to speak, in constant successions of short, simple, effective lectures, delivered in the exhibition building, and let them also have attached to them brief printed notices, historical and descriptive, while every individual object has its own label. Surely, if these things were worthy to be collected, they are not unworthy to be described. If each object is to gain by association with every other, and thus all are to form a grand Art-teacher, invested with authority unknown before, surely the teaching capacity and the teaching value of the exhibition should not be left alike unimproved, because both are unknown through not being declared. These things may be self-evident to the few, by the many they have yet to be learned. We trust, finally, that a catalogue worthy of such a title, because it is both *complete and accurate*, will be before long to be obtained. Such a catalogue would be a permanent record of infinite value, particularly if judiciously illustrated; and this might, as we believe, be done without much difficulty, since so many of the best specimens are already engraved. The existing engravings might be brought together as the originals have been; and then, with a few fresh additions, the "Art-Treasures Exhibition" would possess a worthy illustration in not the least interesting, not the least instructive or valuable of its departments.

THE ROYAL PICTURES.

MANCHESTER FROM KERSAL MOOR.

W. Wyld, Painter.

E. Goodall, Engraver.

Size of the Picture, 1 ft. 8 in. by 1 ft. 2 in.

LITTLE more than seventy years has elapsed since Manchester was looked upon as a town of third or fourth rate importance, with respect to the number of its inhabitants, their wealth, and relative position in the scale of our social community. It has grown up within this comparatively short period of time into a city, having a bishop, and all the other ecclesiastical dignitaries appended to the mitre, and is the greatest manufacturing place in the world.

But though Manchester has so enlarged its boundaries, and become the watchword of commercial enterprise all over the world only within a few years, it is a place of very remote origin, and of considerable historic interest. Writers upon topographical antiquities assume it to have been a Roman station,—the *Mancunium* of the "Antonine Itinerary." Whitaker supposes Aldport—the name given to the place after it had lost its Latin cognomen—to have had its rise in the reign of Titus, and that the place was indebted to the Romans for an improvement in the woollen manufacture, which is said to have been introduced by the Gauls. Under the Saxons it became the residence of a thane, who dispensed justice from his baronial hall, and effected improvements in the town: it had also two churches, one of which—St. Michael's—is mentioned in the Domesday Book. After the Norman Conquest, William gave the place to William of Poitou; and the third baron of Manchester was in the list of those feudal lords who extorted Magna Charta from King John.

At the period of the Reformation, much dissension took place among the inhabitants. The Warden of the Collegiate Church—an office at that time of considerable influence—refused to acknowledge the supremacy of Henry VIII., and many of the principal inhabitants adhered to the Papal cause. When the civil war of Charles's reign broke out, Episcopacy succumbed before Puritanism, and Manchester was besieged by the royalist forces, under Lord Strange. "In 1646, when Lancashire was converted into an ecclesiastical province, under the Presbyterian forms, Manchester, with some neighbouring places, was constituted the first classical division of the county; and under the Protectorate, the electors chose a representative in the person of Mr. Charles Worsley, and then of Mr. R. Ratcliffe." The men of Manchester appear almost always to be given to Jacobite; for we read in its history that a strong Jacobite feeling prevailed during the Rebellion of 1745, which was carried to such an extent that Mr. Dickinson, an influential inhabitant, lodged and entertained Prince Charles at his house. The part which Manchester has played in more recent political demonstrations, is written in the chronicles of England.

Such is a brief history of a place which, whatever its commercial greatness and value, affords but little scope for the artist's pencil. It has no architectural beauty internally, except, perhaps, the Collegiate Church, or Cathedral, as it is now called; and externally, the surrounding country offers little picturesque scenery. From whatever side the spectator contemplates the city, he sees long ranges of factories with innumerable chimneys, which point

"Their tapering spires to heaven;"

but recalling to mind other associations than those to which the poet's line has reference—thoughts of active enterprise, industry, and accumulating wealth. Of late years, however, the city has assumed a new character—all the public buildings of recent erection are fine examples of Art, and its "warehouses" are almost palaces.

Mr. Wyld is an English artist, long resident in Paris. He has somewhat recently been elected a member of the New Water-Colour Society, and has been decorated with the Cross of the Legion of Honour in the city of his adoption. He is an artist of high ability, and upholds the reputation of England in Paris. His view of Manchester has a Turner-like character, and, considering the materials of the composition, is most agreeable.

The drawing is at Windsor Castle.

MANCHESTER: FROM KERSAL MOOR

FROM THE PICTURE IN THE ROYAL COLLECTION

LONDON, PUBLISHED BY G. & C. 1841

THE APPLICATIONS OF IMPROVED MACHINERY AND MATERIALS TO ART-MANUFACTURE.

No. 7.—VEGETABLE FIBRE—PARCHMENT PAPER.

MAN, looking around him for the means by which he can achieve certain ends, finds that Nature, in her beneficence, has produced many of the substances which he requires. Leaves are taken to thatch his rude dwelling, and grass ropes are employed to bind the roof, and secure it from the action of the winds. Advancing from one point to another, by observation he discovers that the grasses which he has been using have a peculiar fibrous structure—that they can be torn up into threads, and those threads twisted into ropes. He advances, therefore, to the use of vegetable fibre, for imitating skins and leaves into articles of dress; and gradually proceeds to the construction of nets and other things for snaring the beast, the bird, or the fish. Eventually, from netting, an advance is made to weaving—and linen and cotton fabrics are the results of thought and industry. There will be but little difficulty, whether we study the history of human progress in the nations of antiquity, or in the conditions of untrained races, as contrasted with those advanced in the refinements of civilisation, in discovering many of those steps which have been so briefly indicated. It is long, however, before much intellectual labour is brought to bear upon Nature; the applications of Science lag far behind those applications which are due merely to the sensual requirements of man. The following passage from one of Sir John Herschel's recently published Essays is so exactly to the point, expressing, in language superior to any we can employ, the condition of man in respect to useful and thoughtful applications, that we cannot resist quoting it:—"The experience of all history has shown that the gratification arising from the exercise of purely intellectual faculties is especially apt to be postponed to almost every other, and in its higher degrees to have been as unduly appreciated by the many, as it has been rarely enjoyed by the few who are susceptible of them. The mass of mankind, too happy in a respite from severe toil and bitter contention, are well content with easy pleasures, which cost them little exertion to procure and none to enjoy. As a conquering, contriving, adorning, and imaginative being, the vestiges left by man are innumerable and imperishable; but, as a reflective and reasoning one, how few do we find which will bear examination and justify his claim! How few are the conclusions, drawn from the combined experience and thought of so many generations, which are worth treasuring as truths of extensive application and utility! How rarely do we find, in the writings of antiquity or of the middle ages, any general and serviceable conclusion respecting things that be; any philosophical deductions from experience, beyond the most obvious and superficial, on the one hand, or the most vague, loose, and infertile on the other; any result fairly reasoned out, or any intelligible law established from data afforded by observation of phenomena—whether material, having reference to the organisation of the system around us, or the psychological, bearing on the inward nature of man." These remarks apply with especial force to the subject under consideration.

Vegetable fibre was soon indicated to the most untutored mind as a subject capable of being extensively applied. It was, at first, taken as nature had woven it in the leaves and in the barks of her forest-trees; it was eventually torn into strings, and twisted or woven into such forms as necessity demanded, or as fancy directed. But we have to confine ourselves to one form of this application. Upon the leaves of certain plants, we are informed, the first written signs for ideas were painted. As experience showed the usefulness of these tablets, and indicated their imperfections, men were induced to prepare the raw material, and the *papyrus* became a prepared leaf,—a leaf, indeed, partly beaten into a paper pulp, but still retained in the leaf-like form by the preservation of the stronger binding fibres. From this, the steps to the manufacture of paper-pulp, and the spreading it out into sheets were natural, although the progress made was slow.

We have already dealt with the peculiarities of paper manufacture, and it is not intended to return to the subject farther than to show some of the peculiar vegetable fibres which are known to be applicable to the construction of this very useful material. Let us examine for a moment some of the sources from which we now obtain materials for the manufacture. Rags of all kinds are collected at home, and imported in large quantities from abroad; and in addition, old navy stores, cordage, bagging, and fishing-nets are employed. The waste of the cotton and flax mills furnish large supplies of the required raw material. The cotton waste produces a paper pulp of great fineness, but possessing little strength; flax waste, on the contrary, gives a paper of great tenacity; so the flax and the cotton are combined to produce a paper of good medium quality. Straw is now manufactured into paper at four or five mills in this country, and it is so rapidly improving in quality that it is getting into more general use. The principal difficulty, and, indeed, the chief source of expense, incurred in the manufacture of straw paper, is the removal of the siliceous coating of the straw, for which an alkali is required. Mr. Durden, of Leeds, to whom we are indebted for much information, informs us that two tons of straw furnish only one ton of paper pulp. This paper requires the use of binding materials, and of plaster of Paris to give it surface. When it is well made, straw paper makes a good scribbling and note paper, and it is pleasant to write on; but it is by no means durable.

Mr. Jeyes, of Northampton, has successfully applied the *common couch grass* as a material for making a stout brown paper and millboard. The twitch or couch grass is a well-known troublesome weed, which, hitherto, the farmer has collected and burnt; it may now be turned to profitable account. Lincolnshire yields the couch grass abundantly,—the feney districts of that county being especially favourable to the growth of the weed. A company has been formed for the manufacture of this paper and millboard at Stamford. Mr. Jeyes has also patented the application of the stems of the *mustard plant* to the manufacture of paper. Mr. Barling, of Maidstone, has succeeded in manufacturing a strong paper from the *hop bine*; and, judging from bleached specimens, Mr. Durden, whose experience is great, says, "I think there cannot exist a doubt of the practical application of the fibre to the manufacture of writing paper. It is estimated that 15,000 tons of hop bine are annually obtainable in this country, the only application of which hitherto has been to form shelter for cattle, or it is burnt to get rid of it." The refuse of the *sugar-cane* has been employed, but not hitherto with much success. Dr. Cumin, of Bath, has made paper of this kind, but we believe it is not found to possess the required tenacity. Wood, in various forms and of different trees, has been used. Mr. Schlesinger, of Bradford, has established works for the conversion of wood into a fibrous pulp, which is capable of being mixed advantageously with rag pulp in the manufacture. It is found that the woods of the fir, the pine, the poplar, and the willow, answer best.

Peat paper. In the neighbourhood of Turin, and in some parts of Germany, peat paper is largely manufactured. M. Lallemand, of Besançon, has patented a process for its manufacture; and Mr. W. H. Clarke is the patentee of a similar process; but the latter proposes especially to use it, as a substitute for paper, in the manufacture of *carton-pierre*, *papier maché*, &c. The peat is not employed alone, but is mixed with old cordage, the bark of the *mulberry-tree*, and like substances. When we remember that there are in Ireland three million acres of peat bog, which are now nearly valueless, we cannot but hope that some of those methods may be found to be commercially available; and that we may, in articles of use or of ornament, see the application of this vast supply, and the consequent conversion of it into real wealth. From a communication made to the Polytechnic Society of Yorkshire by Mr. Durden, we glean the following important fragments of information. M. Vivien, of Paris, has rendered the leaves of trees, plants, &c., more valuable by fitting them for conversion into paper. Very excellent specimens of paper have been produced from the fibre of the *hollyhock*; the fibres of the Spanish rush,

espato, are capable of conversion into a paper of good quality. Lord Berriedale has patented the use of the *common thistle*, and Mr. Evans that of *Brazilian grass*. Dr. Hoskins has fully succeeded in rendering the *galingale*, a plant indigenous to the Channel Islands, available for the manufacture of paper, and is now converting large quantities of this material into the state of "half-stuff" ready for the paper maker, to be used either alone, or in combination with rag pulp. The *spartum* or *water broom* has been patented by a foreigner for a similar purpose. M. Guyardin, of Paris, recommends the *arrow* or *water-arrow* of Brittany. Mr. Gillman, of Twickenham, claims the invention of using the fibrous parts of the New Zealand plants *gajia* and *ti*; and the New Zealand flax will probably, in a short period of time, be largely employed in making paper,—the durability of which will especially recommend it for printing superior and valuable books, or expensive reproductions of the works of Art. Mr. Bureh, of Waltham Cross, manufactures paper-pulp from the *willow*. Dr. Forbes Boyle has directed the attention of mercantile and scientific men to the enormous quantity of raw material fit for paper-making, which could be obtained from the plants and weeds of tropical climes. Large quantities of *jute* are sent to this country from the East Indies in the shape of what are called "*gummy bags*," or bags containing various articles of East Indian export. This material, leached by the patent process of Messrs. Smith and Holdsworth, of Langly Mills, near Durham, seems likely to be extensively employed in the manufacture of paper. The specimens of white paper, of various kinds, containing large percentages of bleached *jute*, sent out by this firm, are of very superior quality. The peelings of the *withey*, and the scrapings of liquorice root, have been experimented upon with some success. Such are the various kinds of vegetable fibre which have been employed for, or suggested to be employed for, the manufacture of paper. It will be evident from this, that almost every variety of vegetable fibre may, in some form or other, be made available to the production of this most useful article.

Advancing by the lights of experimental science, we now come to a more remarkable point in connection with vegetable fibre, and its useful applications. It will be necessary to the complete understanding of the question that the chemical composition of woody fibre should be remembered. Oxygen and hydrogen, in the proportions in which they form water, combined with carbon, are the ultimate chemical elements constituting every variety of vegetable tissue. Many years since Braconnot and Pelouze discovered that if ordinary bibulous paper was exposed to the action of strong nitric acid, it became—when washed with water, to remove the adhering acid—extremely tough, but it also became exceedingly inflammable. It was, indeed, proposed to use it as "*quick match*" for pyrotechnic purposes, and for artillery. Eventually Schönbein introduced gun-cotton to our notice, and he showed that ordinary cotton fibre, became, when exposed to the action of nitric and sulphuric acid, more inflammable than gunpowder. Much attention was directed to this remarkable cotton. It still kept its fibrous form, but it had acquired new and extraordinary powers. Its explosive force was found to be due to the fact of its having taken nitrogen into combination with its other elements; and Kuhlmann has shown that gun-cotton, whether woven or not, will not receive dyes; but that when it has lost part of its nitrogenous principle by spontaneous, or artificially produced, decomposition, the vegetable fibre absorbs colour more energetically than it did in the natural state. This gun-cotton, dissolved in ether, forms *collodion*, which is now so extensively employed in photography; and any one variety of all the vegetable fibres named, may, by treating them with acids, be converted into a similar substance to the gun-cotton. Other peculiarities in connection with changes produced by chemical means on vegetable fibre have been the subject of experiment. Mr. J. Mercer discovered that cold solutions of the caustic alkali, chloride of lime, and oil of vitriol, imparted strength and fineness to textile fabrics.

Upon these investigations an improvement has again been made by W. E. Gaine, C.E., by which the strength and character of parchment is given to

paper. Mr. Gaine ascertained that by drawing a piece of common sized paper through a mixture of two parts of concentrated sulphuric acid with one part of water, and then immediately and thoroughly washing it, this peculiar condition was brought about. It is important that the correct proportions of acid and water should be preserved, for if it falls below, or exceeds the above-named strength, the quality of the parchment paper, as this substance is called, suffers. Parchment paper thus prepared, is so strong that a ring of it seven-eighths of an inch in width will sustain from 63 to 100 lbs.: a ring of parchment of the same weight and dimensions supporting about 56 lbs. Parchment paper, though it absorbs water, does not permit water to percolate through it. It is not disintegrated by water, and, unlike parchment, is not destroyed by warmth and moisture. The weight of the paper is not increased by the change, proving the entire absence of sulphuric acid. The causes leading to this remarkable change are not yet understood, and must—unsatisfactory as it may appear—be referred to that mysterious influence by which bodies occasionally seem to effect, by their mere presence, changes in other bodies, while they remain themselves unaltered. The strength of this substance, and its resemblance to parchment, commend it for many important purposes in which strength and durability are requisite. Having the appearance of vellum, it is likely to supersede the use of that substance in bookbinding, and without doubt it will be largely employed for legal deeds, policies of insurance, leases, and similar important documents. We have seen maps and prints which have been subjected to this process, and the smoothness of surface produced, leads to the belief that they will not speedily be soiled, and that when soiled they may be very readily cleaned. This parchment paper is well fitted to receive oil colours, and it takes water colours admirably; so that in Art and in commerce equally, the discovery promises to be of the first importance. We understand this substance will shortly be introduced into commerce by Messrs. Thomas De La Rue, & Co.

We now know that an immense variety of vegetable fibres are fitted to be formed into paper, and that from many of them a superior kind can be manufactured. We are, therefore, but little dependent upon the supply of rags, which have been said to be unequal to the demand. We may also, by the treatment to which Mr. Gaine subjects the paper, render it stronger than the animal skin; while at the same time it is fitted for writing, printing, or painting upon. When this important discovery comes more fully before the public we may return to its consideration.

Since the above was written, attention has been directed to the use of this acid process for improving the appearance of photographs, and, as we should suppose, for increasing their permanence. When finished positive photographs are subjected to the above mode of treatment, a slight modification is rendered necessary in consequence of the harder nature of the paper upon which they are printed. The following is a description of the manipulations, which, owing to the powerfully corrosive nature of the acid, must be performed with great care:—

“Take a good sound stoneware jug, holding about a pint, and stand this in the centre of a large pan. Measure out eight fluid ounces of sulphuric acid (oil of vitriol of commerce will generally be found sufficiently strong to be used), and pour it into the jug; then measure four ounces of water and pour that into the sulphuric acid; not hurriedly, but taking about ten seconds for the purpose. Stir the mixture now with a glass rod, cover the jug with a plate, and leave it until quite cold. Immediately the water and acid are mixed, great heat is evolved, and the necessity for taking the above precautions will be at once evident, since any breakage of the vessel, through the sudden and great heat to which it is subjected, will be attended with the most destructive consequences to almost everything that the acid touches.

“Have ready three perfectly clean dishes, arranged side by side. No. 1 must be of good porcelain, quite dry, and in size about 10 by 12 inches. Nos. 2 and 3 should be very deep, and holding not less than half a gallon each. Into No. 1 pour the mixture of sulphuric acid and water. Nos. 2 and 3 must be filled with pure water, and to the latter a

few drops of solution of ammonia must be added. Now take the photograph (which must be quite dry), and, in the ordinary way, lay the picture side on the acid, taking great care to avoid air-bubbles; then instantly lift it up, and lay the plain side on the liquid. This will not be at all difficult, as the wetted surface curls slightly inwards, the acid producing an opposite effect to that of water. Any part which is not covered with liquid is now to be gently pressed under with a glass rod or a platinum spatula, and the sheet left immersed in the acid for a space of time varying between a quarter of a minute and two minutes, according to the kind of paper on which the picture has been printed. Canson's thin paper will require about thirty seconds; Canson's thick, one minute; thin paper, Saxe, twenty seconds. Whatnaul and Turner's about ten seconds, if the size has been well removed; but if they still remain non-absorbent, two minutes will not be found too long. After the sheet has soaked for the proper time, gently raise one corner out of the acid, and guarding the thumb and finger from injury with a double fold of blotting-paper, lift it entirely out by means of this corner, and allow it to drain for a few seconds; then with a quick motion completely immerse the sheet in dish No. 2, and move it about in all directions, so as to remove the strong acid from the surface as rapidly as possible. Lift it perpendicularly out of the liquid, and plunge it in again two or three times consecutively, and then transfer it to dish No. 3, where allow it to remain until the whole number of sheets are completed, or it becomes inconveniently crowded.

“Dish No. 2 must be emptied, and refilled with pure water, after about six sheets have been passed through it; and in dish No. 3, a piece of good blue litmus paper should remain, and as soon as this shows the slightest tendency to become reddened, a few drops of ammonia must be added, and the whole well mixed together; for if any, even the slightest trace of unneutralised acid remain in the paper, after coming from this bath, the picture will soon be inevitably destroyed: thus, the necessity of keeping the liquid alkaline, in dish No. 3, will be evident; at the same time experimentalists must not forget that long soaking in ammonia is prejudicial to the half-tints of the picture, and thus the excess of the alkali must be small.

“After coming from the ammonia bath; the sheets will want washing two or three times in clean water, and they can then be dried in any convenient way. The paper, when dry, will have an uneven, crumpled appearance, and will require either to be carefully mounted, or passed between rollers, to render it smooth again.”

We would strongly recommend photographers to institute experiments on their positive pictures, in the manner above described; for which method we are indebted to Mr. W. Crookes: the pictures are greatly improved in appearance, and are far more enduring.

ROBERT HUNT.

VISITS TO PRIVATE GALLERIES OF THE BRITISH SCHOOL.

THE COLLECTION OF WILLIAM BASHALL, Esq., OF FARRINGTON, LANCASHIRE.

THE collection of pictures of our own school, formed only of late years by Mr. Bashall, with a taste and discrimination which do honour to his love and knowledge of Art, may, for the greater part, have either been commissioned by himself or purchased by him from the painters themselves, for all are of recent production. Mr. Bashall resides in a district rich in British Art. We have felt it a duty to speak especially of the more than liberal support which our painters have received from the neighbourhood of Preston and Manchester; and there are other galleries in the same localities, yet to be described, not less interesting than those already noticed. The pictures of which we now speak are distributed in the lower rooms of a mansion well lighted; in such that many of the pictures look more fresh than when exhibited—for a large proportion of them have lately hung on the walls of the Royal Academy, productions of Maclise, Goodall, Hilton, Stanfield, Roberts, E. M. Ward, Linnell, Cooke, Creswick, Johnston, Poole, Frith, Egg, &c. &c.

‘An Episode of the Happier Days of Charles I.’ F. GOODALL, A.R.A.—This picture will be remembered among the engravings that accompanied our sketch of the artist's life. As to light and colour, it is the most brilliant work ever executed by its author. Every work since this is much more subdued in tone, with a deference to the colour and feeling of the Dutch school. It hangs here very advantageously near a window, and comes out with infinitely greater power than it did in the Academy. The subject is a felicitous conception; it is the only composition that we have ever seen in which Charles I. is represented otherwise than in embarrassment, peril of his life, or in death—with the exception of Vandyke's sketch in the Louvre.

‘The Child Timothy,’ J. SANT.—This picture is well known from the engraving which has been published from it; he leans his head on his hand, and is in the act of unrolling a scroll.

‘The Infant Samuel,’ J. SANT.—This is a pendant to the preceding, and, as a pair, no two pictures can sort together better. The qualities of both are identical; they are extremely simple, and are painted without show of colour—in virtuous reliance on expression and *chiar-oscuro*.

‘Milking Time,’ J. LINNELL.—The theme is not an aspiring one, but it is carried out without the introduction of any incident to vulgarise the composition. It is small, and was painted in 1847: essentially a dark picture, closed on the right and left by trees, and showing principally groups of cows.

‘The Portrait,’ W. P. FRITH, A.R.A.—This is suggested by the description in the ‘Spectator’ of Sir Roger de Coverley and the Spectator viewing the portrait, which, it will be remembered, is represented in all cases—for it is a stock subject—very like a Saracen's head. Both figures are full of interest, but there is something successfully whimsical in the *pose* of the baronet.

‘The Stricken Deer,’ A. ELMORE, R.A.—This was painted as an illustration to those verses of Moore's Irish Melodies, ‘Oh, what was love made for,’ &c.; it contains one figure, that of a lady in white, to which has been communicated a sentiment in consonance with the poetry.

‘Gaston de Foix taking leave of his wife before the battle of Ravenna,’ Sir W. L. EASTLAKE, P.R.A.—This is a large picture, painted from a passage which occurs in the life of Louis XII., and it has been worked out with that consistency of purpose which distinguishes all the works of the president. Gaston de Foix is as much a favourite with painters as he has been with poets and analysts; every striking incident of his life has been illustrated. We find him here seated, wearing a suit of black plate armour, over which is cast a white surcoat, and near him lies his plumed helmet. There is a high and pure tone of romance in the picture—this perhaps is carried to extremity; be that as it may, the relation between the figures is eloquent in the tenderest terms of the heart, and the impersonation is no other than the chivalrous De Foix.

‘Going to School,’ F. GOODALL, A.R.A.—This small picture was painted in 1851: those who are ‘going to school’ are two cottage children, a boy and girl, whose mother stands watching their tardy progress. The composition is throughout rendered with infinite care, and the figures are distinguished by all the valuable points which characterise the children generally introduced by this artist into his works.

‘Martha,’ C. R. LESLIE, R.A.—One of the single figures of which this artist has painted very many, all of which abound with suggestion and allusion to the source of the subject. The figure here is seated; the features are seen in profile. She is looking thoughtfully from the window on the moonlight sky. The manner of these works is free and sketchy, but in this manner they are very masterly.

‘Brunetta and Phyllis,’ A. SOLOMON.—This picture will be remembered as having been exhibited some few years ago in the Academy, and within a season or two of the exhibition of the ‘Discipline of the Fan,’ a subject also from the ‘Spectator,’ and, like this, containing numerous figures. The interpretation of the passage is difficult on canvas, but it is set forth here with as much perspicuity as the subject admits. The triumphant air of Brunetta, and the swooning of Phyllis, explain the story as a

ease of rivalry, to which greater point is given by the dress of Brunetta's sable attendant being identical in pattern and material with that of Phyllis. Then the assembly is divided into two parties, one of whom sympathises with Phyllis, and the other sneers with Brunetta. The tone and colour of the picture are sustained in their original brightness.

'The Tax Gatherer,' G. O'NEIL.—We trust that, for the sake of the poor woman upon whom the demand is made, the impersonation of this functionary is a little overcharged. His manner is coarse and overbearing, he is just the man to threaten and oppress; the dog is much scandalised at his insolent bearing, knowing that, although the debt be a just one, the justice of the claim does not palliate undue severity.

'View on an Italian Shore,' J. D. HARDING.—The foreground of this picture is extremely rich in colour, and much broken up with rocks and pools of water—a pictorial confusion, deriving much value from contrast with the more tranquil and airy section of the picture. Composing with the nearer material, there are fragments of buildings dominated by cliffs, the line of which trends round the coast, and far into the view, until lost in the sunny distance. On the beach there are *felucche* drawn up, which, with some characteristic figures, communicate life to the scene. The manner of the work is forcible and independent, evincing in every passage the knowledge and firmness of a master.

'The Dead Sea from Bethlehem,' D. ROBERTS, R.A.—The view seems to have been taken from the top of one of the houses in Bethlehem, whence is obtained a very high horizon, determined by an even range of mountains. The Dead Sea lies in the basin of the intermediate landscape.

'Over the Hills and Far Away,' T. CRESWICK, R.A.—A subject of that class to which this artist owes his early reputation—consisting of a Welsh mountain stream flowing over a rocky bed, closed on the left by a mass of rock and herbage, and on the right by mountains which retire into distance: it is like composition. This painter is extremely skilful in his arrangement of material; his adjustments have very much the appearance of natural coincidence.

'The Woodland Mirror,' R. REDGRAVE, R.A.—One of those simple and tranquil passages of sylvan nature, for the love of which this painter seems to have forsaken the human form. His selection generally fixes on a placid pool of water embosomed in trees. The "mirror" occupies the nearest section of the composition; a road winds round it, and the view is closed by the shaded depth and nearer substance of a summer grove. The proximate masses, on which the light falls, are painted with a minute elaboration of foliage tracery; every blade of the herbage that skirts the water is most conscientiously individualised, and the lustrous reflections of the water are exquisite in their mimicry of nature.

'The Soldier's Home,' J. SANT.—Like all the works of the painter, a picture of very few parts, the interest being centred in a mother and child—the former kneeling by the side of the bed and teaching her child to pray for the safety of its absent father. It is a dark picture of great power, containing a sparing distribution of light, to each passage of which is assigned a most important function in the composition.

'The First Day of Oysters,' G. SMITH.—An every-day street episode very effectively put together, but to be valued especially for the extreme ease of the manipulation. There are three figures—the vendor, an old woman; the consumer, who is content to refresh himself standing; and a girl, who waits her turn, holding a plate. The locality appears to be suburban; it had better been the corner of some well-frequented street.

'Contemplation,' FRANK STONE, A.R.A.—The features of this figure, with their profoundly melancholy cast, declare in a great degree the turn of thought that agitates the bosom of the lady who sits leaning her head on her hand. The female heads painted by this artist are always attractive.

'The Novice,' A. ELMORE, R.A.—This picture formed one of our engravings, published a few months since, with the biography of the painter.

'The Administration of the Lord's Supper,' J. C. HORSLEY, A.R.A.—Engraved in our last month's number.

'The Introduction of Pepys to Nell Gwynne,'

A. EGG, A.R.A.—The style of the composition is jaunty, like that of the diary. Pepys very gallantly kisses the lady on the cheek, a salute which she evidently expected, and receives as a compliment. This picture shows much of the costume of the period at which Pepys wrote. The figures are numerous, and full of vivacious expression.

'Dante meditating his Episode of Francesca da Rimini and Paolo Malatesta,' J. N. PATON, R.S.A.—We do not remember to have seen this picture exhibited. The story of Francesca da Rimini has been set forth of late in an endless variety of versions, derived immediately from the description in the "Inferno," but never before, we believe, has Dante been represented as imagining the episode. We find him here seated in profound meditation under an arch of his house; he sits in profile, his head supported by his left hand; and the narrative is greatly assisted by the subdued light, for the time is evening, and the day is fast fading. The stream of the poet's thoughts is indicated by an airy vision—the figures of Paolo and Francesca, still bound together in the immaterial by that love which they conceived for each other on earth. These figures can be no other than Francesca and Paolo; the sentiment expressed in them is as intense as that we conceive of from the verse; and the Dante before us is no other than he to whom the gossips of Florence ascribed the power of visiting and returning from the blazing tombs whenever he thought fit. It is a production of great power and depth, tender exceedingly in execution, and altogether distinguished by the best qualities of Art.

'Reading the Scriptures,' ALEXANDER JOHNSTON.—A domestic scene from Scottish rural life, consisting of the reader,—a young man, and a prominent impersonation of the agroupment,—the aged mother, wasted in sickness, and supported by pillows, whose days are numbered; to these, with a girl and an aged man, is committed the narrative, which extends beyond the mere reading of the Scriptures. The figures are most judiciously lighted, and made out with a generous manipulation.

'Nymph and Cupid,' W. HILTON.—The head of Cupid here is very like the conceptions of Reynolds; the conformation resembles that of 'Puck,' long in the collection of the late Mr. Rogers; of a mould similar to that of the infant Hercules, but there is of course more detail. The picture is well known from the engraving.

'The Gentle Reader,' A. SOLOMON.—This small picture forms a pendant to 'The Stricken Deer,' in the same collection. It is a study of a young lady in white.

'The Market at Antwerp,' Mrs. E. M. WARD.—The characters and their properties are so accurately rendered, that we feel at Antwerp, and nowhere else. The principal figure is a maid-servant, carrying one of those copper pails, of which we see so many in the market-place at Antwerp.

'Edinburgh from Leith Roads,' C. STANFIELD, R.A.—This is always a fine subject in the hands of an artist who can feel its beauties. It contains an endless variety of marine, domestic, and romantic material. The spectator is of course on the Firth of Forth, with a heaving sea passing through the composition transversely. A brig is the nearest and most prominent of the vessels, but there is a great variety of craft, giving life and interest to the scene, which is bounded on the left by Newhaven, and in the centre distances by the lines of the old town with Arthur's Seat, the Castle, and the Calton, the lower parts of the new town lying in airy indistinctness. In colour and tone it is equal to the painter's best works.

'Sheep-washing in the Isle of Skye,' R. ANSDALL.—The scenery here is bold and romantic, the general character of that of the Isle of Skye; the immediate material being rocks and smaller fragments of stone, rank grass, and water. The superintendent, mounted on a pony, watches the progress of the purification with some round estimate of the value of each fleece. The principal action of the scene is confided to a stalwart shepherd, who seizes the struggling animals by the horns, and plunges them one by one into the pool of the mountain streamlet. The sagacious and busy collie looks wistfully on, but he is tied up, with an injunction not to interfere. The sheep are full of life; each looks like a portrait.

'The Picnic in Epping Forest,' W. LINTON, figures by WRIGHT.—The most aged and timeworn trees

seem to have been selected, and brought into this composition, but after all there is nothing of dramatic refinement in the treatment of the subject; it looks like a veritable *fête champêtre*. The figures are costumed as of the time of Charles I.

'Recollections of Venice,' J. C. HOOK, A.R.A.—This is a small and Veronese-like composition, intended literally and morally as allusive to the Venice of poetry. A party of gallant gentlemen have been serenading a company of ladies, who, in admiration of the chivalrous devotion of the former, are rewarding them with flowers. The serenaders are on the water, and the ladies occupy a gallery overhanging the canal, an arrangement extremely picturesque, assisted by the costume of the fifteenth century.

'The Flitting,' ALEXANDER JOHNSTON.—We read here a story of every-day life, made out with a scorching fidelity, in which no moving circumstance is forgotten. She who changes her habitation is a young widow; her weeds, especially eloquent on her in the language of sorrow, afford at once painful reasons for her removal from an abode in which, her tears declare, she has passed the happiest years of her life. She leans on the arm of an attendant; her pastor, mounted on his pony, is present to console her on her departure; and we see the waggon laden with her furniture already on the road. The sentiment of the picture is refined; there is no approach to exaggerated affectation, and, although the subject be commonplace, the treatment is free from the alloy of vulgarity.

'San Giorgio Maggiore and the Salute, with Fishing-craft off Chioggia and the Laguna,' E. W. COOKE, A.R.A.—Rich as is the architecture of Venice, we scarcely acknowledge it without its natural accompaniment—water; and yet the great reason of the wearisome reiteration of these objects is that they can be seen advantageously only from a few points on the water. This view places San Giorgio prominently in the right centre of the composition, showing the edifices on the right and left all very minutely made out. The left is closed by a group of boats, with the Campanile, every object being brought forward with an earnestness which must compel the admission that the version bears with it a singular semblance of truth; it is, indeed, this circumstantiality on which in a great measure the artist relies for the primary interest of his work.

'The Valentine,' F. STONE, A.R.A.—The missive is received by a girl while in the act of dressing, and in the passive excitement which she evinces lies the force of the narrative. The head, with the expression of the features, is a most successful passage of Art, and the colour and brilliancy of the face are very artfully enhanced by the suppressed reds, which foil the flesh hues. It is more natural, less conventional, than other works of its author.

'The Cruel Sister,' T. FAED, R.S.A.—This picture contains figures larger than those which the artist now paints; the subject is also of a class different from that to which he is now devoted; his style and feeling realising into truth more positive that kind of domestic incident in which he has signalled himself. The picture illustrates the story of an ancient ballad, commencing,—

"There were two sisters sat in a bower,
Binnorie! O Binnorie!
There came a knight to be their wooer,
Binnorie! O Binnorie!"

We see, therefore, the three walking abroad over the hills which look down upon their castelated home; and the "situation" at once tells a story of demoniacal jealousy. The knight walks between the sisters, and his *devoirs* are paid to the younger, whose downcast look betokens the gratification she feels, while rage and disappointment contort the features of her sister. The costume is that of the sixteenth century. The picture was painted perhaps about the year 1849.

'Josephine Signing the Articles of her Divorce,' E. M. WARD, R.A.—This large picture was exhibited some years ago in the Royal Academy, and will be remembered as containing elaborate and accurate portraits of the personages who "assisted" at a proceeding which was dignified into a great act of state ceremony—and so it is here represented; and the painter has so fully imbued himself with the spirit of the scene as to have thrown much of the style and feeling of French art into his work. The personages present are, Napoleon, Murat, and

Cambacères, on the left; and near the centre of the picture the Queen of Naples, with her back turned to the spectator. Josephine is on the right; she holds the pen with which she is about to sign, and behind her is Queen Hortense, and near Eugène Beauharnois and d'Angely. The subject is historical, and it is treated with becoming seriousness.

'The Spanish Donna,' D. MACLISE, R.A.—Of late years Mr. MacLise has produced but few studies of single figures. This was painted in 1852,—representing a lady singing to a guitar accompaniment, the music-book lying open on her knee. The features are invested with much of the significant expression which he uses generally with such felicity.

'The Crusader's Wife,' J. R. HERBERT, R.A.—A study of a head, seen in profile, of the size of life, and in the manner of its art very like fresco—a feeling readily accounted for, the artist having been employed of late almost exclusively in the decorations of the Houses of Parliament. The bust of the figure is seen, wearing a plain blue drapery; the lady is gazing forth upon the sea, as if looking for the ship which is to restore her husband to his home. This was painted as recently as 1851.

'Crossing the Stream,' P. F. POOLE, A.R.A.—A large upright picture, in which appears a girl carrying a child across a mountain streamlet. The effort used by the girl as necessary to sustain the weight of the child is effectively described by the *pose* of the figure—a kind of expression not easily seized, from the difficulty which models generally find of resuming exactly a given attitude. The background is open, mountainous, and romantic—of that kind by which this painter always relieves his single figures.

'The Madrigal,' J. C. HORSLEY, A.R.A.—This picture may be remembered by many as having been exhibited in 1852; it was at the late exhibition at Paris; and seeing it here, we think, more advantageously than we have seen it before, it impresses us as the best of its author's works. The conductor is seated, and accompanies the singers, who stand behind him—two of whom, a youth and maiden, are out of time and tune in the interchange of those silent signs of affection, of the passing of which the spectator alone of the party is cognisant. The conductor looks round penetrated with the execrating discord; but the most remarkable figures are the two impersonations, constituting the audience, an old gentleman and lady—portraits of Dr. and Mrs. Calceott. The former is a very striking figure, beating time with a pinch of snuff between his finger and thumb. The figures wear the costume of the 17th century; and the picture, without being detached in character from our own school, has much of the *genre* subjects of the best Dutch masters. Engraved in the *Art-Journal* last month.

'Fruit,' G. LANCE.—A graceful composition of grapes, melon, white and black plums, with an intermingling of fragmentary foliage painted with much taste.

'The Death Blast,' W. P. FRITH, A.R.A., and A. COOPER, R.A.—The "death blast" is wound by a hunter, who having pursued the stag to the death, now announces with his horn the triumphant conclusion of the chase. He is grouped with the dogs, one of which leaps upon him. The figure and the animals are brought forward with firmness and spirit; the intention of the hunter is at once obvious.

'The New Dress,' T. FAED, R.S.A.—One of those scenes in humble life, in the delineation of which this artist has signalled himself. The composition in its spirit points to Burns' poem, "The Cottar's Saturday Night." The mother and father are seated by the ingle nook, and while the new dress is being shown, the "neighbour lad" enters, in the act of doffing his bonnet; the relation between these two figures is at once established in the mind of the spectator. The lighting of the figures is as successful as if all had been agrouped at once, and so studied; each is sound and palpable, and in this quality the principals do not unduly supersede the secondaries, but all keep their places, retaining that degree of importance properly due to them. We cannot praise too highly the solidity of this painter's manner, it is original and natural, and otherwise enhanced by the highest qualities of Art.

'The Benediction,' LIVERSEEGE.—This picture, which is well known by the engraving, must have

been painted about 1831. A figure veiled, and in bridal attire, kneels at the altar, and receives, in a *pose* of much grace, "the benediction," which is pronounced by a figure characterised by a feeling of earnest devotion. We have always considered this an impressive production, and though extremely simple, and by no means approaching the finish of the works of the present day, yet, as to sentiment, far in advance of the general feeling of its period.

'Pericles, Prince of Tyre,' P. F. POOLE, A.R.A.—This picture, it may be remembered, was exhibited a few years ago, and may be considered as among Mr. Poole's most important works, having been most carefully painted, and carried out with equally cautious elaboration. There is in all the works of this painter a certain mysticism which separates his larger compositions from the realities of every-day life. If he aims at creation, between life-like conceptions and visionary illusion, he succeeds to perfection. In looking for an instant at this picture, and others which he has produced in the like vein, the spectator may believe that he has momentarily looked into a magic mirror. With a certain class of subjects this is the desideratum which but few artists ever acquire, but in a description of substantial life we can scarcely believe that the painter is in earnest.

'Ferdinand and Miranda Playing Chess in the Cave,' P. F. POOLE, A.R.A.—Very striking in its effect of *chiar-oscuro* and force of colour. Ferdinand is about to make a move—both being absorbed in the game; and, in order to assist the "situation," a pair of doves are seen on the floor of the cave. Ferdinand wears red, in support of which the composition is otherwise powerful in colour.

'Norah Creinah,' W. P. FRITH, R.A.—One of the minor studies of this artist, so many of which as single figures he has painted with charming feeling. The features are presented full to the spectator, and the lady wears heather in her hair; altogether an attractive performance.

'The Young Fishermen,' W. COLLINS.—This large and earnest picture must rank among the best productions of its author. The general feeling of the landscape composition is beyond the title given to the picture, being deep, serious, and suggestive. The scene is limited to a foreground by a dense and dark screen of trees, before which is the pool wherein the anglers exercise their craft. One boy is fishing, and another holds up the bottle containing the tithe-bats already captured.

'The Dogana, San Giorgio Maggiore, &c., Venice,' W. MÜLLER.—We have seen several Venetian subjects by this painter remarkable for the generous breadth of their treatment, and, allowing a little for aggrandisement, representing as truly the real feeling of Venetian material as anything that has ever been done. The picture is large, but, for the subject, by no means too much so. There are on the right boats with a variety of auxiliary properties, and the church is brought into the composition in the most opposite site it could occupy, and any angularity or stiffness which might occur in the architecture is very skilfully foiled by other objects. In many of Müller's essays in English scenery there is a playfulness which disposes the spectator, to whom his versatility is unknown, to believe him to have been incapable of exalted description.

'The Flock,' W. LINNELL.—This is one of those compositions put together very successfully from studies of small passages of landscape accessory found in our lanes and commons, of which the intelligence uneducated in Art knows not the value. The flock gives life to the picture, but the well-broken foreground and the dispositions of the distances, although by no means beyond the most commonplace, arrest the attention by their colour and masterly distribution. In the materials of his most aspiring, as for those of his most simple works, this painter seldom moves far from his own home.

'Interior of the Church of St. Jacques, at Antwerp,' D. ROBERTS, R.A.—This is a large upright picture, the figures of which take us back to the Spanish dominion of the Netherlands. The place is thronged with crowds of devotees, whence we may infer the occasion to be some saint's-day, when the reliques are exposed to the awe-stricken multitude. The carved sarcophagi come well out in opposition to the airy tones beyond, and, with his usual success, Mr. Roberts gives imposing height and space to the building.

'Lake Lugano,' C. STANFIELD, R.A.—This is a large and rich picture, richly imbued with that tranquil brilliancy which Stanfield gives to his Italian lake scenery. The architecture of the composition, which has a very oriental character, is situated on a little island connected by a bridge with the mainland, which rises into a mountain-chain that closes the view. The picture is full of colour, but it is not felt to be redundant from its able distribution, not only in the nearest section of the work, but also in the remoter parts, which are more or less subdued by atmosphere.

'The Capture of Carrara,' F. R. PICKERSGILL, A.R.A.—This very spirited composition may be remembered by many lovers of Art as having been exhibited in 1852. It is full of action—Carrara being captured just as about to escape in a boat, accompanied by his wife. On the left of the composition a fierce struggle is going on between Carrara and his captors, who drag him from the boat, and on the right the wife struggles to rejoin her husband, but is held in the boat by her friends.

'The Marriage Feast,' J. C. HOOK, A.R.A.—The subject of the picture which was exhibited in 1852 was thus described in the catalogue:—"Signor Torello goes to fight the Turks, and is made prisoner: his wife, supposing him to be dead, is persuaded by her family to marry again. Torello returns, and appears in disguise at the marriage feast, when he makes himself known to his wife by dropping his ring into a pledge cup." Without such a description, it would be perhaps difficult to determine the point of the story. It is clearly a ceremonial festival: we see the astonishment of the wife-bridal, and the significant look of Torello, but a further relation between these figures could not be established from the narrative on the canvas. It is, however, very elaborately executed, and possesses otherwise high artistic merit.

'Queen Elizabeth reproves her Courtiers for their Flattery on her rising from an Illness,' A. EGG, A.R.A.—This is the sketch made to assist the execution of the larger picture of this subject, which it resembles very closely in every particular.

'Red Deer,' SIR E. LANDSEER, R.A.—This is a large picture, presenting a family group of three of these animals—a stag, a hind, and a fawn. The expression and attitude of the older animals are that of alarm from the approach of some enemy, human or canine. The fixed attention and startled *pose*, especially of the vigilant stag, is a most happy passage of nature.

'Juliet and her Nurse,' J. C. HOOK, A.R.A.—The subject is from the fifth scene of the first act:—

Juliet. What's he that follows there,
That would not dance?
Nurse. I know not, &c.

The guests are departing, and Juliet and her nurse stand as primary figures in the composition; the former appealing most earnestly to the nurse in reference to Romeo. The picture has much excellence in execution and disposition; but not the least of its merits is the distinctness with which the subject is at once determinable.

'The Avenue,' F. R. LEE, R.A.—One of the most successful essays that Mr. Lee ever exhibited. We remember the work as it appeared in the British Institution, now some years since; and so popular was the picture, that Mr. Lee painted in succession other similar versions. It is an avenue of forest trees retiring in perspective, the road here and there lighted by flakes of sunshine with admirable truth.

'James the Second receiving the News of the Landing of William,' E. M. WARD, R.A.—This is a replica of the large picture—so we call it, for its condition is much superior to that of a preparatory sketch, having been perhaps touched from the larger work. It is a scene of general consternation and defection—akin to that occasion on which James lamented that even his own children had forsaken him. He has just read the letter which conveys to him the fatal intelligence that seems to paralyse both mind and body. The queen is present with their youngest child, and a conspicuous figure near the king impersonates John, the first Duke of Marlborough, as page in waiting.

Thus, to the *habitués* of the exhibitions, the above enumeration will call to memory many valuable pictures, with which, speaking for ourselves, we have experienced a high degree of gratification in renewing our acquaintance.

BRITISH ARTISTS:
THEIR STYLE AND CHARACTER,
WITH ENGRAVED ILLUSTRATIONS.

No. XXVI.—GEORGE CATTERMOLE.

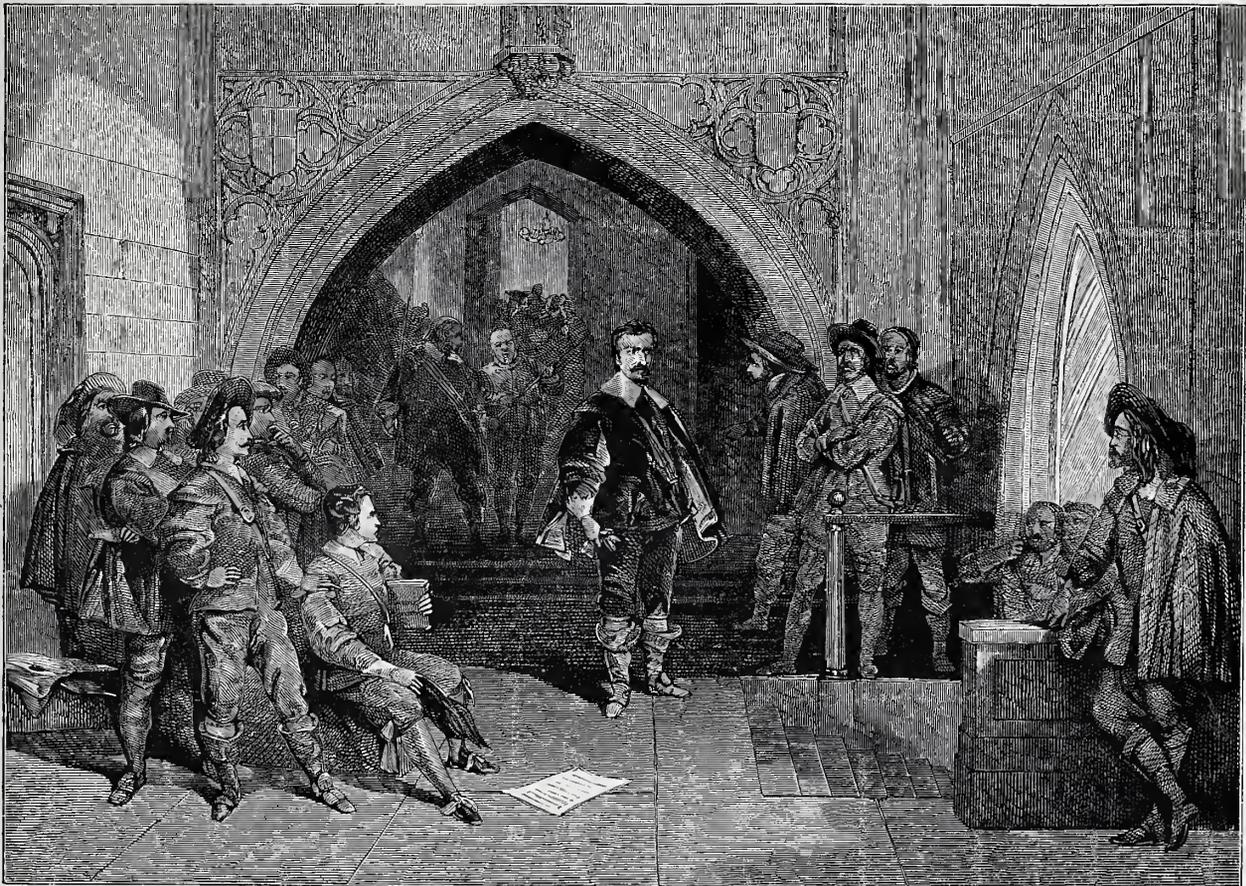

FEW of the constant visitors to the gallery of the Society of Water-Colour Painters, during the last quarter of a century, but must have latterly marked the absence from its walls of the works of one particular member. His contributions were never very numerous,—rarely more than five or six each year,—yet there was in them such originality of subject and treatment, such an exhibition of antiquarian and historical knowledge, of fancy and imagination expressed with the feeling of a poet, and the power, in drawing and colour, of a true artist, that his pictures were always among the first which the lover of genuine Art sought for, and before which he lingered longest and last. Who does not regret that George Cattermole has withdrawn from the gallery in Pall Mall, and from every other Art-exhibition? “we could have better spared a better man,”—if such an one exists.

A walk round a gallery hung entirely with pictures by this artist would carry us back centuries of our history; for he lives in the mediæval ages. Under the magic influence of his pencil, the mouldering abbey rises up again in all its glory, and is peopled with its former tenants, from the courtly, luxurious abbot, to the scarcely less pampered servitor; for there were in those “religious” houses stores of good things for all ranks and degrees of men—stores for their own gratification, and stores for those requiring the charitable aid of the good fathers of the convent. Side by side, perhaps, of some such subject as “Pilgrims at the Gate of a Monastery,” we find a troop of armed men at the portal of a castle, demanding, but not begging for admission; or a “Border Foray,” or a “Skirmish of Cavaliers and Roundheads.” Passing by these and similar incidents drawn from monastic life and the records of history, we enter, with him, into the banquetting hall of some old mansion, rich in the decorations of

Tudor architecture, or of some castle the foundations of which were laid by the immediate descendants of the men who came over with the Norman, and whose names are to be found in the roll of Battle Abbey; and in this banquetting-hall, its lord and master is feasting his guests and retainers, or dispensing his bounties with no niggard hand to his dependents. In a word, while the mind of the painter is ever busy amid the past, it embraces a wide range of what the past was, in its deeds of violence, and in its acts of chivalry and beneficence.

Though it can scarcely be a question whether we—that is, the public—desire to see what is usually called “the good old times” revived in reality, it is quite certain there is no class of pictures which more powerfully arrest the attention than works that recall them. Who would care to hang on his wall a representation of a dinner at the Freemasons’ Tavern or the Trafalgar, or of an aristocratic gathering at Almaek’s, or of the interior of a church in Belgravia during service? The eye and the mind alike shrink from such pictorial inanities; with all our love of the advantages among which we live, and with all our appreciation of the comforts, social and political, that surround us on every side, we revert with no little pride and pleasure to what our ancestors were, and to what they did; and feel grateful to the artist who, like Cattermole, can summon up the past from the sleep of death, can rebuild castle, abbey, and hall, and cause them to be again inhabited by the men of an iron age, but in whose hearts dwelt love, and honour, and every noble feeling—associated, however, as mankind always must be, with others into whose bosoms the slightest ray of sunshine from the throne of purity and goodness could never penetrate.

George Cattermole was born at the village of Dickleburgh, near Diss, in Norfolk, in August, 1800. At an early age his attention was directed to the delineation and study of the architectural antiquities which particularly abound in his native county. At the age of sixteen his name appeared as one of the illustrators of Britton’s “English Cathedrals.” In the execution of such works the young artist laid the foundation of that architectural and antiquarian knowledge he has subsequently brought to bear on his ideal works; and while thus engaged, his mind, doubtless, received so strong an impression of the picturesque character of the feudal times, as to make it for the future the leading idea of his art; and certainly he could not have decided upon one more varied, more attractive, and in many respects, more original. As Scott, with his pen of romance, broke up what may be called the fallow-ground, or the waste lands, of literature, so Cattermole, with his pencil, entered upon a new field of art, and brought to light treasures of pictorial beauty of which men generally had little knowledge, and held in yet lower estimation. Scott and

THE ARREST OF STRAFFORD.

[J. and G. P. Nicholls.

Cattermole may very properly be associated together as resuscitators of a buried world, though the artist only followed the path marked out by the poet and romancer.

Yet if Scott had not pioneered the way into the shadowy land of the past, there is little doubt but that Cattermole, from his early impulses and education, would have turned his thoughts thitherward. At all events, he travelled into Scotland, in 1830, for the purpose of making sketches of the localities introduced into the writings of Scott: many of these have been published in various

forms, and a large number are widely known as illustrations of the “Waverley Novels.” But the book with which Cattermole’s name is most closely associated, as an illustrator, is the “Historical Annual,” written by his brother, the Rev. R. Cattermole; it was published in two volumes, and is devoted to the history of the great civil war.* The engravings in these volumes, executed

* Mr. H. G. Bohn has purchased the copyright of this work, and is now publishing it, in one volume, at a greatly reduced price: we do not know a more interesting illustrated book than this to be had for one guinea.

under the superintendence of the late Charles Heath, manifest the power and versatility of the artist's genius in a remarkable manner; so much so that one scarcely knows which most claims our admiration—the picturesque beauty of his architecture, the drawing and grouping of the figures, or the antiquarian knowledge shown in the costumes and accessories. As examples of these three qualities respectively, we would instance, though only chosen at random, as it were, the following plates in the first volume: "Republican Preaching," in the interior of some richly decorated church or cathedral; "Goring Carousing," and "Selling Church Plunder." It has always appeared extraordinary to us that an artist, whose eye and hand must have been for so long a period occupied with the mechanical operations of architectural drawing, could give to his figures so much of truth, freedom, and vitality—so much of character and of nature. This is a rare combination of artistic excellence. To look at some of Cattermole's drawings, one would certainly say he was an architectural draughtsman, who treated his subjects poetically and picturesquely, yet in accordance with the strict rules of the science; examine other pictures by him, and you would call him a painter of history only: there are others again, such as the "Skirmish on the Bridge," and more especially the "Sortie from Latham House," that would almost restrict him to the title of a landscape-painter. But we will endeavour to recall to mind a few of the works which we remember to have

seen in the gallery of the Water-Colour Society, of which Cattermole was a member for more than twenty years.

We recollect two of his finest compositions, exhibited in 1839: the one, "Sir Walter Raleigh witnessing the Execution of the Earl of Essex in the Tower," a large drawing—the subject set forth with dramatic power, and all its details made out with the utmost skill and care. The other was entitled "Wanderers Entertained;" but the subject is now widely known by that of "OLD ENGLISH HOSPITALITY," the name given to Mr. Egan's engraving from the picture, and published by Moon. We have introduced it among our illustrations, being, perhaps, one of the best works we could select as showing the "style and character" of Cattermole's productions. It is quite impossible to contemplate such a scene—which, though a painter's "fancy," records a fact—and not be sensible that the progress of civilisation and the increase of wealth, have not been accompanied by such an exercise of household charity as was a characteristic feature of the social condition of the middle ages. The "Castle Chapel," the most important work, in size and composition, exhibited in 1840, shows a number of figures—many of whom are armed for battle—in the act of devotion. There is a feeling of solemnity and awe in this work which, in spite of the warlike appearance of the assembled worshippers, knight, squire, and man-at-arms, invests it almost with the dignity of a sacred subject.

Engraven by]

THE HUNTING PARTY.

[J. and G. P. Nicholls.

Of several drawings painted in 1843, some have been engraved, as "Hamilton of Bothwellhaugh preparing to shoot the Regent Murray, in the Streets of Lidlithgow, in 1570;" the figure, standing at an open mullioned window, with a pistol in his hand, shows great determination in expression and attitude. We think we saw the picture, with several others by Cattermole, in the *Palais des Beaux Arts*, Paris, in 1855. The "Chapter House," and "After the Second Battle of Newbury," two other works of the year 1843, may be classed among his best, the latter especially; it is a night scene, representing the royalist troops encamped before Downington Castle; the near part of the picture is thronged with figures and all the material of the warfare of the times; from the windows of the castle issues a strong glare of light, most skillfully managed.

"Benvenuto Cellini defending the Castle of St. Angelo," and the "Visit to the Monastery," both exhibited, with several others, in 1845, are two drawings of very opposite character, but each admirable in conception and general treatment; the latter shows a party of cavaliers and ladies, mounted on their steeds and palfreys, received at the gate of the monastery by its inmates, headed by their principal; some noble trees, whose ages appear antecedent to the building, add greatly to the picturesque quality of the composition. But, perhaps, the most extraordinary display of Cattermole's powers in landscape is to be seen in a picture exhibited in 1846, and entitled "The Unwelcome re-

turned;" it is a magnificent forest scene, such as no other country than our own could show ere the necessities of the population had uprooted the giant trees of the woods, and converted the habitation of the wild deer into a fruitful field. "The huge boles of the oaks seem to be gnarled with the wrinkles of five hundred years, and hold the ground with a tenacity that appears to defy any human power to disengage;" their arms, each one equal in magnitude to the trunk of a tree of modern growth, twist and stretch out in every direction, forming a low and shadowy roofing to an avenue along which a mailed knight rides slowly and thoughtfully: the idea of the subject is taken from Scott's description, in "Ivanhoe," of the return of Richard *Cœur de Lion*. Our estimation of this picture, in our notice of the Water-Colour Exhibition, was summed up in these few brief words:—"A work of such power as not to be equalled by the utmost effort of any living artist." We know not who is the fortunate possessor of this picture, but the owner ought to regard it with something like feelings of veneration.

This was the last work of a size and character to demand especial reference, which Cattermole has exhibited; he contributed several comparatively small drawings in 1849 and 1850 to the society of which he was so valuable a member, and then withdrew his name from the roll of the institution, to the infinite regret of all who had been accustomed to see the walls of the gallery annually adorned with his works. We know not the cause of his secession, but

it probably arose from a desire to devote his time to oil-painting, in which he has been engaged for the last five or six years; during this period he has executed several pictures similar in character to his water-colour drawings, and of greater magnitude. It has never been our good fortune to see any of these oil-paintings, but we can readily believe—recollecting, too, how freely he used body-colour in his drawings—that he would attain even greater power with his new medium than with that he had previously employed, though this seems to be scarcely possible.

Mr. Cattermole has somewhat recently been made, by special diploma, a member of the Royal Academy of Amsterdam, and also of the Belgian Society of Water-Colour Painters—appointments which do honour to his genius, while they reflect the highest credit on foreign liberality of feeling. He was also awarded a first-class medal by the international jury of the Paris Universal Exhibition of 1855, to which he contributed several drawings. Of these the French critics spoke in the strongest terms of commendation. One, M. Gantier, in his *Beaux Arts de l'Europe*, says, "The water-colour drawings of Mr. Cattermole have a brilliant and harmonious scale of colour, which shows an intelligent study of Paul Veronese and the Venetian masters; the subjects, usually selected from history or the legends of the middle ages, have in them nothing of that Gothic formality nor minute trivialities which we are too apt to believe

it is essential to adopt when treating of analogous scenes. He has continued, in water-colours, the romantic revolution commenced by Scheffer, Deveria, Peterlet, Delacroix, L. Boulanger, and, above all, by Bonington, the most natural colourist of the modern school, many of whose qualities of painting he has learned how to appropriate without servile imitation." Complimentary as these remarks are to the artist, we do not think the writer has formed a correct judgment upon his works; Cattermole is one of the last painters whom we should suspect of borrowing from another, or even looking at him with any idea of imitation. He is entirely original in all that he does, and, as it seems to us, in his method of working; his colouring, especially in some of his later works, does, indeed, remind us now and then of the old Venetians, but we regard the similarity as an accident, so to speak, on the part of our gifted countryman, and not the result of intention. His only master—or rather mistress—is, in our opinion, Nature, which, however, he studies in a way peculiar to himself, and which he sees with the eyes of one who lived centuries ago; his whole world, including things animate and inanimate, has nothing in common with the present—it is not that wherein we dwell. A writer in the *Bulletin of the American Art-Union* of June, 1850, which we have before us, humorously says, "Cattermole undoubtedly was some stalwart knight or wandering minstrel of the fourteenth century; he died, but our railroad age has

OLD ENGLISH HOSPITALITY.

[J. and G. P. Nicholls.

been suffered to reproduce him, in order that we might pictorially learn from him how noble errands, gentle damozels, grey seneschals, and reverend friars behaved. I never saw a drawing by him that was not a *poem*—sometimes, indeed, very rugged border minstrelsy, but as often truly epic and elaborate in theme, if not in execution. Here he is very dashing and loose" [we cannot agree with this remark: his pencilling is bold, but extremely careful]: "he seems to paint by inspiration; there is no evidence of effort; the result is *always* delicious colour, generally a true grasp of his subject, which makes it a reality."

In the majority of the pictures which illustrate the age of chivalry and romance, it appears to have been Cattermole's aim to exhibit the noblest characteristics of the period—the heroism of the "belted knight," the devotion and willing obedience of the vassal, the open-hearted liberality of the wealthy, the gratitude of the poor and destitute. In those days the high-born and the lowly were less isolated from each other than now—there was a mutual dependence felt and acknowledged by all, and yet exercised independently, without undue subserviency on the one side, or supercilious pride on the other; it is thus that the artist writes his history of the past. In his illustrations of monastic life—full as it is of the picturesque—he has undoubtedly succeeded in investing them with a deep religious feeling, as if he were thoroughly convinced of the fact that, notwithstanding all the faults and abuses of monastic institutions, they were,

in our own country especially, the nurseries of religion and learning, and not infrequently of liberty also, at a time when almost every art and science, save that of war, was in the keeping of "hooded monk and sandalled friar" only.

For the last six or seven years the attention of this artist has been turned almost exclusively to sacred subjects, chiefly from the New Testament, and we have heard from those who have had opportunities of seeing them that these constitute his best productions. Will he allow us to ask, on the part of the public, that it too may be afforded similar opportunities? All have regretted his withdrawal from the Water-Colour Society, but why will he not exhibit his pictures in galleries that are open to receive them? why does he permit them to pass immediately from his studio into the possession of the purchaser, who is always at hand to carry off every work he finishes? We must enter our urgent protest against this practice, and hope Mr. Cattermole will pardon us for telling him he has no right "to hide his candle under a bushel." Providence endows with especial gifts for especial purposes—that they may be used for the good or the gratification of others; and the "others" include *all* who might derive the benefits these gifts are capable of affording, if they come within their grasp, and not the *few* only who are able to pay liberally for what they receive. Every Art-lover deprecates the absence of this original painter from the exhibitions of the season, and desires to see him again, as in "the days of yore."

ILLUSTRATIONS OF THE BOOK OF JOB.*

ALTHOUGH a notice of this very beautiful volume appeared in our columns two or three months ago, we are induced to refer to it once more, principally because we have now an opportunity of showing our readers some examples of the wood engravings, from Mr. Gilbert's designs, which ornament

the book. The characters and descriptions that form the subject of this passage of sacred writing have led the artist into a field new to him, and which, therefore, must have entailed upon him a considerable amount of study, especially in such matters as pertain to the natural history of

Eastern countries; and he has here shown as much skill in the delineation of botanical objects, of animals and reptiles, and of landscape, as he

* THE BOOK OF JOB, illustrated with Fifty Engravings, from Drawings by John Gilbert; and with Explanatory Notes and Poetical Parallels. Published by Nisbet & Co., London.

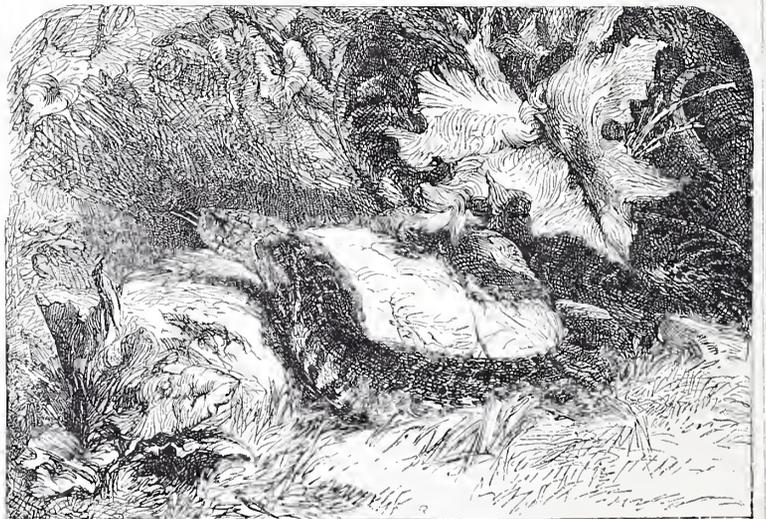

has in many previous illustrated works in his figure compositions. Look, for instance, at the second engraving we have introduced, representing the "Behemoth," and at the last, illustrative of the "Cobra," both of them drawn with as much truth as if intended only as examples of natural history: there are many others in the volume of equal beauty and power. The figure subjects we have selected are

respectively entitled "The Ambush," "Longing for Sunset"—a little gem in spirit and execution, and "Miserable Comforters;" everywhere the artist appears to have thoroughly felt the inspiration of the various passages on which he has employed his pencil, and to have expressed his feelings in the most poetical language of Art. We must point out as a few of the most noticeable examples, "The Mourner,"

"Harvest Home," "Thou shalt come to thy grave in a full age," &c., where the dead body of an old man is carried on a bier to its last resting-place, through a field of ripe wheat; "Like a Flower," a magnificent group of wild plants, beside which lies a sickle; "The Storm," "I was Eyes to the Blind," "Conscience," &c. The variety of subject which "The Book of Job" offers to the artist has brought Mr. Gil-

bert out in unusual strength, combined with originality; and while we observe a certain harmony of conception and feeling throughout the entire series of designs, there is far less sameness than might be expected from the thoughts of one mind, and the working of one hand—which, moreover, have so long been engaged in labours of a similar nature. A more welcome volume than this has not been before us for many a long day; and the noble poem could scarcely have found a better illustrator.

TALK OF
PICTURES AND THE PAINTERS.

BY AN OLD TRAVELLER.

CHAPTER VI.

Giorgio Barbarelli—Harmony of appearance and character—Name of "Giorgione"—Distinctive characteristics—Loss sustained by Art in his early death—Morto da Feltre—Frescoes of Giorgione—Rarity of his authentic Works—Of some of the few in England—Fitzwilliam Museum, Oxford—Royal Institution of Liverpool—The Edinburgh Institute—Drawings at Oxford and Chatsworth—Thirlstaine House—Castle Howard—Bowood—Portrait of Giorgione—Works in the Louvre—The Dresden Gallery—Venice—*Amende honorable* of Von der Hagen—Palazzo Manfrini—Barberigo Pictures now at St. Petersburg—Studies of Heads—The Muses—Venetian Academy—The Stilling of the Tempest—Sebastiano del Piombo—See him in Rome and Venice—Works in our own possession—London—Edinburgh—Hamilton Palace—Pope Clement VII.—Mr. Harford, of Blaise Castle—Marquis of Lansdowne—Works in the Louvre and at Berlin.

THE significant augmentatives of Italian speech are not often used in compliment—they are more frequently the expression of disapproval; even the excellent Masaccio received that well-known extension of his own name, "Maso,"* rather as a good-humoured reproach for his neglect of externals, and for the effect of that negligence on his personal appearance, than as an acknowledgment of his greatness, which all were yet ready to admit. But with Giorgione the case was different: if the names of Giorgio Barbarelli, derived from his family and sponsors, have been all but forgotten in the more familiar "Giorgione," that last recalls no mere eccentricity, no peculiarity of habit—the appellation was assigned to him by common consent, because it well expressed the greatness and distinction attached to his whole being, mental and physical. The stateliness of his lofty stature, and the grandeur of his person, no less than the deep seriousness of his mind and the warmth of his heart—the latter giving unusual beauty to features not otherwise remarkable—these all rise to the pleased and grateful memory at sound of that name, Giorgione: there is, accordingly, but one feeling and one opinion as to the great and distinctive characteristics of this beloved master; "admirable," "noble," "sublime;" these epithets are applied, and justly, to other painters by the coldest of our critics, nor are they refused to Giorgione—but to him there belongs, moreover, a yet dearer distinction; one that all true lovers of Art have agreed to accord him, and that without a dissentient voice. Loving—as all we know of him concurs to prove—much, also has he ever been loved; you have but to open the first good authority, contemporary or modern, that may lie beneath your hand, to be persuaded of the fact. Nor will any be surprised at this who reflect on the character of his works: remembering the elevation of thought that attracts, the depth of feeling that binds us, to this earnest master, all will perceive that he who loves Giorgione can well render his reasons for that love.

Endowed with equal, nay—and that in the grandest essentials—with superior powers of mind and finer qualities of heart than had been assigned to his justly renowned compatriot and disciple, Titian, what might Giorgione not have done had length of days been added to the rich store of his gifts? Is it too much to believe that the downward tendency, of which, even in his day, certain symptoms had become apparent, might have been arrested in its course had Giorgione (the ordeal of his fiery youth passed through) been permitted to settle into the wise and genial worker that he must have proved in those fairest fields of Art towards which his best nature ever led him? We think not; the first place among painters would assuredly have been the conquest of his maturer age, had that maturity been permitted. But little more than a third of Titian's appointed period was that accorded to Giorgione; yet what evidence has he not left us of the much that was to come?

"He looked on life and nature with the gaze and the feeling of poet and painter in one," is the ob-

servation of one German writer—a simple truth; nor is the poet ever to be divided from the painter, if either would speak effectually to human hearts. "The figures of Giorgione may be said to represent an exalted race of beings, capable of the noblest and grandest efforts," remarks another; and he, too, is right: the consequence was one that could not fail to follow from that elevation of nature distinctive of Giorgione. Enumerating the peculiar characteristics of various masters, and comparing the heads painted by certain of the greatest among Italian artists, one of our own writers, speaking to the same effect with those of Germany cited above, remarks that in the heads of Giorgione many of the best qualities lauded in all others are combined; and says in conclusion, "then what power of thought, what intensity of feeling, will be found in all that Giorgione has left us"—or words to that effect, for the writer quotes from memory, and may not be strictly accurate as to phrase, although certainly true to the thought. Such instances might easily be multiplied, but let those given suffice.

The too early death of Giorgione is attributed by some writers to plague, but there is no record of any plague prevailing in Venice during the year 1511, which was that of his decease; and Ridolfi, who had ample means for ascertaining the truth, assures us that he died from a different cause, which he describes as follows:—The Florentine, Pietro Luzzo, called also Zorotto and Morto da Feltre, having repaired to Venice in company with Andrea di Cosimo, was there entertained with frank kindness by Giorgione, who did him numberless good offices, and finally admitted the stranger to his intimacy and confidence. But Pietro repaid those benefits with the basest ingratitude; he found means to estrange from Giorgione the affection of a beautiful Venetian, to whom he was but too passionately attached; the false friend and faithless betrothed are even said to have fled together, and the double wound thus inflicted proved fatal,—the ever-lamented life of Giorgione was cut short, not by disease, but by grief.

Lanzi, alluding to the portrait of Morto da Feltre, pointing to a death's head, now in the Uffizii, and said to be painted by his own hand, has the following:—"Io penso che sia effigie di un uomo inognito, il quale si fece figurare con un dito rivolto verso un teschio di morto, per risvegliare in sé, qualora il mirasse, il salubre pensiero della morte; or nel nostro quadro, il teschio capricciosamente fu preso per simbolo del nome Morto, e si è dato per ritratto e opera del Feltrese."* And the learned Abate is doubtless right; he remarks, further, that the portrait of Morto, as given by Vasari, is altogether different from that of the Uffizii,—a fact of which any one may convince himself who will compare the latter with that in the second or subsequent editions of the *Vite*.†

Few traces of the frescoes executed by Giorgione now remain. The "siroccos and salt winds" might have spared these priceless bequests of a great spirit, to charm centuries yet more remote than is our own from the period of the master; but what the elements have respected, man destroys; change and "restoration" of the palaces once proud to bear these trophies, have all but effaced them; some few poor remnants do indeed remain, but we cannot hope that even these will long escape: this is the more to be regretted, because, although but fragments, they are of striking beauty, and bear ample testimony to the value of all we have lost.‡

The genuine works of Giorgione being confessedly rare, and many bearing his name which have no claim to the honour, England may hold herself fortunate in the possession of several pictures, the origin of which is undoubted. In collections open to the English public they do not abound; the authenticity of the "Peter Martyr," bearing the name of Giorgione, in our National Gallery, has been questioned: the picture at Hampton Court, although bearing the name, and admitted to be a fair production of some good imitator of Giorgione, is not believed to be by his hand. The Fitzwilliam

Museum, at Cambridge, is more fortunate: the "Adoration of the Shepherds," now there and formerly in the Orleans collection, is without doubt an authentic work of the master—"Edel in den Charakteren, zumal das Kind sehr schön, glühend und gesättigt in der Färbung, dies—aus der Gallerie Orleans stammende Bilde"—as above said—"ist in allen Theilen dem Gemälde mit Jakob und Rachel in der Dresdner Gallerie nah verwandt."* The Royal Institution of Liverpool is in possession of a portrait, said to be that of Guidobaldo, Duke of Montefeltre. This work, not known to the present writer, is affirmed by competent authority, to exhibit the elevated conception, and deep golden tone of colour, proper to Giorgione.

There is a small portrait of a man by the same master in the Edinburgh Institution; we name it here chiefly because the work is of the few accessible to public inspection, the colouring, as a whole, not being such as to attract the lover of the master from a distance, as does that of every other work of Giorgione with which we are acquainted; but there is no question of its being by his hand. At Oxford there is a valuable drawing, more to be prized in our circumstances, if of undoubted authenticity, than even the finished work: this is a landscape with figures. An exquisite and certainly genuine example of Giorgione's drawings will be found at Chatsworth—"Christ and the Woman of Samaria;" there are, moreover, said to be two small ones at Lowther Castle—the writer has not seen them, but hopes to verify the statement, if fact, at no distant period. There are others in the collections of our nobles and gentry: the horseman at Stafford House, the knight in armour in the collection of the late Mr. Rogers, two pictures in the Ashburton collection, the portrait of a man at Devonshire House, and the daughter of Herodias, in the possession of Mr. Holford, though in some cases injured by restoration, are all within reach of the English lover of Art. At Thirlstaine House, the seat of Lord Northwick, near Cheltenham, is a work by Giorgione—the "Woman taken in Adultery," some of the best qualities of the noble master authenticate this picture, which is of great value; the expression given to the woman is most touching, her attitude, no less than the face, exhibit the deep humility proper to her offending condition. There is a precious fragment at Castle Howard; but in no English gallery have we a picture more profoundly interesting to those who love the master, than is the "Shepherd," in Lord Lansdowne's collection at Bowood—that shepherd presenting the portrait of Giorgione himself, as all who remember the profound depth of feeling in "the dark glowing eyes" of that in the gallery of Munich, will at once perceive.

If Giorgione was not handsome, as authorities aver, he was much better than merely handsome: in his face is that best beauty, earnest thought, and true warm feeling. Returning ever and again, as one does to the Munich portrait, the shadow of that cloud thrown over his devoted life by the traitorous Feltrese, seems even now impending; you indignantly refuse to believe that the forgotten vows of a worthless woman can have wrecked that noble being; but when the envenomed wounds of friendship spurned, and confidence betrayed, are added to the sum of wrong, you comprehend how that heart, so tender, should burst with the weight of its anguish, and you seek relief from the intolerable pain of the recollection, in vengeful rage against the wretch who could thus reward his benefactor. Ever commend me to a good fit of anger if the eyes are blinded by tears for a grief that cannot find remedy; most effectual is the heat of it for absorbing those drops which you will not suffer to fall, because the cold and uncaring are around you, and never does one want that relief when the thought of Morto is presented. Not *his*, the beautiful head of the Uffizii—do not believe he looked like that—no! not at any moment of his evil life. The hard, stony glance, the coarse mocking expression of mouth, of the Aretine portrait, each aiding the other to mar a face made up of features else not unhandsome, these may indeed belong to Morto, and so it is

* "The son of the notary, Ser Giovanni di Mone (Simone) Guidi, of Castello San Giovanni, in Val d'Arno: he is inscribed in the old book of the Guild as *Maso di Ser Giovanni di Castello Sangiovanni*, mcccxxiv." Gaye—"Carteggio inedito d'artisti dei Secoli, xiv. xv. xvi." 1, 115; see note to Mrs. Foster's Translation of Vasari, vol. i. p. 402.

† See the portrait of Morto, in the edition of Florence, 1822, vol. iii. p. 449.

‡ See Zanetti—"Varie pitture a fresco de' principali Maestri Veneziani," where some relics of these lost treasures are preserved.

* "Noble in the characters, the child especially very beautiful; the colouring full and glowing. This picture resembles in all respects the meeting of Jacob and Rachel in the Dresden Gallery."—See also Dr. Waagen's "Treasures of Art in Great Britain," vol. iii. p. 446.

that Vasari gives them. For the woman, let her pass—a creature fit only to waken the contempt of a moment and be forgotten: grief and shame, that such as she could give pain to the heart of Giorgione! But I hold firmly to my belief—from wounded friendship, not slighted love, came the arrow that found the joint of his armour: one grudges to him who so treacherously sent it, the death, but little merited, which he found, say his compatriots, soon after, on the field of battle. Yet is there one thought that might help us to part in charity even with *Morto da Feltrè*. After betraying his friend, he took service with the Venetian republic, though Florentine by birth, and with no interest in its quarrel: did he hope thereby to expiate the crime that blackens his name? or was it that his life had been rendered unendurable by the recollection of that wrong? Let us believe in his remorse, and we shall not so ferociously grudge him his grave.

To the works of Giorgione preserved in the Louvre, we can do little more than refer the reader; they are happily well within his reach, and we must content ourselves with reminding him that he will there find examples certainly genuine. One of these may safely be accounted among the most precious bequests of the lamented master—not for its beauty only, although that is extraordinary, but because it is one of those most characteristic of himself, and gives evidence of qualities so high as to make the beholder more than ever regret the early bereavement suffered by Art in his person. This work alone would largely repay the traveller for his journey to Paris; yea, even in *our* suffering days, when those hard-hearted, and well-named “iron ways,” have reduced all travelling from one of the best of pleasures to a sore and heavy penance. But there is besides a Holy Family in the Louvre, with St. Catherine, St. Sebastian, and the figure of the donor, a work of the master's early time: there, too, as many will remember, is that picture, said to be a “portrait of Gaston de Foix;” and which owes its origin, as did another described by Vasari, to the well-known discussion between Giorgione and certain sculptors, as to the alleged inability of the Painter to present his subject in more than one aspect at one time, whereas the Sculptor can exhibit the same form in various points of view, if the spectator merely walk round it. “This,” says Vasari, “was at the time when Andrea Verocchio was working on his horse of bronze; and Giorgione affirmed that the painter could exhibit all the different aspects of the figure at one glance, and without giving the spectator the trouble of walking around it.” This he accomplished, in a jesting fashion, by painting a nude figure, with the back turned to the spectator, and with a clear stream at the feet reflecting the front. On one side was a highly polished corslet, which the figure depicted, having divested himself thereof, had laid at his left side, where it served as an effective mirror. The profile on the right was reflected from a glass; and the work, says our author in conclusion, was “sommamente lodata e ammirata per ingegnosa e bella.”* Respecting the Daughter of Herodias receiving the Head of the Baptist, also in the Louvre, and attributed to Giorgione, competent judges express more than a doubt.

The meeting of Jacob and Rachel, considered to be one of the finest of Giorgione's works, and sometimes called his masterpiece, is in the Dresden Gallery. A fine valley, pleasantly embosomed in surrounding hills, is the scene of this greeting; and if the costume and accessories—those of the painter's land and time—be not in strict accord with one's preconceived notions, yet the disappointment at first felt on approaching the picture is not of long continuance: the truth and earnestness of expression in the heads and attitudes of the principal figures, at once compel forgetfulness of those peasants of Friuli, by whom it is, in fact, that the Hebrew and his betrothed are here represented, and the highly-raised expectations with which the traveller approaches the picture, are in the end fully justified.

To the remarkable gift of forgetting, exhibited by our good friend, Von der Hagen, in the case of certain great Venetian painters, we have done ample justice: in the case of Giorgione he does *not* forget. Being at Floreuce, he falls into raptures at sight of

a mere copy—by no incapable hand, but still only a copy—of that boast of the Manfrini collection, the lovely lady, touching her lute, whose imperial beauty, according to one of his compatriots, “commands the whole world to bend in adoration before it.” “Since the time when I first beheld her in the Manfrini Palace at Venice,” says Von der Hagen, “has she constantly been present to my thoughts—so life-like is she, so entrancing, so absorbing, that the impression I then received continues in all its force, nor will it ever be effaced; no, never shall I forget her while I have being.” A truly honourable “*ameude*” for that curious lapsus of memory recorded above, dear denizen of your most praiseworthy city, Breslau; but there is even more:—“the rich violet-coloured robes, with all besides of that costly oriental dress bestowed by the lavish hand of the master on this labour of love,” are set down on your tablets this time, among the “*uever to be forgotten*,”* wherefore you shall hear it, no more of that other matter—we forgive you for it, at once and for ever.

Among the most admired and best authenticated of Giorgione's works is the enthroned Madonna, painted, as is believed, for the Venetian family Soranza, but purchased from that of Balbi, who obtained it by inheritance, for the collection of Mr. Edward Solly. In certain parts the manner of this work recalls that of Giorgione's master, Giovanni Bellini. St. Peter and St. John the Baptist stand on the right of the throne, St. Sebastian and another saint occupy the left; these figures have all the grandeur of character and earnest depth of expression peculiar to Giorgione. The landscape is strikingly beautiful—“*Mit dem glühend leuchtenden Horizonte*,” says a German writer, “*es gehört zu dem schönsten, was man dieser Art aus der venezianischen Schule kennt*.” The breadth and fulness of the treatment are equally remarkable, the colouring is deep and glowing, and in all essentials this picture bears a manifest resemblance to the few paintings known to be from the hand of Giorgione—that, for example, of St. Mark stilling the Tempest, in the Venetian Academy.

The almost equally admired “*Astrologer*” of Giorgione is, or was, in the Manfrini Gallery. An old man, strangely habited, sits beside a marble table; there is a ruined fabric in front of his seat, and in a niche of the building a broken statue of Venus. Gazing into the distance, the Astrologer is holding the instruments of his craft in his hand. A woman stooping, or rather cowering to the ground, is playing with an infant laid before her on the earth, and near her is a young man in armour. In the distance there are soldiers resting beneath a tree. In the gallery of the Barberigo Palace (yielded, as our readers will remember, to Russian entreaty, and now at St. Petersburg) was a treasure of inestimable value in studies of heads by Giorgione. Here also were the “*Muses*”—“*Eine unschätzbare entzückende Darstellung der selig verschwisterten Göttinnen*,” says a writer of our own day, “*vorzüglich amüthig und poetisch ist die holde Emporblickende in Sternenkranze, die Musik; und Thalia die Schauspielkunst*.”

As regards the “*Tempesta sedata dal Santo*” mentioned above, and now in the Academy of the Fine Arts at Venice, heavy reproach has been cast on Vasari for that he, in his innumerable occupations, did commit the oversight of attributing this work of Giorgione to Jacopo Palma—as happened in his second edition, although in the first he had rightly ascribed it to Giorgione. From the life of Palma it is then that we will now take Vasari's description of the picture, and this, were it only to add another proof to those already adduced, showing that “*praise of Venetian painters*” does not “*come reluctantly from his lips*,” as Fuseli—who should have known better, well informed as he doubtless was, than to repeat that refuted calumny of some pretulant, perhaps disappointed contemporary of the Aratine biographer—has somewhere said:—“*Fece oltre ciò, per la stanza dove si ragunano gli uomini della Scuola di San Marco in su la piazza di San Giacomo e Paolo, una bellissima storia nella quale è dipinta una nave, che conduce il corpo di San Marco a Vinezia, nella quale si vede finto dal Palma una orribile tempesta di mare, ed alcune barche combattute dalla furia de' venti, fatte con*

molto giudizio e con belle considerazioni, siccome è anco un gruppo di figure in aria e diverse forme di demoni che soffiano a giussa di venti nelle barche, che andando a remi e sforzandosi con vari modi di rompere l'iuimiche ed altissime onde, stanno per sommergersi. Insomma quest' opera, per vero dire, è tale e si bella per invenzione e per altro, che pare quasi impossibile che colore o pennello adoperati da mani auco eccellenti, possano esprimere alcuna cosa più simile al vero o più naturale; atteso che in essa si vede la furia de' venti, la forza e destrezza degli uomini, il muoversi dell' onde, i lampi e baleni del cielo, l'acqua rotta dai remi, ed i remi piegati dall' onde e dalla forza de' vogadori. Che più? Io per me nou mi ricordo aver mai veduto la più orrenda pittura di quella, essendo talmente condotta e con tanta osservanza nel disegno, nell' invenzione e nel colorito che pare che tremi la tavola come tutto quello che vi è dipinto fusse vero.”* This is followed by certain technical remarks, all in the same spirit, and to the praise of the painter, showing Vasari's sense of the magnitude of those difficulties overcome by Giorgione in this work, with his perfect willingness to admit their existence, and his readiness, not to say eagerness, to give all due praise to him who had obtained the signal success he so warmly celebrates.† Such passages—with that given by Lanzi in our last chapter—should set at rest the question of justice done by Vasari to Venetian painters; but that they will do so is scarcely to be hoped.

Lanzi, speaking in praise of the same work, alludes particularly to the figures of “*tre remiganti ignudi, pregiatissimi pel disegno, e per le attitudini*.”‡

Vasari appears to be slightly mistaken in his description of one part of the subject of this work. The moment chosen by Giorgione is not that of the conveyance of St. Mark to Venice, but that of a storm excited by demons, and allayed by the power of St. Mark, St. George, and St. Nicholas. The story, as related by the Venetian chronicler, Marino Sanuto, is as follows:—“On the night of the 25th of February, 1340, a storm, such as had never before been seen at Venice, was raging around the city, when a poor fisherman, labouring to secure his barque on the riva di San Marco, was accosted by a stranger, who desired to be put over to San Giorgio Maggiore.” The fisherman long refused, but won by promises and entreaties he finally consented to make the effort, and rowed the boat safely to San Giorgio; here a second stranger entered, and the two required to be rowed to San Nicolo del Lido, where they found a third awaiting them on the shore. The three thus united commanded their boatman to pull beyond the castles, and into the open bay. Scarcely had they gained the sea before they perceived a galley approaching with the rapidity of a bird on the wing: that vessel freighted with demons, who were obviously proceeding to effect the downfall of Venice. Then the three companions, rising solemnly in their boat, made the sign of the cross, when the demons were put to flight, the sea became peaceful, and the unknown bade the fisherman return to the delivered city. Here they made themselves known to their boatman, declaring themselves to be none other than SS. Marco,

* See “*Opere di Giorgio Vasari*,” vol. iii. pp. 481, 482. Edit. Firenze, 1822.

† Here follows a free translation, with some little abridgment, of the above, for any who may prefer to see it in English. “He likewise painted a most beautiful historical picture, representing a barque wherein the body of St. Mark is being conveyed to Venice. It is a dreadful tempest, the ships are tossed and driven by the fury of the winds and waves, all depicted with great judgment and the most thoughtful care—as are a group of figures in the air, with demons of various forms, all blowing against the barques in the manner of winds. Impelled by their oars, the ships labour in divers positions to stem the furious waves, but are on the point of sinking. At a word, this work is so well conceived, and so finely executed, that it seems impossible for colour and pencil, however powerful the hand employing them, to express anything with more truth of nature. The fury of the winds, the strength and dexterity of the mariners, the movement of the waves, the lightnings of heaven, the water broken by the oars, and the oars bent by the waves or by the strength of the rowers, all are painted to the life. What more? For my part I do not remember to have seen a more impressive picture than this—all being so truly represented, the invention, the design, the colouring, being all so equally cared for, and the whole so completely that the canvas seems to quiver as it might do if everything depicted were reality.”

‡ Lanzi—“*Storia Pittorica della Italia*.” Tomo secondo, parte prima. Scuola Veneta.

§ See Mrs. Foster's translation of Vasari's “*Lives, &c.*,” vol. iii. p. 376.

Giorgio, and Nicolo, who had come forth to save Venice from being overwhelmed by the sea. In proof of the fact, which they bade the fisherman declare to the Signoria, St. Mark then presented his ring, the delivery of which to the senate of Venice has been selected by more than one of her painters as the subject of his pencil.

Giorgione painted pictures for his own country, the March of Treviso; one of them—executed for that Vedelago which disputes with Castelfranco the honour of having given birth to the master—is the "Finding of Moses," now in the Brera, a gallery much visited by our people; a second is the "Entombment," still at Treviso: but "the composition is shown," says Sir Charles Eastlake, "in a woodcut which the reader will find in the English edition of Kugler's 'Geschichte der Malerei.'"*

That a very high place among Venetian masters is justly due to Sebastiano del Piombo, the most distinguished disciple of Giorgione, will be obvious even to such as have seen no more than the works that form so important a part of our National Gallery; but yet more eminent would have been the position assigned to that painter, by right of his extraordinary powers, had he more steadily devoted them to Art. But Sebastiano resigned himself, as we know, to social enjoyments, and, abandoning his native Venice, passed the greater part of his life in Rome; his later years being spent, unbappily for Art, "in making up to himself," by all permitted and legitimate indulgence, in the varied delights of that delightful city, "for the weary nights and laborious days previously given to his studies."† Richly endowed, indeed, must Sebastiano Luciani have been by nature, since with this feeling, that nights given to Art, and days consecrated to the exercise of her well-repaid toils, were "dreary and fatiguing," he could yet produce such works as we still admire; and great would have been the profit to Art, and perhaps to himself, had he not so early been able to "give himself good cheer."

The question how far Michael Angelo took part in the "Lazarus" of our Gallery has been long since set at rest, nor is there place for it here were that otherwise, neither do we meddle with the inquiry whether the portrait called that of Giulia Gonzaga be really the work for which Ippolito Cardinal de' Medici dispatched the master to Ponds "with four swift horses," to obtain sittings from the "lady, whose celestial beauties, treated by the hand of so accomplished an artist, give us a picture that may be truly called divine;"‡ all know these works, and can examine them at their pleasure. We confine ourselves, therefore, to the mention of some few to be found in other collections. An altar-piece in the Church of San Giovanni Grisostomo, at Venice, with others, both in that city and in Rome, rise appealingly to remembrance, but we name those most easily attainable in preference. There is an Entombment in the Bridgewater Gallery, said, like the Lazarus, to be from a design by Michael Angelo. In the Royal Institution, at Edinburgh, there is a Bacchus and Ariadne, under the name of Sebastiano, but its authenticity is doubted. In the collection at Hamilton Palace are two paintings by this master: one, the portrait of Pope Clement VII., than whom a handsomer or more gentlemanly personage rarely filled the papal chair, is of his earlier and better period; the second, a Transfiguration, "showing in composition and drawing the unmistakable influence of Michael Angelo," is of yet earlier date, being inscribed 1518, with the addition of a long sentence purporting that this picture was formerly presented to the Emperor Charles V.§ Three very fine works from the hand of Sebastiano are in the possession of Mr. Harford, of Blaise Castle,—namely, a Holy Family, a Pietà, and a study of a male head,—the first and last from designs, or in any case after the manner, of Michael Angelo. The Marquis of Lansdowne has a "Monk with a Skull," at Bowood, and there is a St. Sebastian in Lord Radnor's collection at Longford Castle.

† "Se ne stava riposando," says Vasari, "e le male spese notti ed i giorni affaticati ristorava con gli agi e con l'entrare." Opere, vol. iii. p. 690; English translation, vol. iv. p. 68.

‡ See Vasari, as above.

§ See "Treasures of Art in England," vol. iii. p. 305.

In the Louvre they have but one example, a "Visitation of the Virgin," who is received by St. Elizabeth, while Zachariah is also approaching, and descends the steps of their dwelling. This work bears the name of the master, and is dated "ROMA, MDXXXI;" thus proving it to have been executed before the fatal period of self-indulgent indolence had closed its leaden wing over the head of the artist, as indeed may be seen from the character of the work. There are four pictures by Sebastiano del Piombo in the Royal Gallery of Berlin: one of these is the Dead Christ supported by Joseph of Arimathea—Mary Magdalen lifts the wounded head of the Saviour, and regards it with sorrow. A second of these pictures represents Christ on the Cross; the other two are portraits—a branch of art in which this painter—following his master, Giorgione, by whose effective portrait in oil he was first made known to the Venetian world of Art—excelled all the artists of his time; it was, in fact, that wherein alone Sebastiano could finally be prevailed on to exercise his unbappily wasted gifts.

Ludovico Dolce, in his "Dialogo della Pittuora," relates a story to the effect that Sebastiano, having consented to retouch certain of Raphael's frescoes in the Vatican, which had been much injured by the soldiery during the siege of Rome, was conducting his honoured compatriot Titian through the various chambers, at the time of that great painter's sole visit to the metropolis of Art, when the Venetian, remarking the changes thus produced, inquired, "What presumptuous and ignorant hand has dared thus to mar these heads?" whereupon Sebastiano "became of lead indeed," adds Ludovico, alluding to that office of "Keeper of the Lead Seal," whence the name "Del Piombo" was derived.* There seems reason to believe this anecdote a true story; yet we do not read it with the satisfaction which might be felt had Sebastiano been a vain or presuming person, but that was not by any means the case. It was in no spirit of overweening arrogance that he had laid hands on the ruined frescoes of the lamented master. Luciani was indeed a man of sense, who had many excellent qualities, his chief defect being that indolence and self-indulgence before mentioned: yet was this a devouring leprosy never sufficiently to be deprecated, and in the case of the patient here in question more particularly to be regretted, since but for that grievous disease of an unconquerable addiction to the pleasures of sense, he would, without doubt, have proved himself one of the brightest luminaries of Art.

THE SOCIETY OF FEMALE ARTISTS.

ON the 1st of June the exhibition of works of Art by female artists, as announced in the *Art-Journal* for the month of May, was opened at the gallery, 315, Oxford Street. The collection contains 358 works of every kind, including original pictures in oil and water-colours, and a very few copies from Reynolds and other deceased masters, chiefly of the old schools. The number of contributors is 145.

It was a bold experiment of these ladies to challenge, on behalf of their sex, a title to public favour as an associated body of artists, able to produce works which might fairly be worthy of notice. Yet it is quite evident they did not over-estimate their own powers, nor need they appeal to the forbearance of the critic to deal leniently with them, nor to his gallantry for his approbation and encouragement. A visit to the gallery can scarcely fail to satisfy even the most incredulous that this institution, if countenanced as it deserves to be, must eventually take its place among the annual exhibitions of the metropolis, and continue to be of the number of those which every lover of Art will not fail to see.

It has been too much the custom with a certain class of connoisseurs, real or pretending, to speak disparagingly of the productions of female artists—to regard them as works of the *hand* rather than of the *mind*—pretty and graceful pictures, but little else. Yet when a Rosa Bonheur, for example, astonishes the world with a "Horse Fair," or a herd of half-wild oxen, then we hear from the same lips

* See "Dialogo," as above cited, p. 11: Venezia, 1557.

some such exclamation as this:—"Clever—very clever, but *decidedly unfeminine!*" so that these lady artists often have occasion to sing, in the words of the old ballad,—

"What shall we poor maidens do?"

Between the absence of due appreciation on the one side, and the sneers of the other, it is difficult for them to hit the right mark. Moreover, the obstacles which lie in the way of their receiving an Art-education that will qualify them to undertake works of a high order are not sufficiently taken into account by those who assume to be their judges. Though not prescriptively excluded from the lectures of the Royal Academy, few ladies are bold enough to attend them. For a long time no female was seen within the lecture-room, till Miss Fanny Corbaux, we believe, rallied some other ladies around her, broke through the rules established by custom only, and, with her friends, made her appearance before the academical professors. Even in private Art-schools females have not the advantages of unlimited study that students of the other sex enjoy, and which can alone capacitate them for the undertaking of the highest departments of Art; but with all the difficulties in their path, we need only recur to our exhibition rooms every year to receive ample proof that in Art, as in Literature and Science, the women of England possess a just right to claim equal rank with their countrymen.

The exhibition recently opened in Oxford Street could scarcely have been founded on the supposition that female artists have not received justice from the constituted authorities of the older societies; everywhere are their works cordially accepted, and generally well placed. Of course there must be rejections, and consequently disappointments; such things are inevitable, and, perhaps, more to be deplored in their case than in others, inasmuch as the Fine Arts are of the comparatively few sources lying open to well-educated females as a means of subsistence. It must, however, we think, be conceded that other opportunities of exhibiting their productions than those afforded in galleries already existing were required; and therefore that these ladies had sufficient cause to justify the step taken, as they assuredly had for assuming there was among them enough of artistic talent to redeem them from the charge of presumption in making a direct personal appeal to the intelligence of the public. With these brief preliminary observations we proceed to point out some of the contributions that more especially attracted our notice.

Of the ninety-seven oil pictures hanging in the gallery, Mrs. McLAN's "Highland Emigrants" (No. 35) claims the first notice. It is a large composition, full of figures, many of whom are in the act of embarking in a boat, while others are assisting or bidding adieu to the emigrants; a piper is playing the "farewell." The scene is most pathetically expressed, yet without any exaggeration of sentimental feeling; the figures are well drawn, and skilfully grouped; the general colour of the work is low in tone; and although this in some degree detracts from its interest as a mere painting, it is a judicious treatment of the subjects well harmonising with its character. If we recollect rightly, this picture was exhibited at the National Institution a few years ago, but it has greatly improved since then in mellowness of tone: we hope it is not still in the possession of the artist, for assuredly it ought not to be. Mrs. CLARENCE HALL's "Preparing for School" (No. 7) shows good knowledge of the principles of composition and careful drawing, but the flesh-tints are unnaturally purple. The "Tower of Invermark, Forfarshire" (No. 11), and "Bridge at Festiuiog, North Wales" (No. 64), by FRANCES STODDART, are passages of clever landscape-painting; but the background of the former is rather too solid, and deficient in atmosphere. "A Village School near Boulogne" (No. 12), by EMMA BROWNLOW, and "Helping Granny" (No. 75), will attract attention from their truthfulness of character, manifested in subjects of an opposite nature to each other. In the "Cottage Fireside" (No. 30), and "Threading Grandmother's Needle" (No. 66), KATE SWIFT shows talent both in design and execution, which practice and careful study may turn to profitable account. Mrs. ROBERTSON BLAINE exhibits some good pictures of Eastern subjects. Her "Bedouin Bivouac in the Desert" (No. 38) would have been fairly entitled to

a place "on the line" of the Royal Academy; it is a striking and powerfully coloured work: and her 'Christian Woman of Nazareth' (No. 59), and 'Street Scene—Miuich, Upper Egypt' (No. 65), are pictures far above mediocrity. A half-length portrait of an 'Australian Bushranger' (No. 80), by Miss E. BRADSTREET, is a hold masterly study of a hold villanous-looking subject. 'Mountain Mist' (No. 77), and 'A Welsh Stream' (No. 84), by Mrs. J. W. BROWN, form a pair of landscapes very carefully executed: the foreground of the latter picture is, however, too purple even for Welsh scenery. 'Reading the List of the Killed and Wounded' (No. 85), by Miss J. SINNETT, illustrates a painful story very graphically; and the face of the old woman is capital. Mrs. BLACKBURN'S 'Plonging on the Coast of Ayrshire' (No. 90) would be a most excellent picture had not the artist fallen into the error of making it too heavy in colour. The subject is well composed, well drawn, and is treated with much poetic feeling. In her endeavour to realise this latter quality she has evidently been led into a fault which tends to destroy the interest of her work. We must not forget before closing our notice of the oil pictures to point out three charming little portrait sketches of children (Nos. 55, 56, 57) by Mrs. E. M. WARD, who has also sent her 'May Queen,' exhibited last season at the Royal Academy.

In the water-colour department, the drawings of Mrs. ELIZABETH MURRAY are entitled, by their merits and number, to our first notice. This lady paints with a remarkably hold pencil; she has a true eye for colour, and an apt sense of the picturesque: she depicts what she sees without any idea of calling to her aid any of those "mystifications" of Art frequently employed by painters to produce effect. Her most ambitious work is a drawing of large dimensions, 'Funchal, Madeira, taken near the residence of her late Majesty, Queen Adelaide' (No. 200); it is a very brilliant drawing, full of daylight, and rich in colour: a little more attention to finish in the foreground objects would, we think, greatly enhance its value. 'A Teneriffe Market-girl' (Nos. 131 and 211), 'Sketch of Teneriffe Peasants' (No. 145), and 'A Moorish Girl' (No. 228), by the same lady, are charming drawings. Mrs. MUSGRAVE is a liberal contributor to the exhibition, chiefly of portraits: 'Children of the Rev. G. Hodson' (No. 106), and 'Children of Robert Heath, Esq.' (No. 110), are full of life and nature. In her portraits of the 'Hon. Mrs. Rashleigh, and Miss Edith Rashleigh' (No. 180), and of 'Miss Grant' (No. 184), we think she has committed a mistake in introducing dark clouds behind the heads; they require no such relief, and are rudely thrust forward by the background, which also seems to deprive the flesh tints of their purity of tone: in the former of these works a little more attention to the drawing of the hands was needful. A work of more pretensions than any of these, from the hand of Mrs. Musgrave, is 'The Crimean Legacy: a Highland Soldier bringing to the Widow of his Officer the pets of her slain Husband' (No. 221). The incident is given with considerable expression and with much pathos: the picture is also good in colour. 'Little Dora' (No. 217) is another of this lady's works that must not be passed over. Mrs. DUNDAS MURRAY exhibits several landscapes, unmistakable transcripts of nature, rendered with care and feeling: her 'Scaton, on the Coast of Durham' (No. 135), has all the essentials of good Art, and her 'Castle and Bridge of Sorrento' (No. 138), is a picturesque subject, very effectively treated. Miss MARIANNE STONE has also some good landscapes, fruit-pieces, &c.; her 'New Laid' (No. 122), a basket of eggs, is worthy of W. Hunt; and her 'Autumn Fruit' (No. 185), is rich, ripe, and truthful. In the horticultural department also, the two contributions (Nos. 126 and 202) of Miss CHARLOTTE JAMES must not be overlooked: they are delicately rendered. Lady BELCHER'S 'Fir Trees' (No. 114), and 'The Castle of Tancarville, on the Seine' (No. 139), are characterised by holdness of design and touch, but are rather heavy in colour: the subjects are well selected, and arranged very pictorially. Of the various contributions by FLORENCE PEEL, none of which are without merit, we prefer 'Mills at Looe, Cornwall' (No. 159), this lady exhibits some groups of flowers, beautifully drawn and painted, and a bird's-nest with

primroses, executed with much delicacy. A 'Study of a Head' (No. 164), one of several drawings by Mrs. BACKHOUSE, is excellent in pencilling, but the pink dress was certainly not a good selection of colour with reference to that of the face. 'The Cottage Door' (No. 177), by Mrs. V. BARTHOLOMEW, is among the best works of its class in the gallery: the heads of the figures are very expressive of "cottage humanity." Mrs. HOLLFORD, in her 'Sunday Afternoon in St. Peter's at Rome' (No. 186), seems to have had a peep into Cattermole's studio, and brought away—not clandestinely, we feel assured—an idea or two, of which she has made good use. 'The Lord of the Castle' (No. 261), a small drawing by Miss BLAKE, would be an acquisition to any water-colour gallery in the metropolis: so, also, would be two very clever subjects by this lady, 'The Kremlin, Moscow' (No. 205), and 'Schloss Elz' (No. 206). Mrs. GROVE'S studies of 'Buruham Beeches' (Nos. 305 and 307) have in them the true look of nature; and two or three portraits, by Miss L. CARON, will well repay examination. Mrs. HARRISON, contributes several of her beautiful flower-pieces, of which it is almost superfluous to speak. Some canoe portraits by Miss NICHOLLS, would form charming embellishments to a lady's cabinet or toilette.

There are many other works concerning which we could find something commendatory to say, if our space permitted us to enlarge, but we must forbear. Among the copies, however, is one by Miss MARIAN TURNER it would be a manifest injustice to omit: her 'Child Harold's Pilgrimage,' after Turner, is one of the most successful reproductions, on a reduced scale, we remember to have seen. The sculptures are by Mrs. Thornycroft, Mrs. R. R. Smith, Miss Gann, Mrs. Fielder, Miss Levi-son, Miss Burrell, and Mrs. Maccarthy.

Art-societies have grown up into magnitude and popularity from far less auspicious beginnings than this; we have, therefore, little doubt of its ultimate progression. On behalf of this young institution we would appeal to those ladies whose works have already been made known to the public, and received its favourable verdict through the medium of other societies. We do not ask them to forego the advantages attending an appearance in the Royal Academy and elsewhere, but we do ask them to reserve a portion of their strength to further the object of their sisters in Art. A combination of the female "Art-power" of the country could not possibly fail to make itself felt and respected to an extent which would operate beneficially upon all who might contribute to it.

We may remark, in conclusion, that the exhibition was opened within a very short time, comparatively, of the idea being promulgated; great credit is therefore due to those ladies who have exerted their influence and spent their time to gather together such a collection of works of Art. It will gratify them, we know, to find that their labours have not been in vain; pictures have been sold to an extent that could scarcely have been anticipated, and the "receipts" for admission will do more than cover all incidental expenses. This is altogether cheering, and is an encouraging augury of the future.

ART IN THE PROVINCES.

LEEDS.—The annual meeting of the friends and supporters of the Leeds School of Practical Art, was held, on the 3rd of June, in the hall of the Mechanics' Institute and Literary Society. The report stated that there were altogether 104 pupils attending the central school. The head master has under his personal charge, besides the central, eight other schools wherein he gives lessons—namely, Ackworth schools, 200; Wakefield Mechanics' Institution, 26; Leeds Mechanics' Institution (boys' school), 90; Leeds Ladies' Educational Institution, 50; Marshall's school, Holbeck, 150; St. Matthew's, do., 150; St. George's, do., 180; St. Peter's, do., 30. The school has now in action two certificated masters, Mr. John White, head master, and Mr. Charles Ryan, assistant master. The assistant master has under his charge twelve classes in public schools and institutions. At present there are 86 females receiving lessons in connection with the central schools, and under the head master's personal care.

THE SISTER AND BROTHER.

FROM THE ALTO-RELIEVO BY A. MUNRO.

THE two figures composing this group, which was exhibited in the Royal Academy last year, are portraits of Miss Agnes Gladstone and her brother Herbert, children of the Right Hon. W. E. Gladstone, M.P., who is entitled to the merit of being a liberal patron of the Arts, in addition to those other qualifications by which he has raised himself to high distinction. As a portrait-sculptor, Mr. Munro stands in a very good position with the public and his brother artists. His practice is considerable, as we know from the number of works he exhibits annually at the Academy; many of these are busts of children, for the execution of which he seems to possess a peculiar faculty, and consequently he enjoys a kind of monopoly of such works; but not, however, without a due share of commissions in the way of heads of "grave and reverend seigneurs" and ladies fair, and he occasionally produces some ideal subject of a similar character.

In every artist, whether painter or sculptor, who limits his practice almost exclusively to a particular class of subject, we must expect to find him excelling in that alone; hence, in the group we have engraved, the heads are most deserving of attention. The arrangement and grouping of the figures are good, and the feeling expressed in the design is appropriate and very sweet, but the lower portion of the work and the modelling of the extremities are not equally successful: in his attempt to foreshorten the lower limbs of the "sister," the sculptor appears to have been fearful of projecting his model too far out of the niche in which it is placed, and thus the limbs look disproportionately short: the same fault is observable in the arm which encircles the younger child. The heads, however, especially that of the boy, are very beautiful, and quite compensate for the defects we have not hesitated to point out.

It is a fact which almost every one connected with the Fine Arts readily acknowledges, that the most liberal patrons of modern Art are those who are themselves, or whose immediate ancestors were, connected with the mercantile or commercial classes. Mr. Gladstone, who has risen to so great eminence as a statesman, is the son of a wealthy Liverpool merchant; he was educated at Eton, and afterwards proceeded to Oxford, and entered at Christ Church. At a very early age—he had scarcely reached his twenty-fourth year—he was elected as the representative of the borough of Newark, a nomination borough in the hands of the ducal house of Newcastle. Once in Parliament, he soon attracted the attention of the House, and of the Government of the day, by his remarkable business talents, his comprehensive knowledge, and his oratorical powers. "Mr. Gladstone," Macaulay wrote, in 1841, in the *Edinburgh Review*, "is a young man of unblemished character, and of distinguished parliamentary talents. It would not at all be strange if he were one of the most unpopular men in England; but we believe that we do him but justice when we say that his abilities and demeanour have obtained for him the respect and good-will of all parties." It is no part of our duty to follow Mr. Gladstone through his political career, or to express the least opinion upon the course he has pursued; but a statesman of his intellectual powers, and with such an aptitude for taking a prominent part in the politics of his country, must always be regarded with respect, even by those who differ from him. We believe that he is yet destined to fill a much higher position, as a minister of the Crown, than any he has hitherto occupied, when the "circle of political events" shall have taken a few more turns, and wrought another change among the leading personages whose office it is to guide and control the machinery of Government.

The painter, in more respects than one, has an unquestionable advantage over the sculptor in portraiture, especially in the representation of childhood—living childhood. With all the skill the sculptor may exhibit in the marble, however exquisitely his work may be modelled, and however gracefully his forms are produced, the unavoidable absence of colour must ever render such "likenesses" less acceptable to the public in general than pictures, though always most welcome to every lover of the highest department of Art.

THE SISTER AND BROTHER.

ENGRAVED BY W. ROFFE, FROM THE ALTO-RELIEVO BY A. MUNRO.

LONDON JAMES S. VIRTUE.

THE ENGLISH STATE-PAPERS.

VERY important facilities having been recently effected for consulting the important documents deposited in our Record Offices, we propose to devote some space to their history and character.

Few persons are aware of the enormous mass of unused material for the true History of England existing in the Record Offices of the country. Writers are generally content to copy each other's version of important facts, or modify their opinions by reference to printed documents; but few, very few, have gone to the only true source of history, the state-papers, which are, in fact, the very main-springs of public actions, by which the whole government of the country has moved. Our statesmen have entirely acted on the information they afforded, and they remain as the only true record of their proceedings; they are the only keys to many a state secret of the most vital importance, many a dark page in history can only be illuminated by their aid, and very many yet require illuminating.

The question will, in the outset, naturally arise—Why has this been? The answer is a simple one; they were unavailable by their quantity, and the confusion in which they were kept. It has been the labour of a few earnest men, during the present century, to clear this Augean stable, and reduce this confusion to order. Previously the records were utterly neglected—left forgotten in damp and decay to perish, and treated generally as useless lumber. When their guardians thus forgot their value, and almost ignored their existence, it is not to be wondered at that the public scarcely turned a thought in that direction. If some enthusiast for truth felt desirous of consulting such historic papers, his path was obstructed by difficulties, which, in the end, he would find himself unable to surmount. If, after the sacrifice of much time and patience, he should succeed in getting permission from the officers of the Crown to consult these documents, he would find himself only in possession of an unavailable privilege—the right to examine thousands of bundles unsorted, and black with dirt and age; the labour of a year might be devoted to obtain access to a fact which half-an-hour's research in an ordinary library would give on other subjects. Hence the more public state-papers in the British Museum, which were the collections of Sir Robert Cotton and Sir Robert Harley, have been continually used by our chief general depository of facts—our historic mine, which has been well worked by our literary men, with results of the most satisfactory kind to the reading world outside the walls of our great national library.

As an index is to a book, so is a catalogue to a library. Had the papers in the Harleian and Cottonian collections no index, literary men—whose time is never too well paid for—would not have devoted their researches in that quarter. We speak not of such literary men as have leisure, and some amount of independence,—they are few in comparison with the enormous number who are employed on the exigencies of the modern press. The labours of many of these unrecorded authors are great and continuous, and spread over a larger surface sometimes than those of greater men; it is necessary, therefore, that this very popularisation of knowledge should flow from its source purely: it should not be filtered through the prejudiced minds of other writers, or be obtained from the garbled pages of the party historian. It is almost always impossible to get at pure truth in history; for every historian, however honest he may be, can scarcely fail to feel a prejudice in favour of some person or action he may have to record, and some dislike to the opponents of both. It follows, then, that our only chance of arriving at fair conclusions is to have the simple facts on both sides of a question laid before us, and so form our own judgments. These facts exist in the contemporary documentary evidence of the state-papers; they assisted our forefathers to the conclusion of events which now make part of history, and to them we must go to test the soundness of their conclusions, or understand the true state of the facts which occurred in by-gone days.

Facilities for all this research have been increasing yearly, and the recent production of a minute *catalogue raisonné* of that portion connected with the reigns of Edward VI., Mary, and Elizabeth, has re-

cently been printed for public use by Robert Lemon, Esq., F.S.A., the Assistant Keeper of the State-paper department of the Public Record Office.* By aid of this volume any document may be found in a brief space of time—for all have been bound in a series of volumes, and can be readily referred to. It is history made easy for the student. This labour has already borne good fruit, as the following table will show; it records the number of visitors in the commencement of last year before this calendar was printed, and the number who, during the same months of the present year, have availed themselves of the extra facilities it has afforded them for research:—

Jan., 1856.	56	Jan., 1857	144
Feb., „	37	Feb., „	181
	93		325

This is a practical comment on the labours of Mr. Lemon, which is the best of all testimony to its utility; but we cannot yet fully estimate its value on the historic literature of the country.

It will be of interest to describe the history and nature of this new field of research. The detail of the fortunes and vicissitudes of our National Records is pregnant with interest, and it is too little known by the world in general. We shall found our narrative solely on the memoranda furnished by the officers who have been connected with the establishment, and who have revealed instances of the neglect and destruction of precious documents, which could not be believed on evidence less conclusive.

Mr. F. S. Thomas, secretary to the Public Record Office, published, in 1853, his *Handbook* to its contents, a work which may be said to have originated in his *Notes and Materials for the History of Public Departments*, privately issued in 1846, and which abounds in curious and authentic information. By this it appears that in times most remote, the Records were kept in the palace of the king, where the three law courts—the Exchequer, the Chancery, and the Sovereign Court of ordinary Judicature, then styled *Curia Regis*—were held; but as these courts moved with the sovereign from place to place, wherever he happened to be, many of the records were deposited in such temporary residence, and have accordingly been found there. Thus, as recently as 1848, there was discovered in Swansea Castle, the original contract of alliance between Edward of Caernarvon, Prince of Wales, and Isabella, daughter of Philip the Fair, King of France (20th May, 1303). It is known that when Edward II. fled from Bristol to Laundy, and was driven into Swansea by contrary winds, he deposited a number of the national archives that were travelling with the court, as usual, in the Castle of Swansea for safety. When the law courts became stationary at Westminster, the records of their proceedings were kept within the precincts of the Royal Palace there. In addition to these, Stow informs us that the records relating to the public affairs of the kingdom, the treaties with foreign powers, the documents connected with the suppression of monasteries, the books of the Orders of St. George and St. Michael, foreign accounts, and other matters of State, were also preserved in the King's Treasury; and that in the Abbey of Westminster was a room vaulted with stone, and known as “the Old Treasury,” a place always designed for the custody of the leagues of the kingdom; and another where the records of the King's Bench and Common Pleas were kept. The Tower was naturally one of the chief depositories in ancient times, and here were kept the Chancery records, which were sent there in bundles from the dwelling-house of the Master of the Rolls as they accumulated; but the practice was discontinued after the reign of Edward IV., and they were lodged in the chapel of the Master of the Rolls. In process of time these documents increased greatly, and we meet with continued notices of the anxiety of the Crown for the safety and due record of their contents, and continued orders for the removal of many from various other places to the Tower, which seems to have been considered the proper depository. They appear to have been consigned to neglect soon after the Reformation; for it is affirmed that, in the third year of the reign of Edward VI., many records

were discovered in an old house within the Tower, all of which were unknown, until search was made for a convenient place to deposit gunpowder, and many of them had lain so long against the walls that the lime had partially destroyed them.

Queen Elizabeth having been informed of the perilous state of the records of Parliament and Chancery gave orders for their better preservation, but such orders were never executed: the records were neglected, and it is not until the reign of Charles II. that we obtain any positive fact as to the ruin into which they had fallen. William Prymne, the famous author of the *Histriomastix* (who had been pilloried and lost his ears by order of Charles I. for writing it), was appointed by Charles II. keeper of the Tower Records. Prymne had pursued the stormy course of politics all his life, and had written and argued, and fought and squabbled, during the days of the Protectorate, so much as to become a marked man; but ultimately, seeing the folly of his course, had welcomed the Restoration. Charles was somewhat embarrassed by his new friend, and hardly knew how to keep “busy Mr. Prymne,” as he was termed, out of politics, when it was luckily proposed to give him this government place. He went to his new duties with the greatest gusto, and assiduously devoted himself to arranging all the records, bidding adieu to political life. His description of the state in which he found them is very graphic:—“They had for many years by past lain buried together in one confused chaos, under corroding putrefying cobwebs, dust, filth, in the darkest corner of Cæsar's Chapel, in the White Tower, as mere useless reliques not worthy to be calendared, or brought down thence into the office amongst other records of use.” He goes on to narrate how he “employed some soldiers and women to remove and cleanse them from their filthynesse, who, soon growing weary of their noysome work, left them almost as foul, dusty, nasty, as they found them.” He and his clerk were then obliged to take the labour; and he says, “In raking up this dung-heap I found many rare, antient, precious pearls and golden records;” but, he exclaims, “all which will require Briarius his hundred hands, Argus his hundred eyes, and Nestor's century of years, to marshal them into distinct files.” Prymne continued his labours while life lasted, as his valuable volumes show; but enthusiasm on this subject died with him. Although keepers of records were appointed—observes Mr. Thomas—their chief interest was in the fees their office brought them, and the agency business connected therewith. If the records fell into confusion, or became mutilated, so they might remain. They gradually became inaccessible to the public, and, finally, entirely neglected.

It was in the year 1800 that the first important move was made to do something for these “unarranged, undescribed, and unascertained” papers—for so they are described in the Royal Commission issued that year for their better preservation. That the language simply conveys the true state of the case may be seen by the Report of the Select Committee of the House of Commons, 1836, which describe the Records of the Queen's Remembrancer as kept in 600 sacks; “they were all in a most filthy state, and for that reason scarcely legible; and if a document required as important evidence was known to exist somewhere in that miscellaneous collection, the labour and disgusting nature of the search prevented the attempt.” Many sheds in the King's Mews were devoted to receive other documents; and we must quote the sober language of a parliamentary report to describe their condition, lest we should be charged with caricaturing the case:—“In these sheds 4316 cubic feet of national records were deposited in the most neglected condition. Besides the accumulated dust of centuries, all, when these operations were commenced, were found to be very damp. Some were in a state of inseparable adhesion to the stone walls. There were numerous fragments which had only just escaped entire consumption by vermin, and many were in the last stage of putrefaction. Decay and damp had rendered a large quantity so fragile as hardly to admit of being touched; others, particularly in the form of rolls, were so coagulated together that they could not be uncoiled. Six or seven perfect skeletons of rats were found imbedded, and bones of these vermin were generally distributed throughout the mass; and, besides furnishing a charnel house for the dead during the first removal of these national

* CALENDAR OF STATE-PAPERS. Domestic Series—of the reigns of Edward VI., Mary, and Elizabeth: 1547–1580. Preserved in the State-paper department of her Majesty's Public Record Office. Edited by Robert Lemon, Esq., F.S.A. Published by Longman & Co.

records, a dog was employed in hunting the live rats which were thus disturbed from their nests."

The Record Commission having expired in 1837, an act was passed in the following year, by which the present Public Record Office was founded, which ultimately embraced all other offices, which were hence considered as branch establishments, the entire superintendence of all being vested in the Master of the Rolls. It is intended to appropriate the new building in Chancery Lane as a general repository; but as inasmuch as there are two very distinct classes of documents preserved, it is to be hoped that while the larger mass of legal papers be very properly located near the Inns of Court, the historic and domestic series of state-papers be preserved distinct for the literary student in their present convenient locality.

It is with the latter section that our present business lies, and as new and great facilities are now offered for consulting them, we shall be doing good service in pointing out the interesting character of this undeveloped mine of history. The regulations for access to them in their present depository in St. James's Park, is not so simple as it might be; it is invested with more circumlocution than was usual before, or is at all needful; and it is somewhat curious that, while greater facilities are given by the publication of Mr. Lemon's calendar to assist the student, a larger series of merely formal letters have to be written from the Secretary of State to eight or ten subordinates before permission to consult them be granted. It is a mere waste of time in routine, and was not usual before this office was amalgamated with the others. The student, however, has but to apply to the Secretary of State, and patiently wait the result. By aid of this excellent calendar all documents therein noted can be found at once, and placed before the reader in less than a quarter of an hour; many in five minutes; while individuals in the country can send to a London correspondent a notification of any document they may require, and a copy can be transmitted without personal inconvenience at all.

The state-papers spring from three great and original sources: namely, the offices of the Secretaries of State for the Foreign, the Colonial, and the Home Departments. In the State-paper Office they are classified under those several denominations; the papers emanating from the Home Department being technically denominated *the Domestic Papers*, as representing the correspondence of the domestic or home affairs of the nation, in contradistinction to those of the foreign and colonial interests. Of the extreme importance of these documents, and their paramount interest as the only true materials for the history of England, we have the best proof in the eleven volumes printed under the authority of the Royal Commission in 1830, and containing accurate reprints *in extenso* of those which relate to the reign of Henry VIII. Large and important as this public contribution to English history is, it is but a portion only of the papers connected with the reign; others, though they be of minor importance, are of great value in aiding us to understand the spirit and manners of the age. They belong rather to the history of the people than to that of the State; but that yet unwritten history is destined to be one of the most interesting.

The calendar now issued by the present head of the office is a voluminous list of every document connected with the reigns of Edward VI., Mary, and Elizabeth, and is to be continued by others until the whole series be completed. In the space of two or three lines the nature and contents of each document is fully described; and we may form some idea of the labour required in such a volume when we note that it consists of 700 pages, each containing on an average an account of sixteen documents, every one of which had to be carefully perused before it was thus indexed. The eye cannot be east over a single page without curiosity and interest being excited. Mr. Lemon says, in his preface, "For the general reader papers of great interest will appear in the reign of Edward VI., elucidatory of the intrigues of Seymour, Somerset, and Northumberland; and in that of Mary, the obscure plots of Dudley and Throgmorton, and the rebellion of Wyatt will be more fully opened. Immediately upon the accession of Elizabeth a strongly-marked change in the character of the papers will not fail to be observed. Rich as they are in the particular depart-

ments of biography, genealogy, and local history, it is in the details of the social condition of the empire under her reign that the greatest amount of information will be found: the insight into curious and minute points of domestic habits, the intermixture of the utmost simplicity with regal magnificence, the germs of thought then dimly conceived, but lying dormant for three centuries before ripening into perfection, the projects and inventions of mechanical genius still in the nineteenth century remaining uncompleted, are all traceable in the present volume."

The proposition of Gawen Smith, in 1580, "for the erection of a beacon on the Goodwin Sands, twenty or thirty feet above high-water mark, and able to receive and preserve thirty or forty persons at least," notwithstanding our amazing advance in all the mechanical arts, remains yet unaccomplished; while in the application to Walsingham, by one called John the Almain (or German), on behalf of one of his countrymen, "who had invented an arquebuse that shall contain ten balls or pellets of lead, all the which shall goe off one after another, having once given fire, so that with one arquebuse one man might kill ten theaves or other enemies," will be seen the prototype of an idea, successfully carried into execution only in the present generation.

The prevalent tone of superstition of that age is noted in such reports as that of Thomas Mastya to the Earl of Devonshire, in May 1555, that the astrologers Dee, Cary, and Butler, who calculated the natiuities of the king, queen, and Princess Elizabeth, are apprehended on the accusation of one Perys, "whose children thereupon had been struck, one with death, the other with blindness;" or in the statement made in the following year of one John Dethick's application to make experiments on a foreign coin called "caldre gylders" (or old silver guilders) to convert them into gold, "he having skill in alchemy;"* or the particulars of examinations in 1559, at Westminster, of certain persons accused of sorcery, witchcraft, poisoning, enchantment, &c.

The insight given of the private lives of the upper classes is curious in such letters as those of Sir John Bourne, 1560, to a friend, giving an account of his rural occupations, and inviting him to join him; or in that of Sir William Cecil, 1561, who decides that his son, then travelling in France, shall not be at the expense of keeping a horse, as he "fears he will return home like a spending sot, meet only to keep a tennis court."

Queen Elizabeth's dislike to the publication of any likeness of herself without authority is shown by the proclamation in 1563, prohibiting "all paynters, prynters, and gravers" from issuing any such until "some cunning person mete therefore shall make a naturall representation of her majesty's person, favor, and grace." Her majesty had peculiar ideas of Art, and declared all shadows unnatural in painting, hence Niebolas Hilliard gave us the sickly representations of her haggard features, with which only was she satisfied.

The progress of the native trade of the country, by the wise permission for foreign artists' residence, is seen in the account of the progress of the manufacture of glass and pottery, under the superintendence of an expert foreigner, and the clumsiness of the native English glass-makers incidentally mentioned. In July, 1567, we find Bishop Grindal writing to Cecil that the foreign artisans, who have been driven from the Low Countries on account of their religion, should be allowed to follow their occupations in various towns in England. Of course, we also meet with many instances of "vested interests" taking alarm, and petitioning against all this concession; but we trace in the wise regulations of Elizabeth and her minister the foundation of the trading greatness of England.

Many entries show the comparative discomfort of court life in those days. Thus, though a queen ruled, we find Elizabeth's maids of honour at Windsor petitioning "to have their chamber ceiled, and the petition that is of borders there to be made higher, for that their servauntes looke over." The continued

* In March, 1567, we find a solemn engagement entered into by one Cornelius Lanney to produce gold and gems by a chemical process, he having before promised to transmute enough gold in a year to produce 50,000 marks to the Treasury. Sir William Cecil notes that this alchemist "wrought in Somerset House, and abused many in promising to convert any metall into gold."

interference of the court and government in matters of personal freedom, and trade regulations, would in our days be considered most offensive. The accounts of revels, and items of personal expenses for dress and decoration, scattered through these pages are also very curious; as are some notes of a strictly private nature, such as that of a yeoman of Westminster who, with three sureties, binds himself in a sum of £80 not to play at dice or cards "for the rest of his life."

We can do no more than hint at the contents of this volume, or the vast mass of material available for historic purposes of all kinds preserved in these *domestic* documents of the State-paper Office. Mr. Lemon's volume is an admirable hand-book to these treasures. It is a work of enormous labour, conscientiously executed, and has, in addition to all we have already noted, most elaborate indexes of names and subjects comprised in the entire volume. Several competent hands are devoted to the same work, on other portions of the same series of state-papers. It is a labour of the greatest importance, and most worthy of national support; and in concluding our notice of what has been done, we can but "wish God speed" to those who are labouring so earnestly and so well.

CORRESPONDENCE.

To the Editor of "THE ART-JOURNAL."

THE SOCIETY OF WATER-COLOUR PAINTERS.

SIR,—Doubtless the echo has reached you of a hubbub in a certain Water-Colour Gallery, engendered by the questionable doings and short-comings of its committee of arrangement. The *émoué* having gone beyond mere growls, lamentations, and MSS. communications—in short, been followed up by a bold demonstration in print, coupling a free expression of opinions with a sort of table of contents of the gallery, bearing on the distribution of favours therein—you will probably take note of it; but as the question, "How *are* pictures hung, or rather how are they to be hung?" is one of importance, equally great to the public and the artist, requiring, moreover, much discussion, I venture to offer a few suggestions for consideration.

It is scarcely necessary just now to point out how grievously the public is misled by the improper method of hanging pictures in the exhibitions; one must hope and believe that time will teach it, nevertheless, how to discriminate between true Art and its counterfeit, that the now often-heard cry for the right man in the right place, will be succeeded by another of like strength, and as rational—"the right picture in the right place." But it is needful on every opportunity to advocate the cause of the artist, who is much the greater sufferer of the two by the existence of this serious evil; surely 'tis time that the placing his works before the public should be regulated by a higher feeling and a better consideration than has hitherto obtained. He has a right to be fairly represented in the annual parliament of the Fine Arts. Granted, a hanging committee has a difficult, delicate, troublesome, even thankless duty to perform; but as it wields an enormous power for the distribution of good or evil, every member of it should bring to the performance of his trust a determination that justice shall prevail—that, "on occasion," even the more winning presence, *generosity*, shall be suffered to appear. Men before now have removed their own works from posts of honour, that desert in a younger disciple of Art, or aspirant for fame, might be observed. Is it to be considered that Art and its followers shall continue subject to the theories or caprices of an irresponsible hanging committee—to the prejudices, favouritism, or selfishness of weak human nature? or are we to console ourselves with the thought of a "good time coming," when some competent, untrammelled individual, learned in Art, independent of the picture-dealer, with tastes and feelings differing from those of the mere drawing-master, shall be *answerable* for the well and honest disposition of the pictures sent to form a coming exhibition? These speculations, however, must give way to the "hanging matter" which has disturbed the neighbourhood of Charing Cross.

Why so much grief in that charming little gallery? It is never overwhelmed with offerings, as another place always is that could be mentioned; its collection of cabinet size Art-treasures averages something like 320 or so, with ample room and verge enough to display tolerably well all good examples, save at the coveted squeeze of the private view. Whence then the heartburnings of its members, and the difficulties of the committee of ar-

rangement? What were they this year? One, as alleged, an influx of larger drawings than usual; another—not paraded—the striving to give the gallery that even, monotonous tone or harmony, such as results from the furnishing skill of a house-decorator, when intrusted with the fitting up of my lady's boudoir—pleasing enough to the eye, but destructive to the individuality of the pictures—and *voilà tout*. The first might have been easily lessened, to the joy of the non-hanging members, by returning so many of their drawings as creditable places could not be found for, or giving each artist notice of this disagreeable dilemma, with the option of withdrawing his redundant contribution. It was but a sorry excuse for withholding this boon, when sought, to say, "the catalogue was in type," as if the injuring a *fellow-artist* was of less consequence than permitting a little irregularity in the numbers of the catalogue. Much less painful and damaging is it to an artist that his work should remain in his study, to be seen and understood by his friends there, than that they should discover it in the gallery, soaring towards the clouds, or grovelling in the dust. As to the second self-created difficulty, it is enough to say that, by its toleration, many works are robbed of their right position on the walls; and hence some that deserve a better fate get passed over unobserved by the visitor, who comes away with an impression of sameness in all he has seen, finding little or nothing very striking in the exhibition to attract his attention—in fact, having scarcely more than faint impressions made on his memory.

Now as some change seems needed in the *irritating regulations* which prevail in this ruffled society, or at least some efforts require to be made to lighten the sense of wrong which they have led to, why might not the committee, as each member's works arrive at the gallery, or any way, before they are separated, select for placing on the line the one that bore the strongest evidence of merit, and for rejection, the evident so-so example of the same pencil, supposing want of a suitable hanging-place rendered such course advisable; supposing also that the contributors of two, or of twenty drawings, should not be down for equal numbers in the doubtful list. Or better still, why not allow each member and associate to mark which of his drawings he wishes to be dealt with after this suggested fashion. Were either of the above courses adopted, we should have but few complaints of pictures being banished far away from the eye that required to be near to save them from neglect or perdition, and security would not be wanting for there existing between the spectator and a mediocre production that desirable *distance* which lends enchantment to the view. By some such arrangement would the artist come *fairly* before the public, and be stimulated to more carefulness and earnestness in preparing himself for appearing in the best of good company. Aided by such frequent opportunities of seeing truly, would the public learn that "sterling merit" and "a name" do not always co-exist.

VIGILANS.

ON ENAMEL-PAINTING.

BY CHARLES TOMLINSON.

No. II.

THE Ceramic Court of the Crystal Palace contains a large number of specimens which admirably illustrate the beauties and the resources, as well as the defects and difficulties, of enamel-painting. The colours of some of the animals represented remind one less of the zoology of nature than of that of the hostelry, where, from the failure of the intended effect, we have a blue horse, a red lion, &c.; but such blemishes are rare, and it would be unjust to dwell upon them when there is so much to excite our respect and admiration. For the sake of brevity, we select as one of the successes of the art, a porcelain slab representing a lovely woman in an evening dress, leaning forward so as just to catch the rays of the setting sun streaming in through a window on the right, which, however, is not seen. The arch expression of the face, the graceful ease of the figure, the excellence of the drawing, the subdued harmony of the colouring, would make this work admirable as an oil-painting; but when we consider further, the creamy softness peculiar to enamel, and the indestructibility of the work, our admiration ought, it may be said, to be increased. The painting is a Dresden work, lent by Lady Rolle; it is framed and hung up against the wall. It is this last circumstance which makes us qualify our admiration of this charming performance. The doubt crosses our mind whether, notwithstanding so perfect a result, it may

be classed under legitimate Art. A skilful artist in oil would produce such a work in a title of the time expended by the enamel-painter, with none of those uncertainties in the results, which the process of firing entails. His colours would display their mute eloquence, and his work would be constantly associated with the idea of progress, which we hold to be essential to success in Art: in enamel-painting the idea of progress is lost, or embarrassed in the complication of the processes, in the disparity between present effects and final results, and in the uncertainty which must always accompany a work which has to pass through the fire. It is probably on account of the difficulties and uncertainties which beset his art, that the enamel-painter, except in the case of pattern design, seldom rises to the dignity of composition. His most successful performances are copies of celebrated pictures. Each picture furnishes him with precise results, places a standard before him, a target at which to aim, and thus relieves him of some of the uncertainty of his art. Provided he attain the rank of a successful copyist, he is satisfied; he fancies that he has reached the object of his studies. The jury of the Great Exhibition of 1851 (Class XXX.), in passing judgment on certain enamels on porcelain, and on metal, recognise this sort of merit. Speaking of a successful copy of one of Titian's pictures, they remark: "The character and deep transparent colouring of the original are admirably rendered;" and of a less successful copy of a "Holy Family," from a picture attributed to Raffaele, they say, "The flesh is too pale, compared with the warm, powerful colouring of the original." In other words, praise is awarded to the successful copyist, and withheld from the unsuccessful. And justly so. If a copy be attempted, it should be an accurate one, faithfully representing, in an indestructible material, the works of the great masters, and giving to future generations as good an idea of their pictures as can be gained in so different a material: yet we cannot help regretting that the fine talents employed in the mere copying of pictures should not be oftener directed to the more legitimate object of improving and elevating pattern design. Copies of pictures in tapestry, or in worsted, fall under the same objection which applies to enamel-painting, and have not its recommendation of durability. They are produced with great mechanical labour, require little or no mental power in their production, and are as costly, or even more so, than some of the oil-paintings which serve as models. An elaborate picture, woven with the jacquard apparatus, is unquestionably a mistake in Art, and can scarcely rank higher than pictures in needle-work, and "Dignity and Impudence" in worsted. *Patterns*, not *pictures*, are the proper subjects for such materials as fictile ware and textile fabrics, and the pattern-designer has an abundant field for the display of his invention and taste, if he study Nature, and the best models to assist the suggestions of his own genius; for, with the endless magic of form, and the equally interminable harmonies and contrasts of colour, there can be no lack of subjects appropriate to the material to be adorned.

A highly wrought enamel-painting, on a snuff-box, or on a bracelet, is a legitimate exercise of the art: an oil-painting in such a position would evidently be out of place. What we object to is the making one branch of Art usurp the place of another. A full-sized portrait in enamel is a mistake, since it cannot equal the effect of an oil-painting, although the difficulties of production are infinitely greater: a miniature portrait in enamel, on the contrary, as worn in a bracelet, is in character with the ornament to which it is attached, partaking of its durability, and admitting a similar amount of friction and wear.

Vases which appeal to our sense of beauty by the poetry of form and graceful proportion may still be heightened by the magic of colour; but it admits of question whether landscapes and the figures of men and animals find a fitting place on such productions. A convex surface is not well adapted for a picture, and a design must suffer if the spectator have to walk round a circle in order to view it. Hence the judicious artist covers the surface with a pattern, which, seen at one part, can be continued by the mind to the other parts; while the more ambitious landscapes, figures, faces, &c., are disposed in the form of medallions which admit of being viewed separately, like so many distinct pictures, if, indeed, the position of the vase allow us to walk completely round it. In many cases, however, this is impossible; and the artist

falls into the ridiculous dilemma of having painted a couple of pictures, only one of which can be seen. This difficulty is sometimes got rid of by substituting another—viz., by making the vase movable on its plinth, in a vertical axis, as we noticed at the museum at Sévres, in some of the largest vases; thus effectually disturbing the idea of repose, which these massive forms ought surely to produce.

The figures of men and of natural objects introduced on antique vases had often a monumental character, and served the purposes of a people whose records were inferior as compared with our own, and whose religious associations required the use of vases so adorned. These exquisite and highly artistic forms mark the devoted affection of the living for those who had fallen asleep, and contrast strongly with the hideous piles of masonry which we erect to the memory of "the mighty dead." In the figures which adorn the antique vases, the colours are very few in number, and we may adduce as the nearest approach to them in modern times, the Limoges porcelain, in which only white and black are employed, with a few light tints of carnation for the face and some other parts.

But the vase, if judiciously adorned, harmonises so well with the poetry of life, and is always so suggestive of pleasing thoughts, and artistic associations, that we would allow considerable latitude in the amount and style of its ornamentation. Not so with most of the members, or "pieces," of a dinner-service. No amount of argument will convince us that it is decorous to cover with our food a highly finished copy of a picture by a great master. No amount of custom or fashion can make a practice aesthetically right which is, in itself, offensive to good taste. The very circumstance of hanging pictures on the walls of the dining-room condemns the custom of dealing out to the guests pictures on porcelain, to be viewed horizontally, and often upside down, and to be covered with food or its refuse. We quite agree with the opinion that in such articles as plates, dishes, cups, and saucers, the ornamentation should be of a simple and subdued character. The objects themselves may be as graceful and elegant as a due regard to the proper use of the article will admit of; the material may, and, indeed, ought to be, of the purest and choicest kind; the glaze should carry out this idea of purity; the wreath of flowers, or other ornament, ought also to relieve, not disturb, the leading idea of absolute purity in the articles from which we take our food. Good taste in ornamentation will not offend in the minutest particular. A judicious use of gold will indicate the choiceness of the porcelain, since gold is out of place on common ware. The flower groups will be disposed so as not to obtrude either by their size or position. A mistake in this particular lately came under our notice; the interior of a porcelain tea-cup was adorned with four small groups of flowers, equidistant from each other, and near the edge. One group was placed just 90° from the handle, so that the lips could not avoid meeting it in the act of drinking. Good taste would have placed the flowers so as to leave the pure white porcelain for contact with the lips. So with many other articles in white porcelain; the ware itself is so pure and beautiful that we may say of it as the poet said of our first mother—

"When unadorned adorned the most."

Custom, which reconciles us to the intense ugliness of every-day forms, has sanctioned the practice of elaborate ornamentation of dinner and dessert plates. The majolica ware set the example, and the most celebrated porcelain factories have followed it up, and still continue to do so. Now a plate is not a beautiful object; but if it contain a choice enamel picture, it may take its place in a cabinet with other articles, with the forms of which it may harmonise. But what shall we say of the taste which covers the walls of a whole room with dessert plates!—horizontal and vertical rows of round plates embedded as medallions in the walls! And yet we have seen such a room in France, the land of taste—and it was in the Imperial Palace of Fontainebleau; and it was done by order of Louis Philippe. It is true that the plates are of Sévres manufacture, each one containing a landscape, or an historical group, surrounded by a pattern border; but this freak was not wanting to prove that the improper use of beautiful and costly materials must result in ugliness.

The theory of enamel colours is now pretty well

understood. Thanks to the progress of chemical science, we have now happily passed, as Auguste Comte would call it, from "the superstitious" into "the positive phase" of fictile philosophy. And it now becomes our duty to give a brief account of the chemistry of enamel colours; but, as we have occupied so much space with these observations, we reserve our remarks for another paper.

EXHIBITION OF THE WORKS OF PAUL DELAROCHE.

The most noble temporary monument that can be reared to the genius of a deceased artist is an exhibition of his works. This remark applies especially to Paul Delaroche, as in consequence of his long withdrawal from the public galleries of Paris, very many of his best pictures are but little known. The exhibition recently opened in Paris must prove extremely gratifying to the admirers of this great artist, and indeed to all who are able to appreciate historical painting of the highest class; and to artists generally, such an exhibition constitutes a lesson of the utmost value, inasmuch as it develops a regular progressive advancement both in style and thought, from year to year. As many of his works as it was possible to gather together have been collected, and visited daily by crowds of Parisians, and strangers who happen to be sojourning in the city. The oil-paintings are numbered 1 to 61, the drawings in water-colours and in chalks from 61 to 112: numerous engravings after his works were, very properly, exhibited at the same time. We subjoin a list of the oil-pictures, with the dates, respectively, of the years when each was executed.

No. 1. 'Joas Saved,' Salon, 1822. No. 2. 'Fillipo Lippi,' Salon, 1824; engraved by Reynolds. No. 3. 'S. Vincent de Paul Preaching,' Salon, 1824; engraved by Prevost. No. 4. 'Joan of Arc and the Cardinal of Winchester,' 1824; engraved by Reynolds. These early paintings carry marks of academical study, and certainly give little promise of the talent afterwards shown by the artist.

No. 5. 'Death of A. Casani,' 1826. No. 6. 'Miss Macdonald,' 1827; engraved by Reynolds. No. 7. 'Scene of the St. Bartholomew,' 1827; engraved by Prudhomme. In these three paintings there is a visible progress; they are characterised by great delicacy of feeling and treatment.

No. 8. 'Death of Elizabeth,' 1827; engraved by Jazet. This is the well known painting belonging to the Luxembourg Gallery: the execution of the draperies and accessories is very fine, but the heads generally are disagreeable in colour and expression.

No. 9. 'Death of the President Duranti,' painted in 1827; engraved by Pelcé. A well-executed painting; it has been finely engraved.

Nos. 10 and 11. 'Richelieu' and 'Mazarin,' Salon, 1831; engraved by Girard. These are two of Delaroche's *chef d'œuvres*: they look as fresh and as beautiful as when we first saw them at the Salon of 1831; in delicacy of feeling and colour they stand among his best works. The prints, executed on a large scale, have had great success.

No. 12. 'Cromwell and Charles I.,' Salon, 1831; engraved by Henriquel Dupont. This painting, although in the catalogue, is not exhibited; it belongs to the Museum of Nîmes, the trustees of which refused to lend it.

No. 13. 'Jane Grey,' Salon, 1834; engraved. No. 14. 'Assassination of the Duke of Guise,' 1835; engraved. One of his fine small pictures, but unpleasing from the nature of the subject, which is told in a most forcible manner.

No. 15. Studies of Monks' Heads.

No. 16. 'Strafford,' 1837. A most powerful and well-executed painting, one of the best of his large works; it has been magnificently engraved by Henriquel Dupont.

No. 17. 'Saint Cecilia,' 1837; engraved by Forster. A painting in a flat, disagreeable style, with no relief or *chiaro-oscuro*.

No. 18. 'Study of an Angel,' after Mademoiselle L. Vernet; painted at Rome, 1835.

No. 19. 'Napoleon in his Cabinet,' painted 1837; engraved by A. Louis.

Nos. 20 to 23. Portraits.

No. 24. 'Infancy of Pic dela Mirandole,' painted in 1842; engraved by J. François. No. 26. 'Maternal Happiness,' painted in 1843; engraved by A. François. It belongs to the King of Holland. No. 27.

'Mary in the Desert.' A sketch for the painting executed in 1843 for the Marquis of Hertford.

No. 28. 'Young Girl in a Marble Bath;' painted at Rome in 1844. No. 29. 'An Italian Woman and Child,' 1844; engraved by Z. Prevost. No. 30. 'Young Girls Swinging,' 1845. Of the above six paintings little need be said; they are good, and may be mentioned as preparing the way for those exqui-

site small sacred subjects with which he closed his career, and which in delicacy of feeling, both religious and artistic, have rarely been equalled, and certainly never surpassed: one of these is—

No. 33. 'Christ in Gethsemane,' 1846.

Nos. 31, 32, 34, 35. Portraits, various.

No. 35. 'Napoleon at Fontainebleau,' 1847. The well-known painting, ably engraved by J. François; the property of J. Naylor, Esq.

Nos. 37, 38, 39. Portraits.

No. 40. 'General Buonaparte Crossing the Alps;' belongs to J. Naylor, Esq.; engraved by François.

No. 41. 'Marie Antoinette after her Condemnation,' painted 1851; engraved by A. François. A most powerful and interesting picture.

Nos. 42, 43. Portraits.

No. 44. 'Sketch of Napoleon at St. Helena,' 1852.

No. 46. 'Mater Dolorosa,' 1853; engraved by J. François.

No. 47. 'Moses exposed on the Nile,' 1853; engraved by H. Dupont.

No. 48. 'Burial of Christ,' 1853. An exquisite painting, beautifully engraved by H. Dupont.

No. 49. A small reproduction of the Hemicycle. This was executed for M. Goupil, in 1841; was retouched, with considerable alterations, in 1853.

No. 50. Portrait.

No. 51. 'Italian Mother and Child,' 1854; belongs to W. P. Knowles, Esq.

No. 52. 'Beatrice Cenci led to Execution,' 1855.

No. 53. 'A Martyr of the period of Diocletian,' 1855.

No. 54. Portrait.

No. 55. 'The Girondins.' One of the most effective works, and perhaps the best, of the master; began in 1846, finished in 1856: all the finest qualities of the painter are here seen in full force—no praise can be too high for such a work, it is being ably engraved by E. Girardet.

No. 56. 'Virgin Mary and Holy Women,' 1856.

No. 58. 'Christ the Hope of the Afflicted,' 1856.

No. 60. 'The Return from Golgotha,' 1856; sketch unfinished. No. 61. 'Virgin in Contemplation of the Crown of Thorns.' Four of the most beautiful of the small pictures.

No. 57. 'Herodias.'

No. 59. Portrait.

The drawings in chalk, being principally portraits and sketches, need not a particular description; they are beautifully and delicately finished.

No painter has had greater justice from the hands of the engraver than Delaroche, and no one deserved it better; his loss is a severe one to the French school; and when two or three more artists, now advanced in age, are removed, "Who will be able to replace them?" is a question easier put than answered.

ART IN CONTINENTAL STATES.

PARIS.—The jury for the admission of paintings, &c., has finished its task; but the result is, as might be expected, very far from satisfactory to those artists whose works have been rejected: among them are many whose talents ought to have secured them commanding positions in the *Salon*: in our next we shall resume this subject, and give some account of the exhibition.—Death has recently removed several artists of good repute. M. Simart, Member of the Institute, and one of our best sculptors, met with his death in an unfortunate manner: descending from the top of an omnibus, his foot caught, and he was dragged some time before the vehicle could be stopped: death ensued from the injuries he received. M. E. Goyet, historical painter; M. L. Estachon, a pupil of Roqueplan; M. Guet, an artist of merit, and a regular contributor to the *Salons*, several of whose works have been engraved in mezzotint by Girard,—are also among the losses sustained by the Art-world.—M. L. Auvray has received a commission to execute for the Louvre a bust of Watteau.—The Minister of State has allowed 3000 fr. for the erection of a monument to Lesueur in the Garden of the Luxembourg.—M. Dumont has been commissioned to execute a statue of Labourdonnais for the Mauritius.

BERNE.—Out of the number of twenty-three designs lately submitted in competition for the erection of the Roman Catholic church of St. Peter and St. Paul at Berne, two by English architects had prizes awarded to them: a gold medal—the fourth prize—to the design of Mr. Goldie, of Sheffield; and a silver medal to that of Mr. Pedley, of Southampton.

ST. PETERSBURG.—The National Gallery of St. Petersburg has been enriched with the Lichtenburg bequests of pictures, partly collected by Eugène Beauharnais, when viceroy of Egypt; and also with the Barberigo collection from Venice, which, among many other fine works, contains seventeen examples of Titian, from his earliest time to his latest.

OXFORD IN THE STEREOSCOPE.*

SELDOM has there been a series of views so entirely interesting as this—the most successful effort that has yet been made to render the stereoscope, not only a source of intense enjoyment, but a veritable and effectual teacher of Art. The pleasant companion of the drawing-room has ceased to be "a toy;" it has become an instructor: lessening in no degree its power to amuse, it is now a means of education, the influence of which it would not be easy to overrate, inasmuch as it induces thought in lieu of idleness, and makes leisure profitable. No happier theme could be found on which to employ the charming art of photography than that of the venerable and beautiful city of Oxford; it appeals to so many sympathies; is "a memory" to thousands whose early associations are with its

"Domes and towers,
Gardens and groves;"

and who, in these records of its peculiar graces and beauties, may revisit—by no great strain of imagination—the places in which studious youth was passed in preparation for ardent manhood, and the armour was girded on which gave vigour and power for the battle of life.

We can conceive few pleasures equal to that which must be enjoyed by him who resorts to this elegant and instructive "toy" for memories of long past days: every familiar scene is brought before him; he knows there is nothing to deduct for the fancy of the artist—nothing has been added, nought abstracted; stern but attractive truth is there, in each one of these many pictures: if the "walks" are altered, it is only because time has added somewhat to the height and breadth of the trees that give augmented shade to paths he has trodden; if there be some change in the walls and gateways and towers he so well remembers, it is only because age has its influence on all outward things. He may again enjoy Oxford—"that faire cite, wherein make abode so many learned impes"—and enjoy it thoroughly; untroubled by that "tumultuous hope" which here especially "toils with futurity."

If the soldier may "fight his battles o'er again" when tracing on the map the march of armies, surely the scholar has higher and nobler triumphs when revelling in the retrospect—in cloisters pale, in venerable halls, beneath stately porticoes, in silent galleries, in sombre quadrangles, by solemn altars, in quiet gardens, in umbrageous walks; every step or stone of which is as a familiar friend, entitled to a heart-greeting; and welcomed by memory without a thought of reproach.

But considered merely as beautiful works of Art, and entirely apart from any association with a life of intellectual labour here commenced, this series of Oxford views has abundant attractions. The subjects are especially calculated for display by the stereoscope; they are precisely of that nature which are thus made to "tell" best: buildings of striking architecture and order; antique gables and gateways; "bits" by the water-side—the rich banks of the King of Island Rivers; walks amid trees terminated by quaint temples; ancient walls, embattled, which time has "mouldered into beauty;" bridges and streets, unrivalled anywhere; with the several accessories which give peculiar character to each. The themes here selected will indeed be understood by all who are acquainted with the venerable city; while those who are strangers to it will at once feel that a source more productive of valuable materials could not be found in England, not perhaps in the world.

The task of thus multiplying these grand attractions of Art and Nature has been confided to safe hands; no artist could have produced them more satisfactorily than M. Delamotte, while in Mr. Alderman Spiers he found a valuable guide—for to him every spot of interest is known. The photographer and the publisher acting together and in concert, have produced a series which cannot fail to give delight while affording information; they have made the pleasant and graceful "toy" a valuable means of education.

* A Series of Views of the Public Buildings, Colleges, Gardens and Walks of Oxford; photographed by P. H. Delamotte, F.S.A. Published by Spiers & Son, 11th Street, Oxford.

THE BOOK OF THE THAMES,

FROM ITS RISE TO ITS FALL.

BY MR. AND MRS. S. C. HALL.

PART VII.

FROM Abingdon the Thames pursues its course with little to attract the tourist until we arrive at the ferry of Clifton, over which hangs a small hill, the summit of which is crowned by one of the most graceful and beautiful modern churches in England.

Before we visit it, however, let us pause awhile to enjoy the calm quiet of the scene; to examine the luxuriant water-plants, and listen to the music that issues from every "bush and hosky dell," and not unfrequently from the borders of the stream on which we glide.

The chorus of lively chirpings that greets our ear from the neighbouring reed-beds, proceeds from those little aquatic songsters, the Sedge-warbler (*Salicaria phragmites*), and the Reed-warbler (*Salicaria arundinacea*); two birds closely related in appearance and habits, and generally to be found in company in reedy spots by the water-side, uttering their varied chant, the programme of which comprises imitations of the notes of the swallow, lark, sparrow, and linnet, with some original bits of their own.

We append a cut of the reed-warbler—the larger bird of the two, with its curiously constructed and situated nest, suspended between three or four reed-stems above the water, formed of reeds and grass, wound round and interlaced with the supporting stems, and lined with a little wool, fine grass, and long hairs; it is made of considerable depth—a necessary provision for the safety of the eggs or young, when it is considered that, from its suspended situation, their cradle is rocked by every breeze, and in a high wind the slender reeds that support it bow almost to the surface of the water; yet the mother bird has been seen to sit steadily in her nest when it was swinging and dipping with the violence of the wind-gusts, so as occasionally to be almost immersed in the water.

This elegant little warbler is of somewhat sombre colouring, being brown above and buff beneath, with white throat, and is one of our summer visitors only—remaining in this country from April to September, when it seeks a warmer latitude—its insect food becoming very scant as winter approaches. Those who row up or down the Thames, or walk along its ever pleasant banks, have, therefore, a source of enjoyment which inland dells and woods do not afford, for the notes of these birds, even if "Sounds inharmonious in themselves and harsh,"

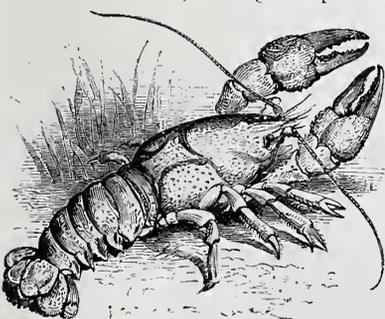

give exceeding pleasure when in keeping with the character of the scene, and in harmony with those "gentler solitudes" which create tranquil joy—

"Nor rural sights alone, but rural sounds,
Exhilarate the spirit, and restore
The tone of languid Nature."

THE REED-WARBLER.

The common river Crayfish (*Astacus fluviatilis*), which abounds in the Thames (and "its tributaries") for the greater part of the course, is frequently brought to market as an article of food, but is not held in much esteem.

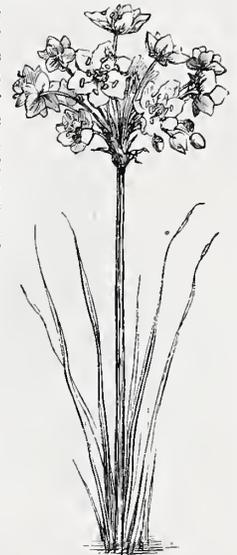

THE CRAYFISH.

In general appearance it greatly resembles a small lobster, but on comparing the two together considerable difference in structure will be observed, the body of the crayfish being flatter than that of the lobster, and the claws being rougher, and of a distinct form. The colour of this animal is a dull, dark, greenish grey, and its usual length about three or four inches. The principal food of the crayfish consists of aquatic shell-fish, the grubs of insects, and sometimes even of such small fish as come within their reach. The following amusing and graphic account of the habits of this species in confinement was communicated by Mr. Ball, a naturalist of Dublin, to Professor Bell, from whose work on "British Crustacea" we quote it:—"I once had a domesticated crayfish (*Astacus fluviatilis*), which I kept in a glass pan, in water not more than an inch and a half deep; previous experiments having shown that in deeper water, probably for want of sufficient aëration, this animal would not live long. By degrees my prisoner became very bold, and when I held my fingers at the edge of the vessel he assailed them with promptness and energy. About

a year after I had him I perceived, as I thought, a second crayfish with him: on examination I found it to be his old coat, which he had left in a most perfect state. My friend had now lost his heroism, and fluttered about in the greatest agitation. He was quite soft, and every time I entered the room, during the next two days, he exhibited the wildest terror. On the third he appeared to gain confidence, and ventured to use his nippers, though with some timidity, and he was not yet quite so hard as he had been. In about a week, however, he became bolder than ever; his weapons were sharper, and he appeared stronger, and a nip from him was no joke. He lived in all about two years, during which time his food was a very few worms, at very uncertain times; perhaps he did not get fifty altogether. I presume some person, presuming to poach in his pond, was pinched by him, and plucked him forth, and so, falling, he came by his death." During our visit to Oxford, a thoughtful friend furnished the breakfast-table with the crayfish, which is there considered a luxury "in season"—the season being the autumn of the year. Although frequently eaten on the Continent, it is but seldom used in England, even as the garnishing of a dish. Like the lobster, it is dark—almost black—when alive, but becomes red when boiled. In several parts of the river, and especially in the neighbourhood of Binsey, above Oxford, the fish is obtained in large quantities; these are caught in traps resembling the common eel-traps, but much smaller; they are formed of common willow-wands, and are baited with animal matter, or with dead fish.

We were gratified by finding in great plenty near Abingdon that most elegant aquatic, the Flowering Rush (*Butomus umbellatus*), clumps of which were constantly occurring where the water was shallow, either at the river-side, or in spots where the ground approached the surface in mid-stream. It is a lordly plant, with its graceful stem rising from the water some three or four feet, bearing on its head a crown of purple and white flowers—a "bunch" of considerable size. The long grassy leaves, which diverge in sweeping curves from its foot, add greatly to its beauty. Those who have seen this charming plant will agree with the eulogium of quaint old Gerard, who, describing it in his Herbal, saith;—"The Water Gladiole, or Grassie Rush, is of all others the fairest and most pleasant to behold, and serveth very well for the decking and trimming up of houses, because of the beaute and braverie thereof." It is by no means common to all the banks along the Thames. We voyaged many miles on several occasions, and sought for it in vain, finding it in great luxuriance in the river Tame, between Dorchester and the junction. It resembles, however, so nearly the common rush when not in blossom, that the unscientific searcher might easily pass it by without recognition.

FLOWERING RUSH.

It is singular that while so many efforts have been made to transfer to the greenhouse and garden the exotics—weeds—of foreign countries, we have so much neglected the wild graces which await, at our own doors, that removal for culture which expands and extends beauty. Even in the miniature lakes which so often refresh an "elegant demesne," or in the ponds that so frequently act as drains to a lawn or plantation, and are made "ornamental," that the eye may be gratified by converting a blot into a grace, we too generally observe that Nature is left to plant as she pleases, while a little aid brought to her from one of her rich stores of fertility and beauty, might essentially add to its other attractions.

The walls and woodwork of the old locks are beautifully decorated with groups of graceful plants that would altogether form choice studies for the pre-Raphaelite painter. Perhaps the most elegant of these is the Ivy-leaved Snapdragon (*Linaria cybalaria*), a pendent plant, with glossy, deep green, ivy-like leaves, and quaintly formed flowers of violet colour, with yellow throat. It appears this is not strictly an indigenous plant; but that it was originally introduced from Italy into our gardens, from which it has escaped and naturalised itself through the country, having now become as thoroughly English as any family that came in at the Conquest. From Oxford to Teddington we are continually meeting with the flowery festoons of this pretty plant, wherever old stonework is found in proximity to the water: we may suppose seeds of it have in old times escaped from some Oxford garden washed by the Thames, and, having been carried downwards by the stream, were deposited in convenient resting-places along the river's course. This will account for the abundance of the plant on the line of the Thames, while in most other districts it is hardly ever met with.

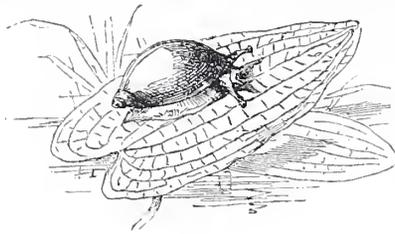

IVY-LEAVED SNAPDRAGON.

It will be obvious that from these water-plants the designer of ornament may obtain very valuable lessons; it is indeed surprising that as yet they have been but little resorted to for the purposes of the manufacturer, or of those artists to whom he gives special employment. He will find within the range of any single mile on the upper Thames a number of valuable suggestions, any one of which would be a "fortunate thought,"—for it would have the value of novelty, inasmuch as subjects to be obtained there have been hitherto made so little available.

On the floating leaves of the water-plants, or among the moist herbage of the river-side, we constantly find a curious little shell—the Amber-shell (*Succinea*

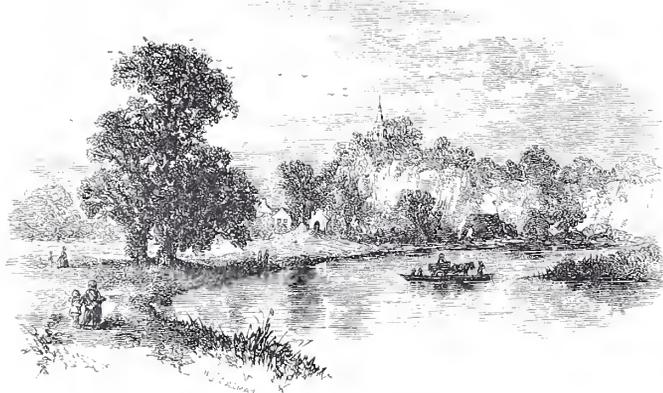

amphibia)—tenanted by an odd-looking little creature of amphibious habits, who, though born in the water and passing much of its existence there, has

AMBER-SHELL.

the faculty of leaving that element at pleasure, and wandering to considerable distances from it without injury; we observed it sometimes high up on the stems of plants, quite removed from the water. The shell is very fragile and transparent, of a clear amber tint, whence its name of "Amber-shell." Many of the fresh-water shells, of which a great number of species inhabit the Thames, are of elegant forms; and the habits of the animals that occupy them render them extremely interesting objects for the aquarium, where their history may be studied to great advantage; moreover, a collection of these shells would make a pretty addition to the cabinet.

Before we reach the little church of CLIFTON HAMPDEN, we pass the villages of Sutton Courtenay and Culham—the former with a modern, the latter with an old church; both are towered and embattled, and have a picturesque effect. They are situated about two miles from Abingdon, the river flowing the whole way through meadows of the richest luxuriance, their banks covered with wild flowers. A mile beyond this, the railway crosses the river at the village of Appleford. The banks here rise to a considerable elevation, and

CLIFTON HAMPDEN CHURCH, AND FERRY.

upon their summits many graves of the early Roman and Saxon settlers have been discovered. At Long Whittenham, close by,—a quiet village embosomed in trees,—some fine Anglo-Saxon jewels have been exhumed.* The scenery is purely pastoral, but is relieved by gently-undulating hills. Upon one of the boldest stands the new church of Clifton—for it is a new church, although externally and internally the architect has followed the best

LICH-GATE, CLIFTON.

models of the best periods of church architecture; it occupies the site of the ancient structure; indeed, the foundations, and some portions of the walls, have been preserved. It is a most attractive and graceful object seen from the river, and will bear the closest examination, for every part of it has been confided to the care of a competent artist; and all its appurtenances are as perfect as Art can make them. The village, too, is neat, well ordered, and evidently prosperous. Over the whole district there is evidence of wise and generous superintendence: the clergyman is, we believe, the squire, and it is obvious that the temporal as well as the spiritual wants of the district have a generous and

considerate minister.† A handsome LICH-GATE of carved oak has been placed at the entrance of the church-yard, adding much to the picturesque beauty of the scene. From the tower of this church, raised as it is so much above the

* The hill above Long Whittenham has earthworks of an early kind upon it, believed to be the work of the Romans; it is certain that these early conquerors of Britain were located here, inasmuch as many antiquities, unmistakably Roman, have been found in the immediate vicinity; and several of their burial-places discovered, from which vases, coins, &c., were obtained.
† "A small church, of mixed styles, beautifully situated on a cliff, at a bend of the river Thames. It has been restored under the direction of Mr. Scott, the architect, in extremely good taste, by the present patron, Mr. Henry Hucks Gibbs, in pursuance of the wishes of his father, the late Mr. George Henry Gibbs, with whom the design of restoring the church originated, and who left by will a considerable sum for this object." ("Guide to the Architectural Antiquities in the neighbourhood of Oxford," Parker.)

surrounding scenery, we obtain a noble view of now distant Oxford; and here, especially, we are impelled to recall the lines of the poet Warton:—

"Ye fretted pinnacles, ye fanes sublime,
Ye towers that wear the mossy vest of time;
Ye massy piles of old munificence,
At once the pride of learning and defence;
Ye cloisters pale, that, length'ning to the sight,
To contemplation step by step invite:
Ye high-arch'd walks, where oft the whispers clear
Of harps unseen have swept the poet's ear;
Ye temples dim, where pious duty pays
Her holy hymns of ever-echoing praise;
Lo! your loved Isis, from the bord'ring vale,
With all a mother's fondness bids you hail!
Hail! Oxford, hail!"

After passing Clifton the hills to the right are somewhat bold in character, and we see more distinctly the picturesque formation of the Long Whittenham range: they are round, chalky hills, with clumps of trees on their summits. We now pass by Little Whittenham Church, which is embosomed in luxuriant trees, and the fine, woody hills beside Day's lock, where the river makes a circuit, passing, as usual, between low and luxuriant banks on either side, where the hay-harvest is ever abundant, but where the husbandman will rarely look for any other crop, inasmuch as the land is covered with water in winter floods.* We approach Wallingford, but within a mile or two of this town the voyager will pause at a narrow bridge, about twenty feet in length, which crosses a poor and somewhat turbid stream. The tourist would row by it unnoticed, as of "no account," but that he knows this to be the famous river Tame, and that here it joins the Thames—or, if the fanciful will have it so, "the Isis;" this being the marriage-bed of the two famous rivers, who henceforward become one; for from this spot, according to the poet,—

"Straight Tamis stream,
Proud of the late addition to its name,
Flows briskly on, ambitious now to pay
A larger tribute to the sovereign sea."

Although most of the poets have described "Tame" as of the rougher, and "Isis" as of the gentler sex, they are not all of one mind on this subject. Camden celebrates the Tame as a female—

"Now Tame had caught the wish't for social flame
In prospect, as *she* down the mountains came."

With Drayton, Tame is the bridegroom—

"As we have told how Tame holds on *his* even course,
Return we to report how *Isis* from *her* source
Comes tripping with delight."

He calls her also—"the mother of great Thames." Pope, in allusion to the Thames, makes reference to

"The famed authors of his ancient name,
The winding Isis and the fruitful Tame."

And Warton,—

"As the smooth surface of the dimpled flood
The silver-slipper'd virgin lightly trod."

The Tame rises in the eastern part of the Chiltern Hills, in Buckinghamshire, between the town of Aylesbury and the village of Quercudon; and after winding through the golden vale of Aylesbury, enters the county of Oxford, and soon refreshes the town to which it has given a name. Hence its course is to the very ancient city of Dorechester, from whence by slow progress—and by no means "running to the embraces" of the fair Isis—it paces about two miles

JUNCTION OF TAME AND ISIS.

to join the Thames beneath the small wooden bridge we have pictured—its whole course, from its rise to its fall, being about thirty-nine miles. Fancy may be permitted full scope and free indulgence while "the voyager" passes underneath the plain rustic bridge that marks the interesting locality. He has visited the scarcely-perceptible source of the great river—already seen it fertilise and enrich cities, towns, and villages; but here he will naturally consider in prospect the mighty gifts it presents to the world, between this comparatively

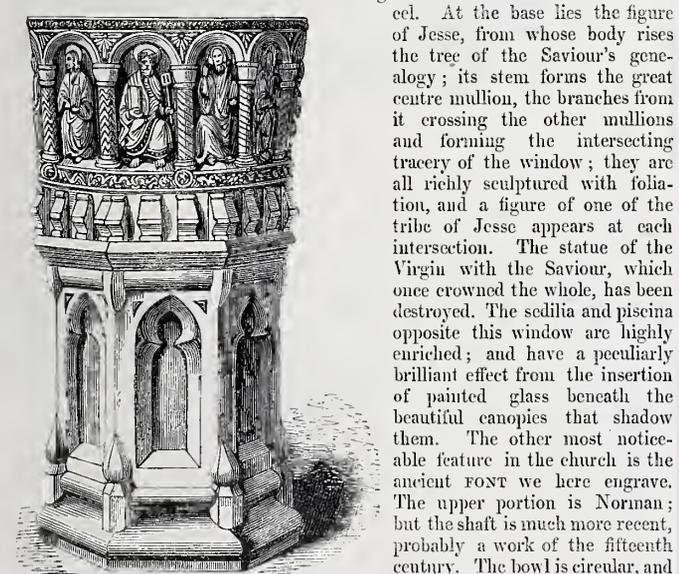

* "Tradition has given to this place (Little Whittenham) an intellectual importance which heightens, at least, if it does not transeend, its native beauties. Here an oak had long flourished—and hard was his heart who suffered the axe to strike it—beneath whose shade Prior is said to have composed his poem of Henry and Emma. The poet has described this spot as the scene of his interesting story, and such a tree might surely have been spared for the sake of its traditionary character, when the general ravage was made, by its last possessor, on the sylvan beauties of the place." (Boydell, 1794.)

insignificant confluence of "two waters," and the illimitable sea to which they are together hastening:—

"Let fancy lead, from Trewsbury mead,
With hazel fringed, and eopse-wood deep;
Where, scarcely seen, through brilliant green,
Thy infant waters softly creep,
To where the wide-expanding Nore
Beholds thee with tumultuous roar,
Conclude thy devious race;
And rush, with Medway's confluent wave,
To seek, where mightier billows rave,
Thy giant Sire's embrace."

A row up the Tame to visit Dorchester will be the duty of those who have leisure and desire to examine the several points of interest on or near our great British river. He will be amply repaid for a brief delay. Although the "city" has fallen to the grade of a poor village, the Roman amphitheatre is an earth-mound, and the cathedral half a ruin,* history and tradition supply unquestionable proofs of its former magnificence—proofs which time has been unable altogether to obliterate. On its site was a Roman station of large extent and importance; and the place was famous during the ages that immediately followed. But its high and palmy state was in the seventh century, when Birinus, who was sent from Rome to convert the West Saxons, here first preached to them the Gospel of our Lord. The missionary had baptised Cuiuigils, the king; and at the ceremony Oswald, King of Northumberland, attended as god-sib; when the two sovereigns, according to Bede (who calls it Civitas Dorceina), gave the bishop this town for the foundation of an episcopal see in honour of the occasion. The see was for a long period of "gigantic dimensions," comprising the two large kingdoms of the West Saxons and Mercians. Twenty bishops here sate in "papal grandeur;" and, although seven bishoprics were afterwards "taken out of it," the see continued to be the largest in England, until about the year 1086, when Remigius removed it to Lincoln. At the Conquest, however, the town had dwindled; it was "small and ill-peopled," although "the majesty of the church was great, either by the antiquity of the building or the diligence of such as had lately repaired it."

The old Abbey Church at Dorchester is remarkable for its extreme length, and for some peculiar architectural features. It is now much too large for the wants of the parish, and was, some few years ago, allowed to fall into a lamentable state of decay, from which it has been in a great degree rescued by a general subscription, under the auspices of the Oxford Architectural Society. The portions of Norman architecture now remaining are striking in their solidity and beauty; but the most remarkable feature in the church is the celebrated "Jesse window" which lights the north side of the chancel.

THE FONT, DORCHESTER.

At the base lies the figure of Jesse, from whose body rises the tree of the Saviour's genealogy; its stem forms the great centre mullion, the branches from it crossing the other mullions and forming the intersecting tracery of the window; they are all richly sculptured with foliage, and a figure of one of the tribe of Jesse appears at each intersection. The statue of the Virgin with the Saviour, which once crowned the whole, has been destroyed. The sedilia and piscina opposite this window are highly enriched; and have a peculiarly brilliant effect from the insertion of painted glass beneath the beautiful canopies that shadow them. The other most noticeable feature in the church is the ancient FONT we here engrave. The upper portion is Norman; but the shaft is much more recent, probably a work of the fifteenth century. The bowl is circular, and exhibits figures of apostles seated

above and below them is a rich border of foliage. The whole of this portion of the font is of lead, and the rarity of such early work in this material makes this example precious in the eye of the antiquary. It is, moreover, a curious work of Art, inasmuch as it presents the peculiar features which are strongly characteristic of the Byzantine taste, founded on the decadence of the great Roman empire in the East. The richness of detail and abundance of decoration visible in the Norman style may be referred to this influence on European Art.

From the junction to Wallingford the "united streams"—

"With friendly and with equal pace they go,
And in their clear meanderings wandering slow"—

soon pass under the bridge of Shillingford, from whence the tourist may walk some two or three miles to offer homage at that shrine in the grand old church of Ewelme, which contains the dust of Sir Thomas Chaucer, the poet's first-born son.

Shillingford is an antiquated village, with many large farm-houses of red brick and timber, warmly thatched, and with an air of picturesque comfort

* An earthwork, intended as a fortification, stretches from one river to the other, across the meadow formed by the circuitous bend of the Thames. It appears to be of Roman work, and to have been a military outpost, to guard the town on a weak side.

about them thoroughly characteristic of English rural life of "the better sort." Indeed, this portion of the Thames is as completely rural and unsophisticated as any part of England. The character of the scenery changes completely at the bridge, and we see again the rich level meadows, with the square tower of Bensington Church, and the quiet village of farms and cottages beside it.* A mile further, and we reach another lock, close to the town of Wallingford, which is nearly hidden by the luxuriant growth of trees in surrounding meadows.

Wallingford was famous in its day: the Gauls, the Romans, the British, the Saxons, and the Danes, had each and all their settlements there; it was a borough in the time of the Confessor, and had a mint before the Conquest.† Traces of its ancient walls and castle may still be obtained by the patient searcher; the latter is described by old historians as "impregnable," but "Time, the destroyer," has effectually removed all its strength except a few indications, which consist of rubble and stones. In the time of Leland it was "sore in ruins, and for the most part defaced." Camden described it as "environed with a double wall and a double ditch; the citadel standing in the middle on a high artificial hill." It must have been of immense size and strength, and was regarded as "impregnable" before

"Villainous saltpetre had been dug
Out of the bowels of the harmless earth."

During the civil wars, when King Stephen and the Empress Maud contended for England, the lady was here besieged by her enemy; but all assaults were vain, until famine came to the aid of the besiegers. Her son, afterwards Henry II., arrived at the seat of war just in time to save his heroic mother; but a conference took place on the river's bank, when it was resolved that Stephen should possess the crown during his life, and that Henry should succeed him. Of its "fourteen parish churches" Wallingford retains only three, one of which was "erected at the sole expense of that eminent lawyer and learned judge, Sir William Blackstone." Notwithstanding its comparative decadence, however, Wallingford has the aspect of a cheerful and thriving town.‡

Soon after passing under its bridge we reach the little Norman church of Crowmarsh, and about a mile further, at a lock known as "Chamber Hole," we observe Newnham-Murrell, with an old church on one side of the river, and Winterbrook on the other. A short distance below is Mongewell,—a fair mansion, with rich gardens, lawn, and plantations. A small modern Gothic church is erected here. We soon reach Cholsey, where an older church awaits the antiquarian tourist. At Little Stoke, some distance onward, we are again met by a railway-bridge, and notice the high chalk down rising above it. Passing the bridge, the church of Moulsoford appears embosomed in trees. Nearly opposite is South Stoke, and, a short distance further, at Cleeve Hill lock, we arrive in view of the Streety hills, at the foot of which are the twin villages of Streety and Goring—the former in Berkshire, the latter in Oxfordshire, joined by a long and picturesque bridge, from which a fine view is commanded of the river, with its graceful windings and its pretty "aits" above and below, and especially between the bridge and the lock, distant some half a mile apart. These villages of course contain churches; that of Goring, however, is by far the most interesting; it stands close to the water-side, and beside it are a graceful cottage and a busy mill.§

The church is of Norman foundation, but the tower only preserves the peculiar features of that style. It is very massive in construction, with round-headed windows, divided into two lights by a central pillar; a winding stair to the belfry is formed in a small round tower appended to the north side of this

* "West of the church is a bank and trench, of a square form: the north side still retains somewhat of its original appearance; to the west and south they are readily traced, but to the east it requires a minute examination to discern them. Doctor Plot mentions an angle of King Offa's palace near the church, which must have stood on this spot, where bones of men and horses, as well as old spurs and military weapons, have been dug up. This, being a frontier town, often changed its masters in the contests between the west Saxons and the Mercians. Offa, king of the latter, considering it to be politically necessary to his government that his enemies should hold no place on that side of the Thames, at length possessed himself of it, and finally united it to his own dominions." (Boydell, 1794.)

† We engrave here the silver penny struck at Wallingford by Edward the Confessor.

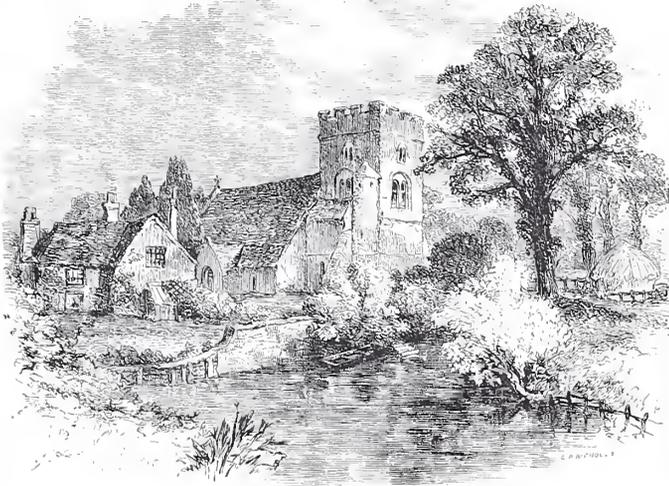

It is a type of the utmost rarity, and is preserved with other scarce Saxon coins in the Bodleian Library. By comparing it with the Oxford coin of Alfred, which we have also engraved, the progressive improvement in the English mintage will be apparent—a neater and truer character prevails in those of the Confessor, indicative of more peaceful times. Indeed, the coinage of England tells in some degree the history of the country. The rude monies of the Heptarchy seem only fitted for barbaric need; and it is not until the amalgamation of the Saxon kingdom under one sovereign that a great improvement takes place. The rude heads of early kings on our coins seem scarcely human; but this of Edward the Confessor exhibits truthful features. In the troublous times which succeeded the death of the Norman Conqueror, the national currency lapsed into its old barbarism, and it was not till the era of Edward I. that it recovered itself. We must refer to the Reading penny, engraved under our notice of that town, as an example, and to the note appended, for a continuation of these remarks.

‡ Camden mentions his having frequently visited it in his academic character, and that it then retained a considerable portion of its ancient grandeur.

§ Nearly a century has passed since the village of Goring was "famous" "on account of the virtues" of a medicinal spring in its immediate vicinity: it was called "Springwell," and was situated on the margin of the Thames. It is particularly mentioned by Dr. Plot (in the reign of Charles II.) as celebrated for its efficacy in the cure of cutaneous disorders, and also for ulcers and sore eyes. Much more recently, however, it was considered "a valuable specific;" for its then owner, Richard Lybbe, Esq., published several advertisements, wherein he states "that other water had been substituted and sold for that of Goring spring;" and he informs the public that, to prevent such deception, every bottle or vessel hereafter filled with the genuine water shall be sealed with his arms, of which he gives a particular description; and that the persons appointed by him to seal and deliver it, shall demand nothing for the water, but a penny a quart for attendance and impress of his arms. The value of Springwell, if it ever had any, has long ceased to be appreciated. The spring now gives its supply to the Thames without fee or reward, and the "penny stamp" is a tradition of the past.

square tower. The body of the church is much more modern—a circumstance by no means uncommon in English ecclesiastical architecture. It has been recently restored in very good taste; but while it gratifies the ecclesiologist, it offers few antique features on which the architectural student can dwell.

GORING CHURCH.

The houses at Goring are excellent examples of those "peasant homes" which nowhere exist more happily than in our own favoured isle. The cottages have that look of comfort so essentially English, and their little gardens are trim and neat. Its opposite village has equal claims to attention, and is more romantically situated on the hill-side. The scenery is the most striking we have yet met in our downward course.

Resuming our voyage, we leave to the right, on the slope of one of the hills which now "accompany" us for several miles, the beautiful mansion of Basildon. Hence, until we arrive at the villages of Pangbourne and Whitchurch, the Thames assumes a new character—high hills, richly clad in foliage, suspend over us on either side, now and then opening, occasionally bare, and frequently fringing the banks of the stream with the branches of the best varieties of British trees. The villages of Pangbourne and Whitchurch, like those of Streatly and Goring, are united by a bridge, a little above which are the lock and weir; the scenery all about this neighbourhood is exceedingly interesting and beautiful—the stream is broad, and the wood-crowned heights that arise on either side add to the view that variety which is especially welcome after so much that is tame and flat, with which the upper Thames so continually supplies us. These low lands, however, have their value; not alone as suggestive of fertility—they abound in the picturesque; of such scenes the poet has happily said—

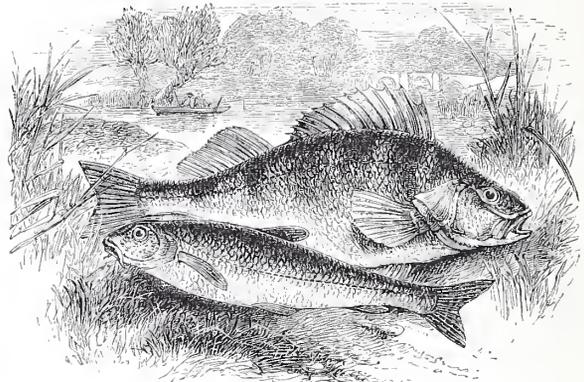

"Everywhere
Nature is lovely: on the mountain height,
Or where the embosom'd mountain glen displays
Secure sublimity, or where around
The undulated surface gently slopes
With mingled hill and valley;—everywhere
Nature is lovely; even in scenes like these,
Where not a hillock breaks the unvaried plain,
The eye may find new charms that seeks delight."

The Thames at Pangbourne—above and below it—is, and has long been, a favourite resort of the angler; its sides "hereabouts" are full of water-lilies and those other aquatic plants which afford the fish shelter and protection; they are especially such as are loved by the perch—and perch fishing in this vicinity is perhaps as good as it is upon any part of the beautiful river. The perch is "one of the most beautiful of our fresh-water fish, and when in good condition its colours are brilliant and striking," according to Yarrell—from whom this passage is borrowed—"the upper part of the body is a rich greenish brown, passing into golden yellowish white below; the sides ornamented with from five to seven dark transverse bands; the irides golden yellow; the fins brown, spotted with black." The scales are rough, hard, and not easily detached, as the angler well knows: the fins are so sharp that those who handle them must be careful of their touch. The fin of the perch is, indeed, a weapon of defence, and is said to protect it against the assaults even of the pike; certain it is that the perch will live and thrive in a pond or lake with pike, while all its other denizens gradually vanish before the tax which the water-wolf perpetually levies. The perch has been emphatically called "a bold fish;" he is unquestionably, as old Izaak styles him, "a bold biting fish." If one be caught another is pretty sure to follow; and as they usually "march in troops," and are seldom scared by any noise or bustle in the water, the angler, when he encounters a "school" of them, is likely to fill his basket before his prey discovers what he is about. Again to quote from Izaak Walton, "they are like the wicked of the world, not afraid, though their fellows and companions perish in their sight." The perch is fished for in the Thames usually with a "paternoster;" that is to say, a gut or hair line of about four feet long is mounted on the ordinary running line, and this gut or hair line contains three hooks, mounted on pigs' bristles, placed at intervals a foot or eighteen inches apart, so that different depths are attained. The usual bait is the minnow, but the fish will eagerly take the brantling or dew-worm. The perch is not often taken in the Thames above a pound weight, or above eight inches in length. They grow, however, to a much larger size, frequently weighing four or five pounds, and occasionally so large as eight or

nine pounds: they breed rapidly. Yarrell states that a perch of half-a-pound weight has been found to contain 250,000 ova. Like the pike, it is a fish of prey, and has great tenacity of life; perch have been kept for twenty-four hours out of water without peril to life. Next to the trout, the pike, and the eel, the perch is perhaps the best fish for the table, its flesh being hard and sound.

The Gudgeon (*Gobio fluviatilis*) is commonly found where the perch luxuriates; although associates, however, they are by no means friends—on the contrary, the one is the prey of the other. The gudgeon abounds in the Thames, and to catch them is a favourite sport of the angler—and a pleasant sport it undoubtedly is, inasmuch as it is usually pursued in hot weather, when there is little disposition to exertion, and repose, amounting to indolence, becomes pleasure for a season. It is in this pursuit especially "the punt" is used, and it is frequent in June and July to see one of these boats moored in the centre of the river, containing three and sometimes four persons, lazily hooking the fish and bringing it to the boat's side, when the fisherman removes it from the hook, sees that the bait is in order, and places it again in the water, to be almost immediately drawn up again for a like operation.

Gudgeons swim in shoals, are always greedy biters, and a very small degree of skill is therefore requisite to catch them; it is the amusement of ladies and boys more frequently than of men; for the fish is sure to hook himself, and little more is required of the angler than to put the bait down and draw it up again, as soon as he sees his light float under water. Consequently, "jokes" concerning this easy sort of fishing are very abundant, and it must be confessed they are not unmerited; for neither skill, labour, nor activity, are requisite to catch some ten or fifteen dozen of this tiny fish by a single hook in a day; and a boat such as we describe may be pretty sure to contain thirty or forty dozen, when a late dinner-bell calls a party home on a summer evening.

PERCH AND GUDGEON.

But let not those who can enjoy no pleasure that is not derived from toil despise that pleasure which is simple and obtained easily. The gudgeon fisher usually seeks a holiday, a quittance from labour, a repose from thought; "his idle time" is, therefore, never "idly spent;" but his amusement is derived from other sources besides those supplied by his rod and line; he moves about from place to place—from "pitch" to "pitch;" the hot sun is rendered not only innocuous but agreeable, when a gentle breeze passes along the river to cool his brow—look where he will his eye encounters some object of natural beauty, and his ear is regaled by the songs of birds along the banks, and the lark ever rising above some adjacent meadow. He has leisure to enjoy all this and much more—musing and not thinking—reclining rather than sitting—because neither the exercise of skill, neither mental nor bodily exertion, are requisite to secure sport.

To those with whom a full and heavy basket is but a secondary consideration, who covet the many other true enjoyments which a day on the Thames affords, there is, after all, no "pleasure" more truly pleasure than that which may be obtained by the gudgeon fisher from morn till eve of a bright day in summer.

The gudgeon is invariably fished for with a small hook, baited with a small red worm, or a blood-worm, usually in water about three feet deep, and as close as may be to the bottom; the fisherman always selecting a gravelly bottom, which, every now and then, he "scrapes" with a large iron rake, part of his boat's furniture. The object of the raking is to draw the fish together; they feed on the aquatic insects, and their larvæ, the ova, &c., which the rake thus frees from the gravel; of course, they seize greedily on the more tempting morsel which conceals the fatal hook. It is not uncommon to catch nine or ten dozen in one "pitch," and, frequently, half-a-dozen will be taken without losing or changing a bait.

The Thames gudgeon seldom exceeds six inches in length, the ordinary size being four inches. The lower jaw is broad, the mouth wide, with a barb at the angle on each side, the tail deeply forked; the scales of the body moderate in size; the colour of the upper part of the head, back, and sides olive-brown, spotted with black; irides orange red, pupil large and dark, gill-covers greenish white; all the under surface of the body white; pectoral, ventral, and anal fins nearly white, tinged with brown; dorsal fin and tail pale brown, spotted with darker brown. If people care to eat, as well as catch, fish, there is no fish of the Thames more "palatable" than the gudgeon, fried with a plentiful supply of lard. It is "of excellent taste, and very wholesome," and has been sometimes called "the fresh-water smelt."

From Pangbourne to Reading—or rather to Caversham Bridge—a distance of six miles, the banks of the river again become more level, although the hills continue for a short distance, and remain long in sight, as a fine background to a most beautiful picture.

THE
NEW GOVERNMENT BUILDINGS,
AND THE EXHIBITION OF THE DESIGNS IN
WESTMINSTER HALL.

As we write, this Exhibition is about to close, and before our words can be read it is probable that the award will have been given which is to determine the competition itself. Certainly it has been said that the month of June should not pass until the judges should have formed their opinion, and delivered in their report; and then, as we have been led to believe, the prize designs, together, perhaps, with such as may be distinguished by "honourable mention," will again be exhibited to the public, that the much-discussed qualifications of the judges may be submitted to that most practical test, criticism upon the judgment which they will have pronounced. This is all straightforward and fair, and is sure to be duly appreciated. Meanwhile, the matter being yet *sub judice*, we desire now to extend our former general observations on this subject, and briefly to remark upon certain of the designs which have been exhibited.

The public interest in the proposed new National Edifices has made itself known with an earnestness of decision that admits of no misapprehension. A palace for the administrative government of England is unquestionably required: what the people ask is, that it be no less certainly worthy of its title and its use. And it has been very gratifying to observe how the desire to have a worthy edifice actually erected, has gradually led to a better understanding and a more correct estimate of the real character and the true merits of the several designs. What, in the first instance, may have seemed to be very noble, simply from being very pretentious, has assumed its genuine aspect after calm deliberation; and much that is really praiseworthy in a degree has come to be estimated in that degree, instead of being raised to a position to which it could never with any justice have aspired. Notwithstanding a considerable amount of indignant declamation from persons whose own views coincide with the bulk of the "designs" (as very many of these projects have been somewhat ironically designated), and whose architectural capacities may be measured by the same standard with them, the accepted opinion is, without doubt, that, with a few most honourable exceptions, the result of the government invitation to architects to a "*grande certamen*" has proved anything but creditable to the competitors. For ourselves, we are persuaded that this competition, however justly it may condemn all architectural competitions as a system, is in no respect whatever to be held as an exponent of the actual status of architecture, either in this country or abroad. Very many architects who do possess the faculty of design, and can command ideas and bid them clothe themselves under material forms, or who are able to deal worthily with styles in which new forms are impossible, and even fresh combinations difficult—very many of such architects have, for whatever cause, stood aloof from the competition altogether. Others of the same class, who have entered the arena, have found themselves compelled to struggle more severely against the urgency of time than the difficulties of the actual contest. But it would seem that there exist many persons desirous of being ranked as architects, who do not need any prolonged period for their productions, and yet are able to put forth their full powers. Works thus produced have constituted a very large proportion of the Exhibition of Designs; and, consequently, there has been a vast amount of superficial display, while but little of mind, of genius, or of taste, has given evidence of its deep and earnest working. Happily, these high qualities have not been absent altogether from the competition; and, possibly, they would have been more abundantly evident, had classic architecture, whether adapted from ancient authorities or revived under modern conditions, been less intractable and more versatile. What we have chiefly lamented over in the classic designs, has been the prevalence in them of one or other of these two unfortunate circumstances—either a most insipid poverty of conception, if not an actual want of all original and distinctive architectural character, or a painful strain-

ing after originality through the sacrifice of all artistic and architectural consistency.

There is scarcely an example of the established classic model which has been treated with thoughtfulness and adapted with skill; while the specimens of the accepted modernised type of this style are, for the most part, lamentably meagre and spiritless. We are now speaking of the *treatment* of this style in the present competition; the style itself may be rejected without hesitation and without compromise; it has made our public buildings and our streets what they are—and what are they? it has been tried, tried long, and until patience herself has been wearied out by the dull and dreary monotony of the results, and found to be utterly wanting; it may have been called Anglo-Roman or Anglo-Italian, but it never has been called English, because nothing can ever, by any possibility, render it English. Most of the designs in the mediæval styles exhibit, more or less strikingly, just that one imperfection which, even at the present time, might have been expected from them: they indicate, that is to say, too decided a tendency towards mediæval treatment, whereas the problem now to be solved is the capacity of Gothic Art to adapt itself to existing circumstances, and its readiness to accept practical conditions arising from both the requirements and the appliances of the present time. Gothic architecture *is* English architecture, and as such it will most certainly—and, as we believe, very speedily—be recognised; but then the readiness of this recognition must be greatly influenced by the promptness with which the style is shown to be the English architecture of every age. The necessity for designing new edifices, in the great Gothic spirit, indeed, of the olden time, but not *after* the olden fashion, needs still to be impressed upon some even of the master spirits of the Gothic movement amongst us. We do not want old buildings to be built over again; we do not want our new government palace to be what it might have been had the Black Prince have presided over a Fine Arts commission at Westminster, or William of Wykeham discharged the functions now entrusted to Sir Benjamin Hall. The Gothic of the present, while as genuine Gothic as that of past ages, must be a fresh emanation from the old fountain-head,—it must be as decidedly the Gothic of the middle of the nineteenth century, as the Gothic of the middle of the fourteenth century bore a decided character of its own. Indeed, our own Gothic cannot be true, so long as we seek its forms of expression only from the relics of by-gone times; this is all very well in the classic Renaissance, because there genuine invention is impossible,—the new architecture can do nothing more than recall the old. Again, another point needs to be carefully borne in mind in seeking to realise the new application of Gothic Art. This is not to be accomplished by combining a certain amount of novelty with certain veteran forms and associations; the whole must be re-cast, so that the result may be uniform throughout,—absolutely consistent—really Gothic; yet really the Gothic of today. We have heard it objected to some of the Gothic designs that they are too foreign in their type, or at least in many of their details. This is no good objection, provided the design be really good and true. We must expect to perfect our Gothic only through the widest study and comparison; and remembering the essential unity of the style itself, we must not reject anything in it that is excellent or valuable, simply because that thing may have been accepted elsewhere. We have not been in the habit of setting aside certain columns because they were Corinthian; we shall, therefore, at least have precedent in our favour when we adopt any noble constructive details that may be, in some special sense, French or German. The favour with which a few—that is, four—Gothic designs have been so generally regarded, has elicited from the supporters of the classic Renaissance the most bitter expressions of disappointed indignation. Finding it difficult to advocate the designs in their own style, these persons have concentrated their energies in an onslaught upon their Gothic rivals. These attacks have been distinguished by their want of all point and of all sound argument and just criticism, and consequently they have proved to be singularly unfortunate for their authors, and as eminently calculated to raise the Gothic designs themselves still higher in the public estimation.

It would now be mere affectation to assume that the authors of the more important designs are not well known, and, therefore, we speak of No. 116 as the design of Mr. G. G. Scott. In this noble composition the architect has shown how completely he is master of the style which in him has found so earnest, and also so popular a champion. Mr. Scott has adhered strictly to the conditions of the government proposition, and in his design he has not shown more than such buildings as would be required for the Foreign and War-Offices. These offices, as he has proposed them, must be regarded, first, as complete in themselves; and, secondly, as associated with other buildings yet to be planned, so that their ultimate effect may eventually be governed by the general character of the entire group. In themselves, the proposed offices constitute a really grand edifice, as in their arrangements they are most felicitously appropriate for the uses that would be required from them; and, doubtless, when more extensive works should appear, these offices, grouping with them, would then declare how well they were originally adapted to form a component of a series of buildings. Their harmony with Westminster needs not to be noticed; here they stand beyond the reach of the most hostile of objectors. Mr. Scott has exhibited two modifications of his general design; both views are distinguished by equal originality, truthfulness, and vigour, and probably the two might be so far actually combined as to produce a work which should exhibit the characteristic excellences of both. Mr. Woodward, in his No. 35, has ably sustained his reputation. It is no less certain that this gentleman understands and appreciates the spirit of Gothic Art, than that he feels what the Gothic has now to do. We know not in what manner to express in stronger terms our admiration for what Mr. Woodward has sketched out in his design, than to say that we wish such congenial spirits as himself and Mr. Scott were working together. Rivals they cannot be, being brethren in Art; and most certainly it would be well for the cause of that art could such brother workmen be united in the closest fellowship. Mr. Woodward's principal *façades* appear to require some breaks, and his roofs, with their accompanying details, might be considerably improved; but his fenestration is admirable; his general grouping also, together with his plan and general arrangements, are equally excellent, while his feeling for sculpture as an accessory to architecture is beyond all praise. Mr. Street has taken, and will maintain, a position of his own in the front rank of the Gothic confederacy. His No. 129, though produced with an unavoidable rapidity which pressed hardly upon him, is worthy of the author. It shows his grasp of a subject, and his power of dealing with it as a master in his art. Compare this design with any of its classic competitors, and inquire where there appear evidences of mind, and of that faculty of conception and expression which marks the artist and the architect? No. 140, the production of Messrs. Seddon and Pritchard, is another excellent design, and yet, like Mr. Street's, it would scarcely do for the purpose proposed. These gentlemen must look forward yet more than has been their wont; they must apply, under fresh conditions, their well-stored treasures of Gothic usage and authority. In both No. 129 and No. 140, the design is scarcely less mediæval in treatment than it is in feeling; and in either case it is so complete, that the buildings afterwards to be erected could scarcely be grouped harmoniously with these foreign and war-offices. The towers which appear in these designs are very admirable, particularly Mr. Street's; and it is to be hoped that such a tower will not fail to be the crowning ornament of the entire group of the new Government Buildings. We do not desire to particularise any of the classic Renaissance designs as special examples of the unworthiness which clings to the style, even in the ablest hands. Many so-called critics have seen much to admire and praise in these productions; to us they have been simply painful, though conclusive testimonies to the justice of the views which we have long felt deeply and earnestly cherished. In common with all who have felt any interest in this competition, we shall look forward to the result with anxiety, but with that confidence which we always are prepared to repose in English honour, integrity, and justice.

THE TURNER COLLECTION.

THE exhibition of Turner's pictures, recently opened in the upper apartments of Marlborough House, enables the public, for the first time, to form a just estimate of the great painter who has left such examples of his marvellous genius behind him. What a record of industry, as well as of genius, do we find within those rooms! what extraordinary indications of intense study, intellectual power, subtle observation, communion with nature, and knowledge of the capabilities and resources of Art to represent nature in every aspect to which she is subjected by seasons, atmospheric influences, and other causes! They who knew Turner only through the works of the last ten years of his life, we may almost say the last twenty, can have no possible conception of the varied greatness of his pictures: now they can see him as he showed himself throughout his long career; they may compare him with himself, for with none else can he be put into comparison; and, while inspecting and examining this glorious collection, they will feel what a magnificent inheritance this unrivalled landscape-painter has bequeathed to the nation.

The number of pictures now added to those with which the public is already acquainted is between sixty and seventy, including many of his largest and finest productions; but we are spared the necessity of describing them, as this was done in the article on the entire collection which appeared in our January number; but we have a word or two to say with reference to their present appearance.

Many of the pictures we had an opportunity of seeing just as they came from the old house in Queen Anne Street; the canvases, either rolled up or unstretched, so covered over with dust and mildew, as scarcely to admit of the subjects being recognizable; now the majority look as fresh as if just come from the painter's easel. The task—one most difficult—of cleaning and restoring devolved upon Mr. Wornum to superintend; of the manner in which it has been performed by Mr. Bentley, under Mr. Wornum's directions, every visitor will have the opportunity of judging, but, in our opinion, the work could not possibly have been better performed. The hanging is also most satisfactory, considering the size of the apartments and their general unsuitability, in comparison with what they ought to be, for the purpose: still we are glad to see them under every disadvantage, and to tender our thanks—in which we are sure all will join—to Sir Charles Eastlake and Mr. Wornum for making them accessible to the public at the very earliest period at which it was possible to exhibit them.

The paintings are hung in the various apartments, in chronological order, so far as was practicable. Turner's first period includes the pictures painted prior to the year 1802, when Richard Wilson was his model; of this epoch we have among others in the same apartment, a "Study of Trees on Clapham Common," "Æneas and the Sibyl," and "A Mountain Scene with Castle." From 1802 to 1819, it is impossible to say whom he imitated, or did not imitate; then he produced his "Harvest Home," in the style of Teniers; the "Blacksmith's Forge," in that of Wilkie; a "Holy Family," and his own portrait, in imitation of Reynolds; "The Death of Nelson," a noble composition; "The Goddess of Discord in the garden of the Hesperides," in the broad and massive style of Gaspar Ponsin; "Dido and Æneas," in that of Claude; the wonderful "Shipwreck;" "Calais Pier;" "Greenwich Hospital from the Park;" and several others, now to be seen at Marlborough House.

After his visit to Italy we discover another change; we see Turner alone, and altogether lose sight of any other artist, whatever his time or country. Now he produced his "Rome from the Vatican;" "The Bay of Baia, with Apollo and the Sybil," glowing in sunlight; the "Vision of Medea," gorgeous in colour; "Childe Harold's Pilgrimage—Italy," an exquisite composition, rich and lustrous in the hues of an evening sun; "Ulysses deriding Polyphemus," full of imaginative and poetic feeling, &c. &c. And lastly, the spectator is introduced to a number of his latest works, wherein he set at defiance all recognised principles and theories of Art, and allowed his fancy to run riot wheresoever it listed; beautiful often in its extravagances, and, paradoxical as it may seem,

not always untruthful in its fallacies, or what appear to be such. Among these are "The Exile and the Rock Limpet," "Rain, Steam, and Speed," "The Opening of the Walkhalla," "The Sun of Venice going to Sea," "Whalers," "Pilate washing his Hands," &c. &c.

We cannot conclude this brief notice without expressing approval of the admirable descriptive catalogue, by Mr. Wornum, of the British School included in the "National Collection;" no one who is not intimately acquainted with the works of our artists ought to visit the gallery without the catalogue in his hand, if he wishes to understand what he sees. In its compilation Mr. Wornum has had very considerable difficulties to overcome; from the lapse of time since many of the pictures were painted, their wretched condition, and the meaningless titles Turner frequently gave to his works, it must have been no easy matter to identify and name them with something like an appropriate title.

The Turner, the Vernon, and the Sheepshanks Collections are now the property, and in the hands, of the public; when will the public become so sensible of their treasures as to demand a fitting habitation for them? shall we long continue to brave the contempt of every enlightened foreigner who visits the metropolis, by the indifference England shows in the matter of her works of Art? with possessions worthy of a great and enlightened nation, we hide them in holes and corners, not as a miser hoards his gold, to keep it safely, but as if we were half ashamed of what we hold.

THE ART-UNION OF LONDON.

THE following works of Art have been selected by the prize-holders of the current year, up to the period of our going to press:—

From the Royal Academy.—"The Child's Grave," J. W. S. Mann, 20*l.*; "Shades of Evening," H. J. Boddington, 120*l.*; "Falstaff proposing to Marry Dame Quickly," D. W. Deane, 100*l.*; "Lynmouth," T. Webb, 75*l.*; "Interior," A. Provis, 60*l.*; "Devonshire Fishing Village," H. Jutsum, 50*l.*; "Lausanne—Evening," H. Moore, 50*l.*; "The Vale of Bettws, N.W.," F. W. Hulme, 40*l.*; "A Fishing Harbour," W. W. Fenn, 35*l.*; "Marlborough Forest," J. Stark, 35*l.*; "Crossing the Common," A. W. Williams, 35*l.*; "Interior," G. Earl, 35*l.*; "Faces in the Fire," J. Brett, 31*l.* 10*s.*; "Conway Castle," J. F. Hardy, 30*l.*; "The Bride," A. J. Simmons, 30*l.*; "Little Market-woman," E. J. Cobbett, 30*l.*; "Little Gleaner," C. Richards, 25*l.*; "Russ—County Wicklow," T. F. Collier, 25*l.*; "Valley of the Lledr," J. F. Hardy, 25*l.*; "Going to Market," N. O. Lupton, 25*l.*; "On the road to Langley," V. Cole, 21*l.*; "A Group in Belgium," H. Weeks, jun., 20*l.*; "Lynmouth Bridge and Tor, N.W.," W. Havell, 20*l.*; "Among the Wild Flowers," J. D. Watson, 20*l.*

From the Royal Scottish Academy.—"Scene among the Islands of Loch Awe," McN. Maclean, 30*l.*

From the Society of British Artists.—"Return from Jaek Fishing," J. Tennant, 150*l.*; "Gipsy Camp," W. Shayer, 80*l.*; "Evening on the Lugwy," J. P. Pettett, 75*l.*; "Fern Carting," G. Cole, 63*l.*; "Beach at the Mumbles," G. Wolfe, 50*l.*; "On the River Usk," J. Tennant, 37*l.*; "The Interrupted Meal," G. Armfield, 36*l.* 15*s.*; "A Hazy Morning on the Thames," H. J. Boddington, 35*l.*; "Rest on the Way," E. J. Cobbett, 35*l.*; "Crossing the Brook," J. Hengall, 35*l.*; "On Holmwood Common," G. Cole, 30*l.*; "A Country Alehouse," W. Shayer, 30*l.*; "Castle and Town of Heidelberg," J. Dobbin, 30*l.*; "Una Hija del sol," P. H. Calderon, 30*l.*; "Puffin Island," J. B. Pyne, 30*l.*; "The Mouse in Danger," T. Clater, 30*l.*; "Scarboro Castle," J. Danby, 26*l.* 5*s.*; "Scene on the Maiddach," C. Pearson, 25*l.*; "Day after the Gale," E. Niemann, 25*l.*; "A Mountain Spring," J. Hengall, 25*l.*; "A Nook in the Conservatory," Miss L. Rimer, 25*l.*; "The Prawn Fisher," W. Shayer, 25*l.*; "Fairlight Glen," J. Godet, 25*l.*; "A Marvellous Tale," E. Coekburn, 20*l.*; "Crossing the Village Ford," A. F. Rolfe, 20*l.*

From the National Institution.—"A Family Group," H. B. Willis, 80*l.*; "Winter Sunset," G. A. Williams, 75*l.*; "Harvester's Repast," F. Underhill, 60*l.*; "Early Morning," H. B. Willis, 42*l.*; "The Stepping Stones," F. Underhill, 35*l.*; "A Village in North Devon," H. B. Gray, 35*l.*; "On the Lugwy," W. Williams, 35*l.*; "The Coming Squall," T. S. Robins, 26*l.* 5*s.*; "Forresters," H. Barraud, 25*l.*; "Scene in Knowle Park," H. B. Gray, 20*l.*; "Master Ford searching for Falstaff," R. W. Buss, 17*l.*; "Hazy Morning," E. Hayes, A.R.I.I.A., 15*l.*

From the Water-Colour Society.—"Bed of the Conway," W. C. Smith, 35*l.*; "Children in the Wood," Mrs. H. Criddle, 25*l.*

From the British Institution.—"Leith Hill, Surrey," G. Cole, 60*l.*; "Lane Scene, October," T. J. Soper, 35*l.*; "English Interior," D. W. Deane, 35*l.*; "The Wood Pickers," T. Earl, 30*l.*; "Gleaners," A. Jerome, 26*l.* 5*s.*; "Blackberry Gatherers," G. Wells, 25*l.*; "Mineral Spring," J. Collinson, 25*l.*; "Dartmouth Castle," H. R. Taylor, 25*l.*; "Farmyard," G. Cole, 20*l.*; "On the Meadows," J. Stark, 20*l.*; "The Unexpected Visitor," A. J. Stark, 18*l.*

From the New Water-Colour Society.—"At Pallanza," T. L. Rowbottom, 100*l.*; "Sorrento, Italy," T. L. Rowbottom, 40*l.*; "Margate Roads," T. S. Robins, 31*l.* 10*s.*; "The Stag Rocks," Philip, 30*l.*; "Artist's Life," J. Absolon, 26*l.* 5*s.*; "Florence," W. Evans, 21*l.*; "Scene off Dieppe," T. S. Robins, 18*l.*

THE ROYAL PICTURES.

THE PRINCESS OF BELGIUM.

F. X. Winterhalter, Painter. D. Desvachez, Engraver.
Size of the Picture, 3ft. 1½ in. by 2ft. ¼ in.

FRANCIS XAVIER WINTERHALTER, a name that has of late years become quite familiar in the Art-circles of England and to the British public, was born at Todtuan, near Baden, in Germany. We presume that he received his early Art-education at the school of Carlsruhe, in the Grand Duchy of Baden; for M. Raczyński, in his work, "*L'Histoire de l'Art Moderne en Allemagne*," written in 1837, mentions him among the artists of that school.

The exact period of his arrival in Paris we know not, nor how he rose into favour at the court of Louis Philippe; but he received the first medal in 1836 for historical painting, and the first medal also in the following year: in 1839 he was decorated with the ribbon of the Legion of Honour. Although he is chiefly known as a portrait-painter, he has executed some works of a purely imaginative character, as his "Decameron," "Dolce far Niente," both of which have been engraved in mezzotint, on a large scale, by Girard, of Paris: several others, principally portraits, have also been engraved in France; and many of the portrait-pictures painted in England have been engraved here.

Winterhalter is the court painter of the day; he appears to be equally a favourite at Buckingham Palace, the Tuileries, and at Brussels: almost every member of our own illustrious royal family, from our most gracious Queen and the Prince Consort to the youngest of the royal children, has been the subject of his pencil, sometimes more than once or twice. In the Paris Great Exhibition last year, he exhibited full-length portraits of the Emperor and Empress, a half-length of the Empress, and a very striking group of the same imperial lady surrounded by her *dames d'honneur*; and if we are not mistaken, the whole of the royal family of Belgium have sat to him: he has certainly been a most fortunate artist, even admitting his talent to be a sure passport to patronage. It is certain that he possesses rare advantages as a portrait-painter.

The portrait of Charlotte, Princess of Belgium, third child and only daughter of Leopold, King of Belgium, by Maria, eldest daughter of Louis Philippe, is a very charming, graceful, and unaffected picture, painted, we believe, about two years since: the Princess is now seventeen years old, the date of her birth being June 7th, 1840: she is habited in simple walking costume, a black mantle over a pink silk dress; a straw hat half shades a face of singularly sweet expression; to which the large, full and sparkling eyes impart great intelligence: we have rarely seen a countenance that, by its simple yet graceful beauty, is calculated to please us so much. Winterhalter has done the subject full justice; so too has Desvachez, a Belgian engraver, in his translation of the painter's work.

Though the position in which Leopold once stood in reference to this country has passed away, the intimacy subsisting between the royal families of England and Belgium, and the general respect entertained here for his Majesty, still seems to unite him in some degree to ourselves; moreover, the King is the uncle of our gracious and beloved Queen—being the brother of Her Royal Highness the Duchess of Kent; and he is also the uncle of His Royal Highness Prince Albert. Those among us whose recollection extends back nearly forty years, do not forget the deep gloom that overshadowed Great Britain, when his first wife, the young and high-minded daughter of George the Fourth, was laid in an early grave. But there are other reasons why Leopold has a claim on the respect and sympathy of Englishmen: chosen unanimously to govern a nation peculiarly circumstanced, and at a period when they had shaken off a yoke that had become burdensome to them, it required the utmost discretion and judgment on the part of their ruler to maintain the position the people had assumed, and to reconcile neighbouring states to the new dynasty and kingdom. He has executed his high and difficult task in a manner honourable to himself, and satisfactory to his subjects.

The portrait of the Princess of Belgium is in the Collection at Osborne.

FROM THE PICTURE IN THE ROYAL COLLECTION.

LONDON, PUBLISHED FOR THE PROPRIETORS.

PICTURE SALES.

SINCE our last report the collections of pictures which have been offered to public competition were of a very miscellaneous character. The first we have to notice is that formed by the notorious Leopold Redpath, which contained several first-class drawings, sold by Messrs. Christie and Manson, on May 23rd, at the following prices:—'Fruit Piece,' W. HUNT, 77 gs.; 'Bird's Nest and Apple Blossom,' W. HUNT, 37 gs.; 'A Frosty Morning,' W. HUNT, 47 gs.; 'The Usurper,' W. HUNT, 58 gs.; 'A Hawking Party,' F. TAYLER, 41 gs.; 'Marauding Troopers,' F. TAYLER, 125 gs.; 'View of Spithcad, with part of the Baltic Fleet at Anchor,' E. DUNCAN, 74 gs.; 'The Conscript's Departure,' F. GOODALL, A.R.A., 178 gs.; 'A Storm and Shipwreck off Scarborough,' COPLEY FIELDING, 89 gs.; 'A Storm off a Rocky Coast,' COPLEY FIELDING, 74 gs.; 'Pozzuoli, near Naples,' and its companion, 'A View of Naples,' T. M. RICHARDSON, 185 gs.; 'The Greeting in the Desert,' J. F. LEWIS, 152 gs.; 'Contemplation,' MARGARET GILLIES, 50 gs.; 'Interior of Herenthal Church,' and 'The Well of Quentin Matsys before the Tower of Antwerp Cathedral,' L. HAGHE, 75 gs. The principal oil-paintings were 'The two Leonoras,' CARL SOHN, 171 gs.; 'Waterfall in the Dargle,' O'CONNOR, 82 gs.; 'Morning' and 'Evening,' views in Wales, by T. S. COOPER, A.R.A., 303 gs.; 'Dutch Pincks off Katwyk,' E. W. COOKE, A.R.A., 140 gs.; 'View in Saxon Switzerland,' KOEKKOEK, 152 gs.; 'Harbour Scene,' KOEKKOEK, 172 gs.; 'Sweet Anne Page,' J. SANT, 80 gs.; 'The Blind Beggar,' by J. DYCKMANS—a distinguished painter of the modern Belgium school—painted in 1853, 910 gs.; 'The Lock,' J. M. W. TURNER, bought by Mr. Gambart for 500 gs. Redpath's collection of pictures and objects of *vertu* realised nearly £9000!

Of the collection formed by Mr. D. R. Blaine, and sold by Messrs. Christie and Manson on May 30th, several admirable drawings and oil-pictures by the late W. MÜLLER fetched good prices, but our space forbids us to enumerate them, with the exception of a 'Sunrise on the Medway, with a View of Gillingham Church,' the figures put in by J. LINNELL, which realised 122 gs.; sold to Mr. Gambart. We may also point out a fine picture, formerly in the Fonthill Collection, by A. CUYP, 'Homeward Bound—a stiff breeze off the Dutch Coast,' £300, bought by Mr. White; 'Landscape, with Figures and Cattle,' by N. BERGHEM, 198 gs.; 'Portrait of Justus Lipsius,' REMBRANDT, from the Feseh Collection, 200 gs.; 'St. Jerome,' VELASQUEZ, 230 gs.

