THE ART-JOURNAL.

LONDON, JANUARY 1, 1857.

THE Twentieth Annual Volume of the ART-JOURNAL—the THIRD of the NEW SERIES, containing ENGRAVINGS FROM THE ROYAL COLLECTION—is commenced with the present Part.

In the Number which closed the Nineteenth Volume, we briefly explained to our Subscribers the leading arrangements we had entered into for the future conduct of this Work, pledging ourselves to every possible exertion for its improvement and increased utility as a representative of the Arts, Fine and Industrial—a position it occupies, and has long occupied, without a competitor in Europe, or in the United States of America.

We require only to know how it is possible to obtain farther advantages for our Subscribers, and the Public generally, to endeavour by every means in our power to secure them.

It is certain that a comprehension and appreciation of ART, in all its varied ramifications, is largely extending; many beneficial influences have combined to produce this salutary effect; a proportionate advance is alike our duty and our interest; and we cannot doubt that those who compare the earlier with the later parts of this Journal will be of opinion that we have kept pace with the beneficial movement progressing everywhere—a movement it is our right to believe we have ardently, zealously, and continually, aided.

We desire now only to express our gratitude—and we do so for the nineteenth time—to those by whom our efforts have been assisted and sustained. It is especially due to the highest authorities in the Realm: and also to the many artists, amateurs, manufacturers, and artisans, whose support has been our encouragement and our reward. To THE PRESS universally we are deeply indebted for cordial co-operation and generous assistance.

Our Subscribers will require no assurance that we shall continue to labour earnestly and assiduously for their pleasure and advantage, trusting they will perceive, from month to month, the progress they require and expect.

4, LANCASTER PLACE, STRAND.

THE NATIONAL GALLERY.

THE TURNER COLLECTION.

SINCE the original foundation of the National Gallery, in 1824, no single event has taken place of so much importance to the advancement of Art in this country, as the munificent bequest to the nation of his remaining works by our great landscape-painter, Turner. One portion is already accessible to the public, and a wonderful instalment it is; and those still to be seen are of equal importance, though they will lack that interest which was necessarily attached to the novelty of the first exhibition of works of such surprising power. When we consider that such works, reflecting the highest honour on the British school, are withheld from public exhibition because the nation does not possess a suitable gallery to exhibit them in, it does appear a singular anomaly; more especially when we consider the boundless resources of the British Government. This could scarcely happen in any other capital of Europe; many of the small cities of the German principalities, even, have contrived to provide for their collections of pictures some ten times the accommodation hitherto afforded by the British Government. That such considerable donations as the Turner bequest could not be foreseen, is but little palliation for the deficiency. If such acquisitions are made in spite of discouragement, what are we to expect from an adequate encouragement of donations and bequests by a noble reception in every way worthy of the acquisition?

Turner's large fortune, both in works of Art and in funded property, he bequeathed to his country—his finished pictures to the nation, on condition that the government should provide a suitable location for them within ten years; and the greater part of his funded property towards the establishment of an institution for the benefit of decayed artists.

The will was disputed by his kindred, and in accordance with a compromise, the property has been at length distributed by the Court of Chancery; all the pictures and sketches have fallen to the nation, and the sum of £20,000 has been awarded to the Royal Academy, in lieu of the establishment of an institution for the benefit of decayed artists; while the prints, the rest of the funded, and all other property, have been assigned to the next of kin. The whole property was sworn under £140,000, but the pictures alone have been estimated, by qualified judges, at a much larger amount. The conditions associated with the public acquisition of the pictures, both with regard to the peculiar situation of the two already for some time in the gallery at Trafalgar Square, and the rest of his works, have been set aside by the Court of Chancery, and all his remaining pictures are now at the absolute disposal of the Government. Not above half of these great works were accessible in his own gallery at 47, Queen Anne Street. But now that they are public property, it is to be hoped that the suitable gallery not only for the Turner pictures, but for all the other national pictures, will be no longer delayed.

Of the value of the Turner bequest the public may form some notion from the pictures already exhibited at Marlborough House, but of its ultimate importance and extent it is, as yet, impossible to conceive an adequate idea. It consists of upwards of a hundred finished oil pictures, comprising most of Turner's greatest works, and some of the noblest specimens of landscape-painting in existence, besides many thousand sketches, including hundreds of valuable drawings.

After the enthusiastic writings of Mr. Ruskin,

the public is perhaps prepared for any commendations of the genius of Turner; and if the quality and objects of Mr. Ruskin's encomiums on Turner's works may be sometimes questioned, the public will perhaps now admit that, in quantity at least, there has been no exaggeration; for these works are of such surprising power that they cannot be too highly rated. We many of us imagine that we are well acquainted with Turner, and that whatever mistakes others may make as to the exact character of his genius, and the relative value of the pictures exhibited during the last ten years of his life on the walls of the Royal Academy, that we have come to no false conclusions; and, from the vivid memory of previous exhibitions, know exactly what relation these last works bear to those of his more efficient time. But there is delusion even here: Turner was an exhibitor at the Royal Academy during the life-time of Sir Joshua Reynolds, and the best of memories can but do him imperfect justice. Some of his greatest works are his earliest, and some of these he never parted with, and they were not to be seen even in his own gallery.

Turner's contributions to the Royal Academy exhibitions extend over a period of sixty-one years, from 1790 to 1850, both inclusive; and, in the hundred pictures now bequeathed to the nation, we have admirable specimens of every time.

Before reviewing the individual specimens of the Turner bequest, *seriatim*, it may be well to premise that Turner has painted in four different styles; if we separate his imitations of Claude as a distinct style; with this exception his career was much the same as that of all other distinguished painters; and his *rise*, *maturity*, and *decline*, are most distinctly and broadly marked. His first style occupied him, at the same time displaying a constant enlargement, for nearly a quarter of a century—from about 1790 until about 1814. To this period belong many of his greatest works, as 'Calais Pier,' 'The Shipwreck,' 'The Garden of the Hesperides,' 'Frosty Morning,' &c.; but these are all in a style or styles the world was already familiar with. His emulation of Claude engrossed his attention for about five years only, from 1814 until 1819, or until his visit to Italy; his third and great style of genuine originality, that which really distinguishes him, was persevered in from his first to his third Italian visit, or from about 1820 until about 1840, when he commenced to indulge in those extraordinary vagaries and experiments with effects of light and shade and colour, which have induced such antagonistic opinions in the Art-world, not only as to his merits, but as to his sanity even; yet certainly the great qualities of his finest masterpieces, as regards light and shade and colour, are frequently reproduced in these singular vagaries of his latter days: they are at least the ghosts of great pictures, if not the realities. Among the hundred pictures or so, now added to the National Gallery, there are good examples of all his styles and periods. Turner was only twenty-six years old when he became a member of the Royal Academy; we find the initials, R. A., first against his name in the Exhibition catalogue of 1802, until then he had produced no striking work in oils, but he had already shown a masterly facility of execution. Previous to this time he was chiefly a water-colour painter; his drawings were highly finished but cold in colour, and he exhibited, for the most part, views of ruins and other architectural subjects; his early sketches of this class of subject, whether in simple lead outlines, or in colour, are exceedingly happy.

This first period, then, until 1802, we may look upon as his period of development, when he was acquiring his technical facilities.

There are twelve oil pictures of this period in the national collection, viz. :—

1. 'His own Portrait.' Bust, front face, painted when he was about five-and-twenty years of age; freely handled, much in the style of the portraits of that day, with a great abundance of cravat: it represents a spare but intellectual and enthusiastic looking youth.

2. 'Moonlight, a study at Millbank,' exhibited in 1797. This is a small, careful, and very effective picture, full of truth; it is the earliest of the collection, and has an additional interest when we consider that it was on a spot affording almost this very prospect that Turner chose his last lodging: it is the view looking east from the vicinity of the cottage at Chelsea, near Cremorne Pier, in which he died.

3. 'Landscape with Rainbow.' A dark and ineffective picture, of no particular merit or interest.

4. 'Æneas and the Sibyl.' A cold picture, completely in the style of Wilson.

5. 'Rizpah watching the Bodies of her Sons.' This is more a sketch than a picture, but treated with great vigour of thought, and with some original accessories.

6. 'Cows on a Hill;' 7. 'Landscape with Cattle in Water.' These already show that Turner possessed a thorough qualification to excel in ordinary English landscape, with nothing but the simple accessories of English meadow scenery to recommend it, by the mere powers of observation and the faculty of reproducing what he saw upon his canvas; and that he must have become a distinguished painter, independent of either extraordinary nature or extraordinary imagination: he later exhibited several masterpieces of this class. 8. 'Mountain Scene with Castle.' 9. 'View in Wales.' 10. 'Small View of a Town.' 11. 'Study of Trees on Clapham Common;' and 12. a 'Small Sea-Piece.' In all of these great mastery of execution is displayed, much in the style of Wilson, but with less manner of handling and more truth of colour than is seen in Wilson's ordinary works; the Small Sea-Piece shows equal mastery in that branch of Art, and beyond which, in mere manipulation and effect, nothing further can be desired.

In 1802 his additional honours appear to have made Turner more ambitious in his subjects; full-length canvases were, from this time, not uncommon, and the water-colour drawings ceded to oil pictures. There was no change in style yet, but his subjects were of a rarer character, much more imaginative, and executed on a much greater scale. This period, extending from 1802 until about 1815, is, by some, considered his most vigorous and his greatest, but he was not always equal; some of the pictures exhibited during these years are quite insignificant, and this is partly to be attributed to his fancy for emulating every new star that arose, or every variety of Art which for some cause or other enjoyed more than an ordinary share of popularity at the time. We thus find Turner occasionally imitating Wilson, Gainsborough, or Ruysdael; Sir Joshua Reynolds, Titian, or Wilkie; Teniers, Claude, or the Ponsins.

13. 'The Tenth Plague of Egypt,' 1802, is a large work in the style of Wilson, but with warmer colour.

14. 'Jason in search of the Golden Fleece,' also of 1802, is a smaller work similar in style. The time chosen appears to be night, when the serpent lies drugged to sleep by the charms of Medea, and Jason is seen in the act of stealthily passing by the terrible guardian of the object of his search.

15. 'Calais Pier—Fishermen putting to Sea—the English Packet arriving,' 1803, is more original; it represents a stormy sea, and a heavy, lowering sky, and is the first of his truly great sea-pieces in which he has dis-

played powers of observation and representation that could treat the most exceptional scenes with as much facility as the most ordinary; it is great in colour, and is, in every respect, a remarkable work of art, probably without a rival of its class, even among the works of Turner himself. To show his extraordinary versatility, in this year also, 1803, he exhibited—16. 'A Holy Family,' in emulation of Sir Joshua, or the Venetians.

17. 'The Destruction of Sodom;' 18. 'Mountain Torrent;' and 19. 'The Shipwreck,' 1805, are all good specimens of his great style of this time.

The Shipwreck is likewise a work of surprising power, sombre in character, and painted with great solidity; the vast wreck is seen in the distance, still crowded with human beings, and in the foreground various fishing-boats with their bold crews, tossed about by the raging sea, are endeavouring to approach the labouring ship, and rescue the unfortunate voyagers from their imminent fate. The coloured sail of one of these boats has the effect of enlarging the scene and throwing the wreck back. This picture has been engraved by Charles Turner and by John Burnet, but neither print approaches the terrible effect of the picture. It was never exhibited, it was purchased by Sir John Leicester, afterwards Lord De Tabley. Turner shortly exchanged it for the 'Sun rising through Vapour,' which he afterwards repurchased at the sale of Lord De Tabley's pictures, in 1827.

20. 'The Goddess of Discord in the Garden of the Hesperides,' 1806, is another of Turner's grandest works; and in this he appears to have been emulating, and has surpassed, the Ponsins; the figures are admirable, equal to anything of the class that the English, or any other school, had then produced: and the huge dragon, lying his whole length on the summit of a lofty rock, of which he appears to be a part, is equally grand in conception and in execution.

21. 'Blacksmith's Shop,' 1807. A small picture sometimes called 'The Forge,' and about which is told an absurd anecdote without any truth, with reference to Wilkie's 'Blind Fiddler,' near which it was placed in the exhibition.

22. 'The Sun rising through Vapour,' 1807, already hanging in the National Gallery, Trafalgar Square, and one of the finest of the painter's early works, in which he has shown his thorough perception of the characteristics of English coast scenery.

23. 'The Death of Nelson,' 1808, a large picture; the moment chosen is when Nelson has just fallen on the quarter-deck, and is being lifted up to be carried below. The composition of the many great canvases in this difficult subject is managed with extraordinary skill and effect.

24. 'Spithead—Boat's Crew recovering an Anchor,' 1809. Another of his large and fine sea-pieces, resplendent with daylight.

25. 'The Garreteer's Petition,' 1809. A small unimportant picture, except for the treatment of lamplight, after the manner of some of the Dutch painters.

26. 'Greenwich Hospital,' 1809. An exact view of the Hospital from the park, with a distant prospect of London and the river; all admirably defined and disposed.

27. 'St. Mawes,' about 1809; 28. 'Abingdon,' about 1810; and 29. 'Windsor,' of the same period. All these simple English views displaying something of the manner of Callcott, with an approximation to the warmth of colouring of Turner's second period. 30. 'A Ruin—perhaps a Welsh Castle—with Cattle in Water,' about the same time, is still warmer in tone, and more free in execution.

31. 'Apollo killing the Python,' 1811. In this work we have a more decided development

of that vigorous imagination which is one of Turner's chief characteristics. The monster in his last gasp, having—irritated by the pain of the arrows of the god—with his huge talons, destroyed himself, extends the whole length of the canvas, while the diminutive god, with his little quiver of arrows, occupies but a small corner of the composition: the foreground is blackened with the gore of the dragon.

32. 'Cottage destroyed by an Avalanche,' about 1812. This also is an example of choice selection and imagination, as well as another very forcible proof of the painter's astounding powers of observation and representation. The scene is a snow-storm in the Alps, an avalanche of countless pieces of ice mixed with snow has broken away a mass of rock which has fallen upon a devoted cottage, but the only sign of life indicated is that of a scared cat springing from among the ruins.

33. Another 'Snow-Storm—Hannibal crossing the Alps,' 1812. A lurid sun is seen behind the driven storm of snow, in which the Carthaginian army is threatened to be overwhelmed.

34. 'Kingston Bank;' and 35. 'Frosty Morning,' 1813. Two charming English scenes of an ordinary character, with appropriate figures and other accessories perfectly rendered, more especially in the 'Frosty Morning,' one of Turner's most charming works.

36. 'The Deluge,' 1813. Sketchy, and among his inferior works.

37. 'Dido and Æneas, or the Morning of the Chase,' 1814. Carthage is seen in the background, and in front is a long procession of the Carthaginian court, prepared for the chase. This is one of those pictures painted in emulation of Claude. It has been engraved. This rivalry of Claude, however, does not appear to have been natural with Turner; he seems to have been driven to it by the representations and criticisms of Sir George Beaumont, who had great influence at the time, and who was so great an admirer of Claude that he could not, apparently, do justice to his own countrymen. The fashionable laudation of Claude, much at the expense of all other landscape-painters, seems to have made a lasting impression upon Turner; he entered the lists vigorously; already, in 1808, he commenced to publish a series of sketches called the "Liber Studiorum," in rivalry with Claude's "Liber Veritatis," and certainly, in comparison with these select compositions, the sketches of Claude appear puerile and worthless; but, in justice to the French painter, it must be admitted that while his sketches are but simple mementoes of pictures without selection, Turner's are studied designs executed in express rivalry. He was engaged many years in preparing this remarkable series of prints, some of which he engraved with his own hand. The original drawings are the property of the nation.

38. 'Apuleia in search of Apuleius,' 1814, is another of Turner's Claudes, painted as a companion to the Petworth picture—and this is the nearest of his imitations.

39. 'Bligh Sand, near Sheerness—Fishing-boats Trawling,' 1815, is a beautiful sea-piece in his own original manner, showing that his Claudes were not painted from any natural impulse of his own taste, but by an extraneous influence. Sir George Beaumont wished to buy this picture, but Turner refused to sell it to him.

40. 'Crossing the Brook,' 1815; 41. 'Dido building Carthage,' also 1815; and 42. 'The Decline of Carthage,' 1817, are three more in the Claudesque style, and almost the last he painted. The sky in the 'Decline of Carthage' is one of his grandest efforts. He seems to have executed these works in order to show, in spite of the opinion of Sir George Beaumont, how easy it was to make Claudes. In the opinion of many besides himself he signally

succeeded, and has infinitely surpassed Claude in his own style. Turner appears to have been anxious that the world generally should take this view, by making provision in his will that 'The Sun rising through Vapour,' and 'Dido building Carthage,' should be hung between two of the best Claudes in the National Gallery—that is, a picture in his own genuine style, and one of his Claude imitations. Some may think this simply vanity, but it was rather the vigorous self-assertion of a conscious and powerful mind. Of the two pictures, 'The Sun rising through Vapour' is on many accounts to be preferred.

43. 'The Field of Waterloo,' 1818. Sketchy and inferior.

44. 'Orange-Merchantman going to Pieces,' 1819. This is a beautiful daylight picture of a wreck on the bar of the Meuse, in which there is no trace of Claude—he has now returned to his own genuine style.

45. 'Richmond Hill,' 1819, representing a fête on the Prince Regent's birth-day. This, if it has no other distinction, is at least one of Turner's largest works: it represents a view of the Thames from the hill, and contains some fine foliage; but it wants the natural simplicity of his earlier, and the refined poetry of his later, works.

In 1819 Turner visited Italy, and this visit constitutes the turning point between his first and second styles—for his imitations of Claude, painted simultaneously with some of the most characteristic of the works of his earliest manner, need scarcely be classified as a distinct style. They, however, come justly into the category of a transition style between his English and Italian works.

Turner appears to have been completely fascinated by the brilliant atmosphere of Italy; and, being so strongly impressed with this natural beauty, it was a matter of course with him to reproduce it in his art. Atmospheric effects, however, being of a general character only, and even interfered with by any special individualising of objects, we find that, as a necessary result, Turner from this time devoted his efforts to the production only of general effects. This constitutes the chief distinction between his earlier and later styles. At the same time, the generalisation of effects led to the generalisation of subject, and his pictures became of a strictly generic class.

The first of the great works of this period is 46. 'Rome from the Vatican,' 1820, painted at Rome; in which Raphael is introduced, supposed to be preparing the designs for his decorations of the Loggia, some of which are represented as complete, and introduced with great mastery. This is a large picture, of the same dimensions as 'Richmond Hill,' exhibited in the previous year; they are the two largest pictures in the collection. The view of Rome is slight, but effective; the accessories of the foreground—a portion of the Loggia, in which the Fornarina, and many objects of Art are introduced—is not so happy. This picture was exhibited also at Rome.

47. 'Rome, the Campo Vaccino,' with a fine view of the Arch of Titus; about 1820.

48. 'The Bay of Baïæ, with Apollo and the Sibyl,' 1823, is another of these great Italian works, and in this instance a magnificent masterpiece, with a view of the sea and distant shore perhaps unparalleled in Art, fully realising the well-known encomium of Horace:—"No bay in the world outshines the pleasant waters of Baïæ:"—

"Nullus in orbe sinus Bais præluet amenis."

In this picture are two of those beautiful pines of which Turner appears to have been very fond: in this instance the trees are carefully elaborated, and the effect of these is exquisite, independent of their value in throwing

back the more distant bay, which the reality alone can surpass. The two mythological personages are not very intelligible; but ruins of the locality, introduced in the foreground and middle distance, add value to the picture and give interest to the scene: and to this ancient world the modern is added by the activity apparent among the boats on the beach, and a shepherd-boy with his flock on the hills to the left. By the very skilful colouring of the foreground the attention is instantly directed to the middle distance, which is the essential portion of the composition, and is considerably faithful to the character of the locality—a fidelity which Turner did not always care to observe: provided he caught the generic truth of a scene, he was commonly indifferent to the individual truth—accuracy of detail.

49. 'Carthage—Dido directing the Equipment of the Fleet,' 1828. A large picture, painted conditionally for Mr. Broadhurst; but it did not give satisfaction, and was declined. It is much inferior to the other two pictures of Carthage already noticed.

50. 'Scene from Boccaccio,' 1828, commonly called 'The Birdcage.' Turner called it, in the Academy Catalogue, 'Boccaccio relating the Story of the Birdcage;' but no such story is to be found in the "Decameron." The scene is a shady glen, with pleasant slopes, and many figures lounging about and in conversation; at the distant extremity is a view of a white castle, which reminds of the lines of Du Fresnoy, illustrated by another of Turner's pictures:—

"White, when it shines with unstained lustre clear,
May bear an object back, or bring it near."

This picture also reminds of Thompson's "Castle of Indolence," and of the compositions of Stothard. The execution is slight, but the colouring and the glimpses of sunshine are agreeable. A birdcage,—a prominent object,—which is lying on the grass in the foreground, appears to have suggested its title in the first instance, though no story of a birdcage is told by Boccaccio.

51. 'Ulysses deriding Polyphemus,' 1829. This is one of Turner's greatest works, full of the true poetic or creative power, and thoroughly worthy of the passage in Homer's "Odyssey" which it illustrates.

52. 'The Loretto Necklace,' 1829. An Italian landscape of rich, warm colouring, with a picturesque view of a part of the sacred city on a high hill to the right: the sloping bank is covered with an olive plantation, of which the cool green tints contrast finely with the warm tints around. The necklace appears to have been placed by a young shepherd on the neck of a girl seated by his side under the shade of tall trees of an arbitrary description, something of the character of the pines Turner was so fond of introducing in his Italian pictures.

53. 'Pilate washing his Hands,' 1830, is one of those extravagant compositions which chiefly distinguished the later years of his life—much light and much colour, but little individuality otherwise.

54. 'View of Orvieto,' 1830, a charming Italian scene, with, however, somewhat of more of vagueness in the atmosphere than is characteristic of Italian scenery at any season. This picture was painted in Rome in 1829.

55. 'Caligula's Palace and Bridge,' 1831. A large picture, similarly arbitrary in its treatment of atmosphere, and of an imaginary ruin, designated Caligula's Palace.

56. 'Vision of Medea,' 1831, painted in Rome in 1829. Such is the title this picture bore in the Royal Academy Catalogue of 1831. It is one of those illustrations of his "fallacies of hope" which formed Turner's subject so frequently in the later years of his life; whether the picture illustrated the verse, or the verse the picture, is immaterial, but the latter was no doubt more frequently the case. This is a

large but slight picture, gorgeous in colour, and belongs to Turner's occasional fanciful subjects from classical mythology. The incident is arbitrary; the lines in the catalogue that profess to explain it are:—

"Medea,
Inferiate in the wreck of hope, withdrew,
And in the fire'd palace her twin off-spring threw."

Medea is performing an incantation—she has destroyed her children—she is on the left, raising a small snake with her wands; to the right are the Fates and the serpent which guarded the Golden Fleece, with other accessories: the figures are large.

57. 'Watteau Painting;' 58. 'Lord Percy under Attainder,' 1831. Two small pictures,—slight figure sketches,—both exhibited with the Medea; the former in illustration of Du Fresnoy's Art of Painting, as already quoted.

59. 'Childe Harold's Pilgrimage—Italy,' 1832. This great work is in illustration of the following well-known lines of Byron's great poem:—

"And now, fair Italy,
Thou art the garden of the world, the home
Of all Art yields and nature can decree—
Even in thy desert what is like to thee?
Thy very weeds are beautiful, thy waste
More rich than other climes' fertility;
Thy wreck a glory, and thy ruin graec'd
With an immaculate charm which cannot be defaced."
Canto iv., 26.

The choice of subject is a grand one, and the picture is fully equal to it; but we do not find that careful execution and individuality that distinguish some of Turner's earlier works; the treatment is general, and the execution is free and original. Turner was now beyond all conventionalities. Byron's lines suggest many beauties and peculiarities, but all, and some others, are concentrated in this remarkable landscape. Those who have seen this picture will better comprehend the beautiful descriptions of nature which abound in Byron's "Childe Harold" than they did before: Italy is placed before them, ancient and modern—the ancient as a memory only, in the decay of centuries. The time is evening, the sun is going down beyond the mountains, but it still shines upon the glorious wreck and ruin of the past, and the indolent pleasure-loving life of the present Italy: the mediæval town and convent are likewise there. It is profanation to speak of colour before such a picture—the Italian air, land, and water, all are palpable—the foliage, the rich fruits, the gay costume of the peasants, the fascinating out-door life, feasting, dancing, love, and jealousy.

60. 'Shadrach, Meshach, and Abednego,' 1832. This is one of the earliest of those prismatic displays which delighted the painter's later years: it is a contrast and a contest between fire-light and day-light, and the subject was well chosen for such a display. There is, however besides, much poetic grandeur in the composition.

61. 'Apollo and Daphne,' 1837. The scene is a beautiful Greek valley, and the fate of Daphne is typified by the greyhound pursuing a hare in the foreground.

62. 'Regulus leaving Rome,' 1837. This was painted and exhibited at Rome in 1829, and appears to have been done in the same spirit of self-assertion which caused him to paint his imitations of Claude, exhibited in England some fifteen years previously. This is a golden Claude, with the indistinctness or want of the definite which henceforth generally characterises Turner's works in matters of detail.

63. 'The Parting of Hero and Leander,' 1837. A large sketchy composition, but with much grandeur of treatment; the "wild Hellespont" promises but too certainly the impending doom of the bold lover.

64. 'Phryne going to the Public Bath as Venus,' 1838. This we must assume to be

another representation of Greece; the landscape is exceedingly rich, and the baths indicate the utmost splendour and luxury of architectural display. This picture is in its spirit analogous to the 'Childe Harold'—the one representing Italy and the other Greece. In the crowd of figures we have, on one side, the philosophy and pedantry of the Greeks in Demosthenes taunting Æschines; and on the other, in the gorgeous procession of undressed women, the extreme licentiousness of Greek morals. The figures in this picture contrast strangely with those of the great picture of 1806, 'The Garden of the Hesperides;' but the difference in his treatment of figures at this time is not greater than that of the treatment of his landscape at the respective periods.

65. 'The Fighting Temeraire tugged to her last Berth to be broken up,' 1839. This is a work somewhat similar in character to the 'Ulysses and Polyphemus;' it is a modern counterpart to that grand composition, and, as treating a popular incident of our own time, it perhaps necessarily appeals much more effectually to our sympathies. Our great painter has in this picture attained to the sublime in effect and sentiment, and perhaps in composition also—on one side, the setting sun and the small dark buoy, on the other, the huge old ship of the line, towed by the little black steam-tug; the cool distance is crowded with life and interest, and the gold and crimson sky is such a sight as one cannot behold in nature without regretting its extremely transitory character—Turner has grasped it, and fixed it for the constant delight of generation after generation.

66. 'Ancient Rome—Agrippina landing with the ashes of Germanicus,' 1839. This is a restoration of the eternal city—the triumphal bridge and the palace of the Cæsars restored. It is painted with the same palette as the 'Temeraire;' and, like it, is among the last of Turner's careful works, as regards the ordinary, or even the possible. With Turner the 'Temeraire' seems to have marked the line between the sublime and the ridiculous. From this time for about ten years we have, with exceedingly few exceptions, little more than prismatic objects, or an infinite variety of indefinite objects, displayed in all the colours of the rainbow.

67. 'Heidelberg,' about 1840. Represents a merry-making, apparently in the grounds of the picturesque old German schloss at Heidelberg, which is most fancifully restored.

68. 'Bacchus and Ariadne;' and 69. 'The New Moon,' 1840, are both of the character just described; 70, 71, 72, three views in Venice, are similar in character, though the first, 'The Bridge of Sighs,' 1840, has some justifiable pretensions to individuality; it is an illustration of Byron's well-known lines:—

"I stood in Venice on the Bridge of Sighs,
A prison and a palace on each hand;
I saw from out the wave her structures rise,
As from the stroke of the enchanter's wand."

73. 'Steamer in a Snow-Storm;' and 74. 'The Burial of Wilkie by Torch-light in the Bay of Gibraltar,' 1842, are, though slight as pictures, grand poetic conceptions. 'The Burial of Wilkie' is a noble contribution towards the memory of that painter; it is a great monument that will for ever move the sympathies of the spectator; such works as this show that Turner was much besides a great painter, if it be allowed at all to define any limits to the capacity and apprehension of a truly great painter.

The following pictures are complete illustrations of what is objectionable of Turner's work, allowing them a full share of the special merits which unquestionably belong to his latest works, but which will necessarily always be variously estimated by various tastes; and if a few may be found who unhesitatingly commend such Art, there are certainly infinitely more who as unhesitatingly condemn it:—

75. 'The Exile and the Roek Limpet,' 1842. This is Napoleon at St. Helena: his fate typified in the rock limpet.

76. 'The Opening of the Walhalla,' 1843. A vague dream, bearing not the slightest resemblance to the original—the temple of Fame raised a few years ago on the banks of the Danube by the late King of Bavaria, Ludwig I., to all the great sons of the German race.

77. 'A View in Venice,' 1843; 78. 'The Sun of Venice going to Sea,' 1843; 79. 'The Evening of the Deluge,' 1843; 80. 'The Morning after the Deluge, or, Moses writing the Book of Genesis,' 1843. The last two he called also Shade and Darkness, Light and Colour.

81. 'Rain, Steam, and Speed,' 1844; 82. 'Port Ruysdael,' 1844. A ship in a stormy sea, with a jetty to the right, which Turner has called Port Ruysdael in testimony of his admiration of the ability of that painter.

83. 'Van Tromp going about to please his Masters—Ships a Sea—Getting a good Wetting,' 1844; 84. 'Approach to Venice,' 1844. This a beautiful luminous little picture, illustrating Rogers' lines:—

"The path lies o'er the sea invisible," &c.

85, 86, and 87, are three more views of Venice, indefinite, 1845; 88, 89, and 90, 'Whalers,' 1845 and 1846; 91. 'Queen Mab's Grotto,' 1846, a real fairy composition in conception and gorgeous colouring.

92. 'Undine giving the Ring to Masaniello;' 93. 'The Angel standing in the Sun;' 94. 'Tapping the Furnace,' 1847. The next four, of the year 1850, are the last pictures exhibited by Turner:—95. 'Æneas relating his Story to Dido;' 96. 'Mercury sent to admonish Æneas;' 97. 'The Departure of the Fleet;' and 98. 'The Visit to the Tomb'—all prismatic vagaries, only turned by their titles into puzzles.

99. 'Richmond Bridge,' and 100. 'The Battle of Trafalgar,' are early works, apparently never thoroughly completed.

The unfinished works are as numerous as the finished works; but the great majority of these are mere beginnings, that can be of little use or little interest to either artist or amateur. Among the most remarkable of these unfinished pictures is a large and striking composition of 'A Fire at Sea'—a terrible subject, worthy of Turner's powerful pencil; it is the war of the elements: to the right, the fire of the ship reaching to the water; to the left, the raging storm; and in the centre the terrified and devoted passengers crowded on rafts, between the fire and the storm, alternately drenched by the one and scorched by the other; fire rains upon them from above, and the waves are opening to engulf them below.

A 'Harvest-Home,' in the manner of Wilkie; 'Petworth Park;' 'Chichester Canal;' and 'A Mountain Glen,' are also among the unfinished works which will interest artists as much, or more, even, than the majority of the finished pictures.

Among the numerous drawings are the originals of most of Turner's published works, and some few of his great water-colour pieces, exhibited formerly in the Royal Academy—as 'Edinburgh Castle, from Calton Hill,' 1800; 'The Battle of Fort Bard, in the Val d'Aosta,' 1800, exhibited in 1815, &c.

With such an addition as this, but briefly and inadequately described, independently of the other invaluable works of the national collection of pictures, any further delay to find a suitable and worthy gallery for their exhibition and conservation, will be not only a national disgrace, but, if put off from any spirit of factious opposition, certainly a national crime. It is for the public to avert such a consummation, and to celebrate the acquisition of this unparalleled and invaluable gift of an individual by a reception that shall not only be worthy of it, but do immortal honour to it.

HER MAJESTY THE QUEEN.

FROM THE BUST OF J. DURHAM.

THIS beautiful example of portrait-sculpture was a gift to the Corporation of London, from Alderman Sir F. G. Moon, at the termination of the year of his Mayoralty: it now ornaments the Council Chamber of the Guildhall—a memorial of the liberality of the donor no less than of his loyalty: a more worthy present could not have been offered to the acceptance of the Corporation. One cannot feel surprised that the desire of Sir Francis to commemorate his year of office should take the form it has done: his long and intimate association with the Fine-Arts—one particular branch of which being the chief source whence he derived his wealth and the position he attained among his fellow-citizens—would naturally incline him to make them the medium of his wishes; while, independent of any proper feeling of loyalty to his Sovereign, Her Majesty had conferred upon him the title he now enjoys, as an especial mark of honour under peculiar political circumstances; and hence an additional motive why the gratitude and respect of the subject should be thus expressed.

Her Majesty honoured Mr. Durham with several sittings for the execution of this work, which is certainly among the best of the numerous similar productions that have been presented to the notice of the public: the head and bust are well modelled; the face presents that combined expression of dignity and sweetness which is at all times natural to the Queen, but especially so when any particular incident or circumstance calls forth peculiar animation. It may appear to some that the general contour of the head and features is too large and massive, but sculpture almost invariably produces this effect—any one who has compared a bust with the living model will at once see how much larger the former seems than the latter. We remember to have been particularly struck with this false idea of unnatural largeness of form in the bust of a friend of ours, by one of our most eminent sculptors, and could not be reasoned out of our belief till we had measured the work of the artist and the *perieranium* of our acquaintance, and found both of exactly corresponding size. A picture never produces this visual illusion—one that, we think, can only be accounted for by the painting being on a flat surface, whereas the bust stands out a solid mass, rendered more ample because the eye has neither colour nor accessories of any kind to act as a "relief" to its proportions.

During the last year or two we have had occasion to notice, and we have done so with exceeding pleasure, the impulse given to the art of sculpture by the Corporation of London: the sixteen statues already executed or in progress for the Mansion House, the Wellington Monument in the Guildhall, and Durham's royal bust, are promising evidences of an earnest desire on the part of our commercial magnates to add to the Art-wealth of the Metropolis. Let us hope that the spirit of the merchants of ancient Venice, the guilds of Antwerp, Bruges, and other cities in the Low Countries, will still further animate our mercantile community, both in London and elsewhere. It is a great mistake to suppose that the Fine-Arts have no relative commercial advantages—that pictures and statues are only objects to be looked at and admired; if they were nothing else, they would still be worth collecting, even—

"Where merchants most do congregate;"

for they attract visitors from everywhere, and wherever these are, there is always a large increase of individual expenditure that finds its way into the coffers of the resident tradesmen. This is, however, but a sorry inducement to patronise Art, an unworthy argument on its behalf: it has a higher and more ennobling claim on public support, especially in places which, from their commercial character, almost induce in man the conviction that to accumulate wealth should be the end and aim of his life. The contemplation of Art-works ought, and generally does, lead him to look into himself, and reflect that he is endowed with a mind to receive pleasure and instruction from the canvas of the painter and the marble of the sculptor, who labour to little purpose if they fail in producing such results.

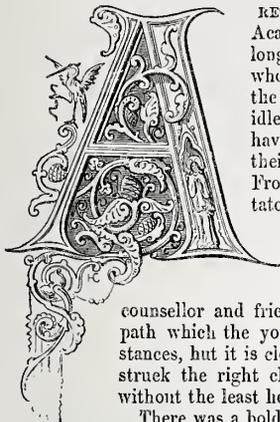

HER MAJESTY THE QUEEN.

ENGRAVED BY R. A. ARTLETT, FROM THE BUST BY JOSEPH DURHAM.

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XXI.—WILLIAM EDWARD FROST, A.R.A.

RETROSPECT of the exhibitions of the Royal Academy during the last twenty years, or even longer, will scarcely fail to remind the visitor—whose object has been to examine and learn what the gallery contained, instead of passing away an idle hour therein—of two artists, whose works have been widely distinguished from those of all their contemporaries: these two are Etty and Frost; the latter the follower, but not the imitator, of the other; for there is no doubt that Frost's introduction, at an early age, to Etty was the means of turning his thoughts into the same channel as that which had so long occupied the mind of his subsequent

counsellor and friend. It would be idle to speculate upon the path which the youth might have followed under other circumstances, but it is clear that the works of the great colourist had struck the right chord of his feelings, and he responded to it without the least hesitation or misgiving as to the result.

There was a boldness in this determination that is not deserving of notice. Etty's choice of subject, and even his manner of treatment, was, and still is, the theme of much unfavourable comment. Barry, Stothard, and Howard, before him, painted the heroines of Greek and Roman mythology, but were more scrupulous in their ideas of propriety than Etty cared to show himself. Frost could not have been ignorant of the rebukes ad-

ministered to him whom he selected as his model, and yet he shrank not from pursuing a very similar course—one that would have deterred a less resolute and enthusiastic mind from entering upon at all. He must have known, too, that his choice would shut him out from a large class of patrons, to whom his pictures could not be acceptable—and, to a young artist, dependent upon his own exertions, such an alternative is almost sufficient to justify a refusal to adopt it.

William Edward Frost was born at Wandsworth, in the county of Surrey, in September, 1810. His father, perceiving in him an earnest desire to become an artist, afforded him every facility for accomplishing such a purpose; and, when his son had reached the age of fifteen, introduced him to Etty, who was then at work upon his great picture of "Mercury interceding for the Vanquished;" the contemplation of which, it may be supposed, settled in the youth's mind his future course of study. Previously to this, however, he had made considerable progress in drawing, through the kind instruction of Miss Evatt, of Wandsworth, a clever amateur artist, and an occasional exhibitor at the Royal Academy many years ago. This lady is, we believe, still living, and, doubtless, has often rejoiced over the success of her young pupil. By Etty's advice Frost was placed in the Art-Academy of Mr. Sass, in Bloomsbury Street, now under the management of Mr. F. S. Cary, where many of our best painters received their early education: here he studied for three years, during the summer months, and also at the British Museum. In 1829 he was admitted student of the Royal Academy. "With the exception, perhaps, of his kind adviser, Mr. Etty," (we are quoting our own words, employed a few years back in reference to Frost), "no living artist ever more fully and eagerly availed himself of the advantages afforded by the lectures and life-school of the Academy; on entering which he commenced his career as a portrait-painter, and during the fourteen years that followed, he painted upwards of three hundred portraits, few of which, however, were publicly exhibited."

More than three hundred portraits painted by a young artist within a period of fourteen years! And, doubtless,—from what we know of his energetic and

CHASTITY.

[J. and G. P. Nicholls.

enthusiastic disposition, veiled as it is under a most quiet and unobtrusive manner,—all of them carefully and conscientiously worked out. Here was practice enough to ensure excellence, even in one less persevering and skilful; and, as we may fairly presume a large number of these portraits were of females, we seem to have in them the foreshadowings of the beautiful images which grace his subsequent ideal pictures. We asked him one day where he met with so many lovely and expressive faces as we frequently see represented on his canvases: his reply was, "Here," touching his forehead. He has, we may be assured, carried with him into the quietude and solitariness of his studio, bright and unfading reminiscences of forms and features that have haunted him from youth.

In 1839 Frost entered his name as a competitor for the gold medal of the Academy, and obtained it—the subject being "Prometheus bound by Force and

Strength;" it was exhibited at the Academy in the following year. Prior to this, however, he had sent, in 1836, a portrait; and, in 1839, two portraits. When the cartoon exhibition was opened in Westminster Hall, he forwarded a drawing of "Una alarmed by Fauns," to which was awarded one of the third-class prizes of £100: there were many competent judges, and among them Haydon, who considered the work entitled to a higher place on the list than it obtained. In 1842 he exhibited, at the British Institution, a small picture,—full of humour and character—entitled "Consequence;" it met with a purchaser. To the Academy Exhibition of 1843 he contributed a picture of rather small dimensions, the subject of which was "Christ crowned with Thorns;" the figure is effectively treated, though too strongly characterised in the drawing by unnecessary anatomical display—a fault originating in the artist's close study in

the "life-school;" it was bought by a lady, who obtained a prize that year in the Art-Union of London, for £60. The following year witnessed the commencement of the series of the pictures that have allied the name of Frost with his friend and prototype, Etty; the first of these, called a "Bacchaulian Dance," was exhibited at the British Institution, and was purchased by the late Mr. Gibbon, of the Regent's Park, and is now, we believe, in the possession of the widow of that gentleman, in whose collection are many other excellent examples of the English school of painting: it represents a number of nymphs and fauns engaged as described; the figures are admirably drawn and most skilfully grouped. A still better work, as to rich and harmonious colouring, is that he sent to the Academy in the same year—"Nymphs Dancing;" it is in the possession of a gentleman of Glasgow.

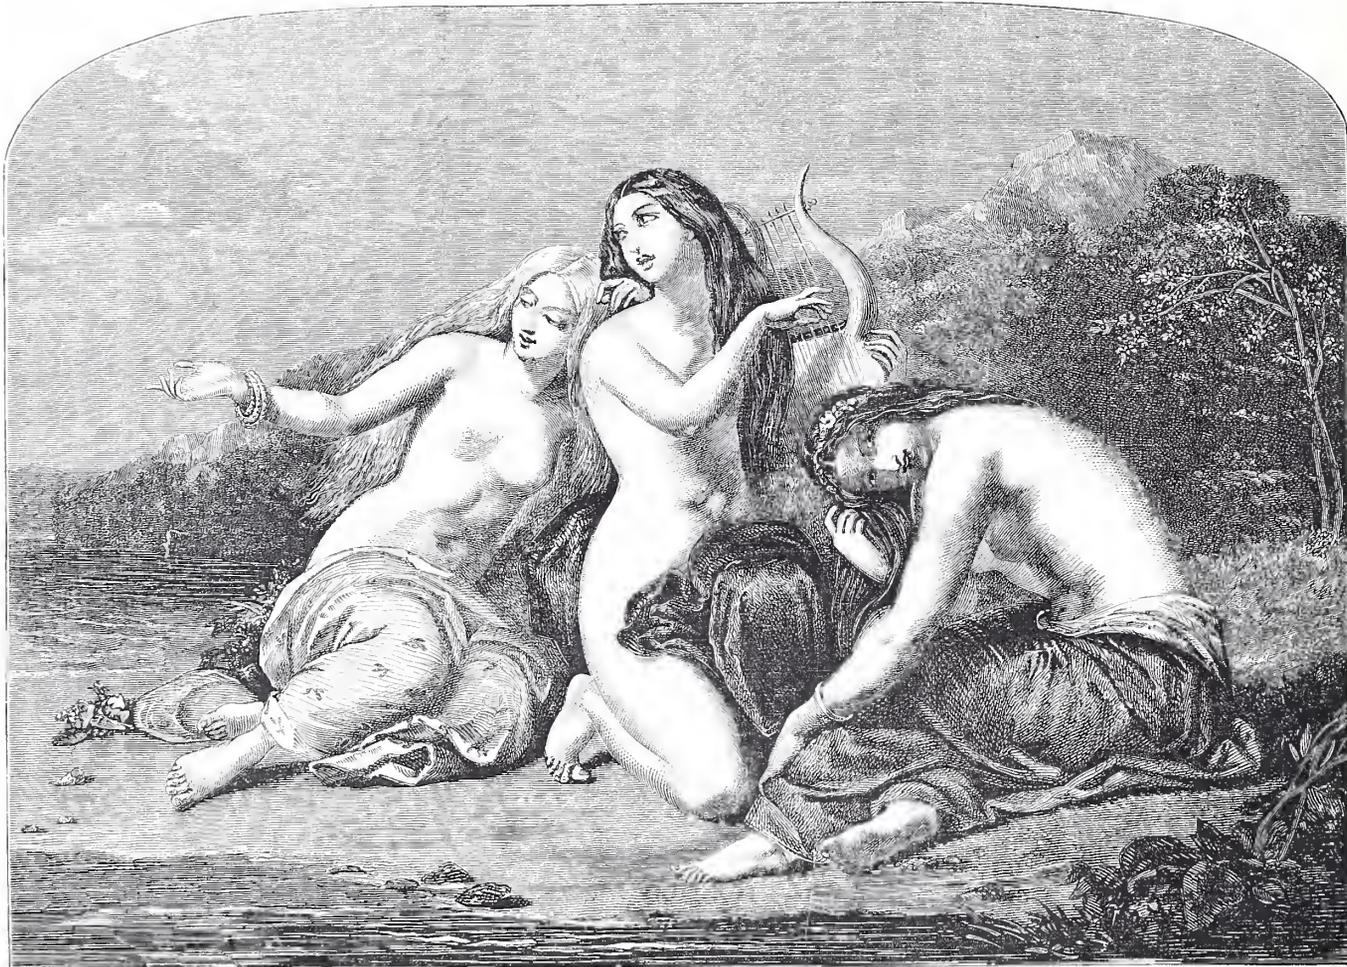

In 1845 Frost exhibited but one picture—"SABRINA," which forms one of our illustrations: it was bought by, and is now in the possession of, the Council of the Art-Union of London, and the large and excellent print, from the *burin* of Mr. Lightfoot, was issued to the subscribers of 1849. The composition is of the highest merit; and all the details show the power and knowledge of the artist in drawing the female figure. We do not think he has ever surpassed this work in purity of feeling and grace of expression. Two other small pictures, painted this year, were "The Ascension," purchased by Mr. Armstrong, of Manchester, and an "Indiau alarmed," by Mr. R. Reeves, of

Birmingham. "Diana and Endymion," exhibited this year at Manchester, was sold to Mr. Wilson.

"Andromeda" is the title of a small picture painted for the Earl of Ellesmere, and sent to the British Institution in 1846: it only represented the daughter of Cepheus chained to the rock, without the assemblage of nymphs who figure in the larger picture of the same subject painted by the artist in 1850. To the Academy he contributed a work of ample dimensions—"Diana surprised by Actæon," replete with fine poetical feeling, exuberant, yet delicate fancy, and masterly arrangement of composition. It was purchased by Lord Northwick. In this year the artist was elected Associate of the Academy.

A little gem of a picture, painted for Mr. Webster, R.A., sparkled on the walls of the British Institution in 1847; it was called "Nymph disarming Cupid;" the "love-god" has fallen asleep beneath a rose-bush, affording a fair opportunity for the nymph to steal his arrow, of which she has taken advantage. The incident is playfully told, and brilliantly executed. His Academy picture of the same year was "Una," a subject from Spenser's "Fairie Queene;" this fine and truly elegant composition was purchased by Her Majesty; but, as it is on our list for engraving among the other "Royal Pictures," we defer any lengthened comment upon it till we are called upon to do so when the print is before us.

"Syrinx," a small nude figure painted with great delicacy, was sent to the

Engraved by]

THE SYRENS.

[J. and G. P. Nicholls.

British Institution in 1848; and "Euphrosyne," a work of considerable dimensions, to the Royal Academy: the latter picture is in the possession of Mr. E. Bicknell, and is described in the account of the "Collection" of that gentleman, which appears in the next succeeding article. Our readers will, perhaps, recollect that, when writing of the "L'Allegro," by Frost, engraved for the January part of the last year, we intimated the three figures composing this group were copied, by desire of the Queen, from the picture of "Euphrosyne."

Another little gem, "A Naiad," was contributed to the British Institution in 1849; at the Academy hung the "SYRENS,"—engraved above,—painted for the late Mr. Andrews, of York; a small *replica* was painted for Mr. Bicknell.

From some one cause or another, which we are not now called upon to explain, our leading painters usually reserve their strength for the Academy, generally contenting themselves with sending to the British Institution a comparatively insignificant production. Thus we again find, in 1850, Frost contributing one of those small, yet charming fancies which he is pleased to paint year after year; this time the little figure was called "Musidora;" it is in the possession of Mr. Creswick, R.A. In the Royal Academy appeared a picture, "The Disarming of Cupid," painted for His Royal Highness Prince Albert; an engraving from it will hereafter be included among our "Royal Pictures," so that we reserve our comments till then. "Andromeda," painted for Mr. M. Carritt, of Birmingham, and exhibited at the same time, represents

that "starred Ethiop queen" chained to a rock, and surrounded by a triton and a group of sea nymphs.

The circular engraving on the opposite page is from a picture exhibited at the British Institution in 1851, and entitled "THE SEA CAVE;" the figure is that of a mermaid, which is "presented in a reflected light, touched here and there with a gleam that tells upon the shaded mass with great power." It was painted for Mr. Alderman Spiers, of Oxford. In the Academy he exhibited this year "Wood Nymphs," painted for the late Lord C. Townshend, at the sale of whose pictures, in 1854, it realised 431 guineas; the subject was suggested by a passage in "Il Penseroso;" it relates no especial incident, but only represents a group of five figures, disposed either in or around a fountain, and painted with the artist's accustomed power in delineating the female form. Another of this year's pictures was "Hylas," painted for Mr. T. Miller, of Preston.

In 1852 we saw two pictures from the pencil of this artist in the British Institution: one—a small nude figure bathing, called "Galatea," finished like a miniature—a *replica* of this work is in the possession of the Marquis of Lansdowne, for whom the artist painted a companion picture, "Musidora." The other a sketch, "Wood Nymphs," differing in treatment from the same subject just noticed, was painted for Mr. R. Sole. In the Academy he had this year three paintings, the largest number to which his name had hitherto been appended: one was simply a female head, probably a

portrait, under the title of "Juliet,"—in the possession of Mr. G. Bassett, of London,—brilliant in colour, and in finish like an exquisite miniature. Nor was the second, "Nymph and Cupid," painted for Mr. J. Eden, of Lytham, scarcely less distinguished by these qualities: the extremities of the figures were proportionately large—it is a rare occurrence, however, to find Frost making a mistake in his "drawing." The third picture, to which the little space still left to us compels only a brief allusion, was called "May Morning," painted for Mr. J. Barlow, of Manchester, suggested by Milton's well-known lines commencing with—
 "Now the bright morning star, day's harbinger."

"The Cool Retreat," painted for Mr. J. Birt, of London, in the British Institution of 1853, is a study of a female figure prepared for a bath, near which she is seated. In this year Frost was absent from the Royal Academy; but in the following year he contributed one of his noblest works—"CHASTITY," engraved on the fifth page: it is a beautiful pictorial rendering of Milton's description, as we find it in the poet's "Comus." The work, now in the possession of Mr. Birchall, of Preston, is a triumph for the painter, whether it is considered as a picture only, or as the interpretation of pure and exalted sentiment. In the British Institution, the same year, he exhibited a miniature head of Shakspeare's "Ophelia," and a small *replica* of the "L'Ailegro," in Her Majesty's Collection—both of them commissions from Mr. Bassett; and, in 1855, another of his elegant Lilliputian figures in the character of a "Sea Nymph," in the possession of the Duchess of Sutherland. The Royal Academy Exhibition of that year contained three pictures by the subject of this notice:—a study of a young girl, apparently in deep meditation, called

"Il Penseroso;" another, "Wood Nymphs," a miniature in oils; and the third, "A Bacchante and young Faun dancing," painted with acknowledged power, rich in colour, and unexceptionable in drawing; but the subject not so agreeable to our minds as others. It is the property of Mr. Gambart.

The last year showed Mr. Frost's pencil to be more productive than ordinarily; we can only enumerate the works he exhibited. At the British Institution, a "Nymph and Cupid," belonging to Messrs. Lloyd; and, at the Academy, "The Graces"—bought by the Glasgow Art-Union,—"A Nereid," "A River Nymph," and "Bacchantians," the last purchased by Mr. T. Freebairn, of Manchester: they are all of so recent date as, we should suppose, to be fresh in the memory of all who visited the respective galleries.

Looking back to the titles of the pictures we have enumerated, it will be clearly manifest to the reader that Frost has limited himself exclusively to one range of subject; but of this he has made himself a perfect master. Less ambitious than Etty to appear as a great colourist, or rather, less lavish of his pigments, and less daring in their application, he is not less true to nature; while, in drawing, in delicacy of feeling, and in beauty of feminine expression, he not only far surpasses his prototype, but is unequalled by any artist of our school, if we consider the variety of heads placed on his canvases. We should like to see him leave allegory for a time, and try his skill in historical painting: with such powers as he possesses he could scarcely fail; while the opening up of a

new pathway to fame would offer a fresh impulse to his energies. Whether he do or not, we are assured he will not mistake our meaning, nor think us weary of his beautiful nymphs, either of wood or water, inhabitants of the pleasant groves of Arcadia, or dwelling in cool sea-caves with the tritons.

SABRINA.

[J. and G. P. Nicholls,

We should not perform our self-imposed task to our own satisfaction, without adding a word or two concerning this accomplished painter to what has been said of his art, which is that whereof the country has just reason to be proud. All who know Mr. Frost must value his acquaintance, while they

admire his genius; the latter quality will always command the highest respect, but his modesty, gentleness, and amiability of disposition, must, and do, win for him sincere esteem everywhere, and from everybody. A painter's works are often a key to his personal character and disposition; they are so here.

VISITS TO PRIVATE GALLERIES OF THE BRITISH SCHOOL.

THE COLLECTION OF ELKANAH BICKNELL, Esq.,
AT HERNE HILL.

THE galleries of native art that are in progress of formation in these Kingdoms constitute a remarkable feature in the Art-history of our time. The vein of patronage to which we are now about to do justice, in a lengthened series of articles, is that to which our living school of artists owe their prosperity. The day has passed when no painter could live without practising portraiture—we do not hear of a valuable landscape being sold to supply immediate existence. Every artist of acknowledged merit has commissions in advance, and many have engagements which they will be years in executing. All the earlier schools of Europe rose under two great sources of patronage—the Church and the Aristocracy; to the one works of Art were a necessity, to the other a luxurious enjoyment; and both lavished large sums of money on their production, insomuch that these schools, even in their youth, never languished, but grew in strength to a degree of excellence which has never yet been attained in later times. Of these schools we have nothing to say here, save to mention them for the sake of comparison. For centuries they were supported, fostered, and flattered, and their best exertions were rewarded with popular triumphs and processions—each equal even to the celebration of a national victory. As to Art these were our dark ages—neither our church nor our aristocracy promoted painting; there was no intelligence of anything save portraiture; and so, in order that we might enjoy in perpetuity the visages of our noble predecessors, now and then a lone star from some remote galaxy shed its light upon our dark condition; it was now Holbein, then the famous miniaturists by whom he was succeeded—now some Dutch portrait-painter of minor note, then Vandyke, and so on in foreign succession. We were the inheritance of the stranger, until the twilight period before Reynolds arose. To say nothing of fifty years back, who, twenty-five years ago, would have been rash enough to assert that, within a period so brief, we should have a school of our own, the productions of which would in the market be sought in preference to those of earlier foreign schools? Yet so it is; not so much that the earlier and later works of foreign schools are not valued and admired, but that patrons of Art have been so continually deceived by fraudulent dealers that they prefer possessing native Art, genuine and original, to holding works which, when brought to the test of the auctioneer's hammer, realise one twentieth of what had been paid for them.* There are among our aristocracy some munificent collectors; but those who possess galleries are principally inheritors of rich and magnificent heirlooms of the great schools, to which they do not add modern English pictures. For years past we have been surprised at the extent of the sales that have been effected at the different exhibitions—everything of any merit that could be seen has been sold; and often at the end of the season, when inquiring into the proceeds, as nearly as possible from the data we could collect, we have been surprised at an aggregate of thousands and tens of thousands of pounds. It is certain that dealers make very extensive purchases annually; but there are those who purchase from the dealers. In England very numerous collections of British Art are in progress of formation; many of the possessors of these collections we know, but there are also many whom we do not know—but to all those to whom the prosperity of our school is in a great measure attributable, we desire to accord the honour which is so justly their due.

It is a remarkable feature in the history of our Art, that its youth should be protected and advanced mainly by private gentlemen and wealthy merchants, who thus achieve for themselves a distinction equal to that of the merchants of Venice and the princes of Florence. The collection with which we commence our series of notices is that of ELKANAH

BICKNELL, Esq., of Herne Hill, who, in his catalogue, numbers some of the finest productions Turner ever painted, besides very valuable works by Gainsborough, Landseer, Callcott, and others of the most accomplished artists of our own time—indeed, every picture has recommended itself to the taste of its possessor by its merit alone; and, besides the works in oil, there is a numerous catalogue of water-colour drawings, many of them also by Turner, and generally distinguishable as the productions of the best painters in this department.

Mr. Bicknell's collection is not hung in a gallery, but distributed in the reception-rooms of his house, which are well lighted by ample windows opening on to a lawn and extensive grounds. We commence with—

HISTORY, POETRY, AND OTHER FIGURE COMPOSITIONS.

W. DYCE, R.A.—'The Arrow of Deliverance.' To Mr. Dyce is due the honour of originality in his subject—we do not know that it has before been executed in our school. The passage occurs in the thirteenth chapter of 2 Kings, seventeenth verse—Elisha addresses Joash:—"And he said, Open the window eastward. And he opened it. Then Elisha said, Shoot. And he shot. And he said, The arrow of the Lord's deliverance, and the arrow of deliverance from Syria: for thou shalt smite the Syrians in Aphek, till thou have consumed them." The entire interest centres in the action of the two figures—which, in their agroupment, are relieved only by the light wall of the apartment wherein they are circumstanced. The king is on his knee in the act of drawing the bow, and Elisha is seated with his hands raised, and looking earnestly out of the window in the direction which the arrow will take. The composition is unusually severe, as there is an entire absence of accessory; a studied denegation of allusion to the regal state of the one, or the prophetic character of the other. We recognise in Joash a conception gathered from the Nineveh sculptures; but the impersonation of the prophet does not so far depart from classic Art. The person of the king is vigorous, with a well-rounded and youthful development; but that of Elisha is the frame of an aged man not so much wasted by disease as to excite painful emotion in the spectator; this is as it should be. The expression of age in the hands, and of sickness with age in the features, is at once acknowledged. In short, 'The Arrow of Deliverance' is the best production we have ever seen from the hand of Mr. Dyce, and it is to be feared that he will paint no more with the same force and simplicity. His composition in the Robing Room, from the life of King Arthur, making every allowance for fresco, may in comparison with this work be considered a retrogression; and, should he have an opportunity of designing for painted-glass windows, the difficulty of return to the quality of this picture will be yet greater.

W. HILTON, R.A.—'The Triumph of Amphitrite.' This is perhaps the best picture Hilton ever painted. It is really in colour equal to Titian, and in composition superior to the great Venetian's works of this class. What is principally to be regretted is that the shaded passages are so opaque, which arises perhaps from the employment of some waxy vehicle, such as that which destroyed the picture in the National Gallery. 'The Rape of Europa' (in the Petworth Collection) is a light picture—this is dark; and, although Hilton's execution secured in his light passages the utmost brilliancy, and in his dark portions he fails of common transparency, yet this is a more impressive work than the 'Europa.' It is worked up to an exaltation, which, having once impressed the mind, can never be forgotten. Poor Hilton! to whichever of the family of human ills the wise ones of science have attributed thy death, we have ever believed that thou didst die of what the unlearned call "a broken heart." Hadst thou condescended to portraiture, and painted as indifferently as others who have made fortunes, the like, no doubt, had befallen thee, and thou hadst yet been a living man and a "prosperous gentleman."

W. E. FROST, R.A.—'The Sirens.' We have seen the subject variously treated, but rarely, especially by foreign artists, without an *abandon* of voluptuousness, which shows their experience has not comprehended the subduing influence of that refinement of siren-fascination which assailed Uly-

sses. The figures are nude, but theirs is the chastity of the best examples of Greek sculpture. There is a playfulness in their allurements the reverse of intense sensual expression: the qualification of the figures is so successful that they seem to shed the light by which we see them—like the impersonations of stars that have wandered from their spheres. The characteristics described by the names of these ladies—Parthenope, Ligeia, and Leucosia—are faithfully embodied, and their attributes prescribed with an accuracy which would have entitled the artist, in the days of Homer, to the hierarchal honours of the Greek theology. The mechanical art is of the utmost delicacy; the soft texture and luminous tint of the skin surface is an unaffected but triumphant version of living nature. With admirable tact there is nothing shown but the sirens—the "hollow ship" of the wandering king does not appear; and yet these impersonations are no other than the sirens.

'Euphrosyne' is a larger work, full of the hilarious movement, ever inspired by the saltatory measure of the verse:—

"Haste thee, nymph! and bring with thee
Jest and youthful jollity;
Quips and cranks and wanton wiles,
Nods and becks and wreathed smiles."

This picture was exhibited but a few seasons ago, and a group of the principal figures was repeated for Her Majesty's Collection. It is wrought to a degree fully as high as the preceding work, but the means of expression are less limited. We have often admired the skilful disposition of the limbs in this work: if we see but the arms, it is not necessary to see the "twinkling feet" of this mirthful society to know that they are dancing; the arms, the feet, and the heads, are all equally eloquent. We find also here a classic elegance entirely apart from, and superadded to, the individualities which, from ignorance of the antique and a too close imitation of the model, are sure to disqualify studies from the life.

W. ETTY, R.A.—'Venus and Cupid.' A small study of the nude, much like those which Etty used to paint at the school in St. Martin's Lane; it is low in tone, but rich in colour. The figure has been solidly and rapidly finished, as is seen by the downward sweep of the brush the entire length of the limbs.

'A Study of a Boy's Head' is one of the most agreeable children's portraits we have ever seen from the easel of this artist. The hair and the entire character are most picturesque. It is touched with freedom, but the study has tempted Etty to dwell upon it longer than he usually did on such essays.

SIR E. LANDSEER, R.A.—'A Highland Shepherd recovering Sheep buried in the Snow.' The form of this picture, when it was exhibited some years ago, struck us as remarkable. It is a large upright, presenting a section of a snow-covered mountain-side, on which is busied a shepherd with his dogs, in recovering from the deep drift certain of the all but frozen members of his flock. The subject is well suited to the form, the scene being an immediately rising foreground. The stalwart and well-plaided mountaineer has extricated one of the animals, is recovering a second, and his sagacious friend below is entreating his attention to a third which he has discovered. We recognise in the collie a well-educated and intelligent animal—a stranger to the overweening and improbable sentiment which excessively characterises the cynography of the time: to use a favourite epithet of the dealers and stealers, he is a "likely" animal; and the entire incident is of common occurrence on the heathery hens of the far north. To account for its form as an elongated upright, it was painted to hang upon a door. The only two vacant spaces in the room were the doors for which two pictures were to be painted, but this is the only one that has as yet been executed.

SIR C. L. EASTLAKE, P.R.A.—'A Family of Contadini made prisoners by Banditti when returning from a Festa.' This picture was exhibited in 1848, and we remember it perfectly from the impressive richness and brilliancy of its colour. The narrative is simple and perspicuous: the prisoners are the husband and wife, the latter holding a child and having by her side an elder daughter. They are dressed in their gayest holiday attire, which contrasts pointedly with the poignant distress into which their capture has plunged them: their ass stands quietly near them, and they are guarded by one of the band, who watches them narrowly, and,

* It is unnecessary to remind our subscribers that to promote and attain this object has been the great labour of our life; we have lived to see the fulfilment of our dearest hopes—Art-patronage diverted from (so called) old masters into the healthy channel of contemporary Art.

by the glances that he casts toward the elder girl, increases the grief and apprehension of the parents. Of these Italian incidents, which this artist executes with so much grace, we feared we had seen the last, when he exhibited 'The Saviour and his Disciples on the Mount of Olives;' but his recurrence to this kind of subject may, although he paints so little, afford a hope that the series is not yet exhausted. The finish of this work is really marvellously elaborate.

F. GOODALL, A.R.A.—'Raising the Maypole.' This is a smaller repetition of the large picture which was exhibited a few seasons ago in the Academy. The subject is one of the utmost difficulty; but we need not say how triumphantly the artist has dealt with such a variety of dispositions of colour, chiaro-oscuro, and agroupment. The theme is new, and has interest and importance as illustrating a revered popular observance of our ancestors, and thus such material should be regarded as semi-historical. The narrative is extremely circumstantial in its detail, and the impersonations most successfully individualised and characteristically descriptive.

R. S. LAUDER, R.S.A.—'The Lady of Shalot.' This subject was exhibited, we think, two seasons ago. It represents the lady seated in a contemplative attitude, and having her face reflected by a glass. It is most careful in composition—so nicely balanced that its harmony of parts could neither suffer addition nor abstraction. It is one of the most graceful passages of sentiment that we have ever met with.

A. JOHNSTON.—'Sunday Morning.' This picture is well known by the engraving. It represents a Scottish family of cottagers reading the Scriptures, at the door of their home, on a Sunday morning in summer. The results of the direct and reflected lights are shown with much truth.

T. WEBSTER, R.A.—'The Joke:—'

"Full well they laughed, with counterfeited glee,
At all his jokes, for many a joke had he."

'The Frown:—'

"Well had the boding tremblers learnt to trace
The day's disasters in his morning face."

These two subjects, from "The Deserted Village," are also well known from the engravings. The arrangement is so originally simple, that few painters would have ventured to treat such materials, and yet a less number would have succeeded in forming a picture of a straight row of rustic figures without counterbalance. In each case the sentiment of the distich is most worthily maintained: in one all is fun and idleness, and we are invited to play marbles or king's cradle; in the other we had rather eschew the society of these sad students, among whom prevails scourged backs and racking toothache.

'The Impenitent Boy.' He has been expelled from the school-room to a kind of back-kitchen, where he stands—

"Nursing his wrath to keep it warm,—"

having indulged himself in the destruction of some of the crockery within his reach. There is more of shade here than we usually find in the works of this painter. The picture would form a perfect pendant to Landseer's 'Naughty Boy.'

'Good-night.' This presents an interior, the home of an English yeoman, the younger members of whose family are preparing for bed. The children are drawn and characterised with a felicity in which this artist is *unique*. It is a full composition, and all the domestic utilities are most scrupulously represented.

'Boys Quarrelling at Marbles.' A dark picture, with some of the best qualities of the Dutch school. If Jan Steen could have drawn, he might have approached this picture.

C. R. LESLIE, R.A.—'The Minstrel—Moonlight.' This is a small picture presenting a single figure—that of a lady, playing on the lyre at a window, at which the light of the moon is streaming in. It appears here to have been the object of the artist to execute a picture with a minimum of colour, inasmuch that it looks little else but white and black. The lady minstrel wears white, which is brought very forcibly forward by the strong shadows round the figure. The manner of the work—that easy sweeping touch—is as strongly defined here as in Mr. Leslie's larger works.

LOUIS HAGHE.—'The Student.' This is a picture in oil, only the second that we remember to

have seen on canvas by this painter. He is a student of Art, seated in his painting-room, with a blank canvas by his side, awaiting inspiration. He wears the dress of the seventeenth century, and his white collar is a very important item in the account, as being the focus of the minor lights. But we know him not. We should have been happy to have recognised Antonio Vandyke or Diego Velasquez, or any worthy of that time with whom we have a nodding acquaintance; but whomsoever Mr. Haghe may intend him for, we congratulate him on the felicity of his *mise-en-composition*.

T. PARIS.—'A PICNIC.' The scene is a garden composition, elegant in conception, and displaying abundant resource in the construction of this class of picture, the principal virtue of which is that it shall look like a reality.

LANDSCAPE.

J. M. W. TURNER, R.A.—'Palestrina.' When we remember that in Turner's earlier works he celebrated so frequently the sublimities of our northern tempests, we cannot help thinking that Italy must have made an impression upon him more profound and exciting than even he can express on canvas. This picture is not, perhaps, strictly descriptive of the place, but it is an effusion given forth in gratitude to a land which has impressed him with an affluence of the most splendid memories. We are at the bottom of the hill where there is a river and a bridge, and on the right an avenue of trees, having on the left a stately pine, whence—let us but wait till sunset—we shall hear the crickets chaunt their twilight vespers. There are on that hill ruins and wretched dwellings, but, with light and sunshine, all are more lustrous than ever was the golden house of Nero. Considered with respect to composition this hill, with its variety of habitations, is not graceful as a form, nor, perhaps, judicious as a quantity; but it is by no means so arbitrary as it would have been in local colour—as Poussin, or, perhaps, even Claude would have painted it. The name is fraught with the most moving associations—the place is the *frigidum Præneste*, which stood, perhaps, equally high with Tibur and Baie in the estimation of Horace. We see the place from the Capitol, rising within a gap in the far distant hills, over the sites of the ancient cities of Gabii and Collatia, towards the supposed locality of Lake Regillus. This fiery canvas seems to declare that Turner must have seen his Palestrina under such an effect of sunshine. Gladly would we see the sketch from which the picture was painted. To the dreamy repose of this picture, what a contrast is presented in 'Antwerp—Van Goyen looking for a Subject'—where the spectator is placed on the left bank of the Scheldt, opposite to the town. You are oppressed by the idle sultry air of the 'Palestrina,' but enervated by any exertion by the breezy freshness of the 'Antwerp.' Van Goyen is on board of a dogger, which has just tacked, beating up the river in the teeth of a head-wind, that sets a pearly crest upon every wave of the heaving Scheldt. He stands upon the deck, by the helmsman; the boat has just tacked—her mainsail is again full—and her wake trails round before us, here and there broken by the waves. It is all sunshine, and, more successfully than in any picture we have ever seen, the gleam of sunshine sparkles everywhere on the watery expanse. The water-forms—which represent the tide running up against the wind—are made out in a manner unlike any that have ever been adopted to represent a similar incident. The composition is essentially a breadth of light—broken by ships—more or less dark to stimulate effect. But little of the city of Antwerp is seen; the lofty spire catches the sunlight, and although so little of locality is specified, the place is Antwerp, and none else. 'Palestrina' was exhibited in 1830; 'Antwerp' in 1833. Another marine subject, entitled 'Fort Ruysdael,' painted in 1827, exhibits a treatment very different from the breezy buoyancy of the last. It is a startling effect—a chase—a thunder-cloud after a fishing-lugger—both exerting themselves to the utmost. There is a breadth of light on the water, broken by the solitary fishing-craft, flying, under all sail, like an affrighted bird seeking a place of refuge. On she comes, steadily, before a wind that shall soon threaten with the voice of the howling tempest. She seems to grow upon the eye, and while fast around is closing that ill-omened cloud which has

fallen on the sea like a pall, and hung the sky with a drapery blacker than night, high above the utmost ridge of the cloud are shot forth jets of the black vapour, like the arms of a malignant genius impatiently urging on the storm. So affecting is the recital, that the spectator feels but one absorbing emotion. It is true he stands upon the shore, and the boat must soon be safe; but it is felt that if such a squall strike her, she must be at once cast upon the waters in fragments. It is certainly true that the mind may be more profoundly affected by a simple combination, than by a complication, in which the interest is distributed. There is but little colour in the work, and it has the appearance of being an earlier picture than is signified by the date; however, should it have been then painted, it looks more like a reminiscence of some painting that Turner may have seen, than his usual method at this time of rendering his own subject-matter. We have next 'Ehrehrenbreitstein,' and the 'Tomb of Marecau,' a view taken from near the end of the bridge over the Moselle, and comprehending the fortress on the opposite bank of the Rhine. This was exhibited in 1835, and to the title in the catalogue were appended the following lines from Byron:—

"By Coblenz, on a rise of gentle ground,
There is a small and simple pyramid
Crowning the summit of the verdant mound;
Beneath its base an hero's ashes hid—
Our enemy's—but let not that forbid
Honour to Marecau," &c.

It is treated with a flood of light, whereby the substance of all the material is diminished, inasmuch as to communicate to the picture that dreamy character, the very perfection of which Turner has realised beyond all other painters that have ever lived. 'Ivy Bridge, Devon,' and 'Calder Bridge,' are both in his early manner—strong in colour, and individual in locality. There are no dates to these pictures; but they were painted at the time when the painter was in search of material for drawing-lessons, and are full enough of warm colour to have pleased even his friend, Sir George Beaumont. A second Venetian subject is called 'The Giudiceca, Santa Maria della Salute, and Giorgio Maggiore'—it was exhibited in 1841; and here we see Turner amid the splendours of his latter style—light and colour wherever they do not flout the eye: but Turner must have been a visitant to the "City of the Sea" before that famous sumptuary edict of the Podesta, which suppressed the luxurious equipment of gondolas, and legalised a coat of black paint only. 'Wreckers—Coast of Northumberland,' appears to be a scene just south of Bamborough Castle, which, rising on the left, closes the view on that side. The sky is full of drift, and a fierce gale blows off the sea. The wreckers are busied on the sand, appropriating portions of the wreck of an unfortunate ship which a steam-boat endeavours to tow off the shore.

'The Campo Santo, Venice.' Here the principal breadths are the water and the sky—the lights and darks which constitute the zest of the composition being almost entirely adventitious, showing, with a knowledge of effect, how little is necessary to the construction of an agreeable picture. We look from the water to the Campo Santo, which is on the right; and on the left is seen one of those light, graceful small craft, which, with its wing-like sails, resembles rather a butterfly than a boat.

'The Brille on the Maas, Holland.' This picture presents a turbulent sea, bearing a Dutch man-of-war, and some smaller vessels: it is also a broad composition, wherein are distributed, with fine taste, a few points of support for the eye.

SIR A. W. CALCOTT, R.A.—'An English Landscape.' In considering this work we miss at once those local asperities which conscientious painters constitute permanent difficulties in their works rather than be charged with the sin of omission. The eye passes over the canvas, not only without suffering the slightest shock from any incidental indecorum, but flattered by the sensible gratification of a powerfully soothing influence. It is a large upright picture, painted in 1842. The whole of the foreground is flooded by a shallow stream, so stealthy in its movement as not to disturb the prevalent repose, and hither a herd of cows have resorted to cool their hoofs. On the right bank rises a throng of stately trees; the centre opens to distance, and the

rest is supplementary of a corresponding kind, with an accompaniment of the odour of honeysuckle and the hum of bees, now and then superseded by the lowing of the cows—upon which, by the way, Landseer has touched sufficiently to make them his own. The picture, therefore, might justly be said to be by Calceott and Landseer, who, in addition to his brilliant distinction as the great Dog Star, may claim a place as a constellation in the Milky Way. This work affects us more by what may have been omitted, than by what is received into the composition; for there are but few natural scenes of this kind in which is not found some discrepant episode. The colour is everywhere retiring; modest amber is found throughout the work, unobtrusive and conciliatory; and all the parts assist the mellow sunlight which suffuses the scene.

'Rochester Bridge and Castle.' We are placed below the bridge on the Medway, which occupies the lower breadth of the composition, the castle rising on the left, the nearest objects being boats on the river. This is also a sunny picture, and so successful that Calceott here seems to break a lance with Albert Cuyp in his own style—Rochester on the one side, Dort on the other. It is remarkable for a high degree of finish without the slightest hardness.

J. D. HARDING.—'A View of Thun, with Mont Blanc in the distance.' This is a small picture, but the nature of the scene, and the space into which it expands, would have well justified a large work. It epitomises Switzerland in its quaintest features, those of its cities—and its sublimest characteristics, those of its mountains. The warm harmonies of the nearest sites contrast strongly with the freezing temperature of the distance. The firm treatment of the subject, the dispositions of colour, and the prominence or retirement communicated to form, pronounce Mr. Harding an accomplished master of his art.

D. ROBERTS, R.A.—'Ruins at Baalbec, Mount Lebanon in the distance.' This picture, which is large, was exhibited in 1841 at the Royal Academy. The subject consists of little more than four columns of the Temple of the Sun, but in the condition in which they are presented to us, surrounded by the ruin and desolation to which they also must soon yield, they are more impressively historic than had the temple remained entire. Such a subject it is extremely difficult to invest with that sentiment which is best befitting it, because, being so simple, its simplicity is rarely left uninvited. As, however, these columns are set up before us, they discourse of a past magnificence, in language which conveys to us perhaps an exaggerated estimate of the reality—this is the art of the painter; he fills at once the mind with his subject, and we feel, to its utmost extent, that of which he only represents a fragment. To this, and similar relics, we cannot deny our reverence, for although an example of the splendid ostentation of a false religion, it is yet an emanation of the utmost refinement of the human mind. The frieze here is broken off—the fallen portions and the other columns the earth has reclaimed as her own, and taken them to her bosom. O fallen Heliopolis! could thine angurs, and the hierarchy that prompted the voices of thy oracle now see thee, by what new jugglery would they justify the promise that the Temple of the Sun was built for a time and for ever? But we find here the Arab of the desert and the Turk of the city; we had rather have contemplated the ruins of Baalbec without such society.

'St. Gomar, Sierre,' is a picture of that class whereby Mr. Roberts has made his reputation. It is a church interior, treated in a manner to convey an impression of vastness—the altar, with all its sacred properties, and the screen with a masterly firmness of manipulation, which, when closely examined, touches perhaps the utmost list of freedom; but at a little distance the whole combines in an example of the most elegant drawing. The painting of the whole rarely rises above or descends below a mellow middle tone, on which the sparse lights from the windows are thrown with the best results, the sparkling darks of the composition being spots carried into the picture by the reverent worshippers of the Virgin and the Saints. Had we but time to offer our orisons within that temple, we should tread lightly on that floor, for it looks as if every step would ring upon it. Again—

'Xeres de la Frontera' is still a church, not a wine, that the painter illustrates, surcharged with Gothic fret-work of the most beautiful kind, which we hope the architect has lighted as well as the painter.

C. STANFIELD, R.A.—'Le Pic du Midi d'Ossau, in the Pyrenees, and Smugglers.' This large upright picture, being judiciously hung a little above the eye, tells with forcible reality. The Pic is a lofty granite pinnacle of the ragged Gothic cleft, and piercing the air to an altitude at which—

"Biting frost would never let grass grow;"

and the rugged pathway at this, its upper base, is not the less a drear solitude that it is the haunt of these wild and lawless men, whose trade is exercised at the risk of life. This is a class of subject to which Mr. Stanfield seldom turns, a circumstance which we think gives additional value to the picture. No painter could resist making a study of this scene, but few could verify the sublime simplicity of that aspiring Pic, which, after all, is but the sorry remnant of some stupendous upheaving from below, having, in thousands of years, suffered dissolution by fragments of hundreds of tons which lie shed around its base.

A picture of another character, and in that department which is more particularly his own, is called, 'Shipping, French Coast, near St. Malo.' It is extremely simple in composition, showing only on the right a portion of the coast, while the left is open to the sea. A principal object on the right is a windmill. It is high water, and the heavy waves beat violently on the shore. It is a subject of the simplest kind, consisting of but few parts, and deriving much interest from its forcible chiaro-oscuro.

'Beilstein, on the Moselle.' This large picture was exhibited in 1837. It presents a view doubtlessly well remembered by those who have any acquaintance with the scenery of this river, where it may be remarked that, more than elsewhere, the towns and villages have been under the protection each of its dominating castle. We are often surprised that the Moselle scenery, so full of pictures, has not been more frequented: in comparison to it the overpraised Rhine is *nil*.

T. GAINSBOROUGH, R.A.—'A Landscape, with Sheep.' A large picture presenting a close scene, with water, trees, and foreground masses, and showing a principal light, according to the prescription of the time of this painter. It is a valuable example of Gainsborough's manner. It is accompanied by a second picture, containing cattle in the intermediate foreground, and very much darker than the other. Gainsborough was such an admirer of Mola, that he frequently painted with a picture of that master placed near him; but this work does not remind us so much of Mola as others we have seen by him. This was given by the painter as a marriage present to his daughter.

T. CRESWICK, R.A.—'The Stepping-Stones.' The subject consists of a shallow river, which diffuses its limpid stream over the breadth of the nearest site of the composition; on the opposite bank a screen of trees closes the scene. This was exhibited some years ago, and we have considered it among the best of Mr. Creswick's latter close river-side views—a class of subject to which he owes his reputation, but which he now appears to have laid aside.

H. JUTSUM.—'The Harvest-Field' is a view over a highly-cultivated country, enriched with picturesque timber. The foreground gives the title to the work, being studded with groups of heavy sheaves. The left is closed by lofty-spreading trees—a most valuable feature in the picture. The colour and firm manipulation of the picture are masterly.

'View on the Devonshire Coast,' opening an extensive prospect over a tract of country rough in bottom, and apparently farmed as a feeding district. In sweetness of colour and expression of distance this picture is rarely equalled.

F. W. HULME.—'View on the Llugwy,' with trees and cliffs worked up to a close imitation of nature. Time was when the freshness of these greens would have scandalised the lovers of landscape-art; but there was no truth in the brown and yellow fallacies of those days—the harmonies of nature must prevail over the harmonies of a baseless theory.

W. COLLINS, R.A.—'Selling Fish.' A class of subject very often painted by this artist—that is, a

breadth of coast scenery at low-water, with a few figures. It is most difficult to produce an interesting work out of the slight material which constitutes very often the best productions of this painter; but by the most elaborate finish, and the irresistible charm of the light and shade which he casts upon them, he wrought these really scant and commonplace materials into works that established a reputation of which he had ample reason to be proud.

There yet remain works enough to form a catalogue, especially of those in water-colour; there are also smaller pictures in oil—as six compositions from the 'Decameron,' by Stothard; and others by Danby, Lane, Clint, Müller, and Nasmyth. The subjects in water-colour by Turner are—'The Castle of Ely,' 'Rouen,' 'Chateau Gaillard,' 'Havre,' 'The Lake of Lucerne,' &c. &c.; 'Berneville,' by Harding; 'Loch Lomond,' and 'The Vale of Dochart,' by Robson; 'The Hotel de Ville, Louvain,' 'Zituan, Morocco,' by Roberts; and others by Bone, Derby, and Hunt. 'The Cartoon Gallery at Knoke,' by Nash; 'Flowers,' by Bartholomew; 'The Cook's Revenge,' and 'The Dwarf's Frolic,' by Cattermole; 'Harvest,' and 'River Scene,' by Devint; 'Autumn,' by Paris; 'Dunstaffnage Castle,' 'Bridlington Harbour,' and 'Rivaux Abbey,' by Copley Fielding; 'Childhood' and 'Youth,' by Stephanoff; 'Family Portraits,' by S. P. Denning; 'Rebecca at the Well,' by Warren,—with other studies in oil and water-colours. The drawings by Turner are in his most spirited manner, being some of those which were made for engraving, and which tell so forcibly in black and white.

SCULPTURE.

E. H. BAILY, R.A.—Mr. Bicknell possesses one of the finest pieces of sculpture of our school in 'Eve listening to the Voice,' had the sculptor never been the author of any other work, this had procured for him an undying fame. Whether this may be called the original or not we cannot tell, but we conceive that it is somewhat different from another statue or east we have somewhere met with by the same sculptor, and named also 'Eve listening to the Voice.' This statue is too well known to require description.

'Cupid.' A statue in marble of the size of life. A butterfly is settled on his shoulder, and he lifts his finger as if to enjoin silence. The poetry of the allusion is exquisitely graceful, and the natural ease of the round, youthful figure is beyond all praise.

'Psyche.' A companion statue in marble, also of the size of life. She holds a butterfly in her left hand, and caresses it with her right. This figure is semi-nude. The head is modelled in the spirit of the best types of classic beauty, and all the other passages of the person coincide in an expression of sweetness unsurpassed even in the best examples of the antique.

'Paris.' A statue in marble of the size of life. This character can never be mistaken; ample justice is done to it here in the manly beauty of the figure, with its gallant bearing, and the attributes of the Phrygian cap and the pastoral staff.

'Helen.' A companion statue to the last. She rests upon the left foot, and draws a veil over her person. The artist's conception of the character is embodied by a certain voluptuous fulness in the figure which may be justified by the story.

W. C. MARSHALL, R.A.—'Hebe.' A statue in marble—semi-nude. The figure stands looking downward; she holds a vase in her hand, and at her feet is a broken cup; thus it may be considered that she has just suffered dismissal, by Jupiter, from her office.

P. MACDOWELL, R.A.—'The Day-Dream.' This, like all the works of the artist, is qualified with the most charming sentiment. His great successes are all in what we may call Christian poetry in opposition to the antique.

In addition to these works there is a 'Dancing-Girl,' by Gott, and a 'Sleeping Cupid,' by Bienaimé.

We cannot close our notice of Mr. Bicknell's Collection without observing that if it have been selected with the intention of affording a comprehensive view of the present progressive state of the British school, it could not have been formed in better taste; and it must be admitted that it is to such liberality and patriotism that this progressive condition is so much indebted.

THE "GREAT EXHIBITION"
MEMORIAL.

It is now some months since we informed our readers, that there was at length a probability of a final move being ere long made in a matter of which the public had for some time past been allowed to lose sight,—but the interest of which is to many, from the matchless memories that surround the subject, as fresh as in the day when it first began to take shape and proportion. The project to which we allude was, that of erecting a memorial, of some kind, in Hyde Park, to report to future ages of the great Industrial Exhibition of 1851. That project is now about to receive its execution. As we write, a meeting is in course of being summoned, to decide on all particulars regarding the appropriation of the fund subscribed,—and ere our day of publication, it will have been determined in what form and under what conditions Art shall make *her* report to posterity of the great event of 1851.

Assuredly, when we think of all the great human interests which that unparalleled event involved and represented—all the mighty morals which were the informing spirit of that visible fact,—we may well wonder, that some attempt at the Art expression of so magnificent a summary of civilisation has not long before this arisen on the green sward which it consecrated. That an area in which assembled day by day through all the days of one long bright summer the most majestic congregations that the world has seen, should have no material mark from the Muse to point it out to the pilgrim generations to come, is a national neglect which it is difficult to reconcile with the national condition of mind that could conceive and carry out the great design. On this green plain the moral of the plain of Shinar was reversed:—in the vast edifice which "the children of men builded here," all possible diversities of the human mind flowed into harmonies, and all the languages of the scattered races of the earth swept down its long crystal aisles in one grand choral music.—It is, indeed, full time that the greatest of modern events should have an Art chronicler.

It is well, that we should go a little more particularly into the history of this monument;—which is very curious, and leads through some strange sinuosities of the human intellect. The first project for the monument took a form so eccentric, that, if we do not record it near its own time, it will be rejected hereafter on the ground of its intrinsic absurdity. In 1853, a body of noblemeu and gentlemen proposed to get up, by public subscription, a memorial of the Great Exhibition; and they found, as they deemed, a fitting embodiment and representation thereof in the Baron Marochetti's equestrian statue of Richard Cœur de Lion, which had been there exhibited. The Baron's statue, as the visitors to the first Crystal Palace who looked beyond the great western gate will well remember, was a very fine work; but how the parties in question got together two ideas which struggle so determinedly for separation, passes mere ordinary apprehension. A rampant warrior, to symbolise the triumph of peace! The hero of a remote and comparative barbarism, to express the sum of all that civilisation which the ages had since been building up! In the days of Cœur de Lion, and under the moral of his time, this gathering of the nations would have been impossible,—and in the age and land which reared the Palace of Glass, Cœur de Lion could not himself have existed. The place of Cœur de Lion as an historical illustration belongs to a page of which the Crystal Palace kept no memories—save in its Mediæval Court. One of the precise proclamations made in the Palace of Glass was, that Cœur de Lion, and

the thing which he typifies, were dead:—by what strange perversity of thought, then, he could be taken to typify the Palace of Glass, no effort of fancy enables us to understand. If the parties to this first project *must* have the man-in-armour for their purpose, we fancy we might have forced ourselves to catch at something like a link of association had they chosen Attila as their exponent. We remember well, how some of these parties resolutely set their faces against the Crystal Palace on the ground of the destruction which it would bring to the green sward in the park;—and it is just conceivable that, under some strange caleature of the imagination, they might see a fit representative of the edifice and its contents in one of whom it was proverbially said, that no grass grew where his horse's hoof had been! No analogy even so remote and fanciful as this can we discover in the other case.—However, the promoters of the project were prevailed upon at length, to see that the two ideas were incompatible; and their scheme for the purchase and erection of the statue remained—in its true character of an ornament to the metropolis—separated from its enforced association with the morals of the Great Exhibition. A large sum of money was collected; and various sites were proposed, and one (in Palace Yard) was even tested by the temporary erection of the work. *What was the issue of that subscription, or the final story of the monument, we do not know*,—further than that, the statue is now in the new Crystal Palace, at Sydenham, where it stands, appropriately, as the representative solely of the monarch whom the Baron Marochetti designed, and, through him, of his times.

Towards the close of the same year, Alderman Challis, in his character of Lord Mayor of London, put himself at the head of a renewed movement for carrying out the idea of commemorating the Great Exhibition; and *he* chose for his representative of that event a chief who certainly had striking relations to the event itself. The proposal of Alderman Challis was, to erect on the site of the Crystal Palace a statue of Prince Albert, as the party in whose breast the thought of assembling the world within its walls originated, and to whose earnest after co-operation it owed so much of its prosperity. His lordship addressed the provincial mayors with great success, won the willing adhesion of men of all ranks and professions,—and subscriptions to a large amount flowed rapidly in. The principle of these subscriptions was, generally, the scheme in its entirety:—the propriety of commemorating the event, and the propriety of the especial form of commemoration. Meantime, an opposition to the latter sprang up,—based on what was clearly a misconception. It was assumed, that the ground consecrated by the Exhibition was seized on for the purpose of an express tribute of respect to the Prince,—whereas, the figure of the Prince was borrowed as presenting the best single expression that could be found for embodying a tribute of commemoration to the Exhibition. It was assumed, too, that this was a statue to the Prince in the sense in which a statue is a verdict of judgment on a man's life,—and it was contended, that none but a man's survivors are entitled to erect such statues. It was objected, that statues to living men may possibly by the closing acts of such men's lives be converted into false witnesses:—that they are sentences passed before all the evidence has been heard. We wonder how many brass and marble summings up of the Duke of Wellington we had before *his* accounts were closed!—However, it is sufficient here to say, that this proposed statue, by its very terms, escaped being judicial in the general, or anticipatory, sense objected to. It had a direct emphatic reference to a single event, and was a judgment on the Prince exclusively in his rela-

tion to that. It expressly defined its own limitations,—and left all the other acts of the Prince's life to the dealing of the moral heralds that have finally to proclaim the true style and titles of the dead. The fact which alone it commemorated *was* a completed fact,—and in reference to our judgment upon that, history could have nothing to correct. Time cannot change the character of that record.—However, the objections were urged in a manner which made many think that it were better to find a way out of them. It was proposed, therefore, to abandon the notion of a work of Art altogether,—and that the memorial should take some sort of educational or other utilitarian form. This was transforming the idea wholly,—and in the opinion of some of the subscribers reducing the entire project to a mere surplusage. It was felt, that memorials of the Great Exhibition, of all other kinds, there had been, and were to be, in abundance, and that the one memorial supplementary and specific—in Art writing, and on the spot—was the thing which they had desired to promote. Many, we believe, withdrew their subscriptions; and the project has been slumbering ever since until a recent period.

As we have said, that project is now revived,—and about to receive its immediate fulfilment. A Committee was some time since formed to carry out the intentions of the original subscribers,—there are already about £6000 in the hands of the treasurer, Alderman Challis,—and it is intended to erect where the Crystal Palace stood *some work of Art*.—We think, we can see in the matter as it now stands means of reconciliation, which may swell the fund. £6000 will command something more than a single figure,—and, therefore, the statue of the Prince may be abandoned. But they who desired to see the memorial assume that specific form, will probably be satisfied to think that from any design which should take larger proportions it would be difficult altogether to exclude the idea of the Prince. So truly was Prince Albert the presiding genius of the Great Exhibition, that his figure comes logically as it were into every argument for its commemoration. As he was necessary to the Exhibition,—so is he necessary to its monument.

There is one point of the doctrines heretofore laid down by us on the subject of competitions for the execution of British works of Art which many of our readers may be disposed to consider not applicable in the present case. As we formerly stated, it is, we believe, the intention of the Committee having the ordering of this competition to extend it beyond the circles of British Art; and it will probably be felt, that if ever there was a competition of the kind amongst us to which foreign nations might justly claim to be admitted, it is one whose object is to commemorate an event to which all the nations of the world were contributors.—Under the strong sentiment of fraternity which mingles with all our thoughts of the Great Exhibition, we, for ourselves, are not unwilling—nor, we believe, would the sculptors of England be so—to acquiesce in this view:—yet, it involves a fallacy, notwithstanding. The thing to be commemorated was, it is true, a gathering of the nations;—but the monument which commemorates it is an English monument, bought with English money. To give a general right, there should have been a general subscription. For the execution of a memorial determined on by the nations, and to which the nations were joint contributors, the artists of all nations would, by the conditions of the case, have been alike competitors; but a monument got up by ourselves, amongst ourselves, for ourselves, and paid for by ourselves, falls into the category (whatever its theme) of British monuments,—and the foreign sculptor can come into the competition for it, not by claim certainly, but only by concession.

THE APPLICATIONS OF IMPROVED MACHINERY AND MATERIALS TO ART-MANUFACTURE.

No. 1.—ON NEW METHODS OF PREPARING PORCELAIN AND OTHER CLAYS.

THE mind of England has within the last twenty years displayed, in a remarkable manner, its utilitarian character. There never was a period in man's history during which so large a number of discovered truths have been applied to useful ends. The great efforts of thought have all been in the direction of rendering known truths available, and of overcoming natural difficulties:—a vast success has attended those efforts. To whatever department of science we may turn, we see the same kind of result; there has been, and is, a constant effort to seize upon all the philosopher has discovered, and use it for the common good.

It is proposed to examine some of these new applications, to describe improved mechanical combinations, and to give accurate accounts of any new materials which may be introduced, or old ones which have been modified. The object of those papers will be to keep the readers of the *Art-Journal* acquainted with the improvements which are constantly being made in the productions of *Art-Manufacture*, adopting that term in its widest sense.

Since the period when Cookworthy discovered in Cornwall a kaolin, more than a century ago, scarcely any improvement has been made in the mode of preparing the porcelain clay of this country. Notwithstanding the immense increase in the manufacture of earthenware of every variety, and the superior excellence of the articles which are now produced in our potteries, we still see the immense clay-pits of Cornwall, rude as they were at the commencement of the present century.

The decomposed granite is quarried out, and the clay separated by the purely natural process of exposing it to streams of water. The water flows onward, with the lighter portions of the stone in suspension, and, in obedience to the laws of gravity, the heavier particles slowly subside, and eventually the finely comminuted clay is deposited in large shallow pits prepared to receive it. In these the clay dries to a certain extent; it is then cut into oblong masses, and when thoroughly dried, they are packed in casks and sent into the market.

The china-clay works of St. Anstle are of a most striking character. A wide expanse of moorland stretches away on every side. If all bears the indications of human labour. Almost every foot of ground having been turned over, either by the tin-streamers or the china-clay workers. Large pits, usually parallelograms, here and there meet the eye, and solicit attention, from a phenomenon of a peculiar character which they frequently exhibit. The water resting upon the clay appears deeply blue. This is often thought to be a simple case of reflection—the blue sky mirrored in the water. But whether the sky is serenely blue, or darkened with rain-clouds, the colour of the water is still the same. It has by some persons been supposed to arise from metallic salts in solution; but, on taking the water from a pit, and examining it, it appears colourless; and the chemist fails to detect any mineral compound capable of imparting colour. The fact is, the colour arises from a peculiar surface refraction, analogous to that which is produced when sulphate of quinine is dissolved in water—a condition to which the name of *fluorescence* has been given.

Near those small lakes of clay are usually seen great excavations, from which the decomposed granite containing the clay has been taken. The rivulets which murmur around, and they are many—the water which urges the small wheels employed in pumping or grinding—and the river which runs down the valley,—in the summer an ordinary stream,—but in the winter a rapid torrent—are all of them charged with clay, and they flow onward like rivers of milk. Since everything which is done is dependent upon atmospheric causes, everything is naturally rendered to a certain extent uncertain. Rains may prevent the consolidation of the clay; even at the most favourable seasons, winds and storms spread over the surface numerous impurities, which it requires much

additional labour to remove. There are other impediments which add to the uncertainties, and increase the cost of preparing china clay.

As we are about to direct attention to a new system, in which machinery and several excellent artificial appliances are introduced, it may be permitted, in the first place, that the natural history of this raw material be briefly described. Under some conditions which have at former periods prevailed, immense tracts of granite rock have suffered decomposition. From an examination of several of the most important clay-works of Devon and Cornwall, it appears not improbable that we may refer the present state of the china-clay granite to the action of water, spread at small depths over the surface of the country: this water, containing air, percolating slowly through the granite mass, has effected the decomposition of the felspar, which is, it is well known, an important constituent of this rock. The chemical constitution of felspar is potash, silica, and alumina; and this crystalline body appears peculiarly liable, under certain conditions, to break up into its ultimate parts. The china-clay granite is, therefore, mainly a mass of quartz, mica, and decomposed felspar, or clay. The object of preparation is to separate, in the purest state, this clay from the quartz and mica.

With this introductory account of the material, we must proceed to describe the arrangements which have been introduced at the Lee Moor Clay-works, on the property of the Earl of Morley, by Mr. Phillips, the managing director of the establishment. The clay being broken out of the quarry, where it is worked to the depth of about sixty feet, it is carried along a tram-road to a neighbouring house: it is then raised and thrown into hoppers, from which it passes into a trough, through which a full stream of water flows, and in which works an ingenious arrangement for separating the clay. At the end of a revolving shaft, nearest the point at which the clay enters, there is a series of radial knives, by which the masses of clay are rapidly divided. Beyond the knives, but on the same axis, are a series of iron arms, the ends of which are furnished with teeth. These, indeed, perform the part of hands by beating the clay thoroughly as it is carried by the flowing stream down the trough. This axis, or shaft, is propelled by a powerful water-wheel. The greatest care is taken to obtain very pure water for washing the clay, and considerable labour, and much thought, has been expended upon the means for bringing the water directly from the springs, and carefully excluding the surface drainage from the peat-soil of Dartmoor; which water is also, however, carefully collected, and employed for the purpose of driving the water-wheels, &c. The water which passes off from the trough flows through sieves, by which all the coarser portions of quartz are separated, and the fluid, charged with clay and mica, passes onward. The mica, breaking up into thin shales, has a tendency to swim; although, being of greater specific gravity than the fine particles of clay, it is gradually deposited. In the separation of these components of the decomposed granite, considerable attention is required in regulating the flow of water: a rapid current would carry on the mica with it; a sluggish stream would allow of the clay to fall with the mica. At these clay-works very long and deep V-shaped channels are carefully built of granite; into these the water charged with clay passes, and their fall is so adjusted that the stream passes on at the required rate; so that by the time it has passed the full length of these channels, the water holds nothing in suspension but pure clay. It then flows into vast reservoirs, in which the clay is allowed to deposit. These clay-pits are carefully holed in, so that they are entirely screened from dust, dirt, or rain; and beneath them circulates air pipes, through which warm air is made to travel; and thus, by producing a slight elevation of temperature, the clay is uniformly dried. Each reservoir is allowed to fill itself with clay before the drying process commences. The water flowing in in a small stream, and these pits being very large, there is, of course, but little disturbance in the fluid between the point of its entrance and of its departure: thus, in comparative repose, the fine clay falls to the bottom, leaving the water above it quite clear. The drying of a mass of clay of several feet in thickness necessarily occupies some time, especially as it is not deemed advisable to employ any elevated artificial tempera-

ture for the purpose; the temperature of these clay-pits, when warmed, never exceeding 90° Fahr.

There is a traditional opinion amongst our potters in favour of weathering the clay: this appears to be derived from the Chinese, who will not, it is said, employ, in the manufacture of porcelain, any clay which has not been exposed to atmospheric influences for many years. There are not any exact experiments enabling us to refer this to any especial cause: the question rests upon a generally received opinion, stamped with the authority of age. In connection with this subject, Mr. Phillips states that the clay which is prepared in the early months of the year is better than that which is manufactured in the summer. May not frosts act upon the clay in a manner similar to its action upon soils, in which it appears to effect a finer disintegration—the water held suspended by the particles rendering them in the process of coagulation?

The clay of the Lee Moor Works, being prepared in the manner described, is packed and sent by a railway—constructed through ten miles of picturesque country—to Plymouth, where it is shipped, or conveyed directly by the South Devon Railway onward to the potteries. The value of this branch of industry, which may appear to some unimportant, may be inferred from the following statement, abstracted from the "Mineral Statistics of the United Kingdom for 1855," published in the Memoirs of the Geological Survey:—

	TONS.
China clay shipped from Cornwall.....	60,188
China clay shipped from Devonshire.....	1,100
Pipe clay shipped from Devonshire.....	20,000
China stone shipped from Cornwall.....	19,961

China stone is a granite less completely disintegrated than that which produces china clay, which is used extensively in the manufacture and glazing of our superior porcelain.

In addition to the Cornish and Devonshire kaolin, there was exported from Poole, in Dorsetshire, in 1855, 53,702 tons of Poole clay, and 582 tons were sent from Poole to London by railway.

The value of the china clay of } Cornwall, at works.....	£51,159 16 0
The value of the china clay of } Devonshire, at works.....	935 0 0
The value of the china stone of } Cornwall, at works.....	17,964 18 0

It should be stated, that the produce of Devonshire will each year show a considerable increase, as the facilities of transport are increased.

The quartz, sand, mica, &c., which are separated from the china clay, are usually regarded as waste and valueless materials. A small quantity is employed in the manufacture of Cornish crucibles; beyond this, we believe, it is turned to no account in that county. At the Lee Moor Works, the mica and quartz are ground up with common clay, and used in the manufacture of fire-bricks, which are employed in the construction of iron furnaces and lead-works in Durham and elsewhere. Drain-pipes and numerous other useful articles are also manufactured, and, in addition to these, various architectural ornaments, for both external and internal decoration and use. By slightly varying the quantities of the constituents, and their physical condition, an artificial stone may be produced, which will rival granite itself in durability and appearance.

This is of the utmost importance—the economising of waste materials is, in fact, adding so much to the national wealth.

A comparative statement of the analyses of the Black Alder and the Stonbridge clays, will show the relative values of each:—

	BLACK ALDER.	STONEBRIDGE.
Silica.....	79.20	67.78
Alumina.....	19.70	26.13
Lime.....	trace	1.47
Oxides of metals.....	0.45	5.20

At the last exhibition of the Royal Cornwall Polytechnic Society, a new brick-making machine, the invention of Mr. Roberts, of Falmouth, was exhibited, and a committee appointed to report upon its merits. We regret we cannot notice it at present.

It is pleasant to be enabled to record the introduction of improved machinery, and still more so to witness the use of waste material, in the production of objects which are directly connected with architecture and Art-Manufacture.

ROBERT HUNT.

THE BOOK OF THE THAMES,

FROM ITS RISE TO ITS FALL.

BY MR. AND MRS. S. C. HALL.

PART I.

THE Thames is "the King of Island Rivers;" if deficient in the grander features of landscape, it is rich in pictorial beauty; its associations are closely linked with heroic men and glorious achievements; its antiquities are of the rarest and most instructive order; its natural productions of the highest interest: it wanders through fertile meads and beside pleasant banks, gathering strength from a thousand tributaries; on either side are remains of ancient grandeur, homely villages, retired cottages, palatial dwellings, and populous cities and towns; boats and barges, and the sea-craft of a hundred nations, indicate and enhance its wealth; numerous locks and bridges facilitate its navigation, and promote the traffic that gives it fame. Its history is that of England: the Britons, the Romans, the Saxons, the Danes, and the Normans, in turn made it their "seat

of war," or, settling upon its banks, sought the repose of peace and the blessings of agriculture and commerce. In all the civil contests of centuries it obtained melancholy renown: the intrenched camp, the castle, the baronial hall, the mansion, the villa, occupied adjacent steeps, commanded fords, or adorned its sides, as harmony took the place of discord, and tranquillity succeeded strife. There is scarcely a mile of its borders which may not give birth to some happy thought in association with the past: abbeys, monasteries, and churches exhibit their remains, or rear "the tall spire," consecrated by use and age; the better parts of their structures having endured with the purer portions of the ancient faith. Sites and memorials of famous battles—king with baron, lord with serf, ancient owners of the soil with its invaders, those who warred for despotism or fought for liberty, for feudal rights or freedom; the cromlech of the Briton, the tumulus of the Roman, the barrow of the Saxon, the sculptured tomb of the knight, and the simple monument of the gentleman;—these are to be found, in numbers, on its banks. The names of very many of the great men of England—who "penned" or "uttered wisdom"—are nearly or remotely connected with this river: in its "fields below'd" their "careless childhood stray'd;" in its city of colleges, "for meditation apt," their youth gathered strength for the strife of manhood. To its banks full often came the soldier, the statesman, the scholar, and the poet, "after life's fitful fever," to seek that rest from labour which is labour's best recompense—to enjoy alike

"The solid pomp of prosperous days,
The peace and shelter of adversity."

Flowing through rich alluvial soil, that is never sterile, during the whole of its course it meets not an acre of unmanageable bog, and hardly a square yard that does not produce pasture or foliage, except where it refreshes and prospers active villages, busy towns, or crowded cities—venerable Oxford, regal Windsor, "mighty London," and a hundred places, wealthy and famous. It would be indeed impossible to over-estimate the value of the Thames to the British capital. It is said that when one of our sovereigns, angry with the chief magistrate of the metropolis, threatened to ruin it by removing the court, he received the memorable answer, "But your majesty cannot remove the Thames!"

It will require no very great stretch of imagination to pass from the little streamlet in Trewsbury Mead to "the Pool" below the Tower. The river, born in a sequestered nook, grows and gathers strength until it bears on its bosom the ships of a hundred nations; enriches the greatest and most populous city of any age; ministers to the wants and luxuries of two millions of people—there alone; becomes the mainstay of commerce, and the missionary of civilisation to mankind, carrying their innumerable blessings throughout the Old World and the New; yet ever the active auxiliary, and never the dangerous ally—keeping from its birth to its close the character so happily conveyed by the famous lines of the poet:—

"Though deep, yet clear; though gentle, yet not dull;
Strong without rage; without overflowing, full."

Few, therefore, are the poets of England who have no word for "Old Father Thames!" Even its minor enjoyments have been fertile themes for the muse; and numerous are they who laud the "gentle craft" of the angler, whose "idle time is never idly spent" beside the river which, above all others, invites to contemplation, and promotes familiar intercourse with Nature. Here, too, the botanist and the entomologist gather a rich harvest of instruction; while to the landscape-painter, wander where he will—

"By hedgerow elms, on hillocks green:

* * * * *
While the ploughman, near at hand,
Whistles o'er the furrow'd land,
And the milkmaid singeth blithe,
And the mower whets his scythe—

it is ever an open volume of natural beauties, which are the only veritable teachers of Art.

It is to this River—the King of Island Rivers—we dedicate this Book.

Before we ask the reader to accompany us on our tour, we require him to pause awhile, and consider two essential points—its source, and the name under which it is rightly to be recognised and known.

Both are in dispute. The Churn, which rises at "Seven Springs," about three miles from Cheltenham, and joins the Thames at Cricklade, is sometimes described as the source of the great river. Generally speaking, the source of a river is the spring farthest from its mouth; and the head of the Churn is farther from the Nore than Thames Head by perhaps fifteen miles. But old writers, old maps, and old documents, unite in representing "Thames Head," near Cirencester, as the head of the river Thames. Leland (temp. Henry VIII.) tells us that "Isis riseth at three myles from Cirencestre, not far from a village cawled Kemble, within half a mile of the Posseway, wher the very head of Isis is;" Stow, that "the most excellent and goodly river beginneth in Coteswold, about a mile from Titbury, and as much from the hie way called Fosse;" Camden, that "it riseth not far from Tarlton, hard by the famous Foss-way;" Atkins (1712), that "it riseth in the parish of Cotes;" Rudder (1779), that "it has been reputed to rise in the parish of Cotes, out of a well." These authorities might be multiplied; and although Atkins and Rudder (the earliest historians of Gloucestershire) both write of the Churn, and its claim to be considered the head of the Thames, "being the highest source from whence it derives its water"—and no doubt such claim will have many advocates—we have treated the river Thames as rising at Thames Head, near "a village cawled Kemble," hard by the "famous Fosse-way."

With respect to the name, it is derived directly from that by which it was known in the time of Julius Caesar, *Tamases*, which, as well as its Anglo-Saxon representative, *Temese*, is sufficiently near the modern *Thames* to be considered as identical with it. Lhwyd, the learned Welsh scholar, believes it to be identical also with the Taf—the name of several rivers in Wales. But there are other English rivers bearing names almost the same. In Staffordshire we have the nearest resemblance in the Tame; in Shropshire is the Teme; and in Cornwall is the Tamar. There are minor streams in other counties bearing similar designations, which appear to be derived from one root, and the signification of all to imply "a gentle stream." "This," writes Camden, "is that Isis, which afterwards joining with Tame, by adding the names together is called Tamisis, chief of the British rivers, of which we may truly say, as ancient writers did of Euphrates in the East, that it both plants and waters Britain." Camden thus speaks of the river as "the Isis" until it mingles with the Tame—with which it is joined between Abingdon and Wallingford—about a mile from Dorchester. But there is just ground to believe that this is merely a fanciful designation, to which currency was given by Camden, who is said by his biographer, Bishop Gibson, to be the author of that Latin poem, introduced into the "Britannia," which commemorates "the marriage of the Tame and Isis."* Stow, Speed, and Hollinshed, his contemporaries, follow in his wake. But Bishop Gibson effectually dispels the illusion, and shows that from a very remote period—certainly anterior to the Conquest—the name of the river was the Thames (*cujus vocabulum Temis, juxta vadum quod appellatur Somerford*), thus confirming not only the fact that the Isis was a name given to it long afterwards, but that the Thames "near Somerford" is that Thames which rises near Cirencester, and not the Churn, which has its birthplace near Cheltenham. "The same appears from several charters to the Abbeys of Malmesbury and Evesham, and from old deeds relating to Cricklade; and perhaps it may be with safety affirmed that it never occurs in any charter or authentic history under the name of Isis." By the Saxons it was undoubtedly called the Thames: † on all ancient maps and documents it is marked as "Thamesis Fluvius." One of the oldest streets of Oxford was Thames Street (now George Street), anciently "Platea Thamesina." The term "Isis" was certainly unknown to our remote ancestors; its use is opposed to every principle of the English language; while it appears contrary to common sense to call a continuous stream by one name in the first half, and by another name in the other half, its channel being in no way changed, and its character in no degree altered. The error, however (for so, after the testimony of Bishop Gibson and others, we must consider it), has largely prevailed. It is traceable, no doubt, to the fancy which tempted the separation of the single Latin word "Tamesis" into two words, *Tame esis* or *Tame isis*—suggested by the fact that another Tame did arise in Buckinghamshire, and pour its waters into the great river, midway in its course between its source and London. There has been much consequent confusion; sometimes Oxford is described on the Thames, and sometimes on the Isis. Even in the Ordnance Map it is called in one place the Thames, in another the Isis, and in another "the Thames or Isis," above the junction. The Tame is among the least important of its tributaries; yielding in importance to many streams, above and below, which "run to the embraces" of the venerable Father. We consider, therefore, the Thames to be the traditional, the geographical, and the legal title of the river, and shall give to it only that name throughout this work. ‡

* Some writers concerning the Thames have given to Camden the credit of inventing the name Isis; but it is clear that it is older than his time. Leland, who preceded Camden by thirty or forty years, distinctly refers to the Thames as the Isis, and quotes from an authority yet older—"Isa nascitur à quodam fonticulo juxta Tetbriam prope Cirestriam—ortus Isidas flui."—(Joannis Lelandi de rebus Britan. Collect.)

† The name of the river at its highest point, and forty miles above its junction with the Tame, near Dorchester, is given in the Saxon Chronicle almost as it is spelt in the present day—that is, "Temese." The following are two literal translations from this curious record:—

"A.D. 905.—This year Æthelwold enticed the army in East Anglia to break the peace, so that they ravaged over all the land of Mercia, until they came to Cricklade, and then went over the Thames.

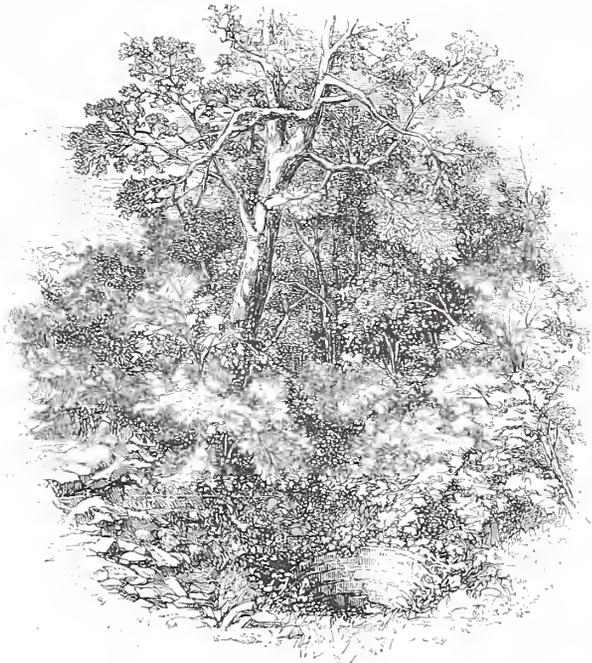

"A.D. 1016.—In this year came Canute with his army, and Eadric the Ældorman with him, over Thames into Mercia at Cricklade."

‡ The Town Clerk of Oxford courteously submitted to us a list of several hundred documents he had examined; in no one of which was "the Thames" ever recognised as "the Isis." We state, therefore, on his authority, that in no ancient record of the city of Oxford is the name Isis to be found; from the time of Domesday to the present time, it is not recognised by that name, but always as "the Thames."

The field in which the Thames rises is called TREWSBURY MEAD, and adjoins a Roman encampment that has long borne, and still bears, the name of Trewsbury Castle: this "castle" is a large mound, now covered by trees, the Severn and Thames Canal separating it from a fountain that, born in this secluded spot, becomes the great river that "both plants and waters Britain." The birthplace of the Thames is in the parish of COTES, in Gloucestershire, but close to the borders of Wiltshire, into which it soon passes. The district is usually described as "at the foot of the Cotswold hills;" but these hills are nowhere seen from the dell, and are, indeed, several miles distant.*

The ancient Roman way—the Aeman Street—crosses the country within half a mile of the source, and connects Cirencester with Bath. The source is about three miles south-west of Cirencester—a famous city in old times, and still a town of some importance, its church and town-hall being fine examples of the architecture of the fifteenth century; its Roman name was derived from the British: Ptolemy calls it Corinium; Antoninus, Duro-Cornovium—most probably from *diow*, the British name for water. Cirencester was strongly fortified, to protect its inhabitants from "the fierce Silures," and appears to have enjoyed considerable wealth and importance. The town still shows many remains of Roman greatness, and some fine tessellated pavements have been discovered, one of which is still preserved in Lord Bathurst's park; the Museum also exhibits relics of the same ancient people, including various memorials of the Roman soldiery. Few English towns have afforded so rich a field for the antiquary; but the whole district to Woodchester and Gloucester abounds in such records, and has furnished Lysons with some of the most important plates to his great work on Roman remains in Britain. Several great roads branched across England from this city, and all may yet be traced in its immediate neighbourhood. They were known as the Irmin Street (north and south), the Aeman Street, the Ickenild Street, and the Fossway.† So admirably were they constructed by the Romans that to this hour they are used, having retained their solidity for centuries.

But the spot to which we direct the more immediate attention of our readers—Trewsbury Castle, a tree-covered mound, at the foot of which is the

THE SOURCE OF THE THAMES.

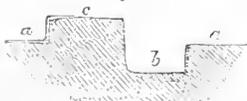

cradle of the Thames—retains nothing to indicate its long-ago importance; in the silence and solitude of the place, and looking across the valley towards the great city of which this was an outpost, we recalled the lines of the poet—

"I was that city, which the garland wore,
Of Britain's pride, delivered unto me
By Roman victors, which it won of yore,
Though nought at all but ruins now I be,
And lie in my own ashes, as ye see!"

Having journeyed about three miles from Cirencester, along the Aeman Street

* This chain of gently-rising downs formed a territorial boundary to the early British tribes; and many of the camps on the ridge are probably their work. But the Romans, fully aware of the importance of this line of demarcation, kept up the old landmarks and added others. In later times the Cotswolds were almost exclusively celebrated for their pastoral character, and the fine breed of sheep there reared. New celebrity was given to them in the reign of Queen Elizabeth as hunting and coursing grounds, and Shakspeare has immortalised the fact in his "Merry Wives of Windsor." Subsequently Mr. Robert Dover, an attorney of Warwickshire, obtained licence from James I. to institute country sports of all kinds there, and he for forty years presided over them in person, "habited in a suit of His Majesty's old clothes." These games have been celebrated in the poems of Ben Jonson, Randolph, and Drayton.

† The Fossway receives its name from the intrenchment which runs parallel to it, on one side or other of its course, and which will be more perfectly understood by the aid of the appended diagram: *a a* is the level traversed by the road; *b* represents the foss or dry ditch beside it. The earth thus dug out was thrown up to raise the road above the ordinary level, as seen at *c*. The Roman roads are generally raised higher than the ordinary level of the land, but there is no other instance of the intrenchment, as in this Fossway. This is one of the most perfect of our Roman roads, and traverses the Cotswold range in a direct line.

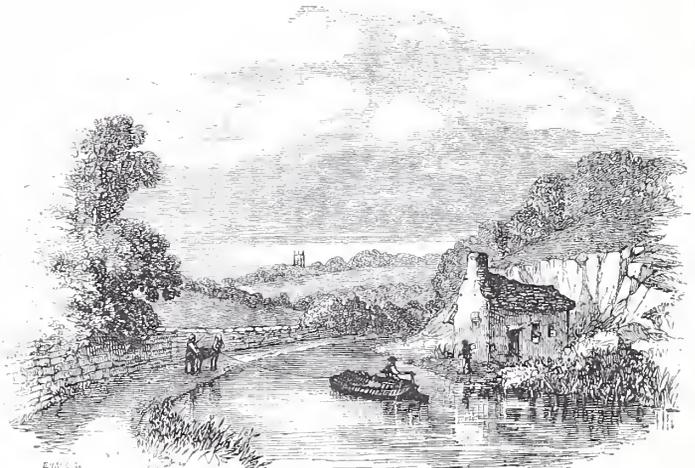

of the Romans, crossed the Thames and Severn Canal, and arrived in sight of a railway, the shrill whistle of which broke the solitude of the place, and sadly jarred upon the mind at the moment, we reached a small valley, in which we had reason to believe we should find THAMES HEAD. But neither maps nor books gave us any aid as guides. We naturally expected to trace the river to its source by tracking the signs that water almost invariably leaves on the line through which it passes along the meadow—

"Which, with a livelier green,
Betrays the secret of its silent course."

But for such water-marks we sought in vain: there were neither alders, nor osiers, nor rushes, to be seen; we observed nothing that could in any degree indicate the infant meanderings of a river. Fortunately, however, we encountered a venerable shepherd of the plain, who conducted us at once to the birthplace of the more venerable father. This is a well, which, when Boydell published his history, in 1794, was "enclosed within a circular wall of stone, raised about eight feet from the surface of the meadow;" the stones have fallen, the well is now filled in; it was with difficulty we could ascertain that it contained water—that water being in the sunny month of June many feet below the surface; but in winter it rises, forces itself through all impediments, ascends in thick jets, and so overflows the valley, making its way to greet those earlier tributaries that await its coming to mingle with it and journey to the sea—"most loved of all the ocean's sons." "THAMES HEAD" is therefore pictured, in the accompanying engraving, merely as a heap of stones, overshadowed by trees of no great size: there is not, as we have said, a single water-plant in its vicinity, the bank of the canal forms its background, the dell is a perfect solitude, no dwelling is near, the foot-path is seldom trodden—for, although there still exists "a right of way" through the meadows which lead from the village of Kemble below to that of Cotes above, it is rarely used; but its loneliness is tranquillity, and its silence peace. The fields are fertile, and all things indicate that unobtrusive prosperity which suggests ideas of "contentment, parent of delight."

Poetry and prose have laboured from age to age to describe the pictorial beauty and the moral power of what may be termed the "church-landscape" of

THE CHURCH AND VILLAGE OF COTES.

England; yet no description can adequately convey an idea of its "pleasantness," or of its elevating influence over a "people." The first sight of the spire of his native village after years, long years of wandering, has shaken many a high and firm heart; and tears of repentance and hope, and good resolves, have been often called forth from comparatively hardened sinners by a sound of the church-bell—first heard in the days of innocence and youth. There can be no loneliness, even in imagination, equal to that which the poet pictures in "Juan Fernandez:"—

"But the sound of the church-going bell
These valleys and rocks never heard;
Never sighed at the sound of a knell,
Or smiled when a Sabbath appeared."

In foreign countries, the richly-elaborated cathedral in the great square commands our admiration; but what can we say of the meagre-looking church, with its few trees, its rampant weeds, its neglected grave-yard, its dreary interior, its dismal pictures and painted effigies, making sometimes a feature in the scenery—but how rarely, as with us, being the sentiment, the centre, the crown and beauty of a whole? Whatever may be our feelings on certain points, with which this, our chronicle of the royal English river, has happily nothing whatever to do, we cannot withhold our tribute of gratitude to the spirit that has rightly restored and fitly adorned so many of our parish churches, whether in the crowded city, in the village, or amid the genial solitudes of our country.

Standing beside the cradle of mighty Thames, and looking forth upon a landscape wealthy in the gifts of tranquillity and hope, and in the varied beauty of sunshine and shade, there rises the tower of the village-church—the Church of Cotes. Solemn and yet pleasing associations crowd upon us; for centuries it has been the beacon to thousands whose graves are at its base,—they may not have been "village Hampdens," but they have fulfilled the mission allotted to them by Providence, and sleep—these

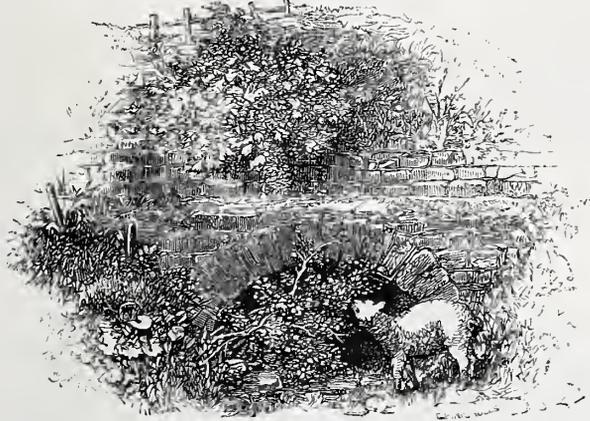

"Rude forefathers of the hamlet"—

beside the homes in which they lived, and under the shadow of the church in which they prayed. What scenes of love and life, of joy and sorrow, have alternated here—come and gone—as time ceaselessly passed onward! Generations

after generations have seen the soft cheeks of youth wither into the wrinkles of age, and the step so light and elastic over moss and harebell, become slow and heavy, then feeble and uncertain, tottering at last from the supporting crutch into the quiet grave. Surely are those village spires the lights of our land: come and gone! come and gone! are all around; yet ever enduring, ever inviting, ever rewarding, they continue. Age after age passes, their peaceful bells are heard above the "crash of empires;" while fears of change alarm the world, "perplexing monarchs," they discharge their mighty yet simple task—

"Invite to heaven and point the way."

A walk along the first meadow brings us to the great Bath Road, under which there is a tunnel formed to give passage to the Thames when "the waters are

THE FIRST TUNNEL.

out." In June it was dry, sheep were feeding at its entrance; but in winter it is too narrow for the rush of the stream that has then gathered in force.

Close by this tunnel, and about half a mile from Thames Head, is the engine-house of the Thames and Severn Canal, which, by continual working to supply water to the canal, drains all the adjacent springs, and is no doubt the main cause of absorbing the spring-head of the river. This engine-house is an ungainly structure, which the lover of the picturesque may well wish away; but although a blot upon the landscape, it is happily hidden from the valley in which the Thames has its birth. The course of this canal we shall describe when we reach its terminus at Lechlade.

Half a mile further, perhaps, and the burns begin to gather into a common channel; little trickling rills, clear as crystal, rippling by hedge-sides, make their way among sedges; the water-plants appear, and the Thames assumes the aspect of a perennial stream; so it runs on its course, and brings us to the village of KEMBLE, which occupies a hillock about half a mile from the bank: its church-spire, forming a charming feature in the landscape, standing on a gentle acclivity, and rising above a bower of trees;—the railroad is previously encountered, the river flowing underneath. This church we shall visit before we resume our tour.

THE PORCH: KEMBLE CHURCH.

too frequently characterises such relics. The parts which first strike the eye are of early English architecture,* the best portion being the large porch we have

* Mr. Akerman, the accomplished secretary to the Society of Antiquaries, at one of the recent meetings read a paper which contained some interesting and valuable information on this subject:—"Mr. Akerman discovered two Anglo-Saxon cemeteries in the village of Kemble, and this had led him to attempt the identification of the land limits, mentioned in grants of Ewen and Kemble to the Abbey of Malmesbury, by the Anglo-Saxon kings. His researches had been amply repaid, and he exhibited a map of the district, upon which he had marked the ancient and modern names. Among these is the spring known as 'Thames Head,' or the source of the Thames, and the 'hoar-stone,' mentioned in the charter of King Æthelstan, as standing near it. This object has hitherto escaped the notice of topographers and tourists, owing probably to its being concealed

pictured, which, however, forms a case, or shrine, to the Norman door, with its chevron ornament decorating the arch.

The water-foilage here commences to encroach upon the stream, giving to it interest and beauty, transparency and health. Among the earliest of the aqueous plants—and that which is seldom out of sight until the Thames loses somewhat of its purity—is the water Crowfoot (*Ranunculus aquatilis*), the large white flowers of which rise in sparkling profusion above the surface; and at this point the curious variety in the floating and submerged leaves is very apparent—the former being broadly lobed, while the latter are cut into minute thread-like divisions, somewhat resembling the leaves of fennel, as shown in the accompanying figure. Further down the river, where the stream acquires increased depth and velocity, the plant assumes a different character—the flat leaves entirely disappear, both stems and leaves being drawn out by the current into mere bundles of cords, often of great length; in this case the flowers are only produced at occasional intervals.

WATER CROWFOOT.

Resuming our walk by the river-bank, we reach THE FIRST BRIDGE which crosses the Thames—all previous passages having been made by stepping-stones, laid across in winter and removed in summer. This bridge, which leads from the village of Ewen, is level with the road, the river flowing through three narrow arches; it is without parapet. Hence, along the banks for a considerable distance, there is no foot-path of any kind; the traveller who would explore its course must cross hedges and ditches, and avoid the main road to Ewen—an assemblage of cottages and farm-houses. And a delicious walk it was beside the river,—pleasure being augmented by difficulties in the way; the birds were singing blithely in small wood-tufts; the chirp of the grasshopper was gleeful in the meadows; cattle ruminated, standing knee-

THE FIRST BRIDGE ON THE THAMES.

deep in adjacent pools; the bee was busy among the clover, and, ever and anon, darted across the stream the rapid kingfisher, the sun gleaming upon his garb of brilliant hues.

"The softly-warbled song
Comes from the pleasant woods, and coloured wings
Glance quick in the bright sun, that moves along
The forest openings."

Perched on an overhanging branch, the Kingfisher (*Alcedo Ispida*) quietly surveys the motions of his finny prey in the stream beneath, waiting with patience the moment for a favourable plunge; down then descends, "like an arrow," the glittering bird, and in an instant he is on his perch again, bearing the fish in his beak; quieting his prey by a few smart raps against the branch, it soon vanishes down his capacious throat.

The Thames here, in its entire loneliness, is precisely that which "most the poet loves:"—

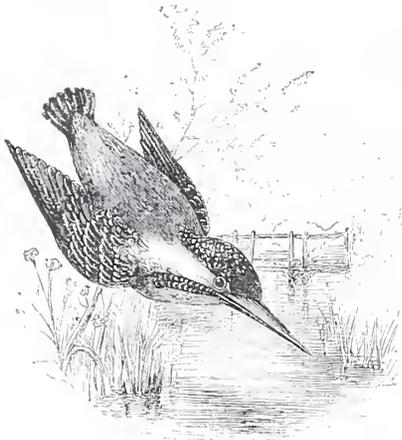

"The rivulet, delighting in its strength,
Ran with a young man's speed."

So quiet are its nooks, into which the whirling eddies run, that it would seem a very paradise of the angler; it is not so, however—bait and fly will be alike unproductive here; although an adventurous trout will sometimes make a journey hither, he soon seeks his way back again, for instinct tells him that during the summer months the sources of these pleasant streams are dry. There are no fish to be found, therefore, except the stickleback and minnow; and these may be properly introduced here as the river's earliest produce of animated life.

The Minnow (*Leuciscus Phoxinus*), called also the Minin and the Pink, is one of the smallest of fresh-water fish, rarely exceeding three inches in length,

from the view of persons who pass along the Roman Fosseway. The ancient name of this district (Ewelme, i.e., Origo Fontis) was derived, in fact, from the source of the Thames, but it has been corrupted to Ewin or Yeving. The circumstance that the field in which the spring rises is called 'Ewen Field,' is a verification of this assertion. In early times there was a chapel at Ewen, but it appears to have been demolished when the church of Kemble was built, as the north side of that edifice is still called the 'Ewen Aisle.' The locality of Kemble, its springs, and its lofty situation, favour the inference that it was an early Saxon settlement, and the scene of the peculiar sacrificial rites of that race. The discovery of two distinct burial-places of people who had not abandoned the pagan mode of sepulture favours this inference."

and not often above two; it is common in rivers and streams, preferring gravelly bottoms, and usually swimming in shoals;

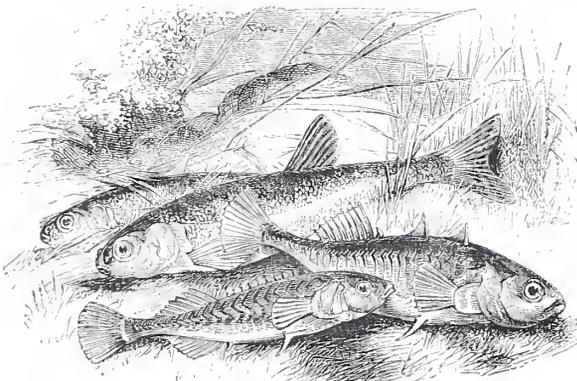

THE KINGFISHER.

it lives on aquatic plants, worms, and small portions of any animal substance. The top of the head and back are of a dusky olive, the belly white, and in summer of a rosy or pink taint, whence one of the names by which it is known; its fins are of pale brown. It is a gracefully-formed and remarkably active fish, and feeds greedily—as the Thames angler well knows, for in fishing for gudgeon he is frequently compelled to leave “the pitch,” because the minnows take the bait every time it is let down. We have the authority of Izaak Walton for believing that “being fried with yolks of eggs, the flowers

of cowslips and of primroses, and a little tansie, they make a dainty dish.”

The Stickleback (*Gasterosteus leucurus*), the common or rough-backed stickleback (for there are several varieties, distinguished by the number of spines, the common being the three-spined), is found in all our rivers, ponds, lakes, brooks, and canals, and inhabits both salt and fresh-water. They are active and peculiarly pugnacious—fighting for supremacy as fiercely as game-cocks, and rarely terminating a duel till one of the combatants is either slain or has made off rapidly. They are seldom longer than three inches, and not often so long. The fish derives its name from the sharpness of its spines; its body is without scales; the colour of the back is green; the cheeks, sides, and belly, are of silvery white; “the sides are defended throughout their whole length by

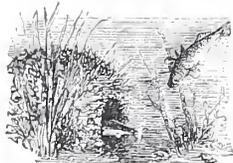

THE MINNOW AND STICKLEBACK.

a series of elongated bony plates, arranged vertically; a small fold of skin forms a horizontal crest on each side of the tail.” If this little creature, pugnacious, ravenous, with natural armor offensive and defensive, were of size proportionate to his vigour and power, he would soon depopulate the stream, of which he would be the despot. Old Izaak says of this little fish, “I kuow not where he dwells in winter, nor what he is good for in summer.” A curious and very interesting statement, however, printed by Mr. Warrington, exhibits the stickleback as a devoted husband and father, constantly protecting his mate and her progeny, and actually building a nest for her comfort and accommodation—a peculiarity which distinguishes him from all others of the “finny tribe.”

Among the many agreeable sights presented by the river “hereabouts” are large wooden tanks, formed to aid the annual process of sheep-washing; these are for the most part situate in sequestered nooks, and are usually connected with the opposite shore by rustic bridges, composed of large branches of trees, with a sort of hand-rail to conduct the wayfarer across.

It is rarely we can tread these solitary paths without the occurrence of some simple incident worthy of record for those who love nature. We seek it sometimes, but often it comes when least looked for and expected. While our artist was sketching this rustic bridge a little lad bounded from the thicket, and

“The day after they had been placed in their new domain, the strongest of the male fish was observed most busily employed gathering small ligneous fibres, and carrying them in its mouth to one particular spot, where he appeared to force them into the sand and gravel with his nose. Being perfectly unacquainted at the time with the fact of this little creature building a nest, I watched him more attentively. He had selected a spot behind a piece of rock-work, almost hidden from view; but on looking down from the top of the water I could perceive that he had already constructed a small hole as round as a ring, and with a good broad margin to it, formed of the materials he had been so industriously collecting, and on which he appeared to have placed numerous particles of sand and small pebbles. This spot he guarded with the utmost jealousy, continually starting forth from his position and attacking the other fish with most extraordinary fury.”—(Vide a paper by Robert Warrington, in the “Annals and Magazine of Natural History,” October, 1852.)

the utmost jealousy, continually starting forth from his position and attacking the other fish with most extraordinary fury.”—(Vide a paper by Robert Warrington, in the “Annals and Magazine of Natural History,” October, 1852.)

danced along the plank until he reached the opposite bank, then, pausing, he shouted, “Emmy, come, Emmy; now don’t be a fool, Emmy!” While speaking he returned to midway the bridge, and made a deliberate stand; a little girl then moved out of the thicket which her brother had quitted at a bound, and cautiously put one foot, and then another on the quivering plank, while the boy see-sawed backward and forward, first on one leg, then on another, to keep up the motion of the bridge; poor Emmy screamed; the little fellow repeated, “Come, come at once; you know you must come—you can’t get home unless you do come;” but “Emmy” held fast by the rail and would not “come.” Screaming at every fresh spring of the plank, every second moment the child looked over the bridge, where—

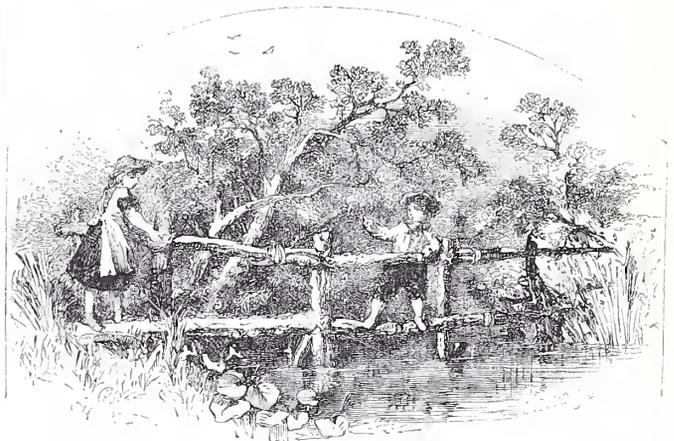

“The water-lily to the light
Her chalice reared of silver bright,”

and we saw her little chest heave with suppress sobs—this was cause for inquiry, “Why will you not cross the bridge, Emmy?”

“I se afeered.”

“What do you fear, Emmy? it is quite safe.”

“Will you take me across?”—the child looked up with the sweet confidence of childhood on her tear-washed face.

THE RUSTIC BRIDGE.

“Mother said she was to come over by herself, because it was growing on her,” interposed the boy, with the determination of young manhood.

“What is growing on her?”

“Please I do try to help it,” said the girl, timidly; “but every time I look over the rail I see it.”

“But, Emmy, mother told you *not* to look over the rail,” persisted the boy.

“If you’d only give me your hand and walk this side, I couldn’t, you know.”

“Then it grows on you, Emmy, and you’ll be a crazy Jane some day—father said so.”

This brought a fresh gush of tears, more abundant than the last, from Emmy’s large blue eyes.

“Emmy, what do you see when you look over the rail? We see the broad green leaves, and white shining cups of the water-lilies, and floating plaits of duck weed, and tall waving rushes, and bright little fish darting here and there, their quick eyes turning upwards as they vanish: you can see nothing else—except, indeed, the dazzling skimmer of the dragon-fly, and the gentle ripple of that little tide-stream, trying to keep its own pathway amid the waters of the Thames—you *can* see nothing else;” the child drew closer, and clenching her little hand over ours, trembling and white, she whispered—

“I see her face down there—down!”

“Mother would be very angry at your telling that nonsense to strangers.”

“No, not at all angry,” we replied; “but look steadily, Emmy, there is no face—that is simply a line of sunbeam on the water. Stay—if we throw in this stone, you will see how the rays divide—the sunbeams will dance merrily then.”

The child shrieked, “No, no, no! you would hurt her—you would kill her. Oh! no, no, no—don’t!”

We turned to the boy, who looked with softened eyes at his sister—“It’s only a notion she has. There, Emmy, they won’t throw stones or anything.” He was no longer a boy-bully, but a sympathising brother—he attempted to dry her eyes with the sleeve of his jacket tenderly, even while he told her she ought not to be a fool. “There now, don’t cry, and I’ll take you over the bridge.” The two went on, hand in hand, together; but curiosity obliged us to recall the boy; he came, and told us the cause of his sister’s agitation:—“Mother does not know rightly what to do with her; some says she must be made to cross the bridge, and so get used to it, others advise sending her away to gran’mother’s for a year or two, till she forgets it. She did so doat on Nanny Green, and took such care of her; and last winter the two were coming over the bridge from school, as it might be now; the plank was thick with snow, and slippery; Emmy held Nanny fast, but she was a wild little thing, springing about like a kid, and all at once Nanny slipped in, and we boys behind heard her crash through the ice, but before we got up Emmy was over after her. We dragged Emmy out all cut and bleeding, but poor Nance was drawn under the ice, and men had to look for her, and at last she was found. I never like to think of it, she was such a fat, merry little thing, and Emmy did love her so; and she don’t understand death, and won’t believe she lies under the churchyard grass, because she saw her go under the water; she won’t believe mother no more than she will me; only everything she sees bright on the water she says is Nanny’s face—Nanny’s face looking up at her! I wish there was another road to school.”

BOTANY,

AS ADAPTED TO THE ARTS AND ART-MANUFACTURE.

BY CHRISTOPHER DRESSER,

LECTURER ON ARTISTIO BOTANY IN THE DEPARTMENT OF
SCIENCE AND ART.

PART I.

THOUGH the science of botany has been long more or less perfectly understood, it has been but very scantily applied to the purposes and requirements of the beautifying ornamentist. Perhaps, upon reflection, we may find that this neglect is pardonable—for how were the two sciences to become mingled? If we ask the ornamentist how long it takes to become thoroughly acquainted with his delightful art, he replies that a life-time is too short; and if we ask the botanist what time is required in order to become thoroughly familiar with his fascinating science, he replies that the cra of man's life is not long enough. Here, then, has been the difficulty—the ornamentist has not had time to study botany, and the botanist has not had time to study the requirements of the ornamentist. This difficulty is now, however, almost overcome; for as a science progresses, its laws become more simple and definite: this is eminently true of the science of botany—old apparent mysteries are now vanishing away, being superseded by simple truth; nevertheless, though the mountains are becoming low and the rough places in this science smooth, we do not mean to say that all difficulties have vanished, and that the science has accomplished its mission by unravelling the entire web of mystery in the vegetable world. Far from it, for whole pages are yet in a labyrinth of confusion. Notwithstanding, there is now so much truth revealed, so much light enjoyed on this science, that it has laid open to us its fundamental principles, and displayed before us its beauties so simply and pleasingly that it is now little more than a work of mere pleasure to gather those gems that shall appropriately deck the ornamentist's choicest works.

It is needless on our part to show you that nature's gay flowers have in all ages been used by the aspiring ornamentist, and that they have ever been the basis on which the science of ornament has stood. We need not rehearse in your ear the pedigree of Art, to show you that the lotus was the chief unit of Egyptian ornament, that the honeysuckle formed the anthemion of the Greeks, the acanthus the Roman scroll, and numerous floral gems the ornaments of the later ages; nor need we point around to establish the fact that the products of the vegetable kingdom furnish almost the entire materials for the enrichments of the present day.

If, then, the showy gems of the meadow, the aerial bells of the mossy bank, the living cloak of the rippling rill, and the bolder foliage of the darkened forests, have in all ages been used as sources from whence to draw the beauties required for the enrichment of our meager devices, is it not imperative upon us to gather all the information that modern light has thrown upon them, that we may be better qualified to fulfil our arduous, though delightful task? If modern research has found a clue to their hieroglyphical language, and has shown that not only are their forms exquisite, their curves graceful, and the aggregation of their parts perfect, but that they speak a language which discloses more than their external beauty seems to reveal, shall we not listen to their speech, and cheerfully imbibe their golden teachings?

We rejoice in the fact that some who have become distinguished for their artistic skill have propagated the sentiments which we now advocate. Pugin, in his "Floriated Ornament," remarks that "Nature supplied the mediæval artists with all their forms and ideas; the same inexhaustible source is open to us: and if we go to the fountain-head, we shall produce a multitude of beautiful designs treated in the same spirit as the old, but new in form." And this is eminently true of other Art-epochs—is it not of the Egyptian, the Greek, and the Italian? but he goes on to say, "We have the advantage of many important botanical discoveries which were unknown to our ancestors; and surely it is in accordance with the true principles of Art to avail ourselves of all that is beautiful for the composition of our designs."

Before we proceed in a systematic manner to examine the merits of our subject, and to adjust

them to our purposes, we will answer a question some may ask, viz.:—How much time must be sacrificed in order to become acquainted with the subject? we answer, You will sacrifice none. Have we not read in our history of that hero who, when an overwhelming force was in full pursuit, and all his followers were urging him to more rapid flight, coolly dismounted in order to repair a flaw in his horse's harness: whilst busied with the broken buckle, the distant cloud swept down in nearer thunder, but just as the prancing hoofs and eager spears were ready to dash down on him, the flaw was mended, the clasp fastened, the steed was mounted, and, like a swooping falcon, he had vanished from their view. The broken buckle would have left him on the field, a dismounted and inglorious prisoner. The timely delay sent him back to his huzzaiing comrades. Was the time here lost which was spent in repairing the buckle? No—it rather proved infinite gain; and the artist's studying botany is only like the hero mending the buckle—for that time cannot be lost which is spent in accomplishing that which shall facilitate his end. You may lend time, but that, we think, will be repaid with usury. The only question that can be entertained is, which is the quickest method of arriving at the required truth. The old system—indefinite observation, or the direct scientific examination of the book of nature. This question we leave the following pages to answer.

If we have now been successful in kindling a desire in the reader's breast for an insight into the wonderful works of the blooming creation, we have done well, for he may then more studiously pursue the following.

It is not the object of these paragraphs to fully develop even the simple and certain truths which botanical science has revealed, nor to furnish essays on the latter science, and thence draw maxims to rule our future conduct. It can only come within the limits of our space to display the results and effects of established truths, with their adaptation to our requirements. Therefore, we shall show the adaptability of every part of the vegetable organism, when thoroughly understood, to the general requirements of the ornamental world; and then reveal the peculiar adaptability of certain forms and lessons to particular cases or manufactures. In this great task we shall allow ourselves free scope among all the ramifications of the vegetable kingdom: we may drag the roaring ocean for its organised pearls; we may dip in the tranquil pool for its vegetable gems; we may ascend the alpine heights to bring down their treasures; we may wander o'er the burning plain, or through the woods of the warmer zones to reveal their beauties; we may spread our arms and embrace all tribes of the vegetable race,—believing that they are all given to help us in our glorious task.

In order to receive the full benefits derivable from meditating on the various parts of the vegetable structure, it will be necessary for us to give as brief an insight as possible into the laws or principles which govern the development of the various vegetable organs, and the influences which bear upon their development, so as to modify or disturb their normal positions.

We ask you to follow us to the woodland, and as we crouch beneath the outstretched boughs, behold the humbler gems which form the carpet of the great hall of nature; as we enter on the grottoes formed by the meeting of the high and lofty arms of the towering trees, mingled with the free-growing creeper, lift your searching gaze and examine the overhanging canopy. Wander on, and lounge on the downy couch by the side of the murmuring rivulet, and scrutinise its nodding bells, its odorous bespangled covering. Take your morning walk, and behold the vegetable virgins of the earth lifting up their heads, unfolding their gay foliage, and blushing to kiss the morning dew: and in these cases we say that you see nature in her true character, in her twofold aspect.

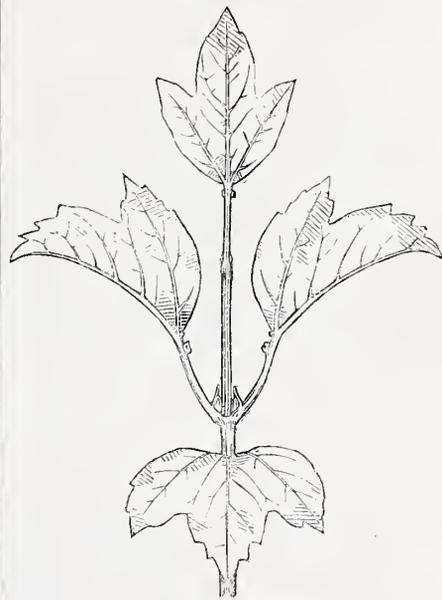

The first and general effect that strikes us in such a ramble is the *rustic*, an effect derivable from two sources—first, the vegetable structures are here modified by external natural influences; and second, they are for the greater part deformed in their growth from the preponderance of interrupting causes. Before, however, we can fully comprehend in what way, and to what extent, nature is here modified by influences from without, we must be familiar with the normal positions of the various

organs and their natural habits. Therefore it behoves us to examine first the principles on which nature works, so that we may learn, as it were, her intentions, or what her productions would be were they unmodified by external influences. This latter condition of nature we shall call its *natural state*. After which examination we shall be qualified to discern between truth and deformity, rule and exception.

A plant is regarded by the botanist as composed of a central rod, or stem, which he names the *axis*, and *lateral* organs of diverse characters, as leaves, &c., which proceed from it. For artistic purposes we deem it expedient to view these structures from two points, or in two lights—first, as looking at the side of the plant (the ordinary view that we have of trees), when it is to us a vertical composition; and second, as looking on the top of the object (the view which we generally have of small plants, as the houseleek, daisy, &c.), when it is to us a circular composition. These observations will lead us to a great principle in the vegetable world—viz., the *centralisation of power, or the exertion of a force in a centrifugal manner from a fixed point*, which gives a marvellous oneness to the structures of this kingdom. This, with the great variety worked out in nature by the Great Head of the universe, has given rise to what is termed "*unity in variety*."

Let us now glance at the axis, or central rod of the plant. If we take the axis of such a plant as the Elder, Lilac, Horse-chestnut, or Guelder-rose, one year old, and view it laterally, we find that it is thickest in its centre, where the root and stem meet, or at the plane from which the plant elongates in opposite directions (this plane has been named the collar, or medial line). This axis, then, is composed of two cones, the bases of which cohere.

The axis, however, is not naked, but is usually garbed in a foliaceous dress; nor is this mantle carelessly adjusted, for every leaf has its own individual position, and each one is so placed as to form, with the rest, a symmetrical series. If, now, we examine the disposition of the leaves, or foliaceous appendages, on one of the axes above suggested (the Guelder-rose, for example, Fig. 1), we shall find that there originates in, or springs from, certain planes

Fig. 1. GUELDER-ROSE.—*Viburnum opulus*.

which cross the stem or axis at intervals, two leaves which develop in contrary directions from the two opposite sides of the stem. In no instance, on this plant, do we find more than two having their origin in the same plane, or less than two developed by this vital point (they are in this case said to be opposite). Not only are the leaves on these plants in pairs, but each successive pair crosses the pairs both immediately above and below it, or is so situated as to form with them right angles. Substitute for the axis just examined that of the Goose-grass (*galium*, Fig. 2), or the Madder, and here we have a series of three or more leaves originating in the one vital plane; hence they are

arranged in rings round the axis (*verticillately*), and each successive verticil is so developed that its

Fig. 2. GOOSE-GRASS.—*Galium aparine*.

members fall between the component parts of the whorls both immediately below and above it. If, now, we turn to the Lime-tree, or *Polygonum cuspidatum* (Fig. 3), we no longer find two or more

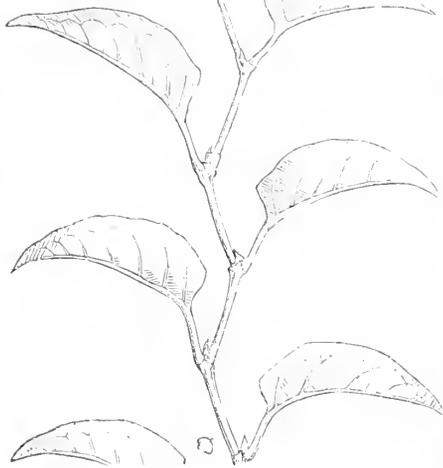

Fig. 3. *Polygonum cuspidatum*.

leaves originating in one transverse plane, but we find the leaves protruded solitary at intervals, one at one side, the other at the other side of the stem (*alternately*). Simple as this arrangement may appear, and actually is, it is nevertheless the first of a series which successively becomes more and more complex; for though the leaves are merely alternately at one side and then at the other, they nevertheless take their consecutive positions in a spiral cycle, as will be immediately seen from a glance at the figure (Fig. 4). To follow out this spiral arrangement, we may notice the *Cereus triangularis*, or the Meadow-saffron (*Colchicum autumnale*), where one revolution of the spiral thread encounters three

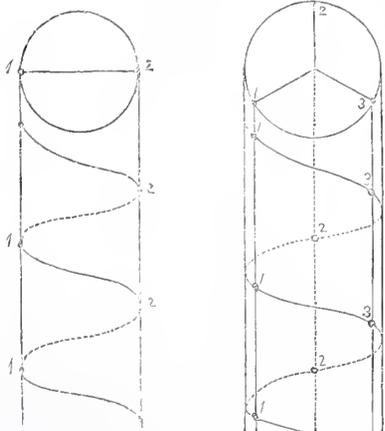

Fig. 4.

Fig. 5.

leaves; the fourth, or, rather, the first of the next cycle, being over the first (the principle of which is shown in Fig. 5), whereas, in the alternate arrange-

ment, two leaves only are encountered in one spiral revolution; the third, which is the first of the next cycle, being over the first. Without following this out in its various modifications, as this is not the object of these pages, but rather to convey a mere outline of principles, we just notice that, in some instances, the spiral thread makes more than one revolution round the axis in order to complete the unit of the arrangement of the leaves. An exceedingly common form of this variety is that in which two revolutions of the spiral thread, encountering five leaves, complete the cycle—this is found in the Oak (Fig. 6), and many of our fruit-trees.

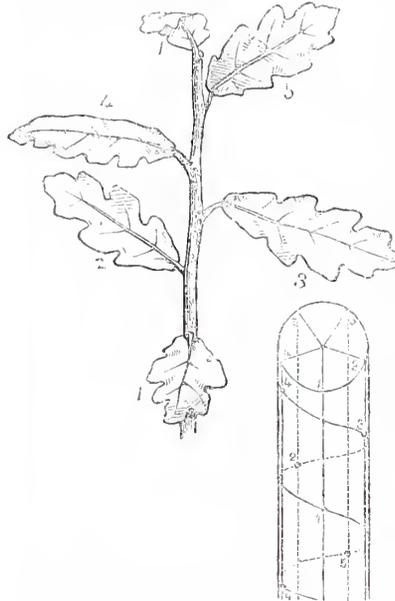

Fig. 6. OAK.—*Quercus*.

These being the principal varieties of the arrangements of leaves upon the axis, furnish us with nature's most simple and characteristic vertical compositions; and few, we think, can have passed even thus far without being forcibly impressed with the lesson that simplicity is elegance.

Having now examined the principles on which leaves are developed, and their varied aspects when viewed in a side or lateral direction, we must notice the peculiarities and appearance of these diverse arrangements when viewed from above.

Recommencing our observations with the opposite leaves, as of the Guelder-rose, and viewing them from above, we find that most frequently each successive pair occupies the spaces midway between the leaves of the pairs both immediately below and above them, as we have already stated, thus giving rise to a cross as the top view (Fig. 7).

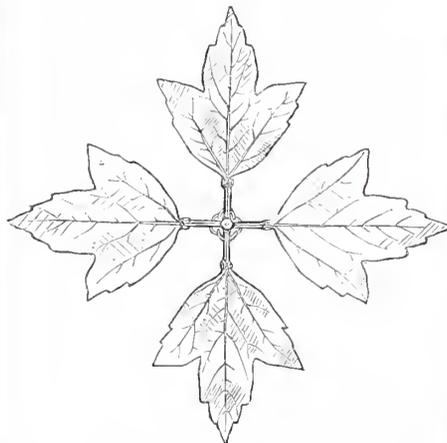

Fig. 7. GUELDER-ROSE.—*Viburnum opulus*.

If we view verticillate leaves from above (Fig. 2), we shall find, as we have previously remarked, that the leaves of each successive verticil, or ring, occupy the spaces between the leaves of the preceding whorl, giving rise to the effect delineated in Fig. 8, each alternate pair being over one another.

Respecting the top, or horizontal view of the spiral modes of arrangement, it is obvious that in

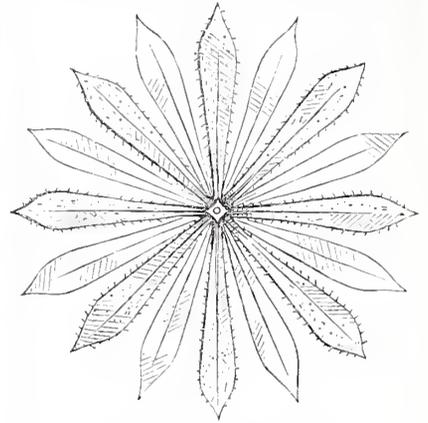

Fig. 8. GOOSE-GRASS.—*Galium aparine*.

the alternate disposition, as that of the *Polygonum cuspidatum*, where one leaf is on one side of the stem, and one on the other, the third being over the first, that they fall simply into two rows, one on either side of the stem (Fig. 9). In that disposition

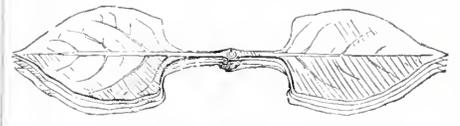

Fig. 9. *Polygonum cuspidatum*.

where three leaves form one spiral cycle, the leaves are in three rows; and in that where five leaves form one unit of the spiral, whether the spiral thread revolves once or twice round the stem in order to complete the cycle, the leaves are in five rows (Fig. 10). This is sometimes carried to a much more complex state, as in the Screw-pine.

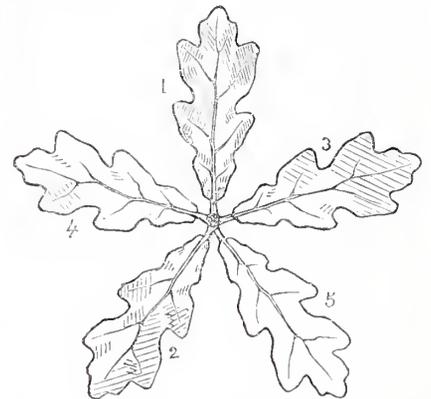

Fig. 10. OAK.—*Quercus*.

These observations reveal to us nature's most characteristic and simple circular compositions, and show forth a series of members, originating in one point, and extending on one plane; and a series of parts, originating in various points, and arranged round an extended centre. This subject will, however, be touched on again. As in all cases the lateral members are the product of the axis, or originate in the central rod, it is obvious that this central axis embodies, or is, the centre of power. And as this axis is in all cases the centre, and the lateral organs proceed from it, there is at once displayed a marvellous unity in the entire products of the more highly organised tribes of the vegetable kingdom—for all, when viewed from above, are circular compositions.

Having now glanced at the most simple compositions displayed before us by our kind Creator, we proceed to notice the principle on which nature constructs, or develops her more complex structures.

It is an axiom in botany, that whatever is the arrangement of the leaves, such is the arrangement of the branches; for a branch is always the product of the development of a bud, and a regular bud is always generated in, and developed from, the axil of

a leaf, or the angle formed by its union, with the stem or axis; this, therefore is evident, and at once reveals the principle on which nature produces her more complex structures. This, which is merely a system of repetition, may be carried to any extent.

There is one point which we should here notice—viz., that although the structure may be extremely complex in appearance, it is so only in extent; for the unit is invariably more or less simple, as well as the method of its repetition.

The French* have expressed themselves thus:—“It is more logical to say that a plant, by growth, repeats than divides itself.” Now upon this beautiful idea one or two things of great interest are built: first, that the branches given off by a parent axis are axes each of which is precisely similar to the parent in its original condition, or, in fact, is a repetition or reproduction of the parent in its original state; and second, that as the power of development is centralised in the axis, each lateral axis has this power also; therefore we have a primary central developing power, surrounded by a series of secondary developing points (Fig. 11). Here we see most clearly that

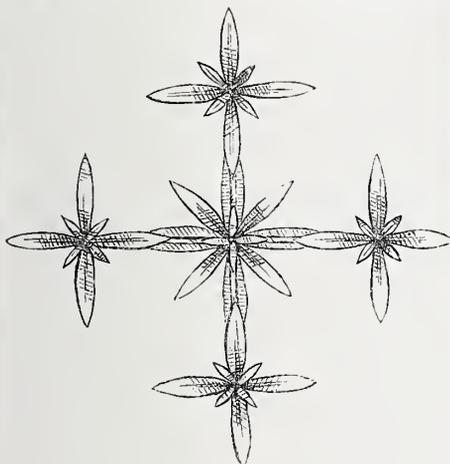

Fig. 11.

the broad principle of unity in variety is wonderfully worked out in the vegetable kingdom.

Need we go further to reveal the simplicity of the structure of the works of creation as displayed in the vegetable kingdom? Having thrown out the unit, can we not readily repeat it; having laid the first stone, can we not readily raise the edifice? Lest we should not have expressed ourselves with sufficient clearness, and left some difficulties yet standing, we proceed to apply these principles to the various parts of the vegetable structure.

Having shown that the entire robe of the central axis is the result of a centrifugal vital force, and that this is not only inherent in the primary axis, but in lateral axes also; having also shown that this one energy, modified in effect, exists in all the more highly organised products of the vegetable kingdom, we now proceed to notice the extent of the modification of this universal vital force. It is entertained by most botanists that, although the arrangement of leaves—hence of buds and branches—is diverse, that, nevertheless, the principle of their development is one; for instance, suppose that an axis develops its leaves in a spiral manner, and that the portions of the stem which separate each consecutive member of the spiral cycle are undeveloped, those portions only being generated which separate each complete revolution of the spiral, the result would be a whorl of parts, and not a spiral disposition. In this supposition we are borne out by many facts in nature (see the Jerusalem-artichoke, *Helianthus tuberosus*). Upon this principle are the parts of the flower adjusted; the flower-stalk is the axis or stem, and the component parts of the flower are leaves in a somewhat metamorphosed state. By the non-development of the portions of the axis which separate the floral leaves, they are aggregated usually into four contiguous rings of parts. These rules, however, are not without apparent exceptions; but space will only permit us to deal with broad principles and general facts.

* See E. le Maout's "Botany."

Deeming the preceding sufficient to show the unity of that divine idea which God has been pleased to work out so wonderfully and so variously in the vegetable products of our globe, and to establish fully the fact that one principle reigns throughout the countless varieties of the floral developments of our globe, we proceed with our task.

Having now examined the laws or principles on which nature works in the vegetable kingdom, it will not be difficult to establish our next proposition—viz., that the productions of nature belonging to the vegetable world are symmetrical in their parts, as well as in the disposition of those parts when aggregated, if their normal arrangement is not disturbed by external influences. The first question that here arises is, What is symmetry? "Symmetry," says Lindley, "may be defined to be the general correspondence of one half of a given object with the other half, in structure, or other perceptible circumstances; or the general correspondence of one side of an object with the opposite side, in structure, or other perceptible circumstances." And he goes on to say:—"If understood in such a sense, all living objects whatever will be included under the denomination of symmetrical. That which we find universally in the animal kingdom belongs to all parts of the living world, and must therefore occur equally in plants, however unlike animals they may be. The student's attention cannot be directed too closely to this important law, from which there is no real departure, except owing to accidents, such as those which produce monsters in objects with which we are most familiar. Indeed, symmetry in plants arises out of their peculiar nature, and is dependent upon a highly-complicated internal structure, which is in itself essentially symmetrical. The basis from which organs proceed being symmetrical, it seems to be an evident inference that the organs themselves should be symmetrical also." This statement—viz., that vegetables are symmetrical—is so obvious that it requires no proof; for we think that none could have joined us thus far in our researches without feeling that this is a prominent characteristic of vegetable pro-

Fig. 12. PLANE.—*Planus orientalis*.

ductions; for, having shown that nature works on set principles, we have shown that her products must be symmetrical, for the result of principle and order is symmetry. If, however, we take any vegetable organ, or aggregation of organs, for analysis, we shall be struck with their marked adherence to this rule.

Take the leaf of almost any plant, and you will find that its two halves are alike (Fig. 12); so constant is this, that the two or three exceptions in the vegetable kingdom are marked by botanists as, to an extent, curiosities, examples of which are the Begonia (Fig. 13) and Elm; and, although these examples prove exceptions to the symmetry or correspondence of the parts of the individual leaf, nevertheless the disposition of these leaves on the axis is such as will restore symmetry. No comment need be given on the disposition of the leaves alluded to, for all, falling into a regular geometrical series, are symmetrical—the spiral not excepted.

* Lys' "Symmetry of Vegetation."

If we turn to flowers, two varieties strike us; both of which are, however, equally symmetrical.

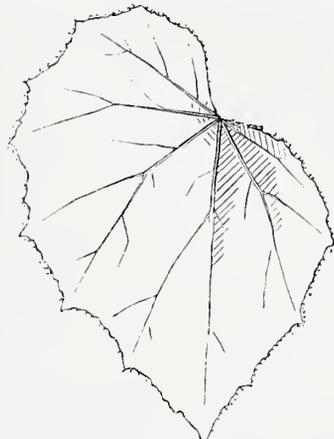

Fig. 13. BEGONIA.

The most common is that in which the flower is composed of a series of units, which are precisely similar; thus in the Stonecrop (Fig. 14), there are five precisely similar lobes forming the outer ring of parts (sepals, constituting the calyx); five yellow leaves, precisely alike, forming the next whorl (petals, forming the corolla); ten awl-shaped members, surmounted with knobs, forming the third ring (stamens, forming the andræcium); and five central parts (carpels, constituting the pistil). Here the units of each whorl are precisely similar, and they have their halves also alike; but it would not interfere with the symmetry were the halves of the members of any of the whorls unequal, provided that all pointed one way, as in the flower-leaves (petals) of the Periwinkle (*vinca*, Fig. 15). The other variety is that in which the

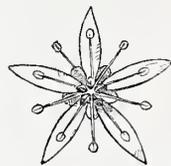

Fig. 14. STONECROP.—*Sedum*.

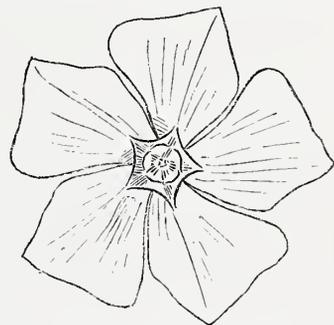

Fig. 15. PERIWINKLE.—*Vinca*.

two halves of the flower only are alike, as the Pansy (Fig. 16); but here there is no loss of symmetry, as the halves are similar, and it makes a pleasing variety. It only demands a peculiar position, which we shall hereafter notice.

None, perhaps, could help being struck with the numbers of the parts of the flower of the Stonecrop (Fig. 14), as we enumerated them, the outer whorl being composed of five parts; the next of five; the next of ten (twice five); and the inner of five. This is a rule in the vegetable kingdom, that whatever may be the number of parts in one floral whorl, that such shall either be the number in the other whorls, or some power (multiple) of that number. This rule, however, is not without exceptions.

We must next notice a principle of paramount importance, which is equally strongly exhibited in the vegetable kingdom with those points above reviewed—namely, adaptation to purpose; this, however, we must defer for our next paper.

Fig. 16. PANSY.—*Viola tricolor*.

THE ROYAL PICTURES.

VENICE: THE BUCENTAUR.

A. Canaletto, Painter. J. B. Allen, Engraver.
Size of the Picture, 4 ft. $\frac{1}{2}$ in. by 2 ft. 5 $\frac{1}{2}$ in.

Of the vast number of Venetian scenes which Canaletto painted, this is, perhaps, the most elaborate in its details, and the most gorgeous in effect—qualities that are sufficiently accounted for by the nature of the subject. Venice, the city of palaces, contains no finer display of picturesque architecture than that part of the Grand Canal which is seen in this picture; and, to heighten its splendour, the artist has introduced the grandest pageant with which the history of the republic is associated. The general character of the works of this painter is so well known, that it is unnecessary to offer much comment upon them; his pictures are portraits of the places they represent, copied with the truth of the daguerreotype, and exhibiting little attempt to invest them with poetical feeling or sentiment. Mr. Ruskin is very severe upon Canaletto, and refuses him even the merit of truth, although admitting that he "possesses nothing but daguerreotypism." After asking his readers to restore Venice, in their imaginations, to some resemblance of what she was before her fall, which they will, perhaps, be able to do "from such scraps of evidence as may still be gleaned from under the stucco and paint of the Italian committees of taste, and from the drawing-room innovations of English and German residents," he thus proceeds, in his own eloquent but harsh language, to speak of Canaletto:—"Let him,"—the reader, that is,—"looking from Lida or Fusina, replace in the forest of towers those of the hundred and sixty-six churches which the French threw down; let him sheat her walls with purple and scarlet, overlay her minarets with gold, cleanse from their pollution those choked canals which are now the drain of hovels where they were once the vestibules of palaces, and fill them with gilded barges and banneted ships; finally, let him withdraw from this scene, already too brilliant, such sadness and stain as had been set upon it by the declining energies of more than half a century, and he will see Venice as it was seen by Canaletto: whose miserable, virtuous, heartless mechanism, accepted as the representation of such various glory, is, both in its existence and acceptance, among the most striking signs of the lost sensation and deadened intellect of the nation at that time; a numbness and darkness more without hope than that of the grave itself, holding and wearing yet the sceptre and the crown, like the corpses of the Etruscan kings, ready to sink into ashes at the first unbarring of the door of the sepulchre."

In a subsequent paragraph Mr. Ruskin enters into a more minute criticism of the works of Canaletto; with some of his remarks we agree, others we dissent from: still, there are pictures by this artist which are scarcely amenable to any of the charges brought against him by the author of "Modern Painters."

The subject of the picture here engraved is one familiar enough to all acquainted with English Art, as it has long been a favourite with many of our painters; indeed, there are few who have visited Venice without bringing back some pictorial reminiscence of the Grand Square of St. Mark, and its contiguous edifices. The Bucentaur, the state galley of the ancient republic, is now, we believe, rotting in the Arsenal, after having for more than six hundred years borne the Doge, and all the great civic dignitaries, to the mouth of the Adriatic, to assist in the ceremony of the espousals of the city with the sea, on the Feast of Ascension, when the Doge dropped the ring into the Adriatic, betrothing her in these words:—"We wed thee with this ring, in token of our true and perpetual sovereignty." This ceremony is traced to a victory obtained, in 1177, by the Doge Zinni, over Otho, son of the Emperor Frederic Barbarossa. The Pope, Alexander III., whose cause the Venetians had embraced, received the conquerors on their return, and presenting their commander with a ring, authorised him to use it as related on every anniversary day of the victory. The ceremony terminated with the occupation of Venice by the French at the close of the last century.

The picture is in the Collection at Windsor Castle.

ISCHL:

A NEW FIELD FOR ARTISTS.

THIS little place, which we have made our headquarters for the purpose of exploring the beauties of the Salzkammergut, a district lying in the south of Austria, joining Tyrol, was, till lately, an insignificant market-town; and though still boasting of no fine public buildings, nor having the evil attractions of a gaming-table, like other baths of Germany, undoubtedly far surpasses them all in the charms lavished upon it by nature. The advantages it offers to the artist, and lover of what is beautiful, are such, that I purpose entering into somewhat lengthened details on the subject, hoping thereby to induce some artist to spend a summer's vacation here, as I regret so few of our English landscape-painters repair to a spot in every way desirable for them. My own attention was drawn to the Salzkammergut by Herr Krummer, the well-known artist of Dresden. From Vienna we came up to Linz by steamer, passing some grand scenes on the Danube. At Linz we took the tram-road to Lambach and Gmunden, stopping at the former a night, in order to enjoy a peep at the Traun Falls, about seven miles distant, more leisurely. The Traun, a stream bright and clear as crystal, dashes over rocks grand and picturesque in form; the white foam, wreathing above and about you, falls like showers of diamonds in the sunshine. The surrounding scenery harmonises well; indeed, I consider these falls equal to Schaffhausen. The lake of Gmunden, or, as it is sometimes called, the Traunsee, is romantic in the extreme—particularly at the Ebensee end, where the Dachstein, with its glaciers, first comes into view. Mountains encircle the lake, but they are not all bare and barren, as in most lake districts, being generally clothed to the water's edge with forests of fir, larch, beech, and oak; bold masses of rock jutting forth, and contrasting well with the varied tints of the neighbouring foliage: thus there is less sameness than is usually found in similar spots.

A steamer carries passengers from Gmunden to Ebensee; and though the idea of a steam-boat so lovely a lake may at first appear rather to jar with one's preconceived notions of the picturesque, and to be sadly out of place, yet I assure you we availed ourselves gladly of the accommodation it afforded, and were soon so thoroughly absorbed in the contemplation of the increasing grandeur of the scenery, as to be perfectly forgetful of our means of locomotion. When about half-way across, the lake makes a sudden bend, and the character of the scene is entirely changed, that part near Gmunden being of a smiling, quiet kind of beauty, while at the upper end the rocks rise majestically from the water, their fine and peculiar outline cutting clearly against the sky—the magnificent Traunstein lowering above them all, and casting its gigantic shadow over the bright green water,—for you must know the colour and transparency of the Traun are shared by every lake throughout the Salzkammergut. Vehicles are at Ebensee in waiting to take people on to Ischl, along the Traun valley, in which fresh beauties present themselves at every turn; in truth, it would be difficult to find in a day's journey scenery to equal that I have endeavoured to give a slight notion of. The accommodation at the hotels is good, particularly at the Kaiserin Elizabeth, kept by a civil, obliging person, Herr Bauer, who speaks English; but for any one who desires very economical quarters, there are several other hotels of less pretension. Apartments are numerous and not dear, if you bargain, as they always demand about double what they intend taking. Capital fishing is to be had. The costume of the women is peculiar as regards the head-dress, it consisting of a large black silk handkerchief bound round the head, and tied so as to bring all the ends banging down behind. The peasantry are not handsome—but to return to my subject. The excursions that can be taken from Ischl are numerous, and gentlemen who are not too fastidious about having luxuries for supper or dinner—as I fear many of my countrymen are—may generally be fairly accommodated for a few nights in the villages round, if, for purposes of study, so long an absence from head-quarters be desirable. A convenient mode of locomotion is to hire a carriage of the

country, called an *Einspänner*, and it is not very expensive. We enjoyed our visit to the Vorder Gosausee extremely. The road that leads thither passes by one end of the Hallstadt Lake, then diverges, and you enter a narrow defile, down which rushes a lively torrent, forming, from the nature of its rocky bed, and the steepness of the descent, a succession of cascades.

Inviting subjects for the pencil present themselves throughout this gorge, as also in the Gosathal, at its upper extremity, where you must leave your carriage, as a forest intervenes between it and the Vorder See: on emerging from the former, the lake suddenly bursts upon you with solemn grandeur, hemmed in as it is by lofty mountains and dazzling glaciers. A boat carries you across, and after a short walk, you come to the Hinter See, yet more sublime in its severe beauty. The scene is one that baffles my poor powers of description. So profound a stillness reigns, that one cannot resist the feeling of awe that creeps over the mind, and at length renders the longing after life and sunshine unbearable. The reflections in the deep, dark water were perfect: the only creature I saw to disturb the repose of the scene was a chamois coming down to drink: he soon fled away on observing us.

The lake of Hallstadt is another of the sombre kind, the mountains being of great height: in fact, in the little village bearing the same name, the sun is not seen for months above their summits. From what I have said, I fear you may fancy the scenery is all of a grand, but savage character—such as Salvator Rosa revelled in; but it is not the case, as all who have visited the lovely lake of Wolfgang will testify, than which nothing can possibly be more picturesque or beautiful.

Less distant excursions offer equally enchanting objects, the only difficulty for the artist being what to commence with; indeed, the sketchbook should never be left at home, as on emerging from the dense woods most exquisite views over hill and valley present themselves, in spots where nothing of the kind could have been anticipated. The trees are ever luxuriant. For the botanist also Salzkammergut has many charms, its stores being rich and varied; and to the seeker after health the exhilarating mountain air is invaluable. The simplicity of the daily routine of life is charming; everybody enjoys himself in a natural, unaffected manner. Breakfast and coffee we generally take in the open air, either at a nice little country inn up the Laufen valley, or at one of the many places set apart for such purposes, and which are always situated where a fine view lies stretched out before you.

Salzburg is easily reached from Ischl; the beauties of its situation are too well known to require any mention here. The drive from thence to Königsee, through the valley of Berchtesgaden, is so fine that no one can regret the time it occupies; and the Königsee itself well deserves its high sounding name. We were much favoured by the weather when we visited it, the day being one of smiles and frowns—so we had opportunities of seeing the lake under many aspects. The mountains encircling the Königsee are grand in the extreme, and as the masses of cloud rolled majestically up, disclosing their fine outlines, they appeared to great advantage. Occasional gleams of sunshine shot athwart the lake as we rowed along, and served to make the gloom more perceptible: it was altogether a strange, melancholy scene. The boats used on this lake are most primitive, being formed only of a single tree hollowed out; they are in shape similar to a canoe, and highly picturesque.

My letter has really become so long that I fear your patience is exhausted, yet I feel how inadequately I have portrayed the delights of a summer's residence at Ischl; however, if I have excited your curiosity, so as to make you come and judge for yourself, my object is attained. Believe me when I say that during my long wanderings a lovelier district than the Salzkammergut, with its magnificent mountains, waterfalls, glaciers, forests, sparkling rivers, and romantic lakes, it never has been my lot to see; indeed, I question if there be a country more rich in the glories of nature, and long, long will the remembrance of the happy hours spent watching the ever-varying effects of evening from our cottage at Ischl be treasured by me.

ETHERS S. PERCY.

L. CANALETTI PINXIT

THE VENETIAN CANALS

FROM THE PUBLICATION OF THE VENETIAN CANALS

Copyright, 1850, by L. Canaletti

ART IN THE PROVINCES.

EDINBURGH.—The stained glass windows painted by Mr. Ballantine, from the designs of Mr. D. Roberts, R.A., have just been fixed in their places, in the building known as the "Scott Monument." There are four principal windows, and the chief architectural ornamentation of the glass consists of elaborate Gothic canopies, with rich mosaic backgrounds, surmounting figures and armorial bearings supported on pedestal pillars, with foliated caps and panelled backgrounds of geometric tracery. The south window has an effigy of St. Giles, the tutelary saint of Edinburgh, habited in the robes of an abbot of the eighth century, and supported on each side by angels with stringed instruments of music. The north window exhibits an effigy of St. Andrew, the tutelary saint of Scotland, supported by two kneeling angels, who present him with branches of palm. The west window contains the arms of Edinburgh; the castle and rock on the shield are copied from a very old engraving: various heraldic devices surround the coat-of-arms. The east window exhibits the ancient arms of Scotland, also surrounded by devices and mottoes. In each window an angel, rising over a richly-carved corbel, holds a shield, on which the arms of Sir Walter Scott are blazoned, and the four windows are surrounded with labelled borderings, on which are inscribed appropriate passages from the "Lay of the Last Minstrel." In addition to these are four smaller windows, filled in with diapered glass. The effect of the whole has been described to us as exceedingly chaste and brilliant, showing Mr. Ballantine to be a master in the "art and mystery" of glass-staining. The sketches for the figures of St. Andrew and St. Giles were furnished by Mr. James Drummond, of the Royal Scottish Academy; so that the entire work is the joint production of artists, the fellow-countrymen of him in whose honour the building is erected.