A collection of English pictures, the property of a gentleman whose name did not transpire, was sold by Messrs. Christie and Manson on the 6th of June. Among the "lots" were examples of Collins, Egg, Eddy, Frith, J. C. Horsley, F. Goodall, Müller, Philip, Creswick, P. Nasmyth, Linnell, Stanfield, Lee, T. S. Cooper, Webster, &c. &c. The specimens of WEBSTER were six in number, all sketches for larger works,—viz. 'The Smile' and 'The Frown,' mounted in one frame, on the back of which is the commencement of a sketch of 'The Boy with many Friends,' 54 gs.; 'The Dame's School,' 76 gs. (Gambart); 'The Race,' 121 gs. (Colnaghi); 'The Return from the Fair,' 135 gs. (Colnaghi); 'The Musical Party,' 27 gs.; 'The Birthday,' 25 gs.; 'A View in Wales,' T. CRESWICK, 131 gs.; 'The Winding of a River near Bettws-y-Coed,' CRESWICK, 200 gs.; 'An English Landscape,' CALLCOTT, 105 gs.; 'Le Bon Curé,' F. GOODALL, 97 gs.; 'The Broken Bridge,' F. R. LEE, 151 gs.; 'Canterbury Cathedral from the Stour,' T. S. COOPER, 132 gs.; 'A Scene from "Comus,"' the design for the fresco in the garden-house of Buckingham Palace, C. STANFIELD, 81 gs.; 'Landscape, with Cattle Drinking,' J. LINNELL, 80 gs.; 'Windsor Forest,' J. LINNELL, 148 gs.; 'The Negligent Brother,' W. MULREADY (painted in 1824), 128 gs.; 'Gipsy Corner,' P. NASMYTH, 104 gs. (Prout); 'Carshalton Mill,' NASMYTH, 140 gs.—an autograph letter of the artist, in which he estimates the value of this picture at *fifteen pounds*, was sold with it; 'An English Landscape,' NASMYTH, painted in 1831, 111 gs. (Gambart); 'View near Lewes,' NASMYTH, 251 gs. (Gambart); 'River Scene,' CRESWICK and ANSDILL, 80 gs.

OBITUARY.

M. EMILE JEANNEST.

The higher class of Art-manufacture in England has sustained a severe loss in the death of M. Jeannest, at the comparatively early age of forty-four. The Birmingham newspapers, in announcing his sudden removal by disease of the heart on the 7th of February last, gave a brief but highly eulogistic notice of his claims as an artist, whose talents had been successfully employed for some years in designing and realising the more important productions of the eminent house of Elkington, Mason, and Co. The materials for a memoir of him are unfortunately very scanty, and although we have been at some pains to collect a few facts connected with his early career, these resolve themselves into the simple statement that Emile Jeannest was a native of Paris, and the son of M. Louis Jeannest, a manufacturer of bronzes, in which department of art he was employed early in life. He was for a period a pupil of the celebrated Paul DeKaroche, and came to England about 1845 or 1846. Prior to leaving Paris, however, he appears to have been employed by the late Duc d'Orleans, the eldest son of Louis Philippe, and by several of the French nobility. It is probable that the untimely death of his royal patron might have had something to do with his determination to try his fortune in England. He was resident in London for about two years, but does not appear to have been very successful. It was at this period that he was first employed by Mr. Herbert Minton, of Stoke-upon-Trent; but the work executed appears to have been so ultra-French in its design, that after its manufacture it was not successful. Subsequently Mr. Minton induced M. Jeannest to settle for a period in the Staffordshire Potteries, and devote his attention to the production of works in parian—a material just then coming into public favour. During this period he appears to have been usefully and successfully employed in the Potteries School of Design, and laid the foundation for the education of the class of young modellers, which has proved so valuable to the staple trade of that district. About seven or eight years ago, the late Mr. Henry Elkington, of Birmingham, engaged M. Jeannest to take the direction of the Fine-Art department which he founded in connection with the manufacturing firm of which he was so distinguished a member. Here the subject of our sketch brought to bear his early experience in metallic manufactures, his fine taste and remarkable—almost unique—power over plaster material finding a full and complete field of operation. The success of his productions were co-incidental with the success and reputation of the important house for which he laboured, and it is not too much to say that the genius and versatility of M. Jeannest, his remarkable knowledge alike of the minutest detail in ornament as in the human figure and animals, did much to elevate the productions of Messrs. Elkington to the position now almost universally assigned to them. During the whole period of his engagement in Birmingham he continued from time to time to design and model for Messrs. Minton; and some of the finest reproductions of majolica ware exhibited by this firm at the Paris Exhibition of 1855, and which called forth so much laudation, were the work of M. Jeannest.

As a draughtsman and modeller his skill was almost perfect, so thoroughly did he appear to master at once the idea sought to be realised, and the material in which it was to be wrought out. As a designer, his residence in England, his love of English habits, and even modes of English thought, had a most beneficial effect upon his taste; and with that remarkable power of adaptability, which was certainly one of his leading characteristics, he appears to have fallen into a track suitable to the taste and wants of his adopted country. The exuberance of his fancy was sobered, and the faults of the school in which he had been trained were subdued,—the result being a chastening of style and comparative severity of treatment, where in a less genuine artist tameness and insipidity would have ensued.

M. Jeannest's chief characteristic as a man was that of exceeding *bonhomie*. In this he was more English than French. He was a favourite

with all who had the privilege of his acquaintance, and especially so with those who acted under him or with him in the course of his labours as an artist. His quiet, earnest manner—the genuine modesty with which he showed whatever he had in hand, and (as it happened at one period that he kindly undertook to supply the want of a modelling master in the Birmingham School of Art), the thorough worship, if the term may be used, with which he was at all times met by his pupils,—were all points to be remembered. His power of explanation, *visu voce*, was very limited, as even in his own language he was no great talker: but the effect of his touches upon the work of a student was, at times, something marvellous, and better than any amount of mere lecture. It was hoped, at one time, that his services would have been secured as the responsible modelling master of the Birmingham School; but the arrangements of the Department of Science and Art, and the want of local means, effectually precluded the possibility of adequately remunerating a special man of M. Jeannest's powers: apart from the fact that such men do not care to associate themselves in a work where efficiency is condemned to the levelling process of a stereotyped routine, which, however well adapted to act as a spur upon listless mediocrity, or as a check upon slipshod discipline and loose organisation, certainly acts as a drag-chain upon earnest and intelligent workers. Men of zeal and experience shrink from being tested by a standard which recognises quantity, in strict accordance with the prescribed metropolitan formula, as superior to any amount of excellence obtained by an intelligent adaptation of the instruction given to special local requirements. The assumption, too, that the youths engaged in the manufactories of a town like Birmingham have the same time at their command, can attend as long a period, and as regularly, as the Art-student whose sole business it is to study his art, is fatal to a fair judgment upon the results of the instruction imparted in the more advanced studies, such as that of modelling, painting, design, &c. Hence the astonishment sometimes expressed that the female students of schools of Art are so nearly on a level with, sometimes in advance of, the male students. The explanation is plain enough. The former are usually of a class who can afford time to attend during the day, when the more showy works are executed. The male students are generally of the artisan class, whose evenings alone are at their disposal, and whose Art-knowledge must be obtained after a hard day's labour in the workshop. This is certainly the case in our large manufacturing towns. In other places where schools of Art have been established, it is possible that many of the male students may be of a different class, and thus enabled to attend at hours more suited to the work they may have in hand. This class, however, has nothing in common with the modellers, die-sinkers, chasers, &c., of a town like Birmingham. To have engaged M. Jeannest for the *diletant* teaching, would have been a waste of money and talent; but it is impossible to calculate what his influence might have been upon the future modellers, &c., of Birmingham, had his services been secured for even the two or three years prior to his death. A rare opportunity for a great and valuable experiment was lost, such, in fact, as may never occur again; through the want of a clear perception of the special local wants of an important town and district.

That it will be a long period before M. Jeannest's place is fully supplied in the decorative and ornamental arts of this country, is certain. His influence, however, has been too great to be easily obliterated; and his best works will, at some future period, be quoted as examples of that influence at a period when professors of Art, *par excellence*, knew little or nothing of ornamental design, notwithstanding all the absurd talk about the influence of fine pictures or fine statues upon the Art-manufactures of the country: since any man who has studied *both* must declare, if he dare honestly to avow it, that there is but little connection between the two, and that that connection can only be seen and appreciated by such minds as that of the subject of our memoir. These, looking at Art in all its bearings, assign to each speciality its own position, and never dream of mixing up in one universal jumble of so-called principles, the aesthetics of a

tea-pot or a calico-print with that of a sketchy daub from Lake Como, or the last new portrait-statue of some illustrious nobody, done in native brass. There are some strange Art-doctrines enunciated here and there in Sir Joshua Reynolds' lectures, which of course people have believed, because the said Sir Joshua wrote them; but of these, few have misled earnest and orthodox, but not over logical, advocates of Art-education, more than that oft-quoted passage about the intimate relation between the progress of the Fine Arts and their influence on commerce. We have often thought that if its author could have seen the use made of his not very profound illustration of the value of the pictorial arts to trade, he would have done something similar to the action ascribed to him, when

"They talk'd of their Titians, Correggios, and stuff,"—that is,

"—shifted his trumpet, and only took snuff!"

Birmingham.

G. W.

D. T. COULTON, ESQ.

A few words to the memory of this lamented gentleman cannot be out of place in the *Art-Journal*; for, although not an artist, the late editor of the *Press* newspaper was one who loved Art, and laboured long and earnestly for its extension and elevation. Moreover, occasions are not to be neglected when affection may go hand in hand with duty to mourn over the grave of departed worth; and it is a pleasant, though a mournful task, to record that excellence by which society has been influenced, and testify to those virtues which have been largely and continually exercised for the good of mankind.

In the late editor of the *Press* the world has lost the thoughtful, fruitful man, whose memory is endeared by all the higher and better sympathies of toil. Mr. Coulton was born at Devizes, in Wiltshire, 1810, and was the grandson of the Rev. J. Coulton, Dean of Bristol. His father died during his early childhood. His delicate health confined him to his home, but he had the advantage of a private tutor, and the still more important teaching of an intelligent mother, and a loving, accomplished sister, who shared his more boyish studies simply because they were his. A home-loving, delicate youth frequently seeks, at once, repose and employment in literature: at a very early age Mr. Coulton contributed both poetry and prose to the periodicals of the time. In 1839 he founded the *Britannia* newspaper, and from that time, with but a short interval, his mind, able as ardent, was concentrated on politics and public events. We quote the opinion of one of his dearest friends as to his line of conduct, because it embodies all we desire to say on what was the leading object of his life:—"The line of politics mainly adopted by him in the *Britannia* was to extend and popularise the principles of Conservatism, and to uphold national Protestantism as embodied in the institutions of the realm. He had nearly all the merits which mark the English schools of political writers. His understanding was singularly plastic, and he could contract or expand an argument with rare dexterity of logic. While endowed with no ordinary imaginative power, his reasoning faculties were of the highest order, but their chief felicity was in the application of ascertained principles to the sudden emergencies produced by social changes. Always popular in his mode of composition, he could be profound in his treatment of complex questions."

In 1847 Mr. Coulton withdrew from active journalism, and sold the *Britannia* in 1850; he then imagined himself "settled" at Goudhurst, in Kent. Married to a most amiable and attractive lady, he endeavoured to realise an elisium, without politics, and "took to" farming, occasionally contributing to the *Quarterly Review*, and publishing a remarkable novel, called "Fortune," which was too full of thought and wisdom to be popular among mere novel readers.

But this "quiet" was too quiet for an earnest working mind, and in 1854 he yielded to the solicitation of "friends," and, putting on his old armour, betook himself with renewed strength to the editorship of the *Press*: devoting himself with the energy and zeal of youthhood, and the firmness and boldness of manhood, to his new work. Not the watching

patience and remonstrance of his friend-sister—not the loving tenderness of his young wife—not the caresses of those children whom he loved more than his own life,—could ever induce him to care for himself, or to think of himself while work was to be done; and even when the toils of the *Press* were ended for the night, his strong active mind urged him to labour which might have tried the strength of a Goliath. His attainments in mechanics were considerable; he invented a new kind of atmospheric railway, which received the favourable notice of several scientific men; he had matured a plan for a most important literary undertaking, which is now in progress. Mr. Murray has secured the copyright of a work, upon which has been lavished the treasures of his genius, and the result of his keen, clear observation—it is called "The Threshold of Life."

But his varied talents and attainments, however great, could not have secured him the hearts of his friends; it is one thing to admire, another to love. He combined abilities of the highest class with the purest and kindest virtues. We have had few sounder, and none who were more generous, critics; the knowledge he had gathered by long and continuous toil, he loved to distribute freely; his taste was delicate and refined; his judgment was solid and practical, while his fancy was excursive and often brilliant. Though occupied for a long period as a political writer, and during times of stormy discussion and party asperity—feeling and writing strongly—he was ever honourably and sternly just; zealous for the cause he believed right, but tolerant of opposition and liberal to opponents. Among his private friends he numbered many who in politics were his "adversaries."

In his life as in his works he was an honour to "the order" to which he belonged; and though, from constitutional debility and a natural indisposition to mix much with "the world," he was but little known out of his more immediate circle, he was esteemed and respected by all with whom he was associated: no man was ever more loved—or merited to be more loved—by the family and friends by whom his home was made happy.

A. M. H.

THE BRITISH INSTITUTION.

THE OLD MASTERS.

ON Saturday, the 13th of June, the Annual Exhibition of Old Masters was opened to private view at this Institution, with a collection of 168 pictures, principally of the foreign schools; and representing a term in Art from the days of Giotto to our own time, with examples of the Italian, Spanish, Flemish, Dutch, and French schools, and, as usual, a limited selection of specimens of deceased members of our own school. We look always here for the gems of the various collections from which the contributions are generally supplied; and there are always some famous pictures, which, even without the *prestige* accorded to them by just criticism, would excite the admiration of persons of taste. Among those now exhibited are a few valuable works from the Orleans and the Camuccini Collections, on which no doubt can be cast, because they can be traced to the easels of the painters. We are led to make the last observation from a knowledge that many of our private collections contain works of at least doubtful authenticity: whenever the history of a picture is unknown, and it does not contain the highest qualifications of the master to whom it is attributed, there is always room to doubt its authenticity. There are pictures to which the name of Rembrandt is attached very much better in execution than Rembrandt ever could work; the real value of such work being ten shillings, whereas, if there were incontrovertible proof of its being a veritable picture, a thousand pounds or more would be its value. And so it is with other works, so extensive and skilful, at various times, have been the imitations of the best and most valuable works: Raffaele, Murillo, Domenichino, Salvator, Guido, Leonardo, Titian—nay, all whose works bear a tempting value have been imitated. But, to address ourselves to the collection before us, No. 4 in the catalogue is a grand gallery picture by Guercino, with rather a long descriptive title—"St.

Louis di Gonzaga, eldest son of the Duke of Mantua, who abdicated his succession to the dukedom in favour of his brother, and entered the Society of the Jesuits." There is but little in the composition, but it is a grand and impressive work. An angel calls the attention of the devotee to the crucifix before which he kneels in adoration. It is not so careful as to the extremities of the figures as we have seen some of the other works of Guercino, but we feel at once the intention of the painter. 'Isabella Lady de la Warr,' by VANDYKE, is an admirable portrait in excellent condition, very Henrietta-like; much superior to the 'Duke of Richmond,' also by Vandyke, who has given to his Grace lower limbs of quality exceedingly indifferent. No. 7 is a 'Portrait of Sebastian del Piombo,' by ROSSO FIORENTINO; but Sebastian looks too much of a gentleman to be the same "quod pittore che piombó," whose office it was to lead the Pope's wine; it is, however, an imposing portrait. 'The Ordination of St. Denis,' by LE SUEUR, is a substantial Vandyke-like work; and 'Christ Betrayed,' VANDYKE, has one or two good heads, but it is generally loosely painted. 'Our Saviour Casting out Spirits,' by GAROFALO, is remarkable for the elevated character given to the Saviour and the disciples Peter and John, by whom he is accompanied; a marvellously elaborate work.

'Il Riposo,' MURILLO, is in colour and arrangement a charming picture; the relief and oppositions are better than is generally found in the works of the painter; the varieties of grey are most valuable. 'The Baptism of Christ,' GUIDO, has not much of the feeling of the master. Guido studied most carefully from the Niobe family, but this work is hard and defective in drawing. 'The Virgin and Child,' MURILLO: the draperies are coloured like those of Murillo, but the study seems to have been made without refinement from a model in low life: we cannot see the master in the work. 'Portrait of a Man in a Ruff,' by RUBENS, is quite good enough for Rubens, being really a fine and luminous head of the warm class. 'A Seaport,' by CLAUDE, is a small picture, in composition similar to that in the national collection, the sun being low in the horizon in the centre of the picture. A small picture of much excellence—"Head of the Virgin," SASSOFERRATO, is a simple study of much purity and simplicity, but without expression. It seems to have formed a portion of a larger picture. 'A Female at a Well,' by GIORGIONE, is the elegant picture in the possession of the Royal Academy. 'A Landscape, with Diana and her Nymphs,' by DOMENICHINO, is a curious essay in landscape composition, whence it may be inferred that the master had but little feeling in that direction. 'The Portrait of a Philosopher,' by SPAGNOLETTO, is a very forcible head. It seems to have been cleaned; from the present appearance of it, we think it had better have remained as it was. 'Rembrandt's Mother:' Rembrandt has not at all flattered his mother here; he has, on the contrary, exerted himself to give an exact account of every furrow in the old lady's face. 'A Landscape and Figures,' by BERGHEM, is a beautiful work; but Berghem left it as it ought to be now—that is, the glazes have deepened, and extinguished the middle distance detail. A worthy pendant to the work is another 'Landscape and Figures,' by BOTIN, characterised by all the airy mellowness of the master: these are the landscapes to live in; the damp ground and cold air of Ruysdael kill people of delicate constitutions in three weeks. Near these, in the middle room, we have an exceedingly grey but very minutely painted landscape by WYNANTS and LINGEBACH—a picture of much merit, apparently painted on the spot it represents. 'Live Fowls,' by HONDEKOTER, in which figure pea-fowls with a variety of very carefully drawn birds, is a very excellent example of the master. 'Our Saviour receiving the Soul of the Virgin,' GIOTTO, is supposed to be the work once in the Ognisanti, at Florence, and mentioned by Vasari as much praised by Michael Angelo. In 'A Fresh Breeze,' N. VANDERVELDE, the ships are drawn with infinite knowledge and *finesse*, but the water is certainly too black and opaque. 'The Virgin and Saints,' by CIMA DA CONEGLIANO, contains conceptions of the Virgin and the disciples, but brought together without relation between themselves.

'A Merry-making,' JAN STEEN, is a composition entirely in the spirit of the master, the scene

being the principal apartment in a household in low life, in which rough jokes and athletic sports seem to be the prevailing taste. The colour is cold and severe, like that of Jan Steen generally. An example of MIGNARD—a portrait of Madame de Montespan—is a work of much sweetness for its period. A 'Landscape and Figures,' by KIERINGS and POELEMBERG, has much grandeur of feeling, but the universal round touch with which the foliage is made out wearies the eye with its monotony. There is not the liquid finish about the picture which we have seen in other works of Poelemberg. A 'Portrait of a Doge,' by TINTORRETTO, presents the sitter in profile; it is very freely wrought, and we recognise at once in the impersonation the chief magistrate of the Venetian republic. A 'Landscape and Figures,' RUYSDAEL, shows of course, as a principal quantity, a group of large trees overhanging a pool of water. The line and tone are taken up by other trees, and carried under necessary modifications into distance. The foliage is painted in the most masterly style, but, as we have already remarked of Ruysdael, his are not landscapes in which we could live comfortably. 'A Fresh Breeze, with Men of War,' by VANDERVELDE, is another of the high-conditioned pictures by this artist, in which the ships are most beautifully made out, but the sea, as before, is too opaque.

In the south room—that in which we usually look for examples of our own school—are some fresh and beautiful works of many schools—as 'Flowers,' RACHEL RUYSCH; 'Landscape and Figures,' G. POUSSIN; 'Interior of a Church,' P. NEEFS—some-what hard, but exemplifying the most patient elaboration; 'Woody Landscape,' HOBBIEMA; 'Exterior of a Caharet,' METZU; 'Family Portraits,' REYNOLDS; 'Courtship,' TENIERS—exhibiting the very best qualities of the artist; 'A Woody Landscape,' VANDERNEER; 'A Forest Scene,' HOBBIEMA—a production of much natural truth; 'A Lady and Gentleman,' GONZALES; 'The Gazette,' TENIERS—a work of great power, depth, and beauty, and how superior to the works of contemporary painters! 'Landscape and Figures,' KARL DUJARDIN; 'Portrait of Dr. Johnson,' GAINSBOROUGH—the best portrait we know of the great lexicographer. There is another well-known portrait in the collection—that of Sterne, by HOLME, in which the subject is represented resting his head on his hand. There are also portraits of West, by HARLOW, and General Paoli, by LAWRENCE, and of Mrs. Siddons, also by LAWRENCE; and 'The Bridge of Verona,' by CANALETTO; 'The Couch of Diana,' STOTHARD; 'Henry the Seventh's Chapel, in Westminster Abbey,' by CANALETTO; 'Fête Champêtre,' WATTEAU; 'Hubert and Prince Arthur in Prison,' NORTHCOTE; 'Landscape and Figures,' JAN STEEN; 'A Frosty Scene,' HOBBIEMA; with numerous other works of great and varied interest which we have not space even to name.

It not unfrequently occurs in this exhibition—by no means the least interesting of the season, although modern Art has made such rapid advances of late years—that we have an epitome—accidental of course—of the progress of some one of the acknowledged schools of Art, now Dutch, then Spanish, at another time of some of the local Italian schools; but amid the excellent works now on the walls of the British Institution, the examples are fitful and fragmentary.

THE ROYAL ASSOCIATION

FOR PROMOTING

THE FINE ARTS IN SCOTLAND.

EXHIBITION OF PRIZES.

This society, we presume, acts upon a principle similar to that practised by the Glasgow Art-Union—that is, they reserve for themselves the selection of the prizes, which is at once seen by the quality of the pictures. The catalogue is not numerous, but every picture in the collection has more or less of quality to recommend it. It is, we believe, the first time that the Royal Association have exhibited their prizes in London; the reputation of the Glasgow Art-Union Exhibitions may have suggested this. The pictures have, we believe, all been selected from the Exhibition of the Royal Scottish Academy, and,

curiously enough, they are all marked by certain common features of our school,—but peculiar to themselves as a selection. With these prizes there are exhibited certain pictures, the property of the Association, which have been purchased with the view of forming a collection of the works of Scottish painters. The most remarkable of these is "The Quarrel of Oberon and Titania," by J. N. PATON, R.S.A., painted in 1850, and acquired by the Association at the cost of £700; a production of exquisite fancy, full everywhere of fairy figures and appropriate material. Another is "The Porteous Mob," by DRUMMOND, painted in 1856, and purchased for £400; a picture also of great power in another class of subject. "Dawn Revealing the New World to Columbus," by HARVEY, painted in 1855, price £315; and a fourth, "Inverloch Castle," by HORATIO MACCULLOCH, purchased this year for £200 from the Exhibition of the Scottish Academy. It is a large picture, presenting an extremely romantic passage of scenery. The ruin stands at the brink of a lake, the view being immediately closed by lofty and rugged mountains; it is low and broad in tone, with much elevation of feeling. Among the prizes of the first class there is another by Mr. MACCULLOCH, "A Summer day in Skye—View of the Cullin Mountains," which represents a kind of scenery not met with on our mainland coasts. The next in cost is "Irish Pilgrims," £180, by ERSKINE NICOL, in which are seen a company of Irish pilgrims kneeling in devotion before a cross; also among the highest prizes, "The Port of London," S. BOUGH. "The Shadow on the Path" (£105), JAMES ARCHER, A.; and "A Nameless Rill" (£100), WALLER H. PATON. In the former of the two last works we see a lady seated in a garden bower with her child; she contemplates a miniature of her absent husband, an officer, of course on active service: from the nearest site a shaded garden walk runs into the picture, in which appears a figure in black approaching. The figure is well drawn, and the whole vigorously painted, but the point of the story is by no means clear. The picture entitled, "A Nameless Rill" is a signal triumph of patience. The subject is simply a thread of water dripping over a stone, near which lies here and there exposed stones and earth coloured with the richest hues of ferruginous deposits; the rill is overhung by a tree admirably drawn, and the herbage all round is marvellous in execution; but the ferns are too blue—we say blue, because their intensity is all but blue. We do not look at—we do not see—nature thus. A single leaf of that fern looked at apart might he of that colour, but by association nature subdues all importunate intensities. Other remarkable pictures are "Lochaline Castle—Sound of Mull," H. MACCULLOCH; "Llewelyn and his brave hound Gelert," "Politicians," A. H. BURR—an excellent production of the cottage-interior class, but feeble here and there in drawing; "Skaters—Duddingston Loch by Moonlight," CHARLES LEES, R.S.A.—a work of excellent quality, the figures are spirited, and the moonlight unexceptionable; "Psyche's Dream," R. HENDERSON; bust in marble, "La Penserosa," W. BRODIE; "Un Giorno Magro," JOHN A. HOUSTON, R.S.A.; "Polly Peachum," W. B. JOHNSTONE, R.S.A.—the figure firmly painted as to the drapery and skilfully brought out, but the flesh painting is weak; "A Quiet Lane near Comrie, Perthshire," and "A Study of a Beach-tree, Comrie," both by A. PRIGAL, A., and elaborately painted from nature; "Sketches of Irish Character," E. NICOL, A.; "Boat-house near Eyemouth," R. T. ROSS, A.; "Ralph presenting Hudibras's Letter," W. DOUGLAS, R.S.A.; "Highland Cottages," WALLER H. PATON; "The Housewife," JOHN BURR; "Glen Sannox," GEORGE SIMSON, R.S.A.; "On the Black Mount, Argyshire," KENNETH MACLEAY; "Old Mill, Cheshire," G. F. HARGITT—a very brilliant picture; "Sunset near Edinburgh," G. F. HARGITT; "Twilight," D. O. HILL, R.S.A.; "The Linn of Muick," J. GILES, R.S.A.; "Arran from the large Cumbrae," J. MILNE DONALD; "The Edge of the Forest," ALEXANDER FRASER; "Sidrophel," W. DOUGLAS, R.S.A., and some masterly drawings by W. S. LEITCH, of which the subjects are "Loch Maree," "The Lake of Geneva," "Near Callander," "View in the Italian Tyrol," and "Glenfalloch"—the whole forming one of the least exceptional prize exhibitions we have ever seen.

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY.—"At a general assembly of the Royal Academicians, held on the 16th June, Frederick Richard Pickersgill, Esq., was elected an Academician; and George Thomas Doo, Esq., an Academician engraver." These elections cannot fail to be satisfactory; Mr Pickersgill has long been a distinguished artist—he has amply merited any distinction that can be conferred upon him—the only cause of regret being, that he did not obtain it long ago, for it is certain that long ago he was entitled to it. The observation applies with equal, or perhaps greater, force to Mr. J. H. Foley, who would do honour to any academy of Europe. He will have to wait for his proper position at least another year. These are evils for which there is but one remedy; that remedy cannot be delayed much longer. Mr. Doo also has been famous in his profession for more than a quarter of a century, and his promotion comes when the benefit is comparatively small.

THE WELLINGTON MONUMENT.—The *Times* has informed the public that "Baron Marochetti is at present engaged in a colossal monument to the Duke of Wellington, which will be raised in St. Paul's, if the design meets the approval of Government." The *Times*, surely, cannot be aware that a competition for this very monument has been "invited" by the Government; that at this moment fifty models, by British artists alone, are collected at Westminster Hall; that a large number, in addition, are expected from foreign sculptors; and that judges are to be named, by whom awards are to be made, and upon whom will devolve the duty of selecting, from these models, that which is to be "raised in St. Paul's." The *Times*, therefore, is grievously in error, unless the competition be a farce, and the "judges" a delusion. The writer in the *Times* has seen the Baron Marochetti's work,—not the model, but "the colossal monument;" for he thus describes it:—"An imitative door of bronze is to be placed between two of the interior pilasters, and on the steps leading to it will sit a gigantic figure of Victory, with outspread wings, supposed to be the constant companion of the hero, even to the tomb. Above the door will stand an equestrian statue of the duke, while on pedestals on each side of the steps will be seated two figures symbolising civil and military honour. The nude figure of Victory, hereafter to be dressed, is now nearly finished, and a grandeur of design by no means common in our public monuments is already indicated." If this be the colossal shadow of a coming event,—foreknown and pre-arranged,—and some seventy or eighty sculptors of all countries have been deluded, by hope and faith, into a large expenditure, the public will find a word that justice and honour will apply to "the Government;" but, at present, we hope it would be difficult to find ten men in the kingdom who could believe that a course so atrocious has been contemplated, much less settled.

THE SITE OF THE NATIONAL GALLERY.—After all, the national pictures are to remain where they are—where some of them are, that is to say, for the Turner and Vernon Collections are at Marlborough House, and the Sheepshanks Collection is at Kensington; the former must be removed at no distant period, and where they are to go is a mystery as yet: certainly there will not be space for them in Trafalgar Square, unless the Royal Academy, with its schools, library, lecture-room, and exhibition-rooms, receive immediate "notice to quit." And then what is to become of this body, with those "rights" of which they undoubtedly stand possessed? The *Times*, who defends the stationary principle, deals with the question on one only of its grounds—*i. e.*, the convenience of the situation; but the subject is to be tried by several other considerations. The end will be, we imagine, that the barracks and workhouse behind the National Gallery will be removed, and a structure erected worthy of the nation on "the finest site in Europe."

THE SOUTH KENSINGTON MUSEUM "is now open to the public both in the daytime and the evening. Besides the various collections of architecture, sculpture, patented inventions, &c., the Sheepshanks pictures will be exhibited in the new gallery erected expressly to receive them. The admission of the public to the museum lighted up in the evening is the first experiment of the kind with

a public institution, and, it is hoped, will be acceptable to those who work in the daytime." This announcement cannot fail to be received with exceeding gratification; it will be difficult to overrate the sources of enjoyment and instruction thus opened out to the metropolis and its tens of thousands of daily visitors. There has been no incident of modern times so certainly productive of good—no event so likely to contribute to the higher and holier purposes of Art. A school is thus formed under the best possible circumstances, while a new means of daily delight is placed within the reach of all.

EXHIBITION OF BRITISH PICTURES IN NEW YORK.—A project has been started, to which we cordially wish success; it is to form an Exhibition of British Pictures in New York, to be opened at the close of the present year. M. Rosetti acts as secretary. A prospectus, signed by that gentleman, was forwarded to us too late to receive the consideration to which it is entitled; and which therefore must be postponed. The project will be either a great success or a deplorable failure; we scarcely anticipate a medium: if the former, it will be productive of largely beneficial results. We confess, however, we are not sanguine as to the results. The time is too short; the Manchester Exhibition absorbs many pictures that may be had as "loans," and generally there will be an indisposition to transfer works *immediately* from the Exhibition for a long period. If this plan be put off until the autumn of next year, there can be no doubt of its being an entire success.

THE TURNER MEDAL.—Mr. Baily has been selected by the Royal Academicians, from amongst the sculptors in their body, to prepare a design for the medal founded by them, in conformity with the desire of the late Mr. Turner, as his prize for landscape painting.

THE PROFESSORSHIP OF SCULPTURE.—Speaking of the Royal Academy,—how is it, we may ask, that steps have not been taken ere now to fill up the vacancy in the body of its professors, occasioned by the death of the late Sir Richard Westmacott? The duties of the office have now been in abeyance a considerable time; and supposing such an office to be—as, of course, it is—a want of the Academy, there is in this matter a neglect by which the students of Sculpture must be supposed to suffer.

NATIONAL COLLECTIONS.—In the year 1856-57 the sum total of 202,467*l.* was expended on national collections, against 228,866*l.* in 1855-56. 46,490*l.* were appropriated to the British Museum establishment, 49,768*l.* to the buildings, and 20,454*l.* to purchases; 12,077*l.* to the National Gallery; 5815*l.* to scientific works and experiments; 500*l.* to the Royal Geographical Society; 58,966*l.* to the Department of Science and Art; 7312*l.* to the Museum of Practical Geology; and 1000*l.* to the Royal Society. The total amount expended on the purchase and laying out of the Kensington Gore estate from 1851 to 1856 inclusive is 277,309*l.*

VALUE OF OLD ENGRAVINGS.—It may surprise some of our readers to know the large prices frequently paid for rare old engravings. At a recent sale by Messrs. Christie and Manson, of a collection of these works of Art, the following are worthy of note:—By Desnoyers—'La Belle Jardinière,' after Raffaele; a brilliant proof before letters, 31 *gs.* 'La Vierge au Linge,' after the same; first state before letters, 14*l.* 15*s.* By Garavaglia—'Madonna della Sedia,' after Raffaele; first proof before letters, 15½ *gs.* By Longhi—'The Magdalen,' after Correggio; proof before letters, 24 *gs.* 'The Marriage of the Virgin,' after Raffaele; brilliant proof before letters, 41*l.* By Morggen—'The Aurora,' after Guido; fine proof, 30*l.* 'The Madonna della Sedia,' after Raffaele; proof before letters, 14 *gs.* 'General Moncada,' after Vandyck; rare proof before letters, 23*l.* 10*s.* 'The Magdalen Praying,' after Murillo; brilliant proofs before letters, 19*l.* By Müller—'The Madonna de St. Sisto,' after Raffaele; fine proof, 49 *gs.* 'St. John,' after Domenichino; fine proof, with the letters, 28 *gs.* By Pontius—'Rubens, with Hat on his Head,' after his own picture; fine proof, 12*l.* By Strange—'Charles I. in his Robes,' after Vandyck; proof with all the margin, 44*l.* 'Charles I. with his Equerry,' after the same; proof in the first state, 19*l.* By Toschi—'Descent from the Cross,' after D. da Volterra; artist's proof before letters, 12 *gs.* 'The Correggio Fres-

coes;' fine India proofs before letters. The lot consisted of twenty-four plates selected and signed by the engravers, 42 *gs.* By Vandyck—(his own etchings). These consist of—1. 'His own Portrait,' in the first state; the pure etching. 2. 'Francis Snyders,' ditto. 3. 'Justus Suttermaus,' first state. 4. 'Paul de Vos,' first state; the pure etching. 5. 'Titian and his Mistress,' first state; and three others, 55*l.* 9*s.*

MONUMENTAL SCULPTURES.—The subscribers to the memorial of Mr. J. Brotherton, late M.P. for Salford, have decided upon erecting a monument over his grave in the Salford Cemetery, and a bronze statue of the deceased, on a granite pedestal, in Peel Park. Mr. Noble has received the commission to execute the latter work, for which we hear he is to be paid 1000 guineas; this sculptor appears to be in high favour at Salford; last month we noticed his statue of the Queen recently erected in Peel Park.—The inhabitants of Montrose—the birthplace of another active member of the House of Commons who has "rested from his labours," the late Joseph Hume—are raising subscriptions for a monument to his memory, to be erected in Montrose: the sum of £500 has already been collected, and two or three artists have been applied to for designs.

Mr. BIRKFOOT'S new Panorama of Sierra Leone, recently opened in Leicester Square, is one of the best pictures, looking at it merely as a work of Art, that we have ever seen even from his well-practised hand. The subject, indeed, may not possess the absorbing attraction of a Crimean siege or a Russian coronation, but it can never be without much interest to all who value the freedom of every nation on the face of the earth: the subject is highly picturesque, and, moreover, it is beautifully painted. The view spread out before the eye of the spectator is from the top of Signal Hill, where, by the way, a group of figures, English ladies and gentlemen, are enjoying themselves, "pic-nicing;" below, on the right, is the small city of Freetown, distant about three-quarters of a mile: on an elevated spot of ground, a little way out of the city, are the barracks for the troops. As the visitor to the gallery proceeds round it to the right, his eye will follow the range of hills, with the noted peaks "Leicester" and "Sugar-Loaf;" in front of the latter, though considerably in advance, is the missionary establishment, which, embosomed amid masses of fine trees, might very easily be mistaken for an English farmhouse; in fact, there are many parts of the scenery that have more of an European complexion than a tropical; the foliage of the trees generally—always excepting, as of course, the palm and cotton-trees—seems to us of this character. Not very far from Freetown is the village of Wilberforce, altogether African in its appearance; and on the opposite side of the Sierra Leone river lie the low marshy flats, called the Bullom country, richly clothed with vegetation. The landscape is dotted, in many parts, with the huts of the natives, and enlivened with figures occupied in various operations of husbandry. The sketches from which the picture is painted were made by Mr. S. Johnson.

NEW CHINESE GREEN DYE.—The attention of silk-dyers has of late been turned to a new kind of bluish-green, imported from China, and which produces a beautiful effect by candle-light. The composition of this green has tried the ingenuity of chemists, many of whom are now engaged in seeking a substitute, equal in quality, to this Chinese produce, and offering the advantage of a lower price, since the original article is sold at the enormous rate of 500 francs per kilogramme. M. de Montigny, French Consul, in China, having received instructions from the Minister of Commerce to obtain information on the subject, at length succeeded in obtaining, in 1854, the seeds of the plant which produces this green, and sent them to Paris. This year the Chamber of Commerce, at Lyons, has received a valuable communication from Father Helot, a missionary in China, on the cultivation of the plant, which he calls *Rhamnus sinensis*. It is a species of alder-tree, rising to the height of from eight to nine feet, and there is every reason to believe that the colour in question may be obtained from some plant of the same family indigenous in France. With this view the Chamber of Commerce, at Lyons has just offered a prize of 6000 francs for the discovery of a process by which the China green may

be produced at a cost not exceeding 100 francs per kilogramme.

THE LATE MR. SCOTT ARCHER.—A subscription is in progress for the benefit of the destitute young family of Mr. Archer, the discoverer of the application of Collodion to photography. The list is headed by her Majesty's donation of twenty guineas, and is followed by another, from the Photographic Society, to the amount of fifty pounds. So large is the number of individuals who take an interest in photography, many of whom have derived substantial advantages from the discovery, that we shall feel much surprised if a considerable sum is not raised for so worthy an object as is contemplated in its disposal. Sir William Newton has undertaken the office of treasurer of the fund, at 226, Regent Street.

HERR CARL WERNER.—An error which appeared in our number last month requires correction: it was stated in the notice of an exhibition of water-colour drawings, at 49, Pall-Mall, that the artist's name is *Wagner*; it should be *Werner*. Many of our readers doubtless remarked the mistake, as Herr Werner is not a regular exhibitor in London.

STATUE TO HANDEL.—While so many are deriving enjoyment from the bequests of this great man, it is well they should know that efforts are making to erect a statue to his honour in the place of his birth. English lovers of his divine art are invited to contribute to the funds necessary for this purpose, which they may do through Sir George Smart, by whom a sub-committee has been formed in London; or through the treasurer, Henry F. Broadwood, Esq. The statue of Handel has been executed by Herr Heidel, of Berlin. It will be inaugurated at Halle, in 1859, on the 13th April, the centenary anniversary of the death of the great composer; and the projected memorial is aided by the King of Prussia, and other sovereigns of Germany. It would be a reproach to England to be inactive in such a cause: Handel belongs almost as much to us as he does to the Germans,—perhaps more to us than to them. His glorious compositions have been the delights of four generations of the English, and have been the safest and best foundations of musical taste among us. We owe a large debt to his memory, and ought to pay it in part; more especially now, when the mingled harmonies of two thousand voices are yet in our ears and our hearts.

FLOWER-POTS IN GLASS MOSAIC.—Mr. Stevens, to whose works in glass mosaic we have frequently made reference, has recently introduced a novelty in the art—adapting it very gracefully to flower-pots intended to grace the drawing-room. Although not of a costly character, they are exceedingly elegant, and cannot fail to obtain general popularity where novel objects of taste are coveted. The glass mosaic is introduced in panels between ribs of pure white cement, hardened and polished, the mosaic being of various patterns—some of them taken from those examples of snow crystals, engravings of which have been published in the *Art-Journal*, by Mr. Glasier. The pot is lined with zinc, so as to contain either mould or water, and to act either as a vase for cut flowers, or a bed for plants. It is difficult to convey an accurate idea of these graceful accessories to home enjoyments, but a visit to the establishment of Mr. Stevens, at Pimlico, will be repaid by an examination of many specimens.

THE SOULAGES COLLECTION.—The "managers" of the Souldages Collection have issued a circular to the subscribers of the Guarantee Fund, discharging them of all liability, by informing them that, Government having declined the purchase, the collection had been purchased for the sum of £13,500 by the committee of the Art-Treasures Exhibition, at Manchester, who at the close of the exhibition will offer it for sale to the city of Manchester at the price of £14,175; and in the event of its being declined, will dispose of it by public auction. The original cost of the collection was £11,000, the sum being augmented by interest, commission, insurance, &c.; and by the very large and apparently unaccountable charge of £452 1*s.* 2*d.* for "printing and binding catalogues," lessened, however, by £97 1*l.*s. for catalogues sold. There is another item not easily understood, entitled "clerical assistance."

"ARMED SCIENCE."—The marble statue of "Armed Science," executed by John Bell, has been placed in the Woolwich mess-room; it was presented

by Colonel Adair and the artillery department of the service, and was inaugurated by a full regimental dinner at Woolwich barracks, on the 4th June; the commandant, General Sir F. Williams, of Kars, being president, and the dinner being attended by a large number of officers, many of whom had served in the Crimea.

THE ART-TREASURES HOTEL, MANCHESTER.—We have reason to believe that many persons have hitherto been kept away from the wonderful and admirable Art-Treasures Exhibition through being ignorant of the existence and of the character of the excellent hotel bearing the same distinctive title. This establishment, formed for the express purpose of providing accommodation for visitors to Manchester from distant parts of the country, will be found to combine every comfort and convenience with such economy as may at once dispel all apprehensions that a visit to the Manchester Exhibition must involve a considerable cost. We feel it at once an act of justice to the proprietor of this establishment (Mr. W. Donald, the contractor for refreshments at the Exhibition), and a duty which we owe to our readers, to state that the results of our own experience authorise us to recommend all visitors to Manchester to establish themselves at the "Art-Treasures Hotel."

ADDITIONAL PICTURES AT THE FRENCH EXHIBITION.—Sixteen pictures have recently been added to the collection which in the first instance formed this delightful Exhibition. Foremost amongst these new works is a picture of the very first importance by Madlle. Rosa Bonheur. It is entitled "Bourricaios (Muleteers) crossing the Pyrenees, Aspe Mountain, Road from Jaca to Urdos," and it represents a turn in the mountain-pass leading downwards to the descent from the eminence which the mules and their guides have just surmounted. The drove, with their picturesque equipments, are advancing towards the spectator in considerable numbers; in the front are two muleteers in earnest conversation, one riding and the other on foot; and in the distance the blue Pyrenees rise, calm and majestic, in all their beauty. In no respect inferior to the "Horse Fair," as well in originality of conception as in vigour and expressiveness of execution, this picture rises above that celebrated performance in the splendour and subtlety of its colour, and in the refinement of its expression. The freedom and ease which distinguish this extraordinary picture, are the truest evidences of the most commanding and the most versatile genius. The keen perception, the deep thought, and the unsurpassed power of the artist are apparent in every detail, while as a whole the composition is absolutely perfect.

THE EARL DE GREY'S CONVERSAZIONE, the first in the present season given by his lordship, took place on the evening of May 19th at the noble lord's mansion in St. James's Square. This most agreeable gathering comprehended, not only all the celebrities of architecture, but a numerous assemblage of painters, sculptors, and men of letters and science, and it also was graced by the presence of many ladies. The rooms abounded in objects of interest, including many fine collections of water-colour drawings. The blank spaces on the walls, covered with crimson cloth, showed how liberal a contributor Earl De Grey has been to the collections of pictures at Manchester.

THE ROYAL HIBERNIAN ACADEMY.—A petition from some members of this body has been presented to the House of Lords by Lord Talbot de Malahide, but his lordship entered into no particulars, and left the subject in dispute unexplained. This Art-academy is the only one in the kingdom which receives a grant from Government; why it was given we could never learn, but it is certain that it has been productive of more evil than good to the Arts and artists in Ireland; its withdrawal would be a boon to that country. It may be our duty hereafter to consider and discuss this matter.

GENERAL WILLIAMS AND HIS STAFF LEAVING KARS.—This subject, a worthy and valuable theme for Art, has been painted by Mr. Barker, and is now exhibiting at the "Auction Mart" in London. The exhibition was opened too late for us to notice this month; but the artist's previous reputation justifies the expectation that in dealing with this deeply-interesting topic he cannot fail of success.

REVIEWS.

POEMS. By ALFRED TENNYSON, D.C.L., Poet-Laureate. Published by E. Moxon, London.

Whether the laureate wreath which adorns the brow of Alfred Tennyson has been won by superiority over every other living poet, is a question we are not called upon to decide: his Sovereign's favour has placed it where it is, and popular applause has followed the appearance of his writings. Under such circumstances it was only reasonable to expect, according to the fashion of the day, an illustrated edition of at least some of his poems; and we have now a very beautiful volume, issued by Mr. Moxon, of the early poems (those originally published in 1830 and 1832), adorned with a large number of woodcuts from drawings by some of our most distinguished artists, Mulready, Maclise, Stanfield, Creswick, Horsley, Holman Hunt, Millais, and Rosetti. The peculiarity of Tennyson's style of writing, imaginative and highly-coloured, but frequently open to the charge of affectation, was perhaps, in some degree, a justifiable reason for enlisting the services of the Pre-Raphaelite school of artists in the work of illustration; yet we are much inclined to doubt whether their aid will be generally considered to have given much additional value to the volume. The quaintness of thought and expression that is found in the verse, needed not necessarily to be followed by quaintness of pictorial design. The artist may work harmoniously with the poet without any participation in the peculiarities of the latter, when these peculiarities have a constrained or affected tendency; he must work from, as well as up to, his model; but then we look for his own ideas of the subject before him, expressed in the true language of pictorial art, and not in that of any particular school or creed. Tennyson's heroes and heroines are not all men and women of the mediæval ages: but even when they belong to it, we would not have them drawn strictly after the fashion of the art of that period.

Mulready is the contributor of four illustrations; of these we prefer "The Deserted House," a solemn scene, yet rich in poetical imagery; and another, "The Goose," a perfect contrast to the former, lively and humorous as Hogarth. Maclise illustrates the "Morte d'Arthur," in two subjects, both exceedingly beautiful compositions, especially the latter of the two, where the king lies extended in the "dusky barge," the decks of which

"Were dense with stately forms,
Black-stoled, black-hooded, like a dream—by these
Three queens with crowns of gold."

From Stanfield's pencil are six sketches, three marine and three landscape; of these the "Lotus-eater" and "Ulysses" merit particular notice for their picturesque and truthful character. Creswick is also a contributor of six subjects, all of them worthy of his great reputation as a landscape-painter. Horsley illustrates the few lines entitled "Circumstance," in a head-piece and tail-piece; and "The May Queen" in three subjects, characterised by taste and delicacy of feeling.

We now come to the Pre-Raphaelite school of artists, of which Millais claims the first notice as the largest contributor, eighteen being the number of designs to which his name is affixed: the majority of these show far less of the peculiarities of the artist than might be expected from his constancy to his adopted style; and among them are a few to which no one, we imagine, would take objection, and which are fine in conception and feeling, and by no means deficient in pictorial beauty: such qualities will generally be acknowledged in the second illustration of the poem—"A Dream of Fair Women," representing Queen Eleanor,—

"Who kneeling with one arm about her king,
Drew forth the poison with her balmy breath,
Sweet as new buds in spring,"—

in the frontispiece to "The Talking Oak," and in that to "Lord Burleigh." Holman Hunt has furnished seven subjects for the volume: most graceful and poetical is the Mussulman sailing down the Tigris, one of two designs illustrating the "Recollections of the Arabian Nights;" the frontispiece to "The Lady of Shalott" is a strange fancy that none but an artist of genius could have invented, but the lady is not drawn after the Pre-Raphaelite fashion. Five subjects are from the pencil of Rosetti; with the exception of "Sir Galahad," a vigorous and effective study, but, so far as we can make it out, without the slightest reference to any descriptive line in the poem it professes to illustrate, these designs are beyond the pale of criticism; if Millais and Hunt have shown something like an inclination to abjure their artistic creed, Rosetti seems to revel in its wildest extra-

vagances: can he suppose that such art as he here exhibits can be admired? Is it not more calculated to provoke ridicule, or, if not ridicule, pity for one who can so misapply his talents?

It is fortunate for the engravers, Messrs. Dalziel, T. Williams, W. J. Linton, Green, and Thompson, that they are not responsible for anything but what has been placed in their hands to engrave; that they have had to do they have done with their accustomed skill: we could only wish that subjects more worthy of their time and labour than some we could point out had been entrusted to them. However, the Pre-Raphaelite school has many admirers, and Tennyson has more, so there need be little apprehension of this volume not finding a home in many households.

AN ILLUSTRATED VOCABULARY FOR THE USE OF THE DEAF AND DUMB. Published at the Asylum of the Deaf and Dumb, Old Kent Road, at the Depositories of the Society for Promoting Christian Knowledge; and by HAMILTON, ADAMS, & Co., London.

Generally, in the capacity of critics, it is our task to review works in which Art is made to administer to intellectual gratification; but in this volume her ordinary duties are reversed, and she becomes the instructress of the ignorant. This vocabulary is an extraordinary book, whether it be regarded for the ingenuity displayed in its compilation and arrangement, the multitude of engravings it contains—in number about four thousand—or the cost of its production, which, from our experience of such matters, could scarcely be less than several thousands of pounds. The purpose of the book, and its character, will be best described by an extract from the prefatory remarks:—"This vocabulary, prepared under the direction of the Committee of the Asylum for the Deaf and Dumb, London, is a selection of words in most common use, comprising many objects in natural history, and most of the nouns used in Holy Scripture. It is intended as a first word book for the deaf and dumb, and, with that view, it has been pictorially illustrated as fully as possible. Words which could not thus be illustrated are left for the teacher to explain by signs—the pantomime language which must be adopted in the earlier stages of mute instruction. In teaching objects, there is no mode so effective as showing, in connection with its name, either the object itself or the model of it, or a correct pictorial representation. Great pains have been taken to render the representations in the present work as exact as possible; so that if the object shall have been seen by the pupil, even before instruction of any kind, he will be able to recognise something familiar to his mind, although ignorant of its name, which it is the design of this work to teach him."

But although this vocabulary has been prepared for the benefit of an especial class of our unfortunate fellow-creatures, its utility must not be limited to those whom Providence has deprived of some of the most valued natural faculties: what a fund of amusement and instruction it would afford to a child! All the school-books and primers ever published cannot come into competition with it, so extensive and comprehensive are its contents: in a nursery or an infant school-room it would prove a positive blessing to superintendents and children, a source of almost endless amusement, helping them to pass in agreeable and instructive occupation many an hour of time, which otherwise might be hours of weariness to both. Some seventy or eighty pages, towards the end, are filled respectively with "Illustrations of trades, and the tools used in them."

The engravings, by Whympier, from drawings by J. and F. Gilbert, Harrison Weir, and others, are excellent, and are capably printed on stout paper: in fact, the book appears to be produced, in common phraseology, "regardless of expense," and deserves a large sale, which we trust it will find, if only to aid the committee of the noble institution in the Kent Road in meeting the cost of the publication.

THE FARMER'S BOY. By ROBERT BLOOMFIELD. Illustrated with Thirty Engravings from Drawings by BURKET FOSTER, HARRISON WEIR, and G. E. HICKS. Published by SAMPSON LOW, SON, & Co., London.

What a library of pictorial art would the "illustrated editions" of British writers form which have been published during the last five-and-twenty or thirty years! Prose and poetry, history and fiction, writings sacred and secular, have all come before the public illuminated with the bright pencillings of artistic fancy. There is scarcely an author whose works take sufficient rank in literature to entitle

them to such distinction, and are of a nature to admit of illustration,—from Shakspeare, Milton, and George Herbert, down to the living Laureate,—who has not been made still more popularly known through the genius of the artist. And who are the men that have been called upon to lend their assistance in the field of æsthetic operations? To a greater or less extent, every distinguished name, in and out of the Royal Academy, that is to be found in the roll of the British school within the period to which reference has been made. One has only to remember this fact to form a just estimate of the aggregate pictorial value of these illustrated books: the highest Art-genius of a nation has, at one time or another, been engaged in strewing with flowers of beauty new pathways for the triumphal progress of her literary heroes.

So rapidly do these books follow each other from the press, and so numerous are they, that as each successive one comes into our hands, we have almost been induced to ask whether we are not getting too much even of a good thing, and whether the public appetite will not become satiated with such a continual feast; but as we turn over the leaves of each new volume, and ponder over the gems of Art contained in it, we feel that the appetite "grows by what it feeds on," and that of the "dainty dishes" continually brought before us, there is not one to which we are so indifferent as to be willing to dispense with it—not one but we should consider a positive loss.

If—and it is not improbable from the mass of poetry which has since been written, and also the nature of the subject, so little in accordance with the popular taste of the present day—there were a chance that the memory of Bloomfield's "Farmer's Boy" would be allowed to slumber with him on the spot where—

"The rude forefathers of the hamlet sleep,"

it is not likely that it will do so now: this exceedingly beautiful edition of the poem must wake it to life again. Considering the comparative brevity of the poem, there are few writings in the language so full of picturesque description of rustic scenes; and with such artists as Birket Foster in landscape, Harrison Weir in cattle, and Hicks—a new name to us as a book-illustrator, but not new as a painter, and a worthy associate of the others—what was to be expected but a series of very exquisite designs? If we said more, it would only be a recapitulation of what we have so frequently spoken when noticing other books of a similar character, with the best of which it is entitled to share equal honours. The engravers of the woodcuts are Thomas, Evans, Bolton, Cooper, Greenaway, Slader, and Wright, most of them "men of mark" in their profession.

HELEN AND OLGA: A RUSSIAN TALE. By the Author of "Mary Powell." Published by ARTHUR HALL, VIRTUE, & Co., London.

The author of "Mary Powell" has opened a new mine, and the ore is as rich and abundant as in mines that are older: we rejoice that such is the case, because, however charming a marvel may be, sooner or later we tire of the one string—the mind refuses to banquet for ever on food, no matter what its quality, dressed after the same fashion; and "Helen and Olga," while giving evidence of careful reading, earnest study, and a perfect understanding of the relationship existing between the Russian serf and the lord of the soil, is a story in a new style, and of deep interest—so much so, indeed, that we imbibe the knowledge while enjoying the pleasure. We must repeat that the story and the style are as fresh and vigorous as if this was the author's first work, while the conduct and development of the tale supply evidence of more purpose and care than are to be found in her last two books. We were hardly prepared for such a charming little romance; and there is a strain of quaint comic humour in one or two of the characters, in which the author of "Mary Powell" has not heretofore indulged: altogether we have seldom read any work that has given us more gratification. The book is tastefully got up and admirably printed.

POPULAR HISTORY OF THE AQUARIUM. By GEORGE BRETtingham SOWERBY, F.L.S. Published by LOVEL REEVE, London.

"Wait till your history becomes popular before you call it so," said a critic to a friend of ours, who had decided upon publishing a "popular" history of—we forget what. We do not mean to say, that this pretty volume does not deserve "popularity," but we think the title somewhat questionable; it is "got up," as are all Mr. Reeve's publications, with infinite taste and at great expense; the illustrations

are correctly drawn and beautifully coloured, and the book contains an immense amount of information.

We have had so much practical experience in the management of fresh-water, and salt-water "vivaria," and have made them a study, as well as a pleasure, that we find but little of what is new to us in this, or in any book we have lately seen on this charming subject; but two years ago we should have been more than grateful for this "popular" history; it would have saved us much trouble and expense, and we can conscientiously recommend it to those who enjoy turning over page after page of the great book of nature as a safe and steady guide. Mr. Sowerby has collated "facts" with much skill and patience, and has gleaned information from the best books, as well as from collectors and collections. Mr. Lloyd's "tanks," in the Portland Road, afforded him excellent studies; and unless the London tyro collects his own specimens, we know that he will find it cheaper and better to buy them of Mr. Lloyd than to import them himself.

The marvellous "vivaria" of Mr. Warrington, the valuable publications of Mr. Gosse, the beauty and arrangement of the collections under the superintendence of the indefatigable Mr. Mitchell, the marine romance of "Glaucus," have all been rifled by Mr. Sowerby; but he does not rob—he takes honestly, and acknowledges whence he takes. Mr. Sowerby advocates the sloping back and slate sides to the "vivarium," which Mr. Warrington has adopted with success; doubtless they are excellent for experimental purposes, but they are not picturesque. The most beautiful tank we have seen for drawing-room purposes is made by an ingenious Frenchman of the name of *Dethier*, who resides at 12, Stockbridge Terrace, Pimlico: by a simple exchange of a particular sort of glass for the usual slate bottom the most cool and delicious effect is produced. We only cover half the base with shingle, and this gives full effect to M. Dethier's plan: he has also an ingenious way of glazing the sides, which prevents the salt water from coming in contact with any cement, but the tank must be seen to be appreciated. The more ornamental these charming receptacles for a long-neglected branch of natural history can be made, the more attractive the collections become. Nothing is more beautiful than vases of *Falissneria* and water lilies, animated by glittering fish; and we especially recommend one to be devoted to interesting and animated stickle-bats. We wish that in the second edition of this pretty book Mr. Sowerby would devote a few pages to the information so frequently desired in vain—as to *where* the various zoophytes can be sought for with the best prospect of success. We found the best *madrapores* at Ilfracombe; the finest *dianthus* at Torquay; while Weymouth is rich in a variety of the most beautiful *actinia*; and the commoner kinds are found abundantly at Dover, and even at Brighton.

A DICTIONARY OF GREEK AND ROMAN GEOGRAPHY. Edited by WILLIAM SMITH, LL.D. Published by WALTON & MABERLY, London.

In noting the close of another important contribution to the stock literature of England, we should be doing injustice to its able editor, did we not bear in mind also the fact that this is only a small part of the useful labour he has devoted for many years to the cause of science. His previous dictionaries of Greek and Roman antiquities, biography, and mythology, are indispensable to students, and have become standard works of reference. It is not possible to open a page of the present book without feeling the large amount of study and the great tact of useful condensation displayed there. We may refer to such lucid articles as those on Rome, Thracia, and Tyre, as examples of the large and accurate investigation of facts, the freedom from pedantry, and happy elucidation of conflicting or difficult statements, which characterise the labours of all the able corps of scholars which Dr. Smith has connected with his own arduous labours. It is very satisfactory in these days of rapidly and cheaply concocted literature—too often valueless and ephemeral—to note the steady production of such important works as issue from the establishment of Messrs. Walton and Maberly, and in the announcement of a forthcoming dictionary of biblical antiquities we perceive that the series is to be continued. If carried out in the spirit of the rest, it cannot fail to be eminently useful. The illustrations to the present work have been restricted to maps, coins, and the more important antiquities of the districts treated of. If we found any objection to the illustrations, it would be only this, that views of places and objects have been too sparingly introduced, though they would have been more valuable than coins, and appeal more usefully to the larger number of readers; whenever engravings have been given, they have been cha-

acterised by the same amount of conscientious simplicity and truthfulness that we have already remarked as conspicuous in the text. When the large expense is considered at which such a work is produced, its price is a really moderate one; and nothing can prove the wholesome state of the English book-trade better than the success which has attended these series of works, which could not have been perfected by private enterprise in any other country than our own.

A DESCRIPTIVE GUIDE TO THE MUSEUM OF PRACTICAL GEOLOGY. With Notices of the Geological Survey of the United Kingdom, the Government School of Mines, and the Mining Record Office. By ROBERT HUNT, F.R.S., Keeper of Mining Records. Printed by EYRE & SPOTTISWOODE, and sold at the Museum, Jermyn Street.

A plain, intelligent, and comprehensive catalogue of the contents of every exhibition-room is indispensable to the visitor who wishes to learn as well as to see, and who is not a mere idle lounge among the wonders of Nature or of Art. Such a guide-book is this which our esteemed contributor, Mr. Robert Hunt, has prepared for the visitors to the Museum of Geology. The contents of the museum are explained in a popular manner, and there is added thereto a large mass of information on the practical uses of the various productions of Nature that are accumulated within its walls. The book extends to nearly three hundred pages—a tolerably sure evidence that nothing has been omitted from it which ought to be inserted; it is, in truth, a small treatise on geological matters in their natural and manufactured states.

BRIGHTON, PAST AND PRESENT: A HANDBOOK FOR VISITORS AND RESIDENTS. By MRS. MERRIFIELD, Author of "Dress as a Fine Art," &c. Published by H. WALLIS, Brighton; WHITTAKER & Co., London.

Whatever opinion one may have formed of the life and character of George IV., there are thousands who have good reason to hold his memory in grateful recollection as the founder of Brighton, without exception the most frequented and the noblest watering-place in the whole world. Prior to the erection, in 1782, of the Pavilion—that architectural gew-gaw—by the Prince of Wales, Brighton, though creeping up into importance, was little else than a fishing-village, around which a few dwelling-houses of a tolerably good class had recently been erected for the convenience of a small number of persons of wealth and position, who had begun to resort thither for the benefit of sea-air and bathing. What it is now all the world, that is, the British world, knows,—for who is there with a crown-piece in his pocket, and the liberty of enjoying himself for a few hours, that has not seen Brighton? Mrs. Merrifield's "Handbook" is a useful guide, as well as an amusing history of the place in its younger days, when the Prince and his boon companions kept high revel within and without. A journey to Brighton, even by parliamentary train, could scarcely be a dull one; but if the traveller chance to have this little book in his pocket,—and we should, under any circumstances, recommend him to provide himself with a copy,—he will possess an antidote to any *ennui* that may overtake him.

THE BEAUTIFUL ISLETS OF BRITAIN. By WALTER COOPER DENDY, Past President of the Medical Society of London, Author of "Psyche," &c. Published by LONGMAN & Co., London.

A well-timed little book is this, making its appearance when sunny weather and long days are alluring everybody not hopelessly chained to his daily avocations into green woods and flowery meadows, and shady lanes, and to the side of the silvery sea. Scattered, frequently at long intervals of distance, around our main coast, lie numerous "beautiful islets"—Wight, Scilly, Man, Anglesey, Bute, Arran, and half a score others besides, some of which are well known, but those of lesser note will amply reward the visitor who may be tempted to travel to a distance from the metropolis; and the means of communication are now so frequent and easy, that there is little difficulty in the way of reaching them. Mr. Dendy gives a sufficiently ample and well-digested description of all the islands of any importance, pointing out their peculiar geological characteristics, and whatever in the scenery or historical associations is likely to interest. Numerous engravings from the pencil of the author illustrate the work; these are more truthful than artistic—but we have no right to analyse the productions of an amateur as closely as if they came from the hand of a professed artist.

THE ART-JOURNAL.

LONDON, AUGUST 1, 1857.

ON THE
EXHIBITION OF ART-TREASURES
AT MANCHESTER.

BY DR. G. F. WAAGEN.

THE Exhibition of Works of Art at Manchester is an event interesting, not alone to all lovers of Art in England, but throughout Europe and the United States; where I have observed, within the last ten years, public interest in matters of Art has increased in a remarkable manner. It may be safely asserted, that never before has an Art-exhibition taken place which has so fully realised all the expectations it was calculated to excite. With equal certainty it may be said, that in no other country than England could such an exhibition be accomplished, since here alone are found the indispensable conditions for such an undertaking. The first of these conditions is, of course, the existence of the necessary treasures of Art in the hands of private individuals; and in this respect no country can compete with England. Few persons indeed can, from personal experience, form an opinion so satisfactorily as myself: during six different visits to this country I have spent nearly two years in the search for these treasures of Art; and although in this period I have seen about one hundred and fifty larger or smaller private collections of works of Art, more or less celebrated,—sculptures, pictures, drawings, engravings, works in ivory, enamel, jewellery, majolica,—in short, all that in England is included under the name of articles of *verth*, I am still far from having come to the end of my search, and continually meet with new collections.

But however fully this first condition is realised, a second is equally requisite to ensure the success of such an undertaking. This is found in the national spirit of association and co-operation which exists more widely in this country than in any other, attended though it may be by considerable sacrifices, whenever any object of importance to the nation at large is to be attained. It is, however, necessary to know intimately, as I do, the value which collectors in England attach to the works of Art in their possession, to appreciate this sacrifice in its full extent. I am well aware, from my visit to Manchester, that the committee for managing this exhibition have felt to the utmost the responsibility they have undertaken, and have consequently taken the greatest care and precautions for the preservation of the works committed to their charge; nevertheless it is impossible to overlook the risk inevitably attending their transport and exhibition. Great, however, as is this risk, in a pecuniary point of view—considering the high price which good pictures realise (for instance, Lord Hatherton has refused an offer of £5000 for the *chef-d'oeuvre* of Hobbema which he has sent to Manchester)—there is yet a higher estimate which the true lover of Art attaches to the works in his possession; they are treasures of artistic value not to be replaced. Another consideration must not be lost sight of: these Art-treasures are distributed in the apartments which their possessors habitually occupy,

and it is no little sacrifice to their owners to be deprived of these familiar objects of interest, refreshing alike to the eye and mind, for a long period of seven months (including the time occupied by the transport to and fro), especially as the season falls precisely at a time when an Englishman desires to entertain his friends, and naturally likes to show his rooms to the greatest advantage. Notwithstanding, because it was the great purpose of this exhibition, by bringing together the most distinguished works in the above-mentioned branches of Art, to present an opportunity of rare enjoyment and instruction to all interested in Art, and thus to aid in diffusing widely a fundamental knowledge of the Fine Arts, and elevating the public taste, with a laudable desire to carry out these views, a large number of possessors of these works of Art have readily consented to make this great personal sacrifice. Such liberality must be acknowledged with the liveliest gratitude by every well-educated person. Her Majesty the Queen has in this instance, as in everything tending to advance the highest interests of the nation, set a noble example; not only has she contributed a series of *chefs-d'oeuvre* from her galleries in Windsor Castle, Hampton Court, and Buckingham Palace, but in many of the finest objects of the other departments in the exhibition her Majesty's name will be found attached. His Royal Highness the Prince Consort has emulated her Majesty's gracious intentions. In his well-known letter to the committee, he first recognised the great importance of this undertaking, and indicated the principal points of view to be observed; and he has likewise contributed from his private collection highly interesting specimens of the old Italian, German, and Flemish schools—works of comparative rarity in England. It is true that the smallest contributor to this exhibition, in one view, deserves equal thanks with the greatest, inasmuch as he has assisted according to his means; but it would lead me too far to mention all here by name. I shall therefore name those who, by large or small number of specimens of the chief value in each department, have aided in raising the exhibition to its present importance. In the department of pictures, the Marquis of Hertford's name stands first: the works he has contributed are hung together, and form a rich bouquet, as it were, of the *chefs-d'oeuvre* of the Italian, Spanish, French, Flemish, and English schools. In the Italian schools must be mentioned pre-eminently Lord Ward, Lord Cowper, and Lord Darnley, without whose contributions these schools in their highest period would be very insufficiently represented. Next in importance are the contributions of Lords Carlisle, Northwick, and Warwick; of Messrs. Labouchere, Baring, Holford, Fuller Maitland; of the Rev. J. Fuller Russell, and of the late Mr. Smith Barry. In the old Flemish and old German schools, the most remarkable specimens are those of the Duke of Northumberland, Lord Carlisle, Sir Culling Eardley, Bart., the Rev. J. H. Heath; Messrs. Beresford Hope, J. H. Green, Lord Yarborough, and Lord Spencer. The later Flemish schools, from Rubens and Rembrandt downwards, are represented the most richly of all by particularly favourable specimens from the following contributors:—the Dukes of Newcastle and Bedford; the Lords Carlisle, Spencer, Darnley, Warwick, Overstone, Yarborough, Hatherton, Ellesmere; the Messrs. R. S. Holford, Thomas Baring, Edward Loyd, John Walter, Edmund Foster, George Field, Henry T. Hope, Henry Labouchere, F. Perkins, J. Dingwall. The pictures of the Spanish school of especial importance have been sent by Sir Culling Eardley, Bart., William Stirling, the Lords Overstone, Elgin, Stanhope; Messrs. Henry Farrer, W. Morritt, the Duke of Bedford, and George A. Hoskins. In connection with the French school may be mentioned the Lords Carlisle, Burlington, Derby, and Yarborough, and Edmund Foster, Esq. The number of contributors to the modern English school is so great, that I might almost transcribe all the names in the catalogue; and the same may be said of the numerous collection of water-colour drawings.

The English aristocracy and gentry have contributed a great portion of the assemblage of portraits of distinguished persons. The exhibition of miniature portraits is principally furnished from the collections of the Dukes of Buccleuch and Portland. The cartoons and drawings of the great masters

consist mainly of contributions from the excellent collection of the Rev. Dr. Wellesley, at Oxford, that of B. Hertz, Esq., at London, T. Birchall, Esq., and the astronomer Johnson. In the extremely rich collection of engravings, the contributions of R. S. Holford, Esq., the Rev. Dr. Wellesley, Felix Slade, Esq., and Richard Fisher, Esq., occupy the first place. With these names worthily rank those of Mr. J. H. Hawkins, Sir J. S. Hipplesley, George Vaughan, F. T. Palgrave, Messrs. Evans, E. Cheney, C. S. Ball, Sir C. Price, M. J. Johnson, the Rev. F. Griffiths, St. John Dent, Esq., Lewis Loyd; and in etchings of Rembrandt, the Duke of Buccleuch; of Claude Lorrain, the Rev. Dr. Wellesley. In the collection of old wood engravings—especially those which are printed in colours from various blocks (*chiaro-oscuro*)—William Russell, Esq., has given the most interesting specimens from his rich collection. The Rev. Dr. Wellesley's liberality has here again not been wanting,—he has given important specimens, to which Dominic Colnaghi, Esq., has also added contributions. In the large collection of photographs, his Royal Highness the Prince Consort has especially contributed,—photographs after the admirable drawings by Raphael, executed by C. Thurston Thompson, which are preserved in the Royal Library at Windsor, and of Italian buildings.

I come now to the most important contributors in the department of sculpture: the larger examples are, with few exceptions, modern,—since the time of Canova,—and mostly by English artists. As the number of contributors in this instance is almost equal to the number of objects, it is impossible to enumerate them. In the small specimens of sculpture, however, executed in various materials, especially in terra-cotta, ivory, and bronze, the case is rather different. In Egyptian, Greek, and Roman Art, the chief contributor is Joseph Mayer, Esq., of Liverpool, who has here presented many specimens from the collection of these works which he purchased from the well-known collector, B. Hertz, Esq., of London. In the fine medallions of the fifteenth century, also, he stands pre-eminent with the Rev. Dr. Wellesley. The contributions too of the Hon. Asbley Ponsonby, Mr. Pulsky, and Mr. Philipps, deserve to be noticed. Mr. Mayer is likewise in the department of sculptures in ivory, one of the principal exhibitors; he has sent the collection which he purchased from the well-known amateur of Art, Mr. Pulsky, called the Fejervari Collection. In connection with the above, three other contributors may be mentioned in this branch: Colonel Meyrick, who contributes the celebrated collection bequeathed to his family by the well-known archaeologist, Douce; Lord Hastings and Robert Goff, Esq., who have also given choice specimens from their admirable collections. To these names may be joined those of the Rev. W. Sneyd, Messrs. Field, and Falcke, Lord Cadogan, Mr. Edward Cheney, Lord de Tabley, the Duke of Buccleuch, and Mr. Norton, have contributed peculiarly valuable specimens of bronze sculptures.

I come next to the department of metallic vessels for ecclesiastical and secular uses; and here are to be named, above all, the colleges of the universities, and the different corporations and companies, from the importance of their contributions. Together with these may be mentioned Cardinal Wiseman, Messrs. Beresford Hope, the Rev. Dr. Sneyd, the Rev. Dr. Rock, Mr. Arnold, and Mr. Farrer, &c. In oriental vessels, the contributions of Mr. Falkener and Mr. Rhode Hawkins, are of the greatest importance. For an excellent selection of silver vessels of the later and modern time, the public is indebted to Messrs. Hurt and Roskell. In the enamel, as well of the earlier mediæval works, as in the vessels of the celebrated manufacture at Limoges, Colonel Meyrick and Lord Hastings again take the first place; whilst the contributions of the Rev. Walter Sneyd and Beresford Hope are also of the greatest importance. In the department of porcelain, of European fabric, such a favourite one in England, the contributions of S. Addington, Esq., R. Napier, Esq., the Duke of Buccleuch, the Marquis of Bath, and Charles Mills, Esq., are most distinguished; and in the oriental productions those of Lord Cadogan, Edward Falkener, and John P. Fischer. In the contribution of earthenware, nearly allied to porcelain, in which the majolica-ware takes the first place, Lord Hastings again is pre-eminent; and next to him

I may mention Sir Anthony Rothschild. Very remarkable artistic specimens of glass vessels have been sent by Mr. Felix Slade, Mr. R. Napier, Miss Auldjo, the Duke of Buccleuch, the Earl of Cadogan, and Mr. H. G. Nicholson; and when the fragile nature of these articles is considered, a double share of acknowledgment is due to these contributors. In all these departments of ornamental art, the contributions made by the Government from the British Museum and Marlborough House, as well as the Soulages Collection, purchased by the committee for this exhibition, are highly important features of the exhibition. I need scarcely remark that the Honourable East India Company and the Royal Asiatic Society have contributed most largely to the Oriental Museum: at the same time, the works from the collections of private individuals, especially those of Mr. Fischer, Mr. Falkener, and Messrs. Hewitt, merit peculiar attention.

The highly interesting collection of armour and arms—several specimens of which have a considerable artistic value—is principally indebted to the liberality of Colonel Meyrick.

The simple existence, however, of all these treasures, and the noble liberality of their owners in parting with them, for the accomplishment of a great purpose, would not have sufficed to accomplish this exhibition, unless accompanied by two other conditions, which are only to be found in England: in the first place, the extraordinary wealth which alone can furnish the means for such an undertaking; and secondly, a readiness to incur a great pecuniary risk, in order to attain so important an object, and, still more, to undertake the serious labour and heavy responsibility inevitably attending the accomplishment of such a design. The fact that such an undertaking has been carried out in the first manufacturing town in England, with such happy results, satisfactorily contradicts the oft-repeated assertion, that an appreciation of the highest mental interests of mankind is incompatible with manufacturing pursuits, and confers the highest honour on the town of Manchester. No person, however, can fully estimate the obligations which all persons interested in Art are under to the members of the committee, but one who, like myself, in establishing the Museum at Berlin, has been engaged in bringing together and arranging, from various quarters, a great collection of works of Art.

The first requisite was a building of a size commensurate with the object in view. With the exception of the Palais des Beaux Arts, in which the works of Art were exhibited in the Paris Exhibition of 1855, I have never seen a building containing such collected works of Art so advantageously lighted as this, while the rooms are airy and of felicitous proportions.

The next question relates to the contents of the building. In order to leave nothing undone that could contribute to the success of this great undertaking, the committee, knowing that I have for a long time been engaged in the study of the treasures of Art in Great Britain, applied to me on this occasion; and I most readily have done all in my power to direct their attention to a large number of the most important pictures in this country.

Another important point was the selection of persons best qualified for collecting and placing the objects in each department, and also making a catalogue of them; in this respect the choice made may be considered fortunate. In relation to the pictures of the various schools, this task has been entrusted to Mr. G. Scharff, jun., who is well and favourably known by his public lectures on the history of Art, as well as by his numerous admirable illustrations of various works. In his arrangement he has, as far as the space would permit, classified the various schools in chronological order—an arrangement which has been also very judiciously adopted in the gallery of portraits, in the English school, in the drawings, engravings, and the collection of armour. This system has, above all, this great advantage,—that each work of Art appears as a link in a great chain, which receives an influence from the one preceding it, and imparts an influence to the one following. Each work is thus illustrated and made intelligible, while instruction is combined with enjoyment. Following this arrangement, the old pictures commence with some specimens of the Byzantine school, which served as models to the Italian painters of the thirteenth century. In order

to obtain a right standard of the significance of the Italian painters of the thirteenth and fourteenth centuries, we must first clearly ascertain what it is that guides the painter in every work of Art. This may be defined as the desire to embody the idea present to his mind in a form at once distinct and beautiful—a desire only to be accomplished by that exaltation of feeling which we term enthusiasm, and by a conscientious use of the mechanical means at his disposal. The degree of development of the artist's mechanical means may, indeed, as in the Italian painters of this epoch, be very imperfect. In drawing they do not surpass a simple indication of the principal forms; the heads have something typical; the colouring is at times dim, at times gaudy; whilst we never meet with any general keeping. Yet, notwithstanding such deficiencies, these works make a deep and forcible impression upon all who can appreciate the highest purposes of Art, from their possessing the above most important conditions in a high degree. On the other hand, works of Art which possess fully all those means of representation,—drawing, beauty of form, individual character in the heads, harmony of colouring, and accurate observance of the laws of perspective,—yet if wanting the first of these conditions, a true enthusiasm, do not fulfil the highest purpose of Art, and leave the mind of the spectator cold and unimpressed; as, for example, at an early period, the pictures of a Vasari; in modern times, of a Raphael Mengs. Unquestionably these demands in a work of Art will be found satisfied in a rare degree in pictures like those here collected, of Duccio (No. 12), Ugolino (Nos. 25, 25 f.), and Simon Martini (No. 37), all from Siena, or Taddeo Gaddi (No. 47), of Florence. The desire to give to their pictures a more true expression lead the Italian, Netherlandish, and German schools of the fifteenth century in every part—drawing, colour, perspective, &c.—to a close study of nature. The admirable works of Fiesole, Peselli Pesello, Cosimo Rosselli, Sandro Botticelli, Pietro Perugino, Francesco Francia, Giovanni Bellini, Andrea Mantegna, &c., here presented, exhibit proofs of this. The following epochs of the Italian schools, although not richly represented, are sufficiently so to afford an insight into each, but not to give an idea of the treasures in these schools which England possesses. In the absence of any work of some consequence of Leonardo da Vinci,—properly speaking the founder of the highest period of the art in Italy,—some works by his best pupils, the two by Beltratio, and a St. Catherine with angels, by Bernardino Luini, serve to represent his style of Art. On the other hand, the exhibition has the rare advantage of containing a true picture by Michael Angelo, "The Virgin and Child, St. John, and Four Angels" (No. 107). Raphael's earliest period, in which he still adheres to the artistic forms and sentiments of his master, Pietro Perugino, is well represented by "The Crucifixion" (No. 123), and the "Christ on the Mount of Olives" (No. 134). The second, or Florentine, period, in which he attains a greater maturity in his knowledge of Art, is represented by the smaller Virgin and Child, from Panshanger (No. 136), the "Bemoaning of Our Saviour" (No. 138), the larger Madonna, from Panshanger (No. 141), and "The Legend of the Girdle" (No. 147). The third, or Roman period, is represented by the old copy of the picture called "The Pearl" (No. 148), together with some tapestries from the cartoons at Hampton Court. Raphael's rival, Sebastian del Piombo, is well represented by a Holy Family (No. 161), and a female portrait (No. 249). Here are likewise two excellent pictures of the Holy Family, by the two greatest Florentine painters of this period, Fra Bartolomeo (No. 118), and Andrea del Sarto (No. 26, Hertford Gallery). The head of the Lombard school, Correggio, is less favourably represented, although the extremely beautiful Angels' Heads (Nos. 166, 167), in the large style peculiar to his fresco paintings, and the Magdalen (No. 165), as a specimen of his wonderful perfection in cabinet pictures, are worthy representatives of this master. Of the two first masters of the Venetian school, Giorgione may be most favourably studied in his picture of "The Daughter of Herodias with the head of St. John" (No. 252), and Titian in his "Europa on the Bull" (No. 259), the Magdalen (No. 261), "The Rape of Proserpine" (No. 262), the so-called Portrait of Ariosto (No. 257), and "The Riposo" (No. 301). The principal picture of the epoch of the Carracci,

toward the close of the sixteenth and in the first half of the seventeenth century, is the celebrated "Three (properly it should be called four) Marys weeping over Christ," from the collection of Lord Carlisle (No. 310). There are some good specimens of the two chief pupils, Domenichino and Guido, as also of Guercino, and the contemporary masters Carlo Dolci, Sasso Ferrato, and Salvator Rosa. There is, of course, no want of excellent works by Canaletto.

The exhibition of the old Flemish and old German schools, although not at all complete, contain specimens sufficient to give a knowledge of its character. In the first of these schools there is a genuine picture by Jan Van Eyck (No. 384), several by Hans Memling (Nos. 393, 397, 398, 399, 401, 402, 403), together with some of the younger Rogier Van der Weyden (Nos. 387, 388, 389, 407, 409, 412, and 450). The most important work of this school, however, is "The Adoration of the Kings," by Mabuse (No. 436). The old German school has a picture by the master of the renowned picture of "The Cathedral at Cologne," Stephen Lothner (No. 330), as well as a genuine one by Martin Schongauer (No. 437). Albert Durer is represented by a masterly portrait of his father (No. 462), and Holbein by several portraits, among which are pre-eminent those of Henry VIII. (No. 471), and Dr. Stokesley (No. 489).

The Flemish school, from Rubens and Rembrandt down to the first half of the eighteenth century, is the most completely represented in the exhibition; and this department is in good proportion to the incalculable treasures of this school scattered over England. As these masters are more generally known, and the number here exhibited is large, I cannot particularise individual pictures, but shall content myself with some general remarks. Rubens may be studied in all his various styles—as historical, portrait, and landscape-painter. In history, the most important picture is "The Holy Family" (22); in landscapes, "The Rainbow" (21), from the collection of the Marquis of Hertford. Rembrandt is, in like manner, presented in his various styles. Vandyck, who resided so long in England, is properly conspicuous, both in historical pictures, and especially as a portrait-painter, in his various epochs, Genoese, Flemish, and English. Among Rubens' other pupils, Frans Snyders and Jacob Jordaens are very well represented. Terburg, Gerard Dow, Metsu, and Frans Mieris the elder, among the great *genre*-painters, are somewhat scantily represented, although the exhibition has a *chef-d'œuvre* of each master. Jan Steen, on the contrary, the most spirited of all, appears in his full strength in ten pictures. There are several first-rate works by Teniers. Adrian Van Ostade is also well presented, and Isaac Van Ostade shines forth brilliantly. The same is the case with Nicholas Maas, Pieter de Hooge, and Gonzales Coques. The Dutch animal and landscape-painters occupy a peculiarly prominent place. Among six of the works here exhibited of Paul Potter, of extreme rarity, are two of his *chefs-d'œuvre* (Nos. 997 and 998): the seven pictures by Adrian Van de Velde are among his choice works. Dujardin and Berchem are less fully, although well, represented. On the other hand, the ten pictures by Cnyp show that no other country can vie with England in his works. There are eleven excellent pictures by Wouvermans; but the eight pictures of Hobbema form one of the brightest features in the exhibition: the entire Continent cannot produce such *chefs-d'œuvre* by this master as are here brought together. Ruysdael is also represented by fifteen pictures, among which are many of his greatest works, together with some seapieces. On the other hand, Jan Wynants and Jan Both are feebly represented. The pictures of Philip de Koning and Artus Van der Neer are not numerous, but very good. Among the marine-painters, the favourite of the English, Willem Van de Velde, shines in all his greatness in ten pictures; while on the contrary, Backhuysen, and the admirable Van de Capella, are insufficiently represented. Of the great painters of flowers and fruits, Jan David de Heem and Jan Van Huysum, there are some very good pictures.

The Spanish school is richly illustrated in various ways, in a manner possible in no other country than England out of Spain. In the older school, there is a remarkable work by Morales (No. 508). The great rarity of the works of Velasquez out of Spain creates our astonishment at the large number of

genuine pictures by that master here presented: I would particularly notice the pictures, Nos. 727, 780, 789, 10, 11, 12 (the three last from the collection of the Marquis of Hertford): also the Venus (No. 787). The specimens of Murillo, twenty-six in number, give a very varied acquaintance with his works. Among the historical pictures are pre-eminent "The Virgin in Glory" (No. 641), "The Flight into Egypt" (No. 643), "The Holy Family" (No. 639), "The Virgin and Child" (No. 642), and "The Adoration of the Shepherds" (No. 1), "The Almsgiving Thomas of Villanueva" (No. 2), and "The Holy Family" (No. 5), the three last from the Hertford Gallery. Among the studies from nature, the most remarkable are "The Woman Drinking" (No. 629); and, in portraits, two of himself (Nos. 640 and 632). The exhibition is well furnished with specimens of the other masters of the Spanish school, as Zurbaran, De las Roelas, Ribalta, Carducho, El Mudo, &c.

The French school is very incompletely represented; works of prominent interest are the following:—"The Triumph of Bacchus" (No. 598), "The Landscape" (No. 600), and "The Four Seasons" (No. 35, Hertford Gallery), by Nicholas Poussin. Of the works of Claude Lorrain, we have, among others, "The Parnassus" (No. 649), "The Riposo" (No. 654), "The Poetical Landscape" (No. 650), and "The Seaport" (No. 655). We may also notice Watteau, Pater, Lancret, and especially Grenze. Notwithstanding some extraordinarily beautiful landscapes by Gaspar Poussin, this master is but insufficiently represented, considering the astonishing amount of treasures by him existing in England.

With regard to the exhibition of pictures of modern artists, the English school (in its most distinguished masters) is represented in a more complete and excellent manner, than was ever the case before. Although I have availed myself of every opportunity of seeing the works of this school, I have here enlarged my knowledge of it considerably, especially with the following masters:—Hogarth, Sir Joshua Reynolds, Gainsborough, Wilson, Stothard, Constable, Turner, Sir D. Wilkie, Patrick Nasmyth, Sir Augustus Callcott, Collins, and Sir Edwin Landseer. It would, however, appear presumptuous in me, a foreigner, to enlarge on individual pictures, as most of the English amateurs who visit the exhibition are better acquainted with these works than I am. I will therefore restrict myself to the general remark, that this exhibition has only confirmed my conviction, that the English school, in all departments of painting, with the exception of the religious, has produced the most remarkable works.

The modern continental schools are, generally speaking, very insufficiently represented. By far the best, however, is the French school, which has admirable works by Ary Scheffer, Horace Vernet, Descamp, Paul Delaroche, Granet, C. Troyon, Meissonier, Rosa Bonheur, Plassan, Fichel, and Chavet.

One of the most interesting portions of the exhibition is, unquestionably, the "British Portrait Gallery," containing 386 pictures, which has been collected by Peter Cunningham, who for several years has been engaged in these pursuits. This gallery comprises celebrated persons of every description, princes and princesses, statesmen, generals, poets, men of letters, musicians, artists, and *beaux esprits*. It may be safely asserted, that no other nation can produce so numerous a collection of the kind, and at the same time interesting as works of Art, of greater or less importance. The portraits of Henry IV. to Henry VIII., are indeed, as works of Art, of little value; but from the latter, downwards, we have here an almost uninterrupted series of distinguished artists. Hans Holbein worthily commences the series, and is followed by Zuechero, Lucas de Heere, Marc Gerard, Van Somer, Mytens, Jansen, Vandyck, Walker, Dobson, Sir Peter Lely, Sir Godfrey Kneller, Sir Joshua Reynolds, Gainsborough, Sir Henry Raeburn, Sir Thomas Lawrence, and T. Phillips.

Closely allied to these is the remarkable collection of miniature portraits and enamel paintings. This series opens with two of the finest miniature portraits by Holbein—Henry VIII. and Anne of Cleves—in the "glass case" which contains the "Ivories" belonging to Colonel Meyrick. The collection of

the Duke of Portland comprises excellent works by Nicholas Hilliard, Isaac and Peter Oliver, Cooper, and Flaxman. That of the Duke of Buccleuch also contains celebrated specimens of the same artists' works, as well as others by Hoskins. Among the other contributions will be found many works dating down to the time of Sir William Ross.

The collection of water-colour drawings, containing 969 portraits, commences with some admirable works, in the manner of the old masters; among which are, prominent, one by Rembrandt (1 a.), and Adrian Van Ostade (No. 2); as well as several by Jan Van Huysum (Nos. II—2I). The works of the English artists, unquestionably the first in this class, may be seen here in their full excellence. Here are brought together the best specimens from many exhibitions and collections. Commencing with the inferior works of Paul Sandby, we trace the achievements of the art down to the masterly drawings of Frederick Tayler; and artists of whom even in the best private collections are seen only a few, are here exhibited in great numbers. Thus we have eighty-four drawings by Turner, twenty by Copley Fielding, thirty by Cattermole, and sixteen by David Cox, &c.

The department of original drawings and cartoons by the older masters is important more from their artistic value, than their number, which only amounts to 260. Of the last, are the Angels to the fresco-paintings of Correggio, in the cupola of the cathedral at Parma, a Virgin and Child, and two Angels by Gaudenzio Ferrari, and a Virgin and Child which I attribute to Luini, especially important. Among the drawings are several of the Italian school of the fifteenth century—Masaccio, Fra Filippo, Donatello, &c. There are specimens of rare beauty by Raphael—two portraits of his sister, St. Apollonia, and studies for different pictures; as "The Entombment," in the Borghese Palace; "The Madonna," in "the Green," at Vienna; the "Massacre of the Innocents," engraved by Marc Antonio. By Michael Angelo there is a most intellectual profile portrait of Vittoria Colonna, also the study for the Bartholomew, and his "Day of Judgment." The drawings of Titian and Claude Lorrain are especially numerous and admirable. Fine specimens by Rubens, Vandyck, and other Flemish masters, are also here. The German School has some drawings by Albert Durer, including a remarkable one of a woman followed by Death.

The most perfect department of its kind in the whole exhibition is that of engravings, etchings, aquatint, and wood-engraving. It may be safely asserted, that never before has there been exhibited, *framed and glazed*, a collection of the kind comparable to this, which contains the rarest and most beautiful works in these various branches of printing down to the present day. A source of the richest enjoyment, and, at the same time, the rarest opportunity of instruction is here presented to the amateur. Some specimens are met with of the old Italian and German masters wholly unknown, even in the largest collections; such, for instance, in the Italian school, as "The Four Cupids playing on Musical Instruments," by Attobello, after Andrea Mantegna: in the German school we have a "Battle of De Hamel." The Italians are especially rich in specimens of Baldini, Andrea Mantegna, Robetta, Nicoletto da Modena, Benedetto Montagna, "the Master of the Caduceus," and, above all, Marc Antonio and next Julio Bonasone. The German and Netherlandish schools have excellent specimens of Martin Schongauer, Albert Durer, and Lucas van Leyden. The artist most feebly represented is the master of 1466, although what works there are by him are excellent. The etchings of the painters are peculiarly brilliant, and a series by Claude is of the highest rank. The same may be said of the works of Rembrandt, Adrian Van Ostade, Paul Potter, and others. The collection of mezzotint engravings is especially rich and interesting. Among the wood engravings, our attention is peculiarly attracted to the large and rare specimens of the Venetian school, in which is recognised the spirit of the great masters Giorgione and Titian.

The collection of photographs contains a very rich series of portraits of English and foreign persons of celebrity; also a series of very beautiful drawings by Raphael, together with remarkably successful specimens in landscape and architecture.

The number of large statues, groups, and busts,

which adorn the nave and transept amount to 160; and, with few exceptions, they belong to the modern period. Among these are seen the works of Canova, Thorwaldsen, Sir F. Chantrey, Sir R. Westmacott, E. H. Baily, Gibson, R. J. Wyatt, W. Calder Marshall, J. Sherwood Westmacott, Von Byström, Rndolph Schadow, Schwanthaler, Hiram Powers, and other distinguished sculptors. The majority of these works, however, are so well known to amateurs, that it would be superfluous to particularise here single ones. Among the older works is that of the "Boy with the Dolphin;" this work, sent from Ireland to the exhibition by Sir H. K. Bruce, Bart., is generally regarded as a work by Raphael. Any acquaintance, however, with the sculpture of the sixteenth century in Italy suffices to disprove this assertion: the work belongs to a later period, and is clearly the production of an inferior artist; the forms are too soft and exaggerated, portions of the head very flat and ugly, and the ear very imperfect. There is a bust of Henry VIII. in terra-cotta, rightly attributed to Torregiano.

On the other hand, the exhibition presents a very complete study of sculpture on a small scale, in bronze, terra-cotta, and especially in ivory, from the times of Antique Art down to the present day. Beside the beautiful statuettes in bronze and terra-cotta, in the collection of B. Hertz (now the property of Joseph Mayer, Esq.), there are also from the same 1371 engraved stones, many of them remarkable. For the later period of Antique Art, there are here the diptych in ivory from the Fejervari Collection, which also contains some excellent specimens of the oldest period of Christian Art. In the period of Romanesque Art (about 900—1220), the collections of Donec and Lord Hastings are especially rich, as well as in monuments of the Gothic epoch (about 1200—1500), and of the period of the Renaissance (about 1500—1600). There are several rare works in ivory, which present a view of the life, the tournaments, and the romantic love of the period, in the form of caskets, covers of mirrors, and hunting-horns.

Of the period of the Renaissance, here are medallions in bronze,—one of the most important and attractive features in the exhibition, and very well supplied. Very complete is the collection of vessels and utensils for ecclesiastical and temporal uses, ornaments, &c., in metal, terra-cotta, porcelain, and earthenware of all kinds. In Antique Art we have again Mr. Hertz's collection. There is also an extraordinary selection of early British, Celtic, and Anglo-Saxon remains, among which the "enamelled ornaments of the Anglo-Saxons," from the Fawsett (now Mayer) Collection, are nearly unrivalled. These remains afford a favourable representation not only of the degree of cultivation, but also of the taste of these people. The number of the relic-chests, censers, ciboriums, crosiers, &c., belonging both to the Romanesque and Gothic epochs is considerable. I may mention the crosier of William of Wykham, contributed by New College, Oxford, as by far the most artistically ornamented. Among the works in metal, the oriental occupy an important place, from their size, as well as their tasteful artistic execution. There is a series of admirable specimens of enamels on metal, of the earlier periods, and the highest stage of this art, from the celebrated manufactory of Limoges. Three of the most beautiful are in the glass case which contains the ivories of the Meyrick Collection. A specimen of particular interest among them is the plate with three women bathing; a casket from the collection of Lord Hastings is also extremely beautiful. Enamels of the size of the large portraits, from the collection of Henry Danby Seymour, occur very rarely even in France. The department of majolica, overrated at the present day, is, if possible, still more richly supplied. There is here a large and choice collection of the vessels from the second half of the fifteenth century, which, from their probable Saracenic origin in Spain, are called "Hispano-Moorish,"—they are distinguished by their delicate patterns and beautiful metallic brilliancy, often closely resembling gold; of the celebrated manufacture which flourished under the protection of the Dukes of Urbino, especially in Urbina and Gubbio; nor is there any want of specimens of the later period, which are connected with the later forms of painting in Italy. The art,

closely allied to these, which was cultivated in France by the celebrated Bernard de Palissy, is well represented, especially by the specimens in the Soulages Collection. But the finest French works of this description are four specimens of the very beautiful and extremely rare vessels of pipeclay, hitherto only known of the time of Henry II., and therefore called "Henry the Second's Ware." A candlestick, contributed by Sir Anthony Rothschild, is one of the most considerable specimens of this kind I am acquainted with. The "Saltceller," contributed by George Field, Esq., is very remarkable, from having a painting of the salamander, the sign of Francis I., a circumstance which proves that this finest species of earthenware was made as early as his time, and throws a new light on the obscure history of this manufacture. There is also no lack of specimens of the beautiful earthen vessels which were made in Belgium and Germany. Lastly comes the exhibition of Staffordshire ware, produced in England since the year 1690; amongst this the celebrated Wedgwood ware is particularly admirable. Of porcelain, as well European as Oriental, the specimens are small in number, considering the quantity which exists in England; the exhibition, however, has choice specimens of both descriptions. The same remark applies to the collection of glasses, especially of the famous Venetian manufacture of Murano.

In modern goldsmiths' art we may particularly notice the shield of the goldsmith Hossauer, justly celebrated from the combination of the intellectual design of Cornelius with the admirable execution of the sculptor Fischer, and the engraver in precious stones Calandrelli, which the King of Prussia, as godfather, presented to the Prince of Wales, and several *chefs-d'œuvre* by the excellent artist Veckte. Among the most important weapons, in an artistic view, the celebrated shield of Benvenuto Cellini, preserved in Windsor Castle, occupies the first place. With this may be classed the "Targets" of Charles V. and Francis I., "the embossed and inlaid suit of armour of Alphonso, Duke of Ferrara," together with other interesting specimens.

The small, but choice, collection of specimens of bookbinding, contains beautiful works by the celebrated French bookbinder Gascon, in the sixteenth century, specimens of oriental binding, and the famous modern bindings of London and Paris.

Lastly, the Museum of Oriental Art, arranged by Dr. Royle, forms a highly interesting department, and, both in number and selection of specimens, realises what might be expected in this department in England. The various works in silk, wool, and gold; the boxes, weapons, and ornaments, display a union of technical skill, splendour, beauty, yet peculiarity of taste, which excites our astonishment, and exhibits to the eye the fairy-tale marvels of the East.

Well aware as I am of the immense amount of inventive genius and labour required to produce all the objects which this building contains, I have never entered it without that feeling of reverence which the most extraordinary productions of elevated and refined minds excite. Nevertheless I am equally aware that the treasures of Art existing in this country are so great, that there can be no difficulty in accomplishing two other exhibitions of the kind, in some departments even richer, in others perhaps less so. But lest any one should regard this as an exaggeration, I will only remark, in relation to the pictures of the old masters, that in the present exhibition there are no contribution from the six first collections of pictures in England,—the Bridgewater Collection, those of Lord Ashburton, the Duke of Marlborough, at Blenheim, Lord Radnor, at Longford Castle, of Mr. Miles, at Leigh Court, and Colonel Egremont Wyndham, at Petworth; and also that the ease is the same with the following very important collections,—of Lord Lansdowne, the Dukes of Devonshire and Hamilton, Sir Robert Peel, Mr. Tomline, Mr. Munro, Mr. Banks.

In conclusion I can only express an earnest hope, that the noble example set by the town of Manchester may soon be imitated in the south of England, most naturally in London; and that the possessors of these, and so many other collections, may feel induced to follow the example of those owners of works of Art who have enriched by their liberality the Exhibition at Manchester.

FLORA.

FROM THE STATUE BY TENERANI.

(IN THE POSSESSION OF THE QUEEN).

TENERANI, the sculptor of this figure, is little known in England, though he takes rank among the most renowned living artists in Europe. He is a native of Carrara, and occupies the position of Professor of Sculpture in the Academy of St. Luke, at Rome; his studies, of which he has three or four large ones in and about the Piazza Barbariui, are filled with casts and models of his numerous beautiful works.

Tenerani's master was Thorwaldsen; but his productions show less affinity with the ancient style than do those of the great Danish sculptor; "his chief triumph," as one writes who has often visited his studio, "consists in a rare union of the sublimest and purest devotional feelings, constituting him, *par excellence*, the Christian sculptor, with the simple grandeur, the dignified repose, the cold and conventional—yet often touching—expression of the Greek school."* One of his finest examples of Christian Art is a "Descent from the Cross," erected in the *Tortorian* Chapel in the *basilica* of St. John Laterano: the figures in this work are larger than life, but the composition is very simple.

Another grand work from his chisel, is a bas-relief representing the martyrdom of two young Christians, Eudorus and Cymodocea, in the Flavian Amphitheatre. The two martyrs, husband and wife, stand in the centre of the arena, clasped in each other's arms; a slave, or athlete, is in the act of raising a pulley for the entrance into the arena of a tiger, ready to spring on his victims. There is remarkable dignity, combined with the heroism of a pure and exalted faith, in the attitude and expression of the two principal figures; to which a striking contrast is given by the stalwart form and unyielding features of the Roman slave. But unquestionably the most impressive, and altogether the noblest, work of scriptural origin produced by him, is the colossal statue of the "Angel of the Resurrection," a portion of the monument of the Duchess Laute, erected at Rome in the Church of the Minerva; there is a sublimity in this figure of which we know no parallel except it be in the "Moses" of Michael Angelo, though the grandeur of each differs essentially from that of the other. A large monumental group to the memory of the Marehese Costabile, at Ferrara, is also from the hand of Tenerani; some who have seen it pronounce it inferior to others he has executed, though possessing most distinguishing evidences of genius.

Of his mythological sculptures we may particularly mention "Psyche Swooning"—an exceedingly beautiful and delicate work in the modelling; "Cupid extracting a Thorn from the Foot of Venus," a commission from the late Emperor of Russia; and the "Flora," here engraved, a commission from our own Queen, which is poetically described by the writer whom we have before quoted as "a nymph of extreme youth charmingly beautiful, joyously advancing, like a returning diver, gleeful with his pearls; her lap piled with flowers, which seem to drop around her, she lightly skins on the ambrosial gales, shedding forth streams of rich distilled perfume." This subject has so frequently engaged the labours of sculptors, that it would be strange indeed to find any novelty in the treatment of it; undoubtedly there is none here—no new reading, nothing but an elegant and poetical rendering of a theme ever pleasing to contemplate.

The portrait statues of this sculptor take high rank in this department of his art; two of these are especially worth pointing out,—a seated statue of the Princess Marie, daughter of, and executed for, the late Emperor of Russia; and another seated statue of the late Count Rossi, murdered by a Roman mob, a few years since, during an *émeute* of the populace. We have no space to enlarge on the characteristics of these and other great works of Tenerani; our readers who desire to know more concerning them will find ample comments in an article, "A Walk through the Studios of Rome," in the volume of the *Art-Journal* referred to below.

THE NATIONAL GALLERY.

NOTWITHSTANDING certain statements which have appeared, in more quarters than one, the Commission which Lord Eleho was last year the means of obtaining for re-opening the question of site in the matter of the National Gallery, and determining some particulars affecting its constitution that were supposed to be already determined, has not at the moment of our now writing—the middle of the month of July—put its Report into the hands of Government. Matters, our readers will remember, had already proceeded so far in the direction of the definite when Lord Eleho succeeded in re-establishing the provisional, that the Chancellor of the Exchequer had actually prepared a bill empowering the Lords of the Treasury to select a site on the ground purchased by the Commissioners of the Great Exhibition of 1851 at Kensington Gore, and to make that ample provision for present approaches and future contingencies which the space there at the national disposal rendered easy. All this, they will remember too, was simply in execution of foregone conclusions. The necessity of removal, for the pictures constituting the national collection, having been affirmed by successive Committees of the House of Commons, a variety of measures had been adopted which had direct relation to that proposition. Accepting the House at its word, the minister had taken progressive steps for giving effect to its expressed will. The logical method had been applied to the parliamentary suggestion; and the country at length touched by its means on a result respecting a subject, as to the delays connected with which it had grown not a little impatient. One step further in advance,—and the legislature would have executed its own avowed intentions; when just at this critical point Lord Eleho succeeded in returning the serpent's tail into its mouth. At his touch, the logical current flowed back, and sought its source. The tree, which had grown out of its own roots, and was their evidence, arrested its growth and consummation, and bent down towards the roots to see if they were really there. The whole series of measures which had been framed expressly to carry out the parliamentary proposition that the pictures *must* be removed, was suspended just as it tended towards its own accomplishment, in order that Parliament might go back to its starting-point, and inquire if there was any necessity for the removal at all!

To a non-synthetic process like this, our readers will at once see, there is not necessarily any end. Lord Eleho's Commission for inquiring into previous inquiries on the same subject, is a perfectly good argument for any future Commission that may be demanded to inquire into the subject-matter of his. Meantime, another year's delay has by its means been secured, as an appropriate answer to the public impatience which had urged that the delays in the matter should end. If rumour speak truly, *that* is not the whole of the gain. It is more than probable, that ere our day of publication for what we now write, the Report of Lord Eleho's Commission will be laid upon the table of the House; but, in the interval, the purport of that report is supposed to have transpired. This Commission has found, it is said, a black to the last Commission's white. Where a former Committee reported *plus*, this Committee writes *minus*. The "yea" of the last inquiry gives "nay" as the result of the present. As regards the leading question of removal or no removal, the new Commission reverses the fiat of the old; and all that has been done *because* a previous inquiry advised that the pictures should be removed, has been done in waste, and may now be undone, because

FLORA.

DESIGNED BY CARLOTTA FROM THE STATUE, BY TENERANI, IN THE POSSESSION OF THE GRAND DUCAL PALACE, FLORENCE.

the result of the present inquisition is, a recommendation that they shall stay where they are. —Our readers need not be informed that the algebraic effect of this *plus* and *minus*, the logical consequence of this *yea* and *nay*, is, to leave the ease exactly where it was previous to either, and suggest the necessity of the whole matter being inquired into anew. For ourselves, however, we deprecate all further delay in the premises, under any circumstances whatever,—and ask for a gallery worthy of the nation anywhere rather than none at all. If the country, being already the owner of a site, is willing to pay for a new one (for in this case, the new is old and the old new,—since it is on the old site that we must purchase anew, and on the new our old purchase is already more than enough), then, let the opinions for and against the fitness of the latter be allowed finally to neutralise each other, and let us by all means unite in doing without further delay in Trafalgar Square what but for the delay interposed by Lord Elcho's Commission we should ere this time have been doing at Kensington Gore.

There is, of course, no difficulty in admitting, that so far as locality is singly concerned the existing site of the National Gallery combines more conditions of convenience and grandeur than any that could be elsewhere proposed. Of mere arbitrary removal, from such a location, of such an institution, even at the suggestions of a system which is nevertheless a sound one, it is probable that no one would ever have thought. If there be no reason why this collection should emigrate in search of better air for its life-blood, or larger space for its natural growth, the argument for a change of place is at once at an end, and need never have been raised. By what means the present Commission has arrived, on these heads, at conclusions the reverse of those affirmed by the Committees which preceded it, we cannot, of course, know till we shall have the Report of this last Commission before us. To that Report, when it comes, we will give a very careful consideration,—of which our readers shall have the result; but meantime, we would observe, that as regards the first question in the cause, that of unwholesome atmospheric conditions, it is one in which equality of testimony, in respect of numbers and authority, on the two sides, cannot be said to have the usual effect of striking an exact balance. Where the matter in dispute affects the life and death of the pictures, the evidence that threatens destruction takes a gravity which greatly swells that side of the equation. The possibility of deterioration must be accepted as on the one hand a figure equal to the probability of immunity on the other. Our fears must have more weight than our hopes where both are equally reasonable, and where the proportion between them has to determine a question of vital precaution. We should require a preponderating weight of opinion for the safety of the pictures to justify us in overlooking the warnings that proclaim their danger. The fact, for example, if it be a fact, as rumour avers, that Mr. Faraday has refused to put his name to the recommendations of this Commission, would demand, to satisfy us, a considerable amount of subscription on the other side. But there is no wisdom in speculating on mere rumours; and so far as the chemical question is concerned, we will, as we have said, reserve ourselves till we shall have the whole of the new evidence, or at least the report founded on it, before us.

As regards the question of possible space, however, which is the one other important element in the decision, and to which the Commission would of necessity have their attention especially directed, it seems to us that there are a few remarks which we may usefully make, even before their Report reaches our hands, and

becomes, as we trust it will, the subject of discussion in Parliament.

That the present accommodation at the disposal of the national pictures is utterly inadequate to the arrangement and display of even the treasures which we possess, is a fact that has long been patent, and somewhat scandalous, to all the nation. It has been one virtue in the vicious nature of this inadequacy of accommodation,—if the nation can so console itself,—that it has been a check on its own unwholesome growth. Insufficient as the means now are which the gallery possesses, the insufficiency would have been greater still but for the corrective supplied by the original insufficiency itself. More than one collection which the nation might have possessed as gifts, or on easy terms, to swell the amount of its treasures, the Government of the day has had to reject for want of house-room. The Blue-books testify to this; and in their records the country may count the gain of its economy. But, it is well understood, besides, that other such gifts have been withheld from being offered, simply on the ground of this notorious want of national room for their reception. Such, nevertheless, is the amount of noble public spirit and generous devotion abroad in this very matter, that no amount of administrative coldness has been able to repel it altogether; and some measure of the wealth that might have accrued to the nation under a more liberal Art-government, may be found in the fact of the splendid collections that have fallen to her store in the face of all the discouragements which it has been her policy to advance. Of lost treasures, such as the Bourgeois, the Fitzwilliam, and the Standish Collections, it is idle now to speak, save in this warning connection:—but the Vernon, the Turner, and the Sheepshanks gifts are there to attest the determined zeal for the public service, in this matter of Art, which even overrides national apathy and legislative delay. The whole history of the growth of the National Gallery to its present dimensions is full of significance in this respect. From 1824 to 1833, as Lord Monteague lately told the House of Commons, the pictures purchased by the nation for the National Gallery in Trafalgar Square amounted to forty-two in number, while the number presented to it by private individuals was sixty-eight. From 1834 to 1843, the number given by the State was fifteen, while the gifts from others numbered sixty-three. From 1844 to 1853, seventeen were bought by the State, and one hundred and eighty-eight presented by private persons. From 1854 to 1856, thirty-eight were added by the State, and one hundred and fourteen by individuals. In other words, from 1824 to 1856, one hundred and twelve pictures were placed in the National Gallery by the State, and four hundred and thirty-three were the gifts of private men. Then came the Turner bequest; comprehending one hundred finished pictures, one hundred and eighty-two more or less unfinished, and no less than eighteen thousand seven hundred and forty-nine drawings and sketches. Mr. Sheepshanks has given to the nation two hundred and thirty-three oil-paintings, the works of British artists, and one hundred and three drawings and sketches. Now, suppose a spirit like this fostered by administrative liberality, and fed by national appreciation, suppose the full and unimpeded action of that magnetic quality by which a great public institution attracts into the mass of its own magnificence the scattered element which is kindred to its own, then let the present unparalleled display at Manchester suggest some notion of the matchless wealth which under such conditions might one day make up the sum of the national treasure. Around a scheme so full and comprehensive as to extend its appeals into all the fields and families of Art, we believe that a collection

would in time group itself which would throw every other Art-museum in Europe into shade.

The Commission for whose Report we are now waiting had, then, to consider whether on the present site which the National Gallery occupies, with the Royal Academy excluded from its walls,—as in such case it of necessity must be,—and with all such enlargements as the accidents that surround it render possible, an amount of space can be secured sufficient to provide for the due arrangement, favourable exhibition, and progressive growth of an institution like this,—measuring its positive demands by the defects of its present, and calculating its future possibilities by the history of its past. And this, be it observed, was the very narrowest formula under which they could consider the question of space, let them interpret their duties as commissioners in what spirit they would. Any attempt to compromise with this limited view of the necessities of the case, to repose on mere immediate adaptation and supply, to overlook in their decision the future fortunes of this great institution, for the purpose of shaping and compelling its present to the dimensions of a favourite scheme, would be simply to hand it over to future commissions, with a new disgrace on its head, and a heavy further cost incurred and thrown away. Whatever other advantages, of any kind, the site in Trafalgar Square may offer, these are worse than useless if that site will not provide for expansion and for system. Something more, however, was given to the Commission to consider, with reference to the question of room, than is formulated as above; and though the additional inquiry to which they were committed is less extensive and liberal than might have been desired, yet we hope that in the course of prosecuting it, they got sight of those larger views to which we are, for ourselves, desirous of drawing attention while yet the important questions connected with the constitution of this establishment are open. A few paragraphs will suffice to indicate those views.

The true method by which to determine the capacities of a building, of whatever kind, is, to determine beforehand, on a comprehensive scale, the purposes to which it will have to be applied. What should be the final character of a national gallery, when established on a scheme worthy of the greatness of the country, and fitted at once to satisfy and to assist the gradually-expanding Art-intelligence of the people, is an inquiry which must take precedence of any question of material accommodations, if it is hoped to make the latter commensurate to the ultimate demands of the former. Now, this logical method of proceeding has not hitherto been a favourite one in this country,—which, in matters of this kind, has acquired a bad habit of living on expedients. The habit, it is at last beginning to be known, has the double disadvantage of being at once costly and ineffectual, and a desire for better and more educated methods is springing up among the people. In this particular question of the true purposes and constitution of an Art-collection, the elements of a just decision have been more and more insinuating themselves amongst the masses who desire,—but sadly want reducing to order for their service by the authorities who can grant. Practically, the logic of the case has been reversed. It has been assumed, as the true position of the syllogism which refers to it, that we can neither make nor accept large additions to our National Gallery for want of sufficient spaces of wall on which to hang them, and that, therefore, we have first to get a building of ample extent, and then to arrange our gallery on its walls. Now, all the terms of the syllogism, as we have had occasion to show, are here only too truly stated,—but their order wants re-arranging. In this method of statement they will never work out to any satisfactory result. Instead of proposing, or per-

mitting, that the building shall determine the extent, or in any way modify or control the arrangement, of the collection, our plan should be, that the collection must prescribe all the conditions of the building. Before, then, proceeding to that fulfilment of the national will which cannot be much longer delayed, we hope the expected Report, when it reaches us, will prove that the Commissioners have well considered what is necessary to its *due* fulfilment. Upwards of thirty years have elapsed since the foundations of the National Gallery were first laid in the Angerstein Collection; and yet, the question which should have met its Trustees on the very threshold of their trust has not even now been decided. No authority has ever informed the public what it is conceived the National Collection ought to be, of what it should consist, how it is to advance towards completion, what is to be its purpose. Before finally determining the question of site, with reference to capacity, it were well that a careful and comprehensive inquiry should be instituted into the principles on which a national collection should be made. On these principles the extent and character of the accommodation must, we repeat, entirely depend; and unless they be thoroughly understood before the nation shall proceed to build, it runs the risk of not building in conformity with its own objects, and failing to carry out intelligently its own desires.

We apprehend, the directors of the public mind, and they who are likely to influence the coming settlement of this long-delayed matter, have all got so far in their appreciation of the questions here raised, as to consider that a national collection of mere pictures, even, should be, at any rate, such as will explain and illustrate the whole history of painting. Dr. Waagen's view is, that the true method of proceeding towards the formation of such a collection is, to lay the nucleus at the highest point of development, and gather round it on all sides:—to begin, that is, with the masters of the age of Raffaele, and add to this centre in both directions,—tracing the history of the art upwards to the earliest times, and downwards through its declension during the last three hundred years. But, whatever the method employed, the result it will, we repeat, be doubtless conceded, should be, to produce a complete exemplification, as regards schools and their relations and their growth, of the story of Art in painting. We think, however, that very many of those who have got thus far will see that, of enlightened necessity, they must go further,—that the history of one art is not completely illustrated without the lights thrown on it from the others. Properly speaking, the history of Art is *one*, and the history of a single art cannot be made complete or intelligible without the annotation of the rest. The arts of design were developed together, and with the aid of each other. A national gallery which does not exhibit them in their union fails to exhibit them in their strength. Rich in examples as we are, and likely to be richer, painting, sculpture, architecture, with its subsidiary arts of decoration, antiquities, and engraving, with its varieties, should all, as on a former occasion we have said, be made to subsidise and throw light on each other in a great national institution devoted to Art. Here, as it should seem, the Art-question might stop; but at this point the field of view enlarges, and it is seen how Art has its inter-relations with and dependence on Science, how the constructive part of Art involves certain branches of practical physics, and how convenient it must be to have in the near neighbourhood of the Art-family which we have thus brought together all the other families with which it is more or less remotely, but always inevitably, allied.—Of all the questions suggested by views like these, the only one formally submitted to the recent Commission is that which

proposes to dismember the British Museum of objects that *there* are in the way of its more especial purposes, while they will consort more fitly with the contents of a national gallery of Art:—but, as we have said, in the prosecution of this inquiry, they cannot have failed to come upon the track of those more extended views which we have ventured here to sketch.

For even the first and smallest of these objects, on the large scale, it may be doubtful whether on the site of the National Gallery in Trafalgar Square there can be obtained sufficient space,—for the largest, were it even on a small scale, it seems to us quite certain that there can *not*. We wait for such correction of our opinions as the report of Lord Elcho's Commission may supply; but if we be right, to build in this place is to deprive ourselves for ever of the power to carry out these larger views should the lessons of experience and the progress of opinion hereafter enforce their value. Meantime, the nation is, on terms and under circumstances more than commonly fortunate, possessor of a site more than adequate to the complete realisation of them all, and of any possible expansion of them; and combining—as we believe we succeeded in showing a year ago, when Lord Elcho obtained his Commission (*Art-Journal* for August, 1856)—most of the conditions which in other respects make a site for such an institution eligible. The reasons are daily becoming more and more numerous and urgent why this question of a National Gallery should have a settlement of some kind or other;—and so, according to any view which we are as yet able to take of the matter, are the reasons why that settlement should locate the institution at Kensington Gore. Among reasons urging generally to a settlement of any kind, is the fact, that, as regards the Turner pictures, the nation is positively guilty of a breach of faith at present, and has taken possession of a bequest without fulfilling the condition on which alone it was bequeathed. Amongst the reasons that point to Kensington Gore, are, the circumstances of the Sheepshanks gift. This gift is made to the nation, in express terms, as the foundation of "a collection of pictures and other works of Art, fully representing British Art," and "worthy of national support." It is not a little significant, that so careful a collector and public-spirited a donor—one who, in his earnestness for the Arts of the country, does not even "desire that his collection should be kept apart, or bear his name"—should select the national estate at Kensington as the fittest locality for its establishment. "Whereas I conceive," he says, in his deed of gift, "that such a collection should be placed in an open and airy situation, possessing the quiet necessary to the study and enjoyment of works of Art, and free from the inconveniences and dirt of the main thoroughfares of the metropolis; and whereas I consider that such a gallery might be usefully erected at Kensington, and be attached to the Schools of Art in connection with the Department of Science and Art now established there." It will scarcely be denied, we think, that a collection "fully representing British Art" is properly a constituent of a British National Gallery,—and that such an institution as the last located in Trafalgar Square will, under the circumstances, have one of its limbs at Kensington. Nor must it be overlooked, that on this Kensington estate are already growing up, one by one, those other establishments to which we have alluded as forming necessary parts of the great Art whole,—and that the final location of the pictures elsewhere, while it will leave the latter collection imperfect for want of the illustrating and teaching elements supplied by the others, will leave the others imperfect for want of that collection itself which should be to them a great and crowning exhibition of results.

One reason more which we will urge as argument for an early and final settlement of this matter of a National Gallery, in whatever direction, is, that sore and angry feeling which seems now to preside over all questions connected with the institution,—and which owes some of its force and pungency to the provisional condition in which all these have so long been suffered to remain. In the matter of this institution the minister has not won the confidence of the country,—and a portion of the distrust which he inspires, because of the unsatisfactory state of the establishment itself, in the face of a general public interest and in spite of large individual patronage, attaches to all persons and things belonging to it. The consequence is, that he cannot propose a vote for the secretary's salary, or for a travelling agent's expenses, or for the purchase of a picture, without rousing an angry polemic in some quarter or another. Such a scene of cavil and bitterness as the House witnessed on the question of the estimates for the National Gallery, brought forward on the second of last month, advances nothing and lets down the figure of the nation, in its relations to Art, before the world. Above all things else we desire, that the means of reconciliation as regards the unsettled questions which affect this institution, and the elements of a better and nobler spirit in dealing with interests so noble, may be found in the forthcoming report of Lord Elcho's Commission.

THE SOUTH KENSINGTON MUSEUM.

On the evening of Saturday, June 20th, the Queen visited the New National Museum at South Kensington, and minutely inspected the various collections which have been there brought together. The royal party included the Prince Consort, the Princess Royal, the princes of Prussia and Austria, the Marchioness of Ely, Earl Granville, Lord Rosse, &c.; the Duke of Buccleuch, Earl de Grey, with other distinguished persons, and the gentlemen officially connected with the different departments of the establishment, were also present. Her Majesty was pleased to express her warm interest in this museum, and her entire satisfaction with the plan and arrangements which had been adopted for its formation. Private views of the museum, which were (in accordance with the custom of "Private Views" in London) very numerous attended, took place on the following Monday and on the Tuesday evening, and since that time the museum has been open, gratuitously during three days in each week, to the public. Thus, the career of this new agent in the great movement for national education has commenced in the most auspicious manner. The favourable opinion of the Sovereign has been promptly and decidedly confirmed by large assemblages of almost every class in the metropolitan community, and the museum is now at work in earnest in its various departments.

While from without, the progress of this museum, during its course of preparation, was assailed with much both of direct hostility and of not less obstructive ridicule, within the buildings a quiet, steady energy went on with systematic perseverance, and it now has brought about results that have fairly silenced every caudid opponent. It is true, indeed, that this museum, as we now see it, is far from being complete, even in its own specialities; but then this museum has been designed only as a temporary provision for a present want, until careful consideration and mature experience shall have enabled the legislature to determine on some comprehensive and permanent scheme for the national museums of Art and Art-education. It is a necessity of the present condition of Art amongst us, as an educational agent, that our Art-museums should be divided, and divided in a manner far from satisfactory. But we have already made a rapid advance towards a complete and a completely satisfactory classification of the various elements which combine to form the Art-museums of a great nation; and

we may with confidence anticipate, at no distant time, a consistent and advantageous adjustment of the entire question. Meanwhile, we shall do well to endeavour to obtain the greatest possible amount of present good from the Art-museums which now exist, and at the same time we may be studying how their best qualities may be most efficiently strengthened, and their capabilities enhanced by general classification and by harmonious concentration. The South Kensington Museum is impressed, in a very striking manner, with the attribute of *practical reality*, as an educational establishment. That it should be so, was all important for the *status* which the museum would assume, and for the degree of value which would from the first attach to its operations. Had it proved merely a speculative affair, or only an exhibition in the ordinary acceptance of the term, however plausible it might have been in the one capacity, and however attractive in the other, as a national Art-museum it must have been at once declared to have been a failure. But it is a success because, having aimed at being real and practical, it has demonstrated the fact that it is both practical and real. We, of course, speak of the entire collections, of the system upon which they have been formed, of the method which has determined their grouping, and of the actual schools for instruction in Art as they now exist: when we analyse the several collections, we find some objects which, if not objectionable, certainly are useless, and which we hope speedily to see replaced by teachers worthy of that title. On the whole, however, we repeat that the contents of this museum command our respect and admiration, and we see in them conclusive evidences of the ability, the zeal, and the practical sentiment of those to whom the direction of the whole has been entrusted. The Prince Consort has evinced a deep interest in this museum, and we rejoice to recognise, with sincere gratitude, the presence of such exalted influence, so judiciously as well as so graciously exercised. Of Mr. Cole, Mr. Redgrave, and Dr. Lyon Playfair, we need only say that those gentlemen have done even more than we had expected from them; while they have found an able and accomplished ally in Captain Fowke, of the Royal Engineers.

The subjects, before they were open to the public, not of adverse criticism only, but also of keen sarcasm, the museum-buildings prove to be well suited to the requirements for which they were constructed. We have not a word to say upon their external aspect, nor do we desire to discuss the question as to whether they might not have possessed externally a more artistic (perhaps we ought to say a less unartistic) appearance, without any undue increase of expenditure: we content ourselves with the remembrance of their being temporary structures only, and then we dwell more fully on their internal qualities of capacity, light, and ventilation: and in these qualities we believe that these buildings may abide the test of the most rigidly critical investigation. The several compartments are spacious and well adjusted; the light is abundant without being excessive, and its distribution is excellent; and the ventilation has been severely tried without eliciting a complaint. The minor details of the schools, corridors, &c., are equally satisfactory: there is a very promising Art-library, and a lecture-theatre, which must prove equally agreeable to both lecturers and their audiences. Unlike the other portions of the museum-buildings, the gallery which contains the collection of pictures and drawings by British artists,—so munificently presented to the nation by Mr. Sheepshanks,—is a permanent structure, and designed permanently to contain these most delightful and most instructive productions. Such was a condition of the gift, that a gallery for the reception of the pictures and drawings should be built in this neighbourhood, and that here they should remain. This condition was stipulated solely with a view to the preservation of the collection from the apprehended injurious effects of the atmosphere in the more central parts of the metropolis: consequently, should it appear that such apprehensions are without foundation, while the concentration of the national collections of pictures in some permanent galleries must eventually be a matter of the very greatest importance, it may be reasonably hoped that Mr. Sheepshanks may consent to withdraw his restrictive condition as to the locality which his gift should occupy. Should

it prove thus, the present building will not have been erected in vain, since it will, in this case, be regarded as a felicitous experiment in the art of constructing picture-galleries, and one of the utmost value in determining both the general plans and the subordinate details of the much more extensive edifices of the same class hereafter to be erected. We have not hitherto been famous for our picture-galleries, and therefore this gallery is the more welcome as an evidence of our having at length been able to produce precisely what was required. It has, we believe, been objected to this charming cabinet of cabinet-pictures, that its walls are not sufficiently solid to ensure safety from the vicissitudes of temperature, &c., incidental to our climate: possibly it may be so; but if so, it is the more plainly evident that an experiment on such a scale, and designed as a permanent gallery, was absolutely necessary before the permanent galleries were built. Certainly here are so many points of success that we may accept them with gratitude, and yet may learn that there remains something to be done before an absolutely perfect picture-gallery shall have been devised and constructed. The allegation to which we have referred is one of a grave character, and it will be necessary at once to adopt such steps as may secure the pictures, whatever alterations or additions may be demanded in the building.

Immediately adjoining the Sheepshanks picture-gallery is a gallery occupied by a series of excellent casts from works by British sculptors. These casts are designed to exemplify and illustrate the condition and also the progress of this great form of Art amongst us: and accordingly, the examples exhibited will be specially selected from their qualities as works of Art, and they will be periodically changed. Next succeeds the Architectural Museum, which will be speedily subjected to a very careful re-arrangement, with a view to its complete classification, and to such an artistic grouping of its contents as may be consistent with such a classification of them. It was found necessary to hang these collections of casts as they were brought from their former abode in Canon Row, or they might have been exposed to serious injuries: at the same time the great numbers of the casts themselves, and the impossibility of classifying them before, rendered their first arrangement necessarily imperfect. This museum tells well in its present location, and it has already attracted much attention from many persons by whom its existence was heretofore unknown. The other galleries are for the most part devoted to various collections illustrating the application of mineral and vegetable products to the purposes of manufacture and to the use and benefit of man. In one compartment the model for Sir Christopher Wren's first design for St. Paul's Cathedral has been placed, and the next—the central compartment at the end of the building opposite to the entrance—does not appear to have been yet definitively appropriated. Below, in the main area of the edifice, are the collections of the commissioners of patents, the miscellaneous educational collections (which include all school apparatus and appliances), and the Museum of Ornamental Art in its various departments, including casts from the antique drawings and models. Many of the more important components of the last-named collections are now at Manchester, where we trust they are doing good service to the cause of Art-education: we shall, on their return, give a specific description of these collections, as we have done in this present number in the case of the Sheepshanks pictures and drawings; and we propose also periodically to enter minutely into the composition, as well as to remark carefully upon the working of this entire museum. We now have desired simply to record the gratifying manner in which this museum has commenced what we both hope and believe will be a long career of honourable usefulness. Hereafter we also intend to conduct our readers through the schools for drawing, modelling, &c., and to introduce to them the details of the system there in practice. It remains for us at the present only to notice, in terms of strong commendation, the manner in which the various objects, and groups of objects in this museum, are made to *speak for themselves*: the pictures, and statues, and casts, as well as the manufactures and educational collections, bear labels, which give to the visitor the informa-

tion which generally can only be obtained from perplexing catalogues; and, besides this, there are many descriptive notices, concise but expressive in their character, and printed in large type, of the general characteristics and the peculiar uses of the various collections. It is much to be desired that similar information, conveyed after the same manner, should also be adopted in the Art collections. Thus catalogues for reference become truly valuable, having ceased to be necessary nuisances as being the sole means of obtaining primary information. The lectures which will, without doubt, be soon organised here, will leave nothing to be desired in the manner of applying what the museum itself can teach.

The time is come, indeed, for all museums and all public exhibitions, whether of pictures, sculpture, &c., or of a scientific character, to adopt the system which has been introduced into the Kensington Museum, and to attach descriptive notices and labels to their various departments, with their subdivisions, and also to the several objects contained in each. Visitors ought not to be compelled to purchase catalogues except for the purpose of reference; and exhibitions ought to simplify their teaching as well as to convey all primary information respecting their contents, without entailing upon visitors the trouble of consulting catalogues. Most painful has the want of labels and brief descriptive notices been felt at Manchester, and without doubt the exhibition has failed, in no inconsiderable degree, from this very circumstance. We would hope that the suggestion we have now made may prove to have attracted the attention of those persons to whom the arrangements for next year's exhibitions may be entrusted, and particularly in the case of the Exhibition of the Royal Academy.

THE SHEEPSHANKS COLLECTION.

THIS collection, which by the munificence of the donor, has been some little time public property, is now transferred to rooms in the "New Kensington Museum," where the public may have an opportunity of seeing the pictures—certainly to greater advantage than in the house of Mr. Sheepshanks; where, in addition to the difficulty of light subdued and unequally distributed, the visitor was in some degree embarrassed by a sense of intrusion. But here he is reassured by certain notices placed conspicuously in the rooms, whereby he is pronounced a shareholder in the property, and called upon to protect his own, in the event of any attempt at injury on the part of evil-disposed persons. How flattering soever this may be to the vanity of a certain class of visitors, there is no reason for the expression of any apprehension of mischief, as tens of thousands of all grades of the public pass every year through open institutions containing our most precious Art-reliques. The light under which the public is introduced to these works is so favourable, that even had the artist to retouch certain of them he could not place them more advantageously; but it is to be hoped that they will not be long in the rooms which now contain them, for the building is too thin, and a high degree of artificial heat in winter will assuredly deaden the lustrous surfaces of the canvases. In this, as in the Vernon Collection, there are works not sufficiently important to be admitted into what a national collection ought to be: we know not whether the reserved discretionary powers of commissioners and trustees extend to these large collective gifts as well as to minor donations; yet it is to be hoped that they have the power of weeding these collections, and will at some time, hereafter, exert that power judiciously. The works do not in dimension exceed the cabinet size, comprehending every class of subject save history and religion. Poetry, the drama, imaginative subject-matter, incident from our standard writers, landscape, marine and animal painting, are all most worthily represented; indeed many of these productions are gems, in which the principles of Art are carried to the highest degree of refinement. But our national collection will contain little else than small pictures; perhaps a relief will come hereafter. And how rapidly will it grow!

knowing as we do yet other first-class collections which will be added to these, containing also pictures on which our affections have long been settled—all well known to the public through engravings. But to speak more particularly of Mr. Sheepshanks' valuable public gift, the catalogue describes two hundred and thirty-two pictures in oil; and of drawings, sketches, and other interesting examples of Art, two hundred and eighty. As to date, the earliest works are by Stothard—he is the father of the contributors to this gallery; and from his time the instances are brought down to the freshest essays of our own day, by Mulready, Landseer, Turner, Linell, Frith, Constable, Callcott, Dauby, Cope, Leslie, Roberts, Stanfield, Webster, Redgrave, Wilkie, Herbert, Creswick, Eastlake, Holland, Lance, and many others; exhibiting the progress of composition from the slightest sketch to the most finished picture. Mr. Sheepshanks was fond of collecting hasty sketches and first ideas: there are many of these in the collection, the histories of which, as given by himself, are extremely interesting. In one of them Wilkie has jotted down a first conceit, on which his picture of "Duncan Gray" was founded; and in others we recognise sketchy outlines, which in finished composition have become prominent passages of Art.

Amid the bright colour by which the eye is tempted, and the improved drawing which challenges criticism, the works of Stothard are felt with less of appreciation than in days gone by. Whatever merit might have been conceded to Stothard as a creator without the life, or even the lay figure, in his earlier time, his works become monotonous, shadowy, and insubstantial, when side by side with compositions that have been most elaborately worked out from living models. His works are in number ten, of which one only is an important picture, that is "Shakspeare's Principal Characters," whereof each impersonation speaks for him or herself; but this is not all we would desire in such a picture. The precisian looks at the composition and exclaims, "Alas, how little did Stothard know of the proprieties of costume!" These too were the high days of the asphaltum infatuation, and the picture is cracked down to the canvas. Then there are "Tam O'Shanter," "John Gilpin," "Sir Roger de Coverley and the Gipsies," "Twelfth Night," "Brunetta and Phyllis," "Sancho and the Duchess," with another or two, but all put in with the utmost license of touch.

There are not less than twenty-four pictures by Leslie, among which are some of this painter's most excellent works. Independently of every other quality, the unaffected balance of parts in that scene of the "Taming of the Shrew," in which Petruchio rates the tailor's men, would be a sufficient basis for a reputation; this picture must have been painted somewhat upwards of twenty years, and if we remember aright, there is a replica of it at Petworth, looking even fresher than this version. "The Principal Characters in the Merry Wives of Windsor," appears to have been impatiently studied, and this for such a theme were at once perdition. "Les Femmes Savantes" is a picture in which is set forth the learning of a lifetime. It is a full composition, abounding with even, small forms, which would be insufferably impertinent in unskilful hands; but the appositions are so masterly, and the light so brilliantly and beautifully distributed, that we feel that the artist has been guilty of a misdemeanour in not having finished the work more perfectly. The sentiment of "My Uncle Toby and the Widow Wadman" is less refined, and partakes little of the playful and sparkling manner which prevails in latter works. "Queen Katherine and Patience" is one of the painter's quiet *chefs-d'œuvre*; the subject is sad, and therefore the treatment is without one pencil of the dusty sunshine which illumines other pictures. We wish the queen's cope had been blue; however, the grave dignity of the composition equals the earnestness of the very best masters of pictorial disposition. In "Autolyous" and "Florizel and Perdita," the costumes are rather scenic than true; in these it is felt that the painter has yielded rather to stage impressions than endeavoured to originate.

It is here that Mulready is seen in his greatest force. "The Wedding Gown," with Dr. Primrose in his youth, and his future bride in her maiden bloom, is Mulready's greatest picture,—memorable as are all those of which the "Wolf and the Lamb"

of former days was the chief, and others in later days, in which the "Controversy" takes the lead. Mulready is yet a student as fresh as he was fifty years ago; he sat down with Nature early in life, and she has not forsaken him in his old age. But we wish the future Mrs. Primrose had been a little taller, her personal brevity struck us from the very first time we saw the picture, and the impression becomes deeper with every interview; but the dazzling effulgence of the colour is unsurpassed by any essay in Art. Then there is "The Butt—Shooting a Cherry"—a butcher's boy with his mouth open as a mark for his companion to shoot a cherry into; the subject is ludicrous, but the principles on which the picture is worked out are those of the great Italian masters. The art has all the gravity of Leonardo and Titian, and yet this does in nowise divert the spectator from joining in the fun of the incident. "The Seven Ages" is a large picture, rather philosophical than poetical. "The Fight interrupted" is another admirable production—clear, pure, and minutely circumstantial. "Brother and Sister" is apparently the sketch from which the Vernon picture, exhibited this year, has been painted. The splendours of "The Sonnet" are undiminished, but we have always thought the two figures too rustic to have any relish for immortal verse. Mulready's early studies about the by-ways of Kensington are gems, they are preferable to his last landscape, which is too metallic. But there are twenty-eight of these works, we must pass on to the works of Sir E. Landseer, which are not numerous, but celebrated. There is "The Dog and the Shadow," in which the landscape is hyper-pre-Raffaellite—valuable and curious as an early work, though much less powerful than those of Sir E. Landseer's matured style. The most popular of Landseer's works was his "Jack in Office," the picture is here as brilliant and pure as ever it was. We need not describe the composition, it is sufficiently well known; it is a gem of canine story—nothing in the way of dogs' tales has ever approached it. Then there is "The Two Dogs," an earlier picture, in somewhat of the feeling of "The Dog and the Shadow," also famous through engraving, and besides these another, of a profoundly touching character—touching because while we look we believe, for there is no hypocrisy in canine expression—we allude to the "Shepherd's Chief Mourner." *Engel! Sivi!* all honour to thee, great Dog-star, long mayest thou yet shine in the galaxy of Art; but when it shall be that thy fires are extinct, if thy surviving friends give thee any other design for a tomb than this, they do thy memory a nefarious injustice!

"The Village Choir," the best of Webster's works, assists at this Art-festival. It is a striking and original idea, in which it must be believed that the artist has brought forward successfully nearly all that he proposed to realise. Certain of the figures have been painted from the same model, but yet each has been made an individuality. "Contrary Winds," as to the interior, and the old woman sitting at the fireside, is equal to the best of the Dutch masters; the children with their ship-launch in the washing-tub disturb the depth and tranquillity of the other parts of the picture. There are also "Sickness and Health," "Going to the Fair," and "Returning from the Fair," but in these the composition is noisy and scattered. The sketches and small pictures by Wilkie are rather allusive to other pictures than pictures themselves,—as "The Broken Jar," "Sketch of a Head and two Hands," "Sketch of a Head, for 'The Rabbit on the Wall,'" &c. The scene from "The Good-natured Man," by Frith—"Honeywood introducing the Lailiffs to Miss Richland as his Friends," is a prominent picture. The bailiffs are slightly caricatured, and have, perhaps, too much of that of which Honeywood has too little—that is, spirit. By the President of the Royal Academy there are two pictures—"A peasant Woman bitten by a Snake," and an "Italian Contadina and Children," both of which are distinguished by the light and colour which characterise all the Italian subjects painted by him. "The Hawthorn Bush," by Cope, is perhaps the best of his lighter poetical subjects. It presents to us that hawthorn-tree so celebrated in "The Deserted Village," and shows it as the trysting-place for village lovers, and the accustomed rendezvous for the garrulous senility of "sweet Anburn." "Palpitation," by the

same artist, shows the agitation and suspense of a young lady, who stands behind the street-door while the postman delivers the letters for the family; and besides these there are also by Mr. Cope, "The Young Mother," "Maiden Meditation," "Charity," and others. "The Governess," by Redgrave, is very well known by the engraving; it is one of those sentimental subjects of which Mr. Redgrave has painted many. "Cinderella" is a larger and more elaborate work. The story has arrived at that point at which Cinderella is about to try on the slipper, to the confusion of her sisters, who are retiring from the vain essay of compressing their feet into the unyielding crystal. Another very full composition is entitled "Preparing to throw off her Weeds," being the story of a young widow, whose term of mourning having expired, is about to try a new dress. The incident is everywhere fully sustained by appropriate circumstance, and the whole is rendered with the most conscientious elaboration. By Turner there are five pictures in various feeling: "Line-fishing off Hastings," "Venice," "St. Michael's Mount, Cornwall," "Coves," and "Blue Lights—Vessel in distress off Yarmouth." The most striking of Stanfield's three works is entitled, "Near Cologne, on the Rhine," and as examples of Callcott's versatility, there are nine compositions,—now reminding us of Claude, now of Cuyp, together with figure pictures from Shakspeare, in which Falstaff, Slender, and Ann Page, play conspicuous parts. Of the nine works by Collins, one is well known to the public, "The Stray Kitten," and the others will win their due meed of admiration. Among the works of E. W. Cooke, of which there are eleven, some evidence approaches to his present manner, although yet far from it. "Portsmouth—the Hulks," and "Portsmouth Harbour—the Victory," are works, we humbly submit, preferable to many he has recently painted. Creswick has but two pictures in this collection—"Scene on the Tunnel," and "Summer's Afternoon." By Dauby there are three, entitled "Disappointed Love," "Calyppo's Island," and "Norwegian Scene," and a small replica of Constable's famous "Salisbury Cathedral," of which the larger version is at Hyde, the property of Mr. Ashton. Hampstead Heath was Constable's great school, and the locality supplies two subjects, besides one in the vicinity of the famous "Dedham Mill," with "Water-meadows near Salisbury," and "Boat-building." We were surprised on first seeing this collection that it did not contain at least one good example of Etty: there is a "Head of a Cardinal," and but one composition, a small picture, "Cupid and Psyche." "The Temptation of Andrew Marvel," by C. Landseer, is one of that painter's best pictures, by whom there are also two others. Linell also is insufficiently represented. To say that there should have been one of those gorgeous glowing works which Linell has of late years painted, is not an expression of discontent at the collection as it is, but rather complimentary, as Mr. Linell's pictures would have been here in better company than in many other places in which we have found them. The three pictures by Roberts are "Entrance to the Crypt, Roslyn Chapel," "Old Buildings on the Darro," and "Gate of Cairo, called Bab-el-Matamellec." By Uwins there are four pictures—"Suspicion," "Italian Mother teaching her Child the Tarantella," "Neapolitan Boy decorating his Inamorata," and "The Favourite Shepherd." Of Bonington there is a small example; and two very finely painted pictures by Crome—"Near Yarmouth—Moonlight," and "Landscape." Two by Holland—"Landscape, near Blackheath," and "Nimuegen, on the Rhine,"—one of his Venetian subjects would have been preferable. In addition to all that are already mentioned, the "inventory" contains the names of Cooper, R.A., Davis, Ducean, Ward, Witherington, Smirke, Nasmyth, Jackson, Geddes, Stark, and others, whose works we cannot even name.

The drawings and etchings are curious and instructive, and it is infinitely more advantageous that they should be framed and hung up, than hidden in portfolios. Thus, on the whole, the Sheepshanks pictures are a most valuable addition to the national collection; but we repeat an expression of our hope that the works are only temporarily lodged in their present abiding place.

What a gallery of British Art shall we possess when this collection, the Turner and the Vernon pictures, are all located under the same roof!

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XXVII.—JOHN GILBERT.

LOOKING at the numerous diversified and extended channels through which the works of Mr. Gilbert have gone forth to the public, there seems to be sufficient justification for speaking of him as the most widely-known artist in the world; this is saying much, but we have no doubt of our ability to prove its truth in the brief sketch we are about to give of his life and its fruits: of the latter the gathering has been most ample, when we consider their producer in his threefold character of an oil painter, a water-colour painter, and an "artist on wood." There are doubtless other men to whom academical rank and fashion have given a higher degree of popularity, but it is infinitely more limited than that which Mr. Gilbert can claim: if they have extorted the homage of their thousands, he has won the approbation of his tens of thousands. We purpose noticing this artist under each of the divisions into which we have classed his works.

John Gilbert was born at Blackheath, in the county of Kent, in 1817. His early love of Art, as well as his proficiency, was manifested when a boy at school, by his carrying off all the prizes for drawing, and, as we have heard him say, by his neglect of all other studies; for what interest could a lad, who was never happy if he had not a pencil in his hand, find in geography or grammar, or working out an arithmetical question or geometrical problem? The current of natural inclination will break through and overspread all the limits within which friends and schoolmasters may deem it desirable to confine the instruction of the young; Nature may be guided, trained, and in some degree controlled, but never can be successfully opposed altogether. It was just the same with him when school-days were over, and he was placed in the office of a "man of business" in the city,—his drawing propensities were a hindrance to advancement, while he not unfrequently got into trouble with his principals by employing his time in sketching all over the blotting and other papers in the office, thus giving to the place anything but a commercial aspect. Here, however, he remained two years, in a most un congenial employment; at the expiration of this time, being pronounced "entirely unfit for the serious pursuits of business,"—a sentence there is little doubt he was well pleased to hear passed,—his friends withdrew him from the office-desk. Among the drawings he made, previously to his quitting, were some most elaborate sketches of the civic state carriages, which proved of signal service to him in after years.

Having determined to become an artist, he made great exertions to enter the Academy Schools as a student, but, notwithstanding the encouragement he received from his kind friend, Sir W. Beechey, R.A., all efforts to gain admission were unsuccessful. We are at a loss to understand how this could be, for the necessary qualifications for admission, the chief of which is a tolerable proficiency in drawing, are by no means difficult of attainment, and there can be no reason to question Gilbert's art-capabilities even at this early period of his career. However, he failed, and therefore, as many other artists have done when unable to secure whatever benefit schools of Art have to offer, he set to work to teach himself. If self-education in Art has its disadvantages, as it undoubtedly has, it offers something to oppose to the evil—an opportunity for the manifestation of originality of style, as well as of ideas: the self-taught artist sits down to his work untrammelled by dogmas and traditions concerning what ought to be done and what omitted; and though he may, and does, not unfrequently fall into error, his productions, generally, show a freshness of thought and a vigour of executive power which one trained in schools rarely reaches: such

qualities of Art constitute no inconsiderable portion of the interest and value of Gilbert's productions.

To aid him in the acquisition of some theoretical knowledge,—as, for example, the principles of Composition,—he studied eagerly and closely Reynolds's "Discourses," and Burnet's "Hints on Painting;" but feeling that colour required other instruction than what books, however excellent, were able to supply, he looked about for some artist whose experience might initiate him into its mysteries; such a guide he found in Mr. George Lance, the eminent fruit-painter, from whom he received most valuable instruction. These lessons from one of our greatest colourists, given at a time when the pupil was ripe to receive them, proved of the highest service to the student.

Mr. Gilbert must have been about eighteen or twenty years of age when he made his first appearance as an exhibitor by sending to the Suffolk Street Gallery a water-colour painting, the subject of which was "Richard, Duke of Gloucester, arresting Lord Hastings at the Council in the Tower." It met with a purchaser, and his good fortune—for it certainly must be considered fortunate when a young and unknown artist finds his primary essay in Art bought out of a public exhibition-room—animated him to future efforts. In 1838 he sent a "Portrait" to the Royal Academy, and in 1841, "Holbein painting the Portrait of Anne Boleyn;" but the picture which first attracted our attention was one hung at the British Institution in the same year, the subject, "Don Quixote giving Advice to Sancho Panza upon entering on his Government;" we published the following comments on this work:—"We are not familiar with the name of this artist; but that we shall be so hereafter is very certain. We should select it from out of the collection as one of the works of the greatest promise; if, indeed, we are so to limit our praise. It is conceived in a right spirit; the character of the Don is capitally preserved, and so is that of the exquisite Sancho. In no way is it overstrained; there is nothing bordering upon caricature; there is just enough of serious and comic humour in the countenances of each to realise the portraits of the great author without marring the effect, either by exaggeration or falling short of his design. The work, moreover, is very ably painted, and manifests a familiar acquaintance with the capabilities of the pencil." That well-known connoisseur, the late Mr. Wells, of Redleaf, gave substantial testimony to the merits of the picture by purchasing it for his collection.

Another subject from Don Quixote was exhibited at the British Institution in 1842, "The Duke promising Sancho the Government of an Island," which, with reference to priority of narrative, should have had precedence over the picture of 1841. The latter work quite equalled, if it did not surpass the former—evidencing boldness of execution, and a just perception of the characters portrayed. He exhibited at the same time a "Scene from Tristram Shandy,"—Uncle Toby and Corporal Trim conversing about the Siege of Dunkirk: in this picture there is little or nothing to call off the attention from the two figures, whose personifications are well sustained. The adventures of the heroic knight of La Mancha have, from the first, been a favourite theme with this artist as well as with many others; in the same year he sent to the Academy another subject from that story, "Don Quixote and Sancho's first Interview with the Duke and Duchess," concerning which we wrote:—"A capital picture, by an artist who might even now be a candidate for the distinction implied by the two mystical letters, R.A.:" if we were justified in pronouncing such an opinion at that remote period of his career, with how much greater propriety may we again record it, recollecting all he has done during the intervening years? Another Spanish scene, but from a different source, formed the subject of a picture sent to the British Institution in 1843, "The Education of Gil Blas,"—a composition of undoubted originality and power; it represents

SANCHO PANZA.

[J. and G. P. Nicholls.

the youth playing idly with a dog, while his uncle, the Canon Gil Perez, intently studies a book that lies open before him. Gilbert did not exhibit at the Academy this year, but in the following season he sent to the Gallery "Don Quixote disputing with the Barber the merits of the great Knights Errant of Antiquity;" it was hung in the room appropriated to drawings and miniatures, but so high as to be beyond examination; what we could see only served to satisfy us that it deserved a far better place than the position to which the hangers assigned it. To the British Institution the same year he contributed, "The Lady in the Robber's Cave," the subject from Gil Blas.

In 1845 Gilbert quitted for a time the territory of Spanish romance, and

turned over the pages of English history as Shakspeare has dramatised them. One of his two pictures in the British Institution was a wild and graphic sketch—little more—of “Gipsies,” rendered with a remarkably dashing pencil, and an almost daring appropriation of red colours: the other was a “Scene from King Henry VIII.,” where the Duke of Norfolk demands from Wolsey the Chancellor’s seal: in this work, also, red is the ascendant colour, almost to a fault, but the incident is forcibly related in the grouping and expression of the figures. In the Academy we saw “King Henry IV.,” a richly-coloured picture representing the monarch repeating the soliloquy—

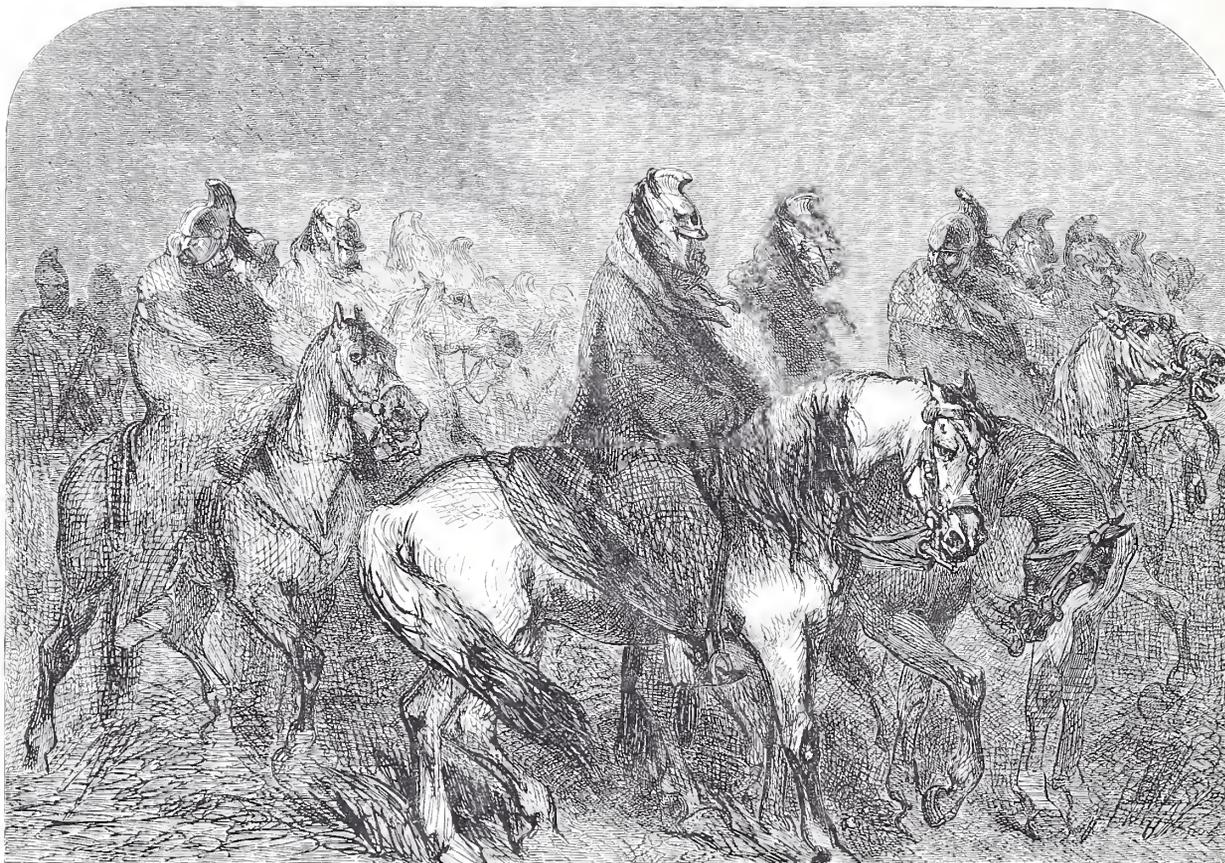

“Canst thou, O partial Sleep! give thy repose
To the wet sea-boy in an hour so rude?” &c.

“The Death of Cardinal Beaufort,” in the British Institution in 1846, is a dramatic representation of a painful subject, into the terrors of which the artist entered with so great *animus*, as to make the picture far from agreeable to contemplate, though this circumstance is in itself an evidence of the skill of the painter. “Desdemona,” and “The Emperor Charlemagne inspecting the Schools,” are the respective titles of two pictures exhibited by him in the Academy this year; the latter a novel subject and treated originally, full of figures well drawn and grouped effectively. In 1847 he sent to the British Institution a graceful little figure called “Celia’s Triumphs,” suggested by a passage from Ben Jonson; a scene from remote French history, called “The Froude Riots,” describing Anne of Austria drawing a curtain aside to show the citizens that her son, who is asleep, has not been removed; the picture is

exceedingly animated, rich in colour, but apparently painted in haste. To the Academy he contributed “Don Quixote at the Castle of the Duke;” it was unworthily hung, almost out of sight, in the architectural room.

The year 1848 passed over without any contribution from Mr. Gilbert to our picture galleries; but in the following season he sent to the British Institution “The Murder of Thomas-à-Becket,”—a composition of very considerable power, painted in a dark, low tone of colour, in keeping with the darkness of the tragedy; and to the Academy another “Don Quixote,” and decidedly the best he had hitherto produced of this class of subject: in this picture the passage illustrated is that where the Don and his squire have alighted from their beasts, and seated themselves under a tree. In 1850 he contributed three pictures to the British Institution,—a large composition, wherein are introduced the principal characters of Shakspeare, each so faithfully personified that we have no difficulty in recognising the character; another, “A Troop of Dragoons” on their march, in a storm of rain—a clever and most truthful sketch, which we have engraved; and a study of a negro’s head, drawn in profile, to which the artist gave the fanciful title of “Aladdin’s Present to the Sultan.” In the Academy he had, half-hidden in the octagon-room, a very beautiful work, careful in detail and finish, “Touchstone and the Shepherd in the Forest of Arden.”

“DON SANCHO PANZA, GOVERNOR OF BARATARIA,” exhibited at the British Institution in 1851, is another of the works of this artist selected by us as examples of his style,—it would have been a positive absurdity to think of “illustrating” a biography of John Gilbert without a specimen of his *Quixotic*

A TROOP OF DRAGOONS IN A STORM.

J. and G. P. Nicholls.

inclinations; his Don Sancho is a capital picture, faithful to the humorous character given him by the novelist. Very different in subject and in feeling is “The Destruction of Job’s Flock,” in the Academy Exhibition of the same year,—a picture fully sustaining the reputation of the artist as an original and varied thinker, and quite as capable of treating powerfully and appropriately the narratives of Scripture as those of fiction or the dramatic historian.

As if for the purpose of showing his versatility of thought, he sent to the British Institution, in 1852, two paintings which might not unaptly pass, relatively to each other, as emblematic of “Peace” and “War;” one, the “Charge of Prince Rupert’s Cavalry at the Battle of Naseby,” so full of spirit and movement that we fancy we hear the trampling of the host of iron-heeled chargers as they rush up the high ground; the other, a small picture, graceful in arrangement and brilliant in display, of “Her Majesty the Queen holding a Drawing-room at St. James’s Palace. By the way, if recent accounts of these august ceremonies be true, pictorial representations of them must be classed among “war-pictures” rather than “peace-pictures;” this, however, is not the case with Mr. Gilbert’s; it is elegant, decorous, and court-like, in the true definition of the term; the artist, when he sketched it, must have had the Lord Chamberlain at his elbow to point out how these matters *ought* to be managed, and not how they *are*.

A picture entitled “A Spanish Landscape and Figures,” which was exhibited at the British Institution in 1853, presents a rich combination of colours harmoniously disposed, and a masterly grouping of the figures,—a Spanish peasant, his wife and child, the two last mounted on an ass led by the man.

This work, we believe, has been reproduced, in chromo-lithography, for the Art-Union of Glasgow. In the following year he sent to the same gallery “Sancho Panza informing his Wife of his coming Dignity, and of his intention to make his Daughter a Countess,” a composition in which the assumed gravity of the expectant Governor of Barataria is so admirably represented, that we look upon him as one already in full possession of the sweets, the power, and the grave responsibilities of office; he has certainly not yet begun to sink under its weighty cares; he

“Blossoms, and bears his blushing honours
Thick upon him.”

We should be well pleased to see an “illustrated edition” of “Don Quixote” from the hand of Gilbert, whose mind, through his pencil, enters so completely into the spirit of the story; the book could not fail of being popular: why has it never been undertaken?

We now take leave of Gilbert’s oil-pictures, for since the dates already given he has exhibited nothing at the Academy or the Institution except his painting of “A Regiment of Royalist Cavalry at Edgehill,” in the latter gallery the present year; all that we need say of a work, so fresh as it may be presumed to be in the recollection of a large number of our readers, is, that it was one of the great attractions of the exhibition.

The absence of Gilbert from the Academy since 1851, and his temporary withdrawal from the British Institution, may be accounted for by his appearance at the gallery of “Water-Colour Painters,” of which society he was elected

associate exhibitor in 1852, and member in the year following; and none can doubt that it gained considerable accession of strength by his election, and especially in a department of art that required new and vigorous blood infused into it.

The identity of Gilbert's water-colour pictures with those he has executed in oil is manifest in the powerful expression of character, brilliant colouring, effective composition, and substantial execution, and in similarity of subject, but his style of execution differs; it is far more elaborated, and it seems to be the result of his constant occupation in drawing upon wood; his manipulation is characterised by what is known in wood-engraving as "cross-hatching," that is, by intersecting lines. There is, however, no evidence of feebleness of touch, nor of want of vigour in any way; the result is altogether satisfactory. The most important of his water-colour pictures are "Richard, Duke of Gloucester, and his two murderers," (1852); "Richard II. resigning his Crown to Bolingbroke," (1853); "Hudibras and Ralpho in the Stooks," (1854); "Shylock entrusting his Keys to Jessica," and "An Alchemist," (1855); "The Standard Bearer," a noble figure, worthy of Velasquez, and "Her Majesty the Queen inspecting the Wounded Coldstream Guards in the Hall of Buckingham Palace," (1856); how many hundreds—nay thousands—of visitors to the gallery lingered long and almost reverently before this interesting picture, interesting as a work of Art as well as in the subject; and "The Duchess reading 'Don Quixote,'" (1857).

Having thus noticed the works of Mr. Gilbert in oil and water colour, it remains for us to speak of him as an "artist on wood," and it is in this character, chiefly, that reference was made to him at the commencement of this article, when we designated him as "the most popularly known artist in the world." It is necessary to go back several years of his life to acquaint the reader with Gilbert's first essay as "a wood-draftsman;" in fact to his earliest

appearance as an exhibitor. A series of pen-and-ink sketches he had made for his amusement was shown by a mutual friend to Mr. Sheepshanks, to whom the nation is so largely indebted for his munificent gift of pictures, recently opened to the public, and who then resided at Blackheath, where the artist also lived. Mr. Sheepshanks suggested to Gilbert the desirableness of his turning

his attention to drawing on wood designs for illustrating books. Acting upon the suggestion, he completed a set of drawings to illustrate "Nursery Rhymes;" but his style of pencilling differed so much from all preceding and contemporaneous drawings that the engravers were at first puzzled not a little to know how to render them; for we should tell the uninitiated of our readers that it is not every drawing which looks well on the wood, that will "cut well," to use a technical term. Gilbert's success in this work brought him into good repute with the book-publishers, and he was soon engaged on a variety of publications; he also undertook and carried through a long and elaborate series of chronological designs of English history, which were reproduced in lithography.

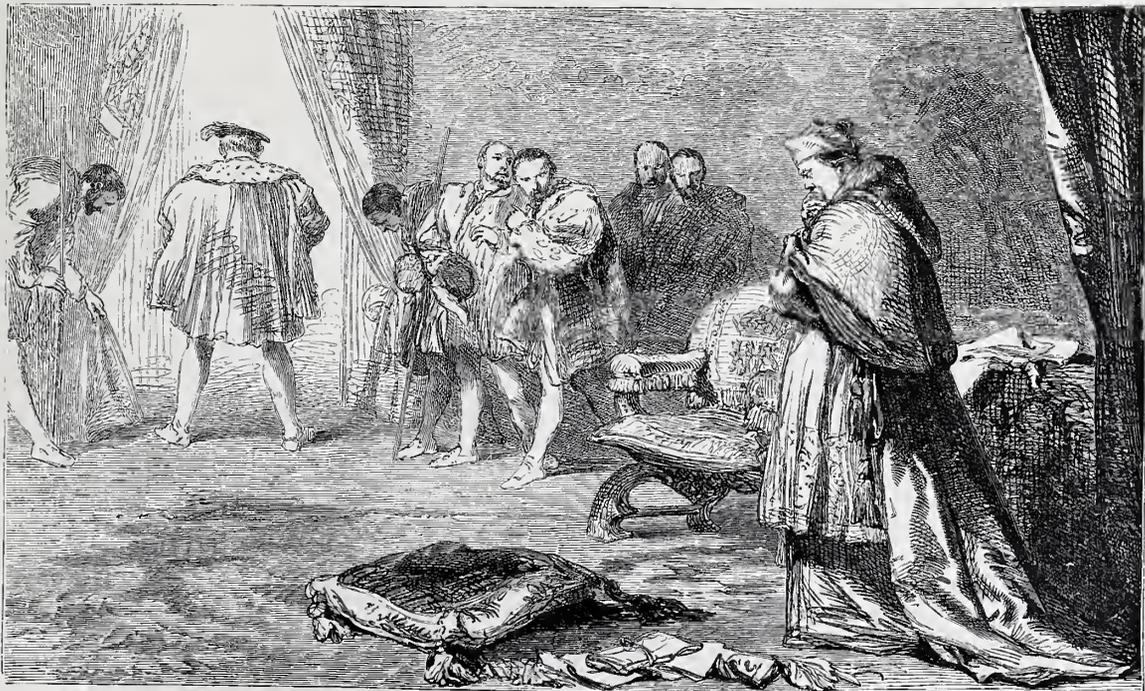

When the *Illustrated London News* was projected, in 1842, the proprietors applied to Gilbert for his aid; he commenced with the first number of that paper, by contributing a set of drawings to illustrate the Queen's *Bal Masque*; from that time to the present he has been, with very few intermissions, a regular weekly contributor to its columns. Now, when we consider that this pictorial record of passing events finds its way into almost every nook and corner of the habitable globe where an Englishman is domiciled, or his language is spoken, we feel fully justified in speaking of Gilbert as "the most popularly known artist in the world." Moreover, his name is associated with all the best "illustrated editions" of British authors, not strictly scientific, that have been published during the last sixteen years and more; how numerous these books have become, our own columns have testified year by year. We may remark, with

reference to these wood-drawings, that, notwithstanding his unwearied industry, he never could get through the prodigious amount of work placed in his hands, if he was not exceedingly rapid in his execution. He very rarely makes any previous sketch of his subject, but at once proceeds to draw it on the wood,

as if it were a matter he had long thought over and studied; it is, perhaps, to this peculiar faculty of extemporising designs that one sees in them so much originality and freshness of idea—with less power he might become more of a copyist, or more commonplace.

THE ROYAL PICTURES.

TEASING THE PET.

F. Mieris, Pinxt.

R. C. Bell, Sculpt.

Size of the Picture, 1 ft. 11½ in. by 1 ft. 6½ in.

AMONG the most famous Dutch artists who flourished between the years 1650 and 1750, were four of the name of Mieris, of one family; all of whom adopted a similar style of painting, yet not with equal success. The first of the four, in precedence and in merit, was Francis, whose picture of "Teasing the Pet" is here engraved; the next, John and William, his two sons; and the last, Francis (the younger, as he is called), son of William: they were all natives of Leyden.

Francis Mieris, the elder, was born in 1635: his father, a goldsmith and lapidary, with the view of cultivating the taste for Art which his son evinced, placed him under the care of Abraham Toorue Vliet, a glass-painter of considerable reputation; and having perfected himself in the knowledge of elementary design, young Mieris became the pupil of Gerard Douw, at that time in the zenith of his fame, and whose celebrity Mieris was ambitious of emulating. In a short time he had far surpassed all his fellow-students, and had won from his master the distinctive title of "Prince of his Disciples;"—there have been, and now are, many connoisseurs who consider Mieris superior to Gerard Douw. Having quitted the studio of the latter, he at once began to practise on his own account, and soon so established himself in the favour of his countrymen that it became difficult to obtain a picture from his hands; for painters in those days, unlike too many of our own time, thought more of the quality of what they produced than of the number of the pictures they could throw into the market. Perhaps, however, Mieris is not altogether to be absolved from a "love of lucre;" for he was accustomed to charge for his works—at least so his early biographers say—according to the time employed upon them, demanding at the rate of a ducat an hour, equal to eight shillings and ninepence of our money.

One of the earliest patrons of the artist was the Archduke of Austria, who commissioned him to paint a picture. Mieris selected as his subject the interior of a mercer's shop, in which a pretty young woman is exhibiting to a gentleman a variety of richly-coloured silks, while the customer, if he intends to be one, is evidently attracted more by the seller than her goods. The archduke was so charmed with the work that he invited Mieris to Vienna, offering him a strong temptation in the way of a magnificent establishment; but the Dutchman was unwilling to quit his country, and pleaded, as his apology for the non-acceptance of the invitation, his numerous professional engagements. When the Grand-duke of Tuscany visited Leyden, he also gave the artist a commission for a picture, which, we believe, is still in the gallery at Florence, and is considered as one of the painter's best works. It represents a young lady, habited in a dress of white satin, playing on a lute; another female and a young man are seated on a couch; a servant is offering to the latter refreshments on a silver salver: the finish of this picture is not surpassed by any work of the Dutch school—a school eminent above all others for this quality. The grand-duke also sat to Mieris for his portrait, which is now in the Florentine Gallery—the most famous in Europe.

The works of this artist, who died in 1681, are small in dimensions, and principally of subjects similar in character to that introduced here: they exhibit the most minute accuracy, the highest finish, correct drawing, and the greatest purity of colour. But while each and all of these excellent qualities of painting are seen in the faces and extremities of his figures, they are pre-eminent in his imitations of textile fabrics; silks, velvets, stuffs, carpets, &c., are copied with extraordinary fidelity, and yet with unquestionable freedom of pencilling and design. We trace in his works nothing of the hardness and stiffness that usually characterise the modern Præ-Raffaellite school in their elaborations.

The picture of "Teasing the Pet," though an exquisitely finished performance, cannot be considered as one of the most valuable examples of the master: it is in the collection at Buckingham Palace.

THE CRYSTAL PALACE:

A TEACHER FROM ANCIENT AND EARLY ART.

BY THE REV. CHARLES BOUTELL, M.A.,

Hon. Sec. of the London and Middlesex Archaeological Society, and of the Architectural Museum, &c.

PART IV.—EGYPTIAN AND ASSYRIAN ART.

IT was in the early spring-time of the world that Art arose, and grew amongst men with a rapid and vigorous growth. The valley of the Nile was the earliest scene of her beneficent working: here, in the first-born of the empires, and beside the great river which, throughout all ages, should be the ever-deloquent though silent witness to her achievements, Art began to declare herself to be a powerful refiner of human life, and also a faithful historian of human sentiments and actions. The ancient Egyptian remains which time, having stamped with the seal of tens of centuries, has yet spared for us to study with wondering veneration, standing as they do at the threshold of the history of Art, are, from the very circumstance of their pre-eminent antiquity, invested with a peculiar interest; and this interest gathers strength from the consideration that amidst the works of the primeval artists of Egypt we learn what is the real and true character of all Art, and what are its genuine and distinctive attributes in every age and in all countries. Art in Egypt we see to have been strictly national, essentially historical, and graphically expressive; while it maintained an inseparable union between its various forms. It was the one expression of the Egyptian mind, speaking its deepest thoughts concerning Egypt. Such would be the natural, and, indeed, the inevitable character of Art in the days of its first youth. Egyptian Art demonstrates this fact; and it also does much more than this—for it shows that in whatever degree Art may be beguiled to fall away from its original standard of unity, of truthfulness, and consistency, in that degree it degenerates and becomes enfeebled. This lesson, so powerfully taught in the first instance in Egypt, received abundant corroboration in after-times and in other regions. In our own country, and at the present time, this same lesson may exercise an influence of special value. We are now, as a nation, votaries of Art. Art has become with us both the passion and the fashion of the day; yet we shall scarcely be prepared to boast of our present Art-achievements. Perchance the venerable teaching of far-off antiquity may accomplish, at least, something of advance and exaltation for us, if we will but search out and accept its lessons. Very much has recently been effected by equally enterprising and judicious exploration and research in ever-wonderful Egypt; and photography has joined its powers with those of the pencil in a strenuous effort to set before us faithful portraits of every variety of Egyptian Art-work; and, besides, with the view to popularise the study of Egyptian Art, the Crystal Palace has produced its Egyptian Courts. It is my present purpose to point out in what manner these Courts discharge the office of teaching; and I shall hope to do this the more successfully if I first indicate the principal points in the history of Egyptian Art, which these Courts were designed to exemplify and illustrate: in other words, it appears to be most desirable for me to sketch out what we ought to be able to learn here, and then to consider how far such expectations may be realised.

Universal experience has shown that Art, however consistently true it may continue to its own peculiar character in any country, invariably passes through certain distinct phases, and appears under several determinate conditions; and it is highly remarkable that in almost every instance Art has marked out for itself three grand eras or periods in its career:—first there is the archaic period; next follows, generally with a rapid step, the great and most perfect period; and then, in its turn, the age of lingering decline succeeds, and points to a fall which sooner or later must be expected. In Egypt the three periods are very distinctly marked out, notwithstanding the marvellous rapidity with which Art here mounted to its zenith. Of the archaic period the great pyramids are the type; Thebes, in the plenitude of its power and grandeur, marks the culminating era; and under the Ptolemies comes the decline, which

should close in the final catastrophe of Rome. We shall, accordingly, look for illustrative examples of these three great Art-eras in the Egyptian Courts, as also for such a sustained chain of minor illustration as may lead us on from one epoch to its successor.

Again, in Egypt Art never admitted any absolute disruption of its unity, whether of aim or of expression. The Egyptians did not practise painting as one art, and sculpture as another art, and architecture as a third; but architecture, and sculpture, and painting, were, both in the Egyptian mind and in the Egyptian practice, so intimately united, the one with the other, that they were actually inseparable. These three made one Art—the *Art*, not the *Arts*, of Egypt; hence the admirable truth of each great form of artistic working. From its union with the other forms it received fresh strength and increased effectiveness, while its own attributes were developed with more complete fulness and more absolute truth. Always obedient also to the laws which the national religion imposed upon it, Art in Egypt was enabled by the religious solemnity which enhanced its intrinsic worthiness. Always limited in its direction by its religious associations, Art in Egypt is seen to have nevertheless combined the most exalted sublimity of conception with a delicate finish in execution which cannot be surpassed. This Egyptian Art thus was true Art, because it was original; also because it was at once truthful and suggestive, energetic and refined. We should expect to discover in our Egyptian Courts specimens of each of these qualities of Egyptian Art; and here we should also expect to learn how it was that the artists of Egypt maintained that unity in Art which it was their great glory that they did maintain; as it is the peculiar opprobrium of the present time that each form and expression of Art should have been compelled to stand alone, and should have been regarded as complete in itself and in its solitary isolation—a picture, or a statue, or an edifice, now being held to be three distinct works of three distinct arts, in place of the edifice being designed to comprehend the works of both sculptor and painter; while painter and sculptor alike designed and worked under the idea of attaining to real excellence only through their association with the architect. And, once again, the Egyptians were builders of temples and constructors of tombs on a scale both of magnitude and of magnificence unknown to other nations: it was their habit, too, to accumulate building upon building, and mass upon mass, each particular work being, when complete, the aggregate result of long-continued working; and they delighted in surface decoration, produced by means of shallow *quasi* relief carving, aided by a free use of colour; and they gloried in giving utterance to their loftiness of conception through forms of colossal magnitude: all these things, consequently, ought to be represented, graphically and after an impressive manner, in these Courts.

Before entering the Egyptian Courts, it must be called to remembrance that *models* only can be expected to be found—models which tell their tale truly indeed, but yet under much of disadvantage. They cannot emulate the vast scale of the originals; they cannot exhibit their imperishable materials; neither can they gather around themselves the associations and the local accessories of actual Egyptian temples or tombs. We have here to deal, I repeat, with models only, not even, as in the case of the sculpture, distinctively so designated, with casts. A model of a pyramid has not been attempted; perhaps the attempt, if restricted to a part only of one of these mighty piles, might have been eminently valuable. As it is, the Courts show nothing of the works of Saphis or Cheops, and his pyramid-building brethren; and, therefore, we have to commence here with the second era in Egyptian Art—the era of the Theban monarchy. In imagination we may gaze still deeper into the depths of the past, until we realise some image of the pyramids of Memphis—that most ancient group of monuments in Egypt, and, as it would seem, in the world—themselves "examples of a style absolutely independent of all previous efforts of human Art either in Egypt itself or in any contemporary nation." And when we seek, higher up the river-valley, for the remains of royal Thebes, we shall go thither impressed profoundly with the conviction that the works of the pyramid builders abound with evidence of their having at-

LONDON; PUBLISHED FOR THE PROPRIETORS.

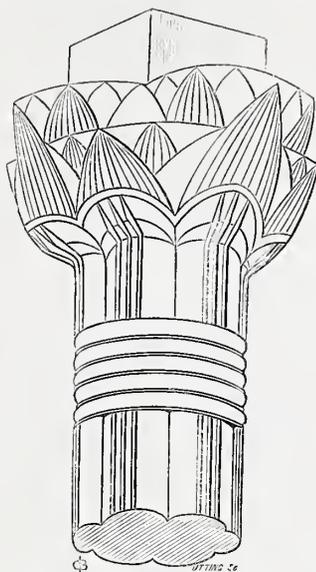

tained to a degree of excellence in Art which Karnae itself could only rival—so wonderful was the elastic energy with which Art reached maturity in this congenial region. Leaving, then, the pyramids on the western side of the Nile, and ascending the stream till we have entered the Thebaid, or Upper Egypt, we come upon the obelisks and temple groups of the eastern bank of the river. Columnar architecture now appears to prevail, and on every side there are evidences of powerful kings and flourishing cities. The columns here are sometimes seen to have been set not merely in ranges, but in a dense array over the greater part of the entire area of the halls of the temple-palaces. The Crystal Palace Court illustrates this most remarkable system of arrangement effectively and well—as well and as effectively as it could possibly be done on a greatly reduced scale, and with such different materials, and without the river, and the sun, and the valley of Egypt. Of the original hypostyle Hall of Manepthah, at Karnae, perhaps the most sublime of man's works, an idea may be imagined from the Sydenham Hall of Columns. I know not how to award a higher praise to the model. The Great Temple, of which this wonderful hall became the crowning glory, was commenced by Osortasen, one of the mightiest of the Pharaohs; and many of his successors sustained the series of structures which combined to form the whole. On the opposite side of the Nile arose the scarcely inferior work of Ramses the Great, the Sesostris of the Greeks. A part of this structure has been reproduced in the Egyptian Courts. The great Temple of Medinet-Hahou, the work of Ramses III., contributes one of the most remarkable of the scenes which are rendered, with exact truthfulness to the Egyptian style, on the walls. The original forms one of the grand group of Thebes, though it shadows forth tokens of the then approaching decline in Egyptian Art. The façade of the outer Court exemplifies another striking feature in the works of the great era: this is the column as it appears in the rock-cut temples of Nubia and elsewhere of the age of Ramses II., and which exhibits the evident prototype of the Greek Doric order of a later age. Various details and decorative accessories from works of the great period are also represented in these Courts, which carry onwards to the succeeding age their graphic history. Abou-Simbel, Dendera, and other well-known names, contribute from their varied stores; and the whole collection of examples is enriched with groups of casts from works in sculpture, including a cast of the celebrated Rosetta Stone. The exceeding beauty and the essential truthfulness of the Egyptian style are eminently apparent in the columns which were so freely used. The models of these claim attentive study. I have here introduced sketches after two of the most cha-

EGYPTIAN PAPYRUS CAPITAL, THEBES.

acteristic forms. It will be observed from these capitals that the ancient Egyptian artists derived their inspiration from that great authority in Art—Nature. The luxuriant vegetation of their country furnished the types for their fairest and their most effective designs. Skillfully, and with most beautiful appropriateness, they adapted the lineaments of the

natural objects to the requirements of their art, and at the same time their art became indelibly impressed by them with both the beauty and the truth of Nature. Examine one of their papyrus-capitals; it is not a block of stone, about which the rich foliage of the plant has been entwined in sculpture; the foliage, or perhaps the flower, is the capital. Other capitals, designed in a questionable taste, are ornamented with, or formed of, heads or figures of personages famous in Egyptian story. The Egyptians also employed colossal figures in situations which rendered them almost *quasi* columns or caryatides; a close examination, however, will show that such statues are in reality additions to the true architecture, and not adaptations of the expressions of one form of Art to the requirements and uses of another.

EGYPTIAN PAPYRUS CAPITAL, PHILÆ.

The teaching of the Egyptian Courts cannot fail to combine for the careful student much of gratification, with more of valuable instruction. He will see in them true Egyptian forms and characteristic Egyptian grouping and combination. The system of surface-decoration is also admirably shown, with its quaint yet truly artistic delineation of Egyptian history. The very colossi are realised in the enormous figures which now sit and gaze, with Egyptian calmness, upon a natural giant from a new world, and which bears the name of a hero greater than Sesostris. The sphinx-avenues also are reproduced, and the Duke of Northumberland's famous lions bear them company. An obelisk, like a pyramid, is wanting; neither is there such a vivid realisation of a rock-tomb as Belzoni gave us more than thirty years ago. Another want is a model which does not look quite new, fresh, and perfect—a model which would show the touch of time and the rougher grasp of violence. Such models or casts, with all the devastations which the originals have had to endure visibly portrayed upon them, are needed throughout these Fine-Art Courts. We require thus to see the originals as they are, no less than to have them again invested with the perfectness of their first condition. I have already noticed this want, which in the Egyptian Courts is felt with peculiar keenness; and I have also invoked the aid of photographs to supply, in the Courts themselves, what they can tell us so powerfully of the actual present state of the Art-productions of the past. These, with some clear and precise indication of the historical order of the model-works, would render the Egyptian Courts worthy of the highest admiration.

In close association with Egypt ASSYRIA now holds its proper place in the history of Art. A few years have sufficed to clear away from this marvellous region the deep obscurity which, during long centuries, had settled heavily upon it. The great valley-plain of the Tigris and the Euphrates has become as visibly and vividly historical, through the magic agency of its Art, as the Nile valley itself. Nineveh is no longer a mystery, and Assyrian his-

tory no longer remains a void. An Assyrian Court at the commencement of the reign of our most gracious Sovereign would have been an impossibility, or rather it could not even have been contemplated. And now we have become familiar with most wonderful collections of the original works of the Assyrian artists, and in the Assyrian Court of the Crystal Palace we can study reproductions of those works, grouped with singular skill, and associated with an architectural structure which may be supposed to realise the actual edifices of Nineveh. The possession by this country of so many of the actual Assyrian works, and their concentration in the national museum, are facts which greatly enhance the value of this Assyrian Court, and impart a peculiarly impressive character to its teaching. The fidelity of the model is thus brought to the severest test, while the work of the restorer is distinctly specified and rigidly defined. It will be found that this Court is worthy of much more attention than is usually bestowed upon it. Its very additions to what may be seen in the British Museum constitute its special claims upon the student. Without doubt the student will require positive authority; such authority the casts from the slabs and sculptures possess in themselves, while their grouping and the accessories, which long and careful study has associated with them, lead on, with scarcely less sure accuracy, along the path of Art-written history.

The three epochs of Art are clearly developed in the recovered "Art-treasures" of Assyria. The first commences after the restoration of native Assyrian dynasties, and the departure of the Egyptian conquerors—that is, the period, according to the Greeks, of Ninus and his successors, in the fourteenth century before Christ, and which coincides with the first decline of the Egyptian power in Egypt itself, and also with the Israelitish Exodus. This period may be considered to close with the revolt of Arbaces, B.C. 821. The second era ranges to the destruction of Nineveh, about B.C. 600. And the third era, extending to the Macedonian conquest, comprehends the revived splendours of Babylon under Nebuchadnezzar, and the great works of Cyrus and Camhyses at Passargadae, with the still more magnificent productions of Darius and Xerxes, which rendered Persepolis so illustrious in antiquity, and have left it so dignified in its existing ruins. This third Assyrian period, after the usual manner, may be considered to extend itself beyond any definite limit, until Art ceased to live in Mesopotamia.

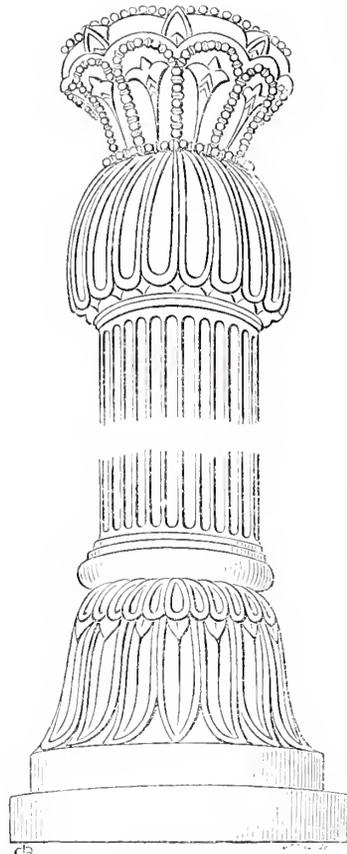

Egypt is the land of temples, temple-palaces, and tombs: in Assyria the palace has the pre-eminence, and the tomb has yet to be discovered; while the temple has hitherto been able to establish but a questionable title to distinct and certain recognition. The Assyrians most surely built and worked for the living; and whatsoever they transmitted for those who should live in after generations, through the agency of Art, had evidently a primary reference to the artists themselves and to their own age. This very self-love, however, in them for us has its advantages. They were scrupulously careful to delineate the living kings and princes and warriors, the living tributaries also and captives; they depicted events as they took place, and personages as they lived and acted; and thus we have Art-records which speak in a yet living language. The men have passed away, and with them has their self-love perished; but their memorial, with its voice of deep and solemn admonition, has been preserved, and thus they will not cease to occupy their own place in the great volume of human history.

Assyrian Art is no less national, no less characteristic, and no less consistent than Egyptian: accordingly it repeats the lesson for us, that these are qualities in Art which we shall do well to acquire. Distinguished by the peculiar feeling of the Assyrians themselves, Art in Assyria is essentially oriental: it also shows its different forms of expression in the most intimate association. The conditions under which the remains of Assyrian Art have been preserved, have restricted those remains within a somewhat narrow range. Fire was the destroying agent which swept away so much, and yet in its very devastation formed the nucleus for the preserving accumulations which should shelter what had not been consumed. Hence works in stone and alabaster and marble have been preserved

in profusion, while whatsoever had been formed of a perishable material has long ceased to exist: and hence also, in consequence of the evident abundant use of wood in their construction by the Assyrians, large portions of their edifices have been destroyed without leaving any clear vestiges of their original character. The existing remains prove that these remains did not constitute the entire edifices in their original forms; and the practice so fortunately prevalent in early times (I cannot apply the same epithet to its prevalence amongst ourselves) of imitating works designed and usually constructed in one material, in other materials, has supplied what otherwise would have been an evident but also a hopeless loss in Assyrian Art. There still exist at Persepolis many remains executed in stone, which are evidently repetitions in that material of what the earlier Assyrian artists constructed of wood. Hence the restorations in the Assyrian Court have been obtained, and their judicious adjustment cannot fail to produce a suitable impression upon the Art-student. Let such a student cherish that impression; but, at the same time, let him not regard restorations and actual reproductions as possessing the very same claims upon him. He will distinguish the one from the other as positive authorities, while he observes how much may be done by thoughtful care to supply what time and circumstances have rendered no longer directly accessible. It will be observed that the Assyrian Court is remarkable for the completeness of its illustration of the arts of Assyria, with the sole exception of the Art-manufactures and the minor carvings and sculptures in ivory in which the Assyrians attained to such high excellence. There is, however, in this Court the imperfection so much to be lamented in these generally admirable structures—the absence, that is, of such an exact classification and arrangement as will clearly distinguish the great Art-eras, and assign to each its own peculiar teaching. This is the Assyrian Court, as it is usually seen and contemplated: it ought to have been, evidently and unmistakably, a court exhibiting three successive periods in Assyrian Art. As before, again I may repeat, that photographs may do much to effect what thus remains to be done; they may be made to demonstrate the eras, and also to show the character of those objects of Assyrian Art of which fac-similes cannot otherwise be obtained.

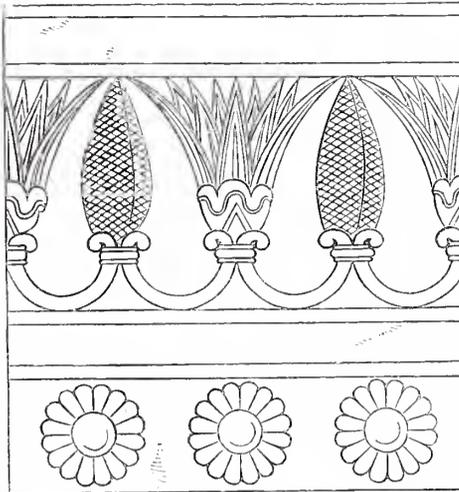

Without attempting to introduce here even a descriptive sketch of the works of Assyrian Art which have so recently become known to us, I may observe that the most ancient of the buildings at present disclosed from the mounds is the north-west palace at Nimroud, built by Asshur-akh-pal, one of the several Sardanapali, who is believed to have reigned about B.C. 900. The other principal discoveries are Khorsabad, to the north-east of Nineveh, the work of Shalmaeser or Sargon; Koyunjik, the splendid palace of Sennacherib, on the Tigris; and the palace of Esahaddon, with several other groups of chambers, complete the series. To these the discoveries in Babylonia must be added; and with them the ruins of Persepolis must be closely associated. These most valuable historical remains lead us on to the still more interesting edifices of the Israelites in the great days of their glory. Not, indeed, that the Persepolitian remains form a directly connecting link with what Jerusalem once was, but that the transition from the platform and the rock sculptures of the Persians to the works of the wise king who reigned on the shores of the Mediterranean, is the most readily effected. As Persepolis is invaluable to us as an exponent and illustrator of Nineveh and Babylon, so do the three possess a special source of interest from the light which they combine to throw upon the arts of Israel. The temple and the royal house of Solomon, as we gather from Holy Writ and from the pages of Josephus, were evidently built and decorated in the styles of Assyria; there were the sculptured and painted wall-slabs, the cedar roof and pillars, the mystic figures, the elaborate yet peculiar enrichments which Nineveh has still, with the aid of Persepolis, preserved for us to contemplate. Whatever additional illustrations from Assyria and Babylonia may eventually be associated with the Assyrian Court, as it now exists, it will be of the utmost importance that Persepolis should also be fully illustrated, and its value as a commentator upon the earlier arts of the Assyrians clearly made known. I have here

introduced sketches of a capital and base from Persepolis, both of them modelled to the full size of the originals in the Assyrian Court, and both of them

CAPITAL AND BASE, PERSEPOLIS.

works of great beauty. The capital, if crested with a nobler upper member, would take a place amongst the best productions of its class, and the base, unaltered, might be adopted with signal advantage.

BORDER OF ORNAMENTED PAVEMENT, NIMROUD.
(The original in the British Museum.)

PART V.—GOTHIC ART: Section 1.

As is the case with their Romanesque neighbour, the Gothic Art Courts in the Crystal Palace suffer from possessing the title which has very infelicitously been applied to them. They are styled "Medieval"—a term devoid altogether of any definite application to a style or period of Art; and which, in the case of Gothic Art, is calculated not only not to satisfy, but actually to mislead the student. The Gothic was indeed the great Art of the middle ages; but it was not the only form under which, during the middle ages, Art flourished in Europe. The term mediæval, as an Art epithet,

would include the Romanesque forms on the one side, and what have been not inaptly designated after-Gothics on the other side. It is well to restrict the term "Gothic" to its own age, and to apply it to its own style, and, at the same time, to exclude from it as well what preceded and what followed it. I shall accordingly, as in the instance of the Romanesque Court, reject the word "Mediæval," and substitute for it the word "Gothic," while treating of the courts which really are devoted to Gothic Art. These courts will demand a careful investigation; they come close to us, and their teaching ought to abound in lessons as well of present practical value as of historical interest. Should it appear that more might have been done for Gothic Art in these Courts than they have actually accomplished, it will also be evident that their teaching will readily admit such aid and support as will render it of the very highest importance. Reversing my previous order of treatment, I propose first to give a general description of these Courts, and subsequently to compare them with what we should both desire and expect to find them. The group comprises three distinct Courts, with the adjoining corridor, and along the entire façade next to the great central avenue of the palace various works in sculpture (chiefly monumental) are arranged. First there is a small court devoted to the Gothic of Germany; the much more spacious court which succeeds is formed of casts from English works in the same style; a second small court contains examples of French Gothic, and the corridor is occupied by miscellaneous specimens; in addition to which there is a second large and very important miscellaneous collection in the extensive open space which corresponds with the present music-hall. Thus the entire style, in all its more important forms of expression, is illustrated; the Lombard and Italian form having received the least share of attention. The student will note this bringing together of Gothic works from different countries, at the outset of his inquiry; it is a matter most seriously affecting his final success, and one which these Courts will do much to represent to him in its true importance. Until very lately the study of the Gothic of England had received but little of illustration from what other countries had to teach respecting the style; but now we have at last begun to recognise the style as one great style, and we have commenced searching out its workings wherever it worked, that thus we may attain to something more closely resembling a full comprehension of the style itself, in the fulness of its deep meaning and its comprehensive power. So long as the Gothic was studied under one form and aspect only, by those who desired to revive it in extended operation, so long they restricted their aim to the mere reproduction of early examples; and mere reproduction will neither make an artist nor revive an art. But when a wider and loftier spirit of inquiry began to exert its influence, and the students and lovers of Gothic Art were led to seek out, not the material forms, but the animating spirit of the style; when they aspired to a fellowship with the feeling and the mind of the Gothic masters, with the view to their own working under kindred impulses, yet without any idea of doing precisely the same work once again, then there began to be such beings as Gothic artists, and Gothic Art began to revive. Thus this great Art may work after a manner consistent with its own essential attribute of applicability to existing requirements, and its versatile powers may be consistently exemplified in availing themselves of every fresh discovery in science, and every addition of a new material or a novel method of applying an old one. The extension of the range of study beyond the Gothic of England, together with the maintenance of the unity of the style throughout its eras, have already done great things towards placing this great art on its proper basis amongst us; and the Crystal Palace Gothic Courts have performed their own parts in this good work, though certainly they have not at present accomplished so much as they may be yet made to accomplish.

The German Court is entered through a cast from the celebrated doorway at Nuremberg, and on either side of this there are grouped various objects from different German churches, including four fine monuments all from Mayence Cathedral; and above is a characteristic and beautiful arcade, made

up of miscellaneous details chiefly from Cologne. At hand are sculptures from Munich, Cologne, and Nuremberg, and other places. Amongst these are the masterpieces of Adam Krafft, with two works ascribed to Albert Durer, and others which carry on the German series as late as the commencement of the sixteenth century. The cloister, which forms one side of the English Court, is, for the most part, a reproduction from Guisborough Abbey, Yorkshire; but, unhappily, this fine work of the noblest Gothic age is mixed up with details of the succeeding era. The open Court itself has been constructed with a direct and evident disregard of all classification,—the several Gothic eras are indiscriminately associated, and an incongruous whole has been the necessary result. But the component parts, when reduced to their own proper independence, are of great value; these are taken from the Cathedrals of Ely, Lincoln, Wells, Rochester, Winchester, Hereford, Salisbury, Lichfield, Westminster Abbey, the great churches of Southwell and Beverley, &c. The Court itself must be visited by those who would examine in detail into its composition: here are niches, canopies, bosses, corbels, spandrels, windows, tombs, a noble late font, and almost every possible variety of Gothic work. Amongst so much that is admirable, and with all these excellent casts ready to form the Court, it certainly is a matter of surprise that the triforium arches of Lincoln should have been made to act as doorways, and that many objects should be made up of parts brought together from various originals. The triforium arches were purposely designed to be seen at a considerable elevation; they cannot be fairly estimated when converted into doorways, and set on a level with the student. There are many examples of sculpture in this Court; and here the same remark is applicable in many instances—the originals are placed at a great height, while the casts are raised but a few feet. A considerable amount of colour has been introduced here, but without producing any satisfactory results. Within the Court are four great easts from celebrated monuments with effigies, which will be fully described hereafter. In the adjoining corridor are other monuments, with various specimens of windows, vaulting, shafts, and niche-work. Some few Italian examples are to be found in the French Gothic Court, together with a more numerous series of works from France itself: here are fine arches from the choir of Notre Dame, Paris, surmounted by canopies from Chartres; and a variety of other celebrated churches have also contributed their treasures of architecture and sculpture. The entire series is very excellent, and its teaching will repay attentive and prolonged study. It is the same with the Gothic works, which at present stand in such singular disorder in the great compartment of the Palace which adjoins the central transept. The student may here contemplate many of the noblest isolated examples of Gothic Art; each has for him its own teaching, but each example would derive fresh powers of instruction from association. The relative bearing of these fine works upon each other, and their respective contribution to the history of Gothic Art has still to be realised through classification. While they are regarded as parts of a great whole, their teaching cannot fail to produce important effects, however they may be placed: and now Art-students have been taught to consider every great Gothic example as, in fact, associated with every other, the whole forming the one volume which that noble art completed in the middle ages, and handed down (sealed, indeed, but with a seal which would admit of being dissolved) for us to study. That same volume needs not to be issued again, or to be simply translated: the spirit of the original survives, and, unexhausted, it seeks at our hands a fresh work, that may bear the same distinctive lineaments with its predecessor,—that may be as true as the former volume to the style and title which it should bear, but which will be characterised throughout by a freshness and energy of its own, and which, on every page, will vindicate at once the fame of the former workers, and the worthiness of their living successors. In these Courts we may recognise collections of valuable authorities from which the new volume may derive some of its materials, and upon which, as upon a solid foundation, it may repose in confident security.

THE APPLICATION OF IMPROVED MACHINERY AND MATERIALS TO ART-MANUFACTURE.

No. 8.—THE ECONOMY OF SOME METALLURGICAL PROCESSES CONNECTED WITH GOLD AND SILVER.

FROM the most remote historic times, the islands of Britain have been celebrated for their metalliferous treasures. Tradition, from a yet earlier period, brings us strange legends of the wealth of the early British tribes. It is certain that the ancient monarchies were indebted to those "far islands of the west" for the tin with which they manufactured their bronzes. We have evidences, traditional and historical, that the merchants of Tyre and Sidon sent their commercial navies round the coasts of Spain, and to the far-famed "Cassiterides," for the tin with which they supplied the great nations of the eastern world.

In connection with this early commerce and ancient navigation, we have the curious and instructive account given by Diodorus. He says,—“We will now give an account of the tin which is produced in Britain. The inhabitants of that extremity of Britain which is called Bolerion both excel in hospitality, and also, by reason of their *intercourse with foreign merchants, are civilised in their modes of life*. These prepare the tin, working very skillfully the earth which produces it. The ground is rocky, but it has in it earthy veins, the produce of which is brought down and melted and purified. Then, when they have cast it into the form of cubes, they carry it to a certain island adjoining to Britain, and called *Ictis*. During the recess of the tide the intervening space is left dry, and they carry over abundance of tin to this place in their carts; and it is something peculiar that happens to the islands in these parts lying between Europe and Britain, for, at full tide, the intervening passage being overflowed, they appear islands; but when the sea retires a large space is left dry, and they are seen as peninsulas. From hence, then, the traders purchase the tin of the natives, and transport it into Gaul, and finally, travelling through Gaul on foot, in about thirty days they bring their burdens on horses to the mouth of the river Rhone.”

Cæsar, in his Commentaries, distinctly states that one reason of his invading the Britons was, because they assisted the Gauls with their treasures, with which their country abounded. Thus we have the evidence of two historians to show that these islands have been from the earliest date regarded as rich in mineral treasures. Traditional evidence is abundant. One of the Welsh Triads informs us that three of the great princes of Wales—Caswallan, Manawydan, and Llew Llanngyfes—were distinguished for their possession of golden cars. The "hoarded treasure" of the prophet Merlin, of which we have strange tales in our ancient British poetry, may also be regarded as indicating, in remote antiquity, the search for the precious metals in this country. The Romans certainly worked some mines for gold; that of Ogofau, in Carmarthenshire, is a remarkable example. In considering this question, the fact must not be allowed to escape us of the discovery of ring-money of gold in the bogs of Ireland, many very interesting examples of which are preserved in the cabinets of the curious.

Although the special purpose of this paper is to direct attention to some interesting modern processes, by which a large amount of valuable metal, which was formerly wasted, is now preserved; it cannot but be interesting to sketch something of the history of the search for gold and silver in the British Isles. Confining our attention, then, entirely to gold and silver, it is curious to discover that our Henry IV. commands Walter Fitz Walter—upon information of a concealed *gold mine* in Essex—to apprehend all such persons as he in his judgment thinks fit, that do conceal the said mine, and to bring them before the king and council, there to receive what shall be thought fit to be ordered. This strange warrant of the king had reference to a tradition "that Cimoline, prince of the Trinobantes—who lived much at Rome in Augustus his time—did at Walden, in Essex, coin according to the Roman way, money instead of rings." There appears to have existed from the

earliest times a vague belief that the much-valued precious metal, gold, was to be found in Britain; and this idea has from time to time been encouraged by the actual discovery of some gold in various places. The Romans, for example, actually worked a gold mine at Ogofau; the remains of their smelting establishment has been discovered, and a gold necklace found, which, for the style and workmanship, would have been no discredit to a modern goldsmith. In the time of James I. it was stated that much gold had been found, and that by careful search much more would be discovered in the Lead Hills, and some other parts of Scotland. One Atkinson wrote on the subject, and after comparing his majesty to David and Solomon for wisdom, he earnestly persuades the king to embark in the gold search, and he promises him riches far beyond the wealth of the Hebrew monarch. It does not appear that any considerable quantity of gold was ever discovered in any part of Scotland, but some has been found in the Lead Hills and elsewhere. Certain it is that more money has been expended in the search for the royal metal than could be coined from what has been discovered.

Several similar manias have from time to time taken possession of the people, and all of them have ended in ruinous loss to those who had yielded to the seductions of the gold fever. One of the most successful of the searches for gold was that in 1795, prosecuted in Wicklow. It transpired that lumps of pure gold had been picked up in a valley on the flank of the mountain called Croghan Kinshela, in the southern part of the county of Wicklow. The discovery, which was purely accidental, was kept a secret for some months; but no sooner was it made known, than crowds of the country people, throwing aside their ordinary occupations, rushed to the spot to secure a share in so promising a harvest. Some hundreds of gold diggers were soon employed about the stream, and during about six weeks appropriated to themselves a considerable amount of pickings. After that time the government, fortified by a special act of parliament, established a more systematic system of streaming, under the direction of special commissioners; and up to the outbreak of the rebellion in 1798 these works were remunerative. During that unfortunate period, however, they were destroyed, and were not resumed until 1801. Attempts were then made to discover the source of the alluvial gold, by mining into the mountain. An adit was driven a considerable distance into the hill, with the hope of cutting the lodes from which it was supposed the gold of the valleys had been derived. After a large expenditure of money and considerable labour—not a particle of gold having been discovered—the mining works were abandoned. The government were advised to this by Mr. Weaver, after some years of this useless search. From the stream, however, they had raised 944 ounces of gold, the total value of which at the time was £3675. The Wicklow gold occurred disseminated throughout an irregular bed, composed of clay and fragments of rock more or less rounded; the particles were generally minute scales; but large solid lumps were found from time to time, the heaviest of which weighed 22 ounces.* Gold has, at all times, been found in small quantities in the tin streams of Cornwall, but never has it been regarded as of sufficient importance to be made an object of special search. The "tin streamers," as these men are called, usually carry with them a small quill, in which they preserve the particles of gold they may discover in washing for tin. These quills of gold are usually sold as curiosities.

It is not many years since the valleys of North Devon were said to be rich in gold; Pactolean streams were fabled to be flowing over golden sands, and the fable of Colchis was to be realised in England. At enormous cost new machines for amalgamating and grinding the auriferous quartz were

* It is only within a few years that the Wicklow gold mines have been entirely abandoned; indeed, it is not improbable that they are at this moment partially at work. Mr. and Mrs. Hall, in their book "Ireland; its Scenery and Character," describe a visit to these mines in the year 1840; they found about fifty men and women busily employed in sifting the gravel of the current of a dried-up river, washing it, and obtaining pieces of pure gold—generally very minute, but frequently of the size and about the thickness of a sixpence. Several such pieces they saw taken from the washing sieves; and the inspector showed them also two or three of larger size. Still the produce was not sufficient to pay for the labour.

fixed; and they rest rotting and rusting on the mines, no gold having been found upon which to test their powers.

It cannot be too much regretted that the education of the people of England is such that they are unable to protect themselves against the bold assertions of pretenders. A machine, in every respect,—regarded merely as a mechanical contrivance,—of the worst possible construction—a return, indeed, to the old ball and basin with which the Saxon wife ground her corn, with the defect of moving the basin instead of the ball—took our public by surprise, and thousands of pounds were spent upon an implement in which the waste of mechanical force was a constant source of loss, and which would not perform the work for which it was constructed and sold. A very slight knowledge of the laws of mechanics would have prevented the impudent projector from returning rich to his native home, and have saved many from ruin.

More recently the hills of Merionethshire have been discovered to be rich in gold, and numerous works have been, within the last few years, established for separating the gold from the quartz, none of which have been remunerative. That gold exists in the quartz lodes of those rocks is certain; but it is so irregularly distributed, that it is exceedingly problematical if it will ever, even under the most economical system, be worth working.

Although—as we have endeavoured to show—gold mining, or washing, has failed to be remunerative in this country, we have, in our improved chemical manufactures, succeeded in saving many valuable products which were formerly entirely lost. In no case is this more remarkably shown than in the recovery from the iron pyrites of Ireland of the copper, the silver, and the gold which they contain in almost infinitesimal quantities. For the purpose of rendering intelligible to the reader, who may not be possessed of much chemical knowledge, the peculiarities which are connected with the manufacturing economy we are about to describe, it will be necessary to explain, though briefly and popularly, the methods adopted in the manufacture of the well-known acid, the sulphuric acid or oil of vitriol. This acid is the result of a combination of oxygen with sulphur. It must be familiar to every one, that when sulphur is burnt a peculiar and suffocating smell is produced. When we ignite a brimstone match, a combination of the sulphur and the oxygen of the air immediately takes place; a vapour escapes, which is this compound, and we call it sulphurous acid. If, by any means, we combine the sulphur with another dose of oxygen, we then obtain the sulphuric acid, or oil of vitriol of commerce. To effect this on a large scale, properly constructed furnaces are prepared, and the sulphur to be ignited is mixed in certain proportions with nitre—nitrate of potash. The sulphur is converted into sulphurous acid, and the nitre into nitrous acid. These gases pass into large leaden chambers, having some water upon their floors, and by a somewhat complicated series of reactions, an additional equivalent of oxygen enters into combination, and sulphuric acid is dissolved in the water. This is continued until the water is strongly charged with this acid; it is then run out into leaden vessels, in which, by the action of heat, it is concentrated; a still greater degree of concentration being effected by subsequently heating the acid in platinum vessels.

Sicilian sulphur is ordinarily employed in this manufacture; but it has been found economical to employ some of the sulphur ores—iron pyrites—of this country, especially the ores of Wicklow and of Cornwall, the former more especially. The analysis of these ores, which are sometimes called *mundic*, shows them to contain iron 46.7, and sulphur 63.5. It is this large quantity of sulphur which renders them valuable. The quantity of these ores shipped from Wicklow and Arklow in 1855 was as follows:

	TONS.
From Ballymurlagh	17,185
„ Ballygahan	12,222
„ Conorra	3,426

In the same year there was produced—

From Llanrwst, North Wales	200
„ Devon and Cornwall	19,840
„ Cumberland, &c.	2,000
„ the coal formations of Durham and Northumberland	1,780

Making a total of 56,653

Beyond these quantities a considerable amount of pyrites were raised, of which no account can be obtained. This ore, when submitted to the action of fire, gives out its sulphur, and the process of conversion into sulphuric acid is that already described. For a long period the sulphur being separated from the ore, the residue was regarded as valueless, and the ashes were thrown to the waste heaps. An accumulation of this sort was sold by a manufacturing chemist for a trifling sum, and he was glad to get rid of the useless matter, as it then appeared to him. In a short time an application was made for another pile of refuse; a larger price was asked, and it was readily given. The demand from the same party for this “sulphur ash,” as it was called, increasing, the manufacturing chemist began to suspect that it contained something more valuable than the trace of copper, which they knew existed, but which, it was thought, it would not pay to separate. A careful examination of the ashes was made, and it was then discovered that the waste of the vitriol works, where the Irish pyrites were used, contained copper, and silver, and gold. These “wastes” were now sold at something like their real value. They pass from the hands of the vitriol-maker, and are treated as follows:—The ashes are mixed with common salt, and subjected to a roasting process at a regulated temperature. When they have been exposed sufficiently long to the proper temperature, the roasted mass is thrown into water, and in a short time all the copper is dissolved out of it. The fluid, when it has become clear, is drawn off into another tank, and old iron being thrown into it, the copper is precipitated in the form of metallic copper. A strong brine is now poured upon the residual ashes. The silver which the pyrites contained has, by being roasted with common salt, combined with the chlorine, and become chloride of silver, a salt which is soluble in lime. The liquor, now holding in solution all the silver which was contained in the ashes, is drawn off, and the silver is precipitated, usually by means of copper or zinc, and melted into a cake. This silver cake is sent to London, and instead of its being sold at the usual price of five shillings the ounce, prices varying from six to ten shillings the ounce are given for it, according to the quantity of gold which it contains. The gold is separated by a process known by the name of “parting,” which depends upon the insolubility of the gold in a perfect solvent of the silver. In this way large quantities of silver and gold are recovered which for a very long period were thrown away. Advantage is now being taken of the fact that gold is soluble in chlorine to separate it from many ores which are known to contain it in small quantities. Works were very recently established in Cheshire for the extraction of gold from quartz; the experiment is too recent to enable any one to express an opinion on the probabilities of its success.

The diffusion of gold is somewhat remarkable; experiments have been made in the metallurgical laboratory of the Museum of Practical Geology, with the view of examining the metals supposed to contain some of this more valuable one. Numerous samples of metallic lead, of white-lead, of acetate or sugar of lead, &c., were analysed, and all of them gave a trace of gold. It was not in sufficient quantities to pay for its separation, but, as establishing the fact of the general diffusibility of gold, the inquiry was of the highest interest.

Some time since Malaguti, Durocher, and Sarzeand, communicated the extraordinary fact of their having detected silver, in very appreciable quantities, in sea-water. The authors of that communication suspected the existence of the metal from the extensive diffusion of silver in the mineral kingdom; the conversion of its sulphide into chloride by the prolonged action of soluble bodies containing chlorine; and the solubility of chloride of silver in chloride of sodium, which exists so largely in sea-water. An English chemist, Mr. Frederick Field, has lately published a most ingenious method for detecting the silver of the ocean. His own words are so interesting, that we quote the abstract of his communication to the Royal Society:—

“As a solution of chloride of silver in chloride of sodium is instantly decomposed by metallic copper, chloride of copper being formed, and silver precipitated, it appeared to me highly probable that the copper and the yellow metal used in sheathing the

hulls of vessels must, after long exposure to sea-water, contain more silver than they did before having been exposed to its action, by decomposing chloride of silver in their passage through the sea, and depositing the metal on their surfaces. A large vessel, the *Ara Guimaraens*, now under the Chilean flag, was hauled down in the Bay of Herradura, near Coquimbo, for the purpose of being repaired, and the captain obligingly furnished me with a few ounces of the yellow metal from the bottom of the vessel. The investigation was interesting, as the metal had been on for more than seven years (an unusually long period), and the ship had been trading up and down the Pacific Ocean all the time. The metal, upon examination, was found to be exceedingly brittle, and could be broken between the fingers with great ease. Five thousand grains were dissolved in pure nitric acid, and the solution diluted; a few drops of hydrochloric acid were added, and the precipitate allowed to subside for three days. A large quantity of white insoluble matter had collected by that time at the bottom of the beaker. This was filtered off, dried, and fused with a hundred grains of pure litharge, and suitable proportions of bitartrate of potash and carbonate of soda, the ashes of the filter also being used. The resulting button of lead was subsequently cupelled, and yielded 2.01 grains of silver, or one pound one ounce two pennyweights and fifteen grains troy to the ton. This very large quantity could hardly be supposed to have existed in the original metal, as the value of the silver would be well worth the extraction. It is to be regretted that the captain had none of the original on board. A piece of yellow metal with which he was repairing the vessel yielded only eighteen pennyweights to the ton. I was enabled, by the courtesy of the captain of the *Nina*, a brig which had just arrived in the Pacific from England, to obtain more satisfactory information. He gave me a piece of Muntz's yellow metal from his cabin, from the same lot with which the brig was sheathed, but which had never been in contact with salt water, and also a small portion from the hull of the ship after it had been on nearly three years. The experiments were performed as before, and the results were very striking:—

1700 grs. from the cabin gave .051 grs. = .003 per cent., or = 19 dwts. 14 grs. per ton.
1700 grs. from the hull gave .4 grs. = .023 per cent., or = 7 oz. 13 dwts. 1 gr. per ton.”

Mr. Field is continuing his examination; and he has instituted a series of experiments which will determine with great exactness the rate at which silver is accumulated on the copper by precipitation from the sea.

Many years since a chemist at Plymouth was engaged in an inquiry on the condition of the copper sheathing of many of our men-of-war, and he discovered considerable quantities of silver in the sheathing of some ships which had been long upon the western coast of Africa. This was then thought to have been in the copper from the time of its manufacture, many of the copper ores being known to contain silver. It is, however, more probable that the silver was derived, as Mr. Field has shown, from the waters of the ocean.

It will be curious to find eventually, that our ships traverse the ocean, carrying the elements of industry, and spreading our civilisation to all lands, and that they slowly and silently collect some of the more precious metals for our use. It is now profitable to separate the silver from the baser metal when it does not exist in proportions larger than three or four ounces to the ton. We send our ships upon their voyages sheathed with copper containing less than this, and, as Mr. Field has shown, in the course of a few years that copper may contain a pound or more to the ton. The separation of this silver will become a source of profit, and we may look forward to the time when the supply of that metal will be increased from a source which had not hitherto been thought of by our chemists.

There are many more remarkable instances of manufacturing economy now developing themselves, to which we shall take the opportunity of returning from time to time. Some of our improvements in the separation of silver from lead will form the subject of an article at a very early date.

ROBERT HUNT.

BOTANY,

AS ADAPTED TO THE ARTS AND ART-MANUFACTURE.

BY CHRISTOPHER DRESSER,

LECTURER ON ARTISTIC BOTANY IN THE DEPARTMENT OF SCIENCE AND ART.

PART V.

HAVING now briefly glanced at the origin of the plant, we proceed to notice the parts of the mature structure, and shall commence this series of observations by an examination of the root or lower portion of the organism: after which we shall gradually ascend the structure, and take cognizance of the bud as an appendage to the axis, although we have classed it with the seed as a generator of the individual.

We have already noticed the origin of the root, and have followed it through its rudimentary development; but, after this, many changes are induced in this organ, a few only of which we can notice, especially as it is one of those parts which is seldom used by the ornamentist; though why this should be the case we know not. The first changes which take place in roots are the result of the branching of the original descending axis which was developed by the embryo plant, by which operation the simple or undivided root becomes to an extent compound, or composed of a number of parts. But the laws which regulate the dispositions of the ramifications or divisions of the root, or the principle of the arrangement of the various members of this organ, it is difficult to detect, as the normal positions of these members are always disturbed, they being developed in a resisting medium. However, it is almost certain that the principle of their development is similar to that of the leaves, and hence of branches; but as the subject has not yet been duly investigated, we must leave it for individual research.

The next changes which are brought about are owing to accumulations of matter, which the organism has the power of aggregating in various parts of this organ. Masses thus formed assume various forms. Thus, in the well-known root of the carrot, the entire central descending axis is thickened by such aggregations; its ramifications, however, remain in their fibrous, unaltered state: also, the root of the Turnip (*Bras-*

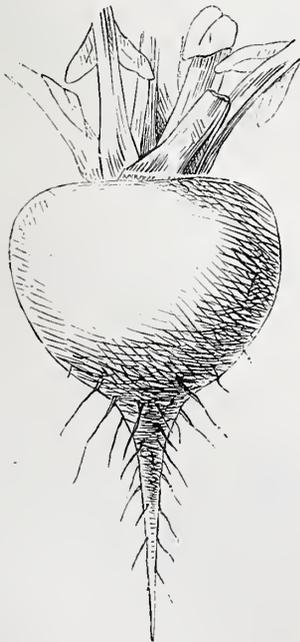

Fig. 34.—TURNIP.—*Brassica napus*.

sica napus) is enlarged by a similar addition of matter, but here it only takes place at the upper portion of the root, the lower preserving its

normal condition (Fig. 34). In these examples, however, this deposition only occurs in the primary descending axis; but it often happens that the growth of this primary axis is interrupted. Thus the principal root of the common Scabious

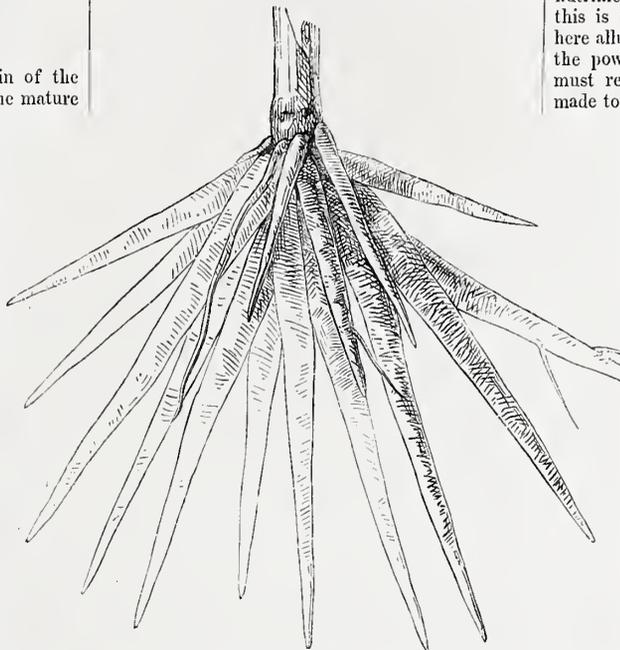

Fig. 35.—*Asphodel*.

(*Scabiosa succisa*) appears to be bitten off, for which reason it is commonly called the Devil's bit Scabious; and it was formerly reported that the cause of this was, that the Devil, out of envy, bit off the extremity of this root, because it was so valuable to mankind. In whatever manner the central axis may be terminated, whether abruptly, or not, if its growth is interrupted, the result is the development of a number of fibres, which surround it, into roots of high importance, and usually of equal, if not greater, value than itself. In these secondary members, these deposits often take place; as in the Asphodel (Fig. 35), where we have a series of fibres which are thickened by these deposits, and in the Dahlia (Fig. 36), where they are more distended.

Fig. 36.—*DAHLIA*.

Sometimes these deposits, instead of occurring singly on the fibre, as in the examples already given, or occupying its entire length, are numerous. Thus the fibres of the root of the Common Dropwort (*Spiræa filipendula*) (Fig. 37) have several swellings on the one thread. Now, although these deposits are common in roots, they almost invariably occur in those plants only which are destined to endure for two or more years (are biennial, or perennial), and the above-ground portion of which dies down annually,

the reason for which will be obvious when their use is explained. Before, however, we notice this part of our subject, it is necessary to state that all roots are furnished with small fibres which appear, almost exclusively, to have the power of absorbing nutriment, which fibres often perish annually. As this is the case with these members of the roots here alluded to, it is obvious that, as they alone have the power of procuring nutriment, the structure must remain dormant, or some provision must be made to meet this emergency. To accomplish this,

when the activity of the root is at its maximum, a quantity of organizable matter is reserved, and stored up in the imperishable portion of the organism: thus, when external circumstances excite the dormant vitality of the root, new fibres are again protruded, which are formed of, and feed on, this stored up food; then, when these fibres are generated, they absorb nutriment from without, and thus return what they have borrowed; also upon the nutriment thus procured is that part of the organism fed which is developed into the air and light. The tuberos swellings, however, which are formed on some roots, are not permanent, but are annual. Thus the roots of many members of the Orchis family are furnished with two of these distensions, one of which dies annually. This, in these instances, gives rise to a curious phenomenon, which has often been noticed with interest—viz., the locomotion of some members of this race of plants. This is brought about by the tuberous swelling, which is destroyed, being always at the same side of the axis, and the new one always being generated at

the opposite side; the fibres surround both, and the new axis, which is also annual, always rising between the two bulbs: thus each tubercle exists two years, and then perishes. By this law of generation and existence the diminutive structure moves in a given direction, and when planted in a garden, near the edge of a bed, will, in some instances, walk off.

Nothing now remains to be said relative to the root for our present purpose, save that the fibrous root, in its various modifications, is much more common than the fleshy; and that all roots, the objects of which are not only to feed the structures, but also to support them in their given positions, are furnished with branches of some description, save those possessed by plants of the most diminutive character; and this provision is necessitated on account of their last ascribed purpose.

Having now briefly noticed the root, we proceed

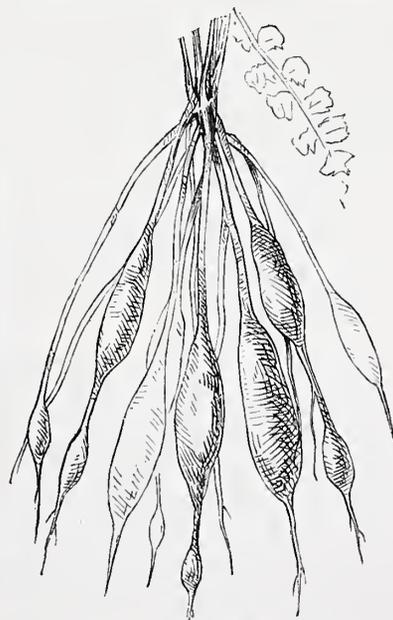

Fig. 37.—*DROPWORT*.—*Spiræa filipendula*.

to examine the stem, or ascending axis. The stem, like the root, becomes branched, but the means by which this is accomplished we cannot now notice;

but we shall hereafter examine that operation: the part which we have now to consider is the stem as already formed. It is needless to notice that the stem presents diverse characters—that it is sometimes large and rough, and then it is named a *trunk*; at other times small, and either smooth or furnished with a variable and more delicate texture, when it is called a *stem*.

Stems are divisible into three great divisions, the characters of which are to be found in the internal structure of this organ, and the manner of its formation: but as this internal difference influences the external appearance, we must here just notice it. If a trunk of any of our common trees is observed, as that of the Oak or Beech, it will be seen that in its entire length it is conical, gradually tapering from the base to the apex; that in its section a centre of pith is observable, around which the wood is arranged in regular concentric circles, and the wood is covered with a bark which is separable from it: these then furnish us with the characters of one great division, which has been termed that of *exogens*, from the fact that the new wood found in such stems is always added to the exterior of the old, consequently just within the bark. If, on the contrary, we examine the stem of a Palm-tree, we observe that it is of a cylindrical form, and that its section presents no centre of pith, but that its entire mass is composed of a similar substance, through which bundles of woody matter pass indiscriminately, and that the entire stem is not covered with a separable bark. This division is called that of *endogens*, on account of the new wood of these stems being produced in their centre. The external appearance of the third and minor group is, like that of the latter, cylindrical; but its section exhibits a large central mass of pith-like matter, and a series of woody bundles, which, however, are not numerous, and assume given zigzag forms, the whole being covered by a somewhat barkly matter. This latter group is that of *acrogens*, in which division the stem is formed by the union of the bases of the leaf-stalks around the original axis; therefore the perfect stem can be produced only at the summit of the organism, as the leaves alone occupy this extremity of the axis.

Now these stems not only vary in internal organisation, but also in external appearance, as is obvious from the preceding; but besides these distinctive characters, there are others which will be observed when we consider the general effect of the varied vegetable structures. There is one point, however, which it behoves us now to mention, viz., that exogenous stems are usually much branched, whereas the stems of endogens are usually little branched, and acrogens very rarely branched at all. Now these varied formations are not only found in the larger structures, but in the more diminutive also, but in these it is necessarily less obvious; for example, if we take the stem of an annual which is an exogen, we find that there is but one circle of wood, and that scarcely separable from the bark; as only one circle of wood is formed in the year, it is obvious that in the larger developments only the structure can be well seen.

We have noticed that the embryo of the seed is sometimes furnished with one, at other times with two or many seed-lobes; now those which have two or many, produce an exogenous stem, while those which have one yield an endogenous stem. The acrogenous structure produces no regular seeds, but bodies which represent them, which are of a very rudimentary nature.

The cause of exogenous stems being conical, while those of endogens and acrogens are cylindrical, though fully understood, is almost beyond the scope of our present papers, therefore we pass on to notice the variation of the form of this organ as exhibited by transverse sections. We may here remark that it is common for the stems of small structures only to widely deviate from the circular form.

If we observe the transverse section of the stem of the *Carex riparia*, we perceive that it is a modification of a triangle, while that of the White Dead-nettle (*Lamium album*) is founded on the square, the Hop (*Humulus*) on the hexagon; and not only have we these pleasing variations, but each one is modified in various ways: thus we have a series which may be regarded as a play upon the triangle, another upon the square, and so on. Thus the stems of the White Dead-nettle (*Lamium album*), the Sting-

ing-nettle (*Urtica*), the *Scrophularia nodosa*, and the *Salvia pratensis*, are all founded upon the square, yet differ from each other in general detail (Fig. 38).

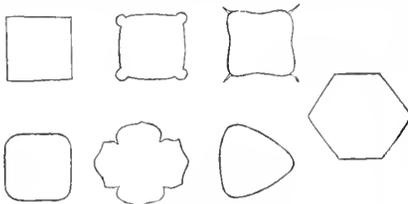

Fig. 38.

We next notice that the stem is influenced in certain particulars by the disposition of the organs with which it is furnished. Thus, if the leaves (which are usually to be found on young stems) are alternate, one at one side of the stem and one at the other, the axis will be more or less angular, the leaf always being situated on the convex summit of the angle; if, however, the leaves assume a rather more complex spiral arrangement, the stem will still be bent slightly from one leaf to the other; but if they are opposite or verticillate, the stem will be slightly distended immediately below the attachment of the leaves with the stem. This does not, of course, interfere with the stem being conical in its entire length, though it, to an extent, makes each portion of the stem situated between each consecutive pair, or ring of leaves, assume the form of an inverted cone.

Having now noticed the chief peculiarities of the stem, it only remains for us to remark that, if a young stem is examined when it is not clothed with foliage, it will be noticed to possess buds, and under each bud a kind of nail-shaped mark, which is the scar left by the fallen leaf. These scars vary in form, but as they are dependent upon the form of the leaf-stalk, we shall notice them when considering that organ; we shall also notice the union of stems, and leaves with stems, after having considered the foliaceous appendages of the axis; and although curious modifications of the stem often exist below ground, we do not deem it expedient to dwell upon them, as our space is limited. We must, however, notice that the object of the stem is to convey fluids, &c., from the root to every part of the organism, and to separate the leaves, so as to expose them all to light and air, as well as being the general above-ground supporting structure of the plant.

If we examine a stem of any tree during the winter months, we perceive that it is furnished with buds, which are its only appendages (evergreens excepted); now we have before said that buds are generators of the individual, and here we learn, from their position, that they are appendages of the axis; their forms, habits, and object, we will now briefly investigate.

Buds present many forms, which are of an interesting character; but as this can be most perfectly observed by individual research, we proceed to notice those points which are to us of higher importance. Before proceeding, however, it is necessary for us to understand that a bud is merely a shortened axis, a shortened branch; by bearing which in mind, our future observations will be readily understood.

Buds are usually clothed with scale-like hodies, which are very simple forms of leaves, the dispositions of which are various; this circumstance, however, is only in accordance with reason, as leaves are diversely arranged, and these are leaves in a metamorphosed condition, or in a simple state. Already light dawns upon our proposition, viz., that buds are merely shortened branches, for we observe that these exterior scale-like leaves are situated very closely together; this would be the result of a branch which produces foliaceous organs at intervals becoming much shortened. Now, as we have just intimated, if the leaves are opposite, the scales of the buds are opposite, and so on, although they may be so closely set as to overlap each other: thus, if we examine the bud of the Horse-chestnut tree (Fig. 39), we find that there is a pair of these scale-like leaves, one of which is at the back, the other at the front; then a pair, one of which is at the right, the other at the left, and so on, from the base to the apex of the structure,

each successive pair being at right angles to the pairs both immediately below and above it, as will be at once seen from our horizontal views of the

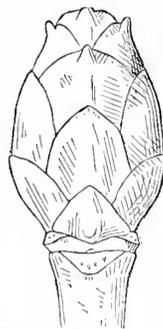

Fig. 39.—HORSE-CHESTNUT.

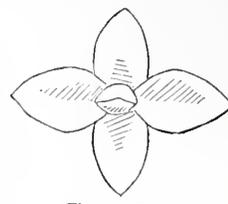

Fig. 40.—LILAC.

Fig. 41.—LILAC.

Lilac bud (Figs. 40 and 41), the structure of which is precisely similar to that of the Horse-chestnut: this fact being so extremely obvious, needs no further comments.

We now proceed to notice the evolution of the bud and its development. As a bud is a mere shortened axis, it necessarily is a branch in embryo possessed of leaves, &c.; now its evolution may be compared to the drawing out of a telescope, the embryonic axis thus becoming an elongated mature branch. In observing the evolution of buds, we are forcibly struck with the grace and beauty of the curves of the scale-like leaves as one and another bend back, the curve of each

Fig. 42.—LILAC.

Fig. 43.—SYRINGA.

forming a beautiful contrast with the others; but as this, with the beauty of the whole aggrega-

Fig. 44.—HORSE-CHESTNUT.

tion, will be fully appreciated from observation, and as our sketches will convey some idea of them,

we proceed to notice one point which must forcibly impress the eye of the ornamentist, namely, a similar

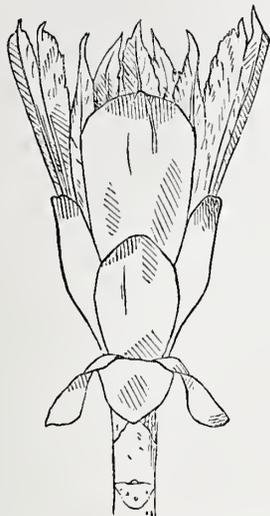

Fig. 45.—HORSE-CHESTNUT.—*Esculus hippocastanum*.

gradual and sudden transition to that which was observable in the germinating seed. Thus, if we

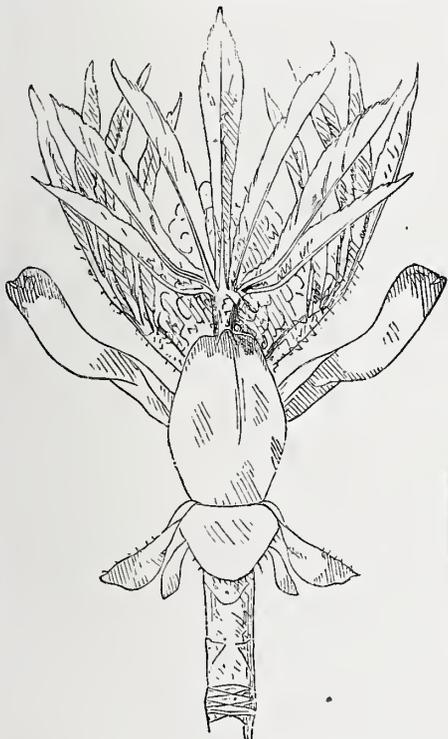

Fig. 46.—HORSE-CHESTNUT.—*Esculus*.

examine the evolution of the Lilac bud (Figs. 42 and 43), we observe that there is a gradual transition

Fig. 47.—*Lonicera*.

Fig. 48.—*Lonicera*.

from the scale to the ultimate leaf, each successive development assuming more of the form of the leaf proper, and less of the simple character of the

scale. On the contrary, if we observe the bud of the Horse-chestnut, we perceive that there is

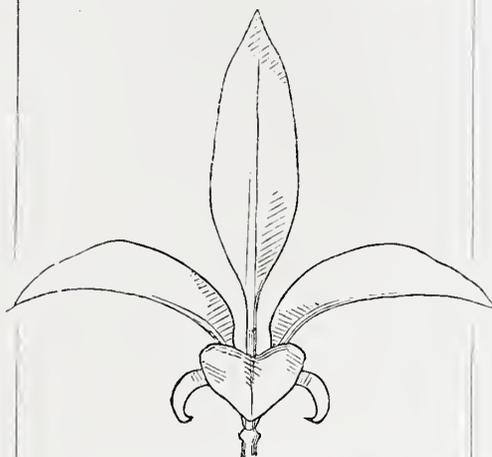

Fig. 49.—COMMON HONEYSUCKLE.—*Lonicera*

a sudden contrast between the ultimate leaf and the scale, the leaf being of a decidedly compound nature, and its margins toothed, while the scales are entire or undivided. We here figure the progressive development of the Horse-chestnut bud (Figs. 39, 44, 45, and 46), as well as the buds of two species of the Honeysuckle (Figs. 47, 48, and 49), believing this to be the best way of calling attention to these beautiful objects. Sometimes branches are abortive, when a spine is the result, a compound form of which we here figure (Fig. 50).

Relative to the arrangement of buds, and consequently their aggregation, it is only necessary to

Fig. 50.

repeat, that as all regular buds are found situated in the angle formed by the union of the leaf-stalk with the stem, that whatever is the arrangement of leaves, such is the arrangement of buds, which will at once be seen from the accompanying sketch of the Lilac (Fig. 43), the buds of which are oppo-

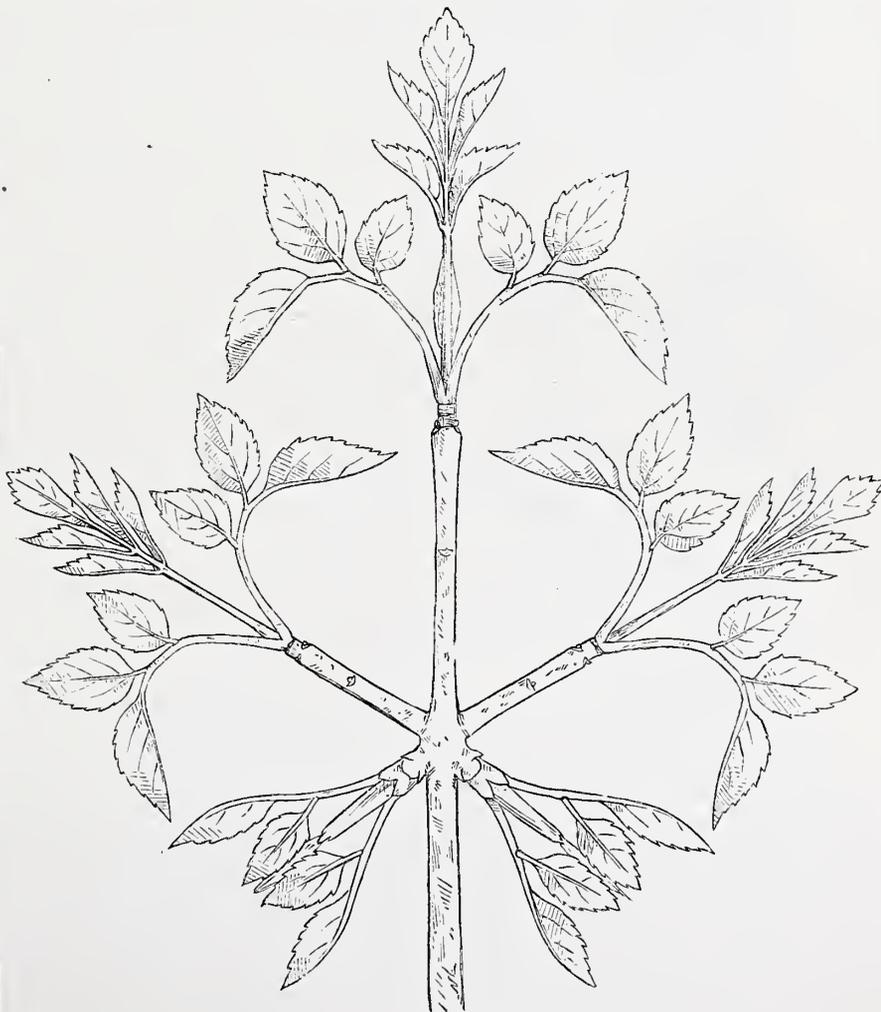

Fig. 51.—ELDER.—*Sambucus*.

site, and consequently the leaves on the developed branches are also opposite.

There is one other circumstance which should

not be lost sight of, namely, that two or more buds sometimes exist at one point of the stem, which may either develop simultaneously, or follow each other

at a somewhat distant period; this, though it seldom occurs, exists in the Elder, the second bud developing the year after the first, and is situated below it, a sketch of which we here give (Fig. 51); it is not, however, always present.

Having now considered the bud, we have noticed the origin of the branch. Each bud gives rise to one branch, which is necessarily a repetition of the original structure. As we have noticed that the embryonic axis of the organism found in the seed is furnished with only one bud, and each bud on a structure must produce a similar development, this is obvious. Were we treating on the principle of adaptation to purpose, we could not fail to call attention to the object of the scales of the bud, which is to protect the germ of life within; in fact, the bud, intrusted with a vital point, has to be protected during the cold winter months, and therefore we often find not merely leathery scales closely laid together, but inside these we find embryonic foliage surrounding the growing point, and these are carefully wrapped in a cottony substance resembling cotton wool, and then to protect them more securely from the frost, rain, and damp, the scales are cemented together, and overlaid with a resinous secretion; thus, beautifully, can we trace adaptation to purpose in all the parts of the vegetable structure. We cannot now stay to trace out the principle of unity in variety as here manifested, but can merely direct attention to the striking resemblance between the seed and the bud; almost the only difference between these two developments being, that the one has the power of developing a root, therefore of procuring its own nourishment, whereas the other receives it from a parent stem; however, even this distinction vanishes when we remember that new wood,

which is formed by young buds and leaves, is transmitted down the stem and goes to form the root of the entire organism; but the full extent of this analogy we must individually trace out. Respecting the sections of buds, we can only figure one or two representations, for which purpose

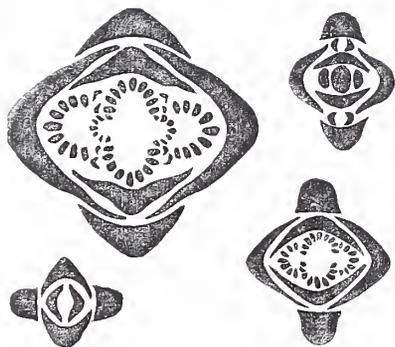

Fig. 53.—Ash.

we have chosen the Ash bud (Fig. 52), four sections of which we give at various planes (Fig. 53).

OBITUARY.

MORITZ RETZSCH.

This veteran German artist, so well known in this country by his numerous outline illustrations of the writings of Shakspeare, Göthe, Schiller, &c., died on the 11th of June, at his residence, Hoflösnitz, near Dresden, in the seventy-eighth year of his age.

In the *Art-Journal* of January, 1851, is an article from the pen of Mrs. S. C. Hall, entitled "A Morning with Moritz Retzsch," to which we would ask those of our readers to refer who desire a personal introduction to the man and his home. From that paper, and from a short biographical sketch of Retzsch in the "Men of the Time," we gather the following particulars of his artistic life.

He was born at Dresden, December 9, 1779, and although the term of his life extended nearly to fourscore years, he had never travelled far from the limits of his native city; of schools of Art, both

ancient and modern, he knew nothing but what the public and private galleries of Dresden showed him. Although he manifested as a child unusual talent for drawing and modelling, his early ambition extended no higher than to attain the post of a royal forester; a little consideration, and a few speaking facts, taught him, however, that this position would not secure him that personal freedom he coveted so much, for as a youth he dearly loved adventure and liberty. Having at length formed the determination to devote himself to Art, he entered, in 1798, the schools of the Berlin Academy, where he made rapid progress: in 1816 he was elected member of that institution, and in 1828 Professor of Painting. Though at the commencement of his career he had chosen historical painting as the branch of Art to which he desired to give his attention, we never remember to have heard of his attaining much celebrity in it: his portraits are held, however, in great estimation for their fidelity and delicate execution.

The reputation of Retzsch was founded, and will always rest, on his outline illustrations of the works of the great poets, especially those to Göthe's "Faust," consisting of twenty-six sheets of etchings, first published in 1812, and again, in an enlarged edition, in 1834. In 1822 he undertook for Cotta, of Stuttgart, a series of outlines from the poems of Schiller, comprising "Fredolin," the "Fight with the Dragon," "Pegasus in Harness," and the "Song of the Bell." His next series was from Shakspeare's dramas, of which series eight parts were published between the years 1827 and 1846; they comprised illustrations of six plays. To this list may be added illustrations of Burger's ballads, two series of "Phantasies," "The Contrast between Light and Darkness," and several others, chiefly single subjects.

Of these works, so well known and so deservedly appreciated wherever Art is admired and loved, it is scarcely necessary for us now to speak: notwithstanding their German origin, they have a freshness and richness of conception, a freedom of execution united with a delicacy, and a feeling of pure, natural poetry, that one rarely sees in works of this kind by German artists; but then Retzsch was not a "schoolman," except as a genuine pupil of nature. "The allegories of Moritz Retzsch," says Mrs. Hall, referring to a portfolio of his drawings she had looked over in his studio, "are not of the 'hieroglyphic caste,' such as roused the indignation of Horace Walpole; there were no sentimental Hopes supported by anchors; no fat-cheeked Fames pulling noiseless trumpets; no commonplacéd Deaths with dilapidated trumpets. They were triumphs of pure Art, conveying a poetical idea—a moral or religious truth—a brilliant satire, brilliant and sharp as a cutting diamond, by 'graphical representation;' each subject was a bit of the choicest lyric poetry, or an epigram, in which a single idea or sentiment had been illustrated and embodied, giving 'a local habitation'—a name, a history—in the smallest compass, and in the most intelligible and attractive form."

An excellent portrait of Retzsch precedes the paper written by Mrs. Hall; the head and face are fine, and wonderfully expressive of intellectual power, deep, earnest thought, and kindness of heart. "The mingling of simplicity and wisdom was one of the strongest phases in his character; so gigantic and yet so delicate in Art; so full of the rarest knowledge; animated by an unsurpassable imagination; proud of the distinction his talents command, and yet of a noble and heroic independence which secured universal respect." "His soul," says his friend and brother artist, Professor Vogel, "was animated by the grand conceptions of Göthe and Schiller; his ears drank in the beauty and sublimity of their poetry; and he lived in the mingled communion of great men, and the lovely and softened beauty of Saxon fatherland." The memory of Moritz Retzsch will not soon fade in the recollection of his countrymen, or of any who ever made his acquaintance, if only during a few brief hours.

In the article to which we have made reference, a description is given of the artist's home and garden, both of which were full of interesting objects, most of them associated with some event in the painter's history. It was peculiarly pleasant and instructive to walk and talk with him in this home of his affections.

THE ROYAL PICTURES.

REST AT EVE.

J. Tennant, Pinxt.

C. Consen, Sculpt.

Size of the Picture, 3 ft. 4 $\frac{1}{2}$ in. by 2 ft. 0 $\frac{1}{2}$ in.

How is it that Art has so frequently the power of producing pleasant sensations in the mind, when a similar power is withheld from Nature herself? Why is it we call that beautiful which the painter has placed on his canvas, when we should repudiate the term if applied to the reality? Here, for example, in Mr. Tennant's picture is an instance of the artist's power over Nature. Not ten, perhaps, out of a hundred persons who might chance to see the scene he has represented—a few cows resting quietly on the banks of a brook running through an extensive marshy level—would give it the least attention, much less be attracted by it as "a thing of beauty;" and yet, we venture to affirm, not one of the hundred looking at the picture, however their tastes might differ upon works of Art generally, would deny to it the admiration it deserves. Strange it seems that the gifts with which man is endowed enable him to exercise a power that the glorious works of his Creator are insufficient in themselves to effect. We can only account for the fact on the assumption that the great mass of mankind is either ignorant of, or wilfully blind to—we rather suspect the latter—the loveliness of the world around us:—

"For we half shut up our senses,
And we hear no music sweet,
Nor smell the fragrant incense
That rises at our feet;
And we close our eyes to beauty,
Nor taste the good we can,
And are careless of the blessings
Which heaven spreads out for man."

It is the enviable mission of the painter to bring before the eyes of his fellow-creatures these "blessings" of the world of nature,—to show them, whether it be in a leaf or a flower, a combination of the most ordinary and apparently uninviting subject-matter, or the representation of the grandest and most sublime features of landscape, that all is excellent, perfect, designed for, and adapted to, our happiness.

Mr. Tennant's landscapes are among the most attractive pictures of their class exhibited at the "Society of British Artists," in Suffolk Street, of which institution he has long been a member and a strong "support." His works are much in request, and deservedly so; for if they do not rank with those of our most distinguished landscape-painters, they are infinitely superior to the great majority. His "strength" lies in river-scenery; his subjects are always well-selected as regards picturesque character, and are treated in a manner at once artistic and natural,—terms that ought to be of similar import; and yet they cannot be called so, when applied to the productions of some painters, where Art and Nature are very far from meaning the same thing.

The picture of "Rest at Eve" was purchased by Prince Albert, in 1852, and is the second work by Mr. Tennant which has been so honoured by his Royal Highness. The scene was sketched on the banks of Dagenham Gulf, in Essex, looking over the Thames to the Kentish side of the river between Woolwich and Erith;—the Thames is seen in the distance, and beyond it is the high ground of Plumstead and Lessness Heaths,—one of the most picturesque localities within twenty miles of London, presenting a combination of richly-wooded upland, verdant pastures, and extensive cornfields, with the noble Thames winding through the low country, almost as far as the eye can reach; the Kentish side of the river offers a most striking contrast to the opposite banks.

It is scarcely giving to the picture here engraved too high a compliment to say it is worthy of Cuypp; the subject is, perhaps, as simple as an artist could select—a quality never to be condemned or slighted when allied with such excellences as are here to be seen,—rich, luminous colouring, effective arrangement of the materials, and most careful execution.

The picture is in the Collection at Osborne.

THE REST AT EVE.

FROM THE PICTURE IN THE ROYAL COLLECTION.

THE WELLINGTON MONUMENT.

THE models which are the answer to Sir Benjamin Hall's summons to a competition in the matter of this most important national work, stand now on their pedestals in Westminster Hall; and on the 20th of the past month the collection was thrown open to the inspection of the public. As it is many years since a sculpture commission of such magnitude has been given in this country, the exhibition is one of more than common interest; and Sir Benjamin having chosen, in the exercise of his discretion, to extend the chances of the competition to the foreign sculptor, it behoves our readers and others to see that this interest does not sleep. By this exhibition of the designs, the minister invites the public to be his assessors in the matter of the adjudication; and it will, therefore, be that public's fault if the decision should be suffered to pass quite out of their own hands. The appeal to general opinion is in itself, and as far as it goes, a pledge of ministerial good faith; but it should be observed, that were anything like the contrary intended, the neglect of this appeal would have the precise effect of enabling the wrong to be done under the forms of fairness. The apathy of the invited censors would permit the private bias to cover itself under the alleged sanction of the public voice.

Our readers well know, that in the matter of the government commissions, there have been too many jobs already perpetrated to give to the above hypothesis the character of offence. It need not be concealed, that in the profession itself there is a very uneasy feeling abroad in reference to this competition. In the first place, the invitation to the foreign sculptor to be a candidate for this commission, the British sculptor has looked on as a stigma to himself; and under the influence of this impression, more than one name has been withheld from the list of native contributors which the lovers of Art will certainly have hoped to find there. Artists of eminent rank amongst us have refused to be venturers in a lottery which has so many blanks to a single prize. In each such case, the foreign model is obtained by the sacrifice of the English one. To that extent, the effect of the ministerial policy has been, not to enlarge the competition, but only to transfer it to the stranger; and supposing the sense of injury felt to have manifested itself generally—as there has been some danger that it would—in the same form, its effect would then have been, to leave the field to the foreigner altogether. The fact is, the principle that looks to the foreign artist at all for the execution of our national works, however sound it may have been in the days of Charles I., is a false one now, let Sir Benjamin Hall say what he will. To rest it on the footing on which it stood in Charles's time, would be precisely the wrong to the English artists which they resent,—and, through them, to the British public. If Government has charge of the national monuments,—so has it of the native arts. If one of its duties be, to raise and refine the public taste,—another is, to foster the national schools. The people that prides itself in its works of Art, should pride itself in producing them. It were wise policy in a country to encourage the growth of its own artists, were it even at some sacrifice of its Art:—but that is a necessity which in the matter of sculpture does not arise in England. We are under no just temptation, even were it fitting, to ask a Russian architect to build our War Office, or a French sculptor to illustrate the victor of Waterloo. For a monument to the national hero in the metropolitan cathedral, Sir Benjamin Hall might very properly have trusted to the resources of British Art.

To the uneasy feeling from the first entertained by the profession at large, no small addition has been made by rumours that have had their origin no one knows how, industriously circulated by it is difficult to say whom, and confirmed by newspaper paragraphs supplied it may be guessed how. These rumours, in their intrinsic improbability, would have little significance were they not interpreted by previous proceedings, to a repetition of which they directly point. For ourselves, we dismiss them at once. Assuming, as it is only fair to do, that the course pursued by Sir Benjamin Hall in relation to the competition for the new Government Offices indicates that which he purposes to follow in this

matter of the Wellington competition, we can honestly say that it raises every reasonable inference of fair play. We hold it far more just to the Chief Commissioner of Public Works to accept his dealing in the one case as a pledge of his probable dealing in the other, than to admit any rumours whatever which contradict such testimony, and question the directness of his intentions. If, for instance, he shall be as successful in the composition of the tribunal which is to try the sculpture models as he has been in the constitution of that which sat on the architectural designs, (for we are writing before the names of the judges have been made known, though they will have been published, no doubt, before this number is in the hands of our readers), this fact alone should go far towards silencing suspicions which probably would not have taken shape at all in presence of such guarantee sooner given. Why, indeed, in either case the names should have been so long withheld, and why the artists should not have been permitted to work under the feeling of security which a well-chosen body of judges suggest, we yet fail to see; but such a court in this latter case even now would of itself negative the presumption of a job. The architectural commission, for instance, had a representative of the House of Lords, in the person of the Duke of Buccleuch, well known for his judgment in architecture,—and one of the House of Commons, similarly qualified, in the person of Mr. Stirling, the member for Perthshire. Lord Evesley, the late Speaker, was chosen because his long official knowledge made him conversant with the features of accommodation needed in edifices constructed for the offices of administration. Lord Stanhope came into the commission as President of the Society of Antiquaries. Mr. David Roberts, the Royal Academician, on the strength of his grand architectural drawings, furnished the picturesque element to the court; Mr. Burn, an architect of high standing in Scotland, supplied the practical; and the place of Mr. Brunel, the eminent civil engineer, in such a commission proclaims itself. Here, then, was a court constituted, seemingly, with considerable ingenuity as to qualification, and as to character above suspicion. Offices were engaged for its business apart from all the government buildings,—and every means was taken to give to its decisions the appearance of a free and unbiased verdict.—So far as things have yet gone in the matter of the Wellington Monument, there are similar appearances of a free competition and suggestions of an upright award. The artists who chose to avail themselves of the permission, had the arrangement of their own models on the spaces which they severally occupy; and to prevent all suggestion of favouritism in the assignment of such spaces, the works are ranged down the hall in the order in which they arrived there. One most important principle Sir Benjamin Hall has adopted,—as establishing what we have so strongly urged, the inviolability of the laws of a competition. He has had all the models measured on the spaces which they occupy, and every one that exceeds the scale prescribed, is understood to be excluded from the competition. All, we repeat, is satisfactory so far,—and contrasts favourably with some previous doings in matters of a like nature. Sir Benjamin Hall has a great opportunity now before him,—and the qualities for seizing it. A body of judges known to be independent, impartial, and qualified, and the public with him as a jury, will enable him to set at defiance all professional complaints which, by the law of professional human nature, must follow competitions like this, let him conduct and organise them as he will.

The models sent in to Westminster Hall are about ninety in number:—fifty, or thereabouts, being the product of the British chisel, and some forty contributions from abroad. Amongst them are some very fine things, as might have been anticipated; and in the mass—which makes a truly magnificent appearance to a spectator standing on the dais, and looking down the grand old hall—there is an amount of talent lamentable to think of in contemplation of the small amount of it that can be here remunerated. This is one of the evils inseparable from competition on the large scale. As might also have been anticipated, the confectioner will find his account in a visit to Westminster Hall,—and the effects of this exhibition will long be seen at the dessert tables of the rich. We shall give our readers a full account of the works here exhibited in our next number.

THE GOVERNMENT-OFFICES COMPETITION.

THE AWARD OF THE JUDGES.

As it had been anticipated, the close of the month of June brought with it the award of the commissioners appointed to adjudicate the prizes in this important competition; but the middle of the month of July has arrived without the publication of the promised "Report" of the judges upon their own award, and also without the fulfilment of the promise that the prize plans and designs should be exhibited to the public. We had hoped that this award would have explained itself, and vindicated the principles upon which it was made, and consequently we had thought but little of what the judges might have to say in their detailed report; unhappily, however, until this report is in our hands, we are compelled to hesitate before attempting any explanation of the decision of the judges, as we must delay our critical comparison of the selected plans and designs until we shall again have been enabled to examine and study them. The prizes have been awarded after the following manner:—

Design No. 1—BLOCK PLAN.	No.	Premium.
1. M. Cressinet, Paris	12	£500
2. Mr. Hastings, Belfast .. .	189	200
3. Messrs. Morgan and Phipson, London... 128	100

Design No. 2—FOREIGN DEPARTMENT.	No.	Premium.
1. Messrs. Coe and Hoffman, London.....	94	£300
2. Messrs. Banks and Barry, London	58	500
3. Mr. G. G. Scott, London	116A	300
4. Messrs. Dean and Woodward, Dublin ...	35	200
5. Mr. T. Bellamy, London	17	100
6. Messrs. Buxton and Habershon, London. 54	100
7. Mr. G. E. Street, London.....	123	100

Design No. 3—WAR OFFICE.	No.	Premium.
1. Mr. H. B. Garling, London	77	£800
2. M. d'Hazeville, Paris	75	500
3. Mr. T. E. Rothead, Glasgow	61	300
4. Messrs. Pritchard and Seddon, Llandaff. 140	200
5. Mr. C. Brodric, Leeds	20	100
6. Messrs. Habershon, London	54A	100
7. Mr. J. Dwyer, London	126	100

The mottoes are of course given with their respective designs in the official statement, which also contains the following rather curious sentence:—The names, it is stated, "are arranged in the order of merit, as decided by the judges, with the motto and amount of premium which was inscribed on the designs." We are willing to accept the opinion which has been put forth by a contemporary devoted especially to architectural matters, and to express it as our own conviction, that this award has given universal dissatisfaction; that by the profession, by amateurs, and by the public, it is equally regarded with surprise, regret, and no little indignation. We question, indeed, if even the "lucky" recipients of the first and second prizes would not share in the prevailing sentiment, had they to show good cause for their occupying their present positions, and more particularly had it been determined that upon them should rest the *onus* of proving both the general and the specific superiority of their designs over those of prizemen Nos. 3, 4, 5, 6, and 7.

The award itself may be considered conclusive upon this point,—that the judges altogether left out of the question before them such considerations as would bear directly upon the erection of the proposed new buildings. The premiums have evidently been awarded simply for certain designs, because those designs appeared to the judges to be better than the others which, in common with these, had been submitted to them; consequently, after all, it is more than probable that this considerable sum of the public money will prove to have been expended without obtaining any practical result whatever, or even any satisfactory data from which a practical result may be eventually determined; indeed, *as the award stands*, the only thing to be done is to leave the judges to elucidate their own proceedings, and for the public to look forward to the real competition for the actual buildings as being yet to be begun, otherwise most "lame and impotent" indeed would be the "conclusion" in this *grande certamen*.

While we leave for future consideration all the more detailed notices which it may appear to be desirable for us to make upon the prize designs, we may now briefly remark in general terms upon the course which has been adopted by the judges with

reference to the four Gothic designs, respecting which we have already expressed our sentiments freely and at some length. The four appear in the prize lists, three of them having the third, fourth, and seventh premiums in one list, and the fourth having the fourth premium in another list. The excellence of these designs thus compelled a recognition from the judges; but are we wrong in surmising that, being Gothic, the judges were determined not to admit the absolute superiority of these four designs over all their fellow-competitors? To admit the claims of the four (we prefer to deal with them as a noble fraternity) at all is virtually to admit their supremacy in the competition, as we shall show when we come to deal with them in comparison with the designs which have been pronounced their superiors. The adversaries of Gothic Art affect to consider the position occupied in the award by the "Gothic four" as equivalent to a triumph for their own favourite, the Classic Renaissance; we believe that, in reality, they feel the deepest mortification at the presence of the Gothic designs in the prize lists in any positions whatever; while, on the other hand, the friends of the Gothic can afford to smile at the manner in which the judges have hoped to extricate themselves from the difficulty occasioned by the superiority of the Gothic designs, being quite satisfied at having obtained a decision as to what that kind of architectural composition is to which the Gothic is expected to yield the palm. Now that we know to what style of architecture and to what class of designs first and second premiums are awarded, we know also the precise and definite conditions under which the Gothic now has to carry on the contest. The "Gothic four" also know the *leaders* of the hostile array, and we do not suppose that they feel much disheartened at this discovery. But will the Classicists and the Renaissance faction recognise Messrs. Coe and Holland and Mr. Garling as *their* leaders? It would have been well had Gothic Art been placed in its proper position at once in this competition; yet we are satisfied that it will prove much better for that great art that in the first act of this competition it should have been dealt with as it has. The opponents of the Gothic have put forth their strength, and in so doing they have both unmasked their resources and declared their standard of excellence; as the contest proceeds they will learn the nature and the capacity of the Gothic *reserve*, which has not yet been brought into action.

ART IN CONTINENTAL STATES.

PARIS.—The present *Salon* here has been compared by the press generally to a large picture-dealer's shop; and this is not an undeserved comparison: 3474 numbers are in the catalogue, of which 2715 refer to paintings and drawings; but a total absence of celebrated names, with the exception of Meissonier, Winterhalter, and H. Vernet, makes it a laborious and difficult task to select from such an immense mass of artistic productions what are really worth noticing; yet even these are almost all of a minor degree in the scale of Art. We miss from the exhibition the great supporters of the French school—Ingres, Delacroix, Rosa Bonheur, Troyon, Jules Dupré, Diaz, Decamps, Brascassat, Lehmann, Aligny, Gudin, Coignet, &c. &c. Moreover, there is almost a total absence of large historic pictures, the contributions being principally small cabinet works, manifesting more of manual facility than depth of thought: indeed, this facility of execution seems the principal aim of the present French school. Of the few painters whose works arrested attention, and inspired a desire to see them often, we may point out those of a young painter who has already attained a high reputation, M. L. Knaus, a native of Wiesbaden: he exhibits two of the best works. The Belgian painters are also strong in talent and number. Among the French, H. Vernet has displayed his usual talent; Meissonier's eight small paintings are very exquisite in execution, but, like most of his, and of the school he has created, the subjects have little interest, being simply figures standing upright, looking at the spectator, smokers, &c. Benouville and Cabanel, historical painters, exhibit some very interesting subjects, cleverly treated; the pictures by Jerome, Courbet, L. Boulanger, Ph. Rousseau, Flamin, and Dubufe, must not be overlooked. Notwithstanding the severity with which the jury exercised its powers of rejection, there are at least 1500 paintings too many.

The sculpture, which is not remarkable, is distributed in the main portion of the *Palais*, on the ground-floor, which is left as it was prepared for the flower-show, and produces a beautiful effect; the small river, swans, green trees, and flowers, make it a beautiful retreat.—The sale of Delaroche's pictures closed the season. The sum of 240,500 fr. was realised by their sale; and a further sum of 65,000 fr. by their exhibition: of this latter amount 20,000 fr. will be presented to the *Caisse de la Société des Artistes*.—Two immense statuary groups, twenty feet in height, are now being executed by M. Prévaut for the Old Louvre; the subjects are 'Peace' and 'War.'—M. E. Robert is at work upon a statue of Geoffrey Saint Hilaire, and M. A. Barre upon one of Mlle Rachel.—On the last visit of the Queen and Prince Consort to Paris, her Majesty presented to the city of Paris the marble busts of herself and the Prince: since that period the Kings of Sardinia, Portugal, and Bavaria, respectively, having visited Paris, the Council has decided that their busts be placed in the *Hôtel de Ville*.—Four statues are to be placed at the corners of the *Pont de l'Alma*, and will represent a Zouave and a soldier of the line, by M. Diebolt; an artillery soldier and a chasseur on foot, by M. Arnaud.—The Chapel of the Virgin, at *S. Philippe du Roule*, is to be decorated by M. Claudius Jacquand.—The large painting by the late M. Chassériau, representing the 'Defence of Gaul,' has been purchased by Government.

MILAN.—The Marchese Spinola has presented to the Royal Academy of Arts in this city a Madonna by Raffaele, for which he has paid £100. It is of great richness and beauty, and may have been painted about the same time as the Madonna di Foligno. A few years ago it was sold for 16 francs, together with the clearings of a house which had just been vacated, and was then in four pieces. It is now in the Academy, and is the admiration of all who see it. The Madonna is represented standing, and removing from the child the veil under which he has been sleeping.—It has been reported that Da Vinci's 'Last Supper' has been repainted and restored; but this is not true, the picture remains undisturbed, and just as it was after its restoration by Baresi. The report may have originated in the proposal to clean and repaint the refectory, which was in an extremely dirty state.

COLOGNE.—A subscription is in course of signature for a statue of King Frederick William III. of Prussia, intended to be placed in Cologne; at the head of the subscription list are the names of the Prince of Solms-Braunfels, the Prince of Wied, the Baron Waldbott-Bassenheim, Count Fürstenburg, &c. &c.

ART IN THE PROVINCES.

EDINBURGH.—Probably it will be in the recollection of many of our readers that, about the middle of last year, we directed attention to an institution then in progress of formation in Edinburgh; the object of which was to encourage Art-Manufactures by means similar to those employed by the various Art-union societies to encourage the Fine Arts. The project has been so favourably received by the public, that, on the 21st of last June, the members of, and subscribers to, the "Art-Manufactures Association," as the society is called, held their first annual meeting in Edinburgh, to receive the report of the committee, and to distribute the prizes. The chairman of the meeting, Sir John Macneil, G.C.B., who was among the earliest supporters of the association, and is one of its vice-presidents, stated that thus far its success had exceeded the most sanguine expectations of its promoters. He alluded in terms of especial satisfaction to the number of persons, the majority of whom were of the working classes, who had attended the evening exhibition of the manufactured works which had been collected from all parts of the country, and from many places on the Continent. "Perseverance in this course," he said, "must tend to produce an important elevation in the taste, and also in the character as well as the taste, of the working classes." During the six weeks when the exhibition was open, the number of ordinary admissions in the daytime was 17,457, and in the evening 17,806. The number of season tickets was 1767: to these must be added those admitted to the dress promenades, and to the several lectures on the subject of Industrial Art, delivered respectively by Dr. Wilson, F.R.S.E., A. A. Wellwood, Esq., C. H. Wilson, Esq., A.R.S.A., and A. Christie, Esq., A.R.S.A., honorary secretary to the association. The number of subscribers on the past year's list was 5333, the amount of their subscriptions £5489: the receipts derived from the exhibition, including those realised by the sale of tickets for the lectures, amounted to the sum of £1445 19s. 9d. The committee expended £3000 in the purchase of objects

of Art-Manufactures for distribution among the subscribers; the preliminary expenses attending the organisation of the association, the establishment of upwards of three hundred agencies throughout the kingdom, the cost of providing larger show-cases, fitted with plate-glass, for the exhibition of works lent and purchased, must be set against the balance that remains: of course these expenses will not have to be incurred a second time, so that a much larger proportionate amount will in future be invested for the benefit of the subscribers. The objects selected as prizes may be divided into the following classes:—1. Gold and Silver work, Jewellery. 2. Works in Electro-plate. 3. Works in Crystal and Metal. 4. Crystal and Glass, white, engraved, cut, and coloured. 5. Pottery, including China, Parian, &c. 6. Carved work in Wood, Horn, and Marble. 7. Textile Fabrics, as shown in Shawls. These productions were purchased from manufacturers in London, Paris, Vienna, Frankfurt, Birmingham, the Potteries, Glasgow, and Edinburgh. The "Art-Manufactures Association," though but one year old, must be considered as an established society; it must grow and increase when a knowledge of its existence becomes more widely circulated: at present such knowledge seems to be almost limited to Scotland, judging from the names and residences of those to whom the chief prizes, 180 in number, were allotted; very few of the prizes came south of the Tweed, obviously for the reason that very few of the subscribers lived on this side. It is expected that next year the committee will feel themselves justified in having an exhibition in London of the works purchased for distribution. In conclusion, we may remark, that the plan of this society, like that of the Art-unions, is to give every subscriber of one guinea annually some good example of ornamental Art-manufacture, and to those who are so fortunate as to have prizes allotted to them, a work of greater value in silver, gold, parian, glass, &c.: some of those distributed at the "drawing" in June were very costly. There is one object the association has in view which must not be lost sight of, as it is this which principally forms its claim as an "encourager" of Art-manufactures: prizes are awarded to competitors in design and manufacture.

The prizes for competition drawings, paintings, and models of the students attending the Edinburgh School of Art, were delivered at the National Gallery in Edinburgh, on the 29th of June. In the ornamental and architectural department, Mr. Christie reported that the number of students who attended the classes in this department last year was 411: the number this year is 225, showing a decrease of 186. But as there were no day-classes last year, the number attending these must be deducted as follows:—male class, 11; female ditto, 50—total, 61, making the actual decrease 247. This decrease appears to be entirely owing to the adoption of the system of charging fees, but is not more than was anticipated. Twelve students have been transferred during the session from this department to the Antique, being three more than the amount of last year. The class of Practical Architecture has increased from 11 to 16, while the class of Composition has maintained its numbers, so that the falling off has not taken place in the advanced classes. The result of the trial of the Geometry shows the necessity of extending the education of the students in this direction. In the Antique Life and Colour Department, Mr. R. S. Lauder reports that, in consequence of the system of students paying fees being adopted, the number has decreased more than one half during the last sessional year. This is an unfavourable omen; it seems that there are numerous individuals willing to receive instruction, provided it costs them nothing.

SALFORD.—The subscribers to the memorial of Mr. J. Brotherton, late M.P. for this borough, have decided upon erecting a monument over his grave in the Salford Cemetery, and a bronze statue of the deceased, on a granite pedestal, in Peel Park. Mr. Noble has received the commission to execute the latter work, for which, we hear, he is to be paid 1000 guineas: this sculptor appears to be in high favour at Salford; recently we noticed his statue of the Queen, lately erected in Peel Park.

MONTROSE.—The inhabitants of this town—the birthplace of another active member of the House of Commons who has "rested from his labours," the late Joseph Hume—are raising subscriptions for a monument to his memory, to be erected in Montrose: the sum of £500 has already been collected, and two or three artists have been applied to for designs.

DUNFERMLINE.—The School of Art in this town is about to be closed, if it is not so already; the cause, we believe, being the entire want of support and interest manifested by the inhabitants. Mr. Baker, the master, will transfer his services to the High School of Scotland.

RUSKIN ON DRAWING.*

WHATEVER may have been thought, said, and written about Mr. Ruskin's teachings and theories, no one will, or ought to, question his enthusiasm with regard to Art, and his earnest desire to see a love of it, and a knowledge, take deep and wide-spread root among all classes of the community. To this end he has laboured ardently and perseveringly in spite of the indifference of artists and the hard words of the critic: all the faculties of a reflective, studious, original, and deep-thinking mind—all the powers of a subtle and poetical imagination united with eloquence of expression, he has employed for what he seems to have made the great business of his life. One may dissent from his opinion, may deny his orthodoxy, regret the tone of arrogance he too often assumes, and laugh at his apparent puerilities as an Art-teacher; but he who can read his writings without becoming better and wiser, either as a man or an artist, must be as dull of perception as he is insensible to the power of language. Mr. Ruskin has not always proved, and even now does not altogether prove, himself to be a safe guide through the realms of Art; but his very waywardness is not without instruction, and he is always one whom it is pleasant to follow, even through his discursive wanderings; all that he writes leaves something for the mind to ponder over and meditate upon: there never, to this day, has been an original thinker who did not make himself amenable to the charge of indulging in peculiarities that many could not, or would not, understand.

From his endeavours to lead the trained and practised artist from the path he has long followed into another—from criticising "Modern Painters," and writing eloquent dissertations upon the architecture of past ages—from diving into the almost impenetrable recesses of Art, as exhibited in the days of Cimabue, Giotto, and Giovanni da Piesole,—Mr. Ruskin has undertaken the self-imposed task of becoming the instructor of those who may hereafter shine as lights in the British School of Painting: he has written a small volume on "The Elements of Drawing," intended not for children, but for young persons old enough to think and reflect. "The manuals at present published on the subject of drawing are," he says, "as far as I know, all directed to one or other of two objects. Either they propose to give the student a power of dextrous sketching with pencil or water-colour, so as to emulate (at considerable distance) the slighter work of our second-rate artists, or they propose to give him such accurate command of mathematical forms as may afterwards enable him to design rapidly and cheaply for manufactures. When drawing is taught as an accomplishment, the first is the aim usually proposed, while the second is the object kept chiefly in view at Marlborough House, and in the branch Government Schools of Design."

"The chief aim and bent" of Mr. Ruskin's system is to obtain, first, a perfectly patient, and, to the utmost of the pupil's power, a delicate method of work, such as may ensure his seeing truly. For I am nearly convinced, that when once we see keenly enough, there is very little difficulty in drawing what we see; but even supposing that this difficulty be still great, I believe that the sight is a more important thing than the drawing; and I would rather teach drawing that my pupil may learn to love Nature, than teach the looking at Nature that they may learn to draw. It is surely also a more important thing, for young people and unprofessional students, to know how to appreciate the art of others than to gain much power in art themselves." The feelings expressed in these latter passages, the whole of which are taken from the preface, form the keystone to the system developed in this volume, and from them may be gathered an accurate idea of the entire superstructure the author has raised up.

The treatise is divided into three parts, or letters, as Mr. Ruskin terms them; the subjects of each respectively are,—"First Practice," "Sketching from Nature," "Colour and Composition." Every one acquainted with the views and principles promulgated by the author, will naturally expect that the system of instruction advocated by him must differ from that of every other teacher; and it is so in his manual. Arguing from his own premises, that all great and good Art is delicate Art, and, on the contrary, coarse Art is bad Art, he recommends his pupils to take a finely pointed steel pen, a piece of cream-laid, smooth note-paper, and "some ink that has stood already some time in the inkstand,

so as to be quite black, and as thick as it can be without clogging the pen." With these materials the scholar is to go to work to cover in a square inch of his paper "with crossed lines, so completely and evenly, that it shall look like a square patch of grey silk or cloth," the object being to produce an even tint. Now we have instanced this first lesson on no account for the purpose of casting a sneer at the exercise, trivial as it would seem to be, but to show how Mr. Ruskin goes to work to teach his pupils, and as an example of the instruction carried through the whole of his book.

Perhaps, therefore, many will be induced to say it is not worth studying: this would be a great mistake. We certainly might not care to be among the number of his disciples, if forced to follow his system, but we are equally certain that no one can carefully study his work without learning much he ought to know, and without deriving a far more elevated perception of Art than most publications of similar character give. We object to his practice rather than to his principles, for he is an uncompromising student of nature, loving her so ardently and religiously that he will not allow the smallest fragment of her manifold beauties to pass unheeded or to be misrepresented. Who, then, that also loves Nature and Art would quarrel with Mr. Ruskin for his enthusiasm? even though it causes him, as it does, to adopt extreme views.

There are, of course, many opinions expressed from which we dissent; we have neither space nor inclination to point them out, being only too glad to meet such a writer as he still exerting himself in the cause of Art; he has not, and will not, labour in vain: another generation will, we are assured, reap a harvest of greatness from his teachings, when the world has learned to accept the good and reject the pernicious.

THE TEMPEST, & KING RICHARD II.,

AT THE PRINCESS'S THEATRE.

SINCE last we gave our readers any detailed account of that extraordinary succession of performances at the Princess's Theatre which constitute to themselves, as we have said, a separate and emphatic chapter in the history of dramatic representation in this country, two others have been added to the series; and it is increasingly incumbent on an Art journal like ours to keep some formal record of doings which are becoming more and more an established and familiar topic in the world for which we labour. Mr. Kean's version of "Richard II." we mentioned at the time of its appearance,—promising to return to it for more particular appreciation at a later time; and on the first of the past month Shakspeare's play of "The Tempest" was produced at the same house. In each of these two pieces the manager has one more triumphant argument to show for the value of the purposes to which he is devoting his stage.

When, in January last, our readers followed us into the scene which this manager peoples with successive marvels, his stage was in full possession of the fairies, and we spent with them the hours of a winter's night in watching the moonlight revels of these "beings of the mind," and seeing, as it were, through the mists of elf-land the strange bewildering human accidents of a "Midsummer Night's Dream." Then, the fantastic and factitious troubles and entanglements which Puck's blundering created and Oberon's beneficence could cure, gave place to the passionate and cruel sorrow of the deposed Richard, and the ground which the fairies had haunted, and the moon watched, was swept, instead, by the pageantrics of mediæval chivalry, and kept by the man-at-arms. Now, we have once more exchanged from historie to haunted ground,—from the stern realities of tragic story to "such stuff as dreams are made of." Mr. Kean's art has recovered the buried book and broken wand of Prospero; and just as Shakspeare knew her, Ariel, that most delicate of all the spirits that poetry has baptised, is submissive to his call. In each one of these latter two highly coloured and strongly contrasted pieces in its kind, Mr. Kean has surpassed everything that even he had achieved before. The realities of English life in the fourteenth century, and the realities of dream-land, so to speak, are alike produced in them with a force, a splendour, and a charm, for which his own previous marvels in this kind afford insufficient parallels.

Never before, we repeat, was archæology so elaborated for dramatic purpose as in the Princess's version of "King Richard II.," and never before out of elaboration came such actual graphic and emphatic life. If archæology be, as has been said, the dry bones of history, in Mr. Kean's hands "these dry bones" do verily and undeniably *live*,—live with their own glowing, peculiar, and many-coloured life. So completely, in this piece, was the attention absorbed by the striking character of the general truth, that it failed, even after repeated attempts, to apprehend the countless minute truths of which *that* was composed. The gorgeous nature of the whole result is a necessary interference in the presentment of a life in whose external modes and manners splendour is itself a truth; and from the glittering spectacle and the picturesque grouping it was difficult at the time of representation so to detach the mind, as to enable it to perceive how every accessory, no matter how small and seemingly insignificant, was an historic note. Scenes, manners, and costumes were alike annotated, as if a whole college of antiquaries had set about the task. The student had never before such an illustrated book of the times in question. Not a badge on a banner, or a bearing on a shield, but had the herald's sanction. Not a property, from the kneeling harts and broom-pods of the unhappy Plantagenet and the ostrich feathers of old John of Gaunt, to the party-coloured garments of the pages, but was a document. Not an act of motion even, or a point of bearing, but had its distinct authority. He who witnessed the performance of "King Richard II." at the Princess's Theatre was for a night bodily amongst the barons. All these details sound, as we state them, prosaic enough: but it must be remembered that, collected by the archæologist, they were handed over to the artist. The dust was shaken away from the dry facts of antiquity, and these were arranged into pictures. The care that hunted up even the prosaisms of the past, compelled them all to the service of a poetry of its own. The lists on Gosford Green, near Coventry, with the old chivalry brought back to life for the occasion,—the Wilds in Gloucestershire, filling first, and swarming finally, with the army of Bolingbroke,—and the room in Ely House, where old John of Gaunt, amid all the pomps and cognizances of his princely rank, lay face to face with that great Shadow whose presence proclaimed their vanity, were all such scenic presentments as are seen only at this house:—presentments in which, if truth had collected the materials for the service of beauty, beauty more than paid back all her debt to truth.—But there is one particular effect in this piece which, for the sense of reality that breathed out of its material picturesque, and informed it back again, transcended everything of the kind that the stage has yet had to show. That well-known passage in which the Duke of York so touchingly describes to his duchess the entry into London of the unhappy Richard, in the train of Bolingbroke, Mr. Kean had, by a daring and wonderfully successful licence, borrowed for interpolation into its place in the action, for the purpose of embodying it as an episode between the third and fourth acts. The passage has been illustrated again and again,—by all the arts,—but never has it had an interpreter like this. The stage actually heaved and palpitated in this scene with the life of the middle ages. In one of its ancient streets, yielding long vistas up others, the mob—the real living mob—of four hundred and fifty years ago were gathered together to await the coming of the captive king. From ancient house to ancient house the street was hung with garlands, as was the manner of that ancient time. Window, and roof, and balcony, and temporary platform, and every point of vantage, and points that offered none, were all crowded with spectators and alive with the movement which they made. The swarming crowd below were swayed to and fro at once by the passions and by the pastimes of the day. The sports and the street temptations of the age had taken their accustomed advantage of the opportunity. The juggler plied his trade among the holiday people, and the morris-dancers, under its more ancient form of the "Dance of Fools," enacted their mystery. The sense of multitude and the sense of space were wonderfully awakened and kept alive. The roar of the popular heart swelled up and floated on the air; and high over all rang out the clamour of the bells—real old

* THE ELEMENTS OF DRAWING; in Three Letters to Beginners. By John Ruskin, M.A. With Illustrations drawn by the Author. Published by Smith, Elder, & Co., London.

bells—just as they might have rung through old London five centuries ago. No words can describe this marvellous resuscitation:—but into this human storm, on "his hot and fiery steed," rides Bolingbroke, "bareheaded," and bending to the popular welcome "lower than his proud steed's neck;" and into this storm rides Richard, bearing on his brow "the badges of his grief and patience," and taking from his people no other welcome than the "dust" that "was thrown upon his sacred head." The scene and its passions—its craft, and its cruelty, and its sorrow—all were here before us.

From this most graphic and picturesque revival of the stormy scenes and passions of our own old historic time, "The Tempest," as we have said, brings us back into the region of the haunted and the ideal. The two pieces lie at the opposite poles of dramatic purpose, and Mr. Kean is an equally successful explorer of both. We said, when Mr. Kean announced the "Midsummer Night's Dream," that, with the high standard which he had set up for himself in his reproduction of facts, we feared he might be rash to venture on ground so purely imaginative and spiritual; and in the present case what was to be feared was, that having on that occasion found a way into dream-land, he should, by too close a repetition of himself, now betray the limited character and amount of the material resources at a manager's disposal for breaking into that haunted land. It is, on the contrary, the peculiar triumph of the present piece, that it does not bring us under the identical spell that summoned the shadows of that immortal midsummer's night. The physiognomy, so to speak, of spirit-land, is as distinct in Mr. Kean's versions of these two several pieces as Shakspeare made it. In Shakspeare's dream-land there are many kingdoms,—and Ariel and Titania are of different race; and a result of Mr. Kean's contrivance is, to mark as sensibly all the differences between them as the one point of supernaturalism which they have in common is marked. Under the moonlights of the "Midsummer Night's Dream," at his theatre, we met our old English fairies—the fairies that left their rings in the meadows of our childhood, and round its heart,—translated by Shakspeare, for his purpose, to the court of Theseus, as he had a right to translate them, because he had power over the fairies, and might do with them what he would,—and somewhat classicalised, it may be, by the new atmosphere in which for the time they had to move. "The Tempest" introduces us to a race of spirit-creatures discovered by Shakspeare himself on a lonely island of the Mediterranean,—lost since, and for ever to its charts, like the land of the Fata Morgana, but of which a wondrous representation may be seen at the Princess's Theatre. The curtain rises on a stage converted into a sea, with the ship that bears the Italian princes tossing, at the footlights, in the storm, and Ariel doing his mission of fire from spar to spar. This is made a sort of Prologue to the piece:—preceeding even the overture, and introducing the human element, by the seeming wreck of the good ship that cuts it off from the world, into the strange wild spirit-accidents of the scene. From the moment when the curtain rises again on the hulling waters, we are wandering through a maze of enchantments. Invisible beings are around us everywhere. The air "is full of noises and sweet sounds, that give delight;" the caves and the cliffs are haunted. Spirits moan in the storm or wail through the basalts. The features of the island transfigure themselves before our eyes. And over all, there is the one sense of a magical compulsion, clearly made out and emphatically pronounced, and strongly distinguishing the supernatural action of this piece from the spontaneous supernatural of the fairies in the "Midsummer Night's Dream." But the pervading charm of this piece is Ariel:—and here we have a good instance of the manner in which Mr. Kean secures his effects by an intelligent use of his materials. The Ariel of Shakspeare has both to fly and to sing:—incidents common enough to a spirit, but very difficult to get in combination from a full-grown lady. To secure the one attribute, managers have generally been content to accept an amount of bone and muscle quite incompatible with the more characteristic presentment of so elemental a creation. Mr. Kean resolves the difficulty very simply. The musical part of the spiriting he procures to be done by a competent angel, in that respect, out of sight; and

Ariel, disencumbered of his burden of song,—which out of dream-land has a physical and ponderable relation,—is left free to use his wings. And so, we have him everywhere,—on the earth and in the air,—from the moment when he falls out of the latter a meteor of fire, and springs up on the former a winged spirit, to the moment when he hangs in sunshine over the sea, and waves his farewell to the disenchanted ship sailing back to Naples. On every side, at the call of Prospero, he comes like a sudden revelation. The aloë expands its leaves and lets him out. The tree bows down its branches, and he is there as the spirit of its homage. He floats to earth like a dream, and rushes skyward like a thought. Everywhere, too, when he appears, he is revealed in an atmosphere of light, which seems an emanation of his own inner nature. By this restoration to the piece of Ariel in something like his transcendental integrity, were there nothing else, we feel, at the Princess's, that we are under the spell of Prospero, and of a magician more powerful than Prospero, and are walking in the body on that actual enchanted island which Shakspeare drew.

Such is the spirit of this reproduction; but of the separate scenes that make it up we can give no adequate account in words. A scene of Nereids sporting in their own element—dancing, with naked feet, down the waters of a cascade—may match as a marvel of beauty with that of the fairies dancing with their own shadows, in the "Midsummer Night's Dream." The manner in which the beauties of this matchless scene grow before the spectator's eyes out of a sterile landscape is a marvel in itself:—and at this point of the piece the enchantments are crowded. The formation of the banquet offered to the weary princes is a triumph of pictorial beauty and mechanical arrangement; and its disappearance, untasted, at the touch of the harpy, is succeeded by an interpolated dance of spirits. Mr. Kean, who seeks to elevate his pieces by all the influences that are within his power, omits no point of classical illustration that comes within his reach. In this piece, besides the dance of the Nereids, already mentioned, we have a vision of Iris, in a view of Eleusis and its temple; a revelation of Ceres and her attendants; and a descent of Juno in her car, drawn by peacocks, with the Graces and the Seasons around her. This is the Masque which Prospero conjures in the fourth act; and the vision of Juno and her accompanying deities hanging in mid air, while it rivals in respect of grouping the similarly produced effects in "Faust and Marguerite," and in "Henry VIII.," in brilliancy of colouring exceeds them all. One effect in particular there is in this succession of effects which is charming. Iris herself is not clad in the colours of the rainbow. She is not the rainbow in its effects, but the rainbow in its essence:—not the rainbow proper, but the Spirit of the rainbow. Iris is here an angel clad in white garments, with wings that in the sunlight look golden:—and she flings the rainbow behind her. Here is philosophy made poetry by the property-man. The rays prismatically resolved upon the cloud, are re-collected into the white light which is their essence in the angel herself. This is the transcendentalism of scene-painting; and, altogether, stage mechanism has probably never been employed to such fine effects as in this act of this piece.—The last effect of all in this marvellous reproduction seems to us, to embody a finer essential poetry than ever before was rendered by mere scenic art, and leaves us, at the close, under the full power of the Shakspeare spell. The air of the island has been ringing with the exulting song—

"Merrily, merrily shall we live now,
Under the blossom that hangs on the bough—"

of the emancipated spirits,—freed from their service by the departure of Prospero and his spell. But, as the ship sails away, Ariel, clad in his own essential light, as in a garment, but with a touch on his face of human regret for the master whom he has learned to love, and is losing for ever, hangs, as we have said, over the sea, waving his farewells to Prospero as he stands upon the deck looking fondly back to the spirit that has done him such faithful service. The curtain leaves the spirit there, hovering over the waters in the track of the receding vessel, as if loth to return to his freedom on the island, thus again for ever cut off from the world of living men.

Before bringing our remarks on these two revivals to a close, we must offer a few words of comment on a question which has been raised as to the propriety of this large amount of Art-illustration applied to the works of the dramatic poet in general, and of Shakspeare in particular. The objection proceeds on an intimation that the poetry of the scene-painter is by it substituted for the poetry of the poet; and that he who undertakes thus to illustrate Shakspeare assumes to supplement him. Without insisting here on the not very flattering want of faith in Shakspeare on the part of the objector himself, when he hints at the possibility of the mechanist thus putting out the poet, we confess we do not see how he is to maintain his argument, unless he forbids the use of scenic illusion altogether. What the manager does in this respect constitutes the exact difference between stage representation and closet reading; and if he may assist the illusion of his text at all by material realisation of the times and places at which the text hints, why may he not do so on a sufficient scale? Where will the objector divide the principle, or draw the line of its application? Let us take Mr. Kean's version of "King Richard II.," to which, as we have said, there has been applied an unparalleled amount of that archeologic illustration to which the argument on the other side objects. Now, surely, the passionate and peculiar sorrow of King Richard, as Shakspeare has uttered it by his verse, is strongly emphasized as being relieved against its own especial background of the middle age, thus carefully reproduced. If Mr. Kean has succeeded so completely as we have described in placing us amid the realities of time and place in which the action is laid, surely the mind is by that very actuality harmonised and attuned to the mood necessary for the full enjoyment of the immortal text. In the closet the mind itself can do all; but where the appeal is also to the eye and the ear, whatever is discordant with the written theme will mar its effect, and whatever is deficient is itself a discord. Shakspeare's own habit of minute painting by incident, as well as by passions, seems itself to furnish so many points of appeal to those who have charge of the visible part of the presentment,—and furnishes at any rate so many points of opportunity. It is true, Mr. Kean, by his mode of getting up this piece, sinks a portion of his own personality:—not commonly a fault with actors. If he is content to let the impression made on his audiences be composed of the sum of a variety of influences employed, without marking prominently and distinctly how large a contribution is made to the whole by his own fine acting, he makes a sacrifice of himself to his worship of the poet, which demands a large return of public appreciation. But he has subjected his own acting, at the same time, to the most stringent tests. So completely has he prepared his audience, for instance, in the Episode scene of Bolingbroke's entry into London, by his vivid presentment of its living features, and of the minor passions moving therein,—that if when he himself rides into the midst of them, the impersonation of the one great and master sorrow of the piece, he were a single shade below the demands of the poetry, it would be instantly felt by his audience as a discord. The immortal verse triumphs, of course, through all, when duly rendered: and we can truly say, as the result of Mr. Kean's acting, and of the frame in which he set it, that never before did we so completely feel the passionate pathos of the part as at that moment, or fall more completely into the fitting tone for the after-moralisings of the broken-hearted monarch. They who witnessed, too, the passion of Mrs. Kean's parting-scene from Richard,—the manner in which her strong agony brought out the tragic element, and of a little part made a great one,—should not say that, in the care for all things bestowed on this piece, care for the poetry of Shakspeare has not been, as it should, greatest of all.

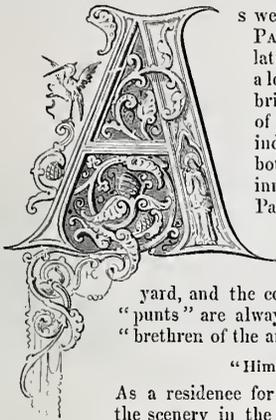

Once more we say, that, while the stage of our day and country is for the most part given up to frivolities, there is a purpose in all this which renders the management of Mr. Kean remarkable in the story of its vicissitudes; and his success in the present phase of that management will give us confidence to follow him into any new one to which the change of manners or the progress of mind may invite him.

THE BOOK OF THE THAMES,

FROM ITS RISE TO ITS FALL.

BY MR. AND MRS. S. C. HALL.

PART VIII.

As we have said, the villages of WHITCHURCH and PANGBOURNE—the former in Oxfordshire, the latter in Berkshire—are twin villages, united by a long, narrow, ungainly, yet picturesque wooden bridge, from which pleasant views are obtained of the river, both above and below. There are, indeed, few prettier localities on the Thames: both have their venerable churches, their homely inns, of which the more “ambitious” is at Pangbourne; but here the angler may seek and find comforts in the little way-side “public” introduced into our sketch, which pictures also the weir-fall, the foreground timber-yard, and the cottage of the fisherman, John Champ, whose “punts” are always ready, and who is in high favour with the “brethren of the angle,” being

“Himself as skilful in that art as any.”

As a residence for a time, Pangbourne has many attractions: the scenery in the neighbourhood is very beautiful; the hills are high and healthful, and command extensive views; the place is sufficiently retired, for although the Great Western Railway runs “right through it,” visitors are few, except those who take the shortest cut to the river-side, and make the most of a morning “pitch” beside the water-plants, which here grow in rich luxuriance, and where the perch abound.

PANGBOURNE.

Pangbourne was held, according to Domesday-book, by Miles Crispin of William the Conqueror. Its manor and church were afterwards granted to the Abbey of Reading, as appears from the confirmations of the charters of Henry II., its founder, by Hubert, Archbishop of Canterbury, and Robert,

WHITCHURCH.

Bishop of Sarum. Pangbourne afterwards formed a part of the possessions of Edward, Duke of Somerset, who was executed in the year 1553, in the last year of Edward VI. It was then granted to Sir Francis Englefield by Queen Mary; and he, becoming a fugitive, it reverted to the crown, “as ap-

pears from an explication of the Inquisition for the finding of him.” The reversion of the mansion and manor of Pangbourne was granted by Queen Elizabeth to Thomas Weldon, cofferer of her majesty’s household. The house is mentioned by Leland as a fair manor-place, that had belonged to the Abbot of Reading. The village, however, has preserved few or none of its antiquities; the visitor will seek in vain for traces of its earlier renown, although he may pleasantly muse and dream of its former greatness, while lulled to repose by the murmur of the “fall” that now gently, and now angrily, gives voice to the waters as they make their way through the weir.

The floral enrichments of the water-side, which have afforded us so much interest and pleasure during the whole of our river voyage, still maintain their luxuriance. A glow of rich purple greets our eyes even from a considerable distance, wherever the Purple Loosestrife (*Lythrum Salicaria*) predominates. The tall spikes of handsome flowers are so large and conspicuous, as to form a prominent feature for the artist to introduce into the foreground of a river-scene, its warm colour rendering it particularly valuable for that purpose. We may not be weary of repeating advice to the artist whose task it is to design for manufacturers, to resort for models to this rich store-house of natural graces and beauties. The weeds of the field, the lanc, and the hedge-row are, indeed, fertile suggestions; but they are far better known than those of the water-side, which are truly but “flowers out of place;” not only in form, but in colour will they be found practically useful—in bud, in blossom, and especially in leaves; and inasmuch as many of them are climbing or creeping, they may be applied to a hundred purposes of which the ornamentist has hitherto little thought.

“Not a leaf, a flower, but contains a folio volume;
We may read, and read, and still find something new,
Something to please, and something to instruct.”

The Yellow Loosestrife (*Lysimachia vulgaris*), which we meet with so abundantly on the banks of the Thames, is interesting for the beauty of its yellow flowers, which have a fine effect when contrasted with its usual companion the Purple Loosestrife, and also on account of the singular property attributed to it by the ancients of taming ferocious, and reconciling discordant animals, whence they derived its name of *Lysimachia*, of which the English “Loosestrife” is a literal translation. A quotation on this subject from Parkins, the old herbalist, may be amusing to our readers: describing the plant, he speaks of its “taking away strife or debate between beasts, not only those that are yoked together, but even those that are wild also, by making them tame and quiet, which, as they say, this herb will do, if it be either put about their yokes or their necks, which, how true, I leave to them who shall try and find it so.” Whether the operation of this invaluable specific be or be not extended to the human race the author does not state; amid the calm and tranquillising solitudes of the upper Thames it may not be required, but of a surety its application is very often desirable somewhat lower down.

Continuing our voyage from Pangbourne—a line of undulating chalk hills on the immediate left, and an uninterrupted tract of flat meadow-land stretching for two or three miles along the opposite bank—we soon arrive opposite Hardwicke House, seated on the slope of a wooded height above the river. It is a large gabled structure of red brick, situated on a terrace of earth raised considerably above the river, upon which are many shady bowers of old yews cut into fanciful arcades. It is so little altered from the time of its erection, that it seems to carry back the spectator to the era of our great civil war. Here Charles I. spent much of his time during the troublous period that preceded his fall, “amusing himself with bowls” and other sports.* On the fine

* No nobleman’s mansion was considered complete, at this period, if it were not provided with a bowling-green. Our little cut exhibits the game as played in the time of Charles I., and is copied from an Italian print, by Rossi, dated 1647. The sport is said to have originated in England; and the earliest traces of it are to be found in manuscripts of the 13th century. Covered alleys were afterwards invented for the enjoyment of the game in winter; and it was looked upon as a gentlemanly

PURPLE LOOSESTRIFE.

THE YELLOW LOOSESTRIFE.

lawn between the house and the river are some noble specimens of eedar, oak, and elm-trees, that, judging from their great age, must have been witnesses of the alternate sports and apprehensions of the sovereign. A little further, and we arrive at an assemblage of choice picturesque objects, such as are not often met with even singly, and are very rarely encountered grouped together into one rich picture as we here find them. At one view we have MAPLE DURHAM ferry, lock, and weir—the mossy old mill embosomed in rich foliage, from which again rises the grey church tower, behind which, though almost hidden by lofty trees, we see the turreted outline of Maple Durham House, forming altogether a painter's paradise.* The river here becomes broad and studded with numerous islets, between which extends a series of weirs, over which the water tumbles and foams, adding life and variety to the general calmness of the scene. To obtain a good view of the house, the tourist should

MAPLE DURHAM CHURCH AND MILL.

land on the right bank, just below the lock, when, looking across the river, he will see, between the two tall elms that frame the picture, a matchless pile of gables, dormers, ornamental chimneys, and all the other elements of "the Elizabethan style." From the river we have no good view of the principal front of the house, which is towards the east, looking down a magnificent avenue of elm-trees nearly a mile in length. There are in the house, it is said, several secret rooms and passages used in the time of the Commonwealth by the Royalist party for the concealment of troops or priests, as the case might be. Maple Durham has long been the property of the ancient family of the Blounts. "The church is of singular design, having a nave of irregular form, with a south aisle only."

On the opposite side of the river is the village of Purley, the small church of which stands close to the bank, buried in a grove of towering trees. Purley Hall, on the right, on high ground, is a plain, square, modern villa. The

MAPLE DURHAM HOUSE.

towing-path is closed where the grounds of Purley reach the Thames, but is continued on the opposite bank of the stream, so that men and horses have to be ferried across, and continue their journey for about a quarter of a mile, when they reach Purley Ferry, and are again carried across to the right bank, where the ferryman's house is situated, from whence the path continues to Caversham Bridge.

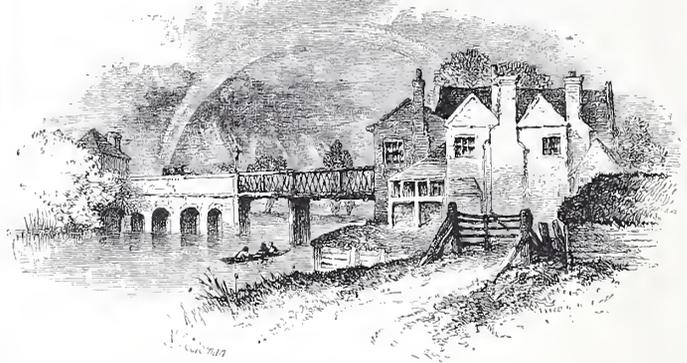

The line of the Great Western Railway is in sight almost all the way between Pangbourne and Reading, and, for the most part, in close proximity to the river. About Purley the tall wooded banks approach each other, and forming now and then close umbrageous scenes of exquisite beauty. Continuing

recreation, of value for the exercise the players attained in its practice. The reader will remember Pope's line:—

"Some Dukes at Marybone bowl time away."

* It was built in 1581 by Sir Michael Blount, then Lieutenant of the Tower of London. In the church are many interesting memorials of the Blount family.

our journey, no object of particular interest meets us for some distance, until coming to a turn of the river where the country opens out, we obtain a sight of Caversham, with its old bridge and church, and the large town of Reading. The ground on the right has now sunk to a level; but on the left, chalk-hills, with steep declivities, approach and almost overhang the stream. From these hills beautiful prospects are obtained of the river and surrounding scenery; and, for half a mile before reaching Caversham, the northern bank is adorned by a fine hanging wood of fir-trees, passing which we arrive at CAVERSHAM BRIDGE and village.

CAVERSHAM BRIDGE.

Caversham Bridge is an ugly structure, partly of wood and partly of stone; at its foot is a small cottage, where boats are hired, and where the curious may trace some ancient remains—probably of a monastic cell. The lock—Caversham Lock—is distant half a mile from the bridge; and a small island, containing about four acres, divides the current. A view of the town of Reading would be hence obtained but for the intervening railway. The steeple of St. Lawrence's Church is, however, seen high above surrounding houses; and so is the red-brick ruin of the Abbey gateway, closely adjoining the modern jail, beside which the ruins of the old abbey have been laid out in shady public walks; they exhibit little remains of distinctive architectural features, inasmuch as the walls have been denuded of the outer squared stone for building purposes, leaving the core of the walls only. A very pretty public garden is in front of this, and a mound, with a fine group of trees, commands a beautiful view of the winding of the Thames, from Purley on the left to Ship-lake on the right of the spectator.

The Kennet, which runs through the town, joins the Thames between Caversham Bridge and Sonning. This river rises near the village of East Kennet, on the eastern side of Wiltshire, in the vicinity of Abury, and "after a sequestered course" of about four miles, reaches Marlborough, afterwards waters the ancient village of Ramsbury, thence visits and refreshes Hungerford, proceeding thence to Newbury, where it becomes navigable; and during a course of nearly forty miles ministers to the wants and industry of man—aiding the operations of the Thames in producing and distributing wealth.

Reading is the venerable capital of Berkshire. "This little city" was called by the Saxons, Rheadyne, from *rhea*, a river; or the British word *redin*, signifying fern, which Leland mentions as "growing hereabouts in great plenty." A strong castle existed here until the time of Henry II., by whom it was destroyed, as "affording a place of refuge to the adherents of King Stephen." Its site has long been matter of speculation. Its Abbey was one of the most considerable in England, "both for the magnitude of its building and the state of its endowments;" its abbots being mitred, and enjoying the honour of a seat in Parliament. The structure was commenced by Henry I., "on the site of a small nunnery, said to have been founded by Elfrida, mother-in-law of Edward the Martyr, in order to expiate the murder of that king at Corfe Castle." The active and honourable part which Reading sustained during the war between Charles I. and the Parliament, occupies a prominent page in the history of the period; but Reading, from its proximity to the Thames, being on the high road to London, and from its strength, "though not a walled town, as may be supposed," shared largely in many of the leading events of the country in all ages.* Of the castle, as we have intimated, even the site is unknown; Leland conjectures that "a piece of the abbey was built of the ruins of it;" while the famous abbey itself there are but few remains, the county gaol now occupying its place. At the dissolution it was "extremely wealthy," and contained many

* The town of Reading had the privilege of coining from the early days of the Saxons, and it was continued until the local coinage of England was merged into the metropolitan mint. The penny of Edward I., here engraved, was struck at this town, which is termed

"Villa Radingy" on this piece, in accordance with the Latinized form so constantly adopted in mediæval currency. The great improvement in the coinage at this time is due to the long and prosperous reign of Edward I., who restored the currency to beauty, from a state of barbarism worse than that of the Saxon era, into which it had sunk after the reign of John, and during the troublous times in England. The coinage remained without change until another great monarch had arisen to give peace after intestine wars—Henry VII., who first gave portraiture on our national money; for from the time of Edward III. until his period, one head only was used for the series, like that upon this little coin; and it is not easy to distinguish the particular coins of some sovereigns from others of the series, except by minute peculiarities known to the students of Numismatics, but which would escape the eye of the general observer.

"valuables." It was peculiarly rich in relics, possessing, among other treasures, "a hand of the Apostle James," and "the principell reliq of idolytric within thys realme, an angel with oon wyng that brought to Caversham the spere hedde that peryd our Saviour is side upon the crosse."* The town is active and prosperous, although of its once famous woollen manufactories there is but the tradition. The only important manufactory it now possesses is one for the production of "bisenits;" and, strange as it may appear, this is so extensive as to employ several hundred men, aided by large machine power. It is foreign to our purpose, or a very agreeable and interesting paper might be written concerning the several processes in use to create this minor accessory of the table, which is exported—not by thousands, but by millions—and sent to every part of the globe. They have and deserve a universal reputation; obtained and sustained by using only the best materials of all descriptions—flour, milk, eggs, sugar, and so forth; and it must be recorded as a gratifying fact that the manufacturers, while making their own fortunes, have contributed very largely to the prosperity of the town.

Reading is the birthplace of Archbishop Laud, and among honourable and happy memories associated with this town, or rather with its vicinity, is that of "Three Mile Cross," long the residence of Mary Russell Mitford. Three Mile Cross is "Our Village."

We ask the reader to leave the Thames for awhile, and make with us a pilgrimage to the grave of this admirable woman, whose writings have found their way over the whole civilised world, rendering familiar to all the peculiar traits of English village character, and the graces, so essentially our own, which decorate the lanes, the homesteads, and the cottages of rural England.

Reading is a credit to the beautiful river that sweeps through its valley; neat, active, bustling—a sort of miniature city, with a sprinkling of pretty villas in pleasant suburbs, some more than half-concealed at this season by the foliage of close shrubberies, and surrounded by borders and parterres of flowers that would joy Miss Mitford's heart, were she moving among them, instead of resting beneath the granite cross erected to her memory in the homely yet solemn church-yard of Swallowfield.

Our first object was to visit the humble dwellings, in one of which she lived for more than a quarter of a century, in the other of which she died. To "Three Mile Cross," the "Our Village" of her stories and sketches, we wended our way. It was a day "brimful" of air and sunshine; no dust, no rain; every leaf at maturity, every bird in song; every streamlet musical; the shadows calm, distinct, and still, as if waiting to be painted; our driver in-

THREE MILE CROSS.

telligent but unobtrusive; our carriage comfortable and not noisy; the "sunny lanes" showing themselves worthy the reputation SHE has given them, and the steady dignified trees proving, if proof were needed, "England before the world" for beauty of upland and lowland, of park and pleasure, of wood and water, of cottage andcroft, of corn-field and meadow, of all things—everything that can render life enjoyable, and plenteous, and happy. We were in Mary Russell Mitford's own county, "the sunny Berkshire," made famous in so many of her bright pages. We fancied we knew the roads and the trees she wrote about or

* A curious story is told in Fuller's Church History, which records a memorable visit of "bluff King Hal" to Reading Abbey:—"As King Henry VIII. was hunting in Windsor Forest, he either casually lost, or more probably wilfully losing himself, struck down, about dinner time, to the Abbey of Reading, where, disguising himself (much for delight, more for discovery unseen), he was invited to the abbot's table, and passed for one of the king's guard,—a piece to which the proportion of his person might properly entitle him. A sirloin of beef was set before him (so knighted, saith tradition, by this Henry), on which the king laid on lustily, not disgracing one of that place for whom he was mistaken. 'Well fare thy heart (quoth the abbot), and here in a cup of sack I remember the health of his grace your master. I would give an hundred pounds on the condition I could feed so lustily on beef as you do. Alas! my weak and squeeze stomach will hardly digest the wing of a small rabbit or chicken.' The king pleasantly pledged him, and heartily thanked him for his good cheer; after which he departed as undiscovered as he came thither. Some weeks after, the abbot was sent for by a pur-suivant, brought up to London, clept in the Tower, kept close prisoner, and fed for a short time with bread and water; yet not so empty his body of food, as his mind was filled with fears, creating many suspicions to himself, when and how he had incurred the king's displeasure. At last a sirloin of beef was set before him, on which the abbot fed as the farmer of his grange, and verified the proverb, that two hungry meals make the third a glutton. In springs King Henry out of a private lobby, where he had placed himself, the invisible spectator of the abbot's behaviour. 'My lord (quoth the king), presently deposit your hundred pounds in gold, or else no going hence all the daies of your life. I have been your physician, to cure you of your squeeze stomach, and here, as I deserve, I demand my fee for the same.' The abbot down with his dust, and, glad he had escaped so, returned to Reading, as somewhat lighter in purse, so much more merry in heart, than when he came thence."

talked of; the rough-coated elms, standing boldly and bluntly out from velvet hedge-rows—a slim stick of sprouting foliage springing here and there from the rugged bark, reminding one of an old man's child, while the great robust treecroppers were telling of vigorous old age! The signs of the over-many public-houses, so quaint and "un-London-like"—the "Four Horse Shoes," "The Fox and Horn," "The Swan," "The George and Dragon," "The Star," were so many landmarks. There were herds of sheep on the uplands and lowlands, and lowing cattle under trees; there were children "clapping their hands, and blooming like roses;" the jobbing gardener, with his rake, his garland of "bass," and his bundle of "shreds—blue, black, and red;" the bronzed and muscular village blacksmith; the pale-faced shoemaker; the ragged, rosy, sautey boys; the fair, delicate "lily-of-the-valley-like" maidens—the descendants of those who were boys and girls when "Our Village" was written,—we saw them all, and identified them all with the painter of "Three Mile Cross." And then we arrived, after delicious loiterings, at "3 Mile X" itself, as it is described, by itself, on the first wall to the right: it is a long, lean, straggling hamlet of twenty houses and a half (we counted them conscientiously), the "hall" being the shoemaker's shop, from whence, in Miss Mitford's time, "an earthquake would hardly have stirred the souter."

The village shop is there still,—"Bronley's shop,"—just as it was in her day, except that the master and mistress are "elderly," and the children not exactly young; but children flourish round them, keeping the picture "fresh." The master of the village shop (a handsome old man) was pleased to talk of Miss Mitford and "the doctor," and of her good-nature and oddity. "Yes," he said, "that was her house, the very next door; we might call it, as every one did, ugly, and small, and inconvenient; but she liked it. She made herself, and everybody else, happy in it: he didn't know what visitors expected the house to be; he could repeat every word she had written on't. A cottage—no, a miniature house, with many additions—little odds and ends of places—pantries and what not; a little bricked court before one half, and a little flower-yard before the other; the walls old and weather-stained, covered with hollyhocks, roses, honeysuckles, and a great apricot-tree."

"But where are they?"
"Ah, the hollyhocks, the roses, honeysuckles, and great apricot-tree, are destroyed and dead; but there is the window into which the doctor used to fling apricots to his children."

Yes, the flowers are all gone, and every tree in the garden is gone—all except the old bay and a fairy rose!

The house, so far as the bare walls are concerned, is much as she left it; an assemblage of closets ("our landlord," she says, "has the assurance to call them rooms"), full of contrivances and corner-cupboards. "That house," to quote her own words, "was built on purpose to show in what an exceeding small compass comfort may be packed."

Yet when we entered the tiny, low-ceilinged rooms, almost without light or ventilation, and ascended the narrow stairs—where erinoline could not come—and saw around us ample evidence of the impossibility to impart to the dwelling anything approaching the picturesque of cottage life, we felt—what?—the most intense admiration and respect for the well-born and once wealthy lady who brought within these "old and weather-stained walls" an atmosphere of happiness, an appreciation of all that is true and beautiful in nature; and sent from out those leaden casements, and that narrow door, such floods of light and sunshine as have brightened the uttermost parts of the earth! Who ever heard her murmur at changed fortunes—when obliged to leave the home, "stately though simple," the home of eighteen years, "surrounded by fine oaks and elms, and tall, massy plantations, shaded down into a beautiful lawn by wild overgrown shrubs!" She confesses, indeed, in her sweet playful way, that at the time it nearly broke her heart to leave it:—"What a tearing up by the root it was! I have pitied cabbage plants, and celery, and all transplantable things ever since; though, in common with them and other vegetables, the first agony of transportation being over, I have taken such firm and tenacious hold of my new soil, that I would not for the world be pulled up again, even to be restored to the beloved ground." What was this? philosophy or heroism? or the perfection of that sweet plastic nature which receives, and retains, and fructifies all happy impressions—which opens to, and cherishes, all natural enjoyments, and adapts itself to circumstances with the true spirit of that practical piety which bends to the blast, and sees sunshine, bright and enduring, beyond the blackest cloud: let the darkness be ever so dense without, the lamp burns calmly and purely within!¹⁶

* Mary Russell Mitford was born on the 16th of December, in the year 1786, at the little town of Alresford, in Hampshire. Her father was George Mitford, M.D., the son of a younger branch of the Mitfords of Mitford Castle, Northumberland, and Jane Graham, of Old Wall, Westmoreland, a branch of the Netherby clan. Her mother was Mary Russell, only surviving child and heiress of Richard Russell, D.D., Rector of Ashe and Tadley, and Vicar of Overton, in Hampshire, above sixty years. He died at the age of eighty-eight, before his daughter's marriage; and remembered having seen Pope when at Westminster School. He was intimate with Fielding, and many of the wits of that period; and Miss Mitford had a portrait of him, with a wig, not unlike a judge's wig, hanging over it.

Three or four years after that, again, when his daughter was in her ninth year, he went to reside at Lyme Regis, in Dorsetshire, in a fine old house, previously occupied by the great Lord Chatham, where his two sons frequently spent their holidays. By this time Dr. Mitford had spent between £20,000 and £40,000, and went to London to stretch and determine his future course of life. His daughter, then ten years of age, was his favourite companion; and, lounging about, he one morning strayed into a dingy house, which proved to be a lottery-office, and for what follows we are indebted to Miss Mitford's "Recollections of a Literary Life," vol. II. p. 124:—

"Choose what number you like best," said dear papa, "and that shall be your birthday present."

"I immediately selected and put into his hand No. 2224.

"Ah!" said my father, examining it, "you must choose again. I want to buy a whole ticket, and this is only a quarter. Choose again, my pet."

"No, dear papa—I like this one best."

"There is the next number," interposed the lottery-office keeper, "No. 2223."

"Aye," said my father, "that will do just as well. Will it not, Mary? We'll take that."

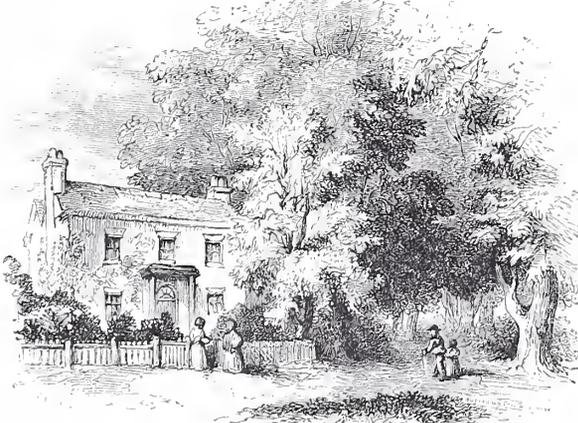

"No," returned I, obstinately, "that wont do. This is my birthday, you know, papa,

Those only who had known the extent and luxury of her former home, and afterwards had the privilege of enjoying her society, in that "scrappy" cup-boarded dwelling at "Three Mile Cross," can sufficiently appreciate the fulness, the warmth, the geniality, the strength of her sunshine, which, without effort or exaggeration, made all within and without happy in her happiness. What the worthy shopkeeper, Mr. Bromley said, was quite true—there was nothing exaggerated in her description of that miniature home; if strangers expected the relics of a cottage *ornée*, that was their fault, *not* Miss Mitford's. She had described it as it was, literally; if touched by the *couleur de rose* of her happy mind, that she could not help. She could no more avoid enjoying the beauties of nature, than the sun could decline to give heat; and if all people have not the same happy gift, that is not the fault of Mary Russell Mitford. Despite the dilapidated condition of the cottage at Three Mile Cross, we fancied much of her genial spirit there; and could, from her descriptions, identify the present race of children with the children of past times. Those villages which yet continue far away from the contamination of railway stations, are "Old England;" and as her sketches are from nature, they remain true to nature still.

The gentle and kindly young woman, the daughter of "Bromley's shop," who had memories for a hundred gracions and thoughtful words and acts, ran after our carriage with a branch of yellow *japonica*—"There," she said, "that is from Miss Mitford's garden;" we had previously obtained a sprig of bay and a fairy rose from the sanctuary, but her kindness made the yellow branch the sweetest of the three.

The drive to Swallowfield, about two miles farther from Reading, was a repetition of the scenery from Reading to "Three Mile Cross," with the exception of the common, which Miss Mitford immortalised by the "crickeeting"—a sport she enjoyed as much as any youth in the county. One of her great powers was certainly her large sympathy; she threw herself into the joys, sorrows, pastimes, and feelings of young and old. Her extensive poetic, and even classic, reading—the glare and glitter, and town-bred celebrity of her dramas, did not lessen her appreciation of the *true*, and practical, and beautiful, in rural life: if the worldly carry the world within them, so did she bear the joyousness of nature within her heart of hearts. We watched to see a graceful greyhound—"Mayflower"—spring out of the hollow beyond the common, but, alas! in vain; that day there were no cricketers, no sheep—only a few boys, and they were too quiet by half; while a winding flock of sober goslings, with their attendant parents, eyed us without a single hiss! We chatted over the peculiarity which had often amused us in our old favourite and friend; the habit—which had increased with her increasing years, and particularly after her father's death—of seldom rising until long past noon, and walking miles by moonlight, or light of lantern—she did not seem to care which, so long as it was night. In the afternoons she was busied with her flowers, and after sunset she would sally forth with her maid, her lantern, and a long stick, almost, if not quite, as long again as herself, and trot merrily off, rarely returning until late at night: her next door neighbour assured us that more than once, when driving home, he found "the dear little lady" breasting a snow drift, and this was confirmed by the kindly and benevolent clergyman who now resides at Swallowfield. She loved the stars as well as the sunshine, but it is singular that she has given no record of these wanderings in the dark.

Swallowfield, to which she removed some four years before her death, and where she died, is a delicious wayside cottage, standing on a triangular plot of

SWALLOWFIELD.

ground, skirted by roads overarched by magnificent trees; it is the *beau-ideal* of a residence for one who loves the country. She could chat over the fence with the passing peasant, and see all who drove up either road; but lovely as it is, we think she must have missed the *village*—missed the children—missed

and I am ten years old. Cast up the figures forming my number, and you will find they make ten—the other is only nine."

The father, like all speculators, was superstitious. The argument was irresistible. The ticket was purchased, and a few months afterwards intelligence arrived that No. 2224 had been drawn a prize of £20,000.

"Ah me!" (reflects Miss Mitford) "in less than twenty years what was left of the produce of that ticket, so strangely chosen? What? except a Wedgwood dinner-service, that my father had made to commemorate the event, with the Irish harp within the border on one side, and his family crest on the other. That fragile and perishable ware long outlasted the more perishable money."

Miss Mitford died at Swallowfield on the 10th of January, 1855; and was buried in the grave-yard of the village church, on the 18th of the month of that year

the hourly life-interests that clung round her heart at "Three Mile Cross." The aged tree had been transplanted; and, superior as this lovely cottage is in extent, in beauty, in the richness of its close scenery to her first humble dwelling, we believe "the roots" never struck far below the surface. Swallowfield was lovely, but her father had never been there; old familiar faces could not be brought there, as to "Three Mile Cross," by a simple effort of memory; they did not *belong* to Swallowfield; it was lovely, but the well-known voices of village children did not bound in through the open window; it was more beautiful, more commodious, but "pretty May" never "stretched" before that fire; "the dear father" never sate under the shadow of that mantelshelf; to the old, these delicious home-memories are more "life" than the actual life in which others exist; the eye may be closed, and the lip silent, but the *past*—the *PAST*—is, with the old, fresh and young as a "blind man's bride."

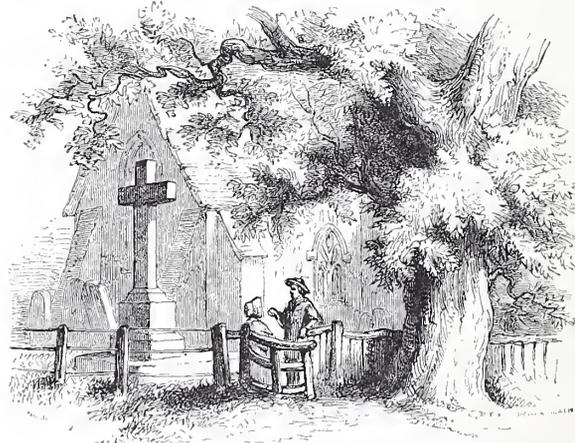

The family at Swallowfield respect Miss Mitford's garden, and have not altered the position of a single tree, nor turned a path, nor done ought to disturb that which her hand has "hallowed." The clergyman showed us her favourite rose-tree, and permitted us to visit the room from which her spirit passed from life's pilgrimage;—no! she never felt life to be a "pilgrimage;" it was rather a ramble through the pleasant paths of a flowering world; and though thorns would now and then show their sharp points among the flowers, even to her, yet, despite the sufferings of her latter days, it was with her

"Life to the last enjoyed."

To the last she was as fond of green trees and lanes, and the songs of bird and bee, and the "mountain nymph, sweet Liberty," as if she had been born a gipsy queen; and she herself would sometimes laugh and say, that, at best she was but a gipsy lady.

She corresponded more or less with the *literati* of her time, and when she was—as she but rarely was—a "star" in London, her society was much courted; but she was out of place in the metropolis—the heat and "celebrities," the noise and tramp, the perpetual movement fatigued her. She loved best to be where the affections and sympathies had time to take root, and grow, and fructify; she was no fine lady, to put out of the sphere of those sympathies and affections such as were not born with a passport to "good society." All were her neighbours, and her poor neighbours knew the value of her regard. It is somewhat singular that, alive as she was to political movements, alive to rural sports, to society, friendships, and affections, she took no interest in education; had no desire that the Lueys and Tommys, the Janes and Jacks, should be educated: her mind was, perhaps, too poetic to embrace the business of education, or to grasp its advantages—she believed more in *inspiration* than in *training*. The dame-school only interested her because it was picturesque; like many others of high blood, she believed herself a liberal, when she was strongly conservative in her opinions and—her prejudices; she had no love for schools or railroads. Miss Mitford's letters were charming; her handwriting, stiff and sturdy; quite unlike the graceful penmanship of Mrs. Hemans, the crabbed strokes of poor L. E. J., or the style systematic of good Maria Edgeworth.

In her introduction to her Dramas, dedicated to her long-loved friend, Mr. Bennock, she expressed a wish to be buried in the church-yard of Swallowfield:

THE TOMB OF MISS MITFORD.

and this excited the surprise, and somewhat of the loving jealousy, of the dwellers at "Three Mile Cross," who imagined she would have rested with her beloved parents, in *their* church-yard.

A cross of Aberdeen granite marks her grave in "the beautiful church-yard of Swallowfield." It may be about a mile from the cottage from which the spirit of Mary Russell Mitford passed to a world, even more beautiful than hers—to "fresh fields and pastures new"—and joins the park of one of her latest and truest friends: the breeze sweeps through the noble trees, and the sunbeams penetrate the foliage, so as to chequer the sward with light; the shadow of the fine old church falls gently over the graves of "the rude forefathers of the hamlet," and the ploughman's whistle mingles with the whistle of the blackbird and the bleating of the sheep: it is an exquisite spot, a fit resting-place for the author of "OUR VILLAGE."*

* A series of interesting and excellent stereoscopic views of "Our Village," and nearly all its remarkable localities, has been taken by Mr. S. Poulton, photographic artist, of Reading, by whom they are published. To the readers of Miss Mitford's stories, and to the many admirers of her ever-enduring sketches of English character and scenery, they are very valuable acquisitions.

MINOR TOPICS OF THE MONTH.

THE 1851 "TESTIMONIAL."—It cannot be forgotten that a sum of money, amounting to about £6000, subscribed for this testimonial, is in the hands of the treasurer, Mr. Alderman Challis, during whose office as chief magistrate of London, the project was promulgated and the monies collected. Mr. Alderman Challis is, as he has always been, desirous to rid himself of all responsibility, and to apply the fund to its original and declared purpose. Its application, however, has unaccountably lingered, but the money has been judiciously placed at interest; and at length serious steps have been taken to carry into effect the design of the subscribers, by erecting on the site of the building in Hyde Park a work of Art that shall perpetuate the memory of the great gathering of nations there during the year 1851. A committee was formed some months ago; two honorary secretaries were appointed—Dr. Booth, of the Society of Arts, and Mr. George Godwin: and after another long delay, these gentlemen have issued an advertisement inviting "sculptors, architects, and others," to furnish designs for the intended memorial; so far so good; better late than never. Six thousand pounds, although not a large sum, may suffice, if judiciously expended, to place in Hyde Park some work that shall be not unworthy the great event it is to commemorate; and the subscribers may ultimately see a wise and effective application of the funds they have contributed. Whether a selection will be made from the designs sent in is more than we can say, for the advertisement pledges the committee to nothing but an award of £100 to the work that shall seem most meritorious to the adjudicators. There is no doubt, however, that an earnest desire will exist to bring this "elongated" affair to an issue; and we feel assured that if a work, suited to the purpose be contributed, its producer will have the honour and advantage of its erection: at all events, we have no dread of any other result than that of rational and equitable treatment of all competitors; and we hope the invitation will be so responded to as to uphold the credit of the country.

THE TURNER MEDAL.—The Royal Academy having called on the most distinguished sculptor of its body, Mr. Baily, to furnish a design for the medal founded by the Academicians, in the name of the late Mr. Turner, as a prize for landscape-painting, we have had the opportunity of seeing the model in the sculptor's studio. The arrangement is of great simplicity—as that of a medal should be; but the figures are charmingly modelled,—and, whether in respect of its mere beauty as picture or in regard to the poetical appropriateness, to the purpose in view, of the thought embodied, the work will do honour to the academy which has to offer it as a testimonial. The design is described in a few words here,—and describes itself when seen. The winged Iris, as the goddess of colour, directs the view of young Genius, by her side, to the rainbow overhead.

THE ROYAL ACADEMY.—Last month, in announcing the election of Mr. Frederick Richard Pickersgill to the full honours of a Royal Academician, we took occasion to lament that a result to which he had long since made his title good, should have been of necessity delayed, for years after that title had occurred, by the narrow scheme of the institution itself. On the same text we had a yet less satisfactory comment as regards Mr. Foley; whose unquestionable claim to the same place of honour is still postponed, and must continue to be so, if the present constitutions, with all the wrong they inflict and all the rancour they engender, are persevered in, until death shall step in to his aid. To say nothing of the practical insufficiencies of the academic scheme,—it should be no very pleasant consideration, that the footstool to each academic chair is a coffin, and a necessary part of the academic costume a dead man's shoes. It happens, too, sometimes, that death takes the wrong man; and, weary of seeing an associate wait so long at the Academicians' door, carries him off, instead of entering to make room for him within. A mistake of this kind occurred in the case of the sculptor Wyatt. With his credentials perfect, he was yet left too long standing at the Academy door,—and death found him there. The Academy has one illustrious name less on its rolls, therefore; but that wrong to

themselves does not balance the account, and make the wrong to him right. All that we and others can do, so long as things remain as they are, is, to point the moral of such cases; and we are, therefore, glad to know, that at the recent election there were still some half dozen members found to repeat the long protest which, year by year, keeps alive within the academic mind the memory of the elder Danby. The secret of the continued exclusion of an artist, of whom it is no disparagement to others to say, that his claim rests on grounds at the least as sufficient as those offered by some which have carried the prize, is one into which it would be curious—but scarcely, we apprehend, convenient—to inquire.—Others there are who have been long knocking at the outer door; to whom also the Academicians appear to have forgotten it is not yet opened.

THE "GEDENK HALLE," OR HALL OF COMMEMORATION.—The approaching family alliance between the royal houses of England and Prussia has given occasion, on a somewhat imposing scale, to a display of that sentimentality which is apt to mix itself up a good deal with most of the acts of German life,—and which, though found at times, in Prussia especially, in combination with spirits that consort with it very ill, and greatly disturb its effect, takes, nevertheless, many pleasing forms and dictates many graceful acts. The instance before us is both pleasing and graceful in a high degree,—though the fancy of the thing be somewhat formal and the sentiment somewhat systematic. The German heart is in the matter,—and so is the German type. It is quite in the spirit of a royal offering in the city of King Frederick William the Fourth, that Art should have a sentimental office, and sentiment an Art exponent:—and both these conditions are fulfilled in the tribute which awaits the daughter of our royal line on her arrival in the future home of her adoption.—Thus grew the *Gedenk Halle*. Some time since, the men of Berlin most eminent in Literature, Art, and Science, put their heads together to devise some worthy and appropriate expression of the congratulations of the capital, on the union, in the persons of the young Prussian prince and his English bride, of the houses of Hanover and Brandenburg. The course of their deliberations led them to see, that there was necessary to any such successful embodiment another element, not necessarily included in either of their categories,—that, in fact, the substantialities of wealth would be needed to give form and consistency to their own spiritualities. Accordingly, the monied interest of the metropolis was invited to join the alliance;—and answered the invitation with a zeal sufficient to secure any result that might be desired. A committee was constituted, embracing all the great interests of the capital,—the Fine Arts, literature, science, and wealth, representatives of the old nobility and the new, of the governments, State and municipal, of the army, the law, commerce, and manufactures, of the two Confessions, Catholic and Protestant; and the design on which this comprehensive committee finally determined was, that of an octagonal hall, on the walls and cupola of which the arts should combine in illustrating, as their leading themes, such passages of history as exhibit the powers of England and Prussia in united action on the destinies of Europe, and such events of a domestic nature as testify to the personal relations between the two royal families. Subordinate to these special texts, it was proposed to illustrate the triumphs of Science and of the Industrial Arts. Then came the question of a site for this temple into which the national heart had brought its bridal offering:—and that question was solved by a very happy inspiration. With the king's consent, it was determined, that the architect Strack should embody this *Gedenk Halle* in the plan of the new palace which he is building for Prince Frederick Wilhelm and his bride; so that, this tribute, to the young couple, of the arts and the affections of the Prussian capital, becomes at once a portion and an embellishment of their home.

THE NIGHTINGALE FUND.—About twenty months have elapsed since we announced an intention to collect by public subscription a sum of money to present to Miss Nightingale, as "an expression of national gratitude," and in order "to enable her to found an institution for the training, sustenance, and protection of nurses and hospital attendants." That which was then in uncertain infancy is now

"a great fact." The honorary secretaries (the Right Hon. Sidney Herbert and Mr. S. C. Hall) have issued a report, by which the public are informed that the subscriptions have exceeded £45,000, a much larger sum than was contemplated by its projectors, and which has, therefore, entirely satisfied all parties who have been concerned in this useful and honourable task. The accounts were audited by one of the accountants of the Bank of England; it was gratifying to the honorary secretaries to know that every guinea was accounted for, that all the subscriptions had been paid up to within a very few pounds, and that by a gradual investment of the monies a considerable sum in interest was added to the fund.

TESTIMONIAL TO M. AND MADAME GOLDSCHMIDT.—Among the most interesting incidents connected with the Nightingale Fund is this:—A commission, which originated in the city committee, was given to Mr. Joseph Durham to execute in marble a bust of Her Most Gracious Majesty the Queen, to be presented to M. and Madame Goldschmidt, in acknowledgment of their graceful liberality to the fund. Their subscription exceeded £1850; but, independent of this munificent gift, they themselves defrayed all the attendant expenses, which amounted to more than £500. It was, therefore, considered right that the committee and supporters of the fund should mark their sense of this unparalleled liberality; consequently, they entered into a private subscription to effect this most desirable object, and the bust, undoubtedly one of the most admirable achievements of British Art, will be presented in due course to these generous and estimable persons.

THE KRÜGER COLLECTION.—Mr. Wilson stated in the House of Commons that the purchase was made under the immediate advice of Mr. Dyce. Previously to such advice being given, there had been reports published of the quality and value of the collection.

MR. J. A. HAMMERSLEY, the excellent master of the Government School at Manchester, has received a commission from His Royal Highness the Prince Consort under circumstances of peculiar grace. It appears that during the visit of the Prince to the Exhibition of Manchester Artists, in Peel Park, he made purchases of some works, and intimated to Mr. Hammersley his desire to possess a production of his pencil, stipulating only that he should choose his own subject. This was a marked compliment; for Mr. Hammersley, having to act as the Prince's conductor on occasion of his visit to the exhibition, was necessarily precluded, by a proper feeling of delicacy, from directing the Prince's attention in any other than a cursory manner to the works exhibited by himself; and it only illustrates the Prince's discernment, and the more than passing interest he takes in Art, as well as the judicious manner in which he patronises artists, that the commission should be given under the circumstances detailed. Mr. Hammersley, on being informed of the Prince's wishes, transmitted a list of subjects of which he had sketches, for the Prince to make his selection, and, in reply, he was informed, through Colonel Phipps, that the Prince selected "The Drachenfels, from Bonn." We may observe that, although Mr. Hammersley possesses sketches of the subject selected by the Prince, he has resolved, in order to do justice to himself, to proceed at once to Bonn, and execute his commission on the spot.

THE STATUE OF RICHARD CŒUR DE LION.—It appears that this mystery is to be solved after all, and that the statue is really to be placed somewhere, having no doubt been paid for long ago by the monies liberally subscribed for its purchase. Sir Benjamin Hall has informed the House of Commons that "no decision had been arrived at as to the exact spot where the statue should be placed, but Carlton Gardens had been suggested." Seeing that six years have elapsed since the year 1851, the interest of the subscriptions must amount to a pretty sum. We marvel it did not occur to some honourable member to ask if the statue be as yet really in bronze or only in clay?

OLD HISTORIC PICTURES.—An old house in Sandwich, Kent, formerly belonging to one of the mayors of the town, but recently occupied as a crockery warehouse, had one of the rooms richly decorated with a series of portraits and historical pictures painted on the panels of the wainscoting.

They were executed in the reign of Charles II., when the house belonged to Tobias Cleere, who was mayor in 1649 and again in 1670, in which latter year he had the honour to receive and entertain Katherine of Braganza on her way to London. This was on the 4th of May, and it is recorded that her majesty would not alight from her carriage, so the banquet was brought to the mayor's door as she passed it. One of these pictures represents the queen at the town gates received by the mayor and corporation; it occupies four large panels, and is a faithful and curious record, not only of the event, but of the aspect of this famed old sea-port at her era. On the opposite side of the room, in the same number of panels, was a spirited picture of the Victory of Opdam, in the Texel, where the Dutch were vanquished. Another panel represented the English conquering vessels refitting in Sandwich harbour. Half-length portraits of the mayor, the queen, and others filled the other panels, which have now all been removed within the last month, and ceded to Lady Ashburnham.

THE FALLS OF NIAGARA.—There is now exhibiting at Messrs. Lloyd's, in Gracechurch Street, one of the most striking and interesting pictures the hand of the artist has ever produced; it represents the most wonderful waterfall of the world—that of Niagara—and is the production of a distinguished American painter, Frederiek Edward Church, of New York. The work would do honour to any school of Art; and we are certainly not surprised to learn that it has excited much enthusiasm in the States, where it has been received, universally, as in all respects an achievement of the highest importance. We have been enabled—and so may any of our readers—to ascertain the value of the fervid criticisms which have come to us from the other side of the Atlantic, where, however, the truth of this ambitious copy of a marvellous scene must have been subjected to the severest test; for no doubt many of its critics are familiar with the original. One of our correspondents writes to us thus:—"Years have elapsed since we sailed over the lakes of Northern United States; stopped awhile at Niagara; passed through the 'Thousand Islands,' over the fearful rapids; looked from the heights of Montreal, the uplifted bastions of Quebec, and took our leave of the St. Lawrence at the charming falls of Montmorency. Since that time we have seen Vesuvius, the Alps, and the Rhine; but no constant scene in nature, that we have ever beheld, so overwhelms one as does the majestic Falls of Niagara. We studied this great scene for days, and from almost every point of view. From Victoria Point, the best view, we studied it as a whole, and listened for many hours to the deep fearful notes of its great anthem; the rising mist with its gorgeous colour appearing like an eternal incense, offered from this great altar of nature up to nature's God. On the deck of the adventurous little steamer we passed along the shore of the seething rapids below—mostly by means of return eddy—near the bank; until from the very midst of this terrific scene, we looked up through the mist and the spray, and almost felt the green plunging ocean was crushing us in its way: we could not breathe; the trembling boat pushed along—it touched the current—in a moment we were a mile below." The writer proceeds to praise the picture as the most meritorious attempt that has yet been made to convey to the eye the several grand peculiarities of this wonderful scene. We are fully and entirely with him in his enthusiasm; although we can but fancy that which he has seen—the awful grandeur of the mighty whirl of waters—it seems to us that no work of its class has ever been more eminently successful: it is truth, obviously and certainly. Considered as a painting, it is a production of rare merit: while admirable as a whole, its parts have been all carefully considered and studied; broadly and effectively wrought, yet elaborately finished. We have seldom examined a picture that so nobly illustrates the power of Art.

ROMAN ANTIQUITIES IN RHINELAND.—A correspondent of our contemporary, the *Times*, writing from Berlin, has furnished to that journal some curious particulars, by way of warning to antiquarian tourists on the Rhine,—which now, in this season of amateur vagrancy, it seems expedient that we should reproduce for the benefit of travelling readers of the *Art-Journal*. Many of these are well aware,

that, of late years, the region round about the Rhine has been much resorted to for Roman terra-cotta remains; a place called Rheinzabern, in the Bavarian Palatinate, having been amongst the sites most eagerly sought in this respect. The various continental museums of antiquities have been enriched by treasures collected at this spot, and the money of English collectors has been sown freely in this undoubted soil of ancient Roman settlements. The effect has been such as money freely scattered has produced on many another field of archaeology,—that, namely, of nourishing the growth of a spurious crop. The legitimate produce being limited and exhaustible by the law of the case, modern ingenuity has stepped in here, as elsewhere, to restore the economic equation between demand and supply. The search after the antique has suggested the manufacture of antiquity,—and the skill of the young world has been summoned to answer the run upon the old. Now, they who conduct this process of artificial supplement are too apt, in the excitement of their success, to forget that the credulity which they draw is—like the antiques for which it craves—an exhaustible fund. It would appear that the un-failing fecundity of Rheinzabern in archaeologic remains had gradually introduced and nourished a suspicion as to the true Roman character of its progeny, which was sure to terminate in ultimate disgrace. Accordingly, a vase, valued at 1000 francs, which came recently under the notice of the President of the Society of Antiquaries of the Rheinland, Professor Brann, was looked on by him with great distrust,—and this distrust set him upon further inquiries. These inquiries led him to the conviction that, not only was this particular relic a forgery, but the greater part of the terra-cotta remains derived from the same neighbourhood by the museums of Paris, Munich, and Luxemburg were spurious too. Professor Becker, of Frankfort-on-the-Maine, followed up these investigations, with a like result:—and then the King of Bavaria sent Professor Von Hefner, a member of his academy and a skilled antiquary, to visit Rheinzabern, and look into the matter. The end is, that the professor has established the fact of a regular manufacture of Roman antiquities existing in this interesting locality; and the stamp of illegitimacy will henceforth attach, as a consequence, to articles hitherto highly esteemed in most of the great public, and many private, collections of Europe.

SIR JAMSETJEE JEJEEBOY.—Some time since, as our readers will remember, in recording the meeting held at Bombay to promote the erection, by way of public monument, of a statue of this good and munificent Parsee, we expressed our hearty wish for the success of an application which had just then been made to the Crown, by a powerful body at home of persons influentially connected with the affairs of India, that the knighthood which had some years previously been conferred on the Indian prince-merchant might be converted into a baronetcy. We must not leave that pleasant record incomplete by omitting now to state, that the application has been effectual and the wish fulfilled. The *London Gazette* has announced the creation in favour of Sir Jamsetjee of the first baronetcy that has struck root in the soil of Hindustan.

THE COLLECTION OF ENGRAVINGS AT THE SOUTH KENSINGTON MUSEUM.—We have observed with very sincere gratification the commencement of a collection of engravings, as a distinct department, in this institution. A long-felt want in our Art-collections will, we trust, be here made good, so that students may be able to derive from this peculiar department of Art, the valuable lessons which it is so well able to communicate. The print collections in the British Museum are indeed treasuries for instruction; but their constitution precludes their being regarded as popular teachers. The "want" to which we have referred, must be met by collections of framed examples of engraving in its various branches, which will really exemplify the Art, and will always be accessible for examination and study. We hope the directors of the Kensington Museum will take up this matter in earnest, and that we shall speedily see, not the commencement merely of collections of woodcuts, engravings on plates of metal, etchings, and lithographs, but a rapid advance made with such collections. Provided they are really well selected, and consistent with the object in view, and are so

arranged that they will readily admit of study, without doubt many persons will be glad to contribute to the formation of these collections either by loan or actual donation.

MEETING OF THE SURREY ARCHAEOLOGICAL SOCIETY.—The yearly meeting of this agreeable and useful member of the archaeological fraternity, this summer, was held at Dorking, when Mr. Hope and Mr. Evelyn threw open their mansions at the Deepdene and at Wotton for the inspection of the members of the society and their friends. The day was brilliant, and a numerous assemblage availed themselves of the opportunity for visiting this beautiful neighbourhood and the deservedly famed places we have specified. At Wotton, the descendant and representative of the Evelyns himself received his visitors, and described the many historical and artistic relics with which his house abounds; and Mr. Hope, with similar courtesy and liberality, conducted the party over the Deepdene. Here the magnificent collection of Etruscan vases, with the fine antique statue of Minerva, and the Venus of Canova, attracted great attention, and elicited strong expressions of admiration. It is much to be desired that a descriptive and illustrated catalogue of the Hope Etruscan collections should be prepared by their accomplished and liberal owner.

THE PICTURE OF "THE HORSE FAIR," BY ROSA BONHEUR, NOW EXHIBITING IN BOND STREET.—Rosa Bonheur's great picture has again been submitted to the London public, and again have its extraordinary merits attracted crowds of admiring visitors. Not the least gratifying, or the least significant circumstance attending the present exhibition of this remarkable work is the fact, that those persons who were most familiar with it before have been amongst the foremost to visit it now. There is a freshness in this picture, and a living power, and a deep, yet simple sympathy with nature, which cause it to grow upon the spectator, so that repeated examination leads rather to a desire again and again to renew so pleasing an association than to any feeling of satiety or of weariness. The original work is now accompanied by the reduced copy (the property of Mr. Jacob Bell), which was painted by the artist herself for the special use of the engraver, together with impressions from Mr. T. Landseer's plate in an early stage. In the smaller picture Mademoiselle Bonheur has deviated from the original in some slight matters of detail, which it is to be hoped in the engraving will be rendered in exact accordance with the artist's first ideas, as they have been expressed in the original itself. The plate promises to be worthy as well of the subject as of the eminent engraver; but it certainly will lose in value should it not in every particular be a true translation from the picture, respecting which we entertain but a single sentiment of regret, and this is that it will not find an honoured permanent resting-place in our own National Gallery. In America, however, it will meet a worthy welcome, and, doubtless, it there will accomplish worthily its work as an Art-teacher. We shall but convey the sentiments of our readers when we express our obligation to Mr. Gambart for having enabled us to renew our acquaintance with this admirable production, and we also feel assured that the engraving from it, which they have almost in a state of completeness, will prove truly acceptable to all lovers of both Art and Nature.

HAYTER'S PICTURE OF "THE CORONATION" is, it appears, for sale; and Viscount Dungannon, in his place in the House of Lords, asked the Government if it was intended to purchase it for the decoration of the Houses of Parliament; which his lordship considered the most suitable place for a work of such historical interest, chiefly on account of the numerous portraits of illustrious personages, many of whom are now dead, which the painting contains. Earl Granville replied, on behalf of the Government, that it had nothing to do with the decorations of the Houses of Parliament, which were referred to a Royal Commission, whereof he was not a member; he could not, therefore, give the noble Viscount any information. He thought, at the same time, it was undesirable that the Commissioners should be called upon to explain the reasons why they did not purchase any particular pictures that might happen to be in the market.

ALTON TOWERS.—The sale of this magnificent mansion and its rich and gorgeous contents has created a great sensation in Art-circles especially;

the collections of objects of *virtu*, of armour, and of pictures, have always been held in much estimation. We have not space to take note of anything—except the paintings—which has passed under the hammer of Messrs. Christie and Manson, to whom was intrusted the disposal of the valuable property. The principal pictures were the following:—"Belisarius," David, 120 gs.; "Head of the Virgin," Murillo, £100; "Philip IV. of Spain," Velasquez, £129; "Morning," A. Cuypp, 565 gs.; "The Virgin and Infant," Murillo, 206 gs.; "Flowers in a Vase," R. Ruysch, 145 gs.; "Virgin and Infant," Sasso Ferrato, 131 gs.; "Peasants with Cattle and Sheep," Ommegeanck, 99 gs.; "Church of St. Redemptori," Pannini, 150 gs.; "St. Catherine," Carlo Dolce, 121 gs.; "The Magdalen," Carlo Dolce, 64 gs.; "The Circumcision," J. Bellini, 120 gs.; "The Virgin, Infant, and St. John," A. Del Sarto, 162 gs.; "The Virgin in a red dress and blue cloak, kneeling in a landscape and holding a book," Raffaello, 210 gs.; "The Virgin in a crimson dress and blue cloak, holding the Infant," who stands on a table covered with a red carpet, on which is a glass of wild roses, the heads of two angels seen beneath in front, Raffaello del Garbo, 275 gs.; "The Virgin seated in a landscape, the Infant on a cushion on her lap," Perugino, 200 gs.; "Poultry," Hondi-koeter, 107 gs.; "Italian Landscape," Both, 120 gs.; "Landscape, intersected by a River," Wynants, 130 gs.; "The Stag Hunt," Wouvermans, 175 gs.; "A Gentleman and Lady, with three Children and Servant, seated in a Garden before a Chatcau," Gonzales, 165 gs.; "March of an Army, with Ladies and numerous figures," Pater, 181 gs. The sale of the pictures occupied six days; the amount realised exceeded £13,500.

THE NOVIOMAGIANS, a club of gentlemen, all members of the Society of Antiquaries, held their twenty-ninth anniversary at Leeds Castle, Kent, on the 1st of July, by the polite invitation of its proprietor, Wykeham Martin, Esq., M.P. This curious residence is less known than it deserves to be; it is situated in the heart of Kent, five miles from the railway at Maidstone,—but they are miles that deserve to be travelled by all who love the picturesque. Bearsted and Hollingbourne are near the road, both possessing old churches of much interest, either architecturally or for the monuments they possess. Leeds Castle is one of the few moated buildings left in England; it is approached by towered gates as old as the time of Edward III., and there are vestiges of earlier date within the building, which has been admirably adapted to the uses of modern life by the present proprietor, without destroying the time-honoured character of the venerable fortress-home. Among the curiosities preserved here is the buff-coat of General Fairfax, the renowned commander in the great civil wars of England; it is in excellent preservation, with the silver tags, or "points," still appended, by which it was fastened across the breast, as well as his waistcoat and high-heeled shoes, also of buff leather.

ROMAN LONDON is seldom exposed to the light, in however fragmentary a condition, in the present day. A few years ago some fine tessellated pavements were exhumed in digging the foundations for the Hall of Commerce, in Threadneedle Street, and the buildings of the Exeise Office in Broad Street. Within the last month similar excavations for building purposes, near Aldermanbury Postern, have exposed about 8 feet in height of the Roman Wall of London, which here exhibits the curious peculiarity of three rows of arches, where, probably, a postern-gate led into Finsbury Fields. Outside the wall several oaken piles were found driven into the black soil; they may have been placed there as the foundation of a roadway into the marsh, which for centuries occupied this spot.

THE NIGHT-GUARD.—The most ambitious picture ever painted by Rembrandt, and the gem of the Amsterdam Gallery, may now be studied in our own National Gallery, by means of an admirable copy, recently bequeathed to the collection. In the original picture the figures are nearly life-size, but our copy is a small cabinet-picture; it however possesses more brilliancy than the original, and by its concentration, helps us better to comprehend the wonderful play of light and shade in the far-famed original. It was once reported to be a *replica* by Rembrandt himself, but it is now believed to have been painted by one of his scholars, probably

Gerard Douw, whose careful style it greatly resembles: Rembrandt never painted with such enamel-like care. Nothing can be more brilliant than the condition of this little gem; it is at once admirable as a copy, and above praise for its manipulative excellence; both qualities declare it the work of a master. It rivals the original.

THE NEW READING-ROOM IN THE BRITISH MUSEUM.—The frequenters of the British Museum have this year had an unusual subject for admiring examination in the new Reading-room, which has been very judiciously opened for public inspection before it is finally devoted to its own definite application. The magnitude of this unique apartment, and the skill with which its arrangements have been carried out in all their details, have elicited warm expressions of approbation. Art alone is needed to throw a suffusion of warmth and animation over the spaces, which the architect appears very properly to have left unoccupied, expressly for the painter and the sculptor to claim them as their own. When the students—for whose use this grand laboratory of the mind has been raised—shall have assembled beneath its lofty dome, they will enter upon their labours with the consciousness that their countrymen, who have gazed approvingly upon their Reading-room, will expect from them results commensurate with what has been done for their accommodation.

PICTURES IN VENICE.—In the capital of the Lombardo Venetian kingdom a measure has been attempted by the Austrian Government, in the service of Art, which would in all probability have been successful in any city where the petty interests assailed did not gain strength and advocacy from the sentiments of suspicion and ill-will subsisting between a sensitive nationality and a foreign rule. Of the valuable paintings, the masterpieces of Titian, Paul Veronese, and Tintoretto, which adorn the churches of that city, few are so placed as to favour the inspection which they merit; and even of those which *are*, long years of ignorance and avarice on the part of the priestly custodians are ensuring the gradual decay. In many instances the damp of the walls has all but obliterated the traces of what should have been an Art immortality; while, as a pleasing and efficient variety of destructive agency, others are subjected to the process of blistering and smoking from the continued action of the tapers that burn perennially before the shrines beneath them. The subject has been one of great anxiety and regret among the Italians themselves; and the Austrian Government has only adopted these native anxieties when it sought to apply a remedy. The municipal council of Venice has been directed to address a circular to the parish priest of each church in that city, informing him that Government, for the purpose of preserving the paintings therein from the injuries which they are sustaining from mildew and other causes, will remove them to the Royal and Imperial Academy:—in each case filling the place thus vacated by a copy of the picture removed, executed by some skilful artist. In Venice, however, it would seem that the paintings on the altar-pieces contribute to the revenue of those who minister at the altar. The inferior ecclesiastics derive a pecuniary subsidy from the donations of strangers who flock to the churches to see the works of Art, through the hands of the *ciceroni* whom the former appoint to show them; and the preservation of the pictures themselves is not motive sufficient in their eyes for an invasion of the flesh-pots. It has not been difficult to get up a cry from the whole body of the clergy against their churches being stripped, and an echo of the cry out of doors:—and, in consequence of the sensation created, the order, it is said, will not be enforced. Titian, and Paul Veronese, and Tintoretto must pay the penalty of a people's want of sympathy with their rulers, and a priesthood's want of sympathy with the Arts.

THE EXHIBITION OF THE ROYAL ACADEMY closed on the 25th ultimo; on which day the usual "evening" reception was given to the exhibitors and to invited guests.

THE OTHER EXHIBITIONS.—The Societies of Painters in Water Colours, the Society of British Artists, the National Institution, and the Exhibition of Works by Female Artists, are either closed or on the eve of closing; so also is the Exhibition of Pictures by French Artists. In fact, the Art "season" may be considered as terminated.

REVIEWS.

THE SUNBEAM, A PHOTOGRAPHIC MAGAZINE. Nos. I. & II. Edited by P. H. DELAMOTTE, F.S.A. Published by CHAPMAN & HALL, London.

Mr. Delamotte has given a most appropriate title to his published sun-pictures, when he calls his work the "Sunbeam;" but to speak of it as a "Magazine," is surely a misnomer, according to the ordinary acceptation of the meaning of the word, which we believe is generally understood as a miscellaneous pamphlet containing original contributions in prose and verse, with or without illustrations of the text. But here the text is, in several instances, quotations selected to suit the pictures. However, we will not run a tilt with the editor upon a point not of any great importance in itself, and certainly of no value at all as regards the "Art" of his publication.

Each part contains four subjects. The first number commences with "The Woods at Penllergare," photographed by J. D. Llewelyn—a close, umbrageous scene, so thick that the "sunbeams" seem scarcely able to penetrate into its recesses; but they fall forcibly on the trunk of a large tree to the left of the picture, and on a rustic bridge that intersects it in the foreground; all else is in comparatively indistinct masses. "The Tournament Court, in the Castle of Heidelberg," photographed by Sir Jocelyn Coghill, Bart., is very beautiful; the architecture of the old edifice comes out sharp and clear in its details; trees, ivy, and long grasses, are defined in all the delicacy of their sprays, leaves, and long tender blades. "Magdalen College, Oxford, from the Cherwell," by P. H. Delamotte, is a very brilliant picture; it makes one feel hot to look at it: marvellous are the lights and shadows that stand opposed to each other. "The Baptistery, Canterbury Cathedral," photographed by F. Bedford, is less vivid, but very striking: the dark trees and shrubs in the foreground contrast effectively with the light thrown on the buildings, which retain all the indications of venerable years, except weakness: the only sign of decay is on their wrinkled fronts.

The first subject in Part II. is "The Old Bridge at Fountain's Abbey," by Dr. Holden: this is an extraordinary sun-picture, taken, it may be presumed, at a late season of the year, for the branches of some of the trees are denuded of their coverings, leaving the minutest spray in clear and sharp relief against the sky. How admirably the whole scene composes itself into a picture! what adjustment and balance of parts to each other! There is throughout not an object too much or too little; nothing that the most skilful artist would omit, and nothing that he would introduce to supply a vacuum, or to aid the effect: had it been possible to lower the shadows on the bridge, it would have made the work a little less heavy, without lessening its powerful *chiar-oscuro*. "Sunshine and Shade," photographed by F. R. Pickersgill, A.R.A., is the title given to two figures, a lady and a gentleman, the former standing, the latter in the act of reading, in the open air under a hedge: the photographer has evidently placed his figures in position, and very pictorially they are arranged, and with wonderful truth are they made to appear. We know not whether Mr. Pickersgill's title has a meaning beyond the mere expression of the sunshine and shade of nature, but certainly the face of the lady is not lighted up with sunny smiles: this is the only "shadow" that casts a real gloom over this exquisite picture. "Cottages at Aberglaslyn," by F. Bedford, is not a well-chosen subject: parts of it are rendered with undoubted fidelity, but, as a whole, it does not come well together, to speak artistically. "The young Audubon," by H. Taylor, is a fanciful title given to a wood scene—the idea suggested by a young rustic, who is standing by a stile, contemplating, it may be presumed, some birds in the trees over his head; this is a beautiful photograph, delicate in colour, in gradation of tints, and in the expression of the minutest object that enters into the subject.

Among the multitude of photographic works now coming before the public, the "Sunbeam," if continued as it has been commenced, must take a foremost place: the subjects, generally, are as well selected as they are varied, and certainly the camera of the photographer has never produced more satisfactory nor more exquisite results.

THE LORD'S PRAYER, with Illustrations after LUDWIG RICHTER. Engraved on Wood by A. GABER. Published by GABER & RICHTER, Dresden; DULAU & Co., London.

Under the title of "The Lord's Prayer" we have eight pretty little woodcuts, each one printed on a

separate sheet of card-board, and ornamented with a chastely designed border of gold; this expensive style of "getting up" the work is scarcely warranted by the character of the illustrations, which are by no means of the highest order, though far above mediocrity. Moreover, the artist has felt himself compelled to bring to his aid other scriptural passages to assist him in illustrating those which are presumed to form the subjects of his pencil; so that title and contents are not strictly in accordance with each other. Thus, "Our Father which art in heaven," is represented by a family sitting outside the door of their cottage contemplating the sky at evening; underneath the print appears, "The heavens declare the glory of God, and the firmament showeth his handywork." "Hallowed be thy name" is represented by groups of villagers wending their way to the rustic church, and below the engraving is another verse from the Psalms, "We will go into his tabernacles, we will worship at his footstool;" and so throughout the series the pictures are more significantly interpreted by the added verses than by the passages in "The Prayer." The designs are expressive of the subjects, free and graceful in drawing, but not very delicately pencilled, or if they were carefully drawn on the wood, they have been engraved somewhat coarsely, except two or three.

ILLUSTRATED NATURAL HISTORY. By the Rev. J. G. WOOD, M.A., F.L.S. With Four Hundred and Eighty Original Designs by WILLIAM HARVEY. Published by ROUTLEDGE & Co., London.

THE COMMON OBJECTS OF THE SEA-SHORE. By the Rev. J. G. WOOD, M.A., F.L.S. Published by ROUTLEDGE & Co., London.

We have placed these two useful and interesting volumes together, because they are compiled and written by the same author, and published by the same enterprising publisher. The "Illustrated Natural History" has already had a sale of upwards of five thousand copies; and in this, the second edition, one third more original matter has been introduced, and between thirty and forty new illustrations will be found in its pages. We know of no more instructive or attractive volume for the young. Mr. Wood's love of his subject has animated his pen, and his tenderness and affection for the living world influence his descriptions, so as to render them particularly valuable for educational purposes. He combats prejudices with great earnestness, and is ever ready with a word of sympathy and kindness for an ill-used animal. If at times we feel his style to be somewhat abrupt, we are called upon to remember that the author has been obliged to put much information into the smallest possible space, and to consider matter rather than manner, and every page is so full of information, that it would be hypercriticism to stumble over straws.

The little one-shilling volume on the popular subject of "Common Objects of the Sea-shore, including Hints for an Aquarium," is restricted to those objects which visitors to the sea-side are sure to find, and is, or ought to be, certain of an extensive sale. It is an unaffected little book, treating of sea-birds, and sea-eggs, and fish, and of creatures of all kinds which give interest to every-day life at the sea-side. We, however, strongly object to Mr. Wood's abbreviations, which deduct much from the dignity of our salt-water science. Only fancy our almost domestic "*Mesembryanthemum*" being abbreviated into "*Mes.*," and that most troublesome, though beautiful, *Crassicornis* being called "*Crass.*" We differ from Mr. Wood on one point. We never could "finger" a *crassicornis* with impunity, and have suffered from sharp "tingling" in the hand and arm for nearly an hour after endeavouring to place him in an advantageous position in our aquarium; but a day or two in captivity lessens this power, and he may then be safely handled. Those who desire to deal in "marine stores" cannot have a cheaper guide than Mr. Wood's, which, we had almost forgotten to state, has the advantage of Mr. Sowerby's illustrations.

POPULAR MUSIC OF THE OLDEN TIME; a Collection of Ancient Songs, Ballads, and Dance Tunes, illustrative of the National Music of England. Vol. I. By W. CHAPPELL, F.S.A. Published by CRAMER, BEALE, & CHAPPELL, Regent Street, London.

It is now nearly fifteen years ago since Mr. Chappell printed "A Collection of National English Airs," which met with great success, was speedily out of print, and has laid the foundation of the present greatly enlarged collection. In quantity it is nearly double the former work; the words of many old scraps have been recovered—sometimes

better versions of both words and music. The music is printed by movable types in the body of the page, which is a great convenience to the student, and the whole of the airs have been harmonised by G. A. Macfarren, than whom a more able musician could not have been found. Certainly Mr. Chappell has well bestowed the research of years; and we envy him the pleasure of his investigation, for we "love a ballad" as enthusiastically as the country girls in the "Winter's Tale;" and any Autolycus might pick our pocket in exchange for one. It is pleasant to read over the list that is given of good old tunes and earnest old English songs in this first volume:—"Robin Hood," "Sir Lancelot du Lake," and "Sir Eglamore," call up memories of romantic eras in our country's history; "The King and the Miller of Mansfield," of the joviality between prince and people; "The Spanish Pavan" and "Greensleeves," of the courtly dances of Elizabeth and James; "The Carman's Whistle" and "Maypole Songs," of the joys of the peasantry, and their innocent life in "The Merry Milkmaids." The solemn strains of "Death and the Lady," or the tales of ill-fated love, like that narrated in "The Bailiff's Daughter of Islington," did duty on winter nights to pass time profitably; while the one enthusiastically described in its title as

"The rarest ballad that ever was seen,
Of the blind beggar's daughter of Bethnal Green,"

was the Pamela story which enchanted the lowly damsels of the seventeenth century, and may have occasioned many day-dreams of "the husband and coach and six," so liberally promised by fortune-tellers. It is pleasant to look back to the old days in England; there was much good in the simple people who loved the good old lays of the redoubtable Martin Parker and other ballad-writers, and we are glad to welcome them all in the excellent work before us.

THE FALL OF SEBASTOPOL. Printed in Chromolithography by DAY & SON, from the Picture by W. SIMPSON. Published by P. & D. COLNAGHI, London.

Such is the peculiar aspect of the present times, so much is the public mind ever concentrated on things that are, rather than on those which have been, that men have already ceased to talk—almost to think—about a war which less than two years ago was the subject of universal colloquy and excitement. Other political events have since sprung up to occupy the thoughts and create anxiety,—the Crimea has given place to India and China, and we seem to have concluded one great contest only to leave us free to commence others.

The large coloured lithographic print now before us represents the last scene in the fearful drama enacted at Sebastopol; in the foreground of the picture the retreating Russians are escaping over their bridge of boats from the doomed city, that looks like a huge fiery furnace, the flames from which shoot far and wide into the darkness of night with a grandeur that is appalling to contemplate, and with a brightness that brings every object distinctly before the eye; the scene, as the artist shows it, could only, in the history of modern warfare, have had its parallel of fiery magnificence in the destruction of another Russian city, Moscow; here, however, we have a large expanse of water reflecting back the lurid flames, and aiding, thus, the sublimity, horrors, and vividness of the catastrophe. The print is not alone an excellent specimen of the lithographic art, and a faithful copy of the original picture, which we have seen, but it appears as a suitable termination to the long series of Crimean views we have been called upon to notice since the outbreak of the war with Russia. *Requiescat in pace!*

THE PRACTICAL ANGLER; OR, THE ART OF TROUT-FISHING, MORE PARTICULARLY APPLIED TO CLEAR WATER. By W. C. STEWART. Published by A. & C. BLACK, Edinburgh.

This little book reached us so late in the trout-angler's year, that we apprehend any commendation of ours will be of little avail to him this season. By the time August has arrived, the best time for fly-fishing is over; trout are getting "off their feed," though they will take the fly, wind and weather permitting, till the end of October; but they decline in condition during the autumn months, get languid, and afford little sport, comparatively, and are scarcely worth capture; we have, however, occasionally been gratified with a good day's "take" in some of the southern streams of England very late in the autumn.

Mr. Stewart's treatise on "The Art of Trout-fishing" is strictly practical and instructive,—just the right kind of work to put into the hands of a

youngster who has not yet "fleshed his hook;" his experience has been gathered, we presume, on the lochs and rivers of Scotland, waters of which we admit to know nothing; but we have had a few years' practice with the rod in the lakes and streams of Wales, and the trout-rivers in the south, and can therefore bear testimony to the accuracy of the information which the author gives his readers on the art of capturing trout, either with the artificial fly or the live-bait. Some of his theories are new to us, but they appear so truthful that we have no hesitation in accepting them as facts, nor in recommending his book to every angler, whether experienced or not, for there is something in it for even an old hand to learn.

PORTRAIT OF THE MARQUIS OF LANSDOWNE, K.G. Engraved by J. R. JACKSON, from the Picture by F. GRANT, R.A. Published by FORBES & Co., London.

Few, if any, of the political leaders of the last thirty or forty years, have secured and maintained so large a portion of respect and esteem from men of all parties as the venerable Marquis of Lansdowne, whose intellectual, mild, and benevolent countenance the pencil of Mr. Grant has most faithfully recorded, and Mr. Jackson's graver has as faithfully reproduced. This is just the kind of print we like to see of such a subject—bold, vigorous, and manly; the representation of one who has laid aside the trappings of office, and appears solely as the enlightened and high-minded British nobleman. The original picture is the property of his lordship's *quondam* colleague, Lord John Russell, and was exhibited this year at the Academy.

HELEN FAUCIT. Drawn on Stone by R. J. LANE, A.E.R.A., from a drawing by F. W. BURTON, R.H.A. Published by E. GAMBART & Co., London.

A full-length portrait of this popular actress and most esteemed lady, in the character of Ion, as she appears with her right hand resting on a tripod, and a leafy wreath in her left. It is a beautiful *statuesque* figure, easy, graceful, and dignified; the countenance expressively sweet, soft, and intellectual. Mr. Lane's lithographic rendering of the subject is very delicate, yet firm in manipulation. As a whole, it is one of the most charming dramatic portraits we have ever seen.

OVER THE SEA; OR, LETTERS FROM AN OFFICER IN INDIA TO HIS CHILDREN AT HOME. Edited by the Rev. S. A. PEARS, B.D. Published by T. HATCHARD, London; ROWBOTTOM, Derby.

We do not suppose these letters were originally written with a view to publication; but there is no reason why other young folk than those to whom they were addressed should not get such an insight into India and Indian life as the writer has given to his children. The scenery and the descriptions lie far in the interior generally, and, therefore, afford to the young reader more of novelty than is usually brought under the notice of children. The officer writes as a father who values the religious growth of his offspring equally with their intellectual progress: while inculcating the knowledge of this world, he does not lose sight of what is necessary to qualify them for an entrance into another.

THE THEORY AND PRACTICE OF LANDSCAPE PAINTING IN WATER COLOURS. By GEORGE BARNARD. Parts I. & II. Published by HAMILTON, ADAMS, & Co., London.

We are relieved from the necessity of entering into a particular notice of this work, by the comments we made upon it about two years since, when it first appeared. The first edition being exhausted, another is now commenced, in which the author has used his opportunity for the insertion of more specific information, by the addition of several new illustrative plates, and enlarged instructions on the mode of working. The book is also printed in larger type, so that in every way its value is enhanced to the Art-student.

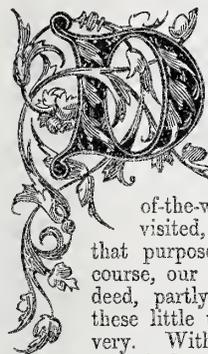

A WOMAN'S STORY. By Mrs. S. C. HALL. Published by HURST & BLACKETT, London.

It is foreign to our purpose generally to notice works of fiction; but we feel assured that our readers will permit us to announce this work as published. Many years have passed since a novel by this lady has been issued; consequently, in this work will be found much of the result of experience, combined with much that cannot fail to interest in character, incident, and story. The author has established a reputation, and has laboured to uphold it.

THE ART-JOURNAL.

LONDON, SEPTEMBER 1, 1857.

TINTORETTO AT VENICE,
AND MR. RUSKIN.*

URING a recent sojourn at Venice, it very soon became one of the prime objects of our gondoliering rambles to find out the more important pictures by Tintoretto, and several obscure out-of-the-way churches, but rarely visited, did we penetrate for that purpose. Mr. Ruskin was, of course, our principal guide, and, indeed, partly our moving power in these little urban voyages of discovery. With much admiration and profit had we read more than once his eloquent elucidations of the marvellously varied and profound observation and exquisite truthfulness of our own Turner; and now we exceedingly wished to avail ourselves of the present opportunity of testing the value of that which may be called his second grand favourite discovery (whether real or imaginary), namely, the unrivalled depth of imagination and peerless general power of Tintoretto. We were keenly desirous of verifying with our own eyes those astonishing descriptions of his by comparing them face to face with the pictures described; and, especially, we wished to satisfy ourselves of the clear, unmistakable existence and pictorial value of those singular conceptions of incidents, or motives, which he regards as supreme masterpieces of imaginative art: and so, with many extracts from his chapter on "Imagination Penetrative," and appendix to "The Stones of Venice," neatly written out in the very van and front of our note-book, we proceeded through the inquiry, the results of which may perhaps be not uninteresting at the present time, or wholly useless in aiding to determine the question thus raised with regard to Tintoretto's proper rank among the great sons of Art. In such topics much that is advanced is, no doubt, to be received as mere matter of individual taste or opinion, which does not prove or settle anything; but in this case it especially happens that Mr. Ruskin's admiration is chiefly founded on certain ideas or incidents in Tintoretto's works, the existence and the merit of which, *on the grounds set forth by him*, are susceptible of distinct affirmation or denial, and decisive controversy; and it is solely from accuracy with regard to these demonstrable points that what we are about to put forward will derive any value, so far as Mr. Ruskin's opinions are concerned. However, it is by no means our intention to limit

ourselves within his footsteps; and we are not without hope of making the subject additionally attractive by such an account of our own unbiassed impressions of this extraordinary painter, as may—without, we trust, passing the bounds of accuracy and due moderation—tend in some degree to interest the imagination of those who have not visited Venice, and rekindle in a pleasant and welcome manner the memory of those who have. With this latter object in view, it may be as well to set out with a few very brief observations on the early career and peculiar characteristics of the painter himself.

Tintoretto has usually been styled a pupil of Titian's, but improperly, since he attended that painter's studio during ten days only. At the end of this brief initiatory term, Titian observing some very spirited drawings displayed in the working room, inquired whose they were, and on being answered the young Robusti's, the "little dyer's," without assigning any cause for so sweeping a measure, he told one of his scholars to take the boy home. Tintoretto, nowise disheartened, but rather nobly fired by what he interpreted as a high honour, thenceforth remained without any personal instructor. Confined, as we are told, by poverty to a mean and inconvenient lodging, but burning with ambition not only to rival all that Venetian Art was then accomplishing, but to add to it an infinity of things which it seemed to him to want, he commenced those indefatigable, those strenuous studies, which are so abundantly characteristic of the energy of the man. Over the door of his room he then inscribed that spirited though anomalous precept, "Michael Angelo's design and Titian's colouring;" and to the study by daylight of every picture he could meet with by the latter, was added far into the night laborious drawing from casts of the great Florentine's sculptures and from the antique. These casts he would swing by cords from his ceiling, and draw from every conceivable, and indeed inconceivable point of view, so as to acquire a mastery of the most difficult foreshortenings. Anatomy he studied with equally devoted earnestness, and having (it is said) first drawn from the best Art-models to acquire a fine style, he then copied the life, remedying its defects by the knowledge they had afforded him. With regard to light and shade, he had recourse to some rather whimsical contrivances of his own. He made little figures, which on occasion he clothed carefully, and placed within a paste-board house, having windows everywhere, which he could open and shut, so as, by the aid of a lamp, to illumine the puppets within in any way that was needful. All this industry was rewarded by a power and mastery over the various technical resources of his art never surpassed or equalled, except by Rubens; and as to this high proficiency he added a fertile and daring imagination, and a professional zeal which impelled him eagerly to grasp at every worthy undertaking, with little or no regard for emolument, he gained, whilst yet a young man, a position which justified him in considering himself the acknowledged rival of the great painter who had driven him away from his studio so unworthily. Tintoretto's besetting defect, on the other hand, was a frequent want of patience and judgment commensurate with his other high powers; and, above-all, a rage for producing too much—for rapidly covering immense spaces of canvas with bold, vigorous, and animated conceptions—for painting houses literally from top to bottom, which he is said to have once eagerly proposed doing for the mere cost of his materials. Sebastian del Poimbo once said of him, "Why, the man will dash off in a couple of days what would take me as many years;" and Paul Veronese, his ardent admirer, would remonstrate with

him for injuring the credit of the different artists by taking up and shining in their respective styles or manners one after the other,—a mode of proceeding which went far, he soberly added, with a shake of the head, to destroy the reputation of the profession. His own credit Tintoretto certainly injured by these habits of swift and sweeping production and ambitious versatility; for the Venetians, in commenting on the inevitable inequality which resulted from them, were wont to repeat a current saying, that he had three pencils, one of gold, one of silver, and the third of iron—a saying so well known, it perhaps might better have been here omitted, only that it may be convenient hereafter sometimes to classify the painter's productions according to these three fabled instruments.

Neither was Tintoretto's spirited character displayed in purely artistic matters only. His self-command in painting after her death the portrait of his beloved daughter, Marietta, who, as an accomplished portrait-painter, had inherited some portion of her father's talents, is well known; as also his manly hint to Aretino, when he found himself becoming the butt of that writer's scurrility. The "Censor of the World," or the "Fifth Evangelist," as he was variously styled, having taken his gossip Titian's part against Tintoretto, began to besmear the latter with his ink freely. The artist at the time made no reply, but took an early opportunity of inviting him to sit for his portrait. Aretino complied without suspicion, and most probably with a pleased vanity; but he had not long taken his place before he was somewhat disconcerted and alarmed by seeing Tintoretto carefully take his measure at different distances and angles. "Eh, Jacopo, what are you about?" he inquired, anxiously. "Nothing important," replied Robusti, with a significant smile; "but I now fully perceive that you measure just two pistols and a half high,"—and Aretino did not venture to lampoon Tintoretto any more; these ominous words had the desired effect. With this firmness and decision of character the painter combined many most amiable and companionable qualities, to which Vasari especially bears lively testimony, dwelling with much emphasis on his remarkable powers of conversation and skill in music.

Until recently the opinions current amongst us about Tintoretto as a painter, were, we believe, that he was a man of extraordinary power in many of the more superficial things in Art (if we may so call them),—such as bold drawing, colour, bodily action, effect, and also possessed of a fine, vigorous, and daring invention; but unless we widely err, few ever thought of looking for profound and lofty thought as among his leading characteristics, or of ascribing to him a poetic imagination of the highest order. It was reserved for Mr. Ruskin to claim this distinction for him; to discover, or glory he had discovered, his greatness and his glory bound to the wall (Prometheus-like) amidst the obscurity, the neglect, the damps, and the decay of La Madonna del Orto and San Rocco; to determine to free them forth, and, seating them between the wings of his aspiring eloquence, endeavour to mount them all at once on the highest peak of the Italian Parnassus, above all but Dante and Michael Angelo—Tintoretto being in his opinion the greatest man but those that Italy has produced.* The very name of Tintoretto seems

* "I think that the central man of all the world, as representing in perfect balance the imaginative, moral, and intellectual faculties, all at their highest, is Dante. The two other greatest men whom Italy has produced are Michael Angelo and Tintoret."—*Stones of Venice*. With regard to Dante, it may be observed, by the way, that many will think his moral faculties (under whatever palliating circumstances) rather light in the supposed balance, from his fierce hatred and bigotry; and his intellectual much too heavy with the scholastic theology and imperialism. With regard to Tintoretto, it may be as well to

* 1. "Modern Painters," by John Ruskin.
2. "The Stones of Venice," by John Ruskin.
3. Ridolfi, "Le maraviglie dell' arte; ovvero le vite degli illustri pittori Veneti e dello stato."
4. Vasari, "Le Vite del più eccellenti pittori, scultori, ed architettori."

to excite and swell his style to its highest tone, and make it resemble the firmest and most imperial brattlings of the trumpet of Fame itself, for which he is evidently somewhat too apt to mistake it. He proclaims him, to our astonishment, as one whose high-reaching intellect and "imagination penetrative" leave those faculties in all other painters far behind; as one who alone has seized the inmost spirit of the most awful and stupendous themes; who alone "has grappled with them in their verity," not contenting himself with the occurrences of the moment merely, but introducing strange occult typical allusions in his details, and dashing in also dim visionary retrospections and anticipations, disregarding time and place even, like the freest and most untrammelled poet, so that he may tell in a solemn, mystical manner the whole of the great story or sequence of events at once. Such thoughts, however, it immediately occurs to us, are far better suited to the poet of the pen than to the poet of the brush, who has another and a distinct function, in which the bard can by no means rival him; and some of these conceptions attributed to Tintoretto are *self-evidently* the exaggerations of his eulogist, being indeed of that class which painting cannot possibly express: others, again, stripped of the amplifications and colourings of the critic's fervid, torrent-like eloquence, seem to us to grow wonderfully small and poor and dry, and to dwindle into fantastical subtleties, curiosities, and trifles, of which he singularly magnifies the interest and value, as well as the power of invention required to produce them. And, finally, some of these illustrations of Holy Writ, though ushered to our notice with praises of their wonderful insight and profundity, uttered in that authoritative, high-priestly, or hierophantic tone which Mr. Ruskin is fond of assuming, are, as we believe we shall have little difficulty in proving, exceedingly bad theology, and altogether at variance with the true spirit of the event recorded. But notwithstanding all these obvious drawbacks and objections,—though, when we can take breath and look a little steadily into these dazzling and accumulative periods, dissent or doubts of the above kind must needs intrude themselves,—still a writer so observant, contemplative, and ingenious, so abundantly eloquent, and of such undoubted literary power, must ever excite considerable curiosity and interest with regard to the objects of his praise; and so, after reading those passages in which the great discovery of Tintoretto is first fully announced, one of our most frequent Venetian anticipations was the forming, under his local guidance, some clear and satisfactory acquaintance with the works of that powerful painter.

say here that we have just found in Moore's Diary a tribute of admiration paid to Tintoretto by two eminent men whose opinion is entitled to high consideration. "Reminded by Chantrey," says Moore, "of my having asked him, when we were on our way from Italy together, which of all the great painters, whose works he had there seen, he would most wish to have been, and his answering 'Tintoretto,' he himself, as he now mentioned, put the same question to Turner after his return from Italy, and his answer, curiously enough, was exactly the same. Chantrey, in relating the above, seemed to think that if he himself could have given the matter a little more consideration at the time when I put the question to him his answer would have been 'Titian.'" With regard to both Chantrey's and Turner's opinions, in order that some little instruction might have been obtained from them, it is a pity the *why* was not asked. Certainly Tintoretto possessed—and perhaps pre-eminently amongst the Italians—those very powers which Turner most needed, that *power of drawing* and muscular strength, wanting which our great landscape-painter's forms are so often poor, and stiff, and tame. Mr. Ruskin is perpetually mistaking Turner's keen perception of the principles of structure, and neat, precise, though frequently tame particularising of them, for fine drawing. In fact, his drawing (examine especially his own etchings in the "Liber Studiorum," or compare any of his foregrounds with that of "Rubens's Chateau") is weak for so great a man. One can easily understand, therefore, that he might most have coveted Tintoretto's powers *in addition to his own*; but it is not so easy to comprehend an absolute preference for them on his part, without some such qualification.

The life-like force and brilliancy of his talents, we remember, first fairly dawned on us on the way to Venice, from his portraiture in the Belvidere Gallery at Vienna, the first two halls of which glow all over with such a magnificent display of Venetian colour, and calm dignity, and intelligence, and sunny beauty, that we should think, though no doubt it is very much to say, even Austrian emperors, even Francis Joseph, even Austrian diplomatists and military leaders, could scarcely pace them without feeling something of mournful compunction and shame for what Venice now is under imperial domination. Here are no less than twenty-three portraits by Tintoretto, inferior, it must be admitted, to Titian's best in *refinement* of expression and also of painting, yet of the true Venetian serene stateliness, and consummate for force both of living character and execution. Their vigour and animation are rarely equalled by anything we ever saw. In portraiture, where he was restrained from besetting extravagances by the necessity of a close and pure rendering of nature, Tintoretto seems to have been almost unfailingly admirable—ever with his golden pencil in hand.

The "Miracolo del Saviav" in the Academy, the first of his pictures we saw at Venice, and to which we shall return presently, Mr. Ruskin has not expressly alluded to in his published volumes, perhaps considering it sufficiently well known and appreciated already; but the two small Tintoretto's opposite to it, "The Temptation of Adam" and "The Death of Abel," he refers to as "among the most noble works of this or any other master, whether for preciousness of colour or energy of thought." Here at once commenced our difficulties, and we were at a loss to conceive by what particular topics such an opinion can be maintained. The colour of the Adam and Eve can hardly be called *colour* in a full sense of the term, the flesh tints being a warmish stone-colour, and the landscape all a yellowish-brown of monotonous hue—the whole picture, in short, of a decidedly artificial, umbery tone. Now Mr. Ruskin, as all his readers well know, is apt to inveigh copiously and exceedingly against brown tones in the later schools of painters, which he abhors so vehemently; and yet here, at once, we find this most unquestionably and very decidedly brown picture by his favourite praised as one of the noblest in the world for preciousness of colour! With regard to his second item of praise, the only "thought" of the slightest importance we could discover is a certain expression of mingled reluctance and fascination in the attitude of Adam, who sits with his back towards you. The Eve, who, seated beside him, presses forward the apple, has an absurd, loosely-sketched face, with nothing that can be called a physiognomy about it; and her limbs, as well as those of Adam, are very badly drawn, and the execution is sketchy indeed, but most disagreeably heavy and coarse,—for Tintoretto, whatever may be said of his general powers as a painter, had often a bad, clumsy touch. In the companion picture, "The Death of Abel," all you can see is a meagre, ill-shaped man sprawling under the murderous gripe of a desperate ruffian of the same ordinary character, with nothing about either of them to distinguish this, the first murder, from any homicide ensuing, except the calf's head, which, with the glazed eye of death, lies beside them, to signify the interrupted sacrifice. In colouring and execution this picture precisely matches the other.

Oh that riddling "energy of thought!" It was *then* (we dimly remember) humiliating to us to stand ever so long before those pictures with the best and most patient intentions in the world, and not be able to find it out, or even make a guess where it lies, except such a one as we were forced immediately to check

for its far-fetched triviality. In order to relieve our perplexity, let us hasten at once, we said, without more ado, to La Madonna del' Orto, where is one of Tintoretto's "mightiest works," "The Last Judgment," some of the thoughts in which Mr. Ruskin *has* pointed out and expatiated upon: there surely we *may* be able to follow him now and then, if only at a humble and halting distance.*

So to La Madonna del' Orto we went, a pseudo-Gothic church of but slight architectural merit: there is no *church* in Venice, except St. Mark's, worth going far out of your way to see. It is situated at the north end of the city, where the canals are thinly peopled and very retired, and you meet with few but the poorer and the idler of the aborigines—old women sitting within their doorways, and children loitering vacantly about the tiny slender bridges, which are here often ruinous, and grass-grown, and solitary, and decrepid, like the fine and truly amiable old mansions they lead to; or like this church of "Our Lady of the Garden" itself, which is in so rickety a condition as to require within the support of a whole forest of scaffolding. Beside the high altar we found the Tintoretto we came to see, his "Last Judgment," an immense work, at least sixty feet high. Truly it is extremely unprepossessing in all that relates to *pictorial* beauty and effect. In general tone it is a heavy greenish brown, with lights but dim, and broad masses of the dingiest obscurity, out of which mysterious crowds of figures and limbs peer forth at the bottom of the picture in a confusion not easily unravelled. It seems as if the earth were everywhere yielding forth substance which once bore the human form, and restoring it to its original shape. It is taking the form of arms and legs, and still slumbering or bewildered faces; and creatures scarcely yet re-fashioned, with grassy sproutings about them, lie thicker in the dim shade than graves in some old *campo santo*. Behind them, and somewhat aloof, the waters also seem (so far as we could

* Mr. Ruskin's opinions given without his reasons are really sometimes very puzzling. He is quite tantalizing in his mysteriousness. To take a home instance from a picture familiar to us all, Millais's "Autumn Leaves," of last year's Academy, without one word of explanation, he pronounces to be the most poetical work of the master. What, more poetical than the "Lorenzo and Isabella," and "The Huguenot," those mawkishly sentimental school-girls, piling up very ill-painted leaves in a manner in which no girls ever did pile them, unless their minds were thoroughly diseased by morbid and maudlin literature and culture in all their various shapes! In what the poetry consists we ourselves never could so much as guess, or learn of any of our equally solicitous friends. Is it, we inquired of each other, intended as a *satire* on the vanities of the present picked age, in which young ladies (thanks to Mrs. Ellis and others) are far too intellectually trained to do such things in the old rollicking way; no longer pushing one another into the heap as they pile it with screams of mischievous merriment, or any other ungraceful impropriety? But this (and we could think of nothing else) would be satire and not poetry. Besides, in that case, the purpose of the painter would surely have been more fully indicated. The refined culture and general habits would have been pointed out by the "Proverbial Philosophy," &c. &c., being laid on the grass beside the mediæval embroidery; and the tall lean *gouvernante* introduced behind as pervading the scene with even more imposing evidences of solemn seriousness in her immense uplifted evening-star-gazing eyes. At least we should think so in our simplicity. With regard to the tone and general effect of this picture, Mr. Ruskin's observations are equally remarkable. Twilight, he says, had never been represented before. Giorgione had given the glow, but not the mist rising from the valley. Now the twilight tone is not by any means preserved throughout the picture in a satisfactory manner; certain gaudy colours here and there flaming or flushing far beyond its influence. However, we concluded at once, on perusing the last clause of Mr. Ruskin's verdict, that something must have been made of the mist rising from the valley, at all events. We expected, on a second visit, to find that this beautiful and interesting effect had been brought forward prominently, with much fulness and delicacy of treatment; but what was our surprise to discover nothing, absolutely nothing, more than a little scumbling or glazing of white in front of a black hill; so small in extent, so slight, and so destitute of any particular feature or character, as scarcely to be worth a moment's notice. Thus does the ever quick fancy of this writer frequently run away with him in expatiating on the pictures of his favourites for the time being. But might not, we ask, equally liberal and ingenious interpretation make something out of even the detested Domenichino, Salvator, and the other "later men?"

see) yielding up their dead; and a boat—a barque of accursed souls—is urged down a swift, pale cataract. Above, and nearer than this, the upper half of the huge tower of a picture is taken up by a coarse unworthy representation of the heavenly hosts, angels and saints, ranged somewhat tier above tier on the most substantial dark blots of clouds with a faint light between them, and our Saviour quite afar at the top, in the point of the Gothic arch which bounds the picture.

Such, vigorously conceived, certainly, within a limited point, but most coarse and ungainly in expression, colour, light and shade, and execution, is the painting which Mr. Ruskin says is the only one in which "this unimaginable event has been grappled with in its verity." Is not this an Irishism (by the way) to say that the event is "unimaginable," and then add in the next words that "it has been grappled with in its verity." However this may be, it certainly seems, as if, stimulated by the delight and pride of a discoverer, and by a consequent overwhelming predilection for Tintoretto, his imagination had altogether run away with him when he penned his highly-wrought and brilliant descriptive passage on the subject. All its more novel and impressive parts are, self-evidently, arbitrary interpretations—imaginary superstructures of his own. They are not borne out by the picture, and, indeed, could not be by any picture. For instance, a spirited waterfall enough in the background (about on a par, we should think, with Colwith Force, in Westmoreland), he has thunderingly magnified into the "oceans of the earth and the waters of the firmament, gathered into one white ghastly cataract, the river of the wrath of God, roaring down where the world has melted with its fervent heat." In this uncontrovertibly exceedingly dingy work the awakening crowds are represented as "blinded by the white light of the new heaven;" and the firmament is described "as full of a very dust of human souls," currents of atom life in the arteries of heaven, "soaring up till the eye and thought can follow no further, borne up by their inward faith and by the angel powers invisible." These fine things, and particularly those which are expressly admitted to be *invisible*, are, it is scarcely needful to add, not in the picture: they are not susceptible of pictorial representation; and they prove the imaginativeness not of Jacopo Robusti, but of Mr. Ruskin. The painter has given him a starting-point, and he has soared quite far away from it, without, perhaps, being altogether aware of the exceeding length of his excursion. And heaven forbid that we should snub the poetic mind. Let Art as well as Nature be its food, and afford it the fullest and freest inspiration. All we contend for is that the result should be carefully distinguished as original poetry, not sober criticism. Let it be recorded in verse, or if not in verse, in some autobiographical work, or sentimental tour, or memoirs of your own imagination and feelings in prose; as thus:—I, the present author, being of an active, readily excited fancy, and looking at this picture, was fired by such and such excursive thoughts:—and thankfully we should receive them, *as the writer's own*. If beautiful, it were a thousand pities to lose them. But what we seriously object to is that such arbitrary assumptions of the fancy should be introduced into passages written for the express purpose of enabling us to estimate the imagination of another. And moreover, together with the extravagant praises with which they are put forth by their author, they of course tend, quite inevitably, to disappoint and disgust the independent mind with the painter whose works give occasion to them; and in that weaker fry of followers who accept implicitly all that is thus eloquently taught, they create a blind admiration, such as entails much weaken-

ing of whatsoever powers of imagination they may possess, much confusion of mind, much waste of feeling, thought, and precious time. Besides, their docile veneration for their gifted teacher deserves a better return than that he should lead them about on a false scent, and with his revered eloquence keep on evermore throwing quantities of gold-dust into their eyes. The British public, we protest, should not be treated in this manner; in short, these extremely exaggerated descriptions lead to an utter confusion of ideas upon a most important part of the subject, which it was one of the primary duties to make clear.

Opposite is another sixty feet of unpleasant canvas, "The Worship of the Golden Calf," in which uninteresting figures, harsh colouring, heavy light and shade, and coarse execution, are, it seems, as a veil to other "mighty thoughts," worthy of being *vis-à-vis* to those in the picture of the "Final Resurrection;" but we did not attempt to decipher them, being attracted in another direction by an altar-piece in one of the side chapels of "The Martyrdom of St. Agnes," also by Tintoretto. Here are attractive thoughts indeed; thoughts such as a picture, and a picture alone, can express; thoughts of magnificent colour and beautiful light and shade, of personal character, and of bodily expression. The saint, in white drapery, with her white lamb beside her, is kneeling on the ground, awaiting her death, amidst a most splendid crowd of figures—nobles in the armour of Tintoretto's times, and priestly and civic dignitaries, all painted with a richness and completeness of effect that vie with Paul Veronese, to say the least of them; the colouring being noticeably more yellow and more deep than his, and the effect more round, solid, and forcible. In all these respects, and in many others, though with a somewhat drier manner, the work reminds one at once of Rubens, the heir of much of Tintoretto's genius, and his only worthy successor, who visited Venice six years after his death, and, no doubt, derived much inspiration and deep and delightful instruction from this picture. It is painted in the magnificent and attractive manner of the master, and so far is to be classed with the "Miracolo del Schiavo" in the Academy, that immense picture produced in his thirty-sixth year, which is so often the first in Venice to impress visitors with a kind of wondering respect for the colossal vigour and brilliancy of Tintoretto. The subject may be thus described:—A certain pious slave of a Provençal knight persists in visiting the relics of St. Mark, in defiance of his master's commands, and on his return the enraged knight has him put to the torture. But behold, before they can carry their purpose into effect, the cords and instruments are miraculously shivered by St. Mark, who descends through the air, unseen, to baffle them. In the picture the naked slave lies senseless on the ground, and St. Mark hovers above, foreshortened, his face away from you. His most boldly represented action, the fine sanguine but sombre glow of his flying drapery, and the mysterious shadowings of the rest of the figure, are magnificent, but ominously so. The glory round his head flames, one may conceive, all angrily, as if it shot forth sharp burning terrors into the hearts of the torturers beneath; and under one arm he bears the volume of his Gospel, as if it were still, in the realms of blessedness, his chief glory and delight. But already his mandate has shattered the cords and instruments of persecution. Small fragments of rope are scattered around, and the iron head of a hammer has been stricken clean in half in its massiest and strongest part—a decidedly vigorous touch, significant of the amazing power that has been thus exercised. In the middle of the picture, a fine picturesque turbaned Saracenic figure holds up before his

enthroned Lord another broken hammer, to demonstrate to him the more emphatically the reality of the astounding visitation; whilst the bystanders crowd forward and bend over the senseless victim with emotions of curiosity, awe, and newly-awakened reverence. He lies calm in a swoon before them. Perhaps the miraculous power of the saint, which has thus frustrated his torturers, has, even at the same time, benignly steeped him in a childlike, soft-breathing, balmy slumber, to nurse and guard a life worn by much suffering. But this is, of course, a mystery.

Altogether it is an imposingly powerful work, much to be admired for the forcible and animated general conception of the *scene* or incident; for the colossal vigour of the execution, most simple, broad, and energetically straightforward; and for the strength, glow, and transparency of the colouring, which is yet finely pervaded by a general yellow-greenish tone, as by a kind of faint and transitory eclipse; as if the miraculous interposition of the saint had cast an ominous shadow and wanness through the air. The hues at first reminded us of a bed of dahlias, glowing and fresh indeed, but influenced by the shadows of passing thunder-clouds.

The fulness and depth of the foreground hues are relieved by aerial architecture, like ivory in yellow sunshine; and here, perhaps, we see the original of an arrangement which became almost habitual with Paul Veronese, and not unfrequent with Rubens. The colours, few in number, are repeated in unvaried masses in the Venetian manner, without the never-ceasing variety and modulation characteristic of Rubens. They are deep, luminous, highly transparent, and perfectly harmonious; but (like every other painter's) they are inferior to the great Fleming's in that which represents the very bloom, freshness, and pulses of life; nor is the execution comparable to his for the union of exquisite lightness, softness, and roundness, with marvellous fire and force; and, therefore, Tintoretto, notwithstanding his extraordinary merit, we, with all due deference to Mr. Ruskin, take to be the far inferior painter, in the proper sense of the term. We also take him to be equally inferior in poetic vigour of imagination, and in that exhaustless fertility of the true pictorial invention in which (with much *grace* and beauty of many kinds, veiled by his unfortunate coarseness of *form*) Rubens is perhaps rivalled by Raphael alone.

These last two pictures were limed with Tintoretto's "golden pencil," no less surely than those we are about to refer to were delineated with his "pencil of iron," or rather his leaden one—we do not mean that highly respectable medium *black-lead*—so heavy and dull are they. In the following instance amongst these, the thoughts praised by Mr. Ruskin are undoubtedly to be made out in the picture; but then they are really thoughts so poor, trivial, and valueless, as to render it marvellous that admiration should have been firmly and confidently bestowed on them. In a "Stoning of St. Stephen," in San Giorgio Maggiore, the future St. Paul is distinguished from the others about him by being clothed in the same colours as the figure of the Almighty above. "It is almost impossible," observes Mr. Ruskin, "to praise too highly the refinement of the conception which marked the dignity to which St. Paul was afterwards to be raised, by investing him with the colours, which occur nowhere else in the picture, except in the dress which veils the form of the Godhead." Marvellous praise! Surely, this is the thinnest and weakest of all conceits that ever were conceived. Raphael, in that noble dramatic manner which characterized his "thoughts," would, if bent on a similar object, surely have pointed out Saul as the one afterwards chosen, by marking in

him a consciousness of zeal, an uprightness—a something, at any rate, in his *mind* and *character*, exquisitely distinguishing him from the others, not by so trivial and extraneous a thing as the colour of his garment. Well, we hoped, however, that Tintoretto's picture might have something to recommend it besides these two flimsy streaks of a "little dyer's" fancy, and a certain other most dry conceit of a similar order ascribed to it. Absolutely, it has nothing. It is a *marvellously* rude, coarse daub, with figures absurdly, grotesquely devoid of character and expression; and most weak pelting, moreover, for, notwithstanding a whole cart-load of stones scattered about him, the proto-martyr seems as yet but slightly injured. There are several paintings of this class, in which the apostles are rude coarse men, *rolling* and *tumbling* about on their seats, in difficult postures, in rooms (like a modern Italian inn) set out with difficult perspectives, and in which the cold ashy and black colour and daubing, as well as everything else in them, are most ungainly and repulsive; but some fantastical incident or "motive," ambushed in the shade, is frequently found out by the indefatigable, ever active-thoughted critic, and adduced as raising them into interest and importance; or the merit of some very coarse attempt at an effect in them, or of the painting of some single piece of detail, is singularly exaggerated by him. We almost wonder, indeed, that he should give up "The Last Supper," at San Trovaso, to the tender mercies of Dr. Kugler, since it is, really, but little or not at all worse than some of the pictures that please him. The doctor, after remarking on the burlesque gestures of the apostles, adds, that one of them "does not perceive the cat who is eating from his dish; and that to judge from an overturned chair, the revel seems to have been of the lowest description." Gently, Dr. Kugler, gently; have, we pray you, more reverence for the sublime mysteriousness of "Imagination Penetrative," and for a mode of treatment which is, perhaps, purely typical. Do you not perceive that those two last circumstances are, in all probability, symbolical, and of the deepest import. That fallen rush-bottomed chair, which forms one of the most conspicuous objects in the picture, let us not rashly find fault with it. May it not be intended to fill us with solemn thoughts of the fallen Judas who has just relinquished it? Is it not a sufficiently significant type of him? and the cat so slyly filching from the platter, is not that one of the most pregnant and "suggestive" images of deceit and domestic treachery that could possibly have been hit upon?

But, by-and-bye, the painter of these repulsive daubs, having fairly succeeded in putting you out of humour with him, all on a sudden lays down his leaden pencil and takes up his golden one, and makes his friend Paul Veronese a *little* unquiet, but charms every one else by painting the beautiful and every way pleasing "Marriage of Cana," in the sacristy of Santa Maria della Salute—a work which may almost console Venice for the loss of Caliar's vast picture of the same subject, so long since removed to Paris. Mr. Ruskin well describes its leading features. "You look all up the table; the marriage-guests," he says, "on each side of it; on one side men, on the other women. The light falls in full length along the line of young Venetian women, who thus fill the whole centre of the picture with one broad sunbeam, made up of fair faces and golden hair. One, who wears a white head-dress of lace and rich chains of pearls in her hair, may be well accepted for the bride. There are beautiful profiles and bendings of breasts and necks along the whole line. The men are subordinate, though there are interesting portraits among them." This perspective of ladies,

lovingly, gallantly singled out and distinguished by a soft, warm sunbeam, is truly a delightful idea. The picture is one of the painter's most charming works, very decidedly a golden pencilled one, and one of those which we should certainly insist on dragging our most hurried friend to look at. If he had more time, we should take him to that dim chapel of La Madonna del Rosario, at Santi Giovanni e Paolo, that he might see on the ceiling melancholy obscurity enveloping a grand jubilant display of the celestial beings—a court day in heaven!—which looks as if it vied with Veronese in magnificence, and were something beyond him in life and vigour. And if he had plenty of leisure, it were perhaps as well to visit the Carmine, to note in an altar-piece of the Circumcision how closely Tintoretto would sometimes emulate the softer, deep rich colour and manner especially characteristic of Titian. But assuredly, under any circumstances, the visitor must not deny himself a few hours in the Scuola di San Rocco, since there alone can Tintoretto's peculiar style of conception, and huge swift dashing manner of painting be seen in full congenial play and energy. The three halls of the building are covered throughout with pictures by his hand, in number sixty-two, and most of them very large, the figures being all the size of life. The fraternity of the Scuola, an association chiefly of laymen, established for charitable purposes, became, in 1560, the patron of this painter, and here he continued to work during eighteen years. The badness of the light, according to Mr. Ruskin, accounts for the coarseness of the execution of most of the pictures. "They are all," he says, "painted for their places in the dark, and are for the most part nothing more than vast sketches, made to produce under a certain degree of shadow the effect of finished pictures. No other series of his works exhibits powers so exalted." "The Scuola di San Rocco," he writes, in another place, "as regards the pictures which it contains, is one of the three most precious buildings in Italy—buildings, I mean, consistently decorated with a series of paintings at the time of their erection, and still exhibiting that series in its original order. I suppose there can be little question but that the three most important edifices of this kind in Italy are the Sistine Chapel, the Campo Santo of Pisa, and the Scuola di San Rocco, at Venice; the first painted by Michael Angelo, the second by Orcagna, Benozzo Gozzoli, Pietro Laurati, and several other men, whose works are as rare as they are precious, and the third by Tintoret." There is a fourth building, the Vatican, containing the Stanze and Loggie of Raphael, which will immediately occur to most readers as an involuntary omission here; but, remembering Mr. Ruskin's intense dislike of Raphael, as the imagined chief corrupter of art from religious purity to mere pride and heathenish sensuality, we have no doubt it may be safely assumed that the omission was actually intended, and that he really means "there can be little question" these things of Tintoretto's are of superior importance to the Disputa del Sacramento, the School of Athens, the Heliodorus, the Incendio del Borgo, the Bible Series, and all the other larger frescoes, the Sistine tapestries, and the lovely ceilings and lunettes with which the marvellous invention of the young man of Urbino decorated the halls and galleries of the popes. Yet it was a little too cool and disrespectful to general opinion to dispose of the matter with so brief and off-hand a phrase. To enter upon any discussion of it here would detain us too long, so we must content ourselves at present with summarily but mildly expressing our amazement that the strange fancies and dry conceits scattered through these pictures by Tintoretto, their inappropriate, inexpressive, and

wholly unimaginative *figures* and coarse painting, should be preferred to the pictorially-delightful thoughts of Raphael, to his profound and clear dramatic expressiveness, his lovely and sublime poetry of invention, his truly noble majesty, his peerless beauty and grace.

The first picture that seizes attention is the "Annunciation," respecting which Mr. Ruskin says some profound-sounding things in his chapter on "Imagination Penetrative." He has discovered for our edification that the Virgin sits before a ruined building, typical of the Jewish dispensation, the corner-stone of which has been made the headstone of a mass of brick-work newly-risen in the foreground, an emblem of the Christian dispensation. Stripped of the imposing luxuriance of Mr. Ruskin's favourite poetico-theological phraseology it is difficult, we conceive, to imagine a duller or dryer notion, or one less fitted for the true purposes of Art than this. Still, we thought it not altogether improbable that there was something in the picture to atone for it, but never were we more disappointed than by the repulsive rudeness and hideousness that presented themselves. The Virgin is a very coarse, ugly woman ("Why, a washerwoman! a washerwoman!" exclaimed our discriminative friend, as we approached her, declaiming the high-flown Ruskinian commentaries), sitting in staring affright before a square pillar of brick and plaster, of the most common and vulgar description, with an ordinary rush-bottomed chair and a crib beside it; and these objects, with other rubbishy ruins behind, and a jet, or stream of very strange, heavy, and gloomy cherubs rushing towards the Madonna, are all that you can make out in this large picture, in which the figure is at least of the life-size; the rest is mere blotch and shade. Mr. Ruskin himself, however, it should be candidly admitted, highly as he admires the incident above referred to, in some degree apologises for the coarseness and painful turbulence of this picture; but, unfortunately, many of the other works are characterised by the same defect; though few, perhaps, in the same degree, except a Resurrection in the hall up stairs, where, with a singular refinement of conception, Tintoretto has represented the angels as sprawling most distressfully under the weight of the gravestone which they are endeavouring with strenuous muscular efforts to uplift.

The next of these pictures on which Mr. Ruskin expatiates is a Baptism of Christ, which he pronounces the only expressive representation of the subject he is acquainted with. He then proceeds to describe what may be called a strange phantasmal conception, a wild and gloomy one, in which the figure of St. John is indistinct; but a harpy-shaped fiend appears "waiting his time," and a mysterious hand holds a typical net, and angels stand on a typical cloud, shaped like the head of a fish, the well-known emblem of the baptismal sacrament, &c.; and the landscape background is partly cut away to afford a wild, melancholy prospect of the immediately-ensuing Temptation. These morbid, night-marish notions, and dry emblematical conceits, where the main subject is shirked, and half merged in another event, which, though it succeeded in point of time, has no affinity or harmony with it in *character*, are, in the usual style, proclaimed to be the only intensely imaginative and impressive treatment of the subject, and the attempts of all other painters on the same theme are (by a rhetorical sacrifice frequent with Mr. Ruskin) pronounced but feeble and uninteresting. "The event," he says, "is ineffable on the features." Without stopping to inquire why it should be considered so, more than any of the other leading events of Scripture, we would simply content ourselves with asking whether Mr. Ruskin has overlooked the "Baptism," by Francia, at Hampton Court? It is

weak enough in drawing, certainly, as might be expected from Francia, but the reverential tenderness in the features of St. John, and the meek submissiveness in those of Christ, are surely anything but feeble and uninteresting; and a touching spirit of peace and love is everywhere—first and chiefly in the affectionate eyes of men and angels, and secondarily in the serene purity of the attendant sky, on the resting trees, and the rocks (tender and gentle in feeling, however feeble in design), and in the water, the stillness of which, supporting the Saviour like a floor of glass, shines with the azure and gold of the heavens, and with the dove-like form of the Holy Spirit mirrored from above with at least its own brightness. This last image, vividly pictured in the baptismal water, is not altogether amiss as a "thought;" but it derives its value principally from its pictorial beauty, as an intense expression of purity and bright repose, such as is always pleasing in itself, and here especially, in harmony with the subject; but where the Holy Spirit is already apparent, enthroned in the countenances of angels and men, we scarcely want it signified by a conceit in things inanimate. Nevertheless, the object here is in itself beautiful and interesting, which is more than can be said of Tintoretto's cross-shaped net and fish-shaped cloud. And can it be maintained that Tintoretto's general conception of this subject is truly characteristic and imaginative? was the moment when the heavens opened, and the Holy Spirit descended as a dove, and the voice said, "Thou art my beloved Son, in whom I am well pleased," a moment of gloom, and wildness, and melancholy portent? Would it not have been far better to paint it in colours drawn altogether from some cloudless roseate morning; as the emergence of the Sun of righteousness, as the event of all others most auspicious of joy, and peace, and happiness to man? It is, indeed (let it be said once for all), quite absurd to say that Tintoretto avoided the usual modes of conception because of their weakness and unimaginativeness. He avoided them because of his own weakness and unimaginativeness. It was utterly beyond him to see the faces of John the Baptist and the angels with the far-upward piercing gaze of gentleness and love as Francia has done. He had none of the "fair humanities of old religion" in his powers of Art, and very little, if any notion, generally speaking, of the expressiveness and power of the human countenance, in which thought and feeling, tenderness, pathos, and grandeur, have their chief seat; and so he was driven to have recourse to the poor substitution of strange and trivial fantasies in things secondary. Yes, from Francia's humble, serene, tender-hearted rendering of the entire subject in its own true spirit, one turns with tart disrelish to Tintoretto's shirking of its so-styled ineffable features, and avoidance of their sweetness and heavenliness in coarse *diablerie* and dry emblematical enigmas, as described by Mr. Ruskin; and, from Mr. Ruskin's description, let us now add, one turns to the picture itself, though not with disappointment, at least with surprise. We will not take upon ourselves to say positively that most of the imagery and incidents he enlarges upon are not there; we only assert that we could not see them on a close inspection in the early morning of a brilliant day, and that, at all events, the picture is so dark and confused, so utterly wanting in ordinary perspicuity, that it must entirely baffle all but the most painful scrutiny, and the most ingenious interpreter. Nor, according to Mr. Ruskin's view, will the darkness of the room account for the mystery, since he expressly tells us that the pictures were painted for their places in the dark, so as to produce under a certain degree of shadow the effect of finished works. It is just possible these vaunted thoughts may

be there; one can only say that they produce no effect at all, and that in themselves, on Mr. Ruskin's own grounds, they are of no value, and not worth any laborious investigation.

The same unredemmed coarseness, disagreeableness, and want of perspicuity characterise the "Massacre of the Innocents," a few vague and obscure hints in which Mr. Ruskin has worked up and embellished with his ever-active fancy into a very definite and highly-wrought picture of rushing, writhing, murderous horror, and maternal frenzy. Raphael's treatment of this subject is pronounced too painful, and yet Tintoretto's, though so much lauded, would, if Mr. Ruskin's description were correct, be incomparably more so. For, "on looking at it," he says, "our eyes seem to become bloodshot, and strained with strange horror and deadly vision. Here is a heap of the mothers entangled in one mortal writhe with each other, and the swords, one sword being caught by the blade and dragged at by the woman's naked hand. The youngest and fairest of the women falls backward right on the sword points. Their shrieks ring in our ears till the marble seems rending around us," &c. A refined and elevating substitute, truly, for Raphael's "degradation of the features," and too painful hardening mode of treatment! But, on turning from this furiously exaggerated description to Tintoretto's picture, one is at once set quite at ease; little or no horror is felt at the coarse and shapeless caricature; and one simply sees how excitable a faculty is Mr. Ruskin's fancy, and where his predilections urge him forward, how slight a cause will elicit its wildest luxuriance. A confused heap, or medley of rolling and tumbling women and children, inanimate, inexpressive, vague indistinct creatures there is in the foreground, and also in the background, but it was some time before we could make out an executioner. All the rest is obscurity and dark blotchy shade, of a coarseness and heaviness perhaps peculiar to Tintoretto.

One more instance of this kind it may be as well to mention, as the subject is a landscape, and the illusion, therefore (landscape being Mr. Ruskin's true forte, his intellectual home, where one is often tempted to wish him to remain altogether), perhaps even more extraordinary. He has described the landscape in Tintoretto's picture here of the "Journey into Egypt" with fair and delicate colours—faint crimson, and blue, and rosy, and silver, and white, and fanciful similes which, until one begins to think for a moment, remind one of some passage in one of Shelley's ethereal morning-cloud-like poems, but which, when looked into a little, are found to be wholly inconsistent with each other, and in the combination unimaginable—a pretty variegated puzzle for the fancy, nothing more.* Yet, when we compare the description with the picture, we cannot help being captivated with at least its *anti-theoretical* appositeness. Rarely have we seen so rude and ugly a landscape as this, which Mr. Ruskin pronounces one of the finest in the world. Of the lovely colours with which he has heightened his description, we could find no trace. The foliage, especially, is most straggling, ill-composed and ill-shaped, and most ponderously daubed in, moreover, with all the repulsive coarseness of common scene-painting. This opinion will, we believe, derive some support from an engraving of a background of Tintoretto's in Mr. Ruskin's third volume, in

* We had better subjoin it:—"I would fain join awhile in that solemn pause of 'The Journey into Egypt,' where the silver houghs of the shadowy trees lace with their tremulous lines the alternate folds of fair cloud flushed by faint crimson light, and lie across the streams of blue between those rosy islands, like the white wakes of wandering ships." Nothing can surpass this for inexplicable confusion of images and hues, but the marvel of the thing is that it should be introduced as a description of a picture (and such a picture!) written for the purpose of making us acquainted with the imaginative powers of the painter.

which the foliage and general treatment are similar, though far better. Are not the background trees in that print very poor in shape, and the leaves and colossal grasses projecting from the dark rock, or trunk, in front (one can hardly make out which it is) a monstrous and very feeble exaggeration? But now, in this picture of "The Journey in Egypt," we come at length to something pleasing; though here (as usual in discoursing on Tintoretto) Mr. Ruskin chills us with his exaggerations, and Raphael-depreciating comparisons. "The Virgin's head, in expression," he says, "is as sweet and intense as any of Raphael's; its reality far greater." Meekly, but confidently, we protest against this. The head—*notwithstanding* this praise, we manage to sustain our admiration for it—is beautiful, certainly; but the features, being much obscured by shadow and a downward look, it cannot be said to have any "intensity" at all, or much individual character. Neither form nor expression is sufficiently developed, and none but a rooted hater of the sweet, divinely-human Raphael would have dreamt of such a comparison as Mr. Ruskin puts forth here.

Similar deductions must be made from his praise of the high priest in the picture of "The Circumcision," of which he says that he knows "no existing old man's head so exquisitely tender, or so noble in its lines." A nice old venerable head enough, one exclaims; but, from slightness and obscuring shadows, nothing more. It is of this picture the eulogist adds, in his own style, that it is "unquestionably the highest existing type of the sublimity which can be thrown into the treatment of accessories of dress and decoration; the whole picture is like a golden charger to receive the child—a picture of the moral power of gold and colour." Here again how poorly does Tintoretto prop these choice flowers of the Ruskinian rhetoric! The whole picture is made up everywhere of black, brickdust colour, grey, and white, with only a very slight indication of some richer hue in the high priest's cope. Not but that this is a pleasing and interesting picture. The high priest is a dignified figure, and the manner in which his ample cope is held up, where he sits, with his attendants on each side, has an imposing effect. The most attractive of these pictures in the lower hall is, however, "The Adoration of the Magi," a work of a similarly deep, but richer and more varied tone.

We could dwell upon it with pleasure for awhile, but it is now high time to ascend the stairs. The light, however, is fading away from these dusky chambers; besides, the space allotted to us for the present is filled up, so we must postpone to another opportunity some notice of those famous works by Tintoretto in the upper halls of this building and the Palace of the Doges, in which we hope to find new matter with regard both to the painter and his critic, such as may be not without interest to the reader, after inditing which it is our purpose to close with a few reflections on certain other subjects naturally branching out from these investigations. But, for to-day, let us content ourselves with issuing from these shady precincts to refresh our eyes in the open air with the living Venetian light, and with the beauty it bathes and glorifies, our weary minds. The gondolier awaits us at the *traghetto*, and what a splendour breathes around, as the lively black swan of a boat swims with us by the Canal Grande! the eyes of that most prying yet liberal connoisseur, the Sun, finding out on the walls beside us every curious and minute beauty, every wreathing curve in those graceful window-arcades, every leafy crown of their delicate shafts, and setting them off with all the eloquence of vivid, ardent light, and the most emphatic strokes of deepest shadow. Descending cloudless opposite, he has restored for a few moments the forgotten gilding of the Casa

d'Oro (the Casa Taglioni, in other words), that most lightly fanciful and ornate gem of fifteenth-century Gothic in Venice, which is so minutely delicate in its embellishments that the imagination is prone to liken it to some palace worked in filigree by fairies. Now its diadem of light pinnacles shines like the lances of paladins in a line, or rather like the quaint javelins of their opposing turbaned paynimry. Tipped with trefoils, in the full blaze of sunset, its reflections beneath flash downwards long shafts or arrows of vivid gold deep into the tremulous green waters along which we float. Oh, it is pleasant—what can be more so?—to glide at such an hour along this broad sea-street, when evening seems scattering rose leaves on those verdurous wavelets; and the acclamations of vesper-bells come softened over them, and the palaces—so many stately monuments of different ages, illustrious families and deeds—sink in long vista from the utmost splendour of sunset to a solemn obscurity, which, concealing their decay, and all that pertains to the present age of sadness and unexampled humiliation for fair Italy, seems to bring back the glorious olden time to them. We are tempted to turn, and turn again, till night deepens around, and all is so lonely that the single lamp on the Rialto looks as if some solitary anchoress had lighted it, and there held melancholy vigil, praying for the departed dead, whose ruinous and deserted, or desecrated, mansions yet rise around him.

(To be continued.)

THE HUNTRESS.

FROM THE GROUP BY R. J. WYATT,
IN THE POSSESSION OF THE QUEEN.

This group was exhibited in 1849, at the Royal Academy, under the title of "A Nymph of Diana taking a Thorn from a Greyhound's Foot." Within a year from that time the sculptor's career was brought to a premature close, so that the work may be regarded as one of the last on which his hand was engaged, as it may also be considered one of his best. The last piece of sculpture exhibited by him was very similar in subject to this, a marble group of "A Huntress with a Leveret and Greyhound." Subjects of this class are scarcely calculated to draw forth the highest powers of the sculptor, nor the highest embodiments which the art is capable of producing: they belong to the realistic, rather than to the poetical and ideal school; they afford ample scope for accurate modelling of forms, but little opportunity for the superior attributes of graceful action and intellectual expression. As a consequence, we see in the group here engraved a natural realisation of the incident represented, without much poetical feeling or allusion: the figure of the nymph is well modelled, the limbs boldly, rather than delicately, formed, as suited to one whose home is in the forest, and her chief occupation is—

"With bended bow to follow the deer."

The attitude into which the lower limbs are thrown is not the most elegant that could be adopted; but if viewed relatively to the position of the dog, it would seem a necessary position, to preserve harmony of lines throughout the whole of this part of the composition; the extension of the nymph's right leg would have separated—to the eye—the entire figure from its companion: by bending it—in a contrary direction, however, to the body of the dog—the lines meet, and harmonise together in a manner that satisfies the eye while it connects the figures; the two now become parts of a whole: the bow resting against the trunk of the tree in which the huntress is assumed to be sitting is skilfully introduced thus, as it aids in giving solidity to the base, and in effecting a necessary balance to the weight of subject on the opposite side. It is quite evident that the work was well and carefully studied.

ART-UNION OF LONDON.

EXHIBITION OF PRIZES.

This is the twenty-first year of the existence of the London Art-Union, which arrives at its majority having distributed directly to artists, and immediately in the production of Art-prizes, not less than 184,000*l*. When, in 1837, the subscriptions amounted only to 489*l*. 6*s*., it seems incredible that they should rise to nearly 18,000*l*. in one year; but so it was, to the confusion of many who had eagerly prophesied that such an institution, regarded with disfavour by the magnates of the profession, could not be successful. The amount of the subscriptions for 1857 is 13,218*l*., of which 6423*l*. has been paid directly to artists for pictures, and 3547*l*. expended in the production of engravings and other prizes. The highest prize this year is 'The Child's Grave,' by J. H. S. Mann, of the value of 200*l*., selected from the Royal Academy. The next in importance is, 'The Return from Jack-Fishing in Llangorse Lake, near Brecon,' 150*l*., by Tennant, selected from the Exhibition of the Society of British Artists. The next is a prize of 120*l*., 'Shades of Evening on the Glyn, North Wales,' H. J. Boddington; and there are two of 100*l*. each—'Falstaff promising to Marry Dame Quickly,' D. W. Deane; and a water-colour drawing by T. L. Rowbotham—'Pallanza, Lago Maggiore, Northern Italy—Hazy Morning.' The entire number of prizes is 152, of which 29 have been selected from the water-colour exhibitions; and the prints of the year are 'The Clemency of Cœur de Lion,' and 'The Piper'—the former from the picture by Cross, and the latter from an exquisite small work by F. Goodall; and for 1858, the plate will be after Turner's picture, 'The Conveyance of Bellini's Pictures to the Church of the Redentore,' engraved by Willmore. Of other works that have been selected by the prizeholders there are, 'Winter—Sunset,' G. A. Williams, 75*l*.; 'Leith Hill, Surrey, looking towards Ewhurst, Hascombe, and Hindhead,' G. Cole, 60*l*.; 'Scarborough from the Sea,' J. Danby; 'The Harvester's Repast,' F. Underhill; 'A Family Group,' a small company of goats, a prominent picture in the National Institution, painted by Willis; 'Lausanne—Evening,' H. Moore; 'A Farm in Sussex,' J. Stark; 'Lane Scene—October,' F. J. Soper; 'The Druids' Circle, St. John's Vale, Cumberland,' 'The Stepping Stones,' F. Underhill; 'An English Interior,' D. W. Deane; 'The Vale of Bettws,' F. W. Hulme; 'Crossing the Brook,' J. Henzell; 'Returning from Labour,' A. J. Stark; 'Fishermen's Children on the Sea-Shore,' Bell Smith; 'Cottage Pets,' C. H. Weigall; 'The Stag Rocks, Lizard Point, Cornwall,' James G. Philp; 'Ecclesbourne Glen, near Hastings,' W. Bennett; 'Sorrento, Italy,' T. L. Rowbotham; 'Prawn Fishers,' J. H. Mole; 'Margate Roads—a dirty day,' T. S. Robins; 'The First of October,' Edmund G. Warren; 'At Rotterdam,' J. Burgess, jun.; 'Artist's Life—the Mawd-dack, North Wales,' J. Absolon; 'Interior, North Wales,' A. Provis; 'A Devonshire Fishing Village at Evening,' H. Jatum; 'The Little Market Woman,' E. J. Cobbett, &c., &c. The interest of the exhibition is augmented by the addition of other pictures, which from time to time have become the property of the Art-Union of London. These are a reduced copy by F. G. Duvall, of 'The Burial of Harold,' from the picture for which the painter, F. B. Pickersgill, R.A., received the government premium of 500*l*.; 'The Surrender of Calais,' painted by H. E. Selous; 'The Crucifixion,' a reduced copy by A. Solomon, from the original picture by Hilton. There are also Frost's 'Sabrina,' and 'The Piper,' by F. Goodall, charming in texture, colour, and depth; 'The Castle of Ischia,' a reduced copy by Denning, from the picture by Stanfield; 'The Convalescent,' a reduced copy of the picture by Mulready; 'Raffaello and the Fornarina,' a reduced copy by Denning of Callcott's picture; and 'St. Cecilia,' a copy of the fresco in the Houses of Parliament, by Tenniel;—although there is among these works a great proportion of copies, yet there are a few pictures which the visitor will see with pleasure. For the next distribution there will be 'The Queen, as her Majesty appeared at Chobham in 1853,' and 'The Stepping Stones,' executed for the society, by Messrs. Copeland, from the original by E. W. Wyon.

THE ART-UNION OF GLASGOW.

EXHIBITION OF PRIZES.

The exhibition of the prizes of the Art-Union of Glasgow was opened on the 10th of August, in the gallery of the Society of Painters, in Pall Mall East. The catalogue numbers 145 pictures, purchased at the cost of 6504*l*.; one marble bust and two casts, of the value of 126*l*.; fifteen Parian groups, 180*l*.; and 1200 portfolios, each containing twelve photographs. The great feature in the rules of this institution is the selection of the prizes by the committee, whereby works of great excellence and value are secured to the prizeholders. Many of the prizes have been transferred from the studio of the painter to this exhibition; they have, therefore, never been seen before, and there are a few which are not yet finished. No. 1 is 'Palanda de la Pava, or Lovers at a Window,' by J. Philip, 420*l*., a work of rare merit, in which are seen two figures—a Spanish girl, standing within a grated window, whispering to her lover, who stands on the outside. The picture has two lights—a lamp inside, and the moon outside, and the two effects are managed with exquisite delicacy. 'Asses Drinking, Seville,' R. Ansdell, 315*l*., another Spanish subject; but the animals are mules, not asses, and the muleter is the same hard-featured old man with whom we have already made acquaintance in another picture by this artist. The next in the catalogue is 'Little Children brought unto Christ,' by F. W. Pickersgill, R.A., 300*l*., not yet exhibited. 'Venice,' by Louis Haghe, 250*l*., was seen a year or two ago. 'A Sabbath in Winter,' by J. Ritchie, 250*l*.; 'Sportsmen regaling,' by Louis Haghe, 200*l*., a picture in oil; 'Flora,' J. Sant, 180*l*., a large picture of much delicacy, but, we think, a misconception of the subject; 'Lago Laguna,' G. E. Hering, 170*l*.; 'The Auction,' W. Macduff, 170*l*.; 'Hinda,' F. Wyburd, 160*l*., already exhibited; 'Landing in the Lacon River, County Westmeath,' E. Nicol, 160*l*.; 'A Salmon Trap,' J. W. Oakes, 150*l*.; 'The Auld Stile,' T. Faed, 110*l*.; 'Haymaking,' A. W. Williams, 120*l*.; 'The Covey,' by Wolfe, 105*l*.; 'Morning after a Storm off the Corbière Rocks, Jersey,' J. Wilson, 100*l*.; 'The Tardy Bridegroom,' Thomas Roberts, 100*l*.; 'The Close of an Autumnal Evening,' H. J. Boddington, 90*l*.; 'A Mountain Mirror,' G. Pettit, 90*l*.; 'Caught by the Tide,' E. J. Cobbett, 84*l*.; 'Ludlow Castle,' Niemann, 70*l*.; 'Lara,' E. W. Cope, R.A., 60*l*.; 'Scene from the "Tempest,"' J. G. Naish; a Study, by Baxter, the cost of this is 52*l*. 10*s*., and it is followed in the catalogue by a lengthened succession of titles, descending in the scale of value to very moderate prices. Of the higher prizes, it must be said that they are of a degree of excellence much beyond that class that are usually left on the walls of Exhibitions for Art-Union prizeholders; and those of the lower graduating scale are selected with much judgment. There are among these works productions which would do honour to any exhibition; and it cannot be doubted that selection by the authorities of the institution is the better means of securing value for the amount of the prize. But there is a rule of the society which operates seriously to the inconvenience of those artists whose resources are not ample; we allude to the suspension of the payment for the selected pictures until December. There are in the catalogue names of painters to whom it were of little moment if the return for their picture were not made for even twelve months beyond the assigned period; but there are others to whom a prompt return for their labour is, as rising men, their only hope of being able to sustain themselves in the competitive struggle that is now necessary to the establishment of reputation. We do not profess to know the rules by which the authorities of the institution govern themselves; and it may be that even the temporary interest of the purchase money may be auxiliary towards the heavy expenses. The Art-Union of Glasgow place themselves in a position to command the attention of the public and of the profession. We find here works hitherto unexhibited, but of great excellence, by Philip, Ansdell, Haghe, Sant, Faed, Baxter, H. Johnson, F. W. Pickersgill, R.A., P. MacDowell, R.A., &c. &c. The engraving for the current year is from Maelise's picture, 'Noah's Sacrifice.'

THE HUNTRESS.

ENGRAVED BY E. ROFFE. FROM THE STATUE BY F. J. WYATT.

IN THE POSSESSION OF THE QUEEN.

AN ARTIST'S NOTES.

THE FAMILY OF FIVE.

How much character there is in the hand! How individual it is! It has its physiognomy and phrenology as well as the head. It is peculiar to man, and is the direct agent of his mind: no wonder then it should be so impressed with his character. Our greatest portrait-painters have been the most careful with their hands. Sir Joshua with their *pose*, and Vandyke and Sir Thomas Lawrence with their *pose* and drawing. We instinctively recognise the appearance of the hand as a part of individual character. We see the hand of Cromwell broad, somewhat coarse, with swollen veins; somewhat flat too, but instinct with vigour, grasp, and decision: that of Newton definite and precise, but more delicate; motive, but attenuated by study. As there is great individual character shown in the handwriting, so I see it also in the hand.

Actions and positions of the hand become habitual to individuals. From its structure it is capable of a great variety of these. It is also affected by employment, and when ground and hardened by physical labour, is less delicate, sensitive, and expressive of thought; as indeed is the mind itself. Both are apt to get, as it were, deadened and case-hardened by physical daily labour. So, doubtless, one sees in a man's hand a token of his condition. Without palmistry, it in some degree tells his fortune.

The hand is a family of fingers, with an united interest and common object: a family of five, with each characteristic and individual in itself. Children in their nursery legend associate them in one litter, and run them over from the thumb to the little finger, singing, "This pig went to market—this pig stayed at home; this pig had some roast beef—and this pig had none; and this pig cried, 'wee, wee,' for a bit." In this is seen a common object—the obtaining of the family beef, and also a diversity in the parties concerned; for as with a family, so with the fingers—a strong likeness runs throughout, but the individuals are different in character, tendency, height, width, size, and office.

Thus the first, or forefinger, is the most active and intellectual. The index finger, as it is called, as being used to point with and indicate, and from its assisting more in gesture than any other. It well has its name, too, of "first" and "fore," for it is first and foremost in almost everything that the hand does, especially in its finer and more delicate offices. Thus, in conjunction with the thumb, it chiefly holds the pen and pencil, while it is the whole hand that grasps the sword, the hammer, or the plough. In nothing, that I recollect, that the hand does is the forefinger left out, but with its close assistant, the thumb, is always a-doing when anything is to be done. These two are quite *d'accord*, and it is fortunate they are so, as one without the other would be comparatively useless. As it is, they transact the principal business of the family; the others following their lead, and doing all they can to assist them. Thus, in holding the pen or the pencil, they are the chief agents, yet the middle finger is a very substantial assistant, and follows all their movements, while the fourth finger also gives her support, and even the wee wee little finger comes in now and then to steady the whole hand on the paper.

The hand, indeed, is an example to family circles, all its members so thoroughly pulling together. Without weakening this, however, there are little predilections and pet friendships among them, such as exists between the middle and fourth finger. It is common to see these with their tips whispering as it were, close together like two sisters in a family who are nearest the same age. The two are especially affected to each other's society, and in almost every action they are found of the same mind. Such sociability is not so much the character of the little finger, which, perhaps, being the small one of the family, fancies he has none of his own standing to play with, and so amuses himself after his own fashion. The young gentleman is apt to have a strong will of his own, and is indeed somewhat eccentric and independent; and this the more inasmuch as he really has a muscle all to himself, the *extensor minimi digiti*, which occasionally sticks him out all by himself.

He is a good little boy in the main, however, and is generally very happy to help his brother and sisters, as we have seen, in the affair of the pen and pencil.

But to return to the elder branches: I always fancy the thumb to be the sturdy boy of the family, somewhat short of his age, perhaps, but making up for this in strength, and regarding with great deference and affection his elder sister, the first finger, and always prompt to assist her. This eldest sister appears the most *spirituelle* of the family; also much the most a woman of business and of the world, although in stature, to be sure, her next and nearest sister has somewhat outgrown her. The middle and fourth fingers are, as I have said before, the two who keep closest together, being very seldom separated at any time. Yet, for all this, they are ever ready to assist in what has to be done, setting thus an excellent example to all younger sisters.

These diversities of character are more strongly developed in the right hand than in the left, although in both a greater readiness in action distinguishes the first finger and thumb from the rest. The powers of the members of either hand, however, are capable of being assimilated to a greater degree than might be at first thought, as may be seen in instrumental playing, where all are brought into constant action on pretty nearly an equality.

But to quit this fanciful personification of the fingers, I would add two or three purely artistic remarks on their form, and on that of the hand. In cases where grace and beauty are the principal objects, it is desirable, I think, to make the middle finger markedly predominate over the first and fourth, and that the little finger and thumb should be rather small; presenting thus a pleasing taper form, and combining sufficient length with delicacy. In this case, however, it might be said that beauty would err from the scholastic, but not very tenable rule, that utility and beauty are identical; for a hand is perhaps more useful and strong when it is in some respects like that of a monkey, with its thumb and fingers all more of a length, and is more suitable for playing on musical instruments. Such a hand could not, however, in my idea, be as beautiful as one possessing the former proportions.

In a man's hand I would, however, keep utility and strength more in view, and not venture to vary the lengths to the degree I would in a woman's hand; but in this respect character is the guide. In a Hercules or a Samson the fingers might be of a slightly more even length than in an Apollo. In the left hand of the Belvidere Apollo the little finger is small.

Of all the fingers only one is truly straight, having its two sides alike, viz., the middle finger; the other fingers incline at their points towards the middle finger, forming, either with or without the thumb, a tapering group. This is to be noticed not only when the hand is open and straight, but in all degrees of bending and being closed. The thumb also can hardly be said to be straight, as its two sides, where it joins the hand, are not alike.

Beauty in the hand is also connected with the gradual lessening of the lengths of the parts from the wrist towards the end of the fingers, which gradation is best observed in a bent hand, beginning with the space from the wrist to the knuckles as the first and largest measurement; from the knuckles to the first joint of the fingers as second, and as less than this in the proportion of about two-thirds, which proportion holds also in the decrease of the next spaces, viz., from the second to the first joint, and from the second joint to the end. Thus the length from the tip to the second joint is two-thirds of that from the second joint to the first, which is two-thirds of that from the first joint to the knuckle, which in turn bears the same proportion to the first bend of the wrist. There are small diversities in this respect in the different fingers, but a gradation closely approximating to this holds with all. A false idea of grace has led to making the tips, or end joints, of the fingers too long, as if by an afterthought; but faithful delicacy and beauty does not admit of a true balance being destroyed, but requires the parts to be duly and naturally tapered in length as well as width.

The Greeks, in their statues, frequently cut the nails rather straight across; that is to say, they did not make them follow the line of the tips of the fingers, nor that of their own growth from out the

finger. I venture not to be convinced of this being either most reasonable or most graceful. The nail is Nature's protection to the end of the finger; in some handwork it wears away conformably with the shape of the tip. I confess I like the nails as close, or closer, at the angles as in the centre, by which means an even curve is obtained, repeating very nearly that of the tip of the finger, and beautiful as well as convenient, affording a double line—a kind of little rainbow arch—as the finish to the finger.

There is a due medium in length of nails, in which beauty and utility coincide. The nail is wanted just a little protruding, so that it may pick up things, but not too long, for fear it should tear. I have seen some fingers in statues look as if they had been bitten to the quick: whereas, on the other side, the only defect in Vandyke's hands is that the nails are often too long, projecting beyond the ends of the fingers: but this may have been the fault of the fashion of the day and the sitter, and not of the painter. I like best the line of the tops of the nails to be round, and close at the corners; the whole nail thus having a filbert, oval shape, with the little white moon at the base peeping up from below into an eclipse of a pink-tinted sky.

There is something to me very uncomfortable, as well as unbecoming, in a projecting edge of nail; it becomes a danger instead of a protection. The Chinese—that strange people who do everything that other folks do not—cultivate them into long talons, that is, many of the so-called upper classes do, to show they do not work; a practice resulting in a very bird or wild-beast-like appearance—fierce but useless, and on a par with the hideous faces they paint on their war-junks to frighten the barbarians. The infatuated devotees of India, who dedicate a limb to their Creator by rendering it useless, and with this object keep a joint in one position till it becomes stiff and grown together, have a favourite position for an arm, which they will hold and tie in an upright position till nature fixes it there, with the hand and fingers clenched, which become equally fixed and immovable. In this position the nails continue to grow, which they do quite through the hand, and issue forth at the back, hanging in long strips. Fortunately we do not do such things here, the strongest manifestation in the way of nail growing being the schoolboy trick, that cherishes some pet nail till it grows so long as to be made into a pen, and written with.

Each joint of the hand has a different character: the knuckle has a sort of petella shape, with a tendon running over it, as at the knee; the next has a somewhat heart-shape, with the point downwards; and the last is like a double bean. These are most seen when they are bent; when straight they are not so apparent, and in women and children they sink into dimples, either simple or complex.

Among the many points to be observed in hands, it may be noticed that in those that are most graceful the sweep of surface across the back of the hand is not one round, but sinks in somewhat along the metacarpal bone of the fourth finger. In perfectly beautiful female form, the hand is also so proportioned to the wrist, and so pliable and capable of being compressed into a long hollow, like a rolled leaf or a pholas shell, as to be easily drawn through the bracelet. Everybody, mothers especially, acknowledge the great beauty of little babies' hands, although they do call them "puds,"—being an abbreviation, I suppose, for puddings,—alluding to their fatness. But there is nothing merely puddingy in a beautiful infant's hand, although the roundness of the form is carried to the extreme consistent with beauty, which, however, is again harmonised by the smallness of the scale. On the contrary, there are a vast variety of little sweeps and deviations of line in it not coinciding with segments of circles, but of various characters that in their aggregate produce the most agreeable flourishes of form all over it imaginable, and result in a most varied, beautiful, and graceful image. A dear little child's hand, in all the simplicity and *abandon* of repose lying on the white coverlet, is a perfect little nest of love to a mother's heart: and, with a true sense of the bathos of the addition, I may say also a perfect study to the artist, both in form and colour, pink as a shell, and soft and graceful as a flower.

I hope I shall not, however, lose with mothers by saying, that, artistically, a beautiful woman's

hand is a still more perfect object. The curves that draw this are of a character more truly productive of beauty than those which describe the former. They are less of circles and more of ellipses, and the more lengthened conic sections are more graceful in the outline of objects than the shorter ones. I may be perhaps allowed, *en passant*, to make the observation that the varieties of the perfect sweeps of the conic sections might well, in artistic views of form, accompany, if they did not supersede, Hogarth's line of beauty. For my part, I invariably see elliptic or parabolic curves in every beautiful form of nature I meet with, and in none more than in a beautiful female hand.

There is "in the trade," as the plastermen call it,—that is to say, sold generally in the plaster cast shops, and more or less good according to the mould in which it has been made,—a beautiful female hand, well known by the name of the "Italian lady's" hand. It also has been said to be the hand of the Marchioness Brinvilliers,—a celebrated criminal mentioned in the "*Causes Célèbres*," who committed so many dreadful murders by poison that she seems to have been possessed by the fiend indeed. One would have been sorry to think that so exquisite a hand could have done such evil deeds, and mixed the potion for so many deaths, and one is glad to know that there is no real foundation for this pedigree. The true origin of the cast seems, indeed, to be lost, further than that it came at first from Italy. It bears on it intrinsic evidence to the artist's eye, in the individuality of its parts, that it is not wholly a work of Art, but moulded from life: yet the texture and minor marks of common nature are not on it. What seems most probable is, that the original cast was moulded from an exquisite example in nature, which was afterwards somewhat touched on by an experienced artist. It is in the highest degree delicate and refined, though pulpy, and reposed, though vital and motive; and we are at liberty, I hope, to believe, in spite of dreadful stories, that it originally belonged to a good, amiable, and refined woman, in all respects an ornament to her sex.