The report of the committee of the "Royal Association for Promotion of the Fine Arts in Scotland," for the year 1855-56, has been forwarded to us: the income of the past year shows a considerable advance over the preceding, the amount subscribed reaching to nearly £5000. With a portion of this sum, thirty-seven works of Art were purchased from the Exhibition of the Royal Scottish Academy, and from the studios of its members and exhibitors, including "St. Patrick's Day," by E. Nicol, £400; six illustrations from "The Gentle Shepherd," by T. Faed, £250; "Watching the Pass—Daybreak," by J. Noel Paton, £150; "Newhaven Harbour," S. Bough, £120; "A Turf Cot—returning from the Bog," E. Nicol, £120; "The Bass, from the Rocks at Canty Bay," E. T. Crawford, £120; "Highland Stream," W. H. Paton, £100; "An English Village—Winter Afternoon," S. Bough, £80: to these pictures a marble bust of "Ophelia," by W. Calder Marshall, R.A., was added, and a number of statuettes, executed in statuary-porcelain by Copeland, from Brodie's "Corinna." The Committee, feeling themselves compelled to abandon the idea of issuing to the subscribers an illustrated edition of the "Gentle Shepherd," substituted for it an engraving, by H. Lemon, from the picture of "The Two Henrys," by J. C. Horsley, A.R.A. For future distribution there are in preparation a series of designs illustrating Burns' ballad of "The Soldier's Return," and an engraving by W. H. Egleton, from Scott Lauder's picture of "Christ teaching Humility." These are the chief points on which the report touches; and we have only to congratulate the Society on the sure and steady progress it appears to be making.

OXFORD.—Six statues of men illustrious in science and philosophy are about to be placed in the grand hall of the Museum at Oxford: these sculptured works are the gift of Her Majesty, and will be executed in Caen stone, and of the size of life. Mr. A. Munro has had two entrusted to him—those of Galileo and Newton; the former is completed, and the latter considerably advanced. Mr. T. Woolner is at work upon another, that of Lord Bacon. We have not learned the subjects of the three others, nor who have been commissioned to execute them; but we cannot speak in too high terms of the gracious consideration which has prompted Her Majesty to command these works, and especially to entrust them to sculptors comparatively unknown to fame, who are thus afforded an opportunity of raising themselves to distinction in an Art—that of portrait-sculpture—in which we certainly are, as yet, far below the artists of the Continent.

NORWICH.—The annual Art-Exhibition was opened in this city on the 19th of November; it is spoken of, by some of the local journals as being the best which Norwich as yet has had, containing numerous pictures by the old masters—Titian, Salvator Rosa, Velasquez, Van Huysum, Van Dyck,

Metzu, and Hals, which were contributed from the galleries of the neighbouring gentry, who also sent specimens of the following deceased English painters:—Gainsborough, Muller, Clarke, Cotman, and Crome, senior: the two last were natives of Norfolk. Of living British painters known in the metropolitan exhibitions, the catalogue includes the names of—Sir E. Landseer, R.A., Frith, R.A., J. Ward, R.A., A. Cooper, R.A., T. Uwins, R.A., H. B. Willis, Williams, Egley, Desvignes, J. Stark, A. F. Rolfe, Zeigler, J. B. Pyne, Gosling, W. Hunt, Bouvier, R. H. Woodman, Vickers, Callow, Mrs. Oliver, Lance, Duffield, and Boddington, junior; and among the local artists whose works deserve especial notice, are those of Mr. Claude Nursey, head-master of the School of Design, A. G. Stannard, Mrs. Stannard, and Miss E. Stannard, D. Hodgson, Ladbrooke, senior and junior, Barwell, Downes, &c., &c.

CORK.—The annual examination of the drawings, &c., executed by the pupils of the School of Art in this city, took place on the 22nd of October, when fourteen medals were awarded to the same number of students, and "honourable mention" was made of sixteen other names. Nine prizes were also awarded for proficiency in perspective, geometry, and freehand drawing. On the 24th of the month, the prizes were presented to the successful students by the Mayor of Cork, in the presence of a large company of the supporters of the institution and their friends.

BANBRIDGE, County Down.—A marble tablet to the memory of Captain Crozier, R.N., who, as Commander of the *Terror* in the last Arctic expedition, is presumed to have lost his life with his brave companions, Sir J. Franklin and others, has recently been erected in the church of his native place, Banbridge. The upper part of the monument represents the doomed ship amidst the icebergs, and underneath the inscription is a medalion portrait of the deceased officer. The work is designed and executed by Mr. J. R. Kirk, R.H.A., a young Irish sculptor, whose productions we have before favourably noticed: this, his latest work, will add to his rising reputation.

YARMOUTH.—The hint given a month or two back, by ourselves and some of our contemporaries, respecting the Nelson Monument at Yarmouth, has, it would seem, received due attention from the gentlemen of Norfolk, who have held a meeting "to take into consideration the best means of providing for its restoration, and preserving it in effectual repair for the future." A committee which includes a considerable number of the most influential "county names," was nominated, and a subscription commenced; so that, ere very long, we trust to hear that this memorial of our great naval commander is no longer a reproach to the county which boasts of him as "their hero."

CHESTER.—At the last public examination of the students of the Chester School of Art, 750 pupils were examined in drawing; of this large number, three received medals, and other prizes were awarded to ninety-five of the scholars.

WORCESTER.—The annual meeting of the Worcester School of Art was held on the 21st of November. We hear that the drawings exhibited by the pupils included a large increase of advanced works; and that the studies have been rendered more practically useful by their application to articles of manufacture. The number of pupils attending the classes, both male and female, is greater during the last sessional year than at any former period.

BURLEIGH.—The annual meeting of the Burslem School of Art was held on the 3rd of December. In the report, the committee congratulated the friends of the institution on the satisfactory progress of the pupils, whose numbers are so steadily increasing as to require a more suitable school-room—a subject which was urged upon the attention of the visitors.

CARLISLE.—The subscribers to the Carlisle School of Art, and the friends of the institution, held their annual meeting on the 1st of December. Mr. Brook has resigned the office of head-master, and is succeeded by Mr. W. Pozzi. The income of the school during the past year had exceeded the current expenditure, so that the school had so far become self-supporting. The number of pupils attending the Central School was 67, and 378 were taught by the master in the various public and private schools.

SWANSEA.—The fourth annual report of the Swansea School of Art was read at a meeting of subscribers, &c., on the 2nd of December. We learn, that in consequence of the withdrawal of two public classes,—the Normal and the National Schools, to the former of which a private teacher had been appointed,—there has been a falling off in the number of pupils and the amount of receipts; but there was an increase of subscriptions, and the committee are quite sanguine of ultimate success.

THE
ART-TREASURES EXHIBITION
AT MANCHESTER.

THE severity of the weather has necessitated a temporary suspension of the progress of the building. A portion of the brick-work façade which fell down during the frost cannot be repaired and proceeded with; but, with that energy which characterises the plan and its execution, this façade has been at once abandoned, and an iron one will be substituted. The entire length of the building is 700 feet, and its entire breadth 200 feet. In form it is somewhat similar to the Crystal Palace, but through the bulk of the building there are no galleries; there is a gallery extending only round the upper portion of one extremity, that is, between the transept and the further end of the structure. The grand centre aisle, and the two smaller aisles, one on each side of it, extending the entire length of the building, constitute the grand central hall, which is again flanked by two other aisles of the same length. The internal appearance, as far as we can judge at present, will be exceedingly graceful, and for exhibiting pictures, the light, we are told, is most favourable; this is especially gratifying, as the edifice will contain some of the finest works of Art the country can show; and our private collections are richer in ancient Art than those of any other nation. It was proposed at the end of the edifice to construct refreshment and other rooms, but this part of the plan is abandoned, and the space originally set apart for that purpose will be laid out as a gallery to hang water-colour drawings; there will also be smaller rooms for special arrangement of collections of *vertu*. The plan of the exhibition, besides the classic and the historical divisions, will comprehend the Anglo-Roman, Celtic, Byzantine, Romanesque, Mediæval, Renaissance, Louis XIV. and XV., &c. The sculpture will present, not only marble statuary, but examples of every plastic manner, metal-work, armour, works in silver and bronze in connection with enamel, damascened work, nielli, &c.; Ceramic Art, every period and style; enameled glass, stained glass; furniture; Mosaic jewellery; textile fabrics; works in leather and ivory; numismatics, &c.; while the Oriental department will consist of works in metal, embossed and damascened, china, pottery, enamel, marqueterie, glass, ivory, wood, &c., from India, China, Japan, Persia, Turkey, Egypt, Mesopotamia, and Northern Africa. We rejoice to announce that the valuable Meyrick Collection of armour will, in its entire state, form a feature of the exhibition; and the whole of the collection in the Tower has been placed at the disposal of the committee.

We might fill a couple of columns with a portion of the names of the contributors to this magnificent enterprise, so patriotically carried out by the inhabitants of Manchester, but in truth worthy of a great nation. We cannot speak in terms too highly of the indefatigable and disinterested exertions of the gentlemen of the committee. They have been worthily met and supported by contributions from Her Majesty and Prince Albert, as also from the Dukes of Bedford, Buccleuch, Hamilton, Marlborough, Newcastle, Manchester, Northumberland, Richmond, and Sutherland; the Marquises of Breadalbane, Lansdowne, Hertford, Salisbury, and Westminster; Lords Ellesmere, Essex, Ashburton, Ward, Overstone, Denbigh, Palmerston, &c., and a very long catalogue of gentlemen, among whom are many possessors of the finest Art-productions in these kingdoms. It is probable that some proprietors of works that would be valuable additions to this exhibition, may decline contributing from an apprehension of injury, but we believe everything will be done that human foresight can devise to prevent accident. Pictures and other fragile valuables, will be conveyed in very carefully padded and stuffed cases. It is proposed to hang the pictures chronologically, so as to constitute the sequence a history of Art; and all schools will be represented—even the Spanish, the works of which are the most difficult to obtain. As soon as the weather will allow the advancement of the works, the building will be finished in six weeks, after which the interior arrangements will be speedily concluded.

INAUGURAL EXHIBITION
AT
THE MECHANICS' INSTITUTION,
MANCHESTER.

BUT for the remembrance of the Great Exhibition of London and Paris, there is in the Mechanics' Institution at Manchester a collection of Fine and Industrial Art which would be widely celebrated as a great event in the history of progress towards refinement. It is not by simply seeing from time to time the beautiful exemplified in precious and unique instances that we advance in the realisation of products refined in taste and elegant in design. We may become familiarised with every object in the Green Vaults of Dresden, or of the Hotel Cluy, without feeling ourselves called upon to "imitate." The study of design fits us for emulation: these exhibitions supply a stimulus which, but for them, would be wanting: and from such stimulus we shall reap the best results. This collection is valuable and comprehensive in extent; it is contained in eighteen rooms, galleries, and "courts," and each of these departments is filled with that kind of Art to which they are devoted. Among them may be instanced as remarkable, the Colebrook Dale Company's Court; the Imperial Court; the Indian Court; the Ceramic Court; the Great Hall and Sculpture Gallery; the Precious-Metal Room and Jewellery Court; the Royal Gallery; the Galleries of Fine-Art, and that of Antiquities; a large collection of photographic pictures, &c. The Royal Gallery contains that brilliant and most elaborately finished selection, copied from the royal collections by the gracious permission of Her Majesty and His Royal Highness Prince Albert. The interest of the collection of oil pictures will be understood from the few of the modern works we have space to name:—'The Expulsion from Paradise,' J. Saut; 'The Tiger's Lair,' Verbeekhoven; 'The Death of the Wolf,' R. Ansdell; 'Windermere,' J. B. Pyne; 'The Return from Hawking,' Sir E. Landseer, R.A., contributed by the Earl of Ellesmere; 'A Welsh Stream,' T. Creswick, R.A.; 'The Bark Peelers,' J. Linnell; 'The Golden Moments of Sunset,' F. Danby, A.R.A.; 'Lake Lugano,' C. Stanfield, R.A.; 'Flora,' W. Etty, R.A.; 'Clifton,' J. B. Pyne; 'The Interrupted Meal,' R. Ansdell; 'The Death of Foseari,' F. R. Pickersgill, A.R.A.; 'Othello's first Misgiving,' J. R. Herbert, R.A.; 'Red Deer,' Sir E. Landseer, R.A.; 'The Zuyder Zee,' C. Stanfield, R.A.; 'Venus and Cupid,' W. Etty, R.A.; 'The Young Student,' J. Sant, &c. &c. But to glance at the industrial products. We find in the room Number 1, a various contribution of great value from the Emperor of the French, and also of home manufacture; many new textile fabrics of surprising beauty, suitable for furniture in silks, and terys at no greater price than French damasks. The Colebrook Dale Company exhibit many useful and ornamental iron-castings which we have not before seen: and many of the productions of Messrs. Jackson and Graham are of extreme beauty. The Ceramic Court contains the last and best works of Messrs. Minton, Messrs. Copeland, Messrs. Alcock, and Messrs. Boote, of Burslem. In the sculpture room are the 'Amphale,' in marble, by John Bell; 'The Day Dreamer,' by P. Maedowell; 'Eve,' by the same; 'Sabrina,' by W. C. Marshall; 'The First Whisper of Love,' by W. C. Marshall, &c. The Precious-Metal Room contains a collection of infinite beauty and great value, the contributions of Hancock, Elkington, and others. The antiquities consist of mediæval pottery and glass; Greek, Etruscan, and Roman pottery; Greek and Roman glass; Egyptian antiquities in bronze, wood, and other materials; and the famous 'Dead Christ,' a carving in ivory, by Gian Bologna, the property of E. N. Denny, Esq. This exhibition, as we have heretofore observed, has been brought together and opened to the public in order to defray the portion of debt yet due on the building; and certainly to the committee and the secretary the best thanks of the public are due for setting before them such a variety of valuable objects.

We hope and believe the exhibition will be—as it ought to be—eminently successful.

TALK OF
PICTURES AND THE PAINTERS.

BY AN OLD TRAVELLER.

CHAPTER I.

Introductory—An importunate thought—The Scala Regia of the Vatican—Shortest path to the Transfiguration and the St. Jerome—The Sala Ducale—Loggia and Corridor of Bramante—Treasures left unvisited—Hall of the Arazzi—The first Pietres!—Bologna—The Crucifixion of Guido—The St. Cecilia—Parma and Correggio—Florence and the Umbrian Masters—Venice and Titian—Venetian Traghetti—Our part in Titian—The Cornaro family—The Bridgewater Beauties—Temple-Newsam—The Recluses of Wiltshire—Holy Family at Dresden.

How perversely will some perplexing or painful thought, or rather imagination, sometimes cling to one's company; I do not say to the mind, since the mind has very little to do with the matter, but to one's society, as it were. You, the recipient of the visit—but slightly flattered by the preference—doing your utmost to free yourself from the unwelcome guest. You seek to displace the obnoxious thought by others, for example; you call on such as are most decidedly antagonistic thereto for aid, but they do not effect its expulsion. The strength of your assailant is too much for you; he will not be won to leave you by entreaty, nor can you enforce his absence by command; the more you bid him begone, the more he won't go: he has marred the hours of your day, and if you have not the better fortune, he shall make you keep with him the watches of the night.

There came a fantasy of this pleasant complexion to attend our leave at the waking hour of the good yesterday, no longer since, and thus did the pale-eyed shadow salute us:—"Suppose the great and treasured pictures of the world,"—Fantasy *loquitur*—"suppose, I say, the best and greatest pictures should all be lost! not merely borne from the shrines of their worship by the conqueror—a mere displacement, to be deeply expiated and atoned for reverently in the better days—but lost, annihilated, resolved into their element—ah! those subtle essences, who shall give them names?—become exterminate; no longer to illumine the ages, no more to absorb the love of man; never again to make the heart leap in the bosom of him who doth but hear the faintest echoes of their name borne to him like sweet music from some brighter sphere than that of his inhabiting.

"Dost thou mark me well? All that Rome enshrined for the world—all that Florence joyed in—all that Venice made her pride, and all that Bologna treasured: some Eidolon—created to that end—nought evil enough had existed till the baleful moment of *that* birth. *This* hath swept great wings of darkness over their charmed existence, and the guardian spirits have yielded, and all have ceased to be!

"Hast thou comprehended what has befallen thee? Behold the Vatican; the cold walls are there, but the Transfiguration, the Last Communion, where are they? What now shall it avail to Rome that men have called her the home of the Cæsar and the Pontiff, if these be gone? Are there tears enough to bewail them? can the mourning ever cease? And *thou*, most wretched! it is the Scala Regia that rises before thee; but to what purpose should thy foot now tread the pure proud marble of that regal way? Wilt thou ever again ascend it with that elastic step which carried thee bounding up its magnificent flights; glad at heart because the shrines of thy worship—the worship of all humanity—shone, dearly guarded beyond?"

"They had received their due homage on the day that was then the 'yesterday,' aye, and the day before it, and on many another behind and behind them. Yet was their perennial newness, their perfection in one part and in all, none the less drawing thee towards them at that fortunate moment which was then the 'to-day.' All eagerly didst thou once more seek them, thy soul wedded to their beauty, and thy heart rejoicing.

"And so thy step was ever onward, and for these thine idols wert thou content to pass swiftly through the Hall of the kings, even though the Sistine was so left for once unvisited. True, thy duty to the great Florentine was paid, aye, duly and dearly paid, on the morrow.

"Still on, by the Sala Ducale, and by that Loggia which the genius of Bramante provided for the grateful centuries: onward still, but now with step subdued and chastened brows, for sacred and deeply touching are the relics on either hand.*

"To these records of wrong and suffering succeed forms of beauty, such as Greece alone could image forth; but you passed lightly, in that day we talk of, albeit with glistening eyes and many a glance of love-franght greeting, for the deities of your worship were yet afar.

"The Torso—the Torso of the Belvidere—presented its grand proportions in the farthest distance; but you did not ascend that intervening space—you left the Torso, you left the Apollo, you left the Laocoon, you left those many halls wherein fair Sculpture has gathered the best of her treasures, all inviting you, and all holding due place in your heart; but your path lay forward, and you held on.

"Who is there that can fail to remember the solemn way that next you trod? who, that has once seen, can forget those Egyptian skies, whose diamond stars pour their beams upon the gazer from so deep a blue? Calm of aspect, and with silent motion, doth he who enters the mystic chambers pass through their awful bounds; and you—you restrained your impatience in those shadowy precincts; but issuing forth to where yet another marble staircase invites the well-pleased foot: you then sprang gladly upward.

"The white marbles of the Sala della Biga gleamed upon you from their stately dwelling, but you made no halt. The riches of dead Etruria—dead, yet living ever—sought to woo your footsteps farther still up the glittering whiteness of that marble way, but you did not pursue the tempting path; your cyanoere was lighting the distance still, and you passed on.

"Rapidly through the halls of the Candlabre, and with hurried glance alone for all they offer, because your heart was intent on the glories beyond, and 'some lighter moment,' you said, 'shall suffice for what is here.'

"Yet farther, and long spaces fell behind you as your feet pressed ever onward. Perchance some bright creation of the sculptor's genius might arrest them for a short space, when your eyes fell on one of the many courts lying far beneath, and presenting themselves from time to time as you traversed the floors of those wondrous corridors through whose length it was that then you glad advanced: but these were transient deviations, and you held on.

"Long travel brought you to the hall of the Arazzi, those undying works of the loom on which the genius of Raphael himself—how truly called divine—hath conferred their immortality. Before these you passed more slowly—nay, you paused; for each one you had brought some tribute of homage, and here, for the first time, you made halt.

"It was besides meet that you should do so, for were you not at length arrived within the very precincts of the sanctuary? One dim and silent chamber only, and that of no wide space, now lay between your eyes and the desired objects of your long yet delightful progress.

"And at length you had traversed even this; the world's first treasure in Art, its greatest picture, † rose bright before you—you stood reverently in the presence of the Transfiguration.

"Time passed, but the votary gazed on, ‡ yet with

* The reader acquainted with the Vatican can remember that memorials of the early Christians, taken from the Catacombs, are ranged on each side of the corridor of Bramante, along a certain portion of its length, that is to say, which is upwards of four hundred paces, the Loggia preceding included. Beyond these are marbles of varied character, the corridor itself terminating in a flight of steps, which, being ascended, places the visitor in presence of the Torso of the Belvidere.

† So have great authorities long decided: the writer has heard discussion on that question, but this is not the place to repeat the arguments, whether on one side or the other.

‡ Yet the mortifying confession has to be made, that only frequent visits—each gradually, yet almost unconsciously, made longer and become more impressive—enabled the present writer to appreciate the works of even this delightful no less than illustrious master. That long acquaintance with the works of Michael Angelo can alone make you capable of comprehending, of enjoying, at the first glance—I could almost have said of enduring them; this I know is a state of things frequently experienced. But not to delight in Raphael, and from the first, that was a mortification! Yet so it was, and such is the truth. It

the sense of a divided duty; allegiance still to be paid, and paid willingly, gladly, devoutly—the allegiance of the heart, for you had but a mere slight turn to make, and the grand work of the honoured Bolognese—the earnest and conscientious Domenichino—St. Jerome's Last Communion—was also your own.

“And now!”

And now!—malignant fancy! impertinent shadow! all vain they were and *did*—the now “is as the then.” Say, therefore, *are* and *do*—both still delight the world—they do and shall; still are they all our own, and we defy thee!

“Suppose Bologna bereaved of the St. Cecilia, and no longer standing in reverence before the Crucifixion of her Guido!—that sublime presentment of ‘darkness visible;’ words, of which you do not comprehend all the import until you find yourself silent, and awe-struck in the grand presence of that immortal work.

“Or think of Parma, shorn of that wealth which makes her pride—the riches bequeathed to her by the love and genius of Correggio? for what were Parma without Correggio?”

“Imagine Florence, no longer hallowed by the light thrown ever round her from the works of her sainted masters*—all uncheered by the relics she treasures of her Leonardo—hers! nay, rather the broad world's Leonardo—the Leonardo of all the Arts, of all the Sciences; for in which of all did the illustrious Leonardo da Vinci fail to attain excellence?”

“And how would Venice bear the oppression of her lot, if, unconsolated by the cordial thought of her Titian's glory, if not sustained by the proofs of his greatness? The chill of death it is that seizes the heart, as one thinks of Venice deprived of Titian.”

Of Titian! aye! in happy hour hast thou evoked his name, ill-omened Fantasy! that magician hath proved too potent for thee; those eyes, grave with the gathered wisdom of a century, yet genial as when his third decennium had just brought him the fair spring-tide of his earliest years; these have exercised thee, horrid shade! the dim edges of thy shadowy mantle are disappearing. Thou art gone! and we know that the world is still rejoicing, yea, and shall rejoice, in the riches that genius hath endowed it withal.

That the great sun of Venice, bright as are its rays, is to the present writer as are certain luminaries of the Roman and Florentine heavens, may not be affirmed: yet has Titian been ever the first of our thoughts when approaching Venice, and the last—though others also mingle tenderly in the feelings experienced, at that moment when the time has come for leaving the much-loved city. To the works of Titian have we constantly paid the first of our visits, and if certain loves, long cherished, cause us to linger around the fanes wherein other great and noble spirits are enshrined, in the more solemn hours of impending separation,† still is the admiration of this great master entwined inextricably with our love for his loved Venice, “*la sua Venezia*,”‡ and highly have we valued what we have greatly as well as largely enjoyed—the privilege of haunting such portions of the city as derive added interest from recollections of the most distinguished among her many adopted sons.

But why, indeed, say such parts as retain recollections of the master, when it is in fact a truth that all parts do so, more or less? Not because he gave us much of Venice in her external forms—he did not: as compared with the vast number of his works,

is also true that the pain of that apathy was not of long continuance, or perhaps, I should rather say, did not occasion a perpetual sorrow. But enough of this.

* Alas, that so few of their works are found in our country. Private collections excepted, the names of Fra Bartolommeo, of Il Beato Angelico, are scarcely heard among us.

† Il Moretto, who, though born at Brescia, and always proudly claimed by his compatriots, is accounted with right among the Venetian masters, has been the object of a warm predilection to the present writer from the first moment of our acquaintance, made some fifteen years since in the Academy of Venice. Masters of a yet earlier period are also there, to whom a large portion of this writer's affection was early given; and it has been a source of infinite satisfaction to us to learn, as we have lately done, that examples of their charming works have been, or are on the point of being, added to our National Gallery. Of these masters, and of their productions, we propose to make such remarks as our recollections may suggest, in a future paper.

‡ “*La mia Venezia*” is the expression of the adopted son, when speaking of his beloved foster-mother.

those in which he has depicted any given part of Venice are but few. Some portrait of a Doge, produced in his capacity of state-painter, perhaps, an office* in which he succeeded his master, Giovanni Bellini, may occasionally exhibit such; but otherwise the architectural beauties of the city are rarely reproduced in the works of Titian. Yet do you find these works most forcibly recalled by the living pictures, grouping themselves in rich variety, as you take your delightful way through this charmed Venice, where all is picture. We have not found them at every step, as we have heard some declare to be their own good fortune; his male figures not always carefully drawn, nor yet remarkable for grace of attitude, yet ever magnificent men, with their faces of deep earnest meaning, or it may be of a dangerous astuteness, have crossed our path, but not through all its length; nor do the rich contours of his women, though seen in greater abundance, invite your admiration at all hours and in every place. Still is it true that things in Venice are constantly reminding you of Titian—things that are Venetian, be it clearly understood;—he is present to you perpetually, and, save in some few places, where you become subjected to the influence of certain other great spirits, ruling here—may be said to possess you wholly; neither are the mind and heart thus subjugated unwilling to wear his chains; on the contrary, they bear them gladly, aye, proudly.

For the people, as Titian painted them, you see these, perhaps, more particularly around and about the Traghetto; not at all of them—far from it; you find them in some favoured localities only. There is one presenting itself at this moment with the vividness of reality to my recollection—and oh, the charm of that delicious memory!

The traghetto are the points of departure or arrival used by the gondoliers; but if you ask, “Why, then, do you not call them stairs or ferries?” we make answer, and say, “Because those names would not apply.” The traghetto serves the purpose of a stair or ferry, but is not like either—whether it be the prosaic and city-suggesting “stair,” or that less commonplace, nay, very often poetic and delightful passage of some fair bright river, called a ferry. The Venetian traghetto is—it is the—traghetto; and he who shall desire to know it more intimately must even betake himself to the place of its birth—no very heavy doom.

But not on all the waters of Venice shall you find the true Venetian traghetto; it is not that which meets you as you descend the Piazzetta, nor shall you find one along the whole “*Riva degli Scabovoni*.” “Stairs” in abundance you may find, neither will you suffer lack of gondolas, nor of the dashing gondolier; but for the traghetto—worthily so-called—you will look in vain. Far away, and among the less travelled parts of Venice, it is that you must seek them, or rather it is in these little-known regions that, in your loving quest of old undying memories, you will come upon the picturesque vine-covered nooks, wherein their barks nestle cosily, to your infinite self-gratification. So it is, I say, that you must seek, and shall find them; but once found, you shall be seen to take those rarely trodden—but how picturesque!—byways, again and again.

My traghetto, at no great distance from that “*Calle Gallipoli*” wherein Titian made his abode, before removing to the Contrada di San Canciano, is one of the many treasure-troves due to our own love for prowling around the long-forsaken abodes of the buried great. Giorgione made his home in the immediate vicinity; and it was after leaving the Church of San Silvestro, or rather the open space before it, wherein our most dear Giorgione passed a no small part of his too short life, that we stumbled upon the narrow *vicolo* or alley by which alone, coming from the land-side, you can approach it.

Having once, but long since, been the water-gate to a building of great extent, now partitioned off into poor dwellings, there are still traces of marble pavement in the cracked steps by which you descend to your gondola, and along the low wall over which you bend to ascertain if your gondolier be there to await your pleasure. And you will pretty surely find him; for rarely does the Venetian gondolier fail his master, though he be but the hiring of a few weeks or months, as the case may be.

* Called *La Senseria*, and conferred on the best painter only; this constituted its value.

Trained over a few slight poles, crossed by rods yet slighter, a vine serves to shelter him who waits there from the too fervid sun. It can scarcely be called luxuriant that vine, but the leaves are broad, and they cast flickering shadows capriciously over the group gathered beneath it—figures that would not look out of place in one of Titian's pictures. They are not numerous—father, mother, and two exquisite children, make up the count; the man, his black cap placed becomingly over a candid brow, is simply a handsome powerful fellow, just now bringing his “*barca*” to shore, for at this traghetto he is at home; but the mother has that luxuriant form and lovely face which the great painter so well knew how to enrich his canvas withal. With one exception, nevertheless, the hair, that is to say: her rich locks are abundant as he could have desired, but they have not the fair tint so much approved in Titian's day, and which was therefore procured by chemical appliances, if the authorities tell us truly. No! the sweet mother's hair is of a brown so dark that you see it is not black simply because the light imparts to it a golden tinge, and not the raven glitter peculiar to black tresses, yet not, as we think, so lovely as this rich dark brown. In all save this, my gentle favourite—her kindly manner and sweet low voice are charming as her looks—is a very Titian. Methinks we'll ask her some day from which of his frames it is that she hath stolen forth. The colour of the hair—and even here the advantage is all on her side—makes the sole difference. The head small and elegant; the features delicate and full of tender expression, melting to softness in the clear and bright, yet somewhat melancholy eyes: such was the mother about whom there clambered one little beauty of a boy, while the other lay yet on her bosom. How charming was the picture they made!

I never heard a name for that Traghetto, or would tell it, that you might go to see them. Yet what do I say! The boy will be now a toiling man, and the infant a youth approaching the age of toil; the dark locks of the gondolier will be taking a tinge of grey; and his beautiful wife! she will not now exhibit the grace of those times, seeing that good twelve years at least have passed since it was our pleasant habit to take boat beneath their trellis of vines, on our way to one of our most-beloved haunts—the Venetian Academy.

The works of Titian crowd on the memory. How should it be otherwise, the activity of his life and its extreme duration considered. Happily, some of the best are in our own country; that of the Cornaro Family, in the possession of the Duke of Northumberland, will recur at once to the recollection of all lovers of Art, as one of the master's finest works. The writer has twice had the advantage of seeing it, but five years have elapsed since the second of those visits (made in 1851, when the mansion was thrown open to the public); and although retaining a recollection of the work very precious to ourselves, we prefer to borrow the words of a more competent authority, for that description which we think must needs be welcome to the reader.

“In the dining-room,” says our author, “I found Titian's celebrated picture of the Cornaro Family, the chief object of my visit. A man already advanced in years, and of dignified appearance, is kneeling in front, as the head of the family, before the left side of an altar, on which the host is placed. He is turning a little towards a man rather younger than himself, kneeling behind him, and is directing his attention to the object of their veneration. The latter, as well as the still younger man, kneeling still further behind, are given in profile. Lower down are three boys worshipping, with whom three others on the opposite side correspond. All the figures are the size of life. This picture is worthy of its high reputation, and holds the same rank among Titian's pictures as the Concina family worshipping the Virgii and Child, in the Dresden Gallery, among those of Paul Veronese. The heads of the three men are particularly grand and simple in the forms, even for Titian, while the portrait-like animation of the characters happily unites with the solemn expression of devotion. To these figures, which, as well as the altar, are decidedly relieved against the bright sky forming the background, the open *naïve* expression of the blooming boys forms a very pleasing contrast. The picture is of Titian's

middle period, the execution very careful, the colours clear, especially in the flesh, which is treated in a bright golden tone. Unhappily this masterpiece has suffered not a little injury—for instance, the right hand of the old man, and the hand of the boy on the left.*

In the Bridgewater Gallery are no less than five of the master's works, and all great pictures! It is true that one or two have suffered by cleaning; nor are they all of equal value. The two Dianas, the story of the Nymph Calisto, namely, and that of Actæon, exhibit those powers in landscape for which Titian enjoys so well-merited a pre-eminence among the great painters of his own time; nor, indeed, is the landscape of the "Ages of Life" less charming; nay, for ourselves we prefer it to those before named. We do not attempt a description of these pictures, because the liberality of the noble owner gives to all the opportunity for making their acquaintance, and renders it needless.

There is a St. Jerome, by the same master, at Chatsworth, which is quite as well known; and, if less frequently visited, that arises not from want of opportunity, which is most freely given:—few among our great nobles so willing to impart of his vast advantages as the Duke of Devonshire—still less from the want of inclination. It happens solely because of the distance between the picture and that great absorbing London, which swallows men up, and keeps them so close within its insatiable jaws, and with determination so inexorable, that only at some hurried moments—blest beyond the lot of the common hours—can they find leisure for aught so reasonable and so delightful as a visit to your St. Jerome, O Titian of our heart!

An earlier work of the same great painter, also in England, but not so familiarly known, perhaps, as those named above, is the portrait of the reformer, Martin Bucer, in the collection of Mr. Ingram, of Temple-Newsam. The excellent authority lately quoted has a few words respecting that picture, and these state a fact which is one of my motives for citing the portrait of the reformer, to the exclusion of certain other works pressing their claims on my attention. "The fine and delicate feeling for Nature, and the tender and earnest execution," says Dr. Waagen, "indicate the earlier time of Titian, when he painted the Tribute Money at Dresden, with which the light transparent golden tone agrees; unquestionably the finest picture in the collection."† When he painted the Tribute Money at Dresden. Now, this last-named picture will very probably be known to many, more especially of our younger artists, to whom the Bucer may never have been mentioned; the writer distinctly remembers the particular quality alluded to as existing in the Dresden picture—of which more hereafter—and a work meriting to be named therewith, in the estimation of so profound a student and so severe a judge as is Dr. Waagen, may well repay the artist for more of toil than is involved in a visit to the West Riding of Yorkshire.

Temple-Newsam, though in the neighbourhood of Leeds—a very beautiful region by the way—is happily some good three miles or more from that sooty emporium of the cloth-workers. I had, however, almost said that, for the sake of this admirable portrait, you might almost venture on facing Leeds herself! But I make pause; it is a question demanding counsel, and I take time to consider. Memories of so dun a colour rise before me as I recall the heavy canopy of smoke under which the great murky town sat brooding, as we did ourselves approach her bounds, that—'tis well to be cautious in matters of moment—methinks the point were better reserved for the decision of the judges.

Meanwhile, and because the said judges are "notourly" a heavy-going *engancee*, I may as well repeat, while they deliberate, that she hath made her seat in very paradise—this discriminating Leeds—also, her sons are of the highest intelligence, and the most kindly courtesy, inasmuch that you—having more courage than this poor field-haunting scribe, who hateth towns worse than she hateth sin,—more's the pity! mortally hateth them (their glorious Arts ever excepted), may even find the presence of the

great busy place an additional attraction; more especially, if you consider rightly what good boys her children were, and how well they learned their lesson when—

"Athene taught their hands to flash along
Her famous looms."‡

Much more difficult of attainment, and rendered so not by distance only, are two most precious works of Titian, guarded from gaze profane at Longford Castle—guarded jealously, as well becometh their worth—but I would that the noble owner of the Dudley Collection, and other great possessors equally liberal, could make their example avail to procure for desiring eyes an occasional sight of these Longford jewels of Art.

"Sure the eyes of us wouldn't hurt them much, your honour." But we refrain from further eulogy: far be it from us to hint even a wish that should seem to question the right of property to exercise all the privileges appertaining thereunto. The boldness of intrusive curiosity may have demanded repression; and his lordship of Radnor has, doubtless, excellent reason for not extending to the lovers of Art those valued facilities so generously accorded by others of our great proprietors "in that sort."

One of these Wiltshire pictures is a portrait of Caesar Borgia, indubitably authentic, whether as regards the master, of whom it is a most precious example, or the subject; for that this is indeed Caesar Borgia none acquainted with the characteristic features of his family can doubt. Many of our readers will remember the portrait of this personage in the gallery of the Borghese Palace, in Rome; the work is commonly attributed to Raphael, but good judges doubt the authenticity, and not without reason; the writer has heard more than one competent authority affirm the picture to be by Giovanni Pumi, better known as Il Fattore. Be this as it may, the firm determined attitude, the decision of gaze, and frank boldness of the whole aspect—a boldness far removed from bravado—which distinguishes the Borghese portraits by no means impress the beholder with the conviction that Caesar Borgia was that monster of wickedness some writers would make him. Violent without doubt, and so far dangerous—but *evil*, no!—the Roman portrait does not proclaim this. That by Titian at Longford, on the contrary, although recording the traditional beauty of the race, and presenting sufficient evidence of ability, implies a character almost irredeemably bad. Give him none of your trust, ye who deal with that base and treacherous man! but you will not: who, having looked upon that countenance, but must hasten to guard himself from all contact with the owner?

Great is the power of him to whom hath been accorded the high privilege of genius! Great is the power, but, O, most awful the responsibility! Here is a man condemned to bear witness to his own turpitude through countless ages!—compelled remorselessly, by the great exorcist whose wand of resistless might was a pencil, to be himself the exponent of his own evil nature; to admit for the comprehension of every beholder all that he would so fain conceal. Just and upright should be the fiat of one holding this vast power, for his decision is final: who, for example, having looked on this portrait could longer question the depravity of Caesar Borgia?

In the Dresden Gallery is a further proof—if any were needed—that Titian had adopted the opinions of his day as regarded the family of Pope Alexander VI.; this we find in the character he has given to the sister of Caesar, whom he has introduced as a suppliant, into a picture of the Holy Family, doubtless because her husband, Alfonso of Ferrara, had commanded that the portraits of his wife and himself should so appear, as was usual in similar cases, at the time.

Here, however, it will be good to remember how potent is the love of the marvellous in all ages. The pontiff and his family once made subject for the tongues of rumour—not to prejudice the question by saying calumny—he who could relate the most wonderful story would obtain the most eager circle of listeners: and that the Venetians were like

the Athenians, in their love of hearing some new thing, none who are familiar with the intimate history of the period can doubt. How amusing, for example, are the "despatches" sent by the Venetian ambassadors in Rome to their "most illustrious and most dread masters"—I Signori. But enough of this, and to the picture.

Alfonso, the first duke of Ferrara, is represented as accompanying his wife, Lucrezia Borgia, while the latter offers her devotions to the Virgin and the Divine Child. His face, evidently a portrait, serves to convince you that if the master held no favourable opinion of the duchess, neither had he been impressed with much respect for her husband. The "manner of being" of Alfonso intimates that propriety of deportment expected from his rank, and his figure has a certain elegance; but the head is heavy, the features devoid of interest, and the expression betrays weakness. He stands partly behind the duchess, whom he seems anxious to detain, or at least to address; and this he does exactly at the ill-chosen moment that a man such as he might have selected, but no other, for her hands are already folded in prayer. Lucrezia has placed her little son—afterwards Ercole Secondo—between herself and the sacred personages composing the Holy Family. You would say she has brought the innocence of the child to intervene between herself and those whom she must feel unworthy to approach: but as you regard the countenance Titian has given her, you doubt whether any feeling so natural, any thought so becoming and so suitable—her condition considered—could be entertained by a woman exhibiting that expression. Beautiful—as everything professing to be the portrait of Lucrezia Borgia must be—of imposing presence, and with that firm uprightness of carriage wherewith one gladly associates the idea of moral rectitude—one would fain give her the advantage of so construing her appearance; but those sidelong eyes forbid the interpretation, and half compel you to believe that her accusers were not all calumniators, as, from certain considerations that cannot here be recapitulated, the present writer has seen reason for hoping.

The Virgin has a book on her lap, and, her attention being fixed on that, she has not yet raised her eyes to the princes: St. Joseph gazes fixedly on the duchess, yet not with looks of approval, and the Divine Child is pressing closely to him a bird which he holds in his hands, as fearing spoliation, or some injury to the little creature, at the hands of the dual family.

This work, if not among the very finest of the master, yet exhibits many of his highest qualities; but these are too well known to need description. There are, besides, works from Titian's hand in the gallery at Dresden which press imperatively on the attention, and would more than fill our space had we yet space at command; the bounds accorded are, however, already overpassed, and all mention of these must be deferred to a future occasion.

ART IN CONTINENTAL STATES.

PARIS.—An article in the *Moniteur* states that the Emperor has decreed the *Salon* of the present year shall be opened on June 15th, and closed on August 15th.—The *Grands Prix de Rome* have been distributed as follows:—*Sculpture*: first medal, M. Maniglier; second medal, to M. Hiolle; another second medal, to M. Lechesne. *Painting*: first medal, M. Clement; another first medal, M. Delannay; second medal, M. Michel. *Architecture*: first medal, M. Guillaume; second, M. Moyaux. *Engraving*: first medal, M. Gaillard; second, M. Dubouchet. Thus two first prizes have been given in painting, and two second medals in sculpture. It is only the first medals that entitle the successful candidates to the journey to Rome.—The paintings by Couture are now visible in the Chapel of the Virgin at St. Eustache; they are of course on a large scale, but they show little religious feeling.—M. F. Winterhalter has begun the portrait of the young prince.—M. Ingres has returned to Paris; he has found time during his holidays, notwithstanding his advanced age (82 years) to execute a drawing representing the "Birth of the Muses presided over by Jupiter;" it contains fifteen figures grouped with infinite art. Ingres is still in good health, and as active as ever.

* See Dr. Waagen. "Treasures of Art in Great Britain," vol. I, p. 393.

† See Art-Treasures, *ut supra*, vol. iii., p. 334. It is of the Temple-Newsam collection that Dr. Waagen speaks when he calls this work—and justly—"the finest picture."

* Mrs. Browning, when Miss Barrett: I quote from memory, and have a dim suspicion that the "Athene" should be rather Pallas; but then I have not the other word required, in that case, by the measure, and, if there be error, will beg to be forgiven for it.

THE CRYSTAL PALACE:

A TEACHER FROM ANCIENT AND EARLY ART.

BY THE REV. CHARLES BOUTELL, M.A., &c.

PART I.

VERY remarkable are the conditions under which the English student of Art, now in this middle of the 19th century, enters upon his great work. No longer a casual accessory, Art has become in this country an essential element of general education. The influences and the teachings of Art, restricted no longer to a comparatively select and exclusive few, now are beginning to develop themselves with most happy effects, in direct connection with the community at large. The Artist-mind and the Art-sympathies of the people are awakening and gathering strength. Art collections are multiplying, and their contents are becoming more practically instructive in their character. At length the idea has taken root amongst us, that the study of Art requires facilities for instituting the very widest comparison between both the various works of different artists in the same style, and the varied productions of the styles of different countries and successive eras. As a necessary consequence of these things, the student of Art finds himself associated with warm sympathies, and surrounded with incentives to energetic exertion which contain within themselves very important means for at once facilitating and ensuring his success.

Many circumstances combine to render the Sydenham Crystal Palace capable of concentrating within itself every requisite for the most perfect School of Art. It has already assumed a commanding position in this capacity. When its diversified collections shall have been rendered more complete in themselves; when the components of each collection shall have been more systematically classified and arranged; and when a living voice shall have been given to them all, with which they may be made, through courses of brief but able and attractive Art-lectures, to address themselves no less to the ear than to the eye of students,—then will the full powers of this grand Institution begin to be thoroughly understood, and its full value to be duly felt and appreciated.

Many recent improvements, which are no less significant than satisfactory, lead to the assurance that all existing deficiencies in the Fine-Art Collections of the Crystal Palace will be eventually supplied; and that whatever errors in the condition, or position, or grouping, of particular examples may still remain, will in due time be rectified. Meanwhile, it may be well to sketch out before the student of Art, and, indeed, before the general public, some of the more prominent characteristics of the extensive, varied and most interesting assemblages of specimens which already occupy those courts of the Palace that have been specially devoted to the illustration of Ancient and Early Art. In carrying out this plan, I shall altogether reject any attempt at giving regular descriptions of the several Fine-Art Courts of the Crystal Palace, one by one, with their contents: my object, on the contrary, will be to select and group together such examples and such details as may generally assimilate in their teaching, or may, each in their own great excellence, stand forward as enduring lessons in the noble and the beautiful to every age. As I proceed, I shall introduce numerous engravings, which will have been drawn for the special purpose of conveying characteristic representations of the objects thus selected for particular illustration; and, while endeavouring to adduce all that is most worthy in these teachings which Art, in its manifold creations, has continually put forth as memorials of the past and as lessons for the future, I shall not hesitate to specify such short-comings as may be apparent, and also to suggest what appear to be essential requisites for enhancing the value and the utility of objects already both valuable and useful.

But, first it appears to be desirable to glance at the entire subject, which thus lies before us, awaiting our scrutiny. At the very outset of our inquiry, it must be plainly and distinctly stated that the collections in this ever-accessible School of Art are not, neither do they in any respect or degree pretend to consist of, original works: they are composed, almost exclusively, of facsimile casts, copies, or tracings, from original works in Architecture, Sculpture, and

Painting; and with these reproductions are associated the invaluable delineations of Photography—that faithful reflector, that echo-voice as well of Nature herself as of Art, together with engravings and other renderings of original productions. It is consequently true that here the student has before him—not the breathing stone or the burning bronze, as they left the hands of great masters in Art; not the glowing canvas (except in the case of modern schools of painting), nor the boldly-wrought stone, nor the ivory touched with exquisite delicacy into miniature life: but it is no less true that here are faithful copies of works, which it would be vain to hope ever to see brought together beneath a single roof; and here, accordingly, is accumulated a concentration of Art-Teaching otherwise impossible to obtain, and of which it is equally impossible to estimate too highly the beneficial capabilities.

In the Fine-Art Courts of the Crystal Palace, properly so called, Architecture, with its every accessory, and Sculpture, are the two great forms or expressions of Ancient and Early Art, which are most elaborately and profusely illustrated. The leading idea has been to produce actual specimens of the architectures of Egypt, Assyria, Greece, and Rome, and also of the Spanish Moors; and with these specimens to associate certain compound structures, made up of various details, which might serve to sustain the continuity of the series, by exemplifying the Byzantine, Romanesque, Gothic,

and Renaissance styles. Casts from original works have furnished models from which some of these courts have been designed and constructed; while, with similar casts others of the courts have been actually formed. The grave errors which, unhappily, have been permitted to detract from the value of these courts, as complete works, are the reckless restoration of the reproduced examples, and the introduction, in some instances, of much that is purely hypothetical in combination with facsimile reproductions of actual and existing realities. Where it would have been a matter of necessity to have left a court in an unfinished condition,—unless it might be conceded to have recourse to analogy and ingenious theories to supply what could be obtained from no more authoritative source,—it would have been desirable to have indicated distinctly and palpably the line of demarcation which divides the probable from the certain. And, in like manner, when the ravages of time or the still more destructive effects of wilful violence and ignorant indifference, have left original works mutilated and worn, restoration might have been admissible in the east destined to be built up into the walls or the arcades of a court; yet, assuredly, an untouched and genuine facsimile of the original in its existing condition, should have shown exactly how much had been added to the finished east, for the sake of obtaining that very finish, and for effect.

Again: the architectures of both antiquity and

APPROACH TO THE GREEK COURT.

the middle ages, as they are represented in these courts, fail, in many essential points, to convey a completely truthful impression to the Art-student. The classic orders do not appear at all in any such forms as alone would be calculated to declare their correct character, and to impersonate their distinctive characteristics. It is the same with the mediæval Romanesque, which is fused into the

Byzantine; and with the Gothic, which loses altogether its three-fold aspect. In the case of the works of monumental art—hereafter to be fully described—the series of casts is historically incomplete, and the infinitely important results of historical classification have been, for the most part, altogether overlooked.

These all are imperfections which excite com-

mingled sentiments of surprise and regret—regret that they exist, and surprise that their existence should have been possible. It is not, however, by any means too much to anticipate that all palpable imperfections will be gradually removed from these courts, in order to admit in their stead more consistent substitutes. In treating of these same courts as they now are, we should fail to appreciate the

true value of all in them that is worthy of careful and confiding study, were we not led to discriminate between the pure and the excellent, and the imperfect and unauthorised. And much there is, very much, in these courts which demands from all who love Art and who would teach it with judicious carefulness, both admiration and gratitude. The very idea of forming these ranges of continuous

Art-museums, in itself possesses very strong claims upon both of these sentiments. It is a very great thing to be able to study in any one court the style and form of Art which therein is exemplified and illustrated; while a few steps on this side or on that will enable the student of one phase of Art to institute a comparison with those other aspects under which, in different regions of the earth, and

EXAMPLES OF MISCELLANEOUS ANTIQUE RELIEF SCULPTURE AND CARVING, ETC.—GREEK COURT OF THE CRYSTAL PALACE.

amongst distinct races of men, the same great influence has given utterance to its conceptions. A multiplicity of details also will be found in every court which, either for their own special teaching, or from their leading to the study of the originals which they represent, deserve a very careful investigation, and can scarcely fail amply to repay any amount of attention and thought that may be bestowed upon them.

The casts from works in sculpture by ancient artists can only be spoken of in terms of the

highest commendation. They combine fidelity to the originals, with a really wonderful degree of excellence in themselves as reproductions. Here are no attempts at restoration—no speculations after effect through either unauthorised finishings or (what are equally injurious) incongruous combinations. If the Venus or the Meleager, the Theseus or the Ilyssus, have suffered from whatever causes, we see them here precisely as the original marbles are. The arrangement of these casts is also admirable: each group or figure is a study in itself, and the

value of its own teaching is infinitely strengthened through the influence of association, and the opportunity for comparison. Nor may the busts be omitted from this general notice, since they constitute a noble feature in the ancient Fine-Art collections of the Crystal Palace, and are replete with teaching precious to both the historian and the artist. Their long ranges (continued, like the other productions of the sculptor, from ancient to modern times) recall illustrious memories, and their presence serves to give animation and reality to the scenes

EXAMPLE OF ANCIENT SCULPTURE IN RELIEF, FROM A SARCOPHAGUS IN THE LOUVRE.

around them. It is the same with the antique bas-reliefs, and other works of a kindred character: they are admirably rendered as well as judiciously selected, and they constitute parts of the ancient classical courts, which at once command attention and proclaim their own great value to those who study them.

The Crystal Palace collections of casts after

ancient sculpture possess peculiar attractions for the English Art-student, who is not able to extend very widely his researches amongst the treasures contained in foreign museums, from the circumstance of their comprising so many precious examples from Italy, France and Germany, which heretofore have been inaccessible without considerable cost and a prolonged travel. The fact also that these courts

remain, always easy of approach, for continued study and for repeated and sustained contemplation, is by no means devoid of interest to travelled artists and Art-students: they, too, may be glad here to confirm old associations, and to reanimate impressions formed long ago from a passing observation of the great originals themselves. Accordingly, when the visitor to the Sydenham Museum has passed

between the seated portrait-figures of Menander and of Posidippus, and gone on through the avenue of classic busts, each bearing a well-known name from the long roll of Greek worthies (one name is that of a woman, Aspasia; Pericles is near at hand, and the frieze of the Parthenon beyond), and he at once finds that he is surrounded by forms new to England, grouped with casts from familiar works, the effects thus produced may vary in accordance with the past associations of different individuals; but for every individual there must, from the very constitution of these collections, be much to impress upon the mind a conviction of their peculiar interest and their special value in the capacity of Art-teachers.

In remarking upon the general character of these collections of antique sculpture, it is necessary to direct attention to the fact that, with but a few grand exceptions, the most renowned productions of the sculptors of antiquity have been lost; and what now stand in the front rank as examples of the power of the chisel in Grecian hands, are themselves generally either reproductions or studies from the masterpieces of antiquity; or, in some instances, they are works of Roman times by Greek artists, who still retained at least some lingering traces of the former magnificent spirit of their fathers. The term "Greek Court" is, consequently, correctly applicable only under certain modifications to the collections assembled within and about it. The grandest remains of Greek genius and skill are indeed here; but here also are many works to which the reputation of being expressions of Greek Art can only be applied through analogy and by probable conjecture.

A somewhat similar remark is, in like manner, applicable to the sculpture which occupies the Roman Court, and which thus is broadly distinguished from the kindred works that are assembled within and around the Greek Court. Many of these

are, without doubt, casts from statues by Greek artists, or from statues copied from the productions of Greek artists, though probably executed at Rome, as well as formed either in the imperial city itself, or in parts of the Roman empire far distant from

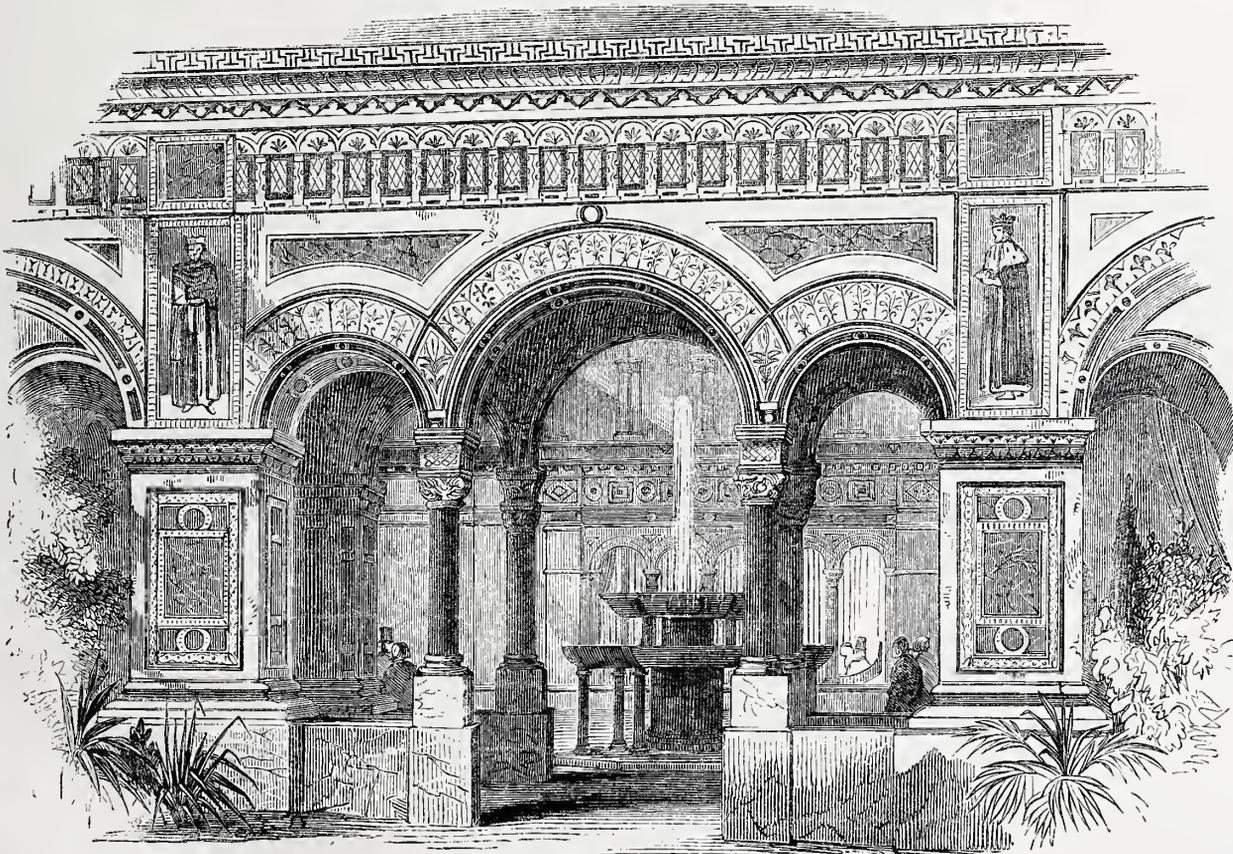

LARGE MEDALLION IN BOLD RELIEF, "SPAIN," FROM THE LOUVRE.

Greece. In themselves, both the Greek and the Roman Courts can be regarded as but little more than enclosures for the sculpture, with adjoining galleries. The architectural styles of Greece and Rome have, indeed, been consulted in producing

these courts, but the student will be careful not to regard them as authoritative examples of either Greek or Roman architecture. In this respect they differ altogether from the actual example of Roman domestic architecture which invites attention in the Pompeian Court, as also from the Egyptian and Assyrian Courts, which profess to be actual models or reproductions of the edifices of the Valley of the Nile and of Mesopotamia. These earliest remains of the arts of architecture and sculpture will be found to convey lessons peculiarly their own—lessons which bring with them from primeval times an impressive witness to man's inherent and instinctive desire to perpetuate, through the instrumentality of Art, the incidents and the truths of history, and, at the same time and by the same agency, to give expression to noble thoughts and sublime aspirations.

Detailed notices of particular works in the ancient courts will be given hereafter. All more direct and special consideration also of the Roman Court, as distinguished from the Greek, with its architectural relics, its statues, reliefs, and busts, it will be desirable to connect with the examples of the so-called revived classical style of after-times, or the Renaissance, which has its own courts on the opposite side of the Palace. By associating them after this manner with what the true arts of antiquity have left for us to study, the works of the Renaissance artists will be estimated correctly. Thus, it will be seen how far they may with justice be regarded as revivals of styles which for many ages had ceased to exist when they began to flourish; the modifications also under which the ancient types reappeared (supposing them to have reappeared), will be clearly distinguished; and the student will be enabled to understand the real character (and, as connected with the real character, the true worth) of that form and aspect of Art which has exerted in our own country an influence at once so powerful and so widely extended.

APPROACH TO THE BYZANTINE AND ROMANESQUE COURT.

And again, on the other hand, both the Classic and the Renaissance Courts will be brought up, side by side, with whatever the Crystal Palace contains of the most characteristic productions of the deep-thinking and energetic Art-workers of the middle ages. This is a comparison which will produce palpable effects in more than one direction; it will be easy, too, to discern its value, and to apply to our

own practical advantage the lessons which it will not fail to disclose.

The value of the Mediaeval Courts is greatly increased from the circumstance of their bringing together illustrative specimens of the varied works of the artists of the middle ages, as well from France and Germany as from different parts of our own country. These courts will be found to develop

their own teaching most effectively through their choicest examples. As they themselves will lead us on to the Renaissance, so to them we shall be led, from the classic regions of more remote antiquity, by that court which illustrates in union the styles that arose in the East and West upon the ruins of the arts and the empire of Rome—the Byzantine and Romanesque Court.

PROGRESS OF
BRITISH ART-INDUSTRY.

THE WORKS OF MESSRS. KERR AND BINNS,
OF WORCESTER, IN THE CERAMIC COURT
AT THE CRYSTAL PALACE.

As illustrating the progress of British manufacture, in connection with its most ancient and interesting branch of artistic industry, we have selected for engraving a group of the so-called "Worcester Enamels," as remarkable evidences of classic feeling, combined with a delicacy of executive expression and elaboration of detail, that mark them as the most successful features of modern ceramic art.

The costliness of these works, consequent upon the amount of labour and degree of risk involved in their execution, must somewhat restrict the demand; but we feel confident that only publicity is required to ensure for them, among the many patrons of high-art products in this country, a prompt and cordial encouragement. The production of such works will necessarily be limited, from the peculiar talent necessary to their manipulation; and we are gratified to learn that commissions have lately been given to an extent beyond the immediate capabilities of the manufacturers to supply. We have before referred to the spirited exertions of the present proprietors of the Royal Worcester Works (formerly Chamberlains), to revive the *prestige* of this famous manufactory, and to the marked success which has

attended their efforts. Improvements in every branch attest the influence and value of the taste and judgment which direct its operations.

Referring specially to the "Worcester Enamels," these qualities are strikingly evident, and we earnestly recommend such beautiful examples of fictile art to careful examination. They are in the manner of the celebrated "Limoges Enamels," of varied designs, but executed upon porcelain instead of copper. The ground of the ware is a deep royal blue glaze, and the decoration is raised upon it by hand labour (and that of the highest class), with "white enamel," being a preparation of tin and arsenic.

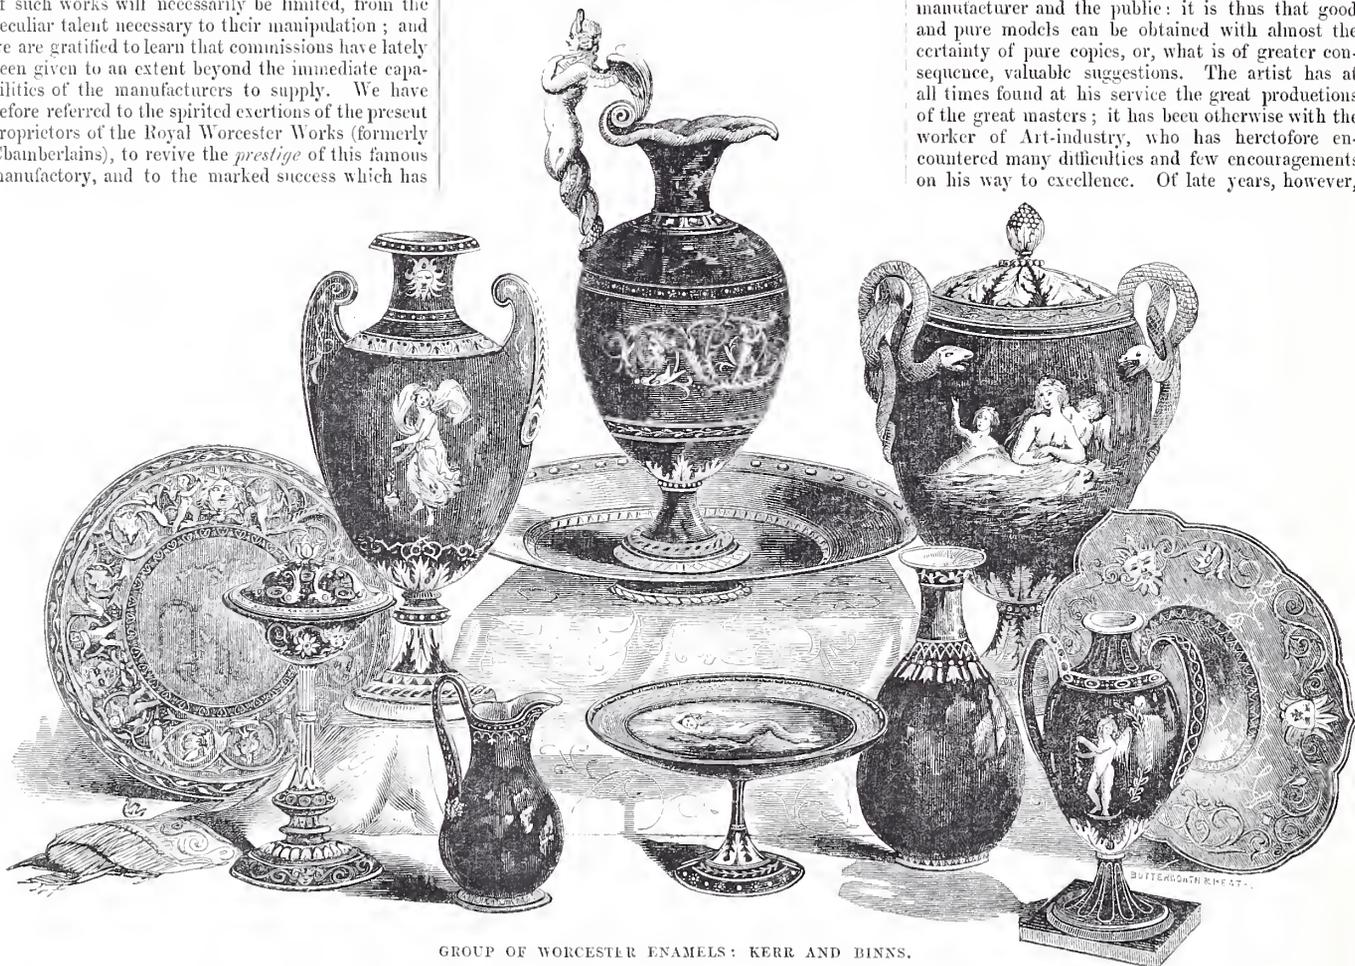

It would be impossible to convey to the uninitiated an idea of the difficulty of "working" this medium, from its peculiar nature; and, therefore, the full extent of merit in such successes as are here realised must, to the general observer, be necessarily unappreciated: but the great beauty of the works will be apparent to all. Several of Flaxman's designs have been adapted with considerable skill, and seem eminently suited to the peculiarity of this style.

We are glad to perceive that Her Majesty has

already conferred valuable and appreciative patronage upon these productions. A duplicate of a tazza executed for Her Majesty is exhibited at the Crystal Palace; the design being Raphaelesque, and admirably delineated, both in drawing and manipulation.

The studies for the earliest of these works were lent to Messrs. Kerr and Binns by Sir Edward Lechmere, who has been their constant and liberal patron—and who must, therefore, cordially rejoice to find them so universally appreciated. The famous collection of General the Hon. Edward Lygon was also placed, by the liberal feeling of its owner, at the service of the manufacturers, who have now also in progress copies of some of the celebrated "enamels" belonging to Henry Danby Seymour, Esq., M.P., kindly lent by that gentleman for the purpose.

We cannot pass, without a word of acknowledgment, the honourable and patriotic feeling which prompts collectors of works of such beauty and value to devote them to the improvement of our manufactures. It demonstrates strongly the advanced intelligence of the age, and is one of its most hopeful signs. We cannot, indeed, too strongly advocate a principle so pregnant with beneficial results to the manufacturer and the public: it is thus that good and pure models can be obtained with almost the certainty of pure copies, or, what is of greater consequence, valuable suggestions. The artist has at all times found at his service the great productions of the great masters; it has been otherwise with the worker of Art-industry, who has heretofore encountered many difficulties and few encouragements on his way to excellence. Of late years, however,

GROUP OF WORCESTER ENAMELS: KERR AND BINNS.

instructive books in abundance have been issued; the national stores have been augmented with a view especially to his service; and there has been a liberal desire on the part of collectors to assist his progress, by lending, or permitting access to, the choicest and costliest efforts of all countries and ages.

"The ancient city of Worcester" is deeply interested in the success that has attended the revival of its Porcelain Works: the fame they had acquired was little more than traditional until renewed by the efforts of Messrs. Kerr and Binns. The early productions of the establishment of Messrs. Chamberlain now realise almost fabulous prices; but, of late years, little or nothing had been done to sustain the reputation they obtained. Under the management of their enterprising and ingenious successors, however, the works are again famous, and the venerable city will be advantaged by their renown.

The objects delineated in the appended group require a few notes and comments.

The predominance of a cultivated taste in the

selection of such types as best adapt themselves to the purpose of this manufacture is evident in the forms of these examples. The flowing, unbroken outline, which is the characteristic of the early Greek pottery, is here freely rendered, affording a surface for the decoration on which the drawing of the details of figures and ornament can be accurately preserved.

The centre vase of the group presents a novelty in the finish of the handle, it being produced in oxidised silver upon porcelain; this process, as applied to porcelain, is the invention of Mr. Binns, and in effect is perfect, it being impossible—even upon the closest examination—to discover that it is merely a metallic surface. This process has also been applied to some of the statuettes made by this firm; and if the principle of imitation—in this sense be admitted, the result is perfectly successful.

The figures and arabesques of Raphael, together with studies from Flaxman, form the leading features of the designs generally, combined with such acces-

sories and such originality of treatment as impart a character of novelty as well as beauty.

The introduction of the "gilding" is in extremely good taste. It is delicately applied, and instead of being "burnished" in the ordinary manner, is merely relieved by "chasing." We cannot too strongly recommend these works to the inspection and patronage of all interested in the advancement of English Art-manufacture.

The Ceramic Court at the Crystal Palace is thus rendered attractive, in the highest degree, by the exhibition of truly fine works—produced by British manufacturers. We assert, without hesitation, that the productions here collected, are surpassed by no establishments in Europe,—if we except those which, under direct government aid, and by a lavish expenditure of government grants of money, issue works with which no private firm can compete. The formation of this "Court" has been of universal service, by inducing a general conviction that the means of achieving excellence are within our reach.

CORRESPONDENCE.

To the Editor of "THE ART-JOURNAL."
THE STEREOSCOPE.

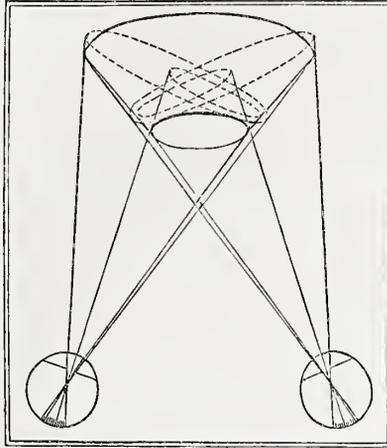

Sir,—In the descriptions of this instrument, which have already from time to time appeared in the *Art-Journal*, no place has yet been found for a short explanation of the physiological principles which are involved in the use of it. This explanation, it is true, may have been purposely withheld by former able contributors, either from considerations of the incompleteness of scientific research, or from their belief in its inappropriateness to these columns. Yet, there is neither difficulty nor deficiency in that theory which Sir David Brewster propounded shortly after the publication of the original reflecting Stereoscope, by Professor Wheatstone. And there is no longer any expressed difference—at least, well-supported difference of opinion—upon the matter; nor is there any subject, as we regard it, which is more akin to this very Journal than the physiology of vision, whether of one or two eyes. With these convictions, we venture in a very few sentences to supply the omission.

Within the last few years, it is certain that many thousands of people have been charmed to rapture by the relievo prospects of the Stereoscope; and, of these, hundreds have doubtless been arrested by the extreme simplicity of the discovery, and of its Art-appliances. But, even of the latter class, it is too probable that most rest contented with the bare knowledge of three simple facts—1st, that they have two pictures of every object of regard in their open eyes at one and the same time; 2nd, that these pictures are, according to the objective character and distance, always more or less dissimilar; and 3rd, that, consequently, when the two pictures of any view which have been previously imprinted by photographic art on slides, or, so to speak, on cameral retina, are represented to their proper eyes, they must, by the mere act of opening their eyelids, realise the vision of the object or group of objects themselves, and that by simple transference of the pictures to their own retina. Now, so far as they go, it is quite true that these are valuable portions of knowledge; and they alone are, moreover, the very facts by whose intelligence the first invention was suggested. But, facts though they be, this is by no means either an accurate knowledge or an adequate measure of the whole discovery; and it certainly rests far short both of the extent of modern research, and of the ascertained principles of common vision. The more complete intelligence of binocular vision, which we now proceed to render, rests entirely upon the nature of the eye itself; and happily there are but few organs of the human frame which are either better understood, or more easy of apprehension.

The simplest view which we can take of the human eye is that of a ball or sphere, of about an inch in diameter, having a dark interior coating called the *choroid*, and admitting the light, whereby we see, by means of a small circular orifice—the well-known *pupil*. To this little sphere a ball and socket motion is given by the agency of several muscles, whose respective extremities are attached to the unseen part of the ocular convexity, and to the concavity of the socket. A circular tensile plane, named from its variety of colours the *iris*, divides the eye into two unequal compartments, and enables us to expand and contract the pupil according to the light. The aqueous and vitreous humours which fill these compartments serve to keep the ball itself distended; and the *crystalline* lens, which is situate immediately within the pupil, and amid the vitreous humour, has for its object that of the ordinary convex lenses of art, the concentration of those cones of light which proceed from every point of outward objects upon the retina, or nervous sensorium, which lines the back of the eye.

From this brief word-sketch of his eye—it is little more, we confess, than a mere word diagram—let the reader now pass, and take an attentive look at the perspective figure we have drawn of two eyes and a solid. A part of a cone is here represented as the object towards which the pictured eyes are gazing. Let us see, in the first place, what are the respective pictures which that object would imprint on the retina of these eyes. In the diagram, we have not attempted to do more than indicate their position by points; but the pictures themselves will evidently be the exact counterparts of those which we have represented as crossing the solid in broken lines, and in planes respectively perpendicular to the axial lines of the eyes. The retinal pictures, no doubt, will differ from them in size, and also in a certain hollowness corresponding to the magnitude and sphericity of the eyes; but these differences, again, may be disregarded here, for they will in no wise affect the proof which, by this single diagram, we seek to give of our single vision with two eyes.

These broken-line pictures exhibit very distinctly the nature of that dissimilarity which always accompanies our ordinary vision of solid objects, and of varying distances, and which forms the basis of stereoscopic vision. From this point, therefore, the proof of single vision will be the same both for the

case of actual solidities, and for that of double dissimilar pictures of such solidities; for it is well known that, instrumentally and otherwise, we can readily super-impose the images of these pictures. Let us now, in the second place, note the positions of the transferred pictures, that is, of the dissimilar pictures which lie on the retinae. The points and the directions of the radiant lines in the figure will show that these positions are not symmetrical, and hence that the old doctrine of nervous decussation is unequal to the solution of binocular vision. What then remains to solve the common every-day mystery? If the power of the imagination be cited to the difficulty, few men of judgment, we believe, would be found to yield to it the strange prerogative. And the well-known indistinctness incident to the vision of any considerable space would come in to mar such a conclusion of imaginative power. But there is no need of such a wild hypothesis, for the eyes in pair have other and material means of determining distance, and therewith of securing the utmost distinctness at the very same moment; and these means consist in their admirable economy for speed, accuracy, extent and ease of motion. Who does not or may not perceive, every waking minute of his existence, that his eyes are in almost perpetual motion, and not only the balls of his eyes, but the lenses and pupils likewise, independently of the balls? Of these motions, moreover, the pupillary contractions and expansions are only necessary, as we have already mentioned, in order to regulate the amount of light which enters the eye; and the crystalline lens, with movements even more refined, enables us to meet the varying distances of outward objects, by invariably condensing their rays upon the retina—the pictorial seat of innumerable foci, and itself the netlike expansion of the optic nerve. From this latter fact it is that philosophers have jumped to the conclusion that distinctness of vision is simply dependent upon equality of distance from the ocular centres; and German physicists have improved upon it, by affirming that single vision of whole lines and surfaces is the ready consequence of their position upon the superficies of a binocular sphere, which passes through the two ocular centres and the successive parts of external scenery. But is it not also an incontestable fact that we can never see more than a very small space, almost a point, of any object distinctly at one time? And, if so, are not these theories too manifestly defective? The truth is, the retina of the eye is incapable, by reason of failing sensibility, of imparting distinct vision for any part of its pictures excepting that which lies upon the *fovea*, or portion of it diametrically opposite to the pupil. No theory of single vision can therefore stand for a single instant, unless in conformity with this fact; and we are compelled to look to the motions of the eyeballs themselves as the primary source of single vision with two eyes.

By these motions it is, in fact, that our pair of eyes can and do, every moment, converge their axes of vision upon single parts of any object of view, and glean the most perfect distinctness of both its character and position. And this they accordingly do, with the most perfect unison, upon all parts of the object, behind and before, above, beside, and below, for which the mind wills to have such distinct information; and, in so doing for only a very few points of any object or landscape they will necessarily fix the general shape and dimensions to the mental view. Nor does the full demonstration

stop here. Let another significant fact of ocular optics be added, viz.—that the impressions of the retina are not, as might be naturally supposed, instantly evanescent with every change of the eyes' direction; that these impressions, on the other hand, are retained for an appreciable period of time; and we see at once how, when the eyes do make the change of direction upon successive points of the field of view, the idea of distance and depth is gained with such unerring accuracy as we actually experience. And hence, to gather these remarks into one further observation, we conclude that the true stereoscopic effect, both in nature and art, is due to the successive convergencies of the optic axes alone, and that the distance between our eyes is for each individual the true base of his measurement.

Such and so few are the principles of that theory of binocular vision which is not one of the least, or least important, of the fruits which have resulted from the invention of the stereoscope; and we conclude the subject with the hope that it too may, ere long, be as widely known and appreciated as are the many striking effects of the instrument itself, which now occupies so large a share of public estimation, and promises to amuse and educate the people.

One word more regarding the common stereoscope and the recent differences of opinion which have been so fully expressed in the columns of the "Photographic Notes," regarding the proper distancing of cameras to secure stereoscopic pictures. Two rules have been proposed to guide the photographer in this matter, and he, singularly enough, restricts himself to neither. One of these rules directs that the cameras be invariably placed at eye-distance apart, and the other at such a distance as to form with the object a triangle similar to that which the eyes, in using the stereoscope, form with the combined pictures. The accompanying

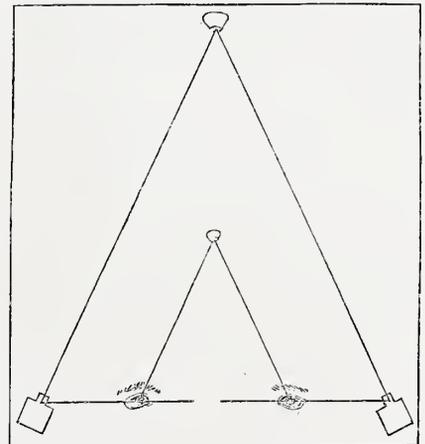

figure exhibits the latter view; and it is obviously founded upon the principle that the vision of pictures cannot be disjoined from the real distance of the canvas or other plane material upon which they are depicted. So far, however, is this from being a true principle of Art, that the very opposite is the universally admitted aim of all high Art whatever. And if, as Mr. Ruskin and good sense affirm, the truest painting simply consists in truth-telling, how much more should the attainment of truth and reality be the grand aim of an instrument which professes to enhance our picture vision by an appearance of depth, distance, and relief beyond every effect of shading, circumstance, and aerial perspective. No one denies that the true consequence of this rule is to limit the stereoscope to the vision of models of every object and view, excepting those whose photographic pictures are equal to their own superficial dimensions. This were to make it a very *toy* indeed. But who that has seen its best effects will venture to uphold the term? Is it not, on the other hand, certain that some of the very best stereoscopic transparencies have been taken by cameras at eye-distance apart from each other? And is it not well known that, though the practice of taking pictures at every distance, and quite abnormally, is common, yet these are but tricks of a new art to increase the apparent relief, while they utterly destroy the appearance of reality. To us, indeed, the fact that eye-distance is the only proper distance of cameras when set for taking prospects, appears so very obvious that we can only wonder how the grave error has held so long. For it is only with these pictures, we are firmly convinced, that the imagination has any chance of influencing the judgment toward the belief of reality, and the stereoscope of proving a valuable ally to highest Art and design.

L.

THE SOULAGE COLLECTION.

THIS Collection of Works of Decorative Art (*Art mobilier*) has been brought into public notice in this country under very singular circumstances; and, as a consequence of these circumstances and apart from its intrinsic merit and value, it is calculated to exert a peculiar influence upon Art-teaching among us. It becomes necessary, therefore, to subject this Collection to the most searching critical examination; and, in order to place it in its legitimate position, we have both to deal with it carefully and candidly as it is, and also to investigate the causes which have led to its having acquired a special character.

This Collection was formed by M. Jules Soulage, an advocate of Toulouse, chiefly during the period between 1830 and 1840, and it was the result of repeated tours through Italy, made with the express purpose of acquiring specimens of the Art-productions and manufactures of the Renaissance style. Originally located in Paris, the Soulage Collection was afterwards removed to Toulouse, where it enjoyed a high reputation amongst the artists and antiquaries of France. From time to time offers were made to purchase portions of the Collection, but M. Soulage resolved not to part with it except in its entirety. Representations were afterwards submitted to the English Government, by some gentlemen interested in the progress of Art in England, that this Collection might constitute a most important addition to the National Museums, which, having been formed at Marlborough House, have now been for the most part removed to Kensington Gore South; the time, however,—it was during the continuance of the war,—was considered to be unfavourable; then was the plan formed which eventually brought the Collection into this country as English property. It having been determined to make an effort to effect the purchase of the entire Collection, a number of influential persons associated themselves together for that purpose, and guaranteed the necessary funds. Three gentlemen—Mr. D. C. Majoribanks, M.P., Mr. M. Uzielli, and Mr. H. Cole, C.B.—were deputed to act for the subscribers, and in their name the purchase has been concluded. The Collection has been again offered to the Government by its present proprietors at the cost price, with a certain additional sum for interest and contingent expenses; but, should the nation fail to accept those terms, the whole will be offered for sale by public auction, having first been exhibited, under Government authority, at Marlborough House, and subsequently having been deposited for a time for a similar purpose amongst the other Art-treasures at Manchester.

The taste, the discrimination, and the judgment of M. Soulage, have thus received a very extraordinary sanction. His collections have been purchased by an association of judges of Art, and they have been purchased in this manner with the express view of securing them for the nation as a possession of too great importance not to be obtained if possible. They make their first public appearance under the same roof with the Turner pictures; they at once command, in an unusual degree, the interest and attention of the community at large; a place of honour awaits them in a great provincial city, at such a gathering of Art-productions as probably will never have been before witnessed; and their eventual destination is matter of anxious speculation in very high quarters. The questions which hence necessarily arise are—Do these collections really justify all this, and are they found to realise such high expectations? It will be requisite, in order to reply to these inquiries, to examine into what was the aim of the French collector in his researches, and how far the objects which he was enabled to bring together may be considered to have accomplished the purposes he had proposed to himself. The Soulage Collection may be classed under the four following sections—majolica, Palissy and other earthenware, Italian bronzes, cinque-cento furniture, and miscellaneous articles, including Venetian glass, some enamels of Limoges, a series of 106 medals, chiefly Italian, of the quattro and quinque-cento periods, with some Della Robbia ware, knives, forks, &c.; in all there are 756 pieces. Without attempting to enter upon the subject of the decorative pottery which was produced in Italy at the time of the revival of Art in that country, we

may remark that the examples contained in this Collection illustrate all the most important and the most esteemed varieties of majolica, and that the greater number of the examples are favourable specimens of their respective classes. The specimens of the celebrated metallic crimson lustre of Gubbio are unusually numerous and very fine. There is also a highly interesting and characteristic group of earthenware, the production of Bernard Palissy, and of other artists of the south of France. The several specimens in the other sections of the Collection may be generally described as being, for the most part, good of their kind; so that, on the whole, M. Soulage was unquestionably successful, and that in no ordinary degree, in the accomplishment of his object. But such success is far from determining in the affirmative that the Soulage Collection merits the position in which it has been placed, and that its possession is essential to the National Art-museums. The character of the Art of the Revival period, in Italy, is the grand consideration to be brought to bear upon this question, and we do not hesitate to pronounce upon this point an opinion, differing very widely from the views entertained by the cinque-cento enthusiasts of the day. That an earnest and truthful feeling for Art, in the purest acceptation of the term, combined with a truly wonderful technical knowledge, was exhibited in their works by the majolica *maestri* is evident from the works themselves; yet, as the same evidence declares, they found themselves fettered by the vitiated taste that overshadowed the period in which they flourished, so that we are constrained to consider the present estimation of this ware to be extravagant, and altogether to be deprecated. There also prevails a similar tendency to exaggerate the Art-character, and proportionately to enhance the value of every other production of the period. Now we would have all these works, whether components of the Soulage Collection or not, dealt with on their real merits—their real merits as productions and examples of Art, as illustrating historically a remarkable epoch, and as being in themselves models and teachers to artists. Thus regarded, and also with special reference to the national museums, we should desire about half the Soulage Collection to become the property of the nation; but for such a selected moiety we should consider a half of the sum which has been guaranteed rather to exceed than to fall short of the value of the objects chosen for purchase. We have a vivid remembrance of the rejection of the Fansett Collection by the trustees of the British Museum; and we entertain very decided views relative to the comparative worth of the labours of the Kent clergyman and the advocate of Toulouse.

ALNWICK CASTLE,
AND ITS DECORATIONS.

We have watched with deep interest the controversy that has arisen upon the character of the interior fittings and decorations which have been adopted by the Duke of Northumberland, as the completion of his restorations of Alnwick Castle. His grace is himself a learned antiquary, an accomplished scholar and experienced student of Art; and he has taken into his councils men whose names rank high as "authorities" in their profession. The fine old feudal fortress has been thoroughly restored, yet it is a fine old feudal fortress still; and we know no form of higher commendation for the work of the restoration. But pass through the massive entrance archway, and enter the actual apartments within the castle, and all is changed! You can admit no one association of the Scottish Border. You are looking up from that heavily mullioned window for the deep blue sky of Italy, and around for all that encircles and identifies a Roman palazzo. Your own language surprises you—you ought to be speaking and thinking in that softened Latin, which is Italian.

The Duke of Northumberland has decided that the interior of such modern or Renaissance palaces as are familiar to him at Rome are the fittest, and, indeed, the only fitting models for the interior of his own Border castle, now that it has become the residence of an English noble family of the

highest rank—hence the controversy of which we have spoken. Some of our most distinguished architects have resolutely supported the decision of the duke; while others of at least equal celebrity have denounced the decision as involving a direct violation of every sound principle of Art, and as establishing a precedent calculated to produce most prejudicial consequences. On one side it is argued that the architecture of the middle ages can appeal to original examples, which render the work of such a restorer as Mr. Salvin at once comparatively easy and certain to be correct and truthful; but that the Romanesque and Gothic know nothing of such interiors as in a modern dual residence are imperatively required, neither do they furnish any analogy from which original designs for such interiors could be devised; and it is further added that attempts of this kind have been made, and have failed—and hence it has been concluded that Romanesque and Gothic edifices of dual rank can have no interiors of equal rank which shall also be Romanesque or Gothic. It is but a single step in the argument which leads from this point to the inference, that since a modern Italian palace has been proved to contain rooms suitable for a princely family, which rooms are in their character faithful to the Renaissance style of architecture and general Art—the Renaissance is the style for interiors when the exteriors are Romanesque and Gothic.

The opposing argument strikes at the root of this theory, and maintains the entire capability of the mediæval styles to provide their own details, and to adapt themselves to every possible contingency of circumstance and use.

It is scarcely necessary to observe that the cause of Art, as a working impulse and a living agency amongst us, must be very seriously affected by the issue of this controversy. In the first place, if the Duke of Northumberland and his professional supporters are right, certain great and noble forms of Art stand convicted of being utterly powerless beyond the requirements of mere construction and exterior decoration; and again, in this case, it is a proved fact that there exist no such things as congruity and uniformity in architecture and its accessories; and, once more, thus the capacity of the Renaissance is demonstrated to be superior to that of the Gothic, both in the general case of being able to complete itself, and particularly in the important condition of adaptability to the highest requirements of civilised life. Now all this may be very specious, and both professors of architecture and the Duke of Northumberland and the public may accept and believe it all; but does not the entire matter resolve itself into such a proposition as the following? Modern (or Renaissance) Italian palaces are fit for dual residences; while Gothic castles fit for dual residence do not exist. It does not follow as a consequence of these facts, that a Gothic castle must, to become fit for a dual residence, be fitted up like an Italian palace. Nor does it follow, because Wyattville and Barry have not produced perfect palaces from the Gothic, that that great style cannot produce a palace. Yet such is the train of argument which has brought the works of the lamented Canina and his Italian carvers to Alnwick Castle. We are prepared to admit the excellence of all that the Commendatore has done, and that Professors Cockerell and Donaldson have approved—their excellence in Italy, and for Italy, and in a Renaissance palace; but we cannot sanction the actual association of these works with Alnwick Castle. It is an absolute and a most unfortunate fallacy which has brought these Italian excellencies into a position, in which their own high merit serves to render their unfitness for that position the more glaring and the more conspicious. We do not now touch upon the question of the intrinsic merit of the Renaissance; our reasoning is simply directed against the introduction of this style into Alnwick Castle. We claim for Gothic Art free range as well as cordial sympathy in association with Gothic Architecture. The Gothic may not have put forth its full powers, as we now may require their expression; this, however, may not be from any shortcomings in the powers, but because they have not been brought fairly and fully to the test of experiment. And, in this very matter of interior fittings and decorative accessories, the Gothic has accomplished a wonderful advance.

Surely there is enough in the Palace of Westminster, if not to serve as a model for the Palace of Alnwick, to give abundant promise that the Gothic style can now produce a palace worthy of its own traditional fame; worthy also of the present condition of Art in its loftiest developments, and of refinement under its most elaborate forms; and not unworthy of an English duke, even though he bear the time-honoured name of Percy.

That the Renaissance works at Alnwick are a mistake, and worse than a mistake, we are convinced; at the same time, we believe that such a mistake as this is, was needed in order to bring the capabilities of Gothic Art suitably under discussion; and, consequently, we anticipate to the general cause of Art ultimate results of a most advantageous character from the controversy to which the Duke of Northumberland has given rise.

OBITUARY.

THE COMMENDATORE LUIGI CANINA.

The archæologists and architectural artists of Rome have to deplore the sudden death of this distinguished professor, which took place October 17th, at Florence, as he was returning to Rome, after a prolonged stay in this country. Canina was pre-eminently and exclusively a classic archæologist: devoted to the architecture and Arts of antiquity and the Renaissance, he refused to recognise the works of that great Art-epoch which intervened between them. In his own department of Art, he was a high authority; and his acquirements and judgment were regarded with the utmost respect by those who, really knowing him, really knew his worth. In the opinion of the mediævalists, Canina necessarily occupied a very different position: this was the inevitable result of his not being content to devote himself to one great form and expression of Art, without ignoring altogether another of equal nobleness. A systematic, laborious, and also an enthusiastic worker, Canina has left behind him a series of volumes, unsurpassed, and perhaps unequalled, in their peculiar department, by the productions of any other single individual. Like Piranesi, and other Roman authors, he had the whole of the branches of publication carried out in his own house: in one room worked engravers, and in an adjoining apartment the plates were printed off: it was the same with the preparation and actual production of the type of his printed volumes; and, with one or two exceptions, the whole were issued at his own expense. His first important work, in three folio volumes of plates and nine octavo volumes of text, is a history of ancient architecture, and comprises the Egyptian, Greek, and Roman. The ancient Basilican churches of northern Italy next attracted his attention; and, after these, he proceeded to devote his studies to the edifices of ancient Rome and the Campagna—the Forum attracting his special regard. "Researches upon the Architecture of the Ancient Jews and of the Temple of Jerusalem," preceded a second series of Roman works, which, in their turn, gave place to equally important treatises upon Etrurian remains, upon domestic architecture, and upon the antiquities of the Via Appia, all of them being profusely illustrated with engravings of the utmost value. Canina had travelled much throughout Europe, and had studied on the sites themselves the monuments of Sicily and Greece proper. His recent visit to England was the second that he had made to this country. "His researches and labours," writes his friend, Professor Donaldson, "were appreciated by many princes and sovereigns; and he was decorated with a profusion of orders of various countries. But the distinction which he valued most was the position he held as Director of the Museum of the Capitol, which, with the title of Commendatore, ranked him among the forty nobles of Rome. This gave him just pride, as did also the Royal Gold Medal conferred upon him by the Institute of British Architects in 1849, with the approval of Her Majesty and Prince Albert." The Commendatore was a man of early habits, and singularly energetic in the prosecution of his labours. He was punctilious in his correspondence, and obliging in his disposition. He formed friendships slowly, but was a

firm and faithful friend. He was most liberal in his dealings with all persons; and Art he loved for its own sake. "He was very susceptible of criticism and opposition of opinion, and deeply resented the strictures of the German *litterati* who disputed his scholarship, and the critiques of the French who called in question his taste. He was not free from the superstitious sentiments common to so many of his countrymen, and, from an intuitive dread of consequences, would never allow his portrait to be painted, nor his bust to be modelled." By a friendly stratagem, Professor Donaldson obtained a photographic likeness of his friend; but it did violence to his feelings, "and, in order to avoid the '*malocchio*,' he arranged (as he thought, unobservedly) the fingers of his right hand, as a charm against the evil consequences that he feared—a presentiment which the sad event of his death so soon after almost seemed to realise. The photograph faithfully represents the serious character and deep thoughtfulness of the scholar; but his expressive features, however, in moments of familiar and social relaxation, were often lighted up by a most pleasing smile. . . . It is a striking and a touching coincidence that Canina and Braun, the leaders of the rival systems of the two schools of archæological research at Rome—the Italian and the German—should have died within a few weeks of each other; and thus left the field open to other, but it would be hold to say to nobler or more zealous, minds."

MR. FREDERICK NASH.

This gentleman, one of the oldest members of the Water-Colour Society, died at his residence, at Brighton, on the 5th of December. We may at a future time—for intelligence of his decease only reached us when we were on the eve of going to press—be able to give some account of his life; at present, we can only refer to him as a painter of architectural subjects and marine views, whose drawings were held in very general estimation.

THE ARCHITECTURAL MUSEUM; ITS REMOVAL TO KENSINGTON GORE.

So numerous and so important are the additions which have of late been made to the contents of this Museum, that it has assumed both the proportions and the character of a national institution. Mr. Ruskin has deposited here his very valuable collections of casts from Venice; from Notre Dame, some noble specimens from the triforium of the nave have been acquired by the Committee of the Museum; Mr. G. G. Scott, Mr. Burgess, with many other gentlemen, have been contributors; and various groups of casts, of greater or lesser extent, and obtained from different sources, might also be specified amongst the recent accessions: and, in addition to casts, the Museum has become the depository of many original examples of architectural details, which, from whatever cause, have ceased to possess any secure resting-place of their own. This increase in the number of its contents has, however, served to place in a more prominent position that great drawback, as well from the general estimation of this Museum as from its practical utility to architectural students—want of space. Not only are the premises occupied by the Museum too limited in extent to enable the Committee suitably to classify and display their collections, but it has now become necessary to pile up specimen in front of specimen, until many parts of the Museum have almost ceased to be available for examination and study. Under these circumstances, and finding that even their present premises would sooner or later be absorbed in the proposed new government official buildings, the Committee have wisely adopted a proposition which was submitted to them, for forming such an arrangement with the Government Department of Science and Art as would enable them to obtain for the Architectural Museum a part of the new national Museum Buildings at Kensington Gore South. It might be objected to such an arrangement that the situation of these new buildings would be far less convenient than the present Gallery in Canon Row for architectural students, and also for the general public who might be disposed to visit this museum,

and to seek from its varied collections some authoritative teaching upon the great art now almost universally regarded with such deep interest. To this objection the reply is both ready at hand and in itself conclusive—it is no longer an open question whether the great Fine-Art Museums of the nation should be concentrated at Kensington Gore South; this has been decided in the affirmative—whether wisely or not, the decision has been made. Consequently, for the Architectural Museum *not* to be in this selected locality would be to place it in an exceptional condition, and to cut it off both from contributing its own beneficial influences to the general Art-capital of the country, and from sharing, in its turn, in the advantages to be derived from association and comparison with other collections devoted to other departments of Art.

In the new buildings ample space will be afforded to do justice to the collections which have been actually buried at Canon Row; and there also the Museum may expect to acquire such further additions as will render it complete in itself, and of infinite value in its capacity of a practical teacher of architecture. While subjected to certain general regulations in common with the rest of the establishment, the Architectural Museum will remain, as heretofore, dependent upon its own resources, and under the control and direction of its own Committee. Its infinitely greater capabilities for advancing the best interests of architecture amongst us will not fail, we are persuaded, to be recognised by the subscribers to the Architectural Museum, who will feel that upon them devolves the charge of strengthening the hands of the Committee, and, indeed, of securing for a public institution their all-important services. For this will be a peculiar feature in this Museum, as a department of the general Art-establishment, that the most eminent members of the architectural profession voluntarily make themselves responsible for its character, and bestow upon it an amount of personal attention which it would be impossible to purchase. Doubtless the government both understand and appreciate the worth of the Committee of the Architectural Museum, as well as the intrinsic value of the Museum itself in connection with their Art-establishment: it is well that it should be thus—that these really wonderful collections should find, provided for them at the public cost, a becoming dwelling-place, and that the nation should acquire the reciprocal advantage of having both an architectural museum already prepared for it, and the most able architects, as a committee of management, willing to render their voluntary services.

It is expected that the Architectural Museum will be established at Kensington Gore South in time to admit of its being open to the public, with the other Art-collections there to be assembled, in the month of March. In the course of this present month of January, the Committee of the Architectural Museum will have secured to themselves a fresh claim for public gratitude and support from a second award of prizes to Art-workmen for the best productions after their own designs, upon specified subjects. We shall not fail to record the particulars respecting a decision which bears, so directly and under so practical a form, upon both the advancement of true Art and its recognition in its true capacity.

THE

"MIDSUMMER NIGHT'S DREAM,"

AT THE PRINCESS'S THEATRE.

It would seem as if a sort of contest had arisen between Mr. Kean and his critics. No sooner has the critic made an effort to do justice to the former's principles of management, and their results, than the manager seems as if he had made a new and determined effort to justify his critic. In our recent remarks on that series of illustrated dramas which must hereafter form a chapter in the history of our English stage, we described Mr. Kean as constantly competing successfully against his own success; we have now to describe him as competing more than successfully against the praise that records it. In answer to our acknowledgment of variety, he breaks up for us a fresh field:—for our admission of archeology made poetry, and which we can seize

by its archæologic points for description, he gives us a poetry so refined and essential, that the pro-saisms of descriptive criticism cannot reach it.

We will frankly confess, that, for our own part, we were under the impression that Mr. Kean had here ventured on a dangerous attempt. In most of his previous versions he leaned on a variety of well-defined aids, to which he could point incontrovertibly as his vouchers,—where learning could be appealed to as giving its authority to the witcheries of Art. In the present instance, in all that makes the essential character of the piece to be represented, Mr. Kean was committed to the spiritualities alone; and to fail of their expression, was to fail altogether. For this one night the manager was to be a poet—and a transcendental poet,—or the circle of his successes was here to be broken up. If he could not take his audiences into dream-land, then he would have done wisely to abide by the old historic paths. If he could not give them a glimpse of the fairies in their own charmed atmosphere, ever remote “from the presence of the sun,” and “following darkness like a dream,” he should have stuck by the dim yet recoverable outlines of ancient fact. If Prince Theseus and his earthly court should loom too prominently through the haunted haze of that midsummer’s night, then the closing appeal of his spirits was to be in vain, and his “shadows had offended.” There are, we must avow, certain of the Shakspeare dreams which we have always felt unwilling to see submitted to the ordeal of stage presentment;—and this wild and wondrous creation is one of them. The faery that, left alone with the poet, and in its own “witching hour,” has followed again and again the moonlight wanderings of the fairy queen, or looked in upon “her deep repose, won by no mortal music,” has almost made it a part of its own religion that “no mortal eye may gaze upon that bower” wherein the slumber of Titania is watched by “the moon, her playmate of a thousand years.” Against this sort of poetical reluctance Mr. Kean has, in his present revival, had to contend, in addition to his other difficulties; and his triumphs of fact are all the greater, that he has had likewise to triumph over a sentimental opposition.—For, a triumph this revival is:—and such an one as has not, in its kind, been achieved on the stage before.

As we have hinted, we know not how to describe the charm of this piece. We have never dreamed that so much of fairyland could be put on the stage. The manager has so contrived, that we are under the express Shakspeare spell. All through the hours of a midsummer night, won out of mid-winter, we are consorting with the elves. The world into which we are introduced teems with “these beings of the mind;” and the moon that lights them is the moon of fairyland. Everywhere these spirits of our old English poetry are about us, they, and their fairy music. They glide over the green sward, trip in the moonlight, “dancing their ringlets to the whistling wind,” float through the night air, lie rocked on the stems and shaded by the calices of flowers, dart away on the message of the fairy king, leaving a trail of light behind like that of a falling star, or swarm on the marble stairs of the house of Theseus, giving the “glimmering light” of their countless fairy lanterns, and the wild music of their charmed fairy blessing.—For ourselves, we, the spectators, are of the party of the fairies. We are within the charmed circle,—and have no relations with that outward world which is represented by Theseus and his court, save such as the elves have themselves. They and their fortunes are seen by us, too, through the mists of dreamland; and we look with a sort of wondering bewilderment and puzzled pity on those strange wild entanglements of a midsummer night, wrought by the benignant but blundering interference of a power only half immortal with the threads of destiny,—forgetting for the nonce the portion that we ourselves have in all such errors, and half inclined, in our “midsummer night’s” privilege, to echo the comment of Puck—“Lord! what fools these mortals be!”—And so, Mr. Kean has contrived that we shall read these Shakspeare transcendentalisms on his stage in the same faith in which we read them in the closet, but with the heightened effect of the illustrations which he throws on the poetry that embodies them from all the other Muses.

Nevertheless, although Mr. Kean’s art has thrown

into their due subordination and perspective the human interests involved in this wondrous poem, yet on the figures which represent these interests he has bestowed as careful editing as on any one other of his productions. Left to the expedients of his own fancy for the realisation of fairyland, the Greek element of the play furnished him once more with the opportunity for grappling to archæology;—and this resource he has used, as on former occasions, with that intelligent latitude which substitutes one fact not suited to his purpose by another that yields him a beauty. It is no part of Mr. Kean’s office, with such a text-book as Shakspeare before him, to comment on that mixture of two mythologies which transfers the supernaturalisms of romantic lore to classic ground; but he knows, that in a chronology already so wild and irregular, it would have been the mere pedantry of adherence to attach importance to what Shakspeare had deemed of none, and go implicitly back to the time of the quasi-historic Theseus, when its Cæropian forms and modes would have matched—or contrasted—with the other poetic embodiments of this marvellous piece. So, keeping the play on its Athenian ground, Mr. Kean took for his classic background the Athens of Pericles; when, to use his own words, “it had attained its greatest splendour in literature and art,—when it stood in its pride and glory, ennobled by a race of illustrious men, and containing the most beautiful objects the world had ever seen.” Out of the material features of this matchless city Mr. Kean gets his first picture. And what a picture it is! From a terrace adjoining the Palace of Theseus, the spectator looks on Athens, with its Acropolis and Areopagus (the council-room of a Greek people, and the pulpit of a Christian apostle)—the temples of Minerva and of Theseus—the Erechtheum and the Pandrosium—the columns of Jupiter Olympius—the Agora, the Clepsydra, the Academy, the Pnyx, the Musæum and the Stadium—the Hissus and the Cephissus—the mountains and the sea!—It may mark Mr. Kean’s careful mode of annotating, to add, that in the scene which succeeds to this, and which exhibits the interior of the workshop of Quince, the carpenter, the furniture and tools introduced are copied from discoveries in Herulanum.—And, while dwelling on this Greek portion of the play, there is one other matter to which we are strongly tempted to allude;—both as illustrating incidentally the wholesome teaching, of so many kinds, which these revivals of Mr. Kean’s afford, and for the sake of enforcing the particular lesson on our own account. Let us join the happy bridal groups, escaped from the crosses and bewitchings of the wood, and seated in the hall of Theseus, to witness the “most lamentable comedy” and “very tragical mirth” which make a portion of the nuptial revels. We will entreat our fair readers to cast their eyes over this Greek saloon, and then around their own English hemisphere of the house,—and honestly ask themselves which nation had caught the secret of beauty in dress. Amid the eccentricities and extravagances and distortions of present costume, the exquisite draperies here presented are positively felt as musical phrases yielding their distinct and appreciable contribution to the harmony of this matchless piece.

With the exception of these few Greek scenes, all night, as we have said, we are wandering with the fairies in the wood:—now lost in its floating mists, now emerging in its moonlit glades,—and everywhere listening to such fairy song as Mendelssohn and Beethoven knew. One of the charmed scenes to which these wanderings bring us we may report here, as an instance, for our readers:—and then bid them thread the haunted forest for themselves. In this scene, we come upon an opening where the moonlight falls white upon the forest floor,—bounding itself by a circle of shade which shows that it is a dancing ring for the fairies:—and into this circle, accordingly, the fairies glide, throwing their shadows before them. This dance of the elves, with each her own dancing shadow for a partner, is a thing of preternatural beauty,—itself a poem.—And, after this fashion, scene by scene, does Mr. Kean interpret Shakspeare’s “Midsummer Night’s Dream.”

* For the power to render this beautiful scene with so much accuracy,—so as indeed to become a “pictured lesson,”—Mr. Kean is, we believe, indebted to his valuable ally, Mr. George Godwin, whose assistance has been so useful to him on all the occasions of his revivals.

THE ROYAL PICTURES.

CHARITY.

J. Van Eycken, Painter. P. Lightfoot, Engraver.
Size of the Picture, 1 ft. 3¼ in. by 1 ft. 1½ in.

OF the many excellent artists who, during the last few years, have been included within the schools of Belgium, John Van Eycken is one of the most distinguished. He was born at Brussels in 1810, and, after studying some time under M. Navez, pupil of David and a painter of high reputation, he entered the Academy of Brussels, and in 1835 carried off the first prize in painting. He made his appearance the same year in the exhibition at Antwerp, by exhibiting a picture of St. Sebastian, which obtained for him considerable distinction. To the exhibition of the Brussels Academy, in the following year, he sent “Christ crowned with Thorns,” and “The Young Tobias restoring his Father to sight;” these two works, of which the former is characterised by purity and harmony of colour, and the latter by forcible and truthful expression, completely manifest the style of his master Navez.

In 1850 Van Eycken sent two pictures to our Royal Academy Exhibition—one entitled “The Vintagers,” the other “Calvary;” they attracted but little notice here, and were returned to the painter unsold; he never attempted a second time, we believe, to bring his works before the British public. In his own country they were always duly appreciated; nor from the fact of his “Charity,” and another very charming composition, “Abundance”—now in the hands of our engraver—being found in the Royal Collection, would it seem that the merits of this painter were unrecognised here in high quarters.

Van Eycken died at Brussels in December, 1853, under somewhat melancholy circumstances, the particulars of which were narrated a month or two afterwards in the *Art-Journal*, when a short notice of this artist appeared.

The works of Van Eycken are chiefly religious subjects, or episodes of life treated allegorically. His “Charity” belongs to the latter class, and we must therefore examine the subject as a composition only; for, if we test it by the laws of nature or truth, it will be found contrary to both, and almost incomprehensible. The subject divides itself into two classes, or groups—the givers and the receivers, the principal of each being respectively the two mothers; but it is quite clear that the five children surrounding the figure on the right cannot be all her own—they are too nearly of an age; and, moreover, it is most improbable that children would be so circumstanced in a cornfield without any covering; nor could wheat, either cut or growing, be forced into such a sheltering canopy as that which bends over them. The painter has throughout sacrificed truth to fancy; but this must almost always be the case in works of an allegorical character, and Van Eycken has only followed in the footsteps of the great masters of ancient Art when they handled such subjects; and, indeed, very often when they assumed to paint historical facts—instances of which are so numerous as to require no special allusion to any one of the old painters to confirm the statement.

But, looking at the picture for what it professes to be, there are beauties in it which cannot but elicit much commendation. The destitute mother and her child are expressed with a reality painful to witness—the countenance of the woman is not, indeed, attenuated like that of one starved, but it is most suggestive of woe and misery, and her sickly infant is an absolute embodiment of disease and want. The group to the right forms a brilliant contrast to its wretched companion—here we find health, enjoyment, and everything that conveys to the mind “the luxury of doing good.” The three central figures are very charmingly composed; but the head of the child in the lap is not good—the forehead is unnaturally prominent, and the drawing of the leg resting on the wheat-stalk is bad. The chief merits of this work lie in the charming sentiment conveyed in the composition, and in its rich and truthful colouring: a little more attention to drawing would have made it a fine example of allegorical painting.

The picture is in the Collection at Osborne.

MINOR TOPICS OF THE MONTH.

AT THE ROYAL ACADEMY, on the 10th of December (the eighty-eighth anniversary of the foundation of the Royal Academy), silver medals were awarded to the following artists:—

To Mr. Philip Richard Morris, for the best painting from the life, and also for the best painting from the living draped model.

To Mr. Victor Boutellier, for the best drawing from the life.

To Mr. George James Miller, for the best model from the life.

To Mr. John Simons Constable, for the best architectural drawing.

To Mr. Alexander Glasgow, for the best drawing from the antique.

To Mr. John Constant Worman, for the best model from the antique.

To Mr. Francis Trimmer Gompertz, for a perspective drawing in outline.

To Mr. George M. Atkinson, for the best drawing in sciography.

There appears to have been no gold medal given; and we presume the above includes all the intelligence which the Academy have to communicate to the profession and the public.

THE "TURNER" MONUMENT.—Our readers will not have forgotten that, under the will of the late J. M. W. Turner, R.A., whereby he proposed to give effect to his presumed English privilege of bequeathing the money for which he had toiled, to whom he pleased, a sum of £1000 was left to be given as the price of a monument in the testator's own honour, which he proposed should be erected in St. Paul's Cathedral. Somchow or other, an idea had got abroad that this particular bequest had been swamped, amongst other of the great artist's testamentary intentions, on one of the many shoals that lie sunk in the great sea of Chancery; and the sum in question has been supposed to have disappeared in that distribution of the property which the salvors had made amongst themselves, under the term compromise,—the dead painter's directions notwithstanding. We are glad to know, that the provision in question has been picked up somewhere since the wreck in Chancery,—and the fund reappears in the following Resolutions, come to at a meeting held during the past month, and which our readers will like to have in the language of the Resolutions themselves:—

That the Executors and Trustees consider the most desirable mode to adopt for carrying into effect the wishes of the Testator, as regards the erection of the monument in St. Paul's Cathedral, will be, that the sculptors *who are Royal Academicians*, be requested to submit to the trustees and executors a design for the monument, either by a statue or otherwise, and by a drawing or a model to a scale of one inch to a foot, the expense of the monument not to exceed the sum of £1000 (as provided by the will), including its erection and all expenses whatever attendant thereon.

The site for the monument is intended to be on the east side of the south entrance into the Cathedral, corresponding with the position of the monument erected to the memory of the late Sir Astley Cooper.

It being intended that the artist whose design shall be accepted shall be entrusted with the execution of the work, the Executors regret that they have it not in their power to make any remuneration to the other gentlemen whose designs may not be adopted, and therefore they have no wish to have submitted to them any elaborate drawings or models, &c.

The drawings and models to be sent to No. 47, Queen Anne Street, Cavendish Square, the residence of the late Mr. Turner, before the 17th day of January, 1857.

Now, the sculptors who are at present full members of the Royal Academy (a deduction having recently been made from their body by the death of Sir Richard Westmacott) are five in number,—Mr. Baily, Mr. Gibson, Mr. MacDowell, Mr. Westmacott, and Mr. Marshall. Mr. Gibson is in Rome; and, as the drawings and models are to go in on the 17th of the present month, he is out of the question, and the competitors are reduced to four. Without pausing to question, as we very well might, why an artist so great and unacademic as Mr. Turner might not have had such larger chance of fitting illustration as an appeal to the profession generally would have conferred,—we may say, at any rate, that, as the Royal Academy contains in its body one, and only one, other sculptor—Mr. Foley,—an artist of great eminence, and second to few in Europe, though as yet he has not got beyond the list of Associates,—to leave him singly out of this competition will be felt as a grievance and an offence:—and we think this commission might have been given amongst the members of the Academy, instead of amongst the Royal Academicians. We suppose, however, that it is an affair of rank, and that none but a Royal Acad-

mician is fit to effect a Royal Academician's monumental apotheosis.—One thing rejoices us exceedingly,—though, as yet, we get it only in the form of an inference. As the monument has turned up, so also, we trust, will the almshouses for his aged and decayed brethren of the pencil which form so noble a feature in the testamentary dispositions of the late Mr. Turner. The receipt by the Royal Academy of £20,000 out of his property becomes, then, intelligible,—in a sense which should do them great honour, if it may be so read. Perhaps it is their intention to appropriate that sum in carrying out the benevolent purpose of the illustrious testator:—a purpose which, in the confidence of Art-brotherhood, he had committed to their keeping, in the character of trustees.—Let us remark, however, that the scale of an inch to a foot, prescribed to the competitors, is wholly inadequate to convey any notion of such a work as that by which one great sculptor should illustrate another.

THE COLLECTION OF MR. SHEEPSHANKS.—The *Times* of the 8th of December contained the following announcement:—"We understand that Mr. Sheepshanks has munificently presented to the nation the whole of his collection of paintings and drawings, for the purposes of public instruction in Art. Mr. Sheepshanks, disapproving irresponsible management by boards like the trustees of the British Museum and National Gallery, has made it a condition that the responsibility for his collection must rest with an individual minister—the minister for education. Mr. Sheepshanks considers that a crowded thoroughfare is not a suitable site for quietly studying works of Art, and has stipulated that his collection must be kept in the neighbourhood of its present locality, at Kensington. He is willing that the pictures, &c., should be lent to those provincial towns which provide suitable places to exhibit them. Upon these conditions, which we believe Lord Palmerston has cordially accepted on behalf of the government, Mr. Sheepshanks has signified his readiness to hand over immediately the whole of his very fine collection, which is especially rich in the best works of Mulready, Landseer, and Leslie, and contains fine examples of the principal modern British painters in oil. The value of the collection may be estimated at about £60,000." It is impossible to overrate the worth of this acquisition, or to express in sufficiently strong terms the gratitude of the country for a gift of such magnitude. It is of acts such as these that the people may well be proud, and which must be monuments for ever to the honour and glory of the giver. It has been long believed that the intention of Mr. Sheepshanks was to *bequeath* his collection to the nation; but he does infinitely more—he presents it to his country during his lifetime, so removing all possible chance of dispute for its possession. Long may this admirable man and munificent benefactor live to witness the beneficent effects of the boon he has conferred on his country and the world!

TO THE TURNER COLLECTION at Marlborough House the following six pictures have been added:—

Sea-Picce. Painted about 1802.

Calais Pier—Fishing-boats preparing for Sea—the

English Packet arriving (1803).

Bacchus and Ariadne (1840).

The Exile and the Rock Limpet (1842).

Undine giving the Ring to Masaniello (1846).

The Angel standing in the Sun (1846).

It is probable that, until more space can be obtained "somewhere," no other pictures will be exhibited. Enough, however, have been shown to convince the public that a proper National Gallery has become an imperative necessity.

THE EARL OF ELCHO has written a letter to the *Times*, in which he complains, in regard to the proposed site of the new National Gallery, that although on the 27th of June last the House of Commons ordered an address to be presented to Her Majesty, praying Her Majesty to issue a "royal commission" on the subject, nothing has yet been done, that, in fact, the matter remains where it was, the public not being a whit nearer to the attainment of an object in which they are deeply interested, and the necessity for which becomes daily more and more apparent. His lordship concludes his communication as follows:—"I know it is said that the question of the National Gallery site is one of extreme urgency, which admits of no delay, in consequence of the

Turner bequest and the recent purchases which there are no means of exhibiting; but this is a difficulty which is far from insuperable if Government will have the courage to do their duty and give the Royal Academy notice to quit that portion of the present National Gallery to which they have not even a parliamentary title, but which the nation has generously allowed them to occupy for twenty years."

[It is understood that a royal commission is about to issue, appointing Lord Broughton (formerly Sir John Cam Hobhouse), the Dean of St. Paul's (the Rev. H. H. Milman), Mr. Ford (the historian of Spanish Art), Professor Faraday, Mr. Cockerell, R.A., and Mr. George Richmond, "to inquire into and determine the site of the new National Gallery, and to report on the desirableness of combining with it the Fine Art and Archaeological collections of the British Museum." We confess to a belief that the wisdom of this "selection" will be very generally questioned: and can as yet scarcely have faith in its accuracy. The matter, however, will very soon be "settled."]

MR. MORRIS MOORE'S longing for "notoriety" must have been amply gratified during the past month, for he has been in the custody of the police at Berlin, and has had several letters inserted in the *Times*. It is not our business to inquire concerning the "cause" of his detention: it is very unlikely that he would have been arrested by the Prussian authorities if he had in no way committed himself, and, if we may judge from his antecedents, reasonable grounds may have existed for the outrage of which he complains. His lively imagination, however, and, perhaps, his conscience, attributed the wrongs he endured to the influence of "Waagen and Co." The accusation has called forth an indignant but very dignified protest on the part of Dr. Waagen, who writes of Mr. Morris Moore in terms we do not choose to copy. The character of Dr. Waagen stands too high to be affected by any assailant. There are few men living more esteemed or respected than the estimable German critic; and he may rest assured that if the universal opinion concerning him be destined to undergo a change, it will not be by the testimony of Mr. Morris Moore.

NEW METALS.—We have been of late directing much of our attention to the improvements which have been made in the manufacture of *aluminium*. The cost of producing this very important metal has been so reduced that it is employed for the eagles which surmount the regimental colours of several of the regiments in the French army; and there are prospects that lead us to expect a yet greater reduction in the cost of producing this metal. *Sodium* is most necessary in the manufacture of aluminium; and we learn that in this country there is every probability of its being manufactured at the low cost of two or three shillings the pound; if this is accomplished, aluminium will be at once rendered cheaper than silver. *Lithium* has been produced, by M. Froost, from lepidolithe, a mineral which occurs in the granite near Rozena, in Moravia. Whether this remarkable metal is destined to find a place in the arts or manufactures remains a problem which time alone can solve. Its striking characteristic is its extreme levity—*lithium is a solid metal which floats upon rectified naphtha*. M. Froost and St. Claire Deville are both of them working on this metal. *Calcium*, the metallic base of lime, has been obtained as a beautiful gold-coloured metal by Professor Benson, of Marburg; but as yet not in any quantity. Since we now know that the clays and earths are all of them reducible to the metallic state, what may we not expect in a few years in Art-manufacture. Solids as durable as silver and less liable to tarnish will be placed in the hands of artisans, from which to produce articles of use or ornament far lighter than cork.

THE SCULPTORS' INSTITUTE have published the correspondence with Sir Benjamin Hall to which we adverted last month, and which leaves the subject of the Wellington Monument in a state far from satisfactory. It is quite certain that much suspicion exists in reference to it; and while confidence is most essential to the production of a great national work, such confidence is not induced by the course adopted by "the authorities."

THE BRITISH INSTITUTION, as usual, issues its announcement for the receipt of paintings to form its annual exhibition; and as during the past year there has been no circumstance to direct the attention of

artists elsewhere, we may reasonably hope that in February next the collection in Pall Mall will rightly represent the progress of British Art. As we were among those who urged the Directors to decline pictures with which the public had been previously familiar, we are not justified in complaining if the consequence has been a marked deterioration in the character of late exhibitions as compared with exhibitions of former years. This evil is by no means the necessary consequence of a change that was unquestionably beneficial; neither is it entirely attributable to such change. None of our leading artists now exhibit pictures for sale, as they used to do some ten or twenty years back: they prefer consequently, to keep back their works for the May gathering at the Royal Academy. This is really the cause why the British Institution has of late contained the productions only, or chiefly, of second-class painters. We trust, however, that our masters in Art will see it their duty to assist the Directors here: a few contributions from the higher sources would be assuredly beneficial to the Institution.

THE SCHOOL OF PAINTING (as it is called, but on very insufficient grounds), at the British Institution, has continued this year its annual custom of exhibiting copies of famous pictures, made by students from the works lent to form the exhibition of the Ancient Masters. Several young ladies and gentlemen have here proved their industry, but nothing more. We have always considered this periodical show as prejudicial rather than serviceable to Art: the permission to make copies is in itself scarcely a boon; but their exposure is the opposite of beneficial, either to the copyists, their friends, or the public.

FIRST EXHIBITION OF THE FLEMISH SCHOOL OF THE FINE ARTS IN LONDON.—We have a cordial welcome for this fresh addition to our metropolitan winter exhibitions. Artists of the Flemish school will always be regarded with friendly sentiments in England; and when they come amongst us with their works, and open an exhibition in London, they may feel sure that there prevails a general predisposition to receive them as friends, and to treat their productions with favour. However suitable for the display of their collections, the Pall Mall Gallery, with its recent associations, involuntarily subjects the Flemish artists to a comparison with their brethren and sisters from France—and this is a comparison which they have scarcely strength to endure. Still, though not to be admitted to the same rank with the French collections, there is much to interest and to gratify the observer in this Belgian exhibition. An excess of matter had already crowded our pages when this exhibition claimed our attention, we now are, in consequence, unable to do more than to notice and to welcome its presence in London, and at the same time to invite those of our readers who may pass along Pall Mall to follow our example in visiting the Gallery, and thus confirm our friendly and approving expressions. We purpose next month to write more at length and to enter upon particulars, from which we are now precluded by the narrow limits of the space at our disposal.

THE "NEWTON" MONUMENT.—The amount of subscriptions which the men of Grantham have available for their monument to the late Sir Isaac Newton is £1200; and for this sum,—which is to cover all expenses of erection, &c.,—they have determined on having a bronze statue on a granite pedestal, and have called five sculptors into competition. The artists invited are—Mr. E. H. Baily, R.A., Mr. Campbell, the Baron Marochetti, Mr. Theed, and Professor Rauch.—The men of Grantham, it will be seen, have taken the foreign fever in an aggravated form. Of five sculptors summoned to contend for the honour of illustrating their provincial town, and pocketing £1200 for a big bronze statue reared on granite, one is an Italian, and another German. We say, a "big" bronzestatue, because these Lincolnshire patrons of Art intimate the not very aesthetic intention of getting as much as they can for their money. "The magnitude of the figures," they say, "will be"—by them—"considered an important element in the design." Doubtless, this will be a temptation to Professor Rauch, for instance:—the expected size, *plus* the distance, being among the conditions under which he is privileged to take a fifth chance in a lottery for the execution and erection of a bronze statue and pedestal, cost £1200, in the good town of Gra-

tham! Should he fail them, however, they have Italy to fall back on; and Italy, in this case, is at hand,—as the English sculptors have good reason to know. The models, including figure and pedestal, are not to exceed three feet, and are to be sent in on or before the 15th of next March, to the Institution of Civil Engineers, in Great George Street, Westminster. Mr. Baily has, we understand, declined entering into this competition:—so that, England and the Continent have the chaises between them, half and half.

M. CHEVREUL has been for some time engaged in researches upon the composition of the Egyptian statuette of "Serapoum." His analyses indicate the presence of lead, which metal had not hitherto been discovered in ancient bronzes. It is supposed to have acted in the preservation of these little idols by producing on the surface a coating of oxide, which acted as a varnish would have done.

THE BRONZE STATUE of the late Lieutenant-General Sir Charles J. Napier, executed by Mr. G. G. Adams, and recently placed at the south-west angle of Trafalgar Square, though in many parts a bold and spirited composition, is far from being an agreeable work. The singularly-marked features of the hero of Scinde appear, if they are not in reality, much exaggerated; and the head altogether looks preposterously large. If the sculptor has not exceeded the truth with respect to the former, it would have been more politic for him to have reduced these peculiarities of feature, which might have been done without prejudice to the gallant soldier; while, if the masses of hair had been broken, a great advantage, picturesquely, would be gained. The drapery is heavy, and by no means graceful, adding to the apparent weight of the figure, instead of becoming, as it should do, a medium of conveying to it grace of outline and richness of effect. The pedestal, too, is "a mistake;" it is too small for the statue, as it is designed: a broader "standing-place" would have lessened the size of the figure.

M. FR. KUILMANN has published some interesting and important investigations on the power of albumen in fixing and retaining dyes. He shows that fibre of any kind, which has been impregnated with the white of egg, receives and retains with much permanence many colours which are usually evanescent. We shall examine this subject when it is further developed by the author.

GERMAN ART-JOURNAL.—It is announced in the German papers, that an Illustrated Journal of Art is about to be published in Berlin; the capital necessary for so costly a work to be supplied by a Joint Stock Company. Among the principal conductors will be Dr. Kugler and Dr. Waagen. We shall cordially greet such an acquisition to the true "Art-treasures" of the world. It is discreditably to Germany that the Arts have not there been adequately represented by literature.

THE SECRETARY OF THE ARTISTS' GENERAL BENEVOLENT INSTITUTION has received a compliment which no gentleman has ever better merited. Mr. Roper has conducted its affairs for no less a period than *forty years*: it is impossible to rate too highly the value of his services; his heart has ever been in his work. Not only has he laboured with zeal, energy, and perseverance, but the exceeding delicacy with which he administered the funds of the society is above all praise. During the long time over which his task has extended, how many sorrows he has soothed! how many hopes he has encouraged! how many broken hearts he has healed! That which is next best to the consciousness of desert, is appreciation. It is a large reward to this excellent gentleman to find that, in the more immediate circle where he is best known, he is valued as he deserves to be: but the public, at least all who have been in any way associated with him, join heartily in the feeling which induced the Council of the Artists' General Benevolent Institution to present, "by their private subscriptions," a silver inkstand and salver "to W. J. Roper, Esq., as an expression of their personal esteem, and testimonial of the high sense they entertain of his valuable and indefatigable services during a period of forty years as Secretary." Our only regret is that the subscription to this testimonial was not as "general" as the objects of the Institution.

MR. W. SIMPSON, who, as well as the actual combatants, gathered laurels in the Crimea, has exhibited at Messrs. Colnaghi's, a picture to com-

memorate "Kars and its defenders"—a worthy subject for Art, and one to which the excellent artist has done full justice. It is to be engraved.

PHOTOGRAPHIC VIEWS.—Among the most interesting, and certainly the most striking of the many subjects we have lately seen, are a series of six views of cathedrals, executed by Mr. Thomas Greenish; those to which we immediately refer represent the cathedral at Lincoln; but we believe Mr. Greenish is, or will be occupied in thus exhibiting the whole of these beautiful and time-hallowed structures, which ornament and honour England. They are not published, although it is probable they will be so. Mr. Greenish is not an artist by profession, although his works display much artistic skill, and have that degree of perfection which can only arise from a knowledge of the capabilities of Art. He is, however, a chemist, and these views have been obtained chiefly as experiments—in which he has been eminently successful. There has been no theme as yet taken up so likely to be universally attractive as that which this gentleman has made his study—the architecture of the kingdom presents no views of so much interest as those supplied by the English cathedrals.

THE PHOTOGRAPHIC SOCIETY.—A soirée was held at King's College, Somerset House, on the 17th December, at which the members gave their friends a rare intellectual treat. The works exhibited were numerous, very beautiful, and of infinite variety. We regret we can at present do no more than thus briefly refer to an "evening," that was, in all respects, gratifying and instructive.

THE ARCHITECTURAL EXHIBITION.—The winter season is now expected to bring with it this Exhibition in the galleries in Suffolk Street; and year by year we look for fresh evidences, not only of the firm establishment of this exhibition as a fact of annual recurrence, but also of its increasing value and importance in its own very valuable and important department of Art. Last year the Architectural Exhibition contained much that was good, and gave promise of more that might be better; this year that promise will be found to have been at once realised and repeated. The present collections are decidedly in advance of their predecessors, both as works of Art and as architectural productions; and they also lead us on to expect successive advances in the same noble course which conducts towards perfect excellence. We may particularly notice, as distinguishing features of the present exhibition, the presence of two groups of the designs which were sent in in competition for Lisle Cathedral and the museum buildings at Liverpool. Mr. Allom's and Mr. Street's designs are included in these two series of drawings. The present collections are also remarkable as showing that the practical study of the Gothic style is assuming a more definite and a more strictly and consistently Gothic character, especially amongst the junior members of the profession. There is much that is satisfactory, and, at the same time, suggestive in this circumstance, and more so when it is considered in connexion with a remembrance of the restless wildness which characterised so many of last year's original Gothic conceptions. We are compelled to leave until next month our remarks upon particular drawings and other works in this exhibition; we now record with much gratification its generally satisfactory character.

PRODUCERS OF ART-MANUFACTURE throughout the kingdom should be aware of the altered circumstances connected with the display of meritorious productions at the Crystal Palace. At an earlier period of the management there, a ruinous error was committed by levying an enormous tax upon all exhibitors. It was in vain we raised our voice against an act so suicidal, contending that contributors of good works were the best aids of the establishment, and ought to receive, rather than to make, payments for the spaces they occupied. A foolish policy, however, prevailed; and although for one year the sums demanded were paid,—very reluctantly, and under many protests,—the Crystal Palace, as an exhibition of Art-manufacture, naturally and necessarily dwindled, and its Art-courts became half empty. The directors, however, having seen the folly of this course, by which their project was grievously impaired while the manufacturers were wronged, and the public perpetually disappointed, have resolved on allotting spaces to all meritorious manufacturers of high-class works who

will fill them, charging for them merely nominal prices. We trust, however, that this boon will be accompanied by a somewhat strict *surveillance*, and that all inferior or even mediocre articles will be suffered to be shown only in the galleries. There can be no doubt that thus rightly and wisely encouraged, all good producers will desire to show their productions here,—for the advantages here presented are obvious,—and they will certainly be augmented next year. We hope and expect to see all the Art-courts full; and believe that before the month of February next it will be more difficult to obtain space than it has heretofore been to procure objects. Early applications will be wise; for, as in most other matters, those who first apply will be the first to receive benefits.

A PICTURE OF ST. SEBASTIAN, presumed to be painted by L. Carracci, has been placed in our hands by a gentleman who has quitted England, and into whose possession it came under circumstances that now render it almost impossible to trace back its pedigree, though competent judges who have seen it throw no doubt on its authenticity. The treatment of the subject differs materially from any pictures of St. Sebastian we know of, though we have the authority of Mrs. Jameson, both orally and in her "Sacred and Legendary Art," as to the existence of similar treatment in one or two pictures she has seen in Italy. The "saint" is not tied to the tree, but is in the attitude of falling from it, the body being held up by the right arm, which is thrown over a broken branch; at the back of the figure the physician supports the head, while a female—one of the "charitable Christian women"—gently draws out an arrow from the side. The whole of the picture is finely painted; but the figure of the martyr is certainly one of the grandest examples of anatomical drawing and painting we ever saw. It has called forth the admiration of all who have seen it, with an expression that such a "study" ought not to be out of our National Gallery. Our chief object in directing attention to this work is to elicit any information our readers may be able to give us respecting it; and for this purpose we shall be glad to allow any to inspect the picture who may desire to do so. On the frame on which the canvas is stretched is the following inscription:—"Peint par Louis Carracci pour le Cardinal Odeard. Varnese en 1583, apporté en France en 1806, pour la celebre Galerie Levrin." It was remarked by some who have seen the picture, but without having any knowledge of the inscription at the back, that it painted by J. Carracci it must have been done at a comparatively early age, when his drawing was more precise, and his colouring more finished and "fleshy" than in his later period. The date would make him about twenty-eight years old.

RAFFAELLE'S CARTOONS, at Hampton Court, are, we understand, now so hung that, on the least apprehension from fire or any other sudden casualty, they can be instantly removed and taken away. This is effected by a simple machinery that readily "cases them down" from the wall; and the cartoons, having been fitted upon strainers which can be unbuttoned, and instantly detached from the frames, and which are constructed with a joint or hinge in the middle, their reduced size when doubled up facilitates their transport. Writing of Hampton Court reminds us that a contemporary published a short time since a statement to the effect that an original portrait of Raffaele, by his own hand, has recently been discovered there. It was described by Passevent as existing at Kensington Palace at the time of his visit, about twenty-five years since, since which period many of the pictures at Kensington were removed to Hampton Court.

DORCHESTER HOUSE.—In one of our more recent numbers we gave some details respecting this mansion, now building for Mr. Holford in the Regent's Park, but as various statements have lately appeared in the public prints, which, from their incorrectness, are likely to mislead, it is only due to Mr. Vulliamy, the architect of the building, to let the public know that the whole of the internal works, including the decorations, have been executed under his direction. It may, therefore, be anticipated the same harmony and agreement in the several parts of the exterior which have been so much admired will also be found to prevail in the interior, when the whole is completed. The decorations of those apartments that are already finished—namely, the libraries, and other rooms on the ground-floor,

and also the boudoirs on the first floor, &c., have been ably carried out by Messrs. Morant and Boyd, the eminent decorators, under the direction of the architect; the careful and elaborate execution and high finish of these works reflect the greatest credit on the taste and skill of Mr. Morant, who has given his unremitting personal attention to the task entrusted to him.

MR. R. McLAN.—Just as we were closing our sheets for the press, we saw, with exceeding regret, the death of this artist announced in the daily papers, after a protracted and painful illness. We shall refer to the subject in our next number.

THE ROYAL POLYTECHNIC INSTITUTION.—With the return of the Christmas season this established favourite with the public is always ready with fresh attractions, that are impressed with the character of that best species of novelty—new forms of instructive amusement. It is a distinguishing feature of the Polytechnic that it is always in action. Its career is open before it, and it is ever on the advance along its own proper path. It knows no halt—no pause! There is always something to be heard there, and something to be seen, and something to be learned. This "something" is also sure to be just that very thing which the Polytechnic ought to produce. It is sure to be just that very thing which at the Polytechnic we should both expect and desire to hear, to see, to learn. And it requires no slight amount of energy, coupled with no ordinary ability and judgment, to give life to so essentially vital a machine. This is but in an indirect manner to indicate what we are prepared to express after a different fashion when we pronounce Mr. Pepper a very energetic, a very able and judicious person; or perhaps we might leave the inference that, as sole manager of the Polytechnic, Mr. Pepper is "the right man in the right place," to be drawn from the following statement of what he has provided for this present Christmas. It will be seen that the "dissolving views," which have been so long popular, are still employed as a principal method of obtaining illustrations to lectures, or as providing the pictorial representations with which the lectures are associated as descriptive notices. These views now are painted with great excellence, and they are so adjusted to the optical instruments as to produce truly artistic effects. The "Views of Scenery illustrating a Traveller's Portfolio," by Mr. Clare, which take the lead amongst the novelties, fully justify what we have said of the improved capabilities of "dissolving views." They carry the spectator almost round the world; and their pictorial delineations go far to realise scenes replete with individual interest, and differing as widely as possible from each other. Then there comes Mr. Pepper himself, with a lecture on "Remarkable Optical Illusions," profusely illustrated,—and thoroughly well illustrated,—as all Mr. Pepper's lectures are, with curious experiments, and shadowy appearances, and views, so real in their first appearance, that we scarcely believe our own eyes when they would persuade us that they have fairly "dissolved" in our presence, leaving no rack behind. And once more does this same process do good service in the matter of illustration to a new rendering of an "old, old tale" (not Frank Stone's, though it has something in it that just touches upon it), entitled, "YE FITIFULL AND DIVERTYNGE HISTORIE OF BLEW BEARD." Finally, under the auspices of Mr. Darby, those delights of boys, fireworks, appear under a variety of forms, which prove that the term "artist in fireworks" is capable of conveying much serious meaning. Mr. Pepper gives a descriptive lecture on the components and the manufacture of these brilliant varieties of "dissolving views;" and as he rises with his subject he introduces the most elaborate pyrotechnic compositions as the full developments of the squib, and pin-wheel, and cracker. We cannot thus direct attention to the amusements which have very recently been brought out at the Polytechnic, without adding a brief expression of warm sympathy with the effort which Mr. Pepper is making to provide solid advantages for young men in the metropolis in the CLASSES which he has established in connection with the Society of Arts.

EXHIBITION OF ART-MANUFACTURE, EDINBURGH.—This Exhibition was opened on the 15th of December; but in an incomplete state—the catalogue not being "ready." We shall no doubt be in a position to refer to it at length next month.

REVIEWS.

THE HAPPIER DAYS OF CHARLES I. Engraved by E. GOODALL, from the picture by F. GOODALL, A.R.A. Published by E. GAMBART & CO.

A beautiful and a true remark is that we remember to have somewhere read,—"The veil which hides from our eyes the events of future years is a veil woven by the hand of Mercy." Few have had greater reason for appreciating the blessings it expresses than had the unfortunate monarch to whom Mr. Goodall's picture refers; though, it is not impossible, and we seem to mark it even in these "happier days"—happy only in comparison, for troublous shapes tracked early his footsteps to the throne,—he had some forebodings of the evil destiny that awaited him in the estrangement of the allegiance of his people, if not as the victim of their displeasure. We have been so accustomed to see Charles represented by artists as a man on whose forehead misfortune had set an indelible seal, while

"Melancholy marked him for her own,"

that it is quite pleasant, as well as novel, to look upon him basking in a gleam of sunshine, however transient, and to feel there might have been times when he had moments of enjoyment in common with the most humble of those in whose hearts the storm of rebel indignation was then gathering, in a few brief years to hurl the crown from him, and his dynasty—for a season—and to bring him to an untimely, we will not call it an ignominious, death.

Very many of our readers will, we doubt not, recollect this picture in the Royal Academy in 1853, as well as the wood-cut we gave from it, in 1855, in our biographical sketch of the painter. The subject is well calculated to make a pleasing engraving as much from its novelty as from the very agreeable manner in which it is treated. The print is large, yet not too large for the materials of the composition, and Mr. Goodall, sen., the engraver, has put upon the plate some of his best work; this would naturally be expected, however, when engraving a picture by his son. Mr. Goodall's forte being landscape, we scarcely looked for so much delicacy and general excellence as we find in his rendering of this group of royal figures, which are finished with extreme care and great beauty of expression, affording a strong contrast to the bold and vigorous lines and touches presented in the boat, water, and other portions of the composition. On comparing this engraving with our wood-cut—the latter taken from the original sketch—we notice that the artist, in painting the large picture, has deviated from his first ideas, in the form of the clouds, and of the group of trees to the left, and in the figures standing by the archway of the palace of Hampton Court; his second thoughts are decidedly the best, especially those which have reference to the sky; in black and white the alteration here tells with manifest advantage to the large engraving.

EPOCHS OF PAINTED VASES; AN INTRODUCTION TO THEIR STUDY. By HODDER M. WESTROPP. Published by WALTON & MABERLY.

At a time when the ceramic art is exciting more than ordinary attention, and the Ceramic Court at the Crystal Palace has become a leading feature among its numerous attractions, Mr. Westropp's book appears very opportunely. It may seem strange to many that the study of such comparatively insignificant objects as vases should be worthy the consideration of intelligent and cultivated minds; but though we cannot altogether agree with Mr. Westropp in his remark that they may be regarded as "the most curious, the most graceful, and the most instructive remains that have come down to us from ancient times," we freely admit that "the beauty of the forms, the fineness of the material, the perfection of the varnish, the variety of the subjects, and their interest in an historical point of view, give painted vases a very important place among the productions of the arts of the ancients." Since they first were thought of sufficient value to be collected and studied, about a century and a half ago, they have been made the subject of discussion with many learned archaeologists and writers upon Art, who have extracted from their study much interesting and instructive matter. We are not, of course, now speaking of what the potters of the middle ages, and those of Dresden and Sèvres have introduced, but of those which Etruria and Greece sent forth, and the latter of which are, to this day, considered as the types of all that is pure in form, and beautiful in ornamentation. Mr. Westropp divides his styles or epochs of painted vases as follows:—"The Early or Egyptian; the ground of these is of a pale yellow, on which the figures are painted in black or brown; the figures consist chiefly of animals, and borders of flowers and other orna-

ments run round them. They date B.C. 660 and 550. Next comes the Archaic Greek, dating B.C. 430; with black figures on a red ground, representing scenes taken from the Hellenic mythology. The Severe, or Transitional style, follows; the figures here are red on a black ground, and similar in subject to the preceding." The forms of these vases have something more elegant than those of the second, though they present great variations in style and size; they date generally from B.C. 460 to 420. A few years later, that is about B.C. 400, we arrive at the "Beautiful, or Greek," when the art seems to have reached perfection as regards form, material, and beauty of design; this style is the more perfect development of the former—its severity and conventionality which distinguish the earlier styles having entirely disappeared. The predominating subjects are Greek myths or representations of Greek manners. Then comes the period of "Decadence," when the vase assumed an enormous size and exaggerated proportions; it was also characterised by a multitude of figures, complexity of composition, inferiority and carelessness of design, superfluity of decoration; while at a still later period we find a yet greater deterioration in the arts of design and more capricious forms; and following these, inferior imitations of the earlier works, both as regards material, form, and ornament.

Mr. Westropp professes to offer only a few general remarks upon the subject of ancient vases, but brief as they are they will afford sufficient information to enable the unlearned to distinguish the various styles, and to create a desire to search into more elaborate treatises. The text is illustrated by a large number of well executed engravings of works arranged in their respective epochs.

LADIES OF THE REFORMATION. By the Rev. JAMES ANDERSON. Illustrated by JAMES GODWIN, GEORGE THOMAS, &c. Published by BLACKIE & SON, Glasgow.

This is a noble and beautiful volume for all seasons, and one of especial interest to the female world. In his preface, Mr. Anderson says that "in countries such as this, where the Reformation has triumphed, its benign influences have descended richly in blessings upon woman. It has abolished the confessional, and no priest may now extort from her the inmost secrets of her breast. . . . In following her convictions she is no longer exposed to the peril of imprisonment, of torture, or of the stake, or doomed to see the field, the scaffold, or her own hearth stained with the blood of her relatives." This is perfectly true—and we may well glory in the Reformation, and the liberty in holiness with which it enriched these lands; but we must not forget that there have been women of other creeds who have exhibited as much heroism and as earnest devotion as any recorded in these pages. We can only regret that their teaching had not a purer source; but their steadfastness in what was right, according to their knowledge, at least, commands our admiration.

Mr. Anderson has taken most exemplary pains with this volume; he has gathered his goodly concave of heroic Christian women from Germany, Switzerland, France, Italy, and Spain, and compressed their acts and deeds into as small a space as could well be devoted to each; he has written a sound historical introduction to each division of his subject, and abstained, perhaps as much as it was possible, from bitterness towards the Church whose dominant spirit has been that of persecution.

The volume contains ninety-six illustrations of varied subject and interest, chiefly from the pencil of Mr. James Godwin, who has displayed considerable skill and power in many of the groups, but he frequently mistakes size for dignity, and drapes his figures so heavily that the beauty of form is altogether lost. There are some ornamental headings and borderings in Mr. Humphries' usual style of excellence; and the architectural "bits," with occasional landscapes,—scenes where the struggles between Romanism and Protestantism took place,—add greatly to the value of the volume, and have been well rendered by Mr. Thomas, Mr. Johnson, and others.

We may wish the book had been called "*Women of the Reformation*" instead of "*Ladies*." The cause is too noble to derive any advantage from the circumstance of birth—it is too highly spiritual to need earthly distinction. We regret that we have not more space to devote to this volume; but it will speedily speak for itself in all Protestant homes.

HUTCHINGS' CALIFORNIA MAGAZINE. Published by J. M. HUTCHINGS & Co., San Francisco, California.

Amid the clang of the pickaxe of the gold-finder, and the echoes of a multitude of loud, discordant voices that sometimes one fancies he hears sweeping across the waves of the Atlantic, there come now and then

softer and sweeter sounds, denoting that gentle and soothing influences are also at work among the strange community located in the regions of California. We have on our table the first four parts of a monthly magazine, the publication of which commenced in July last. Its object, to quote the introductory address of the editor, is, "to picture California, and California life; to portray its beautiful scenery and curiosities; to speak of its mineral and agricultural products; to tell of its wonderful resources and commercial advantages; and to give utterance to the inner life and experience of its people, in their aspirations, hopes, disappointments, and successes—the lights and shadows of daily life."

We have looked very carefully through these numbers, and can safely say that in matter, illustrations, paper, and printing, the California Magazine would be creditable to a London publisher; facts and fiction are pleasantly told; and occasionally a graceful poem gives evidence of gentle spirits mingling with the rough and stern workers out of the realities of life. Here and there we find sentiments and expressions which would scarcely pass current in a periodical circulating among a more refined people; but as a whole the publication pleases no less than it surprises.

ILLUSTRATED BOOKS

FOR THE YOUNG.

THE poet Hood was not entirely just in his estimate of the criticism that children exercise over stories intended for their instruction or amusement, when he penned those beautiful lines:—

"A blessing on your merry hearts,
Such readers I would choose,
Because you do not criticise,
And never write reviews!"

Children are happily exempt from "reviewing," and its pains and penalties;—but set a clear-headed child of ten or twelve years old to read a story, and encourage her (girls at that age are much more critical than boys) to say exactly what she "thinks," and you will soon see how the book falls to pieces. Children hardly comprehend sufficiently to understand the bearing of a whole volume; but they dissect admirably. We gave to one of those juvenile critics a very useful story, by the useful sisters Mary and Elizabeth Kirby; * the lesson here inculcated is excellent, and the illustrations, by John Absolom, unaffected and pleasing; but our little friend was not satisfied—"Yes, I like Matilda—she is so noble and right; but I do not understand Julia. Proud girls, if well educated, are not vulgar; now Julia is vulgar; here, she talks about *riding in a carriage*;—I have always heard that people *drive* in a carriage, and *ride* on horseback. I do not think there ever could have been a well-educated young lady so rude and vulgar as Julia Maitland." The little girl saw, at once, the fault of this, in other respects clever, story: the character of Julia is exaggerated; no girl accustomed to well-bred society, no matter how proud, could speak or act as she did.

THE EARLY DAWN; OR, STORIES TO THINK ABOUT—by a Country Clergyman †—reminds us, both in matter and manner, of one of Miss Edgeworth's "Early Lessons." Our young friend read the book, from the first story, "Oh, it's such a Trouble," to the last, "It's all in the Dark," with evident satisfaction—shrinking a little at the deer-shooting, and two or three other details connected with the destruction of animal life, which should have been tempered by a few observations to inculcate the principle that the life of the smallest creature must not be wantonly destroyed. The corner of St. Paul's Church-yard keeps up its character; the publications hence issued are well "got up," and Harrison Weir's illustrations to this charming little volume are models worth copying. We cannot too strongly express conviction, that illustrations to children's books should be good in design and execution.

SELF AND SELF-SACRIFICE; OR, NELLY'S STORY, ‡ cannot be considered a child's book—and not exclusively a book for the young. The author has portrayed the virtue of *self-sacrifice*, and urges throughout the story that there is but *One* strength that is able to nerve us against temptation. Considerable power is manifested in the delineation of the characters, and the good *intent* of the author commands respect; the progress of the story, however, is unskillfully prolonged; it would have been far more effective if curtailed: young authors are seldom aware of the strength of brevity.

We have seldom seen Alfred Crowquill's versatile talent turned to better account than in a very

* Julia Maitland; or, Pride goes before a Fall. Griffith & Farran.

† Illustrations by Harrison Weir. Griffith & Farran.

‡ Groombridge & Sons.

amusing and instructive *brochure* sent forth under the Germanised name of GRUFFEL SWILLEN-DRINKEN; OR, THE REPROOF OF THE BRUTES.* If, as we suppose, the story—as well as the most clever and amusing illustrations—are from the pen and pencil of our gifted countryman, not only will he be among the most popular of authors in the nurseries of England, but deserve the brightest of all golden medals from the Temperance Society—they cannot fail to appreciate the value of such a satire upon the huge insanity of England.

GRANNY'S WONDERFUL CHAIR. †—It is now some years since our attention was drawn to sundry poems, appearing at intervals, by "Frances Browne, of Stranolar;" and when we learned that Nature had exchanged gifts with this young girl—deprived her of this world's light, and bestowed upon her the light of poetry, we felt still higher admiration for her productions—not that they need "sympathy" or "consideration;" all that she writes stands bravely by itself, and yet is full of womanly tenderness and expression. "Granny's Wonderful Chair" is simply a "chair" to pin fairy tales upon—not "Irish" fairy tales. We suppose Frances Browne thought that Croker, and Keightley, and Mrs. S. C. Hall, and the host of Irish writers, had pretty well exhausted the fairy mythology of Ireland; and so, although "Frosty Face" and "Fairy Foot" certainly belong to the "Green Isle," she gives them all names, but no local habitations, save on the pretty pages of this pretty book, which is announced as illustrated by Kenny Meadows—the very portrait-painter of fairyland. But either Mr. Kenny Meadows repeats himself, or we have seen several of these illustrations in Mrs. S. C. Hall's "Midsummer Eve," which certainly contained the richest and greatest variety of illustrations that ever adorned a single volume. This little book is charmingly "got up," and no prettier Christmas gift could be imagined for any little lady about to enter her "teens."

PICTURES FROM THE PYRENEES. ‡—This title is not a thread to hang stories on, but a veritable narrative of places and people. Our young friends may revel in the knowledge that it is "every word true," and visit with "Agnes and Kate" the scenes and places so simply and graphically described. We have, ourselves, read every page with much interest, and believe there could hardly be a better guide to the "Eaux-bonnes," and its beautiful and varied scenery.

HARRY HAWKINS'S "H" BOOK. SHOWING HOW HE LEARNED TO ASPIRATE HIS H'S. §—We have given the heading of this pretty little book complete, because we think that all Cockneydom should assemble, and vote a testimonial to the philanthropic firm at the corner of "St. Paul's Church-yard," for such an invaluable publication. No family or school-room, within, or indeed beyond, the sound of Bow bell should be without this merry manual; and were the City authorities to invest a fair sum, so as to distribute the book amongst their public companies, there is no telling how much their pronunciation of the much-slighted letter might be improved by Easter! The construction of the book is ingenious; but the idea may take a wider range, and many of the ill-used letters of the alphabet—S and W for instance—obtain their proper sounds—"victims" be no longer "*wic-tims*," and "vinegar" no longer "*winegar*."

Mr. H. G. Kingston || is pretty popular by this time with all the boys of England. What boy has numbered twelve years, and not felt his heart beat at the adventures of "Peter the Whaler," or "Mark Seaworth?"—to say nothing of the most charming of them all, "Blue Jackets." The very name, "SALT WATER," is suggestive of the most marvellous perils, and their equally marvellous escapes. We have an inborn affection for "Middies"—little, troublesome, ne'er-do-well rascals on shore—never out of scrapes, never at rest; and yet, at sea, how they grow into the dignity and glory of the "naval officer!" We never see one of those trim "chaps," with his gold-banded cap and ostentatious dirk, without feeling that Jarvis, and Howe, and Blake, and Nelson, were once such as *he* is now! "Salt Water" rakes up one or two old stories which rather wearied us, as we knew them before; but to the youngsters they will be quite new; so there can be no objection to these twice-fold tales. Mr. Kingston has an excellent way of conveying a moral; he never preaches, but he lets, as it were, the *lesson* of the story show itself. This volume will become as popular as its predecessors.

THE ART-JOURNAL.

LONDON, FEBRUARY 1, 1857.

NATIONAL PORTRAIT GALLERY.

So long ago as the 6th of June, in last year, the Chancellor of the Exchequer obtained from parliament a vote of £2000, to enable him to take the first step towards the formation of what, we trust, is destined in time to be a great Portrait Collection of the Worthies of Britain. It is right that we should pause at this point, to remark, that when we speak of a collection of British worthies, we somewhat enlarge the terms—we do not say, the intentions—on which the minister founded this claim upon the public purse. It is not unimportant to point out, that a Gallery of Portraits of “the most eminent persons in *British history*”—certificated, the terms would seem to imply, in something like the spirit of the great collection at Versailles—was what the Chancellor of the Exchequer asked for, according to the reports of the time. Now, we are compelled to say, that history has not always kept her records as fully and faithfully as might be desired; and one express office which we recognise in the new institution proposed, would be, that of making certain rectifications in her written page. Out of the dim places of old French chronicle, for instance, we could drag a name or two whose omission from an assemblage wherein names stand for the figures that make up the sum of the national greatness, is a falsification of the account. There are gaps to fill in the French Pantheon, if the true historic religion were understood:—a few inscriptions yet to make in the list of the “*grands hommes*” who receive there the conspicuous homage of “*la Patrie reconnoissante*.” And so it is with ourselves, at home. The Muse of history has not always been most worthily invoked amongst us. Many a man would find a fitting place in a collection of British worthies whom *her* priests have neglected to enrol among the “most distinguished,” and whom Chancellors of the Exchequer—not always working by the lantern of Diogenes—are apt to overlook.—On this head we shall have more to say hereafter; but it seemed desirable, at the very outset, to clear away any possible misunderstanding of the kind from the terms of the argument on which we are about to enter. Let it be distinctly premised, that British worthies have not always been historic worthies in the accepted sense,—that the ground of the national *bene meruit* is a wider one than any occupied by party history. Such a national portrait gallery as we desire to see, would, of course, be an illustration of our national history; but of a history many chapters of which have yet to be formally written,—a

history that sweeps into its scope all the conditions of modern civilisation, and in doing so comes upon figures that the heralds had passed by without perceiving. The spirit of inquiry, it must be conceded, is carrying its lights into many dark and neglected places of the past,—the genins of the age is eminently supplementary and corrective,—and it may be, that the Chancellor of the Exchequer and we both mean the same thing. But if so, it is safer to enlarge the expression to a conformity with the larger meaning,—or, to start by explaining, that the history which we propose to illustrate by the help of this parliamentary vote is a far less partial and more comprehensive one than that which is written by the court historian, or has been commonly read by Chancellors of the Exchequer.

To return, then, from what we scarcely admit to be a digression:—It will be in the recollection of our readers, that this vote, of eight months old, was the consequence of an address of yet older date, agreed to by the House of Lords, on the motion of Earl Stanhope, with nearly unanimity of consent,—and of the ready and cordial acceptance which the project therein suggested received from the Crown. In the House of Commons itself, the sentiment of the grant was scarcely disturbed by those economic murmurs which have a perennial echo throughout that place of approach to the national strong-box, and are the expression of a sound chronic condition in the peculiar atmosphere of the locality:—and, though we Englishmen have been taught by experience not to look for any very rapid action from Chancellors of the Exchequer, save in the matter of taxation, yet, in this instance, we cannot but remember, that the finance minister took the scheme under his express patronage, and promised such an administration of the grant as should correspond to the zeal of the national estates. We think it, therefore, not unreasonable, after this interval of time, and on the eve of parliament’s once more assembling, to inquire what has been done towards giving effect to these intentions on the one hand, and undertakings on the other. Have the Chancellor of the Exchequer and his colleagues laid the foundation of a National Portrait Gallery with the funds entrusted to them for the purpose,—and are they prepared to point to any prosperous result as a plea with Parliament for a further grant? Something, by this time, they should be in a condition to show they have done in the matter:—and, as the subject will doubtless come before both Houses, in some form or another, at an early period of the approaching session, there are certain considerations connected with the due execution of the new scheme on which we are anxious to have a few words with our readers previous to any discussion of the same topics that may take place elsewhere.

In the first place, then, let us express more emphatically than we have yet done our earnest assent to this proposition of Lord Stanhope’s, if it be carried out in the spirit which the very terms imply, and in which we have no doubt whatever its noble promoter conceived it. Unhappily, our readers are not to be told, that no amount of clearness in the terms of a proposition is sufficient to protect its integrity against the genins of jobbery when that monster is rampant in the land,—and therefore a project like this had no chance of successful execution in any other age than one which, like the present, is, among all its shortcomings, distinguished above most others by a conquest over the stormier passions, and an honest desire for an adjustment of the moral balances. This consideration must reconcile us to the past delay in what is one of a series of measures the neglect of which has, whatever the causes, been

so much waste of matchless national means. How rich the past of England is in the men and in the facts that make the materials of history, our readers need not be told; but she is rich, too, incomparably beyond all her rivals, in the documents that record the one and the other. This latter wealth she has suffered to run to waste with the prodigality of a spendthrift. No other country under the sun has such a body of records as England:—at once the witnesses of her glory, and a subject to her of most serious reproach. In spite of partial dispersions and destructions, like those of the civil wars, there is no other nation that can point to a series of vouchers of its events nearly so continuous and complete. Yet, these priceless treasures, in which the history of a people is written, have been so dealt with as to make them useless to the historian in the years that are past, and enlist the moth and the mildew for securing them against his possible inquisition in the years that are to come. What sort of access had Robertson or Hume to the documents which—and which alone—keep the true secret of our national story? In the first place, our records have been buried in cellars and hidden away in lumber-rooms, that such literary resurrectionists might not find them, and interfere with their character of dead letters. Then, lest their place of sepulture should be, nevertheless, invaded, and some excavator more enterprising than his fellows should threaten to disinter some one of the historic figures which they include, the next device was, to dismember them,—burying a limb here, and a limb there,—so that their connexion might be broken, and he get at best either an imperfect figure or a false one. We say nothing, of course, of the documentary treasures that lie heaped away in private collections—those of the great historic houses of the land,—or in quasi-public ones, like the Bodleian and the Ashmolean. But, Carlton Ride gave the lie to the Norman Chapel in the Tower, and the old Chapter House at Westminster Abbey kept witnesses to testify against both. The chances of final annihilation were further promoted in one case, by a magazine of gunpowder placed beneath the receptacle of these priceless munitions, and in another by the provision of easy access to periodical washings from the overflow of the Thames. When the river was not there in person, damp was his resident ambassador,—and the rat was *attaché*, with “the run of his teeth.”—We speak of these things now with some mitigation of the remorse, because the remedy is at length applied. Among other rectifications of the age, we have finally succeeded in obtaining a building ample for the reception of the existing records and the probable accumulations of half a century to come, and well adapted to their classification and arrangement; and provisions of more than one kind are making for publication in some cases, and for access in all. On the subject of this new and most important national depository, and its arrangements, we may probably give our readers some further information at another time:—at present, we link this part of our subject on to that from which we started by a truism. A great history is not built up but by great men,—and the eminent fact has everywhere and in all cases its eminent individual type. The portraits of such men are at once the complement and the fitting illustration of our Book of History. Now,—premissing that, whether as regards the past or the future, if we are to have this illustration at all, we will delegate to no one sect or party its ordering, but will have our history illustrated on all its pages,—we may observe, that, in the matter of such illustrations, the national attention being now directed to the subject, the future can, of course, take care of itself. But it happens also, that, as regards the past, we, in England, are

in these, as in the other materials of history, more rich than any other people of Europe. Without pointing to our stone records in Westminster Abbey and St. Paul's, and in the other cathedrals of the land,—we may mention, that our insular immunity from the war cyclones that have left their destructive traces almost everywhere on the continent of Europe, and our habitual exemption from the action of the internal fires that have periodically convulsed so many states and ransacked so many private houses, have left amongst us an unusually large amount of portrait treasures to supply the means of such an institution as is now proposed. The royal palaces of England, the halls and libraries of our ancient colleges and our inns of court, the palaces of our bishops, our public institution-rooms, and the town and country houses of the nobles and the old English gentry throughout the land, could furnish between them, if brought together, such an historical Portrait Gallery as would dim at once, by comparison, the vaunted glory of Versailles.

While such an institution as the country should owe to this motion of Lord Stanhope, and of which, as we have seen, the materials lie abundantly to hand, has its uses of many kinds, it is desirable that it should be clearly understood *what* those uses are, and who are the parties benefited. It must be distinctly asserted, that it is not for the sake of the illustrious men of past or of present times that we desire these pictured presentments. Intrinsic greatness can derive nothing to itself from monumental commemoration. The homage which the world pays to its great actors, when rightly paid, is paid for its own sake, not for theirs. We would not appeal to our modern men by so mean a motive,—even as a supplementary argument. In our day, the commemorations of picture or of marble are understood as the records—not the rewards—of genius or of virtue. It was not altogether so in the old Roman time. Much of the Roman greatness was itself conventional, and fitly paid by a convention. The Roman virtues were many of them statuesque and attitudinal, in principle and in action,—and to such, a statue was appropriate and tangible immortality. To stand in the forum in brass or in marble before the citizens of after-times, was the probable and reasonable object of ambition to him who lived and moved before his fellows in posture,—taking his principles of greatness from their opinion, and his articles of goodness on their prescription. A statue properly recompensed the deed of daring and of self-sacrifice which the mere hope or promise of a statue would itself have bought. *We live in nobler times.* The "*monumentum ære [vel, picturâ] perennius*" is a fact dawning more and more upon our public men.—But, there is moral inspiration in the contemplation of the features of the great departed, which it is a national waste to throw away. The tone and temper of the popular mind are raised by such studies. The mighty spirits who ruled the world in which they were present, "yet rule as from their urns," to our own great gain, by means of the statue or the picture. The portrait-painter, in a scheme like this of Lord Stanhope's, wields Agrippa's glass,—and the great figures in the procession of history pass, by his means, before the student's eyes, each with his moral written on his forehead. The value of such teaching the Romans themselves had not overlooked. It was well observed in the discussion on this subject in the House of Commons, that the old Roman placed in the vestibules of his house the portraits of his ancestors, that his children might read the lesson which an ancestry bequeaths as they passed out and in. The pictures of a nation's illustrious ancestry should thus be assembled at some con-

spicuous point before the people's eye.—Then, again, the great figures in the history of a kingdom are the jewels in its crown,—and it wears its regal aspect in the eyes of the world when it thus puts them all on.—In a word, if the best part of a nation's property be the great spirits that it has produced, the homage that it pays to them is at once homage and profit to itself. A National Portrait Gallery is a mode of banking one of its essential treasures, so as to yield a constant interest by the law of emulation.—But, besides these objects of public moral teaching, there is no doubt that history itself is powerfully commented by pictorial presentments of the men who were at the main-springs of its events. It has even been said that without such aids to its reading, history, however significant as a narrative of facts, is, as regards the men themselves, a mere record of abstract names. We read in its page, for instance, it is asserted, that Pompey was defeated by Cæsar,—and we have in the after-story of the Roman state the confirmation and the sequel of the fact. But, as to the chiefs themselves, with all their distinct and mighty individualities, their several figures are utterly confounded for us who look back on them through the haze and long perspective of the ages,—and Cæsar might be Pompey, and Pompey Cæsar, without changing any of the visible conditions of the tale. That this detracts something from the life and dramatic force of historic narrative, there can be no doubt;—and portraiture, inasmuch as it helps to rescue the actors from this species of obliteration, and to individualise each, is, as we have hinted, not less than a complement of history itself. The mighty men whose "brows are cold" we desire thus to see separately as they were, and for ourselves to trace and—

"Know
Their likeness to the wise below,
Their kindred to the great of old."

If any of our readers would desire to learn emphatically how much of history may be written on the foreheads of those who are its themes, let them spend an hour in the Holbein Gallery, at Windsor Castle, and read the grave, sad comments there uttered from the walls. There are portraits in that collection that will let them into chambers of the past, never looked on by them with such a stern familiarity before. No chronicler's page was ever half so eloquent as the portrait-painter there.—For all these reasons, and others like them, we repeat, Lord Stanhope's project, and the minister's promise, of a great National Portrait Gallery, has our own warm approval, and we are anxious to enlist in its cause the hearty sympathy of our readers.

The principle of the new institution being firmly established, we are willing to concede to the minister that there are certain difficulties to be encountered in the way of its technical execution,—and that one great difficulty is, to know where to begin. The sum of £2000, as the amount in the minister's hands applicable to the purpose, will probably have struck most of our readers as absurdly disproportioned to the dimensions of such a scheme as we have sketched,—and nearly useless even for the purpose of laying its foundations. The smallness of the demand was, however, probably determined by the consideration, that the first application for a grant was an experiment on the temper of the house as respects the project. For ourselves, indeed, we confess, that we should be unwilling to put any large sum into the minister's hands for a purpose like the present until we have a more definite assurance of the spirit in which he understands his trust, and something like an explanation of the details proposed to be made applicable to its execution. There is, as we shall have presently to show, a peculiarity in an institution like this

which would make its mal-administration something more than merely a failure. The principle of the thing may be so handled as to operate an absurdity, and the right created under it so interpreted as to enact a wrong. But what we have first to point out is, that this sum of £2000 is not so inadequate to any possible initiatory measure as at first view it seems;—because no power of parliament, and no amount of money which it can vote, could command such a portrait collection as that which is shadowed out in our rapid glance over the field on which the rich materials of British portraiture lie. It must be remembered, that a very large proportion of the originals in which England is so abundant are in the hands of private corporations or of individuals,—who are without the motive to sell;—and that, in the latter case, they are amongst the most valued of all the heir-looms in a land wherein peculiar importance is attached to this species of family illustration. It is also to be remembered, as a further difficulty in the way, that many of these existing portraits have a value far beyond their value as documents,—being among the master-pieces of the great masters of the limner's art. Holbein and Vandyke, Reynolds and Lawrence, are contributors to the picture-history of England,—but contributors at the same time, of the most important kind, to the rich treasury of British art. Now, it is essential that the intrinsic idea of this national Portrait Gallery shall be preserved in its unity, and kept clear of the complication into which it is very apt to fall. In this new institution we are in search of history, not art,—collecting records, not master-pieces. Of course, where we can have history illustrated by high art, as where we can have high art illustrated by history, always and in every case the better,—but it is important, nevertheless, to our present object that the two ideas shall be kept distinct. Into another particular department of our National Gallery (supposing this Portrait Gallery to form ultimately, as we trust it will, a constituent part in a comprehensive scheme of national collection) a portrait would find its way on the ground of its being a Holbein or a Reynolds,—into this, a Holbein or a Reynolds would find its way only on the ground of its being a portrait. In one case, the interest attaches intrinsically to the thing represented,—in the other, to the manner of the representation. There, it is the painter we prize,—here, the subject. The one quality supplementing or superseding all others in this Portrait Gallery of ours is, *likeness*. It is obvious, then, that for this specific object a good copy will serve as well as an original,—and so, the difficulty which made the original inaccessible is overcome. In the course of years, no doubt,—for the growth to its best and highest conditions of an institution like this must of necessity be slow,—in the course of years and the accidents which they bring, some of these originals themselves will, from time to time, find their way into the market, and be secured for the nation. Nor do we doubt, from the noble public spirit which has already been more than once exhibited in directions kindred to this, that, when the institution is once fairly formed and honestly and intelligently governed, many another original will ultimately be added to the national property by means of gift or of bequest. But, in the meantime, they who will neither give nor sell, will lend for a national object; and by the means of *copies* thus obtained we may be constantly adding picture-links to our historical and chronological series. Towards this object our £2000 will help us some little way; and we should be glad now to learn, amongst other things, if the Chancellor of the Exchequer has given any commission on the strength of this parliamentary vote, and whether, as we have said, he has any results

to show. We remember, too, that it was intimated, in the House of Commons, by that minister, when he asked for the money, that Government would, in all probability, initiate the new scheme by a temporary exhibition of portraits which they hoped would be voluntarily lent for the purpose:—a measure which, if generously promoted by the proprietors of such works, would enable the country to take stock of its treasures in this kind, and assist in the formation of the list on which the eoyist will have to work. For this purpose the iron building erected on the estate at Kensington Gore for the reception of the sheds and other buildings from Marlborough House was, we believe, suggested at the time,—and the country will desire further to know, what steps the minister has in the interval taken to give effect to that suggestion. We see that the managers of the forthcoming Exhibition, at Manchester, of the Art-treasures of the kingdom, announce their intention to assign an important place in their arrangements to a Collection of Portraits. By the conditions of the case, we should be led to conjecture that an *Art* collection of portraits is here designed, rather than an historical one; but it would be well that we should be informed how far this northern project may, by possibility, have modified the purpose of the Chancellor of the Exchequer,—or if, in fact, it may not even be itself the new form which his initiatory movements towards the formation of a National Portrait Gallery has taken.

The most important, however, of all the considerations connected with the sound and successful working of the new institution, is one at which we partially glanced in the outset of this article, and on the subject of which we have reserved a few remarks for its close. The proposition which it involves is a double one:—who are the parties to be selected for the species of illustration which Lord Stanhope's scheme proposes? and who are the parties by whom the selection is to be made? On these heads there is no doubt that a considerable amount of distrust prevails in the public mind,—and it is based on precedents of no very distant date, that might fairly make us the laughing-stock of Europe. We make wild work with our monumental commemorations, of many kinds. In the matter of statues, alone, we have done things that should give us an immortality in Gotbam. At one time, for instance, we commissioned a first-rate artist for a work of sculpture,—and then build a tall column on which to lift it so far beyond the reach of natural vision, that no possible reason suggests itself unless it be that of a desire to stimulate improvements in the telescope. At another time, we raise a bronze hero, horse and all, on to a roof, and let him air his proportions where a chimney would seem more natural. We have done everything absurd with our statues short of setting one of them to stand on its head. In other forms of historic illustration, we have performed equally wonderful things. The well-hacknied joke of the play of Hamlet without the part of Hamlet has, after all, nothing absurd for some of our national managers. There is a certain public document amongst us in which we have done the very thing. Not exactly able to strike the Commonwealth out of history, we did what we could in that direction—we struck out Cromwell. According to certain authorities amongst us, the Protector is a myth. It would scarcely have been more absurd if the same men had reared a statue to Mrs. Harris!—Party, in charge of the public monuments, has little hesitation in falsifying history.

One question there is (supposing that the word "historical," introduced by the Chancellor of the Exchequer, is to be retained), about which we must come to some sort of understanding before we vote freely the money of the nation towards an alleged collection of the

nation's representatives:—viz., what is to be taken as constituting an historical man? Here, as we have already hinted, we should, for ourselves, demand a greatly enlarged definition. A nation's real history is the record of all the forces that have shaped its present figure,—and its historic men are the men who have moved them. Some of these have been bringing up the gold which is wrought into a social framework like ours from deep mines, into which the imperfect lights of written history have failed to flash. To say nothing of the great scientific explorers and mechanical contrivers who are the conquerors of our day,—many of the best chivalries of our modern life are not enacted on fields of cloth of gold. The tilt against the social giants is run in lists not kept by the heralds. The war with the dragon that lays waste our fields and devours our children is fought by the St. George of these later and nobler times without his shining armour. The worthiest names have thus sometimes missed their fitting record. The public commemorations have not always been for those who had the most sacred claim on the public sympathies. In this sense the poet was right who said—

"The world knows nothing of its greatest men."

There would be some re-distribution of the figures if we had the ordering of the earthly Pantheon. We would depose Hannibal in favour of Howard, and give Watt the place of Alexander the Great. If we could no otherwise find a pedestal for Jenner, we think we should dethrone Gog and Magog.—Then, there are the men who have taken out the life-boats into the social breakers, rescued many drowning wretches from the wrecks of feebly constructed institutions, and toiled and toiled at the great moral breakwaters of the world. Surely, in the history of a people's wealth and civilisation, *they* have historic names to whom it owes its large amounts of moral salvage.—There is, in fact, no individual merit—literary, artistic, professional, or scientific—that does not make up a portion of a nation's history, if we could read it as the Recording Angel can, and constitute its owner an historic man. Well, then, let us have something like guarantees that the state will make effectual provision for the careful and conscientious editing of this its volume of worthies. We know too well how the several editions of such a work would vary in various hands. Let some individual editor have his own way, and, such are the distortions of prejudice or of passion that it is quite possible to have a portrait history of England wherein no mention shall be made of Wickliffe or Wesley, of Clarendon or of Falkland. Whig men would dwindle below the dimensions proper to such a page in Tory telescopes,—and Tories would disappear under the focal peculiarity of Whigs. Religious rancour and political partizanship will each furnish their lists of proscription. Let it never be forgotten—for we cannot repeat it too often—that we *have* a history of England without Cromwell! They who doubt the petty things that passion will do, need only remember, too, the clever device which supposed it had made a blot in the first Napoleon's list of soldier-chiefs, when it turned the portrait of Ney, in the Hall of Marshals, with its face to the wall!—We must have no such party-conjuring as this in our new Portrait Gallery.

If that gallery is, in truth, to be instituted into a great and public document of the mark and authority suggested, it will probably be found a proper course, in the outset, to appoint a commission, charged with the preparation of lists of the names yielded by the *past*, which should have a place in this Portrait Prytaneum. Such a commission should be sufficiently large to embrace amongst its members all varieties

of opinion,—and composed of men individually likely, so far as the unconscious tyranny of human sentiment will allow, to perform conscientiously any public duty with which they may be charged. The principle of election for the men of the *present* and of the *future* into this collection of British Worthies wants also determining,—so that we may know that it is removed beyond the influences of irresponsibility or the action of caprice. The authority to confer what will be a public honour should be clearly defined. In all probability, the collection will, like other similar institutions in this country, be handed over to the keeping of a body of trustees:—if so, is it intended that the right of nomination to a place in this National Portrait Gallery shall be amongst their prerogatives? In that case, it will be well that the exercise of this prerogative should be controlled by the necessity of an annual return to parliament.—In some instances, it is not improbable that parliament itself might order a place in this Portrait Gallery to one whom it should delight to honour; and the ready means of a special public distinction is thus provided in the new institution. In any case, a place in this great national representation would grow finally into a sort of Order of Merit:—and, in this view, let it never be forgotten, that the party-spirit which should usurp the right to keep a man who had won his spurs, on any well-fought field of social action, from these walls, would by such exclusion be practically executing a sentence of condemnation, and striking, as it were, a name out of the rolls of chivalry.

On all these heads, we repeat, the public will expect to have information at no distant period after the minister meets the house. There are other points of detail—such as questions of classification and arrangement—which must probably be left to follow the labours of the commission referred to, in case such commission be intended; and some points which must wait on other issues that are likely to come to trial in the approaching session of parliament,—such as, that which is to determine the place or no place of this institution in a wider scheme for a great National Gallery of Art. A time will probably come, too, when it may be thought well to consider, whether the photographer might not be called in, to multiply these portraits, or some of them, for distribution, with biographical summaries, and at a price almost nominal, amongst the people. Besides their collective access to the great national library of portrait, individuals will like to keep a volume or two at home, for fireside perusal,—and it is an object well worth the care of a paternal government thus to furnish them with the means. Hero-worship is a natural instinct; and since the popular mind *will* have its idols, it is no light duty to assist towards their choice in a sound direction. This cheap distribution, as a method of popular instruction, seems one form, and no unimportant one, of the gain that may be extracted out of the new National Portrait Gallery.—But these, and other questions, we postpone:—and shall be satisfied for the present to know, that the Chancellor of the Exchequer has something to show for the credit which we gave him towards the realisation of this useful and interesting project,—and that the conditions of its utility and interest have been secured by the application of sound and wholesome principles in its constitution.

In what form the subject will come before the Houses of Parliament during the ensuing session, we are of course entirely ignorant; but after the principle of the necessity of such a gallery was acknowledged by the grant of last year, the matter must proceed.

THE ROYAL PICTURES.

A SCENE FROM "MIDAS."

D. Maclise, R.A., Painter. S. Sangster, Engraver.
Size of the Picture, 4 ft. 2½ in. by 3 ft. 4 in.

SUCH a singular combination of fact and fiction is to be found in this picture as to render a rather lengthened explanation necessary to the understanding of its meaning. Had the figure with the guitar been habited as some modern strolling musician, the composition would have been perfectly intelligible; but, in his semi-classic costume, however harmonious may be the music he produces from his instrument, he certainly is not himself in harmony with his auditory, nor with the place in which they have all met.

The subject is a scene from the comic opera of "Midas." The author of this amusing, but not most refined burlesque, was K. O'Hara: it was written and first performed in Dublin, about a century ago, and was played at Covent Garden a year or two afterwards; if we remember rightly, it was produced last at the Haymarket Theatre, about three years since. The characters introduced into the scene presented in this picture are Sileno, an old farmer, in whose house they now are; Mysis, his wife; their two daughters; and Apollo, in the disguise of a shepherd. Apollo, having offered some offence to Jupiter, is cast down from Elysium, and descends on the farm belonging to Sileno: a shepherd, seeing him fall, runs off alarmed, leaving behind him his coat, hat, and guitar, which the banished culprit picks up and appropriates to his own use. In this condition he is met by Sileno, who immediately hires him for service, and to divert his wife and daughters:—

"You can help to bring home harvest,
Tend the sheep, and feed the hog.
Come, strike hands, you'll live in clover,
When we get you once at home,
And, when daily labour's over,
We'll all dance to your strum-strum."

Apollo is accordingly brought to the cottage, and introduced by the farmer to his wife and daughters, as we see the group in the picture:—

"Now, dame and girls, no more let's hear you grumble
At too hard toil: I chanced just now to stumble
On this stout drudge—and hired him—fit for labour."

The old lady regards the musician with contempt, and rails at her husband for bringing home such "rubbish, a strolling thrummer:" the girls, anticipating, no doubt, much amusement from his musical attainments, and pleased with the comely appearance of the stranger, "so modest, so genteel," offer him as kindly a welcome as bright, shining, coquettish faces can present. Apollo, to soften the wrath of Mysis, at once touches his guitar, and begins to sing the well-known song which, with the play-going public of our own time, is identified with Madame Vestris, when she took the part of Apollo—one of her most successful characters:—

"Pray, goody, please to moderate the rancour of your tongue,
Why flash those sparks of fury from your eyes?" &c.

Maclise's picture was exhibited at the Royal Academy in 1829. The *dramatis personee* are throughout well studied; the boldness and assurance of the young Apollo—the angry and contemptuous look and posture of the dame—the remonstrating action of the farmer—and the arch coquetry of the daughters—are unmistakably represented. Like all the works of this artist, his "Midas" is painted with the utmost attention to detail and finish in all its parts, and has less of the hard, dry manner which many of his later works exhibit. The colouring is more subdued than we now generally see on his canvases, yet sufficiently brilliant to produce a richness of effect.

It is so long since we saw this burlesque acted on the stage, that we cannot tell whether or not the artist has reproduced on his canvas what was actually brought before the audience of a theatre, or whether the composition is purely ideal, founded on his reading of the author's writing: it is, however, so dramatic in character, that one is inclined to believe Maclise painted what he had seen.

The picture is in the Collection at Osborne.

PHOTOGRAPHIC EXHIBITION.

THE Photographic Society has opened its fourth Annual Exhibition; and it is a thing to see, and to talk of after it has been seen. The sun has been made to work after an admirable style, and to tell us many remarkable truths. There we find certain chemical ingredients spread upon paper, developing, under solar influence, into artistic studies,—into regions of cloud-land,—and into water, trees, and rocks. We have wonderful light and shadow, and we can but marvel at the beautiful gradations of tone which this ethereal painter has produced. We rejoice in the progress of this delightful Art; and we perceive that the photographer has a power at his command, which will, if tempered with due care, produce yet greater wonders. There are many shortcomings here, and in the friendliest spirit we call attention to them, hoping that they may cease to appear in the next Exhibition. Any man can now take a camera-obscure, and he can, with but little trouble, learn to cover a glass plate with iodized collodion, render it sensitive, and place it in his dark box. He may obtain an image, or images, of external nature; but it does not follow that he will secure a picture. There are many photographs in this Exhibition which are anything but well-chosen subjects, and which have been obtained under badly-selected aspects. There are another class which must be regarded as only accidentally good. We say accidentally good because we see a great want of uniformity in the productions from the same photographer. We think we could point to some pictures, which are the picked result of some twenty trials upon the same object. This should not be; nor need it be if the photographer will patiently study the physics and the chemistry of the agents with which he works. There are many charming pictures, showing peculiar atmospheric effects. We look at those with great pleasure, but with some doubt. It would be most instructive if the photographer would give a clear description of the *true atmospheric effect* which produced the *photographic effects* to which we refer. Beautiful as are some of skies, with their heavy and their illuminated clouds—pleasing as are some of the mist-like valleys, and the vapour-capped mountains,—we desire to be assured that the photograph is a true representation of the natural condition of the air and earth at the time the photograph was taken. We cease to value a photographic picture if it is not true. Are the fleecy clouds on the blue empyrean faithfully transferred to the sensitive tablet? Are we not deceived? Did not dull masses of rain-cloud float over the blue of heaven? Were not the heavy cumuli coloured with the golden and the rosy rays of morning, or of evening, when those pictures were taken? Was not nature very bright when the photograph indicates obscurity? Did not a glorious sun flood those hills with yellow light which look so poetically obscure?

We know this to be the case with some of the photographs: may it not be more commonly the case than is generally imagined? Again, much has been said about the fading of photographs. It is a sad thing to see so many pictures in this Exhibition which must of necessity fade. This is the more lamentable since we know that a little more care would have rendered them quite permanent. There is no mistake upon this point. The presence of sulphur-salts in the paper is evident, and they are only to be secured now by thoroughly washing and re-mounting them.

The committee having charge of the Exhibition would do wisely to reject such photographs as these, for it is most damaging to the Art to find its productions fading out like a shadow. With the Photographic Exhibition it is not necessary to speak of individual works as we would of the productions of the painters. The cases are not parallel: the painter employs, or should employ, eye and hand, governed by a presiding mind, the photographer uses a machine, and requires a little judgment. The artist works from within to that which is without; the photographer employs external agents to do his bidding. A few alone require especial notice. Mr. Rejlander comes with a new and extensive series of compositions, many of them being remarkably clever. We feel, however, in looking at productions of this class, that we are looking at

portraits of actors—excellent in their way, but still actors. "Grief and Sorrow," "Don't cry, Mamma," do not impress us with any feelings of sympathy from this want of reality. Many of these studies of Mr. Rejlander are excellent; but they cannot be regarded as works of Art, and, indeed, we should be sorry to see such productions taking place amongst us as works of Art. Mr. Fenton has, as usual, many very beautiful landscapes and truth-telling pictures of time-honoured piles. Mr. Cundall's portraits of "Crimean Heroes" are a fine and interesting series of portraits; and the portraits of living celebrities—George Cruikshank and Robson, Professor Owen and Bell, Samuel Warren, Rowland Hill, and others, will command attention. Mr. C. T. Thompson's copies of prints and drawings, Dr. Diamond's Portraits of the Insane, Mr. Robertson's Views of Malta, Mr. Backhouse's Swiss Scenes, Dr. Bram's Views of Rome, Rev. Mr. Holden's Old Buildings, are especially commendable for their respective excellences. Mr. De la Motte has been very happy in his Oxford Scenes. Mr. Rosling has produced capital pictures, with more force than usual. Mr. F. Bedford, Mr. Llewellyn, Mr. Gastineau, Dr. Percy, Mr. Spiller, and numerous other well-known "children of the sun," have been successful in catching some of the beautiful effects of illumination which give a poetry to nature.

ART IN CONTINENTAL STATES.

PARIS.—M. Eugène Delacroix has been elected a Member of the Royal Academy of Fine Arts, of Paris, in the room of the late P. Delaroche. The postponement of the opening of the Paris Salon seems to have caused great dissatisfaction, as it will open when all the Parisians who have the means will be in the country, enjoying the charms of green fields, &c.; but, on the other hand, foreigners who habitually visit Paris in the *belle saison* will have the benefit of seeing it.—Sir W. C. Ross, R.A., has been here painting a miniature of the Empress, who has given that eminent painter several sittings.—A splendid collection of antique statues and busts has been purchased by the Minister of State, M. Fould, to be placed in his princely mansion in the *Faubourg St. Honoré*.—M. Robert Fleury has offered to undertake the restoration of the portions of the Hemicycle of P. Delaroche, which were damaged some time ago by fire.—The fine painting by M. Abel de Pujol, which was destroyed in the repairs of the new Louvre, having been painted on the ceiling, is now in process of reproduction on canvas by this clever artist, and will be placed in one of the rooms of the new building: the subject is the '*Renaissance des Arts*.'—Workmen are now occupied in placing, in the Church of St. Eustache, the mausoleum of Colbert, designed by Lebrun, and executed by A. Coysevox and B. Tuby.—A Roman theatre has been discovered at Triguères, near Château-Renard; it is sufficiently large to contain 10,000 spectators; measures are being taken to effect a complete examination of the same.—The Exhibition of the Society of Arts, Bordeaux, will open on the 1st of March; all paintings are to be sent in by the 10th of February, to M. Binant, 70, Rue Rochecouart, Paris, or direct to the Society.—The Municipal Council of Paris has voted 36,000 fr. for an album of the different scenes of the baptism of the young prince: two copies will be executed, one for the Emperor, and the other for the Empress.—M. E. Dubufe has just completed a fine portrait of Rosa Bonheur; she is represented leaning on a magnificent ox, which is painted by herself.—A distinguished amateur artist, the Reverend P. Martin, is just dead; he was celebrated for his learned publications on architecture and early Art; his principal work was on the '*Cathedral de Bourges*.'

BRUSSELS.—On the 12th of November, Jacob Von Reichel, an Imperial Councillor of the Russian Empire, died here. In the early part of the present century he was one of the most distinguished miniature-painters in Europe, and numbered among his sitters the Emperor Alexander, the Empress Marie, and the Princes and Princesses of the imperial family. His admirable portrait of the Empress Marie is preserved in the Hermitage at St. Petersburg. Having given up his profession, he was appointed conductor of the state printing establishment, which office he held till his death. He was a collector of coins, medals, autographs, &c. His collection of medals, containing 40,000 pieces, is of great value.

VISITS TO PRIVATE GALLERIES
OF THE BRITISH SCHOOL.THE COLLECTION OF THOMAS MILLER, ESQ.,
OF PRESTON.

THE Collection of Mr. MILLER, consisting entirely of works of our own school, has been long and extensively known as containing many very valuable and beautiful productions by the most celebrated and accomplished painters of our time. The more important are all of that class which, in the year of their exhibition, have constituted, and been spoken of as attractions on the walls of the Academy, or where else soever they may have been exhibited. The proprietor of these works is one of a knot of gentlemen all residing near each other, many of whom have been enriched by manufacture, and all distinguished by their manifest patronage of Art. Mr. Miller has done justice to his Collection by the addition to his house of a gallery lighted from above; gladly would we see such an adjunct more universally adopted; we submit that in the end it would be found to be an economy.

'Hunt the Slipper,' D. MACLISE, R.A.—This picture was exhibited in 1840. It represents the scene at Neighbour Flamborough's, in which the two ladies from town surprise the party—the Primrose and the Flamborough families—when most earnest in the game. The two ladies enter on the right of the composition, in the full-blown dignity of their ignorance and vulgar assumption. The confusion occasioned by the ill-timed visit is shown without any exaggerated expression. The picture is pure and brilliant, and is among the best ever painted by Mr. Maclise.

'Girl with a Dove,' C. R. LESLIE, R.A.—The head and bust of the figure only are seen; she leans on a table with both arms, holding the dove before her. It is one of those minor studies of which the artist paints many, all diversified by much ingenuity of treatment.

'Sophia Western,' C. R. LESLIE, R.A.—The face is eminently sweet in expression; it is a small half-length figure presented in profile, with a striking and tasteful arrangement of the hair. She is occupied in assorting a vase of flowers.

'Van Tromp at the Mouth of the Scheldt,' J. M. W. TURNER, R.A.—This picture was painted in 1832, and was therefore executed long before the twilight of Turner's best period. It is a large picture, having for its principal object a first-class man-of-war at anchor, with a variety of other craft belonging to the fleet. A boat has just left the admiral's ship, in which Van Tromp himself may be recognised as about to go ashore at Flushing. The sky bears an indication of a storm coming off the sea. This is one of a series of marine subjects which Turner produced, all similar in composition and effect, yet differing much in minor detail, and each distinguished by beauties peculiar to itself.

'The Stage-Coach,' W. P. FRITH, R.A.—Our readers will remember the subject of this picture from the engraving from it, introduced in our notice of the works of the artist a few months since. The coach is stopped by a highwayman, who presents a pistol and demands the purses of the travellers, and the point of the story turns upon the consternation which ensues at such a rencontre.

'Deerhounds,' R. ANSDALL.—Three heads effectively grouped, and relieved by a sky background.

'A Study,' R. P. BONNINGTON.—Presenting a single figure—that of a lady in a green dress, supported by a red background and red drapery. It has been very rapidly executed, but in that firmness of manner which alone compensates absence of finish.

'Dancing Nymph and Faun,' W. ETTY, R.A.—A conception in the classic vein, and equal to the best of the classic and its best followers. The exulting abandon of the nymph is accounted for by the empty wine vase. She wears a leopard skin, and dances with more earnestness than grace, accompanied by a faun with cymbals.

'Ramsgate Sands,' W. P. FRITH, R.A.—This is a replica of the picture that was exhibited a few years ago. It is small, but equal in finish to the larger work.

'The Breakfast Party,' T. WEBSTER, R.A.—The party consists of a girl seated at a cottage-door, breakfasting on a bowl of bread and milk, for a share

of which a small black spaniel supplicates, sitting up on her hind legs. This, we believe, is not the first picture which Mr. Webster painted of this subject, but it differs from the first in consequence of the introduction of a puppy, which renders this picture unique.

'Our Saviour,' W. ETTY, R.A.—A small head, seen almost in profile, of which the features are a departure from the common type generally given to the impersonation. This picture was, perhaps, painted a year or two before the death of ETTY.

'Reading the Will,' C. R. LESLIE, R.A.—The subject is from "Roderick Random," and its realisation here produces very strikingly the great variety of character described in the text. The firmness of execution prevailing throughout the work contrasts powerfully with the thinner manner which is every day becoming more popular.

'Peace,' J. E. MILLAIS, A.R.A.—This work having hung so recently on the walls of the Academy, it may not be necessary to describe it; but it must be observed that it has been much improved since its removal from the exhibition, as Mr. Millais has had it in his possession for some months working upon it.

'L'Enfant du Regiment,' J. E. MILLAIS, A.R.A.—This work will also be remembered as having been seen in the last exhibition. The scene we may suppose to be some church in Paris during one of the street conflicts that have been so frequent, and thither has been conveyed a wounded child, who now rests upon a tomb covered by a soldier's coat. It is a most felicitous and affecting episode, constituting one of the best works of the artist.

* * * * * E. M. WAED, R.A. :—

"As a beam on the face of the waters may glow," &c.

This and the following lines, from Moore's Melodies, constitute a subject selected as an illustration to a recent edition of the work. The picture turns upon the personal history of Byron, as showing him contemplating Mary Chaworth through the windows of Annesley Hall. It is night, the room is brilliantly lighted up, and she is dancing with, it may be supposed, the man of her choice. The picture was exhibited, we think, last season.

Another plate for the same edition of the Melodies has been engraved from a picture by A. EGG, A.R.A., the illustrated passage being :—

"Come rest in this bosom, my own stricken deer,
Though the herd have fled from thee thy home is still here," &c.

The picture—which, it will be remembered, was recently seen in the Royal Academy—presented two figures, an Irish gentleman imprisoned on some political charge, and his wife, who visits him in his confinement.

From the same poetical source there is a third picture, by D. MACLISE, R.A., illustrating the lines :—

"O could we do with this world of ours
As thou dost with thy garden flowers!
Rejoice the weeds and keep the flowers,
What a heaven on earth we'd make it!"

The composition contains two figures, and the sentiment is supposed to be addressed by a youth to a maiden who is culling from the luxuriance of her garden-bower. This work is also a very recent production.

'Griselda,' A. ELMORE, R.A.—A large, important, and elaborate work, which was exhibited some time ago, containing as principal impersonations the Count and Griselda, with others as secondary and auxiliary. Chaucer is but little consulted for subject-matter. This is one of the most carefully-executed works we have ever seen painted from his verse.

'Jacob and Rachel,' W. DYCE, R.A.—"And Jacob kissed Rachel, and lifted up his voice and wept." Such seems to be the passage whence the composition has been realised. All the incidents and contributive circumstances are according to the descriptions of the 29th chapter of Genesis. Jacob has seized the hand of Rachel, which he has carried to his own breast, and he draws her eagerly towards him, as about to accomplish the act mentioned in the text. The figures are well drawn, and the treatment of the subject is strikingly original.

'Comus,' L. HUSKISSON.—A composition of small figures, describing the confusion when the brothers rush in and wrest the glass from the hand of Comus, and break it. The subject affords scope for the introduction of an endless variety of cha-

raeter, and of this the artist has availed himself to fill up his canvas with imagery the most poetic.

'Kensington Gravel Pits,' W. LINNELL.—This picture must have been painted perhaps forty years ago. It represents purely and simply these Hyde Park diggings, as they may have been at an early epoch of the present century. At that time the appearance of such a work would excite the utmost curiosity and surprise. If it were a production of the present day, it would be at once pronounced an essay from photography, for every pebble is fairly represented. This most laborious picture did not find a purchaser in London; it was sold, however, in Liverpool for fifty pounds, and the inadequacy of the sum induced Mr. Jannell to take up portrait-painting as a collateral security against the mischances of the profession.

'Highland Game,' Sir E. LANDSEER, R.A.—This is a dark picture, an agroupment of birds cast upon the ground—grouse, blackcock, ptarmigan, woodcock, snipe, and partridge—painted with an execution less showy, but more careful than later works of the artist. This picture was sold at the distribution of the effects of the late Duchess of Bedford, and is placed among Sir E. Landseer's best productions. It was at the Paris Exhibition.

'The Chevalier Bayard at Brescia,' J. C. HOOK, A.R.A.—This was exhibited a few years ago; it contains a group of four figures, Bayard and the two ladies who so kindly nursed him, and from whom he is about to take leave, and his attendant, who is buckling on his spurs.

'The Blackberry Gatherers,' P. F. POOLE, A.R.A.—This was exhibited a few years ago in the Royal Academy; it is an upright composition of great force of colour. The figures are a girl, and a boy carrying a child on his back, the last reaching up and plucking the blackberries from the tangled hedgerow.

'San Giorgio, the Ducal Palace, the Library, St. Mark's, &c., Venice,' J. M. W. TURNER, R.A.—This view, taken from the water, places the Ducal Palace in the centre of the composition, which has all the brilliancy of Turner's Venetian pictures. The water is thronged with the light craft of these waters, several of which, at certain distances, are put in as darks to force the higher tints. The expression of space is masterly, and the almost dazzling reflections proclaim the presence of the sun.

'Fruit,' G. LANCE.—Consisting of white and black grapes, peaches, plums, figs, Siberian crabs, with embroidery, an antique cup, &c. This was painted in 1851.

'Sir Thomas More in Prison, visited by his Daughter,' J. R. HERBERT, R.A.—A replica of the picture in the Vernon Collection.

'A Dead Calm,' F. DANBY, A.R.A.—Twilight is here closing in over an estuary in which, in the nearer section, is a ship at anchor. Both sky and water are enriched with the fading lines of what has been a glorious sunset. But the sentiment of the picture is a perfect tranquillity, and so fully is this realised that the spectator is sensibly affected by the voiceless stillness of the scene.

'Interior of St. Jacques, Bruges,' D. ROBERTS, R.A.—One of these magnificent church interiors which Mr. Roberts treats with greater success than any living artist. The light and shade are most effectively apportioned; the whole is so well lighted that all details are seen, and space is most successfully realised.

'Feeding the Calves,' W. P. FRITH, R.A., and R. ANSDALL.—This picture, it will be remembered, was exhibited last year. The country girl who tends the calves is painted by Frith, and the animals, of course, by Ansdall.

'The Nile Flower,' F. STONE, A.R.A.—The fitness of this title does not appear. The picture presents a girl looking earnestly at some object in the distance.

'The Purchased Flock,' J. LINNELL.—The subject is properly a section of green lane scenery, such as may be found anywhere in the neighbourhood of London, but those niceties of adaptation and omission which necessarily go to an accomplished composition require the experience of a master. The flock is coming down the lane.

'The Saviour in his Youth,' J. R. HERBERT, R.A.—This is the youthful impersonation of the Saviour, from a picture which was painted some years ago by this artist, and which contained also Joseph and the Virgin.

'Lady Jane Grey,' C. R. LESLIE, R.A.—A small half-length figure of infinite sweetness of expression. She is seated reading.

'Quillehauf,' J. M. W. TURNER, R.A.—There is little in this picture, and what there is—that is, the material—is by no means of an aspiring character, yet the work is perhaps the most sublime of Turner's sublimest essays. The water and the sky are passages of the most subtle enchantment, and the light and colour of the work have no parallel in Art.

'The Reflection,' A. EGG, A.R.A.—The subject is a girl adjusting her dress before a mirror.

'The First Lesson,' C. R. LESLIE, R.A.—Presenting a mother and child, the former instructing the latter; it appears to be an early work.

'The Lady's Maid,' W. P. FRITH, R.A.—This picture has been engraved under the title, we believe, of "Hot water, Sir;" it contains one figure, that of a servant tapping at a bedroom door with a jug in her hand.

'The Mountain Road,' J. LINNELL.—A dark picture, in its best qualities equal to Claude, and better in its detail and manipulations. The landscape occupies three-fourths of the canvas, and the remaining portion is filled by masses of rolling cloud, which, of all living artists, Linnell paints the most successfully. This picture was in the Paris Exhibition.

'The Applicant,' C. W. COPE, R.A.—A widow with her son, waiting patiently at the door of a "Pension Office;" an impressive tale of sad bereavement.

'Othello's First Suspicion,' J. C. HOOK, A.R.A.—The Moor has cast himself down on a seat, his face hidden by his hands. Desdemona vainly essays to re-assure him.

'The Judgment of Paris,' W. ETTY, R.A.—The three goddesses are in the centre of the composition, and Paris and Mercury occupy the left. This appears to have been executed as a sketch for a larger picture. It is charming in colour.

'Catherine and Petruchio,' A. EGG, A.R.A.—They are seated on a sofa, Petruchio faces the spectator, but Catherine sits, in profile, with an expression of extreme displeasure. Petruchio looks excited, he holds in his hand a small whip, with which we are to suppose he has been chastising Kate. The picture was painted in 1851.

'Mother and Child,' C. W. COPE, R.A.—The mother holds her child before her, both being introduced in profile.

'The Welcome Return,' G. O'NEIL.—The scene is a cottage-door, at which a grandfather, on his return from the fair, is welcomed by the family, especially the grand-children, who are eagerly inquisitive about what he may have purchased for them.

'Cupid,' W. ETTY, R.A.—A small single figure, equal in colour to the best essays of Correggio.

'The Maid and the Magpie,' P. F. POOLE, A.R.A.—The girl leans back on a bank, and the bird is perched on her. She looks up and holds a conversation with the bird. The work is spirited and original.

'The Nosegay,' W. P. FRITH, R.A.—A single figure, that of a lady circumstanced in a garden composition, and occupied in culling and arranging flowers.

'The Fisherman's Return,' J. C. HOOK, A.R.A.—The appearance of reality in this picture suggests its having been worked out, stone by stone, from some sea-side locality. The fisherman, as he ascends the ladder of the sea-wall, is welcomed by his child.

'The Bird-Trap,' W. COLLINS, R.A.—Painted in 1819; it shows two boys setting the bird-trap—an interesting instance of the earlier subject-matter treated by the painter.

'The Gipsy Camp,' F. GOODALL, A.R.A.—The picture sets forth much of the truth of gipsy life, with perhaps some of its romance; there is accordingly the tent as a principal form, assisted by an appropriate piece of landscape composition, with characteristic figures coloured with much taste. It was exhibited in 1847.

* * * * * J. PHILIP.—

"As on the dandelion's downy wings,
Fond lovers bid their gentle wishes speed."

An old story, yet ever new in skilful hands: the lovers in this case are two rustics; the lady casts her fate on the oracular dictum of the seed of the salutary *taraxacum*, while her Corydon endeavours to snatch it from her.

'The Falcon,' W. P. FRITH, R.A.—A small picture containing a single figure, that of a lady in picturesque costume, holding on her wrist a falcon, and being about to mount her horse.

'A Study at Cairo,' W. MÜLLER.—Simply a brass gun oxidised into bright green, and near it an Egyptian sentinel. It was painted in 1845.

'Hylas,' W. E. FROST, A.R.A.—The figures here are placed, as usual, at the brink of the stream; two of the nymphs kneel on his left, a third is in the water. The figures are drawn with the wonted accuracy of the artist.

'Benjamin West's First Essay in Art,' E. M. WARD, R.A.—We find West here in his earliest boyhood, kneeling by the side of his little sister's cradle, and very earnestly drawing the child as she sleeps. It is a sparkling picture.

'Peter the Great sees Catherine for the First Time,' A. EGG, A.R.A.—While Peter and his generals in camp are planning field and siege operations, Catherine enters as a *vivandière*, and the attention of Peter is arrested by her personal appearance. This is a large and important picture, the best production of its author, being qualified with some of the best properties of historical art. It was exhibited in Paris.

'The Windmill,' J. LINNELL.—A small picture admirable in effect and finish. A replica of the Vernon picture.

'The Coral Finders,' W. ETTY, R.A.—This picture is well known as that presenting the charming and brilliantly painted figure in the boat, which ETTY intended for Venus. It is one of the painter's most exquisite essays, and would form a most suitable pendant to the Vernon picture.

'The Fireside,' T. WEBSTER, R.A.—A small cottage interior, with two figures in the old-fashioned chimney; an old woman knitting, and a boy with a basin of broth. It is very carefully finished.

'A Deerhound,' Sir E. LANDSEER, R.A.—The head in profile, apparently finished at one painting. A characteristic type of the race.

'Landscape,' T. CRESWICK, R.A.—This is the darkest picture we have ever seen by this artist. The dominant form is a mass of trees on the left of the composition, with a rocky stream in the nearest site.

'The Accusation of Witchcraft,' W. P. FRITH, R.A.—This is perhaps the best of the artist's works. The story turns upon the accusation before a magistrate of an old woman who is supposed to have bewitched a girl, whose real malady is her secret love for the falconer. The picture is large, and full of appropriate and well-conceived characters, drawn and painted with infinite spirit.

'Bridge at Prague,' C. STANFIELD, R.A.—A small composition, showing the bridge in the centre distance. The nearest site on the left is occupied by a block of houses, the whole being very Venetian in character.

'Leonora D'Este,' G. O'NEIL.—A small study of a girl wearing a Moorish mantle, and holding in her hand a feather fan. Her features are shown as a three-quarter face, and her hair is dressed with flowers.

'Queen Elizabeth reproving her Courtiers for their Flattery after her Illness,' A. EGG, A.R.A.—The scene is the queen's bedroom, in which she has received certain of her courtiers. She is seated on a low stool by the side of her bed, and her countenance declares the gravity of her address. On the left are the ladies-in-waiting, one of whom is about to offer a looking-glass to the queen. It was exhibited in 1849, and is a large picture, admirable for its harmonious colour.

'Mignonne,' G. O'NEIL.—A study of a small figure, that of a lady playing a guitar: it is very carefully wrought.

'Doubtful Weather,' W. COLLINS, R.A.—One of the studies of that kind of coast scenery to which this painter principally devoted himself. In the nearest section of the composition, a fisherman is looking up at the cloudy sky, which threatens wind and rain. The scenery resembles the coast near Folkstone or Sandgate.

'Crossing the Brook,' W. MULREADY, R.A.—This is one of those very highly finished drawings in black and red chalk, of which the artist has produced many, that are in every respect equal to the finest engravings. There is in the Vernon Gallery a picture under the same title, but in this case the in-

terest of the composition centres in an infantine navigator, who, much to his delight and the admiration of his parents, is courageously crossing a stream in a tub.

'A Calm,' E. W. COOKE, A.R.A.—The craft in this picture are Dutch doggers, on the masts of which hangs the canvas idly waiting for the reluctant breeze. This phase of marine subject-matter the artist paints with much sweetness and truth.

'The Faun and the Fairies,' D. MACLISE, R.A.—The original picture whence the engraving was executed in Bulwer's "Pilgrims of the Rhine." We see only the head and brawny arms of the Faun, whose occupation is to give music to a company of fairies, who flit about him in a ring. In finish and elegant design the picture is a gem; it must have been painted more than twenty years.

There are in this collection a few water-colour pictures, of which the most important is 'Cader Idris,' by Turner; a dark drawing, but certainly one of the grandest productions of the water-colour school. It was executed many years ago for the father of Sir John Dean Paul, and hung, we believe, in the house in the Strand until the effects were sold. It is very elaborately worked, broad, transparent, and marvellously powerful.

'A Vase of Flowers,' W. HUNT.—Exquisitely drawn and coloured—having for background the fragment of bank which this artist so frequently introduces.

'The House of Petrarch,' S. PROUT.—From this drawing there is a well known engraving.

'Fruit,' W. HUNT.—Two blue plums and one yellow, with a repetition of the mossy bank. 'Primroses,' by the same author, has the addition of a hedge-sparrow's nest; all very minutely finished.

'The Fountain,' P. F. POOLE, A.R.A.—This drawing presents an arrangement of two figures; a girl at a fountain giving water to a child from a pitcher. It has all the best qualities of the minor studies of the artist.

'The Atelier of Benvenuto Cellini,' R. CATTERMOLE.—This composition contains numerous figures, and details a pointed story about some robbers, who, having possessed themselves of some richly designed plate, offer it for sale to Cellini, who attentively examines a cup which he discovers to be his own work. The drawing is full of dramatic force. Another drawing, by the same artist, is entitled 'Amy Robsart,' and presents two female figures. It is firm in drawing, forcible, and characteristic.

THE COLLECTION OF HENRY COOKE, ESQ., OF MANCHESTER.

This Collection, which has been formed principally of late years, consists entirely of water-colour drawings. It is not numerous, but the quality of the Art evidences much refinement and elegance of taste; there are but few drawings in the catalogue that are not by artists now living, and they are all in the very best spirit of the painters.

'Sunset,' F. DANBY, A.R.A.—The drawing of this work is really as infinitesimal as engraving: it presents a view of an approach to a castle sunk in some degree below the level of the near site of the view. The trees on each side, and the foreground, are forced with dark colour, to assist the effect of the setting sun.

'Hotspur and Lady Percy,' G. CATTERMOLE.—This is the farewell before the battle of Shrewsbury; Hotspur wears a full suit of plate armour, and Lady Percy is plainly dressed in white.

'Morning,' W. WYLD.—A view down the river, taken from a point above Blackfriars Bridge, and showing principally the buildings on the Middlesex side, the whole dominated by St. Paul's, and telling, in various and refined airy gradations, against the light morning sky. The material is dealt with in a manner extremely skilful.

'Evening,' W. WYLD.—This is a view looking upwards, the Houses of Parliament being the principal quantities in the composition. The view is taken from some point on these sweet waters near the Lambeth shore, and the drawing is equally meritorious with the preceding.

'The Harvest Home,' F. GOODALL, A.R.A.—The sketch made for the picture which was exhibited under this title a few years ago, we think in 1835. Having been so recently before the public we need

not describe it; it is enough to say that it has been worked out with as much care as the picture.

'The Mother's Blessing,' F. W. TOPHAM.—A composition of two figures at a well, mother and child; the former introduced in profile, and holding a cross, the latter seen at three-quarter face, and in the act of drinking.

'The Mother's Pride,' P. F. POOLE, A.R.A.—This is a repetition of a subject which the artist has painted in oil. It contains two figures, those of mother and child: the latter caressing its mother, who in playful fondness has thrown herself back on the bank by her child.

'Marino Faliero,' J. R. HERBERT, R.A.—The subject may either illustrate the historical fact, or the passage in Lord Byron's play, wherein a form is given to the awful imprecations understood to have been uttered by the old man when he read the infamous inscription—"Marino Faliero dalla bella moglie—altri la gode ed egli la mautica." His right arm is lifted, and he frantically adjures heaven to register and to realise the maledictions which he pours forth on Venice, in language that strikes terror into the heart of his wife, and who expresses the utmost alarm lest he should be heard. The princely diadem of the Doges lies spurned at his feet.

'Windsor Castle,' J. M. W. TURNER, R.A.—The best view of the castle—that from the river, between the Home Park and the fields on the Eton side; the line of the castle, the Round Tower, St. George's Chapel, with a continuation of buildings down to the bridge, are brought in varieties of grey and warm tints against the flood of sunlight in the sky. We cannot think that so much of the new front of the castle is visible from this point, but we accept the work as it is set before us.

* * * * D. ROBERTS, R.A.—Are we in Seville or Toledo? We lose here the thread of our whereabouts, but we are in Spain, inquiring our way in these Iberian cities, glorious in mementoes of past splendour. In the centre of the view rises a massive tower of mixed Gothic and Italian architecture, and on the left stands a cathedral porch of the most richly decorated Gothic. The mellow airy colouring of this drawing is beyond all praise: this transparency is maintained in the lower parts, pierced—as is usual with this artist—by figures, positive, definite, and with all the sharpness of one who knows that he draws small figures well.

'Carlisle,' J. M. W. TURNER, R.A.—This is the best view of the town; that taken from a short distance down the stream of the Eden, where the castle is seen as the principal object, and the town generally is lost. It is a small drawing, and appears to have been made for engraving. The nearest passages are in strong light, but on the left the distance lies under a rain-cloud, in which appears a fragment of a fading rainbow.

'The Windmill,' D. COX.—The material of this composition is slight, being simply a plain divided by a road, leading the eye to a misty distance. On the left is a windmill. It is evening; the cows are coming home, and the crows in noisy flights seek their nests.

'View in Wales,' P. DEWINT.—We know not the precise year of this drawing, but it is in the artist's very best manner. Much that seems left to chance appears, on examination, to have been anxiously drawn. The assertion of the distances, the pervading mellowness of the hues near and remote, the earnestness of the description, and the elements and quantities of the composition, everywhere satisfy the eye.

'Interior of a Church, Seville,' D. ROBERTS, R.A.—The lower part of the composition is crossed by a screen very richly carved, above which, and on the left, is the organ, seen in profile, whence the eye is led to the details of the architecture. The space shown here is extremely imposing. We know not whether to esteem this artist most as a painter or an architect. This drawing was made in 1837.

'Ghent,' (?) J. M. W. TURNER, R.A.—A small drawing, made apparently for engraving. The principal object is a brick building, glowing in the vibrative rays of the sun, brought against a powerful blue sky: round the base of the eminence on which the edifice stands, flows a river down to the left of the nearest site of the composition. Small as the drawing is, it evinces everywhere the most exquisite feeling in its composition.

'Rolandseck, on the Rhine,' J. M. W. TURNER, R.A.—In this picture there is but little; it prescutes simply that *flèche*, surmounted by the ruined tower to which all who have passed have had their attention called as the scene of a romantic legend. It rises here prominently upon our left. We look up the Rhine, and the cliffs decline from this point until they are lost in the grey distance, in which the eye yet seems to discover remoter forms. Near us, and floating idly down the stream, are some of the clumsy carrying Rhine-rafts. And mark the master-stroke of the magician: the golden wealth of the drawing resides in the sunny cliffs and that mellow, respirable atmosphere; and had the same elegance characterised all the incidents of the composition, that which Turner has dwelt on and prepared as the most striking passage would have lost half its value. No romantic water-party in painted barges or gilded canoes would have intensified the sentiment to this degree. At a glance, the drawing looks slight and easy; but it is the result of a succession of the most careful washes, conducted in such a way as to render the paper itself all but transparent. In the cunning of his art Turner has never outdone this drawing.

'Doge Dandolo and his Family,' J. R. HERBERT, R.A.—The subject of this drawing, which was made in 1839, is a domestic composition, with personal allusion to the Doge, which has become matter of Venetian history. We read the text—"Onore al chiarissimo eroe," and Dandolo shows the armour in which he fought the battles of the republic. His wife and children are present, the scene being the gallery of his own palace, open to the canal.

'The Gleaners,' D. COX.—Like many of the small works of its author, this drawing is one of those which may have been made to show the finesse of Art without direct reference to nature. A group of figures gives the name to the drawing.

'A Study,' W. MÜLLER.—This is an interior of the fifteenth century, perhaps one of those for which this artist made a portfolio of drawings about fifteen years ago: it represents a sumptuously furnished apartment, of which the fireplace is ornamented with caryatides and a quantity of carving. There are also in the room two richly-wrought cabinets; and the adornments are even continued in the ceiling, which is coffered, each coffer showing a shield.

'View in Venice,' S. PROUT.—It were impossible to recognise *Venezia senz'acqua*; we have, therefore, one of the small canals, flanked by a palace of the most richly decorated architecture. A bridge crosses the canal, and beyond these rises a tower; the whole rendered with the firmness of touch and the simplicity of colour characteristic of the works of Prout's best time.

'Nuremberg,' S. PROUT.—At once do we recognise one of those oriel windows, the modified result of an imitation of oriental architecture when Nuremberg was a principal depot for the merchandise brought from the East, by the caravans which conducted the commerce of the East and West during the middle ages. And there is a fountain—not that in the Hauptmarkt, by the Rupprechts, nor that in the Lorentzplatz; but it must be that in the Maxplatz, although the oriel window seems to be brought too immediately into the composition.

'The Gipsy Fortune-teller,' F. W. TOPHAM.—This is one of the artist's Spanish subjects, having been executed three years ago from sketches made at Seville. We make here the acquaintance of a tawny sybil, who vaticinates, for better for worse, of the future to two girls who are waiting for the fitful current of a fountain to fill their cruses. Near this group is a company of muleteers and others of the street vagabondage of southern cities—those ragged, picturesque supernumeraries of every population, who never have a home, who are never to be apprehended by any census—even in our climate, which forbids dwelling *sub Jove*, whether in Westminster or Whitechapel. The picture is assisted by well-selected fragments of architecture, in which we recognise at once the architecture of the Spanish cities.

'Lady Macbeth,' G. CATTERMOLE.—She has just taken the daggers from the hands of Macbeth, and is about to proceed to replace them in Duncan's chamber.

* * * * L. HAGHE. This is a large drawing, which we remember to have seen in the room of the New Society of Water-Colour Painters, in

1850: but we have forgotten under what title it was exhibited. The scene is the exterior of an enclosed fountain at Cairo—Alexandria—it matters not where, the subject not being locality, but personal incident. Cups of water are placed without the window, accessible to all who seek to quench their thirst. A fellah woman is giving water to an old man, and a Nubian boy is handing down a cup of water to another applicant. One of the company is an armed Arab—a genuine denizen of the desert. The incident is intelligible as instancing the value of water in cities bordering on the desert. Here is truly the charity of the cup of cold water illustrated by a custom which has existed since the time of the Saviour. The figures are conscientiously accurate in their maintenance of nationality. The drawing is new as to its class of subject, but yet possesses the qualities of Mr. Haghe's best works.

'A Festive Scene in Spain,' J. LEWIS.—A merry-making among certain of the Spanish peasantry. A man and a woman are dancing, and two men play the guitar; all the figures are drawn with much spirit. The dance takes place under a trellis, covered with the luxuriant foliage of the vine.

'Café in Algiers,' W. WYLD.—A composition containing numerous figures smoking and otherwise occupied. The fragmentary architecture in the drawing is admirable for form and quantity: the character and *tenue* of the impersonations are, we doubt not, perfectly accurate.

'The Cricketer,' W. HUNT.—That boy whom we all know so well has had his innings for the last twenty years; whether we meet him with his hot soup or his gooseberry tart, sleeping or waking, he has been always the same. Here he is, "the cricketer," just about to strike the ball, with an expression that ensures at least six runs. The firmness, action, and expression of the figure, are beyond all praise. This drawing was at the Paris Exhibition.

'Going to Market,' J. UWINS, R.A.—A picture of Italian rustic life, containing figures attired in picturesque costume, bearing fruits and vegetables to market. The characters are principally women and children.

'The Larder,' F. TAYLER.—The life of the picture is the cookmaid, who carries a sucking pig in a dish ready for the spit, and has two wild ducks suspended from her arm. The composition is rich in the properties of the larder, as a variety of game, poultry, and fish, of which latter, the colour of the carp contributes richness to the lower part of the drawing.

'The Pilot-Boat,' R. P. BONNINGTON.—A small drawing, spirited and broad in execution, showing a pilot-boat struck by a heavy sea, but yet standing up against the growing squall, and making way towards vessels in the offing. It seems to be an early work.

'At Chelmsford,' J. M. W. TURNER, R.A.—One of the grey drawings of the earlier period of our water-colour art. It is small, and contains as a principal a wooden bridge in the proximity of the church. We think the title a misnomer, for the bridge at Chelmsford is of stone, and the church is near the further extremity of the town.

'The Studio of Pereira,' D. MACLISE, R.A.—Pereira married a lady of good family, but not being sufficiently rich to add a duenna to his establishment, he painted one and placed her at the entrance to his studio; an old friend of the lady salutes her on entering, while his attendant bows with the utmost deference to the picture of the duenna. The anecdote is most charmingly rendered. The drawing is of extraordinary depth and minute finish. It is the darkest we have ever seen by MacLise.

This collection is hung in the dining and drawing-rooms of Mr. Cooke's house, in Burlington Street, Manchester; and we have noticed, we believe, the whole, as every drawing is of great merit.

In passing through the various galleries which it has been courteously permitted us to visit for the purposes of these brief notices, two facts have impressed themselves on the mind: one, the high character which the English school of painters has reached; the other, the taste and judgment manifested by the owners of these pictures in their selections. As we proceed we shall expect to receive still further confirmation of our opinions.

THE ROYAL PICTURES.

THE YOUNG SHRIMPERS.

W. Collins, R.A., Painter. A. Willmore, Engraver.
Size of the Picture, 3 ft. 9 in. by 2 ft. 11 in.

This picture is the result of a commission given to Collins, in 1824, by George IV., who desired to have a companion work to the "Fisher Boys." The scene lies off the coast of Hastings, where the artist fixed his residence during the summer of that year, that he might give the subject his most immediate and particular study. The picture was never publicly exhibited, as it was sent home almost as soon as finished, and the painter had the gratification of hearing its royal owner express, in a personal interview, his pleasure at his new acquisition, when he was summoned to Windsor to superintend the hanging of the picture in a proper light. It still forms a part of the Collection in Windsor Castle.

Like almost the whole of Collins's "Coast Scenery," the materials of this picture are few and simple; in truth, he rarely sought those of any other kind, whatever subject he proposed to himself; while they are almost as invariably treated with a prevailing sentiment of quietude and repose. We never remember to have seen a storm, nor an extraordinary atmospheric effect, attempted by him; he looked at Nature only in her ordinary aspect, but he then studied her closely. Mr. W. Wilkie Collins, in his "Memoir of the Life" of his father, writes thus of the method he adopted in collecting his materials and commencing operations:—"The general composition of his pictures, the arrangement of the clouds, the line of the landscape, the disposition of the figures, he usually sketched at once in chalk upon the canvas from the resources of his own mind, aided by sketches. The production of the different parts, in their due bearings and condition, next occupied his attention. For this he made new studies, and consulted old sketches with the most diligent perseverance, covering sheet after sheet of paper, sometimes for many days together, with separate experiments, extended to every possible variety in light and shade, colour, and composition; watching, whatever his other accidental occupations, and wherever they might happen to take him, for the smallest and remotest assistance of external nature; and not unfrequently consulting, on points of pictorial eloquence, probability, and truth, the impressions of persons who, while conversant with nature, were unacquainted with Art." In all that he did there is evident a conscientious determination to make his art a true exponent of nature, and of real value, in the lowest acceptance of the term, to those who might possess his pictures; for it was his maxim, as we read elsewhere, "that the purchasers of his pictures had a right to expect a possession which should not only remain unaltered and undeteriorated during their own life-time, but which should descend unchanged to their posterity, as a work whose colour and surface should last as long as the material on which it was painted. To make a good picture was his first labour, and to make an enduring one was his last." We should expect, from the solidity of his painting, and entire freedom from all the trickeries of art, that his pictures will outlive those of many of his contemporaries, who seem to have worked only for their own generation.

His "Young Shrimpers" is, as we have just remarked, a composition of the most simple materials—a young boy, who carries a child on his back, and a little girl holding up her apron to receive from the net of the fisher some of its contents, occupy the beach in the foreground; in the middle distance, and holdly relieved against the sky, are three other shrimpers pursuing their work among the pools of water, for they have not ventured out into the shallows of the open sea. The flat rocks, covered with sea-weed, extend down to the right-hand foreground. The high cliffs of Hastings rise in the left distance; the sea fills up the right. The sky indicates a light breeze; for the clouds, though large are not low and heavy, are here and there broken into graceful forms, and are painted with much delicacy. The tone of colour throughout is pure, yet subdued.

Collins received from his Majesty 300 guineas for the picture.

TALK OF
PICTURES AND THE PAINTERS.

BY AN OLD TRAVELLER.

CHAPTER II.

The masterpiece of Titian, "Il Pietro Martire"—Story of Fra Pietro—St. Dominic and the Inquisition—Tomb of St. Peter the Martyr—Meritorious edict—Evil times—Exile of the Picture—Return to the Motherland—Opinions of the Authorities—The Tribute-money—Other works of Titian in the Dresden Gallery—Cambridge—The Fitzwilliam Museum—Princess Eboli and Philip II. of Spain—Wealth of Venice in the works of Titian—Maofrini Palace—The Entombment—The Three Ages—Academy of the Fine Arts—Assumption of the Virgin—Presentation in the Temple—St. John in the Wilderness—Santa Maria Gloriosa de' Frari—Madonna of the Pesaro Chapel—San Nicololetto de' Frari—Altarpiece—The titular Saint—Martyrdom of St. Sebastian—The Picture resigned to Pope Clement—Taken to the Quirinal—Pope Pius VII. bestows it on the Pinacoteca of the Vatican—Northcote in description—L'Anonimo—Padre Guglielmo della Valle.

As the Transfiguration among the works of Raphael, and the St. Jerome among those of Domenichino, so is the Pietro Martire among those of Titian—that picture is declared, almost without a dissentient voice, to be his best work. Most of our readers are familiar with the subject of this painting. Yet as there may be some to whom the story is not known, the general outline may be usefully given.

One of the earliest generals of the Dominicans,* Fra Pietro da Verona, immortalised by Titian in his Peter Martyr, even more effectually than by the Canons of the church, was also one of the most zealous founders of the Inquisition in Italy, where his severities caused him to be hated as well as feared. He had proved himself more particularly unjust and oppressive towards various members of a family called Cavina, and by one of these, or, as others say, by a hireling suborned by them, the General of the Dominicans was assassinated. Returning from a consultation with the Grand Inquisitor, wherein measures of increased rigour had been determined on, and bearing with him instructions to that effect, he was met on his way through a wood then crossing the road from Milan to Como, and cut down by the stroke of a sabre. His only companion at the time was a lay brother of his convent; he also was attacked by a second assassin, as the chronicle relates, and as is, indeed, probable;† but according to the artist,—that most effective writer of history,—he was a dastardly poltroon, who, making no attempt to assist or defend his superior, fled from the presence of the murderer in a frenzy of fear. Who that has seen the picture can forget the impression of terror visible in his movements, and impressed on every feature.

The canonisation of the victim was an early consequence of his death in such a cause, shrines were raised for the worship of the new saint, and to the erection of one sumptuous monument to his memory the excellent Pisan sculptor, Giovanni Balduccio, devoted some ten precious years of his too short life.

All who know the well-endowed city of Milan—and few are the lovers of Art who neglect to make her acquaintance—will remember the work in question. In the Church of Saint Eustorgio, on the Corso della Porta Ticinese, and in a chapel consecrated to St. Peter the Martyr, is the gorgeous tomb wherein the relics of the saint repose. His own statue, with those of St. Peter the Apostle, and St. Paul, the Apostle to the Gentiles,‡ form the chief ornaments of the mausoleum, which is further enriched by figures of St. Thomas Aquinas and the four Fathers of the church, all in the finest marble of Carrara. The master did not live to complete his work, which was continued by his disciples, the most distinguished of whom, Bonino da Campione, executed those fine *rilievi* representing the Passion of Our Lord, and also in white marble,—a

* The order of the Dominicans (Predicatores) was founded at Toulouse, in 1215, by the Spaniard Dominic de Guzman, who likewise took part in the establishment of the Inquisition, commanded about that time by Pope Innocent III., for the repression of heretics in general, and of the Albigenses in particular, throughout the realm of France. De Guzman was canonised by Pope Gregory IX. in 1233, twelve years after his death, which took place in 1221.

† The reader will remember him as so depicted by Giorgione in our own work by that master, now in the National Gallery.

‡ Not St. Paulus Eremita, as say some of the Milanese guides.

gift from one of the Visconti,—which the reader will remember as forming the decoration of the high altar in the same church.

The death of this saint it is, then, that Titian has chosen for the subject of what all agree to declare his finest work. Painted for the high altar of SS. Giovanni and Paolo, in what may well be considered the best period of the master's life, this picture was early estimated at its true value, and the pain of death was subsequently decreed by the Venetian senate against any who should attempt to bereave their city of that treasure. Good cause for this edict was given by the community of St. John and St. Paul, since those fathers were on the point of concluding a sale of the picture, to which they had been tempted by the large sum of 18,000 scudi, when the senate stepped in with its veto, as aforesaid.

"Città comanda, ghe tagie la strada,"

says Boschini, in his Venetian dialect, that most charming of the tongues that make Italy all musical. Brethren and friends! would that even now the delicious sounds were in our ears:—

"Città comanda, ghe tagie la strada,
Col dir, 'Lasseia la! pena la vita.'" *

A most significant injunction, and one the purport of which could scarcely be mistaken—a quality not always to be found in laws. This decree saved the picture, and although it was taken to Paris,—the grief and supplications of the inhabitants notwithstanding,—yet, as among the first restorations demanded, was that of the Pietro Martire, so was it ultimately restored to its rightful possessors. In Northcote's "Life of Titian" is a description of this work, which has the merit of simplicity, and is very nearly accurate; the words are these:—

"In this composition the saint is represented larger than life, fallen on the ground, attacked by a soldier; he is mortally wounded in the head, and the agonies of death are in his face. His companion is flying, with looks that exhibit great terror. In the air are two or three little angels descending with the crown of martyrdom, and surrounded by a sudden blaze of glory, shedding a light over the landscape, which is most admirable. It is a woody country. In the foreground are several alder-trees, executed with such perfection as it is much easier to envy than to imitate. The fear in the friar's face, who is making his escape, is well expressed—it seems as if one heard him crying out for mercy. His action is rapid as that of one who is in extreme danger, and his friar's dress is exquisitely managed so as to show the proper development of the figure in swift motion. There is no example of drapery better disposed for effect. The face of St. Peter has the paleness usually attendant on the approach of death. He puts forth an arm and hand so well expressed that, as a good critic has said, Nature seems conquered by Art. The tall branching trees, with the flashing lights of the troubled sky, would seem to indicate that something terrible is passing below, even if it were not visible; and the distant Alps, discovered between the trees, impress the spectator with horror of the dreary and desolate spot (so fit for such a deed) on which the murder is perpetrated."

Dissenting from the critic, who speaks of Nature as the victor of Art,—since Art, though often seeking to elevate Nature, does not attempt to vanquish,—we add the closing words of Northcote's description, wherein he does but express his own accord with the opinions of all whose voices are of moment:—

"This composition is the most celebrated of any Titian ever painted. I think it justly deserving of the name given to it, and by which it is universally known, 'the picture without a fault.'" †

A more spirited description will be found in the words below, wherein the author, first paying a tribute most justly due to Giorgione, and remarking that after his death Titian was left without a rival, proceeds to say:—"This great painter (Titian) began, of course, like all Venetians, to paint directly from nature, without having previously dissected or drawn, nor was he sensible of this error of the Venetian School till, coming to Rome, and seeing the works of Michael Angelo, Raffaele, and the

* Which may be rendered as follows:—

"The men who rule us barred the way,
Saying, 'Leave that alone! or die the death!'"

† "Life of Titian," by James Northcote, Esq., vol. i. p. 43, *et seq.*

W. COLLINS, R.A. PINX.

THE YOUNG SHRIMPERS

FROM THE PICTURE IN THE ROYAL COLLECTION

A. WILLMORE SCULPT.

antique, he, like a great genius, set about remedying his deficiency, and the perfection of this union of form and colour is seen in his greatest work—*Il Pietro Martire*. This picture occupied the master eight years, and the eight years were well spent in such a production. The terrific gasping energy of the assassin who has cut down the monk; the awful prostration of the victim, wounded and imploring heaven; the flight of his companion, striding away in terror, with his dark mantle against a blue sky; the towering and waving trees, the entrance, as it were, to a dreadful forest; the emhrownd tone of the whole picture, with its dark azure and evening sky, the distant mountains below and splendid glory above contrasting with the gloomy horrors of the murder; its perfect, though not refined drawing, its sublime expression, dreadful light and shadow, and exquisite colour, all united render this the most perfect picture in Italian Art.*

And all this is true: nay, more, and much more, might well be affirmed respecting the surpassing merits of this great work; yet, since Art has so much to offer, and life so little time wherein to consider it, I refrain from comment of my own, believing we shall all find more profit in the words of some few more among the efficient writers who have made this priceless production their theme. With these, then, we shall close the sojourn one feels to be making with the noble picture while listening to their discourse concerning it.

Kugler, in his "Handbook of Painting," speaking of the *St. Peter Martyr*, assumes, as a fact, that Titian's highest excellence is more frequently displayed in the delineation of figures in repose than in those in action: he adduces the *Christ crowned with Thorns*, in the Louvre, in support of his assertion. On this Sir Charles Eastlake observes—"It has not been thought necessary to notice every instance where the judgments of the author differ from received opinions; but it is impossible to suffer the above remarks on the *Pietro Martire* to pass without, at least, observing that the majority of critics have long placed this picture in the highest rank of excellence. The *Christ crowned with Thorns* is unsurpassed in colour, but the *Pietro Martire* has been always considered as excellent in invention as in the great qualities which are peculiar to the painter. Having said thus much, it may be granted that the author's general remark respecting Titian's superior treatment of grave subjects appears to be well-founded, and instances of exaggerated action might undoubtedly be quoted. A certain imitation of Michael Angelo is to be recognised in Titian's works in the most vigorous period of his career; but this imitation seems to have been confined to qualities (such as contrast in action and grandeur of line) which were analogous to his own characteristic excellences. The friar escaping from the assassin, in the *Pietro Martire*, is as fine an example of the union of these qualities in form as is to be found in the works of any painter: other instances were, perhaps, less successful. For the rest, the taste was not permanent in Titian; he returned to that 'senatorial dignity,' which Reynolds has pointed out as one of his prominent qualities, and in this view the remark of the author, must be allowed its due weight."†

Frederick Von der Hagen, whose "Briefe in die Heimath" is among the most useful of his painstaking compatriots' many useful works, brings his testimony to the value of the picture in aid of all previously cited:—"Dieses Bild," he says, "wird überall für Tizians Meisterstück gehalten."‡ He adds a remark that might seem to require confirmation, and which the present writer has not seen elsewhere—"Die Engel oben in den Bäumen sind nach dem erwähnten antiken Bildwerk in der Bibliothek." "The angels hovering over the scene, and in the trees, are taken from the before-mentioned antique sculptures of the Library,"—that of *St. Mark*, Venice, namely, to which he had previously referred.

To the *Cristo della Moneta* (the *Tribute-money*) some slight allusion has already been made. § This picture, painted for Alfonso the first, Duke of Ferrara, is in

the Royal Gallery of Dresden. It has given rise to much discussion, as to the extent of influence exercised on the manner of the master when painting it, by Albert Dürer: for these we refer the reader to the German and other commentators who have touched on the subject. One of their number* disputing the fact, points to other causes—the still possible influence of Gentile Bellino among them—as accounting for that dissimilarity to the master's later manner remarked in this picture. "Be these things as they may," continues Förster, "the *Tribute-money* serves to exhibit the great master of the Venetian school on a second eminence, to the elevation of which no other had ever attained, and to which he did not himself again ascend."

Lanzi, alluding to the same work, and also referring to the supposed influence of Dürer,† says—"He worked at his *Christ* with such attention to delicacy that he surpassed even that master of minuteness [Albert Dürer] one might count the hairs on the head, and the pores of the skin, and yet the effect is not injured; for, while the pictures of Albert, by diminishing the size, diminish the value, Titian enhances and renders them more grand. Happily for the Arts, this, and the portrait of Barberigo, are the only works in the manner now under consideration that Titian ever executed after freeing himself from the school of his master."‡

But, if there be diversity of opinion on the question thus mooted, there is but little as to the merit and beauty of the picture. Kugler calls it "the most finished and beautiful of Titian's early works;" "or, rather," he proceeds to say, "one of his most beautiful works of any period, is *Christ* with the *Tribute-money* (*Cristo della Moneta*), painted for the Duke of Ferrara, and now in Dresden. In the head of *Christ* everything combines to produce the noblest effect; the union of the flesh tints; the delicate handling of the beard and hair; the graceful lip; the liquid lustre of the eye; the mildness of the reproving glance. The contrast of the crafty Pharisee is admirable."§ It is true that another of the German critics, and one of no mean account—Ernst Förster, namely—affirms the divinity to be wanting in this head of *Christ*: he adds, what is indeed to be lamented in but too many of our most valued treasures in Art, that the work has been much injured by restoration.

Few galleries are so rich in the works of Titian, as is that of Dresden, and were it but in reference to these, one feels constantly disposed to say with Dr. Waagen—"Du weisst dass mir der Aufenthalt in Dresden jedes Mal ein wahres Fest ist."|| The Ducal family of Ferrara, in prayer before the *Virgin*, has been already named; there is, besides, a work of great merit representing the *Madonna*, with the *Divine child* standing on her lap: *St. John the Baptist* forms part of the group, and before them is a young woman of the true *Titianesque* type. Her bright fair hair, scarcely restrained by its silken bands, falls in rich tresses on the beautiful neck. Over her graceful head, *St. Jerome*—her patron saint—extends his crucifix, as in the act of recommending her to the especial protection of the *Virgin Mother*. A second saintly protector—if I recollect rightly, *St. Paul*—has also accompanied the gentle suppliant, whose bent eyes, and the somewhat anxious expression of her mouth, would seem to imply—as, indeed, the figure also makes manifest—that no common occasion has brought her thither.

A *Venus*, one of three, all much admired by the German critics, is principally remarkable—as compared with other fine works of the master, of which this is undoubtedly a very fine one—for the peculiar character of the landscape without; it has all those many characteristics—comprehended without a word, but which many words would not suffice to enumerate—of a hazy midsummer day. The hills are bathed in a glow of sunshine, dark and deep are the

shadows cast by the trees midway, and you tell yourself it is beneath them that you would now be tempted to repose, if it were your lot to be travelling on the road to those hills. A youth, playing on a musical instrument, is seated at the feet of the *Venus*, but with his back turned towards her as well as to the spectator.

This picture is a replica of that in the Fitzwilliam Museum, Cambridge, where it is called the *Princess Eboli* and *Philip the Second*—an appellation that may have been determined in part by the guitar. The hand of the restorer—restorer!—is, unhappily, but too clearly manifest in the Fitzwilliam picture, more especially does it appear in the head of the *Venus*; that of the *Cupid* has suffered in like manner, although scarcely perhaps in equal degree.

That the churches and palaces of Venice should be rich in the works of Titian is what all will anticipate, and most of us know to our infinite advantage and delight. The mournful Entombment, in the Manfrini Palace, will at once recur to the reader as among the most impressive—perhaps, indeed, the best remembered of all. Even to those who have not seen Venice the work need scarcely be unknown, since the Entombment in the Louvre has more than equal merit. Or if, saddened by the heavy sorrow expressed so eloquently in this masterpiece, he desire relief in the contemplation of perfection in other forms, let him turn to the exquisite *Three Ages*, in the same palace; or let him take boat for the Academy—thrice blessed be the hour!—and in the glorious Assumption—or, for many, yet more effectual to the purpose, in the *Presentation of the Virgin in the Temple*—he will find matter fully worthy to occupy his thoughts, even though these have been elevated by long lingering before the great and heart-moving Entombment.

And now, pressing is the temptation to describe these wonders of Art, were it for no better reason than the delight one has in recalling their minutest details, never so effectually presented to the eyes of memory as when seeking, however ineffectually, to set forth their beauties and merits for the admiration and homage of others. But the desire must be resisted: neither may we do more than indicate the *St. John in the Wilderness*, also in the Academy—but painted for the Church of *Santa Maria Maggiore*. That the Assumption of the *Virgin*—that too now in the Academy, as before mentioned—was formerly in the conventual Church of *Santa Maria Gloriosa de' Frari*, most of our readers will remember; nor will any who have seen it forget the *Madonna of the Pesaro Chapel*, in that church, where the donors of the picture, all portraits, are kneeling before Our Lady, who has *St. Peter* and *St. George* beside her. All who are familiar with Venice will equally remember the little Church of *San Nicoletto*, which makes part of that magnificent convent of the *Frari*. For the high altar of this church Titian painted a picture, wherein is the martyrdom of *St. Sebastian*. The saint is a figure much extolled by many critics, for truth and fidelity to the life, but censured by others—*Vasari* among the number, but by him very gently—for the absence of ideal beauty. "The *St. Sebastian* having been copied from the life, without the slightest admixture of art," says *Vasari*, "nothing has been done for beauty in any part, trunk or limbs; all is as nature left it, so that it might seem to be a sort of cast from the life: it is, nevertheless, considered very fine, and the figure of Our Lady, with the *Divine child* in her arms, is also accounted most beautiful."* Of this inestimable work—for such, notwithstanding that dissonance among the learned just alluded to, is the *St. Nicolo* generally allowed to be—the community consented, towards the close of the last century, to deprive their convent. Alas! that gold should have so much power, and that men's resolves should exhibit so little firmness; for many great ones of the earth had more than once desired to possess the treasure, but the monks had hitherto stood firm in their declaration that no price should ever buy it from them—yet for money was it ultimately sold, and in so much was the Republic—then triumphant, for this took place in the year 1773, or 4—in so much was she shorn of her glory. Let us suppose that unwonted pressure must have been exercised on the

* Ernst Förster "Briefe über Malerei," whose words are as follow:—"Für diese hatte er, im benachbarten Mailand, ganz andre Mistreiter, ja sein eigener Lehrer konnte ihn zu solemem Beginnen durch seine Werke herausgefordert haben."

† "Jedenfalls, zeigt es uns den Meister der Venezianischen Schule auf einer zweiten Höhe, die kein Anderer erreicht und auf die er sich selbst nicht wieder begeben hat. E. Förster, *ut supra*."

owners; or rather—and why forget the fact so long?—let us be certain that their sense of duty to the head of their church alone had power to prevail over every other consideration,—for the purchaser was no less sacred a personage than Pope Clement XIV., and the place of the exiled picture's destination—and remembering that circumstance, many would hesitate to say that of its banishment—was no other than the pontifical palace of the Vatican.

Here it was that the present writer first made its acquaintance—here that in subsequent visits the beauty of its many admirable parts seemed ever to become more beautiful, while such defects as more profoundly informed observers have discovered in the work, eluded, in almost every instance, the perceptions of this writer, although so much may be admitted as that the St. Sebastian is not an attractive portion of the picture, however fine. But even this would scarcely be granted by good judges; and the writer, conscious to a weariness of the figure of Sau Sebastian, which meets you everywhere and in all galleries, has seen cause for attributing that amount of imperfection in the pleasure conveyed by the work to a prejudice in the beholder rather than to failure on the part of the master.

And here, in support of the last observation, let us add what an Italian once remarked to the writer, as regarding this very figure, "It justifies the eulogy of your countryman," he said; who declared that "the flesh of every other great painter is but paint, while that of Titian has a real circulation of blood under the skin." It was of Haydon the Roman was speaking, in whose "Treatise on Painting," the passage, not then known to the present writer, will be found.* Another Italian, speaking of the same figure, assures us that in this Martyrdom of St. Sebastian, Titian has taught us how the nude should be treated—"Sfuggendo le masse degli scuri gagliardi e le ombre forti che giovano al rilievo, ma diminuiscono la morbidezza della carne."† Northcote, describing this picture, declares the figure of St. Sebastian to be that of "a most beautiful young man, heroically sustaining the extreme pains of approaching death;" he proceeds to describe the whole with a perspicuity that would render his Life of the master truly valuable, had he bestowed some portion of that quality on his arrangement of the excellent materials he has collected. But, woe the while, what confusion worse confounded have we here! Take with you the very largest measure of patience when you consult his pages—nay, press it down and heap it up, or the very largest shall prove insufficient. The work is otherwise a fair and good one; competent authorities have been consulted, and a large mass of useful matter has been collected industriously, from sources where it was most likely to be found—Vasari and Ridolfi principally, perhaps, but others also have been consulted, and in sufficiency. The sole defect is that "most admired disorder" before alluded to; but for this we say again "take patience," and take enough.

Northcote's description of the St. Sebastian is as follows:—"On a bright cloud, illumined by the rays of the setting sun, is seated the Virgin, with the Divine child on her breast; before them are standing, in most devout attitudes, two handsome boys just emerging from childhood. A ruined edifice occupies the bottom of the picture, in which is seen the titular saint [St. Nicholas] absorbed in a pious ecstasy, and keeping his eyes fixed on the heavenly mother. * * * * * At the side of the Virgin is standing, with an air of modest dignity, St. Catherine, a woman of great beauty. The complexion is somewhat dark, the grand forms and contours, as opposed to the delicacy of the Virgin mother and the Magdalen, show her capable of enduring the most exquisite tortures of martyrdom. The figure of St. Peter assists wonderfully in giving harmony to the picture, to which the sober colour of the dresses of St. Francis and St. Anthony also contributes."

St. Francis, if the recollection of the writer be correct, bears a cross, and is represented as in ecstasy. St. Anthony of Padua has the lily; St. Ambrose is also present.

"But what is most wonderful of all," adds Northcote, "and where the flesh is executed most naturally, is in the figure of St. Sebastian. This figure alone would be sufficient to confute the old calumny of those who, allowing Titian the palm of colouring, deny him that of design."

"Perhaps," he continues, "the remark of some one else would be more reasonable, about his having united saints of different ages and countries, who never met while they lived. But besides that such an anachronism would in part be justified by the will of him for whom the work is done, it is also lessened (?) by the skill of the painter, who makes a glory which collects round him all those who are called to participate in it."

This last proposition is not very clearly argued, but it is rightly felt as regards the master, and that shall suffice us: in a note, Northcote further says, "It is proper to mention that Titian was much pleased with this performance, having written in large letters '*Titianus faciebat.*'" "Of this work," writes the anonymous author, "being of supreme excellence, he was himself quite enamoured, and courted that it should be seen by all the world by means of a print taken of it." P. Gagliemo della Valle, in a note to an edition of Vasari prepared under his inspection at Siena, says, "This stupendous picture, obtained by Clement XV., is to be seen in the pontifical gallery of the Quirinal,† and every one finds in it that beauty with which Titian himself was so enchanted."‡

THE PANORAMA:

WITH MEMOIRS OF ITS INVENTOR, ROBERT BARKER, AND HIS SON, THE LATE HENRY ASTON BARKER.

MANY of our readers will have derived so much pleasure from viewing the panoramas in Leicester Square, that in recording the recent decease of Mr. Henry Aston Barker, the former proprietor and painter of the panoramas, we cannot but think that a brief account of that particular kind of painting, and of the invention of it by the late Mr. Barker's father, with some biographical notices of the inventor and his son, will be generally acceptable. We, therefore, avail ourselves of a memoir of Mr. Barker in the Obituary of the *Gentleman's Magazine* for October last, to which we are able (by favour of the family) to add some interesting particulars from the late Mr. Barker's own memoranda.

Henry Aston Barker was born at Glasgow, in the year 1774: he was a younger son of Mr. Robert Barker, a native of Kells, in the county of Meath, by his wife, a daughter of Dr. Aston, a physician of great eminence in Dublin.

Mr. Robert Barker was the ingenious inventor and original proprietor of the panoramas in Leicester Square, which invention originated in the following manner:—Mr. Barker, who was a man possessing much inventive talent and unwearied perseverance, was a portrait and miniature painter, and had invented a mechanical system of perspective, and taught that art at Edinburgh, where he was resident. He was walking one day with his daughter (the late Mrs. Lightfoot) on the Calton Hill, when observing her father to be very thoughtful, Miss Barker asked him what was the subject of his thoughts. He replied, that he was thinking whether it would not be possible to give the whole view from that hill in one picture. She smiled at an idea so contrary to all the rules of Art; but her father said he thought it was to be accomplished by means of a square frame fixed at one spot on the hill: he would draw the scene presented within that frame, and then, shifting the frame to the left or right, he would draw the adjoining part of the landscape; and so going round the top of the hill, he would obtain the view on all sides: and the several drawings being fixed together, and placed in a circle, the whole view might be seen from the interior of the circle, as from the summit of the hill.

This idea he forthwith put in execution, having no one to assist him but his son Henry Aston, then only about twelve years old. Mr. H. A. Barker says:—"I was set to work to take outlines of the city only, from the top of the Observatory on the Calton Hill. I have no idea now what sort of drawing was made by me,—no doubt it was wretchedly bad,—but it answered my father's pur-

pose; and from the outlines he made a drawing upon paper, pasted on linen, which gave a rather rude representation of 'Auld Reekie.'"

But the greatest difficulty remained. The drawings being made on flat surfaces, when placed together in a circle the horizontal lines appeared curved instead of straight, unless on the exact level of the eye; and to meet this difficulty Mr. Barker had to invent a system of curved lines peculiarly adapted to the concave surface of his picture, which should appear straight when viewed from a platform at a certain level in the centre. This difficulty, with many others of a similar nature, which may more easily be imagined than described, having been surmounted, Mr. Barker "took his picture up to London, where, being introduced to Sir Joshua Reynolds, then President of the Royal Academy, the new invention was exhibited to him, put in a circular form, and shown by candle-light; but whether (says Mr. H. A. Barker) the drawings were so bad, or Sir Joshua did not comprehend my father's idea, he, with great politeness, said the thing would never do, and therefore recommended him to give it up! Here was a disappointment, but my father was too confident of success to be thus dissuaded from following up his plans, and he therefore took out a patent for the invention under the title of '*La nature à coup d'œil.*'"

"To Lord Elcho (son of the Earl of Wemyss)," Mr. Barker continues, "I believe my father was indebted for pecuniary assistance, as well as for introductions to persons of rank in London. Thus was he enabled to follow up and extend his plans for bringing out a view of Edinburgh on a complete circle, for which purpose I was sent again to the Observatory, and began to take outlines of the entire view; of course it was a long time before the painting could be commenced, for I worked slowly. The circle on which my father painted the first view of Edinburgh was twenty-five feet in diameter; canvas, with paper pasted on it, formed the surface, and the picture was painted in water-colours, in the Guard Room of the Palace of Holyrood, and being at last finished, was opened to the public in the Archer's Hall, at Holyrood, from whence it was removed to a lower apartment in the Assembly Rooms, George Street, New Town, and was subsequently exhibited at Glasgow."

So much was thought of the discovery of its being possible to take a view beyond the old rule of forty-five degrees, that Mr. Barker was induced to exhibit his picture in London; and in the month of November, 1788, he quitted Edinburgh, taking with him his son, Henry Aston, and came to London, where, in the spring of 1789, the View of Edinburgh was fitted up in a large room, at No. 28, in the Haymarket, and was opened to the public early in the summer of that year.

Mr. Barker then determined to exhibit a picture of London, for which the drawings were made by Henry Aston Barker, from the top of Albion Mills, near the foot of Blackfriars Bridge, on the Surrey side. The scene on the Thames was the Lord Mayor's procession by water to Westminster on the 9th of November. These drawings were afterwards etched by H. A. Barker, and aqua-tinted by Birnie, and published in six sheets, 22 inches by 17.

This view was more than half a circle. It was painted in distemper, and was exhibited in the spring of 1792, in a rough building at the back of No. 28, on the eastern side of Castle Street, Leicester Square, where Mr. Barker then resided.

"This view was very successful. Even Sir Joshua Reynolds came to see it, and gratified my father much, when, taking him by the hand, he said, 'I find I was in error in supposing your invention could never succeed, for the present exhibition proves it is capable of producing effects, and representing nature in a manner far superior to the limited scale of pictures in general.'"

In the year 1793 Mr. Barker took a lease of a piece of ground in Leicester Place and Cranbourne Street, where he erected the large exhibition-building in which the panoramas have been ever since, and are still, exhibited. The large circle is ninety feet in diameter, and the small upper circle is constructed within it, being supported by the centre column. The entrance to the small circle is over the top of the picture in the large circle. While the building was proceeding in Leicester Square, Mr. Barker and his son, Henry Aston, went to Portsmouth, to take a view of the grand fleet then lying at Spithead. When the walls of the panorama were completed to their full height, and before the roof was put on, they began to paint the picture in a temporary building of wood, in the centre of the circle, so that by the time the building was finished the work was much advanced; and "in May, 1793 (Mr. Barker says), I think it was ready for opening," but it must have been 1794, as the agreement for taking the ground is dated the 16th of September, 1793.

* See "Painting and the Fine Arts," p. 172; this is the reprint of articles written for the "Encyclopedia Britannica," by Haydon—who, with some heresies, mingles valuable truth—and by Hazlitt, whose acquaintance with his subject is by no means so profound.

† See "Galleria de Quadri al Vaticano," p. 41.

* Of the writer so called, and not certainly known by any other name, we shall have more hereafter.

† It has been removed to the gallery of the Vatican, as aforesaid.

‡ Life of Titian, vol. ii. p. 115, *et seq.*

"The king, queen, and princesses, came to see the picture before the public were admitted: Lord Harcourt was the lord-in-waiting. I (Mr. H. A. Barker) exhibited the picture to the royal party, whose easy affability soon removed the alarm I felt in having to attend upon them. The king asked many questions; and when answered, turned round to Lord Harcourt, to whom he gave the answer verbatim, always beginning with 'He says' so-and-so. His majesty had a large gold-headed cane, which he pointed with, and sometimes put into my hand, making me stoop down in a line with it, to be informed of an object so small that I could not otherwise understand him." Queen Charlotte is reported to have said that the sight of this picture made her feel sea-sick.

As a good name was considered essential to the success of the novel experiment on the public taste, Mr. Barker applied to his classical friends, who furnished him with the very expressive and appropriate name of Πανωραμα.

Mr. Barker's panorama was not, however, without rivalry even in its early days; Mr. Robert Ker Porter (afterwards Sir Robert) painted and exhibited at the Lyceum three great historical pictures of the storming of Seringapatam, in 1799, of the siege of Acre, and of the battle of Alexandria, March 21, 1801. The printed descriptions and outline sketches of Seringapatam and Alexandria are now before the writer. These three pictures were three-quarters of the circle. He afterwards exhibited at the same place a great historic and panoramic picture of the battle of Agincourt, which picture he presented to the Corporation of London, and it is still in existence, we can hardly say preserved, at Guildhall.

In the year 1802 Mr. Barker's eldest son, Thomas Edward Barker, who was not an artist, but had been an assistant to his father in the panorama, and Mr. Ramsay Richard Reinagle, afterwards R.A., who had painted at the panorama for Mr. Barker, entered into a partnership, and erected a rival panorama-building in the Strand.

In Knight's "London," vol. vi. 283, it is said that the process of painting the panoramas is distemper, but that is an error, except as to the original picture of Edinburgh and that of London: the panoramas are oil-paintings, and the canvas was used for several pictures, one being painted over the other as long as it would last, except some of the pictures of the small circle, which, after having been exhibited in London, were sold for exhibition in the provinces. The panorama of Athens (1822) was sent to Harford College, Connecticut, N.A., where it may yet be in existence.

After much patient energy and perseverance, Mr. Barker, ably assisted by his son, Henry Aston, succeeded in establishing the panorama in the favour of the public; and at his death, which happened on the 8th of April, 1806, at his house in West Square, Southwark, at the age of sixty-seven,* he left a comfortable provision for his widow and family.

There are two portraits of Robert Barker: one engraved in 1802, by J. Singleton, after a picture by G. Ralph, Svo.; and another engraved by Flight, from a picture by Allingham, folio. A memoir of Robert Barker will be found in the "Biographical Examiner," by Theophilus Quin, 1814.

The house in which Henry Aston Barker resided with his father, in Castle Street, Leicester Square, was nearly opposite the house of the celebrated anatomist, John Hunter, whose habit of early rising was an object of observation and emulation to Henry Barker; but rise as early as he would, there was John Hunter poring over his anatomical preparations. At that time, several other subsequently distinguished persons resided in the same street; and in the immediate vicinity lived Anna Maria and Jane Porter: to the latter Henry formed a boyish attachment, and was frequently seen escorting her to the parks, &c., where she, being then very handsome, attracted great attention, which induced Henry Barker to resign the fair one to the more dashing pretensions of a certain captain in the Guards.

Soon after coming to London, Henry Barker became a pupil at the Royal Academy, where, among his fellow-pupils and intimate associates, were John Wm. M. Turner (afterwards), R.A., and Robert Ker Porter, the cousin of his fair friends Anna Maria and Jane: the three were great companions and confederates in boyish mischief.

Henry Barker continued to be the chief assistant of his father in the panoramas until the death of the latter in 1806, when, being his father's executor, he took the panorama into his own hands, and, by his eminent artistic taste and skill in his particular branch of Art—by his energy, perseverance, and good judgment in selecting and placing before the public what was agreeable to them,—he succeeded

not only in paying off some incumbrances which had been left by his father, but in realising the handsome provision made by his father's will for his mother and sisters, and making a moderate and well-merited provision for himself and his own family.

Mr. Barker frequently travelled, to take his own drawings for his pictures, which were always remarkable for faithfulness and truth. His first journey was in 1799, to Turkey, to make drawings for the Panorama of Constantinople. We resume Mr. Barker's memoranda:—"On the 26th of August, 1799, I quitted home for Portsmouth, to join the vessel then lying off the Motherbank, that was to carry me to Palermo. December 6th I entered the harbour of Palermo. The next day, I went with our captain to call upon Sir William Hamilton, the English Ambassador at the Court of Naples. Sir William was not at home when we called; however, we saw Lady Hamilton, who kindly invited me to dine with them that evening. I cannot forget her appearance in the evening—her fine commanding form, dressed in a kind of robe, trimmed with roses from her neck to her feet—her beautiful countenance, with lovely dark eyes. I was introduced by Sir William Hamilton to Lord Nelson, who took me by the hand, saying he was indebted to me for keeping up the fame of his victory in the battle of the Nile for a year longer than it would have lasted in the public estimation. At the dinner, Lady Hamilton placed me on her left, while Lord Nelson sat on her right hand, and she cut his meat for him." During his stay at Constantinople, Mr. Barker had the opportunity of saving from destruction part of a portfolio of beautiful drawings by Tweddell, the traveller, which had been recovered from the wreck, and had lain rotting in the wet: this he did for Lord Elgin, who was very kind and attentive to him during his stay at Constantinople.

The Panorama of Constantinople was exhibited in 1802. A picture from the same drawings was exhibited by Mr. Burford in 1829. These drawings were engraved and published in four plates.

In 1801 Henry Aston Barker went to Copenhagen, to obtain a view and particulars of the battle. There he was kindly received and treated by Lord Nelson.

In May 1802, during the peace of Amiens, he went to Paris, and drew a panorama of it. He was on that occasion introduced to, and noticed by, Napoleon, then Premier Consul, by whom he was addressed as Citizen Barker.

The naval victories at the end of the last and the commencement of this century afforded admirable and most popular subjects for the panorama; and Henry Aston Barker's knowledge of nautical matters, and accurate representation of shipping, &c., made him a great favourite with Lord Nelson. The Peninsular campaign also furnished admirable subjects for pictures of the battles of Badajos, Vittoria, and others, of which Mr. Barker presented such able and spirit-stirring representations to the British public.

The drawings for these pictures were made chiefly, if not entirely, by Mr. Burford; but Mr. H. A. Barker went to Malta, where he made drawings of that port, exhibited in 1810 and 1812; of the latter of which the writer has a vivid recollection, being the first panorama he ever saw.

An incident is related of a Newfoundland dog, which being brought to the panorama, was so deceived by the natural appearance of the water in the harbour, that he leaped into the picture, to enjoy a bath in the briny element.

After the abdication of the Emperor Napoleon, Mr. Barker also went to Elba, where he renewed his acquaintance with Napoleon, by whom he was graciously received. And after the battle of Waterloo he visited the field, and went to Paris, where he obtained from the officers at head-quarters every necessary information on the subject of the battle. A set of eight etchings, by Mr. J. Burnett, from Mr. Barker's original sketches of the field of battle, were printed and published. His drawings of Gibraltar were also published in two large sheets.

He went to Venice with Mr. J. Burford, to take views for a panorama which was exhibited in 1819. His last grand panorama was the coronation procession of George the Fourth, exhibited in 1822. The panorama of Waterloo was very successful. It had been painted on an older picture, but was not painted out, being laid by and re-exhibited some years later.

The rival panorama in the Strand was purchased, in 1816, by Mr. Henry Barker and the late Mr. John Burford, who paid a considerable sum to Mr. Reinagle, and secured an annuity to Mr. T. E. Barker and his wife for their lives, as the price of their interests in the Strand panorama, which Mr. Barker and Mr. John Burford then kept open in partnership, Mr. Barker retaining to himself the

panorama in Leicester Square. But the panorama of Waterloo had fortunately been so successful as to give Mr. Barker the opportunity, which he then required, of retiring from the labours and anxieties ever attendant on exertions to please the public; and in, or previous to 1826, he transferred the management of both panoramas to Messrs. John and Robert Burford, who had been the able and much esteemed assistants of himself and his father for many years.

Mr. John Burford dying however, in 1827, was succeeded by his brother, Mr. Robert Burford, the present able and indefatigable proprietor of the panorama in Leicester Square, which still continues its interest and attraction for the public, although the rival exhibitions of the Colosseum and the Diorama, in the Regent's Park, have not been able to hold their ground.

In 1802 Mr. Barker married Harriet Maria, the eldest of the six daughters of Rear-admiral William Bligh, commander of the *Bounty* at the time of the celebrated mutiny during a voyage to transplant the bread-fruit from the Society Islands to the West Indies, and subsequently Governor of New South Wales. By that charming and most amiable lady Mr. Barker has left two sons and two daughters: his eldest son, the Rev. Henry Barker, is vicar of Weare, Somersetshire, to which church Mr. H. A. Barker presented an organ on his son's institution; his second son, William Bligh Barker, was brought up to the medical profession, but preferred the Arts; his eldest daughter, Elizabeth, was the wife, now widow, of the late William Glenie, Esq., R.N., and civil-engineer, who died a few months since; and his youngest daughter, Mary, is wife of North Pritchard, Esq., of Willsbridge.

When all Britain was filled with military enthusiasm, Mr. Barker enrolled himself as a defender of his country from foreign invasion, and he bore a lieutenant's commission in the Princess Charlotte's regiment of Loyal Southwark Volunteers.

While carrying on the panorama, he lived at a house in West Square, St. George's, Southwark, next door to that in which his father had lived, and which was still inhabited by his widowed mother, behind which was his painting-room; and he built a home for himself in Lordship Lane, Dulwich; but, on giving up the panoramas to Messrs. Burford, he went to reside at Cheam, Surrey, and afterwards removed to Park Street, Bristol, from thence to Willsbridge, and lastly to Bitton, both near Bristol.

Mrs. Barker died on the 26th of February last, and was soon followed by her husband, who died at his house at Bitton, on the 19th of July, at the age of eighty-two: they were both buried at Bitton.

The distinguishing characteristics of Mr. Henry Aston Barker were firmness, neatness, and precision in whatever he did. In his works, in his writing, in his conversation, and in his dress, those characteristics were remarkable. His pictures, although on so large a scale, were highly finished; he bestowed perhaps too minute pains on them; but hence the almost magical appearance of reality which they possessed. He seemed to be imbued with a determination that whatever he did should be done as well as he could do it; and consequently he never did anything in a hurry or carelessly. His letters are very indicative of this, being examples of neatness of writing and expression; and he always wrote his signature at full length, in a large, upright, square hand. His manners and bearing were those of a polished gentleman, and his conversation was full of liveliness and anecdote, and was most particularly interesting from the observations he had made, the countries he had visited, and the people he had known.

The following is a chronological list of most of the panoramas painted and exhibited by Mr. Robert Barker, and his son, Henry Aston Barker:—

Edinburgh, exhibited at Edinburgh and Glasgow, 1788, in the Haymarket, London, 1789; London, at 28, Castle Street, Leicester Square, 1792; Spithead, at Leicester Square (where all subsequent panoramas were exhibited), 1794; Lord Howe's Victory, 1794; Bath, 1795; Windsor, 1798; Bridport's Victory; Margate, 1798; Plymouth; Cornwall's Retreat; Dover; Battle of the Nile, 1799; Ramsgate, 1800; Constantinople, 1801; Copenhagen, 1802; Paris, 1803; Gibraltar, 1804; Trafalgar, 1806; Edinburgh, 1806; Bay of Dublin, 1807; Weymouth, 1807; Grand Cairo; Flushing, 1810; Brighton; Malta, 1810; Messina, 1811; Lisbon, 1812; Harbour of Malta, 1812; Badajos, 1813; Vittoria, 1814; Elba, 1815; Battle of Paris, 1815; Waterloo, 1816; St. Petersburg, 1817; Algiers, 1818; Spitzbergen, 1819; Lausanne, 1819; Naple, 1820; Berne, 1821; Corfu, 1822; Athens, 1822; Coronation of King George IV., 1822.

Each of the large circle pictures averaged 10,000 square feet of canvas; the small circle, 2700 feet.

* See Gent. Mag. vol. lxxvi. p. 389.

THE EARLY FLEMISH PAINTERS.*

No school of Art has ever attained to such a degree of excellence as the early Flemish school, and yet remained in obscurity. The fame of the Renaissance turned all eyes to Italy, and her *prestige* in Art eclipsed for centuries the rising claims of the schools of all other nations. Lightly, however, as the southern schools may have esteemed that of Flanders, Vasari does ample justice to the success of the northern painters. When we think of the early Flemish school, we think only of the Van Eycks; to us they constitute the early school. But they were preceded by one or two others worthy of mention. These were attached to the court of Philip the Hardy, Duke of Burgundy, being entertained as "*pointres et varlets-de-chambre*." It is of little interest to inquire relative to their duties in the latter department of their twofold capacity; but we learn that as "*pointres*," their duties were multifarious—such as designing and ornamenting banners and pennons, and painting heraldic equipments; but the works which assign them places among the painters of their school are their efforts in religious Art, of which some altar-pieces survive. The names of the "varlet"-painters that have come down to us are Jean Malouel, Melchior Broederlain, and Jean de Hassett. Of the works of the first and last little remains to testify of their quality; but in the Museum of Dijon there is a remarkable production by Broederlain, consisting of several compartments, in which are represented the Annunciation, the Visitation, the Presentation, and the Flight into Egypt. The book before us contains an outline engraving of this work, which is characterised by the executive infirmities of its time—the last years of the fourteenth century. The artists and varlets above-mentioned, with a few others of minor note, were the predecessors of the Van Eycks.

The Van Eyck family had its origin in the Duchy of Limburg, on the banks of the Meuse; but such was the obscurity of the family, that there exists no record of it before it became famous by the works of the brothers Hubert and John. By some writers it is supposed that a certain Joes Van Eyck, a member of the Guild of Painters of Ghent, was the father of the Van Eycks. Very little of the life of Hubert van Eyck, is known previously to his admission to the Guild of Painters of Ghent; but subsequently to that it is ascertained that he painted more than one picture in *tempera*, and perfected the education of his brother John; and the discovery attributed to the latter was effected, according to Vasari and Van Mander, in 1410, when John was yet in his youth, and Hubert was in the vigour of manhood. In the respective associations and manner of life of the brothers there was a remarkable difference. Hubert was independent of courtly patronage—there is no mention of his having been numbered among the varlets of any reigning seigneur; while, on the contrary, John was the creature of courtly favour. The value of the discovery of oil-painting seems to have been at once understood by the good Flemish burghers, and they seem also to have comprehended with equal readiness the injury accruing to simple oil and colour by the introduction of experimental media. They in their days, as we in ours, had seen works of Art ruined by ignorance and caprice. Reynolds exhausted the possible and impossible arcana of vehicles; and the results are open to us—the surfaces of some of his best works are in rags. Of this fact, "Mrs. Siddons as the Tragic Muse" is a sad evidence; but yet, even of late years, the search for the lost medium of the old masters has been again revived, but only again to subside in disappointment. We discover only too late the value of simplicity in all things. Reynolds was bewildered by belief in some enchanted compound, as were also his followers: this was his and their weakness. Only nine years after the discovery of oil as a vehicle for colour, the sagacious burghers of Ghent, in contracting for the execution of certain works of Art, prohibited the use of anything but oil. "Wilhelm Van Axpoile," says the text of the book under notice, "and John Martiens, licensed painters (*vrie schilders*) were employed, in 1419, 'to paint in good

oil-colours, unmix'd with any corrosive substance,' several important pieces for the Town-hall; John Van Coudenburg and Mare Van Gestele to adorn, in 1430, the church of Rosede with four great prophets 'à vie,' with 'The Death of our Lady,' 'Our Saviour in the Sun's Rays,' 'The Last Judgment,' and 'The Baptism of Christ,' all which aforesaid pictures the said John and Mare were bound to finish for eleven livres." It may be assumed that in those days painters had been endeavouring to improve upon oil as a vehicle, and had failed; hence the terms of the contract. If these works still exist, their condition would at once be an evidence for or against the simple medium. To Hubert Van Eyck was confided by Jodocus Vydt, a wealthy citizen of Ghent, the execution of an altar-piece for a chapel founded by him for the reception of the mortal remains of himself and family. When Hubert received the commission for this really great work, he was formally admitted to the honours and the privileges of the fraternity of the Guild of Painters. Hubert, however, died before he completed this work: the upper portion only is by him, the rest having been painted by his brother John. He died at Ghent in 1426, and was buried in a crypt of the chapel, we believe, which he was decorating. The epitaph inscribed upon his tomb is remarkable, it runs thus:—"Take warning by me ye who walk over me; I was as you are, but am now buried dead beneath you. Thus it appears that neither Art nor medicine availed me. Art, honour, wisdom, power, allucene, are spared not when death arrives. I was called Hubert Van Eyck. I am now food for worms. Formerly known and highly honoured in painting, all this was shortly after turned to nothing. It was in the year of our Lord one thousand four hundred and twenty-six, on the 18th day of September, that I rendered up my soul to God in suffering. Pray God for me, ye who love Art, that I may attain to his sight. Flee sin; turn to the best (objects), for you must follow me at last." As a memorial of the living man, the right arm with which he had so successfully employed the brush, having been severed from the body, was suspended in a casket above the portal of St. Bavon, where it still remained in the sixteenth century. It is supposed that John Van Eyck was born between the years 1382 and 1386, at Maaseyck, where his brother Hubert was his instructor, from whom also he acquired a knowledge of drawing, painting, and chemistry. In considering the probabilities in relation with the means employed by the Van Eycks, Vasari theorises at some length on the probable causes of their successes, but especially in reference to John Van Eyck, who is considered the greater genius. But to quote again from the book before us—how far was John Van Eyck the discoverer of these improvements, and what share had Hubert in them? The desiderated means of producing pictures in such materials as should withstand the changes of such a climate as that of the Netherlands, was probably an early subject of study with Hubert Van Eyck. The question was agitated in Germany and Flanders long before it became a matter of interest in Italy. This can be readily understood, from the perfect preservation of very early works of Art in Italy. It would appear that those writers who assign to John Van Eyck the employment of oil as a medium in Fine Art, have formed their conclusions on unsatisfactory evidence, for assuming the earliest employment of oil in Fine Art to have taken place in 1410, we find at this time Hubert Van Eyck with an established reputation as a painter, while John, not more than nineteen years of age, and perhaps only fifteen, must have yet been a pupil of his brother. It was not until 1420 that fame connected John Van Eyck with the discovery of oil painting: it was in that year, and not before, that he was present at an assemblage of painters at Antwerp, where he exhibited, in triumph, a picture of the Saviour, on the colour and character of which were pronounced the most lavish encomiums. It is probable that ten years had sufficed for a perfect knowledge of the new method of working, and that as his brother's practice was known to him, the honours of the discovery were awarded to him. In the works of the elder brother his superiority is manifest, and it was not until the decease of Hubert that John was regarded as the most eminent of his craft. This was the conviction of John himself, as

is evidenced by an inscription on "The Mystic Lamb," the work commenced at Ghent by Hubert, and finished by him. The work respectively of the brothers presents a contrast unfavourable to the younger. "The Mystic Lamb" was completed in 1432, six years after the death of Hubert: it was finished at Bruges, and as the panels were perfected they were sent, it may be supposed, to Ghent. The panels of this work are now separated, some are yet at Ghent, the rest at Berlin. It is to be regretted that the results of study so profitable, and the fruits of a mind so noble as that of Hubert Van Eyck, should be so inconsiderable—"The Mystic Lamb" being the only remnant of his work. In its finished form this altar-piece merited the great and lasting admiration which it excited; it formed not only in itself a splendid harmony, but having been executed for the place in which it stood, it harmonised with all around it. Chapels and churches were then furnished very differently from what they are now or were some time earlier. The walls were covered with tapestries and stuffs, and enriched with votive pictures and costly offerings to the patron saints. Philip the Good, Duke of Burgundy, was the friend of John Van Eyck, who was treated with the highest consideration by the duke, inasmuch that he served him not only as his principal painter, but also in the capacity of ambassador on missions of confidence and importance. His death took place at Bruges in 1440—41. The powers of the elder Van Eyck are thus very fittingly described in the book before us:—"Hubert Van Eyck was sacrificed for centuries to the fame which John Van Eyck succeeded in engrossing by final improvements in the oil medium and varishes. No neglect was more unjust than this, for Hubert transcended in genius John Van Eyck, and every other painter of the Netherlands. His grand characteristic, as chief of the Flemish school, was serenity and nobleness of expression: his great quality was colour, but he failed in idealism. The gravity and pensiveness which marked his sauits, were not in every instance coupled with a sentiment of holiness and that elevated type which Scripture would impress; and though he never proved himself a trivial or a vulgar painter, his mind was not above some weakening conceits. Had he possessed the entire gift of simplicity, he would not have laden the broad and sweeping folds of his drapery with the superfluous ornaments which profusely cover them: with these exceptions nothing is wanting in the pictures of Hubert Van Eyck. Few men of his time in Italy, none in the Netherlands, have proved themselves as perfect as he was in anatomy and in the perspective of the human frame; but that in which he excelled was, as has been already said, colour."

The book contains a curious history of "The Mystic Lamb," with some account of the influence exercised by the work upon contemporary schools. The pictures which are attributed to Hubert Van Eyck neither support that attribution by any approach to the quality of the panels of "The Mystic Lamb," which were finished by him, nor can they be traced to his hand by any pedigree of proprietorship. It is probable that any works executed by him may have been destroyed by the iconoclasts of 1566, or in those military forays to which the cities of the Netherlands were so long exposed.

The works of John have survived the calamities which have, from time to time, devastated the Low Countries. It is remarked that the quality of his work declines in proportion to the remoteness of its date from the lifetime of his brother—an evidence strongly in favour of the superior intellect and power of Hubert. The picture in our National Gallery, absurdly called "A New Married Couple," we have long regarded as presenting portraits of John Van Eyck and his wife, notwithstanding the professed dissimilarity of the features from those of the portrait in that portion of the Ghent picture which is at Berlin.

The successors of the Van Eycks were Cristus, Van der Meire, Van der Goes, Justus of Ghent, Roger Van der Weyden, Antouella da Messina, Hans Memling, &c.; but the Van Eycks and their works are of paramount importance, and we feel that as we might have justly extended our notice of them far beyond the limits we assign it, we could in nowise do justice to painters whose names are more or less illustrious in the annals of Art by a simple record of dates and titles.

THE BOOK OF THE THAMES,

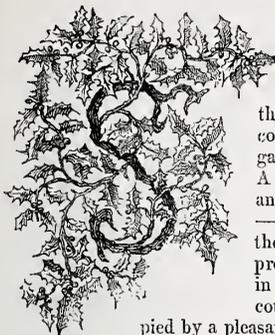

FROM ITS RISE TO ITS FALL.

BY MR. AND MRS. S. C. HALL.

PART II.

SOON after we leave the valley in which the Thames is born, and where its infant wanderings are but promises of strength, the river becomes well defined, and of no inconsiderable breadth and depth; its waters have gathered force, and are turned to profitable uses. A mile or so of pleasant walk along its banks, and we reach THE FIRST MILL ON THE THAMES—the earliest effort to render it subservient to the wants of man, ministering to industry and producing wealth. The mill is sufficiently rude in character to be picturesque: it is in an open court, fronted by an old pigeon-house, and occu-

piated by a pleasant and kindly miller, who reasonably complains that the engine of the canal frequently leaves him without water to move his wheel. He was, however, busy during our visit, and seemed well pleased to aid the artist in his efforts, apparently much interested in the progress of his work.

THE FIRST MILL.

While the artist was thus employed, we had leisure to rove about the adjacent meadows, and to examine the numerous wild flowers and water plants

THE COMFREY.

which, in this vicinity, assume forms more than usually large. Among the most prominent was the Comfrey (*Symphytum officinale*), which appears in great abundance on the river-bank, rearing its bold form above the lowlier herbage. When in blossom—every branch decorated with clusters of pendant bell-shaped flowers, varying in every shade of colour from white to deep purple—the comfrey is one of the most ornamental among the many floral beauties that grace the water-side, and it once held a high place in the herbal of our forefathers for its great healing virtues: but its reputation for these qualities, whether deserved or not, has passed away, in common with that of most of our native medicinal herbs, to make way for the drugs of foreign lands, which, if sometimes less efficacious, are at least more novel and costly.

Hence a turn in the road (or through a pleasant meadow, if we prefer to cross it) leads to the village of SOMERFORD KEYNES, with its beautiful and graceful little church. It is covered with flowers—roses and honeysuckle intertwined with green ivy—from the base to the roof; and is lovingly cared for by its present incumbent; it is a model of cheerful aspect and simple beauty. It consists only of a nave and chancel, with a small side chapel. There is a small piscina by the altar; but the most curious features within are the fragments of paintings that once decorated its walls, and portray legendary histories of the Romish church. Thus, opposite the door is a gigantic figure of St. Christopher bearing the Saviour across an arm of the sea, his passage being assisted by the lantern held by a monk. So great a value was attached to the intercession of this saint in former times, that it was believed no peril could happen to him who during the day had offered a prayer before his image. Erasmus alludes to this superstition in his "Praise of Folly."*

THE CHURCH, SOMERFORD KEYNES.

From the church we traverse the river-bank; again through meadows, until we arrive at a graceful gravel walk overarched by trees, in the grounds of the ancient manor-house; and soon we reach the village of ASHETON KEYNES: the river here obtains a picturesque character by being arched over in numerous instances, forming footways to the various pretty cottages that skirt its bank. The church is old, but by no means picturesque—the interior being thoroughly modernised, and thus forming a contrast to the Church of Somerford Keynes. There are in this village the sockets of three ancient crosses.

Thence our path lay to WATERHAY BRIDGE, and then across several sloping fields laden with corn, from the elevations of which, above the river, are obtained many fine views:—and so we enter the ancient market town of CRICKLADE, in Wiltshire. It presents no feature of interest, except that at the bridge—a new bridge, outside the town—the rivers Churn and Rey† meet, and mingle their waters with the Thames. Its church-tower is, however, a "landmark" for many miles round. It was a famous town in old times, and is said to have been inhabited by learned monks, from whom it derived its name of *Creeklade*, corrupted into *Cricklade*—another fanciful invention of the poets; and Drayton, following ancient historians, makes this town the predecessor of Oxford, where—

"To Great Britain first the sacred Muses sung."

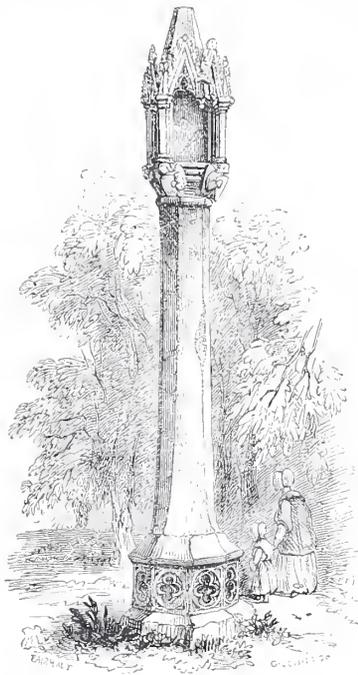

Its name is probably derived from the British *cerigwald*, a stony country; it has two churches, dedicated to St. Sampson and St. Mary; neither, however, advance any pretensions to architectural grace or beauty. The two crosses still preserved in Cricklade are unusually fine specimens of those sacred mementoes in England. That in our first engraving now stands beside an avenue of trees in the church-yard of St. Sampson's, but it formerly stood

* His legendary history declares him to have been a pagan giant of evil propensities, who used to destroy travellers by pretending to carry them across a river; but the Saviour appearing to him as a little child, miraculously surprised him by the almost immovable weight he was upon his shoulder. Christopher, astonished, inquired of him the reason, and was answered, "You bear now the whole world, and also its Creator." With much difficulty and fear he crossed the water; and, being christianised, performed as many good deeds as he had previously done evil. Our little engraving displays the ordinary manner in which this very popular saint was represented by mediæval artists, who in all instances worked to conventional rule; hence in England or upon the Continent there is a complete similarity of treatment for this saintly legend; in the same way the Greek Church at the present day preserves in its pictures the conventional forms of the tenth century unaltered. We constantly find traces of similar representations of the saint in old English churches; but in continental ones they abound: nor is it unusual to encounter gigantic statues of him at the gates of cities (as at Treves, on the Moselle), as if to cheer the parting traveller, or welcome him home on his return.

† The river Rey is of small account, although of some importance as one of the earliest tributaries of the Thames: it rises below Swindon, in Wilts. The Churn, however, demands especial notice, inasmuch as it advances claims to the honour of being the source, and not a tributary, of the great river. It has its rise at "Seven Springs," about three miles south of Cheltenham, and its course is above twenty miles before it loses itself in the Thames—"Thames Head" being not more than ten miles from the junction of the two waters. The Churn has changed its name but little—it is the *Chayrn* of the British, signifying rapid. Drayton calls it "the nimble-footed:" it passes through the villages of Cowley, Colesbourne, North Cerney, and Baunton; then waters Cirencester, passes through Siddington and South Cerney, and so joins the Thames at Cricklade.

in the High Street of the little town. The finial has been broken, and the figures which once occupied the canopied niches have disappeared. Our second engraving exhibits the more perfect cross in St. Mary's church-yard, nearer the Thames. This remarkably graceful example has figures of saints in the niches, as well as a representation of the Crucifixion. Both appear to be works of the fourteenth century—a period when religious foundations flourished. It was at this time the custom in England (as it still is upon the Continent) to erect these sacred emblems not only near churches and in cemeteries, but by the road-side, to aid the devotions of the traveller,

CROSS AT CRICKLADE.

or ask his prayers for some other wayfarer who may have met death by accident or violence. They were also occasionally used to mark great events; such were the crosses erected to commemorate the places where the body of Queen Eleanor rested; or to signify where important battles had been fought. The town of Cricklade is about ten miles from the source of the Thames. "Thames Head," though in the county of Gloucester, is so near to its southern border that the river, after meandering a mile or two, enters Wiltshire—the village of Kemble being in that county: and it is in Wiltshire the great river first assumes the character of a perennial stream—for the meadows between that village and the source, are, as we have intimated, usually dry during the summer months; soon, however, the river re-enters its native county, which it continues to fertilise during many an after mile of busy toil and tranquil beauty.

Having rested awhile at Cricklade, we pursue the river on its course, and arrive at EISEY BRIDGE. At this bridge the traveller will pause awhile to examine the church, which, standing on a gentle acclivity, overlooks the stream, that here assumes a bolder aspect, and is navigable at all seasons for boats of small draught. A mile or two farther along its banks, and we reach CASTLE EATON—a village now, but once a place of size and strength: "the grete ruines of the Lord Zouche's castle" exist no more; but, here and there, some venerable walls bear records of "hoar antiquitie." A school, so aged as to have been the seat of learning of the great-grand-fathers of the urchins we found within; and a church, very old and very curious; with a pretty bridge, more than sufficient for its traffic—these are the only points that demand notice in this secluded and most pleasantly situated spot, where the "busy hum" is rarely heard.

The church is picturesque, but exceedingly simple in plan, consisting merely of a nave and chancel; the chancel arch is early English; but the general structure and the principal doors are Norman. The walls have recently been denuded of a thick coat of whitewash, and many of the ancient paintings that once covered them are again brought to light. They appear to be works of the fourteenth century, and to illustrate scripture history or saintly legends. The font is early English, with a simple wreath of foliage boldly carved around the basin, which is supported on a central pillar of carved stone. The church has boasted a fine cross at one period, but only the stone grooves now remain. Upon one of the bells is inscribed, "God prosper this place." The bell-turret is the most remarkable feature of the exterior; it stands upon the junction of the roofs of nave and chancel, and is entirely constructed of thick slabs of stone, the bell swinging on a massive beam within.

Our readers will have perceived that while we conduct them on their voyage down the Thames, we desire to "gossip" with them now and then, believing that "matters of fact" are rendered more impressive by indulgence in those "fancies" which are suggested by scenes and incidents described. Our visit to the school

at Castle Eaton naturally suggested a comparison between the venerable adjunct of the village in old times, and that by which it is now-a-days usually "adorned."

There are few things so changed in character throughout England, both internally and externally, as its village schools, which, in days not long gone by, were nearest in picturesque effect to the village church—simple, contemplative dwellings, covered with climbers, coroneted with flowers, a many-paned window at either side of the door, which was shaded by a covered porch, sometimes solid and thatched, or else open and matted with woodbine—this terminated the path whose line was carefully marked out, and guarded by a border of thrift or a box edging; while within the sanctuary flourished all kinds of "poseys"—wall-flowers, and stocks, and sweet-williams, and riband-grass, a white rose, and a red rose-bush; and, mayhap, a flaunting York-and-Lancaster, or tower of white lilies—the gift of sweet "Miss Mary," who married, and had children five, and now is in the church-yard underneath a marble tomb; "herb rosemary" grew there, and woody lavender, and lavender cotton—

"The tufted basil, pun-provoking thyme,
Fresh balm, and marigold of cheerful hue,"

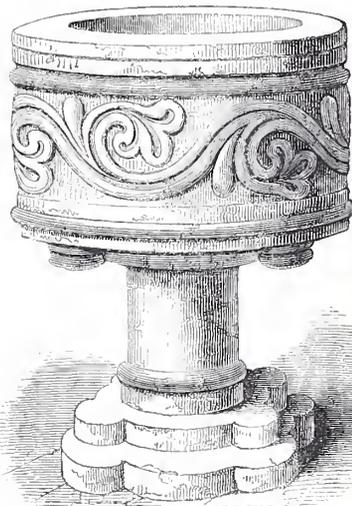

and streaky pinks, and rich crimson cloves, and sage (a leaf in tea to make it wholesome), and feathery fennel, and such hot turnip-radishes, and little onions, whose silver bulbs disdained the earth, and shot their waving green and narrow leaves above their heads; the row of double parsley was a green banquet to the eye:—all was in harmony with the sweet low-roofed house,

from which came the hum of young voices, sometimes low and sweet, sometimes shrill and troubled. The low palings, which divided the garden from the road, were green from age, and had, as it were, taken root and grown their own way, some remaining upright in their rectitude of purpose, others, like weak-minded persons, leaning to the right or left, and having no will of their own. Often a blackbird or a thrush hung in a wicker cage beneath the porch; an old cat on the window-sill winked at the sunbeams; and beyond, close to the yew hedge, whose centre was clipped into some monstrosity called a "peacock," or "flower-pot," lay a shelf of bee-hives, more than half concealed from public gaze by a row of broad-beans, or blossoming peas, upon which the bees under the straw thatch came to banquet. Now the school-house is generally a new, clean, trim two-storied house, of no particular order of architecture; but upon the external ornamentation of which enough has been spent to clothe, as well as educate, a rising generation. Money, it has been said, is not wealth, neither is size or elaboration beauty—and as yet our national schools look hard and dictatorial. When the softening hand of time passes over those seats of embryo learning—when the bright red brick, or the pure white stone, is toned down by the weather, and ivy and Virginia-creeper clasp the gables, and take off the sharpness of those corners—when, in fact, the new becomes old—the schools of the present time will better harmonise with the character of our beloved English scenery.

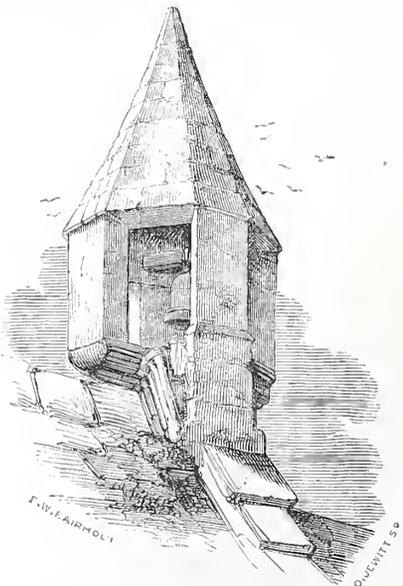

But, if the change is so apparent in the schools, what is it in the teachers? Shenstone has drawn with fidelity the picture of the "dame," in the old times of dames' schools:—

"Her cap, far whiter than the driven snow,
Emblem right meet of decency does yield;
Her apron dyed in grain—as blue, I trow,
As in the harebell that adorns the field;
And in her hand, for sceptre, she does wield
Tway birchen sprays."

She was old, and mild but firm; the nod was her help, the rod was her argu-

FONT AT CASTLE EATON.

BELL TOWER, CASTLE EATON.

ment; the shake was her warning, the foolscap her disgrace; a kind smile or word, accompanied by a gingerbread-nut on rare occasions, her reward. We cannot but wonder how those bright, clever-looking women, sent from normal schools to diffuse education in our country parishes, would look in close mob-caps, "whiter than the driven snow," linsey aprons, and "russet stoles and kirtles!" Alas! for the back-headed bonnets and gay muslin—or *mousseline*—dresses, that sweep the school-room floor, and the air of superiority with which our simple questions, born of domestic wants, are often answered—making us sigh for the days when girls were taught by dames to mend stockings, darn invisibly, sew on buttons to remain on, and piece linen or broadcloth so that the rent became a myth.

Some twenty summers have come and gone since we were much interested by an aged woman, who for many years had kept a dame's school in a quaint little village not a long way from the Thames—indeed, you could see its placid waters from the school-house door, shining and shimmering through the trees. She was called "Dame Madam," or, sometimes, "Madam"—people said that was not her real name, but the "real name" nobody knew. She combined the calling of nurse with that of schoolmistress; but she would only engage to "nurse" at night, as nothing could prevail on her to neglect the charge of "her children." The school outside was like a garland, a tangled mass of clematis and all kinds of climbers; it was built on a knoll facing the south; the ground had never been levelled, so the school-room stood on an inclined plane—the "top" form being considerably elevated over the rest. The Dame said that was an advantage, as, her seat being on high ground, she could at a glance overlook every little urchin, creep he where he would. The children, and, indeed, the villagers, held "Dame Madam" in great respect. There had been a rumour, when she first took the little cottage—consisting of two rooms and a shed—a quarter of a century before our acquaintance with her—that she had been "somebody," who was "whispered about and watched;" but the rumour faded away. She would rise in the night to attend the sick poor—if they could pay her, well, if they could not, that was well also; and the most incorrigible of village children did her bidding without birching. The time of her coming framed so long past that it had become a legend; and although her delicate frame was worn and bent, and the dimples round her sweet placid mouth had grown into wrinkles, no one ever thought of the time of her going was drawing near. She never had much to give, and yet, when in the summer's evening she sat knitting under her great rose-tree, the labourers or wayfarers never passed her door without a greeting or a blessing; she said she liked that seat in the gloaming, when there was no call for her elsewhere, because she could hear the children's voices, as they played and shouted to each other on the green; one would have thought she had had enough of those "sweet voices" during the day; but no, she would listen and exclaim, "There, that's Jimmy Grey; what lungs he has! and that's Peggy Lloyd; how she screams—she will hurt herself by screaming; and that's Bat Thompson's growl—Bat is so like a lion." The cottagers declared that Madam, under the rose-tree, was "quite a picture"—and so she was. Her mob-cap, of spotless white, was tied beneath her chin with a bow of soft white muslin, a white "Rockspun" shawl folded over her bosom, the ends concealed by a white muslin apron; she wore an open dress of brown stuff, and a quilted black petticoat: there was certainly vanity in those neat-fitting Spanish-leather shoes, peeping out daintily on the straw stool. One thing I had nearly forgotten to mention—the dame always wore a green silk over her eyes, like a pent-house; so that, between the shade, and the wide border of her mob-cap, and the great soft bow under her chin, you caught only glimpses of her pale face, except her mouth and the dignified tip of a nose decidedly aquiline; yet nobody ever heard her complain that she was short-sighted. For some time past Dame Madam felt the "shadow of coming events," which is surely the shadow of an angel's wing; she became more silent and thoughtful, and the Bible had almost usurped the place of her knitting; her fame as a nurse continued, and though she was unable to do much, yet the doctor said Dame Madam's head was worth five pair of hands. The first sweet month of summer had passed, the evening of the first of June closed in, and the dame had vacated her seat under the great rose-tree, and gone into the cottage; the birds had ceased to rustle among the leaves—the stars were made visible by increasing darkness—there were bright phosphoric lights glancing over the placid river, giving an almost unearthly interest to the scene; the ray of Dame Madam's candle threw the shadow of stems, and leaves, and tendrils across the path; she heard her little gate "click" and open, and a step struck upon the pavement of "pretty stones," which her scholars had laid down, that their beloved Madam's path might be always dry. She closed her Bible, repeating the last words she had read therein—"Blessed are the merciful, for they shall obtain mercy."

"Dame Madam," said a rough voice at the window, "a gentleman at the inn has taken bad, and missus says please come up, for doctor wants ye."

"Has the gentleman no servant of his own, Giles?"

"Yes, his wife and a black-a-moor; but missus says they be fools—so come up, Madam, you're bad wanted."

The dame tied on her black hood, threw her scarlet cloak around her, and, having extinguished her candle, hastened to the inn. She found the poor lady-wife nearly as ill and worn out as the sick gentleman. She prevailed on her to go to bed, received the doctor's instructions, and took her seat by the bed-side. The patient slept: when he awoke, his voice shook the dame as if she had been galvanised, and when he asked her to move his pillows, he thought she would have fallen on the bed. With trembling hand she gave him his medicine—and then some instinct prompted him to ask her name; and that told,—as it never had before been told in the village,—it became his turn to tremble. Excited beyond all power of self-control, he entreated the wife he had married and abandoned in the days of their youth to have mercy on him; he swore that some years after his desertion he sent from India, and heard she had disappeared, believed her dead, and again married. The dame heard him with seeming calmness; she had recovered her composure; she knew his excuses were untrue, but still her heart yearned to the white-headed, attenuated old

man who had been the love of her youth. "He would make her rich," he continued, "give her gold"—anything so she would keep silence, and not destroy the mother of his children, and brand his sons with the name that blanches the cheek of honourable manhood. He would have crawled from the bed to her feet for pardon and mercy if he could. All this time she spoke not.

"If their child lived he would provide for it."

Then her mother's indignation burst forth—if her child *had* lived, she would have broken her vow of secrecy, and spoken out her honour to the world. No; her child watched for her in heaven!

The excitement and alarm was more than he could bear; he lay back gasping on his pillows, face to face with the woman whose peace and happiness he had destroyed; his hands clasped in supplication; every limb quivering with strong emotion. The Dame withdrew from beneath the folds of her handkerchief—where they had been concealed day and night during years of anguish—the certificate of her marriage, and sundry letters, yellow from age, and spotted with tears; one by one she opened them, and held them with her small transparent fingers before his bloodshot eyes—well he knew them,—and from his parched lips came the prayer, "Mercy, mercy! for HER and our children!" but he did not dare again to offer her gold. One by one she held those evidences of his dishonour and of her honour—those treasures of her life—over the candle, and saw them flutter and fall, in dark transparent flakes, upon the snowy sheets. She then drew out a ribbon, which passed round her neck and through a wedding-ring; she tried to break it—it would not yield. The man's heart was touched—"Noble, generous woman!" he faltered forth, and tears, hot scalding tears of remorse, if not of penitence, came from his eyes: "Not that—it is enough! Not that!" She fell on her knees by his bed-side, and her cheek, if not her lips, were pressed upon those yellow hands! There were no more words spoken between them; and when in the grey light of morning the lady, enveloped in her cashmere dressing-gown, stole gently into the room, she thought her husband's fever increased, and the old nurse, looking so ill, that she pressed a gold coin into her hand, and entreated her, in a soft low voice, to go home and sleep. When she turned from the bed, a ray of early sunshine was sporting with the coin upon the floor; and the nurse was gone. What power sustained her trembling steps until she arrived at her fragrant home, where every leaflet bore the wealth of jewels that Nature pours upon the sleeping earth—who can tell? She never shut the door, but laid her on her bed and died. The "gentleman" recovered, and, much to the amazement of the village, erected a monument to her memory; the text upon it is there still—"Blessed are the merciful, for they shall obtain mercy."

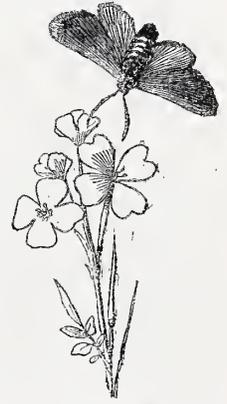

In the meadows that lead by a somewhat steep ascent to Crielklade, our attention was attracted by a number of bright green insects flitting over the long grass: on capturing one, we recognised it as the moth known to entomologists as the Green Forester (*Ino staticea*), by no means a common species in most localities, but here were thousands, either on the wing or at rest among the grass. The prevailing colour of this pretty moth is a very unusual one among the British lepidoptera—the whole surface, except that of the lower wings, being of a lustrous golden green, while the body glitters like a gem. The caterpillar feeds on the cardamine, dock, and some other semi-aquatic plants which everywhere abound in this humid district; we may thus account for the great abundance of the moth in this locality.

The perfect transparency of the water, with its uniform shallowness, gives great facility for studying the zoological, as well as the botanical curiosities of this well-stocked aquarium. Several species of freshwater shells (*Lymneus, planorbis, &c.*) were plying about in great abundance on the sandy bed, or adhering to the herbage that fringed the water-side.

Again the river flows onward—again waters flat, but fertile fields—again affords a rich supply of water-plants, but undergoes no change of character; yielding no food for thought until re-entering Gloucestershire, the county of its birth, it passes under the beautiful church, and washes the foundations of KEMPSFORD—a palace of the Plantagenets long ago: of this there are some interesting remains, but of the dwelling of their Saxon predecessors there exists only a vague tradition, confirmed, however, now and then, by evidence gathered from adjacent earth-mounds.

The manor of Kempsford was the property of the great Harold; the Conqueror gave it to one of his Norman soldiers; it passed from him to the family of Chaworth; and from them, by marriage, to Henry Duke of Lancaster, who, in the year 1355, presented it to "the Church;" at the Dissolution, the crown granted it to the Thynnes, ancestors of the marquises of Bath; by whom it was sold to Lord Coleraine, whose tomb is in the church; by him the ancient mansion, erected by Sir Thomas Thynne in the reign of James I. (a quadrangular structure of large dimensions, of which two engravings exist), was dismantled and sold for the value of the materials, the trees were cut down, and a host of "fair memories" destroyed by the recklessness of one bad man. The place is, notwithstanding, full of rare associations; the foundations of the castle may yet be traced, the battlements being in some places unbroken.

The church is a noble structure, remarkable for the grand windows which light the junction of nave and chancel, and above which rises the tower. It was chiefly erected at the expense of Henry Duke of Lancaster, in the fourteenth century, whose arms, and those of other noble families, are conspicuously displayed amid the spandrels within. There are many fragments of fine painted glass in the windows, one of the most perfect delineating St. Anne teaching the Virgin to read. There is also a characteristic altar-tomb of a priest in the chancel, upon which is sculptured the Rood, and the Virgin in glory; but they have been grievously injured by the hands of iconoclasts. The floor is remarkable for its early English tiles, and the roof for its timber-work. The

THE GREEN FORESTER.

porch is early English, forming a framework for the earlier Norman door within it.

The vicar's garden, adjoining, was originally known as the Provost's Garden (probably the garden of the provost-marshal), and, until the year 1800, the road went to the ford across it. The level field on the opposite side is still known as "the Butts,"* and marks the site of the ground appropriated to the military exercises of the soldiery who once garrisoned the castle. "The Butts" were mounds of earth, marked with a ring like a target, and were used in practising archery. A strong arrow with a broad feather was necessary to be

THE CHURCH AT KEMPSFORD: AND THE GUNNER'S ROOM.

used; such bows and arrows as gave "immortal fame" to the archers of the English army at Crecy and at Poitiers.

Of the castle itself but a few fragmentary walls remain, and a portion of a tower, which is traditionally known as "the Gunner's Room." The windows command the river, and the embrasures defend the castle at an exposed angle, which seems to have received an additional amount of attention from the architect. The walls are very massive, and now afford abundant room for wild plants and bushes, overshadowed by patrician trees; we may almost imagine we are in the gloomy room of him who guarded the approaches in days long past, when security depended more upon stoue walls than on "even-handed justice." A horse-shoe nailed to the church-door continues to sustain the legend that when Henry Duke of Lancaster was quitting it for ever, his steed cast a shoe, which the villagers retained as a memorial, and placed where it is found to-day. However much we may lament over secues of grandeur passed away, it is a rare consolation to see the church, the rectory, the grounds, and the whole neighbourhood kindly thought of, and well cared for, by the incumbent, who preserves what time has left, and restores where restoration is desirable.

A few miles further, but with little to detain the traveller,—unless he linger awhile at Hannington Bridge, and hence obtain a view of the distant church of Highworth,—and we approach LECHLADE; but, within a mile or so of the town, we pause at a place of much interest; for here the Coln contributes its waters to the Thames, and here terminates that gigantic undertaking—the canal which unites the Severn with the Thames, and which, when steam was thought to be a day-dream of insanity, poured the wealth of many rich districts into the channel that carried it through London to the world.

The Coln—a river which the angler loves, for its yield of trout is abundant—rises near Withington, in Gloucestershire, and, passing by Foss Bridge, Bibury, Coln, St. Aldwin, and Fairford—a town rendered famous by the painted windows in its church†—runs its course of twenty-three miles, and finishes by joining the Thames at the place we have pictured, the terminus of the canal being close to "the meeting." The nearest village, that of INGLESHAM, has a very ancient church, small and rude in character, and strangely isolated in

* Butts, or "dead-marks," as they were sometimes called, were embankments of earth

having marks, or "bull's eyes," upon the flat face, for practising soldiers in archery. They were in constant use in the middle ages, and erected near great towns, or where soldiers were stationed—hence the constant occurrence of the term "Butts," appended to names of streets and places near old cities. One of the most ancient pictures of the exercise is copied on a reduced

scale in our woodcut. The original is a drawing in the famous psalt or executed for Sir Geoffrey Loutereil, who died in 1345. It exhibits an archer aiming at the butts, his arrow drawn to the head, several others are stuck in his girdle. His companion points triumphantly to an arrow fixed in the bull's-eye, and awaits the prowess of his companion previous to trying again, for which purpose he already holds his bow and arrow.

† Fairford is but three miles from Lechlade, and will amply repay a visit. The windows are in number twenty-eight, and are said to have been painted from the designs of Albert Durer; they are certainly of his period, and are not unworthy of so illustrious a parentage. They are all allegoric, the more remarkable of them exhibiting the perse-

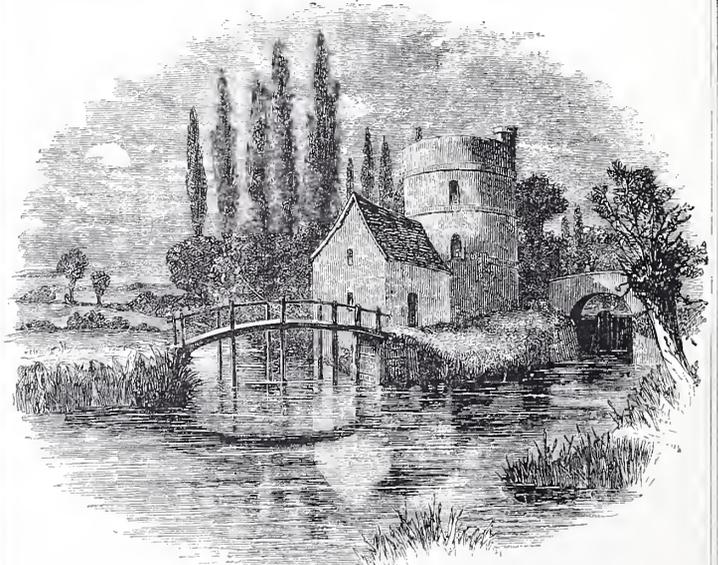

position, being at considerable distance from any cluster of houses. It consists of a simple nave and chancel, a bell-tower crowning the roof, somewhat similar to that we have already pictured at Castle Eaton. Beside the porch there is inserted in the wall the very curious piece of sculpture we here

engrave. It represents the Virgin seated, and holding in her lap the Infant Saviour, who rests his left hand upon a book, while his right is extended, giving the benediction, as still practised in the Latin church. A similar benediction is given by a hand above, which is evidently intended for that of the first person of the Trinity. It is surprising how this sculpture (which may be a work of the thirteenth century, or earlier) has escaped the destruction awarded to so many monuments of early faith; but it is worthy of observation that these old villages on the Thames' banks retain many vestiges of a past age still unmo- lested: thus the steps and shaft of an old stone cross stand close to the porch at Inglesham, and we have already noted several such relics of the Romish faith in the earlier part of our tour.

CARVED STONE AT INGLESHAM.

The Thames and Severn Canal was commenced in 1782, and opened in 1789; but, so far back as the time of Charles II., the scheme of thus uniting the two great rivers of England had been entertained; and Pope mentions that to effect this object was a cherished thought of Lord Bathurst, "when he had finer dreams than ordinary." In 1782 Mr. Robert Whitworth, an eminent engineer, "formed plans and estimates," and, in the following year, an act was passed for carrying them into operation; it was complete within seven years, the first boat passing through on the 19th November, 1789. "This navigable canal [we quote from Boydell] begins at Wallbridge, where the Stroud navigation ends, and proceeds to the immediate vicinity of Lechlade, where it joins the Thames, taking a course of thirty miles seven chains and a half. From Stroud to Sapperton comprehends a length of seven miles and three furlongs, with a rise of two hundred and forty-one feet three inches; from Sapperton to Upper Siddington, including the branch to Cirencester, nine miles eight chains and a half, and is perfectly level; and from Upper Siddington to the Thames near Lechlade, it continues a course of thirteen miles, four furlongs, and nine chains, with a fall of one hundred and thirty feet six inches; the general breadth of the canal is forty-two feet at the top, and thirty feet at the bottom."

JUNCTION OF THE THAMES, THE COLN, AND THE CANAL.

"THE ROUND HOUSE,"—for so the lock-house is named from its form,—the lock, and the two rivers, at their "meeting," are pictured in the appended cut.

cutors of the Church, surmounted by demons; and its upholders and protectors associating with angels. Although some of them are much injured, chiefly by hail-storms, they are for the most part in a good state of preservation. The history of these windows is curious:—a sea-captain, named Ta en, took them on one of his piratical voyages, and, his conscience not permitting their personal appropriation, he built this church for their reception.

BOTANY,

AS ADAPTED TO THE ARTS AND ART-MANUFACTURE.

BY CHRISTOPHER DRESSER,

LECTURER ON ARTISTIC BOTANY IN THE DEPARTMENT OF
SCIENCE AND ART.

PART II.

ADAPTATION TO PURPOSE.

THE first question which presents itself to our minds relative to this important subject is, What are the circumstances in which the various vegetable structures are to be placed?

First, we notice that plants are to be situated on a globe of a certain magnitude, the matter of which is of a given density. Without entering into details relative to this part of our subject, we notice that this consideration is one which must have been of high importance in the original creation of vegetable objects, as adapted to our earth. The conditions which were hereby rendered necessary were, that the various vegetable structures should be of a given strength, and that their weight should not exceed their strength; or rather, that the cohesion of the particles composing the structure should be greater than the attraction of the earth should be able to overcome. Though this consideration may appear trifling, it was one of paramount importance in the adaptation of vegetable products to our globe; for were the magnitude of our earth greater, and the matter composing it of the same density, then our structures would be incapable of supporting themselves,—for the attracting power of the body increases with its magnitude, if the density is not decreased; therefore, what we commonly call the weight of the body, is the degree of influence which the attraction of the earth exerts upon it, and is governed by the magnitude and density of the sphere. Or were our planet to possess the same mass of matter, but be condensed into half its bulk, the attracting power would be greater—as this influence is exerted in an increased ratio as the attracted body approaches the centre of the attracting mass; and consequently the vegetable structures which now grow on our globe would not be adapted to such circumstances. Thus the organisms which are appropriate to our planet, would not be appropriate to certain other planetary worlds. In this point, therefore, we see clearly adaptation to purpose, as we know from daily observation that the strengths of the objects forming the vegetable kingdom of our earth precisely accord with the mass and density of our globe, therefore, with its attracting force.

The next condition of our earth which we shall notice is, that its temperature is not uniform throughout its entire surface, but is variable in various latitudes, and at different altitudes. This necessitates the vegetable products which inhabit it to be variously organised, in order that they may cover the entire globe: some must endure heat to a given intensity, while others shall require a very small amount of this agent. This is also beautifully carried out in the vegetable products of our globe, for some can, and do, endure much heat, while others flourish in the colder zones. Thus the vegetable products of our world are perfectly adapted to this necessity.

Moreover, this sphere is one composed of land and water, and if both are to be the occupants of vegetable life, plants must on this account be diversely formed. Both are to be cheered with vegetable forms, therefore some are adapted to form a mantle for the wide-spread plain, some stud the parched rock, some clothe the woodland's floor, while others are wrapped in the bosom of the ocean; some are to garb the shallow rill, and therefore, after fixing their roots at the bottom, as if to secure themselves as by an anchor, develop their gay foliage, leaf after leaf rising from out the limpid waters; others are to mantle the deeper lake, and are therefore furnished with aerial floats, and thus the little plant, like a tiny bark, undulates on the rocking wave, fearless of the depth of the dark blue waters: thus are plants adapted in this particular, also, to their destined purpose.

Again, the planet which they are to occupy is one which has periodical intervals of light and darkness, and these are variable in most latitudes. That the plants of our globe are so organised as to be

perfectly adapted to this condition is at once obvious. Go forth and wander in your garden, and as night approaches you observe flower after flower closing up its blossoms, plant after plant folding up its leafy arms; yea, Nature is retiring—behold, she sleeps, for—

“Night, sable goddess! from her ebon throne,
In rayless majesty, now stretches forth
Her leaden sceptre.”

But soon the sable goddess Night brings forth a son, a spark of light and joy. He wakes, and, flapping his downy pinions, rises on the wings of the morning, and, smiling on all nature, takes his place on his mother's throne. The birds arise to sing his song of welcome and of praise, all nature wakes; the flowers unfold their arms and raise their drooping heads, for the season of repose is again past; and so beautifully intimate is this relation between the physiological constitution of plants and the seasons of light and darkness, that it is probable, yea, certain, that if these periods were materially altered in duration, that death must ensue to a great portion of the vegetable world. And so precise is the harmony existing between the members of the vegetable world and the constitution of our sphere in this respect, that Linnæus, the immortal Swede, even ventured to propose a *floral clock*, which entirely rests upon this harmony. Thus the Day-lily opens at five in the morning, the common Dandelion at six, the Hawk-weed at seven, and so on; the closing of the blossoms marking corresponding hours in the afternoon. And Mrs. Hemans, in her homely verse, takes up the strain:—

“’Twas a lovely thought to mark the hours,
As they floated in light away,
By the opening and the folding flowers,
That laugh to the summer's day.”

“Thus had each moment its own rich hue,
And its graceful cup or bell,
In whose coloured vase might sleep the dew,
Like a pearl in an ocean shell.”

The earth is also visited by periods of cold and heat, which are variable both in duration and intensity in various climates. To this condition of our sphere the products of the vegetable world are likewise adapted, for not only is nightly rest required by these structures, but a season of continued repose is also demanded, or a period in which a given work shall be completed internally, and the outer and more active life laid aside. This necessity is provided for by the existence of a period of cold, which is to vegetation a time of repose, or a period in which the outer and more active work of the organism is laid aside, and in which an internal work may be accomplished. The intensity of this variation of temperature being variable with climate, certain plants are adapted for given districts which may be exposed to the maximum or minimum of these variations: thus Lichens can flourish near the poles, Exogens in temperate zones (as our common trees), and Eudogeus in the tropics (as palm-trees).

The globe is also furnished with an atmosphere; hence with winds, clouds, rain, and snow. Therefore it follows, that as plants are exposed to winds, they must either be elastic or sufficiently strong to entirely resist its influence; to meet this requirement plants are possessed of elasticity, which is even so obvious in these structures, that elasticity is ascribed to the cell—which is the unit of the vegetable—as one of its particular attributes; therefore as the unit is elastic, the structure, which is a mere aggregation of these units, must be elastic also: but no system of reasoning is required in order to reveal fully this fact. See how the boughs yield to the whistling wind; they are rocked about by the storm, yet are not broken: this, therefore, is conclusive. However, another condition is hereby rendered necessary, namely, that if the vegetable structures are to proceed from the ground, and to occupy a vertical position, they must be in some way united with, or bound to the earth by some secure tie: this is beautifully accomplished in many ways by the various roots which are possessed by those developments which occupy this position. But time would fail us to examine the ways in which this is brought about, for nothing but a due examination of the diverse structures of this organ could fully reveal the manners in which this is accomplished: and as we must hereafter allude to this, we shall pass on,

receiving the fact, taught by daily experience, that plants do rise vertically from the earth to which they are bound by some peculiar means of attachment, and that sufficiently securely to resist (as a rule) the influence of the wind. As clouds are casual, but still natural and frequent phenomena, and intervene between the sun and the earth, and hence exclude the direct solar rays, plants must also be adapted to this contingency,—and so they are in every particular: but it is probable, yea, certain, that clouds play an important part in other atmospheric operations, but for their every phenomena the vegetable race is suitably adapted. But these clouds are also the reservoirs of rain, and from them it is poured forth on nature; therefore are vegetable structures formed of such substances as are insoluble in this medium, and receive no injury from momentary contact with it. The action of snow would be somewhat similar to rain, though of a more chilling character; but so beautifully has nature adapted her vegetable structures to its influence, that they not only sustain no injury from contact with it, but it is to them an ermine dress to protect from the biting frosts of the bitter Boreas. Thus we see that the vegetable products of the earth are beautifully adapted to these varied circumstances.

Vegetables are also required to be produced on a world the surface of which varies geologically, therefore its chemical composition is not the same in every part. To meet this emergency, nature has designed that some should grow on clay, some on chalk, and others on varied soils. Thus one race of plants flourishes on one soil and one on another, and so the whole earth becomes covered with these lovely gems.

The last condition which we shall name under this part of our subject is, that it is a world to which nothing shall be hereafter added. This necessitates one generation to make way for the next; and how beautifully is this carried out in the vegetable world! at a given, though variable period, the life of plants terminates, and as soon as the active principle of vitality deserts the organism, decomposition commences, it is resolved into its elements, which are again to unite, and form the coming generation. Thus there are no after additions required: the circle being once formed is now endless, and will continue to revolve till it is snapped asunder by Him by whom it was formed. Thus beautifully do we see that not only in one particular, but in all, are the members of the vegetable kingdom accurately adjusted and beautifully adapted to the existing conditions of the globe. And not only are plants so formed as not to sustain injury from the varied circumstances in which they are placed, but from nearly, if not quite, all of these varied conditions they reap congenial aid.

We next notice whether the globe on which these structures are to be placed is to be inhabited by animals, and if it is, what are their characters. The sphere which is to be the abode of these various vegetable structures is to be inhabited by an animal race, the members of which are variously organised and differently constituted physiologically; but the only difference which it is necessary for us to notice is that some are wholly herbivorous, some binivorous, while others are carnivorous. The fact that some live wholly, and others partially, on the vegetable products of the world, requires that a certain number of the members of this kingdom should be composed or formed of those materials which should not be poisonous or injurious to those whom they are destined to feed: nor is this all, these edible herbs must also exist in sufficient quantities to supply the demands of the entire race of vegetable eaters. How beautifully is this carried out in the vegetable creation—for not only are numbers of these products not poisonous or injurious, but they are nourishing and invigorating; and, added to this, they are precisely adapted to the taste of the various creatures which they are destined to feed. Also the quantity is in the strictest harmony with the requirements of the herbivorous races, or at any rate there is no lack, but enough and to spare.

Not only are plants called upon to supply a large portion of the animal kingdom with congenial nutriment, but they are also destined to fulfil other conditions. The result of the respiration of animals

is the presence in the atmosphere of a large quantity of carbonic acid gas; now as this gas is poisonous to animals, and its presence in more than a given quantity in the air is detrimental to their well-being, it must be removed. This duty is devolved upon the vegetable race. In order to this, plants have been so organised as to absorb this fluid greedily; and it even forms a part of their food. Also, the principle of animal life contained in the atmosphere is the gas named oxygen; therefore plants are not only called upon to purify the air by absorbing the carbonic acid, but likewise to decompose this latter gas, which is a compound of carbon and oxygen, to retain the carbon, to exhale the oxygen, and thus continually furnish the air with a fresh supply of the stay of animal life. Not only do they furnish land animals with oxygen, but they also supply this element to marine creatures: thus upon the presence of these beautiful structures in the bosom of the deep, as well as upon the land, rests, to a great extent, the well-being and life of animals.

Another question relative to the physical constitution of animals may here be noticed: it is, that animals are the subject of diseases, whose energies, if not diverted, will terminate their existence. As antidotes to these maladies, many of the members of the vegetable race were formed, in whose system are accumulated those secretions which will alleviate many a woe, mitigate many a pain, and even defer the blow of Him who terminates the earthly existence of all animal beings. Thus beautifully are these requirements also fulfilled. We next notice the susceptibilities of these creatures for pleasure, and whence this enjoyment is derived: here we must confine our remarks chiefly to man, the masterpiece of creation. Experience teaches the fact, that man is susceptible of enjoyment of the purest and highest nature, which may be derived from various sources; thus certain forms, combinations of colour, odours, &c., yield enjoyment to this intellectual organism. Nature, that is the God of nature, in accordance with this fact, produced certain of the various constituent members of the floral world of such forms as should convey to man a maximum of delight when beholding them, and of such colours and such combinations of colours as should seem to him most beautiful and gorgeous; and also imparted to them such odours as should be most cheering and reviving: thus the vegetable race having to charm man by its forms, colours, and odours, is adapted to these requirements.

One other point relative to this part of our subject suggests itself, viz.: that as the animal race is to be perpetuated, and the life of each vegetable structure is limited, the latter must be endowed with the power of reproduction, in order to supply the wants of the higher races which they are to feed. This requirement is also beautifully fulfilled, for not only do plants reproduce themselves in embryo in the form of seed, which they have the power of scattering and setting, but diverse means of propagation are furnished by nature, which are too numerous to be here mentioned: provision is hereby fully made, not only for the perpetuation of the race, but also for its non-annihilation by the ravages of the herbivorous and binivorous races.

Thus beautifully do we see the varied products of the vegetable world adapted in every particular to the necessities of those animals, the life of which they have to sustain. Some, however, may object to this latter argument, as animals were formed subsequent to vegetables; to this we reply, by asking the question, whether it is at all probable that the greater was formed to suit the lesser? is it not much more reasonable to suppose that the lesser was formed for the greater. Again, it may be objected that, owing to vegetables being formed before animals, and therefore before their characters were developed, it was impossible to adapt them to the then unknown characters of future animals. To this we merely reply, that the Creator had a perfect knowledge of what he was about ultimately to form, and He prepared the world by clothing it in living vegetation for the reception of its more noble guests.

We next notice, that although the varied structures of the vegetable kingdom are so beautifully and perfectly adapted to their varied positions, nevertheless the constitution of this sphere is such

as must necessarily prevent them (in certain cases) from occupying the position which they were especially designed to fill, therefore they must be adapted to these contingencies.

This point, though of great interest, we shall not dwell upon, but will merely view those circumstances which are of primary importance to the ornamentist.

First we notice, that although a plant may be designed for, and specially adapted to a given position, when its station is altered, hence the surrounding circumstances, it will even modify its manner of growth in order to adapt itself to this contingency.

For example, take a tree, and view it when situated in an open position, in which case nature appears to feel that it can, and is to be viewed equally from all sides, it is developed as a perfectly symmetrical structure, extending its arms equally in all directions. Now let a similar tree, when young, be placed close by a wall, and you have not the same result, for it is obvious that branches cannot be protruded in the direction of the wall without meeting with such an interrupting cause as would altogether mar the beauty of the structure; also, there is no necessity for the development of those branches which would protrude in that direction, for a wall being opaque cannot be seen through, therefore the buds thus situated remain undeveloped, the development taking place exclusively in the direction of the spectators, who must be on the same side of the wall as the viewed object. Thus, in this instance, we notice that the normal development of the structure is departed from in order to secure the greatest amount of beauty in the given position—for doubtless there is far more beauty displayed by that portion of the structure which is external being regularly developed, and the other portion being undeveloped, than in all being protruded and thereby forming a confused irregular mass.

Having now noticed that plants will modify their

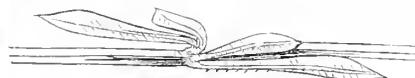

Fig. 17. GOOSE-GRASS.—*Galium aparine*.

normal developing energy in order to adapt themselves to those stations in which they may be called casually to exist, we proceed to notice that the organs developed will also deviate from their normal

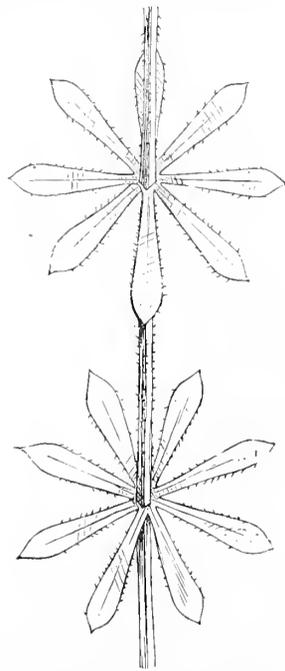

Fig. 18. GOOSE-GRASS.—*Galium aparine*.

positions, in order to perfectly adapt themselves to their particular stations. Thus, if we wander by a "border" (a strip of ground running in front of a wall), and gaze on the varied vegetable structures

there situated, we observe that each leaf and every flower is turned outwards, or towards us, the spectators; now the normal position of most leaves is that in which one surface faces the sky and the other the earth, but here they are more or less oblique, which is certainly the most beautiful position when in this situation. Again, this variation in the direction of the leaves in some cases produces a modification which is well worthy of notice; thus the verticillate leaves of the Goose-grass—*Galium* (which was figured in our last paper, Fig. 2)—proceed at a given angle from the stem, each member of the whorl leaving the stem at the same angle; but this only takes place when the plant occupies a vertical position, which it gains by climbing hedges, &c., and this it can readily accomplish by means of the little hooks with which it is furnished. In some cases, however, it is compelled to remain prostrate, its stem being too feeble to support it, and no kindly friend offering its aid, in which case it has to become a horizontal decoration; it now no longer develops its leaves, so that each member of the whorl forms with the stem the same angle, but some form with it an angle which is very acute, and others remarkably obtuse; in fact the whorls of leaves, instead of being more or less at right angles with the stem, are almost parallel with it (Fig. 17), appearing from above as a series of circles connected by the axis (Fig. 18).

But more than this, the normal arrangements of leaves is departed from, as well as their primitive directions. Thus, if a spray of the Ivy be examined which has grown in an open space, and hence is an object to be viewed on all sides, it will be seen that the arrangement of its leaves is spiral, two revolutions of the spiral thread encountering five

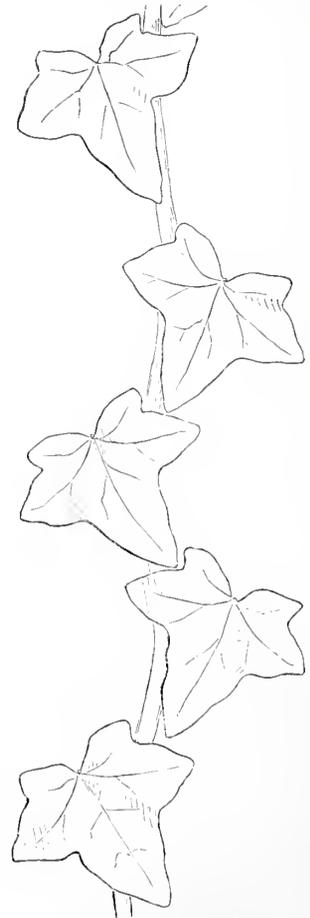

Fig. 19. IVY.—*Hedera helix*.

buds, as was delineated of the Oak in a figure in our last paper (Fig. 6); but let us now take a branch of the Ivy which has grown against a wall, where it is an object to be viewed on one side only, and we no longer find the leaves disposed in a somewhat complex spiral manner, but they assume simply the alternate disposition, one being at the right, the other at the left of the stem (Fig. 19). Again, if a spray is taken from a plant of Jasmine which has

grown in an open space, its leaves will be found to be *opposite* and *decussate*, two proceeding from the same point of the stem in opposite directions, and each pair crossing those both immediately below and above them (Fig. 20); but take a spray from a plant which has grown close to a wall, and you will find that each successive pair is over those both immediately below and above it, and does not cross it (Fig. 21); this also occurs with the flowers. Thus we see that nature will adapt herself to her position. We must here justify ourselves before proceeding: we have said that the leaves of a plant, the arrangement of which is opposite and decussate (that is in pairs, each of which crosses the pair both immediately below and above), cease to form right angles with each other when placed against a solid background; also, that leaves have in their axils (the angles formed between leaves' stalks, and the stem) buds which, when developed, are branches; and yet that plants, whether their leaves be opposite and decussate, or otherwise, do not develop those buds which face the wall; this apparent contradiction arises from this, that plants with very strong stems will not often alter their leaves, if decussate, from the cross to the parallel series, whereas those with thinner stems readily do; also, if a young plant is moved to such a position (as against a wall) after the buds are formed, say just after the fall of the leaves, those buds only which are exterior will develop.

Having now examined, at as much length as space will permit, the manner in which the products of the vegetable kingdom are adapted to their varied positions, it only remains for us to make one or two general remarks upon this subject. First we notice that, in order to the perfect adaptation of the structure to its destined purpose, each part must perform its particular duty, and each part must be adapted to its particular office; for if one part is not adapted to its particular purpose, the beauty of the whole is sacrificed. Without entering into further detail, we proceed to apply these preliminaries to our purposes. Noticing first that we have dwelt longer on this point than we otherwise should, believing it to be one of those considerations which are most overlooked in the aggregate productions of the present day, and therefore deeming it necessary to dwell rather longer upon it, and also being a point of such high interest it demands due meditation. Need we say in the outset that all vegetable structures are relief decorations, and must necessarily be such, as a living structure demands a circulating system of fluids, &c., and that this necessitates thickness or rotundity; also, as these beautiful structures are destined to break the monotony of the plain, they must have magnitude, and therefore must be relief decorations? A permanent decoration, or one which is never to increase in magnitude or alter, may be without thickness, but a growing ornament must be relief. Nature, then, appears to have started upon this principle, and first, having taken all circumstances into consideration, produces a series of vegetable structures which harmonise, or form a beautiful contrast with all surrounding objects, and which are in every particular adapted to the varied positions in which they may be placed, as well as possessed of capabilities for performing their every duty: to accomplish this, she, knowing that rotundity was necessary, instead of trying to disguise it, fully reveals it; therefore every marking on the stem, and other members of the vegetable, go to express more definitely their solid forms. Need we go further to apply our subject? need we throw out the hint to all who are engaged in the lovely art of original composition, do as nature did?—first duly consider the purpose of the required

object; secondly, the material at disposal for its formation; thirdly, the circumstances with which it will be continually surrounded; and lastly, let there be no shade of hypocrisy about any part of the production, but let every line go to express and give force to the intention of its every part, and this will be found advantageous rather than otherwise, if, having duly considered what was necessary, the most fitting forms have been em-

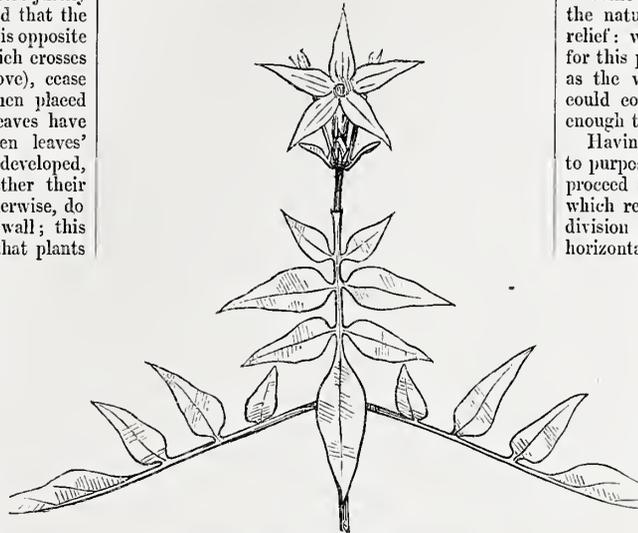

Fig. 20. JASMINE.—*Jasminum officinale*.

ployed, whether relief or otherwise, varying according to circumstances. If we have duly learnt the lesson of consistency, which has been the object of these paragraphs, we shall pardon their tediousness, and, we think, acquiesce in the proposition of Vitruvius where he says—"The perfection of all works depends on their fitness to answer the end proposed, and on principles resulting from a consideration of Nature herself."

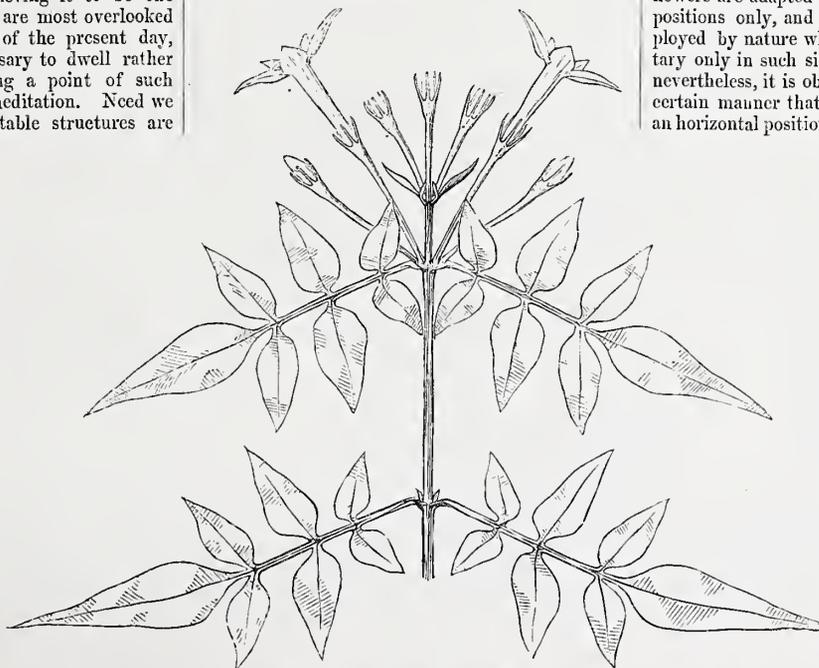

Fig. 21. JASMINE.—*Jasminum officinale*.

We need not say that all the products of the vegetable kingdom, being relief ornaments, furnish no proof that all ours should be such; on the contrary, the very fact that nature has employed relief decorations only, which were the only ones which would be adapted to her requirements, proves to our mind that we should in certain instances employ those decorations which are not only minus relief, but also the very appearance of such, as they, and they alone, can carry out, in certain cases, the principle of adaptation to purpose—for example, a floor is a

plane, the beauty of which is its evenness, or why form it of smooth boards? why, then, should not the decoration carry out this delightful feature, and not convey the idea of a rough and rugged stony path; fully persuaded are we that, if Nature were assigned such a task, she would accomplish it in the above described manner: in this statement we are supported by all markings in flowers of various colours, as Sweet-williams, &c., for none aye relief.

Some may, however, argue that grass, which is the natural carpet of the great floor of nature, is relief: we reply that that grass, which is congenial for this purpose, is short, and gives merely a texture, as the velvety pile of some carpets, which none could condemn; and those plants which are large enough to cast bold shadows we gladly avoid.

Having now worked out the principle of adaptation to purpose, as set forth in the vegetable world, we proceed to notice one or two points in this subject which refer to form only, carrying out our original division of plants, as destined for vertical or horizontal ornaments. We have noticed that a principle of symmetry is carried out in the developments of the vegetable world, but that this symmetry varies in quality or extent. Thus the Violet has only its two halves corresponding with each other, while the Stonecrop is composed of a series of similar units. Now it is obvious that where the structure is composed of a series of similar units that it is equally well adapted for an horizontal or a vertical ornament—say to adorn a wall or a floor; and this is carried out in nature, for the Primrose has an horizontal position, while the Cowslip has a vertical—that is, in the

former case we view it from above, as a floor decoration, in the latter laterally, or as a wall decoration. On the contrary, those flowers the two sides of which only are alike, are solely adapted for a vertical position, such as a wall decoration, &c. However, though individually such flowers are adapted for such positions only, and are employed by nature when solitary only in such situations,

Fig. 22. CANDY-TUFT.

nevertheless, it is obvious that when aggregated in a certain manner that they are perfectly adapted for an horizontal position. Thus the flowers of the Candy-tuft (Fig. 22), as well as those of most umbelliferous plants, are so formed that the two halves only correspond, nevertheless they enjoy an horizontal station, but here there are a number of flowers, arranged round a common centre in the most rigid order, and the smaller portion of each flowret points to the centre of the aggregation:—thus does Nature beautifully adapt her varied structures to their particular purpose. Although we have said that a composition composed of a series of similar units is equally adapted for an horizontal or a vertical position, nevertheless, there is a slight modification in these structures oftentimes brought about by nature when placed in these diverse positions; thus, if the flower is to stand erect or be horizontal, the central organ, or rod of the flower (the pistil) is usually erect, and is surrounded by a series of awl-shaped members (stamens), which are situated equidistant from it at all sides, whereas, if the flower occupies a vertical position (as adapted for a wall decoration), this central rod, with its accompanying members, usually recline on the lower portion of the flower, as in the Cactus.

These considerations we deem amply sufficient to fully establish the fact that the various vegetable structures are adapted in every particular to their fixed destiny.

RAMBLES IN ROME.

No. I.—THE MODERN ROAD TO ROME—FIRST IMPRESSIONS THERE—THE FORUM AND ITS MONUMENTS.

How much of truth, as well as poetry, is conveyed in the phrase by which we generally designate Rome—"the Eternal City!" Its interest is indeed immortal; the very earth upon which its palaces once stood is eloquent with history, and has inspired poets with their richest imaginings; while the relics of "the masters of the world" draw from all lands pilgrims as devoted as those who travelled in the past ages to Jerusalem. The student of history finds here the very monuments which make part of its records; the antiquary studies here the fragments which aid him in reconstructing its ruined temples and its past life, by which we may the better understand the historian's pages. The artist in his youth yearns towards the great old city—it is the hope and earnest struggle of his life to visit it, and in maturer age the memory of the sojourn there is ever present among his happiest experiences. The poet dreams amid its ruins, or rather, sounds his rhyme like a trumpet-call to the civilised world, gathering other devotees:—

"With silent worship of the great of old!—
The dead, but sceptred sovereigns, who still rule
Our spirits from their urns."

But yet let us not, while worshipping the past, forget the greatness of the present age, nor do it the injustice of not feeling its own peculiar power. It is not our necessity to construct a Coliseum, but our great commercial works are often as noble, and aid the march of civilisation in a manner unknown to any previous era. Thanks to "the iron road," and the power of steam, time, wind, and tide, are partially subdued, and their rule, once absolute, rendered more amenable to our necessities or pleasures. "Distance" has resolved itself into "time," and thus Rome is very much nearer now to us than it ever was before.

If the traveller be fond of classical antiquities—and it is not very likely that he would guide his steps to Rome without being so—he will find much to interest him on his way thither. The artist, also, who may have the Eternal City in view for its Art-treasures only, cannot fail to be interested by those *en route*; which will, in fact, prepare him for the grander ones he has to see. Less striking in quantity, the old Provençal cities contain some few antiques equal to those in Rome—nay, the *Maison Carrée*, at Nîmes, is the most perfect Corinthian temple existing. If he be a lover of landscape, the banks of the Rhone are as grand as those of the Rhine; while the view from Orange across the fertile olive gardens of Provence toward Mont Ventoux has been compared to the scenery of Greece by travellers of taste and discrimination. To those for whom the mediæval era has charms, and the pages of Froissart delight, we would suggest a stay at Montelmart, Rochemaure, or Tarascon, where René of Anjou kept court in the old troubadour taste. All travellers of mind, he they artist or amateur, author or student, must own the influence of such scenes; and, while flying through them by the express train, regret that the passing glance should not rather be the leisurely survey. We whirl through life so rapidly in the present day that youth and old age are the only resting-places of "the fitful fever" we have made out of its great middle course. Let the traveller arrange for a due knowledge of the country through which his journey lies—it will well repay him. Avignon may detain the poet. Here Petrarch lived, and here first met his Laura; his classic home at Vaucluse is but a few hours distant, and is reached by travelling over a country of truly poetic beauty. Where the poet leads, the artist may safely follow, and if he be not detained by the grandeur of the old city of the popes, or the castle-crowned rock of Villeneuve opposite, the magnificence of the scenery around him, and the beauty of the home of Petrarch, cannot fail to charm. Its climate has been happily described in the proverbial words:—"Avenio ventosa, sine vento venosa, eum vento fastidiosa."

But now let us imagine the dangers and difficulties of the journey over, and the traveller safely within the walls of Rome. He has settled the last extortion of the last conductor of the diligence, and may go to St. Peter's and return thanks that the *genus* is

extinct where railways are laid down. The misery and expense of the old diligence travelling has made these "institutions" a greater blessing to the tourist abroad than among ourselves—but in Italy railways are comparatively unknown. A short line from Rome to Frascati, a distance of about seven miles, is all that is to be met with in the Papal States, and the visitor to Rome must be prepared for a city far behind in the race of improvement which characterises the great capitals nearer home.

It would be difficult, if not impossible, to describe the conflicting feelings which crowd the traveller's mind on a first visit to Rome. The most indifferent experience this, the most enthusiastic are bewildered in expressing them. Conflicting they necessarily are—feelings of satisfaction or disappointment continually chase each other through the mind. Some celebrated things do not come up to a preconceived idea of them, others surpass expectation. Rome, as a city, is not striking, particularly on approaching it over the desolate campagna. A wearisome plain stretches from the sea, a few elevations occasionally break the monotony, but they are of no significance, nor do they present picturesque features. High walls shut in the city, above which is seen the dome of St. Peter's and the Castle of St. Angelo; but the view is disappointing, the scene has little to interest the stranger, or give him a realisation of preconceived ideas of imperial Rome. The historic localities, the ruins which are part of the world's history, lie some distance on the other side of the Tiber, and away from the modern, or fashionable localities, where the richer classes reside. The city of the popes lies northward of the city of the classic Romans, and the column of Antonine marks the boundary of interest to the archaeologist.

Upon the Capitoline Hill is a square of palaces, sacred to Art and Science. Here the ancient sculptures are enshrined, and modern *savants* hold their meetings. The noblest equestrian statue in the world occupies the pedestal in its centre: it is the bronze of Marcus Aurelius, which Michael Angelo worshipped with an artist's enthusiasm. Let us ascend the grand staircase, whose easy gradient was formed for the convenience of Charles V. of Spain, and passing the statue, mount the steps of the central palace beyond, known as the Palace of the Senator, which is built on the oldest structure in Rome, the "Tabularium," believed to have been formed in the days of its republic. High above this building rises a tower, which, when ascended, furnishes the best panoramic view of Rome. Immediately beneath us lies the Forum, "the heart" of the ancient city, but now nearly the southern boundary of the modern one. You still look upon the irregular masses of stone which paved the road, winding from the arch of Septimius Severus between the temples of Saturn and Vespasian, to the summit of the Capitol. The ruts of the Roman chariot wheels deeply impress these stones, and invest them with an almost sacred interest when we recall the history of past ages, and the scenes of triumph and glory enacted by the masters of the Old World in the classic ground beneath us. The rows of trees across the Campo Vaccino lead in a direct line to the Arch of Titus, famous for its bassi-relievi commemorating the conquest of Judea. To the left, close to the Capitol, and below the Church of Ara Coeli (where Gibbon first conceived the idea of his immortal work) is the little Church of St. Pietro in Carcere. It is built over the famed Mamertine prisons, completed by Servius Tullius 578 years before the Christian era. Opposite this stands the Church of St. Luke, where the far-famed Academy meet, and in which is the noble figure of the Saviour by Thorwaldsen; and this is separated by a small street from another church, the brick front of which belonged to the Temple of Hadrian. A short line of plain modern houses leads to the centre of the Forum, and here we perceive the Temple of Antoninus and Faustina, partially converted into the Church of St. Lorenzo. It was consecrated to their memories as deities by the adulation of the Roman Senate, and the inscription recording the act is still upon the frieze. Opposite is the walled garden of the Villa Farnese, bounding the Palatine Hill, and enclosing the ruins of the Palace of the Caesars. In front of this stand the three solitary columns of a temple, which has already received as many names as learned men have contended it should do. The deep excavations recently made beside them reveal

the marble floors of many noble buildings which once crowded the Forum, and so bring us back to the solitary column of Phoebus, in the foreground of our view. If we carry our eye beyond the Arch of Titus, we shall see the vast circle of the Coliseum, and the gigantic arches of the Basilica of Constantine, rising far above the puny buildings around them; while gardens, churches, and houses, cover the rest of old Rome. Turning the other way, modern Rome, with its crowded houses, spreads to the foot of the Pineian Hill; the columnus of Trajan and Antonine, the dome of the Pantheon, and the Castle of St. Angelo, being the only striking remains of ancient labour we detect in the midst of modern work.

Let us descend, and walk to the Arch of Titus, which bounds the view in the modern forum. How noble are the fragments (alas, that they are fragments!) which the artist of his day sculptured to commemorate the fall of Jerusalem. Little did the vainglory of old Rome consider that the representation of the half-despised spoils of the Temple should give one chief point of interest to their city, when the hated Christianity should flourish on the ruins of classic heathenism. The Coliseum could only be effectually preserved by consecrating it to the early Christian martyrs. How powerful are the lessons which history teaches! But let us not leave these damaged bassi-relievi without an acknowledgment of their artistic beauty; it is an acknowledgment that we do not remember to have hitherto seen rendered to them—their great historic interest has absorbed all attention:—yet note the glorious beauty of these horses' heads, as they bear along the triumphant Caesar; their eyes glow and nostrils dilate as if conscious of their charge. They are as fine as the Elgin marbles; nor will the chaste beauty of the heads of the attendants who crowd the scene suffer by a comparison with these glorious works.

We will pursue our way down the inclined plane of the *Via Sacra*, which Horace relates he used to make his favourite walk; and then let us study the older parts of the Arch of Constantine. These older parts are portions of the Arch of Trajan, which the unscrupulous Constantine "appropriated" to his own glory. They all represent events in the life of Trajan, with that fidelity of detail, that perfect *vraisemblance* so conspicuous in the finer works of antiquity, and which never injures the grandeur of their conception, or the breadth of their treatment. They are true pictures, and noble works of Art at the same time. Criticism has not yet done justice to the admirable figures of Dacian captives that surmount its columns. They look down upon you in dignified silence, erect and kingly, though bound by their conquerors; it is as if the Roman sculptor felt obliged to respect and express the innate nobility of the despised barbarian, and magnanimously accorded to their stony representatives the expression which was their due. They seem now rather placed to elaim respect and pity, than to swell the glory of a conqueror.

Time has dealt leniently with these ancient works: to a northern eye, the cleanness and perfection of monuments which have been exposed to the weather during so many centuries, are most surprising. Age has merely tinged them with a warm rich glow; but has "written" no "strange defeats on their brow." It is the barbarism of man alone which has done mischief; and the deep indents we perceive so constantly between the stones are the works of the old Goths, who chipped down to the clamps which held them together to get at the metal. Since their period, the popes and nobles used the monuments as stone quarries, and constructed from them palaces so enormous, that they have become a trouble to keep up. But the Roman people, however poor and debased, have never destroyed their monuments. We see now the finest works of ancient and modern Art fully exposed and unscathed. The old Roman Janus Quadrifrons, which gives the name to the Ponte Quattro Capi, is unprotected; so is the beautiful modern sculpture on the road up the Pineian Hill. Hundreds of other examples might be given of the most valuable works freely exposed night and day. The people are familiarised with them, and respect them as public property; they are the treasures of the poor in Rome, who jealously guard them, as the noble may his own works in his own palazzo. Let us he taught the lesson thus offered.

F. W. FAIRHOLT.

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XXII.—ALEXANDER JOHNSTON.

F historical records and associations were sufficient of themselves to create a great national school of historical painters, then assuredly the Scottish would stand second to none of the European schools, ancient or modern. The whole country north of the Tweed is a vast field of incidents, real and legendary, over which an army of artists might expatiate without weariness, and gather ample stores of material without exhausting its productiveness. Mountain and moor, loch and fastness, abbey and castle, town and city, are haunted with the spirits of past ages, whose deeds have been sung in ballad or epic, or narrated by the historian and the writer of fiction in language scarcely less inspiring than that of the poet: the feuds of hostile clans, the contests of rival claimants of the throne, from the Pictish king, Angus MacFergus, to the last of the Stuarts; the public and domestic scenes associated with the histories of the great Scottish families; the peculiar

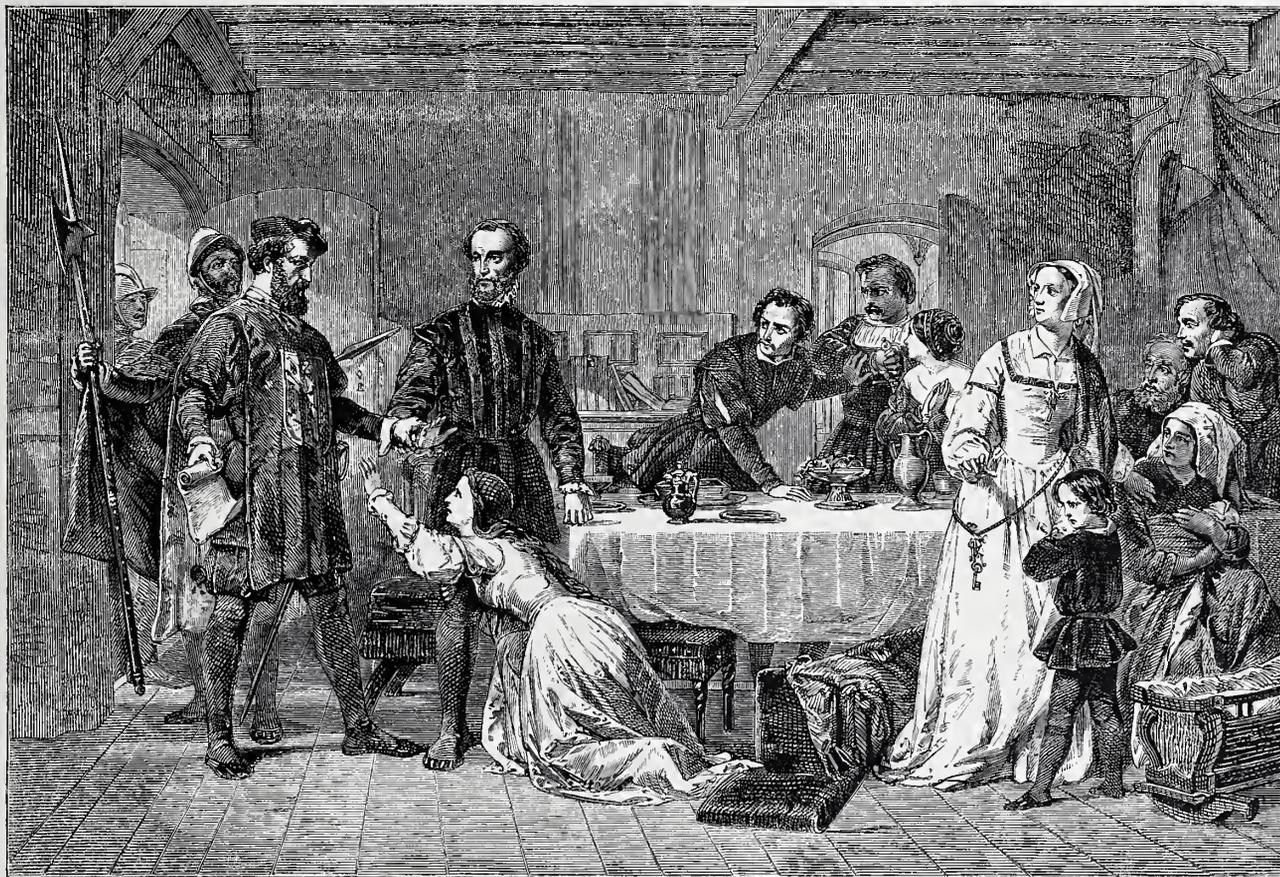

habits, customs, and superstitions of the lower classes; the religious controversies and persecutions in which the whole people were at various times involved; their heroic endeavours during a very long period to maintain their position as an independent nation;—what a volume do not these offer to the observation and thought of the painter! and if, moreover, his eye surveys the romantic and picturesque beauties of the land in which these events were enacted, no country on the surface of the globe possesses so rich a heritage at the command of the artist, nor, as we said before, one so well calculated to produce a great national school.

It is a fact, however, that till the pen of the novelist had made the public familiar with Scottish history, it had rarely evoked the genius of the painter;

the pages of Sir Walter Scott have been, and are, the great text-books which the latter has consulted; almost every picture drawn from recorded incidents is exhibited with a quotation from his writings, just as Shakspeare appears to be the authority of the painter of English history, rather than Rapsin or Ilume: the dramatist or the novelist suggests the subject, sketches it out, gives it character and expression, and colours it—the artist transfers it to his canvas. Yet the latter is neither a copyist nor plagiarist: there may be as much originality of conception, as much depth of thought, as much poetry of feeling and truth of character in the language of the pencil as in that of the pen; and, after all, books are the only sources to which the painter can apply. We can but reiterate a wish often expressed, that our historical painters would look a little farther than they are accustomed to do for what they require; their world is almost limitless in extent, as it is infinite in variety and inexhaustible in wealth.

If Scotland has produced but few painters of history, it certainly has not arisen from a scarcity of subject-matter in her annals. Wilkie and Allan are generally considered to stand foremost in the ranks of the Scottish school; yet there are others, and among them must be included the name of Alexander Johnston, who are not unworthy followers of these leaders, and whose works are even more strictly "historical" than those of either Wilkie or Allan. And if the country of Bruce and Wallace has a shorter array of great artist-names among her sons than England can show, her glorious records and her magnificent landscape scenery have been the means of adding many bright leaves to the laurel crown of the Southron. We do not intend by these remarks to make any invidious distinction between the two countries, and altogether repudiate any idea of contending about nationalities; Scotland has been, and will always be a great benefactor in every way to British Art, and what she has not created, she has fostered and matured; over her mountains, amid her glens, and through her palaces and fortresses, the English painter has found the path that led him to the temple of fame.

Alexander Johnston was born in Edinburgh, in 1815: his father, whom he had the misfortune to lose at a very early age, was an architect of considerable repute. At the age of fifteen his son was placed with a seal-engraver of that city, and, having displayed considerable talent, as well as taste, for Art, he was, at the expiration of a year, admitted a student in the Trustees' Academy, then

THE ARREST OF JOHN BROWN, A LOILARD.

[J. and G. P. Nicholls.

under the presidency of the late Sir William Allan. Here he continued for three years, when he left Edinburgh for London, bringing with him an introduction to Wilkie, who recommended him to enter the schools of the Royal Academy, into which he was admitted in April, 1836. Hilton at that period filled the office of "keeper," whose principal duty it is to superintend the studies of the pupils; under this judicious teacher and fine painter the young Scotch student made good progress, and gave favourable evidence of the latent talent which future years were destined to unfold and develop. We will venture to assert that, notwithstanding the neglect that Hilton himself experienced as a historical painter, such was his enthusiasm for this noble department of Art, he would never have attempted to dissuade a young artist from pursuing it when he saw promise of ultimate success.

Previously to his quitting Edinburgh, Johnston had devoted his attention to portraiture; and on the first year of his arrival in London he exhibited at the Royal Academy a portrait of the youngest son of Dr. Morison, and, in the year following, a group of portraits of Dr. Morison's family. In 1838, he exhibited at the Academy another portrait, and a little picture called "The Mother's Prayer;" this was his first approach towards historical painting. In the same year he sent to the Society of British Artists, in Suffolk Street, a small painting entitled "Scotch Lovers," now in the possession of Sir George Crewe, Bart.: and to the same Gallery, in 1839, a picture called "The Mother's Grave;" it was the first time the works of this artist had attracted our notice—or rather, we should perhaps say, that inasmuch as the *Art-Journal* was only established in that year, it was the first opportunity afforded us of publishing our opinion

of any picture. We spoke thus approvingly of the painting in question:—"The Mother's Grave," by A. Johnston, whose name we meet for the first time, is one of the sweetest and most effective pictures in the Gallery. It represents a forlorn orphan-boy standing beside the humble grave of his parent. It is touching to the highest degree. The mind that conceived it, and the hand that painted it can be of no ordinary character. There is nothing in the collection that we so much covet, and sure we are it will not be long unsold." His contributions to the Academy, in 1839, were two portraits, and a "subject-picture," called "The Departure."

In 1840 he exhibited at the Academy "THE GENTLE SHEPHERD," a charming composition, which forms one of our engravings; it was bought by Mr. E. Miles: and in the Edinburgh Exhibition "The Departure," just mentioned, and "The Happy Contest," a well-composed and cleverly executed picture, representing a group of rustic urchins amusing themselves with swimming tiny boats in a tub. Another painting of this year, a commission from Mr. H. Britton, was never exhibited: the subject is a "Highland Bagpiper."

In our notice, last month, of Mr. E. Bicknell's Collection, we spoke of the "Sunday Morning," by this artist; it was hung in the octagon-room of the Academy, in 1841; yet, even in that "den," it could

not escape the eye of this discriminating collector. To Edinburgh, Johnston sent a small, but sweetly-painted picture of a girl with a lamb, to which he gave the title of "Affection," and a work of far greater importance, the first of his historical works, "The Interview of the Regent Murray with Mary Queen of Scots;" the picture is characterised by truthful and masterly drawing, and by the varied and appropriate expression of the heads; it is altogether a work of great merit, and was purchased by the Edinburgh Art-Union. In 1842, he exhibited at the British Institution two pictures—one the "Braw Wooer," as sung by Burns; the other a large canvas, "The Landing of Jeannie Deans at Roseneath," a picture of considerable ability, yet scarcely equal to some of the artist's earlier performances: it was bought by a prize-holder of the London Art-Union. "The Martyr's Grave," exhibited in Edinburgh this year, found a purchaser in a subscriber to the Art-Union of that city. "The Covenantant's Marriage" was purchased from the Royal Academy Exhibition by Mr. G. Virtue, and is still in the possession of that gentleman; this admirable picture, which so truthfully and painfully describes the perils to which these persecuted champions of a religious faith were exposed, was engraved for the "Gems of European Art." The ceremony—one can scarcely call it joyous under the circumstances—takes place under the open canopy of the blue heavens, in the midst of an amphitheatre of hills; the friends of the bride and bridegroom are many of them armed, to repel any hostile attack that may be made upon them; others are on the look out, and one seems to be making a signal of danger, arising from the appearance of two or three horsemen riding up in the distance, whose object, it may be presumed, is not that of congratulation on the event that has assembled together the picturesque group in the composition.

Of two pictures exhibited by Johnston at the British Institution in 1843, that which stood first on the catalogue has our preference: it is called "The Highland Repast," suggested by a passage in "Waverley," where the hero of the tale is seen listening to the song of the young Highland girls. The other is a composition of two rustic figures, to which the title of "Rural Life" was appended. At the Royal Academy this year his single contribution, "The Highland Home," was again assigned to the octagon-room; nevertheless, the stalwart Highlander, who is represented in the picture as playing with his child at his cottage-door, soon found an admirer in a prize-holder of the London Art-Union, who paid one hundred guineas for him and his bairn.

A solemn and affecting subject, treated with characteristic feeling, is

"The Highland Lament," exhibited at the Academy in 1844. Campbell's lines—

"O heard ye yon pibroch sound sad in the gate,
Where the band cometh slowly with weeping and wail?"—

form the argument of this composition, which is replete with touching sentiment, expressed in the most poetical language that the pencil can supply. The picture is in the possession of Mr. R. Twentyman. In 1845, Mr. Johnston exhibited at the Academy his picture of "Lord William Russell and his Lady receiving the Sacrament:" it was bought by Mr. Vernon, and is now at Marlborough House. Most of our readers are, of course, acquainted with the work from the engraving we published in our "Vernon" series: in truthfulness of feeling, united with simplicity yet beauty of composition, we have ever regarded this as one of the most successful productions of this artist; it is painted with vigour and firmness, while the light and shade are most judiciously managed.

"Prince Charles's Introduction to Flora MacDonald, after the Battle of Culloden," we have not seen since it was hung at the Academy, in 1846; the impression it made upon our mind at that time was not the most favourable—owing chiefly to the varnish upon the canvas having

unfortunately "chilled," which proved very detrimental to the colouring of the picture; the composition we remember to have been good. The scene—which the history of the period tells us took place when the English government offered a reward of £30,000 for the apprehension of the prince—is laid in what our northern countrymen call a "bothie:" Flora MacDonald, attired in the ordinary costume of a Scottish maideu, is introduced by a gentleman, one of the prince's party; Charles appears as if he had just left the battle-field, unshaven, wan, and weary: the point of the subject is well sustained, though it leaves a painful impression from its peculiar character. In 1852, the committee of the Glasgow Art-Union awarded the premium of fifty guineas to Mr. Johnston for this picture, which he very honourably declined to accept on the ground of the work having been painted so long previously.