OBITUARY.

MR. WILLIAM BRADLEY.

The career of this distinguished artist has been so much connected with Manchester, and the features of so many of our "notabilities" have been portrayed by his pencil, that a short notice of his life and works may not be unacceptable. Mr. Bradley was born in Manchester on the 16th of January, 1801. He had the misfortune to lose his father (an ingenious and inventive man, who resided at Garratt Hall) when only three years of age, and commenced life as an errand-boy in a warehouse, at the small wages of three shillings weekly. Art draws her votaries rather from the field and the workshop than the mansion and the palace, and so she took William Bradley from the packing-room of Messrs. Weight, Armitage, and Co., and at the early age of sixteen we find him practising entirely as an artist. His beginning was humble enough; he took black profiles at one shilling each, and advertised himself as "portrait, miniature, and animal painter, and teacher of drawing." He had a limited number of lessons from Mather Brown, then in high favour with the Mancunians, in whose mind, it is said, Bradley excited strong feelings of jealousy. At the age of twenty-one he went to London, where his friend Mr. Leveson treated him with great kindness. He first took lodgings in Hatton Garden, but subsequently removed to Gerrard Street: he obtained an introduction to Sir Thomas Lawrence, who took great interest in his works, and allowed him to bring them at all times for inspection. Mr. Bradley now became established in the metropolis, but occasionally paid a flying visit to his native town. In 1833 he paid a longer visit than usual to Manchester, accompanied by his friend, Mr. R. B. Faulkner; they worked together in the studio of Mr. Charles Calvert, the landscape-painter, in Princes Street; and in the same year Mr. Bradley married Mr. Calvert's eldest daughter, and, after the lapse of a few months, again returned to town. In the year 1847 Mr. Bradley removed entirely to his native town, where he con-

tinued to labour at his profession with devoted ardour; it was, however, obvious to all that his health was shattered, and his brain more or less affected. He lived a sort of misanthropic life, frequently never stirring from his studio for months together. He died at his rooms, at Newall's Buildings, on the 4th of July, of typhoid fever. In his illness he received the devoted attentions of his wife and daughter up to the last hours of his existence. As an artist, Mr. Bradley undoubtedly possessed high talent; and though showing but little of the creative faculty, and chiefly confining his attention to portraits and fancy heads, what he professed to do he certainly did admirably, ever giving the most elevated and exalted character to the subject that came under treatment of his pencil. His heads are remarkable for skilful drawing, and he was not second to any man of the day in producing a striking and intellectual likeness. He excelled in colouring, and wrought on purely philosophical principles, deduced from earnest study of the works of the great masters. His knowledge of light and shade was profound; and his proficiency in this most difficult branch of artistic study contributed in a large degree to the success of his works. His fancy pictures are numerous, consisting mostly of beautiful female heads. Bradley's practice was chiefly based on the works of Rubens, Vandyke, Rembrandt, and Raphael, and on the principles deduced and exemplified by their followers in our early English school—viz., Sir Joshua Reynolds, Gainsborough, Romney, and Sir Thomas Lawrence; "trying," as he said on his only visit paid to the Art-Treasures Exhibition, "to do something which should have resemblance to their work, putting touches which would puzzle the many to tell the meaning of, and which, when the work was done, would please people in spite of themselves." His perceptive powers were very extraordinary, enabling him at once to detect that which constituted the success or failure of a picture. Although in the receipt of a large income for many years of his life, such were, we regret to learn, his improvident and heedless habits, that his widow and four surviving children are left in very unfavourable circumstances. The following are the names of some of Mr. Bradley's sitters:—Lords Beresford, Sandon, Denbigh, Bagot, and Ellesmere; Sirs E. Kerrison, John Gladstone, Benjamin Heywood, Robert Jeppings, and Thomas Potter; Colonel Cureton, C.B.; Colonel Anderton; W. E. Gladstone, Esq., M.P.; Sir James Emerson Tennant; Sheridan Knowles, W. C. Maeredy, Dr. Dalton, Charles Swain, Liverseege, John Isherwood, John Brooks; Joseph Brotherton, Esq., M.P.; Pndsey Dawson, Esq., Hornby Castle; Rev. Canon Stowell; Rev. H. W. M'Grath, &c. We have only to add that the youngest son of Mr. Bradley displays a remarkable talent for drawing, and, with due cultivation and training, promises to add another name to our list of local artists. This training, it is understood, the necessitous circumstances of his widowed mother prelude, and it has been suggested that an appeal should be made to the public, and especially to those whose portraits have been painted by the late Mr. Bradley, to assist Mrs. Bradley in maintaining and educating her family, and especially the son referred to (now about fifteen years of age), in placing him to pursue the study of Art under proper circumstances and discipline.

MR. C. TURNER, A.R.A.

This eminent mezzo-tinto engraver died on the 1st of August, at his residence, Warren Street, Fitzroy Square, in the eighty-fourth year of his age. Mr. Turner was a native of Woodstock. He came up to London with his family when a youth, and was introduced into the establishment of the late Alderman Boydell, where he acquired his taste for the Arts. Among the plates he engraved were several of his namesake's—"Liber Studiorum" and his "Wreck;" many of Lawrence's portraits of distinguished personages were also engraved by him. In the Academy exhibition of last year he exhibited some "Academy Figures," sketched by him in the year 1794, when he was about twenty years old, so that it is presumed he was a pupil of the Academy about that time, and doubtless must have known Reynolds, or at least have seen him, when Sir Joshua, who died, in 1792, was engaged for Boydell in painting pictures for the Alderman's magnificent

edition of Shakspeare. By the death of Mr. Charles Turner another of the few remaining links that bind the English school of Art as it now exists with its earliest foundation is lost to us. It is probable that, in a future number, we may be able to give some particulars of the career of one whose long and intimate acquaintance with the artists of this and the preceding generation cannot but have produced much that would be interesting to know.

MR. JOHN BIRCH.

Mr. John Birch died at South Hackney, near London, on the 29th of May. Although but little known in the "Great Metropolis," the chief portion of his life having been spent in Sheffield, he achieved an enduring reputation in that town as a portrait and landscape-painter. He was born at Norton, Derbyshire (the birthplace of Chantrey), on the 18th of April, 1807, and, as a boy, gave early indication of his love of Art, his leisure hours being absorbed in sketching the beautiful scenery of the neighbourhood, notwithstanding he had never seen a print nor drawing of any description. For some time he assisted his father as a file-cutter, a business he relinquished for a situation at Mr. George Eadon's, carver and gilder, Sheffield, with whom he remained seven years, and then determined to commence the arduous profession of a portrait-painter. To perfect himself in the art he went to London, and studied under H. P. Briggs, R.A. Here he received many commissions to paint the portrait of the late Mr. Cocker, of Sheffield, from the original by Briggs, and was so successful, that it was difficult to distinguish the copies from the original. Mr. Birch lost no opportunity that presented itself of studying the great masters of his loved art, and accordingly became a devoted student of the works of Reynolds, Gainsborough, Cuyp, Murillo, Wilkie, Constable, and many others. In consideration of his ability, he was elected a life-student of the British Institution. Several of his landscapes consist of views of the magnificent scenery in Derbyshire: "Dove-dale," "Miller's Dale," "Matlock High Tor," and the "Entrance to the Peak Cavern," were favourite subjects of the artist's pencil. He was an intimate friend of the late Ebenezer Elliott, the corn-law rhymer, of whom he painted many portraits—in fact, Mr. Birch was the only artist to whom the poet sat. The half-length portrait of Elliott among the rocks of Rivilin attracted very great attention at the exhibition in aid of the funds of the Sheffield Mechanics' Institution, which took place at the Music Hall in 1839. The origin of the picture was as follows:—The poet and painter walked from Sheffield one summer's morning to the valley of the Rivilin, and lighting upon a most romantic spot, Elliott suggested that the rocks and the gushing stream would make a glorious background for a portrait. The artist soon "rubbed in" a portrait of Ebenezer Elliott, with the rocks, as suggested, for a background; and while the artist was busy with his pencil, the poet took out his pen, and the lines called "Ribbledin, or the Christening," were composed on the spot.

John Birch was a man of enlarged and liberal views, and of great conversational powers. For some years past he resided in London, making occasional visits to Sheffield; during his last visit he painted about forty portraits in nine months. He then returned home, and in little more than two months died from disease of the chest, after protracted and severe sufferings. Within a few days of his decease he talked of his friend Ebenezer Elliott, and he was so unconscious of the near approach of death, that he determined upon going to Manchester to see the Art-Treasures Exhibition. He has left a widow and son to mourn the loss of an upright and honest relative.

M. LASSUS.

The French papers of last month announced the death, in Paris, of M. Lassus, one of the best of the architects of France. His principal works are the restoration of the Sainte Chapelle, a beautiful edifice, and of the Cathedral of Notre Dame; the last is still unfinished. M. Lassus possessed very considerable talent, and was much esteemed; he died at the age of fifty.

BRITISH ARTISTS:
THEIR STYLE AND CHARACTER,
WITH ENGRAVED ILLUSTRATIONS.

No. XXVIII.—JOHN GIBSON, R.A.

THE name of one sculptor only, that of Flaxman, has hitherto been brought before the notice of our readers in this series of biographical sketches. Two reasons may be assigned for such inequality of numbers: the first, and most obvious, being the limited list of sculptors of the British school, in comparison with the long catalogue of painters; the second, that sculpture in general cannot, from its essential nature, supply such varied and popular materials for illustration as painting supplies. But when, as in the case of Flaxman, and now in that of Gibson, we meet with works that are the glory of the country in which we live, and the admiration of Europe, it would

be unjust towards such men and their productions to exclude them from our pages.

More than eight years ago we published, with a portrait of Gibson, a memoir of his life, from the pen of a lady whose writings upon Art hold a very high position amid the best literature of our day. Presuming, from the lapse of time since the appearance of the article, that the majority of our readers will have forgotten the incidents therein related, we shall refer to it for such information as may answer our present purpose.

John Gibson was born at Conway, Carnarvonshire, in 1791. His father, a native of Llanidan, in the Isle of Anglesea, was a landscape-gardener; he went over to Conway to lay out the grounds of a gentleman, and continued his residence there for several years. The son's taste for Art early developed itself by drawing animals, chiefly, on his father's slate; but there was little in the

small Welsh town to foster the child's progress, nor did his father pay much attention to what seemed an innate faculty of the boy. When the latter was about nine years old, the family, whose circumstances were by no means prosperous, removed to Liverpool, with the intention of emigrating to America, but their plan was never realised. In Liverpool, young Gibson saw much that increased his earnest desire after Art. "On his way to and from school he lingered, spell-bound and enchanted, before the prints in the shop-windows, struck with a new sense of beauty, filled with vain longings to possess, to imitate. Hopeless of obtaining what he so admired and coveted, he hit upon a singular plan of study. He would stand for a long time before some particular print, dwelling on a single figure till it was impressed on his memory, then he would run home quickly and imitate on paper the action or attitude, then return to the window again and again, and correct and recorrect his drawing till it was completed. This habit of drawing from recollection stimulated his perception and strengthened his memory for form; and he has been heard to say that the advantages thus oddly obtained were of incalculable importance to him in after-life. It was interesting and amusing too that, even thus early, with the study of Art as a taste, grew the practice of Art as a profession. He used to dispose of his drawings to the school-boys, and was thus enabled to obtain what the poverty of his parents denied to him—a little pocket-money. One of his school-fellows having received from his mother the gift of a new prayer-book, wished to honour the gift by an 'illustration' on the blank page. He applied to Gibson. The subject selected—from what notion of the fitness of things it would now be difficult to guess—was 'Napoleon crossing the Alps,' from the print after David's picture, which they had seen at a shop-window. The drawing was made, the boy gladly paid sixpence for it, and stuck it as a frontispiece in his prayer-book." At the age of fourteen, Gibson's school-days were over, and he was asked to choose his profession. He tried to prevail on his parents to article him to a painter, but the requisite premium was beyond their limited means, and he was apprenticed to a cabinet-maker. The business, however, was of too mechanical a nature for his taste, and, after serving a short time, he induced his master to cancel his indentures, and bind him over again as a wood-carver. In this employment, carving his scrolls and ornaments for furniture, he

"HE SHALL GIVE HIS ANGELS CHARGE CONCERNING THEM."

passed two years, when, chancing to visit with a young companion the marble-works of Messrs. Francis, new thoughts and ideas, arising from what he saw there, filled his mind with surprise and disquietude. Sideboards, glass-frames, table-legs, and all the various decorations of "household-furniture" weighed as nothing in the balance against cupids, monumental urns, marble and stone works of every kind. Returning to his old workshop, he threw down his tools, and told his masters, who highly respected him, and treated him with invariable kindness, that he "would never work for them any more—he would be a sculptor."—"Not work!" said they; "we will have you up before the magis-

trate, and you shall serve the rest of your time in jail." He remained immovable. "They had been most kind to me," said Gibson, once, in relating his part in this transaction, and speaking with deep and simple-hearted feeling, "and I was, as I now think, horribly ungrateful; but there was something working too strong for me or any one to control—I felt it must be, there was no help for it." Mr. Francis, hearing of the circumstance, went to the cabinet-maker, and generously paid him the sum of £70 to redeem the lad from his servitude, and for the third time Gibson signed articles of apprenticeship. He was now in the workshops of his new masters, on the high-road to the point at

which all his desires aimed, and his industry and talent very soon rendered his services of the highest value to his employers.

But even the marble-works were not, after a little time, a field wide enough for the aspirations of the young sculptor—he panted to be released from such comparatively mechanical labours; and one day, through the kindness of his master, he was introduced to the late Mr. Roscoe, then rich, prosperous, and highly respected for his intellectual qualities as much as for his wealth. Mr. Roscoe invited him to his residence at Allerton Hall, lent him prints and drawings to copy, introduced him to friends and relatives, especially Mrs. Lawrence and her sister Mrs. Robinson, two ladies whose taste, accomplishments, and patronage proved of the utmost service to their *protégé*—in a word, to Mr. Roscoe and his family is due all the honour of extricating Gibson from obscurity, and placing him in a position to work out his high destiny. His generous and kind patron had intended to send him to Rome at his own expense, but the misfortunes which overtook Mr. Roscoe, and which elicited the strongest sympathy of the thousands who knew him personally or through his writings, frustrated the plan; yet, though his own purse was too scanty to furnish the requisite sum for such a purpose, some munificent gentlemen of Liverpool, influenced by the representations of himself and Mrs. Lawrence, entered into a subscription to send the young sculptor to Rome, and maintain him there for two years. From that time to this, a period of forty years, Gibson has resided in that city of Art, though paying frequent visits to his native country, generally about the period of our Art-seasons; but he was, we believe, twenty-eight years in Rome without once coming over to England, so unwilling was he to forego, even for a few months, those labours which were all his delight.

On his way to Italy, he stopped for a few days in London, where he was introduced to Lord Brougham and Mr. Watson Taylor, a well-known patron of Art. The former gave him a letter of introduction to Canova; he had, before

leaving Liverpool, been furnished with one by General d'Aguilar, brother of Mrs. Lawrence; and Mr. Taylor gave him several commissions for busts of himself and his family, together with a cheque for the sum to be paid for them, so that Gibson's purse was far from indifferently filled. In London, also, he made the acquaintance of Flaxman, who offered him much friendly counsel and advice, of which Gibson was not slow to avail himself.

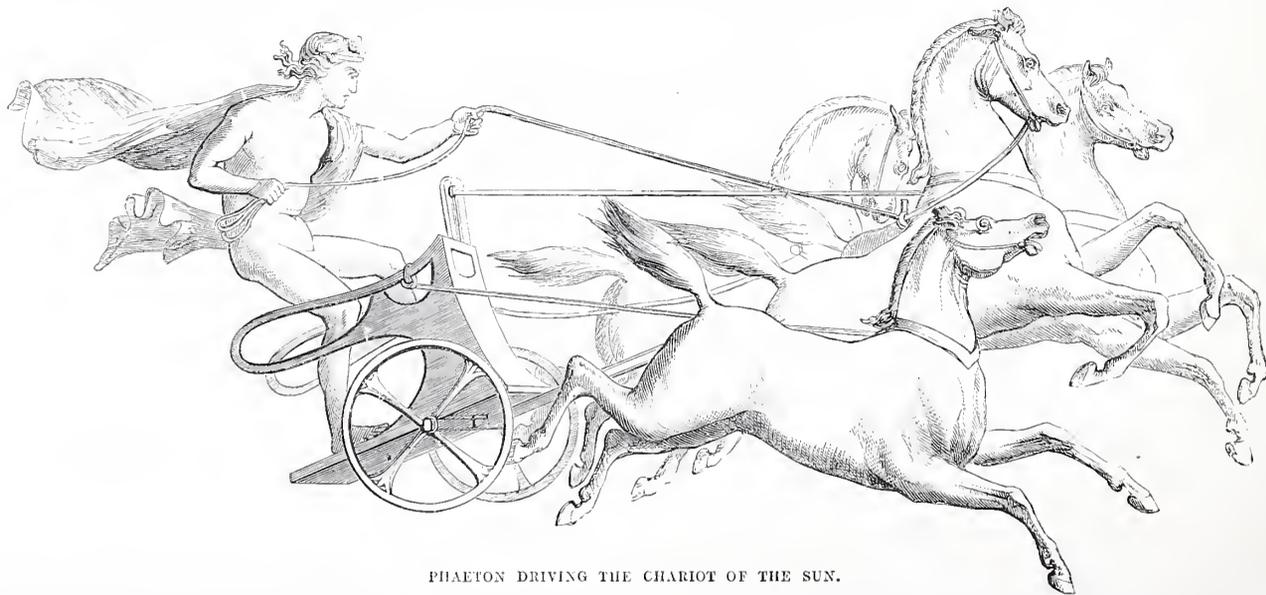

Towards the end of the summer of 1817, the young Englishman presented himself, with his letters of introduction and his sketches in his hand, to Canova. His reception was all he could desire, and, at a second interview, this generous-minded Italian artist addressed him thus:—"I have been thinking much about you; with steady industry you will become a great artist. I know that many men of great talent come to Rome to pursue their studies with very little money in their purses; now, the want of means must be no obstacle to your progress. I am rich; you must allow me to pay all the expenses of your sojourn here till your own talent and industry have rendered you, as they certainly will render you in time, independent of everybody." Gibson, with strong expressions of gratitude, declined the liberal offer of Canova, alleging that he had ample funds to maintain himself with economy during the two years he—then—proposed remaining in Rome.

In the studio of Canova Gibson worked assiduously for three years: at the expiration of this time he left it, and opened one for himself in the Via della Fontenella. "Here," says the author of the article on Gibson previously published, "I found him at work in the year 1821, on his beautiful group of 'Psyche borne by the Zephyrs.'" In the self-same studio he was found twenty-six years afterwards, modelling the exquisite bas-relief of the "Hours leading forth the Horses of the Sun."

On the death of Canova, whom Gibson always calls his "noble master," he placed himself under the directions of Thorwaldsen, and, aided by the instructions of this admirable artist, and by his own manly and moral sense, he has shown

LOVE PURSUING THE SOUL.

PHAETON DRIVING THE CHARIOT OF THE SUN.

that he could emulate the grace and elegance, without being led into the faults, of his first instructor." Several years, however, passed away before the English public had the opportunity of judging of the works of one of the greatest sculptors of modern times, or even of knowing that in the solitude of a Roman studio a young sculptor was industriously and enthusiastically working his way to imperishable renown. The first contribution sent by Gibson to the Royal Academy was in 1827; the subject, "Psyche borne by the Zephyrs," a group

commissioned by the late Sir George Beaumont. In 1829, he exhibited a "Cupid;" in 1831, a "Nymph untying her Sandal;" in 1833, "Venus and Cupid." The exhibition of these four works was considered by the Academicians quite sufficient to justify them in electing the sculptor an associate: in 1836 he was elected a full member of the Academy.

The first commission Gibson received in Rome was from the Duke of Devonshire. One day, while he was at work upon a model of "Mars and Cupid," a

tall young man entered his studio. "Are you Mr. Gibson?"—"Yes, Sir." The stranger modestly announced himself—"The Duke of Devonshire. Canova has sent me to see what you are modelling." The duke looked at and admired the work on which the sculptor was engaged, and ordered it to be executed in marble for him, as well as another bas-relief—"Hero and Leander," which he had modelled at the request of Canova, from a drawing made for Mrs. Robinson. Both these works are now at Chatsworth; *replicas* of the former were executed for the late Emperor of Russia and Prince Torlonia. Many of Gibson's sculptures have found such favour with amateurs that he has frequently been called upon to reproduce them.

Among the most famous poetical statues of Gibson we would point out, besides those just mentioned, "Aurora," a winged figure bearing two ewers, engraved in the *Art-Journal* for September, 1849; a "Greek Hunter and his Dog,"—these two beautiful works were executed for the late Mrs. Henry Sandbach, of Liverpool, daughter of his early patron, Mr. Roscoe: a duplicate of the "Hunter" was subsequently made for Lord Yarborough; the "Sleeping Shepherd," executed for Lord George Cavendish, and repeated for the Duke of Northumberland; "Sappho," in the possession of Mr. Ellams, of Liverpool; "Proserpine," executed for Dwarkanath Tagore, of Calcutta; "Hylas and the Nymphs," in the Vernon Collection, and engraved in the *Art-Journal* for January, 1854; and a "Venus," which has been completed some time, and is destined ultimately for the public hall of Liverpool, but the sculptor, hitherto, has been unwilling to release it from his studio in Rome.

To the bas-reliefs already referred to may be added as among the most striking and important—"Amalthea feeding the Infant Jupiter," in the possession of the Earl of Carlisle; "Cupid and Psyche," in the collection of the Queen, and engraved in the *Art-Journal*, January, 1856; "The Angel of Hope," a beautiful figure, also engraved in our publication, July, 1855; a "Wounded Amazon leading her Horse;" the "Hours leading forth the Horses of the

Sun," executed for Earl Fitzwilliam; and "Hebe pouring out Nectar for Psyche."

Of Gibson's portrait-statues the first place must be assigned to the statue of the Queen, engraved in the *Art-Journal* for May, 1849; this noble example of sculpture is placed in the vestibule at the top of the grand staircase in Buckingham Palace; a duplicate is at Osborne. Another statue of Her Majesty the Queen, demi-colossal, represented sitting on her throne, with Justice standing on her right hand and Clemency on her left, is erected in the Prince's Chamber of the House of Lords. Next in artistic value to the statue of Her Majesty, though antecedent to it in date, is that of Huskisson, a commission from the mercantile community of Liverpool; it is placed in the cemetery of that town, under a small Greek temple; a second statue, in bronze, presented by the widow of this distinguished statesman, stands in front of the Custom-house of Liverpool—it differs a little from the other; and a third, in marble, similar to the second, executed for Mrs. Huskisson, was presented by that lady to the committee of the London Royal Exchange, and now stands in the great room at Lloyd's. The statue of Sir Robert Peel, erected in Westminster Abbey, is another fine example of portrait-sculpture from the chisel of Gibson.

Gibson is the first of our sculptors who has had the daring to introduce colour into his works. In the statue of the Queen he has run a very

delicate tint of pale rose and pale blue round the edge of the drapery, the wreath and the bracelet being also tinted with gold colour. But, in the "Venus," of which we have spoken, this innovation—it is such in modern Art—has been carried still further,—the statue is entirely coloured of a pale flesh tint, which gives it the appearance of wax; the eyes are blue, with the pupils marked, and the hair faint flaxen; the only part of the marble left white is the drapery thrown over the left arm, but the edge of the drapery has a border of pink and blue.

All Gibson's ideal sculptures are founded on purely classic models: the

PSYCHE BORNE BY ZEPHYRUS.

CUPID AND PSYCHE.

reverence for Greek Art, which he acknowledges to possess, is seen in all that he does; his works are eminently distinguished by the utmost refinement of feeling, exceeding gracefulness of form and expression, and by almost unrivalled delicacy of execution: in his bas-reliefs especially, from which all our illustrations on these pages are taken, as being, if the term may be allowed, the most pictu-

resque for our present purpose, he shows himself to be an artist of the highest poetical imagination; while in his personal character he is, like most men of real genius, unaffected, simple-minded, kind, and invariably courteous to all who come in contact with him, whether of high or low degree. Gibson has never married—his art is all the world to him.

PROGRESS OF ART-MANUFACTURE.

THE PATENT SILICEOUS STONE, INVENTED BY MR. FRED. RANSOME, OF IPSWICH.

It is with no ordinary satisfaction we introduce this subject to our readers; illustrating this page by en-

pen of Professor Hunt. It will be at once seen that, however great may be the advantages of this so-

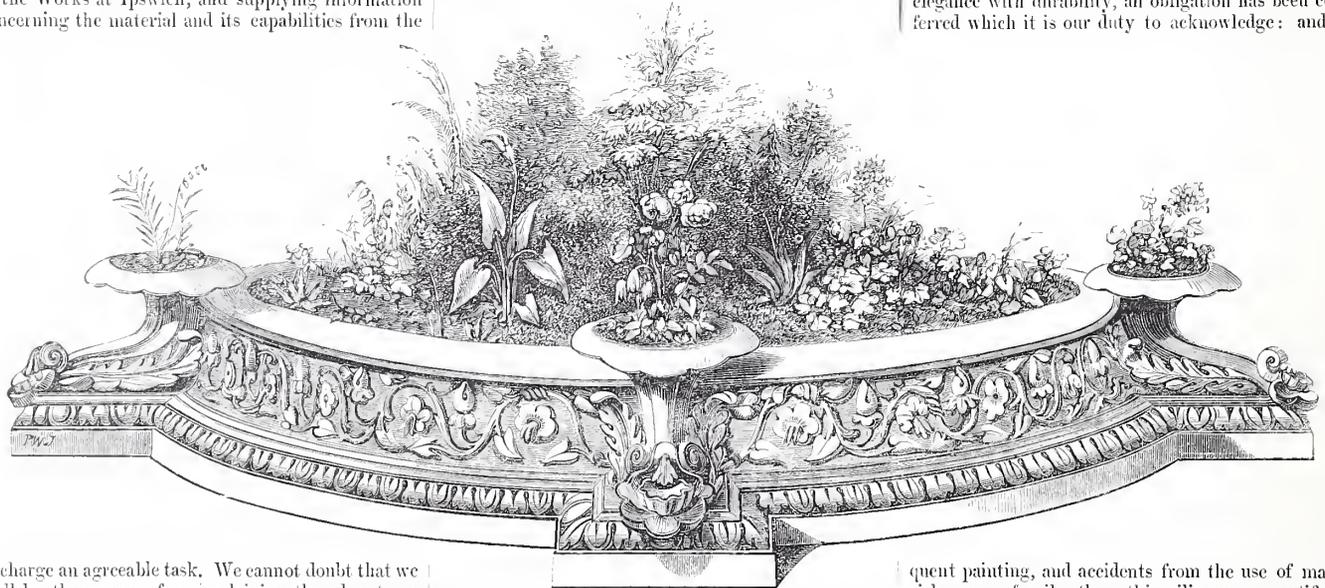

operation of the artist has been sought and obtained in designs for the more graceful utilities of the

gravings from some of the more recent productions of the Works at Ipswich, and supplying information concerning the material and its capabilities from the

called "Patent Stone" for the purpose of the architect and for larger requirements in building, the co-

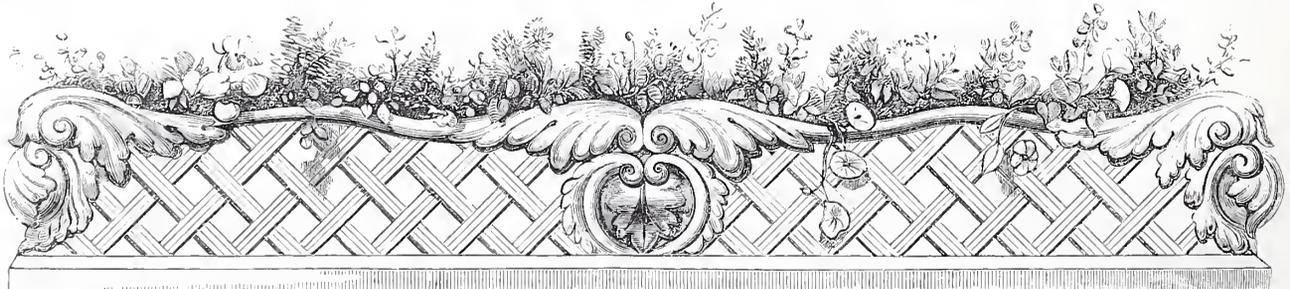

greenhouse and the garden. In thus combining elegance with durability, an obligation has been conferred which it is our duty to acknowledge: and so

discharge an agreeable task. We cannot doubt that we shall be the means of so explaining the advantages of these productions as to induce their adoption where such elegant accessories are required, without

incurring the evils that too generally arise from exposure to a winter atmosphere, the necessity of fre-

quent painting, and accidents from the use of materials more fragile than this siliceous or artificial stone. We have selected for engraving a few of the many works of this particular class produced at

Ipswich: a large collection may be seen at the Crystal Palace, together with objects of a more substantial character—such as windows for churches,

fonts, monumental memorials, enriched caps and bases, balustrades, gate-piers, pedestals, &c. Our selections, however, will serve to show that the ma-

nufactures are keeping pace with the advancing taste for elegance of design, in every article which a Manufactory is required to produce.

THE APPLICATION OF IMPROVED MACHINERY AND MATERIALS TO ART-MANUFACTURE.

No. 9. — RANSOME'S PATENT SILICEOUS STONE, AND PROCESS FOR PRESERVING STONE.

In the *Art-Journal* for 1849, artificial stone formed the subject of several articles. In one of those the cementing powers of silica, and the methods which had been adopted for using it, as a preservative glaze and as a binding agent, were noticed. Mr. Frederick Ransome had then, recently, brought under the attention of the Institution of Civil Engineers his patented process for forming artificial stone, and it was incidentally, though briefly, alluded to. In the eight years which have elapsed since those articles were written, much has been done towards perfecting a process which, from the first, bore evidence of its high utility; and we now find it brought to such a state of perfection that, in recording, as we desire to do, the progress of Art-Manufacture, we feel the time has arrived for giving a detailed description of Mr. Ransome's process.

In Art we are only successful when we carefully follow out the processes which Nature observes. If we would produce an aggregation of sand, so as to form artificially a stone, we can do so only by one of the methods which Nature has adopted in the production of her coherent rocks. If we attentively note what is taking place upon the hills of howu sand which we find on the western shores of our island; if we examine the processes of consolidation which are in progress throughout the more recent tertiary formations of our eastern coast; and if we read aright those "sermons in stones" which every mass of modern *hercinea* preaches,—we shall discover some of the methods, by imitating which we may be successful in artificially forming a stone.

In some cases we find Nature employing lime, in others silica, and again in others iron, as her cementing material; the resulting rock varying in its physical and chemical characters, as one or the other of those agents had effected the consolidation of the particles. We are informed that Mr. F. Ransome was first led to make experiments in this direction, from observing the peculiarities attendant upon the process of refacing the celebrated French burr stones. It then occurred to him that by carefully selecting the solid particles, and then agglutinating them, if possible, a stone of far more uniform grain might thus be produced, than that which obtains generally in the mill-stone grits, from which, as the name indicates, the stones for our corn-mills are usually obtained. Such was the starting-point of the inventor; and, pursuing a somewhat devious course, and trying processes which were not true to nature, he was for some time unsuccessful. Eventually the true light broke in upon his mind, and SILICA, the grand cementing agent of our hardest rocks, presented to Mr. Ransome the agent of which he was in search. The experiments made with this chemical substance became in the highest degree promising, although still surrounded by difficulties; but, with great perseverance, each difficulty was encountered, and, by degrees, overcome, until at last a high degree of perfection has been reached. The limits of our space will not allow of our following out the history of each discovery connected with this process; it must suffice that we describe the main features, and so much of the manipulatory details as will enable all readers to understand the conditions under which the siliceous stone is formed.

Flint and siliceous sand are the materials employed. If these are fused together the result is a kind of glass; a process of fusion could not therefore be adopted. Flint is a compound of a peculiar metallic base *silicon* (upon this metal M. Sainte-Claire Deville is at present eagerly experimenting) with oxygen, and the compound, which we call flint, possesses the property of combining with an alkali, potash or soda, in different definite proportions. In one proportion we have glass in its ordinary condition, in the other we have a soluble compound of the silicate of potash or soda. The soluble silicate of soda, rendered as neutral as possible, is employed by Mr. Ransome. This silicate is thus prepared:—Caustic soda and flints are hoiled together, under pressure;—but a little more exactness of description may be here acceptable. In the first place the soda

ley, or caustic soda, is obtained by treating a solution of the carbonate of soda of commerce with quick-lime; the lime seizes the carbonic acid, and remains as a solid carbonate of lime, while the soda is held in solution, uncombined with any acid, or, as it is said, in its caustic state. If we boil powdered silica in soda ley, at the ordinary temperature and pressure, we obtain eventually some silicate of soda, but, with a large excess of free alkali, which would be very objectionable in the formation of any stone, giving rise to efflorescence and exfoliation. By exposing, however, flints, as they are found in the chalk formations, to the action of the caustic soda, at that elevated temperature which is represented by a pressure of about sixty-five pounds to the square inch, a soluble silicate of soda is obtained, which is, with proper care, prepared without any alkali in a free or uncombined state. Many precautionary measures have to be adopted before all the conditions necessary are secured. The carbonate of soda of commerce is found always to contain some undecomposed sulphate of soda, and this, if allowed to enter into the composition of the stone, gives rise to efflorescence. To remove this, the clear caustic soda is placed in a tank and treated with baryta—which is prepared by burning the carbonate of baryta with wood charcoal. The affinity of baryta for sulphuric acid is very great, and, consequently, it removes all this acid from the soda, and forms an insoluble sulphate of baryta, which falls to the bottom, and *pure* caustic soda is thus obtained.

The apparatus employed to dissolve the flints consists of a vertical digester, placed in a steam chest, which is connected with a steam boiler. The caustic ley is placed in this digester, and flints in a wire cage are immersed in it. The opening in the top of the digester is closed and screwed down, so as to resist the pressure, when at its full power the steam is turned on: by this means the whole arrangement soon acquires the temperature of the steam, and this is maintained for about thirty-six hours. The fluid is then tested, the workmen usually trusting to the taste: if it is found to be alkaline the heat is continued longer, until it passes off with merely a sweetish taste: a more scientific and accurate mode is to add some hydrochloric (muriatic) acid to the solution, the acid combining with the soda, sets free the silica, forming a white gelatinous mass, which, by its quantity, indicates the strength of the silicate of soda. When the fluid has arrived at that state which shows that it has taken up as much of the silica as it is capable of doing, it is passed into another vessel, in which it is allowed to stand, to deposit any adventitious earthy or other matters which may be suspended in it. It is next passed into an evaporating pan, which has a steam jacket, and evaporated until it becomes of the consistency of treacle, and has a specific gravity of 1.600. This then is the cementing agent.

The materials used in making the artificial stone may be varied for the purpose of producing different effects; but usually they are ten parts of siliceous sand, one part of powdered flint, one part of clay, and one part of the alkaline solution of flint, which has been described. These ingredients are all well worked together in an ordinary pug-mill until the mixture has a putty-like consistency, and appears of a uniform character. This plastic mass admits of being moulded into any form. The moulds employed are of plaster of Paris, which have been painted over with oil to destroy their absorbent character, and then dusted with powdered glass, to prevent the adhesion of the composition to the mould. The soft paste is pressed into the mould, and worked into every part with a short stick, the cast thus obtained preserving all the most delicate cuttings of the mould. Being washed with a solution of the silica, the workman goes carefully over every part, and repairs any defects, or adds any artistic touches which could not be given by the mould. As this material admits of the application of the modeller's skill, in the same way as clay does, there is no reason why works of a very high order of Art should not be executed in it.

The next process is that of drying the artificial stone; in this a great and unexpected difficulty presented itself at first, which has, however, been very satisfactorily overcome. In drying masses of artificial stone it was found that, indurating first upon the

surface, an impervious crust was formed, which prevented the escape of the water from the interior, except at a high temperature, and then the surface coating was broken through, and presented unsightly cracks. It became necessary to devise means for drying the interior of the mass first, and to effect this a very ingenious contrivance was adopted by Mr. F. Ransome: instead of using an open kiln in which to dry the moulded masses, he placed them in a closed chamber—into, indeed, the interior of a steam-boiler, which was surrounded by a steam-jacket, to regulate the temperature. In the first place, to prevent any superficial evaporation, while the stones were being raised to the temperature of 212° Fahr., a small jet of steam was allowed to flow into the chamber, and condense upon the stones. Now, by this means all was kept in a moist state, until every part of each mass had acquired the temperature of boiling water, and consequently the moisture escaped as readily from the centre of each mass as from its surface. The desiccation is in this way perfectly effected, the steam being allowed slowly to escape from the chamber; the interior of the stone is thoroughly dried, while the exterior is still involved in a cloud of moist vapour.

The siliceous stone, obtained up to this stage, although very hard, is liable to one objection, it may be acted upon by water, the silicate being still soluble in that fluid. If, for example, we precipitate silica from any of its salts, and dry the powder thus obtained, we shall find that it is soluble in water; but if that precipitated silica is exposed to a red heat it becomes absolutely insoluble, owing to some merely physical change in the molecular arrangement. The dried casts of the artificial stone are therefore exposed to a regulated heat, sufficient to produce this insoluble state; and another advantage is gained by the process. It has been stated that into the paste a portion of powdered flint is put: should there be any uncombined alkali in the stone, it fuses at the high temperature to which it is exposed into an insoluble silicate, and thus increased durability is secured for the siliceous stone.

In this material we have indeed the best, that is, the most durable particles of matter—siliceous sand, cemented together with the most perfect binding agent, flint or silica, the whole mass being a semi-vitreous compound of pure silica, and an insoluble silicate of soda. This process of firing requires, however, much care, and many precautions have to be adopted which are not required in the ordinary modes of baking clay.

When thoroughly dried, the articles are taken to the kiln, hut, instead of being placed, as earthenware is, in seggars of baked clay, as is usually done in the potter's kiln, the goods are bedded up in dry sand, to prevent any risk of their bending or losing their shapes while burning. Flat slabs of fire clay are then used to separate the articles from each other; and upon these similar slabs are placed, so as to form a shelf, upon which another tier of goods is arranged, and so on until the kiln is filled. The temperature of the kiln is very gradually raised for the first twenty-four hours; the intensity is then augmented until, at the end of forty-eight hours, a bright red heat is attained, when the kiln is allowed to cool for four or five days, after which time the articles are ready for removal.

It will be evident to every one that the patentee, by varying the degrees of fineness or coarseness of his sand, has the power of producing all varieties of artificial stone, from the fine sandstone to the coarser mill-stone grit; and it appears capable of imitating with much exactness the ornamental brecciated masses which many of our native rocks afford.

This artificial stone is applied to the production of a very miscellaneous description of articles. We have statuary of this siliceous mass—garden-stands for flowers, ornamental fountains, chimney-pieces, monumental tablets, with decorations of a very elaborate character, and ecclesiastical ornaments, as mouldings, Gothic foliage, crosses, corbels, pinnacles, and all the variety of architectural aids which are happily being restored in our modern buildings, adding greatly to their effective beauty. The following characteristic description of this artificial stone, from the pen of one who is thoroughly acquainted with all its peculiarities, and with the character of building stones generally, is much to the purpose:—

"The fine crisp, natural texture of Mr. Ransome's stone we believe to be altogether inimitable by any

amount of care or dextrous manipulation on the part of the sculptor, where natural stone is employed. This free, untooled, and natural spontaneity of external texture in the siliceous stone has not been obtained by any sacrifice of the sharpness in the lines or angles on its surface; on the contrary, it appears capable of receiving an amount of minute and delicate tracery which the most careful touches of the chisel or the file can give no conception of. In examining the external surface of a large seashell, it can hardly fail to escape the notice of the most casual observer, that there is a something in the character of the detail altogether beyond the skill of the most perfect artist to produce. The minute lines and wrinkles which have been the result of a living process of growth cannot be copied by the graver. Something of this quality appertains to the texture of this siliceous stone—it can only be imitated by going through the same process as that by which it has been produced."

As the quantity of the cementing material is varied, and the character of the sand changed, the stone can be made porous or non-porous, as may be desired. Of the stone as ordinarily prepared, the absorbent power is less than that of the Bolsover Moor dolomite, used in the Palace of Westminster, and a little more so than the sandstones from the Cragleigh Quarries, near Edinburgh. Availing himself of the very valuable power at his command, the patentee constructs stone filters and filtering-slabs, which have been largely employed with the most perfect success. We understand that the town of Southampton has adopted Mr. Ransome's filtering-slabs, and that several hundred thousand gallons of water are daily filtered through them. This shows us in a striking manner the entire insolubility of the silica in the composition of the stone.

We have witnessed with great delight the construction in this metropolis, and in many of the great towns of the United Kingdom, of stone buildings. Many of these are of the most ornamental character, and they will eventually be regarded as good examples of our transition state from stucco to stone. Although a very sufficient commission reported upon the building-stones of the kingdom, and upon that report the Bolsover Moor dolomite was selected for the Houses of Parliament, and although the stones of other quarries of much repute have been selected for other buildings in London and elsewhere, it is certain that a premature decay is manifested upon these stones to a lamentable extent. When we find many of our ancient buildings—sacred to us by their historical associations—exhibiting still the tool-marks of the old masons upon their remaining skeletons, we are naturally led to ask, Did our forefathers understand the principles upon which stone should be selected for large buildings better than we do, or are there deteriorating influences now in existence which did not prevail when they constructed the abbeys and castles which still tell us of their constructive skill? It is certain that in many cases we are using stones from the same quarries as those from which the stones for our older buildings were selected. We believe, however, that in very many cases, the question of price has led to the introduction of stones from beds which are known to be of a less permanent character than others existing, but which are more difficult to work. It is equally certain that the volatile and gaseous principles escaping from the coals employed for our domestic purposes, and in our manufactories, do exert deteriorating influences upon the best stones, to which they were not formerly subjected. This being the case, there is an imperative necessity for devising some means of protection. A variety of organic compounds have been from time to time spoken of, but every kind of oleaginous or resinous coating is constantly oxidising by exposure to atmospheric changes, and a renewal of the paint is periodically required. Is it not lamentable, in this age of scientific application to be driven to paint a building of stone? If we are driven to this, we may surely return without censure to the economy of stucco.

It was a natural process, that the patentee of the siliceous stone should endeavour to silicify the surface of stone, so as to give it increased durability. Mr. Ransome appears to have succeeded in overcoming many difficulties in the way of applying his siliceous compound, and there is every reason for believing that he has devised a method which is applicable to all kinds of stone, and which produces

an exceedingly permanent facing. Mr. Ransome has described his process before the Royal Institution of British Architects, and we quote his own words in description of his process from the society's reports:—

"Having been led to consider the importance of preserving the stonework of our public and private edifices from the decay resulting from the variable condition of our climate, and other causes, I directed my attention to the existing processes proposed for effecting such an object, and more especially to that which has been for some time in use on the continent, in which a soluble silicate is employed, and I found that this process, though having for its base so important and indestructible a mineral as silica, was nevertheless very imperfect in its results. It appeared to me that one great cause of failure arose from the fact that the silicate, being applied in a soluble form, was liable to be removed from the surface by rain, or even the humidity of the atmosphere, before the alkali in the silicate could absorb sufficient carbonic acid to precipitate the silica in an insoluble form. But another great and serious defect in this process still existed, viz., that even were it possible to effect the precipitation of the silica, still it would be simply in the form of an impalpable powder, possessing no cohesive properties in itself, and therefore able to afford but little, if any, real protection to the stone. It seemed to me, therefore, necessary not only to adopt a process which should insure an insoluble precipitate being produced, independently of the partial and uncertain action of the atmosphere, but that, to render such a means efficient, a much more tenacious substance than merely precipitated silica must be introduced; and in the course of my experiments I discovered that, by the application of a second solution, composed of chloride of calcium, a silicate of lime would be produced, possessing the strongest cohesive properties, and perfectly indestructible by atmospheric influences. The mode of operation is simply this:—the stone, or other material, of which a building may be composed, should be first cleaned by the removal of any extraneous matter on the surface, and then brushed over with a solution of silicate of soda or potash (the specific gravity of which may be varied to suit the nature of the stone or other material); this should be followed by a solution of chloride of calcium, applied also with a brush; the lime immediately combines with the silica, forming silicate of lime in the pores of stone; whilst the chloride combines with the soda, forming chloride of sodium, or common salt, which is removed at once by an excess of water. From the foregoing description it will be apparent that this invention has not only rendered the operation totally independent of any condition of the atmosphere in completing the process, but the work executed is unaffected by any weather, even the most excessive rains. Experience has shown that when once applied to the stone it is impossible to remove it, unless with the surface of the stone itself. I do not confine myself solely to the solutions above referred to. In some cases I prefer to use first a solution of sulphate of alumina, and then a solution of caustic baryta, when a precipitate of sulphate of baryta and alumina is formed, the main object being to obtain by two or more solutions, which upon being brought into contact mutually decompose each other, and produce an indestructible mineral precipitate in the structure and upon the surface of the stone."

The rationale of the former of these two processes, which we regard with the most favour, is such that it appears to promise that intimate combination with the stone, and that insolubility of surface, which is the great desideratum. Time alone can determine the real value of this, or of any other process; but one thing is certain, that a siliceous coating, uniformly spread over the surface of any building, and adhering by virtue of its having been absorbed into a considerable depth beneath the surface of the stone, must possess preservative powers of a very decided character, and we hope to witness the results of some large experiments, under the influence of the fuliginous atmosphere of London: any process that will give cleanliness and durability to the labours of the architect in the metropolis is most needed.

ROBERT HUNT.

THE ROYAL PICTURES.

PREPARING FOR THE CHASE.

J. Mourenhout, Painter. T. Sherratt, Engraver.
Size of the Picture, 2 ft. 1 in. by 1 ft. 9 in.

MOURENHOUT, the painter of this picture, belongs to the modern Dutch School; his birth-place is Ekeren, near Antwerp, but he settled early in life at the Hague, where he is, we believe, still resident. His works plainly indicate that he has made Wouwerman his model; they consist, almost without exception, of skirmishes of cavalry, military halts, interiors of stables, hunting-scenes, &c.; in fact, of all subjects in which he can appropriately introduce, as a leading feature, his favourite animal, the horse. His pictures are much sought after in the Low Countries; and there are few of the principal collections in Holland and Belgium which do not contain examples of his pencil, and they are valuable additions to any gallery.

While the modern historical Art of these two countries—we should, perhaps, rather designate them as one in Art-matters, they have become so intermingled and united—pointedly manifests the influence of the practice of David, the French painter, landscape and genre-painting retain the peculiarities and much of the excellence of the old masters. The originality of the English school, as it has existed during the last fifty years, is principally owing to our artists being thrown back on their own resources; they were preceded by none—or but by two or three only—whose genius so immortalised their works as to make it a species of infidelity not to reverence and imitate them: and herein we believe they have had advantages that far more than counterbalance the good to be derived from following implicitly in the footsteps of any predecessor, however great; an *original* painter, provided he never "oversteps the modesty of nature," will always gain a larger share of notice even from those well conversant with Art, than one who only follows in the wake of some distinguished master, and who, in so doing, obviously provokes comparison with his teacher.

We have had in our metropolis within the last two or three years, and there may now be seen in the Crystal Palace at Sydenham, abundant evidences of the truth of our remarks respecting the works of the modern Dutch and Belgian schools. The Dutch painters especially, like many of the Dutch ship-builders, seem to consider they cannot improve upon the old models: the latter certainly might, but we are not so positive about the others; still few critics will be inclined to find fault with them if they equal what has been done by those who have gone before them, and this it can scarcely be denied some do. In passing through the galleries to which reference has been made, one would easily point out among the contributions, pictures bearing the closest resemblance in character and style to those of Ostade, Teniers, Vander Heyden, Ruysdael, Huysman, Kalf, and others.

Wouwerman, so far as our observation has extended, has found few imitators than many of his contemporaries, or those who lived about his time: this may possibly arise from his subjects being of a less popular nature; the cavaliers of Holland and Belgium have passed away with the age of chivalry, military halts are unfrequent, and when they occur, offer, it may be presumed, comparatively little interest; hawking, too, is out of fashion, and hunting is not so eagerly followed as a pastime as it was in the days of Rubens, Snyders, and Wouwerman: in a word, it is there as with us, artists of this kind look rather to the present than the past for subject matter, unless it be for some historical incident, in which the animal-painter may have a good opportunity for bringing his artistic powers into action.

Mourenhout's picture here engraved is a charming little work; the composition a reminiscence of the olden time; the grouping of the figures is striking, and the drawing spirited and correct; the time of day is early morning; the masses of dark clouds appear rolling away before the uprisen sun. The colour of the painting is bright and rich, yet delicate and harmonious; it is in the collection at Osborne.

FROM THE PICTURE IN THE ROYAL COLLECTION.

LONDON, PRINTED BY R. CLAY AND CO. 1814.

THE
ART-TREASURES EXHIBITION.

THE ENGLISH SCHOOL.

THE probable results of an Art-exhibition, in the spirit of that of the Art-treasures at Manchester, have been much discussed and closely questioned as to their beneficial tendency. But so it was when the British Museum was established on its present footing, when the National Gallery was opened, and when Art-unions were proposed. The tastes of Manchester might not have been known; it is certain they were not understood. An industrial exhibition was supposed to be more consonant with the intelligence of the people. But such an exhibition was opened towards the end of the last year, we believe with success; at least, it was thronged with a company consisting principally of the labouring classes on the occasions on which we visited it.

The purpose of this account of the works of our school is not an examination in critical detail. We are familiar with them, and nearly all have been already described—that is of the recent pictures—in the pages of the *Art-Journal*. The important question is the progress of Art, rather than the reputation of individuals. We must, therefore, regard with some little interest the evidences left us by those whose names occur the earliest in our Art-history; and the more so that these names arose and shone with a sudden burst of splendour, unequalled by the slowly-kindling brilliancy of any other school.

It may not be generally known that Manchester and its neighbourhood contains many of the best collections of English pictures that exist in the country; and from these collections some of the most signal productions of our school have been ceded to assist in enriching the catalogue. We see again these works with infinite satisfaction. The impressions, yet fresh, which they have left since the various years of their first exhibition, are in the majority of instances confirmed as to ourselves—a significant admission, when it is remembered that our school is divided into parties, and the eye has been so cruelly tried by harsh line and harsher paint. The sources whence are drawn the pictorial section of the exhibition are particularly two. The works of the “ancient masters” are in a great measure heir-looms, originally the property of persons who were collectors before we had what we are now pleased to call a school of Art. To their Art-wealth they rarely make additions, because, with the pictures, they may not have inherited the taste; and again, from the difficulty of procuring genuine works. We have witnessed attempts at the formation of collections of the “old masters;” and subsequently, when circumstances rendered it necessary that they should be disposed of, pictures for which thousands have been paid, have been sold under the auctioneer’s hammer for less than half as many hundreds. And this has been of incalculable benefit to living native talent. The *impromptu* formation of collections of ancient Art is shown to be unsafe. Most of the famous collections have been gathered from the studios of the painters themselves, and, having during centuries remained either in the family of their first proprietor, or been subjected to but few changes of proprietorship, such works are undoubted, and they do not appear often in the picture-market. A large measure of good has been eliminated out of the malpractices of evil dealers. They have not been able to procure originals, and have therefore manufactured them to an extent which has destroyed their trade by turning the demand upon the works of living English painters; and the patronage of Manchester and the neighbourhood of that place has been most liberal. We have already, in those articles entitled “Visits to Private Galleries,” described a few of these galleries; but there are others, containing some of the best productions of our time, yet to be noticed. And who shall then question the propriety of a Manchester Exhibition of Fine Art? When Giorgione and Titian, Velasquez and Murillo, painted, Manchester was not the ancient masters are not, therefore, rife in Lancashire; but there are English pictures which bear an equal value, and which are yearly growing into greater worth.

Contemporary Art is not sustained by patrons of the same class as that by which it was protected up to even the first quarter of the present century. Art

flourished in Italy, especially, under the protection of the Church, the servants of which were intensely scandalised at the mythical essays of the profane Venetians, who lavished on their painters gold without weight or tale, for portraits of themselves and stories from heathen poetry. In the history of the art, we know of no patrons who, as a class, are comparable to those splendid Venetian heretics, save our northern manufacturers. The history of Venice is like a romantic dream; the daily circumstance of the lives of her princes was a poetical tissue; but these are not indispensable conditions to a taste for painting. The potentates of Lancashire live on in solid prose, and yet are magnificent in Art. Both have arisen apart, and stand out in relief,—the former from the ecclesiastical patrons of painting in Italy, and the latter from its noble protectors among ourselves. Those drew their wealth from the silks and spices of the East; to the cotton of the West these are indebted for their riches: and they have contributed their best and most valuable works. We see at Old Trafford pictures which have been the points of attraction in their respective years of exhibition,—pictures which, having seen once, we never forget, and are glad to see again. But in this they have not been imitated by the noble holders of ancient Art. Where are the Warwick Vandykes, and where the Petworth Vandykes? where the Sutherland Cuypp and the Wellington Velasquez? We might chronicle a list of high and noble names, but that is not our purpose now. The Queen has, with the most gracious liberality, allowed the Committee to select from her palaces, but the royal example has not been imitated. Behind what excuse soever the proprietors of these glories of the extinct schools may shelter themselves, we cannot believe that they could not have sent their pictures. The ancient pictures communicate a paramount interest to the exhibition. Thousands who see the collection could have formed before no just conception of the effect of an assemblage of ancient Art. The “Art-Treasures” is a most felicitous idea, and it has, on the part of Manchester, been realised with a noble spirit. It is far behind the wonders of the Pitti Collection; but not so incomparable as to small pictures with the Louvre. The exhibition of Fine Art might have been limited to modern compositions, of which a great part of the catalogue Lancashire and the neighbouring counties might have furnished; but this would have appeared too ostentatious, even could we suppose that such an interpretation would have been received as the fulfilment of the promise held out in the words “Art-Treasures of the United Kingdom.”

We know not what causes may have operated to mar the classification of these works, but, arranged as we find them, they do not enlighten the inquirer as to our progress in Art. Such an occasion as this may never again occur of presenting an effectively-illustrated history of the British school. There may have been some inconvenience, occasioned by, perhaps, the late arrival of certain of the pictures; but it had been worth some trifling sacrifice to have hung the works in chronological sequence. This was most desirable for two reasons, of which either were sufficient. These are, the desirability of being able to estimate the advance of the art generally, and to observe for better or for worse the vicissitudes of manner of each painter in particular; neither of which objects can be so conveniently accomplished as when the pictures are hung in their proper succession. Many of the painters are, of course, contemporaries, but their places in the succession would have been determined by seniority. We have not heard why this was not effected, we can only feel that no obstacle ought to have prevented a chronological arrangement. We have, for instance, No. 28, “Portrait of Frank Hayman,” Sir Joshua Reynolds; again, No. 42, by the same artist; Nos. 51, 52, 53, 54, 55, 56, and 57, by the same, with others in the same disjointed order: the last of Reynolds’s works being No. 163, preceded by pictures by Nasmyth, Dawe, Daniell, Harlowe, Reinagle, and others who were never heard of until long after Reynolds’s death. The collection commences with works by Dahl, Aikman, Kent, Jervas, Cradock, Scott, Ramsay, Wootton, Vanderbank, and Hayman. The example of Dahl and that of Jervas are studies from the same person, a little girl—Miss Margaret Cavendish Harley. In one picture she is presented helpless, as it were, in one of the inexorably stiff dresses worn by children in the time of Vandyke; in the other, we see her dressed in blue and silver,

like a boy. The pictures by Scott are “Westminster Bridge in Progress,” and “London Bridge,” two large studies of considerable merit, painted with much firmness.

The extreme feebleness of much of the Art of this period fully justifies the censure with which it has been visited. Those artists on whom public patronage was lavished were portrait-painters; there was no encouragement for professors of any other department. For a portrait-painter it was considered that but little preparatory study was necessary, and hence the faulty design which disfigures the canvases of even Kneller and Lely. Vandyke was prodigiously ostentatious of his hands; he has introduced into portraits hands which really vitiate the composition, and give the figures attitudes extremely ungainly. But Vandyke drew hands with exquisite delicacy, though generally too much of one type. Rembrandt could not draw hands, therefore we find him throw his extremities into shade; and, notwithstanding the example of Vandyke, so it was with our own artists—a little success in executing a head constituted a painter. The drawing in Hogarth’s earlier works is faulty beyond everything, as in “The Idle and Industrious Apprentices,” “The Rake’s Progress,” and even in those of his productions which in their day were themes of universal praise, as the “March of the Guards to Finchley,” “Southwark Fair,” the two last of which are exhibited at Manchester. The “Scene from the Beggar’s Opera” is the study for Mr. Murray’s picture; it was purchased at Strawberry Hill by Mr. Willett for £57 15s. It presents Walker as Mac-heath, Miss Fenton (afterwards Duchess of Bolton) as Polly, Hippisley as Peachem, and Hall as Lockit, with several well-known characters among the audience. The picture was painted for John Rich, the celebrated Harlequin, at the sale of whose effects it became the property of Horace Walpole. The picture, belonging to Mr. Murray, was painted in 1729 for Sir Archibald Grant, of Monnymusk; and another subject, called a companion to this, is from the gallery of Lord Carlisle. “The March to Finchley” was painted in 1750, and is in the possession of the Foundling Hospital. George II., desirous of seeing the work, sent for it; but it was returned to the painter without any observation from the king; in resentment of which, Hogarth dedicated the engraving to the King of Prussia. It is most likely that this famous “progress” was not conducted with anything like the decorum and precision of the military promenades of our own time; but with Hogarth’s disposition to caricature, it cannot be doubted that the scene is immensely overcharged with grossness and debauchery; and we cannot wonder that George II. should reject such a picture of the men who, for a time, by their firmness, baffled the attacks of the entire French army at Fontenoy. The most daring of Hogarth’s essays was his attempt to rival Correggio, a weakness which he may be very well excused. Curiously enough, both of these pictures are at Manchester, the so-called Correggio being No. 348, Saloon C. It is now assigned to Furini, and it is only matter of surprise that it should have ever been accepted as by Correggio, being so inferior in every way to the quality of that painter. But now that, in the National Gallery and in private collections, the public enjoy opportunities of seeing genuine examples of the most celebrated artists of all schools, such impositions will be less frequent than in the days of Hogarth. The subject of this competitive essay is “Sigismunda weeping over the Heart of her Lover.” Hogarth shared with his fellows of our earlier school the mantle of Velasquez, which Wilkie says has fallen among them. His portrait in Marlborough House is his best performance in this direction, and worthy of comparison with anything that has ever been done in portraiture. At Manchester is the portrait of Captain Coram, from the Foundling. But versatility was a feature of the period; even in our own time, of several branches of Art exercised by the same professor, one is made to support the other, save where the artist was exclusively a portrait-painter. To this rule Richard Wilson was one of the melancholy exceptions; he was a martyr to his fatal constancy to landscape, at a time when that class of patrons, of whom we have already spoken, had not arisen. At a much later date the fate of Nasmyth was not dissimilar—even Nasmyth, who is far a-head of all the Dutch land-

scape-painters, as an unpoetical interpreter of everyday nature. When Hogarth sent to a friend, as an invitation to dine, a rough sketch of a pie surrounded by knives and forks, and accompanied, as a legend, simply with the three Greek letters η , β , π , which meant "eat a bit o' pie," such was the public impression of the resources of the art that it was a matter of agreeable surprise and congratulation that Hogarth should have a pie to eat. But Hogarth was everything—engraver, and painter of portraiture, landscape, architecture, conversation, the drama, fabulist, moralist, and caricaturist. He stands alone as the originator of a *genre*, which none who succeeded him have ever attempted with success. In all the coarse and sordid material of so many of the eminent painters of the Dutch school, there is no sentiment beyond a description of passages of the lowest condition of life; and, subsequently, in the more refined license of the French, but little which can be read in a didactic spirit. Hogarth is as coarse as Teniers, Ostade, or Jan Steen; but in his painting of vice the lesson is emphatically given. His most elaborate work, "Marriage à la Mode," in the manner and the essence of its narrative will never be equalled.

When we consider the fame which Reynolds enjoyed, and the knowledge of Art which he had accumulated, we are surprised that he should have done so little in narrative composition. His discourses tell us that he was sensible of more than colour, but he was so entirely absorbed by a feeling for colour as to give himself unreservedly up to it in his practice. Although he wrote against colour, and ranked the Venetian school as only among the third-rate, yet the production of brilliant effect was the enduring effort of his life. His works, apart from poetry, were really what they were, poetical, sentimental, or mythological, by accident—that is, a ruggedly picturesque figure encountered in the streets, and brought home as a study, suggested "Ugolino;" a similar incident, the "Banished Lord;" when making a study of a child, "Puck" was suggested, and the ears were lengthened and the title given; and something similar is the history of the "Infant Hercules." But, with all his faults and errors, who has equalled him in portraiture? He has painted heads so luminous and life-like as to be surpassed in their best qualities by the productions of none that have gone before or who have yet succeeded him. He spoke disparagingly of the costume painted by Vandyke, but as to pictorial breadth and flow of line, the cavalier dress is incomparably superior to the brown coats painted by Sir Joshua. The flowing curls also of the seventeenth century assist a portrait much more than the perukes and powder of the eighteenth. But Reynolds has made the most of this unseemly attire; in the enchanting colour, argumentative features, and masterly effect, we forget these linear and angular coats, and the time will come when they will be coveted for picturesque quality as much as now is the cavalier costume, so despised in the time of Reynolds. Among the examples of the master there are No. 44, "The Hon. Mrs. Tollemache as Miranda;" No. 45, "The Captive;" No. 46, "Angels' Heads;" No. 47, "Lavinia, Countess of Althorp;" No. 48, "Portrait of Himself in his robes as Doctor of Civil Law;" No. 49, "Archbishop Robinson;" No. 51, "The Duke of Portland;" No. 52, "The Braddyl Family;" No. 53, "Sir W. Chambers, R.A.;" No. 54, "The Rev. J. Reynolds;" No. 55, "Lady Sarah Bunbury, Lady Susan Strangeways, and Charles James Fox;" No. 56, "Girl Sketching;" No. 57, "Young Wynn as St. John." These works show a great diversity of taste and feeling; No. 44 is an admirable example of a practice very prevalent in the time of Reynolds, and before his time—that of presenting the sitter in a poetic or historic character. The lady wears a white dress, she is attended by Caliban, and Prospero appears as a secondary figure; the field of the composition showing one of those charming tree backgrounds—a kind of relief which Reynolds alone has been able to convert into a pictorial passage of the composition. The "Angels' Heads" is a replica of the picture in the National Gallery; it is the property of Lord Overstone, and has not been cleaned so recently as the other, which is in unusually fine condition for a Reynolds. The studies were made from Lady Isabella Ker Gordon, and the picture is perhaps the most exquisite piece of colour that the painter ever

executed. In it we see what he means by the note "think of a pearl and a peach." No. 58 is a study of a negro's head, but unfinished; it has been commenced upon tichen very slightly prepared. No. 60 is a portrait of the Countess of Dartmouth, an early picture, with much of the feeling of Kneller. It has not been finished with a glaze, as all his best portraits were, but the flesh is to a certain degree waxy and opaque. This should have been one of the first in the numbers assigned to Reynolds. No. 75 is the "Puck" so long in the possession of Mr. Rogers; it is said in the catalogue to have been painted for Boydell's Shakspeare. It was not painted for that work, but it was adapted by Boydell. There are moreover portraits of Lady Jane Halliday, Lady Hamilton, Lady Frances Cole, Sir Richard Worsley, Mrs. Hartley, Samuel Foote, and among others a portrait of George Viscount Althorp, a full-length figure in black satin, in a composition imitated from one of Vandyke's portraits. There is a difference in the head; the features are finished with a broad glaze, which gives the appearance of a work of which the face was painted by Reynolds and the figure and background by Vandyke. Master Wynn as "St. John" is very like a Spanish picture; when Reynolds painted it he must have been thinking of Murillo.

Before we can arrive at a just estimate of the benefits accruing to the English school of Art from the advent of Reynolds, it is necessary to know its condition and prospects before his practice began to have its effect. He had worked in the painting-room of Hudson about, we think, two years, when he was suddenly dismissed by his master, under the pretext of negligence, but in reality from a feeling of jealousy. He had been desired by Hudson to take to Vanhaeck a portrait, in order that the draperies might be painted; but the night was wet, and young Reynolds did not take the portrait until the following morning. Hudson was only waiting for an opportunity of relieving himself of the presence of one whom he felt was already superior to him in knowledge and power; for he did no more than paint the heads in his own works, which were finished, especially the draperies, by this Vanhaeck, who assisted also others in the same way that he aided Hudson. It is said that on the death of Vanhaeck Hudson was embarrassed beyond measure; and, if there was any significance in a caricature made by Hogarth, many others had reason to regret his loss. This caricature represented most of the painters then practising in London assisting in profound grief at the obsequies of the Dutch painter. In order also to avoid the difficulty of drawing and painting hands, Hudson availed himself of certain expedients, of which one frequently repeated was to conceal one hand within the waistcoat and the other within the hat, which was placed beneath the arm. Hudson was the pupil and son-in-law of Richardson, and he enjoyed for many years the reputation of a portrait-painter of the highest eminence, after Richardson and Jervas had quitted the field, although Vanloo, and Liotard afterwards, received a proportion of patronage. The last portrait that Hudson painted was in 1756, twenty-three years before his death, and while yet capable of painting as well as in his best time. Reynolds was then about thirty-three. From the lowest condition in the scale of European Art, the latter raised our portraiture above the standard of that of any foreign school. Lely came to us with the Restoration, and he was succeeded by Kneller, after whom there was a blank till the time of George I., between whose accession and the reign of Henry VIII. there were temporarily or permanently in England only five artists of enduring reputation; these were Holbein, Rubens, Vandyke, Lely, and Kneller. During two centuries Art in England was in abeyance. Hogarth was the first English painter who rose into public estimation. Mortimer and Wright of Derby, were pupils of Hudson; but all that is remarkable in their works is that they followed Reynolds rather than their master. From a letter written by Dr. Johnson to Baretti, we learn that Reynolds's income was £6000 a-year; and we know that his house was the resort of the most learned and brilliant men of his time,—all but the home of Johnson and Goldsmith—

— "for shortness called Noll,
Who wrote like an angel, but talked like poor poll."

It has been urged against Reynolds that he did not embody in any considerable composition the

principles inculcated in his discourses. There is truth in this; but it must be remembered that these discourses were the result of his position. He never would have delivered them had he not been in the presidential chair of the Academy. But in delivering such a course of lectures he was bound to illustrate the practice of the great masters of the art. His feeling did not lead him to historical composition—nothing could have restrained an enthusiastic nature like his from the pursuit of its bent.

A few years after the accession of George III. many painters rose to distinction; though the distinction of some was reputation without profit. Barry came forward under the cordial patronage of Edmund Burke. The landscapes of Wilson and Gainsborough excited immeasurable wonder—not from the high qualities with which they were enriched, but because any men in their senses should devote any time to such a branch of Art. Poor Wilson felt the force of the objection, but Gainsborough fell back upon his portrait-painting; and in their way to his portrait-room visitors passed without notice a long array of his best and most elaborate landscapes. About this time, too, West came home from Italy, and the first historical subject which he exhibited was considered by a certain set of critics as an impertinent surprise, but by the mass of the *diletante* public as an interesting curiosity of Art. The works of Gainsborough that we find here are—No. 43, "Welbore Ellis" (Lord Mendip); No. 50, Portrait; No. 70, "Landscape, with cows, sheep, goats," &c., and a number of others; but the most remarkable picture is the famous "Blue Boy," No. 156, the property of the Marquis of Westminster, painted by Gainsborough in presumed refutation of Reynolds's precept, that cold colour, especially blue, is unsuitable for the principal lights and masses of a picture. It is undoubtedly a valuable picture—in high preservation, and Gainsborough has taxed his best taste and utmost powers in its production. It is usual to regard the work as a triumph—as subversive of the principle which Reynolds lays down in his eighth lecture, in these words: "Though it is not my *business* to enter into the detail of our art, yet I must take this opportunity of mentioning one of the means of producing that great effect which we observe in the works of the Venetian painters, as I think it is not generally known or observed. It ought, in my opinion, to be indispensably observed, that the masses of light in a picture be always of a warm mellow colour, yellow, red, or a yellowish white; and that the blue, the grey, or the green colours, be kept almost entirely out of these masses, and be used only to support and set off these warm colours; and for this purpose a small proportion of cold colour will be sufficient. Let this conduct be reversed; let the light be cold and the surrounding colours warm, as we often see in the works of the Roman and Florentine painters, and it will be out of the power of Art, even in the hands of Rubens or Titian, to make a picture splendid and harmonious."

It is known that there was little cordiality between Gainsborough and Reynolds, and if we consider the bearing of each towards the other, there is reason to believe that while the feeling of Reynolds towards Gainsborough showed a disposition to cultivate friendly relations, the sentiments of Gainsborough towards Reynolds were of a different character. The "Blue Boy" is one of Gainsborough's most remarkable but not one of his most agreeable works. The meaning of the author of the Discourses is sufficiently plain, and the "Blue Boy" in nowise invalidates the precept. There are cold and grey pictures of enchanting beauty; but they are apart from the "splendid" nature which Reynolds means, which he felt so profoundly, and described with such genuine pathos. All painters, in their time, have sought relief for the eye in breadths of cold colour; but inquiry teaches us that these are but experimental and playful essays. One of the most remarkable of these that occurs to us at this moment is the blue Ostade, in the Louvre, in which there are figures in every possible tone and tint of blue. The picture has been executed with some such feeling as Gainsborough painted the "Blue Boy;" but the principle as illustrated by Ostade is carried out in full score, whereas Gainsborough gives us but the key-note and the first bar of the treble. When Reynolds wrote the passage he was not only thinking of his "pearl and his peach," but he was, in turn with Rubens and Rembrandt, with those luxuriously mellow Venetians

that he talks so much about, condemns yet imitates—with fine old Bonifazio, with Fra Bartolomeo, and Andrea del Sarto, seen only in the Palazzo Pitti at Florence. The "Blue Boy" is the frontispiece of one set of harmonies, and that which Reynolds means is founded upon another principle of nature, the base of his arguments being that a breadth of warm and mellow colour is more grateful to the eye than a passage of a cold hue—the utmost power of cold colour does not equal the lustrous brilliancy of warm colour. But we have no space further to consider the question. Near the "Blue Boy" there is, by Gainsborough, a charming portrait of Mrs. Graham, but the severity of the expression is a mistake—the features of the lady might have had this repulsive character, but she should not have been painted as a Medea. Gainsborough's landscapes remained a long time in his own possession—with his power in portraiture he could afford to keep them—but eventually many fell into the hands of dealers at reduced prices, and were forced by them into collections of older Art. When West's first picture, "Orestes and Pylades," was exhibited, it was much admired by the possessor of a gallery of ancients, who spoke of the production in terms of high praise to his father, when the latter said, "If you admire the picture so much why do you not buy it?" to which the son answered, "What could I do with a modern English picture in my house? I could not hang it with my Italian and Dutch works." And such was the prevalent prejudice which during seventy years was most oppressively felt by the profession. The same feeling yet exists, and to very many of these collections no modern additions have been made; but other sources of patronage have presented themselves by which in reality the progressive school has been sustained. Between Wilson and Gainsborough there is but little community of sentiment. The former had a settled disposition for sunny, open scenery; the latter painted most commonly close passages of deep tone: in the works of the former there is always a vein of romance; those of the latter are purely domestic, unspiringly homely, and many of his productions recommended themselves to country gentlemen of strictly local tastes, in consequence of a general resemblance to this or that portion of the home grounds. Gainsborough admired Mola and Ponsin, and we trace the influence of both in his works; and although he so frequently painted English scenery with a foreign sentiment, yet he has had many followers, and even in the present day we observe his manner of execution practised by one of the most eminent landscape-painters of our school. The examples of Wilson here are—"Cicero's Villa;" "View on the Thames;" "The Vale of Langollen;" "View on the Arno," and other landscapes, among which is a remarkable version of "Niobe," the property of Mr. Wynn Ellis, besides which there are four others of the same subject, respectively in the Bridgewater Gallery, in Thirlstaine House, in the National Gallery, and in the collection of Mr. Munro, who, by the way, possesses some of Wilson's finest works, as, "Rome from the Villa Madama," and others of equal excellence. Wilson intended himself in early life for a portrait-painter; but on showing Zuccarelli, in the north of Italy, one of his landscape sketches, the latter exclaimed, "Che spirito ha quest'uomo;" and the expression did not escape him as an idle compliment, but he earnestly persuaded Wilson to become a landscape-painter, and he thenceforward declined portraiture, for which he was but ill-qualified. He painted from mythology. The Niobe story is the best example of his works of this class, in all of which we recognise his deference to Claude and Salvator. His open landscapes, painted from veritable localities, have more of actual truth in them: it is obvious that in Italy he could never forget the atmosphere of England—nor when in England could he ever forget the sun of Italy; but the compositions here are not his happiest successes.

We now enter upon a period in which we observe the influence of Reynolds not only in head painting, but in figure composition. We recognise it in Romney, No. 77, "Lady Broughton," and No. 83, "Lady Hamilton as a Bacchante;" in No. 93, Zoffany, "Love in a Village," and "Poote as Major Sturgeon;" in Hamilton, No. 106, "Mrs. Siddons;" in No. 117, Northcote, "La Fayette in the Dungeon at Olmutz;" No. 119, "St. Michael," by Howard; No. 124, "Age and Infancy," by Opie, and, indeed, by all his contemporaries who practised

portraiture or figure painting; and the revolution is the more patent in a comparison of the vigour and tone of this period with the cold inanity of the entire interval between the death of Vandyke and the return of Reynolds from Italy. The force and substance of our masculine portraiture after the advent of Reynolds surpassed that of the works of any other period in the history of painting. Much of the vigour and intensity communicated to male heads by Reynolds is attributable to his habitually working from a high light when painting men—a method of lighting not so systematically pursued by Vandyke, Lely, Kneller, or any other artist who was settled in this country antecedently to Reynolds. If we consider the character given to heads by this manner of lighting, it must be agreed that it points rather to the Spanish than the Italian feeling; and this it is that gave occasion to the observation of Wilkie (his Life, vol. ii., p. 486, writing from Madrid), that "Velasquez, however, may be said to be the origin of what is doing in England. His feeling they have caught almost without seeing his works, which here seem to anticipate Romney, Reynolds, Raeburn, Jackson, and even Sir Thomas Lawrence. Perhaps there is this difference, he seems to do at once what we do by repeated and repeated touches. It may be truly said that wherever Velasquez is admired, the paintings of England must be admired with him." Fuseli, in a note to one of his lectures, takes a view somewhat similar of the sources of our style—"But in oil," he says, "the real style of portrait began at Venice with Giorgione, flourished in Sebastian del Piombo, and was carried to perfection by Titian, who filled the masses of the first without entangling himself in the minute details of the second. Tintoretto, Bassan, and Paolo of Veroua, followed the principle of Titian. After these it migrated from Italy to reside with the Spaniard, Diego Velasquez, from whom Rubens and Vandyke attempted to transplant it to Flanders, France, and England, with unequal success. France seized less on the delicacy than on the affectation of Vandyke, and soon turned the art of representing men and women into a mere remembrance of fashions and airs. England had possessed Holbein, but it was reserved for the German, Lely, and his successor Kneller, to lay the foundation of a manner which, by pretending to unite portrait with history, gave a retrograde direction for near a century to both. A mob of shepherds and shepherdesses, in flowing wigs and dressed curls, ruffled Endymions, humble Junos, withered Hebes, surly Allegoes, and smirking Penserosas, usurped the place of truth, propriety, and character. Even the lamented powers of the greatest painter whom this country, and perhaps our age produced, long vainly struggled, and scarcely in the eve of life succeeded to emancipate us from this dastard taste." Fuseli is right in the main features of his rapid sketch, but not so in his statement that Rubens borrowed anything in portraiture from Velasquez, whose senior he was by twenty-two years; moreover, their portraits, from first to last, are differently lighted, and Rubens painted into that glaze with which Velasquez finished.

The success and the distinguished position of Reynolds tempted a throng of aspirants into the arena of Art; many commenced the career without any qualification for it. Of the works of those who have left names more or less honourable, the exhibition affords worthy examples, as Nos. 109, 113, 115, &c., "The Battle of La Hogue," "The Departure of Regulus," "The Death of General Wolfe," &c., by West; No. 112, "The Death of Major Pierson on the Invasion by the French," and No. 108, "The Tribute Money," by Copley; No. 119, "St. Michael," Howard; No. 122, "Jael and Sisera," Northcote; No. 102, "Hotspur and Glendower;" No. 104, "Thor Battering the Serpent of Midgard;" No. 105, "Theseus and Ariadne," by Fuseli; No. 158, "Pandora, or the Heathen Eve," by Barry; No. 133, "The School-mistress;" No. 124, "Age and Infancy," by Opie; No. 136, "African Hospitality;" No. 139, "Rustic Scene;" No. 142, "Gipsies;" No. 143, "The Englishman's Return for African Hospitality," and No. 145 a, "The Recruit," by George Morland; No. 130, "Landscape—The Ringwood Picture;" No. 131, "Landscape, with Waterfall;" No. 141, "Edinburgh," by P. Nasmyth; No. 121, "Maritana," by H. Thomson; with others by Harlowe, Dawe, Shee, Daniel, &c. &c.

Fuseli leaves us little grounds for affectionate remembrance. If we do not carefully examine the facts with which he deals, we are wrong into assent by the oppression of his style as a lecturer, in which we continually feel his effort for antithesis—his struggle for an epigram: but apart from this defect, his lectures are erudite, though little profitable to the student. In everything that he has done we feel that he was continually haunted by an extravagance of conception, which, in his lecture on invention, he thought it necessary to justify. On the subject of painting from abstract idealty, he says,—"The ancients were so convinced of their rights to this disputed prerogative, that they assigned it its own class; and Theon, the Samian, is mentioned by Quintilian—whom none will accuse or suspect of compounding the limits of the Arts—in his list of primary painters, as owing his celebrity to that intuition into the sudden movements of nature which the Greeks call *φαντασιας*, the Romans *visiones*, and we might circumscribe by the phrase of 'unpremeditated conceptions—the reproduction of associated ideas.'" In the works the titles of which are noted, the figures look like representations of visionary beings, rather than those of men who have lived and moved on earth; and we cannot help being struck here with a circumstance which Fuseli seems to have made a principle, that is, the extraordinary length of the lower limbs in proportion to the bodies of his figures. This occurs so continually, that we cannot believe it accidental. In this he might have professed to follow the Eginetan school, which gave short bodies and long legs to their male figures—a disproportion that is also observable in the Amazons of the Phigalians.

Towards the close of the last century, Italy was even more than now considered the *alma mater* of painters; and it is the Italian impression that we recognise in all the higher aspirations of the time. Northcote was honest enough to say that he went to Italy "to steal what he could;" others went with the same intention, but they did not confess it. The branch of Art now recognised by the comprehensive term "*genre*" was not known; the domestic and semi-dramatic subjects of the Dutch were called "conversation pieces," and the style was considered unworthy of men who felt themselves inspired by the sacred and eloquent works at Rome, Florence, and Bologna. West was the most successful of the historical painters, but it must be remembered that he was sustained by George III., by whom, first and last, he was very liberally commissioned. Had it not been for the royal patronage, West would not have been so prosperously conditioned as many of his contemporaries of inferior position, for he was but an indifferent portrait-painter. The grand style was the prevalent taste; all who were not exclusively portrait-painters executed large pictures: but the taste was confined to the painter, it did not make way with the public. But bow indifferent soever were these works, we have seen worse accepted as national effort, and their authors cheered onward by reward and popular applause; and however faulty these pictures, they would have been accepted had they been cordially felt; but in the national taste they left yet a void, and that void has been supplied by small pictures. It need not be said now that had the public taste cherished history, painters of high merit would not have been wanting.

In contrast to these too ambitious artists, and as a painter of small pictures and insignificant subjects, George Morland may be cited. He was of no school, but he painted everything—signboards, sentiment, landscape, animals, coast scenery,—and would have painted history had he been commissioned to do so; but he was too fully occupied. His colour was as good as that of Wilson, and he excelled him in execution and certainty of touch; and, without being able to draw figures, he painted them with more natural truth than many an educated painter. Those of the sylvan subjects which he painted in his lucid intervals are charming examples of fresh and original Art. Morland was perhaps our first really popular professor of that branch of Art which accepts as subject-matter every incident of every-day life. Morland's friends expressed many wishes that he had been a gentleman; but had he been a better man, it might be feared that he would have been a worse painter. Everything that he did was worth a price; while the

arduous and weary labours of men of high attainments did not procure them bread.

Barry was professor of painting in the Royal Academy in 1782, as successor to Penny, the first occupant of the chair of painting; he was, however, expelled the Academy in 1799, in consequence of his letter to the Dilettanti Society. The "Pandora" (No. 158) was sold at Barry's sale, in 1807, for £230, and in 1846 it was resold at Christie's for eleven guineas and a half; and at a price of £60 has at length found an abiding place in the Manchester Institution. But Barry is to be seen only in the rooms of the Society of Arts in the Adelphi. These works are grand and original, and in tone and execution bear the impress of the character of the man. For the seven years during which he was occupied in these compositions, he received only two hundred and fifty guineas from the society, and the proceeds of two exhibitions. Barry's essays have left no impression on the progressive school, while, on the contrary, a small picture, "The Death of General Wolfe" (No. 115), by West, excited universal attention, and marked the commencement of a revolutionary crisis in our historical Art. He was much ridiculed for the common-sense effort of painting men in the costume they commonly wore. For the Death of Wolfe, Barry would have painted the apotheosis of a Greek hero; and Fuseli would have turned it into a saturnine drama, with every character attired in doublet and hose. The French school, at the end of the last century, was resolutely classic: Roman and Greek history were ransacked for instances of self-sacrifice, which by a forced interpretation might be made to apply to the new order of things in France. But West's coats and waistcoats were a source of fruitful reflection to the painters of our own school, and each asked another why this rationalism was not thought of before. But simplicity is the last excellence at which we arrive in all things.

Romney was a most diligent portrait-painter, and made a considerable income by his art; his manner, like that of all those professing this department of Art, was based on the practice of Reynolds, preserving its force but failing of its delicacy. The solidity and readiness of Opie's manner (Nos. 124 and 133) describe the impulsive disposition of the man; his friends praised his productions, but he ridiculed their eulogies, and was never satisfied with anything that he could do. Copley's admirable picture (No. 112), "The Death of Major Pierson," and "The Death of the Earl of Chatham," now in Marlborough House, very materially aided the common sense treatment of historical and semi-historical incident; and we had generally dismissed the nude heroic, while David and his disciples were yet under the intoxicating spell of the Rhodian Art.

We cannot pass unnoticed No. 130, though altogether out of its place. It is a landscape—"the Ringwood Picture," by Nasmyth; a masterpiece of simple nature, brought forward with a feeling similar to that of Ruysdael, but it is superior in everything to Ruysdael. Nasmyth was a plain-spoken man, but minutely circumstantial and incorruptibly veritable in all he describes. In his roadside cottages there is nothing romantic, and in his stunted garden-trees there is no poetic form: he has not an eye for colour equal to that of the luxurious Both, nor has he listened to the birds with the profit derived from their melodies by Minderhout Hobbima; but the genuineness of the locality invites us into the picture, into which we step with pleasure and look about us.

The genius of Turner brought him into notice at the end of the last century. The works by which he is represented here are—No. 191, "Pluto carrying off Proserpine;" No. 198, "Dunstanborough Castle;" No. 228, "Sunrise—Mouth of the Thames, with Men-of-war;" "The Vintage at Macon;" No. 208, "The Wreck of the Minotaur;" No. 232, "Dolbadern Castle"—Turner's diploma-picture, exhibited in 1799; No. 266, "Walton Bridge," &c. &c. With regard to Turner much has been said and written,—we will only allude to the sources of his early inspirations. The marine subjects of his first manner incontestably declare an imitation of the Dutch masters, as "The Wreck," "The Wreck of the Minotaur," and others. There is one charming sea-picture, in the collection of Mr. Bicknell, known to have been painted after a famous

Ruysdael, in the possession of Mr. Munro; but, with their own cold white and black, Turner excelled both Ruysdael and Vandervelde.

We are approaching the time when the teaching of the Academy begins to be felt, but we must ungratefully abbreviate our contemporaries into a space in which we could not really do justice to even one of them. We pass without note the continental reproach continually launched against us of our inability to draw; if it were at all profitable, scores of instances might be adduced from these walls in support of the truth of the stigma. We find in Stothard—No. 171, "Charity;" No. 172, "The Picnic;" No. 173, "The Canterbury Pilgrimage," &c.; and in Smirke—No. 179, "Scene from Foote's Comedy of 'Taste,'" and No. 181, "Don Quixote and Sancho,"—much of the feeling of the sketching days of our school, but with flashes of genius which frequently draw forth the question, "What would these men not have effected if they could have drawn well?"

The works of Lawrence are well chosen; they show his first manner, strongly indicating the influence of Reynolds, and his more advanced performances as the devotee of fashion and refinement. No. 183, "Miss Farren, Countess of Derby;" No. 202, "Lady Leicester as Hope;" No. 212, "Sir Sidney Smith;" No. 214, "Gipsy Girl;" the Portrait of Mr. Croker and that of Miss Croker, extensively known by engravings; but the fashion of Lawrence is fading, while the earnest nature of Reynolds yet rises in our estimation.

We stated at the commencement of this notice that it was not our intention to analyse the contents of the Manchester Exhibition. As to its arrangement, it might have been made a significant exponent of the progress of our school from its darker time to what the scientific historian hereafter may class as the Drift Period of our annals—for we now live in a wilderness of *genre*. We had no intention of detailing the contents of the catalogue, or even mentioning all the painters by name. These we speak of at least once a year, and with every modern picture in the collection that has been exhibited within the last twenty-five years we are perfectly familiar, and glad to have an opportunity of again welcoming in a public exhibition. But there are men who have shone as bright stars before the period we mention, who have fascinated a larger throng of followers, and who, as worshippers of nature, have converted many to their faith and strengthened others in it. Let us take the numbers as they come, with a wish that the arrangement had been better:—No. 195, "The Rustic Bridge;" No. 243, "Salisbury Cathedral;" No. 257, "Landscape—Barge passing a Lock;" No. 277, "White Horse—Landscape," &c., by John Constable; No. 226, "Bivouac of Cupids;" No. 263, "Ulysses and the Syrens;" No. 281, "The Homeric Dance," &c., by Etty. No. 244, "Sketch for Blind Man's Buff;" No. 247, "Boys Digging for Rats;" No. 258, "Blind Man's Buff;" No. 265, "The Rent Day;" No. 274, "Guess my Name;" No. 287, "Scene from the 'Gentle Shepherd';" No. 259, "Distraint for Rent," &c., by Wilkie. These three men are remarkable as having set prejudice at naught, with talent sufficiently great to constitute themselves propounders of new articles of faith. Reynolds at first pronounced against West's "Death of Wolfe," and in like manner what he would have said on hearing "The Rent Day" or "Blind Man's Buff" proposed as a subject is one thing, but what he might have said, as in West's case, on examining the finished picture, would be another. With respect to Constable, the story of Sir George Beaumont and the "brown tree" is well known. Constable was told that his version would "never do," nevertheless, it did succeed, and gave a new feeling not only to the landscape-art of our own country, but also to that of France. Constable was true to himself to the last: Wilkie had the nerve to set aside high art for domestic art, but he was subsequently weak enough to repudiate the class of subject on which his fame rested, and then fell to the level of mediocrity; though, had he lived, he would have been at the head of another revolution—that of painting sacred history in the oriental costume as it is now, and as it was in the days of Abraham, to the entire dismissal of the conventional draperies that have been borrowed from the Greeks.

But we have yet a host of brilliant names attached to famous pictures, as No. 280, "The Judgment of

Solomon;" No. 421, "The Mock Election," by B. R. Haydon; No. 230, "Ganymede," and No. 231, "Venus Disarming Cupid," by Hilton; No. 359, "Christ Weeping over Jerusalem," and "Pilgrims coming in sight of Rome," by Eastlake; No. 522, "The Ghost Scene in 'Macbeth,'" No. 538, "Snap-apple Night," "Moses Preparing for the Fair," "The Return of Moses from the Fair," &c., by Maclise; No. 347, "The Barber's Shop," Nos. 355, 356, 357, and 358, "The Forgotten Word," "Train up a Child," &c., "The Bathers," and "The Dog of Two Minds," with "The Wolf and the Lamb," &c., by Mulready, with some of the most memorable works of Landseer, as "Dignity and Impudence," "Alexander and Diogenes," "Lassie Herding Sheep," "Rat-catching," &c.; of Roberts, as "Rome from the Gardens of St. Onofrio, on the Mount," "Giralda—Seville," &c.; of Stanfield, "St. Michael's Mount," "The Abandoned," "The Passage of the Magra," "Dartmouth," &c.; of Leslie, as "Sir Roger de Coverley going to Church," "The Rivals," "Scene from 'Henry VIII.," &c., with numerous other interesting and beautiful productions, of all of which we have spoken when exhibited on the walls of the Academy, by Danby, Frith, Goodall, Ward, Creswick, Cooke, Cope, Webster, Herbert, Poole, Linnell, Sant, Müller, Collins, Callcott, Millais, Hunt, and a numerous list of other well-known artists.

But in any estimation of our progress in Art there are two questions which force themselves on our consideration; one is "To what extent have we benefited by the competitions instituted in reference to the decorations of the Houses of Parliament?" the other is, "What may be the ultimate tendency of Pre-Raphaelism?" We can only allude here to these questions; we reserve them for future consideration.

It is in an exhibition of this character that we might have looked for any effect which had resulted from the really great efforts made by the Government with a view to popularise fresco and "high Art," but all indications of the temporary impulse communicated by those competitions have become gradually extinct. We recognise nothing that has reference to the public works in the Houses of Parliament, save, we think, the pictures by Herbert, Nos. 329 and 468, one being a small oil version of "Lear disinheriting Cordelia," the other, "The boy Daniel," a single figure exhibited a year or two ago in the Royal Academy. We remember the reply made by Newton to a lady who said to him, "Mr. Newton, you are not an historical painter."—"No, Madam," he answered, "but I shall be so next week." Poor Newton! if it was *his* "Lear, Cordelia, and the Physician" that he then contemplated, he had better have kept the work by him until some influential friend had prevailed upon him to amend the puerile drawing. We know that exalted principle is applicable equally to small works with large, but we cannot agree with Newton, that an "historical painter" is made in a week. We continually see large pictures disqualified by a treatment and execution fitted only for small works; and small works exalted by a breadth and grandeur approaching that of the standard examples of the great schools. In each case the artist misapplies his powers, but especially the painter of the large picture. We have ample evidence that we have among us artists equal to any thing that may be required of them, but the public do not desire large pictures.

Could we suppose an opinion pronounced upon our Art, gathered essentially from our Art-literature, by one of those imaginary impersonations—the creation of a living Addison or Goldsmith—after having read the lectures of Reynolds, Fuseli, Flaxman, Barry, Opie, and others, and without having seen the works of our school, it cannot be supposed that he could be impressed otherwise than with a conviction that our painting was that of a school unutterably transcending the most shining virtues of all other schools, extinct and contemporary. His irreversible conclusion must be that inasmuch as these learned discourses inculcated the noblest principles of painting, the works of our artists could be in no other spirit than that of divine aspiration. It were impossible to believe that after so much written and said in precept so little should have been done. Place then in the hands of our shadowy inquirer the "Life of Haydon," and he

learns that all that this elaborate teaching has produced is but one artist worthy of the name of painter, who was despised and neglected because Art was not yet understood in England. Then let him turn from Haydon to Ruskin, and from him he will learn that there were many pretenders, but still only one painter, and he was a landscape-painter, to whom all others were as nothing. Could then our imaginary friend, after the contradictory apophthegms of the two writers we mention, be introduced within the walls of the Royal Academy on the occasion of an exhibition, it would be the climax of his confusion to see every classic principle outraged even by those works which stand the highest in the public estimation.

George III. regally patronised ambitious Art in his time: the only objection to his proceeding was that he did not extend his patronage to more than one painter. Barry was true to his mythological and poetic myths, and remained unemployed; poor Hilton would not paint portraits, and commissions to him were but exceptional sunny rays in his desponding life. We cannot marvel at the public diffidence in not employing Haydon: he did not suffer himself to be forgotten. Had he been as respectably economical as Hilton or Barry he would have lived happily to an old age, and have died rich.

Thus we take leave of the Exhibition for this month, with the hope of affording, at some early occasion, a brief view of the Water-Colour Department.

VISITS TO PRIVATE GALLERIES OF THE BRITISH SCHOOL.

THE COLLECTION OF J. H. MANN, Esq.,
OF OLD CHAPEL HOUSE, KENTISH TOWN.

THE pictures which we now describe are the property of a gentleman from whom the profession of Art acknowledges having received many benefits. It has never fallen within our province to discharge a duty more agreeable than this, which affords us a legitimate opportunity of rendering homage to one who has ever been foremost in his heartfelt advocacy of the best interests of the artist. It is now nearly thirty years since Mr. Mann became connected with the "Artists' General Benevolent Institution;" during the last fifteen years of which period he has given his earnest exertions to this institution as vice-president and chairman of the council. Long before Art was so popular as it now is—before the friends of Art were so hopeful as they now are—he stood almost alone in his own position, as the active promoter of the welfare of the painter. There are those who rise at once into reputation and prosperity; but these are not the men who require support and encouragement. In looking round the collection which is now under notice, we observe early works of men who have now risen to eminence, and the pictures of others who are yet infirm in public estimation. It is not difficult to understand this: these pictures were acquired long ago; purchased, perhaps, with kindly terms of good-will towards, and warm expressions of hope for the future prosperity of the painter. Mr. Mann keeps these side by side with his best acquisitions; and we know not how long, but a single glance tells that his collection has been long in course of formation. Many collectors and patrons of Art have risen up of late years, of whom not a few make their selections, not so much according to their tastes, as according to the probable growing value of the pictures. The collection of which we now speak has always consisted of the same works—save the progressive additions; they have never been weeded with any view to commercial advantage. On the subject in which he is so enthusiastic, Mr. Mann is an eloquent and impassioned speaker—qualifications which it may be supposed place him frequently in the chair on public occasions when Art is in question; and all who know him acknowledge the services which he has rendered to the profession as well in this way as in others—for he was the friend of the painter when his friends were few, and he is not less distinguished as his supporter now that his friends are many.

The "Suburban Artizan Schools" have proved an inestimable boon to industrial Art. The first of

these—"The North-London School of Drawing and Modelling"—was established by Mr. Mann, Mr. Neville Warren, and the late Mr. T. Seddon; and so successful was the institution, that the plan has been adopted by government—but not until all difficulties had been surmounted by the energy, industry, and benevolence, of these three gentlemen. Indeed, wherever the interest of the profession was to be advanced, we find Mr. Mann among the most earnest of its promoters. But to turn to the pictures.

'Leith and Edinburgh, from Leith Roads,' W. A. KNELL.—This is rather a large picture, grey in tone; but notwithstanding a studious denegation of colour, extremely sweet and harmonious. The distances in the wilderness of brick and mortar which falls under the eye are distinctly defined, and ultimately closed by the high ridges of the old town and the dominant points, the Calton, Arthur's Seat, and Edinburgh Castle. The nearest water section is broken into a succession of sweeping surges, painted with an enviable facility of manipulation, and occupied by picturesque craft, of which a small Dutch galliot is the principal.

'Fruit,' G. LANCE.—A composition of white and black grapes, with some small addition to the dessert.

'Lord Mayor's Day,' D. ROBERTS, R.A.—Here we meet the procession turning from Ludgate Street into Bridge Street; we look up Ludgate Street, which is crowded with pedestrians and carriages: the eye is led perspective into the composition until it rests on the dome of St. Paul's, which rises high above the houses. This picture was painted just twenty years ago, and therefore differs somewhat in manner from later works.

'Lavinia,' F. STONE (engraved).—A study of a young lady, in profile; she is seated, and in the act of sketching: the figure is relieved by a foliage background.

'The Coquette,' A. ELMORE, R.A.—A group of two small full-length figures, very expressive, and at once explanatory of the relation proposed between them. The persons are well rounded and substantial, because no passage of gradation, however slight, is omitted. He presses his suit earnestly, but despairingly: she is unhesitating in her rejection.

'Mid-day,' H. B. WILLIS.—Principally a group of three plough-horses, two grey and a brown, accompanied by a couple of rustic figures, all temporarily resting from the morning's labour. They are introduced in an open landscape; such an arrangement is always agreeable when the figures or animals are well painted.

'Clovelly,' SHAYER.—On the left, and scarcely beyond high-water mark, the view is immediately closed by a group of sea-side cottages; the line of which is taken up and carried into the picture by fishing-boats, with their sails set. The figures on the beach are such as are often seen in the works of the painter,—an old man on horseback, with others interested in the sale of fish.

'The Characters in "As you Like it,"' T. STOTHARD, R.A.—A small composition, presenting a crowd of persons wearing the histrionic costume all but universal on our stage forty years ago—that is, for the men the doublet and hose, and for the ladies a modification of the past fashion of short waists and long skirts. But the figures are well drawn, graceful in movement, and the arrangement of colour is most agreeable.

'The Characters in "The Tempest,"' T. STOTHARD, R.A.—There is more movement here than in the preceding coterie. Prospero and Ariel occupy the centre of the picture, having grouped on the right and left Miranda, Ferdinand, Trinculo, and Caliban. The picture displays inventive power of a high order, indeed the reputation of the artist for this kind of composition has stood very high.

'Westminster Abbey from Lambeth,' ANDERSON.—We do not know the works of this artist, but the picture is an evidence of his taste and experience. The view is taken from the end of Westminster Bridge, that is, from the quay near the stairs above the bridge, and it was painted when the abbey still rose high over the old houses of parliament; but this view is now superseded by the river front and lofty towers of the New Houses, so that the picture hereafter will be an interesting authority as to the former condition of that section of the Middlesex shore immediately above the bridge. The light and shade of the picture are masterly, and the manner of the work bespeaks experience.

'Calais Harbour,' J. B. PYNE (engraved).—The view is taken from a jetty which occupies the near section of the composition, and being firmly painted, assists in keeping the town in its place. But little is seen of the town, the curtain with its embrasures being principally shown. It is extremely well drawn and painted, although it was executed before Mr. Pyne matured his style.

'The Frozen Dan,' C. BRANWHITE.—This is one of those winter essays in which this artist stands unrivalled. A mill with its stream ice-bound; pine-trees thrown up against the sky, contrasting forcibly with the other leafless trees; the foreground and nearest sections crowded with small but valuable incident, all described with a firm and sharp touch; the ice cracked, so that we can tell its thickness: these are but a little of the material of which this very successful picture is composed.

'Child and Parrot,' J. H. S. MANN.—A small picture in which a child who holds some grapes is apprehensive lest an importunate parrot should deprive him of a portion. The painting of the face, and the tinting of the complexion, are of the utmost delicacy.

'Llyn Idwal,' S. R. PERCY.—The subject is of the most picturesque character, and the feeling given to the scene is even beyond romance; it is wild and weird, and would have been much more suggestive without the introduction of rustic life. The lake appears to be set in a rude frame of rocks and broken banks, reflecting the little light the sky affords it, for overhead the clouds are portentous and menacing. The view is closed by mountains: the whole was painted on the spot.

'Norbury Woods,' R. REDGRAVE, R.A.—This attractive passage of sylvan scenery seems to have been painted also on the spot, or perhaps partially composed from nature. The trees could not have been otherwise so truly individualised; those especially on the left, with the piece of light bank below, are very faithfully descriptive of the reality. It is one of the most highly finished of Mr. Redgrave's tree-pictures.

'The Housewife,' J. H. S. MANN.—A study of an old dame knitting, well drawn and painted with much firmness: an early picture.

'The Tittlebat Party,' ALLEN.—A dark and forcible picture, to which life is communicated by a party of children fishing at the brink of a pool.

'Landscape,' A. W. WILLIAMS.—The subject looks like a passage of Welsh scenery, brought forward under the effect of a clouded summer day.

'Cottage Children,' T. BARKER.—One drinks from a pitcher which the other holds up. The incident would paint effectively, but the artist seems to have treated it as a reserve memorandum.

'Vale of Maçon,' a copy of Turner by COBBETT.—In this picture there is an elevated classical feeling; it is broad, Claude-like, and abounds with epic allusion. A company of nymphs are dancing in the foreground, whence, by gradations, the eye is carried to a distance which fades into a dim horizon.

'A Study,' W. P. FRITH, R.A.—The picture represents a girl sleeping, she is extended on the grass, with her left-hand resting on a book which she has been reading; the features are well drawn, broad in the painting, and fresh in colour.

'The Campagna of Rome,' R. P. NOBLE.—The nearest section of the composition is an eminence with ruins, whence a vast expanse of the country is seen below extending to remote distance. The figures are successfully national.

'Coast View,' CORBOULD.—This is a small picture by the late Mr. Corbould; it looks like composition, in the feeling prevalent forty years ago: the parts are few, and the oppositions decided.

'A Pastoral,' TOWN.—A small picture presenting a group of cows.

'Sketch for the Reading of the Will,' Sir D. WILKIE.—A small and slight sketch on white panel of that groupment in the composition consisting of the grandmother nursing the baby, the widow, and the officer in uniform. The picture is the property of the King of Bavaria, and hangs in the palace of Schleissheim, near Munich, in very good preservation, being the only one of Wilkie's important works that is out of the country.

'Landscape,' R. WILSON.—A small picture, from the foreground of which rise lofty trees, limiting, on the right and left, the prospect of a charming

glimpse of distance, thrown off and cleared up by the opposition of the dark masses of near foliage.

'The Casket,' C. BAXTER.—A small half-figure, that of a lady attired as a bride, holding a casket. The sweetness of the expression, and the clear and brilliant flesh tints, which so highly qualify Mr. Baxter's productions, signalise him as one of the most eminent colourists of our time. It has been objected to these works, that in the features there is too much similarity; but this will hereafter be lost sight of, and they will continue to grow in public estimation.

'The Gleaner,' PASMORE.—A study of a child resting on his return from gleanings; the head is full of life and intelligence.

'On the Thames,' A. GILBERT.—A small, bright, and sparkling picture, in which the water reflects the full force of the light of the sky. There is but little material in the picture, but what there is, is rendered fully available. The distant clouds are described with surpassing felicity; the eye acknowledges this as the most agreeable passage in the picture.

'Highland Scenery,' H. BRIGHT.—The tone of this picture is generally subdued, as in the entire field of the composition there is but one passage of high light. The subject is a grand and imposing mountain tract, broken into effective forms, and painted with a fascinating harmony of low tints. There is more of careful detail in it than in Mr. Bright's more recent works, which bear evidence of an injudicious haste of execution.

'The Village Congregation,' A. RANKLEY.—This is a small composition, a study, we think, for a larger picture, painted on a principle extremely difficult to carry out, that of presenting each object in its full and legitimate value to the eye. The scene is strictly real; there is no arbitrary disposition of light and shade: the row of charity girls is what we see anywhere once a week; but the squire, in the costume of the last century, takes us back to the days of the "Spectator."

'A Filatrice,' D. W. DEAN.—A study of an Italian peasant woman spinning, in the manner practised by the primitive nations of the earth when the world was yet young. It is extremely simple, but in colour and skilful and effective touch, very charming.

'Cupid,' C. BAXTER.—Study of a small head and bust, the features being turned full to the spectator; he is in the act of fitting an arrow to his tiny bow. The picture looks like the portrait of a child in the character of Cupid.

'Cattle,' T. S. COOPER, A.R.A.—Three cows grouped upon a knoll, whence we obtain a very extensive view of the adjacent meadows (near Canterbury). This picture, although painted as recently as 1849, is one of the most sparkling productions of the artist. It is an arrangement which he frequently repeats, but in brightness and finish it excels all the recently exhibited works by the same hand.

'Mother and Child,' J. H. S. MANN.—The mother holds her sleeping infant on her lap. The little picture is remarkable for sweetness of colour and the delicacy with which it is worked.

'A Bacchante,' (?) J. P. DREW.—The figure in profile, but the head turned, looking at the spectator; it shows much freedom and decision of execution.

'Hampstead,' T. CLINT.—The foreground is rich in sandbanks, broken into available forms, the high colour of which is opposed to a wooded distance lying in deep shade, and showing an expanse of country such as we see only in our own country.

'Deer,' W. BARRAUD.—In the centre of the composition are grouped a pair of bucks, well thrown up against the sky; the attitude of the animals is that of alarm, and their earnest and attentive gaze is a successful study from the life. The locality is a highland deer-forest; in the distance an undulating and impermeable wilderness.

'Benbridge,' A. VICKERS.—A small, broad, and agreeably painted landscape, looking to the sea.

'The Deserted,' J. INSKIPP (from Mr. Vernon's collection).—This appears to be an early picture, as being much less sketched than the late works of its author. It is a single figure, that of a lady seated, and wearing a red striped scarf, which covers the greater part of the person. It is essentially a dark picture, painted with a very full brush.

'Landscape,' J. O'CONNOR.—The subjects generally chosen by this painter were extremely simple,

but he rendered his works very interesting by the natural aspect which he communicated to them. The picture has much of the poetry and feeling of Wilson.

'Moonlight,' J. PETHER.—A composition with water and other objects which generally have a place in Pether's pictures.

'Coast View,' J. WILSON, jun.—On the right of this composition a jetty shoots into the sea, having on the left an open view, where, as a principal object, is seen a fishing smack. The water is very grey in colour; yet much of the picture seems to have been painted under the immediate dictates of nature.

'The Woodman's Return,' HILL.—He is about to enter his cottage, met by the welcome of his wife and children. The figures are touched with much freedom.

'Griselda on the Eve of Marriage with the Marquis,' R. REDGRAVE, R.A.—This is an important picture—a very full composition, and we believe, the largest the artist has ever exhibited. We remember it in the Academy in 1850; so recently as to render description unnecessary. The picture has been most elaborately studied throughout.

'The Mill,' G. WILLIAMS.—This small picture is one of the most agreeable we have ever seen by this painter. It seems to have been closely studied from nature, so well relieved and individualised are the masses of foliage which overhang the old mill. The arrangement is picturesque, and the colour harmonious.

'The Birthday,' W. P. FRITH, R.A.—This is a small repetition of the picture exhibited in 1856, and introducing to us for our congratulations the little girl enwreathed with flowers, and surrounded by her happy relations, with portraits of Mr. and Mrs. Frith.

'The Bouquet,' C. BAXTER.—A group of three girls, painted with all the charms of this painter's sweetness of colour and softness of execution. The work is now being engraved.

'Landscape,' T. CRESWICK, R.A.—This is an early work, painted before this artist adopted his present sober system of colour. The subject is of that kind that he would now select, being a rapid rocky stream in a wild and romantic country, closed by distant hills. It is bright in colour—in this respect the very opposite of Mr. Creswick's present works.

'An Old Mill,' P. W. ELEN.—The mill is situated on a rocky stream, and enclosed by trees constituting with the auxiliary material a composition of great picturesque quality.

'The Lock,' J. CONSTABLE, R.A.—The subject-matter represented in this picture is of a commonplace kind, but, by the treatment of the master-mind by whom it has been adopted, we lose sight of the ordinary nature of the material in the elevation of character given to it. The immediate site contains a canal running transversely into the picture; a canal-boat is passing, temporarily retarded while the horse comes round and leaps the sluice-gate. The picture is according to the known tastes of the painter—low in tone, and contains but little variety of tint; but it is assuredly one of Constable's best productions.

'A Composition,' DE LOUTHÉBOURG, R.A.—The subject is an interior, containing three figures, a striking example of the feeling of our school towards the end of the last century. It is thinly but freely painted, and conveys the impression that at this time execution was all in all.

'Precarious Possession,' BRISTOW.—A small composition, in which is seen a cat that, attacked by a dog, has sought refuge on the top of a tea-chest. The little picture is carefully finished.

'The Trespasser,' BRISTOW.—A pendant to the preceding, in which a stray spaniel is fiercely hunted by a large terrier, with a probability of paying dearly for having ventured within the territory of such a tyrant.

'Landscape,' P. NASMYTH.—Under the hand of this artist the most commonplace subjects become interesting. This picture presents to us only a wayside house, with trees of a very ungraceful presence, but the extreme fidelity with which the entire locality is rendered is such that the spectator may believe he has many times seen the spot. The work is so minute in finish, as to rival the utmost niceties of Dutch Art, and to convince the most prejudiced

Pre-Raffaellite that in the manner which he professes there is nothing new.

'Landscape,' B. BARKER.—This is a dark and Salvator-like composition—an essay full of poetic suggestion, but painted rather under the influence of Art than Nature: highly successful as an imitation of those dark and mysterious passages, which seem to have been worked out under impressions gathered from the enchantments of Ariosto.

'On the Dutch Coast,' T. S. ROBINS.—The glimpses afforded here of a low lying shore are alone a sufficient indication of the whereabouts, which in some degree resembles the mouth of the Scheldt; for there are Dutch craft, evidently at home, sailing under a breezy sky over the short chopping seas of an estuary.

'Winter,' E. WILLIAMS.—The objects presented here are a farm-house and out-buildings, beyond which the view opens to distance; the whole brought forward under a wintry effect—an aspect of nature which this artist represents very successfully.

'Venus,' J. WARD, R.A.—A study of a nude figure, with an accompaniment of a pair of swans, and also a pair of doves.

'Landscape,' J. WILSON.—This is not the class of subject usually painted by this artist, but the feeling and execution are those of refined taste and experience. The work is broad and firm, with a distance generally flat.

'The Breakfast Party,' COSWAY.—The party consists of two, a cottage boy and a cat; but the breakfast seems destined but for one, as the cat is very importunately begging a portion of the bread and milk. The manner of the sketch points at once to the early days of the Academy.

'The Fair,' G. WILLIAMS.—In the centre of this composition rise the densely-leaved trees of a village green; beneath are seen the booths and busy groups of the fair, the whole realised with great refinement of touch.

'The Sister of Mercy,' E. A. GOODALL.—A French rustic interior, in which a sister from a neighbouring convent is teaching a child its earliest lessons. The little picture has been studied from a careful sketch of the reality, and brought forward with much sweetness of colour.

'Fruit,' G. LANCE.—Consisting of a pine, peaches, and grapes. A small picture.

'Gibbon,' Sir J. REYNOLDS.—One of his finest works, in the highest state of preservation.

'The Combat,' W. ETTY, R.A.—The picture finished by the artist for the engraving by Doo.

'Head of a Child,' ETTY.—Life-size, one of his happiest efforts, both in colour and expression.

'Elgiva forcibly torn from her Husband, Edwy,' by command of Odo, Archbishop of Canterbury, J. E. MILLAIS, A.R.A.—This work was exhibited in 1847, and is described in the notice of the exhibition of the Royal Academy of that year. It is remarkable as the last picture painted by Millais before he yielded to the Pre-Raffaellite fanaticism. It was unsold in the Academy, but was purchased by Mr. Mann for 100 guineas, by way of assisting the young painter, among whose very best works it must always be placed. The story is the forcible removal from the court of Edwy's queen, by order of Odo and his creatures, who supposed that she distracted his attention too much from affairs of state; and the subject is treated in an earnest and dignified feeling, which would render the work well fitted as an addition to the historical series in the houses of parliament, if the proprietor were ever disposed to part with it.

'The Ascension,' WEST, P.R.A.—From the Vernon collection.

A large sized miniature of Mr. Mann, by ANDREW ROBERTSON—one of his finest productions for depth of colour and force, rivalling oil painting.

The original sketch for the 'Penny Wedding,' by D. WILKIE, R.A.

'Landscape,' J. LINNELL.

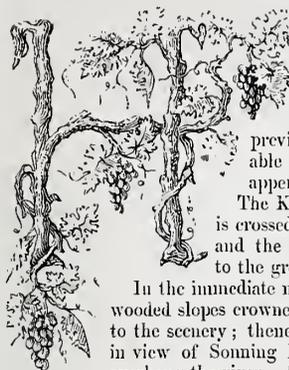

In addition to these works which are here described there are others, curiosities of Art, by earlier members of our school—as West, Morland, &c.; as also a collection of water-colour drawings by Martin, Stanfield, Hunt, Topham, F. Taylor, &c.; together with objects of *virtu*, all of which bespeak the taste and knowledge of the proprietor, and his liberal patronage of Art.

THE BOOK OF THE THAMES,

FROM ITS RISE TO ITS FALL.

BY MR. AND MRS. S. C. HALL.

PART IX.

HAVING rambled through Reading, noted its large capabilities for commerce, visited its principal antiquities, and made our pilgrimage to the home and grave of Mary Russell Mitford, we continue our voyage, entering the boat at Caversham Bridge, previously examining the picturesque and venerable church, and the singular "bit of ruin" that appertains to the boat-house.

The Kennet, close to its junction with the Thames, is crossed by two railway bridges—the South Eastern and the Great Western, the latter being the nearest to the great river into which the tributary runs.

In the immediate neighbourhood of Caversham Lock, there are wooded slopes crowned with villas, which give variety and interest to the scenery; thence the banks are flat and tame, until we come in view of Sonning Park, and pass underneath the woods which overhang the river. The church and village of SONNING are very simple, but highly picturesque,—the former is venerable from antiquity, but exceedingly neat and well kept; the latter is clean, neat, and sufficiently aged to retain many of the best characteristics of its "order," which, unhappily, are fast decaying throughout England. It is described by Leland as "an upland town, set on fair and commodious ground, beneath which the Tamise

SONNING CHURCH.

runneth in a pleasant vale." A handsome bridge of brick connects it with the opposite side: many of the cottages are covered with climbing plants—the old honeysuckle, the time-honoured jasmine, and the sweet clematis, mingled with the more recent acquisitions of simple florists of humble homes.

On the opposite bank, a little above the junction, is the village of SHIPLAKE,

SHIPLAKE CHURCH.

backed by hilly slopes, on one of which is the church, of which Grainger, author of the "Biographical Dictionary," was the incumbent; living here "in competency, obscurity, and content"—so says the tablet which marks his grave;

and here dying, in 1776, "as he was officiating at the altar." From the church porch there is a glorious view of the valley of the Thames:—

"The tranquil cot, the restless mill,
The lonely hamlet, calm and still;
The village spire, the busy town,
The shelving bank, the rising down,
The fisher's punt, the peasant's hom,
The woodland seat, the regal dome,
In quick succession rise to charm
The mind, with virtuous feelings warm;
Till where thy widening current glides,
To mingle with the turbid tides;
Thy spacious breast displays unfur'd
The ensigns of th' assembled world."

The lock and mill of Shiplake are now reached, just below which the Loddon meets the Thames; the great river being crossed by the railway from Twyford to Henley. The Loddon is "composed of various branches,"—its most distant source being in the vicinity of Basingstoke; one of its accessory rills gliding through a part of Windsor Forest. The village of WARGRAVE is then reached—a pretty and long village, with a picturesque church, surrounded by well-grown trees, and environed by productive meadows. In the venerable church is a monument to Thomas Day, the eccentric but amiable author of "Sandford and Merton," who was killed by a fall from his horse on his way from Anningsly, his home, near Chertsey, to the residence of his mother at Bear's Hill, near Wargrave. The monument contains these lines, written by Day as an inscription for the tomb of a friend; but they were well applied to himself:—

"Beneath the reach of time, or fortune's power,
Remain, cold stone, remain, and mark the hour
When all the noblest gifts that Heaven e'er gave
Were cut'r'd in a dark, untimely grave:
Oh! taught on reason's boldest wings to rise,
And catch each glimm'ring of the opening skies,
Oh, gentle bosom of unsullied mind!
Oh, friend to truth, to virtue, to mankind!
Thy dear remains we trust to this sad shrine,
Secure to feel no second loss like thine."

WARGRAVE CHURCH.

We now approach one of the cultivated "lions" of the Thames—"Park Place," famous in the annals of the river for the beauty of its site, the growth of its trees, and some circumstances which give it interest beyond that of ordinary demesnes. The house was built by the Duke of Hamilton: it was some time the residence of Frederick Prince of Wales, the father of George III.; but it is mainly indebted for its many attractions to Marshal Conway, who, towards the close of the last century, became its possessor, and who "set himself the task"

THE BOAT-HOUSE AT PARK PLACE.

of giving to Nature all the advantages she could derive from Art. The grounds have since received the benefit of time; they have not been neglected by successive lords; and the gentleman who at present owns them has evidently studied, by all the means at his command, to render them—what they are—"beautiful exceedingly." Visitors, by whom access on fixed days is easily obtained, land at the very charming "BOAT-HOUSE" we have pictured; it is, in reality, a furnished dwelling, and contains some fine, and several remarkable, works of Art—statues, pictures, wood carvings, and foreign curiosities—in the examination of which half an hour may be profitably expended.

A walk through the grounds, however, is a more exquisite treat,—hill and dale, richly-wooded slopes, and shaven lawns, are happily intermixed; while every now and then judicious openings supply views of the Thames underneath, or the landscape far beyond.

Here and there, on green hillocks or in gloomy dells, mimic ruins have been introduced; some of them built out of the debris of Reading Abbey. In one of them is a long subterraneous passage (cut through a chalk bed) leading to a Roman amphitheatre, the base of which is planted with the mournful cypress.

This is the work of Marshal Conway; but there is an object of greater interest in these grounds, although its value is lessened by the knowledge that this also is "artificial." Strictly speaking, however, artificial it is not; for the DRUIDIC TEMPLE which stands on the summit of one of the small hills, was placed exactly as it was found, keeping precisely the same form and character it received from the hands of the "builders," it may be twenty centuries ago. We may briefly tell its history. The temple was discovered on the summit of a high hill near the town of St. Helier, in the Isle of Jersey, on the 12th of August, 1785; it was entirely covered with earth, having the appearance of a large tumulus, and was laid bare by workmen employed to level the ground. Fortunately, General Conway was then Governor of Jersey; his attention was at once directed to its preservation; and, on his leaving the island, it was presented to him, and by him removed to Park Place.

"This curious structure is sixty-five feet in circumference, composed of forty-

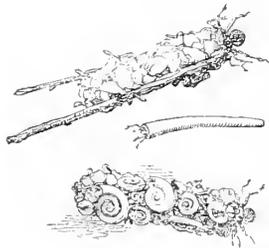

THE DRUID TEMPLE AT PARK PLACE.

five large stones (measuring, in general, about seven feet in height, from four to six in breadth, one to three in thickness), and contains six perfect lodges or cells. The supposed entrance, or passage, faces the east, and measures fifteen feet in length, and four feet and upwards in breadth, and about four feet in height, with a covering of rude stones from eighteen inches to two feet thick. In the removal of this curious temple from Jersey, all the parts were marked with such care as to be correctly placed in their original form, and precise direction, when they were re-erected on the charming spot which is distinguished by them. In the eighth volume of the 'Archæologia' a particular account is given of this venerable antiquity.*

We ask the reader to pause awhile at this pleasant "Place," and give a few moments' consideration to another subject which may be suggested to his thoughts in various parts of the river; and nowhere, perhaps, will it occur to him more forcibly than it does here.

Perhaps every angler may not be aware that the May-fly (*Phryganea*) and the Caddis-worm are but one and the same insect in different stages of development; such, however, is the case, the Caddis-worm being the grub which afterwards changes into the winged fly. The Caddis, during his aquatic existence, is a worm of no very prepossessing appearance, but he makes amends for his own want of personal attraction by investing himself with a most picturesque and original garment, which, in its formation, shows among different individuals a curious variety of taste, or instinct we must call it, in the selection and adaptation of the materials employed. Sometimes it is a collection of seeds of various plants that are cemented together to form the caddis-worm's case; sometimes a grass-stem is cut into nearly equal

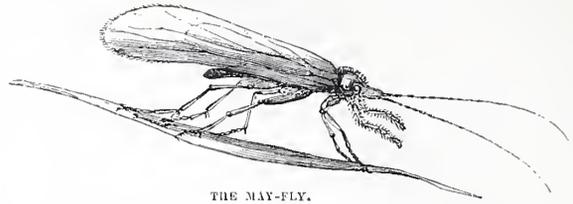

THE CADDIS.

lengths, and arranged in a polygonal form of great regularity. One specimen that we fished up had made choice of the clearest crystalline grains of quartz from among the sand, and had built himself a veritable crystal palace. But the oddest and most attractive of these little curiosities, are those composed of fresh-water shells, while still tenanted by their living inhabitants, and arranged together in grotto fashion (as shown in one of the accompanying figures), forming "a covering," as Kirby and Spence remark, "as singular as if a savage, instead of clothing himself with squirrel skins, should sew together into a coat the animals themselves." After a few months spent in these sub-aqueous

* We have retained the popular term "temple," as applied to this antiquity; but it is properly a tomb. Recent researches in Jersey and Guernsey have sufficiently established that fact. The circle of stones formed the wall of a small chamber, which was covered by heavy slabs; the "cells" contained bodies of the dead. A narrow covered passage led to this chamber, and a mound of earth was placed over all. In the thirty-fifth volume of the 'Archæologia,' Mr. Lukis, of Guernsey, has described several of these burial-places, from his own investigations in these islands; he describes the avenue or entrance to them as rarely more than 3 ft. in height by 2 ft. in width; the interior chamber of the largest was 8 ft. in height, 45 ft. in length, and 15 ft. in width; the roof stones, of granite, were computed to weigh thirty tons. They appear to have been used for successive internments of the aboriginal chieftains of the islands, and have been found with additional chambers as the original ones became filled with the "great departed." Sometimes in these chambers skeletons are found; sometimes bones, which show that the body was consumed by fire; sometimes the ashes are preserved in urns, rudely decorated with incised ornament; the other articles found in these tombs tell of an early and primitive people, such as spear and arrow-heads of flint, as well as knives of the same material, rudely formed beads of coloured earth, bracelets of jet, &c.

operations, the caddis-worm retires into his cell, puts a grating over the aperture, and then shortly emerges in the shape of a large brown fly, to commence his aerial existence, happy while he can avoid the hook of the angler or the gulf of the trout, for now he is a "May-fly."

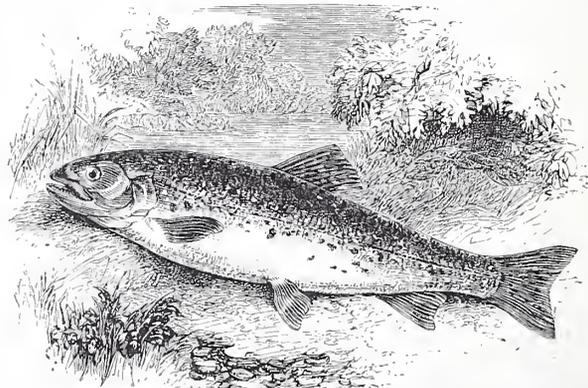

THE MAY-FLY.

We constantly meet this insect haunting the water-side, and flitting about with a loose flight over the herbage; in appearance it greatly resembles a moth, but the wings are semi-transparent, and covered with hairs, not scales, like those of the moth; the prevailing colours are various shades of brown. The following note on the proceedings of a female May-fly is quoted from Pattersou's Zoology, to which it was communicated by Mr. Hyndman of Belfast, and may be of interest to our readers:—"I first observed the *Phryganea* on the leaf of an aquatic plant, from which it crept down along the stem under the water, very nearly a foot deep; it appeared then to have been disturbed by some stickle-backs, which approached and seemed inclined to attack it, and swam vigorously and rapidly beneath the water, over some other plants. I then took the insect up, and found a large bundle of eggs, of a green colour, closely enveloped in a strong jelly-like substance, attached to the extremity of its abdomen." This power of diving and free movement under water is very remarkable and unusual among winged insects.

The trout is so well known that a few remarks only are necessary in reference to this the "best-loved" of all the fish of the river, not by the epicure so much as by the angler. The trout is, however, not very often caught in the Thames, there is so much space, and so ample a supply of food, that he will not often rise to the fly; on the other hand he lives, while he does live, in the midst of so many enemies, that his chances of growth are few. Those who do escape death, however, by good fortune, vigorous constitution, or peculiar watchfulness, grow to be aged and very large; usually every season there are a dozen or twenty trout caught in the Thames, weighing each between ten and twelve or fourteen pounds; but we do not often find them, as we do in other rivers, weighing between one pound and two pounds; and the "fish of size" are usually caught by "spinning," the bait being a bleak, a small dace, a gudgeon, or a minnow. The trout fisher, however, should go "farther a-field" who covets a good day's sport, and loves to walk along banks, scenting the thousand wild flowers that spring about him, inhaling the pleasant breeze, and listening to the songs that rise from meadow, tree, and bush—when

"The wind from the south
Drives the hook into the fish's mouth."

The Common Trout (*Salmo fario*) is an inhabitant of most of the English lakes and rivers, yet varies considerably in appearance in different localities. Mr. Yarrell gives the history of several species—the salmon trout, the Great Lake trout, the Lochleven trout, the bull trout, the Gillaroo trout, the sea trout, and the common trout. "The trout"—we quote from Yarrell—"though a voracious feeder, and thus affording excellent diversion to the experienced angler, is so vigilant, cautious, and active, that great skill, as well as patience, are required to insure success. During the day the larger sized fish move but little from

THE TROUT.

their accustomed haunts, but towards evening they rise in search of small fish, insects, and their various larvae, upon which they feed with eagerness. Though vigilant and cautious in the extreme, the trout is also bold and active."*

We never yet knew an ardent fly-fisher who was not also an enthusiastic lover of nature; in truth, it is almost impossible to separate the one from the other. The trout is an inhabitant of the swift, clear, running stream, where

* A few years ago a trout weighing twenty-two and a half pounds was caught in the Tame, near Tamworth; it was at once forwarded to Sir Robert Peel, who, with his customary courtesy and consideration, immediately ordered it to be sent to Professor Owen: the professor had an accurate portrait of the fish painted—or rather two portraits, one of which he presented to Sir Robert, the other now graces his own cottage in Richmond Park. He then took steps to preserve the skeleton, which is now at the Museum of the College of Surgeons. It was a pure trout, richly spotted, and although very aged, a remarkably beautiful fish.

the banks are fringed with the tall flag, and the pebbly bottom is half concealed by beds of rushes, often extending many yards of continuous length, and rising to a level with the water. On the top of these beds, or in the narrow spaces between them, the trout lies with his nose against the stream, waiting to rise at any moth or fly that may chance to be floated down on its surface. The experienced angler knows a "likely place" where a fish is to be found, and casts his artificial fly, with wonderful precision, within a few inches of his nose, even at a distance of twenty or thirty yards. Other favourite spots of resort are close under high grassy banks, bushes, overhanging trees, caddies, behind fragments of rock and large stones, at the junction of streams; in fact, wherever it is probable the current of the water will carry or collect such food as the trout prefers to feed on. If the trout be—as he unquestionably is—"a bold and voracious feeder," he is readily alarmed, even by so slight a thing as the shadow of the line or the rod, if it chances to pass over him, and when once frightened away from his home he does not soon return to it.

Angling is often called an "idle pastime," and we cannot deny that to sit in a comfortable chair in a firmly-moored punt on the bosom of the Thames, seems an amusement open to such an imputation; but to walk fifteen or twenty miles in a day, "whipping the water" from sunrise to sunset, during twelve or fourteen hours, is anything but an idle pastime. Whatever fatigue it brings with it, however, it is pleasant, health-giving, and instructive—so far as to make the angler acquainted with much of the science of nature, animate and inanimate, and keenly sensitive to the beauties that Providence, with so lavish a hand, spreads out before his gaze as he wanders by the side of the winding, silvery stream—

"To tempt the trout with well-dissembled fly,
And rod, fine tapering."

During our rambles in the neighbourhood to which we are now introducing our readers, an incident occurred which we recall to memory with much pleasure, especially as it is associated with the subject we are treating. It was a warm soft evening, and the shadows fell heavily across the green lane, which somewhat diverges from the line of our regal river, yet not out of sound of the breeze among its reeds and pollards: we could hear the sudden splash of the water-hen, and, after a while of loitering and listening, we crossed a stile, and were again on the bank. The swallows were skimming the water, "hawking insects," and so intent on their sport, that they winged closely to us in their undulating rounds. But we little heeded the swallows or the insects, our attention being at once attracted by a tall, thin old man, who, attended by a slim, fair-haired boy, was as busily employed with his rod as if the day were but just born; his face was turned towards the stream, but his silver hair and curved back told that he had passed even the autumn of his days. We saw by the motion of his rod that he had a "bite;" yet when he drew in his line the little lad seized it, and took the fish off the hook.

"I caught my last trout with a worm," said the old man, "and then we put on a minnow: sure it was a minnow, Alf?"

"Yes, gran'father, a real minnow; but this is only a chuckle-headed chub."

"The varlet! let me feel—let me feel," added the old man, impatiently. He extended his thin, muscular hand, and the lad placed the fish in it.

"A chub, sure enough—cat's food! We'll move on and try another quarter of an hour—trout are so hard to get."

"Gran'father, it grows late, the sun is long down, and the evening grey. Mother will fret—you promised her you would be early home."

"Not so, Alf, it can't be getting grey yet—we have been such a little time—so few fish! What did the church clock strike last? It can't be sundown yet."

The lad made some reply which we did not catch, and then ran towards us—"Will you tell me the time, please?"

"Half-past eight."

The old man caught the words and repeated them,—*"Ay, I remember, it grows a little grey at half-past eight."*

"Is your grandfather blind?"

"He is quite blind," answered the boy; "he was once a great fisherman, and it amuses him still, so mother often sends me with him in the afternoons; he takes such delight in it that he will never believe the night is at hand."

We had heard of the "blind angler!" and were not a little pleased at the meeting.

In a few minutes the old man warmed to a brother of the angle; he sat beside us on the stile, and talked of the past,—old age loves to recall "the past," whether painful or pleasant. He had been a fisher in his youth, a sailor in his manhood, and returned to his old haunts in the autumn of his days, incapacitated for active service by a severe wound in his knee. He "whipped the river" with a "loving rod," until a flash of lightning deprived him of sight. "More than ten years have passed," said the old man, "since I have seen sunlight or moonlight on the waters; never, never shall I see fin of fish again—never see the flutter or the rise! but I can feel them and bear them. When his mother cannot spare the lad to stay with me, my little gran'daughter leads me to the bank, and while she chases butterflies and gathers flowers—sweet lamb!—I listen to the fish—I do indeed! I can tell the short quick turn of the bleak in the water; I know the heavy scud of the barbel in the deeps; and what column of soldiers ever marched more closely than the young eels in eel-fare time? I know all the points and turns of the river so well—God bless it!—that I say, lead me to such a turn, or under such a tree; and if they tell me the hour, I know which way the shadows lie, and what sport I shall have. I can still teach a youngster how to fish for roach in winter, with paste and gentles, and in April with worms: many a roach have I tied to the top of the water, just by that old pollard you—"

"I have told gran'father the pollard is gone," interrupted the boy.

"Ay, ay, my lad, but not the roach," said the blind man, turning his head quickly. "I could teach any youngster, sir, to make the best ground paste for roach and dace; but he must have a small hook, a quick eye, and a nimble hand

to catch them. Angling comes by nature—it can be improved, but it's a gift, a wonderful gift: it's more soothing than all the bacca that was ever grow'd in Virginia. Lord, sir, I could love a Frenchman while I'm angling! This lad here is not a bad lad, though somewhat of a scoffer at angling. I thought to make him eyes to the blind; but he doesn't learn, sir; he tells me it's night when I know the sun shines."

"How can you say so, gran'father? I'm sure it's all the same as night now; I couldn't tell a bleak from a gudgeon by this light."

"Nor by any other light," said the old man reproachfully; "when I was his age there wasn't a fish in the stream, or a fly over it, but I knew—ay, as well as I did my Bible; and there is much in the knowledge of the things that God makes, to teach us God's power—not only His power, but His love; and I think more of the beauty of His works, now that I cannot see them, than ever I did when I had my blessed sight. But I should like to see the waters and the fish once more, and my little gran'child—the girl, I mean; I know this lad—a little rosy, curly-headed fat thing; it's his being so fat makes him so lazy."

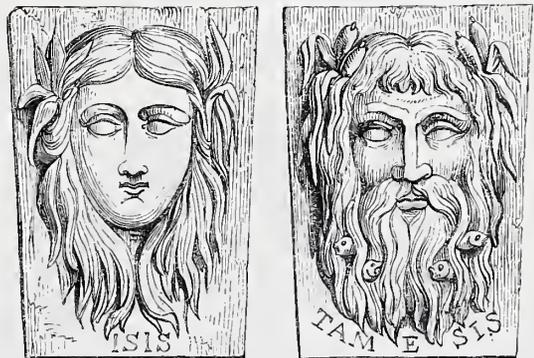

The boy was as lean and as lank as a fishing-rod; he looked at us, and said with a smile,—*"Mother says I was as fat as Annie when I was a baby; gran'father calls mother a slim, pale girl, and she has such a red face!"* This was an *aside*, but it recalled to us the exquisite poem of "The Blind Man's Bride."

The old sailor had such a touching habit of sitting with his head thrown back, and those sightless eyes up-looking to the heavens, and his fingers clasped round his rod,—it was quite a picture.

"My daughter does not tire of her old blind father," he resumed, after a pause, "nor indeed does her husband,—he is a good son to me: still I bless God and her MAJESTY I am no burden to them, except in the way of kindness—that is another blessing. My daughter will not let me go near the river without the boy, so I promise her, and keep my word; and the gentlemen who fish hereabout tell me of their sport, and I give them my advice, and sometimes they buy my nets. And one will have me in the punt; but I soon weary of that—I like best my liberty of the stream—I like to eat my dinner on the soft sweet grass, and to know that some of God's creatures, the wild winged birds of the air, will dine off the poor man's crumbs."

We made some observation as to his having a devotional spirit; he answered that he ought to have: he had been shipwrecked once, and passed a night and part of a day on the deep floating on a spar. He then learnt what it was to be alone with God, but he had NO FEAR; he knew in Whose care he was. This was said with a simplicity that was positively sublime. "I have received," he said, while we walked with him towards his daughter's cottage, "I have received nothing but mercies and blessings all the days of my life; yet I think I should have been bappier if I could have looked on the blue waters and the bright fish to the last—I think I should—they are so pleasant! And yet—I can't tell: I have such dreams about streams and fishes, that I wake up as refreshed as if I had been ten hours angling; surely that in itself is a mercy, though I shall never, never, in this world, see fin of fish again!"

Half a mile or so from Park Place, and we arrive in sight of HENLEY BRIDGE, a graceful structure of four arches, erected in 1787, and which will be inter-

MASKS OF THE THAMES AND ISIS.

esting to Art-lovers as containing two sculptured works—masks of the Thames and Isis—from the chisel of the Hon. Mrs. Damer;* they decorate the consoles of the central arch, exhibit talent of no common order, and are interesting as examples of that genius which adopted the most difficult of all the arts as the occupation and enjoyment of rank and wealth.† This is not the only memory preserved at Henley. It was here that Shenstone wrote the familiar lines on an inn:—

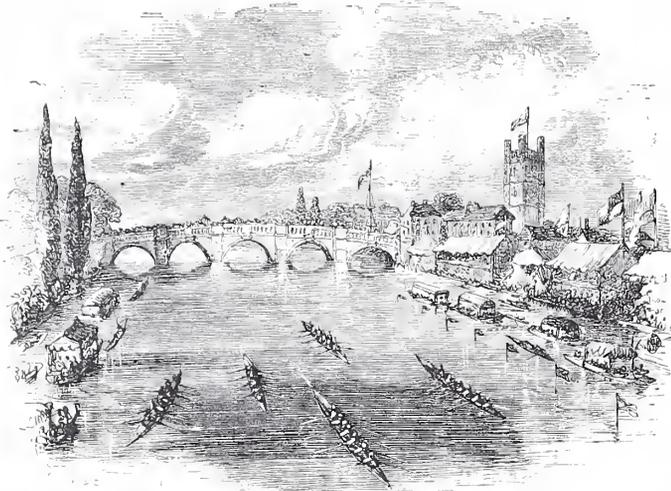

"Who'er has travelled life's dull round,
Where'er his stages may have been,
May sigh to think he still has found
The warmest welcome at an inn."

* Anne Seymour Damer was a lady of noble descent. Her father, General Conway, was brother to the Marquis of Hertford; her mother the only daughter of the fourth Duke of Argyll; and she was cousin to Horace Walpole, who speaks enthusiastically of her graces of person and mind. She was a real lover of her art—an art so seldom practised by ladies; and honestly earned a reputation her position in the great world might have given her with less labour, had she not desired the judgment of connoisseurs, as well as the praises of titled friends. Her husband, the eldest son of the first Lord Milton, destroyed himself after he had been married nine years: he died in debt, and his widow sought consolation in renewed Art-study, and travelled in Italy. Her father, the general, resided at Park Place—hence her contribution to the bridge. Walpole left her Strawberry Hill for life. She died in 1828, in the eightieth year of her age.

† That toward the source of the river represents the Isis—a female head, round which water-plants are entwined; that on the other side is an aged male head, the Thames, crowned with bulrushes, and from whose flowing beard little fish peep forth. Both heads are very boldly executed, and have been highly eulogised by Horace Walpole.

The inn—the Red Lion—is still there, but it has been long unoccupied; it gives, however, uncontroverted proofs that it was abundant in comforts during the days of its glory; its large rooms are now unfurnished; its snug and “cozy” chambers are without light and warmth; the stables and outhouses, the lofts and hen-roosts, are all empty; and those who visit the house because of the associations it awakens, and contrast its present loneliness with its former bustle and gaiety, may “sigh” that here a “welcome” is no longer to be found: his lament will not be lessened, because in its successor he finds a grievous contrast in reference to all the good things of life of which an inn is proverbially productive. The town of Henley is happily situated, above and below the scenery is charming. A fine old church adds to its interest; and the bridge is one of the most beautiful of the many that span the noble river.*

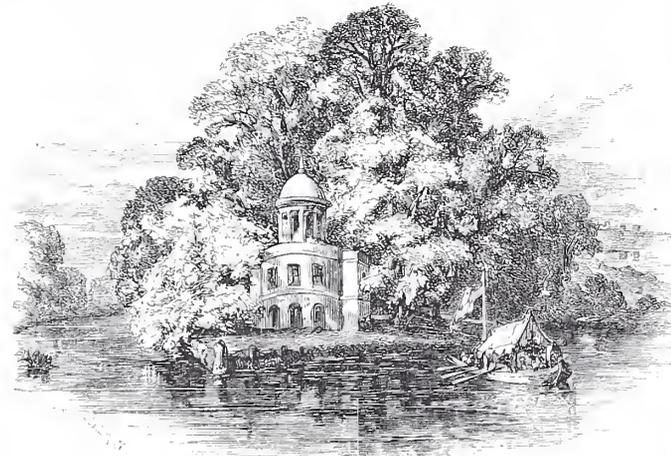

Henley is in Oxfordshire; but soon after leaving it we part from that

HENLEY-ON-THAMES.

county and enter Buckinghamshire—on the north side of the river, that is to say, for on its southern banks we are still in Berkshire, and continue so to be until we have passed Windsor. As our boat rows us downward, we soon arrive in sight of FAWLEY COURT: a summer-house, situated on a pretty island, attracts the eye as one of the graces of the Thames. It is built after a Greek model. Close to this is the village of Remenham, at the base of some high ground charmingly wooded. Fawley Court—its Grecian summer-house, that is to say, on the small island—is famous in the history of the Thames as the starting-point of the Regatta, which annually “glorifies” the river, and assembles here a host of gay and happy lovers of water-sports. A few remarks on the racing-boats of the Thames, and the “race,” cannot here be out of place.

The most singular and the most peculiar of all the Thames boats, not excepting even the “punt,” is the racing-boat. This boat is of various sizes, adapted either to a single rower, or to crews consisting of two, four, some-

ISLAND, FAWLEY COURT.

times six, and frequently eight persons: the eight-oared boats being those which are employed in the more important races. The boats themselves vary in form, being sometimes sharp at both stem and stern, in which case they are denominated “wherries;” when they are built flat at the stern, they are termed “cutters.” Wherries are now rarely built for more than

* The architect was a “Mr. Hayward;” he died before the work was even commenced, but his designs and plans were adopted. His heart was evidently in his task, and the structure must be regarded as his monument. He had, it is said, frequently expressed a wish that in the event of his death before its completion, he might be interred beneath the centre arch, but his desire was not responded to. He lies, however, in the church close beside it, where there is a handsome tomb to his memory. In this church, also, was interred the General Dumontriez, famous in the early stages of the French Revolution; he died in the neighbourhood in 1823, at the age of eighty-four, having lived through the several eventful periods that intervened between his exile and the restoration. In the church-yard was buried Richard Jennings, “the master-builder of St. Paul’s.”

two rowers; when there are more than two rowers, the boats are provided with accommodation for a steerer. In length these boats range from about twelve to nearly seventy feet, and they are always very narrow, being so constructed that they simply provide sitting room for their crews; the oars are sustained by “rudlocks” or “row-locks,” which project considerably from either side, and thus afford leverage for the rowers. As would be expected, these fairy-like boats are built with the utmost care, the materials being usually the finest pine-wood, with fittings of mahogany. They are so exceedingly light that a man may carry one of the smaller ones on his shoulder with ease; and their draught is very small, yet, when in progress, the boat is, fore and aft, on a level with the water; where the rowers sit the gunwales have a slight elevation to prevent the flow of water, which sometimes passes over the other parts of the boat, that are accordingly protected by a covering of light oilskin. The rowers’ seats and the “stretchers,” or boards for their feet to rest against, alone occupy the open space allotted to them, which is, in fact, simply a kind of trough. The rate at which an eight-oar boat progresses, if well pulled, is not less than twelve miles an hour. It is evidently a delicate operation to embark in one of these gossamer vessels, and to occupy it is always attended with some degree of danger, in consequence of the equilibrium of the boat being maintained entirely by the even balance of the oars. And yet accidents are of rare occurrence, while the light craft are taught to yield to the most energetic exertions of their manly crews, who exemplify, in high perfection, the practical application of the truly English adage, of “A long pull, a strong pull, and a pull all together.” It is a nervous thing even to look upon the voyager in one of these boats; for our own parts, we would as readily trust ourselves on the back of a wild horse on an Indian prairie; and we marvel much that the cool self-possession of the “boating-men” themselves should so generally preserve them from casualties. But at Oxford, all the men and boys, and many of the women, learn to swim; there is always a charm in peril—danger is ever a pleasant excitement; and so it happens that these boats are in far more frequent request than such as cannot upset.

The boat-race itself is indeed an animated and a brilliant spectacle: there the island spirit of England shows itself after a most characteristic fashion—the enthusiasm of those who are actually engaged in the struggle extending its influence to the spectators of every class who crowd the river-sides. At Oxford there are several races which take place according to a prescribed order of arrangement, during the spring and summer period of each academic year; and here almost every college has its representative afloat. There are few more striking sights than that afforded by the long line of dashing boats gallantly manned, covering the classic stream, and rushing over its waters

RACING-BOAT.

between such a “run on the banks” as needs to be seen, and indeed to be shared in, to be adequately appreciated. The flash of the oars keeps time with the cheers of ardent and encouraging friends, who strive on land to emulate the speed of the swift skimmers of the waters; a victory achieved elicits still louder acclamations; and each race concludes amidst mingled congratulations, because of present success, and anticipations of future success in races yet to come. The number of the boats, and the comparative narrowness of the stream at Oxford, render it impossible for the competing crews to be arranged side by side; they consequently start and pull in a line a-head—the object of each crew being to touch with their own boat the boat before them in the line. Such a “bump” leads to a change of places in the case of these two boats; and thus the best boats-crew bump their way to the “head of the river,” where, if they can, they may hold their honourable and honoured position.

The fine reaches of the Thames at Henley are yearly the scene of boat-races, open to all competitors, and which afford an opportunity for every variety of racing-boat to show its own capabilities and the powers of its rowers. In these races the two Universities of Oxford and Cambridge take a part, together with the “crack” boats of London, and with other worthy rivals from various parts of the country. The matches include races with eight, four, and two-oared boats; and there are also “sculling-matches,” as those races are designated in which each boat is rowed by a single person. The incidents so familiar on the river banks at Oxford, at Henley are repeated on a still more important scale—the very circumstances of the Henley races raising to the highest pitch the interest inseparable from them. The broad river here allows the rival boats in every race to be placed alongside of each other; and thus, with even bows, they spring forth upon a career which not unfrequently closes upon them still being side by side, the winner having perhaps half his boat’s length in advance.

Still further down the stream, the same light racing-boats may be seen in active exercise, and particularly at the matches of the Thames watermen, and at the grand annual contest between the picked eight-oared boats’ crews of Oxford and Cambridge. This “University boat-race” was first pulled, upwards of a quarter of a century back, at Henley, but now it is generally decided, like the watermen’s races, in the neighbourhood of Putney. On these occasions the Thames swarms with boats of every size and kind, nor is a flotilla of river steamers wanting to complete the aquatic picture, and to contribute to the scene the smoky attribute of London. A clear course is, however, kept for the racing-boats, each distinguished by a tiny flag a few inches in length at the bow; and, happily, notwithstanding the crowded condition of the river, the animation of the races is rarely overcast by the sad reflections arising from any serious mischance.

THE WELLINGTON MONUMENT : THE EXHIBITION IN WESTMINSTER HALL.

THE exhibition of the models offered in competition for this important national work has been continued throughout the month; the court appointed to determine the question of the prize works has been named,—and the judges have published their award. In the more detailed account of these models which we have promised our readers, it will be seen how far we agree with this award, and with the principles on which it has been made:—and, as introductory to our remarks on the subject, it will be right that we should make a few observations on the constitution of the court itself.

We said in our last number, that if Sir Benjamin Hall should be as successful in the composition of his tribunal for the trial of the sculpture models as he had been in the structure of the court which sat on the architectural designs, he would thereby remove from himself a large share of the responsibilities which wait on such an award as this. We mean no impeachment of the honesty of his intentions in this respect, and certainly no disrespect to any of the individuals whom he has brought together as judges, when we say, that as a body they scarcely fulfil the conditions of such a trust. Sir Benjamin Hall may have done the best he could in the matter; and we have no difficulty in believing the rumour which asserts that he met with great difficulties in his attempts to organise a tribunal. The responsibility of adjudicating on the relative merits of such a body of Art as he has summoned into life, was very great,—and would be felt most, exactly in the quarters in which the qualifications demanded were most certainly to be found. It was the misfortune of the case, that the further the minister travelled for his selection from the field of the appropriate judicial knowledge, the further was he removing himself out of the range of those sensibilities which suggested the unwillingness to act judicially in such a case. The difficulty of constituting a court on the best principles possible, may be admitted as some excuse to him for constituting it on the best principles he could; but it is not easy, as regards either the composition itself of this particular court, or the results to which it has come, to give Sir Benjamin Hall the full and unrestricted benefit of such an excuse. An inspection of his commission leaves it impossible not to suppose that something more to the purpose might have been had by a minister anxiously in search of it. Personally, its members are above suspicion,—as, for the most part, they are far above a high average in point of general qualification; but it will, we think, be very strongly felt, that no men duly qualified *quoad hoc* could have made some of the selections for which these judges, and through them the Government, are responsible. Sir Benjamin Hall's court of adjudication consists of six members,—and they qualify, it would appear, as follows. At the head of the list is Lord Lansdowne;—and he, we suppose, is to be taken as representing the Cabinet in this commission. Now, that the Government should desire to have one of its own members taking part in decisions for which it has to incur so large a responsibility, is intelligible enough; but such a principle of nomination is, it will be allowed, to begin with, something different from the principle of fitness. The ancient superstition which assigned the whole range of human knowledge to a minister of state is extinct,—along with the faith in the infallibility of princes, of which it made a part; and it is openly held in our day, that there may be possible commissions in which the opinion of a cabinetmaker shall be worth more than that of a cabinet minister. In the particular case before us, however, the Government had the good fortune to find within the cabinet a qualified Art-commissioner; and the only doubt suggested by Lord Lansdowne's name in this connexion arises out of his advanced age and its accompanying infirmities,—raising a question as to whether he can have devoted to the duties of the commission such an amount of examination as the large body of models submitted, and the great interests at stake, demanded. The next name on the list is that of the Rev. H. H. Milman,—a gentleman well known for his varied and scholarly accomplishments, and who may be presumed to have made his way into

this commission as dean of the cathedral in which the monument is to stand, and so, having official charge of the site. Here, again, it will be observed, the ground of nomination is something distinct from express qualification,—and the chapter which Dean Milman illustrates in the commission is not the chapter of Art. The dean is followed by the financier:—and if the large sum of money offered for the Wellington Monument were the matter on which the influence of this commission had to operate, instead of the Art of which that money is to be the price, then we could understand the place of Lord Overstone in this commission. As it is, we fail to apprehend the speciality of his appointment,—unless, in virtue of some lingering relic of the old superstition, it may be possible that his coronet is to be taken into account. The minister of state, the high church dignitary, and the ennobled financier,—three of the great aristocracies of the land,—having been thus duly inducted into the commission, it would seem as if a certain amount of ingenuity had been really exercised in keeping still aloof from the true ground of qualification; and where the public will doubtless have been thinking it is high time the artist should at last appear, we have next, in his place, the soldier! Now, this strikes us as the strangest appointment of all. The logic by which, we suppose, it is defended, is eminently strained and feeble,—the reason for it curiously remote; while it is opposed by an inherent objection, which is significant enough to have silenced logic far more emphatic had it been forthcoming, and outweighed reasons greatly more direct. Of course, it is to be understood that our remarks, where they are those of objection, have no application to individuals, save in as far as these represent the principles involved,—and that we are discussing the composition of a court for deciding on questions of Art merely on the ground of its professional merits. There is no offence, then, to General Cust in our stating why the last quarter in which we should, ourselves, have thought of recruiting for this Fine Art commission, would have been amongst those gallant men who bear her Majesty's commission to wield the sword. That in an age of increasing civilisation the soldier should be somewhat behind the spirit of his age, is what, by the mere theory of his profession, should be expected. Founded, as it is, in that doctrine of physical force which is the strength of barbarous times, the moral lights that daily more and more show its essential rudeness are scarcely likely to be received by him with the same readiness as by men of whose pursuits they but reveal the dignity and the beauty. The mechanical and prescribed nature of his service drives him for self assertion into a conventional independence, which looks hourly more and more artificial in the improving philosophy of the time; while, in matters of taste, an original difficulty has been created for him by that tinsel pomp and barbaric colouring which have been, from time immemorial, employed to hide the darker morals and embellish the ruder realities of his calling. In seasons of war, when these elements of impediment are all in active force—and perilous occupation and important results combine to give to that calling an air of dignity,—it is not to be expected that the soldier should disentangle the truths of progress from the old fictions which surround him, or discern the purer lights through the nearer false ones that once dazzled half the world, and still dazzle himself; and in periods of peace—when he is a dweller amid the same humanities and a sharer in the same civilising influences as other men,—he has yet, as a consequence, to overtake his more fortunate brethren, to whom the circumstances of life have given a start before him in the race for their apprehension, and is impeded in the effort to do so by the glare of the lights yet in his eyes and the weight of the arms which still he carries. As we have said, then, we should have looked to hands otherwise trained than the soldier's to hold the scales in which the interests of a whole profession, not his own, were to be weighed. The moral of his presence in this commission, according to Sir Benjamin Hall, we suppose, is, that the monument in question being a monument to a soldier, a representative of the military profession was necessary to the completeness of the court which was to decide on its nature. To us, we confess, a fancy like this presents a strange confusion of ideas. On any point by which the

Duke of Wellington could have illustrated *himself* in his life, his brothers in arms are, by virtue of their profession, necessarily the best judges after his death; but the point involved in the Art-illustration of his greatness, is that in which, not only the professional instinct fails, but for which, as we have said, it in some measure incapacitates. The Duke himself was the most eminent soldier of them all; but we would no more have called him into council on a question of high Art, because it proposed the apotheosis of a soldier, than he would himself have consulted an artist on the arrangements of a coming fight, because they were one day to yield the elements of a picture. However, as we have said, for the purposes of this most delicate adjudication, the financier is followed by the soldier:—and the next following name in the commission is that of the Right Honourable W. E. Gladstone. Mr. Gladstone, of course, represents the House of Commons; and there are a good many other men in the House of Commons who would have represented it very fitly on this occasion. But Mr. Gladstone possesses what Sir Benjamin Hall obviously considers the further Art-qualification of being a privy councillor. A gentleman without some sort of aristocratic decoration to his name, could scarcely have taken his place fitly, we suppose, on the same justice-seat with two lords, a cathedral dean, and a general. Of Mr. Gladstone, therefore, in this relation, we shall say nothing more, save that his figure helps still to hide the artist; who does, however, finally come in behind his back,—thrust in at the tail end of the commission, like an after-thought, in the person of an architect, Mr. Cockerell. One halfpenny-worth of Art-bread to modify all this quantity of aristocratic sack!—In reference to this point of the matter, too, a curious effect is attempted:—but which, we think, must be considered as having failed. Mr. Cockerell's name starts up amongst the names of these titled judges, only to disappear. The artist comes into this commission like a dissolving view. Though named in the document appointing the court, his signature is not attached to the conclusions at which it has arrived. But we are given distinctly to understand, that its absence thence does not imply dissent on his part. It arises, doubtless, from that professional sensibility which renders an artist unwilling to appear as umpire in a matter in which the interests of so many of his brother artists are concerned. We are bound to tell Mr. Cockerell, however, that he cannot thus shake off the responsibilities which he has assumed. He cannot enjoy at once the influence of a commissioner and the immunities of a non-commissioner. However cleverly he may contrive to jump through the commission at the moment of publication, we see his legs under the table. "Mr. Cockerell," say the commissioners, in their published report, "the only one of the appointed judges professionally connected with the arts—though, *we have derived from him valuable assistance and information in the progress of the examination*,—has declined taking a part in the ultimate decision." How Mr. Cockerell, in "the examination" of these works, can have rendered important assistance towards the decision, and yet taken no part in the decision, passes our apprehension. If his advice had no influence on the judgment, then, it was not "valuable" advice to the judges,—and, if it had, then it was an element of the judgment. The fact is, since Mr. Cockerell consented to act under this commission, he must not shrink from his share in its awards. The sensibility that did not prevent his taking a part in its deliberations, comes too late when it serves him only to withdraw his name from the document which records their results. We shall take the liberty to read that name, amongst the others, at the foot of this report,—and give it a share in all these judgments, be they good or bad. It will be seen, in the sequel, that,—with some strange exceptions,—these decisions, even where they do not command assent, in whole or in part, are yet such as a body of judges need not hesitate to avow.

Our readers have not to be told how seriously we have looked on the duties which this commission had to perform; and they who, like us, take deeply to heart the interests of Art, would not fail to be affected by many conflicting considerations as they gazed on this congregation of its creatures evoked by the spell of Sir Benjamin Hall. The first thing, as we have said, that struck the visitor to Westminster Hall, as, from

the upper floor, his eye glanced over their long array, was, the rich and beautiful show which they made, ranging down the grand old chamber, with the sunshine passing through the dust of ages to touch variously their details, and light up their forms of bronze and marble into mimic life. Then, came a thought of pain for all the sum of toil and aspiration wasted here,—the ten disappointments that, under this competition, go to build up a single triumph,—the mass of Art recklessly squandered to yield an Art unit. We question greatly whether the touching sight of the talent here invested for which it is known that there is to be no possible return, will not lead to a reconsideration of the economics, as well as the moralities, of the practice of competition,—at least, on this unrestricted scale. There was a marked difference in the sentiment which attended a visit to the hall on or before the 10th of the month just passed. Up to that day, each work was itself a potential triumph. The sense of a great final heartsore which hovered indefinitely over all, was kept aloof, because each man's contingent was plumed with his own hopes, and the contest had not yet selected its victims. After that day, the victor legend on nine pedestals left all the rest saddened by suggestions of shattered fortunes and perished hopes. There were models in the hall that could not have been executed at the cost of £1000, and the value of the labour and material bestowed upon the whole has been estimated at the large sum of £25,000; and this cold money calculation takes no account, as none *can* be taken, of the Art expended and the sickness of the soul incurred,—all idly, and in waste, since that which was designed for a special purpose is, just in the degree in which it was well designed for that, useless for anything else. Much of this waste and suffering is even cruelly provoked, since it is incurred on the part of those who never at any moment had even the precarious set-off of a chance. In the general wreck of expectation which saddens Westminster Hall, one really knows not which to grieve over most,—the many evidences of unquestionable power put forth to a single issue, and returned unremunerated on their owners' hands, or the labour taken from some more humble field on which it was productively employed to be rashly expended on an undertaking of which the candidate knows not the very language. Mistakes of all kinds there are amongst these models, generated under the hot temptation of £20,000. There are models that could not be duly executed for £20,000, even if the men who designed them could execute them at all,—models that the designers could not themselves carry out if they were paid twice the money, or any other sum,—and models that it would be national bankruptcy to execute if they could be had for nothing. Turners rise into sculptors for the occasion, and send what, in reference to the object proposed, can count as little better than aberrations of the human intellect; journeymen modellers strike for immortality and £20,000, and contribute candidate works that do what in them lies to throw an air of ridicule over the whole affair. To the true artist, the pain of rejection must derive an added sting from the fact of his being rejected in such company.—We repeat, this question of unlimited competition must, we think, undergo reconsideration.

The next point by which the visitor to the models at Westminster Hall was probably struck, would be, the curious varieties of idea that present themselves as the appropriate treatment of a single theme:—and side by side with this point of observation would obtrude another,—its exact opposite,—the monotonies and repetitions arising out of similarity of treatment. Now, these two circumstances, as regards their Art-significance, stand in very different categories:—and we cannot but observe, that the tone of the press in relation to this matter has not, we think, been such as was due to the gravity of the subject, and the claims of the artist. The strange notions that have found embodiment as monuments to the Duke of Wellington, and run through all the gamut of caprice, are so far,—even where they involve, as they often do, high talent,—subtractions from the Art ideal; the features of resemblance in the treatment by several hands of one identical subject, presenting very marked and prominent points, is almost a necessity of any treatment which should be true to the ideal of the subject at all. The varieties in question reside in the sculpture mind applied to the subject; the resemblances in question reside in the

subject to which the sculpture mind must apply itself. That next January will show us much novelty, traceable to Westminster Hall, in the patterns of twelfth cakes,—that one man commemorates the Duke monumentally by a system of corkscrews,—that a second offers as his monument an undeniable cabinet of *ricoco*, a third makes him the leading figure on an unquestionable *pendule*, a fourth suggests a wine cooler or a footpan to keep his memory in, and a fifth celebrates him sculpturally by a figure of a flying Fame coming out of his cocked hat,—are among the eccentricities which may well call down and justify the flippancies of criticism; but that the duke, who was both soldier and statesman, and in each character reached the highest place, should be presented by more sculptors than one between Peace and War, seems an obvious illustration of a leading peculiarity in the subject to be commemorated,—whose obviousness does not preclude all such varieties of application as genius has at its command. From no single sculptor to whom this work might have been entrusted alone, would this sculpture incident have seemed other than a natural and expressive phrase of the theme; and why, then, should it be liable to the charge of triteness because employed by three or more sculptors, working, to the same end, singly and apart? The suggestion, not inherent in the work itself, arises only from the fact of the variety of works which contain it being seen together.—So, with our ancient friend the British lion. That stately and intensely respectable animal certainly does perform an amount of work in this exhibition which lays him open to the pleasantries of the critic. So multiplied were his repetitions on the models in Westminster Hall, that if the commissioners who had to decide on these were, indeed, "Daniels come to judgment," they found themselves appropriately in a "den of lions." The effect—to those whom the gravity of the subject did not make grave—was ludicrous enough in the combination; but on any single one of all the works here displayed, the critic would certainly not have been at all started to find the British lion crouching by the great Duke's side, or watching monumentally at his tomb.

We think it possible that Sir Benjamin Hall may, for his own individual part, have derived one especial moral from an examination of these models, created at his summons, and furnished to his own conditions:—a conviction, viz., that the site appropriated to the monument is not the best which he might have commanded. Our readers will remember, that, so far as we are concerned, we did not wait for the models to arrive at that conviction; but certainly, a sight of them goes far to fortify our already expressed opinions on the subject. Besides the essential objection which forbids generally the pagan practice of hero-worship in our Christian churches, and cannot give that hearty acquiescence which the monument demands to the illustration of human glory in those solemn areas beneath whose awful shadow all earthly dignities are supposed to find a common level,—there is no doubt that the sculptor's difficulties have been increased by the particular architecture presented in St. Paul's. It is true, that it is the office of genius, and the attribute of the highest, to reconcile all difficulties to itself,—to mould to its purpose incidents the most adverse,—to turn by its own harmonising spell even contradiction into commodity. All the great aims of Art are difficult to reach:—or, rather, we should say, perhaps, that they are *not* difficult to the great artist, and are impossible to all others. The difficulty is a test of the greatness. A whole class of works, however, amongst these models, pass at once out of judicial view as candidates for this Art prize, though some of these are among the most remarkable in the exhibition, by reason of their utter inapplicability to the peculiarities of the spot which they propose to occupy. This is so elementary a mistake in meaning, that it is really surprising to find it in combination with so much skill in performance. It has been decreed, by Sir Benjamin Hall, that the national monument to the Duke of Wellington shall stand in St. Paul's Cathedral,—under an open arch,—and *that*, not a terminal arch, nor an arch independent, but one of a system of arches, all open like itself, and from which it has no character of distinction. With these accidents it is the sculptor's business to make his work compose,—at once giving and taking character where it stands,—conforming to all that is without itself,

while it makes due assertion of its own individuality. It must speak the language of the locality assigned it, but for the utterance of a thought which is its own,—and where it borrows an architectural support, it should return a sculpture grace. This is the true architectonic principle, as applied by the highest Art. But what shall be thought of the Art which assumes to supplement the idea that it finds, by repeating it? The two cardinal terms of the local proposition in this case are,—a temple, and an arch. Would any reader of ours, applying the most elementary form of reasoning to Art, expect to have the Duke's monument offered in the form of a temple, to stand within this temple,—or of an arch, to stand beneath this arch? The temple and the arch being the things already expressly furnished to the sculptor's hand, might not one be prepared to find him going in search of any other thing for their illustration (to his particular end) rather than these very things themselves?—There is another mistake, also implying defective thought, though in nothing like a degree so damnable, which has disabled, for this particular object, more than one work that, for another, would have been, as regards both design and execution, amongst the finest in the exhibition. In this latter class of cases, the disability derives from a disregard, in part of the demands of the locality assigned, and in part of those of the purpose to be served. In some of them, the Art would be irreproachable if the æsthetic were sufficient. Their fault is, that they are lyrical, rather than monumental. They suit the triumph anywhere else than by the side of the tomb which has triumphed over it. Their beauty is composed of such exulting sculpture phrases, and they build up into such Art poems, as might well adorn some other place and occasion, but are unbecoming the shadow of the cloister and the solemnities of the sepulchre. A people that dances at the funerals of its chiefs might plant trophies of such a character above their graves. In Christian lands, the Muse who sits by the mausoleum is a mourner. The place is holy,—and her sandals are off her feet. The full song of human triumph cannot be poured over the Christian's grave,—and this is one reason why the cathedral is not a fitting place for the records of victory.—The sculptor who forgets these things is not master of the spiritualities of his art.

We cannot, however, leave this part of our subject without observing, that, in reference to this important, and as we think essential, question of adaptability, the commissioners seem to have adopted a strange, and scarcely intelligible, reading of their duties. "We have not," they say, in the report which conveys their award, "considered ourselves bound to take into exclusive consideration the peculiar fitness and adaptation to that spot in St. Paul's Cathedral which appears to be in contemplation for the erection of the proposed monument:—*which consideration might possibly have led to some difference in the selection.*" Now, the terms of this document are throughout singularly vague and inconclusive,—but here they become more indefinite and unsatisfactory than ever. The question is, what value is to be assigned to the word "exclusive" in this clause,—and the result of any such inquiry seems to be, that the clause must be read without it. In its ordinary sense, the word is here without a reasonable meaning; because, to suppose that a work which recognised the characters of the locality should *therefore alone* be admitted as the national monument,—or to a prize in respect thereof,—in spite of any poverties of Art which it might exhibit, is a proposition simply so absurd, that the judges can scarcely have intended to waste their time in its rejection. Any other needless negative might just as well have done its no duty amongst the grounds of their award. If the word be either left out of the clause as redundant, or have assigned to it there the meaning which remains,—if they did not take fitness into account at all, or, taking it into account, did not give it the force of *excluding* any work, whatever its properties in other respects, which was unsuited to the place,—then, their decisions will be received with great distrust by the art and by the country. The words which we have printed in italics, above, are highly unsatisfactory. If the judges, as they would seem to suggest, have given a prize to some clever work, which, nevertheless, was not a clever Wellington monument to stand under a particular arch in St. Paul's Cathedral,—then, they

have given it for a cleverness essentially different from that which the competition challenged. Sir Benjamin Hall has asked them one question, and they have answered another. No amount of merit could be entitled to one of these prizes which was not merit suited to the place appointed for this national memorial.

To return, however, from this digression. For the reasons which we have stated above, and for reasons kindred to them, a process of judicial elimination, with regard to this competition, is constantly continued, which began early with reasons yet more obvious and emphatic. Numbers of models are gradually swept out of the field of adjudication; and the task of selection, which seemed hopeless at first view, is brought in the end within reasonable limits. In fact, that which will most of all strike the student of these models is, the remarkable absence of thought which they so generally betray, in obvious combination with qualities which thought *should* direct to immortal issues. All sculpture graces are here in abundance, save the crowning sculpture grace. Measured either by the number of works contributed, or by the talent invested in them, the whole result is far below what might be expected. With an exhibition of faculties that justify the largest amount of aspiration, there is scarcely a token here of inspiration. Figures of unquestionable value in themselves, yield no large product. Amid a host of technical excellences, there are few revelations of genius. The consummate hand has wrought again and again, without the sanction of the informing mind,—and so, wrought in vain, so far as any high Art purpose is concerned. Executive power—as the minister, too, of a fanciful fertility—is often apparent; but rarely as the exponent of the *true* creative. One satisfactory circumstance there is, in connexion with this part of the subject:—Sir Benjamin Hall will have learned from these models, what he would not take on our assurance, and that of others,—that he need not, in future, go abroad for any sculpture Art which the government may need. He will now know, that the best of its kind is to be had at home. This is the second time within a few years that the schools may be said to have measured themselves against each other,—and the result has been in each case the same. There need be no doubt, in future, that England holds the first place in the European sculpture system. Inferior to none in the technicalities of the art, her school shows itself superior to all in the spiritualities. When we speak of schools, it will, of course, be understood, as we have said elsewhere, that we are speaking of the general practice and average expression in each, and leaving out the great exceptions in all. England, Ireland, Scotland, France, Italy, Germany, Spain, Portugal, Greece (fancy a contest with Greece for the prize of sculpture!) and America, are understood to have contributed to this competition. From the ranks of our own sculptors some of the best names are absent,—and others of the schools, also, are probably not here represented by their whole force. Taking this, then, as an even trial of strength, the result should be, to relieve the foreign sculptor from future contest for our national works of Art. That our own numerical share in these models far exceeds that of the foreigner, introduces no difference into the conditions of the problem; because the trial of strength is, of course, between the best,—and the worst are such as are no strength to any school, but are not weakness only because Art cannot be discredited by the imbecilities of those who usurp her name. In all that relates, then, to the sound canon and serious practice of sculpture, the English school asserts her unquestionable superiority in this gathering of European and Transatlantic schools. That part of the present sorrow and disappointment which has to slink back, out of this competition, into continental homes, made sadder and poorer by the competition, may henceforth, we submit, be spared on occasions of the kind.

The question of allegory as a sculpture resource has had one more trial, on a large scale, in this exhibition; out of which it comes with some modification of the dogma that would exclude it altogether. The enmity which it meets has arisen out of that abuse of its nature which employed it as a sculpture end, instead of a sculpture means, and has been nourished by the absurd puerilities and conceits that up to a recent period were offered in its name

as final Art-expressions. For ourselves, we have little doubt, that allegory should be employed only to do that which cannot be done without it, and that the sculptor who *may* remain on the ground of the ideal, free to choose his own theme, will do well to select such as can dispense with its services. His art has far more spiritual interpreters than this; but their language, as we think will be seen, may be too transcendental to meet all occasions. The practice of allegory is apt to fall into two extremes,—both fatal to high and expressive Art. Either it narrows into convention, in which case the symbol ultimately supersedes the sentiment; or it expands into vagueness, and affects to do what no sculpture can do, and what it would be a thousand pities if sculpture could. The first of these issues to the use of allegory is the least distressing, because, even where it dispenses with Art, it at least gives us something that we can understand. If Venus be known by her doves, then, he who cannot model a Venus, can at any rate put the doves beside the female figure which he does model, and we know that he means it for a Venus. The opposite error—in examples of which this exhibition abounds—leaves us at the mercy of an exposition to be sought elsewhere. Qualities and abstractions of all kinds are undertaken to be embodied in marble; but *what* the particular quality or other abstraction intended, is known only by the label that supplements it. Figures are offered to us as something in particular, which, being as like anything else in general, are very properly inscribed with their names. Groups are said to be doing something specific, which, but for the authority of the written document that asserts it, we should say certainly are doing no such thing. If the great work of sculpture be that which proclaims its own intentions in its own unaided language,—every sculpture detail, as in a perfect lyric, being a phrase contributing to the general meaning,—what shall he thought of more than one work in this exhibition which needs the whole pages of literary dissertation given to it on its pedestal,—and scarcely repays the service of explanation which the document renders by being itself, in return, a true explanation of the document. Some of these labels look like treatises, and occupy nearly as much paper for the description of the sculpture figures to which they relate as these might be wrapped in. The art is a dead art that so writes its meanings. Among the personations that people the hall, we have, Prosperity, Strength, Order, Civil Virtue, Justice, Temperance, Prudence, Decision, Constancy, Valour, Protective Force, Power, Truth, Duty, Honour, Energy, Loyalty, Law, Anarchy, Military Genius, Wisdom, Legislation, Diplomacy, Science, Despotism, Military Service, Veneration, and Industry. Of these, some have the symbol,—as Justice, the balance, and Strength, the sword; but where they have not, the figures might, in many cases, be shuffled together and stand for one another. The figure of Temperance that might serve as well for a figure of Prudence, and the figure of Valour that might change places with that of Military Genius, are not necessarily the one or the other,—and not, therefore, the Temperance or the Valour of any true Art-poetry.

But whilst it is amongst the responsibilities of the artist who has the selection of his own theme to choose only such as his art will express in its highest language, there are more classes than one of subject constantly appealing to him for illustration which cannot, as we have said, be transcendently rendered, and which need the help of allegory. Of these is, the monumental,—and the historical-monumental in especial. It would seem as if the sculptor, whenever he leaves the ground of the sentimental and ideal, and comes upon the field of narrative, were driven to allegory as a means of expression, because of the character of summary and condensation which his work must often bear. From time immemorial, even the private monumental has resorted to types and figures for its utterances, which have been fatal to originality in this prolific and affecting field of sculpture. The sorrow that haunts all the churchyards of the land in one essential and unchanging form, not unnaturally grew uniform and conventional in the methods of its mourning,—and so, took to symbol. But genius is equal to reconciling the feelings which are eternal, for the grief that is immutable, with such varieties of expression as shall reclaim it from the tendency to be

a copyist; and in its hands—as has been seen in some recent examples—the old symbolic figures are capable of translation into something different, in virtue of the deep poetry and pathos that reside in the subject,—the sorrow that is passion in the young and pain in the old, but essential sorrow in all. It is somewhat different beside the tomb at which a people sits as mourner. The national sorrow is eminently epic and attitudinal. Political mourning is an affair of posture and of costume, rather than of tears. If Art affects the allegorical beside the grave of private love, where she may expatiate, she *needs* it by the tomb of the hero of a hundred fights and the leader of a hundred debates, where she must condense. The history that must be written in a page, must use cipher. All that is demanded in the matter, is, that the allegory shall be precise,—clear in its meanings, and familiar in its language. Where allegory is *more* than a mere subsidiary, it must justify its use by the comprehensiveness of its application;—and everywhere, whether subsidiary or not, the one condition of its acceptance not to be compromised, is, that it shall speak in terms which those to whom it addresses itself can understand.

In casting our eyes round the models in Westminster Hall, we come at once upon a work which may serve as an illustration of what we have said. This work was numbered 35 in the exhibition, and represents as its leading theme the Estates of the Realm mourning for the great Duke. Here, of course, is a summary expression for the national pride and national regret, if it can be rendered monumentally:—but how are the Estates to be presented? The Queen offers no difficulty. She is an Estate in herself, and appears in her own person. The Lords and the Commons are severally corporations, and must appear symbolically if they appear at all. But the symbols which present themselves are at once familiar and dignified,—and lend themselves well to monumental composition. The Lords appear in the person of their Chancellor,—who, by the constitutional, and perfectly understood, theory, *does* embody in his person the collective dignity and prerogative of their house,—and the Commons are similarly impersonated, in their own house and here, by their Speaker. Here, then, we have allegory doing its work in language so direct that it is scarcely allegorical, and so comprehensive that it sweeps into its purview the whole figure of the national lament. The fact of the Duke's double figure as warrior and statesman is even suggested in this union of the Estates;—to be marked more emphatically by the figures of Peace and War uniting in the tribute to his memory. Peace and War as personations belong, of course, to the classic idea; but they are, nevertheless, of that class of accepted allegorical figures which are generally understood,—and so obviously carry on the idea here, that they unmistakably express themselves. Thus, in a few grand epic phrases the entire subject is expressed:—the Duke's fame divided into its two several parts, and a nation, for its double sake, in the attitude of mourners at his tomb. The breadth of scope is obtained by the utmost simplicity of character; and the unity of the thought leaves out no part of the subject which was necessary to its fulness. Amid things of far greater show and pretension, a work like this, which effects its object by means so sculpturally direct, was very likely to be overlooked by the crowd; but should not have been so by any competent judges, were it only on the ground of its modelling. The Chancellor and the Speaker, with Peace and War, form the figures at the four angles of the pedestal. Raised, in a centre, above the figures of the Chancellor and the Speaker, so as to bring the three Estates in front, sits the Queen; and her raised arm carries on the eye, and the thought, to the Duke, standing monumentally on the summit of a low pillar which rises out of the centre of the pedestal. The back and the front sides of the pedestal show in bas-relief the first and last fights of the hero,—Assaye and Waterloo: and the sides are enriched with shields, coronets, and cornucopias. The varieties of costume have grown into rich sculpture incidents in the modeller's hands:—and these fine figures, all detached, and carried out on the great scale ultimately intended, would make a noble, and beautiful monument beneath the arch in St. Paul's. This work is understood to be from the chisel of Mr. Baily, the Royal Academician: and another work (32) is attributed to the same

sculptor, in which allegory is employed in a manner more recoude, and expressed in a composition of more rich and elaborate beauty. Throughout this composition, also, the double character of the Duke is enforced. Around the base of the monument, through the marble waves of that allegorical sea which represents at once the seat and the symbol of British empire, sweeps the car of Britannia, attended by the sea deities, in a procession that no other sculptor, since Flaxman, could have modelled. The idea, of course, is, to picture the foundations of that power for whose maintenance the life of the hero was spent in the field and in the senate. Then, the peace that he purchased with the battles that he fought is allegorically expressed above. Round the rock-pedestal that rises out of the sea are grouped, in an ascending arrangement which likewise carries up the eye to the crowning statue of the great Duke, a series of figures, in whose action Peace is made to proclaim to Europe, that, through the victories of her hero, Britannia is still triumphant. The base of this monument wants greater breadth; and would doubtless have it, if carried out on the great scale, which the limitations of size for the models forbade. It has not the epic and monumental severity of the group which we have first described; but as a piece of modelling, it unquestionably excels every other work in the exhibition.

These two models, and almost every other of mark in this collection, contribute to the proof that, without the help of allegory little can be done in this matter. Those of our readers who think otherwise we refer to No. 81;—in which there is a fine and satisfactory contempt of the ideal. Here, the national monument is reduced to portraiture, and divided in equal halves between two celebrities,—the Duke of Wellington and his horse Copenhagen. It is not easy to say which the artist who deals thus in facts considers the leading fact, the chief or the charger. The duke is on foot, and so is the horse; and the one stands beside the other: that is all.—Or, our readers may look at No. 31; in which, so far as we understand it (because in this and some other instances we are not exactly sure of our readings), the substance of the work is fact, and the accessories only are allegorical. The effect of the two styles, mixed up in this proportion, is, as if a man should build himself a Grecian house, and put a Gothic knocker on the door. There is some little confusion even in the facts. The duke lies, as it seems to us, in his clothes, on a couch spread on his funeral car, and is being wheeled, as we suppose, to his grave, on castors. The allegory comes in with the castors, which are British lions;—and more quaint and conceited-looking little lions there are not in all Westminster Hall. Britannia is by their side, as a walking mourner. There is a bas-relief on the panel of the car, but we have not been able to read it. The only thing in it that we can distinctly make out is a very excellent piece of matter-of-fact. The Duke of Wellington is riding on horseback through the sea, and holding his sword well up to prevent its getting wet.—No. 30 is also distinguished by its simplicity. Her Majesty the Queen rests her arm upon a tomb, and hears a shield embossed with a medallion of the duke. The elegiac intention is conveyed by the extremely lachrymose aspect of the Queen, and that of a small lion who reflects her grief, and looks intensely demure, proper, and ridiculous.—Again we say, let there be an end of unlimited competition, which mocks the earnestness of a nation with things like these.

The model No. 66 is understood to be the joint work of Messrs. Durham and Lawlor. It is not in the published list of prize works chosen by the judges,—but we find it in ours. It is too much broken into groups for epic treatment; but the groups are all well designed, and very ably modelled, and the whole looks massive and monumental. In the leading group,—which is another version, less obviously treated, of the double character,—Wellington is in the act of surrendering the sword to Justice which is needed no longer for war. Two other groups may be said to keep the same moral. In one, Victory is shown as the result of Valour,—in the other, as the result of Wisdom. Attendant geni on either side hear crowns such as the earth yields, and such as the heavens reserve. The eye comes to the repose and harmony of this work again and again, when wearied with the clever multiplicity in so many places round it.—There are also two models of

remarkable ability, Nos. 57 and 60,—or, rather, they should be spoken of as one, for they are the same design with variations,—by Mr. Bell; of whom, too, no notice is taken by the commissioners. The principal objection which we have to these works is, their massive character, and the solid way in which they would fill up the assigned arch; but the modelling is of great excellence. The design is sepulchral, and so far appropriate to a cathedral for locality; and the front of the sepulchre has the figure of Wellington reversing his baton in sign of peace:—thus presenting him, as most other models here naturally do, at the Janus point, between figures of War on the one side and Peace on the other. These figures form the principal group, and are composed in a pyramid. On a lower base are six figures, forming also pyramids, back and front. In the front central niche is History recording, and in the back Britannia mourning. There are other figures on the angles, different in the different models. The works are not very easy to describe; but it is, at any rate, incredible how these should have escaped the eyes of the judges when certain of the prizes were given away.

The judges have given the first prize, of £700, to Mr. W. Calder Marshall, for a work which is designed by him to be erected in bronze:—and about whose place in this award there will most certainly be differences of opinion, though it is a work of talent beyond doubt. We had ourselves marked it for a prize,—but will not say *where*, further than that it was not where we find it in this judicial report. The design is the accustomed one,—Wellington between Peace and War. The pedestal on which the Duke stands is supported at the angles by figures representing Wisdom, Valour, Duty, and Peace. Here, then, we have *two* figures of Peace:—Peace in the first place, and Peace in the second,—Peace as a subordinate, and Peace as a result. This is a fault in construction. On one side of the pedestal, a mother, with a child in her arms, finding the dead body of her husband, indicates the horrors of war; on the other, Commerce and Agriculture triumphant symbolise the blessings of peace. There are bas-reliefs representing the siege of Badajoz, and the Duke receiving the thanks of the House of Commons; and, on the base are the battles of Assaye and Waterloo. It is proposed by the sculptor that statues representing the Grenadier Guards, the Life Guards, the artillery, and the infantry shall be placed at the angles supporting the arch under which the monument is to stand:—and the model which Mr. Marshall originally sent in included a segment of the cathedral arch, showing these figures. But this addition enlarged the dimensions beyond the limits permitted by specification; and, under the strict application of Sir Benjamin Hall's own rule, the sculptor was, we believe, required either to withdraw his model as an infringement, or to sacrifice that part of his design which made it so. The portion abandoned is an important feature in the effect, and we hear it talked of now as a constituent of the design to which the judges have given their first prize. If they *have* taken the arch and its figures into account, and have permitted to Mr. Marshall the benefit of this forfeited portion of his plan, then they have directly contravened the expressed intentions of the First Commissioner of Public Works, and mistaken their trust in a far more serious sense than that to which we before alluded. If it be so, it will be necessary that the sculptors who were candidates shall bestir themselves at once in the matter, and that the award, so far as regards the first prize of £700, shall be re-opened. The matter is serious, and affects the good faith of the whole proceeding.

If the public verdict be worth anything in a matter like this, there should be much Art-virtue in a work which was numbered 36 in this exhibition, and contributed by Mr. Edgar G. Papworth. The judges are of the opinion of the public,—and have awarded to it their third prize, of £300; and we are of the opinion of the judges,—with something of a difference. It is probable, that if the distribution of these awards had rested with us, we should have assigned to this model pretty nearly the place which it now occupies with reference to the exhibition generally:—with reference to the works only which are actually chosen as prizes, we should have placed it better. The character is eminently solemn and sepulchral, and the sepulchral view is expressed with great

poetic beauty. Working for a church and for a tomb, the sculptor has kept conscientiously in view the dread Presences in which he wrought—Death and Religion,—and made his art the minister to both. No passages of triumph disturb the awful shadows of the place,—no sculpture phrases affect to evade the authority of the great destroyer. The body to death, and the great memory to fame,—is the moral here written, in characters distinct and beautiful, by Art. By the grave to which the mortal that has “passed away” is solemnly committed, the resented Immortality is handed over to the keeping of History. No better test could be afforded of the value of the thought here embodied, than the way in which the mind was affected by the sense of monumental fitness when it came suddenly on this work from some of the *touder* ones, so to speak, that preceded it up the long sculpture aisles. The silence of the grave was at once felt to be here,—but out of it “a still small voice” speaking clearly to posterity. Here, is thought,—thought solemn, poetic, and un-borrowed,—and allegory speaking a language at once sweet, subdued, and majestic. The design is as follows.—On the summit of a lofty mausoleum stands the figure of the great Duke, with his robe gathered round his breast. Two figures, male and female, are grouped reclining at his feet; and may be considered as representing the genius of War, and that of Peace. The Duke's sword-point reversed, and resting on the ground, may be taken to indicate that period in his life in which he is passing from the first to the last; while, amid the other touching morals of the work, it is felt also as faintly shadowing out that final rest from his labours of which this monument is the record. By the tall bronze gates of the mausoleum, which are imitated from the famous Ghiberti gates, at Florence, and intended to be covered in all their panels with the sculptured events of the Duke's life, stands the Angel of the Grave,—calm, serene, and beautiful. Her finger is on her lip, to indicate the eternal silence,—and her outstretched hand is closing the gates for ever against the world. Through the narrow opening is seen the marble sarcophagus of the Duke; and opposite to the angel, the lion of England sits watching by his tomb. At the back of the monument History—a finely-modelled figure—has taken up her office where it properly begins, and commences the keeping of the great record whose incidents have just been closed on the other side.

We wish any of our readers who may have seen it could help us to some solution of a very remarkable model in this collection known as “The Star Monument,”—but which we, ourselves, have already alluded to as “The Corkscrew Monument.” Ours is the better name; because the star is no part of the design, and the corkscrews are its leading feature. The Duke stands on a large screw, which climbs out of the centre of a pedestal supported on eight smaller screws,—and the pedestal has a circular battlemented edge, mounted with cannon. There are figures of Peace and Justice, and some other things; but all else is subsidiary to the corkscrews. Now, this work has given us great mental trouble, in the attempt to master the intention that underlies it. Whatever may be said for or against allegory, we question if sculpture can be canonically treated as a conundrum. We do not like to give it up, however; and have wondered whether the author of this mystification could possibly mean to indicate that Wellington had uncorked bottled fame wherever he found it, and drunk off all the wine of glory at the cannon's mouth. The fact that the greater number of the Duke's victories were achieved in a wine-growing country, favours this solution. Still, we cannot feel quite certain that we have here done the work of *Oedipus*.

The judges have awarded the second prize in this competition (£500) to No. 56, the work of Mr. W. F. Woodington. Now, this group, according to our judgment, has many great artistic qualities of its own, and many properties which rob it of essential fitness for this particular purpose. The Duke is seated aloft in a chair, in an attitude of meditation, reviewing to himself, as it should seem, the events of his life; and at the angles of his tomb are seated, severally, impersonations of the virtues which the sculptor conceives to have been its guiding spirits. These are, Energy, Decision, Devotion, and Order. Now, as a variety in treatment, after that monotony of treatment which, as we have already said, must be

F. W. WOODS DEL.

G. SCOTT & BOWNE ENGRAVERS

THE PRINCESS VICTORIA ROUPHAMMA OF BURMA

FORMERLY EMPRESS OF THE BURMA EMPIRE

WOMAN OF THE BURMA EMPIRE

a consequence of excellence itself, we dare say the judges were not sorry to come on this model; but, that it would have been taken as satisfying the conditions of a Wellington monument if it had been presented alone, we cannot persuade ourselves. In the first place, it sinks all notice of the Duke's military character,—which scarcely becomes the record of a great soldier; and in the second place, the treatment is philosophic, not religious,—and in so far, less suited to a church. The air and attitude of the Duke are those of an ancient sage. Then, the four virtues attributed are really essences far too subtle for impersonation; and it is quite certain that no visitor could name the figures but for the gilt letters that direct him. Equally certain is it, that some of them might change places, without rendering it necessary to shift these letters. Noble shapes, beyond doubt, they are,—greatly conceived, and beautifully executed; and the work has the one grand Art-grace of simplicity. But the whole monument is an abstraction, and has no moral to suggest and no story to tell.—It seems, however, to have inspired the judges with a taste for the abstract; for their fourth prize, £200, is given to a work in which figure as impersonations those airy conceptions, Temperance, Constancy, and Protective Force. Science, too, sits in this monument for her portrait;—but that is more possible, as an affair of costume. This is an Italian work, and its author is the Cav. Giovanni Dupré, of Florence. On the four sides of a quadrilateral base are represented in bas-relief some leading events in the life of the Duke. At the angles of a raised cornice are the embodied invisibilities named; and above all rises a group composed of Wellington clad in a toga, led by Victory, and knelt to by Peace. The work builds up well, and has considerable merit:—but should not have received a prize till many others in this hall had been so distinguished.

A work of great sculpture qualities is No. 20, from the hand of Mr. Matthew Noble. It has obtained from the judges a prize of £100. The grand Art-feature of simplicity made it always a relief to pause beside this model after a travel amid the extravagances of the exhibition. The figures are five only in number, and all designed to be colossal. They represent the Duke standing on a pedestal, on whose base are personations of Ireland, India, Europe, and Great Britain. Wellington is represented as in the matured vigour of life; his military character being indicated by the sword and the volumes of the Wellington Despatches, and his civil by a state document which he holds in his hand. The character of the whole work is that of mass and firmness; and the figures stand well and nobly on their pedestals, and are serious and majestic in their sentiment and bearing.—Of the class to which it belongs, there is nothing finer than this work in the hall.

Another prize of £100 has been given to No. 63, the work of Mr. Thomas Thorneycroft, and a very striking production. It differs in its treatment from most of the other models in the hall; and had, we dare say, its air of originality to recommend it to the judges, in addition to its own great intrinsic merit. Nevertheless, the leading incident by which it is distinguished has in all probability been suggested by the Prussian sculptor Rauch's monument to Frederick the Great. Here, as in Mr. Woodington's work, the Duke is seated, and musing; and around him, as supporters, are allegorical figures of Victory, Peace, Science, and Industry. A series of bas-reliefs present a variety of incidents in the career over which his thoughts appear to be travelling. As in the monument to Frederick, bronze statues of the companions-in-arms who helped to make that career illustrious support him; and soldiers of all the arms which he commanded meet in a procession around the base of the monument. We believe, the public are well content that this work should have a prize.—But the public will, we also believe, travel no further with the judges,—and here, at all events, we ourselves part company from them. There are three other prizes, of £100 each; and these have been given severally to No. 12, the work of two Florentines, M.M. Mariano Polcini and Ulisse Cambi,—No. 18, that of Mr. Alfred Stevens,—and No. 21, contributed by Herr Ernestus Julius Häbnel, of Dresden. Of these three, the award to the Englishman is unquestionably a mistake. On no possible principle of judgment can we understand how this work came to be singled out from such a collection as this,—and least of all, for such a purpose. Of the two foreign

awards, that to the Florentines adopts an arch under an arch,—and of the German work, we shall say no more than that it represents the Duke in the act of sheathing his sword after victory, with his foot planted on a gun, that Britannia sits by the pedestal in front, and that on detached pedestals at the four corners are allegorical figures representing Wisdom and Strength, and War and Peace.

It is not our intention to go through these works in Westminster Hall at length:—our design has been, to illustrate the amount and principles of our agreement with, and disagreement from, the judges who have made this award. It will be seen, that, although we think they have fallen into some strange mistakes, yet their award will meet with a considerable amount of acquiescence; and that is perhaps as much as in general such an award can aspire to. Many heart-burnings and bitternesses there will be,—heavy suspicions of prejudice perhaps, and certainly much sense of wrong; but these things are inseparable from such a competition, so entered into. Good ground of disappointment, too, there is. There is, for instance, a work here which is understood to be by Mr. Thomas, so remarkable for its talent,—though in our opinion unsuited to this particular purpose, on principles which we have already laid down,—that it will be difficult to satisfy the sculptor that under any circumstances it should have been overlooked by the judges; and a model by Mr. Physick is one of a class which furnish good evidence of what our school can perform. The resulting question is,—What, now, will Government do in the matter of this Wellington Monument? It is probable, that no one model which appeared in this collection will be executed as the national work:—certainly, we should apprehend, not the one to which the judges have awarded the first prize. But the minister has the money, and we suppose means to have the monument; and there has been far too much of the power necessary for the execution of such a work displayed in this competition, to make it possible for him now to pass by the talent which he found in Westminster Hall. It seems to us, that the wise course will be, to summon to a final competition from eight to twelve—not less than the first, nor more than the last—of the leading sculptors of England *alone*; in which number, as a matter of right, the three great prizemen in the contest just ended shall be included. Let these new competitors make models, to the half size,—the price of the final monument being reduced by such a sum to each as shall greatly diminish the cost of his model,—and on the distinct understanding that one of these shall be selected for execution, with such alterations and modifications as may be agreed on between the Government, the Court of Selection, and the sculptor himself. Let the Court of Selection be constituted with a care justly proportioned to the importance of the function which it will have to discharge; and contain a sufficient amount of the Art-element, of such a satisfactory kind as might be represented by unexceptionable names.—By such a process, the minister will most certainly arrive at an honourable result in the long-pending matter of the Wellington Monument.

ART IN CONTINENTAL STATES.

PARIS.—The excitement caused by the *Salon* having subsided, Paris has assumed its appearance of desertion usual at this period of the year.—A new exhibition has been opened in the *Rue Rivoli*, by order of the *Ministre de la Marine*, of the various productions of Algeria.—An Art-society has just been established at Besançon.—The following statues have been commanded by the Directors of the Fine Arts and by the Minister of State:—a bust of Cartellier (sculptor) for the Institute, by M. Meusnier; of Picard for the French Theatre, by M. Trelin; a bust of the Duke of Malakoff, by M. Crauck; and a marble statue of "La Penserosa" for the Louvre, to be executed by M. Lanzirrotti.—Ary Scheffer is in England, painting the portrait of the Queen Marie-Amelie.—The large painting of the "Taking of the Malakoff Tower," by Yvon, is to be placed in the gallery at Versailles.—The bronze statue of the illustrious Bichat has been inaugurated in the *Cour de l'École de Médecine*: this was the last work of David d'Angers.

BORDEAUX.—A painting, presumed to be by A. Carracci, has been discovered in the Cathedral of Bordeaux.

THE ROYAL PICTURES.

THE PRINCESS VICTORIA GOURAMMA OF COORG.

F. Winterhalter, Painter. R. Graves, A.R.A., Engraver. Size of the Picture, 5 ft. $\frac{1}{2}$ in. by 3 ft. $\frac{1}{2}$ in.

Coorg, as many of our readers probably may not know, is a small principality of Hindostan, situated near the Mysore country; its greatest length is about seventy miles, and the mean breadth about twenty-two miles. Hyder Ali contrived, in the middle of the last century, to get possession of Coorg by treachery; but in 1787 the young rajah, Beer Rajinder, his prisoner, escaped from confinement through the aid of several of his subjects, and succeeded in establishing himself in his dominions. At his death, in 1808, he left the succession to an infant daughter, to the exclusion of his brother, to whom of right it belonged according to ancient usages; but the young princess soon after abdicated in favour of her uncle, with the sanction of the British Government, and to the satisfaction of the people of Coorg. The country has since become, if we mistake not, an integral portion of the British empire in Hindostan, now engaging so much of the solicitude of every Englishman; or, if not, it is under our protection.

The Princess Victoria Gouramma is daughter of his Highness Prince Beer Rajinder Wadair, ex-rajah of Coorg; she was born in February, 1841. The melancholy circumstance of the death of the mother, two days after the birth of the child, seems to have led to increased affection for his offspring on the part of the father, who, from his own previous convictions in favour of Christianity, determined that his favourite daughter should be brought up in the principles of the Christian faith. From this period the ex-rajah entertained an anxious desire to visit Europe, in order that, when she had arrived at a suitable age, she might be introduced into European society, and thereby receive such impressions as would promote a feeling favourable to Christianity. Accordingly, in the early part of 1852, the prince quitted India for this country, leaving at the city of Benares the rest of his family, consisting of eleven children, with their mothers; for, notwithstanding his strong bias towards the Christian faith—and he is said to be a firm believer in its creeds and doctrines—he does not appear to have disapproved of polygamy. On his arrival in England the object of his visit was made known to the Queen, who at once most kindly and graciously consented to become sponsor to the young princess. The baptismal ceremony—on such an occasion more particularly interesting—was performed by the Archbishop of Canterbury in the private chapel of Buckingham Palace, on June 30, 1852, in the presence of her Majesty, the Prince Consort, and numerous other members of the royal family: the princess received the prefix of "Victoria" to her Indian name of "Gouramma," by which she had been called after one of the pagau divinities of her country.

It must be allowed that the act of the ex-rajah manifested great moral courage in one of high birth, strictly educated in Hindooism and nurtured in Asiatic prejudices; and it is almost impossible to foresee what beneficial advantages may result from it among the higher classes of the Hindoo population, should his daughter return to India to show them by her example what true Christianity is. When he surrendered his child to the gracious and maternal charge of her Majesty, he addressed the young lady in these simple yet touching words:—"Endeavour to gain every day more and more the grace, and to merit the love and kindness, of Her Most Gracious Majesty the Queen; and thereby all Europe, India, and the rest of the world may hear and be pleased with your good conduct and fame. May Heaven bless you, and keep you always under its divine protection and especial care. This is my advice to you, my dearest daughter, and my most earnest prayer to the Almighty on your behalf."

The princess is now in her sixteenth year, and promises to improve in the various studies in which she is engaged. Her personal appearance is exceedingly interesting and intelligent, and the complexion of her skin is but little darker than that we Europeans call a deep brunette. Her portrait, which Winterhalter painted by command of her Majesty, is at Buckingham Palace.

MINOR TOPICS OF THE MONTH.

THE SITE OF THE NATIONAL GALLERY.—The commissioners have issued their report—a Blue-book containing nearly two hundred pages, with lithographed plans. It is probable we shall pass this goodly volume under review at no distant period, for the subject is one that cannot fail greatly to occupy the public mind, and upon the result of this “inquiry” will largely depend the future of British Art. The following witnesses were examined:—Sir C. Eastlake, P.R.A., Mr. H. Farrer, Mr. J. Nieuwenhuys, M. J. Bentley, Mr. Knight, R.A., Mr. Cooke, A.R.A., Mr. Parris, Mr. Mulready, R.A., Mr. J. M. Smith, Mr. Denning, Mr. Smart, Mr. A. Pauzizi, Mr. E. Hawkins, Mr. W. H. Carpenter, Mr. Oldfield, Mr. Sydney Smirke, R.A., Mr. J. Bell, Sir C. Barry, Mr. Westmacott, R.A., Baron Marochetti, Mr. J. Ruskin, Mr. Hurlstone, Mr. J. Ferguson, the Chancellor of the Exchequer (Sir G. C. Lewis), Mr. E. A. Browning, Mr. Doyle, Mr. A. J. B. Hope, M.P., Sir E. Landseer, R.A., Mr. J. F. Lewis, R.S.A., Mr. H. Warren, Mr. Donaldson, and Mr. Digby Wyatt. For the present we content ourselves with copying from the *Times* the following abstract of proceedings, merely observing that the public will find it difficult to understand how so eminent a gentleman as Mr. Faraday—he, indeed, on whom dependence was principally placed—should have declined to vote.—“It appears that on the 12th of March a resolution was proposed to the effect that the evidence hitherto adduced, collectively considered, did not lead to any decisive conclusion against placing the new National Gallery within the metropolis, on which Mr. Faraday moved an amendment admitting this fact, but pointing to the advantage to be obtained by ‘the removal of the gallery to a clearer and more airy site,’ which amendment was negatived by three to two, Mr. Richmond voting with Mr. Faraday. The original resolution was afterwards adopted. At the meeting of the 7th of May a letter was read from Mr. Justice Coleridge, advocating the claims of the existing site in Trafalgar Square, on the ground of its general accessibility. On the 21st of May Professor Faraday moved two resolutions: first, ‘that in respect of the future plan of the National Gallery, the three leading considerations which should govern the choice of a site are clear space for a building of magnitude sufficient to provide for the prospective increase of the collection, accessibility to the public, and the preservation of the pictures; and, secondly, that, in the opinion of the commissioners, the first consideration is essential in any case, that the second and third, although of extreme importance, are highly antagonistic, inasmuch as the removal of the pictures to a clearer but distant place takes away that accessibility which the present site, although, no doubt, with a great amount of wear and tear, provides.’ On these two resolutions the commissioners divided, affirming the first by four to one, and the second by three to two. Mr. Richmond then proposed that after a resolution adopted on the 27th of April (‘that it is not expedient to break up or remove the collections of ancient sculpture and archaeology in the British Museum’) another resolution be added, to the effect that the future combination of sculpture with painting should be provided for in the new National Gallery, ‘a primary use of which should be to preserve examples of the Art of past ages in all its branches in the order best adapted to exhibit their beauty and to illustrate their sequence and character.’ This resolution was negatived by three to two. It was also unanimously agreed that the choice of sites lay between the site of the present gallery (if sufficiently enlarged) and the estate at Kensington Gore. The result was that the chairman (Lord Broughton), the Dean of St. Paul’s, and Mr. Cockerell, voted for the present site in Trafalgar Square, and that Mr. Richmond (alone) voted for the Kensington Gore estate. Professor Faraday declined to vote at all, his mind being equally balanced between the two sites.”

THE ROYAL ACADEMY.—At length the vacancy created by the death of Sir Richard Westmacott, Professor of Sculpture to the Royal Academy, has been filled by the election to the chair of his son, Mr. Westmacott, R.A., who, without disparagement to any others, is undoubtedly the fittest sculptor to succeed the late professor.

THE NATIONAL PORTRAIT GALLERY.—It will have been seen with no common indignation that an attempt—not the less discreditable because it was an utter failure—was made in the House of Commons to withhold the annual grant of £2000 to form a gallery of British worthies. We treated this subject at great length a few months ago; it is unnecessary to recur to it. Certainly the grant would have been asked for more gracefully if there had been anything like a satisfactory report of progress. If the trustees wait until gift-pictures are collected, they will wait long before the public can appreciate their labours. Purchases are not to be made, or, at all events, not often: but for all the useful purposes contemplated by such a collection good copies would be quite as beneficial as the originals, and these are to be procured easily and at comparatively small cost. The £4000 now granted might obtain fifty pictures, valuable as teachers of the million; and if multiplied by photography, accompanied by a brief but sufficient biography, and sold at very low prices, a new and most effective means would be devised of gratifying and instructing “the masses.” If “biography be history teaching by example,” what schoolmaster can teach so well as a single picture that shall stimulate to virtue by exhibiting its best reward! We regret to learn from the debate in the House of Commons that the recompense to the secretary is one hundred a year! Surely the trustees neither require nor expect labour at his hands; certainly they enter into no contract to pay for it.

THE HALLS OF THE CITY COMPANIES.—Our weekly contemporary, the *Athenæum*, has published in a recent number a “Report,” drawn up by Sir Charles Eastlake, “on certain minor galleries of pictures which exist in London, for the benefit of the parliamentary commissioners.” “The Report,” adds the editor of the journal in question, “besides serving its special purpose, contains much curious information on old portraits and pictures, and on City Companies.” We know not if Sir Charles Eastlake reads the *Art-Journal*, but if he does, he will probably remember that during the years 1852-3-4, we published a series of articles, from the pen of Mr. Edward Hall, F.S.A., on this very subject. In these respective papers the halls of the principal civic companies, and other public buildings in London, were referred to at very considerable length, both as to their history and their adaptation to Art-purposes, while whatever pictures or other works of Art they contained received ample comment from our contributor. Sir Charles’s “Report,” if the *Athenæum* publishes it *in extenso*, is a very meagre production in comparison with Mr. E. Hall’s papers: moreover, the president of the Academy has entirely omitted several of the principal halls, as the Goldsmiths’, the Fishmongers’, the Grocers’, Haberdashers’, and Salters’; in fact, there are but four of which he has spoken—the Mercers’, Drapers’, Skinners’, and Merchant Tailors’, though allusion is made to the pictures belonging to the Weavers’ Company and the Clockmakers’, which hang in rooms in the City of London Tavern, appropriated to these companies respectively. Of the whole of those passed over by Sir Charles there appeared “much curious information” in our pages; an analysis of our report would have enabled the president to place in the hands of the parliamentary commissioners a far more comprehensive and useful document than that he has submitted to them.

ART: ENGLAND AND AMERICA.—It is known that a plan has been for some time in progress for sending to the United States such a collection of British pictures as shall uphold and extend the reputation of our artists, and be otherwise advantageous to them, while it may have the effect of benefiting our brethren on the other side of the Atlantic by acting as a teacher. This project is admirable in theory, and we shall very cordially rejoice if we find it so carried out as to be really what it ought to be, and must be, to become practically useful. Our doubts arise from our belief that it is next to impossible to collect a sufficient number of high-class pictures to form an exhibition, which exhibition is to open in New York on the 1st of November; and we strongly advise its postponement for a year. It will be a serious and fatal mistake to imagine that the Americans will be satisfied with mediocrity—they can distinguish excellence quite as well as we can; they have many liberal and judicious collectors, and several extensive collections, and especially their

artists generally are entitled to take prominent rank. We shall not find it in England so very easy to over-match the more eminent of their painters. The experiment will, therefore, be a failure unless a large number of paintings of the highest merit be submitted to them. The project, originally started, we believe, by a few English artists, is now mainly under the direction of Mr. Gambart: he is a gentleman of intelligence and experience, and is, perhaps, the only person in England in whose hands it will be comparatively safe: but even he will find it difficult, if it be possible, to achieve this object worthily. We confess that our fears on this subject are stronger than our hopes.

LONDON AND MIDDLESEX ARCHAEOLOGICAL SOCIETY.—The members of this society and their friends assembled in very considerable numbers on Tuesday, July the 21st, for the purpose of visiting the Tower of London. The authorities of the Tower had entered with the most cordial good feeling into the views of the society, and the meeting was accordingly attended with the most gratifying success. Many of the parts of this celebrated fortress which possess the strongest claims upon the attention of the archaeologist will not admit of being visited by more than a few individuals at one time: it was consequently arranged that careful and minute descriptions of such parts of the Tower should be read at a meeting of the society, to be subsequently held on some evening in the course of the next autumn or winter, while those other parts which are capable of being examined by large parties of visitors should occupy the attention of the present meeting. It was found to be necessary to divide the entire assemblage into no less than eight different groups: each of these groups was placed under the direction of a member of the society and of one of the wardens, and each group thus conducted visited in succession the chapels of St. John and St. Peter, the council chamber, the armouries, the Wakefield and Beauchamp Towers, and the Jewel Tower; and also walked round the fortifications, examining in their way the Traitor’s Gate, the various flanking towers of the ancient fortress, and the modern batteries and other buildings. In each chapel, tower, or apartment where the visitors paused to institute a special examination, some member of the council of the society was placed, who gave to every succeeding party a description of the place in which he was speaking: this duty was discharged in a manner which gave the utmost satisfaction, in the council chamber by the Rev. Thomas Hugo, in the chapel of St. John by W. A. White, in the Wakefield Tower by Mr. Deputy Lott, in the armouries by Mr. Fairholt, in the Beauchamp Tower by Mr. C. Baily, in the Jewel Tower by Professor Tennant, and in the Chapel of St. Peter by the Rev. Charles Boutell, the Honorary Secretary of the society, by whom all the arrangements had been made, and who personally superintended their being carried into effect. Brief general introductory addresses were also delivered by Lord De Roos, the Lieutenant of the Tower, and by the Rev. Thomas Hugo. It is most singular that it should have been left for this recently formed society to hold the first archaeological meeting in the Tower of London; but it is, at the same time, no less satisfactory to know that the society which has held this meeting is altogether equal to the duties which it has undertaken, and that its efforts are met with such sympathy on the part of those in authority, and such approbation on the part of the public as distinguished in so eminent a degree this very gratifying gathering within the old walls of the Tower. One feature in the proceedings of the London and Middlesex Archaeological Society demands from us at once special notice and strong commendation; and this is, the popular manner in which it deals with the various subjects which it takes in hand. To render archaeology popular is, or at least it ought to be, a special object with our country archaeological societies: and we rejoice to observe that the metropolitan society has adopted a system of action which cannot fail to extend widely its own range of action, by rendering its operations no less attractive than useful, and no less interesting than fraught with valuable instruction.

THE PEACE TROPHY AT THE CRYSTAL PALACE.—It appears that the cost of this lamentable affair—a slur upon the Crimean war, and an insult to Art—was no less a sum than £1908. Surely the share-

holders have a right to complain of an expenditure so reckless producing a result so humiliating. We suppose the Baron Marochetti has recovered from the injury he sustained by this miserable failure; but sure we are that a British sculptor who had publicly exhibited a work so thoroughly wretched would have been ruined by it for ever.

A SERIES OF PICTURES AND DRAWINGS are now exhibiting at 49, Pall Mall, which cannot fail to interest deeply all Art-lovers, more especially such as have visited Italy, and have sojourned in some of its less known localities. The collection consists of a variety of paintings, drawings, and sketches, by Mr. E. V. Ripplingille, an artist who has long occupied a prominent position in Art, and who has wrought much for public instruction with the pen as well as the pencil. These works are of considerable excellence, and they are exceedingly interesting as introductions into by-places, where the English traveller rarely treads—places, however, which he usually longs to visit, although deterred by the many obstacles in his way, and the difficulties, almost insurmountable, to be encountered. We may direct particular attention to several drawings which picture the haunts of the bandits—not the fanciful descriptions of the novelists, but the real and actual scenes, to every one of which terrible stories are attached. One of them represents the courtyard of a house in Sonuino with the heads of thirteen bandits spiked over the gateway, and another the deep hole into which their bodies were flung. The extirpation of these villains was the work of Austrian soldiery. A visit to the atelier of Mr. Ripplingille cannot fail to afford a rare intellectual treat, due regard being had also to the instruction that may be derived from a gentleman who is, and has long been, a master in Art.

THE VALLEY OF THE LUNE.—A noble landscape picture has just been completed by Mr. Linton, which might serve as a companion to his fine picture of "Lancaster,"—and has been removed by him for exhibition to Manchester. It shows the windings of the river Lune through the beautiful valley whose features are described by the poet Gray, in his letter to Dr. Wharton, published in the memoir of his life by Mr. Mason. The point of view chosen is near that which to this day is known, from the description in question, as "Gray's Station." Whoever, however, says West, in his "Guide to the Lakes," "makes choice of that station" (at the three-mile stone from Lancaster) "will fail of taking one of the finest afternoon rural views in England." The station which Mr. Gray points out, he says, is a quarter of a mile too low, and somewhat too much to the left. "The more advantageous spot, as I apprehend, is on the south side of the great, or Queen's Road, a little higher than where Mr. Gray stood;—for there the vale is in full display, including a longer reach of the river and the wheel of Lune, forming a high-crowned isthmus, fringed with tall trees." Mr. Linton has verified this preference for himself, and chosen the long reach. His picture shows the river wandering miles away through its girdle of the hills,—and sweeps into one magnificent view all the rich incidents of a various natural landscape, further varied by such incidents of Art as the town of Horbury on its distant height and the bridges that cross the stream. Nor has Mr. Linton feared to introduce the railway-train into his picture: but, like a true artist, he has used it so as to give a new sense and animation to the scene, without disturbing a single Dryad.—The work is on a large scale, and holds the eye long that has once looked on it.

THE GUARDS' MONUMENT.—The model designed by Mr. John Bell, for this work, is that selected by the committee; it is, we believe, in the form of a pillar or obelisk: the monument will be erected in Hyde Park.

LOCK BOTTLES.—We are tempted to go somewhat beyond our prescribed limits in order to notice an ingenious and useful invention patented by Mr. G. Stevens, of Pimlico, whose "glass mosaic" we have frequently referred to. He has recently introduced to the public what is appropriately called a "lock bottle," the object of which is to afford security to its contents. In the neck of the bottle a kind of screw is inserted, which, when drawn out, forces back a spring that holds the stopper firmly by means of a groove in the latter; when the screw, or key, is taken out entirely, the contents of the bottle are proof against depredation. The greatest

utility the inventor ascribes to his work, is security in the case of poisonous drugs and chemicals, some of which few families are rarely without in the household pharmacopœia; and which, in such bottles, are strictly under lock and key: it has already, we learn, received the approval of a large number of chemists and druggists, with whom it is expected these bottles will come into very general use. These locks are also applied to decanters for wine and spirits.

THE CŒUR DE LION STATUE.—A whimsical idea was suggested in the House of Commons—neither more nor less than to place this huge affair on the top of the Marble Arch! Really, simple people must be at a sad loss to know the value of the "collective wisdom" in reference to Art. The suggestion was not adopted; but it might have been without leaving an idea on the public mind that the knowledge and taste of "the House" had very much deteriorated.

THE MEMORIAL OF "1851."—Mr. Laurie questioned Sir Benjamin Hall on this subject in the House of Commons. Sir Benjamin stated in answer, with reference to the site of the memorial, that he could give no pledge on the subject "until he saw the design." Of course not; if the design be good, appropriate, and suited to the park as to composition and magnitude, no doubt it will be located there: and we feel assured that Sir Benjamin will consider that its fitting place. We hope the architects and sculptors are alive to this proposal, and that we shall have a satisfactory result. The committee have resolved on extending the time for receiving models; competitors will not be required to send them in before February next—a very desirable change.

THE PHOTOGRAPHIC SOCIETY.—This useful society has held several meetings during the summer, partly to advance the art, and partly for social intercourse. The members selected "pleasant places" for the enjoyment of both; and on each occasion their president, the Lord Chief Baron, occupied the chair. The society has gradually grown until it has assumed a position of much importance. Its labours have had the effect that was anticipated upon the progress of the art; and although it is composed mainly of amateurs, the works produced under its auspices are of a high and very interesting character.

GAS-LAMPS in London are usually most unsightly objects, deficient in all features but those of the merest utilitarianism. We have ere now, in our pages, exhibited examples of beauty of design for lamps, but we have not been able to point to any in our metropolis. Recently the Junior United Service Club has taken the lead in an artistic reform, and has placed on pedestals outside their house some remarkably striking groups of bronze figures, which act as supporters to the lamps above. The groups consist of young geni supporting military and naval trophies, and as works of Art possess much merit; they are additionally valuable as proving the adaptability of sculpture to general decoration—a fact too frequently overlooked in England.

THE EXHIBITION AT BROMPTON increases, if possible, in attraction. It is now open free three nights in each week. The numbers who visit it on these nights are curiously indicative of the leisure hours of the working classes. Thus, on Mondays, 5000 is about the number, on Tuesdays 3000, and on Saturdays 2000. The ordinary pay-days average from 200 to 300 visitors.

THE AWARD OF MEDALS to the successful students of the London district Schools of Art, took place on the 16th of July, in the new Lecture Theatre at South Kensington. The successful competitors, and the other pupils who were present, were addressed by the chairman, the Hon. Mr. Cowper, Mr. Redgrave, R.A., and Mr. Cole, C.B.

THE SEDDON SUBSCRIPTION has reached an amount that will enable the committee to attain one principal object for which it was started, namely, the purchase, for £420, of Mr. Seddon's large picture of "Jerusalem, with the Valley of Jehoshaphat," to be added to our national collection of British Art: the trustees of the National Gallery have accepted the work. The remainder of the subscription-money, whatever sum may be received, will be presented to Mr. Seddon's widow. This surplus is expected to amount to a considerable sum, about £150, or even more.

POLEY'S EQUESTRIAN STATUE OF LORD HARDINGE will, we understand, find a temporary resting-place in Burlington House, prior to its shipment for Calcutta; so that the public will have the opportunity, though for a short time only, of seeing this fine work of Art—without any exception the noblest equestrian statue of modern times. It is, as we stated some months ago, the earnest wish of many of the companions in arms of the late commander-in-chief, and of others who hold his memory in respect, to have a duplicate of this work erected in London; but there seems to be a point of etiquette standing in the way of the consummation of their desires: it is said there is no precedent in this country of an equestrian statue being raised to any not of the blood royal, except in the case of the Duke of Wellington, to which no objection was taken. We give the rumour just as it has reached us, without in the least degree vouching for its authenticity; nor are we inclined to put much faith in it, for we cannot suppose that any authority, ministerial or otherwise, would interfere with a project that would do honour to a gallant soldier, while it would leave to England a work that marks an era in British sculpture. The original statue was cast in bronze, by Messrs. Elkington and Co., and in separate pieces for convenience of carriage; its weight exceeds four tons. We would recommend all interested in British Art to inspect this fine example of sculpture, and thereby to satisfy themselves that we need not seek abroad for artists to execute our national works.