From Scottish history the artist passed, in 1847, to a mournful incident in English annals, by exhibiting at the Academy a picture of "The Burial of Charles I. in St. George's Chapel, Windsor." The authority whence the painter derived the treatment of the subject which he adopted, is Rapiu, who says that the interment took place in the presence of the Duke of Richmond, the Marquis of Hertford, the Earls of Southampton and Lindsey, and Bishop Juxon, who had attended the unhappy monarch during his last moments on the scaffold. Whitechot, the Roundhead governor of the castle, was also present; and

when the bishop, who was attired in full episcopal robes, was preparing to read the burial-service, according to the rites of the Church of England, over the body, the governor peremptorily forbade him, and the mutilated remains of the king were consigned to their resting-place like those of a dog, without an audible prayer for the peace of his soul; Whitechot keeping his hat on while the noblemen, uncovered, placed the coffin in the vault. The picture is most carefully studied, and painted with great power of execution: it is in the possession of Mr. E. Pemberton, who must congratulate himself upon possessing a fine work of Art.

The year 1848 was almost a blank with Mr. Johnston, the only appearance he made being at the British Institution, where he exhibited a pretty little picture of a Highland soldier, just returned from the wars, embracing his wife at the door of a cottage. But he was not idle during this period; on the contrary, he was girding up his strength for the following year, having received a commission from Messrs. Graves to paint a large picture of "The Trial of Archbishop Laud," which was hung at the British Institution. The picture greatly enhanced the reputation of its author: it is, we believe, in

THE MAGDALEN.

[J. & G. P. Nicholls.

the hands of the engraver at the present time. Another work, exhibited at the same time, was a scene from the "Gentle Shepherd," entitled "Roger and Jenny;" a small "domestic bit," painted with much delicacy of feeling: it was purchased by Mr. C. Cope, of Euston Square. The Academy picture of this year illustrated a passage from Scott's "Lady of the Lake," that wherein the poet describes Douglas separating the "struggling foes," Grame and Roderick, in the presence of Ellen, Margaret, and the aged harper. This is a most spirited composition, sustained by perfect and powerful individuality in the characters, and offering a charming contrast in the fierce and angry attitudes of the one group, and the serenity of the other. The picture is in the possession of Mr. Wallis. It is right we should add that it obtained the premium of £50 from the Academy of Liverpool, where it was exhibited in the autumn of 1849.

Speaking of two cabinet pictures, "The Novice," and "A Highland Shepherd and Maiden," exhibited at the British Institution, in 1850, we made at the time the following remarks:—"The 'Novice' is seated, and apparently engaged in divesting herself of her worldly attire. The treatment is exceedingly simple; the colouring is remarkable for its unassuming propriety, and

the clean working and neat touch afford a rare example of masterly execution: of the other it was said:—"The figures are drawn with the usual firm touch of the artist, and many passages exhibit extraordinary power." His contribution to the Academy this year was entitled "The Hay-field," suggested by two lines in the old ballad of "I was within a mile of Edinbro' towu,"—

"Bonny Joekey, blythe and gay,
Kisses sweet Jenny, making hay."

There are many other figures in the composition than the two principal characters, and the whole are most felicitously placed with regard to pictorial effect, heightened by the luminous and brilliant colouring which the painter has given to his canvas. This work was painted for Mr. Wallis; who is also the possessor of "Family Worship," exhibited at the Academy in 1851, representing a Scotch family group engaged in their evening devotions: we do not recollect any picture by Johnston that bears stronger evidence of his skilful disposition of figures, and masterly arrangement of light and shade: it is certainly one of his best works. A brilliant example of colouring, and most happy in its general treatment and expression, is a small picture exhibited in the same

Engraved by]

THE GENTLE SHEPHERD.

[J. and G. P. Nicholls.

gallery, of a lady with a guitar, seated with a music-book before her; it was called "Music" in the catalogue.

We have spoken of a picture, painted in 1841, called "The Covenanters' Marriage;" a kind of companion to this, though the respective narratives differ so widely, is "The Covenanters' Burial," exhibited at the Academy in 1852. What a tale of persecution and distress does that scanty assemblage of mourners furnish, as they stand in the midst of their native hills to lay their dead in ground consecrated by no priestly ceremony! language never spoke to the ear in more pathetic and poetical accents, nor more impressively, than this mute interpreter of real sorrow and tribulation—the painter's canvas—makes its striking appeal to the heart. Throughout the composition there is a solemnity of feeling and sentiment befitting the occasion: it is seen not only in the group of mourning friends or relatives, but also in the absence of all glare and obtrusiveness of colour, though the strong contrast of light and shade, forcibly opposed to each other, gives the picture a brilliancy which the most positive colours could scarcely produce. The painting is in the possession of Mr. Baily of Cornhill, for whom it is being engraved. Certainly not less pathetic as a subject than this picture is another exhibited at the same time, "The Flitting" (Scotch); it represents a young female, in the

garb of widowhood, quitting the home she has enjoyed but for a brief period: the cottage seems to have already been emptied of its humble furniture, and the husbandless, accompanied by her pastor—on such an occasion a true minister of consolation—turns to take a last look on her late home. The narrative is both eloquently and artistically described: the picture adorns the gallery of an eminent collector of British Art, Mr. Bashall, of Manchester.

In the north room of the British Institution hung, in 1853, a small picture, a female figure, to which the title of "Genevra" was appended: the work is a gem of its class. To the Academy exhibition of the same year Johnston contributed two works, both of them important in size and character. One, entitled "Melancthon," illustrates an incident in the life of Luther's friend, as related by D'Aubigné in his "History of the Reformation;" where we are told that a French traveller, calling on Melancthon, found the great "Preceptor of Germany" rocking his infant to sleep with one hand, while in the other he holds a book he is reading. In the picture Melancthon is seated, beside him is his wife, and the visitor stands near the door: the character of the work is very truthful yet dramatic, the colouring rich, luminous, and transparent: it was painted for Mr. J. N. Turner, but is now in the possession

of Mr. Gibson, of Saffron Waldron. The other picture forms the subject of the engraving on this page. "THE FIRST INTERVIEW OF EDWARD IV. WITH ELIZABETH GREY," not Woodville, as it was described in the catalogue. The lady was daughter of Sir Richard Woodville, and married Sir John Grey, who was slain at the battle of St. Alban's, fighting on the side of the Lancastrians against Edward; her two children by this alliance form part of the group in Mr. Johnston's picture. The king, coming accidentally to the house of her father, where she was residing after the loss of her husband, the young and beautiful widow flung herself at the feet of the monarch, and entreated his clemency on behalf of her children. The result of the interview was—as most of our readers know, it is presumed—that Elizabeth became the wife of Edward. Like the majority of the pictures by Johnston, this is distinguished by great simplicity of treatment; there is in it little of accessorial subject to divert the attention from the chief points of the narrative, and what there is, serves some useful purpose in the entire composition. It is a picture that will please as much from its elegance of design—no other term seems adapted to our meaning—as from the power with which the design is carried out. It is in the possession of another eminent provincial collector, Mr. J. Leathes, of Leeds.

At the British Institution in the following year, Johnston exhibited a small

replica, with some slight alterations, of his "Melancthon," and a picture of two figures, entitled "Peggy and Jenny," in an open landscape; figures and landscape are painted with extraordinary brilliancy. D'Abigné was again referred to for the Academy picture, and a subject was found in "Tyndale translating the Bible into English;" Tyndale was at this time in exile, but so sought after for persecution's sake, that he was forced frequently to change his residence to avoid arrest: a companion is introduced into the picture—another of the sufferers in the cause of truth—Fryth, who had escaped from confinement in the prison of Oxford, and had joined his friend. "The force of the picture lies in the painful earnestness with which Tyndale devotes himself to his task. The composition is in excellent taste, and the execution has that remarkable precision which is found in all the works of this artist." It is the property of Mr. J. Cressingham, and has been engraved, we understand, by G. R. Ward, for the London Art-Union, for future distribution.

"Hope," a finished study for a large picture, very small, yet very sweet in colour, was hung at the British Institution in 1855. It was followed, at the Academy, by "The Abdication of Mary, Queen of Scots," which she is forced to sign by Lord Lindsay, her most bitter and relentless enemy, who is seen grasping the wrist of the unfortunate Mary in his gauntleted hand, so firmly as to cause, it seems, severe torture. There is but one other personage intro-

Engraved by]

EDWARD IV. AND ELIZABETH GREY.

[Daniel Brothers.

duced on the canvas, the queen's female attendant; and more would only have appeared intrusive, so admirably has the painter excited the interest of the spectator in those that are before him. A greater ruffian, with an aristocratic mien and in knightly costume, than the fierce zealot Lindsay, never was portrayed; nor could queenly beauty, under the influence of pain and terror, be more truthfully rendered by the pencil. The picture is in the possession of Mr. Penn, of Lewisham, the eminent engineer.

"THE ARREST OF JOHN BROWN, OF ASHFORD, A LOLLARD," and one of the first martyrs in the early part of the reign of Henry VIII., was exhibited at the Academy last year; it is engraved on the first page of this notice. Brown was a gentleman of Kent, of comparatively slender means, and living at Ashford in quiet retirement: he and his family were among the earliest converts to the new doctrines promulgated by Luther: his arrest, at the instigation of Archbishop Laud, is thus described by the French historian of the Reformation:—"Brown's wife having been churched that same day, a feast was prepared for their friends, as was usual on such occasions, and they had all taken their seats at table, joy beaming on every face, when the street-door was abruptly opened, and Chilton, the constable, a cruel and savage man, accompanied by several of the archbishop's apparitors, seized upon the worthy townsman—all sprang from their seats." This is the precise moment chosen by the artist for illustrating the story: the assembled party manifest, in various

attitudes and actions, their surprise and agitation, Brown alone retaining his self-possession and calm bearing on hearing the business on which the officials of the episcopacy have forcibly entered his dwelling; the incident is graphically placed on the canvas. Another of our engravings we can only briefly refer to; it is that of the "MAGDALEN," a picture in the possession of Mr. Wallis: the finished sketch, from which our print is taken, is in the collection of Mr. Twentyman; we have introduced it to show the artist's treatment of a class of subject that differs so entirely from his usual works. The larger painting was exhibited at the British Institution in 1849.

Ours is little else than a running comment on the works of this excellent artist: but enough, it is hoped, has been said to show that he is one in every way worthy of being included in our series of eminent British painters. His subjects, it will be seen, are almost invariably selected from the history, public or domestic, of the country to which he owes his birth. He never attempts to grasp at more than he is equal to,—grand and complicated themes, requiring the powers of the greatest masters of art: nor, on the other hand, does he content himself with the ordinary and commonplace. Furthermore, whatever he undertakes is done well and satisfactorily; his pictures are always welcome and most pleasing contributions to our annual exhibitions. We think Mr. Johnston has deservedly earned a title to academical honours, which we hope soon to learn have been conferred on him.

OBITUARY.

MR. FREDERICK CHRISTIAN LEWIS.

We regret to have to record the death, from an attack of apoplexy, of this excellent artist and most inestimable man, which occurred on the 18th of December, at Enfield. Mr. Lewis was in the 77th year of his age. He was born in London, in 1779, and was placed by his parents at an early age with an engraver of some celebrity, named Stadler. Subsequently he became a student of the Royal Academy, and a most diligent one; he here formed friendships with most of those great artists, his contemporaries, who were then his fellow-students, and whose esteem he had the satisfaction to retain during life. At the commencement of his profession on his own account, he contracted an intimacy with Girtin, and engraved his "Views of Paris." Shortly after this the late William Young Ottley, who was publishing his "Italian School of Design," engaged him to engrave as *facsimiles* most of his celebrated collection of drawings by Michael Angelo, Raffaele, &c. He now felt that his sympathies were excited, and admirably did he perform his task, for it is admitted that no modern engraver has ever produced such transcripts of such great works. While thus occupied, he lived for five years at Enfield, and when the *burin* was not employed, he was sketching early and late from nature. Returning to London, Sir Thomas Lawrence, who thoroughly recognised the talent which had reproduced "Ottley's Raffaels," &c., placed in his hands some of those exquisite chalk drawings of portraits, so celebrated for their delicacy and refinement, and which then no engraver had succeeded in imitating. But here Mr. Lewis was at home, and until the death of his friend Sir T. Lawrence, in 1830, he was almost wholly occupied in engraving from his works. Mr. Lewis had the honour of being appointed engraver to H.R.H. the late Princess Charlotte, and successively to their majesties George IV., William IV., and the present Queen. Mr. Lewis, in addition to his talents as an engraver, was a landscape-painter of no ordinary excellence. Till within some few years, he exhibited at the Royal Academy regularly, and frequently at the British Institution. His engravings from his own sketches of Devonshire rivers will be well recollected by many of our readers. Nothing could exceed his delight when, in conjunction with the "Sketcher" of *Blackwood's Magazine* (the Rev. John Eagles), he was exploring some Welsh waterfall, or Devon moorland.

He has left three sons: the eldest, John F. Lewis, President of the Society of Painters in Water-Colours; the second, Charles G. Lewis, the well-known engraver of some of Landseer's most important works; and the third has pursued his career as an artist in India. Two daughters are also left to deplore the loss of their venerable parent.

MR. FREDERICK NASH.

We are now enabled to give our readers some account of this artist, whose death was announced in our last number. Mr. Nash was the son of a respectable builder, and was born in Lambeth in 1782: he early displayed a taste for drawing, which ripened into an unconquerable desire to become an artist, steadily rejecting the advantages that were offered him by a wealthy relative to pay all the costs of a legal education, and to advance him in the law. The boy "thought to be an artist was greater than to be a king;" and his parents, finding him bent upon following his favourite pursuit, yielded to his desire, and placed him with an architectural draughtsman, of some reputation in his day, of the name of Moreton, under whom he acquired a thorough knowledge of perspective, and received the bias for architectural subjects, to which, in after life, he devoted himself. As a young man, he was occasionally employed by Sir Richard Smirk, and other eminent architects, to make drawings from their designs. In 1808 he was elected into the Society of Painters in Water-Colours at the same time with Copley Fielding and Dewint, and soon after was appointed architectural draughtsman to the Society of Antiquaries, which office he retained for many years, and executed for the Society some important works; one of the principal being a series of drawings of the ruins of St. Mary's Abbey,

York, afterwards lithographed by himself for that Society's publications. In 1810 Mr. Nash commenced his work on St. George's Chapel, Windsor, which obtained for him an introduction to his late majesty George III., who received him most graciously, and presented the young artist to the queen and the princesses; conducting him through the rooms, to show him the works of Art which graced the walls of the palace. In 1819 he executed the drawings for the work well known as "Nash's Paris," for which he received five hundred guineas: these drawings were afterwards purchased by Sir Thomas Lawrence. In 1824 he visited France, to execute a series of views of the "Environs of Paris" for a gentleman of fortune, and for which he was paid three hundred guineas; and in 1825 he was again in Paris at the urgent request of Sir Thomas Lawrence, who was there painting the portraits of the French king and royal family, to assist the court painter in the accessories of his work. The throne in perspective, and certain other parts that came within the speciality of Mr. Nash, were painted by him. In 1837 he narrowly escaped destruction whilst at work upon his picture of Arundel. A heavy stack of chimneys being thrown down by a hurricane, broke in the roof of his painting room, burying him in the ruins, from which he was with difficulty extricated.

Switzerland, Normandy, the Moselle, and the Rhine, were successively visited upon sketching tours: sometimes Mr. Nash was accompanied by his amiable wife, who read to him, or recorded in her journal the passing incidents, whilst the painter sought to fix in varied colours the beautiful scenes that lay spread out before them. An ardent lover of his art, he lost no time in seeking to make himself acquainted with the diversified aspects of nature. An early riser, he might be constantly seen between five and six o'clock in the morning, portfolio under his arm, wending his way to some favourite scene that had attracted his attention, and where he laboriously worked out the day. His practice on such occasions was to make three studies of the same subject, under the different effects of "early morning," "mid-day," and "evening," a habit that might be beneficially followed by landscape-painters generally. But it is upon his architectural subjects that his reputation will mainly rest; and we may judge of the estimation in which his works of this class were held by the character of the purchasers, and the high prices that were paid for them. So early as 1811, a hundred and fifty guineas was paid by Mr. Wheeler for the drawing of "The Inside of Westminster Abbey, with a Funeral Procession." A few years later Mr. Allnutt purchased another drawing of the "Interior of the Abbey, with Monks," for one hundred and twenty-five pounds; and Sir Thomas Lawrence a third "Interior" of the same edifice for one hundred and fifty pounds. These were sums rarely realised by artists in water-colours at that period. Turner is reported to have pronounced Mr. Nash the finest architectural painter of his day—a high compliment from one who had given no little time and study to the examination of the monastic remains of this country. To judge fairly of the merits of an artist, we must look to the works of his best period, and not to those executed in declining years and failing health. Those who have only seen the recent works of Mr. Nash can ill judge of his talents. Of his industry it may be stated that, from 1810 to 1856, he exhibited no less than 472 drawings in the Water-Colour Society's exhibitions alone.

Devoted to his profession, which he loved above all things, he used to say that he should die with a brush in his hand, a prediction in some measure realised,—for in the delirium that accompanied his last illness, his hand moved as though at work, and he complained of the fatigue which he had undergone by painting upon his picture all night: exhausted with the effort, he gradually sank, and calmly expired on the 5th of December, 1856, at his residence at Brighton, to which place he had retired from London in 1834.

A good husband, amiable and upright in all the relations of life, we are not often called upon to record the death of one who leaves a worthier name behind him.

MR. JOHN BRITTON, F.S.A.

This veteran antiquarian and architectural artist is among those whose death it is our melancholy duty to record in our pages this month. Mr. Britton died on New Year's Day, at his residence in Burton Street, Burton Crescent, having nearly reached the advanced age of eighty-six, and retaining almost to the last his mental and physical qualities in an extraordinary degree of vigour: he has gone down to his grave like a shock of corn fully ripe. Only a few weeks prior to his death we were in his company, enjoying his animated and kindly conversation, and witnesses of his constant desire to afford pleasure, and to promote the happiness of others.

A remarkable man was Mr. Britton. Born at Kingston St. Michael, Wiltshire, in 1771, the first few years of his life were passed either at the village school, or in assisting his father, who carried on a sort of general business, and also cultivated a small farm. In 1787 he was brought to London by an uncle, who apprenticed him to the then host of the Jerusalem Tavern, Clerkenwell, where his chief employment seems to have been in the wine cellars. He spent nearly six years of his life in this ungenial occupation, and then engaged himself as cellarman at the London Tavern. His next employment,—as we learn from the *Builder*, in an article written, we presume, by the editor of that publication, who, like ourselves, had for many years the pleasure of enjoying the friendship of Mr. Britton,—was with a hoppersmith in the Borough, to which succeeded a three years' service with an attorney in Gray's Inn. Notwithstanding the obstacles which these various occupations offered to mental improvement, Mr. Britton continued to find a few opportunities for reading. He made the acquaintance of Mr. Essex, the bookseller, father of the well-known enamel-painter, and also had become intimate with Mr. E. W. Brayley, who was afterwards connected with him in some of his publications. "He was now able," says the writer referred to, "to give time to reading at booksellers' stalls and shops, and he frequented debating societies, where he attained a fluency of speech which never failed him."

In 1799 Mr. Britton was engaged by a Mr. Chapman, at a salary of three guineas per week, "to write, recite, and sing for him, at a theatre in Panton Street, Haymarket." This engagement brought him into association with theatrical persons, and was probably the origin of most of his early literary productions, pamphlets, song-books, &c. We must pass over these matters, however, to others of more importance.

Mr. Wheble, a publisher in Warwick Square, persuaded Mr. Britton to undertake an illustrated work on the "Beauties of Wiltshire." With the aid of Mr. Brayley, it was completed in two volumes, and published in 1801. This was followed by the "Beauties of Bedfordshire," and, in succession, by the "Beauties" of all the other counties; the whole embracing twenty-six large volumes, occupying twenty years in their production. Mr. Brayley and Mr. Nightingale were associated with Mr. Britton in the production of this work, but the last-mentioned author had by far the largest share of the labour.

In 1805 he engaged with Messrs. Lougman to publish his "Architectural Antiquities of England," a work extending to five quarto volumes, containing 360 engravings. It was followed by his "Cathedral Antiquities," in fourteen volumes, folio and quarto, with 300 engravings. It was commenced in 1814, and completed in 1835.

We have no space even to enumerate the numerous publications of minor importance to which Mr. Britton's name was attached, either as author or editor: it must suffice to say that his contributions to the antiquarian literature of the present century are a library in themselves: it is wonderful how much his energy and perseverance accomplished.

From 1845 to nearly the last day of his life, he was occupied in preparing his "Autobiography:" we believe it had almost approached completion; and there is little doubt of a very curious and entertaining volume resulting from the experience of so long and so chequered a history as that of Mr. Britton's life.

About a fortnight after his death, the Institute of Architects voted unanimously that a tablet should be erected to his memory in Salisbury Cathedral, provided the Dean and Chapter will give their assent—of which there can be no reasonable doubt.

MR. ARTHUR WILLIAM HAKEWILL.

Though several months have elapsed since the death of this gentleman, whose lectures and writings upon architecture are well known beyond the profession, we did not chance to hear of the event till quite recently. The following brief sketch of his life, by one who knew him well, cannot fail to be interesting.

The late Mr. Arthur W. Hakewill was born in the year 1808; inheriting the genius of his mother, under whose watchful care he grew, he at an early age responded to her desire by discovering a decided talent for literature;—well would it have been for him had he never deserted that profession, for which nature intended him. Seldom, however, do we find circumstances favour our wishes. He was, contrary to his inclinations, placed with Mr. Decimus Burton for the purpose of studying architecture, where, under the chilling influence of an office, his sensitive mind pined, as it were, after his favourite studies, and he became perfectly incapacitated. This painful circumstance rendered it necessary for him to visit Italy, where he remained for the space of three years: nevertheless, without deriving permanent benefit, in consequence of his being compelled to follow the same profession upon his return to England. Being forcibly struck by the graceful buildings in Rome, he devoted some time to the study of classical architecture, and upon his return published several works of great merit, consoling himself with the conviction of it being a worthy task to preserve and to hand down to generations to come the works of great men. He confined his notice to the architecture of the seventeenth century, the productions chiefly of Inigo Jones and Wren. His ability in design equalled his judgment in that which was the work of others. At the competition for the Nelson Memorial, he produced a design which, to use his own words, "should make the silent language of art eloquent." In 1848 he was appointed lecturer to the Architectural Society in Lincoln's-Inn-Fields. His contributions to various periodicals, the *Art-Journal* among them, were numerous, and for the last few years he fulfilled an engagement with the *Daily News*. Worn by the fatigues and cares of life, his strength gradually declined, but his hope brightened as his end drew near; he died in peace June 19, 1856, aged 48.

Among the published works of which Mr. Hakewill was the author are "Modern Tombs," "Architecture of the Seventeenth Century," "An Essay on Porticoes," &c. &c. His lectures include one on Barry's Paintings in the Adelphi, and another on the proposal for the Shakspeare Monument.

MR. THOMAS SEDDON.

Scarcely six months have elapsed since we noticed the exhibition, in Bond Street, of a considerable number of pictures and highly finished sketches, painted on the spot, in Egypt and the Holy Land, by Mr. Thomas Seddon; and now intelligence has recently reached England of his death, near Cairo, after a few days' illness: his age was only thirty-five.

Prior to his first departure for the East, Mr. Seddon exhibited occasionally at the Academy; his pictures chiefly consisting of scenery of Brittany. About four years since he left England, in company with Mr. Holman Hunt, for Egypt; the paintings exhibited in Bond Street, and also three which were hung at the Academy last year, were the results of this first visit. Having disposed of these works, and receiving commissions for others of a similar character, he again set out for the East, and was actively pursuing his labours when he was attacked by dysentery, which his constitution was unable to resist. In noticing the death of this artist our contemporary, the *Athenæum*, narrates an incident so honourable to his memory that we cannot forbear quoting it:—"Our readers will probably remember that we especially drew their attention to 'Sunset behind the Pyramids' as a picture of singular beauty. Connected with this very beautiful work of Art, is a little history, which, now that death has placed his seal upon the hand which painted it, sheds a glory over the painter and the picture. In the Desert Mr. Seddon had accidentally met with a young Englishman who was near to death; and, in order to soothe his last weeks of suffering, took up his abode with the invalid in the true spirit of the 'good Samaritan,'

and never left him until he had closed his eyes in peace. It was during this time of watching beside the otherwise desolate bed of a stranger in the Desert that this beautiful picture was commenced and almost entirely painted. It is lovely to recognise how, when the hour of his own need arrived for the painter, also in the Desert, a ministration of human love was raised up for him who had, on a similar occasion, so nobly acquitted himself of the last sacred duties towards a fellow-sufferer." To render the last paragraph intelligible to our readers, it will be necessary to state that when Mr. Seddon was attacked with the disorder that proved fatal, he received every attention from the Rev. Mr. Lieder and his family, who caused him to be removed from the village in which he was staying, to the Church Mission House in Cairo, where he expired.

MR. JOHN MIDDLETON.

This rising artist was born at Norwich, in 1828, and having evinced very early a taste for Art, he received some instruction from the late J. B. Crome, and also from Stannard, in Norwich. His feeling for painting increased with his years; so much so, that in 1846 he determined to pursue Art as a profession. Accordingly he became a pupil of Bright, with whom he studied until the death of his father caused him to return to his native city, where he resided till his death, which took place on the 11th of November last. From 1847 to 1855 he was a regular contributor to the exhibitions of the Royal Academy and the British Institution. During the last two years of his life the declining state of his health denied him the gratification of longer practising that art from which he had derived so much enjoyment. Among his best works may be mentioned, "A Study, in March, on the Norfolk Coast," which was exhibited in 1852, and is now in the collection of Mr. Arden; "Weybourne, on the Norfolk Coast;" "Summer," exhibited at the British Institution in 1852. His last work was in the Royal Academy in 1855. Having generally resided in Norwich, he was not personally known to many of his brother artists; but those who had the pleasure of his acquaintance cherish a warm remembrance of his kindly nature, and regret sincerely the decease of one who, had he lived, would have signalised himself in his profession.

MR. ROBERT RONALD McIAN.

This excellent and estimable artist died at his residence, in Hampstead, on the 13th of December, at the age of fifty-four years; and he was interred at the cemetery, Highgate, on the 23rd of that month, according to the ritual of the Church of England. He was a true Scottish Highlander, one of the ancient and renowned race of the McIans or Macdonalds, of Glencoe; and he loved, with a hearty and manly affection, the solitary home of his ancestors, whose persecutions he felt as a personal grievance two centuries after they occurred. The earlier years of McIan's life were passed upon the stage; and he obtained high repute as an actor of parts associated with his native country, especially as the Dougal Creature in "Rob Roy." About fifteen or eighteen years ago, however, he quitted the profession, and adopted that of Art, in which he arrived at considerable excellence, applying himself with the indomitable energy that was the leading feature in his character. A writer in the *Literary Gazette* thus speaks of his pictures:—"The results were visible in his five pictures of 'The Battle of Colloden,' and of 'An Encounter in Upper Canada,' in which a party of the clan Fraser made a gallant stand against a greatly superior force of French and American Indians. His picture of 'The Coronach' will also be fresh in the memory of many of our readers. His pencil never seemed so much at home as in painting scenes of savage life, or of violent conflict. There was no posture-making or child's play in his battle-pieces. It was all genuine work. You felt that every shot told, and every stroke left its mark. Mr. McIan was a warm-hearted, honourable man, and highly esteemed by all who knew him. Both as actor and painter, he was held in respect by his brethren, for he pursued both arts with enthusiasm, and with elevated aims. His friends mourn the loss to their circle of a kind and manly heart, a gallant spirit, and an independent mind; and the English school of Art has lost a devotee,

who, in his own particular department, gave promise of adding to its renown. Mr. McIan leaves a widow, the able mistress of the London School of Design, herself well known by her admirable pictures, of which, unfortunately, the public has of late years seen too few."

To these remarks we might add much; but we prefer to occupy our space with the following tribute to his memory from the pen of one of his many friends, Mrs. S. C. Hall, by whom his friendship was largely estimated and valued:—

A Memory of the late R. R. McIan.

While we write the bells are ringing the old year out!—the year which commenced as a giant to run its course, and is now departing amid the damps and dreariness of a dim winter's night, while rejoicing bells are loudly calling on their fellows from steeple to steeple, after the world's fashion, to spurn the old and triumph with the new. Pass away old year! you take much with you we have loved and cherished—to our grief, but to the deliverance and exceeding joy of those we loved. Our last "brother" whom you called "home" was a true, cordial, earnest man, who would rail at an enemy openly, and shield the honour of a friend with his life. It is impossible to gather rapidly the memories that extend over fifteen years; but the past is pleasant to recall; and it was so ordered that, deeply as we regret his departure, to *him* it was an act of mercy. For more than two years the frame of the Highland painter wrestled with an illness that would have vanquished an ordinary man in as many months; the spirit of life beat warmly in his pulses, and at times so triumphantly that his medical attendants hoped he might yet regain all he had lost; but the palpitating hope, the desolating fear, have settled into the stern reality:—on the 23rd of December the mortal part of Robert Ronald McIan found its last resting-place in the cemetery at Highgate. It seems but yesterday when we first made the acquaintance of the painter and his painter-wife—two who went hand in hand, and heart with heart, together through the world, two in one—one in the same pursuit, one in truth and faithfulness, in love and friendship, one in life, and all but one in death,—for their friends feared that Mrs. McIan's devotion to her husband would have brought her to a premature grave before *his* time for departure arrived.

Our memory goes back to a time when the theatre rang with well-merited applause at McIan's delineation of a particular class of character, more particularly of "Dougal," in "Rob Roy;"—the actor so identified himself with the wild Highlander that a great tragedian is said to have directed that no weapon should be placed within McIan's reach during his performance of the "Cataran," for that he was so "terribly in earnest" as not to be master of himself. It was a singular transition from the brightness and glare, the excitement and exhilaration of the foot-lights to the calm and quiet, the seclusion and repose, the "inner life" of the artist's studio; but though McIan quitted the stage, his sympathies remained with his old profession—he took a lively interest in theatrical affairs, and was ever ready to help a brother of the buskin. His mind was essentially dramatic, and unconsciously he "dramatised" with equal power on the canvas and in the social circle; his portraits of character, his developments of Scottish national scenes and circumstances were amongst his most successful pictures, and there was always some touching and delicate episode, which told the story with eloquent power and pathos. Those who have heard him sing "Donald Caird," or "We are na fou'," can never forget the inimitable reading he gave to both Burns and Scott. On one occasion, while a guest—as he often was, and ever a welcome one—at our house, he so perfectly acted the passage—

"We are na fou',
We're not that fou',
But just a drapie in our ee,"

that an old servant, thinking the gentleman quite unfit to remain in society, whispered to his master, with a glance towards Mr. McIan, "If he should go for a cab?" When in health and spirits he was a charming companion, his memory well stored and ready, and his keen appreciation of the beautiful, finding words in enthusiastic language, created an

interest which a cooler or calmer person could never achieve;—he talked pictures even faster than he painted them. He was too rapid in his judgments, too often suffered his heart to run away with his head, not to have been frequently mistaken in his estimate of personal character; but it was difficult to make him relinquish what he had once adopted, and even when deceived, the kindness of his heart permitted him to be deceived again; and, if his prejudices were strong, his affections were stronger. There are few greater treats in the world than to witness the zeal of a friend in a friend's cause, and, however hurt McLan might have been at times, at his pictures being "badly hung" on the crowded walls of the Royal Academy, it was delightful to see him forgetting it, even on the "first day," in the enjoyment he experienced at a great "success;" and to observe how he dragged up one critic after another to see some "marvellous bit of nature," or "wonderful effect" (never his own), which, but for his zeal, might have failed to attract notice. At such moments his eyes would flash like lightning, and, if his earnestness induced smiles, it also called forth sympathies; people were sure to be the better for his good word, for it was spoken to the world before the world, and not whispered in a corner. It is some years since we journeyed through the Highlands together, and enjoyed with him their matchless scenery; the heather grew in his heart, and there was no music he loved so well as the bagpipe on the wild hill-side. There are people who would open their eyes in wide astonishment if you assured them that all his experience of the foot-lights had not chilled an atom of McLan's love of nature; that though he enjoyed deer-stalking, and has lived weeks amongst the hills in the "shooting season," he would shed tears over a sick dog; indeed, his tenderness towards beast and bird was the tenderness of a girl: this may not be considered "consistent" with his hunting and shooting, but we believe no Highland gentleman could withstand the chance of hooking a salmon or shooting a deer—certainly our friend never passed a river without peering and "speering" as to the chance of finding a salmon within its depths, and he was just as keen in his inquiries after the deer and blackcock. He seemed to us to know every inch of the Highlands; he accompanied us both by daylight and moonlight through the "Pass of Glencoe"—through the wilds of Arasaig—round and over the well-known lakes, and to the renowned islands of Staffa and Iona—paused and pondered and conjectured, with us, beside Rob Roy's grave, and listened to the rush of the waters and the sigh of the wind in the island burying-ground of the Macnabs—where the last grave has been made, for the clan has sought its home in the new world. How we enjoyed Blair-Athol, and revelled in the pass of Killiecrankie! McLan's ready and rapid pencil caught every passing scene, and transferred it to his sketch-book; and then, in the mountain inns, he would tell us stories and sing us songs, all in keeping with the time and place. We shall never forget the spirit with which he poured forth, from the summit of the monument in Glenfinnan, his friend Bennoch's song of "The old Highland Gentleman," or how eloquently he described *there* the march, in costume, of the clans to meet their prince. It seems almost impossible that high-beating heart, so warm and true and earnest, should have ceased to palpitate. The loss of so many of his dear and loved friends—those noble Highland officers who fell in the Crimea—affected him greatly; his friendships were wound about his heart—they could not change; his friends' sorrow was his sorrow; and he mourned the loss of those gallant gentlemen as if they had been his brothers. These losses worked upon his excitable temperament in a way which more evenly balanced natures would find it difficult to understand; his illness came on gradually but surely throughout, and especially during the last few months. He was keenly alive to the watchful tenderness of his loved and loving wife: who, before and after her daily duties at the Female School of Design, was blessed with strength to watch him day and night; her presence became more and more his light, his joy, his life, and nothing could exceed his gratitude to her. His deep and earnest affections remained in full activity to the last,—they were the strongest elements of his nature.

THE APPLICATIONS OF IMPROVED MACHINERY AND MATERIALS TO ART-MANUFACTURE.

No. 2.—THE USE OF MAGNETO-ELECTRIC MACHINES IN PLATING AND ORNAMENTING METALS.

WE have, by the steady advances of electrical science, proved the identity of the several forms under which this force presents itself for our consideration.

Man, through a long period of time, witnessed with terror the phenomena of the lightning, and heard with superstitious awe the rolling thunder, little thinking that the age would come when this agent of destruction should be applied to the uses of humanity. The fossil resin *amber*, the *electron* of the Greeks, was long exhibited as a rare curiosity, from the remarkable property it possessed of gathering up light bodies which floated near it when it was rubbed. The province of Magnesia, in Greece, was known to produce a singular iron ore, which exhibited strange powers of attraction and of repulsion; and there is good evidence to show that this *loadstone*, or *leadingstone*, was employed by the oriental tribes, at an early period, to guide them over the desert and the ocean.

There was no suspicion that the principle or power of the thunder-cloud had any relation to the amber or the loadstone. Eventually, however, came the time for the birth of a new truth. Theu Franklin rose his kite into the air, and the spirit of the storm, answering to his call, revealed the secret to man, that the flash of lightning, and the attractive power of the amber, were identical. Man thus learned how to protect himself and his temples from the "angry bolts of Jove," and the phenomena of frictional electricity were carefully studied by Franklin and his followers. Galvani then discovered that chemical change would develop a peculiar force; or, rather Volta, correctly reading the results which Galvani obtained, showed that a metal undergoing oxidation, gave out a power analogous to the electricity of the machine. Galvanism, or voltaic electricity, became, in the hands of Sir Humphrey Davy, a most important element in the investigation of nature. This philosopher, who has not yet obtained his true position amongst the great ones of the earth, succeeded by the voltaic battery in proving the true composition of the earths and alkalies—lime and magnesia, potash and soda, were shown to be metals combined with oxygen: and Davy opened the road which has led us to the discovery of that peculiar and valuable metal *aluminium*, the base of the most common of the substances which constitute the superficial coating of the earth—clay.

Ersted, of Copenhagen, demonstrated that a current of voltaic electricity possessed the property of compelling a magnet to place itself at right angles to its direction: and Sturgeon taught us that such a current converted a piece of soft iron into a powerful magnet. Thus, step by step, we became acquainted with the fact, that the lightning of the air, the electricity of the machine, the galvanism of the battery, and the attractive power of the magnet, were but modified forms of one principle. There was still one question to be replied to—Could we from a magnet develop a force which should have the powers of that developed by friction from the electric machine, or by chemical action from the voltaic battery? Faraday, by a series of beautiful inductive experiments, proved that every motion of a copper wire near a magnet, or of a magnet near a copper wire, produced an electrical disturbance, which circulated as a current. The identities of the electricities were thus fully proved: and, yet more recently, improved arrangements in coil machines have shown that all the intensity of static electricity can be produced by securing perfect insulation of the arrangement; and thus that a very small quantity of current electricity may be developed as electricity of high tension. Such is a brief outline of the progress which has led to the construction of magneto-electric machines, to which we desire especially to direct attention.

If a reel of copper wire, covered with silk, be placed in front of the poles of a good steel magnet, with some arrangement for giving it motion, we shall find, when motion is established either in the magnet or the coil, that an electric disturbance is produced,—that an intense current traverses the wire.

The intensity of this electric force is regulated by the strength of the magnets employed, the extent of the wire, and the rapidity of motion. This curious electrical disturbance may be produced by very simple means. If a loop of copper wire is merely passed up and down over the poles of a magnet, an electric current will circulate through the wire; and if the wire is connected with a galvanometer, the needle of the instrument will be deflected every time the loop of wire is passed in either direction, up or down, over the pole of the magnet.

For practical purposes a number of magnets are fixed in a circle, and the armatures, carrying coils of copper wire, are made to move rapidly in front of their poles: thus is generated a current of any power, capable of effecting any amount of electro-chemical decomposition. Arrangements of this kind are employed in many establishments, instead of the voltaic battery, for all the purposes of the electrotype; and to some new and peculiar processes we have to direct attention.

It is important to the correct understanding of what takes place when a magneto-electric current is produced, that the philosophy of it should be, as far as possible, understood. A magnet is a reservoir of power, as far as we know, quite inexhaustible; and the force—intensity—with which that power is developed, depends upon the mechanical force applied to move the machine, the rapidity of motion determining the working value of the current. All compound bodies appear to have their constituent elements held together by some electrical condition. One of the most beautiful of the laws established by Faraday being this—*The quantity of electricity which is required to decompose any substance exactly represents the quantity which that body contained previous to decomposition.* Now, if the terminal poles of the coils of copper wire which are in motion in front of a magnet are dropped into a solution of a salt of gold or of silver, the electricity passing through the fluid liberates the metal, which appears at one pole, and the acid, which escapes at another. The rapidity with which this is effected depending upon the mechanical power employed to drive the machine. Magneto-electric machines have been for many years in use in the electro-plating and gilding establishments of Birmingham, and it is found that, notwithstanding there has been a constant demand upon them for electricity, yet they exhibit no diminution of the supply.

Recently, on the Continent, some novel processes have been introduced, by which ornamentation of various kinds are produced on metals. A plate of steel, brought to a very high polish, is connected with one of the poles of a magneto-electric machine, and the other is brought to a fine point; when the point—the pencil of the artist, which is fixed in a handle of glass or ivory—is brought within a certain distance of the plate of steel, a brilliant spark passes; this is due to the combustion of the steel, and it will be found that after every spark, a white spot is left on the polished surface of the steel plate. As these sparks may be produced with any degree of rapidity, a line is soon formed, and any design traced upon the steel. The result is extremely pleasing, and we learn that the process is employed in France and Austria to ornament sword blades and other articles of steel.

M. Alex. Henri Dufresne, of Paris, has patented an invention which relates to the gilding, silvering, and ornamenting of metals not susceptible of direct amalgamation. This invention embraces any of the means now in use for producing coatings of the metals, by either chemical, electro-chemical, or mechanical means, or for removing portions of the coatings thus formed. The invention divides itself into several parts:—First, the precipitation by a magneto-electrical machine, or by voltaic batteries, of one or several metals. Secondly, in the application of protecting matter, such as varnish, printer's ink, &c., upon the intermediate metals, to form the reserves to be gilded, silvered, or ornamented: such reserves being produced by photographic means, or by a general coating of some kind sensitive to light. Thirdly, in the destruction of the intermediate unreserved metals by baths of different kinds—such as ammoniacal or acid solutions, applied so as to preserve the polish, or to act on the surface of the metal to be gilded, sil-

vered, or ornamented, for the production of flat or of relievé designs. Fourthly, in the removal of the protecting matters which have served to preserve the surfaces operated on. Fifthly, in gilding or silvering the surfaces by means of mercury, according to the ordinary processes of gilding and silvering by amalgamation; and, finally, the volatilization of the mercury by heat. The details of this process may be described in a single example—the ornamentation of steel. A sheet, or any object of polished steel is taken, and by means of the magneto-electric machine, it is coated with copper. If any of the alkaline salts of copper are used, the steel beneath the copper loses little of its brilliancy, and, when the copper is eventually removed, it appears again in its true colour and brightness. If the object of the artist is to obtain an elaborate design, it is best effected by photography: either of two processes may be employed:—1st. The coppered surface of the steel is covered with bitumen of Judea, by warming the plate, and pouring upon it the resin dissolved in French oil of lavender, the heat being still continued, the essential oil is evaporated, and a sensitive coating left upon the plate. The design, drawn upon paper—an engraving or otherwise—is placed upon this sensitive tablet, pressed close by a glass, and exposed to sunshine. The parts which have been covered, and those which have been exposed, acquire unequal degrees of solubility—so that one portion can be dissolved off by means of ether or naphtha, while the other remains unchanged. 2nd. Bichromate of potash and gelatine may be used instead of the bitumen of Judea, in the same manner as it is employed by Mr. Fox Talbot for engraving upon steel, and by Mr. Pretsch in his photogalvano-graphic process. When this coating is exposed to sunshine with any object superposed, all those portions which were preserved in shadow are capable of being dissolved off by water, while the chromic acid liberated by the solar action combines with the gelatine, and renders it insoluble. By either of these processes we have the design formed on the plate, the metal along certain lines being left quite bare. It is desired to remove the copper from those exposed parts—chromic acid is poured on the plate, and the copper is readily removed, while the steel is not affected by it. The exposed steel may now be left bright, or it may be bitten into by acids, or any design may be worked upon it; and if we choose to gild it, we have but to connect it with the magneto-electric machine, and place it in a solution of gold, by which means any thickness of gold can be thrown down. If we desire to have silver in relief on the steel, that metal is roughed by an acid; the plate is put into a solution of the oxide of silver in cyanide of potassium, and by the electro-chemical action any thickness of the metal can be deposited along the exposed lines, the other parts being still protected by the resin or the gelatine. If with a resinous varnish any design is traced upon the exposed steel, those parts will be protected from the action of the deposit, and the resin being subsequently removed, bright steel remains in the midst of the design traced out by the gold or silver. Now the resin or the gelatine remaining on the plate can be removed, and we thus expose the copper surface. We may treat this as we have described in respect to the steel, and precipitate upon it any metal we may desire.

To operate upon platinum, that metal is covered with copper by the battery, and then the design is formed as already described. The unprotected parts of the copper are then dissolved out by nitric or any other acid, and the varnish being removed, any process of ornamentation, by amalgamation or otherwise, can be applied.

To operate on silver the processes are modified. First, there is deposited on the silver surface a triple metallic coating—copper, then iron, and then again a coating of copper. This is done by the magneto-electric machine. Produce by photographic processes, or otherwise, the reserves on this, the last coat of copper, and then destroy in succession the unreserved parts of the superposed metals, so that the iron, which presents itself on the removal of the upper coat, prevents the mercury from adhering to the first copper or silver surface during the amalgamation. The iron is subsequently removed by any suitable solvent. The object of interposing the iron between the two copper surfaces is to facilitate and shorten the operation, by limiting the employment of the reserves to the surfaces to be gilded

or ornamented. This object is effectually attained by the agency of chromic acid, which readily dissolves the copper, without at all interfering with the iron.

Instead of employing an interposed coating of iron between the two coats of copper, there may be employed, and in many cases more advantageously, a surface of nickel or antimony, which are readily acted on by chromic acid. The last surface of the copper may be removed by an ammoniacal solution, which has the advantage of leaving the silver untouched.

It will be seen that this invention involves the agency of electricity, light, and chemical affinity. It is surprising how greatly these processes can be varied, and what an infinite number of beautiful effects can be produced. To all who are acquainted with the electrotype and the photographic processes, it will be evident at once that they are here combined in practice, with much apparent advantage. We are enabled to produce the most complicated arabesques and designs in a variety of metals. Upon the same tablet we may have steel, copper, platinum, gold, and silver, in any thickness we please. For such purposes as these, the electricity of the magneto-electric machine, being of higher intensity than that of the battery, is found to be the most effective. We regard this as a step in advance, in the direction of employing the physical powers of nature for the purposes of Art-decoration. By the agency of the sun-beam and electricity we have already several beautiful and useful processes; this process of Dufresne is another added to the list, and we expect ere long to see it become of general application.

ROBERT HUNT.

ART IN THE PROVINCES.

ALNWICK.—A window of stained glass to the memory of Hugh, the late Duke of Northumberland, has recently been placed in St. Paul's Church, Alnwick, an edifice erected and endowed, at a cost of nearly £20,000, by his grace. The window was designed by Mr. Dyce, R.A., and executed at the Royal Manufactory at Munich, under the direction of Professor Aimmüller. The subject of the design is the preaching of the Apostles Paul and Barnabas, at Antioch; it occupies the five lower lights of the window, the tracery lights being entirely filled with ornamental patterns. The scene is represented as taking place within a recess or shrine of Gothic architecture, the back of which is pierced with windows, through which the blue sky appears; the front is open, with the exception of an overhanging, flat-fronted canopy of delicate workmanship which terminates the upper part of the composition, and the base of the canopy, which terminates the lower part of the window, and upon which are represented the family coat-of-arms of the Percy family, and the arms of the several baronies to which the duke was entitled, as well as the following inscription:—"In the year 1856 this window was placed, by public subscription, to the much-valued memory of Hugh, third Duke of Northumberland." The principal group occupies the centre light; the two apostles stand upon the raised step of a throne, or canopied chair of state, and are in the act of addressing the unbelieving Jews, who are grouped together on their left, some seated on a bench on the foreground, others standing in various attitudes behind. On the right of the Apostles is a group of male and female figures, and from their expressive countenances, while listening to the preaching of Paul and Barnabas, who are directing the attention of the others to them, it is easy to perceive they are converts to the new religion. The window, both in design and execution, is considered a very fine example of the art of glass-painting.

LOWESTOFF.—Somersetton Hall, the new mansion recently erected by Sir Morton Peto near this town, contains some excellent specimens of modern wood-carving, in the style of the period of James I.: the library is entirely lined with carved oak, the whole of which was, we understand, designed and executed by Mr. J. M. Wilcox, of Warwick; the furniture in that apartment, as well as that in the drawing-room, boudoir, &c., was also executed by him.

WORCESTER.—The number of pictures, &c., recently exhibited in the Gallery of the Worcester Society of Arts was four hundred and thirty-one, including paintings by Creswick, E. W. Cooke, Frith, Hollins, Davidson, Peel, Havell, Callow, Boddington, H. Dawson, Duffield, Noble, Mrs. Oliver, &c., &c. The sales were comparatively few in proportion to the number exhibited, yet sufficient to inspire hope for the future. Thirty-four pictures found purchasers, realising upwards of £580.

THE FRUIT-GATHERER.

FROM THE STATUE BY E. WOLFF.

AMONG the foreign sculptures exhibited in the Crystal Palace, at Sydenham, are several by E. Wolff, a distinguished German sculptor: we will briefly refer to them. They consist of—"Telephus suckled by a Hind," a group smaller than life-size, the original of which was executed for the King of Prussia; a life-size statue of a "Nereide," or rather of a nymph, fishing—she is reclining on the sea-shore, with some shell-fish near her; a small life-size statue, entitled "Wiuter," who is symbolised by a boy, dressed in a lion's skin, and holding in his hand a cone of the fir-tree, with which the Italians light their fires; "Diana," standing and resting on her bow, also small life-size; "A young girl in German costume, with a lamb;" and "The Fruit-Gatherer," that forms the subject of the engraving. This statue, which is executed in what is generally called the "ornamental" style, is a bold and well-designed composition. The form and limbs of the figure are not modelled from the figure of a Greek Venus, graceful in outline, and delicate in expression; they are those of one who has laboured in the vineyards of Italy, aiding to pluck and gather in the purple fruits of the vintage; her limbs are strong and vigorous, yet not masculine. The sculptor has placed her in a picturesque, natural attitude, as if stopping to rest for an instant; but much of the "repose" of the figure, and its "breadth" of effect is lessened by the multitude of lines into which the sculptor has thrown the drapery. On the other hand, such a treatment rather assists the florid and ornamental character in which the statue is designed.

Emile Wolff was born at Berlin in 1802; he studied first under J. G. Schadow, director of the Berlin Academy, and afterwards went to Rome, where he had the advantage of attending the atelier of Thorwaldsen. Since the death of Rudolph Schadow, in 1822, Wolff has occupied the studio of that sculptor in Rome, where, under the direction of Thorwaldsen, he completed Schadow's last great work, left unfinished, "Achilles defending the body of Penthesilea." He was also entrusted with the execution of the marble monument erected to the memory of Schadow, in the Church of St. Andrea delle Fratte, Rome. On a bas-relief, in front of the monument, Schadow is represented standing before his unfinished statue of "La Nonneuse de Sandale;" the angel of death arrests him at his work, while Fame places on his head a crown of laurel. The composition is fine, though it exhibits much of that ultra-poetical feeling we so frequently meet with in foreign monumental sculpture.

Several of Wolff's principal works we have pointed out already; others, deserving of especial mention, are the following:—In the possession of the King of Prussia is a "Sportsman." In the same collection is a "Shepherd" playing the flute as he rests against a tree; his dog lies by his side. A replica of this group is, we have heard, in the possession of a gentleman in England, a Mr. Douglas. His Prussian majesty was also the purchaser of Wolff's "Fisherman," a nude figure, holding a line in one hand and a fish in the other.

At the country mansion of the Prince Royal of Prussia, Charlottenhof, near Potsdam, is a charming group of "Thebe and Ganymede."

There are two statues by this sculptor, we are informed by Raczyński, in his "*L'Art Moderne en Allemagne*," in the possession of an English gentleman, Mr. R. Holt. One is an "Armed Warrior," the other a "Huntsman holding back his Dog." Wolff, we may remark, is distinguished for his clever sculptures of animals. For the Countess Wielhorski he executed a "Thetis seated upon a Dolphin, with the arms of Achilles;" and, in 1837, a fine group, the destination of which we have not learned, representing a "Wounded Amazon leaning on the shoulder of another female warrior." A "Pandora" may also be mentioned as among his best works.

In 1841 Wolff was in England, and obtained the patronage of the Queen and the Prince. He executed a statue of the latter in the costume of a Greek warrior.

THE FRUIT-GATHERER.

ENGRAVED BY E. ROFFE, FROM THE STATUE BY E. WOLFF

LONDON, PUBLISHED FOR THE PROPRIETORS.

THE OLD CHURCH OF TRINITY COLLEGE, EDINBURGH.

THE Town Council of the "modern Athens" have been justifying the right of their city to its self-assumed title after a fashion which, as regards the taste, is borrowed from the Vandal, and, as regards the morality, from the Carthaginian. Luckily, there is a protesting element among the people, which affords some prospect that the matter in dispute may yet be redressed in the interests at once of Art and of good faith.—The old church of Trinity College, in Edinburgh, was founded about the middle of the fifteenth century by Mary of Gueldres, the widow of the Scottish monarch James II. It is one of the most remarkable fabrics in Scotland, and dear to the antiquarian heart as nearly the only surviving specimen of the Soto-French development of Gothic architecture which that kingdom affords. Well, the great modern iconoclast, our readers know, is the Iron Horse. The grass will not grow where its hoof of fire has been, and column and fane go down before the rush of its headlong career. One day, it will ride down St. Peter's itself, unless St. Peter's successor will open up a pathway for it to go round. Coming through the Calton tunnel, some years ago, the Iron Horse found the old college church standing right in its way. Then, poured down the wise men of the northern Athens,—the priests of Art, and the worshippers of the picturesque,—and in the name of Mary of Gueldres they exorcised the Iron Horse. In plain language, the North British Railway entered into negotiation; and the then Lord Provost, Mr. Black, intrusted with the city interests in the British Parliament, of which he was a member, accepted a compromise in the matter. Seeing that the impatient monster, who stood pawing by, would fairly hurry the old church beneath his tread, if the latter were allowed to stand where it then did, and *he* came in upon a higher level, it was agreed between the parties, that the railway company should remove and rebuild the church on a convenient site, as near as might be to the site on which it then stood, and on the model of the ancient monument,—or, as an alternative, that the magistrates and Town Council of Edinburgh should accept a sum of money from the company as compensation, and take the rebuilding on themselves. In pursuance of this agreement the railway company, in due time, presented plans for a new church, at a cost of £16,371; and these plans, we beg our readers particularly to observe, the Council opposed, chiefly on the ground that *they were not a restoration of the ancient edifice*. So, the above sum was, then, offered in money, instead of the plans, and was accepted on behalf of the city of Edinburgh,—the church was taken down in 1848, and, its restoration being still kept in view, the stones which composed it were carried to the slope of the Calton Hill, and there left to await their place in the reconstruction. Delays and disappointments have since succeeded one another in the matter of procuring a fitting site; and now, at this distance of time, a new Town Council have arisen,—to whose proceedings we desire very particularly to call the attention of our readers. First, let us observe, Mr. Black distinctly informs this Council, that he rested his case for compromise and compensation before the parliamentary committee on the ground of restoration alone,—and let us observe, also, that a sum exceeding £16,000 was far beyond what would have been needed for the erection of an ordinary church, and was paid with a direct view to the reconstruction of the old edifice of Mary of Gueldres. And avowedly, as we have seen, because the plans offered instead *were not such reconstruction*. What do our readers think, then, of a Town Council who now declare, that, having got this large sum of money into their hands for a specific purpose, they consider themselves at perfect liberty to apply it to another,—that, having increased the compensation on the ground of restoration, they are under no obligation to restore! The conditions of their trust they affirm to be satisfied when they shall have built a "suitable church" for the parish where and at what price they will. Let the old monument perish as a fact:—it did its work as a pretence when it extorted a few thousands more from the railway company!—The members of the Society of Antiquaries protest,—

the bar protests,—the men who represent literature, Art, and taste in general, in the metropolis of the north protest. A public meeting resolves, that "the rebuilding of the church in strict accordance with the original model was not only desirable on grounds of Art and history, but was imperatively demanded by the obligations of public faith." In vain! Vainly does Colonel Mure plead for the true model, as an old relic,—vainly does Mr. Robert Chambers, with a shrewd apprehension of civic susceptibility, insist on the *advantage* of preserving to Edinburgh the elements of its beauty and *attraction*,—vainly does Mr. Black affirm, that "he could no more have thought of not restoring the church with the money than he could have thought of not paying an honest debt." Certain it is, that if Edinburgh be the modern Athens, the present Lord Provost is not Pericles. The old church of Trinity College is lost to its Acropolis, unless the law courts shall come in aid of the Scotch Minerva, or the British Parliament, before whom the matter will in all probability be brought, shall give now an explicit and authoritative interpretation of its own previous oracle.

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY.—On the 12th of December the members of the Royal Academy met for the election of an academicien in the place of the late Sir Richard Westmacott, and filled up the vacancy with the well-known name of Mr. Alfred Elmore. The contest lay principally between that gentleman, Mr. Frederick Richard Pickersgill, and Mr. Sydney Smirke; though a few scattered votes were given to men whom this Academy seems unaccountably to have left behind,—and some to men whose claims are yet comparatively young, and who can well afford to wait. Mr. Elmore's election to their full honours by his academic brethren is one which the public voice will very cordially ratify. It is probable that his fine picture in the last year's exhibition—"The Emperor Charles V. at Yuste"—had much to do in determining the present contest in his favour against such competitors.

THE ROYAL ACADEMY has, we hear, adopted, through the Council, the following resolutions:—"That with a view to the instruction of students, lectures may be given in the Royal Academy, by the members, irrespective of the professorships. That such instruction may comprehend, not only painting, sculpture, and architecture, but also engraving, and such other subjects as, when submitted to the Council, may be deemed by them desirable. That such instruction may consist of short courses, or even of single lectures, to suit the convenience of members. That members, including associates of the Royal Academy, and honorary members, on testifying their wish to the council, may, with the sanction of the council, be authorised to give lectures accordingly." This is another step—the election of engravers into full membership was the first—towards that change in the laws and constitution of the Royal Academy which the artists of the country, and the public, too, have so long required. We shall look with some degree of anxiety and curiosity to ascertain what use will be made of the privilege now granted, and who among the members and associates will step forward as a voluntary and gratuitous Art-teacher.

THE "VARNISHING DAYS" AT THE ROYAL ACADEMY.—We have learned with great regret, and certainly not without some surprise, that an attempt is making within the body of the Royal Academy to restore to the academicians the most obnoxious of all the privileges which, for so long a series of years, they exercised under the diploma,—that of painting on their pictures after they were hung in the place of exhibition. The rule under which this injustice—so unworthy of the rank and character, and in most instances, let us add, the talent of those who benefited by it—was perpetrated, was as follows:—"Three days or more, according to the convenience of the arrangement, and the discretion of the Council, shall be allowed to all the members of the Royal Academy, for the purpose of varnishing or painting on their pictures, in the places which have been allotted to them, previous to the day appointed for the annual dinner in the Exhibition Room." When, a few months ago, we offered a somewhat lengthened comment on the defective constitutions

of the Royal Academy, and the abuses which had grown up under them, we purposely abstained from all allusion to this offensive rule and practice, because the academicians themselves had not long before made a voluntary surrender of so unhand-some an advantage over their brother artists, and it seemed to us ungenerous to refer to a wrong, however long persisted in, which had at length been redeemed by an act of grace. We desire to use no harsher terms in reference to this academic privilege than we have heard applied to it by academicians themselves. There were many of the body who sat uneasily for years under a prerogative which, while it inflicted a wrong on others too glaring for the public to overlook, lent itself to a world of epigram against themselves. If the pictures of the Royal Academicians could not be made to show advantageously on the walls of the Academy without this process of naturalisation, what could be thought of the men who kept the process for themselves, and left their brethren to the disadvantage from which *they* thus, in the matter of their own works, escaped? What could be said for those who, being the strong on the authority of the diploma, compelled those who by the inference of its absence were comparatively the weak, thus to carry weight in the race for fame and for bread. Practically, the wrong was a double one. The academicien who painted up his own picture, usually painted down his neighbour's. The original defect of tone in both works became increased in the one by the means taken in the other to redeem it. The academicien's *plus* was the non-academicien's *minus*. The legends of the varnishing days are many of them sad, some ludicrous, and none to the credit of the Academy. The attempt to revive so unquestionable an abuse, just at the moment when public attention is likely to be particularly directed to the doings of this Academic body, is singularly injudicious; and we hope—and, indeed, scarcely doubt—that the Council, to whom, for the present, the matter is referred, will deal with it in that higher spirit which so recently resigned the privilege. If it be found that it is really desirable, for the gain at once of the artist and of the public, that the former should have the opportunity of touching on his picture with reference to the accidents of its place, then, we trust that arrangements will be made for extending the opportunity to all. Either way, there *must* be equality in this matter. Those of the academicians who felt strongly, before, that the privilege could not be retained, will surely think with us, now, that it cannot be restored.

THE HOUSES OF PARLIAMENT.—Another statue, that of the Earl of Chatham, by Mr. MacDowell, R.A., has recently been added to the number of similar works which stand, like watchful sentinels over the laws and constitution of the British empire, in the grand entrance of the Houses of Parliament. The figure of the illustrious statesman is a fine example of portrait-sculpture, dignified in its action, and truthful as a likeness. This makes the tenth statue, if we mistake not, which has reached its final destination; two more are to follow, those of Burke and Grattan, whose impassioned speeches shed such brilliancy over the senatorial debates in the lower house, in an age when parliamentary eloquence was the rule and not the exception.

THE STATUE OF THE LATE LORD HARDINGE, the work of Mr. J. H. Foley, A.R.A., is now completed, and will, ere long, be forwarded to its destination at Calcutta. The members of the United Service Club are about to have a meeting to consider a proposal for erecting a "replica" of the statue in some conspicuous part of the metropolis.

PHOTOGRAPHY.—We have examined a series of landscape photographs by Mr. Henry White, which for delicacy of detail, choice of subject, and artistic taste and feeling, surpass all that we have yet seen in this way. They comprise sketches of wood and water, distance and foreground, studies of foliage and river scenery, which cannot fail to charm the amateur of this delightful art, and to the artist must be invaluable, bringing as they do Nature herself in her most beautiful and varied forms into his studio—depicted, too, with such fidelity, minuteness of detail, and accuracy of drawing, as the graver can never hope to equal. This may be especially remarked of the studies of ferns and brambles, corn, and other natural objects. Mr. White obtained for some of these works a first-class medal at the Paris

Universal Exposition, in 1855; and we are happy to see that he has again obtained the highest prize—a medal with special mention—at the late Universal Exhibition of Photography at Brussels, where, among upwards of one hundred photographers of all nations, only seven obtained this high distinction, two of whom were our countrymen, Mr. Fenton and Mr. White, whose landscapes are placed by the reviews of that Exhibition—lately published in the bulletin of the French Photographic Society, and in the *Cosmos* of October last—at the head of all English landscapes, which they, at the same time, admit to surpass those of all other countries.

THE BRITISH MUSEUM has recently received some interesting accessions of antiquities, found in the Crimea during its occupation by our armies. These objects consist of Grecian vases of various shapes, material, and colour, sculptured figures, and fragments of monumental decorations, the latter being chiefly flowered ornaments carved in wood, sculptures in ivory, and wall-paintings rich in colour. The Roman antiquities consist of numerous glass vessels; while some objects of Anglo-Saxon date and workmanship show, as a contemporary remarks, "that in remote times our ancestors had habitations on the same spots which have been occupied by our troops during the recent war."

MAYALL'S IVORY PHOTOGRAPHS.—The want of a tablet for photographic pictures, which should be, at least, equally as absorbent as paper, and free from those inequalities and impurities which are such constant sources of annoyance to the photographer, has long been felt. Mr. Mayall appears to have succeeded in producing a surface possessing all the required qualities—perfect whiteness, uniformity of absorption, and chemical purity. This well-known photographic artist has very properly used the term ivory to express the character of the surface upon which he now produces his pictures. Except ivory itself, we do not think a more beautiful medium could be produced. It appears to be composed of barytes and albumen; and this, when solid, is well rubbed down and polished. The photographic portraits which are printed upon this surface are in themselves remarkably fine productions. It is, however, the purpose of Mr. Mayall that all this class of picture should be finished by the hand of the artist. We have examined several portraits, which possess the highest degree of finish—being, indeed, in scarcely any respect inferior to ivory miniatures of the highest class. These are produced at one-fifth the cost of the work of the miniature-painter—the sun, by one impulse, works in all the beautiful and minute details, so that a wash of transparent colour from the artist's hands is all that is required to produce these truly beautiful pictures. Beyond these points of excellence we were much pleased with the artistic and picturesque arrangement of Mr. Mayall's figures, each one of which was evidently a careful study. In the place of the cold and formal daguerreotype portrait which used to perplex us, we may now possess portraits of our friends which are truly artistic productions, pleasing in whatever light they may be viewed, and truthful beyond the artist's power.

WALLACE AND HUME MEMORIALS.—We have seen in a Dundee paper, and quoted in some of the London journals, a notice that the sums subscribed for these monuments have only reached, in the one case £2000, and in the other £1300—indicating them as failures, and thence taking occasion to say that we attempt too many public memorials of this nature! Why any one can be so "superfluous" to use our old friend Falstaff's expression, as thus to check the encouragement of a noble Art inadequately fostered as yet in this country, and also akin to the records of literature, we cannot imagine. Government, through its board of trade, applies several tens of thousands a year in direct efforts to inculcate public taste, and promote its spread; but these costly endeavours were worse than vain, if no eventual high rewards are to be held out; and, it must ever be remembered that the highest classes of Art *must* be encouraged, or we can never hope to pull up to their due level the lower, though wider spread, grade of ornament. We are the more surprised at the remark, as it bears on its face its own refutation. £2000 is quite enough for a fine bronze statue of the Scottish Hero; and in the case of Hume, what could be a more fitting memorial to him than a marble statue in the Houses of Parliament, the

scene of his honourable labours; and why should it cost more than the seven foot statues in St. Stephen's Hall already erected at a cost of £1,000 each? What could his nearest friends and chief admirers desire more fitting than this; and, supposing the fund reached no more than the sum quoted by our contemporary, does not that leave £300 surplus for extras? We do not, as we have said, understand the animus that has dictated the remark to which we allude, but we are glad to perceive that it is calculated to bear different fruits from those contemplated, and rather to encourage than repress public monuments to the good, the wise, and the great; inasmuch as it might well be said, if such worthy consummations are the results of failure, what would be accomplished by a success?

THE ART-TREASURES EXHIBITION.—The interest of this great undertaking increases from day to day; there is absolutely a glut of Art-treasures; and the Committee will now have to encounter the irksome duty of selection, for the building cannot contain half the proffered contributions. The new appointments are very judicious: Mr. Delamotte undertakes the task of selecting and arranging Photographs; and Mr. Holmes, barrister, will select and arrange the Engravings, assisted by Messrs. Smith and others. The Royal Academy has decided on lending some of the diploma pictures—another departure from "rule" which does credit to that body. The Committee are indefatigable in their exertions, and are getting satisfactorily through their benevolent labours.

BARON MAROCHETTI, whom, we presume, may be designated the "Court Sculptor," has completed, and erected in St. Thomas's Church, Newport, Isle of Wight, the monument to the memory of the Princess Elizabeth, daughter of Charles I. The monument was a commission from the Queen; it represents the figure of a young female reclining in a kind of recess, the head resting on an open Bible, which forms its pillow. The princess died in Carisbrook Castle, in 1640, and was buried beneath the chancel of the church in which the tomb is erected.

WALL CLOTH HANGINGS.—Mr. Joseph Adshad, of Manchester, has patented what is described as a durable and economical substitute for plastering, papering, painting, &c., called "Anti-moisture Cloth," to supersede ordinary paper-hanging, &c. The material is in imitation of woods, marbles, &c., and also flower-groups; and several examples of it are placed in one of the rooms of the Mechanics' Institution. The imitations of the woods include most of the kinds known in this country, with specimens of granite, painting, marble, &c. The surface is varnished, and can be cleaned even with hot water without injury. The cloth is a warm fabric, and of fine quality, and, as a cloth-hanging, appears to be admirably adapted for all the purposes of house decoration, and peculiarly suited for the paneling and ornamentation of public buildings, &c. The extra cost of the material is by no means considerable, while the advantages are obvious. The invention is, indeed, a near approach to the ancient tapestry, for the material is capable of receiving any amount of art. The specimens shown at the inauguration of the Manchester Mechanics' Institution were of great merit, and attracted general attention; but since then several important improvements have been introduced; and although not yet perfected, the invention already holds a high place in public favour. We shall probably be enabled to furnish a more detailed report on this subject at no distant period.

THE PLAYS AT TAVISTOCK HOUSE.—It has been made known by the public press that Mr. Charles Dickens has been receiving "company" at his residence, and has been there entertaining them by the representation of plays, in which he acts the leading characters. A drama of very great excellence, entitled "The Frozen Deep," was written by Mr. Wilkie Collins expressly for these occasions; and it is unnecessary to say the audience—exclusively the friends and acquaintances of the great and popular author—were gratified to an extent inconceivable by those who were not of the invited. The invitations, however, were very numerous—on each of four evenings the guests numbered nearly 150, including a very large proportion of the men and women of "mark" who are the "celebrities" of the age and country—statesmen, judges, artists, men of science, poets, and authors of all classes. To meet such an

assembly was, in itself, a rare intellectual treat. Much of the scenery was painted by Mr. Stanfield, and the "*mise en scene*" was as perfect as we can imagine it to be in a private house. The dramatic powers of Mr. Charles Dickens have been the theme of frequent comment; they are unquestionably of the very highest order; there can be no doubt that if he had been an actor he would have been as truly great as he is in that higher and more enduring art of which he is the leading professor in modern times. This is saying much, but not too much. We can conceive nothing finer than his performance of the part allotted to him in Wilkie Collins's play. There were other parts—those, especially, that were sustained by Mr. Mark Lemon and Mr. Augustus Egg—of rare excellence; and, altogether, an evening more agreeable, more intellectual, or more entirely instructive it would be impossible to pass under any roof, public or private.

A SALE OF DRAWINGS took place last month at the rooms of Messrs. Foster: the principal were:—"The Gallant Act," Stanfield, 25 guineas; "Grapes," W. Hunt, 31 guineas; "Newark Castle," Cattermole, 15 guineas; a pair by J. D. Harding—"Aurillac" and "Bologna," 30 guineas; "Shooting Pony and Dogs," F. Taylor, 32 guineas; "The Rustic Toilet," P. F. Poole, 28 guineas; "Grapes, Plums, &c.," W. Hunt, 57 guineas; six tinted drawings, by Turner, from Dr. Munro's Collection, £27 8s.; and, lastly, Turner's "Wiudermere," engraved; this, after an eager competition, was knocked down to Mr. Gambart for 255 guineas—about one fourth of the entire sum realised by the whole collection. With the exception of this work, and Hunt's "Grapes, Plums, &c.," the drawings seem to have realised an unusually small sum.

MR. W. SIMPSON, whose pictures of the recent war have become universally known, has been commissioned by the Queen to paint a picture of the visit of her Majesty to the Arctic ship, the *Resolute*, to receive the courteous gift of the American government. Permission has been accorded for an engraving to be executed from the painting.

HAMPSTEAD CONVERSAZIONE.—These agreeable reunions recommenced for the season on January 21st, after our sheets were closed for press. If we may be permitted to judge of the future from the past, we augur that the subscribers and visitors may anticipate exceeding gratification from what the committee will provide for their inspection. These "Evenings at Hampstead" are well supported by the numerous artists and amateurs resident in the vicinity.

THE ARTISTS' AND AMATEURS' CONVERSAZIONE holds its first meeting for the season on the 5th of the month, at Willis's Rooms. Four meetings are arranged for, to take place respectively on the first Thursday of each month, commencing with the present. This Society includes among its members many names of good repute in our circles of Art, and of amateurs of scarcely inferior talent: its president is Mr. J. D. Harding. An annual subscription of one guinea for each season qualifies for membership. We ought also to add that ladies are very properly admitted into the society as members.

THE FOUNDLING HOSPITAL.—Mr. Calder Marshall's statue of Captain Coram, the founder of this institution, has recently been placed at the entrance-gates, in Guildford Street; the funds for the work were raised by public subscription. Hogarth's portrait of the benevolent seaman has furnished the sculptor with a model for the head and features: the work well sustains the reputation of Mr. Marshall.

THE EARL OF SUFFOLK'S PICTURES.—No one has been obtained to unravel this mystery: we are therefore inclined to think the proper steps have not been taken to discover the thief—a liberal reward to an efficient "detective" would surely have traced the lost treasures to any part of the globe. It is probable they have been painted over in distemper, with a view to their exportation; but they can be valuable only when their value is made known; and although they may be out of sight, cannot be "out of reach." It is the opinion of those who know something of such "doings," that Lord Suffolk's pictures have found their way into Russia, a sure market for good ancient pictures. A correspondent—"H. Clark, M.D."—suggests that of all fine pictures in private collections photographic copies should be made, inasmuch as successful thefts would then be much more difficult.

REVIEWS.

THE GRAMMAR OF ORNAMENT. By OWEN JONES. Illustrated by Examples from various Styles of Ornament. Drawn on Stone by F. BEDFORD. Printed in Colours and published by DAY & SONS, London.

On looking over this work, the concluding parts of which, with the explanatory text, have just reached us, we are almost astounded at what the artists and publishers have accomplished. Such a publication would have been considered, not many years ago, the labour of a life, and the project of a Lorenzo de Medicis, or some other powerful and liberal patron of the Arts. But to produce one hundred folio plates, each containing several subjects—in some instances twenty, thirty, and even more, the whole three thousand in number, and all full of delicate and intricate details, coloured, too, with the utmost brilliancy and delicacy,—to effect this within the short space of one year is a marvel, as it is also a sign of the enterprising spirit that actuates the producing classes of the day, from the capitalist and master down to the lowest "hand" he employs. Having explained the character and nature of Mr. Owen Jones's "Grammar of Ornament" towards the close of the last year, it seems only necessary now that we announce its completion, with the remark that a more valuable publication for the instruction and gratification of the man of taste, and for the use of all engaged in ornamental work of every kind, has never been put forth in any age or country. A few words are, however, due to those who have aided Mr. Jones in his gigantic and laborious undertaking, and have enabled him to bring it to so successful a termination. In the formation of the Egyptian collection, he was assisted by Mr. J. Bonomi and Mr. J. Wild, the latter gentleman contributing also the materials for the Arabian collection. For the plate of stained glass he was indebted to Mr. T. T. Bury; from Mr. C. J. Richardson the principal portion of the materials of the Elizabethan collection was obtained; those of the Byzantine collection were contributed by Mr. J. B. Waring, who also wrote the valuable essays on Byzantine and Elizabethan ornament. Mr. J. O. Westwood assisted in the Celtic collection, and wrote the interesting history and exposition of the style. Mr. C. Dresser, a contributor to the columns of the *Art-Journal*, provided the plate that exhibits the geometrical arrangement of natural flowers. Mr. Digby Wyatt is the author of the essays on the ornament of the Renaissance and the Italian periods. The drawings, not hitherto mentioned, were chiefly executed by Mr. Jones's pupils, Messrs. A. Warren and C. Aubert, who, with Mr. Stubbs, reduced the whole of the original drawings, and prepared them for publication. To Mr. Bedford and his assistants—Messrs. H. Fielding, W. R. Tymms, A. Warren, and S. Sedgfield—was assigned the onerous and most important task of reproducing the drawings upon the stone; how well it has been executed the publication itself will testify. And, lastly, Messrs. Day and Son are entitled to no small commendation for the manner in which they have performed their duties as printers. None but a large establishment conducted with vigilance, care, and attention could have accomplished a work of such magnitude and beauty—one as well adapted for the library and drawing-room table as for the studio of the ornamentist; in truth, we cannot imagine a few hours more agreeably passed than in the examination of its multitudinous and varied examples of Decorative Art.

NOTES ON THE TURNER GALLERY. By JOHN RUSKIN, M.A. Published by SMITH, ELDER, & Co., London.

The first impression made by the Turner bequest upon its proprietors, the public, is by no means favourable, principally from the fact that they are hidden rather than exhibited in Marlborough House. Nevertheless, and invisible though they be, much has been written and said about them. From Mr. Ruskin's prolonged silence, we expected a volume from him on the subject of the Turner bequest—but we have only a *brochure*. In a few prefatory observations, the writer assigns four periods to Turner's career of art—but these refinements of distinction are by no means easily determinable. In the artist's earlier time, everything he did had more or less relation to the contemporary English school; this is more observable in his water-colour than his oil-pictures; and when he departed from this affinity everything was transitional, approaching nearer and nearer to that style of Art which was his own only. Every painter who ceases to be a student becomes a hopeless mannerist. We cannot think that Turner ever ceased to look at Claude; but it is very probable that in age his physical powers of con-

straining nature, as they did also in earlier years, failed him. We hear continually of artists who "do not paint so well as they did." These have either ceased to be guided by nature, or there is some physical defect to account for the failure. Mr. Ruskin notices the works in their chronological order, commencing with the "Moonlight, a Study at Milbank," then succeeds "View in Wales" (1800), "View on Clapham Common" (1802), "Jason" (1802). Of the "Shipwreck" the writer says—"The sea painting in both this and 'The Calais Pier' is much over-rated. It is wonderful in rendering action of wave; but neither the lustre of surface nor nature of the foam—still less of the spray—are marked satisfactorily. Through his whole life, Turner's drawings of large waves left them deficient of lustre and liquidity; and this was the more singular because, in calm or rippled water, no one ever rendered lustre or clearness so carefully." It is not fair inference that reflection is wanting in such a picture as this, because it is abundantly found in his still water. Now the colour, and light, and shade of still water is all reflection, but in water violently agitated broad reflection is superseded by form. "In the Goddess of Discord in the Gardens of the Hesperides," Turner breaks new ground; having visited Switzerland, he introduces into this picture his impressions of that country. We find him, therefore, painting (1802-3) "Bonneville, Savoy, with Mont-Blanc," "The Chateau de St. Michel, Savoy," "Glacier and Source of the Arverne," &c. "The Decline of the Carthaginian Empire" is not favourably spoken of; it is certainly an anomalous work, but yet possesses many beauties, and like so many others of Turner's works that may be objectionable in colour, would tell effectively in black and white. In speaking of "The Bay of Baia," Mr. Ruskin says—"The colour of this picture, take it all in all, is unsatisfactory; the brown demon is not quite exorcised; and although, if the foliage of the foreground be closely examined, it will be found full of various hue, the greens are still too subdued." This picture was painted in 1823, and in this brown colour which is here spoken of is nothing more than that qualification of burnt sienna or burnt umber which was used by all the painters of that time: the recognition of any grey earth in a foreground at that time was a foul heresy. Pictures successively dwelt on are—"Ulysses deriding Polyphemus" (1829), "Childe Harold's Pilgrimage," "Apollo and Daphne," "Phryne going to the Bath," "Agrippina," "Bacchus and Ariadne," "Venice, the Bridge of Sighs," "The Exile and the Rock Limpet," &c. Of the "Fighting Téméraire," it is observed—"Of all the pictures of subjects not involving human pain this is the most pathetic that was ever painted." Our notice of these criticisms is necessarily too brief; but we cannot close it without saying that it is as powerfully written as anything its author has ever put forth, and the spirit of the criticism is the most just and genial that has ever animated Mr. Ruskin's writings.

THE CAMPAIGN IN THE CRIMEA: 1st & 2nd Series. From the Drawings of JOHN SIMPSON. COLNAGHI & Co., London.

These two volumes are of the deepest interest to all who hold dear the honour and glory of Great Britain. Dismal as the story is, the war in the Crimea may be referred to with national pride: our soldiers and sailors did their "duty" there as everywhere; but there especially it was discharged under discouragements and disasters that would have crushed the spirit of any other army of the world. Its memory, therefore, will always be a retrospect of glory and shame. Those who examine these books will do so with a mingled sensation of sorrow and joy. The letter-press descriptions are gathered for the most part from the written accounts of Mr. Woods, published in the *Morning Herald*, and those of Mr. Russell, the "famous" correspondent of the *Times*. To these gentlemen the country owes much: think what a rich treasure would have been gathered for us from the bloody fields of Spain, if there had been writers so active, intelligent, and enlightened, to follow the march of our armies in the Peninsula—following to observe. The lithographic drawings of Mr. Simpson are well known: these volumes are formed of reduced copies, convenient in size, and sufficiently large to convey accurate notions of the several pictured details. There are no less than forty prints, and the subjects are so varied as to present all the leading incidents of the war. The artist has obtained a reputation high among the highest—not alone for his professional skill, but for the bold, daring, and resolute courage he displayed in the prosecution of the important task he had undertaken; he was literally everywhere;—no peril alarmed him; no difficulty discouraged; the point

of danger seemed ever to be the point most attractive. If to the authors we owe much, our debt is even larger to the artist, who has given us the real where formerly we had but the ideal—facts in lieu of fancies; in short, whose pictures are histories. Messrs. Colnaghi have therefore issued two volumes that cannot fail to achieve extensive popularity.

THE BOOK OF JOB. Illustrated with Fifty Engravings, from Drawings by JOHN GILBERT. Published by NISBET & Co., London.

In the search which for some years past has been made for writings suited to form illustrated volumes, it has seemed surprising that the book of Job should so long have escaped the attention of publishers; perhaps, however, they have considered, that as it forms a portion of the sacred writings, it would attain a less degree of popularity than a work of pure fiction. And yet what a treasure-house of rich pictorial matters does this grand poem contain!—a poem which, whatever a man's religious creed or belief may be, must, if he can appreciate sublimity of thought and eloquence of expression, win his highest admiration. "It sets before us," says the writer of the preface to this edition, "pictures wonderfully vivid of the husbandman, the warrior, the traveller, the sportsman, the stately magnate, and the starving outcast of that departed era. And, not to mention that it contains some of the most magnificent descriptions of natural objects and phenomena to be found in any language, we must search its page in order to find the earliest forms of those sublime and beautiful images which delight us in the poems of our own day; and in which Job anticipated by many ages Homer, Pindar, and Sophocles."

Whether Job was a real personage, which some writers have denied, though he is affirmed to be such by the far larger number of commentators, and among these the most learned and orthodox, all agree in pronouncing the book which treats of him as the most ancient poem on record. The chronology of the Bible dates the trials of the patriarch about the year 1520 before the Christian era, or about thirty years before Moses led the Israelites out of Egypt. But from the absence of any allusion to great historical events which happened in the vicinity of Job's country, Idumæa,—such as the destruction of the Cities of the Plain, and which it is presumed Job would scarcely have passed over, had those events occurred during his early lifetime, or anterior to it,—many writers conjecture the poem was composed before Abraham undertook his journey into Canaan. The authorship of the work, as well as its date, has given rise to much curious speculation: the latter we believe to be, inferentially, more easily determinable than the former; but either, or both, are of little comparative importance; it is sufficient that in it the Christian world possesses the noblest poem that was ever penned; and that "while the memorable records of antiquity have mouldered from the rock, the prophetic assurance and sentiments of Job are graven in scriptures that no time shall alter, no changes shall efface."

With so vast a fund of pictorial matter at the command of the artist, Mr. Gilbert's most difficult task must have been that of selection. The fifty subjects he has chosen might be enlarged to five hundred without exhausting the materials; but the examples he has taken are judiciously made, both as to interest and variety. As a figure draughtsman Mr. Gilbert is too well known and appreciated to require a word of commendation from us; but here he seems as much at home among the beasts of the field and the desert, the birds of the air, and the fishes of the sea, while in landscape he would break a lance with Birket Foster; nothing, in fact, appears to be beyond the reach of his facile and elegant pencil. All is beautiful in his designs; and Messrs. Dalziel, Whymper, and Thomas, have engraved them in a way that does full justice to the artist, and great credit to their own taste and skill.

The explanatory notes and poetical parallels introduced into the volume add much to its interest, as does its outward adornment of blue and gold to its value as a gift-book. We will only add our hope to that expressed by the editor—"That some may be induced to read in the present edition this most ancient of poems who have never yet given to it what it so eminently demands, and will so richly repay, a continuous perusal."

THE COURSE OF TIME. By ROBERT POLLOK. Illustrated Edition. Published by BLACKWOOD & SONS, London and Edinburgh.

A poem which has passed through twenty editions in about thirty years has received a public verdict that places its popularity beyond doubt; such has been the case with Pollok's "Course of Time"—a work which fully merits the tribute of praise accorded to it by the general voice, though, as it has

been remarked by one of the poet's own countrymen, "it is often harsh, turgid, and vehement, and deformed by a gloomy piety which repels the reader, in spite of the many splendid passages and images that are scattered throughout the work." It should, however, be remembered that the poem was the production of a young man—one, too, nurtured in a church whose religious tenets are peculiarly strict and unalluring; hence, perhaps, the spirit which casts a shadow of gloom over the imaginative thoughts and powerful language that are found in so many passages of the "Course of Time." Years, and a more enlarged acquaintance with the world, would probably have tended to modify his views of mankind; certainly time would have ripened his poetical genius, so that we might have seen it hereafter produce fruits of a more engaging and refined nature. It was otherwise decreed: Pollok died the same year that his poem was published, in 1827, so that he scarcely lived to hear the first blast of the trumpet of fame, which was destined to carry his name wherever his native language is spoken.

The richly-ornamented and illustrated edition now published by Messrs. Blackwood can add nothing to the poet's reputation, but it will cast a beautiful and unfading light upon many of the scenes and descriptions which his pen transcribed. The designs are by Messrs. Birket Foster, Tenniel, and J. R. Clayton, whose drawings on the wood are engraved by Messrs. Evans, Dalziel Brothers, H. N. Woods (a new name to us), and Green, who seem to have all worked in wonderful harmony of spirit and feeling.

It may appear invidious to select one of the artist-designers for especial notice where all have done so well; but we direct attention to Mr. Foster only to remark that two or three of his subjects remind us of John Martin's Miltonic compositions. We have often admired the pencil of Mr. Foster when delineating the simple and beautiful pastoral scenery of nature; it is here equally successful in its representation of the grand, the terrible, and demoniacal.

PEN AND PENCIL SKETCHES. By THOMAS HOOD. HURST & BLACKETT, London.

"TOM HOOD"—*redivivus*!—the Murillo-like boy we knew in petticoats—grown beyond boyhood—gone to college—and publishing a volume! Out upon Time! and it passes so stealthily! The poet prettily said that—

"Noiseless falls the foot of Time—
That only treads on flowers."

In sooth it treads as noiselessly over flints. Had this volume been very different from what it is, it would have been received cordially by press and public; the child would have been "kissed for the sake of the nurse." Tom Hood the Second would have been honoured for the sake of "Tom Hood" the First; but there is so much feeling—so much genius—in many of the fugitive pieces which both in prose and poetry fill this volume, that there is little to do except to praise; and even while we record our disapprobation of slang and smoking—we feel we are hard-hearted, because in time the author's mind will cast off, by a natural effort, the affectations which here and there vexatiously mar what, but for them, would be really beautiful. We hardly know a more powerful and exquisite sketch in the whole range of literature than the "Gate-keeper of the City of Tombs;" it is full of the gentlest feeling, blended with the kindest sympathy and the soundest philosophy. The poems scattered here and there are bright with smiles or tears, and it is no dishonour to the father to say that many of these compositions would have done credit to the author of "The Song of a Shirt," and the "Plea of the Midsummer Fairies."

LES BONS AMIS. Engraved by F. REVEL and A. BLANCHARD, from the Picture by MEISSONIER. Published by E. GAMBART & Co., London.

This is a small print, but one of rare excellence, showing qualities of engraving that are seldom found in the Art of the present day—solidity, brilliancy, and delicacy, throughout every part of it, and all so manifest, and yet so harmonious, that it is impossible to say which quality is most attractive to the eye; the tone is perfect. *Les Bons Amis* are three respectable middle-aged men, of the *ancien régime* of France, seated at a table in the centre of an apartment, who are discussing, over their pipes and glasses, some subject which excites their close attention; one is evidently laying down a proposition to which the others listen most unabstractedly: the three heads are admirable studies—intelligent, serious, as at present engaged, and individualised in character. The original picture, which is, we believe, in the possession of the Queen,

is of the old Dutch School in subject; but the occupants of the room are not boors, they are gentlemen spending a social evening together; perhaps talking over the financial schemes of Mirabeau, or the last bit of scandal from Versailles or St. Cloud. We should naturally look for this unique print in the portfolio of every collector of taste and judgment.

THE GOOD OLD TIMES: A TALE OF AUVERGNE. By the Author of "MARY POWELL." Published by HALL, VIRTUE & Co., London.

"The Good Old Times!" All the publications of this accomplished lady bear the impress of a high and holy mind—turned into a peculiar channel; thinking old world thoughts, and expressing them in old world language, she has made the quaint style her own; and so true and earnest is she, that the "quaintness" is entirely devoid of affectation. We will not anticipate the story, for we hope it is in everybody's hands by this time; if it has a want, it is the want of a sacrifice—but our fair author has no heart towards blood-shed; she has too great a desire to make all sects turn towards "Peace in the Lord" to show the dark side, even of persecution; she delights to make things end well, and would be positively miserable at leaving any one at the last page in trouble or perplexity: perhaps this is one of her great charms; for her warmest admirers are among the gentle and the good. We have exceedingly rejoiced to welcome her again at this happy season.

CURIOSITIES OF HISTORY. By JOHN TIMBS, F.S.A. Published by BOGUE, London.

Mr. Timbs has followed up his first volume of "Things not Generally Known" by this upon our table; but *here* he has dealt with the "CURIOSITIES OF HISTORY," and we can conceive no more amusing book for the drawing-room table, or one more useful for the school-room. The author commences with a quotation from Ritson's "Polychronicon," which states that "Damascus is as much as to say, shedding of blood, for there Cain slew Abel, and hid him in the sand;" and after devoting a few pages to Sacred Writ, proceeds into Egypt, Greece, Rome, &c.; but we must protest against Mr. Timbs calling the Bible "The Sacred Story." We quite believe he intends no disrespect to the holy volume; but in the ears of the young, for instance, it might become generalised with other "tales," and suffer in its sacred character.

LIBRARY EDITION OF THE BRITISH POETS. THE POETICAL WORKS OF WILLIAM SHAKSPERE, AND THE EARL OF SURREY. With Memoirs, Critical Dissertations, and Explanatory Notes, by the REVEREND GEORGE GIFFILLAN. Published by J. NICHOL, Edinburgh; NISBET & Co., London.

Four years have now elapsed since the publisher of this edition of the British Poets issued the first volume; it has progressed, as originally announced, at the rate of six volumes each year; so that we are enabled by this time to form a tolerably correct opinion of the manner in which its conductors have kept faith with the public. Their avowed object was to produce a work which, for excellence of typography, quality of paper, neatness of appearance, and judicious editing, should, combined with cheapness, entitle it to the patronage of all classes: this object they have hitherto effected in a way that cannot fail to satisfy even the most fastidious. On referring to the twenty-four volumes which have now been published, we can confidently assert that, as a whole, the poets of Great Britain have never been made so accessible to the people of Great Britain, and in a form more agreeable to every kind of reader. Unencumbered by long, and too often valueless, notes—yet always of sufficient length to elucidate the meaning of any obscure passage or obsolete word,—the text is printed in a bold, clear type, so that he who runs may read. The prefaces are written by Mr. Giffillan, with taste, judgment, and impartiality—three qualities essential to good editorship. This work deserves a circulation commensurate with the style in which it is produced, and the cheapness of its cost.

SAARBURG, NEAR TREVES, ON THE MOSELLE. —SCENE IN WALES. Chromolithographed by M. N. HANHART, from Pictures by J. D. HARDING. Published by E. GAMBART & Co., London.

A pair of large coloured lithographs, executed, we should presume, from their bold and dashing style of handling, from sketches by Mr. Harding. Saarburg is a picturesque scene, with a mountain torrent tumbling and boiling over its rocky bed, between piles of old buildings and precipitous banks.—The Welsh subject also shows a mountain stream,

somewhat less angry however, winding its way between masses of rock, among which, on one side, tall trees have taken root and sprung upwards, while an over-shot mill, almost concealed by foliage, contributes, on the other, its scanty supply of liquid to the narrow watercourse. Both these prints are very gay in colour, the latter especially so, as the scene is lighted by a rich sunset. Framed and hanging on a wall, they would tell most effectively; they are just the kind of chromolithographs for such a purpose.

THE OCEAN CHILD: OR, SHOWERS AND SUNSHINE. A TALE OF GIRLHOOD. By Mrs. HARRIET MYRTLE. ADDEY & Co., London.

We remember Mrs. Harriett Myrtle's "Pleasures of the Country" as one of the most charming of juvenile books. Writers do not sufficiently remember how few children in our towns and cities really know anything of country life, and that every species of information from thence must be of value, because it is a record of nature's works. We can trace the same sweet and benevolent mind in "The Ocean Child" that prompted a record of "Pleasures of the Country;" and congratulate our young friends on possessing an interesting story, fraught with the especial lessons which children ought to learn without the sensation of "being taught."

OCEAN GARDENS. By H. NOEL HUMPHRIES. Published by LOW, SON, & Co., London.

Mr. Humphries has produced a most charming little volume on the history of "Marine Aquaria," which cannot fail to be welcomed by those who bring a miniature ocean into their drawing-rooms; the illustrations are of course beautiful; and "the flowers of the sea" were never before seen to so much advantage—upon paper.

The information Mr. Humphries has drawn together is correct, and given with intelligence and simplicity; but as we anticipate a very speedy second edition for the book, we would intreat the author, for the sake of those who will seek *all* the necessary information in his pages, to be more explicit upon certain points. We know by experience that one class of those beautiful sea-creatures thrive best in deep water; another do best in very shallow pools, overhung by sea-weeds; while others, to be kept for any length of time, ought to be out of the water for an hour or more each day, and two or three times a week be slightly sprinkled with *fine* gravel. We are glad to find how vehemently Mr. Humphries insists on the use of the syringe; it can hardly be too frequently resorted to. As a rule however, we believe that all zoophytes thrive best in shallow water, particularly if they are frequently syringed.

Some of these creatures are found in greater beauty and abundance on one part of the coast than on the other, and a knowledge of their "whereabouts" is of value to the collector.

Mr. Humphries states that "artificial salt water has been found sufficient for zoophytes, but not for fish and others of the higher class of marine animals, except for a given time."

We have non-artificial water made *fourteen months ago* by Mr. Lloyd's prepared salt. We have occasionally added a little fresh water to the tank when the evaporation caused it to be required, and it is perfectly clear. It now contains, besides the usual marine plants, zoophytes and serpula; two hermit crabs and a swimming crab, who have lived there in health and prosperity for nearly three months. A wrasse enjoyed its existence for two months in the same water, and would most likely have been alive now, but for the very hot weather in July, when, owing to the tank not being properly shaded during the absence of its mistress, the water became turbid, and the fish and more delicate creatures, such as prawns, &c., died. The tank was kept in darkness, and well aerated for several days, and the water regained its present clearness.

JESSIE CAMERON. By the LADY RACHAEL BUTLER. Published by BLACKWOOD & SONS, London & Edinburgh.

This "Highland Story," which introduces a new author in what may be called "domestic fiction," is replete with simple pathos and beauty. The style is well suited to the story—graceful, and free from the affectation of bending too low, as if the feelings and affections (which are altogether different from the knowledge and information) of the upper classes differed from the feelings and affections of the lower, and the pretty volume is equally free from stilt and intolerance. We hope for good as well as great things from the pen of this accomplished lady; she is one of the proofs of the sympathy felt by the rich for the poor,—a sympathy which it is the practice of a clique entirely to deny.

THE ART-JOURNAL.

LONDON, MARCH 1, 1857.

THE BRITISH INSTITUTION.
EXHIBITION, 1857.

HE Exhibition of this Institution was opened, as usual, early in February. The private view took place on the 7th, and the rooms were opened to the public on Monday, the 9th. There are altogether 579 works, of which fourteen are sculptural. The entire collection presents no serious essay in what is known as "high Art"—no thoughtful adventure in history; but this is not (as we have a hundred times before said) the fault of the painters, but of the public taste.

We are fast approaching a period of miniature in oil; truly the smallest pictures are the best, and some of these present heart-breaking instances of microscopic manipulation; but this is the character of a majority of the works in every exhibition of the season. The subject-matter of the most carefully-wrought productions does not reach the dignity of what the dealers in, and collectors of, the elder schools call "conversation-pieces;" but enough has been said on this subject—proceed we, therefore, at once to specific instances.

No. 1. 'The Colossal Pair, Thebes,' FRANK DILLON—

"Nothing beside remains. Round the decay
Of that colossal wreck, boundless and bare,
The lone and level sands stretch far away."

These are the two seated statues of the vocal Memnon and his wife on the sandy plain of Thebes, which here rise in sullen grandeur against the twilight sky. The vast solitude deepening in gloom is very impressive, and even painful is the effort made by the eye to penetrate the mysterious distance. A living figure, to show the magnitude of the statues, would have vitiated the feeling the artist has been desirous to preserve. The skeleton of a camel, ingeniously placed at the base of the nearer statue, serves in some sort to show the size. The picture may be classed among the most admirable of modern works.

No. 2. 'Sunny Hours,' LOUIS HAGHE. The subject is a party assembled at dessert within a large bay-window, which looks into a garden. We cannot help, of course, comparing this work with Mr. Haghe's triumphs in water-colour, and wonder that he should ever think of touching oil, standing alone as he does in the splendours of his own particular art.

No. 3. 'The Devonshire Coast,' H. JUTSUM. A very ordinary section of sea-coast scenery, painted in an unbroken breadth of daylight. The nearest site is a harvest-field, which slopes downward to the shore, and the retiring passages are, on the left, the tranquil sea, and, on

the right, a succession of grassy headlands, which, until the utmost distance is accomplished, succeed each other in green slopes down to high-water mark. It is highly successful in its local and aerial colour, and simplicity of daylight effect.

No. 10. 'Dutch Boats in a Calm, off Antwerp,' E. HAYES, A.R.H.A. A small picture showing principally a Dutch sailing-boat in the stream of the Scheldt, abreast of the entrance to the inner basin. The boat is drawn with elaborate minuteness.

No. 22. 'The Pet Rabbit,' R. BUCKNER. This is a group of portraits of the size of life—those of three children, one of whom shows the "pet rabbit." The great object of the painter is refinement, personal and characteristic.

No. 25. 'The Mountain Despot,' R. H. ROE. The despot is an eagle that is perched on a rocky peak, with a duck that he has borne to his retreat from the lake below. The picture is true to nature, and very beautifully painted; it is indeed one of the most meritorious and attractive works of the Exhibition.

No. 27. 'The Island of Murano, Venice,' G. E. HERING. This is the place where the famous glass was made, and where, we believe, the cemetery is. We see the place as if from Venice, with a solitary gondola bearing some curious stranger to the landing-place. It is not a crowded composition: there are but two principal quantities, each of which assists the other. The artist has produced many charming pictures of Italian scenery, but we think this the most elegant, chaste, and truthful version he has ever exhibited.

No. 32. 'The Landing-Place, Top-Hané, Constantinople,' E. A. GOODALL. This looks a very honest representation of a veritable locality, deriving life from numerous figures which, in costume and character are, we are certain, scrupulously accurate. The great merit of the work is such a realisation from materials really not very striking.

No. 33. 'The Molo, Venice,' E. W. COOKE, A.R.A. A small picture in which the line, with its buildings, runs transversely into the composition from the left, showing the library and the palace, the buildings further to the right being screened by a group of boats, on the whole skilfully managed; but we really have such a surfeit of this subject that we turn refreshed to a moderately well-painted Highland bothie.

No. 35. 'Watermill near Llanarmon, Denbighshire,' P. DEAKIN. A small and rickety structure, built, or rather thrown together, so as to receive a thread of water, which drives the wheel. It is carefully painted, but, perhaps, too foxy in colour.

No. 42. 'Corinne,' H. WEIGALL. This is a life-sized head and bust in profile, coloured with infinite sweetness and brilliancy, and remarkable for its elegant simplicity.

No. 48. 'In the Highlands,' A. COOPER, R.A. The subject is an agroupment of a man in Highland costume standing with a grey pony; the latter is well drawn and painted.

No. 51. 'Vesuvius, from Capri,' E. W. COOKE, A.R.A. Capri is generally painted at a distance, but here we are tenants of the rock, looking forth upon the sea, beyond which, in the distance, lies Vesuvius with its eternal wreath of smoke. The sea and distance are carefully wrought, but the rocky dwelling of the fisherman is very sketchy.

No. 52. 'Cochem, on the Moselle,' G. C. STANFIELD. On the Rhine we may believe ourselves as of to-day, but on the Moselle we cannot help feeling very mediæval—living under the mild discipline of some William the Lion or Otho the Tiger. Houses were of the same pattern as these five hundred years ago, and why may not these be as old? Then there are the well-known castellated peaks, each some time

the den of one of those fierce priests or princes who, like the dragon of a chivalrous tale, was the scourge of the neighbouring country. We can never mistake the Moselle; the picture is somewhat hard, but of much excellence.

No. 57. 'Athens,' W. LINTON. This view of Athens is taken from near the site of the Temple of Jupiter, the remaining columns of which rise in the foreground. Athens is sufficiently pronounced in the picture; the Acropolis can never be mistaken.

No. 58. 'Beautiful in Death,' G. LANCE. The subject is a dead peacock, the plumage of which, especially that of the tail, is painted with the nicest imitation of nature.

No. 59. 'The Village Farrier,' R. BRANDARD. Mr. Brandard has painted this class of subject with extraordinary power of colour and effect, but this is not equal in quality to others that have preceded it.

No. 62. 'A Monk of Old,' H. MOORE. Simple, substantial, and characteristic. The monk is coarse in favour and coarse in attire; he sleeps over his wine—thus for him the good things of this life are not its outward show, but its creature comforts.

No. 64. 'Too late!' J. G. NAISH. This, we are told, is an incident of the late war, and it is intended, perhaps, to express that the peace comes too late, as the two figures which constitute the subject (two girls) are in mourning.

No. 65. 'The Evening Drink in a Mountain Lake,' F. DANBY, A.R.A. It cannot be supposed that the allusion points to anything but cattle. So it is; but the herd is only accessory; it is a lake and mountain subject, the expanse of water being enclosed by mountains which rise in various ridges, and so conclude the view. The glow of the evening sky tints the entire scene with an endless variety of mellow harmonies. We feel continually that really fine execution has much to do with sentiment—here, for instance, the theme is tranquillity, but our goodwill to fall in with the sedative disposition of the painter is disturbed by here and there some importunities of touch; and again, the water rushes past in a dancing stream, dazzling the eye by its coruscations, and vexing the ear with its everlasting and monotonous tale. The work is nevertheless a production of much excellence.

No. 66. 'The Gamekeeper's Daughter,' W. UNDERHILL. She is circumstanced as if in a larder plucking a fowl, and surrounded by varieties of game. It is superior in execution to antecedent works.

No. 75. 'The Gallant Action fought by the British 18-pounder 36-gun Frigate, *Penelope*, Captain Henry Blackwood, and the French National Ship, *Guillaume Tell*, Captain Saulnier, bearing the Flag of Rear-Admiral Decrès, on the Morning of the 31st of March, 1800,' E. DUNCAN. In this picture the story is only of two ships, and the narrative is perspicuous and most circumstantial. On the 30th of March the *Guillaume Tell*, taking advantage of a strong southerly gale and the darkness that succeeded the setting of the moon, weighed and put to sea from the harbour of Valetta. The *Penelope*, a small fast-sailing frigate, gave chase, and coming up with the French ship at half-past twelve, luffed under her stern, and gave her the larboard broadside. In this manner the fight was continued all night. It is now daylight; the Frenchman is sailing out of the picture, pitching heavily over a rolling sea, while the little frigate is crossing his wake and delivering her larboard broadside. The maintop-mast of the *Guillaume Tell* has just come down, causing immense confusion on the upper deck, the mizetop-mast having been shot away some time before. The *Lion* and the *Foudroyant*, two of our luc-of-battle ships, are seen in the distance, and on their arrival the *Guillaume Tell* struck. We understand at once

No. 338. 'Landscape with Calves,' G. W. HORLOR. Well drawn and extremely clean in execution—*mais pourquoi toujours veau?*

No. 342. 'View on a Common, near Worth, Surrey,' H. WEEKES, A.R.A. A very extraordinary subject, painted, we may presume, as a *divertissement* amid severer sculptural studies.

No. 348. 'Roman Boy with a Pitcher of Water,' R. BUCKNER. This figure has been studied from a native Roman model; the head is really charming.

No. 359. 'Holding, as it were, the Mirror up to Nature,' W. HEMSLEY. The scene is a cottage-interior, in which an aged dame, having fallen asleep, some children are amusing themselves by throwing the reflected sunlight on her face by means of a looking-glass. The figures are most carefully drawn and painted, and the reflected lights are most felicitously dealt with.

SOUTH ROOM.

No. 374. 'Interior, Westfield House, Ryde, Isle of Wight,' C. H. STANLEY. This is a study of a large room lighted from a skylight. It contains pieces of sculpture and objects of *virtu*, which, with the elegant furniture, are painted with the utmost exactitude.

No. 375. 'Lane Scene, October,' T. J. SOPER. A production far in advance of everything already exhibited under this name.

No. 383. 'Bianca,' T. GOODERSON. Rather Brunetta, being a study of one of the dark daughters of Italy—a Roman model for all the world, and attired as simply as the other famous Bianca, though more forcible in tone.

No. 389. 'The Dream,' J. A. FITZGERALD. A small highly-finished picture representing the dream of an artist, about whom are flitting numberless party-coloured elves—a fantastic conception most successfully carried out.

No. 393. 'The Mother's Grave,' MISS E. BROWNLOW. Firmly painted, but the extremities of the figures are imperfectly drawn.

No. 407. 'Janet Foster,' FRANK WYBURD. She is presented erect, and carrying a small tray. The figure and the elaborately-ornamented apartment constitute a most charming miniature.

No. 408. 'The Vintage,' W. E. FROST, A.R.A. Also a miniature, but of another class. There are two principal figures—a woman bearing on her head a basket of grapes, and accompanied by a child. In praise of this little picture too much cannot be said.

No. 415. 'Thy Will be Done,' H. LE JEUNE. This is likewise a small work, the subject of which is the Saviour praying in the garden. It is enough to say that it is strikingly Correggesque in feeling.

No. 437. 'Partant pour la Syrie,' N. J. CROWLEY, R.H.A. Interpreted by a life-sized figure of a little girl who has donned a steel scull-cap, and grasps her papa's sword with an air of extreme self-satisfaction.

No. 436. 'A Florentine Holiday,' J. D. WINGFIELD. This is a garden composition, with figures in picturesque costume—a class of subject in which this artist excels.

No. 441. 'Calcutta, Government House, Town-hall, Ochterlonie Monument, and part of Chowringhee' (taken from the fort), MARSHAL CLAXTON. This, we doubt not, is a faithful representation of the place which it professes to describe. It is a large picture.

No. 446. 'The last Scene in the Merry Wives of Windsor,' G. CRUIKSHANK. The scene at Herne's Oak; we find, therefore, Falstaff on the ground tormented by the fairies. If there be any difference between this and former works, it is that it is more careful as to forms. Cruikshank is comparable only to Cruikshank.

No. 457. 'The Old Cavalier,' T. MORTON. A small and brilliant picture of a well conceived character.

No. 458. 'Molière reading his Comedies to

his House-keeper,' T. P. HALL. A good subject; but its earnestness is enfeebled by the multitudinous minute incidents brought into the composition. It is, however, full of point and character, and gives promise of greater excellence hereafter.

No. 464. 'View in the Environs of Albano,' E. DUVAL. The view is picturesque, and forcibly treated in the manner of the French school.

No. 465. 'Leith Hill, Surrey, looking towards Ewerst, Hascombe, and Hind Head,' G. COLE. A noble subject, and most characteristically English; the distances are happily described.

No. 471. 'On the Thames, Maple Durham,' G. W. SANT. For the sake of breadth the whole of the incident is worked out within a few grades of a monotone; the foliage is too grey, but it is withal what is generally understood as a "clever" picture.

No. 476. 'Spanish Ballads,' P. H. CALDERON. A study of a lady playing the guitar; an attractive picture, entirely English in feeling.

No. 483. 'The Two Extremes—the Post-Raphaelite,' H. O'NEIL. This and 'The Pre-Raphaelite,' by the same artist, illustrate these opposite Art-theories, with some causticity of allusion to the latter.

No. 484. 'Off to the Lido, St. Agnes' Eve,' J. HOLLAND. Another of those imitatively brilliant Venetian essays from the exhaustless portfolio of this artist.

No. 491. 'The Banks of the Machno,' J. DEARLE. The water is more successful than in antecedent works, but the leafage is less so.

No. 500. 'Church of St. Pierre, and ancient Portal de la cour at Auxerre, France,' L. J. WOOD. This is, perhaps, too deeply glazed; but the building cannot be mistaken, for there is no other like it in Europe.

No. 506. 'A Music Lesson,' E. HOPLEY. The master and pupil are two boys, one of whom whistles the air which the other is to follow on his tin pipe. The point of the narrative is sufficiently obvious.

No. 510. 'May and Sheep,' F. W. KEYL. A very small picture, executed with a fine feeling for the freshness of nature.

No. 511. 'The Corn Flowers,' LOUIS HUARD. The scene is a corn-field, in which is a group of children decking each other's heads with wild flowers. The light and shade of this picture are very masterly.

No. 519. 'An Old Water-Mill,' ALFRED MONTAGUE. So old that it seems about to fall into the shallow stream; it is, however, very like many we have seen.

No. 525. 'A Little Scarecrow,' T. F. DICKSEE. A study of a rustic child in the act of using a clapper to frighten the birds; the figure is well drawn and firmly painted.

No. 539. 'A Letter requiring an Answer,' W. CAVE THOMAS. We see here a lady seated in profound reflection, and the letter which has caused her so much thought lies at her feet. The figure is admirably drawn, but the colour of the features is not sufficiently fresh.

No. 543. 'Killeaghy Church, above the Lakes of Killarney,' Captain J. D. KING. The picturesque material of this little picture is very forcibly represented.

Of sculpture there are fourteen pieces—'Ariel,' W. CALDER MARSHALL, R.A.; 'David playing before Saul,' J. S. WESTMACOTT; 'The Refuge,' W. CALDER MARSHALL, R.A.; 'The Skipping Girl,' MRS. THORNEYCROFT; 'Happy as a Queen,' T. EARLE; 'Instruction,' R. A. WILSON; 'England's Hope,' CARLETON M'CARATHY; 'Repose,' ALEXANDER MUNRO; 'A Study,' ROSS HARVEY; 'A Statuette of His Imperial Majesty Napoleon III.,' HAMILTON M'CARATHY; 'Il Penseroso,' G. HALSE; 'Sunshine,' J. DURHAM; 'L'Allegro,' G. HALSE; 'Leap-frog,' G. ABBOTT.

THE ROYAL PICTURES.

QUEEN HENRIETTA MARIA.

Van Dyck, Painter. F. Joubert, Engraver.
Size of the Picture, 3 ft. 5¼ in. by 2 ft. 9 in.

VAN DYCK stands forth at Windsor Castle in all the glory of portraiture: "No gallery in the world," says Dr. Waagen, when speaking of the Van Dyck Room in that royal residence, "can display so large a number of portraits by this great master; there are no less than twenty-two. As a portrait-painter he was, without doubt, the greatest master of his age. His conceptions are almost always pleasing, and often fine; the attitudes easy and unstudied; the general effect admirable; the drawing of the heads and hands refined. To all this is added a great clearness and warmth of colouring, and freedom and yet softness in the handling, so that his portraits are in the highest degree attractive and elegant. As he passed the last ten years of his life (from 1631 to 1641) with but little interruption in England, and as the English have also proeured many master-pieces of his earlier time, his talents in all the various stages can nowhere be so well studied as in this country."

The education this painter had received in the school of Rubens enabled him to bring to the ennobling of his portraits those principles which confer a dignity and consequence on the portraits by Titian; and from his giving a greater attention to detail, both in the colour and minutiae, and a grander delicacy in handling, his works, especially those painted before he came to England, are the perfection of this branch of the art. His earlier portraits, painted in Flanders, possess great delicacy and finish, yet a fine, manly, historic character; those he executed in Italy, and after his return from that country, more firmness, and the luminous style of the Venetians; while in England he gradually became slighter in his finish, from the multiplicity of sitters, and often less imposing, from his painting many of his heads in an ordinary light, with the window not sufficiently high to give importance to his shadows.

Charles I., that unfortunate monarch, was yet happy in finding a painter who could hand down to posterity, as Van Dyck has left us, such noble records of a countenance royal amid all its sorrows. The head of the king, by the hands of any other artist, looks meanly peevish, and the several features are defined with trifling terminations; in the hands of Van Dyck those features assume dignity from the style of drawing, and appear suited to form part of an historical composition, which requires grandeur and largeness of proportion; even the masses of the hair, and the manner in which the beard and moustache are arranged, contribute to this character.

There are in the Van Dyck Room, at Windsor, four single portraits of Henrietta Maria, Queen of Charles I., besides a picture in which she is represented with her husband and two of their children. This royal lady was the youngest daughter of Henry IV. of France; she was born in 1609, and was only a few months old when her father was assassinated by the fanatic Ravallac. She was married to Charles in 1625, when she had scarcely passed her sixteenth year, and died in 1669 at the convent of Chaillot, near Paris, which she had founded soon after her return to France, on the imprisonment and execution of the king. One of her historians describes her as "a clever and fascinating, but superficial and volatile woman."

"Of the numerous portraits," writes Mrs. Jameson, "which Van Dyck painted of her this is the most attractive, and gives us a strong impression of the lively, elegant, wilful Frenchwoman, whose bright eyes and capricious so fascinated her husband. Davenant styles her, very beautifully, 'the rich-eyed darling of a monarch's breast.' This picture hung in Charles's bedroom." Dr. Waagen says: "The head is extremely attractive and delicate; the conception of the utmost elegance. The broad treatment of the remaining portions is almost too slight." She is represented in a dress of white silk; her hair is adorned with pearls and a red band; the royal crown and a red rose are on the table on which the right hand rests. The initials of the queen, surmounted by the crown, are seen on the distant wall.

VAN DYCK. PINXIT.

J. H. DEAR, SCULPT.

QUEEN HENRIETTA MARIA.

FROM THE PICTURES IN THE ROYAL COLLECTION.

PRINTED BY W. CLAY AND COMPANY, LONDON.

ON THE CRYSTALS OF SNOW,
AS APPLIED TO THE PURPOSES OF DESIGN.

As any original source derived from nature for originating new forms of truth and beauty is scarcely to be overlooked in this age of progress, we wish to draw attention in the following columns to the crystals of snow observed by James Glaisher, Esq., F.R.S., of the Royal Observatory, Greenwich—a gentleman whose scientific acquirements are well-known throughout the country. In the course of his examination of these snow crystals, it occurred to Mr. Glaisher that they would furnish novel and most beautiful suggestions for the ornamental designer; and, our attention having been directed to them, Mr. Glaisher has kindly placed in our hands a few of the numerous blocks he has caused to be engraved, and has also supplied us with the interesting and valuable communication that accompanies the engravings. We may, perhaps, be allowed to add that the drawings from the crystals were made by Mrs. Glaisher; their extreme accuracy and delicacy are most striking; some coloured examples we have seen, by way of application to manufacturing purposes, exhibit a thorough knowledge of the true value of colour. As these crystals form a comparatively new subject for investigation, it is necessary briefly to explain the principles of their formation, both in reference to the position they occupy in regard to scientific inquiry, and in reference to their power of adaptation to the purposes of the designer, who, possessed of a knowledge of the rules guiding their arrangement, instead of copying from the published examples, may create fresh combinations for himself suited to any purpose he may have in view. On this subject Mr. Glaisher writes as follows:—

Snow, in the ordinary acceptation of the word, is suggestive of a soft flocculent matter of considerable opacity, falling in flakes, and, as compared with water, of little density—a foot of fresh-fallen snow producing but from a tenth to a twelfth part of water. Snow, however, does not always fall in flakes; under certain conditions of atmosphere and temperature it occasionally falls in groups of slender needle-like particles or spiculæ; under the micro-

a white molecule. These are seldom less than from four to five tenths of an inch in diameter, and are generally collected in tufts of half-a-dozen or more together, which in calm weather waft uninjured to the ground; sometimes these are mixed with other stars of more intricate figure, to be spoken of presently. Fig. 1 illus-

forming, a serrated incrustation of leafy or arborescent character is attaching itself, so that in time the greater number of them, become each the centre of a crystalline pinna, not unlike a frond of the Lady fern. Fig. 3 is a sketch of one, the size of the original, as observed by T. G. Rylands, Esq., of Warrington, and sent to us during the severe winter of 1855. The overlapping, observable on one side of the pinna, is a peculiarity generally to be found in three out of the six leaves forming the entire crystal.

Fig. 4 (on the following page) represents the crystal when complete; the drawing was made by ourselves in the winter of last year, and gives with great exactitude the figure of the needles, which, it will be observed, diverge from the main stem uniformly at an angle of 60°. The position maintained by them around the centre of the crystal is beautifully adaptive, and well worth examination.

It is not always that the primitive spiculæ are divergent in groups of six. At times they arrange themselves irregularly in clusters, and crystallisation proceeds with results of a character somewhat different, but scarcely less beautiful, of which Fig. 5 (on page 75) may be considered a type. This is analogous to the fanciful forms of frost seen on the interior of a pane of glass, and is frequently to be found where the water is very shallow, and where its mixture with some gritty substance, or blade of grass, or other obstruction, has in all probability interfered with a more geometric arrangement. By

degrees the whole surface of the water becomes interlaced with needles and pinnae, whether singly or in groups, and thin laminated surfaces of ice which cover all interstices. Then, according to external influences, the ice either thickens, obliterating all this beautiful tracery, or it melts away before the rising temperature of the day. It often happens, however, that these processes occur after dark, or that the water freezes so rapidly as to disappoint the wishes of the observer. At moderate temperatures these changes are best observed; but, in our opinion, they are somewhat dependent on other atmospheric conditions. The formation of the needles is common to the freezing of water under all circumstances, and they vary from a few inches to a few feet in length.

To return to the crystals of snow. Fig. 6 is

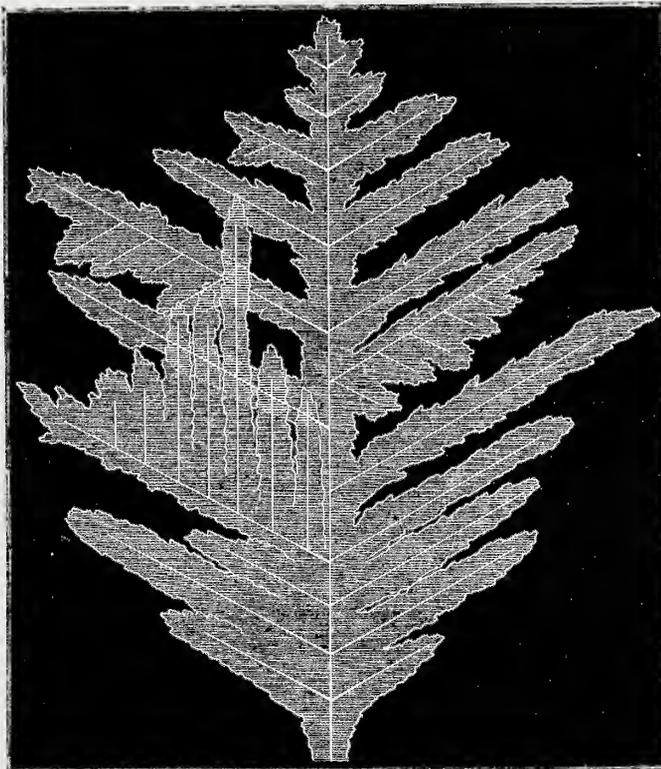

Fig. 3.

trates this variety, and is enlarged to double the proportions of the original.

Sometimes a heavy fall of ordinary snow may be accompanied by a number of minute specks, glistening among the flakes like fragments of talc, or mica, as seen sparkling in a mass of granite. On careful investigation, these prove to be thin laminated hexagons of the most perfect delicacy and symmetry of form, as shown in Fig. 2.

The hexagon and star being the base of all the crystals of snow yet observed, we will proceed to show how the more elaborate figures are compounded of these two primary elements.

To explain various peculiarities of structure which occur in several of the larger drawings, we will refer to the process of crystallisation as

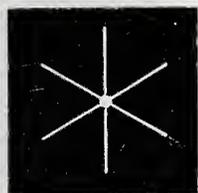

Fig. 1.

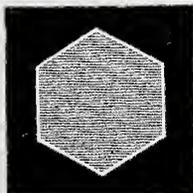

Fig. 2.

Fig. 6.

Fig. 7.

Fig. 8.

Fig. 9.

scope they exhibit no structural detail worthy of remark, but are irregular and jagged in outline. This is one of the most imperfect forms of snow crystallisation, and occurs generally at a temperature but little above freezing, and at the commencement of a severe and continued frost, or immediately preceding a general thaw.

At other times a light feathery snow may be seen to fall, composed almost entirely of stars of six spiculæ or radii, united in the centre by

carried on at low temperatures, on the surface of still or gently-moving water.

Water freezes at an angle of 60°. On its first congelation, under favourable circumstances for observation, we perceive in parts, generally about the centre and around the margin, a corrugation of its surface. This corrugation presently discovers a series of distinct figures, needle-like in form, and analogous to the spiculæ of snow. As the process continues, to each of these needles, while yet

another elementary figure, common to temperatures about the freezing-point; it is not often less than half-an-inch in diameter, and is a miniature copy of the water crystal.

Another simple order of figures, and containing within themselves the germ of the most symmetrical combinations, is that of which Figs. 7 and 8 are types; they exhibit secondary spiculæ diverging from the principal radii at an angle of 60°.

Around the simple star it frequently happens

that a secondary and smaller star is arranged, as in Fig. 9, the radii of which are intermediate between those of the former. An angle of 30° is, however, of unfrequent occurrence, and it seems probable that in this and similar cases, it is the union of two crystals of distinct hexagonal formation.

Sometimes it happens that the secondary spiculae, which we see in Figs. 7 and 8, are continued down the main radii, until they form a contact with each other, as in Fig. 10. The star thus inclosed about the centre, generally becomes laminated and of great transparency. In other varieties, as in Fig. 11, it is intersected by the rays of the secondary or intermediate crystal.

Having traced the elementary principles of these figures to the first formation of a simple nucleus, we will proceed to the consideration of the more compound varieties, in which the nucleus is a conspicuous element of construction.

The figures we have been considering, although possessed of unity of design in a high degree, are found to exhibit no great perfection of structural detail when examined beneath a lens; those that we are about to inquire into belong to a more perfect order, much more minute and very compound.

Fig. 12, is a figure of this class, much enlarged and drawn as seen beneath a microscope. It was highly crystallised, and the angles and planes of which it is composed were sharply and well defined. The prisms at the end of the radii were cut into facets, and glistened with brilliancy, as did the six prisms around the centre. The radial arms were sharply cut, six-sided shafts, very different to the snowy rounded spiculae of the elementary figures. It was easily discernible to the naked eye, and principally those parts which are white in the engraving, and which communicate to the copy very much the effect of the original when under the full influence of direct light; the centre is laminated, hexagonal in form, and within it we perceive the secondary star of prisms, also that each addition to the radii diverges at an angle of 60° .

Fig. 13 is another, highly crystallised, and composed of parallel prisms, divergent from the radial arms at an angle of 60° , and without nucleus. The irregular blade-like terminations arise from an ill-advised eagerness

six-sided, as they remain still at their base, and the leafy incrustations to have been regularly distributed prisms, as in the preceding figure. That the crystal, in its descent, has passed through various temperatures of intense cold, probably exchanged for a warmer at one instant of time, in which it has partially thawed,

radii. The base of these must be referred to the hexagon as shown at Fig. 2. The most highly elaborate of our illustrations shown at Fig. 17, exhibited a succession of planes raised one above another, the centre of each radial arm intersected by a slender crystalline shaft laden with delicate prisms. Fig. 19 preserves more the form of the ordinary hexagon, and was cut very regularly into facets. Of Figs. 18 and 19, we were unable to observe the exact disposition of the raised surfaces, and have delineated the outline only; these figures fell, with several others far more complicated, during the continuance of a very unusual degree of cold for these latitudes.

We have thus far endeavoured to show the true bases of construction, and how that crystallisation proceeds onwards from the simple forms to the more complex, and have selected from numerous varieties a few types the best illustrative of this progress. Our limits will scarcely permit us further to individualise these beautiful creations; yet, not to mislead, it is necessary to refer to an intermediate order, in which the hexagon star is laden with divergent spiculae intermediate between groups of prisms. Fig. 20, selected from this very numerous class of figures, was one of several observed during the cold weather, following upon the general thaw, which terminated the long-continued and severe frost of 1855. The spiculae were icicle-like, of the utmost delicacy, opaque, and well defined; the prisms on the contrary were

watery, almost rounded, and, as it seemed, on the verge of dissolution. The entire figure had the appearance of two distinct orders of formation—the prisms, which belong to a very low temperature, and the spiculae, which are commonly formed at, and about, the freezing-point. It is much to be wished that a return of favourable weather may enable us to elucidate with more precision the governing laws and peculiarities of these bodies. Fig. 21 is another of the same class, and in a very intermediate state, the additions to the main radii are neither prisms, nor spiculae, yet partaking of the character of both: its peculiarity consists in the tertiary incrustations being placed downwards towards the centre. This form has been observed only during very severe cold.

Fig. 22 is somewhat analogous to the crys-

Fig. 4.

and again passing into a cold stratum in approaching the ground, has been once more congealed, giving rise to the white opacity and irregular form of its terminations. And this explanation is the more reasonable, as will be gathered from a description of the dissolving or thawing of these bodies.

Fig. 15 is a crystal seen just previous to its returning to the primitive drop of water. Originally composed of the ordinary radial arms, each supporting prisms of the form seen in Fig. 13, and with a simple hexagonal nucleus, under the influence of a very slightly increased temperature, the rigidity of each line has become relaxed, whilst the crystalline matter, all but fluid and no longer heaped up into prisms, is distributed over a wider area, according to the laws of attraction and corresponding area of surface.

Fig. 10.

Fig. 11.

in the observation of their originally very complicated structure, by which they were in a moment dissolved, without injury, however, to the symmetry of the figure.

Fig. 14 is a beautiful compound of the higher order of crystallised bodies, with the more elementary, the nucleus belonging to the former, and the radii at their extremities to the latter. This, at first sight, appears an anomaly; but we explain it on the supposition that the entire structure of the original crystal has been of a high order; the shafts,

A very different order of figures are those of which Figs. 16, 17, 18, and 19 are types.* The originals were exceedingly small—so minute, indeed, that the specks containing all these beauties of detail were almost inappreciable to the naked eye. It will readily be perceived that they differ greatly from the order arising out of the primitive star, or its secondary

* These illustrations, and all others that are referred to, will appear in the next following number of the *Art-Journal*, in which this most interesting article will be continued.—[Ed. A.-J.]

tals of water; its centre is hexagonal, but the prisms are irregular crystalline incrustations of the utmost delicacy and transparency; it was of large size, fully half-an-inch in diameter, and glistening like a fragment of tale among the snow flakes, was discernible at a considerable distance.

Fig. 23 is a specimen of a double crystal; that is, two similar crystals united by an axis at right angles to the plane of each. It is highly complex, and the effect of each is more than doubled by the arrangement. Crystals so

united were not unfrequent during the severe weather.

During the winter, our observations numbered nearly two hundred varieties; it is sufficient, however, for our purpose, to refer those of our readers interested in the fact, to the "British Meteorological Report of 1855," and to announce that we propose very shortly to publish the entire number of these figures, with the addition of several from Canada; also explanatory letter-press concerning the circumstances of their formation.

The series of small drawings was made with a lens of moderate power, but they are not equal in value or structural detail to those drawn beneath the microscope. They are among the most elementary figures observed; and as illustrative of the first principles of formation, are chiefly worthy of consideration.

The idea of observing snow crystals is by no means original. We know for certain that Aristotle observed them, also Descartes, Grew, Kepler, and Drs. Nettes and Scoresby of modern times. Sir Edward Belcher also devoted a considerable degree of attention to the study of the crystals of snow in the Arctic regions; there the radial arms were seldom less than an inch in length, and might be seen, according to Sir Edward Belcher, drifted in heaps, into the crannies and recesses of the ice; they were seldom to be obtained in a perfect condition, generally separating by reason of their weight and size on descending to the ground.

Having brought to a close all that is here necessary to say respecting the formation of these bodies, and the position they occupy in regard to scientific inquiry, we may now turn to a consideration of their capabilities to suggest new forms in decorative design, as applied to the Industrial Arts. Being ourselves desirous to promote the adoption of the appropriate, as well as the simple beauty of truth in ornament, we will first inquire how far these figures are in accordance with those general principles of arrangement of form, which, in all ages and countries have constituted the truly beautiful in Art.

These are summed up briefly in the propositions contained in the opening chapter of the magnificent work by Owen Jones, Esq., just completed, and entitled, "The Grammar of Ornament;" we extract the following:—

tions, the whole and each particular member should be a multiple of some particular unit.

"Proposition 10.—Harmony of Form consists in the proper balancing, and contrast of the straight, the inclined, and the curved." Further on, from the same high authority, we receive as an axiom—"That there can be no

as originating a new order of forms for the further supply or extension of those so long acknowledged and admired. We do not, however, consider that they will equally well assimilate with all or any of the orders of Decorative Art. It appears to us, according to the means placed at our disposal for arriving at a conclusion, that they are analogous in many respects to the numerous specimens of angular composition which belong to the mediæval period of Byzantine Art.

It may not be altogether foreign to the subject briefly to consider the united power of geometric figures, in conjunction with colour, to produce the striking and beautiful effects which form so important a feature in Byzantine and Moresque mosaic (but particularly the former) specimens of Art.

The base of Byzantine mosaic is principally the relation of the hexagon to the triangle, upon which base almost innumerable combinations have been constructed. In the Byzantine Court at the Crystal Palace are a large number of these compositions, arranged in borderings round panels of porphyry or serpentine. They are extremely simple in structure, some being made up entirely of the triangle, others of stars,

either six or eight rayed, singly or enclosed in a hexagon or octagon, placed at intervals and united by the more simple figure of the triangle, which, arranged in groups, serve as connecting links from one to the other. The whole composition is rendered either sparkling or monotonous according to the employment of contrasted effects, or a limited and uniform range of colour; and are admirably illustrative of how the uniformity of the geometric figure may be broken up and destroyed, its very character changed, indeed, according to the system of colouring employed; an illustration still further confirmed by a study of the varied and evolved designs on a part of the encaustic pavement of the Court, which, described in shades of neutral tint throughout, upon a ground of the same colour, renders it difficult for the eye to detect any variation of pattern.

The specimens of Moresque mosaic with which we are acquainted, differ somewhat in character from that which we have been considering. Based upon the square and its affinities, it is constructed mainly with reference to the ratios of eight, four, and twelve, as may

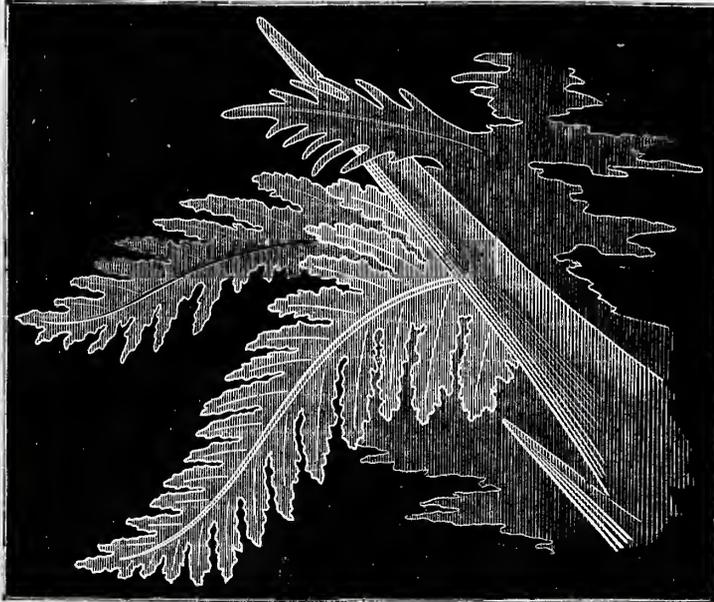

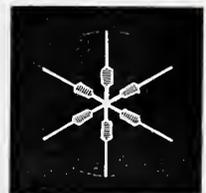

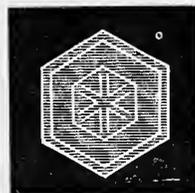

Fig. 5.

perfect composition where either of the three primary elements are wanting—the straight, the inclined, and the curved, or where they are not so harmonised that the one preponderates over the other two." In the crystals of snow we perceive these last conditions are implicitly fulfilled, inasmuch as they include the varieties, straight, angular, and curved, of which the angular has a decided preponderance.

With regard to the proportions of number on which these figures are based, we shall find them almost all deficient in the maintenance of a ratio, water crystallising at an angle of 60°, a fact exemplified in the radial arms, and the secondary and tertiary additions, which, always produced at the same angle, are characteristic of the greater number of these crystals. Thus they can be considered suggestive only of more complete designs—the centre, in fact, of a bordering or pattern-work, to be completed round them according to the intended application, and with due reference to those ratios of number which are found most acceptable in composition.

Founded upon a strictly geometric base, and a uniform repetition of a certain harmonious

"Proposition 3.—As Architecture, so all works of the Decorative Arts should possess fitness, proportion, harmony, the result of all which is repose.

"Proposition 5.—Decoration should never be purposely constructed: that which is beautiful is true, that which is true is beautiful.

"Proposition 8.—All ornament should be based upon a geometrical construction.

"Proposition 9.—As in Architecture, so in the Decorative Arts, every assemblage of Forms should be arranged on certain definite propor-

irregularity of parts, bound together in one harmonious unity by the laws of circular composition, which serves to lend beauty to their constructive details, and constitutes the archeus of the figure, we are impressed with a conviction of their truth, and conformity to the natural principles of beauty.

The impulse created in their favour is thus subsequently confirmed on rational and acknowledged grounds of admiration; this is the more satisfactory that, belonging to no school of architecture or design, they may be considered

be seen in the Court of the Alhambra. It is less glittering in colour than the Byzantine, and attracts the eye more to masses than to fragments.

The figures of snow are nearly allied to the principles of these decorative styles of Art, based, as they are, upon a system of angular geometry; we perceive, also, that the primitive base of the crystals is the leading figure of mosaic, founded, as most of it is, upon the hexagon and its combinations, though occasionally admitting, with great effect, the employment of the octagon. Thus they seem naturally sug-

gestive of an extension of the forms common to mosaic, and may be the means of eliciting fresh combinations scarcely less beautiful than those transmitted to us from the past.

The fitness of mosaic for the purposes of decoration is evident, on the ground of its conformity to certain fixed principles of truth, which scarcely permit of deviation. One of the

oldest of the mechanical arts, originating in experimental combinations with cubes solid and transparent, subsequently improving as the science of geometry became more generally understood, it is now in the hands of some of our most eminent manufacturers not the least important among the industrial agents of the present day, as may be seen in the beau-

tiful encaustic and painted tiles for pavements and decorative purposes generally, executed by Messrs. Minton and Co., of Stoke-upon-Trent.

One great fault of the decorative designs of the present day is, the want of "appropriate" ornament to the purposes in view, and the mixture of schools, or styles of Art, which characterise so many of the patterns commonly

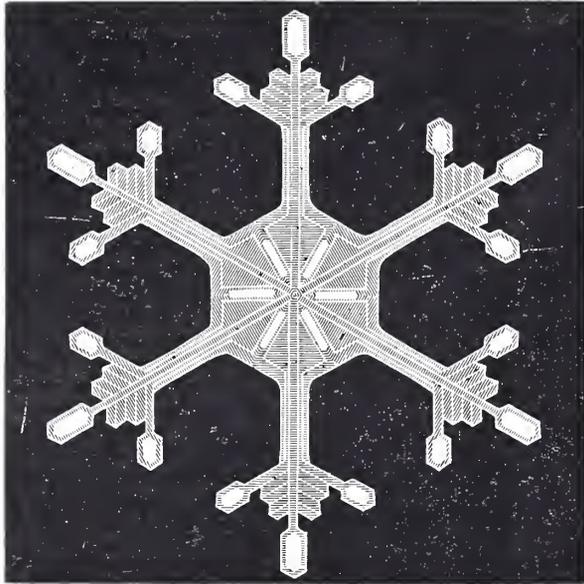

Fig. 12.

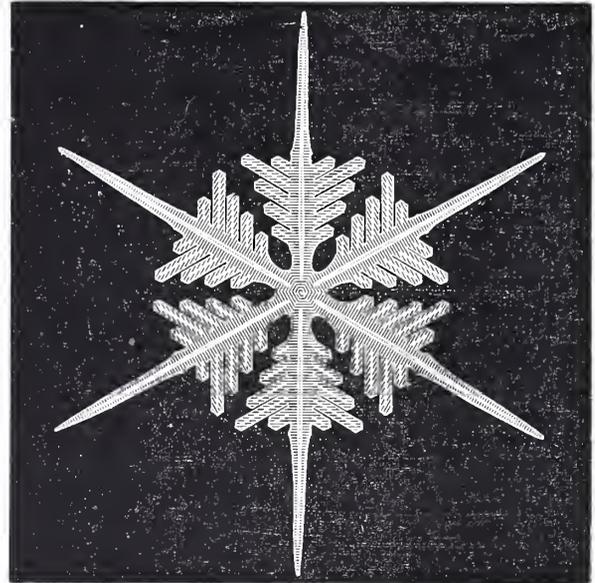

Fig. 13.

produced for domestic and even higher applications,—a mixture too often involving the entire destruction of truth, fitness, and proportion, the three essential elements of beauty. Now that we have open to us, in the Courts of the Crystal Palace, and in the magnificent work on the "Principles of Ornament," by Mr. Jones, an entire history of the past in architectural design, classified into schools, the origin and progress of each, either traced or

traceable in connexion with the period at which it flourished, and the people who gave it birth, we may surely anticipate that the pure and beautiful so made known and naturalised amongst us, may exercise an important and beneficial influence on design, from its highest to its lowest applications.

We do not forget, however, that the art of mosaic, taking its rise beneath the sunny skies of Italy and Greece, and glittering even now

on the walls and beneath the cloisters of the Byzantine churches of Italy and Sicily, and within the mosques and palaces of the East, accords rather with the genius of the South and the gorgeous taste of the East, than with the less florid tone of more northern lands; and a thorough understanding of the conditions under which it so long assimilated with, and continued to constitute a dazzling feature in, the decoration of two, if not three, of the highest

Fig. 14.

Fig. 15.

styles of architecture—the Moorsque, Byzantine, and Arabian,—is necessary to enable us to profit to the full by its capabilities as an industrial agent; nor do we forget that the rise of mosaic (we are speaking of its conventional varieties) was accompanied by, or was rather the result of, the decline of Art, when for a period a mechanical process usurped the place of higher efforts of design and fancy.

For the very reason, however, that the art and its imitations must be to a great extent

mechanical, we could wish to see its range of utility still further extended; not admitting of wide deviations from fixed principles, we would prefer to see it substituted for the large mass of nondescript patterns to which we have already made allusion. And our facilities are great for introducing it into more general use; for in the same way that the painter's art has, with the utmost truthfulness of effect, reproduced for our study and admiration on the walls of the Byzantine Court representations

of the elaborate inlayings of marble and glass, with which the originals, centuries ago, were constructed, we may carry its imitation successfully into almost every branch of manufacture or decoration; and, whilst preserving the spirit of the combinations, unfettered by the constructive difficulties of the original work, we may engraft new figures, and originate new styles of pattern perhaps available for a variety of applications.

(To be continued.)

TALK OF
PICTURES AND THE PAINTERS.

BY AN OLD TRAVELLER.

CHAPTER III.

Sala del Gran Consiglio, Venice—Battle of Cadore—Sketch in the Uffizi—Landscapes of Titian—Just Praise of the Authorities—All Honour for the Work done—Regrets for the Work left undone—Portraits of Titian—Their Historical Value—Ippolito de' Medici—Pope Paul III.—The Child of Roberto Strozzi—Portraits in the Uffizi—Laura de' Dianti—The Master's own Portrait—Question of the Visit to Spain—Works of Titian in that Country—Wilkie at the Escorial—Social Life of Titian—Suppers of the Garden—Contemporary Description—Plague in Venice—Death of the Master.

IN the year 1547, that hall of the ducal palace, in Venice, called the Sala del Gran Consiglio, was destroyed by fire; many valuable works of Art then perished; and among them was the great Battle of Cadore, painted by Titian at command of the Venetian senate. The battle was fought between the imperialists on the one hand, and the Venetians, led by Alviano, the general of the republic, on the other. The composition of this work is rendered familiar by the engraving of Pontana; and Ridolfi, who declares himself to have seen a good copy, and may have known persons acquainted with the original,* has given a minute description of the whole. Of this the reader will find certain parts in Northcote's life of Titian, already quoted. The Italian author, alluding to the various parts of this lamented work, declares the landscape to have been faithfully depicted from Cadore—Titian's native place. He enlarges on the grand effect produced by the Castle of Cadore, which had been struck by lightning, and had taken fire. The building pours forth dark masses of smoke, "these, rolling in heavy clouds from the half-burnt structure, contributed greatly to the force of the general effect," says Ridolfi, "adding new terrors to those of the tempest roaring above, and of the conflict raging below." In the Florentine gallery of the Uffizi there is a sketch, made by Titian for the Battle of Cadore; in this, if the writer remember clearly, the general holds the baton of command; Ridolfi (*Maraviglie dell' Arte*) describes him as leaning on his sword.

To the pre-eminence of Titian as a painter of landscape the authorities have borne unanimous testimony. Speaking of the landscape, in a "Flight into Egypt," painted for "Messer Andrea Loredano, che sta da S. Marcuola," Vasari has the following:—"Nel qual quadro è dipinta la nostra Donna che va in Egitto, in mezzo a un gran bosaglia e certi paesi molto ben fatti, per avere dato Tiziano molti mesi opere a fare simili cose, e tenuto perciò in casa alcuni Tedeschi, pittori di paesi e di verzure." †

Du Fresnoy, alluding to the landscapes of Titian, remarks that, "No man ever painted landscape in so great a manner, so well coloured, and with such truth of nature." ‡ English commentators are equally lavish of their praise. "As a painter of landscape," says Haydon, "Titian was never surpassed." Northcote, speaking also of Titian, enumerates, among the many other qualities of the master, "his excellence in landscape-painting: whether introduced as an accessory or predominant," says the eulogist, "landscape is always treated by Titian in the grandest and most picturesque style."

Assenting cordially to all this, and most particularly to the "great manner and look of nature" claimed by Du Fresnoy as characteristic of this master, there is still a want, felt, if not by the painter, who may content himself with the indisputable excellence of what Titian did, yet always by the lover of nature—of nature in those external forms wherein the Greeks of old did well to suppose divinity, for are they not informed by a spirit which is indeed divine!

To Nature, in some of the holiest and most inspiring of her material forms, Titian, if not insensible, was at least cold; he did but mark in them what sufficed for his purpose of the moment; but shall this be accepted? Can he whose soul bends reverently before the shrine, whose whole heart is east all lovingly on the steps of the altar—can he content

himself, for the object of his worship, with such homage as is paid by the mere crowd? He cannot, and does not.

Yet but little beyond this was offered by Titian. He does not approach the fancies with the simple reverence, the touching humility that win the very heart from one's bosom, as one lingers long sweet hours with the older masters; neither has he for one moment devoted to them that passionate love by which certain of our modern artists are lifting themselves above the mass.

Every other quality I grant him, and in abundance. How grandly do the many proofs he has left us of his truth and power rise in their well-remembered beauty and stateliness to the charmed and lingering memory! Yet, admitting this—this and more, for much more might well be affirmed—I repeat that Titian did not give enough of his heart to the world without. A child of the mountains, he loved his native Cadore, and frequently returned to refresh his spirit amidst the deep glens and rich woods of his home, as certain of his works amply prove; yet did the life of the city too quickly resume its influence, and the pleasures of her interior existence, rather than the beauties of her outward aspect, then ruled the ascendant. Nor let Pietro Aretino bear all the blame—Titian's companionship (I do not say friendship) with that bad man did not commence until he was fifty years old, and Aretino was much younger than himself: neither are these strictures to be called mere cavilling, they are at least made in no spirit of cavil; let the objector rather tell me, has he watched the sunset or the sunrise from that point whence Titian had the privilege of daily seeing both; has he felt the deus of mingled gladness for himself and gratitude to their Creator dim his eyes as the purple and the gold, the pearly tints and the delicate paly green, or rather all those indescribable hues—some faint semblance of which we seek to convey by these poor names, for lack of words more befitting—the hues of a rich Venetian sky; has he seen these when the sunset of Venice is making earth all holy with its beauty? Or, even more impressive, perhaps, have you, who are content with so much as the master has given, have you marked those broad, bright fields of space, that seem indeed to be opening the rejoicing plains of heaven itself to your reverent gaze, as you stand—not marvelling that the Persian kneel, nay, bending in heart and soul as he bent when that glorious sun declined—have you seen all these, as Titian must have seen them, from the spot where he stood daily? If you have not seen them, go then, give to your eyes that festival of beauty—beauty in its most entrancing, yet most sacred, most awe-inspiring loveliness; do this, and you will at least regret that, having all these glories for his vision, the man so favoured should have died and left the world no sign. Yet this has Titian done. So far as the writer's knowledge of his works extends, he has in no ease given their full value to those heights, fair rising for thee fortunate Venice, with all their ever-changing wealth of beauty. He has left all but untouched the rich stores spread before him, and stretching, aye, from his home* in the radiant city, across the glittering waters and across the fruitful plains, even to the Euganean Hills, and the far, far Alps of the eloquent Rhetia. Beauties which, but to see as the mere stranger and sojourner sees them, suffice to fill him with regret that the power of reproducing their pure loveliness for the eyes and hearts of all men, hath not been of his inheritance. All these, seen daily, hourly, with all their enchanting variations of phase, never to be loved enough—at morn, at noon, in the purpling sunset, and beneath the one sweet star of early evening—with the fair moon looking in charmed delight over all, and again in the deep blue midnight, when the darkness is but in seeming, and the eyes of love are still potent as at noon-day to discern the divinity ever present:—all these were his, yet his in vain. Never, so far as we know or can ascertain, was the master inspired to

seize his powerful pencil, and to say, "Not fleeting, not evanescent shall be now thy glories, oh beauty! adored and made for adoration. Not for this bright moment only, but for all time shall be thy loveliness, heart-gladdening, for to this end hath man been touched by the fire of genius." Titian did not say this; he did not feel it.

"Nay, but perchance he knew that even the might of his power would strive in vain to reproduce that splendour of beauty, and so the hand fell by his side nerveless and trembling; no Hymn that he could raise was holy enough, and he kept silence in his despair."

Ah! so be it; and if you can hold thus of Titian, take that faith to be your consolation. Happily, the beauty for which his eyes were blind remains eternal. Still does it smile along the plain, still light the distant summits, for him whose joy at once and privilege it is to stand where once the famed Venetian stood, regardless. Happily, for when the hour shall bring the man, some faint, pale shadowings of that beauty may yet bid the outer world rejoice in the rich treasures of its spiritual loveliness.

And now you will say, "We have no need to seek far regions for the glory of the sunset, we fortunate English;" and you are right, we have such beauty—purple banks of clouds combining to form one of its many phases—as in some of its characteristics, will be found in no country beside. The writer retains remembrance—may Heaven be praised for memory!—of some few instances, gathered in a loving lifetime, of certain examples that no other land has approached; but for those vast infinitudes of space, those limitless regions laid open by an Italian sunset, to Italy you must go. Here, rich as we may be—as we are—in our varying beauty of clouds and sunshine, each enhancing the glory of the other, we have not the breadth of Venetian skies. Do you doubt this? *libre à vous*, and it is in charity, not in resentment, that I bid you go and see.

To the perfection of this master's portraits, writers of all lands do and have done such justice as repeated plaudits, echoing from all sides, may avail to secure; nor, as regards their fidelity, and the value they possess in their relation to the history of the period, could they be overrated. Kugler does but echo the general voice of authority when he affirms Titian to be "the finest portrait painter of all times." "He was not content," says the German writer, "with giving his subjects all that was grand and characteristic in style,—he also gave them the appearance of dignified ease. He seems to have taken them at the happiest moment, and thus has left us the true conception of the old Venetian, by the side of whom all modern gentlemen look poor and small."*

Poor and small indeed! and well would it be for modern portraiture if even this were the worst that could be said of the look imparted to its subjects—its victims rather—if, indeed, it be not the painter who is made the victim of his subjects' paltry vanity. Yet, if that be so, therefore will he consent to the degradation? Is it for Art—the redeeming, the refining, the elevating—is it for her to put on fetters at command of the earth-born Vanity? But let us forget the matter,—there will come the remedy when Art shall have assumed its true place among us. The dawn of that day approaches; desiring eyes behold faint gleams in the distance; they become brighter: we have but to take patience, and the light shall come.

Of Titian's portraits, Du Fresnoy says, "They are extremely noble, the attitudes being very graceful, grave, and diversified, and all are adorned after a very becoming manner. †

True and forceful exposition of individual character is likewise among the precious qualities justly attributed to the portraiture of Titian. That of Ippolito de' Medici is thus contrasted by Hazlitt with one of a young Neapolitan—both in the Louvre when Hazlitt wrote—"All the lines in the face (of Ippolito), the eye-brows, the nose, the corners of the mouth, the contour of the face, present the same sharp angles, the same acute, edgy, contracted, violent expression; the other portrait, that of a young Neapolitan noble, has the finest expansion of feature and outline; it conveys the most exquisite idea possible of mild, thoughtful sentiment." ‡ A

* In the Abate Cadorin's work, "Dello Amore ai Veneziani di Tiziano Vecellio," the reader will find many circumstances of great interest as regards the domestic life of Titian, and his residence of some forty-eight years in the Via di San Canciano; but new buildings and other circumstances have now greatly altered the localities, and the character of the whole district is changed; the house itself remains, but the interior would not be recognised by its former dweller, were he now to revisit his earthly abode.

* Ridolfi, as we learn from Lanzi and others, was born in 1596.

quality of inestimable value in the painter who is the exponent of history, is truth of expression; nor is the advantage confined to the countenance only in the works of Titian—it extends to the whole work, and pervades every part of the person.

Of Paul III., painted a second time by Titian, with his grandsons, the Cardinal Farnese, and Octavio, Duke of Parma—Fuseli, examining the work, in company with Northcote, at the Capo di Monte, agreed with the latter, that it was, indeed, one of the finest examples in the world, "more particularly in regard to the expression, which is inimitably fine." Fuseli concluded his remarks by exclaiming, "This is true history."

Speaking of a portrait not known to the present writer—that of Pope Paul IV., namely—Mrs. Jameson remarks, and with truth, that "There are hands of various character; the hand to clasp, and the hand to grasp; the hand that has worked, or could work, and the hand that has never done anything but hold itself out to be kissed, like that of Joanna of Arragon, in Raphael's picture.

"Let any one look at the hands of Titian's portrait of old Paul IV., though exquisitely modelled, they have an expression which reminds us of claws; they belong to the face of that grasping old man, and could belong to no other."

That so much eloquence of expression as we find attributed to the portrait in question may be found in a pair of hands, when those hands are painted by Titian, will surprise no one; the word grasping must, however, here denote, not avarice, but tenacity of character, or such hands as those above described could scarcely be attributed, with truth, to Pope Paul IV. Even in Pope Paul III. (Alessandro Farnese), whose portrait, painted by Titian, is known to all,† the grasping of avarice was no distinctive characteristic; although, for his son, the ill-fated Piero Luigi, and for his grandsons, that pontiff was insatiable of honours and dignities, and in pursuit of these may have been led to the desire for treasure, as a means to his end; but to Paul IV., the determined reformer, the zealous restorer of the then dying Inquisition, the founder of the festival in honour of St. Dominic, and of the rigid Order of Theatines, the debasing vice of avarice was absolutely unknown. Many wrongs had he to expiate, many errors to bewail; but a grasping love of gold was not among them. It is true that the reforms he sincerely desired to make were permitted to suffer interruption from the fierce war waged by that pontiff against the whole might of Spain, and the Empire; it is also true that he, whose whole previous life had been a protest against the nepotism of former popes, no less than against all other abuses in the Church, was by that war betrayed into according undue ascendancy to his own nephews, for whom the house of Colonna, and other great families, were despoiled of their possessions. But this took place in a period of difficulty and danger: when the return of peace gave him leisure for learning the truth, Paul IV. did not spare the guilty because they were those of his own household; above all, in no case did he appropriate any portion of the spoil. Again, if the statues, once erected to his glory, were torn from their pedestals and dragged through the streets by a furious populace, before the eyes of the pontiff had well closed in death, that was not because of oppression induced by avarice; but because the nobles, pursued by his uncompromising justice, resorted to their well-known custom of inciting the people to revolt, and also, perhaps, because these last had suffered cruelly from the consequences of the Spanish wars. It was, in fact, the Pope's first care, on the cessation of those wars, to reduce the taxes, and remit every impost bearing hardly on the people: to amass treasure was at no time one of his aims, and of the papal avarice none did or could complain. The ruling passion of Paul IV. was, without doubt, love for the Church—the Church, not in its abuses, as he found, and, unhappily, left it also; but in its primitive lustre and purity, to which he had fondly hoped it might be recovered by his means. Fain would Giovanni Pietro Caraffa have restored whatever, in doctrine or discipline, was, in his opinion, calculated to enhance the true dignity of the Church. To her

services he would fain have imparted an elevation worthy of those days when all was best and fairest. For her ritual he had conceived hopes of an ideal perfection, the devotional splendours whereof none had previously beheld: neither was he permitted to witness them. Not only did he exhort the princes of the Church to perform the duties of their office faithfully, he gave them the example in his own person, and compelling his cardinals to preach publicly, the pontiff also ascended the pulpit, and taught them how the duty should be performed. On this point we have the testimony of the Venetian ambassador, Mocenigo:—"Nelli officii divini poi, e nelle ceremonie, procedeva questo pontefice con tanta gravità e divozione che veramente pareva degnissimo vicario de Gesù Cristo. Nelle cose poi della religione si prendeva tanto pensiero, et usava tanta diligenza, che maggior non si poteva desiderare."*

Hear, also, what another ambassador from the Venetian Republic to the papal court, Bernardo Navagero, namely, reports to the Signori, his masters, of this same pontiff:—

"Ha una incredibile gravità e grandezza in tutte le sue azioni, e veramente pare nato al signoreggiare."‡

Of Titian's success in the delineation of children we have many proofs. Ticozzi relates the following anecdote:—"In the year 1542, Roberto Strozzi was in Venice with a beautiful child, whom he tenderly loved, and now would he have Titian paint him her portrait at full length. Then it chanced, something more than a century later, that this portrait was placed in the open gallery of St. John's Church, on the day of the Baptist's festival, and was there seen by the young Count, Lorenzo Magalotti, then a boy of six years old, who has himself told us how his whole life was ever afterwards haunted by the recollection of that picture." In the sixtieth year of his age he writes to Leone Strozzi, a descendant of Roberto, entreating, and not for the first time, that a copy of his beautiful kinswoman may at length be granted for his solace; he cites many proofs of "the terrible ascendancy this little girl has had over him;" and if the reader be not very hard-hearted, he will rejoice to hear that the copy so long desired was ultimately sent him.

In the Florentine Gallery of the Uffizi is a work in which are the portraits of the Duke of Urbino, of Francesco della Rovere, and of the Duchess, his wife—this is considered to be a masterpiece in its kind. The duke is in armour, and in the perfection with which the metal is portrayed, as well as in the delicacy and transparency of the colouring throughout—the face of the duchess being more particularly remarkable for these qualities—foreign critics find an inexhaustible subject of eulogium. The portrait of Catharine Cornaro, Queen of Cypress, is likewise here; she is presented under the semblance of Catharine of Alexandria, and the work is one of great beauty.

The picture called "The Flora of Titian," likewise in the Uffizi, has been much discussed, and is well known: this also is a portrait, and is considered to be a replica of that in the Louvre called "Titian's Mistress"—they are consequently both likenesses of Laura de' Dianfi, second wife of Alfonso, first Duke of Ferrara. The appellation, "Titian's Mistress," is now understood to be a gratuitous assumption, in this instance as in so many others; it is from Ticozzi, not always to be depended on, that we obtain the settlement of this question: he declares himself to be convinced by a careful comparison of medals and well authenticated portraits with those now in question, and in this instance is supported by collateral evidence of so much authority, that no reasonable doubt of his accuracy can, as we think, be entertained. In an earlier work mentioned by Vasari,‡ and still, as is believed, at Ferrara, Titian had already depicted "The Signora Laura;" but when, after the death of his first wife, Lucrezia Borgia, the duke married this second duchess, the great painter was called on to delineate her features once more, together with those of her well-pleased

lord, who had bestowed on her the name of "Eustochia," to intimate his entire satisfaction with that second choice.

That the master's own portrait, painted by himself, is in the Uffizi, our readers know: this, also mentioned by Vasari,* was sold to the Bellonese painter, Marco Ricci, at some time early in the last century, by a certain Osvaldo Zuliano, guardian to Alessandro Vecelli, a minor of the painter's family, from whom it was in fact purloined by Zuliano, under the pretext of having it valued in the interest of his ward. Taking the portrait to Venice, he next declared it to have been sent back to Cadore—where it had been carefully preserved by Titian's earlier descendants—having been found, as he said, of no value. But the messenger entrusted with the valuable deposit never arrived. The picture, transferred by Ricci to the Florentine Gallery, was discovered there by Alessandro Vecelli, by whom a process was instituted against his treacherous guardian to recover the value, but the result is not known.

Three times did Titian paint the portrait of Charles V., and on the last occasion the Emperor declared himself to have been thrice immortalised in consequence. The story of the fallen pencil, with the declaration of his imperial majesty, that to wait on Titian was a fitting occupation for the Caesar, is well known, as are the princely honours conferred on the favoured master in Rome, at the court of Ferrara, and at that of Urbano.

Portraits of Francis I. of France, Sixtus IV.,† Popes Julius II. and Paul III., with those of Francesco Sforza, Duke of Milan, Guidobaldo II., the old Cardinal of Lorraine, Solymau, Emperor of the Turks,‡ and many more, are enumerated as among the works of Titian, by Vasari, who proceeds, until, losing breath, he says—"Ma che perdimento di tempo è questo? Non è stato quasi alcun Signore di gran nome, nè principe, nè gran donna, che non sia stata ritratta da Tiziano, veramente, in questa parte, eccellentissimo pittore."§

Whether Titian did or did not visit Spain, is a question frequently mooted among Italian and Spanish writers; the latter affirming, the former denying, that he did so. Cean Bermudez,|| almost always correct, maintains that his country was so favoured, adducing various facts in support of his assertion—that of Titian having taken the portrait of the Empress Isabella, for example; Bermudez contending, that as the empress did not leave Spain after her marriage, and could not have sat to him elsewhere, so the painter must needs have taken her likeness in Spain. But his opponents find a reply to this, as they do to the affirmations of his countryman, Palormino¶—not so much to be depended on as himself, and manifestly in error, even by his own showing, since he declares the patent of Titian as Count Palatine to have been signed by the Emperor, and by him presented to the master at Barcelona in the year 1553, Charles being then confined by illness at Brussels: the true date of the patent is, besides, 1535, as correctly given by Cean Bermudez. But whether Titian did or did not visit Spain, most essential is it that all who would form a fair judgment of his works should go thither. Speaking of the Venetian school in the Royal Gallery of Madrid, Ford, the most important and most valuable of our authorities for Spain, has the following:—"By Tiziano Vecellio of Cadore, there are forty-three pictures—a museum in themselves. . . . Titian's own portrait is among them, as is the renowned Apotheosis of Charles V. and Philip II., painted in the best period of the master, and considered by many to be his masterpiece. By his will Charles directed that this work—known as the

* "Delle buone cose che siano in quella casa, è un suo ritratto che da lui fa finito quattro anni sono, molto bello e naturale." [Among the excellent works in that house (the house of Titian) is a portrait of himself, finished four years since, very beautiful and faithful.] Opere, p. 214.

† Pope Sixtus died in 1484: that pontiff could, therefore, not have sat for the portrait here in question, Titian being then but eight years old.

‡ In this case Titian did not paint from the life.

§ "But what a waste of time is this? There is scarcely a noble of high name, scarcely a prince or great lady who has not been portrayed by Titian—truly a most excellent painter in this branch of Art." Opere, vol. v. p. 208.

|| "Diccionario Historico de los mas ilustres Profesores de las Bellas Artes en España."

¶ "Vidas de los Pintores Españoles." The work is not for the moment within reach of the present writer, nor is that of Bermudez, cited above; but the reference to either will be easily made.

* See "A Commonplace Book of Thoughts, Memories, and Fancies, Original and Selected," p. 239.

† Of this portrait there is a replica of undoubted authenticity in Lord Northwick's Collection at Thirlstaine House.

‡ Rilatione di Messer Bernardo Navagero alla Serenissima Repubblica di Venezia, 1558.

§ "Similmente ritrasse la Signora Laura, che fu poi moglie di quel Duca (Alfonso) che è opera stupenda." [He also painted that Signora Laura whom the duke afterwards married; a truly wonderful work.] See Opere, vol. v. p. 198.

Gloria—should always be hung where his body was buried; it remained at San Yuste accordingly until Philip removed the body of his father to the Escorial.*

In the same gallery is, or was, another of Titian's great works, Charles V. on horseback. "This," says Ford, "before its recent restoration, was the finest equestrian picture in the world."

Of the noble "Last Supper," also in the Escorial, one of the grandest of Titian's religious works, and "on which," says Stirling,† "his pencil lingered lovingly for seven years," there is an affecting anecdote, told by Southey, as follows:—"When Wilkie was in the Escorial, looking at Titian's famous picture of the Last Supper, in the refectory there, an old Jeronimite said to him, 'I have sat daily in sight of that picture for now nearly threescore years; during that time my companions have dropped off one after another—all who were my seniors, all who have been my contemporaries, and many, or rather most, of those who were younger than myself: more than one generation has passed away, and there the figures in the picture have remained unchanged! I look at them till I sometimes think it is they who are the realities, and we the shadows.'

"I wish I could record the name," adds Southey, "of the monk by whom that natural feeling was so feelingly and so strikingly expressed." The reader will join him in that wish. The anecdote will be found—with how many other strange things rich and rare!—in that strangest of all strange books, "The Doctor,"‡

Ford, speaking of this painting, when describing the *Iglesia Vieja*, declares it to have "hung flapping in its frame for years, like a hatchment in our damp country churches." He adds:—"It has recently been repainted."§ Repainted! the unhappy word! When Ford wrote the above, some twenty-two years since at least, the picture was still in the refectory where Wilkie had seen it; but we learn from Stirling that it is now in the Queen of Spain's gallery at Madrid. The same author, speaking of the Palace of the Pardo, tells us that "the Hall of Portraits contained no less than eleven from the easel of Titian; likenesses of the Emperor and Empress, of Philip II., of the great captains, Duke Emmanuel, Philibert of Savoy, and Fernando, Duke of Alba, with several princely personages of Germany, all of which perished by fire in the next reign."||

It was this conflagration whereby the renowned Venus of Titian was endangered, and which gave rise to the anxious inquiry of the king for its safety, so frequently cited, with his as often repeated declaration, when relieved from his anxiety, to the effect that, "Since this was safe, every other loss might be either repaired or endured."

Returning for a moment to the question of Titian's visit or no visit to Spain, Mr. Stirling, in the first authority we now possess as to all *cosas de España* connected with the Arts, has the following words:—"In age, as in fame, the venerable name of Titian stands first on the list of Philip's painters. Although he never set foot in Spain, he may, for his works, be fairly enough ranked among the artists of the Escorial."¶ In a preceding passage, Mr. Stirling, referring to what Northcote has said on this subject, complains of that else most useful writer's defective arrangement, and that he dees so with reason is most certain, for do but hear how that dear Northcote treats the matter: first he says—"Carlo Ridolfi, the biographer of Titian, declares that he never came into Spain, but in this he is mistaken. It was not, however, until the year 1553 that he visited that country. During his residence there he executed many admirable works, and received many princely rewards for them." This in the first volume, and at page 109; but what do we next find? Turn to volume second, and you shall see.

"With respect to Titian's visit to the court of Spain, it is necessary to take some slight notice of the subject, were it only for the obstinacy with

which the Spanish writers, incautiously followed by others, have given weight to this popular tradition. Don Antonio Palomino Velasco did not hesitate to enumerate Titian among the Spanish painters, asserting that he remained in Spain from 1548 to 1553. It would be lost time to set seriously to work to confute an opinion so void of all probable foundation. I ask those who have still any doubts about it, to read the letters written to Arcetino by Titian, and others respecting Titian, from 1530 to 1555, in which will be found from month to month an account of the places in which he was in the course of those twenty-six years. To this is added the testimony of those who have written his life, who all positively affirm that Titian declined the invitations of King Francis to visit France, and those of Charles V. and Philip II. to go to Spain. The anonymous author says, 'He was also, after the death of Charles, invited by Philip his son, but in vain, for he would not go to any distance from his native place. But he consoled Philip in a very satisfactory manner by some pictures of more than common perfection.'

These last words are those of "L'Anonimo;" but, as the reader will perceive, our Northcote had with his own hand effectually demolished the assertion of his first volume.* There is, besides, yet further testimony in a letter from Arcetino to the sculptor Leone Leoni, wherein, replying to an intimation from that artist of Pope Paul's desire that Titian should visit Rome, Arcetino assures Leoni of the great master's willingness to do so, "although he declined the request of Charles V. to the effect that he should visit Spain." The question may therefore be considered as set at rest. It was in Vienna and Bologna that Titian held his well-authenticated intercourse with the "Cesarean majesty;" but not in Spain, where, to conclude with the words of Stirling, "he never set foot."

The private and social life of Titian are well known, that of his later years more especially so. We have minute details respecting it from contemporary writers. Lodovico Dolce, his intimate friend, and his less worthy associate, Pietro Aretino, among the number. Of the latter, M. Louis Viardot has a few words that go far to explain what has been called the friendship subsisting between Aretino and the great master. Viardot is speaking of the portraits by Titian in the Pitti Palace, and among others, he names that of "Pietro Aretino, le poète satirique et redouté, l'ami et le conseiller du peintre, qui le craignait cependant plus encore qu'il ne l'aimait."†

The contemplation of his earlier and more difficult, if not more laborious, days, has still greater interest in the estimation of the present writer; but their character has been sufficiently intimated, and, remembering who was the presiding genius of the festive assemblies enlivening his later years, few, perhaps, will listen with indifference to what Francesco Priscianese says of "a sort of Bacchanal feast" to which he had been invited. This was held "in a delightful garden," says Priscianese, "belonging to Messer Tiziano Vecelli, a most excellent painter, as everybody knows, and a person truly fit to provide with his affability every honourable entertainment. With the said Messer Tiziano were assembled—as like always desires like—some of the most rare geniuses at present in this city; and of ours, principally, Messer Pietro Aretino, a new miracle of nature. Next to him, the great imitator of it with the chisel, as the provider of the entertainment is with the pencil, Messer Jacopo Tatti, called Il Sansovino; then Messer Jacopo Nardi; and, lastly, myself. Thus I was the fourth part of such great wisdom. Here, before they spread the tables, as the sun, though the place was shaded, still made the force of his beams to be felt, the time passed in contemplation of the most excellent paintings, of which the house was full, and in talking about the true beauty and loveliness of the garden, which every one was singularly pleased with and much admired. It is situated at the furthest part of Venice, on the edge of the sea, looking over to the lovely isle of Murano, and other beautiful places. This part of the lagoon, so soon as the sun had gone down, was covered by a thou-

sand gondolas, adorned with the handsomest ladies, and resounding with divers harmonics, with vocal and instrumental music, which till midnight accompanied our delightful supper." There is much more, but this shall suffice; not that the picture is anything less than charming, taking the site and the master of the feast well into the account, but because all can now prefigure to themselves the delights that followed.*

Then come the "Suppers"—no inconsiderable part do they perform in that period of the master's life which he passed with Arcetino, Sansovino, and the rest—the suppers, I say, to which "Messer Tiziano" was, in his turn, bidden.

"A brace of pheasants, and I know not what else, expect you at supper with the Signora Angiola and myself," writes Arcetino, "therefore come, that Old Age, the spy of Death, affording us continual amusement, may have nothing to tell his master, save that we are old."

Or if any be further curious as to the *menu* of these "feasts of intellect," let him know that the grosser material need not be wanting even now; let him see only that he gather the guests befitting them, and the Titianesque supper may yet be imitated, come what may of the rest.

"For the fine and excellent turkey your true kindness sent me from Padua," writes Arcetino to an occasional *convive*, "I give you as many thanks as he had feathers in the tail and wings. The ambassador of Mantua, Monsignor Torquato Bembo, Sansovino, and Titian, enjoyed the turkey, bestowing blessings on the giver at every mouthful." And again—"It seemed to Titian, who gives life to colours, and to Sansovino, who gives breath to marble, that it would be almost ungrateful for me alone to thank you for your gift of pickled fennel and spice cakes; they, then, both now with me, sending their words, and adding the testimony of their good appetite in the eating thereof—they being fond of such savoury food—confess to be much obliged to you for it." To another of their comrades the same writer says—"The pearls you sent from Vicenza are fine and juicy; nor need you ask whether Titian shares them with me, for it is well known to you that we sup almost always together."

Is that enough? or will you have a continuance of these details? They are in sufficient abundance, but the sources are accessible to all; wherefore, and for the present time, I beg you to agree that those given may suffice.

No lover of Art remains long in Venice without turning his steps towards the ancient dwelling of Titian, in the Via di San Canciano; but the first visit of the present writer was also the last: although more than once in Venice since that first was paid, we have not again returned to the deserted dwelling of the honoured master. Sordid chambers were at that time crowded by threes and fours within the space of those wide halls, once resounding to the majestic step of Titian. This state of things contrasted painfully with what we had just before seen, and again beheld long afterwards, in the Casa Buonarroti at Florence, and altogether offered no temptation to return.

Painful and saddening is the contrast presented by the closing scene of this great man's life, extended to within a few months of a century, to be extinguished at last amidst the horrors of pestilence and the desolations of abandonment: but the details are fully known, and we need not dwell on them. Some writers have spoken of Titian's son Orazio as squandering the rich patrimony left him by his father in scenes of unworthy riot; but these have confounded the younger son Orazio, with the elder, Pomponio, who did, without doubt, permit his father's priceless works to be disgracefully scattered, and was himself unworthy to be called the son of Titian. As regards Orazio, if he did not expire on the same bed with his father, as many affirm, but was carried forth to the public hospital, with some faint hope of saving his life, as is declared, and with a better show of truth, by others, yet it is known that he did not long survive the effects of the plague, so fatally raging; nor, had he done so, was Orazio of a character to offer so much dishonour to his father's memory, as was inflicted by the heartless conduct of Pomponio.

THE PICTORIAL TUBE.

EVERY one who has seen a good dioramic exhibition must have remarked the closeness of its approach to reality; and some, like ourselves, may have been even deceived for a time into the belief that the natural picture was itself before them. Yet these dioramic pictures are generally much inferior to the works of highest Art. Does not this, therefore, prove the more, how necessary it is, when we are looking at paintings, that we should try to eliminate in every way we can the multiplicity of objects which usually surround them, distracting our attention, mingling with their proper lights, and disturbing their effects? The diorama effects these eliminations by cutting off, as absolutely as possible, the light of day, and substituting for it an artificial illumination of high power, which, by passing through the picture alone, carries, as it were, a more perfect semblance of the reality to the retina of our eyes. In this way all canvas reflections are entirely obviated, and the vision of circumjacent objects largely suppressed.

The tube, which is here engraved in two forms, has been designed to render to the higher Art-pictures the same service which this elimination so effectively yields to dioramic, without displacement of that only perfect compound light which the sun so bountifully sheds and the atmosphere so equally

As a mere invention, it claims little regard—its principles are so simple and its structure so easy; but it will have, none the less, some considerable claim to usefulness, if, as its author takes

leave to affirm, it shall prove available to increase our enjoyment and our discrimination of the world of Art-painting.

The contrivance may be said to spring from, and claims kindred with, the almost universal custom of connoisseurs in looking at pictures through such tubes as the bent hand, rolled paper, and the like; and simply consists of a short tube of any material, blackened inside, and having at its wider end a band of india-rubber, which can be distended at any two fixed and diametrically opposite points *a* and *b*, and also by means of a semicircular ring of wire, at two varying points *c* and *d*, whose variation will accommodate the figure of the opening to that of a square or any oblong picture. By nudging the distension, it gives a circular opening, and this can be changed into the elliptical form by giving the band, or, which is better, another diaphragm inside it, a partial motion on one of its diameters as an axis.

The whole instrument need not be much longer than a watchmaker's eye-piece, and may be used singly or in pair. It becomes an optical instrument at once, if a diverging lens be inserted for the eyeglass, and a tube be affixed to the other end containing an object lens of longer focus than the tube itself. The focal image will then take the place of the picture itself; and though, as in the Galilean telescope, the image will be only virtual, yet the consequences will be unaltered, while the band or diaphragm will be smaller

and the picture will be magnified. In every case the eye-piece should be in the form of a slider, so as to adapt the tube to the varying sizes of pictures and the different distances of the beholder. L.

CORRESPONDENCE.

To the Editor of "THE ART-JOURNAL."
AN ARTIST'S VISIT TO CORSICA.

As I have been acquainted with your valuable *Art-Journal* ever since its commencement, I am fully aware that occasionally you insert brief details of artists' ramblings, and having recently returned a second time from the Island of Corsica,—a country which gave birth to two of the greatest generals of their time, Paoli and Napoleon Buonaparte,—I feel anxious to add my testimony to the fact, that now a sketcher may safely ramble without the danger of being either murdered or taken prisoner to Monte Rotondo, or, as it is sometimes called, Monte d'Oro—a desert mountain rendered noted ever since the maternal parent of the great Napoleon hid herself with a few chosen compatriots, in consequence of dread of the English troops, who had obtained possession of Ajaccio. This circumstance took place only a very short time before the birth of Napoleon.

The principal families have lately sworn a religious oath, in the presence of the authorities, to forego for ever the fatal custom of the Vendetti, and have complied with the orders of Government to deliver their arms. They were returned to a few persons whose honour might be trusted; but even they were compelled to make oath that their arms would be used by the *cacciatori* (sportsmen) only.

There is a peculiar beauty in the scenery of Corsica not to be found even in Bel Italia. The objects that more especially call the attention of the artist are the crystallised caves of Bonifacio, and the splendid rocky scenes of its shores. The general landscape is rich in picturesque beauty; and on the road be-

tween Bonifacio and Sartene is seen an extraordinary freak of nature in the object of a "*Lione di pietra*," set majestically on a rocky cliff. He appears to have a crown upon his head, and rests at his case like the king of the forest, but here the king of the rocky mountains. In making a coloured drawing of this most marvellous object, I found I had only to copy literally what I beheld, and I should have as true a resemblance of a lion as was possible. It is probably six times the size of the actual monarch, but from the road it appears of natural dimensions. The scenery of Corte, the wild passes between Saint Fiorenza and Bastia, are replete with the grand works of nature.

It has been incorrectly remarked, that the Buonaparte family do not respect the Island of Corsica, which gave birth to their illustrious relative Napoleon. This is not true, as there is now a mansion near Calvi belonging to Prince Napoleon, who spends a portion of every year there as a *cacciatore*. And the present Emperor of France has erected a marble statue of his great uncle, Cardinal Fesch, and another of Napoleon Buonaparte. There is a third statue of an eminent person lately raised in Ajaccio, placed there at the expense of the present Emperor. He has also employed an artist of Bastia to make a series of drawings of Corsica, for the purpose of embellishing a grand historical work of this island. Besides, he is now at the expense of improving and repairing most of the churches and public buildings. And it is in my power to relate that even foreigners also participate in his liberal patronage, by receiving commissions for drawings of Corsican scenery. This I can vouch for as correct. Surely the present Emperor has some love for Corsica.

Feb. 1857.

WM. COWEN.

ARTISTIC REPRESENTATIONS OF DEATH.

SIR,—I trust to be permitted, through the medium of your invaluable *Journal*, to call the attention of artists of to-day to one great and grave subject that hitherto seems to have been allowed to remain in all the darkness and error in which heathenism might have clothed it. I say *might*, for I think that in one period of ancient art Death was personified as a beautiful youth. If so, is it not strange that the heathen should have dreamed and depicted beautifully what becomes a reality to the Christian; and yet more strange that the Christian should continue to depict what might have been a reality to the heathen, but is to him a dark falsehood? Is it not wonderful that in this Christian world, among men claiming the grand name of *Christian artist*, Death should still be found reigning triumphant as the King of Terrors?—should be pictured a grim, ghastly, grinning skeleton?

That these representations do infinite evil in the world, especially to the poor, there can be no doubt, for all falsehood ever will, and *must*; and as the truth rises in its grandeur and brightness, so the ugliness of the falsehood that denies it increases.

It is only diseased human nature that prefers to contemplate the horrible and revolting; the healthy mind instinctively recoils from it, and seeks only the beautiful and true; and yet you set up this grim skeleton for a symbol of that which it is essential, both for present and future well-being, we should learn to look on and grow familiar with. How can we? even the most darkly frowning life has more smiles and beauty than that stern, cruel monster.

Is it not time this error was dead? Is there not one defender and lover of truth in Art to be found in all Christendom who will devote his whole energy and power to the rooting out of these fallacies, and substitute a noble *Christian* ideal of Death? not one who will so picture Death that all may feel in their inmost souls there is no King of Terrors; that men may learn that Death is an angel sent by God to close the gates of mortal life, and open those of life eternal; to take off our earth-garments, the body, and clothe us in garments of immortality; that looking on this new picture men shall feel the fulfilment of those words, "Whosoever liveth, and believeth on me, shall *never die*;" and thus, instead of shrieking away from Death, filled with terror and despair, they shall take it to their hearts, a holy and sustaining thought shining through the toil, joy, and gloom of present life, and telling of that Heaven that is, where "the wicked cease from troubling, and the weary are at rest." And graver and more important than all this, the ever-present thought of death shall imperatively demand a careful, watchful life—a continuing preparation to stand upright, unshamed, within the sight of God.

What nobler work could a Christian artist seek? or how better render his name immortal? I trust that Art may not long be darkened by this error—this skeleton of days when man had no sure hope beyond the grave—when Death (for aught he *knew*), indeed, triumphed over beauty, love, and life.

AN ART-STUDENT.

TURNER'S "LIBER STUDIORUM."

SIR,—Allow me a small space in your valuable periodical to make a few inquiries relative to the "*Liber Studiorum*" of the late J. M. W. Turner, R.A.—a work which perhaps, just now, may possess an additional interest, seeing that it contains the sketches or original ideas for more than one of the Turner pictures recently bequeathed to the nation, and now exhibiting at Marlborough House. A copy of the work in my possession consists of fourteen numbers, containing, with the engraved title, seventy-one plates, and which I have understood formed the complete work; but an advertisement, recently met with, dated February 1st, 1816, states that "the whole work will be comprised in *twenty* numbers, forming two volumes." Will you, or any of your correspondents, kindly inform me if the whole twenty numbers were published, or whether the issue was confined to the fourteen numbers.

In *Arnold's Magazine of the Fine Arts*, 1833, p. 322, it is observed that "many years ago Turner executed a series of engravings called the '*Liber Studiorum*,' but with a desire to render the work hereafter more valuable and scarce, after a certain number of impressions, he destroyed every one of the plates."

Can you further inform me whether this statement is correct? P.

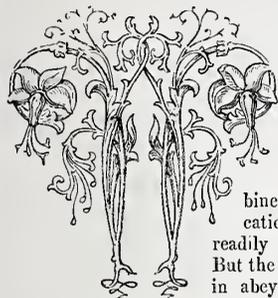

[Perhaps some one of our readers can furnish us with a reply to the above queries, for we are rather uncertain.—Ed. A.-J.]

THE BOOK OF THE THAMES,

FROM ITS RISE TO ITS FALL.

BY MR. AND MRS. S. C. HALL.

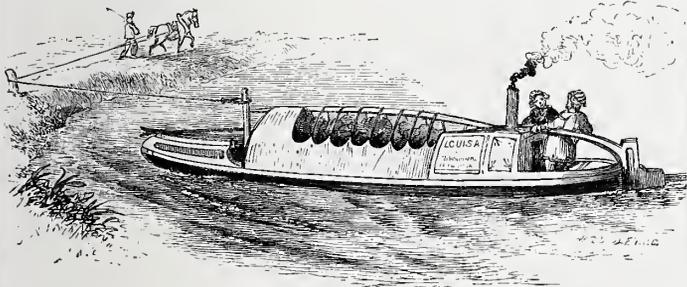

PART III.

WE have now arrived at that point in the Thames where it becomes navigable for boats of burthen; the canal conveys in barges, each from thirty to sixty tons, the produce of the four quarters of the globe into several parts of England; the port of Bristol is thus united with that of London; other canals are combined with this: and so an internal communication was formed, the value of which may be readily estimated before the introduction of steam.

But the railways have placed this mode of traffic almost in abeyance—the canals are comparatively idle, and ere long, perhaps, will be altogether deserted. The passage of a boat through the lock is now an event of rare occurrence; it is seldom opened more than once or twice in a week. Greater speed is obtained by the railway, of course, but the chief impediment arises from the cost incurred in passing through the locks and weirs along the Thames—sirange as it may seem, the expense hence arising to a laden boat of sixty tons burthen, between Teddington, where the locks begin, and Lechlade, where they terminate, is not less than thirty pounds. The natural consequence is that steam absorbs all the traffic, except to places remote from stations; and then boats are in use only for heavy cargoes, chiefly timber and coal. The barges here used are necessarily long and narrow—the appended engraving will convey an accurate notion of their form; they are generally drawn up the river by two horses, and down the river by one, along the

passage of a boat through the lock is now an event of rare occurrence; it is seldom opened more than once or twice in a week. Greater speed is obtained by the railway, of course, but the chief impediment arises from the cost incurred in passing through the locks and weirs along the Thames—sirange as it may seem, the expense hence arising to a laden boat of sixty tons burthen, between Teddington, where the locks begin, and Lechlade, where they terminate, is not less than thirty pounds. The barges here used are necessarily long and narrow—the appended engraving will convey an accurate notion of their form; they are generally drawn up the river by two horses, and down the river by one, along the

THE BARGE.

“towing-path”—a footpath by the river-side. The towing-paths between Lechlade and Oxford, in consequence of the causes we have observed upon, are so little disturbed as to be scarcely perceptible; they are for the most part so “grass-o’ergrown” as to be distinguished from the meadow only after a careful search. Indeed, all along the Thames’ bank to Lechlade, and much lower, almost until we approach Oxford, there is everywhere a singular and impressive solitude; of traffic there is little or none; the fields are almost exclusively pasture-land; the villages are usually distant; of gentlemen’s seats there are few, and these are generally afar off; the mills are principally situated on “back-water;” and but for the pleasant cottages, nearly all of which are peasant hostelries, which, in their immediate relation to the locks and weirs, necessarily stand on the river-bank, with now and then a ferry-house, the whole of the landscape for nearly forty miles from the river-source would seem as completely denuded of population as an African desert. Between Kemble and Lechlade we did not meet two boats of any kind, and only at the lock-houses did we encounter a dozen people—except at the few villages of which we have taken note. This loneliness has its peculiar charm to the wayfarer; it will be long ere we lose remembrance of the enjoyment we derived from a reflective saunter beside the banks of the grand old river, where solitude invites to thought—

“The blackbird’s note comes mellow from the dale,
And sweeter from the sky the glad some lark
Warbles his heaven-tuned song.”

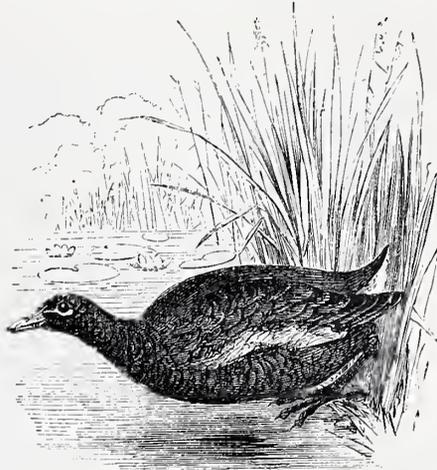

The moorhen revels here in security, for it is her own domain—if a footstep shake the shelving bank, it is that of a peasant, of whom the shy bird has no fear; it was a rare pleasure to note this liveliest of all our water-fowl darting from side to side, or plunging midway in the channels, to rise in still greater security among the reeds and rushes farther off.

The Moorhen (*Gallinula chloropus*) is commonly seen not far from its reedy haunts, swimming along with a peculiar nodding motion of the head, and picking up its food first on one side and then on the other. It feeds generally on aquatic plants, insects, and small fishes. Mr. Selby mentions that he has frequently known this bird to have been taken on a line baited with an earth-worm, intended for catching eels or trout,—from which he infers that it is by diving it obtains the larger water beetles and the larvæ of dragon-flies, &c., upon which it is known to feed. Shenstone refers to the recluse habits of the moorhen, and its frequent associate, the eot:—

“To lurk the lake beside,
Where coots in rushy dingles hide,
And moorcocks snu the day.”

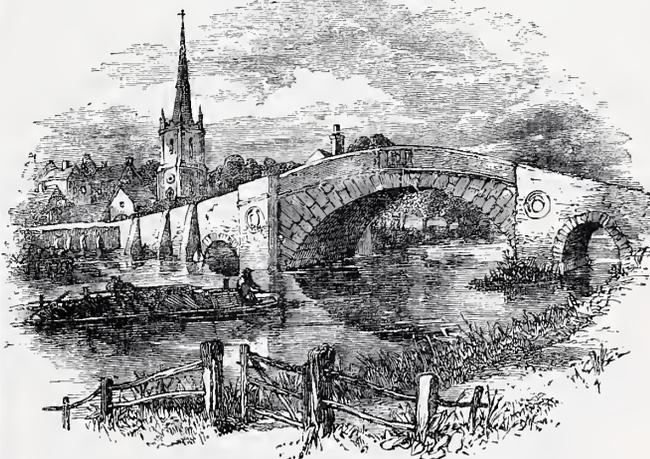

The colouring of the moorhen, quoting from Yarrell, is as follows:—“The beak

yellowish-green; the base of it, and patch on the forehead, red; eyes reddish-hazel; the back, wings, and tail, rich, dark olive-brown; head, neck, breast, and sides, uniform dark slate-grey; under tail-coverts white; legs and toes green, with a garter of red above the tarsal joint. Contrary to the almost universal rule among birds, the female is frequently more richly coloured than the male. The length of the moorhen is usually about thirteen inches.

THE MOORHEN.

We are, however, now at LECHLADE, where the Thames is a navigable river, and a sense of loneliness in some degree ceases;—effectually so, as far as Lechlade is concerned, for, as the reader will perceive, its aspect is an antidote to gloom. Lechlade is a very ancient town; it derives its name from a small river that joins the Thames about a mile below its bridge. The Lech is little more than a streamlet, rising in the parish of Hampnot, in the Cotswold district, and passing by Northleach and Eastwich. The name is derived from the British *lech*, signifying “stone,” “from the petrifying nature of its water”—a quality, however, of which we could neither see nor hear anything. The proofs of its antiquity are now limited to its fair and interesting church, dedicated to St. Laurence. Close to the north porch is an interesting relic of the olden time, “a penance stone,” on which formerly offenders against the discipline of the church stood enshrouded in a white sheet to do penance. The spire is a pleasant landmark all about. It is now, as it was when Leland wrote, two hundred years ago, “a praty old tonne,” where those who love quiet may be happy; it is clean and neat, and has a well-ordered inn, where a “neat-handed Phyllis” strives to make the way-worn traveller at ease and in comfort. The priory of “Blake Chanons, at the very end of St. John’s Bridge,” is gone; of “the chapelle in a meadow” no stone remains; the bold barons—from

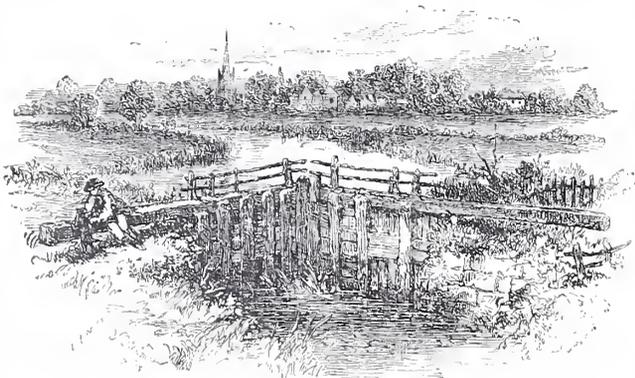

LECHLADE BRIDGE AND CHURCH.

Baron Siward, who slew Tofte, Earl of Huntingdon, to Ferrers, Earl of Derby, and Roger Mortimer, the Talbots, Spensers, and Hollands—who once lorded over the district, are forgotten there; but the Thames still rolls its waters round the town, and blesses a generation to whom rumours of war are but far-off sounds—

“All glory to the stern old times,
But leave them to their minstrel rhymes.”

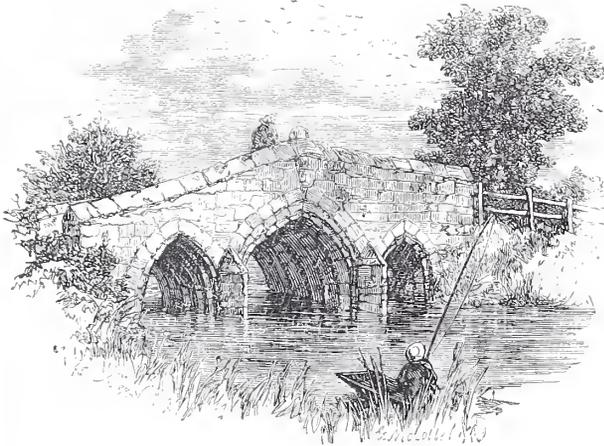

A mile from the town—much less to the pedestrian—and another and much older bridge is reached—St. JOHN’S BRIDGE, beside which is “The Angler’s Inn;” and here “a hop, step, and jump” will lead from Gloucester into Berkshire, and from Berkshire into Oxfordshire. But bridges are now becoming numerous; it is here we first meet a point of greater interest—the first lock on the river Thames. It is rude enough to be picturesque. This lock occurs, however, in a back-water, or rather an artificial cut, the main branch of the river flowing through the arches of St. John’s Bridge, and passing the village of BUSCOT, where is found the first example of the lock and weir in combination. As it will suit our purpose better to treat this topic somewhat further on, we shall continue our voyage, leaving the fine house and grounds of Buscot, and the pretty villages of Kelmescott and Eaton Hastings, and continue still by the river-side, by green meadows, which, in their solitude, seem to progress unaided by the art of man. At Buscot “the river

quits the open meads for a more secluded progress, and, having been from Inglesham a boundary of Berkshire, it now leaves for ever its native Glou-

THE FIRST LOCK.

estershire, and begins to mark the limits of the county of Oxford." Our next point of interest is a venerable relic of antiquity—RADCOT BRIDGE.

RADCOT BRIDGE.

We have leisure, however, just now to ask the reader's attention to circumstances and objects that will have occurred to him, or have been presented to him on his journey. After passing Lechlade thousands of glittering Dragon-flies, of the species figured (*Caleteryx virgo*), kept up an incessant fluttering over the water-side herbage; their graceful and rapid movements, with the metallic brilliancy of their green and azure colouring, gave an unwonted vivacity to the scene. It is to these insects, the *demoiselles* of the French, that Moore alludes—though in reference to a far different scene:—

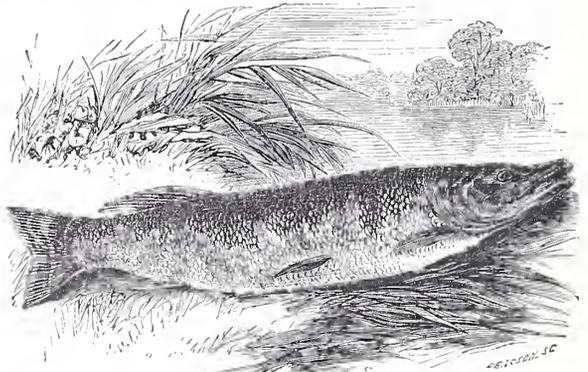

THE DRAGON-FLY.

"Chasing, with eager hands and eyes,
The beautiful blue damselflies,
That fluttered round the jasmine stems,
Like winged flowers or flying gems."

The Pike (*Esor Lucius*) is abundant in this neighbourhood, and the troller may have ample sport. It is the wolf of pond, lake, and river; and any mode by which he can be taken is considered right. The longest-lived of all the fish of fresh-water, he is the largest and the most ravenous, growing sometimes to enormous size—often to fifty, sixty, or seventy pounds; in the Thames, we believe, none have been caught of greater weight than thirty-five pounds. The body of the pike is elongated, nearly uniform in depth from the head to the commencement of the dorsal fin, then becoming narrower; "the head is elongated, depressed, wide;" the colour dusky olive-brown, lighter and mottled with green and yellow on the sides, and passing into silvery white on the belly. The angler takes this fish by trolling; but, sometimes, also with "live bait;" in the latter case a gudgeon, a small dace, or, better still, a small trout, is placed on a double hook; the pike seizes it sideways between his jaws, and makes off to his lair; time must be given him to "gorge" it before the

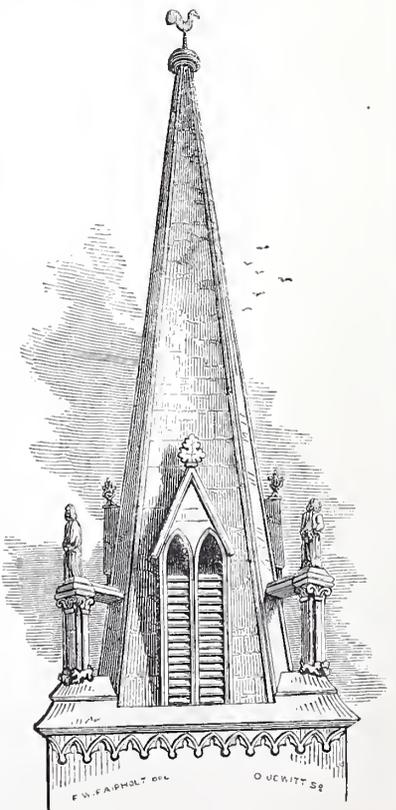

strike. But trolling is the more common practice, on the Thames especially; in this case, a dead fish is impaled on a "trace" of hooks—*i. e.*, six hooks so arranged as to embrace the bait from the head to the tail, the mount being gimp wire, for gut would be instantly snapt in twain—nay, it is by no means rare for the pike to snap the gimp asunder, and make off with the six hooks; but so voracious is the fish, and so insensible to pain, that frequently another trace of hooks will be immediately taken by the fish, and the lost trace be thus recovered. We have known instances in which two traces have been thus expended, a third being successful. When the troller sets to work, he usually lets his boat glide gently with the tide, or impels it very gradually; the bait having been dropt overboard, is drawn quietly through the water at a distance of between fifteen and twenty yards. When the pike is hooked, and the angler has what is called "a run," it is not easily taken, but makes a bold struggle for life. The trace of hooks must, however, be mounted with a swivel, in order

THE PIKE.

that, by frequently turning in the water, it may more nearly imitate the motions of the living fish; artificial, or imitation fish, are in frequent use, and are of very ingenious make—they are sometimes good substitutes, but anglers well know that the actual fish is the thing. Unless a breeze ruffles the surface of the water there is but little chance of a run. The pike is also called the *luce* (it is the *lucie* of heraldry), and in Scotland its name is the *gedd*. The jack is, properly, a young pike. The pike is a solitary fish—even two of them are rarely seen together; his usual haunt is a dark and comparatively still nook, thick with rushes or close water plants; here he remains, seldom moving an inch until his eye fixes on his prey, when a sudden rush is made, and back again to consume it at ease and leisure. Some startling anecdotes are told of his voracity—he will swallow a fish of nearly his own weight. The pike is said to be a good fish for eating, and many are fond of it; the flesh is certainly hard and sound; much, however, depends upon the skill of the cook—old Izaak gives a receipt for its dressing, which he says "makes a dish of meat too good for any but anglers or very honest men."

We have delayed the tourist too long. At RADCOT BRIDGE he has a view on the right of Faringdon Hill, and on the left of Bampton Church spire; either place may lure him awhile from the river-bank—each being distant about two miles. The wood-crowned heights above FARINGDON have, indeed, been pleasantly in our sight for a long time along our course. Faringdon is well entitled to a pilgrimage; although the house is gone which so bravely withstood the army of Cromwell, when the assailants were led to the attack by the owner of the mansion himself—Sir Robert Pye, who had married a daughter of the patriot, John Hampden. Of a far older castle, which "the favourers of Empress Matilda erected, and King Stephen pull'd down," there remains nothing but tradition. There sleeps, however, in the village church a brave knight, whom England chronicles among the worthiest of her worthies—that Sir Edward Unton, who, while Queen Elizabeth's ambassador to France, upheld her honour and that of his country by sending a challenge, couched in memorable words, to the Duke of Guise, who had slandered the fair fame of his adored queen and mistress, and who, in speaking basely of her, had "most shamefully and wickedly lied."

SPIRE OF BAMPOTON CHURCH.

BAMPTON, in Oxfordshire, on the left bank of the river, but distant about a mile, is a pretty village town, remarkable for its interesting church, which has the singular peculiarity that it has three rectors, who are all presented by the Church of Exeter—"to which certain lands were given by Leofric, Chaplain to Edward the Confessor, and first bishop of the see, about the year 1046." Bampton steeple is so very conspicuous for many miles on this part of the river that we have deemed it right to delineate its features, which are in themselves sufficiently remarkable to warrant their introduction. The tower is square, from which rises an octangular steeple with four bellfry windows. Pinnacles are at each corner, supported by slabs resting against the steeple, and forming basements for statues which surmount them. This unique arrangement is very striking; the church is well worthy a visit—as, in the characteristic language of Skelton, it is affirmed to contain "examples of almost every period of architecture, from the Conquest to the reign of King George III."

At Radeot Bridge the Thames is divided—a circumstance of frequent occurrence in the course of the river—a new cut and a "short cut" having been made to facilitate navigation—thus also deepening the channel. The tourist will take the old stream, which passes under three venerable arches; although

THE DOCK.

it is considerably choked up with weeds, and closely overhung with branches of the water-willow; he will here have occasion to pause and admire the foliage that adorns the banks, or rises from the bottom of the slow current: a nosegay of wild flowers may be gathered here, such as might deck a maiden's brow, and vie in beauty with the rare exotics of the conservatory. We direct attention to some of them—first asking observation to the Great Water Dock (*Rumex aquaticus*), the luxurious growth of whose flamboyant foliage gives to it a gigantic character among its lighter and more graceful neighbours. The astringent root of this plant formerly had a considerable reputation as a medicine, but its use is now almost obsolete.

Our course may be rapid between Radeot Bridge and NEW BRIDGE, although the distance is some ten miles; for there is no village along its banks, but one small bridge—Tadpole Bridge—and but one ferry.

There are, however, several weirs that act as pathways for foot-passengers; and these weirs break the monotony of the river, afford "rests" to the voyager, and add materially to the picturesque of the scenery—nearly all of them being old and somewhat dilapidated. These are Old Man's weir, Old Nan's weir, Rushy weir, Kent's weir, Ten-foot weir, and Shefford weir: they occur during the first half of the voyage, Rushy weir being the only one that has the adjunct of a lock. A stone's throw from the river, a small cluster of houses, scarcely to be called a village, points out the site of ancient Siford, or Shefford; yet, on this lonely and isolated spot, now apparently far removed from human intercourse, the great Alfred held one of his earliest parliaments. "There sat, at Siford, many

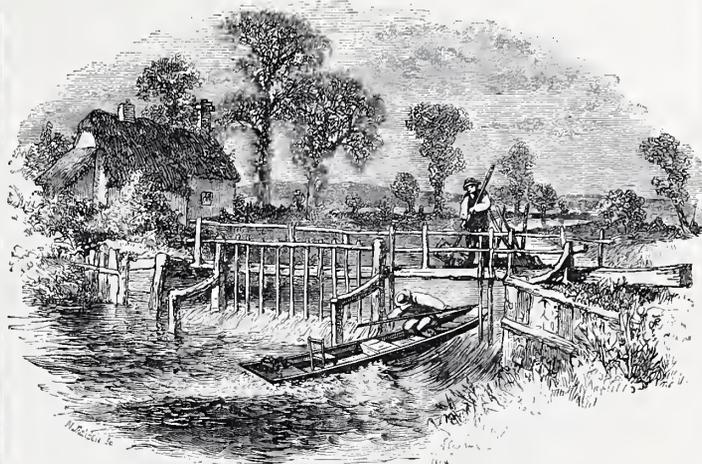

NEW BRIDGE.

Thanes, many bishops, and many learned men, wise carls and awful knights. There was Earl Elfrick, very learned in the law, and Alfred, England's herdsman—England's darling. He was king of England: he taught them that could hear him how they should live." What a dream might have been enjoyed, resting under a hayrick the mowers had raised in a corner of the meadow in which this memorable event is said to have taken place!

Arrived at NEW BRIDGE, we again pause awhile to look around us—to ponder and reflect. The neighbourhood is unchanged since Leland described it as "lying in low meadows, often overflown by rage of rain:" a small inn stands on the Berkshire side, and a busy mill on that of Oxfordshire; in the time

of the venerable historian, there was here "a fayre mylle a prow lengthe of;" and it is probable a hostel also entertained the wayfarer. Age has preserved only the bridge, which was "new" six centuries ago, and is now, we believe, the oldest of all that span the river. A short distance below, the Windrush contributes its waters to the Thames,—one of the prettiest and most pleasaunt of English rivers; it rises among the hills of Cotswold, near Guiting; and, passing through Bourton-on-the-Water, Burford, Minster, Lovel, Witney (so long and still famous for its blankets), fertilises and flourishes rich vales, quiet villages, and prosperous towns; having done its duty, and received grateful homage on its way, it is lost for ever—absorbed into the bosom of the great father.

Again the locks and weirs pleasantly and profitably bar our progress—the principal of these are Langley's weir and the Ark weir—until we reach the ferry, which continues the road between the village of Cumnor and that of Stanton Harcourt—the former in Berkshire, the latter in Oxfordshire—each being dis-

HART'S WEIR.

tant about two miles from the river-side. To visit one of these weirs—Hart's weir—we must ask the reader's company before we proceed farther on our route. In describing this, we shall make him sufficiently familiar with an object, to which it will be requisite frequently to direct his attention during his progress.

Sometimes the weir is associated with the lock; but, generally, far up the river, where the stream is neither broad nor deep, the weir stands alone. We shall have occasion hereafter to picture them in combination. The weirs are artificial dams, or banks, carried across the river in order to pen up the water to a certain height, for the services of the mill, the fishery, and the navigation. A large range of framework rises from the bed of the river; this supports a number of flood-gates sliding in grooves, and connected with a sill in the bottom. Our engraving represents a group of these flood-gates as they were drawn upon land, and resting against the support rudely constructed for them beside Hart's weir. They are thus used:—The square piles in the

WEIR PADDLES.

foreground are first struck at regular distances in the sill under water: between each of these one of the gates is placed by means of the pole attached to it—the boards completely stopping the space, and forming a dam across the river. Two forms of dams are used: one with the board full upon the centre of the piles, and secured to them by strong plugs, over which the boat-hook is sometimes passed to aid lifting; the other has the water-board on one side, with a groove attached to it. Both of these are shown in the cut, as well as the rude stay for the rope of a barge to pass through, and which is generally formed of the branch of a tree. Such are the usual accompaniments of a weir in the upper Thames. When these dams, or paddles, are drawn up, the whole body of the stream, being collected into a narrow space, rushes through with great rapidity, and gives a temporary depth to the shallows, or,

by the power of the current, forces the barges over them. It is obvious that care is required to prepare the boat for the descent; for there is some danger to be encountered.

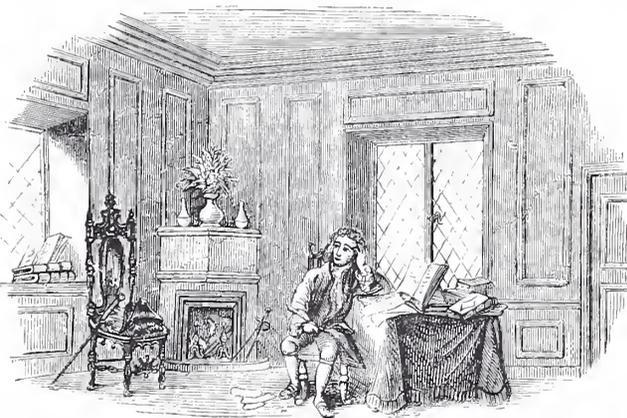

The weir is ever picturesque, for the water is always forcing its way through or over it—sometimes in a huge sheet, forming a striking cascade, at other times dribbling through with a not unpleasing melody. As we have elsewhere observed, there is usually a cottage close beside the weir, for the accommodation of the weir-keeper; generally this is a public-house, pleasantly diversifying the scenery, and not the less so because often rugged and old.

The tourist, to visit either Cumnor or Stanton Harcourt, must moor his boat at the very pretty ferry of BABLOCK BRIDGE. He will turn to the right on his way to Cumnor, and to the left on his road to Stanton Harcourt; the latter, especially, will amply recompense him for an hour's delay in the progress of his voyage. Cumnor has been made famous by the novel of "Kenilworth," the scene of which is here principally laid; but neither history nor tradition do more than supply a few dry bones, to which the great magician gave life. A few vestiges only indicate the site of Cumnor Place; but the "haunted towers" are down; a "Black Bear," still exists; and it is not likely that Cumnor will ever be without a village hostelry so named.

STANTON HARCOURT.

Stanton Harcourt, the old seat of one of the most ancient and honourable families of the kingdom—a family with much to dignify and less to discredit it than perhaps any other of which England boasts—is but a relic of its former magnificence; but that relic suffices to indicate its early grandeur, and retains much that cannot fail to create deep and absorbing interest. The Harcourts have possessed this manor of Stanton for more than six hundred years; the original grant was from Henry I. to "Milicent, the kinswoman of the Queen," whose daughter Isabel, marrying Roland de Harcourt, the deed of gift was confirmed by the Kings Stephen and the second Henry. It ceased to be their dwelling in 1688, and fell gradually to decay, until, in 1770, it was taken down—all except the porter's lodge, now the residence of the rector, the "kitchen," and one of the towers—the tower some time the residence of the poet Alexander Pope, and where (as he has himself recorded) he translated the fifth book of Homer. On the ground floor of this tower is a private chapel, the walls still bearing indications of painted story; the small room on the second floor, to

POPE'S STUDY, STANTON HARCOURT.

which ascent is gained by a narrow stone staircase, is called, and will ever be called, "Pope's study;" it commands a fine view, and must have given to the poet that happiest of all enjoyments—quiet in the country. On a pane of glass in one of the windows he wrote an inscription, recording the fact and date that here he "finished the fifth book of Homer."* The kitchen is best described by Dr. Plot, the old historian of Oxford county:—"It is so strangely unusual that, by way of riddle, one may truly call it either a kitchen within a chimney,

* This pane has been removed to Nuneham Courteney, the seat the Harcourts now occupy, a few miles below Oxford, and which we shall visit on our voyage

or a kitchen without one; for below it is nothing but a large square, and octangular above, ascending like a tower, the fires being made against the walls, and the smoke climbing up them without any tunnels or disturbance to the cooks, which, being stopped by a large conical roof at the top, goes out at loop-holes on every side, according as the wind sets, the loop-holes at the side next the wind being shut with falling doors, the adverse side open." This description is accurate now, as it was then; it is still used by the gentleman who farms the estate, whose dwelling-house, formed of the old materials, adjoins the kitchen. It is surmounted by a vane, the crest of the Harcourts.

The church is a fine and very interesting structure; much of it is of Saxon architecture: it is among the most beautiful of the many beautiful churches of Oxford. Through one of the doors the men have entrance, while the women enter by another, in accordance with "a custom established there from time immemorial." The decorations of the interior are of very early date: the oak wood-screen being considered the oldest, of wood, in England. A small chapel contains the dust of many of the Harcourts—a race honoured and esteemed, always and without exception, from the founder of the family to the present representative of the name and honours of the illustrious family. It is surely something to be a gentleman of six hundred years! In the church-yard is a monument to the memory of an affianced pair who were struck dead by lightning: the epitaph is from the pen of Pope; so also is an epitaph to the only son of the Lord Chancellor Harcourt—the good and learned peer who was the friend of Pope and the other poets of the age. This epitaph contains the touching lines of lament—

THE VANE.

"How vain is reason—eloquence how weak!
That Pope must tell what Harcourt cannot speak!"

We crept up the narrow stairs which led from the chapel—where, no doubt, the poet often worshipped according to his faith—and, seated in this small chamber, pondered over the many great works that have made his name immortal. It is a theme for a volume, but must be treated briefly. There is ample evidence that many of his letters to Lady Mary Wortley Montagu were written here; one of them, in particular, is intimately associated with his residence in this retirement. "I have a mind," he writes to the lady, "to fill the rest of this paper with an accident that happened just under my eyes, and has made a great impression upon me. I have just passed part of this summer at an old romantic seat of my Lord Harcourt's, which he has lent me; it overlooks a common field, where, under the shade of a hay-cock, sat two lovers, as constant as ever were found in romance, beneath a spreading beech. The name of the one, let it sound as it will, was John Hewett, the other Sarah Drew. John was a well-set man, about five-and-twenty; Sarah a brown woman of eighteen. John had for several months borne the labour of the day in the same field with Sarah; when she milked, it was his morning and evening charge to bring the cows to her pail. *Their love was the talk, but not the scandal of the neighbourhood*, for all they aimed at was the blameless possession of each other in marriage. It was but this very morning that he had obtained her parents' consent, and it was but till the next week that they were to wait to be happy. Perhaps this very day, in the intervals of their work, they were talking of their wedding clothes, and John was now matching several kinds of poppies and field-flowers to her complexion, to make her a present of knots for the day. While they were thus employed (it was on the last day of July) a terrible storm of thunder and lightning arose, and drove the labourers to what shelter the trees or hedges afforded. Sarah, frightened and out of breath, sunk on a hay-cock, and John (who never separated from her) sat by her side, having raked two or three heaps together to secure her. Immediately there was heard so loud a crack as if heaven had burst asunder. The labourers, all solicitous for each other's safety, called to one another; those who were nearest our lovers, hearing no answer, stepped to the place where they lay. They first saw a little smoke, and after, this faithful pair—John with one arm about his Sarah's neck, and the other held over her face, as if to screen her from the lightning. They were dead. There was no mark or discolouring on their bodies, only that Sarah's eyebrow was a little singed, and a small spot between her breasts. They were buried the next day in one grave, in the parish of Stanton Harcourt, in Oxfordshire, where my Lord Harcourt, at my request, has erected a monument over them." The poet then quotes the epitaph he had written to their memory—lines not worthy of him, and which still stand in the church-yard just above their grave.

In the immediate neighbourhood of Stanton Harcourt are two large stones, popularly known as "the Devil's Quoits;" all earlier writers mention three; there are now but two, and these are distant nearly a quarter of a mile from each other. They are said to commemorate a battle fought at Bampton between the British and the Saxons, A.D. 614.

from that city down the Thames. The pane measures about six inches by two; it is of red stained glass. We append a copy of the inscription, taken from "Ireland's picturesque Views," and which we compared with the original, courteously shown to us by Mr. Vernon Harcourt.

In the year 1718
ALEXANDER POPE

Finished here the
Fifth Volume of HOMER

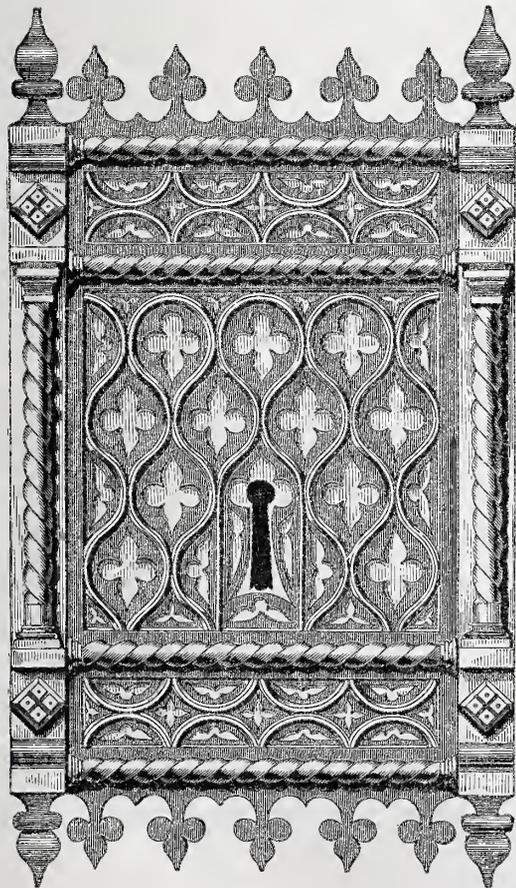

* The most interesting of these monuments are those which contain the effigies of Sir Robert Harcourt, and Margaret Byron, his wife. The knight received the Order of the Garter about the year 1463. His lady, who reposes by his side, is also, like her husband, adorned with the mantle of the order, and has the garter on her left arm, just above the elbow. This is one of only three examples of female sepulchral effigies thus decorated.

LOCKS AND KEYS.*

In a great commercial country like our own, where the security of valuable property, that scarcely comes under the denomination of "goods and chattels," and that offers every facility to the depre-
dator, is of primary consequence, it is not surprising

that the attention of the manufacturer and of the scientific mechanic should be earnestly directed to its safe custody. Only within the last

few weeks, the public mind has been occupied with proceedings in a court of justice, which have shown us how much ingenuity and perseverance are exercised by the dishonest to accomplish their object,

* "A Treatise on Fire and Thief-proof Depositories, and Locks and Keys." By GEORGE PRICE. Published by Simpkin, Marshall, and Co., E. and F. N. Spon, London.

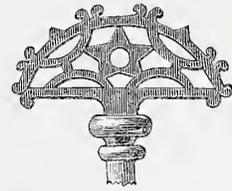

and how successfully they have worked to baffle every scheme of presumed safety—so true is it that "the strong man armed" can only keep his goods in peace till a "stronger than he cometh, and taketh away from him that wherein he trusted." Impressed with the importance of providing a secure depository for our valuables, Mr. Price, the proprietor of the "Cleveland Safe Works," at Wolverhampton, has been at the pains of writing and publishing a large volume of matter pertinent to the subject, for, as he says—"It is almost incredible in these days, when the Arts and Sciences are lectured upon in almost every provincial town in the kingdom, when the artisan is taught not only that such a result follows a certain law, but the why and the wherefore—the cause as well as the effect—that persons of general intelligence and scientific knowledge should place their valuable convertible property in a cast-iron safe, with a box of wards for a lock, expecting that it will preserve such contents from destruction by fire and abstraction by thieves; that others, for the sake of saving a few shillings in the primary cost of a lock for the safe-keeping of their property in an iron safe or other receptacle, will purchase one that can be readily picked with a quill or a skewer, not only by the accomplished burglar, but by an ordinary mechanic or intelligent artisan, as well as by the amateur lock-picker."

Though Mr. Price's volume necessarily, and to a considerable extent, treats of the specialities of his manufacture, his manner of introducing the subject, and the curious history connected with it, are powerful antidotes to what would otherwise be considered dry and uninteresting reading. The first portion of the book, occupying about one-fourth of its pages, discusses the subject of Fire and Thief-proof Depositories; the remainder that of Locks and Keys, including a lengthened account of, and commentary on, the great lock controversy, with which Mr. Hobbs, the American, agitated the public—or, at least, a large portion of the public—soon after the closing of the Great Exhibition of 1851. All these matters, however, scarcely come within the prescribed limits of our Journal; we must, therefore, refer our readers desirous of information upon them to the volume itself, contenting ourselves with a few brief observations on the Art connected with the manufacture of locks and keys, for even in such comparatively insignificant objects there is ample room for the exhibition of the taste of the ornamental designer: we have examples of this in the annexed engravings, selected from a large number with which the author of the volume before us has illustrated its pages.

The first is from an old iron coffer, of foreign make, in the possession of Mr. Price, who purchased it a few years ago at a custom-house sale at Gloucester. Both externally and internally it is richly ornamented. The lock was engraved from a modern specimen exhibited at the Great Exhibition of 1851 by the manufacturer, Mr. James Gibbons, junior, of Wolverhampton. As Mr. Price has introduced into his volume, we follow his example here, although it will be found in our *Illustrated Catalogue* of the Exhibition. It is a very beautiful example of Gothic design applied to this branch of manufacture.

On the last column are several examples of key-handles drawn from ancient examples, though, probably, not earlier than the sixteenth and seventeenth

centuries: they show the taste and ingenuity which the artisans of those days employed on works of so comparatively trivial a character. In the second example an heraldic design is introduced; we find several similar instances among the engravings in

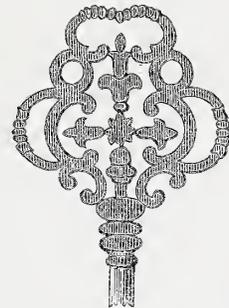

Mr. Price's work, as a lion passant, a grotesque figure of a man, a "spread eagle," a cross springing from large leaves, &c. &c.

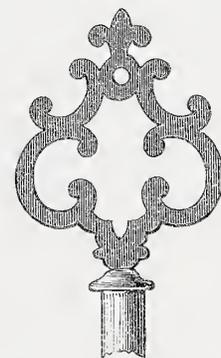

There is little doubt but that the cost of pro-

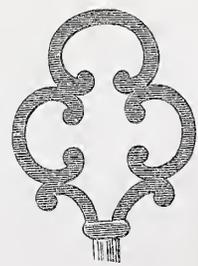

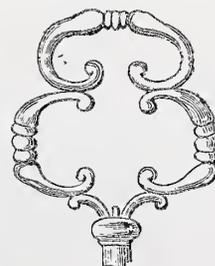

ducing these ornamental keys has been the chief cause of the simplicity of those now commonly used. Mr. Price is of opinion that the value, at the period of their production, of some of the

specimens exhibited at Marlborough House could not have been less than from ten to twenty guineas each. We have some idea of the cost of producing them at the present time, when he tells us that

the handle alone—or bow, as it is called—of the fourth cut on our page is valued at six shillings; and of the fifth, fourteen shillings: the key itself forms a distinct charge, and is made by quite a different class of workman.

This brief notice of Mr. Price's treatise will show that it contains much curious and not uninteresting information.

BOTANY,

AS ADAPTED TO THE ARTS AND ART-MANUFACTURE.

BY CHRISTOPHER DRESSER,

LECTURER ON ARTISTIC BOTANY IN THE DEPARTMENT OF
SCIENCE AND ART.

PART III.

IN continuing our investigation of the laws of nature as manifested in the vegetable world, with a view to ascertain the cause of the beauty of the varied structure, and from whence that beauty is derived, we proceed to notice that although symmetry is one of the leading principles in her compositions, that the symmetry of individual parts is sacrificed to the general symmetry and beauty of the whole. We endeavoured to show in our last paper that the varied vegetable structures, as well as their every part, are perfectly adapted to their given positions, and that nature would vary the manner of her developments in order to more fully fit herself for given situations. It is this cause which brings about the effect described in our last proposition, and therefore which necessitates us to dwell upon this subject. We noticed in our first paper that, by growth, a plant merely repeated itself; therefore, whatever is the nature of the primary development, such is also the nature of the parts of the matured structure, it being but an aggregation of members similar to the original; though this is a beautiful truth, and reveals at once in the most simple manner the structure of the entire vegetable development, nevertheless modifications are brought about, which more or less influence the normal forms or dispositions of certain parts, as well as their original tendency, as we have already shown. To illustrate our proposition, take the central twig from the summit of any tree, say that of a Horse-chestnut, and we find that its leaves in protruding form a given angle with the stem—the angle formed by each of its opposite leaves being equal; but if any lateral arm of the same plant be examined (especially one of the lower, its position approaching most nearly to the horizontal), the angle formed by the union of the leaf-stalk of either of the opposite leaves with the stem is not always equal, for where the leaves are above and below, the angle formed by the stalk of the lower leaf and the stem is much more acute than that formed by the upper and the axis (Fig. 23); also the stalk of the

Fig. 23.

under leaf is much longer than that of the upper, and the lateral axes are all more or less curved, whereas the central, and that alone, is straight: now the cause of this curious circumstance is the effect of light upon vegetation, for plants manifest a strong tendency to approach that agent, or to elongate in the direction from whence they receive the greatest supply of its influence. Now, in order to show the correctness of our proposition, which says, that a matured

vegetable structure is a mere repetition of the earlier state of the same organism, we notice, that although the lateral axes are more or less curved, they nevertheless coincide in every other respect with the primary axis. Their leaves are developed on the same principle, and buds are found in the axils of these leaves just as in those of the primary axis, the deviation being merely in the curvature of the stem, or axis, and the variation in the direction and length of the leaf and leaf-stalk. Next we notice that although the lateral axes are not symmetrical in their parts, nevertheless the symmetry of the entire structure is not in the slightest interfered with, for the arm proceeding to the right is exactly like that which extends to the left, and that protruded in the front is exactly like that developed at the back. So exact, therefore, is the symmetry of the whole, that were the entire structure divided down the centre, the two halves would be precisely alike, those cases being excepted where the disposition of the lateral developments is spiral, in which case the symmetry is not departed from, but assumes a diverse character. By this arrangement infinitely more beauty is gained in vegetable organisms than were each not merely a repetition of the parent axis in principle, but literally; as, were this the case, all the lateral arms of the varied structures would be parallel—for whatever is the original angle of our branch, such is the angle at which all are protruded, and this repetition of parallel members would be far from beautiful. This fact, viz., that the central branch only of the structure is symmetrical in itself, demands that if we wish to have a truthful representation of a spray which is to occupy a central position, and can only procure a lateral arm, that we should restore the required symmetry in our delineation, which is perfectly legitimate; in verification of which we may examine a plant when only one or two years old, according to the size of the required spray, and we shall see a similar structure, designed for a central position, in which, therefore, this symmetry is present. This fact also leads us to the conclusion, that it does not follow because a structure is beautiful as a whole that its component parts are, if taken singly, when their positions are altered. This is obvious, inasmuch as it destroys the necessity of the important principle, namely, adaptation to purpose. This beautiful law has even more to accomplish than the giving grace and beauty to the arms of the structure, for it is upon this that the following curious fact to a great extent rests, namely, that the leaves or foliaceous organs of plants, though so extremely numerous, never clash (accidents excepted), but each one is so situated as not to interfere with the others. A little consideration will show how this is brought about. It is obvious that this curving towards the light—for this is the cause of this departure from symmetry—gives to the various arms diverse curves; thus those which are nearest the apex of the structure being the shortest are the lightest, consequently most erect and least curved; whereas when we approach the base of the structure the arms become lengthy, and are therefore more or less weighed down by their weight, and are consequently more or less lateral, hence their apices are drawn or curved up more towards the light. As, therefore, the curve of each arm varies, so the direction of the organs proceeding from these lateral members must vary also; hence, instead of meeting, as they would if they were parallel, they pass between one another, and consequently, instead of producing a mass of confusion, an orderly well-arranged structure is the result.

We have next merely to glance at a fact, which, though of paramount importance in ornamental composition, is so prominently set forth in the varied vegetable structures that it is familiar to all, therefore we shall not dwell on it here. This fact is, that all parts of the structure or composition, however distant, are traceable through the branches to the root. Again, plants elongate at both extremities; yet, although this is the case, the downward elongation is of a decidedly different nature to the upper, and must necessarily be present, as it, and it alone, oftentimes supports or holds the plant in its required vertical position, and also procures food for the organism. Now, whether this growth in two opposite directions would occur to any extent if these necessities were absent, is a difficult question to answer; this, however, we say, that a

number of the *Algæ*, which adhere to rocks and do not require a regular root, are possessed of a mere circular disk at their base, similar to the "sucker" of the school-boy, which completes its required union with the body to which it adheres. The object of these remarks is merely this, to reveal, as fully as possible, the principle on which Nature works; and we notice from this latter consideration, that in no case in the vegetable world are foliaceous members protruded in the two directions—that is, from the base and apex of the structure.

We now proceed to notice one point which at once manifests the high character of the design displayed in the various vegetable organisms—viz., that no portion could be removed from the composition and improve it, or leave it equally good, (we speak in an ornamental point of view only). For example, take a spray, as that figured of the Guelder-rose in our first paper (Fig. 1), the leaves of which are opposite, and what leaf could be removed, and yet leave the spray equally good? The same would apply to verticillate leaves (Figs. 2, 3, 6, Part I.), alternate, spiral, &c., in any of which, if one were removed, the chain would be broken and the beauty destroyed. Apply this principle to the arms of the structure, and the result is similar; if they are opposite, remove one and you remove the beauty; if they are alternate, the beauty is still destroyed, and it matters not what is the principle of order on which these organs are arranged, if one is removed the beauty of the entire structure is marred, just as much as the beauty of an animal is by being deprived of a limb. It may be urged that our beautiful garden-flowers are repeatedly cut by the gardeners; this we admit, but are also fully confident that each application of the knife to the structure leaves a more mutilated stock; and it is only the shooting out of the young branches with their accompanying symmetrical developments, which more or less hide the deformities that render them tolerable; and we would here avail ourselves of the opportunity of recommending the student of nature to study those structures which are unmarred, and, consequently, whose beauty is unmarred; for it is no more preposterous to accept a peacock cut out of a holly-bush as a standard of beauty—where, instead of a beautiful vegetable structure, you have a *gardener's idea* of that handsome bird—than to receive other structures deformed to an almost unlimited extent as your guide. Our proposition may be objected to by some on the ground that we may often take a leaf from a plant, or even a spray, and it not be missed, or, if it is at first, it soon becomes imperceptible. To this we reply, that one cause of this is, that plants are necessarily exposed to such numerous disturbing causes, from which their want of locomotion prevents their escape, that nearly all our hardy vegetable structures are more or less deformed, or rather the normal positions of the organs are disturbed, and hence it is not so obvious; the cursory way, too, in which these structures are oftentimes observed, is another cause, as is also the ignorance of the mass of spectators, which arises from a want of studious observation.

We next notice that the union of all lines, as of axes with axes, leaves with axes, &c., is tangential—that is to say, if a leaf, or other member, leave an axis, it leaves it at a tangent. Although at first sight exceptions to this proposition may appear numerous, we believe that there is no principle more fully carried out in the various vegetable structures than is this; for, from the very principle on which plants grow, it cannot be otherwise, as could readily be demonstrated would space permit; suffice it to say, that all lateral organs appear on the axis first as little bell-shaped prominences—a rude idea of which may be derived from placing the finger in the interior of an indian-rubber tube, and pressing it outwards at a particular point—the tube will represent the axis, the finger the vital energy protruding a lateral development, and the prominence caused by the finger the first appearance of the lateral organ. As this, therefore, is the principle on which lateral members are protruded, and their after-growth is a mere expansion and enlargement of this tumour in given directions, it is obvious that there cannot be a direct angle at the point of union of one axis with another, but a small curve will connect them, which gives rise to the tangent. This, though often small and insignifi-

cant, is the cause of much beauty; for nothing can be more offensive than to see arms uniting with the primary axis in a decidedly angular manner, as if a hole had been bored in the axis, and the lateral arms stuck in, and the only variation between them is, that in the one case the union is tangential, while in the other it is angular.

We have next to call attention to a very interesting part of our subject, inasmuch as it is one which plays a prominent part in giving rise to the beautiful effects of the various vegetable structures—namely, that not only are the parts of the vegetable structure beautiful in form, and the disposition of those parts is pleasing, but the general form produced by the entire structure is magnificent. Now it is said that all compositions, a group of figures, for example, should fall into a given general form, or rather, that the beauty of the composition is thus much enhanced; this principle, which cannot be carried out by Nature in the animal world, owing to the subjects being possessed of locomotion, is beautifully accomplished in the aggregation of the parts of the vegetable structure; for, although a tree is composed of a number of similar arms, or branches, and may, therefore, be regarded as an aggregation of smaller plants, nevertheless, they are so aggregated as to compel the whole mass to form a pleasing general figure. And this is in accordance with that admirable proposition of Mr. Owen Jones,* where, in giving the general principles to be regarded in design, he says, "The general forms being first cared for, these should be subdivided and ornamented by general lines; the interstices may then be filled in with ornament, which may again be subdivided and enriched for closer inspection." Now, the general form of vegetable structures is usually somewhat conical, or egg-shaped—that is, the general form of each structure is usually a modification of a cone, or is of an ovoid form: thus the general form of the Poplar-tree is that of an elongated egg; shape of the Horse-chestnut-tree, a shortened egg; shape of the Scotch Fir, an elongated cone; others, however, are more or less globular (Fig. 24). Now this general form is of para-

mount importance; for it is the only form which can be distinguished at a distance, it being the general contour of the entire structure, and being thus conspicuous it demands primary consideration. The full weight of these remarks it is difficult, however, to appreciate, as the vast majority of trees have, during some portion of their existence, been deprived of some of their primary arms, which has necessarily destroyed their primitive figure.

Having just alluded to the general form of the structure, we notice the manner of its formation, or whence its origin. Now, it is obvious that the angle at which the axes are protruded from the primary axis plays the most prominent part in bringing about the general form. Thus in the Poplar-tree, the lateral axes are developed, forming a very acute angle* with the primary axis, while in the Horse-chestnut it approaches nearer to the right angle. And we may here just say, that the original tendency of all lateral axes is such as to form an acute angle with the axis by which they are generated, although oftentimes they ultimately assume such a position as to form an obtuse angle with their upper surface and the stem. Now this angle, viz., the angle formed by the upper surface of the branch and the primary axis, has lately been shown to be of such botanical interest that the species to which the plant belongs can almost be told by this alone; and although this truth has comparatively recently come to light, yet it has long been acknowledged more or less in practice by even the most casual observers, for many can recognise a tree at a distance, of which the general form only can be distinguished; and as it (the general form) is the result of the angles formed by the arms with the trunk, it has, therefore, long been employed as the means of recognising individuals. This leads us to notice that the arms of tall and narrow vegetable structures are more or less vertical, while those which are pronounced in width are more or less horizontal; that is, in the former the arms form with their upper surface and the trunk, or central axis, a very acute angle, while in the latter they approach nearer to a right angle. This, then, should

is sufficiently fine to bear the most scrutinising examination, and is even then stamped with beauty. Thus the mind is gradually led on from the primary or general form to the detail, and thus the monotony of observing the same thing is destroyed; for it is fresh to an extent at every variation of the distance of the spectator, as well as at every lateral alteration of the observer's position.

We have now to notice the curves of the parts of plants, which consideration is one of deep interest to the ornamentist, as all are aware that the lines entering into a composition materially influence its appearance. It has been said, and probably justly, that all compositions should, to be perfect, contain the right line, the angle, and the curve; this, though carried out in the vegetable world, if not absolutely, yet in effect, is not the part on which we wish to dwell, we merely desire to call attention to the character of the curves employed in the various vegetable structures. It is held by the highest authorities that that curve is the most refined, and therefore most agreeable, the origin of which is the most difficult to detect. Thus Redgrave teaches that an ellipse is more beautiful than a circle, because it has two centres, while the former has but one; its origin being, therefore, the more difficult to discover. The oval (egg-shape) is more beautiful than the ellipse, because it has three; the cardeoid than the egg-shape, which has four, and so on; the origin of each necessarily becoming more complex and more difficult to detect, and the curves becoming more beautiful as they become more subtle. Now the curves of the parts of the vegetable structure are of a most subtle character, for they are ever-varying curves, and we argue that this is one great cause of their beauty. If we look at a flower, we at once perceive that its parts are not circular, nor are they formed of any number of segments of circles; but the curves of the parts are of exceedingly complex origin, and are therefore of an exceedingly refined nature. Contrast the two, and all will be struck with this truth. We are informed that one of the architects of the present day, who is renowned for his tracery, feels this so forcibly that he delineates his by hand, rather than with the compass. Not only do the parts of the flower possess these peculiar curves, but they are common to every part of the vegetable organism—thus the leaves, though so varied and diversified, are invariably formed of curves of these subtle ratios; and so universal is this in the vegetable world that we even venture to say that a sphere cannot be found in the entire vegetable kingdoms, not even in the seed or fruit. Not only are the curves of the bounding lines of the various members of the vegetable organism of these refined forms, but the same class of curve is found in the inclinations of the arms. Respecting the causes of the curves of these members being thus subtle, we have remarked relative to the arms of plants that, although all are protruded in an upward direction (we speak of those bearing foliaceous appendages only), or so that they form with their upper surface and the axis a more or less acute angle, that nevertheless, in virtue of their length, their weight weighs them down; also that light draws them in the direction from whence they receive their greatest supply of that agent, which is usually from above, therefore the curve must be subtle, for there is an arm protruded of an elastic nature, the entire mass of which bends down in virtue of its weight, or is drawn down by the attraction of gravitation, and the apex is drawn up by the influence of light. Now there is one point at which both these influences act most powerfully: thus, the influence of light is the greatest at the apex of the arm; and at a point situated nearer the centre of this lateral development, but varying with its direction and form, the attracting influence of the earth is most powerful. This effect can be studied by experiments of a simple nature: first as to the direction of the member. If a string be fixed by its extremities in a horizontal position, and not stretched very tightly, it will be seen that its centre is the lowest—consequently that the point at which the influence of the earth's attraction is most apparent is in the centre of the length; but let one end be gradually raised, it will be observed that the point of maximum curvature gradually passes towards the other, or lower extremity of the line:—due observation will also show that the curve thus formed is of an exceedingly subtle ratio, which could be demon-

Fig. 24.

be expressed in even the most rude sketches of these varied organisms, for a false line may hinder the observer from receiving the desired impression.

Having now considered the general form of the vegetable structure, we must just glance at the manner in which this mass is divided or enriched for closer inspection. First, we notice that the general lines which cut up the structure are furnished by the primary arms of the organism, and that a secondary form is furnished by each arm with

its attendant members, which form is a mere modification of the general form of the entire structure, as we have before shown. These divisions are again divided into smaller parts, as the leaves, &c., which organs are also frequently cut up by indentations, which, being of diverse character, yield varied effect. The leaves are also traversed by beautiful markings, or veins. Thus when we behold a tree at a distance, we see its general form only, which is pleasing; as we approach it we gradually distinguish the primary divisions, which are again beautiful; then the smaller members; till ultimately we discern the detail, which

* In using the term angle we speak of the general relations of the axes, and not of the exact union.

* See Programmes of Lectures on the Articles in the Museum of the Department of Science and Art, by Mr. O. Jones, from whence I have derived several of the ideas which I have introduced into these paragraphs.

strated did time and space permit, we merely throw out the hint for individual consideration. This simple experiment is of great value in giving the desired class of curves and their variation when the arm producing them varies in position, but should the exact point at which the maximum of influence is observable be required, it may be found by placing a weight of any description (a brass ring, for example) on the line, which must then be of a smooth character, when it will find this point, and remain stationary at it. Having now briefly alluded to this circumstance, which plays a powerful part in bringing about the varied curves of the arms of vegetable structures, we proceed to notice how far these considerations apply to our circumstances. We notice that the arms of vegetable productions are not fixed at both extremities, as was our cord in this experiment. Although this is the case, yet being fixed at one end, and the other being held up, as it were, by the influence of light, the curve is made to assume somewhat the nature of the result of two fixed extremities. Another fact which can readily be observed by experiment is, when one end is fixed only. If a flexible rod be fixed by one extremity in the earth, rising not perpendicularly, but at a given angle, the apex will be drawn downward, and the curve will be convex with the earth's surface rather than concave, as in the former experiment, and the point at which the maximum of curvature takes place will again be variable with the direction of the rod. Now this influence modifies the former in certain cases, and acts most powerfully when the subject is most concealed from the operation of light. One other consideration which must not be overlooked, is, that the majority of stems are of a conical form, which must necessarily alter the curve of the arm as it moves the point at which the curve is most intense; thus, taking up our last experiment of the rod being raised from the earth, we observe that the shorter the cone, the nearer to the apex the point of maximum curvature is transferred. These considerations, however, we have already pursued to a greater length than is consistent with our allotted space, therefore must leave it with our readers to apply these hints to practical purposes, and to trace out the degree in which these various modifications are exhibited in certain positions.

If these influences bear so powerfully and so beautifully upon the vegetable products of our sphere, as to produce such beauty in the curvature of the varied arms of her productions, or rather to cause these varied lateral arms to assume such refined directions, and if these curves of the arms are always in harmony with their direction—which must be the result from the manner in which they are brought about, verifying our former proposition relative to adaptation to purpose—we notice that if in our compositions we would attain like beauty with Nature, we must duly consider the relation existing between curve and direction.

Having now noticed the causes of the curves of the arms of the varied vegetable structures, the question urges itself upon us, What is the cause of the peculiar curves of the boundary lines of the various members of these organisms? To this enigma we can give no solution. The cause of one leaf assuming one form and another having a different contour is altogether unknown, therefore we lay aside surmises, and content ourselves on this subject with the fact that the curves are of the subtle nature above alluded to.

We have now to call attention to a fact which is carried out in the vegetable products of our sphere, viz., that in a composition the parts are not all of the same magnitude. Thus, in looking at vegetable products as a whole, we not only observe some large (trees for example), others small (herbaceous plants), and others of a medium stature (shrubs), but in the individual organism we usually find, as we do in the heavens, parts of the first, second, and third magnitudes. Thus, if we take a flower, we notice usually one ring of comparatively large parts, another of medium size, and another of small; or these are made up in effect by the varied aggregations of parts of nearly the same magnitude. To parts of the same size this effect may also be imparted by the members being diversely coloured; thus, one series of parts if of a primary colour would be more conspicuous than another series which might be of a secondary colour, and this again

might be more conspicuous than a third series which might be of a tertiary colour. This effect may also be produced by the variation of the surface; thus, in one instance it may be glossy, or such as will powerfully reflect light, in another such as will diffuse it, while in the third it may be such as will absorb these ethereal rays; but as these will ultimately be considered under the head of texture and effect, we shall not longer dwell upon them.

Having now dwelt so tediously upon preliminaries, which, however, we have deemed necessary for the right appreciation of our subject, we shall in our next paper proceed to consider the vegetable organism and its parts.

ART IN CONTINENTAL STATES.

PARIS.—The embellishments of Paris continue on a large scale; in a few years all "Old Paris" will have been demolished. The *Hôtel de Clugny*, which is joined to the ancient Roman *Thermae*, called *Thermae de Julien*, will shortly stand in the midst of gardens, and will form a pleasing object in that antique part of Paris, the *Pays Latin*. In pulling down the houses in *Rue de la Harpe*, several large portions of Roman remains have been brought to light; these will be preserved, and ornamented with appropriate shrubs and trees. The *Hôtel de Clugny* will hereafter have on two sides the *Boulevards* of *Sebastopol* and *St. Germain*.

MUNICH.—The King has confirmed the election of the honorary members of the Academy of Arts, and the result will be officially made known on his Majesty's birthday. This nomination has long been due to Ernst Förster, who has been so long distinguished by his writings on the new school of German Art. Of native artists, the patriotic battle-painter, Dietz, is one who has been chosen; as also Kierner and Edward Sbleich—the former well known by his genre works, and the latter by his landscapes. Besides these there are two Prussian artists:—Meyerheim, whose works are illustrative of national habits and manners; and Richter, who, as a portrait painter, enjoys an extensive reputation.

GENEVA.—An artist of some celebrity has lately died here—a lady named Henrietta Rath—the survivor of two sisters of that name, to whom is due the honour of having founded the "Musée Rath" in this city. Henrietta Rath was a pupil of Isabey, and at an early age she produced works of great merit, especially in miniature and enamel, and even as early as 1801, she was elected an honorary member of the Society of Arts—a distinction accorded to only another lady besides herself.

NUREMBERG.—A short time since, a rude country boy was seen in the Museum at this place, carrying in his hand a box—himself less remarking the visitors than he was observed by them. When brought before the President of the Museum, Baron Von Aufsetz, he showed him a small figure carved in wood, representing a horseman, which he himself had made. The boy is an adopted child of the schoolmaster of Waldsassen, on the Bohemian frontier, and his talent having been recognised by the son of the Baron, he sent him to Nuremberg for improvement. The carved figure is intended for a portrait of his patron, and it is acknowledged to be in some degree like him. But the carving was the admiration of all who saw it. Although the boy was entirely ignorant of drawing, the proportions were correct, and the execution spirited, and in every way corresponding with the conception. When he was asked if he had carved the figure with a pen-knife, he drew from his pocket a knife of the rudest form, such as are purchased at village fairs for a few pence. At such an instance of his genius for Art, he was provided with instruction and the means of living until his education was completed. He was, however, subjected to another trial: a chessman of the fifteenth century was set before him, and he was furnished with the best carving-tools that could be procured; but all these he set aside, and drew forth his pocket-knife, with which he executed a copy of the chessman qualified with all the exquisite feeling of the original. Since the days of Gibbon, we have never heard of a carver of precocity equal to this Nuremberg genius.

AMSTERDAM.—A committee has been formed to conduct a subscription opened with a view to the erection of a public monument in memory of the poet Tollens, lately deceased; and so cordially has the project been received as to leave no doubt of ultimate success. Tollens was a native of Rotterdam, where he always resided, and there the monument will be erected; but, as he was the poet of the nation, it is decreed that the testimonial shall not be local but national.

THE ROYAL PICTURES.

THE RIVER-BANK.

Vander Heyde, Painter. J. Outhwaite, Engraver.
Size of the Picture, 1 ft. 11½ in. by 1 ft. 6½ in.

THE name of this distinguished Dutch painter is generally written "Heyden;" but as his pictures are, we believe, invariably signed "Heyde," it is only right to assume this to be the correct way of writing it, and therefore it is adopted here. John Vander Heyde was born at Goreum, in 1637: his father, a glass-painter in that town, instructed him in the rudiments of drawing, with the idea of introducing him to his own business, which consisted chiefly in staining glass for church windows. The knowledge he thus acquired, however, was turned to a different purpose: his studies naturally included the science of perspective, and from this he imbibed a taste for painting architectural subjects, instead of those which commonly appear in illuminated windows. The notion of following the profession of his father was soon given up, and young Vander Heyde began to draw and study from nature, and to perfect himself in the art of oil-painting on canvas; and, ere long, his pictures began to be eagerly looked after in his own country as works of a very high character in his peculiar department of art. Subsequently he travelled in Germany, Flanders, and, according to Mr. Stanley, in England. "At Cologne, Brussels, London, and other places," says this writer, "he took interesting views of their remarkable monuments." The accurate minuteness with which he delineated every object on which his pencil was employed "would have awakened admiration only at the excessive labour of the artist, had he not added to his work the beauty of colour in all the suavity of which it is capable. The delicate lightness of his pencil coincided with the microscopic objects; the colours melt and blend with each other; and the delusive chiaro-oscuro, heightening the charm, gives force and vigour to every part, making it true to nature. The beauty of his skies, whether clouded or serene, or illumined by sunshine, has great attraction. The light, floating, silvery vapour relieves the intensity of the azure, or, gilded by the sun, enriches by contrast the verdure of his foliage."*

Vander Heyde, as a painter of architecture combined with landscape, was a thorough pre-Raffaelite; but without the hardness and cutting outlines that characterise the style of painting which in these days has obtained that cognomen. Had he lived in a time when photography had been discovered, it would have been said he painted from sun-pictures—so truthful are his delineations of each brick and stone, leaf and blade, spray, stem, and branch. He selected as his subjects the most remarkable edifices in cities—the churches, town-halls, and mansions of the wealthy—not representing them, however, as isolated objects, but as forming the principal features in his views. His favourite subjects were small towns, and villages situated on the banks of rivers, or country houses, similarly placed—like that in the picture which is here engraved. Mr. Stanley also states "that he made many highly-finished drawings of conflagrations;" we have never chanced to see one of these drawings, nor, indeed, do we remember to have heard of them; but do not for these reasons question the accuracy of the statement made by his biographer. The far larger number of the pictures by this painter are embellished with figures and animals by A. Van de Velde, and some others by Eglon Vauder Neer, or Lingelbaek. Vander Heyde died in Amsterdam, in 1712, at the advanced age of seventy-five.

All the excellences of his style, and those of his coadjutor, Van de Velde, are seen in the picture here engraved. The colouring is beautifully transparent and silvery; the various objects are pencilled with the utmost delicacy and minuteness, while the trees show less formality and stiffness than are usual with this painter; the view is evidently copied from nature—one of those suburban mansions, probably, to which the wealthy burghers of Amsterdam were accustomed to resort when the "hours of 'Change" had passed.

The picture is at Buckingham Palace.

THE APPLICATIONS OF IMPROVED MACHINERY AND MATERIALS TO ART-MANUFACTURE.

No. 3.—CLAY, ALUM, AND ALUMINIUM.

NOTWITHSTANDING the prominence which has been given in our scientific literature to the discoveries in chemistry, which have been made since the days of Sir Humphrey Davy, there appears still to be but a very imperfect knowledge of the wonderful part played by oxygen in the great economy of nature.

It is true, every school-boy learns that our atmosphere is a compound of two gaseous elements, oxygen and nitrogen; and that water is oxygen in mysterious combination with hydrogen. All who are in the habit of attending the lectures of our popular institutions hear of oxygen combining with the metals to form oxides. Possibly they may have been interested in witnessing the strange combustion of a globule of potassium upon water, or the brilliant scintillations of sodium upon a sheet of ice; and have learnt that these phenomena are due to the combination of these metals with oxygen.

If we carefully examine the phenomena of the animal world, we shall find that, upon the combination of oxygen with carbon in the system, the temperature necessary for health depends; and analysis shows us that this element forms an essential part of the solid and of the fluid principles of the body. Most curiously, under the influence of light, does the vegetable world act as an agent of reduction. Oxygen is separated from some of its combinations, and sent back into the air; and, at the same time, many of the proximate principles are formed by the combination of this agent with carbon, hydrogen, and nitrogen. In the mineral world we find, again, oxygen combining with every ordinary metal; gold and platinum alone appear to resist the oxidising influences. Our mountains are but combinations of this oxygen with strange metals; the sub-soils which rest upon the rocks are usually rich in clays, which are oxides, while the fertile soils above them are constituted, not only to combine readily with oxygen, but mechanically, to condense it within its sponge-like pores.

No element in nature is more active than this one. In air, in earth, and in water, it is the main constituent; and all the conditions of fire, unless under extraordinary circumstances, are the result of combinations with oxygen. Lavoisier first brought us acquainted with the true character of oxygen, and Sir Humphrey Davy rendered it from its chemical compounds by voltaic agency. This last chemist taught us that potash and soda—well-known alkaline salts—possessed metallic bases. At this day, even, when we are familiar with the powers of voltaic electricity, it cannot be otherwise than instructive to recur to the discoveries made by Davy exactly fifty years since. We have no better description of these than that given by Dr. Paris,—we therefore quote it in part.

“After numerous trials, during the progress of which the difficulties which successively arose were as immediately combated by ingenious manipulation, a *small piece of potash*, sufficiently moistened by a short exposure to the air, to give its surface a conducting power, was placed on an insulated disc of platina connected with the negative side of the battery in a state of intense activity, and a platina wire communicating with the positive side, was, at the same instant, brought into contact within the upper surface of the alkali. Mark what followed! A series of phenomena, each of which the reader will readily understand as it is announced—for it will be in strict accordance with the laws which Davy had previously established; the potash began to fuse at both its points of electro-lysis; a violent effervescence commenced at the upper or positive surface; while at the lower, or negative one, instead of any liberation of elastic matter, which would probably have happened had hydrogen been an element of the alkaline body, *small globules resembling quicksilver* appeared, some of which were no sooner formed than they burnt with explosion and bright flame. What must have been the sensations of Davy at this moment! *He had decomposed potash, and obtained its base in a metallic form.*”

The decomposition of potash having been effected,

the steps were comparatively easy; consequently, we advanced rapidly to a knowledge of the true composition of the alkalies and of the earths. Not only was soda shown to be like potash, an oxidised metal, but lime, barytes, and magnesia were decomposed, and their metallic bases exposed; and alumina, the pure earth of all clays, and the principal constituent of alum, was determined to be a metal, also in combination with oxygen.

The alkalies and earths were at first decomposed by the power of stupendous voltaic batteries; it was, however, soon shown that the decomposition could be effected by chemical means. In 1808 Gay-Lussac and Thénard proved that fused potash, being run into a gun-barrel containing red-hot filings, gave up its oxygen, and potassium was distilled over. It was subsequently produced by igniting potash with charcoal. The remarkable characteristic of these metals is their specific gravity. We ordinarily associate the idea of much density with any metallic body. The ruling power of this conviction—once much stronger than it now is—is manifested by the following anecdote. Shortly after the discovery of potassium, Dr. George Pearson happened to enter the laboratory in the Royal Institution, and upon being shown the new substance, and interrogated as to its nature, he, without the least hesitation, on seeing its lustre, exclaimed—“Why, it is metallic, to be sure!” and then balancing it on his finger, he added in the same tone of confidence, “*Bless me, how heavy it is!*” We must remember that the metal so balanced was lighter than water. The two metals, potassium and sodium, have been regarded as chemical curiosities, and until very recently they have not found any application in the Arts. Sodium—the metallic base of soda having, however, of late rendered important service in the preparation of a metal which promises to be of great importance in the economy of manufactures—requires a little further notice.

The common mode of preparing sodium has been to unite, by trituration, caustic soda and charcoal. This mixture is introduced into an iron bottle, which is then placed in a wind-furnace, supported on bricks. To its mouth is adapted, by a screw, or by grinding, a short iron tube, the other end of which passes into a receiver. This receiver consists of two copper boxes, one fitting into the other. The upper one is a thin parallelepiped, ten inches long and five or six inches thick, shut at top and open at bottom; and is divided by a diaphragm passing to a third of the bottom. An iron wire passes through this partition, opposite the end of the iron tube, for the purpose of keeping the iron tube from being blocked up by the volatile matter in the iron bottle. The upper vessel dips into another vessel, open above and shut below, to which it is exactly adapted so as to pass to the bottom of it. A few inches of mineral naphtha are placed in it, and the air excluded by means of a fat lute. An aperture in the top allows gases to escape. Heat being applied to the iron bottle, the charcoal removes the oxygen from the soda, and carbonic oxide is formed, while the sodium drops into the naphtha in brilliant globules.

Both sodium and potassium are remarkable for the readiness with which they take oxygen from the air, or any body containing it; hence the necessity of keeping them in naphtha, which is a compound of carbon and hydrogen only, its formula being, carbon 6, hydrogen 5.

ALUMINIUM has been within the last year or two exciting considerable attention; and, naturally, much interest has been felt in the discovery that a permanent metal could be obtained from every variety of clay.

The proportions in which the pure earth alumina exists in clays and in clay shales vary considerably; hence, although all kinds of clay, and nearly all rocks, contain alumina, yet it is not economical to attempt the preparation of the metal from any except such as contain the alum-earth in large quantities.

The well-known substance alum is a combination of the earth alumina with sulphuric acid. Strictly speaking, alum is a compound of sulphate of potash or soda, or ammonia and sulphate of alumina. We prepare alum in this country by two methods. The porcelain clay of western England, or the clay from the coal-measures, is first calcined, and then it is heated with sulphuric acid in wooden vessels

by passing steam through the mixture; the liquor thus obtained is evaporated, one of the alkalies named is added, and, on further concentration, beautiful crystals of alum form. The largest quantity of alum is, however, made from the alum-slate, which is generally found associated with the coal-measures. At Hurlet and Campsie, near Glasgow, alum was formerly made by waiting for the spontaneous decomposition of the alum-slate in these exhausted coal-mines; but, from the increased demand, it is now necessary to accelerate the process of oxidation. At those two places, and also near Whitby, large manufactures of alum are carried on. Alum-slate has a dark blue colour; it is a siliceous clay, combined with coaly matter and the bisulphuret of iron. When this rock is exposed to the air, the iron pyrites are rapidly converted into sulphate of iron, and the excess of sulphuric acid unites with the alumina of the clay. Heaps of this alum-slate are carefully constructed, and fire applied to them. The carbonaceous matter of the slate is sufficient to keep up a moderately quick combustion, so that, indeed, means have to be adopted to prevent the two rapid inflammations of the mass. Such heaps as are usually prepared require from one year to one year and a half for perfect calcination. The calcined mineral is now placed in a “steep” to dissolve out the soluble salts formed; these are sulphate of alumina and protosulphate of iron. A process of evaporation now follows; the iron is separated from the alum, and the necessary quantity of potash is added to form the crystallisable alum of commerce. If we take a solution of alum, and add to it any body having a strong affinity for sulphuric acid, such as caustic ammonia, we throw down the pure alumina, which is a white powder of a very infusible character, having a chemical composition of two equivalents of alumina united to three equivalents of oxygen. Although Sir Humphrey Davy indicated the true composition of alumina, he does not appear actually to have produced the metallic base of this earth. Wöhler obtained it as a grey powder by placing alumina, or rather the chloride of aluminium, in a platinum crucible, with alternate layers of potassium. It was reserved for M. St. Clair Deville to produce ALUMINIUM in a perfectly coherent form. He found sodium preferable to potassium as a means for its production. From alum this metal is obtained in the following manner:—Alum, freed as much as possible from iron by repeated crystallisations, is converted into burnt alum in the usual way. The mass is then reduced to a coarse powder, and this is exposed for about two hours to a strong red heat in a crucible. The substance thus obtained is alumina, still retaining a trace of sulphuric acid. Some carbonate of soda being added, and the mixture again calcined, pure alumina is obtained. This alumina is then converted into a fluoride by being exposed at a high temperature to the fumes of hydrofluoric acid. This fluoride of aluminium is employed to prepare the new metal.

We have numerous examples which serve to illustrate the position that every truth has its fixed time to be born; and we may frequently observe that when one discovery has been made, others rapidly follow, which render the first of real value. The following passage from a paper by M. St. Clair Deville, published in the *Comptes Rendus* will illustrate this:—

“Nearly two years ago I undertook a series of experiments to determine the precise equivalent of aluminium, by operating upon small quantities of the metal in a state of absolute purity; subsequently, in order to check my first numbers, I have had to try different methods of obtaining pretty large masses of unexceptional material. For a long time I failed, in consequence of the nature of the vessels employed. . . . A second obstacle is caused by the foreign matters which always accompany aluminous compounds; *fortunately, within the last few months, considerable masses have been found of a mineral which has hitherto been very rare, the kryptolite of Greenland*, a double fluoride of aluminium and sodium, which appears to be nearly pure.”

This mineral, in powder, is put into a porcelain crucible with alternate layers of sodium mixed with a little common salt. The porcelain crucible is placed in an earthen one, and heated to a bright red heat until complete fusion is effected. The material is stirred with a rod of earthenware, and allowed to

cool. All the aluminium is collected in a lump, which is found at the bottom of the cold mass.

The metal which is thus obtained has a colour between that of lead and silver, it is exceedingly light, not being heavier than flint-glass; but, perhaps, its most remarkable property is its resistance to oxidation, and the manner in which it retains its colour under circumstances in which silver rapidly tarnishes—sulphuretted hydrogen gas producing no effect upon the metal aluminium. When wrought, aluminium exhibits greater resistance than silver, its tenacity approaching that of iron. Its fusing-point differs but little from that of silver, and its specific gravity is 2.56, silver being 10.5. It can be smelted and cast without being perceptibly oxidised; it is a good conductor of heat. As regards the action of gases, &c., on it, Deville says, "It is not in the least affected by moist or dry air, does not tarnish, but remains bright by the side of zinc and tin freshly cut, which soon become dull; sulphuretted hydrogen has no action upon it, cold water does not alter it, boiling water does not tarnish it; it is not acted upon by nitric acid, weak or strong, or by weak sulphuric acid, employed cold. Its true solvent is hydrochloric acid, with which it forms chloride of aluminium. Heated to redness in hydrochloric acid gas, it furnishes dry volatile chloride of aluminium. It will be readily understood what important uses such a metal, which is white and unalterable like silver, which does not blacken in the air, is fusible, malleable, ductile, and tenacious, and has, in addition, the singular property of being lighter than glass, may be turned to if it can be readily obtained. This there is every reason to believe will prove to be the case, for the fluoride of aluminium is decomposed with remarkable ease by the common metals at an elevated temperature; and a reaction of this kind, which I am attempting to carry out on a large scale, will solve this question in a practical point of view."

Professor Rose has devoted much attention to the preparation of aluminium, and he also strongly recommends its preparation from the Greenland mineral kryolite. The result of the continuance of Deville's researches, and those of Rose, has been the great reduction in the cost of production. Kryolite appears to have been first brought from Greenland, by way of Copenhagen, to Stettin, under the name of *mineral soda*, and sold at about 9s. per cwt.; it is now obtained at a much cheaper rate. The present price of the metal aluminium is about 7s. 6d. the ounce; but it must be remembered that an ounce of aluminium is of nearly five times the bulk of silver.

The alloys of aluminium promise to become of great value; the most remarkable which have yet been examined are the following:—An alloy of 10 parts of aluminium and 90 parts of copper produces a metal having greater hardness than the ordinary bronze, and as the quantity of aluminium is increased, the hardness becomes greater still. Both gold and copper lose their colours when alloyed with aluminium. If with aluminium we unite small quantities of zinc, tin, gold, silver, or platinum, it becomes very brilliant, and acquires increased hardness, remaining, at the same time, perfectly malleable. It may, indeed, contain as much as 10 per cent. of copper without losing its malleability. The aluminium-bronze unites, with the property of being forged when hot, that of great impenetrability in the presence of hydrosulphate of ammonia. An alloy of 85 per cent. of copper and 15 per cent. of aluminium has been recommended for telescope mirrors. The resulting metal is beautifully white, and it will not tarnish. An equal portion of aluminium and silver produces a material as hard as bronze. If with 99 parts of gold, one part of aluminium be united, the resulting metal is very hard, and of the colour of green gold; while ten parts of aluminium render the mixture colourless and crystalline. If five parts of aluminium be united with 100 parts of silver, the metal is as hard as the silver of our coinage; the properties of the silver being quite unaltered, except that it resists all tarnishing agents. One-tenth of aluminium with copper gives an alloy of the colour of pale gold, of great hardness, possessing high malleability, and which will take a polish equal to steel.

Aluminium has been employed in the manufacture of some of the imperial eagles which surmount the regimental colours of the guards; here lightness was a great object. Experiments have been made with success on employing aluminium for coating other metals. From its lightness it has been used for

making small weights, and also in some parts of watchwork. When a bar of aluminium is properly suspended and struck, its vibrations are of the most musical character. It has therefore been suggested that it should be employed for pianoforte wires.

With time, and that reduction of price which must follow the manufacture of this metal on a large scale, there can be no doubt that so valuable a metal will find numerous applications in the Arts. At present its production mainly depends upon the cost of the metal sodium, still employed to decompose the alumina; but, with the increasing demand for sodium, the price of that article has been reduced to less per pound than it was a few years since per ounce.

Thus we steadily advance. Science makes a discovery; its applications are studied and realised, and then the manufacturer seizes upon the labours of the philosopher, pursues his experiments on an enlarged scale, probably finds new natural sources from which to obtain the raw material, and cheapens the whole process of production.

ROBERT HUNT.

VISITS TO PRIVATE GALLERIES OF THE BRITISH SCHOOL.

THE PICTURES OF CHAS. FREDK. HUTH, Esq., UPPER HARLEY STREET.

WITH a view to relief and variety in these notices, we propose, as may be already understood, to alternate the metropolitan collections with those in the country; and have accordingly selected one from the former, distinguished rather by the excellence than the number of the pictures; yet including a very considerable catalogue, among which occur the names of the magnates of our school,—as Etty, Turner, Constable, Linnell, Frith, Wilson, Holland, Collins, &c., &c. Mr. Huth is also in possession of a judiciously selected series of water-colour drawings, containing, at least, one example of every distinguished member of the water-colour school; but these, we regret, we cannot describe at length in consequence of our usual notice of the British Institution—which compels us also to limit our notice of the oil pictures.

'Sancho tells a Tale to the Duke and Duchess to prove that Don Quixote is at the bottom of the Table,' W. P. FRITH, R.A.—This subject occurs in the thirty-first chapter of the second part. "Then thus," quoth Sancho, both of them being ready to sit down, "the husbandman contended with the gentleman not to sit uppermost, and he with the other that he should—as meaning to command in his own house; but the husbandman presuming to be mannerly and courteous, till the gentleman, very moody, laying hands upon him, made him sit down before," &c. This picture was painted for Mr. Huth, and will be remembered as one of the remarkable productions of the exhibition of 1850. In the Duke, Duchess, and Don Quixote, there is much thoughtful description; but the emphasis of the composition rests upon Sancho, who differs from every other Sancho we have ever seen, as possessing more of the patent simplicity of the philosophic squire. The arrangement is without complication, and the figures are well relieved by a background of tapestry on which appear the armorial bearings of the Duke.

'Rebecca,' F. HURSTONE.—A half-length figure of the size of life, supporting with her left hand a water eruse on her left shoulder, which she steadies with her right raised over her head, constituting a very beautiful play of line, although the pose seems difficult.

'The Dinner Hour,' J. LINNELL.—A study of a section of rough roadside bottom, with all its wealth of wild herbage, ruts, and broken ground. The foreground rises, and is crested by trees which immediately close the subject. A woodman is seated by the wayside, to whom his wife brings his mid-day meal. It is a most conscientious study of a very common-place piece of subject-matter to which value is given by the treatment, especially in colour and drawing.

'Cupid in his Chariot drawn by Doves,' W. ETTY, R.A.—The figure stands upright, grasps a bow in his left hand, and raises an arrow tri-

umphantly over his head. There is a quality in this small and sketched picture equal to the best works of the most eminent men of the Venetian school.

'Nora Creina,' W. P. FRITH, R.A.—She is seated in a chair, and holds in her hands a flower; but she looks out of the composition. There is very little colour in the work; it was painted, we believe, for engraving.

'Venice from the Grand Canal,' J. HOLLAND.—We are here placed nearly abreast of the Campanile—the ducal palace occupying the left centre of the composition. In the execution of this work there is great regard to local truth, and the water is extremely successful as to lustre and reflection.

'Avenue, Shobrook Park, Devonshire,' F. R. LEE, R.A.—The first, we believe, of these Avenues which Mr. Lee exhibited at the British Institution in successive exhibitions. The lines converge from the extremities of the base with a very happy perspective effect. There is more drawing in the trees than in those of later works; the ground shade is broken here and there by a stray sunbeam. The picture was painted in 1846, and is among the best of the artist's works.

'A Sea-piece,' G. CHAMBERS.—A simple composition, presenting various craft sailing with a light breeze. There is a charming freshness in all the works of this artist, who, had he been spared, would have built for himself a lofty reputation.

'A Nymph Angling, attended by Cupid,' W. ETTY, R.A.—This admirable picture would be called spotty by the lovers of tranquil breadths; but there is a valuable balance in the disposition of these apparently contending lights that soothes the eye and gratifies the sense. The principal figure is seated; she holds an angling-rod before her, and her attention is fixed on the pool into which she has dropped her bait. Cupid stands listlessly by, made up into a beautiful system of lines, like a true love-knot. The light falls upon the agroupment behind and from above; the breadths, therefore, of the lady are in shade, while a broad and brilliant outline of light encloses the figure. It is probable that in this picture Etty has essayed the embodiment of some ethical idea gathered from the poets.

'Stratford Mill on the Stour, near Bergholt,' J. CONSTABLE, R.A.—This is one of that magnificent series of large landscapes of which it is ever to be regretted that Constable painted so few. It is thus mentioned in Leslie's *Life of Constable*:—"This noble picture, which I well remember at the exhibition of 1820, and which has since been admirably engraved by Mr. Lucas, is about as large as 'The White Horse,' and has more subjects. On the extreme left of the spectator a wheel and part of a watermill are seen. In the foreground are some children fishing, admirable for the expression of their attitudes, their faces not being seen. Sir George Beaumont said of the elder boy, that 'he was undergoing the agony of a bite.' To the right, and in the middle distance, a barge lies, with great elegance of perspective, in the smooth river, and a group of tall trees forms the centre of the composition. It is a view, and when it was painted was an exact one, of Stratford Mill on the Stour." This picture was exhibited at Somerset House in 1820, and became the property of Mr. Tinney, of Salisbury; and in 1848 it passed into the possession of Mr. Huth, from the widow of Mr. Tinney.

'A Bacchante,' C. BAXTER.—The upper part of the figure is seen in profile, but the face is turned towards the spectator: she wears a leopard skin.

'Partridge Shooting,' G. MORLAND.—There is much more of grace in this little picture than is to be found in Morland's latter works; it is remarkably sweet in colour and perfect in condition. There is a pendant, the subject of which is 'Pheasant Shooting,' perhaps even more agreeable. These pictures were in the collection of the late Archdeacon Markham.

'View in Venice,' J. HOLLAND.—One of those subjects which this artist treats with so much success. He is very felicitous in his selection of subject-matter, consisting of building and water, the class of material which he always paints.

'The Vicar of Wakefield, after his first reverse of Fortune, reproving his Wife and Daughters for appearing in their usual Finery,' A. SOLOMON.—The subject occurs in the fourth chapter:—"The first Sunday in particular their behaviour seemed to mortify me. I had desired my girls the preceding night to be dressed early the next day, for I always

loved to be at church a good while before the rest of the congregation. They punctually obeyed my directions; but when we were to assemble in the morning at breakfast, down came my wife and daughters dressed out in all their former splendour," &c. We have accordingly the vicar's sarcastic censure, Mrs. Prinrose's gentle remonstrance, and the ultimate concession that the dresses should be altered. The work is everywhere distinguished by the most careful study.

'The Corn-field,' J. LINNELL.—A literal transcript of a passage of scenery, perhaps in Surrey. The nearest breadth of the canvas is occupied by the corn-field, with reapers at work. As a piece of local truth nothing can exceed the reality of the description.

'Sunset,' J. LINNELL.—The subject looks like a passage of some secluded back-water on the Thames, wild with all the feathery summer herbage of the river-side. A punt is moored among the willows, in which two fishermen are about to embark, and a many-branched pollard rises, fan-like, against the evening sky, in which the sun is descending towards the horizon. The foreground is in deep shade, but the glazing is deep and transparent. This picture was painted in 1847, but was retouched in 1851.

'Boulogne, Early Morning,' W. COLLINS, R.A.—This was one of the last pictures painted by this artist, and is certainly one of his best. On the right of the composition a line of boats runs perspective into the picture, penetrating into distance, and so skilfully managed as to exclude all sight of the shore. In the immediate foreground a fisherman sits upon a barrel, while his wife and son estimate the value of the night's fishing. The morning sunshine is effectively maintained throughout the picture, the left of which opens to the sea, graduated to the horizon with a most truthful expression of distance.

'A Study,' W. F. WITHERINGTON, R.A.—A passage of wooded scenery, studied apparently upon the spot.

'The Fan,' C. BAXTER.—A study of a female head, beautiful in colour, and eminently sweet in expression.

'Mouth of the Bisagno, Gulf of Genoa,' J. HOLLAND.—The verification of a locality, treated with much knowledge and power, and preserving the distinctive characteristics of a Mediterranean shore.

'The Sportsman's Repose,' G. MORLAND.—A small picture, freely touched, but carefully finished, and in perfect condition. To this picture there is a companion entitled 'The Shepherd's Repose,' somewhat similar in composition. A larger picture, also by Morland, and differing from the others, is called 'The Visit to the Child at Nurse.' It has been engraved. Also by this artist there are 'Setters in Cover,' from the collection of the late Jesse Curling, Esq., with others, entitled—

'Nutting,' 'The Muscic Gatherers,' 'Interior of a Shed, with a Cow and a Calf, and a Woman feeding Pigs.'

'Piazza dei Signori, Verona,' J. HOLLAND.—A small picture, which we recognise at once as a subject from Verona, very graceful in treatment.

'Lake Nemi,' R. WILSON, R.A.—A work of infinite elegance and refinement in the chiaro-oscuro dispositions. It was painted for the late John Bannister, the comedian, in whose possession it remained until his death.

'A Study,' C. BAXTER.—A female head, remarkable, as usual, for its purity of colour, and simplicity of treatment. The works of this artist extend to portraits of several of the younger branches of Mr. Huth's family; and these works, in purity of tint and animated expression, equal the very best productions of their class. We do not usually notice portraiture, but these works are full of pictorial quality.

'Mallam Cove, Yorkshire,' J. M. W. TURNER, R.A.—This drawing is one of a series of six formerly in the possession of the late Sir William Pilkington, Bart., of Chevet Hall, near Wakefield.

'A Study,' T. GAINSBOROUGH, R.A.—A very curious and spirited sketch, in charcoal, for a portrait of the Duchess of Devonshire. It is small, and presents the figure erect, wearing the walking-costume of the time.

'A Lady,' SIR J. REYNOLDS, P.R.A.—This is a portrait of a member of the Ducie family, which, from its character and masterly execution, may be considered rather a picture than a portrait.

Besides the oil pictures which we have particular-

ised, Mr. Huth's collection comprehends an extensive series of water-colour drawings, remarkable as containing specimens, not only of painters who professedly practise water-colour Art, but also of many of those who exhibit only in oil. Of this numerous catalogue we regret that we can name only a few, as—'A View of Stonyhurst,' J. M. W. TURNER, R.A.; 'View of Warwick,' J. Constable, one of the three only finished drawings he ever made; 'Mount Ararat,' Sir A. W. Calcott; 'Grand Canal, Venice,' Bonnington; 'A Sea-piece,' C. Stanfield, R.A.; 'View of Rotterdam,' D. Roberts, R.A.; 'Olivia and Viola,' C. R. Leslie, R.A.; 'Charles the Second and Cooper the Artist,' D. Maclise, R.A.; 'A Sunny Landscape, with Water and Cows,' J. Linnell; 'The Love-letter,' F. Goodall, A.R.A.; 'Scene in Holland,' E. W. Cooke, A.R.A.; 'Classical Landscape,' Barrett; 'Landscape,' Dewint; 'Dog, with ancient Furniture and Armour,' John Lewis; 'Interior of a Convent, with Monks Distributing Alms,' G. Catermole; 'Dover Castle, Sunrise,' Copley Fielding; 'Windsor Forest,' W. Bennett; 'A Hawking Party,' F. Taylor; 'Fruit,' W. Hunt; 'Fruit,' G. Lance; 'The Crochet Worker,' C. Baxter; 'Girl and Goat,' P. F. Poole, A.R.A.; 'Chiesa de Santa Salute,' J. Holland; 'A River Scene,' J. B. Pyne; 'A Sea-piece,' G. Chambers; &c. &c. This series of drawings may be considered unique, as containing rare examples; and, in addition to these may be mentioned a variety of "first thoughts" by very many of the most distinguished painters, constituting altogether a curious, interesting, and valuable collection.

LIVERPOOL ACADEMY OF ARTS.

THE Exhibition of the Liverpool Academy, which is recently closed, has well sustained the reputation of former years; while the sales effected have reached the amount of £2900. The following is the list of the principal portion of the pictures which have found purchasers:—

'The Village Postman Reading the Letter,' HENRY ROBERTS, 55*l.*; 'An Interval in the Performance,' JAMES CAMPBELL, 12*l.*; 'The Chair Mender,' BENJAMIN WILLIAMS, 12*l.*; 'The Early Lesson,' SAMUEL ROBERTS, 6*l.* 6*s.*; 'View on Loch Katrine,' JAMES DANBY, 35*l.*; 'Minnow Fishing,' PETER DEAKIN, 8*l.*; 'Village Amateurs,' J. W. HAYNES, 40*l.*; 'Ariel,' F. M. MILLER, 8*l.*; 'Le Combat Terminé,' J. VANIMSHOOT, 10*l.* 10*s.*; 'The Pig Drover,' JOHN E. MARTIN, 3*l.* 3*s.*; 'Looking up the Pass of Llanberris,' JOHN STEEPLE, 6*l.*; 'A Sketch at Paris,' E. TUSON, 3*l.* 3*s.*; 'Old Castle of Assyn,' J. A. HOUSTON, R.S.A., 15*l.*; 'Rough Weather Coming on,' W. J. C. BOND, 8*l.* 8*s.*; 'Reading a Chapter,' WILLIAM WEIR, 10*l.* 10*s.*; 'Girl Watering a Flower,' JAMES HARDY, jun., 7*l.* 7*s.*; 'Terrace, Haddon Hall,' CHARLES C. RILEY, 2*l.* 2*s.*; 'Pig-keeping in Berkshire,' J. D. WATSON, 5*l.* 5*s.*; 'In Richmond Park,' THOMAS FROUD, 7*l.*; 'Summer Visit to a Winter Haunt,' WILLIAM PROUDFOOT, 3*l.*; 'A Path through the Iver Wood,' GEORGE SANT, 36*l.* 15*s.*; 'Lago Maggiore,' V. DE FLEURY, 10*l.* 10*s.*; 'A Bit too Long,' JAMES HARDY, jun., 10*l.* 10*s.*; 'Primitive Music,' J. D. WATSON, 10*l.* 10*s.*; 'Hales Owen Abbey,' T. H. BAKER, 7*l.* 7*s.*; 'At Bruges,' ALFRED MONTAGUE, 5*l.*; 'Minster, near Ramsgate,' MRS. OLIVER, 3*l.* 3*s.*; 'Stepping Stones, North Wales,' H. J. BODDINGTON, 40*l.*; 'Now for Real Crinskirik Gingerbread,' HENRY J. CHARLTON, 2*l.* 10*s.*; 'How Nice!' Miss JANE G. MARTIN, 3*l.* 3*s.*; 'Entrance to Carnarvon Castle,' R. RICHARDS, 3*l.* 10*s.*; 'The Elm-tree Shade,' ALEXANDER FRASER, 12*l.* 12*s.*; 'Dortrecht, Holland,' J. Dobbin, 10*l.*; 'Study of Sheep,' W. H. MORRIS, 15*l.* 15*s.*; 'On the River Erich,' G. L. BETHOLME, 12*l.*; 'Fisherman and Boy Baiting Lines,' J. G. NAISH, 15*l.*; 'Croft Church, Yorkshire,' JAMES PEEL, 9*l.*; 'Exit from Council-house, Shrewsbury,' Miss H. HENSHAW, 4*l.* 4*s.*; 'Gleaners,' E. J. COBBETT, 63*l.*; 'Interior of a Fisherman's Cottage,' J. CASSIE, 70*l.*; 'Study of Trees, Litherland,' J. E. NEWTON, 5*l.* 5*s.*; 'I. Pifferari,' EDMUND EAGLES, 31*l.* 10*s.*; 'Mill at Pengvern,' T. H. BAKER, 6*l.* 6*s.*; 'St. Catherine's, Isle of Wight,' WILLIAM GRAY, 12*l.* 12*s.*; 'Four o'Clock,' JOHN H. DELL, 15*l.*; 'A Widow during

the Carnival at Rome,' W. FISHER, 36*l.* 15*s.*; 'Near New Ferry,' W. J. C. BOND, 5*l.* 5*s.*; 'Sunset, River Mersey,' SAMUEL WALTERS, 5*l.*; 'Boat Hauling Off to a Fishing Snack,' ALFRED HERBERT, 10*l.*; 'Yarmouth Beech,' ALFRED HERBERT, 10*l.*; 'The Jung Fraw, Egber and Mouch,' GEORGE BARNARD, 12*l.*; 'Convent at Amalli,' WILLIAM HAYLE, 6*l.* 6*s.*; 'Camellias and Azaleas,' THOMAS WORSLEY, 12*l.* 12*s.*; 'A Welsh Cottage,' ANDREW DEAKIN, 4*l.* 4*s.*; 'Vessels Ashore,' EDWIN HAYES, A.R.H.A., 10*l.*; 'Fruit, Game, and Mistletoe,' MISS HUNT, 26*l.* 5*s.*; 'Tranquillity,' THOMAS AUSTIN, 2*l.* 10*s.*; 'Coast Scene,' ROBERT BRIDGEHOUSE, 2*l.* 3*s.*; 'On the Seine,' ROBERT BRIDGEHOUSE, 5*l.* 5*s.*; 'A Country Churchyard,' S. READ, 26*l.* 5*s.*; 'An Errand to the Village,' DANIEL MUNRO, 35*l.*; 'Drying the Nets,' ISAAC HENZELL, 35*l.*; 'Great Fair, Mayence,' J. DOBBIN, 26*l.*; 'French Fisher-girl,' OCTAVIUS OAKLEY, 15*l.* 15*s.*; 'The Sister's Entreaty,' R. HOLLINGDALE, 40*l.*; 'The Goldfish, a Corner at Speke Hall,' WILLIAM COLLINGWOOD, 52*l.* 10*s.*; 'On Guard,' BENJAMIN WILLIAMS, 4*l.*; 'Cupid Protecting Psyche,' GEORGE GRAY, 11*l.* 11*s.*; 'A Wayside Petitioner,' EDWARD DAVIS, 20*l.*; 'A Drop on the Sly,' WILLIAM HEMSLEY, 30*l.*; 'Sketch in Windsor Forest,' Miss EMILY NICHOLSON, 3*l.* 3*s.*; 'Geraunium,' THOMAS WORSLEY, 4*l.* 4*s.*; 'The Student,' LEWIS MORRISON, 5*l.*; 'Cupid,' M. LUDOVICI, 21*l.*; 'The Orphans,' ALFRED A. PATTEN, 15*l.* 15*s.*; 'At Amiens,' ALFRED MONTAGUE, 10*l.*; 'A Rest by the Way,' BELL SMITH, 26*l.* 5*s.*; 'Wayside Greeting,' WILLIAM PARROTT, 30*l.*; 'Isabella Kerr Gordon,' WILLIAM FORD, 12*l.* 12*s.*; 'Shotwick-on-the-Dee, Cheshire,' WILLIAM DAVIS, 15*l.* 15*s.*; 'The New Song,' OCTAVIUS OAKLEY, 73*l.* 10*s.*; 'Old Cottages near Edinburgh,' GEORGE T. HARGITT, 4*l.*; 'Goldsmith,' T. P. HALL, 94*l.*; 'Kate Kearney,' ERSKINE NICHOL, A.R.S.A., 22*l.* 10*s.*; 'Very Interesting,' JAMES SMETHAM, 26*l.* 5*s.*; 'Heath Blossoms,' JOSEPH BOUVIER, 20*l.*; 'Interior, at Pennanguer,' ALFRED PROVIS, 31*l.* 10*s.*; 'Boats on the Mersey,' W. J. C. BOND, 6*l.* 6*s.*; 'Lake of Windermere,' Miss JANE NASMYTH, 10*l.* 10*s.*; 'Chateau of the Tuileries,' Miss MARTIN, 5*l.*; 'The Lassie at the Burn,' J. BOUVIER, sen., 10*l.* 10*s.*; 'A French Fisherwoman,' CHARLES S. LEWIS, 12*l.*; 'Shepherd's Home,' G. W. HORLOR, 21*l.*; 'The Belfry, Calais,' WILLIAM CALLOW, 15*l.* 15*s.*; 'Hark! the Merry Laugh Resounds,' ROBERT CLOTHIER, 52*l.* 10*s.*; 'Welsh Interior,' D. W. DEANE, 20*l.*; 'A Bit from Nature,' HENRY CHAPLIN, 3*l.*; 'The Last Ships of the Spanish Armada,' Captain E. A. INGLEFIELD, R.N., 40*l.*; 'A Peep at Bolton Abbey,' W. G. HERDMAN, 10*l.*; 'Scene in Cirencester,' W. G. HERDMAN, 10*l.*; 'Inverness, from the Castle Hill,' W. G. HERDMAN, 15*l.*; 'A Summer's Afternoon in the Woodlands,' J. S. RAVEN, 60*l.*; 'Welsh Peasant at a Window,' E. J. COBBETT, 42*l.*; 'The Missing Curl,' THOMAS ROBERTS, 26*l.* 5*s.*; 'Beethoven,' JOHN MORGAN, 25*l.*; 'Commoners,' W. H. HOPKINS, 26*l.* 5*s.*; 'Llyn Coron, Anglesey,' J. W. OAKES, 26*l.* 5*s.*; 'Interior of a Cottage in North Wales,' D. W. DEANE, 30*l.*; 'The Toilet,' LEON GOUGHIL, 26*l.* 5*s.*; 'Searching for Lost Money,' A. RIPPINGILLE, 31*l.* 10*s.*; 'Interior of the Ancient Church of Kirby Lonsdale,' W. G. HERDMAN, 40*l.*; 'Lazy Morning on the Thames,' G. A. WILLIAMS, 20*l.*; 'The Old Knight's Blessing,' WILLIAM COLLINGWOOD, 21*l.*; 'Fruit, &c.,' WILLIAM DUFFIELD, 18*l.*; 'Near Leith,' DOWNWARD BIRCH, 15*l.*; 'Hastings, Boats Waiting for the Tide,' ARCHIBALD WEBB, 21*l.*; 'Jeannette,' JULIUS BOUVIER, sen., 16*l.* 16*s.*; 'The Watering Place,' B. SHIPHAM, 15*l.*; 'Bray, county of Wicklow,' GEORGE HICKEN, 10*l.*; 'Taking the Horse to Drink,' SOUPEL, 31*l.* 10*s.*; 'Emily and the White Doe of Rylstone,' F. M. MILLER, 10*l.* 10*s.*; 'The Doll and her Friends,' WILLIAM ROMER, 15*l.* 15*s.*; 'Taking it Easy,' JOHN DAVIES, 12*l.* 12*s.*; 'Bassenthwaite Lake,' THOMAS EDWARDS, 10*l.*; 'Gathering Sticks,' GEORGE SANT, 21*l.*; 'Roman Tower on the River Burr,' W. ART IN THE PROVINCES.

SHEFFIELD.—The opening of the new building in this town for the use of the School of Art took place on January 22nd, when the Annual Meeting was held, and the report read by Mr. Young Mitchell, the head master. The income for the past year had been £984, of which £510 was a grant from Government, £255 were from students' fees, and £203 from subscriptions. On the evening of the following Monday, several hundreds of the principal inhabitants of Sheffield attended a conversazione in the new edifice, in the rooms of which a large number of works of Art of various kinds, the property of the neighbouring gentry, were open for exhibition, together with the drawings, &c., of the students. In the course of the evening addresses were delivered to the assembled company and the pupils by Mr. Roebuck, M.P., and Mr. H. Cole, C.B., of the Department of Art, and the annual prizes were delivered to the students. The "Parker Scholarship," value ten guineas, and the "Mayor's Prize," of equal amount, were both awarded to George Theaker; the former for having "obtained the greatest number of departmental medals in the two years preceding the session of 1857;" and the latter for "the best design for an article of Sheffield manufacture," which in this instance proved to be for a swing tea-kettle. The "Master Cutlers'" prize was awarded to H. H. Stannus; our space will not permit us to particularise the other awards. Mr. Cole in his address highly eulogised the Sheffield School; he remarked that it "stood at the head of all the schools in the country," with regard to its efficiency, as proved by the number of medals awarded to the students—by the head Department of Art, we presume—in proportion to the number of pupils who availed themselves of the instruction afforded in the school. At the same time he regretted much to find how insignificant a proportion of the population availed themselves of the aid of the master to learn elementary drawing—only eighteen out of a population of 135,000: we find this reported in the local papers, but it seems to be almost incredible. We presume, however, from Mr. Cole's preceding remarks, that this number of eighteen does not refer to the actual number of students of the Sheffield School, but to those belonging to the parish and other schools, for whom an "elementary class" is opened in Sheffield. Still this is extraordinary; for the School of Exeter, with a population of 40,000, has 835 such pupils coming forward for examination; Cheltenham, with a population of 3500, has 1350; Chester, 1200; Worcester, nearly 500. Manchester, with a population of 300,000, musters only 230!

One word respecting the new edifice in which the studies of the Sheffield pupils will in future be carried on. It is built of coloured brick, relieved by stonework; the architecture is in the Byzantine and Romanesque style; all the interior arrangements are said to be well adapted to the purposes of the building. The entire cost of the building, including site and fittings, is £7100, of which £1600 still remains to be realised. We do not suppose that the good people of Sheffield, who have hitherto entered so heartily into the project, and to whom so great credit is due for what they have accomplished, will long allow this debt to remain unliquidated.

BIRMINGHAM.—The Annual Meeting of the subscribers and friends of the Birmingham Society of Arts and Government School of Art was held at the rooms in New Street, on the 3rd of February: Lord Ward, president of the institution, in the chair. From the report of the honorary secretary, Mr. C. R. Cape, it appears that the treasurer's accounts showed a balance in favour of the institution of £17 4s. As a proof that the school maintains its position, it is only necessary to mention that the examiners appointed by the Department at Marlborough House have awarded twenty-four bronze medals for drawing in the present exhibition, although some of the very best in the series, viz., the detailed anatomical studies, are excluded from the competition by rules laid down by the Department. The number of students receiving instruction at the end of the past half-year was as follows:—

Central School, New Street	631
Classes in various Parochial and other Public Schools	563
Worcester Diocesan Training School	33
Elementary Branch School, Spon Lane	47
Elementary Branch School, Cape, Smethwick	35

Total..... 1309

There was a liberal distribution of prizes to the students at the meeting: we regret we have not room to point out the names of those who distinguished themselves.

GLASGOW.—The Annual Meeting of the members of the Glasgow Art Union took place in the month of December last, though a report of the meeting

has only just reached us. The Lord Provost occupied the chair. The secretary read the report, which announced the continued prosperity of the Association, and stated that while the subscribers were not so numerous as last year, the committee had been enabled to devote a larger sum to the purchase of paintings and other works of Art than they had hitherto been able to accomplish. Of the 211 paintings exhibited, 82 were by Scottish artists, acquired at the cost of £1027; 128 were by English artists, at the cost of £1266; and one painting of flowers, of the value of £35, was the production of a distinguished French artist. In addition to the works of Art enumerated, 55 bronze and Parian statuettes and groups have been acquired for distribution at this meeting, and 12,000 chromo-lithographs of a picture painted by R. Galvin, A.R.S.A., expressly for this purpose, are in course of being finished. The whole value of paintings, statuettes, and chromo-lithographs to be distributed as prizes amounts to nearly £10,000, and the value of the engravings supplied to the members amounts to about £3800, making a total sum expended in works of Art this year of nearly £14,000. For next year the committee had arranged that each subscriber will get an impression of the large steel engraving of "Noah's Sacrifice," from the celebrated picture by Maclise.

NORWICH.—The students of the Norwich School of Art recently presented to Mr. Elton, their late assistant master, a handsomely bound copy of Byron's works, illustrated, as a mark of their respect and esteem for that gentleman.

WARRINGTON.—The School of Art in this borough appears to be making most satisfactory progress, and, judging from the energy displayed both by Mr. Thompson, the master, and the pupils generally, it bids fair to become a formidable rival to the most successful of provincial schools. At the recent visit of H. M. Inspector of Schools of Art, Mr. R. G. Wylde, twenty-three works had medals awarded to them, and fourteen others received honourable mention; this, it must be admitted, is highly creditable to all connected with the school, the more so when it is considered that thirty medals is the maximum that can be awarded to one institution. Of the other works exhibited, Mr. Wylde spoke in the highest terms, and expressed himself agreeably surprised both by their number and the high standard of excellence to which they had attained. Mr. Wylde also visited the public schools of the district where drawing is taught by Mr. Thompson, and seventy-five prizes were awarded among them; viz., fifty-nine to the Warrington Educational Society's Schools, twelve to the National Schools, five to the Wargrave School.

DONCASTER.—The local papers speak most favourably of a model-design, by Mr. Tibbury, of Doncaster, for a monument to the memory of the late John Wesley, founder of the sect that bears his name. The figure of this ardent "home missionary" represents him with a Bible in one hand, and as in the act of addressing one of those large assemblies that attended his preaching, both in the open air and within the walls of the sacred edifice. Three of the tablets beneath the statue are filled with alto-relievos, representing respectively, "Christ blessing little Children," "Christ healing the Sick," and the "Last Supper." The figure is surmounted by a Gothic canopy. Subscriptions are in progress for the execution of the monument.

CORK.—At a recent meeting of gentlemen interested in the Cork School of Design, it was stated by the secretary, Mr. T. S. Duncombe, that the receipts of the past year amounted to £501 9d.; including the grant from the Corporation of £222, and fees from students, £191 3s. 3d. The expenditure of the year almost equalled the receipts; it would, indeed, have exceeded them by more than £20, if a debt of £25, due to the Gas Company, had been liquidated. The Cork School appears to receive a liberal pecuniary support from the Corporation, in comparison with that afforded by other civic bodies; whatever monetary obligations, yet unpaid, the school has incurred, have clearly not arisen from any indifference on the part of the local authorities.

SALFORD.—The second General Meeting of local artists in reference to the exhibition with which it is intended to inaugurate the new wing of the Salford Free Museum and Library, was held in the Town-Hall on the 24th of January. Mr. J. Hammersley, of the Manchester School of Art, who presided on the occasion, stated that the labours of the committee had hitherto been attended with the most satisfactory results, a large number of pictures, both by deceased and living artists, having been promised for exhibition. The committee have decided upon connecting an Art Union with the exhibition, "whereby a fund would be raised to insure the sale of a portion of the pictures, and it was confidently anticipated that, with a little exertion in the way of canvassing, a large subscription list might be obtained, and a handsome sum raised to be expended in prizes."

EGERIA.

FROM THE STATUE BY J. H. FOLEY, A.R.A.

MANY of our readers will remember that about two years since we stated that the Corporation of London had given commissions to six of our principal sculptors to execute each a statue to fill certain niches in the Egyptian Hall of the Mansion-House; the subjects to be selected from British poets; at a later date six other statues were ordered for a similar destination. In both cases Mr. Foley was one of those to whom commissions were given; his first work, "Egeria," is here engraved: it was exhibited at the Royal Academy last year, and is now erected in the Egyptian Hall.

Egeria, as some Roman writers tell us, was a nymph of Aricia, in Italy, and, according to Ovid, married Numa Pompilius, the second king of Rome: after the death of her husband she became so disconsolate that she melted into tears, and was changed into a fountain by Diana. Others say she was the favourite nymph and invisible protectress of Numa, and that she generally resided in a celebrated grove, situated near the Appian Way. The fable, whatever the ancients may have said concerning it, has given a name to a fountain, in the valley between the old Appian Way and the modern road to Naples, which Byron has made the subject of some exquisitely beautiful verses in the last Canto of "Childe Harold." Mr. Foley has taken them as the text of his work.

"Egeria! sweet creation of some heart
Which found no mortal resting-place so fair
As thine ideal breast; what'er thou art
Or wert,—a young Aurora of the air,
The nympholepsy of some fond despair;
Or, it might be, a beauty of the earth,
Who found a more than common votary there
Too much adoring; whatso'er thy birth
Thou wert a beautiful thought, and softly bodied forth.

"The mosses of thy fountain still are sprinkled
With thine Elysian water-drops; the face
Of thy cave-guarded spring, with years unwrinkled,
Reflects the meek-eyed genius of the place,
Whose green, wild margin now no more erases
Art's works; nor must the delicate waters sleep
Poisoned in marble, babbling from the base
Of the cleft statue, with a gentle leap
The rill runs o'er, and round fern, flowers, and ivy creep.

"Here didst thou dwell, in this enchanted cover,
Egeria! thy all-heavenly bosom beating
For the far footsteps of thy mortal lover:
The purple Midnight veil'd that mystic meeting
With her most starry canopy." . . .

In a subsequent stanza the poet appeals with infinite truth and felicity of expression to the power which the sculptor possesses to create the beautiful, and place it before us as a type of what the world ought to, but does not, show. Byron was, or professed to be, when he wrote his "Childe Harold," a sceptic in the matter of love; he apostrophises her thus:—

"Oh Love, no habitant of earth thou art—
An unseen seraph, we believe in thee,
A faith whose martyrs are the broken heart;
But never yet hath seen, nor e'er shall see,
The naked eye the form as it should be;"

and then, as if he were in the act of contemplating Foley's graceful conception, he adds:—

"Of its own beauty is the mind diseased,
And fevers into false creation;—where,
Where are the charms the sculptor's soul hath seized?
In him alone. Can Nature show so fair?
Where are the charms and virtues which we dare
Conceive in boyhood, and pursue as men—
The unreach'd paradise of our despair,
Which e'er informs the pencil and the pen,
And overpowers the page where it would bloom again?"

We have always regarded Mr. Foley as one of the most poetical of our living sculptors, yet his conceptions never carry us beyond the limits of humanity. We do not agree with Byron that Nature could not show us a creature as fair in person, as perfect in form, and as pure in mind, as this Egeria is represented, though such a being is a comparatively rare example of the daughters of Eve. The sculptor has chosen an appropriate and charming subject for his art, and has treated it with the utmost delicacy of feeling and gracefulness of expression. The Corporation of London may well pride itself in possessing this very beautiful statue.

EGERIA.

ENGRAVED BY J. H. BAKER. FROM THE STATUE BY J. H. FOLLY A. R. A.

THE CRYSTAL PALACE:

A TEACHER FROM ANCIENT AND EARLY ART.

BY THE REV. CHARLES BOUTELL, M.A., &c.

PART II.—ROMANESQUE ART.

BROADLY and decidedly distinguished one from the other in their individual characteristics, the two great divisions of Art—the “ancient” and the “early”—are, at the same time, bound together by a close and indissoluble connection. Hence, in the Crystal Palace the Byzantine Court, which is designed to illustrate the line of demarcation between these two grand Art-eras, serves also to demonstrate the transitional or derivative process that brings them into contact, and maintains their union. In this Court, accordingly, the Art-student can take up a position between the representatives of antiquity and of the middle ages; he can here trace out, from the full development of Roman Art, how it was that Mediæval Art arose; while, on the one hand, he has before him examples of such works as Egypt, and Assyria, and Greece transmitted to Rome, and, on the other hand, the Romanesque expands before him into the Gothic, again to decline in the Renaissance. Here, then, with the greatest advantage to the student, may be sought the first of the lessons which the Crystal Palace is able to give, as “a teacher from ancient and early Art.”

We enter the Byzantine Court beneath a shafted arch, richly decorated with colour, gilding, mosaic-work, and with incrustations of variously coloured marbles; this arch forms a part of an arcade which has been reproduced from the cloisters of Sta. Maria in Capitolio, at Cologne—a church commenced in the eighth century, and completed during the course of the tenth. Before us, and around us, are various examples from Venice, Rome, the south of France, several parts of Germany, and from Ely, Salisbury, Romsey, and other places in England; and in the adjoining gallery are many other specimens from Italy, with contemporaneous works from Ireland, &c. To the west of the Court itself lie a group of casts from the highly interesting monumental effigies in the Temple Church, London; and within it are other casts from the English royal effigies at Fontevault, in Normandy, with the well-known effigy of King John from Worcester Cathedral. With the exception of the examples from that very wonderful edifice, the Cathedral of St. Mark at Venice, this Court is thus found to contain no specimens of Byzantine Art, strictly and properly so called; but it does appear to comprise much of the western and northern Romanesque, which must be considered to be specifically distinct from the kindred and contemporaneous expressions of Art in the East. This court is, in fact, therefore, incorrectly named; its proper title would be the *Romanesque Court*; and this term would imply that there have been brought together examples of that comprehensive form of Art which grew up into such energetic life upon the ruins of the Arts of Rome. Derived directly from Roman Art, the Romanesque in process of time adapted itself to the combined requirements and influences of the eastern and western tracts of Europe; while in Italy itself, and especially in Lombardy, it retained distinctive characteristics peculiarly its own. The arts of the middle ages, therefore, in their birth may correctly bear the single title of “Romanesque;” but this general title would gradually be resolved into the several distinct appellations by which the various forms and expressions of the Romanesque were severally distinguished. Of these forms and expressions the “Byzantine,” as being the direct descendant, and the long-surviving representative of both Greek and Roman Art, is one of the most important; and it is, indeed, true that this term “Byzantine” has both a primary and a secondary acceptance in early Mediæval Art; that is to say, it designates such works as were actually constructed during and subsequently to the age of Justinian at Byzantium itself, or those of a similar character which at different times and in various places were produced by Byzantine artists upon pure Byzantine principles; and this same term is also applied to another class of works that are both scattered over central Europe, and occasionally found in its south-western and western regions, in which works a Byzantine influence may be seen to

have been exercised. Such an influence was the result of the very general employment of Greek artists upon works which were both designed and executed without any direct or deliberate reference to Byzantine principles of design and construction. The discriminating student will carefully distinguish between this Byzantine influence indirectly exercised upon the western Romanesque, and the true Byzantine style, which is of eastern growth, and which flourished without interruption throughout Eastern Europe until about the period of the decline of the Gothic in the West.

Keeping carefully in remembrance what it is that this term “Byzantine” really conveys, the Art-student will regard the Crystal Palace Byzantine Court under the more comprehensive, as well as the more correct, title of “Romanesque;” and he will then consider what that teaching is which he has a right to expect from its components and its contents. He will seek for illustrations, (1.) of early Romanesque, as it separated itself from the declining Roman; (2.) of the Byzantine or eastern development and practice of the Romanesque; (3.) of the Norman or western and northern Romanesque; (4.) of the later Romanesque of Italy; and, finally, his search will extend to some examples of those forms of Art which are to be distinguished as Lombardic and Rhenish. The result of an examination of the Court and of its gallery, with the casts of the same periods and styles, and the small casts of early carved ivories, which (under some strangely perverse influence) have been associated with a miscellaneous collection of works in the compartment adjoining the great central transept towards the south-east, will be found only so far unsatisfactory as they are deficient in simplicity and exactness of classification, and in completeness in the several varieties of the examples themselves.

Of the early Romanesque of Italy examples are altogether wanting; these, however, would have been found to have differed but little in their artistic character from some of the later specimens which have been faithfully and effectively reproduced. The peculiarity of the earlier Romanesque works consists in their progressive advance towards the formation of the then new style from the ruins of its predecessor; in other words, it consists in the gradual adaptation of the arch to true shafts in the place of classic columns, and in the appropriate development of the several members, both constructive and decorative, which are associated with the pure Romanesque arcade. Ravenna, Parenzo in Istria, and Torcello in the Venetian Lagoon, contain remains of the earliest Romanesque, which are equal in interest with the relics that are yet preserved in the imperial city itself; and these examples all combine to show how directly the steps taken by them in advance of the Roman style, led to the more complete and expressive forms of the tenth and eleventh centuries, and of those by which they were immediately succeeded. Thus, in the Crystal Palace examples we have representations of Romanesque Art of the utmost value, since, in these examples, we are enabled to study the expression of this Art when it had become matured, and also while it yet remained true to the original type. And these observations are no less applicable to the enrichments that are superadded to the architectural forms and combinations, than to those forms and combinations themselves: here also the original usage in ornamentation is faithfully exemplified, though the actual examples of ornament are far from being derived from the earliest period. The system remained the same throughout the entire period; and what are here for us to study, are reproductions of such specimens as are at once some of the best in existence, and also some of the most characteristic. In one point of view, it certainly would have been more satisfactory to have had, in bodily presence before us in this Court, some casts from the earliest Romanesque of Rome and of Ravenna: and the shrine of Torcello might have yielded a precious, though brief passage to the Romanesque chapter in this Art-teaching; and some of the small old churches which linger along the shores of the Adriatic, as yet unexplored by archaeologist or artist, had a search been instituted amongst them, would, it is more than probable, have filled in with curious details the well-nigh blank centuries in Art that intervene between the sixth century and the tenth. Still, since we know

under what forms the Romanesque arose at the first, and since we are also familiar with its earliest accessories and associates, we may be content, in such an institution as the Crystal Palace, to enter practically upon the study of “early Art,” with specimens from the Cathedrals of St. Mark’s, of Augsburg, and Hildesheim, and with the Cologne cloisters of Sta. Maria in Capitolio.

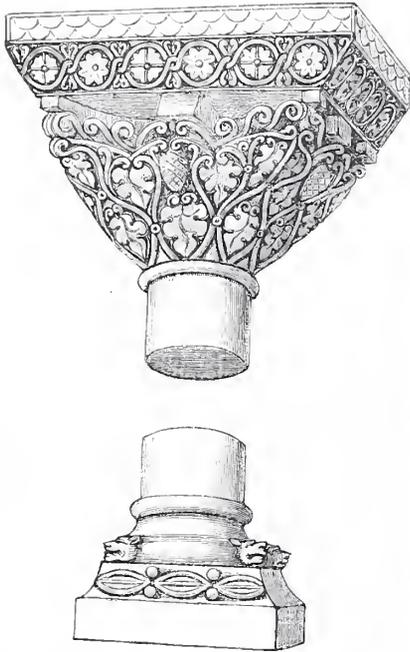

In the arrangement and formation of this Romanesque Court, the plan has been to employ the double arcade of a cloister with parts of other arcades of smaller proportions, and with these to associate, in such a manner as to form a single composition, several fine door-arches, a chancel-arch, and various examples of sculpture and decorative carving. The principal arcade (from a work of the tenth century, as has been already stated) shows the combination of arch and shaft adjusted, indeed, with much skill, but yet under conditions which declare that the adjustment was far from having been perfected. The object of the architect was to cause an arch of considerable thickness in section to rest upon a short and comparatively slender shaft of marble; and he has carried this design into effect by employing a capital which expands from the shaft-moulding to meet an abacus of the requisite dimensions. The capitals thus formed may be considered to be of two orders—the lower order being the true capital, and the upper a species of corbel interposed between the capital and the springers of the arch. This is an arrangement highly characteristic of the early Romanesque; it remained long in favour under every modification of the style; and in our own country we have occasional examples of its existence in the baluster-shafts of the arches that are attributed to Saxon times. The arcade in the Romanesque Court consists of a range of principal arches, each of which covers two sub-arches that carry a solid spandrel: the principal arches rest sometimes on piers and sometimes on shafts; when they are shafted, the shafts are of the same dimensions and the same character with those of the sub-arches. The bases of all are classic, and of great purity; but the capitals, while in some instances indicating a controlling reminiscence of the Ionic type, are distinguished by that varied treatment of conventional foliage and of interlaced work intermixed with strange animal forms, which are so characteristic of early mediæval as distinguished from classic Art. The example which I have figured, in its

CAPITAL, CLOISTER OF STA. MARIA IN CAPITOLIO.

ornamentation, inclines somewhat to the Egyptian character; the leaves of which it is composed are arranged about the block with much grace, and, like almost all the carved work of the period, executed with considerable skill and power. This capital, with its shaft, exemplifies the adjustment of the slender support to the massive arch, which I have just described. Occasionally, the disproportion between such a shaft and the superincumbent mass led to the introduction of “coupled shafts”—two shafts, that is, set close together beneath a common capital. The examples which are given in this Court from the Abbey of Moissac, include specimens of a pair of coupled shafts, but here there are two capitals united under a common abacus. Other coupled shafts appear in the arcade from the Church of St. John Lateran at Rome. The Moissac capitals

are very fine examples, and they show a considerable advance in style—the uppermost member of the composition being a true abacus, though very massive, and carrying still further the great spread of the capital itself beyond its shaft. The bases of these shafts are no less valuable than the capitals, as illustrations of the artistic feeling of the period in its treatment of this important architectural member. The carved figures which rest upon the angles of the plinths are not only characteristic of Romanesque Art, but suggestive also to the artist of the present day who seeks (as every true artist will ever seek) for whatever is excellent from the works of all time, that he may apply its teaching in the works of his own times.

CAPITAL AND BASE, MOISSAC ABBEY.

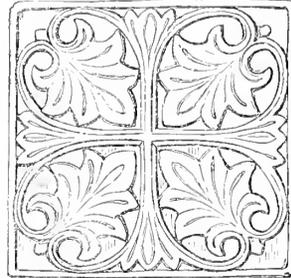

These bases rest upon corbels from St. Mark's, and grouped with them are several medallion-like panels of sculpture of truly Byzantine character from the same rich treasury of Art. All these works, even those which are in themselves comparatively both rude and harsh, attest significantly the originality of conception, and the earnest striving after effective expression, which so honourably distinguish the artists who led on "early Art" towards its glorious culmination. And herein do the works of the "early" masters teach much more than that lesson in Art and in the history of Art, which may be read from their forms and from their decorations: they show how the men who designed and who executed them gave themselves up, with heart and feeling and deep devotedness, to every possible means of advancement and exaltation which, in the pursuit of their Art, they could command. Whatsoever in ancient examples appeared to them to be worthy of study, they studied with that thoughtful spirit which penetrates through forms into principles. When they believed that they could best invent and design for themselves, they then brought to bear upon the matter before them all that their study, their observation, and their own faculties of imagination and reflection would yield to their earnest summons. This is a lesson which teaches with most powerful persuasiveness, when plainly set forth, without any word of comment or of application.

The cloister arcade of Moissac, which has furnished me with an engraving from the east in the Romanesque Court, has its arches pointed, and may be assigned to the first quarter of the twelfth century. The strictly Romanesque character of the shafts of this arcade at this period, and the treatment of the entire work, demand from the Art-student thoughtful consideration.

Comparison with the details of other edifices that closely resemble those from which the Romanesque Court has derived its examples, has been rendered easy to the student by the illustrations introduced

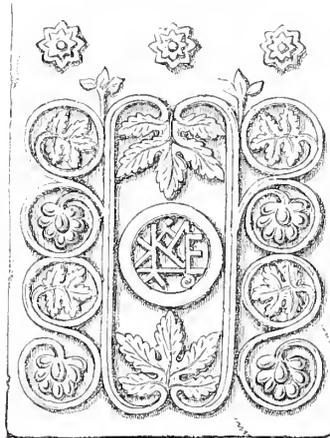

with such free liberality into his "Handbook of Architecture," by Mr. Fergusson, the able and accomplished Art-director of the Crystal Palace. I may here particularly specify the engravings from the cloisters at Zurich, and at the Huelgas near Burgos, from Gelnhausen, and the Wartburg, and from Foutifroid, at pages 553, 587, 589, 610, and 837.

The Church of St. Mark's, that exceptional edifice, which rears its eastern cupolas in the midst of the strictly Italian Romanesque and the Gothic of Venice, was commenced in the year 977, and its architectural construction appears to have occupied about a century. The mosaics, and other interior decorations, were subsequently added, so that the entire edifice was completed a short space before the close of the eleventh century. Both within its walls and on their external surface, it displays in high perfection the decorative system of Byzantine Art. Whatever specimens of decoration, therefore, may be taken from its almost countless stores, may be regarded as faithful exponents of the style. From the various examples

CONVENTIONAL FOLIAGE, ST. MARK'S.

that have been introduced into the Romanesque Court from St. Mark's, I have selected for illustration two, which exhibit the forms of foliage that are there to be found in such great abundance and variety, and which also show the peculiar manner in which the foliage is generally arranged. In one

FOLIAGE FROM ST. MARK'S, VENICE.

of these groups the leaves approach to the natural character, but in the other they appear to have been rendered after a strictly conventional manner, evidently derived from a classic type. The mosaics and variegated marbles which glitter throughout the Venetian cathedral are not without their representatives in this Court: these are essentially Byzantine modes of ornamentation, and they are to be regarded as necessarily appertaining to the style. It is not, however, by any means necessary that these accessories should be considered as exclusively the property of the Byzantine style; on the contrary, their use in the edifices of Eastern Europe, and in St. Mark's, may teach us with what advantage they may be introduced into our own architectural compositions. Besides the representations of mosaic-work, marbles, and painted figures, positive colour has been freely introduced into the Romanesque Court of the Crystal Palace, in many parts of it which can scarcely be considered to have any Byzantine sympathies; possibly the carved stone in the originals may have been taught, after a similar manner, to assume a character not

its own; but certainly the painting here displayed upon works of the Norman Romanesque is productive of effects most prejudicial to the works themselves, as exponents and teachers of a style of Art. But before I enter upon any particular examination of these examples of the Romanesque of our own country, there remain several other continental specimens which invite attention and are worthy of careful regard. The Cathedral of Mayence, on the Rhine, contains the noble doorway (erected A.D. 1112) from which an admirable east is placed to the south of the arcades from St. John Lateran and from Gelnhausen, in Southern Germany. The head of this lofty arch is closed with a tympanum covered with sculpture, illustrative at once of the capacity of the artists of the twelfth century, and of that Byzantine influence I have mentioned to have extended where the style of Byzantium was unknown. With this doorway there corresponds another of similar proportions, of which the details have been brought together from several places; all are fine examples of Romanesque under the influence of Byzantine tradition, which in some of them extends so far as to give them the distinctive character of the Eastern style. Such details of this composition are from Venice. The arcade from the cloisters of the Lateran will be most appropriately considered hereafter, in comparison with some classic details. The other arcades (and there are several), with some examples of sculpture from different localities, and two corbeltables from Romsey, abound in characteristic features, and will repay a careful study of their every arch and figure, and curl of foliage.

The two grand doorway openings are filled with noble examples of the bronze doors which are to be found in many Italian churches, and occasionally, as in the case of these fine works from Hildesheim and Augsburg, in Germany. These doors are covered with decorative compositions in bold relief, illustrative of passages in the Old and New Testaments, arranged in a series of panels. The Hildesheim doors, made in the year 1015, are about sixty years earlier in date than those of Augsburg; but, in artistic conception and execution, they are greatly superior. Both are fine examples, and they take a position far higher than can be assigned to the massive doors of oak, covered with elaborate but unmeaning scroll-work of iron, which were introduced at a later period. I reserve, until I come to describe the Florentine doors, a more minute notice of these German works of the same class. In the compartment adjoining the central transept stands a cast from another work in bronze at Hildesheim: it is a column, now destitute of any capital, ornamented with twenty-eight subjects from the New Testament, executed in relief, and arranged about the shaft after the manner of the Roman columns of Trajan and Aurelian. This is another admirable illustration of the capabilities of the German artists, who produced works in metal as early as the year 1022.

Near to the bronze doors in the Romanesque Court are placed easts from two very remarkable bas-reliefs, which have been discovered within the last few years at Chichester, and are now preserved in the cathedral of that city. The subjects have reference to the raising of Lazarus, and they are evidently the work of artists who had a strong feeling for the antique, and also had been trained in the Byzantine school. These sculptures yield in interest to no early examples of a similar class which have yet been found in England, and by the Art-student they will always be regarded as fraught with much of curious and valuable instruction.

A group of arches, chiefly doorways, in the Norman Romanesque which prevailed to so great an extent in this country, next meets our view: they are from Ely Cathedral, from the abbey church of Romsey, and the singular churches of Kilpeck, in Herefordshire, and Shobden, in Yorkshire, both of which were built a few years before the middle of the twelfth century. All these arches, throughout the entire composition of their several orders, are covered with elaborate carving. Shafts with their capitals, and jamb-piers with their abaci, are similarly treated; and the whole present a series of examples of the peculiar surface chisel-work which the artists of the period delighted to lavish upon their productions. The designs are infinitely diversified, and comprise zigzag, inter-

lacing, and conventional devices, with quaint animal figures and grotesques of almost every possible variety. The Ely doorway, known as the Prior's Entrance, also exhibits several peculiar forms of foliage, of which some indicate a sympathy with classic types, and others bear a close affinity to the conventional leafage identified with the first of the three great periods of the English Gothic. I have given two engravings from the details of this door-

DETAILS OF THE PRIOR'S DOORWAY, ELY CATHEDRAL.

way, with a view to show more clearly some of its most remarkable ornamentation: these same figures, with the shaft and capital from Shobden, and the

CAPITAL AND PART OF SHAFT, SHOBDEN CHURCH.

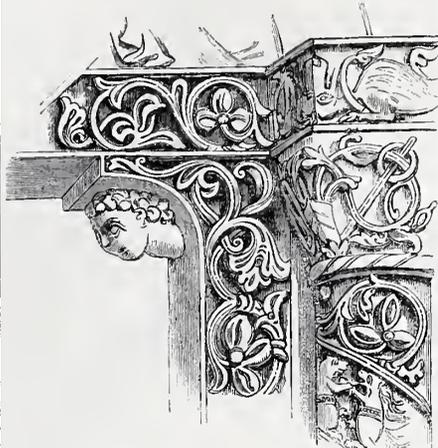

Birkin capital, will also exemplify, after the most characteristic manner, the decorative carving of our Anglo-Norman Romanesque. The innermost order

CAPITAL, BIRKIN DOOR.

of the jambs of the Ely doorway carries the carved lintel of the tympanum; it is peculiar in having at its head arched projections, from which, on either side, there projects a corbel-head. The form thus obtained would seem to have been, in some degree, the prototype of the foiled arch of the Gothic style. The tympanum of this doorway-arch is filled with carving; so also is that of the doorway from Shobden, and they both have their own teaching upon the subject of Romanesque figure sculpture. To the eastward of the Ely doorway is a cast of a

remarkable panel, occupied with sculpture in relief, from the baptistry of St. Mark's, which was probably executed in the thirteenth century; the subject is the baptism of our Lord by John the Baptist, and the treatment is altogether free from any Eastern influence. The monumental slab and effigy

DETAILS OF THE PRIOR'S DOORWAY, ELY CATHEDRAL.

of Bishop Roger, of Sarum, I leave for future consideration, with the other casts from works of monumental art, including the royal effigies which are within this Court;—I may, however, here observe, that the head of the episcopal figure in the Salisbury memorial is of a very different period from the rest of the work—a circumstance which, in giving the date of the monument, ought to have been particularly pointed out.

Of the earliest forms of the Romanesque which are known in England the Court contains no example, to contrast with the enriched specimens from Ely and elsewhere: this is an omission much to be regretted, since it leaves a void in the historical succession of the series of casts; and it appears to be the more singular, since it would have been easy to have introduced the Romanesque arches of Bishops Remigius and Alexander from Lincoln Cathedral, which illustrate so happily the characteristics of the earlier and the later Anglo-Norman. The Cathedral of Tuam, with one or two smaller churches, have supplied most interesting specimens of the Romanesque of the sister island; and these Irish examples have received great additional value from the collection of casts from early crosses both in Ireland and in the Isle of Man, with which they are associated. In the gallery adjoining the Romanesque Court, from which the great chancel-arch of Tuam opens the way towards the south, stands a cast from the black marble font of Winchester Cathedral, an eminently characteristic work of the commencement of the twelfth century; and near to this is another font, probably of a somewhat later period in the same century, in which the ornament consists of interlaced-work instead of groups of figures: it is from Earsley, in Herefordshire. Above this gallery is thrown a vaulted ceiling, decorated with carefully-painted representations of the mosaic enrichments of one of the vaults of St. Francis at Assisi, between Rome and Florence.

Such are the chief materials which have been brought together in the Sydenham Museum, with the view to illustrate the Romanesque style of Art. Their teaching is clear, expressive, and easy to be understood. It declares by what means a new style grew up, to take the place of the Art which had sunk down and ceased to live with the decline and fall of the Roman empire; and it traces out the progressive development of the first forms of Mediæval Art, until they were sufficiently matured to merge into the full nobleness of the Gothic. The Art-student, who has felt as well as listened to these lessons, will glance around the Gothic Court, into which either the Ely or the Shobden doorway will admit him, and then, having crossed over to the other side of the building, he will sit down and meditate amidst the sculpture of Greece and Rome.

THE TURNER DRAWINGS AT MARLBOROUGH HOUSE.

THIS selection—but a small portion of the contents of those old, worn, and smoky portfolios that crowded the sanctum of that well-known dirty-looking house in Queen Anne Street—this selection, we say, contains the vignettes made for Rogers' "Italy," the drawings for "The English Rivers," "Rivers of France," &c., the earlier works in sepia, the later in colour. Here, then, at length are before us those mysterious works which, in engraving, have charmed the world. It cannot be said that all are equally successful in imposing effect, but those that are not so attractive as others, are remarkable for a marvellous breadth of seriously minute elaboration, with the ever-recurring assertion that nature has no lines, but consists only of formal darks and lights. Turner's principle of employing alternately dark and light forms is alphabetically shown in the sepia drawing "Martello Towers at Bexhill;" but the art is concealed, and is apparent only on analytical examination. With the masses and the distances of the view some liberties have been taken, but we at once recognise the locality. There are a few larger views richly coloured, as "The Burning of the Houses of Parliament," "The Arsenal, Venice," "Ivy Bridge," &c.—the last named a charming drawing. Certainly, in the works of the latter period, the forms are generally superseded by light or shade, and surely no artist of any time has ever employed clouds so significantly as Turner. There are two sketches for marine pictures of marvellous power as to chiaroscuro, and so fresh in description that we even feel the wind that blows out of the picture. Of the English rivers there is the Wye, with a ruin, perhaps intended for Goodrich, but not like it. "South Shields, the Tyne"—a moonlight, looking seaward, with Tynemouth lighthouse on the left; then, on the same river, "Newcastle," looking up from far below Pandon Dean, with, on the right, all the salient points—St. Nicholas, All Saints, the Castle, &c. Famous old Norham accompanies the Tweed, looking down the stream, which, by the way, is too narrow, and the sun is certainly too low in the sky for this aspect, having descended behind the ruin, which must be certainly south or east. Then there are "The Dart;" two of the Medway, one with, of course, Rochester Castle, and that bridge, now no more, which every English landscape-painter has at least sketched; the mouth of the Humber, rich with a Dutch galliot—here we look seaward, with the distant docks on the left, and Grimsby on the right, in the distance; but we think the indication is nearer than the truth. "Moor Park, the Colne," and another, illustrating the Medway, "Stangate Creek," a very brilliant agroupment of boats and figures. Here are the drawings made for the "Liber" which may at once be said to be *et studiorum et veritatis*; the "Jason," a composition with a bridge in the middle distance, a production of a grand classic character; "Bridge and Cows," more domestic and Gainsborough-like; "Solitude," the "Little Devil's Bridge;" "Hindoo Devotions;" "Thun, Switzerland;" "Bonnevill, Savoy"—this place, which is but seldom painted, is on the road to Chamouni; "Mount St. Gothard;" "Inverary Castle;" "The Coast of Yorkshire;" "Hind Head Hill," &c. Of the French series there are several on the shores of the estuary of the Seine—"Honfleur," two views, one above the harbour, looking over the town to the Côte de Grace, another looking up the river. A charming view of Quillebeuf, from which Turner painted one of his noblest works; two views of "Tancarville," one of "Harfleur," looking towards Havre, and showing the richly fretted spire of the church, which we have always considered the most elegant specimen of architectural *bon-bonnerie* in Europe—attributed, of course, *aux Anglais*, as everything extraordinary in Scotland is to the fairies. Of Rouen there are several views, in which the cathedral on one hand, and the Quai D'Harcourt play, perhaps, exaggerated parts. The Italy vignettes are so familiar to us in spirited black and white that we may confess to a little disappointment in seeing the originals; it is, however, on the whole a most gratifying exhibition; yet we long to see some of those touched proofs of which there are stores in the portfolios, because Turner kept all he touched upon.

THE GLASS COURT
OF STEIGERWALD, OF MUNICH,
AT THE CRYSTAL PALACE.

ONE of the most interesting additions to the sights in the Crystal Palace is a very extensive collection of articles in coloured glass, vases, and vessels of every description, exhibited by Franz Steigerwald, of Munich. The collection consists of vases in the Moorish, the Egyptian, and the Grecian styles—from those of colossal dimensions, down to the smaller sizes, suiting chimney-pieces and the drawing-room table, dessert-services, fancy-flowers, and numerous other articles.

Those only who are acquainted with the almost insurmountable difficulties of the manufactory of glass can fully appreciate the merit of these articles; even they will be surprised at designs of such dimensions and intricate forms, with their ornaments in all their details.

It cannot be uninteresting to our readers if we supply a brief description of the locality in which these elegant specimens of the industry and skill of man are created. The manufactory is situated in the midst of a mountainous district known by the name of the Bavarian Forest, in the vicinity of the Danube—3500 feet above the level of the Mediterranean, at the foot of the Arber, the highest summit of this chain of mountains, and about 6000 feet high. The raw material, an exceedingly beautiful quartz, is chiefly gained in close proximity to the manufactory, from the Hünner Kobel quarries; and, as this mountain rises about 1000 feet, means are thus afforded for conveying the requisite quantity of quartz on sledges during the winter with great facility to the manufactory. The forests, which cover a vast area, consist of pines, beeches, maples, &c., affording an abundance of wood; so extensive are these forests that the number of trees which perish by natural decay is probably much larger than those that are cut down for firewood. The winter season, however, which commences in October, continuing with uninterrupted severity till the month of May, covers the whole district with such enormous masses of snow that the roads for the sledges are carried over deep chasms, rocks—nay, even over hedges and houses, thus affording the only means of conveying the requisite materials to their destination. Within a certain distance from the manufactory the snow generally accumulates to a height of five or six fathoms, but is, as before explained, of the greatest importance to the establishment.

The usual number of workmen in the different branches of the manufactory seldom exceeds 350 or 400.

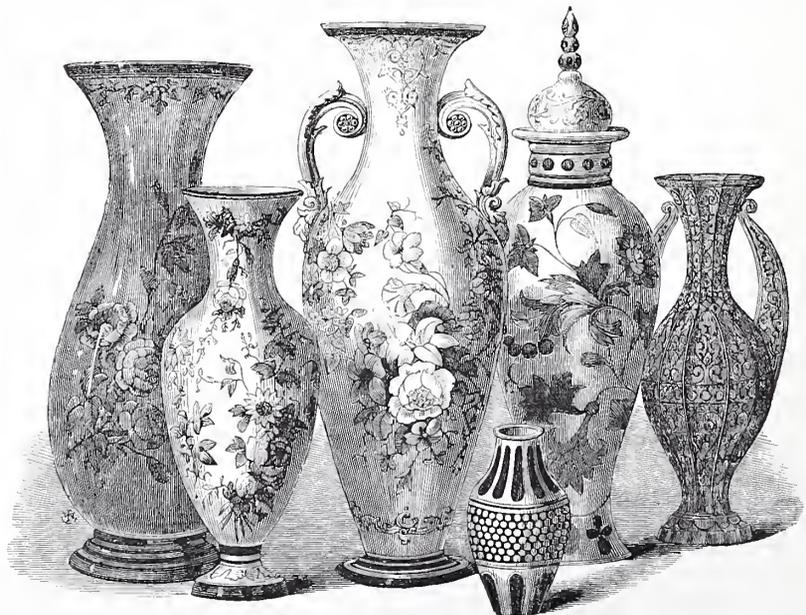

The produce of the manufactory is, however, so large that a considerable quantity of glass goods are regularly exported to the Bohemian mountains, where great numbers of workmen are occupied in cutting, engraving, gilding, and painting the various glass vessels. But the finest and largest pieces are kept back and finished at Schachtenbach, because those works of Art must be treated with particular care. It is a peculiarly interesting feature in the manufactory of glass, that the skilful workmen employ none but the simplest tools for producing the most complicated works of Art. Everything is done by hand; no machinery—such as is applicable in other branches of industry—is used. Thus, for instance, the whole apparatus for cutting consists of simple disks of iron, stone, or wood, which turn around their axis; those of the engravers, of copper and lead: the former are moistened with water, and the latter lubricated with oil and emery, and by the mere turning and twisting, and holding the vessel under different angles to the disk, the ingenious hands of these simple workmen create the glorious ornaments which delight our eyes.

As every country and every climate possesses its peculiar advantages, thus the long winter of those mountainous districts is followed by a delightful summer, which can nowhere be paralleled in freshness and brilliancy. Before the snow has melted away, the meadows are covered with a luxuriant carpet of flowers; the trees exhale refreshing fragrance, and nature is endowed with new life and activity. The soil is furrowed by the active hand of man, the cattle being driven up to the Alpine meadows to graze there for the whole summer.

The inhabitants of this district are generally strong and healthy; their countenances exhibit a mixture of cheerfulness and good-nature, the reward of a life of temperance and industry. Their food consists chiefly of milk, bread, and potatoes—a dish of meat seldom adorning the rustic table. The only beverage they enjoy is the pure clear spring-water which everywhere issues from the rocks, so refreshing and delicious that they do not feel the want of artificial liquors.

The subjects we have selected for engraving from the remarkable collection of articles manufactured and exhibited by Herr Steigerwald, are, first one of the Chandeliers in bronze, containing a variety of foliage and ornaments in coloured glass,—this

object is skilfully composed, and has a very agreeable effect: the second engraving consists of several of the Vases, in various styles, of which there is a valuable display of "all sorts and sizes."

PICTURE SALES.

THE announcement of the sale, by Messrs. Foster, of a large and valuable collection of pictures and drawings, on the 28th and 29th of January last, was one we scarcely looked for at so early a period of the year; sales of such a character rarely commence till the London season has fairly set in. If we are to augur from it a large amount of business in the auction-room during the next few months, we are also encouraged to think, from the prices which the works in question realised, that the productions of our painters are still eagerly sought after.

The catalogue issued by Messrs. Foster announced the collection to be the property of "a gentleman resident in the north of England." The sale of the drawings, 140 in number, occupied the first day; they realised nearly 2000*l.*; our space will only allow us to point out a few of the best specimens:—'The Windmills, with Don Quixote and Sancho Panza,' G. CATERMOLE, 14½ *gs.*; 'View on the Rhine,' J. D. HARDING, 17*l.* 6*s.* 6*d.*; 'Little Nelly in the Church-yard,' J. W. TOPHAM, 56 *gs.*; 'The Hay-field,' and 'The Harvest-field,' a pair by J. ABSOLON, 42 *gs.*; 'The Mirror,' BROCKART, 25 *gs.*; 'The Rosebud,' BROCKART, 15 *gs.*; 'The Dame's School,' a drawing by W. GOODALL, from Webster's picture in the Vernon Collection, 21 *gs.*; 'The Fall of Clarendon,' a drawing by A. FUSSELL, from E. M. Ward's picture in the same Collection, 20 *gs.*; 'Fruit,' W. HUNT, 49 *gs.*; 'The Sisters,' D. MACLISE, 26 *gs.*; 'The Falls of Terni,' J. M. W. TURNER, an early specimen, 21 *gs.*; 'Tivoli,' a later example by the same painter, 21 *gs.*; 'The Chapel of the Virgin in the Cathedral of Liege,' L. HAGHE, 23 *gs.*; 'The Merchant of Venice,' J. R. HERBERT, 54 *gs.*; 'The Sportsman's Return,' F. TAYLER, 32 *gs.*; 'A Peasant and her Child crossing a Mountain Stream,' P. F. POOLE, 82 *gs.*; 'Landscape,' COPLEY FIELDING, 49 *gs.*; 'The Twins,' W. GOODALL, 22 *gs.*; 'Market-place at Segovia,' E. GOODALL, 28 *gs.*; 'Head of an Old Man,' BROCKY, 17 *gs.*; 'View off the Isle of Wight,' C. BENTLEY, 17 *gs.*; 'Poissardes and Donkeys, near Boulogne,' J. J. JENKINS, 35 *gs.*; 'Landscape and Gipsies,' J. D. HARDING, 26 *gs.*; 'The Love-letter,' F. STONE, 15 *gs.*; 'Haddon Hall,' D. COX, 18½ *gs.*; 'The Masquerade,' F. STONE, 15½ *gs.*; 'View of the Village Flühlen, Lake Uri,' J. M. W. TURNER, a late example, 125 *gs.*; 'Grapes, Pears, &c.,' W. HUNT, 64 *gs.*; 'Glen Dochart, Ben More, Perthshire,' T. M. RICHARDSON, 25 *gs.*; 'The Pets,' J. H. WATT, the engraver's drawing after Landseer's picture, 32 *gs.*; 'The Arrival of Desdemona at Cyprus,' F. R. PICKERSGILL, 21 *gs.*; 'Heidelberg, with the Valley of the Neckar,' D. ROBERTS, 40 *gs.*; 'Ehrenbreitstein,' the companion drawing, 23 *gs.*; 'The Drachenfels' and 'The Mill of Bruges,' a pair by D. ROBERTS, 30 *gs.*

The oil-paintings, 61 in number, realised 7156*l.*; the principal lots were the following:—'The Head of a Grey Horse and some Pigeons,' J. F. HERRING, 26 *gs.*; 'The Old Greenwich Pensioner,' E. M. WARD, R.A., 51 *gs.*; 'Windsor Castle from the Thames,' J. B. PYNE, 45 *gs.*; 'Day by Day we Magnify Thee, O Lord,' SOLOMON, 49 *gs.*; 'Fruit, &c.,' GRÖNLAND, 70 *gs.*; 'An English Homestead,' CROME, sen., 60 *gs.*; 'The Forest of Fontainebleau,' MULLER and POOLE, 79 *gs.*; 'An Arcadian Scene,' F. DANBY, A.R.A., from Mr. Wadmore's Collection, 38 *gs.*; 'A Lady's Head,' C. BAXTER, 70 *gs.*; 'The Sisters,' C. BAXTER, 46 *gs.*; 'The Stepping Stones, Bwtlys a Coed,' T. CRESWICK, R.A., 107 *gs.*; 'Eudymion's Dream,' W. E. FROST, A.R.A., 50 *gs.*; 'The Seventh Day of the Decameron,' P. F. POOLE, A.R.A., the study for the large picture exhibited in the Royal Academy, 1855, 62 *gs.*; 'Solitude—the Knight and the Palmer,' F. DANBY, A.R.A., 26 *gs.*; 'Raffaello drawing the Fornarina,' SIR AUGUSTUS CALLCOTT, R.A., from Lord Northwick's Collection, 25 *gs.*; 'The Assertion of Liberty of Conscience,' J. R. HERBERT, R.A., a finished study for the large picture, 69 *gs.*; 'Morning,' T. S. COOPER, A.R.A., 86 *gs.* (Mordant); 'The Boar Hunt,' J. LINNELL, 57 *gs.*; 'Castles in the Air,' F. STONE, A.R.A., exhibited in the Royal Academy, 1855, 59 *gs.*; 'The Birthday,' C. R. LESLIE, R.A., a recent work, 100 *gs.* (Gambart); 'Aneona,' C. STANFIELD, R.A., 133 *gs.* (Lloyd); 'A Rural Scene,' F. R. LEE, R.A., with felled timber and figures, 48 *gs.*; 'Patricio and the

Ladies at Breakfast,' A. L. EGG, A.R.A., scene from "Asmodeus," 122 *gs.* (Broadcrip); 'The Haunt of the Sea-Fowl,' W. COLLINS, R.A., from the Collection of C. Birch, Esq., 165 *gs.* (Martin)—at the sale of Mr. Birch's Collection this picture fetched 185 *gs.*; 'Light and Shade,' T. CRESWICK, R.A., 142 *gs.* (Loekey); 'Fruit, with a chased gold vase,' G. LANCE, 115 *gs.* (Leggatt); 'Sunset,' J. LINNELL, landscape, river winding, in the foreground boys fishing, 100 *gs.*; 'Venus,' W. ETTY, R.A., painted for Mr. Gillott, on panel, 55 *gs.*; 'The Message,' J. SANT, 45 *gs.*; 'The Procession to the Temple of Esculapius, at Athens,' SIR AUGUSTUS CALLCOTT, R.A., presented by the artist to his medical friend, Dr. Carpenter, 260 *gs.* (Holmes); 'Rescuing Sheep after a Storm,' T. S. COOPER, A.R.A., scene in the Highlands, 67 *gs.* (Mordant); 'The Armenian Convent at Venice—Mazziorgo in the Adriatic,' C. STANFIELD, R.A., 165 *gs.* (Gambart); 'Off a Lee-Shore,' C. STANFIELD, R.A., 202 *gs.* (Upham); 'The Woodman's Return,' F. GOODALL, A.R.A., 280 *gs.* (Upham); 'Landscape, with View of Distant Country in the Vicinity of Reigate,' J. LINNELL, 280 *gs.* (Gambart); 'A Woody Lane Scene in the Neighbourhood of Redhill, with Gleaners,' J. LINNELL, 240 *gs.* (Leggatt); 'Neapolitan Fisher Girls surprised Bathing by Moonlight,' J. M. W. TURNER, R.A., 700 *gs.* (Gambart); 'Spanish Girl returning from the Fountain,' J. PHILIP, 100 *gs.* (Cox); 'Lear and the Fool in the Storm,' W. DYCE, R.A., 105 *gs.* (Cox); 'Babes in the Wood,' D. MACLISE, R.A., 1856, 250 *gs.* (Mordant); 'The Dream of the Future,' T. CRESWICK, R.A., W. P. FRITH, R.A., and R. ANSDALL, 390 *gs.* (Leggatt); 'The Benediction,' T. WEBSTER, R.A., from the Collection of Lord Northwick, at Thirstane House, 380 *gs.* (Gambart); 'Hamstead Heath,' SIR AUGUSTUS CALLCOTT, R.A., 285 *gs.* (Mordant); 'Canterbury Meadows,' T. S. COOPER, A.R.A., 285 *gs.*; 'Sunset on the Sea-Coast,' J. LINNELL, 480 *gs.* (Cox).

Since the sale of Mr. Charles Birch's Collection there has not been so choice a gallery of English pictures dispersed by public auction as that of Mr. John Barlow, of Upton House, Manchester. A few years ago, such a collection would have been sent for sale to London, but now Manchester vies with the metropolis—indeed, outbids us in the market for works of British artists; and the late owner of these pictures was fully justified in confiding them to the hammer of Mr. Capes, of Manchester, by whom they were sold on the 21st of January; the prices realised show that the auctioneer performed his duty to his employer, as most assuredly the buyers performed theirs to the works submitted to them.

The sale commenced with the water-colour drawings, thirty-six in number; of these the most important were:—'The Rialto, Venice,' J. HOLLAND, 21*l.* 10*s.*; 'The Gipsy Fortune-Teller,' OAKLEY, 21*l.* 10*s.*; 'Lago Maggiore,' G. E. HERING, 32*l.*; 'Lions,' SIR E. LANSEER, 23*l.*; 'Mary' (engraved), D. MACLISE, 28 *gs.*; 'Ship on Fire' (engraved), G. CATERMOLE, 30 *gs.*; 'Cottager and Child,' W. HUNT, 32*l.*; 'Il Penseroso,' W. E. FROST, 18 *gs.*; 'Room, at Fontainebleau,' W. MULLER, 27*l.*; 'Apples, &c.,' W. HUNT, 33 *gs.*; 'Charles II., Major Colby, and the Dukes of Buckingham and Ormonde in the Armoury of the Tower,' G. CATERMOLE, 120*l.*; the original sketch, in black and white, for the picture of 'The Old Woman accused of Witchcraft,' W. P. FRITH, 32*l.*; 'Irish Courtship' (engraved), F. W. TOPHAM, 185*l.*; 'Boulogne Shrimpers,' J. J. JENKINS, 44*l.*; 'The Adoration of the Magi,' F. R. PICKERSGILL, 48*l.*; 'Arundel Castle,' J. M. W. TURNER, 189*l.*; 'A Spanish Posada, Bull-Fighters regaling,' J. LEWIS, 325*l.* 10*s.*

The oil-pictures numbered forty-seven; the principal of which were the following:—'A Felucca returning to Port,' E. W. COOKE, 40*l.*; 'The Gleaner,' P. F. POOLE, 32*l.*; 'The Approaching Traveller,' P. F. POOLE, 29*l.*; 'The Sleeping Beauty' (engraved), W. P. FRITH, 48*l.*; 'Andromeda,' W. E. FROST, a small circular, only nine inches in diameter, 39*l.*; 'Boys gathering Water-Cresses,' G. SMITH, 35*l.*; 'Nymphs and Cupid,' F. R. PICKERSGILL, a small oval, 32*l.*; 'Returning from Market,' SIR A. W. CALLCOTT, the finished sketch for the large picture in the Vernon Collection, 72*l.*; 'Dolly Varden,' the well-known picture by W. P. FRITH, 89*l.* 5*s.*; 'Head of an Oriental Jew,'

W. ETTY, 90*l.*; 'Head of a Lascar,' ETTY, 48*l.*; 'Beatrice,' A. ELMORE, 55½ *gs.*; 'The Toilet,' KENNEDY, 37*l.*; 'Female Figure,' J. SANT, 59*l.*; 'Mercury instructing Nymphs in Dancing,' F. R. PICKERSGILL, 95*l.*; 'Rydal Water,' J. B. PYNE, 190*l.*; 'Cymon and Iphigenia,' KENNEDY, 80*l.*; 'The Sonnet,' A. ELMORE, 110*l.*; 'Portia, Shylock, &c.,' J. C. HOOK, 165*l.*; 'Charles II. and Nell Gwynne,' E. M. WARD, 94*l.* 10*s.*; 'Landscape with Sheep,' T. S. COOPER, 106*l.*; 'Landscape with Cows,' T. S. COOPER, 88*l.*; 'Pluto carrying away Proserpine, opposed by the Nymph Cyane,' F. R. PICKERSGILL, 170*l.*; 'Slave Market in Grand Cairo,' W. MULLER, 144*l.*; 'Landscape with a distant Sea-View, Cows, and Sheep,' F. R. LEE, and T. S. COOPER, 315*l.*; 'Dutch Pilots warping their Craft out of Harbour in Rough Weather,' E. W. COOKE, 200*l.*; 'From the Lake—Just Shot,' G. LANCE, 140*l.*; 'A Sultry Day, Naples, Capri in the distance,' W. COLLINS, 235*l.*; 'A Peasant Woman with a Child on a Bank,' P. F. POOLE, 215*l.*; 'A Calm—Dutch Shipping on the Scheldt,' G. W. COOKE, 136*l.*; 'May Morning,' W. E. FROST, 145*l.*; 'Othello relating his Adventures to Desdemona and her Father,' C. W. COPE, 350*l.*; 'The May-Queen preparing for the Dance,' P. F. POOLE, 230*l.*; 'Phœdria and Cymocles on the Idle Lake,' ETTY, 640*l.* 10*s.*; 'Hamstead Heath,' LINNELL, 630*l.*

The total amount realised by the sale was 6757*l.*; we believe that the majority of the pictures fell to the biddings of gentlemen in Manchester and the neighbouring manufacturing districts. We will venture to suggest to these gentlemen that a visit to the studios of many of the artists whose works they have bought, would enable them to secure pictures equal to those in merit at about two-thirds of the prices they paid Mr. Capes for them.

MINOR TOPICS OF THE MONTH.

PROPOSED NATIONAL PORTRAIT GALLERY.—The Lords Commissioners of her Majesty's Treasury have appointed the undermentioned noblemen and gentlemen to be trustees for the formation of a gallery of the most eminent persons in British history:—The Lord President of the Council for the time being; the Marquis of Lansdowne, K.G.; the Earl Stanhope; the Earl of Ellesmere, K.G.;* Lord Elcho, M.P.; Lord Robert Cecil, M.P.; the Right Honourable Sidney Herbert, M.P.; the Right Honourable Thomas Babington Macaulay; the Right Honourable B. Disraeli, M.P.; Sir Francis Palgrave; Sir Charles Eastlake; William Smith, Esq.; W. H. Carpenter, Esq. This list is unexceptionable.

THE ROYAL ACADEMY.—The apartment in which the Sculpture has hitherto been exhibited (?) at the Royal Academy is to be enlarged prior to the next opening; improvements with respect to light as well as space have long been required here. The sculpture-room was always a discredit to the Academy; we only marvel it has been permitted to exist in its present state till now.

THE CORPORATION OF LONDON, desirous of recording their sense of the services rendered to it by the late Mr. Thomas H. Hall, chairman of the improvement committee, have commissioned Mr. Durham to execute a bust, in marble, of that gentleman, to be placed in the council chamber of the Guildhall. There is no artist to whom the task could have been confided with safer assurance of a satisfactory issue.

SOCIETY OF PAINTERS IN WATER-COLOURS.—At a General Meeting of the above Society, held on the 9th of February last, Mr. Samuel Read was elected an associate. Mr. Read is a painter principally of architectural interiors, whose works we have from time to time noticed with well-merited praise. The society having lost within a few years several of their members who devoted themselves to this branch of the art, Mr. Read may possibly fill a void felt in the exhibitions since the deaths of Prout, Mackenzie, and more recently of Frederick Nash.

THE SHEEPSHANKS' GIFT TO THE NATION.—Certain papers, moved for by Lord Montague in the House of Peers, supply us with information on

* Unhappily a vacancy has been already created by the lamented death of the Earl of Ellesmere.

this deeply interesting subject. From his lordship's statement we learn, that from 1824 to 1856 the State purchased 112 pictures; but during that period no fewer than 433 pictures were presented to the people by private individuals. It appears that the gift of Mr. Sheepshanks is of 233 pictures, and 103 drawings and sketches; while that of Mr. Turner amounts to 282 pictures, and 18,749 drawings and sketches. Well may his lordship call upon the country to manifest its sense of this munificence. We shall consider this subject in detail next month; but in doing so, we shall have to go over much of the ground we have trodden annually for several years past.

THE NATIONAL GALLERY.—A report is in circulation, but we know not on what reliable authority, that the National Gallery will ere long receive an addition of several pictures from the Manfrini Gallery, at Venice, which have been recently purchased by the British Government.

THE "ARTISTS AND AMATEURS," under the presidency of Mr. J. D. Harding, held their first *Conversazione* for the season on Thursday evening, the 5th of February, at Willis's Rooms, St. James's. Hitherto the Society had its meetings in the lower room, but on this occasion it was held in the large upper apartment, which was brilliantly lighted up, and, by nine o'clock, was almost filled with the members and their friends; the admission of ladies—a wise regulation of the Society—contributed in no measured degree to make the scene gay, animated, and interesting. Owing to the crowd of visitors, it was with some difficulty we could procure a sight of the works brought forward for exhibition; some of the portfolios we were quite unable to have a glimpse of, from their being so surrounded. The contributors to the evening's entertainment provided a full supply of good things, if one could only have got within sight of them.

NEW EDUCATIONAL MUSEUM.—The Committee of Privy Council on Education have arranged to open the New Educational Museum, at the new buildings, South Kensington, in the spring. It is hoped that the museum will afford great help to all classes of the public in carrying out the work of national education, and especially those engaged in teaching. The museum will exhibit, under a proper classification, all important books, diagrams, illustrations, and apparatus connected with education already in use, or which may be published from time to time, either at home or abroad. The public will be admitted free as a public exhibition on certain days of the week; and on other days, which will be reserved for students, opportunity will be given to examine and consult the objects with the utmost freedom. The objects exhibited at St. Martin's Hall in 1854, which were presented to the Society of Arts, and by that Society given to the Educational Board in order to found a museum, will form part of the Educational Museum. The producers of apparatus, books, diagrams, maps, &c., used in teaching, will have the privilege—subject to certain regulations—of placing their publications and productions in the museum, and thus making them known to the public, and we understand that a unanimous desire to assist has been expressed by all the great educational societies and publishers. A catalogue will be prepared which will contain the price lists which exhibitors may furnish for insertion. The books and objects will be grouped under the following divisions:—1. School buildings and fittings, forms, desks, slates, plans, models, &c. 2. General education, including reading, writing, grammar, arithmetic, mathematics, foreign languages, histories. 3. Drawing and the fine arts. 4. Music. 5. Household economy. 6. Geography and astronomy. 7. Natural history. 8. Chemistry. 9. Physics. 10. Mechanics. 11. Apparatus for teaching the blind and the deaf and dumb.

THE TURNER MONUMENT.—The commission for this work has been given by the Royal Academy to P. MacDowell, Esq., R.A.: there could have been no better selection. This artist, though possessing the highest genius, whose works would confer honour upon any country in any age, finds "patronage" little more than a sound. It will astonish a future generation that a sculptor so worthy to take his place beside the great masters of the world, should have lived for years—in the vigour of intellectual power—to produce models by scores, and marble by units. There can be no doubt that he

will treat this subject—a statue of Turner—with consummate ability, although of materials there are few or none, and the theme is not of the best.

THE CHALCOGRAPHIC SOCIETY.—The fiftieth anniversary of the institution of this Society was celebrated at the house of Mr. Duncan. Half a century ago the society was established for the protection of the interests of engravers, which were considered endangered by circumstances arising out of a trial at law relative to the engraving of Copley's famous picture, "The Death of the Earl of Chatham." A principal object in the formation of this Society was the publication of the works of the members; but we believe but few prints have been published in this way.

THE SOULAGES COLLECTION.—After having been submitted to public criticism at Marlborough House since the 7th of December, the exhibition of this collection was closed on Saturday the 7th of February. During this period it has been visited by upwards of forty-eight thousand and ninety-three persons, which is just double the usual numbers attending at this season. Among these visitors as many as five thousand one hundred and twenty-six persons have paid for admission, being ninefold the average numbers paying. We understand that the offer of sale has been made to the Government for £13,620, with the recommendation that if bought for the nation it may be sent to Manchester. A committee of the Institute of British Architects have prepared a memorial, to be submitted to the Government, relative to the purchase of this collection of works of Renaissance Art. This memorial is a voluminous affair, minute in its details, and both curious and characteristic withal. Our contemporary, the *Times*, has found space for it *in extenso* within its ample columns: we must, however, be content, in noticing its existence, to protest in general terms against its urgent recommendation that the entire collection of M. Soulages should be secured for the national Art-museums. We are equally anxious that these museums should comprehend every possible specimen of real value, and that they should be as free as possible from everything that is valueless. And a most careful examination of the Soulages Collection has convinced us, that its value consists in its choice specimens, and not in its being kept together as a whole. Indeed, it contains much to which we should not be disposed, under any circumstances, to accord a place in the Art-museums of the nation: and, consequently, while we do hope that their true value may be paid for all the worthy specimens by the Government on behalf of the nation, we trust that other purchasers may be found for the remaining portions of the collection. The present patriotic proprietors of the "Soulages Collection" need not anticipate any pecuniary loss from such a breaking up of their purchase: this might be prevented by the Government purchasing the whole for the sum originally proposed, for the purpose of making a selection and afterwards disposing of the rejected specimens. But, whatever the method by which the present proprietors be repaid, let a selection be made, and let only a selection be retained for the nation, as components of the national Art-museums.

THE LATE MR. T. SEDDON.—A meeting was recently held at the residence of Mr. Holman Hunt, to express the sense of the merits of the late Mr. Seddon, whose death we announced in our last number, and to adopt whatever measures might be deemed necessary with reference to his decease. Lord Goderich presided at the meeting, his lordship being supported by Mr. Ruskin, Professor Donaldson, Mr. Tom Taylor, and other gentlemen. The two following resolutions were proposed and carried:—"That an exhibition be held, during the present season of the works left by the late Mr. Seddon, which shall be open to sale." "That out of the public subscription which it is proposed to raise, four hundred guineas be given for the purchase of Mr. Seddon's principal work, the oil-picture of "Jerusalem," from his widow, for presentation to the National Gallery; and that if any surplus remain after the purchase and payment of the necessary expenses of the exhibition, &c., Mrs. Thomas Seddon be requested to accept it." Mr. Ruskin has consented to act as treasurer, and Mr. W. M. Rossetti, of No. 45, Upper Albany Street, as secretary. We sincerely trust that the objects which the friends and admirers of the lamented

artist have in view may be successfully carried out: the National Gallery will be a fitting depository for his fine picture of "Jerusalem."

For many years past the shop windows of Messrs. ACKERMANN and Co. have proved a point of attraction to pedestrians passing through the Strand. During the last few weeks, however, they have exhibited nothing but whitened panes of glass, chequered with the bills of auctioneers, announcing the sale of the vast stock accumulated during a long period of active and extensive business, in consequence of a dissolution of partnership between the two gentlemen who have conducted it since the death of their respected father, by whom it was first established. The house of Ackermann and Co. has too long been connected with the Fine Arts not to be missed, if circumstances had compelled its entire extinction, as at one time was expected. We are glad, however, to find that Mr. George Ackermann has undertaken to continue the business in less costly premises, No. 35, Strand, where we heartily wish him all the success to which his urbanity and industrious habits entitle him: we feel assured his numerous friends will rally round him, and give their support to his new undertaking.

THE ROYAL HIBERNIAN ACADEMY.—There has been in the Irish papers a long and painful correspondence and discussion concerning this academy—the only Art-society of the kingdom which is directly supported by a government grant. We cannot do much service by devoting space to the subject. The history of the society is, we fear, but a lamentable record of mismanagement and consequent failures.

THE WEST OF SCOTLAND ACADEMY appears, at present, to be without a "home" this season. From statements which have been published in some of the Glasgow papers, it seems that the academy had applied for, and obtained from the Town Council, permission to use the McLellan Gallery for the exhibition of their pictures; but at almost the eleventh hour, the managing committee of the Art-gallery informed the artists that they could not have the rooms except on conditions with which the latter did not feel themselves in a position to comply. We have heard this unfortunate affair referred to in terms of strong disapprobation, but as the evidence before us is *ex parte*, though from a disinterested source, we refrain from stating more than the above facts, leaving comment to a future occasion.

THE SHAKSPERE BIRTH-HOUSE.—It will startle many to learn that arrangements are in progress for covering with glass—or rather for putting into a huge glass case—the house in which Shakspeare was born at Stratford-on-Avon. The houses on both sides have been taken down, and the monument now stands alone. The object of this course is to protect the house against the effects of weather and the further influence of time; we question, however, the taste of the arrangement, and fancy it will be the step from the sublime to the ridiculous.

CRIMEAN MONUMENTS.—Mr. Edward Richardson, the sculptor, has been commissioned by the officers of the 7th Royal Fusiliers, and of the 49th (or Hertfordshire) regiment, to execute monumental memorials to those members of these distinguished corps who fell in the Crimea. The same artist is also occupied on monuments to Generals the late Earl of Cork and Sir George Thomas Napier, the latter work being for Geneva. We rejoice to record the fact that these commissions have been entrusted to an English sculptor; and, at the same time, we are well assured that Mr. Richardson will prove himself to be an artist fully competent to produce works worthy of the heroes with whose memories they will be associated. We also observed in the studio of Mr. Richardson a bust, at present unfinished, of Sir Edward Tierney, Bart., which will eventually be the companion to the bust of Sir M. Tierney, Bart., so admirably executed by Chautrey.

MR. W. G. ROGERS has recently executed an elaborately-carved oaken pulpit for the parish-church of St. Anne's, Linnhouse, erected from the designs, and under the direction of, Mr. A. W. Bloufield, architect; as a work of sculptured Art, now but rarely seen in our ecclesiastical edifices, this pulpit deserves especial notice. Its form is that of an irregular octagon, and it rests upon a fluted column with an enriched capital; above the abacus and on the angles are projected eight trusses, the

form of which was suggested by a marble and mosaic pulpit of the fifteenth century at Perugia, of which the architect made a drawing; the three larger panels, that face the body of the church, are filled with sculptures representing respectively the "Birth at Bethlehem," the "Presentation in the Temple," and "Christ disputing with the Doctors;" these all, but especially the last, are fine in composition, and very delicately executed. The capital of the shaft is in very low relief; in it are introduced eight designs, chiefly of natural objects, emblematic of the cycle of religion from the Fall to the Crucifixion—thus, in succession, are the apple and the serpent; the pomegranate and bells; the poppy, typical of death; the trefoil, symbolical of the Trinity; the rose of Sharon: the lily of the valley; the vine and wheat, sacramental; and the passion-flower. There are numerous other enrichments introduced in various parts, which we have not space to enumerate; altogether, Limchouse can boast of a pulpit in its church that outvies any other in the metropolis. Among the wood-carvings on which Mr. Rogers has lately been engaged, we may also mention ten large borders for panels, each upwards of twelve feet high, for the Sultan's new palace on the Bosphorus; they are composed chiefly of fruit and flowers, in the style of Grinling Gibbons. If we are not mistaken, Mr. Rogers executed some large and important carvings, a few years back, for the palace of the late Count Woronzow, at Odessa—so that he appears to be equally appreciated by both Russian and Turk; but we do not think that he ever received from one of his own countrymen so extensive a commission as that with which the Turkish sovereign has intrusted him. This style of decoration will be a novelty in his dominions.

CIROMATIC DECORATIONS OF PETERBOROUGH CATHEDRAL.—In addition to the important works of general restoration which are being carried on in this cathedral under the direction of Mr. G. G. Scott, the vaulted ceiling of the choir has received some decorations in colour of too remarkable a character to be permitted to remain without notice in these pages. We understand that it is in contemplation to extend this species of decoration over the entire surface of the vault of the choir; meanwhile, we would direct attention to the manner in which one principal compartment has been treated by Mr. Clayton, assisted in some minor accessories by Mr. Castell. The idea which the artist has desired to set forth, under visible imagery, is conveyed in the passage—"I am the vine, and ye are the branches." The Saviour, accordingly, appears seated within a vesica, or pointed oval glory, and around him, and as if springing from about his person, is a flowing scroll of vine-work, having within its convolutions busts of the twelve apostles, painted in a manner corresponding with the treatment of the principal and central figure. The ground of the ceiling, beneath the ornamental work, is of an azure blue colour, but within the aureole the groundwork is of gold—gold is also freely used throughout the composition. The figure of the Saviour, if erect, would be about seventeen or eighteen feet in height, and it may, without doubt, be considered the most important work of its kind that has been attempted in our churches in modern times. The vine-scroll, though conventionally (perhaps too conventionally) treated, is in colour nearly true to nature; the heads are all characteristic, expressive, and well executed; that of the Saviour himself is peculiarly effective, and the figure throughout is distinguished by a dignified simplicity almost amounting to grandeur. Without pronouncing upon the propriety, or, at least, upon the desirableness of such decoration in a Protestant cathedral, or church of any degree, we have pleasure in recording our admiration for the manner in which the duty entrusted to him has been discharged by Mr. Clayton. We may add, that a good drawing (though without colour) of the principal figure in this composition may be seen in the Architectural Exhibition.