ARCHITECTURAL PHOTOGRAPH SOCIETY.—This society is becoming gradually established on a very firm basis, and it already gives promise of the most extensive and important operations. Local secretaries are being appointed in every city and important town throughout the country, and the co-operation of all persons who are interested in its success is earnestly invited by the London committee, and their able honorary secretary, Mr. Hesketh.

THE EXHIBITION OF WORKS BY ANCIENT MASTERS at the British Institution closed at the end of the last month; it is the latest of the exhibitions of the summer season; and although no doubt there will be, occasionally, collections to be seen during the autumn and winter, Art is in a great degree a book "shut" until the spring of 1858. The Sheepshanks Collection, at South Kensington, however, remains open; so do the Vernon Gallery, the Turner Gallery, and the National Gallery of course; although, perhaps, the whole of them will be closed during the month of September. There will be enough, therefore, to interest and instruct visitors to the metropolis.

THE STATUE OF QUEEN ANNE, in front of St. Paul's, is about to be cleaned from the soot of a century and a half; the small portion finished exhibits the marble in its original purity. It was executed by J. Bird, and is a curious historic memento. The fact of France, represented as a vanquished attendant on her majesty, being with the other figures at the basement, called forth a bitter satire from Garth; and the position of the figure of the queen during the famous Sacheverell days, led the high-church party to declare that she

"—left all in the lurch,

With her face from the city, and back to the church."

STATUETTE OF "OLD TIFF."—A statuette of much merit and considerable interest has been recently produced by Mr. Alderman Copeland, in statuary porcelain; it is the work of Mr. Warburg, an American sculptor of "mixed blood," an artist of great ability and general intelligence, who is now resident in England. The group represents "Old Tiff," the hero of Mrs. Stowe's latest novel, nursing the little maiden who is the heroine of the story; and at the same time rocking a cradle with his feet and busied with his hands. It is a striking work, and cannot fail to find favour with the tens of thousands who in England, and in the United States, sympathise with the subjects whom Mrs. Stowe has pictured with so much feeling and pathos. The accomplished authoress has criticised this group of Mr. Warburg's, in a letter which we have perused:—"It is," she writes, "beautifully truthful, and shows how far the expression of love and fidelity may go in giving beauty to the coarsest and plainest features." Certainly the sculptor has exaggerated rather than allowed the peculiarities of the African type.

REVIEWS.

THE PAST AND THE FUTURE. Engraved by FRANCIS HOLL, from a drawing by MARGARET GILLIES. Published by Messrs. FOKES, London.

We have before us a very charming print thus entitled, which, by picturing two graceful and beautiful women, tells a story of Memory and Hope; but it is told by the expression of the features alone, for there are no accessories of any kind: the artist, therefore, undertook a task of no small difficulty, and, having succeeded, has added another leaf to that wreath which the universal accord of contemporaries long ago adjudged to her. Miss Gillies, at all times, aimed to make Art a minister to the loftier and nobler feelings of mankind; her associations have ever been such as were calculated to elevate not only her mind, but the minds of all who came within its influence. She has painted always well, and always with a high motive; and it is pleasant to the critic, as it will be with the public, to renew acquaintance with her under this very agreeable form. Mr. Francis Holl holds prominent rank among engravers in the "mixed style;" he has in this, as in many other instances, maintained a right to his position: the print is remarkably well engraved, and we imagine that "expression," upon which the fair painter mainly depended for success, has been rendered with fidelity. Altogether this engraving may be accepted as one of the most pleasing and effective of modern issues; and we trust, as we believe, that Messrs. Fokes will find the public appreciating its excellence.

OFFICIAL GENERAL GUIDE TO THE CRYSTAL PALACE AND PARK. By S. PHILLIPS. Revised, with new Plans and Illustrations, and an Index of Principal Objects, by F. K. SHENTON. Sold at the Crystal Palace Library, and by BRADBURY & EVANS, London.

Carefully as the late Mr. Phillips arranged and compiled his catalogue, experience has taught those who have used it that certain alterations and introductions would add materially to its utility. What was necessary to be done seems to have been effected in this new edition by Mr. Shenton: he has simplified the reference to particular objects, added considerable new matter to the descriptions, and described and illustrated the botanical collection, the omission of which in the previous catalogue was much felt by the numerous visitors to whom the "tropical region" of the palace is an attraction. For a general and comprehensive view of the edifice and its contents this guide-book will amply suffice; we only wish we could see it more frequently in the hands of visitors than we have been accustomed: it may safely be affirmed that not one individual in twenty who goes there avails himself of the means within reach to get wisdom and knowledge—not one in twenty who seeks an intelligent guide to instruct him: people do not go to the Crystal Palace to learn, but to be amused: it is lamentable that it should be so, but the fact cannot be denied. The fault, however, does not rest with the managers, who have done all in their power to render the place a great school of learning; but it is comparatively lost upon the thousands who go thither.

PHOTOGRAPHIC ART-TREASURES. Part IV. Published by the Patent Photo-Galvanographic Company, Holloway Road, Islington; and by LLOYD BROTHERS, London.

Parts I. and II. of this work have been already noticed in the *Art-Journal*: Part III. has not come into our hands: that now before us scarcely equals in interest those which we have had the opportunity of examining. "The Brace of Birds," by Lake Price, is as soft in its "feathery texture" as the reality, but the heads and breasts are in such intense shadow as to lose their distinctive characters: one can only imagine, from what is seen, how delicate the markings would have been with a little more light upon them. "Like Sister Lizzy," from a painting by Mrs. Anderson, is the gem of the number, both as a subject and as an example of the photographic process by which this publication is distinguished from all others: the subject reminds us of Uwins's charming picture of the "Chapeau de Brigand" in the Vernon Collection. A little girl has thrown over her half-naked shoulders "Sister Lizzy's" lace scarf, placed a head-ornament among her curls, and a huge fan in her hand, and is contemplating, as she looks over her left shoulder, the magnificence of her unusual costume, the long scarf trailing behind her on the carpet: it is a capital representation of childish vanity exhibited in a most pleasing form; there is far more

of archness than of pride in the countenance, and one is only apprehensive that if "Sister Lizzy" should chance to enter her dressing-room and see her beautiful lace scarf doing the work of the housemaid's broom, that merry and innocent little face will assume a graver form. "Richmond on Thames," by R. F. Barnes, is a subject scarcely worth introducing into a work of this character: the view is taken from the Richmond side of the river, a little above the hotel—we forget its name at the moment—that stands immediately on the bank, a short distance from the bridge: it is winter time, or early spring, for the trees are leafless, and the water has a cold and dingy hue on the surface; the houses, barges, and boats, stand out with much distinctness. The last plate, "Cattle," after T. S. Cooper, A.R.A., has the appearance of an indifferent mezzotint engraving; it is black, muddy, and deficient in atmospheric effect, although the time of day is presumed to be evening, or early morning: we want the sunshine that is only indicated by the entire absence of clouds, and the long shadows which the cattle in the stream throw upon it: the engraver's tools might have done more than they have to give brilliancy to the subject. From the list of "contents" printed on the wrapper of the part, this last print seems to have been substituted for another.

THE MANCHESTER EXHIBITION: WHAT TO OBSERVE. A walk through the Art-Treasures Exhibition, under the guidance of Dr. WAAGEN. Published by J. MURRAY: W. H. SMITH & SONS, London.

Dr. Waagen's little work is a catalogue of those pictures only, or chiefly, by the dead masters, which he would point out to the visitor as most deserving his attention. The doctor's well-known connoisseurship is a sufficient guarantee against misdirection, and there is no doubt but that those who accept his guidance will be repaid by seeing the best of the pictures which are collected at Manchester; but it is not quite so certain that the classes for whom he has especially written—those who can have little or no judgment of their own—will be greatly edified or enlightened by his critical remarks, which show too much of the learned Art-scholar to be comprehended by the multitude: criticism, to be popularly intelligible, should be expressed in plain language, free from all unnecessary technicalities.

RUSTIC ADORNMENTS FOR HOMES OF TASTE. By SHIRLEY HIBBERD. Published by GROOMBRIDGE & SONS, London.

We do not agree with Mr. Hibberd, when he terms this age "the age of toys." We have certainly succeeded in rendering science familiar, and have brought stores from land and sea into our drawing-rooms; the plant cases, and the marine and freshwater vivaria are all, as our author quaintly says, "beads in our rosary of homage to the spirit of beauty;" but we consider them all, lovely as they are, studies rather than "toys"—they cannot be neglected with impunity; and though they give no trouble to the lover of nature, they require continual care and attention. Of all the books of this kind that have come before us, Mr. Shirley Hibberd's is the most comprehensive—the most useful either in a city or a country home; it is not sufficiently profound for the naturalist, but it cannot fail to be acceptable to the student and the lover of whatever is true and beautiful in nature. Six chapters are devoted to the marine aquarium, four to the fresh-water vivarium, two to the Wardian case, one to the Waltonian case, a charming chapter on the care and management of table flowers—cut flowers we mean—and all the plants most ornamental for our rooms and windows, with various hints for their culture and preservation. The three chapters on the aviary comprise as much as can be said in so small a space on the management and character of birds; and this is followed by four interesting chapters on the apiary. Then we arrive at "The Pleasure Garden," "The Flower Garden," "The Garden Aquarium and Water Scenery," "The Rockery" and "Wilderness," "The Fernery," and many most useful and valuable hints are given as to the management of the "Pleasure Garden." In short, the volume is a perfect treasure-house of interest, and fragrance, and beauty; we have seldom enjoyed a book more entirely, for the author's heart goes with his pen, and his feelings consequently harmonise with his subject. The illustrations are sufficiently pretty and attractive; and, as a drawing-room table-book, a companion in town or country, "Rustic Adornments" is without a rival, and ought to be found in every "home of taste."

THE BELL-FOUNDER, AND OTHER POEMS.—UNDER GLIMPSSES, AND OTHER POEMS. By P. FLORENCE MACCARTHY, M.R.I.A. Published by KENT & CO., London.

It was with pleasure we received this edition of Mr. MacCarthy's poems; we laid it aside as a welcome treat for a leisure hour, assured (as we afterwards proved) that the time of relaxation would be profitably and pleasantly spent—thinking his thoughts or speaking his words. There are freedom and freshness, brightness and purity, in Mr. MacCarthy's style, which give a rare charm to his graceful and eloquent verse; his thoughts are good in themselves and admirably expressed. We have not only the beauty of the rose, but we inhale its richest perfume; and instead of rising from the perusal of these volumes, as we too often do from the perusal of poetry, with a sense of lassitude and weariness, we linger fondly over them, re-reading favourite passages, and speculating upon what Mr. MacCarthy would do next. "The Bell-Founder" and "The Tidings" come first among our favourites; a pleasing narrative runs through the pages of the former, tender and touching from its simplicity, while the musical rhythm dwells upon the mind like some well-remembered melody. "Summer Longings," under the semblance of the lover of nature, pining for the glad spring-time, beautifully expresses the soul's longings and aspirations for that *ideal* which may not long dwell with man—the yearning for those rays of gladness which radiate around the highest throne. The "Advance," and others which space will not permit us to enumerate, are spirited and original in their conception. Mr. MacCarthy's love of nature—from the mountain to the mill-stream, from the noble forest king to the lowly wild flower in the cottage-garden—supplies themes for his overflowing sympathy and devotional spirit; giving to his poetry a freshness that is rare as it is delightful. If there were more poets like Mr. MacCarthy, seeing the hopeful and joyous in our daily walks and ways, and making the shadows of life *exceptions* instead of rules, we should have fewer morbid and melancholy fancies instilled into the mind of youth; while a more healthy Christian feeling would be excited—that of seeing God in all, "and good in everything."

BOHN'S ILLUSTRATED LIBRARY. POTTERY AND PORCELAIN. By H. G. BOHN. Published by H. G. BOHN, London.

This book is a reprint of the sale catalogue of the Bernal Collection, pictures, pottery, porcelain, furniture, arms and armour, and objects of *virtu* of every kind, with the prices which each object realised at the sale, and the names of the buyers: it thus forms a valuable and important work of reference for future collectors. But Mr. Bohn's volume contains something more than the priced catalogue: this portion is prefaced by a concise yet comprehensive essay, by the author, on pottery and porcelain; while an "Appendix of Monograms," gathered from every available source, and extending over several pages, brings the whole subject to a satisfactory conclusion. The Bernal Catalogue was a curiosity of its kind quite worth preserving: in its present extended form it offers additional interest to the collector.

LIFE AND ITS REALITIES. By GEORGIANA LADY CHATTERTON. Published by HURST & BLACKETT, London.

Although, as a *novel*, "Life and its Realities" has no claim to a notice in the *Art-Journal*, we are glad of an opportunity to assure Lady Chatterton that we hail her return to the world of literature with even greater pleasure from the hope that it is but the herald of her resuming her graceful and faithful pencil. Her "Rambles in the South of Ireland," and her "Home Sketches," were delightful transcripts of what she saw and felt, and it is not often we meet a lady who is as eloquent with her pencil as with her pen. Lady Chatterton does *not* belong to the strong-minded, who forget woman's duties in woman's rights. She is gentle and earnest in her councils; but perhaps the greatest fault in "Life and its Realities" is, that her prose is too poetic, and consequently her facts are clothed like fictions. Still throughout the tale (which we recommend our readers to peruse and unravel for themselves) Lady Chatterton is firm to her purpose; she has looked upon society with more penetration than her former works evince, while her opinions are decided, and such as deserve respect and consideration. Her style is always elegant and refined.

THE ART-JOURNAL.

LONDON, OCTOBER 1, 1857.

TINTORETTO AT VENICE,
AND MR. RUSKIN.*

most silvery of mornings! and where could its light find a more interesting mirror than this open Lagoon of Venice, whither an unusual stretch of activity has brought us from beneath those lazy musquito curtains thus early, to see the market-boats flocking from Mestre and its neighbouring shores towards the island city? The lake-like expanse of water, now at its utmost height and calmness, reflects little less than the full brightness and void serenity of the heavens, where it lies around us, with its own far-off ring of peaked mountains, the Julian and Friuli Alps, and its inlaying gems of islets, shining here and there with domes and campanili, between which the craft we came especially to admire yet again, seem now racing with each other, convergent towards the Cana'reggio, as directly and as fast as little ducks who see the feeder's hand held out to them. So pure and keen is the light that, notwithstanding a considerable distance, we can see well their various ladings—heaped joints of meat (copious veal and beef), the piles of garden produce, and the other "gifts divine" which they are bearing to the markets about the Rialto; amongst them the scarlet gourds, and some masses of flowers shining with pre-eminent brilliancy. Further off, there lies a group of becalmed fishing-boats, which almost look suspended in a vacancy of silver air; and in this wondrously clear atmosphere, we can discern the religious emblems with which their green and amber sails are variegated. Nay, more remote than these by many a long league, we can see, kindling with fair golden touches, what is but rarely beheld so brightly—the minutely jagged outlines, the broken peaks or needles of Titian's Cadore mountains, near which he was born, and whose forms (the influence of which may be traced in some of his backgrounds) seem rapidly changing from the substance of pure aerial grey clouds to that of glowing rock and turf steep.

Where shall we go? It were a glorious morning for some of the remoter parts of the Lagoon; but then, how perfectly adapted is this light for displaying to the utmost those pictures by Tintoretto in the dusky halls of San Rocco, which we have still to notice, in order to complete that investigation of the painter's works, and of Mr. Ruskin's remarks on them, which we entered into on our former opportunity. Still, in that building, the two or three most striking instances of Tintoretto's powers, and of Mr. Ruskin's errors, remain untouched; and afterwards we must to the Ducal Palace,

and there close our inquiries, appending to them, as we before said, a few brief observations on certain other subjects, which naturally branch out from them. Yes; the work half finished before freer pleasures! Therefore will we fall in with these market-boats, and accompany them so far as our course mingles itself with theirs, on the way to the Scuola di San Rocco.

And now let us mount the stairs, and, passing as we ascend that exquisite Annunciation by Titian, in which the Madonna is a lady of a refined sweetness and grace, unrivalled, perhaps, in any picture in Venice, let us enter the Upper Hall, also covered, walls and ceiling, with large pictures by Tintoretto. In some of them the figures, conceived and painted in a large and bold style, have a very grand and imposing air; but the usual coarseness and a pompous coldness greatly prevail, and the colouring is for the most part weak and cold; nor are any of the other characteristic attractions of the Venetian pencil to be met with in them. Incomparably the finest production in this hall is the "Plague of Serpents" on the ceiling, assuredly a striking and terrific conception, and in that respect one of Tintoretto's masterpieces. Numbers of figures are lying scattered on the ground, at different distances, in various attitudes of agony, despair, and exhaustion, invaded and bitten by certain mysterious winged reptiles, not serpents, by-the-by, and of no great size, yet full of horror—numerous, inevitable, incessant, pitiless—terribly they bite their tortured and writhing victims, each of whom has been fastened on by one of the busy swarm, from which there is no flight or defence. It is a fearful picture of helpless agony.

On the ceiling of the third hall, a smaller apartment beyond, is the painting referred to by Vasari as the subject of his well-known anecdote illustrative of Tintoretto's deplorably off-hand habits of working. The brotherhood of the Scuola being delighted with his Crucifixion, newly set up in this room, determined to decorate their ceilings also with pictures, and accordingly invited competition for the purpose, when Paul Veronese, Zuccheri, and Salvati, forthwith diligently set themselves to work in preparing designs and studies. But Tintoretto, meanwhile, having secretly obtained the admittance of one of the spaces to be filled, completed a picture at once, outright, and managed so as to have it already set up in the allotted place on the day appointed for settling the business, to the no small surprise of the meeting. He protested, however, that this was his way of preparing designs; the only way, he most likely added, of securely guarding against a picture unworthy of the sketch, or unsuited to the light and position, and offered to present them with the work, provided they objected to it on other terms; so, after some opposition, it was suffered to remain in its place. Hitherto the "San Rocco in Heaven" in the ceiling has been supposed to be the work in question, but we cannot believe it. Mr. Ruskin, without disputing the usual tradition to that effect, observes that this picture is quite different from Tintoretto's common works. It is indeed so entirely in its hard, bright colouring, its dry flatness, and, above all, in its touch (in which especially an artist's genuine work is so prompt to declare itself), that we feel confident it is not by Tintoretto at all. Mr. Ruskin adds that it resembles Correggio more than any Venetian painter; to which it may be replied that nothing can be more unlike the work of Correggio.

On the wall beneath it is the "Christ before Pilate," one of Mr. Ruskin's prime favourites. The tall figure of Christ wrapped in long white drapery, such as reminds you something of a winding-sheet, is an impressive figure on a cursory view, but it has nothing whatever of the moral beauty and interest one chiefly looks for, and we fear resembles too much an ordi-

nary man doing penance in a white sheet. In allusion to this figure, Mr. Ruskin says it is "pale like a pillar of moonlight, half bathed in the glory of the Godhead, half wrapt in the whiteness of the shroud." But there are not, according to the best of our powers of perception, any traces of such glory or divineness in Tintoretto's figure; and surely very properly in that hour of trial and humiliation, when our Saviour having, if ever, "freely put off" that glory, submitted himself to the most degraded and dreadful lot of poor, simple, unaided humanity. To represent him as "half bathed in the glory of the Godhead" at such a moment is surely no proof of that intensity or truthfulness of imagination which Mr. Ruskin claims for this painter in his high-sounding, authoritative, theological style; and Tintoretto has, assuredly, fallen into no error of that kind here. What we should first look for, on Mr. Ruskin's own alleged principle of essential and undeviating accuracy is, of course, some touching expression of that real, actual, substantial humanity—some moving picture of as much resignation, loving patience, and dignity as may truly become a man so tried. But of this we get nothing in the present picture, and instead of it (according to the principles which Mr. Ruskin is never tired of enforcing on other occasions, and especially when depreciating Raphael) we are not content to be put off with phantasm similitudes, or evasive effects of "pillars of moonlight," and of mingled glories and grave-clothes, not proper to the immediate matter or moment, however much so they might be as accessories in a representation of other events in our Saviour's history. In taking leave of this picture, we cannot help borrowing its eulogist's inappropriate image, and applying it to his own description—it is altogether a pillar, a tall pillar of moonshine itself.

In the same room is Tintoretto's famous "Crucifixion," in point of invention his masterpiece; a picture of which Mr. Ruskin says that "it is beyond all analysis, and above all praise." "I will not insult this marvellous picture," he says, "by an effort at a verbal account of it. I would not whitewash it with praise." If to describe pictures is to insult them, alas! how grievously has Mr. Ruskin insulted those other pictures of Tintoretto's on which he expatiates with such fulness! And if praise be whitewash, how cruelly has he whitewashed Angelico, Turner, Michael Angelo, and the arcades of the Ducal Palace and St. Mark's Church, and a multitude of other things, which are quite hidden and confused by the glare of his thickly-applied eulogies. But, after all, these expressions of his are perhaps a mere thoughtless rhetorical flourish; at least, one thinks so after carefully studying the picture, and discovering that decidedly moderate terms of admiration suffice for its merits. It is a large work, in which the subject is not treated in the usual way, but altogether originally, with novel incidents boldly conceived, and expressed with so much life and energy that much of the effect of an actual living scene is attained, especially on the first impressions, which are wonderfully striking. The Saviour's cross, in the middle of this very wide picture, rises from its foot, and those to whom he was dearest are assembled beneath, some of them lying huddled together in an exhaustion or trance of grief—somewhat coarse figures, but vigorously expressive. Elsewhere the evil powers of the world are represented as in vehement action. On your left they are drawing up the cross on which one of the thieves is already stretched; it is half up, pulled by a long cord with all the muscular energy of a powerful ruffian. On the other side, the third cross lies on the ground with the other thief seated on it; and one stands over him with a long auger, boring a hole for one of the nails, and another is pulling hard and

* Continued from p. 270.

cruelly at a cord which binds his limbs. Just before them, crouched low on the ground, are two throwing dice for the seamless garment—hideous, reptile-like figures, coarsely and darkly daubed in, as if by the artist's thorough scorn for them. There are numbers of other figures encircling all these—faithful men regarding Christ aloof with tender sorrow, and one nearer, by himself, is leaning forward and gazing on him with a calm but most intense earnestness, which expresses, if we mistake not, the tranquil but full enjoyment of triumphant malignity. Then there are pious dignitaries carelessly looking on, as in some arena, at that event, which, *as they may imagine*, rids the world of a singular character, who was beginning to make himself a little too troublesome. A wan, lurid light shines on the ground, and a very atmosphere of horror seems to prevail around the cross, and there are a fiendish animation and activity in some of the groups which strike the imagination powerfully. A sombre, brownish tone prevails in the colouring, with heavy shades, and vehement, but coarse painting. It is an admirable scenic general conception of the event; but the *event* is almost everything, the *persons* are not much; they will scarcely pass for the persons of Scripture. The St. John looking up at the Saviour, for instance, is a very ordinary Italian, and some of the other saintly mourners are rude and almost grotesque figures. On looking further for pathetic and sublime traits of individual character and feeling you are disappointed.

The figure of Christ himself strikes us as being one of the feeblest parts of the picture, and Mr. Ruskin has strangely exaggerated its effect. In ascribing to Tintoretto an unrivalled depth of imaginative insight into this subject, he praises him for despising vulgar expressions of bodily pain, and for "seeking rather to express the fainting of the deserted Son of God before his Eloi cry, by the repose of the figure and by casting the countenance altogether in shade." The passage is likely to be warmly admired everywhere but in front of the picture, in which, unfortunately, all idea of fainting is excluded by the appearance of life and animated composure in the figure. It seems as if speaking to the St. John who looks up from beneath. Mr. Ruskin goes on to say that "the agony is told by this, that though there yet remains a chasm of light on the mountain horizon where the earthquake darkness closes on the day, the broad and sunlike glory about the head of the Redeemer has become wan, and of the colour of ashes!" Here, again, the words fade lamentably before the picture, for the light is by no means awfully concentrated anywhere, and the pale grey, watery-looking halo round the Saviour's head is so like the tone of the sky around it, and that of many other objects which assist in giving its general complexion to the work, that it becomes exceedingly doubtful whether Tintoretto had any such imagination as that here attributed to him. We think that if he had, he would at least have expressed it with some little emphasis, so as to render it in some slight degree effective; at any rate, this may be said confidently, as an expression of agony it is rendered valueless—quite neutralised by the perfect composure and serenity of the figure itself.

But there is another "thought" in this picture which Mr. Ruskin places at the very apex of his fanciful pile of eloquence, his huge mountain of admiration reared in honour of Tintoretto. In the shade behind the cross you can just make out the man seated on an ass, who is pointing out to the multitude the crucified Saviour with malignant triumph, whilst, as Mr. Ruskin has shown us, the ass on which he is seated is eating the very palm leaves which that giddy multitude but a few days before strewed in his path with Hosannas and shouts

of loving welcome. "A happy idea enough!" one exclaims; "an ingenious, shrewd, satirical, Hogarthian touch, happily significant, certainly, of the fickleness of the multitude, though one can hardly help wishing this fickleness had been illustrated by some circumstance less bordering on the vulgar and grotesque, some incident more in accordance with the sublimest terror and sadness of the event, than this one of the donkey feasting on the remnants of the triumphal branches." Nevertheless, we accept the "thought" graciously, with mild approbation of its ingenuity and cleverness; but when we find it cited in Mr. Ruskin's most solemn, puissant, and authoritative diction, as the master-stroke which must terminate at once all doubts as to the unequalled depth of Tintoretto's imagination, we cannot help seeing at once, very clearly, that the power of mind required to produce this thought, and its value when produced, have been singularly, wonderfully exaggerated. Most of the works of Hogarth, it may be confidently stated, abound in touches at least as significant and ingenious; and if such conceptions, indeed, place Tintoretto as a man of mind on the very summit of the painter's Parnassus, as Mr. Ruskin evidently thinks, surely our own Fielding of the pencil ought to be raised there too, very little or not at all beneath him—an exaltation very gratifying to our feelings as Englishmen, certainly. And it should be added, with regard to this vaunted incident of Tintoretto's, that there is absolutely nothing but the bare conception of it, for the pictorial embodying is altogether coarse, slovenly, and uninteresting.

But surely such fancies as these discovered in Tintoretto (none of them, after all, proofs of any remarkable genius or inventive power) are not the foremost things we ought to expect from great painters. Rather what we first look for from them is the direct expression of thought, passion, and character, beauty and dignity, *as shown in the bodily form and countenance of men and things*. This, this is the pre-eminent and exclusive office of Painting, to which History and Poetry, having said their best, and laying aside their exhausted pens, lovingly and reverentially invite her, as the sole means of rendering the record livingly complete, or the poetical vision perfectly bright and clear, and enriched especially with those mute looks whose eloquence begins to move us when words fail, and of which words yield no account. Were all these conceits of Tintoretto's, so much lauded by Mr. Ruskin, as ingenious as his favourite asinine fancy in the Crucifixion,—the only one amongst them which seems to us to have some slight value,—we would delightedly exchange them all for one direct touch of the more pathetic or sublime emotions of the persons portrayed, such as a higher order of painters had proved to be within the fitting aim of Art, and wanting which, Tintoretto's merely scenic notion of the crucifixion (however powerful and striking of its kind) must take rank with an altogether lower order of conceptions.

But apart from the particular attempts in his chapter on "Imagination Penetrative" to prove that Tintoretto's imagination and general power were of the very highest order, it is continually striking us that the very limited praise to which Mr. Ruskin seems obliged to confine himself whilst describing the pictures in detail, corresponds but ill with the admiration he ever bestows on the master when speaking of him generally. He admits over and over again that the conception of the more exalted subjects is often utterly unworthy, and the merits in these and other pictures are acknowledged to be in the conception or execution of some subordinate part or other: as one seems painted entirely for the glorious downy wings of the angel; another is chiefly to be admired for the

painting of a fig, or olive-tree, or a cloud, or a stone, or "the sublime head of an ass," or for the mystical significance of a colour, or of some other allusion at least as trivial as any we have been mentioning. Sometimes defects in this painter are indulgently ascribed to ill-health, or to a mechanical manner occasioned by too little reference to nature; but sometimes he is conceived to have wilfully daubed vilely from an aristocratic feeling of contempt for the humbler classes of his fellow creatures.

The passage in which this last peculiarity is noticed is remarkable. In the Adoration of the Shepherds—"it seems as if Tintoretto determined to make the shepherds as uninteresting as possible. I believe that this is one of the painter's fixed principles; he does not, with German sentimentality, make shepherds and peasants graceful or sublime, but he purposely vulgarises them,—not by making their actions or their faces boorish or disagreeable, but rather by painting them ill, and composing their draperies tamely. As far as I recollect at present, the principle is universal with him: exactly in proportion to the dignity of character is the beauty of the painting. He will not put out his strength upon any man belonging to the lower classes; and in order to know what the painter is, one must see him at work upon a king, a senator, or a saint. The curious connection of this with the aristocratic tendencies of the Venetian nation, when we remember that Tintoretto was the greatest man whom that nation produced, may become very interesting if followed out."

Without admiring "German sentimentality," we really must be permitted to say that we prefer it to the aristocratic deadness of feeling supposed to be manifested in this very foolish and fantastical way, and which, though passed so lightly over, is surely as fitting a subject for sarcasm. If these remarks are just, the human sympathies of this painter (so paradoxically but so quietly assumed to be the greatest man whom his nation produced) must have been narrow, and ignorant, and dull indeed, and we can the more readily account for his manifest want of power over the tender feelings of the heart, and his treating the most pathetic events of Scripture with little else than wild and dreamy fantasies.

We now see how wild and coarse a latitude Mr. Ruskin allows him in them, from fish-shaped clouds and palm leaves removed to Mount Calvary on purpose to be eaten by the ass at the crucifixion, up to the presence of the devil at Christ's baptism at a moment when surely he would have been neither so bold nor so foolish as to intrude himself. But when Raphael, in one of the noblest and most beautiful pictures in the world, the "Charge to Peter," takes an imaginative license in *his* way—that is to say, reverently offers up to the sacred theme all the tenderness and beauty of expression, and dignity, and majesty, he can bestow on it, and, treating his subject in a poetic or ideal manner, which Mr. Ruskin would have applauded in Tintoretto, departs from the close matter-of-fact rendering of the Scripture narrative, in order to represent with due dignity the establishment of the Petrine supremacy, or of the Roman Church, *according to his own creed* (actually placing the keys in Peter's hands, to indicate that object unmistakably),—this impartial and exceedingly temperate critic stigmatises the work as "infinite monstrosity and hypocrisy," and Raphael's allusion to that erroneous though (we may assume) sincere article of his faith, as "a lie."*

* The Coronations of the Virgin, by Mr. Ruskin's saintly pet, Fra Angelico, are equally "lies"—lies of precisely the same class and character. Mr. Ruskin falls cruelly foul of the "handsomely curled hair," "fringes," and "long robes" of Raphael's figures in this picture, which plain things he stigmatises by the sufficiently inapplicable words, "vapid fancies;" yet when Angelico and

However, we must not pursue this subject at present, but confine ourselves to Tintoretto, and finally follow him to the Ducal Palace, where, from want of space, our sojourn must be briefer than it otherwise would have been. There, in the Sala del Maggior Consiglio, is his "Paradise," which Mr. Ruskin inexplicably considers to be, on the whole, his *chef-d'œuvre*, and "the most precious thing that Venice possesses." It is said to be the largest picture ever painted on canvas, being a little more than 84 feet in width. At the very top sits the Redeemer, bending with a most royal majesty towards the Madonna, who kneels reverently before him: they are both highly dignified and beautiful figures. All the vast space beneath them is crowded—literally crowded—with numbers of the blessed of different ranks and classes; it is estimated that there are not less than 500 of them, supported on clouds and in masses confused and intricate in themselves, yet divided into several stages of concave groups, wreathing under the two supreme figures above, like horizontal vapours curling and travelling along beneath the beams of the uprisen sun; the bright spaces between them in the distance being also filled with crowds of beatified spirits, half merged or lost in light. So far all is nobly imagined; and the whole picture displays a command of artistic resources and an energy in labour, which are certainly highly commendable; but the filling up is far less satisfactory: and these crowds and crowds of figures, sitting and bending and rolling together in the heavens, with but few exceptions, are devoid of expression, character, grace, beauty, or any kind of interest. In Paradise one would naturally look for something of repose, order, and expansive serenity; but here it must be confessed that the blessed are a little in each other's way—they have not even elbow room. Neither are blissful contemplation, nor adoring rapture, nor any of the other infinitely varied kinds of happiness which one may suppose to prevail in Paradise, expressed in any

the other earlier men array the Redeemer and the Virgin like a king and queen of the fourteenth century, in all the really rapid finery of mediæval times, covering them with gold spriggings and Gothic diapers till you are quite nauseated with the barbaric glitter and frivolity, his complacency is extreme, and the censer of his transcendental fancy swings apace till you can hardly help smiling at the wreaths of fantastical vapour which keep issuing from it. For instance, the gaudily gilt curtains of Angelico's Madonna, in the Florentine Uffizi, which are stiff with the most definite Byzantine patterns, are said "to flow with a visionary grace," and a few touches of gold leaf on angels' wings are most preposterously assimilated "to the glittering of many suns upon a sounding sea." To hide his palpable inconsistency in this matter, Mr. Ruskin says that these earlier pictures "had been received as pleasant visions, but the Cartoons of Raphael were received as representations of historical fact." Now this is begging the question altogether. Who that knows anything of Raphael will say that his works were intended to be received as mere accurate representations of historical facts? Why, is it not perfectly clear that he was an idealist as much as any of his predecessors?—one whose poetic imagination was ever adorning his subjects with beauty, majesty, and grace, according to his special and pre-eminent gift. Mr. Ruskin's fundamental error is to delude himself with the notion that Raphael worked from "pride," and without feeling, and in obedience to cold "academic formulae." Such an opinion only shows a partial dulness in the writer's perceptions, or the heat of his prejudices and temper, or both. And with regard, by the bye, to these obnoxious curly heads and Athenian draperies, in what respect are they different from those of the ever supremely lauded Leonardo, or from the draperies and hair of Tintoretto's sacred figures, excepting that Raphael's draperies are beautiful, and Tintoretto's bad—Raphael's hair healthy and vigorous, and Tintoretto's a good deal shabbier, and in less creditable order? But Raphael was the prime corrupter of Art! Did his grace and beauty corrupt Art more than the magnificent ostentation and anatomical power of Michael Angelo, the object of Mr. Ruskin's boundless veneration? Was not Art corrupted rather because those who followed could not comprehend the divine spirit of either of these great men, and contented themselves with imitating their more superficial characteristics or mere effects. It is lamentable that this ingenious man should thus throw discredit upon matter at the serene meridian sun of Art, inevitably to recoil on himself. His caricatured description of Raphael's Madonna is altogether false, ascribing to the painter motives and aims which every one acquainted with his works knows to be quite uncharacteristic of him in every respect, and all this spleen, and want of candour, and unjust, uncharitable attributions of baseness, are put forth on high grounds of religion and morality!

interesting or touching degree amongst these complicated hosts of Tintoretto-creatures; and you soon retire from the further contemplation of the picture disappointed, little interested, and indeed almost bewildered.

Why it should be considered "the most precious thing that Venice possesses," it is entirely out of our power even to guess. In another passage Mr. Ruskin calls it "the most wonderful piece of pure, manly, and masterly oil-painting in the world." We were unable, after several impartial attempts, totally unable to discover the grounds of this last opinion either. The picture does not appear to us by any means a specimen of either first or second rate painting. The blotches of heavy black shadow, the abrupt scattered lights, and the disagreeable ashy paleness of much of the flesh tints, all frequently to be found in Tintoretto's pictures, may be partly attributable to the injuries of time, and partly to the painter's known use of colours as fugitive as what we are apt to mistake for friendship; but the touch, as is also commonly the case with Tintoretto, is coarse and heavy. As a piece of painting, it cannot for one moment be compared with the roundness and living freshness of Rubens, or the exquisite lightness and graceful precision of Paul Veronese, or the crystalline purity of Bellini, or the tender and rich perfection of Titian; not to mention many other painters much inferior to any of these. Mr. Ruskin is acquainted with a vast number of objects and effects in nature (especially landscape nature), and no doubt can accurately decide whether the forms and hues have been accurately copied or not, up to a certain point; but his boundless admiration of such workmanship as this, and of much thick, heavy, bad execution of the Pre-Raphaelites, and we will add, his preposterous raptures at the hard, stiff, painfully-minute labouring of Lewis's last year's drawing, producing with such over lavish means, so thin and poor an effect, may well awaken a doubt whether he yet really knows what good painting is. He tells us somewhere, that since he first discoursed to us on Art, he has devoted ten years of his life unremittingly to the acquisition of a knowledge of the subject. Perhaps in another ten years a still further accumulation of knowledge may modify his views considerably, and induce him loudly to condemn much that he now authoritatively admires—with regard to such matters as we have now been discussing, as well as many others.

Titian's magnificent pictures in the Ducal Palace were, all but one, destroyed by fire the year after his death; but his impetuous rival, Tintoretto, is abundantly represented there. With regard to him, as usual, our admiration for frequent manifestations of extraordinary power, is but too commonly checked and chilled by coarse, heavy painting, and the unexpressive wholly uninteresting character of many of his allegorical or celestial groups, which seem introduced merely as exercises or exhibitions of technical skill, rather than as appeals to our imagination or finer feelings. His frescos, however, in the Sala delle Quattro Porte, on that Sansovinian ceiling of bossy gold and azure, and pale statuary, above Titian's great Grimani picture, and the four splendid marble portals of Palladio—his frescos there still afford glimpses of a magnificent spirit, but, alas! they are falling to pieces and spotted all over by the appearance of the plaster behind them. And of a touching loveliness scarcely in its kind rivalled in Venice, are those four sweet and innocent children reclining amongst the rushes or on the grass, in the corners of the ceiling of the adjoining Atrio Quadrato. They are, we believe, ascribed to Tintoretto, but we have never seen anything else by him like them, or showing so tender an appreciation of infantine beauty and gentleness. Of his

more daring productions, perhaps the finest here is that large oval, of Venice personified by an enthusiastic lady in brocade seated amid the clouds with many deities, in the ceiling of the Senate Hall, whose massy garlands of gilded fruits and flowers, and huge bands, entwined and grasp the picture like the convolutions of some enormous sea-serpent. Some of Tintoretto's figures here exhibit limbs disproportionate and distorted in their most difficult fore-shortened postures. But vigorous conceptions full of genius abound, and especially to be admired, is that long group of figures of geni rising from the sea, like one huge wavy column, with the various treasures of the deep, to present them to Venice, enthroned aloft. This is full of animation and fine aerial movement. Something too much, however, is there in other works by Tintoretto here, of old doges kneeling before unintelligible aerial personages, who express little or nothing but the artist's skill in difficult postures, action, or foreshortenings. It is noticeable, by the way, that most of these same doges (who appear, on the whole, very little moved by all these displays of sacred patronage) are disagreeable, and some of them even mean-looking old men, with shabbily-wrinkled, lunkstering, or even maudlin faces. You could easily fancy that some of them had been worried out of all heart and spirit by the ever dogging civilities of the Ten, the Forty, and the Avogadori: nay, in more than one instance, they look somewhat heavy-eyed and muddled, as if, hopeless of political excitement and pleasures, and thoroughly teased and worn out by all these various yet one-sided antagonistic councils, they had endeavoured too much to console themselves with the wine of Clary and Cyprus, with the deeper satisfactions of the table—turbot from Malamocco yonder, and more sanguiferous dainties from the pastures of the Brenta or Isonzo. Or were they in other instances, in which a hard, sordid eye seems still to glimmer under the ducal beretta, merchants, or bankers, taken from their counting-houses in part repayment of loans made to those who influenced the elections, and also because of a mean spirit which was not likely to give much trouble to the all prevalent oligarchy? Tintoretto, no doubt, has here introduced their portraits with a valuable and highly commendable fidelity; but those aerial beings above them are most tautologically tiresome; and with regard to more superficial matters, the shadows are often so black and blotchy, the flesh tints so yellow or ashy, and the execution, we must say, sometimes so coarse and scene-painterly, that, on the whole, you are again tempted to be somewhat out of conceit with Tintoretto, till you pause in the Ante Collegio, or guard-room, before a picture of his so poetically conceived and admirably wrought, indeed so pleasing in all respects, that you wonder still more at the dull and uninteresting character of so many of the others. Yes, here, *Il Furioso Tintoretto*, leaving ostentatious, barren displays of technical power, has once again had the gentleness and patience to make himself thoroughly agreeable. Ariadne, a beautiful and noble figure, is seated undraped on a rock, and Bacchus, profusely crowned with ivy, advances from the sea and offers her the nuptial ring; whilst above, Venus, her back towards you, lying horizontally in the pale blue air, as if the blue air were her natural couch, spreads, or rather kindles, a chaplet or circlet of stars round Adriadne's head. Here, those who luxuriate in what is typical, may tell us, and probably not without truth, that Tintoretto wished to convey a graceful hint of Venice crowned by beauty and blessed with joy and abundance. Bacchus arising from the sea well signifies these latter gifts, and the watery path by which they came to her; and the lonely island nymph to whom he presents the wedding ring, may be intended to refer to the situation

and original forlornness of Venice herself, when she sat in solitude amidst the sandy isles of the lagune, aloof from her parental shores, ravaged by the Hun or the Lombard. The pale yellow sunshine on these nude figures, and their light transparent shadows, and the mild temperate blue of the calm sea and air, almost completing the most simple arrangement of the colouring of the picture, are still beautiful, and no doubt were far more so before its lamentable fading, occasioned, it seems, by too much exposure to light: you feel quite out of doors, all on the airy cliffs, as you look on it, and almost taste the very freshness of the sea-breeze.

With this picture of "Ariadne," painted with Tintoretto's most delicate, golden pencil, we would willingly have closed these researches, had not our Ruskinian notes urged us, almost perforce, after two works in the Ante Chiesetta—"St. George and the Dragon," and "St. Andrew and St. Jerome," "painted," says the eulogist, "in Tintoret's most quiet and noble manner, and pre-eminently to be admired for their grave yet delicious colour." This we found out to be one more of those wonderful stretchings of admiration which, a week ago, would have surprised us greatly, but by this time, of course, surprise on such grounds was altogether over with us. Oh, what an ungrainly, uninteresting picture is that of the ugly and ungraceful princess seated on the dragon by St. George; and in the other what ordinary saints are those! Nor is the grave colour in either, in our opinion, worthy of the enthusiastic praise bestowed on it. Indeed, we should not have thought it worth while to take the reader into this same Ante Chiesetta at all, but that these pictures afford a somewhat amusing instance of Mr. Ruskin's inconsistent and extravagant way of writing. It will be remembered how copiously he inveighs against the colour brown, which is so much his capital aversion as a prevalent hue with the obnoxious later schools, that when he finds his favourite Dante applying it to twilight shades and dark water, apparently so pleased with it as even to lay on a couple of layers in the words *bruna bruna*, Mr. Ruskin very coolly and quietly assumes that the poet (although the most intensely accurate of bards in his expressions) did not know the meaning of the word he was using, and meant dark grey instead! And then, having jumped at this conclusion, and becoming puzzled immediately that Dante should not have acknowledged the existence of brown at all—his browns being in fact all grey (oh, admirably solid yet modest foundation for the inquiry!), Mr. Ruskin proceeds to relate complacently how "one of our best living colourists" accounted in some measure for the poet's comfortably assumed omission, by telling him that he "had found there was no brown in nature, what we call brown being always a variety either of orange or purple."* But here in the Ducal Palace, in exquisite harmony with all this most sensitive, and, indeed, almost anxious anti-brownishness, Mr. Ruskin tells us that the productions of his favourite colourist—which he admires supremely for their colour—"are nearly all brown and grey," and that "he would rather have these two small *brown* pictures" (we use his identical words) "than all the other small pictures in Venice put together which Tintoret painted with bright colours for altar-pieces."

Now, independently of much admirable and indeed very superb brown in Titian, Rembrandt, Reynolds, and others, we have, no doubt, had too much brown in Art—bad brown especially; and to guard us against a repetition of the excess might have been well enough, but to endeavour, in pages of abund-

antly self-satisfying, janty writing, to seduce us into the notion that there is in reality no such thing as brown in nature, in the face of numberless objects, in spite of the autumnal pomp of solemn groves, and especially of those deep, rich evening glowings, which Dante has, after all, justly denoted by his *bruna*, and which we ourselves well remember to have enjoyed "at evening on the top of Fiesole," under the scarlet clouds of sunset dispersed above the Carrara peaks—this, all this, is simply ridiculous, the mere humorsome partiality of one who himself is but too apt to substitute his prejudices and the exaggerations of his seldom-resting fancy for the plainest and most obvious facts, strict as he is against that fault in others;—a lamentable habit in a critic, surely, whose prime office it is to make distinctions clear, sober-mindedly, instead of confusing, and sometimes burlesquing, the objects under consideration, with the aid of an indifferent style of humour, to the mystification and misleading especially of that weaker herd of followers, unfortunately so numerous amongst us, who are utterly in the thrall of eloquence, and so much more easily convinced through their ears by copious and confident words than through their own proper eyes. How whimsical is his assumed denial of brown by his favourite poet, contrasted with his admiration of his favourite colourist's use of it: how unjust and one-sided his voluminous abhorrence of the gloom and "feelingless mannerism" of the later men, and his toleration or ignoring of so much of similar qualities in his idol Tintoretto, whose frequent blackness, heaviness, and coarseness, are the less excusable, inasmuch as he was, so far as they are concerned, a recreant Venetian, sinning in opposition to his original gift, and with the very finest influences of colour and brightness beaming about him.

Candidly, we cannot help suspecting that Mr. Ruskin, notwithstanding all his ingenuity and extraordinary activity of thought, all his powers of description and analysis, has not quite lit upon his proper vocation. His foremost and prevailing gift we take to be a brilliant but excitable and eminently *fugacious* fancy, such as is ever prone and precipitate to give its own high colourings, from vehement likings or dislikings, and to start away from the object professed to be contemplated, into its own airy regions; a quality, when predominant, fatal to just criticism, whose office is, of course, to present things as they are in themselves, apart from these subjective or modifying influences. Yes, "Memoirs of my Fancy," we venture respectfully to submit once more, would have been better, or perhaps "Fra Giovanni's Pilgrimage," in which these free sallies and soarings of the mind would, in their more successful instances, have possessed a pure and unalloyed value, being modestly submitted as such, and not as descriptive criticism authoritatively promulgated as from a judgment-seat, to exalt one man and condemn another. An awful act, this last, not to be ventured on so lightly; and if done coarsely or wildly, as offensive, no doubt, to the illustrious spirits of those bepraised as to those censured, as Tintoretto's ghost may hereafter in the other world prove to his eulogist, by asking him why he doomed his unfortunate works to disappoint everybody. That chapter on "Imagination Penetrative," in all that regards this painter, we certainly take to be the masterpiece, so far as we know, of imagination predilective, fugacious, combustible, explosive. It is indeed weightily valuable as a psychological lesson, showing how far an excitable, headstrong fancy has the power of ignoring the actual, and substituting the airy offspring of its own likings and wishes. On the whole, we believe that Mr. Ruskin leaves Tintoretto pre-

cisely where he found him, having failed utterly in the attempt to put him forward as an imaginative genius of the highest order; since the thoughts he adduces as entitling him to that eminence are, in fact, either not in existence in his works, or else poor, trivial, or erroneous without exception. Tintoretto will, we suppose, continue to rank just as formerly, as a very energetic, but not delicately or sublimely imaginative painter of the second class—one strong in scenic conceptions, and in the more superficial and decorative resources of his art, but poor, very poor, in the higher requisites of expression and character—a kind of Venetian Rubens in short; not so fleshly coarse as the Fleming, but far inferior to him in poetic fire and exuberance of invention (such as rolls forth as from the very cornucopia of Plenty herself), and also much beneath him, as every other painter is, in rendering in a magnificent manner the very health, bloom, and active pulses of physical life. Indeed, we cannot help wishing that Mr. Ruskin had chosen Rubens for his second stalking-horse instead of Tintoretto. Without being, so far as we are able to discover, in any considerable degree "typical" in his modes of treatment, we believe him to be a far more legitimate subject for the purposes of fine encomiastic writing; besides, he is as little generally understood and appreciated as Turner himself was formerly. A far more fruitful tree than Tintoretto would have been shaken; he would have filled out the splendid robes of eulogy with a portlier grace. How much unappreciated *grace*, infantine loveliness, and sweet and naive human expression, how much magnificence and true poetic fire have been unhapplily concealed from us by his too Belgian delight in lusty health, and bloom, and animal vigour. But should we turn away for ever from all those excellent former things we have just mentioned, and hosts of others, simply because they have become, in a great number of instances somewhat too lusty and fat?

A principal object in this essay has been to put the reader on his guard against inordinate habits of praise on the part of a writer whose confident eloquence gives him for the present a far too absolute influence over large numbers of captivated hearers. We will close our observations with a brief protest against that equally ill-founded censure and depreciation of some of our greatest literary men, in which he indulges in his recent volumes, singling out, especially for opprobrium and contempt, as we shall show, one whom most just and generous men, really acquainted with his works, would be warmly desirous of defending. In these criticisms of Mr. Ruskin, cynicism has assumed its most insidious and mischievous form,—the theological. Having, according to his own admission, passed most of his days in the intense contemplations and abstractions of solitude, he has, by an almost inevitable consequence, weakened in his breast most of the ordinary social sympathies. In the tender passion (to take one large instance) he seems to feel no interest, and very little indeed in those domestic virtues and enjoyments which spring from and surround it; and he has got himself far too much into the way of estimating things in the sour and austere spirit of some mortified anchorite; insomuch that he is dissatisfied even with men whose gracious gift and first object it was to afford pleasant relaxation, restorative amusement, remission from mental care, to their fellow-creatures,—such as our great novelist and dramatist,—simply because they did not utterly spoil their work with brain-fussing, intellect-oppressing, monomaniacal considerations of theology and ascetic morality, such as appear to have grievously narrowed and weakened his own mind. His morbid analysis of Scott, on this ascetic prin-

* Is there no *medium* between this orange and purple? What does the orange become when it begins to deepen in the shadows of a warm toned atmosphere?

cept, in which he says that he "knows no poetry so sorrowful as his," and "that all his thoughts were in their outcome and end less than nothing and vanity," is one of the most mistakenly dismal and nauseating passages in literature, always excepting his half-patronising estimate of Shakspeare, in which our bard of bards is looked down upon from the supremacy of that "specular mount," Denmark Hill, as an imperfect mind, decidedly of a secondary order, also because not sufficiently accompanied by theology in its flights, in Mr. Ruskin's favourite fashion. "It was necessary," we are told, "that he should deprive himself even of his conscience, in order to be able to sympathise so completely with all creatures." In this respect we always thought Shakspeare the most conscientious of writers, inasmuch as he reports of every one with the most perfect impartiality, fulness, and fairness, nothing extenuating, and setting down nought in malice, and giving his worst of villains their due. Had Shakspeare possessed a conscience, it would, we are profoundly told, have made him unjust to these latter: as if injustice were a natural consequence of conscientiousness! Then we are informed that it was necessary for Shakspeare to be "utterly without purpose; that he was forbidden of heaven to have any plans. To do any good, or get any good in the common sense of good, was not to be within his permitted range of work; not for him the founding of institutions, the preaching of doctrines, or the repression of abuses. Neither he nor the sun did on any morning that they rose together receive charge from their Maker concerning such things." To which it may be answered, that to teach us the human heart and character in their varieties, to show by what insidious sophisms our passions attain the mastery over us, to instruct us so that we may know ourselves and others, and enlarge our sympathies to the world's width, and regard our fellow-creatures with such palliations as justice and truth require, was purpose and plan enough, and "good in the common sense of good," such as no other man uninspired ever accomplished. And as he effected this, we need not be disappointed that he, a poet, a literary man, did not likewise found institutions, preach doctrines, or practically attempt the repression of abuses. The passage last quoted, in which Mr. Ruskin with quiet decision alludes to the Creator as having views with regard to the poet in harmony with his own purblind paradoxes, is for modesty, propriety, and what is commonly called good taste, exquisite, and altogether richly characteristic. We think it may be pretty safely assumed, and stated, without presumption, that on the morning when he penned these paragraphs Mr. Ruskin had not "received charge" to criticise Shakspeare.

So far, however, all this ambitious and restless plunging after profundity, which, diving past the pearls and golden sands of the clear deep, does nothing but stir up and fetch aloft gravel and mud from beneath, speaks sufficiently for itself; but, perhaps, not so his harsher and more unqualified attacks on others. If there is anything in his writings to us more painful than the rest, it is the ruthless, cold, and summary way in which he will drag forward and sacrifice the fame and character of certain other departed great men, for the very small purpose of giving point to some austere ascetic sentiment, or of heightening the vivacity of a paragraph. If there is a writer whom we should in former days have conceived to be respected by him it is Shelley, since he himself in some of his best passages resembles him even remarkably. The most poetical of his descriptions, in which the fine landscape imagery is heightened by the colourings of a brilliant fancy, are like faint echoes of the soaring

skylark amongst the poets, the wondrous laureate of the clouds. And yet Shelley is the very poet now most frequently introduced by Mr. Ruskin in his writings to perform the mean office of foil to what he admires, to set off as a dark and impure shadow his own exceeding radiance, and to be morally and intellectually misrepresented in unfeeling and insulting language. Thus we have, without explanation or further comment, "passionate, unprincipled men like Shelley," though Shelley's moral principles are certainly conspicuous enough throughout his works, and at least as gentle, disinterested, loving, pure, and near the true Christian morality in several of the most essential points as those of any of the other poets of his day; whilst amongst them none equalled him in the courage, and few in the perfect sincerity, with which they were put forth. Secondly, we read with no small access of illumination that "Keats has no more real sympathy with Nature than he has with a bottle of claret; and Shelley is nearly the same, but with even more troublesome selfishness." The ardent philanthropist (whether or not mistaken in some points does not affect the question of selfishness), and cordial, helpful, generous friend, is not very sagaciously or temperately denoted by these words, "troublesome selfishness." And, by-and-bye, we have Shelley shown up on Mr. Ruskin's oratorical platform again, to be as briefly stigmatised as impious, though few men have ever felt a more habitual love and tender reverence for most good and noble things, except (as we take leave to lament no whit less than Mr. Ruskin) the doctrinal part of that religion which his unhappy scepticism—something palliated, surely, by the circumstances of his early life—estranged him from. Surely it does not evince much delicacy of moral perception, much justice or charity, to apply to so noble and gentle a sufferer the hard, unmitigated, untender term "impious." Finally—but this is amusing—we find him exhibited in the decretals sent forth from our temporary Vatican of criticism, as an example of a morbid temperament, looked down upon as from a serene superior height, as a mind of the weaker class. Truly, he was so, in some sort, and very pitifully. But the author of the "Ode to the Skylark," and the "Prometheus Unbound," and the "Cenci," should have been designated as such, not frigidly or haughtily, but with the gentleness and tenderness of a deep fellow-feeling by one far more so—by one of so morbid a temperament as to give forth all this thoroughly unhealthy inflammation about Tintoretto—by one so weak that he rarely has the power of describing anything without almost spoiling his description by some touch of exaggeration proceeding from the excitability of his fancy, or nauseating his readers with some hard and austere assumption of a religious tone, in which the elements indispensable to religious writing of any value, such as modesty, truth, justice, and candour, are habitually wanting. It is a religion this with which the fancy seems to be incessantly on fire, but the heart the while appears to remain cold and untouched; indeed, the main tendency of his writings in this respect (like so much of the other religious writing with which our press teems now-a-days) seems to us to be rather to weaken religion in our human hearts, its healthy, active, and happy seat, and to make it restlessly, painfully, consumingly burn in the mere dreaming faculty—the intellect and imagination. Mr. Ruskin is indignant with *Blackwood* for having recommended Keats to return to his gallipots. But is it not better to depreciate even to that extent the literary productions of living men, than thus to cast rude and coarse opprobrium, as he has done, on the moral as well as intellectual character of the voiceless, unreplying dead?

ART-TREASURES AT MANCHESTER.

THE ENGRAVINGS AND ANCIENT ARMOUR.

HAVING discussed the picture treasures of Art in the most modern of our Crystal Palaces at Old Trafford, let it now be our business to bestow some amount of attention on that very important "younger sister of the arts,"—the art of Engraving. It yields in patient dexterity to none, while in its power of disseminating the noblest works of genius among every nation and people it surpasses all; adapting itself, as it does, to the pleasures and the pockets of the humblest votary of Art; enlivening the homes of the cottager even more than those of its wealthier lovers, by touches of beauty, or glimpses of happy life dear to "the sons of toil." No one can see the joy-lit, earnest faces of the Lancashire working men and their wives, as they gaze on the Art exhibited now in Manchester, without feeling that good pictures are moral agents, yet too much overlooked in our English world of never-ceasing work; while the peasant pays his humble quota of honour to the artist who delineates country life so well.

It is perhaps not possible to overrate the great good that the art of engraving has done for mankind. It is to the painter what printing is to the author; it multiplies his unit a thousand fold, and scatters his genius and thoughts over the whole world. These pages would want their pictured comments, and our Journal lose its most useful charm, if we were not aided by the *burin* of the engraver on metal or wood; patient Art-labourers who assist the press in its most graceful mission—that of conveying a familiar knowledge of Art, in all its phases, to the homes of all people.

There is no more curious fact than this, that while the art of engraving can be traced to the most ancient era, the discovery of its power to disseminate itself by printed copies did not occur for some thousand of years afterwards. The ancient Egyptians, before the time of Moses, engraved plates of metal, having lines incised, from which impressions may be printed in an ordinary way by the rolling press; but the means of effecting so simple a process remained undiscovered until the early part of the fifteenth century of the Christian era. The series of engravings so patiently collected at Manchester "begins at the beginning," and very properly commences with a specimen of Egyptian engraving at a period of 3000 years previously to the present era; the plate from which it was impressed being taken by Dr. Mead from a mummy, now preserved in the British Museum. It is the contribution of E. Holmes, Esq., who died while forming this curious collection for the instruction of the Manchester people, and whose death was probably accelerated by his earnest endeavours to perfect it.

The elegant designs frequently incised on Greek mirrors are equally capable of multiplication by the printing press, and many have been so printed in modern days; Roman, Saxon, Norman, and Mediaeval decoration of the same sort may be successfully reproduced in a similar manner; but it was reserved for Tomaso Finiguerra, of Florence, who lived in the first half of the fifteenth century, to create the art of printing from engraved lines on metal. He was a goldsmith, and, in accordance with the taste of his day, was employed in decorating his work with engraving, the lines being filled with a black composition termed *niello*, consisting of copper, silver, lead, and sulphur, which left an appearance on the metal as if an engraving had been printed on its surface. To test the work before this composition was filled into the lines, a cast was taken in clay, sulphur was then melted into the cast, and a perfect counterpart of the original plate taken; a viscid ink, made from lamp-black, was used to fill in these lines, and the effect proposed by the engraver tested perfectly. While Finiguerra was one day thus employed, he noticed that the ink left the clear mark of his engraving on the cloth used to clean the surface of the sulphur, and this discovery induced him to try if the same effect would be obtained by impressing damped paper upon his work. The trial was successful; eventually a thicker and blacker ink was employed,—and thus the art of printing from engraved lines became a new gift to the world.

These early proofs—for such are they—are of

the greatest possible variety; the Manchester exhibition is singularly rich in specimens liberally lent by their proprietors, the larger number being from the collections of R. S. Holford, Esq., and the Rev. Dr. Wellesley, of Oxford. So remarkable a collection of early engravings has never been seen under one roof before; and grim and strange as many may appear to eyes unaccustomed to their peculiar features, there are many traces of noble imaginings in the art that was predestined to multiply the painter's ideas. In some instances we find the painter himself practising this mode of spreading his work, and these autographs—as they may be termed—are of much value. However rude they may be, the master-mind guides the hand, and it is visible in the bold etching of Andrea Mantegna, though wanting the graces of finished engraving.

The Italian engravers seem to have regarded the new art with little consideration; and we must look to the German engravers of the fifteenth century for its popularisation, and for the real establishment of the print-trade. Several practised the art, and with such improvements that beauty, clearness, and depth of line were perfected in their works, though the names of the industrious artists have not descended to our day. Such were the engravers known as "the Master of 1466," "the Master of the Navette," &c.; but it was Martin Schongauer, often called Schoen, of Colmar, and Israel von Mecken, or Mecheln, of Malines, who first made themselves known as engravers by profession. Their first period ranged from the middle to the close of the fifteenth century, when a greater than all appeared in the old town of Nuremberg, a man destined to give the greatest impetus to the art—Albert Durer. This wonderful artist, who combined within himself the knowledge and practice of all the arts,—who could design for goldsmiths, or decorate their works with engraving—paint portrait, history, or saintly legend, and draw and engrave it afterwards, either in metal or wood, or carve in stone or wood figures of the utmost delicacy,—this artist first saw the great power the art of engraving possessed of disseminating design. He devoted himself to perfecting it; and how well he succeeded let the walls of the Manchester exhibition tell. Where shall we find in his own day, or long after, engravings equal to those from his hand? His "Adam and Eve," and "St. Hubert," abound in manipulative excellence; his "Knight of Death," equally fine, is full of the wild imaginings of the German mind, and gave the Baron de la Motte Fouqué the idea of his charming tale, called "Sintram." But it was his marvellous woodcuts that popularised the art of engraving, and spread the fame of the artist over Europe. It is pleasant to look upon the honest, earnest, face of Durer here, boldly delineated by his own hand: how grand and simple too are the few powerful lines upon the large woodcut head of the Saviour beside it; how mystic and strange his first great series of cuts illustrative of the Apocalypse; how simple and true those devoted to the life of the Virgin, and the Passion of the Saviour! They were spread far and wide, and the "divine Raffaele" himself complimented the Nuremberg painter, and exchanged works with him. The Italian artist had an equal perception with the German of the latent power of the art, and he engaged Marc Antonio Raimondi to engrave his designs on copper; he superintended the work, kept the engraver in his own house, and paid all the necessary expenses. From that day forth, engraving, as a fine art, was firmly and nobly established.

There are very many examples of these fine prints executed under Raffaele's eye, by Marc Antonio, in the collection; but one of the most interesting is an unfinished print, which clearly depicts this great engraver's mode of working. It is the allegorical figure of Peace, contributed by Dr. Wellesley, one of the most liberal collectors who have enriched the Art-treasures here. The print was left unfinished, the outline and middle tint only is engraved, and the lighter and darker lines added with a pen, which appears to have been his mode of working. His prints have higher scholastic power than is displayed by Durer; their Art is purer, because imbued with Italian, and not German, sentiment; but, as engravings, they do not equal in clearness and finish the works of the Nuremberg citizen.

Contemporary with Durer, Lucas van Leyden practised engraving in the Dutch town whence he

was named, and copied all the work of Durer. They were soon rivalled by a host of other practisers of the art, and in this collection we may trace its onward progress to the present day, so complete is the gathering at Manchester. Of the "little masters" of Germany, such as Albert Altdorffer, Henry Aldegrever, and the Behams, there are many examples; and never was the art of delicate engraving carried farther than by these patient men; whose works are, however, never deficient in artistic effect, or proper vigour of touch. It was reserved for such engravers as Jerome Wierix, of Amsterdam, and the numerous family of De Passe, of Utrecht, to carry engraving to its utmost pitch of elaboration without destroying its general excellence; their works require a magnifying-glass to fully appreciate the infinite labour which has produced them; but all this labour is properly subservient to a broad general effect: they are not merely works of patience and time—it is Art and labour wedded harmoniously.

Engraving as an art *sui generis*—expressing by line alone what artists express by tint—reached its culminating point at the early part of the seventeenth century, for at that time pure lines were adopted for the entire work; they were never confused in a mass for the purpose of obtaining deep shadow, and they were laid in with strict attention to form, so that the drawing of every object was expressed in every line of the graver. Engraving consequently became an art by itself; it was a translation into another language of the work of the painter—not a mere imitation of his chiaroscuro by a heap of lines. In the works of H. Goltzius, we find the most exquisite examples of this propriety of line, and it would not be possible to quote an engraver who exhibits his art in all its purity more strikingly than he. Each line "tells," and flows over every surface with the most perfect knowledge of its form; his works will bear examination with pleasure for this quality alone, though they are never deficient in boldness or general effect. In Callot we trace the same qualities; and his grotesque imaginings are most powerfully expressed in lines as bold as are his conceptions. Another French artist, Claude Mellan, carried this love of pure line to an extreme; he had the custom of making one line do the whole of his labour, by thickening it in its course. Thus the face of the Saviour, here exhibited, is entirely formed by one spiral line commencing at the tip of the nose, and encircling the entire plate, increasing in its width as shadows are demanded: a certain softness of effect is the result of this method. There is, however, a poverty in the style which had few followers, nor can it be considered but as an artistic eccentricity.

English engraving dates from the reign of James I.; and its earliest professor was William Hole, who studied in the school of the Flemish engravers, and whose works are chiefly remarkable for soundness of line. At this time Elstracke and Delaram were employed in English portraiture, and were succeeded by an English artist, William Faithorne, whose works in this way have never been excelled: to his acknowledged success we may attribute the foundation of a native school of engraving, for it was previously the custom to send to Holland or Germany for such engravings as were required for book illustration. Robert White, George Vertue, and Sir Robert Strange, successfully practised the art from the days of Faithorne until the close of the last century, in company with many minor engravers of portraiture; while Woollet, Bartolozzi, and Sharp, carried the art to the highest pitch of excellence in copying landscape and history.

Artists were not idle during all this time; but availed themselves of the *burin* frequently. There are few of the great painters who have not engraved. Durer is believed to have been the first to discover the art of etching, or corroding by means of acid, lines made on a plate covered with composition—a process by which a large amount of tedious labour is spared. The art was a favourite with painters who wished to translate into lines their designs, and spread their copies. Claude, Vandyke, Poussin, Ostade, Waterloo, Potter, Berghem, Ruysdael, Both, all practised the art; but none with such celebrity and peculiar effect as Rembrandt, whose etchings are among the most coveted (and most expensive) treasures of the connoisseur. The collection is rich in specimens of all these works, and contains some

great rarities. Among the most important is an India-paper impression of Rembrandt's great work, "Christ Healing the Sick," known as "the hundred guilder print," because the artist esteemed it as his best work, and refused to take less money for an impression in his life-time; good impressions would now fetch more than £200, and this proof may be estimated at any assumed value. Of the "Sabre" print, only four are known, and one of the finest is at Manchester. It is exhibited with the subject as cut down to a simple study of a head by Rembrandt himself, and on looking at the original we are tempted to believe that the reason for this was the very inaccurate drawing of the right arm of the figure. Rembrandt printed his own plates, and his great knowledge of chiaroscuro led him to try the effect of leaving shades of ink on the surface of the copper, or allowing it to be deposited on the paper from the "bur" raised by the etching-needle. The curious series of impressions showing the varieties of effect adopted by him in the treatment of one print, "the Flight into Egypt," is worthy of study; while his grandeur of light is strikingly exemplified in "the Resurrection of Lazarus," and his power as a portrait-painter in the noble heads of his Amsterdam merchant patrons.

A new art made its appearance in Holland at the beginning of the seventeenth century—the art of Mezzotint engraving. It was once popularly believed to have been invented by Prince Rupert, who gave a specimen engraved by his own hand to John Evelyn, to publish in his "Sculptura," 1662; and he also allowed Vaillant to engrave his portrait and style him "inventor of the art;" but the honour is undoubtedly due to another soldier, Louis von Siegen, who taught the prince while he served in the wars of the Low Countries. Siegen's earliest work at Manchester is a portrait of Amelia, Landgravine of Hesse, finished in 1657, but he had engraved a portrait of the Queen of Bohemia in 1643. Caspar Furstenberg, a canon of Mayence, was his pupil; and three specimens of his ability are at Manchester; as well as "the Little St. Christopher" by Thomas, of Ypres, remarkable for its moonlight effect; all of which were engraved before the earliest dated work of Prince Rupert, the "Executioner of St. John," which was completed in 1658. The art seems to have been principally practised in the Low Countries, and never reached any great excellence until Mac-Ardell, John Raphael Smith, and Richard Earlom for the first time produced engravings which rivalled in delicacy washed or crayon drawings. The noble series of prints from Turner's "Liber Studiorum" are able exponents of the power and beauty of the art.

Wood-engraving, from the earliest to the latest examples, is also well represented here. The grim old prints from "the block books" of the Low Countries exhibit the infancy of the art. These books are so called from the fact that type and picture were all cut on one block, the size of a folio page, and printed by friction from the surface. They consist of little more than rude outline, until the time of Durer, who may be said to have first established it as a fine art. With him flourished Hans Burgkmair, Lucas Cranach, and others, who were succeeded by Jost Ammon, Solomon Bruard, and many more, extensively employed in book illustration until the middle of the seventeenth century, when the art ceased to be patronised; and although it never actually "died out," was so far forgotten, that on its revival by Bewick, of Newcastle, he was popularly considered as "the inventor of the art." He was certainly the inventor of that style of wood-engraving which imitates painter-like effects, and expresses drawing by touches of the graver; for before his time wood-engraving was a mechanical rendering of lines laid down on the surface of a wood-block by a draughtsman, and a wood-engraver had little else to do but cut away the space between them. It is wonderful to note the power Bewick possessed of expressing, by cutting with his graver in a block of wood, the foliage of trees, the foam of the sea, the plumage of birds, or every aspect of nature; it was a certainty of hand, the result of a deep study of the things he represented; and though his works have been surpassed in smoothness of effect, and carefulness of finish, they have never yet been equalled in vigorous truth. In the 167 specimens of his labours contributed by the Rev. T. Hugo, we see every variety of his peculiar

power, and they are well worth studying. Of his successors in the art, there are many examples; the highest rank is taken by John Thompson, and the living engravers, Williams, Linton, Jackson, and Dalziel deserve due honour, which must be also accorded to Jewitt, the best of architectural engravers.

If we would see the ambitious character of early wood-engraving as regards size, we must go back to the days of Durer, and look upon "the Triumphant Arch of the Emperor Maximilian," which is nearly ten feet in height by nine in breadth; the long views and ceremonies of Venice, after the designs of Titian; or the "Destruction of Pharaoh," engraved by Andreani, of Milan. Very large specimens also occur of chiaroscuro engraving, by which the effect of painting was produced by broad masses of colour deposited from a series of blocks, but it is an art only satisfactory to the eye in modern examples.

The modern masters of the art of engraving are also well exhibited at Manchester—but their works are happily so well known, and easy of access, that we do not feel called upon to dwell, in detail, on their varied excellences; suffice it to say, that the British school of engraving is worthily upheld by its living professors, who may be successfully rivalled, but not excelled, by their continental brethren.

In the opening paper of the Manchester exhibition, published in our June number, we alluded to the collection of armour, as "perhaps the most interesting and instructive division of the whole series of ancient works" contained in the building. Happily for England, its inhabitants have known so little of the practical part of war, since the day of Charles I.,—when Cavalier and Puritan opposed each other with a fury, as if in blood, as in opinion, they were foreign to each other,—that much public interest has never been exhibited in studying collections of ancient armour; nor have we ever had many collectors. Our knowledge of its history and peculiarities is chiefly owing to the late Sir Samuel Meyrick, who wrote two series of volumes on armour, arranged the national collection in the Tower, and collected the extraordinary assemblage at Goodrich Court, his modern antique home on the banks of the Wye, in Herefordshire.

In this, as in all other collections, we must not expect to find very ancient specimens of such defences as were adopted to ensure the personal safety of the warrior. Sir Samuel himself despaired of obtaining specimens earlier than the fifteenth century; but the determined research of other antiquaries has brought to light early examples, which are, however, generally restricted to head-pieces and minor defences. The Earl of Warwick has contributed the most ancient, a heaume of the twelfth century, or of the earlier part of the thirteenth; it was discovered in the ruins of Eynsford Castle, Kent. It is barrel-shaped, with a flat top, and was worn over the iron cap of the knight, resting on the shoulders, and having only a slit across the face for the convenience of seeing. The many curious effigies in the Temple Church, London, exhibit knights in similar heaumes, and they also give the best extant representation of the entire armour of the period, with its ringed chain-mail covering the entire body of the knight, and the long sleeveless surcoat over all.

The next specimen in point of date is the heaume of Sir Richard Pembridge, from the Meyrick collection. This nobleman died in 1375, and this heaume was originally suspended over his tomb in Hereford Cathedral; it is perforated with a series of holes for breathing, but has only the slit across the centre for sight, as in the earlier specimen just alluded to, showing the slow growth of change in warlike defences. Our only guide for the knowledge of arms and armour in the thirteenth and fourteenth centuries are the drawings in manuscripts, or effigies and brasses in churches, as executed by contemporary hands. It is not till the time of Henry VI. that we meet with complete suits of ancient armour, one of which, from the national collection in the Tower, is placed on the south side of the nave at Manchester.

It will be instructive to trace briefly the history of armour up to this time. Commencing with ringed-mail or chain-mail, additions of plate were adopted to cover the knees and elbows about the time of Edward I.; and this led to the further adoption of defences of solid plate for the leg and

arm; then came breast-plates; so that in the reign of Edward III., the knight appeared in the field encased in plate armour, the old chain-mail being only retained for the gussets and gorget, where pliability was necessary. Armour in some degree "followed the fashion," and we can trace whimsical varieties in its form, dictated by a desire to imitate civil costume: thus the suit of the time of Henry VI. exhibits the sharply-pointed toe then fashionable; while one of the glass-cases contains a monstrous specimen of absurdity in a long-toed soleret of the middle of the fifteenth century (contributed by Mr. James, of Aylesbury), which hangs at least eight inches in advance of the foot, and is made to screw on the toes, when the knight was in the stirrup; it is a copy, in a minor degree, of the long-toed shoe then fashionable, which hindered the wearer from walking until its tip was held up by a chain fastened to the leg of the wearer, as narrated by the old chroniclers.

The helmets, bascinets, salades, and other defences of the head, are extremely curious and perfect as a series. In looking cursorily at these quaint old pieces of metal, the ordinary visitor may be inclined to underrate such unattractive things; it is necessary, therefore, to point out their value, by noting that many are unique, and that all, as a collection, are so; for in no public or private armoury is the series so complete as the one now in Manchester, which has been contributed from many sources, and is not likely to be united again for the use of the historic student.

When the knight had been, by general custom, thus encased in armour, the ingenuity of the armourer was exerted to adapt its form to the best advantage, or vary it with the caprice of fashion. Extra defences were also invented to fasten on the complete suit, and portions of the shoulder and knee-pieces were elongated, or turned, to cause a lane to pass off from a dangerous juncture. With the reign of Henry VII., came the great and lasting improvement in plate, free of all fanciful freaks, and really adapted for the best defence of a mounted soldier. But it was exceedingly ponderous, and the knight was immovable in his saddle, looking a mere mass of polished metal, mounted on a powerful Flemish horse, also heavily armed over head, breast, and flank, with similar defences of steel. We can completely understand how a knight, when unhorsed, was at the mercy of his adversary; he lay immovable, to be killed or captured, if, indeed, he did not die by the shock of a sudden fall. No one who has not tested the fact, by encasing himself in a full suit of armour, can understand the difficulty of using the limbs in it, or the stifling sense of dark confinement felt when the vizor is closed over the head. There is also another curious fact in connection with suits of old armour, which is, that they are generally too small for men of the present day; and we have heard from the best authority, that the chief difficulty experienced over the suits obtained for the Eglinton Tournament, was that of getting them large enough for the use of the modern representatives of the knights of the olden time.

When armour had arrived at its greatest pitch of utilitarianism, attention was naturally directed to its enrichment by gilding, engraving, and otherwise decorating its surface. Sometimes it was embossed in high relief, with a series of mythological figures, the shoulders and arms formed into lions' heads, and the suit covered with inlaid work (*damascene*), consisting of elaborate chasing, into which threads of gold and silver wire were beaten: of so exquisite and costly a character were these suits, that the knight now ran a new risk in war, and was sometimes slain that his rich armour might add to the booty of the soldiery. Of such really artistic work we have a very fine example, which belonged to the Duke of Ferrara, and is of the middle of the sixteenth century. The fine effect occasionally produced by a simple form of enrichment may be well studied in two German breastplates, also in the Meyrick collection, one consisting of simple foliation on a black ground; the other, also black, has upon its centre a raised figure, in uncoloured steel, of the crowned Madonna bearing the Saviour, and standing on the crescent moon amid rays of light. It is powerful through its pure simplicity.

It is in the minor articles of the collection that we chiefly find the great artistic beauty of ancient

armour. The old armourers loved their trade, and a convincing proof of it is here in the highly-enriched auvil, formerly used by one of these old artisans, and which is quite as artistic as the armour made by its aid. We may be sure the workman is fond of his art when he bestows his leisure in decorating his tools. But look around on all these glass cases which stand in front of those suits, and the spectator almost loses sight of the fact that what he looks upon were constructed for the grim uses of war or death, and he values them as fascinating pieces of Art-workmanship. Begin with the British shield, with its delicate and peculiar decoration, enriched by embossing, and studded with coral; then look at the ivory cross-bows and saddle, the exquisite gauntlets and morions, the enriched daggers and swords, some with guards, that are marvellous for patient elaboration of workmanship and exquisite invention, and then say whether the art of ornament could be carried farther than is done here.

In extreme beauty of manipulation the steel suit of the time of Henry VI., from the Tower collection, cannot be surpassed. Every portion is worked with the utmost carefulness; no mathematical instrument for modern uses could be more thoughtfully fitted and finished. Indeed, the suits selected from the Tower are all excellent of their kind, and very curious in detail. There is one with a deep skirt of overlapping plate of striking character; and the Meyrick collection contains others, of the time of Henry VIII., in which the slashed and puffed dresses of the day are successfully imitated in metal. The grotesque taste which the Germans always have possessed, may be seen in the bourguinot of steel formed like a conic mask, with twisted moustache; it is of the time of Maximilian of Germany; and the very rare English helmet of the reign of Henry VIII., exhibited by Lord de Lisle, gives us an example of the knightly crest which usually surmounted it, in this instance a porcupine, the crest of the Sidneys: the helmet has been preserved at Peushurst, the old seat of that family, in Kent.

The equestrian figures which appear in the nave aid us perfectly in comprehending the jousts and tournaments of the early part of the sixteenth century, and exhibit all the extra defences of plate to which we have before alluded. One of the suits was made for an Elector of Bavaria, and another equally superb displays the crowned E, adopted in honour of our Queen Elizabeth by some courtly knight of her era. It is of blue steel, richly engraved and gilt, with double borders of graceful intersecting patterns, decorated with the royal rose of England, the badge already noted, and groups of military trophies. But the most interesting historic suits are those made for the sons of our King James I., the Princes Henry and Charles; these fine suits are also remarkable for the beauty of their workmanship, and which there is every reason to believe was by English artisans. It should be remembered that Germany was at this time the great place for the fabrication of arms and armour of all sorts; but Mr. Planché considers we are safe in assigning this suit, at least, to a British workman, inasmuch as the original warrant exists in the State-paper Office for the payment of a portion of the £350 due to William Pickeringe of Greenwich, "master workman," for "one rich armour, with all pieces complete, fairly gilt and graven;" and no foreign suits made before the early death of this prince would fit him at the period when this was preparing. This is the identical suit in which he is painted in the full-length portrait at Hampton Court; it is profusely decorated with the royal badges of England, France, and Scotland, as well as with the letters H. P. conjoined beneath a coronet. This suit, and that traditionally allotted to Prince Charles, are the property of her Majesty, and are of much interest, as closing the series of enriched plate armour which ceased to be used soon after.

The favourite defence of the soldiers in the great civil war was the buff-coat; the great improvement in fire-arms, no doubt, contributed to this. If we look at the splendidly decorated breastplate of Maurice, Elector of Saxony, we shall find its raised arabesque cut through with the pistol bullet which destroyed him at the battle of Sieverhausen, in 1553; plate-armour, therefore, ceased to be regarded as impervious, and a sword stroke might be

blunted by a strong buff-coat. We have two interesting examples of these old defences, one contributed by Lord Hastings, having been worn by his ancestor, Sir Jacob Astley, of Reading; and the other exhibited by Mr. Hatfield de Rhodes, also a descendant of the original wearer, Sir Francis de Rhodes, of Barborough Hall, Derbyshire. Armour for the legs and feet was abandoned in the reign of Charles I., observes Mr. Planché, to whom we are indebted for the arrangement of the Manchester collection;* and by the time William of Nassau landed at Torbay, little remained of the iron panoply of war beyond the breast and back-plate.

In going through the Manchester collections—for we would speak of them in the plural, inasmuch as they embrace a very varied series of very different objects—we must express our opinion of the importance, in an educational point of view, of such combined gatherings from all sources, public or private, for the general good of all. We cannot also help expressing deep regret that in a few months all is destined to be scattered, never to be again grouped in so public and useful a form. We noted in July last the best practical mode of making all this useful in the largest sense of the word, by instructing visitors how to see, and better still, how to appreciate, the things they would see, by the delivery of a series of critical and historical lectures, and the publication of a well-detailed catalogue. The advice has not been acted on, and the consequence is this, that by far the larger number of visitors enter the doors as to a great show, and depart from them with a confused idea of walking till they are tired among a mass of valuable things, which they do not at all understand. The managing committee have thus nullified their own great labours, and having achieved a noble work, have sunk at the moment of triumph, by failing to direct due attention to their own achievement. To many who visit this collection it is a sealed book, and to the workman who can afford his shilling, but will not afford the tax of another after he has entered, to pore over the pages of an unattractive catalogue, it is altogether useless, except as a holiday show. If the managers had hung the walls with Indian shawls, and filled the cases with stuffed birds, "the sight" would have been equally attractive and useful. The very fact that a band of music must be added to the attractions of the exhibition, and draw to its vicinity the larger number of visitors, is the strongest proof of the lax view the managers have taken of their own position.

For ourselves, we have all along felt that too much has been gathered even for due study; that each branch of the collection would have been enough for proper contemplation alone; that the pictures might have absorbed attention enough; that antique Art might have caused a thoughtful desire to penetrate the secret of its constructive beauty; that the history of engraving, and many other things which arise to the mind in contemplating this collection, have not been brought before the notice of visitors in such a way as would instruct as well as delight them. There is no use in exhibiting, if we do not educate. It is no disgrace to many hundreds who enter this building that they do not understand much they see; most men in England—particularly citizens—are absorbed in their own trades, in studying how to perfect themselves in it, and how to support their families—they have no time for other study; and many of the other classes have not been thrown in the way of critical knowledge in many branches of Art here exhibited. All would be grateful for such aid.

It is in no other spirit than that of an earnest desire that the greatest good should accrue to the greatest number that we make these remarks. We have ourselves done what we best might to direct attention to this important exhibition; it is impossible for the most stoical to do otherwise than feel most strongly the value, in every sense, of this great Congress of the Arts, in the palace at Old Trafford: it will be "a bright spot in memory's waste" for years after each portion of the building has ceased to exist in the locality rendered temporarily famous by its erection.

* We have already referred to the obligations incurred by the committee at Manchester to this gentleman; he received much valuable assistance from Mr. Pratt; the results of their labours are among the most satisfactory and useful of the exhibition.

THE ROYAL PICTURES.

THE PRISON GROUP.

F. Bouvy, Painter. D. Desvachéz, Engraver.
Size of the Picture, 2 ft. 0½ in. by 1 ft. 8 in.

FIRMIN BOUVY is a painter of the Antwerp school: he was born at Deynze, a small town near Ghent, in 1822. He met with a very fair amount of patronage in his art till the French revolution of 1848 deprived him of many of his resources, and compelled him to seek out some other channel through which he might develop his talents. This he found in colouring and retouching photographic pictures, and, after a little time, having managed to save some money, and being assisted by his family, he went to Paris, where he is now practising as a painter. From causes with which we are unacquainted, his name has not, so far as our memory serves us, yet appeared among those of the exhibitors in the Paris *Salons*, although he has painted several pictures of good character.

We know not how or when the "Prison Group" came into the Royal Collection: it is, however, signed and dated "Anvers, 1846," so that it must have been painted when M. Bouvy was residing in that city. The scene would lead one to infer that it illustrated some fact of history or incident in the story of the novelist, but it is, in truth, neither the one nor the other: the artist's intention was to personate the different vices and crimes that consign evil-doers to the custody of the law. But it is evident that he has gone back two or three centuries for his characters, and even for the stronghold in which the criminals are confined: it looks exceedingly like the interior of a Spanish jail, or rather like the vault of a church or castle converted into a prison, and the occupants generally appear to be of that nation.

It is not easy to specify by his particular appearance, the precise crime of which each individual has been guilty; indeed, there are two or three faces that certainly have not crime, or at least what men usually regard as crime, written on their foreheads: the female, for example, shows no mark of vice or criminality, and though she has seated herself on the straw that covers the floor of the cell, and seems to take an interest in the gambling quarrel of her companions, she appears in no degree a more worthless character than that of a wandering minstrel, whose only offence, it may be assumed, is vagrancy. The nearest figure is unquestionably a desperado; he is a man against whom prison-bars are not proof: a heavy shot is attached to his ankle for his safe custody. It is not always true the saying, "There is honour among thieves;" that stout, well-dressed fellow, with feathered hat and slashed doublet, whose offence, we venture to state, is that he and some party parted company overnight at the tavern, has not only been cheated out of his money with the dice-box, but his right-hand neighbour has a hand in his pocket to relieve him of the money of which cheating has not yet deprived him. The man in a military garb is an unmistakable ruffian—far more of a brigand than a soldier; thieving has been a life-long trade with him: even now he has made free with the stakes, and bids defiance to those he has robbed. The young fellow standing under the doorway belongs to a class far above the others; what he has done to bring himself within the meshes of the law we can scarcely imagine.

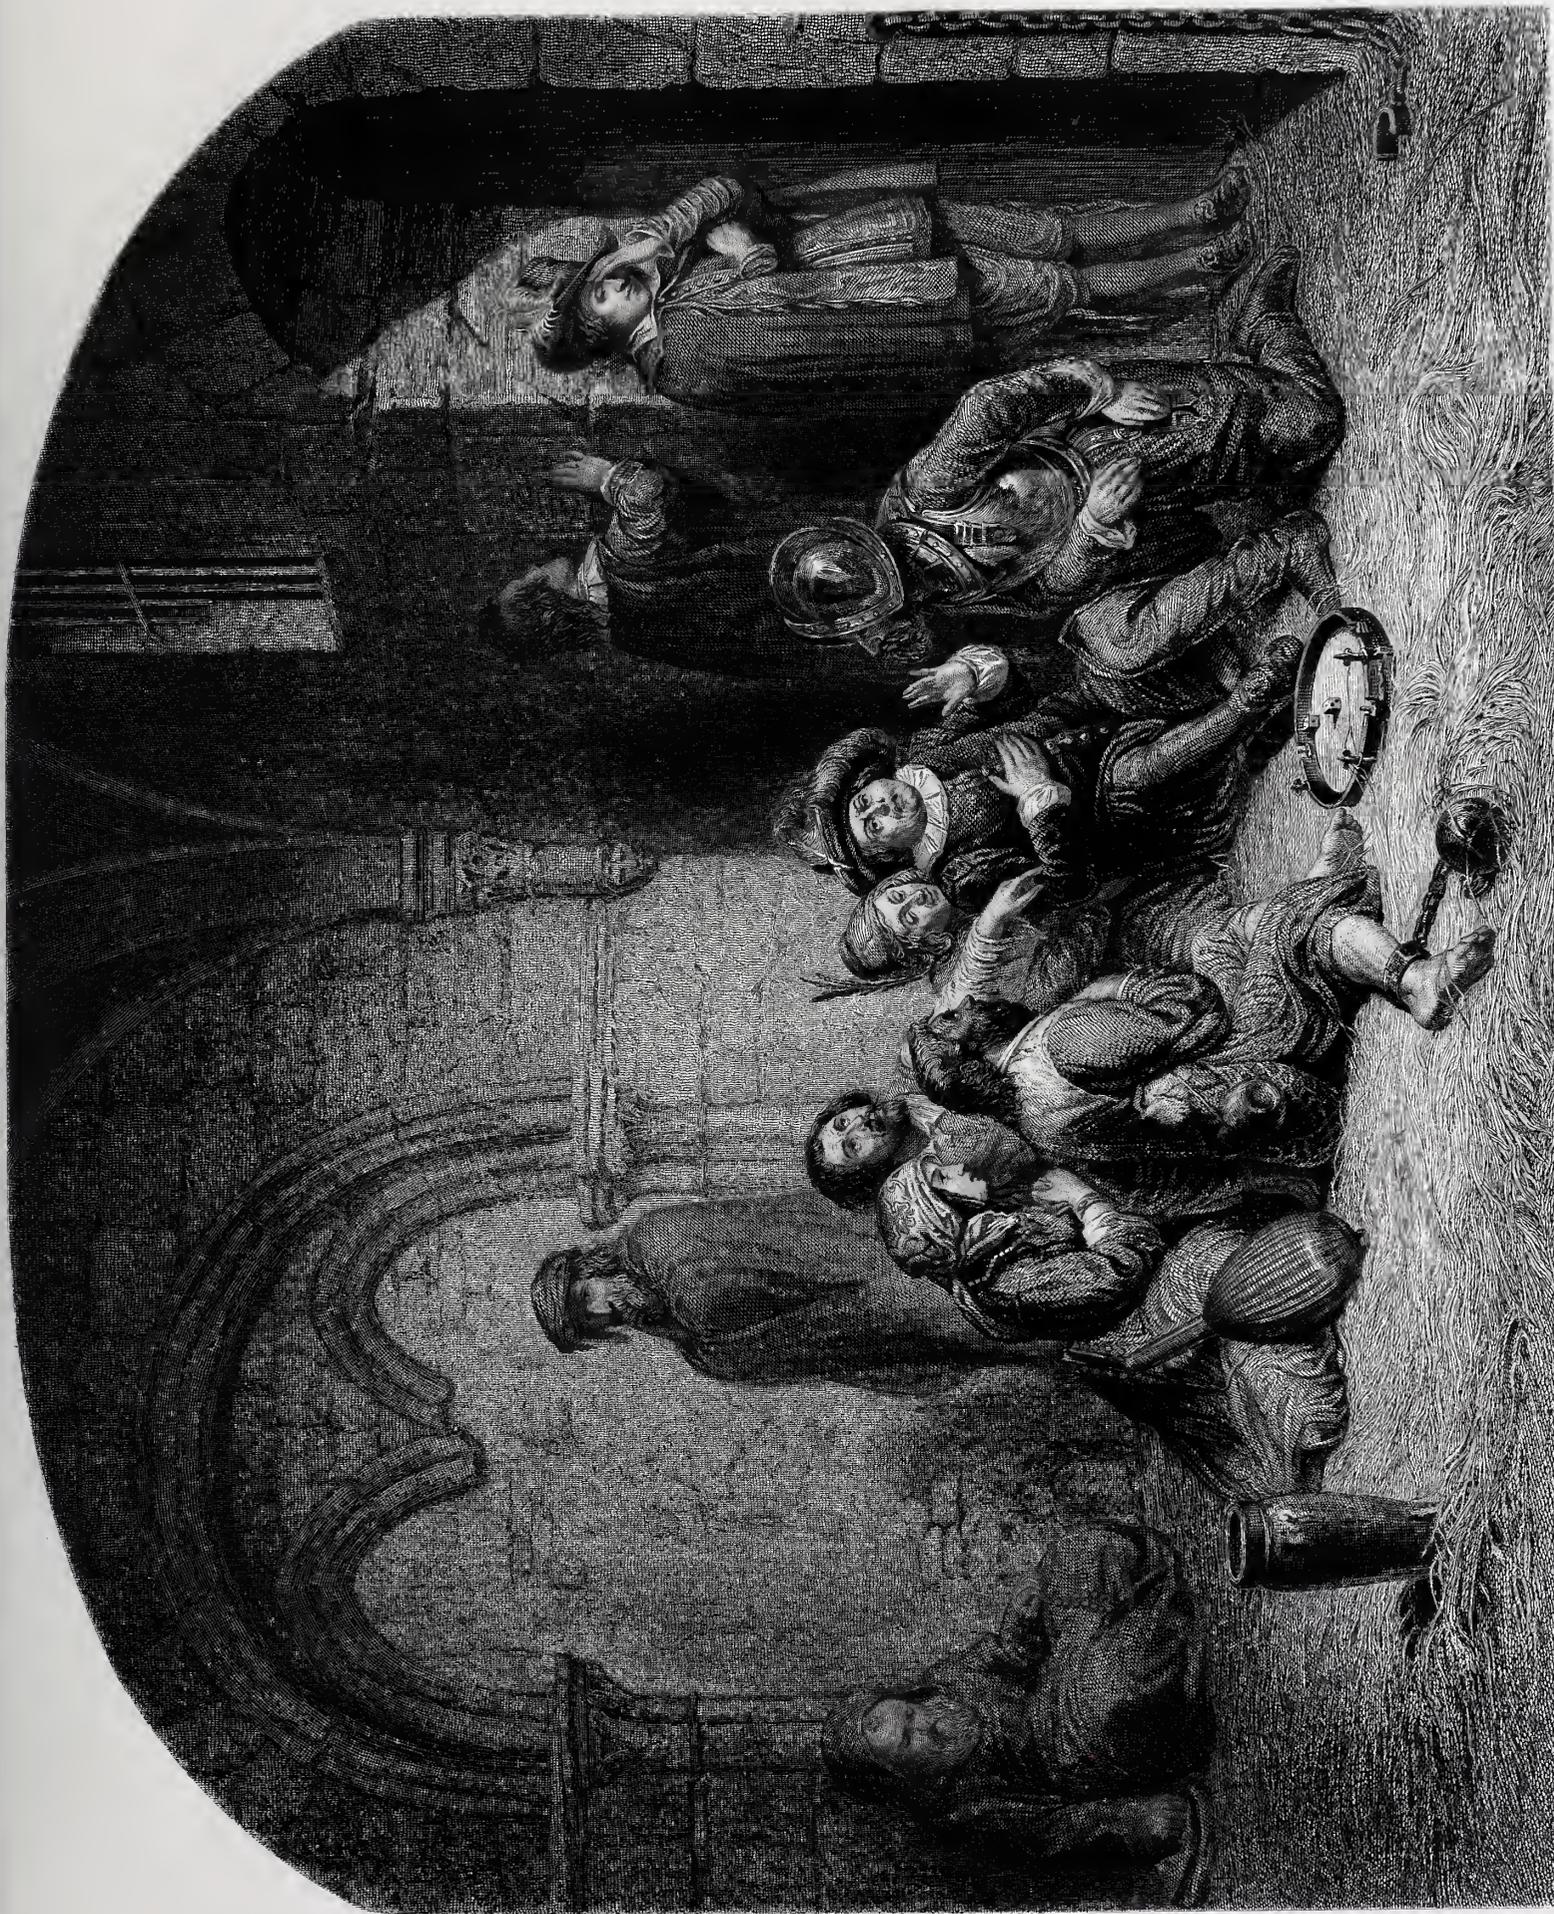

In the opposite corner of the picture is an aged monk, whose term of imprisonment is not of very recent date, else his beard would not have grown to the length it has: it is only charitable to assume that this venerable ecclesiastic has, by the faithful discharge of the duties of his office, given offence to those who have rewarded his fidelity with the felon's lot. If the artist intended one of his characters for a murderer, it can be no other than the figure standing near the monk; he looks the impersonation of every crime enumerated in the Decalogue—the incarnation of the spirit of evil.

It is a clever picture, viewed either as a whole or in its individual parts: the tone of colour is low, though of good quality and in excellent keeping; the manipulation is everywhere most careful.

The picture is at Osborne.

THE NATIONAL PORTRAIT GALLERY.

As our readers already know, the second annual vote of the very moderate sum of £2000 towards the formation of a collection of the portraits of illustrious men, gave rise to one more display of that false economy which would shut up all the Art-issues of the national purse, and that angry polemic which fights on the stumps of an argument after its legs are cut off. In vain did the Chancellor of the Exchequer point out, that this vote was the consequence of an address to the crown, a message from the Queen, and a cordial determination of the House of Commons itself; and in vain did Mr. Ingram strive to tempt Mr. Spooner by the prospect of a future place for himself in the Portrait Gallery:—Mr. Coningham, Mr. Drummond, and others,—each from his own very different point of view,—would have had the house once more reverse its own decision, and proceed to its not unfamiliar occupation of undoing all that had been done in the matter. The value of the arguments adduced may be illustrated by one of Mr. Drummond's, which only wanted turning inside out to be a good argument:—and this Mr. Hope did for it. Mr. Drummond had found "in one place, in the house of the representative of three great historical families, a number of portraits, lying on their faces, in a chamber over a stable. They had been there thirty years, and he supposed were there now." Mr. Hope thought, that if old portraits were hid in stables, it was a very good argument for a gallery like this to rescue them,—and that the public might as well have an opportunity of looking at pictures that were lying face downwards. We think so too, and have used, our readers will remember, something like the same sort of argument before. We, and they, took so large an interest in this project when it was first started, that they will doubtless like to know, through us, from time to time, how far the arguments which we then advanced in its favour maintain themselves in view of such progress as has been made towards its fulfilment. As we have said, we are not quite satisfied with all that has been done, or all that is explained:—though there is already something to indicate the success, and the kind of success, which we anticipated. Our prediction, that a gallery like this, once initiated, would be sure to grow by donation, has been even thus early verified. The late Earl of Ellesmere made a gift of his famous Shakspeare portrait known as the "Chandos;" and Mr. Disraeli stated to the house, that "a number of valuable portraits had already been presented, both by families and by individuals." He added, in general terms, that the number presented was "almost as many" as the number that "had been purchased:"—and here it is that we find, or fancy we find, some ground of dissatisfaction. On the most sanguine view, the liberality of individuals can scarcely have exceeded what *should* have been the action of the national commissioners,—the number of gifts to the country can scarcely have been more than the acquisitions which they *should* have made,—if they have been true to the reasonable conditions of their commission. The portraits presented will, in nearly all cases, have a value of a kind with which the commissioners of an historic portrait gallery have nothing to do,—their value as originals, or their value as works of Art. In laying the foundations of an institution like this, with a limited grant, copies only are compatible with anything like immediate public action; and copies fulfil, as we have said, all the purposes demanded. Mr. Disraeli stated vaguely, that the collection was proceeding,—that what had been as yet got together were temporarily deposited in a house in Great George Street—and that, when a sufficient nucleus had been formed, they would be exhibited to the public. Now, as we have said, with the £4000 already in their hands, and the supplement of private donation, the commissioners should be in a condition, ere long, to let the public see a result, if they have used the money and used it wisely.—It was very satisfactory to the views which we entertain, to find the Chancellor of the Exchequer stating to the House of Commons, that the portraits are intended to form a future portion of the National Gallery,—when the House shall let us have a National Gallery of such dimensions as will make arrangements of the kind possible.

THE PRISON-GROUP

FROM THE PICTURE IN THE ROYAL COLLECTION

BRITISH ARTISTS:
THEIR STYLE AND CHARACTER,

WITH ENGRAVED ILLUSTRATIONS.

No. XXIX.—GEORGE LANCE.

VARIETY in a gallery of pictures is as essential to true and unwearied enjoyment as is variety in landscape or in a garden of flowers: it is necessary as a relief to the eye and to the mind. What can be more monotonous than the contemplation of a number of paintings all of which belong to one class of subject, though differing perhaps in treatment and in colour? and what interest would one feel in a garden decked with the most brilliant flowers, yet all of a similar kind, in comparison with that wherein grow plants diversified in hues, in form, and in size? The sky in its broad expanse of unchequered azure is very beautiful, but how much more beautiful when at morn or even it is mantled over with clouds tinted with innumerable colours from the rising or setting sun? in

truth, there is little either in Art or Nature so lovely and enchanting that it does not gain something by contrast and opposition. Undoubtedly, in the picture-gallery, in the landscape, and in the garden, each visitor will be attracted by what pleases him best, or what is most congenial with his tastes; yet he cannot be altogether indifferent to other objects of beauty or excellence which by their presence help to constitute a magnificent whole, or by contrast heighten the charm of what is most delightful and agreeable to his sense of gratification.

Hence, to apply the foregoing observations to the subject immediately before

us, pictures of fruit and of flowers, though too often erroneously considered as a second or third-rate class of Art, have a relative value in a gallery beyond that which may belong to the excellence of the works themselves. All Art is valuable that teaches, edifies, or affords pleasure; all Art is great that is worthy of the intellectual powers, that helps to humanise and refine; and greater still, when it lifts the heart upwards in thankfulness to the Source of all the beauty and all the blessings we enjoy—when it is made the symbol of mercies, the type of eternal goodness. And are not fruits and flowers indicative of such goodness—gifts of love and kindness? why then should the painter of these “rich and rare gems” of nature, the flowers, or of those productions, the fruits of the earth, so welcome and refreshing to the taste—have an inferior position in the scale of artists? so inferior, in the judgment of some, as to be recognised as little better than a decorator: we must record our strong protest against such a verdict; it is not founded on evidence that commends itself to feeling or reason—not based on facts that come, or ought to come, within the knowledge of us all.

Since the time of the old Dutch painters no artist with whose works we are acquainted can be compared, as a painter of “still-life,” with George Lance; while, in fact, his pictures will bear comparison with any of the same class, whensoever and by whomsoever produced: his “fruit-pieces,” which are his “speciality,” have never been surpassed in luxuriance and richness of colour, in truth, and in effective and most harmonious grouping. Lance has much to answer for in the covetous desires he calls forth every season in the crowded rooms of the Academy on a hot July day: who has not longed to quench his thirst with the refreshing juice of that bunch of “black Hamburgs,” so alluringly offered to the sight? or with a slice from that magnificent melon, already deprived of one of its sections? or with that downy peach, on which a wasp has settled and begun to feast? or the purple plums or ruddy cherry? These are fearful temptations to covetousness in a heated exhibition-room, and might be made to plead a justification, if anything could, for an infraction of one of the commands of the Decalogue.

George Lance was born, on March 24, 1802, at the old manor-house of Little Easton, near Dunmow, Essex. His father, at the time of his birth, held

Engraved by J.

HERONS FIGHTING.

[J. and G. P. Nicholls.

the appointment of adjutant in the Essex Yeomanry, having previously served in a light cavalry regiment; his mother was the daughter of Colonel Constable, of Beverley, Yorkshire. After residing several years in that ancient mansion, the yeomanry staff was reduced, and Mr. Lance's family removed to the neighbourhood of London. Lance, even at a very early age, showed a strong preference for pictures and picture-books over all the ordinary amusements of childhood and boyhood, and never felt so happy as when engaged in attempting

to imitate what was before him; his great ambition was to be an artist. His friends, however, not altogether coinciding with his desires, sent him, when he had reached a suitable age, down to Leeds, and placed him there in a manufactory conducted by connexions of the family. It was a sad disappointment to the boy, and greatly depressed him; moreover, his constitution was naturally delicate, and this overthrowing of all his hopes and anticipations of future greatness as a painter by no means tended to strengthen his body or to com-

pose his mind. His Yorkshire friends soon found out that they had not "the right boy in the right place," and recommended his parents to remove him from the factory and the desk, and to allow him to follow the bent of his own inclinations: their advice was taken, and he came back to London.

The first consideration with his parents was to find a suitable master for their son, and one whose terms would be moderate, for the circumstances of the family though good were not affluent. This, at that period, was not so easy a task as it would now be: good teachers of Art, forty years ago, were very rare; even at the present day, though we have many excellent artists, the number of good masters is comparatively few—so difficult is it for a man to teach others what he knows himself. But young Lance relieved his friends of such a responsibility by choosing one for himself, and in a way so characteristic of an enthusiast that the story is worth telling. Walking one day through the streets in the neighbourhood of the British Museum, without any definite purpose,—though it may be presumed his mind was tolerably full of the future,—he turned into the Museum, wandering through the apartments till he reached that in which the Elgin sculptures were then placed. Here he saw three young men drawing. He mustered up courage enough to approach somewhat closely, and saw in the respective corners of the sketches that each had just finished, the name of the draughtsman, to which was added, "Pupil of B. R. Haydon." Looking eagerly at the faces of the three students to ascertain which of them would be most likely to give a kind and sympathetic answer to any remark he might make, he at length, though with some misgivings as to the result, addressed himself to one, on whose cartoon drawing was written the name of Charles Landseer, the present Academician. "Will you be kind enough to tell me," said Lance to him, "on what terms Mr. Haydon receives pupils? and do you think he will take me?"—"You had better go and ask him yourself," replied Landseer, curtly, but in a very friendly tone. The boy—he was then under fourteen—thanked him very heartily, and Landseer continued,—"Go in the morning, and go early."

Accordingly, early the very next morning, Lance knocked at the door of Haydon's residence, and with no slight trepidation, we dare say, for Haydon was at this time in the height of his popularity, and the young aspirant knew it well. In a few moments he was ushered into the private room of the great man, and stood before him, as a relative of Lance's once described the scene to us,—"*Jacket, frills, corduroys, and all, looking more pale, more delicate, and more childlike, from intense anxiety, than was his wont,*"—and without a single line of introduction. "Well, my boy," asked Haydon, after looking intently at him for some minutes, and expecting him to announce his business, "and what do you want with me?"—"I am anxious to become an artist, sir, and want to be one of your pupils; I am come to ask your terms, if you will receive me."—"Terms! my good little fellow; when I take pupils I never look at their father's purses: bring me some of your latest drawings, and if I think they give promise of future success, I will do for you, as I do, and ever have done, for all those who study under me, *take you for nothing.*" When Lance has spoken in after life of this interview, he confesses he has no recollection of the manner in which he reached his home; he might have been carried thither on angels' wings for aught he knew to the contrary; it was enough for him that he felt Haydon was to be his master. Two or three days only elapsed before he commenced, under the guidance of that gifted, kind-hearted, but impetuous man, a term, extending through seven years, of severe, but interesting and valuable study, from the antique, from the life, in anatomy, and in architecture, both at the Royal Academy and at home. Aided by the

advice, and stimulated by the encouraging remarks of his master, Lance's prospects of advancement now rapidly brightened; his cartoon drawings were often highly commended by Haydon, and his copies of the antique elicited the praise of the venerable Northcote. At length he was considered to have made sufficient progress to undertake a picture; a subject was selected from the "Iliad," and the composition sketched out; but prior to the commencement of the painting it was deemed advisable, for the purpose of acquiring more complete mastery over his materials, that he should improve his execution by copying, from nature, objects of "still-life." Accordingly he composed and painted a group of fruit and vegetables, with which the late Sir George Beaumont was so pleased, that he at once expressed a desire to purchase it. The success of this work induced the artist to commence another of a similar kind, which became the property of the late Earl of Shaftesbury, who gave a commission to the painter to execute, as a companion to it, a subject composed of figures, animals, and still-life. Shortly afterwards the Duke of Bedford requested him to paint two large pictures of fruit only, but to contain specimens of every fruit grown by English horticulturists; these were to adorn an elegant kind of summer-house, erected in the grounds of Woburn Abbey, for the especial purpose of

entertaining therein William IV. while visiting the duke. Henceforth the career of Lance was marked out, and his prosperity continued without interruption, save during a short interval of time, when ill-health compelled him to quit his studio; and thus the heroes of Homer, classic lore, and all imaginations of what is generally regarded as "high Art," gave way before the constant and almost overwhelming influence of his success as a painter of still-life. Haydon was at first much disconcerted to find his pupil had become so eminent an artist in this department as to make it improbable that he would ever venture upon the uncertain future of historical painting. "Lance, my lad," he once said to him, "it seems a pity to cast off the nobler walk of Art, but I am so convinced you will have no competitor in that you are now following, that I feel I should do wrong to Art and yourself, if I said one word to deter you." And who will say that Lance did not act both wisely and well? he has proved himself a consummate master of the art which it is evident nature intended him to follow. For a period of nearly twenty years he has had, each season, a "horticultural exhibition," both at the British Institution and the Royal Academy, and has borne away the principal prizes, no other "grower" being able to compete with him; and his pictures of the

MELANCTHON'S FIRST MISGIVING OF THE CHURCH OF ROME.

[J. and G. P. Nicholls.

feathered tribes, "beautiful in death," are incomparable,—such, for example, as the "FIGHTING HERONS," here engraved, and the "Dead Peacock" exhibited this year at the British Institution; how much of the poetry of Art is manifest in both these compositions!

There are few collections, of any note, in England which do not contain one or more specimens of the works of this painter; we have already mentioned some of his earlier patrons, and to this list may be added, at later dates, the names of Lord de Lisle, Sir J. Wigram, Mr. Vernon, Mr. Sheepshanks, Mr. T. Baring, Mr. Forbes, Mr. W. J. Broderip, &c. &c., as those of his most eminent patrons. During his career he has painted about four hundred pictures, and found eager and expectant purchasers for them all.

But his labours have not been entirely restricted to those subjects with which his name is most closely associated. About the year 1836, having an interval of what he calls "spare time," he resolved to occupy it by painting a historical subject, with the view of submitting it in competition for a prize offered by the Liverpool Academy for "the best historical picture of the season." The result was his "MELANCTHON'S FIRST MISGIVING OF THE CHURCH OF ROME,"

engraved on the preceding page; to this work the council of the Liverpool Academy awarded the prize, no little honour to an artist whose practice hitherto had almost been limited to fruits, gold and silver flagons and dishes,—by the way, we remember, many years ago, some wonderful imitations of these latter objects, painted by Lance from the originals, manufactured by the once celebrated goldsmiths' firm of Rundell, Bridge, and Co.,—vegetables and feathered fowl. The "Melancthon" picture was purchased from the exhibition-room by Mr. George Holt, a wealthy merchant of Liverpool; it now occupies a prominent position among the Art-treasures collected at Manchester. The title of the work almost declares the subject, although we are ignorant of the historical source from which the artist has drawn it, for we have no recollection of reading that the young German reformer was ever domiciled in a monastery, as he is here represented; however, Lance no doubt has authority for the treatment adopted. Melancthon's first misgiving arises from his discovering the prior of the convent in a sound sleep after partaking heartily, as it would seem, of a feast of good things, an indulgence totally inconsistent with the prescribed self-regulations of the Romish Church. It is in every way a clever picture, both in composition and execution.

The success of this picture led to others of a somewhat similar character; it was followed by "The Village Coquette" and "The Lady in Waiting," both painted for Mr. Broderip, and "The Biron Conspiracy," painted for Mr. Vernon. The last-named picture is, perhaps, the best work of historical character which

the artist has painted: to describe it, as well as to express our estimation of its merits, we cannot do better than repeat the remarks we wrote when it was exhibited at the Academy in 1845:—"In the place of a title an explanatory passage is substituted, describing the subject, which could scarcely be done in less space than is here given to it, since the theme is neither matter of state history, nor an incident which points to anything beyond the immediate action. It is a gorgeous production, and of a style more elevated than anything we have ever seen by its author. It represents the receipt, by the Marshal Duc de Biron, of a letter from the Duke of Savoy, urging him to betray his sovereign and benefactor, Henry IV.; to which requisition he is about to consent, when his sister, the Countess de Roussy, reminds him that the king saved his life at the battle of Fontaine Française. The Marshal is here seen crushing the missive and spurning the proposition: he is standing equipped in a superb suit of armour, of that period when the jambes were laid aside. The composition abounds with objects which are painted with the known skill of the artist in still-life."

One of his finest works, combining as it does figure and still-life, the former occupying so much of the canvas and so large a portion of the interest of the composition as to render it something more than a fruit-piece, is "THE SENESCHAL," one of the illustrations here engraved. This picture is one of four which decorate the noble dining-hall of Sir S. M. Peto's mansion, Somerclayton Hall, near Lowestoffe; the other three are respectively by Sir E. Landseer, Stauffield,

Engraved by]

THE SENESCHAL.

[J. and G. P. Nicholls

and Herbert. We have heard that Lance received £800 for his work, and a letter of commendation from his patron, which, from our personal knowledge of the artist, we will venture to affirm was as gratifying, if not as welcome, to him as the cheque that accompanied it. This act of patronage led to others of equal liberality from Mr. H. W. Eaton, of Princes' Gate, Mr. Betts, of Prestou Hall, near Maidstone, Mr. Leech, Mr. J. M. Rendel, and Mr. J. Earle, all residing in Kensington Palace Gardens. This last gentleman, one of Lance's most valued friends, possesses what the painter regards as his "best cabinet picture;" it is now at Manchester.

We have no room to enlarge upon the works of this popular and admirable painter, nor to remark upon the "Velasquez Controversy," with which his name was so mixed up some few years back; but before concluding our notice, we must repeat the substance of a question we put when writing of Harding last year, and ask, "How is it Lance is not in the Academy, not even as an Associate?" These are matters which the world outside the temple of Art in Trafalgar Square cannot understand. We find his pictures occupying honourable positions in the public galleries, side by side with those of men who are entitled to place cabalistic letters after their names, and we know also that his pictures are coveted and possessed by the most enlightened Art-patrons of the kingdom,

who value them as highly as any work which Academician or Associate ever painted: he is a gentleman, a Christian in the highest sense of the word, and an artist unrivalled in his *time*, and yet though his name has appeared on the list of candidates for admission during very many years, there seems to be as little expectation now of seeing him elected as there was upon the day when he inscribed his name in the book. If Lance's Art be considered by the Academy "low Art," we regard it as so high that few of its members can reach it, as colourists, or possess a more intimate acquaintance with all those laws of colour and of light and shade by which the most beautiful combinations are produced. Besides, are the rich and luscious fruits of the hothouse and garden—presuming Lance had never painted anything else, and his figure subjects are very numerous—lower in the works of creation than dogs and horses, sheep and cows? and if not in Nature, why should they be thought so in Art?

There are two painters whom Lance is proud to call his pupils, and who are themselves proud to acknowledge him as their master—the one is W. Duffield, fast rising into eminence as a painter of "still-life;" the other John Gilbert, who, as we remarked the other day in our notice of him and his works, says that all his knowledge of colour was acquired from the instructions of his preceptor.

MONUMENTAL COMMEMORATIONS.

MONTH after month is adding, each, its new and touching chapters to that graceful but melancholy volume which is to write, in brass and marble, the sculpture-history of the late brilliant but deadly war.

A MONUMENT TO THE MEMORY OF CAPT. LYONS, the gallant son of our Crimean admiral, Lord Lyons, has recently been placed on the south side of St. Paul's cathedral. The work is from the chisel of Mr. Noble. Capt. Lyons was killed on board his ship, the *Miranda*, which he led in a night attack on Port Constantine, on the 15th of June, 1855; and on the large tablet which forms the monument, the *Miranda* is carved as in the act of assaulting the battery. The national flags of England, France, Sardinia, and Turkey, wave round the medallion which keeps the features of the hero for futurity, intermingled with branches of oak and of laurel. Nothing can be more simple than this marble record; and its simplicity is matched by that of the inscription, which tells how the memorial is erected, "in deepest grief, by the officers and ship's company of her majesty's ship *Miranda*, who had served under the gallant officer in the Baltic, White Sea, Black Sea, and the Sea of Azoff."

This touching page in the sculpture Book of the War will be followed, ere long, by a chapter of loftier tone, though kindred spirit,—that of

THE GUARDS' MONUMENT.—The money subscribed for the memorial proposed to be erected to those officers and men of the brigade of Guards who fell during the same contest, has reached the amount of £3000; and, with this sum in hand, the committee applied to certain English sculptors for models in competition for the work. We have already stated, that permission had been obtained for the erection of this monument in Hyde Park;—and the site now determined on is, we are given to understand, that which immediately fronts Grosvenor Gate. The materials to be employed were, by the conditions of the competition, limited to granite and bronze:—the bronze to be supplied gratuitously, by Government, to the successful artist. In this case, therefore, we should expect an important addition to our public monuments. Is it only to be hoped, that the desire for the showy and euphatic, which is not unnatural to a body of military subscribers, and is slightly indicated in some of the demands of the committee, may have been duly controlled by that artistic element in the judicial authority to which the committee themselves very wisely appealed. We say this, because, in some of the models sent in, the competitors did not, as we know, escape the temptation to cater for this assumed professional bias,—and there has been some danger that exaggeration should prevail over the language of pure and expressive Art. The model chosen to be executed is, as we announced last month, that of Mr. Bell; and the pillar, or obelisk form, to which, as we said, it is to be referred, while it adopts the trophy character, admits of any quality of Art accessory which the genius of the sculptor has at command.

There is something affecting in the sentiment of brotherhood that determines these demonstrations of the several share which each corps in the service has in a common grief:—a sort of family tenderness adding its grace to the other graces that mark the memorials raised by each distinct body to its own lost brethren in arms. The Guards' Monument will be followed by a

MONUMENT TO THE WELSH FUSILIERS; and the town of Swansea has been chosen as the scene of its erection. As at present decided, the Guildhall Square is pointed out as the immediate site on which it can be most advantageously placed; but, as the design of the monument has not been definitively settled, this arrangement is subject to possible change. The present idea is, to have a monument about thirty feet high, standing on a base of some twenty feet; and, as in the case of the Guards' Monument, it is intended to include officers and men in one common record of glory and regret.

To these Crimean memorials, it is not out of place to add a paragraph or two on the military honours that were reaped on older fields. Mr. Foley's

COLLOSSAL STATUE OF LORD HARDINGE has been exhibiting in the court-yard of Burlington House, to give the public, as we announced, an opportunity

of seeing it previous to its departure for India. The statue is, we have said, equestrian,—and intended, of course, to commemorate the services of the late commander-in-chief more especially in his character of governor-general in our eastern empire. It will stand on a granite pedestal, occupying a site close to the Government House, in Calcutta. It may be interesting to state, that the horse is a portrait, as well as the man;—Lord Hardinge being mounted on his famous Arab charger "Mecanee," which bore its master through the battles on the Sutlej,—as it had previously borne another governor-general, Lord Ellenborough, through the fight of Maharajpore.

Finally, we may mention, amongst these tributes to the sword, that, besides all the Wellington monuments which have been exhibited in Westminster Hall, Mr. John Bell has executed another, to which he gives the title of

PEACE AND THE SOLDIER'S RETURN.—It is intended to be executed in bronze and granite, for the open air,—and may now be seen in the museum of the Department of Art at Brompton. The Duke is represented on his horse, Copenhagen; and other sculpture figures and incidents are employed in the constitution of a tribute to his memory.

While the above memorials of wars but recently brought to a close are starting into being throughout the land, at the bidding of the living hearts that are yet aching for the dead whom they commemorate, certain parties amongst us have suddenly bethought them that England has no monument to a soldier who laid the foundations of empire, with his sword, one hundred years ago. It may be, that the zeal with which the national heart has just now betaken itself to this modern monumental chronicling, has helped it to remember that there are ancient blanks in the sculpture record which imperiously demanded filling up. Certainly, England has been not a little capricious in the distribution of her honours of this kind, even to those of her sons whose title to them has been earned "at the cannon's mouth." Long ere the hero of her Peninsular war died, he could not look out of his own windows without catching some bronze reflection of himself, in person or in attribute:—while fifty years after the death of another actor in the same great series—the mightiest name in the long list of England's naval commanders,—we are unable to finish the one public memorial whose incompleteness communicates a perpetual air of the desert to the space in which it stands. Before our repeated attempts to perfect the Nelson monument, the commemorative genius of the land has utterly broken down. That spirit of Necessity which weighs on the tall shaft has done what Nelson took care that nothing else should do,—beaten the Ions. Morally, the rider of the seas is shelved,—as monumentally, he is mast-headed. The Genius of the Pyramid, it should seem, has had some strange and mystic power to set his seal of desolation on this impossible record of Baron Nelson of the Nile! The moral of the Memnon and the Sphynx has made a settlement, unnatural and premature, in Trafalgar Square. Isis and Osiris have their vengeance on him who desecrated, with the cannon's voice, the worship of silence that sits upon their shores. On the dead sea-captain presses some category of doom akin to that which hung over the living mariner who killed the albatross. No Englishman retains any hope of ever seeing this monument completed. Raised in our own time, it is already archaic. It stands in the category of fragments. It was born a ruin.—But, another claimant there is for those marks of her remembrance which England puts upon the builders up of her imperial greatness, against whom the only monumental impossibility so far recorded is that of man's forgetfulness. Suddenly, as we have said, the hundredth anniversary of the Battle of Plassey—June 23—has awakened the nation to the fact, that it has no—

MONUMENT TO LORD CLIVE.—By way of repairing this deficiency in the national records, the present proposal is, to erect a statue to the architect of British India in Shrewsbury, his native town. Now, truth to say, this local recognition scarcely, we think, satisfies the want. That the men of our towns should desire thus to reflect back upon themselves, as it were, some portion of the greatness which had its source in their soil, is a wholesome sentiment; and in a great variety of instances the monument

itself will derive a specific interest from the fact of its connection with the particular spot. History is often fitly illustrated thus,—and for the most part we would gladly see the cities of the empire reclaiming their own after this fashion. But there are certain reputations which cannot be localised, or, if localised, not in this direction. Shakspeare is fitly commemorated, in any form, it is true, at Stratford; but had we our wish, we would have his monument on his own cliff, lifted up towards the everlasting stars, and looking out over the immemorial sea. From Shakspeare to Clive is a descent, of course,—as the genius of him who built up a limited and material sovereignty by conquest, is far below the genius that subdued to itself all the realms of nature and of mind: but even in the case of the soldier, the figure is too large for district commemoration. For a statue to the founder of Empire, a provincial pedestal is out of proportion. If there is to be a monument to the victor of Plassey, we should be glad to see the dimensions of the scheme expand. Surely the matter is one which the Indian government should take in hand,—when matters of more pressing interest will permit. It is probable, that the events now taking place in India will postpone all further action in the matter of this monument to a more fitting time. The claim which has been overlooked so long may wait now till the storm be past that is desolating the soil on which it grew; but when the time shall come for its revival, we trust it will be felt that the argument is imperial, and the work a nation's.

We have often had occasion to comment on and illustrate the fact, now so familiar to our readers, of the great change which even in our own day has taken place in the relation between the artist and his public. Instead of the narrow and privileged class to whom, not long since, the artist looked at once for his critics and for his patrons, the spread of taste and education among the people has made the great body of the nation—as always in the best days of Art—the recipients of his truths, and given him for patrons all the great towns of the kingdom, and the merchant princes who dwell therein. It might have been supposed, that in all the forms of patronage by which this new and enlarged spirit of Art-appreciation expresses itself, a city which has at this moment made so remarkable a demonstration of this spirit in its culminating attitude as Manchester, would take the lead; and accordingly, in the matter of sculpture monuments, which is our present theme, the manufacturing metropolis of the north has shown a disposition to enrich her own streets, and make her contribution to the national Walthalla. Strangely enough, however, in doing this, she has hit upon a method, by which her recognition of sculpture art is ingeniously contrived as a repudiation of the art of the sculptor,—her multiplication of statues is made to express a limitation of models,—and her place among modern patrons is effected by a refusal of patronage. As the repetition of this piece of ingenuity implies a principle, and as the spread of that principle among us would destroy sculpture by the process of adopting it, we must devote a few words of comment to the recent inauguration, in Manchester, of the—

BRONZE STATUE OF JAMES WATT.—If ever a world-wide reputation could be fitly localised, James Watt is well placed on a pedestal in Manchester:—the very metropolis, as it were, of that great mechanical empire of which his patient and practical spirit made the conquest. Of such a temple he is the peculiar and appropriate genius. Here, the Art presentment of the man arises on an express field of his especial triumph; and from morning till night goes up around it the ceaseless homage of the mighty mechanical forces that he set in motion. Here stands, monumentally, the magician at whose spell ten thousand wheels are, on every hand of him, in daily revolution for the service of the world. The statue, cast in bronze by Messrs. Robinson and Cottam, of Pimlico, is raised in front of the infirmary—Manchester's best site for the purpose,—where it groups with the previously erected figures of Peel, Wellington, and Dalton. It is a sitting figure, corresponding with that of the illustrious Dalton, which it matches in place:—and this is a good point of correspondence, for effect's sake. It has another point of correspondence, however, against which we desire emphatically to protest. Like the statue of Dalton, it is a work at second-hand. The "James Watt" is a copy made, by Mr. Theed, from the marble figure, by

Chantrey, in Westminster Abbey. Manchester is getting into the way of dealing in the old clothes of Art. What we desire to impress upon a city making such Art-pretensions, and really so powerful for its cause, is, the fact, that the sculptor is still in the land, and that she is under no necessity of borrowing her Art. In the Dalton case, Manchester carried the practice to a yet more curious result:—she borrowed from herself! The city, on that occasion, turned her *own* sculpture-suit for second wear. Having determined to honour by a public monument one of the most illustrious men who ever lived and wrought amongst them, the citizens carried out their laudable intention in an economic way. Possessing already a statue of the philosopher, by Chantrey, in the hall of the Royal Institution, they proposed to have an exact copy of it made for their open-air site,—and executed their intention! Two copies of the same statue, in the same town! We remember, the defence offered on that occasion, when the singularity of the practice was assailed—mutton for the first course, and mutton for the second, and in each case the same joint,—was, that the committee “doubted the possibility of procuring anything better than Chantrey’s production.” Waiving the imputation cast upon the great artists amongst us by the doubt,—we shall only say, that, both for the sake of the school and for the sake of variety, we should rather have had something new, even were it lower in quality, than a repetition of the same dish. The “Watt” case is not quite so glaring as the “Dalton” absurdity; but still, it treats sculpture expression as a dead language, and drives us to the ancient books.—A Manchester paper took ground in justification of the Dalton copy, which, were it good ground, would be equally applicable here; and from which, if its argument involve the principle that Manchester is desirous of establishing now, it is important to dislodge it. The position was, that the philosopher being dead, the Art-access to him was closed,—and that Chantrey, himself dead, was the only man who could have sculpturally restored to us the dead whom it was desired to honour. This argument, singularly, overlooks the notorious fact, that statues of the dead, admirable as records, are made every day from surviving data; and that in that case of Dalton, as in this of Watt, the documents were abundant which might be consulted for resemblance. It was not, and is not, seen by those who would use it, that these very works by Chantrey were, themselves, among such documents; and it was pertinently asked, at the “Dalton” time, in reference to that fact, by what strange confusion it was that the parties who saw the possibility of copying the whole statue, could not see the possibility of copying that quality of it which was likeness?—As regards the probable future practice of Manchester herself in the matter, we confess, this second instance of repetition is alarming; but we trust, in any case, that the other towns of the empire which have the patronage of our schools at heart, will not adopt the Manchester device of getting a new work by means of repeating the old one.

In this same town of Manchester,—or rather, in Salford, but, though separate as boroughs, our readers know that locally Manchester and Salford are one town,—designs and models have been exhibiting, for the inspection and opinion of the public, for a—

MEMORIAL TO MR. BROTHERTON, the late member for the last-named borough. The money subscribed amounts to five hundred guineas; and for that sum the committee invited designs for a monument, which was not to be a statue. The reply to this invitation has been, a collection of no less than seventy-four models; and we have before us the printed descriptions of these which their authors furnished, and of which the committee made a pamphlet. We wish we had space to give our readers some amusement out of this pamphlet. It is a most curious comment on the kind of taste which the locality is nourishing by such specimens as the above of a combined desire for sculpture art and determination to economise it. The mingling here of fancy run wild with matter of fact grown rampant, is something nearly incredible. Art is utilised by some of these candidates after a fashion which would leave behind even the town of Chelmsford,—the town that put its statue of Judge Tindale on the borough pump. Essex, we think, has certainly the credit of having led the way in the

training of the Sculpture Muse to make herself useful, and was the first to put the goddess out to service:—but, let her look to her laurels! The idea of a chief-justice erected into a water-god in spite of his wig,—of him who sat in life by the fountains of law and dispensed its waters, having as his apotheosis, after death, the presidency of the public conduit,—is an idea far outdone, in its own direction, by some of the Art-economies offered to the town of Salford,—though it may have suggested them. One specimen our readers must have:—but with it, they must take our assurance that we are quoting honestly. The thing is too like a satire on the locality, not to demand a distinct affirmation that such a model *has* really been sent in. After describing that his design is “An ornamental composition, comprising a granite base, a bronze basin for a fountain, scalloped, from which rises a sandstone pedestal, bearing mythical horses spouting water into the basin. Dial clock marked upon a pecten shell, the hand pointing to the hour of twelve (midnight); above, a portrait, enameled on china, surrounded with cereal wreath and festoons of fruit. The base of granite bronze basin, rock of red grit stone; sea-horses in yellow stone; and portrait and inscription, on the obverse side, enameled on china, copper, or marble.—Holes to be deeply cut in the rock, for the growth of ferns, lichens, and water-lilies, to be planted in the basin:”—the artist goes on to say,—“The fountain is not an indispensable part of the design, but it is submitted that its cost might be met by its after use for mill purposes, or for flushing the sewers if required. *The running water and the lichens and lilies will aid in giving a perennial freshness to the memory of the deceased.* It is also suggested that if the four river horses and the topmost flower jetted out gas-light by night, it might be useful; likewise if the time-piece were a real one with two faces: but the water-pipes, gas-pipes, and time-piece are not included in the estimate.” The fine bit of the ideal which we have here marked in italics comes in with delicious effect amid the utilities in which it is set. The mixture of romance and reality, each in its calenture, yet monumentally harmonising, implied in this design, has nowhere, that we remember, been surpassed. No man in Chelmsford was probably equal to the idea of making the same fountain at once flush a common sewer and keep a commoner’s memory flush. The fancy, which is somewhat exuberant, is sobered by the fact, and the fact, which is somewhat unsavoury, is deodorised by the fancy. Of course, the hand pointing to the clock, about to strike twelve, was a notion too obvious to be overlooked by such designers of a monument for that worthy member of the House of Commons whose own hour of midnight has sounded now, and whose rule is made absolute as against himself, that “there shall be no more” work done! The difficulty of practically utilising a clock which monumentally must mark always the hour of twelve, has been overcome by an ingenuity which indicates a study in the school of Bottom the Weaver. The one dial makes an apology for the other, after the manner prescribed to Snug, the Joiner. The clock on the one side makes constant proclamation that the clock on the other side is only a dramatic one,—and that *it* is the real working town-clock.—Seen by the light of this new Art dispensation, we feel that there has been much waste of the public monuments in London. Should the Baron Marochetti’s statue of Richard Cœur de Lion obtain the footing which it seeks on the Marble Arch, we trust the Government will make terms. Such a pedestal to such a work is an extravagance itself; and out of the attempt to sober it down, as in Chelmsford, and in Salford, a public accommodation may happily be obtained. Cœur de Lion on the marble arch should be permitted only on condition of his holding aloft a vane, a gas-lamp, or some other utilitarian matter, on the point of his lance.

With an intimation that the STATUE OF DR. JENNER, by Marshall, is at length finished, and that it will be publicly erected ere long,—it is said, in Trafalgar Square,—we may bring to a close this present record of “Monumental Commemorations:” only, however, to resume the subject at a future opportunity; these works are becoming a feature in our Art-history, and, for the honour of the country, they must be carefully watched.

VISITS TO PRIVATE GALLERIES OF THE BRITISH SCHOOL.

THE COLLECTION OF JOSEPH ARDEN, Esq.,
CAVENDISH SQUARE.

THIS collection contains some of the most remarkable works that have of late years been produced. There are in each year certain pictures to which the *habitué* of the exhibitions finds himself involuntarily attracted, and which, though at the conclusion of the Art-season they are withdrawn from the public eye, are never forgotten—they have left an impression which is ever accompanied by a desire to learn their whereabouts. Mr. Arden’s catalogue is enriched by some of these memorable works, for his pictures are principally the productions of living artists; he may be classed among the most patriotic friends of contemporary Art—one of those to whom our school is indebted for its rapid elevation to the present degree of excellence by which it is distinguished. The best of Millais’s compositions, “The Order for Release,” is one of the remarkable pictures to which we allude; the best because free from the laborious errors and the eccentric weaknesses which characterise so many of his other productions. “The Harem of a Bey,” by Lewis, is another work which at the time of its exhibition was much criticised by the public, and canvassed in the circles of Art. In this picture the *finesse* of water colour is more apparent than is the cunning of oil-painting in the picture by Millais. The mastery is palpable yet inimitable—fascinating by its natural simplicity, and convincing us that we never before knew the more beautiful utilities of body colour. There are also some of Roberts’s most interesting essays, Spanish and Oriental, and other valuable productions by E. M. Ward, Stanfield, E. W. Cooke, Creswick, &c., which, having been already described in the *Art-Journal*, a minute and lengthy recurrence is thus on the present occasion rendered unnecessary.

“The Harem of a Bey,” J. LEWIS.—One of the most celebrated of that extraordinary series of water-colour works of which Mr. Lewis has exhibited at least one almost every year since his return from the East. This was contributed, in 1849, to the exhibition of the Society of Painters in Water-colours. By all who have seen the work it will be remembered as showing the interior of a harem, with the bey seated on the left, and near him two of his wives resting languidly on cushions, while, on the right, a Nubian eunuch unveils the person of a slave offered to the bey as a purchase. This drawing was at the Great Exhibition in Paris, where it excited the admiration and wonder of French artists. It is painted almost entirely in body colour, or it may be white tinted with colour; and the manner, distinguished with such surpassing finish, is peculiar to its author. The impersonations are purely oriental, each figure being a standard type of its class.

“The Letter from the Seat of War,” C. W. COPPE, R.A.—This picture contains but one figure, that of a woman, who is convulsed with grief at the contents of a letter from the Crimea. The incident is circumstantially and pathetically set forth. It was painted in 1855.

“The Studio of Giorgione,” CARL WERNER.—This is a water-colour drawing, which shows one of the splendid saloons of a Venetian palace of the Cinque-Cento. The painter stands with his back turned to the spectator, and before a portrait on which he is at work. The room is a renovated transcript from the faded reality, worked out with unexceptionable truth.

“The Bird-Trap,” B. WILLIAMS.—A small picture, very elaborately wrought.

“The Bouquet of Violets,” J. E. MILLAIS, A.—The composition presents a single figure, that of a girl who is compressing a bouquet of violets into an envelope. The tone is low, like many of the smaller studies of the painter, but not less careful in manipulation than his best works. It was painted in 1854.

“The Plough,” H. LE JEUNE.—This small and brilliant picture was exhibited in 1855. It contains a party of children playing with a forked branch of a tree, to which two are harnessed as horses, while another enacts the part of ploughman. It is exquisitely sweet in colour.

“A Study,” J. E. MILLAIS, A.—A figure of a girl,

studiously individualized from the life; she wears a pink striped gown, to every minute stripe of which the most scrupulous justice is done.

'The Veranda,' J. D. LUARD.—A small composition, worked out with infinite neatness of execution.

'The Stile,' J. E. MILLAIS, A.—Also a small picture, showing principally a paddock wall, with a stile, on which sits a maiden in profound meditation; the whole shaded by trees. The figure is rendered with much precision, and, although in shade, the minute nicety of the labour is sufficiently obvious; but in the secondary material there is greater breadth of manipulation than is generally found in Millais's works.

'The Rescue,' J. E. MILLAIS, A.—This is the picture which was exhibited two years ago, the subject being the rescue from a house in flames of two children, by a fireman, who is met on the stairs by the agonised mother. Such is the earnestness with which this work has been executed that it retains its lustre and powerful effect without the least degree of diminution. The leg of the boy in the arms of the fireman must always remain the most marvellous feature of the picture as to drawing and colour. This remarkable work was noticed at some length in this Journal at the time of its exhibition.

'The Order for Release,' J. E. MILLAIS, A.—This picture will be remembered in the exhibition of 1853. It is the best which Mr. Millais has yet produced, and will remain the most estimable of his performances, unless he recover himself from his downward tendency by some strong effort. By a happy resolution in the treatment of the subject there is an entire absence of any damaging element in the composition. Mr. Millais has narrowed the limit said to exist between the sublime and the grotesque, inasmuch that in some of his works it is difficult to say whether he would be serious or facetious. But the story here is pathetic, and the uniformity of the treatment has excluded every item in the slightest degree open to misconstruction. The execution is most minute; and here again the leg of a child is wonderfully real, and all without any parade of manner or pride of touch. The work, we repeat, is the most earnest that Mr. Millais has produced.

'The Old Old Story,' F. STONE, A.—Two French coast figures, a youth and maiden at a cottage door, so circumstanced with respect to each other as to leave the spectator in no doubt as to the subject of their whispered discourse. The picture is extremely powerful in colour, and contains, we think, the largest figures that Mr. Stone has ever painted.

'Scene from "Old Mortality,"' A. FRASER.—The principal characters here are Claverhouse, Henry Morton, his uncle, and others of the celebrities of the story. The picture, as to much of its execution, pronounces itself at once akin to some of Wilkie's more freely painted works. Mr. Fraser assisted Wilkie in his latter productions, and hence is observable a marked sympathy—the 'Peep o' day Boy's Cabin' is that perhaps in which the relation is most distinct.

'The Caravan in the Desert,' D. ROBERTS, R.A., was exhibited some years ago. The scenery is Egyptian, particularly like that about Memphis or Thebes. There is a tank in the foreground, and the place is evidently a halting station for caravans and travellers. A multitudinous company of the latter are journeying onward towards the banks of the Nile, the line of which constitutes the distant horizon. It is probable that the picture is a conscientious transcript from the locality which it proposes to represent.

'On the Greta,' T. CRESWICK, R.A.—This is one of those close river fragments which in his earlier time made the reputation of this painter. The river here breaks from a placid pool into a miniature rapid, and the painting of the water in repose, and the downward broken current, are full of natural truth. There is more colour and freshness in the foliage than we find in the late works of the artist. This picture was painted in 1841.

'Marine Subject,' E. W. COOKE, A.—The subject is the entrance to a Dutch harbour, with a dogger running in with a stiff breeze, seeking shelter from a coming squall. Dated 1851.

'The Royal Family of France imprisoned in the Temple,' E. M. WARD, R.A.—This well-known work was one of the most attractive essays of its

season (1856), and perhaps the most interesting of the series that Mr. Ward has painted from the revolutionary history of France. We have already described the picture at length on the occasion of its exhibition; we see it again with pleasure, and find it mellowed and harmonised by even the brief period that has elapsed since it was painted, and that without any diminution of the substantive reality of the figures, or the moving expression of their features.

'Characters from Shakspeare,' T. STOTHARD.—Composition of this kind was much practised by Stothard; besides the *personæ* in certain plays, he more than once painted collectively the principal characters from the most popular plays. The prominent impersonations here are from "The Tempest," "The Merry Wives of Windsor," "King Lear," &c.

'Landscape,' G. STANFIELD.—Painted with great vigour; but, being near a widow, it is extremely difficult to examine its detail.

'St. Peter's, Rome,' D. ROBERTS, R.A.—A small picture, presenting a view of St. Peter's apart from the wilderness of human habitations which is associated with it in the view from the other side of the edifice: here the great temple is the only considerable object offered to the eye. The picture was exhibited a few years ago; it bears an inscription (written on the canvas by the artist himself) to the effect that it was painted for Mrs. Arden as a *souvenir* of her visits to Rome.

'Coast View,' S. P. JACKSON.—The incident is the commo-place of ordinary sea-side scenery, but the whole is painted with a promptness and firmness of touch which effectively approach the reality of nature. It is a picture of considerable size, with the sea lying on the right in deep shade, and rolling in heavy volume on the shingle; but it does not hang so favourably as could be desired, for examination of its quality.

'The Flock,' R. REDGRAVE, R.A.—A very elaborate composition, on the left of which is an open space containing the sheep, and on the right is a weedy stream, the whole being inclosed by trees. Every object is brought forward by the most minute and conscientious pencilling from nature. In the works of this painter every spray and each blade of grass is formally individualised—an accuracy of representation which characterises this not less than others.

'The Fisherman's Wife,'—A figure costumed according to the subject, and seated near her cottage selling fish. The composition is full of appropriate incidents satisfactorily made out.

'Dance of Nymphs and Satyrs,' S. A. HART, R.A.—This is a large picture, distinguished by all the proprieties of classic subject-matter. The action of the figures, their *abandon* to the excitement of the dance, show that they are exhilarated by wine. The two prominent dancers are a dark satyr and a nymph personally delicately fair. The composition of these two figures, and the lines formed by their limbs, especially their arms, is a graceful result of well matured study. They are dancing to the music of pipes, a lyre, and cymbals, and all the musicians suggest at once remembrance of the more spirited of the ancient representations of the children of *Enterpe*. The picture is brilliant and harmonious in colour.

'Remains of a Greek Temple,' W. LINTON.—A class of subject which this artist paints with better feeling than any other material that he treats. The ruin is situated at the base of a range of hills which extend into the distance of the picture; the left-hand portion of the view is an open plain, of which the nearest section lies in shade. The scene derives life from a goatherd and his flock. The sky and the distance are painted with natural truth and delicacy.

'Robinson Crusoe,' A. FRASER.—This work we remember years ago; Mr. Fraser, we believe, was the first artist who drew upon Defoe's narrative. Crusoe is here represented as sitting down to dinner, and in the act of supplicating a blessing, surrounded by his family—his dog, cat, goat, and parrot; and, according to authority, by a variety of household, or rather shiphold items, saved from the wreck. The figure is dignified and impressive, and the treatment of the theme points at once to its source. The whole is painted in the subdued light which may be supposed to have existed in Crusoe's primitive mansion. Like most of Fraser's

works, it has been freely glazed throughout, perhaps with asphaltum.

'Fruit,' V. BARTHOLOMEW.—A water-colour study, consisting of a pine, white and black grapes, and other fruits, imitated, as to form and surface, with the utmost accuracy.

'A Street View in Rouen,' S. PROUT.—These quaint old houses afforded endless resource for the pencil of Prout; in fact, they suggested to him that touch so well adapted to describe dilapidation and the grotesque in architecture. There are in this collection three or four of Prout's works, all representing passages of continental street architecture. Of these the largest looks like an early drawing, from the thinness of the tint. The time is fast approaching when such drawings will be considered as pleasantries of the painter, for the prevalent spirit of renovation will leave no trace of the ancient wood and plaster habitations which we regard in pictures and read of in novels with feelings very different from those with which we inhabit them, when our hotel happens to be a fabric of this class in some remote locality of Brittany or Normandy—more romantic than comfortable.

'The Ponte Rotto,' C. STANFIELD, R.A.—This relic is prominently and advantageously seen from many favourable points; but the artist has here judiciously made it the principal mass in his composition, by having taken it from the level of the Tiber, to the exclusion of that architectural confusion which reduces the importance of the ruin from a higher point of view. In the right distance appear St. Peter's, and the bridges and buildings that occur in the same direction, constituting the principal forms in the view, which is worked out in the best manner of the painter.

'Landscape,' F. R. LEE, R.A.—The picture, which is somewhat large and painted with great attention to detail, shows principally an agroupment of majestic and venerable elms—we presume these trees to be. In the painting of these masses of foliage there is an elevation of feeling beyond the rest of the subject, which is opened on the left by a road running directly into distance, the nearest section of the ground being flooded by a limpid and shallow brook, to which some horses have been led for their daily draught—the mass of shade being broken by a grey pony standing in the current. The picture is dated 1847.

'The Phreologist,' W. H. KNIGHT.—The scene is a well furnished sitting-room, in which we find an aged enthusiast examining the "cerebral development" of a boy who holds a spaniel in his arms, and in his turn examines the animal's head. There are two ladies seated at the window, apparently deeply interested in the result. This picture is remarkable for the care with which the draperies are painted.

'The Negligent Servant,' J. F. PASMORE.—A single figure, that of a female domestic, who has fallen asleep in the act of preparing vegetables for dinner. It is a dark picture, and as to feeling and subject bears some relation to the Dutch school.

'Landscape,' W. LINTON.—The principal passage of the subject, a modern Italian town, occupies the centre of the composition, lying for the most part in shade, according to a favourite disposition of this artist; on the left stands a convent, and from the immediate foreground a road descends to the town, the site of which is a valley lying between two lofty ranges of mountains. It is a large picture, worked out with an earnestness which suppresses all the frivolous detail that so often enfeebles and vitiates the best subjects.

'The Grandmamma,' J. P. KNIGHT, R.A.—A small and an early picture by this artist, who has not, we believe, exhibited a subject picture for many years. The old lady is seated contemplating her grandchild, who is giving milk to her cat.

'A Study,' W. F. WITHERINGTON, R.A.—A figure of a child—a girl seated at a cottage door, and amused by the gambols of a kitten that plays with a ball of worsted.

'Landscape,' J. WILSON, Jun.—A small dark picture, containing on the right a stream, the view being closed by masses of trees towards the right.

'A Study,' G. B. O'NEILL.—A small composition, in which is presented a boy resolutely cutting his name in the bark of a tree. The incident is substantially rendered; the earnestness of the youth merits the best wishes of the spectator.

'In the Crypt of Basenstoke Priory, Wilts,' A. PROVIS.—This was exhibited recently at the Portland Gallery. It is a small picture, remarkable for the most assiduous finish—containing a boy seated and holding on his knee a water-jug; and composing with an anomaly of material, which greatly assists a picture like this—ingenious, elaborate, and masterly in colour.

'Cottage Interior,' F. D. HARDY.—A rustic dwelling, furnished with a catalogue of such objects as are met with in these remote rustic habitations alone. The only inmate is an aged woman, who is seated reading—her Bible, it may be.

'Coast View,' J. MIDDLETON.—The subject is a passage of scenery very like that of the Isle of Arran. The composition consists, it may be said, of two sections: a gentle foreground slope, the ridge of which rises against the sky; and on the right a calm, inland bay inclosed by a distant and mountainous shore. But the foreground constitutes the force of the work—here all the executive cunning of the painter is shown. The ground, which is warm in tone, lies in shade; but every idle pebble, every gadding blade of grass, is conscientiously introduced, nothing in short, in minute representation, can excel the almost microscopic pecciling of the work. John Middleton was a rising artist, whose works promised a brilliant future—but he was not permitted to attain to that maturity whence so much was expected.

'The Coming Passenger.'—A boy is here described as standing ready to open a wicket for a person about to pass. He stands with one hand on the little gate and the other respectfully raised to his cap; and a girl, perhaps his sister, sits with a basket of oranges, of which she offers some for sale to the passenger, who is so near that his, or her, little dog is barking at the attendant of the wicket. The approach is so forcibly described, that we expect the imaginary third person to step into the picture.

'The Water Nymph,' W. S. FROST, A.—She is seated at the brink of a pool, dressing her hair with water lilies. The figure is full but yet graceful, and distinguished by that delicacy of colour, and softness of line, which add so much to the charm of the painter's works.

'Study from Nature,' F. D. HARDY.—Simply a cottage interior, with an old man, in profile, smoking, worked out with the nicest attention to detail.

'Street in Cairo,' D. ROBERTS, R.A.—A large picture, showing an open space inclosed by lofty houses, painted with alternate lines of red and yellow, all telling effectively in the composition, in their variety of line, form, and quantity. The place is thronged with figures, every one of which is a successful sketch from the life, and nothing can be more purely oriental and Turkish than these turbaned idlers, whose acquaintance we make here. Mr. Roberts describes the Turks with a truth and gusto for which they will assuredly do him as much honour as the best pacha that ever went before a tail. The picture was painted in 1842.

'Coast View,' J. WILSON, Jun.—The picture is large, but the objects are few and simple. From the right a broken line of chalk cliff passes transversely into the composition, and from the near section of this a small jetty has been thrown out as a harbour for fishing-boats. It is high water, and a boat is passing the jetty. The water is a truthful essay: it is painted with breadth and freshness.

'Venice,' E. W. COOKE, A.—We are here placed on the sea, and the Ducal Palace, with the Campanile, and all the remarkable edifices, terminating with the Dogana on the extreme left, are seen in distance. The near objects are fishing and coasting craft, which are painted with a *finesse* that induces the belief that every most minute characteristic has been remembered. The composition, with its glimpse of the sea-girt city, is most skilfully managed. It was painted in 1854.

'Landscape,' F. R. LEE, R.A.—This appears to have been painted on the spot; it is a simple passage of rural scenery, of which the principal mass is a group of trees that rise from the side of a path leading to a farm-house—beyond these lies an expanse of distance.

'Interior of a Church,' D. ROBERTS, R.A.—The church is a Spanish cathedral of imposing character, showing, as a principal object on the left, a tomb of great magnificence. The artist has succeeded in

communicating a feeling of vastness and space perhaps beyond the reality; be that as it may, notwithstanding the richness and beauty of the edifice, he maintains the solemnity of effect becoming to the subject.

'View in Holland,' A. MONTAGUE.—A small picture, representing a canal running between two lines of houses, of that ragged and time-worn character that are good for nothing but to be painted. There is a companion to this by the same artist, also a Dutch canal view, similar in composition.

'Landscape,' CROME.—The composition is in two distinct parts, being closed on the left by a clump of forest trees, but on the right opening over a flat country, very like that through which the Yare passes towards Yarmouth. The distance is painted with tints beautifully atmospheric and silvery.

'Waiting for the Carrier,' W. S. P. HENDERSON.—A country boy with his donkey is waiting the passing of the waggon, which is seen in the distance slowly approaching.

'The Jack Pool,' S. R. PERCY.—The subject is a passage of river-side scenery, very like some well-wooded backwater of the Thames. The stream is full of aquatic plants, and its opposite bank encumbered with fallen trees. The composition is extremely full, comprehending almost every incident of waterside material; but all most carefully drawn and painted.

'On the Coast of Normandy,' J. WILSON.—The view is shut in on the right by a sea-wall of chalk, very like that at the Foreland. It is a small picture, containing boats and figures, touched with masterly power.

'Poultry,' COUTURIER.—This is a small dark picture of the French school, extremely simple in subject and composition. In it, are introduced two cocks fighting; the birds are drawn with spirit, and charmingly coloured.

'Venice,' E. W. COOKE, A.—This view comprehends the line of buildings from a little distance on the right of the Ducal Palace, to those beyond the library and towards the Grand Canal. On the left the view is closed by a line of Venetian craft of great variety, some having sails hoisted, others with cordage only. On the right also the quays are thronged with boats and figures, every object being made out with the most delicate drawing. The work is small, but the composition is, perhaps, the fullest that the artist has ever painted.

'The Avenue,' T. CRESWICK, R.A.—The subject consists of a double row of trees, which run perspective into the picture, and through the dense foliage of which the sun's rays here and there streak the ground with light. It is certainly more true in colour than later works.

'Coast Rocks,' T. S. GOOD.—A small picture representing a section of a rocky shore, with two fishermen. It is clear in execution and agreeable in effect. This artist gained a reputation by the high finish which he communicated to his figures; but his works are rare. He is a native of Berwick-upon-Tweed, where we believe he now resides in retirement.

'The Valentine,' T. WEBSTER, R.A.—This is an early work; the missive has been addressed to a housemaid, who, intent on perusing it, suffers the ale tap to overflow the jug which she has placed beneath it. The expression of the girl's face is a very felicitous essay.

'A Brace of Spaniels,' G. ARMFIELD.—The animals have started wild fowl, and are eagerly giving chase in the direction of the flight. They are extremely well drawn, and painted with infinite spirit.

'Landscape,' J. MIDDLETON.—The subject of this work is one which, in ordinary hands, it would be extremely difficult to render interesting; but of the little variety the most is made, and the ground-breaks and workings are rendered most serviceable. It is a view over some rough pastures intersected by a winding stream; a farm-house appears on the right, and the trees are all leafless, as if the time were late in autumn. In the management of the material great taste and executive skill are shown; it is extremely mellow in colour, and very minute in descriptive elaboration.

'Landscape,' W. H. MILLAIS.—The subject is principally a spreading oak tree, which, together with the other material, seems to have been worked out on the spot.

'Coast Study,' J. W. INCHBOLD.—This view is

taken from a cliff overhanging the sea, and comprehends a little bay, with the sea-wall and cliffs by which it is inclosed. It is a solitude, without sign of life, save the screaming sea-mew. The small foreground is an intricate wilderness of rank grass and weeds, which is realised with marvellous patience; but the beauty of the work lies in the pellucid waters of the little bay, the reflections of which are a triumph of Art.

In the acquisition of the higher class productions which enrich this collection much taste and sound judgment are manifested. The authors of the various works we mention may paint worse, but they will never excel the quality of these examples, some of which are not seen to the best advantage; but it is the fate of works of Art in London residences especially, they cannot be all placed in a uniformly good light.

ART IN CONTINENTAL STATES.

PARIS.—The statue of Geoffroy St. Hilaire, the distinguished naturalist, has recently been exhibited at the entrance-gate of the Louvre. It is by E. Robert, and is destined for the town of Etampes; to be erected by public subscription.

FLORENCE.—An interesting discovery has been made at Florence of the "Madona di Soreto," by Raphael, as it is reported; it is in the possession of M. Walter Kennedy Lausie, resident in that town.

MUNICH.—A fire took place on the 13th of July at the Glyptothèque, at Munich: the celebrated frescoes by Cornelius have been much damaged by the water thrown from the fire-engines; the statues have not suffered.

VIENNA.—The new medal for the decoration of those admitted of the order of Maria-Theresa has on the obverse a portrait of the foundress, with the legend, "Maria-Theresa, 18th June, 1757;" and on the reverse, the cross of the order resting on a sword and a crown of laurel, with the inscription, "A hundred years of wealth in heroic deeds, 18th June, 1857." The medal has been struck in gold, silver, and bronze.—The Vienna Society of Antiquarians has decided that women may be admitted as members.

ROME.—A new gallery has been inaugurated at Rome, by order of the Pope, to receive the paintings now contained in the Vatican.

WEIMAR.—The inauguration of the statues in honour of the *literati*, Wieland, Göthe, and Schiller, was necessarily postponed until the 3rd of September,—the sculptor, Rietschel of Dresden, having given it as his opinion that the works could not be ready before that time.

DORDRECHT.—The recent death, at Rome, of the landscape-painter, Abraham Teerling, who was a native of this town, has suggested the propriety of asserting the importance of the place as a nursery of Art, by some worthy memorial commemorative of the many distinguished men who have lived there, and from whose *prestige* Dort claims to be ranked as a school of Art. Van Stry and Versteegh resided at Dort; so also did Schoumann, the master of Schotel, the well-known marine-painter. The place is famous also as the residence of Albert and J. Cuyp, Hoogstraten, Bloemaert, Bischof, Ferd. Bol, N. Maas, and Schalken. The painters of Dordrecht were patronised in the seventeenth century by Albert Cuyp's friend, Cornelius Van Beveren, and at a period nearer our own time by Peter and Cornelius Van Braam. It was chosen as the abiding place of the German painter, J. B. Scheffer, and there his two sons, Ary and Henry were born. Some of the best examples of the Dordrecht school are preserved in the collection of Herr de Kat, whose gallery is open to visitors; but many of the best Cuyps are in England, a demand for them having arisen some time after Cuyp's death, when the merits of his works had been recognised, and they were eagerly purchased by connoisseurs in London.

BERLIN.—Some seven years ago we gave in this Journal an account of a collection of pictures well known in Germany, that of the Consul Wagner. Dr. Waagen is now engaged in writing a new catalogue of this gallery, to which, since we saw it in 1850, many valuable works have been added; among these are a work by Wider, of which the scene is the steps leading to the Capitol, the subject being divine service in the open air by pilgrims during the holy week. Another, of which the subject is 'Divine Service in Church,' is by Leys; a third, by Schrader, the masterpiece of that painter, 'Esther before Ahasuerus,' together with others of minor note.

THE ROYAL PICTURES.

THE BIRTH OF BELPHEBE AND AMORETT.

W. L. Leitch, Painter. C. Cousen, Engraver.

Size of the Picture, 2 ft. 0½ in. by 1 ft. 4½ in.

FOLLOWING the example of some of the old landscape-painters, as Claude, Gaspar Poussin, and a few others, Mr. Leitch has, by the introduction of a group of figures borrowed from a poet's story, given a title to a picture which would ordinarily pass as a landscape only, so comparatively subordinate a position is occupied by the group. To justify such a practice, the characters and the scene must be in perfect harmony, as they are here: a group of classical figures in a rustic setting, so to speak, would present a most incongruous combination; so too would a party of swineherds or of gipsies, holding high revel in the bower of Paphos, or under the shadows of old Parnassus: such a scene would justify the charge of heterodoxy in Art against the painter who dared to perpetrate so palpable an outrage on taste and æsthetic principles. The scenery in Mr. Leitch's picture is Claude-like, and so far perfectly in harmony with the poetical fiction that forms a part of the composition; but here all similarity between the two artists terminates: in colour the modern work differs widely from anything Claude ever painted. It must be remembered, however, that the scene is presumed to lie in England, not in Italy: and it seems to us as if the artist had coloured it with the recollection before him of the red and purple tints of Scotland: we think he is a "North Briton."

To render this intelligible to those who are unacquainted with Spenser's "Fairie Queene," we must refer to that part of the poem in which "the birth of fayre Belphebe and Amorett is told:" it is in the sixth chapter of the third book. The entire poem, which Spenser called "a continued allegory, a dark conceit," has reference to events and personages contemporary with the author. Thus one of his critical commentators, Upton, who wrote upwards of a century ago, says,—"The mythology is all our poet's own, Belphebe is Queen Elizabeth; if we carry on the illusion" (in the first of the following stanzas), "Chrysoonee should be Anna Bullen: but this will not hold true no more than Amorett is Queen Mary, because said here to be sister of Belphebe. However, I neither affirm nor deny that Amorett is the type of Mary Queen of Scots, whom Queen Elizabeth called sister."

"Her mother was the fair Chrysoonee,
The daughter of Amphisa, who by race
A fairie was, yborne of high degree:
She bore Belphebe; she bore in like case
Fayre Amoretta in the second place:
These two were twinnes,—

"To search the god of love her nymphes she* sent
Throughout the wandering forest every where,
After them herselfe eke with her went
To seeke the fugitive both farre and near.
So long they sought, till they arrived were
In that same shady covert wherest lay
Faire Chrysoonee, in slombry traunce whilere;
Who in her sleepe (a wondrous thing to say)
Unawares had borne two babes as faire as sprituing day.
"Which when they both perceiv'd,
They were through wonder nigh of sence bereiv'd,
And gazing on each other nought bespake:
At last they both agreed her seeming griev'd
Out of her heavie swoone not to awake,
But from her loving side the tender babes to take.
"Up they then tooke, each one a babe uptooke,
And with them carried to be fostered."

Mr. Leitch's picture is in the Collection at Osborne: it was a commission from His Royal Highness Prince Albert. The artist is a landscape-painter of considerable talent, but he exhibits but rarely, and very seldom more than one picture at a time: this is chiefly owing, we believe, to the delicate state of his health. His works are principally of Italian scenery, or of imaginary subjects which, like the present, are invented on the models of the landscapes of that country. Within the last ten years we remember to have seen the following pictures, at the Royal Academy, by Mr. Leitch:—"View near Ournelo Contrada di Sora, Kingdom of Naples;" "The Villa Fountain," engraved for the Art-Union of Glasgow last year; "The Temple of Juno Lucina, at Agrigentum, in Sicily;" "The Campagna of Rome."

* Venus.

TALK OF
PICTURES AND THE PAINTERS.

BY AN OLD TRAVELLER.

CHAPTER VII.

First Visit of the Englishman in Venice—Paolo Veronese—Works at home and abroad—Public Galleries—Luton House—Mr. Harford's Collection at Blaise Castle—Lord Daruley's at Cobham Hall—Bonifazio Veneziano—Petworth—Colonel Egremont Wyndham's Gallery—Alton Towers—The Return of the Prodigal Son—Works in Foreign Galleries—The Bassani—Examples in Collections open to the Public—Jacopo at Edinburgh—Francesco and Leandro at Hampton Court—Francesco at Liverpool—Pordenone—Lord Brownlow's Collection—Works at Chiswick and Darleigh—Berlin—Udina and Piacenza—Mantua—Venice.

THERE is perhaps no Venetian master—Titian alone excepted—whose works receive, and have received, so much attention from the great body of English travellers, as do, and have done, those of Paolo Veronese: all rush to the Ducal Palace before they are half a day old in Venice; and the certainty of this fact helps to diminish my regret that I cannot, with due respect to the brilliant qualities of an artist so much admired, here attempt to do more than allude to the whereabouts of some few among the vast number of paintings produced by his hand.

The National and Dulwich Galleries, Hampton Court, the Fitzwilliam Museum at Cambridge, the Royal Institution of Edinburgh, and other public bodies, possess pictures by Paolo Veronese always accessible to the student; there are besides examples of his works in almost all the more important collections of the country. The Marquis of Bute has four at Luton House. Lord Daruley's collection at Cobham Hall boasts an equal number. Mr. Munro has two, both of high artistic value, and considered to exhibit the most admired qualities of the painter. In the collection of Mr. Harford, at Blaise Castle, there is a "Pietà" by Paolo Veronese, very beautifully painted. There are drawings by his hand at Chatsworth; and they have one in the magnificent collection of those treasures possessed by the University of Oxford: a banquet of cardinals is the subject of this drawing, which is one of great interest to the admirer of the master. The portrait of Paolo, painted by his son Carlo Caghari, will be found, among those of other great painters, in the collection of the Duke of Bedford, at Woburn Abbey; that in the Uffizi, at Florence, will be familiar to the recollection of all acquainted with the Florentine galleries.

Works of varied character by Paolo Veronese enrich the Louvre: of these the most important and justly renowned is the "Marriage in Cana," a favourite subject with the gay and genial painter. To this picture increased interest has been given by the description which Zanetti cites, as preserved in the Venetian convent of San Giorgio Maggiore, that document proving nearly all the figures to be portraits of persons the most distinguished of their time—the Emperor Charles V.; Francis I. of France, with his queen, Eleanor of Austria; our own Mary; Soliman I., Grand Signor; Alfonso D'Alalos, Marquis del Guasto; and the justly celebrated Vittoria Colonna, Marchese di Pesaro,—are among them, as is Paolo Veronese himself, with his brother Benedetto Cagliari, and his brethren in Art, Tintoretto and Jacopo da Ponte.

Speaking of this work, Vasari calls it "Opera maravigliosa per grandezza, per numero di figure, per varietà d'abiti, e per invenzione." When Vasari wrote, Paolo Veronese was not more than thirty, or perhaps thirty-two years old—a circumstance to which the biographer has previously alluded,† and one which amply accounts for the fact that Vasari has not described his works at greater length.

A picture representing Jesus in the house of Simon the Pharisee, and which, although scarcely so characteristic of the master as that last named, is yet of great interest, as regards many important qualities that cannot here be insisted on, will also be found in the Louvre: Vasari describes it as "La cena che fece Simone lebbroso al signore, quando la peccatrice se gli gettò a piedi." In this work, painted for the refectory of San Nazzaro in Verona, a monastery of black friars, there are two dogs,

highly praised, among other parts, by Vasari,—and with justice, as all who have remarked that animal when painted by Veronese will readily believe. "They seem to be alive," says the biographer; and to this he adds the following—"More in the distance are certain figures of lame and halt, which are also excellently done." There is a sketch for this picture at Alton Towers, where will also be found a portrait of a lady, declared to be from the hand of the same master.

To say nothing of Venice,—because all seek Paolo Veronese there,—the galleries of Vienna and Munich, the Brera at Milan, with the collections at Dresden, Berlin, and other capitals, have also works by this master, but those here named must suffice for our present purpose.

Of Bonifazio Veneziano, of the Bassani, and of some few beside, among the Venetian masters of the period before us, we would fain cite pictures recurring pleasantly to remembrance, as the churches and palaces of Venice rise before the willing eyes of the gladdened memory; but we must restrain ourselves for the most part to the mere mention of some few works in the possession of English collectors within reach of the English student. By the first-named painter there is a picture, but not a good one, at Hampton Court—"Christ with the Woman of Samaria" is the subject, and the work was long attributed to Palma Vecchio; it has been much injured, but even when at best can scarcely have presented a fair specimen of the master.* Of much higher value is the "Last Supper," in the Royal Institution of Edinburgh—since this work, if my recollections do not mislead me, gives full evidence of that elevation of thought and dignity of manner so entirely distinctive of Bonifazio, and which raise him to a level with the very first of his contemporaries. Nor is the Edinburgh picture of less importance as an example of that perfection in colouring wherein Bonifazio, as is well known, was scarcely inferior to Titian, whom he did without doubt follow zealously, as regards that great essential, but with no servility of imitation, nor in any manner derogatory to his own high and true genius.

In the collection of Colonel Egremont Wyndham, at Petworth, there is an Adoration of the Kings, from the hand of Bonifazio Veneziano, respecting which Dr. Waagen has the following remark:—"Besides his usual warmth and transparent harmony of colour, this picture exhibits a closer finish of detail than is usual with Bonifazio."† Higher eulogies might have been added, and with justice; nor is there reason to believe they would have been withheld, had the German writer consulted his inclination only, and had he not been restricted by the brevity imposed on his words by the exigencies of his subject. This may be inferred, not only from the general tenour of Dr. Waagen's works, as they relate to masters of the highest class in general, but also from various remarks respecting Bonifazio in particular, to be found in other passages. Thus, describing a valuable picture by that most noble artist, in possession of Sir Charles Eastlake,—Our Lady with the Divine Child, and other figures,—Dr. Waagen speaks as follows:—"This rich and beautiful composition, with the fine character of the heads, especially that of the female saint, approaches Titian in warmth and harmony of colouring." So far the German critic, if he had added the declaration that Titian is not unfrequently surpassed by the less familiarly known painter in depth of thought, in purity of sentiment, and in elevation of purpose, he would have done no injustice to either master.

But perhaps the most important and valuable work by Bonifazio in possession of any English collector, is that now at Alton Towers, and which was long attributed to Titian. The subject of the picture is the Return of the Prodigal Son; the figures, life-size, are in the Venetian costume of the painter's day, they have, therefore, not the pastoral character always suggested to the mind by the words of the sacred text, but, apart from this circumstance,—reduced by many considerations, that cannot here be entered on, from its seeming character of a fault,—these figures are absolutely perfect, as is the whole

* Many valuable details respecting this and other painters of the period will be found in the "Notizie" of Morelli (*L'Anonimo*).

C. COUSIN, SCULPT.

THE BIRTH OF BELPHEGEBE AND AMORETT

FROM THE PICTURE IN THE ROYAL COLLECTION

THE ROYAL COLLECTION OF ENGRAVINGS

scene wherein they act, with all its details. The principal group is standing before a building, which, if not of the most lofty pretensions, is evidently the dwelling of an important and opulent personage; the moment is that immediately subsequent to the command, "Bring forth the best robe, and put it on him; and put a ring on his hand and shoes on his feet." The "shoes" are already on—one servant is presenting the "ring," which he holds daintily between his fingers, while another has approached his master with the robe, and stands at his left hand, holding the garment of honour with due respect across his outstretched arms. In the face of the prodigal, whom the father—a venerable and beautiful old man, and, as might be supposed, the chief person of the drama—is raising from what has doubtless been a second prostration, made in acknowledgment of his goodness, there are ample evidences of that weakness ever to be found, under some one of its many forms, in the company of vice: nor has this been done by the wise and thoughtful master without due reference to our instruction; of that we may be sure, and shall do well to profit by it. The elder brother, on the contrary, is a noble and dignified figure, as befits the man of passions duly restrained and life devoted to life's duties: thus, although the lesson given us in this parable of our Lord does in some sort involve a reproof to the elder brother, yet is it on him—after the father—that the attention of the spectator is most permanently fixed, and not on the prodigal, whom one is willing to leave to the cares of the servants, so dutifully ready to attend him. This our favourite then, despite his fault of a momentary displeasure, which will not be lasting—we have but to look on his fine face for assurance of that fact—is seated on horseback at some distance from the principal group. He is returning from the chase, and his dogs are at the feet of his horse; servants also are round him, and from these he is receiving an explanation of the event passing before his eyes. It is impossible to imagine anything more life-like, and, at the same time, more graceful than are all the figures composing this group, on which the critic in Art might long expatiate before enumerating half its merits: the horse is not such, at all points, as the connoisseur would select for his uses; but Venice does not count among her glories the being an especial land of horses; nay, a man may live long years in the midst of her beauties—our heison upon them, one and all!—without ever seeing a hoof, save only those belonging to St. Mark's stud, of immortal renown. But even the horse, noble as he is when truly portrayed, and well as we love one "of a worthier race," as Gervase Markham hath it, can scarcely detain us in this instance from the human interests around us, and of these we have in this one picture enough to minister food for thought that may last you a lifetime. And in this fact is the real triumph of the master truly great, as is Bonifazio Veneziano. You will delight in him for the beauty wherewith he has blessed your eyes; but that is a benefit you may derive from others: his distinction is that he awakens and enriches the mind, and for this you revere him and are grateful; that he softens and amends the heart, and for this it is that you give him the dear love of a life-time.

Not to all great painters is that last best tribute due; nay, you shall count the names that compel it from you on little more than the ten fingers of your hands—but Bonifazio Veneziano is pre-eminently among them; and with some two, or perhaps three, of his Venetian brethren, added to certain among the older Florentines, will come first to your recollection when this highest of all qualities is in question. A bright name or two from the Roman schools, with yet more, and of better claims, from those of Umbria, rise appealingly to the recollection, as one writes of this matter, and most lovingly has each "its claim allowed;" but to your memory and your good heart, oh reader, must now be left to pay the debt for all, seeing that the grand work of the revered Venetian now before us looks for all our attention, and is not of the class that can be duly treated with aught less. A rich mountainous landscape forms the ultimate background and closes the whole, but within this are various distances, all appropriately occupied: over one of them there is a hunting party galloping cheerily, and to them it is we may suppose the servant, making signals from an exterior gallery, is blowing a horn, hiding them return to

their part in the feast about to be prepared. Beneath a portico of the lordly dwelling other servitors are preparing the board; figures are in movement within and without, and in all directions, yet each maintained in due subordination, and none of all interfering with the chief action of the piece, which maintains its interest unimpaired through all. Women are looking forth from their apartments in an upper story of the house; there are two now issuing from a doorway; they approach the summit of a flight of steps: but half-informed of what is causing the movement below, they are about to summon a servant who will give them better intelligence: we need not listen to him, since we know all he can tell; but they have a pleasant "coign of vantage," there, with their faces to the beloved mountains, and it is not without reluctance that we leave it.

Of this Bonifazio, we have said that it is now at Alton Towers; but alas for the mutability of things human, how little value is there in that "now!" To be precise then, it is there at the now of the present—this bright and blessed morn of June, being the seven-and-twentieth day of the month, in the year of our redemption one thousand eight hundred and fifty-seven.

But when the month shall call itself August—where?

It is a question that would bring most sorrowful considerations, were it not for our hope that the great lessons conveyed by this immortal work may be thenceforth secured for the benefit of larger numbers than have ever yet been permitted to profit by them. Nay, who knows that we may not all become "part-owners" in this invaluable gift from one who stands high among the best of the richly productive past to the needy and desiring of our sterile present? Why should the nation itself not then be proprietor of Bonifazio's bequest to all time? Let us entertain so consoling a hope; there can be no good reason to be given against its realisation; and he sure that no picture in our present possession will assemble so large a crowd as will daily be seen around "THE RETURN OF THE PRODIGAL SON,"* if you will but give it fitting place in the gallery that must some day be made worthy to be called the National Gallery of England.

There are three pictures by Bonifazio in the Louvre—a Resurrection of Lazarus, a Holy Family of great beauty, and a Madonna with the Divine Child, St. Catherine, St. Agnes, and St. John, also a child. This picture was long attributed to Palma Vecchio.

Our good and rarely failing friend, the Royal Gallery of Berlin has one work, and I think but one, of this master: the picture represents Our Saviour pointing out the writing he has traced, to the Pharisees, who have brought before him the woman accused of adultery. The accused, surrounded by her captors, awaits her judgment at his hands; a group of pitying spectators is in the distance, and in the background there is a landscape with buildings.

But for Bonifazio, as for all the masters now in question, the cities of Italy, more especially Venice, must be visited, if the student would make effectual acquaintance with their works. In the Libreria Vecchia is a painting, wherein Bonifazio has represented the encampment of the Israelites: this is said to be

* Since the above was in type, the writer has heard numerous remarks from persons varying much in condition, all proving this picture to be one of those that fulfil the highest purpose of the master—whose aims are truly great—by touching the large heart of the people; a single instance shall suffice. Bewailing the dispersion of the paintings generally, a keeper in the Alton woods, declared to the writer, that for the loss of one among them he could find no consolation. "That one I did love," said he, "and when I used to be called to move any of 'em in John Talbot's time,—for my lord would have 'em changed sometimes,—I was more afraid of harm coming to that, than to all the rest put together. Aye! I loved that picture." "And that one," inquired the writer, "what was it?" "They called it the Prodigal Son," replied the woodman, and he looked down sadly on the bright green turf before him, evidently recalling the features of his lost favourite with a deep regret. These were the words, but how eloquent were the looks and tones! they were such as the noble master himself might have seen and heard with a just pride.

"John Talbot" is the Staffordshire name of the earl. John, the predecessor of the late Lord Shrewsbury—few titles have so grand a sound as have those two names on the lips of the peasantry, still mourning him who bore them; nor is any title often pronounced with so respectful an affection as is that fine old name, "John Talbot."

the first attempt made by any painter to give the real effect produced by the sun. The Academy—Academia delle Belle Arti—has a picture, among others, of "The Rich Man's Supper," thus described by Kugler, with whose words our brief notice of the master must close:—"The time is the afternoon, the place an open hall, with a table at which the rich man is seated between two female figures; one, with her hand on her breast, is assuring him of her fidelity, the other listens thoughtfully to a lute-player, and to a half-kneeling violincellist, whose music is held by a Moorish boy, while a bearded noble overlooks the group. On the left are two pages drinking wine; on the right, Lazarus, the beggar, is being turned away by a servant with a dog; in the background is a stately garden, with falconers, pages, and grooms."*

Other Venetian masters are represented in the Shrewsbury collection, and among them are Giovanni Bellini, Giorgione, Sebastiano del Piombo, Pordenone, Bonvicino, and Tintoretto: no less than four pictures are attributed to the last-named of those great masters, and three of them may be by his hand; the fourth does not appear to be so, but it is a point we cannot now discuss. There is one by Carlo Crivelli, but of this, as of some by other masters, notice will be found in a subsequent column. Palma Vecchio is also here, as is Morone, who has four pictures under his name: of these, two are hung so high that the spectator has no power of examination; the third is certainly not by his hand, but the fourth has every appearance of being the work of Morone, and is a fair example of the master.

The gardens of Alton Towers are said to be the finest in Europe, and in their manner—they are Italian gardens—they do certainly surpass all previously seen by the writer; even those of the Villa Doria, outside the walls of Rome, were not, in all respects, equal to them, although "beautiful exceedingly," before those grievous changes wrought among them, as in those of the Borghese Villa, during the year '48.

The gardens of the Kinski Palace, outside the fortifications of Prague, will recur to the remembrance of all who, knowing them, shall ascend the private footway to the seat of the Talbot family; but there is a care and finish in the English garden not found in that of Prague. The gardens of Caserta, always a favoured residence, and now the constant abode of the royal family of Naples, are extensive, and in parts richly decorated, but they are not equal to those of Alton.

Unlike the German boast of Schwetzingen, also widely renowned, the Alton Gardens, which resemble them in the variety of their fountains, waterfalls, temples, lawns, terraces, and gleaming statues, have the inappreciable advantage of a fine site; and if in this respect the Boholi Gardens of Florence overmatch them, as regards grandeur of distant prospect and wealth of association, yet is this fair Staffordshire "pleasance" richer in its bright loveliness, and infinitely more attractive in its immediate surroundings, or what may be called the home-views, which consist of emerald slopes and wooded heights, well worthy to make part of paradise. They have, beside, the charming quality of being well within the range of vision, although extending to great distances, and forming a truly magnificent domain.

To the hearty and rich odours of that series of living and breathing pictures called "the Rock-walk of Alton," no grounds known to the writer can offer a parallel. There is a delicious solitude, of slightly similar character, at Chatsworth, but even this—rarely seen, perhaps, by any but such as linger most lovingly where Nature is least restrained, and little known to the mere passing visitor—will not presume to compare its paler loveliness with the royal perfections of its sister at Alton. Or you may here and there find a priceless jewel hidden preciously among the far depths of the flowery Pyrenean valleys, and to these the memory may recur, with a glad recognition, when coming suddenly on some new beauty in this bright vision, the legitimate "Pride of Staffordshire;" but in mere "grounds" formed by mau, look for no resemblance to it. Happy he who may linger in the whole fair region more years than we are giving weeks to its enjoyment; yet even our weeks are growing to months,

* Schools of Painting in Italy, vol. ii. p. 451.

may Heaven make us thankful for the privilege! and I would that you, who do but read thereof, were here to share it.

That family of artists, of whom Jacopo Bassano, called Da Ponte, has the most distinguished name, is represented in our country by a picture in the National Gallery from the hand of Leandro, the son of Jacopo; at the Royal Institution of Edinburgh, where there are two pictures by Jacopo himself; at Hampton Court, where there are several by Francesco Bassano, with one by Leandro; and at the Royal Institution of Liverpool, where there is a work by Francesco, with one attributed to Jacopo; but this last, unknown to the present writer, is not considered to be a good specimen of the master. In private collections works by the Bassani may also be found: that of Mr. Miles, at Leigh Court, has a "Presentation in the Temple" from the hand of Jacopo, and there is an Adoration of the Shepherds, also by Jacopo, at Belyoir Castle; this last is a work of great beauty. At Chiswick there is a picture of high value by Bassano—it represents Christ bearing his Cross; and the Marquis of Exeter is in possession of a Return of the Prodigal Son, and "The Israelites gathering the Manna;" these are at Burleigh. The late Mr. Rogers had a picture by Giacomo Bassano, which he greatly prized, and with reason; the subject is, Dives and Lazarus: in the same collection was a "Good Samaritan," by Francesco Bassano. There are two important pictures by Giacomo at Devonshire House, and the "Maries," at Chiswick, will at once recur to the memory of all who have seen that work; there was one at Alton Towers, but the student who desires to see it must now look elsewhere. The subject of the last-named work, also by Giacomo da Ponte, is the Nativity of Christ; it bears the name of the master, and if not in all respects to be accounted among the best of his works, is allowed, and by severe critics, to exhibit very fine colouring.

The gallery of the Louvre is rich in works by the Bassani, and among them are several by Jacopo; Berlin has examples of all these masters. Dresden is equally fortunate, nor is Florence unprovided. "St. Martin dividing his Cloak with the Beggar," and the "Baptism of Santa Lucia," are at Bassano. The early manner of Jacopo Da Ponte is, in many respects, preferable to that of his later day; a specimen from the hand of Francesco will be found in the Church of San Luigi de' Francesi, at Rome; and there is one by Leandro in that of San Giovanni e Paolo, in Venice; this last is considered to be a highly favourable example of the painter.

Of Giovanni Licinio, called Pordenone, the friend and follower, perhaps the disciple, of him whose early death "the noble Arts" (as they are truly called by the loving Vasari) can never sufficiently deplore—the still and ever to be lamented Giorgione, as of the other admirable masters above named, none should presume to make a mere casual or hasty mention, nor shall we do so without extreme reluctance. He, too, is represented at Hampton Court and in Edinburgh. A Holy Family, two finely painted portraits, and a lady playing on a musical instrument, form part of the first-named collection; the second has but one example; nor is that one among the best productions of Pordenone,—the subject of the work is our Saviour on the Mount. There are three pictures by Pordenone in Lord Brownlow's collection,—one, the figure of a man with an open music-book, bearing the name of the master and the date 1524. There is an admirable work of the same earnest painter at Alton Towers, the figures recalling that elevation of character which all who have seen his works in Venice, will remember, with a pleasure much enhanced by that respect for the artist which the best of his works inspire. The "Adoration of the Kings" is the subject of the work; and if there were not a thousand good reasons why the lover of beautiful Nature should ever rejoice in some fair excuse for visiting the attractive region surrounding Lord Shrewsbury's seat, the lover of Art will find sufficient cause for doing so in this one picture. In the best manner of the Venetian school, the "Adoration" here in question, might also be transferred with advantage to the national collection. The head of the worshipper, who is bending to kiss the foot of the divine Child, is remarkable for the majestic beauty which Pordenone so well knew how to impart to the features of one whom he delighted

to honour: the reverential expression impressed on the whole being of this noble personage, in no wise detracts from the dignity of his aspect, which is entirely worthy of Pordenone. The second of the Magi regards the Babe with a mingled expression; whether to wonder most or most to adore seems undetermined in his mind; not so in that of the attendant beside him, whose face is eloquent of the deepest awe. There is not enough of the exterior world in this picture, which one longs to see extended, by that masterly hand, over a broader space of landscape. It is, beside, in so disadvantageous a position at the present moment, that minute examination is nearly impossible: let us hope that the coming change will at least correct that fault.

The Marquis of Exeter is in possession of two pictures by Pordenone, erroneously attributed to Titian and Jacopo da Ponte. The first is the "Finding of Moses"—"noble in the characters and expression,"—as it should be, if it claim to bear the name of Pordenone;—"grand in the forms, and of a warm, full tone of colouring, I do not know any other gallery which can boast two such works by this rare master." So says Dr. Waagen, speaking of the first-named of these paintings; the second he calls, and justly, "a rich and admirable picture." This last is that hitherto attributed to Bassano (Jacopo da Ponte), but declared by Dr. Waagen, as is the Finding of Moses, before mentioned, to be the work of Pordenone.

In the excellent collection at the Royal Museum at Berlin, there are two pictures by Pordenone which the writer remembers with pleasure,—these are "Christ washing the Feet of the Apostles," and the "Woman accused of Adultery;" a third is mentioned, but this we have not seen.

Of Pordenone's works in Udina and Piacenza, we can but say here, that no student or lover of Art who may pass within reach of either city should neglect to visit them. Vasari speaks in highly eulogistic terms of a fresco at Mantua, exhibiting beautiful children twined fancifully amidst the giant letters of an inscription purporting that the dwelling of the owner is reared for himself and his friends,—a familiar custom of the day: this we have not had the good fortune to see, in the sole visit made by the writer to Mantua; a city which has not too much in all the riches of its varied associations to make up for the utter dreariness of its water-logged aspect. In the Venetian Academy, in the Church of St. Rocco, and in other churches and palaces of Venice, are also works of inestimable value, by Pordenone; but we can do no more than intimate the fact. Fortunate the eyes that shall verify it for themselves!

THE APPLICATIONS OF IMPROVED MACHINERY AND MATERIALS TO ART-MANUFACTURE.

No. 10.—COLLODION AND PHOTOGRAPHY.

PHOTOGRAPHY was, but a few years since, regarded as one of the wondrous of science—it is now numbered amongst the common things of the day. Herschel, Talbot, and one or two other men, were the only persons engaged in examining the striking phenomena of chemical change under solar influence, and the results of their studies were handed about as examples of a strange natural magic. Daguerre, the French dioramic painter, who has given his name to the photographic process, which he discovered, then required a period of twenty minutes to obtain a picture on his metal plate, and he then wrote to the writer of this article, stating his belief that he had discovered a process by which portraits from the life could be taken in from two to three minutes. Now, there are thousands at work, and their productions are in every person's hands. At the corner of every street we are beset by *touters*, proclaiming the merits of their respective works, and they parody the human face "at any price you please." From the twenty minutes of Daguerre, we have advanced in the chemistry of this art so rapidly that as many seconds are all that are now required, under ordinary circumstances, to produce a far better result than any which he obtained. In skillful hands, and with careful manipulation, such a degree of sensibility can be secured that less than a second of time will fully impress the prepared

tablet with any set of images, full of the minutest detail. It is instructive to contemplate what photography has done and is doing.

From all parts of the world we receive sun-pictures of celebrated scenes. The pyramids of Egypt, and the tombs of her kings and priests, with every hieroglyphic, so faithfully printed that Mr. Birch can read their story with as much ease as a schoolboy reads our ordinary letter-press, are now in every photographic portfolio. Assyria and Babylon, and the sites of old civilisations, are brought home to us in strange fidelity. The sands which have worn the porphyries of which the enduring monuments of those ancient powers were constructed, can be counted at the base of a statue, and the marks of the fine attrition are preserved upon the stone in the sun-picture. The vegetation of any and every clime, in all its native beauty and wildness, can now be copied, and the botanist can study in his closet the flora of far-off lands. The peculiar characteristics of the human race, wherever one of the great family is found, can now be secured and preserved for the benefit of the untravelled ethnologist. Beyond this, the proverbially restless ocean, is now made to leave upon our photographic plates true delineations of its passing waves, and impressions of its breaking billows. The fleeting cloud, whether in sunshine or in storm, now leaves its ever-varying image on the sensitive tablet. The moon—"pale mistress of the night"—is compelled by her "mild light" to print her own image; and the "god of day" is to be made to register, for our instruction, those strange disturbances, manifested to us as black spots, which are ever, with strange regularity, taking place in the atmosphere by which the great centre of our system is enveloped. In our observatories, too, we press photography to our aid. The varying pressure of the air is registered by it;—the constant changes of temperature are recorded by it;—and those mysterious alterations which are ever occurring in the magnetism of the earth are noted with rare accuracy by its means. Man must have repose, and there are limits within which the range of human—even the most trained—observation are confined: consequently the most skilled observer could only register results at certain fixed periods, and many variations are too small to be noted by the human eye, or marked by mortal hand:—the camera-obscura, aided by the light of a common gas-burner, is placed for ever before the instrument, and each movement for every second of the twenty-four hours is marked for the study of the philosopher!

All this arises from the careful study which, a few years since, was made of the chemistry of the art, but which we fear is too slightly thought of at present. In all our photographic processes there has been much refinement in the manipulative details, and whether we regard the calotype, the albumen process, the wax paper, or the collodion, we cannot but be struck with the degree of certainty with which, in skilled hands, a high degree of perfection is secured. To nothing, however, has the wide extension of photography been due, so thoroughly as to that curious chemical preparation to which the name of COLLODION has been given; and it is our purpose to devote a short space to the consideration of the physical peculiarities of this compound, and especially to direct attention to some improvements, by which it would appear that the prepared collodion plates can be kept in a state of high sensibility for a considerable time.

Gun-cotton dissolved in ether is called Collodion, because of its adhesive properties, from *κόλλα*, to stick. If cotton-fibre or paper, which, being prepared from some vegetable fibre, is in fact chemically the same material, be examined as to their properties, we shall find that they will not dissolve in water, in alcohol, or ether, but we shall discover that if placed in nitric acid (*aqua fortis*) they change character, and are gradually dissolved. A careful investigation of what takes place instructs us in the fact that the cotton or paper (chemically *lignine*) has received some oxygen from the acid, and then it has become soluble in that fluid. If sulphuric acid be added to the nitric acid in certain proportions, the latter acid will no longer dissolve the *lignine*. If we examine the cotton or the paper treated with those mixed acids, we shall perceive that there has been a contraction of volume, but beyond this no visible change. Upon removing either of those substances from the mixed acids, we shall discover that they

have respectively increased in weight by nearly one half, and they are now soluble in ether and alcohol. Beyond this, whereas the cotton or paper burnt but slowly in the first place, it exploded with violence when brought in contact with flame after it has been treated with the acids. We have here a very remarkable change in the properties of a body without its having undergone any visible change of form. It was cotton to the eye, and it is cotton to the eye, but there are striking physical differences between the two substances.

Schonbein, of Basle, the discoverer of this preparation, announced the fact at the meeting of the British Association at Southampton, and it was then thought that it possessed properties which rendered it in many respects superior to gunpowder as a projectile. Trials were made with it as a destructive agent, and great were the advantages to be derived, *apparently*, from its use. Additional experience proved, however, that there were many objections to the employment of gun-cotton in war, and the great danger which attended its manufacture in large quantities has in this country led to its abandonment for this purpose. In Austria, however, experiments are still being carried on in the hope of employing gun-cotton for artillery.

Cotton thus changed in its character has been called *pyroxyline*. An analogous substance has been called *xyloidine*. Gun-cotton, or *pyroxyline*, appears to be a direct combination of anhydrous *lignine* with nitric acid. Hydrogen and oxygen, which exist in the equivalents necessary for the formation of water, exist in the *lignine*, and, by the acid treatment which we have described, two atoms of these elements are replaced by two atoms of nitric acid. *Lignine* is composed of—

Carbon,
Hydrogen,
Oxygen.

This is treated with nitric acid $\left\{ \begin{array}{l} \text{oxygen} \\ \text{nitrogen} \end{array} \right\}$, and the result is *pyroxyline*, having the following composition—

Carbon,
Hydrogen,
Oxygen,
Peroxide of nitrogen.

There are three or more varieties of *pyroxyline*, dependent upon small differences in the mode of manufacture which has been adopted. Some of these are not so well fitted for photographic purposes as others. The gun-cotton best fitted for the manufacture of collodion is not very explosive, but it dissolves freely and entirely in a mixture of ether and alcohol. It is not our purpose to describe the processes of making collodion further than we have already indicated them. We will suppose the amateur is either familiar with the best process for making it, or that he depends upon some skilful chemist for his supply.

This *collodion* is to be impregnated with a salt of iodine (usually the iodide of potassium); this is effected by dissolving the salt in alcohol, and mixing the alcoholic solution with the collodion. In this state it is known as iodized collodion. When poured upon a plate of glass, and uniformly diffused over its surface, the ether, evaporating, leaves a very delicate film, which is the surface on which the future picture is to be formed. When the film is set, the plate is placed in a bath of nitrate of silver, and the iodine, combining with the silver, forms in the film iodide of silver. This iodide of silver, in contact, probably in combination, with the complex compound constituting the film, is rendered exceedingly liable to change under the influence of the chemical rays of the sun.

The collodion has been frequently stated to be used merely "to support a delicate film of iodide of silver upon the surface of a smooth glass plate." This is taking but a very narrow view of the important part played by the collodion. In no other body with which we are acquainted have we the same important set of elements—carbon, hydrogen, oxygen, and nitrogen, so combined as to be constantly in what Sir John Herschel calls "a state of unstable equilibrium." By Heat, by Light, by Electricity, the balance of affinities is readily disturbed, and decomposition ensues. The sensibility of the collodion process depends upon this "unstable equilibrium," which renders the photographic

compound one which is instantly overturned by the actinic power of the sun-ray; and the decomposition of the collodion is at once communicated to the metallic salt (iodide of silver) in combination with it. Iodide of silver, spread in the most delicate film on dry collodion, is no more sensitive than other preparations. The collodion process, on account of this wondrous instability, which renders it so easy of manipulation at home, is a source of constant trouble to the traveller. The plates have been usually presented to the object while still moist, consequently a tent, or cumbrous contrivance about the camera-obscura in lieu of a tent, has to be employed out of doors. The operator has to prepare his plates in the field, and to carry from place to place his collodion and his silver bath, and indeed all his stock of chemicals. This has greatly retarded the use of collodion by the traveller; and it is quite certain that, although very fine photographs may be obtained by some of the paper processes, there is not one of them which ensures such perfection of detail as the collodion process. The attention of photographers has been turned to the preparation of collodion plates which would keep; and many of the modes adopted, especially by Mr. Llewellyn, with his oxymel process, by Mr. Shadbolt, with his glycerine, by Messrs. Crooks and Spiller, with their deliquescent salts, and by some others, have been successful. One process, however, appears to commend itself beyond others, and to that, a process devised and published by Mr. CHARLES A. LONG, we desire to direct attention. Mr. Long has published all the details of his process in a little book, to which we refer our readers, intending only to deal with the preservative solution, which appears applicable to the collodion film under a great variety of conditions. In the first place we will give the mode of preparing this preservative solution:—

"Some care is required in the preparation of this solution, in order that it may be clear and bright when finished, and not contain particles that would be deposited in its passage over the collodion film when being used. The chief precaution to be observed, is *not to allow it to boil too rapidly, and not to conduct the operation over too fierce a fire*; attention to this will prevent many failures, and ensure a solution in every way suited for the process. Take 200 grains of the best transparent gelatine, cut it into small shreds, and throw it into a pipkin in which has been previously placed 10 ounces of distilled water; set this on a slow fire, or over a lamp, until the gelatine is completely melted; then weigh out 100 grains of pure citric acid, and dissolve it in 2 ounces of distilled water; add this to the solution of gelatine, stirring it during the addition with a glass rod. The solution in the pipkin is now to be gently boiled until half of it has evaporated; this should be in about 15 minutes; remove it from the fire, and add sufficient distilled water to make up the bulk of liquid to 12 ounces. When quite cold, the liquid in the pipkin is to be filtered through two thicknesses of pure white blotting paper into a bottle perfectly dry and clean. We now add to every 12 ounces of filtered preservative solution 1 ounce of alcohol, of the specific gravity of .840. The solution thus prepared is ready for use, and should be of a pale amber colour, without any signs of insoluble particles floating in it; should any appear after it has been prepared for some days, a second filtration will remove them, and render the liquid again bright and clear."

The collodion plate being prepared, the preservative solution is applied in the following manner:—

"Taking the plate in the left hand by means of the pneumatic holder, incline it slightly; then having poured into a perfectly clean measure rather more of the preservative solution than is necessary to cover the plate twice,* pour half of it along the upper edge in such a manner that a wave of the solution may flow uniformly from one end of the plate to the other; allow this to flow off into the waste pan or sink, and then bring the plate to the horizontal position, and pour on the remainder of the preservative solution, four times at least, allowing it to flow back into the measure from each corner in succession, in order that the whole plate may be brought uniformly under its influence. The plate is to be then placed on a piece of clean blotting paper, and its back

wiped with a fragment of blotting or *papier Joseph*, in order to remove any of the preservative solution that may have run from the surface to the underside in the previous operation. The plate thus preserved is to be reared on a piece of blotting paper, with its face against the wall, until dry, and is then to be stowed away in a plate-box, perfectly light-tight, to await the exposure in the camera-obscura."

It will be evident that the great point which has been secured is the preservation of the collodion film from the influences to which the disturbance of its instability are liable. It is defended by an airtight coat of gelatine; and we can state from our own experience, that plates thus prepared have been kept a fortnight without losing any of their sensibility. A set of plates were prepared by Mr. Charles Long for a gentleman who took them with him to Belgium. He, without any trouble, impressed them with a set of views, replaced the plates in his dark package, and on his return to this country the pictures on them were developed—and most perfect representations of nature they were.

It will be understood, that the sensitive plate fully retains that degree of sensibility which it has when first the preservative solution is applied. The sensibility is slightly lowered by its application, but for a month the plate is said to suffer no further loss of power; the surface is so hard that any number of plates can be packed together in one parcel. They can be taken out—in the dark of course—one by one as required, placed in the camera-obscura, and impressed with the lenticular image, again removed from the camera, and placed—in the dark—in the package, until a favourable opportunity occurs for developing the dormant picture. If the result of enlarged practice confirms the results of our own experiments, this process of Mr. Charles Long* must prove a valuable addition to photography.

ROBERT HUNT.

OBITUARY.

THOMAS UWINS, R.A.

YEAR by year death is thinning the ranks of the elder members of the Academy, leaving their places to be occupied by those who, though comparatively young in age, are old enough in repute to sustain the honours of our national school. It is our sad duty to record the decease of Mr. Uwins, R.A., on the 25th of August.

He commenced his career in the world of Art under an engraver of the name of Smith; but the occupation and the employer were alike distasteful to the youth, so that at the earliest fitting opportunity he quitted the studio—or perhaps it ought to be called the "workshop," for it was little better—of his master, and became a student of the Royal Academy, and also attended the anatomical lectures of the late Sir Charles Bell. It was, however, necessary that he should realise the means of supporting himself during this period of study; he therefore employed his leisure hours in making drawings for illustrated books, and copying, in water-colours, pictures of the old masters for the purpose of engraving. His designs were soon in much request by publishers, and were considered to hold a worthy place by the side of the great book-illustrators of the day, Stothard, Smirke, Westall, and Howard; while his copies were so successfully executed as to obtain the notice of many leading patrons of Art, as well as of some of the best artists of the period. In 1811 Mr. Uwins was elected a member of the Water-Colour Society, and subsequently became its secretary. In 1814 he visited the South of France, and returned home with a considerable number of sketches, from one of which, more than thirty years afterwards, he painted for Mr. Vernon, the "Vintage," now in the national collection. Shortly after his return from the continent he became involved in pecuniary difficulties, through the defalcation of a friend, the collector for the Society of Arts, for whom he had made himself responsible. To discharge himself from the burden thus unexpectedly thrown upon his shoulders, he was

* See "The Dry Collodion Process," by Charles Long, Bland & Long, Fleet Street.

* A plate, 9 inches by 7, takes about 1 ounce of solution.

compelled to forego, for a time, all hope of advancing in his profession, and to labour only to realise the means of getting free from his obligations. But in effecting this honourable object he greatly impaired his health, and almost ruined his sight; yet it was accomplished, and then followed an entire suspension from work for a considerable time to recruit his exhausted energies; but his sight, even after he resumed his pencil, had been too much injured to permit of his continuing to execute delicate drawings in water-colours. He then directed his attention to portrait-painting, and visited Scotland, where he remained two years, finding ample employment and acquiring considerable reputation. But he had long cherished the idea of seeing Italy, and, as his health and vision were now perfectly restored, he set out for Geneva in the autumn of 1826; thence he moved forward to Florence and Rome, and, after sojourning some little time in these cities, he proceeded to Naples, then to Venice and the north of Italy, returning to England in 1831.

The earliest picture resulting from Uwins's Italian tour was exhibited at the Academy in 1830, "Neapolitans dancing the Tarantella;" it was followed, in 1832, by "The Saint Manufactory," a subject so novel, and so admirably treated by the artist, that it at once fixed the attention of the Art-loving public upon the painter, and the Academy recognised his merits by electing him an Associate in the following year. From this period he continued to send annually to the Academy a succession of pictures, chiefly representing the manners and customs of the Neapolitans, a class of subjects for the most part new to the British public, and rendered with much beauty, feeling, and expression: we can enumerate a few only of these:—"Taking the Veil," "The Festa of Pie di Grotta," "The Boy's Song of Love—Bay of Naples," "Festa della Madonna del Arco," "Confession of the Black Crucifix," "The House of Mourning—Naples," "Bower in a Vineyard near the Tomb of Virgil," "The Mandolin," "Children asleep in a Vineyard," "Neapolitan Peasants returning from a Festa," "The Fisherman's Song of Naples." These subjects were occasionally varied by others; such, for example, as "The Woman taken in Adultery," exhibited in 1838; "The Chapeau de Brigand" (1839), now in the national collection; "Shylock and Jessica," (1840); "Lear and Cordelia in Prison" (1841); a scene from Don Quixote, "Dorotea disguised as a Shepherd Boy."

In 1836 Mr. Uwins was elected Royal Academician, his diploma being the first which bears the signature of Queen Victoria. He was also one of the artists selected to execute some frescoes in the Pavilion at Buckingham Palace, and soon afterwards was appointed Librarian to the Royal Academy, a post which he resigned, on account of ill-health, about two years ago. In 1842 he was appointed by her Majesty Surveyor of the Royal Pictures, and in 1847, Keeper of the National Gallery, succeeding Sir Charles Eastlake; this office he held till 1855, when the arrangement, by which this institution is now managed, came into operation. The cabal that drove these two gentlemen from office, was the subject of much comment in the *Art-Journal* at the time when it occurred.

Mr. Uwins's pictures are characterised by graceful composition and delicate execution; whatever he did was done carefully and conscientiously; and his works will always be valued as examples of simple, pure, and unaffected Art.

We have received, from a valued correspondent who knew Mr. Uwins intimately, the following remarks, which we gladly append to our own:—

"The vacancy which has occurred in the Royal Academy, though for some time anticipated, came upon us unexpectedly: the tender watchfulness of Mrs. Uwins had so frequently, during the last few years, restored Mr. Uwins to comparative health, and his last visit to Brighton had served him so well, that his friends believed in the renewal of his strength, while he himself was fully impressed with the hope that he should regain his command of the pencil; and many of his latter hours were happily passed in "the labour of love" which has placed his earlier pictures amongst the best of the English school. When he left Kensington, he chose a residence at Staines, that overlooked a charming garden: he intended, we believe, to have passed into perfect retirement; but this could hardly be; his

name was known and respected; and even those who could not appreciate his art, felt involuntary love and respect for the venerable and benevolent old gentleman, who never passed a child without a smile and a blessing.

"His evening days were, perhaps, the happiest of his long life; he was much esteemed by his brethren of the Royal Academy (an institution which he ranked with Church and State, and in which he could see no wrong); his domestic life was perfect in its happiness; his friends were sincere and affectionate; he was proudly and gratefully conscious of the Queen's favour; and he was able to enjoy the perfume of flowers, and the beauties of nature, until within a few hours of his death.

"His connection with the National Gallery was patent to the world, and the vexations attendant upon it had much better now die, as they had nearly faded from Mr. Uwins's remembrance.

"His illness commenced in 1855: his picture of a lady making her way through the unfrequented paths of a wood, was exhibited in a scarcely finished state. The next spring he contrived, by great exertion, so great as to be followed by the temporary loss of the use of both arms, to finish an English scene of "Gleaners." In the autumn of 1856, when unable to go abroad to work, he painted a small landscape from his study-window, "Langford Bridge." This was his final exertion; for while planning many things, and sometimes being set up at a canvas, he never afterwards had strength to complete a single work.

"When his hand refused even the mere weight of palette and maul-stick, he resorted to water-colours, and made some sketches in the neighbourhood. The last was of Mr. Ibotson's paper-mill, at Ankerwyke—a place always romantic and particularly interesting in the spring, because the swans bring up so many cygnets there. On Friday, the 21st of August, the venerable painter, faithful and loving to his art, was out of doors sketching; his energy far exceeded his fitness for such exertion; the following day, although his hands were cramped by pain, he applied himself closely to his drawing; and it was only by stratagem that Mrs. Uwins was able to "coax" away the drawing materials. Even when unable to be dressed, his strong yet gentle spirit did not yield to mere bodily weakness. He bowed with true Christian meekness to the almighty fiat, and anticipated the last with the most perfect fortitude; but he still loved the air and sunshine, and was wheeled in his chair to the window overlooking his friend's pretty garden. What followed touched us deeply. After gazing some little time—"I have always," he said, "feared there would come a time when I should look out on the beauties of Nature, and see no beauty in them. *It is come!* I look out this morning, and see no beauty in that beautiful garden!" True, indeed—it was then that death was nigh at hand! He passed away on the 25th of August, 1857, in his seventy-sixth year. He was born the 25th of February, 1782.

"We have lost an old and valued friend—that concerns ourselves; but Art has lost one whose appreciation of the pure, the beautiful, and the holy, was sincere, as it was perfect. Some of Mr. Uwins's Italian pictures, painted when his hand was firm, and his observation faithful and vivid, shed happiness around them. He always chose such subjects as created 'sunshine in a shady place'—subjects in harmony with God's beautiful works. His children were earthly angels—for he mingled the earthly with the spiritual, as only a pure and elevated mind could do; his women, whether in repose or action, never suggested an idea that was not fit for the domestic sanctuary.

"We can hardly overrate the accomplishments of his mind; his residence in Italy was during his best time; and his reading was extensive and profound; he was graceful and elegant as a letter-writer; and we hope that Mrs. Uwins will give to the world the stored correspondence that must be at her command—the shortest note written by Mr. Uwins was worth preserving. His taste in all things was somewhat too refined for strength; nor was this refinement a matter of Art,—it was his nature and character in all things.

"The artist was buried on the 2nd of September, in the picturesque church-yard of Staines. His remains were followed to the grave by twelve members of the Royal Academy, his old and cherished friends."

A. M. H.

CATHEDRAL RESTORATIONS.

NOT many years have passed away since the restoration of a cathedral involved results so surely and seriously disastrous, that the process itself might justly have been regarded as a national calamity. Essentially, and after a peculiar manner, our cathedrals are national edifices: from generation to generation they hand down each its own chisel-graven chapter in the history of a great and noble art, while in their uses and through their associations they all unite in a common appeal, as well to our holiest as to our most cherished sympathies. So long, accordingly, as to "restore" was synonymous with to mutilate, if not to destroy, so long would cathedral restoration be an operation to be resisted, if possible, by the interposition of the nation; if inevitable, it must, as we have said, have been felt to have been a national calamity. But a most happy change has been wrought in the architectural acceptance of this term restoration. We now have learned to understand something at least of the true spirit of Gothic Art, and hence the restoration of a cathedral no longer conveys the idea of quasi-classic insertions, and screens of stucco, and substitutions of slate for lead, and of street-paving for slabs of porbeck, and such like things.

For a building to be time-honoured is a condition inseparable, in some degree, from its being also time-worn; and sometimes the wearing effects of the lapse of centuries render the work of reparation imperative, unless the once strong fabric is to be permitted to sink down into the picturesque desolation of a ruin. Such a consummation the appointed guardians of our cathedrals are bound to avert, precisely as it is their bounden duty not to permit a new cathedral to be substituted for an ancient one. The grand cathedral of Ely has been restored upon a splendid scale, and after a most admirable fashion. At Hereford the comprehensive works which have been long suspended are about to be resumed with fresh and increased vigour. Graceful Lichfield is prepared to follow. In all these great works Mr. G. G. Scott is the architect whose ability, experience, and earnest devotedness to his art have secured for him the direction of the restorations. Carlisle has been very ably dealt with by Mr. Ewan Christian; and Worcester is now undergoing a course of restoration which may take its place amongst the most important and also the most satisfactory works of its class. This singularly interesting edifice appears to be comparatively unknown to architectural students, and yet it possesses features which assign to it a place in the front rank of our noblest and most beautiful churches. The composition of the north and south fronts of the lesser transept, and of the adjoining compartments towards the east and west, are amongst the most perfect expressions of Gothic Art, and the interior of the cathedral abounds in exquisite details. The south wing of the east transept required actual reconstruction; accordingly, its south front has been taken down, each stone has been carefully marked, and its injuries having been as carefully repaired, it has been restored to its former position. The eastern and western compartments are to be similarly treated. The corresponding compartments towards the eastern extremity of the cathedral are almost completed, on the same plan of restoration; and the eastern gable has been rebuilt from the ground, the design having been studied with the most scrupulous exactness from the original design of the transept. The original eastern termination of the cathedral had passed away without leaving any traces of its character, beyond what might be gathered from other portions of the building that were erected at the same time with it. Much has also been done in the interior of this cathedral in removing whitewash from porbeck shafts, restoring mutilations, &c. The same judicious treatment has pervaded the whole of these works, and the execution of the new carving shows that here we are able to rival the productions of the greatest of the mediæval periods. Mr. Perkins, a citizen of Worcester, is the architect to the dean and chapter, and he has proved himself to be worthy of the confidence of such generous and high-minded patrons. Though much yet remains to be done, we doubt not that all will be gradually and satisfactorily accomplished.

THE BOOK OF THE THAMES,

FROM ITS RISE TO ITS FALL.

BY MR. AND MRS. S. C. HALL.

PART X.

PASSING Culham Court, and underneath a range of wooded hills, we reach "Mill End," or Hambleton, lock. The adjacent country becomes exceedingly beautiful, varied by alternate mills, islands, meadows, and hills, with every now and then ornamental "forest trees" hanging over the stream, and giving pleasant shade to the current on its downward flow. Magpie Island is reached and passed; but those who have leisure may linger about this charming spot. The wood of Medmenham soon comes in sight; the ruined Abbey is seen among the trees; and close beside it a pretty ferry with the pleasant way-side inn of Mrs. Bitmead—a domicile well known to artists, her frequent guests, one of whom, who has since become "famous," painted a sign-board which hangs over the door, and is of so good a quality that it might grace the Exhibition of the Royal Academy. The ABBEY has been pictured a hundred times, and is a capital subject seen from any point of view; the river runs close beside it; there is a hill adjacent—Danes' Hill; dark woods and green meadows are at hand; gay boats and traffic barges are continually passing; the ferry is always picturesque; and the artist is constantly supplied "on the spot" with themes for pictures; especially he has before him the venerable ruin—"venerable," at least, in so far as the eye is concerned. Time has touched it leniently; some of its best "bits" are as they were a century ago, except that the lichens have given to them that rich clothing of grey and gold, which the painter ever loves, and added to it here and there a green drapery of ivy.

The manor of Medmenham was, in the reign of King Stephen, given by its lord, Walter de Bolbec, to the Abbey of Cistercian Monks he had founded at

MEDMENHAM ABBEY.

Woburn, in Bedfordshire; and in 1204 the monks placed some of their society here, on this pleasant bank of the Thames; hence arose "a small monastery, being rather," as the writers of the order express themselves, "a daughter than a cell to Woburn." In 1536, it was annexed to Bisham. At the dissolution, according to returns made by the commissioners, "the clere value of this religious house was twenty pounds six shillings; it had two monks, and both desyrin to go to houses of religion; servants none; woods none; debts none; its bells worth two pounds, one shilling, and eight pence; the value of its movable goods, one pound, three shillings, and eight pence; and the house wholly in ruine." It must have undergone considerable repair early in the sixteenth century, and probably very little of the original structure now exists, although relics of antiquity may be traced in many of its "remains." That portion which fronts the Thames is kept in proper repair, and a large room is used for the convenience of pleasure-parties. The whole of the back, however, is in a wretched state of dilapidation, although inhabited by several families. The property belongs to the Scotts of Danesfield, a mansion that crowns a neighbouring hill.

Medmenham derives interest from events of more recent date than the occupation of its two monks, without goods, and without debt. Here, about the middle of the last century, was established a society of men of wit and fashion who assumed the title of Monks of St. Francis, and wore the habit of the Franciscan order. Although it is said the statements contained in a now forgotten but once popular novel—"Chrysal; or, the Adventures of a Guinea"—were exaggerated, the character which the "assumed" monks bore in the open world, was sufficiently notorious to justify the worst suspicions of their acts in this comparative solitude. The principal members were Sir Francis Dashwood (afterwards Lord Le Despencer), the Earl of Sandwich, John Wilkes,

Bubb Doddington, Churchill, and Paul Whitehead the poet. The motto,—*"Fay ce que vouldras,"*—indicative of the principle on which the society was conducted, still remains over the doorway of the Abbey House. Tradition yet preserves some anecdotes illustrative of the habits of "the order," and there can be little doubt that this now lonely and quiet spot was the scene of orgies that were horrible and infamous.

DOOR OF MEDMENHAM ABBEY.

The Thames now flows through one of the richest of its many rich valleys; and hence, until it arrives at Marlow, its windings are frequent and of long continuance,—the flatness of the view being relieved, looking back, by the wooded slopes of Culham and the distant Chilterns, in Buckinghamshire.

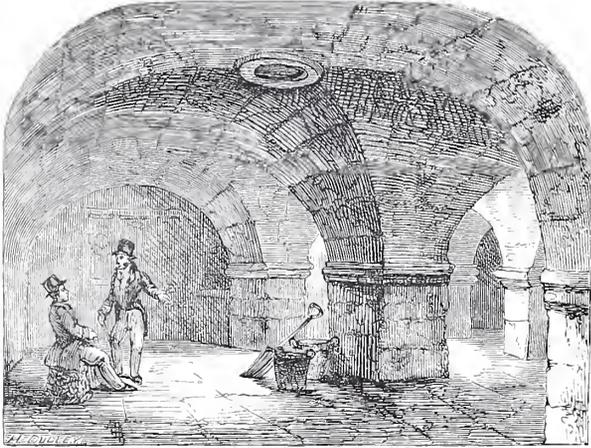

The pretty and picturesque village of Hurley is now reached, it is in Berkshire; another village, that of Harleyford, occupying the opposite bank. Adjoining Hurley, was Lady Place,—formerly a priory for Benedictine monks, more recently a stately mansion; but now indicated only by aged garden-walls. The house was erected, during the reign of Elizabeth, on the site of the ancient convent, and out of the debris of the buildings, by the then owner of the estate, Sir Richard Lovelace,—one of the brothers in arms of Sir Francis Drake. "He was a gentleman of metal," writes old Fuller, "who had the success to light on a large amount of the King of Spain's cloth of silver,—I mean his West Indian fleet,—wherewith he and his posterity are warmer to this day." He was created Baron Lovelace, of Hurley, by Charles I.; but during the reign of his two successors, the house was the meeting-place of the several peers and leading commoners whose movements led, eventually, to the "calling in" of the Prince of Orange. "The meetings were held under cover of splendid hospitalities, by which the noble owner of the mansion is said to have exhausted his fortune."* The more secret and perilous consultations were, it is said, held in a vault underneath, originally the burial-place of the monastery. The house is described by Boydell, in 1794, as "a spacious edifice. The hall, which occupies a disproportionate part of it, is a noble room, with a light gallery round it; the saloon is wainscoted with English oak, which was sent over in panels to Italy to be painted, according to the family tradition, by Salvator Rosa. The views are undoubtedly Italian, and in the bold style of that great master."† The structure having become much dilapidated, was altogether removed in the year 1837. Fortunately, Mr. Fairholt visited "the Place" about that period, and made sketches of the various objects of interest, among others of the famous vault; and to his pen and pencil we are indebted for the following details.

Lady Place obtained its name from the monastery upon whose foundation it stood having been dedicated to "our Lady" the Virgin. The exterior had projecting wings and a porch, in accordance with the prevalent taste of the reign of Elizabeth, said to have been thus generally adopted in compliment to that sovereign, the ground plan forming the initial of her name, thus—**PL**. The inner arrangements were singularly inconvenient, except in the lower story, where they were much enriched with stucco ornament, and painted landscapes; but the upper rooms were small, and the gutters of the roof ran through them, freely admitting both water and air. The vault below was reached by a trap-door in the hall-floor, and was very solidly constructed, receiving its light from a grated window below the level of the garden. In one recess (that behind the figures in our cut) a square tablet was inserted, containing three inscriptions in as many compartments, giving the chief facts connected with its history: first detailing its original foundation, "at the time of the great Norman revolution, by which revolution the whole state of England was changed;" then, "that

* When the prince became converted into the monarch, as our King William III., he did not forget the service that Lord Lovelace had rendered him; he made him captain of the Band of Gentlemen Pensioners, and gave him other emoluments; but the taste for open housekeeping and display, engendered by his revolutionary meetings, never left him. He made great alterations at Lady Place, re-decorated the interior, and lived in an extravagant style; so that his possessions were sold, under a decree of Chancery, at his death, to pay the debts in which he became again involved.

† They were, more probably, the work of Antonio Tempesta, who designed in the same style, and was much employed in such decorations as these. The paintings had but little merit, and brought very small prices when the house was destroyed.

in this place, six hundred years afterwards, the revolution of 1688 was begun, and it is said that several consultations for calling in the Prince of Orange were held in this recess, on which account this vault was visited by that powerful prince after he had ascended the throne; the third inscription commemorated another royal visit in these words:—"Be it remembered that this place was visited by their majesties King George III. and Queen Charlotte, on Monday, the 14th of November, 1785." The visit of General Paoli, the celebrated commander of the Corsicans in the revolution of that island, was also noted in May, 1790; as well as the fact that, in digging below the floor, some bodies in Benedictine habits had been found, the last denizens of the old monastery. As we have said, there are now no remains of Lady Place, except the garden walls, to indicate its "whereabouts."

THE VAULT AT LADY PLACE.

Passing Temple Hall, the seat of the old and honourable family of Williams, we arrive at BISHAM ABBEY,—one of the most picturesque objects on the Thames, and also among the most venerable and interesting of all the ancient remains which time and use have consecrated.

The Abbey and church are in admirable "keeping;" but each has its own peculiar features. The Abbey is now a modern residence, tasteful, and comfortably arranged, furnished, and decorated. The mansion is old—of the Tudor period; it was built on the site of the Abbey—originally a preceptory of the Knights Templars, but subsequently a priory for canons of the order of St. Augustine, founded by William Montacute, Earl of Salisbury, in 1338. His body was interred in the church, together with that of his son William: here also were laid the "mortal parts" of that Earl of Salisbury who died at the siege of Orleans, in 1428; Richard Neville, "the king-maker," killed at the battle of Barnet, in 1470; and Edward Plantagenet, son of the Duke of Clarence, beheaded in 1499 for attempting an escape from confinement.*

It is impossible to tread these grounds, sombre as they are,—for the hues of dark and heavy trees are in solemn harmony with the ancient church, and the almost as venerable mansion,—without being impressed by a degree of awe

BISHAM ABBEY.

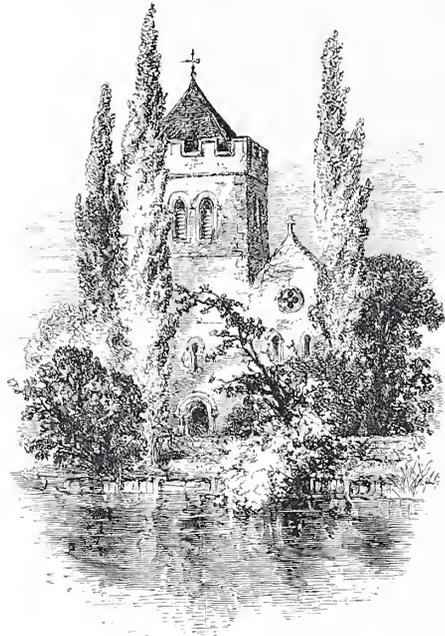

amounting to sadness. What a story might be told by those old walls, of the times when the Templars revelled in their glory!

Immediately on leaving the shadows which the tall trees of Bisham throw on the water, the eye and mind are relieved by the graceful suspension bridge which spans the Thames at Marlow—Great Marlow. It is a quiet town, and has the recommendation of being some miles distant from a railroad. Some thirty or forty years ago, however, it was as full of bustle and excitement as it is now of repose; for the Military College was here, and here some of the bravest and best of our soldiers were educated. It was thus circumstanced, however, for no

* The tombs of the Hoby family, of the times of Elizabeth and James I., are now the most remarkable monuments in the church. The present mansion at Bisham was built about 1590, by the head of that family.

very long period—the establishment commencing in 1799, and removing to Sandhurst in 1810.

Marlow is the very paradise of the Thames angler: perhaps no part of the whole river, from its rise to its mouth, will afford him safer assurance of a day's sport; such sport, that is to say, as will content the unambitious lover of

BISHAM CHURCH.

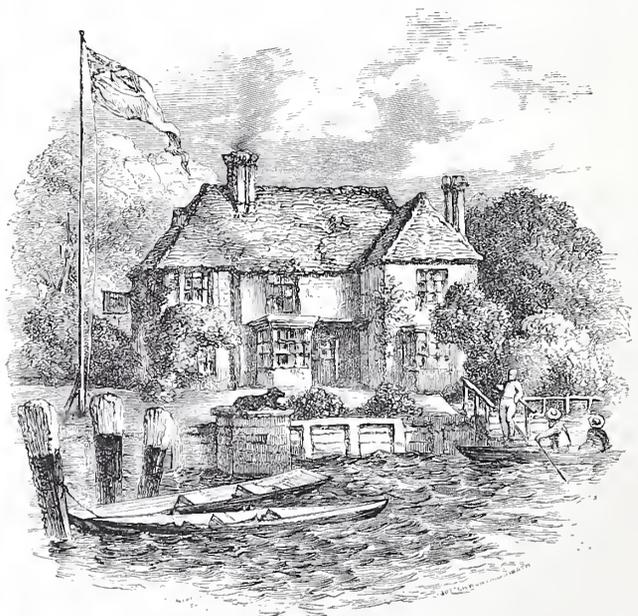

"the gentle craft;" for if he everts to excel in its loftier achievements he must "go further a-field," and make acquaintance with streams more accommodating than that of the good and generous old "Father."

But the Thames angler loves the river hereabouts; not only because it seldom fails to fill his basket—here he obtains all the other enjoyments which our king of island rivers abundantly supplies. Does he seek health and quiet?—He finds them here. Does he love nature—the rural sounds as well as rural sights that give pure and true enjoyment?—They are here—everywhere. Does he seek to call up, in fancy, the great of gone-by ages—the worthies of his country, in pulpit, in senate, or in arms?

—"The dead—
Who rule our spirits from their urns"—

No where can he obtain so many associations with the heroic past.

Nor is it to be forgotten that among the other attractions of Marlow is one of the prettiest and pleasantest inns remaining in railway-ridden England; with

THE INN AT MARLOW.

a most kindly and accommodating landlady, who seems, by intuition—and certainly is from long practice—aware of all the ways and wants of brethren of the angle, who are her best, and, indeed, almost her only customers; for her "hostelry" is not in the town, but in a quiet nook close by the bridge on the Berkshire side of the river.

Fortunate will he be who is a dweller here, especially if Rosewell, one of the oldest and best of Thames fishermen, be his companion and guide to the several "pitches" where he is to look for his day's sport. He will rise with the lark, and all will be ready for him; the neat and clean punt is moored close beside that pretty little summer-house of trees and climbing flowers; the baits are in—gentles, and red worms, and graves, with soaked bread and clay for the manufacture of ground-bait; the rake will be there too, for at mid-day, probably, he will have a "try" for gudgeon, although his special victims are to be the roach and dace; and for these his "gentle-box" is full, the gentles being "well bred" from the liver of the ox; he has purchased them in London, no doubt; for he does not choose to incur the hazard that Rosewell's store may have been exhausted by some successful party of the day before.

He has had an early breakfast, and Mrs. Parslow has not neglected to draw an eel—a genuine Thames eel—of a pound weight, out of the tank pictured at the landing-place, and where she generally contrives to preserve a few for choice friends—true anglers, to whom alone they are given, and who alone should have them; or, it may be, he prefers the "new-laid egg" which yonder clucking hen has just contributed by way of welcome. He is off till dinner-time—or, what is more likely, if he be a genuine lover of the sport, his dinner is in the hamper that stands at the bow of the boat, for he may grow hungry just as the fish are biting most freely; and let us see the true angler who would leave a productive pitch for the best dinner that ever graced an alderman's table!

His rod is put together; it is just twelve feet in length, really tapering, but comparatively "stiff"—certainly so in the eyes of the trout fisher; it is made of bamboo, except the top, which is of hazel; his reel whistles full, and is in good order; a fine and new line of gut is fastened to his running line; the hook, very small—so small that it seems only made to suit a minnow, but is in reality large enough for a barbel of ten pounds weight—is mounted upon horse-hair of sandy colour; the float, of elongated and shapely quill, is "a pretty thing to look at;" towards the end of the line are some forty or fifty shot, small and distributed at intervals—these sink the baited hook, for he is "bottom-fishing," and contrives that the bait shall just pass half an inch or so above the gravel, and he also wishes it to sink rapidly, so as to lose as little as may be of "the swim." He is quite ready, and meanwhile Rosewell has chosen his first pitch—there, in mid-stream; but by-and-by he will select ground somewhere nearer the bank, or perhaps a position close to those weeds that run a good way out into the current, or he may prefer a chance under those aged pollards, whose roots run

of him "who sits quietly in a summer evening on a bank a-fishing"—as that great and good man, Sir Harry Wotton, often did, and as so many other men, as great and good, have as often done—is not to be despised by those who have the power to ramble half the world over to seek enjoyment, and to find far less of it than is found by him who is content—

"To see his quill or cork down sink
With eager bite of perch, or bleak, or dace."

A short distance below Marlow, a paper and corn-mill added to the lock, completely block up the Thames, but there is a back-water in which the

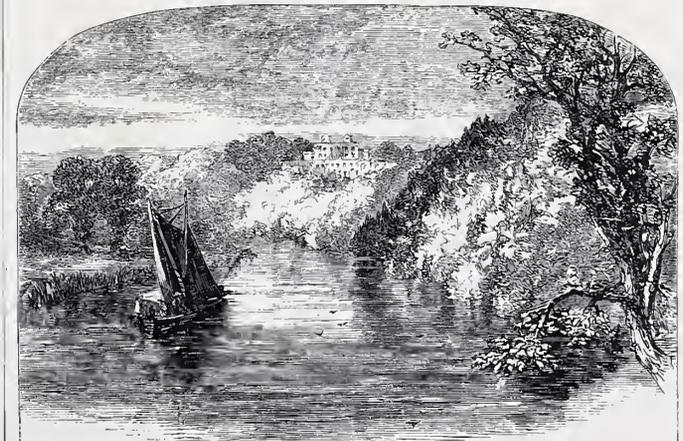

COOKHAM CHURCH.

angler is pretty sure to find enjoyment. If he be a bottom-fisher, it is probable that Rosewell will take him half a mile lower down, and moor his boat at Quarry Point—a bay which is left undisturbed by river-traffic, and is shaded by the tall trees of Quarry Wood. This beautiful demesne is succeeded by that of Winter Hill, where the Thames becomes a broad sheet of water, and assumes the character of a small lake, from which there is no apparent outlet. On the Berkshire side there are many pleasant slopes crowned with villas, while on that of Buckinghamshire, the land is flat and marshy, but the distant hills give a valuable effect to the scenery—wooded here and there, and frequently varied by green fields and "arable land."

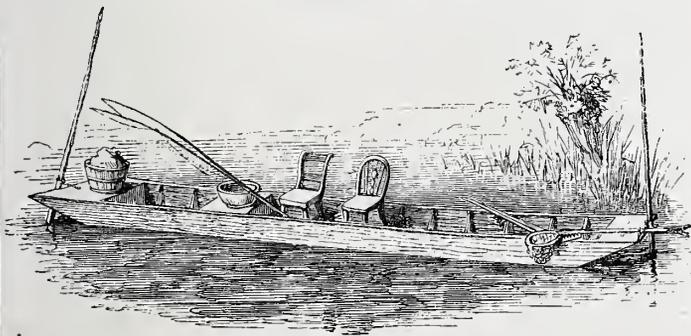

Shade-Oak Ferry is next reached, and here the river begins to assume a more busy and active character—barges, punts, boats, "canoes," and racing-boats are more often encountered; the shores are more populous than they have been hitherto, and we gradually lose that sense of solitude with which the grand old "Father" has so continually oppressed us higher up the stream. The woods of Hedsor—the seat of Lord Boston—companion us for a long way, and for some miles we keep in sight a remarkable structure which crowns the summit of a hill,—we learn that it is nothing more than a summer-house, placed there for the sake of the many views it commands; but it looks like the huge ghost of some mighty edifice which man has deserted. On the opposite bank—in Berkshire, that is to say—is COOKHAM, a pretty village, with a fine old church. A little lower down, and we row beside a lovely island of some acres in extent; it has been laid out in charming walks, with here and there seats for rest, and summer-houses,—every corner planted with fair flowers, shrubs, and cheerful evergreens. Another island—Formosa Island—somewhat further on, greets the voyager, and is also full of attractions.

We are now approaching that part of the Thames which supplies its most abundant beauties—of mingled wood and water, hill and valley, shrubby

CLIEFDEN.

heights and richly-cultivated fields. The river here closes in, or seems to do so; for although in reality wide, it is narrowed to the eye by the steep hills which rise from the banks on either side, clothed in varied foliage from the base to the summit. Those who accuse our great island

FISHING PUNT.

almost as far into, as their branches do over, the river. The boat is moored; two poles, one at either end, prevent its moving, and keep it steady; but you see how cautiously this has been done—Rosewell knows the fish are there, and that a clumsy push would be a warning to them to remove from dangerous quarters. Carefully, and with as little stir as possible, the plummet, secured to his hook by the bit of cork let into the lead, is sunk to the bottom to sound the depth—it is ascertained to a nicety; a "half hitch," effected by twisting the line round the top of the float prevents its slipping; two gentles are neatly placed on the hook, and the angler begins his work. Rosewell soon collects the fish by throwing in a few balls of ground-bait—bread, bran, and graves, and, it may be, coarse gentles (always desirable), mixed with clay; the clay soon dissolves, and the fish come up at a "fin gallop" to learn the source of the supply, indicated by many floating particles.

Hah! a touch! they are gathering, and are growing bold; the float is carried under; strike! the smallest bend of the wrist is enough—force will break the hair, or pull the hook out of the mouth: it is well struck—you feel by the weight that "you have him;" it is a roach of half-a-pound—you know it is a roach, although you cannot see him—he makes no sudden spring, as he would do if a dace, or, still more, if a chub; there is no mistake about it now, for he comes sailing towards the boat, and you note the redness of the eyes and fins through the water. Do not hurry—patience is the angler's virtue—he is at your hand—draw in your line gently, and remove him from the hook to the well—that heavy-looking space which stands out near the boat's stern, through which the water runs by holes made in the sides, and to which you will, before the day is over, consign some ten, or, it may be, twenty dozen of his fellow-captives, who will swim about in happy ignorance that their destiny is to be transferred to that neat and graceful basket of white wicker-work, the form of which is as well known as the shape of a ship's anchor.

And such is Thames angling—a joy above all joys to those who love it, compared to which—

"Other joys
Are but toys!"

And although the "business" of the angler, thus pursued, may be, as it has ever been, a theme of sneer and sarcasm with those who throw a fly across the Tweed and land a huge salmon, after an hour's labour to subdue him—the pleasure

Pictou, Napier, Londonderry, Crawford, Beresford, Hill, Lynedock, Hardinge, Raglan, Anglesea, and Gurwood. The statues of statesmen would represent those who flourished about the Waterloo period in one group, including in their number the Marquis Wellesley; in the other group would appear Peel, Lansdowne, and other statesmen, colleagues of the Duke in more recent times. One of these statues would be a portrait of the present premier. At the head, and also at the foot of the composition, the historical portrait-groups would be continued by statues of eminent foreign princes, generals, or statesmen, who had co-operated with the Duke; here there might appear Alexander of Russia, Frederick William of Prussia, the Prince of Orange, Bernadotte, Blucher, Metternich, &c. In the face of the third step, beneath each statue, the shield of arms of the person represented might be introduced. In the centre of either side, between the groups of statues, an inscription—the one commemorative and the other historical; these inscriptions to be on plates of brass fixed to the granite, or cut in the granite itself. The granite-block to be represented as being covered with the union-flag of England, which would be sculptured in the granite itself, and would partly fall over its uppermost portions.

3. Upon this union-flag would stand the third order of the composition, a second and smaller oblong block of white marble, rising from a base of Purbeck marble, and supporting a slab of black marble, both upper and lower slabs being richly wrought about with pure classic mouldings. Each side of this block would be divided into four compartments by a column, with which two smaller columns would be clustered, and would carry rounded arches. At each angle, a cluster of the principal columns. All these architectural members to be executed in serpentine, porphyry, or other precious marbles. Beneath each arch would be the arms of one of the countries in which the Duke (an unprejudiced distinction) held the military rank of *field-marshal*, with his knightly and military orders depending from each achievement of arms. At the head and feet the arms of the Duke himself, and those of his father and mother, each under a similar arch, and with appropriate accessories. All this heraldry to be studied with the utmost care, and expressed in noble sculpture, or rendered in enamel—due care being taken to show that heraldry is an art as well as a science.

4. Upon the black marble slab would rest the fourth, and uppermost order of the composition. This would consist of a thick plate of fine bronze, parcel gilt, and boldly diapered with heraldic and military devices, mottoes, &c., and supporting the *effigy*, which would be recumbent, the head uncovered, and the hands upraised and clasped. The figure would be represented in the full uniform of an English field-marshal, having thrown about it the mantle of the Garter. About the effigy there might be introduced the cocked-hat, the ducal coronet, the sword, the sword of state, with a volume of the "Despatches," one also of the statutes of the realm, and a Bible. The effigy to be of the finest bronze. Over all a canopy, if any canopy be needed, of open work, richly wrought throughout in bronze and polished brass.

In conclusion, I revert briefly to the models of designs which were sent in for the competition. While several of these possess many high artistic qualities, and exhibit the sculptural feeling of their authors, not one appears to have emanated from a just idea of the monument required, and accordingly, it would be easy to subject them all to such critical tests as would demonstrate, either from their unfitness to their unworthiness, that they fail absolutely to realise a national Wellington Monument. In these designs the ideas, when not either commonplace or inappropriate, have already been repeated *ad nauseam* under some form or modification, and the allegorical and symbolical imagery is precisely of that kind which, while essentially worthless, and indeed, often highly objectionable, is directly opposed to the simplicity and earnestness of the great Duke himself, and to the strict reality of his character. In these designs, also, heraldry and historical portrait-sculpture, as forms of expression of the utmost power and value, have been overlooked and omitted, or at best adopted in a subordinate capacity only. The knightly rank and character of the Duke have also been passed over without notice. The imper-

fections, errors, and failings which characterise the competition designs, and render them unfit to be actually adopted, will imperatively demand a similar decision in the case of every design which may be conceived in the same spirit, and which it is proposed to treat upon the same principles.

London, September 12. CHARLES BOUTELL.

A TEMPLE OF THE FINE ARTS.

SIR,—It was my happy privilege for many years to create amusement and cause merriment amongst the musical and general public, and I can assure you I have a very pleasing recollection in my old age (forty-seven!) of the ringing laugh of the fair daughters of England. Now it is a difficult thing to make the public laugh *en masse*, and I was not always quite sure of doing so; but what I am about to name to you will, I am quite sure, raise the risible faculties of many in the artistic world, at my even presuming to have such an idea. Not being an architect, and not being a mechanist, not being an artist, and not having studied any qualifications which would be essentially requisite for my purpose, I have—(will my nervous system permit me to write the title?)—I have boldly erected, to scale (on paper), "A TEMPLE OF THE FINE ARTS." This would at first appear a pretty amateur idea, but I am certain of one thing, I have done what is *really wanted* in an exhibition-room—a good sight of each individual picture and piece of sculpture. My ideas are not chimerical, they are founded upon the experience of thirty years close intimacy with the Fine Arts; and not being, as I said before, architectural, &c. &c., perhaps I am not conventional, and my drawings, with all their numerous faults, I am not afraid of showing, for the reasons above stated, "hoping" (as I was sometimes obliged to say to the public on "influenza" nights) "the kind indulgence," &c. &c.

I hear already the thanks of every artist and sculptor for having at all events *endeavoured* to do something for their noble and elevating art, by letting their works be *thoroughly seen*, and consequently appreciated. Now, Sir, in this I fancy I have fully succeeded, when I tell you by my plan (which, by the bye, can be qualified or modified to any extent) that, were there sixteen hundred pictures, each painting is within the range of, and the larger ones at a proper distance only from, the eye of the spectator; also several persons can, in some parts of the hall, see the same picture at the same moment, though "on the line;" and the sculptor will be pleased to hear that by my contrivance, that is, in my "Temple of the Fine Arts," each piece will be individualised, and all its merits shown, by the kind of light best suited to his subject. I have made my building also a silent public monitor, by its form *exteriorly*, and its purely and essentially devotedness to its object, the Fine Arts. I do not call mine a "Palace" (we are rather tired of the name); I do not call it "National Gallery," for fear of being thought presumptuous just at the present moment, but it is, or rather would be, a national instructor interiorly and exteriorly. It would cost some money to carry my ideas out, but that money would be bestowed, not on unnecessary mouldings, &c. &c., but upon mechanical contrivances and effects to benefit the artist and sculptor in every sense of the word. You see I don't tell you how I would do all this, but it would give me the greatest possible pleasure to explain myself more fully, and to lay my views (or my "idea") before the public, should you approve; remembering I have no other object in view than a love, a very great love, of Art (I believe many thousand persons can attest the truth of this statement), and also thinking that if one is vain enough to suppose he has hit upon something, he ought not to keep it all to himself. I want nothing beyond the kind word of the artistic profession when they shall see "the idea;" and they may say if they like, with my friend Charles Mathews (in "Used Up") "There's nothing in it," if they will only add, "But he meant well."

JOHN PARRY.

P.S.—I send this to your excellent Journal, as I am sure of a "just and impartial hearing;" in fact, I look upon your volumes with a reverential and *referential* eye, having gained nearly all my artistic knowledge from its pages, it being in my library from its birth, February 15, 1839. I shall not fill up this long postscript with a long commentary on "the service this Journal has," &c.; "the great and unknown good;" "the poor artist;" "fostering care," &c. &c.; the world and public at large acknowledge these things by the extensive sale of your admirable and instructive work.

St. Andrews, Southsea.

THE HUNTER.

FROM THE GROUP BY T. CRAWFORD.

THE sculptors of America are beginning to occupy an honourable place among the distinguished artists of our time: at the head of them are Hiram Powers and Thomas Crawford. Ives is another who is rapidly winning a name for himself; and Bartholomew, whose "Hagar and Ishmael" we engraved in our last year's volume, bids fair to run a good race for priority with the best of his contemporaries: we have lately seen some photographs of his works that evidence genius of no ordinary character. These sculptors either have studied, or are now studying, their art in the best school, that of Rome. "The American school of Art, as developed at Rome,"—we quote from an article published in the *Art-Journal* two years since, from the pen of a resident in the city,—"evinces excellence, earnestness, and true feeling for Art; it is a school of promise, bidding fair to take its place, and hold its head aloft, in the great artistic republic. . . . Untrammelled by the dogmatism of any particular school, ranging at pleasure through the accumulated treasures of bygone centuries, spread before them in the wondrous galleries of Italy, they faithfully and earnestly propose to imitate all that is beautiful, without considering whence it comes or whither it may lead them. They surrender up their souls to the guidance of their artistic conscience, and like true republicans, refuse to bow down before any graven images of conventional tyranny." The writer does not refer to sculptors only: the remarks are intended to include painters also.

Crawford is a native of New York: he was born in 1814, and having at an early age a strong predilection for the art he has subsequently practised with so great success, he placed himself, as a preliminary step, and almost the only one then within his reach, under a wood-carver. In 1834 he went to Italy, and entered the studio of Thorwaldsen. His first work which attracted general notice was a statue of "Orpheus;" but a beautiful group, "The Babes in the Wood," executed some time afterwards, gained universal admiration: "Words," says the writer already referred to, "cannot describe the touching pathos of those sleeping children. I was glad to turn away: the life-like expression was too painful." Casts from two of Crawford's productions, "Flora" and the "Dancers," are among the sculptures in the Crystal Palace. His great work, however,—great in character as well as in size,—is the monument to Washington, to be erected at Richmond, the capital of Virginia. Another fine work, on which he has been occupied for the last two or three years, and which, we believe, is incomplete, is a pediment for one of the new wings of the Capitol at Washington: of this pediment a detailed description appeared in the *Art-Journal* of February, 1855.

"The Hunter," which we have engraved, certainly verifies the truth of the observations quoted in our first paragraph: it is a group of sculpture "untrammelled by the dogmatism of any particular school;" it is bold and unconventional, deficient in the graces of Greek Art, and in the refinement of the productions of all those who regard as heterodox whatever is not based on the principles of the old Greek sculptors. But as a "set-off" to what is lacking in grace and refinement, we have originality in conception, and vigorous, *manly* modelling: the hunter is one who evidently has followed the chase from his boyhood; his limbs are well set and firmly knitted together, and there is a strength and a compactness throughout the whole figure which are demonstrative of fleetness of foot and endurance of toil.

We regret to add that Crawford has been compelled to rest awhile from his labours through impaired eyesight, induced by incessant devotion to his work: his residence is in Rome, but we heard he was in London during the past summer, whither he had come for a little relaxation, and for surgical advice. Let us add our hope that he will soon be restored to his work; for all lovers of Art, and those among his own countrymen especially, can ill afford to lose the services of this gifted sculptor, who is yet in the very prime of life.

THE HUNTER

ENGRAVED BY J. H. BAKER FROM THE STATUE BY T. CRAWFORD

ON CHURCH ARCHITECTURE.

BY DR. FRANZ KUGLER,

PROFESSOR IN THE ROYAL ACADEMY OF ARTS IN BERLIN.

THE subject of Church Architecture has of late years excited great attention, and given rise to much discussion. It has been a matter of reproach that, in the present age, our ecclesiastical edifices are deficient in that correct and consistent style, which, corresponding to the popular feeling and spirit of the age, should constitute a lasting monument of its existence. All the sacred edifices of the early periods of history survive, in this manner, as speaking witnesses of the spirit and temper of the people who erected them, which readily and invariably found a form to give it expression: in modern times, on the contrary, this form is wanting. History directs our attention to the tendencies and the ultimate object of this mental energy, regardless of the form which it may unconsciously and naturally assume. Art, however, cannot entirely acquiesce in these views; it is her province to co-operate in the mental development of age, to the elicit the spirit, to call it into life, and to assist in clothing it with a form. Art has for some time laboured with creditable zeal to introduce into church-building a reform corresponding to the spiritual requirements of our times; the subject is of sufficient importance to merit close attention.

Architecture, in its elements of design, takes two opposite directions: in one view, the creations of former ages appear wholly foreign and remote; this school limits itself to its own individual productions,—at the same time adopting as its standard, on the one hand, the simple subjective or individual feeling, and, on the other, the outward conditions—as of space, composition, and connection in the building materials. This school lays down its own laws, and adheres exclusively to their guidance; its principles profess to give perfect expression to, and to satisfy fully, the necessities of our age; while, nevertheless, if followed in this one-sided direction, they suggest points of grave doubt and question. The monuments of architecture which were erected hundreds, and even thousands of years ago, bear the distinctive impress of the respective ages and peoples to which they belong; in this light they have, to us, an appearance perfectly strange and foreign, and yet it must be remembered that they embody and represent the universal principles of form, while the progressive development and operation of these general principles and laws are exhibited and illustrated in historical succession. Architects who give themselves up entirely to the guidance of their own fancy, only manifest the weak presumption of pretending to accomplish by hasty individual caprices those vast results in Art which have engaged the study and labour of the first minds for centuries.

The second principal tendency or school in architecture takes an opposite direction: instead of aiming to create any new system, it follows exclusively laws and systems already in existence, after having satisfied itself that these laws have developed what appears to be the most perfect form attainable by man. According to this view, it is conceived that there is ample room for the application of such a pre-existing system to the conditions and requirements of the present state of Art. One particular system is selected,—for instance, the Greek,—which is exclusively followed; or a transition is made from one school to another, according to the character and object of the structure: for example, whilst the Greek style is adopted for a theatrical edifice, the Gothic may be preferred in the erection of a church. These views, however, are opposed by the consideration, which has been mentioned above, that all the various architectonic systems and schools, whilst adhering to their general principles, have been in all ages and countries, subject to the conditions of time and place, and that their style has consequently been dependent on influences which are now obsolete or invalid. It is obvious that we are not at the present day surrounded by many of these external elements or conditions of style; and as our own individual mode of conception must exert a natural influence, the imitation introduced into our present architecture can seldom claim the merit of entire purity.

Between these extreme tendencies in architecture

there is likewise an intermediate one, which aims at seizing all that is correct and true in the two others, and avoiding all that is incorrect. This school recognises the general principles, that form and structure must be determined by the laws of space, and that these are variously exhibited in the series of architectural systems; it recognises, moreover, the existence of a standard in nature, an intrinsic law involving certain conditions of necessity, and this law it seeks to follow and appropriate, in opposition to local and historical peculiarities and accidents. It maintains that from every architectural system—even the rock-tombs of ancient India, and the grotesque monuments of the Chinese—some things may be acquired capable of improving our own scientific labours. But the most important part of these eclectic views is, that instead of any servile imitation of particular models, they advocate the adoption and the adaptation of all these fundamental elements to our own modes of feeling. A firm historical basis is thus laid, without any danger of our becoming mere copyists of a past age; and the architect retains the independent freedom of his own scientific views, and modes of conception, without abandoning internal consistency, or becoming the sport of the capricious play of fancy.

Admitting the general correctness of this eclectic direction in architectural science, we obtain just views of the attempts at the restoration of church edifices, corresponding to the spirit of our times—indeed, the only correct point of view for that which must always constitute the basis of these attempts. Much is indeed gained by the determination of this groundwork, which gives a standard and measure to the labours of artistic expression. Through successive centuries the European nations have devoted an earnest attention to the erection of their ecclesiastical edifices, in a manner commensurate with their purpose of receiving the assemblies of worshippers, and of awakening in them an elevated spirit of devotion consonant with the objects of their cult. In this endeavour they have laboured to impart to these structures the character of their age and nationality, and at the same time to carry out those laws of Art which are intimately blended with the internal spirit of the building, in as varied and developed a manner as possible.

Varied and multifarious as are the systems and styles in architecture transmitted to us in the history of Art, they may all be ranged under two principal classes, designated by the most characteristic architectural features,—the Columnar style, and the Arched style. The column presents the first contrast and break to the stiff and heavy mass of material: it rises from the ground freely and independently, singly or in rows, regulated by its own artistic conditions, and at the same time subservient to general purposes of utility or effect pervading the entire building: it rises to meet, and to support, the superincumbent rafters or entablature. But here again, the entablature, however ornamented, presents necessarily a stiff and heavy mass, which terminates the idea of rising, of aspiring, inherent in the column. When, however, the arch takes the place of the entablature, this abrupt termination ceases; the continued line of the column is unbroken, but divided, and springs on either side with mathematical precision and artistic beauty, to meet and unite with the corresponding arch springing similarly from the nearest point or column. The arch is the principle of completion and combination in architecture; and is further carried out in the vaulted roof, which imparts coherence, regularity, and freedom of elevation to the whole building. The simple columnar structure is found in all the architectonic systems of the ancient world; but, noble as it appears singly, and however beautiful in its use by the Greeks, it yet exhibits the limited elevation of spirit found among the nations of the ancient world. It is true that instances of the introduction of the arched and vaulted forms are occasionally met with, as in the grotto temples of ancient India, dedicated to the Buddhist worship, as well as among the Etruscans, and especially the Romans. But in these instances, this form is not independently adopted or carried out, while, on the contrary, the strict columnar style appears predominant, to which the arch is subordinate. The appearance of the latter, indeed, can at most be regarded as early indications of the development of a later age. The true cultivation of the arch belongs to the times of Christianity, and is one

indication of that higher spiritual elevation by which that age is distinguished from antiquity.

We shall now consider the principal features of Christian church architecture, as they have successively arisen. The subject is a very extensive one, and I shall restrict my remarks to the most important and distinctive forms. It may suffice here, to enter only upon the artistic arrangement of the interior of the edifice. As the erection of churches is calculated with reference to the multitudes which assemble in them, the interior must naturally be the most important subject for consideration, and must, to a certain extent, regulate the forms of the exterior.

The general introduction of the Christian religion, and the consequent requirement of churches for the celebration of the new worship, were coeval with the decline of civilization in the ancient world. The invention of an entirely new style of building, corresponding to the purposes of the new religion, was not to be expected in such an age, which was content with imitating the styles of architecture already existing, especially as they appeared to satisfy one chief requirement—their adaptability to accommodate large assemblages of people. The temples of the ancients were not suited for this purpose, as in general they did not contain any extensive inner space: the people used to remain in the court of the temple at their religious festivals, and the attention of the architect was consequently directed more to the external decoration than to the interior of the edifice. The space, however, which was wanting in the temples, was found in another description of building—the basilicas. These edifices were intended for the reception of a large concourse of people; they served as the *exchange*, for mercantile transactions, and at the same time as courts for the administration of civil justice: in every part of the Roman dominions they were met with, and Rome itself boasted many, ornamented with the utmost splendour. It is much to be lamented that so few remains of these buildings have survived to our times; we learn from the descriptions of ancient writers, that they formed one long hall, with colonnades on either side, supporting galleries, and that at the end of this hall, opposite to the principal entrance, was a large semi-circular niche, or recess, the tribunal, in which was a semicircular seat for the judges. It appears that in the chief basilicas, the large open space was generally uncovered; and we must conclude that the internal plan was in strict accordance with the laws of ancient columnar architecture.

The churches which the Christians erected after the model of the basilicas were designated by the same name; and the colonnades, as well as the recess of the tribunal, were retained. In the latter the priests took their seat, and in front of it was erected the altar. Unquestionably here also the laws of the ancient columnar architecture were at first retained, although important changes were soon introduced. All the basilicas belonging to the early Christian times, still existing in Italy, especially those in Rome and Ravenna, exhibit peculiarities in plan, quite at variance with the ancient columnar structure, and consequently decided innovations. The galleries over the colonnades disappeared almost entirely; and in place of the upper row of columns which formed these galleries, walls were built up, enclosing the upper portion of the central nave, which was lighted from the windows in this wall, the building being always roofed. This is an undoubted deviation from the antique arrangement, and this upper wall forms a weight out of all proportion to the columns which support it, and this pressure is the greatest on the straight entablature, which runs along the columns in the antique manner. Some of the early basilicas in Rome illustrate this remark. The majority, however, have, in place of this entablature, arches spanning from column to column, which more effectually support the superincumbent weight. One of the most beautiful specimens of this early Christian basilica is the Church of S. Paolo fuori le Mura, outside the walls at Rome. This church was erected about the year 400 B.C.; it was burnt down in 1823, but has been rebuilt entirely in its ancient form: the walls of the central nave, over the colonnades and under the windows, were ornamented with paintings.

The early Christian basilica thus exhibits ancient and modern elements in combination; but the recent innovations mar the ancient portion, and in any

attempt to erect basilicas expressly for Christian churches, at the same time adhering to the pure style of the antique, these innovations, however conceived, must be abandoned. Nevertheless, these comparatively modern changes have important advantages to recommend them; by the removal of the galleries, the entire space acquires a more imposing effect, the nave appears more lofty, connected with the side aisles. The arches surmounting the columns give the effect of increased lightness, combined with strength, and harmonise with the grand form of the arched recess of the altar. Nevertheless, the pressure of the upper wall upon this arcade remains, and the flat roof of the nave and aisles has a cold and stiff appearance, contrasted with the elegance and lightness of the arcades. The roof of the early Christian basilicas was undoubtedly flat; and in many of the Italian basilicas (as the Church of S. Paolo, at Rome) are still seen the open rafters, which, without doubt, belong to the latter part of the middle ages. This flat roof is often artistically ornamented in an interesting manner, but the effect is only of a decorative character, and deficient in architectural repose. An examination of the new features introduced into the early Christian basilicas shows clearly that they form the basis of a new architectural development.

The basilica was the predominant style of church building for many centuries in all countries of the Christian world; in Germany it was very general, and studiously cultivated. Basilicas were erected in great numbers as late as the thirteenth century, and numerous examples remain to the present time, although these remains seldom exhibit the original plan in its entire purity. Saxony, and especially the northern frontier of the Hartz, are rich in such architectural remains. Many of them have modifications in their details, derived from the peculiar feeling for form of the people or race by whom the edifices were erected, and the peculiar spiritual tendencies of the age to which they respectively belonged,—one while the style being rude and confused, at another fantastic and irregular, or again rich in a luxuriant play of form. One of the most important modifications of the original design, occurring frequently in Germany, is the substitution of square pillars for the columns. These pillars form a firmer support for the walls above the central nave. At the same time the lightness and elegance which impart to the column its peculiar effect is entirely wanting in the pillar; the pillars produce only a heavy and rude impression, which is imparted to the basilicas where they are found: a considerable number of these edifices still exist in the Rhenish provinces and elsewhere. It is, however, more frequently the case, that the advantages of both plans are combined by an alternation of pillars and columns, one or two columns being placed between the pillars, and imparting accordingly a more or less open effect. In some rare instances, where the pillars alternate with a single column, the former are connected by large arches, spanning over the smaller ones which spring from the capital of the column. This disposition exhibits, perhaps, the most perfect and characteristic development of the style of the basilica,—the two arches, large and small, presenting together a much stronger support to the superincumbent weight of the wall, and equalising in the most beautiful and effectual manner the proportion between the weight and its supporters. It is strange that such an admirable plan has been so little adopted; I have seen it scarcely anywhere but in a few basilicas on the northern limits of the Hartz, of the date of the end of the eleventh century: the best example is the church of the former Convent of Hulseburg, at Halberstadt, one of the best-preserved basilicas in Germany.

We must pass over some other not unimportant modifications in the structure of the basilica, as the introduction of the transepts, which give to the whole building the cruciform ground-plan, the arrangement of the choir, and its elevation above the floor of the church, the plan and structure of the crypt, &c. All these features, however important and interesting in other points of view, do not essentially affect the fundamental law of architecture.

In the eleventh and twelfth centuries another change was introduced in the structure of the basilica, so rich in its results as to form the basis of a new architectonic system; this was the employment of the vaulted roof. At certain equal distances

large transverse arches (similar to those which had already appeared in the flat-roofed basilicas at the intersection of the nave and transepts) stretched from one wall of the nave to the other, filling the intermediate space with transverse vaulted roofing, resting upon the cross arches. This perpetual variation, and at the same time connection in the architectural forms, led the eye upwards and onwards at the same time; the roof was divested of its rude stiffness, the sides of the building were brought into immediate connection, and the upper end of the area was raised, and thus acquired a solemn and significant meaning. The application, however, of this change in the plan of the interior was not limited to the roof; the change involved others, and the rest of the building had necessarily to be made to harmonise with it. The increased weight of the vaulted roof required the support of pillars, almost exclusively, for the wall above the central nave. The heavy massiveness of the pillar, however, soon yielded to the introduction of articulations, fluted pillars, and half-columns, which were carried upwards and along the pillar and upper wall; and from these sprung the origin of the arches of the roof, imparting to the solid and heavy masonry of the pillars and walls a character of elegance combined with grandeur, which well harmonised with the rounded and majestic forms in the arched roof. This conception of the vaulted basilica was carried out in the most varied manner; an infinite number of secondary changes were introduced, according to the articulation of the columns, their fulness and ornaments, their connection with the arches and the roof, and the plan of the upper wall and the galleries surmounting the columns. I will mention only one example, in which the treatment of the forms appears, it is true, heavy, severe, and dry, and yet in which the fundamental principle of the structure exhibits a clearness, proportion, and dignity scarcely seen in any other edifice of the period: I refer to the interior of the Cathedral of Speyer.

The introduction of the vaulted basilica appears, as we have observed, in the eleventh and especially the twelfth centuries. The architectural style which characterises this period is usually, but inappropriately, termed the Byzantine; recently, however, the more correct name of the Romanesque style has been substituted. To this succeeded, in the thirteenth century, the so-called Gothic style, the external groundwork of which appears to be of an Oriental cast, characterised by those intersecting arches usually designated as the pointed arch, and which, as far as we can judge, were extensively used in Arabian architecture. In Sicily, which was for centuries under Arabian dominion, the pointed arch was first combined with the forms of the simple basilica, being introduced over the columns of the nave. In Western Europe the artistic spirit of the age was marked by this combination of the pointed arch with the vaulted basilica, which gradually acquired a harmony of structure, and led imperceptibly to an essentially new class of forms. The characteristics, however, of the pointed arch, as at first introduced, exhibit only one side of those features which distinguish the Gothic style—a character of historical transition; but there is another point of view from which it may be considered separately, although at the same time intimately connected with the general features of this style, and in this light it presents the highest perfection which architecture has ever exhibited. I have adverted above to the vaulted basilicas, upon which were grafted the more perfect development of the Gothic style: in these the heavy mass of the pillar and wall still remained, but in combination with the lighter forms which were subsequently added, the pillars acquired again a more columnar form, and small half-column and fasciated shafts were introduced, while every trace of heaviness disappeared from the upper walls of the nave. The whole architecture of the interior acquired an expression of strength combined with lightness, which led the thoughts of the beholder involuntarily upwards, whilst a perfect symmetry combined an effect of motion with the most elevated repose, and a sentiment of strength with the noblest majesty. The edifice in which the multitude were assembled, became the direct outward expression of the spiritual worship which they met to celebrate,—one universal hymn of prayer.

The beauty and rich development of the Gothic style appear, in the most finished church edifices,

carried out in a great variety of ways, aided by the national and local influences of different periods. The noblest specimens of this style are found in Germany, and among these the Cathedral of Cologne undoubtedly stands preeminent.

The Gothic style lasted only for two centuries. The period of the revival of learning witnessed its decline, not only in those features which may be said to characterise the individual mediæval spirit, but the entire law which regulated a higher development of architectural life. The predilection for those fantastic elements which had been intimately blended with the Gothic style, yielded to a taste for the simplicity and clearness found in the classical works of antiquity, which harmonised with the learned tendencies of the age. These classical forms, however, seldom corresponded with the requirements of church-building. In occasional instances, simple basilicas were erected with columns, as far as possible, in accordance with the laws of the antique: pilasters, half-column, and single column, with friezes, &c., were introduced, similar to those in ancient architecture,—perfection in the art was sought in mere decoration. The interior of St. Peter's, at Rome, offers one of the principal examples of this modern style of church architecture, which is certainly imposing, but almost exclusively so from its vast and grand dimensions. This modern style of building has existed for several centuries, with many variations.

I have already mentioned the Byzantine Cupola style. In connection with this, I may remark the introduction, in early Christian times, of the *baptistry*, which was exclusively intended for the baptismal service. The baptistry, after the model of the antique, had a circular or polygonal ground-plan, usually octagonal; it was partly flat-roofed, and partly vaulted with a cupola. One important peculiarity distinguished the baptistry; a passage running round the central space, standing in the same relation as the side aisle of the basilica to the nave. This structure was grandly conceived in the Byzantine style, particularly that of the time of Justinian, and was introduced in large churches, sometimes retaining the polygonal ground-plan, and sometimes lengthening this in the style of the basilicas.

A new problem in architecture had now to be solved,—the construction of a cupola to roof over the pillars and arches. This the Byzantine accomplished in the grandest manner, and the noblest example of such an edifice is the cupola of St. Sophia, at Constantinople. To this principal cupola, however, were soon after added others in various ways—semi-cupolas, cylindrical vaulted ceilings, and so forth, giving a peculiar and complex aspect to the entire roof; whilst the space beneath was occupied with columnar arcades. One of the most remarkable buildings of this description is the Byzantine Church of S. Vitale, at Ravenna, of the age of the Emperor Justinian.

The Byzantine vaulted style of architecture was at a subsequent period combined with the basilica style of Western Europe, and a cupola surmounted the large arches at the intersection of the nave and transept, giving an increased grandeur to the choir. With the Gothic style the cupola almost entirely disappeared, but was again introduced in modern architecture, and is seen with a peculiarly grand effect in St. Peter's, at Rome; rows of cupolas were also supported on arches. Some of the most beautiful ecclesiastical designs of the greatest architect of modern times, Schinkel, are based on the combination of the principles of the baptistry and the cupola.

In the above remarks I have been able only to survey generally the leading features in the various styles of church architecture, without entering upon their manifold modifications; it would lead us too far to examine these details; but a subject for serious and interesting reflection is, the rich inheritance we possess, from the fifteenth century, in the long series of ecclesiastical monuments, which it is our duty, as well as privilege, to study and profit by. The great secret of accomplishing this, is simply to discriminate between the general æsthetic principles of the art, the local and historical accidents of its treatment, and the impress of style and spirit marked by successive ages; this constitutes the great historical interest of the art. In aiming therefore to attain a fixed basis and a correct judg-

ment, and to apply these to the erection of our churches at the present day, it appears to be necessary, not to adhere to the imitation of any one of the existing styles, even with modifications, but rather to collect from the sum of all past experience those general laws of form and design, which impart to such edifices dignity and elegance, with rythmical solemnity and elevation; the development of these elements of style in the noblest manner, will most worthily create, and transmit to posterity, the impress of our age, its feeling and its spirit.

ART IN THE PROVINCES.

EDINBURGH.—The annual meeting of the "Royal Association for the Promotion of the Fine Arts in Scotland," took place on July 18th, in Queen Street Hall, Edinburgh. The Report—drawn up and read by the secretary, Mr. J. A. Bell—stated that the subscriptions of the past financial year had reached £5400, showing an excess of income over the preceding year of £426, and of £1133 over the subscriptions of 1855. The committee, out of this sum of £5400, have purchased seventy-eight works of Art, of the estimated value of £2409: these works were all selected out of the recent exhibition of the Scottish Academy, and were sent to London for exhibition: a notice of them appeared in the *Art-Journal* for July. Each member of the association for the past year receives an illustrated edition of Burns' "Soldier's Return," containing six line engravings from drawings made expressly for the society by J. Faed; while every subscriber who, between the years 1854 and 1858 inclusive, shall have paid the amount of five shares in one or more payments, will receive an additional engraving of "Christ teaching Humility," from the picture by Scott Lauder. Macculloch's painting of "Inverlochy Castle" has been purchased by the association for £200, with the view of placing it in the Scottish national collection, in accordance with the regulations of the Board of Trade, under the charter of incorporation. With respect to the future operations of the society, we learn that Burn's picture of the "Politicians" is to be engraved for the subscribers of 1858; and arrangements have been entered into with G. Harvey, R.S.A., for the execution of a series of illustrations of Burns' song, "Auld lang syne," for the subscribers of 1859. The Scottish Association seems now to have a fair "headway;" we wish it a prosperous voyage, and—a long one.

CORK.—We regret to hear that Mr. Raimbach, the head master of the Cork School of Design, has resigned his appointment. To judge from the Report of the past year, recently issued by the committee of management, Mr. Raimbach was a most zealous and efficient officer, and we trust his secession may in no way militate against the continued success of the institution.

NEWCASTLE-UPON-TYNE.—At the recent annual meeting held, on the 24th of August, for the purpose of awarding prizes to the students of the School of Art in this town, it was stated that, out of the six Schools of Design comprehended within the northern district of England, the number of prizes gained by the pupils of the Newcastle school was larger than the whole number awarded to the pupils of the other five.

BIRMINGHAM.—We understand that Mr. Thomas, of London, and Mr. P. Hollins, of Birmingham, have sent in models of a statue to be erected in the latter place to the memory of the late Mr. Thomas Attwood, M.P. The committee had not made their decision when we went to press.

BRIGHTON.—The town-council of Brighton have received plans, offered in competition, for converting certain portions of the pavilion into apartments suited respectively to the purposes of a music-hall, a winter-garden, public library and reading-room, picture-gallery, and museum.

IPSWICH.—A School of Art will, we expect, be opened, ere very long, in this town, and with good prospects of success.

DONCASTER.—Before this number of our Journal is published, an important archaeological meeting will have been held at Doncaster, of which we purpose hereafter to give a detailed notice. The noble church which has arisen so auspiciously, under the direction of Mr. G. G. Scott, from the ashes of its predecessor will, on this occasion, be thoroughly examined and carefully described. The high character of this edifice, and the various difficulties which have been overcome by the architect, will thus be generally understood, and the success of the work will accordingly be more fully appreciated.

LECTURES AT THE CRYSTAL PALACE.

At length the authorities of the Crystal Palace have determined on an experimental course of popular lectures upon the Fine Art department of their wonderful edifice. These lectures are to be delivered in the palace itself on alternate days, commencing early in the present month of October. It has been a subject for much regret to ourselves, in common with almost every friend of the Crystal Palace, that lectures have not long formed a regular component of the arrangements in that remarkable establishment. They have long been greatly needed there: they are greatly needed, indeed, wherever Art or Science address themselves to the public at large. The experiment has but to be tried in a fitting manner at the Crystal Palace, and its inevitable success will demonstrate, not only the value of regular lectures there, but also the necessity that similar lectures should be associated with all our more important exhibitions. We are all well aware of the many difficulties which have to be overcome before such a system could be introduced; at the Crystal Palace it has been the difficulties that surrounded the execution of a project for lectures, and not indifference to the lectures themselves, which have hitherto been the real cause for their not having been adopted. But these difficulties are greater in appearance than in reality, and they will be found to yield before a resolution to surmount them. On the other hand, the results of such lectures will prove to be more satisfactory than might have been expected; provided, that is, the exhibition or institution with which they are connected, be really of an intellectual character. And in such exhibitions or institutions, popular lectures of the kind of which we are now speaking, are liked, not merely because they are both didactic and suggestive, but also because they concentrate and give a definite form to the sentiments of visitors. A short time ago, one of the merchant princes of Manchester, sent all the people connected with his establishment to inspect the Art-Treasures Exhibition, of course paying all expenses, and, indeed, doing all that might conduce to render the day a holiday in the best and happiest sense—a day of cheerful relaxation, combined with intellectual cultivation. If the preparations were great, still greater were the anticipations. The visit in due time was made; but what were the results? For a couple of hours the visitors wandered about those wonderful saloons, gazing with puzzled anxiety; and then, eagerly and with a mixture of apprehension and weariness, they inquired "when the exhibition would begin?" Obtaining no such answer as they desired, they gradually dispersed, to seek consolation for themselves in the neighbouring places of "good entertainment." Now had these people been told, that if they assembled at such a part of the building at 11 o'clock, they would be spoken to on the subject of the exhibition, such an address—if one of the right kind—would to them have been the "beginning of the exhibition;" and from that beginning they would, without doubt, have gone on, so long as the day would admit, towards its completion. An incident, bearing on the same point, occurred to ourselves during one of our own visits to the Art-Treasures Exhibition. While resting for a brief space, a party of intelligent-looking, but evidently disappointed artisans, took their seats beside us, and presently one of them asked of us whether there was *any machinery* to be seen there? We replied, that though there certainly were no steam-engines in the exhibition, there was much which would show how skilfully iron and steel and brass had been worked by the smiths and artizans of this country in times long past away; having then briefly described to our new friends some of the armour and other works in metal, we had the satisfaction to see them examine many objects which before had failed to attract their notice, and on leaving the building we received their thanks for having taught them that, all they wanted to make them interested in the exhibition, was just a few plain words which would lead them to understand something about it. We do not pretend to suggest that in *all* exhibitions—particularly in all Art-exhibitions—the case of the visitors is directly illustrated by these incidents; but we are prepared to maintain that visitors to the Art-Treasures Exhibition, and the Crystal Palace, and to other Art-

Exhibitions also, would be glad to have provided for them such lectures as would suit their various conditions and their varied requirements. Popular lectures would have (as we believe) secured the pecuniary success of the Art-Treasures Exhibition; they will accomplish much (as we both believe and hope) for the prosperity of the Crystal Palace. In the Crystal Palace we trust that for the future, at least one good, simple, effective, popular lecture will be to be heard daily; might they not even yet be introduced, with beneficial results, into the Art-Treasures Exhibition while it continues to exist?

We are glad to observe that, besides the regular series of more formal lectures, there will be courses of popular lectures in the Architectural Museum at South Kensington. Free admission to these lectures (which will be given on the evenings of alternate Wednesdays) may be obtained by applying to any subscriber, or to the honourable secretaries, and we strongly recommend all students of Art not to neglect such opportunities for gaining valuable information. The ensuing lecture-season will also produce various other lectures on Art, and we anticipate an important step in advance in this direction. The London Institution has set a good example in having chosen the Art-Treasures Exhibition as the subject for one of its courses of Lectures. In our next journal we hope to be able to notice many similar announcements.

THE BRITISH ASSOCIATION.

THE twenty-seventh meeting of this association for the Advancement of Science has recently been held at Dublin. It has hitherto been our custom to notice these re-unions of the scientific minds of our country, and to extract from their proceedings such matters as bear, even remotely, upon Art or on Art-manufacture. The meeting in Dublin has been an eminently successful one, yet we mark in it a very distinguishing feature—the entire absence, with one solitary exception, of any communication having a relation to those subjects which are the province of the *Art-Journal*.

Many valuable communications were made in all the sections, and there were some which possessed high interest as bearing directly upon the improvement of Ireland. Many of the papers read in the section for *Economic Science and Statistics* were striking examples of this. Among others we might especially refer to Mr. James Kavanagh's "Sketch of the Rise, Progress, and present prospects of Popular Education in Ireland;" Mr. Bianconi's paper "On his Car Establishment," illustrating, in a remarkable manner, the power of an earnest will in overcoming obstacles, and to achieve a great success; and Dr. John Strang's communication "On the advantages arising from the Improvement of Tidal Rivers, as exemplified in the present state of the Clyde." It is to be hoped, that the observations made in the section, upon the reading of this paper will not be lost, but that the result may be apparent in the improvement of the navigation of the Liffey. The geology of Ireland,—the economic products obtainable from her peat bogs,—and many other matters of interest, formed subjects of discussion. An evening was devoted to a lecture by Professor Thomson, on the Atlantic Telegraph. This has failed, but no doubt the difficulties, purely mechanical ones, will be overcome, and eventually the Old and the New World will be united by this wonderful electric nerve. A copper wire, coated with gutta percha, or some other insulating substance, will no doubt be eventually laid from shore to shore, and America will respond to the pulse-beat of Europe—while Europe again will send back to America the echo of her young thoughts. "I do not know," says Professor Thomson, "the name of the man who first used gutta percha to insulate under the sea; but he will have a monument more lasting than bronze, when the Atlantic cable lies along the Atlantic in its quiet ocean depths." Beautiful were the concluding remarks of Dr. Robinson, of Armagh, in returning thanks to the lecturer,—“Let them return him their thanks for what he had done, and join with him in the heartfelt prayer, that the expectations with which he concluded would be realised; which

was, that when they next met again in that parliament of science, the glorious result would be achieved, and that the great link would be completed of that golden chain, which would one day join the whole of mankind in the brotherhood of Christian love."

The solitary exception to which we have alluded, is the communication of the Abbé Moigno, of some improvements in the electrolytic processes: one was the employment of platina instead of copper in the battery, and, a somewhat imperfect description of a mode by which busts, statues, and groups, in full relief, could be obtained by one operation. The second was for galvanising or coppering iron, and cast iron, to any thickness required without the cyanide bath, and its employment in commerce and in the navy. We have already described some of these processes in a former number of the *Art-Journal*. The last branch of the paper treated of Messrs. Christofani and Ronillet's process for strengthening electrotypes. The process consisted in fusing brass by means of the oxyhydrogen blowpipe over the back of the thin electrotypes, which could be done, the abbé stated, without injuring it in any way.

The Abbé exhibited some microscopic photographs by M. Bertsch:—a method of exhibiting by photography the phosphorescence and fluorescence of bodies by Niepce de St. Victor; and he showed some improved photographic copies of oil-paintings by Mr. Bingham.

Dr. Daubeny, it is true, in addition, explained the process by which parchment paper is made, and exhibited some of it to the section.

We have said the meeting was eminently successful, and it was so in every sense but one. The attendance was large, the attention of the authorities in Dublin was worthy of all commendation; the excursions were well planned and well carried out, and everything went "smiling as a summer day." But there was sad evidence of the absence of that spirit of deep inquiry which has distinguished some of these gatherings. The time of many of the sections was taken up by communications which have been published to the world long ago; and some things were brought forward as novelties which have been patented, tried, and proved worthless. In the Physical and in the Chemical Sections there were several communications of this class; surely the sectional committees should avoid things of this kind. We hope when, next year the British Association meets in the centre of our manufacturing districts, LEEDS, that we shall have to record many communications which will have a direct bearing on the special industries by which they will be surrounded.

MINOR TOPICS OF THE MONTH.

PROFESSORS OF THE ROYAL ACADEMY.—Our readers will remember that, more than a year ago, we called their attention at some considerable length to the defective scheme of this association as an institution affecting to represent the embodied arts of the nation; and such instances of its action and inaction, alike injurious, continue to be brought constantly before us, as make it imperative that ere long we should return to the argument. We believe, that the time is not far distant when the relations which the Academy has with the country will have to be discussed; and it is important, therefore, to keep the public alive to its rights in the matter. Nobody can assume such an attitude as that taken by the Royal Academy, without incurring obligations to the society in which it is placed, even if the nation did not make a direct and formal contribution to its housekeeping. By that contribution, however, the nation recognises the position assumed, and is bound to see that the interests and dignity of the national arts suffer no neglect, and no injury, in the hands of those whom it permits to affect the character of their keepers. As an instance of their sluggish action, their want of earnestness in the cause of which they are supposed to take charge, we need go no further back than to the fact which we reported last month—their filling up, at a period so late, of the long-vacant Professorship of Sculpture. At the death of the late

Sir Richard Westmacott, the sculpture chair—which had for some years served the late incumbent as a mere easy chair—appears to have been wheeled into a corner as a useless article of furniture, and has been standing up against the wall we scarcely know how long. Now, the Academy keeps, our readers very well know, a *certain* number of professors expressly for show:—officers, the Royal-Academical theory of whose function avowedly is, that they have nothing to do, and who properly discharge their function by doing it. But the Professorship of Sculpture is supposed to be a part of their teaching system, and to have a real action which it should be a loss of some part of their vitality to suspend. Either, the duties which this professor has to perform are of no value,—in which case he may pass at once into the rank of honorary professors,—or, they are valuable, more or less,—in which case somebody is wronged by their being kept in abeyance. The professorship is, at length, as we have said, filled up by the election of Mr. Richard Westmacott, the son of the late professor; and, as that gentleman assisted his father in the work of the office for years, and has been long considered as his designated successor, it is difficult to understand why the nomination has been withheld for such a lengthened period. It was high time, certainly, that the voice of the sculpture professor should be heard in the schools.—Then, has Mr. Cockerell resigned his post of Professor of Architecture? His name does not appear in the list of professors this year as advertised in the catalogue. If he has withdrawn, why? and have the voluntary lectures of Mr. S. Smirke and Mr. Gilbert Scott had anything to do with Mr. Cockerell's retirement?—So much for neglect of trust: but we have instances of the manner in which the trust is exercised to bring before our readers on a fitting occasion—instances by which the body itself is discredited in the eyes of European Art at large, and the country is made, as things now stand, to incur a share of the discredit.

VACANCIES IN THE ROYAL ACADEMY.—By the death of Mr. Uwins, another vacancy has to be filled up in the ranks of the Royal Academicians. This event, and the elevation, during the present year, of Mr. Elmore and Mr. F. R. Pickersgill to the "upper house" will impose upon the members of the Academy the duty of electing three Associates from the list of those who have entered their names on the book as candidates for honours. Who the artists may be that will have the good fortune to secure the suffrages of their seniors we cannot tell; but who they ought to be, both ourselves and every one else out of the Academy who takes an interest in Art might readily point out. One gentleman, Mr. D. Harding, has placed himself *hors de combat*, by withdrawing his name from the list of candidates, after waiting till the last spark of expectation had faded out, and the "hope deferred" made his "heart sick." Mr. Gilbert is also ineligible, as being a member of the Water-Colour Society. But there is a goodly roll of fit and able men from which to choose, and we trust such a selection will be made as will convince the public that the Academy attends more to the interests of British Art than to the whisperings of a clique, or the urgent promptings of a faction. Mr. Uwins's successor, too, ought to be one, whether painter or sculptor, who has done something to elevate the character of the arts of his country,—something which the world has seen and talked of lovingly and admiringly. The Academy just now must look to its doings, for it has no popularity to spare.

SURVEYOR OF ROYAL PICTURES.—This office is vacant by the death of Mr. Uwins, R.A. There are several applicants for the post, which may be regarded mainly in the light of a sinecure, and is probably considered as a boon to an artist in the decline of years, and in the decay of power. It is scarcely necessary to say that the appointment rests entirely with her Majesty, and there can be no doubt of its being worthily bestowed.

THE MEMORIAL OF THE GREAT EXHIBITION.—The committee have issued an announcement "to sculptors, architects, and others," inviting models or drawings to be sent to the house of the Society of Arts, on or before the 2nd of February next. "Each competitor is to state the exact sum, including all expenses, for which he would be prepared, if required, to erect the memorial. The sum at the disposal of the committee is nearly £6000, within which sum the cost of the memorial must be con-

fined. The committee hope to obtain the sanction of the authorities to erect the memorial on the site of the Great Exhibition in Hyde Park. A premium of one hundred guineas will be paid to the author of the selected design, if he be not commissioned to carry it into execution; but it is the desire of the committee that he should be so employed, if found competent to carry out the work satisfactorily, and a site be obtained. A scale of two inches to the foot has been suggested, but the committee, desiring to give the greatest possible freedom to artists, do not insist on this as a condition. The designs will be exhibited to the public." We earnestly hope this invitation will be properly responded to. The amount is not large, but it is sufficient for a worthy memorial of the great year 1851, especially if fitness rather than display be studied. It is, therefore, a "thing settled," that the contributions are to be expended as the subscribers contemplated, and that there will be no attempt to direct the amount collected into a channel for which it was not designed.

EXHIBITION OF ENGLISH ART IN AMERICA.—We alluded last month to the projected exhibition, in America, of the works of British artists; we have since then received a catalogue of the pictures which have been collected for the purpose: it contains a list of about 170 oil-paintings, and nearly 180 water-colour drawings; but the committee have evidently found it, as we hinted they would, no easy matter to get together any number of works of the best order, and by our best painters. Among the oil-pictures are examples of Anthony, Archer, Armitage, P. M. Brown, Burton, T. S. Cooper, Cross, F. Danby, Dillon, Gale, Gosling, F. Goodall, J. D. Harding, G. Harvey, G. E. Hering, J. C. Horsley, Hulme, Holman Hunt, Lance, Leighton, James Linnell, Lucy, Maclise, Oakes, J. N. Paton, H. W. Pickersgill, P. F. Poole, Redgrave, Sant, G. C. Stanfield, F. Stone, F. Taylor, E. M. Ward, Wingfield, &c., &c.; but with a few exceptions it seems very doubtful whether these pictures will offer to the American public an adequate idea of the powers of the respective painters. The water-colour artists are, we presume, better represented: the list includes very many of the leading men in both societies; and, inasmuch as drawings are more easily collected than large and important works in oil, the exhibition in this department bids fair to do credit to our school. The commencement of the project is thus far promising, if it is not all we desire it to be. We hope the Americans will view the exhibition, when it is open to them, only as a first and very small instalment of what they may receive hereafter, provided circumstances warrant a repetition of a scheme that deserves success.

THE EXHIBITION OF ART-TREASURES is announced to be closed on the 15th of the present month: we shall thus be enabled, in our ensuing number, to give a full report of its results; and to subject to detailed criticism many matters connected with it.

THE SOCIETY OF PAINTERS IN WATER-COLOURS.—The usual and justly merited success of this institution does not fail it this season; of the 317 pictures exhibited only 73 remained unsold at the close of the rooms on the 25th of July. The attendance of visitors, though somewhat below that of last year, was considerably greater than in previous seasons. Mr. Holland has succeeded to the honour of full membership.

THE SOCIETY OF FEMALE ARTISTS.—If the first season of the existence of this society may be accepted as an augury of its future, the institution may be said to be established. The committee express their gratification in announcing that the success of the first exhibition has fully equalled their expectations, and they venture to hope for yet more advantageous results from their second exhibition, when the existence and the purposes of the society shall have become more widely known, and a proper time given for the execution of works expressly for this exhibition. We earnestly hope that no "apple of discord" may impair its utility.

LINCOLN'S INN HALL.—The painting of the interior of this hall was, it may be remembered, undertaken some time ago by Mr. G. F. Watts; but it was suspended in consequence of the ill health of the artist, who, for its re-establishment, visited Constantinople. He has resumed his work, the subject of which is the Lawgivers, from Moses to the time

of Charlemagne. The composition is, of course, in fresco, and the design may be said to have been suggested by the "Disputa" of Raffaele.

TURNER'S "LIBER STUDIORUM."—Mr. Love, of Bunhill Row, has favoured us with the following communication relative to the above work, in answer to a question asked some short time ago by one of our subscribers:—"A complete copy of the 'Liber Studiorum,' consists of fourteen numbers, containing seventy plates: the plates are not destroyed, but are in a bad state, in fact, no two printings are alike, all through the work. Turner made continual alterations to suit the subjects as they began to wear. The letter or letters on the top of the plates of the 'Liber Studiorum,' refer to the style of subjects thus:—E. P., Epic Pastoral; P., Pastoral; A. Architectural; M., Marine or Mountains, and so on; many of the plates are without names, but that does not denote their being proofs; to be so, they should have no letters whatever, or occasionally Turner's own scratched writing on them; but he played so many tricks with them as to render it impossible to tell what they are without seeing them. There are seven or eight different states."

WINTERHALTER has received a commission from the Emperor of the French, to paint a portrait of Alexander II., of Russia, to be placed in the Gallery of Versailles.

THE LIFE SCHOOL, LANGHAM CHAMBERS.—The weekly sketching meetings of this institution recommence on the first Friday in October. The collection of sketches in course of formation, by contribution from members and visitors; promises as it advances to be of great interest, and contains already examples of every variety of working material—as oil, water-colour, charcoal, &c., with subject-matter sufficiently excursive in poetry, facetiae, marine, landscape, and *genre*.

PHOTOGRAPHS FROM THE ART-TREASURES EXHIBITION.—To the lover and the student of Art, the very contemplation of the breaking-up of the Manchester Exhibition cannot fail to be associated with most painful ideas. When once those varied "treasures" are dispersed, that they again may resume their own old places on walls or in cabinets, situated in almost every quarter of the land, a last farewell to some, at least, of the most treasured objects of his admiration will have been paid by many an earnest student. That peculiar value, also, which the most precious works of Art derive from extended comparison will cease to exist when comparison is brought to an end, because separation will have succeeded to companionship. It is in such a case that photography steps in with the happiest effect. In photography the groups can be perpetuated as they were seen in the verities of actual association: photographs are living memories of these very important and instructive Art-alliances. We must plead for many additions to the photographs already taken, or intended to be taken, at the Art-Treasures Exhibition. More particularly we desire photographs from the mediæval works, such as the ivories; and with each photograph of a group, we would urge the necessity of having a series of representations, on a large scale, of the various individual objects of which it is composed. In the case of the ivories alone, Art-teaching of the utmost value would thus be obtained—Art-teaching not otherwise obtainable. The proprietors of these fine works, who have so generously lent them for exhibition, will not hesitate to sanction their leaving behind them their sun-drawn images; and we cannot anticipate any difficulty arising from the cost of producing the photographic negatives, since the copies of such photographs would in themselves be Art-treasures which so many persons would be anxious to possess.

MESSRS. ELD AND CHAMBERLAIN, of Birmingham, exhibited at the Archaeological Meeting recently held in that town some new carpets, of which the patterns were reproductions of the designs of the Assyrian pavements now preserved in the British Museum. There is nothing remarkable in the fabric, except, indeed, its general excellence: but the idea of adapting these ancient designs to the richest carpets now manufactured, appears to claim from us a distinct notice, and the more so since the colours have been determined on and adjusted with the purest taste and the utmost skill, the general results being eminently satisfactory. A sketch of the border, and of one of the patterns, will be found in the *Art-Journal* for August last (p. 246). This same border is made to

adapt itself to each pattern, the colours of the whole being uniform, though subjected to various modifications. We shall be glad to know that these beautiful carpets have found their way into many of the mansions in London and elsewhere, in which their Art-quality will be appreciated.

THE WELLINGTON MONUMENT.—The work to which we referred (No. 66), is now known to be the joint production of Mr. Durham and Mr. Lawlor: it was, we understand, excluded by the adjudicators in consequence of its having exceeded by three inches the stipulated size. But for this unfortunate mistake on the part of the sculptors, there can be no doubt that to this very meritorious work would have been awarded one of the premiums—to which it was eminently entitled. It is understood that the group contributed by Mr. Gibson, R.A., was excluded for the same reason: and we believe there were other sculptors similarly circumstanced.

THE FRENCH SCHOOL AT THE CRYSTAL PALACE.—An exhibition of painting by French artists is now open at the Crystal Palace. The list of exhibitors does not contain the names of any of the leading masters of the school; but nevertheless the collection may be good and instructive. We shall endeavour to bring it under review next month.

"IMPROVEMENTS" IN THE TEMPLE.—We may express regret that by arrangements in progress for "improving" the Inner Temple, some of the most interesting and venerable of its "memories" are about to be swept away; among others, the rooms once occupied by Samuel Johnson, and those in which Charles Lamb passed so large a portion of his simple and instructive life are about to be removed. It is rumoured also that the time-honoured fountain will cease to play after a brief while; the dulness of these courts and alleys will then be unrelieved by associations with the honoured past.

PICTURE-DEALING.—A case of alleged fraud in picture-dealing was recently brought before the sitting magistrate at Bow Street. Mr. Henry Smart, of Tichbourne Street, and Mr. Thomas Closs, of Charlotte Street, Blackfriars, were summoned "for conspiring to defraud Mr. H. Fitzpatrick, of Sheffield, carver and gilder, by obtaining £120 from him under false pretences;" or, in other words, by selling the prosecutor a copy of a picture by John Linnell as an original. The matter was still *sub judice* when we went to press, and therefore it would be premature now to pronounce any opinion upon it: which, however, we shall assuredly do next month.

THE SCULPTURE ROOM of the Department of Science and Art, at Brompton, has recently received two additional works, both by Mr. John Bell; his statue of the "Maid of Saragossa," which we engraved in the *Art-Journal* a few months since, and his design for the Wellington memorial to be erected in Hyde Park.

PHOTOGRAPHY has now become so far popularised that its practice may be at times considered a public nuisance. In the suburbs of London, particularly at the east end, the streets are impassable with "touters" of rival establishments, who, with showy gilt frames in hand, intercept all passengers, and almost drag them into their dens. An enormous trade is carried on upon Sunday at all hours, in defiance of public decency. It has really now become a matter for police interference, both on the grounds of propriety and public comfort.

THE ARCHITECTURAL MUSEUM CONVERSAZIONE.—Earl de Grey, K.G., the President of this important institution, presided at the conversazione held, in accordance with annual usage, on Saturday, July 18th. The noble earl was supported by the committee and many of the other warm friends of the museum, and he received a cordial welcome from a very large general assemblage in the new galleries at the South Kensington Museum Buildings. In the course of the proceedings, the various objections which have been made in certain quarters to the removal of the Museum from Canon Row to its present location were fully considered and most conclusively answered; indeed, the spacious and commodious gallery in which the meeting was held, in itself was the best reply to every objector who could remember the crowding and the inconvenience of the conversazione when held in Canon Row. The collections of the museum can scarcely be considered to have yet illustrated the great advantages which they derive from their change of galleries, in consequence of their

not being yet completely classified and arranged. We have much pleasure in being able to state, however, that a most careful classification and arrangement is in progress, and that this museum will shortly receive most important and practically valuable additions. Now that they have space in which to work, the committee will not be found wanting in energy to avail themselves of every practical means for establishing and confirming their claim upon the architectural profession, and also upon the public at large, for a far stronger and more widely extended support than has hitherto been accorded to them. It must not be forgotten that this museum depends absolutely upon its own subscribers for support, as it is entirely under the control and direction of its own committee of management. In its present position, it is capable of conferring the most valuable advantages upon all who are in any way connected with, or interested in, architecture in England: it is the first institution of its class which has been formed amongst us, and it owes its existence to the liberality and carefulness of a comparatively few individuals, who have devoted themselves to an arduous work, because they felt that such a work must be productive of great benefits, and because they relied upon such an appreciation of their labours as would ultimately render their museum a national institution. A national institution the Architectural Museum may now be justly considered; we are convinced that it will be found to be worthy of such a title in every respect. This museum will continue open throughout the autumn, and the committee will shortly announce a series of lectures to be delivered when open for study in the evening.

THE ARCHITECTURAL PHOTOGRAPH SOCIETY.—We observe, with much satisfaction, that this society is making such a steady advance as gives promise of a complete, and also a permanent success. While scarcely a day passes without an accession to the number of subscribers, the committee, with their able and zealous secretary, Mr. Hesketh, are no less continually occupied with some practical measure calculated to produce beneficial results. Thus, local honorary secretaries have been appointed in several provincial cities and towns, and active steps are being taken to add considerably to their numbers. Arrangements are in progress for organising distinct yet associated committees in both Scotland and Ireland. The sanction of the Secretary of State for War has been obtained for the co-operation of the photographers of the Royal Engineers—a sanction already warmly seconded by both officers and men of that distinguished corps. Nor has the distribution of copies of photographs among the subscribers failed to receive its due share of attention. Overtures have been made to several photographers of the highest eminence both at home and abroad, and with such success that the committee have already secured several series of admirable works, of various sizes, and illustrating edifices in different styles of architecture. The formation of collections to be kept in London, Edinburgh, and Dublin, and of other collections which may from time to time be sent to different places for exhibition, is also in the course of progress; and it is intended that in the metropolitan cities there shall be an exhibition of these interesting works always open for inspection and study. We have reason to believe that the second issue of the Society's photographs will comprise more than one series, prepared expressly for the society upon a plan which will ensure the most effective and complete illustration of the edifices selected. General views will be accompanied by details on a large scale, the whole having been photographed from points of view chosen with the utmost care. We may add that, in the selection of subjects for distribution, the committee have wisely determined to admit many of a popular character, their object being to extend the operations of the society as widely as possible beyond the range of the architectural profession. From the intelligent interest thus excited in their Art, the architectural profession cannot fail to derive signal advantages; and, on the other hand, many and important are the reciprocal benefits which are certain to be developed by such an alliance between architects and the general public.

REVIEWS.

NOAH'S SACRIFICE. Engraved by W. H. SIMMONS, from the picture by D. MACLISE, R.A. Published by the ART-UNION OF GLASGOW.

The council of the society for which this print has been executed is upholding the high character of the institution by the publication of so fine a work. We much question whether any private publisher would have ventured his capital in such a speculation; but there cannot be a doubt of the fact that the subscribers to the Art-Union of Glasgow during the current year will possess the noblest engraving of its class which has appeared in England for many years: we see such produced sometimes in France and Germany, but they are of rare occurrence indeed among ourselves. Mr. MacLise exhibited his picture, if we remember rightly, about nine or ten years ago, at the Royal Academy, and though painted in a low and flat tone of colour, very similar to fresco-painting, without glazings or varnishes of any kind, and brought into proximity with pictures brilliant and powerful in colour, and therefore damaging to it when these qualities of Art are regarded as of paramount importance—still the sublimity of the subject, the grandeur of the composition, the accuracy of the drawing, and the care bestowed upon every detail of the work, impressed the spectators with the assurance that they stood before a picture which only an artist of the highest intelligence and executive power could produce. Now, in the print we lose sight of that quality—colour, which many considered the weak point of the picture, but its other characteristics are retained: if it had been painted solely for the purpose of engraving, a more effective result could scarcely be attained than that found here. The subject is one presenting vast difficulties: whether Mr. MacLise has surmounted them all is a point determinable only by the conditions which the taste and judgment of every one attach to high Art, and according to which all estimate it more or less. The artist may not have fulfilled some of the conditions we, perhaps, should require; for example, we had rather he had omitted those angelic figures that appear amidst the rainbow; they are not necessary to the subject according to the narration which Moses left upon record, and they are not agreeable to the eye viewed artistically, nor essential to the composition: there are mysteries, especially in sacred themes, which no art can successfully deal with; and therefore it would be wise never to attempt them. The foreground of the picture is that part where the artist's triumph is complete; it is throughout solemn, grand, and impressively sacred; a beautiful, though ideal, representation of such a sacrifice as—save *one*, nearly two thousand four hundred years after—man never offered nor witnessed.

Mr. Simmons has engraved the plate admirably in mezzotint; it comes out very brilliantly: he would have improved it, we think, by lightening the upper portion of the smoke that rises from the altar, which catches the eye intrusively, and seems to "cut up" the composition.

TRANSACTIONS OF THE LONDON AND MIDDLESEX ARCHAEOLOGICAL SOCIETY. PART I., VOL. I. London: published for the Society by J. H. and J. PARKER, 1856. Distributed gratuitously to members.

It was in December, 1855, that a meeting was held at Crosby Hall, in the City, for the purpose of forming a society, of which the operations would be specially and exclusively devoted to the archaeology of the metropolis and metropolitan county. And now we have before us the first of what we well may hope will prove a prolonged series of the Society's "Transactions." That no association or institution should long ago have been formed with precisely the aim and object of this society, is at once a subject for deep regret, and a most singular omission. There is that peculiar historical interest attached to all that our own London either preserves for us, or discloses from time to time of the London of times long past away, that a metropolitan Archaeological Society for the metropolis would seem to have been but the involuntary result of an universally acknowledged requirement. One by one, however, most of our counties have framed associations, which should devote themselves to antiquarian research and all kindred duties, within their respective limits, but not so Middlesex. The antiquarian institutions which have their home in London, are cosmopolitan in their range, or, at least, imperial—they deal either with universal archaeology, or with the archaeology of the British empire. London and Middlesex are by them regarded precisely on the same terms with Nimroud and Central South America, or with Malta and Delhi, with Glasgow, Chester and

Glastonbury. That London should be their *habitat* is simply a consequence of London being the capital city of England; it does not imply that they devote any special attention to London archaeology, nor have they actually done so. The necessary consequences have been precisely such as must ensue from the non-existence of an accredited and recognised Archaeological Institution in London for London. Many precious relics of the past have, in one way or another, been lost altogether; many (and often such as would derive a special value from comparison) have been dispersed, and for public purposes are become almost, if not absolutely, inaccessible; and still more have been either grievously injured, or treated with neglect and indifference. At length an effort has been made to fill so palpable a void. A "London and Middlesex Archaeological Society" is in existence, and at work. And it has entered upon its duties in the right spirit; it invites to its meetings all who can sympathise with what it desires to accomplish; and it puts forth, even before a single year has passed since its establishment, the commencement of its publications.

We confess to having taken up this first publication with no ordinary feelings of anxiety. The Council of the Society must themselves have felt that these sheets would determine whether their Institution should stand or fall; that to them an appeal would be made to give a reply to the questions—Is this Society equal to its work? is it strong enough for its place? It was a wise and a judicious determination to publish, at an early period of the Society's career—that is, provided the publication would endure the test to which it would assuredly be subjected. We can best express our opinion of this first part of the Society's "Transactions," by declaring that now we are no longer anxious respecting the future of the Society itself. These pages are characterised by that quiet, business-like earnestness which, beyond any other quality, bespeaks the commencement of an important work. However important the work may eventually prove, here it will possess a worthy opening.

This Part I. touches upon many topics, and it shows that the Society enters upon its duties with a full consciousness of their comprehensive nature. Mr. C. Roach Smith supplies a highly interesting communication on Roman London. Mr. Sydney Smirke and Mr. G. G. Scott show that the Society has secured their valuable co-operation. The Rev. Thomas Hugo, besides several minor notices, has an excellent paper on Crosby Hall. Mr. Deputy Lott brings forward some curious and instructive records; and Mr. Crosby communicates an equally remarkable document. The Rev. C. Boutell commences a series of papers on the monumental memorials of London and Middlesex, and, with his descriptions, he associates a memoir of singular interest; and Mr. Mogford opens the way to a thorough investigation of "reminiscences of Westminster." Illustrations are introduced with liberal freedom; and they all are well selected, and executed in the most masterly style: one of them—a chromolithograph—represents a singular (and probably unique) portion of a monumental slab, of which the surface, in addition to parts of a cross and of an inscription in brass, is enriched with an incrustation of glass-mosaic, composed of small tesserae of gold, crimson and white: the original is in Westminster Abbey, and has been preserved through being covered over by a step leading eastwards from the Chapel of Edward the Confessor. It was discovered by Mr. G. G. Scott, and is here described and figured by Mr. Boutell.

We shall rejoice to welcome a second part of these "Transactions," and we hope that at no distant period it will confirm the satisfactory anticipations produced by its predecessor.

PERCY'S RELIQUES OF ANCIENT ENGLISH POETRY. Edited by K. A. WILLMOTT. Illustrated by E. CORBOULD. Published by G. ROUTLEDGE & Co., London.

This book is offered to the public as a "popular" edition, which, in the present day, means a cheap edition, therefore we have no right to examine too closely into its defects; these, however, are only apparent in what is of least comparative importance—the type and the illustrations; and of them we will only say that we wish they were better, only because we prefer our old friend Percy in the best dress that can be provided for him. The editor has cleared away much of the "lumber," as he terms it, which appeared in the original edition, because "since the time of Percy, ingenious scholars have diligently traversed the paths which he trod, lighting up many dark places in their way. But the claims of Percy deserve respectful deference: I have never talked when he might talk for me, and phrases in harmony with the old colouring of the verses are constantly preserved." Percy's "Glossaries" are considerably improved and enlarged in this edition, the more obscure words being explained in foot-notes

at the bottom of each page, so as to be of easy reference: in every way the utmost care seems to have been given by Mr. Willmott to render his book an intelligible and "popular" edition of the "Reliques." We too wish with him that he had "gratified his judgment by the omission of two or three of the compositions of which the merits and the fitness are extremely doubtful:" their "fitness" for popular reading could scarcely be "doubtful:" it was a pity to mingle a few drops of deadly poison with so much that is pure and healthy.

MATS OF INDIA. Published by J. WYLD, London. Little more than a year has elapsed since we, as doubtless many others did, rolled up the maps that hung on the walls of our library, and on which we had traced through so many weary and anxious months the movements and progress of the armies and navies engaged in carrying on the war with Russia: and, as we laid them aside, it was not without a hearty wish and prayer that we might never again be called upon to consult charts associated in the mind with so much of sorrow and suffering. But the war-cry is again floating over the land, and the forces of England are hastening onward to take vengeance on those who have outraged every feeling of humanity, committing deeds that would put a savage, uncivilised race to shame; and we who remain behind are again consulting our maps, and marking the sites of villany and bloodshedding. We have before us two maps just published by Mr. Wyld, with an express reference to recent events in Hindostan: one, rather large, in which all the civil and military stations in India are indicated, and tables appended of the distances between all places of importance: the other, a smaller map of India and Burmah, with a table of distances through the overland route. Either of these charts will be found most useful for reference in the present juncture of Indian affairs.

THE YOUTH'S MAGAZINE. Published by J. F. SHAW, London.

We remember, in the day of our boyhood, a periodical that used to be put into our hands every month, called the "Youth's Magazine;" and a very amusing book it was, though, we must confess it, containing a great deal that did not quite suit our taste: it was, in a word, too "good" for us; we should have been better pleased with more stories, and histories, and anecdotes, and less of moral teachings and religious instruction. Is Mr. Shaw's publication a lineal descendant of the other? with the freshness and bloom of a young life upon it, animated with the same spirit as was its progenitor, entertaining, instructive, and "good" also, but after a fashion somewhat more attractive? We presume our conjecture as to its origin is not far from being correct, for the volume we have received is lettered on its bright blue cover, "Vol. IX., New Series," in letters of gold: and there are inside words of wisdom that deserve to be printed also in letters of gold, and amusing tales, and chapters on natural history, and well-written poetry, that every youth and maiden may read with pleasure and profit. When so much foolish and almost noxious literature is offered to the young mind, as one sees at the present day, it is well to find an antidote in such an excellent little periodical as this.

COLLECTANEA ANTIQUA in the possession of HODDER M. WESTROPP, Esq., of Cork. Printed for private circulation.

Many men collect antiquities, but few publish the results of their gatherings; hence collecting often becomes a mere selfish gratification, which deprives the student of relics that might elucidate his researches. Every collector knows that "few and far between" are the visits of connoisseurs to his museum, and hence he does good service when he sends to them what they cannot travel to see. This is well done by such plates as are now before us, which truthfully and cleverly depict the best specimens of Mr. Hodder's collection. This opening part is chiefly devoted to Etruscan antiquities; but we hope to see others more intimately connected with Ireland, for there is much yet to be done for our native antiquities, which can only be effected by individual enterprise—an enterprise that cannot fail to honour all who persevere in it.

THE POETICAL WORKS OF SIR WALTER SCOTT. Published by A. & C. BLACK, Edinburgh.

In one compact volume, encased in a cover of emerald green and gold, Messrs. Black have issued the whole of Scott's poetical writings, in small but clear type, and on good paper, with numerous illustrations on steel and wood. As a cheap edition of the poetry of the "Wizard of the North," it must find, as it deserves, its way into many households.

THE ART-JOURNAL.

LONDON, NOVEMBER 1, 1857.

THE REPORT
ON
THE NATIONAL GALLERY.

"I asked a question which you *must* answer," prescribed a great authority in polemical philosophy, to one who suffered under an uncommon form of malady—a doubt of his own wisdom,—“content yourself with giving the answer simply, in its Yes or No. On no account be betrayed into stating your reasons. The chance is only equal against your answer being right; but there are fifty chances to one in favour of your reasons being wrong.” Now, if to give or to withhold their reasons had been,—as, of course, it was not,—in any degree optional with her Majesty’s Commissioners for determining certain questions connected with the site of the new National Gallery, it would have been wholly unaccountable how they should have ventured on the publication of the evidence attached to their present Report. To us, no reconciliation between the two seems logically possible. Standing alone, the answer given by this Commission might, perhaps, have contrived to sustain itself, on the authority of the names subscribed to it; but it goes down inevitably, if every name had been ten, the instant the Commissioners produce their reasons. If the evidence here printed be right, the Report *must* be wrong:—if the Report be right, the reasons here given are, unquestionably, the wrong ones. The Blue-book before us embodies an elaborate *non sequitur*. Its problem is worked out by an algebraic law singularly contradictory of that of the schools. The sum of many affirmatives is made therein to yield a negative. The rule of evidence is reversed, for its use. A cloud of witnesses testify, each and all, with scarcely an exception, to the fact that, where the national pictures now are, they are subjected to a process of deterioration, whose end is of course destruction; and the inference drawn by the Commissioners is,—that they ought not to be removed! The constant need of the picture doctor, with the great danger of death, and the certain eventual loss of constitution, in his hands, are shown to be *necessities* of their present site:—*therefore*, say these Commissioners, using a logic emphatically their own, we “recommend,” that the new National Gallery “should be on the same site as the present!”

If we could have thought it possible, that six gentlemen, selected as commissioners on a public question, could have agreed in the peculiarity of ratiocination necessary for arriving at the conclusions of this Report by the path of this evidence,—if it had been credible that these half-dozen authorities, met at this point, had all united in the idiosyncrasy which paints the hand on the guide-post with the finger pointing exactly the wrong way,—then, we should have had more difficulty than we now have in asking our readers to turn their backs resolutely on the direction there indicated, and carry the national pictures anywhere rather than to the spot designated by the Commissioners’ Report. We will produce for

them, by-and-by, ample reasons why they should do this, on the authority of others than the Commissioners; but, meantime, we undertake to show that, notwithstanding the Report, the authority of the Commissioners themselves is *not* so directly opposed to the evidence before them, and to the views which we have to maintain, as on a hasty view must seem to be the case. *What* our views on this question have hitherto been, our readers know well,—and that we have to a great extent exhausted the subject by anticipation, as far as its merits were then understood by us, in our articles in this journal for August of the last year, and for August of the present. We have now to tell them, that we find nothing in the document before us but what is strongly confirmatory of the conclusions at which we had already arrived; and that we are prepared to stand now to all our previously expressed opinions, not in the face, but on the strength of this very volume which embodies the Commissioners’ Report.

We begin, then, by denying that this Report is the report of a majority of the Commission itself, in the sense claimed,—or in any sense which could give it weight to override the serious considerations that we find therein pointing another way. In its original constitution, this commission included six members. Of these members, one, Mr. Ford, was disabled by illness from taking a share in its deliberations; and it remains, therefore, to be known what particular view he would have adopted of the heavy responsibilities that hang on the decision. As he took no share in the inquiry, his name is not attached to the conclusions arrived at,—a course clear and consistent,—and certainly more intelligible than the attachment of signatures by parties who *did* take a share, and *that* share directly opposed to the conclusions thus vouched. Throughout all the discussions of the Commissioners, we find another, and a most important, member of their body, Professor Faraday, practically arguing, as will be seen hereafter, on our side of both the leading questions raised: and, after being beaten in his attempts to give effect to his arguments, dragged into signing the Report as it now stands only by the formal necessity of his signature to enable the Commission to report at all. “As the royal warrant,” say these Commissioners, “requires that five” (the precise number to which Mr. Ford’s secession had reduced them) “signatures should be affixed to our Report, we have been compelled to frame a statement to which all of us could agree.” That we are entitled to claim Dr. Faraday as supporting our views, in a sense which renders the possibility of his agreement in the statement before us unintelligible to ourselves, we shall, as we have said, proceed presently to show:—but Mr. Richmond must have had a yet greater difficulty in complying with the practical absurdity involved in the literal necessity of his position. About *his* opinions there is neither vacillation nor misapprehension. They are all on the same side as our own,—and emphatic in the highest degree. Step by step, throughout the progress of this inquiry, and with an energy, a knowledge, and a talent which are remarkable, did he support the views which he finally surrenders by a single stroke of the pen. Such a Report cannot, in common reason, be taken seriously, or acted on practically. In point of fact, the recommendations which it contains are, under any view, the recommendations of one half only of the Commission. And this is not the only—or even the principal—point of weakness impeaching the authority of the Report itself. Taking it as it stands, with all the five signatures attached for the form’s sake, its recommendations, as we will show, are accompanied by such admissions and qualifications on the part of all the Commissioners themselves as should determine the matter against them, even if those recommendations had represented the spontaneous and unquestioning verdict of the whole.

We are dealing, it must be understood, for the present, only with the proceedings of the Commissioners themselves, and the final Report to which these brought them:—leaving the evidence which they had before them, and with which these proceedings assume to deal, to be examined by-and-by. One of the grounds, then, let us observe, of Dr. Faraday’s express reluctance in the matter of this Report was, precisely that on which we have, ourselves, laid so much emphasis, and which we find so much additional reason for emphasizing in this Blue-book,—the danger to which the pictures in

the National Gallery are exposed from the atmospheric influences by which they are surrounded in the heart of London. On such a subject, Dr. Faraday should be a considerable authority himself,—and better qualified than most men to weigh the evidence of others bearing on the practical questions which it involves. It was moved by him, in the committee, and seconded by Mr. Richmond,—“That the preserver of the National Gallery within the smoke and atmosphere of London involves, from the consequent extra dirtiness and necessary cleaning of the pictures, an amount of wear and tear which would occur only in a smaller degree in clearer and more airy situations.” This proposition was negatived by the majority which, under the circumstances, we have contended is no majority at all. Once more let us insist, that where doctors disagree on a question directly affecting the life or death of a patient so important as the national collection of pictures, we cannot speculate at our ease on the possible negation which arises out of the balance of their differences. The quantities on the two sides of the equation do not, we repeat, destroy each other, because the figures are not of equal value. The fears of Professor Faraday and Mr. Richmond should weigh with us more than the confidence of Lord Broughton, Mr. Milman, and Mr. Cockerell,—even in the event of Mr. Ford’s taking the side of confidence, to back them. Where there is so much even as a doubt, were it no more, a treasure so precious as these national pictures must have the benefit of that doubt. “The removal of the pictures,” say the Commissioners, by a majority of three to two of their acting five, “to a clearer, but distant place, takes away that accessibility which the present site, *although no doubt with a great amount of wear and tear*, provides.” Now, we say, that we cannot afford to sacrifice clearness of atmosphere to even so important an object as accessibility,—and that we will not consent to pay for it in “wear and tear.” The life of the pictures is a question paramount to all questions of their use, and the accessibility will be of little value when the wear and tear shall have done its work.—But, this is not all. In this very Report, which recommends that the National Gallery shall remain on its present site, the *five* Commissioners sign their names to the following important admission:—“In regard to atmospheric impurities it is, as has been previously admitted, inferior to the site of Kensington.”—If “atmospheric impurities” be a term of dangerous significance where pictures are concerned, then, we earnestly hope the nation will reverse a decision which comes before it on appeal, accompanied by a hint so suggestive as this.

So much for the one strongest ground on which the argument for the removal of the national pictures rests; and which, if all other considerations pointed to an opposite conclusion, must yet outweigh them all, supposing it to be established by the evidence laid before this Commission. But, on the second important question also—that of space—on which our argument for removal was founded, we find new reasons in this Blue-book for urging our views on the public against the Report of the Commission, and, *in spite of* the Report, we find allies amongst the Commissioners themselves. On this point, as on the other, we have, their final signatures notwithstanding, Dr. Faraday and Mr. Richmond with us,—and Mr. Ford, in virtue of his non-signature, not against us. Our readers will remember, that, of all the questions relating to the proper constituents of a great Art-collection which we argued at length in our number for August last, the only one submitted to this Commission, as supplementary to its inquiry into the question of site, regarded the desirableness or otherwise of “combining with the new National Gallery the Fine Art and Archaeological Collections of the British Museum.” On this point, the committee have come to the conclusion, that “it is *not* expedient to break up or remove the collections of ancient sculpture and archaeology” in the institution in question. As this decision would seem to have been arrived at, however, solely on considerations affecting the British Museum itself, and did not necessarily decide—as, in fact, the question had not distinctly raised—the more important proposition of the wide scope and range proper to a National Gallery,—Mr. Richmond made an attempt to save the general principle for future use. He moved, and had, as

usual, Dr. Faraday's support,—“That though the Commissioners think it undesirable to break up the Collections of Ancient Art and Archaeology in the British Museum, and for the present inexpedient to remove them, they are yet of opinion that the future combination of Sculpture with Painting should be provided for in the new National Gallery,—a primary use of which should be to provide examples of the Art of past ages in all its branches, in the order best adapted to exhibit their beauty, and to illustrate their sequence and character.” This proposition, says the Report, significantly,—*very significantly*,—we challenge the attention of our readers to it,—“the other three Commissioners *did not think it necessary to adopt*.” It should seem, then, that the views, not of these Commissioners, as we have pointed out, but of their pseudo-majority, in respect of the sufficiency of space to be obtained on the present site, proceed on the ground of a narrower scheme for such an institution as a National Gallery of Art than the expanding intelligence and growing desires of the nation are certain one day to demand. But it is important to bear in mind that such are not the views of Dr. Faraday and Mr. Richmond; and that the Report before us, though signed with their names, wants in all important respects the sanction of these two Commissioners,—as it wants the sanction of the most important portion of all the evidence on which it professes to be based.

That most important portion of the evidence refers, as we have said, to the health of the pictures in their actual place of abode; and that this was the most pressing point for inquiry, seems to have been recognised by the Commissioners themselves, when, at their first meeting, on the 30th of January, they determined to commence their labours by considering—“How far the conservation of the pictures of the National Gallery is compatible with its present site in Trafalgar Square.” Let us see what the nature of the evidence is, out of which they have been able to extract a recommendation that these treasures shall not be removed. If in the terms of the question stated, for the word *conservation* be substituted the word *destruction*, the logic of the Blue-book, we shall find, is at once restored, and the evidence and the Report are finally reconciled.

In turning, however, to the evidence for examples, there is one remark which we will make at the outset, that we may get quit of it at once, and divest it of every character of offence which, on its first statement, it might seem to bear. It is impossible, on going over this evidence, not to be struck by the fact, that while, of all those examined, every artist, save perhaps one, (and even he makes admissions which bring him into the same category,) who is not professionally a picture-cleaner, testifies to the injury which pictures sustain from the incidents of the London atmosphere,—every picture-cleaner, on the other hand, maintains that this charge of destructiveness is a calumny on the London smoke, save only Mr. Smart. Now, certainly, we mean no impeachment whatever of the picture-cleaners as a body, or of any individual of them who gave evidence before the Commission, when we make this remark. The fact comes before us, as a fact,—and it is impossible to overlook it. Neither is it possible, in connexion with the other evidence in the case, to overlook its significance. The argument of the picture-cleaner for keeping the pictures in London becomes actually, as we see it, evidence in the opposite sense to that for which it is given, and reinforces the testimony of the artist to the injury which they there sustain. In all this there is, assuredly, no charge,—no imputation beyond the imputation of average human motive. Mr. Smart, for his part, frankly avows his belief, that he should not be so much wanted in his capacity of picture-cleaner, if pictures generally were kept out of London. The men who thrive on calamities—and who are, by the very fact, among the most useful, as they may be amongst the most honourable, members of the social body—cannot have the same hearty enmity to the calamity as *they* have to whom it brings no profit. The “ill wind” will have its partisans as long as it “blows anybody good;”—and the dislike of the many, and the welcome of the few, are alike evidence that it is an “ill wind.” The physician, though a lover of his kind, cannot be expected to be indifferent to the prevalence of disease,—nor the picture-cleaner, though a lover of Art,

to the unwholesome exposure of pictures. On ordinary human principle, a strong argument for the removal of pictures from any given locality should be inferred from the eagerness of picture-cleaners to keep them there. Nor is the professional bias, in this case, made up wholly of the vulgar motive of pecuniary profit. The picture-restorer, like the restorer of human bodies, has the pride and excitement of his art,—and a certain dignity which he arrogates to himself out of the mystery with which he surrounds his calling. It is true, in the one case and in the other, the mystery lets in the quack;—but then, each man knows, that if there be any quack in the matter, it is his neighbour, and not himself. Some of these gentlemen are strong in their sense of the universal applicability of their art, or their science, or whatever it is. If there is anything the matter with a picture, in the city or elsewhere in London,—if it is too dark or too white, or seems to have sustained an injury of one kind or another,—it is only, and always, according to them, that it wants subjecting to some one or other of the various processes of picture-cleaning, or restoring. Some appear to go pretty nearly the length of thinking, that the cleanings effect an improvement even on the original picture itself:—a rather suggestive moral! Some of them give their evidence with an unctious which it would be difficult not to admire,—and some are oracular to an extent at which it is impossible (in reference to the patients on which they practise) not to tremble.—Mr. John Mountjoy Smith, for instance, is strong for the London dirt:—sweeping in assertion, but economic in reasons. There are answers of his, which might have taught the Commissioners before whom they were given a closer logic than, so far as this Blue-book is evidence, they seem to possess. Questioned, for instance, by the chairman, Lord Broughton, as follows:—“Are there not parts of the country in which the atmosphere is much less dry than in others; such, for example, as places near the sea, or on a high land?”—he replies, “I should imagine, that in a place situated on a high land the atmosphere might be more dry; but speaking of the difference between the country and the town, *the atmosphere is much drier in the country than in the town.*” And then, asked further, by the Dean of St. Paul's, “What do you think is the cause of that?”—“I should imagine,” he says, “*it is from the dryness of the atmosphere itself.*” Now, here is a witness to whom the warning at the head of this article does not apply. Mr. Smith may be trusted to give his reasons, because there is no compromising quality in them. He rides his “argal” so steadily, and holds it so well in hand, that it is scarcely possible it should throw him. His reason keeps so close to the side of his assertion, that it cannot stray. A witness who contents himself with answering a question touching the dryness of the atmosphere by a reference to the dryness of the atmosphere itself, may abide calmly the cross-questioning of a whole commission.

Let us, then, pass on from the class of witnesses in question, with this repeated remark:—that, they are, one and all, with the exception of Mr. Smart, of opinion, that pictures contract no injury from the smoke of London beyond the necessity of being handed over to the picture-cleaner.—We shall see, from the evidence of the artist in general, what amount of injury is considered by him to be involved in that necessity itself. These witnesses, who are unanimous in their belief of atmospheric injury done, may be themselves divided into two classes:—those who believe that the injury is a mechanical injury, done to the body of the picture itself,—and those who think that it is an injury confined to the surface, and within reach of the remedies which the picture-cleaner has at his command. They seem all, however, to think, that it comes to pretty much the same thing in the end,—that at the point of deterioration at which the atmosphere leaves the picture, the cleaner is very likely to take it up,—and that though the picture should not die of the disease, it may possibly die of the doctor.

The first of these witnesses examined before the commission was, Sir Charles Eastlake, Director of the National Gallery, and President of the Royal Academy,—well acquainted with all the incidents of the locality, and long accustomed to watch the effects of the influences to which works of Art are there subjected. Sir Charles is distinctly of opinion, “that pictures in London *must* suffer more or less from

the London atmosphere.”—Very curious, we may observe, is much of the evidence given throughout this Blue-book, as to the peculiar and pernicious character of that London smoke (not the smoke of towns in general, though that will be bad everywhere,—but the smoke of “London by itself, London,”—London “particular”) which, according to Mr. Glaisher, blackens the clothing of sheep as far as Eltham, and puts all the sparrows of the London streets into perpetual mourning,—and which Mr. Denning, of the Dulwich Gallery, knows whenever he meets it, in the air or on the snow. The sorrow of Mr. Denning's life, is the London “blacks,”—and his grievance is, that the wind should ever blow from London.—But, to come back to Sir Charles Eastlake.—“I find,” says the Dean of St. Paul's, “that in the Report of the Committee of 1852, M. de Kleuze says, that the smoke is particularly thick and offensive in the neighbourhood of the National Gallery, from the chimneys of the Baths and Wash-houses, and from the river, and from the other side of the water, from which there is a constant emission of very thick smoke. Do you think the site of the present National Gallery worse than most parts of London?” *Answer.* “It certainly is very objectionable on those grounds. The most decided evil, because the nearest, is that of the Baths and Wash-houses. * * The smoke [from them] always passes more or less over the National Gallery. * * It is necessary to keep the sky-lights open. The heat, when the rooms are full, is very great in summer, and there is no mode of excluding the smoke that comes in from the open windows.”—“Generally speaking,” pursues Dr. Milman, “if there were more space, and if the space were better ventilated, would not the objection with regard to smoke and dirt be diminished in proportion?” *Answer.* “Undoubtedly. If the space were larger, if those Baths and Wash-houses were removed, and if the present evils were diminished, the pictures would suffer less:—*but they would still suffer, in my opinion.*”—“Did you not say,” asks Professor Faraday, “that the pictures were certainly injured in their present place by the conditions arising from their being in London,—that there was a *certain* injury, not a problematical one?”—*Answer.* “Yes.”—“With regard to newly-painted pictures,” Sir Charles says elsewhere, “I am perfectly sure that they are not only obscured by the substances deposited on them, but chemically injured.”—Asked by the chairman, in reference to the pictures in the Dulwich Gallery,—“Do you conceive that those pictures are in a better state of preservation than the pictures that are to be found generally in the metropolis?”—Sir Charles Eastlake answers,—“They are much freer from the effects of smoke. * * Some of them had suffered from time when they were first placed there; but I do not imagine that from the effect of the atmosphere they have suffered since they have been there.”—“I believe it possible,” says Sir Charles, when pressed by the Dean of St. Paul's, “with great care to remove those effects of smoke which injure the appearance of a picture, so that it shall be, after such cleaning, what it was before. But, as I have already said, *I think the operation is always a hazardous one, and that any state of things which compels the repetition of such operations is to be avoided if possible.*”—“The cleaning of a picture,” he says, “is *always* more or less dangerous.”

From Sir Charles Eastlake, pass we on to Mr. John Nieuwenhuys:—and he says,—“The London atmosphere is particularly injurious to pictures.”—“When I return to my home,” he says, “after three months' absence, I am always obliged to remove the dirt occasioned by the smoke from my pictures. * * The accumulation of smoke spoils everything, but more especially works of Art. * * If you wipe a picture constantly, it cannot do it good. * * The repeated cleaning is calculated to materially injure them. * * * The London smoke penetrates through everything. When an old picture gets cracked, the smoke will get into the cracks, as well as on the face, and in time it will deteriorate the picture and depreciate its value.”—“Is that peculiar to London, or to England in general?” asks Mr. Cockerell;—and Mr. Nieuwenhuys answers,—“Not to England in general, but particularly to London.” He concludes his evidence with this summary:—“The atmosphere occasions the dirt, and the dirt causes the repeated

cleanings, and the cleanings injure the picture in its substance.—That is what I mean.”

Mr. John Prescott Knight is, our readers know, a Royal Academician,—and has had good official opportunity for learning all the atmospheric secrets of the precise locality to which some of these Commissioners are willing, and the rest have consented, to entrust the national pictures. “I have observed,” says Mr. Knight, “that the pictures belonging to the Royal Academy, both those which have been exposed upon the walls for many years and those which were exposed more recently, have come into a much more decidedly deteriorated condition than could have been expected, or than I have seen in any pictures exposed for a similar time in the country.”—As, however, we shall have to return, by-and-by, to the evidence of Mr. Knight, for another purpose than our present, we will content ourselves with quoting from him, just now, a word or two of opinion touching the extremely hazardous nature of the practice of picture-cleaning, even when practised in its most simple form, on a collection of old pictures like those in the National Gallery.—In referring to evidence of this kind, and in what else we have said, and have to say, on the subject, it may be well, for the sake of escaping misapprehension in the meantime, to state here, what will appear more fully hereafter, that our object is by no means to deny either the necessity or the utility of the picture-cleaner's office. We desire simply, to enforce, at the sacrifice of every opposing consideration, any measure which may reduce a necessity so calamitous to its minimum form, and contract a utility so perilously conditional within the narrowest possible sphere of action.—“I was once present,” says Mr. Knight, “when a picture-cleaner was cleaning two very fine pictures by Gaspar Poussin, for a nobleman, and he was describing to me the process as he went on. ‘Sec,’ he said, ‘how I will bring this out.’ And he certainly went on to such an extent, that he brought out one of those feathery trees standing against the sky, so that it completely vanished.”—Here was picture-cleaning, with a vengeance! To use a colloquialism, especially expressive in this case, one of Poussin's trees planted for immortality was *clean gone!* An immemorial tree, with its root far in the past of painting, and the consecration of ages on its head,—in whose hallowed shade our modern student was to lie down and dream of Art,—cut down by an acid! It takes a hundred years to grow a forest tree, on the ground where a forest tree was felled; but who shall replace, and when, the tree that Poussin planted and the cleaner blotted out? *Anathema maranatha!*—This feat of conjuration was, of course, effected by one of the “strong means” which the picture-cleaner has for use:—come we, however, to the simple process of “moistening and washing.”—“If there were cracks in the picture,” says Mr. Richmond, “even although they had been painted upon an oil ground, should you trust to this process, or should you think that the water penetrating under the paint through the crack, would be likely to separate the paint from the ground?” *Answer.* “There is no question, that, if any water or any moisture could penetrate under the upper surface, it must have an injurious effect upon the picture.”—“Is there not a picture in that collection attributed to Giorgione, which is painted upon a plaster ground?” *Answer.* “Yes.”—“Would you submit that picture to the same operation that was being performed upon those pictures which were oil pictures, and painted upon an oil ground?” *Answer.* “I should be very tender of trying anything upon that picture.”—“Would you not think, that, as most of the Italian pictures in the National Gallery have their surfaces more or less cracked, and are for the most part painted on plaster grounds, the application of a sponge and water, or whatever else is used to other pictures, would be a very unsafe mode indeed?” *Answer.* “Yes.”—“For the Francias, for instance, would you not think it utter ruin?” *Answer.* “I should consider, that it would be highly dangerous to apply water to any picture painted upon a plaster ground.”—Surely, then, if the Francias and other Italian pictures in the gallery cannot be cleaned, it is of the most vital importance that they should be removed beyond the action of such influences as are rapidly contributing to make them dirty!

Mr. Edward William Cooke, an Associate of the Royal Academy, can see no safety for pictures

withiu the central action of the London smoke. No man, save only Mr. Denning, gives that smoke a worse name than does Mr. Cooke. There are “two different kinds of injuries to pictures from it,” he says,—a mechanical action, and a chemical one. They suffer, according to him, at once from “the sulphurous acid, which is evolved from chimneys, and the sulphuretted hydrogen which arises from the decayed animal fecula and vegetable matter in the river.”—“I went this morning,” he states, “to the Linnean Society, to examine the coloured prints of plants in some of the books; and I found that some colours were invariably changed by the action of the air. It even penetrated the hooks which were closed. I saw to-day one plate of a ranunculus (in which the yellow was I presume, a chromate of lead); it was so grey, that the plant presented quite a different character. * * * I saw another plate in which white was used,—which was changed to a dingy, silvery colour.”—“Then, you object,” says Dr. Faraday, “to a London atmosphere, both on account of the dirt which adheres to the pictures from it, and also on account of the chemical change which it produces?” To which Mr. Edward William Cooke emphatically answers, “Yes.”—“Would it be possible,” says the same querist, “to keep either your pictures or any others in London without cleaning?”—“They *must* have,” Mr. Cooke answers, “a great deal of cleansing, because the atoms of smoke in the atmosphere are so small, that if they fall on the sky of a picture, there is no means of getting them off successfully.”—“Is there any mode of cleaning pictures,” then asks Professor Faraday, “either by the application of some dry material, or by moistening them with water, or by hand, which will remove the dirt without some degree of injury to the picture?”—and Mr. Cooke replies summarily, “The picture *must* suffer.”—Nearly every artist examined repeats, after Mr. Cooke, these two first terms of the syllogism which we are most earnestly seeking to complete. If the pictures are dirty, say they, as a major, they *must* suffer in the cleaning. If the pictures remain in London,—is the minor,—they *must* get dirty. *Therefore*, say we,—we should be almost ashamed to state our conclusion seriously, but for the false inference of the Commissioners,—the pictures *must* be removed from London.

Mr. Edmund Thomas Parris offers the single exception—above hinted at—among the artists examined, to the evidence which ascribes a pernicious influence of a peculiar kind to the atmosphere of the metropolis; and that exception, before it can be received as such, must be qualified in two several ways. In the first place, Mr. Parris practises largely, himself, the profession of a picture cleaner,—as appears by his own evidence given before this commission; and, in the next, we get even from Mr. Parris himself the following admission.—“It is only the oil that changes; but I think that light and air have an immense deal to do with retarding that change.”—*Dean of St. Paul's.* “The brighter the light, and the purer the air, the less, generally speaking, is the change?”—*Answer.* “There can be no question of it.”—“Then, the change would be less rapid in the country than in London?”—*Answer.* “Decidedly; because we have less of those injurious influences which we have in London.”

Mr. Mulready, the Royal Academician, believes “the London atmosphere is as unfavourable to the healthy colour of pictures as it is to our own healthy colour.” He thinks that the pictures in the Royal Academy “would have been more like what they were originally, if they had been further removed from London;” and he has heard, “that Sir Joshua's pictures are very much darker and less brilliant in colour than they were when he left them.”—A question was put to Mr. Mulready, which he has answered with great temper and moderation: but under that moderation it is impossible not to see the artist wound, and judge very clearly what is felt. The whole matter is highly suggestive.—“With regard to your own pictures,” says Deau Milmau, “some of which, no doubt, are in the collections in London, and others in the country, do you consider that those which have been kept ever since you painted them in London collections have suffered from the dust?” *Answer.* “They are darker a great deal.”—“Is that a darkness,” follows up the Dean, “that might be removed without damage to the picture?”—“That,” says Mr. Mulready, “I do not know. The pictures

of my painting, that have remained in London a great many years, and that have been cleaned, have not been cleaned under my direction. I cannot say whether what was upon them *might* have been removed safely or not. I cannot tell how far I am responsible for what has happened to them. *I may have painted some portions of them very incautiously.*—“Is not cleaning,” he is asked, “always more or less a source of injury?”—and he replies, “There is always more or less danger in it.”—One extract more from the evidence of Mr. Mulready bears directly on the question of the gain to be expected from a removal of the national pictures beyond the influence of the metropolitan smoke. “I remember,” he says, “when Lawrence painted the portrait of Sir H. Englefield [for the Dilettanti Society]; I remember that picture in the Royal Academy, and I know how it looks now. There are other pictures by Lawrence, and by Shee. I remember those pictures very well; and they are decidedly darker and flatter than they were when Lawrence painted them. I remember the look of a picture which Sir Thomas Dilettanti about the same time as one or two of his Dilettanti pictures. I believe it has never been in London since it was exhibited. It is a portrait of ‘The Countess Grey.’ I saw that picture in Northumberland long after Lawrence painted it, and I could not perceive any change in the picture. There were three other pictures by Lawrence in that collection. They had been long painted, and they appeared to me to be unchanged. The pictures painted at the same time for the Dilettanti Society are greatly changed. The flesh looks flat and faded.”

Mr. S. P. Denning is curator of the valuable collection of pictures kept at Dulwich College, and has held that office for thirty-seven years. Seven and thirty years have, one after the other, fed and intensified the enmity which exists between Mr. Denning, as a keeper of pictures, and that great destroyer of them, London smoke. Mr. Denning hates and despises the “blacks,” as if he were a man from Missouri. Loud and emphatic is his testimony against the meteorology of London. “I do not think,” he says, “that any care or attention could get rid of the evil that would arise from an atmosphere like this. I do not pretend to understand the nature of the atmosphere; but I distinctly know the result of a dark murky atmosphere like that which we see this morning, in the course of three or four years. I know what effect it produces on pictures.” Mr. Denning would, if he might, carry his pictures far away beyond the possible flap of the wing of the dark spirit that broods over London; but he thinks every single mile a gain—two or three miles a great gain,—and thanks God for Dulwich, since it may not be Florence. “I have looked back,” he says, “to the works of Art, many of them pictures of a fine character, that I knew in London forty years ago. They become dark and dirty, and dingy and dull. They are then consigned to the cleaner. The cleaner may have taken off what appeared to be a bad colour, and may have taken off dirt; but the process is one attended with such risk, that I believe that no picture, however much injured by the smoke of London, ever can be cleaned without injury to the picture itself. And two or three times cleaning a picture, and subjecting that same picture to the same chance of dirt and discolouration, would, I feel convinced, go a great way to take the picture away altogether.” Referring to the care bestowed by him on his own collection,—the comparative good condition of which is conceded on all hands,—he is asked:—“Supposing the pictures in the metropolis ‘had had the good fortune to be under your care, might not a good effect have been produced, if they had been in an equally happy condition?”—and his answer is,—“I could not have undertaken to keep them so.”—“I would not,” he says, “undertake the responsibility of the national pictures at this moment, if it were offered to me: and this is the reason why I would not. Evil has arisen in them. I know the pictures very well—no man better; for I was for years with the pictures before me, painting from them, and I know that they were fine beautiful pictures then, though now many of them are destroyed. I would not take the pictures as they stand, with the probability of greater evil showing itself within a short time, even though a memorandum were made of every picture as it is now, on account of the risk of finding other evil

going on which has not been seen."—"Would you not," he is asked, "undertake the care of those pictures if they were sent to Dulwich?"—"No," he replies, "I would not become responsible for the safe custody of any pictures that had been, as they have been, in London forty years."—On the subject of picture-cleaning, Mr. Denning is equally clear and emphatic; and he spares neither others nor himself, in the cause which he has at heart. Questioned generally as to the effect of the practice, he says, "It is dangerous in the extreme."—"Have you ever yourself personally tried to clean a picture?" *Answer.* "I have done it constantly in my present situation."—"Are you in the habit of cleaning the pictures as they may require it at Dulwich?" *Answer.* "Yes; it is my duty to do so."—"Do you think, that with all your care, you cannot clean a picture without injury?" *Answer.* "Of course, I think it may be done much better by a good cleaner than by a bad one; but I must speak of even those who perfectly understand the subject. *I do not believe I ever cleaned a picture in my life as to which I did not, at some point or other, find that I had done injury.* I have done that which has been thought successful—and I know that it has been successful; but any way which should exist of removing the old varnish as well as taking off the dirt, may here and there move a portion of the paint that is on the surface, and in that respect it does injury."—"Have you cleaned the greater part of the pictures at Dulwich?" *Answer.* "I have done something to almost all the leading pictures."—Evidence like this naturally exposes the witness to the following adverse syllogism; but he shows that he has never had the slightest intention to evade it.—"You said, that you never cleaned a picture without, to a certain extent, injuring it?" *Answer.* "I believe I never did; but I believe it would have puzzled anybody who was not a very good judge to find out where the injury was. But I left the injury as I made it, without attempting to paint it out; for I think it is an outrage to touch an old picture."—"You have also said, that you have cleaned the greater part of the pictures at Dulwich?" *Answer.* "I have done something to almost every one of them."—"That being the case, of course the greater part of the pictures at Dulwich must have been injured?" *Answer.* "To the extent of the assertion I have made, it would be so. If I had been a very prudent man, I should have drawn a curtain over my own sins, but I did not wish to do that. And I think that, though an injury may be done in the manner which I have stated, yet I believe it is so done that I can leave it to the eye of the spectator to find it out—and I think it would puzzle him."—It is to be understood, that these reparations which the pictures have required at the hands of Mr. Denning were demanded by injuries which they had contracted before they came into his custody, or occupied their present abode. In Mr. Denning's hands, and where they are, the Bourgeois pictures thrive well.—Of course, it is not to be expected that he whose earnestness for the protection of these treasures of Art prevents his sparing himself, should spare others. "I think," he says, "pictures are subject every day in London, more or less, to injury. I have a clear conviction on my mind as to that;"—and he thus gives a summary of the mischievous influences at work for the final ruin of these priceless treasures,—all having their origin in that enemy to his peace and their own prosperity, the London smoke.—"They [the custodians of pictures] have been driven, I believe, to the necessity of trying to remove the cause of that gloomy surface on the pictures; and the pictures have been cleaned,—put in the same place again, and discoloured again,—cleaned again, and again,—and (as I know in some cases to be the fact) half wiped away.—But, this has been done, also; in many places paint has been put on, to cover up the mischief done by injudicious cleaning."—"Does it appear to you," asks Mr. Richmond, "that any length of time in a clear atmosphere will bring the varnish to the deep colour to which in a few years it is brought in London?"—and Mr. Denning replies as follows:—"Certainly not. I have a conviction in my own mind that any length of time will not greatly alter it. For instance, I have always been accustomed to pictures from a child, and I think that in an atmosphere like Dulwich, which is pure and unchanged, varnish may remain with even but a trifling alteration.

Thirty or forty years' intimate acquaintance with the varnish on the pictures in question enables me to say, that it is nearly pure now,—so pure now, that any man acquainted with the subject would say that it would be a great pity to remove it. In London, in three or four years the pictures would require attention."—Surely, there is no possible escape from the inference which is suggested by evidence like this,—accredited as it is by long experience of the most practical kind, and coloured by no instinct save that one instinct which must be the public's own in the matter,—a desire for the preservation of the treasures of picture which the country possesses.

Mr. Richard Thomas Smart is an eminent picture-cleaner in London; and he illustrated the practice of picture-cleaning before the Commission by working, in their presence, on a portion of one of the diploma pictures belonging to the Royal Academy. These diploma pictures had been "solicited for exhibition" by the committee of the then approaching Art-Treasures Exhibition, at Manchester; but they were found to be in such a filthy condition when taken down for the purpose, that the previous office of the picture-cleaner was absolutely necessary for the purpose of making some of them even visible. If, then, we find Mr. Smart—himself a picture-dealer, and certainly thriving on the smoke of London, just because, and in proportion as, the pictures do not—honestly taking up his parable against that smoke, and joining his testimony to the testimony of so many other competent witnesses affirming its fatal action,—we may very conveniently close our extracts from this overwhelming body of evidence with one or two of his significant answers.—"What is the cause," says Dr. Faraday, referring to the operation which the Commission had witnessed, "of the difference between the parts of this picture which have now been cleaned, and the part that is not cleaned?" *Answer.* "I should think it has arisen from the fires of London, from the accumulation of smoke from the fires, and from the gas."—"How long will it take for the exposure of the picture to the same circumstances which it has been under—namely, the gas in the air of London—to bring it back to the state from which you have cleaned it?" *Answer.* "Ten years, in the building from which it has come."—"You think that in ten years it would be necessary to clean that picture again?" *Answer.* "Unless it were protected."—"By glazing?" *Answer.* "Yes."—"Have you any idea that a picture would be better off two or three miles out of London, on the one side or the other, than it is in London?" *Answer.* "I should say decidedly so."—"Would it be better on the west than on the east of London?" *Answer.* "Certainly, if you reckon from some central point in the metropolis. I do not know, however, that it would make much difference which way you took it, so that it was out of London." *Chairman.* "When you say out of London, what distance do you mean?" *Answer.* "I think perhaps a mile from the outskirts would be sufficient, if it were as much as possible away from all dwellings." *Professor Faraday.* "You would wish to keep it away from the gas and the smoke." *Answer.* "To keep it as far as possible from the gas and the smoke of London."

Can any reader who has followed us thus far understand how, in the face of such evidence as we have produced, extracted by us from a host more of the same kind, it has been possible for these Commissioners to arrive at the inference, that "the evidence hitherto adduced, considered collectively, does not lead to any decisive conclusion against placing the new National Gallery within the metropolis?"—"Considered collectively!"—and "decisive conclusion!"—In what part of the "collection" do the Commissioners find anything to destroy the effect of passages like the above, if the evidence of the picture-cleaner be excluded?—the picture-cleaner, whose profession, as we have said, has its actual foundation in the maladies to which pictures are exposed, whose own good condition depends on the bad condition of his patients, who lives by what, it is testified by all competent witnesses but himself, must in the end be death to them, and who, Mr. Smart candidly avows, will be less needed when the national pictures have left London! Why, that last clause, if true, settles the whole question by itself. The judges who would give to the testimony of parties thus interested—though as honest as the rest,

it is not for a moment doubted—the effect of overbearing the testimony of men as well informed as themselves, and having no personal bias, are the very men to put an undertaker at the head of a sanitary commission.—But the case need not rest even here. Notwithstanding the professional instincts of the picture-cleaner, and all the reluctance which, quite fairly and naturally, arises out of them, let us see what kind of admissions, in relation to the subject in hand, we get occasionally from these very gentlemen themselves,—and all the significance of such admissions when the reluctance is allowed for, and when these admissions come in enforcement of evidence so emphatic as that which we have produced from other quarters.

Mr. Smart's avowals as to the perilous quality of the art which he practises, were made, as we have seen, with frankness and unreserve. To Mr. Bentley, we believe we need not go for so much as an admission. At the very opening of his examination he unfurls the picture-cleaner's flag,—and he stands by it manfully and unflinchingly to the last. On no summons, and on no persuasion, is it ever lowered by him for a moment. To every possible form in which a question affecting the infallibility of his art can be put, he presents the same unmoved front. According to him, nothing is—or can be—wrong with pictures, so long as they can be cleaned. To need cleaning, and be cleaned, he looks on as the natural condition of pictures. He would seem to think, that most of them are painted for the express end of being cleaned. He believes in any amount of restoration, short of actual resurrection,—in case he does not believe in that. As he was not formally asked if he could restore a picture which had been consumed by fire, we have no distinct assurance that he puts even that limitation to the power of his art,—while the general tone of his evidence would suggest the inference that he does not.—But, let us see what we get from Mr. Henry Farrer,—one of the most eminent members of the same body of practitioners, and certainly a reluctant witness in the same sense as Mr. Bentley. Mr. Farrer seems, however, to think that he best accredits the strong points of his calling by admitting its weak ones,—that he enhances the virtue of its use by conceding the extreme peril of its abuse. And Mr. Farrer is right:—yet, we gather from his evidence, notwithstanding, the moral, that we had better do without the picture-cleaner, if we can. In the following extract from one of that gentleman's answers, we have presented to us the two horns of the dilemma to which pictures are exposed,—unless means can be found to prevent their getting dirty so fast:—a condition which brings in our term of the syllogism once more. "There has been," says Mr. Farrer, "in the public mind, a great want of confidence in the persons who have had anything to do with the cleaning of pictures,—and, perhaps, rightly so; because a great number of pictures have been injured by being intrusted to the hands of those who did not understand them. And the consequence of that want of confidence in cleaning pictures generally is, that people have gone to the opposite extreme, and have allowed their pictures to be covered with soot, so that often you can scarcely see the beauties which the artist intended." Of course, the words in this quotation which we have marked in italics are qualifying ones in a sense perfectly natural and fair,—words of self-reservation, in fact, out of the sweep of an adverse admission. It is the moral of the old Greek story over again,—each man writing his own name in the best place, whichever of his neighbours he may choose to place second. But, besides that Mr. Farrer is, as we have said, at the head of his profession, we would certainly rather trust to the practice of a picture-cleaner who knows, and admits, its peril, than to that of one who looks on the agents which he employs as the natural and constitutional food of pictures.—"From all your observations of pictures," says Professor Faraday, "whether in this country or abroad, whether in town or in the country, have you any evidence to show that there is any deteriorating effect in towns which does not appear in the country, other things being the same?"—and Mr. Farrer, in answer, admits this much,—"Yes: I should say that pictures in the country are not apt to chill so much as pictures in town."—"Does it not come to this," says the querist, "that in the

town more care should be taken of the surface of the pictures than in the country?"—and Mr. Farrer answers,—“Just so.” Now, this very care of the surface, with all the processes that it implies, is the one thing to be dreaded, as our readers have so abundantly seen. Why are we needlessly to expose the varnish of our pictures to be discoloured, or their pigments to be oxydised,—or, as Dr. Faraday prefers to call it, “sulphuretted,”—on the faith of an art whose practice its own advocate is driven to stigmatise as follows:—“I am sure, that picture-cleaners have done a great injury to Art. I am one myself,—but I am obliged to admit it.”—“Pictures,” says Mr. Farrer, in another place, “certainly get black sooner in London than they would anywhere else.”—and he thus hints, elsewhere, at the progress of degradation which they undergo in the cleaner’s hands:—“The reason that a picture requires repairing is, that it has been over-cleaned or injured,—and therefore, he who has the charge of pictures, if he is a wise man, will not clean them more than he can help.” Of course, it is the ignorant or unskilful picture-cleaner only who is intended to be indicated in all these admissions as responsible for the injuries which pictures sustain; but let us take the most eminent practitioner of the class,—take Mr. Farrer himself,—and the evidence in this Blue-book makes us tremble before the obvious uncertainty of the processes which he employs. “We have our secrets,” says one of these witnesses,—meaning, that they are the picture-cleaner’s secrets as against the world; but it is only too manifest, that his own operation is often a mere guess at the solution of a painter’s secret, where the annihilation of the quality secreted and sought, is the probable penalty of the guess being wrong. Mr. Farrer himself, for instance, tells these Commissioners a little anecdote, which strikingly illustrates the empirical nature of the picture-cleaner’s practice. “A most extraordinary thing,” he says, “happened to me on one occasion, with regard to a blue. It was in a very fine picture of Canaletti. The whole of the blue appeared to have flown,—or, at least, it had gone to a grey, instead of being a brilliant blue. I frictioned off a little of the varnish. I wanted to bleach this picture by putting it in the sun. I feared that perhaps there was a portion of oil in it, and I did not wish to clean the picture if I could avoid it. That portion of the picture from the surface of which I had taken off the varnish, after being in the sun came into one of the most beautiful blues I ever saw. But the part that was covered by the varnish was not changed in any way whatever,—it remained a dull heavy colour. The operation of the light upon the paint which had been cleared of all the varnish changed the blue in that way. I was so delighted with this effect, that I cleaned half the picture, and the blue in that half became brilliant. I cannot account for it. I do not know what was the cause of the change, or what colour was used:—but I dare say it could be accounted for chemically.” Probably it could:—and where this little story of a picture came from, we dare say there are more with the same moral,—and some, perhaps, in which the manner of inculcating that moral was less welcome. To this sort of experimental handling, which is surprised at its own effects, must we be compelled to commit at times the inestimable treasures of our national collection, so long as that collection remains where it is. Less pleasing surprises than this may well be expected to have their turn, in the course of a practice which at one time rubs out a tree by inadvertence, and at another starts a blue where it was least expected.—In another place, Mr. Farrer says, speaking of a work by Correggio,—“Where a picture is painted in that way, it is utterly impossible to know what is under the paint, or to say whether the party who restored it had not done too much to it.” Struck by the sort of uncertainty of practice betrayed in much of the evidence given in relation to this delicate matter of picture-cleaning, Professor Faraday puts a significant question to Mr. Farrer:—“May we not suppose that a great deal of what you, or any person, might say to us upon this subject, must be a matter of opinion, and not matter of fact?” To which Mr. Farrer—not very logically—replies:—“I consider that what I state is fact.” But Dr. Faraday sticks to his doubt,—as we do,—and repeats it in another form. “Would not any other person who

agreed with or differed from you consider the same?”—“I am obliged,” says another witness, Mr. Bentley, speaking of a Turner which he is restoring, “to protect the birds in this picture, because they are put in in water-colour:—they would go away if I put a sponge upon them.” Well, then, we can only say, we are very glad the birds are in Mr. Bentley’s hands, and will be taken care of:—but what if they had happened to roost in Poussin’s tree!

So much, then, for the “no decisive conclusion” to be gathered from the evidence repeated in this Blue-book “against placing the new National Gallery within the metropolis!” A host of evidence to show that so long as the pictures remain in the metropolis, they must be constantly in the cleaner’s hands,—and a host of evidence affirming, what the cleaner himself does not deny, the perilous nature of the processes to which they are in his hands exposed! No decisive conclusion! Never was a case for removal more pressingly made out. We have ourselves not hitherto been half sufficiently alive to the peril of delay. This Blue-book, which shows the Commissioners so calm and unmoved, has fairly startled us with its revelations. Our only consolation out of such a reading would be, that it points distinctly to the remedy. Why must our pictures—such pictures—the priceless works that we have, and the priceless works that we hope to have—be exposed to this constant rough handling, fatal to their constitution in the end, when the necessity for it might be to a great extent obviated by locating them in a better air? The matter will admit of no compromise. All other considerations must make way for the consideration of climate. If the question of a new National Gallery were not actually in hand, it would have to be raised to meet this evil. The case is one which upsets an old proverb, so far as an exception can:—a non-removal will, assuredly, be worse in this matter than three fires!

And be it observed, that all other remedies, short of the one remedy of removal, which have hitherto been devised, only temporise with the question. They are mere evasions of a better thing than themselves, and practised at a cost of their own. They might be resorted to on the large scale, where the true cure could not be had—and may have to be resorted to on a limited scale, even where it can; but, in addition to their essential sin of being inferior to the remedy which they would replace, they have the accidental one of obscuring or distorting the Art which they would protect. Take, as an example, the proposal to cover the oil pictures of the old masters by glazing. Glass, by all means, and at all sacrifices, if the pictures cannot be saved without it:—but, see, at any rate, what the sacrifice is! The glass yields, of course, reflections of its own,—and, as a consequence, something more will occasionally be found in the picture than the painter put there. The different conditions of the light at different times of the day make of the picture what may be called an inconstant one; and this mode of getting several pictures at the price of one, will scarcely be recommended as among the practices suitable to a National Gallery. Sir Charles Eastlake gives an instance of the inconvenience of glass as affecting the appearance of a picture. “It is weak,” he says, “in effect; yet, as the lights of the picture are low, the mirrored objects are almost as distinct as the picture. The conditions under which glazed surfaces act most as mirrors should be taken into account, in considering the expediency of protecting pictures with glass. Undoubtedly, a very dark picture acts more as a mirror than a light one; and where the lights of the picture are low, and the whole effect weak, glass is also prejudicial.”—What strange effects, for a gallery of Art, and a circulation of spectators, is suggested by a passage like the following:—“I have always considered that the effect of pictures under glass depends very much on the objects temporarily opposite to them. The presence of a person in a light dress, for example, will frequently destroy the effect by reflection.” Really, this method of getting one’s self projected into a picture embodying some scene which happens to take the fancy, is not without its ingenuity,—but it could scarcely be expected to have met with the original painter’s sanction. The man who throws himself by reflection into a Claude Lorraine, and gets therefrom the pleasing sense that “he too has been in Arcadia,” would do well to question whether his presence there had not

changed the characters of the scene itself, and made “Arcadia” a misnomer.—In a word, a Raphael seen under a glass is not Raphael’s picture.

Evasive in a sense infinitely more prejudicial than even this, however, is the notion entertained by some—generated out of an intense horror of the picture-cleaner,—that the true method of dealing with an old picture, after it has become dirty, is to leave it under its cloud. It is curious to observe, how many questions were directed to the witnesses, seeking to ascertain if the injury which pictures sustain from the London atmosphere be essential injury, or injury only on the surface,—prompted apparently by some strange mysterious notion that, if, under the “London crust,” the integrity of the picture be intact, all is well, provided the picture-cleaner will only let it alone. Now, we confess, that we are unable to share in this sentimental reverecue. In the matter of pictures, we want to live by sight, not by faith. If a picture by Raphael under a glass be not Raphael’s picture,—a picture under a thick coating of London smoke is not a picture at all. “*De non apparentibus et non existentibus eadem est ratio.*” It is idle to assure us that a picture is not dead, if it be buried. What do we gain by being told that the picture in its coffin of cloud is undergoing no process of corruption, if it is never to come out of its coffin? If pictures be dirty, we admit that they must be cleaned. The loss which a picture may sustain in the cleaner’s hands is problematical, and perhaps partial:—the loss sustained by leaving it uncleaned and invisible, is certain and total. Whatever injury the cleaner may do, he can, at any rate, do nothing worse than shutting up the work altogether. The gentleman who rubbed out Poussin’s tree, made it, of course, a dead letter in Art:—but he would have done just the same thing if he had walled it up for ever.

In the progress of a picture towards this final state of extinction, too, it is curious to observe how it is constantly shifting its character, and baffling the connoisseur as to the integrity of its readings. There is some evidence in this Blue-book to show how sensitive a matter this is, and how difficult it may be to know when we have the true text of the painter before us. Of course, we are not sure of it, even with the editing of the picture-cleaner. “I imagine,” says Mr. Mulready, speaking of certain pictures to which his attention is called,—“that, at the rate at which they were going on during the first four or five years that I saw them, their small parts would hardly be discoverable by this time.”—“I have been watching,” says Mr. Knight, “the operations that have been going on,” with the diploma pictures; and, as the washers brought out the condition of the pictures, “I was very much surprised to see what the pictures were. Now that they are cleaned, they are very different from what I had conceived them to be.”—“There was one,” he says, “which I examined the other day, which I was curious to see because it had frequently fallen under my observation. It has been cleaned; and I must confess that it quite astonished me to see the colours that there were in that picture. I had no idea that they were there before.” So, with Reinagle’s picture of ‘The Eagle and the Wolf.’—“Before it was cleaned, you could scarcely discern what the colours were. I find, upon its being cleaned, that it is rather a brilliantly-coloured picture.”—All this, it will be seen, is ticklish work. But, if the pictures be sick, they must, we repeat, have the physician:—and the point is to insure, that they shall, for the future, have less need of him.

Supposing, then, the question of removal to be finally determined—as we earnestly trust it will—in the affirmative, it is important to remark, that much of the evidence in this Blue-book points directly to the very locality in which the people happen to have already an estate of their own, waiting for some such appropriation as this, in part paid for with a large sum of money by themselves, and ample for all the possible purposes that an institution like that in question should include. We have seen what Mr. Smart said as to the short distance at which an escape from the worst influences of the London smoke may be secured.—“I have observed,” says Mr. Denning, “the subject of the winds with great care; and I think that for seven or eight months in the year the wind would blow more or less from the west, and therefore I should think the mischief caused by the London atmosphere would be less in the west than in the east.”—“I think,” says Dr. Milman to Mr.

Mulready, "you reside at present in Linden Grove, Bayswater: do you find that the influence of the London atmosphere extends as far as your present residence?"—"I know," answered Mr. Mulready, "that my pictures suffer very little change in my own house during the time that they remain in it; and those pictures that have been out of my possession and have returned to me very dark, have not increased in darkness since. I live a few hundred yards from the main western road. * My pictures suffer more in Grosvenor Street than in Linden Grove."—Mr. Cooke, speaking of the distance to which the influence of the London atmosphere more or less extends, says,—"I consider that even at the distance of two miles from the general mass of the buildings in London there is a great difference."—"There is an amazing difference," he says, "in the tone of the air in the west of London as compared with the north-east and east:"—and in answer to a further question, he says, that he lives and works at Kensington himself.—"Would you consider," he is asked, "that the best site for a National Gallery, whether in London or in the neighbourhood, would be to the south or the west of London?" and he answers, "Yes. I think that the west is even better than the south, as being further from the river Thames."—All these conditions sought by the artist for his own pictures, meet, it most fortunately happens, with others of an importance only second to them, in the national estate at Kensington Gore.

Once more, then, we repeat, we dissent from all the conclusions of this Report:—so, we think, will the public—and so we trust, will the Government. The question of climate is of such paramount importance over all others in this matter, that we have for the present confined ourselves principally to that:—but there are in the Blue-book before us many particulars of great interest bearing on the question of space, and on the nature of the scheme which should determine the amount of the demand in that respect,—to which we may perhaps think it desirable to return for another article, on some future occasion.

PSYCHE.

FROM THE STATUE BY W. VON HÖYER.
IN THE POSSESSION OF THE QUEEN.

How or when this statue came into the possession of the Queen, we know not; nor have we been able to get any information concerning the sculptor, except the brief notice given in Count Raczynski's "*L'Art Moderne*," published in 1841, in which his name appears among the German artists then studying in Rome, and as the author of two plaster figures—a "Psyche," and a "Young Girl returning thanks to God for the cessation of the Cholera;" we presume that the marble statue engraved here is from the former of these two plaster studies.

Psyche has long been, and we suppose will continue to be, with modern sculptors a kind of "stock" subject. There are few who have not attempted to realise this beautiful fabulous conception, but how rarely are such attempts successful! the best, so far as our recollection serves us, is that by the late Sir R. Westmacott, which is the property of the Duke of Bedford, and ornaments the gallery of his grace at Woburn: an engraving of this really exquisite work appeared in the *Art-Journal* nearly ten years ago. Von Höyer has adopted in his work—or it seems so to our reading of the subject—a different moment of the narrative from that employed by the English sculptor.

As the work of a young sculptor, for we regard it as such, there is in the statue by Von Höyer much to be commended: the story is faithfully narrated, and though the figure does not quite reach the true Grecian type of feminine grace and beauty, it is elegant and easy in its pose. The wings, those of the butterfly, are too solid and substantial, and are deficient in graceful outline; and the drapery, considering the mission whereon Psyche was sent, is too cumbrous; but the quantity which the sculptor has thought proper to introduce has afforded him the opportunity of arranging its folds with much taste, and displaying them to great advantage.

TALK OF PICTURES AND THE PAINTERS.

BY AN OLD TRAVELLER.

CHAPTER VIII.

Alessandro Bonvicino—Birthplace of Il Moretto—Works in Brescia—Frescoes—Paintings in England—In the Louvre—At Berlin—In the Leuchtenberg Palace—Madonna in the Städelsche Gallery—Girolamo da Santa Croce. Works in possession of the Liverpool Institution—Lord Northwick's Collection at Thirlstaine—Hamilton Palace—Foreign Galleries—Early Masters—Gentile da Fabriano—The Bellini—Marco Basaiti—Vittore Carpaccio—The Vivarini—Gentile Bellino at Constantinople—An imperial demonstration—How the cities of old received their Painters—Diary of Marino Sanuto—Drawings in the British Museum—Portrait of Giovanni Bellino—Early Masters in the Dudley Collection.

THE Brescian painter, Alessandro Bonvicino, better known as Il Moretto, is usually accorded to Venice; yet he was, in fact, the disciple of his compatriot Fioravante Ferramola, and but slightly attached to the Venetian school, since the influence of Titian on his manner, whatever that may have been, was, without doubt, surpassed by that of Raphael, or rather was overruled by the force of his own beautiful nature. Sometimes given to Rovato, this excellent master was without doubt born at Brescia. Let us remember it: many are the woes of the noble city, very deep her wounds, and they rankle sorely still: let us not deprive her of her glories in the past, and here is one of her sons not unworthy to be named with that yet earlier child of her love, the martyred Arnold,—with him whose voice was raised in the cause of Christian truth even before that of our own Wickliffe had gone through the world,* and whose ashes, cast into the shuddering Tiber, were denied—even they—to the sorrowing city of his birth.

The authorities are, as usual, divided as to the exact time of Il Moretto's activity; some declaring him to have painted the well-known Magdalen, now in the Venetian Academy, in the year 1515, while others maintain that he was not born until the year preceding the supposed production of that work, which, according to these disputants, was not painted until the year 1530, two years, that is to say, before the St. Nicholas, also called an early work of the master, and painted for the Church of Santa Maria de' Miracoli, in the year 1532.

More interesting than these questions is the fact that no painting, of whatever period, was undertaken by Il Moretto before he had first made reverent preparation of heart and mind, by prayer and meditation, as is known to have been the practice of Fra Angelico, and perhaps one or two other masters of the Florentine and Umbrian schools. This could not fail to produce its effect, and accordingly the authentic pictures of Il Moretto may take place beside those of Il Beato Angelico himself, for deep religious feeling and for purity of purpose. Nor is Bonvicino less remarkable for the elevation of his characters; their grace and tranquillity, their stateliness and holy repose, will be remembered, by those who have seen the master in his native Brescia, with a respect accorded but to few even of the greatest names in Art.

Admirable as a colourist also, but here, too, giving proof of entire freedom from all servility, and exhibiting a character essentially original, Il Moretto's works are not confined to the oil paintings, by which he is best known, in fresco also he has distinguished himself; and the writer has to regret the loss of two fair opportunities for the examination of one example in this kind, known to few, perhaps, among the more youthful of our readers. We allude to the frescoes of the Villa Martinengo, which we might have seen, but failed to do so,—ah! *maxima culpa mea!*—in the year 1842, when a merely nominal acquaintance with the master caused indifference to works requiring more than ordinary pains to discover their existence and whereabouts; and a second some years later, when circumstances, beyond the travellers' control, presented impediments that were not to be overcome within the time permitted to their stay.

Of Il Moretto's works in our own country there are but few, and among these perhaps not the least important is the picture in possession of Sir Archibald

* Arnold, of Brescia, was burnt in Rome by Pope Adrian IV., as our readers will remember, in the year 1155. John Wickliffe first saw the light in 1324. Richmond, in our own broad Yorkshire, lays claim to the distinction of being his birthplace.

Campbell, and long attributed to Pordenone, as was the more renowned picture of Santa Giustina, with the kneeling figure of St. Cyprian, now in the Palace of the Belvedere, at Vienna. In what was called the "Triumph of the Talbot Gallery," at Alton Towers, there was a picture of "Our Saviour appearing to the Virgin after his Resurrection;" with the portrait of a seuator: the head and hands of the latter are carefully painted, but neither hand nor head exhibit much character. A third work lately in that collection also bears the name of Moretto; but this last is certainly not by his hand, nor is the "Resurrection" by any means a fair example of the master.

Chiefly executed for his native city of Brescia, many of Bonvicino's works are still to be found there. The picture of the high altar in the Church of San Clemente, representing the Assumption of the Virgin, with Saints, is among them; as are also a Coronation of the Madonna, in the Church of SS. Nazario e Celso, and a San Giuseppe, in that of Sta. Maria delle Grazie, all of priceless value. Some few pictures have been taken elsewhere, and these are to be found in cities more immediately within our reach: there are two in the Louvre; four, or perhaps five, in the good and friendly gallery of Berlin, and one in the gallery of the Leuchtenberg Palace, at Munich. In the Städelsche Gallery, at Frankfurt, is a Madonna enthroned, with the four Latin Fathers: St. Jerome points to a passage in his translation of the Bible (the Vulgate), which Pope Gregory I. holds open before him; St. Ambrose, Bishop of Milan, bears the cord of discipline in his hands, in allusion, says Passavant, to the severity of the rule maintained by that prelate. This picture, long the pride of San Carlo-in-Corso, was removed from the Roman church to enoble the somewhat indiscriminate collection of Cardinal Fesch, on the dispersion of whose gallery it was secured by the fortunate city of Frankfurt.

Of the Bergamasco, Girolamo Rizzo,—called and better known as Girolamo da Santa Croce, from the place of his birth—the master who most of all perhaps of his period clung affectionately to the then fast-fading traditions of the past,—we are not absolutely without examples in England. There are two in the Liverpool Institution, transferred at this moment to the neighbour city, and adding to the treasures so richly garnered there. The collection of Lord Northwick, at Thirlstaine, has also two—a Virgin and Child, with St. John (a child) and four Saints. In this picture, as well as in the second, a Resurrection of Christ, there is a landscape, the last-mentioned one of great interest. Equal to any of these in many respects, and in some perhaps superior to all, is a portrait with landscape at Hamilton Palace; but in the case of Girolamo da Santa Croce, as in that of so many other masters, your best friend, as a single gallery, will be the Royal Museum of Berlin, where there are no less than five pictures by that worthy follower of Giovanni Bellino, all of great if not of equal interest. Three at least of these works present examples of those angels for which Girolamo da Santa Croce is renowned, and all should be carefully examined by him who would study the transition of the period.

In Venice there are pictures of Girolamo that none who visit the city will fail to see. There is a Martyrdom of San Lorenzo, for example, in the Church of San Francesco della Vigna; but the Last Supper, in the same church, sometimes attributed to Girolamo, is scarcely worthy of his hand, nor do the best judges believe it to be by him. The Church of San Martino has a Cenacolo, said to be a work of this master; and there is a Madonna with Saints in the Venetian Academy. But it is in the Church of San Silvestro that the best work of Santa Croce, now to be fully authenticated, will be found; the subject is St. Thomas of Canterbury, with St. John the Baptist and St. Francis.

The picture of the Last Supper, still in San Francesco della Vigna, and named above as there attributed to Girolamo da Santa Croce, is by Francesco Rizzo, also of Santa Croce, and a relation of Girolamo, but whether father or elder brother has not been ascertained. He, too, was a disciple of Giovanni Bellino.

More attaching in themselves, and in their works of yet more touching interest than are even the best of those already alluded to,—some one or two only excepted,—is a group of masters, now and lastly to be mentioned. Lastly named, but by no means

PSYCHE.

FROM THE STATUE BY W.VON HOYER, IN THE POSSESSION OF THE QUEEN

LONDON. JAMES S. VIRTUE.

last to be thought of, they are, indeed, but rarely absent from the recollection of the present writer whenever the beloved and noble Arts are in question. And when are they forgotten? those fair lights of a world else groping in darkness, those friends never chilling nor changing, save only to become ever dearer and more dear, although change be the law of existence as regards all beside.

Geniale da Fabriano, the Bellini, with their excellent follower Basaiti, and the good disciple of Giovanni, Cima da Conegliano; with Vittore Carpaccio, and Vincenzo Catena, are among those first rising to recollection. Of a somewhat earlier period than the last-named, nor always equal, Luigi excepted, in the force of their appeal to our sympathy, although yet well beloved, the Murano family of artists, the Vivarini, come next—Antonio, Bartolommeo, and Luigi, are they called, the last-named master a charming painter, of whom one grieves to speak in haste or as of one in a crowd. Carlo Crivelli, accounted in his own day among the best masters of the period, though but little talked of in ours, and those other disciples of the Bellini—Cordegliahi, a follower of Giovanni, and Mansueti, a careful observer of the elder brother, Gentile Bellino, whose disciple he was, and to whom his works have been sometimes attributed—claim also their part, and have it gladly allowed. Mansueti is said to have likewise studied under the greater artist Carpaccio. Of many among these masters we are wholly without example in our country; few of them are worthily represented, the Venetian painters suffering in this respect even more than do their Florentine brethren of the same period, some of whom—and Fra Giovanni Angelico da Fiesole, unapproached in his own sweet and heavenly sphere of action, is happily of the number—have received at least a portion of their praise at our hands.

Paris is more fortunate; Dresden less so than might be hoped and expected from the extent of her galleries. In Munich the lover of these old Venetian painters will meet little but disappointment; there is a Madonna by Giovanni Bellino in the Leuchtenberg Gallery; and at Schleissheim, a palace some few miles distant from the capital, as most of our readers will remember, is a Judgment of Solomon, by the father of Gentile and Giovanni, Jacopo or Giacomo Bellino: the works of the last-named painter are rarely seen beyond his native city of Venice, within whose precincts only some others, among the masters above-named, are to be found.

But for him who must yet defer his intention of making long abode in Venice,—the hope and desire of every artist,—there is Berlin for consolation, as regards these excellent masters: in that collection only will he be presented with examples of all; but since some among them have found place in a few of our own galleries, let us first see where these are to be sought by those who stay at home. Beginning with Gentile Bellino, as the elder brother, rather than for any better cause—unless, indeed, you will allow that such may be found in the interest of his subject—there is a drawing by this master in the British Museum,* and it has the rare privilege of being unquestioned as to the genuine character of its claim to be called a work of his hand. The persons represented are the then reigning Emperor of the Turks, Mahomet II., with the Sultana-mother, and the time is that of Gentile's residence in Constantinople. The drawing is a pen-and-ink sketch, manifestly taken from the life, and a note is made of the colours to be used by the master, in the dress of the Sultana, when he should subsequently paint from the sketch.

And as regards that mission of Gentile Bellino to the "Signor Turk," who had seen certain Venetian pictures with great admiration, and desired to have something similar for the decoration of his own palace, the matter is related in his "Diary," by Marino Sanuto on this wise:—"August 1st, 1479. —To-day there came a Jewish orator, with letters from the Signor Turk. He would have the Signoria send him a good painter, and invites the Doge to the marriage of his son." In a subsequent notice we find, "The Serenissima Republica has replied to the Grand Turk, thanking him for his invitation, and the Signoria has sent Zentil Bellino, an excellent painter, who has departed with the galleys of Romania."†

* Bequeathed to the nation by Mr. Payne Knight.

† See Morelli, "Notizie d'opere di disegno," p. 99, as quoted in Mrs. Foster's Translation of Vasari, vol. ii.

The effective lesson bestowed by the "Signor Turk" on the Venetian painter, when the question was how best to depict a man with his head cut off, will be fresh in the memory of all readers, and needs no repetition here. Ridolfi, by whom it is related, adds that Gentile much desired to put the seas between himself and his imperial instructor from the moment when he beheld the decapitation of the slave on whose hapless neck the Grand Seigneur had made his "demonstration." He returned to Venice, therefore, as speedily as might be thereafter, having been dismissed with many honours, and bearing a letter to the most Serene Senate, wherein the emperor's approval of him was very cordially expressed. A massive chain of gold was among the many gifts added by the Sultan, and this, says Vasari, "is still in possession of Gentile's heirs." All the city met the painter with glad welcome on his arrival, and the senate conferred on him a pension of two hundred scudi, "which was paid yearly for the remainder of his life."

The name of Gentile was given to his firstborn son by Jacopo Bellino, says Vasari, "per la dolce memoria che teneva di Gentile da Fabriano, stato suo maestro e come padre amorevole,"* a circumstance not of unusual occurrence in those cordial days, be it remembered to their credit, when the disciple himself very frequently took the name of his master from the love and reverence ever afterwards borne by him to the guide and friend of his youth. Of this fact numerous instances will recur to the memory of all; but to go no farther than that before us, look at the portrait of Gentile da Fabriano, you who have the good fortune to be acquainted therewith, and see if you do not find promise of all the goodness implied in the passage just cited, from the earnest gaze of that serious and expressive countenance.

There is a painting, by Gentile da Fabriano in the collection of Mr. Labouchere, at Stoke, near Windsor, and among those invaluable portfolios in the British Museum, containing impressions of niello plates on paper, is an Adoration of the Magi, from a work of Maso Finiguerra, for which, Dr. Waageu declares, the artist has taken "the exquisite picture by Gentile da Fabriano, now in the Academy at Florence," as his model. This is proved by the richness of the composition, which all who are acquainted with that profoundly interesting collection, the gallery of the Florentine Academy, will recall with admiring pleasure.

Returning for a moment to Gentile Bellino, for whom we confess an old affection, we find the following, quoted from the "*Diarii Veneti*" of Marino Sanuto, in a note to the English translation of Vasari:—"November 15th, 1516.—We hear this morning that Zuan Belin, an excellent painter, is dead. His name is known through the world, and, old as he was, he painted most admirably. He was buried at Zanzopolo (St. Giovanni e Paolo), beside his brother, Zentil Belin, also an excellent painter (*optimo pnytor*)."[‡]

Two drawings, said to be by Giovanni Bellino, are also in the British Museum, and there is a Portrait of a Doge in the National Gallery, which is without doubt by his hand; but in the great gallery of the nation one would fain have something better than a solitary specimen of a master so truly admirable, and there is reason to hope that we may one day be more richly endowed "in that sort." In the Royal Institution of Liverpool there is a portrait of Giovanni Bellino by his own hand. This work, not known to the present writer, is said to bear indubitable marks of authenticity.

But it is to the private collections of our great nobles and high gentry that we must have recourse, here, as on other occasions, if we would make acquaintance with some of the best of the early masters: to the Dudley Collection, for example, our English world of Art is largely indebted; we have there examples of Venetian as well as of Florentine painters of an early period, to say no word, at this moment, of other schools, or of the

p. 167, note. This "Notizia" is the work so frequently cited by writers as "L'Anonimo."

* "One of Jacopo's sons was called Gentile, a name given to him in memory of the tender affection borne to Jacopo by Gentile da Fabriano, his master, who had been as a kind father to him." See Opere di Giorgio Vasari, tomo secondo, p. 268, also English Translation, vol. ii. p. 157.

† Mrs. Foster's Translation of Vasari, vol. ii. p. 165.

unrestricted liberty with which the public is permitted to profit thereby, although the benefit is one that must needs be held in grateful remembrance by all who desire to see the humanising influence of Art extending among us.

Of the Bellini, Lord Ward's collection does not present us with more than one example, a portrait from the hand of Giovanni; but in the works of another old Venetian, Carlo Crivelli, the gallery is richer—it has three, all characteristic of the period no less than of the painter: but we refrain from description, and the rather as these pictures are happily open to the study of all. Not so easy of attainment, but well meriting a visit, is that Pietà of the Vatican—sole work by his hand in the gallery—wherein Crivelli has so admirably depicted her great sorrow in the face of the Virgin. Once seen, this head can never be forgotten. There was a figure of St. Bernard at Alton Towers, but this work, although given to Crivelli, is not worthy of his hand. Of higher interest is the Virgin and Child, with four saints, in the collection of Sir Charles Eastlake: of that picture Dr. Waagen affirms, that "both in the noble expression of the individual heads, and in the earnest, deep, and full harmony of the colours, it belongs to the best works of the master;" a passage here cited all the more readily because it touches on precisely those qualities for which it is that the early Venetian masters are most beloved by the present writer, in common perhaps with all who look at paintings with the eyes of their hearts rather than with those of the learned head.

Mr. Miles is in possession of a truly valuable work by Giovanni Bellino, an "Adoration of the Magi," probably forming part of an altar-piece painted for the brotherhood of San Girolamo, and the loss of which is still bewailed in the native city of the master. Mr. Miles's picture is a predella, and is considered not unlikely to have been that of the San Girolamo altar-piece, which represented the Nativity of the Saviour, and the figures of which are declared to have been "molto lodate" at the time of their execution. The collection of Mr. Miles—always courteously exhibited to applicants, as many of our readers will have pleasant cause to remember—is, as most of them know, at Leigh Court, within a moderate walk of the lovely Clifton, and of those "hot wells," so dear to the memory of our mothers—grand, great-grand, and even earlier. The house stands on a fair plateau, in the midst, or rather on the summit, of the beautiful Leigh woods, among whose soft green beamy slopes, exquisite depths, and far-stretching vistas, the landscape-painter might profitably expend more lifetimes than commonly fall to the share of any one artist.

There, before him, as he luxuriates in the grounds of Leigh Court, or, better still for his purpose, as he lingers through delicious days among those dream-like woods of Leigh, rise the bold bluff rocks of St. Vincent; and these may serve him well to vary his theme, though they be not all that our good friend Evelyn would fain persuade us they are: for do but listen to what he says respecting them. He is slightly touching on the diversions he found at Bristol, where, with his "company," he had "a collation of eggs fried in the sugar furnace." But what was most stupendous to me," adds our beloved guide in the woodlands of home, and through many a foreign land beside, "what was most stupendous to me, was the rock of St. Vincent, the precipice whereof is equal to anything of that nature I have seen in ye most confragose cataracts of the Alps, the river gliding between them at an extraordinary depth. Here we went searching for diamonds, and to the hot wells at its foot. There is also on the side of this horrid alp"—this horrid alp!—"a very romantic seat, and so we returned to Bathe in the evening."*

After that, is it any marvel that the descriptions of travellers should be taken with certain grains of allowance? and this too from a man who had seen the Swiss Alps! nay, who had traversed them not once only, but many times, and that at the utmost peril of his life. Here is a proof of it. With a son of Sir Christopher Wray, and "others of his company," Evelyn is crossing "Mount Sampion," which is no other than that Simplon, now the familiar acquaintance, or rather the often-sought, if not

* "Memoirs and Diary of John Evelyn," vol. i., p. 275.

always very gentle, friend, of us all. But then things were different; no bowling-green pleasance for the idling summer tourist were then the passes of the Alps, and accordingly Evelyn truly declares his route to be "by wildes covered with snow ever since the creation; and where the perpetual freezing flaw'd y^e very skin off my face." Yet does he talk of St. Vincent's rocks as worthy to be compared with the Swiss Alps!

But there is more: a horse slides "down a frightful precipice, which so incen'd the choleric cavalier his master, that he was sending a brace of bullets into the poor beast; but just as he was lifting up his carbine, we gave such a shout, and so pelted y^e horse with snow-balls, as, with all his might plunging thro' the snow, he fell from another steep place into another bottom, neere a path we were to pass. It was, as we judged, *almost two miles that he had slid and fallen.*"

Very likely, provided you are not meaning in perpendiclar depth, Evelyn of our hearts; but then what becomes of your comparison with "that horrid alp" of St. Vincent, delightful old companion? Why, after that, we shall hardly know when we may trust you. Fortunately the poor horse "took no harm beyond the benumbing of his limbs for y^e present, but with lusty rubbing and chafing he began to move, and after a little walking did well enough."*

We return to our masters. Woods or mountains alone could wile us from them, but to the mountains and the woodlands even they must yield. There are two pictures by Giovanni Bellino in Lord Northwick's collection at Thirstaine House; the one is a Madonna holding the Divine Child, with St. Peter and St. Sebastian to the right and left: "Serious and noble in the characters, and of a deep glow of colour: in these qualities, and in the admirable completion, we recognise this inestimable artist." The second work is a *Repose of the Holy Family*: this also is highly praised by Dr. Waagen, whose words are those quoted above. Nor does he do either work more than justice, both are indeed characteristic of the master; the last-mentioned more particularly, presenting—among other excellencies, if the recollection of the writer may be trusted—one of those broad, and beautiful, and hope-inspiring skies peculiar to the older painters. Clear and serene, these skies soothe you into forgetfulness, while basking in their golden light, of the fact that clouds and storm go to make any part of their being; so slight seems the veil they interpose between the visible heaven itself and the desiring gazer, as to make one almost pause in hope of further revelation. One, and not an unimportant element, is this, of their enchanting skies, in the strong attraction exercised over heart and spirit by the works of the early masters. Many and most precious are the examples that rise to the memory, in attestation of this truth, whether we think of the Florentine or Venetian schools—provided always that care be taken to go back far enough.

Some few of these are to be found in the mansions of our nobles and gentry, but we have not space for separate mention of them—a circumstance the less to be regretted, since very many of the masters to whom Art is most deeply indebted, have been made known to such as worship at her best and purest shrines, by the great gathering at Manchester.

Of works by the Bellini in the Louvre, where there are the portraits of both brothers, with the "Reception of a Venetian ambassador at Constantinople," by Gentile, I will but indicate the place, desiring to reserve the remainder of my narrow limits for some two or three painters less known among us. The galleries of Berlin, Dresden, and Milan, must be treated in like manner—a necessity for which I am sorry, as regards the last-named, where there is a work of great interest by Gentile Bellino, the "Preaching of St. Mark," namely, which the traveller will find in the Brera. In Berlin too would we very gladly linger; Berlin, where, among other works by Gentile and Giovanni, there is a portrait by the former of his brother and himself. You do not admire the choice of costume, and in the somewhat hard features of Giovanni you look in vain for any very eloquent expression of that kindness which made *him*, the friend and defender of Albert Durer, when against some among the Venetian painters of that day the excellent father of

German Art was warned that he must be on his guard, "nor eat nor drink with them save with caution," as he tells his dear friend Pirckheimer in words of quaint and quiet simplicity. Looking at his face, you would scarcely perhaps give Giovanni credit for the softness of heart that rendered his own few remaining days unendurable to him, save as he lightened their dreariness by the exercise of his beloved art, when, "rimaso vedovo di Gentile, il quale aveva sempre amato tenerissimamente," he went sorrowing towards the grave wherein they were happily soon to be united. "Left bereaved of his Gentile, whom he had ever most tenderly loved," says our Vasari—who "paints himself," as Ludwig Schorn says people generally do, while he thought only of depicting others—Giovanni did not long sustain his loneliness; and, touched by all the Aretine biographer's words imply, you feel reluctant to turn from the gallery, were it only because you must first bid adieu to that portrait. Still more difficult is it to pass rapidly before the appealing works assembled in Venice by her noblest masters, as they rise clearly before you, while—the memory pleasantly awakening—you find yourself by turn in the palace, the academy, or the church, wherein picture after picture stands ranged, and regarding you, each presenting the delightful aspect of a friend revered no less than beloved. Yet can we do no more than look at one and all with eyes of love; merely to name their names will be permitted to us but in very few instances.

Among these few the most important is the Madonna enthroned, by Giovanni Bellino, in the sacristy of Santa Maria Gloriosa, a church better known perhaps as that of the Frari. Of a later period, but equally beautiful, and in some parts even more striking, is the altar-piece in the Church of San Giovanni Grisostomo, where the grand and noble figures of the saintly fathers—St. Jerome, seated and reading, St. Augustin, and St. Christopher—are contrasted with exquisite effect by that of the child whose hand is raised caressingly, and who seems not unsuccessfully to have called the last-named from his contemplations of that heaven which is yet remaining reflected on his benevolent face, as he bends it towards the infant. Go to Venice, student of the good and true, were it but to give golden hours to the study of those two priceless treasures, and then to return with the riches thus accumulated.

Invaluable works by the Bellini, the Vivarini, and other masters, were destroyed in the deplorable conflagration of the Ducal Palace in 1577; others, once enriching different palaces, have been alienated by the necessities of the owners, or by other causes, and must be sought in distant galleries, but many still remain. In the Academy there is an altar-piece, executed for the Church of St. Job, the subject a Madonna with the Divine Child in her arms; saints are around her, and beneath are children with instruments of music. There are also works by Gentile in the Venetian Academy, and to the present writer these were of themselves a sufficing reason wherefore the gondolier should turn his "barca" very frequently towards that gallery. You can scarcely have enough of looking at the beautiful city, as she appeared in those days when the faithful hand of Gentile depicted her portrait; and here has he given you that portrait to perfection. In the "Procession of the Cross," borne across the Piazza di San Marco, you have the rich quaint beauty of that better day, preserved with so much love and care, that you feel almost tempted to believe the truthful master to have had some secret presage in his mind of the consolation he was thereby preparing for us—who were to come sorrowing after—and you half persuade yourself that he worked with a pitying exactitude accordingly. Yet if your belief be such, it but deceives you; he thought only of exhibiting the miracle recently witnessed by all the city, with the ceremonies consequent thereon, and depicted things as he saw them, because it was in the truth of his nature so to do. Let us be thankful nevertheless; the works are ours, although not painted with a view to our consolation, and if the Venice of these present times be afflicting you beyond your patience—if you be driven from the Piazza di San Marco by all the various impertinencies, and worse than they, so grievously deforming it in the days that are—you have but to seek these chambers of the Academy, and may there live in the days that are past.

THE HORSE FAIR.*

It is more than singular that the leading publisher of prints in England is a Frenchman: although M. GAMBART has so long resided in London, and is so closely identified with British Art, that he may be almost considered an Englishman. We cordially wish him success in his many liberal undertakings: and if in this instance the exhibition of the picture, and the production of the engraving, have been largely profitable to him as commercial speculations, he is eminently entitled to the advantages he has obtained, by a degree of forththought, enterprise, and liberality, we shall rejoice to see emulated, as well as rewarded.

We have so frequently noticed this great work, and the public are so familiar with it, that it cannot be necessary to describe it in detail. When first exhibited, it excited admiration amounting to astonishment; it was difficult to believe so masterly a painting was the production of a woman. It manifested so thorough a knowledge of Art, and so intimate an acquaintance with nature—afforded so many proofs of matured study—was so entirely satisfactory to the most competent critic of the animal especially pictured, and was so admirable in composition, arrangement, and execution, as to create but one opinion—that the present century had not produced a work so altogether excellent.

Those who knew personally the lady who painted it, were no little surprised to find in the artist a remarkably *petit*, delicate, and graceful woman—full of animation and energy, but one who seemed more likely to devote her mind to picturing flowers, than to the production of works of magnitude, which involved labour, thought, time, and patience. Undoubtedly, Rosa Bonheur has done more than any woman of her age to assert and maintain the supremacy of her sex. There is no man who could have painted a better picture than "The Horse Fair."

Mademoiselle Rosa Bonheur was born at Bordeaux, March 25th, 1822. She remained there till she had attained her fourth year, when her father, a promising young artist, removed to Paris. At the age of ten she showed indications of extraordinary talents, but her father, much as he loved Art himself, was unwilling to make his daughter a painter. The workings of her mind were, however, too strong to be turned aside from their object, so he at length admitted her into his studio, and cultivated her genius with the most assiduous care. In due time he sent her to the Louvre to copy the works of the old masters, and admirably were her tasks performed. At the age of seventeen she commenced the study of animals, to which her taste inclined from its earliest dawn; and, young as she was, she had the moral and physical courage to undergo a daily attendance at the Roulé slaughter-house, in the study of Nature. What else could be expected from so much enthusiasm, united with such natural gifts, but that they must produce pictures like "The Horse Fair?"

The subscribers to this print—and they are to be found in all parts of England—have been expecting it with some anxiety. They will not be disappointed. It has received ample justice at the hands of Mr. Thomas Landseer. At first sight it will seem to require greater force; and we ourselves may desire, perhaps, that the lights and shades were more *prononcés*: but it will amply satisfy those who examine the skilful drawing and careful manipulation, and can appreciate the harmony that prevails throughout.

The production of such a work is important at a time when so many tawdry productions are filling the windows of our "print-shops"—making us ashamed that we are so far behind our neighbours in all that really merits the name of Art: and it is no wonder that we find the critics of Germany and France deploring our decadence, when they judge of us from the "half castes" exhibited to their view as the productions of British painters and engravers—considering them such as the British public will only buy; yet it is notorious that when a really good print is engraved in any part of the Continent, its principal buyers are found in England.

BRITISH ARTISTS:
THEIR STYLE AND CHARACTER,
WITH ENGRAVED ILLUSTRATIONS.

No. XXX.—SAMUEL PROUT, F.S.A.

STRANGE as it may appear to many, among all the numerous illustrations of every kind which have been published in the *Art-Journal* since its commencement, there has never been introduced a single example of the works of Samuel Prout—and yet none hold them in higher esteem than ourselves. But Prout painted in water-colours only, and the Vernon Collection is restricted to oil-pictures, while the Royal Collection, which we are now engraving, though it combines works executed in both kinds of materials, unfortunately does not possess a specimen of this artist's pencil. If, therefore, an apology were necessary for including him in this series of biographical notices, no other, it is presumed, need be offered than a desire to supply an omission which has arisen from circumstances beyond our control, and which we are only too glad of the opportunity of filling up.

Samuel Prout! how this name is associated in our mental vision with the mediæval ecclesiastical edifices that are scattered over the greater part of the European continent—with the old domestic architecture, so quaintly picturesque, that abounds in Flanders, Normandy, and the German provinces—with ruined abbeys, and time-worn towers, and Venetian palaces—and, to go back to many of his earlier works, with sea-stained hulls of ships that have carried thousands of brave English hearts safely through the battle and the storm, or have brought home the wealth of the Indies to the shores of Britain—and with the low thatched cottage, whence the sailor and the fisherman went forth to face the perils of the deep. These are the subjects in which the pencil of this excellent

painter made, at one period or other of his life, entirely his own, and in which it had no equal. Taking up, by chance, a day or two before we sat down to write this notice, Mr. Ruskin's pamphlet entitled "Pre-Raphaelitism,"—which, by the way, we had not looked into since it was published, more than six years ago,—we met with the following passage: it so entirely speaks the thoughts that have frequently occurred to us when contemplating Prout's pictures that we quote it; and with the more readiness, for the sake of our readers, because no language of our own would half so well become the subject:—"I have in various other places expressed my sincere respect for the works of Samuel Prout; his shortness of sight has necessarily prevented their possessing delicacy of finish or fulness of minor detail, but I think that those of no other living artist furnish an example so striking of innate and special instinct, sent to do a particular work at the exact and only period when it was possible. At the instant when peace had been established all over Europe, but when neither national character nor national architecture had as yet been seriously changed by promiscuous intercourse or modern 'improvement,'—when, however, nearly every ancient and beautiful building had been long left in a state of comparative neglect, so that its aspect of partial ruinousness, and of separation from recent active life, gave to every edifice a peculiar interest—half sorrowful, half sublime, at that moment Prout was trained among the rough rocks and simple cottages of Cornwall, until his eye was accustomed to follow with delight the rents, and breaks, and irregularities which, to another man, would have been offensive; and then, gifted with infinite readiness in composition, but also with infinite affection for the kind of subjects he had to portray, he was sent to preserve, in an almost innumerable series of drawings, *every one made on the spot*, the aspect borne at the beginning of the nineteenth century by cities which, in a few years more, rekindled wars, or unexpected prosperities were to ravage or renovate into nothingness."

It seems to us, who often had the pleasure of holding familiar intercourse with Prout,—and who had this privilege without deriving benefit and enjoyment from it?—as if we were unlocking "the prison-gates of death," and calling the sleeping captive forth, when we talk of him again—for it appears scarcely longer than a few months back since we sat by his side in his small, "saug" studio, watching his progress on a large drawing of Venice; and yet nearly six years have passed since it was our sad duty to record his name on the "Obituary"

THE DUCAL PALACE: VENICE.

[J and G. P. Nicholls.

page of the *Art-Journal*, adding thereto a few brief lines in honour of his memory—for his friend Mr. Ruskin had, two or three years previously, favoured us with an article on the works of this artist, brief, but so comprehensive as to make any further comment unnecessary at the conclusion of an intervening period so comparatively short in its duration. It may, therefore, possibly be considered by some a superfluous task to re-write his history, or repeat what has been already published concerning him; but inasmuch as the pictures which Prout painted must always take their place among the most original and beau-

tiful examples of water-colour painting produced in this or any other country, so, whatever is written that may tend to exalt both the artist and the man, and to lead those who knew him not, rightly to value both him and his works, can scarcely be deemed intrusive and uncalled for; still, we shall find it necessary to consult our former pages for what we have now to record.

Samuel Prout was born at Plymouth, September 17, 1783. Whatever success he might have achieved in another profession,—and his general intelligence and high moral character would in any position have tended greatly to his advance-

ment,—it was clear nature intended him for an artist, though his friends were much opposed to such a pursuit for their child, who, almost from his birth, showed extreme constitutional debility. Before his tiny fingers had strength enough to hold a pencil steadily, he would employ every minute, not otherwise engaged, in attempting to draw. "Reproofs were affectionately repeated, and every effort made to dissuade the boy from what was considered an 'idle amusement,' but it was soon discovered that opposition was unavailing, and the attachment too strong to be checked. It might perhaps have been otherwise, but for some rays of encouragement received from the observant kindness of his first schoolmaster. To watch the direction of the little hand when it wandered from its task, to draw the culprit to him with a smile instead of a reproof, to sit him on the high stool beside his desk, and stimulate him, by the loan of his own pen, to a more patient and elaborate study of the child's usual subject, his favourite cat, was a modification of preceptorial care as easy as it was wise; but it had, perhaps, more influence on the mind and after-life of the boy than all the rest of his education together."

He had scarcely passed the fourth year of his age when an event occurred that for a time endangered his life, and from which may be dated the many, many hours and days of suffering experienced almost to the end of his career—aggravated, as this first malady was, at a future period, by another, if possible as distressing both to mind and body. One sultry autumnal morning he went out alone, armed with a hooked stick, to gather nuts: towards the close of the day he was carried home by a farmer, who had been attracted by his moans to the spot under a hedge where he was lying, prostrate and insensible, from the effects of a sun-stroke. From that day forward he was subject to attacks of violent pain in the head, recurring at short intervals; and until thirty years after marriage, not a week passed without one or two days of absolute confinement to his room or to his bed. "Up to this hour," he sometimes said to his friends, towards the close of his life, "I have to endure a great fight of afflictions; can I therefore be sufficiently thankful for the merciful gift of a buoyant spirit." "That buoyancy of spirit," writes Mr. Ruskin, "one of the brightest and most marked elements of his character, never failed to sustain him between the recurrences even of his most acute suffering; and the pursuit of his most beloved Art became every year more determined and independent." The marvel to us, whenever we have thought of Prout with reference to his works, and to his distant and prolonged sketching expeditions, was that he could accomplish so much, and do what he did so well, under circumstances that seemed likely to paralyse effort, mental and bodily.

His earliest essays in sketching from nature were made in the company of Haydon, his school-fellow and fellow-townsmen, and about three years his junior: we could pause, had we space for such observations, to comment upon the ultimate fate of these two artists respectively, but must forbear. When Prout first began to draw, his only examples, or studies, were the mediocre prints of that period, so that he acquired a cramped and mannered style, from which nothing but a constant and close reference to nature extricated him. "Whole days, from dawn till night, were devoted to the study of the peculiar objects of his early interest—the ivy-mantled bridges, mossy water-mills, and rock-built cottages, which constitute the valley scenery of Devon and Cornwall;" they who remember the elementary books of instruction published by him at a subsequent period, will recollect how many subjects of

this character were included in the examples. The only teachings Prout ever received, consisted of a few lessons from a drawing-master in Plymouth, of the name of Williams.

It happened that, in the winter of 1801, John Britton, the late well-known antiquarian, visited Plymouth on his way into Cornwall, for the purpose of collecting materials for his work, the "Beauties of England;" and at the house of Dr. Bidlake, master of the Grammar School, under whom Prout had been educated, and who took a lively interest in his doings, Britton was shown some of the sketches made by the young artist; he felt so pleased with them and their author, as to desire to have the youth as his travelling companion, and to assist him in the work on which he was engaged. Having obtained the consent of his parents, they set out on their journey westward, but after getting as far as Truro the travellers parted, Prout to return home, as his employer found that he was not sufficiently acquainted with the intricate details of architectural

drawing to make his service available; the mutual introduction, however, was not without advantages to both at a future time. About eighteen months afterwards, Britton, who had returned to London, received from his young friend—for they separated with all good-will and mutual esteem—some sketches recently made; these manifested such improvement as to induce him to have some of them engraved in his "Beauties of England," and others in another publication, called "The Antiquarian and Topographical Cabinet;" but still more important results to the young artist followed; Britton invited him to London, and took him into his house, where he remained two years, employing himself chiefly in copying architectural drawings by the early water-colour painters, Turner, Hearne, Alexander, Mackenzie, Cotman, &c. In 1803 and 1804, he engaged his young protégé to visit the counties of Cambridge, Essex, and Wiltshire, to sketch; many of his drawings are engraved in the publications of the antiquarian.

But this kind of work by no means satisfied Prout's ambition; what he had seen and copied in London, though at the first he felt greatly discouraged, stimulated to greater exertions and more careful study, when he returned home, in 1805, chiefly on account of ill-health. Happily, he was able in a short time to resume his labours, but on subjects totally distinct from those that afterwards occupied his attention; for, as yet, his range of subject was undetermined, and seemed likely to have been very different from that in which he ultimately

became pre-eminent. The shipping and picturesque marine material that abounds in his native place afforded prolific and agreeable themes for his pencil, and to these he assiduously addressed himself. Long after his second return to London, whither he had been invited by many most promising offers of encouragement, by far the larger number of his pictures were marine subjects. But other work was in store for him: about the year 1818 his health, which, as we have seen, had never been vigorous, showed signs of increasing weakness, and a short tour on the continent was recommended. The route by Havre to Rouen was chosen, and soon Prout found himself in the grotesque labyrinths of the Norman streets, and "among those objects with which the painter's mind had the profoundest sympathy: . . . his vocation was fixed from that hour."

This journey was the first stage, so to speak, of the many continental excursions made by Prout, as its results produced the first instalment of the large array of drawings which, for more than thirty years delighted, as well by

SWISS COTTAGES AT LAVY.

[J. and G. P. Nicholls.]

their originality as by their beauty, the lovers of water-colour painting, for "he ransacked every corner of France, Germany, the Netherlands, and Italy, for its fragments of carved stone."

Mr. Ruskin places Prout first on the list of architectural painters. "We owe," he says, "to Prout, I believe, the first perception, and certainly the only existing expression of precisely the characters which were wanting to old art, of that feeling which results from the influence among the noble lines of architecture of the rent and the rust, the fissure, the lichen, and the weed, and from the writing upon the pages of ancient walls of the confused hieroglyphics of human history. . . . Numerous as have been his imitators, extended as his influence, and simple as his means and manner, there has yet appeared nothing at all to equal him; there is no stone drawing, no vitality of architecture like Prout's. . . . Faults he has, manifold and easily detected, and much declaimed against by second-rate artists; but his excellence no one has

Further on, in allusion to composition and colour, he says,—“Prout’s streets are the only streets that are accidentally crowded, his markets are the only markets where one feels inclined to get out of the way. With others we feel the figures so right where they are, that we have no expectation of their going anywhere else, and approve of the position of the man with the wheelbarrow, without the slightest fear of his running against our legs. One other merit he has, far less generally acknowledged than it should be; he is among our most sunny and substantial colourists. Much conventional colour occurs in his inferior pictures (for he is very unequal), and some in all; but portions are always to be found of quality so luminous and pure that I have found these works the only ones capable of bearing juxtaposition with Turner and W. Hunt, who invariably destroy everything else that comes within range of them. His most beautiful tones occur in those drawings in which there is prevalent and powerful warm grey, his most failing ones in those of sandy grey.”*

It is very easy to understand from the extracts we have introduced from Mr. Ruskin’s writings, in what consists the superiority of Prout’s drawings over those of most other artists; looking at the architecture one generally sees in paintings, it may as readily be assumed that it was reared within the present century as five hundred years ago: there is little in its aspect to testify—we are speaking, of course, of ancient buildings—that generations have come and gone since the stones were fashioned and piled in forms of beauty, that the hands that sculptured and raised them have long mouldered into dust; but Prout’s edifices are hoary with age, they show the wrinkles that time has engraved on their faces, and the rich colourings with which the suns and storms of centuries have tinted them; whether we walk with him through the old streets of Flemish towns, or glide in his gondola beneath the palaces of Venice, or sit with him in the shadow of some ruined archway, we feel to be surrounded by objects unmistakably venerable, the living, speaking memorials of ages and histories that go far back into the records of the past.

The introduction of the art of lithography very soon attracted the attention of Prout; turning over the other day the contents of an old portfolio in our

possession, we came upon some of his earliest essays in this kind of work; they are chiefly sketches of shipping, and seem as if executed with a large etching needle. To these succeeded examples of a far better character, bolder in manipulation, with broad masses of light and shade: of this description are the cottages, bridges, and old buildings sketched in the west of England. At a later date, and after he had paid two or three visits to the continent, appeared the first of his large lithographic publications, “Sketches in Flanders and Germany,” containing a rich collection of glorious old architectural studies made in Brussels, Louvain, Cologne, Nuremberg, and other places. In 1839 he published another large work, “Sketches in France, Switzerland, and Italy,” a fine work in every way, but the subjects, admirable as some are, have not, as a whole, the interest which the artist’s genius had thrown into the former; certainly they were less adapted for the development of his peculiar powers: he does not seem, to use an Art-phrase, to have *felt* them. In the same year

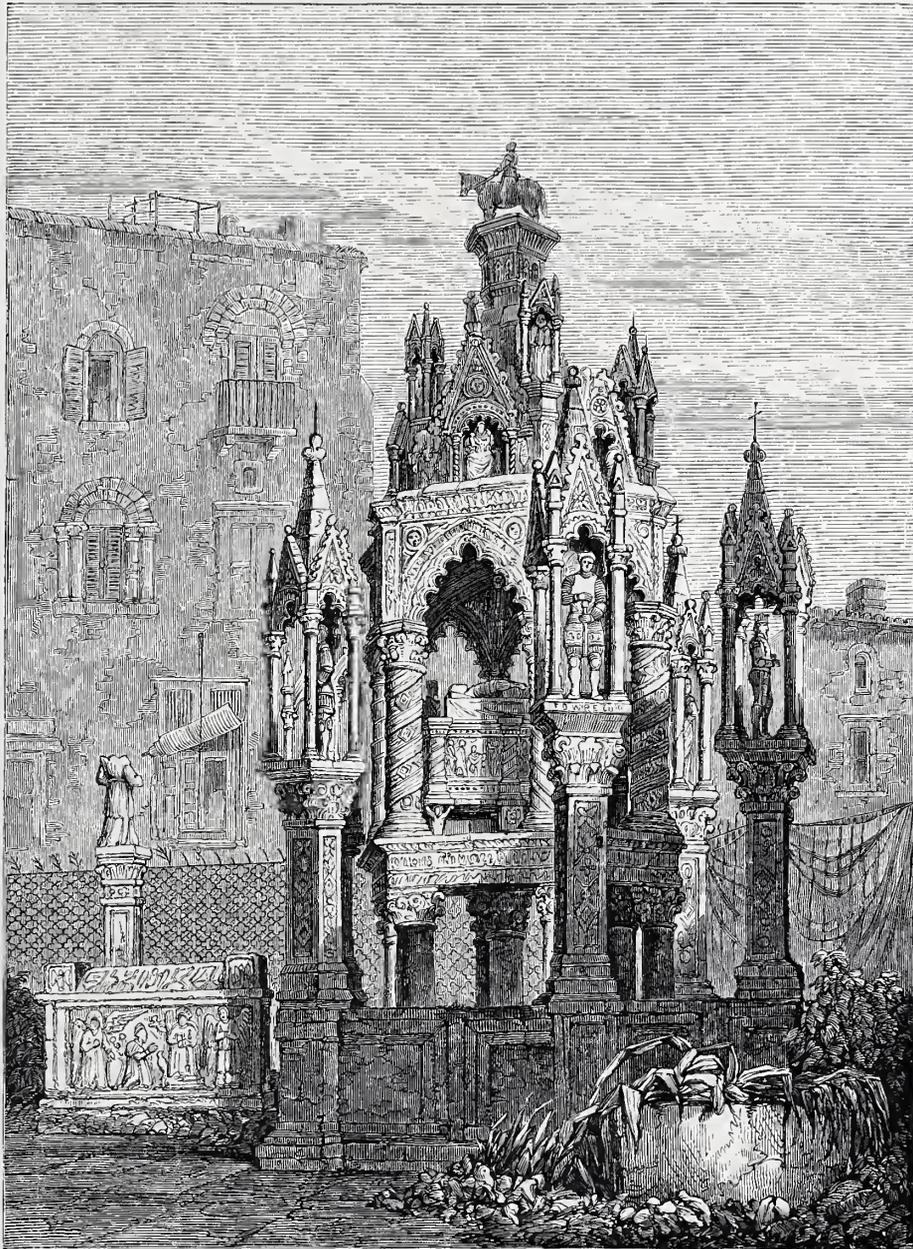

too he put forth other works, books of instruction: “Hints on Light and Shadow,” a work from which we remember to have derived, at the time of its appearance, much profit; and before the year closed, he published his “Young Student’s Drawing-Book.” Two other publications in lithography were produced at a later period; one called “Exteriors,” the other, “Interiors,” both containing a number of excellent studies for the amateur and student.

But in speaking of publications with which the name of Prout is connected, the “Landscape Annual” must not be forgotten. The volumes for 1830 and 1831, contain engravings from his drawings—the former Swiss and Italian subjects chiefly, the latter Italian only.

In 1836, the state of his health compelled him to quit his residence in the vicinity of London, and remove into the country; but he was not missed from the exhibition-rooms of the Society of Painters in Water-Colours, of which he was one of the earliest members; year by year the walls of the gallery testified to his industry and to the charm of his pencil: ten, fifteen, and sometimes twenty pictures, and not a few among them of large size, were generally contributed by him annually. Shortly after her Majesty came to the throne he was appointed “Painter in Water-colours to the Queen,” and a few years afterwards was honoured with a similar appointment by the Prince Con-

sort. He was also elected a Fellow of the Society of Antiquarians.

After an absence of eight years from the metropolis Prout returned hither, and took up his abode at Camberwell; his health had been partially restored, so that for a time he was able to resume his labours as assiduously, and almost as free from distraction, as was his wont; but increasing age by no means tended to diminish the bodily weakness and physical ailments that had been all through life his constant companions; outwardly his lamp burned brightly, inwardly it flickered and “waxed dim,” for to the end his powers, as an artist, exhibited no signs of decay, and his cheerfulness and serenity of mind never forsook him, even when—to use his own words spoken to the writer of this notice, but a short time before his death—“the dark cloud was apparently not far distant.” It came, and very suddenly at last; on the 9th of February, 1852, Prout closed his well-spent life—well spent in every way, as an artist, a man, and a Christian; if there was ever one whom to know was to love and admire, such a man was Samuel Prout.

BOTANY,

AS ADAPTED TO THE ARTS AND ART-MANUFACTURE.

BY CHRISTOPHER DRESSER,

LECTURER ON ARTISTIC BOTANY IN THE DEPARTMENT OF
SCIENCE AND ART.

PART VI.

WE now proceed to notice the leaf, which, though an object of such high interest, is one which can readily be seen: and as that feature of this organ which is most essential to the ornamentist is its form, a few general considerations relative to this development is all that is necessary. Botanists divide leaves into two classes, one of which they term simple, the other compound. The simple are characterised by being invariably formed of one piece, though it does not matter how much this piece may be cut up; thus the leaves of the Lilac and the Vine are alike simple. The other division, namely, that of compound leaves, is characterised by being composed of more than one piece; thus the Horse-chestnut leaf is compound, as is that of the Rose and Laburnum. Now it will be noticed that at the union of the leaf with the stem there is usually a slight contraction, giving rise to a kind of

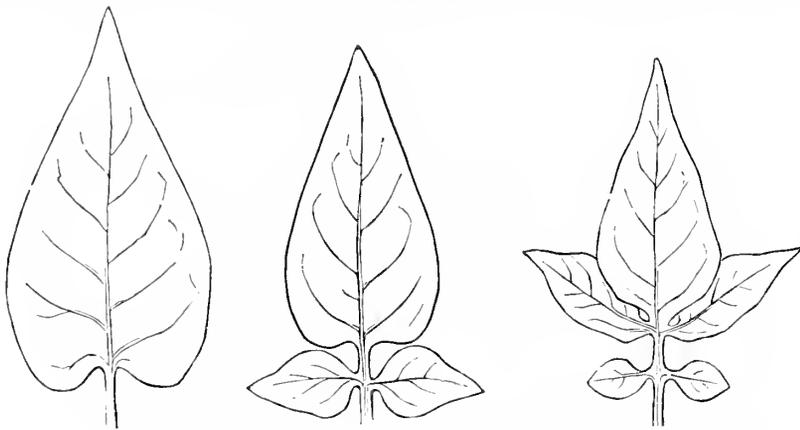

joint, which contraction is usually situated at the base of the leaf-stalk, where the leaf separates from the stem when it is shed by the latter; but in those leaves which have no stalk, it is obvious that if this contraction exists, it must be situated immediately at the base of the blade of the leaf. Now this contraction is not only found at the base of the leaf, but in compound leaves at the base of each of their parts; and at this point the component members (leaflets) of the compound leaf often separate from the leaf-stalk before it separates from the plant. The presence of this contraction between the blade and the stalk of the Orange leaf has caused it to be regarded as compound, though composed of but one leaflet. All leaves, however, are not thus jointed to the stem by which they have been generated, examples of which are the leaves of Palm-trees. Now this is a distinctive character in trees, and as the leaves of all exogenous trees have this contraction, their leaves are shed annually; but those of endogens have not, therefore their leaves are permanent, separating from the stem only by decay. Although leaves are simple and compound, the only difference between them is, the compound leaf is more developed than the simple; this will be readily perceived by observing the progressive development from simple to compound of the leaf of

which there are two leaflets; in the Clover there are three; in the Four-leaved Shamrock there are four; in the Potentilla five; while in the Horse-chestnut there are seven, and in one of the Lupins nine. This also could probably be completed up to about fifteen. One more remark is all that space will permit us to make on the general form of the leaf, which is, that not only are these diversities traceable, but also others, which are the result of the shortening of the leaf. Thus the apex is extremely long in the *Ficus religiosa* (a species of fig); it is shorter in the Lilac; it is blunt in the Bladder-senna; it is as if cut off in the Tulip-tree (*Liriodendron*), and concave in the centre in the *Passiflora medusa*. The number of the segments of simple leaves is also well worthy of notice: thus some are divided into two parts, as the *Bauhinia aculeata*; and some into three, as the *Hippatica*, and so on. However, this part of our subject we must now leave, and notice the margins of leaves.

The margins of leaves are extremely diversified, and give different characters to the entire structure, but of this, as well as of the texture of the leaf, we will speak when considering the general effect of the structure. We shall here notice the margin considered in reference to form only. Botanists are in the habit of distinguishing several varieties of margins: thus the edges of some leaves are said to be *entire*, that is undivided (ex. Lilac); others are said to be *serrated*, that is saw-like, all the teeth pointing to the apex of the organ (ex. Violet); others are *dentate* from the fancied resemblance of these marginal projections to the teeth of an animal (ex. Melon)—the character of the dentate margin is when there is a series of teeth which are directed outwards, and not towards the apex of the leaf; others are *crenated*, or as if segments of circles had been cut out (ex. Holly), and so on. These four are, however, the principal varieties, their modification and transitions, one from another, forming the margins of most foliaceous appendages to the axes of plants.

We shall next notice the nerves of the leaf. The nerves, or more properly ribs, or veins of leaves, though sometimes inconspicuous, most decidedly mark the characters of these developments, and as they furnish marks of internal organisation, they demand paramount attention. A cursory examination of plants will show that veins are disposed in two distinctly different ways, and a more scrutinising research will detect three varieties, of which two only are common in our land. The first, or principal group of which consists of those leaves which have a reticulated venation, that is, the veins are so distributed as to form a kind of anastomosis, or net-work over the entire organ; modifications of this variety, however, occur in which the external veins are only branched two or three times, as in the Oak, therefore the best character is, if the veins are branched, the plant belongs to this class. Now, this venation of the leaf corresponds with the exogenous stem, and the seed possessed of two seed-lobes—that is to say, the seed, the embryo of which has two or more seed-lobes, produces an exogenous stem, which stem develops those leaves only which have a reticulated venation, this leaf therefore characterises the group of exogens. A popular test of this division is to tear a leaf; if it tears zigzag, it is an exogen. The second group consists of those leaves whose veins are parallel—that is to say, all those veins which are external, hence visible, are not branched, but run side by side from the base to the apex of the leaf. This leaf is characteristic of the group of endogens, hence is produced by a stem which is endogenous, and which has been generated by an embryo possessing one seed-lobe. This leaf will tear straight. The other division is characterised by a forked venation, each rib dividing regularly into two branches, which again become bi-forked, which forking may be carried to any extent: this venation characterises the group of aerogens.

Although the preceding marks furnish distinctive characters of large groups of plants, and are therefore worthy of special attention, there are yet other points which are as characteristic of individuals as these are of groups, and are therefore in certain cases of equal if not of greater importance. We can here allude to one example only. The leaves of the Vine and Plane are alike five-lobed, and have therefore five prominent ribs, one passing up the centre of each lobe; but the origin of these ribs is not similar;

Figs. 54, 55, 56.—NIGHTSHADE.—*Solanum Dulcamara*.

the Nightshade (*Solanum Dulcamara*), Figs. 54, 55, 56.

For ornamental purposes a second classification will also be found expedient, the characters of which are even more obvious than those of the simple and compound. Leaves are formed in two ways, the majority have the blade of the leaf extending on each side of the mid-rib of the leaf, which mid-rib is a straight continuation of the leaf-stalk (if it exists) into the leaf, as, for example, the Apple and Plum. The other is that in which the blade of the leaf is perpendicular to the leaf-stalk, as in the Nasturtium (*Tropaeolum*) and the Castor Oil plant (*Ricinus*). To trace out the variations in these two varieties is extremely interesting to the ornamentist; we may accomplish this in a simple and limited way—which must suffice for our present purpose—by following the progress of development in various leaves.

Starting with the former class, we observe first the Lilac; here we have a leaf without divisions, and hence *entire*. From this we proceed to the Violet, where we have a leaf whose edges are somewhat saw-like; in the Stinging-nettle this is carried to a greater extent; in the Elm we have a leaf the teeth of which are toothed; in the Hawthorn this is carried further, and in the Chrysanthemum further still, the secondary teeth being toothed; whilst in some species of Poppies the leaf is divided into distinct segments: these, however, are all long leaves.

Starting again with a short leaf, a member of the same class, we notice first that of the Asarabacca (*Asarum europæum*), which is a reniform (kidney-shaped) leaf, entire or undivided; from this we pass to the Mallow (*Malva sylvestris*), which is a lobed leaf; from this to the Ladies' Mantle (*Alchemilla Alpina Conjuncta*), which is cleft about half-way down; and from this to the Potentilla, which is cleft into a number of segments, thus introducing us to the compound leaf.

Taking up the second division, let us start with

the Nasturtium (*Tropaeolum*), the blade of which leaf is perpendicular to the leaf-stalk; here we have again an entire leaf. From this proceed to the leaf of the Castor Oil plant (*Ricinus*), which is lobed; while in the Horse-chestnut (*Esculus*), it is divided into distinct segments, and is therefore compound. Without entering into further detail on this part of our subject, we proceed to notice a few points which present themselves in compound leaves. Compound leaves, as we have already said, are those which are composed of a series of leaflets or little leaves; now these leaflets (little leaves) are arranged in two ways, one of which is that in which they all radiate from a common centre (the top of the leaf-stalk), as in the Horse-chestnut, and the other is that in which they are arranged along the sides of the stalk, as in the Robinia and Rose. To trace out the modifications of these varieties, we notice first a few of the most common of those arranged along the side of the leaf-stalk, or mid-rib of the compound leaf. Thus the Sweet-pea has two leaflets, the Scarlet-runner three, other peas four, the Rose five, the common Pea six, the Jasmine seven, and so on; this could probably be traced uninterruptedly up to about twenty by careful observation. We must notice, as we pass along, that all those leaves which have an odd number of leaflets have one situated at the apex of the mid-rib of this compound organ, while those with an even number have not; this produces a decided difference in the effect. In those cases where there is no terminal leaflet, the leaf-stalk is oftentimes prolonged beyond the leaflets in the form of a tendril, as in the Pea, which may be branched or entire. These necessarily give diverse characters to the foliage of plants. Diversity of effect is also produced in this class of plants by the leaflets being in some cases placed opposite each other, while in other instances they are alternate. Also in some leaves the leaflets are all of one size, while in others they are of different magnitudes, as in the Gum and Agrimony. To follow out those which are radiated, we commence with the *Bauhinia racemosa*, in

thus, in the Vine leaf (Fig. 57), it will be observed that the five ribs radiate from a common centre, whereas in the Plane (Fig. 12), three only proceed from one point, the remaining two separating from

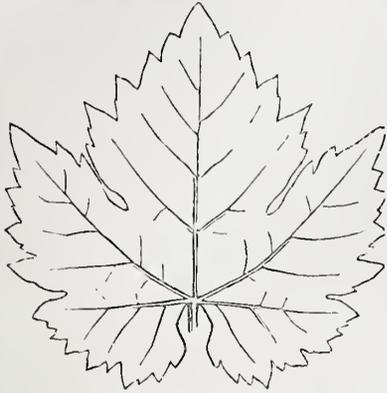

Fig. 57.—VINE.—*Vitis*.

the two other lateral ribs at some little distance from the base. Not only have the Vine and the Plane these characteristic features, but each leaf has its own particular venation, which is characteristic of the individual.

The leaf-stalk also demands notice. The forms of the leaf-stalk are almost as diversified as those of leaves, though not so conspicuous. It is usually flattened and distended at the base, or where it is attached to the parent axis. Now, upon the form of the base of this organ depends the form of the scar found on the stem after the leaf is shed; and it will be noticed that on this scar, as well as on the base of the leaf-stalk, there is usually a number of dots, formed by the woody matter passing from the leaf to the axis; their number and form are of high importance. Sometimes the leaf-stalk assumes the character of a flat, leafy expansion, as in the Orange, at other times it is of quite an anomalous nature—thus the far-famed Pitchers of the Pitcher-plant (*Nepenthes*) are modifications of this organ, the lid only being the blade of the leaf. Having thus alluded to the leaf-stalk, we proceed to notice the union of the leaf with the stem, and upon this point it is extremely difficult to offer any remarks which would prove serviceable, although it is a point of very high interest. The difficulty of giving a pleasing union of lines must be well known to all ornamentists, and the beautiful manner in which this is accomplished in many members of the vegetable kingdom is just as manifest. This union is necessarily influenced by various circumstances, as, for instance, the form of the organ uniting with the axis, as well as the form of the axis itself; and this union is oftentimes so characteristic as at once to enable the practised eye to detect the individual. If the object (say a leaf) is large which is united with the stem, strength is required, therefore this is considered in this union (Fig. 58); but we shall notice this when considering the constructive principle of the vegeta-

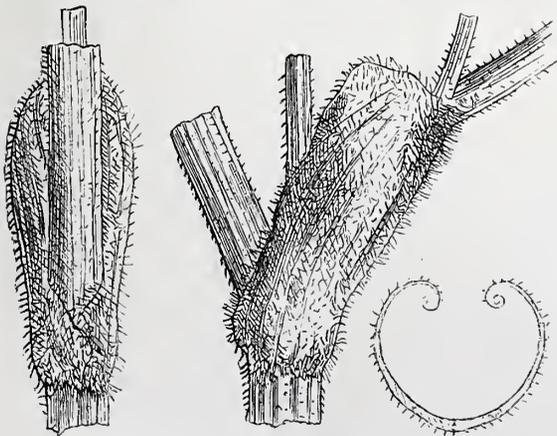

Fig. 58.—COW PALM.—*Neracium spondylium*.

ble. In some instances a peculiar character is given to this union by the leaf, instead of terminating at this point, passing down the stem in the form of a membraucous expansion. Modifications in this

union are innumerable, therefore we merely proceed to notice one general feature, which is, that there is a strong tendency manifested on the part of nature to hide the actual point of union of contiguous

organs, therefore small leafy expansions are often situated at this junction, as in the Hawthorn (Fig. 59), and Passion-flower: the axillary appendages are not, however, always leafy, thus in the Robinia they

Fig. 59.—HAWTHORN.—*Crataegus*.

are spiny, in the Elder awl-shaped, and in the *Smilax latifolia* they are tendril-like. In some cases they adhere more or less perfectly to the leaf-stalk, as in the Strawberry Angelica (Fig. 60), and Sero-

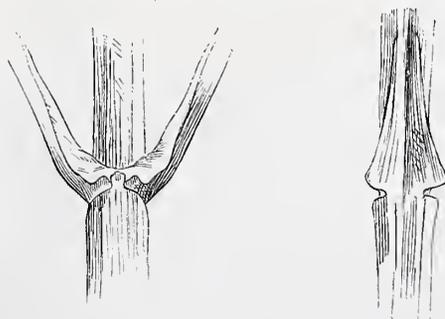

phularia (Figs. 61, 62). They are usually two in number, one of which is situated at the right, the other at the left of the base of the leaf-stalk, therefore, when opposite leaves are furnished with

Fig. 60.—*Angelica*.

these appendages, there are four at the union of the bases of the leaf-stalks, two belonging to each leaf.

Sometimes, from the union of each contiguous pair, two only appear to exist, which then occupy a central position between the bases of the two leaves;

Figs. 61, 62.—*Scrophularia nodosa*.

this occurs in the Hop. These appendages are called by botanists *stipules*. A similar development to that of the stipule occurs in some instances at the bases of the leaflets of the compound

leaf—thus, at the bases of the leaflets of the Scarlet-runner (*Phaseolus multiflorus*), little leafy members are found which are of this nature. Before leaving our present subject, we must glance at a point

of great interest connected with these foliaceous developments, which is, the variation of the leaf from the base to the apex of the structure. This subject has been already alluded to when speaking of the germination of the seed, therefore a passing notice must suffice. We have observed that the first leaves developed by plants are often of a very rudimentary character, and that, as development progresses, they become more and more perfect: this

continues till the energy of the plant arrives at its maximum, and as long as this maximum of vital energy remains, the organs developed are similar; but at a given period the energy begins again to subside, when the foliaceous organs gradually diminish, till ultimately they assume the same simple form as those which were the first developments of the axis. This can be well followed in the Lilac, where, as we have noticed, the scales surrounding the bud are of a rudimentary nature; but each successive development assumes more of the nature of the leaf proper, and if this is followed out, it will be observed that when we arrive at the flower-head, there are at the bases of its branches little leaves which are precisely similar to those possessed by the young axis when it

first evolves from the opening bud. The influence of the decline of the vital energy upon the leaf we illustrate by the Garden-mallow (Figs. 63, 64, 65, 66, 67).

Having now noticed those particulars relative to leaves which have seemed to us to be of the greatest importance, we proceed to notice a leafy appendage to the axis, which is usually situated near its apex, and is called by botanists a *bract*. A bract is a leaf of a somewhat rudimentary nature, varying in form, colour, and situation; but is characterised by a flower-bud being developed in its axil, and not a leaf-bud, as in the axil of the leaf proper. The bract varies in so many particulars that it is extremely difficult to define it, or its habits; and the gradual transition from the true leaf into this organ often renders it impossible for the limits of either bracts or leaves to be determined. The little scale-like leaves

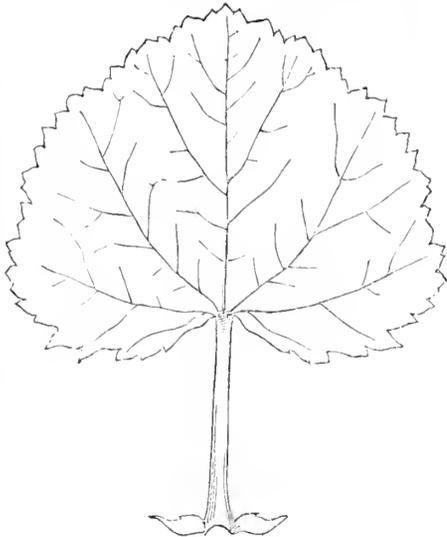

Fig. 63.

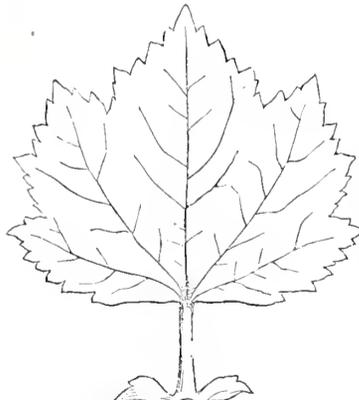

Fig. 64.

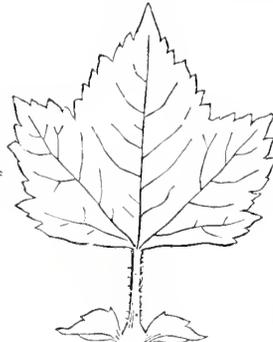

Fig. 65.

Fig. 66.

Fig. 67.

which we have just alluded to, found in the head of Lilac flowers, are bracts, as are those from the axils of which the flowers of the Veronica proceed; also the upper smaller leaves of the Mallow (Figs. 66 and 67). It sometimes happens that many flowers are developed from one bract, as in Polyanthus Narcissus, and the Lily of the Nile (*Arum*), where the great white leaf, which is vulgarly called the flower, is the bract, which encloses a series of rudimentary flowers. At other times bracts are aggregated in whorls or rings, in which case the whorls usually enclose a series of flowers; thus, in the Sunflower there are two or more rings of bracts, which enclose a number of small flowers (florets): this also occurs in the Thistle head, where the bracts are spiny.

Passing from leaves, with their various appendages, we proceed to glance at other organs, which, for artistic purposes, may be classed as appendages to the axis, although their origin would demand for them a different position in a botanical treatise. Among these we may notice those organs which act as the supports of feeble plants, when they are not sustained by the twining of the stem, as in the Convolvulus, which twines to the right; and the Hop, which twines to the left; or by the clasping of the leaf-stalk, as in the Canariensis (*Tropaeolum*).

Among the organs which we must here notice, the tendril is conspicuous, as it is one of the developments most commonly employed in the vegetable kingdom as a support for the structure. The tendril, which is a wiry organ, varies in form and habits, and is produced from various parts of the organism; its botanical origin is also diverse, but on this part of our subject we cannot dwell. Tendrils are either simple or compound—that is, branched or unbranched: in the Bryony and Passion flower they are unbranched, and are of a flexible nature, and wind round the supporting body in a spiral manner. In the Virginia Creeper (*Ampelopsis*) the tendrils are branched, and the extremities of the ramifications are more or less hooked, and in some species they are furnished with little suckers; the object of these contrivances being to penetrate the crevices of rocks, walls, &c., and thus to sustain the plant in the required position by a secure adherence to the structure climbed; little scale-like members usually exist at the separations of these lateral tendrils from the primary, which must not be lost sight of.

In the *Bauhinia racemosa* we have a tendril of an interesting character which divides into two arms, each of which forms a regular volute by its precise spiral curvature. This is not the only point of interest in this tendril; it also develops a

bud from between the origin of these two arms; and as these arms are hard and enduring, they ultimately appear as two volutes, one on either side of the axis, the axis being formed by the developed bud and the thickened, unbranched portion of the tendril. In this latter example, although the tendril only forms one or two revolutions round the supporting body in order to sustain itself, the grasp is extremely secure, as the tendril, after having assumed this position, becomes extremely hard: so secure is its grasp that it is almost impossible to separate it from its support without destroying it altogether.

Before leaving this part of our subject, we may just notice, as we have already hinted, that all tendrils are not adapted for supporting the plant in the same situation. Some are particularly adapted for adhering to rocks, and are sufficiently secure to support a weighty structure in this position, whereas others are adapted to sustain plants among other members of the vegetable world stronger than themselves.

Other supporting structures are the root-like, aerial developments of certain plants, as the Ivy; these, though root-like, are not roots, properly so called, but appear to be developed for the purpose of support only: they are usually small succulent members, protruded copiously from that part of the stem which faces the surface to which the plant has to be attached; the means of adhesion appears to

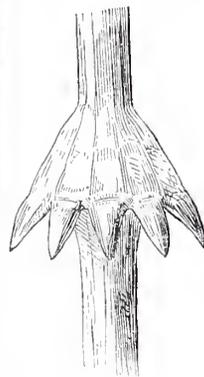

Fig. 68.

Fig. 69.

be penetrating the supporting surface, and forming a vacuum, oftentimes between a concavity in the root-like development and the supporting plane.

Certain other means of support are also employed by vegetable structures besides the root-like develop-

ments, or more properly the sucker, and the tendril. Thus the Goose-grass (*Galium aparine*) climbs hedges by means of little hooks, with which the four corners of its stems are furnished, as well as the backs of the mid-ribs of its leaves. More complex hooky appendages are found on the Plectocomo Palm (Figs. 68, 69); they are best seen on the mid-ribs of its enormous compound leaves; these hooky appendages, which are of a compound character, by their great strength enable the plant to lean most securely on others for support. The structure of these organs is extremely pleasing, when we remember the fact that the plant must ascend by growth; therefore, these hooks must in no way interfere with this ascension, but only sustain it in its elevated position; a glance at our sketch will show the manner in which this is accomplished.

PICTURE DEALING.

BOW STREET.

THERE has occurred during the past month another of those cases which ought to act as impressive and salutary warnings to those who buy pictures—no matter from whom, unless it be from the artist. Continually, during the last twelve years, have we been endeavouring to induce conviction that dealing with dealers is at all times hazardous; while often the chances are as many against a purchaser as they would be against a player at one of those houses, with an objectionable name, at which people stake their money upon the colour of a card for the benefit of the establishment. We take for granted—indeed we know—that our warnings have not been without effect; “old masters” now bring prices only as furniture pictures. This “trade” has been destroyed. There is as little probability of “a genuine Raffaele,” or “a veritable Titian,” bringing a large sum, as there is of a jaded horse being passed off at Tattersalls for a scion of Blink Bonny. But there are people who, though they turn from dirtied and smoke-dried specimens of ancient schools, imagine they are not likely to be “taken in” by examples of modern artists, with whose styles they are familiar; and so they buy from “best-known and most respectable men in the trade,” in full confidence they have that which they have paid for; not often discovering their mistake at all, or when discovering it, finding it very difficult, if possible, to obtain a remedy—for the chances are many and great in favour of the seller and against the buyer.

Now and then, however, there does occur a case, such as that to which we here direct attention.

Let us not be mistaken: there are many honest and honourable men dealers in pictures, in London and in the provinces—men who are incapable of fraud, and who are useful to the artist, while serviceable ministers to the wants of the collector; but they are few in number compared with those whose business is to cheat. In this commercial country, trade is a wholesome as well as a legitimate pursuit, and is undoubtedly to be fostered and encouraged when conducted upon principles beneficial to both the buyer and the seller. In these remarks—as in those we have so frequently made, and may have often to make hereafter—we hope to be understood as placing a distinction as wide between the upright and the fraudulent dealer in pictures, as we should do with reference to any other vocation which implied traffic;—there are some who may be dealt with as safely for pictures as Dr. Chambers for a prescription. But cases such as that which has recently been heard at Bow Street, and is appointed to be, in due course, heard at the Old Bailey, are of such frequent occurrence, that it behoves all buyers to be over, rather than under, cautious at all times; they have usually the risk of being wilfully and deliberately imposed upon; and not unfrequently this danger also—that the honest dealer may be himself taken in, and so innocently wrong a customer.

In dealing with this case we shall be naturally—necessarily—prudent: our readers will not, any more than ourselves, have forgotten, that we have paid a heavy penalty for the part it was our duty to take in reference to picture-dealing. The wound is not yet healed inflicted upon us, by Mr. Louis Hart, at Warwick; or to speak more correctly, inflicted not by Mr. Louis Hart, but by the judge (now dead as well as the prosecutor) before whom we were tried for libel. We confess we have no desire to appear again in court, under similar circumstances and at a like expense; but this becoming disrelish for nominal “damages” and excessive “costs,” shall not prevent our discharging our duty whenever it is to be done: and in observing upon the case now under notice, although we can say little more than we have said a score of times, we supply to our readers and the public another warning.

It appears then that a Mr. Henry Fitzpatrick, a carver and gilder (and we imagine a picture-dealer also), at Sheffield, summoned to Bow Street, Mr. Henry Smart, of Tichborne Street, and Mr. Thomas Closs, of Charlotte Street, Blackfriars, for obtaining from him £130, under false pretences: the result being, that the first-named accused was discharged and the other committed for trial. A Mr. Frederick Adams was, it appears, the go-between; and by his evidence we learn (it being previously understood that Mr. Fitzpatrick had been shown, by Mr. Smart, a picture by Linnell, for which he asked £200, and that this little incident occurred on the 20th or 21st of July) that Mr. Closs called upon him on the 24th of July (*three days afterwards*) to say he had a picture of Linnell's for sale. Being asked by Mr. Adams, “Is it the picture that Mr. Fitzpatrick has seen at Smart's?” he answers, “Yes it is.” Being again asked, “Is there anything wrong in it?” he gives the assurance that it is an *original*; and under these circumstances it was offered by Mr. Adams to Mr. Fitzpatrick, who purchased it for the sum of £130—Closs having previously agreed to sell it for £120, adding, that when he (Closs) took that sum, “he should lose £40 by it.” Mr. Fitzpatrick, who seems to have acted with proper prudence in the affair—whether he had his suspicions, or desired to make assurance doubly sure—after he had purchased the picture took it to Mr. Smart: “I placed it in a good light,” he says, “and I asked him if that was the picture I had seen in his house?” He replied, “Yes; there can be no doubt about it.” “When I first called at Mr. Smart's,” says Mr. Fitzpatrick, “I saw in the shop a man who I now believe was Mr. Closs.” Three days afterwards the forged picture was delivered to him. Can it be possible that the copy was made during these three days?—or is it impossible? “It had no appearance of being freshly painted,” says Mr. Fitzpatrick, “and therefore I thought it to be the same I had seen at Smart's.” When the forged picture was submitted to him, “it was in the same frame and box that he had seen it in at Smart's.” “I feel,” he says, “confident of this, although I could not swear to it positively.”

That is the transaction, let the reader infer what he will.

It is said in the report—we know not on what authority—that on the same day that Closs sold the “copy” to Mr. Fitzpatrick, through Mr. Adams, he sold the original to another picture-dealer, who sold it to another picture-dealer, who sold it to another picture-dealer, by whom probably, ere this, to another picture-dealer it has been sold. It is added, that the “copy” also was passing through a variety of hands—not, we imagine, in London, but somewhere in the country, where detection is not quite so easy as it would be in town. Whether this is the *only* “copy” of this picture in circulation, or whether it is one of several “copies” made by the hands of the artist whose feelings (as we shall presently see) were, or ought to have been, “hurt” by the small value put upon his work, who shall say? For our own parts we believe there is more than one “collector” who may now consult his acquisitions, and who will apply (when the Old Bailey has adjudicated) to have his money back, to be answered, as of old, “no money returned: *Vivat Regina!*” But will this case be ever heard within the walls of the Old Bailey at all? We much doubt it. The *exposé* is already very “disagreeable,” and it will be still more so if there be more “stir” about the matter. It may not be convenient to Mr. Closs to refund; but there will be no great difficulty in making up the money to repay Mr. Fitzpatrick, or rather to get him back his acceptances, *only one of which was indorsed by Mr. Closs*. The chances are ten to one that the public will hear nothing more about the matter—except in so far as the *Art-Journal* is concerned.