A PICTURE, entitled "The Reaper's Morning," by Mr. Thomas Faed, the Scotch painter, was lately sold by auction, at Glasgow, for the large sum of £750: it was purchased by a gentleman of Ayrshire.

The deaths of the EARL OF ELLESMERE, and of Mr. E. P. FINDEN, occurred on the eve of our going to press: our notices must be deferred till the following number.

REVIEWS.

HIS MAJESTY'S SHIP THE "VICTORY" (WITH THE BODY OF NELSON ON BOARD), TOWED INTO GIBRALTAR, 28TH OF OCTOBER, 1805, SEVEN DAYS AFTER THE BATTLE OF TRAFALGAR. Engraved by J. COUSEN, from the picture by C. Stanfield, R.A. Published by T. AGNEW & SONS, Manchester.

At length Mr. Cousen has accomplished the arduous task on which he has been engaged for the last three years, and the subject of Stanfield's fine picture is now, by the aid of the engraver, placed within the reach of the hundreds who, we believe, have been on the "look-out" for it for some months past. The work is a noble tribute to the memory of the dead hero, and must ever be regarded as one of deep national interest. "Nelson" is the watchword of our naval hosts; his spirit is the companion of the "youngster" as he paces backward and forward on the deck at night, and it animates the veteran seaman to fresh deeds of daring valour. It may be long—and God grant it may—before the historian of English annals has to record another Trafalgar; but should such a hostile meeting ever again occur, the name and example of Nelson will prove the certain harbinger of victory.

It is unnecessary for us to speak of Mr. Stanfield's picture—the property of Sir S. M. Peto, who gave the artist a commission for it—at any length; this has been already done on three former occasions; first, when it was exhibited at the Royal Academy, in 1853, and twice when Messrs. Agnew had it "on view" in Cockspur Street, in the following year. It is undoubtedly one of the finest examples of the pencil of our great naval artist, whether we look at it as a historical composition, or a piece of truthful and brilliant painting. The subject was well described in the Academy catalogue by an extract from an old song, the spirit of which is more expressive than the wording of the poet:—

"Battle-stained and tempest-tost, a mighty ship comes on;
No shout of triumph welcomes her for the glorious victory won:

For she carries her dead Admiral, killed in Trafalgar's bay,
And Nelson's flag hangs droopingly on that triumphant day.

Sail on, proud ship! thy battered hull proclaims thy place
in war,

A fitting bier for him who fell in the fight at Trafalgar."

The more we contemplate and study this fine work, the deeper is the effect on the mind produced by its admirable treatment; "never, perhaps, was so impressive a subject so touchingly and powerfully painted; the very clouds seem to mourn, the sea has a wail of sadness in its swoop; all things around seem eloquent with sorrow." How heavily and wearily the noble vessel moves through the waters, looking like some huge coffin—so dark and solemn she seems—on its way to the place of sepulture; while the busy crews of the fishing and trading boats in the foreground of the picture have suspended their labours for a few moments, as if to do homage to the glorious dead.

The engraving of Mr. Cousen more than justifies the confidence reposed in him by the publishers when they intrusted him with the task of re-producing the picture. From our own experience of Mr. Cousen's talents we were fully prepared to see a fine plate, and we have one which would do honour to any school of engraving; with the exception of the sky, that rather lacks air and motion in the clouds, there is not a portion of the work that is not fully entitled to the highest praise. The water is eminently successful—full, flowing, transparent, and deep; the ships and boats are solid and rich in colour, and the aerial perspective of the giant Rock of Gibraltar and every distant object, is well preserved; while the whole is "brought together" in perfect harmony; in every sense of the term it is a national work, and must be so esteemed.

FINDEN'S ROYAL GALLERY OF BRITISH ART.
PART I. Published by R. GRIFFIN & Co.,
London and Glasgow.

Messrs. Griffin and Co. having, as we presume, purchased the plates of this work, which was originally published some twelve or thirteen years ago by Mr. Hogarth, are now issuing it at less than half its original price. The three plates in Part I. are Miller's "Battle of Trafalgar," after Stanfield; W. Finden's "Interior of a Highlander's Cottage," after Sir E. Landseer; and J. T. Willmore's "Oberwesel," after Turner. The plates have doubtless been retouched, as the impressions before us are in very fair condition; so that the new issue, from its cheapness, and the beauty of the subjects engraved, ought to find a good sale.

PHOTOGRAPHIC ART-TREASURES. PART II. Engraved by the PHOTOGALVANOGRAPHIC PROCESS, and Published by the COMPANY, Holloway Place, Islington.

This second part is an improvement upon the first, reviewed in the *Art-Journal* in December last. It opens with an admirable picture of "Don Quixote in his Study," composed and photographed from the life by Mr. Lake Price, by which we are to understand that Mr. Price has set all the models, including the living model who represents the hero of La Mancha, and then photographed the scene. The artist has certainly displayed the paraphernalia of knight errantry to the best advantage, while the only fault we have to find with the Don is, that he is too handsome for our preconceived notions of this worthy. The head is a really fine study; and the general effect of the print is most striking, though the right arm, from the elbow downwards, requires detaching from the body; a few touches of the graver would have effected this. Plate 2, "Crimean Braves," photographed from the life by Messrs. Cundall and Howlett, represent three privates of the Coldstreams, "men of the trenches and battle-field." The figures are well grouped, and stand out with truth and delicacy combined. "Lynmouth, Devon," photographed by Mr. L. Colls, is a bright and sunny picture, in which, unfortunately, the harmony is destroyed by the intense black spot on the left; it is, moreover, difficult to understand what this mass is intended to represent. "Hampton Court," as seen from the Thames, is photographed by Mr. Roger Fenton: this is a sweet picture, taken, we presume, on a day of cloudless sky and tranquil atmosphere, so softly and deeply the fine trees in front of the palace are reflected in the water.

There can scarcely be a doubt that this new process of plate engraving and printing is destined to achieve greater things than any it has yet accomplished. Short as the time is since its first introduction, we have already seen how satisfactory are its results in matters purely pictorial from nature, and should now be glad to see it applied to the reproduction of the paintings and engraved works of the great masters of Art, which are at present beyond the reach of all but the affluent. These, at the comparatively low prices at which they could be published, might then find their way into the home of the artisan. And, descending into the region of Art-manufacture, he might also make himself acquainted with the works of Cellini, and with the beautiful chasings of the Spanish School, when the age of chivalry was in its glory; with the carvings in wood and ivory, the encrusted arms and armour of the East, Italy, Flanders, &c. By such means he may be won from ignoble pursuits to his own intellectual fireside, and receive lessons that may enable him to compete successfully with the foreign workman, who now too often occupies in the factory and the workshop the position which our own countrymen ought to fill.

THE LEGEND OF THE WANDERING JEW. Illustrated by GUSTAVE DORÉ. Poem, with Prologue and Epilogue, by PIERRE DUPONT; Biographical Notice by PAUL LACROIX (Bibliophile Jacob); with the Complaint, and Beranger's Ballad set to Music by ERNEST DORÉ. Translated, with Critical Remarks, by G. W. THORNBURY, author of "Art and Nature at Home and Abroad." Published by ADDEY & Co., London.

From the above heading, copied from the title-page of this volume, it will be seen that many heads and hands have been engaged on the publication; it is, however, a large book, with large illustrations, and text in a type that an octogenarian may read without the aid of glasses. Of the names which appear on its title-page, our business now is only with that of M. Gustave Doré, who made his appearance before us some months ago as the illustrator of the story of "Jaufry, the Knight," in a series of designs that showed a fertile but wild imagination. The old legend of the Wandering Jew, as sung by Beranger, has brought out the artist in all the full development of those powers with which nature has gifted him; for we believe it would be impossible to find any tale of fiction, except, perhaps, "Rabelais," which he has also illustrated, but which we have not seen, better suited to his peculiar talents.

We would, however, rather have seen him engaged upon any other subject than this. "Esthetically speaking, the legend is faulty," says Mr. Thornbury, "since it represents our Saviour as vindictive, and uttering a curse at a moment when he was, in his great humility, suffering a shameful death for the sake of mankind. The legend is, in fact, eminently unchristian in its moral." If such be the case, and it does not admit of doubt, it surely was injudicious, to use a mild term, to introduce it among a people like our own, who rightly repel every attempt to

perpetrate the least outrage on their Christian feelings. The "Salathiel" of Dr. Croly is not a character from whom one instinctively shrinks, as from something loathsome and hideous; it is assumedly historic, and he is brought forward so prominently in the actual events that followed, for a century both in Judæa and Rome, the crucifixion of Christ, that we regard him less as one on whom a terrible curse has been pronounced for an awful crime, than as an important, though strange, actor in a momentous period of his country's annals. But the pencil of M. Doré scarcely elicits a thought of pity for so unhallowed a being—who evokes no sympathy, asks no indulgence; his Wandering Jew is a wretched outcast, the sport of the dissolute, a wanderer on the pathless waters, a dweller among the tombs and in the region of the shadow of death—though there is no death to terminate his tortures—a spirit of evil that seems to transform everything around him into shapes as evil and godless as himself,—a mysterious, unshriven spirit in human form.

"Hated alike by angels, saints, and men."

Turning from the character of the individual to the artistic character of the illustrations,—and we can only speak generally of them,—they exhibit, in a remarkable degree, the bold, versatile, and wild imagination of the artist; anything more daring in conception, more vigorous in execution, and, we may add, more unnatural, we do not remember ever to have seen. Repudiating, almost entirely, every recognised principle in the laws of composition, he has given the rein to his fervid and impetuous fancy, and allowed it to rush onward at will; the effects he produces are startling in their intensity of light and shade, and in the horrors of the scenes depicted; his pencil is as bold as his imagination. There is one picture particularly fine, and free from all the hideous features that distinguish the others—that where the Jew is passing a crucifix by the roadside in the midst of a storm at night: it is a grand example of composition and execution.

But, let us ask, what good purpose can such a book as this subserv? We may admire the artist's genius, and that is all. These pictures afford no pleasure, they offer no instruction; they only produce a feeling of pain, allied, however, with regret that so much real talent should lead to so unsatisfactory a result. A friend of ours says he shall not despair of "Young England" becoming as wise and as brave as their fathers so long as Punch gathers crowds in our streets; but we should certainly despair of good and true Art being appreciated in our country if M. Doré's "Wandering Jew" finds a hearty welcome among us.

SIR JOSHUA REYNOLDS AND HIS WORKS. Gleanings from his Diary, unpublished Manuscripts, and other Sources. By WILLIAM COTTON, M.A. Edited by JOHN BURNET, F.R.S. Published by LONGMAN & Co., P. & D. COLNAGHI & Co., London; R. LIDSTONE, Plymouth.

In the year 1854 we published in the *Art-Journal*, as most of our readers will doubtless remember, two papers, with illustrations, on Sir Joshua Reynolds, the materials for which were placed at our disposal by Mr. Cotton, a gentleman residing in the vicinity of the painter's birthplace, and who had employed his means and his leisure in collecting together the documents and the information he kindly put into our hands. We stated at the time that we believed it to be the intention of Mr. Cotton to publish his manuscripts and papers at some future opportunity, and, consequently, we were quite prepared for the appearance of a volume respecting Sir Joshua, yet scarcely for such a book as that before us. The author had in his possession ample materials for writing a valuable biography, had he used them judiciously, and been disposed to enter upon a critical examination of the merits of the painter; he would then have separated the valueless from that which is worthy of preservation, and with the latter might have reared a literary monument to his Art-idol that would do honour to his memory. But the wheat and the tares have been sowed together indiscriminately, and have grown up together; as a consequence, the harvest is unsatisfactory to those who desire to reap profit from it, though by no means uninteresting to such as seek only amusement in gossip and anecdote. Of such matter there is abundance scattered almost broadcast, and this may render the volume acceptable—perhaps more acceptable than a learned dissertation on the style and works of Reynolds—to the general reader. As a justification or palliation of Mr. Cotton's shortcomings, he says, "I have abstained altogether from introducing my own opinions and remarks on Sir Joshua Reynolds' method of painting, and on his merit as an artist, preferring to avail myself of the more valuable and important observations of Wilkie, Haydon, and Burnet." The remark, and the entire absence of anything like criticism, induce the opi-

nion that though Mr. Burnet's name appears on the title-page as editor of the volume, his labours must have been restricted to seeing the sheets through the press; there are no editorial notes that can lead to the supposition that so practised a writer on Art as Mr. Burnet had any hand in them.

Speaking of the press, what can be said about the "getting up" of this volume? It is printed in a provincial town—not a small one, however—and in many places the provincial press has shown itself little inferior to the metropolitan. But this book is as miserable a specimen of printing as we ever saw: the woodcuts—which are *replicas* of those introduced in our articles, and we know, therefore, what they ought to have been—are abominable—absolute blots on the volume: far better they had never been inserted than to be thus printed. In the time of Reynolds, such illustrations would scarcely have passed muster, even in a child's book; in our age of advanced typographical work of every kind, they are unpardonable. We recommend Mr. Cotton to look to this matter, if a second edition of his work is called for.

THE LOVER'S LETTER BOX. THE GARDENER'S SHED. Printed and published by G. BAXTER, London.

It is so long since we have seen any new examples of Mr. Baxter's pretty "oil-prints," that we thought he was contenting himself with the laurels already acquired in his peculiar branch of productive Art. The appearance of these two subjects, both of considerable size, proves, however, that he has not been resting on his oars, and that he has progressed in more ways than one; for the "Lover's Letter Box"—a young lady stealthily and wickedly dropping a letter into the hollow of an old tree, from a picture by Mrs. McLeod—is, in purity of colour and in delicacy, a vast improvement upon a somewhat similar print published a year or two since; while "The Gardener's Shed," from a drawing by Bartholomew, is as brilliant and as gay as any artist's colour-box could impart to a drawing of rich flowers and ripe fruit. These prints are really worth framing and hanging up in any lady's boudoir.

THE LIFE OF MICHAEL ANGELO BUONAROTTI; with Translations of many of his Poems and Letters. Also MEMOIRS OF SAVONAROLA, RAPHAEL, AND VITTORIA COLONNA. By JOHN S. HARFORD, ESQ., D.C.L., F.R.S. 2 Vols. Published by LONGMAN & Co., London.

ILLUSTRATIONS, ARCHITECTURAL AND PICTORIAL, OF THE GENIUS OF MICHAEL ANGELO BUONAROTTI. With Descriptions of the Plates by the COMMENDATORE CANINA, C. R. COCKERELL, ESQ., R.A., and J. S. HARFORD, ESQ., D.C.L., F.R.S., Members of the Roman Academy of Painting of St. Luke. Published by COLNAGHI & Co., LONGMAN & Co., London.

Michael Angelo Buonarroti,—Architect, Sculptor, Painter, Poet,—where else, under one name—except that of Leonardo da Vinci, who, unlike Buonarroti, did not show equal power in all—would biographer find such a combination of subject-matter for his pen? And among them there is not one that can be omitted, or even lightly passed over, without great injustice to his memory. Though Reynolds, Flaxman, Fuseli, &c., have left us their respective opinions upon particular characteristics of one or other of the arts practised by Michael Angelo, and the history of his life has been written by Duppa,* much, very much, yet remained to be said of one who stands upon so lofty a pedestal in the temple dedicated to Art. Mr. Harford's two volumes will go far to supply deficiencies previously existing, but the theme is still far from exhausted.

On reading the lives of many of the old masters of Art, one cannot but be struck with the fact that these men occupied no unimportant place in the political histories of the times in which they lived. The Arts seem almost to have engaged as much of the attention of popes and princes as any matters connected with the rule and government of their states; and thus artists were not only the friends and guests of their sovereigns, but were active participators in events that stand forth as remarkable in the annals of their country. Mr. Harford, therefore, very judiciously, as it appears to us, takes up that part of the life of Michael Angelo which other writers have omitted to tell us, especially as regards his intimacy with Savonarola, who attempted to regenerate the church and the age, and with Vittoria Colonna, the noble-minded Marchioness of Pescara. His aim has been, as he says, to develop Michael Angelo's character, artistic and social, political and religious, and to prove him to have been in each of these particulars equally worthy of esteem and admiration.

* Bogue's "European Library." London, 1846.

The Platonic philosophy pervading the Florentine School at that period held firm possession of the mind of the "triple-crowned" artist, and powerfully influenced the character of his art and his poetry: this subject Mr. Harford discusses at considerable length, and affords the reader a tolerably clear insight into the speculative theories of its doctrines. The volumes also include many of Buonarroti's poems, which reflect back so large a portion of the lofty thoughts and pure sentiments that shone in the mind of their author; "showing," as Wordsworth says, "how conversant his soul was with great things." This subject was admirably treated by Mr. J. E. Taylor, in a little work that came under our notice five or six years ago,* but which Mr. Harford does not appear to have met with; or, if he has, he makes no reference to it.

The limits of our "review" columns forbid extracts, else there are several passages in this work we would gladly have transferred to our pages. It is one without which no Art-library will be considered complete.

The book of illustrations, the title of which is given alone, is almost a necessary adjunct to the "Life." It contains several well-engraved examples of Buonarroti's finest works in architecture, sculpture, and painting. The scale on which these are drawn is large, consequently they could not be conveniently included in Mr. Harford's volumes.

PENCILINGS IN POETRY: A SERIES OF POEMS. By the Rev. M. VICARY, author of "Notes of a Residence at Rome." Published by A. HALL, VIRTUE, & Co., London.

Mr. Vicary speaks truly when he says, "the pillars of the press, those arbiters of reputation, seek patiently for any traces of gold they can find"—in modern poetry—"and whisper hope and help, as confidently as kindly, to the intellectual investigator;" but we are not quite sure that the exercise of such amiability of spirit is always judicious, or even kind; it may seduce a young traveller in the realms of imagination into a path the difficulties of which he has not strength to contend against, and the end of which is to him literary extinction, so that it would have been better for him never to have tried it. We are far, however, from thinking that Mr. Vicary is to be classed among the number of those who are in danger of being beguiled by the voice of that siren, the friendly critic, for he is worthy of encouragement. His volume of poetry—the subjects chiefly sacred or sentimental—is written with taste and feeling, though the thoughts, good in themselves, are sometimes expressed in poverty of language, and there is an occasional halt, or irregularity in the measure. The sonnets are the most finished productions, but the longest poem in the volume, "Eva," a tale of the Irish conquest, is written with spirit and descriptive power.

THE LITTLE WORLD OF LONDON; OR, PICTURES IN LITTLE OF LONDON LIFE. By CHARLES MANBY SMITH. Published by A. HALL, VIRTUE, & Co., London.

A series of most amusing papers, which, though they have made their appearance in various periodicals, are of sufficient interest to be collected and published in a separate form. Mr. Smith has dived into many of the mysteries of London life, not in its lowest phases, but into those which lie open to the observation of most men who frequent the highways and by-ways of our vast metropolis. In the course of his wanderings and his experience he has fallen in with some strange acquaintances and stranger localities, and possessing the happy talent of imparting a vivid, yet not unnatural, colouring to his canvases, he has produced a little collection of life-like pictures. Speaking of pictures draws our attention to one of these sketches in particular; it is called, "Confessions of a Picture-Dealer's Hack," we think we know two or three "Mr. Sappers" who might have sat to Mr. Smith for his model; the race of picture-forgers is not yet exterminated.

THE NATIONAL DRAWING MASTER. By W. A. NICHOLLS, Part I. Published by REEVES & SONS, London.

The demand for a re-issue of this work, noticed in the *Art-Journal* on its first appearance, about a year ago, has afforded the author the opportunity of adding to his previous remarks an "Appendix on Sketching from Nature," which will be of service to those who are endeavouring to accomplish a difficult, but not always an impracticable, task—that of teaching themselves to draw. There are many useful suggestions thrown out in this Appendix.

* "Michael Angelo, considered as a Philosophic Poet: with Translations." By J. E. Taylor. Published by J. Murray, London.

THE ART-JOURNAL.

LONDON, APRIL 1, 1857.

THE NATIONAL INSTITUTION.

THE number of works that have been offered here for exhibition has been greater, we believe, this season than on any previous occasion. By accepting pictures that have been declined, many hundreds of square feet of the walls which are now unoccupied might have been covered. And in this Institution the rejection of works sent for exhibition is not without its sacrifice, as according to the number of pictures hung, so are the receipts augmented or diminished. It has often been observed of this exhibition that it is distinguished rather by its strength in landscape productions than its essays in figure composition. This is perhaps more remarkably the case this season than heretofore. There are, it is true, landscapes which compensate for the absence of personal narrative; but, again, there are others which render some relief very desirable. But it is not only here that the prevalence of landscape art is found; with the exception of that of the Royal Academy, there is a preponderance of landscape in every other exhibition. An artist who paints for competitions must, in spite of himself, be a voluptuary in colour; and so generally is the dissipation yielded to, that a sober picture seems now not so much an exception as an impertinence. We have not latitude enough to say—

"Hæc amat obscuro, volat hæc sub luce videtur
Judicis argutum quæ non formidat acumen,"

for there is no middle path—all affect the light: we come to a grey picture as the wayfarer under a burning sky arrives at the refreshing fountain. In respect of the prospects of the Society, this is the tenth year of its existence, and we learn with satisfaction that it has reached a condition of prosperity which confirms its establishment as one of the popular metropolitan Art-institutions.

No. 1. 'An East Indian Officer's Servant,' A. WIVELL. The head and bust are of the size of life; he is carrying a tray with wine and fruits. The features, which are presented in the full face, are well painted and characteristic.

No. 14. 'A Trespasser,' B. LEADER. The subject is not so much "the Trespasser," as a strip of copse which has been assiduously worked out on the spot; but far beyond this in merit, is the foreground, of which no blade of grass has been forgotten. The trespasser is a boy who seems to be a successful bird-nester; his rustic frock is too clean, he wants toning down. The work is altogether one of the best promise: we may safely expect the painter to take his place ere long among the magnates in Art.

No. 15. 'Evening: a scene near Richmond, Yorkshire,' W. CARTER. This is a large composition, of which the principal feature is a mere pool of water, at which cattle are drinking. The site is immediately closed by the dense foliage of hanging trees which shade the foreground. It is a spirited production.

No. 16. 'Biddy,' DAVIS COOPER. This is a small half-length figure of a girl with a basket on her head. The head, arms, and hands are extremely well drawn and painted, and the colour is equally commendable.

No. 17. 'Fishing-boats,' A. MONTAGUE. We may suppose them to have come in at high-tide. They are ranged in a perspective line going into the composition. The picture is light and effective.

No. 18. 'Rustic Landscape,' J. E. MEADOWS. The subject is a roadside farm-house with the usual inclosures. The greater space on the left of the canvas is occupied by an open road, broken and treated with appropriate circumstance. There is much minute work in the picture.

No. 21. 'In the Highlands,' C. LESLIE. The subject is a lake and mountain solitude, described in few quantities and few gradations. The quiescent lake, which bears the dark reflection of the mountain, lies on the right; and on the shore, as if about to drink, is seen a single stag. The materials are dealt with in a spirit of breadth and simplicity.

No. 24. 'La Fille mal Gardée,' J. H. HIXON. This is really a production of much merit, but it would have been better introduced by any other than a hacknied French title. The point of the story is the antique incident of the conveyance of a note into the hand of a young lady while walking with her father, whose arm she holds, but he is so absorbed in his newspaper that he does not see what is going on at his side. The daughter is a charming study, and the old gentleman is sufficiently matter-of-fact and querulous. As a group of spring-tide and winter, they had constituted, alone, a better picture without the unseen lover.

No. 25. 'The Scarecrow,' P. R. MORRIS. A study of a little peasant-boy seated on a stile, holding a bird-clapper; apparently painted with firmness.

No. 29. 'The Cottage-door,' C. W. BRAGG. The shadows in this little picture are deep and powerful, but scarcely true in daylight effect. There are three figures of cottage children.

No. 30. 'Pony and Companions,' T. BARRETT. This little society is introduced in a stable, the "companions" spoken of in the title being a bloodhound and a cat. The pony is well drawn and carefully painted, but the composition wants force.

No. 31. 'Bolingbroke's Entry into London,' F. COWIE. The subject is from the second scene of the fifth act of "Richard the Second."

"The duke, great Bolingbroke,
Mounted upon a hot and fiery steed,
With slow but stately pace kept on his course,
While all tongues cried—"God save thee, Bolingbroke!"
You would have thought ———
—— that all the walls,
With painted imagery, had said at once—
'Jesu preserve thee!'"

All subjects which necessitate many figures and groupments are most difficult to deal with, because their very spirit is antagonistic to simplicity. Any rendering of this subject must involve crowds of figures, and here, indeed, they are in embarrassing variety. Bolingbroke is, of course, the principal figure—a gallant cavalier and well mounted; himself and those who welcome him, the one by his condescension, and the others by their enthusiastic welcome, realising the point of the description.

No. 33. 'The Secret,' G. WELLS. The subject is very pointedly set forth by two girls, one of whom, jealous of an eavesdropper, whispers "the secret" to the other. The figures are well grouped and highly satisfactory

in drawing and expression, but they are less carefully painted than others we have seen exhibited under this name.

No. 34. 'Dutch Tankard and Fruit,' W. DUFFIELD. The tankard may be one of those holding half a gallon, which it might have been the boast of the ancestors of Rip Van Winkle that they exhausted at a single draught. It is associated with an assortment of grapes, plums, a cut melon, and a sliced pine—all represented with the nicest veracity.

No. 35. 'Returning from Labour,' A. J. STARK. We see here a team about to be led into their stable, an outbuilding of some farmhouse. All the objects seem to have been solicitously studied.

No. 37. 'The Stepping-stone,' J. DEARLE. This appears to be a passage of Welsh scenery, consisting principally of a shallow stream, the bed of which is thickly studded with rocks and stones. It is seldom we complain of a superabundance of grey in a picture, but here it is a monopoly to the exclusion of all force.

No. 39. 'Fishing-boats returning to the Harbour of Flushing—Rain clearing off,' S. ROBINS. We had thought that the opposite shore of the estuary of the Scheldt was visible from this point, but it does not appear in this picture. The proposition of the departing rain-cloud is well supported—it is very often a question whether the rain-cloud is advancing or receding, from the absence of all indication as to the quarter of the wind, but here we feel which way the wind blows.

No. 43. 'Evalston, Derbyshire,' J. D. WINGFIELD. The subject is a country mansion seen from its gardens, in which are distributed figures wearing the costume of the last century. It is a class of subject in which this artist excels.

No. 44. 'On the Welsh Hills,' A. W. WILLIAMS. This large picture consists of but very few parts, and as those parts are in themselves breadths in opposition, it will at once be understood that such a principle is likely to be productive of good results;—and so it is. The nearer quantity is a passage of grassy foreground lighted up by a watery gleam of sunshine, and throwing off a background of grand and romantic hills. In the right section of the sky a rain-cloud is passing off, succeeded by sunshine on the left. There are on the grass immediately before us some cows and figures which play a most important part in the composition. In short, it is a landscape of extraordinary power—and success, in no small measure due to the simplicity of its treatment.

No. 45. 'Judith escaping from the Tent of Holofernes,' J. G. NAISH. This is kit-kat, of the size of life; successful as to character, but the subject would have been better supported by a direct allusion to the circumstances of Judith's departure from the tent.

No. 47. 'Old Houses and Church of St. Croix, York,' J. HENSHALL. A well-chosen subject: we see but little now of our own domestic architecture—improvement has left us nothing comparable to those dear, dirty old houses that we see at Rouen, Dijon, Beauvais, Biberich, Nuremberg, and a hundred other places we could mention on the Continent.

No. 48. 'Puritan Barracks,' H. STACY MARKS. This barrack is a church bearing evident marks of the iconoclastic fury of the Praise-God-Barebone class of reformers. A figure, presumed to be one of Cromwell's men, is sitting smoking his pipe; the composition is forcibly descriptive.

No. 50. 'Rochester from Strood,' E. C. WILLIAMS. This is really an admirable picture. The point of view is a few hundred yards below the old bridge now no more; and looking up the Medway, we have, of course, the principal feature of the town—the castle—on the left. The whole of the distance is

powerfully thrown off by the substantive treatment of the immediate right—a composition of boats and other incident, which excludes the less interesting matter on the right bank of the river, carrying the eye at once to the masterly distance. This picture far outdoes everything that has been hitherto exhibited under this name.

No. 51. 'A By-way among the Hills,' F. W. HULME. This is a small, upright picture, showing a narrow, stony, and uneven path, shaded by trees which have not yet become timber; and the shade is spotted here and there with a sprinkling of subbeams. The reality of form discernible in the trees suggests that the work has been executed on the locality itself, and with a crisp and forward, but infallible, touch. The easy, sunny indifference of the thing is most agreeable—nay, more, it is a delectable scrap of wayside poetry.

No. 55. 'At Hampton Court,' G. B. MOORE. The point of the subject is one of the gates by which we enter the grounds. It is well drawn, and judiciously contrasted by the luxuriant foliage of the trees. No. 61, also entitled 'Hampton Court,' and painted by the same artist, shows a small section of the palace, and is a more practicable subject than the other.

No. 56. 'Fishermen's Children on the Seashore,' BELL SMITH. The picture contains nothing beyond the promise of the title, though perhaps the happy agroupment, like a certain personage in a certain famous "walk," are

"Dressed in their Sunday best,"

and look well pleased with all around them. The figures and the coast composition are brought forward under a broad and bright daylight effect.

No. 59. 'Portrait de la Calende, with the Tour de Beurre, at Rouen,' W. HENSHALL. The subject has very frequently been treated—it contains an immensity of material, and in the way of elaboration, ample justice is here done to the famous *tour*.

No. 66. 'Haymaking in Switzerland—Lau-sanne—painted on the spot,' H. MOORE. Some distance to travel to assist at these rural sports; but really the artist justifies his progress to the land of the Schreckhorn—dread king of the snows. This is quite a novelty; who ever went to Switzerland without painting glaciers and strawberry ice? We have to do principally with a pair of bullocks, honest and patient animals, in excellent working condition; and really the drawing and the painting of these worthy bees are beyond all praise. A blood-thirsty gaddy has settled on the leg of one of them, and we expect every instant to see the foot hastily lifted. The waving and flowery grass, yet uncut, is almost pretty, but yet we have seen the sort of thing sparkling with a thousand summer hues. The oxen make the figures look spectral: it were to be wished that the principal haymaker had put on a dark waistcoat. The background, with all its beautiful detail, is scarcely of a piece with the foreground—it wants warmth.

No. 67. 'The Ford, Winter Evening,' G. A. WILLIAMS. This is very successful as an expression of intense cold; look where we will, everything is in keeping with the title.

No. 69. 'Returning from the Conventicle,' H. STACY MARKS. A figure in the costume of the time of Cromwell, in his best sad-coloured raiment, coming from divine service. An eccentric subject, but well painted.

No. 70. 'A Mountain Mirror,' G. PETTIT. The title is accompanied by lines from Scott—

"But here above, around, below,
On mountain or in glen,
Nor tree, nor plant, nor shrub, nor flower,
Nor aught of vegetative power,
The wearied eye may ken."

'The Mountain Mirror' is a tarn lying at the base of a stupendous mountain cliff, which rises on the right of the composition, the chain

being continued far into distance. The subject has been most industriously studied on the spot, therefore every available stone and inequality have been pressed into service; nothing can be more successful as an abstract representation of given locality than the foreground passages of this work. And the little lake, with its multitudinous reflections, is a study so entirely successful as to set at nought any attempt to carry beyond this the painting of still-water surface. But there is no repose for the sense—the human eye cannot compass at once more than a minute portion of what is here set forth. The retiring mountains are too uniformly cold, and present somewhat the semblance of having been brought into the picture from another region; but these appearances do not detract from the really sound merits of the work.

No. 75. 'A Pastoral,' H. B. WILLIS. This artist breaks a lance with Berghem—the materials are three cows standing in a river, the relieving landscape being carried off with considerable depth of tone. The animals are extremely well drawn.

No. 76. 'An autumn Afternoon near Calercoats,' HENRY WILLIAMS. This place is on the Northumberland coast, and the view affords simply a near section of the shore looking northwards. The subject is broken into available forms; the artist has made the most of it.

No. 79. 'A Rugged Path,' C. DUKES. This is a group of peasants, principally father, mother, and child—the last borne upon the shoulders of the first, whence he has been able to remove his mother's bonnet from her head, at which both are much gratified. The figures are well drawn and substantial, and the whole constitutes an effective performance.

No. 81. 'The Startled Sheep,' J. C. MORRIS. A single sheep on a mountain side, looking fixedly at something that has arrested its attention. A spot of black would have done everything for the picture; why not have made the animal of the black-faced race?

No. 82. 'The Vale of Ffestiniog,' SIDNEY R. PERCY. This is a large picture, with much of the character of the mountain scenery which this artist usually paints. The near field of the composition is occupied on the right by an expanse of water lying in shade and without a ripple. The mountains rise abruptly from the shores of the lake, and are diversified in tone by light and shade. The sun on the left, just out of the picture, lights up the sky in that part; and opposed to this is the left foreground, which is painted with great force of colour, and with beautiful instances of detail.

No. 85. 'A Lane at Watford, Herts,' T. J. SOPER. A small picture, in which a mill, worked by an undershot wheel, is the principal object; it is shaded by trees, and, although commonplace, is an advantageous study.

No. 87. 'The Mountain Stream,' W. UNDERHILL. This is an upright picture of rather large dimensions, containing figures of rustic children, one of whom draws water from a passing streamlet, while others stand looking down from a kind of wooden bridge. The circumstances present a veritable description of rustic life as far as the subject goes; the children are well drawn, firmly painted, and with a higher degree of finish than antecedent works.

No. 91. 'A Shallow Part of the Thames,' G. A. WILLIAMS. The current occupies the principal part of the canvas, swaying the rushes, and lively with its expressive ripple; this, by the way, is an eloquent feature of the view.

No. 94. 'Interior of St. John's Hall, Norwich,' S. D. SWARBRECK. A very quaint subject, with its gallery, steps, and balustrades; it has nevertheless received ample justice, being represented here with the most conscientiously laborative drawing.

No. 95. 'The Fair Precisian,' C. ROSSITER.

The assumed plainness of the character scarcely sorts with the luxurious appointments of the apartment she occupies. "The Fair Precisian" is represented by a small figure reading the Scriptures—a tolerable impersonation of Major Bridgenorth's daughter.

No. 99. 'The River Llugwy, North Wales,' F. W. HULME. The character of this stream cannot for a moment be mistaken; we are here looking up a portion of the watercourse within which the river has shrunk to its summer dimensions, and so left dry a long array of blocks and boulders, of which the best use has been made. On both sides of the river rises a dense grove of forest trees, the foliage of which is painted with the usual elegance of form that distinguishes the tree-painting of this artist. The picture appears to have been painted almost entirely on the spot; hence its firmness and reality.

No. 102. 'Chepstow Castle,' W. LUKEING. Treated according to the simple rule of opposition—the castle in deep shade being relieved by a light sky; this is always productive of striking effect.

No. 103. 'Gorleston, near Yarmouth,' W. E. BATES. This is a view up the river Yare below the ferry-house, on the right shore, looking up towards Yarmouth. It is very successfully painted, under an aspect of broad daylight, and is altogether a charming work in composition and execution.

No. 104. 'Festival of the Vintage Valley, and Summit of the Stubay sonree of the Rutz-bäch, and Convent of St. Valentine,' JOHN BELL. This is a large upright picture, showing in the nearest site a company of peasants dancing, and in the distance a succession of landscape passages of the most romantic kind. The picture evidences much labour.

No. 106. 'The Watering Place,' J. F. HERRING and ROLFE. The point of the picture is a herd of horses that have come to drink at a pond. The water is overhung by trees, and on the right the view opens, showing a grassy upland. The horses are the work of Mr. Herring, junior.

No. 107. 'Hush!' D. COOPER. The exclamation is presumed to be uttered by a young mother whose infant sleeps in her lap. The figure is accurately drawn and agreeably coloured; the work is altogether a highly creditable production.

No. 109. 'Westminster Abbey,' HARRY WILLIAMS. The subject is a portion of the interior, the entrance to the chapels after passing through the iron gate. We look towards the nave, and see the perspective of the vaulting drawn with much success, as affording a description of space. It is a large picture, and is very like the place.

No. 118. 'A Calm,' E. C. WILLIAMS. The principal objects here are boats—a group of sailing-boats and barges on a river very like the Medway. There is but little colour in the picture, but it is made out with a charmingly harmonious system of warm and cold greys. There is also by the same artist a sea view, No. 123, 'A Fresh Breeze,' in which appear only one or two boats. The title is, however, well supported, because the expression of wind on the sea is perfectly intelligible.

No. 125. 'Maternal Love,' D. PASMORE. This affection is shown by the mother holding her child to a rose, which grows upon a high bush. The scene of the demonstration seems to be the court-yard of some old ruined mansion, and it is made out with little departure from a grey monotone. The mother and child constitute an interesting group.

No. 128. 'Coast Scene, Isle of Arran,' J. PEEL. We were about to observe that to Arran it was far to go for mere coast scenery, but certainly there is a dash of the picturesque here that we do not meet with on the coast of

England. The sea lies on the left, and from the shore rises a rough and straggling piece of the "sea brae," covered with stunted trees and all kinds of rank herbage, save one patch of cultivated ground, which now yields its crop of oats. The crisp and significant manipulation with which the whole is worked out is effective in realising minute and probable incident. The sea is equally well painted, with its sunny lights and breezy ripple.

No. 129. 'A Cottage Interior,' C. J. LEWIS. A very careful study, with instances of dazzling sunlight. But is not the young lady nursing the infant something superior to cottage life?

No. 132. 'Meg Merrilies and the Dying Smuggler,' R. S. LAUDER, R.S.A. This scene must be fresh in the remembrance of every one who has read "Guy Rammring." Here is Meg chanting over the dying man—

"Wasted weary—wherefore stay
Wrestling thus with earth and clay?
From the body pass away—
Hark the mass is singing," &c.

The smuggler is extended apparently on the floor of a hovel, the upper part of the body being nude. The attire of Meg Merrilies is wildly dramatic, perhaps more so in feeling than Scott himself would have made it, could he have painted the subject; but it is upon the features that the eye rests—the face constitutes the point of the picture, being remarkable, not only as to its cast, but also because it is very skilfully lighted for impressive effect. It is a picture of eminent quality, every passage in it evidences learned acquisition and skilful execution.

No. 133. 'A Salmon Fishery,' R. S. BOND. A large composition, showing in the nearest parts a torrent rushing over a bed of loose rocks, beyond which the eye is carried to distant and lofty mountain forms draped in clouds. The near rocks and water are effectively defined.

No. 134. 'On the Sands of Yarmouth,' W. E. BATES. This view is taken from a point somewhere near the "look outs." We see therefore the jetties at the mouth of the Yare, Nelson's column, the high land of Suffolk, and all the prominent points towards the harbour. The picture is carefully painted, and is a very faithful transcript of the locality.

No. 139. 'A Water-carrier,' J. H. S. MANN. A study of a life-sized female figure, bearing on her right shoulder a brown water-jar. The features are finished into roundness with the utmost care in the gradations and softness of the lines; and in colour the face is brilliant, with the richest hues of an Italian autumn. It is a graceful and unaffected performance.

No. 141. 'In the Inn Valley at Kufsteine, in the Tyrol,' F. L. BRIDELL. Some passages of this picture are worked out with so much felicity that we lose sight of the paint. The distances are felt with intense reality, and much of the immediate site is of the utmost value; but the formal sweep taken by the line of the nearest masses is objectionable.

No. 156. 'View of Windsor Castle from Romney Island, below the Lock,' A. F. ROLFE. It is seldom that this well-known view of the castle is brought into such judicious composition as we see it here. The massive and well-broken quantities of the lock, together with the trees, are very prominent portions of the picture; but yet they leave interest enough for the castle, which is thus seen only partially, but more agreeably than from any point lower down the river, where the entire line of the building is uninterruptedly discernible.

THE SECOND ROOM.

No. 246. 'The Merry, Merry Month of May,' J. S. RAVEN. The subject is a broad common-like pasture, on which is distributed a herd of sheep. The place is broken up by paths and inequalities into a tolerably paint-

able superficies, to which a generous manipulation has communicated valuable texture. The picture would have been better if of half the size. The title is certainly a misnomer, as the work is characterised rather by earnestness and solemnity than by mirth.

No. 248. 'Game, Fruit, &c.,' W. DUFFIELD. The game is limited to a hen-pheasant, the other bird being a wood-pigeon. Both birds have been accurately studied, and the fruit has received equal justice.

No. 249. 'Mill at Yeo, North Wales,' J. F. HARDY. A small upright picture, representing a bridge, a stream, the mill, and some trees; it is a very agreeable composition.

No. 252. 'Early Morning on the Llugwy, North Wales,' H. B. WILLIS. The scenery of this stream is always beautiful—it may be to a certain degree monotonous, but this derogation is entirely outweighed by its better qualities. We find here a small society of cows in the stream, on each side of which are the accustomed masses of foliage, with a back of high land closing the view, all presented under the aspect of the sober grey of the morning;—a most successful essay.

No. 254. 'The Stepping-stones,' F. UNDERHILL. This title survives all the good and evil of the craft of Art. It is here given to a picture in which we see a peasant family crossing a brook. The mother availing herself of the stones, grasps one side of a basket containing her child, while the father, wading in the stream, supports the other side. Besides, there are other impersonations, and all are drawn and painted with firmness and substance; but the trees on the left, and one or two other little incidents interfere with the agroupments.

No. 262. 'A Salmon-trap, Evening,' J. W. OAKES. This is a large composition; dark, deep, and powerful—a work, in which colour seems to have been set aside for the sake of force. This trap is constructed at a weir, which traverses the nearest part of the view; and on the right, where the water flows over, the stream passes through an undershot grating, and so flows on fretting in its stony bed past the spectator. The variety of lines and accidents obtained from the broken and patched woodwork, constitutes no small part of the pictorial quality; objects really unimportant, being made of importance by their insignificance being masked. Above the weir we have a glimpse of the river, and beyond that an amphitheatre of hills, lying in lines almost parallel with the base of the picture. The sun has set, and the evening mists are rising on the mountain-side, nevertheless it is difficult to determine whether it is an evening or a morning effect. If the scene be a reality, the artist leaves too much untold; if it be a composition, certain definitions have been overlooked. We see nothing of the breadth or the course of the river, and the relation between the river and the mountains is, perhaps, open to question. But we admit that these considerations are entirely superseded by a treatment truly masterly in its purpose and the power with which it is realised.

No. 264. 'Lucy Ashton,' C. J. LEWIS. A lady of the size of life introduced at half length. She is fresh, nay brilliant; but it cannot be denied, matronly withal. If this be the Lucy of whom we have dramt for the better part of a lifetime, then we say with Caliban—that

—"In thus waking,
We cry to dream again."

No. 265. 'Unloading a Collier—a Night Scene,' E. G. WILLIAMS. A large picture, in which are set forth the circumstances of the incident that gives the title to the picture. But the interest of the scene is in the description of the rising of the moon, the palpitating light of which is caught by a wide array of clouds, with surprising reality of effect.

No. 267. 'Moel Siabod, North Wales,' WALTER WILLIAMS. This is a picture of great purity, breadth, and repose; the description of deepening twilight is rendered in terms very impressive.

No. 270. 'The Old Church of St. Jean, Dijon,' L. J. WOOD. This part of Dijon is not the most picturesque in that old city, though the church tower rises imposingly over the mean buildings by which it is surrounded. 'Notre Dame, Dijon,' No. 272, is of incomparably better quality, being richer in colour, and assisted by variety of form; then, again, by the same painter, we have No. 271, 'Rue St. Etienne, Sens,' showing the tower of the Cathedral, as well known as that of Dijon to all who have travelled south from Paris. These three pictures are accurately drawn, conscientiously worked out in all their details.

No. 273. 'First at the Rendezvous,' L. M. HAY. This face is too well painted to be accompanied with such a display of millinery. It is a study of the size of life, representing a young lady waiting for—whom?—and hence a perilous example to young ladies.

No. 274. 'Highlanders Secreting Arms—Scene on the Span Brace, Lochaber,' the late R. R. McIAN, R.S.A. This was the resource of those of the Highlanders who possessed weapons, in response to the stringent order that all arms should be delivered up, with a view to the disarmament of the clans. We see here, accordingly, a number of clansmen burying their claymores, muskets, and other weapons, in a secluded nook, entirely encompassed by high rocks. In the spirited and characteristic representation of Highland customs and historical incident, no artist has ever approached the late R. R. McIan, whose departure from among us leaves a blank which perhaps in our day we shall not see filled up.

No. 279. 'May,' D. PASMORE. A small picture representing a girl plucking from a hawthorn branches of "May." It is an elegant and sparkling production.

No. 281. * * * * G. A. WILLIAMS.

"Now from the world—sacred to sweet retirement
Slow let us trace the matchless vale of Thames,
Far winding up to where the muses haunt."

Such are the lines standing in the place of a title to this picture, which is large, and describes a summer evening on the Thames. The sun is low in the sky, and to it is opposed the dominant quantity in the composition—a deep and powerful mass of trees, which, in their breadth of tone are worked out to an infinitude of form and desultory detail.

No. 285. 'Gilbert à Beckett, Esq,' C. COUZENS. A head and bust of the late Mr. A'Beckett, presenting all the features as a front face. The resemblance is unmistakable.

No. 286. 'The Death of Arthur Duke of Bretagne,' R. S. LAUDER, R.S.A. This picture was exhibited in the Edinburgh Exhibition of last season, on which occasion we had an opportunity of noticing it.

No. 290. 'A Woodland Dell, Autumn,' SIDNEY R. PERCY. The immediate material seems to be the banks of a river, with a road winding over it, broken into available forms and planted with trees, the whole shut in by a mountain-chain. It is a large picture, with something of the feeling of composition; the foreground material is extremely successful.

No. 292. 'The Wreck at Yarmouth,' W. E. BATES. The subject is suggested by the description of the wreck in David Copperfield. It is represented as having occurred near the jetty, on the side of the Denes. The vessel is grounded, and the sea makes a clear breach over her.

No. 299. 'Christopher Sly,' H. STACY MARKS. There is much character in the figure, perhaps a trifle verging towards caricature. The whole of the incident and necessary material is beyond all praise.

No. 303. 'A Common near Pyrford, Surrey,' F. W. HULME. The subject is insignificant, but it is worked into a picture of very high merit.

No. 307. 'The Taming of the Shrew,' W. M. EGLEY. This is the scene in which Petruchio brings in refreshment for Katharine, but desires it to be removed because she does not thank him. The figures of Hortensio and Petruchio are unobjectionable, but in the Katharine there is perhaps a deficiency of grace; the whole, however, of the still-life auxiliaries of the composition are painted in a manner that cannot be excelled.

No. 315. 'Interior, Accrington, Lancashire,' D. PASMORE. The subject is a modern drawing-room, but it is rendered interesting by skilful manipulation and composition.

No. 316. 'Mrs. J. D. Harding,' BELL SMITH. This is a small portrait, in which the lady appears seated and facing the spectator: the features are painted with great delicacy and feeling, the colour is brilliant and life-like.

No. 321. 'Modern Minstrelsy,' C. ROSSITER. The performers are two boys, one of whom plays the banjo, while another labours with more energy than grace on the "bones." The character and action of the figures are admirable.

No. 325. 'George Blizard Abbott,' G. WELLS. A small portrait of much excellence.

No. 330. 'Master Ford searching for Falstaff,' R. W. BUSS. This is the search in the buck-basket, the last rag of which Ford has just cleared out. The composition is very full of figures.

No. 334. 'Ara Force, Westmoreland,' T. C. DIBDIN. The "force," as a waterfall is called in the north of England, is seen at a short distance within the nearest composition—a wild piece of river-side rock, above which rise trees of full and fresh foliage; the whole constituting an extremely romantic passage of scenery.

No. 337. 'A Lane at Watford,' T. J. SOPER. The lane is shaded by overhanging trees, which seem to have been painted on the spot.

No. 351. 'Cullercoats Pilots,' T. MORTEN. A small sketch of much power. The two following numbers are studies of equal merit.

No. 370. 'The Mountain Repast,' J. D. WINGFIELD. A study of a country girl carrying a tray with bread, and milk, and fruit; the head of the figure is highly successful.

No. 388. 'The Arrival of Guests,' D. PASMORE. These guests are received by their host in a magnificent carved and panelled hall of the fifteenth century, at the extremity of which is a gallery with a balustrade, that, together with a variety of incident, constitutes a passage of much quaintness and originality. It is the best picture we have ever seen under this name.

No. 395. 'Morning Light on the Hills,' A. GILBERT. The effect is similar to that of antecedent works of the artist—that is, the sunlight striking the summits of hills on trees. Here the sunlight gilds the ridges of a range of hills on the right of the picture with an effect striking and powerful.

No. 400. 'A Family Group,' H. B. WILLIS. The family consists of three goats—male, female, and kid—all brought forward with the closest observation of nature.

No. 409. 'The Tempest,' J. N. NAISIE. The lines whence the subject is derived are those so often painted, "Come unto these yellow sands," &c. The figures are numerous, well drawn, and powerful in colour—but the poses are not so graceful as they might be, and some of the draperies are stiff and heavy. The secondary group is exquisite, but wherefore is the composition shut in by architecture?

No. 413. 'A Signal of Distress in the Offing, Coast of Dover,' E. HAYES, A.R.H. No boat could put off from the beach in such a sea—we have seen boats, in attempting this, turned

over like nutshells, abreast of the upper end of the harbour.

No. 427. 'The Ascent of Iris,' W. A. SMITH. The conception is poetical—a quality very deficient in modern Art.

'Portrait of a Lady,' C. COUZENS. A full-length portrait of the size of life, treated with much of the simplicity and severity of the "old masters." The lady wears black velvet, which serves well to clear up the rich but low-toned background.

No. 448. 'Times of Peace,' W. NICHOLL. A domestic subject, comprehending many figures assembled within their modest home. Among them is a soldier, who may be supposed to be on leave. There is much careful labour in the work.

No. 455. 'A Merchant of the Levant,' LEWIS WALTER. This appears to be a veritable study from the life—the subject being a negro attired in a rich Greek costume. It is a highly commendable performance.

No. 456. 'Crossing the River,' A. MONTAGUE. A large picture, proposed as a Dutch scene, in which boats from the near shore are crossing to a city like Amsterdam or Antwerp; it is fresh and breezy in feeling.

No. 458. 'Near Southgate, from Nature,' P. W. ELEN. A small picture superior in the quality of its execution to preceding works.

No. 461. 'A Study from Nature,' H. S. ROLFE. The subject is a dish of fish—carp and tench—painted with the most perfect imitation of the living fish; and No. 446, 'Salmon and Trout,' is equally successful.

No. 462. 'Harvesters' Repast,' FRED UNDERHILL. They are assembled in the harvest-field, in the shade of a solitary tree. The shades and reflected lights on the features are rendered with beautiful truth; but we often wish, in looking at these pictures, that the draperies were painted with more of breadth.

In addition to the pictures on the walls, there are five screens, both sides of which are hung with many small works which could not be seen raised above the eye; and besides those on the screens are exhibited a proportion of water-colour drawings, many of which are of distinguished merit—as No. 158, 'A Group of Roses,' MRS. WITHERS; No. 162, 'Wild Roses and Nest,' R. P. BURCHAM; 'Court-yard of the Hospital del Rey Burgos, Spain,' T. R. MACQUOID; No. 212, 'Spanish Girl at Prayer,' E. MURRAY, a study of much excellence; there are also by the same lady, and equally meritorious, No. 213, 'A Country Girl,' No. 218, 'The Flower of the Day,' and No. 223, 'Dacila, a descendant of the Gunches.' There are also worthy of mention, No. 170, 'The Divining Peel,' F. SMALLFIELD; No. 188, 'Hurstmonceaux, Sussex,' S. J. SOPER; No. 200, 'Fieldfare and Bullfinch,' P. HOLLAND; 'A Wood Nymph,' R. H. MASON; No. 204, 'A Highland Farm,' A. STANLEY. The following are in oil:—No. 226, 'Near Streatley on the Thames,' E. BODDINGTON; 'At Antwerp,' A. MONTAGUE; 'A Study of Birds,' A. COOPER; No. 230, 'Reading and Reflection,' G. WELLS; No. 236, 'Lane Scene, Clifton, Nottingham,' B. SHIPMAN; No. 240, 'A Scene in Lincolnshire,' H. B. WILLIS; No. 244, 'Dutchmen returning into Dole on the Scheldt,' T. S. ROBINS; No. 478, 'Landscape, Cheshire,' W. A. WALL; No. 480, 'Ravenswood preparing to meet Colonel Ashton,' No. 489, 'On the Welsh Hills,' C. E. LESLIE; No. 490, 'Stones of Devon,' MISS H. C. HUTCHINGS; No. 493, 'Evening,' A. J. STARK; No. 496, 'On the Coast, Hastings,' P. WEST ELEN; No. 504, 'Yorkgate on the Thames,' and No. 505, 'At Hampton Court,' G. B. MOORE; No. 510, 'At Berneville on the Moselle,' MRS. W. OLIVER; No. 513, 'Salmon and Trout,' H. S. ROLFE; No. 519, 'The Refreshing Draught,' J. T. HIXON, &c. &c.

MINISTERING ANGELS.

A. Müller, Painter.

W. Ridgway, Engraver.

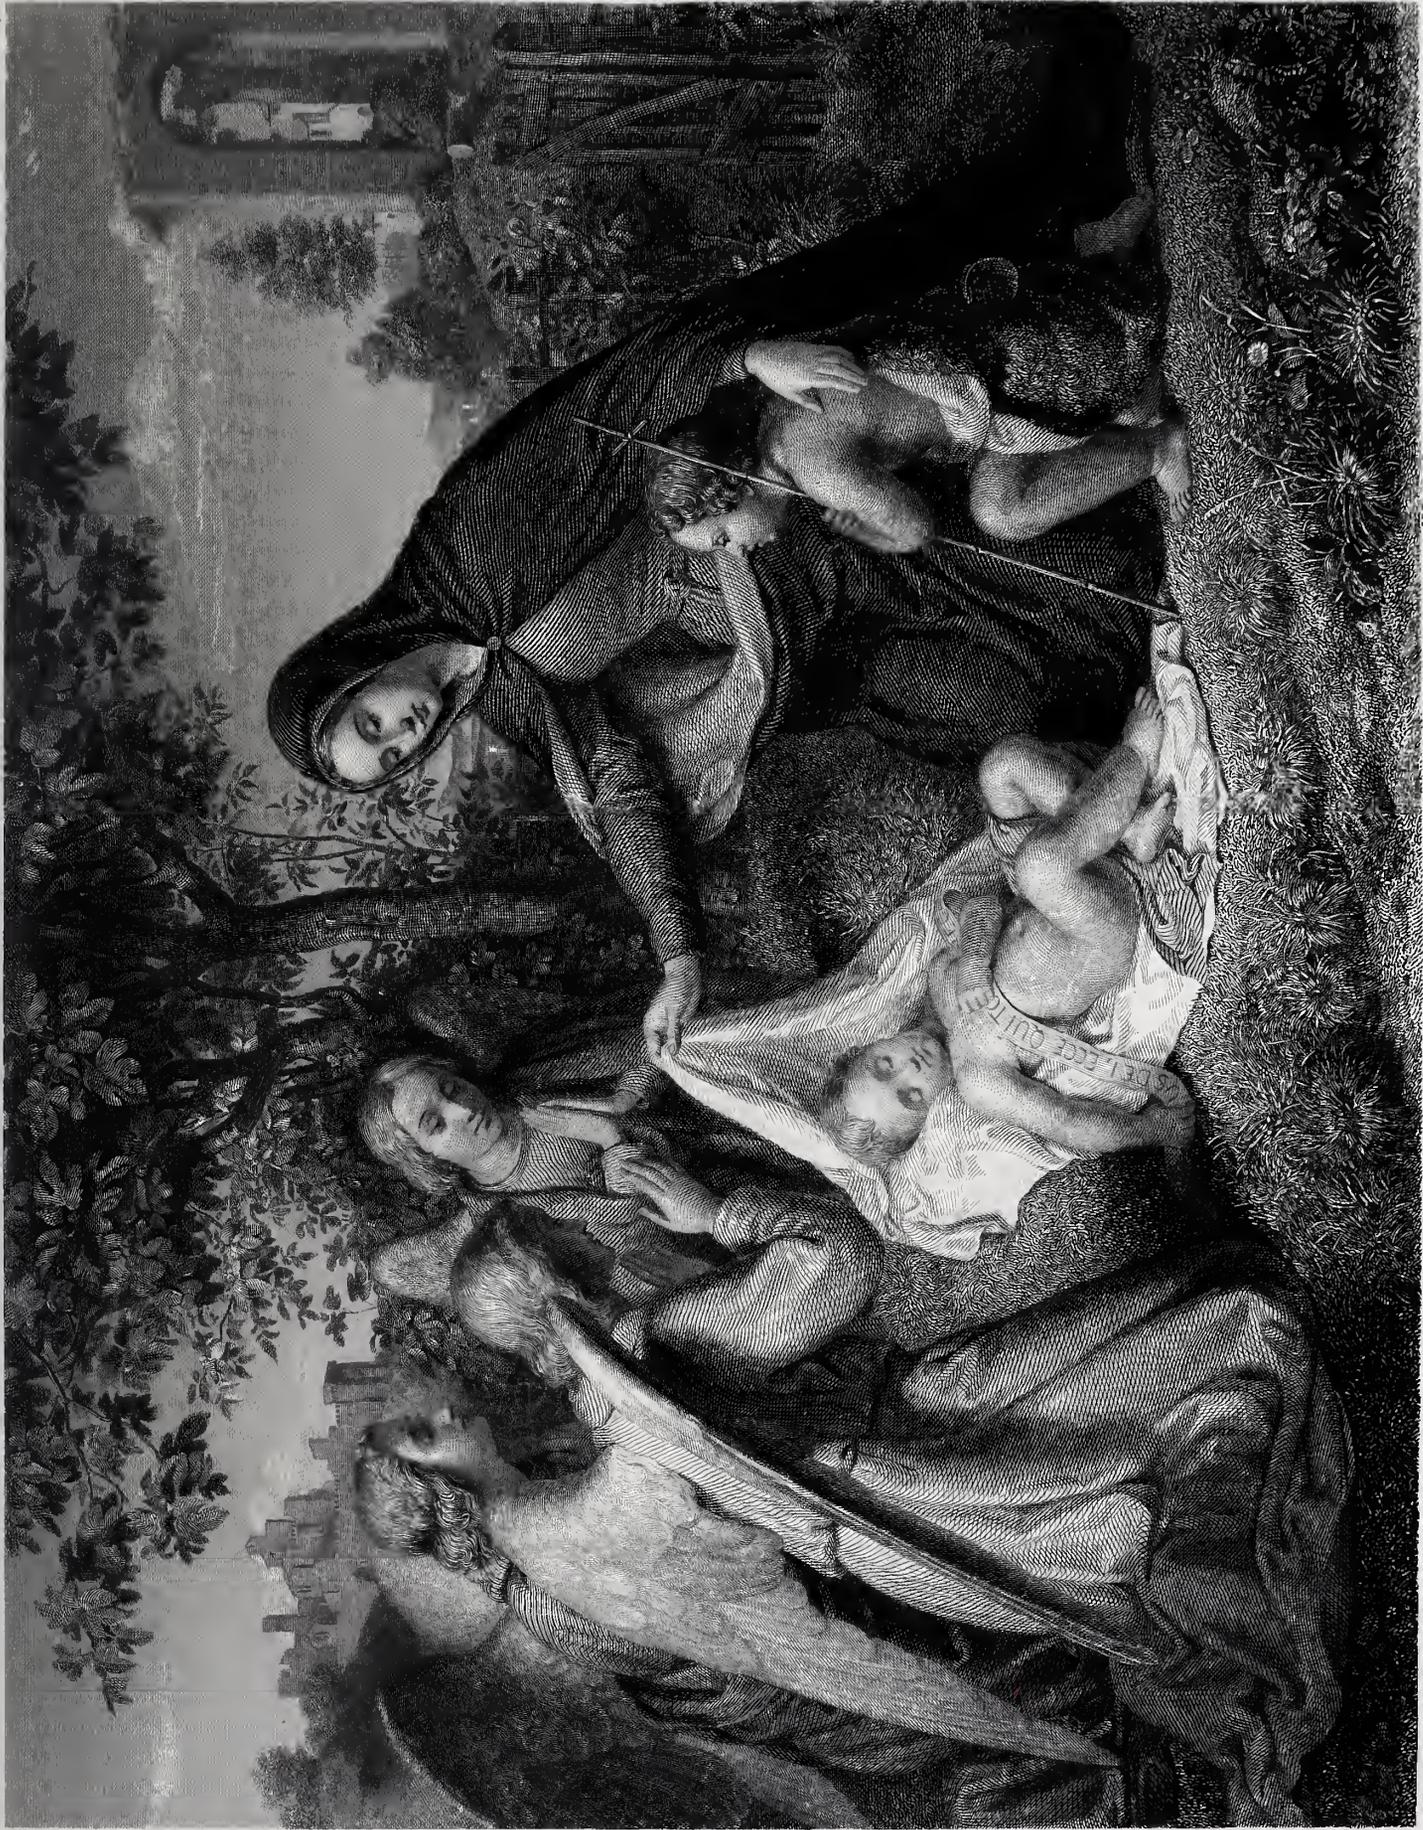

OUR subscribers will, we feel assured, be little disposed to complain if we depart this month from our usual arrangement by omitting the engraving from one of the "Royal Pictures," and substituting in its stead a print from a very beautiful picture, painted not very long since expressly for the *Art-Journal*, and now in the possession of Mr. G. Virtue, the publisher. It is by Andreas Müller, a distinguished artist of the Düsseldorf school.

Notwithstanding the narrow, mystical, and almost infidel views of the Christian religion which now prevail in Germany, it is still an indisputable fact that Christian Art flourishes and is encouraged there far more than in any other country: the works of Corneilius, Overbeck, Hess, Bendemann, and their numerous disciples or followers, have no parallel elsewhere either in number or excellence. We are not prepared to admit that the German school is altogether that which we admire,—we are speaking of religious painting,—but still it exhibits a grandeur of design, a solemnity of feeling, and an earnestness of purpose, that is to be seen nowhere else among the moderns.

Mr. Ruskin, in his fourth Edinburgh lecture, calls modern Art—speaking generally, it may be presumed—"profane:"—"This then," he says, "is the great and broad fact which distinguishes modern art from old art; that all ancient art was *religious*, and all modern art is *profane*. I say all ancient art was religious; that is to say, religion was its first object, private luxury or pleasure its second. I say all modern art is profane; that is, private luxury or pleasure is its first object, religion its second." He does not, however, admit that ancient art was *more* religious than modern, because the question is not one of degree—but he argues negatively, that all would be purer if engaged in the service of Christianity:—"The simple fact is, that old art was brought into that service, and has in consequence received another form; that this is the great distinction between ancient and modern art, and from that are clearly deducible all other essential differences between them. That is the point I wish to show you, and of that there can be no dispute. Whether or not Christianity be the purer for lacking the service of art is disputable, and I do not mean now to begin to dispute; but that art is the *impurer* for not being in the service of Christianity, is indisputable, and that is the main point I have now to do with."

If we understand Mr. Ruskin rightly in his remarks, he argues that Art can only be pure when devoted to sacred subjects; consequently, that the true artist should limit himself to these; and we take the liberty of joining issue with him on these points, sensible as we are of the value of sacred art, and fully agreeing with him that Art ought to be pressed into the service of all religion—but not limited to it. Art is granted us for our pleasure as well as for our mental and spiritual profit; practical wisdom and moral virtues—aye, and Christian virtues also—may be learned from many ordinary incidents of life, and from great historical facts: have we then a right to reject these altogether, because the pages of Scripture teach the self-same truths in a more solemn, impressive, and authoritative manner? Surely Mr. Ruskin would scarcely force his arguments to such an extremity. Besides, what law is there, either human or divine, to forbid the enjoyment of such "fancies" as the imagination of the artist may suggest, provided he keeps within the limits of sense and reason? We must, however, go back to Herr Müller's picture.

The composition is ideal; we have no warrant in Scripture for presuming that angels descended upon the earth to pay homage to the infant Christ; yet are they not the less the "ministers" of the Deity, at all times "fulfilling his will." The Virgin Mother and the infant John form the opposite group to these "winged messengers;" the whole of the figures constitute a beautiful assemblage, and are arranged with great judgment, and with harmony of individual parts and lines. Everywhere is a fulness and a richness of subject-matter rarely to be seen in the works of modern German painters.

ANDREAS MÜLLER, PINXIT.

THE BOOK OF THE THAMES,

FROM ITS RISE TO ITS FALL.

BY MR. AND MRS. S. C. HALL.

PART IV.

rejoin the Thames at the Ferry of BABLOCK HITHE; it is a horse-ferry, as will be observed by the appended engraving. The river is narrow here, and for some distance, above and below, it passes by the sides of low meadows—famous pasture land for cattle, though occasionally under water in winter, and when there have been heavy and continuous falls of rain. We keep in view, as we descend the stream, the pleasant hills—those of Witham—which environ Oxford, distant about seven miles; but the distance is doubled to those who make “the voyage”

in boats—so continually does the river “wind.”

The better dressed, the more comfortable and “respectable,” are our peasantry, the less interesting and picturesque they become as subjects for the pen or pencil of the tourist. We so seldom meet on our journeyings any one who looks, or does, or says, what can be called “original,” that we have a delightful sensation of “freshness” when we encounter aught that promises a departure from “every-day” existence. While crossing the Thames in the primitive “horse-hoat,” at Bablock Hithe, our attention was attracted by an unusually tall man, who was leaning, in an attitude at once careless and graceful, against the door of the ferry-house; his smockfrock, of some grey material, was elaborately pleated and worked on the shoulders; and his heavy, but handsome, Saxon features were expressive of the most intense melancholy. On the ground beside him was what looked like the foundation of an arm-chair,

BABLOCK HITHE FERRY.

crossed and recrossed by wicker-work, round which various long grasses in seed and flower were twisted, every passing breeze hending their heads or rustling among their stems: the chair was divided into three or four compartments, overarched by these grasses—howver fashion—and we imagined we saw something moving within each recess. We inquired who the stranger was. “That!” replied the boatman; “oh, that is Tom Hirsell, the owl-finder.”

“Owl-finder!—what do you mean?”

“Why, he travels the country from one end to the other looking for owls and hats; owls, especially, he catches, or steals from their nests, and tames, and then sells them to the gentry, or may he to gardeners. Many a one likes them in barns and granaries better than cats; and Tom is a man of his word—if he promises an owl he’ll be sure to bring it, and for the price he named, even if some one else offered him twice the sum. He don’t matter a walk of thirty mile to get the owlets, and he’s as true as a sun-dial.”

We asked “Tom Hirsell” if he had any owls for sale.

“None fit,” he replied—none that he could recommend.

There was a sleepiness in the man’s look; his eyes winked in the sun, as if light were disagreeable to him; he moved his head, too, slowly, in a sort of half-circle, while he spoke, and we fancied he had imbibed some of the owl-nature—

“Our nature is subdued to what it works in.”

One of our party laughingly observed, that in a former state of existence he must have been the bird of night. Certainly, there was much about him unlike any other peasant we had ever noted; he seemed hardly awake, and yet it was evident he saw and observed us. We inquired if there was an owl under shelter of those long grasses? “Yes, there was; a fine tame one. He had a deal of trouble training that owl; it was such a sulky; he had taken it at Farnham; but it was promised to a lord’s gardener near Marlow; he couldn’t sell it—it was promised.” He pulled the bird out; it fluttered, and winked, and twisted on his hand, and shook its feathers, and its eyes dilated and contracted

while creeping up his sleeve, gently, and hiding its great full head in the neck of his smockfrock: he drew out another—a fierce, spiteful little bird—who hissed like a serpent, and chattered, and clapped its beak, and tried to bite, though it evidently did not see what to bite at.

“It will take another month or two to tame this one,” he said.

“Had you ever one you could not tame?”

The owl-finder gave a grim, solemn smile, while a sort of phosphoric light glittered in his eyes. “One I could not tame?” he repeated: “they’re all awfully stubborn—it’s their nature; they take different training from other birds—not at all the same; the younger they be the better; but I’d be sorry to find one I couldn’t tame.”

“Do you find them at night?”

“Night and day is all the same to me; day and night—all one. Glow-worms, owls, bats, night hawks, snakes, fish, flesh, and fowl—all the same; I can catch anything I like; tame anything I like; but the owls are my favourites—I know them best, and they know me.” The peculiar light that glittered in the eyes of the “owl-finder” was anything but pleasant, and the more he talked (his talk was decidedly an undertone, grave-yard whisper), the more he blinked his eyes and moved his head. “I’ve a young one here,” he continued, “Pope I call it; it came from the tower where the pope lived once; they call it Pope’s Tower.” He pulled it out of its appropriate cage, and held it up: the bird hooted and hissed, and the others took up the inharmonious notes, and hissed in concert, flapping their wings. “Here is a thing,” said the man, “I don’t understand, though I’ve been among them, man and hoy, these many years, for my father was grave-digger to an old church, and so I may say I grew up among them. I used to climb the ivy when I was a little chap—so high—in twilight, or moonlight, or dead darkness—all one; and I knew well the two great nests of the big buff owl, and the horned owl, at different sides of the old clock-tower; and I used to take up bits of meat or mice, and lay ‘em on the edge of the nest; and the great buff owl, or the horned owl, would come and take up the things, and feed the little muffy owlets; and at last they came to know me, and would coo like doves when they heard me coming; and I had, like many another boy, a mother-in-law—step-mother some call it—who had no feeling for the child of the dead bones that were in the church-yard; and she’d often, when my father was abed and asleep, turn me out in the shiny snow or the bitter rain, and I’d away, and just climb up and shelter under the nest of the great buff owl in the angle of the tower, warm and dry; and the old owls would come and coo at me as they did to their young ones, but never seek to hurt me; and many’s the star we’ve seen shining and falling through that darkness, and many a blink of the moon I’ve got that never reached the earth, and seen and heard much through the broad leaves of the ivy that nobody would believe if I was to tell it. There’s more roams the skies a’ nights than we think of. I shall never, on this earth, have the happy time again I had under the huff owl’s nest.” He raised his dreamy eyes, but their brightness was gone; they looked dim and heavy, and the poor fellow sighed.

We reminded him he had said there was something he did not understand about the particular owl he called “Pope.”

“Oh, yes; day or night, night or day, whenever Pope hisses all the rest hiss; and if he hoots they all hoot; he seems like a master among them—they have their masters; he never minds their hooting.”

“Is Pope bespoken?”

“Yes. I’ve only three with me; they’re all hespoken.”

“Have you any at home?”

“At home?” he repeated, then moved his head in that strange half-circling way, and added, “home! I have no home; but I have two or three sets to take from different parts of the country. You’re from the town, I think. I shall be on Waterloo Bridge on the 12th of November, and if you want an owl by then, I’ll keep one for you;—I rest there for a couple of hours between two and four.”

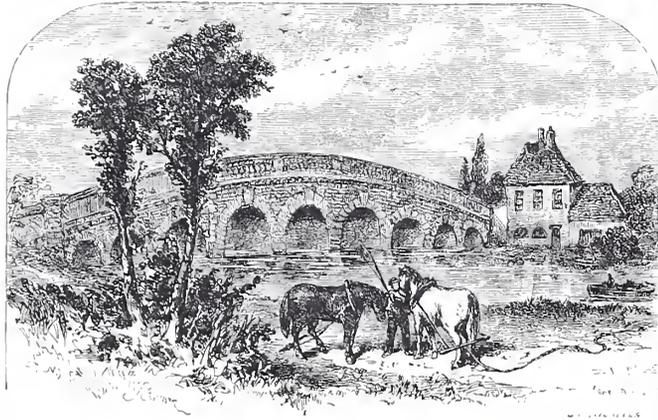

We bespoken an owl. Tom Hirsell replaced his birds, tying all to their perches, except the senior, who seemed to have an affection for his master, and a desire to nestle about his person, rather than return into the shadows of the long grass. There was something strange and mysterious about the “owl-finder.” He did not seek even to dispose of his game. What an unchildish childhood must his have been!—escaping from the brutality of a cruel step-mother to shelter under an owl’s nest in the tower of an old church—finding a forerunner in those savage birds which was denied him in his father’s house—hanging like a bat from the ivy tower above the mouldering graves—watching the stars, and peering through the ivy at the moonbeams—wondering if the shooting stars were angels—wondering and feeling, rather than thinking—alone! alone! in the mysterious universe of night, when the animate and inanimate assume shapes, and sounds, and shadows all unlike themselves. If the young and the brave—the strong-hearted and strong-minded, knowing as much of causes and effects as it is given us to know—become superstitious in the darkness, and often quail and quake with undefined sensations which they shame to confess, it is no subject of astonishment if the mind of the poor, ill-used child was so shaken in his youth as to grow up morbid and melancholy, deriving a species of pleasure and excitement from the companionship of the unearthly birds with whom he associated during those lonely hours.

It was a rude and evil thing of one of our friends, after we had left the “owl-finder,” to suggest that the stalwart fellow was a “Detective” in disguise. The months passed on; we had forgotten our *tryst* on Waterloo Bridge, and were crossing it on the 12th of January—two months after the appointed day—with no memory of Tom Hirsell in our minds, when a soft, quiet, clear voice, heard amid the din of traffic, said—

“Will you please to have your owl?”

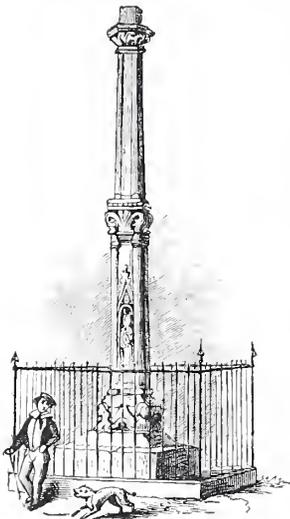

And we did have it, and brought it home, and it was put in a parrot’s cage; but it seemed so unhappy, both by day and night, that we sent it to the country, where it has already established a good mousing reputation.

From Bablock Hithe we encounter no object of interest (excepting the broad reach, and the quaint old "public" at Skinner's weir) until we arrive at Ensham—or, as it is called in the Ordnance map, Swinford—Bridge.

ENSHAM BRIDGE.

Ensham, Eynesham, or Einsham, was a place of note before the Conquest: so early as 1005 an abbey was founded here by Ethelmar, Earl of Cornwall, in the reign of Ethelred, the king "who signed the privilege of liberty with the sign of the Holy Cross;" and here he held a general council in 1009. At the dissolution, the abbey and its site became the property of the Earl of Derby. None of its remains can now be found: a few stones here and there indicate its site. A venerable cross stands in the market-place, opposite the church; but its date is not very remote, although time has much defaced its beauty.

ENSHAM CROSS.

It is in this neighbourhood we begin to perceive the dangerous results of the recent and rapid growth of the weed, *Anacharis alinastrum*, commonly called "the American weed." It has not been known in England more than ten years; but during that brief period it has spread so extensively—almost universally—through every district of our island, as very frequently to affect the traffic of rivers and canals, to impede the currents of minor streams, and even to fill up isolated ponds. It has already rendered the Thames, in some parts, almost impassable without difficulty. A small

pamphlet, written by William Marshall, Esq., of Ely, gives its history as far as it can be given. "The intruder is so unlike any other water-plant, that it may be at once recognised by its leaves growing in threes, round a slender stringy stem. The colour of the plant is a deep green; the leaves are about half an inch long, by an eighth wide, egg-shaped at the point, and beset with minute teeth, which cause them to cling. The stems are very brittle, so that whenever the plant is disturbed, fragments are broken off. Although, at present, it cannot propagate itself by seed (all the flowers being male) its powers of increase are prodigious, as every fragment is capable of becoming an independent plant, producing roots and stems, and extending itself indefinitely in every direction. Most of our water-plants require, in order to their increase, to be rooted in the bottom or sides of the river or drain in which they are found; but *this* is independent altogether of that condition, and *actually grows as it travels* slowly down the stream, *after being cut.*" That this weed is "a foreigner" there can be no doubt. Weeds very closely resembling, if not identical with it, are found in American rivers. Mr. Marshall is of opinion that it is an importation from North America; and that, probably, its first visit was paid to us in a load of American timber. He considers that all attempts to "get rid of it" must be futile; that it *never can be eradicated*; and that all we shall be able to do is to "keep it down." Its rapid spread is one of the marvels of nature. It is becoming a serious evil: the Commissioners of

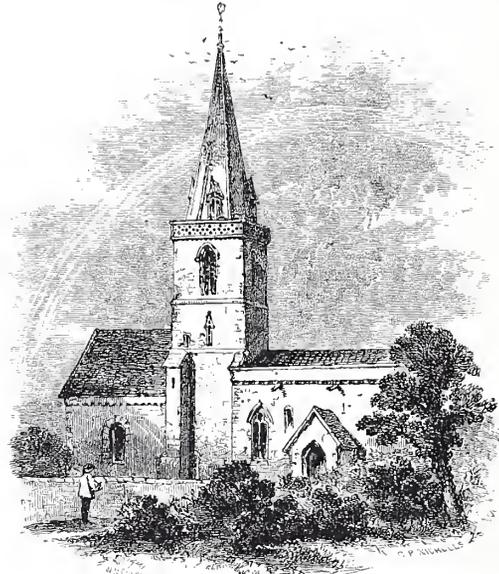

AMERICAN WEED.

the Thames should lose no time in grappling with the common enemy. Immediately below Ensham Bridge we make the somewhat dangerous passage of the weir, close to which, on the south side, is the site of "The Burnt Tree," dear to Oxford citizens as the scene of many a merry picnic. This tree was struck by lightning, and formed for many years a very pictu-

resque object, and an excellent excuse for making a pleasant water excursion. We soon arrive at Canott's Ham, on the north side, into which many a pheasant strays from the neighbouring wood, and where in winter the snipe and wild duck abound. It is also noticeable as one of the few places on the river where the teal is to be found.

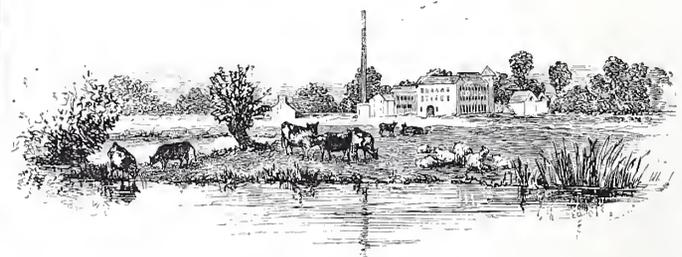

The distance from Ensham to Godstow Bridge is about three miles; between these bridges we meet the Evenlode, a pleasant river, which, rising on the edge of Worcestershire, and passing by Moreton-in-the-Marsh, Charlbury, and Combe, and refreshing Blenheim Park, here joins the Thames, and proceeds with it to Oxford.* All along to the right of the river highway we keep in sight the wooded heights of Witham,—a pleasure enhanced by the numerous windings of the river, which exhibit the hill in every variety of form. This "bit" is the more valuable because of its rarity, as contrasting with the ordinary flatness and sameness of adjacent lands.

On the opposite side of the river is seen the tall spire of CASSINGTON CHURCH; it is in view all the way to Oxford, and is ever a pleasant sight, refreshing to the eye and cheering to the heart.

CASSINGTON CHURCH.

On the same side of the river a building has been recently erected, which may be accepted as evidence of the progress of the age, in the midst of so much that is eloquent of "hoar antiquity;" it is the new paper-mill of the University. All makers of books are well aware that of late years the manufacture of paper has not been what it was a century since, or, rather, three centuries ago; while the leaves of our great-great-grandfathers are as fresh and fair as on the day they issued from the press, modern books, and illustrated books especially, are often full of unsightly and diseased marks, that mar the beauty of the volumes. The University, having experienced this evil, resolved

THE UNIVERSITY PAPER-MILL.

to make its own paper; it is a boon which claims public gratitude. The manufactory has a picturesque character seen from the Thames—not the less valuable because of the purposes to which it is dedicated.

* The Evenlode receives the Glyme, and conveys it to the Thames; the Glyme takes its course through Blenheim Park, and waters the ancient town of Woodstock. The palace built by Henry II. is entirely gone, but "Rosamond's Well" still yields delicious draughts to the wayfarer; several naiads of various ages are in attendance to welcome visitors. Of the house in which Chaucer lived and wrote, a few fragments remain in the garden of a modern dwelling. Of the manor-house, where Queen Elizabeth was some time imprisoned by her sister Mary, nothing now exists. Blenheim, however, takes the place of Woodstock—unsurpassed in clumsy magnificence and untruthful grandeur. The mansion contains many good pictures, which are heir-looms; the library is extensive, but unavailable for any useful purpose. Nature and Art have combined to make the grounds and gardens beautiful. Blenheim, to alter somewhat the inscription on the great monument in the park, stands as a record of "Britain's glory and Marlborough's gratitude." We had the pleasure during this portion of our tour to enjoy the companionship of the accomplished American author, Nathaniel Hawthorne, whose admirable works have become as familiar in England as they are in his own country, and eminently merit the fame they have obtained. We had also as our friend and guide in this deeply interesting neighbourhood, and especially to the impressive wonders of "learned Oxford," Mr. Alderman Spiers, F.S.A., to whose long and intimate knowledge of the locality, and all that appertains to it, we are deeply indebted; and for Mr. Hawthorne, as well as ourselves, we record our obligations for his courteous attentions and useful aid.

GODSTOW BRIDGE is highly picturesque: the river divides here, and at the brink of the older and more shallow channel is a pleasant inn—"The Trout," well known to anglers, but better to the "Oxford scholar," as a place accessible to the rower, who here seeks refreshment after toil, and finds the homeward voyage with the current an agreeable and easy evening task. At this spot commences the meadow—"Port Meadow," which, containing 439 acres, reaches almost to the city, whose property it is, and has been from time immemorial, as recorded in Domesday. Every citizen has the right of free pasturage for cattle, or, rather, a right for which he pays the annual tribute of two pence for

GODSTOW BRIDGE.

each horse or cow found there on the day upon which the city authorities meet for inspection—a day of which, of course, no previous notice has been given. It is usually overflowed in winter, and has thus time for repose.

The story of "Fair Rosamond" has been told in a hundred ways: the "fair and comely dame" who was loved by Henry II. was, according to the legend, concealed by the king in a hower at Woodstock from the jealous eyes of his Queen, Eleanor. The theme was in high favour with the early minstrels, and historians have not disdained to preserve the memory of her surpassing beauty and her sad fate. She was, according to Stow, who follows Higden, the monk of Chester, the daughter of Walter Lord Clifford, became the "iemman" of Henry II., and died at Woodstock, A.D. 1177, "poisoned by Queen Eleanor, as some thought." Stow proceeds to relate that her royal lover had made for her a house of wonderful working, so that no man or woman might come to her

RUINS OF GODSTOW NUNNERY.

but he that was instructed by the king, or such as were right secret with him touching the matter. This house, after some, was named Labyrinthus, or "Dædalus' worke, which was wrought like unto a knot, in a garden called a maze." Drayton, using the poet's licence, describes it as "consisting of vaults underground, arched and walled." And, in the famous ballad of "Fair Rosamond," it is more minutely pictured as "a bower," curiously huilt of "stone and timber strong," having no fewer than one hundred and fifty doors, and so cunningly contrived with turnings round about, that none could obtain access to it except by "a clue of thread." But jealousy is proverbially quick-sighted: Queen Eleanor discovered the secret, possessed herself of "the clue of thriddle, or silk," and

so dealt with her rival that "she lived not long." Authorities differ as to the mode by which the queen obtained the necessary guide. Hollinshed seriously states that "the king had drawn it after him out of her chamber with his foot;" and Speed, that "it fell from Rosamond's lappe as she sate to take ayre, and, suddenly fleeing from the sight of the searcher, the end of her silk fastened to her foote, and the clue, still unwinding, remained behind." But historians content themselves with informing us that the lady "lived not long after," and do not insinuate that she was wounded with other weapons than sharp words, although tradition and the ballad makers unite in charging the queen with the murder of Fair Rosamond by compelling her to drink poison. She was buried at "Godstow, in a house of nunnce beside Oxford," according to Stow, and "with these verses carved upon her tomb:"—

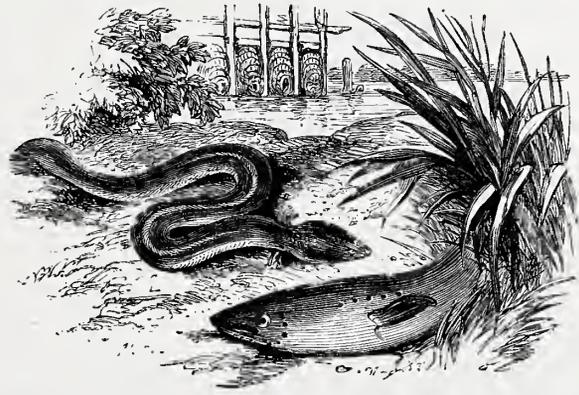

"Hic jacet in tumba Rosa Munda!
Non redolet, sed olet quæ redoletæ solet."

Her royal lover expended large sums in adorning her tomb. But, in the year 1191, Hugh, Bishop of Lincoln, ordered the removal of her remains "without the church;" he was obeyed, but after his departure her bones were gathered into a perfumed bag and laid again in their resting-place, "under a fayre large grave-stone, about whose edges a fillet of brass was inlaid, and thereon written her name and praise."

Of "the house of nunnce" there now exist but a few ivy-clad walls; it was consecrated for Benedictine nuns A.D. 1138, in the presence of King Stephen and his queen; seven hundred years and more have passed since then, and three hundred years since the last abbess resigned her home to the physician, Dr. George Owen, to whom Henry VIII. had given it; still the river rolls by its rugged court-yard and dilapidated gables, recalling to mind the story of the fair and frail beauty who gives the ruin a special place in history.

At the foot of Witham Hill—the hill that has so cheerful and fair an aspect from all points of the river within a range of several miles, and so agreeably enlivens the view from Oxford—is the ancient village of Witteham, or Wightham, where a nunnery existed in the year 690. Here the Earls of Abingdon have now their seat, partly built, it is said, with the stones of Godstow.

The Eel (*Anguilla acutirostris*) "sharp-nosed," is that which chiefly abounds in the Thames, and the other rivers of England, although the broad-nosed Eel (*Anguilla latirostris*) is almost as common; the names sufficiently indicate the distinction. The Thames eel is the eel *par excellence*; in consequence, perhaps,

EELS.

of its cleaner feeding, it is far more delicate and yet much richer than the fish found elsewhere; but it is not easily obtained, and is rarely offered for sale. In the Thames, the eel is rarely caught by the angler, although in ponds, and lakes, and other rivers it is freely taken with hook and line. "Eel-pots" made of wicker-work, which are sunk "over-night," baited within with any sort of animal matter; or eel-baskets, which are fixed in convenient places across hy-currents of the river, are the "traps" by which they are secured in the Thames.

The Thames eel seldom grows to a very large size; it is not often obtained of a weight greater than three pounds, although occasionally one is found to weigh as much as seven pounds; about seven or eight years ago, an eel was caught in a trap at Hart's weir that weighed eleven pounds; we had some doubts as to the statement given to us by the weir-keeper, by whom it had been caught, but it received confirmation from a fishmonger at Oxford, to whom he had disposed of it, and who kept it for some time as "a show." During last year a fisherman brought to us, while angling on the river, a *lusus nature*—a yellow eel, entirely and purely yellow, from head to tail inclusive. We recommended him to offer it for sale to the Zoological Society; but, by some accident, it was lost. Subsequently, we communicated the fact to Professor Owen, who informed us that, though very uncommon, it was by no means a solitary instance. The fish was remarkably beautiful, as well as curious.

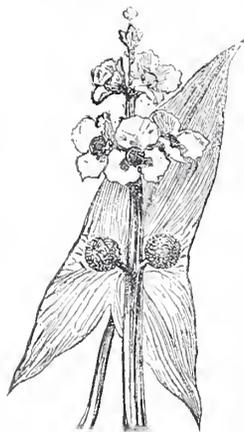

The form and character of the eel are so well known as to render description unnecessary; its great characteristic is its tenacity of life—it is almost impossible to kill it, as the cook knows to her great discomfort. It is certain that the eel can move about freely on land, travelling through the dewy grass for miles from one pond or river to another. It has long been in dispute whether the eel is oviparous or viviparous. Mr. Yarrell seems, however, to have set the question at rest—he considers it "oviparous, producing young like other true hony fishes;" and it is stated by Mr. Jesse that "they have been bred artificially from spawn."

All readers are aware that for ages there existed a strong prejudice against this fish, originating, probably, in its general resemblance to the serpent; the popular belief was that they were created out of decomposed animal matter—"sprang from mud"—were produced by horse-hairs generated in water, and so forth; and in many places even now people will starve rather than eat them.

Perhaps, of all the fish of the fresh-water, they form the most delicious food. A Thames eel of two pounds weight is a dainty dish to set before the Queen.

When the eel is fished for with the hook, it is generally with the night line, for they prowl only by night; a line with perhaps forty or fifty hooks, baited with lob-worms, is thrown into the river to take its chance, and it is usually successful when the water is "coloured," or after a flood; but this is, of course, a practice to which the angler does not condescend: the Thames angler can rarely obtain an eel, except by means of "a silver hook."

One of the handsomest of British aquatics is the Arrow-head (*Sagittaria sagittifolia*), whether as regards

THE ARROW-HEAD.

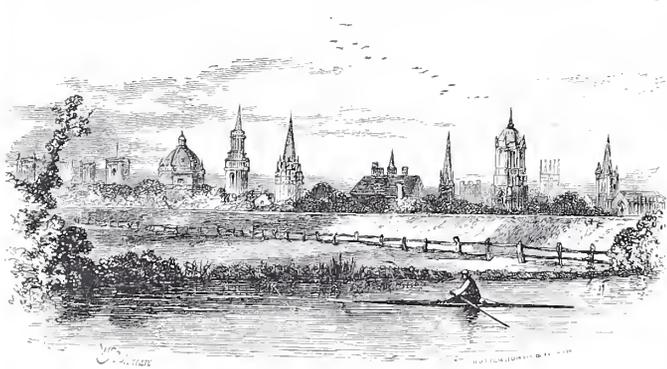

the elegant spear-shaped leaves of glossiest green, or the flower spikes rising in pyramidal form from the water with strong fluted stems, and presenting altogether a striking resemblance to a highly-decorated gothic finial; the flowers are three-petaled, white, with a flush of violet towards the centre, from which rises a granulated boss of green, that adds much to the beauty of the flower. This plant is extensively cultivated among the Chinese—not for its beauty, but for the sake of the bulb, which fixes itself in the solid earth below the mud, and constitutes an article of food. The roots attain a larger size in China, it appears, than they do with us; but still we should think that, even in this country, their cultivation might be attempted with success in very watery localities, where other esculent plants are not grown; and a little attention to its culture might produce the same improvement in the size and quality of the root, as has been the case with most of our garden vegetables. This very graceful plant is found in great abundance in this

neighbourhood; but there are few parts of the upper Thames which it does not enliven by its luxuriant foliage.

Having passed through Godstow Lock, Oxford City comes in sight; the village of Wolvercot is passed, but that of BINSEY claims a moment's thought. The voyager will pause at Binsey weir, for here a charming view is obtained of ancient and venerable Oxford—its pinnacles, and towers, and church spires rising proudly above surrounding domiciles. Nowhere do we obtain a more striking view, and here especially do we recall the expressive lines of the poet:—

"Like a rich gem, in circling gold enshrined,
Where Isis' waters wind,
Along the sweetest shore
That ever felt fair culture's hands,
Or spring's embroidered mantle wore—
Lo! where majestic Oxford stands."

We step ashore awhile to visit the little village, and to walk to its church, half a mile or so distant from the river-bank. At Binsey, A.D. 730, the holy virgin

OXFORD, FROM NEAR BINSEY.

Frideswide had a chapel constructed of wallyns and rough-hewn timber;* hither were sent of her nuns "the most stubborn sort," to be confined in a dark room, and to be deprived of their usual repast; and here, too, was the famous well of St. Margaret, which St. Frideswide, "by her prayers, caused to be opened;" here came the people to ease their hurried souls, and to be rid of their diseases; consequently the adjoining village of Seckworth became a large town, containing twenty-four inns—the dwellings chiefly of the priests appointed by the Prior of Binsey to confess and absolve the penitents. Binsey has now but a dozen poor houses; its church has a heart-broken look; and of the Well there is but an indication—a large earth-mound in a corner of the grave-yard completely dried up, there being no sign of water; the spring is lost, and so, indeed, is its memory; for we inquired in vain among the neighbouring peasantry

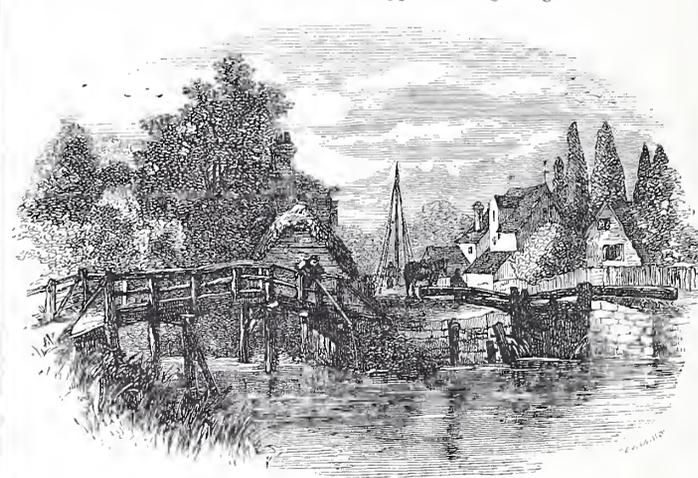

* The little chapel thus constructed by the saint was evidently one of those wooden buildings, dedicated to ecclesiastical services, which were not uncommon in the Saxon era. The "wallyns" used by Frideswide were the timbers which formed the mainstay of the building, and were such as we still find in old timber houses; the "rough-hewn timber" was fastened on them, and so made the outer walls. The Saxon chronicles give many notices of similar buildings. Thus, when Edwin was converted to Christianity in 627, he was baptised in a wooden church, on the spot where York Cathedral now stands. The famous church of Lindisfarne was first constructed, in 652, of sawn oak, and thatched. The most extraordinary existing instance of such a primitive English church is at Greensted, in Essex, which is believed to have been originally erected in haste to receive the body of the martyr king, St. Edmund, in its passage from Suffolk to London. The body of the church is formed by a series of split trees, the flat side inward, and the rough bark outward; they fit in sockets above and below, also formed of timber; and this is doubtless the sort of erection Frideswide constructed, after the Saxon fashion.

for St. Margaret's Well, of which they had heard and knew nothing—*sic transit!**

The ancient farm of Medley, which adjoins Binsey weir, is still a farm, as it was before the Norman conquest.

Shortly before Oxford is reached a cluster of old houses points out the site of Osney; and here the river separates into two channels, its "divided flood" meeting again just below the city, at the foot of Folly Bridge, at the commencement of the Christ Church meadow.†

We first pass, however, through OSNEY LOCK, one of the most picturesque locks on the river; although its accessories are only low houses and broken walls, they are such as the painter loves,—and to our friend, Mr. E. W. Cooke, we are indebted for the sketch of which we append an engraving.

OSNEY LOCK.

OSNEY, or OSENEY ABBEY, once rivalled in extent and architectural beauty the grandest of the colleges that now adorn and dignify the proud city. It was "seated on a flat or low ground, but for the grove, and trees, and rivulets that encompassed it not a little pleasant." It received its first erection in 1129, by the donation of Robert Doyly, at the instance of his wife Edith; and the legend is, that often, when walking out of Oxford Castle by the river-side, she observed magpies chattering on a certain tree, "as it wer to speke to her;" much marvelling at this, she asked of her confessor the meaning thereof, who told her they were not pies, but so many poor souls in purgatory, who were complaining to her, and entreating of her some good. Thereupon, and for their relief, she procured the building of the abbey where the tree stood; her "confessor," of course, becoming its abbot. During after-times, it was enriched by other donors, until it became "one of the first ornaments and wonders of this place or nation;" to the great hall would often come, as guests, kings, prelates, and nobles of the first rank; whatever heart could wish the monks enjoyed, "by means of the generosity of their founders and succeeding benefactors;" the church was adorned by the gifts of the pious—all who contributed something towards the building being entitled to "forty days' indulgence and forgiveness from sin"—hence it became "the envy of other religious houses in England and beyond sea;" of architecture exquisite and full of variety; with haugings of most excellent work, windows of famous painting; with pillars elegant and uniform, each bearing a statue; with wonderful variety of carvings and paintings, "that not only fed the eye with delight, but struck the spectator with surprise and admiration." Of this grand and glorious work there is now not one stone remaining upon another; "it suffered not a little from the Rump Parliament,"—Time did the rest, and—

"Of it there now remains no memory,
Nor any little monument to see."

The abbots of Osney were peers of parliament. The last abbot was Robert King; who, in 1539, "surrendered" the abbey to Henry VIII.—who, in 1542, made it the see of a bishop, assigning Gloucester Hall, now Worcester College, Oxford, for his residence. In 1546 the episcopal chair was transferred to the conventual church of St. Frideswide, which was then constituted the cathedral of the See, and called Christ Church, and the last abbot and only bishop of Osney became the first Bishop of Oxford. Of Dr. King there is a portrait in the library at Christ Church, the background of which is a picture of the abbey. Others of its treasures are also in that college—"Old Tom," the famous Oxford bell, being one of them. Standing upon the site it occupied in the days of its power and grandeur, and searching in vain for a few stones to indicate its splendour, the mind is absolutely forced to ponder and reflect.

* A superstitious belief in the efficacy of holy wells was one of the most characteristic features of the middle ages, and to them pilgrimages were made from great distances. Some religious establishments were generally near them, which profited by the devout. There is scarcely a large town in England without a record of some holy well near, and London had several—the most famous being that of Clerkenwell, which takes its name from it, and the holy well in the Strand, which still designates the street there. The most famous of all these mediæval wells is that still remaining in Flintshire, and known as St. Winifred. The marvels told of the miraculous cures here effected obtained such renown for the waters, that a gothic chapel of singular beauty was erected over them. But it was not curative properties alone they possessed—they had other virtues; thus the well at the far-famed Abbey of Walsingham gave access to the "wishes" of the pilgrim who drank of it devoutly. Other instances of "wishing-wells" might be quoted, and superstitious observances noted, more akin to fortune-telling than medicine.

† The Thames, at and about Oxford, forms a complete network of streams—so much so as to be puzzling even to the surveyor. Our Oxford readers will recollect the various names of "Seckworth," "the Reach," "the Dunge," "Pott's Stream," "the Wyke Stream," "the Four Streams," and many others.

BOTANY,

AS ADAPTED TO THE ARTS AND ART-MANUFACTURE.

BY CHRISTOPHER DRESSER,

LECTURER ON ARTISTIC BOTANY IN THE DEPARTMENT OF
SCIENCE AND ART.

PART IV.

As we are now about to enter upon an examination of the varied parts of the vegetable organism, and to notice their adaptability to our purposes, we must necessarily point out in the first place what parts are distinguished in the perfect matured structure. The highest phanerogamous (flowering) plants have a central rod, which is termed the axis; one portion of which descends, or elongates in a downward direction, and is therefore called the *descending axis*. The other portion ascends or elongates in an upward direction, and is called the *ascending axis*: the plane from which this separation takes place being called the medial line. The descending axis, with its ramification, constitutes the root, each member or branch of which is like that by which it was generated. The ascending axis has also divisions, the primary of which are called *branches*, and the secondary, or divisions of branches, *twigs*, if the structure is large; these latter, which are necessarily the youngest shoots, have alone the power of generating those lateral expansions which are named *leaves*. The only other part which is conspicuous, entering into the composition of the higher vegetables, is the flower, which, as we have before intimated, is formed of several series of parts, but these we will distinguish and name when dwelling upon this compound organism; the fruit, which is the result of the flower, may also be mentioned in this brief catalogue, which, like the flower, being conspicuous and popularly known, needs here no definition.

Although we have here enumerated the parts of a perfect plant, there are other organs which enter into its composition worthy of equal attention, if not of greater, with those just alluded to, by which the plant or its parts are generated: thus we have the *seed*, which is the generator of the entire structure, and the *bud*, which produces a portion of the more mature organism.

It may seem to many as commencing at the wrong end of our subject to start with the seed, as the last work performed by a vegetable structure is that of forming these organised bodies; nevertheless as it is from the seed that the entire structure springs, we deem it most expedient for our purposes to commence by giving it a due examination. The seed, then, may be defined to be a body composed of an embryonic plant, and integuments in which it is contained, the former concealing a latent power, capable of being stimulated into action; the result of the operations of which stimulating energy is the production of a plant similar to its parent.

Though all true seeds answer to the above definition, nevertheless there are two modifications of this organism, as we shall proceed to reveal.

If we take the seed of a plant, as that of the Oak* (*Quercus*), the acorn, for example, and proceed to analyse it, we see that it is composed of two large lobes (usually called the halves of the seed, as of the pea, &c.), which are united by a small central rod or axis† (Fig. 25). This little central rod is the axis of the mature plant in miniature; its lower extremity is a cellular tumour, which is destined to become the root; and its apex is surmounted with an embryonic bud, which is destined to be the origin of the stem. If, however, we take other seeds, as those of the Broad-bean (*Faba vulgaris*), or Scarlet runner (*Phaseolus multiflorus*), we still discern these parts, neither

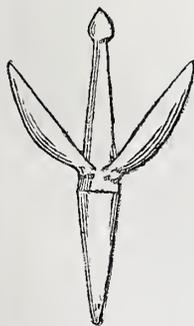

Fig. 25.

* The seed is in this example generated wrong way upwards; as the acorn stands in the cup, the root points upwards, it must therefore be inverted.

† In this figure the axis is enlarged, and the seed-lobes diminished, in order to make the idea more apparent.

more nor less, excepting that in some this miniature bud is more developed than in others. But upon observing the seeds of many Pine or Fir trees, we notice that instead of their having only two fleshy lobes, as has the acorn, bean, and pea, they have from four to twelve; in all other respects, however, they are alike.

Now, if we take a seed of the Maize, or Indian-corn, we find that it is possessed of one seed-lobe only, which more or less envelops the rudimentary axis; in other respects it resembles those with two or more seed-lobes. Thus a seed is possessed of one, two, or many seed-lobes; which differences, though seemingly insignificant, are of high importance, as will ultimately be seen. Relative to these we may say that those plants the embryos of which are possessed of two seed-lobes, and those possessed of many, are much more nearly allied to each other than to those with one seed-lobe only.

As we have glanced at the interior of the seed, which may be compared to the jewel, we have now to glance at its integuments, which are commonly called the skins of the seed. These may be compared to the casket, which is only destined to conceal and protect the jewel.

The integuments of seeds vary in consistency, texture, and colour: thus they are sometimes horny, as in the Acacia; sometimes leathery, as in the Broad-bean; and sometimes membranous, as in the Wheat: but as there are other points of greater interest to the ornamentist, we shall not dwell here. However, we must notice one point, which is, that the skin is penetrated by a small nearly circular aperture (*micropyle*), which is found in the Broad-bean at one side of the scar formed by its separation from the pod, while in others it is found at the summit of the seed.

The texture of the seed is various, and sometimes extremely interesting: thus the seed of the Water-cress (*Nasturtium*) is covered with beautiful reticulations; that of the Poppy (*Papaver*) with alveolar depressions; the Chickweed (*Stellaria*) with tubercular eminences; the Larkspur (*Delphinium*) is surrounded with ridges and furrows; the Toadflax (*Linaria*) with a membranous margin; and the Cotton (*Gossypium*) with a hairy coating: this texture may be the result of a modification of one skin, or more—for the skin of the seed is usually double or treble.

We have now to notice the relation existing between the embryonic plant and its integuments. First we observe that the relation between the position of the root portion of the embryonic plant and the integument is fixed; thus this root portion of the embryonic axis is invariably situated in, or points directly towards the small hole (*micropyle*), which we observed was always, more or less conspicuously, present in the skin; it, however, becomes more and more invisible as the seed approaches maturity, therefore in some seeds is not readily observable. Second, upon the form of the embryonic plant and the positions of its parts must depend the general contour of the seed: now, although we have named the parts found in the seed, these parts are not only of extremely diverse forms (as, for example, the seed-lobes of the Pea are hemispherical; of the French-bean, kidney-shaped; and of the Maple, long and narrow), but they are also wrapped up in various ways, which must necessarily give rise to the general form of the seed. We must now offer one or two general remarks, which must conclude our short paragraph on the dormant seed. We have said that the seed is composed of integument or skin, and an embryonic plant; in some seeds, however, there is laid up within the skin, besides the embryo, a little store of nourishing matter, the object of which we shall notice hereafter. Again: although the forms of seeds are so diversified, they are always pleasing and graceful. Relative to the colours of seeds, which are various, we can merely notice that they are derived from various sources: thus in the French-bean the ground colour of the skin is a low-toned pink, which is speckled with black—in which case it is solely derived from the integument; whereas, in the Green-pea the skin is of a pale-yellow colour, and is semi-transparent, which permits the dark-green colour of the seed-lobes to show through—in this case the colour is partly derived from the integument and partly from the embryo. The contrast usually exhibited between the colour of the scar caused by the separation of

the seed from the parent plant, and the general colour of the skin, is well worthy of notice; thus the skin of the Broad-bean is of a rich low-toned yellow colour, and the scar is black.

We have next to notice the germination of the seed. This has been defined* as the act by which the embryonic plant increases itself, and extricates itself from its integuments. Without entering into any reasons for this germinating work, or the manner in which it is accomplished, we proceed at once to notice the varied effects produced during different stages of this operation.

The first effort of the vital energy is exerted in lengthening the embryonic root, or the root portion of the axis; and after this has, by successive additions to its extremity, acquired a given length, the little bud surmounting the axis commences to develop, which development, combined with the stretching of the little ascending axis, or ascending portion of the axis, produces the stem with its leaves. The object of the root being first protruded is manifest, for it is through the root that the chief portion of nourishment is received into the vegetable organism, therefore it is necessary that it should be first developed in order that the plant may receive sustenance; after it has found congenial nutriment, the bud destined to give origin to the stem, &c., develops itself; thus beautifully do we again see adaptation to purpose carried out in the various parts of the vegetable structure.

The question here suggests itself, If the root elongates before nourishment is received into the organism, from whence is the matter derived by which it enlarges itself? All seeds are hygrometrical bodies, and therefore absorb water greedily; and all seeds contain a store of matter capable of organisation, which is deposited in various parts of this body, sometimes being situated between the skin and the embryo plant (as we before noticed), as in the Indian-corn, and Pimpernel (*Anagallis*), and sometimes being incorporated with the seed-lobes, as in the Acorn, Bean, and Pea. This substance being acted upon by the water which is absorbed, as well as by oxygen derived from the air, is converted into congenial nutriment for the young root to feed upon: thus the effect of germination is the impoverishment of other parts of the seed.

It will now be necessary for us to notice the nature of the parts found in the seed, so that we may be enabled to follow the various changes which take place in the plant as it advances towards maturity.

The embryonic axis, as we have before said, is analogous to the root and stem of the matured plant; and these seed-lobes, two of which we have found in the Bean and Pea, and one in the Indian-corn, are leaves of a simple character: thus we perceive that the embryonic plant contained in a seed is a perfect plant, of the most simple character; it has an axis, one portion of which forms the ascending axis or stem, and one portion the descending axis or root.

The first effect produced by the germination or sprouting of the seed is the rupture of its integument, which is always accomplished first by the protrusion of the young root, which, as we have before said, is the first act of germination; the second act however is variable, and upon this variation depends the aspect of the perfectly developed infantine plant. If we observe the seed of the common Pea, or French-bean, we notice that the second act of germination is the rapid development of the little bud which surmounts the axis, which, by its elongation, produces a stem protruding into the air, and developing leaves, first of a rudimentary character, but successively more and more complex, till we have ultimately the perfect leaf. If, however, we substitute a seed of the Lupin (*Lupinus*), or Goose-grass (*Galium*), for that of the Pea or Bean, we find that the second act of germination is not the evolution of the little bud surmounting the ascending portion of the axis, but a rapid elongation of a very short portion of the axis which is situated between the medial line, or line from which the plant elongates in two opposite directions, and the point of union of the seed-lobes with the axis (the *caulicle*),—the seed-lobes are necessarily situated on the ascending axis, as the descending cannot produce foliaceous organs of any description. By this rapid elongation of this small portion of the axis, these seed-lobes are

* E. Le Maout.

raised above the surface of the earth, where they separate, and become the first epigeal (above ground) leaves developed by the plant; whereas, in the former case, as the elongation of the axis takes place, almost, if not quite, exclusively above the point of union of the seed-lobes with the axis, these lobes must remain under ground. We may here, also, remark that when the seed-lobes remain under the earth's surface, or are hypogeal, they usually remain enveloped

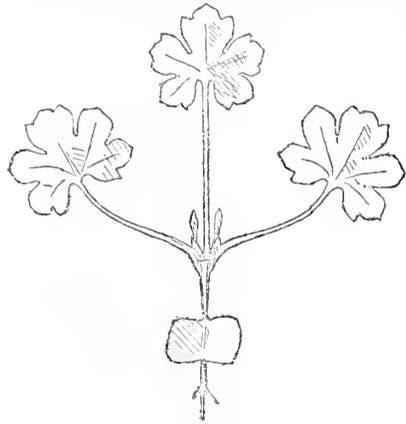

Fig. 26.

in the integument, with which they perish, both having completed the object of their mission—the latter by protecting the germ which it has safely preserved, and the former by feeding the infantine axis, and also by protecting the growing point; whereas, when the seed-lobes are raised above the earth's surface, they usually protrude, enveloped in the integumentary easement, which is thrown off by

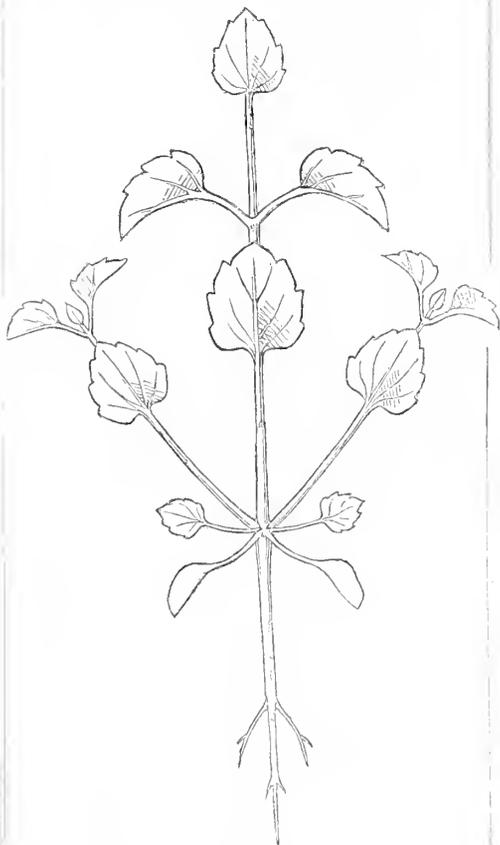

Fig. 27.

their expansion. Although we have not yet arrived as far as the leaf, we cannot pass without glancing at the various modifications of this organ set before us by the germinating seed.

The leaves developed by different plants are various, but upon this we shall dwell more fully hereafter; however, through variations in these developments, various effects are exhibited by young plants. These effects, though so extremely various,

may be aggregated for our purposes into two great classes, the first of which comprises those in which the second leaves entirely differ from the first in form (we speak of those appearing above the ground only), thus producing a decided contrast with them;

the second is that in which there is a gradual transition from the first to the ultimate leaf, each assuming a little less of the simple form, and more of the nature of the ultimate development: the former we shall call the sudden, the latter the gradual system

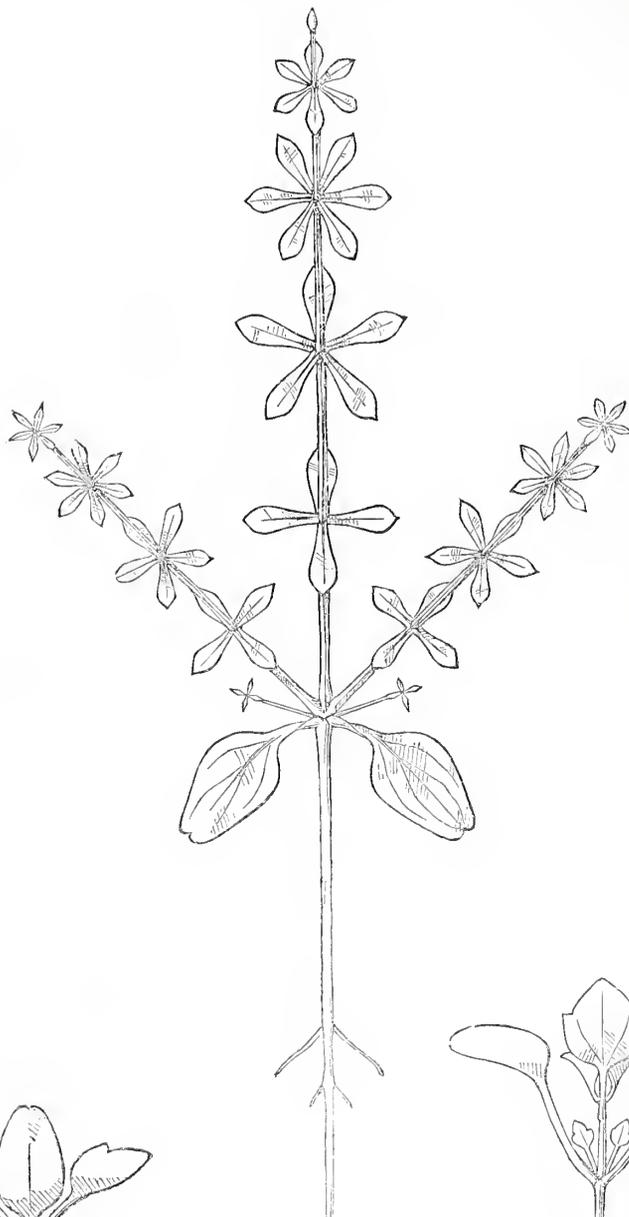

Fig. 28.

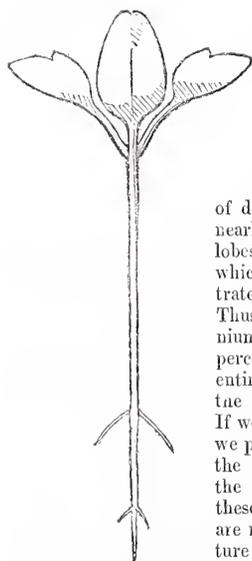

Fig. 29.

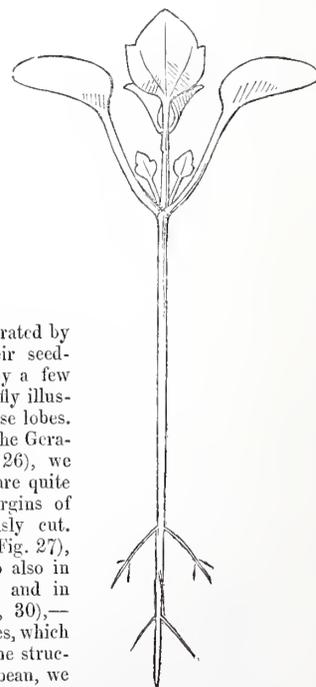

Fig. 30.

of development. The former is illustrated by nearly all plants which develop their seed-lobes above the earth's surface, and by a few which do not; while the latter is chiefly illustrated by those which do not raise these lobes. Thus, if we examine a young plant of the Geranium (*Geranium rotundifolia*), (Fig. 26), we perceive that these seed-lobe leaves are quite entire or undivided, whereas the margins of the future developments are variously cut. If we take the *Veronica Barbaeumii* (Fig. 27), we perceive a similar effect, as we do also in the Goose-grass (*Galium*), (Fig. 28), and in the Speedwell (*Veronic*), (Figs. 29, 30),—these, however, all raise their seed-lobes, which are necessarily the lowest leaves on the structure; but if we examine the French-bean, we perceive that, although it does not raise its seed-lobes, this contrast is produced—for the first leaves developed above the ground are un-

divided, while the future developments are trefoil: these first leaves, which are not seed-lobes, but are of a distinctly different form to the remainder, are named *primordial* or *root-leaves*. We have also

in certain cases a double effect of this nature: thus the seed of the dwarf Haricot-bean raises its seed-lobes and develops root-leaves likewise, from between which the ultimate trefoil leaves arise. Having thus

dwelt upon this sudden contrast, we must hastily glance at the gradual system of development. Let us now turn to the common Broad-bean (Fig. 31), and we at once perceive that its seed-lobes are not raised; and upon examining the first leafy development expanded above ground, we perceive that it is of a very rudimentary character, that the second assumes more of the character of the ultimate leaf,

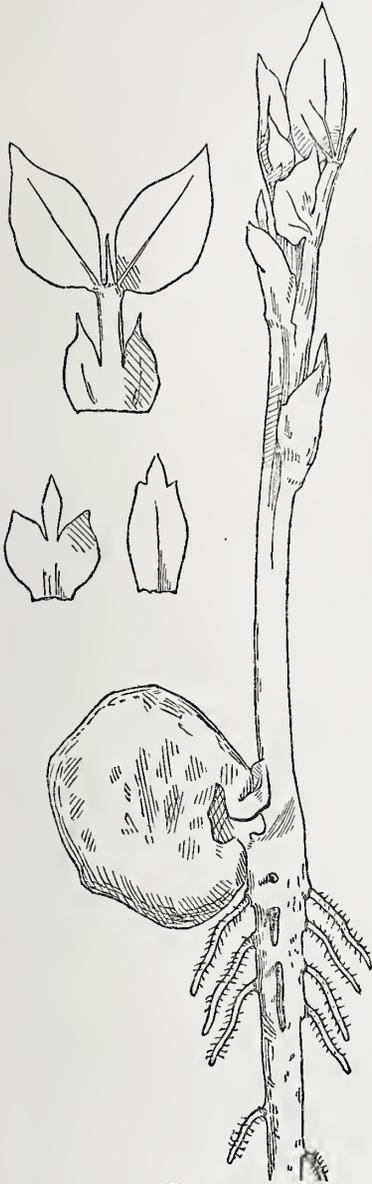

Fig. 31.

and that each is more and more perfect, till about the fourth or fifth, which has the ultimate form.

In those cases where the seed-lobes are raised, and we have still somewhat of the gradual effect, it is only owing to the seed-lobes, and the leaves proper being of similar forms; it is not therefore the

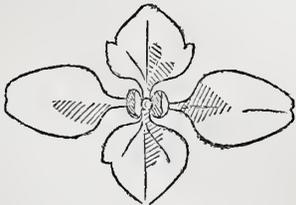

Fig. 32.

true gradual system of development, though somewhat similar to it in effect.

Before leaving the young plant, which is the result of germination, we must glance at its top view, which view of the Speedwell we here figure (Fig. 32); and it will be observed that here

we have an ornament precisely adapted for an horizontal position, or one which is to be viewed from above; and whatever may be the arrangement of the leaves, such will be the disposition of the parts of this ornament, as we showed in our first paper, save of the seed-lobes, which are generated at the first leaf-generating point on the stem, which, as we have just shown are one, two, or many in number, and are all arranged in a verticillate manner, whatever may be the disposition of the ultimate leaves. The germination of those seeds, the embryos of which have one seed-lobe only, is somewhat different; the Indian-corn, which is of this class, we here figure (Fig. 33).

It will be found for experimental purposes desirable to germinate seeds either in cut-up worsted or moss well damped; cotton, wool, or flannel will do, but the former are much the most convenient, as they do not entangle the roots, so as to necessitate injury by freeing them. The only conditions necessary for germination are the presence of air, heat, and moisture; heat above 32° and below about 90°, about 60° is a good average. In these circumstances, seeds will germinate and grow as long as the nourishing matter contained within the vegetable egg holds out a supply of organisable food. By damping the worsted with a solution of superphosphate of lime, they may in some cases be raised to a considerable height; we have raised a Scarlet-runner to three feet high in this way, when it was cut down by the frost; the growth is necessarily somewhat feeble.

Fig. 33.

THE APPLICATIONS OF IMPROVED MACHINERY AND MATERIALS TO ART-MANUFACTURE.

No. 4.—MOSAICS, MARQUETRY, BUHL, PARQUETRY, &c.

At a very early period man appears to have produced works of ornament by cementing together pieces of differently coloured stones and woods. The primary efforts in this direction were naturally rude, both in construction and in design. By degrees it became apparent that elaborate designs could be produced by this process, and hence we find geometric patterns of considerable intricacy were introduced. Eventually the art was brought to such a degree of perfection that the most delicate pictures were produced by it, with all the gradations of shade most beautifully preserved.

The origin of the term *mosaic* is doubtful. By some it is supposed to have been derived from *Moses*, who has been regarded as the inventor of the art—for this, however, there is no satisfactory evidence: others derive the term from *musa*, in the sense of beauty or elegance; while some, with some probability, refer the term to *muscum* (as signifying a grotto sacred to the Muses), many of which places were ornamented in this manner. The Italian *mosaico* evidently originated from the word *mosaicon* of the Byzantine Greeks; and the French *mosaïque* appears to be derived from the same source.

Under the same general term we find included, not merely the process of cementing together fragments of stone, cut into some determinate form, but also the production of works of Art, by inlaying, and in some instances by enamelling. Although the distinctions are in many cases to be drawn with much difficulty, yet, strictly, the term *mosaic* should be restricted, to the art of producing patterns or pictures by uniting together small pieces of stone or wood.

Mosaic-work had its origin, with many other ornamental arts, in the East; but we know not to what nation to refer its introduction. It is not improbable, looking at the luxury, sensual in every particular, of the chiefs of the ancient oriental empires; looking at the barbaric splendour with which the wealthy then surrounded themselves, that this kind of ornamentation may have arisen amongst them. It is true that *mosaics*, in the sense to which we restrict the term, have not yet been discovered

in the disintombed palaces of the oriental kings: but both Babylon and Nineveh have furnished us with examples of enamelling, which assimilate to the mosaics which were so beautifully made in Byzantium.

From the East the art passed to the Greeks, by whom it was brought to a high degree of perfection, and from them it extended to the Romans about the time of Sylla. With the increasing luxury of this great people, we find an extension of every art which could be regarded in any way as indicating the possession of wealth. Not merely was the construction of mosaics of every kind largely encouraged,—since the time expended upon even the simplest work of this kind was considerable, and hence the product costly,—but the value was enhanced to an enormous extent by the introduction of the rarest gems, coloured glasses,—then rare and expensive,—and even the precious metals.

Wherever the Roman arms opened up the paths along which Roman civilisation was to spread, we find the evidences of Roman luxury and splendour indicated in the ruins, which time has left us to tell their instructive story. Temples, and palaces, and tombs, are equally marked by productions of the class we are considering, either on their pavements or on their walls. Throughout Italy examples of mosaics, in all their forms, are sufficiently common; and even in this country we have found some choice examples, marking the period during which our island was a Roman colony. When in the fifth century the arts and sciences were driven from Italy by the distracted state of the country, this art was preserved by the Byzantine Greeks. For several centuries the production of mosaics was confined almost entirely to this people, and the mode in which they employed the art is well illustrated by the copies of characteristic works which are to be found in the Byzantine Court, in the Crystal Palace at Sydenham. In the thirteenth century it was restored to Italy, and being peculiarly suited to the Italian character, it rapidly advanced to its highest degree of perfection. Clement VIII., at the commencement of the seventeenth century, had the whole of the interior of the dome of St. Peter's ornamented with this work. At this time valuable paintings appear to have been first copied in mosaics with extraordinary care; the Martyrdom of St. Petronilla, by Guercino, and Domenichino's Communion of the dying St. Jerome, were, amongst other great artistic productions, thus treated. The object in these cases was to secure for ever, in an unchangeable and consequently imperishable material, the productions of the highest Art. The art is said to have taken this direction from the discovery of a new cement, by Giambattista Calandra, which secured the most perfect adhesion of the pieces, one to the other, and also to their bedding. In the eighteenth century a school for mosaic was opened in Rome, by Peter Paul, of Christophoris, and many of his scholars attained to the highest degree of excellence. Such is a rapid sketch of the progress of the art of mosaic, advancing slowly, but steadily, from the rude design made up of but roughly formed stones to the most perfect copies of the master-works of Art.

It may not be out of place, as showing the early perfection obtained by the Romans in the art of mosaic, to describe one or two of their productions, of which we have the examples amongst us. The Roman station of Corinium, the modern Cirencester, furnishes us with several choice examples. Professor Buckman, in his "Remains of Roman Art," thus describes one of the rooms discovered in digging a cellar:—"The form of the room would appear to have been a parallelogram, surrounded on four sides by an elegant labyrinthine fret of blue stones, the intermediate spaces being filled up with white freestone tessellæ. The space without the borders, judging from what remains, was entirely occupied by marine subjects. From what might have been the centre of the apartment is a portion of a wheel, being pushed by an attendant Cupid; this probably belonged to a chariot, which, from surrounding Neptunian objects, we might conjecture was that of Neptune himself. Another Cupid is riding on a dolphin, whilst portions remain of what was doubtless a well-drawn figure of a Nereid, sitting on a dolphin of larger size than the previous one. The filling up of the field of the floor is occupied by the following subjects:—marine Dragons; the Sea-leopard; the Sea-horse; Fishes, in which the Conger Eel is

conspicuous; the Lobster, Crab, Star-fish; spiral Shells of different species, and bivalve Shells. So that this room, when perfect, must have presented a complete cabinet of marine natural history. . . . Some of the shells are admirably drawn; as an instance of this, we have the Tellina as an example of the drawing of a bivalve shell, with the yellow internal colouring faithfully imitated. Again, the idea of the fluidity of the medium in which the animals are sporting themselves, is finely given; the rotundity of the parts, and the smooth yet crisp outlines of the tails, in the varied motions of the sea-monsters, all betoken that freedom of action which can only belong to beings habituated to a movable element like water."

The materials with which the artists of Corinthum had to work were but few. The following is the list given by Professor Buckman:—White—*chalk*. Cream colour—*hard fine-grained freestone from the great oolite*. Grey—*the same stone altered by heat*. Yellow—*oolitic and Wiltshire pebbles*. Chocolate—*old red sandstone*. Slate colour or black—*limestone bands of the lower lias*. Light red, dark red, and black—*terra cotta, from the clays of the districts*. Transparent ruby—*glass, coloured red by the oxide of copper*.

Such examples as these show the state of advancement to which this art attained in Roman Britain; many other similar examples might be given if it were necessary to do so. In the natural course of things, we might expect that the introduction of ornamental work of this kind would lead to many modifications.

Shrines and altars were adorned—chiefly in the Byzantine style—regardless of cost. Stones, glass, and jewels, were employed in the process of inlaying, and the splendour of these enrichments of sacred spots was thought to mark the piety of the wealthy donor, who usually defrayed the cost as an offering to the church of his adoption. Upon these, however, it is not our purpose now to dwell. Eventually, in Florence, a new style of ornamentation arose, in which larger pieces of stone were employed than in the Roman mosaics. The Florentine style was attended with more trouble in the selection and workmanship than the Roman, as from the size of the stones used, perfectly coloured pieces were more difficult to obtain, and a considerable amount of labour was expended in shaping and fitting them to each other. The difficulties of the Florentine mosaic-work, and its great cost, led to the adoption of wood instead of stone—the naturally coloured woods being employed in some cases, and dyed woods in others. The extravagance of Florentine work may be judged of by a statement of the materials employed, as given by Mr. Digby Wyatt:—"The materials employed are jasper of various colours—agates, chalcedony, lapis lazuli, and other stones, rendered suitable by their colours, hardness, or polish. Oriental alabaster, giallo antico, &c., are also used, and are valuable from their beautiful colour and polish, though less hard than the above: occasionally other substances, such as mother-of-pearl and coral are introduced. The ground is sometimes made from *rosso antico*, but more frequently *nero antico* is used, and occasionally porphyry and other stones of equal hardness. The subjects formerly represented were principally scrolls and conventional ornaments, to which a taste for the execution of landscapes and architectural subjects, such as the Pantheon, the tomb of Cecilia Metella, &c., succeeded. The result was, however, unsatisfactory, as the inlaid agate-work, being entirely dependent for its colour and gradations of tint upon the natural colours of the stone itself, is fit only for subjects involving simple forms and but few different tints. Flowers, foliage, shells, and vases, are the subjects now most frequently represented, and these are mostly made up in tables, paper-weights, brooches, vases, &c." Such is the practice in modern Florentine work: many imitations—and most successful ones—of which are produced in Derbyshire and elsewhere. We propose in a future article to examine the present state of this ornamental art in this country.

The modern mosaic manufactory at Rome differs but little, as it regards its general manipulatory details, from the practices which prevailed in the seventeenth century.

The process now adopted at Rome is as follows: a metal plate of the required size is surrounded by a

margin of about three-quarters of an inch in height; it is then covered for about a quarter of an inch in thickness with a mastic cement, composed of powdered Travertine stone, lime, and linseed-oil: when set, this is covered to the level of the margin with plaster of Paris, on which is carefully traced the outline of the picture intended to be copied: from time to time portions of the plaster are removed with a fine chisel to allow the insertion of small pieces of *smalto*. The *smalto* is composed of glass coloured by different processes. It is prepared in circular forms, about half an inch thick, and about six or eight inches in diameter. Nearly ten thousand varieties of colour are kept in readiness in the stores of the Papal 'Fabrica,' and from them the artist separates a piece of the required tint, which he brings into the shape he requires by placing the *smalto* upon a small metal edge, and striking it with a hammer of a similar form. The *smalto* is thus broken as far as possible into the form desired, and it is afterwards ground with emery powder upon a lead wheel until the precise size and form are obtained. The piece is then bedded in its proper position, having first been moistened with a little cement; and the process is repeated till the whole picture is finished, when it is ground down to an even face and polished. For the manufacture of minute mosaics the *smalto* is reduced into thin sticks or rods.

For this account we are indebted to the admirable report of Mr. Digby Wyatt, on Furniture and Decoration in the Paris Exhibition. Those who are interested in knowing the details of the process may examine it, and a fine set of Roman mosaics, in the Museum of Practical Geology.

To turn our attention to mosaics in wood, which, we have said, originated in Florence, it may be stated in brief that *tansia* or *tarsia*, as it was called, was much used for the decoration of churches and palaces of the ecclesiastics and rich merchants of Florence, Sienna, and Pisa, as well as in their furniture, in which great richness of ornament prevailed; "and," says the authority already quoted, "there still exists a series of pictures in the chapel of the Palazzo della Signoria, at Sienna, said to have been designed by Taddeo Bartolo, in the beginning of the fifteenth century, and executed in black, brown, and light-coloured woods."

Vasari informs us that the best works of this class were executed at Florence, and the Filippo di ser Brunellesco, and Benedetto de Mariano, were the chief artists in wood. Giovanni de Verona extended the art by giving artificial colours to the woods employed, by means of "waters—coloured infusions—and penetrating oils;" to obtain high lights he was accustomed to use delicate slips of willow. From Italy the *tansia* or *tarsia* passed through Germany into France, where it received the name, by which it is generally known, of *marqueterie*, from *marqueter*, to spot. The museums of Dresden, Berlin, and Munich, contain numerous examples of the wood mosaics of the period of the Renaissance. In the sixteenth century Cologne became the centre from which a very large number of inlaid articles of furniture were spread over northern Europe, and especially France.

In France, *Bonte*, or *Buhl*, and *Reisner*, were two celebrated cabinet-makers, who have given their names to peculiar varieties of inlaid-work which are well known. Buhl was born in 1642, and died in 1732: he was appointed to an office, "Tapissier en titre du Roi;" Reisner, in the succeeding generation, was appointed "Ebeniste de Louis XVI."

Buhl-work consists of inlaid veneers, and differs from marquetry in being confined to decorative scroll-work, frequently in metal; while the latter is more commonly used for the representation of flowers and foliage; the process of buhl-work will be described in a future article.

Reisner's work was of the most exquisite finish, both of adjustment and surface. His woods are frequently stained, but never to such an extent as to mask the play of light in the fibre. D'Alembert says the wood forming the base of the marquetry was not cut down for the insertion of the ornament until after the veneer had been glued down to the surface of the work. This enabled the ornament to be sawn out rather full, and then adjusted to a microscopic joint by filing down the edges. It was in this way that those extraordinary fine lines, too thin for the passage of any saw, were obtained, which

seem so astonishing in the joints of Reisner's finest work.

Mosaics in wood were introduced for flooring probably about the same time as marquetry became employed for altar decoration. Floors of this description are usually termed *parquetry*, from the French *parquet*. Elms, in his definition of the term, says—"A species of joinery or cabinet-work, consisting in making an inlaid floor, composed of small pieces of wood of different figures." Since the term *parquet* signifies the bar in a court of justice, and the place close to the pulpit where the ministers and elders of a French Protestant church sat together, *parquetry* has been thought to owe its name to the fact of the flooring of these parts—the most sacred—being formed of inlaid woods. The name may, however, be derived from *parquer*, to pin up, as indicating the mode in which the pieces were fastened together. Marquetry is, however, commonly applied to the inlaying of woods for the decoration of furniture, and representing generally fruits and flowers; while *parquetry* is used almost exclusively to signify wood mosaic flooring, or similar decorations, applied to the sides of an apartment. Usually, *parquetry*, or *parqueterie*, consists of thin pieces of differently coloured woods, veneered upon some less expensive material. The cost of this kind of work was considerable, and its durability not great, owing to the thinness of the veneer, and the liability of it to break away from its base.

Our attention has been lately directed to the solid Swiss *parquetry* introduced into this country by the Messrs. H. and A. Arrowsmiths, of Bond Street. This manufacture is made solid throughout, and every portion of the ornamental woods which form the patterns is grooved and tongued together, and fastened with marine glue; this admits of its being fixed at once upon the joists when used for flooring. This *parquetry*, as its name indicates, is constructed in Switzerland. By steam saw-mills and other machinery the pieces of wood are cut, about one inch in thickness, and of the required shape; these are carefully tongued into one another, and, where it is possible, grooved together: in many cases solid lines of the pattern running through all the work. In this way the utmost degree of solidity is given to the *parquetry*. In France this new manufacture is largely employed; the *ehâlet* at the Bois de Bologne, near Paris, is fitted up with it; and the apartments at St. Cloud, which were occupied by the Queen and Prince Albert during their late visit to the Emperor of the French, were fitted up with the Swiss *parquetry*. It is our intention, in a future article, to describe the minute details of the manufacture of wood mosaics, and consequently of *parquetry*; we have only now, having sketched the progress of this Art-manufacture from the earliest period to the present time, to name a few of the important advantages of this novel solid *parquetry*. It is an inch thick, and solid throughout, the only difference in the two sides being that the upper one is rubbed down smooth and polished. It is excessively durable, being made of the hardest woods, well seasoned, as the oak and walnut, &c. Another special recommendation is its cheapness. In Switzerland, where labour and timber are plentiful, the designs in the softer woods cost 1s. per square foot, while the richer and handsomer patterns in hard woods are 2s. 6d. per square foot; patterns composed of both kinds of wood intermixed, 1s. 6d. and 1s. 9d. per square foot.

This *parquetry* has been employed not only for floors, but for ceilings and walls; and as it can be at once fixed in its place, all delays and inconveniences are avoided. The ball-rooms at the Turkish embassy, the entrance hall at Sandon Hall, and some parts of the House of Lords, are fitted with it.

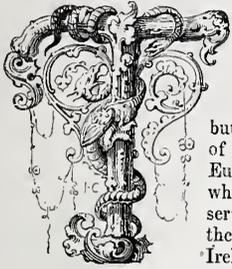

There is so much to admire in the very chaste geometrical designs in which this wood mosaic is now made, that we argue from its introduction an improved taste in house decoration. We have seen at Messrs. Arrowsmiths' some charming designs of Swiss *ehâlets*, entirely constructed of this solid *parquetry*. We understand that these will very shortly be introduced to this country, when we shall take the opportunity of returning to the subject, and of presenting our readers with some of the designs in which it is proposed to construct them, and of giving additional information on all the varieties of mosaic manufacture.

ROBERT HUNT.

BRITISH ARTISTS: THEIR STYLE AND CHARACTER,

WITH ENGRAVED ILLUSTRATIONS.

No. XXIII.—ALFRED ELMORE, R.A.

THE birth-day of Mr. Elmore was a day that will ever be regarded as a great day in the annals of the British empire; not, however,—and we say it with all the respect due to his talents,—because it introduced an excellent artist into the world, but because it is associated with an event on the issue of which depended the peace and the liberties of Europe: he was born on the 18th of June, 1815, while the armies of England, in which his father had served, were engaged on the plain of Waterloo in their final struggle with the hosts of Napoleon. Ireland has the honour of being the birthplace of several of our most distinguished artists, and of these

the county of Cork claims the larger proportion, and among them Mr. Elmore, who was born at Clonakilty, or Cloughnakilty—the latter orthography being, we believe, that more generally adopted in Ireland. His father, Dr. Elmore, was a distinguished army-surgeon attached to the 5th Dragoon Guards, but he retired from active service at the conclusion of the Peninsular war.

In the history of almost every individual there is to be traced some incident which develops the latent feeling or bias of the mind: in the case of Mr. Elmore we have heard that a picture of the "Dead Christ," said to be by Van Dyck, which his father had purchased abroad and taken home, so riveted the attention of the boy that he resolved to become a painter. Dr. Elmore offered no opposition to the choice of his son, and the family having removed to London when the son was about twelve years of age, no unnecessary time was lost in carrying out the wishes of the latter. Happily Dr. Elmore was in a position to afford his son the best means of pursuing his studies; he commenced with drawing the sculptures in the British Museum, and after

working assiduously at these for about six months, entered as a student into the schools of the Royal Academy: this was in 1833. There are few young artists unambitious of seeing their names inscribed in the catalogues of the Academy; it is a natural desire, and laudable in itself, though not always attended with the most satisfactory results to the self-complacency of the tyro in Art. The year following Elmore's entry at the Academy, he sent a painting to the exhibition, entitled "A Subject from an old Play." The three years that succeeded were employed in gaining strength for another trial; he sent, in 1837, to the British Institution a picture of "Christ Crowned with Thorns;" and, in 1839, to the same gallery "Christ Crucified," a work no doubt resulting from the study of the picture belonging to his father. It may appear like an attempt to exalt unduly our powers of critical judgment to repeat what we said of this picture at the time it was exhibited, but the future career of the painter has almost entirely confirmed the truth of our remarks, which were these:—"This artist has essayed a lofty flight, and has not fallen; his wings, though scarcely fledged, have proved strong enough to bear him up, and enabled him to join in harmony with hardier and more experienced mates. It is rarely that the higher class of Art is attempted, and still more rare to find the attempt successful. Under no circumstances are we disposed to check a noble effort; but we must rejoice when we find it hazarded upon good and substantial grounds. . . . Mr. Elmore, we understand, is young; if he progresses as he has commenced, we shall ere long add another name to our limited list of great English masters. . . . The picture is admirably conceived; its simplicity adds greatly to its effect; the interest is concentrated: there are no groups of lookers-on to break it into bits—no scattered objects to distract the eye from the engrossing *one* design of the picture. . . . The drawing of the group is fine; the anatomy of the Saviour's figure preserved with masterly accuracy and truth. The picture has its faults; the colouring is raw and crude, and the face of Mary Mother far too aged: but we perceive even in this defect a proof of genius," &c. &c. This was Mr. Elmore's first and last attempt at sacred Art; few English painters have the courage to persevere in a course which, whatever honour is attached to it—and this, unhappily, is but grudgingly bestowed by the great majority of our professing amateurs—brings with it little else. There is, however, less apology to be made for Mr. Elmore in forsaking this department of Art than for most other young artists, as he has always been, we believe, peculiarly

HOISPUR AND THE FOP.

[J. and G. P. Nichols.

independent of his profession. A new field of observation was, however, soon to open up before him, and draw his attention to matters possessing a different interest: the noble and varied subjects of Scripture gave place to the stories of fiction and the narratives of secular historians. Still we cannot but regret that he should altogether have forsaken his earliest attachment—the highest themes with which the mind of man can be occupied, with whatever view he contemplates and studies them; we have so few painters who attempt to carry their art into the hallowed and sublime regions of biblical truths, that we can ill spare one whose first essays promised well for the future.

In 1840 Mr. Elmore sent to the Royal Academy a large picture, "The Martyrdom of Thomas à Becket;" it was a commission from Mr. Daniel O'Connell, and is now in a Roman Catholic church in Dublin, where also is the "Crucifixion," exhibited during the preceding year. The "Martyrdom" is painted in a style that shows the artist's powers had made considerable

progress both in conception and execution: the subject presents numerous difficulties for a young painter to grapple with; but the fact of his picture being thought worthy of a place in a metropolitan church is sufficient evidence of the good opinion entertained of it.

At several periods between the years 1833 and 1839 Elmore visited Paris, to study the works of Art in the Louvre; and he also attended one of the "Life Schools" in that city. In the summer of 1840 he set out for Italy, taking Germany in his route, and visiting the galleries of Munich, Dresden, and others of note. At Munich he remained three months, studying the ancient and modern pictures that abound there, and also drawing in the Academy. Thence he passed on to Venice, remaining there about the same time, to make himself acquainted with the works of Titian, Tintoretto, and the great colourists of the Venetian school. From the shores of the Adriatic he travelled to Bologna, Florence, and Rome, thus visiting in succession the chief

schools of ancient Italian Art. Tempted by the multitude and variety of the Art-treasures in Rome, he was induced to remain there nearly two years, and during his residence painted several pictures, some of which were exhibited after his return to England in 1842. We omitted to mention that before he departed for Italy he exhibited some small pictures at the gallery of the Society of British Artists, in Suffolk Street.

The first-fruit of the Italian expedition was seen at the British Institution in 1843: the picture was called "A Window in Rome during the Carnival," a title that explains the subject. The work bears abundant evidence that the country in which the artist had lately sojourned, and the art and nature he saw there, had effected a complete revolution of all his previous ideas and practice: the colouring of Titian, and the dark eyes and rich complexions of the Roman ladies, had left a visible impress upon his mind, and they shone out on his canvas with a free and rather sketchy style of handling. In the same year he exhibited at the Academy "The Novice;" it represents a young monk seated at the door of the convent, for whose solitude he has left busy life and his former companions, of whom a number are seen in the distance enjoying their usual diversions: the world and the cloister seem striving for the mastery in the heart of the recluse—

"For who, to dumb forgetfulness a prey,

Left the warm precincts of the cheerful day,
Nor east one longing, lingering look behind?"

This is doubtless the sentiment intended to be conveyed, and it is forcibly

expressed in the countenance of the principal figure. The picture was sent to the British Institution in the following year, but both here and at the Academy it was hung so high as to be almost beyond critical examination. So also was another work by the same hand exhibited—or rather *hung*, for we cannot say it was *exhibited*—at the British Institution in 1844; and in the latter case the act of the authorities was the more to be regretted, because the pictures in question chanced to be the only landscape we ever remember to have noticed from the pencil of Mr. Elmore: it was entitled "An Italian Corn-field," in which, so far as our memory serves us, a group of figures occupied a prominent place on the canvas. "Rienzi in the Forum," exhibited at the Academy in 1844, was a fine subject in the hands of a young artist whose imagination was filled, by a long residence on the field of action, with visions of the past glories of Rome. The picture was commenced in Rome, but not completed till some time after Elmore's return to England. The "Last of the Tribunes" is represented haranguing the multitude who assemble to hear his summons to shake off the yoke of the oppressor; beside him sits Petrarch, listening to the words of the orator with a countenance indicative of hearty sympathy with his appeal to liberty, while the rest of his hearers, by their gestures, action, and excited faces, show that the words of the speaker do not fall upon heavy and unwilling ears: the composition is very spirited, and the individual characters are all well sustained. The picture attracted great and deserved attention, and at once pointed out its author as a rising star in our artistic orbit.

When the "Cartoon Exhibition" was opened in Westminster Hall, in 1845,

THE INVENTION OF THE STOCKING-LOOM.

J. and G. P. Nicolls.

we quite expected to see Mr. Elmore's name among those of the exhibitors, recollecting that his earliest efforts were directed to the highest Art-subjects, and that here was an occasion for the fullest exercise of his powers: but neither at this time, nor in 1847, when the artists once more lined the walls of the ancient Hall with their works, was he a contributor. Pursuing our course, from where we left off, in chronological order, we find him exhibiting, in 1845, at the Academy, "The Origin of the Guelph and Ghibeline Quarrel in Florence," as related by Sismondi, who says, that—"In 1265, a member of the family of Buondelmonte being on the point of marriage with a daughter of the Ghibeline house of Amidei, a noble lady, of the family of Donati, invited him into her room where her women were at work, and lifting the veil of her daughter, said, 'Here is the wife I had reserved for thee. Like thee, she is a Guelph, whilst thou takest one from the enemies of the church and thy race.'" The result was, that Buondelmonte married the Guelphite lady, and thereby roused the deadly anger of the opposite party:—

"What great events from trivial causes rise!"

The centre figure in the artist's composition is the daughter, from whose face her mother is withdrawing the veil. Buondelmonte salutes her, and is evidently struck with the beauty of her person, though the young lady certainly does not exhibit those charms which would offer some apology—if any can be admitted—for the violation of a pledge entailing also with it intestine national feuds. The great merit of the picture is the expressive power and feeling with which the story is told on the canvas.

"The Fainting of Hero," the scene in "Much Ado about Nothing," was exhibited in 1846, at the Royal Academy, of which Mr. Elmore was now an Associate member. The picture is full of figures, ranged in two almost distinct groups, those who assist the fainting lady, and the other, the bridegroom Claudio and his friends. Notwithstanding the existence of two or three comparatively trifling objections, which we pointed out at the time, the picture is one of undoubted excellence, and fully justified the choice of the Academicians in electing the artist into their Society.

Mr. Elmore's last appearance on the walls of the British Institution was in 1847, when he exhibited a small picture entitled "Bianca Capella." To the Academy he sent "THE INVENTION OF THE STOCKING-LOOM," a work of original character, and most successfully treated: it has been engraved on a large scale, and it likewise forms one of our illustrations. Another contribution of this year was "Beppo," with Laura and "her adorer," just landed from their gondola: the three figures well sustain the description of the poet.

Unquestionably the best picture which Elmore had hitherto produced was that sent to the Academy in 1848, "The Death-bed of Robert, King of Naples, surnamed the Good and the Wise;" the event, as illustrated by the artist, is described in Mrs. Dobson's "Life of Petrarch." The composition contains numerous figures grouped with masterly skill and effect; but the great point of interest is the head of the dying monarch, which evidently had been carefully studied. The whole work shows more finish than the painter's previous productions. In 1849 he exhibited three pictures, the highest number he ever

sent to any gallery. The first was called "Religious Controversy in the time of Louis XIV.:" the discussion takes place between a Huguenot minister and a Capuchin friar, in the presence of a dignitary of the Romish Church, and the family of the owner of the mansion in which they are all assembled. The calm bearing of the apostle of Protestantism is well contrasted with the impassioned gesture of the Romish priest, while the non-disputants seem deeply engrossed by the arguments of the controversialists. The second presented a scene of a totally different character, "Tristram Shandy" giving instructions to the tailor at the shop-window of the latter: the heads of these two figures are very fine, and full of character. The third picture was "Lady Macbeth" listening while she expects Banquo is being assassinated. The disposition of light and shade in this work is not among its least valuable characteristics, and is well suited to the subject.

In 1850 we had two pictures,—one, "Griselda," from Chaucer's "Clerk's Tale;" the lady is represented depositing the vase she has carried on the steps of the "threshold," in the presence of her father and the marquis; other figures are introduced into the composition as subordinates, according to the text of the poet, whose description the painter has closely followed and carefully studied: the tone of colour in this picture is lower than

Mr. Elmore generally adopts. A graceful and elegant little picture is the other exhibited at the same time,—"The Queen of the Day," suggested by Boccaccio's "Decameron." The principal figures in the composition are a youth and a young girl, who have separated from their companions, and are resting beneath a group of trees; the youth is in the act of placing on the head of the damsel a chaplet of flowers.

"HOTSPUR AND THE FOP," exhibited in 1851, and engraved on a preceding page, is, we think, one of the happiest conceptions of this clever and painstaking artist; each of the groups between which the trimly-dressed lord stands, is finely composed, and the contemptuous looks of Hotspur in the one group, and of the stalwart soldier assisting to carry the dead soldier in the other group, are inimitably expressed; and what an unmistakable portrait of a fop of the olden time is portrayed in the centre figure! with what an air of disgust he waves off the party who would

—"bring a slovenly, unhandsome course
Betwixt the wind and his nobility!"—

we wonder not that Harry Percy should feel sore pestered by such a popinjay, and his "bald, disjointed chat." By the way, Percy seems much older than Shakspeare has taught us to consider him at this time.

Engraved by

THE NOVICE.

[Dalziel Brothers.]

In 1852 Mr. Elmore exhibited "A Subject from 'Pepy's Diary.'" "Mr. Hale begun my wife's portrait in the posture we saw one of my Lady Peter's, like a St. Katherine: while he painted, Knipp, and Mercer, and I sung." The subject was not one suited to the talents of the painter; at least, that was the impression it made upon us at the time. Another, "THE NOVICE," engraved on this page, pleased us infinitely more; she is seated in a room of her convent, listening, perhaps, with some secret desire to be a participator in the festivities that are going on without, for it is a day of high carnival, as we learn from what is shown through the window of the apartment, in the open doorway of which some elder members of the sisterhood—one of whom is probably the Superior—are approaching the chamber of the novice.

Since the year 1852 Mr. Elmore has exhibited but two pictures; our space will only admit of our giving their titles,—one, in 1853, "Queen Blanche, Widow of Louis VIII., ordering her son, Louis IX., from the presence of his Wife;" and the other, exhibited last year, "Charles V. at Yuste;" the latter, for originality of treatment and powerful colouring, must be considered as the artist's *chef-d'oeuvre*.

In the February number of the *Art-Journal* of this year, we stated that Mr. Elmore had been elected Royal Academician; he has well earned the honour conferred upon him, but, at the same time, we must think him a very

fortunate person to have received such speedy justice at the hands of the Academy; he has known little or none of that "hope deferred which maketh the heart sick." While others—men of acknowledged talent, too—have been knocking, so to speak, through long and weary years unsuccessfully at the doors of the Academy, Mr. Elmore appears to have been admitted almost as soon as he presented himself at the threshold. On reckoning up the number of pictures he has exhibited there since 1834, a period of twenty-two years, we find them to be nineteen, or not one *per annum* on an average; and he had exhibited *five* only when he was elected Associate. Such an instance of good fortune—for talent, unhappily, is not always recognised and rewarded as it ought to be—is, we imagine, without a parallel in the history of the Academy. He must not think these remarks imply the slightest dissatisfaction with the choice of his brethren, for it was in every way a right and a judicious choice; but we make them to show how easily some men, in comparison with others, find their way into the temple of fame. Mr. Elmore is an artist who follows no beaten track; he thinks for himself and works out his ideas in a spirit of independence, affording as great pleasure in the novelty of the subjects he places before us, as by the skilful and effective manner in which they are treated. We should be glad to see him more often than he pleases to show himself on the walls of our Academy.

RAMBLES IN ROME.

No. II.—THE GALLERIES OF ANCIENT ART.

It requires the revolution of many centuries, and the decay of the greatest nations, to form a museum like the Vatican. In it we study the soul of past ages, we trace the aspirations towards the grand and the beautiful—from the first archaic forms of Greece, scarcely freed from the mannerisms of ancient Egypt, through the youth up to the manhood of Art, and are lost in contemplation of the superhuman efforts which gave to the world sculptures like the Apollo:—

“All that ideal beauty ever blessed
The mind with, in its most unearthly mood.”

Ideality and truth are here so exquisitely blended, that, while the anatomist may detect the latter quality, the poet may recognise another phase of his own Art, “which makes the stone live.” After wandering over the countless chambers of this marvellous museum, the student leaves them with a nobler idea of human nature; he feels that man was really made from a god-like mould, and that the mind with which he is endowed is indeed immortal. The fire of Greek and Roman genius still burns unquenched here; it reasserted its prerogative after ages of neglect; it stimulated and evolved the latent genius of the middle ages; it received the acknowledgment and worship of the greatest men in Art—Raffaello and Michael Angelo—it guided their taste; and, as years roll on, the admiration of all true connoisseurs increases towards those noblest works of human genius.

An old traveller of the last century has correctly characterised Rome as an inexhaustible treasure-house—“An exact survey of Rome would ask a man's whole life. After a dozen visits to every church, palace, or ancient ruin, something still will remain unobserved and worthy attention.” All other collections sink in importance after this of the Vatican. It contains enough to make the reputation of fifty museums, as we see them in the capitals of Europe. Statuary of the most wonderful kind is here so crowded and abundant, that the mind is bewildered with its quantity alone; and it is only by reflecting on the rarity of such works elsewhere, that we fully appreciate the rich storehouse in which we stand.

It is to the sculptor that Rome offers its greatest lessons in Art. Other cities may rival it in painting, but in sculpture it is still “mistress of the world.” A personal visit is absolutely necessary to fully appreciate the beauty of these works. Familiar as we are with the Apollo, the Laocoon, and other world-renowned figures, we shall fail in completely appreciating their beauty by the aid even of a cast; there is a delicacy of texture, a mellowness of tone in the marble which is lost in any copy: the latter is like having a peach without the bloom upon it. Worse still are the photographs with which Roman shops abound—they are hideous caricatures of noble works; some fault may result from bad manipulators, and worse lenses, but the yellow stains of age upon the marble producing heavy tints of brown over the surface of the photograph, is a difficulty which the new art has not yet surmounted, and is fatal to the beauty of such representations.

There are some few works in the Roman collections which demand attention for their antique formation, or historic interest; and of these, perhaps, the most remarkable is in the Museum of the Conservatori, on the Capitoline Hill. It is the famous Bronze Wolf, “the thunder-stricken nurse of Rome,” so nobly described in Byron's “Childe Harold.” Indeed, the English poet has re-invested most of Rome's monuments with a new interest by his magical inspirations; it is as if he had been imbued with the feeling which governed the ancient artists who conceived them, and he is the only fitting exponent of the thoughts they should convey.

Antiquaries have quarrelled over this figure as warmly as they have quarrelled over every antique site in the old city. There is scarcely a temple or ruin which has not been honoured by treatises to show what it once was, or was not; and the best of these labours frequently leave the student more bewildered, after much weary reading, than he was at the outset of his inquiry. This ancient bronze carries upon it marks of the early age in which it

was executed; the whole contour is in the severe style of Etruscan work—the hair on the mane and back is expressed by short, compressed curls, chased by the tool and arranged in close order; the head is equally archaic in treatment; but the twins, who are sucking the teats, are evidently of much more recent workmanship. It is believed to be the group mentioned by Cicero, as standing in the Capitol, a relic of sacred interest in his day. Consternation once seized the people when lightning struck it, as it was an omen of fearful import; the left hind leg of the animal still shows the effect of the blow, which has fractured and partially melted the metal. A prosaic antiquary recently deceased (with that love for writing more on a subject already exhausted, which characterises some few of the fraternity) promulgated a doubt on this very fracture, and asserted it to be a flaw in casting. To look on the figure is to see the folly of this. It is only noted here to record the love the doubters have for doubting. In the same spirit, the grand statue of Pompey in the Spada Palace has been questioned as that at the base of which Cæsar fell; but, after centuries of quarrelling, the old faith has triumphed, all reasonable doubts have been set at rest, and the spectator may apostrophise it in the words of Byron as—

“Thou who beheldest, midst the assassins' din,
At thy bathed base the bloody Cæsar lie.”

This stern and striking figure is the only one of note in the elegant little palace of the old Spada family. It was found in 1553, and ran risk of destruction at the moment of its discovery, inasmuch as one portion of it was buried under one house, and the other beneath the adjoining one; each proprietor quarrelled violently over his share, and, like the mothers before Solomon, determined to divide it between them; but the Pope, as wise as the Jewish monarch, quieted the combatants, and secured the figure for 500 crowns in gold. To have appealed to their pity or love would have been useless; the Pope more effectually appealed to their pockets. When the French, under Napoleon, played Voltaire's “Brutus” in the Coliseum, they carried thither this statue, and for their convenience lopped off the right arm. It is now restored, but the correctness of its position may be doubted. The statue is at present placed in a had situation, between windows which distract the spectator with cross lights. It is not always that a statue has the honour awarded to the Venus of Milo, at the Louvre; the goddess there occupies an entire saloon, and the most ordinary visitor is impressed with the due feeling of respect and attention so great a work of Art should receive. In the Vatican this honour is awarded to three works only—they are the Apollo, the Antinous, and the Laocoon; had the same been granted to many others deserving honour, Rome itself would be too small to contain temples to hold its statues.

The decay of old families has deprived Rome of many Art-treasures once within its walls; but the private palaces still contain many gems of price. A short walk without the walls to the Villa Borghese will exhibit a sample of the riches which once filled the houses of the Roman nobles. The entire ground-floor of this palace is devoted to ancient Art. Its floors are inlaid with mosaics, possessing the greatest interest, and its collection of statuary is admirable. There are, however, two instances here of bad antique work, which may be useful in teaching us to check mere blind admiration for all that is old. There is a group of Antiope combating Hercules and Theseus, in which the figure of Antiope is out of all proper proportion; and the same may be said of a Cupid seated in the lap of Venus in an adjoining room. A very unsightly effect is sometimes produced by the props left in the marble. The Gladiator with the Strigil, in the Vatican, is a remarkable instance: here a prop stretches from the thigh to the extended arm of the figure: it is a solid bar of marble, destroying the flow of line which is the charm of statuary.

On the other hand, let us do justice to the greatness of antique Art, even when contrasted with the greatest names of modern days. The enthusiasm of Michael Angelo for the works of the ancients is part of his history, and the world-renowned “Torso” of the Vatican still exists to prove the soundness of his admiration. Yet this great man, with all his love and reverence for the labours of the great sculptors

of old, failed when he ingrafted his work on theirs; and he did it in all respect and admiration. He restored the right arm and toes of both feet on the statue of the Dying Gladiator; but the restorations are stone, not flesh, as the rest of the marble appears to be, by the superhuman genius of its manipulation. The foldings of the skin at the knuckles are indents, not anatomy. The group of the lion attacking a horse, now placed in the court of the palace of the Conservatori, has the horse's head, neck, and legs, added from the same studio; but they are not classic, and form lines and angles uncharacteristic of the high Art of ancient times.

In a city abounding with galleries public and private, the visitor is continually meeting with unlooked for treasures; thus the Corsini Palace in the Trastevere has in its picture-gallery two antique marbles of rare beauty. One is a Greek chair, enriched with sculpture of the most delicate kind; a work of the greatest refinement. The other is a small figure, not more than six inches high; it represents a young man carrying a dead boar. We could learn nothing of its history, nor are we familiar with it in engravings or casts; yet it is one of the finest Greek works, attractive in its treatment, and would be eminently popular if reproduced in modern “Parian.” Such small figures, so exquisitely rendered, must have been “cabinet articles” even in ancient Greece.

New and enlarged views of ancient Art must force themselves upon the minds of all visitors to the Roman galleries. In the Capitol we are astonished by the colossal remains of the statues of emperors which once decorated the city; they rival the works of ancient Egypt, and we see nothing of this kind elsewhere. The enormous bath, cut from one mass of porphyry, and measuring forty-three feet in circumference, in the circular hall of the Vatican, testifies to the luxury as well as the grandeur of the old Romans. In the mosaics of their pavements we detect the graceful and cultivated tastes which the poets of antiquity inculcated, and call to mind the Lyrics of Anacreon, or the Odes of Horace. Though at no time equal to Greece in the acme of elegance, we are continually reminded of the refinements of old Rome in the thousands of graceful decorations which meet us here on every side—not a vase or candelabra that is not redolent of beauty. All they touched they consecrated, and the altar of a past faith is precious to us as an Art-treasure. It is only in so great and varied a collection as this that one fully feels the vast variety of power they possessed in the discursive flights of Art over all nature; thus the Hall of Animals, in the same building, is astonishing for the variety of creatures there sculptured, with a truth and power which a Snyder or a Landseer might envy. Pliny notes the excellence of Greek sculptors in this particular branch of Art, but we rarely encounter specimens of their proficiency; it is only here that we can fully appreciate their powers; in this hall, filled with birds and beasts of all kinds, a veritable “menagerie of Art,” we feel how entirely they studied “each phase of many-coloured life,” and triumphed as much in the delineation of the doves of Venus as they did in the statue of the goddess herself.

This omnipotence of antique sculpture is a striking feature in Rome. It leaves nought unrepresented, and all its achievements are triumphs. They stand all tests; and the glorious beauty of the Antinous of the Capitol has had the testimony of John Bell, the best of our anatomists, to its perfection in that particular. He says decidedly, “The anatomist would look in vain to detect even the slightest mistake or misconception; yet such is the simplicity of the whole composition, so fine and undulating the forms, that a trifling error would appear as a gross fault.” The admirable way in which this knowledge is displayed he notes in the “Gladiator:”—“no affectation of anatomy here; not a muscle to be distinguished, yet the general forms perfect as if they were expressed.”

There is a charming bust of a *hacchaute* in the same gallery (marked No. 43); it almost seems to breathe; the lips are full and soft, the eyes beaming with gentleness; you gaze on it until you cease to think it marble, and expect those quivering lips to utter the “Io Bacchus.” Wonderful, indeed, is this power of mind over matter!

But the triumph of ancient Art lies not so much in its own imperishable beauty, as in its unconquer-

able vitality; the barbarian may be master of old Rome, and hold his orgies in its ruined fane: unable to appreciate, he may rudely injure the great works of nobler men; but while a limbless torso remains to be exhumed, the vivid lessons of ancient Art survive. An Angelo will come to worship and resuscitate its principles. He forms his mind, and gives his living hand the true direction pointed out by the great of former days; thus do they indeed "rule us in their urns," for all must bow to the lessons based on the immutable laws of truth and beauty; and where do we see them more gracefully or more vigorously pronounced than in the immortal works which crowd the galleries of old Rome?

It is not only in the greatest productions we trace this important element; it meets the eye, and appeals to the mind, in every variety of artistic decoration so abundantly adopted in the habitations of the ancient Romans. The floral ornament upon a vase, the clusters of fruit upon an altar, or the more fanciful combinations of foliage, animal and human forms in an arabesque, are all based on the deep study of nature. They founded the style of Raffaele, as adopted for the walls of his Loggia in the Vatican, and are familiar to us all through the numberless adaptations we still use for the decoration of our own homes. The originals have, however, a freshness and vigour which copies never possess; you trace in them the immediate influence of nature, and not the tamer copy of a copy. In the exquisite Villa Borghese, the modern arabesques on its walls appeal less powerfully to the mind than the antique mosaics on its floors. There you have gladiatorial combats, so evidently the transcripts of what the workman had seen, that you at once feel his principal study must have been the Coliseum, and his work the reproduction of what he had seen there. The gladiators, with their abundance of animal power and small mental conformation, are as true as the dying gasps of the tigers and other animals we see transfixed in other parts of the subject. This is the great secret of the enduring vitality of the classic school of Art, which survives all changes of time or taste, and is always acknowledged as the greatest and truest teacher. Be proud, then, of Art, all ye who profess it; to you is given a victory over time, greater than the conqueror's over kingdoms. The neglected artist of one age may be the ruling spirit of another, provided he be the ardent worshipper of nature and of truth, and the faithful expounder of their graces; for the laws are immutable by which they rule.

F. W. FAIRHOLT.

TALK OF PICTURES AND THE PAINTERS.

BY AN OLD TRAVELLER.

CHAPTER IV.

Last Moments of Titian—His Disciples—Santo Zago—Girolamo Dante—Andrea Schiavone—Battista Zelotti—Domenico Campagnola—Lament for Giorgione—Jacopo Robusti—Paris Bordone—His Works and Character—Relative value of Authorities—A Word for an Old Friend—Return to Tintoretto—Mode of Study—A former Acquaintance—Of certain Works within reach—Galleries abroad—Venice—San Giorgio Maggiore—Martyrdom of St. Stephen.

DEPLORABLE above all beside is the description of Titian's dying moments. Struck by the plague, then devastating the city, he lay breathing his last sighs, when a body of impious ruffians, rendered bold by impunity and by the dispersion of the magistrates, who were flying in their dread of that fearful pestilence, burst into his chamber, all unwatched by friend or servant, and carried off—not jewels and rich furniture only, but even those pictures so highly valued that Titian had refused to part with them at any price—with the studies of his most renowned works, and those more recent designs which the master regarded as among the best of his productions! and thus mournfully died one so long the favourite of fortune! not even a menial to close his eyes—dread of contagion had caused all to take flight, and the master was left to expire alone.

The disciples of Titian were not so numerous as might reasonably be expected, the great reputation and long life of the master considered. Santo Zago, of whose frescoes the authorities speak in high terms; and Girolamo Dante, called Girolamo da Tiziano, who

is said to have been his favourite, were among them; as was also Andrea Schiavone, his laborious life passed drearily, and his genius crushed beneath grim "Poverty's unconquerable bar;" with Battista Zelotti (but these for a short time only), the latter an excellent painter in fresco, whose works have sometimes been attributed to Paolo Veronese: Domenico Campagnola, equal to Santo Zago in fresco-painting, and superior, as says Ridolfi, to most painters in landscape, may close the list. Of Campagnola, Titian is said to have become early jealous, an infirmity by which he was unhappily much afflicted: the truth may not be denied, however much regretted. "It might," indeed, be wished, as says Fuseli, that "the mean jealousy, and its meaner consequences, were less authenticated."

That this deplorable defect—wholly incompatible with the character of the artist in its highest development—was eminently displayed in the case of one whom it might else have been his glory to have formed to Art's noblest uses, can never be forgotten. The reader will perceive that this can apply to none but Tintoretto, and it is of him we speak. Now, remembering that force of will by which Tintoretto was subsequently distinguished, it would doubtless be easy to imagine other causes for his expulsion from the school of Titian, than the "paltry meanness" and "bad passions" augrily attributed to the latter by hosts of our English writers; but we have the assertion of Ridolfi—all but a contemporary—to show the common belief of his time. I write from memory only, not having Ridolfi's work at hand, but remember well his declaration to the effect, that Tintoretto had been but a very short time in the school of Titian, when the latter, after examining certain studies made by him—the spirit and beauty of which were the admiration of the school, and could not be disputed—called one of the elder of his disciples—I think Girolamo Dante—and, inquiring by whom the drawings before him had been executed, then commanded the young Jacopo Robusti—the name, as our readers will remember, of him whose by-name of Tintoretto has since been and now is one of the greatest in Art—to depart instantly from the school. This is lamentable, and goes far to justify the reproaches that have been heaped on the delinquent master: the offence cannot be palliated; but let us remember that on subsequent occasions Titian was more generous in his conduct towards Robusti—a fact named thus incidentally only because want of space prevents a more extended reference. Let us remember also that the homage paid to an unfinished work of Titian's, after his death, by the younger Palma, had long before been offered by Titian himself to one left unfinished by Giovanni Bellino. Palma writes—"What Titian commenced was reverently completed by Palma." But something of the same kind had been previously done by Titian, who had at least appended the signature of his master, when he might have affixed his own. That Tintoretto was unhandsofly expelled is beyond question: it would, nevertheless be fair to suppose that some flagrant departure from rules laid down by the master—a most probable circumstance, the firm yet not obstinate character of our Jacopo considered—may rather have been the cause, and that no fears of the future rival were in the case. But there is a second charge against Titian, that of unwillingness to impart his knowledge even to the best of his disciples; and from this it will be difficult to defend him—the instances are too numerous to be explained away: one only shall be cited, but it is conclusive.

Well-born,—well in the best sense, and admirably trained, a necessary consequence of the true "well-born,"—endowed with extraordinary ability, and above all imbued with a profound love for the painter's art, Paris Bordone, after the careful education suited to his rank, was placed in the school of Titian. It is not easy to believe that a youth of so much promise could fail to be the delight of his master; and if the love of Art had been pure in the heart of the latter, so he must have been: but see what follows:—

He—Paris—"Andò a stare con Tiziano, ma non vi consumò molti anni, perciòchè vedendo quell'uomo non esser molto vago d'insegnare a' suoi giovani, anco pregato da loro sommamente, ed invitato con la pazienza a portarsi bene, si resolvè a partirsi, dolendosi infinitamente che di que' giorni

fusse morto Giorgione, la cui maniera gli piaceva sommamente, *ma molto piu l'aver fama di bene e volentieri insegnare con amore quello che sapeva.*"* I pray you mark me that last, good friends!—Giorgione taught all who desired to learn from him, and that "with love and care." Without doubt he did, and so will ever the true master in Art, worthy of his name. The earnest desire to learn of that excellent Bordone—of whose character we are enabled to form a well-founded opinion, and that of the highest, from the details of his life—would have been his best claim on the attention of Giorgione; other qualities would have won the affection of the admirable master; and good reason had Bordone for "grieving excessively" that "Giorgione was dead in those days."

Works by Paris Bordone will be found in the Louvre, at Berlin, Dresden, and Munich; other galleries also possess them, but these are first named, as being—after those in our own country—most easily accessible to the English student. In the Dudley Collection is a painting respecting which there is doubt as to whether Titian or Bordone be the master, but Dr. Waagen assigns it to the latter. It represents a woman receiving her clothing from two attendants. The Royal Institution of Edinburgh has a "Lady at her Toilet," not considered by good judges to be among the better works of the artist, but named here as within easy reach of our own students. Mr. McLellan of Glasgow is also in possession of a work by Paris Bordone, not known to the present writer; the subject is Our Lady with the infant Christ and St. George; the Magdalen is also present with St. John, who points to the lamb. "A good picture of his earlier time," says Dr. Waagen, "in which an earnest and religious feeling prevails. In this respect the Baptist, who is glowingly coloured, is very fine; the Virgin, the Child, and the Magdalen, partake of the character of his later pictures."† There is a "Repose of the Holy Family" at Bridgewater House, "in a rich poetical mountain landscape," says the author quoted above, who calls the work "an uncommonly carefully executed and glowingly coloured picture;" but adds, "by this very unequal follower of Titian." Now we do but rarely venture to differ from authority so greatly superior to our own as is that of the writer just quoted: if we cannot think at all times with important speakers, we can at least hold our peace, and mostly do so, but we submit that this is scarcely a fair description of Paris Bordone. That his works are not unfrequently attributed to Titian is most certain; the Borghese Gallery in Rome supplies a case in point: the far-famed Judith, namely, turning her back on the spectator, long attributed to Titian, is now by common consent assigned to Paris Bordone; and there are many others. This may serve to give the measure of Bordone's distinction as to certain qualities, but does not prove him a follower of Titian; he should rather be called the follower of Giorgione, whose manner he did "set himself to imitate," says Vasari. But so also did Titian, and that the two masters should resemble each other—with a long interval between them, as regards high qualities, without doubt—is thus sufficiently accounted for. Bordone would indeed appear to have chiefly followed his own inspirations, an affectionate attachment to the manner of Giorgione being allowed its due influence.

Of thoughtful mind and retiring habits, there was indeed much to repel Bordone in the artist life of Venice as just then constituted; wherefore "knowing that he who would succeed in that city must endure much servitude in paying court to one or another, and averse to certain modes of proceeding then prevalent, Bordone resolved to depart and take what Fortune might offer elsewhere, without compelling him to become a beggar for employment." So successful was his study of Giorgione,

* He was placed with Titian, but did not continue many years with that master, whom he perceived to have but little pleasure in teaching his disciples, even when earnestly entreated to give them aid, and encouraged to do so by their patience and good conduct. He departed, therefore, grieving much that Giorgione was no longer living, the manner of the latter pleasing him greatly, but more the reputation he had of instructing all who desired to learn of him, affectionately and with great care. See "Opere di Giorgio Vasari," vol. v. p. 216. [Florentine Edition of 1823.] Or the English reader may consult Mrs. Foster's translation, vol. v. p. 403.

† See "Treasures of Art in England," vol. iii. p. 288.

that the proficiency he had attained was early acknowledged, and at the age of eighteen the brotherhood of San Nicolo dei Frati Minori commissioned him to paint an altarpiece for their church; but of this Titian sought by every means he could devise to deprive him, and continually threw difficulties in his way. Then it was that he repaired to the French court, and thence the subsequent journeys to Vicenza, Milan, Augsburg, and other cities, in all of which he executed works declared by the best writers to have given proof of extraordinary merit in the artist. Many of these are unhappily destroyed, or lost to his name, and are perhaps gilding those of other masters; the fine frescoes executed at Augsburg for the princely merchants of the Fugger family, with others at Vicenza, are more particularly to be deplored.

In Treviso Bordone produced numerous works; frescoes, portraits, and others of various kinds: he was greatly respected, as well as much admired, in his native place, as one who "well loved the same: a truly able artist and an excellent man." Some of the works here alluded to are now in the Venetian Academy, that of "Il Paradiso," painted for the church of Ognissanti, among them. Returning to Venice, Bordone executed various works there also, more particularly one for the Scuola di SS. Giovanni e Polo (the Venetian form of Paolo), wherein he has depicted the fisherman transmitting the ring of San Marco to the Signoria of Venice—a work of great interest as well as beauty, were it only for the precious memorial of the city, as she then was, which this painting preserves to us.

There is a most graceful little picture by this master in the Pitti Palace, its subject one that Paris much delighted in—a *Repose in the Flight of the Holy Family*; this is, or was, in the room called *La Stanza di Marte*. In the same gallery, and in the room known as "*Stanza dell'educazione di Giove*," is a much admired work of the master, "*The Tihurtine Sybil*," namely. This picture the authorities agree for the most part to call Bordone's masterpiece. Beside the altar of sacrifice stands the Emperor Augustus; the Sybil is near him, and points to the infant Christ in the distance; her figure, one of great beauty, is described by competent judges as—"von schönsten tizianischen typus" (of the most beautiful Titianesque type).

Approaching the close of his life when Vasari wrote, Bordone was then "living quietly in his house," says that biographer, "being now seventy-five years old;" he works only at the request of princes, or others of his friends, avoiding all rivalry, and undisturbed by those vain ambitions that do but trouble man's repose; seeking, as he says himself, to escape the destruction of his peace and tranquillity by such as, proceeding by doubtful paths, are devoid of charity and disregard the truth. Bordone is in effect attached to that simplicity of life which he has ever sought; a man of upright mind, he proceeds according to his natural goodness, and desires no contention with the malice and subtleties of those who act less openly. Writing of contemporaries, Vasari is manifestly speaking with the reserve proper to a man who does not desire to exalt himself into a judge of questions the merits of which are not fully known to him; but the impression left by his words is altogether favourable to Bordone.

Nor are they discredit to himself. It is true, as a German writer remarks—I think the lamented Ludwig Schorn, whose translation of Vasari, left incomplete at his death, is an invaluable work—"that no man exhibits his own character so effectually as when portraying that of another," † and very estimable is the character which Vasari thus unconsciously reveals on many occasions. Those who accuse him of partiality cannot have studied either himself or his works as a whole. Van der Hagen, who is well acquainted with him and them, calls him "the true-hearted," ‡ and you will not persuade a German to use that word lightly. Equally unfair is the reproach of inaccuracy; for admitting that he was unable, with all his earnestness and diligence, to obtain minute information on every point,

it may with equal truth be affirmed, that if you take well into account the extent and difficulty of his work—the biographies—with the time when it was written, and the absolute non-existence of all material, you will find the errors few rather than many. Succeeding writers have worked under circumstances much more favourable; nor is it any disparagement of the learned and accurate Lanzi, to say that but for Vasari and his subsequent editors, his own valuable work could never have seen the light. Lanzi would have been the first to admit this; and as regards the pretended enmity of Vasari to the Venetian school, let that writer himself bear testimony:—

"Non è il Vasari quel maligno verso la Scuola Veneta che vorrebbe farsi apparire. Scrive di queste pitture [he is speaking of Antonio Veneziano's works in the Campo Sauto of Pisa] che 'universalmente, ed a gran ragione, son tenute le migliori di tutte quelle che da molti eccellenti maestri sono state in quel luogo lavorate.' Eccoli dunque anteposte da lui alle fiorentine tutte e alle senesi, che ivi sono; giudizio confermato dal P. della Valle che pur tanto spesso da lui disseute." *

And the Abbate is right: Vasari was no calumniator, nor was he ever consciously partial. If not a genius himself, he was the unenvying "admirer of genius in others;" as our own honest Northcote, who also knew him well, has well said, "displaying the character of a good man devoted to the Arts." † These testimonies could be multiplied to great extent if need were, but those given shall suffice; and if Vasari was sometimes mistaken as to a name or a date, are his successors infallible, even after all that he has done to clear their way? Is Baldinucci, trustworthy as he is, always right? is Ciognara invariably correct?—examine his works, and you shall see. Does Malvasia make no mistakes?—let Fuseli reply, and he will do so amusingly, if you consult him. But this is ungracious work: defending our first benefactor, let us remember also what we owe to others; *culpa mea, culpa mea*—but I repent me, and desist.

We now return to Jacopo Robusti. Cherishing no unworthy resentment at his expulsion from the school of Titian, Tintoretto inscribes on his studio those often-quoted words—"The design of Michael Angelo—the colouring of Titian;" and restraining in no wise the free course of his own genius, he proceeds to give it development under the guidance of those two fair rules.

Obtaining casts from Daniele da Volterra of the figures on the Tomb of the Medici, by Michael Angelo, from these, as Lanzi tells us, ‡ he studied day and night, continuing his labours by lamp-light to "give the greater breadth and effect to his light and shade." § Furthermore, and to acquire a perfect acquaintance with foreshortening, less carefully studied at that time by the Venetians than by the Lombard masters, Tintoretto suspended figures in the air; he also "frequented the lectures and dissections of anatomists, to obtain a complete knowledge of the muscular contraction of the human figure."

And the result? Strange and varied, yet in every case affording evidence of the power within. "The most daring genius he," says Vasari, "that painting hath ever possessed." Fresco, oil-painting, portraits from the life—he refused none, and excelled in all. It is true that some inconvenience is affirmed to have resulted from this method of "suspension;" and Fuseli considers that "the want of equilibrium sometimes found in Tintoretto's figures, may have been not unjustly ascribed to this habit:" he adds, that "the master at last became so used to it that he occasionally employed it for figures resting on firm ground." ||

The rapidity of production, which earned for Tintoretto the name of "Il fulmine di pennello," is known to all, and with the anecdote related of his "St. Rocco in Heaven," still in the Scuola di San Rocco, most readers are acquainted; but since there may be some to whom it is not known, the facts are briefly given. The picture forms the centre of the ceiling in that room known as the *Albergo*, or Guest-chamber, and was painted under circumstances related by Vasari,

as follows:—"In the same city of Venice there lived, and does yet live, a painter, called Jacopo Tintoretto, a great lover of all the noble arts, and who delights in playing on various musical instruments"

"He, having painted a large picture of the Crucifixion"—that Crucifixion still the glory of Venice—"for the Scuola di San Rocco, the men of that brotherhood, desiring some honourable work for the ceiling of the room, would have it done by the best painters then in Venice. They consequently called Giuseppe Salviati, and Federigo Zuccheri, with Paolo Veronese, and Jacopo Tintoretto, commanding each to prepare a design, with promise that the work should be adjudged to him who should acquit himself the best. But while the other masters were giving themselves with all diligence to the preparation of their designs, Tintoretto did but measure the space for which the picture was required, and taking a large canvas, he painted it with his accustomed rapidity, and, without saying a word to any one; affixed it instantly to the place intended for its reception. One morning, then, when the brotherhood had assembled to examine the designs, and determine their choice, they found Tintoretto's work completed—nay, already fixed in its place. They were at first much displeased, saying that they had required a design, not given him the commission; but Tintoretto replied that this was his method of making designs, that he knew no other. He added, that designs or models for all works should be made after that fashion, to the end that all might see what was intended for them, and not be deceived. Finally, though not without many difficulties, Tintoretto prevailed, and the picture remains in its place." *

Venice is, as might be expected, the city where Tintoretto may be most worthily studied; there is, indeed, no other where his wonderful powers can be fully appreciated; but some of those within reach of our own people may yet more usefully be mentioned in this place, and shall, therefore, take precedence.

The "St. George" in our National Gallery is known to all, and needs no further reference. Almost equally easy of access are the paintings at Hampton Court, where there are six by this master; of these, three are portraits, one said to be that of Ignatius Loyola, and sometimes attributed to Titian. The remaining three, are, an allegorical picture, called "The Expulsion of Heresy;" Esther before Ahasuerus—this last much praised; and a picture of the Virgin, with one representing the Muses.

In the Bridgewater Gallery also there are paintings by Tintoretto; three of them are portraits, the fourth is an Entombment of Christ; of these, too, the mere names alone are thus rapidly given, because, thanks to the liberal kindness of their noble proprietor, they are nearly as easy of access as those in our public galleries. Sir Charles Eastlake is in possession of a portrait, by Tintoretto, that of a noble Venetian; and in the collection of the late Mr. Rogers was the original sketch for one of his most renowned works, the "Miracle of the Slave." Mr. Rogers had also the finished sketch for Titian's "Gloria."

At Windsor Castle is a Holy Family, which, if my recollection serve me rightly, has all the force and suggestive powers peculiar to this admirable master, whose works rivet the beholder by the many thoughts they suggest; they should, if possible, always be visited when at leisure to profit by this high quality, and with time sufficient for the worthy consideration of their many other beauties. This, as we know, is not always to be done in certain cases; but in such—and Windsor Castle may be one of them—there is a remedy: go again, and again, there will be large reward—of that be certain—even for him who rates his moments at their true value. No time will be lost that is given to Tintoretto.

In the collection of Lord Shrewsbury, at Alton Towers, there is a fine example of landscape by this great master; the subject of the picture is "Joseph's Dream," "warm and clear in the tone of the flesh," and very "careful in the execution," few works of Tintoretto, within reach of the student at home, will be found more instructive. There is also a sketch of the Angels appearing to the Shepherds, this too is full of spirit, and highly characteristic of the master; both are works of great value.

With a visit to these and other treasures of Alton Towers, you may combine one to Dovedale. Happy

you! and being there, take your delightful way across that *most* attractive eounty of Derby; making, if it so please you, the charming round leading by the picturesque Matlock, and pleasant Rowsley. A short walk then takes you to Haddon, whence a delightful three miles, best enjoyed beneath the first fair beams of sunrise, present your delicious way to the lordly Chatsworth, where you shall find large consolation in the "pleasance," though the hour should be—and by many—too early for admission to the presence of that great master to whose genius you would do homage. Happily there is no mansion calling the Duke of Devonshire lord, from which the lover of Art is doomed to turn away disconsolate, present yourself boldly, therefore, though you be the last and least of her worshippers,—you will find ready access, with ample cause to rejoice in the privilege.

The picture of "Christ and the Woman of Samaria" is, perhaps, the first work of Tintoretto to which you will give your attention; there is, besides, the portrait of an ecclesiastic,—the Archbishop of Spalatro,—nobly conceived and finely executed, with that of a Venetian admiral, somewhat different in manner, but entirely characteristic of the master, and showing all the force for which he is remarkable. Two fine landscapes by Titian also enrich this collection: the one has St. John preaching, the other is a St. Jerome; but the figures, in the first instance, are wholly subordinate to the landscape. There is besides at Chatsworth a portrait by Titian of Philip II.; but although that monarch—less repulsive in his youth than in middle life—is here represented as a young man, yet are his many deformities of character, and the amount of suffering inflicted on humanity by his means, so constantly present to the memory, that no semblance of his face can be regarded with pleasure, even though the limner write himself Titian. Forget this, then, so soon as the artist-nature of you will permit, and, bending your steps northward, when the gates of the hospitable Chatsworth shall have closed behind you, take next your suggestive way by the lovely dale of Middleton, and let your resting-place be the village of Eyam.

I am supposing you to be sensibly proceeding at your "own sweet will," as doth the river you wot of—not borne along, as are the cotton-bales, by that ruthless railway, fit for the voyaging of nothing more sensitive. Thus you have leave to pause before whatever may be found worthy of arresting your step—nay, it shall be lawful for you to turn aside for all that may attract you, whether by its loveliness or its worth—close Cousins for the most part; and it is for the latter that you shall pause at Eyam. There, standing reverently by the grave of the venerated Mompasson, the devoted vicar of Eyam at the time of the Great Plague, by recalling the deeds of that good man,*—"the priest, the physician, and the legislator of a community of sufferers,"—you may divest yourself of whatever shade may cling to your thoughts from contemplation of those cold, pale, evil eyes, revealing the evil nature of the Spanish Philip.

Of works by Tintoretto in other lands those most easy of access to our people are, perhaps, in the Louvre; and among them the most interesting are the portrait of the master, painted by himself; with a work said to be a sketch for the great picture in the Gran Sala del Consiglio of the Ducal palæe, at Venice, and known as "Il Paradiso." No detailed description of Tintoretto's works in the Louvre can here be given, but we may remark in passing that the painting just alluded to—Il Paradiso, namely—is remarkable, as are so many of the master's works at Venice, for that vast number of figures, which cause the spectator who is but hurried past them, to resign all hope of comprehending what he sees before him; but every one of which is found, by him who gives them worthy examination, to have its own, and that a great, significance. Shining in glory and high above all appears the Saviour Christ, with the Virgin Mother, whom he is in the act of crowning; the Apostles are ranged on either hand; next follow the various orders of the celestial hierarchy—"Thrones, Dominations, Principalities, Vir-

tues, Powers," with the Evangelists, the Fathers of the Church, the Confessors, and the Virgin-martyrs, all glorifying the Lord of all.

A Last Supper, attributed to Tintoretto, is also in the Louvre; but this work is not considered by good authorities to be painted by his hand.

In the public gallery of Berlin is a Virgin and Child, by Tintoretto, with three portraits; two of them are those of "Proveditori di San Marco;" the third is that "of a man unknown." There are works by the same master in Munich, Vienna, Rome, Florence, and Madrid, nay, in all the greater galleries of Europe. Tintoretto, born a painter, passed no day in which he did not exercise that art which to him was as the breath of his life, his works are consequently numerous; but in his native city it is that, of right as well as in fact, the best and most important of them are found.

To Venice then we return once more—Venice the sole and only—Venice with whom the heart of us hath been lingering, even while our words have been of others. It was once the fortune of the present writer to be for some short time alone in that enchanting city, a circumstance rarely occurring in the life of an Englishwoman; but in this instance so far profitable, as that the hours of each day being given either to the Academy or to the Scuola di San Rocco—that last known to be a sort of gallery for the works of Tintoretto—the writer was thus enabled to form a more intimate acquaintance with the paintings of the master than could otherwise have been obtained.

Repelled at first, and incapable of comprehending the vast fields of story here laid open to his astonished gaze, the spectator is for some time rather bewildered than edified, and far more frequently disappointed—I had almost said displeased—than delighted: but let him persevere, light will break in upon him if he consent to wait the advent in humility; and he who does but come with the ordinary feeling of interest in a place, popularly known as one containing the works of a renowned painter, will return ere long with a love and respect for the man, no less than with admiration of, and delight in, the artist.

No painter impresses more of his own character—a truly admirable one—on his works than does Tintoretto; "a most sprightly mind, a vivid fancy, and friendly, cheerful manner," are among the characteristics attributed to him by his contemporary, Vasari, who says elsewhere—"Most admirable is Tintoretto in every way, and most estimable, as is proved by all he does." Knowing him well, then, as his works enable you to do, you cannot marvel that his sweetest Marietta, the worthy daughter of his love, should refuse all that the most potent sovereigns of her day could bring to tempt her, rather than separate herself from that beloved father: and then that Death, the ruthless, should so early sever them! Alas! alas!

In the autumn of 1852, the present writer, crossing the Tyrolese Alps, and proceeding from Styria into Italy, had suddenly to lament the disappointment of a fixed intention once again to visit the City of the Waters and her abounding treasures of Art; but was in some degree recoupled to the privation on hearing at Verona of the lamentable havoc made, even in the Scuola di San Rocco itself, by the balls poured on the city in 1848. Cannon-balls through the pictures of Tintoretto! Woe, woe for Art, when so deplorable a sacrilege is even possible.

It is not without a painful sense of insufficiency that we presume to speak of the works bequeathed by this truly noble master to the ever-increasing admiration of all ages. Some one has said that none should venture to sit in judgment on paintings who has not spent a lifetime in the practice as well as the study of Art; what then of us who have but the love of a lifetime to offer in the place of both? We seek aid, therefore—we take refuge behind the broad ægis of our betters, and will not spoil a good subject by feeble handling.

Of Tintoretto, "Ne parle pas qui veut"—to adopt a phrase from our friends across the water—there is, indeed, but one author—English or foreign, writing in such tongues as are accessible to the present speaker—by whom the truly admirable Venetian artist now in question has been worthily treated. In his words it is, then, that the paintings of Tintoretto, in Venice, shall chiefly be described—but

where begin? Churches, Palaces, the Academy, and first of all, though last named, the Scuola di San Rocco, all put in their claims—and affectionate remembrance would fain allow them all. But when it is remembered that, half lost in the dark and solitary chambers of the building last mentioned alone, there are more than sixty pictures, it will at once be seen how small a portion of their number can here have space, even for its name; therefore it is then, and also because of our own deep reverence for their high deserts, that we would have our description of the few selected for mention to be nothing less than the choicest, the most complete.

We commence with a picture in the Church of St. Giorgio Maggiore—not because it is the best of Tintoretto's productions, but because few, even of this most noble master's works, exhibit more forcefully his power of appeal to the heart and mind, as well as to the imagination of the beholder; and also because the limner in words, whose efficient reproduction of its features we appropriate, has done his part with a love and care amply proving his appreciation of those invaluable qualities.

Placed over an altar in the north transept, this work represents the "Martyrdom of St. Stephen." "The saint is in a rich prelate's dress, looking as if he had just been saying mass, kneeling in the foreground, and perfectly serene. The stones are flying about him like hail, and the ground is covered with them as thickly as if it were a river-bed. But in the midst of them, at the saint's right hand, there is a book lying, crushed, but open, two or three stones, which have torn one of its leaves, lying upon it. The freedom and ease with which the leaf is crumpled, is just as characteristic of the master as any of the grander features; no one but Tintoret could have so crushed a leaf; but the idea is still more characteristic of him, for the book is evidently meant for the Mosaic History, which Stephen has just been expounding, and its being crushed by the stones shows how the blind rage of the Jews was violating their own law in the murder of Stephen. In the upper part of the picture are three figures,—Christ, the Father, and St. Michael. Christ, of course, on the right hand of the Father, as Stephen saw him standing, but there is little dignity in this part of the conception. In the middle of the picture, which is also the middle distance, are three or four men throwing stones, with Tintoret's usual vigour of gesture, and behind them an immense and confused crowd; so that at first we wonder where St. Paul is; but presently we observe, that, in the front of this crowd, and almost exactly in the centre of the picture, there is a figure seated on the ground, very noble and quiet, and with some loose garments thrown across his knees. It is dressed in vigorous black and red. The figure of the Father in the sky above is dressed in black and red also, and these two figures are the centres of colour to the whole design. It is almost impossible to praise too highly the refinement of conception which withdrew the unconverted St. Paul into the distance, so as entirely to separate him from the immediate interest of the scene, and yet marked the dignity to which he was afterwards to be raised, by investing him with the colours which occurred nowhere else in the picture, except in the dress which veils the form of the Godhead. It is also to be noted as an interesting example of the value which the painter put upon colour only; another composer would have thought it necessary to exalt the future apostle by some peculiar dignity of action or expression. The posture of the figure is indeed grand, but inconspicuous; Tintoret does not depend upon it, and thinks that the figure is quite ennobled enough by being made a keynote of colour.

"It is also worth observing how boldly imaginative is the treatment which covers the ground with piles of stones, and yet leaves the martyr apparently un-wounded. Another painter would have covered him with blood, and elaborated the expression of pain upon his countenance. Tintoret leaves us under no doubt as to what manner of death he is dying; he makes the air hurtle with the stones, but he does not choose to make his picture disgusting, or even painful. The face of the martyr is serene and exulting, and we leave the picture remembering only how 'he fell asleep.'"

* See "Stones of Venice," vol. iii. p. 204.

* The reader, if there be one to whom the touching story of this excellent churchman is not known, may find it in the histories of Derbyshire, or in those of the Great Plague of 1665-6; see also Rhodes' "Peak Scenery," pp. 31-43.

THE ROYAL PICTURES.

THE HARVEST-FIELD.

C. Tscheggeny, Painter. J. Cousen, Engraver.
Size of the Picture, 6 ft. 6 in. by 4 ft. 8½ in.

CHARLES TSCHEGGENY, an artist of the modern Belgian school, is a painter whose works are not altogether unknown in England. He was born in 1815, and, we believe, was for some time employed in the civil service of the Belgian government, which he quitted, in 1837, to devote himself entirely to the pursuit of painting. Admitted into the studio of Verboeckhoven,—more, however, as a friend than a professed pupil,—he acquired those principles of Art which distinguish the works of this excellent animal-painter. In 1845, Tscheggeny received from the Academy of Brussels the gold medal for a picture,—“The Labourer at Rest,”—which is now in the possession of the King of the Belgians. In 1848 and the following year he visited England, passing his time chiefly in London and Oxford, in each of which cities he received several commissions for portraits of favourite horses. Two pictures he painted while here, were exhibited at our Royal Academy in 1850; one was entitled, “An Episode of the Field of Battle,” but it was hung so high as to be almost out of the reach of critical remark: the subject is a wounded soldier lying partly underneath his dead charger; another horse, which has lost his rider, is in the act of nearly trampling on the prostrate man, as the animal gallops wildly over the field. So far as we could judge of the merits of the picture, at the distance it hung from the spectator, the composition is spirited, and the figure and horses are very correctly drawn. The other—“The Straw-yard”—was placed in the room appropriated to the drawings and miniatures. Of this work we had a closer inspection;—the title declares the subject; the various animals introduced are picturesquely and appropriately grouped, are life-like, and painted with considerable delicacy of touch: but, like the majority of pictures by his master Verboeckhoven, the tone of colour is low, especially when compared with that adopted by our own animal-painters.

The first important picture painted by Tscheggeny, after his return to Brussels, was the “Harvest-field” here engraved. It was exhibited in the Academy of Brussels in 1851, and gained for the artist the decoration of the “Order of Leopold.” The work was selected by the government as one of several pictures to be disposed of by lottery;—the person to whose lot it fell sent it to the Dublin Industrial Exhibition in 1853, where it was seen and purchased by the Queen. There is very considerable merit in this production, though the colouring of some parts is open to objection; the shadows, for example, are heavy and unnaturally opaque. Had they been painted with greater transparency, the whole work would have assumed a more luminous appearance; moreover, the long shadow projecting from the waggon and horses into the immediate foreground is too straight and formal, and, from its uniformity of depth and the parallel lines it presents, seems to convey the idea of great irregularity in the ground,—the shadowed part looking like the edge of a slight elevation, when the whole is evidently intended to be a flat surface: the engraver has judiciously broken the long shadows, and reduced their intensity. The general colour of the picture is good; the beat of an autumnal afternoon pervades the entire landscape, which exhibits the peculiarity of the natural scenery of Belgium,—extensive tracts of land brought under cultivation, but unadorned with those objects which the English landscape-painter finds in his own country;—noble trees skirting the fields in many places, and the monotony of cultivated lands relieved by the verdure of thick umbrageous woods.

The horses in this picture are well drawn, and have evidently been sketched from nature; but Landseer or Herring would scarcely have put the “leader” of the team so much in the shade, or rather would have given to the animal greater transparency of colouring than Tscheggeny has: he has fallen into a similar error to that pointed out on the stubble.

The picture of the “Harvest-field” is in the Collection at Osborne.

ON ENAMEL-PAINTING.

BY CHARLES TOMLINSON.

[Enamel, properly so called, is a glass rendered opaque by means of the hydrated oxide of tin (stannic acid); and enamel-painting is the art of painting in vitrifiable colours on a ground so prepared; but, as enamel colours and vitrifiable colours are usually taken as synonymous, we shall, in the following papers, take enamel-painting to mean the art of producing designs in vitrifiable colours on a prepared ground of porcelain, earthenware, glass, or metal.]

AN artist in oil and an artist in enamel were one day discussing the well-worn subject of the cleaning of the national pictures. “My pictures,” said the enamel-painter, “never want cleaning; theirs is a perennial youth.”—“But,” retorted the other, “they crack in the fire, or come out warped or flamed, and produce *fata morgana* landscapes.”—“Not now,” replied the enamel-painter, “we know how to fire our work better than they did formerly. Now here is a picture that has been five times through the fire, and it is neither cracked nor warped.” The oil-painter examined it attentively, admitted its merits as a work of Art, and returned it with the remark, “There is a flaw in it.” The other heaved a sigh, and made some remark about people having sharp eyes.

This little incident may serve as an exponent of the strength and the weakness of enamel-painting. It is quite right that the enamel-painter should prefer his branch of Art to any other branch, or even to the parent stem; for such we must consider oil-painting to be, even though it be objected that the children are older than the parent. No progress can be made without enthusiasm; and we are disposed to look kindly on even the vagaries of a man whose heart is in his work. The dancing-master, who could not understand how the prime-minister, William Pitt, could be a great man, since he could never make anything of him, had his soul in his profession: so had also an acquaintance of ours, a teacher of the Spanish guitar, who claimed for that feeble instrument a rank above that of the pianoforte, because the *slur* could be so much better executed on the one instrument than on the other. Doubtless the strength of enamel-painting lies in its durability. Of course, in estimating this valuable property, we do not take accidents into account; for the disasters of fire, and the no less terrible disasters of clumsy housemaids, cannot be said to have anything to do with the durability of the painting, however much they may limit that of the article which it adorns. Nor can we take into account the carelessness of the owner, such as we have lately witnessed at the country-seat of a celebrated collector, where costly specimens of Sèvres, Chelsea, and Bow, were arranged, on edge, on small unsafe-looking shelves and brackets attached to the wall, without cover of any kind. It appeared as if the slamming of a door, or a high wind, to say nothing of the daily cleaning of the room, would be sufficient to destroy unique specimens which could never be replaced. Nor can we take into account the calculation of the South-American gentleman, who was accustomed to estimate the shock of an earthquake by the amount of crockery destroyed. Accidents then apart, there is absolutely no limit to the durability of an enamel painting. Provided the specimen pass through its various fiery ordeals unscathed, it is immortal. It may witness the slow but sure decay of the canvas and the paper; Rubens or Velasquez may become dingy or worn, and want cleaning or restoring; your Woolletts and Stranges may become yellow and brittle, and past hope of cure: while the enamel painting alone has imbibed the *elixir vite*, and is superior to the ordinary accidents of mortality. Damp walls and smoky rooms affect it not; dust may sully its fair face, but a wet sponge will renew its radiance. It does not fade nor crack, nor does its surface scale off. The *amatorii* of the majolica-ware still perpetuate the names, the dresses, and the charms of “the fairest of the fair” of their day; the snow-white enamel of Inca della Robbia still continues to dazzle us; and the *pièces rustiques* of Palissy charm us with their fresh quaintness; for even quaintness is fresh when the fields, the woods, and the streams have lent their inspiration to it.

Conceding, then, to the enamel-painter whatever advantages he may claim for his art on the score of durability—admitting that this is the strong point

of the art, let us now say a few words about what we said was the weak one, or rather *one* of the weak ones; for enamel-painting has other weaknesses besides that of crazing or cracking in the furnace, or warping, or forming bubbles or numerous minute pits, flaws, or discolorations. Our friend, the enamel-painter, states that productions of this kind do not crack or craze in the fire as formerly. That statement does not agree with our experience. A few years ago, on visiting the Royal Porcelain Manufactory at Meissen, near Dresden, we saw a slab containing a beautiful group of roses which had just been taken out of the fire cracked in two pieces, and warped. Such accidents are far from being rare, although much less frequent than formerly. But what shall we say to the multitude of minor accidents to which the work is subject during the firing, any one of which is often sufficient to ruin in a moment the labour of weeks. The light which chemistry has thrown upon the art has revealed the causes of most of the ills to which the enamel is subject; others can only be avoided by practical skill, which can neither be taught nor transmitted; others, again, are still unexplained, and, as ignorance and superstition are twin sisters, the artists fall back upon the fancies of the old enamel-painters, and declare the cause of failure to be in the air, or in the breath of the lookers on, and they forbid the approach to the work of any one who has been eating garlic or taking blue pill.*

The palette of the enamel-painter is the Sahara of Art—dry, cheerless, and discouraging, and a furnace in the distance. The various metallic oxides ground up with essential oils, which form the pigments, give little or no promise to the untaught eye of what they will be when they have passed through the fire. Before that process they are absolutely hideous, and as the artist so carefully and tenderly lays them on, we see indeed the form of a group of flowers, or of the human face divine, but we turn with disgust from the dark lines and patches which seem to be a mockery of Art.

In an oil-painting it is positively delicious to watch the proceedings of a skilful artist—to see the brightening colours grow into the poetry of form, and to draw cheerfulness and encouragement from every touch: in fact we see *progress*, which always inspires cheerfulness. In the enamel-painter's work the progress is not apparent. He appears to be working in the dark—grope after effects—enjoying nothing of the present, but addressing himself, as it were, to the posterity which lies on the other side of that purgatory which is to try his work by fire. And such is the tentative nature of the process, that this fiery ordeal is merely an elaborate method of taking a proof impression, to enable the artist to touch and retouch—to fire again so as to get another proof; and yet a third, a fourth, a fifth time must the work be passed through the dangerous Gehenna, and at each trial the work is subject to a multitude of accidents which may deteriorate, deface, or ruin it; which accidents we will now briefly consider, in order to show that our artist's boast of the efficacy of his fire insurance requires at least some modification.

Considering that the lowest heat of the muffle in which the colours are vitrified is about 1100° Fahr., and that some colours require as high a temperature as 1850°, we may readily suppose how difficult it is to regulate the furnace. The most successful method of proceeding is to begin with a low heat, to raise this rapidly up to the maximum, and as rapidly to let down the furnace. All notions of economy of fuel must be sent to the winds—what is wanted is a fierce, but short heat. A moderate but long continued heat may produce devitrification of the enamels, wherein the elements of the flux recombine in a different manner, and produce an opaque substance known as *Reaumur's porcelain*. If the temperature be carried too high, the more delicate colours, such as the roses and the greys, become faint or disappear altogether, while the blues, the greens, and the blacks remain. On the other hand, if the maximum temperature be

* The Abbé Jaubert (*Dictionnaire des Arts et Métiers*, Lyons, 1801, article *Peinture en Email*), speaking of the dangers of firing the work, and the causes which lead to its failure, says: “On accuse encore quelquefois la mauvaise température de l'air, et même l'haleine des personnes qui ont approché de la plaque pendant qu'on la peignoit; c'est par cette raison que les artistes éloignent ceux qui ont mangé de l'ail, et ceux qui sont soupçonnés d'être dans les remèdes mercurels.”

C. TSCHAGGENY, PINT.

THE HARVEST - FIELD.

FROM THE PICTURE IN THE ROYAL COLLECTION.

LONDON, PUBLISHED FOR THE PROPRIETOR.

J. COUSEN SCULP.

too low, the colours come out without that peculiar creaminess and glossiness which belong to this art; they remain dull and lifeless. By long experience, some artists estimate very correctly the proper temperature by the colour of the fire; but the most usual method is by means of *watches*, or small slabs of porcelain bearing some trial colour: these are introduced, from time to time, into the muffle, by an opening made for the purpose, and the indications afforded by these watches, on being withdrawn, show how the vitrification is going on within. The trial colour usually selected is the earmine produced by the purple precipitate of Cassius. This acts as a useful exponent of all the other colours employed, and varies considerably in tint, according to the temperature. By arranging, therefore, a scale of temperatures corresponding with a scale of tints, a tolerably accurate thermoscope is produced. A third method of judging of the temperature is by the expansion of a bar of fine silver, nearly eight inches long, introduced into the muffle, and connected with a graduated apparatus on the outside. Such is *Brongniart's pyrometer*, which has long been used with good effect at Sèvres.

But supposing the heat of the fire to be well regulated, there are many causes, slight and scarcely to be appreciated, which render it uncertain whether the desired tint will be obtained. With so delicate a colour as the purple precipitate of Cassius, the method of porphyrisation with water or with oil, a little more or less finely; the difference of touch of different artists in laying on the same colour,—will produce differences of tone, although the other circumstances of firing, &c., may not vary.

The kind of fuel employed for heating the muffle has an influence on the colours, for, whatever precautions he taken, it is scarcely possible to prevent some of the products of combustion from reaching the inside. The smoke of common coal is most disastrous, spoiling all the colours; wood appears to act injuriously in consequence of the pyroigneous acids which are developed. Charcoal is less objectionable, although the carbonic oxide, rather than the acid arising from it, appears to be a source of some danger. Coke has also the grave objection of producing sulphurous acid. So injurious is an acid in the muffle that it is necessary to wash thoroughly all the reds procured from sulphate of iron, in order to get rid of the least traces of acid. It is also stated that a muffle in which couperose has been calcined cannot be used for the firing of the colours.

Another source of danger lurks in the oxide of lead, which is absolutely required in the preparation of certain colours, but is injurious to the development of some others. The fixed alkalis used in the composition of the glaze may also react on the colouring oxides, especially when the muffle attains its maximum temperature. The oxide of chrome is peculiarly liable to this defect, the green intended to be produced becoming yellow. So also the oxide of tin used in some glazes imparts its own opacity to the colours. Nor is the choice of the kaolin—the canvas of the enamel-painter—a matter of indifference, some kinds being more favourable to the colours than others. There are even some kinds of kaolin which are positively inimical to certain colours; thus the kaolin of Ebreuil will not allow any colour derived from gold to be developed.

The oxide of lead, the potash, and the soda, may not only act injuriously on the contiguous colours by contact, but those oxides at certain temperatures become volatilised, and may thus affect injuriously every colour in the muffle. Vapour of water, if present, appears to act mechanically rather than chemically; but we have heard of a curious instance of the vapour arising from a crowded assembly acting injuriously on the delicate colour produced by the purple precipitate of Cassius. Some novel effects of glass-painting, produced by this colour, had been used in a church window, and were observed some time after to have faded. On a close inspection, the artist found that one single piece had escaped the general degradation, and that the coloured surface of this piece had been accidentally turned out to the weather, while all the other glass had, as usual, the coloured surfaces within. Now this delicate colour had resisted the rain and the dew, the sunshine and the wind—the pure influences of nature, in fact; while the sheltered portions, exposed to the air which was frequently poisoned by the respiration of human beings and the combustion of lamps and

candles, became corroded and spoiled:—a powerful argument this in favour of ventilation.

But, to return to our subject, such are the difficulties of enamel-painting that a piece may pass with success through the ordeal of two firings, displaying a good development of colours; and yet, after having been retouched and fired a third time, it may come out scaled and crazed. This arises from an unequal expansion and contraction between the porcelain and the colours, in consequence of the metallic oxides and the fluxes having been badly compounded. This effect does not belong to soft porcelain, which greedily absorbs the vitrifiable substances placed on it,—and the exception once led to an ingenious fraud. The art of making the soft porcelain of Sèvres of the best period having been lost, and the best specimens of that period fetching enormous prices, the dealers some years ago discovered a method of giving to inferior specimens the outward appearance of the finest. They filed off the old paintings, and employed skilful enamel-painters to copy and otherwise imitate the works of the best Sèvres artists on the ground thus prepared, and, on passing these spurious specimens through the fire, it was found that they had in their first manufacture absorbed so much glaze that enough remained to come up to the surface and combine with the new enamel colours which were being vitrified. This plan was so successful that the market was flooded with specimens of the best period, and the very richness of the harvest led to suspicion and discovery of the fraud. So excellent are some of these specimens that none but the most experienced dealers can detect them, and even these have been at fault, and have had to apply to the museum at Sèvres, where the models are preserved of every piece that has been executed within its walls.

On another occasion we propose to offer some remarks on the æsthetic principles of the Art, and on the chemistry of the colours employed in enamel-painting.

OBITUARY.

MR. RICHARD COOK, R.A.

THE death of this artist, on the 11th of the last month, will, at length, erase his name from the list of Royal Academicians, where, for many years past, it ought not to have stood; inasmuch as we never remember to have seen a picture from his hand during the whole course of our connection with the Arts. Of this matter we have once and again said our say, and need not therefore enter upon it again: besides, *de mortuis*, &c. Mr. Cook was in his 74th year.

MR. EDWARD FINDEN.

There are few names which have been more extensively connected with the engraved publications of the last forty years than that of Mr. Edward Finden, whose death, after a long and painful bodily affliction of five or six years' duration, occurred on February the 9th.

Edward Finden, as well as his elder brother William, with whom he was long associated in his profession, and whose death is recorded in the *Art-Journal* of November, 1852, was a pupil of the late Mr. James Mitton. His first works of any importance were undertaken in connection with the late Mr. Murray, of Albemarle Street, for whom he executed engravings to illustrate the voyages of some of our enterprising Arctic and other travellers—Franklin, Parry, Lyons, Back, Beechey, Denham, &c. A very considerable number of the engravings in the "Annals" were also produced under his direction. The first work he commenced in connection with his brother was the "Landscape Illustrations of Byron," the sale of which was very large, and, we believe, remunerative: it was undertaken by the brothers, and published on their own responsibility. This was followed by the "Landscape Bible," "The Graces," "Beauties of the Poets," and some others of minor character. Their most important work, however, was the "Gallery of British Art," but to them, as proprietors, the most unfortunate; for, after being carried through several numbers in the most spirited and satisfactory manner, the Messrs. Finden, in order to

save themselves from utter ruin, were compelled to bring it to a close: but even so far it involved both in pecuniary difficulties, which pressed heavily upon them during the remainder of their lives. In our "review" columns of last month we noticed the republication, by Messrs. Griffin, of Glasgow, of this really beautiful national work: its premature discontinuance was much regretted by all who take an interest in such matters, for it promised well as one of the finest publications produced in any country. The last venture made by Mr. E. Finden was the "Beauties of Thomas Moore:" this unhappily also turned out an unprofitable speculation, though it certainly deserved success.

There cannot be a doubt that the enterprise, energy, and talents of the Messrs. Finden were the means of extending over the country a love of fine-art publications; and those they produced were calculated to improve the public taste: the names of these artists deserve, therefore, to be associated with those of all others whose efforts have tended to the intellectual culture of their fellow-men, and as such to be held in our respect. William Finden engraved several large plates for separate publication, but we do not remember any on which the *burin* of the younger brother was solely employed; in fact, we believe the former was the engraver, *par excellence*, while the other was the man of business, superintending the staff of able assistants in their studio, aiding them by his advice and experience, putting the final touches to their plates, and directing the issue of the publications.

Mr. Edward Finden was a kind, warm-hearted man, ever ready, when he had it in his power, to render assistance to those who needed it. At the time of his death he had reached the age of 65.

THE EARL OF ELLESMERE.

The death of this accomplished and truly estimable nobleman, briefly announced in our last number, demands more from us than a mere passing notice, such as we had then only time to give.

Literature, the Arts, and the Sciences have lost in Francis Leveson Gower a warm friend, a liberal and enlightened patron. Endowed by nature with intellectual qualities of a high order, which, as a young man, he took every opportunity of cultivating and extending, he applied his attainments to the noblest and best purposes—the moral, social, and mental improvement of mankind. Before he reached his twentieth year he had written and published for private circulation a volume of poems, and at various subsequent periods of his life his taste for literature showed itself in the production of several poetical works, especially in translations of the poets of Germany, and in adaptations of foreign dramatic writers.

Receiving by inheritance the renowned "Bridge-water Collection" of pictures, his lordship testified to the public how worthy he was of receiving so noble a possession by adding to it a number of the best works of our most distinguished living painters, by erecting the splendid mansion at the end of Pall Mall for their reception, and by throwing his galleries open, at suitable opportunities, that the public might enjoy the privilege of inspecting their contents.

The Earl of Ellesmere was a trustee of the National Gallery, and had also been appointed, just before his decease, one of the commissioners of the projected National Portrait Gallery. The loss of such a man will not only be felt among the classes we have alluded to: it will be felt everywhere, from the "order" of which he was so bright an ornament, down, through the various ranks of society who were admitted into his company, to the humblest of the community, whose welfare he earnestly endeavoured to promote. Fully appreciating the worth of this excellent man in its manifold bearings, we think the noblest and truest inscription that can be placed on his monument would be the words of the Psalmist—"He hath dispersed abroad, he hath given to the poor; his righteousness remaineth for ever."

BARON DESNOYERS.

The Paris papers of the early part of last month announced the death of the Baron Desnoyers, one of the most eminent French engravers. His best works are his plates after the pictures of Raffaele, which have a European celebrity.

ART IN CONTINENTAL STATES.

PARIS.—Messieurs Danton, sen. and jun., have been ordered to execute the busts of General de Maroilles and Perrin de Jonquière, two officers who died gloriously on the field of battle in the Crimea: they are for the Gallery of Versailles.—M. Flandrin has been named Professor of Painting at the School of Fine Arts, in the room of the late M. Delaroche.—The king of Prussia has conferred the Order of Merit on M. R. Fleury.—Cornelius has just finished a grand cartoon of the "Preparation for the Last Judgment;" it is now exhibited at Dresden.—A portion of the gallery of Cardinal Fesch has been sold by auction; the amount realised was 112,000 francs, but it is rumoured the pictures were almost all bought in.—Kaulbach has recently finished a picture of the "Death of Cesar" for his Shakspeare Gallery.—A painting, presumed to be by Giotto, in excellent preservation, representing a Virgin and Child, has just been discovered in the possession of a dealer in old stores at Saint Jean du Gard.

ANTWERP.—M. Wuyts, a wine-merchant of this city, recently deceased, has bequeathed to his countrymen, on the death of his widow, his fine collection of Dutch and Flemish pictures, containing among them valuable examples of the works of Rubens, Rembrandt, Teniers, Van Dyck, &c.

MILAN.—The Emperor of Austria has given orders for a monument to be erected in this city to Leonardo da Vinci, whose noble fresco of "The Last Supper," in the Convent delle Grazie, is to be restored, by imperial command.

ART IN THE PROVINCES.

BIRMINGHAM.—The Mayor and Corporation of Birmingham have met, and unanimously passed a vote of thanks to Mr. Sheepshanks for his munificent gift to the nation. A copy of the resolution was engrossed, and sent in an oak-wood box to Mr. Sheepshanks.

EDINBURGH.—We have generally devoted a considerable space in our columns to a notice of the Annual Exhibition of the Royal Scottish Academy; but we find, at least for the present, our pages so pre-occupied that we can only afford room for a few general notes. In portraiture, the president, Sir J. W. Gordon, takes the lead; he exhibits seven pictures, among which the portraits of A. Campbell, Esq., of Blythswood, and of Mrs. Campbell, of Monzie Castle, stand pre-eminent. Mr. J. Swinton has an excellent portrait of Lady Claude Hamilton; Mr. J. Graham Gilbert, of Mrs. W. Cowper and Mrs. R. Macfarlane, besides others; Mr. Smith, of A. Buchan, Esq., and of Mr. C. Graham. Mr. Macnee exhibits several portraits. Mr. G. Harvey's picture of "Bunyan at the door of his Prison" is quite worthy of his well-established reputation: this affecting incident in the life of the author of the "Pilgrim's Progress" is illustrated with much pathetic and descriptive power; the subject and its skilful treatment would cause it to make a highly interesting and effective engraving. Two pictures by Mr. James Drummond, entitled respectively "Scottish Music" and "Borderers," are pleasing and clever works. "Christ betrayed by Judas," by Mr. R. S. Lauder, is a work of high pretensions, and manifests, in many points, passages of considerable power and excellence; the figure of Christ, for example, and the heads of the Apostles, are striking and dignified; but a subject of this nature requires genius of the highest order to render it perfectly successful, and Mr. Lauder's is not equal to the undertaking. "The Messenger of Evil Tidings," by Mr. W. Douglas, illustrates a supposed scene in the time of the great civil war: a courier, who seems to have travelled a long distance and with great speed, has presented to a venerable-looking personage, in his ancestral hall, a document portending evil news; for as his master reads it his countenance indicates alarm, a feeling in which his young daughter, who clings to his arm, participates: a number of domestics have forced their way into the "presence," eager to hear the tidings which have reached the house. The story is dramatically put on the canvas, and is well coloured. The "Alchemist," another work by the same hand, is an interior, full of choice old artistic "stuff," among which is seated their owner, deeply intent on unravelling some mystery or other, the unfolding of which may, perhaps, give immortality to his name if not to his years. Mr. J. E. Lauder has two pictures from sacred history, "Gethsemane," and "Hagar." Mr. Noel Paton's "Hesperus," a title he has given to a young couple, kneeling and pledging to each other eternal constancy, is, like all the works of this poetical artist, full of graceful fancy and gentle feeling. Mr. Paton's mind is too educated to treat a commonplace subject in an ordinary

way; and so, while he has shown originality in the treatment of this, he has still not "o'erstepped the modesty of nature:" it is a sweet picture. We may probably in a future number be able to go more explicitly into the exhibition of the Scottish Academy: till then we must defer all notice of the landscapes, and of such other works as we would gladly refer to now, if space permitted.

PENZANCE.—A portrait of Colonel Seobell, for twenty years chairman of the Penzance Union, has been recently hung in the Board-room of the Union. The picture is painted by Mr. Pentreath, of that town, an artist whose landscapes, exhibited at the Royal Academy, we have occasionally pointed out; the work was subscribed for by the guardians of the Union, and presented by them as a tribute of respect to their chairman. Those who know the venerable officer, and have also seen the portrait, speak of it as an excellent likeness, and a well-executed work of Art.

KENSINGTON GARDENS.

LIPPING THE "ROUND POND," &c.

WE want Art in Kensington Gardens, and, as a duty, we periodically have something to say about them—just as we now and then mildly object to the Sculpture-room in the Royal Academy, and some few other Art-abuses and shortcomings! Thus we again raise our voice in regard to Kensington Gardens. We are glad, however, to be able to add honestly, that Sir Benjamin Hall already deserves well there of the public, for the many seats and resting-places that he has of late provided.

Our knowledge of Kensington Gardens reaches back many years. We are proportionally attached to them, and think we have a right to talk about them. We recollect them when they had quite a different character from what they now possess: when they were walled and ivied all around, and had an air of seclusion more like that of some country demesne, than of royal grounds close to a great city. We remember when at the corner nearest to the site of the Exhibition stood a mound just within the gate, so steep as to be dangerous to adventurous urchins; and when at the opposite corner, near the old kitchen-garden of the Palace, which is now "Palace Gardens," was a reclusé pond amid the yew-trees, that still afford so charmingly sombre a shade (all which spot being called, "The Siege of Troy"). These two features—the "mound" and the "pond"—have passed away. Both had evils, which were neutralised by a simple act—the one was thrown into the other; and for many years now has the green level turf, that so freshly clothes our parks, been growing over their sites—that delicious, springy, fragrant, verdant "gazon" which our neighbours envy us, and which we do not prize half enough, till we have been out of our own isles. How superior, for instance, is the turf of Kensington Gardens or Regent's Park, to the dusty surface of the Champs Elysées and the Bois de Boulogne! What trees, too, we have in Kensington Gardens! There are limes and elms there as luxuriant, and nearly as large, as any in the country; and in the early summer, how bright and delicious is the pink and white hawthorn bloom, and somewhat later the balsam-like flowerings of the horse-chestnut! Of the last a noble example beuds over the wall and shades the road near Kensington Gate, opposite Craven Place, holding out in its great arms a royal bouquet of bloom; and our good Queen sometimes stops her carriage to look at it, as an old acquaintance, no doubt—as many of her early days were passed in Kensington. Later still, the many limes take up the office of welcoming the stranger with their honeyed fragrance and golden bells and balls, pendent in myriad drops, each from beneath its flower-leaf. Sit beneath the branches, and a multitudinous hum, almost a roar, surges on the ear, of the many bees that are thronging above, below, within and without, among the flowers for nectar and pollen—that is, for board and lodging, as they make honey of the one, and their cells of the other!

As veritable Cockneys we are desirous of enjoying what we have, and we have Kensington Gardens. We are jealous of their reputation. As loyal subjects, too, and independent Britons, and common-sense people—oh, those English expressions!—we are aware we gladly pay our portion towards keeping them up, and, therefore, we deem we have good right to walk in them and enjoy them: and to

see other people enjoy them too, which they do very much. And we are grateful that we have all this pleasure in these gardens, without the trouble of being their exclusive master; and we are very proud that when we come back in the autumn from our summer rambles east, west, north and south, that we can still look on our accustomed haunts with satisfaction, and feel that after all, we have not met with anything superior to them in their way. It must be allowed, however, that the autumn is not the most favourable season for the charms of this spot; but that is all the fault of the smoke of London, which, as we are strong hoppers—on principle as well as by nature—we trust will soon be ameliorated or done away with altogether. Why if it were, it would not be half so wonderful as the Electric Telegraph! and so, in our "mind's eye," we have a vision of the gardens some future autumn as fair as in spring. At present it may not be denied, though the young spring foliage of the trees in the early days of the year is just as fresh and transparent and green as it would be fifty miles from the metropolis—and though the flocks of Mr. Slater, the great Kensington purveyor, are quite white enough for imaginary Corydons and Phyllises to tend for the first week of their sojourn—that in the after part of the season the leaves become somewhat sombre, the trunks of the trees dirty, and the white fleece sooty, doubtless frequently reminding the dear little children—of which there is usually such a plentiful crop trotting about on the turf in knots and hand in hand, like fairy rings of peripatetic mushrooms—of the familiar nursery rhyme, "Ba, ba, black sheep, have you any wool?"

We are grateful, however, for what we have, and still more so for what we hope to have. Does not Rochefoucault make use of some such expression as "Gratitude is a lively sense of favours to come!" And we are grateful to Sir Benjamin Hall if he is prepared to go on with his ideas as to this locality—at least, in as far as he may be quite sure of his ground. As regards the keeping up and further embellishment of the gardens, for the healthy and worthy recreation of the people, he may feel morally certain he is doing no harm, but undivided good.

Up to the present time, in the course of its changes, Kensington Gardens appear to have been unusually fortunate, and to have enjoyed an immunity from the evil fate which generally overtakes old places which are being improved! Each step for many years has been in the right direction, and the opening out of them to public view from various quarters has been done without spoiling them. To be sure, all this could not be effected without a change from their original recluse character; but we must allow (although archaeologically inclined) that all has been so well done that they are all the better for it. It cannot be said of the dryad of the spot—if there be one—as of Byron's famous simile of beauty and the butterfly:—

"For each touch that wooed its stay,
Has brushed its brightest hues away."

For she appears all the brighter for the attentions she has received—especially for those of the present Chief Commissioner, who has not only provided so many lovers' seats "under the hawthorn's shade," that, may be, their influence will be perceived in the statistics of metropolitan marriages; but he has judiciously widened some of the old walks, altered others, and created new ones—plaiting young trees here and there with good taste and forethought, as a "rising generation," to take the place in good time of those that show symptoms of decay.

To enhance Nature by heightening her best points is the backbone of English landscape gardening—and Sir Benjamin has regarded this, in treating a space originally laid out, and very well too, by William III. So far so good, but we wish him to go on further still, and take quite a stride, in addition. We want him to add Art to Nature, and to add Sculpture to Kensington Gardens, and a little Architecture too, and some ornamental decorations. We should be very glad to see £5000 voted by Parliament for the purpose.

It may appear a very simple announcement, that the "round pond" in Kensington Gardens is not a round pond! It is called the round pond, and the name has stood for the fact; nevertheless, it is not a round pond, and never has been a round pond, strictly speaking, although its edges have been at

times stamped in and worn out of its original shape. The fact is, that its area, though approximating to a circle, is of a regular composite form, and has properly a margin of round and straight lines, combined strictly in an ornamental character, and pleasing enough. And here comes our first substantial suggestion—viz., that this be made emphatic, and that the "round pond," so called, be forthwith haud-somely lipped with stone, which would, once for all, preserve its margin and define its form.

In addition, our fancy can well picture how fountains, symmetrically arranged in this basin, would enhance the scene—for apart from the Art-charms they might possess, the eye is never weary of looking on moving water. People, for instance, ever gather round, with pleased attention, to watch even the vagaries of a burst pipe in the street, and will go miles in the country, and make elaborate picnics, to visit "falls!" But supposing fountains were ever here, we would not have them too high—for that is a great mistake. We don't want, as familiars, aqueous convulsions—great geysers! Such may be all very well as "*tours de force*" now and then at Crystal Palaces, but for our friends, commend us to gentle-minded fountains, ever flowing and cheering the scene, combined with forms of Art, and never standing arid and forlorn, and gasping like a dry pump! It must be a very beautiful Art-fountain indeed, that will stand the test of being streamless. If such an image may be permitted, a dry fountain is only a fit companion for a "*hortus siccus*," but in a live garden, with the vegetable life-blood bubbling up in all the tiny cells around, and thrusting forth leaves and buds and flowers at all the plants' finger tips, it is quite out of place.

However, for the present we will be satisfied without the fountains, and rest content with the centre basin being substantially and gracefully lipped with durable British stone, or, perhaps, "*pietra dura*," which might be better. We flatter ourselves that this would at once find favour with all who love gardens in general, and these in particular; but, as our idea is one of principle, perhaps we may be excused for a little more detail.

When ornamental forms are introduced in the laying out of pieces of water, they demand a precise architectural finish. If the basin in question were irregular, like the Serpentine, such would be out of place; but, as it is of an artificial form, it requires to be so completed as a piece of Art, and as an architectural feature. A house or a palace is a piece of artifice; it may be regarded as especially man's work. Then comes the Garden, which may well be treated as a piece of Nature's and man's work combined; and then the Park and Grounds beyond, which may well be left to Nature's hand, except as regards trimming them of weeds and tangles. May not this apply to Kensington Palace, Kensington Gardens, and Hyde Park? We confess we do not object to a moderate piece of ground, in immediate contiguity to a residence, being laid out in the most formal manner, with terraces, steps, and even trimmed yew hedges—affording as it were a continuation of the house out of doors, which, in fine weather, you may well use as such. What carpet so soft as close-shorn turf, or so decorated as the gay parterre? What walls so charming as the well-kept trees—affording shade and cool shelter? or what roof so delicious as their branches, each over each in their high depths, with the blue sky over all? Such pleasant spots, "clipt and trimmed and deftly kept," immediately adjoining a house appear to us as in the best taste; and we have Lord Bacon on our side, who wrote a good deal about gardening. When the free-and-easy style, called English landscape gardening, came in (as we are apt to go to extremes) it swept away a vast deal that was worth retaining, and many a charming yew fence and group of philareas (one of our earliest ornamental trees in England)—the growth of years—was ruthlessly sacrificed to meet the new fashion. The precisely formed and more decorated portion of garden and grounds immediately around the house may be viewed as forming the extended fortress (every man's house in England being his castle), and hold the position of "outworks," the house itself being the citadel, to which he retreats at the advent of bad and cold weather. But when the sun comes out, and the wind blows from the south, open fly windows and doors again, and out come he and his family, rejoicing anew, into his more extended apartments, which have only floors

and walls to bound him, and nothing above but the far away sky for ceiling!

This is the philosophy, in our idea, of the immediate *entourage* of a house. You walk out of your house into a *soignée* decorated space of walks and turf, and flowers and shrubs. It is a belonging to the residence, and a dress to the façade. It is an *introduction* to the wilder parts of the domain. It gives the residence a *place*. It shades the bricks and mortar off into the country; it makes them seem to grow there appropriately, and prevents a house looking as if it were plumped down in the middle of a green field, or a wood, as if it had no business there!

To go a little further as to Kensington Gardens. Whatever may be thought of the Palace, it is allowed on all hands that the garden is well laid out, so as not only to produce a good effect in each portion of it, but to obtain a great appearance of extent. From the basin, for instance, although vistas extend in various directions, hardly a house is to be seen; or, if one or two appear in the distance, they only look like far-away country places. The basin is situated symmetrically in front of the Palace, and as an adjunct to it, and forms the centre of the design of the gardens, from which, as a fixed point, the other arrangements take their rise and extend. A broad expanse of sward surrounds it, bounded on the west by the broad gravel walk crossing from Kensington to Bayswater, and on the other three by masses of fine trees, broken here and there by vistas and avenues. It is near and backing against these plantations, and away from the basin, but fronting to it as a central point, that we would suggest the first introduction of decorative features of a high character—such as fine examples of statues and urns, each on pedestals. Such would "tell," as the landscape-painter would say, admirably as lighter points against the broad green masses of trees; repeating also the general circular form of the basin at greater width, and drawing out the sight to embrace the whole open space. We see no reason why we might not have the effigies of some of our worthies here. The house still stands in Kensington which was occupied by Newton. Why not have a Newton in Kensington Gardens, and a Bacon, and a Shakspeare, and other great spirits? The post-house which Oliver Cromwell used, and which even now bears his name, still stands in Knightsbridge, not a mile off. Why not then Old Noll? If, however, we be "kicking over the traces" in suggesting a lord-protector so near a royal palace, or in indicating special portrait-statues, it only arises from the wish to see intellectual worth honoured at the same time with Art; and our not suggesting the precise best subjects for these Art-enhancements does not affect the appropriateness of Art of that character being placed in Kensington Gardens. When it is, it will be sure to be welcome to the people.

There are many other spots in the gardens, at junctions of paths, and under avenues, and by the sides of the principal paths, that suggest themselves to the wandering Art-lover as appropriate sites for such Art-enhancements as are seen in the gardens of the Tuileries or the Luxembourg. We have such trees and such turf as they have not there, and far more space; but we lack the statues and the vases and their pedestals, as objects of interest, and as points in the landscape, and to enhance the green of leaves and grass with the contrast of their colour, and to give the gardens a completed character.

But of what material, it may be asked, should these works be? We would say brouze, *pietra-dura*, and terra-cotta, and stone for the pedestals. But brouze, it may be said, would be very expensive. Very well, then iron painted or electroed. The great thing is to *begin* to have good Art in the open air in these gardens—never mind the material at first; we may improve afterwards—that is why we mention terra-cotta, because it is cheap. Let us have iron, *pietra-dura*, and terra-cotta. If Sir Benjamin Hall were to set about to get works in these materials executed for this purpose, we are confident he would be met half way by both artist and manufacturer. The Colebrook Dale firm gave their very expensive gates in the gardens to the Crown, and several artists worked at less than half-price in doing the terrace-figures for the Crystal Palace, at Sydenham.

We fancy if the Chief Commissioner (we have seen him not a few times in the gardens, looking after the

recreation of the people) would but take, in the above regard, a fresh survey, that if he did not come exactly to our conclusion, he still would arrive at one not far removed: and so, for the present, we touch our hat, and wish him a fine day for his next walk in the gardens, and an artist of refined taste for his companion—such as Sir Charles Eastlake or Mr. Redgrave.

DAVID COX AND HIS SKETCHING-GROUND.

If any painter of our school merits the distinction of "purely English," it is the subject of this notice, for the main facts of which we are indebted to the columns of the *Brighton Gazette*; and these particulars we do not apologise for extracting, as they convey reliable information "anent" the father of a large and yet increasing family—we mean the Water-colour School. Neither the volcanic crests of the Rhine, nor the wine-bearing shores of the Moselle, have been able to charm the constancy of David Cox from his first love—Bettwys-y-Cocod. There is but little of "*solidarité*" (what do not our neighbours owe the *Chaussée d'Antin* for this valuable word?) in the characteristics of those painters whose excursive affections comprehend everything between the Augustan Forum and the furthest Thule. David Cox set up his altar and worshipped Nature in the same fields as did Girtin, Robson, Turner, Copley Fielding, and all those who "adorned the profession" in the earlier part of our progressive century. We have seen Robson's father turn his back upon his son with these encouraging words: "Sir, I have lived by the wine trade to be an old man; but you will never live beyond your youth by your water-colour trade." The old man was right; but he did not wish to be so. And Cox remains the only link between the present and that time, now long past, the deepening twilight of which is gilded, also, by the shining names of Dewint, Prout, and others, who live now only in their works.

"Bettwys-y-Cocod, a name for many years familiar to all visitors of the London exhibitions, from the numberless paintings which annually appear on their walls, representing scenes and incidents in that now much frequented and admired place, was, at the commencement of the present century, scarcely known beyond the district in which it is situated, or distinguished in any way from other Welsh towns and villages with equally-unpronounceable names. Fifty-five years ago, this then obscure and inaccessible village was visited by a young man, then as unknown as the place which became his temporary residence, who, after essaying various trades and callings, had resolved to devote himself to the art of painting. That young man was the now celebrated David Cox, who will ever be remembered as one of the most original and distinguished of England's landscape-painters. With a rare constancy, the more remarkable from the ever-changing pursuits of his youth, he has continued to be a frequent visitor to the scenes of his earlier studies. It is said that for thirty-five years he has never missed a single season. The present has been no exception to this long-established habit. Not long since the well-known, sturdy, fresh-coloured, and hearty-looking old man, now verging on fourscore years, was to be seen imbibing fresh inspiration from the perpetually-changing atmospheric effects in that mountainous district, with all the ardour and enthusiasm of youth. Many are the anecdotes told in the village of the kind-hearted and simple-minded artist who, unspoiled by success and intercourse with the world, has still preserved that most attractive and rarest of all gifts of manner—a genuine and unaffected simplicity. Many are the memorials which are proudly exhibited of his frequent and long sojourns at Bettwys. The landlord of 'The Oak' boasts of a sign-board painted by his yearly visitor. A paragraph appeared not long since in some of the papers about this sign. A Manchester manufacturer, so the tale went, had, during a recent visit, tempted the landlord with the offer of 100 guineas; the offer was accepted, and the manufacturer bore off the sign in triumph. The offer may have been made, nothing more likely, considering the enor-

mous signs which the great Art-patrons of the present day, the merchants and manufacturers of England, offer for any really-meritorious production; but if so, it was rejected. The veritable sign, as painted by the great artist, still remains in its original position; and long may it be before this pleasing reminiscence of a genuine Englishman and English painter be removed from the place for which he destined it! Sign-painting has been the occasional amusement of many artists, and sometimes it has been adopted by the less provident followers of Art as a convenient mode of settling an account with the landlord. Moreland is known to have had recourse to this expedient on more than one occasion. Wales can boast of another sign from the pencil of a distinguished landscape-painter. For the little inn of the hilly Ruthin, Richard Wilson painted the well-known 'Loggerheads,' with the inscription, 'We three Loggerheads be.' The 'Oak' at Bettwys has other memorials of the artist's skill, besides the signboard. The walls of the parlour are ornamented with specimens of his art, and that in a style very different from what he exhibits at the Water-colour Gallery. A figure, life-size, having all the effect of fresco, but probably painted in water-colour on the plaster, is a copy from memory of the fresco by Redgrave, exhibited at Westminster Hall, of Catherine Douglas securing the door with her bare arm. English artists do not, like their brethren on the Continent, form a class apart, and are not, like them, gregarious in their habits. English artists have no such places of rural rendezvous as the French meet with in the forest of Fontainebleau, at Barbizon. Perhaps the nearest approach to these continental assemblages which Great Britain affords is at Bettwys, where 'The Oak' occasionally shelters at one time ten or a dozen artists. This distinction is entirely owing to David Cox. It is his pencil that first made the little village known to the world of Art; it is the fame he has acquired which has induced others to visit this district; and for the many solid advantages which result from this succession of visitors, the inhabitants are indebted to the friendly, warm-hearted artist, who enjoys the happiness of doing good to others. What Walter Scott did for the Highlands, and Wordsworth for the Lake district, David Cox has done for Wales— attracting there not only the younger aspirants for artistic honours, but the admirers of wild, uncultivated, and picturesque scenery, and even the ordinary tourist, who hurries from place to place in search of that mental excitement he is incapable of feeling.

"To those who can appreciate such scenes, no more interesting excursion can be conceived than a visit to Bettwys. A journey of sixteen miles from Conway will bring the pilgrim to the little village, situated in a beautiful valley. On either side rise lofty hills, from which huge masses of rock stand out in bold relief against the sky,—some perfectly bare, others partially concealed by heath and fern, which grow around and upon them with the utmost luxuriance. Through the bottom of the valley rushes and roars the Llugwy, fretting and foaming over its rocky bed, until, with the Lleder, it falls into the Conway hard by. The ash and the beech spring from the fissures of the rocky banks and droop into the stream, whilst here and there bright patches of meadow and corn-land vary the surface of the lowlands.

"All around the country may be said to be Cox's land. Every wide expanse or lofty mountain, every nook and corner, every object which meets the eye, every incident and every effect which can occur in such a district has furnished a subject for his prolific pencil. The wild uplands and craggy steeps, flooded in sunshine or veiled in mists; the brawling stream and flashing river, where the water comes dancing from the hills, leaping from rock to rock with a great rush and a great cry, as only mountain torrents can, seaming their sides with threads of silvery hue and brightness. Peat-gatherers and fern-gatherers, splashing through boggy fens, or winding their weary way to strange out-of-the-way places on the hill-side or mountain-top, where not unfrequently the poor but hospitable owner will startle the visitor by producing a sketch or other memorial of some artist, perhaps now of established and wide-spread reputation, or long since removed from the scene of his triumphs and

his mortifications, who years gone by had found shelter beneath the lowly storm-buffeted roof. The little church, too, how many subjects has that suggested, with its morning, its mid-day, and its evening effects—its christenings, its weddings, and its funerals, an epitome of human existence. The picture of the Welsh Funeral at Bettwys, exhibited a few years since, is one of David Cox's most impressive works; the tone of colour so perfectly in keeping with the sad scene—deep, full, and solemn. Few incidents are more touching than such a funeral scene in the dark gloom of the mountain-wild, so calculated to excite reflection upon the vastness of nature, and the littleness of men. Moel Siabod, towering to the clouds, looks down, as it has looked down, generation after generation, on the mournful throng passing slowly beneath its shadow. A Welsh funeral is a great gathering,—all the neighbours of the deceased attend the body to the grave, or, if prevented, some representative of the household attends, so that even the poorest has many followers; but, for the wealthy or the highly respected, the train is exceedingly numerous. This custom, still religiously observed, is probably derived from former habits, when the people, instead of being widely scattered, as now, over the face of the country, were collected in and around the castle of their chief, forming as it were one family. Those who are familiar only with the recent drawings of David Cox, would scarcely recognise some of his earlier productions as the works of the same artist. In his younger days he bestowed far more care and finish than we observe in his recent drawings; many of his earlier ones being as remarkable for purity and delicacy of colour as those of his later years for breadth and vigour of execution. The laws of Pre-Raphaelite minuteness might pronounce these last to be mere blots of colour, from their entire absence of detail; but however slight and apparently careless, they evince the hand of a master, and are often far more suggestive of the real scene or effect, than the most laboured imitation of the minute and accurate copyist of nature's details. This style may be characterised as a happy power of seizing upon the leading points of his subjects, and rendering them in broad and effective masses of light and shade—truthful and sober in colour, and simple in execution as his own rare character. Probably all strongly individual minds illustrate themselves in their works, and traces of the man may be found both in the choice of subject, and mode of execution. The artless nature of David Cox is seen in every subject from his hand, and impressed by every touch of his pencil. This working out of a deep-seated feeling is essential to originality, and a part of the constitution of every great painter; without it he becomes a mere imitator of other men's works, seeing through the eyes of some favourite idol of the day, instead of re-producing his own sensations direct and fresh from nature. Individuality is the very soul of painting, and its highest worth. It rendered Turner the greatest of landscape-painters, originating with him new thoughts and modes of expression never before seen in the world of Art. As a painter of light, with all its tender and delicate gradations through space, he surpassed all men. The pictures of Cox are valued and admired for the same reasons that induce us to appreciate the works of Turner—their perfect originality—because they are so unlike the works of any one else. Like Turner, he gives his own free view of nature, unbiassed by the thoughts of others, faithful to his own perceptions, distinct and original."

Fifty-five years ago! and still so constant to Bettwys. Most rare ingenuity, to extract so much good out of a thing so small! In connection with this there is but one wish to express—and we may do that publicly which it would scarcely be graceful for a man's friends to propose to himself—that is, whenever it shall please God to take to himself the spirit of the man of whom we write and read with so much pleasure, that a monument of him be placed in the little church of Bettwys. The story of his life will not be complete without this consummation. And now for a time farewell, David Cox; but a few weeks and we shall see thee, we earnestly hope, fresh and vigorous on the walls of the Old Water-colour Society, and may we expect thy coming for many a future year!

BEATRICE CENCI.

FROM THE STATUE BY HARRIET HOSMER.

ON the last visit of Mr. Gibson, R.A., to England, a few months ago, he brought with him, and placed in our possession, a drawing from a work of sculpture executed by a young American lady, Miss Harriet Hosmer—it forms the subject of the appended engraving.

Sculpture from female hands is of rare occurrence; independent of the peculiar characteristics of the art, and the knowledge which it is necessary for every artist to acquire who would practise it, the chisel and mallet are not the most pleasant tools, we should imagine, for a lady to use, or stone or marble the most subservient materials to yield to the efforts of her will. But genius and enthusiasm are not easily impeded by obstacles, however contrary to nature and custom in general; and thus we have seen in England the Hon. Mrs. Damer, in France, the Princess Marie (daughter of Louis Philippe), distinguishing themselves in sculptured art, and now America sends forth a lady to claim the homage due to her talent.

Miss Hosmer is the daughter of a physician residing near Boston. Animated by an ardent desire to devote herself to sculpture, and feeling that in Rome only the knowledge she wished for could be best gained, she, accompanied by her father, set out for Italy about four years since, taking with her a certificate for anatomical studies at the College of St. Louis, and some daguerreotypes of a fancy bust, modelled and sculptured in marble by herself. When these were shown to Mr. Gibson, and he had learned the object of the young lady in visiting Rome, he felt so assured there were in them the germs of great future excellence that, contrary to his usual custom, he at once admitted her to his studio, with the determination to afford her all the aid in his power to promote her object. There, then, Miss Hosmer has been from that time; not, however, as a professed pupil, but as the artist-friend of our countryman, who offers the lady such advice and assistance as he considers may be useful, but leaving her to follow the current of her own genius and inclination.

Among the works executed by Miss Hosmer during the time she has been with Mr. Gibson, we may mention a fine bust of "Medusa," a small figure of "Puck," seated on a stool, and in the act of throwing a stone; a life-sized statue of "Enone," when deserted by Paris; and "Beatrice Cenci." She is, we understand, engaged at present upon a monumental figure, to be erected in the Church of St. Andrea delle Fratte, to the memory of a young girl who died some months since in Rome.

The story of Beatrice Cenci will be found, we believe, in Sismondi's "History of the Italian Republics;" her history was most unhappy: condemned to an ignominious death, she yet entertained hopes of a pardon, "and when the priest went in to announce to her that she was to die in the morning, he found her peacefully and calmly asleep in her miserable cell;" it is thus that Miss Hosmer has represented the unfortunate prisoner, treating the subject, however, with the licence permitted to the art of sculpture as regards the drapery and accessories. The figure lies in a graceful and strictly natural attitude of repose; the head rests on the right arm, the left falls easily over a raised block of stone, and in the hand is a rosary, which the fingers, in a state of inaction, refuse to grasp. The left leg is half drawn up under the extended right, an arrangement which has enabled the sculptor to vary the lines of the drapery with much skill and agreeable effect, without disturbing the general harmony or destroying the least indication of the forms of this portion of the figure; this is to our eye the most sculptural and beautiful passage in the whole work. The face is not so pleasing as we think it might have been made, the sharpness of the nose and the rigid expression of the lips detract from its beauty; still these peculiarities are not inconsistent with the circumstances of the subject; or it is yet more probable that the artist who made the drawing in Rome has somewhat deviated from the original.

The work has been executed for the public library of St. Louis; but previously to its being forwarded to America we may not improbably see it in our Royal Academy.

BEATRICE CENCI

ENGRAVED BY W. HOFFE FROM THE SCULPTURE OF BARRI SASSINI

LONDON, PUBLISHED BY THE PROPRIETOR

ON THE CRYSTALS OF SNOW,
AS APPLIED TO THE PURPOSES OF DESIGN.*

At the conclusion of our previous remarks on this subject we referred to mosaic-work as one of the revived decorative arts of a by-gone period. An attempt to adapt a revival of Byzantine glass mosaic to various household elegancies

has within the last few years been attempted by Mr. George Stephens, of Pimlico, who, after considerable study of the mosaics of antiquity, has designed a large variety of elaborate and beautifully-executed patterns for tables, stands, panelings, candelabra, &c. In the specimens that we have seen, his combinations have been based, many of them upon the hexagon and its varieties, and several upon the octagon, which

is necessarily more removed from the simplicity of the Byzantine school. In the opinion of Mr. Stephens, the figures of snow are highly suggestive of a still further extension of the forms known in mosaic, and he considers that they will materially aid in the construction of new figures; we believe that it is his intention shortly to attempt an adaptation of some of them to the purposes of his Art.

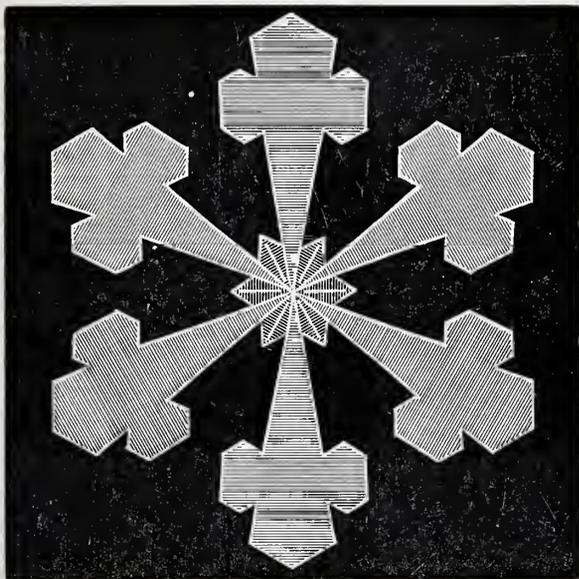

Fig. 16.

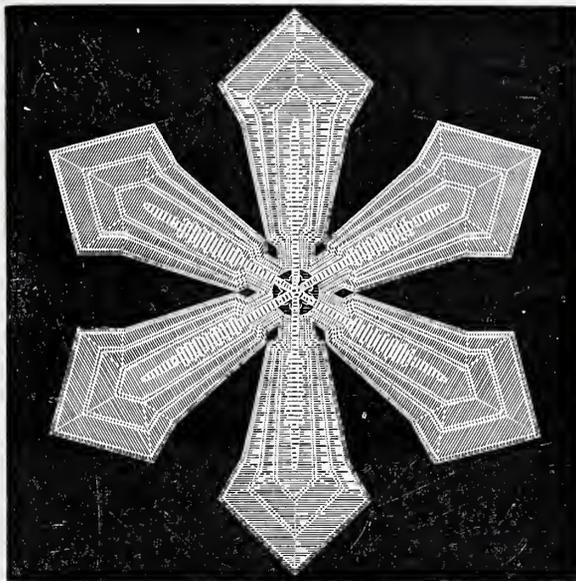

Fig. 17.

We feel that we cannot sufficiently admire the structural detail of the greater number of these productions, and the rich effects of colour united in their composition. But here we may remark, that to render the ancient Byzantine mosaic an appropriate decorative agent, it is necessary that the artist do not copy implicitly from the works of the past, but that he seek most to maintain between it and surrounding influences, the same relation that formerly

existed between it and the people under whose hands it attained such distinguished pre-eminence. As we have already said, the art originated beneath the skies of Italy and Greece, and with it the system of bright and glittering colours which rendered it so perfect in itself, and in its relation to all surrounding things; wanting in these bright influences of climate, we find it in our own country no less beautiful in itself, but wanting in a due harmonious

relation to the tone of colour it is brought in contact with. To remedy this, to naturalise the art, in fact, the artist should be content to trust rather to harmony of design than to chromatic effects; so that the eye, uncaught by a general sensation of brilliancy and glitter, may repose upon the quiet harmony of the design; and this remark we make as applying more or less to all mosaic, and entering as a matter of consideration into every application of which it

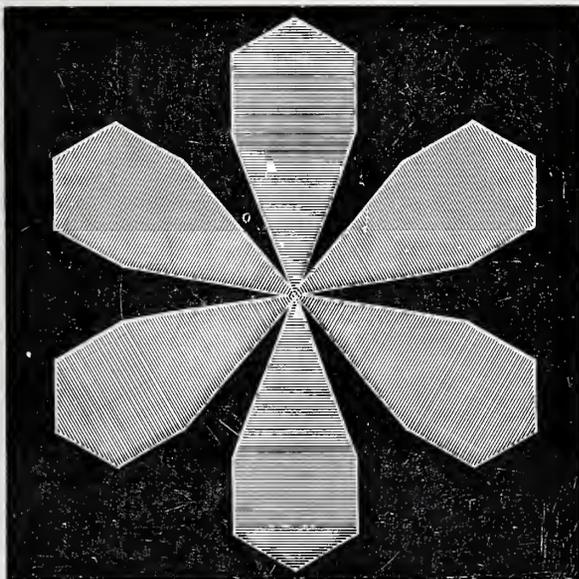

Fig. 18.

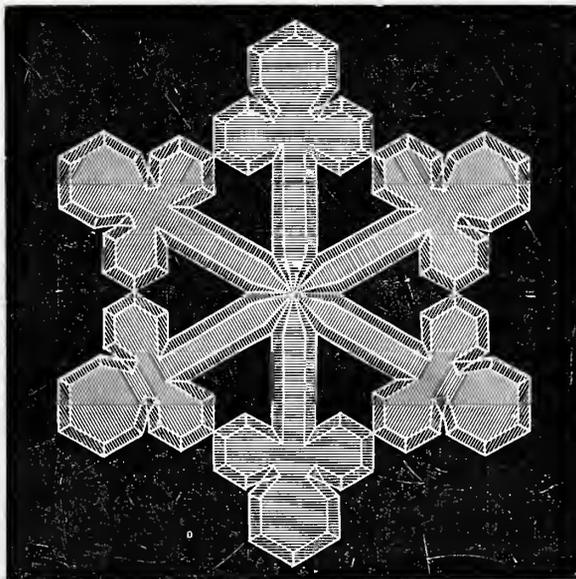

Fig. 19.

is capable in this country, though more particularly in reference to the particular description executed by Mr. Stephens.

In rejecting strong chromatic effects, however, we would not be understood to sanction neglect of the very material aid afforded by colour in giving life and purpose to mosaic; but we would have it studied with a view to its creating as many varieties of pattern

* Continued from page 76.

as can possibly result from the introduction of a limited range of colour upon a uniform series of designs. For instance, how many varieties of pattern the eye is able to trace from the simple repetition of a six-rayed star of uniform colour, upon a ground broken into triangles by the introduction of two other colours to complete the triple harmony. This is an unfailing charm in mosaic; however simple or however complex the construction of the

design, viewed from a distance, the eye is constantly discovering, without mental effort, fresh combinations which, arising out of natural and fixed laws, communicate pleasure to the beholder.

To encaustic tile-work and its imitations, the figures of snow appear peculiarly suggestive; and it is remarkable that a few of the patterns preserved to us from antiquity, are exactly similar to the nuclei of some of the

snow crystals, as may be seen in parts of the encaustic pavement of the Byzantine Court. In this application, far more than in the conventional glass mosaic and its imitations, of which we have been speaking, we are compelled to seek effect in symmetry of design; necessarily excluded from imparting the idea of raised surfaces, such being inconsistent with the intention of flooring, which is to present a level surface to the eye and feet, we are also confined to a very limited range of colour, in order not to interfere with the decorations of the walls and ceilings, and the manufacture of encaustic tiles being in itself limited to the employment of but few colours. Thus excluded from the rich and subtle harmonies of colour, and the relieve of light and shade, our attention is principally directed to the design, which, in regard to this application, should combine simplicity with uniformity of outline, and be easily referable to a purely geometric base. And here we may add, in regard to the figures of snow, that, whether in outline or in relieve, they are equally symmetrical. In the one case, they are simply enlarged copies of the general effect to the naked eye; in the other, they present to us structural details only visible by the application of a high-power lens, or as seen by the aid of a microscope.

An equal range of application is likewise open to them in regard to floor-cloth, which involves attention to the conditions above mentioned, as applying to tile-work, but in a less degree, inasmuch as its more household and domestic applications allow a somewhat greater latitude in fancy and colour. As applied to canvas, they will admit of various supplementary borderings and intricacies of pattern, conceived around them in the spirit of the original design, and serving as a means for the introduction of the colours most commonly employed in this branch of manufacture.

In regard to the figures of snow, we have two distinct suggestive ideas in reference to

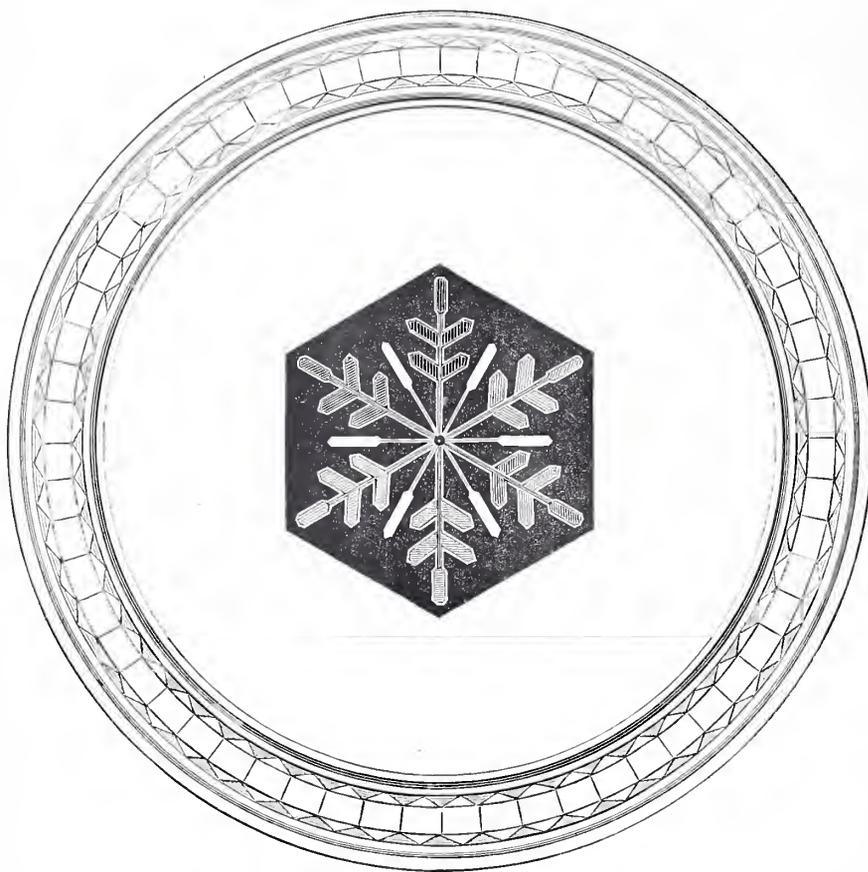

partment, and whose influence was felt more or less in every home of the kingdom, had no guide but his own ill-educated and distorted will; he threw things together without the least regard to harmony of colour, fitness of proportion, or form of any kind, and called the heterogeneous mass "a design." Of late he

be received into the higher application to porcelain. We all know that porcelain has long enjoyed a monopoly of the most tasteful designs that Art could suggest, whether of birds, flowers, medallions of figures, or arabesques; but we are in hopes that they may suggest a few novelties of design to this the most favoured

medium for the display of the natural and beautiful in Art; this hope of itself suggests the question,—how far has the beauty and symmetry of the geometric figure been acknowledged and employed hitherto in their designs? To answer this question would involve an inquiry into the history of design as applied to pottery, from its first crude attempts at the delineation of natural objects to the present time, when, both in England and abroad, it has attained to such great perfection. As a distinct inquiry, this would be scarcely less interesting than instructive, leading, as it would, the student in design to a correct knowledge of that which is beautiful and appropriate, rather than conventional. The Ceramic Court of the Crystal Palace, now open, as arranged by Mr. Battam, late of the establishment of Messrs. Copeland and Co., offers a means of study never before so thrown open to the student in Ceramic design, and contains materials which will eventually

form a complete history of pottery from the earliest up to the present time.

For a brief period of Italian Art we are enabled to glance cursorily at this history of design by means of the Soulagés Collection now open at Marlborough House; this history of progress is brief and distinctly marked, and within the compass of our present limits to trace. The most crude attempts, dating from the conclusion of the fifteenth and the beginning of the sixteenth centuries, are easily distinguishable by the rude outlines they exhibit of men and animals and flowers, in some cases strictly imitative, so far as the skill of the workman has permitted, in others, fanciful and grotesque.

have had better opportunities for the acquisition of knowledge, but what is of far more importance, he has had better informed critics; in some instances his task has preceded, in others it has followed, that of his customers; but assuredly we do not now often see upon our walls the monstrous perpetrations which disgraced those of our childhood. If the paper-hanger will examine this collection of suggestions from nature—from nature as she exhibits only one phase of grace and beauty—we feel sure that he will be at once convinced that their adoption will be of immense value to him.

There is one application yet to mention, that we have reserved to this place as involving

their application,—the one, that of ingrafting them into different styles of ornament for their further extension into new forms; the other, that of their adoption to various decorative purposes now usurped by designs or patterns, which in part sanctioned by use, are greatly censurable on the grounds of fitness and taste. In the latter spirit we consider that they may be, most usefully applied to paper-hangings, although of late in this branch of design there has been a manifest improvement: not long ago, the "artist" who presided over this de-

sign, somewhat lengthy consideration—that of their application to the manufacture of earthenware and porcelain; the ungainly and unmeaning spots that are so often put upon plates, and the distorted ornament which so frequently degrades cups, and saucers, and jugs for ordinary domestic use, we hope may, to a great extent be displaced by these snow crystals, which, varied to infinity, would cause the eye and mind to receive that refreshment which arises from the true and the beautiful; nor are we without hope that they may ultimately

In some specimens belonging to this period of Art, are attempts at creative design in the geometric precision with which similar forms of leaves and interlaced patterns are represented, chiefly described in shades of the same colour upon a uniform ground, and differing much in regard to the accuracy with which they are executed. Some of the subjects chosen are religious, including representations of our Saviour; some allegorical; and others, again, heraldic devices. The rude, but flowing, and sometimes evolved, designs of the interlaced

and outline patterns are chiefly borrowed from leaves and flowers, rather than based on principles of geometry; the colouring, also, is bold and prominent, in conformity with the spirit of the design, and exhibits the primaries blue, red, and yellow, but slightly tempered by the milder and subsidiary tints, upon which, at a later time, the painters of majolica knew so well how to rest their most soft and agreeable effects.

Of the Raphael ware, so well known and so highly prized by connoisseurs, little here need be said. Raphael, in his early youth, is supposed to have devoted some time to the painting of majolica, and hence its name at this period and for some time beyond; whether or no the easy grace and spirited style of these paintings, chiefly allegorical, though representing sometimes passages from history, and the harmonious

softness of the colouring, give intrinsic value to the most trifling specimens of the art, whether for ornament or domestic use; and many rich specimens still remain to attest their value, and the exuberant taste and fancy of those painters who were content to trust their creations of fancy to so brittle a medium. To them the designers of the present day remain indebted for a certain freedom and unconventional display of Art,

Fig. 20.

Fig. 21.

which, restrained and modified, long exercised an influence on design, and is traceable even at the present day.

A few years later, an entirely new class of designs was originated by Palissy, master potter to Francis I. This eminent ceramic artist, born in France, was the originator of the Palissy ware, scarcely less known than that of Raphael. His works are executed in relief, and are distinguished from others of the period

in the choice of subjects, which are chiefly drawn from natural objects, such as plants, reptiles, fishes, &c. Among the specimens known by the name of Palissy ware, are rustic baskets, designed on a strictly geometric base of divergent lines from the centre to the circumference, partly in relief, and very effective in style and composition. The chief merit of this artist consists in his fidelity to nature, and an original whimsicality of conception. Pass-

ing on from Palissy, we come, many years later, to specimens of china of a tasteful degree of ornament, that would do no discredit to the porcelain works of the present day; here, in the central medallion, is a group of figures, Raphaellesque in their easy grace of outline, yet highly studied, and claiming the rank of a finished picture.

The Berlin porcelain, of which a fine collection may be seen in the Ceramic Court,

Fig. 22.

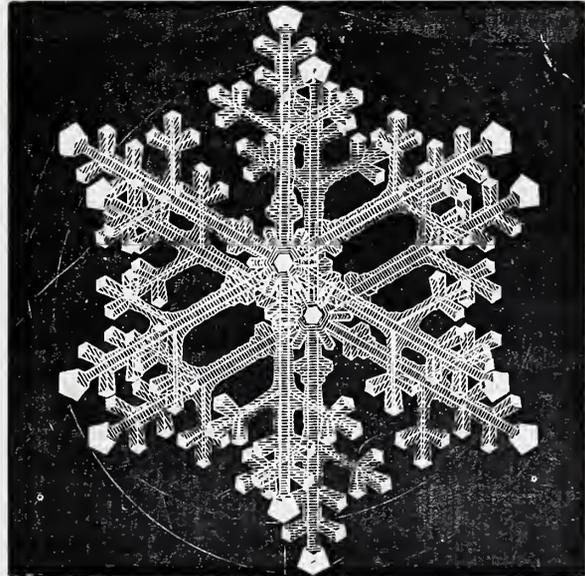

Fig. 23.

illustrates the perfection of that union which combines the imitation of the beautiful in nature with the less sensuous beauty of the geometric figure. In the Sevres porcelain, in the same collection, the geometric figure rises to higher importance, forming in the beautiful "Versailles Service" a frame-work for the jewels which enrich the exquisite centre medallions.

The impression we derive from retracing

the history of the past, is, that the geometric figure has rarely been employed as a principal agent in decoration. We are speaking still in reference to the period we have been considering, and which is one calculated to trace with effect the progress we have in view. Prominent among the earlier specimens, is the delineation of simple forms borrowed from nature, repeated with indifferent fidelity of execution, and spread over the entire surface of the piece,

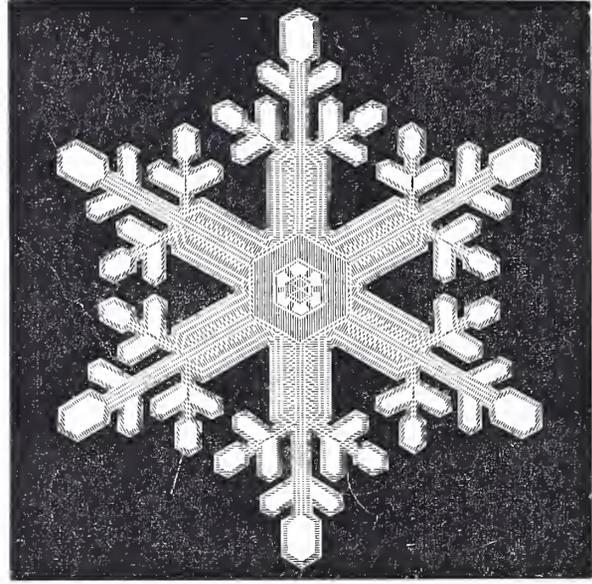

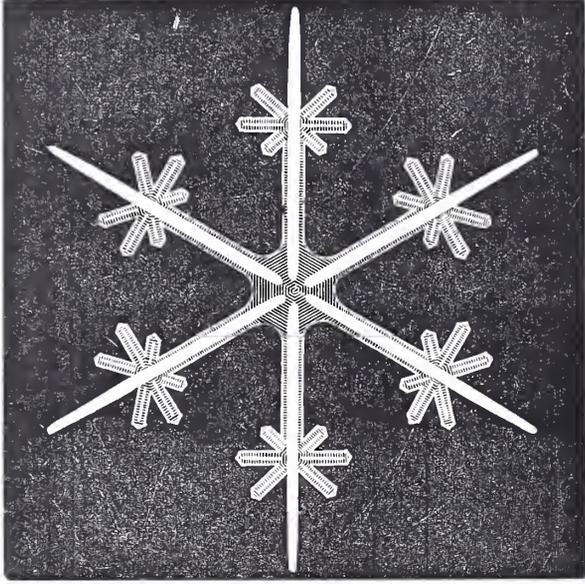

whilst in later times, when the mechanical processes improved and admitted of greater accuracy, we find it restricted to light and artificially constructed borderings, so arranged as to lend additional beauty to the freedom of colour and design elsewhere displayed; and we gather, also, that if in the works of high Art we find it nowhere unmixed with designs of a less formal character, there is scarcely a work of high Art that is not indebted to the grave and

conventional arrangement of pattern founded upon a genuine knowledge and elucidation of its principles.

It has ever been greatly against the very general adoption of geometrically constructed figures for the purposes of porcelain, that the unaided hand of the draughtsman is insufficient to insure the requisite accuracy of outline; a difficulty which even at the present day

limits to a very great extent their employment in this department of Art. Still, we are led to hope that the figures of snow may prove suggestive of a new basis on which to construct designs, no less symmetrical than those which we have seen to proceed from other and better-known sources; whilst the rate of modern improvement in most branches of industry leads us to hope that this difficulty before long

may become less formidable, and that improvements in printing will enable manufacturers to repeat with tolerable cheapness patterns which have been confined to the more costly articles of luxury. Of modern applications, one in particular occurs to us—it is that they may aid in the formation of a set of ice-plates for the dessert or supper-table: we can imagine the ground of the plates a clear light blue; in

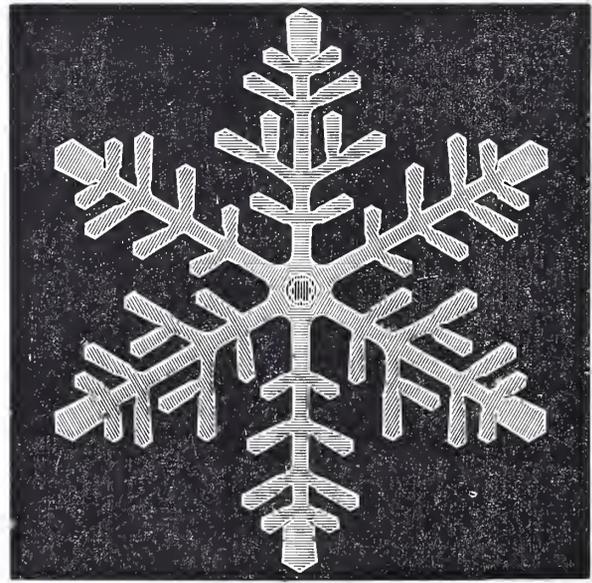

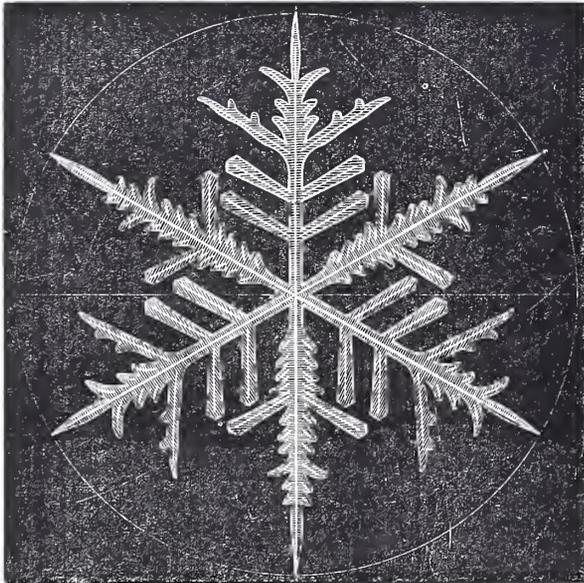

the centre may be the crystal, selecting in preference from those forms which are most crystalline and arborescent; among them, that most graceful of all, the water crystal, distinguishing it from the ground by shades of grey, which should be so distributed as to impart to the copy the frosted effect of the original. Around the centre, and immediately beneath or upon the raised margin of the plate, might be arranged a circular bordering, similar to that we have

described as surrounding the margin of a pond, on its first congelation, when the needles, becoming incrustated with crystalline deposit, assume the appearance of frosted ferns.

There is yet another application that suggests itself to us, although the beautiful designs on porcelain, executed by Messrs. Copeland and Co., scarcely leave anything to be desired by the most fastidious; we refer to the painting of tiles or slabs of porcelain, to be mounted in

frames of silver, or wood, for ornamental or domestic purposes, and for which, of late, there has been a large and increasing demand. The large engraving on page 126 is designed for this application from one of the snow crystals.

To turn to yet another and far wider scope which may hence be given to the cotton printer; millions of "dresses" issue every year from Manchester; for those which are designed to clothe "the masses," there is usually little

attempt at design. A simple form of a single colour is all that is sought for, and the puzzle is, how to obtain variety. Here is a book of patterns, no one of which has ever been used; leaf after leaf may be turned over, "and still find something new"—something that may be copied as it presents itself, something that will be suggestive.

Our references have been made to but a few of the Arts, which may be (which must be)

largely influenced by this power to resort to another means of teaching; but it is obvious that there is no branch of manufacture which may not, to some extent, be benefited by it. Let the reader give the subject a moment's thought, and he will be convinced of this; let him look down to his carpet, or up at his ceiling, let him turn to the cover of the book he is perusing, notice any part of his lady's dress, or of his own, where ornamentation is admis-

sible; let him, in short consider any object, anywhere, under any circumstances, and then examine the few examples we set before him on these pages, and he will at once perceive how much of harmony, of truth, of beauty, may be obtained by an intellectual study of these forms which are neither more nor less than nature's teachings from a book hitherto unopened.

PICTURE SALES.

IN the month of February, 1856, the first portion of the pictures collected by Mr. Charles Birch, of Mitchley Abbey, Birmingham, was sold by Messrs. Foster and Son, Pall Mall; and in the same rooms, on the 27th of February last, another portion of the same collection was submitted to public sale: the catalogue contained a list of seventeen drawings and fifty-one paintings in oil.

Of the drawings, ten were small works by DAVID COX, exquisite little "bits," that were certain to find, as they did, ready customers. Of the others we need only mention 'Sunset at Sea,' COPLEY FIELDING, 21 gs.; 'Rustic Devotion,' now in the hands of the engraver, by W. HUNT, 31 gs.; 'Scene on the Nile,' J. M. W. TURNER, 68 gs. (Gambart); 'Venice,' J. CATTERMOLLE, 71 gs.; 'Spanish Pilgrims,' J. LEWIS, 40 gs.

The following were the most important of the oil-pictures:—'The Crochet Worker,' ETTY, 30 gs.; 'Good morning, dear,' KNIGHT, 35 gs.; 'Girl with a Paroquet,' a sketchy work by Mrs. CARPENTER, 33 gs.; 'Dead Game—Hare and Pheasant,' a study of colour, ETTY, 30 gs.; 'Fruit' and 'Flowers,' a pair by T. GRÖNLAND, 61 gs.; 'Wood Scene,' an excellent specimen of the artist, J. STARK, sen., 74 gs.; 'The High Priest,' ETTY, 155 gs. (Lloyd); 'Dead Game,' ETTY, 29 gs.; 'Ye Ladye Margaret's Page,' MACLISE, 111 gs.; 'Bettwys Church,' one of DAVID COX's few oil-pictures, and one of his best, 85 gs. (Lloyd),—a Welsh funeral is most effectively introduced into this composition; 'The Concert,' by the French painter FICHEL, 41 gs.; 'Mrs. Norton as the Muse of Poetry,' MACLISE, 80 gs. (Gambart); 'Landscape in the Great Meadow at Bettwys,' D. COX, fresh and breezy, 39 gs.; 'The Graces,' a copy, by DENNING, of Raffaele's celebrated little picture, 38 gs.; 'Child in a Storm,' GAINSBOROUGH, 25 gs.; eleven copies, by ETTY, of pictures by Titian, P. Veronese, Tintoretto, and Rubens, were knocked down to Mr. Wallis for 725 gs.; 'The Spirit of Justice,' MACLISE, 300 gs. (Holmes); 'The Fleur de Lys,' ETTY, 500 gs. (Holmes); 'Nimrod, the Mighty Hunter,' J. R. HERBERT, 130 gs. (Holmes); 'The Golden Age,' ETTY, 600 gs. (Wallis),—this picture was bought in at the previous sale for 850l. 10s., so that its value seems to have diminished nearly one-third within the year; 'The Opening of Waterloo Bridge,' CONSTABLE, 580 gs. (Wallis): Constable used to say he painted for other generations rather than his own; and he was right, for this picture appears as fresh now as on the day when it left the easel. Not so, unfortunately, is F. DANBY's 'Advent of Spring'; it seems to have lost colour even since the former sale, when it was knocked down to Mr. Holmes, as was generally understood, for 273l.; it was purchased at the second sale by Mr. Gambart for 250 gs., a small deduction from the former price. The last work to be noticed is MACLISE's fresco, 'The Spirit of Chivalry,' which sold for 110 gs. Taking the average prices realised by these pictures, they are certainly lower than we have been accustomed to record as given for works of similar character, and assuredly much less than was paid for Mr. Barlow's pictures at Manchester the other day.

CORRESPONDENCE.

To the Editor of "THE ART-JOURNAL."

CHROMO-LITHOGRAPH DRAWINGS: A SUGGESTION TO THE COUNCIL OF THE ART-UNION.

SIR,—It is with a due sense of the obligation which all who are really desirous of the advancement of Art in this country owe to the Art-Union Society, and with respect for their past exertions, that I now ask you to allow me, through your columns, to suggest to the Council their making use of the new chromo-lithographic drawings. I am fully aware that it needs great discretion on the part of those who, whilst they strive to advance a love of any science, endeavour at the same time to relieve talent, during the early stages of its development, from the trammels with which it is surrounded by false opinions and timidity. But in advocating the cause of this beautiful invention, I cannot but feel that they would equally aid the cause of true Art, and do service to painters themselves, by dissemi-

nating more widely a greater admiration of their works; for all earnest lovers of Art must see with pleasure the advances which continue to be made in perfecting these drawings. Some of the late impressions have been very beautiful productions, possessing that freedom in style which has always been so difficult of attainment in such copies of pictures, and a purity of colouring which is almost unexceptionable.

The objects of the Art-Union have always and most properly been, the propagation of the love of Art—or rather of high Art and pure taste—as opposed to the constant stream of second-rate, so-called Art, which private interest and the unaided efforts of uneducated persons are continually forcing upon us. To effect this the society offers a vast number of opportunities for the selection and purchase of first-class original works; and, so far as its own direct influence could be exerted, it has hitherto been liberal in the distribution of good engravings. All this is excellent; but to early subscribers, who have now on hand a large number of the engravings, a change, in the shape of some first-class chromo-lithograph drawings, would certainly be grateful; whilst the drawings themselves have in them those merits which, without detracting from the dignity of the Art-Union's object, would undoubtedly tend to advance that object, and add an honest popularity which no such society can afford to be without.

The interest which I know to be felt by many subscribers on this subject must at once be my apology for offering this suggestion to the Council of the Art-Union, and asking you to lend it the influence of your Journal. The present time seems particularly favourable for a consideration of the question, as shortly the usual Annual Meeting of the Society will be held, when facilities will exist for ascertaining the truth of my remarks, or announcing any fresh arrangements.

I am, Sir,
Your very obedient servant,
C. H.

THE LIFE OF MICHAEL ANGELO.

SIR,—In the notice with which you have honoured my "Life of Michael Angelo" in the last *Art-Journal*, you state that I have made no reference to the essay of Mr. J. E. Taylor, or his poetry: I am anxious to correct this mistake. In my second volume, page 136, honourable allusion to it will be found; and perhaps you will allow me, by means of your widely-spread Journal, to add that I highly appreciate the ability with which he has traced back the great artist's poetry to its primary and philosophic sources.

J. S. HARFORD.

Blaise Castle, near Bristol.

[On referring to the page pointed out by Mr. Harford, we find Mr. Taylor's work alluded to in a short note, which had escaped our observation.—ED. A.-J.]

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY PICTURES will be received (according to advertisement) on the 6th and 7th of the present month: the Exhibition will no doubt open, as heretofore, on the first Monday of May.

THE ROYAL ACADEMY.—The subject selected for the gold medal competition of this year is "The Good Samaritan:" it applies to both painting and sculpture.

THE ROYAL ACADEMY LECTURES ON ARCHITECTURE.—Two amongst the architectural members of the Academic body have recently set an admirable example to their brethren, by coming forward to address to the students of their own particular department of Art a series of lectures eminently calculated to produce a beneficial influence. Mr. Sydney Smirke and Mr. G. G. Scott have increased their already high reputation by these addresses, which, besides their intrinsic value, can scarcely fail to lead to the delivery of many other similar lectures bearing upon various departments of Art, as well as such as would treat of the great art of architecture. Courses of lectures in Art, available to the public as well as to Art-students, would be of great value, and we are disposed to believe they would be duly appreciated. Architecture, in particular, is a subject upon which public attention at the present time is concentrated with singular earnestness, and yet there is ample room for much public teaching upon this form and expression of Art. We have able and attractive lecturers, who might deal with this subject in a satisfactory manner: it is to be

hoped that some amongst them will make an attempt thus to direct along a right channel the taste and feeling of the public at large, while others devote themselves more particularly to professional students.

THE SOCIETY OF BRITISH ARTISTS was opened to the public on the 23rd of March, but too late to be treated in the present number of the *Art-Journal*.

THE ART-TREASURES AT MANCHESTER.—Our report may be given in a sentence—the supply of all classes and kinds of objects of Art has been "excessive." The Exhibition will open early in May: His Royal Highness the Prince Consort will preside on the occasion.

THE MANCHESTER MECHANICS' INSTITUTE.—The Exhibition closed on the 16th of March; the results having been entirely satisfactory, a sum of about £4000 being thus added to the fund.

THE SHEEPSHANKS' GIFT.—Arrangements are in progress for rendering this munificent gift as largely useful as possible to the people to whom it has been presented. We postpone for awhile the notice we contemplate of this invaluable acquisition. The papers moved for by Lord Montague have not yet been circulated; it is probable, however, they will give to the public little information beyond that which they now possess—sufficient to justify the warmest expressions of gratitude. We shall, no doubt, be ere long enabled to bring this treasure under detailed review.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS, at a Special General Meeting of its members at the beginning of last month, unanimously passed a resolution—"That it is humbly submitted for her Majesty's gracious consideration, that the Royal Gold Medal for the year 1856 be awarded to Owen Jones, Fellow, author of the 'Alhambra,' the 'Grammar of Ornament,' and other works." This proposition is as honourable to the body from whom it emanates as it is to Mr. Owen Jones, whose hooks are certainly among the marvels of the age, and as valuable as they are beautiful. We shall rejoice to hear that the recommendation of the Institute has met with the approval of her Majesty: the gold medal could not be more worthily bestowed than upon this most laborious, learned, and skilful student of decorative art.

EQUESTRIAN STATUE OF THE LATE LORD HARDINGE.—We hope that every one—and, unhappily, there are many who are so blind or so ignorant as to entertain such an opinion—who thinks that England cannot produce a grand work of sculptured art, may have the opportunity of viewing Mr. Foley's colossal equestrian statue of the late Lord Hardinge, prior to its departure for Calcutta, its final destination: and if, after careful examination, they are not converted from their error of judgment, why then there is no help for them, nor hope that anything will eradicate their credulity. To our minds it is the finest work of the kind we know, either here or elsewhere—bold, almost daring, in conception, and masterly in execution. Lord Hardinge is seated—and the "seat" would be the admiration of the best horsemen in the kingdom—on his Arah charger "Meance," the animal he rode throughout the engagement. The general is hareheaded: over his uniform is thrown a short cloak, falling in light graceful folds almost to the knees; his attitude and bearing are firm, resolute, dignified, yet easy; there is repose, but not inaction—calmness holding in check the energy of life. Of the horse we know not how to speak in terms sufficiently high: Joh's magnificent description of the war-horse comes to our aid: Mr. Foley certainly had it in his "mind's eye" when he modelled the animal, though "Meance" was before him:—"Hast thou given the horse strength? Hast thou clothed his neck with thunder? . . . The glory of his nostrils is terrible. He paweth in the valley, and rejoiceth in his strength: he goeth on to meet the armed men; . . . he swalloweth the ground with fierceness and rage. He saith among the trumpets, Ha, ha; and he smelleth the battle afar off, the thunder of the captains, and the shouting." From whatever point of view one examines this sculptured group, it presents something to admire, and causes us almost to envy the inhabitants of Calcutta the possession of so noble a work of Art. It has been cast in bronze by Messrs. Elkington & Co., of Birmingham, and will, ere very long, be shipped for India. There has been some talk, we believe, in military circles, of erecting in London some tribute to the memory of

the late commander-in-chief; and it ought to be a duplicate of the Calcutta memorial: wherever located, it would be honourable to the worth of Lord Hardinge, and honourable to the country and the sculptor, who, by it, has placed his genius in the production of "heroic" Art side by side with that he has long since shown in the representation of the beautiful and the pathetic—each of them on the loftiest pedestal of artistic fame.

EXHIBITION OF PLANS IN WESTMINSTER HALL.—In answer to a question put by Lord R. Cecil, in the House of Commons, on the subject of the approaching competition for the new government offices and their approaches, in Westminster, a statement was made by the Chief Commissioner of Works, which in all probability is intended to express his intention in the matter of the Wellington Monument also,—and which demands a word of notice, inasmuch as it had the air of making some pretension to a principle, while revolving itself into a very evident fallacy the moment it is examined. Sir Benjamin Hall announced, that "it was not his intention to nominate any of the judges until after the plans were sent in." At first sight, an impression seems to have been produced—and perhaps intended—that the First Commissioner had hit upon an expedient for securing fair play in the matter of selection among the competitors,—inasmuch as he intended to take care that the parties commissioned to decide between them should not be known till he had all the competing models in his hands. Anybody who will look twice at the proposition will, we think, fail to see what is gained in the matter. Sir Benjamin Hall *must*, we suppose, name his judges *some* time before judgment can be given; and, on the hypothesis that any undue influences are intended to be attempted on the part of individuals, they are just as easily set in motion after the models are in Westminster Hall as while they remained in the studios of the several competing artists. We abide by our opinion, that it would have been far more satisfactory to the artist body in general if they could have had some assurance before they began to work under this competition, that labours so special as theirs would undergo the testing of a competent and impartial tribunal. The answers of the First Commissioner to some further questions proposed by the same noble querist were of a more satisfactory kind. "With regard to the judges," he said, "it was his intention to nominate some gentlemen who were not connected with engineering or architecture, and to associate them with others having a thorough knowledge of those professions. It would not be difficult, he thought, to select competent persons who were not at all connected with the competitors, and it was not his intention to appoint any judges who were connected with the candidates."

GIBSON'S "QUEEN."—Mr. Gibson's group, for the new houses of Parliament, representing the personal Majesty of England—and for which Parliament voted a sum of £5000 some years ago,—has, after many delays, been completed on its site, and may now be seen by such of our readers as choose to pay a visit to the House of Lords. It stands in what is called the Prince's Chamber, the ante-room to the house itself, with its back to the throne within; and so fronts the Queen, as she passes from her robing room to meet her faithful Lords and Commons in the Upper House. The site assigned to the work is expressly architectonic,—and the work itself, in character and arrangement, is eminently architectonic, to fit it. In this point of view the performance is an imposing one. It has much of the simplicity and repose which are suitable to history. The work possesses great advantages of site and of accessory,—and these advantages have been used with a sobriety and dignity which are felt to be proper to the theme. Occupying the terminal centre of the fine room mentioned, the group is thrown into strong relief, and gets at the same time an effect of colour to enrich its white forms, by means of a background of gold. In this regal atmosphere, as it were, three separate female forms convey at once the abstract idea and the individual personal presentment of the royalty of Britain. Seated in her coronation chair, on a tall pedestal (whose facets have allegorical representations, in low relief, of the forces—commerce, science, &c.—which lay the foundations of her empire), her Majesty the Queen holds in her hands a sceptre

and a laurel crown; and on levels scarcely raised above the floor on either side of her, so as to make the arrangement strikingly pyramidal, stand the figures of Justice and Mercy, as joint supporters of her throne. It must not be denied that, to obtain the fine general effect, some minor graces have been sacrificed, and the several figures, that of the Queen herself in particular, are not such as we could offer for examples of the best that our sculptors can do in this kind. The figure most to our taste of the three, is that of Justice,—which has a severe and stately beauty, highly characteristic of the theme. In a word, if we were to regard this work only in a sculpture point of view, we should say that it is not such an one as could either make or extend a reputation like that of Mr. Gibson;—but looked at architecturally, as suited to its place and purpose, it is, as we have said, a fine performance, and forms a striking and important Art-addition to the new Palace of Westminster.

THE LITERARY FUND.—The management of this valuable institution has been during the last two or three years subjected to various embarrassing "criticisms;" two parties having adopted very opposite views; both, we cannot doubt, being influenced by an earnest desire to enhance its means of utility. At the head of the one are all the officers of the Fund; while the other is led by Mr. Charles Dickens, Mr. John Forster, and Messrs. Dilke, senior and junior. We imagine, however,—and we certainly hope—the painful and useless discussion has been brought to a close: for the questions at issue were determined during the past month—a series of resolutions, moved by Mr. Dilke, sen., and seconded by Mr. Mark Lemon, having been rejected by a majority of sixty-nine to eleven. We only allude to the discussion because the principal ground taken by the opposition is that inasmuch as the "Artists' General Benevolent Fund" is conducted at about a third of the cost of the management of "The Literary Fund," the machinery of the latter ought to be made as inexpensive as the former. Without entering into explanations as to the essential differences between the one and the other, we are bound to say that the "Artists' General Benevolent Fund" is managed with far too much thought to economy: and we believe it is fully admitted by the benevolent gentlemen who superintend its concerns, that a somewhat more liberal expenditure would add very considerably to its income.

THE LORDS OF THE TREASURY have appointed Mr. Thomas Carlyle, the well-known author, one of the commissioners of the projected National Portrait Gallery, in the room of the late Earl of Ellesmere. Apartments in the house, No. 29, Great George Street, Westminster, have been temporarily placed at the service of the Commission, where business will for the present be transacted, and the portraits which may be acquired will be located. Mr. W. H. Carpenter undertakes the duty of Secretary *pro tem.*; but it is understood that the office has been conferred on Mr. George Scharff, who is at present employed, and will no doubt be employed for a year to come, by the Committee of the Art-Treasures Exhibition at Manchester. Mr. Scharff is undoubtedly a gentleman of much ability, but his fitness for this appointment may be fairly questioned. We believe he has devoted no part of his time or attention to British biographies or British portraiture; and, moreover, it is said that Government (by whom, and not by the Trustees, the appointment has been made), with its usual regard to "economy" in all that appertains to Art, have allotted so poor a salary to the office as to exclude all idea that Mr. Scharff will give much labour to its duties.

SCOTTISH ASSOCIATION.—The first list of pictures selected by the Council of the "Association for the Promotion of the Fine Arts in Scotland" has reached us; the list contains the titles of seventy-six works, chosen from the Exhibition of the Royal Scottish Academy; these will be distributed among the subscribers of the current year. The prices vary from £3 to £200, that being the highest sum paid for a single picture—Mr. H. Macculloch's "Summer Day in Skye;" Mr. E. Nicol's "Irish Pilgrims" has been bought for £180; Mr. Bough's "Port of London" for £126; Mr. J. Archer's "Shadow on the Path" for £105; and Mr. H. Paton's "Nameless Rill" for £100; the remainder have lower figures marked against them. By the way, we see that

fifteen drawings—of single figures, we presume, by their titles—by Mr. E. Nicol, have been purchased at £5 each. Surely this, to say the least of it, is giving undue preference to one artist, who, whatever his talent, ought not to have monopolised the suffrages of the Council. Such exclusive patronage will, we think, scarcely satisfy the subscribers, and certainly is not calculated to *promote the Fine Arts in Scotland.*

THE LONDON STEREOSCOPIC COMPANY continue their bountiful issues of pictures of all conceivable subjects; the most valuable and interesting of which, however, are certainly those which contain "portraits" of places rendered memorable by history or events, or remarkable for scenic beauty. The latest series is that of Windsor; it was impossible to obtain a theme more desirable, or one that advances a larger claim upon the English people. It is treated in a variety of ways; all the most attractive points have been taken; and with so much accuracy and startling effect, as to bring the venerable structure absolutely before the eye. The Company are, we understand, about to introduce several novelties in their most agreeable and instructive art; and we shall no doubt be ere long called upon to treat the subject again at some length.

THE PEACE CONFERENCE.—The chronicles of our time are as frequently written with the pencil of the artist, as with the pen of the scribe, and oftentimes more effectively. Coronations, marriages, christenings, royal visits, "tales of flood and field," the operations of war, and discussions concerning peace, banquetings of the high and mighty, and incidents of general domestic interest, are constantly rising up before our eyes in the dramatic language of the painter's art. Future students of history will find in these a record of events to which the political bias of the painter has given no partial colouring; unlike the historical writer, generally, he is independent of creed and party. A large picture of the Peace Conference, painted by E. Dubufe, C.L.H., and the property of the Emperor of the French, was exhibited at Messrs. Leggatt's and Co., during the past month. The subject is one of that unpicturesque class which demands more skill to render it agreeable than do events of stirring action and history,—and M. Dubufe has certainly disposed of the fifteen pleipotentaries, ordinary and extraordinary, who form the high contracting parties, in as pictorial a manner as the circumstances admit of. The figures are all life-size, and are vigorously painted; that of the Turkish ambassador is fine, and the heads of the others very like life. M. Blanchard, of Paris, is engaged in engraving this work. Messrs. Leggatt had also "on view" an admirable three-quarter-length portrait of Mademoiselle Rosa Bonheur, by M. Dubufe; it is the property of Mr. Guruey, and is to be engraved by Mr. S. Cousins. The lady stands with her right hand, in which is a pencil, on the neck of a heifer, painted by herself. The bright eyes and intelligent face of this extraordinary female artist have been most happily rendered on the canvas by M. Dubufe: the drawing and colouring of the entire figure are excellent; but the hand spoken of seemed to us the perfection of painting.

NELSON'S MONUMENTS.—Sir Benjamin Hall stated a short time since, in the House of Commons, in reply to a question put by Mr. Warren, that a sum of £4000 was required to complete the column in Trafalgar Square, but that Government did not consider it advisable to put in a claim for the sum during the present year. We have also heard that the small amount necessary to repair the Nelson column at Yarmouth cannot be scraped together. Well may our contemporary, the *Builder*, cry out, "Poor Nelson! his glory seems to be departed." What stains are such facts as these upon the British nation! "Poor Nelson," indeed! poorer people, we say: poor in spirit, poor in purse—"all too poor to do him reverence."

THE COLLECTORS' CLUB.—A new society of amateurs of *virtu* has just been formed under this title; consisting solely of such gentlemen as *collect*, for their own tastes, objects of antiquity, and are not dealers therein. The society will have stated meetings, at which will be exhibited the articles of Art and antiquity gathered by the members. Baron Marochetti gave the use of his studio for the preliminary meeting, at which a large assemblage gathered; and Sir A. Fountaine's antique majolica formed an important point of attraction. As collecting is decidedly on the increase in England, such

meetings will be of much interest for the exhibition of objects and comparing of notes among collectors, as well as for the opportunity afforded of seeing much generally hidden from public gaze, no country having such rich private collections as England, many of which are comparatively unknown.

THE KRUGER COLLECTION, at the National Gallery, has been "weeded," and thirty-seven pictures have been sold by Messrs. Christie and Manson for the sum of £249 8s., ten pictures having been previously selected by the governors and guardians of the National Gallery of Ireland. Seventeen pictures have been retained, for which the country has paid about £2500. The weeds have thus been in number somewhat less than half that of the flowers; while the seventeen have cost about six times that which the thirty-seven brought. This is, however, by no means to be assumed as an evil; in every collection there will be a mingling of bad with good, and it is wise to remove the one while preserving the other.

REGULATIONS CONCERNING THE EDUCATIONAL MUSEUM AT SOUTH KENSINGTON have just been issued by the Department of Science and Art. The Museum will be open free to the public on Mondays, Tuesdays, and Saturdays; and on Wednesdays, Thursdays, and Fridays, to students and the public generally on payment of 6d. each, or a subscription of 10s. a year, or 5s. a quarter, payable in advance.

EXHIBITION OF ART-MANUFACTURE AT BIRMINGHAM.—It is in contemplation to have an Exhibition of Art-industry at Birmingham; but there is at present some uncertainty as to whether it will take place this year or during the year 1858. Probably a postponement will be determined, inasmuch as public attention will be absorbed in 1857 by the display at Manchester, although modern industrial art is not to be represented there. Birmingham has been making admirable progress of late, and if the Exhibition be delayed, and time for preparation be thus given, the result cannot fail to be highly honourable and largely beneficial to the great capital of our staple trade.

THE PRINCESS'S THEATRE.—Although it is probable we shall bring under detailed review the revival of "Richard the Second" at this theatre, we cannot allow the event to pass even for a month without some comment. It is beyond question the most perfect work that has ever been represented on the stage, and is well described in the *Times* newspaper as "more like the production of a society of antiquarians than the result of a single manager's energy and genius." But, in truth, the aid of such a society has actually been made available; for Mr. Kean has obtained the valuable and cordial assistance of Mr. Shaw, Mr. Salvin, Mr. George Godwin, Mr. Fairholt, and others; and the artist, Mr. Grieve, has worked so earnestly and ably with them, as to render every portion of the scenery, and its accessories, as exquisite in character and as authentic in facts, as if they had all been employed in illustrating a volume that should gratify and satisfy alike the Art-connoisseur, the antiquary, and the historian. In noticing the *mise en scène* of this play, however, we may not pass over the acting; although certainly, the gorgeous decorations, the admirable costumes, and the several aids to it as "a spectacle," put, in a degree, aside the merits of the actor. There will be, however, but one opinion on this head; Mr. Charles Kean will be taught to consider the part of Richard as his best character: it was conceived and sustained throughout with admirable judgment and discrimination, and may, indeed, be described as by far the most perfect performance we have witnessed on the modern stage. It is impossible to overrate the public debt that is due to Mr. Kean for rendering his theatre not only a means of rational amusement, but a source of useful instruction.

A DIORAMIC VIEW of the most celebrated places in the northern part of Russia is to be seen in the building in Leicester Square, known as the Great Globe. The pictures, which are skilfully and brilliantly painted by Mr. Marshall, include cities, palaces, fortresses, rivers, &c.; the incidents of the late war, and the coronation of the emperor.

MR. PEABODY, the opulent American merchant resident in London, recently presented to the city of Baltimore a sum of 300,000 dollars, for the establishment of an institution which is to include a free library, a musical academy, and a picture-gallery. The gift is hereafter to be increased to half-a-million of dollars. Such munificence as this—so rare but

so honourable—carries with it its own reward. Men like Mr. Peabody deserve all the wealth they acquire: in their hands it becomes a wide-spread and fertilising stream of blessedness.

EARLY EDITIONS OF PLAYS BY SHAKSPEARE AND BEN JONSON.—Some of the French journals state that several Shaksperian and other discoveries have been lately made in Switzerland. The editions of "Romeo and Juliet," 4to, 1609; "Hamlet," 4to, 1611; "King John," 4to, 1591; "Volpone," by Ben Jonson, 4to, 1607; and other scarce plays and works of early English history.

THE MEMORIAL CHURCH AT CONSTANTINOPLE.—The judges appointed to select the best designs, and to award the prizes in the competition for this most interesting edifice, have reported to the committee, upon the forty-six designs submitted to them, that they have awarded the prizes as follows:—1st, to Mr. W. Burges; 2nd, to Mr. G. E. Street; and 3rd, Mr. G. S. Bodley. An additional prize is recommended for Mr. W. Slater, and honourable mention is made of Messrs. C. Gray, R. P. Pullan, G. Truefitt, Weightman, Hadfield, and Goldie; A. Bell, F. Franke, of Meiningen, Howell and Budd, Prichard and Goldie. Hence it appears that the same gentlemen who obtained the first and second prizes at the Lille Cathedral competition, again occupy similar honourable positions. The prize designs were exhibited for a single day at the Architectural Exhibition, and subsequently, for a short time, at the apartments of the Society for the Propagation of the Gospel, where a lecture upon them was delivered by Professor Willis. All the designs are now about to be exhibited publicly in King's College, and when we shall have been enabled to compare the prize designs with those which have failed to attain to that distinction, we hope to give some particulars respecting both the prize designs themselves and certain others of the group. Meanwhile we invite public attention to these designs, as possessing peculiar claims upon general regard; and we congratulate the prizemen, and also the architectural profession, on the high terms of approbation which have been used in their report by the Bishop of Durham, Sir C. Anderson, the Dean of Ely, Professor Willis, and Mr. Beresford Hope. There is one circumstance connected with the report upon Mr. Burges's design, which demands a word of present notice—it is that this design, as originally prepared and submitted to the judges, contained such fittings as are only suitable for the altar of a Roman Catholic church. This grave error has been properly noticed by the judges. When will those of our architects who now show themselves best competent to deal with Gothic architecture, understand that the grand principle of their complete success consists in their producing in the true Gothic spirit churches which shall also in every respect be in harmony with the true spirit of the Church of England? We desire also especially to remark upon the importance, or rather the necessity, that the proposed Memorial Church, in order to its being in reality what it will profess to be, and what it will be expected to be, should be essentially true to the type and the traditions of the Ecclesiastical Gothic of England.

SHAKSPEARE PORTRAIT.—The somewhat celebrated picture, purporting to be a portrait of Shakspeare, painted by Burbage, the actor, on the back of a pair of bellows, and hence termed "the Bellows Portrait," is again in England for sale. It was purchased by the great French tragedian, Talma, who was stated to have encircled it with diamonds. It appears that he only bestowed upon it a case padded with green silk. The portrait is painted on canvas, which is affixed to the wood, and an inscription carved on the edge of the bellows around it. It is curious as showing what was unblushingly done in the way of deception some years ago. The whole history has been plainly told in the pages of Wivell.

AUSTRALIA.—An Art-exhibition, consisting of works of painting, sculpture, photography, &c., has recently been opened in Melbourne, and premiums were awarded for the best specimens exhibited. At Victoria an "Institute of Architects" has been already established; and thus, with the increasing prosperity of the colonists, comes increasing desire to encourage and possess those objects of taste and elegance which are the surest marks of progressive civilisation, refinement, and intelligence.

REVIEWS.

PRE-RAFFAELLITISM. By the REV. EDWARD YOUNG, M.A., Trinity College, Cambridge. Published by LONGMAN & Co., London.

Every man who propounds new doctrines or theories, and attempts to establish them by the destruction of what is valued, if not for its worth, yet for its antiquity, must enter the arena of contest fully prepared for the vigorous opposition of adversaries. There is scarcely anything more ungenial to the natural mind than an attempt to reason it out of its belief; such an attempt seems an insult to the understanding, while, if it succeeds, it casts down the object of our love or our idolatry, wounding our vanity, and dissipating every atom of self-sufficiency. It is possible that when Mr. Ruskin entered the lists of Art-criticism, to prove that for nearly four centuries the world had seen only a single great and true painter, he may have expected to encounter great hostility; but whether he did or no, he has certainly found it, and as certainly owes much of the opposition with which he has been met to the manner, rather than the matter, of his attack. It was assuredly quite unnecessary that, in order to set up his "golden image," he should knock down the golden images of others, ruthlessly, discourteously, yea, savagely. It is this, "the head and front of his offending," that has raised up, and will continue to raise up, so large and powerful a host of adversaries, not for the purpose only of proving Mr. Ruskin and Turner are not right, but to show that the former is an advocate whose arguments are not always to be trusted, inasmuch as they frequently contradict each other. We have sometimes felt surprised that so deep a thinker and so subtle a logician as Mr. Ruskin generally appears to be in his writings, should have overlooked his errors of this character, and also have arrived at different conclusions from the same premises adduced at different passages in his various books. The apology we offer on his behalf for these mistakes of judgment, and for his many strange deductions, is that the writer's imaginative powers and enthusiasm have led him astray, made him oblivious of foregone assertions, have often rendered him paradoxical, and sealed up his more sober senses.

Under the title of "Pre-Raffaellitism, or a Popular Inquiry into some newly-asserted Principles connected with the Philosophy, Poetry, Religion, and Revolution of Art," Mr. Young makes a vigorous and well-directed attack on the new school of painting in its most objectionable practice, and on its strong supporter, Mr. Ruskin. As to its practice, let any one go into the rooms of the British Institution now open, and notice pictures hanging there by candidates for "Pre-Raffaellite honours," and then let him consider what English Art (!) is striving after: the "offence is rank." Several chapters at the commencement of the volume are, however, devoted to show the inconsistency with itself of much that the "Modern Graduate" has written, and the dubious truths—if such a term may be allowed—of more; and we think that Mr. Ruskin himself will be surprised at Mr. Young's analytical extracts. In the other chapters, treating of the poetry, religion, and revolution of Art, he handles the respective subjects in an honest, hearty, fearless manner, with a felicity of thought and eloquence of expression scarcely inferior to the champion whom he assails. His book will, it cannot be doubted, find very many readers; and of these, it is even less problematical, he will carry with him the suffrages of the far larger portion; for, to quote one of his observations in the vindication of his course of inquiry, he says that Mr. Ruskin, "by pushing beyond all wholesome or legitimate limits the demands of science, and by converting artistic criticism into a moral impeachment, he has not only disturbed our enjoyment of ancient Art, but wounded our sense of justice, and compelled, I might say, a fight for decent standing-room in the commonwealth of the liberal Arts." To this we will add another, as the expression of our own opinion and feelings:—"Cut out of his writings all I understand by Pre-Raffaellitism, and few would go beyond myself in the admiration of the remainder."

TRAVELS IN BOHEMIA, WITH A WALK THROUGH THE HIGHLANDS OF SAXONY. By AN OLD TRAVELLER. 2 Vols. Published by T. C. NEWBY, London.

Few countries of central Europe are so rarely visited by English travellers as Bohemia; and yet it is not difficult of access, and, moreover, lies contiguous to the kingdom of Saxony, whose capital, Dresden, is a great point of attraction to continental tourists who do not object to journey a considerable distance from home. One of the causes which,

perhaps, deters travellers—we mean, of course, that class especially who must go somewhere for a month or two in the year, and who travel without any particular object, except to see something and be amused—from directing their steps thitherward, is the general absence of what ordinary "sight-seers" usually look for—picture-galleries, places of great and well-known historical interest, numerous and gay company. Another cause is the comparatively indifferent accommodation offered in the hostels of the country; for we English have a decided feeling in favour of comfortable lodgment and a delicate table, which essentials the Bohemians have not, as yet, found it expedient to provide for our necessities, unless it be in three or four of the principal towns—as Prague, Carlsbad, and Töplitz. Yet, in spite of these drawbacks to mental and personal enjoyment in those who so consider them, Bohemia is a country that is quite worth a visit: its scenery is beautiful, often magnificent; the climate healthy, the people, generally, are refined and intelligent, while there is enough for the eye to rest upon in the shape of ruined castles, monasteries, palaces, and other public buildings, and in the quaint architecture of private dwellings, to wake up tales of old romance, and to delight the lover of the picturesque.

The *nom de plume* adopted by the author of the "Travels in Bohemia" is that which has appeared at the head of a series of papers published in the *Art-Journal* for the last two years and longer; both productions are, in fact, from the same pen; many of our readers, we are assured, when they know this will not require our good word on behalf of the "Travels" to recommend them. But without any reference to such a coincidence, these volumes will be appreciated for their own merits. A pleasant, entertaining, and instructive writer is their author, a lady,—we may so far reveal the secrets of our prison-house to tell the reader,—now leading us through galleries of Art, (but this before she enters the territories of Bohemia), now relating old legends attached to some dilapidated baronial residence or ecclesiastical edifice—for the spirits of romance and of superstition still brood over the land; at one place carrying us back to the ancient chronicles of the country, and at another introducing us to the various phases of modern life; here inviting her readers to accompany the "Traveller" through some lofty mountain-pass; and there to wander with her through rich grassy meads, where young maidens do the work of our robust husbandmen. The style in which these volumes are written, and their varied and interesting contents, can scarcely fail to give them popularity. The "Old Traveller" is neither too prosy nor too loquacious; she is cheerful, intelligent, and observant—qualities one is always pleased to meet with in a writer of such works as this.

THE ARAB'S RIDE TO CAIRO: A LEGEND OF THE DESERT. By E. T. WHITE MELVILLE. Illustrated and Illuminated by Mrs. WOLFE MURRAY. Published by SETON & MACKENZIE, Edinburgh.

This very beautiful volume is, we believe, the joint production of a brother and sister. The name of Mr. White Melville is well known; he is the author of several excellent works of fiction, and takes high rank as a man of letters. The ballad is founded on a Moorish legend, and is of that character with which we have been made familiar by many writers—the latest being Mr. Lockart. It is interesting in story, and composed with a happy mingling of the heroic and the pathetic. It is illustrated on every page by lithographic drawings, printed in colours—and very carefully printed—at the press of Messrs. Schenck and MacFarlane, of Edinburgh. The accomplished lady who has undertaken this task as "a labour of love," draws with feeling, force, and expression. The vignettes which head the pages are exceedingly graceful, some of them far above the usual order of book illustrations; they are rightly executed without tints, colours being applied only to illuminated letters and page-borders. Here a large amount of ingenuity and fancy have been exercised; they are of no classic or "authorised" class, but the themes are generally derived from the "hot south," in which the scene of the ballad is laid—leaves, fruit, flowers, and birds being tastefully interspersed with arabesque enrichments. The book is dedicated to her Royal Highness the Duchess of Gloucester, and a more graceful publication, or one more entirely satisfactory, has rarely emanated from the fair hand of an amateur.

CHROMOLITHOGRAPHS. Printed by VINCENT BROOKS. Published by T. BOYS, London.

Mr. Boys has just published two pairs of chromolithographic prints, from drawings by J. Ritchie, an artist who has a good reputation as a landscape

painter in his native country, Scotland. One pair, of very large dimensions, represent respectively "The Enjoyments of Peace," and "The Miseries of War;" the former a composition in which the artist seems to have had Rubens before him for the landscape, and Teniers for the figures, but the combination does not come well together; the picture is fragmentary, broken up into parts, over which the eye travels from one to another without finding repose: there are all sorts of groups, occupied in all sorts of amusements on the village green. The companion-print shows a village fired by some unseen enemy, and the inhabitants fleeing from the scene of devastation; but not a soldier makes his appearance before the spectator. These prints are singular rather than agreeable, and must be accepted more as examples of the art of clever and powerful colour-printing, than for any excellent pictorial qualities they show. The other pair, entitled respectively the "Cricketers," and a "Picnic," are much smaller, and are certainly better as compositions; still there is a peculiarity in Mr. Ritchie's style which, it must be confessed, we cannot admire; if he looks at nature and assumes to copy her, he undoubtedly selects the most unpicturesque and ungraceful of her forms, and the most "unnatural" of her effects. We would suggest to him a close study of the laws of harmony in composition and in colour.

THE ANNALS OF ENGLAND: AN EPITOME OF ENGLISH HISTORY, FROM CONTEMPORARY WRITERS, THE ROLLS OF PARLIAMENT, AND OTHER PUBLIC RECORDS. 3 Vols. Published by J. H. & JAMES PARKER, Oxford & London.

As the title of this work indicates, it is little else than a record of events arranged in the chronological order in which they occurred; but this, in our opinion, is just what a history designed for young people ought to be; it will be quite time enough for them to read works calculated to render them partisans, when they have become thoroughly acquainted with facts, and have arrived at years when reason and judgment may be brought to bear upon opinion. The early history of Britain has been so slightly glanced at by most writers, that, with the exception of accounts of some of the principal narratives, we are almost left in the dark respecting it; this deficiency is well supplied in these "Annals," the best and most recent authorities having been consulted for information. Throughout the whole of the work, which, however, comes down only to the end of the Stuart dynasty, brief biographies are given of the chief personages that figure in its pages, and numerous illustrations from coins, seals, monuments, &c., are introduced, and are valuable as offering a series of portraits, heraldic arms, and devices. At the end of the volume are an appendix, notes, and an index, which will be found most useful as references. The novel arrangement of this History, and the concise and careful manner in which it is couched, are strong recommendations in its favour, and entitle it to a large claim on the public notice.

A CYCLOPEDIA OF THE PHYSICAL SCIENCES. By J. P. NICHOL, LL.D. Published by GRIFFIN, Glasgow and London.

The numerous applications made of the discoveries in physical science, render it more than ever necessary that we should be enabled easily to obtain some reliable information on that important department of human knowledge. Electricity has been engaged to multiply equally the useful and the beautiful by the electrolytic process. In the electric telegraph we have one of the most remarkable triumphs of mind over matter which high intelligence has yet achieved. The sunbeam has become our artist, and truthfully and beautifully the shadows of external nature are fixed upon the tablet of the photographer. It is not merely electricity and light which have been subjected to man's control, but the study of the laws regulating the force of heat has led to numerous useful inventions relating directly to this force. Our space will not admit of our stating even the branches of physical science which have been made subservient to our wants or our luxuries; suffice it to say that the present age can boast of having applied a large number of the truths which were developed by the industry of former ages; consequently there never was a time when a cyclopædia of the sciences was more required than at present. It is not many men who can afford the time, or who have the inclination, to wade through the few standard works on physical science in our language, and a still smaller number who can seek out the truths which are scattered through the memoirs of our learned societies. Professor Nichol has performed a laborious work, but it is an eminently useful one. Such a book as a cyclopædia of physics

is only valuable according to its reliability, and had the work fallen into less able hands, the result would not have been so satisfactory. The position of Professor Nichol in the world of science, and his world-wide reputation as a writer on astronomy, are sufficient guarantees of the sterling character of this work. In the heavy task Professor Nichol has been assisted by men of the highest class. The Rev. Dr. Robinson of Armagh, Sir William Rowan Hamilton, Professors William Thomson and Rankine, may be named amongst others as having supplied valuable articles upon astronomy, mathematics, electricity, and heat. The printing of the volume and its illustrations deserve commendation; and, as a whole, we know of no book which so completely supplies a want long felt—a standard general work on the physical sciences.

LOCAL NOMENCLATURE: A LECTURE ON THE NAMES OF PLACES, CHIEFLY IN THE WEST OF ENGLAND. By GEORGE P. R. PULMAN. Published by LONGMAN & Co., London.

Proper names of persons or places have now nearly lost all significance among us; we can receive no precise idea of a person from the surname he bears, or of the place in which he may reside, from the name given to it; but it was not always so, nor was it natural that it should be. Names were bestowed in accordance with personal peculiarities, or personal prowess, as amongst the Romans. Ovid was termed *Naso*, from his prominent nose; and Scipio, *Africanus*, from his victories on that continent. With the northern tribes similar customs existed, and their proper names indicate some real or imaginary resemblance to great types in nature, or great mental endowments: as Æthelwolf (in our own annals) signified "noble wolf"—an animal peculiarly typical of the predatory and piratical habits of the Northmen; or as, at a later period, our Henry I. was named "Beancleg," from his learning; and Edward I., "Longshanks," from his legs. Nearly all our towns and villages bear names that are equally translatable into the vernacular, though now meaningless to modern ears: thus Exeter is *Exan-caestre*, the fortified town upon the river Exe; Cumberland, the land of *combes* or valleys; Chepstow, the *market-place*, from the word *ceap*, to buy or sell (a word we still use in our term *cheapening*), and *stow* a place. Terminations of other words also aid us to their meaning when the whole is not subject to the rule: as words ending with *ham*, such as Clapham, signify the home or dwelling of a chieftain whose name forms the first syllables—this being *Clapa's home*. In the same way *burgh* or *bury* indicates a stronghold or city; *holt*, a wood; *hoast*, a thicket; *croft*, a farm, &c. Many places still retain their meaning, because the old Saxon proper names are yet used among us—as Rushywood, or Heathfield, which requires no translation. To all who would understand these, and hundreds of other proper names, this little book will be welcome. It is, as Moore the almanac-maker phrases it, "calculated for the meridian" of the West of England; but it is useful all over the country. Such little books are capital travelling companions—good, useful handbooks; not curious merely, but having an enlarged utility, leading to conclusions and study beyond their own bounds, they teach us to think and investigate, and are consequently of double value to the ordinary "run-and-read" style of compilation with which modern literature abounds, and which is often as trashy as it is pretentious.

MADEIRA: ITS CLIMATE AND SCENERY. A Hand-book for Invalids, and other Visitors. By ROBERT WHITE. Published by A. & C. BLACK, Edinburgh.

This is a new edition of Mr. White's book, published about five years since; but, even during this brief space of time, so many changes and alterations have taken place, even in the small and far-off island of Madeira, that it has been found necessary to "re-write and re-cast the whole work," a task which was confided to Mr. J. Y. Johnson, the health of the original author not permitting him to undertake the task. The book is strictly what it professes to be, a succinct and particular account of the island, containing all the information with which the visitor, whether he goes thither for health or pleasure, need be acquainted; nothing seems to be omitted that a stranger from England would desire to know; even to the shops from which he would draw his daily supplies of food, his articles of clothing, his mental aliment in the shape of books, or his drugs—if unhappily he requires them. No one who contemplates a voyage to Madeira should omit to carry Mr. Johnson's "Hand-book" with him as his guide and counsellor.

THE ART-JOURNAL.

LONDON, MAY 1, 1857.

VISITS TO PRIVATE GALLERIES
OF THE BRITISH SCHOOL.THE COLLECTION OF HUGH MUNRO, Esq.,
HAMILTON PLACE, PICCADILLY.

It has seldom been our good fortune to meet with a collection of pictures so interesting as that which we now describe, as to the modern portion of its catalogue—that is, of our own school. It may be observed that patrons of

Art seldom blend to any extent ancient with modern productions, or *vice versa*. Those who have purchased ancient Art, or who have acquired examples of the old masters as heir-looms, are content to retain them; and the eye, having become so habituated to the mellow harmony of hundreds of years, is oppressed by the brighter colour of more recent works. The collection of Mr. Munro is one of the very few in this country which contain some of the best productions of the great masters, with the best examples of our own school. The catalogue of the Italian pictures is that of a gallery of the first class—and it has been very much augmented since it was noticed, now some years ago, in this Journal. The catalogue of the productions of the British school is that also of a collection of the highest order. Each work has in its year of exhibition been noted as a fresh wreath to the brows of him who produced it, and the greater proportion of these works has constituted the transcendent splendours of each particular exhibition in which they have been seen. But Mr. Munro is not merely a painter in feeling, but a painter in deed—for he passes day after day labouring assiduously in his studio: it is, therefore, an ardent love of the beautiful that has urged him to the formation of this valuable collection, and, we believe, with a worthier motive than the hope of its increasing moneyed worth. The catalogue of works of the British school comprehends an unusual number of Turner's best productions—celebrated works—the emanations of the healthiest period of his art; and the numerous and brilliant series of Etty's pictures is nowhere equalled. The collection contains, also, very many of the noblest landscapes of Wilson, the best works of Bonington, landscapes by Constable, a variety of subjects by Stothard, Hilton, Fuseli, Wyatt, Maclise, Paton—portraits by Reynolds and Gainsborough; and, moreover, other valuable pictures placed with their faces to the wall, because there is no space to hang them. And in addition to these, we have observed some highly meritorious works in crayon, especially a study of a young lady in a black dress, distinguished by exquisite sweetness and simplicity of expression. We proceed to particulars of some of Turner's works.

'Rotterdam,' J. M. W. TURNER.—This would form an excellent pendant to Turner's picture of Antwerp—both are so breezy and sunny—both painted under the excitement of a like enthusiasm. Here we are nearly abreast of the Church of St. Lawrence, with which every voyager who has visited Rotterdam is familiar. The eye, the most

insatiate of colour, could not be otherwise than gratified here, although the whole composition is made out in tones departing but little from grey in its warm and cool varieties. The colour is focussed in the sail of a boat, which is running past us with the wind on her quarter. The Church of St. Lawrence, like Antwerp Cathedral, rises in the sunshine, the brightest spot in the picture; but the quays are invisible, and we look in vain for the site of the house of Erasmus. In this picture we see how little served Turner to establish local identity; in others which we are about to notice, it will be seen that the most minute details were not beneath his attention.

'The Piazza San Marco, Venice,' J. M. W. TURNER.—This is really not a tempting subject, as consisting principally of domestic architecture; but the scene is presented to us lighted by the moon, and the thousand glimmering lights which assist at a Venetian *fiesta*, for to such are we here invited—the festal eve of St. John, or St. Mark. We look from the lower end of the Piazza, at the other end of which towers the Campanile, and behind it St. Mark's, in all the breadth of its mosque-like architecture. According to the perspective, we are placed at a considerable elevation, because we see the Ducal Palace over the houses, and the line of the quays of the Porto. The piazza is thronged with groups of pleasure-seeking Venetians, and vessels off the quays are throwing up fireworks. This is a most difficult subject to divest of its angular every-day character; it has been painted as a *tour de force*, and no one but Turner could have conceived the moonlight and all but unreal character with which the whole is invested. It is a combination of phenomena but rarely seen, and when seen, it is such as to require for its representation the highest order of human power.

'The Grand Canal, Venice,' J. M. W. TURNER.—We look here up the vista to the distant Dogana on the right, and the Ducal Palace on the left; but the buildings are only accessory—the force of the picture resides in its composition of fishing and carrying craft, with those endless gondolas. And here we recognise the surprising merit of the black spots which Turner inserts here and there in different degrees of force, and at different distances, and with degrees of tone so nicely graduated as at once to define distances with the utmost perspicuity. We are again at a *fiesta*—perhaps that of St. Nicholas—for all the vessels in the canal have "dressed ship," and are therefore hung with their gayest colours. But this must not be taken for the usual aspect of the canal; a simple voyager may peer for years from the windows of these palaces without witnessing such a scene. The picture, then, consists of the agroupment of boats, and if we look at the work, we see that the colour is perhaps exaggerated; but if we consider it as a reality, we are sensible of colour, yet do not feel the scene as a painted canvas.

'Modern Italy,' J. M. W. TURNER.—This composition places the spectator on an eminence, whence he looks down upon a river that flows at the foot of a precipice, on the summit of which is a city. This is the left section of the nearer composition. On the right the ground rises also from the level of the water to a broken height, on which appears a procession of priests about to enter a church. Here, then, is a city like an amphitheatre, and a river mocking the Po with its unbroken lustre, and imitating the wilder Adige where it is confined by rocky and precipitous banks; or we might think we are looking down on the Arno from near Empoli. And the Campagna is not forgotten, for beyond the river and the city is opened a vast plain, lying in alternate breadths of subdued light and shade, which succeed each other until the distance mingles with the sky. Here, then, is Italy, materially and sentimentally, in the full tide of its dreamy and sunny *far niente*—nothing is forgotten. The scene is full of minute allusion to existing circumstance: it was painted for the Rev. T. Daniell, but he never possessed it, as he died in Asia Minor while it was in progress.

'Cicero's Villa,' J. M. W. TURNER.—This subject is near Puteoli, in Campania, and there Cicero may have passed the greater part of his time after the battle of Pharsalia. Turner has made the most of the site and its splendid ruins; the place looks

extensive, insomuch that we would ask Pliny where Cicero's interest began and ended. We are placed upon a terrace, and a little below us extend those walks and vistas which, in the days of their pride, were abundantly planted with the rarest fruit and flower-bearing trees and shrubs. Again, the allusive indefiniteness of the picture carries us back to history, far beyond the vulgarities of an insolently literal imitation—the professed faith of the many, because so few can accomplish that kind of narrative which thus passes from the realities of the present to the shadows of the past.

'Boulogne,' J. M. W. TURNER.—Turner was accustomed to say that he never went to Boulogne except in a hurricane—he never saw a Boulogne sky save presided over by a storm-cloud. The spectator is here placed at the end of the jetty, with a fearful sea rolling in, driven by a howling tempest eoming directly on to the land. Between the vast volumes of water and the grand forms of the clouds there is a coincidence of movement, which is assisted wonderfully by a near boat, that appears to be pitched within the jetty on the crest of a wave. As in his 'Rotterdam,' 'Antwerp,' and other similar pictures, Turner identifies locality by one striking feature; here, it is the Column, which is lighted up by a fitting gleam of light.

'Modern Rome,' J. M. W. TURNER.—This picture was painted for Mr. Munro, and, at his request, it was to be "a portrait of Rome." From the point of view—the Capuchin Mount—we look down upon the Tiber, which goes into the picture, and at a little distance is crossed by the Ponte Rotto, and there we lose its course, which is thence indicated only by the recognised points on its shores. The cauvus presents a vast expanse to the eye, but we find every striking feature of the city in its proper place, especially all the *monti*, with their prominent buildings—far away on the right St. Peters, and lower down in the grey shade the Castel St. Angelo; then again the Capitol, and everywhere the forms of the well known churches. But the triumph of the work is the manner in which Turner has disposed of the lofty modern buildings on the quays below, which run into the composition, with all their angularity of form and inexorable stiffness of line, without being disadvantageously felt. The space shown in this work is prodigious; those forms which we know to be the most important in the vast panorama are as nothing to the extent under the eye; and the warmth and harmony of the colour, so much assisted by a near pine thrown up against the sky, are most captivating.

'The Departure of Adonis for the Chase,' J. M. W. TURNER.—This is the only large figure picture by Turner we have ever seen; and so well are the figures painted, that it might be suspected that he had some aid in the work. Venus is extended on a bank, and Adonis, accompanied by his dogs, and grasping his hunting-spear, is about to depart for the chase, but Venus seeks to detain him. The upper part of the composition is closed by trees, against which, in relief, are seen four Cupids disporting on the wing. It is spirited and Titianesque in character, and so different from all Turner's other works, that but for a knowledge of the fact it would never be attributed to him.

'The Colosseum,' J. M. W. TURNER.—This view is from the Campo Vaccino, presented under an afternoon effect, and showing the Colosseum opposite in the middle distance, standing out as a principal object, to which all near edifices are but as minute accessories. As in all this magnificent series, the whole is presented under the aspect of a broad and sunny daylight, and with the same fidelity of notation observable in the others. The small section of foreground is forced with shade tints, that throw off into airy distance the whole of the remote composition, which is essentially a picture, having for its principal features some of the grandest memorials of the Rome of the Caesars.

'Ancient Rome,' J. M. W. TURNER.—In composition this picture resembles the 'Carthage,' as here the Tiber occupies the centre of the field, each bank being covered with buildings, which on the left side rise to a great height, temple above temple. In the nearest section are strewn the spoils of a victory, and removed a little inward is a crowd of galleys and figures. To the sunny splendour of this work no description can do justice.

'Avalanche in the Val d'Aosta,' J. M. W. TURNER.—When the sketch was made for this picture, Mr. Munro was with Turner, who expressed a hope to him that he (Mr. Munro) did not know what he proposed to paint, for if so he should feel himself obliged to abandon the subject. This, not less than any work he has ever executed, is an example of Turner's power of impressing the mind with sentiments of wonder and awe.

'The Wreck Buoy,' J. M. W. TURNER.—This is an open sea-view, simple in its construction of effect, but marvellously powerful in its concentration of light and colour. The near breadth of the heaving water is thrown into shade in such a manner as to force colour and effect into one flash of brilliancy. There are two rainbows in the sky, and a heavy rain-cloud is passing off on the left. The principal object in the composition is a passing boat, the sails of which are constituted the colour focus, supported by the buoys, which are also forced, but only contributively, with colour. There is the utmost amount of knowledge presented to the eye in the semblance of the utmost simplicity. This is the art of the master—most learned yet most simple.

'The Golden Age,' W. ETTY.—A picnic, the number of the participants being that of the Graces—a happy trio, that is, before the invincible wine stretched the ladies on the green sward. There are, in short, three figures, a satyr and two nymphs; a golden wine-cruze lies by them, emptied of its ruddy liquor, and the nymphs (*victæ vivo*) have fallen asleep; but the copper-skinned satyr,—as rich in colour as a Pawnee,—with his harder head, survives his applications to the wine-flask, and crowns the sleeping nymphs with flowers. ETTY here passes at once all the Roman poets, and takes his place among the Greek pastorals.

'The Forest Family,' W. ETTY.—An agroupment of three figures, dispersed in the shade of a dense texture of branches and foliage. The mother, a nude figure, lies extended, with her left arm cast around her infant, which is on the ground near her; the man, with his back turned, reaches toward some grapes that hang over the party. It is a work of great power, distinguished by all the facile execution of the painter.

'The Bathers,' W. ETTY.—A group of two children who have just stepped into a pool to bathe; the younger is in shade, the elder, with the utmost brilliancy of flesh-tint, presents a forcible contrast. The timidity of the two is a beautiful expression, and their innocence and purity are charmingly felt.

'The Backbiter,' W. ETTY.—This title is given to a composition consisting of a nymph sleeping, while a snake coiled round a tree is preparing to strike her. No effort in flesh-painting has ever excelled this figure in roundness, breadth, mellowness, and vital warmth.

'Repose after Bathing,' W. ETTY.—Consisting of three female figures, of which the centre one presents the face nearly full. On the left the back of the second is shown, and the third, on the right of the agroupment, is seated. This picture was painted for the late Mr. Carpenter, who stipulated that it should contain the utmost amount of brilliant colour that could be thrown into it. When an essay of this kind was proposed to ETTY, it may be understood what the merits of the work may be. The exquisite tone of these incomparable nudes is supported by a great power of colour, disposed in relief of the group.

'The Good Samaritan,' W. ETTY.—A figure, representing the wounded man, worked out with great breadth and purity of tone, is extended parallel with the base of the composition, while the Samaritan kneels and bends over him, in the act of ministering to his need. These two figures, with the ass of the Samaritan, constitute the principals of the picture. The uncharitable wayfarers pass on as secondary figures. This picture was painted for Mr. Cartwright, the medical attendant of ETTY, as a mark of his estimation of Mr. Cartwright's services; and when the work was presented, the painter said that it was worth six hundred pounds to him should he at any time desire to turn it into money. After ETTY's decease Mr. Cartwright parted with the work.

'The Signal,' W. ETTY.—A nude figure extended at length, having the back turned to the spectator,

and raising her right hand, in which she holds a handkerchief. This back is a charming study, and the lines of the figure are essentially those of beauty. The incident and supplementary material show great elegance of feeling.

'A Naiad,' W. ETTY.—She is extended, and presents her back, resting with her left arm on a vase, whence flows a stream of water. This picture looks less finished than others that we have noticed; it contains but little of accessory, the merit of the work being concentrated in the beauty of the figure.

'The Standard-bearer,' W. ETTY.—A small picture, presenting a study of a knight in armour grasping a standard. It is a dark, broad, and sketchy picture, improving upon Giorgione, supplying that force and breadth of which he is deficient.

'Diana visiting Eudymion,' W. ETTY.—This is perhaps the most charming piece of idealism that ETTY ever painted; and we think it original—at least we have never before seen the subject thus treated. According to the classic conception of the moon every night visiting the mountain, we see here Diana, in her quality of crescent, luminous, contemplative, and very elegant in design, bending over the sleeping youth. The picture is hung rather high, but as far as we can see there is less of individuality here than in other conceptions of the painter.

'The Bather,' W. ETTY.—A study of a single nude figure standing in water, and relieved by a sky and water background, entirely open.

'A Sleeping Nymph,' W. ETTY.—She rests upon her side, having a veil loosely thrown over her. The composition is open on the right, and a group of trees assist in forcing the colour, which is as luminous in tone, and as descriptive of vital warmth, as anything the artist has ever painted.

'Zephyrus and Aurora,' W. ETTY.—He here pins his faith to Milton—the passage in "L'Allegro;" but everything, even to the veil of the rosy-fingered Eos, is strictly according to the classics. The golden chariot of Aurora awaits her, but she is detained by Zephyrus, who is seated with his back to the spectator, having his left arm thrown round the goddess, who is in the act of dispelling night and sleep. The picture is in parts freely painted, but the personal breadths are executed with unimitable tenderness of gradation, and a purity of tint never to be excelled. The movement of the figures, and the dispositions of the limbs, afford a masterly system of lines. This, in colour, is one of ETTY's most splendid essays.

'A Nymph on the Sea-shore,' W. ETTY.—She has cast herself on a bank in grief or weariness, and lies turned towards the ground. The back and lower limbs constitute a study of incomparable truth in the imitation of the throbbing warmth and roundness of life. The lustrous breadth of the study can never be surpassed.

'A Nereid,' W. ETTY.—She is extended at length on the sea-shore, the back of the figure only being seen. On the left, and hanging nearly over her, is a jutting rock; on the right the view is open to the sea. Like many of these works of which we have already spoken, this is one of the most captivating exercises of ETTY's genius.

'Venus Bathing,' W. ETTY.—She stands upright near the brink of a pool or river, on the bank of which, at a little distance, stands Cupid; one arm of the figure rests upon the bough of a tree, and she is relieved by trees.

'Cupid and Psyche,' W. ETTY.—Psyche is extended on a couch sleeping, and Cupid, while contemplating her, raises his torch above his head.

'Venus and Mars,' W. ETTY.—A very large picture, painted while ETTY was working with Sir Thomas Lawrence, to whose feeling there is much resemblance in the picture.

'A Study,' W. ETTY.—This was the property of Sir Thomas Lawrence, at the sale of whose effects it was purchased by Mr. Munro. It is an exquisite study of the back of a nude female figure.

'The Deserted,' W. ETTY.—A nude figure seated, and looking to the ground with a fixed expression of grief.

In addition to this long and valuable list, there is a copy from Paul Veronese, and an Academic study.

'Francis the First and his Sister,' R. P. BONINGTON.—The public is well acquainted with this very attractive picture, by the engravings which have been published from it. The composition is so

well known that we need not describe it. We have never before seen the work, and we confess much agreeable surprise at its sustained tone and excellent condition. There is a great deal of red in it, but it is by no means monotonous, from the harmonious variety of hue given to the king's dress, in which this colour prevails. The two dogs play a most important part in the work as vehicles of black and white, besides assisting, by expressive form, the lower part of the picture. It is sketchy in execution, but it is Bonington's *capo d'opera*—he never attained the same degree of excellence in any other work. He is one of the few who have displayed equal power in two very distinct departments of Art—that is, figure subjects and coast scenery. The French claim him as a painter of their school; but if he be a French artist, then every French student who passes any time in Italy is a member of an Italian school. The feeling which certain departments of the French school derived from Bonington is still recognisable.

'The Fish-market, Boulogne,' R. P. BONINGTON.—This is a large picture, showing at the left extremity the cottages of the fishing inhabitants, and on the left centre a concourse of figures with a squadron of boats, from which the fish is being landed. The effect is sunny and Cyprian-like, the boats with their sails hoisted to dry tell forcibly against the warm and broad sky.

'Coast View,' R. P. BONINGTON.—A small picture; an example of a lengthy series of similar coast views, painted with great breadth and facility of execution; charming as affording the most captivating effect with the smallest quantity of material.

'Coast View,' R. P. BONINGTON.—Another example of this minor class of subject, most harmonious in unobtrusive colour; admirably diversified with light and shade, and very poetically expressive of air and distance.

'The Little Coquette, Novar,'—This is painted by Mr. Munro himself; it is a single figure, representing a girl looking complacently in a glass at the garland of flowers with which she has adorned her head. It is admirable in colour, and very skilfully painted.

'Hampstead Heath,' J. CONSTABLE.—A small picture, containing a very picturesque disposition of quantities. The nearer section presents a large proportion of broken ground, which rises in the right of the picture; the left opens with near trees, water, and graduated distances terminated by a remote and airy horizon. It is a skilful composition, and would have been worthy of development in a large picture.

'Near Highgate,' J. CONSTABLE.—Another small picture from the same picturesque vicinity. Here the gravelly bank rises on the immediate left, and the right opens to distance over a succession of fields studded with trees, and retiring to an almost invisible distance.

'Rome, from the Villa Madama,' R. WILSON.—This is a very large picture, and in superb condition. The whole of the broken foreground, which is an eminence overlooking the valley of the Tiber, lies in deep shade. The river appears on the left, and we trace the line of its course to and through the city, which occupies the middle distance, extending nearly across the entire composition. By close examination, we recognise individual edifices here and there, but the entire expanse lies in one breadth of mellow light, and beyond the city all definite form is lost, until the eye rests on the Appennine chain which closes the distance. This is one of the most important pictures that Wilson ever painted.

'The Destruction of the Niobe Family by Apollo,' R. WILSON.—This work is so well known from the version of the subject, also by Wilson, in the National Gallery, that it is not necessary to describe it here. This is the first picture—that in the National Gallery is a repetition. This was executed by Wilson for the father of the late Lord de Tabley, but when the latter understood that the price was three hundred pounds, he demurred to such a price, and declined the purchase. When Mr. Grenville heard that the work had been rejected, he expressed a desire to possess it, and acceded to the terms of the painter. It is in the best possible preservation, and all its details are more distinct than those of the work in the national collection.

'Italian Landscape,' R. WILSON.—This picture is

extremely pure in colour and perfect in surface. It was the property of Colonel Bowles (having been originally executed for a member of his family), from whose possession it passed into that of Mr. Munro. The composition shows on the left an ancient fountain, near which are three figures: a river flows from the right transversely to the distances, on the opposite side of which is the ruined tower, which appears so frequently in Wilson's works. The extreme distance is closed by mountains.

'Adonis crowned by Venus,' R. WILSON.—A classic landscape, resembling the works of Claude in the tranquil dignity of its sentiment. The components are very similar in all Wilson's productions of this class. The left is closed by a dense screen of lofty trees, and in the more open portion appears a river, a ruined temple, and a distance, concluded by a chain of blue mountains. The group of figures, of which Venus is the principal, was painted in the landscape by Cipriani. This picture was also the property of Colonel Bowles, and was, like the preceding, executed for a member of his family.

'View of Sion House, from Kew,' R. WILSON.—This large picture was painted to commission. The view is taken from a point opposite to Sion House, and looking up the river towards Richmond. It is broad and fresh in colour, distinctly different from Wilson's so-called classical compositions, in which he was so much influenced by Claude. There is in the collection another example of English scenery—fresh, luminous, and natural, apparently a subject from the romantic banks of the Wye. In the enunciation of these two very distinct sentiments this artist was most enthusiastic—his compositions are studiously mysterious, but his pursuit of nature is a continuous sunny revel.

'The Harlot's Progress,' W. HOGARTH.—The collection contains two of the compositions of this serial story. They were the property of Mr. Beckford, and are all of this set that survived the conflagration at Fonthill. The series is well known to the public through the engravings. These two are the scene in which the tea-table is overturned, and that in which the profligate is beating hemp in the House of Correction.

'Landscape,' J. M. W. TURNER.—This is an early picture, extremely simple in composition and colour—presenting a wild, rocky, and mountainous landscape, consisting of a very few principal parts. The base of the view is the termination of a plain, broken up with incidental rocks and inequalities of surface. On the left rises a mountain, on which, everywhere, the bones of the earth crop-out above the vegetation. Another more distant mountain occurs, closing the centre and right of the picture, and rising above the clouds which sweep its rocky sides. The sentiment of the work is elevated and impressive—the feeling of the lower portion being supported by a sky correspondingly wild. This picture must have been painted in the early years of the present century, long before Turner vindicated for himself the Turneresque. We read his unsettled thoughts while at work on this canvas—he was distracted first by Poussin, then by Wilson, now by Loutherboung, then by Salvator.

'The Bride,' W. ETTY.—This is a semi-nude figure, seated, in profile, the lower part of the person being covered with a red drapery. In the hair is interwoven a chaplet of flowers, and from the head falls a gauze veil. The high and mellow tone of the figure is forced and relieved by some dark green foliage immediately behind, leaving the rest of the field light.

'A Sleeping Nymph,' W. ETTY.—This is also a nude study of great beauty, representing the figure lying on her right side, and showing the features, though in some degree screened by the right hand being thrown over the head. The upper part of the figure is relieved by a red drapery, the remaining portion of the background consisting of landscape with trees. It is painted upon one of those brown milled-boards of which ETTY continually made use, both at the Royal Academy, and also in the school at St. Martin's Lane.

'Leda and the Swan,' W. ETTY.—This picture was commissioned by, and painted for, Sir Thomas Lawrence. In comparison with many of the works we have already mentioned, it is less mature in its manner than those—indeed it is an early picture. The breadth of light formed by the figure and the

swan is opposed to a red drapery, suspended from the trees, which rise above it, and close the rest of the background.

'A Study,' W. ETTY.—The subject is a female figure recumbent on her left arm, the right arm being extended downward, the hand resting on the right leg. The head of this figure is among the most characteristic of the series—passionate enough for Medea, proud enough for Semiramis, and deriving not a little of its force from the manner of the black hair. The red drapery here occurs again—a very favourite resource with ETTY, but always effective and never obtrusive.

'The Vow of Vengeance,' W. ETTY.—A study of a nude male figure seated, and looking upwards with an expression of earnest determination, as menacingly grasping a sword in his right hand. The character of the features is oriental, and the deep complexion of the person is also eastern in its hue.

'The Bower of Venus,' W. ETTY.—Venus is here extended at length on a draped couch, reclining on the left side, with the face turned from view. The flesh tints are high and mellow in tone, and the disposition of the figure affords the most beautiful flow of line with the utmost delicacy and elegance of proportion. She is attended by two Cupids, one of whom attempts to catch a flying dove.

'Venice,' R. P. BONINGTON.—Again we are afloat, but this time only on a raft (ingenious device!), on that famous Grand Canal, with San Giorgio on our right, looking up to the Dogana, with the indistinct forms of the palace and adjacent buildings reduced by distance. The most fastidious advocate of the mysterious interpretation of Venetian subject-matter must be charmed with the simplicity of this picture. Turner admired this picture so much that he wished it to hang near his own works.

'Titania and Puck,' J. NOEL PATON.—A small picture, worked out with the veriest minuteness of manipulation.

'Rose Bradwardine,' C. R. LESLIE, R.A.—A head, the bright features and joyous expression of which are well known through the engraving.

'A Lady playing with a Parrot,' C. BROCKY.—Very much in the feeling of the Dutch school—powerful in colour. To this little picture there is a pendant, the subject of which is a lady standing at a window, and on the outside is a small black spaniel. These pictures, although pendants, afford each a contrast to the other in tone and colour. There are in the collection many very accurately drawn and brilliantly-coloured pictures by this artist, who can scarcely be said to be a member of a foreign school, as he came to Loudon under the patronage of Mr. Munro, before he had in anywise distinguished himself elsewhere.

'Satan, Sin, and Death,' W. HILTON.—The composition is strictly according to the text of Milton: Satan is a dark figure in strong opposition to the lighter tone of Sin and the other groupments. The forms are distinguished by the usual good drawing of this artist.

'La Penserosa,' G. S. NEWTON.—This is a small picture, the most charming of all the minor studies that Newton painted. It is a head and bust of a girl presented in profile—she is reading a large volume, and rests her head upon her hand. A black veil is cast over her head, and she wears a large miniature, suspended by a ribbon from her neck. It is an essay of infinite sweetness, and is well known from the very excellent mezzotint engraving executed from it before the death of the painter, published first as an individual plate, and secondly in a collection of his works. Gilbert Stuart Newton was a native of America, but he exercised his profession in Loudon, and died a member of the Academy.

'The Deserted,' G. S. NEWTON.—Also a small study; the head and bust of a lady presented full-face. The dress has been originally white, but it is finished with a thin red glaze. This is much more sketchy in execution than the preceding picture; it has also been engraved and published with the collected works.

'An Oriental Study,' W. WILD.—The subject is a section of the enclosed garden of some Moslem harem, with two figures lying in shade in the centre of the composition. We recognise at once our whereabouts by the architecture and the character of the vegetation.

'A Study from Nature,' J. CONSTABLE.—A small

picture, presenting a rich variety of English scenery, trees and green fields, in most effective disposition. 'The Tinker,' ALEX. FRASER.—A small dark picture, showing the tinker at work before a cottage door, and in the act of raising to his lips a glass of ale. A gardener stands in conversation with the peripatetic mender of pots, and a woman stands at the door. It is probable that this is an early example, when the artist was intimately associated with Wilkie.

'The Cup of Cold Water,' C. W. COPE, R.A.—The subject is treated not scripturally, but in the spirit of ordinary charity. The picture is rather large, but everywhere finished with the utmost care. A pilgrim family, consisting of father, mother, and child, have stopped at a rich man's gate to crave a cup of cold water to revive their fainting girl, who has fallen in exhaustion before the gate. An elegant and touching sentiment pervades the composition, of which every figure is a well-conceived impersonation, strictly appropriate to the tender motives of the subject. A powerful stream of light passes through the doorway, the reflections of which subserve a beautiful variety of tones.

'A Tiger attacked by a Boa-constrictor,' J. WARD, R.A.—This is the most brilliant and exciting picture we have ever seen by this veteran painter. A large male tiger is represented writhing in the crushing folds of a boa of the largest size. The huge and terrible python has wound himself in many circles round the body of the animal, which, in helpless agony, yields to the vast contractile power which is crushing its bones.

'Lady Stanhope,' SIR JOSHUA REYNOLDS.—The pose of the figure is in some degree like that of Mrs. Siddons as the 'Tragic Muse.' The lady is seated, and rests her head upon her left hand, looking upwards in a contemplative attitude. The head is a most captivating essay, both in colour and expression. The dress is white and of the utmost simplicity, and the general treatment of the composition is correspondingly unaffected.

'Kitty Fisher,' SIR JOSHUA REYNOLDS.—She is seated, and presented in profile, holding a dove before her, with a second bird of the same kind near her.

'An Italian Landscape,' R. WILSON.—The favourite object of a broken bridge is introduced here; the pieces stand in a river, which is circumstanced in an extremely romantic country. This work is very highly finished.

'Landscape,' R. WILSON.—Rarely is a composition of this artist to be seen without water. This is an upright picture, showing in the distance a castle on the banks of the river—a portion of the sky is obscured by the dense foliage of trees in the immediate foreground. In another very highly finished picture, lately the property of a gentleman at Bath, the foreground is entirely shaded by overhanging trees, from beneath which appear the windings of a road with two figures, one mounted on horseback, and beyond these portions of the composition there is a very tenderly painted distance. A yet larger picture than these is a romantic Italian subject, with a city on an eminence on the left—the nearest sections deep and powerful—and beyond these a far-spreading campagna. With a 'View on the Thames' we may conclude the enumeration of Wilson's pictures.

'Sin and Death,' FUSELI.—This picture is considered the masterpiece of Fuseli. It shows Sin as a principal yielding to Death—a shadowy and fearful form beyond her—and whose hand is placed upon her heart. It is very much the best example we have ever seen of that mysticism in which Fuseli excelled. There is also by him a picture entitled 'Revenge,' containing five figures—one of whom, a man, supports a woman in his arms, into whose breast another woman is about to plunge a dagger. Also a subject from 'Romeo and Juliet,' and another from 'The Tempest.'

There are numerous pictures by STOTHARD—subjects from a variety of sources:—two from the 'Arabian Nights,' 'Adam and Eve entertaining the Angel Raphael,' 'Bacchanals,' 'Lear and Cordelia,' 'Halloween,' 'Temperance,' from 'The Economy of Human Life,' 'The Resurrection,' a subject from Blair's 'Grave,' 'Pericles,' 'Hope,' 'All's Well that Ends Well,' &c., &c.; and besides the works by Reynolds already mentioned, there is another portrait of 'Kitty Fisher,' when no longer young, and a portrait of Reynolds's sister—a very piquant performance.

THE ARCHITECTURAL MUSEUM AT SOUTH KENSINGTON.

IN consequence of their decision to remove the collections of the Architectural Museum from Canon Row to the Government museum buildings at South Kensington, the committee of management have had to encounter precisely that kind of opposition which, perhaps, they might have had reason to expect, but to which they certainly ought not to have been subjected. That some few individuals should consider the location of the museum in their own immediate neighbourhood as an indispensable condition for them to render to it their support, would have been naturally anticipated. These collections have become of the utmost value to earnest, thoughtful, laborious students of architecture; and to such persons a distant position of the museum, which involves the consumption of time in reaching and returning from it, is really a serious consideration. So soon, however, as the removal of the museum has been completed, such objectors will scarcely fail to consider whether, in their new position and under their fresh arrangements, the collections of casts and other objects will not have acquired a value, impossible to have been attained by them before, which will more than compensate to the student for the additional expenditure of time required by a visit to South Kensington rather than to Canon Row.

But there are other objectors, whose opposition to the removal of the museum is far less reasonable in itself, and who consequently may not be so readily open to ultimate conviction. In the opinion of these persons, the committee have acted in this matter either under an influence altogether unworthy, or without the exercise of any thought, reflection, or discretion. The composition of the committee of management of the Architectural Museum, coupled with their devotion to its welfare, ought to be a sufficient guarantee that so important a matter as the removal of the museum itself would never have been contemplated by them without motives at once consistent and powerful, and that they would not have actually resolved upon any such removal unless convinced that it was necessary in itself, or calculated to prove beneficial both to the institution and to their art. And, on the other hand, from the cold and indifferent supporters of the establishment in Canon Row, a sudden display of energy in opposition to the decision of the committee leads rather to the opinion that the imputation of thoughtlessness, indiscretion, and a want of due reflection ought to rest with themselves in place of the museum committee. The fact is, that the first idea of this removal was forced upon the committee in consequence of their failing to obtain such a measure of support as would enable them either to develop the existing capacities of the museum at Canon Row, or to extend its range, and, by adding to its contents, to render it more complete and more perfect. In the quaint old galleries where they first were gathered together, the collections of the Architectural Museum have long ceased to be practically available for study, except so far as each student might be able to discover for himself what he desired amongst the crowded assemblage of casts. Every effort was made with the view to accomplish a satisfactory classification and arrangement; but the limited space and the peculiarity of the construction of the rooms rendered these efforts abortive. Nor could a more extended area be obtained on the spot, nor (with the sole exception of their locality) was it even desirable that the Canon Row premises should have been so far extended as to have met the requirements of the museum. The Canon Row lofts have been elevated into "galleries," through the potency of association; but, in plain matter of facts, lofts they are, and such they will remain until the contemplated new palace of the executive Government sweeps them away altogether; and, even for the sake of being within a stone's throw of Westminster Bridge, we ought not to locate in such a home what may now claim to be the national museum of the noblest of the arts. Such a museum ought to have a suitable habitation, though it be but a temporary one, as well as an appropriate and consistent position. We are well aware that the *suitableness* of the South

Kensington Museum buildings for their purpose will be instantly disputed; nor are we disposed to enter upon any attempt to advocate their cause, beyond the point with which we now are immediately concerned. As a temporary structure, designed only to fill a void until the deliberate voice of the legislature shall have pronounced what shall be the National Museum of Art, perhaps it was a matter of indifference what the external aspect of these buildings might be; and possibly with many persons it might be considered desirable that they should be unmistakably impressed with the visible characteristics of a brief and subsidiary existence: still we confess to a feeling of regret that, even in their capacity of temporary museum-buildings, these structures should have been produced as they now appear. But the character and external aspect of the South Kensington buildings are considerations altogether subordinate to the capacities of these buildings for effectually discharging the duties required from them. We have now simply to consider how far the galleries, which will contain the Architectural Museum within these walls of iron, in place of the former walls of wood, are calculated to provide for the requirements of the museum collections, and to meet the wants of students and visitors. This is a matter which appears to have been very generally overlooked, when the external aspect of the so-called Art-museum had been seen, and, having been seen, had been promptly condemned. The exterior being so far from satisfactory to the eye, the interior was assumed to be as remote from what would be required for use. But here, certainly so far as the Architectural Museum is concerned, a conclusion exactly at variance with the facts would be arrived at by such a process of reasoning. The galleries of the Architectural Museum are admirably suited to their purpose. Spacious, commodious, well-arranged, well lighted, these galleries enable the committee of the museum to place their collections upon a system at once altogether satisfactory and consistent with the importance of the collections themselves, and they will also enable students to study, and visitors to inspect, the contents of the museum with every facility and every advantage. What they so greatly needed is here provided for the museum committee—available space and light. The Architectural Museum had outgrown its home at Canon Row, and yet it demanded space for a continual and a vigorous growth. At South Kensington it has the room it now requires, and what it may need in time to come can be provided, and will be provided for it. Nor is it only a larger range of gallery which the Architectural Museum can now command. The museum collections having now been classified and arranged, can be seen and compared; so that one visit to the museum as it is, ought to be more valuable in its results than several such visits as heretofore could be made at Canon Row. The great objection to the South Kensington Museum, arising from the distance of its location, is here met with a reply which, while it confessedly still leaves this distance much to be deplored, really deprives it of its most serious evil. This is a point which will establish its own importance when the museum, shall have been attended for a while by students; and it will, without doubt, be found to operate very effectually towards removing the unfavourable impression excited in the public mind by the position of the South Kensington museums. The combination of several Art-collections there, beneath a single roof, will also speedily demonstrate its own influence for good—for good, no less in popular opinion than in practical effects. In the case of the Architectural Museum it must be particularly borne in mind that, besides better, more spacious, and more commodious galleries, the institution derives various other important advantages from the removal, which will combine to render its development comparatively easy to be accomplished. New means of obtaining fresh casts are opening before the committee; and the resources already at their disposal being no longer burdened with rent and certain other charges of a somewhat similar character, will admit of a direct application of their full powers to the purposes of the museum itself. And in all these matters the action of the committee will continue to be absolutely free and independent. With them will rest the entire direction of the museum, as in time past the removal will have been accomplished under their orders,

though not at their cost; the collections will have been rearranged by them, and with them the future destinies of the museum will rest. There has been some misapprehension in this matter, which it will be well to have removed. It has been alleged that the government authorities will gradually encroach upon and eventually absorb the independence of the Architectural Museum Committee. What the government authorities will do, will be this—they will desire to render all the Art-collections which may be brought into contact with one another beneath their roof as perfect as possible, and as practically valuable as possible; and in the department of architecture they will gladly secure the services of the museum committee on the only terms upon which those services could be obtained—by securing to the committee themselves their independence of action, and by maintaining their authority.

THE SOULAGES COLLECTION AT MANCHESTER.

THE Government having exercised, as we believe, a wise discretion in declining to purchase for the National Art-museums the Soulages Collection, the Directors of the Manchester Art-Treasures Exhibition have become the purchasers; and accordingly, the labours of the old advocate of Toulouse have found an unexpected recognition from amongst the merchant-princes of the great emporium of English textile manufactures. This is a fact at once singular and significant: singular, since it indicates the deep hold which the present Art-passion has taken upon the Manchester mind; and significant as demonstrating that this passion has assumed just that practical bearing which with Manchester men is the sure token of sound sense, and the equally sure promise of genuine utility. The Soulages Collection is far from being simply a collection of works of Art, in the direct and usual acceptation of that term: on the contrary, consisting of an assemblage of different productions of what we now understand under the designation of Art-manufactures, it is to the manufacturer who would improve and elevate his productions through the agency of Art rather than to the student of the history of Art and to the artist properly so called, that this collection makes its appeal and propounds its teaching. Its Manchester proprietors, without depreciating its historical value, have formed a just estimate of its character; and hence it is that we regard the purchase of it by them with such sincere satisfaction.

From the hour in which we first examined the much-extolled Soulages Collection, we have considered that it has been estimated considerably above its intrinsic and real merits; and, consequently, we have invariably entertained and expressed a hope that, as a whole, it would not become national property. The conditions under which the purchase of this collection has been effected at Manchester do not, in any respect or degree, militate against such an ultimate disposition of its various components as may place in the national museum certain most desirable specimens, while Manchester itself, and perhaps other provincial cities and towns also, may become the permanent possessors of other portions of this series of Art-Manufactures and works of Art. Thus, whatever benefits the practical arts of our own times and our own country may acquire from this Soulages Collection, will be more diffusive in their application than if the whole were kept together; and, at the same time, what would be useless in one museum may become useful through the different circumstances in which it may be placed when in another. And should the result of the Manchester purchase be to keep the Soulages together as a single collection, and as a department of one museum, it would in that capacity possess a greater value in any other museum than in the Art-museums of the nation. We can better spare the whole collection from the national museums than admit the whole collection within them: and hence, though we certainly should be glad to know that certain works, once the property of M. Soulages, had been purchased by the Government, we rejoice to feel assured that the Government purchase will be restricted to selected specimens, instead of extending over the entire collection.

BRITISH ARTISTS:
THEIR STYLE AND CHARACTER,

WITH ENGRAVED ILLUSTRATIONS.