Some two years have passed, we believe, since the fraudulent copy of Mr. E. M. Ward's picture was the subject of investigation; we then heard much about actions at law and so forth. No action was brought by any one against any one; somebody made something out of the affair, and we suppose somebody lost something: at any rate, all parties concerned seem content not to worry the public any further with the matter. We shall marvel if in this case it be not exactly as it was in that; we do not observe there has been any binding over of witnesses. There are, however, one or two points arising out of the Bow Street examination, which may or may not “be continued” at the Old Bailey, to which we desire to direct the attention of our readers. A passage in the report, worthy of special notice, is this: Mr. Fitzpatrick having been asked what he considered the worth of the picture for which he had paid £130, answered, he would not give £5 for it: upon which the lawyer observed—“Don't hurt the feelings of the gentleman who painted it!”—Probably “the gentleman” was in court; be he who he may, we do not hesitate to say, that rarely has a darker culprit stood within the bar of that police-office. When he made that copy he knew what he was doing as well as does the forger who signs a copper-plate imitation of a bank-note, which another hand is to get changed into gold. The two pictures—the original and the copy—were precisely alike, so alike that if Mr. Smart's attorney is not in error, Mr. Smart himself did not know the one from the other—alike in size and in character, as nearly as possible touch for touch: both were exhibited in court, where the copy was considered “exceedingly skilful.” Mr. Linnell himself (being examined) said, that although he should know it was not his painting *upside down* (thereby having a large advantage over Mr. Smart), the colouring had been well imitated, and it might deceive an inexperienced eye.” He added, “*the signature to it was a forgery.*” * The artist who painted it may not have

* We say nothing here of the heavy grievance sustained by Mr. Linnell, who it appears painted the original picture expressly for Mr. Smart. Unhappily, in this country the artist has no remedy, however much he may suffer in reputation and in money by these forgeries, which substitute copies for his actual works. It appears they manage these things better in Belgium. We copy the following from the *Literary Gazette*:—“The Belgian courts of law have just decided a case of considerable importance. A picture-dealer sold a landscape, frame included, for thirty francs, which he said was by Kutyntrower, one of the most celebrated landscape-painters of Belgium. Herr Kutyntrower brought an action against the dealer, alleging that the picture was a work of such inferior merit as for it to be impossible to be mistaken for one of his. The tribunal decided that a man pretending to be a picture-dealer was bound to understand his business, and to have recognised an original of Kutyntrower's, and awarded heavy damages to the artist.”

been aware that his copy was to be sent to the buyer in the same frame and box in which the original had been displayed before his admiring eyes, or at all events, in a frame and box so nearly resembling them, that Mr. Fitzpatrick says, “I feel confident they were the same, although I cannot swear to it positively;” the artist may not have been a party to any “doctoring,” which enabled Mr. Fitzpatrick to say, “it had no appearance of being freshly painted;” nor may the artist have had any participation in the bills, for £15 at two months, for £40 at three months, for £50 at four months, or the present payment of £25, which his copy was to bring to its then fortunate owner: but we repeat, he *knew* full well that his copy was to be by some one substituted for the original; he is as guilty as any “receiver” who receives stolen goods knowing them to be stolen, and for him six months at the tread-mill, or picking oakum, would be a small punishment compared with his offence. If we knew his name, we should publish it, for the information of the profession he has dishonoured and degraded as far as in him lay.

The attorney for the defendant Closs—acting no doubt according to his instructions—did not hesitate to say in the presence of a large number of picture-dealers, that “it was notorious that half the pictures which adorned the walls of titled collectors throughout Europe were nothing but very good copies.” Perhaps Mr. Smart and Mr. Closs have enlightened him as to the whereabouts of some of them. He added, that “in *this* case the copy was really so good that Mr. Smart himself did not know the difference” (unfortunately Mr. Smart neglected to repudiate this gross attack on his professional repute); the inference of course being that the victim might have been content without making such “a row,” because he received a copy when he had paid for an original:

“He that's robbed, let him not know it,
And he's not robbed at all.”

The following little “side-bit,” like my Lord Burleigh's shake, says much: we copy the report:—

“Mr. Abrahams, Smart's solicitor, said his client was one of the best known and most respectable men in the trade, and such a charge against him was most preposterous.”

Mr. Metcalfe (who conducted Fitzpatrick's case). “Don't compel me to state what has come to my knowledge in reference to Mr. Smart in other transactions.”

Both lawyers may be in this instance correct. Mr. Metcalfe, perhaps, may not be aware that Mr. Smart may be “one of the best known and most respectable men in the trade,” and yet that he might have a deal to say concerning what has come to his knowledge “in reference to Mr. Smart in other transactions.”

Having, as we have said, a salutary fear of the law of libel, we shall not inquire relative to these “other transactions,” although we do not think it likely that the bench supplies a fitting successor to the late Baron Alderson, who, in the case of another of the “best known and most respectable men in the trade”—the late Mr. Louis Hart—absolutely prohibited all reference to “other transactions” in which that worthy dealer in pictures had been concerned previous to the case in which a jury was induced to convict us of libel.

If Mr. Smart's solicitor describes his client as one of the best known and most respectable men in the trade, Mr. Closs's solicitor claims a similar character for *his* client, whom he describes as “equally well known and respected in the trade.” It may be so!

If collectors of pictures will give no heed to the warnings they so often receive, but will be cheated “with their eyes open,” they merit little sympathy. They have learned—many of them by dearly bought experience—to distrust the dealer in “modern” as well as in “ancient” pictures; and it cannot be requisite to tell them, yet again, that there are manufactories, notoriously well known, in which spurious imitations of British painters are fabricated daily—the forger usually receiving as “hire” shillings where pounds are obtained by the employer, who pays him for his crime.

We might say very much more on this subject, and probably shall do so ere long; at present we leave this case of Fitzpatrick *v.* Smart and Closs for the consideration, the guidance, and the “warning” of our readers.

THE ROYAL PICTURES.

GATE OF THE SERAGLIO: CONSTANTINOPLE.

F. Danby, A.R.A., Painter. J. T. Willmore, A.R.A., Engr.
Size of the Picture, 3 ft. 7 in. by 2 ft. 6½ in.

LOOKING at pictures of eastern scenery, as they are generally presented to our notice, one is almost led to conclude that one or other of the prismatic colours of the rainbow tinges every object that is placed before the eye of the painter; gold and azure, vermilion and purple, are the gorgeous hues overspreading the landscapes of the eastern world; while the inhabitants, as if with the desire not to be outshone by the brilliancy of nature, clothe themselves in garments—so far, at least, as their means will allow—whose colours are scarcely less dazzling in their brightness. Everything, in truth, assumes an aspect of splendour which must be almost oppressive to the eye of an European, but especially so to that of the English artist, to whom the more sober, but not less beautiful, tints in which the hills and valleys of his native land are dressed, can scarcely fail to prove a most agreeable relief after a protracted absence, and must impel him to give a cordial greeting, on his return, to the island of his home—

“Rich queen of mists and vapours.”

We have sometimes tried to imagine what sort of pictures Turner, in his later time, would have shown us, if he had ever been allured into the countries of Western Asia; or, like David Roberts, had made a pilgrimage through Palestine and Syria; for if, as he seems to have done, he almost exhausted the resources of his pigments on the realisation of European scenery, it is next to impossible to conceive what treatment he would have adopted, or what colours his eyes would have seen, in the landscapes of the East. Artists less likely to go astray—or, to speak more correctly perhaps, with different powers of perception—have not unfrequently made us sceptical as to the truth of nature in their works. Turner's poetical feeling, depth of imagination, and knowledge of colour, would, in all probability, have leguiled us into a belief that the world he painted was not that which mortals inhabit. Perhaps it is well for his reputation that he never landed on the Asiatic shores: we are quite content to see Europe as he has showed it to us, and the East as Roberts, Linton, Lewis, and a few others, have presented it.

Danby's eastern subjects are, we believe, purely ideal; he has never, so far as we have been able to learn, travelled further from his native country than the banks of the Rhine; his “Gate of the Seraglio,” therefore, is only a “faucy,” an artist's dream of a place which has the character of being pre-eminently picturesque and lovely. But though he has taken a painter's licence with the subject, it is only with that portion of it which appears as the “Gate;” the position of this, relative to the city, and the view of the latter, are sufficiently correct to be accepted as pictorial truths.

This picture was exhibited at the British Institution in 1845, from the gallery of which it was purchased by command of the Queen: the catalogue offered the following remarks, by the artist, to the reader:—“The effect intended is that of the full-orbed moon rising at sunset, while the sun, behind the spectator, is reflected on the palace windows of an eastern city.” Notwithstanding, however, that both sun and moon form a union of light, the picture is dark as a whole; all the shadows are of intense depth: in fact, darkness, and not light, seems to be the rule and principle of the composition. Yet the general effect is rich and gorgeous to a degree,—this richness being produced chiefly by the surface of the water being stirred into gentle ripples, the crests of which are tinged with the crimson hues of the setting sun, and, in the distance, with the pale tints of the “full-orbed moon:” it is altogether a work that shows the peculiar genius of the artist in a most favourable point of view, but the peculiar treatment of the subject presents so much difficulty to the engraver, that none but an artist of more than ordinary talent and judgment could have transferred it into black and white with any chance of making it effective.

The picture is in the Collection at Osborne.

THE WATER-COLOUR DEPARTMENT
OF THE
ART-TREASURES EXHIBITION.

MAY we hope that the Turner sketches in water-colour at Marlborough House will one day assist in the formation of a collection of British water-colour art? May we venture to hope that such a collection will ever be formed? In answer to such a question it can only be said, that if we have a national feature in Art, it is our school of water-colour; and the formation of such a collection is certainly due to the *prestige* it enjoys. But whenever such addition is made to our museums, it is earnestly to be desired that it will appear as well in the form of a progressive and circumstantial history as in that of an illustrative collection. In little more than half a century this branch has been carried from a thin raw wash, to its ultimate perfection. When the fresco question was introduced in reference to the decoration of the Houses of Parliament, foreign professors and learned amateurs were in despair that British painters knew nothing of fresco-painting. But because fresco-painting was, after all, but water-colour painting, the surprise was great that mural painting was not only not difficult to members of our school but that they became at once so exuberant in execution as to essay in fresco the various means of effect to which they had been accustomed in water-colour. How eccentric soever may be some of the pictures in the Poets' Hall, there is at least one to which we can point, the greater part of which was five times cut out before the artist could satisfy himself. The earnestness of Michael Angelo, the fastidiousness of Correggio, or the severity of Raffaele, never did more than this. But to return to our pictures on paper: whatever may be said of their origin, much of the earlier excellence of the art is due to those professors who spent their lives as teachers, and that at a time when water-colour practice was deemed only within the extreme list of Art, and an invention cultivated only for the amusement of young people. And that is what Mr. Ruskin still considers, as he says, when he aims at teaching his pupils to paint the grandest phenomena of nature, “Make frequent memoranda of the variegations in flowers; not painting the flower completely, but laying the ground colour of one petal, and painting the spots on it with studious precision. . . . Be careful to get the *gradated* distribution of the spots well followed in the calecolarias, foxgloves, and the like,” &c. This is very much the kind of instruction that the same master gives in proposing to instruct tyrones to register the grandest moods of nature, which he has elsewhere discussed eloquently but unprofitably. It is to be regretted that the water-colour exhibition at Manchester does not contain a greater variety of the beginnings of the art, showing the excellence it attained very early in miniature—some of the monochrome sketches of the great masters, and an example or two of fresco practice (which are to be had framed); for all these must be comprehended in any history of water-colour art. Thus it would be seen where the practice was left by foreign schools, and where our own painters found it. The degree of splendour to which it has been carried is sufficiently shown at Old Trafford. The earliest instances contained in the collection are entitled, “Man and Dogs,” by Jacob Jordaens; “A Girl leaning over a Gate,” by Rembrandt; “Exterior of a Cottage,” by Van Ostade; Dutch Interiors, by Dusart; “Exterior—Garden and Portico,” by Moucheron; “Poultry,” by Shenstenburg; “A Female Head,” by Watteau; and various sketches of flowers by Van Haysum, who died in 1749. Of the works of Paul Sandby there are sixteen, the subjects of which are views in various localities in England, Wales, and Scotland, as “Bothwell Castle, Clydesdale;” “Carnarvon Castle;” “View near Virginia Water;” “Hyde Park,” &c. &c. It is generally considered that Sandby did much during his long life (he died at the age of eighty-four) to advance water-colour practice; and it is undoubtedly true that he did. From the dates affixed to his drawings exhibited here, we learn that they were all executed within a space of twenty-five years, commencing from 1770, when he was forty-five years of age. We have never before

seen so many of Sandby's works, and though their merit is comparatively great, we are in some degree disappointed at their want of enterprise, and the crudity of their forms, especially those of the trees. The means and appliances were not then what they are now; but we think that instead of a thin wash, more solidity might have been obtained. Nothing, however, can deprive this master of the honour due to him as the father of the British school of water-colour landscape art. There are two drawings by Reynolds, “The Triumph of Sculpture over Painting,” and a portrait of Reynolds himself; but it will be at once understood that as figure sketches they have no reference to that particular branch which we are considering. By Gainsborough there are four sketches—“Cattle near a Pool,” “Study,” pen-and-ink wash for Sir T. Baring's picture; “Water Party in a Park;” and “Lady walking in the Park;” the last really an interesting work, with much of the feeling of his large oil portraits. John Cozens, who died in 1794, seems to have had opportunities of seeing continental scenery, of which he successfully availed himself. His views in Italy, especially those of Florence, the “Isola Borromeo,” and the “Villa Farnese,” are productions of great truth and earnestness. Passing Byrnie, Wheatley, Hamilton, and Rowlandson, we come to Girtin, to whom honour is due as one of our most distinguished pioneers: and with him worked a friend rejoicing in no less than four names, the last of which was his great patronymic, the other three being little known to the world—and this was Joseph Mallard William Turner; and we would rather have seen Turner's early works in their place by the side of Girtin's, and the men of the last quarter of the last century, than placed apart, as if the progress of the individual were independent of that of the school. The class of subject painted by Girtin may be understood from the titles of a few of his works, which are “Interior of Exeter Cathedral;” “Ely Cathedral;” “Helmsley Castle, Yorkshire;” “Carrow Castle,” &c.; and among his studies are some which will never be surpassed in natural truth. Near these works are several figure compositions, simple in subject, but highly meritorious in execution, by Thomas Heaphy, of which some of the titles are, “Quarrelling at Cards;” “The Mother;” and “Stealing the Tarts.” At the commencement of the present century teachers of drawing multiplied rapidly, and a knowledge of water-colour execution began to be considered an elegant accomplishment. But in those days exhibitions were not so popular as they have become since, and the taste for, and education in, Art, were not so extensively cultivated as in our time. Though the reputation of these artists was limited, it may be justly said that their works ought to have won for them a higher distinction than they enjoyed during their industrious lives. There are some admirably spirited drawings by Bonington, who, such was his skill in either craft, claims to be regarded as a painter of high pretension in both oil and water. His works here are, “A Felucca;” “Coast Scene;” “Verona;” “Venice;” “On the Scheldt;” and “Sea Piece and Pier.” His manner in small works is extremely playful, yet decided, having produced, as is evident in his sketches, precisely the effect he desired frequently with one sweep of his brush: and notwithstanding what our French neighbours may say about the characteristic points of their school, they have clearly learnt much from Richard Bonington. John Constable is another of our originators to whom the French school of landscape is deeply indebted. For ourselves, we have gone on our way rejoicing, the good old rule, *quisque pro se*, ever prevailing among us.

And now we arrive at a period when what Mr. Ruskin calls the “pestilent” practice of sponging, or washing, becomes common. Turner washed and sponged, and Mr. Ruskin has vehemently landed some of Turner's finest effects, produced only by this process. When Varley was asked by a well-known patron of Art how he produced such an exquisite effect in a certain work, he replied that it could be only done by this process, and the drawing had been washed at least fifteen times. It is generally found in water-colour practice that half measures are not successful; the most effective and spirited works result either from repeated washes, or decisive execution without washes. Among these drawings there are many which are not the productions

PRINTED AND SOLD BY W. LAURENCE & CO. LONDON

of professed water-colour painters; at these, therefore, we do not look as indicative of the progress of the art. By Robson there are three drawings, they are, "On the Donne," "London Bridge—Sunset," and "Durham;" an insufficient representation, we think, of this painter. Neither Flaxman, nor Cruikshank, nor Bewick, have any claim to be here, but they are nevertheless represented; and of Stothard there are no less than nineteen examples; and he is succeeded by Anstin, Westall, Constable, Clennell, Chambers, Danby, and Wilkie,—the majority of whom were professors of oil painting, their productions in water-colour being only intended as subsidiary to their larger works. It was Wilkie's tours in Spain and in the Holy Land that compelled him to water-colour practice, for which purpose he used paper slightly tinted, employing Chinese white with his flesh colours. George Barret is represented by six drawings, some of which are of extraordinary beauty; the warm effulgence of his best works was produced by washes: and there are eight drawings by Varley, mannered, but full of poetry and touching sentiment. It was, we think, Constable who indulged in much pleasantry at Varley's brief recipe for execution, which was, "the warm grey, and the cool grey, and the round touch." With any such abiding rule of practice, no painter can avoid becoming a mannerist. Varley is followed by Reinagle, West, Calcott, Owen, Haydon, Collins, and others, who did nothing to advance the art. From the portfolios of Müller there are thirteen sketches, the majority of which were made during his tour in the East; some of his most finished works were his studies for his Renaissance series, but none of these are here.

In the room No. 2 we find the works of some of the giants of the art. There are a dozen drawings by Dewint, who painted nothing but British scenery, here and there free in execution, but most natural in colour; of these examples may be named "Lewber Castle," "Lincoln Cathedral," "Sketch on the Wye," "Neath Abbey;" indeed, all are worthy of most honourable mention. In the early and more finished works of Dewint nothing is more enchanting than his Welsh subjects; the breadth, tone, and feeling of those landscapes are beyond all praise. For Samuel Prout we have ever had the highest respect; how eccentric and mannered soever he may be, his works possess high artistic excellence; but we cannot go the length that Ruskin does, in recommending them to the imitation of students, after which he proceeds to say,—“Then work from nature, not trying to Proutise nature by breaking smooth buildings into rough ones, but only drawing *what you see* with Prout's simple method and firm lines. Don't copy his coloured works; they are good, but not at all equal to his chalk and pencil drawings; and you will become a mere imitator, and a very feeble imitator, if you use colour at all in Prout's method. I have not space to explain why this is so—it would take a long piece of reasoning; *trust me for the statement.*” It is not at all surprising that Mr. Ruskin should venture to print such precepts as his book contains, since he has already sent forth matter much more censurable. Can it be supposed that if the manner of Prout were fitted to be a basis of imitation for a school, that there is wanting the sagacity among painters not to have discovered this before. Prout's works—that is, his earlier pictures—are charming; but that he is not followed is, because it would be most unsafe to imitate any manner so loudly pronounced. So much of late has been said of Turner that we shall say of him here as little as possible. Of his works there are upwards of eighty examples, from the first exhibited drawing to the last sketch—the former being “The Ruins of Malmesbury Abbey,” and the latter “An Alpine Pass,” the property of H. A. J. Munro, Esq. This series alone contains an epitome of the progress of the art; for Turner tried all known resources and availed himself of everything which he believed would assist him in expression. We find him, therefore, now intensely jealous of the disembodied purity of his colours; now mysteriously opaque, with white tinted with every colour of his palette; now hastily—peremptorily—finishing everything with a touch, and leaving it with one flood of colour of many rugged outlines;—or, again, finishing with consecutive washes which seem to have dissolved the paper into the picture. Oil painting is not susceptible of such

a substantive variety of manner; and no professor has ever in his life-time seen any branch of fine Art arise and flourish in mature bloom as Turner has seen—(*parsque cuius fuit*)—water-colour painting. We look here on the practice of one man during a term of at least half a century, with all its vicissitudes and eccentricities. The truth of very much that Ruskin has written about Turner must be admitted; but it can never be received that he was the only painter that ever understood nature. The best productions of the master require no written eulogy; the praise of all who see them cannot be expressed otherwise than by a burst of enthusiasm—for who unmoved could look on such pictures as, “Llanberis Lake,” “Durham,” “Daren Castle,” “Arundel Castle,” “The Bass Rock,” “Florence,” “Lucerne by Moonlight,” “Kussnacht”? These we mention especially, because in all collections of one man's productions there is inequality of merit. Copley Fielding enjoyed an enduring and well-earned popularity, even to the end of his successful career: he is represented by twenty-one admirable drawings, in which his feeling for the sunny downs of Sussex, and the stormy North Sea is sufficiently patent. By John Absolon there are nine drawings of great merit; and a few by George Dodgson, each of which has an unwrought strain of the sweetest poetry.

When we look upon the drawings of George Cattermole, it is but to renew our lament that he should forsake these inimitable things, and seek to disguise himself in oil. There never was a wider range of subject than he takes, for from history and poetry down to the arithmetical zero, he makes pictures of everything and nothing. There are no less than thirty-one of these most ingeniously composed drawings, and among them is the famous “Sir Biorn surrounded by the armour of his ancestors.” John Gilbert, another most fertile designer, is represented by only three drawings, of which “Richard II. resigning his Crown” is one. Then comes David Cox, who now for nearly fifty years has been constant to the Royal Oak at Bettws; for he, like Copley Fielding, is content to paint home scenery. By Carl Haag there are some exquisite compositions, and some of Louis Haghe's best pictures; and a long list of the bright studies of William Hunt, painted from anything, but especially those spadefuls of turf cut from under the hedgerow of some green lane; and different views of the boy who cut them, in “The Attack,” “The Defeat,” “Too Hot,” &c. Hunt, like others whom we have mentioned, is an originator, and his excellence is of a kind that places him beyond the reach of imitation. The examples of Harding do not show him as he ought to be seen. His life has been a long career of exertion as a master, and we know of none whose manner and feeling have been more extensively imitated, not only at home but throughout Europe. His innumerable lithographs have been most profitably studied, and the results of such influence are recognizable in oft-recurring instances. The masterly treatment of “The Falls of the Tummell,” “Sunrise on the Bernese Alps,” “On the coast near Marseilles,” a “Viaduct and Landscape near Llan-gollen,” shows a decision of manner which is the very perfection of water-colour execution. Bartholomew has reached the limits of flower-painting in water-colours—nothing can be more brilliant and natural than his “Convolvuli,” “Hollyhoeks,” &c. There are many minutely-finished examples of Joseph Nash; and, by J. F. Lewis, a selection comprehending studies from his oriental sketches, and others of an earlier time—Spanish and Italian subjects. The Breton incidents of Jenkins, highly finished, and qualified by the most effecting expression—will be seen with increased interest by all to whom they are already familiar in engraving. The selection from the works of David Roberts is very numerous, presenting scenes in various parts of Europe, and also in the East. Many of these drawings are of exquisite beauty, having been very highly wrought for engraving.

But we have not space in any wise to do justice to so many precious works, any of which might supply a chapter in the history of water-colour art, a volume of which might be written on the productions of Frederick Tayler, F. W. Topham, Duncan, G. A. Fripp, Holland, W. Lee, T. M. Richardson, Pyne, Corbould, Bennett, Davidson, Poole, Warren, Wehnert, &c., &c.; and these we have mentioned are only a portion of the painters whose works are

contributed to this superb exhibition. But it will be observed that we have mentioned principally the works of men distinguished as purely water-colour painters, though the catalogue abounds with the names of gifted men highly distinguished in oil painting, which is the department wherein they have achieved their reputation.

It is difficult to believe that any further improvement can be accomplished in water-colour execution. We have seen everything done in pure water-colour painting—its power of depth, richness, harmony, atmosphere, and, above all, luminous quality, can never be surpassed, and with white and opaque colour every imaginable result has been obtained. All effects procurable by means of oil painting were exemplified centuries ago; but it has been left for our school to bring to perfection painting in water-colour. The collection at Manchester is such as we may never see again; it contains certainly a great proportion of the best works in this class; and, by an assemblage of the labours of each artist, the amateur is materially aided in the just conception of the taste and compass of each painter. And it must not be forgotten that the labours of the painter have been most efficiently seconded by the colour-maker. Never was so much ingenious and unwearying enterprise manifested in the production of the ancillary auxiliaries of Art, as we have of late years seen promoted for the advancement, especially, of this branch of Art. It is not enough to say that our colours and papers are of transcendent excellence, but every other aid that science can devise has been introduced for the furtherance of the quality of these pictures. If any other provincial city propose to form another collection of “Art Treasures,” we know not whence they could be gathered together. It is to be feared that the stores have been exhausted by the men of Manchester.

THE APPLICATION OF IMPROVED MACHINERY AND MATERIALS TO ART-MANUFACTURE.

No. 11.—ON SOME PHYSICAL AND CHEMICAL PECULIARITIES OBSERVED IN DYEING.

INDIGO.

Is there not a natural law regulating the distribution of colour, in the vegetable and animal kingdoms, over the surface of the earth? Is not the delicate appreciation of colour—the feeling of acrobatic harmony, so strikingly evidenced by some races—a psychological phenomenon mainly dependent upon the influences of external nature?

In the organic world we may, upon careful examination, discover zones of colour, which are regulated, to a great extent, by the influences of LIGHT. This is most strikingly shown under those conditions where we have, as in the ocean, the luminous power diminishing in a regular order. All those plants and animals which inhabit the region between high and low-water mark, and are consequently exposed to the full influences of the solar radiations, are varied in colour, and rich in the hues with which they are adorned. As we descend zone after zone in depth, we find them becoming less and less perfect in their organisation, and their external colours gradually fade, until eventually we find every plant and animal assuming either a dull neutral tint or becoming purely white.

If we examine the prevailing colours of the terrestrial zones, we find that the plants and animals of the Arctic regions exhibit but little variety of colour; and the birds and the flowers of even the temperate zone are less brilliant in their plumage, and less deeply tinted in their leaves, than those which rejoice in those climes where the sun is ever

“Shining on, shining on, by no shadow made tender,
Till love falls asleep in its sameness of splendour.”

Some one has proposed to represent those chromatic phenomena by the colours of the prismatic spectrum: the most refrangible rays, the indigo and violet, representing the colours of the colder climes; the brighter blue, and the lively green, the region of tempered light and heat; while the least refrangible rays, or the yellow, orange, and red, were regarded as typical of the equatorial realms,

where nature rejoices in "one unclouded blaze of living light."

Within the same zones may be found man in widely different stages of civilisation; yet whether we examine

"The poor Indian, whose untutor'd mind
Sees God in clouds, or hears him in the wind,"

or the inhabitant of those kingdoms where the highest order of civilisation has spread its humanising influences, we shall still find that the ornaments with which the human form is decorated have a prevailing colour, and that that colour varies in character or in degree with the latitude. There is a deeper philosophy in this than appears at first; it is one of those fine clues which, if followed through the windings of the maze, will lead to a development of some of the mysterious influences of matter upon mind, of physical force upon psychological phenomena. In time, as in space, we find the same conditions prevailing: from the earliest ages the oriental peoples have been addicted to the use of the decided primary colours, while the inhabitants of the northern climes have chiefly indulged in secondary combinations, or in varieties of neutral tint.

The art of dyeing dates from the most remote antiquity. The relics of Babylon, Assyria, and Egypt,—especially the mummy cloths and ornaments,—show us the high perfection to which the art of dyeing had arrived amongst these nations. The Phœnicians introduced, to Europe and all the countries with which those merchants of Tyre traded, the use of the Tyrian purple, and, in all probability the Kermes,—the Alkermes of, and derived from, the Arabians.

The first named colour was derived from a shell-fish found abundantly in the Egean Sea, belonging to the family *Entomostomata*, the particular species employed being the *Buccinum Lapillus* of Linnaeus, the *Purpura Persica* of De Blainville. Many of the *Purpura* produce a fluid which gives a crimson dye; it may be obtained by pressing on the operculum. The *Purpura Lapillus* abounds on the British coast; this is the species known as the *Whelk*, so commonly exposed for sale in the streets of London. From this common variety the colour may be obtained; and, in 1684, we find Mr. William Cox of Bristol describing in the *Philosophical Transactions* the process by which a purple dye, analogous to the purple of the ancients, may be obtained. His description is so curious and interesting, that no excuse is made for quoting it:—

"The shells being harder than most of the other kinds, are to be broken with a smart stroke with a hammer on a plate of iron or firm piece of timber (with their mouths downwards), so as not to crush the body of the fish within; the broken pieces being picked off, there will appear a white vein, lying transversely in a little furrow or cleft next to the head of the fish, which must be dug out with the stiff point of a horsehair pencil, being made short and tapering. The letters, figures, or what else shall be made on the linen (and perhaps silk too), will presently appear of a pleasant light green colour, and, if placed in the sun, will change into the following colours—*i. e.* if in winter, about noon; if in the summer, an hour or two after sunrise, and so much before setting, for in the heat of the day in summer the colours will come on so fast, that the succession of each colour will scarcely be distinguished.

"Next to the first light green it will appear of a deep green, and in a few minutes more it will alter into a watchet blue; from that, in a little time more, it will be of a purplish red, after which, lying an hour or two, supposing the sun still shining, it will be of a very deep purple red, beyond which the sun can do no more. But, then, the last and most beautiful colour, after washing in scalding water and soap, will (the matter being again put into the sun or wind to dry) be of a fair bright crimson, or near to the prince's colour, which afterwards, notwithstanding there is no use of any styptic to bind the colour, will continue the same, if well ordered, as I have found in handkerchiefs that have been washed more than forty times, only it will be somewhat allayed from what it was after the first washing. While the cloth so writ upon lies in the sun it will yield a very strong and fetid smell, as if garlic and asafetida were mixed together."

With the exception of the reds produced from Kermes, and the cochineal, it is very seldom that any animal dye is now employed. Most modern blues and purples are obtained from vegetable productions—such as indigo and logwood—and from mineral compounds—such as Prussian blue. Our purpose, at present, will be best served by restricting attention to one of these "dye stuffs," and indigo appears the most suitable.

Indigo belongs to a species of leguminous plant found in India, Africa, and America. This shrub never grows more than three feet high. It nearly resembles our broom in its seeds and branches; its small leaves are blue green; it is sown in the summer, and cut down at Christmas. The plant is triennial, and produces three sorts of indigo. That of the first year, while the plant is young and full of sap, is very coarse and heavy, of a brownish cast, and sinks in water. This is one test for indigo, the fine varieties floating on that liquid. When the plant is two years old it yields the best Spanish indigo, of a purple cast, floating lightly upon water, and when rubbed between hard substances becoming bronzy. The product of the third year is seldom so good as that even of the first.

There are two methods by which the colouring matter can be extracted from indigo. The first is by fermenting the leaves, and the second is by allowing the leaves to change colour by exposure to the sun. The fermentation process is that which is usually adopted. The indigo plant, when cut, is tied up in bundles about five feet in circumference, and conveyed as quickly as possible to the vat. When the vat is sufficiently filled with the vegetable, a bamboo grating is placed over it, and fastened down, and cold water is poured into the vat, until it rises to within three or four inches of the upper edges. In a short time fermentation commences, and is completed in about twelve hours. Before drawing off the liquor, and while the fluid is flowing from the vent-peg at the bottom of the vat a process of beating is adopted, the object of which is to separate all the indigo from the liquor. The blue precipitate is collected, and, after undergoing two or three kinds of treatment, which it is not necessary to describe, it is cut in small cakes, and dried, forming the indigo of commerce.

Indigo appears to exist in the plant as white indigo, and in the process of fermentation it changes to the blue. Upon this Sir R. Kane has some excellent remarks. "The indigo is secreted in the cellular tissue of the leaf in a form (white indigo) which can be artificially produced; it is then colourless, and remains so as long as the tissue of the leaf is perfect. When the leaf begins to wither, oxygen is absorbed, and the indigo assuming its colour, the leaves become covered with a number of blue points, the first appearance of which shows that the period for collecting them has arrived. The fresh leaves are thrown into large vats with some water, and pressed down by weights. After some time a kind of mucous fermentation sets in. Carbonic acid, ammonia, and hydrogen, are evolved, and a yellow liquor is obtained, which holds all the indigo dissolved. This is separated, mixed with lime-water, and then exposed to the air until the indigo becomes blue and insoluble, and is completely deposited as a precipitate. The theory of this action is, that by the putrefaction of the vegeto-animal matter of the leaves, the indigo is kept in the same white soluble condition in which it exists in the plant; and a clear solution of it being thus obtained, it is precipitated, according as it absorbs oxygen, in a much purer form than otherwise could be effected. The putrefying pasty mass of leaves, obtained from the *Isatis tinctoria*, constitutes the *woad* or *wad* employed in the hot indigo bath for dyeing cloth. Blue indigo, obtained by the above process is still a mixture of several bodies—as indigo red, indigo brown, and indigo gluten, which are removed by repeated treatment with alcohol and dilute acids and alkalis. When pure, precipitated indigo is a rich blue powder, which, when rubbed by a knife, assumes the colour of metallic copper, it is perfectly insoluble; when cautiously heated, it sublimes in rectangular prisms of a dark purple colour and metallic lustre."

By the gradual oxidation of indigo, a substance is formed which crystallises in large red prisms, and is termed by Laurent *isatine*. If we treat indigo with nitric acid, two new and remarkable bodies are formed, called the *anilic* and *picric* acids. The che-

mical composition of indigo is, according to M. Dumas and Mr. Crum,—

Carbon	32
Hydrogen	10
Oxygen	4
Nitrogen	2

Here we have a colouring matter of the greatest intensity, from which we prepare several peculiar and beautiful blues and purples, by some modification of the following combinations:—

Saxon Blue. A pound of best Spanish indigo is mixed with eight pounds of strong oil of vitriol, and digested together with agitation for a few days.

Royal Purple. This is a mixture of *madder* dye with indigo, the whole rendered alkaline by pearl-ashes.

Dark Royal Blue is a combination of orchil with indigo.

Mazarine blue, a mixture of indigo and cochineal.

The importance of indigo has led to a very careful examination of its chemical qualities; and hence we are acquainted with several remarkable peculiarities in connection with this substance. If indigo is brought into contact with any body having a powerful affinity for oxygen, it is turned *white*. White indigo is soluble, blue indigo insoluble; the chemical difference between these two indigos being, according to Dumas:—

	Blue.	White.
Carbon	32	32
Hydrogen	10	12
Oxygen	2	2
Nitrogen	2	2

the only difference here represented being that white indigo contains two proportionals of hydrogen more than the blue variety. This is not, however, in strict accordance with what we find taking place with other colouring matters. *Chlorophyll*, the green colouring matter of leaves, and the colouring matter of flowers, we know to be due to the oxidation of colourless carbon compounds. Liebig holds a view in many respects different from that of Dumas; but the essential difference is, that Liebig supposed the existence of a substance in the indigo plant containing no oxygen, which he calls *anyle*: white indigo is *anyle*, with the addition of one proportional of oxygen and one of water; while blue indigo is *anyle*, with two proportions of oxygen, and no water. A knowledge of these facts enables the dyer to prepare a solution of dyeing matter from white indigo, which he could not obtain, without the use of strong acids, to an injurious extent, by any other means.

We give a solid dye of indigo blue to wool by plunging it into an alkaline solution of *indigo white*, and then exposing it to contact of the air; thus we have a beautiful exemplification of the effect of oxygen in giving colour. Prior to leaving this peculiar substance, indigo, it should be noticed that there are two preparations which promise to be of great importance to the dyer. If we add common nitric acid to powdered indigo, and apply heat until the blue colour disappears and a yellow solution is formed, from this we may obtain crystals of *isatine*, which are beautiful, splendid, reddish-brown, hexagonal prisms, with a rhombic base. These crystals are volatile, slightly soluble in water, and very soluble in alcohol or ether. If *isatine* be heated with potash, we form *aniline*; and from this aniline one of the most beautiful permanent purple dyes is now obtained. When it is remembered that we are dealing with compounds of carbon, hydrogen, oxygen, and nitrogen, in certain proportions, and that the physical character of the substance is altered by the slightest variation in its chemical constitution, we can understand how the chemist may make in his laboratory, by artificial treatment, those colouring-matters which nature has eliminated, under the influences of the physical forces, in the organic world. Aniline, therefore, may be obtained by distilling *oil of coal tar*, first heating the oil with chlorohydric acid, which unites with the basic oils. These form the lowest layer, which is to be neutralised with milk of lime, or an alkali, and the oil which separates is to be distilled. A white fluid condenses in the first instance, containing aniline and *leucol*. This mixture is purified by treating it with acids and alkalis successively; and lastly, by heating it with oxalic acid, and decomposing the oxalate by

potash. Aniline may also be obtained from *nitrobenzide*, one of those hydro-carbon compounds which have their popular representative in benzoic acid, or the aromatic flowers of Benjamin. Aniline is readily detected by its producing in minute quantities, with solutions of chloride of lime, a fine *violet blue*, resembling the ammoniacal oxide of copper—that intense and beautiful blue which ornaments the windows of our druggists.

From the offensive refuse of our gas-works we are now obtaining the aromatic benzoic acid, and several other most fragrant perfumes; and from the dark and dirty oil found in the gas liquor, we obtain one of the most beautiful and brilliant dyes. The question naturally arises in the minds of reflecting persons, how is the colour given to wool, silk, or cotton? Does it exist as fine particles distributed through the fibres, or is it a combination of colouring matter with the animal or vegetable material? Bergman was the first to show us that something like affinity between the fibre and the dye stuff existed. Having plunged wool and silk into two different vessels containing a solution of indigo in sulphuric acid, diluted with a great deal of water, he observed that the wool abstracted much of the colouring-matter, and took a deep blue tint, but that the silk was hardly changed. He ascribed the difference to the greater affinity subsisting between the particles of sulphate of indigo and wool, than between those and silk; and he showed that the affinity of the wool is sufficiently energetic to render the solution colourless, by attracting the whole of the indigo, while that of the silk can separate only a little of it. He thence concluded that dyes owed both their permanence and their depth to the intensity of that attractive force. Dyeing must, no doubt, be considered as a play of affinities, not exactly chemical, but rather of a mechanical character—an exertion by the fibres, whether of cotton, wool, and silk, of what has been called by Professor Graham the *osmose force*. Every intelligent reader is now acquainted with capillary attraction, with the condensation of gases in the pores of charcoal, with the phenomenon of the Doberiner instantaneous light-lamp, and with the peculiar actions of porous walls of clay, or of animal membrane, known as *exosmose* and *endosmose*. These are all operations of some similar mechanical force, residing upon the surface of all matter; and to the exertion of this power we have, no doubt, to refer the operations of dyeing. Dufay says, we have to consider in dyeing the play of affinities between the liquid medium in which the dye is dissolved, and the fibrous substance to be dyed. When wool is plunged into a bath containing cochineal, tartar, and salt of tin, it readily assumes a beautiful scarlet hue, but when cotton is subjected to the same bath, it receives only a very feeble pink tinge. A cloth woven of woollen warp and cotton weft was manufactured by Dufay: this cloth was exposed to the fulling-mill, in order that both kinds of fibres might receive the same treatment. He then exposed it to the scarlet dye; he found that the woollen threads became of a vivid red, while the cotton continued white. By studying these differences of affinity, and by varying the preparations and processes with the same or different dye stuffs, an indefinite variety of colours may be obtained. For the purpose of extending this power, and indeed of calling in the action of chemical in addition to mechanical force, *mordants* are employed. These bodies were supposed, in the infancy of the art of dyeing, to seize the fibres by an agency analogous to that of the teeth of animals, and were hence called mordants, from the Latin verb *mordere*, to bite.

Mordants may be regarded as not only fixing, but also occasionally modifying the dye, by forming with the colouring particles an insoluble compound, which is deposited within the textile fabric. Dyes which are capable of passing from the soluble to the insoluble state, and of thus becoming permanent without the addition of a mordant, are called *substantive*, and all the others have been called *adjective* colours. Indigo and tannin have been regarded as substantive colours; but probably atmospheric oxygen so modifies these colouring agents in the process of fixation, as to remove those also to the list of adjective colours, the oxygen playing for them the part of a mordant. It is not possible at present to enter on the examination of the peculiarities exhibited by different mordants. This may

probably form the subject of another paper, as it is our intention to return to the consideration of some other dye stuffs, to describe the modes in which they are employed in giving colour to various textile fabrics, and to illustrate some of the peculiarities of calico-printing.

The chief point, in conclusion, to which attention may be drawn, is the important part played by the oxygen of the air in giving colour to various substances, as indigo, colouring matter of leaves, &c.; and, again, to the fact that in every case of the destruction of colour under the influences of light or heat, it is oxygen which becomes the discolouring agent. This all-important gaseous element, in the first place, gives that beauty to nature which is due to colour,—and to it all the brilliancy of Art and of Art-manufacture are due: yet this same agent no sooner produces that which is brilliant and beautiful in the highest degree, than it begins its work of destruction. That which has been called *eramaccousis*—from the Greek words, signifying slow combustion—commences with the germination of the seeds of the cotton-plant, and, checked through the whole period of the growth of the plant by the exercise of vegetable vitality, it again exerts its power the moment the plant ceases to live; and in every stage, until the textile fabric falls to dust, the oxygen is slowly and surely destroying both colour and texture. The active agent of life is an equally active agent in the process of decay.

ROBERT HUNT.

THE FOREIGN PICTURES AT THE CRYSTAL PALACE.

THE portion of the building which is allotted as a picture gallery, is extremely well adapted for the display of such works. The light is broad and unbroken, and the amplitude of the space admits of each work being hung in a place suitable to it. The large pictures are numerous; they are advantageously seen, being removed from the eye; and with respect to smaller productions of elaborate manipulation, their most subtle pencilling is perfectly distinguishable. We notice now only the foreign art, although the gallery contains pictures by Stanfield, Roberts, Creswick, Ansdell, Leslie, Cross, Knight, and a long catalogue of well-known British Artists. Many of the works by which they are represented are among their most celebrated productions: and from a long list of French painters who give their support to the gallery, we select at random the names of Deveria, Le Poittevin, Flandin, de St. François, Schopin, Jacquand, Comte de Balleray, Kiorboe,—but the catalogue extends to some seventy names, which it is not necessary to detail.

It is rare to meet with a miscellany of foreign pictures without seeing numerous examples of what we call historical art treated according to the principles of the grand style. Of this class is "The Recantation of Galileo," by F. Reichert, of Berlin,—the philosopher being, of course, the prominent figure of the composition, the left of which is occupied by his persecutors, among whom are conspicuously a cardinal, a bishop, and a group of inferior ecclesiastics, while on the right are the soldiers and officers, in whose charge he has been brought before the tribunal. He has turned from the court, and we may suppose him to be enunciating his unbroken faith in his theory "*Nondimeno—muove*." But the artist has not had a good portrait of Galileo: there are three in the gallery at Florence, two of which we believe have been engraved. It is, however, a fine picture, the impersonations are full of life and character, and the subject bespeaks its source. "The Decadence of Italy," T. Couture, is also a composition of life-sized figures, rather poetical than allegorical, conceived in the efflorescence of the sentimentalism of the art and literature of our French neighbours. The idea is embodied in a party of voluptuaries, who might constitute a foreground group of the party of ten, who retired to that famous garden at Fiesole during the plague at Florence. The figures are attired in what is called mediæval costume; the prevalent expression is that of exhaustion from sensual indulgence, there is no political element; we read, therefore, that Italy, during its decadence, was one universal *Capua*, and thus the

work is impressive in its description of the *abandon* of pleasurable excess. The subject of "Tintoretto Painting his Daughter after Death," has been several times treated by foreign painters; it is a subject especially suitable to the feeling of the French school. The picture here, which is by Louis David, is composed of two life-sized figures; the daughter extended in death upon a couch, and the far-famed painter standing by her with his hand on her heart, as if doubting that it had ceased to beat. This version of the story is extremely simple, there is nothing in the picture to detract from the importance of the figures to which the narrative is entirely confined. Perhaps the stately red robe of the painter might have been dispensed with,—it is an investiture not becoming to the sad circumstances of the incident, the detail of which is simply in the relation between the figures. "The Death of Tasso," by Jos. Betteman, is also a picture of historical dimensions, painted with a full and nervous touch, and very elaborately studied as a *chiaro-oscuro* effect. The dying man is extended on a couch, and grasps in one hand a scroll, inscribed "Gerusalemme Liberata," and the other is held by a physician, as if to learn the moment of the departure of the spirit—a light is cast on the features from a torch held by a monk who stands by the bed-side; the effect is suitable to the subject, being solemn and mysterious.

"The Death of Louis the Ninth," E. Bower. This event took place in the year 1270, somewhere near the site of Carthage, and on the occasion of a second crusade undertaken by this king, notwithstanding the disastrous results of a similar enterprise undertaken by him some years before. His death was occasioned by a pestilence, which destroyed also numbers of his followers. He lies upon a lofty couch in the open plain, or rather near the seashore (though this is not apparent in the picture), surrounded by all the pomp and military circumstance of the time, and regarded with a veneration of one worthy of canonization in the middle ages. It is an historical work of the class of those that record the earlier history of France at Versailles, and it is quite equal to the best of them. Another work similar as to the material of its composition, though differing in sentiment, is "The Battle of Antioch," by Zwecke, which represents a gorgeous *mêlée* of Christian and infidel knights. If the painter be of a northern school, we may suppose that he paints here—

"La gente candida e bionda,
Che tra i Franchi e i Germani e' mar si giace,
Ove la Mosa, ed ove il Reno inonda,
Terra di biade e d'animai ferace;"

and nothing can be more chivalrous than the bearing of these soldiers of the cross. Tasso describes men who are beyond all human wants, and the artist has succeeded in giving to both sides much of the elevation of the verse, and power enough to accomplish the fabulous feats attributed to Godfrey, Robert, and others of these irresistible chiefs. "Roland Grame," by Deville, is a large picture, in which the wayward *protégé* of the Lady Glendinning is presented in association with the knightly accessories of the time. When Roland declared himself a gentleman, Mistress Lilian added, "Such a gentleman as I would cut out of a bean-pod with a rusty knife:" but the artist is more just in his impersonation, for he places Roland before us strictly according to the text.

"The Captivity of Babylon," by Mdlle. Louise Guimard, is a good subject, but it has been so frequently painted, and by men of the highest rank in Art, that unless it be brought forward with points of rare excellence, each ulterior version loses by comparison with these more signal efforts. "Episode of the Retreat from Moscow," C. Verlaet. There is undoubtedly much of fearful truth in this picture, for, we believe, that the horrors of that retreat cannot be exaggerated. It is a large picture, and the "episode" turns on the fate of a solitary charger, that has sunk in the snow, which covers far and near the boundless steppe. We may suppose that the rider has fallen a prey to wolves, which are now about to attack the horse. This fearful passage of French history has been fruitful in subject-matter to the painters of the native school, but the truthful simplicity of this work is equal to the best of those that have preceded it: there are no figures, it is consequently entirely free from a certain conventional affectation, which even vitiates sometimes the best

productions of the French school. "Gipsies," Diaz. There are many of the continental painters who yet adhere to a free and sketchy manner, and not the least successful of these is Diaz; he is certainly assisted by his subjects, but this, and all others of his works, sufficiently testify to his knowledge of form. We would scarcely expect that such freedom of execution would linger so long in a school in which a severe academic discipline in education admits of nothing approaching any laxity of manner. "Constantinople from the Golden Horn," by Eugene Flaudin, is a large painting, presenting from the water a view of that part of Constantinople—including also the palace of the Sultan—which rises like an amphitheatre from the water's edge. The entire field of view is covered with buildings, all as accurately realised as if they had been painted from a photograph. It is a remarkable production, and so circumstantial in its detail, as to afford a succinct epitome of Turkish life. The picture is large—bearing everywhere evidences of patient and resolute labour.

Of the single figure pictures there is one which we cannot pass without notice, it is entitled "The Orphan," and is painted by D. F. Langée; the subject is embodied by a child, so disposed, with regard to expression and circumstance, as to describe the lowest depth of human destitution. Towards destitution the result of crime, the heart is not moved; but this is clearly a picture of innocence in affliction, and it appeals at once to our better feelings. There is very little colour in it, and it is very low in tone, but it nevertheless evidences masterly power, with convictions contrary to much of the charlatanism of Art.

There are several works by Eugene Le Poittevin, especially a charming production entitled "The Farm," consisting of a piece of rural scenery, apparently painted on the spot, into which are introduced two foreground figures, a woman and a country lad. The work contains more of the character of nature and less of the ideal than we usually find in the works of this painter; the figures are exquisitely finished, and the picture altogether is among the freshest we have ever seen by the painter. Another by the same hand, is entitled "The Coast of Brittany," in which are seen boats and figures—a class of subjects that Le Poittevin has much cultivated. In a cattle picture by Troyon, may be recognised those characteristics of nature which distinguish all his works. This is a large work, containing only a few cows, and describing a race of cattle which has not been refined by what is called "breeding." The fine limbs and shining coats of our own oxen are not here, but we have what we recognise as nature, unqualified by the arts of man. It is really an admirable work, valuable for that kind of simplicity which it is so difficult to attain. "Tickling with a Straw," H. de Beaumont, will be at once understood as a *genre* picture: it shows a girl who has fallen asleep at her spinning-wheel, and some children take advantage of the circumstance to "tickle her with a straw." A very simple subject, entitled "An Algerian Marabout," by J. de St. François, is a work of a high degree of merit: it represents only a solitary building in an open country, but the effect under which it is brought forward is admirable; in ordinary hands such material would be stale and unprofitable, but as it is here presented, it constitutes a production of much excellence. The artist has, we observe, other works here, but this by many degrees excels the others. Koeckkoeck contributes a marine picture of much merit; the subject seems, from the low shore, to be on the Dutch coast: it contains boats, figures, and an effectively painted rough sea. There is another marine subject by Gudin, but of a different character; it represents a sea fight. "The Housewife," D. F. Langée, is a very simple but a very attractive study, although only of an old woman stooping and taking a loaf of bread out of a chiffonnière. We have already mentioned "The Orphan" by this artist, and there are other works by him, executed in the same taste and with little show of colour. "The Reverie," G. de Jonghe, is a study of a lady in modern attire, seated in an attitude of thought; the figure tells forcibly against a broad light background; the dress, a dark silk, affords a perfect imitation of the material. "The Intercepted Letter," by the Baron Jolly, is a composition very much in the feeling of the earlier Dutch school: the draperies in this picture are really most

meritorious. By H. Leys, a "Battle between Huguenots and Spaniards in Antwerp," illustrates a street *mêlée*, the combatants being equipped in the picturesque military garb of the 16th century. An artist, named Jeroslav Cernak, exhibits a view at Ostend—simply some figures on the beach near the entrance to the harbour: it is very felicitous as a sunny effect. Some of the German landscapes are productions of high character, we regret that we have not space to describe them. Thus the works exhibited here are numerous, varied, and many are of great excellence; such a collection, therefore, cannot fail to be interesting and attractive, as the pictures are being continually changed.

OBITUARY.

JAMES LEGREW.

On the 15th of September last, the Art of Sculpture lost one of its most amiable professors in the person of James Legrew. Two years before his death he became affected by strong mental delusions, the symptoms of which, however, were much mitigated through the care of his family, and travelling abroad; indeed, although he never recovered his true tone of mind, he usually appeared, latterly, to all but his family and a few intimate friends, perfectly himself; and but a few days before his death he attended the funeral of his friend and former neighbour, Mr. Uwins, without showing any signs of peculiarity. Meanwhile, however, the successive shocks which he had received since the time of his first seizure, viz., by the deaths, in rapid succession, within a little more than one year, of his father, his only brother, and his niece, to all of whom he was tenderly attached, was doing its work on his sensitive and affectionate mind. About four days before his death he was attacked by a severe accession of mental delusion, amounting to complete insanity, and in spite of medical attendance, and the care and watching of his sisters, he, in an unguarded moment, put a period to his existence. The verdict was "unsound mind."

His father was the rector of Caterham, in Surrey, in which parish the subject of this brief notice was born in 1803. In early childhood he evinced a decided attachment to the art he afterwards followed, by modelling a variety of little works, chiefly animals; inasmuch, that after giving him an excellent education, his father placed him with the late Sir Francis Chantrey. In 1822 he received the silver medal of the Society of Arts, for a copy in plaster of a single figure; in 1824, the silver medal of the Royal Academy "for the best model from the antique;" and in 1829, the gold medal of the same institution, for the best original model of an historical subject. Shortly after this he travelled abroad, and spent a considerable period of time in his professional studies in Rome. On his return to England, his studio was for some time in Pimlico; but for the last eleven years of his life, he resided and carried on his profession in his house in St. Alban's Road, Kensington, where he died.

Among the best known of his works, are his statue of "Samson breaking his bonds," a fine vigorous conception, and a group of the "Murder of the Innocents," or rather of "Rachel Mourning for her Children," a composition full of most touching sentiment, of both of which there are copies in the collection of British Sculpture at the Crystal Palace. He also produced a large figure of Ajax, unquestionably fine in modelling, and in the display of the male form, and a full-sized and graceful group of "the Blind Bard of 'Paradise Lost' dictating to his Daughters;" also various female figures, most of which, however, from the small amount of encouragement given to that class of art in this country, never found their way into marble. He executed, in addition, various monumental and portrait works.

His taste was purely classical, and his criticism on his own art, which was most excellent, was always extended to his brother artists in the most liberal manner. Although, as regarded encouragement, his own professional career was not successful, he in no degree allowed this to affect his feelings towards his professional brethren. In the studio of a brother artist he would ever strive to do all the good he could by the most careful suggestions, and his ex-

cellent, and kind, and thorough criticism was as valuable as it was uncommon. He would not offer a remark, however, unless it was requested; as in this, as in all other respects, he was naturally of a reserved disposition, and it was only his intimate friends who knew fully what a wealth of kindness existed in his nature. He was deeply impressed with the truths of religion, was exemplary in its duties, and was very charitable to persons in distress, especially to those in his own profession; and in the whole of his worldly career he showed himself a person of strict integrity, of honourable and liberal feeling, and as one that could not endure the least shadow of meanness.

Besides his acquirements in his profession, he was highly educated in other branches of the liberal arts. He was in the habit of reading, not only French, Italian, German, and Latin, but also Greek, Hebrew, and Syriac. In 1855 he published a small work on the Ancient Sculpture of the Jews, displaying much research, which however was only intended as the precursor of a larger work, that was to embrace the sculpture of all times. He wrote also a short life of Flaxman, which has been published. He had great talent for music, and was especially fond of the organ, having had one built under his own direction, on which he was in the habit of playing up to within a short time of his decease.

Although of a most affectionate disposition, Mr. Legrew never married. He was in easy circumstances at the time of his death, and is universally regretted by all who knew him.

MR. THOMAS CRAWFORD.

With much regret we record the death, in London, of Mr. Crawford, the distinguished American sculptor, whose statue of the "Hunter" we engraved last month. In the remarks then made it was stated that Mr. Crawford was in London, seeking surgical advice, but we had no idea that his general health was so affected as to lead to the result we have announced. He died on the 10th of September.

The introduction of that engraving afforded us the opportunity of writing a short biographical notice of the sculptor: we have now only to lament his death as a calamity to Art—to the United States especially; the works he has produced not only gave him fame, they added to the renown of his country. Yet America has happily many worthy sons to replace this one it has lost. It is indeed singular that sculpture, the most difficult of all the arts, and that which receives everywhere the least encouragement, should be the art in which the Americans excel. We have continual evidence of this, and anticipate much more. While referring to American sculpture, we may remark, that among the meritorious contributions to the competition for the Wellington Monument, there was one which, although small in size, and "lost in the crowd," possessed many claims to notice: it was the production of a sculptor in "the far West,"—Columbus, in Ohio,—Mr. JOHN B. EARNSHAW. We have no doubt his name will be famous hereafter. We should have offered some comments on this work in our notice of the exhibition, but that the plan on which we proceeded, and the space to which we were limited, prevented our doing justice to many productions that, examined apart, would have demanded and deserved criticism. Mr. Earnshaw, however, may be assured that he occupied a prominent place in the collection.

W. E. SCHORN.

The German papers announce the recent death, at Bonn, of W. E. Schorn, director of the Cabinet of Engravings at Berlin. He was an intimate friend of Alexander Von Humboldt, and associated much, and corresponded, with a large circle of the most eminent literati and artists of his country. It is said that he has left behind him a vast mass of correspondence, which may hereafter come before the public. The present arrangement of the print-room in the Berlin Museum was completed under the direction of Schorn, who also compiled the elaborate catalogue of its contents. He died at the age of fifty-one, of a disease of the heart. His life, had it been prolonged, would have been most usefully employed for the advantage of the art he loved, and of which he was so distinguished a professor.

THE BOOK OF THE THAMES,

FROM ITS RISE TO ITS FALL.

BY MR. AND MRS. S. C. HALL.

PART XI.

MAIDENHEAD is a small town, at some distance from the bridge—a structure of much elegance, built in 1772, from the designs of Sir Robert Taylor. The name is said to be a corruption of that which it bore so early as the reign of Edward III.—Maydenhithe—*hithe* being the Saxon word for haven or port: Camden, however, fancifully derives its title from the veneration paid there to the “head” of a Virgin, one of the “eleven thousand” whose houses may be now seen at Cologne! The view from the bridge, both above and below, is very beautiful: on the one

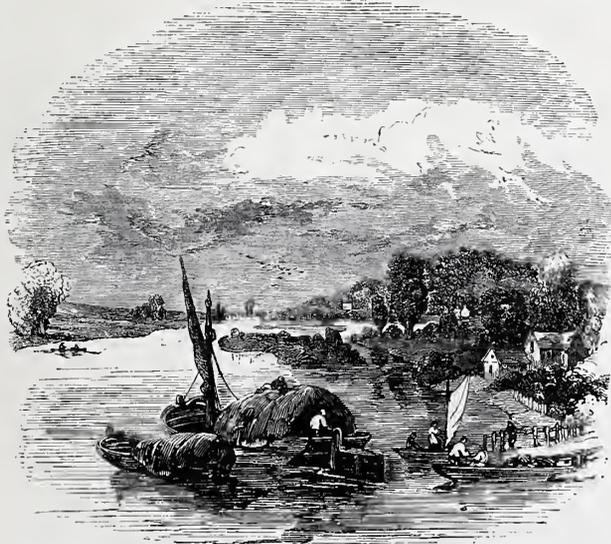

side the trees rise from the river-bank to the wooded heights that surround Cliefden; while on the other the pretty islet, the Church of Bray, the bridge of the railroad, the near meadows and distant hills, attract the eye, and tempt the passenger to linger awhile in admiration.

In this district, indeed, are to be found all the several advantages which the noble river so abundantly supplies: a channel of depth sufficient for any required traffic, a populous and flourishing town close at hand, pleasant cottages,

MAIDENHEAD BRIDGE.

comfortable inns, and villas, grand or graceful, scattered at convenient intervals, by the bank-sides, on the slopes of adjacent elevations, or crowning distant hills in the midst of “patrician trees” and “plebeian underwood;” while the heart-cheering turrets of Windsor Castle occasionally come in sight, to add to

VIEW FROM MAIDENHEAD BRIDGE.

the interest of the scenery the lessons and the pleasures of association. The land is thus fertile in themes, and the water is hardly less so: the barges, the punts, the gay wherries, the racing boats, are everywhere; and perhaps in no part of the world are there to be obtained enjoyments so many or so full—at once so quiet and so active—as are to be found in this part of the Thames, where the venerable Father leads us to classic Eton and regal Windsor.

The voyager will surely go ashore at Bray, not only to examine the venerable church, but to speculate concerning that renowned vicar who has obtained a larger share of immortality than any of his predecessors or successors. The vicar has indeed no tomb in his church to perpetuate his memory, but his fame is preserved in song; and its application is not uncommon, even now-a-days, to those who find it convenient to change opinions.* BRAY CHURCH is a large and interesting structure, exhibiting that mixture of architectural features so frequently observable in buildings which have survived many ages of change.

BRAY CHURCH.

Inside are several old monuments, the best being the brass of Sir John Foxley and his two wives (of the early part of the fourteenth century); the figures occupying a sort of shrine, based on a column, which is again supported by a *fox*, in allusion to their names. Another fine brass to members of the Norreys family is dated 1592, and there is a very interesting one to Arthur Page, “of Water Okelye, in the parish of Braye,” and Sescly his wife, 1598, which shows that the name of Page was known in the Windsor neighbourhood when Shakspeare chose it for one of the chief characters of his immortal drama. The tomb of Henry Partridge, of the same era, is remarkable for the enumeration of the virtues of the deceased, the chief place being given to the assertion that he

“Next to treason, hated debt.” †

Soon after leaving Bray we step ashore at “MONKEY ISLAND;” the fishing-lodge built here by the third Duke of Marlborough is now “a house of entertainment;” and the grounds, although limited in extent, are famous for “picnics” in summer seasons. The room which gives a name to the island is still preserved unimpaired; the monkeys continue, on canvas, to do the work of men—to hunt, to shoot, and to fish: and no doubt the “monkey-room,” which is the *salon* of parties, is an attraction profitable to the landlord, although he may not be successful in conveying assurance, as he seeks to do, that these

* The vicar was named Symond Symonds: the authority for his history is Fuller, who says,—“The vivacious vicar thereof, living under King Henry VIII., King Edward VI., Queen Mary, and Queen Elizabeth, was first a Papist, then a Protestant, then a Papist, then a Protestant again. He had seen some martyrs burnt (two miles off) at Windsor, and found this fire too hot for his tender temper. This vicar being taxed by one for being a turncoat and an inconstant changeling—‘Not so,’ said he, ‘for I always kept my principle, which is this—to live and die the Vicar of Bray.’”

† The popular ballad is essentially incorrect in all its details, and by changing the true period of the vicar’s residence here, has represented him even worse than he was. It makes him commence his career in the time of Charles II., and continue a series of changes, religious and political, until the accession of George I. The song is, therefore, chiefly political, its concluding lines being the declaration—

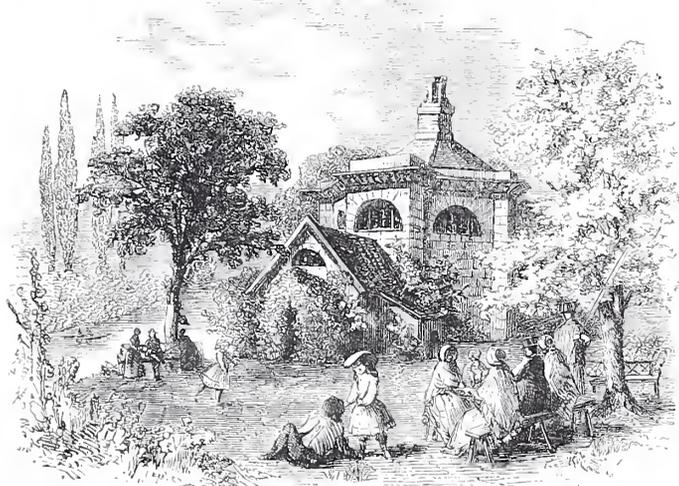

“That whatsoever king shall reign,
I’ll be the Vicar of Bray!”

Ritson, who was such an industrious collector of our English popular songs and their music, has given the words and tune of this song in his “Select Collection of English Songs,” 1783; but he was not able to say who was its author, although it was evidently written not more than sixty years before that period. It was most probably the production of one of the men of talent who visited Tomson at his house, close by Bray.

† In this church is still preserved one of those chained books commonly placed in the sacred edifice for general use in the days of the Reformation. The custom began with the Scriptures, which were thus chained to a desk for the consultation of the laity, “free to all men.” The Bray specimen belongs, however, to a later period, the days of Elizabeth, after the power of the Roman Catholic church had gained a temporary supremacy in the days of her sister Mary, and had, by her excess of severity, given greater stability to the reformed faith. The record of those who had suffered in the struggle was published by John Fox, and his “Book of Martyrs” became second only to the Bible in general interest. It was placed with the sacred book for general perusal in our churches, and the folio still preserved at Bray is a tattered and well-worn copy of the famed record of the struggles of the early disciples of the Protestant faith.

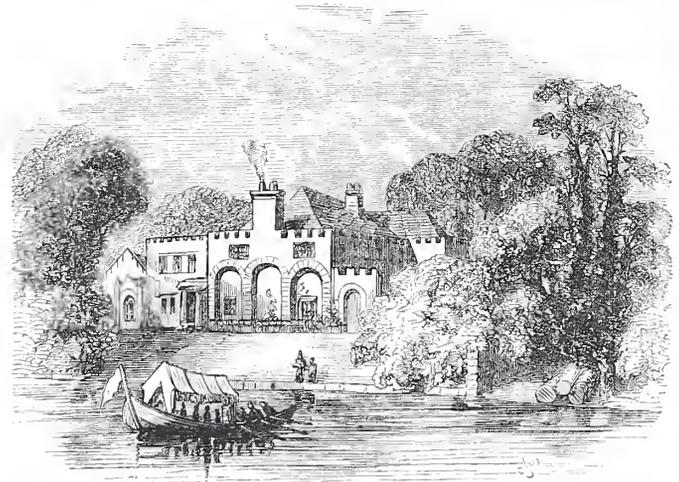

pictures are the works of Sir Joshua Reynolds.* "Marlborough's Duke" must have expended large sums upon this "fane," for the lodge is built of cut stone, and is evidently of a costly character; moreover, there is a detached building, now used as a billiard-room, but in which, in the palmy days of the island, the guests probably had their banquets: it is a structure of much elegance, and no doubt was a charming retreat when fittingly furnished.

MONKEY ISLAND.

Of the many villas that intervene between Maidenhead and Windsor, the only one that requires especial notice is DOWN PLACE, once the residence of the famous bookseller, Jacob Tonson, the first of his fraternity who took an enlarged view of the trade, and succeeded in achieving a celebrity and fortune previously unknown. "Genial Jacob," as he is termed by Pope, succeeded in gathering around him the chief talent of his day, and the famous "Kit-kat Club" was formed in his house: it consisted of noblemen and gentlemen, with the Earl of Dorset at their head, and under the plea of literary joviality they banded for a higher purpose—the defence of the House of Hanover. They took their name from one Christopher Catt, who originally supplied them with a simple

DOWN PLACE.

dish—"mutton-pies," which always appeared upon their table. They had thirty-nine members, all distinguished for rank, learning, and wit, many holding important offices under government. Tonson acted as their secretary, and Sir Godfrey Kneller painted the portraits of the members, which were

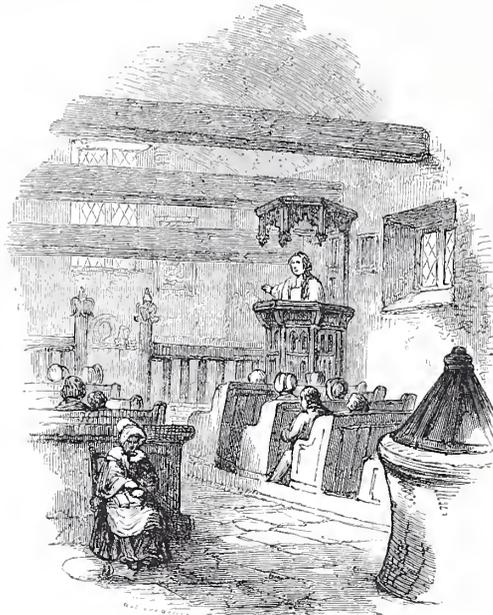

The room is very inviting to the numerous picnic parties by whom the place is visited throughout the summer season, and it is deservedly popular.

* In Westall's "Views on the Thames" the paintings are said to be the work of "a French artist named Clermont;" although clever in design, they are of no great merit in execution. One of the best of these groups we engrave—it represents two of them awkwardly carrying home fish, the eels escaping from the basket. The most ludicrous scene occupies the centre of the ceiling, and is a burlesque on the triumph of Galatea; even the Cupid attending her is represented as a winged monkey with fluttering drapery, strewing flowers on the nymph, who, with her attendant tritons and sea-nymphs, are also represented as monkeys.

afterwards engraved and published.* Down Place is now a mansion of large size, to which many additions have from time to time been made; our engraving is of the older part, where the wits and men of learning assembled under the protecting wing of the great bibliopole.

We are now approaching Windsor; its stately towers have long attracted the eye of the voyager: before we reach it, however, and while the boat is delayed to pass through Bovney Lock, let us step ashore for a brief while, to visit you "wee" church, half hidden among lofty trees; it is the CHURCH OF BOVNEY, and is the last of its class we shall encounter; for, although we may meet some more aged and many more picturesque, there will be none along the banks of the great river that so thoroughly represents the homely and unadorned fanes where the simple villagers have been taught to worship. It is very small, and

BOVNEY CHURCH.

of the most primitive construction, consisting of four walls merely, the chancel end being railed off by wood-work; the font is large and simple in character, and there are traces of early mediæval work in the external walls; the pulpit is Elizabethan, but the open seats of oak may be much earlier; the roof is arched, but has originally been supported by open timber-work, the cross-beams now alone remain.† We have engraved the interior as an interesting example of one of our ancient sacred edifices, where, through many ages, sate

"The rude forefathers of the hamlet."

After inspecting the interior, and wondering why so small a church was ever built, we returned to the church-yard, and stood for some little time beneath the shadow of a glorious old tree, whose boughs and foliage formed a protection against rain or sunshine. The old withered woman who had opened the church-door followed, and regretted the gentry should be disappointed, as there was "nothing to see." We differed from her, saying there was a great deal that interested us—could anything be more picturesque or beautiful than the church-yard? She shook her head. "The church-yard was thick with graves, some with stones and some without, like any other place of the sort—a poor, melancholy place it was. She thought it so lonely and miserable, and yet sketchers were always making pictures of it; and she had seen a printed book once with a picture of it, and its history all done into print. She could not but think the gentry had very little to write about. Yes, there were stories about those who lay there—many stories: there was a story of two brothers—wicked men, she called them—who died, she could not well tell how; and as to the things cut upon tomb-stones, she set no count by such grand words—she knew her own know! People could get anything they liked cut on stones if they paid for it. There was a cold, proud man who lived at the Hall when she was a child—a bad, cruel man; his shadow would wither up the young grass, and the look of his eye was as bad as a curse. He died, as he had lived, full up of bitter riches: he was not buried in this church-yard—it was not grand enough for him, but in a fine new one; where so much was put on his tomb about his charity—he who would steal a halfpenny out of a blind man's hat—about his justice, who would rob a foot off the high-road to add to his own field—about his being a meek

* These portraits were long preserved at Down Place, and were all painted of one uniform size, which is still remembered, and the term used to designate a certain canvas, *Kit-kat size*, measuring 28 or 29 inches by 36. The whole of this fine and interesting series of portraits are now in the possession of a descendant—W. R. Baker, Esq., of Bayford-bury: they are all in excellent condition, pure and clear; but the finest is certainly the portrait of Tonson himself, who is represented holding a folio copy of "Paradise Lost," of which he had the copyright, and by which he greatly added to his large fortune. His features exhibit a combination of shrewdness and inflexibility very characteristic of the man.

† The key of the church is one of those massive pieces of metal-work constructed when strength was believed to have been the chief security in locks. As a curious specimen of a bygone fashion, we append a cut of it; such securities are now rare.

Christian!" the woman laughed, scornfully; "meek! meek! the haughty reprobate! Well! a poor little lad, who had but too good reason to know the falsity of the whole, from first to last, wrote under it, 'It's all lies!' and though every one in the place said the lad was a true lad, and a brave lad, yet he lost his situation, and not one in the place dared give him food or shelter, so he left the neighbourhood, did the lad; but as sure as that sun is shining above us, so sure is there One who sifts the tares from the wheat—yes, indeed, the tares from the wheat. And I forget how it was, for I married out of the village, and just came back ten years ago, like a crow to the old nest,—only he grew rich, through honest labour and fame, and his son is in the Hall now; and the great tombstone was cleared away, and nothing to be seen now but a broad slab, with never a word on it, over the bad man's dust and ashes."

She was a strange, weird-looking old creature, with odds and ends of information: like an artist who can paint a distance, but not a foreground, the past was with her light and bright enough, but the present was already her grave—she could tell us nothing of the present. She still leant against the old tree, and we were so soothed by the silence and tranquillity of the scene, that we lingered among the tombs, when suddenly we heard a quick, light step behind us, and before we could turn round to ascertain whence it came, a thin hand rested on our arm, and a pale face, the lips parted over white and glittering teeth, and the eyes, deep sunk and restless, were advanced so close to our own that we started back almost in terror. "Can you tell me the grave?" she inquired eagerly, but in a low voice: "oh! if you know it, do tell me! I know he is buried here—they all own that, but they will not tell me where; do tell me—I am sure you will—come, make haste!"

The lady was dressed in faded mourning, the crape was drawn and crumpled, and the widow's cap beneath her bonnet did not conceal a quantity of fair hair, which looked the fairer from being streaked with grey.

"What grave?" we inquired of the pale, panting little creature, who wrung her hands impatiently, "what grave?"

"Oh! you know—my husband's! Round and round, across, along—from the first tap of the *reveillé* to the last drum-roll at night, I seek his grave. I throw myself down and talk to the dead and buried, but they tell me to let them alone: and then they say he is not here, but I know he is. We went out in the same ship, and returned in the same ship, so we must be both here, you know. We went out in the same ship, and returned in the same ship," she repeated, mournfully, "and they buried him here. Oh! have pity—have pity, and help me to find his grave!" She hurried us on, pointing to each green mound we passed—"It is not that, nor that, nor that—no, no! do not look at the tombstones, there was no time to put one up—the enemy was too fast on us for that!" She cast herself on her knees beside a grave close to a bank, murmuring "Charles!" into the long grass, and holding up her finger to indicate that we should keep silence, expecting an answer.

At the instant, a tall, venerable gentleman entered the lonely grave-yard—"Jane, my child—my darling," he said, tenderly, "here again! Come, my child, we can look for the grave to-morrow." The old man's eyes were filled with tears; but she did not heed him, murmuring amid the grass. "Forgive her," he said, "my poor child's mind wanders: her husband was killed at Inkerman, and she fancies he is buried where they were married!" It required some little force to raise her from the sward, and then, after a little struggle, he raised her in his arms, her head resting quietly on his shoulder—the large tree the next moment hid them from our sight.

BOVENEY LOCK.

Boveney Lock is now reached, and, while the boat is passing through, we may look about us, and give consideration to some of those peculiarities which add interest and beauty to our noble river.

There are few objects which so essentially contribute to the attractions of the Thames as the swans, which are met at intervals in all parts of the river, but are encountered more frequently as we approach the villas that ornament its slopes and banks. The bird is so well known that to describe it is unnecessary: few of the calmer waters of England are without this special grace and ornament: with the poets of all ages it has been a favoured theme:—

" The swan with arched neck
Between her white wings mantling, proudly rows
Her state with oary feet."

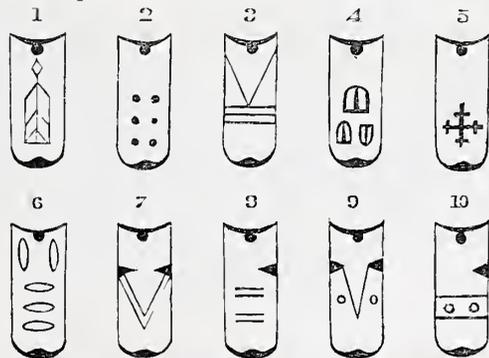

With this charming portrait "drawn from nature" by the poet Milton, we may

associate that by the poet Wordsworth, when describing the calm and solitary quiet of a scene he drew with so much delicious fidelity:—

"The swan on sweet St. Mary's lake
Floats double—swan and shadow."

Happily, too, the swan is a very long-lived bird: Willoughby writes of some who were reported to be three hundred years old, and though this is probably an exaggeration, there are satisfactory proofs that many "paddled" the same waters for more than a century. Few sights are more pleasing than that of the royal bird, followed by her cygnets, either among the rushes or into mid-stream of the Thames; to note the courage which the parent displays in defence of its young; to observe now and then the mother taking her new-fledged offspring on her back, while sailing proudly and majestically through a current more than ordinarily rough and strong. We would almost as soon part with the trees which border its banks as with the swans that grace the surface of our noble river. The parent usually makes her nest in one of the aits or islands where the tide rarely reaches it; this nest is composed of "reeds, rushes, and other coarse herbage," but is seldom chosen with a view to shade, and is usually found rather in exposed than retired spots, as if the beautiful bird was conscious of its right to protection, and knew it was under the guardianship of special laws that secure its safety.*

The swans, which appear somewhat abundantly on the Thames between Staines and Putney, are chiefly the property of the companies of Dyers and Vintners of London; those about Windsor and Eton belong to the Queen and the college, although the Vintners enjoy the right of keeping them in this neighbourhood—beyond the jurisdiction of the city of London. It was the custom at the close of the last century, to send six wherries as far as Marlow, manned with proper persons, to count and mark the swans; it has of late years been made a festive journey by the citizens as far as Staines, and the voyage is termed "swan-hopping," a corruption of swan-upping, or *taking up* the young swans to mark them. Thus the orders for the game-keepers of the reign of Elizabeth show this clear use of the term, when they ordain "that the *upping* of all those swans, near or within the said branches of the Thames, may be all upped in one day." The swan was considered a royal bird, and was protected by laws of a peculiar kind, and it was the privilege granted to certain persons only that allowed them to be kept. In the reign of King Edward III., it was ordained that no person who did not possess a freehold of the clear value of five marks should be permitted to keep them. The right of marking was also subject to a fine of 6s. 8d. paid into the king's Exchequer for each swan; and any person driving away swans in breeding time, or stealing their eggs, was liable to one year's imprisonment, and fine at the royal pleasure; and any person found carrying a swan-hook, by which the birds may be taken from the river, he not being an authorised swan-herd, or not being accompanied by two swan-herds, was liable to a fine of 13s. 4d. It is also ordained that every year the swans be examined and numbered on every river, and "that every owner that hath any swans shall pay every year, yearly, for every swan-marke, foure pence to the master of the same for his fee, and his dinner and supper free on the upping daies." A large number of similarly minute laws regulate the "Order for Swannes," which became the law for the protection of "the Royal Bird;" the grant, therefore, to the city companies was an especial compliment from the crown to the city—one of those concessions given at a period when the trade of England began to assume importance, and rival that of the Low Countries, when it became the wish of the crown to conciliate the wealthy traders, and accord to them various privileges once held by nobles only. The rule adopted for the marks was thus:—the bird, when young, was taken up in the presence of the king's swan-herd, and a mark was cut in the skin of the beak, the same that was upon the beak of the parent bird. These marks were entered in a book, and kept as a register of swans; any found without such mark were seized for the king, and marked with the royal mark. No new marks were permitted to interfere with the old ones; and all generally consisted of simple figures, and some few were heraldic. The following are examples:—

SWAN MARKS.

|------------------------|--------------------------------------|
| 1. Eton College. | 6. Queen Victoria. |
| 2. Queen of Charles I. | 7. Vintners' Company (modern mark). |
| 3. Charles I. | 8. Dyers' Company (modern mark). |
| 4. Cambridge. | 9. Vintners' Company (ancient mark). |
| 5. Oxford. | 10. Dyers' Company (ancient mark). |

* Recently we visited the swannery of the Earl of Ilchester, at Abbotsbury, within a few miles of Weymouth. The scene is a low series of swamps of salt water, which forms the land border of the isthmus which is divided from the ocean by the singular pebble ridge that runs from Portland Island for about eighteen miles inland. The number of swans here collected amounts, it is said, to seven hundred; but they have been much more numerous. Walking in and out, for upwards of a mile, through this morass, in which various channels are cut for ingress and egress to water, we continually met the nests of the birds, now deserted; they were generally shaded by tall reeds and rushes.

No. 6. is the royal swan mark of Queen Victoria. This mark has been used through the reigns of George III., George IV., and William IV., to the present time. According to Mr. Yarrell (to whom we are mainly indebted for this information), the whole number of old and young swans belonging to her Majesty and the two Companies, at the swan voyage in August, 1841, was as follows:—

	Old Swans.	Cygnets.	Total.
Her Majesty	185	47	232
The Vintners' Company	79	21	100
The Dyers' Company	91	14	105
	355	82	437

Probably they have not since increased; but the numbers were formerly much greater; at one period the Vintners' Company alone possessed five hundred birds.* In the language of swan-herds, the male swan is called a Cob, the female a Pen; the black tubercle at the base of the beak is called the berry. The nest of the swan is built of reeds, rushes, and coarse herbage on the edge of the river; and instances are given by Yarrell of singular instinct in cases of floods, when the birds have beforehand raised their nests two feet and a half above the level of the stream, to protect the eggs from the inundation. He also notices the attention of the parent bird to the young, which are sometimes carried on the back of the female as she sails about the stream. Mr. Jesse, in his "Gleanings of Natural History," also notes this; he says:—"Living on the banks of the Thames, I have often been pleased with seeing the care taken of the young swans by the parent bird. Where the stream is strong, the old bird will sink herself sufficiently low to brink her back on a level with the water, when the cygnets will get upon it, and in this manner are conveyed to the other side of the river, or to stiller water. Each family of swans on the river has its own district; and if the limits of that district are encroached upon by other swans, a pursuit immediately takes place, and the intruders are driven away." Yarrell says, "their food consists of the softer part of water plants, roots, aquatic insects, and occasionally small fish: a swan has been seen to eat a small roach; they also eat grain and bread."

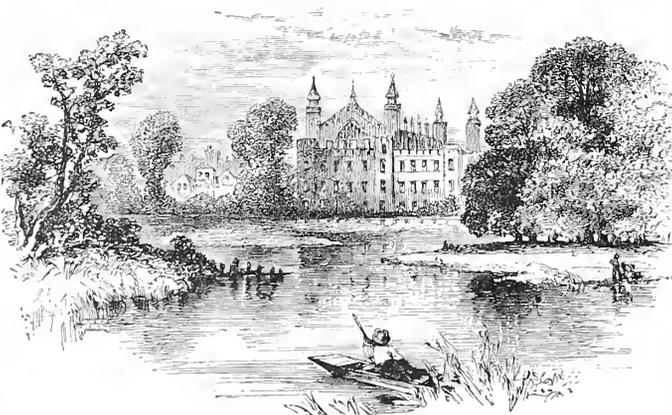

Having passed the loek, we are at once in the midst of "a bustle." We are ignorant that "the rule of the road" is not the law of the water, and run much risk, in our comparatively unwieldy barge, of upsetting one or more of the tiny cockleshells in which a youth is seated, rowing up the stream; we cross rapidly over and give free passage—not without an audible reproach for our want of skill in Eton boat lore—to those

"Who foremost now delight to cleave
With pliant arms thy glassy wave."

The youths are on the banks, as well as on the water of old Father Thames:

"A sprightly race,
Disporting on thy margin green,
The paths of pleasure trace."

And the associations of those who look upon the scene, and think!—are all of them happy, though they are all of the future: out of this "careless childhood" or heedless youth must issue much of the after-renown of England—upon them mainly rest the hereafter of her fate. The embryo statesman is here; the philosopher in the bud; the hero in the *crucua*; the germ of that greatness, the high destiny of which is to preserve the honour and extend the glory of a

ETON COLLEGE.

kingdom upon which the sun never sets; and as boy after boy passes—the father of the man—one can scarcely fail to murmur a hope, with a faith, in his career, or to exclaim:—

"Hail to thee who shall be great hereafter!"

In the lives of a very large portion of the foremost men of our country, it is an incident that they were "educated at Eton;" and to have been an "Eton boy" is the proud boast of many who have gathered laurels in peace and in war.

Eton is in Buckinghamshire, Windsor is in Berkshire. The river divides

* The marks are termed "nieks;" the Vintners' mark is two nieks; hence the well-known tavern sign, "the swan with two necks."

the counties—a very pretty bridge joining the towns. The College at Eton owes its birth to Henry VI.,—

"There grateful Science still adores
Her Henry's holy shade,"—

the charter of incorporation bearing the date 1440. The buildings consist of two quadrangles, in one of which are the chapel and school, with the dormitory of the foundation-scholars; in the other are the library, provost's house, and lodgings of the fellows. The chapel is a handsome Gothic edifice, and is that which "tells" so well in all pictures of the place. A statue in bronze of the royal founder occupies the centre of one of the quadrangles. Few buildings are more happily situated; "the meadows" adjoin it, the Thames rolls its refreshing waters immediately in front, while always in view are the towers of "regal Windsor," inciting to that loyalty which is ever the associate of virtue in the young.

The college, as originally founded by Henry VI., was, in accordance with the feelings of his age, charitable as well as scholastic; having also a number of priests to properly perform religious services in this "College Royal of our Ladie of Eton," as it was first termed. It then consisted of a provost, ten priests, six clerks, six choristers, twenty-five poor grammar scholars, with a master to instruct them; and twenty-five almsmen, who lived upon the foundation. The king granted the lands of the dissolved monastery of Deerhurst, in Gloucestershire, to the college; but this led to disputes with the powerful prelates of the Abbey of Tewkesbury, which lasted until the reign of Henry VII., when, by way of peaceful conclusion, an exchange was made with them for other lands. Even during the progress of this suit, the lands originally granted were taken by Edward IV. to bestow on a more favoured college at Fotheringham, in Northamptonshire, founded by one of his ancestors. When Henry VI. had decided on this establishment, he incorporated two small colleges, or hostels, at Cambridge, one of which he had founded two years before; and thus King's College, Cambridge, originated, to which, as Lambard remarks, "Eton annually sendeth forth her ripe fruit." The college was especially exempted in the act of dissolution, and its revenues were then valued at £1101 15s. 7d. It was by the command of King George III. that the scholars are termed "King's scholars." They are eligible from the ages of eight to fifteen years, and are required by the statute to be "indigents" (which they now never are), and skilled in reading, chanting, and grammar. There was a curious old custom here, known as the "Montem," which has been discontinued only a few years since: on which occasion the boys dressed in fancy costume, and "begged" on the first Tuesday of Whitsun-week of all passers by. The money was termed "salt," and the gatherers "salt-bearers;" the proceeds were generally large, and were given to the senior boy to defray his expenses at Cambridge. The ceremony was usually very gay, there being always among the spectators the relatives and friends of the aristocratic scholars who levied the "salt;" and who were little scrupulous in assailing the purses of their connexions, in their eagerness to make up the largest possible sum "for the honour of the college." The practice has been very properly discontinued; although rendered in some degree respectable by time, and certainly venerable by age, the usage was derogatory and humiliating. It is now only a matter of history, having passed away as one of the evidences of the "wisdom of our forefathers," which society has benefited by abolishing altogether: like many other matters of a gone-by age, it was

"A custom more honoured in the breach than in the observance."

Collier, in his Map of Windsor, 1742, thus notes concerning Eton in his time:—"A woden bridge over the river Thames joins Windsor to Eton, so call'd from its low situation among the waters; for Eton is the same as Watertown, but, as they are running waters, and it is a gravelly soil, it is observed that no place is more healthy than this. It is well known for the college, founded here by Henry VI., 1440,* and for the great number of the sons of noblemen and gentlemen that are sent to the school here for their education." The college at this time consisted of a provost, seven fellows, a master, usher, seventy scholars and sixteen choristers.

The library is extensive, and contains some curious books; its principal contributors were the Bishop of Chichester, Sir Thomas Reeve, Lord Chief Justice of the Common Pleas, and Dr. Richard Mead, whose collections included those of Mr. Richard Topham of New Windsor.†

* Our engraving exhibits the seal of the college used in the reign of Edward IV., it is

termed upon it "The Royal College of the Blessed Virgin Mary," and her assumption is depicted in the centre, above the arms of the sovereign. She is represented in royal robes, surrounded by glory, crowned and supported by angels from an aureole of clouds. There is much that is curious and instructive in the study of these old seals, irrespective of their interest as historic documents to the antiquary. Thus the conventional religious picture afforded by the present example, is so very characteristic of a certain era in the art of design, that a date is not necessary to determine its age by the eye accustomed to examine such relics. The regal dress in which the Virgin is wrapped, and the peculiar arrangement of the angelic host in the sky, are all indicative of a phase in the art of the mediæval era; an art, however, wanting in elegance, yet never without a certain earnestness and love of truth.

† The greatest rarity in the library is a copy of "Ralph Roister Doister," the earliest comedy in the English language. It was written by Nicholas Udall, before 1550, who was one of the masters of Eton school, and is noted by Tusser, the author of the "Five Hundred Pointes of Good Husbandrie," as his master when there, and as a very severe one to him and others.

DEPARTMENT OF SCIENCE AND ART.

DISTRIBUTION OF MEDALS AT MANCHESTER.

AN exhibition of prize designs obtained by students in the several schools of Art throughout the kingdom has been held at Manchester during the past month; and on the 9th of October a meeting was held in the Town-hall of that city, in order, with all due ceremony, to distribute the various prizes to which successful competitors were entitled. The president on the occasion was the accomplished Earl Granville. Mr. Cole and Mr. Redgrave were in attendance; and there was a brilliant assemblage of the *élite* of Manchester to witness a ceremony more than usually impressive and instructive.

It fell to the lot of Mr. Redgrave to explain the circumstances under which the meeting was called together; and his duty was discharged with considerable ability. He commenced by endeavouring to convey to his auditors the conviction by which the directors of the schools are guided—a truth we have been endeavouring to impress on the public mind as long, and perhaps with as much effect, as the Department of Science and Art: viz.,—

“It was necessary, if we desired to improve the public taste, that we should educate all classes, and especially the consumer, who was to purchase the articles manufactured, as well as the designer and the artisan, who were to execute them. It was discovered that drawing, if properly taught,—the elements of drawing, at least,—exercised a very great influence on general education; that if we taught a boy drawing, it enabled him to see better, to compare better, and to have a better sense of things altogether than he would have by the mere rote learning which had previously been in practice.”

These are simple truths, now universally admitted. We can, however, recur to a time, not very distant, when such ideas were pronounced absurdities, their advocates being considered visionary speculators upon idle fancies. “The Department of Science and Art,” the successor of the old “school” at Somerset House, has unquestionably been labouring, and with good effect, to instruct both the producer and the consumer. Other elements have been at work also; and those who compare the present with the past will have no difficulty in arriving at the conclusion that an immense amount of good has been achieved, during the last ten or twelve years, by the practical working of the schools in the metropolis and in the provinces.

The medal (which is not yet ready) for distribution to the students is, it appears, the work of M. Yechte, of Paris, an artist, unquestionably, of high renown. But it must have been somewhat humiliating to the various successful prize-gainers to learn that a foreigner has been engaged to do that which his employers believed an Englishman could not do. It is another of the memorable facts which operate as “heavy blows and great discouragements” everywhere in England, but especially in Manchester, where an enormous sum is annually paid to French designers for cotton printers—an evil, however, which we hope and believe is gradually becoming less and less.

The great attraction of the day was the speech of Earl Granville. It is so sensible, and withal so eloquent, while calculated to be extensively useful, that we shall subject it to but little abridgment.

His lordship stated that, in visiting Manchester for the third time this year, he had peculiar pleasure, inasmuch as the occasion was “the first illustration of a principle which the Department of Science and Art had endeavoured to establish—that is, as much as possible to de-centralize the action, except where absolutely necessary to centralize it, of the department in London.”

His lordship continued,—

“About fifteen years ago a very great popular feeling existed, and at last manifested itself by appeals to Parliament and the Government, to take some steps in reference to a deficiency which was too painfully apparent. Manchester, which is apt to be foremost in pointing out that which requires reform, and is not slow to suggest a remedy, was, I believe, almost the first town to make this appeal to Parliament and the Government. There is no doubt that the facts fully warranted any appeal of

the sort. While we were superior to all other nations in advantages for manufacture, both in regard to the enormous accumulation of capital and to the cheapness of the material we required, with regard to our maritime position, and with regard to the immensity of our mineral wealth, at the same time we thought—and, I believe, not unjustly—that we equalled, if we did not surpass, other nations in energy and love of honest labour. But there was one point in which our manufacturers were certainly deficient, when compared with those of some of our continental neighbours, more especially the French. It was in that finish which Art alone can give, and which often imparts greater value to an object than the intrinsic value of the material, or even the common labour that is displayed upon it, can effect. Now, this was a thing Englishmen surely ought to feel was to be remedied. Parliament met the question, committees sat, and the result was that ‘schools of design,’ as they were first called, were established. I believe some mistakes were made at the outset, but it was felt that some steps were necessary to counteract what had been the course of this country. Now, what was the reason of our inferiority to our French neighbours? I am quite willing to concede the great imagination of the French, their great cleverness, and the advantages of a very bright climate, but I deny that there is anything natural in our constitution or our temperament which makes it impossible for us, if our talents are properly developed, to excel also in Art. For more than a thousand years the Government of the French nation have encouraged and fostered in every way the Art-education of the people. They have done it in every sort of manner. Their kings, some of them possessing very great taste, have done it in a manner which I believe was most beneficial to the nation in other respects. While erecting enormous palaces, lavishing upon them all the treasures of Art, they forgot that they were doing it for their self-glorification, and draining the pockets of the people they ought to have encouraged to sustain themselves, to raise themselves; and, I believe, a bitter penalty was afterwards paid, in that first revolution, for these very extensive oppressions. But when you take it in the point of Art, it is impossible not to feel that it did give a great advantage, and that by these institutions, the ornamenting of great public buildings, and the collections that were amassed, a great opportunity was given to educate the taste of every Frenchman of every class in that great country. Our own history was of a different kind. For some time there was encouragement to Art from our kings in the same way. In the middle of the last century there was a great movement, and some of our admirable painters who then appeared, our admirable sculptor Flaxman, and other distinguished people who were in the habit of travelling on the continent, having wealth and leisure enough to do so, brought back a strong feeling for Art. But that was never applied to manufacture; and the result, I believe, was perfectly true, and most certainly proved at the Exhibition of 1851, that in that respect, and, I believe, in that respect alone, our manufacturers were decidedly inferior to the manufacturers of France. Those are some of the reasons which created the necessity of schools of design. I believe it to be of the greatest importance to provide the best copies and examples for every school in the country, and I believe that a provision of this sort can much more easily be made, and much more cheaply made, by a central body than would be possible by individual efforts. I believe, again, that the training of masters, to supply one of the most important deficiencies at this moment felt, and which was still more apparent a few years back, is what a merely central authority can do. There is another object, which is to encourage the general taste by the making of collections which may show what the principles of good taste are. I quite admit that this is a point which may be very much abused. I entirely deny that London has a right to monopolize advantages of this sort. But we try as much as possible to avoid that evil, by disseminating through the country parts of the collections, in whatever way may be most useful to the country; and we endeavour to extend to every district the good which we disclaim wishing to retain exclusively to ourselves. There was another point alluded to by Mr. Redgrave which I believe to be of the utmost importance to all; and I am more inclined to dwell upon this, because there is, perhaps, some deficiency in this respect in the progress which has been made at Manchester—I mean with regard to the teaching of elementary drawing generally, not in the schools of Art, where the pupils are of a higher order, but in the common schools of the country. I believe all that has been said about the advantages of teaching drawing to be perfectly true, and all the objections that are made to be perfectly false. I met yesterday in the Exhibition a

friend of mine, and one of the most munificent, intelligent, and judicious promoters of education I know, who objected to the universal teaching of drawing, admitting that drawing was good for men, that it was good for carpenters and joiners, for persons employed in manufactures, but saying that it was bad for a very large class of those brought up in our schools—namely, those girls who were destined to be domestic servants. I believe, even here, that there is no doubt the objection is a fallacy, and if you consider what Mr. Redgrave said about the sort of education which drawing confers, the precision and neatness it leads to, then the advantage of this kind of instruction must be very apparent. I believe, after all, there is a design in the cutting out of a frock; and a friend of mine went still further, and suggested that to lay a knife and fork perfectly parallel to one another required the sort of eye which was perfected by a drawing-lesson or so. And still further is the fact agreed to by the general assembly of all the schoolmasters at Marlborough House, that so far from drawing taking up time which might be more advantageously employed, they found the children who had half of the allotted number of hours given to drawing, and half to writing, progressed more rapidly in their writing than those who were occupied in learning to write during the whole of those hours. I believe the advantage of this instruction is great in every class of life. * * * I think there is nobody here who will deny that our present Sovereign, together with Prince Albert, has shown an interest in this subject; and I remark just now that it is singularly characteristic of the spirit of the present age, and of the just appreciation by the Sovereign of that spirit, that whereas former monarchs worked almost entirely either for the gratification of their individual taste or for their self-glorification as to their regal state, I trust that in the encouragement from the Crown which has been given to Art, while there is great individual enjoyment of the thing itself, an encouragement has also been given to education, and there has been an endeavour to make every class of the community co-operate in every manner in the work which was in hand; and I believe there is nothing more evident, or that has done more good, than the example set by the Queen herself, of the very generous use of any object of Art in her possession, by circulating it as widely as possible, and letting it be known in every possible way. The example has been followed, I must say, in a very marked manner. I may instance the fact of the public institutions being open to the people, and established more for the people, and also the very fact of this great Exhibition of the Art-Treasures of the Kingdom, which, I believe, would have been impossible some years ago. The very fact of some of the leading men of Manchester having originated that Exhibition, and the readiness with which they have been met and been able to collect from every source the treasures which have been entirely concealed from the eyes of the people for centuries, shows the sort of impulse which is now given to the public taste. The spread of education tends very much to it; and there are also other things. I was reading the other day an account of most interesting words used by a Frenchman on the union of Arts and Commerce, and he particularly dwelt upon this point, that he did not mind our rivalry when carried on by exiles of his own country, because there was something not fully vital in that, but that he did foresee great danger to their supremacy in what he remarked was taking place in England now, which was the recurrence to the old simple principle of Art, and a determination to adapt the ornament and the design to the parts of the object which was ornamented or designed. But, with regard to these schools of Art, I believe it is possible that, in this sort of institutions, the indirect effects are much greater than the direct effects. I believe it is perfectly possible to point out some very tangible results. I believe it is a result to find that the students in these schools in the last ten years have become exactly ten times more numerous than they were ten years ago. I think it is a result to find that our education costs exactly one-fourth of what it did seven years ago. I think it is a result to find, as a positive fact, that almost all the most eminent porcelain manufacturers, almost all the most eminent cabinet-makers, and upholsterers, and paper-hangers, and almost all the most eminent ornamental metal-work men, have got in their establishments at this moment men whom they have drawn from schools of Art in different parts of the country. I think this is a great result, and that from those local examinations, referred to by Mr. Redgrave, you will find that there are not merely many persons now learning to draw, but that you have a positive proof, in the drawings they produce, that they have profited by the lessons.”

AN ARTIST'S NOTES.

"A SHILLING A HUNDRED, NEW WAA-NUTS!"

IN fine weather Nature is better than Art; in bad weather Art is better than Nature. Many an artist feels this. In the cold gloomy days of November, when Nature seems rolling herself up in a fur of fog for her winter quarters, what a delight it is to have a brisk fire in one's studio, and live in one's dreams! There is nothing to distract one then. One feels, "Well, this is the best place in the world!" and there is no bright sun shining in at the window, and inviting one out, like a merry companion, to go and play truant. Then one feels thankful to have resources in one's art to bid defiance to the frowns of the cold months, and one wraps oneself round with one's art as with a prophet's mantle, and one dreams dreams, and sees visions, and paints pictures, and makes statues. O divine Art, what a resource you are in yourself to the true enthusiast! but, oh! diviner still, inasmuch as you teach us the more to worship Nature, from which you draw your inspiration!

All this is a bright prospect for winter; and how many of us are trusting, hoping, and believing—and we are quite right in believing, as nothing good is done without belief—that we are going, this next winter, to do something much better than we have ever done before; something more up to our own views of Art; something even to astound our best friends! But just now I am interrupted by that before-mentioned bright sun, which is showering his beams into my room, and I look out, up into the clear sky, which makes lakes of blue amid those fleecy white islands, and bears me off on the wings of imaginings to scenes more in accordance with its bright ceiling than the crowded deeds of man around me—Bricks and mortar! mortar and bricks!

What is that I hear? "A shilling a hundred, new waa-nuts!" That is an autumn cry! No one but a resident in London can fancy how much the various metropolitan street cries of the year mix themselves up there with the associations of the seasons. That cry tells me at once a number of things. For instance, it tells me that the trees in the country are beginning to take the varied hues of the later months, and that there pervades in the woods now that pleasant smell of fallen leaves, exhilarating, and sharp, and aromatic, which seems to smack more of promise for the next year than of the decay of this. That cry, too, tells me that "Rotten Row" and the parks are now deserted by fair equestrians (*amazonas*, as the French call them), and noble-looking men and horses, and that only the "last rose of summer" still lingers in the clubs, or on "the shady side of Piccadilly." That cry, too, tells me that, in spite of all my love of Nature, I have lingered in town until the brightest hours and longest days have past.

Oh foolish fashion of England that year after year dooms the great, the wise, the beautiful, the rich, the powerful, and all that hang thereto, and depend thereon, to spend the genial days of delicious summertime in the great hot city, and entombs the delicate and the fragile in many a country seat in the winter, with the wind screaming like a banshee through the bare branches around! And this is all for the sake of "de sport," as the French now call it. English gentlemen must have "de sport." I presume this is all right and proper, and goes to make up the "stabilities" of this great nation; but in my own small circle I do not recollect having ever met a great shot who was also a great lover of Nature. Many people live in the country actually without seeing it, and among these, too frequently, is your sportsman. It is quite amazing, and amusing, to myself, the height of superiority from which I, trudging along in a country lane, in my humble way, with my stick, and, perhaps, knapsack, look down upon the mere sportsman—for instance, on the dashing gentleman, in his perfect hunting appointments, as his noble horse carries him at a bound over one hedge into the road before me, and over the other again into the next field; or on the thoroughly got up first-class shot, with his array of dogs and keepers, banging "one two" with perfect precision and success through a turnip-field!

"Poor fellows!" I think, "they do not see the riches around them—only the fox and the birds!"

But there is no point of discord between us. I am beneath their consideration, and I look at them as part of the landscape; that is, I try to do so, for, to say the truth, it is not easy always to hit upon a point of view which will make them in true keeping with the scene. A cherry-cheeked damsel, the prettier the better, or a hardy rustic, even in his best apparel, or an old man in a worked and braided smockfrock slop, or an old woman in the orthodox red cloak, or any groups of merry children coming from school, and scrambling up the bank, and clutching the hedge boughs, after the nuts, always come in the right place in Nature's pictures. They are elements which she has no difficulty in composing in perfect harmony with her delightful scenes; she does it just as easily and happily as she ever makes the leaf and flower compose in colour, but a fresh importation from town is sometimes a hard matter for even her brush to combine.

However, you see I am not at all one of those misanthropic lovers of solitude, who think that man should be left out of a country picture. On the contrary, I think no country is perfect without country people, and feel it a sad gap where *genus homo* is omitted; and thus, when I go and stay in the country, I love to make my head-quarters at the edge of a village. Such a spot affords such varied pictures, and then it is even more unlike town than solitude itself!—at least, if less thoroughly divided, it offers more points of comparison to mark the difference. Take, for instance, as a contrast to the *entourage* of your town home, the wakening up of the little village in the first morning after your arrival. The early bright sunshine streams through the lozenge windows and mottled white dimity curtains, and, with the twitter of the martins under the eaves, arouses you to open the catch-fastened window, and put your head out into the village street, and watch the proceedings. There is a little boy in fustian coming up the street; he does not see you, for he is only half awake; he is rubbing his eyes with his sleeve, and he opens the gate of the farmyard opposite for the early pigs to go out on the moor. As he goes into the yard the geese cackle. Then the yeoman appears, and he unbars a gate or two, and dives into his stable to see how his horse is, who salutes him with a whinny, and he shakes him down some fresh hay. He is an early man, who, with careful policy, likes to be up as soon as his workmen are, and to put them to their work; and he trudges off to the field, with his trusty dog after him. Then you see his buxom wife (early too), or perhaps servant girl, undoing the shutters. The latter loiters a bit to have a passing word or joke with the sturdy labourers who are coming down the village street to their daily work, blithe and hearty, with their bundles of provision and brown bottles over their shoulders. They turn round on one foot, and chat awhile with "Mary" and with an old man, the oracle of the village, who, even in white old age, has not forgotten his habits of early rising, and now, supported by his staff, steps slowly from his cottage door across the road to give prophecies as to the weather. Then you hear a lowing, up the street, the matins of sundry cows, which are being driven, saunteringly, out to their daily and day-long feed, to labour for their masters and mistresses as perseveringly as possible, by eating all the while,—an easy life on the whole, the only trouble in it being when their calves are being weaned, when they and their offspring rush about complaining loudly to the world at large, with their tails held up, and twisted like one turn of a corkscrew. After this vision has passed away leisurely from under the window, the car is struck with a vast clatter of trotting hoofs coming down the street, when suddenly rush past a troop of great heavy carthorses, shouldering one another down "to water," driven by a farm-boy of some twelve or thirteen, sitting very back on the last one, and flourishing his arms and beels with great rapidity. Altogether they go along as if they desired to make all the noise possible, and to drive the last remains of sleep out of the little village for this day, in which they succeed.

Now all this, though it must be acknowledged to be very rustic and very homely, suggests to the artist a series of pretty pictures; and to remark them and make much of them is, I conceive, as much to the purpose of a true lover of the country, as to watch the opening of a flower, the effect of the first beams of the sun upon the landscape, or the

early habits of the birds in field or wood. I shall be smiled at as an enthusiast when I confess that there is to me something so angelic about early morning in the country, that the commonest thing appears refined by it. Everything then seems so good. Even Hodge, who has had a little too much beer over night (it is harvest time), gives you such a civil "good morning," as he passes you, that he seems no exception to the scene.

I love the village *shop*,—that wonderful place, so small, and yet which supplies the whole country round—in which you can obtain everything you want, from an umbrella to a ham; from pins and bobbins to a pound of butter; from a pond of tea to a straw hat; and from a peg-top to getting your five-pound note changed,—for to his other avocations the respected shopkeeper adds that of being a banker, in a small way, to those who encourage his "emporium." The village shop is the true "mutuum in parvo;" and among the many things I have seen in it are various very pretty and characteristic pictures,—not on canvas, believe me—but formed by groups of purchasers. Tall men, whose heads reach among the brushes, and coils of twine, and gammons of bacon that hang aloft, buying reap-hooks perhaps; and pretty lasses bargaining for some bits of Sunday finery; and little children with their heads not up to the counter, sent from their mothers (it is astonishing at what an early age children are obliged, I suppose from the pressure of circumstances, to transact business in the country!)—"sent from maummy," to buy three-halfpenny worth of something, with the three halfpennies clutched tight in their little hands. Well, there is poetry in all this, if you will look at it so; and picture-food, too, if you will gather it up.

I love the "politics" of a country village—that is as I see them; and the pleasure I take in noting them is all mixed up with my love for Art. Neighbour So-and-so has bought a new horse; he is going to try it in his old harness. Farmer So-and-so has sold his wheat well, and has a wonderful fine field of turnips and wurzel. I imagine the rustic group of the "neighbour" and the horse, and his difficulties in introducing the new horse to the old collar, over the eye-bones especially; and I see the bluff farmer showing his sample of wheat to the purchaser, and I will assuredly go and see his fine field of turnips and wurzel. Now all these things may have more or less interest to those who live in the country; but they have seldom, I believe, the same kind of interest as they have with such as I. With me everything in the country possesses a kind of poetry, like a frieze of rustic subjects cut in alabaster. Following a great bard, who saw "*sermons*" in everything, so do I see *pictures* in everything; and I thank God for it; and I like to be reminded of my fellow-artists as I do so, and, as the day goes on, among its various scenes to recognise now a Wilkie, or a Motland, a Webster, or a Hunt; and in going further afield to be reminded of the happy pencils of Linnell, of Lee, or of Creswick, *cum multis aliis*.

Loving, as I do, country-people as well as the country, I am very glad to notice among the paintings of the day that the difficulty of uniting, as equal objects of interest, the human figure with landscape seems worn away. Time was when it used to be said that either one element or the other must palpably predominate in a picture, or a pleasing result could not be obtained. This always appeared to me a strange dogma. At any rate, if it was a problem, our painters seem to have solved it very satisfactorily. In various of our most charming country pictures now—representing spots you yearn to make personal acquaintance with—the human and landscape elements are pretty equally balanced with the best effect. Redgrave, Hook, and others present you with sylvan, and field, and lane scenes, in which one knows not which most to admire, the figures or the landscape—human or vegetable life: and this is particularly charming to me, inasmuch, as I have said before, in my idea the country is not perfect without country-folks.

Some delicate people, on reading this, may recur to some noisy scene they may have witnessed at some country alehouse, when the "malt got above the meal," and will recall, perhaps, the smell of strong tobacco and the boisterous *désagrémens* of a village tap-room; but let them recollect that perhaps chance brought them to the said inn on some Saturday night, at harvest time, when wages and wagers had to be drunk out; while, too, the quiet

landlord and landlady were as anxious as possible that the next few hours should pass off quietly, they drawing as little beer as they could (which honest caution, in opposition to their interest, I have often noticed in the country); and compare this with the gaudy excitements and allurements of a blazing London ginshop, the results of which one hears of and sees but in the police reports.

However, I do not consider a country village quite a celestial city, holding it to be one of those very many things the impression of which depends on the frame of mind in which you look at it—at the kind of mental window through which you view it. There is, or was, a child's toy, in which you look at things through variously coloured pieces of glass. How different they appear through them! One makes the landscape look as if snow were all over the ground, the other as if the world were all afire. Now, of all glasses in the world to look at the world through, for quiet pleasure, commend me to a poetic glass (what is the world without poetry?), or rather, I would say, a poetic and artistic glass. Then all creation appears endowed with interest, and a mere walk or drive in the country will appear a succession of romances. A vast deal of the delight which children have in everything is from the fresh, early bloom of involuntary poetry which they have brought into the world with them, and which has not yet been rubbed off. This forms, as it were, a sort of atmosphere about them, through which they see everything. They are not matter-of-fact, God bless them! and a deal of pure, innocent pleasure they have from not being so. What a bower of romance to them is a hole in a hedge, and what an enchanted forest is a little jungle of underwood, where they can creep through little sly paths to odd nooks, where older people cannot follow them!

Oh let us be children as long as we can, especially in the country! I love to stroll, or ride, or drive through new country in companionship with a child; there is such a constant, quiet excitement of interest ever arising as to "what will come next?" or whether the next turning or glade will lead us; and one always fancies beyond greater beauties than we have yet seen; and then there is a twitter, and one does not quite know the bird to which it belongs; and then one stops and watches, to find out, and at last sees the bird, and then one has learnt something; and then there is the tap of the woodpecker, which we *do* know; and then a startled rabbit runs out of our way across the path; and then one sees a new flower or a new moss, or a butterfly one has not seen before. How very pleasant are such little incidents amid such scenes! what a constant thrill of pure excitement they keep up—an excitement without reaction. One feels it is an excitement that the great Father of all does not disapprove of, and it draws us up to Him instead of putting something, as it were, between Him and us, as so many other excitements do.

Oh! a country walk does one good, mind as much as body—perhaps more. A country walk is a Gospel, and tells us to love our neighbour as well as to admire nature. When one contemplates a charming scene, one wishes all one's friends were there to see it too. Surely no one but a follower of Christ can feel fully the holy beauty of Nature. The chord of universal love which He struck on earth seems almost audibly thrilling through Nature when one stands entranced before some exquisite picture which the Almighty hand has drawn out before us.

Let us be children as long as we can—that is, good children, and obedient children, and loving children, with souls open to Nature, and the endless and exquisite "gays" which she spreads out before us. Let us ever, while we can, keep a green place in our hearts, where, as on a village green, fresh young innocent fancies may bound about in harmless frolic; and to keep us thus, let us love the country, and let us ever, if we can, in sentiment, be poets, even if we don't write, and painters, even if we don't paint.

"Waa-nuts! a shilling a hundred new waa-nuts!" That cry again! I ring the bell, which is answered. "John," I exclaim, "I want my carpet-bag from downstairs, and my walking shoes blacked, for I am going into the country this afternoon."

ART IN THE PROVINCES.

LIVERPOOL.—The Liverpool Art-Union Society seems at this time to be in a failing condition, owing, it is said, "in part to the unfavourable season, and, in part, to a difference in the minds of its supporters, as to the privilege now accorded to prize-holders of making their selections at the opening of the exhibition" of the Liverpool Academy of Art. At the annual meeting for the drawing of prizes, &c., held in St. George's Hall, on the 10th of September, the number of subscribers was announced to be 374 only, and the amount of subscriptions £382. This is a very poor exhibition for so large and wealthy a population; a population, too, not usually accustomed to deal niggardly in matters of Art; we shall hope for better tidings another year.

WARRINGTON.—The annual meeting of the supporters of the School of Art in this town, took place on September 26. Since the last preceding meeting, in February, 1856, the pupils have taken possession of the new building erected for their use, which furnishes the most convenient and ample accommodation for the wants of the school. The average number of pupils attending monthly during the past sessional year, has been 43 in the public class, and 23 in the special class; but beyond these, five public schools, and one private, have received instruction through the head school at Warrington; the total number of persons who have thus come within its operations amounted to 848, being an increase of 159 over the list of the former year. The Warrington school is under the superintendence of Mr. J. C. Thompson.

CORK.—The last annual report of the Cork School of Art, read at a meeting on the 4th of September, stated that the attendance for the present term, in the central school, amounted to 121, of which number 40 were female pupils and 81 male, a number that corresponds with the list of the preceding year. In the various national schools, 400 pupils received instruction, the fees paid by them amounted to £28 16s. 6d. for the term.

DARLINGTON.—A branch school of Art is, we understand, about to be opened in this town.

YARMOUTH.—Mr. T. W. Chevalier has been appointed to superintend the Art-department of the "Government Schools of Navigation and Art," in this place, which it was expected would be opened during the past month.

GREENOCK.—In our number for December of last year, we stated that Mr. W. Stewart, head-master of the Paisley School of Art, had undertaken the superintendence of a new school recently opened at Greenock; but the number of pupils in attendance has now so largely multiplied, that a committee of the inhabitants has just been appointed to organise an establishment altogether independent of aid from Paisley; the duties of the two schools have become too arduous for one staff of teachers to undertake.

TORQUAY AND BRIKHAM.—It is proposed to open a School of Art for the benefit of the residents in these picturesque and improving localities; a provisional committee has been formed for this purpose, of which Dr. Harris, the rector, has agreed to act as chairman, Mr. E. Vivian, as treasurer, and Mr. Edmonstone, as honorary secretary.

COVENTRY.—The annual meeting of the Coventry School of Art took place last month at St. Mary's Hall. The report congratulated the subscribers and friends of the school that the progress of the institution since last annual report had been steady and satisfactory. The number of students entered on the books during the past year, however, was only 371, against 384 in 1855-6, and 340 in 1854-5. The late exhibition of the works of students had been visited by upwards of 3500 persons. It was now necessary to make an effort for the erection of an adequate building for the accommodation of the school, and a convenient site was being looked out, when a meeting would be convened, and a scheme for raising funds submitted. The finances of the school were now in a better position than they had been in since the government grant for the payment of the masters was withdrawn. The balance in hand, however (£13), was insufficient to meet current expenses, and increased subscriptions were pressed for.

FALMOUTH.—The annual exhibition of the Royal Cornwall Polytechnic Society took place on the 29th of September, and four following days; and it speaks well for its position that the attendance was greater, and the receipts at the door larger than on any previous occasion. Several objects of great interest and novelty were exhibited. A magnificent escutcheon of sculptured granite, intended for the Scutari Monument, adorned the centre of the hall. Clifford's boat-lowering apparatus, a large model of the Albert Bridge over the Tamar, and various other specimens of mechanical skill, excited great interest. Through the exertions of the secretary, Mr. Sydney Hodges, an excellent collection of pictures, ancient

and modern, adorned the upper walls. Among the contributors were the well-known names of Lucas, J. Danby, Niemann, Zeitter, T. F. Marshall, &c. The "Dream of the Future," the joint production of Frith, Creswick, and Ansdell, which was exhibited in the Royal Academy of 1856, and is now the property of S. Gurney, Esq., M.P. for Falmouth, who kindly contributed it, occupied a leading position, and excited general admiration. Some interesting lectures were delivered, and the *conversazioni* held in the evenings, passed off agreeably.

COLEBROOK DALE SCHOOL OF ART.—This school, which was opened in December last, and of which Mr. J. A. Mulligan is the master, is progressing in a very favourable manner, in consequence of which the Colebrook Dale Company are erecting a School of Art in a more central position than the one now in use, in connection with a new building for the literary association. The school, which will comprise two commodious rooms, will be properly fitted up, so as to afford greater conveniences for study than the room now temporarily occupied. The other schools within the borough of Wenlock—also under the mastership of Mr. Mulligan—are progressing in a very encouraging manner.

THE DYING ARTIST.*

THESE slanting rocks—their shadows best
I love—and this bare rugged strand;
Here let me for a little rest
On this green strip of shaded land,
And look again on either hand
To scenes I loved; still let me be
In sight and sound of yonder sea.
Longer, yet longer, for the sun
With widening orb yet riles the sky;
His godlike course in glory done,
I follow still with glazing eye:
Those fires the coming morn will give
Again—but my long night is nigh;
No vain regrets—I would not live.
Of hope—long past—oh, speak no more;
Of love—alas! I loved in vain;
Your passing words, this lonely shore,
With all I lost, and most deplore,
Revive sad memories again
From clouded years; to me it seems
Life, love, and death, are only dreams.
The glories of a coming day
Are pictured sunlike on my brain,
And from mine unaccompanied way,
And from this mighty source of pain,
My larger soul, and wider sight,
With thankful energy regain
Their fountain-head—the Light of light.
Marvel not, dying I should gaze
On God's own emblem to the last,
Though weak that type—yet, oh, those rays
Are not of earth, though earthward cast:
My soul sweeps onward through the maze
Of whirling passions, and I feel
The "silver cord" is loosed at last,
And broken too life's cistern wheel.
My name? a blank above my grave—
'Twas only charactered on sand;
The eddying wind and blinding wave
Will blot its memory from the land.
Fame loves alone the wise, the brave,
But I—my years were like this strand—
Bare, bleak, and barren, from whose roots
There springs no bud, and bloom no fruits.
Wave curls on wave—how deeply blue
Our Indian skies are imaged there!
And not a cloud to meet the view,
Nor breath to cool the burning air.
O shade of death! if life be fair,
Can one so young then welcome thee?
Thy low voice seems, like my despair,
To mix with murmurs from the sea.

Brussels.

WILLIAM HENRY CROME.

* In a note which Mr. Crome, whose name as a painter must be familiar to many of our readers, sent us with the poem, he says—"A very young artist of great promise, after a short sojourn on the continent, returned home to die—his illness a broken heart: after much flesh-weariness he reached the Malabar coast, his native home, and died, as he desired, on the lone sea-shore. I knew him well, and have endeavoured to embody somewhat of the impress made on me by the tenour of the last letter he ever wrote, which was to me."

THE ROYAL PICTURES.

THE BEAUTY OF ALBANO.

A. Riedel, Painter. L. Stocks, A.R.A., Engraver.
Size of the Picture, 4 ft. 4½ in. by 3 ft. 2 in.

RIEDEL, the painter of this picture, is a native of the town of Baireuth, in Bavaria; he was born about the commencement of the present century, and entered the School of Munich at the period when Robert de Langer filled the office of Professor of Painting at the Academy; the historical pictures, both in fresco and oil, of this artist are highly esteemed. In his early years Riedel acquired considerable celebrity by the boldness of his designs and the spirit, rather than the grace, of his compositions. About twenty years ago he quitted Munich, and took up his abode at Rome, where he has since resided; at the same time he altered his style of painting, by substituting *genre* subjects for historical, to which he had almost constantly adhered in his own country. He soon rose into public favour at Rome, and has continued to maintain his position, his pictures being much in request. Among those that earliest brought him into notice was a "Mariner playing on a Lute;" it was purchased by Thorwaldsen, and a *replica* was ordered by the Prince Royal of Bavaria, and now forms part of the royal collection at Munich. The figure in the duplicate is, we believe, life-size; in the original it is considerably smaller. Another of Riedel's early pictures, painted in Italy, which attracted attention was the "Bathers."

We cannot avoid thinking that the title of this very charming picture, "The Beauty of Albano," is a misnomer, for the figure seems rather to have had its type in one of the daughters of England than in any of the Roman ladies who resort to the Alban territory, to escape the malaria of the Papal city, during the warm months of summer and autumn. The face of the "beauty" is fair and exceedingly delicate; her hair is of a rich auburn colour, the eyes are hazel, and her dress, though we do not presume to be learned in such matters, seems to us to have been fashioned by the skill of a London or Parisian *modeste*: in truth, were we not told the contrary, the picture might readily be presumed to be a portrait of one of the aristocratic "beauties" that shed a brilliancy over the court of Queen Victoria, and look down upon us from the walls of our Royal Academy. But whether it be a portrait of English or Italian lady, or only the embodiment of the artist's fancy, it is a work of more than ordinary sweetness in conception, and treated with perfectly appropriate feeling, combined with originality: the figure stands in a kind of bower, through which the warm sunlight streams, casting its rays on her face and portions of her dress. The latter is of a pale greyish hue, yet sufficient in depth of tone to give brilliancy to those parts on which the sunlight falls: the truth and purity of colour of these lights are almost magical, and show how closely the artist has studied nature, and his knowledge of the materials with which he works. The background immediately behind the figure is painted of a rich dark brown colour, and although the object is not positively defined, it seems to be the trunk of some enormous tree, to whose sides the convolvulus and climbing roses cling pertinaciously; the deep crimson flowers of the latter, which are seen only in the lower part of the composition, greatly enrich the whole of it with their warm glow: had they been placed higher up, the face of the lady would have lost much of the delicate colouring it now has. Throughout the picture the painter has made a most judicious and effective use of his various pigments.

One rarely sees so realistic a work as this from the hands of a modern German painter; it shows nought of the severity of style we are apt to associate—and not untruly—with this school; and possibly, if Riedel had always remained in Munich, he would not thus have separated himself from his contemporaries. The atmosphere of Italy seems to have wondrous power over the minds of artists, by causing them to shake off the trammels of home-education: or at least it enables them to see with other eyes, and to apply in a new direction what they have learned elsewhere.

The picture is in the Collection at Osborne.

ART IN CONTINENTAL STATES.

PARIS.—The September Exhibition of the prizes awarded by the Academy of Paris, and of the productions of the French students in Rome, has taken place.—The provincial exhibitions are now open, or about to open; those of Marseilles and Lyons are the most prominent.—A hospital for invalid workmen has been inaugurated by the Emperor at Vincennes.—Several antiquities have been found in the Seine lately, in preparing the foundations for the new bridges—rings of the reign of Henry III., pins of Charles IX., a "St. Louis," in ivory, a silver ornament of the period of Louis XIII.; they have been purchased for the cabinet of M. Arthur Forgeais.—The four allegorical statues for the front of the barracks at the Bank have been confided to the care of M. Duprez; the subjects are, "Strength," "Prudence," "Vigilance," and "Order."—On the anniversary of the 15th of August, a number of various objects of Fine Arts were distributed to the Museums and Provincial Libraries; among them, paintings by Moulignon, Goldsmidt, F. Besson, Baron, H. Vernet, &c.—We have to record the death of M. L. Garneray, a marine painter of talent, and of M. G. Planche, a distinguished writer and critic of the fine arts.

JENA.—Her Majesty and the Prince Consort have given a thousand thalers in aid of the fund which is being collected for the erection of a monument commemorative of the pious John Frederick, surnamed the Constant, one of the firmest champions of the Reformation, who in the cause of Protestantism risked, and lost, liberty and all his possessions at the battle of Mühlenberg. Next year the University of Jena will complete its third centenary, and it is upon the occasion of the jubilee proposed, in celebration of this event, that the monument will be inaugurated. The work, which was confided to Professor Drake, of Berlin, is a statue ten feet high, and has been already cast in bronze contributed for that purpose by the King of Prussia.

PERUGIA.—A picture in the Church of St. Augustino, and which has hitherto been ascribed to Domenico Alfani, is presumed, from recent examination, to be by Raffaele: it has also been attributed to Orazio, the son of Domenico Alfani. The subject of the work is "The Adoration of the Magi," and hitherto no name or inscription has been discoverable on any part of it until lately, when the date 1505 has been found under the hem of the mantle of the Madonna. The beauty of the execution and tenderness of the drawing seemed so far beyond the powers of Alfani, that persons experienced in the Art of the early part of the sixteenth century considered the picture as a production of Perugino; but on the discovery of the date, and after a close inquiry into its merits, it was believed that it could be attributed to none other than Raffaele. The picture, which is large, is situated over an altar in the left transept. The background consists of a hilly landscape, with slender trees, such as are seen in Raffaele's open compositions. In the immediate foreground stands a wooden hut, the roof of which reaches almost to the upper extremity of the composition, and from the open door are protruded the heads of an ox and an ass, the latter drinking from a small current of water. The Virgin Mother sits on the right, wearing a drapery of a yellowish red colour, and a dark blue head-dress. In her left hand she holds a prayer-book, and with her right she holds the infant Saviour, whose attention is attracted by the rich offerings held forth by the worshipping kings. Mary is partially turned to Joseph, who stands by her side, and points with a finger of that hand in which she holds the book, to the child. The old king, who kneels, is only seen in profile, holding in the left hand his oriental head-dress, to which is attached a crown, and with his right extends to the infant the golden vessel. Behind this figure, which is masterly in drawing, stands the second king, whose features bear an unmistakable expression of doubt; and between these appears the youngest of the three, a youth of great beauty, and bearing an expression of trustful belief, with which he is desirous of inspiring his companion. Of the attendants only two or three are visible. There is also present a young man of twenty or twenty-two years of age, wearing a red cap; and behind the principal group a negro slave, who shades his eyes with his hand; and on the right two shepherds, with their bagpipes. Above in the clouds appear four angels, singing songs of praise to the music of stringed instruments. The composition is elegant and simple, and the sentiment of all the figures at once intelligible, without the slightest approach to conventionality. The colour, as well as it can be seen in the unfavourable situation in which the picture is placed, is extremely harmonious. Many circumstances and coincidences point

to Raffaele as the author of this picture. The two principal figures of the Holy Family are like those of the early works of the master, and the angels in the clouds are like those of the St. Cecilia. The chapel in which the picture is placed is the property of the family Oddi-Baglioni, and it is known that Raffaele was patronised by that family.

VIENNA.—The new director, Engerth, of the gallery at the Belvidere has commenced his duties in a manner which it is very desirable were imitated in other collections of ancient Art. The Saint Margaret instead of being, as heretofore, distinguished by the name of Raffaele, is now more properly attributed to Giulio Romano; and "The Flight into Egypt" is ascribed to Fra Bartolomeo. The charming St. Justine, which has been supposed to be by Pordenone, has now the name of Moretto attached to it. The "Baptism of Christ in the Jordan," supposed to be by Perugino, remains with the name of that master attached to it. The portrait of a youth, which had usually been classed as of the Florentine school, has been determined as a work of Masaccio. This is, it may be conceived, but the commencement of a salutary change with reference to the false attribution of so many of these pictures, among which certainly the names of Letto and Giorgione will be removed from the Entombment and the "Portrait of a Warrior." There are many other collections besides that at Vienna which would rise in estimation by a just attribution of very many of the pictures which are falsely ascribed to painters of the highest class. Some corrections have been made at Dresden, but they have not been carried sufficiently far; and there is also room for question and inquiry in the Louvre, and in the collection at Berlin.—The missal which has been commissioned by the emperor for the Pope will not be finished until next spring. Some of the most eminent artists in Vienna will contribute to it, all the text will be executed with the pen, and each page enriched with a border of elegant design: for the binding, elaborate and beautiful ornaments are in course of preparation.

MEININGEN.—The works of William Kaubach are well known in England through engraving, but they become more interesting to us when designed from the writings of our greatest poet. Among the historical cartoons which are exhibited at Meiningen are the series of subjects from "The Tempest," "Macbeth," and "King John;" and as all who are in anywise acquainted with the splendid compositions of Kaubach, at Berlin, may be desirous of knowing what subjects he would select; we give them as follows:—

1. *Ferdinand*. O, most dear mistress,
The sun will set before I shall discharge
What I must strive to do, &c.
Tempest, Act iii., scene 1.
2. *Caliban*. Thou makest me merry: I am full of pleasure, &c.
Tempest, Act iii., scene 2.
3. What are these,
So withered, and so wild in their attire, &c.
Macbeth, Act i., scene 3.
4. *Lady Macbeth*. Here's the smell of the blood still: all the perfumes of Arabia will not sweeten this little hand.
Macbeth, Act v., scene 1.
5. *Macbeth*. I'll fight, till from my bones my flesh
be hack'd.
Give me my armour, &c.
Macbeth, Act v., scene 2.

The others are from the third and fourth act of "King John," and the third act of "Julius Caesar." WEIMAR.—The long-talked of inauguration of the statues of Schiller, Wieland, and Goethe, took place here in September, amid a general expression of enthusiasm. On the day before the exposure of the statues, the busts of these distinguished men, with those of Herder and Karl August, were placed in front of the house in which Schiller lived, surrounded with flowers, and relieved against a red background.

The streets of Weimar were decorated, nearly every house being hung with garlands and ornamented with the busts of these eminent men; and banners were numerous displayed from the houses. The most extraordinary part of the ceremony of the inauguration of these statues was, perhaps, the admission of the public to the vault in which lie the remains of Karl August, his wife, Goethe, and Schiller. It may be supposed that as the crowd of visitors passed through the vault that all eyes were fixed in silent emotion on the coffins which contained the remains of Goethe and Schiller. The ceremonies attracted a numerous throng of visitors from neighbouring cities, and the whole passed off with the utmost enthusiasm. Soon after the inauguration, the municipal freedom of Weimar was presented to the sculptors Rietschel, who executed the statues of Goethe and Schiller, Schaller, the author of the statue of Herder, and Gassler for the monument of Wieland.

A. RIEDEL PINX.

L. STOCKS ARA. SCULPS.

THE BEAUTY OF ALBANO

FROM THE PICTURE IN THE ROYAL COLLECTION

LONDON: JAMES COCHRAN.

MINOR TOPICS OF THE MONTH.

THE EXHIBITION OF ART-TREASURES AT MANCHESTER closed "for ever" on Saturday, the 17th of October. A brief speech of the chairman of the Executive Committee, Thomas Fairbairn, Esq., responded to by the hearty cheers of the assembly, terminated proceedings that have been watched with deep interest during the year by a vast proportion of the people of these realms. We shall this month limit our observations to a mere record of the fact; a report will soon be published, and it will be our duty to bring it under detailed review. We rejoice to learn that it has been successful even as a commercial speculation, which we never expected it to be; that a balance amounting to several thousand pounds will remain in the hands of the committee after all expenses are paid—enough certainly to justify that liberality to all parties concerned, which was by no means manifested during the earlier movements of the scheme, the consequence of which has unquestionably been a degree of dissatisfaction which, if suffered to continue, will be a blot on the character of Manchester. When all has been done that ought to be done, there will still probably remain a sum for judicious application; this will, we trust, be expended in some way or other for the benefit of Art in that great city—by preserving a record of the event that shall be a perpetual teacher. There is now the duty of returning to the owners the enormous mass of contributions that formed the exhibition. It is said that up to this time little or no injury has been sustained. We earnestly hope this statement may hold good when all the articles are again at their several "homes;" but we need not add, that to achieve this important object there must be at least as much care in packing as there was in unpacking. This is the duty of policy as well as gratitude, for the result will greatly influence the destiny of all future schemes of the kind. People will be encouraged to lend, or be deterred from lending, according to the experience they derive from the grand experiment. Upon the several points connected with the exhibition we shall have to comment next month.

ORIGINAL DESIGNS FOR MANUFACTURERS, ORNAMENTALISTS, ARTIZANS, ETC.—It is doubtless within the recollection of very many of our subscribers that about six or seven years since we engraved and introduced into our pages a series of original designs adapted to the purposes of manufacturers and ornamentalists of every kind. These illustrations were continued, almost without intermission, during two or three years, and were found to be of signal service to those for whose benefit they were especially intended; even at this distance of time we hear of these pages being now referred to for practical purposes. But although their utility was very generally acknowledged, we deemed it necessary to discontinue the plan, for the sake of giving variety to the contents of the Journal, and because other matters, scarcely less important, were pressed upon our attention. The manufacturing classes constitute neither a small nor unimportant body of our supporters; the withdrawal of these "Original Designs" was to them a subject of much regret, and we have often been solicited to resume them. Applications of this nature having of late crowded upon us, we have determined to commence the next year's volume with a second series of a similar nature, and to continue them through each successive month, so far as is practicable. To enable us to carry out our plan, we now invite the assistance of artists and ornamental designers, from whom we shall be glad to receive original drawings of objects that come within the range of Industrial Art. As it is proposed to purchase such drawings as are offered to us, and of which we approve, they will become, when engraved on our pages, public property, our chief objects being to aid the manufacturer, and to develop the artistic taste and skill of the designer, especially of those who may now be studying in the various SCHOOLS OF ART throughout the country; to the attention of the latter class we would particularly direct this notice. It would be strange, indeed, if, after all the Art-instruction afforded by these schools during the last few years, some practical fruits of the teachings are not evidenced: it will give us much pleasure to be the medium of exhibiting progress in the "Department of Science and Art."

AT THE POLYTECHNIC INSTITUTION there is exhibited a series of views illustrative of many of the localities which have now, unhappily, attained a "bad eminence" for rebellion and massacre. The pictures are preceded by a map of India, in which sites of the capitals of the presidencies were marked by numbers, to show their relative positions, and the situations of Allahabad, Meerut, Cawnpore, Delhi, &c., were shown in like manner. The first view was that of Calcutta, showing a line of its palaces, a little removed from the foreground. The second is Lahore, the capital of the Punjab, a city most offensive to Europeans, from its filth, and the disgusting odours which continually prevail there. The picture shows a section of the palace. There are two views of the rock-cut temples at Ellora, in the Deccan. The first presents a vista of columns; and the second exemplifies "the Temple of Paradise," with its marvellously carved ornamentation, referring to a state of ancient civilisation of which no other record remains. In the portrait of the hideous idol Juggernaut there is not the slightest attempt at imitation of the human form—the picture is said to afford a correct representation of the moustrousity as it was seen in the house of one of the natives in which it had been lodged. A portrait of Geneva was also exhibited—that deity with the elephant's head, to whom all the Hindoos offer up a prayer for success in their undertakings. The view at Meerut has a prospect over the plain, the scene of the mutiny of the 3rd Native Light Cavalry. Here are seen hungalows on fire, and the sowars riding off in the wildest confusion. There is a snaject from Agra, and a glât at Benares; the parade at Allahabad, and a representation of the outbreak at Cawnpore, with the palace at Delhi, and the Chandy Chowk. The events now passing in India invest such views with a melancholy interest which, under ordinary circumstances, could not attach to them.

MR. MARSHALL'S PICTURE OF DELHI, exhibited at the Auction Mart, near the Bank of England, is a view of the city from the left bank of the Jumna, opposite the palace, a point whence the entire city and the immediately surrounding country are distinctly seen. In the left centre distance appear the ruins of old Delhi, and on the right the cantonments of the British troops, with the space of perhaps a mile and a half of that debateable land lying between the British camp and the walls of the city, the scene of so many desperate conflicts, and so thickly strewn with the bodies of the sepoys, as to infect the air with the taint of a sickening and poisonous corruption. Delhi is about a thousand miles from Calcutta, and is called by the natives Shahjehanabad, having being built by the Mogul emperor Shah Jehan in 1631. It is seven miles in circumference, and is strongly defended by a granite wall, with a ditch, and glacis, and cut in the fortifications there are seven gates, each built of freestone, and respectively called the Lahore, Ajemeer, Turcoman, Delhi, Mohur, Cashmere, and Agra gates. In this picture the whole of the *enceinte* is most favourably shown, with the position of our small army, and the conspicuous features of the surrounding country.

BUSTS OF DISTINGUISHED ENGLISHMEN.—M. C. Delpach, a French sculptor, resident in London, has suggested, and is prepared to carry out, if sufficiently encouraged, a project for executing a series of busts of celebrated Englishmen, to be placed in our various public museums and scientific institutions; these busts would be executed by himself, and, according to his plan, he would have them of a uniform size; this may be easily done by his system of reduction, which admits of the most scrupulous fidelity, whatever the dimensions required may be. In his proposed series, his idea is to have them about one-third life-size, as large enough for the purpose of public galleries, and to be made either of bronze, porcelain, or plaster. M. Delpach, since he has been living in London, has executed a reduced copy of the "Clytie," in the British Museum, for the Art-Union of London; of Marochetti's figure of the "Princess Elizabeth," forming part of the monument recently erected to the memory of this daughter of Charles I., in Newport Church, by the Queen; of the bust of the "Prince Consort," by the same sculptor; of Mrs. Thorneycroft's busts of the Duchesses of Kent and of Gloucester; of Foley's "Egeria," and of Monti's bust of "Louis Blanc," with several others. The project

is undoubtedly worth entertaining by those who may have the power to encourage it; for, as the *Courrier de L'Europe* says, in noticing it, that "if such a collection of great Englishmen were formed, not only would the public be able to admire it in our National Gallery, but, by means of duplicates, all provincial museums, libraries, and schools, might possess the same advantages," or at least to such an extent as might be within the reach of the funds at their command.

THE STATUE OF THE POET MOORE was inaugurated in his native city on the 14th of October. It is the work of the poet's namesake, Mr. Christopher Moore, and is in all respects creditable to the theme and to the country. We are preparing an engraving of this statue, and much that we might now say we shall defer until our observations can accompany the print. One of Moore's earliest friends, the Earl of Charlemont, was properly selected to perform the ceremony of "the inauguration;" but the Lord Lieutenant, the Lord Mayor, the Lord Chancellor, and much of the intellectual rank of Dublin, formed "the assembly," by whom the venerable nobleman was supported on an occasion so honourable to the capital of Ireland. Ireland has thus rendered justice to one of the most admirable of her many men of renown. Long has it been her reproach (and certainly the reproach is not undeserved) that she is indifferent to the welfare and the glory of those to whom she has given birth—to be a son or daughter of "the soil" has been usually a misfortune. To be "Irish" is perhaps a drawback in England, but it has been, assuredly, a serious disadvantage in Ireland, where there has rarely been a party, or even "a set," to believe that the distinction of an individual is an honour to the country, and that in the success of an Irishman Ireland participates. We earnestly rejoice that the late proceedings in Dublin will contribute *something* to amend this evil. We are compelled to measure the term, for the list of persons in attendance is very limited, and we recognise few among them with whose names we are familiar as belonging to any party except *the one*. Yet that one does not seem to include a single Roman Catholic of note: there were present but two peers, but one judge, and of either hierarchy none. We have no desire at present to go into this irksome part of the subject; for while there is connected with the ceremonial much at which to rejoice, there is also some cause for humiliation and regret. This ceremonial will not be referred to as presenting features which lead to a belief that in Ireland the present differs materially from the past. There were of course several eloquent speeches on the occasion; and at all events there is in the native city of Moore a statue of the poet. Possibly another generation may see such "memorials" more numerous; and those who work for the fame of their country may hereafter look for posthumous honours on the banks of the Liffey. Meanwhile the poet sleeps in that little grave-yard which lies in a sequestered nook in Wiltshire, very near the humble cottage in which the later years of his life were passed, and where his admirable and devoted wife is calmly waiting the summons to lie beside him.

STATUE OF DR. BARROW.—The marble population of Trinity College, Cambridge,—already, as our readers know, sufficiently distinguished in its examples,—is about to receive an accession in the person of one of its own eminent masters—Dr. Barrow, the well-known theologian and divine. For this work Mr. Noble, the sculptor, has received a commission from the Marquis of Lansdowne; and the model—which is to be executed in Carrara marble—is now nearly finished in the artist's studio; it promises in all respects well.

VIEWS IN INDIA.—The city of the Mogul has always been famous in oriental history, but now it becomes a place of paramount interest to ourselves, as the great theatre of events in which our heroic countrymen are chief actors. Delhi is a subject not likely to be lost upon our spirited panoramic illustrators, to whom the public are so much indebted for communicating form to the descriptions of memorable localities, which are abundantly put forth in the public prints. At the Great Globe in Leicester Square there are three very meritorious dioramic pictures; one of which affords a distant view of the city, another shows a portion of the Chandy Chowk, or principal street, and the third is a view of the palace from the river-side. The point from which

the general view of the city is taken is an eminence, that must be supposed to be somewhere near the British lines. Between the spectator and the red granite walls of the city the space appears to be covered with the ruins of ancient Delhi—a fragmentary wilderness of marble. The picture is treated so skilfully as to show great space: the palace lies to the left, with its multitudinous towers and eucolas, and from the centre of the city rises the grand mosque, Jumna Masjid, where towers a minaret to an altitude superior to that of any other similar erection, we believe, in the world. The course of the granite fortification is conspicuously traceable, and the gates and other striking features of the place are readily distinguishable. The line of the Jumna glistens beyond the buildings, and the distance is closed by a chain of mountains. The Chaudy Chowk was the scene of the slaughter of the inhabitants by Nadir Shah, in 1739; and in the second picture is seen the palace from which he gave the signal for the massacre, by holding up a sword: but the old man was not sufficiently strong to continue the signal, to become satiated with the blood of his helpless victims; he called, therefore, to his aid two black slaves, who sustained his feeble arm, that the indiscriminate slaughter might proceed. The palace of the King of Delhi, which occupies a site said to be a mile square, and inhabited by 12,000 persons, is presented to us from the banks of the Jumna. The contrast of the red granite with the white marble is very striking. The river-side in appearance is an irregular construction of small domes and turrets; beyond the right extremity of the building we see the bridge of boats by which the mutinous Sepoys crossed the river and entered the palace.

THE FRESCOES BY CORNELIUS and his scholars in the Glyptothek, at Munich, which were damaged by the water used in extinguishing the fire that recently threatened the building, have escaped any serious injury. The rooms are again opened, and the pictures are in all their pristine beauty; the slight restoration of gilding, &c., has given new brilliancy to the rooms. A triumphal arch is in process of erection to connect this building with the Pinacothek.

THE MOUSE TOWER, near Bingen, on the Rhine, celebrated as the scene of Bishop Hatto's destruction by the rats, has been recently entirely repaired, the upper part fortified, and a watch-tower added, from which the Prussian flag hangs. This has been done at the instance of His Majesty of Prussia, but it may be questioned whether the lonely old tower, standing in decay, was not more satisfactory to look upon than this semi-antique—"an old friend with a new face" that is not easily recognised.

THE MUSEUM OF OLD GERMAN ART, inaugurated some three years ago in the garden-tower of the old castle at Nuremberg, has outgrown the confined limits of that locality, and a building just without the walls of the town has been accorded to it. It is a singularly curious series of relics that has been gathered here; nothing can better illustrate the domestic life of Germany of the time of Luther than this collection. A similar domestic history of England would be welcome to ourselves.

ALBERT DURER'S HOUSE, at Nuremberg, is at present undergoing a necessary repair, and it is the intention of the authorities of the old city to make it a shrine to his honour, by exhibiting therein specimens of the art of its great inhabitant; for this purpose drawings, woodcuts, and engravings by him are to be procured, and added to what is already secured, by which the truest idea of his great genius may be formed by visitors.

AT MARLBOROUGH HOUSE, which now contains only the Turner Collection and the Vernon Gallery, we have been somewhat startled to find fixed to the gateway a conspicuous black board, containing in large letters the words, "RUSKIN'S CATALOGUE TO BE HAD AT THE LODGE WITHIN." On inquiry, we ascertained that the catalogues thus advertised "by authority," and so under the immediate patronage of the trustees of the National Gallery, are neither more nor less than the little shilling book some months ago printed by Mr. Ruskin, and which shilling book contains *some* remarks upon *some* of the paintings by Turner exhibited in the building. To call the book "a catalogue" is very like a deception; and although the porters may and no doubt do derive a profit from the sale, those who buy it are justified in complaining that they pay for that which

they do not obtain. But this is not the chief ground on which complaint may be urged. It is obvious that to give the sanction of "authority" to a private speculation, and thus to dignify the criticisms of an individual, is a departure from propriety, to say the least, of which the trustees (or whoever is responsible) have not rightly estimated the consequences.

MR. JOHN BELL'S STATUE OF "OMPHALE," executed for the Paris Exhibition of 1855, has been purchased by the Manchester Mechanics' Institution—an act of taste no less than of liberality, which entitles the committee of this society to the highest praise. The marble group of "The Babes in the Wood," by the same sculptor, an engraving of which appeared in the *Art-Journal* some time ago, has been bought by Mr. Fitzgerald. His "Guards' Memorial," of granite and bronze, to be erected in Hyde Park, is rapidly progressing in his studio. And if Mr. Bell is thus receiving the reward of his talents and industry, he knows, too, how to be generous to others, for we hear he has lately presented his marble statue of a little girl, called "The Child's Attitude,"—for which, perhaps, a better title might have been found, though this is of little matter,—to the Artist's General Benevolent Fund, in aid of its funds.

THE SCHEME of a great central "place" in the heart of London, uniting, into one vast area, Trafalgar Square, by a broad bridge, with a proposed open space on the opposite side of the water, is now forming a subject of discussion in the pages of some of our contemporaries. Our readers will probably remember that the matter was mentioned by us more than a year since.

THE LONDON STEREOSCOPIC COMPANY are amply redeeming the promise with which they set out—to supply examples of this wonderful art, of infinite variety, and to meet public requirements by issues at prices ranging from high to low. They have now produced what they term a "stereoscope for the million," at a cost of half-a-crown; but their latest work of this class is a manifest improvement: it is called "The Archimedian New Patent Stereoscope," and is described as follows:—This stereoscope has the strong recommendation of being approved by Sir David Brewster, as conforming strictly to the optical principles by which clear stereoscopic vision is adduced. The improvement is founded upon highly philosophical deductions, not only as to the refracting and magnifying power of lenses, but in assimilating their powers and action by simple means to the conformation and movements of the human eyes. The lenses are so placed as to move in the arc of a circle corresponding to the frontal arc reversed, and the clear combination of the *two pictures* is facilitated by the action of a compound Archimedian screw, whereby the adjustment is effected to the greatest nicety. So simple is the arrangement, that a child will instantaneously adjust the instrument to its sight, without any instruction, in consequence of the refraction of the lenses, by their moving on a radius, being ever adjusted to the proper angle." Among the recent stereoscopic views are a series exhibiting the Art-treasures at Manchester—the building, with much of its valuable and beautiful contents. These are of great interest, more especially to those who have not visited the great city of cotton and pictures. Two subjects, which seem to have attained large popularity, issued by this company are termed "the ghost in the stereoscope." They are singular and striking; one of them more especially, in which a novel effect is produced, by some mode or other, which is properly kept secret, although probably it will soon be sufficiently well-known to induce imitations. A group is terrified by a shadow which stands in a threatening position; it resembles a white film, with something of the human form, and is made exceedingly and "amusingly" effective. We mention but a few of the novelties recently issued by the Stereoscopic Company, but it will be readily understood that the supply is made to equal the demand, and that hundreds of new subjects are issued weekly at the establishment in Cheapside.

SIR EDWIN LANDSEER.—We rejoice to state that this accomplished artist is comparatively convalescent, so much so, as to be able to resume his pencil. This news will give delight to thousands, not only of his personal friends and admirers, but to all who value the high and excellent in Art, and desire to maintain the supremacy of the British School.

THE PRINCESS'S THEATRE has commenced a new "season," and with good promise of a success equal to that which has attended the past efforts of the manager. It is beyond question the established favourite of the public, at all events of that portion of it which can appreciate excellence in every part of the drama; for while Mr. Kean has paid especial attention to its ART, he has neglected no one of its requirements. If he has earned, he has undoubtedly merited, the popularity he has achieved; we trust—and believe—it will be continued so long as this most agreeable theatre is under his judicious and liberal management. The theatre has been entirely re-painted, and is in a condition to sustain its character for elegant yet refined taste. The general tone of the interior is light cream colour and gold. The ceiling displays allegorical figures of the Seasons. The panels under the private boxes present a series of paintings in encaustic, comprising on the Queen's side,—'Falstaff over the Body of Hotspur,' 'Prospero summoning Ariel,' 'Inbert and Arthur,' and the 'Caldron Scene in Macbeth;' and on the opposite side,—'Hamlet and the Ghost,' 'Titania in her Bower,' 'The Trial of Hermione,' 'Richard II. resigning his Crown,' and the 'Vision of Queen Katherine.' Between the panels, extending also round the dress circle, is a series of Shaksperian kings,—John, Richard II., Henry IV., Henry V., Henry VI., Edward IV., Richard III., Henry VII., and Henry VIII.,—all at full length, and very well painted. Mr. Kueckuck has executed the work. The chandelier has been remodelled and improved, and Mr. Telbin has painted a new drop, wherein drapery half open discovers a statue of Shakspeare on a pedestal.

"RICHARD THE SECOND."—A series of very admirable stereoscopic views of groups in this drama, as performed at the Princess's Theatre, has been issued by M. la Roche, of Oxford Street, a photographer who has been eminently successful in the several branches of the art, in portraiture more especially. The series exhibits all the leading remarkable incidents of the play, and the several groupings have been studied with sound judgment; but they are chiefly valuable as so many pictures of costume, for it is unnecessary to say that Mr. Kean has placed beyond dispute the accuracy of his revival in this essential particular. The costume is peculiarly calculated for effective display in the stereoscope; it is highly picturesque, and strongly marked, while the backgrounds and accessories are all of great value as contributions to the history of an eventful age. We have thus another evidence of the value of the art. Long after the theatre has closed, its draperies broken up, and the scenery erased, these records will be preserved, to be accepted, as they may safely be, by the artist who shall hereafter paint the acts or the heroes of the period. Mr. Kean will, therefore, have laboured not alone for his own time, but for generations yet to come, who may benefit by his efforts to do his work "wisely and well." M. la Roche has produced a collection of views more clear and, so to speak, "emphatic" than any we have yet seen. The relief obtained is positively wonderful; while every part of the minutest matter is developed with amazing finish and effect.

CONTINENTAL ART-INSTRUCTION.—Professor Donaldson, who has recently paid a visit to Belgium and the Rhinish provinces, says that "Antwerp, Ghent, Liège, Brussels, and Düsseldorf, has each its well-appointed schools, with first-rate professors in all branches, and directors of the highest eminence. At Antwerp there are 1300 (!) pupils in the Art-schools, preparing to carry the fruits of their teaching and studies into the active purposes of after-life, and who are distributed throughout the various productive classes of the community—some to be devoted to the higher objects of painters, sculptors, engravers, or carvers; others contributing to the embellishment and refinement of the manufacturing industries,—all tending to elevate the taste. I venture to call attention to these striking facts." Comment on such a statement as this is needless; it speaks for itself, loudly proclaiming that if our Art-manufactures of every kind are to be upheld in the commercial world, our Art-schools must rival in efficiency those of the Continent. Professor Donaldson has long been advocating, with earnestness, and, we trust, with some effect, the interests of British Art.

THE OLD HOUSE (No. 96) IN THE STRAND, so long and so usefully occupied by THE ACKERMANNs, is now in the occupation of Mr. EUGENE RIMMEL, the famous perfumer, whose reputation has gone into all quarters of the globe. We allude to this change, chiefly because in its present position it is not destined to abandon Art; we write less with reference to the "fittings up," which are at once tasteful and elegant, than as regards the improvements he has introduced in the vases and bottles which contain the thousand-and-one perfumes of his manufactory. Few persons have visited the Crystal Palace without admiring the graceful stand where a "neat handed Phyllis" vends his far-famed "vinegar;" some idea may be hence obtained of the manner in which his establishment in the Strand has been arranged. But our chief obligation to him arises from the mode in which he has improved the comparatively minor matters of his trade—substituting for the old vial, which contained essence, a neat and indeed elegant vase of glass; it is really "a pretty thing" to keep, after its contents have been used, and, not many years ago, would have been considered worthy to remain on the chimney-piece of a drawing-room as one of its most agreeable ornaments. The buyer pays nothing for this elegance, thanks to Sir Robert Peel, who relieved glass from a most odious impost, the article is fabricated at a singularly small cost; and thanks also to the growing belief that "beauty is cheaper than deformity," people are becoming convinced that they are not necessarily taxed when they obtain that which delights the eye and improves the mind. Mr. Rimmel will no doubt find his account in this, as he ought to do, for he is a large contributor to that advancement in general *taste* which inculcates virtue; as all men are who practically illustrate the impressive truth, that "a thing of beauty is a joy for ever."

MR. GEORGE SCHARE, JUN., the secretary to the National Portrait Gallery Commission, is lecturing at Birmingham, on Italian and German Painting.

THE BURNS MONUMENT, AT AYR.—It is held by many very worthy but unsympathising persons,—and notably by the Rev. George Gilfillan,—that the poet Burns was but a "Ne'er do weel," after all, and such an one as the Church cannot recognise, even in a collection of British poets, without a protest from its own especial point of view. There are others, again,—thousands upon thousands,—who still think the flow of Doon, with its everlasting hymn, sweeter and holier for the memories of Burns that mingle with it,—and do not hesitate to call, with Mr. Robert Chambers, the temple which rises as his monument on its banks "sacred" for his sake. There is no denying, that, to the Church militant, Burns was somewhat of a "troublesome customer:"—and, whether by accident or by design, the Church would seem to have taken a curious revenge. Close by "Alloway's auld haunted kirk," stood the lowly cottage where the poet was born;—and near it a new Alloway Kirk is now beginning to rear its proportions, one of whose effects will be, it seems, to "swamp" the monument which keeps his fame. The men of Ayr have taken the alarm, and sent Mr. Robert Chambers to verify the facts. "The banks of the Doon," he says, "are there of unsurpassed beauty; and enshrined amid the finest of the scenery is the well-known monument of the poet, an exquisite Grecian temple, hitherto seen in all directions around. It is scarce credible, but only too true, that the promoters of a church for the district are building it so close to the monument as not only to disturb the pilgrim visitor with an incongruous idea, but block up the latter building from view in the two directions from which for the most part it is approached. Thus, a pretty place, hallowed with softening memories, and annually a scene of pleasing and elevating recreation to scores of thousands, is threatened with a blemish which must deprive it of three-fourths of its attractions and its sentimental effect."—The walls, he adds, "are not yet two yards high; they might, at no great expense, be removed to an unobjectionable site two hundred yards distant."—The Scottish writer grows warm in behalf of the Scottish poet, and threatens the promoters, if they persist in crushing the Burns monument, with an uneasy life, "anywhere within twenty miles of the Brig o' Doon."—Certainly, we trust, for ourselves, and on behalf of many a reader of our own, that means will be found to compromise the matter.

REVIEWS.

ON THE BANNERS OF THE BAYEUX TAPESTRY. By GILBERT J. FRENCH. Reprinted, for private circulation, from the Journal of the Archaeological Association.

The Bayeux Tapestry is one of those Art-manufactures of an early epoch, which, possessing great intrinsic value as an antiquity of the rarest kind, has also an extrinsic value as an historic monument, second to none of its peculiar nature which have been preserved for modern study. Its history is curious, and though it has been subjected to some rather microscopic cavilling at the hands of a few antiquaries (that body of gentlemen generally being prone to captious criticism), it has stood the test well, and is now fairly considered as the work of Queen Matilda, the wife of our William the Conqueror, assisted by the ladies of the court. It depicts the whole of the events which led to the Conquest, and all the minute incidents that occurred up to the Battle of Hastings. It was a gift to the cathedral of Bayeux, for exhibition at great festivals, when it was hung round the choir. Previously to the commencement of the last century it was completely unknown, except at Bayeux, where it was kept rolled up on a kind of winch, and used once a year as an old hanging on the festival of the relics preserved there. About the year 1724, M. Lancelot found a drawing of a portion of it, among others preserved in the Cabinet of Antiquities in Paris, and he at once saw its value as a picture, illustrative of ancient history. The learned Jesuit Montfaucon was at this time busily compiling his great works on the Antiquities of France, and he made diligent inquiries for the original. In those days it was a much more difficult task than in ours, thus to hunt out the forgotten original of an old drawing; and even now it would be no easy matter to ascertain the locality of such an object, when it was not known whether the original was a basso-relievo, a painting on glass, or a textile fabric. At last it was found to be at Bayeux, and Montfaucon published a copy of the incidents delineated upon it; but it was no copy of the tapestry in the modern sense of the word, inasmuch as it totally lacked *vraisemblance*, and did not give the style and character of the original. This task was reserved for the late C. A. Stothard, eldest son of the more famed Thomas Stothard, R.A., and in the year 1817 he went to Bayeux, and faithfully copied every portion of the tapestry, imitating stitch for stitch some fragments of the work. Upon his return, the Society of Antiquaries, who paid the expenses of his journey, published the whole in a series of carefully executed plates; but they broke down in their laudable labour, and never published any descriptive letter-press. That task has recently devolved on Dr. Bruce, of Newcastle-on-Tyne, who has published an elegant quarto volume, with reduced copies of Stothard's drawings.

It may safely be affirmed, that the importance of this curious work, as a contemporary record of history, has increased with the critical attention that has been bestowed upon it. It depicts many minute facts nowhere else to be found, and it is just that free rendering of a great event that might be expected to come from the hands of persons conversant with its minutiae. The arguments seem to us entirely in favour of the tapestry being the work of Matilda and her handmaidens, to record this great event of her lord, the king, who had made her his own by the roughest of all courtship, scolding her for her coolness towards himself, and then rolling her in the mud of the streets of Bruges, to cure her of her supercilious vanity. She seemed, however, to love him the better for this really "violent" affection; and appears to have been most devoted to him. There is something pleasant in picturing herself and her ladies busy in the palace for long months, plying the needle, to record, as only ladies then could record, the worthy deeds of their masters. The gaunt old figures, with their quaint attitudes and curt Latin inscriptions, told however a striking tale, more useful to the eyes of such as went, on great festivals, to the cathedral of Bayeux, than the pages of the chronicler; all the world could understand the rude tapestry-picture; but how few in those days readers were!

So important an antiquity as this is deserving of every regard; and the greater the amount of investigation it receives the better for its own use and value. Many essays have been written upon it, but they have been entirely devoted to its history and the events it depicts. Mr. French has gone into a new field, and devoted his studies entirely to the heraldic charges which appear on the banners and shields borne by the various figures in this old work. The origin of heraldry is a somewhat vexed question, and any light thrown on its early history is of value. The Crusading era is generally thought to be the birth-time of true heraldic

charges; but there are not wanting instances of something like heraldic bearings on the shields of warriors upon Etruscan vases. Mr. French is inclined to consider that "the banners of the Bayeux Tapestry supply indications of some early and very interesting charges." One most interesting point in his argument goes to prove that the flame-like terminations of these banners had a significant religious symbolism, like the glories around the heads of holy personages in painting; and he is inclined to think that the pile in heraldry represents the termination of such banners. It may be here noted, that the old sacred banner of France—the Oriflamme—was similarly "rayed" at the end, a matter Mr. French has not alluded to, but which strengthens his conjecture. There are many curious facts elicited, and many others suggested, in Mr. French's Essay, which is well illustrated with engravings.

ORNAMENTAL DRAWING AND ARCHITECTURAL DESIGN. With Notes, Historical and Practical. Edited by ROBERT SCOTT BURN. Published by WARD & LOCK, London.

In the compilation of his book Mr. Burn has skimmed the cream off several others of like import, and serves it up in a form that must be palatable to every student of design; but it must be used as introductory to treatises of a more extended character, and for such a purpose it is well adapted.

The examples, amounting to more than two hundred illustrations, are arranged in three divisions—of which the first comprehends four sections, consisting, respectively, of ornament in which straight lines are found; those in which circles with curved lines are used, drawn mechanically; similar ornamentation, but drawn without the use of mechanical aids; and illustrations of ornament as applied to the decoration of textile fabrics chiefly: the second division comprises historical and æsthetical notices of the various principal styles of architecture, European and Asiatic; and the third division comprehends examples of architectural plans and details "for practice."

It is quite evident that much pains have been taken to render this work as comprehensive as the limits of a *cheap book* would permit. The notes generally are short, but sufficiently explicit to serve the purpose of the young student. The illustrations are not of the highest order of Art-work, but, with a few exceptions, as the trusses on the last page, they are well selected as to subject, and correctly drawn. We should take this to be a very suitable book for the pupils of our Government Schools of Art—far more so than many we have seen that are in common use among them.

INSTRUCTION IN ILLUMINATING AND MISSAL PAINTING. By D. LAURENT DE LARA. Published by ACKERMANN & Co., London.

The title-page of this little book announces it as the "second edition, considerably enlarged;" the first edition, which we have never chanced to see, was published, as we learn in the preface, in 1850; and M. Laurent de Lara, who has the honour of proclaiming himself "Illuminating Artist to the Queen," further informs us that "since that period upwards of three thousand pupils have been under my tuition, amongst whom I have to count some of the first nobility of the land." Now we could never have supposed that the art of illumination, beautiful as it is, could have found so large a number of disciples; it is an elegant and interesting accomplishment, but we imagined that the "spirit of the age," to use a phrase in common use, would be entirely antagonistic to work requiring so much patient assiduity, and so much mathematical nicety. Moreover, the illuminator must be, or should be, an inventor—unlike the painter, he must *create* his subject; he cannot take Nature for his guide, and follow her abstractedly through the infinite variety of forms which she places before him—all that he can do is to mould and adopt them to his own purposes, and this involves enough of thought and originality of idea to deter many among amateurs of Art, we should have expected, from engaging their faculties on a process so exacting.

There is no doubt that the art of illuminating has, after lying buried for more than three centuries, risen to life again, both here and on the Continent. While the printing-press was the great means of extinguishing it for a season, so the printing-press of our own day has revived it, through the recent introduction of chromo-lithography: the works of Owen Jones, and Noel Humphreys, with others, in England, and of many artists in France and Germany, have created a taste for its revival, and have, we may believe, aided to bring it into fashion as an accomplishment among those who can thus employ leisure hours; and certainly leisure

hours may be far more unprofitably occupied than in imitating the example of the scribes and monks of the mediæval ages. It is for this class of amateur ornamentalists that the author of this work has, more especially, prepared his book of elementary instruction; its object, he says, "is not so much to enter into any detailed history of the progress of ornamental art, and which becomes a separate and intricate study, than well to smooth down the difficult path of the beginner, to unravel for him apparent mysteries in the art, to give him examples of practical designs to imitate from (*sic*) suitable to his skill; to point out to him clearly and unmistakably such rules as from my experience I have found absolutely necessary to adopt, and if studiously followed up will, in a great measure, assist his first efforts, and enhance his ultimate success and proficiency."

M. Laurent de Lara is, we presume, a foreigner; his errors of grammar and composition may therefore be overlooked, but it would be well for him to get some practised hand to revise the sheets for another edition, should he publish one. His instructions are few, and entirely of an elementary character, but they appear ample for a beginner, and are simple, as elementary teaching ever should be. The notes on colours will be found especially useful; and the few examples of "illuminating" introduced may serve as good studies for the pupil to imitate.

NOLAN'S ILLUSTRATED HISTORY OF THE WAR.

Published by J. S. VIRTUE, London.

Dr. Nolan has now brought his comprehensive and interesting history of the late Russian War to a conclusion. The task cannot have been an easy one, to collect and arrange the vast mass of materials of every kind which, short as was the duration of the conflict, was crowded into the space of time from the first signal of hostility to the final act of the terrible drama; yet in every way has the author accomplished his work satisfactorily, while the publisher has kept faith with the public by issuing it regularly, and keeping it within the limits announced at its commencement. Not an incident worth recording appears to have been overlooked by Dr. Nolan, who has consulted every source from which creditable information was to be derived, and has had ample assistance from many individuals who shared in the dangers and honours of the campaign; hence the narrative may be depended upon for its truthfulness. Like every other historian, the author evidently has his partialities, but they do not lead him to adopt unfair conclusions nor to make *ex-parte* statements, and his style of writing is that which is best known by the word "popular;" it is addressed to the public, yet is sufficiently good to satisfy the educated reader. The two volumes comprising the history contain about eighty well executed engravings that give additional interest to the publication.

Unhappily, the thoughts of every Englishman are now occupied with the events of another war, more direful and more sickening than that out of which we have only just emerged. If anything were necessary to arouse the national mind from any feeling of despondency created by this recent and unexpected calamity, the history of the Crimean campaign would effect the purpose; we see here what the resources of Great Britain, and the courage, energy, and resolution of her sons accomplished; what these did on the shores of the Baltic and Black Seas they will do on the banks of the Ganges and Jumna, on the arid deserts and swampy marshes of continental India. The Russian war, after all, may possibly prove to have produced more beneficial results than the nation ever contemplated. By the way, we see that Dr. Nolan has in the press a "History of the British Empire in India," on a plan somewhat similar to the work he has just concluded.

IONA AND THE IONIANS: THEIR MANNERS, CUSTOMS, AND TRADITIONS. With a few Remarks on MULL, STAFFA, AND TYREE. By W. MAXWELL. Published by T. MURRAY & SON, Glasgow.

Though English tourists are to be found, and in numbers, too, everywhere at home or abroad, within reasonable distances, and very often far out of reach, the western islands of Scotland are but rarely visited. We may say of our travelling countrymen, with Scott,—

"They pause not at Columba's isle,
Though peal the bells from the holy pile
With long and measured toll;
No time for matins or for mass,
And the sounds of the holy summons pass
Away to the billows' roll."

But the "holy pile" reared in honour of good St. Columba is a ruin, so is the nunnery, and all else—

or nearly all, for there are a few interesting antiquities left—which would be likely to attract any large number of those who search about for health or amusement in the autumn months; and Iona cannot show such qualities of the picturesque as would please the many, nor offer such creature-comforts as "comfortable" travellers require; and hence, though in the island "a church was planted, which, small at first, yet nourished by the living waters of the Gospel, grew and flourished until its fame was spread throughout the then civilised world," the spot is still as comparatively unvisited as if it were a far-off island in the Pacific.

Mr. Maxwell has published a brief history of these Scottish islets, but we doubt much whether he will succeed, by his descriptions and illustrations, to draw wanderers thither; for speaking of Iona, the principal one of the group, he says,—"If there is nothing 'rotten in the state of Denmark,' most assuredly there is something very decidedly so in that of the roads here. Throughout Iona, of Macadam and his art the inhabitants are in a state of blessed ignorance. There is not a road, properly so termed, in Iona; the only thoroughfare leading across the island to the various farm-houses and cottages almost defies description, as much as it does the unfortunate wayfarer when he attempts to pass along it. In wet weather, particularly, it is as a 'Slough of Despond,' being then a quagmire of the most yielding nature, absolutely impassable to either man or beast. As to vehicles, they are out of the question." This is not a picture—and we could introduce several more of a similar character—to invite tourists; no wonder they "pause not at Columba's isle!" still, if any have the hardihood to venture thither, by all means they should take Mr. Maxwell's book, which "tells them all about it," neither extenuating nor setting down aught in malice, it may be presumed. The chief object of the writer appears to be to draw the attention of the proprietor of the island, the Duke of Argyll, we believe, so as to make it, what he thinks it might be made, a pleasant place of enjoyment to others, productive to the inhabitants, and profitable to its owner.

DIE MONOGRAMWISTEN. By Dr. G. K. NAGLER.

Published by G. FRANTZ, Munich.

This is the first number containing the introduction to a work which Dr. Nagler proposes shall be a full completion of his Artist's Dictionary, and also contain a rich supplement to it, wherein a great number of artists, under known signs and initials, shall be introduced: he also intends adding to it a monogram lexicon, with a *catalogue raisonné* of the best productions of unknown masters, of whose existence no mention has been made in other writings on Art and artists. Of the known masters who made use of monograms, or of the initials of their names, the text is confined to fixing the epoch at which they lived, full particulars being given in the Artist's Dictionary of their lives and productions. The use of monograms dates, the author tells us, from the middle ages, and was introduced by stonemasons and architects. The key to the art became lost by degrees from the end of the middle ages, as journeymen, in their wanderings, chiselled their signs and marks on pieces of stone, &c., upon which they might have been employed, which accounts for the number of monograms to be met with. The author quotes several works in which examples of monograms are to be found, the earliest being that of M. de Marolles, entitled "*Catalogue de Livres d'Estampes et de Figures en Taille-douce, avec un Dénombrement des pièces que y sont contenues. Fait à Paris, 1672,*" containing 163 monograms. This number concludes with several examples of initial monograms of known and unknown masters.

LETTERS ON CONNOISSEURSHIP. By W. NOY WILKINS. Published by CHAPMAN & HALL, London.

These letters treat briefly of the qualities constituent of good Art, and also of much of the mechanical requisites for its execution, as "The Idea," "Detail," "Concentration and Unity," "Pictorial Arrangement," "Expression," "Colour," "Form," "Style," "Pigments," &c. The author of this little work does not write for artists or the artistic amateur; but for those who may love Art, yet are not skilled in discriminating its subtle qualities. In speaking of the difficulties which beset the path of the rising painter, Mr. Wilkins mentions the middle-man or dealer as one of his greatest evils. The patron, in the majority of cases, purchases through the dealer, to whom he pays at least fifty per cent. on the prices fixed by the painter: the evil of this system has often been the subject of comment in our pages; only this month, in a preceding article, we are again compelled to bring

it to the notice of our readers. And the influence of dealers is increasing rather than diminishing—so few collectors have an entire confidence in their own judgments: and this is especially true in cases where there is wealth without taste or knowledge, and in most cases where the collection is a mercantile speculation. On the subject of hanging works for exhibition, it is urged that all of a certain dimension should be placed upon the line: when that can be brought about it will indeed be the painter's jubilee, but such a boon it is to be feared will never be conceded to the struggling aspirant. Thus we find, in these pages, many useful observations immediately relative to practical Art.

SOYER'S CULINARY CAMPAIGN. Published by G. ROUTLEDGE, London.

While holding, what are called "the joys of the table" somewhat in contempt, we have every desire to cultivate the art, which, humanly speaking, prolongs life by promoting health: and to this art Monsieur Soyer has devoted the best years and energies of an intelligent and observant career. These "historical reminiscences" are the record of his residence and exertions in the Crimea, during the period of our peril and sickness, and when almost every official seemed profoundly ignorant of his duties and resources; but M. Soyer has written his censures with a feather, his good deeds speak for themselves. The volume is sparkling and amusing, full of "hints" on the "great stomach question," and at the end containing a variety of recipes, not only for the rich and luxurious, but for the sick and necessitous. It is pleasant to see the "chef's" sympathy and kindness oozing out without an effort; he appreciates and enlightens. We only wish that his star would rise in the east now, where, we fear, our poor fellows are exposed to much the same mismanagement, in the fearful impromptu war which has struck terror and dismay into all our hearts. Monsieur Soyer never offends our prejudices, or uproots our preconceived opinions with a violent hand, he knows that our boiling and roasting system—the "plain wholesome food" we are so foolishly fond of extolling—wastes half our culinary resources; but he deals gently with us, and shows us the *right* way, mildly suffering us to draw the inference that we have been in the *wrong*! We hope to see the "cookery for the poor" made into a twopenny pamphlet, so that all may be able to obtain it; this will be the greatest of all Monsieur Soyer's philanthropic triumphs, and they are numerous.

THINGS NOT GENERALLY KNOWN. POPULAR ERRORS EXPLAINED AND ILLUSTRATED. By JOHN TIMBS, F.S.A. Published by KENT & CO. (late Bogue), London.

We have to thank this most patient and instructive teacher for another interesting volume; indeed, its perusal proves that it is no idle boast to call it a "book for old and young." If not as full of information as the former volumes, it is simply because there is little more to tell. It is impossible to overrate the amount of labour bestowed upon the compilation, or the advantages to be derived from such a compendium.

DRAWING FOR ELEMENTARY SCHOOLS. By ELLIS A. DAVIDSON. Published by CHAPMAN & HALL, London.

This little manual is published under the sanction of "The Science and Art Department of the Committee of Council on Education;" its author—the head-master of the Chester School of Art, and professor of drawing at the Chester Diocesan Training College—announces it as "specially adapted for the use of masters of national and parochial schools." Mr. Ruskin's system and Mr. Davidson's are, certainly, "wide as the poles asunder;" the one furnishes black-board examples, the other recommends small bits of card and fine steel pens: now are not these extreme methods most puzzling to any one who wishes to find a safe and sure guide to teach him to acquire a knowledge of Art? It seems to us that both are totally inadequate to the purpose; drawing is no more to be learned by causing the pupil to copy the letters of the alphabet in "large Celtic characters, about two inches high," and by making diagrams of snakes, and saws, carpenter's tools, and objects of a similar character, than by scratching flat tints on glazed card-board. Of the numerous elementary drawing-books which have been published within the last ten or fifteen years, how few are there of any intrinsic value to the student; and Mr. Davidson's is not, in our opinion, among the number, though "sanctioned by authority;" besides such a work, even were it good, is uncalled for; a dozen at least, similar in character, have been already published.

THE ART-JOURNAL.

LONDON, DECEMBER 1, 1857.

THE Twentieth Volume of this Work is completed by the present Part: we commence the Twenty-first with the New Year. While the retrospect is cheering, we trust and believe the prospect is not less so: ART has largely progressed in England, Scotland, and Ireland, during the past twenty years. There are now no privileged classes to whom it is an enjoyment from which others are debarred; its advantages may be obtained by all who desire them.

It is a Teacher of the many, and not of the few. Its lessons have been so widely disseminated, that the Artizan and the Villager may command all, or nearly all, the resources which, until recently, were regarded as appertaining to the high-born or the rich.

Those who give consideration only to the Present, and do not revert to the Past, may find much that requires improvement; but a comparison of the two is undoubtedly encouraging and hopeful.

Our Subscribers and Readers will permit us to believe THE ART-JOURNAL has contributed to this advancement. Such belief is, indeed, the best recompence of our labours, although we are grateful for the large amount of support we receive, in the conduct of a Work that has continued during twenty years under the superintendence by which it was commenced, when its resources were far less extensive and its means of aiding progress comparatively weak and few.

Those who have consulted and confided in us so long, will not need an assurance that our efforts will be in no degree relaxed. An examination of the Volume which this Part concludes cannot fail to show we have availed ourselves of every Power that can maintain the position we occupy—alone in Europe. While in the general conduct of the Journal no material changes will be looked for, we may announce several improvements as evidence that we are perpetually striving to keep pace with public requirements, and minister, by every available means, to the wants and wishes of all to whom Art, in any one of its many ramifications, is either a luxury or a pursuit.

THE
ART-TREASURES EXHIBITION.

ITS OBJECTS AND RESULTS.

IN the middle of October last the ART-TREASURES EXHIBITION at Manchester ceased to be a present reality, and was transferred to that wide domain over which history presides. And before the same month had finally closed, the executive committee submitted to the gentlemen who had provided the guarantee fund, a Report of the financial results of the Exhibition, together with certain resolutions which were cordially adopted.

The Report showed that the actual expenditure had exceeded the actual receipts by £1000; and that an additional sum would be required to enable the committee to offer some special acknowledgment for the services of certain officials connected with the exhibition, and also to defray the charges attendant upon the restoration of the Art-treasures to their several proprietors. On the other hand, the exhibition building, which may be estimated as calculated to produce at least £10,000, remains in the possession of the committee. Thus the exhibition will prove to have left the guarantee fund intact, and more than this, to have produced a few thousand pounds in the form of a surplus. The Report, as might have been expected, was considered satisfactory. This sentiment was expressed in the "Resolutions" to which we have alluded. In these resolutions also, the generous liberality of the owners of the Art-treasures was cordially recognised; a justly-deserved tribute was paid to the various individuals who had, in a pre-eminent degree, contributed to the success of the project; and it was further suggested that the surplus money should be applied to the establishment of some memorial of the exhibition. We propose now to consider under what form the Art-Treasures Exhibition, held in Manchester in the year 1857, may be most worthily, and, at the same time, most consistently commemorated. Such a consideration will involve at least a glance at the general subject of the Art-Treasures Exhibition itself.

Unlike the great exhibitions, its predecessors, the assemblage of works of Art at Manchester, in its very title, assumed the loftiest intellectual position. It was composed not of the productions of the industrial arts, whether in their simpler condition or in their highest development, but of such objects only as could be claimed to be entitled "Treasures of Art." From the present age, and from men now living or but lately passed away, this exhibition would accept only works of high Art, and of these for choice specimens alone would there be a welcome. But the past was called upon to open its Art-treasury. The masters in Art who worked, whether with the brush or the graving-tool, in the olden time, were summoned to produce their noblest achievements, that they might be associated with the costliest productions in enamel and the precious metals, and in ivory, and wood, and iron, and glass, and porcelain. It was to be the distinctive characteristic of this exhibition that in the department of Art-manufacture, the objects exhibited should consist rather of authorities than of specimens—of authorities which the past has bequeathed for study, and guidance, and encouragement, rather than specimens of what the present is actually producing. And all these various works of Art—pictures, sculpture, engravings, armour, plate—with their long array of allies, were found to be readily obedient to the summons which called them together. The great centre of modern manufacture without Art, invited the Art-treasures of the kingdom to a grand gathering, and the unprecedented

project was realised with a combined rapidity and success which can have astonished none in so powerful a degree as the very persons who devised the scheme and made the appeal. That Manchester should propose such an exhibition was surprising enough; but how much greater was the marvel that such an exhibition as was actually formed, should have established itself at Manchester! This was not a vast assemblage of manufactures exhibited by those who both made and sold them; on the contrary, the Sovereign, with the nobility and gentry of the land, here concentrated their most prized treasures. Most certainly the projectors of the exhibition deserve all honour for having made their applications in a form so irresistible, while at least equal honour is inseparable from those who were found to be ready to lend objects, so precious and so varied, in such extraordinary numbers.

The grand difficulty of the exhibition might have been considered to have been surmounted when the building was completed, and the various collections had been brought together beneath its roof. Admitting such an opinion to be correct, other difficulties scarcely of inferior magnitude remained to be encountered. All these collections had to be arranged, and when arranged, they had to be explained and made intelligible to the un instructed and the inexperienced in Art; and besides these most serious considerations, the attendance of large numbers of visitors to the exhibition had to be insured. The exhibition itself would, indeed, be sure to attract certain classes of visitors; and these persons, who would not fail to be found within the walls of the Art-palace at Old Trafford, were precisely the individuals who would scarcely need the simplest catalogue to guide and assist them in their inspection and study. Two questions, however, would still remain to be solved,—the one whether Manchester would witness vast gatherings of very different classes, for the purpose of exploring this wonderful exhibition; and the second, whether such visitors, supposing them daily to throng the building, would acquire and retain any permanent impressions calculated to elevate, to refine, and practically to improve them? For this is the only true and consistent "memorial" of such a grand mustering of the Art-treasures of Britain,—that it should exhibit the practical tokens of its beneficent working in a more true appreciation of Art, and a more faithful application of Art, as Art, first in Manchester itself, and then throughout the length and breadth of the land. But we can scarcely indulge in the hope of witnessing the realisation of such a memorial. The Art-Treasures Exhibition has proved the practicability in this country of a project which elsewhere it would be the very wildness of enthusiasm even to desire. It has shown how rich we are, as well in treasures of Art, as in the liberality of those who will lend them for public exhibition. It has brought very many persons to Manchester who doubtless were in no slight degree surprised to find themselves there; and it has caused no less surprise to very many persons in Manchester that such things should be called Art-treasures, and being so called, should be so highly prized. And, having succeeded in realising a few clear thousands, the fact of the exhibition itself having once really existed, will be kept alive in Manchester memories, by means of some visible exhibition-memorial. But will Art be better understood at Manchester in 1858, and more duly appreciated, than it was in 1856? In years to come will Manchester manufactures show, in their fairer aspect, that the sunshine of Art has been diffusing its invigorating influence in the midst of them?

We have all along regarded the Manchester Exhibition with watchful, and also with anxious,

eyes. While it remained uncertain whether, in a strictly Manchester sense of the term, it might not prove a failure, we urged the national disgrace that such a result would produce; and when, as the days of the exhibition began to be numbered, we perceived that the number of visitors was gradually augmented, until the building was daily filled, there were none who regarded the altered aspect of things with more sincere gratification than ourselves. And yet we have never been able to persuade ourselves that, in the noblest acceptance, a success would be achieved. We have not felt, we could not feel, that Art really was *at work*, on a scale before untried, and with energy before never called into action. And to the very day which witnessed the close of the exhibition, we found it impossible to divest ourselves of the impression that there was a want of harmony between the exhibition itself and the locality in which it was formed. We have no special sympathies for centralization, nor do we desire to bring everything to London; but it is evident that in London alone could a national Art-Treasures Exhibition be really triumphant, because there alone it could be both understood and made intelligible. And who does not share with us in this conviction? None, certainly, but they who believe that at Manchester the Art-treasures there assembled exhausted their faculties for teaching.

One circumstance which, in the most powerful degree militated against the successful working of the Manchester Exhibition, as the greatest instructor that ever gave a lesson in England, was its own excessive excellence. This, at the first, may appear a somewhat paradoxical statement; on reflection, however, it will be discovered to be most strictly true. The exhibition was overwhelmed by its own splendour, its own grand richness, its own amazing variety and comprehensiveness. There was so much to be seen, that there was no time for studying. It was difficult even to look at all that might justly claim equal shares of attention; and in developing such a system of administration as alone would enable intelligent visitors to make the most of a few visits, or even of a single visit, and would so guide inquiring visitors that they might at least master something, the authorities failed absolutely. They were great with their guarantee,—they were more than successful in the formation of their exhibition; but here they came to a halt. From before the opening of the exhibition, it was clear that the *working* of their enterprise would prove too much for them; and in this all-important respect,—that they would not gather around them the cultivated intellect and the refined taste of the kingdom, in order that through such an agency they might work out the teaching of their Art-treasures. They had not an idea of anything of the kind. They had brought together those marvellous collections, and they were content with what they had done. Had any others besides themselves done as much? Wherefore, then, should they seek for farther aid or wider co-operation? Why tax themselves with the task of teaching people *how* to look at the exhibition, or of imparting to the exhibition itself the auxiliary faculty of conveying and impressing manifold lessons in Art? Wherefore should they undergo the burden of a widely extended courtesy, or the cost of a no less enlarged hospitality? Indeed, why do more, after the exhibition had been actually formed, than advertise it and take the visitors' shillings? This was the course which was carried out to the very letter. The exhibition was left to work as it best might, without any agency for working. The authorities and directors of the exhibition did not even attempt more than the production of catalogues, which visitors would be sure not to read, or which, when read, would do little more than either

awaken a curiosity that could not be gratified, or increase a perplexity already sufficiently distressing; and all aid and co-operation from beyond their own narrow circle were kept resolutely at a distance. Men of learning and of high reputation in Art, instead of a cordial and a glad reception, were not received at all, even when they volunteered their presence and their services. The few eminent persons who were necessarily invited to take a part in the preliminary arrangements, congratulated themselves when their duties had expired; and quitted Manchester with no very elevated idea of either its refinement or its hospitality. And now, in looking back upon this magnificent school of Art, the first impression that strikes the reflective observer, is the success with which its managers contrived to sever it from artists, and from all who are learned and experienced in Art. Neither can it be forgotten how "the public," when they visited the exhibition, were left to themselves to make of it what they could. Had it been definitively arranged that the collections should teach as little as possible, they could not have taught much less to the mass of the visitors. And now these things show their recoil. Already it is felt that the great lesson which Manchester has taught, is the total unfitness of Manchester for such an exhibition, and of such an exhibition for Manchester. We believe it to be an inevitable inference from such a conviction, that the organisation of a similar undertaking in London must be admitted to be an actual and an urgent necessity.

Possibly it may be considered by some persons, that the *teaching* of an Art-exhibition is but a secondary matter after all. Such persons would be content to leave the various visitors to draw for themselves their own inspirations; and those visitors who are content to look at such an exhibition without one thought of deriving from it any permanent impressions, they would permit both to come and to depart without bestowing upon them any farther trouble. This may have been our practice; and possibly it is this very practice that has placed us in our present position in the matter of Art. It is but too true that we have formed exhibitions upon principles which we have not cared to elucidate; and when we have collected worthy objects, and have worthily arranged them, we have considered our work done, without even placing labels upon the picture-frames. And as to such a system of criticism as would really *apply* our exhibitions to any higher purpose than mere passing amusement, we have not even contemplated attempting any such thing. But the great gathering of the Art-treasures was to have inaugurated a better state of things. There nothing was to be admitted which was of the second order of merit; there such arrangements were to be displayed as would impart a fresh and an energetic impulse to the collections themselves; there also it was to be shown that an Art-exhibition had a high and a noble purpose—nothing less, indeed, than the refinement of the national mind. It was in the power of the directors of the Manchester Exhibition to have realised all these admirable objects; it was in their power—that is, if they had chosen to adopt the only practicable means for attaining to such results. The grandeur of the exhibition may not be permitted to dazzle us when we take a retrospective review of what, in true reality, it was enabled, or rather was permitted, to achieve. In the first place, the mixed character of the collections themselves now comes home with painful associations to the mind of the candid and discriminating observer. Treasures of Art of priceless value were made to form incongruous alliances with many things which had no pretence to be considered treasures in any respect whatsoever. The collections, again,

were unnecessarily, and therefore inexcusably imperfect. The aim was to illustrate Art throughout the successive phases of its career. This was fairly well done with the drawings, and was well attempted with the engravings, but in the oil-pictures both artists and schools were far from being adequately represented.

And what are we to say respecting the arrangements? The old system of wearying monotony of lines was carried out with unsparing rigour. Grouping, except in unbroken continuity, was altogether disregarded. The object was to hang up rows of pictures, instead of bringing together the works of a great artist, or of some distinguished school, distinctly by themselves, and with void spaces around them. There were plenty of pictures which might have been spared, to produce the uncovered wall-spaces. And every picture (we cannot repeat it too often) ought to have been distinctly labelled with its subject, the artist's and the proprietor's name, the school of Art to which it might belong, and the period at (or about) which it was painted. The glass cases, with their truly wonderful contents, so far as the greater number of the visitors were concerned, might almost as well have been filled with artificial flowers. So completely were they wanting in even a good general classification, and so absolute was the impossibility for any persons not previously familiar with them to discover even what these cases contained, that it is unquestionably the fact that the finest collection ever formed of Art-manufactures has been dispersed without leaving any practical traces whatever of its having ever existed.

Thus it is common to find persons who consider that they studied the exhibition with care—educated and intelligent persons also—by whom the contents are regarded and spoken of as having been simply a collection of pictures, of different classes, in different styles. They have no idea that it was ever intended to extend the title of Art-treasures to the contents of the cases which they remember to have filled up certain parts of the central area of the building. They had no previous taste, as the phrase is, for "curiosities;" and there was nothing to impress upon them with any special interest in collections, which they would naturally regard in such a light. Nor was it much better with those visitors who were predisposed to regard with interest precisely such collections as had been brought together within these glass cases—unless, that is, they were familiar with and understood them well before. The extraordinary character of these collections, consequently, was lost, except to the initiated few; and now that they are dispersed, it can be only by a few that their worth will be remembered, or even their treatment lamented. When these collections were formed, the object must have been to have shown in them the most perfect illustrations of Art under manifold forms of expression; and hence to have conveyed to the student of Art the most diversified, as well as the most valuable, teaching. How deplorable, therefore, the result, that, because there were none at Manchester who could deal with these "Treasures" of Art as Teachers of Art, they should have so signally failed to do what they possessed the power to have done so thoroughly! All these considerations—these examinations into the results of the different departments of the exhibition, taken in connection with the remembrance of the objects with which the various collections were formed—these things lead us to sum up, in a single question, our reflections upon the teaching of this truly great exhibition—for in this instance, at least, an exhibition was formed for the express purpose of being a teacher—What has it done? The question is best answered by putting another—What could it do? The exhibition itself was capable of conveying, with commingled

authority and attractiveness, precisely the instruction in Art which at the present time is so urgently needed. It could have at once exemplified and impressed the fact of the universal applicability of Art, and the never-failing advantage of its consistent influence. It could have demonstrated both the consistency and the salutary operation of that law of excellence,—that manipulative dexterity and skill must be subordinate to the faculties of invention, and thought, and design. It could also, under peculiarly favourable conditions, have conducted the study of design through the comparison of similar works as they were produced at different periods. The works, of whatsoever kind, which past ages have preserved and transmitted to ourselves can only develop their full instruction through a comprehensive comparison. And the intelligent and thoughtful student, with the means for such comparison placed before him and pressed upon his attention, will thus trace out for himself a course of action which will be sound, because based upon authority, and at the same time free to expatiate beyond the control of arbitrary systems. We stand greatly in need both of such means for study, and of such study as will elevate the character of the designs which are produced in our manufactures. It is true that much has been accomplished upon this very point, and that even more is diligently sought after; and yet we are improving in design for manufactures more in treatment than in character; we deal too exclusively with the teaching that lies within a narrow circle, forgetting that Art expands its instruction over a wide range, as well of time as of subject, and that the wise student of Art will gather together for his improvement all that is really noble and truly excellent. Has Manchester, from her Art-treasures, treasured up for herself, and also for us all, those principles of Art which will raise the head-work of our manufactures to its rightful supremacy over the hand-work—principles from which really improved designs may be developed, and a higher tone in Art-feeling be established? When they reflect upon what their exhibition has really done,—when, after their own practical, and, therefore, sensible fashion, they weigh the results of their enterprise,—what will the Manchester merchant princes find in their hands besides the comparatively trifling balance at their bankers? They will not be content to count the number of visitors, and say 1,335,915 persons came to our exhibition,—for they cannot but know that it is not a throng of admiring gazers at pictures which rather bewilder them, or at statues of which they are somewhat suspicious, that constitutes a “successful result” from a great exhibition such as that at Manchester. There must be something permanent—something which will affect after times—something to which an appeal may be made as to a happy and a beneficial influence. A pillar or a statue, or even a public institution connected with Art will be of little avail at Manchester as a “memorial” of the exhibition, unless there be also, everywhere present and always in operation, some practically beneficial agency directly deducible from the exhibition itself. And it is here that we fear the exhibition will be found wanting, through the inefficiency of the system upon which it was administered.

The true aim of such an exhibition should be to kindle nobler sentiments, to teach men to observe with thoughtfulness, to lead them to the appreciation of all that is beautiful and admirable, and thus to induce in men’s minds the determination either to impart beauty to the works of their own hands, or to cherish beauty in what other men may produce as a source of peculiar delight. But such sentiments and impressions will not arise from the mere inspection of collections of beautiful and admir-

able things. Beauty and excellence depend upon many subtle principles and latent combinations, besides being in some of their aspects patent even to the casual observer. And all this requires to be taught: at any rate, it is necessary to point out both that these things need to be studied, and the manner in which they may be studied with success. Again, men in general have very confused, and also decidedly abstract, ideas of beauty and excellence. They require to be led to the recognition of that beauty which dwells in felicity of association, and of that excellence which is produced from fitness of adjustment. They need to be trained in the modifications to which abstract beauty must be subjected when applied to human productions; and, at the same time, the lesson ought to be taught, and it may with ease be taught to them, that all human productions may, in their degree, be brought into harmony with all natural productions, through their possessing an appropriate beauty. The glass-cases at Manchester had much to say, and much that was well worthy of attentive hearing, on the subject of appropriate beauty: and, more than this, these lessons of theirs were of that eminently practical character which most readily comes home to the actual worker with the hands. But, how many, or rather, how few of the men who work with their hands have carried away from the Art-Treasures Exhibition such stores of precious teaching, as will constrain them to aim higher than heretofore, and will empower them to accomplish what before they never would have contemplated? These are the “memorials” which such an exhibition ought to establish—memorials, worthy of itself, and which might have been built up upon a strong foundation in our greatest manufacturing city.

Whatever the shortcomings of the exhibition that now has closed, and has dispersed its collections, it has not left us without both clear and forcible admonitions for our future guidance. We have learned, from what this exhibition has not done, how to deal with what it has left to be hereafter accomplished. We now understand that an Art-Treasures Exhibition closely resembles an army in the field: it is not enough for it to be composed of good materials, unless the good materials are well handled. And so, when we look forward, and would sketch out amidst the shadows of the future a gathering together of the Art-treasures of England at London, we assign positions of the first importance in our picture to those arrangements which will ensure for the future exhibition a masterly administration. Art and artists there will be associated in a noble confederacy. Every object exhibited will have its own peculiar office to discharge, and it will be placed in precisely the position which will best enhance the value of its teaching. And all who are most distinguished in the practice of Art, in Science, and Literature also, there will find an honourable recognition, and through their instrumentality the teaching of the assembled Art-treasures will be accomplished. This is no visionary phantasy, but a sober anticipation of a great reality to come.

Meanwhile, we return again to Manchester; and while we regret that its exhibition certainly has not effected what it ought to have done, and might have done, we would strive to exalt to the utmost its actual results. Those who went for the express purpose of study, and who were able to search out for themselves that mine of intellectual wealth, know well the value of the Manchester Exhibition. It is at Manchester itself that we desire to witness corresponding impressions. The exhibition was not formed at Manchester simply because it is a wealthy, a populous, and an important city: on the contrary, Manchester was specially selected for the exhibition, with a view to the special

effect that the exhibition might have on Manchester. This effect, whatever it may prove to be, will in a great degree be measured by what their exhibition will have accomplished for the merchant princes of Manchester. By their example the population of their city and neighbourhood are necessarily influenced. Their impressions are sure to be widely communicated and keenly felt. And these gentlemen have taken a personal and a prominent part in this exhibition: they have visited it frequently, they have become familiar with its contents, and have enjoyed abundant means for gathering from it the richest stores of intellectual advancement. By giving evidence of having made such advance, they will most effectually erect a worthy “memorial” of their wonderful exhibition,—by showing that they have felt its influence, as well as been proud of its presence; and that they have imbibed its spirit, as well as guaranteed its solvency. It may indeed be well to apply any surplus fund to the establishment of some institution, in which Art may be taught at Manchester in its purity and its simplicity,—in its comprehensive spirit also, and its essential nobleness. Some institution of this kind might have been invaluable, as introductory to the exhibition of the Art-treasures. It will be inverting the natural and rightful order of things that the lesser good should arise from out of the greater; yet we may be glad to know that thus it will be. We may be content, and more than content, should the experience of this year prove to have wrought in Manchester the twofold conviction—that Art is a great principle, worthy of diligent, thoughtful and sustained study, and that without such study, Art cannot be truly understood. The teacher is indeed gone, and the eloquent voice can now be no longer heard: perhaps, while yet speaking, that voice failed to command attention with adequate impressiveness. Still, memory and reflection may do much. The very consciousness that grand opportunities have been treated with even comparative neglect, will sometimes arouse a spirit of inquiry unknown before. Thus, from what would have appeared profitless, a direct benefit may be deduced. It would be most sad were the Art-Treasures Exhibition to prove profitless to those who might and who ought to have gathered from it the more abundant profit; but any such sadness would at once give place to a happy hopefulness, were it to become apparent that the remembrance of this magnificent assemblage of works of Art had persuaded men to reflect concerning Art, and to desire to know what Art is, and what she can teach them. If it be thus, the Art-Treasures Exhibition will not be left without a noble record and a worthy “memorial” of its existence.

THE

SOUTH KENSINGTON MUSEUM.

THE first condition of success has already been realised by this museum,—it has rapidly attained to a high degree of popularity; and now the time has come in which it must establish its claim to the continuance of this popularity by demonstrating its practical usefulness: for the collections which have been brought together for the purpose of forming this museum have a much higher mission than the mere passing amusement of even admiring observers; they have to teach as well as to amuse—to convey information as well as to attract attention; and this teaching office of these collections is to be characterised by the most decidedly practical effects. If it produce any results at all, these results are to show themselves in what they do towards achieving the great work of national intellectual advancement.

It is to be hoped that the altogether unprecedented success which has hitherto attended their operations, will prove to have impressed on the directors of this institution the importance of the duty which de-

volves upon them, of wielding so powerful an agency with an earnest purpose, and also with a strong hand. They have proved their ability in conducting the preparatory stage of their great enterprise. We trust that, having thus far shown themselves to be masters of their position, they will be found fully competent to carry out their own plans, and to lead into action their own forces.

Many are the difficulties which surround the attempt to convey to the mass of the community, or even to particular portions of the community, a higher and more cultivated information than they already possess. Men may be conscious of their want of precisely such an accession to their present intellectual possessions; but they too generally shrink from admitting the existence of such a want, and consequently they are prone to neglect the means for supplying its requirements. This difficulty, however, will not have to be surmounted by the South Kensington Museum in its capacity of a public teacher. The want of precisely such teaching as it professes to provide, is on all sides admitted; and more than this, on all sides there is apparent an ardent longing for that form of instruction, over which Art will preside as the chief instructor. So far, therefore, the ground is open to the museum. Neither has it any rival with power either to divert its energies, or divide its success. We have no other public and popular Art-school formed on a broad principle, and capable of extended and effective action. The Crystal Palace, indeed, might accomplish great and noble things as an Art-teacher, but the directing powers there seem to prefer to leave all such teaching to be gathered from their vast stores by inference, or to be imparted by them through some happy chance, to adopting any definite course of direct and systematic Art-instruction. Not so, however, with the authorities at South Kensington. They have put forth announcements of a comprehensive scheme for teaching through the two great media of lectures and classes. Before these lines are in the hands of our readers, the plans for these lectures and classes will have been completed: as we write they are so rapidly advancing towards completion, that we may now deal with them as if already in their complete state. It will be kept in remembrance that, besides those collections which actually are integral components of this museum, as being the property of the Government in their capacity of national trustees, several other collections of the utmost importance have been brought to this same museum by the societies to whom they severally belong. In framing their first series of general lectures, the directors of the museum have very wisely determined to give one lecture upon each department, and its special teaching, before they enter more fully upon what each department may be expected to develop. This general course will be followed up by the several departments themselves with more detailed courses of their own: and thus the teaching capabilities of the museum will be at once made known, and a very simple and yet most efficient plan for actually conveying instruction will be commenced. And besides these lectures, classes are formed for carrying out into much more minute detail, the educational system. The great principles set forth in the lectures, in these classes will be dealt with in the fulness of their applicability to the most varied incidents and conditions; and the students will thus be trained thoroughly, and always with a view to their practical application of the studies which they may pursue.

The Sheepshanks Collection of pictures, so munificently presented to the nation, is to form the subject of a lecture by Mr. Redgrave, R.A. This lecture will not only be in itself interesting and valuable in the highest degree, but we are assured that its interest and value will be infinitely enhanced from the inevitable result, that it will open the way to a new condition of things in the conveying popular instruction in the art of painting. Everybody wishes to possess some knowledge upon a subject so popular as painting; everybody wishes to be considered to know something already about painting. But how few there are who are in any degree satisfied with what they are conscious of knowing on this subject, or who are at all better satisfied with the ordinary sources from which they derive their scanty information. They want such things as this lecture of Mr. Redgrave's will be found to be, and such things also as this lecture

will be sure to produce in sufficient abundance and in continual succession. The same may be said of the other lectures of this course by Mr. Cole, Mr. Fergusson, and their colleagues: each lecture will prove to possess a twofold value, in what it actually teaches, and in the teaching to which it will prove to be the introduction. Mr. Fergusson has undertaken to conclude the course with a lecture upon architectural museums, and their value as teachers. The Architectural Museum which forms so valuable an accession to the South Kensington collection, is prepared to fulfil its own duty in its teaching capacity. The committee of management have in preparation a far more important series of popular lectures upon the subject of architecture than has ever been before open to a public audience; and besides these more regularly organised addresses, they propose that there should be constantly delivered in their gallery, when it is open in the evening, a brief and plain class-lecture upon the contents of the museum itself. This plan we earnestly commend to the thoughtful consideration of the directors of the several departments of the entire museum. We believe that such addresses are pre-eminently calculated to give effect to the collections themselves, to establish their value as instructors, and thus to perpetuate while strengthening their popularity. We have not observed any proposal from the British Sculptors' Institute to impart vocal powers to their excellent group of casts at this museum. Sculpture needs every possible means for securing an adequate recognition amongst us, through its being made to be better generally understood and appreciated; and we consequently rely upon the opportunity here presented for popular teaching upon this great form and expression of Art being neither neglected nor disregarded. On a former occasion we noticed the commencement of the formation of a collection of engravings and etchings of different classes in this museum: here is another field for Art-teaching as yet unworked, but abounding in precious materials. The porcelain, and other fictile collections, also have their own tales to tell, their own instructive lessons to impart. In the same manner might we particularise many other special forms under which practical Art-teaching might be made to convey most valuable instruction, through the agency of this museum, in addition to the more immediate schools of Art now in operation under its roof. We propose to observe with anxious, and also with hopeful vigilance, the working of this museum throughout its entire range of operations, and we trust continually to be enabled to record that it is working in earnest, in a right spirit, with a comprehensive aim, and with encouraging success. That it will succeed we doubt not.

There is one point bearing directly upon the Art-teaching of this museum, upon which we would speak a few earnest words; and this is, that no narrow-minded exclusiveness be permitted to impart a restricted, partial, and partizan character to Art, as here it is regarded and dealt with as a teacher. There is by far too much of party to be seen and to be felt in our present dealings with Art, in our Art-study, in our Art-criticism, and also in our very love and admiration for Art. One form and aspect of Art is too commonly set up, not for admiration because of its own higher excellency, but because of its special antagonism to some other expression of Art. All this is alien to the comprehensiveness of true and truly noble Art: it is also a powerful obstacle to advancement in the knowledge and the feeling for all that is true and truly noble in Art. We do not advocate any indifference or any generalising spirit in the study of Art, but we do urge the suppression of all party views and party hostilities. Let Art be taught and let Art be studied upon the broadest principles, and with the most comprehensive views. Let all excellence be diligently sought out, and all mediocrity be no less diligently avoided. We are seeking a higher refinement, coupled with a more worthy practice, through a better knowledge and a more extended experience: we must, then, shake off whatsoever must inevitably militate against our success, no less carefully and with no less resolution, than we must be anxious to adopt, and ready and determined to work out, the fresh means which now are opening before us for rendering our success at once more sure and more complete.

THE ROYAL PICTURES.

EVENING IN ITALY.

T. M. Richardson, Painter. E. Goodall, Engraver.

Size Picture, 3 ft. 3 $\frac{3}{4}$ in. by 2 ft. 1 $\frac{1}{2}$ in.

SOME pictures there are whose titles, like those of some books, are a favourable introduction to general notice; they possess in their names an attractiveness which induces one to look into, or after them, as the case may be, when otherwise they would pass without observation. Granted that neither the title of one nor of the other is any criterion of its merits, still it is natural to expect enjoyment or amusement from what a work promises in its name: it intimates something pleasing to the taste or fancy, and this in itself becomes a recommendation.

What, for example can be more suggestive of a scene of picturesque beauty than "Evening in Italy?"—the imagination instantly conjures up a vision of lake and verdant mountain, palaces, ancient ruins, vineyards, and forests, which, though the eye sees them not, the mind arranges in the order of its own fancy, and paints with the glowing colours of its own pencilling. With what true poetic feeling Byron expresses his recollection of one of these Italian evenings:—

"The moon is up, and yet it is not night—
Sunset divides the sky with her; a sea
Of glory streams along the Alpine height
Of blue Friuli's mountains; heaven is free
From clouds, but of all colours seems to be
Melted to one vast Iris of the West,
Where the day joins the past eternity;
While on the other hand, meek Dian's crest
Floats through the azure air—an island of the best."
CHILDE HAROLD, Canto iv.

Gilpin, in his "Remarks on Forest Scenery," makes an observation, the truth of which we have often felt when contemplating a certain class of pictures. He says,—*"Landscape painters, in general, pay too little attention to the discriminations of morning and evening. We are often at a loss to distinguish in pictures the rising from the setting sun, though their characters are very different both in the lights and shadows. The ruddy lights of the evening are, indeed, more easily distinguished, but it is not perhaps sufficiently observed that the shadows of the evening are much less opaque than those of the morning."* A little further on he says,—*"It is a doubt whether the rising or the setting sun is more picturesque. The great beauty of both depends on the contrast between splendour and obscurity. But this contrast is produced by these different incidents in different ways. The grandest effects of the rising sun are produced by the vapours which envelop it; the setting sun rests its glory on the gloom which often accompanies its parting rays. A depth of shadow hanging over the eastern hemisphere gives the beams of the setting sun such powerful effect, that although in fact they are by no means equal to the splendour of a meridian sun, yet, through force of contrast, they appear superior. A distant forest scene under this heightened gloom is particularly rich, and glows with double splendour."*

Mr. Richardson's picture, entitled "Evening in Italy," is a composition, but it has all the character of a reality; the scene is very beautiful, and the subject is painted with exceeding delicacy, yet with a remarkable firm pencil: in colour it is rich and glowing. Behind the red and purple hills in the distance golden clouds "float through the air," the whole being thrown far back by a line of deep purple shadow stretching across that part of the landscape where the ancient villa is a prominent object: the mass of trees which come down almost to the edge of the lake is of a warm subdued green; this is repeated in the water till it imperceptibly blends with the reflections of the sky tints, which are cool towards the base. The foreground is warm, but shows no positive colour that obtrudes on the eye. The figures are capitably placed and well drawn.

The drawing was purchased by Prince Albert, in 1852, from the Gallery of the Painters in Water Colours, of which the artist is a member and a valuable contributor to its annual exhibitions. It is in the Collection at Osborne.

LEAVING IN THE MORNING
FROM THE BOAT IN THE BOAT

THE END OF THE WORLD

RAFFAELLE IN ROME,

BY F. W. FAIRHOLT, F.S.A.

THE ILLUSTRATIONS FROM ORIGINAL SKETCHES BY THE AUTHOR.

We consecrate the memory of great men, and when the master-spirit has flown to Him who gave it, is it not pardonable—aye, laudable—that we treat reverently the relics of their sojourn here—that we make pilgrimage to the homes they once inhabited—that we endeavour, as best we may, to call up to the mind's eye the very habit and manner of the great souls long departed, and let the mind linger over their earthly haunts as if awaiting their presence again to revivify the scenes made sacred to us by such connection? There is, perhaps, no spot of "mother earth" more abounding with associations of all kinds, to interest men of every civilised country, and induce many hundred pilgrimages, than those few miles of ground upon which stands Rome, that imperial ruin in a papal garb:—

"We cannot tread upon it but we set
Our foot upon some reverend history."

The mind is here overwhelmed by the crowding memories of the great events of hygone time—"centuries look down upon us" from the ruined Colosseum—from the ivy-clad masses of wall where once stood the palace of the emperors of the world. These arches record their victories and their triumphs. This dirty, ill-enclosed space, now named from the cows who rest upon it after dragging the rude carts of the peasantry into Rome, was once the Forum—the very focus of all that was great in the whole history of the old world:—

"Still the eloquent air breathes—burns with Cicero."

On this small patch of ground occurred events which form the most cherished memorials of history. Around us on all sides are the crumbling mementoes of the great of old, whose presence stirred the nations. The very fragments—the shadows of a shade—of their past greatness have been sufficient to revivify the human mind after many ages of mental darkness; and the long-buried works of the old Romans, in the palmy days of Michael Angelo and Raffaele, quickened the genius of their great minds, guided their thoughts aright, and ultimately led to the purity and nobility of modern Art.

The great revival of learning in the fifteenth century led the student back from the legendary history of the middle ages to the more ennobling study of the classic era; and this acquaintance with the acts of the great led to the desire to possess more tangible relics of their period. Hence coins and medals were sought after, not merely as works by ancient hands, but as authentic records of their history, rendered the more valuable by their autograph character. Inscriptions were sought for the same reason. Statues were untoned, and gazed at in wonder, for the truth and beauty of their proportions, as contrasted with the gaunt conventionalities of their own schools of sculpture. Men regarded these works as the productions of superior beings; but such contemplation resulted in elevating the minds of the students, and slowly, but surely, the long-lost Arts broke in full radiance from the clouds which had so long obscured them.

It was in these great days of resuscitation that Raffaele lived. The popes and the nobles vied with each other in obtaining the best works of ancient Art, and liberally rewarded the discoverers.* Lorenzo de Medici, well distinguished as "the Magnificent," made his palace at Florence a museum of Art, and liberally gave free access to all students who chose to come there. Michael Angelo was of the number

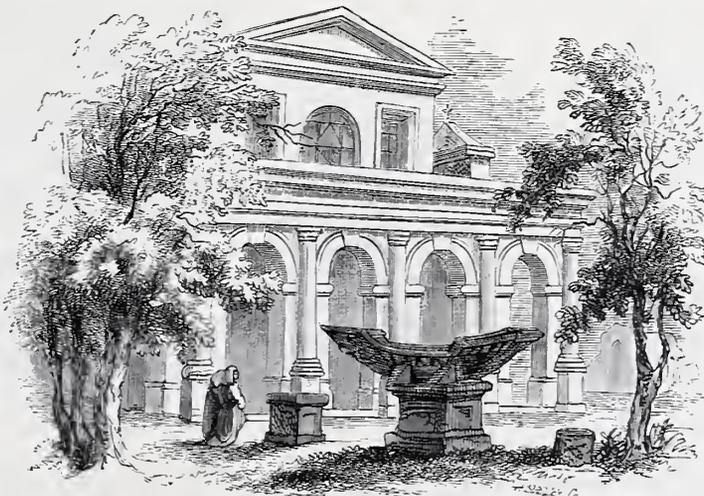

* Felice de Fredis, who discovered in 1508 the celebrated group the Laocoon, in the Baths of Titus, had bestowed on him in consequence, by the Pope Julius II., the lucrative gift of the tolls and customs received at the Gate of St. John Lateran—an ample fortune in itself. Michael Angelo, who was in Rome at the time, describes the excitement the event caused. By a happy omen had his god-fathers named him *Felice*. The gift was so large that the

who studied in the beautiful garden where the sculpture was located, and the great duke often spoke encouragingly to the young lad who laboured there so thoughtfully and so well. Words led to deeds, and it was not long afterwards that the duke adopted Michael as his *protégé*, gave him a room in his palace, and was the friend of him and

RAFFAELLE'S FIRST RESIDENCE, ROME.

his family, death only severing the tie. Many other artists had to thank the liberal duke for the use of his Art-treasures, and Raffaele was among the number. The Cardinal Bembo, one of the most enlightened men of that day, rivalled the hospitality of the Medici, and received Raffaele into his palace as a honoured guest;—and are not the names of both noble

THE CHURCH OF ST. MARIA IN SATICELLA.

men more nobly immortalised by such patronage? The early life of Raffaele was happily circumstanced. His father was himself an artist, who saw

Church of St. John importuned the succeeding pope to compound with him for its restoration; but he only gave it up for the noble place of Apostolic Secretary, which he enjoyed until his death in 1529. He lies buried in the left transept of the Church of the Ara Coeli. The inscription on his grave-slab is nearly obliterated. Is there no kind hand in Rome, the city of sculptors, to recut the few lines recording the name of one who did the world of Art much service?

his son's great genius, and fostered it from the birth. The child's early life was passed in a lovely home, rendered cheerful by the practice of refined pleasures, the only labour known there being the cheerful toil that awaits the student of Art. Of pleasant manners and agreeable looks, the boy-artist made friends everywhere, and the record of his whole life is a narration of the accession of new friends. In the Italian cities where he went for study he made warm friendships with the best and greatest in Art and literature. It rarely falls to the lot of a biographer to narrate a life of such unvarying happiness as that of Raffaele. Pleasant and profitable as this genial study and companionship would naturally be to the young painter, whose devotion to Art never relaxed, and whose patrons increased with his years, greater triumphs awaited him in the imperial city itself; and hither, in 1508, he travelled at the request of Pope Julius II., to decorate the halls of the Vatican, the invitation having come through his uncle Bramante, the great architect, who enjoyed the patronage of that pontiff. The artist was now twenty-five years of age, and had already given evidence of his powers; he had the fullest scope for their exertion, and the remainder of his too short life was devoted to the glory of the church and its head in Rome.

In the labyrinth of short streets that lead to the heart of the old city, opposite Hadrian's Bridge, is situated the house in which Raffaele first resided. It is in a narrow street, known as the Via Coronari; the tall houses close it in, so that the sun never reaches the lower stories,—a valuable arrangement where shade is to be most courted, but which gives a gloomy and stifling look to Italian towns. The house is featureless, and might not be recognised but for the nearly decayed ebiaroseuro portrait of its great tenant, which was painted by Carlo Maratti in 1705, when it was renovated and partly rebuilt. The interest of this house, in connection with Raffaele, did not cease with his life; it was ceded at his wish to the Church of St. Maria della Rotonda, after his death, by his executor, Baldassare de Pesca, the Papal Secretary, that a chapel might be endowed to the honour of the Virgin in that venerable building, where prayers should be said for the repose of his soul. At that time the house produced a rent of seventy crowns per annum. In the year 1581, at the desire of Saticella, arch-priest of the Pantheon, Gregory XIII. united the property to the revenue of his office; and in the year 1705, the arch-priest of that time mortgaged the house to pay for the repairs noted above. It now produces a very small surplus, and that is said not to be applied to the purposes indicated in the will.

The chief memorials of Raffaele's residence in Rome, are the immortal works which still decorate the papal palace of the Vatican. The hall called *della Segnatura* was first decorated by him with the great compositions known as "The Dispute of the Sacrament," "The School of Athens," "The Parnassus," and "Jurisprudence." They occupied him nearly three years. Toward the end of that period the sight of Michael Angelo's grand conceptions in the Sistine Chapel are believed to have influenced the young painter to a greater elevation in the treatment of his works. The sybils and prophets in the Church of Santa Maria della Pace, as well as the painting of the prophet Isaiah in the Church of St. Augustin, executed about this time, are cited as proofs of this influence. On the walls of the palace of Agostino Chigi he had painted his famous "Galatea," and had achieved for himself a fixed and honourable position in Rome, surrounded by friends of the highest and most influential kind, and some few scholars who aided his labours.

In 1512 the second hall of the Vatican was commenced, in the February of the following year the pope died. Julius was more of a soldier than a churchman; and is recorded to have told Michael Angelo to place a sword rather than a hook in the hand of the bronze statue he destined to commemo-

rate him. Leo X. had more refined taste, and became celebrated as a patron of the Arts. To narrate all Raffaele's labours for this pontiff would be to swell this page with a list of world-renowned works, familiar to the whole world for their lessons of beauty, cultivated by the highest technicalities of Art. Suffice to say that the Art-labours of the Vatican never ceased, and when Bramante died Raffaele was appointed his successor. His first architectural work was the rows of galleries which surround the court-yard of the Vatican, the foundations of which had only been laid by his uncle Bramante. These triple arcades rising above each other, and commanding magnificent views over Rome, were richly decorated by Raffaele with designs which startled the world by their novelty, and captivated by their beauty. Founded on the antique mural decorations then recently discovered in the Baths of Titus, the genius of the painter adopted their leading ideas, infusing the composition with his own fancy and grace; and thus gave a new decorative art to the world. Raffaele was ever alive to the progress of Art, and its interests were consulted by him in the largest way. He fostered the genius of Marc Antonio Raimondi, the engraver, at a period when the graphic art was looked on merely as a curiosity; in the midst of his laborious occupations he found time to design for him subjects for his *burin*, and to superintend their execution. But more than all, he defrayed the whole expenses of these engravings himself, taking Marc under his protection, until the new art had established itself in popular favour, and could be followed as a lucrative profession. To Raffaele, therefore, the art of engraving, and the traders in prints, owe a deep debt.*

The early artists were men of multifarious accomplishments; they were not painters only. We have record of their power in many branches, and examples of their versatility still remain to us; hence we need feel no surprise that the painter Raffaele was installed to the post of papal architect. Michael Angelo also practised architecture, as well as sculpture and painting; but more than this, he fortified the city of Florence, and successfully superintended its military defence during six months, when it was attacked by the Prince of Orange in 1529. Benvenuto Cellini has also left record of his fighting powers, when he served in the siege of the Castle of St. Angelo, in 1528. Albert Durer introduced the Italian style of fortification to his native city of Nuremberg, and wrote a treatise on the art; he was also painter, sculptor, designer, and engraver on wood, copper, and stone. Leonardo da Vinci excelled in the arts, and added thereto such sound philosophical views as to have been greatly in advance of his age; indeed, his research in optical science has led to his being considered the father of the modern daguerreotype, inasmuch as he propounded the possibility of securing images by the action of light alone.

Of Raffaele's architectural powers Rome has varied examples. The principal are at the Vatican and St. Peter's, whose construction he superintended during the rest of his brief life. On the authority of Vasari we may attribute to him one of the most beautiful of the Roman *palazzi*, the Villa Madama. The Caffarelli Palace is also known to be his design,† as well as the very beautiful funeral chapel for his friend and early patron Agostino Chigi, in the Church of Santa Maria del Popolo. Among the quiet gardens of the Celian Hill is one of his most picturesque works, the little Church of Santa Maria in Navicella, an edifice abounding with the most interesting artistic associations. It stands on the site of the house of one of the earliest Christian saints, St. Cyiac, and was built by Leo X. entirely from Raffaele's design, with the exception of the simple and elegant little portico, which is by Michael Angelo. The paintings within are by Raffaele's favourite scholars, Julio Romano and Perino della Vaga. This interesting

* It should be noted, however, that Albert Durer was really the chief populariser of the art. His prints on copper and wood (the latter particularly) had circulated over Northern Europe, and were well-known in Venice. Raffaele saw at once the latent power by means of which he might propagate and perpetuate his own designs, and at once encouraged the labours of Raimondi. This engraver had copied in Venice many of Durer's engravings, to his detriment, and Durer had complained to the magistracy for redress. It is to Durer we owe the discovery of etching and corroding a plate by acid, one of the greatest boons to the engraver, and an enormous saving of labour.

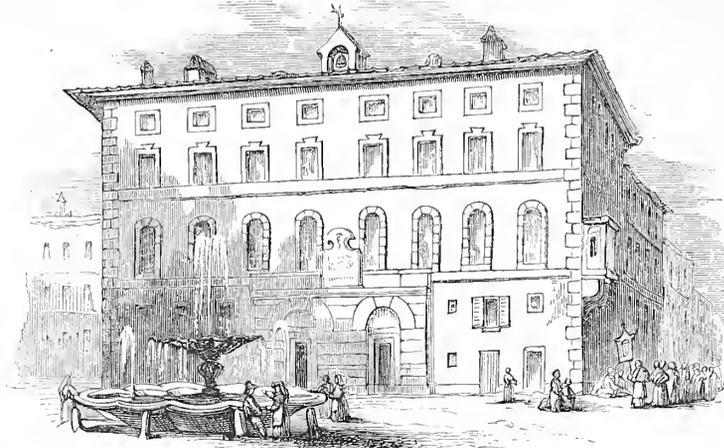

† It is opposite the Church of St. Andrea della Valle, and is now called the Palazzo Vidoni; the upper portion is not Raffaele's work.

church takes its distinguishing name from the marble galley placed on a pedestal in front of the portico, by that famous patron of the Arts, Pope Leo X., in whose time it was discovered. It is a curious work of the Roman era, and is seen in our cut, with other classic fragments placed beside it.

Raffaele had now achieved so high a position in Rome, and was so overwhelmed with commissions, that his scholars and assistants increased greatly. But for their aid it would have been impossible for him to have executed the large number of works he did. It became his practice to design, superintend, and finish only; but the labour of carrying out his

works was left to his scholars, who all became men of mark. The chief was Julio Romano, who painted a large portion of the Vatican. The Loggie was the work of many hands; the figures, the flowers, the scrolls, and the ornament, were all apportioned to the facile and ready powers of the army of artists the "divine master" had at command. It is recorded that he had a retinue of some fifty who were thus employed; these formed his train in public, so that "he appeared like a prince rather than an artist;" the fascination of his manners led to affection for himself irrespective of his genius.

But death came to carry the artist away in the

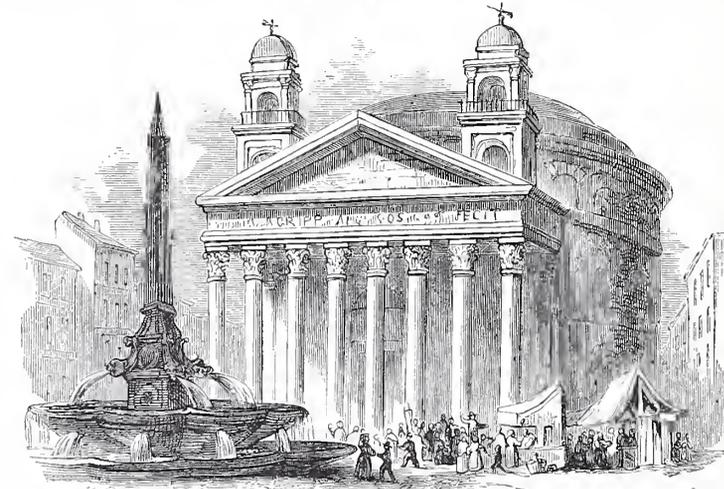

RAFFAELE'S LAST RESIDENCE, ROME.

midst of his triumph, ere he had entirely reaped the full harvest of his fame, leaving the world greatly the loser. Raffaele, now a wealthy man and living like a noble, had purchased for himself a mansion worthy of a nobleman born. His affianced bride, the niece of Cardinal Bibiena, died in 1518, and was buried in the Pantheon; and in April, 1520, the painter was laid in his tomb in the same edifice. It was less than twelve years of thought and action that had sufficed him to found immortal renown in Rome, and leave that city the bequest of the most glorious Art-treasures in the world. His life had indeed been sacrificed to his eagerness to serve the

pope; harassed by a multiplicity of engagements, Raffaele had hurried from the Faruesina, the palace of the wealthy banker Chigi, which he was engaged to decorate, to consult with the pope about his works at the Vatican. He had overreached himself with running this quarter of a mile; and he felt a sudden chill as he stood in the cold unfinished building; he went to his palace (a very short distance only), and in the course of a few days died there at the early age of thirty-seven, April 7th, 1520.

The last home of Raffaele is still pointed out in Rome; it stands in the district termed the Trastevere, in the small square midway from the Castle of

THE PANTHEON, ROME.

St. Angelo and St. Peter's. It occupies one side of this square, and is an imposing structure. The architects were Bramante and Baldassare Peruzzi; it is now known as the Palazzo degli Convertiti, and devoted to the reception of converted heretics. Here his body lay in state in front of his unfinished picture of the "Transfiguration,"* his greatest, as it was his last, work. There was a grandeur in such a death—a glory in such a death-chamber, "which

* The picture was afterwards finished by his pupil Julio Romano. It had been ordered by the Cardinal Medici for Narbonne, but was placed over the high altar of the Church of St. Pietro in Martorio, at Rome. It was then removed to the Vatican; from whence it was carried by Napoleon to Paris, but was restored to Rome at his fall.

time has not yet effaced from the memory of man. It was no doubt one of these *impromptus* of the eloquence of things which owed its effect to a cause so much the more active and fruitful, because it was natural and not arranged."*

— "And when all beheld
Him, where he lay, how changed from yesterday—
Him in that hour cut off, and at his head
His last great work; when, entering in, they looked
Now on the dead, then on the master-piece;
Now on his face, lifeless and colourless,
Then on those forms divine that lived and breathed,
And would live on for ages—all were moved;
And sighs burst forth, and loudest lamentations."†

* Quatremere de Quincy.

† Rogers' "Italy."

All Rome mourned the death of the great painter. The pope wept bitter tears; his loss was indeed great, for the spirit who could make his pontificate glorious had departed, and left none to fill the void. "Rome seems no longer Rome since my poor Raffaele is gone" writes Castiglione to the marchioness his mother. His funeral *cortège* included in its ranks the greatest men in station, and the most talented in Art and literature. These, with his friends and pupils, marched amid the lamentations of the whole city to the Pantheon, and reverently laid the painter beside the altar he had endowed.

Rome—perhaps the world—possesses no building of more interest than this. The ancients described it with admiration eighteen centuries ago, and it still remains the best preserved monument of modern Rome.

"Relic of nobler days, and nobler arts!
Despoil'd, yet perfect, with thy circle spreads
A holiness appealing to all hearts—
To art a model; and to him who breaths
Rome for the sake of ages, Glory sheds
Her light through thy sole aperture; to those
Who worship, here are altars for their heads;
And they who feel for genius may repose
Their eyes on honour'd forms, whose busts around them
close."*

Let us enter this noble relic of the past, sacred with the associations of ages. Over the portico is an inscription, recording its erection by Agrippa in his third consulate (B.C. 25); the pillars of this "more than faultless" portico are Corinthian columns of oriental granite. The bronze doors are antique; so is the open grating above them: you pass them, and the interior strikes you at once by its simple grandeur. It is a rotunda supporting a dome, the only light being received through the circular opening in its centre. The rain falls freely upon the floor; and in the pavement may be noted the star-shaped apertures by which it may descend to the drains beneath. No antique building exists for modern uses so unaltered as this.† In the walls are seven large niches, and between them are eight *adricula*, or shrines which have been converted into altars of the Christian saints. Opposite the entrance to the left of the centre, the visitor will notice an altar, in front of which hangs a triple light, supported by a silver monogram of the virgin; the same monogram is above the altar. It is that founded by Raffaele, for the perpetual support of which he gave the house which forms the first of our engravings. The figure of the Virgin and Child, now known as "La Madonna del Sasso," was sculptured by his pupil Lorenzo Lotti. Under this altar the body of Raffaele was laid, and upon a lower panel of marble to the left of it is the epitaph to the painter written by Cardinal Bembo. On the opposite side is the epitaph to Annibale Caracci; and in other parts of the building are buried Raffaele's betrothed wife, and his scholars, Giovanni da Udine, and Perino della Vaga. Baldassare Peruzzi, one of the architects of Raffaele's palace, also lies here; as well as Taddeo Zucari, and other eminent painters. Its most modern artistic monument is Thorwaldsen's bust to Cardinal Gonsalvi. Where can the Art-pilgrim pay a more soul-inspiring visit than to this

"—sanctuary and home
Of Art and piety?"

Carlo Maratti desired to place a more striking memorial of Raffaele's resting-place than the simple inscription, and accordingly, in the year 1674, a marble bust of the painter, executed by Paolo Nardini, was placed in one of the oval niches on each side of the chapel. The epitaph to Maria Bibiena (Raffaele's betrothed) was removed to make way for Maratti's new inscription; and it was currently believed that the skull of Raffaele was re-

* Byron, "Childe Harold's Pilgrimage." The busts are now all removed.

† "Though plundered of all its brass, except the ring which was necessary to preserve the aperture above—though exposed to repeated fire—though sometimes flooded by the river, and always open to the rain, no monument of equal antiquity is so well preserved as this rotunda. It passed with little alteration from the pagan into the present worship; and so convenient were its niches for the Christian altars, that Michael Angelo, ever studious of ancient beauty, introduced their design as a model in the Catholic Church."—FORSYTH'S *Italy*. The bronze here alluded to, which once covered the interior of the dome, was stripped off by Pope Urban VIII., and moulded into the great canopy now over the tomb of St. Peter in Rome; the rest was used for cannon which were placed on the Castle of St. Angelo. Venuti has computed its weight at 450,250 lbs.

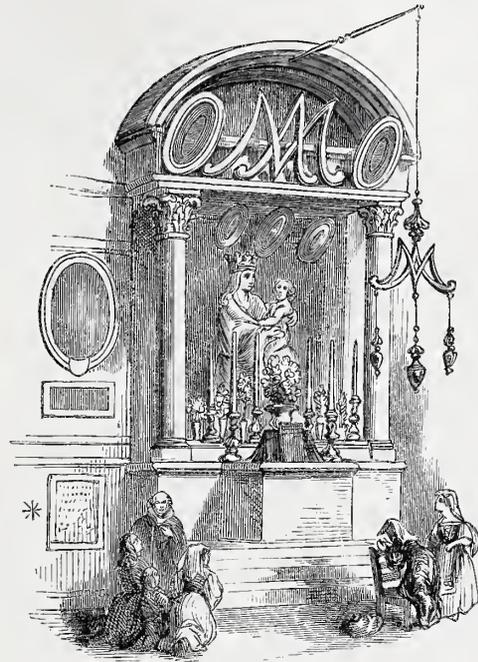

moved; at least such was the history given of a skull shown as the painter's, religiously preserved by the Academy of St. Luke, and desecrated on by phrenologists as indicative of all the qualities which "the divine painter" possessed. But scepticism played its part: doubts of the truth of this story led to doubts of Vasari's statement respecting the exact locality of Raffaele's tomb. Matters were brought to a final issue by the discovery of a document proving this skull to be that of Don Desiderio de Adjutorio, founder of the society called the Virtuosi, in 1542. Thereupon, this society demanded the head of its founder from the Academy of St. Luke; but they would neither abandon that, nor the illusion that they possessed the veritable skull of the great artist. Arguments ran high, and it was at length determined to settle the question by an examination of the spot, which took place on the 13th of September, 1833, in the presence of the Academies of St. Luke and of Archaeology, the commission of the Fine Arts (including Overbeck and others), the members of the Virtuosi, the governor of Rome (Monsignor Grimaldi), and the Cardinal Zurla, the representative of the pope.

The result will be best given in the words of an eye-witness, Signor Nibby (one of the commission of antiquities and Fine Arts), who thus described the whole to M. Quatremere de Quincy, the biographer of Raffaele:—"The operations were conducted on such a principle of exact method as to be almost chargeable with over nicety. After various ineffectual attempts in other directions, we at length began to dig under the altar of the Virgin itself, and taking as a guide the indications furnished by Vasari, we at length came to some masonry of the length of a man's body. The labourers raised the stone with the utmost care, and having dug within for about a

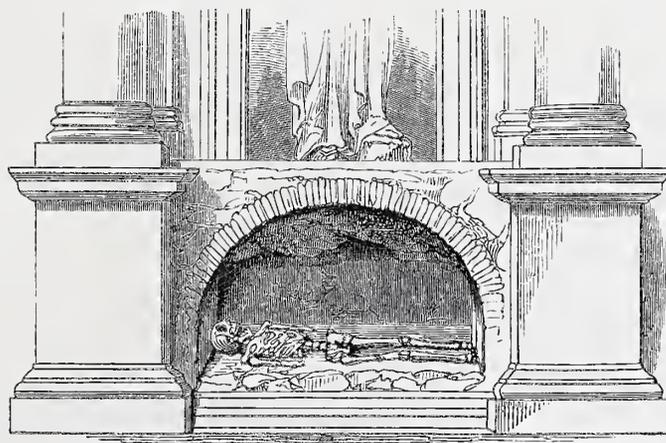

foot and a half, came to a void space. You can hardly conceive the enthusiasm of us all, when, by a final effort, the workmen exhibited to our view the remains of a coffin, with an entire skeleton in it, laying thus as originally placed, and thinly covered with damp dust. We saw at once quite clearly that the tomb had never been opened, and it thus became manifest that the skull possessed by the Academy of St. Luke was not that of Raffaele. Our first care was by gentle degrees to remove from the body the dust which covered it, and which we religiously col-

lected, with the purpose of placing it in a new sarcophagus. Amongst it we found, in tolerable preservation, pieces of the coffin, which was made of deal, fragments of a painting which had ornamented the lid, several bits of Tiber clay, formations from the water of the river, which had penetrated into the coffin by infiltration,* an iron *stelletta*, a sort of spur, with which Raffaele had been decorated by Leo X., several *fibulae*, and a number of metal *anelli*, portions of his dress." These small rings had fastened the shroud; several were retained by the sculptor Fabris, who also took casts of the head and hand, and Camuccini took views of the tomb and its precious contents; from one of these our cut is copied.

On the following day the body was further examined by professional men: the skeleton was found to measure five feet seven inches, the narrowness of the coffin indicated a slender and delicate frame. This accords with the contemporary accounts, which say he "was of a refined and delicate constitution; his frame was all spirit; his physical strength so limited that it was a wonder he existed so long as he did." The investigation completed, the body was exhibited to the public from the 20th to the 24th, and then was again placed in a new coffin of lead,

RAFFAELLE'S CHAPEL.

THE GRAVE OF RAFFAELLE.

and that in a marble sarcophagus presented by the pope, and taken from the antiquities in the Museum of the Vatican. A solemn mass was then announced for the evening of the 18th of October. The Pantheon was illuminated, as for a funeral; "the sarcophagus, with its contents, was placed in exactly the same spot whence the remains had been taken. The presidents of the various academies were present, with the Cavalier Fabris at their head. Each bore a brick, which he inserted in the brickwork with which

the sepulchre was walled in." And so the painter awaits "the resurrection of the just," and the fellowship of saints and angels, of which his inspired pencil has given us the highest realisation on earth.

* This will be understood when we remember that the Tiber has inundated this lower part of Rome several times. On the external wall of the adjoining Church of Santa Maria sopra Minerva, are the marks of the height to which the waters rose, and which is five feet above the pavement level.

THE CRYSTAL PALACE:

A TEACHER FROM ANCIENT AND EARLY ART.

BY THE REV. CHARLES BOUTELL, M.A.,
*Hon. Sec. of the Architectural Museum, &c.*PART V.—GOTHIC ART: *Section 2.*

WHEN before treating of GOTHIC ART, as it is taught in the Courts of the Crystal Palace, I gave a brief sketch of what these Courts contain, and I endeavoured to apply the teaching of their contents to the study of this great art in its most comprehensive range. In resuming the subject, it will be my object to glance at certain particulars in which these Gothic Courts are deficient as teachers, and to indicate the means by which it appears that a complete compensation may be made for those deficiencies.

Gothic Art is not merely another form of expression for a particular style of architecture. It is the object of certain persons, who now set themselves forward to oppose the growing interest that is taken in the arts of the middle ages, and to resist the prevailing desire to study and elucidate them, and who apparently are induced to this course of action simply because the arts of the middle ages are not understood by themselves,—it is the present object of these persons to represent mediæval art as solely and exclusively ecclesiastical, both in its principles and in its working, as being, indeed, church architecture only, and the church architecture of those times. It would seem that thus they hope to divert the attention of the student, as well from the universal applicability of Gothic principles under every condition and expression of Art, as from the fact that Gothic architecture is itself equally the architecture of every class of building. And this contracted, and unjust because contracted, view of Gothic Art, in some respect characterises the teaching of the Crystal Palace Courts. They set before us a wonderful collection of striking and strikingly noble details; they show how readily the details will yield themselves to that process of fusion (not confusion, as some have called it) which was employed to blend them into union; they appear before visitors as "Gothic Courts," not mere groups of Gothic fragments; but they do not attempt to do more than convey some idea of the works of the architect, strictly and properly so called. It is true that architecture was and must continue to be the principal and most important expression of Gothic Art; but courts which would teach Gothic Art, in its length and its breadth, must do much more than exemplify architecture—they must go on to illustrate the consistent development of the same spirit of Art in various departments of its working. In one instance this has been well done in these very Courts, and that is in the beautiful cases of easts from ancient and mediæval ivories which they place before the visitor for his instruction. Seals, another important branch of mediæval art, might easily have been added, because they are in the palace; but they have not found for themselves their "right place." The great point, however, in which the teaching of these Courts falls short of realising what a stranger would naturally expect from them, is their want of classification: they do not even attempt to deal with the Gothic historically. In vain would the student seek to trace out from them any illustration of his pre-conceived notion, that the noble architecture which he had learned to admire assumed distinct aspects at successive eras, and while always consistent and invariably true, was continually passing from one definite phase of expression to another. And this is really a very serious shortcoming. The student can hope to master this style of architecture as it flourished in the middle ages, only by studying it chapter by chapter, while he regards each of those chapters as a part of one volume. The Gothic Courts of the Crystal Palace have taken details from every period, and built them up into a single Gothic specimen. Had the details been carefully kept in such isolation as would have preserved their individuality, and so exhibited every one of them as components of a series of Gothic parallels and Gothic contrasts, it would have been well. The error has arisen from the forming them into "Courts." The excessive restorations, which have so generally been adopted in the preparation of the various easts, form a third grave obstacle to sound teaching by means of these

Courts. Art, of whatsoever period, or under whatsoever form, must be permitted, as well as enabled, to speak for itself. The restored east is, indeed, by far a more pleasing teacher than the mutilated relief; but one speaks with authority in the few broken sentences it may utter, while the smooth flow of language with which the other may charm the ear conveys at best an historical fiction. Had untouched facsimile easts of the old works been set side by side with the restored reproductions of them, or even been placed in some adjoining compartments of the palace, the value of the series would have been great indeed. A single example will sufficiently illustrate the importance of teaching from genuine facsimiles in the absence of the actual original works. Not many of the Gothic easts in the Courts are more interesting, or capable of conveying more and more diversified teaching, than the group of sleeping guards from the Easter Sepulchre at Lincoln Cathedral. But who that knows the worn and mutilated original would recognise it in its assumed counterpart in the Crystal Palace? The teaching of the east rests upon the authority of the restorer; that of the original is almost superseded.

The teaching of these Gothic Courts, notwithstanding their imperfections, might yet be easily made to assume a comparatively perfect character. And this may be accomplished by pointing out clearly, and without reserve, their true character as they now exist, and by supplying them with that ever-ready auxiliary—a collection of photographs. Such pictures of actual buildings and their details as already are in existence, aided with those which the Architectural Photograph Society will not fail to produce, would enable the student to regard the Crystal Palace Courts in a new and a higher capacity; and such brief descriptive lectures as would bring home to even a casual listener the lessons which any of the Crystal Palace Courts may be empowered to teach, would not fail to attract attention, because they would enhance the attractiveness of the "Courts," by causing them to be better appreciated through being better understood.

PART VI.—GENERAL REMARKS.

Before entering into any special consideration of another particular Court, it may be well to pause, in order to take a brief general review of the Fine-Art collections which have been gathered together within the Crystal Palace. When passing these really wonderful collections in review in their collective capacity, the first impression which will naturally and necessarily present itself to every reflective observer is their unique value for the purpose of comparison. If we analyse the contents and composition of any one Court, we may readily determine that certain omissions, and certain errors in judgment, are equally palpable; we may not be altogether satisfied with the system of arrangement; and we may object alike to the rendering of certain details, and to their selection, and to their grouping; yet the power and the value of the whole command recognition. In no other school can we find so many examples of what Art has done—no other museum will enable us, with equal facilities, to institute a really comprehensive comparison between the works which Art has produced in different ages, in countries widely separated one from the other, and by means of the most diversified agencies. It is impossible to estimate too highly the importance of this world-wide comparison. Everything which true Art accomplishes derives a fresh interest, and has its intrinsic qualities more fully developed, through association with every other worthy emanation from the same spirit. It is, perhaps, the chief impediment to the attainment of a higher and purer feeling for Art, that men are so prone to take every individual work of Art, and study it by itself, and estimate it without reference to other things. We look at a statue or a picture, and we form our opinion of them without giving a single thought to what they may acquire through harmony, or lose through incongruity of association. Our Art-exhibitions prove this but too painfully. We thrust a mass of sculptured marbles or moulded plaster into an ill-lighted cavern which will just hold it all, and forthwith we criticise what the art of sculpture has been either devising or accomplishing. Every statue, every bust, must fail to realise its power of impressiveness, of expression,

and of suggestiveness, so long as it remains severed from objects with which it will harmonise, and which will prove to be in harmony with it. Though somewhat less in degree, in principle it is the same with an exhibition of pictures, and with every single picture that forms one of the continuous outspreadings of gilded frames and painted canvases, that we are in the habit of styling "exhibition." The worthiness of each picture will, in some degree, lie latent until the picture itself be properly placed. And proper placing implies appropriate and harmonious associations.

But there is also another aspect under which all works of Art need to be regarded; and this is that comparison of which I have been speaking. This is not the comparison of the crowded exhibition-room, but such as may be obtained from the study of many and various works, of which every one occupies a suitable position. The Crystal Palace, of necessity leaving very many of its collections devoid of appropriate associations (as is the case, unfortunately, with the majority of the sculpture-easts), has formed such a series of at least comparatively happy groupings as exist nowhere else. It is possible here to linger in one half-hour within such an edifice as the tragic poet might have claimed for his own, on the shores of the Bay of Baie; and in the next to lie down for reflection on the carpets of the Abencerrages; having passed meanwhile, not without thoughtful observation, from the columnar halls of Egypt, through saloons of both Athens and Rome. And the arts of the middle ages, as they flourished in Europe, have their Courts close at hand. If we look through all the framework that binds the veritable facsimile easts of various details together, and then look into each object with the view of gathering from it its teaching,—and so pass on—observing, studying, and comparing,—who can estimate the peculiar value of the general impression thus to be produced? And if a concentration of the collections already within the palace were to be effected,—if a more historical classification were carried out, and photographs were added, and descriptive addresses delivered,—surely we should hear no more of failure in the Art-teaching of the Crystal Palace. Visitors may not, as things are, perceive the teaching faculties that surround them; they may be even unwilling to admit their existence: there they do exist, however; and all that they need to give them effect is, that they be called into action. Here the Crystal Palace is like the late Manchester Exhibition: the "Treasures" are collected, and then left alone to work as they may—as they can. They need to be set to work, and kept at work, and then they will assuredly demonstrate their faculties for working.

In the present peculiar circumstances in which Art is placed amongst us, it will be well from time to time to seek from the Art-Courts of the Crystal Palace material for consideration. We can there observe certain characteristics of the styles now arrayed against each other in hostile array, and we may gather some useful suggestions from observing them there in friendly rivalry. In the actual conflict, the arts of the middle ages gradually but surely are gaining ground: the very bitterness with which Gothic Art is assailed, is in itself conclusive evidence that it is advancing towards the establishment of its supremacy; and, as it is now studied, and as the study of it and the practical application of it also now are advocated, it will maintain its advance. The Crystal Palace Courts may do much to illustrate the comparative merits of the rival styles: there, on the one side, are carefully studied specimens of classic Art, and opposite to these are ranged corresponding examples of Art as it expressed itself in action in the middle ages. We do not need, we do not desire to have either the ancient or the early lessons acted out again. We seek from them instruction in noble principles, and we would apply those principles with all the aids of advanced science and cultivated refinement, to the conditions of our own age and the requirements of our own circumstances. Many persons would persuade us that, in the architecture of classic lands, and in the arts of classic times, we shall find what is best adapted to ourselves; but others have happily ventured to look beyond this stereotyped sentiment, and they have found that in more recent ages and on our own soil, Art has left us a far more precious inheritance both of instruction and example.

TALK OF
PICTURES AND THE PAINTERS.

BY AN OLD TRAVELLER.

CHAPTER IX.

Marco Basaiti—Not represented in our Galleries—Works in the Gallery of Berlin—Altar-piece—the Madonna—Sant'Anna and Santa Veronica—Martyrdom of San Sebastian—Works in the Venetian Academy—Murano—The Abbey of Sesto—The Vivarini—Antonio—Bartolommeo—Works in the Ducal Palace—In the Academy—Luigi Vivarino—Churches of Venice—Cordelle Aghi—Marriage of St. Catherine, in Sir Charles Eastlake's Collection—Cima da Conegliano—Works in our own Country, in the Louvre, at Berlin, and in the Brera—Works at Venice—Vittore Carpaccio—German Appreciation of his Merits—Gentile da Fabriano—Vincenzo Catena—A Reluctant Adieu—Conclusion.

CONTEMPORARY with the Bellini, and if not equal in power to Giovanni, whose disciple he was, yet imbued with a similar spirit, and worthy for many causes and qualities to be placed beside him, is the Greco-Venetian, Marco Basaiti, for whose works the lover of his heart-appealing manner will seek vainly in our own country—so far as the present writer has been able to ascertain. Nor will the student find examples in the public galleries of Paris or Munich, and the writer remembers no work of Basaiti as enriching the gallery of Dresden.

Better inspired, and more faithful to their mission, the true lovers of Art in its purest phases, by whom the delightful galleries of Berlin have been carefully controlled and are most lovingly cherished, have secured two of those treasures to that capital, and to the people of the north. One of them is an altar-piece in four compartments: the Madonna, holding the Divine Child on her lap, is in the uppermost portion, having St. Anna on her right hand, and Santa Veronica, who displays the Vera Icon, or true image of the Saviour, the legend whereof is known to all, on her left. The centre of the lower part is occupied by St. John the Baptist; St. Jerome is on the right, and St. Francis on the left; in the background is a landscape. The second picture represents St. Sebastian bound and pierced with arrows; here also is a landscape of great beauty; and this work bears the name of the master. Both exhibit the high qualities which prove this painter to have been a worthy disciple of his excellent master, with some portion of the defects, much slighter and of less importance, that are, not without justice, attributed to him;—these works are indeed of all the greater value as being thus characteristic of their author. The drawing is good, the colour fresh and clear, pure and animated; the faces have not the beauty of expression exhibited by those of Giovanni Bellino, his master, and there is in parts a certain hardness, recalling that disposition towards the more angular forms of Bartolommeo Vivarino, with which this painter is sometimes charged; but the landscape forming the background is treated lovingly, as was the manner of Basaiti—that in the St. Sebastian more especially so, if I remember rightly; this last exhibits numerous small figures.

But for Basaiti, as for all the masters now in question, it is to Venice that you must go. "The Agony in the Garden," painted for the Church of St. Job,* with "The Calling of St. Peter and St. Andrew," for that of the Carthusians, are now both in the Academy. These, and more particularly the first-named, are considered to be among the best of Basaiti's works; but there is an Assumption of the Virgin in the Church of San Pietro Martire, at Murano, which, if the recollection of the writer may be trusted, is in no wise inferior. Other works by Marco Basaiti will also be found in the Venetian Academy, but we are compelled to restrict ourselves to the mere mention of those named. There is a Deposition from the Cross in the Abbey of Sesto, affirmed to be the only work of Basaiti to be found in his native Friuli. This is, or was, in the Abbey of Sesto; it is described as exhibiting great powers of landscape, and much care in the figures; to the present writer the work is not known.

For our knowledge of the Vivarini we are in like manner indebted to foreign galleries, and those of the more distant. France and Bavaria, great and important for certain masters, will do nothing for us here. Dresden, and even the Brera, where some few of their contemporaries may be found, avail us but little more. It is again to Berlin that we must have recourse, while awaiting the fuller fruition reserved

* San Giobbe.

for us at Venice: to Berlin, where you will meet with fewer disappointments in your inquiries for the masters of this period than in any other capital of Europe—Venice herself excepted. Not that we are to hope for numerous examples even in Berlin: of Antonio there is only one; but this is a fine altar-piece—a picture in six compartments, and full of matter. It is in the three uppermost that the hand of the elder Vivarino is seen; those below are attributed to Bartolommeo. The figures are on a gold ground; in the centre are ministering angels beside the tomb of the Saviour; in the division on the left are St. Jerome and St. John the Baptist; in that on the left St. George and St. Paul.* The lower part of the picture presents the Virgin with the Apostles, on whom the Holy Spirit is descending. A portion of landscape is perceived between the piers of an arch: in the compartment on the right is St. Francis, with St. Anthony of Padua; on the left are St. Bonaventura and St. Vincent.

Of Bartolommeo Vivarino's works in this inviting portion of the Berlin gallery, an "Ecclesiastic reading" is one, and a "St. George piercing the Dragon" is another—a rocky landscape with buildings, occupies the distance, and the king's daughter, kneeling, is returning thanks for her deliverance.

By Luigi Vivarino, the most distinguished of the family, there are likewise two paintings, both representing the Virgin enthroned, with saints. Notes made at the period of the writer's first acquaintance with these pictures express great delight in one of them—an altar-piece, wherein is the Virgin seated with the Infant on a throne, St. Peter, St. Catherine, and other saints surrounding them; but the remarks then made shall not be here repeated, I will but add that all are on panel, and the one last alluded to is signed "Aloixine . Vivarino."

In the decoration of the Ducal Palace, at Venice, these masters took part with the Bellini, an intimation of the high esteem in which they, but more particularly Luigi, were held by the senate and people of Venice. There is a fine work by the latter in the Church of Santa Maria Gloriosa dei Frari: this represents St. Ambrose seated on a throne, with other saints. In the Venetian Academy are numerous works by the Vivarini, many of those formerly in the churches of Venice, having been there deposited for their better security. It is to Venice, then, as before remarked, that the lover of Art who would study them effectually must proceed.

Cordegliahi, or Cordelle Aghi, as he is more correctly named, is believed to have but one representative in our country—a Marriage of St. Catherine, with landscape background. This picture, formerly at Stowe, and now in the possession of Sir Charles Eastlake, Dr. Waagen considers to be "a good specimen of the mildness of expression, especially in the head of St. Catherine, and of the delicate gradations in the flesh-tints, peculiar to this rare scholar of Bellini;" and Vasari, who calls the painter Giannetto, while other Italian writers give him the name of Andrea, speaks of Cordelle Aghi as having "una maniera molto delicata e dolce, e migliore assai che quella dei sopraddetti," although among those "sopraddetti" are many names of renown.

Of Cima da Conegliano, the worthy disciple and earnest follower of Giovanni Bellino, the examples within immediate reach of the English student are not so numerous as might be desired,—more especially is it to be regretted that we have not more specimens of his landscape. A Virgin and Child, bearing the name of the master, is in the possession of Mr. Deuistoun, of Edinburgh; Mr. McLellan, of Glasgow, has a Holy Family attributed to this master, and believed to be authentic, although the fact has been questioned. There are two of great beauty in the collection of Lord Northwick, at Thirlstaine House. One of these, a Virgin and Child, has a landscape in the background which adds much to its value, since, although not among the best of Cima's works in that kind, it yet serves to show the manner of the master, whose landscapes are often pre-eminently beautiful: those wherein he has depicted his home of Conegliano, in the March of Treviso, whence he has derived his name, are among the most frequent, if not the most striking. A St. Catherine, also at Thirlstaine, has yet higher merit in certain of its details, and bears the painter's

* Not the Apostle, if my recollection serve me rightly, but St. Paul the Hermit.

name.* Lord Alford was in possession of a Madonna and Child, by Cima da Conegliano: this is believed to be now the property of Earl Brownlow. A picture of the Virgin and Child, with St. Peter and St. John the Baptist, is in the collection of Sir Charles Eastlake; and the Duke of Sutherland has a Presentation in the Temple, by the same master: this is, or was, at Stafford House.

In the Louvre is that Virgin and Child, with St. John and Mary Magdalen, long renowned as one of the treasures of Parma, and one of the works not restored to Italy at the general restitution in 1815. This painting, which exhibits precisely one of the landscapes alluded to above, is signed "Giovanni Batista da Conegliano;" † it has been engraved by Rosini. The gallery of Berlin is unusually rich in this painter's works; among them is the "Madonna Enthroned," a picture of the utmost value as characteristic of the artist. The portrait of his master Giovanni Bellino, affectionately depicted by his hand, is also in this collection, and some few will be found in other galleries more or less within reach of the English traveller. In the Brera, at Milan, for example, there is a Virgin and Child, with St. Jerome, and Mary Magdalen at Munich, and a Presentation of the Virgin in the Temple in the Dresden Gallery. But in Venice it is again that the student will most profitably study the works of Cima. In the Church of San Giovanni-in-Bragola, is the "Baptism of Christ," by his hand. In that of Santa Maria dell'Orto is a work respecting which Lanzi declares himself unable to find expressions of eulogy strong enough: the beauty of the heads, and the harmony of the colouring, are more especially insisted on. There was at one time a Madonna Enthroned in the Church of the Carità: this is now in the Venetian Academy: two angels are sounding musical instruments, and the Virgin is surrounded by St. George, St. Sebastian, St. Nicholas, St. Catherine, and St. Lucian. Of these works we do not permit ourselves to say anything beyond giving the names, nor can we do more for the "Descent from the Cross," painted for the Church of San Nicolo, in Carpi, and highly eulogised by Zani, ‡ who declares it to have been esteemed by the possessor, Alberto Pio, Prince of Carpi, as in no respect inferior to the best efforts of Michael Angelo and Raphael, some of whose finest qualities he affirms to have been united in this work. § Kugler describes the male figures of Conegliano as "characterised by a peculiar seriousness and dignity," and this is true; but the German critic is scarcely just in attributing to his Madonnas "an inanimate expression that is very remarkable." In common with all the masters of the religious schools, Cima da Conegliano impressed the faces of his Virgins with a devout and solemn character, far removed, and properly so, from hilarity, and even from exultation: but their purity and sweetness do not often degenerate into lifelessness or insipidity—in the hands of the best masters never; and it is certain that those of Conegliano are among the best. Speaking of a picture by Cima in the Church of the Carmine, at Venice, this writer gives the following just and truthful description of the work. First remarking that the colours, and at this distance of time, "glisten like jewels," the author adds, "the Virgin is represented kneeling in an attitude of the most graceful humility before a crib in which the child is lying. On the right is Tobit, conducted by a beautiful angel; on the left Joseph and two devout shepherds; further in the picture are St. Helen and St. Catherine in conversation. The background consists of a steep rock overhung with trees, with a rich evening landscape; there are towers in the distance. In this way, as in other Venetian pictures, the combination of a sacred event with other figures takes a new and charming form." ||

In an earlier chapter some slight reference has been made to another disciple of Giovanni Bellino, Francesco Vecellio, namely, brother—and believed to have been the elder—of Tiziano himself. Few pictures

* With the work last named many thousands have been privileged to make acquaintance during the present year, when it formed a conspicuous part of the Manchester Exhibition, as did a Marriage of St. Catherine, by the same master, and now the property of Mr. Watts Russell.

† I find that the inscription is in the Latin form, and goes thus—"JOANIS BAPT. CONEGLANESIO OPUS."

§ See also Ridolfi's "Meraviglie dell'Arte" for Cima, as well as for other Venetian masters.

|| Schools of Painting in Italy, vol. i. p. 243.

known to be by his hand exist, but there is one in the Dresden Gallery, which is declared by competent judges to be authentic. The subject is the Ecce Homo, and the work may have interest for such as examine the question how far the great brother of the painter may have had cause for that jealousy of his kinsman—but too lightly attributed to him—by which he is declared to have been so far influenced as to have dissuaded Francesco from the practice of painting. This accusation is, however, not based on sufficient grounds; other causes, without doubt, determined Francesco Vecellio to the choice of arms, in the first instance, and subsequently to that of commerce, as his profession. In the early life of the brothers, and before the success of either could have time to be determined, there may have been most cogent reasons why both could not prudently adopt the same pursuit, and to some of these we must assuredly have recourse, if we would know the true reason why Francesco Vecellio became first a soldier, and afterwards a merchant, rather than a painter.

Among the engravings of the British Museum is a Holy Family, bespeaking "in its delicately executed background" a design by Vittore Carpaccio; and this is very nearly the sum of our possessions as regards that important Venetian master, whose admirable qualities, remarks a German author, "wohl oft das Auge des Künstlers entzückt haben."* And this is true, or rather it is part of the truth only, for the works of Vittore Carpaccio do more than "enchant the eyes;" they awaken the mind, they amend the heart. If, as a competent writer observes, "the conceptions of this master, who is, properly speaking, the historical painter of the elder Venetian school, incline to the *genre* or romantic style," yet must it also be conceded that he maintains that style at the very highest point of elevation. Vittore Carpaccio selected his subjects worthily, and he ennobled all that he touched. This, considering that his themes were usually lives of the saints, and subjects analogous, is much to say; but examine any one of Carpaccio's works, and you will find the remark fully justified. A few words from the author above cited will bring the mode of the master clearly before us. "He successfully introduces the daily life of the Venetians of his time in the greatest variety and the richest development; loving to fill up the background with landscape, architecture, and various accessories."

That does he indeed, and he effects it to purpose, as the long hours we give to him in the one gallery of the Venetian Academy alone, may suffice to prove. But there is more, and all to your honour and glory, thrice worthy competitor of the great Giovanni Bellini—wherefore let us give it place. "In this respect he may be compared to the Florentine masters of the fifteenth century; but the surrounding landscape and architecture of Carpaccio display a far higher finish, and assume a much greater importance. He avails himself freely of these accessories in his compositions, and binds them all together with a deep and powerful colouring."†

Three pictures by Vittore Carpaccio, now treasured among the most valued possessions of the Louvre, the Royal Gallery at Berlin, and that of the Brera at Milan,—each collection having secured one,—will be seen with especial interest by all who shall visit them consecutively, since they belong to one and the same work, the life of St. Stephen, namely, a series painted for the Scuola di San Stefano, in Venice, towards the close of the master's active life. The picture in the Louvre exhibits the saint in the act of preaching the Gospel to the Jews at Jerusalem; that at Berlin presents the consecration, to their holy work, of St. Stephen and six of his companion believers,—Philip, Procorus, Nicanor, Timon, Parmenus, and Nicholas, namely,—by the hands of the Apostle St. Peter, behind whom stand others of the apostles. The picture in the Brera consists of two from the number of these figures: it is accounted, and with reason, among the most valuable possessions of the great Milan Gallery. The Berlin portion of the work bears the name of the master, "Victor Carpathius," and the date 1511; that belonging to the Louvre claims to possess the portrait of the master himself, a figure standing in the crowd of spectators, wearing the

beard very long, and with one hand placed on it. A long beard was certainly one of the distinctive characteristics of Carpaccio's head; his features are strongly marked, and one does not readily forget them: thus the truth would be easily verified by comparison of his known portraits (they may be borne without difficulty in the memory); but the writer has not done this, not having visited the Louvre since the question was presented.

In the Venetian Academy there is a painting—among others to be found there—representing the Virgin, who places the infant Christ in the arms of St. Simon. Of this picture, painted for the Chapel of our Lady, in the Church of St. Job, Vasari says, "Il colorito di tutta la tavola è molto vago e bello."‡ He speaks, furthermore, of a History of the Martyrs, painted for the Altar of the Resurrection, in the Church of St. Anthony, but now also in the Venetian Academy; of this he says,—"In that work there are more than three hundred figures, large and small, with many horses, and numerous trees. The opening heavens, the various attitudes of the figures, clothed and nude, the many foreshortenings, and the multitude of other objects represented in this painting, prove the master to have executed his work with extraordinary love and care."*

Among the pictures in the Academy is a series of eight, from the life of St. Ursula; these Kugler describes as "particularly worthy of attention; they are masterly works, rich in motives and character; the monotonous incident which forms the groundwork is throughout varied and elevated by a free style of grouping, and by happy moral allusions. The colours shine with the purest light."†

Speaking of other works, all mention of which we must forbid ourselves, the writer alludes to the vivid representations of Venetian life, buildings, people, and costumes, to be found in Carpaccio's works; and this is the fact. Superior in all beside to our good Gentile Bellini, Carpaccio was faithful as he—more faithful he could not be—in the delineation of Venice as she was in the days of her beauty; and for this do we owe love and gratitude to both the excellent masters. Over the high altar of the Church of San Vitale, in Venice, is a "Santa Conversazione," likewise mentioned by Kugler as exhibiting "the most finished execution. The architecture of the background still constitutes a kind of symmetrical framework to the figures, who are in eager conversation with St. Vitalis,—the latter seated on his horse, and occupying the centre of the piece." In the Church of Santa Maria-in-Vado, at Ferrara, is a "Death of the Virgin," declared by certain of the commentators to be the chef-d'œuvre of Carpaccio. Ernst Förster, among others, considers it to be his best; the present writer has paid but two short visits to Ferrara, both hurried, and made, moreover, when all but unacquainted with the works of the master.

Of some few other early Venetian painters, for whom we would fain bespeak the close attention of the student, we must yet keep silence at this moment, lacking space for even their names and those of their works; to say nothing of the due expression of that respect and gratitude which is the always gladly accorded due of more than one among them. With Gentile da Fabriano we would fain pass some time, nor is Vincenzo Catena‡ to be passed over without regret; but the time has come for parting with all, nay, even with the city of their love, if not always of their birth—that last a matter of but secondary import. And well did you then merit all the deep affection they gave you: glory at once and sorrow of our hearts, beloved Venice! In you it is, and in that neighbouring Tuscany, whose best light also poured its beams over the world, in what were your days of goodness—which is greatness—in you, that we find masters with souls informing their bodies, and with hearts that spoke directly to the heart of every beholder. Woe, woe, for the years that came after, and double woe for that the good ones shall never return! To us, to the future of our artist-life, they may come, they are coming; we look forward hopefully, steadily; but to you—never, never—the decree hath gone forth—it is finished!

‡ One picture by this master—a Madonna with saints—was among those lately exhibited in Manchester.

THE APPLICATIONS OF IMPROVED MACHINERY AND MATERIALS TO ART-MANUFACTURE.

No. 12.—THE STEAM-ENGINE.

We are told by Mr. Smiles in his "Life of George Stephenson," that the great engineer, when once looking at a locomotive engine travelling on the first railway, proclaimed to his wondering companion, the great fact that the huge carriage was urged on its course by *sunshine*.

There is no passage in that extraordinary life which shows so strikingly as this one does, the far-seeingness of Stephenson. Years pass away, iron roads run the length and breadth of the land, and hundreds of locomotive engines rush to and fro with bird-like speed; and now, half a century having passed into the abyss of time, since this truth was uttered, our schoolmen, as if they had caught at a new idea, talk of the mechanical value of the sunshine, and prove to us, by the most elaborate mathematical researches, that a lump of coal represents an equivalent of solar power.

It may not immediately appear that this is an apt commencement to one of a series of articles which proposes to tell of "improved machinery;" but it cannot be denied that George Stephenson's is an exalting thought, and that with this fine idea correctly appreciated, we are prepared to enter on the consideration of some of the phenomena connected with the creation of modern genius—the Steam-Engine. Shortly, we purpose directing attention to a few of the remarkable machines which are employed in our textile manufactures. We therefore think it will not be out of place if we devote an article to the consideration of the motive power by which those machines are impelled. The perfection of much of our weaving machinery is so great, that we can scarcely hope to see it improved. The machine appears to possess *life*, and almost to exercise a *will*; but when we examine it, we find that seeming will, is some delicate pre-organised arrangement, developed in the inventor's mind. Automatic engines are ever an instructive study, and more or less perfectly so are all the forms of steam machinery which we employ,—whether it be the mighty engines of a vast Atlantic steamer—the ponderous machine which lifts tons of water every minute from the depths of the coal or copper mine, or the delicate combinations which spin the cotton, flax, or silk, and weave it into those beautiful combinations which give permanence to the idea of the artist. The revolving shaft, the ponderous beam, the thousand spindles, and the flying shuttles, are each and all the representatives of the mechanical power locked up in a little mass of coal. As in the human system every motion of the body involves an expenditure of muscle, so in the machine every revolution is the result of the conversion of a certain quantity of carbon in the coal into gaseous carbonic acid.

Mechanical power, under whatever conditions it may be developed, is the result of a change of state in some body, somewhere. If we employ horse-power, the energy rendered available is at the expense of the muscle of horse; if steam-power is used, its mechanical force is the result of the combustion of coal in the furnace; and if the much-talked-of application of electricity as a motive power should be brought to a practical result, it would be at the expense of the metals in the voltaic battery that the force will be obtained.

It has been shown by some beautiful experiments of Dr. Joule, that motion and heat bear an exact relation to each other. Thus a body in falling through a certain space generates a definite quantity of heat, and that quantity of heat is capable of producing precisely the same mechanical force as that which the falling body could have exerted.

These are facts, quite independent of any theory; and whether heat be considered a *positive entity*, or merely a sensation, dependent on the undulation of the particles of matter, this law of the mechanical equivalent of each increment of heat is a truth, and admits equally well of explanation by either of the rival theories.

The steam-engine is now one of the most perfect of machines, but it has been long in reaching its present state. Hero of Sicily has connected his name with an engine somewhat like a windmill, the fans of which were urged round by the impulsive

* Ernst Förster.

† Kugler's "Schools of Painting in Italy," edited by Sir Charles Eastlake, vol. i. pp. 244, 245.

foree of a jet of steam. We have indications, though dimly seen amidst the clouds of the superstitions of the middle ages, that steam was sometimes employed, rather for purposes of astonishment than for use. It is not, however, until a late period that any intelligible account is given to us of man's knowledge of steam-power. The Marquis of Worcester describes a steam-engine in his "Century of Inventions," but it is very doubtful if he ever constructed one. De Caus and Papin, in France, certainly advanced man's knowledge of the powers of steam; but it was not until the development by Black, of the laws of latent heat, and the experiments of Cavendish and Watt that any real advance was made. In the hands of Watt, that which was a mystery and a terror, became a trained power bent to do man's bidding. It must not, however, be forgotten that in this country, long before Watt, Savery wrote a treatise on the "Impellent Force of Fire," and that he constructed an engine for the purpose of draining mines, which he called the *Miner's Friend*. Newcomen, of Dartmouth, availed himself of his knowledge of the pressure of the atmosphere, and of the force of steam, to construct an atmospheric steam-engine; these, however, were still imperfect machines. It is not proposed to write the history of the steam-engine, or, now, even to describe the mechanical arrangements applicable to the several ends for which it is required. Having in future numbers to detail peculiarities connected with the machines employed in Art-manufactures, of which steam is the prime mover, it has been thought advisable in the present article to confine attention to a few of the more remarkable discoveries which have been made in connection with the action of heat on water in producing steam. It should be understood by all our readers that steam-engines are constructed upon principles involving the use of—

- 1st. High-pressure steam.
- 2nd. Low-pressure steam.
- 3rd. Steam working by expansion.
- 4th. Steam working by expansion and condensation.
- 5th. Engines combining in action two or more of these conditions.

It will be sufficient to explain that when water is vaporised at 212° Fahrenheit, under the ordinary pressure of the atmosphere, it is in the condition termed *low-pressure steam*. If however water is vaporised in a vessel from which the escape of the steam is prevented, there is a constantly increasing pressure, the limits to which appear to be only the strength of the material of which the boiler is constructed; consequently steam under this condition is a compressed steam, capable, when liberated, of exerting the force which is due to the amount of compression. In other words, a certain quantity of heat is necessary to produce steam to fill a cubic foot of space under the ordinary pressure of the atmosphere; now, if we continue to apply heat, and prevent the steam which is constantly being formed from occupying more than the cubic foot of space, we are storing a power which is exactly equal to the additional quantity of heat which has been developed; this is *high-pressure steam*. In some engines this high-pressure steam, when liberated from the boiler, exerts its force under the piston, and escapes; in others *low-pressure steam* alone exerts its power, and is removed by condensation. In others, again, a certain quantity of high-pressure steam is allowed to flow from the boiler into the cylinder—a quantity not nearly sufficient to fill the cylinder—and it is then *cut off*. The result is that the steam does its work by expanding in volume, or in passing from the state of high-pressure to that of low-pressure steam, after which it is condensed.

Numerous methods have been introduced for the purpose of generating steam more rapidly, and numerous contrivances have been made by which it has been hoped to develop force of higher intensity, but these have not generally been successful, owing to the imperfect knowledge existing as to the laws by which heat acts in the conversion of water into steam. The uncertainty of knowledge upon this point has been one of the fruitful causes of steam-boiler explosions, so frequently attended with the most disastrous consequences. Among the discoveries of the last few years are two in connection with this matter, which are in the highest degree curious and instructive. To these the remainder of this article shall be devoted.

Water exists in three conditions—solid, liquid, and gaseous; or as ice, water, and steam. These physical states, are entirely due to the quantity of heat. If we rob water of its heat, it becomes ice; if we add heat to water, it becomes steam. Now these conditions depend upon another peculiarity in water, viz., its power of absorbing and holding in solution atmospheric air.

Those who are accustomed to the aquarium know that plants and animals soon exhaust the water of air, and that they perish if air is not supplied. They will also know that the water can be re-saturated with air, either by passing a stream of water through it, or by allowing the water to fall through the air. The point of attention is this—water containing air, and water deprived of air, are physically different bodies. There are two ways of depriving water of the air it may contain: the first is by *freezing* water; the second is by *boiling* water.

Every one must have observed that the ice which forms upon still water is full of air bubbles; whereas the ice which is formed under conditions of disturbance is free from them, being clear and transparent. It is a most remarkable fact that in the process of congelation water rejects everything it may have held in solution in its liquid state. If water be coloured with indigo, or any other dye—if we add to it spirit, or acid—if we dissolve in it sugar or salt—if we disseminate through it any inert substance, or any deadly poison, and then freeze the water, keeping up a gentle disturbance, to prevent the mechanical entanglement which might otherwise occur—the dye, the spirit, the acid, salt, sugar, or poison, are each alike rejected; and we have a mass of frozen water, colourless, tasteless, and inert. Even the air contained in water is *squeezed* out of it in freezing. If we boil water under circumstances which will prevent the accession of air—as, for example, in a flask having a very long neck—the same result is obtained. By the application of heat, water parts with its air; and as the long neck of the flask becomes filled with steam, the air cannot re-enter, and the mutual affinity of the two cannot be exerted. It may not appear that, beyond the curious nature of the fact, there is much or anything of practical value in this.

Another remarkable phenomenon has been discovered:—*Water containing air boils at 212° Fahr., but water which does not contain air will not boil at this temperature.*

Having obtained a lump of airless ice, we place it in a proper vessel, and to prevent the accession of air, we drop upon its surface a little olive or almond oil. We now apply heat, and convert the ice again into water. We continue the application of heat up to the boiling-point; but there will be no sign of ebullition. We still apply heat, and any thermometer placed in the water will indicate an increase of temperature up to 250° or 260°, and still no signs of boiling. Now the experiment becomes dangerous, and the vessel should be surrounded with a shield of wire gauze; for as the temperature is still increasing, the water will, before it reaches 300°, *explode* with as much violence as the same quantity of gunpowder. The whole mass of water, at one effort, exerts an expansive force, due to the full quantity of heat which it contains.

Again, when we boil water in a flask with a long neck, it will, although the heat is still applied, in a few minutes cease to *boil*; but, instead of boiling, there will be, at intervals, convulsive bubblings, which very frequently break the flask. Avoiding this result, we procure water in a similar state to that obtained from ice, and the final results are similar. There is one other curious and important point. If water which does not contain air, is brought up to a temperature of 250° Fahr., and then a single drop of *water containing air* is allowed to fall into it, the whole mass bursts into an explosive ebullition of the utmost violence. To this cause many of our steam-boiler explosions may be traced. It very frequently occurs that a steam-boiler explosion happens after a rest of the engine, just at the moment that it is again set to work. Let us examine into the cause of this. During boiling, water parts with the air it contains; but as the engine continues at work, feed-water is constantly supplied, and air is carried in continuously; thus the normal state of water is maintained. The engine is at rest; the fires are still under the boiler, and no feed-water is supplied. Under these conditions the water acquires the high

temperature of 250°, or more, without boiling. The engine is set to work, the supply-pipe is opened to the boiler, water containing air is admitted, and an explosion ensues, rending the iron plates asunder, or lifting the boiler from its bed, and carrying it many hundred feet through the air, destroying alike life and property. Does a knowledge of the fact indicate a remedy? It does, and a simple one. *If the supply of water to the boiler is never checked, an explosion from this cause cannot occur.*

There is another phenomenon connected with the action of heat on water which is yet more curious, this is the so-called *spheroidal state*. If drops of water are thrown upon a very hot plate of metal they assume a spheroidal form, and roll about in a strange manner, while vaporisation takes place with extreme slowness. If water is thrown into a red-hot vessel, and this high temperature is maintained, *it will never boil*; but remove the vessel from the source of heat, and when it has cooled to a certain point, the whole mass is converted into steam.

If a metal bottle is made red-hot and some water is poured into it, we may still, as has been said, maintain this high temperature without establishing ebullition. Beyond this, we may cork the bottle and still urge the source of heat to any extent—the vapour formed will be insufficient to drive out the cork; remove the vessel from the heat, and allow it to cool, and the cork will be expelled with explosive force. To explain, although we can do so but very imperfectly, the rationale of this, two or three other experiments must be named.

Make a ball of platinum or any other metal white-hot and plunge it into a glass jar of water,—it will be seen that the water does not touch it. The fluid is repelled and stands around it, reflecting the white light, of the heated ball, in a beautiful manner. Gradually the ball cools, and as this takes place the sphere of vapour collapses around the ball, and eventually the water falls in upon it, and it boils. Make a metal sieve white-hot over a well urged blow-pipe flame, and while the flame still plays upon it pour into it water. The fluid will not flow through the meshes of the white-hot wire, and we may fill the vessel with liquid matter; when full, remove the sieve from the flame, and when the wires have cooled to dull redness in daylight, the mass of water rapidly rushes through.

Into a white-hot vessel place any organic body, any combustible substance such as gunpowder, or any two chemical bodies having a great affinity for each other, and it will be found that the organic body will not be burnt, the combustible will not explode, the chemical affinity is entirely suspended, so long as this high temperature is maintained.

The point, however, of especial interest at present is this,—if by any want of attention, or by any accident the water in a boiler is allowed to be low, a plate of iron over the fire may be heated to redness, water now being let in, will assume the spheroidal state as it comes in contact with the heated iron. The spheroidal state involves the following conditions:—A temperature, *of the water*, below 212° Fahr., the escape of *vapour from the water* having the temperature of the surface of the metal from which it is escaping, *i.e.* a temperature considerably above 1000° Fahr. This vapour has no expansive force so long as this high temperature is maintained, but allow it to cool, it exerts a force due to all the heat it contains; consequently, from its suddenness of action, and the intensity of the developed power, it is resistless. In this way, without doubt, many explosions in steam-boilers are to be explained. Indeed, we believe, where the boilers are not themselves defective, that one or the other of these causes will be found to explain all boiler explosions.

Boutigny, to whom is due all the merit of investigating the spheroidal state of water, has devised a boiler, in which he proposes to use this spheroidal water and steam, as he conceives with great economy, as his motive power. The result of the experiment is not yet known.

Having sketched out some of the peculiar conditions which may be regarded among the novelties of science, that have an especial bearing on all kinds of machinery of which steam is the motive power, we leave the subject for the present, hoping to return to it, from time to time, in the consideration of those beautiful combinations which relieve human labour, and give perfection to Art-manufacture.

ROBERT HUNT.

GIFT-BOOKS FOR CHRISTMAS.

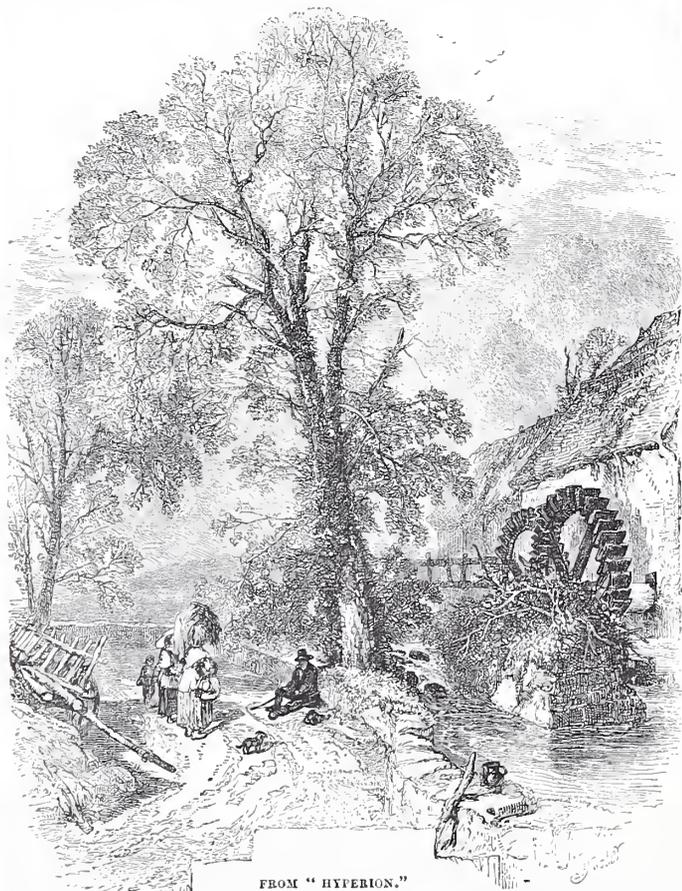

THE PUBLICATIONS OF MESSRS. KENT & CO.

If there be one class of individuals whose business it is, more than that of any other, to watch "the passing moments as they fly," and on whose attention the rapidity of their flight leaves the most vivid impression, it surely is that class to which the public journalist and the conductors of periodical literature

FROM "PARADISE LOST."

belong. Speaking from our own experience, we may remark, that our year resolves itself only into twelve epochs, each following its predecessors in such quick succession,—the labour of one almost interweaving itself with the duties

FROM "HYPERION."

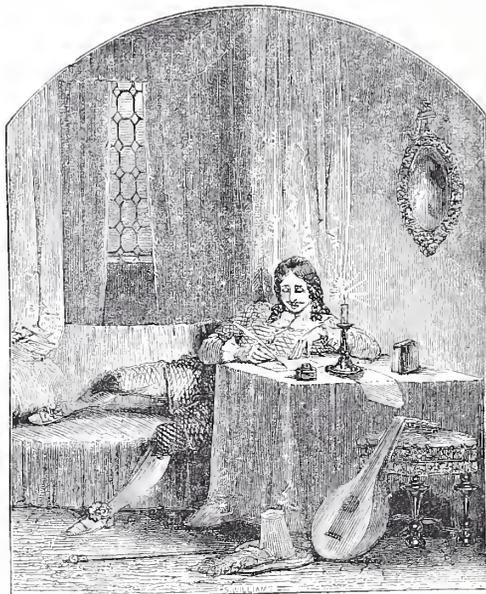

of the following, in "one eternal round," as it were,—that it is only by the recurrence of certain events which annually demand our attention, or by the

advent of certain matters appertaining to a particular period, we are reminded that another considerable portion of time has been added to "the years

FROM COWPER'S "TASK."

that are awa'." And thus, for example, the receipt of a number of books

FROM THOMSON'S "SEASONS."

"adapted for Christmas Presents," which Messrs. Kent and Co. have just

FROM COWPER'S "TASK."

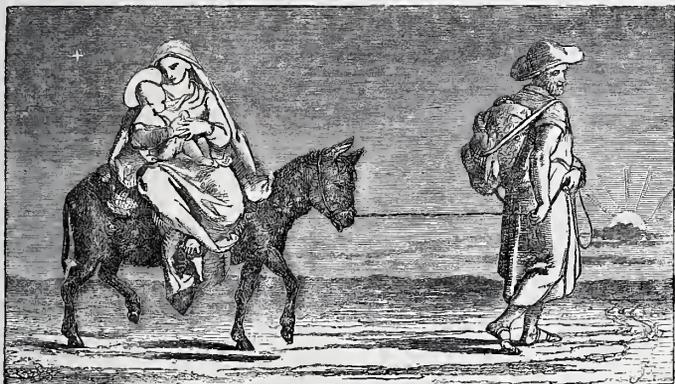

forwarded, indicates to us, in intelligible language, that we are fast approaching the termination of another year: it completes the twentieth of our existence.

Beautiful as were the "gift-books" of former years—the "Annuals" enriched by

them. The miscellaneous character of the "Annuals" was calculated

contributions of the most popular writers of the day, and embellished with engravings

to which the term "gems of art" were never more appropriately applied—we do,

FROM LONGFELLOW'S POETICAL WORKS.

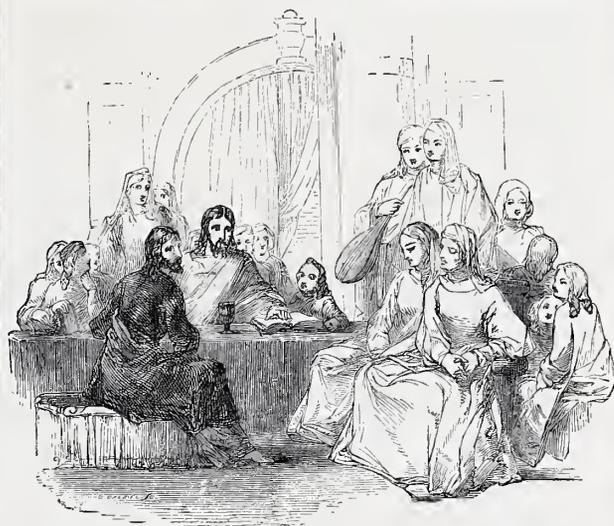

without hesitation, give the preference to the class of works that have now superseded

upon them with a kind of loving feeling, inasmuch as they pious

FROM "THE PILGRIM'S PROGRESS."

to render them ephemeral, but they served their legitimate purpose

FROM "THE PILGRIM'S PROGRESS."

well; and even had this not been the case, we should still look back

FROM MILTON'S "SAMSON AGONISTES."

the way for the multitude of highly embellished books that have succeeded them, and gave to the public an appreciating taste for a high tone of illustrated literature, and a desire to possess works of such a class. The "Annuals" fell away only when they had existed so long as to make people feel the want of something better; and hence, to meet this necessity, publishers found that their own interests, and the demand of the public, were best served by the reproduction of the works of standard writers illustrated by the pencils of the first living artists. And there are thousands, both in Great Britain and her wide-spread colonies, not to mention countries that form no part of her dominions, to whom our artists are known only by what they have contributed in the way of book-illustrations; while the progress that has been made in this phase of Art can only be estimated by comparing the works of the present time with those that were produced fifty years ago, or even less.

There is scarcely a publishing firm of any eminence in the metropolis which has not lent its aid, in a greater or less degree, to this progressive movement: one of the earliest and most enterprising of these publishers was Mr. Charles Tilt, whose illustrations of the Bible, of Byron's works, and of several other popular writers, were known far and near. On Mr. Tilt's retirement from business, with an ample fortune, it fell into the hands of the late Mr. David Bogue, at whose death, not many months since, Messrs. Kent & Co. became his successors. Mr. Bogue, following the example of his predecessor, issued a considerable number of charmingly illustrated books, especially during the last two years of his life: some of these did not happen to come under our notice when they were first published; but as the copyrights are now the property of Messrs. Kent, who has afforded us the opportunity of examining these volumes, and ascertaining their claim to public favour, we propose passing them under review; for books of this class are not for a time, but for all time; they are "gift-books" for the Christmas of every year—presents adapted to all seasons, and suitable for all who can relish whatever is solid and good in literature, and elegant in pictorial embellishment.

The first volume we take up is Milton's *L'ALLEGRO AND IL PENSEROSO*, illustrated with thirty plates, designed, and etched on steel, by Birket Foster. Often as these poems have been the themes of our artists, they appear inexhaustible, and Mr. Foster's fertile imagination and ready pencil have extracted new sweets from the flowers of poesy that everywhere abound; whether the subjects be figures only, or landscapes only, or a combination of the two, he is alike happy in each and all; we can but point attention to a few—"Haste thee, nymph," &c., a group of maidens, followed by companions of the opposite sex, is a most graceful composition, all light, and life, and movement—so lightly and joyously do they "trip it," that the feet of the maidens scarcely seem to touch the earth; it is all sunshine here, on the landscape and in the heart. Sunny, too, is the little bit of landscape illustrating the passage, "By hedgerow elms, on hillocks green," &c., the scene might have been sketched almost in any lane, and yet the artist has so skilfully put his materials together as to give them the most picturesque character. The two subjects on the following page, the ploughman and the milkmaid, and those on page 9, "Corydon and Thyrsis," and "Phyllis and Thestylis," are tempting enough to allure any one into the fields and meadows to share the labours of the peasant, even with no more probability of becoming rich in this world's goods than the peasant's wages offer—for the air is sweet with the new-mown grass, and the meadow is jewelled with the golden king-cup, and everything is pleasant to the eye, and looks as if health and happiness pervaded all living creatures; here we see only the poetry of rural life, and sweeter poetry an artist's pencil never expressed. The group gathered round the blazing fire listening to "stories told of many a feat," is capitably done; the peculiar management of light and shade tells very effectively; and an elegant Watteau-like composition is that which forms the tail-piece of the *L'Allegro*. *Il Penseroso* opens with a stately, contemplative female figure walking alone; behind her are the arches of a bridge and the towers of a castle, forming the middle distance, and relieved against an expanse of sea, partially lit up with the shining

of a young moon: the picture is in harmony with "the goddess sage and holy," whom the poet designates Melancholy: this is followed by a lovely little sylvan scene, in which Saturn and Vesta "met in secret shades." Similar in character to this, but with only a single figure introduced, are the engravings on pages 17 and 19; the misty moonlight in the last is beyond all praise. But we have no space to enlarge, though we could readily find something to say by way of commendation on each plate; and can only regret that we cannot introduce a specimen of these charming engravings, as they are on metal; hence, as examples of Mr. Foster's art, they possess an advantage over wood-cuts, however well executed, for his free and delicate touches could never be so produced by the most skilful wood-engraver.

The next book lying before us is *CHRISTMAS WITH THE POETS*, "embellished with fifty-three tinted Illustrations by Birket Foster, and with Initial Letters and other Ornaments." Of this volume we cannot give specimens, for the reasons alleged with regard to the last. It is "got up," as a whole, in a far more costly style than the preceding—gold initials, ornaments, and borders being scattered more or less over every page; but the illustrations are not so numerous, and moreover, are not, in our opinion, improved by the tintings, which, in some instances, seem to conceal the fine work of Mr. Foster's etching-needle. His compositions are, nevertheless, quite up to his own mark, and little more need be said in praise of them; though on new ground as it were, among the songs and carols of the old poets, of which the text is principally made up, his fancy is as fertile, and his pencil as pleasant and truthful, in delineating the customs of our long-buried forefathers as they are when busy amid the scenes of our own times. On one page he depicts the court-yard of an Anglo-Norman mansion, with a group of carollers singing their Christmas hymn, while others enter bearing all sorts of "meat and drink, and each dainty," that will presently cover the Christmas table. On another page the boar's head is carried into the old hall in triumph, with sound of trumpet and voice of song—

"Lords, knights, and squires,
Parsons, priests, and vicars,
The boar's head is the first mess."

Then we have a charming picture of "Old English hospitality to the poor," another of the "Jolly wassail bowl," and others of the "Yule log," a "Merry Christmas to you all," "Tenants bearing presents to their landlord," the "Shepherds of Bethlehem," "Wassailing fruit-trees," "Christmas sports," and a host more, which we cannot stay to enumerate. This is, *par excellence*, THE book for Christmas, albeit we live in more sober times than those to which it specially refers, and although there are two or three songs or poems it would have been judicious to omit, at least for general reading.

LONGFELLOW'S *POETICAL WORKS*, richly dressed in bright marone and gold, contains upwards of one hundred and sixty engravings on wood, from designs by Jane E. Hay—better known to many of our readers by her maiden name, Jane E. Benham—Birket Foster, John Gilbert, E. Wehnert, the last two gentlemen contributing only about three each. From such a multitude of subjects, how is it possible to make anything like an adequate selection by way of criticism? we have introduced three specimens, which our readers may take as examples of the whole. Mrs. Hay's appearance as an illustrator of books, is of more recent date than that of her fellow-labourers in this volume; in fact, so far as our recollection extends, it is the first book on which the lady has been extensively engaged; but henceforth we shall expect to meet with her often. She resided in Germany for a considerable time, and her style is founded on the German school, but she has not fallen into the hard and dry mannerism adopted by so many of the artists of "Fatherland;" there is a richness and a fulness in her designs which the men of Dusseldorf and Munich rarely exhibit. This edition of the writings of the most popular American poet is worthy of being made a household book in the homes of Great Britain, quite as much as in those of the States: America gave us her poet's songs, in return we give her our artists' pictures:—

"Et vitula tu dignus, et hi."

In a less showy, but not less ornamental garb than the preceding volume, arrayed in deep purple

and gold, is Longfellow's romance of *HYPERION*, illustrated with nearly one hundred engravings on wood, by H. Vizetelly, from drawings by Birket Foster, whose aid has now become almost a necessity in every work claiming a pretension to be ranked among the best class of illustrated literature. We learn from the few prefatory remarks to this edition, that all the local illustrations were sketched on each respective spot, a journey of between two and three thousand miles being expressly undertaken for the purpose. It may be assumed there are few persons who have not read *Hyperion*; all who have, know that the scenery of the tale lies in Germany and Switzerland; of these local views there is a large number; others, referring to no particular place, are imaginary; as, of course, are those that come strictly under the title of figure subjects. The volume is produced with taste and elegance; and if it pleases us less than those already noticed, it is only because even Mr. Foster's pencil cannot give to such materials as Germany has supplied him with, the beauty and richness which his own fancy forms out of the characteristic features of English landscape. We introduce one engraving from this book, and two from

THE PILGRIM'S PROGRESS. This volume is ornamented with a very considerable number of designs by W. Harvey, engraved by the Brothers Dalziel. True it is that John Bunyan's noble allegory requires not the assistance of the artist's genius to render it welcome, but were such aid needed, it could not have fallen into abler hands than those which have worked on this edition: they have had a wide and productive field wherein to labour, and the harvest reaped is rich and ample in proportion. A long and beautifully written memoir of Bunyan, by the late Dr. Cheever, of America, gives increased value to this most acceptable edition.

THE POETICAL WORKS OF JOHN MILTON, in two volumes, are embellished with one hundred and twenty engravings on wood, from designs by W. Harvey. The peculiar nature of the chief poems of our great bard renders the task of illustrating them one of the most difficult it can fall to the lot of an artist to undertake, whose fancy need be inspired by "airs from heaven, and blasts from hell," as well as by gentle breathings from the paradise of earth. It has been said that Art can exercise an influence over the understanding that no descriptive eloquence can effect; but while this may be admitted as a general rule, there are many exceptions to it, and especially when the subject in hand ranges beyond the confines of earth; and thus the wonderful conceptions of Milton, when he carries us out of the garden of Eden, and frequently when he keeps us within it, are altogether unapproachable by even a Michael Angelo, or a John Martin, whose fervid, visionary, but poetical imagination, enjured up some wondrous pictures. Mr. Harvey has very wisely refrained from venturing far upon such mysterious ground; only now and then does he hold communion with the spirits of the air, the angels of light, and the angels of darkness; but there are many exquisite bits of scenery, and groups of figures, scattered through "*Paradise Lost*" and "*Paradise Regained*," "*Comus*," "*Arcades*," and Milton's minor poems have also received their due portion of the artist's attention. The engravings are by Thompson, S. and T. Williams, O. Smith, J. Linton, &c.: we have found room for two specimens.

COWPER'S WORKS in two volumes, with seventy-five illustrations by John Gilbert, engraved by J. O. Smith, next claims our notice. Our readers, to whom Mr. Gilbert's style must be perfectly familiar, will perhaps scarcely recognise him in the examples we have introduced. It is, therefore, right to mention that this edition of Cowper's poems was originally published, several years ago, by Mr. Tilt, when Gilbert had only just begun his career as a book-illustrator. We can, however, trace in them all the germs of that excellence he has since attained; indeed, some he has never surpassed, even to the present time, in tenderness, and in purity of feeling. His drawings now show more of the master's power, but not more of the artist's true and natural fancy. Two specimens are introduced.

THOMSON'S SEASONS AND CASTLE OF INDOLLENCE, in one volume, have found their illustrator, both as designer and engraver, in Mr. S. Williams. The example introduced, selected out of forty-eight, will suffice to show that the task did not

devolve upon one incompetent to fulfil it. The volume is uniform in size and "getting up" with those of Milton and Cowper, and is worthy of being associated with them.

Lastly, and to conclude our notice of the publications of Messrs. Kent and Co., we have GRIMM'S HOUSEHOLD STORIES, with two hundred and forty illustrations, by E. H. Wehnert; of these we could find no room for specimens, and can only observe that they well accord with the spirit of the stories, which are as fanciful and unreal as the most mystery-loving German ever penned; there is a vast amount of talent and ingenuity, both in the tales and the wood-cuts, which may amuse if they do not edify.

ON ENAMEL-PAINTING.*

BY CHARLES TOMLINSON.

No. III.

TWENTY years ago, Mr. Alfred Essex published a paper entitled, "Some Account of the Art of Painting in Enamel," † in which he expressed his opinion that "writers on the subject of enamelling confounded the art of painting in enamel with those of painting on glass and porcelain; although these three arts are almost as dissimilar as their products—a painted window, a richly ornamented vase, and an enamel painting."

We have received from Mr. William Essex, "Enamel-painter in ordinary to Her Majesty and H.R.H. the Prince Consort," a letter in which he makes the same complaint with reference to our treatment of this subject. According to him, the difference between the art of painting on porcelain and enamel-painting is that "the latter can be fired as many times as required. I never finish a picture," he says, "in less than ten fires, and I have subjected one to thirty, but that is unnecessary, although it proves the durability of the material." The second distinction pointed out by Mr. Essex is, that "on account of the great heat to which the picture is exposed, many metals are perfectly useless to the artist in enamel, such as iron, copper, and lead."

In answer to these objections, we must remark, that the chief reason why those branches of Art which depend so much for their success on chemical operations are beset with so many difficulties, is that the artists are not chemists. Hence, too, it is that the early writers on the subject are so confused and unsatisfactory; and it is not without justice that Mr. Alfred Essex, in the paper above referred to, exposes the complicated elusiveness of an enamel colour which, in 1817, was crowned with the prize of the Society of Arts. Such a recipe would not have been concocted had the inventor been a chemist; and we think that Mr. William Essex's first objection would not have been made, had he taken a scientific, instead of a technical, view of the subject. The best writers regard enamel-painting, or the manufacture of enamels, "only as one of the branches of the art of vitrification." ‡ Labarte also says (p. 101), "The subject of the present chapter will be enamel applied to painting on a metallic excipient; and in treating of the ceramic art, we shall speak of enamel-painting upon pottery." Laborde also says, "Toute matière susceptible de supporter, sans brûler, éclater ou fondre, la chaleur nécessaire pour faire entrer l'émail en fusion, peut recevoir cet émail, qui, pour réussir complètement, doit être en rapport de dilatation et de contraction avec cette matière. L'émail appliqué sur le métal, et les émaux qui, sous le nom de couverte et de vernis, recouvrent la porcelaine, la faïence, les briques, les grès, les schistes, la lave, et les vitraux sont les mêmes quant au rôle qu'ils jouent, et au maniement." § Let us now see what the chemists say on the subject. Thénard says, "Les émaux s'appliquent par la fusion sur les métaux et les poteries." || Dumas says, "Tout le monde sait qu'on parvient à fixer sur les poteries, le verre, et les émaux des couleurs variées, brillantes et capable

de résister à l'action de l'air, de l'eau, et même à celle de quelques agents plus énergiques. C'est en se procurant des mélanges fusibles colorés par divers oxydes métalliques que l'on arrive à ce résultat." * And again (p. 629), "Il est bien évident qu'avec des précautions convenables, toute matière vitrifiable pourra servir à émailler." Reboulleau also recognises the same fact:—"Les émaux destinés à décorer les métaux doivent avoir toutes les qualités requises pour ceux qu'on applique sur le verre ou la porcelaine." † It may also be remarked that the French apply the term enamel to the glaze which covers earthenware, the ornamentation of which we suppose Mr. Essex would scarcely object to as enamel-painting. Thus Dumas says, "Tous les potiers savent fort bien préparer l'émail qu'ils emploient comme couverte pour la faïence commune;" and Brongniart defines the enamel so applied as "un enduit vitrifiable, opaque, ordinairement stannifère," a definition accepted by all good chemists. Thus Professor Miller, of King's College, in his "Elements of Chemistry," published in 1856 (Part ii. p. 767), says, "Enamel is the term given to an opaque glass, which owes its opacity to the presence of bioxide of tin."

But notwithstanding the *chemical* identity of the processes, we are quite willing to admit the *technical* differences insisted on by Mr. Essex, and to divide the art of painting in vitrifiable colours into—first, painting in enamel; secondly, painting on porcelain; and thirdly, painting on glass. With respect to the assertion that iron, lead, and copper are never used as sources of colour under the first head, we may remark that the French enamel-painters employ all three metals: the copper, in the state of deutoxide, for a green enamel; lead, in the form of minium, in what are called the *émaux de Winn*; and iron, in the form of fine filings, in a brown enamel, and, in the state of red oxide, for an orange-coloured enamel. The calcined sulphate of iron is also used. Many other examples of the use of these metals might also be given, although Mr. Essex may probably, in his own practice, object to their use. But this is a matter of very small importance, our object in writing this article being to insist on the important truth, that the difficulties which beset the art of painting in vitrifiable colours are chiefly due to the absence of chemical knowledge. The distinguished chemists who have written on this subject are not, and indeed do not require to be, enamel-painters; but it is quite necessary that the enamel-painters should be chemists, or at any rate be ready to receive with respect the observations of such men as I have quoted. This is not always the case. The practical man, as he delights to call himself, often assumes an antagonistic position with respect to the scientific man. He regards him as a mere theorist, and fancies that he himself must know his own art better than a man who has never been apprenticed to it. There is, however, this great distinction between the methods of Art and those of science. Art (that is the technological, in contradistinction to the æsthetical portion) consists of certain processes or facts, together with rules for their application; science consists of principles whose peculiar function it is to gather up and generalise facts, to explain processes, and to substitute laws for rules. Art is human and subject to error; science belongs to nature, and is precise and unerring because divine. The light of science cannot shine upon Art without improving it; and the practical man who refuses the aid of science or theory, as he is pleased to call it, voluntarily accepts a disadvantageous position by placing himself behind the knowledge of his age. He may by his own skill and natural abilities attain a large share of success in his art; but so long as he wraps himself up in his secrets, and carries on investigations alone—*i.e.*, unaided by science—he will be subject to repeated and mortifying failures.

In order, therefore, that the results of Art may be harmonious and consistent, and their identity at different times remain undoubted, we must avail ourselves, so far as we are able, of the stability of nature as revealed to us by science. In no other branch of technology is there more need of the aid which is furnished by fixed chemical laws, than in the pre-

paration and application of vitrifiable colours. In this art we can only be certain of our results by having the materials in a state of chemical purity, and compounding them according to the laws of definite proportions. For example, in order that the yellow colour furnished by chromate of lead shall be identical at all times, it is obviously a first condition that this compound consist of nothing but equal equivalents of oxide of lead and chromic acid. If this condition be complied with, the pigment will be the same at all times, and in all places; and if operated on under the same circumstances, will produce precisely the same results; but if either of the proximate elements of this salt be impure, the compound is no longer to be relied on. Different specimens will produce different results, according as they differ in the nature and amount of the impurity, although the identity of the circumstances under which they are applied may be carefully observed at different times. But it is not always enough that the chemical purity of the pigment be assured. In certain cases the physical condition of one of the ingredients may have considerable influence on the resulting colour; such is the case with oxide of zinc, which enters into the composition of some of the enamel greens, yellows, yellow-browns, and blues. If the oxide be lumpy, granular, dense, and friable, it will produce by its admixture with the colouring oxides a dull and unsatisfactory pigment, although it may be perfectly pure; whereas a light, flocculent, impalpable oxide of zinc, identical in chemical composition with the former, will produce satisfactory results. It is further necessary to identity at different times that the solution of a particular metal, or its oxide, &c., be always made at the same temperature; that the acids, &c., which dissolve it be of the same specific gravity; that the solution be always of the same strength; that the precipitate be neither more nor less rapid on one occasion than on another. All these, and many other conditions necessary to the production of a definite colour, require the careful consideration of a scientific chemist, which conditions having been well understood, committed to writing and published in some work of repute, an important step is made in advance; the artist as well as the chemist may proceed with certainty; the one to practice certain processes which have been made intelligible, the other to adopt such processes as a starting point for new investigations. Thus may mortifying failures and the repetition of scientific researches be avoided. During a long series of years such a course has been adopted at the porcelain manufactory at Sèvres, and a large amount of valuable information respecting the preparation and application of vitrifiable colours has been digested and published, under the competent authority of M. Brongniart.* Most of the prescriptions for the preparations of the colours are the result of experience at Sèvres, either made under M. Brongniart's direction, or copied from the archives of the factory, which contains minute descriptions of the processes adopted for compounding these colours. M. Brongniart remarks that the chemist, M. Salvétat, who for many years has been entrusted with the preparation of the colours, has dignified the art by imparting to it that scientific perfection in which it was formerly deficient, "that is to say, he has given to these prescriptions the method, the exactitude, and all those precise conditions which belong to science, and which have been introduced with so much success and utility into industry." (Tome ii. p. 506.) Such a service as this was fairly to be expected of an institution which from the time of Louis XIV. has been maintained at the public expense, and has numbered among its directors such distinguished men as Macquer, Brongniart, Ebelmann, and Regnault.

Enamel colours are formed by the combination of certain metallic oxides and salts with certain fluxes, which enable them to fuse into coloured glasses. The metallic oxides are usually those of chromium, of iron, of uranium, of manganese, of zinc, of cobalt, of antimony, of copper, of tin, and of iridium. The salts and other bodies used to impart colour are chromates of iron, of baryta, and of lead; the chloride of silver, the purple precipitate of Cassius, burnt umber, and burnt sienna, red and yellow ochres, &c. Some of these colours develop them-

selves at the highest temperature of the porcelain furnace, and they form the *couleurs de grand feu*, as the French call them; others, and by far the larger number, are called *muffle colours*, since they require only the more moderate heat of the muffle, in which the painted articles are enclosed, to protect them from the products of combustion of the fuel.

The *couleurs de grand feu* are limited to the blue produced by oxide of cobalt, the green of oxide of chromium, the brown produced by iron, manganese, and chromate of iron, the yellows from oxide of titanium, and the uranium blacks. These colours furnish the grounds of hard porcelain; and as the temperature employed in baking this substance is capable of fusing felspar, that substance is used as the flux. For an indigo blue, the proportions are 4 parts oxide of cobalt and 7 parts felspar; for a pale blue, 1 part oxide of cobalt and 30 parts felspar. The materials in each case are to be well pounded and mixed by sifting them together at least four times, after which they are to be fused in a crucible in the porcelain furnace. The colour thus formed is reduced to powder, and is ground up with oil of turpentine, oil of lavender, or some other convenient vehicle, and is applied to the surface of the biscuit in the usual manner, when being again raised to the high temperature of the porcelain furnace, the colour fuses and incorporates itself with the substance of the ware. The other colours are afterwards applied in the usual manner, and these are fused and incorporated with the ware at the more moderate temperature of the muffle; but although the *couleurs de grand feu* require so high a temperature for their fusion, this temperature is accompanied with certain inconveniences in the case of cobalt,—it is liable to volatilise, so as to affect the objects near it; thus, if a white vase be placed near one that is being coloured blue, the cobalt of the latter will rise in vapour, and give a decided blue tint to that part of the white vase which is nearest to it. Moreover, cobalt is uncertain in its results; it occasionally leaves white uncoloured patches, or it may present a dull granular surface, or display metallic grains. Oxide of chromium is sometimes employed without a flux to impart a green colour to hard porcelain, but as this colour does not penetrate the ware, it is liable to scale off. A bluish-green is produced from a mixture of 3 parts oxide of cobalt, 1 part oxide of chromium, and one-tenth of felspar; this mixture is not previously fritted, but is applied in a minutely comminuted state to the ware as usual. A fine black is produced from mixtures of the oxides of iron, manganese, and cobalt; and by omitting the cobalt various browns are formed.

With respect to the muffle colours, which are too numerous to be particularised here, it may be remarked that they are fired at a temperature equal to about the fusing point of silver. A higher temperature would be of advantage to many of them, in increasing their solidity and brilliancy; but it would be injurious to those colours which are obtained from the purple precipitate of Cassius, on which the artist relies for some of his finest effects. Muffle colours do not penetrate the glaze of porcelain, as may be proved by boiling in nitric acid a piece of painted porcelain after it has been fired, when the colours will disappear: hence the glaze of hard porcelain has but little reaction on the colour, and if this be not acted on by the high temperature, it ought to preserve its proper tint. The principle of painting on hard porcelain is, according to Dumas, the art of soldering by heat, to a layer of the glaze, a layer of fusible colour, the dilatation of which shall be the same as that of the glaze, and of the body of the ware. The function of the flux is to envelop the colour and attach it to the glaze. In most cases it has no action on the colour, but is simply mechanically mixed with it: it is, however, necessary that the flux should combine with the glaze. Dumas gives a caution against the common notion with respect to vitrifiable colours, that the colour and its flux are capable of chemically uniting by heat, and forming a homogeneous compound. In the case of muffle colours the contrary is usually the case, the flux being only a mechanical vehicle for the colour. Hence the flux must vary with the colour; but, as all the colours ought to be capable of being mixed, the range of fluxes is but limited. A common flux is the silicate of lead, or a mixture of this with borax. The borax cannot be

replaced either by soda or potash, on account of the facility with which these alkalis become displaced in order to form other compounds: moreover, it is found that the presence of these alkalis causes the colours to scale off. The mode of employing the fluxes varies with the colour: in certain cases the flux is ground up in proper proportions with the colour, and is so employed; in other cases, it is previously fritted with the colour. When the colour is easily alterable by heat, the first mode is adopted; but when the oxide requires a high temperature for the development of its tint, the second mode is employed.

The application of enamel-colours to metal is beset with greater difficulties than in the case of porcelain and glass, on account of the facility with which the metal becomes oxidised; and it would probably be found that in all cases the metal has acted injuriously on the colours. The peculiar merit which Mr. Essex claims for his branch of the art—in being able to pass his work through the fire as many times as required—must be considered a doubtful advantage, for the oftener this is done the more likely is the oxide formed on the surface of the metal to become dissolved by the enamel, which thus displays defects which are beyond the control of the artist. Another inconvenience resulting from this frequent firing is, that if the enamel contain oxide of lead,—which it nearly always does, except in the case of the best Venetian variety,—the enamel reacts on the metal, metallic lead is formed, and the colour of the enamel is destroyed. The early enamellers sought to get rid of this inconvenience by employing gold as the excipient; but as gold is usually alloyed with copper for the sake of imparting hardness, the difficulties were thus only partially evaded. If the excipient be copper or silver, the enamels are almost certain to be injured in colour by contact with these metals, and the artist may think himself fortunate if this change be confined to the layer which is in immediate contact with the metal, although even this circumstance would be fatal to the effect of transparent enamels. Hence opaque enamels are preferred, but with them the edges of the work often show the mischievous influence of contact with the metal excipient.

In concluding these few remarks on the chemistry of enamel-painting, we will give a very short account of the method adopted at Sèvres for preparing the purple precipitate of Cassius. The number of rich and varied tints produced by this pigment have caused it to be highly esteemed by the enamel-painter, especially by the flower-painter. This pigment is formed by adding a solution of gold to one of chloride of tin, for which purpose fine gold is dissolved in *aqua regia*; the solution is diluted with water, filtered, and again largely diluted, when the colour should be of a light citron yellow. During these operations a solution of tin is to be prepared with the greatest care, for on this depends the success of the operation. The tin is also to be dissolved in *aqua regia*, in small fragments at a time, and these must be allowed to disappear before a fresh quantity is added. Pure laminated Malacca tin is to be preferred, and the operation must be conducted in a cool place, it being important to keep down the temperature of the solution. In this way a protochloride, and a deutochloride of tin are formed, the mixture of the two chlorides being necessary to ultimate success. A scanty black sediment will also be formed, but this may be separated by decantation, after which the solution of tin is to be poured drop by drop into the solution of gold, with constant stirring; but as soon as the precipitate is of a purple colour, the operation is to be arrested. When the purple is deposited the liquor is to be decanted off, and the precipitate collected on a filter; it should assume a gelatinous consistence. In this state it is fit for use, but must be kept under water. The quantities used at Sèvres are as follows:—15 grammes of tin are dissolved in *aqua regia* consisting of 4 parts nitric acid, 1 part hydrochloric acid, and 10 parts water; the solution is then diluted with 5 litres of water. The quantity of gold dissolved in the *aqua regia* is 5 grammes; but excess of acid is to be avoided; this is diluted with 5 litres of water, and the solution of tin is added as already described. It is usual to wash the precipitate with boiling water, when it should remain of the fine colour of old wine; and when mixed with proper fluxes, be capable of producing fine purple, violet, and carmine tints.

ART IN THE PROVINCES.*

HALIFAX.—Our contemporary, the *Builder*, gives, in a recent number, the following description of the public park, which was formally presented to the corporation on the 14th of August: it is the munificent gift of Mr. F. Crossley, M.P., to the people of Halifax:—"It is situated on the western side of the borough. It has four entrances, two in Park Road, one in Hopwood Lane, and one in King's Cross Street, and the whole is surrounded by palisades. The promenade is reached by means of flights of stone steps. In the centre of the terrace is a semicircle of steps, nine in number, and 27 feet in width. At the top of these steps a stone building is erected, 30 feet high, with arches in front, borne on pillars of stone. On each side of the building will be small fountains, and Grecian vases on pedestals. In different parts of the terrace are productions of marble statuary, of life-size, eight in number, the work of Italian artists, representing Hercules, Venus at the Bath, Aristides, &c. Below the terrace is a stone basin, 4 feet in depth, and 216 feet in circumference, with a fountain in the centre. Lower down is a little lake, with a serpentine walk about it, and bridges over it,—one formed out of rocks. The park grounds, which are laid out with trees, shrubs, plants, and flowers, comprise in all about 12½ acres, suitably studded with numerous seats for the use of visitors." The inhabitants of Halifax, through generations to come, will have good reason to venerate the name of Mr. Crossley, of whom, we are happy to hear, it is proposed to erect a statue in the park. The subscriptions of his fellow-townsmen have already reached a considerable sum for this purpose.

PAISLEY.—The annual meeting of the subscribers to the Paisley School of Art was held on the 31st of August, for the purpose of receiving the annual report, and distributing the prizes to the students to whom they had been awarded. The attendance of pupils seems to have been less than that of previous years; but the deficiency is explained by the circumstance that, in former years, many of the pupils of the Neilson Institution attended the Paisley school in order to receive instruction in elementary drawing; but during the past season Mr. Urie, the second master, had attended the Neilson Institution twice a week, and given lessons to about 200 scholars, thus rendering it unnecessary to attend the parent establishment.

COVENTRY.—The annual meeting of the supporters of the Coventry School of Art was held on the 8th of October, the Right Hon. Lord Leigh presiding on the occasion. The Report stated that the number of students entered on the books during the past sessional year was 371 against 340 in 1855-6, and 340 in 1854-5. The progress of the school has been steady and satisfactory. Out of the eighteen works to which local medals were awarded last year, four obtained medals in the national competition in London; but as two of the awards were made to drawings by the same student, T. Mallinson, only three medals were distributed to the school. It seems, from a comparison between the number of awards and that of the registered students, with those of other provincial schools, that the Coventry school stands fourth in the order of merit.

SHEFFIELD.—The friends and supporters of the Sheffield School of Art had their annual gathering on the 29th of October, when Mr. Young Mitchell, the head master, read the Report. The council regretted that no diminution had taken place in the debt on the school-room since the last meeting; it amounts to £1680, and the council, unable at present to raise so large a sum, had borrowed £1000 at 5 per cent., on a mortgage of the building. The number of pupils for the quarter is 263, an increase of eighty-two over the corresponding quarter of last year.

* We depart from our usual practice of disregarding all anonymous communications to answer a query which some over-sensitive correspondent at Glasgow puts to us. He asks—"Why does the Editor of the *Art-Journal* persist in offering an insult every month to the people of Scotland? Does he require to be informed that Scotland is not a province of England?" We feel greatly obliged by our correspondent's desire to enlighten our presumed ignorance, but we do not stand in need of his teaching, nor do we think that the "people of Scotland," whose self-constituted champion he has become, consider that we offer them "an insult," because it suits our purpose to place notices of Art-matters in Scotland under the general heading of "Art in the Provinces," to distinguish them from Art-news in the metropolis of the United Kingdom. We do not find our Irish or Welsh friends making it a subject of complaint that we chronicle their doings in the same way, neither do we see any reason why an exception should be made in favour of Scotland. Perhaps our Glasgow correspondent might furnish us with a reason; and if he will write to us in his own proper name—for anonymous letters are generally consigned to the waste-paper basket—we promise him to take the matter into consideration.

DRAWN BY WILLIAM EVANS

ETON, FROM THE LOCKS.

ENGRAVED BY JAMES REDAWAY

THE BOOK OF THE THAMES.*

FROM ITS RISE TO ITS FALL.

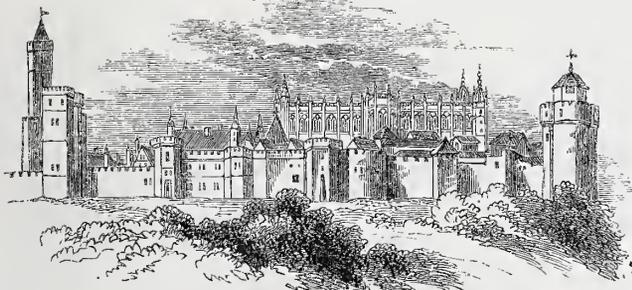

BY MR. AND MRS. S. C. HALI.

PART XII.

WINDSOR CASTLE, occupying a hill to which there is an ascent from all sides, is seen from every part of the adjacent country, and the several distant heights; it is always a pleasant sight, not only as regards the scenery, but with reference to its many "happy and glorious" associations with the past, and its suggestions of hope and joy as the favourite residence of the Queen, the Prince Consort, and the royal family of England.

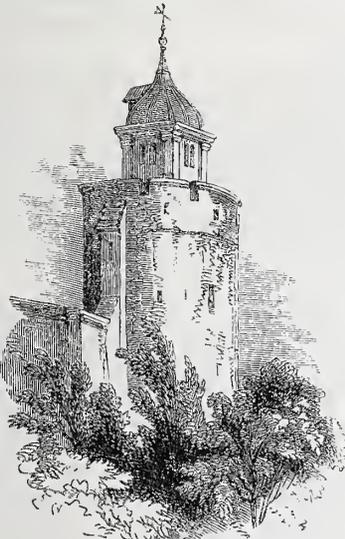

The earliest engraved representation of Windsor Castle is that to be found in Braun's "Civitatis Orbis Terrarum," 1594, which was drawn by a foreign artist—George Hoefnagel—for that work. We copy the portion that exhibits the walled forecourt, with the Chapel of St. George in the midst. The round tower beyond, as depicted in the same view, is very much beneath its present altitude, and is there termed "the Winchester Tower." The portion inhabited

ANCIENT WINDSOR CASTLE.

by royalty beyond this consisted, in the reign of Elizabeth, of a conglomerate of square and round towers, the work of successive ages of change, which adapted the fortress-home of the earlier kings to the more secured and refined life of the days of the "Lion Queen."

The terrace is represented in this curious print as a simple embankment supported by wooden piles, with a row of rails to protect promenaders from a fall into the ditch below. The town at this time appears to have been a collection of small cottages, and a shepherd reposes with his sheep in the foreground of the view, while mounted courtiers pursue the deer in the park, accompanied by huntsmen who run on foot beside them. Such was the Windsor of the days of Shakspeare. The present aspect of the castle is widely different; but, during every change, there has been one striking feature preserved—the old BELL TOWER, which we here engrave. It formed one of the most ancient of the defences; it is seen in the old view engraved above, and is now one of the most conspicuous points of the castle when viewed from the river, or seen in its full proportion as the visitor

THE BELL TOWER.

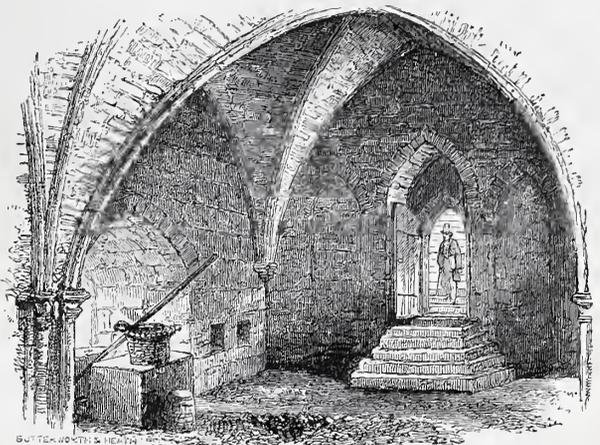

wends up the main street of the town to the principal entrance.

The bell tower, anciently "the curfew tower," was in early times the prison of the castle; and in the crypt underneath, the cells are still perfect in which state prisoners were confined. On the stone walls are many initials and dates, several so far back as A.D. 1600, but none earlier, except such as are undoubtedly forgeries. The accompanying engraving will convey an idea of this interesting interior,—in which, by the way, a subterranean passage has recently been discovered, said to lead under the Thames to Burnham Abbey,

* The reader will no doubt be pleased to receive, in lieu of the usual engraving of a work in sculpture, the accompanying print of ETON COLLEGE. It is engraved from a view by Mr. Evans, and cannot fail to be acceptable as illustrating this Tour of the Thames. There are few buildings in the kingdom more interesting to a large class; its interest being so essentially enhanced by association: many of our greatest men in arts and arms—warriors in "victories of peace and war"—having been educated there, and having there laid the foundation of that fame which is also the glory of their country.

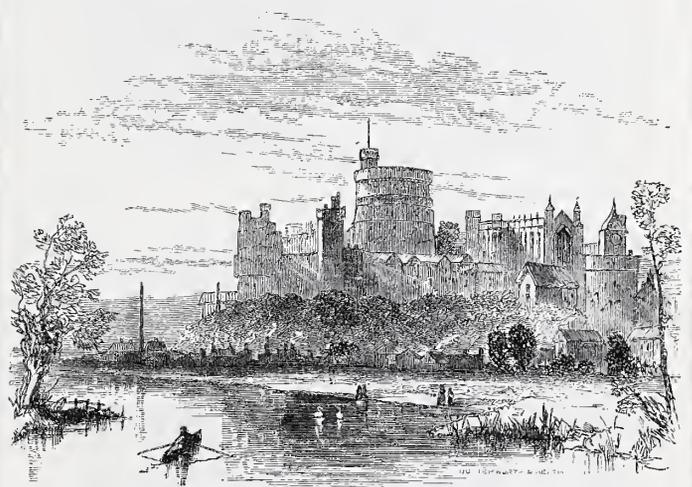

distant three miles, and supposed to have been constructed to facilitate the escape of the garrison at a period of anticipated peril.

Camden conjectures, "plausibly enough," that Windsor derived its name from

CRYPT IN BELL TOWER.

the winding shores of the adjacent river, being by the Saxons called "Wyndleshora:" in very ancient documents it is also so termed; and by Leland, Wyndlesore. The earliest notice of "Wyndleshora" is to be found in the "deed of gift," by which the Confessor presented it to the monks of St. Peter, Westminster. It did not, however, continue long in their possession, for the Conqueror, very soon after he subjugated England, "being enamoured of its situation, its convenience for the pleasures of the chase, the pureness of the air, and its vicinity to woods and waters," obtained it "in exchange," bestowing on the monastery Wakendune and Peringes, in Essex. He at once commenced to

WINDSOR CASTLE.

build a castle on the pleasant site; and in the fourth year of his reign kept his court there, and held there a synod. For eight centuries and a half, therefore, Windsor has been the palace of the British sovereigns, and its history is in a great degree that of the kingdom over which they ruled.*

In the prodigious pile which now covers the hill, there can be little resemblance to the castle in which the first William received his proud Norman barons, and the humbled Saxon "thegns" he had subdued. But it was not until King Henry I. had enlarged it "with many fair buildings," and kept his Whitsuntide there, in the year 1110, that it became known as the royal residence. He was married to his second queen at Windsor, in 1122, and five years afterwards he held another "solemn feast" at the castle, when David, King of Scotland, and the English barons, swore fealty to the king's daughter, the Empress Maud, at which time Windsor was esteemed the second fortress of the kingdom. More than one parliament was held here in this reign; it was within its walls that John angrily awaited the meeting of his barons at Runnymede, they having refused to trust themselves by visiting the king in his stronghold, and the king

* The seal of the Corporation of Windsor is here engraved. It will be perceived that the castle forms the principal object: the inhabitants were first incorporated by Edward I., when Windsor was made the county town until 1314, when Edward II. transferred it to Reading. The genuine old name of the town, slightly Latinised into "Wyndlesorie," appears on this seal. The corporation consists of a high steward (H.R.H. the Prince Consort), recorder, mayor, six aldermen, &c. It was declared a free borough in 1276. The population, by the census of 1851, was about 9000. The borough sends two members to parliament. Its principal public structure, the hall and corn-market, was built by Sir Christopher Wren, in 1686.

merely leaving the fortress to append his signature to Magna Charta, and return sulkily to his fastness. During the barons' wars the garrison was lost and won by both parties in turn. But the peaceful days of the first Edward note only the records of tournaments and residence here; his successor had several royal children born here, and "Edward of Windsor" was his eldest, who afterwards figures so nobly in English history as Edward III. It derived accessions of strength and beauty from many succeeding monarchs. By the third Edward it was almost entirely rebuilt: the famous William of Wykeham being clerk to the works, "with ample powers and a fee of one shilling a day whilst at Windsor, and two shillings when he went elsewhere on the duties of his office;" his clerk receiving three shillings weekly. As evidence of the liberty the king's subjects then enjoyed, it may be stated that "three hundred and sixty workmen were impressed to be employed on the building, at the king's wages: some of whom having clandestinely left Windsor, and engaged in other employments to greater advantage, writs were issued prohibiting all persons from employing them on pain of forfeiting all their goods and chattels." Good old times!

In the great civil war the castle was garrisoned for the parliament, and was unsuccessfully attacked by Prince Rupert in 1642. Six years afterwards it became the prison of Charles I., who here "kept his sorrowful and last Christmas."

After the Restoration, the second Charles restored the castle from the state of dilapidation in which he found it. But for its present aspect we are mainly indebted to his Majesty George IV., who, by aid of his architect, Jeffrey Wyatt, afterwards Sir Jeffrey Wyattville, and "assisted" by copious parliamentary grants, gave to the palace its high character; Art contributing largely to the advantages it received from Nature. It is, however, to be regretted that these restorations were not postponed to a later date, when Gothic architecture is so much better understood; we may well imagine how infinitely more perfect the structure would have been if the successor of William of Wykeham had been Gilbert Scott, and not Sir Jeffrey Wyattville. To describe Windsor Castle is foreign to our purpose; it would demand a volume instead of a page; and there are many guide-books that do so with sufficient accuracy. Visitors are admitted freely to examine all the more ordinary apartments;* and these are richly decorated by works of Art. The corridor contains a large collection of paintings by many of the old masters, mingled with several of our own time,—the portraits of Lawrence, and the commemorative pictures of Wilkie, Leslie, and Winterhalter. During a considerable portion of the year, Windsor Castle is the residence of the Sovereign. It is unnecessary to say that "the apartments" ordinarily called "private," but which are occasionally, and under certain restrictions, shown to visitors, are fitted up with a degree of graceful refinement unsurpassed in any mansion of the kingdom. They will not indeed vie in costliness of decoration, and extravagance of ornament, with many of the continental palaces; there is here no lavish expenditure, and but little of that "display" which excites more of wonder than admiration; but there is an elegant "fitness" in all things, appertaining more to comfort than to grandeur, and belonging less to the palace than "the home." But in furnishing and decoration, in the several chambers for state purposes, and in all they contain, there is amply sufficient to make the subject satisfied that the sovereign is worthily "lodged" when at Windsor, to rejoice that it is so, and fervently to pray that so it may continue to be through many generations yet to come.

Windsor Castle has been always described as the only royal residence in England; certainly, it is the only appanage of the crown that can be considered on a par with those regal dwellings in which other European sovereigns reside, or compared with some of the seats of our nobility scattered throughout the several shires. It is in truth a palace worthy of our monarchs; rising proudly on a steep which commands prospects innumerable on all sides, there is perhaps no single spot in our island from which can be obtained so grand an idea of the beauty and the wealth of England:

"And ye, that from the stately brow
Of Windsor's heights th' expanse below
Of grove, of lawn, of mead survey,
Whose turf, whose shade, whose flowers among
Wanders the hoary Thames along
His silver-winding way."

But the value of Windsor is largely augmented by the associations that connect it with the past. Many of the illustrious names of ten centuries have their records here: here the Order of the Garter was instituted; Windsor Castle is the temple of the order, which has been rightly described by Selden as "exceeding in majesty, honour, and fame all the chivalrous orders of the world."† True heroes, many, have been numbered among the "poor knights," who have still their "convenient lodgings within the walls."‡

St. George's Chapel is in the lower ward of the castle, it was begun by King Edward IV., the older chapel, founded by Henry I., having gone to decay, as

* Tickets to view the state apartments may be obtained in London from Messrs. Colnaghi, Pall Mall East, and other publishers. But also, by a recent and very judicious arrangement, visitors may receive orders from J. Roberts, Esq., at the lord chamberlain's office, within the walls.

† The origin of the name has not been recorded by historians; it is a mere fancy, that which relates how the gallant king picked up a garter at a ball, and, observing the "sportive humour" of his courtiers, exclaimed, "Honi soit qui mal y pense;" and added that whilst that they should soon see that garter advanced to so high honour as to account themselves most happy to wear it. It is asserted by some writers to be derived from the circumstance of Edward having given "garter" as the watch-word at the battle of Cressy.

‡ This establishment was formed by Edward III. They were originally called "*Miles Pauperes*," subsequently "Alms, or poor knights of Windsor," but are now distinguished only as "military knights of Windsor." Their number is thirteen of the royal foundation, and five of the foundation of Sir Peter Le Maire, in the reign of James I. There is also an establishment (founded by the will of Mr. James Travers), but not within the walls, for seven naval officers. By one of the early regulations, it was declared that "the knights should be elected from gentlemen brought to necessity through adverse fortune, and such as had passed their lives in the service of their prince." This wholesome rule has been seldom adhered to until of late years. During the sovereignty of Queen Victoria no claims have been regarded except those of merit and service.

well as that rebuilt by Edward III. The king, determined that his new building should equal any fabric then in existence, appointed the Bishop of Salisbury to superintend it: so costly and laborious was the work that it was not completed till the reign of Henry VIII., the roof of the choir being the last thing done, in the year 1508. Sir Reginald Bray, the prime-minister to Henry VII., succeeded the Bishop of Salisbury as clerk of the works, and he was a liberal contributor to its completion; his cognizance occurs on several parts of the building. Some remains of the older chapel of Henry III. are still, however, believed to exist on the north side of the dean's cloisters, and at the east end of the chapel, behind the altar, where one of the doors is covered with old wrought iron-work of much beauty.

The chapel is the mausoleum of many kings. The earliest buried here was the unfortunate Henry VI.; but his tomb has been long since destroyed, and the royal arms, under a simple arch, marks the spot where it once stood. In the north aisle is the tomb of Edward IV.; it consists of a simple slab of touchstone, over which is erected an open screen, highly enriched with Gothic tabernacle work in iron, which has been gilt. In the year 1789 the vault below was opened, and the skeleton of the king discovered in a plain leaden coffin. In a vault beneath the choir King Henry VIII. lies buried; he has no monument, but one was in course of erection by him when he died, which he directed to be made more stately than the tombs of any of his predecessors. They were all despoiled and destroyed in the great civil war. One of his queens, Jane Seymour, is also buried at Windsor; and so was the unfortunate King Charles I.*

St. George's Hall was built by Edward III. as a banqueting-room for the Knights of the Garter, when they met to celebrate the festival of their patron

annually at Windsor. The old seal of the warden and college of the chapel of St. George, at Windsor, is curious, as depicting the king kneeling to the patron saint of England, with all that minutiae of detail which gives so much interest to these early works. At this time the festival was celebrated with tournament and processional display; many noble foreigners were invited to be present, and the utmost splendour of feudal pomp was lavished on the ceremony. For more than two centuries feasts of this kind were annually held at Windsor; the new statutes of the order, made by Henry VIII., precluded the necessity of holding the great feast here; and in the reign of Elizabeth it was arranged to be held wherever the court happened to be. So showy were these displays, that knights-companions were allowed to bring fifty followers; and admission to the order has always been considered one of the highest honours an English sovereign

can bestow. Their number (exclusive of foreign princes) is limited to twenty-five. The stalls of the sovereign and the knights-companions of the Garter are situated in the choir of St. George's Chapel. Each stall is enriched with carving, and behind is the armorial bearings of each knight, and above the silken banner emblazoned with their arms. The royal stall is on the right of the entrance, and is distinguished by a larger banner of velvet, mantled with silk.

But greatest among all the many attractions of Windsor Castle are, perhaps, those which are presented to the visitor by the views he obtains from the terraces, or any of the adjacent heights, and especially from the battlements of "the Round Tower,"—

"Of hills and dales, and woods and lawns, and spires,
And glittering towns, and silver streams."

He stands in the centre of a panorama of unequalled beauty, and he is, as he ought to be, proud of his country. Look where he will, some object of deep and exciting interest meets his eye. Immediately beneath him, and seeming as if part of the grand domain, is Eton, with its many associations of the present and the past, and fertile in hopes of the future. Here Wellington learned his first lessons in war; here, in his boyhood, the victory of Waterloo was fought and won; here William Pitt, the elder and the younger, were the pilots that steered the ship through the storm; here Bolingbroke, Camden, Walpole, Fielding, Boyle, Fox, Porson, Canning, and a host of other immortal men, laid the foundations of that renown which became the glory of their country. A little farther on is Slough, where, in a comparatively humble dwelling, the Herschels held commune with the stars;‡ there is the church-yard in which Gray lies—that of "Stoke Pogis;" while a little nearer is the "ivy-crowned tower" of Upton, immortalised in the most popular of all his poems; there too are the hills and woods that shadow the cottage in which Milton wrote; the mansion in which Edmund Waller and Edmund Burke lived and died; and the little grave-yard of "the Friends," where William Penn is at rest.

Iver, Langley, Bulstrode, Dropmore, Burnham, and Dorney—places honoured in history, and cherished in letters—will be pointed out to those who examine

* The tomb-house now used as a royal burial vault was originally designed by Wolsey for himself. It was fitted as a chapel by James II., and, after his abdication, allowed to decay, until George III., in the year 1800, gave orders that it should undergo a thorough repair, in order to be used as a place of interment for himself and family—a purpose to which it has been since dedicated.

‡ The famous telescope of Dr. Herschel is still preserved in the garden of the house in which he lived, and may be seen without much difficulty by persons desirous of rendering homage to the memory of the great astronomer.

the rich landscape in this direction. Looking eastward and southward, other rich historic sites, and other examples of beautiful scenery, come within his ken. On a level with the eye is a range of hills—St. Leonard's Hill, High-standing Hill, Priest's Hill, and Cooper's Hill; while further eastward are St. Anne's Hill and St. George's Hill. At St. Leonard's Hill dwelt "for a season" the Earl of Chatham, "the great father of a greater son;" there, too, is Binfield, where Pope "lisp'd in numbers,"—

"First in these fields he tried the sylvan strain,"

under the trees of Windsor forest, in his boyhood, he coned his lessons, accompanied by his tutor, an old French Roman Catholic priest. Cooper's Hill overlooks Runnymede, commemorated in the beautiful verse of Denham:—

"Here his first lays majestic Denham sung;"

while St. Anne's Hill looks down on the town of Chertsey, where dwelt in calm retirement, after seasons of exciting labour and thought, Charles James Fox, and where

"The last accents flow'd from Cowley's tongue."

Gazing up "the Long Walk,"—that noble tree-avenue of three miles,—the visitor sees the statue of the third George, whose memory is dear to all who love the kindly, the good, and the true; while at intervals, among its younger hopes, are those venerable sovereigns of the forest, who wore their green leaves in glory when the Conqueror was at Hastings.

To enumerate half the places seen from Windsor Castle, and which time, circumstance, and some heroic or grateful memory have rendered famous, would occupy pages of our tour. We may not forget, however, that the sight is often cheered and gratified while wandering over the view from "Windsor's heights" by those well-managed and productive "farms," which, under the personal care of the Prince Consort, are examples and lessons to the English gentleman.

But to the present age, and the existing generation, the castle at Windsor is suggestive of holier and happier feelings than those we derive from the past. The most superb of our palaces is accepted as a model for the home of the humblest, as of the highest, British subject; the lowliest in position, as well as the loftiest in rank, deriving their best example from those graces and virtues which are adornments of the proudest mansion of the realm. And not alone is this "home" pre-eminent for domestic happiness: the personal character of the Sovereign, and that of her illustrious Consort, influence every class and order of society; they are the patrons of all improvements for the good of their country; all its charities are helped and forwarded by them; under their just and considerate rule, at a time when every state in Europe was in peril, there was no disaffection at home: loyalty has become the easiest of English duties; those who teach the present generation the old and venerated lesson, "Fear God and honour the Queen," have to contend against no prejudice, to reason down no opposing principle, to overcome no conscientious scruples that rational liberty is abridged by earnest and devoted homage to the crown. It is the universal heart of her kingdom which utters the "common" prayer—"that God will with favour behold our most gracious sovereign lady Queen Victoria; endow her plenteously with heavenly gifts; grant her in health and wealth long to live; and strengthen her that she may vanquish and overcome all her enemies."

HERNE'S OAK: THE EARLIER.

The "Little Park," so called, because of its immediate contiguity to the castle, and to distinguish it from the "Great Park," is described as about four miles in circumference; it derives interest, in addition to its intrinsic beauty, as the scene of those revels which Shakspeare has described in his "Merry Wives of Windsor."* And here was the famous tree—"Herne's Oak"—round which "the hunter"—

"Some time a keeper here in Windsor Forest"—

was doomed to walk "all the winter time." The veritable tree seems to have been cut down by some unfortunate accident at the close of the past century.

* The Little Park was enclosed some years ago, during the present reign, and the meadow below the slope was given in exchange to the people of Windsor, who now play at cricket there, and use it for fêtes and other amusements.

Ireland, in his picturesque views of the Thames, published in 1792, describes it as then standing, and gives an engraving of it, which we copy.

There are, however, many in Windsor who believe that *this* tree was not the tree, but that a venerable ruin which still exists, and to preserve which every possible care has been taken, is actually that to which the "immortal poet" made reference in the drama of which the scene is laid in this neighbourhood. Among the most strenuous advocates for this view of the case is Mr. Jesse, whose works exhibit so much of pure fancy in combination with observation, thought, and genuine love of Nature; for there can be no doubt that the venerable father of the forest, whose cause Mr. Jesse eloquently adopts, was aged when Falstaff was pricked by the fairies under the branches of some denizen of the forest "thereabouts."

"Under its boughs, all mossed with age,
And high top bald with grey antiquity."

At all events, be it the true tree or its successor, it is venerable and interesting, and the reader will be pleased to examine its likeness, as an example of the antique character of the sylvan scenery of Windsor.*

HERNE'S OAK: THE LATER.

From the parks at Windsor we are naturally led to some consideration of Windsor Forest: there is nothing of its class in the kingdom more entirely beautiful,—in a word, it is worthy of the magnificent castle to which it is attached.

WICKLIFF'S OAK.

Although now of comparatively limited extent, it was "anciently" among the largest forests of the kingdom.† "It comprised a part of Buckinghamshire,

* The question as to the identity of this tree with that named by Shakspeare was anxiously inquired into by Mr. Knight in his edition of the immortal poet's works, and he places beyond doubt the fact of its destruction. West, the president of the Royal Academy, used to relate that King George III. "had directed all the trees in the park to be numbered, and upon the representation of the bailiff that certain trees encumbered the ground, directions were given to fell those trees, and that Herne's Oak was among the number." Mr. Nicholson, the landscape-painter, some time after this made further inquiries on the point, and requested Lady Ely to ask the king himself, and he confirmed the story, saying, "that when he was a young man it was represented to him that there were several old oaks in the park which had become unsightly objects, and that it would be desirable to take them down; he gave immediate directions that such trees should be removed, but he was afterwards sorry he had given such an order inadvertently, because he found that, among the rest, the remains of Herne's Oak had been destroyed."

† One of the most beautiful spots in Windsor Forest is "the Heronry;" the birds are still numerous there. It lies in the vicinity of the red brick tower at the western extremity of the park. The neighbouring scenery strongly calls to mind the sylvan descriptions in "As You Like It;" it is probable that Shakspeare derived many of his ideas of forest scenery from Windsor Forest.

as well as a considerable district of Surrey, and ranged over the whole of the south-eastern part of Berkshire, as far as Hungerford." In Surrey it included Chertsey, and its eastern boundary is said to be marked by an aged oak tree, still standing at Addlestone, and under the boughs of which tradition states that Wickliff preached. The reader will, no doubt, be gratified if we submit to him a picture of this tree also.

Let us vary our more matter-of-fact details by the introduction of one of those sketches which, though of little importance in themselves, like the lights in a picture may give strength and value to a subject.

Many years have passed since we believed we knew every house, cottage, lodge, and tree, in the picturesque neighbourhood of Old Windsor; indeed once, when in very ill health, we spent three months at a keeper's lodge; his wife had been the favourite servant of an old friend, and we were especially recommended to her care because of the air, and quiet, and new milk, and fresh eggs, and the quantity of game (no imputation on the good keeper's honesty). It was then we learned all the green paths and brown roads, and dales and dells, of this charming locality; spending hours, day after day, in the forest, with no other companions than a sure-footed pony and the keeper's only child—a particularly shy, mild, blue-eyed, blushing sort of girl, who looked fifteen, but was quite twenty; who used to cry over "Paul and Virginia" at least once a week, and knew by heart every word of "Turn, gentle hermit of the dale," and "Margaret's Ghost," who loved moonlight, believed in fortune-tellers, and confessed that whenever she tossed a cup she found a true-lover's knot in the bottom. It was, therefore, evident that the girl had a lover somewhere; but as we had never seen him, we asked no questions. We had taken several excursions together, and we fancied we had made considerable progress in all kinds of forestry: could tell the different sorts of birds'-nests at a glance; could find a hare's form, and could track a rabbit; could tell how the wind blew, and where the deer lay; and knew many lonely roads and winding paths where that enemy of tranquillity, "the public," had never been.

One evening, returning from a delicious ramble, our fair guide turned into a cover so close that we almost laid down on the pony's neck to avoid contact with boughs and brambles; and when that peril was past, we found ourselves on a long strip of upland which stretched away for a considerable distance. This narrow elevation, had it been near the eastle, or any other dwelling, would have formed a terrace, sloping as it did on each side into the wildest underwood, running on boldly and unsheltered, save at its abrupt termination, where, in far back times, two trees had been planted, designed perhaps to form what their interlacing boughs really had formed—a natural arch. Through this there was a bird's-eye peep at the Thames: there lay, like a vast mirror, the calm, silent river, lending its magic light to the landscape, touched here and there by the rose-coloured and saffron tints of the setting sun: indeed, the sun had set, but the tender, farewell colours still lingered on the clouds, and were reflected by the faithful river. The scene was so unexpected, and so fascinating, that we drew up with an exclamation of delight, much to the pony's contentment, who immediately began to crop the grass. After a sufficient pause, so rapidly were the tints fading that, as we rode slowly along the ridge towards the trees, the river, in the deepening twilight, assumed a very soft, grey, lake-like effect—it was the perfection of repose. We asked our fair guide (whose bustling, thrifty mother had given her the out-of-the-way name of Rizpah) if this elevation was supposed to be natural or artificial, and she informed us that some said it was thrown up in old times in a single night, so that one of the ancient queens could sit there on her palfrey to see a battle. This was not satisfactory, but our guide had no more to tell. Rizpah, however, deficient as she was in historic information touching the pathway, became quite eloquent in its praise; she thought it the prettiest spot in park or forest—the river shone so bright between the trees. Did we not observe how beautifully the ferns waved at either side?—they were so large: and in the little valley beyond the trees, just down the slope, there were so many orchids; and at the other side of the wood-cutter's hut (yes, that distant brown ridge was a wood-cutter's hut) there were such lovely beds of iris, and such reeds! Should she go and gather some? the pony could not well go along in the hollow—the felled timber lay here, and there, and everywhere; but she could run over them—it was so pleasant to spring from one log to another! But the blackbird was whistling his evening hymn, the bees and butterflies had folded themselves up for the night, and the "whang" of the cockchafer, and peculiar cry of the owl—not the "hoot-who!" but the waking cry, a struggle in his throat, trying his voice, as it were, before he commences his fearful shout—warned us that the night would fall before we arrived at the lodge if we tarried longer; and so we told Rizpah very decidedly—for she always tried to have her own way—that we would come another time—the dew was falling, and we dared not linger.

The girl looked disappointed, and we turned our pony (nothing loth) homeward; suddenly a clear sharp cry—the nearest attempt a woman makes at a shout—broke upon our ear, and in less than a minute it was answered. We looked for Rizpah, and saw her running towards us from beneath the long shadows of the arched trees.

"What cry was that?"

"It was I," replied the panting Rizpah, as she laid her hand on the pony's neck, and seemed intent on picking her steps, though the path was broad and clear, a rich carpet of short grass and moss; "It was I; and did you not hear the echo?"

"Echo!" we repeated; "we heard an answering shout, but no echo."

"It is a curious echo," persisted Rizpah; "we have many curious sounds in these parks and forests."

Now we had been fully convinced that Rizpah was practising upon our credulity, and were half amused and half provoked at the coolness and self-possession of the shy, innocent-looking forest girl, but we simply repeated, "Very curious indeed; was the echo there when the queen sat on her palfrey to see the battle of the Thames?"

Rizpah replied, with her usual mixture of coolness and innocence, "She did not know."

Rizpah's mother was a stout, rosy dame, simple-minded and straightforward—bright, cheerful, good-natured, and somewhat noisy; but though her voice was loud, it was not unmusical or inharmonious, and there was a tenderness in its tone when she spoke to the sick or the old, or the little children who sometimes found their way to her door, that was quite pleasant to hear. Her husband was like all other "keepers"—a tall, broad-shouldered man; we never saw him out of his dun-coloured leather leggings, or without his gun, and hardly ever heard his voice. She patted and petted him and her daughter, and patronised them in an easy, good-natured way, as if they were both little ones. She extended this care-taking to ourselves; and thus saved us all trouble in our domestic arrangements, while evidently increasing her own happiness. A great portion of that happiness depended on her being considered a "clever woman;" she was proud of that, proud of being clever and clear-sighted.

On our return, we were reproved for being out so late, and Rizpah was rather sharply questioned as to the cause. We had just commenced telling the good dame about the echo, when Rizpah, who was preparing tea, poured, as if accidentally, a little of the boiling water out of the teakettle on her mother's favourite cat—a cat, by the way, who was chained every evening at six o'clock to the fender, to prevent its poaching. The scolding and commiseration which followed interrupted the story.

The cottage was a perfect bower of ivy, and elematis, and roses, and woodbine: along the south wall each climber seemed to flourish over its own particular territory, but at the gable end, where our rooms were situated, all mingled together; while the eaves were tenanted by birds which even the cat did not seem inclined to disturb.

"If you please," said Rizpah, while removing the tea-tray, "there is no use in telling mother about the echo; she never believes in it, or in anything—not even in Herne the Hunter, or the fairy bridges at full moon over the Thames. Father and I never tell her anything of that sort."

"But she could test the echo."

"It's too far for mother to walk, and the pony would not be able to carry her; so, if you please, it's better to say nothing about it. She would begin to fancy things."

"What things, Rizpah?"

"Oh, I don't know," replied the girl, blushing; "mother has a very active mind: I would rather you said nothing about it." And she raised her soft liquid blue eyes to ours with such an appealing look, that we said quietly, "Very well," and commenced reading.

In about an hour we heard a soft, low whistle, a little to the right; it was repeated twice. We opened our door, and passing along a passage, entered the kitchen; there stood Rizpah, looking decidedly sulky, with extended hauds, holding a very thick skein of worsted, which her mother was slowly winding, talking all the time in an unmistakable lecturing voice.

"I fear," I said, "there are poachers about; I have heard a whistle repeated three times."

"It's only the wind in the woodbine," said Rizpah, quickly; and while she spoke the clock struck nine.

"It's too early for poachers," said the dame, "and the moon is at full; they know better than to be about at this hour, or at full moon."

"It was *not* the wind in the woodbine, Rizpah," we replied, "nor in the ivy either—surely we must know the whistle of a man from the whistle of the wind: besides, there is not sufficient air aloft to move the petal of a rose."

At that moment an ill-favoured, snub-nosed, rough-coated, faithful, ugly dog—one of those miracles of canine sagacity and bad temper to be depended on only in moments of difficulty and danger—stood suddenly up on his hind legs, and placing his stubbed, vulgar paws on the ledge of the window, pricked his ears, bared his teeth (Rizpah used to call it laughing), whined, and wagged a nothing of a stump, which courtesy might designate a tail, most vigorously.

"Down, Dicken! down, sir!" exclaimed Rizpah, stamping her foot.

"Oh! oh!" said the dame, throwing her ball on the floor, "is that the wind in the woodbine? Soh! There's but one human creature beside your father and us two that Dicken laughs at!" The dame threw up the window, and there was a rustling among the branches; but Rizpah held the struggling Dicken in her arms.

"It's either father, or the white owl in the ivy," faltered Rizpah, still restraining the dog.

"Father, or the white owl in the ivy!" repeated the dame, in her loudest and most contemptuous tone; "why, you jade, you know father's always a-bed and asleep, on moonlight nights, until eleven. The owl in the ivy, indeed! why he was found dead this morning." In a moment she had seized one of the guns, which always lay in a corner of the kitchen, and presented it at the darkness. Rizpah fell on her knees screaming, and Dicken sprang out of the window.

"What's to do here?" inquired the keeper's gruff, determined voice from the outside, and we saw him dimly under the shadow of the projecting roof; "put down the gun, mother, and open the door; it's quite time to put a stop to this hide-and-seek foolery."

Rizpah, trembling and blushing, rose from her knees: it was not so dark but she saw that her father had taken a prisoner. "Oh, mother! mother!" she exclaimed, "father knew he was come back—and oh, mother! mother!"

And "Ah, Rizpah! Rizpah! was that the echo from the Thames? Is that great six-foot-one young man the 'wind in the woodbine?' Is the individual you call 'Paul' the 'owl in the ivy?' Sly, sly, quiet little blushing Rizpah! for shame!"

The next morning it was the dame who looked sulky, and instead of patting and petting Rizpah, it was Rizpah who patted and patted the dame. There might have been "family reasons," which did not concern us, but it was evident that the usually self-contained gamekeeper had determined Paul should marry Rizpah, and that Rizpah offered no opposition. The dame was either tired out, or won over—perhaps a little of both: at all events, we lost our forest guide, but not before we knew the forest well.

THE ADDITIONS
TO
THE NATIONAL GALLERY.

THE national collection has opened after the recess with a very important addition to its attractions; whence it may now be inferred that the authorities are in earnest in the formation of a catalogue worthy of the nation. The additions are seven in number, of which the principal is the famous Pisani picture, by Paul Veronese, that has been purchased for £14,000. Another is that everlasting anatomical *pons asinorum* of the old masters, a "St. Sebastian," by Antonio Pollajuolo; a third, an example of Filippo Lippi the younger, having for its subject the "Virgin and Child," with St. James and St. Dominic; "St. Jerome in the Desert kneeling before a Crucifix," by Cosimo Rosselli; a picture by Sandro Botticelli; a portrait by John Van Eyck; and lastly, a portrait of a Young Lady, by Lucas Crauach, purchased at the late sale at Alton Towers.

The picture by Paul Veronese, entitled, "The Family of Darius at the Feet of Alexander after the Battle of Issus," is large, being in height upwards of seven feet, and in length more than fifteen. The treatment of the subject is in its spirit similar to that of "The Marriage of Cana;" the agrouements being relieved by an architectural screen of white marble, consisting of arches and pillars alternately, and surmounted by a balustrade, behind which, according to the known taste of the painter, numerous figures appear contemplating the scene beneath them. It may be supposed that in opposition to such a ground the masses and figures tell very effectively—indeed, the artist has fully availed himself of this vantage-ground. The conqueror and his circle of attendants occupy the right wing of the composition, while the centre is filled by the captive and kneeling suppliants, the mother, wife, and daughters of Darius. Having mistaken Hephæstion for Alexander, the queen-mother, Sisygambis, implores pardon of the conqueror for the error into which they have fallen; but pointing to his friend who stands by his side, Alexander tells Sisygambis there is no mistake, for Hephæstion is another Alexander. Statira, the elder of the two daughters of Darius, kneels behind. She became subsequently the wife of Alexander, but she was afterwards put to death by Perdiccas, at the instigation of Roxana, the second Persian wife of Alexander. In the group with Alexander and Hephæstion is Parmenio; and a male figure composing with the kneeling captives represents an aged minister of Darius. On the extreme left appears the upper part of a standing figure; the head is probably a portrait of Paul Veronese himself, at least the features are like those of the portrait among the *Ritratti dei Pittori*, at Florence. Familiar as we all are with the practice universal among the early painters, of treating every subject, sacred and profane, with the costumes of the period in which they themselves lived, we accept as they are presented to us these figures, wearing the rich Venetian attire of the sixteenth century in the place of the properties, Persian and Greek, of the fourth century before the Christian era. The wife and daughters of Darius, attired in robes which would really do honour to the living *modistes* of the Rue de la Paix, is to the antiquarian mind an objection which can in nowise be reconciled.

The impersonations of Alexander and his friends are handsome, and their bearing majestic. Alexander is dressed in red, wearing the Roman tunic, but beneath that, the hose of the sixteenth century, over which he wears a highly ornamented *cothurnus*. Hephæstion wears a suit of plate armour, that is the corslet with paddrons and brassarts, but his continuations are also horse, and terminations *cothurni*; a curious mixture with these are the Venetian silk gowns, worn by Statira the daughter, and Statira the wife of Darius. That such anomalies have been so extensively practised by the old masters, does not in anywise modify the whimsical impression which they convey to the students of our day, so fastidious in costume. But these anachronisms are even less objectionable than the extraordinary *mélange* in "The Marriage of Cana," or the climacteric of "The Martyrdom of St. Catherine," at Florence, wherein the saint is introduced in a shot-silk dress.

The heads of Alexander and his friends are not

classic, not even historical; they are seen in profile, and it is sufficiently obvious that they are portraits; but the pose and personal carriage are elegant and easy, and the expression is refined and without condescension. Nearly all the figures are drawn in profile, and on the same plane, but the very effective line formed against the white marble screen reconciles us to the formality. On the left, indeed, the composition is like that over a Greek portico, each succeeding figure being less than the other. On the extreme right appears the head of a horse, but it is indifferently drawn, and towers unnaturally above the heads of the figures; and interspersed through the picture there are certain accessories which damage the narrative without assisting the composition. The principal of these is a monkey, for the introduction of which there must have been a reason—such an animal may have been a pet of the family. There is also a dwarf—he too may have been a household familiar. If such creatures were domesticated within the Palazzo Pisani, the introduction of them into a family picture could only be interesting to those who may have remembered them, and it was at least a weakness on the part of the painter to alloy his composition with elements certainly derogatory to a picture so aspiring. These are not unimportant objections; for how exultingly soever we may admire the imperial group on the right, how sympathetically soever we may be touched by the humiliation of the captives when the eye passes to the left—the monkey and the dwarf condemn us at once for the extravagance of our emotion. But are we not proud in the possession of such a picture? We have indeed reason for self-congratulation, and those who have been instrumental in procuring such a work really merit a vote of public thanks; for next to "The Marriage of Cana," it is the finest Veronese in any public collection out of Italy. The only considerable works by this master in Germany are at Dresden, where there are several, and among them another Marriage at Cana, but the quality of the Pisani picture is far beyond the merit of all these. It is now more than two centuries and a-half since this picture was executed, and in contemplating it we are compelled to confess that very little has been done for Art since that time. Paolo Veronese was one of the great originators of the Italian schools. He began his labours at a time when public admiration was especially directed to the works of Bassano and his followers. When, however, he was, as a youth, invited to Mantua by the Cardinal Gonzaga, to paint certain altar-pieces, he is said to have surpassed all the Veronese celebrities of the time, and eventually acquired a reputation second only to that of a very few who have won the highest praise that their fellow-men can bestow.

The Veronese will always remain one of the grander features of the collection. The history of the work is so well known as to set aside any question of its authenticity. It was painted for and from the Pisani, and has been for centuries an heirloom in the family. It may be that the history and antecedents of the other pictures are more obscure; and yet if every good picture were declined because of the deficiency of a link or two of the evidence of its genuineness, such a rule of selection would exclude many valuable additions to the gallery. We observed some time ago that in the Dresden Gallery, for the pseudonyms under which the public had been accustomed to regard certain works, others more probably consistent with truth have been substituted. The styles and manners of all the magnates of the art are now so generally understood, that it will be extremely difficult to sustain a false attribution. This revision of catalogues having commenced at Dresden, the new director of the public collection at Berlin has ventured to follow such a worthy example by the reversal of the judgment of his predecessors. If other public collections are to be exempt from imputation, the same regard for truth must be observed with them; and there is perhaps no collection of recent formation which could be subjected to searching inquiry without such results as those to which we allude at Dresden and Berlin. Many a Raffaele, and many a Titian, must submit to be known by less glorious names—a change which might really have been effected very creditably before the pressure of public opinion set in; because those who on the one hand profited by deceiving, and those who on the other were gratified by the deception, have long since

passed from the scene of their negotiations. But there is a natural vanity in the possession of fine works of Art:—listen to the broad and brown-faced Normans, who wander in stolid admiration through the Louvre; or, better still, to the everlasting "Ecco!" of the raw, serge-coated *virtuosi* from the vineyards of the Tuscan hills, as they stroll, with open mouths, through the marble halls of the Pitti—both parties having some indefinite idea that pictures, as well as marriages, are made in heaven. It is at least an unpalatable change to be convinced into considering a so-called Raffaele a Giulio Romano, or to reduce the estimate of a work from £3000 to £300.

The "Martyrdom of St. Sebastian" by Pollajuolo is a large picture containing many figures; the saint being represented by a nude figure tied to a tree, at some height from the ground. The treatment of the subject as resembling rather a crucifixion, differs from all the conceptions of it we have ever seen. The dying man is pierced by many arrows, and around the foot of the tree are his executioners, some shooting with the long-bow, and others with the cross-bow. Of the painter a few words may be said, as this is the first picture which we possess by him. He was born in Florence, about the year 1430. Different dates are assigned to his birth, and the date we give is the mean time. In those days the studies of the artist took many directions, and if Pollajuolo had pursued exclusively the calling to which he was apprenticed, he would have been a goldsmith, and nothing else. Bartoluccio was his master, and Bartoluccio was also stepfather to Ghiberti, to whom the world owes the famous gates of the Baptistery of St. John at Florence. Ghiberti discovered considerable talent in Pollajuolo, and employed him as one of his assistants in modelling the ornaments of the architecture of the gates, which were finished in 1452. From ornamental modelling he addressed himself to sculpture, and acquired an extensive reputation for his productions in bronze. He is said to have been the first artist who studied anatomy, aided by the dissection of the subject. To painting he turned his attention last, and, in conjunction with his brother Piero, who was a pupil of Andrea del Castagno, he executed works which acquired for him a reputation equal to that of any of the masters of his time. In 1484 he was invited to Rome, by Pope Innocent VIII., and was there employed in the execution of certain monumental works in St. Peter's, especially the tomb of Sixtus IV. He died in Rome in 1498, having realised a handsome competence, which he divided between his two daughters. This work by Pollajuolo was painted for the chapel of the Marchese Pucci, at Florence, and it has remained in the possession of the family until purchased this year for the National Gallery. It is mentioned by Vasari, and is regarded as one of the best examples of the art of the fifteenth century, and for such a preference there is ample reason, if we compare it with even all that has been effected in the study of the nude up to the time of this master. The head of the saint rises to within a very little of the frame, which gives the picture the appearance of having been cut; when, however, we saw it in Florence, twenty years ago, the composition conveyed the same impression which it now does. It is clear that the "St. Sebastian" has been studied with a view to a development of anatomy beyond that usually seen in the works of the period; but, according to the feeling of the time, the shades and markings are timid; they have received too much of that softening which should have been shared by the outlines. This timidity in dealing with gradations gives the work the appearance of not having been carried beyond a flat, dead colouring. The poses of the figures want firmness; but there is a foreshortened figure winding up a cross-bow, which, at the time of execution, was considered an immense triumph. The landscape is so like the valley of the Arno above Florence, as to point at once to the source of this part of the composition.

The subject of the Filippo Lippi is "The Virgin and Child," with a saint on each side—on the left St. Jerome, and on the right St. Dominic; the former nude and primitive, as a saint might have been eighteen centuries and a half since, but the latter wearing the vestments of the church as they were worn in the fifteenth century. The heads in this picture are really admirable; the drawing, and even the colour, though yet somewhat

dry, show a great advance on contemporary Art. The figure of St. Dominic is very like a study of the Spanish school—equal even to the essays of the Spanish painters of a century later. The background is a rocky landscape; and in contemplating these parts of ancient pictures it is difficult to understand the principle which prompted an elevation here, and a depression there—the more so that these caprices in nowise assist the reliefs or composition, and are brought together in a manner very little in accordance with the dictates of Nature. The group had certainly been better without the landscape, for the drawing is superior to the better efforts of the time, and the heads are endowed with an earnestness of expression worthy of the best art of the best period. This, according to Vasari, was painted about the year 1490 for the Rucellai Chapel, in the Church of San Pancrazio, at Florence; but on the suppression of this church the work was removed to the Palazzo Rucellai, where it remained until recently purchased of the Cavaliere Giuseppe Rucellai, for the national collection. Whatever the merits of our purchases may be, it is satisfactory to know their history. Filippino Lippi was the son of Filippo Lippi, and is supposed to have assisted Botticelli in his works. Vasari supposes that he was the first to introduce trophies, grotesques, and armour into his works, but the compositions of Squarcione contained such accessories before he employed them.

"The St. Jerome," by Cosimo Rosselli, presents that saint kneeling before a crucifix, but the figure occupies the centre one of the three compartments into which the work is divided. On the left are Saints Damasus and Eusebius, and on the right Saints Paola and her daughter Eustochia. According to the custom of the painters of the early schools, Rosselli introduces his patron, Girolamo Rucellai, and his son, kneeling below. Rosselli was born at Florence, in 1439; he was the pupil of Bicci, and the master of Fra Bartolomeo.

The new Botticelli is a circular picture, and forms a passable pendant to that already in the gallery, but it is a more advanced work. It represents the Virgin seated on a kind of low stone balustrade, behind which roses are growing. She holds the infant Saviour on her lap, and receives the celestial crown from two angels, one of whom is on each side of her. A fourth figure represents St. John worshipping the child. This artist was born at Florence, in 1447, and was employed to assist in the decoration of the Sistine Chapel, his competitors being Cosimo Rosselli, Ghirlandajo, Signorelli, and Perugino.

"The Portrait of a Young Lady," by Lucas Cranach, is pure and brilliant, even Rubens-like in colour. She is presented front face, and the easy carriage of the head and relief of the pose are natural graces which place the picture far in advance of its time. When we consider this little picture, it is almost a matter of surprise that a head could have been so sweetly painted, and the costume should have been left in all its ungainly stiffness.

The Van Eyck is a small portrait of a man wearing a green turban-like head-dress, of the fashion of the fourteenth century. It was purchased at Munich, and had already, we believe, been offered to the Bavarian Government. There is beneath the figure, the legend "Leal Souvenir," with the date—"Oct. 10, 1432," and the signature of the painter. The features are dark in tone, and by no means agreeable in character. It is painted with exceeding care, yet is inferior to the two other works by the same hand which hang near it. Nothing further of the history of the picture is known; but, of course, the Commissioners have been satisfied as to the authenticity of their purchase. The *Kunstblatt* of Oct. 19, 1854, contains a description of the picture, which was then recommended as an addition to the Pinacothek, in which there is no example of the master. In the Lochis Gallery, at Bergamo, there is a replica, but without the inscriptions. This is ascribed to Pontormo, but is much more in the style and feeling of Van Eyck, and most probably a copy by a foreign artist. In 1428, Van Eyck—"peintre et varlet de chambre de M. S.," Philip the Good, duke of Burgundy—went on a confidential mission to paint the portrait of Isabel of Portugal, whose hand was sought in marriage by the Duke; and he acquitted himself so much to the satisfaction of all parties, that the marriage was solemnised as soon as the preliminaries could be adjusted. He executed

several other important commissions for the Duke; but during the years 1432 and 1433 he was probably working in his own house at Bruges, according to the following extract from the "Compte de Jehan Abonnel:"—"Aux varlets de Johannes Deyk, peintre, aussi pour don à iceulx fait quant M. D. S. a esté en son hastet veoir certain ouvrage fait par le dit Johannes. xxv. sols."* If this be not the work alluded to, it is certain that it must have been in progress at the time, for Van Eyck painted very slowly, and had not many works under his hand at the same time. The most weighty reason against such a supposition is that, the picture being small, it might have been conveyed to the Duke; but it must not be forgotten that 1432 was the year in which he finished the "Mystic Lamb," and this might be the work which the Duke came to see.

The cost of these acquisitions, particularly of the Veronese, has been very considerable. We have, of course, paid for them more than any other nation would have been content to give; but we have at least the satisfaction of knowing the principal purchases to be unquestionably authentic.

ART IN CONTINENTAL STATES.

PARIS.—The Paris artistic news is still very flat, but artists are arriving from their summer excursions. The sale-rooms are preparing their attractions; and amateurs of *vertu* are looking forward with interest towards the excitement of the auction-room. Many good sales are announced, of which we shall give accounts in due time.—The distribution of prizes—*Prix de Rome*—at the Institute has, in consequence of the fine weather, been rather thinly attended. Several of the *fauteuils académiques* were empty.—M. Lallemand, the engraver, has recently discovered a method of applying photography to wood blocks, which it is expected will be serviceable to wood engravers.—M. P. Ramus has received a commission to execute a bust of M. Sauvage, inventor of the screw for steam-vessels; it is for the *Conservatoire des Arts et Métiers*. This great man, after a life of poverty, died in a lunatic asylum, where he was placed through the kindness of the Emperor. His whole length portrait has been painted by Gavarni.—A tumulus, attributed to the army of Attila, has been opened near Chalons, and several interesting vases, iron articles, and medals, have been found in it.—The Cathedral of Notre Dame is advancing rapidly; the works, which had been suspended by the death of M. Lassus, are now going on under the direction of M. Viollet le Duc, a clever architect.—The demolitions now proceeding in the *Rue de Jerusalem* will destroy the two houses in which Voltaire and Rousseau were born.—It is expected that next summer what remains of the *Rue de la Harpe*, and a great part of *Rue St. Jacques*, will be pulled down. In a few years little of ancient Paris will be left.—The junction of the Louvre and the Tuileries makes the *Place du Carrousel* the largest in Europe. Its superficial extent is 40,100 metres. Fourteen archways give access to this place, without counting the Louvre entrances. Now that all the scaffolding is removed the effect is very fine.—A statue of *Notre Dame de France*, of sixteen metres height without the pedestal, has been cast from the canon taken at Sebastopol; it will shortly be placed on the *Mont Cornicille (Puy de Dome)*.—Workmen are busy taking down the eastern fountain in the *Champs Elysées*, in order that it may be coated with copper by galvanism; this prevents oxidation. The fountains in the *Place de la Concorde* will also undergo the same operation.

MILAN.—The monument in honour of Leonardo da Vinci, of which we spoke in April last, is to be erected in the Piazza San Fedele. The Milan Academy of Arts has contributed 60,000 francs towards its completion.

VIENNA.—The Emperor of Austria has decided there shall be an annual exhibition of paintings at Vienna; 10,000 florins are allowed each year for the purchase of paintings.

THE BRAZILS.—The government of Brazil had offered three prizes of 12,500 francs each for an equestrian statue of Don Pedro I. M. Bienaimé, a pupil of Thorwaldsen, is one of the competitors whose design has been accepted.

MUNICH.—Professor Kaulbach has again resumed his labours, from which indisposition during the summer had compelled him to abstain. He has almost completed his sketch for his large picture of "The Battle of Salamis."

* "The Early Flemish Painters," &c., by J. A. Crowe and G. B. Canalaselle.

THE PICTURE-DEALERS

AT THE OLD BAILEY.

It appears, after all, that the "detected" has been left in the lurch; he committed the crime of being "found out," and must be the scape-goat accordingly. Mr. Closs, who is described in the newspapers as "a shabbily-attired man, wearing a beard and moustache," has been convicted at the Old Bailey of "fraud," in obtaining from Henry Fitzpatrick certain bills to the value of £130 by false pretences, and also for having feloniously uttered a certain picture with a forged name with intent to defraud. Mr. Closs did not "peach," consequently we cannot say who employed him; but we may be very sure that the "shabbily-attired man" was not trading on his own account; he has cheated *himself* grievously if he has neglected to make such terms with his employers as will keep him comfortably in Newgate. This conviction is of immense importance; it will go far to put a stop to an infamous system of robbery. Rogues will now have a salutary dread of jails; and buyers who find themselves swindled will know that punishment awaits the forger of pictures, as well as of bank-notes. We hope this trial will have the effect of inducing persons who *suspect* they have been taken in, to examine their collections forthwith, and test the reality of all their purchases from dealers, no matter how far back the examination may go. There can be little doubt of forcing "the most respectable persons in the trade" to disgorge their ill-gotten gains. We have reason to believe that more than one copy of the "Linnell"—now brought into court—will be found in more than one of our provincial cities, and recommend the collectors in Manchester especially not to delay making "inquiries," which may be answered by a return of monies paid. Other "most respectable men in the trade" may be heard of at the Old Bailey ere long. Very little was added at the trial to the information obtained at Bow Street. Smart, it appears, asked £200 for the original picture; three days afterwards, Fitzpatrick purchased it (as he thought) for £130; it was a copy, stated in court to be "worth about £6;" such copy (again we quote the newspaper report) "most carefully adhered to the original" (which was also produced in court) "in frame, canvas, and every minute particular." It does not appear that Mr. Smart was examined, which he ought to have been, if his abode during the trial was in any part of England. It might have been inconvenient to that "most respectable man in the trade" to explain how it was that a copy so "carefully adbering" to the original was in circulation three days after Mr. Fitzpatrick saw the original at his shop in Tichborne Street, Haymarket, and to have answered, upon oath, whether he (Mr. Smart) had, or had not, seen the said "carefully adbering" copy. Nay, he might have found it necessary to swear whether he knew, or did not know, by whom the copy was made, and what sum was paid to the copyist for his work; whether more or less than the £6—"about its worth." At all events, Mr. Closs, though "a shabbily-attired man," has confessed nothing, but has heroically taken upon himself all the consequences of the act; and if he had any partners, he was not "shabby" enough to divulge their names. Neither do we learn what has become of the copy since the trial; whether it remains the property of Mr. Fitzpatrick, or whether, the money having been repaid to him, it is destined to go back to Closs, or to the party from whom Closs obtained it.

Again we say results most beneficial to Art will arise out of this memorable trial: there are hundreds of such cases in memories, and now there is one "on the books." Mr. This, That, and The Other—"respectable" picture-dealers in London and in the provinces—must be in future more cautious than they have been. Pictures have been sold, at very large prices, which even a very delicate inquiry would have shown to be forgeries; but such inquiries have not been made: the copies will be issued in future, at the proper peril of those who fabricate or sell them. The Old Bailey is not an agreeable place, but Newgate is even less so: and although we have reason to believe that Mr. Closs, when he made his appearance at the bar, was "shabbily dressed," *deliberately and for a purpose*, we may yet see in a similar position

some "respectable man" whose tailor lives in Conduit Street.

Surely, then, collectors will learn from this trial the folly of buying from dealers without the exercise of caution amounting to suspicion: we have here seen a copy substituted for an original, although the original had been inspected by the buyer only three days previously; that the copy "carefully adhered to the original in frame, canvas, and every minute particular;" that the name of the artist had been skillfully imitated; that the copy was shown by the buyer to the dealer who had offered to sell him the original, and that the said dealer, when asked if that was the picture that had been in his possession, replied, "There can be no doubt about it." After this, how much more than *caution* is needed in dealing with picture-dealers!

We might record a number of cases quite as strong as this; but it would not be prudent to do so, although we may comment freely on that which has found its way to the public through the reports of a police court and the Old Bailey. But those who read this statement may be assured that such practices as that which is thus exposed are of daily occurrence: we can tell where Stanfields, Turners, Wards, and Creswicks, as well as Linnells, are hanging in glory upon walls in magnificently furnished drawing-rooms, or in spacious galleries, which these artists never saw, each of which is worth "about six pounds,"—a sum they will bring, perhaps, if they are ever submitted to the hammer of Mr. Christie—but for which their unenlightened owners have paid hundreds.

The law has been compared to a spider's web, which entangles all the lesser flies, while the big "blue-bottles" break through and escape. We verily believe the "shabbily-dressed" man, though deservedly punished, is no more guilty than he who passes a bad note which another has forged. If Closs would but make "a clean breast," what a revelation we should have—how many buyers he would make pale, and how many sellers tremble with affright! Some time ago we fortunately obtained information, and that frequently, from a person who, having been one of the fraternity, was led by remorse—or vengeance—to tell us much concerning, not his own course, but that of his brethren; and it was by his aid mainly we were enabled to do the good we did by repeated exposures of frauds in the manufacture and sales of fraudulent pictures. As we have said, heretofore, we have thus completely put a stop to the iniquitous traffic in fabricated "old masters;" we may be fortunate in obtaining help (and shall not hesitate to use it, though it may again come from a repentant sinner) in exposing the several methods by which "modern artists" are manufactured and sold, with the parties who manufacture, and those who sell them.

It would be difficult to convey an idea of the enormous number of forgeries of modern pictures that are in circulation, and it is high time to arrest the progress of a most iniquitous, but a most profitable, trade.

If we can bring home the offence to the artists who *make* these copies, or imitations, we shall certainly print their names,—without their aid the dealers could do nothing. We are by no means entirely ignorant as to the guilty parties in this traffic, but our readers will consider that without such proofs as will satisfy a legal tribunal we are compelled to hold over our evidence: it may be more complete ere long.*

It is by no means impossible that we may, at no very distant period, publish a statement—that X. Y. Z., a very clever painter of copies, did make and paint certain copies for certain dealers *whom we shall name*: a Linnell for Mr. —, a Turner for Mr. —, a Creswick for Mr. —, a Pyue for Mr. —, and so forth: the said X. Y. Z. being a

* Not very long ago, an artist of established repute, whose pictures bear high prices, was visited by a dealer; the following brief conversation took place between them:

The dealer.—"I have about a dozen paintings in your style; and if you will give about half an hour's touching upon each of them, and sign them with your name, I will give you £500."

The artist.—"Sir, you mean to tempt me to commit an infamous fraud. I request you will instantly leave my house."

There is little doubt, however, that the dealer did without the artist; and it is not improbable that an unscrupulous "brother" was found to do the touching, and to sign the name, at much less cost to the dealer.

landscape artist, and remarkably skilful in imitating the styles of the several masters, whose original works were placed before him. We may at the same time be able so to describe some of the pictures copied, as to enable the present owners of these copies, to ascertain whether their walls contain the actual works of Linnell, Turner, Creswick, Pyne, and so forth, or the works of X. Y. Z. If we are enabled to do that which we intimate we may do, we shall produce no little consternation among a few of the victims who have been for some years back delighting themselves and their friends by imaginary picture wealth.

CORRESPONDENCE.

To the Editor of "THE ART-JOURNAL."

THE DÜSSELDORF SCHOOL OF ART.

SIR,—At the present time the School of Düsseldorf consists of about six hundred artists, and two hundred students. The artists are divided into two schools; the academicians, and those who are independent, who follow no conventionality, but paint their own ideas. The two schools are separated by their different ideas of finish; the academicians holding in principle and in practice that minuteness of finish—an absolute and rigid imitation of nature, even to the surface of things—constitutes the great perfection of Art; the other party contending that this servility, or rather perfection of execution, is not necessary: that if a work has the effect intended on the mind at a proper distance, it is a waste of time to add details that could please only the ignorant. Among the academicians Carl Müller and Hernau Becker stand conspicuous. These gentlemen, like the majority of their adherents, paint Scripture pieces. Why it is that they have fallen on these used-up subjects is hard to guess, except, perhaps, it is that the continual strain on their patience, caused by their mode of study, naturally throws the mind into a religious mood. Another class of them paints *genre* and still-life. Their paintings of still-life, to which their mode of execution is more peculiarly adapted, are really wonderful; they are not paint and canvas, but a reality that requires the touch to convince one it is only a shade.

Taken as a whole, the academicians seem not to comprehend the object of Art; they paint blindly, without thought, without feeling. It is their ambition to produce deception, to imitate nature as it is; they never ask when this is done, what then? It does not concern them. Hence, after years of study, they accomplish in months what a photographic instrument would do in a moment. Their pictures have, however, one great merit, that of mechanical execution; in this necessary branch of Art they can, possibly, instruct the world. Their drawing, colour, light, and shade, are perfect; but as pictures, as works of Art, they excite no feeling, appeal to no prejudice, are barren of all traces of mind: they amuse only the eye of the curious, or astonish the simple by their minuteness.

The other school comprehends nearly all the artists residing here who have celebrity; among them we find the names of Lessing, Sohn, Hildebrandt, Köeler, the Achenbachs, &c. Of such men as these the "School of Düsseldorf" is properly composed; but because they have no marked peculiarity of style common to them all, and no academy for the instruction of students, it is currently believed that this school is one of academicians—of men whose only artistic power is mechanical. This is a mistake, and should be corrected, for it not only wrongs the artists who are the subjects of it, but also the artistic world. We have seen in criticisms on pictures by these artists some minute trifle, existing only in the critic's imagination, praised as an excellence, because the supposed finish to the characteristic of the school. These artists, however, do not mistake the representation of threads for the finish of a painting, nor the imitation of surface for the highest perfection of Art: their pictures are not painted to astonish the vulgar, but are addresses to the minds of enlightened men.

There are at present three exhibitions of paintings open to the public; two of these are annual, the other permanent. The first two contain upwards of five hundred pictures, sent from all parts of the continent; the permanent exhibition consists of works by the Düsseldorf artists, and are for sale. The great majority of these pictures are *genre*, still-life, and landscape: in all three of the exhibitions together there are only five paintings that pertain to what is conventionally termed high Art. One of these is the "Hiding of Moses," by Röeler. This picture has the same beauties and defects as all the rest of Röeler's pictures. It has been engraved.

In the engraving the faces of the two women are much lighter than in the original: and several other parts have been altered, which give it a finer general effect than its original. A picture by Leutze, of "Columbus departing for America," is also in the permanent exhibition: this painting seems to have been left imperfect; the tale is well enough told, but a disagreeable red colour, and a want of shade which pervades the canvas, take much from its effect. However, the dignified figure of Columbus, standing out against the sky, and pointing over the waters, as he receives the blessings of priests and friends, is well worthy of Leutze. M. Leutze has painted another work of the same subject, which is said to be much better, both in design and execution, than the one here mentioned. A "Syren," by Sohn, appears to be perfect of its kind: it represents a beautiful woman, with her harp hung on the top of a projecting crag; she has finished playing, and, leaning on one arm, bends over to witness the effect. An eagle is seen at the level of her feet, flying downwards; this gives the spectator an immense idea of height. The figure is life-size, and fully draped, but in such a manner as to show the form throughout: it is relieved by a dark ground of clouds, through which a single star is shining. A painting, by W. Sohn, of "Christ on the Water:" Christ and the apostles are represented in a boat during a storm. The face of our Saviour, who has fallen asleep, suggests the idea that his mind is active and conscious of what is going on around him. Several other faces are equally excellent, but the imperfect light, coming apparently from several directions, and omitting to illuminate certain things, together with the difficulty of conceiving how several of the figures could maintain their balance, makes the picture, as a whole, very unsatisfactory. The largest painting on exhibition is that of "Christ restoring Jairus's daughter to life;" it is painted by Gustavus Richter, of Berlin. This painting has called forth universal admiration, despite several portions of it that might be called faults. The attitude, for instance, of Christ has the appearance of being studied; and the whole figure of the apostle on the left expresses mere vulgar astonishment. The head of the girl is slightly raised off her pillow, with the intention of showing that life is just reviving in her frame, but it seems difficult to fix in one's mind that this is the case. The figures are all clad in thick stuff, and, owing to the handling, the steps, floor, and background, have the appearance of so many blankets of their several colours tightly stretched. It may be said of it, that, as a work of Art, it does not appeal to our sympathies, and, as a painting, its execution is far from perfect. It would appear, however, that its size, and the fact of it belonging to the king, are redeeming qualities even in this country.

Among the other compositions on exhibition, those of domestic scenes, by Heddemann and Tide-mann, are remarkable, both for the excellence of their designs and their masterly execution. Some of these pictures may be compared to Wilkie's. The paintings of animals, on exhibition, are rather attempts than anything else. Two by Lachenwitz are noticeable for their intense fierceness of expression and great beauty of execution. The assemblage of Virgins, Saints, and infant Saviours, are not easily enumerated; for the most part, they appear to be attempts of students, nearly every one of which is a failure. These paintings are respected even by the collectors of auction pictures, and left alone in all their glory of vermilion and blue. A picture of the "Annunciation," by Carl Müller, is considered as a successful attempt, in the style of the academicians, to illustrate Scripture. In this painting a book lies open before the Virgin at a page on which her name is printed; the book is neatly gilded, and of modern construction. She kneels on a planed floor. The angel has on a pink muslin dress, very finely decorated with pearls, &c. Such is the painting by a man who is considered one of the heads of a school. He being a master in his way, some estimate may be formed of his followers.

The great bulk of the landscapes, like the subject pictures, exhibit a knowledge of Nature as it is, accompanied with mechanical power of execution, but unaided by reflection. Hence, their landscapes look like studies from Nature—hard, barren Nature, unelevated by idealty, destitute of beauty. One by Lessing, and two by the brothers Achenbach, are magnificent, both for their arrangement, their effect, and execution.

Portraits are rare. One by Marie Weigman, of a boy, full-length, and one of an officer, by Hildebrandt, are really artistic works; they are simple, expressive, and natural—nothing is overdone, and nothing is left to be desired.

Düsseldorf, November 11, 1857.

P.

THE ROYAL PICTURES.

THE JÄGER.

P. Foltz, Painter. C. H. Jeens, Engraver.
Size of the Picture, 1 ft. 3½ in. by 1 ft. ½ in.

BRUNEN, in the grand duchy of Hesse, is the birth-place of Philip Foltz; but, as an artist, he belongs to Munich, in which city he has long been resident, and of whose Art-school he is a distinguished ornament. He was born in the early part of the present century.

We find in the "Histoire de l'Art Moderne en Allemagne," by Count Athanase Raczyński, the following remarks upon this painter and his works:—

"Of all the pupils of Cornelius, Foltz exhibits the greatest distance from the precepts and examples of his master. In his works at the Chateau of the King Ludwig of Bavaria, he has abandoned himself without reserve to his own natural impulses and fancies: there he was commissioned to execute a series of subjects taken from the poems of Bürger, a German writer of the last century, whose songs and ballads especially are very popular in his own country. These pictures are principally borrowed from Bürger's 'Leonora,'—which, by the way, has been translated into English,—his 'Wild Jäger,' and a few other poems. The colouring of Foltz is brilliant and harmonious, his touch bold and emphatic; but his pictures have little dignity and elegance, notwithstanding his figures are characterised by a certain amount of spirit. His pictures would seem to bear some resemblance to those of Teniers, if the scenes he represents were less of a historical nature, and if, in respect of expression, they were not so free from vulgarity; but it may be assumed that they would have been more in accordance with the natural bias of the painter, had the subjects belonged more decidedly to the class of *genre*.

"Foltz is endowed with great talent; his *genre* pictures have always a peculiar character; they are original, and oftentimes have a profound meaning or sentiment. He would not have done so well had he followed the direction of the School of Munich, or any other established course: he has kept himself as far as possible from an approach to the classic or antique epochs, and is a stranger to style, in the ordinary acceptance of the term; still he continues to produce some most excellent works. He is one of those men who ought to be in the Academy, and the Academy should render him this justice.*

"Of all the pictures in the 'Salle de Bürger,' as it is called, that which represents the 'Women of Weisberg' is the one that most arrests our attention, and which, perhaps, affords us most pleasure. His picture in the 'Arcades' can scarcely be ranked among his best work."

These observations appear in Raczyński's volume, under the head of the historical painters of the Munich School, among whom he classes Foltz; but he also places him with the *genre*-painters of the same school, and he says:—"We have already spoken of Foltz in the article on the painters of history; I place his name here because of the direction he follows, and which appears to me to approach *genre*; still it would not be just to confound him with the mass of artists who belong to that category only. He is a man of great talent, and one who seems to have formed for himself a distinct class, which it would be difficult to characterise."

His little picture of the "Jäger" is, we presume, one of the subjects suggested by Bürger's poem, and we are informed, was added to the Royal Collection with two others by the same artist, of which we shall have to speak hereafter, by Prince Albert. The huntsman is a bold and vigorously-drawn figure; he stands in an easy attitude on the summit of an Alpine crag, surveying the vast range of country stretched out before him: the time is evening—a cool and quiet evening—the grey mists cover the heights in the middle distance, and blend into soft and cloud-like masses of lines the far-off perspective of valley and lake.

The picture is in the Collection at Osborne.

* Count Raczyński wrote this twenty years ago: Foltz is now, and has been for a considerable time, a member of the Academy of Munich, and one of its professors.

MINOR TOPICS OF THE MONTH.

PAINTERS' MORALITY.—Among a great deal of suggestive and highly interesting matter which is to be found in the body of evidence published with the recent Report on the National Gallery Site Commission, there occurs a passage in the examination of Mr. Mulready which deserves detaching, because of the question of conscience which it raises, and the very important bearing which a right interpretation of that question is calculated to exercise on the art of painting. The matter is hinted at in other places, also, of this body of opinion; but it is one of some delicacy, and not easily dealt with by an individual painter arguing from examples. The short life which is predicted, however, for many of the finest works of the modern school of painting, makes it very important that the attention of the artist should be called emphatically to the subject in question; and we are glad that Mr. Mulready has spoken as plainly on it as he has,—though visibly under some restraint:—that very restraint, of course, giving increased significance to the suggestions that struggle through it.—"The Commissioners," said Professor Faraday, questioning the distinguished painter then before the Commission, "have several times heard the words 'legitimate painting' and 'vicious pigments' used. Is it not understood in the profession that every painter has a right to use exactly what means he likes to produce his pictures?"—"I am not sure," says Mr. Mulready, "that that is the understanding in the profession. I am not sure that a painter has a right, except in experiments, to use pigments which he knows are short-lived. I do not think he has a right to use such pigments in a picture that he knows the purchaser expects to last."—"Have you any right," rejoins the Professor, "to expect that painters like Turner can be brought under strict regulations,—or, are we obliged to get pictures of all sorts of construction according to the ideas of the painters?"—"To which the painter is compelled to reply,—"If you are obliged to get pictures, you can hardly avoid some risk in that respect."—"We cannot govern that point?" pursues the Professor:—and the answer is—"I think you cannot govern it in a direct manner: it is a question of morality with the painter."—"In providing for a National Gallery," says Dr. Faraday, "must we not provide for such pictures, as well as for those of more pure painters like Holbein?"—"Answer. "There is no doubt of that. I have just said what I think of the use of vicious pigments; I cannot venture to define what is legitimate painting. I think an artist should be very careful to embody the means that will produce an effect that deserves to last; and he should be very careful to employ the means that are most likely to produce a picture that will last. * * There are those who consider the use of copal varnish in the vehicle as unsafe and improper. Some persons think that the use of wax in painting is not legitimate."—"Are not the public," says Professor Faraday, "liable to all these incidents with the pictures that come under the case of the National Gallery?"—and Mr. Mulready says, "Yes: but I hope that pictures by our living painters are not so liable to accidents in cleaning as some of the pictures painted by a few of the men of Turner's day."—"Do you consider?" asks the Professor, "that the injury which has happened to Turner's pictures is a change in the pigment itself?"—"I think," says Mr. Mulready, "some of Turner's pictures have suffered from that cause; and I believe that some of his pictures may have suffered from the process which he employed. * * When he was very much pressed for time, he may, I fear, have paid too little regard to the quality of the vehicle used and the permanence of the pigment."—The subject is sufficiently indicated in these extracts; and the interests which it affects, it will be seen, are of more kinds than one. The rights concerned are both public and private,—but the prosperity of the profession is involved through each of them. The question is at once a question of morality and a question of Art. It regards the claims of the individual purchaser, and the permanence of the National School. As we have said, it is well worth bringing under the notice of the modern painter himself. In a practice so purely empirical as that of painting, of course, no code is

possible;—but there are certain broad principles of morals, as well as certain broad principles of means, which are plain enough, and which Art cannot overlook without suffering in her own character and in that of her professors.

THE ROYAL ACADEMY.—John Phillip, Esq., and George Richmond, Esq., were elected associate members on the 10th of November. These elections are satisfactory; it was generally expected, however, that the distinction would have been conferred on Mr. Foley; and surely there is no artist in Europe better entitled to it. Mr. Phillip's reputation is not of to-day; he ought to have been a member long ago; his rights to the position were as solid seven years back as they are now. Mr. Richmond does not profess the higher branches of Art; he draws portraits—we believe he does not paint them; but in his "Art-walk" he is unsurpassed. There can be no doubt, however, that he owes his elevation mainly to the "fashionable" fame he has obtained, and to the position he occupies in general society; for, as an artist, his claims cannot be for a moment compared with those of several other candidates.

THE NATIONAL PORTRAIT GALLERY has recently received three additional pictures, bequeathed to it by the late Sir Robert Inglis. These are portraits of Spencer Percival, by the late G. F. Joseph, A.R.A.; of Wilberforce, an unfinished work by Lawrence; and a water-colour drawing, Lord Sidmouth, by Richmond. Contributions do not flow in very rapidly, but by the time we have a new National Gallery, in which it is presumed the collection will be placed, we may look for a considerable accession of portraits of England's great and good men.

THE SUFFOLK STREET GALLERY is receiving some alterations and improvements under the superintendence of Mr. F. H. Fowler, the architect. The roof of the large room has been taken away, and an entirely new roof, which will afford more light, is to be substituted. Mr. Hurlstone, President of the Society of British Artists, is preparing to decorate the cove with the portraits of eight kings, on each side of whom there will be representations of the artists whom they patronised.

LECTURES AT THE SOUTH KENSINGTON MUSEUM.—The series of lectures to be delivered by the officers of the department in the new Lecture Theatre at the Museum, was commenced on the evening of Monday, November 16th, by Mr. Cole, who, with the utmost propriety, selected for his subject "the Functions of the Science and Art Department" of the Committee of Council on Education. The Museum itself being the central field of operations, it was well that the aim, purpose, and powers of this new and highly important department of the government should there be clearly and fully set forth by the executive chief. Mr. Cole evidently felt that his words would be regarded and dealt with as authorities; and, accordingly, while he sketched out the comprehensive scheme of Art-teaching now actually inaugurated, he was careful to define with precision the principles upon which the operations of the department would be conducted. As we shall have occasion to refer, from time to time, to these principles and to their practical application, it will not now be necessary to enter more fully upon the subject.

SOCIETY OF FEMALE ARTISTS.—An appeal for public subscriptions in aid of this society has appeared in the daily journals—much to our regret. We understood that the first exhibition last year had been so far successful as to pay its expenses; it seems, therefore, somewhat incomprehensible that such an appeal should be needed, for it is at the outset of an undertaking like this that pecuniary assistance is most required; having surmounted its primary difficulties, we considered the future stability of the society as secured. We are sorry on other grounds to see this application: Art, in a country like ours, ought in no instance, especially where a body of ladies is concerned, to be in the position of requiring eleemosynary aid; if it be needed, however, we trust that it will be cheerfully and liberally given by those who desire to encourage the female Art-talent of the country.

THE SHEFFIELD CRIMEAN MEMORIAL, AND THE BROTHERTON MEMORIAL AT SALFORD, two commemorative works now in progress, are significant indications of the *set* of popular feeling in the matter of Art in its widest acceptance. Both are Gothic. The former work is of much greater importance than the latter, but both are in the same style, and both

P. FOLTZ. PINXT.

THE JÄGER.

FROM THE PICTURE IN THE ROYAL COLLECTION.

LONDON JAMES S. VIRTUE.

more or less partake in that imperfect rendering of the Gothic style which can be avoided only through a very careful study of early authorities. What these works will prove to be deficient in, is breadth and an appropriate massiveness. They are too attenuated and too slight—not too light, for this is a different matter altogether; still, both possess good qualities. Of the several models sent in competition for the Crimean Monument, the first prize was awarded to Mr. E. W. Wyon, and the second to Mr. Goldie, whose design the committee have adopted. The foundation stone was laid by the Duke of Cambridge on the 21st of October. The base of the monument is octagonal. There are four ascents of steps, with four bastions interposed, each bastion supporting a cannon. The pedestal has four faces, on each of which are bas-reliefs representing Crimean actions. The names of the fallen are inscribed beneath suspended garlands on projecting buttresses or pilasters at the angles. The pedestal has its base moulded (with stone seats between the buttresses), and its cornice sculptured with the national emblems. At the four angles over the buttresses rise square detached pedestals inlaid with marble, and having moulded bases and foliage capitals. These support niches carried by marble shafts, and protecting statues seven feet high, representing the allied kingdoms. In the centre of these four niches rises the main feature of the design. Upon a cluster of coloured marble columns, with an octagonal granite shaft in the centre, is a large canopied niche. It is richly moulded, arched, crocketed, &c., with angels bearing the shields of the allied kingdoms in the pediments of the canopies, with lions on marble shaftlets supporting gilded vanes at the angles. The canopy consists of a pyramidal stone roof, bearing as its finial the crown and orb of England. Beneath the groined roof of this canopy sits throned upon lions a colossal female figure representing England victorious, resting on her half-sheathed sword, and crowning her heroes. It is proposed to adopt the portrait of the Queen as the head of this ideal figure. An inscription generally commemorative of the objects of the monument runs round the pedestal at her feet. The materials for this structure are Aberdeen granite, Connemara and Derbyshire marbles, and Darley Dale stone. —We must protest against the “urn covered with drapery” which Messrs. Holmes and Walker have introduced into their design for the Brotherton Memorial, in the midst of an assemblage of figures and angels, and beneath a Gothic spire canopy. What can an urn have to do there? Sepulchral urns are inseparable from the idea of ashes—the ashes of the dead—produced by and collected after cremation. And cremation is absolutely in antagonism with figures of angels and with Gothic architecture. Nor is it less at variance with the facts of the case. The remains of the late deservedly respected representative of Salford were buried, with all becoming solemnity, beneath the ground upon which this very memorial is to be erected. It is to be hoped that the urn will not stultify the entire design for this memorial. It would have been a happy circumstance had the angel-figures been spared the duty of caryatides; and a still happier had they been omitted altogether. Notwithstanding these faults there are many good points about this design, and we cordially congratulate both the town of Salford and the architects on its adoption in preference to another classic incongruity.

NEW APPLICATION OF PHOTOGRAPHY.—At a recent meeting of the Liverpool Photographic Society, a paper was read by Mr. J. A. Forrest, the subject of which was a new and beautiful application of photography. He had tried experiments with a view to arrive at some process that would enable him to fix the photograph by burning in the impression in the furnace with a coating of glass over it. From these experiments he found, that if “you grind a piece of opal glass very finely; afterwards collodionise, sensitize in the usual manner, and lay a negative upon it by super-position, you will receive a very beautiful impression by transmitted light; and after being fixed, washed, and dried in the usual manner, you will discover that the film adheres most rigidly to the glass, and scarcely any amount of rubbing will take it off. This is a plan that any one may follow out on a winter’s evening by gas-light;” and its results, if the designs were of a suitable character, might be advantageously displayed

in hall-lamps, or the windows of stair-cases might be filled with landscape views. Mr. Forrest subsequently entered into a description of a process whereby he had obtained the yellow silver tint in opal glass, and he exhibited to his audience several specimens, which were much admired.

FREE LIBRARIES AND MUSEUMS.—Some curious statistical information on this subject was given by Mr. David Chadwick, of Salford, at the recent meeting at Birmingham of the National Association for the Promotion of Social Science. From the following tables, prepared by him, we ascertain the number of volumes, and the issues, in seven of the principal new Free Libraries, and four of the old Free Libraries:—

NEW FREE LIBRARIES.

	Number of Volumes.	Total Issues last Year.	No. of times the whole Library has been circulated last Year.	Average Daily Issues.
Liverpool.....	41,490	474,546	Nearly 12	Vols. 1581
Manchester.....	32,573	156,553	5	521
Salford.....	20,433	147,300	7.4	491
Bolton.....	15,097	78,670	5.4	262
Sheffield.....	7,084	120,875	17	402
Oxford.....	4,520	26,000	6	86
Cambridge.....	2,579	14,628	6	48

OLD FREE LIBRARIES.

	Total No. of Volumes.	Total Issues last Year.	No. of times the whole Library has been circulated during the Year.	Average Daily Issues, at 300 Days per Year.
British Museum, open to ticket holders from 9 to 4 in winter, and from 9 to 6 in summer	565,000	416,802	Not quite once.	1,359
Archbishop Marsh's Free Library, Dublin, open from 11 till 3 Daily.....	18,300	7,000	About once in 2½ years.	23
Robinson's Free Library, Armagh, open from 12 to 3 in winter, and from 12 to 4 in summer.....	10,000	Not given; very few
Chetham's Free Library, Manchester, open Daily from 10 to 4.....	21,000	2,851	Once in 5½ years.	12

It will be seen by the above returns that the number of issues from public libraries is generally in proportion to the opportunities afforded for their use to the working-classes. If the libraries are closed in the evenings, the number of issues (and consequently the actual use of the libraries) is less per annum than the total number of books in the library. If libraries are open only at stated periods, or require the privilege to be paid for, as in the case of the libraries at mechanics' institutions, the issue of the whole number of books in the library is limited to about twice per annum. But if, as in the case of free libraries generally, they are open all day, till about nine o'clock in the evening, the circulation, or issue, of books in the libraries will average about seven times the total number. As regards public museums, the restricting the hours of attendance to not later than 4 P.M. has the same effect in preventing the mass of the people visiting them as in the case of public libraries; notwithstanding the incomparable superiority of the British Museum to all others, it appears that the total number of visitors, last year, was:—

To the British Museum.....	361,000
„ Derby Free Museum (Liverpool).....	125,000
„ Royal Free Museum (Salford).....	550,000

The number of visitors to the Salford Royal Museum, in the present year, will have exceeded 800,000. These extraordinary results can only be accounted for on the grounds that, at Salford, the Museum is open from 10 A.M. to dusk (Sundays excepted) during the whole of the year, and therefore during the summer months affords great convenience for the visits of the working-classes.

ROYAL POLYTECHNIC INSTITUTION.—Mr. Pepper has a truly marvellous faculty of suiting the lectures

and exhibitions of the ever-popular Polytechnic to the circumstances of the time; and in his hands old subjects, as they would seem at first sight to be, prove that they are either actually new, or that he can bring much that is new out of them. Just as we are practically convinced that the brilliant summer of 1857 is really past and gone, and that another winter has in its turn succeeded, Mr. Pepper emerges from a coal-mine, scuttle of coals in hand, and while we rejoice in the comforts of a fire-side, he enhances our grateful sensations by his admirable lectures on coals, and the mines whence they are produced, and the means whereby they are brought to our homes. Of course the lecture is well illustrated, and (also of course) it combines much that is eminently useful with not less that is attractive and amusing.

MR. ARDEN'S COLLECTION.—In our notice of this gentleman's picture-gallery, in the October Number, we spoke of a painting by Le Jeune, entitled “The Plough.” The picture in Mr. Arden's possession is, we have since learned, only the sketch for the larger work, which belongs to Mr. Brooks.

ASTON HALL.—Our readers are perhaps aware, that this time-honoured structure, once the dwelling of James Watt, which ranks among the most perfect as well as beautiful of the buildings usually styled Elizabethan, is in danger of demolition. It adjoins one of the most prosperous of English towns, in a district very wealthy, and where of late there has been an immense amount of “talk” concerning the value of Art and the blessings of education. It would be an eternal disgrace to Birmingham to permit the destruction of an edifice so especially sacred to its inhabitants; such an act of Vandalism would go far to justify a belief that all the speeches of great men delivered so recently in their Town Hall, were, in their estimation, so many sounds that signified nothing. We have, however, but little fear of so disastrous an issue; inasmuch as a joint-stock company has been formed with a view to conserve this building and its adjacent grounds for the health, recreation, and instruction of the people of that mighty borough town, richer and more populous than four-fifths of our cities. No doubt arrangements are in progress by which the purchase will be not only a wise but a profitable investment; for the people seldom desire to have enjoyments for nothing, and will pay willingly for such amusements or teachings as are in keeping with the requirements of the age. We earnestly call upon the wealthier inhabitants of Birmingham to “fraternise,” for this high purpose, with “the working-men's committee,” already formed, to achieve a good and avoid a reproach,—one of which must be perpetual as a signal benefit or a shameful dishonour to Birmingham.

A SERIES OF STEREOSCOPE VIEWS, of very conspicuous merit, has been issued at Brighton by Mr. Mason, the well-known and much respected print-seller of that town. They are the productions of his son, a young and promising artist, who has studied in a good school,—that of M. Hennebe, whose principal assistant he is. The photographs consist of various subjects—out-door and in-door scenes, dead game, figures in repose and in action, and so forth. They are cleverly grouped and arranged, and “tell” with good effect in the stereoscope, giving high relief, and being singularly free from blemishes.

MESSRS. SOTHEBY AND WILKINSON are commissioned to sell by public auction the collection of engravings of the late Mr. Charles Turner: it is rather rare than extensive, including several proofs of the “Liber Studiorum” of the engraver's great namesake and personal friend.

THE SUCCESSOR TO MR. UWINS, in the keepership of the Royal Pictures, is Mr. R. Redgrave, R.A. The appointment involves no great labour—it is, indeed, more an honorary distinction than a post with which arduous duties are associated, and has, therefore, been conferred on a gentleman who not only occupies a high position in Art, but has in many ways contributed to public instruction.

MR. E. M. WARD'S fresco of “The Execution of Montrose” has been placed in the corridor of the House of Lords; the other, “Alice Lisle,” will be added in a few days; workmen are busy preparing the panel of the wall for its reception. Mr. Cope's “Pilgrim Fathers” has been in its place some time.

PAINTING ON GLASS.—When it is remembered that in this branch of art there are prizes well

worth contending for, it is a matter of surprise that we find it practised by so few men entitled to be called artists. The Germans have, by the aid of the most careful education, carried the art to what must be regarded an ultimate perfection in minute manipulation; but among ourselves the influences to which the practice of glass-painting is subject, operate not only to retard it, but to fix the period of its utmost excellence in the middle ages. There is a certain perversion in this taste for ancient fallacies which are repugnant to the educated intelligence; and unfortunately there are those professing this kind of decoration who readily second the suggestions of a barbarous taste, because they are incapable of improving upon monkish grotesques. We have been induced to these observations by having seen a large window, the work of Mr. George Hodgeland, which may be seen in his gallery at 13, York Place, Portman Square. The subject is, Christ blessing little Children, and the principal figures are nearly of the size of life. The harmony and brilliancy of the colours are most effective and successful—and the drawing and expression of the figures are masterly to a degree. If glass-painting is to advance at all beyond imbecile tradition, it is surely something of this kind that the time demands.

PHOTOGRAPHS OF INDIAN CITIES, &c.—There are now exhibiting, by Mr. Hogarth of the Haymarket, a series of beautiful photographs, presenting localities that must hereafter be regarded with an interest far beyond that which ordinary historical events communicate. The views are thirty in number, and have been executed by J. Murray, Esq., M.D., resident at Agra. They are very large, being each eighteen by fifteen inches, but, nevertheless, it is only on examination with a glass that the ornamental detail of Indian palatial architecture becomes visible; and great indeed is the contrast between these sumptuous edifices and the squalid habitations by which they are so often surrounded. At Agra there is a fort, which, in 1804, stood a long siege before it was taken; it is built of red sandstone, occupies a considerable area, and is enclosed by a ditch. This is one of the subjects, and it may readily be believed that it is sufficiently strong to repel a numerous attacking force. Immediately below the river-front of the fort flows the Jumna. The gardens of the palace of Akbar remind the spectator of the scenes in the Arabian Nights, and convey to him an impression that the descriptions contained in these tales are not all fable. All that has reference to Agra we contemplate with deep feeling, for the fortress of the place is the refuge of the Lieutenant-Governor, Mr. Colvin, and all the English and Christians to the number of six thousand. In the view showing the front of the palace of Shah Jehan, we see the whereabouts of the memorable entertainment given by Lord Ellenborough to the residents of Agra and the neighbouring stations. Secundra is interesting to us as the residence of a number of native Christians, who, protected by our government, had been taught different trades. Many were employed in printing, which was carried on to a considerable extent here; but, on the 5th of July, Secundra was destroyed by fire, and the well-affected inhabitants were removed into the fort at Agra. By a view of a portion of the city of Muttra we are reminded that, according to recent accounts, the flying sepoy have thrown themselves on this place; but results we have yet to learn. It was here, as Colonel Ewart states in a letter to the *Times*, "That in consequence of the two companies at Muttra (three marches north of Agra) having mutinied and plundered the treasury there, (which two companies belonged to one of the native regiments at Agra,) he, the lieutenant-governor, resolved upon disarming the native regiments at Agra"—which he accordingly did, and this promptitude has perhaps saved Agra. It is impossible to do justice to the marvellous detail of these photographs, of which we have pointed out a few only.

THE BRITISH INSTITUTION.—On the 18th of last month the annual exhibition of copies was opened at the gallery of this institution; and it must be observed that there was a more numerous and varied selection of works left for students than we ever remember to have seen. But it must strike all who understand the qualities of these valuable pictures, that the copies are made more with a view to sale than improvement. There were no less than six of

that portrait of Dr. Johnson which is attributed to Gainsborough, while veritable and better Gainsboroughs were left untouched. Rembrandt is always a favourite: the two which had been selected are copied with indifferent success, because the glazes employed by that master are not understood. The beautiful Giorgione—the property, we think, of the Royal Academy—was also there; and a splendid Hobbima. "The Gazette," by Teniers; Snyders' "Boar Hunt;" the charming Vandyke "Lady de la Warr;" "An Architect," and "A Philosopher," by Spagnoletto; Murillo's "Assumption of the Virgin;" "A group of Family Portraits," by Reynolds; "The Bridge at Verona," by Canaletto; a landscape, by Poussin, and others by Ruysdael; with a sea-piece, by Baeckhuysen, and another by Vander-velde. Thus there was material for students of figure and also of landscape, together with marine, animal, and *genre* subjects. Among the copies, we observe one or two by the veteran Reinagle. Other copyists were Mr. Kendall, Mrs. Sykes, Miss Young, Miss Pye, Mr. Hawthorn, Mr. Holyoake, &c.

DR. WAAGEN'S supplemental volume to his "Treasures of Art in Great Britain" has just been published by Mr. Murray. As our pages were arranged before a copy reached us, our notice is postponed till next month, when we propose considering it at some length. For the present it must suffice to say that every picture collector and amateur in the kingdom should have these books in his possession.

THE TEMPLE COLLECTION recently bequeathed to the British Museum—the result of a long and careful gathering of the finest specimens of Classic Art in Greece, by the Hon. Mr. Temple, our official representative there—is one of the most important gifts of the kind ever made to our national collection. All these antiques are the finest of their class, and have been arranged with an elegance and care that have never before been exhibited within the Museum. We may yet hope to see the day when our collection will rival the Louvre in appearance; it unquestionably does in the character of the objects it holds, though we have not hitherto shown them to any advantage, as our French friends have theirs.

The session of the ARCHITECTURAL ASSOCIATION has been opened by an able and impressive address from its president, Mr. Wigley. Such addresses as these cannot fail to impart a fresh dignity to architecture itself in the eyes of both professional students and amateurs, and must be eminently calculated to produce beneficial results. We hail with sincere pleasure the continually advancing interest displayed in the art of Architecture, and at the same time we observe with equal satisfaction that the claims of architecture are being so ably advocated, and set forth in a manner so lucid and so attractive. We propose to devote more of our space than we have done heretofore to architecture, in the full assurance that by so doing we shall be doing good service to the cause of Art.

THE SCUTARI MONUMENT is, it may be presumed, now on its way to its place of destination. The vessel in which it was shipped left London some time since, as we understand, but it would be delayed at Penryn to receive the granite base and pedestal from the quarries of Messrs. Freeman. We are only too glad to know that Baron Marochetti's miserable design was not intended for England.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS commenced the meetings of the present session on Monday, November 2nd. A paper was read by Mr. Wyatt Papworth upon painting wood in houses and other buildings, which led to a discussion of much practical value upon the use of varnish without paint. After this Mr. T. H. Wyatt presented a rubbing from the brass which has been recently completed, under his direction, by Messrs. Hardman, to the memory of the late John Britton, and which is to be attached to a slab of marble in Salisbury Cathedral.

DUBUFE'S fine picture of the "Expulsion of Adam and Eve," or rather a *replica* of it, is now on view at 121, Pall Mall. The original, painted twenty-five years ago, is at Sydney, after having travelled almost the circumference of the globe, and everywhere receiving the homage due to its excellence. We understand Mr. Ryall is engraving a large plate from the picture.

REVIEWS.

THE HOME AFFECTIONS PORTRAYED BY THE POETS. Selected and Edited by CHARLES MACKAY. Illustrated with One Hundred Engravings, drawn by eminent Artists, and engraved by the BROTHERS DALZIEL. Published by G. ROUTLEDGE & Co., London and New York.

It was a happy idea that suggested to Dr. Mackay this volume of love lyrics, the gentle musings of about a hundred poets, living and dead; a string of pearls in rich settings; a princely gift, as "a thing of beauty," for Christmas-time, albeit Christmas is regarded, and rightly, as a soul-cheering season, and many of the poems introduced are sad, though sweet. The subject of the volume is "Love," says the editor, "in its widest and most universal acceptance—the Love of Home, Country, and of Kind; Love in innocent childhood, Love in courtship and youth, Love in matrimony and middle-age, and Love in the confines of the tomb"—a theme that "has found poets worthy to celebrate the name." "The selections," he adds, "have been made in one spirit, and with one object—the exaltation of the Domestic Affections, not alone in the one development which is the favourite theme of the romance-writer and the lyric, but in all its manifestations, both as a passion and as a sentiment, as a pleasure and as a duty." Among the poets of the present century, both English and American, there is scarcely one of any repute whom Dr. Mackay has not enlisted in the service of his book.

But our business is more especially with the Art exhibited in the volume. In this, too, he has been successful in securing the aid of a large portion of the most eminent artists of the day, whose drawings are exquisitely engraved by Messrs. Dalziel, to whom must be ascribed much of the credit which the book cannot fail of procuring for all who have assisted in its production.

Prominent among the landscape illustrations are those by Birket Foster, about twenty in number, each a gem of pastoral beauty. Harrison Weir, whom we have hitherto known chiefly as a draughtsman of animals, contributes six diversified subjects—forest-trees, architectural, and rural—scarcely less elegantly picturesque than Mr. Foster's. W. Harvey's five designs are not unworthy of his long-established reputation. Another of the landscape contributors is S. Read, who has also furnished five subjects, tastefully and delicately drawn, and good in point of composition. T. B. Dalziel is the author of nine designs, part of them landscapes, and part figure subjects, all highly meritorious. This young artist promises to take rank with the best of our book-illustrators. G. Dodgson's three subjects come under the denomination of landscapes; of these we prefer that which illustrates the poem "Church Bells." J. M. Carrick has a snow scene of great beauty, and three figure subjects, of which one, "An Episode from Life," is very clever. E. Duncan's sea-piece must not be overlooked, nor J. Sleight's "Pleasant Teviotdale," one of the most charming landscapes in the book.

John Gilbert maintains his high position among the artists to whom the majority of the figure subjects have been delegated; he contributes six, of which it is sufficient to say that they are his, for every one knows of what kind of stuff his Art-dreams are made of. J. Absolon's four compositions are purely natural, and marked by no affectation, a fault this clever artist sometimes commits. J. R. Clayton contributes one only, but it is not surpassed in poetical feeling and good drawing by anything in the volume. J. Allon Pasquier, a name with which we are unfamiliar, is the author of seven subjects, not all of equal merit, yet all good; he seems to have taken Mr. Gilbert's style as his model. F. W. Topham's two pencil sketches of Irish character are inimitable; and A. Johnston's Scotch lovers, and "John Anderson, my Jo," tell their story to the public eye unmistakably and pleasantly. In each of the six designs contributed by F. R. Pickersgill, R.A., the figures are drawn of too large a size to suit the pages—there are several others of which the same remark may be made; it is a great mistake this in every way—moreover, they are not up to his own standard of excellence either in composition or in execution. A. Madot, a name new to most of our readers, we believe, but not to us,—for it is to the pencil of this young artist that we are indebted for many of the best drawings on the wood for our series of "British Artists," published monthly, and we have foreseen some time that he was on the road to gain good repute,—furnishes six remarkably clever designs, but we would warn him against a Pre-Raphaelitish tendency, of which there seems some danger. J. Tenniel is always at home among the knights and barons of olden time; he has two sub-

jects of this class, somewhat stiff and stately, but therefore, we suppose, not the less in keeping with the bearing of those doughty champions of Christendom. G. Thomas has a spirited illustration of Dibdin's song of "Nancy." James Godwin has made considerable advances since we met him in work of this kind; his name is affixed to five subjects, which must be classed among the best in the book. J. E. Millais, A.R.A., exhibits two; the first truthful and natural, the second incomprehensible. E. Dalziel's "Threnody" is cleverly drawn and humorously expressed, but the figures are too large by half—it seems out of its place in such a book.

Thus, we believe that we have mentioned every contributor to this volume, for which much popularity may be anticipated during the forthcoming season of "gift-books." Our protest against the size of many of the figures must extend to some of the subjects, both landscapes and figures, considering the dimensions of the page, the block should not exceed five inches either way; whatever goes beyond this is antagonistic to elegance of proportion.

CHROMOLITHOGRAPHS. Published by ROWNEY & Co., London.

We have received from Messrs. Rowney & Co. a considerable number of new subjects in chromolithography. This firm keeps ahead of all others in the publication of miscellaneous works of this kind; but the art does not seem to make any progress: perhaps, however, it would be unreasonable to expect such, seeing that it has already accomplished so much as to bring colour-printing into competition with original drawings; or, at least, to render the copy almost a match for the picture from which it is taken. As a whole, the prints now before us are not equal to others that have reached us from the same quarter; there is a general heaviness in colour, an absence of the painter's crisp and decisive touches, and of delicate, half-tints; light and shadow is each definitely expressed, but they want bringing together by that which would restore harmony through the entire subject; in short they are *prints*, pretty and attractive, but yet prints, and not what others have often been taken for—drawings. We wish to see in works of this class, more of the pencil and less of the printing-machine.

The best of these novelties is a scene "On the Coast of Calabria," from a drawing by T. L. Rowbottom. It is a most picturesque view: a deep ravine, running towards the open sea, intersects the subject; on one side an ancient castle, and other buildings, crown the heights; on the other is a road defended from the abyss below by a stone wall, and, on the left side, skirted by a rocky back covered with shrubs, and partially shaded by a group of Italian fir-trees. The picture is bright and sunny, and far less open to the objections we have just urged than the others. An "Old Water-mill, near Ringwood, Hants," after G. Frupp, is represented as if the sun had just broken out after a shower of rain—every prominent object has caught its yellow tints; but the print is heavy, and the manipulation looks "woolly." The "Stolen Kiss" is after J. Absolon: the thief is a young soldier, in the regimental uniform and three-cornered hat of the last century, who has waylaid a peasant-maiden at the field-stile, and robbed her—audacious villain that he is!—in the broad daylight: however, she does not seem altogether an unwilling party to the theft, although one cannot determine by the expression of her face—so unmeaning is it—whether she is pleased or otherwise. The print is sketchy in execution, even for Absolon, but is brightly coloured. M'Kewan's "Water-mill, Dorking," has been more successfully copied than Frupp's water-mill; it is sober in tone, and the trees and long grasses that border the stream are touched in with considerable emphasis; we seem to see the artist's hand here. "The Mill-Stream," after P. De Wiut, is a fair transcript of this painter's style of work—one, from its free, broad handling and unstrained effects, well-suited to the capabilities of colour-printing. "Heidelberg," after T. L. Rowbottom, is in all respects a worthy companion to the Calabrian scene: the view is taken from the heights above the town, with the old castle stretching its extreme length in front of the spectator. The water and the distance are excellently managed. "Youth and Age," an old admiral and his daughter, it may be, taking a turn round the garden of their mansion, is from a drawing by F. Taylor: it is quite a sketch, very clever, and by no means indifferently copied: there is some one, out of the picture, but in the garden, who attracts the attention of the promenaders and their companions, two pet spaniels, for all eyes are fixed upon the unseen intruder; and the old sailor looks less pleased at the interruption than does the dark-eyed girl on whose arm he leans: the dog at her feet certainly recognises some one they have both, we may be sure, seen before. The "Castle of Ischia," after W. Leitch, was scarcely

worth reproducing, to judge from the copy; the artist has not made the most of his materials. A "View in North Wales," after H. Bright; a mass of rock-stone, a group of fir-trees, a bit of a lake, closed in by some lofty hills, the whole wound up by the setting sun, compose this little picture, which must be classed with the best of those we are noticing: it is really good. "The Page—on Duty," according to the artist's—W. Hunt—version of a page's duty, it is to go to sleep, instead of watching the commands of his royal or aristocratic master or mistress; at least, the little fellow here represented, in his bright silken tunic, silk hose, and satin shoes, has fallen soundly asleep over the back of his chair, wearied out, doubtless, with overwatching; his hat, adorned with a scarlet feather, is thrown down at his feet: 'tis a pretty picture, worth a frame, and a place in "my lady's boudoir." A pair of fruit-pieces, "Grapes," &c., after F. T. Baines, brings our list of Messrs. Rowney's works to a conclusion for the present. The grapes look luscious, but they want the transparency which, it may be premised, the original drawings had; the leaves, baskets, &c., are carefully copied and well imitated.

THE POETICAL WORKS OF WILLIAM CULLEN BRYANT.—THE POETICAL WORKS OF EDGAR ALLAN POE. Illustrated by Engravings on Wood. Published by SAMPSON LOW & Co., London.

These poets have long been famous on both sides of the Atlantic; yet it would be difficult to name two more remarkably dissimilar; and if we consider them together, it is only because they are published in the same style, illustrated by the same artists, and issued by a publisher who has done much, and very successfully, to bring America and England into closer alliance, by showing that each may derive from, and give to, the other true enjoyment. May all such efforts prosper!

Bryant, we believe, ranks highest among the many admirable poets of the United States; in England he follows Longfellow, who is undoubtedly more popular with us. To our minds, there is a long distance between them. It is a very general opinion in this country that places Longfellow at the head of the "English" poets; for English he undoubtedly is in all that is essential, as much so as Milton or Wordsworth. We can relish what he writes as thoroughly as if he were island-born; his thoughts, as well as his words, are ours. Happily no translator is needed to make the poet of America the poet of England. Bryant has amply merited his popularity. Full of tenderness, feeling, energy, and sense—usually, perhaps, more rational than fervid, he addresses the judgment as well as the heart, and satisfies both.

Of another order is the poet Poe. His writings are, like his life, wayward and fitful, full of fire, but it is often the fire that scorches where it should warm, and oppresses where it might invigorate. He is undoubtedly original, as well as force-full; and that in this age is no mean praise; but he has left little that the world will much care to keep, or that it will "not willingly let die." Die, however, his poems never will, although far too generally they evidence "a mind diseased."

It is, however, more with the artist than the author we have now to deal. The books are beautifully illustrated—lavishly too—while it is obvious that neither care nor expenditure have been withheld to do honour to the work that is to associate the artist with the poet in a labour that both would love. The illustrations have been principally designed by the established favourites—Harvey, Foster, Pickersgill, Duncan, Tenniel, and Harrison Weir—but there occur some names less familiar to us; three of them are known to be Americans—Darley, Cropsey, and Duggan—and they take their places worthily beside their veteran brothers in the art. Indeed, the first named of the three is surpassed by very few, if any, either in design or the skill with which his drawings are placed on the wood. Mr. Cropsey has his full share of honour, although he appears in the same volume with Birket Foster; while the drawings of Mr. Duggan are at once delicate and vigorous, and manifest a thorough acquaintance with the capabilities of the art—to which there is a limit. Among the names of English artists whom we here encounter nearly for the first time, we are bound to mention those of Madot (referred to also elsewhere) and Thomas Dalziel; the latter is, we imagine, brother of the eminent engravers, and if so, they have a most effective ally close at home. The engravings are for the most part executed by the Brothers Dalziel; indeed, the whole of those that illustrate Bryant are, we believe, from their gravers. They uphold in all respects the reputation they have justly acquired. The engravings of Mr. J. Cooper have also considerable merit, and taken altogether, there have not been many illustrated books more satisfactory than these,

which are doubly welcome, not only for their own value, but as an additional mode by which we in England can know, and estimate, and respect, the Literature and Art of our brethren of America.

THE ILIAD OF HOMER. Translated by ALEXANDER POPE. With Observations on Homer and his Works, and brief Notes, by the Rev. J. S. WATSON, M.A., M.R.S.L. Illustrated with the entire series of Flaxman's Designs. Published by H. G. Bohn, London.

We notice this edition of Pope's Homer, which Mr. Bohn publishes in his "Illustrated Library," chiefly for the purpose of pointing out that it is embellished with the entire series of Flaxman's wonderful compositions from the poem. These designs have ever taken rank among the purest in style and the most beautiful in conception which this great artist produced; they are models of inventive genius exercising its powers with the utmost delicacy, grace, and vigour. The plates have been very carefully reduced from those originally engraved by H. Moses; they have long been in high repute among amateurs of classic Art both here and on the Continent, nor do they suffer in interest or in excellence by undergoing this change. The spirit and delicacy of the outlines are most successfully maintained in these smaller examples.

TIGER SHOOTING IN INDIA. By WILLIAM RICE, Lieutenant 25th Regiment Bombay N. I., and late Captain, Turkish Contingent. Published by SMITH, ELDER & Co., London; SMITH, TAYLOR & Co., Bombay.

We are quite willing to accept the testimony of Captain Rice that "tiger shooting is the most exciting and glorious sport this world affords;" we are quite satisfied to hear it is all this without a wish to learn the truth experimentally, even after reading of his victories over tigers ten and twelve feet in length, and looking at his pictures—of which the volume contains many—of his deadly encounters with these savages of the jungle. If Mr. Gordon Cumming has a right to assume to himself the title of the "Lion Hunter," Captain Rice may justly lay claim to that of the "Tiger Slayer;" for he states that "during the year's sport in Rajpootana, India, our 'bag'"—a tolerably large one it must have been, and heavy to carry under a tropical sun—"consisted of 156 head of 'large game,' killed and wounded, as follows:—68 tigers killed, 30 wounded—total 98. Panthers, killed 3, wounded, 4—total 7. Bears killed, 25, wounded, 26—total 51." The gallant officer makes up his "return of killed and wounded" in true professional style, as if he proposed to enclose it for the information of the Secretary-at-war, or as if they were so many Sepoys dispatched by his rifle and the rifles of the "troops under his command;" unhappily we have heard of late that Sepoys and tigers may almost be considered as synonymous terms, only in adopting them we should do injustice to the latter.

The destruction of these beasts of prey is, we doubt not, a necessity in countries which human beings inhabit: this has always induced the Indian government to set a price upon each tiger's head that is brought before the proper authorities, just as country squires in England reward those who destroy the "vermin" infesting their game preserves. But Captain Rice shoulders his rifle with no mercenary views; he has a passion for tigers and bears, but only to get a shot at and "bag" them: for this he is almost ready to peril his commission, as he frequently jeopardised his life; nay, so earnest is he that he would fain become "Tiger-hunter General for India," for, "in order to gratify his passion," and test "the practicability of making any sort of impression on the tigers of Singapore, 'I most respectfully beg,' he says, 'that my honourable masters, should they approve the cause, may see fit to attach me temporarily to some Madras regiment doing duty either at Singapore or some of the neighbouring stations at Burmah. . . . All I ask is to make the experiment either at Singapore or any other part of India infested by wild beasts: wherever tigers prove troublesome it would be equally agreeable to me,' (the italics are our own), "so long as there was a chance of plenty of sport," &c. If this is not the enthusiasm of a true sportsman we know not what is. But Lord Canning has at present other work for the courage and skill of such a gallant officer; so that it is to be feared he will not, for some time at least, get the leave of absence he so ardently desires.

Chacun à son goût: whether any of our readers will care to peruse Captain Rice's exploits must be left to themselves; if they do they will certainly find much in his narrative to amuse them. It is written in a free, off-hand style, without any assumption of authorship—the work of one more used

to handle the rifle than the pen. Several coloured plates, from drawings by the author, illustrate some of his adventures; but the tigers everywhere seem of a prodigious size, with legs thicker than the body of a man. Surely this is an exaggeration, or else even the Royal Bengal tiger collapses when he reaches this country.

ALADDIN; OR, THE WONDERFUL LAMP: a Dramatic Poem in Two Parts. By ADAM OEHLENSCHLÄGER. Translated by THEODORE MARTIN. Published by JOHN W. PARKER & SON, London.

In his preface to a charming story known and loved from our childhood, Mr. Martin says, that when this drama was written Oehlenschläger was in the first bloom of manhood; he was in love, and he had recently lost his mother. Aladdin's story seems to have an affinity to his own. In the faculty of poetic creation, which had begun to stir within him, he found, as he says in his autobiography, a veritable Aladdin's lamp. His own passion sought a vent, in depicting that of Aladdin for Gulnare, and his tears for a loving, and much-loved mother overflowed as he wrote the "Dirge of the Eastern Boy at the Grave of Morgiana." This is a key to the construction, as well as to the feeling, of the whole drama. The young poet was so filled with mingled passions, each so different, each so full of power—love uprising in his heart in all its delicious freshness—overthrown for a time by the first great sorrow he had ever known, that the only relief to his poetic temperament was pouring forth his anguish, which we can trace in the exquisite lament on the death of Morgiana, and the outbreaks of tenderness and devotion for "Gulnare." Without "the key," which Mr. Martin has given into our hand, much that is now earnest and passionate would have seemed stilted and overstrained. Let no one, because they know all about "Aladdin and his Wonderful Lamp," be deterred from taking this volume into the quietness of their chamber, and reading it from the first page to the last. Together with much that is certainly known, and some things which, with all deference to the accomplished translator, might, we think, have been omitted, there is a freshness, a vigour, and originality, not only in the treatment of the story so faithfully followed, but in the bursts of poetry, and the spiritual network which encompasses the whole with its golden threads, that cannot fail to give intense pleasure, and remain long after the volume is closed. The second part bears the richest fruit, probably because Oehlenschläger was less trammelled by the story; yet we cannot but wish that the poisoned cup had been given by any other hand than Gulnare's to the necromancer. Aladdin is preserved from being the instrument of retribution by a commonplace incident enough, yet managed with such art that it becomes highly dramatic—we wish the same tenderness had been evinced in the poet's treatment of his love. The moralist will abundantly rejoice over the spirit's reproof to Aladdin when he wishes for the "roc's egg." All we have space to add to this brief notice is an expression of regret, that a poet so full of feeling and originality as Mr. Martin has proved himself to be, should be content with translating the thoughts of others, when his own muse is ready to be the "slave of his lamp," whenever he chooses to command her services. We say this in all sincerity, though we are grateful for the translation, which has given us so much pleasure.

BUTTERFLIES IN THEIR FLORAL HOMES. Published by PAUL JERRARD, London.

This is an exceedingly beautiful gift-book; well fitted for the season when butterflies are out of season. It contains twelve prints in chromolithography, each exhibiting the choicest and most charming of the graceful and elegant insects amid the leaves and flowers that are considered more especially their "homes." The drawings are richly coloured; and there is ample evidence that Nature has been carefully followed. A brief but sufficient description is appended; and each print is accompanied by a very pretty and appropriate poem. The getting up of this very superb book is in excellent taste: the leaves are of thick drawing-paper, and the binding is exceedingly elegant. Altogether, there is no book for Christmas and the New Year, that may more truly grace the drawing-room table.

POETRY AND PICTURES FROM THOMAS MOORE. Published by LONGMAN & Co., London.

There is no poet of our age from whom "selections" could be more welcome. Undoubtedly there are many of Moore's poems too "warm and tender" for general reading; yet among those which he wrote when a very young man, and the publication of which he lived to regret, there are some as exquisitely beautiful, as truly touching, and as altogether "right" as any he produced in his riper years. We have here a veritable treat; the gems of gems are now collected, infinitely varied in subject—light and serious, trifling and tender, didactic and descriptive—all of that rare delicious "mellowness" that no poet of any time or any country ever surpassed. The selected poems are judiciously scattered through the volume, some from the "Irish Melodies," others from the "Sacred Songs," others from the "National Melodies," others from the books less known and popular; the whole closed by extracts from "Lalla Rookh" and "The Loves of the Angels." Those who know the poet—and who does not?—will, therefore, readily conceive what ample and admirable themes the artist has found. Perhaps there are none of the poets who supply so many and such varied subjects for the painter. Moore was not merely a poet of sentiment: even in his smallest lyrics there is, so to speak, a character, which the eye, as well as the fancy, may "body forth": in scenery also he is often minute as well as rich, and many of his pictures, such as "The Meeting of the Waters," and "Inisfallen," are taken from nature. It is not, therefore, surprising to find this book very beautifully illustrated: Messrs. Longman—the personal friends, as well as the publishers of the poet—have rendered ample justice to his works, "bringing out" the book with all the advantages that elegant binding and graceful topography could confer upon it.

The artists whose aid has been sought and obtained are MacIise, Pickersgill, Birket Foster, Duncan, Le Jeune, Harrison Weir, Cropsey, Topham, Thomas, Horsley, Cope, and Warren. Not many years have passed since in the *Art-Journal* it was our continual duty to deplore that the higher order of British artists would not "condescend" to make drawings on wood; that while in France it was a common practice, in England this large means of giving enjoyment and instruction was left almost entirely in the hands of those who were supposed incapable of loftier achievements. Happily this evil exists no longer; we have lived to see our best painters devoting much of their time and talents to preparing wood-blocks for engravers. And our engravers have advanced in proportion; nowhere in the world can some of the prints in this volume be surpassed: let the finest productions of their class be compared with those of Evans, Linton, and Cooper, which embellish the exquisitely beautiful book, "Poetry and Pictures from Thomas Moore," which we heartily and cordially recommend as a very valuable contribution to British Art and literature, especially to be welcomed at this period of the year.

THE SHIPWRECK. A Poem by W. FALCONER. With Life by ROBERT CHAMBERS. Illustrated by BIRKET FOSTER. Published by A. and C. BLACK, Edinburgh.

So numerous have of late years been the "illustrated editions" of our poets which publishers have issued, that one might almost have thought the entire series of poetical writings was exhausted; but every now and then a volume appears that has escaped our recollection, though not those who make it their especial business to search after works suitable for illustration. We have such an one in Falconer's "Shipwreck," which Messrs. Black have just published in an elegant form, to bring it within the class of "Gift-books" for Christmas and the New Year. Mr. Chambers says truly, in his biography of Falconer, that a poem founded as this is, "on truth and nature, elevated by imagination, and presenting the most affecting examples of human suffering and moral heroism, may be said to rest on an imperishable basis. It has survived many retellings of taste and opinion, and unquestionably will be read as long as British enterprise and valour maintain their empire on the sea." If the "Shipwreck"—and it is not improbable such is the case—should be among the number of those writings which more recent poets have caused to be set aside, ex-

cept among the few, this edition will call it into life again, and extend its popularity. Mr. Foster's pencil revels luxuriantly amid the sylvan scenes of home, and among those that "do business in great ships," and "go down into deep waters;" his designs are exquisitely engraved by the Brothers Dalziel, W. T. Green, and E. Evans. Some beautiful vignettes and initial letters, designed by Noel Humphreys, and engraved by H. W. Woods, give additional value to this very pretty volume.

SABBATH BELLS CHIMED BY THE POETS. Illustrated by BIRKET FOSTER. Published by BELL & DALDY, London.

Although we cannot class this among the new "Gift-books" of the season, yet the appearance of a second edition, showing some changes on the face of it, demands a notice. In the new edition the initials are printed in black instead of in colours, as in the first issue. The colouring of Mr. Foster's beautiful designs is retained: we would rather have seen these also in black, but the tinting pleases many, and is a novelty, to a certain extent, in books of this class; the publisher therefore is justified in adopting it. "Sabbath Bells" must be a favourite volume.

POEMS AND SONGS BY ROBERT BURNS. Published by BELL & DALDY, London.

Among the many Christmas books this may be regarded as one of the most beautiful. It cannot fail to be acceptable everywhere, but especially in Scotland, and to the Scottish people; for it is a worthy monument to the memory of the "true bard"—of whom not only his country, but the whole world is justly proud. We regret that the charming book came to hand too late for notice in our present number, and must therefore be postponed. It is richly and very lavishly illustrated by the best artists and the most eminent of our engravers.

PORTRAIT OF GENERAL SIR HENRY HAVELOCK. Published by MASON, Brighton.

This portrait may be accepted as authentic. The original, painted by Mrs. Mannin, has been copied in lithography by Basébe; it is in the possession of Sir William Norris, and may therefore be regarded as "undoubted." Yet those who see it may be tempted to believe it a fanciful rather than an actual likeness; for it is precisely that which conveys an idea of the true hero, whose name is loved as well as honoured throughout these kingdoms. The head is a rare and happy instance of blended firmness and generosity: it is that of a lion in war and a lamb in peace. The broad and high forehead evidences large intellectual strength; the eye seems all-seeing; while the mouth is indicative of extreme gentleness and suavity. It is, in truth, a beautiful head—as fine and perfect an example of manly beauty as the artist could find after a long search among the relics of old Rome, or could create as the result of all his studies, aided by a fertile fancy. To such a man we may safely confide the interests of England, and also those of humanity. There are thousands who pray daily that he may live to be welcomed home—

"Who, doom'd to go in company with pain,
And fear, and bloodshed, miserable train!
Turns his necessity to glorious gain."

ARCHITECTURAL DETAILS. By the Rev. G. SCRATTON. Published by LONGMAN, BROWN & Co., London.

Though this little book is intended chiefly for professional builders, it will, perhaps, be found of more real service to those amateurs who delight to indulge in bricks and mortar, of whom there are many, and some with more money than wit for such speculations. Mr. Scratton will save these gentlemen much time and cost, if they will consult his work, which comprises—"Tables of convenient form, and designs for details, with examples, &c., for assistance in estimating all the chief items in projected buildings, or in reducing or enlarging the expenditure as circumstances require." These tables appear to be very carefully compiled, and to include all the principal external parts of a dwelling-house.