No. XXIV.—CLARKSON STANFIELD, R.A.

LARKSON STANFIELD is a native of Sunderland, in the county of Durham; he was born, we believe, in 1798. The fact of his boyhood having been passed in a seaport town, where everybody, as well as everything, is, or seems to be, impregnated with sea air and salt water, had, no doubt, considerable influence in determining him to enter the marine service, in which he passed several years of his early life, and thereby acquired a partiality for the class of art which he has since so successfully followed, and such an acquaintance with the sea and shipping as enabled him to attain the high position he has reached as a marine-painter. He made his first appearance

in London as an exhibitor in 1823, at the Society of British Artists, in the formation of which he, with David Roberts, and some others who have risen to high distinction, took great interest. But before speaking of the pictures which have passed out of Stanfield's studio, it will be necessary to allude to another branch of Art with which his name is honourably associated, because we are of opinion it laid the foundation for a large portion of his future excellence.

While Stanfield was serving at sea, we have heard that he used frequently to amuse himself with painting, employing whatever materials were at his command. On his settlement in London, he engaged himself to paint scenes for one of the minor theatres; here was an excellent school of practice, from which the artist, no doubt, derived considerable benefit, and through it Stanfield himself was the means of raising scene-painting to the dignity of Art: before his time it was little else than daubing for the stage. We are old

enough to remember the beautiful drop-scenes and dioramic views which he subsequently painted for Drury Lane;—pictures they were of real beauty, so beautiful as to make it a matter of sincere regret that they should have passed away with the season which called them into existence. To Stanfield, and David Roberts, who had rendered himself famous by his architectural representations, succeeded Marshall, Beverley, and some other names, whose works are the delight of the present generation of dramatic patrons; but to the two former must be assigned the honour of rendering the scenery of the British stage what it now is—the best in Europe.

The first of Stanfield's easel pictures that attracted marked attention was "Market Boats on the Scheldt," exhibited at the British Institution in 1826: the picturesque grouping of the boats laden with various commodities, the number and diversity of figures in gay costumes, all reflected in the quiet surface of the water, constituted a representation as agreeable to the eye as it was true to nature. In the following year he exhibited, in the same gallery, the "Wreckers off Fort Rouge, Calais," a work of far greater originality and power than the preceding: many of our readers may probably know the subject from Quilley's mezzotint engraving; the print, however, conveys but an imperfect idea of the spirit of the original. In the same year (1827) his name first appears in the catalogue of the Royal Academy, appended to a picture entitled "A Calm."

His next important work, exhibited at the Society of British Artists in 1829, was of a subject differing entirely from all preceding it—a view of "Earlstoake Park," the seat of the late George Watson Taylor, Esq., a distinguished patron of Art. We have no recollection of this picture, but we find an anonymous writer speaking thus of it three or four years after it was exhibited:—"An extensive view of a very beautiful country, masterly coloured, and executed with magnificent powers of handling."

On reference to our catalogue of the Academy Exhibition of 1830, we find sundry "notes" of commendation upon his picture of "Mount-St. Michael, Cornwall;" certainly it is superior to the "Wreckers."

It was about this period, we presume, that Stanfield first visited the Continent, for he exhibited at the Academy, in 1831, four pictures, entitled respectively "A Storm," "Strasburg," "Venice," and "A Fisherman of Honfleur;" the three last were drawings: these foreign scenes constituted the advanced-guard of that long array of continental scenes which we have seen passing

[J. and G. P. Nicholls.

before us, and ever welcome, up to the present time. In 1832 he exhibited at the British Institution "Portsmouth Harbour," a commission from William IV., and engraved among the "Royal Pictures" which have appeared in the *Art-Journal*; and at the Academy another commission from his late majesty, "The Opening of the New London Bridge," which Mr. Prior is now engraving for us. In the autumn of this year Stanfield was elected Associate of the Academy.

In 1833 he exhibited at the Academy the first of a series of large pictures commissioned by the Marquis of Lansdowne for the banqueting-room at

Bowood; they are ten in number, and are inserted in the panels of the wall: the subjects are all of Italian scenery,—the "Piazza di San Marco," the islands of "Mazerbo" and "Livenza," the "Ducal Palace from the Dogana," "Sta. Maria della Saluta," the island of "Murano," "Citara," &c. &c.; this last completed the number, it was finished in 1840. In 1834 Stanfield commenced a series of Venetian views, for a similar purpose, for the mansion of the Duke of Sutherland.

About this time it was that those charming ephemeral illustrated books called "Annuals" were at the height of their popularity: Stanfield executed a

number of drawings, varied in interest and beautiful in character, for the "Picturesque Annual," which were published in the years 1834 and 1835. In the latter year he was elected Academician.

In 1836 he exhibited his large picture of the "Battle of Trafalgar," painted for the Senior United Service Club; the original sketch was purchased by the late Mr. Vernon, and is now in the National Collection at Marlborough House: an engraving from it appeared in the *Art-Journal* for November, 1851.

We pass over the succeeding two years of Stanfield's life—although they were productive of several admirable works—simply because of our limited space: in 1839 he was absent abroad; but in 1840 there hung on the walls of the Academy six pictures from his pencil,—“Citara,” one of the Lansdowne series, “Ancona,” “Salerno,” “St. Georgio Maggiore,” “Avignon,” “View near St. Malo,” and “Amalfi,” all of them landscapes of a high order of merit.

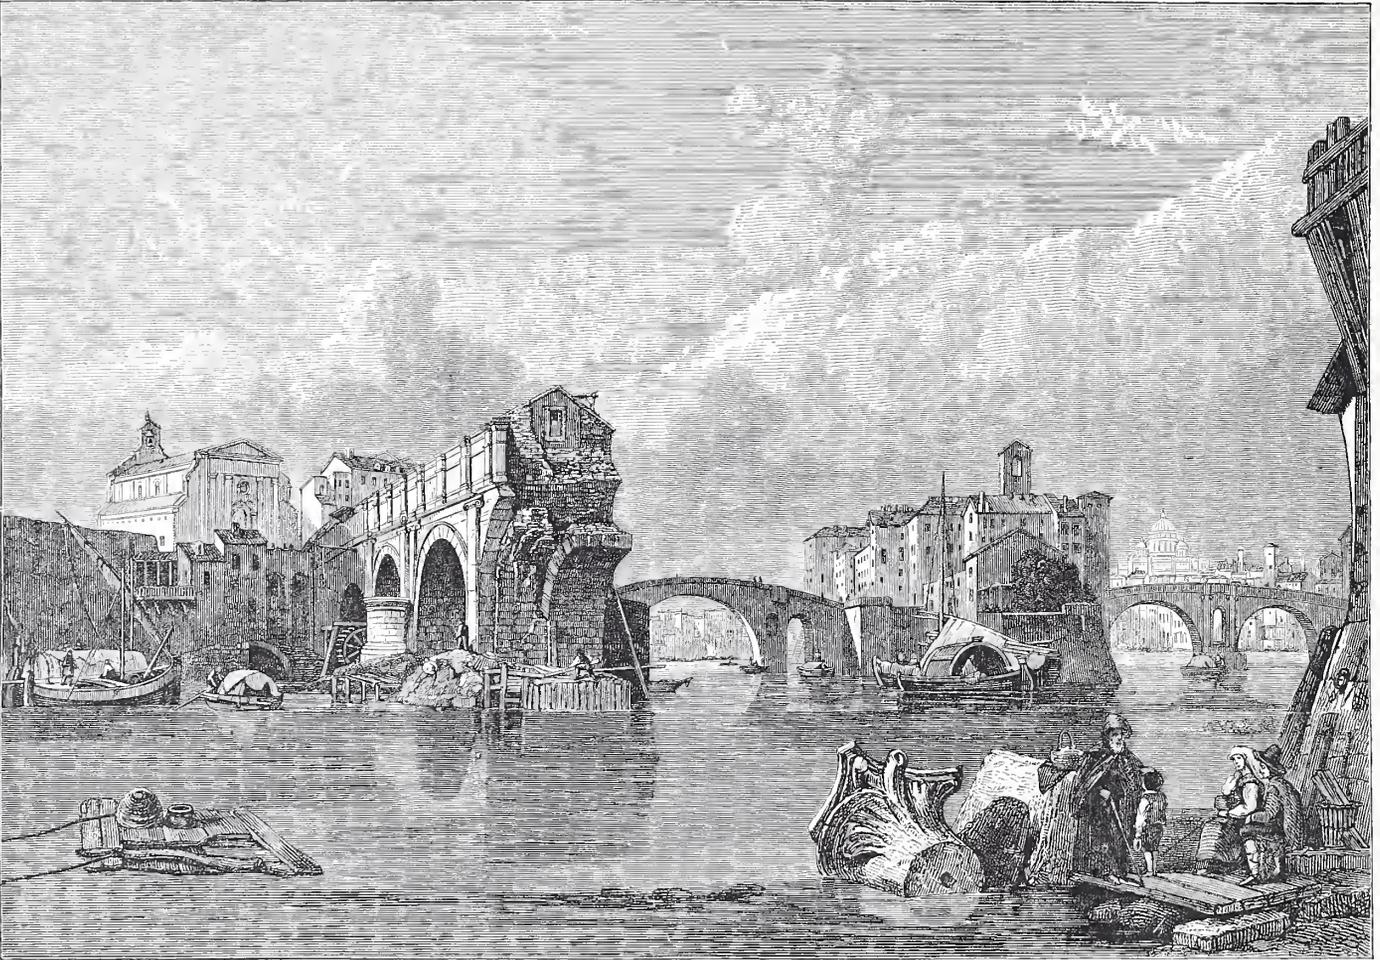

Of two pictures exhibited in 1841, “The Castle of Ischia,” and “Pozzuoli, Bay of Baia;” the former is tolerably well known from the engraving issued by the Art-Union of London, in 1844.

“Vallone dei Malini, Amalfi,” a rocky defile, crowned in the near distance by a few white Italian buildings; “Isola Bella, Lago Maggiore;” a view of

“Pozzuoli,” taken from a different point to that of the picture of the preceding year; and “Kitchen of the Inn at Amalfi,” a semi-interior,—were Stanfield's contributions to the Academy in 1842. In the following year he sent “Mazerbo and Lucello, Gulf of Venice,” one of the finest landscapes he has ever painted, “The Ducal Palace and Columns of St. Mark, Venice;” and to the British Institution, a “View of the Islands of Ischia and Procida.”

In 1844 Stanfield left the fair country of Italy, and carried us to the shores of Holland, through the medium of two pictures—one “Oude Scheldt, Texel Island,” a comparatively small but beautiful example of his pencil; the other, a truly noble composition, “The Day after the Wreck—a Dutch East-Indiaman on shore in the Ooster Schelde,”—this work, studied carefully in all its parts, was the greatest triumph the artist had yet achieved; and although in two or three later productions he may have equalled, he has certainly never surpassed, it in fidelity to nature and poetical feeling: the masterly treatment of the sea, yet chafing under the effects of the storm that passed over it, is, perhaps, the most striking passage in the picture.

Of three pictures exhibited in 1845, “The Mole at Ancona, with Trajan's Arch;” “Dutch Boats running into Saardam, Amsterdam in the distance;” and the “Action and Capture of the Spanish frigate, El Gamo, by the English

IL PONTO ROTTO, ROME.

[J. and G. P. Nicholls.

sloop, Speedy, commanded by the then Lord Cochrane, now Earl of Dundonald,—we can only just refer to the last, as being one of the few sea-fights which the painter has given us: he seems to have caught, in his representation of the action, no little amount of the spirit which the gallant Cochrane showed in the capture of his comparatively gigantic adversary.

Three pictures were Stanfield's contingent to the exhibition of 1846,—“A Dutch Dogger carrying away her Sprit;” “IL PONTO ROTTO, ROME,” in the possession of Mr. Arden, Cavendish Square, who has kindly afforded us the opportunity of engraving it; and a “Scene at Mounikendam, on the Zuyder Zee;” the first full of life and motion, the second truthful and substantial, the last a quiet picturesque representation of Dutch coast-land. In 1847 he contributed six pictures—two views of “Dordrecht,” gems, rich and luminous; “On the Zuyder Zee,” showing a number of Dutch craft in a stiff breeze; “Scene near Catolica, Adriatic;” “Naples,” a smaller “gem” than the “Dordrecht” pictures, but quite as beautiful; and “French Troops fording the Magra in 1796,” painted for the late Earl of Ellesmere, a picture which to describe at a length, in some proportion to its merits, would occupy a column of our page: it must suffice, that we say it honours the collection in which it is placed, and that is no mean compliment to the work.

“A Saw-mill at Saardam,” in the British Institution, in 1848, is a highly picturesque subject, painted under a twilight effect. “Amalfi,” a large picture, and the “Mola de Gaeta, from the Appian Way,” sustained the well-earned fame of the artist in the Academy exhibition the same year. In the following

he sent to the Academy five pictures,—“TILBURY FORT, WIND AGAINST TIDE,” painted for Mr. R. Stephenson, M.P., engraved by the Art-Union of London, and also introduced as one of our illustrations; “Lugano, Switzerland,” a lake scene of exquisite beauty and finish; “Salvator Rosa's Studio,” a wild, rocky composition, most true to nature; “Lago Maggiore;” “Near Miori, Gulf of Salerno;” and a home scene, “The Reculvers by Moonlight.”

Glancing over the Academy catalogue of 1850, before we had seen the pictures, we noticed the name of Stanfield appended to one entitled “Macbeth,” and naturally enough began to think that this great master of landscape and marine desired to essay his powers in historical painting; but on examining the work we found it to be a large picture of dreary moor and mountain, in which Macbeth, Banquo, and the witches are introduced, to give it a name as it were. Another, painted for the late Sir R. Peel, and exhibited at the same time, a “Scene on the Maas, near Dordrecht—Market-boats waiting for the evening Tide,” is a composition of abundant pictorial materials, simple in themselves, but expressed with such powerful artistic qualities as entirely to redeem the work from everything that could be construed into a charge of commonplace. Three other pictures of scenes previously painted were also exhibited this year.

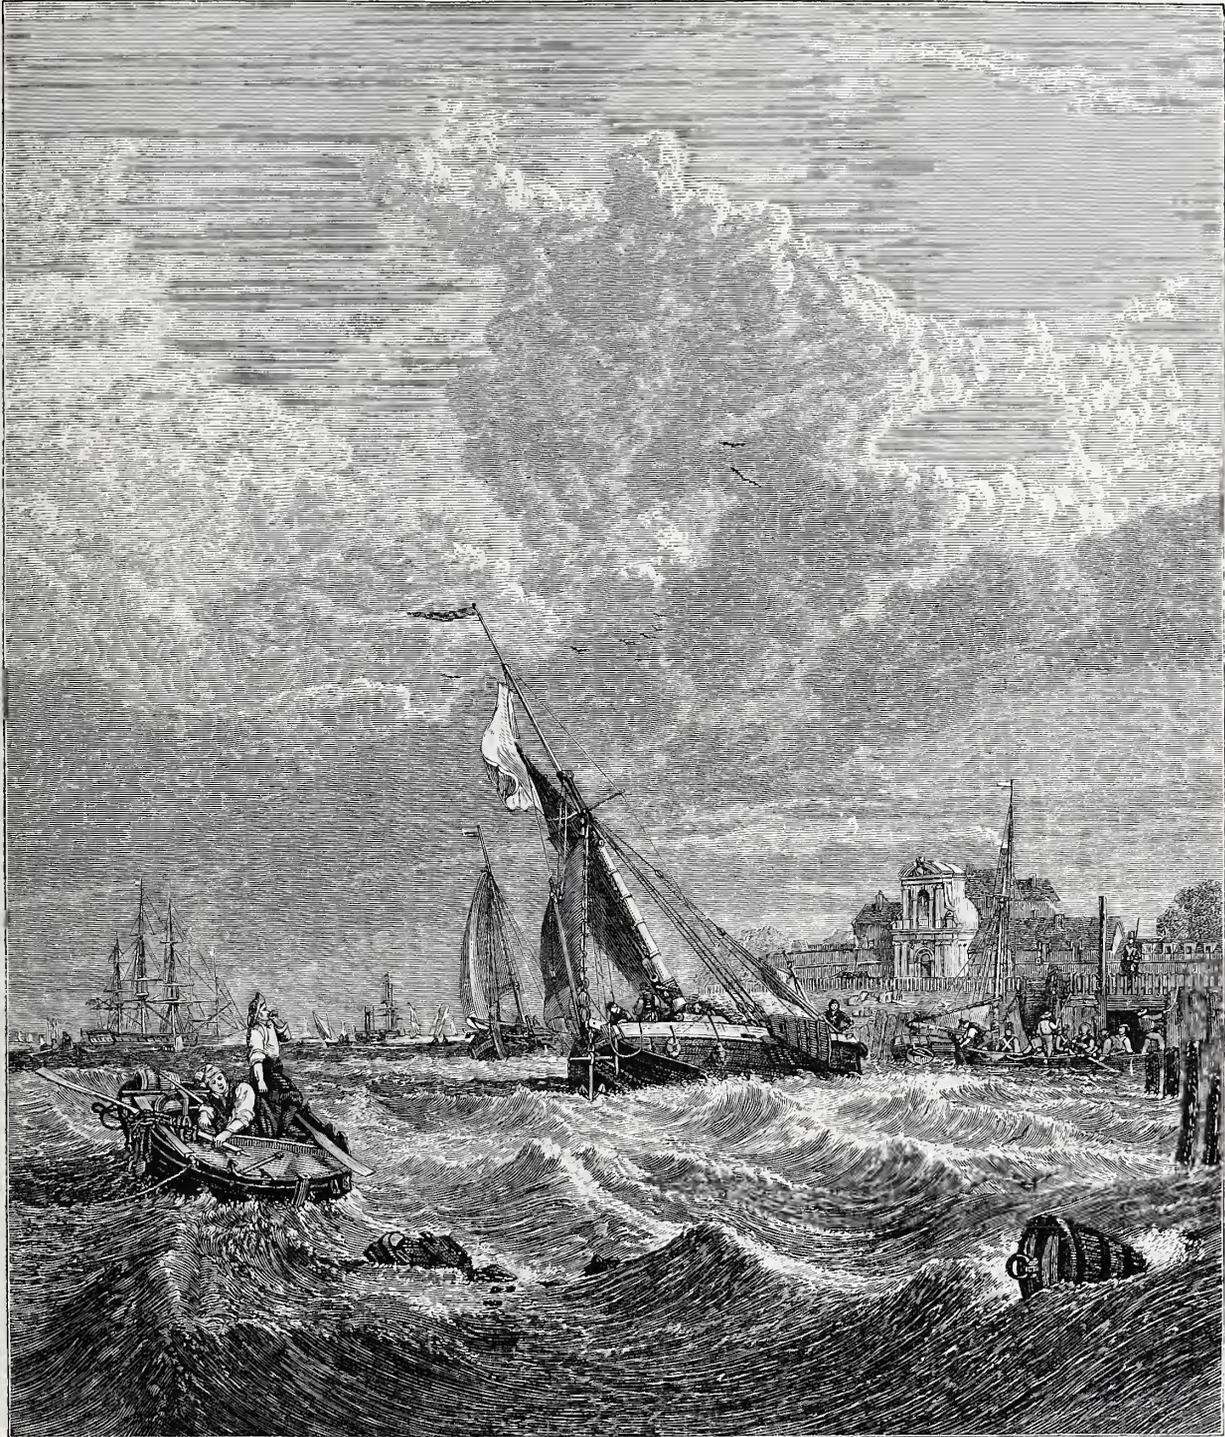

“The Battle of Roveredo” is one of the four pictures exhibited by Stanfield in 1851: it was painted for J. Astley, Esq. The engagement was fought in September, 1796, by the French, under Massena and Angereau, and the combined forces of Russia and Austria under Davidowich, who guarded the Tyrol with a force of forty thousand men. The point of the picture is the

passage of the French troops over the Adige; but the whole composition, which covers a large canvas, is full of material skilfully disposed as to pictorial effect, while every object is worked up to the closest imitation of nature. "Near Monnikendam, on the Zuyder Zee;" "Arco de Trajano, Ancona;" and "The Great Tor, Oxwich Bay, South Wales," were the respective titles of the other pictures exhibited by Stanfield this year.

In 1852 he contributed three works, "The Bay of Baiæ, from Lake Avernus;" "The Port of Rochelle;" and "Citara, Gulf of Salerno;" familiar subjects to the visitors, with the exception of the second, but not less welcome,

for though the artist often repeats his subject, he varies his treatment, so as to render them almost novelties.

The next year we had but two pictures from him; one of these, however, "The Victory, with the dead body of Nelson, towed into Gibraltar," was among the "stars" of the exhibition: we spoke of it two or three months since, when noticing the engraving by Mr. John Cousen, and need, therefore, say nothing more. The other, "An Affray in the Pyrenees with Contrabandistas," is a spirited and powerfully expressed work, but painted with less attention to finish than we ordinarily see in Stanfield's pictures.

Engraved by]

TILBURY FORT—WIND AGAINST TIDE.

[J. and G. P. Nicholls.

Four pictures were exhibited in 1854,—"The Last of the Crew," a cast-away sailor seated on a rock against which his small vessel has been wrecked—the composition tells the tale with touching pathos; "La Rochelle," an old subject; "Hulks in the Medway," a beautiful "harbour view;" and a "View of the Pic du Midi d'Ossau, in the Pyrenees," a winter scene, into which the artist has introduced a band of brigands. "Ilfracomb, Devon," "Dutch Boats entering Harbour, Zuyder Zee," and the "Siege of Sebastian," the companion picture to the "Victory," both painted for Sir M. Peto, were in the Academy in 1855: last year he exhibited "The Abandoned," and "A Guarda Costa riding out a gale of Wind off Bidassoa:" of the three last-mentioned we can only say that they must always take rank with the most remarkable pictures

which have come from his easel, and with the best, in their respective classes, which any age or country has produced.

If any of our readers should, perchance, complain of the meagre notice given of this popular artist, they must bear in mind how frequently we have been called upon to speak of him; moreover, what can be done in our restricted space with a painter who has been before the public upwards of thirty years, and each year sending forth numerous pictures of exceeding interest and undoubted excellence? True it is that, unlike historical painting generally, such works as Stanfield's have a certain degree of sameness; but there is not one unworthy of comment, and of more than a few brief lines, were we to enter upon an analysis of each: we have been able to do little else than enumerate the chief of them.

THE ROYAL PICTURES.

"NOLI ME TANGERE."

Rembrandt, Pinxt.

G. Levy, Sculptor.

Size of the Picture, 2 ft. 3 in. by 1 ft. 8 in.

FROM what authority this picture has received the title here adopted, and by which it is known among many connoisseurs, we have no means of ascertaining: "Noli me tangere," we just remark for the information of those who do not read the dead languages, is the Latin for "Touch me not," the words in which, as we learn in St. John, Christ addressed Mary Magdalene at the sepulchre. This picture has, however, received another title, by which it is also as well known, that of "The Gardener;" this is intelligible enough, and is sufficiently warranted by the artist's conception of the principal figure in it, as the whole narrative is related by the evangelist:—"Jesus saith unto her, Woman, why weepest thou? She, supposing him to be the gardener, saith unto him," &c.

Perhaps the singularity of Rembrandt's genius in his compositions from sacred history is nowhere more conspicuous than in this work; he has rendered literally the words of St. John, by representing the risen Christ as a gardener, though one can scarcely suppose that even a Jewish gardener was so habited: he wears a broad-brimmed straw hat, a spade in his hand, and a pruning-knife is placed in the girdle round his waist: here are the attributes of the gardener's occupation. Moreover, as we read in the narrative that "in the place where Jesus was crucified there was a garden," so Rembrandt, whose ideas of such a place could never have travelled beyond the limits of Dutch horticulture, has fashioned his Eastern garden after the similitude of one about Leyden or Amsterdam, with its carefully trimmed borders of box, and caused to grow therein a mass of huge dock-leaves, whose natural bed would be the edge of a Dutch river or dyke. The same train of thought seems to have pervaded his mind in other parts of the composition: a flight of steps leads to the sepulchre, as to a bower or temple in the garden, and the undignified attitude of the two angels in white may not unaptly be compared to two sculptured figures placed as ornaments at the entrance. Rembrandt has borrowed his ideas of the architecture of Jerusalem, as seen in the distance, from the ruins of some old Norman castle.

The question may not unnaturally arise to the minds of some who read this description, "Why has so strange a composition been selected for engraving?" The replies to such a query are three: first, to issue a work professing to emanate from the Royal Collections in Art in England without an example of Rembrandt would be absurd; secondly, out of the very few Rembrandts in the Royal Galleries, this one is, in most respects, the best for our purpose; and thirdly, and chiefly, its very peculiarities are significant of the master, and moreover, it is in itself a fine piece of painting, held in the highest repute by the best judges of Art. Dr. Waagen says—"This composition has, in a high degree, that strange originality which is peculiar to Rembrandt. The dawn of morning has given full scope for his deep *chiaro-oscuro*. It is very carefully executed." And Smith, in his "*Catalogue of the Works of the Dutch and Flemish Painters*," remarks—"There is a sublimity about this picture which stamps it among the most poetic compositions of the artist." It exhibits but little colour beyond the deep brown of the back and foreground in general, and the lurid yellow light in which the early day is represented shining full on the figure of Christ, and on the upturned face of Mary. This arrangement of the *chiaro-oscuro* produces a wonderfully powerful effect.

This picture, in the Collection at Buckingham Palace, is signed by the painter, and dated 1638: it was purchased in 1736 by the Elector of Hesse Cassel, of Madame de Reuver; was taken, in 1806, to Malmaison; was sold with the effects of the Empress Josephine, in 1816; brought to England, and purchased by George IV. It is painted on panel, and is in excellent preservation, though it has become very dark.

TESTIMONIAL

PRESENTED TO CHARLES RATCLIFF, ESQ., OF BIRMINGHAM.

THE manufacturers, Messrs. Elkington and Mason, having furnished us with a drawing of a very beautiful claret-jug, recently produced by them, and having submitted to us the production itself, a work of considerable elegance in design and of great merit in execution, we have been induced to engrave it;—not only for its own worth, and as evidence of satisfactory progress in Art-manufacture, but as an honourable mark of public favour to a gentleman who has been long respected by all classes of his fellow-townsmen in Birmingham. It is pleasant to record such gratifying instances of acknowledgment for public services rightly and

liberally performed. Mr. Charles Ratcliff, who for many years held a foremost rank among Birmingham manufacturers, and who contributed largely by judgment and good taste to improve the Art-character of its productions, has, it appears, retired from business, but devotes his time and mind to the good of the town, and to the advancement of its many useful and benevolent institutions.

A Library and Museum have been recently established at "Adderley Park," and their "opening" was commemorated by an entertainment, at which the Lords Leigh and Lytleton, Sir Robert Peel, and several of the town "authorities" were present—received by Mr. Adderley, the founder of the institution.

We extract from one of the local papers:—"The most interesting incident of the occasion was the presentation of a testimonial to Charles

PRESENTATION CLARET-JUG.

Ratcliff, Esq., whose praiseworthy exertions in connection with the opening of the Park had won for him much esteem, and whose energy and public spirit, as manifested in his promotion and encouragement of the various institutions of the town of Birmingham, and his philanthropic efforts to elevate the working classes, reflect so much credit on his judgment and good feeling, &c. There was an inscription on the plate to the effect that it had been presented to Mr. Ratcliff in token of the esteem

in which he is held by the friends of social progress for his philanthropic efforts in behalf of suffering and degraded humanity, and the elevation of the working classes."

We believe there are few persons in Birmingham, and none in his own locality, who will not participate in the satisfaction thus obtained by Mr. Ratcliff, and the numerous "friends and neighbours" by whom his exertions have been appreciated.

REMBRANDT PINXIT

W. L. G. DEL.

“NOLI ME TANGERE”

FROM THE PICTURE IN THE ROYAL COLLECTION

LONDON: PUBLISHED BY T. AGNEW & SONS, 1854.

THE APPLICATIONS OF IMPROVED MACHINERY AND MATERIALS TO ART-MANUFACTURE.

RECENT PATENTED AND OTHER INVENTIONS.

WHENEVER the attention of the public becomes engrossed by any subject of general interest, all the efforts of thought which do not flow in the pervading channels are subject to a considerable depression, or, sometimes to actual interruption. As, when we suffer from some severe epidemic, we find that the number of smaller diseases are diminished, and those which prevail assume the general epidemic type—so when one leading idea seizes on the mind, all things are drawn in the direction of that idea; and as the rod of Aaron swallowed the rods of the lesser soothsayers, so the greater thought involves all the minor efforts of the mind.

This is manifest in the conditions of our patent lists during the past twelve months—and it is evident in the Exhibition of Inventions at the Society of Arts. There is little of novelty in either the one or the other. War, with its feverish excitement, prevented that calm thought from which alone any important invention can arise, and unless it was in the direction of the agents of destruction, there appears to have been an absolute repose on the part of our inventors. Let it not be understood that we pretend to say that the patent lists are not so full as usual—all that is meant is, that the character of the things patented display crude ideas and imperfectly digested plans. Few indeed of the entire number will ever be useful to mankind.

While speaking of patent inventions, a word or two on our system of granting patents cannot be avoided. Any person applying for a patent, and conforming to the fixed rules of the Act of Parliament, has, unless he is opposed, his patent granted to him. It is quite possible that there may not be a new idea in the invention—that every point involved in the patent belongs to other men, and yet the patentee secures to himself the results of the mental industry of others, unless they are disposed to pass the expensive and harassing ordeal of a trial before a jury—not one man of the twelve probably having the slightest knowledge of the principles involved before he goes into Court. Take another case:—A man may honestly produce some new invention; he may have laboured diligently, and thought deeply, and the result may be really an advantage to the community. He is allowed to patent his invention, and he incurs much cost in placing it before the world, when some one finds that in some out-of-the-way work something like it has been published before, and the patentee is deprived of his privilege, and possibly ruined. A third condition occurs to us: a man seizes upon two known substances, known in combination and separate—and he uses them to produce a certain result. The patent laws, in the opinion of eminent counsel, secures to that patentee the right of using these two substances, and even the discoverers of their properties cannot employ them. At the present time a case in connection with this instance is in the hands of the lawyers. A second party uses the two substances employed by the first patentee to produce a different result from that previously patented, and patentee No. 1 brings an action against patentee No. 2 for infringement—the fact being that neither of them have any moral right to the materials which they use. Here we have in every direction some injustice, and this condition of things is constantly leading to the most unsatisfactory legislation. This might be avoided by forming a properly constituted board, that is, a board formed of men who were known to be conversant with mechanics, chemistry, and manufacture. To this board every inventor applying for a patent should submit his plans in all their entirety, and he should be informed, after due examination, if he was using what was the property of the public,—having been made so by publication,—and prevented from taking that to himself which belongs to all, or to another. This board should decide what portion of a process a man could secure by his patent, and what he could use but not lock up; and at the very outset of the matter the patentee might know exactly his position, and fairly

proceed with his speculation. At present it is known that a patent is quite valueless until a jury has decided upon its validity. Surely this ought not to be. An inventor should be enabled to secure, by a straightforward process, all that which he can prove to be his own; and he should be prevented from securing to himself those things to which he cannot establish a legitimate claim.

The Exhibition of Inventions consists mainly of engineering and mechanical appliances, which, although of much importance, would not prove of much interest to our readers. Among the articles belonging to this class there is but one which appears directly to concern us, which is a machine for “beetling” woven fabrics.

In the ordinary system of “beetling,” or the mechanical finishing of woven goods, by a direct percussive squeeze upon the fibres of the cloth, the effect is produced by an arrangement of cam hammers, which strike the cloth so as to work up the threads to the required degree of finish. The inventor of the “Stenter” finishing machine has, in his improvement, substituted a purely rotatory motion for the reciprocating hammering. The rotatory “beetle” consists of a triple roller arrangement working on a mangle or calender frame. The central roller is made with alternated surface and sunk parts over its entire surface: it is cast in metal, with the diamond relieve and intaglio portions upon it. The fabric to be beetled is wound upon one of the plain and external rollers, and during the process it is wound off this roller, passed round the central beetling roller, and rewound upon the opposite plain roller. The two external rollers are kept in hard contact with the diamond roller between them, so that the central roller is thus made to exert a powerful squeezing pressure upon the fabric as wound upon the external rollers. When put in operation, the rollers are driven first in one and then in the other direction, winding and re-winding the fabric, until the required “beetling” effect is produced.

There are two varieties of artificial stone exhibited: one is a combination of emery and metallic substances, for the purpose of producing a very abrasive surface, which may be used for sharpening, grinding, and polishing; and the other is Frederick Ransome’s *Siliceous Stone*. In the first, which is the invention of A. Meillet, we do not ourselves see any great advantage, as many natural stones—the French burr stones, for example, and some of our Yorkshire grit stones—possess abrasive powers equal to that which can be produced by the artificial aggregation of powdered emery, or any other hard substances.

We have formerly described Ransome’s siliceous stone. It may, however, be stated that it is formed by cementing together sand by means of a solution of flint. Flints from our chalk formation are subjected to the action of caustic soda in close steam-boilers, under some increased pressure. Thus is formed a silicate of soda or a soluble glass, which is mixed with about ninety-two per cent. of sand. While in a plastic state, this composition is pressed into moulds, dried, and subjected to the action of heat in a kiln. Thus the silicate forms a glass cement, which connects the particles of sand together, and forms an imperishable material, in texture and colour similar to our best Portland or Bath stone. As this material is first in a plastic state, it admits of being moulded into capitals, friezes, or any architectural ornaments. Mr. Ransome has also introduced a method for preserving stone in our buildings. Whether we employ the best Portland stone, or the Roche Ahhey stone, in this metropolis it is found that in a very few years a considerable amount of disintegration will take place, and many of the best buildings which have been reared in the metropolis within the last few years are found to be already in a state of gradual decay. This is, no doubt, hastened by the effects of the combustion of gas and coal. These are continually pouring forth into the air sulphurous acid and other eroding agents, beyond the ordinary carbonic acid and water, which are the constant products of combustion, and it is to these that the disintegration of the stone is due. Mr. Ransome’s process is as follows:—The stone is first coated with a solution of silicate of soda, and then with a solution of the chloride of calcium; the result is the formation of an insoluble silicate of lime in the pores of the stone, filling in every

vanity, and thereby preventing decay from the action of the weather in or on the substances.

The *Lithometer*, or stone-cutting machine, is an ingenious arrangement for cutting stones for building with much rapidity. It is the invention of Mr. William Williams of Milford Haven; and the patentee states that the time occupied in cutting about forty-four superficial feet would be only one minute.

An improved apparatus for making moulds for castings, by Mr. James Howard of Bedford, is very ingenious, and, as belonging especially to one branch of Art-manufacture, we must attempt to describe it. The patterns are mounted on a sliding mandrel; a plate surrounds the pattern of the exact shape of the profile, and when the mould has been rammed up in the usual manner, the mandrel is drawn down by means of a screw; the mould is then free to be lifted off the plate without risk of disturbing the moulded sand, or injuring the sharp edges of the impression.

The *corrugated Papier Maché* of Messrs. Healey and Allen, of the Strand, appears to promise much. The sheets are prepared of various thicknesses, the corrugations being proportionate to the thickness of the sheets and quality of the material. The patentees state that these sheets of papier maché can be rendered water-proof and unflammable—*i.e.*, although they can be charred, no flame can be produced. The sheets are made of various sizes, suitable for the exterior walls, or the interior lining of portable houses; also for partitions, panelling of furniture, doors, &c. The thin sheets can be made into ornamental boxes, screens, &c. The surface of the sheet may be ornamented by painting, or inlaying to any extent, and afterwards varnished or French polished. The grain being produced in the manufacture itself, or by means of dye-colours, it may be rendered very ornamental at a small cost.

Among the useful things may be named the clay “imperishable garden labels, indicator tiles, and ground indicators.” These are hollow bricks, of peculiar and adaptable forms, made hollow, either of the red pottery clay, in terra cotta, or in stone ware. They have a solid beveled top, on which are impressed, and coloured with a permanent vitrified black, any letters, figures, or devices, which may be required. At the lower part are some perforations, to give the indicators a firmer hold in the ground.

Gutta percha has now become one of our necessities; it is applied to so many uses of real importance that any failure in the supply of this interesting vegetable production would be severely felt. A new combination of gutta percha and cocoonut fibre is now introduced, as a “patent improved gutta percha.” The advantages claimed for this combination by the patentee are the following:—“The vegetable products, the cocoonut and the gutta percha, being of the same botanical family, the chemical affinities are nearly identical; hence sufficient carbon is eliminated for the chemical combination of the two matters when in contact, to produce a substance superior in essential qualities to gutta percha alone.” We must confess we have not the least idea of the meaning of this; the cocoonut may improve the gutta percha, but the “sufficient carbon,” and the “chemical combination of the two matters in contact,” are mysteries far beyond us.

“The economy of the adjunct is evidenced by the fact, that it will not exceed £20 per ton, prepared for the gutta percha; and from 25 to 40 per cent. of the adjunct may be combined, according to the description of the manufacture. But, besides economy, the improvement includes its capability of use in all climates, durability, resistance to extreme friction, elasticity, and universal adaptation. Gutta percha gives and spreads in warm temperatures, and in cold climates becomes very brittle and cracks; but by the use of the adjunct, the effects of high and low temperature, and severe friction, are equally obviated.” “It is suited for (covering) electric wires, for mill-hands, over-shoes, soles, tubing, covering damp walls and floors, for ornamental purposes, &c.” The material, indeed, appears to be one which may be available to many important uses. If it proves to possess but one half of the many advantages enumerated by the patentee, it is sure to command attention. If it possessed ten times those applicabilities which he has enumerated, its introduction would be retarded by the absurd description of the combination.

The flat pressure process of *Stereotyping*, by James Hogg, of Edinburgh, appears to be really of

much promise. The process is as follows:—A stiff paste, chiefly composed of cheap earthy substances in a state of impalpable powder, is made up and spread evenly upon a stiff wrapper. This paste is laid upon the "form" of types, and an impression taken similarly to the pulling of a proof-sheet. This gives the matrix, which, when properly dried, is cast from, by pouring the fluid type metal into an ordinary casting-box, consisting of two iron plates held vertically, and having between them the matrix, with a gauge for the required thickness of the plate. The flat pressure process is stated to be quite as cheap as the old methods, and is recommended as having the following important advantages:—There is no appreciable wear in the types; they are neither ground nor rounded on the face; they are not dirtied; they are not returned to the compositor in a caked condition. The matrix gives a level surface, almost free from shrink or twist, hence the plate is easy to "make up" at press. The matrix having an earthy base, the type-metal can be poured at the proper temperature (in order to obtain a homogeneous plate), without fear of charring, an evil to which the paper system is liable. The plates are perfectly free from those globules of metal, which, in the gypsum system, fill up the "daylight" of letters. Woodcuts, whether separate or mixed up with letter-press, can be taken with remarkable sharpness, and without the slightest injury to the blocks. By the paper system woodcuts cannot be taken, and by the gypsum system the blocks must first be coated with a varnish, which has a tendency to fill up the fine lines. The specimens which are exhibited appear to fulfil all those conditions; and should this be found to be the case in general practice, Mr. Hogg's process for stereotyping must be deemed very valuable.

A good portfolio for holding loose leaves or pamphlets is wanted. M. A. A. Gaget attempts to supply this want. His invention consists in the employment of hooks for binding or holding together at top and bottom all such loose leaves, &c. At the top and bottom of the cover, a connecting piece is placed over all the hooks for obtaining a firmer hold. The back is composed of wood in one or several pieces united together, as it is fixed or progressive, and is furnished with slides or notches to receive the pressure hooks and connecting pieces.

We have been much pleased with the very beautiful forms adopted in the patent apparatus for the more perfect combustion of gas, by Mr. D. White. Most of them have been adopted from the antique tripod, and so adapted as to form ornamental stands, at the same time as they possess many elements of utility.

Some "imitations of stained glass" are ingenious, but we doubt its applicability. The invention consists in the use of sheets of gelatine upon which designs are painted in mineral colours. The gelatine picture is then placed between two sheets of glass and fixed in the usual manner. As an improvement upon diaphane and potichomane, this may be adopted by ladies as a means of displaying a large amount of artistic effect.

The Patent Glass Enamel Company of Birmingham have exhibited some very interesting examples of their manufacture. Not merely have we enamelled saucepans, which recommend themselves by their cleanliness, but they are now producing enamelled plates and dishes of all descriptions, upon which the ordinary earthenware designs have been painted; thus we have all the advantages of pottery in a much more durable material.

Nothing has interested us more than the patent process for coating iron with copper and brass, by Mr. William Tytherleigh, of Birmingham. In these examples the metals are spread over the iron by means of heat. We have seen some other specimens in which the same result has been produced by the electrolyte process. As an advance, and an important one, in Art-manufacture, we shall return to a consideration of these processes.

The solid parquetry we have already fully described. Some parquet floors and borders are now exhibited by the Loudon Parquetry Company, but these are veneered, and upon the relative advantages of the two we have already expressed an opinion.

Such are the few articles, in the ninth Exhibition of Inventions, which fall within the province of the *Art-Journal*.

ROBERT HUNT.

THE EXHIBITION OF THE SOCIETY OF BRITISH ARTISTS.

THE thirty-fourth Annual Exhibition of this Society opened on the 23rd of March, with a collection of works of which landscape, and what may be called *genre*, constitute the majority. It is known that there are members of this Society who have painted works of high character, but it is much to be feared that the privileges of institutions induce a sense of security which destroys that healthy energy which should be fostered by competitive exhibition. There are among these pictures landscapes painted with a conscientious devotion truly exemplary; but in the personal narrative we seem to have a nodding acquaintance with all the characters; this remark is, however, but essentially a reiteration of the standard complaint of the deficiency of figure pictures. Yet there are a few essays in poetic art of ambitious character, and others which pointedly exemplify the curiosities of execution.

No. 13. 'Landscape and Cattle,' G. COLE. A large picture, presenting many agreeable features of landscape composition. On the right flows a river closed by rising banks luxuriantly wooded, and leading the eye to a distance, very skillfully treated as to atmosphere and colour. The cows are well drawn and painted; in short, it is the best production that the artist has of late exhibited.

No. 16. 'Fresh Breeze—Scene between Bantry and Glengariff, South Ireland,' ALFRED CLINT. This is a view from the sea, looking upon a rocky and iron-bound shore. We feel here that, in some degree, the expression of wind is assisted by colour as much as by form. The subject is romantic and striking, and brought forward with a feeling that justifies the title.

No. 18. 'Portrait of a Gentleman,' T. J. HUGHES. This is at once recognised as a portrait of Mr. Willmore, A.E.—a sufficient testimony of the highest merits of a portrait.

No. 24. 'An incident from Walpole's "Anecdotes of Painting in England,"' J. NOBLE. The incident is a visit paid by Charles II. to the widow of Oliver the miniaturist, who then resided at Isleworth. The king's object was to prosecute personally his inquiries relative to the Oliver miniatures, which, in the time of Walpole, were preserved in Queen Caroline's closet at Kensington. The king is seated in Mrs. Oliver's humble abode, examining the miniatures as they are drawn forth from a cabinet; while Rogers, the person who apprised the king of the existence of the relics and their whereabouts, stands behind the king. The subject is admirably adapted for painting,—in these days all praise is due to the artist who reads for himself.

No. 25. 'On the River Usk—Early Morning,' J. TENNANT. The thin and almost watery sunshine is here a very definite allusion to the "early morning." We know not whether we compliment this artist too much, but it must always be felt, in looking at his works, that each seems to be a most conscientious reduction from veritable locality. This is fresh and substantial.

No. 26. 'Refreshment by the Way,' A. J. WOOLMER. A group of a mother with her child resting on a wayside bank. The head of the former is very sweetly painted.

No. 31. 'Return from Jack-fishing in Llaugorse Lake, near Brecon,' J. TENNANT. The process of weighing the jack, which is the life-incident of the picture, is scarcely sufficiently sentimental for a landscape so distinguished by romantic beauty as this. It is a large picture, in which it has been the desire of the artist to express space. The distance is an amphitheatre of mountains, on which the intervening atmosphere is painted with the utmost delicacy of feeling.

No. 32. 'A Contadina,' T. GOODERSON. The treatment of this picture is perhaps too sombre; we feel, however, that the character is rendered with truth. We meet her in her every-day gear; she is not flaunting in those *fiesta* colours and the gay attire, without which we seldom see an Italian peasant in a picture.

No. 36. 'The Delights of Summer,' A. J. WOOLMER. In these "delights" there is no activity of enjoyment; the subject might well have been ac-

companied by a passage from the "Castle of Indolence:—"

"For each sound here to languishment inclin'd,
Lull'd the weak bosom and induced ease."

The story is somewhat of the Watteau or Decameron kind, with park-like scenery instead of a garden composition.

No. 37. 'A Willowy Stream,' H. J. BODDINGTON. The water-course runs transversely into the composition from right to left, shaded on the further bank by the willows alluded to, and rich on this side in the rank vegetation which tells so effectively in a picture. The execution is extremely neat, and the colours are the freshest hues of summer.

No. 38. 'On the Beach near Hastings,' W. SHAYER. This artist executes these beach compositions with much taste and good feeling.

No. 40. 'Going to Market—Winter,' J. ZEITLER. A peasant woman mounted on a pony, endeavouring to make her way through a snowy wilderness. The difficulties of the passage are impressively described.

No. 46. 'Cottage Scene on Willesborough Lees, near Ashford, Kent,' J. J. WILSON. This simple subject is rendered very agreeable from the manner of its execution. It consists only of a row of cottages, with adjacent trees, all put in with a studious sobriety of tone and tint, and forming a spirited and interesting picture. No. 58. 'Kentish Pastoral,' by the same painter, is a similar subject, treated with like success.

No. 51. 'A Sea Rover,' R. B. PAUL. We have yet to know this sable model, who is all things to all painters—now a black pasha, now a slave merchant, and anon the father, it may be, of the lost Haidee.

No. 52. 'Heartsease,' C. BAXTER. 'The Lily' was, we believe, the title of the work which last year occupied this place. The idea is similar, that of a female figure bearing a bunch of heartsease. In this impersonation there is more of rustic character than in the other. It is, however, distinguished by equal purity of colour and sweetness of expression.

No. 53. 'Tasso,' J. MORGAN. This composition is grounded on the story that Tasso believed himself inspired by a beneficent spirit, with which, upon the occasion of a visit paid by the poet to Count Manso, he held a conversation with his invisible patroness, which struck the count with awe and admiration. The work has many merits, and nothing but what is honourable can be said of an artist who reads and thinks for himself.

No. 60. 'Christmas Time,' W. HEMSLEY. A small picture, representing a boy crossing a snow-covered plain, and carrying a quantity of holly enriched with its scarlet berries. The expression of cold is highly successful.

No. 64. 'Near Trefricu, North Wales,' J. SYER. This is a small landscape, impressive in effect and very agreeable in colour.

No. 65. 'Calves and Landscape,' W. HORLOR. The animals are certainly well drawn and painted. This devotion to calf-painting is a resource not without an originality of its own, even amid the wild vicissitudes of taste. It is calf-extra.

No. 72. 'Absent Thoughts,' A. F. PATTEN. A study of a girl in Greek costume presented in profile at a lattice. It is a small picture, very studiously worked out, and charming in expression.

No. 76. 'Nest and Grapes,' W. WARD. An unworthy subject for such exquisite elaboration: the modest, retiring, yet marvellous manipulation of this little picture is well adapted for examination by microscope.

No. 77. 'The Gardener's Daughter,' A. J. WOOLMER. She stands at the door of her father's cottage, idly plucking the flowers that cluster round the threshold. Her listless air reminds us of the poet Thomson, who accustomed himself to eat the fruit of the trees in his garden with his hands in his pockets.

No. 79. 'The Letter,' J. NOBLE. A study of a girl reading a letter. The features are presented under a very powerful reflected light.

No. 80. 'Recollection of Sunset on the Thames,' ALFRED CLINT. We look up the river from some point—perhaps off the Stepney shore. From this point, and lower down, where the masses of buildings are not yet lost, the sunsets are of the most gorgeous description. This is a worthy "recollection."

tion" of what the artist may himself have seen there.

No. 81. 'Peasant Boy of the Roman Campagna,' T. Y. GOODERSON. There is an elevated feeling in the treatment of this study: but the pose and sentiment of the figure are too melodramatic. The person is not that of a rustic, but rather that of one assuming the character for the nonce: but in all else the work is successful.

No. 84. 'Recollections of the Rhine,' E. NIEMANN. The spectator is here placed upon a rocky eminence overhanging the stream, which flows in a narrow channel formed on both sides by steep and rocky barriers, clothed with wild and luxuriant foliage. The picture is masterly in manipulation.

No. 86. 'The Sick Boy,' T. ROBERTS. The subject we are told has been suggested by a passage of Nicholas Nickleby; and the picture, according to the title, represents a boy lying on a pallet in a garret, and immediately by the window, attended by his nurse, a girl, who sits near him. It is a striking example of clean and effective execution—extremely simple in colour, and without the slightest embarrassment in, or impropriety of, composition; the room is fittingly described, and everything falls into its place. It may, however, be observed that both faces are in profile; and, without any special purpose to serve, a portion of the dress of the girl is a repetition of that of the bed-quilt. It is a production of the highest promise.

No. 88. 'Roslin Chapel—showing the Apprentice Pillar,' S. D. SWARBRECK. A faithful description of this oft-described interior.

No. 101. 'Innocence,' W. D. KENNEDY. *Dulcia dulcibus*—a combination of beauties rarely met with in so small a compass. Innocence is personified in a female figure wearing a white drapery, and standing in a pool of water shut in by trees. A sketch of captivating sweetness.

No. 109. 'The Fisherman's Return,' J. J. HILL. He is welcomed by his family at the door of his sea-side hut; the view on the right opens to the sea, where his boat is seen, from which he comes loaded with his net. It is a large picture, very powerful in colour.

No. 114. 'Puffin Island, North Wales—Timber Ship Ashore,' J. B. PYNE. A small composition of dazzling power as to light and colour. The island and the ship are but supplementary incident—the story is a poetical description of a gorgeous sunset, to which great intensity is given by a piece of rich foreground.

No. 115. 'On the Northumberland Coast,' J. HENZELL. A study of rocks, with a couple of limpet gatherers: in the drawing and painting there is much of the force of reality.

No. 117. 'C. Ionides, Esq.,' C. COUZENS. A portrait of a gentleman in a Greek dress—qualified by that kind of individuality which bespeaks resemblance.

No. 120. 'Treport, Normandy,' J. J. WILSON. The subject is perhaps the most picturesque on that line of coast—it has been painted from every possible point of view by French artists. From this part of the beach the tower is but partially seen, the church and the cote being the principal objects. There is more material in the composition than in any antecedent work of the artist.

No. 121. 'Mont Blanc from the Col de Balm,' J. P. PETTIT. A very impressive view of the mountain is obtained from this point, which in every passage has been worked out with scrupulous assiduity.

No. 128. 'The Son of Louis the Sixteenth under the tutelage of Simon,' F. Y. HURLESTONE. The particular instance of barbarity in the treatment of this unfortunate child set forth in the picture is, that Simon surprises him while in the act of repeating his morning prayers. We see, therefore, the child in a devotional attitude, and Simon, seated in the exercise of his trade, turns round and menaces him. The composition contains only three figures—those of the boy, Simon, and his wife, with enough of allusion to indicate the calling of Simon. The picture is not vulgarised by an excess of important accessory, the treatment relying rather on personal expression, than still-life auxiliary, for its narrative.

No. 142. 'Portrait of Mrs. Clement Satterthwaite,' H. MOSELEY. The lady is presented at half length, and of the size of life, with a treatment of much elegant simplicity.

No. 143. 'Scene on the Hastings Coast,' E. J. COBBETT. This is the largest work we have ever seen exhibited under this name. The base of the picture, a sea-cliff section of thin seeded grass and stones, is most skilfully introduced; and here is circumstanced a group of coast children, one of whom, a boy, who has been shrimping, is a most felicitous example of his class. The view opens to the sea, and the sea cliffs trend off to the right.

No. 146. 'The Valentine,' J. NOBLE. A study of a girl reading "the Valentine," having placed it so near her face as to throw a strongly-reflected light on the features.

No. 153. 'Il ritorno della Contadina,' E. EAGLES. Without the bad taste of giving a foreign title to this picture, there is sufficient evidence on the canvas that the artist has studied in a foreign school. It is an Italian peasant woman wading across a river, and bearing on her head her child in a basket. The figure is accurately executed, but the landscape portion of the work is feeble.

No. 160. 'The Finishing Touch,' T. CLATER. We observe here a youthful aspirant in art, making a study of his elder sister, who presides at the same time at the cradle of a younger child. The picture is painted with much decision of execution, and otherwise evidences a command of the means of good effect.

No. 167. 'A ruined Stronghold, Argyleshire,' J. MOGFORD. This ruin is most picturesquely situated, being surrounded by the waters of a lake which lies encircled by mountains. The castle is in shade, opposed with felicitous result to the glowing sky of sunset.

No. 171. 'Sons of George Carew Gibson, Esq., of Bradston Brook,' P. Y. HURLESTONE. A group of two children seated on a fragment of rock, and relieved by a larger and darker portion of like material. The heads are charming in colour and expression.

No. 172. 'The Wounded Lamb,' W. SALTER. The lamb is borne by a country girl: the pose of the figure is graceful, the head being turned to the spectator, while she is walking away from him. The picture is substantially painted.

No. 176. 'Le Papillon,' A. J. WOOLMER. This is a very luminous picture, but too full of contending material: it represents a girl, as about to catch a butterfly that has settled on her shoulder.

No. 178. 'Salmon Leap on the Couway,' J. SYER. The subject is a rough and stony water-course, over which the downward current makes its impetuous way, opposed by rocks and boulders. It is an attractive composition, distinguished by varied and harmonious colour and firm execution.

No. 187. 'Othello's Lamentations—Iago, Montano, and Gratiano—

Emilia. Nay, lay thee down and roar,—
For thou hast killed the sweetest innocent
That e'er did lift up eyes.'

The subject is from the second scene of the fifth act, and Emilia, who stands on the extreme right, addresses these words to Othello, who is kneeling at the bedside of the lifeless Desdemona. Iago, Montano, and Gratiano, are entering the chamber, alarmed by the cries of Emilia—Montano first, in official robes, followed by Gratiano and Iago. The impersonations are judiciously brought together and well conceived, inasmuch that the subject is at once declared. The picture is extremely powerful in colour.

No. 193. 'Coast Scene, North Devon,' W. WEST. This is principally a study of rocks, which in nature are different in colour from their representation here; but the utmost care has been exercised in drawing the masses, and the retirement of the line of cliff is very effectively managed.

No. 195. 'Evening on the Llugwy, from the Bridge, Bettws-y-Coed, North Wales,' J. P. PETTIT. This is an admirable subject, which we do not remember to have before seen painted from this precise spot. It is a large picture, and has been worked out with marvellous labour.

No. 205. 'Near Capel Carig, North Wales,' J. SYER. A study of rocks, circumstanced in a country which breaks up with advantageous effect. The whole is brought together into a most agreeable whole, but looking rather like composition than nature.

No. 206. 'Beg, sir!' E. J. COBBETT. This command is addressed by a girl to her dog, which looks most anxious to fulfil in every way the command

of his rustic mistress. The principal figure comes out very forcibly, being relieved by a white wall. It is rather a large picture, but distinguished by the same earnest manipulation as are the smaller pictures.

No. 212. 'Kilchurn Castle, Loch Awe—Evening mists gathering on Ben Cruachan,' P. C. AULD. An attractive subject, treated in a manner to sustain the title.

No. 223. 'A Summer's Noon,' H. J. BODDINGTON. This picture presents some of the grandest features of our landscape scenery—water and stupendous mountains, both introduced in a manner most immediately to affect the mind. The sun is overhead, just out of the picture, and the disposition of the shadows, the warm haze of the atmosphere, and tranquillity of the scene, coincide in strong expression of the heat of a sunny mid-day.

SOUTH-EAST ROOM.

No. 267. 'A Summer's Evening on the Thames,' H. J. BODDINGTON. The dispositions here have become perhaps too popular—that is, showing one line of the river bank running into the picture. The greenish cast of the evening atmosphere is, under certain conditions, not uncommon; but it is to be apprehended that the strength of this tint may be deepened by time.

No. 269. 'Scene from "As you Like It"—Rosalind, Celia, and Orlando,' H. A. BOWLER. The production exemplifies the new principle of forcing on the eye as the primary that which is properly only the accessory of the composition. Every praise, however, must be accorded to the author of the work for the elaborate justice which he has rendered to the foliage and herbage. He desires, perhaps, to distinguish himself rather in this direction than as a figure painter.

No. 270. 'Affection,' G. HOLMES. A family group, remarkable for the substance and drawing of the figures, and even more so for the positive definition of direct and reflected lights.

No. 281. 'Dumbarton on the Clyde,' W. E. BATES. A small picture, presenting the picturesque scenery of the subject under an evening aspect of much truth.

No. 320. 'Paddies on the Move,' J. ZEITLER. This is the most dramatic composition that its author has of late years exhibited. It represents an emigration of Irish peasants, whose picturesque rags constitute the most valuable feature of the sketch.

No. 322. 'Ariadne in the Cave,' T. R. POWELL. A study of much classic elegance, containing a recollection rather of the statuesque than an impression of living individuality.

No. 328. 'A Labrador of Valentia,' F. Y. HURLESTONE. A study of a boy playing the guitar; the head charming in the sweetness of its youthful expression.

No. 329. 'Fraternal Affection,' A. J. WOOLMER. A group of a brother and sister seated on the steps of a garden composition. An essay of great power of colour.

No. 332. 'A Tender Chord,' T. ROBERTS. The subject turns upon the endearments of a pair of youthful lovers, of whom the lady, while responding to the caress of her companion, touches a piano which is placed within reach. It is a picture containing many beauties of a high order; the relation established between the figures merits unqualified eulogy.

No. 339. 'The Novel,' H. J. PIDDING. A study of a girl reading. The features are characterised by an appropriate expression. The head is the best that has of late been exhibited under this name.

No. 324. 'A Passing Shower,' H. MOORE. The subject is not so much the shower as a well-painted group of cattle cooling themselves in a stream.

No. 359. 'Solitude—Evening,' J. TENNANT. This is a composition infinitely sweet in sentiment.

No. 368. 'The Hay-field,' J. J. HILL. The warm breadths of the hay-field are very powerfully contrasted with some very firmly painted trees in the near centre of the view. The position of the tree—by the way, a daring expedient—at once fixes the attention.

No. 379. 'Waiting for Legal Advice,' J. CAMPBELL, jun. To the artist who works out his subject thus earnestly all praise is due. The face of the patient client is singularly life-like.

SOUTH-WEST ROOM.

No. 391. 'A Nook in the Conservatory,' Miss L. RIMER. Flowers and their leaves rivalling nature in the vividness and delicacy of their hues.

No. 396. 'Home Again,' J. COLLINSON. The story is of the return of an old soldier of the Coldstream Guards to his home, where he is received by his family circle. The work contains numerous figures, and is full of appropriate material very minutely executed.

No. 418. 'Old Mill near Caernarvon,' A. DEACON. A passage of wild scenery, immediately shaded and screened by trees, and shut in by more distant rocks. The drawing and painting of the trees are very felicitous: it is altogether a production of much merit.

No. 421. 'In the Essex Marshes—Barking in the distance,' T. F. WAINWRIGHT. This is a broad daylight picture, showing a wide expanse of meadow land, with a knoll on the left, on which are placed some sheep. The bright effect of the view is extremely agreeable.

No. 429. 'Glaucus and Nydia,' A. F. PATTEN. These, it will be remembered, are the names of two prominent characters in "The Last Days of Pompeii." There is much elegance in the way in which the figures are brought together. Nydia, the blind girl, in a paroxysm of fear at the madness of Glaucus, clings to him as he raves. There is by the same artist, No. 483, 'The First Meeting of Preciosa and Victoriau,' a picture also of excellent quality. If these works were of no merit, the novelty of their subject is deserving of high commendation.

No. 437. 'Lucy Ashton at the Mermaid's Well,' W. D. KENNEDY. The figure is taller than the general impression conveyed by the text; it is, however, a conception of much impressive depth and force.

No. 444. 'The Dream of Love,' C. BAXTER. A study of a head and bust of the size of life, equal to the very best of the artist's works.

No. 445. 'I am helping Mamma,' S. ANDERSON. This is a production of exquisite finish, representing a little girl busily engaged in needlework.

No. 475. 'Early Spring,' W. J. WEBBE. An eccentric but most elaborate study from the roadside, with, from the grove, the addition of a pair of redbreasts.

No. 507. 'Scarborough from the Sea,' J. DANBY. We look towards the cliffs from the sea, between which and the spectator is interposed an expanse of water, warmed and richly tinted by the light of the setting sun. The airy glow of this picture is most successfully felt.

Of the more remarkable of the works in the North-east Room we can do no more than give the titles, as—No. 521, 'Little Bo-peep,' J. D. H. FRANCIS; No. 522, 'Portrait of the Countess of Fife,' J. R. SWINTON; No. 532, 'Ma Belle,' W. F. SMITH; 'Sunday Morning,' E. J. COBBETT; No. 550, 'Approaching Storm near Marlow-on-Thames,' H. J. BODDINGTON; No. 551, 'Pennyarth and Dharvole Mountains, Breconshire,' J. TENNANT; No. 554, 'On the Bridgewater River,' E. NIEMANN; No. 574, 'Peasants of Murcia, Spain,' F. Y. HURLESTONE; No. 575, 'Willie,' C. BAXTER; No. 595, 'Going to School,' J. F. PASMORE; No. 605, 'Rustic Group—Autumnal Evening,' W. SHAYER; No. 608, 'Gravesend,' E. NIEMANN; No. 618, 'Fête Champêtre—time of Louis XV.,' J. FRANKLIN. And among the water-colour drawings there are—No. 653, 'Zuleima,' KARL HARTMANN; No. 662, 'Antwerp,' J. DOBBIN; No. 663, 'Study from Nature, Shipbourne, Kent,' T. CAFE, jun.; No. 673, 'The First Meeting of Florizel and Perdita,' MISS MACRONE; No. 681, 'Under the Beech-wood Shade,' G. BARNARD; No. 687, 'Pifferari,' KARL HARTMANN; No. 692, 'Near Wimbledon, Surrey,' C. GROVES; No. 724, 'Fruit,' MRS. BARTHOLOMEW; No. 725, 'Crayon Portrait of Hamilton Becket, Esq.,' T. SENTIES; No. 741, 'A Portrait,' S. B. GODBOLD; No. 751, 'Sketch of Character,' J. HAYLLAR; No. 760, 'An Itinerant Shoeblick,' F. SMALLFIELD; and others by J. CAMPBELL, jun., F. PIERCEY, T. W. BOWLER, E. EVANS, R. W. CHAPMAN, G. S. KEYS, G. H. BROWNE, C. PEARSON, &c. In sculpture there was but one exhibitor, E. J. PHYSICK. The entire number of works exhibited is 852, of which 644 are oil pictures.

THE ROYAL PICTURES.

THE AMAZON.

(PORTRAIT OF THE PRINCESS HELENA.)

F. Winterhalter, Paint. T. Vernon, Sculptor.
Size of the Picture, 7½ in. diameter.

BENEATH a well-brushed casque, and rising above the circle of a glittering shield, we see here a face almost as round as the latter object of defence, and as bright: it is a portrait of the Princess Helena Augusta Victoria, accoutred, certainly, as a youthful Amazon, but, excepting her armour, as unlike a descendant of those stern female warriors as one might expect to find even in a poet-painter's dream. What kind of fellowship could such a ruddy, joyous countenance, such laughter-loving eyes—their radiance heightened, no doubt, by the thought of her novel costume—have with creatures whose pastime was war, violence, and bloodshed? as ancient writers tell us. Those wavy, golden locks seem as if they should be set free for the summer breeze to play with, instead of being confined, as they now are, by the pressure of the steel helmet—a crest but ill-suited to the head of childhood in all its beauty, freshness, and innocence.

Yet 'twas a pretty conceit—whether of the painter, or of his royal patron, we know not—to have the young princess thus represented: pictures of children "in character," when not overdrawn, or, rather, overacted, are always agreeable, and in this the natural sweetness and intelligence of the royal lady's countenance seem to be more strikingly developed by its fanciful "setting-off": it is a charming picture.

The Princess Helena is the fifth child of her Majesty: she was born May 25, 1846, and is consequently now in her eleventh year. But the portrait by Winterhalter must have been painted some time back; it represents a child four or five years of age.

We remember to have heard old men speak of Windsor Castle and George III. towards the close of the last century,—men who had seen the monarch

..... "On his throne proud,
Walking in health and gladness;
Begirt with his court, and in all the crowd
Not a single look of sadness."—HORACE SMITH.

The glory of the scene, however, as described by those who witnessed it, was not so much the courtly throng by whom the monarch was surrounded, as the train of royal children who, in pairs, followed the King and Queen as they walked to and fro on the terrace, in the midst of their subjects, on the days when the public were admitted to join in the promenade. It was a sight well calculated to leave a strong and most pleasing impression upon the minds of a people in whom domestic happiness is a deeply-rooted feeling.

The picture presented to the generation of our fathers in the family of George III. is reappearing to us in the family of our own most gracious Sovereign, whose royal grandmother, Queen Charlotte, is said to have been "a pattern to wives and mothers;" how truly the remark applies to Queen Victoria is felt and believed by us all, though of course it can only be actually known to those who are privileged to be witnesses of the manner in which the young members of the royal family are trained and brought up under the immediate eye and careful watching of their august parents. It is at Osborne principally where the "studies" are carried on; and here, in the "home" of her Majesty and the Prince Consort, is accumulated whatever may tend to enlarge the intellect, and develop its faculties; the accomplished and well-stored mind of Prince Albert contributing in no measured degree to the work of instruction with respect to the education of the royal princes, for whose use there is an apartment fitted up with a large variety of ingenious mechanical and scientific instruments, besides the ordinary tools employed by the carpenter and bricklayer, to teach royalty the use of common things; and in this apartment many an hour is passed by those whose future destinies will in all probability involve the interests of kingdoms and nations.

The Portrait of the Princess Helena is at Osborne.

ART IN THE PROVINCES.

MANCHESTER.—At the last annual meeting of the Manchester School of Art, the chairman, Mr. Potter, announced that the committee had been enabled, during the year, to pay off one-half of the debt of £400, for which they had become responsible. So far this is satisfactory; but, he added, that "although no similar institution stood firmer, there was one clog—the school was desperately heavily rented. Considering the Art-Treasures Exhibition, if something was not done this year to put the school upon a higher footing, the chance might almost be considered as gone for ever. During the twenty years' existence of the school they had certainly improved as to the system of teaching; but, generally, they had not taken the rise they ought to have done. This year he thought that a move should really be made to attach the school to the Royal Institution."

NORWICH.—The Exhibition of Works of Art closed a short time since, and the number of visitors exceeded 4000. Although the sales effected have not been numerous or of large amount, still the committee are by no means discouraged—it has been of much service in the city in promoting a love and knowledge of Art. The East Anglian and City of Norwich Art-Union, held in connection with the exhibition, has been very successful—211 shares having been disposed of, double the number sold last year. The Norwich Photographic Society exhibited in conjunction with the Fine-Art Society, and had more than 600 photographs: some of considerable merit were exhibited. Out of about fifty contributing photographers, one-half were members of the Norwich Photographic Society. A large majority of the pictures, however, seem to have been received from strangers, since the members, with a single exception, exhibited entirely as amateurs; whereas 450 out of the entire number were for sale. Mr. Hogarth, of London, sent his Egyptian series. The Fine-Art committee made arrangements that every subscriber of 10s. 6s. to the Art-Union should receive a photograph of a certain value. This arrangement aided very much the sale of photographs. The rooms were visited by about 3900 persons. An exhibition productive of such results can scarcely fail to be followed by others, and a taste for the beautiful in nature and art will thus be created, or at least stimulated, in a population which is now supposed to be almost exclusively devoted to music as a relaxation from the cares and business of life.—The new building for the School of Art erected by the corporation of Norwich is now completed, and the School of Art was to reopen in these premises on the 28th of April, with a students' *soirée*. The number of pupils in the morning classes has much increased, and all the classes are well attended. The Yarmouth School of Art is now made a branch of the Norwich School, and is under Mr. Nurse's—the head-master—superintendence.

DUBLIN.—We copy the following paragraph from our contemporary, the *Builder*:—

"NATIONAL GALLERY OF IRELAND.—There seems to be a fair prospect of the establishment of this institution. The Board has directed its attention to two objects:—the erection of a suitable building on Leinster Lawn, for which a fund of £11,000 has already been provided; and the creation of a fund to purchase Works of Art to exhibit permanently in the building when finished. The plans and estimates are in the hands of the Building Committee, with a view of entering into the necessary contracts, so that the ceremonial of laying the first stone will shortly take place. The building will correspond externally with the Museums of the Royal Dublin Society, now in course of erection on the south side of the lawn, and form a corresponding wing to the main building on the opposite side. The 'Picture Fund' is also progressing."

The bronze statue of Thomas Moore will shortly be placed in its destination, opposite the entrance of the House of Lords, College Street, Dublin. It is the work of a sculptor bearing the same name as that of the poet.

WARRINGTON.—The opening of the new premises recently erected for the School of Art in this town was signalled by a *soirée*, which the local papers report to have been well attended. "The various rooms are large, commodious, completely and excellently fitted with all the requirements of a first-class School of Art; well warmed, ventilated, and lighted, and in every way calculated to promote the great and valuable object to which they are devoted."

READING.—A School of Art is about to be founded in this town; several meetings of the inhabitants favourable to its promotion have been held, and a committee, with a president, vice-president, and treasurer, appointed.

PORTRAIT OF H. R. H. THE PRINCESS HELENA

FROM THE PICTURE IN THE ROYAL COLLECTION

TALK OF
PICTURES AND THE PAINTERS.

BY AN OLD TRAVELLER.

CHAPTER V.

Confession of Von der Hagen—Forgotten jewels—Giovanni Bellino and Vittore Carpaccio—Santa Maria della Salute—Tintoretto's "Marriage in Cana"—Church of San Cassano—Crucifixion in the chancel—Santa Maria dell' Orto—Last Judgment—The Academy—"The Miracle of St. Mark"—Death of Abel—The Ducal Palace—Il Paradiso—Short-comings of the Master—The Critic not partial—Hands held up for Mercy—Wait awhile—Scuola di San Rocco—Adoration of the Magi—Domenico and Marietta Robusti.

USEFUL and even valuable, for many purposes, are the works of Von der Hagen; nor is it altogether in reprobation of the excellent author that the following confession is related;—nay, rather, I would have you admire, with me, the useful warning to his reader, as well as credit to himself resulting from the candour of his announcement. He has been visiting the churches of Venice—that of Il Redentore, of Santa Maria della Salute, and of San Giorgio Maggiore, among them—and he says, "There are many great and important pictures in these churches; works by Paolo Veronese, Tintoretto, and other great masters, but I have forgotten them all."*

A most "lame and impotent conclusion," without doubt, and one for which the reader is so little prepared, that his first sensation, on reading it, is one of disappointment and displeasure. But a moment of consideration induces him to forgive the faithful companion, who, if then deserting his side for an instant, has, on other occasions, served him well; wherefore, accepting the frank declaration as merely intimating that he must, for that time, seek assistance elsewhere, he shakes hands again with the culprit, and restores him to that fair place in his favour, which had, for the moment, been forfeited.

Yet must you love him well before you concede so much, for do but see what it is that he has "ganz vergessen!" Omitting works of Giovanni Bellino, Vittore Carpaccio, and other truly admirable masters, whose works are all to be found among these "forgotten pictures," I will but mention some few of those by Tintoretto—his "Martyrdom of St. Stephen," namely, described in our last chapter,† "The Gathering of the Manna," and others, all in the Church of San Giorgio Maggiore, with the "Marriage in Cana," in that of Santa Maria della Salute, where is, or then was, a St. Mark, with SS. Cosimo and Damiano, by Titian, other works by the last-named master being also among "the forgotten" of our culpable friend Von der Hagen.

We, too, if not forgetting, must at least be silent respecting the greater part of these pictures; we can find place for the mention of one only—Tintoretto's "Marriage in Cana," in the sacristy of Santa Maria della Salute.

"No genuine work of Art ever was or ever can be produced, but for its own sake; if the artist do not conceive to please himself, he never will finish to please the world." So thinks Fuseli,‡ and he is right; the picture before us is one of the many that might be adduced to show what results when the artist *does* work "to please himself," and that he has done so in this instance there is abundant evidence throughout. Few pictures received the signature of Tintoretto—three, or at most four, of all his many productions, are thus distinguished—"The Crucifixion," in the Scuola di San Rocco, is one—this "Marriage in Cana" is another; it bears the name of the noble master, and well does it merit the honour; numerous as are the excellencies attributed, by common consent of every good authority, to the works of Tintoretto, in this you shall find all exemplified. That grandeur of design wherein he had reverently, and yet confidently followed where Michael Angelo alone could lead the way; that knowledge of form, "that brilliancy of imagination, that freedom of execution and beauty in his tones of colour," accorded to him even by a writer but little addicted to indiscriminate praise, and ever keeping an impartial eye on the defects no less than on the beauties of his subject,§—all are

to be found in the picture before us. "It is not often that the works of this mighty master conform themselves to any of the rules acted upon by ordinary painters," remarks another authority; "but, in this instance, the popular laws have been observed, and an academy student would be delighted to see with what severity the principal light is arranged in a central mass, which is divided and made more brilliant by a vigorous piece of shadow, thrust into the midst of it, and which dies away in lesser fragments, and sparkling towards the extremities of the picture. This mass of light is as interesting by its composition as by its intensity.

"The table is set in a spacious chamber, of which the windows at the end let in the light from the horizon, and those in the side-wall the intense blue of an eastern sky. The spectator looks all along the table, at the farther end of which are seated Christ and the Madonna, the marriage guests on each side of it—on one side men, on the other women; the men are set with their backs to the light, which, passing over their heads, and glancing slightly on the table-cloth, falls in full length along the line of young Venetian women, who thus fill the whole centre of the picture with one broad sunbeam made up of fair faces and golden hair. Close to the spectator a woman has risen in amazement, and stretches across the table to show the wine in her cup to those opposite; her dark red dress intercepts and enhances the mass of gathered light." The writer has previously remarked that "there are assuredly no female heads in any of his (Tintoretto's) pictures in Venice elaborated so far as those which here form the central light." He calls attention to the fact that neither bride nor bridegroom are unmistakably to be distinguished, but considers that "the fourth figure from the Madonna, in the line of women, who wears a white head-dress of lace and rich chains of pearls in her hair, may well be accepted for the bride." . . . "Be this as it may, the fourth female face is the most beautiful, as far as I recollect, that occurs in the works of the painter, with the exception only of the Madonna in the 'Flight into Egypt.' It is an ideal which occurs indeed elsewhere in many of his works—a face at once dark and delicate, the Italian cast of features moulded with the softness and childlikeness of English beauty some half a century ago; but I have never seen the ideal so completely worked out by the master. The face may best be described as one of the softest and purest of Stothard's conceptions, executed with all the strength of Tintoret. The other women are all made inferior to this one, but there are beautiful profiles and bendings of breasts and necks along the whole line. The men are all subordinate, though there are interesting portraits among them; perhaps the only fault of the picture being that the faces are a little too conspicuous, seen like balls of light among the crowd of minor figures which fill the background of the picture. The tone of the whole is sober and majestic in the highest degree; the dresses are all broad masses of colour, and the only parts of the picture which lay claim to the expression of wealth and splendour are the head-dresses of the women. In this respect the conception differs widely from that of Veronese, and approaches more nearly to the probable truth. Still the marriage is not an unimportant one; an immense crowd, filling the background, forming superbly rich mosaic of colour against the distant sky. Taken as a whole, the picture is perhaps the most perfect example which human Art has produced of the utmost possible force and sharpness of shadow, united with richness of local colour. In all the other works of Tintoret, and much more of other colourists, either the light and shade, or the local colour, is predominant; in the one case, the picture has a tendency to look as if painted by candle-light, in the other it becomes daringly conventional, and approaches the conditions of glass-painting. This picture unites colour as rich as Titian's, with light and shade as forcible as Rembrandt's, and far more decisive."**

After reading the above, you will be glad to know that the next to follow, a Crucifixion in the Church of San Cassano, will be treated by the same hand. "It is among the finest in Europe," says the authority we quote, "and is one of three by Tintoret, all in the Church of San Cassano, a

building not otherwise remarkable." After expressing his satisfaction at the care with which this picture has been preserved to us, declaring it to be "in a better state than most pictures in galleries," and remarking that the light, though not bright, permits all such parts as are seen at all to be seen well, the writer, having mentioned "the new and strange treatment of the subject," proceeds to say, "It seems to have been painted more for the artist's own delight,"—what a promise is in those words! nor is any part of their import unfulfilled,—"for the artist's own delight, than with any laboured attempt at composition: the horizon is so low that the spectator must fancy himself lying at full length on the grass, or rather among the brambles and luxuriant weeds, of which the foreground is entirely composed; among these the seamless robe of Christ has fallen at the foot of the cross, the rambling briars and wild grasses thrown here and there over its folds of robe but pale crimson. Behind them, and seen through them, the heads of a troop of Roman soldiers are raised against the sky; and above these, their spears and halberds form a thin forest against the horizontal clouds. The three crosses are put on the extreme right of the picture, and its centre is occupied by the executioners, one of whom, standing on a ladder, receives from the other at once the sponge and the tablet with the letters I. N. R. I. The Madonna and St. John are on the extreme left,—superbly painted, like all the rest, but quite subordinate. In fact, the whole mind of the painter seems to have been set upon making the principals accessory, and the accessories principal. We look first at the grass, and then at the scarlet robe, and then at the clump of spears, and then at the sky, and last of all at the cross. As a piece of colour, the picture is notable for its extreme modesty. There is not a single very full or bright tint in any part, and yet the colour is delighted in throughout; not the slightest touch of it but is delicious. It is worth notice also, and especially, because this picture being in a fresh state we are sure of our fact, that, like nearly all other great colourists, Tintoret was afraid of light green in his vegetation. He often uses dark-blue greens in his shadowed trees, but here, where the grass is in full light, it is all painted with various hues of sober brown, more especially where it crosses the crimson robe. The handling of the whole is in his noblest manner, and I consider the picture generally quite beyond all price."**

Very powerful is the temptation here to repeat what our author has remarked of the "Massacre of the Innocents," and the "Flight into Egypt," and greatly will he profit who shall turn to that passage which we mark for his guidance;† but our space would fail us: we are the slaves of "Circumstance," so well called that "unspiritual god," and must remain within the narrow limits prescribed. Of "The Last Judgment," the poor remains of which are in the Church of Santa Maria dell' Orto, our author, after alluding to the treatment of the same subject by Giotto, Orcagna, Fra Angelico, and other masters, proceeds to say:—"By Tintoret only has this unimagined event been grappled with in its verity; not typically nor symbolically, but as they may see it who shall not sleep, but be changed. Only one traditional circumstance he has received, with Dante and Michael Angelo—the boat of the condemned; but the impetuosity of his mind bursts out even in the adoption of this image; he has not stopped at the scowling ferryman of the one, nor at the sweeping blow and demon dragging of the other, but, seized, Hylas-like, by the limbs, and tearing up the earth in his agony, the victim is dashed into his destruction; nor is it the sluggish Lethe, nor the fiery lake that bears the cursed vessel, but the oceans of the earth, and the waters of the firmament gathered into one white ghastly eataract; the river of the wrath of God, roaring down into the gulf where the world has melted with its fervent heat, choked with the ruins of nations, and the limbs of its corpses tossed out of its whirling, like water-wheels. Bat-like, out of the holes, and caverns, and shadows of the earth, the bones gather, and the clay-heaps heave, rattling and adhering into half-kneaded anatomies, that crawl, and startle, and struggle up among the

putrid weeds, with the clay clinging to their clothes, and their heavy eyes, sealed by the earth darkness, yet, like his of old who went his way, unseeing, to the Siloam Pool, shaking off, one by one, the dreams of the prison-house, hardly hearing the clangour of the trumpets of the armies of God; blinded yet more, as they awake, by the white light of the new heaven, until the great vortex of the four winds bears up their bodies to the judgment-seat: the Firmament is all full of them—a very dust of human souls, that drifts, and floats, and falls into the interminable, inevitable light; the bright clouds are darkened with them as with thick snow, currents of atom-life in the arteries of heaven, now soaring up slowly, and higher and higher still, till the eye and the thought can follow no further, borne up, wingless, by their inward faith, and by the angel powers invisible, now hurled in countless drifts of horror before the breath of their condemnation.”*

Now, if there be any one of our students who has not read these suggestive descriptions in the pages of the author, he will feel obliged to the present transcriber—for that it is in those words, and not in any less instructive and thought-inspiring, that our account of the lost treasure in question is given. Lost, because unhappily the picture is so cruelly injured that “unless the traveller be one accustomed to decipher the thoughts in a picture patiently, he need not hope to derive any pleasure from it.” “Yet no pictures,” says our author in another place, where “the Worship of the Golden Calf,” is joined in his lamentation over the neglect suffered by the paintings in the Church of Sta. Maria dell’ Orto, “no pictures will better reward a resolute study.” And this is true, without doubt, of the one picture as of the other; but in respect to the “Golden Calf,” the present writer, discouraged by a first attempt, did not make a second, and was impressed chiefly by the conviction that the dampness of the place must eventually destroy that painting utterly! There is a “Martyrdom of St. Agnes,” with a “Presentation of the Virgin in the Temple,” also in this church; the latter, as our author informs us, has recently suffered renovation.†

In the Academy of the Fine Arts (Accademia delle Belle Arti) is the renowned “Miracle of St. Mark,” painted, as were others from the life and works of that saint, for the Scuola di San Marco, and described by Vasari as follows:—“Nella Scuola di San Marco da San Giovanni e Paolo, sono quattro storie grandi, in una delle quali è San Marco, che, apparendo in aria, libera un suo divoto da molti tormenti che se gli veggiono apparecchiati con diversi ferri da tormentare, i quali rompendosi, non gli potè mai adoperare il manigoldo contra quel divoto; ed in questa è gran copia di figure, di scorti, d’armadure, casamenti, ritratti, ed altre cose simili, che rendono molto ornata quell’ opera.”‡

A picture representing Cain slaying his brother Abel is also among the treasures of the Venetian Academy. Painted by Tintoretto for the Church of the Servites—that building now a ruin to weep over, so beautiful are its few poor relics in their sorrowful decay—the picture once formed part of a larger work, the uppermost portion, as described by Italian writers, comprising figures of the saints Philip and Augustin. These last were painted on one of the doors closing an organ, and on the opposite fold was an Annunciation, now very probably the boast of some distant gallery; but the writer has not been able to ascertain its fate with certainty, and this is no place for the accumulation of mere conjectures; nor can we add more respecting the works of Tintoretto in the Venetian Academy, save only the recommendation that ample time be reserved for the study of these paintings by any stu-

dent whose good genius may be preparing for him the high privilege of long hours therein.

By the Ducal Palace we must pass all but in silence, yet not regardless. Who that loves Venice—and this comprises all who know her thoroughly—but must feel his heart leap at the remembrance of all that he has here luxuriated in, or grieved over, as the case may be—for where have neglect and decay more to answer for than here? In this building is that “Paradise” for which what some call a sketch, but what French critics affirm to be an independent work, is to be found in the Louvre, as we have said above. A picture of vast dimensions, occupying one end of the great council-chamber, it contains “not less than 500 important figures. . . . The whole composition is divided into concentric zones, represented one above another, like the stories of a cupola, round the figures of Christ and the Madonna, at the central and highest point; both these figures are exceedingly dignified and beautiful.”* I would fain give the whole of our author’s words in relation to this picture, which he furthermore designates as “on the whole, Tintoret’s *chef-d’œuvre*,” and “the most precious thing Venice possesses.” But it appears to me that we shall find even more instruction for our particular purpose in the short sentence referring to a picture in the Sala dei Pregadi—“The Doge Loreddano in Prayer to the Virgin,” and I give these in preference:—

“Sickly and pale in colour, yet a grand work; to be studied, however, more for the sake of seeing what a great man does ‘to order’ when he is wearied of what is required of him, than for its own merit.”

Let the painter and his patron alike ponder this; it has been said in substance, and more than once, by other writers, but the reminder will not be useless. I have beside another motive for quoting these words here. When our author—beyond all doubt the first of his day and subject, or rather the first of any day as regards his subject—when, in his wise impartiality, our author has in any case signified a fault, after dwelling delightedly on the beauties of the master in discussion, there are those who say, “A recantation!” Is, then, the above a recantation? Are the remarks that follow recantations of the praise just bestowed on Tintoretto? Certainly none who read this great and earnest writer, as he should be read, will ever be persuaded to think so. Speaking of the “Descent into Hades,” in the Church of St. Cassano, Mr. Ruskin says:—“Much injured and little to be regretted, I never was more puzzled by any picture, the painting being throughout careless, and in some places utterly bad.” It is true that there is a doubt expressed as to whether this picture be by Tintoretto or not, but in respect to the following no such doubt is intimated, yet is the expression of opinion equally frank and unfeathered. “Saint Rocco in Glory” is called “one of the worst order of Tintoret’s; with apparent smoothness and finish, yet languidly painted.”† Of a “Last Supper,” which, like that above, is in the school of St. Rocco, we have the following:—“A most unsatisfactory picture, I think about the worst I know of Tintoret’s where there is no appearance of retouching.”‡ There is more to the same effect, but these must suffice for the moment, although we might still continue, and that to our great profit.

Yet would we fain implore one added grace from the master, at whose feet it is so good to be seated; let him spare us those shrieks that rend the air in all directions, as he holds up some hapless delinquent, caught, as he will have it, *flagrante delicto*, and convicted of *lese majeste* in the realms of Art. For, admitting the baseness to be proved,—a thing not in every case easy to admit, with all one’s respect for the authority of the judge,—why will he lash the culprit to the bones?—nay “syne” shake the very life out of him, nor release the victim from that ruthless grasp of his, until he cast him forth a mere shapeless mass, wherein those who have best loved and most warmly admired the form once holding honoured place, shall find no trace of all they had been wont to delight in—

“The very mother that him bare
She had not known her child.”

The rule of Draco is not a good or wholesome rule, and within the gentle sway of the well-beloved Arts, we should deeply mourn to see it established.

* Stones of Venice, vol. iii. p. 294.

† Ibid., p. 338.

‡ Ibid., *loc. cit.*

It will be said, that to what he holds to be villain baseness *only* is Mr. Ruskin thus merciless—and that is true; but even when “the offence is rank,” must the criminal be torn with beak and claws? From what appears to him to be vile, Mr. Ruskin revolts with a loathing that finds utterance in phrases making one shiver with resentment, even while fearing that they may not be wholly inappropriate. One lays down the book—one looks round for some good edgel that shall defend the creature, flagellated so cruelly; but not always—and this must be admitted—with very signal or encouraging success, for when, having exhausted one’s own resentment—perhaps caught a knock or two on one’s own crown from said edgel, in one’s own unskilful hand—one looks more coolly into the subject, ten to one but justice is found to be at the base of the judgment; and even while weeping over the wounds inflicted, you can do little more than pity the victim; rarely do you see hope of a reversal to that decree under which he suffers. Mr. Ruskin has but a poor gift at doing things by halves—sure and why would he, your honour?—but if you doubt the fact, take him some pretensions picture—present it in your most pretentious fashion, and you shall see. Well, you are satisfied? Fully! Without doubt, *et pour cause*.

But all nonsense apart, and deploring what we admit to be the unsparing severity of our author, never—we repeat it—never is he consciously partial or unfair, whether in praise or blame. Even as relates to the object of his first and best regards—that Master whom all agreed with him in lamenting—the firm resolve of the writer is ever to be just, though the friend in him be self-wounded by the words he utters; thence, indeed, the chief cause given for those charges of inconsistent and contradictory statements occasionally made against him.

As respects the “self-contradictions” affirmed to exist in Mr. Ruskin’s works, let him who believes he has found one, read again: let him turn—as is most needful in all works involving the discussion of numerous considerations, and as sometimes directed in the margin—to other sections of the book in hand—or to other works of the author, as the demand of the moment may require—and the cases will indeed be very few wherein all such seeming contradictions are not clearly explained, all apparently conflicting statements fully reconciled. At a word, the high attribute of justice is to be counted among those distinguishing this great writer; but it might be advantageously tempered with a somewhat larger exercise of mercy; and let us hope that this may at some future time be added to the rest. He is busy trouncing us now, and finds the “sinus unwhipped-of”—the judges—too many for his present amount of longanimity; but let us wait awhile,—he will have driven some scores of them out of us some day, if we prove not the more hardened sinners; and when that shall have been accomplished, see if he will not “put on his white kid gloves,” as say our friends across the water, to deal with all the rest.

The small remainder of our space must be given to the “Adoration of the Magi,” by Tintoretto, also in the Scuola di San Rocco, and with that we must conclude the mere glance, which is all our space permits us to take of the works of this noble Venetian master.

“The most finished picture in the Scuola, except the ‘Crucifixion,’ and, perhaps, the most delightful of the whole. This work—the ‘Adoration of the Magi’—mites every source of pleasure that a picture can possess; the highest elevation of principal subject, mixed with the lowest detail of picturesque incident; the dignity of the highest ranks of men, opposed to the simplicity of the lowest; the quietness and serenity of an incident in cottage life, contrasted with the turbulence of troops of horsemen and the spiritual power of angels.

“The placing of the two doves as principal points of light in the front of the picture, in order to remind the spectator of the poverty of the mother whose child is receiving the offerings and adoration of three monarchs, is one of Tintoret’s master touches; the whole scene, indeed, is conceived in his happiest manner. Nothing can be at once more humble and more dignified than the bearing of the kings; and there is a sweet reality given to the whole incident by the Madonna’s stooping forward and lifting her hand in admiration

* Modern Painters, vol. ii, pp. 174, 175.

† See “Modern Painters,” vol. ii. pp. 173–175; see also “Stones of Venice,” vol. iii. pp. 317, 318.

‡ See “Opere di Giorgio Vasari,” Ed. Flor. 1823, vol. iv. p. 467. The version following is taken from Mrs. Foster’s “Translation of Vasari’s Works.”—“In the Scuola di St. Mark, near the Church of SS. Giovanni e Paolo, are four large pictures by Tintoretto; the first exhibits St. Mark appearing in the air, and delivering a man who was his votary from grievous torments, while an executioner is preparing for him, but the iron break short in his hands, and cannot be made to act against the pious votary. In this picture there is a great number of figures, and much able foreshortening, with numerous portraits from the life, buildings, armour, and other objects of various kinds, making the work one of much interest.” See “Lives of the Painters, &c.,” vol. v. p. 55.

of the vase of gold which has been set before the Christ, though she does so with such gentleness and quietness that her dignity is not in the least injured by the simplicity of the action. As if to illustrate the means by which the Wise Men were brought from the East, the whole picture is nothing but a large star, of which the Christ is the centre; all the figures, and even the timbers of the roof, radiate from the small bright figure on which the countenances of the flying angels are bent, the star itself, gleaming through the timbers above, being quite subordinate. The composition would almost be too artificial, were it not broken by the luminous distance, where the troop of horsemen are waiting for the kings. These, with the dog running at full speed, at once interrupt the symmetry of the lines, and form a point of relief from the over-concentration of all the rest of the action.*

Respecting that "Crucifixion," "excepted" in the lines above, we have these significant words:—"I must leave this picture to work its will on the spectator, for it is beyond all analysis, and above all praise." We add a short passage respecting the "Flight into Egypt," and some others, which we refused ourselves the pleasure of dwelling on above, partly because restricted by the close limits of our space, but principally in the hope of sending you, for your benefit, to the volume itself:—†

"I should exhaust the patience of the reader," says Mr. Ruskin—but then the reader will be most unworthy to approach the book—"I should exhaust the patience of the reader if I were to dwell at length on the various stupendous developments of the imagination of Tintoret in the Scuola di San Rocco alone. I would fain join awhile in that solemn pause of the journey into Egypt, where the silver boughs of the shadowy trees lace with their tremulous lines the alternate folds of fair cloud, flushed by faint crimson light, and lie across the streams of blue between those rosy islands, like the white wakes of wandering ships; or watch beside the sleep of the disciples among those massy leaves that lie so heavily on the dead of the night, beneath the descent of the angel of the agony, and toss fearfully above the motion of the torches as the troop of the betrayer emerges out of the hollows of the olives; or wait through the hour of accusing beside the judgment-seat of Pilate, where all is unseen, unfelt, except the one figure that stands with its head bowed down, pale like a pillar of moonlight, half bathed in the glory of the godhead, half wrapt in the whiteness of the shroud. Of these, and all the other thoughts of indescribable power that are now fading from the walls of those neglected chambers, I may, perhaps, endeavour at some future time to preserve some image and shadow more faithfully than by words; but I shall at present terminate our series of illustrations by reference to a work of less touching but more tremendous appeal—the 'Last Judgment,' in the Church of Santa Maria dell'Orto."‡

And of the "Massacre of the Innocents," hear only the closing words—"Their shrieks"—the shrieks of the mothers—"ring in our ears till the marble seems rending around us; but far back, at the bottom of the stairs, there is something in the shadow like a heap of clothes. It is a woman sitting quiet, quite quiet, still as any stone, she looks down steadfastly on her dead child, laid along on the floor before her, and her hand is pressed softly on her brow."

Admirable Tintoretto! many have been thy eulogists, and according to the measure of their perceptions have they given thee praise, but here hast thou found an exponent worthy of thyself.

To the son of the master, Domenico Robusti, high praise has not at any time been awarded; but it is too much to call him "a miserable painter," as is done by our great authority: his feebler light was eclipsed by the glory of that within whose sphere he moved, but contemporaries speak of him as a portrait-painter of considerable merit, and a French writer—one of the most upright of our day and of his country—refers to Domenico's historical works with some approval. It is true that, comparing him with his father, the French author remarks, "Il le suivait comme Aseagne suivait Enée, dans l'incendie

de Troie, non passibus aënis,"—but who is it that does follow Tintoretto "with equal steps?" And further: "Il l'imite, sans l'atteindre, il lui ressemble, sans le remplacer."* But a painter may go far, and happily too, without "overtaking" Tintoretto; and it is not a little to say that the son "resembles" such a father. That he should "replace" him is not to be expected, nor yet desired.

The passing events of the day were those by which Domenico Robusti was chiefly occupied, portraiture excepted. Of these the reader will find examples in the Ducal Palace of Venice, where there are now two battle-pieces, both mentioned by Viardot,—the second taking of Constantinople, and a naval victory, that obtained by the Venetians over the emperor, and in which Prince Otho, son of the latter, was made prisoner. In the Venetian Academy there is a "Christ crowned with Thorns," with two portraits of senators, by Domenico Robusti. In the Church of SS. Giovanni e Paolo is a picture representing the Doge Aluise Mocenigo concluding with Philip of Spain and the Pope the well-known treaty, of which one result was that "Battle of Lepanto," which all will remember to have seen depicted;—and on the good broad space in which the soul of the painter, who is no other than our Giorgio Vasari, delighted,—between the door of the Scala and that of the Sistine Chapel in the Sala Regia of the Vatican.

Of Marietta, the daughter of Tintoretto, we know much less than could be desired, but of that little, one circumstance is highly significant. The disciple of her father in his well-beloved art, she confined herself for the most part to portraiture, but in that branch she became renowned: not only were the most eminent of her father's compatriots and fellow-citizens ambitious of delineations by her hand, but she received the offer of commissions from personages of yet higher rank, and was invited to the Court of Spain, first by the Emperor Maximilian, and then by King Philip II. But no temptation could avail to separate the devoted child from her beloved father, nor could Tintoretto be prevailed on to support the applications of those who would have lured her from his side. United in their lives, in their deaths they were not long divided. Marietta died when not quite thirty years old, and her father survived her but four years: with her the best light of his life was extinguished; yet is it pleasant to remember that in his art the glorious master not unfrequently found consolation, even for that irreplaceable loss.

MR. OTTLEY'S LECTURES ON ART-HISTORY.

A FEW years ago, the Manchester Exhibition of Art-Treasures would have been an impossibility, and a lecture on Classic Art, intended for a popular audience, an absolute failure. Now the Art-Exhibition is a great fact, which, in the midst of many other exciting influences, the whole people look forward to with avidity; and an Art lecture—the first, we believe, of a course—has been delivered by Mr. H. Ottley (son of the late Mr. Young Ottley, the well-known collector and author), and promises to become popular. Mr. Ottley inaugurated his lecture with the title of "An Hour with the Old Masters," at the Mary-le-bone Literary and Scientific Institution, on Wednesday evening, the 4th of March, and he has since repeated it at the same institution, and at the Myddleton Hall, Islington, to an increasing audience; and he is now, we believe, on his way to repeat it in Manchester, and other large towns in the manufacturing districts. We will glance at a few of the heads of this interesting discourse.

The lecturer, after a brief reference to the achievements in Art under the Assyrians, Egyptians, and Greece, and the conquest of Greece, which led to the dispersion of Art throughout the Roman empire, came at once to the history of the revival, which commenced in the early part of the thirteenth century, tracing the progress of improvement, and the discovery of resources and appliances, under the hands successively of Cimabue, Giotto, Ghiberti, Massaccio, Fra Bartolomeo, to the glorious days of Leonardo da Vinci, Michael Angelo, Raphael, Correggio, Giorgione, Titian—a mighty galaxy, who crowned and closed the swelling theme of high poetic Art in the early part of the sixteenth century.

We were thus carried over the real Pre-Raphaelite period, which gave occasion for some remarks from the lecturer upon a pseudo similar movement now going on amongst us. Without wishing to disparage living Art, he invited the judicious observer to compare the works of the old masters of the thirteenth, fourteenth, and fifteenth centuries with those of the Pre-Raphaelite school of the present day, having regard to their essential characteristics and obvious tendencies, and to judge for themselves how far the two movements were parallel, and likely to lead to a similar result. A recent writer on Art-History had remarked, as a distinctive characteristic of the Florentine and Roman schools of this early period, that they arranged their groups of figures so as to make complete compositions, without the intervention of drapery, and afterwards clothed them without interfering with the first arrangement; whilst, in later times, the drapery became an essential part of the composition, commanding attention by the opportunities it afforded for the display of splendour, colour, and chiaro-oscuro. The same fatal mistake still prevailed, and we have frequently occasion to admire very elaborate fancy costumes, resting entirely upon their own independent pretensions, without a hint of fleshly influences to sustain them. Another striking feature in the artists of that period was their entire freedom from affectation and conceit; they learned and laboured truly to do justice to the subject in hand by the best means at their disposal, without indulging their own fancies, or attempting to show off their own cleverness, merely for purposes of display. The lecturer showed how these old Pre-Raphaelites had been, indeed, the precursors of Michael Angelo and Raphael himself—there being scarcely a point of excellence seen in them but in its nature, not certainly in degree, had been already foreshadowed in the works of one or other of these earnest labourers. He described, in pointed and happy terms, the distinguishing features of Michael Angelo, Raffaele, Correggio, Titian, Giorgione, and other principal masters; and then, after a glance at the rapid decline which followed them, spoke of the Bolognese school under the Caracci, which, with all its errors of fanciful theory, did much for Art, if in this alone, that it combined beauty of colour and chiaro-oscuro with excellence in design and composition.

But this executive excellence was no sufficient substitute for earnest purpose and grand inspiring sentiment, which had marked the earlier Art, and now every day gave way more and more. Art had hitherto been wholly employed in the cause of religion; now this grand unity of theme began to fail, and give place to mythological and fanciful subjects, and at length to portrait and landscape; whilst religious subjects themselves were treated in a fanciful manner, in which the artist often indulged his own conceits at the expense of the solemn interests of his theme. Then came a long, dull, dubious interval of misrule and humiliation. Art, in search of patronage and pay, was fain to minister to every vain taste, every weak and foolish taste, every depraved taste, until the very name of Taste became a by-word of reproach with men of sense and station.

The general tendency of the lecturer's remarks was to show that the Fine Arts, to be great and productive, must be free, and accepted by the people as a national requirement;—how that, whilst under the imperial patronage of the Cæsars they languished hopelessly; it was in the free republics of Venice, Pisa, Florence, and amongst the commercial communities on the Rhine and in Flanders, they revived in all the grandeur of creative power. Nor did the illustration of the pleasing fact end here. In our own country, Art, which in the midst of state intrigue and turmoil had languished to the extreme of dejection when dependent solely upon the chances of courtly patronage, now, in times of peace and commercial prosperity, found in the cotton lords of Manchester, the woollen lords of Leeds, and the merchant-princes of London and Liverpool, munificent and discriminating patrons. In America, also, Art was making energetic and noteworthy efforts from the spontaneous action of free intelligence. He insisted, therefore, that the dogmas of Art were not to be considered an exclusive mystery; that artist and public should both understand a common language; and that Art-Education, widely diffused, would be the best promoter of Art, as of the civilisation of communities.

The lecture, which lasted upwards of an hour and a half, was illustrated by a large number of copies and fine engravings after the principal masters; together with a very fine photograph, fully five feet wide, after "The Last Supper" of Leonardo da Vinci, which, arrived from Milan, was lent for the occasion by Messrs. Colnaghi. On the second night were, in addition, several original gems by Raffaele, Gentile de Fabriano, Gozzoli, and other rare masters, the property of Mr. Farrer, &c.

ART IN CONTINENTAL STATES.

THE pressure of domestic subjects has excluded of late from our pages much of the intelligence we have usually given relative to Foreign Art. The interest and importance of the incidents daily occurring in relation with the most eminent of our contemporary schools, require at our hands a retrospective summary, especially of those matters which are more than mere passing subjects of Art-gossip.

PARIS.—There is in active preparation at the Gobelins works a series of portraits of the famous artists and architects of the Renaissance, intended to be placed in the Salon d'Apollon, in the Louvre. —Ingres, the well-known French painter, although eighty years of age, has executed a work entitled "The Naiads," which is the admiration of all who have seen it; it is even preferred, by a large circle of critics, to his famous *Odalisque*, painted many years since. It has been purchased by Count Duchatel for 23,000 francs.

BERLIN.—The photographers of Berlin are experimenting according to the process discovered by Beauregard, of procuring at once in the camera portraits with all the natural colour of life; the process is described in the *Polytechnic Journal*.—The King of Prussia has commissioned V. Kleber to paint the mythological subject, "Perseus and Andromeda." The work is in progress, and promises to equal the best productions of this painter, who has achieved a celebrity in this class of subject. His "Cupid and Psyche" is now in the hands of Seidel, to be engraved as a plate for the Art-Union of 1859. —The landscape-painter Eduard Pape has won for himself honour and distinction by his picture of the "Bernese Alps." This artist feels deeply the grandeur of Alpine nature, and invests it with a charm peculiar to the magnificent features of such scenes.—Hildebrandt's last picture, "Evening," which is enriched by the warm glow of his powerful colour, has been purchased by the Russian Count Tschkiewitsch, for 250 Frederichs d'or. The same nobleman, with a view to the formation of a gallery of modern Art, has effected many other purchases, and is now in Paris in search of eligible works.

—Two landscapes of surpassing merit are in progress by Max Schmidt, the subject of the larger represents a harvest in the Campagna of Rome, with extremely picturesque figures of Apennine neatherds, who with their oxen are come to assist in the harvest—in the distance are seen the broken arches of an aqueduct. The subject of the smaller is a passage of simple landscape material from Dessau.—Schrader, the historical painter, is engaged upon a religious picture—in this there is nothing anomalous; but as another instance of the versatility of talent, in which there is some anomaly, Karl Steffech, the horse-painter, is engaged on an altar-piece for the Protestant church in Karlsbad, the subject of which is the "Ascent of the Saviour to Heaven."

BRUSSELS.—The King of Holland has named Schelphout, the landscape-painter, a commander of the Order of the Crown of Oak. This aged artist—the Nestor of the living school of the landscape-painters of the Netherlands—received from his brother artists on the occasion of his last birthday, a congratulatory address written upon vellum.

MUNICH.—The Rubens Festival, recently held in Munich, was distinguished by some novel features in its preparation. When the committee met to consider the different propositions for carrying out the entertainment, the sketches of Lembke were unanimously adopted. The various departments were thus determined: the background—a View of Antwerp—was executed by the architectural painter, Schwendy, from Berlin; to Kirchner, also a painter of architecture, were assigned the trees and foliage. Another portion was executed by the genre-painter Seitz, and the decorations fell to Lembke, consisting of angels, garlands, &c., &c.; and thus the whole was accomplished by divided labour. The costumes for the men were designed by Petzl and Martin, and those for the ladies by Bamberg.—The sculptors Brugger and Widemann, to whom has been confided at Munich the execution of a monument in honour of King Ludwig, have so far advanced their work that it was inspected by the king before his departure for Rome.—The Academy of Munich was established in the year 1808, therefore, next year there will be held in that city a jubilee in celebration of the fiftieth year of its existence, on which occasion will be got up a general exhibition of all the works which have been effected under the auspices of this Academy, wherein every branch of Art will be represented.

DRESDEN.—On the occasion of the finishing of Rietschel's great work, the Goethe and Schiller monument, a festival was held here in honour of the

sculptor. The room in which the guests and contributors were entertained, was, by means of floral decoration, turned into the semblance of a garden. After the health of the King had been drunk, the artist Lichtenberger rose and announced in verse the object of the assembly. At the conclusion of his address a transparency was instantaneously exposed, representing the Schiller and Goethe monument, and between the figures was placed the bust of Rietschel, in such wise that the wreath which they held was suspended over the head of the sculptor—a very elegant compliment, that was at once acknowledged by those present, who rivalled each other in their congratulations of the sculptor. The health of Rietschel was proposed by Julius Hübner in a copy of verses, in which he animadverted severely on the taste and feeling of those who devoted themselves more to the study of costumes and draperies than expression.—Overbeck is now in Rome, and the Pope has visited his studio to inspect his new work, "The Saviour communicating to future Evangelists the Secrets of the Trinity."

ULM.—An ancient mural painting has lately been discovered at Ulm, which has apparently been executed in water-colour on the dry wall. It has not suffered materially, the colours having changed but little; the work, therefore, may be regarded as a favourable example of its period. The subject is the interment of a saint, and the composition consists of four figures. The body lies upon a white cloth, and three angels are about to raise it, as if with the intention of bearing it for interment to a tomb high in a neighbouring mountain-side. The saint—a woman—wears a red robe, and on the head a golden crown, and over and partly behind this appears a nimbus with a broad gold border, the inner breadth of which is filled up with red of the same colour as the drapery. The angels have a white drapery falling in ample folds to the feet, and pointed wings widely extended. The angel on the other side of the body, already rising on the wing, supports the head with the right hand, and with the left points upwards to the tomb prepared as it were, in a cloud. The second angel that holds the sheet at the feet of the body is standing, and the third is still kneeling. The style of Art is distinctly that of the end of the fifteenth century, having been whitened over at the time of the Reformation. There is below the picture a legend, but it is so defaced as to be entirely illegible. From another source, and after extended research, the picture is discovered to represent the death of St. Katherine of Alexandria. This discovery is of some importance to the history of Svanian Art.—At Cologne the contributions for the last year to the fund for the restoration of the cathedral amounted to 42,000 thalers, an increase upon the receipts of the preceding year of 11,230 thalers, and approaching the sum collected in 1845—the largest amount which has yet been received.

DARMSTADT.—The erection of the Luther column at Darmstadt, the town in which the great German reformer appeared before Charles V. and the council of the empire, progresses slowly, but surely. Important contributions continue to be received, so that it is hoped that a memorial so purely national will soon be brought to a happy conclusion.

DANTZIC.—The Dantzic society for the preservation of antiquities have lately worthily exerted themselves in the restoration of many interesting and valuable relics. The well-known picture restorer, Stübbe, of Berlin, has been summoned to Dantzic, in order to restore and examine a work attributed to Hans Memling; and Keller, the restorer to the Museum, has been invited to assist. Of this opportunity advantage will be taken for the restoration of the altar-piece in the Church of St. Mary, which will be effected at the expense of the physicians of Dantzic.

HANOVER.—Frederick Kaulbach, who has been some time occupied in painting portraits of the royal family of Hanover, has received from the King the appointment of portrait-painter to the court.

SAXE-WEIMAR.—It is stated that the Grand-duke of Saxe-Weimar has it in contemplation to assemble within the walls of a new Museum the various artistic collections which at present have a separate existence throughout his capital; and that the building of this Museum will be commenced as soon as the restoration of the Wartburg, on which he is at present engaged, shall have been completed.—At Weimar another monument, in honour of the greatest *literateurs* of Germany, is in progress—that commemorative of Goethe, Schiller, and Wieland. The sum of 7500 thalers has been collected for this work, and the King of Bavaria has presented the metal; but there is yet a deficit of 600 thalers, the estimated cost of the casting and pedestal. It is proposed to inaugurate the monument on the 3rd of September, in the current year.

BOADICEA.

FROM THE GROUP BY J. THOMAS.

THE early history of England, like that of all other countries of ancient date, is so shrouded in obscurity that we are only able to take hold of a fragment here and there as something real and tangible. We are indebted to the Roman historian Tacitus for the little that is told of Boadicea, the widowed wife of Prasutagus, king of the Iceni, or those early Britons who inhabited the counties of Norfolk and Suffolk. While Suetonius, the Roman commander in Britain, was absent in the Isle of Anglesea on a military expedition, Catus, the collector of the revenues, was guilty of great excesses among the natives of the eastern part of Britain: his cruelty in causing Boadicea to be scourged, and her two daughters to suffer the grossest indignities, roused the indignation of her subjects and of their neighbours, the Trinobantes, the inhabitants of Middlesex and Essex. They flew to arms, attacked the Romans and their allies within their territories, of whom 70,000 were slain, and compelled Catus to flee into Gaul. Suetonius, on hearing of the revolt, hastened back with his army, and, posting his troops in a narrow pass, where the hosts of undisciplined savages were unable to avail themselves of their numerical superiority, completely defeated them, and their gallant leader, Boadicea, who, in a chariot with her two daughters, went from tribe to tribe exhorting them to fight bravely and revenge her wrongs and their own. This occurred A.D. 61.

"There is a sound of armies on the sea;
Northward the eagle's mighty wings are spread;
O'er conquered Gaul he wildly rushes free—
Gloats o'er the dying, and devours the dead.
Victorious legions, by the Cæsar led,
Cleave the rough wave to Britain's hostile shore:
With bloody strife the furrowed sands are red,
The white cliffs echo back the battle's roar.
Rouse, Boadicea, arm!—the foe is at thy door.

She comes—her chariot glistens from afar;
Half-maddened coursers drag its ponderous wheels:
Revenge and fury guide the whirling ear,
Upon whose track the famished wolf-dog steals."

Rapin, the French historian, who wrote the earliest complete history of England down to the death of Charles I., says that Boadicea closed her address to her countrymen on the occasion referred to with the following words: "It is much better to fall honourably in defence of liberty, than be again exposed to the outrages of the Romans."

This is the subject, and the point of time in the narrative which Mr. Thomas has chosen for illustration, and it is one well adapted to the requirements of sculpture, where vigorous action and energetic expression are intended to be made the chief characteristics of the work; but there are others that can scarcely be deemed subordinate to them—a deeply-seated sense of wrongs inflicted, and the desire to avenge them. The introduction of the three figures has also afforded the sculptor scope for portraying as many varieties of female beauty—the perfect form and mature features of the mother, in contrast with the slight figures and expanding loveliness of her daughters. Mr. Thomas has assumed, as he had a right to do in the absence of contrary evidence, that the queen of the Iceni and her daughters were cast in nature's fairest mould, though Cæsar says the men painted their bodies blue, to terrify their enemies.

The principal figure in the group is, of course, Boadicea, standing with her arm uplifted towards heaven, as if in the act of invoking its vengeance on the oppressors; the left hand grasps nervously a portion of her robe: the countenance and attitude are expressive of powerfully excited feelings; the Roman shield and sword she has trampled under her feet. In the young female to her right we seem to perceive one who echoes the mother's prayer; in the other, her younger sister, one who has resigned herself to whatever fate may befall her. The composition as a whole, no less than in its several parts, is poetical and beautiful.

Mr. Thomas, it may not be known to many of our readers, is the artist who has so successfully carried out the various ornamental sculptures that adorn the exterior of the new Houses of Parliament. His "Boadicea" is the property of Sir M. Peto, who, having seen the model, commissioned the sculptor to execute it in marble.

PART V.

ALTHOUGH, no doubt, much was gained to religion and liberty by the suppression of monasteries, and we may rejoice that we no longer hear in our "schools"

"The harsh jargon of contentious monks,"

something was surely lost of intellectual supremacy. Osney shared the fate of so many wealthy establishments which the cupidity, and not the piety, of Henry VIII. caused him to suppress. Although the friaries and the lesser monasteries were destroyed by law, the more powerful establishments were ruined by "surrender." By threats, cajolery, or bribery, the abbeys came into the king's hands, or under his control. Untractable abbots were summarily disposed of by easily-sustained charges of high-treason, and the monks were "sent adrift to dig, or beg, or starve." Osney revived somewhat in the days of Queen Mary, masses were again chanted within its walls; but during the Commonwealth its ruin was completed, and of its remains there is now nothing but the site, which the Thames waters as freely and abundantly as it did three centuries ago.

In the still recesses of the river we found that queen of water-nymphs, the White Water-Lily (*Nymphaea alba*) in the greatest luxuriance, both in number and in the extraordinary size of the flowers and leaves; on dragging some of these into the boat we found that the stems were from eight to ten feet in length, and the leaves were of immense breadth; the flowers also were unusually developed, and some specimens were suffused with a blush of roseate tint that contrasted delightfully with the rich green of the calyx and leaves. It

THE WATER-LILY.

is in our aquatic flora, certainly, that we can vie with the richness of tropical regions; and we should wish to see our ornamental waters better stocked with these native beauties than, with few exceptions, is the case. What more lovely decoration could a small piece of water receive than a group of water-lilies, white and yellow, the elegant Frog-bit, and the princely Flowering-rush, with its crown of purple and white blossoms, with a number of other charming plants either growing in the water or fringing its edge?

On the current which runs to the left are the few indications which still exist to point out the locality of another abbey—that of Rewley. REWLEY ABBEY, "sometime seated within pleasant groves, and environed within clear streams," with its twenty-one elm-trees, and a tree by itself, to represent the abbot and

GATE OF REWLEY ABBEY.

the number of its monks, was situated on this branch of the river; its former splendour is, however, indicated only by a doorway, and a wall which now incloses part of the North Western Railway.

The left stream is the course that is most picturesque; but there is no

exit, as the current is arrested to turn the mill which still works there, where, by itself and its predecessors, it has worked since the castle first reared its strong and stately towers and battlements by the river's side; indeed, there is evidence that the miller had precedence of the chateain. We pass under a new railway bridge, close to the entrance to the Oxford and Coventry Canal; and, at the entrance to the city on this side, as we near one of the most ancient of its bridges—Hithe or Hythe Bridge—we observe a small cluster of rude and primitive houses, the small dwellings of a race of fishermen, who have followed that calling from father to son in unbroken succession for several hundred years.

It was in this neighbourhood we heard an anecdote, to listen to which we ask the reader a brief delay "*en route*."

Years many and long must pass before "ceneteries," with their cold marble monuments, and hard-hearted catacombs, their vaults, and gravelled walks, and slender trees—rational, and well-ordered, and necessary as they are—can become a natural feature in our English landscape; the village church-yard was and is a sanctuary—however neglected, however overcrowded, it is sanctified to us by that strong English bond, "old association:" it has formed for centuries the link between the living and the dead—the present and the past. The church has been deprived, by modern innovation, of a most imposing and attractive ceremony, which the law of man has changed from a religious compact to a civil contract—thus breaking with a rude and coarse hand a tie that was hitherto so sacred; but the old English church-yard is still with us, and still bears the hal- lowed fruitage of abundant memories: it is one of the evidences of the

"Immortality that stirs within us,"

this craving to perpetuate the remembrance of what was dearly loved in life. The sentiment is as strong in the lowly, when they mark a resting-place by a simple head-stone, as in the rich when they erect the costly cenotaph. This

"Keeping the memory green in our souls,"

is one of the dearest of all hopes and all duties, and the humblest natures cling to it as closely as do the highest.

Within sight of our noble river, some ten years ago, a man named Jabez Lloyd, was considered as treading the path to independence; he was growing from a village carpenter into a boat-builder. He was a courteous, frank, and kindly fellow, becoming famous for launching those canoes in which "Oxford men" skim the surface of the Thames. Jabez was married to a meek, dove-eyed little woman—one of those who continue to work on silently through the world, attracting very little attention while they are with us, but if laid up by illness, or called home by death, leave a blank which, because we find it impossible to fill up, we know how well it must have been filled. In this instance, however, it was not the meek little creature—never bappy but in the sunshine of her husband's presence—who was taken, but the strong-handed Jabez; he was trying one of those painted skimmers of the Thames, and had just got free of the reeds and weeds and rushes that weave a leafy barrier at a particular bend of the river, when, leaning incautiously a little on one side to extricate his oar from the tough fibres of some water-plants, he went over, right into a bed of lilies, and was drowned before he could be extricated from the meshes of the golden-chaliced flowers and their broad leaves. Jabez left absolutely nothing, or "less than nothing," to his widow. After the sale of spars, and paint, and fishing-tackle, and household goods, there was barely enough to pay the funeral expenses, and to purchase unpretending mourning. And in the overwhelming and miserable loneliness of her first widowhood, the little creature was forced to think of what she should, or could, do, to keep from out the workhouse. She was quite uneducated; he married her when she was but sixteen, just learning to be a dressmaker. What could she do? She could sew, and attend to a cottage home; she could be a farm servant—that little delicate pet of a woman, whom the great boatman cherished and watched over, and tended as if she was his one darling child—poor Mrs. Lloyd a farm servant! She tried it. She hired herself out at three shillings a week at the farm,—you can see the ricks and trees of that large farmhouse from where we stood,—and the farmer's wife—a great glory of a woman, as far as size and good-nature goes—trained her voice to speak gently, and abandoned altogether the tone of an ill-used woman she was wont to assume when addressing her domestics, saying, "Thank you" to Mrs. Lloyd for every service, meek and useless as she thought it, which the poor little woman rendered. She washed and ironed, and took most loving care of the poultry; chickens grew rapidly under her superintendence, and young turkeys "cut" their red heads—as children do their teeth sometimes—with very little difficulty. She worked too at her needle. She did all she could; but she was so neat and exact, so fond of doing everything she knew how to do in the best manner, that the farmer's wife considered her "slow." She preferred her "helps" to be quick and slatternly; she could not bear them to be slow. The little widow felt this, but what could she do more than she did? and despite the sympathy of the farmer's wife, her quick temper overcame her humanity, and she gave the widow warning. Just at this time the curate of the village wanted a housekeeper, and with a belief in her being quite unfit for such a post, Mrs. Lloyd still felt it a duty to "try;" and so, with a trembling hand, she raised the garden latch, and presented herself as a candidate. The curate, besides being the earnest, hard-working minister so suited to a country parish, was just the person to inspire poets with a subject, and young ladies with the enthusiasm which leads to the manufacture and presentation of pen-wipers, slippers, and footstools; he was pale and thin, with a clear soft voice, and such truthful eyes! Well, he told Mrs. Lloyd that he was too poor, he feared, to offer her sufficient remuneration; he could not afford to pay a good servant. And Mrs. Lloyd assured him she was *not* a good servant, and if he would try her, very moderate wages would be more than she deserved: indeed, she feared she was hardly worth wages, but she had something to do before she died, and she could not be happy until it was done. Accordingly that evening she brought

a bundle, and the clerk carried her box. She was installed in the smallest of all kitchens, and had even a smaller bedroom; but there was room on the white wall for a portrait of her husband, which some Oxford youth had painted, and though a dreadful daub, it was a likeness. Before *that* she knelt, and before *that* she prayed; and at the end of the week the curate thought—such was the peace, and comfort, and quiet, and neatness of his cottage—that he must be entertaining an angel unawares. The curate had £50 a year, and the rector, who had £800, cautioned him, when he first came, in a fatherly sort of way, not to be extravagant. The advice was very good, and the young man profited by it, for he kept out of debt, and often sent his sister, who was a governess, small sums in postage stamps. All he could pay the little widow was about two and sixpence a week, and she had to find her tea and sugar and “beer” out of that. Do not pity her! She was bright and cheerful; she could do very well without sugar, and as her master could not afford “beer,” surely she was better without it. She was her own mistress—never found fault with; her black dresses (she had two) wore to a miracle, but she was forced to buy another, because she must look respectable: that took away the savings of more than six months. But she went on saving, adding halfpence to halfpence, denying herself everything almost which the humblest servant considers she wants; sitting up at night when the moon was at full (for she would not waste her master’s candle), making her caps “do,” and ironing out her cap-strings—darning, turning, trimming, all to save perhaps twopenny; but she had a purpose to work out. She rarely opened the garden gate except to go to church or to do the small marketings. On Sunday evenings she indulged in the luxury of tears over her husband’s grave; and returning from market, she always paused at the stone-cutter’s yard, eyeing the tomb-stones. Once she entered timidly—she was timid in all things—and inquired the various prices; and the stone-cutter, when he saw her threadbare but neat dress, and observed the fluttering of the washed-out crape curtains on her bonnet, and noted how limp and poor she looked, wondered why she troubled him: but he was a kind man, and did not say so. Time wore on: the curate had an ever-accumulating stock of pen-wipers, slippers, and foot-stools; sometimes went out to dinner, but more frequently to tea; and still more frequently visited the poor and the schools, and lectured, or staid at home; or, as a great luxury at Midsummer, when there was not much sickness in the parish, and it was holiday time in the school, took his rod to wander beside the queenly river he loved so well. The rod was simply an excuse for loitering, though he did sometimes bring home some little fish that would have formed good subjects for the microscope. Time wore on, and some people wondered that the curate permitted his little servant to wear such threadbare black; but others—the majority—only saw the widow’s meek thankful face, and her soft hopeful eyes, and marvelled, with more reason, how neat and pleasant she made all things in her master’s house. How different are the meanings different people draw from the same readings!

Time again passed on, and it was now three years since the strong boat-builder had found his death in the Thames, when the “widow” again entered the stone-cutter’s yard; she placed a slip of paper in his hand, and he read:—

SACRED TO THE MEMORY OF
JABEZ LLOYD,
AGED TWENTY-EIGHT, BOAT-BUILDER,
WHO WAS DROWNED IN THE SUNSHINE OF THE 24TH OF JUNE, 18—,
AMONG THE WATER-LILIES OF THE THAMES.
HE WAS BELOVED BY GOD AND MAN.

She pointed to a tombstone, the one upon which her heart had long been fixed.

“But who will pay for this?” inquired the stone-cutter.

The little widow put the money into his hand. The man looked at her with astonishment, and involuntarily lifted his hat while he spoke.

“It is a very humble stone,” she said, “and no one can think I have taken a liberty in putting it up. I have worked and saved for it day and night. I shall be able to see it every Sunday. You will put it up at once, sir?”

“God bless the woman!” exclaimed the stone-cutter; “I would have done it long ago if I had given it a thought. I loved Jabez; and as to your money, I’ll not touch it. You shall see the stone in its place next Sunday.”

Such a warm colour as came to the widow’s cheeks—such brightness as flashed from the widow’s eyes! and how she trembled beneath her threadbare drapery!

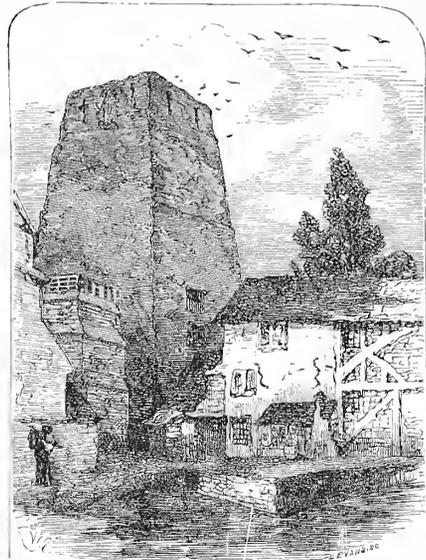

“You *must* take the money,” she said firmly; “it *must* be my doing. Take the money, sir, or else I must go elsewhere; only thank you for your offer—you meant it in kindness.”

The following Sunday it *was* in its place, and the stone-cutter told the story over and over again, interrupted occasionally by a guttural sort of sound in his throat. The only one who did not appreciate this woman’s offering was the churchwarden, who stoutly contended that the poor had no business with such fine feelings, and grew very red, and looked very indignantly at the tombstone. Nevertheless it excited a good deal of interest; after evening service, even the little children retired from the corner of the church-yard in which it is placed, knowing who had a right to kneel there in solitude and silence.

Of Oxford Castle there remains only a solitary tower; but the mound, planted with evergreens, still rises at its northern side. As will be seen in our engraving (for the sketch we are indebted to Mr. Harvey, of Oxford), the old mill and its dependent dwellings are in harmony with the old walls with which they have been so long associated. The castle was begun by Robert Doyly in 1071, and finished in 1073, “to keep in order the neighbouring parts, especially the city of Oxford, which gave great affronts and proved troublesome to King William.” It was famous from that time to the civil wars, when it had lost much of its strength and value, afterwards it gradually became a ruin, which ranks among the most interesting relics of the venerable city.

“Time’s gradual touch
Has mouldered into beauty many a tower,
Which, when it frown’d with all its battlements,
Was only terrible.”

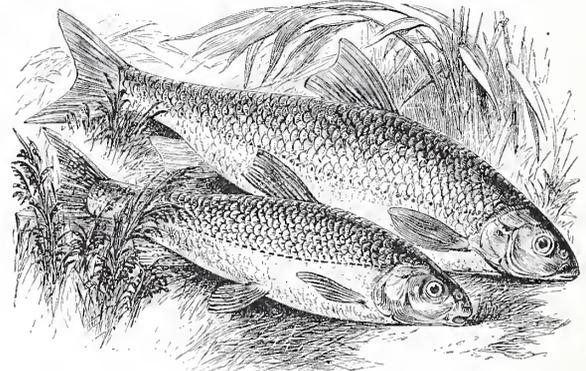

The old castle could tell many strange stories from its palmy days, immediately following the Conquest, to the commencement of the present century, when this tower was the jail of the county. Perhaps the most remarkable of its incidents is that which relates to the Empress Maud, who, being besieged there by the army of King Stephen, contrived to escape thence into Abingdon. The river was frozen over, and, accompanied by three trusty knights, all clad in ghostly white, she issued from its postern gate at dead midnight, and, crossing the ice, passed the sentinels of the enemy unobserved.

OXFORD CASTLE.

We bring together, in the appended engraving, the ROACH and DACE, for as all Thames anglers know, they are generally found together, and caught with the same bait—the gentle. These fish supply the principal sport of the angler during the summer months—the dace being more abundant in June and July, and the roach in autumn; biting most freely, and being in best condition, in September and October. It is only the skilful angler who can fill his basket with these fish, although they abound in all parts of the Thames.

The Roach (*Leuciscus rutilus*) is found in nearly all English rivers, preferring, however, those which are comparatively slow; and living freely in lakes, ponds, and pools, where the water has no egress. According to Yarrell, “the colour of the upper part of the head and back is dusky green, with blue reflections, becoming lighter on the sides, and passing into silvery white on the belly; the irides yellow, cheeks and gill-covers silvery white; dorsal and caudal fins pale brown tinged with red; pectoral fins orange red; ventral and anal fins bright red; the scales are rather large, marked with consecutive and radiating lines.” The roach is a handsome fish, and is known at once by his bright red colour, and especially by the marked redness of the eye. It is frequently caught

THE ROACH AND DACE.

of about six or eight inches in length, and weighing between half-a-pound and a pound. It is not uncommon to catch four or five dozen of that size as the result of a day’s sport; particularly in the neighbourhood of Marlow, where perhaps the largest roach are found in greatest abundance—especially during the autumn months, and when the water has been somewhat “coloured” by rain. It is rare to find a roach in the Thames weighing more than two pounds. Mr. Jesse speaks of one that weighed three pounds; we have ourselves caught one, but only one, that weighed a pound and three quarters.

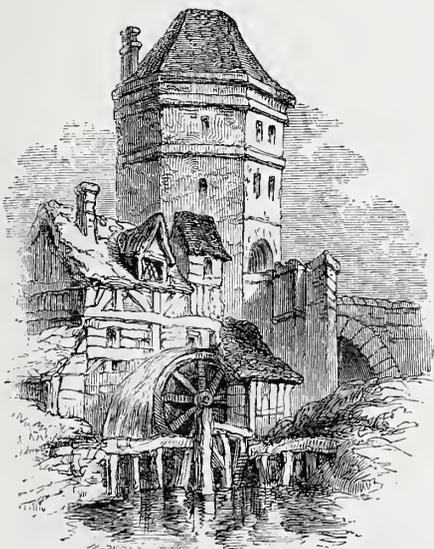

The Dace (*Leuciscus vulgaris*) is like the roach, gregarious—roaming and feeding in shoals; it is found in all parts of the Thames; it bears a resemblance to the roach, except that its body is more taper and graceful, the scales are much smaller, and its hue is silvery without any admixture of red. It prefers the more rapid to the quieter current; and, although, as we have stated, these fish are usually found together, the angler knows by experience where the one will be found more abundantly than the other. The dace seldom measures

more than six inches in length, and rarely weighs more than half-a-pound; but it is by no means uncommon for a skilful angler to kill twenty dozen of them in the course of a day. The dace is frequently caught with the fly, for it will rise freely.

The usual mode of angling for roach and dace is, however, by "bottom-fishing," in a depth of water about six feet: the angler moors his punt in some well-known "pitch," where the fish are known to congregate; it must be free from weed, and the current neither too rapid nor too slow. He fishes with a very small hook, baited with a single gentle, or it may be two gentles; his bait should lie as near the ground as it can be without actually touching it; his bottom line is of horse-hair, or, at all events, the lower portion of his line—not plaited, but single; and he soon finds that, if his strike is sharp and sudden, he loses both hook and fish; good hair, however, will last a whole day, if properly used, and be of sufficient strength to land a heavier fish than any roach or dace in the Thames. Many anglers prefer to fish with fine gut; but no matter how fine it may be, it is never so efficacious as the single hair: the gut will always "magnify" in water, and usually raises bubbles, so small as to be imperceptible to the human eye, but which the fish see well enough to have warning of danger; the hair has not these disadvantages: in using either, care is taken that the colour is of a pale tint—as near as may be to the colour of the water. It is obvious that the angler who fishes with hair must be more skilful and experienced than he who trusts to gut; but we answer for it, that he who uses the one will be twice as successful as he who depends on the other. "When you fish for roach or dace," as honest Isaak says, "you must have a small hook, a quick eye, and a nimble hand." And let the fly-fisher say what he will—and he does say a deal to lower the craft of the bottom-fisher—the skill required to secure sport is at least equal to that which is demanded by him who throws the mimic insect under a bough across a river fifty feet wide. The ire of the fly-fisher, however, is chiefly induced by a common practice of the bait-fisher, who, in order to draw the fish to his vicinage, is continually throwing in ground-bait—*i. e.* balls composed of bread and bran mixed up with clay, which, dissolving and separating, attract the fish to the source from whence food has proceeded. It must be confessed that this practice does look unseemly, and goes far to justify the sneers which the more ambitious anglers of the Scotch and Irish lakes so frequently aim at the simple joys of those who are content with such pleasures as are supplied by the venerable river which gladdens and glorifies the great capital of the world.*

Leaving to the left the rugged island, once the site of Osney, and now covered with houses of a low grade, with rough gardens, inclosed by dilapidated walls or broken palisades, and to the right the fertile meadows around which winds the ancient bed of the river, we arrive at Folly Bridge,† but must previously pass through a lock, the river here having a fall of about three feet. At the extremity of the little island we have described, was the famous tower with which for centuries was associated the once dreaded, but now venerated, name of Friar Bacon.

"Friar Bacon's Study," which formerly stood on this bridge, "near the end next the city," was taken down in the year 1779; and the prophecy thus

FRIAR BACON'S STUDY.

failed, that "when a man more learned than he passed under it the tower would fall"—hence the old warning, when a youth was sent to the University, "Beware of walking near the Friar's Tower!" It is certain that to this tower Roger Bacon, a Franciscan friar (who died in 1292), used to resort at night "to take the altitude and distance of the stars." Popular prejudice accused him of practising magic, and he was cited to Rome by the general of his order; but having cleared himself, he was sent back to England. The tower was said to have been built in King Stephen's time, as "a Pharos or high watch-tower for the defence of the city."

* Not very long ago, roach and dace were valuable chiefly for their scales, which were used in the manufacture of artificial pearls; this trade has, however, now altogether ceased. Neither of these fish is desirable for the table, although some persons profess to be fond of them, and they may be good enough when nothing better is to be had.

† The bridge at which the several branches of the Thames unite was anciently called Grand Pont and South Bridge; it is now named Folly Bridge.

We have been passing for some time through the lower parts and the outer side of Oxford; for these picturesque houses and gardens that skirt the bank of the river are the lanes and alleys of the city. Into Oxford, however, it is not our design to enter with a view to describe it; our business proper is with the Thames, and sufficiently to describe the city would be to occupy the volume we devote to the whole theme. The visitor will readily lay his hand on one of the many books in which it is illustrated largely and described fully.

We will only, therefore, ask the reader to "step" with us into Oxford before we rejoin the river, and resume our voyage between its banks.*

Its antiquity is as remote as that of any existing English city. The earlier chroniclers, in the absence of fact, had recourse to fiction; and finding the early history of the city depended on tradition only, gave these traditions a lasting form in monkish history. Of these the most amusing, but the most fanciful, is the work of Geoffrey of Monmouth, a monk who lived in the twelfth century, and whose industry and credulity were both equally remarkable. He declares Oxford to have been originally built one thousand and nine years before Christ, by Memphrii, King of the Britons, when it was called Caer-Memphrii, "upon the ryver Teines," and therefore "deserves to be reckoned not only amongst the first and most ancient cities of Britain, but of all Europe and of the world." More correct chroniclers come to our aid, and we know from authentic history that the Saxons "much affected this city with hurt." It was burnt by the Danes, and suffered in a hundred ways during the wars and civil contests that followed—from the Conquest to the struggles of Charles I. and his parliament.

At the conquest its citizens numbered twelve hundred. It is stated in Domesday Book that in OXENFORD "are two hundred and forty-three houses, as well within as without the wall, that pay or yield geld; and five hundred and twenty-two more, at least, which are so wasted and destroyed that they cannot pay geld." †

Commentators differ as to the derivation of the name. It is probable that Oxenford, by which it was called in early time, means neither more nor less than a ford for oxen; much useless controversy has been expended on this point, which might, it would seem, be at once determined by common sense: Domesday, the old Saxon chronicles, and the city seals,‡ confirm THE FORD. It was called Oxford probably from the king's oxen being driven thither (for it was a royal demesne under the care of a bailiff) from the royal forests, in the summer, to pasture on the luxuriant grasses of the meadows, which were flooded and inaccessible to them in winter. In the time of Harold the walls were so ruinous that the rents of several houses were allotted for their repair. It is certain that it was a walled town in the time of the Confessor: nay, that King Alfred had set his halls *infra muros Oxoniae*, and that long previously the city had both walls and gates. Of these walls there are several interesting remains; the best preserved being in the gardens of New College. The Mayor and Aldermen have an annual ceremony—proceeding in procession to trace these walls, and demanding the right of entry into any garden or house that occupies the site of any portion of them. The moat and trenches may be still accurately traced,§ and are generally clothed with ivy—

"To gild destruction with a smile,
And beautify decay."

It is to the University, however, that Oxford mainly owes its fame; for centuries it has been—

"That faire citie, wherein make abode
So many learned impes, that shoote abroad,
And with their branches spreade all Britanny."

Walking through its lanes, and courts, and streets, and reminded at every turn of the sacredness of its history, associated with so much that is great and good—of learning, piety, patriotism, and true courage—the enthusiast is almost tempted to cast the shoes from off his feet, for the ground on which he treads is holy; while it is impossible for the mind least instructed or inspired to withhold homage, or to avoid exclaiming with the poet—

"Ye spires of Oxford! domes and towers!
Gardens and groves! Your presence overpowers
The soberness of reason."

The High Street, from the bridge which crosses the Cherwell—the Botanic Gardens on the left, and the fair and honoured college, Magdalen, on the right—to the Carfax Church, at its extremity, is said to be the most beautiful street in Europe; and, surely, with truth, for the very inequalities of the later-built houses aid the picturesque; while, on either side, are the interesting and time-honoured structures—University College, Queen's College, All Souls' College, and the richly-adorned Church of St. Mary; down narrow alleys, glimpses are caught, at brief intervals, of New College, St. Peter's Church, St. Mary's Hall, Oriel College, of Corpus, also, and Brazen Nose, the Radcliffe and Bodleian Libraries, "the Schools," Lincoln College, and the great college, Christ Church, in St. Aldates.

* The distance from London to Oxford by water is one hundred and sixteen miles and a half; by land it is fifty-two.

† Domesday Book is the most important and valuable monument of its kind possessed by any nation. It was compiled under the direction of William the Conqueror, and in accordance with the resolution passed at the council held in Gloucester, A.D. 1085. It contains a survey of all England, and minutely specifies the extent of lands in every county, and who they are held by. It also gives the various tenures under which they are held, and notes whether they are meadow, pasture, or tenty districts. In some instances it gives the number of persons living on them, and notes if they be bond or free.

‡ The old city seal represents an ox crossing a ford.

§ The Corporation claim a right to refreshment at certain places on the route—commencing with crawfish and sops in ale at the starting-point, a house in St. Aldate Street, and ending with "Canary wine" at the lodgings of the President of Corpus.

Without dating the commencement of learning in Oxford so far back as did Geoffrey of Monmouth—a thousand years before the commencement of the Christian era—we may safely believe that in the ninth century it had become the fountain whence issued many learned clerks, and that among the earliest to endow it was the king *par excellence*—King Alfred,* “whose memory shall be always sweeter than honey.” The erection of colleges, or houses set apart for students, and for their special accommodation, did not, however, commence until the middle of the thirteenth century—students having been previously lodged in various houses of the town. Merton College, Balliol College, and University College, were founded about the same time, between the years 1264 and 1300; Exeter College, Oriol College, Queen’s College, and New College, between 1314 and 1386; Lincoln College, All Souls’ College, and Magdalen College, between the years 1430 and 1460; Brazen Nose College, Corpus Christi College, and Christ Church, between the years 1507 and 1532; St. John’s College, Trinity College, and Jesus’ College, and Wadham College, between the years 1555 and 1610; Pembroke College in 1620; and Worcester College in 1714. There are thus in Oxford nineteen Colleges, and five “Halls,” which differ from the colleges only in some unessential forms and privileges. These halls are St. Alban, St. Edmund, St. Mary, New Inn Hall, and Magdalen Hall.†

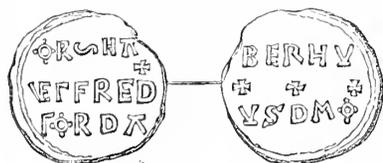

The Bodleian Library owes its foundation to the munificence of Sir Thomas Bodley, by whom it was commenced at the close of the sixteenth century; it has been increased by the gifts and bequests of many other benefactors, and also by annual grants of the University. But its principal augmentation was by an act of parliament, which ordains that a copy of every new book shall be contributed by the publisher. The library was first opened to the public on the 8th of November, 1602. Its management is creditable to the liberality of the University; it is freely opened to all applicants who desire its use, and are properly introduced; and it has thus been made available to men of letters, not only of England, but of all other countries.

The Radcliffe Library was founded by the eminent physician, Dr. Radcliffe, about the middle of the eighteenth century.

The lovers of Art have always a special treat at Oxford: the “University Galleries”—erected by C. R. Cockerell, R.A.—contain treasures of rare interest and value—chiefly the drawings of Michael Angelo and Raffaele, collected by Sir Thomas Lawrence; and the gift of the widow of Sir Francis Chantrey of the busts and monumental figures which were the original models of the accomplished sculptor. This is a new building—and by no means the only one by which modern architecture preserves the supremacy of the city; while, from time to time, “restorations” are effected judiciously and liberally. Oxford to the Future will therefore be as grand and beautiful as it has been to the Past.

Of the once famous Beaumont Palace, built by Henry I., nothing now remains; its site, however, is indicated by a new street, to which it gives a name. Of ancient structures—made venerable by time and holy by uses—Oxford has, of course, many besides her colleges; the most interesting of these are the several parish churches, all of them containing venerable relics of times long gone by. In several of the streets, also, there are singular relics of old houses. But, as we have stated, to convey anything like a reasonable idea of the attractions of this great city would be to fill a volume of more than “goody size.” For this reason, also—because it would be impossible to do justice to the theme within limited space—we have given fewer illustrations than usual to this part of our work. The establishment of Messrs. Parker and Son will, however, supply all the information the tourist can need; and that upon every subject concerning which he will require knowledge.

* The curious little silver penny here engraved, from the rare original in the Bodleian Library, was coined by King Alfred in the city of Oxford. The letters exhibit all that irregularity which characterises the early Saxon coinage of England, many of them being upside down, while the O looks more like an ornament than a letter. On one side is the king’s name, ALFRED, and above and below it the name of the town, spelt ORSNAPORDA. The other side contains the name of the “moucyer,” or person who struck the coin.

† “The University is a corporate body, styled and to be styled by none other name than the Chancellor, Masters, and Scholars of the University of Oxford.” It is not, as is often supposed, a mere collection of colleges, nor do the colleges form part of the corporation, though its existence may be said to depend on a union of them. The business of the University is carried on in the two houses of Congregation and Convocation, which are made up of members of the University who have obtained the degree of M.A. The duty of the upper house, or Congregation, is principally to pass grades and dispensations, and grant degrees. The power of Convocation reaches to all the affairs of the University, though it can only entertain questions sent to it from the Hebdomadal Board, or heads of houses, who are so named from their meetings being held weekly; and its power is limited with regard to matters regarding the statutes of the University. Yet, while these houses are entrusted with such authority, their measures are subject to an absolute veto by the chancellor or vice-chancellor singly, and by the two proctors jointly. The chief officer of the University is the chancellor, who is elected for life, and holds, nominally at least, high powers; but, actually, these are delegated to the vice-chancellor. According to Oxford etiquette the chancellor, after his installation, never enters the University, except when he is called upon to receive or accompany any royal visitants. The office is now an honorary one, and is always conferred upon some eminent nobleman who is already a member of the University. The resident head of the University is the vice-chancellor, who is chosen in rotation from the heads of houses, and holds his appointment for four consecutive years. He is the chief executive officer of the University, and his position is one of much dignity as well as importance. His immediate deputies are the two proctors, also officers of importance. The other University officers are the professors, and such as are required for carrying out its educational purposes, with those necessary for the enforcement of discipline, and the management of its pecuniary concerns. The chief distinction in the members of the University is into those ‘on the foundation,’ and those ‘not on the foundation;’ the former consisting of the heads of houses, or persons holding college fellowships or scholarships, and receiving from them a certain income; those not on the foundation being, on the other hand, such as maintain themselves, while at the University, wholly at their own expense. The distinction is pointed out in the term applied officially to the two classes, the one being styled ‘dependent,’ the other ‘independent’ members. There is no difference in their privileges.” All students who matriculate at the University are required to belong to some college.”

We have but named the several colleges and public structures which have made, and make, Oxford famous throughout the world; and give to it importance next to London, and interest second only to that of regal Windsor:—

“Leaving us heirs to amplest heritages
Of all the best thoughts of the greatest sages,
And giving tongues unto the silent dead.”

The visitor who goes through and about them will have days of enjoyment, not alone because of “old renown” and the memories associated with every step he treads, but as the great intellectual hereafter of the nation. The names that will occur to him are those of England’s loftiest worthies: here, apart “from the bustle of resort,” they girded on their armour to battle against ignorance, superstition, infidelity; here, great men of the past, who best “pen’d or uttered wisdom”—

“Their spirits, troubled with tumultuous hope,
Toil’d with futurity”—

drank deep of that holy fountain which gave them strength for life. Here the aristocracy have their full share of glory; but here the people have just right to pride;—for high among the highest of their country’s benefactors are, and ever have been, those who “achieved greatness” unaided and alone.* Rare delight, and ample food for thought, will he obtain who wanders through the streets where Wolsey walked in triumph, and Shakspeare honsed in obscurity; where Land and Wesley taught; where liberty inspired Hampden; where Wielif planned for his country freedom of conscience, achieved and kept; where was the chief battle-field of that great contest which threw from England an intolerable burthen; whence the Reformation spread its light; and where perished the great THREE, who, by their deaths, “lit such a candle in England as, by God’s grace, hath never since been put out.”

Here have gathered, fraternised, or fought, great men—from the age of Alfred to the reign of Victoria: men hostile in politics, opposed in religion, often zealous over much, but earnest, faithful, and unflinching; however separated by opinion, all labouring in the great cause of human progress—differing only as “one star differeth from another star in glory”—

“their names
In Fame’s eternal volume live for aye!”

But chiefly the visitor will pause and ponder beside the iron cross which, in the middle of a causeway, marks the spot where bigotry consumed three prelates—Cranmer, Latimer, and Ridley; and he will thence make pilgrimage to the “Martyrs’ Memorial,”† which a grateful posterity raised as a perpetual reminder that by their heroic deaths they gave vigorous life to that purer faith, which, far above all other things—kings, principalities, and powers—makes England a land of liberty.‡

It is, indeed, impossible to exaggerate the claims to consideration of stately and learned Oxford; such is its solemn and impressive grandeur, that even in walking its streets laughter seems desecration, and haste unnatural. Its very atmosphere is a lure to study; the “mossy vest of time” is everywhere instructive; the crumbling of its ancient walls tempt to thoughtful repose. Even the waters of the Thames are calmer here than elsewhere; while its many spires are closely, and in true glory, linked in happy association with the memorable past:

“Amid th’ august and never-dying light
Of constellated spirits, who have gained
A name in heaven by power of heavenly deeds.”

In cloisters pale, in venerable halls, beneath stately porticoes, in silent galleries, in sombre quadrangles, by solemn altars, in neatly-trimmed gardens, in umbrageous walks,—the students think and work: its rare libraries, enriched by the wisdom of ages; its large assemblages of Art-wonders; its vast resources of science,—are their daily teachers. Lessons still more valuable are taught by tombs and tablets in their chapel courts; by quaint windows, that let in “religious light;” and by statues of pious founders and canonised saints, still speaking from niches they have occupied for centuries, giving emphasis to that memorable text, more impressive here than elsewhere, commingling piety with loyalty,—“Fear God! Honour the king!” Move where we will in this fair and holy city, we think and feel as of a higher and a better race than the world’s ordinary denizens; while

“The attentive mind,
By this harmonious action on her powers,
Becomes herself harmonious.”

We must resume our course; and, making our way again to Folly Bridge, bid adieu to the fair city, quoting, as we enter our boat, the quaint and homely couplet of the old poet:—

“He that hath Oxford seen, for beauty, grace,
And healthiness, ne’er saw a better place.”

* As old Fuller quaintly says, “It is not the least part of Oxford’s happiness that a moiety of her founders were prelates, who had an experimental knowledge of what belonged to the necessities and conveniences of scholars, and therefore have accommodated them accordingly; principally in providing them the patronage of many good benefices, whereby the fellows of those colleges are plentifully maintained after their leaving the University.”

† “The ‘Martyrs’ Memorial’ was erected in 1841, and stands in St. Giles’. It is the work of Messrs. Scott and Moffat, the statues of “the Great Three” having been sculptured by Weeks. It is a fine work of Art, and worthy of the city.”

‡ It has been ascertained that the burning took place a few yards from the spot indicated by the iron cross in Broad Street. Mr. Parker, whose numerous publications have given to Oxford a renown akin to that which it derives from its University, has instituted a close research into the facts connected with this deeply-interesting subject, the result of which has been to demonstrate that the fire was lit immediately opposite the gateway of Balliol College, over which at that time the master’s lodgings were situated.

RAMBLES IN ROME.

No. III.—MODERN ART IN ROME.

THE pontificates of Julius II. and Leo X. included the Augustan age of modern Art in Rome. To grandeur of conception, and a boundless liberality, they added an enthusiasm which ever urged onward the great men by whom they were surrounded. Impatient of delay, or even of rest, the fiery Pope Julius quarrelled chiefly with the pace which could not keep up with the velocity of his wishes. Michael Angelo seems to have been best fitted by nature to cope with this pontiff; but the gentle Raffaele died under the impetuosity of Leo. The artist, fearing this want of patience, ran from his palazzo upon a sudden summons, in the full heat of the sun, and died immediately afterwards. His pupils carried out his great designs, but we miss the master-mind after his death. The galaxy of talent which shed a glory over the pontificates of these popes makes their rule an important era in the history of Art. The faded glories of the Vatican still shadow forth the grandeur of design and beauty of execution which rendered it the greatest Art-palace of the age of the Renaissance.

We say these walls "shadow forth faded glories," and we say so advisedly. Perhaps no feeling can be more distressing to the artist, or lover of Art—who has made his pilgrimage to Rome for the first time—than the mortifying state of decay in which he finds some of the most celebrated works by these master-minds. The gloomy chambers, whose walls exhibit this crowd of faded figures, are the famous "Camera" of Raffaele; the open galleries around the court-yard of the Vatican, partially decayed by weather, is his "Loggia." The dim grey picture on the wall of the Sistine Chapel, whose general features are now only barely distinguishable, is "The Last Judgment" of Michael Angelo. "After all your high-raised expectations, you will walk through a set of cold, square, gloomy, unfurnished rooms, with some old, obscure, faded figures painted on the walls—your disappointment will have no bounds. But have patience—suspend your judgment—learn to look on them, and every fresh examination will reward you with the perception of new beauties, and a higher sense of their excellence."^{*}

The ruin brought upon these noble works is the result of the most wanton neglect and injury. In 1528, when Rome was taken by assault and cruelly pillaged by the Constable Bourbon, the brutal soldiery did more mischief than the Goths in their earlier ravages. They lighted their fires in these glorious rooms, blackening Raffaele's frescoes, then fresh in their beauty, and wantonly destroyed many of the finest heads he had painted. The popes afterwards endeavoured to repair the injury; but the charmed hand was wanting, and Lanzi reads a severe remark made by Titian on this "restoration" when he first saw it.† Every inch of walls and roof of these chambers were once refulgent with the glories of Art. So was the Loggia; Lanzi says, "They who saw it after it was finished—when the lustre of the gilding, the brilliancy of the colours, and the freshness of the marbles made it resplendent with beauty on every side—must have been struck with

amazement as at a vision of Paradise." The open gallery in which they are painted overlooks the district of the Trastevere and the whole of Rome beyond, the view being bounded by the Sabine Hills; it is the noblest prospect to be seen of the city, with the grand colonnade of St. Peter's at your feet. Well might the old popes delight to linger in this lovely gallery, and inhale the pure breezes as they floated over the Eternal City; but Lanzi sorrowfully notes that "the exposure of the gallery to the inclemency of the weather, had almost reduced it to the squalid appearance of the ancient grotesques" in that comparatively short period. Now the frescoes have, in some places, faded altogether, many great pieces of stucco have fallen from the walls, and the whole has a dirty and ruined look. The present pope has glazed the whole of the arcades; but this is like another realization of the old proverb—"Shutting the stable after the steed is stolen." He has also commenced an expensive restoration of the top-most story, which is certainly a most brilliant reproduction; but, of course, it ceases to be of the same interest as the original work, and it is much to be regretted that a loving care was not earlier bestowed on this renowned work.

The "Last Judgment" of Michael Angelo is a still greater wreck. It also has suffered from its position. It occupies the entire wall of the Sistine Chapel, against which the altar is placed, and this obscures a great part of the picture. To make it still worse, a baldachin rises high above it, and altogether hides the central part of the lower half of the design. The smoke of the incense, and the chills and damps, as well as the general neglect of more than three centuries, have ruined it as a picture, and you can now only dimly discern the general design; the figures come forth, as you study it, like ghosts through the foggy haze of a supernatural vision. It is like experiencing a dream to look upon it.

It is in the divine pictures by Raffaele that we must now seek his master-mind. "The Transfiguration," the noblest of human works, still exists in purity. We need not descant on that which is so well known, but speak rather of his other works in Rome. In the Borghese Gallery is his own portrait at the age of thirteen, remarkable for its purity and truth, and full of the rich promise of his after life. In close proximity is placed his first historical picture, painted when he was twenty-four years of age. It is full of action, powerful in composition and colour, and as perfect in preservation as could be wished. On looking at such pictures, astonishment rises in the mind stronger than ever, that men should exist to "write down" so divine a spirit; and, cloyed with the beauties of pure and true Art, defend and worship the hideous conventionalities of pre-Raffaellitism: thus preferring the darkness of the middle ages to the "light from heaven."

In the bright light and clear air of Italy, pictures certainly "tell" more powerfully than in our dingy galleries. They evidently accord better with a sunny land than a foggy one. Their artists, too, seemed to have dipped their pencils in brighter tints, and had generally a gayer fancy than the northernmen. No artist shows to more advantage here than Titian; his glorious allegory of "Sacred and profane Love," in the Palazzo Borghese, is a work on which the eye and mind may rest without satiety. There is a half-length of a noble female slave, richly dressed, among the small collection of pictures in the Barberini Palace, finer than the Raffaele Fornarina (a coarse picture of a coarse woman), or the over-praised "Beatrice Cenci," which Shelley has invested with a poetry not its own. Then for Titian's power as a portrait-painter, look upon the children of Charles V. in the Corsini Gallery; you leave them as if you were leaving living people, and you remember them afterwards as vividly as you do the persons to whom you may have been introduced at Rome. For such undying records of fleeting life can any artist be paid too highly? It is but a purchase of immortality!

In visiting the Roman palaces, the stranger will be first astonished by their enormous size; then by the lavish splendour of their decoration; and lastly by their desolate air. Generally constructed in the sixteenth and seventeenth centuries, when the nobles were very wealthy, and anxious to outstrip each other in display, they are now scarcely properly tenanted. Many are let in suites of lodgings, or for the season to wealthy travellers. The Bar-

berini Palace has the look of a deserted barrack, and the remains of the picture-gallery are huddled in three small rooms down a back stair; while acres of apartments show closed shutters, broken windows, or servants' rags out to dry. More melancholy pictures of fallen magnificence than some of these palaces exhibit, cannot well be conceived. It is in the Palazzo Pamphile-Doria only, that we see a noble building nobly kept up, and absolutely lit with gas—an improvement quite recent in Rome, and so much opposed to the spirit of the ruling powers, that it is restricted to the one long avenue—the Corso—all others being left in dark, dirty insecurity, two centuries behind the present age.

The older palaces, the Borghese, Spada, &c., are very striking in their interior arrangements. The fountains in the saloons of the former are pleasant novelties to a stranger; but the sculpture, painting, and gilding which cover walls and ceiling are quite oppressive by their lavish design. It reminds one of the full-blown glories of the court of Versailles. But it is all splendour and no comfort; you clatter along on stone or stucco floors, and the rooms are totally unprovided with fireplaces. A brazen or an ugly open pan of charcoal is introduced when warmth is required; generally the inhabitants content themselves with a small earthen pot of charcoal, which is placed in the lap, and the hands held over it in cold weather. The alternations of climate are sometimes very severe in Rome; generally the change of temperature between day and night is violent. From the contiguity of the Pontine Marshes, fevers are generated, and there are few cities more unhealthily situated.

In wandering through the half-deserted streets between Ponte Rotto and the Ponte St. Angelo, many fine old houses will be noticed, once the residence of important signors, now inhabited by colonies of poor families. Traces of misery and want peep forth from the dirty doors and broken windows of these noble old mansions; but the walls tell tales of better days. Many fine fragments of ancient sculpture decorate their *façades*, and you occasionally meet with pleasing designs upon the fountains with which Rome is provided abundantly. The classic Romans first gave the inhabitants this supply of pure water; and though it is now more limited, it is still a noble one for all purposes. Many of the large palaces have a small fountain at an exterior corner, always running, for public use; and there is one at the Simonetti Palace very indicative of the sixteenth century, it represents the half-length figure of a man in a gown and cap, holding a barrel in both hands, and pouring the water through the spigot-hole. With grander designs for fountains Rome abounds,—from the vast heap of sculpture at the back of the Conti Palace, known as the Fontana di Trevi, to the simple and graceful Triton who blows the water through his shell in the Piazza Barberini. The first is in very questionable taste—a huge assemblage of rocks, sea-gods, horses, and shells; but the latter is an elegant design by Bernini.

Rome possesses specimens of the art of Bernini in all its phases, and exhibits his gradual deterioration in style as he grew older and more mannered. Thus, the group of Apollo and Daphne in the Villa Borghese, executed when the sculptor was only eighteen years of age, is a really fine work: so also is the *Æneas* and the *David*; it is, indeed, in this one room, "the Camera di Bernini," we see how great the sculptor was when young. If we would see what he was in the zenith of his fame, when he unfortunately exercised a fatal influence on the Arts, we must go to St. Peter's; and there, in the place of honour, see his gigantic absurdity, the group of fathers of the Church supporting the bronze case for the chair of St. Peter. Here you have his vulgar figures, his conceited attitudes, his meaningless draperies, in perfection, and sigh to think of the mischief his want of taste did in his own day, and long after it, by means of the false school he founded.

Canova has honours in Rome second only to the ancients. To him one of the four pavilions in the "Cortile di Belvidere" of the Vatican has been assigned. It contains the *Perseus*, and the boxers *Creugas* and *Damoxenus*. A work more characteristic of the peculiar style of this artist, is the reclining *Venus* of the Borghese collection, modelled by him

* "Rome in the Nineteenth Century," 1820. This opinion of an amateur is still more strikingly enforced by the written experience of one of our greatest painters—Sir Joshua Reynolds—who visited these works with longing enthusiasm. He records his first impressions thus:—"I remember very well my own disappointment when I first visited the Vatican; but, on confessing my feelings to a brother student, of whose ingenuousness I had a high opinion, he acknowledged that the works of Raffaele had the same effect on him; or rather, that they did not produce the effect which he expected." He adds how much he felt mortified at not finding himself enraptured with the works of this great master, and declares "it was one of the most humiliating circumstances that ever happened to me." He naturally solves the enigma in the course of due study; and finds that if Raffaele's works "had really been what I expected, they would have contained beauties superficial and alluring, but by no means such as would have entitled them to the great reputation which they have so long and so justly obtained. The excellence of his style is not on the surface, but lies deep, and at the first view is seen but mistily. It is the florid style which strikes at once, and captivates the eye for a time, without ever satisfying the judgment."

† It was Sebastian del Piombo who had been employed thus, and Titian purposely asked him who had presumptuously and ignorantly debauched them. Lanzi, in his *Storia Pictorica*, thus records his words:—"Che fosse quel presuntuoso ed ignorante, che era embrattiti quoe' volti?"

from the sister of Napoleon; its delicacy is almost carried to excess—it is the “stippling” of sculpture, and, like his “Graces,” reminds us of the opera ballet rather than of nature. How great and pure he could be, let his monument to Pope Clement XIII. in St. Peter’s testify! Nothing can be finer in conception, or purer in execution, than one figure here—the Genius of Death. It is a graceful figure seated with torch reversed, the face tinged with melancholy; but it is the melancholy of reflection, rather than of sorrow; the pondering over mankind’s inevitable doom; a melancholy seductive, rather than repulsive; no hideous, hopeless sorrow here, like the weeping children, and broken-down mourners over urns on ordinary tombs. Death is here not frightful, but hopeful. He is the angel of God employed in his immutable decrees,—the harbinger of a better world, whose placid holy face bespeaks the quiet and happiness that he brings to all who walk faithfully on earth. This one figure is worth a journey to Rome, and few minds have produced so high and holy an embodiment of pure thought and right feeling.

The studios of modern Roman sculptors—including as they do many who are only Romans by residence—are among the most delightful visiting places within the whole city walls. You need no ceremonious introductions here. You merely knock and enter. Around you are the workmen and their labourers,—the living artists who cut from the shapeless marble-block works destined to last ages after the frail human hand that fashioned them has mouldered into its native clay. Happy men seem they all!—for all true lovers of Art must be happy. The consciousness of the appreciation of beauty is a joy to every mind; how much more must be the pleasure of giving that consciousness a tangible form—an enduring existence; rewarding him who made it, gratifying him who possesses it, and hundreds yet unborn who may gaze on it? Master-minds in various grades of life there are many; but the poet and the artist has the most powerful mastery in the witchery of his works through all ages of change.

To the honour of Art and its professors in Rome let us close our notes with a testimony to the brotherhood they form. From all quarters of the world students flock to Rome; and here they literally live as “a hand of brothers.” The nature of their studies breaks down all barriers which nationality or customs might impose elsewhere, and all meet on common ground, whatever their native country may be. An amicable cordiality seems to reign in men who might, in all else but Art, feel and act very oppositely to their compeers; but Art is the cement of friendship and peace: may it always produce “goodwill among men!”

We have no statistics of the numbers of native and foreign artists who reside in Rome. Very many are foreigners, who, like our own Gibson and Penny Williams, live there entirely: others are students—birds of passage—who carry home the experience of months for the guidance of home-life in after years. They have their known resorts, and one famed one is the Café Greco, in the Via Condotti, where coffee, ice, tobacco, and general conversation employ their evenings, and where breakfasts of a simple kind are generally eaten. An artist’s day is passed in his studio, and if his dinner be not sent from a *trattoria*, he goes there. It would not be easily possible to mention an existence more replete with the elements of happiness than that of a true votary of Art. Removed from the turmoil of life, he exists only for the study of the beautiful; and if his course be chequered by the crosses which are the lot of all, he may console himself by knowing they are fewer than those that beset the more adventurous in the battle of life; while his mental organisations open a field of pleasure closed to mere worldly men. If Rome offered no other lesson, this, that teaches the amenities Art always offers to its devotees, whether professional or amateur, is worthy of all consideration.

“Ye nobler Arts! as life’s last lustre given,
Gilding earth’s grossness with the gloss of heaven,
’Tis yours to crown complete the social plan,
And harmonise the elements of man.”*

F. W. FAIRHOLT.

* Sir M. A. Shee’s “Rhymes on Art.”

THE NATIONAL PORTRAIT GALLERY.

THE Board of Trustees appointed to carry out the new parliamentary project of a National Portrait Collection of British Worthies, have made known certain of the principles by which they propose to bind and govern themselves in the execution of their trust. These principles, so far as they go,—for they leave questions of great and leading interest wholly untouched,—harmonise sufficiently well with the views which we have ourselves announced as necessarily underlying a successful embodiment of the scheme. It will be their desire, the Board say, in either making purchases or accepting presents, to look to the celebrity of the person represented rather than to the merit of the artist representing. Why, this, as we have pointed out, is of course:—matter of what must be called “first principle” in such a project. In this particular collection we are in search of the portraits of illustrious men, not of the works of illustrious portrait-painters. If we can have the first in the form of the last, so much the better; but the first is, by the terms, what we want, in whatever form. A portrait of Sir Joshua Reynolds is far more to our purpose here than a portrait by Sir Joshua Reynolds. A likeness of some nobody by the great master would be a valuable addition to our present National Gallery; but a likeness of Sir Joshua, even by a nobody, would be the welcome feature in our new Gallery of Portraits.—The trustees proceed to say, that they will attempt to estimate the celebrity of the person proposed for exhibition in this gallery, without any bias to political or religious party. Very good, so far as the expression of their intention goes; and we should scarcely expect any body of trustees, in our day, to say less. But the manner in which this intention shall be actually carried into effect includes, as we have said, one of the vital conditions of the scheme. We believe, that it is for the most part in some higher name than that of party that party works its injustices. Even good abstract intentions themselves have too often broken down before particular applications. In morals, as in mechanics, it is the law of bias that it must act after its nature. Colour blindness cannot contain within itself the means of its own correction; the faculty of rectification must be sought in a careful and honest appeal beyond its self-consciousness. It is precisely at this point that the trustees will need most careful watching, and have most need carefully to watch themselves. We confess, that what follows gives us some uneasiness:—“Nor will they [the Board] consider great faults and errors, even though admitted on all sides, as sufficient ground for excluding any portrait which may be valuable as illustrating the civil, ecclesiastical, or literary history of the country.” Here we are on very ticklish ground. This mention of “faults and errors” lets in all the suggestions of party judgment. Great action *must* have its historic place in any great portrait history like this, without being subjected to the chance of condensation as below standard on any partial and shifting assay. We are not reconciled by the qualifying clause which speaks of “great faults and errors, even though admitted on all sides.” We should like to know how many of the greatest names in history there are which are wholly free from the “faults and errors” that must be “admitted on all sides.” We wish that “faults and errors” had not been mentioned at all in connexion with this subject. It is true, the trustees declare their intention to reject such elements from their decisions; but we do not hear the mere hint of these considerations as possible influences affecting the integrity of an historic series without a painful recollection of the monstrous things which have been already enacted by the dogmatism that affected to determine what was “fault” and what was “error.”—No portrait, the Board go on to say, of any person still living, or deceased less than ten years, shall be admitted by purchase, donation, or bequest, except only in the case of the reigning sovereign, and of his or her consort, unless all the trustees who shall be at the time in the United Kingdom, and not incapacitated by illness, shall, either at a meeting or by letter, signify their approbation. “And no portrait shall be admitted by donation, unless three-fourths, at least, of the

trustees present at a meeting shall approve it.” Thus, so far as appears, the trustees consider themselves as the tribunal of final resort for the dispensation of such fame as depends on a place in this portrait gallery. Their arrangements, however, are of course young and experimental,—and will probably grow as the institution grows for which they are framed. We should have gladly welcomed, even in the outset, something larger and more definite in the expression of principle than these rules embody; but there is, at any rate, nothing in them which is not consistent with a wholesome growth. That growth we shall expect with an interest free from apprehension; because, notwithstanding its present delegation in the matter, we still look, beyond the trustees, to Parliament as a court of appeal.

PICTURE SALES.

A COLLECTION of pictures by the old masters, the property of Mr. Braine, was sold at the rooms of Messrs. Christie and Manson, on the 6th of last month, and realised nearly 8000*l*. The principal lots were the following:—‘The Grand Canal, Venice,’ GUARDI, 47 *g*s.; a small ‘Landscape,’ BOTH, 41 *g*s.; ‘Night Scene,’ a small picture charmingly painted, VAN DER NEER, 65 *g*s.; ‘A Troubled Sea View,’ BACKHUYSEN, 65 *g*s.; ‘Interior,’ ECKHOUT, 54 *g*s.; a figure subject by OSTADE, 69 *g*s.; a ‘Marine View,’ VANDERVELDE, 112 *g*s.; ‘Fête-Champêtre,’ LANCRET, 77 *g*s.; another ‘Marine View,’ VANDERVELDE, from the De Gruyter collection, 116 *g*s.; two small pictures by LANCRET and F. MIERIS, respectively, 66 *g*s. and 77 *g*s.; a composition of figures, by TENIERS, a fine specimen, 205 *g*s.; ‘River Scene,’ P. WOUVERMANS, also an admirable example, 205 *g*s.; ‘Interior,’ OSTADE, 105 *g*s.; a ‘Rich and Elaborate Composition,’ METZU, 155 *g*s.; a ‘Sea View,’ VANDERVELDE, a very beautiful work, 255 *g*s.; a graceful example of the pencil of GREUZE, from the collection of Mr. Pierpoint, 240 *g*s.; an exquisitely finished small ‘Landscape,’ WOUVERMANS, from the collection of the Baron Nagel, 200 *g*s.; an ‘Italian Scene,’ A. VANDERVELDE, from the Montcalm Gallery, small, 72 *g*s.; a pair of CANALETTS, Venetian views, very fine, and large, 215 *g*s. and 230 *g*s. respectively; an ‘Interior,’ peasants drinking and smoking, OSTADE, 203 *g*s.; a ‘Lady and a Cavalier,’ an interior scene, very small, from the De Berri collection, NITSCHER, 94 *g*s.; ‘Landscape,’ RUYSDAEL, 126 *g*s.; ‘Landscape,’ WYNANTS, a picture of the highest quality from the Nagel collection, 210 *g*s.; another ‘Interior,’ by OSTADE, 185 *g*s.; ‘Camp Scene,’ WOUVERMANS, 150 *g*s.; ‘Landscape,’ VAN DER HEYDEN, 93 *g*s.; ‘Head of a Girl,’ GREUZE, 150 *g*s.; ‘The Bowl-players,’ D. TENIERS, small but brilliant, 110 *g*s.; ‘Landscape,’ N. BERGHEM, very fine, from the collection of Count de Morry, 261 *g*s.; a magnificent ‘Landscape,’ by CLAUDE, was knocked down to the Marquis of Hertford for 500 *g*s.; ‘River Scene,’ CUYP, eagerly sought after, 110 *g*s.; ‘Figures,’ G. DOUW, 95 *g*s.; a fine ‘Italian Scene,’ DU JARDIN, from the Montcalm Gallery, 180 *g*s.; Lot 45—considered the “gem” of Mr. Braine’s collection—a small picture by P. POTTER, after a keen rivalry among the bidders, was knocked down to the Earl of Normanton for 590 *g*s.; ‘Italian Landscape,’ BOTH, 215 *g*s.; a ‘Landscape,’ N. BERGHEM, from the Redleaf collection, an exceedingly fine work, 370 *g*s.; and one equally beautiful, by WOUVERMANS, from the De Berri collection, 350 *g*s.; the ‘Rape of Europa,’ TITIAN, was bought by the Marquis of Hertford for 325 *g*s.

At a sale of water-colour drawings, in the early part of April, by Messrs. Foster, five small subjects by TURNER fetched the following prices:—‘Aysgarth Force, on the Tees,’ 50 *g*s.; ‘The Alpine Pass,’ with figures, 50 *g*s.; ‘Ehrenbreitstein,’ 95 *g*s.; ‘The Land’s End,’ 55 *g*s.; and ‘Hastings from the Sea,’ 90 *g*s. ‘A View of the Lago Maggiore,’ by STANFIELD, brought 53 *g*s.; and ‘The Hay-field’ and ‘Driving the Flock,’ by DAVID COX, companion drawings, 48 *g*s.

Mr. Lewis Pockock’s pictures, recently sold by Messrs. Foster, realised good prices; but we have not space to enumerate them.

THE WELLINGTON COMPETITION.

THE time is near at hand when the public will be called on to take their share in this important award. By our next day of publication the competing models will have been delivered in at Westminster Hall, or such other place of address as the First Commissioner of Works may in the meantime direct;—and the business of arrangement only will remain between them and that exhibition on which, if the public be true to itself in the matter, the fate of this great monument must, to a considerable extent, depend. It is of the utmost importance, then, that we should once more, while yet there is time, call the serious attention of our readers to the part which properly devolves on them in the approaching Art-contest. In the face of the opportunity about to be afforded to them, we summon the public to take charge of the interests at stake, and to exercise the control which belongs to themselves over the balances in which these interests are to be weighed.

It will be in the recollection of our readers that, in the number of this Journal for October last, we explained to them the terms on which the First Commissioner had summoned this competition for the great national monument to the late Duke of Wellington; and that we took that opportunity of trying the provisions of the minister's manifesto by the principles for which we had ourselves contended as the fit ones to preside over the distribution of the Government Commissions in respect of the National Works of Art. We were glad, then, to recognise a certain amount of reconciliation between Sir Benjamin Hall's views and our own; though we had at the same time to call attention to the fact, that on some points which we had treated as of great importance the Commissioner still remained ominously silent. The general assumption to himself of an authority in the matter of this Monument which we maintain that he could receive only from Parliament, coupled with the silence in question as to points of detail which we deem of high significance, had left with us, we confess, a feeling of distrust, and taken from even the concessions made, as we think, in a right spirit, something of their value. We have reason to know, that our views as to the legitimate principles of Art-competition, and our distrust as to their application in the present case, are both shared by some of the most eminent members of that profession for whose service, and for the service of the public through whom, they were originally designed.

Our readers will remember that, amongst other points of difference between ourselves and Sir Benjamin Hall, we differed from him on the question of site. That objection may as well be now withdrawn,—for the question of site must be considered as settled. Sir Benjamin Hall clings to the notion of the last half century, that St. Paul's Cathedral is the English Pantheon;—and in St. Paul's, accordingly, it seems to him inevitable that our modern Mars must have his monument, among the *dii minores* who already "fight their battles o'er again" beneath the shadow of its cross. It is just possible that this is one of the particulars in which the First Commissioner may find the summary character of his action disapproved of. If Parliament should happen to be of opinion that the most fitting site has not been chosen, it will see, at the same time, that Sir Benjamin Hall has put the point beyond the reasonable reach of a parliamentary remedy. Under his ministerial summons, an amount of Art-labour has been called into action, with direct reference to this locality, with which the omnipotence of Parliament will not choose to break faith. The House may, nevertheless, be disposed to hint that, having found the money for the Monument, it would have desired to be consulted on this and some other matters. For ourselves, we retain the objection, which we have already expressed, to disturbing the *one* idea that should preside within a Christian temple by the intrusion of hero-worship;—and we also retain our opinion, already expressed, that the metropolis offers a space that expressly recommends itself for this Monument. The wide area that stretches between the Horse Guards and the ornamental ground in St. James's Park, amongst other favourable conditions, contributes, as we have said, in its inevitable associations, much of the sentiment which is necessary to the completeness of a work of the kind,—while it is itself greatly in want of just

such an embellishment and illustration as this Wellington Monument would be. We can say, nevertheless, that considered in an architectonic point of view, the site actually chosen is a fine one. We have examined it carefully with a view to this Monument; and certainly, within the conditions which it offers, a grand composition may here be obtained.—So, the argument against proclaiming human triumphs in Christian churches may be considered as for this once more adjourned. The Wellington models have been made for, and the Wellington Monument will arise doubtless in, the nave of St. Paul's Cathedral.

The presence of the foreign artist in this competition may also—and for a similar reason—be regarded now as a settled conclusion. Since the specification appeared, there have been hundreds of applications for copies at the Office of Works,—and of the copies issued in consequence, more than one half have been sent into foreign lands. Should Parliament even be of opinion that it was unnecessary to supplement English inefficiency by calling in the foreigner,—that the celebration of a British hero is most fitly assigned to a British sculptor-bard,—it will, still, be unwilling to confiscate, after the high ministerial fashion, the conditional rights of those whose models are already growing in the Art cities of two hemispheres under this specification. The question, therefore, how far it is necessary—or reasonable—that the artists of foreign nations shall, to the prejudice of our own, be maintained by our national grants, must also, we apprehend, like the question of site, be for this once more adjourned. On these two points, we are, for the present, beaten by a *coup de main*.

But there are certain other points in reference to the management of this competition on which Sir Benjamin Hall has of late suffered a more definite expression of his intentions to transpire:—some of which we must meet by a word or two of comment. Generally speaking, their character is not reassuring. They partake too much of that air of official assumption, official irresponsibility, and something like official infallibility, which had its votaries in happier times, but has lost its *prestige* in this questioning age. Sir Benjamin has fallen upon sceptical days. The faith in wisdom *ex officio* is extinct:—a hint which, by-and-by our readers will see, is not without its justification. On one head, however, under which, as we have formerly taken pains to show, many abuses have been wrought, we are indebted to the First Commissioner for a clear and distinct enunciation of principle conclusive against such abuses. The terms of the specification prescribed, amongst other things, the dimensions on which the competing models are to be executed; and this express form of prescription has been again and again violated on former occasions, with the result of a triumph to him who broke the law of competition over those who wrought in obedience to it. Again and again the very wrong against authority, authority has sanctioned as establishing a right. Against any such evasion of his own enactment the First Commissioner expressly declares war. In the interpretation of this particular clause he adopts the logical method,—not always recognized in the reading of ministerial programmes,—and declares that his specification is meant to be specific. No departure from the dimensions therein demanded will, he expressly announces, be allowed.

But Sir Benjamin Hall's refusal to give any hint as to the nature of the tribunal by which this competition is to be adjudicated on, coupled with his direction that all these models shall be addressed to himself, is, as our readers know, a subject of considerable uneasiness to those who are anxious, as we are, that this great contest shall have a result which cannot reasonably be impeached. To this source of uneasiness we have now to add another. It is declared by the First Commissioner that, with half the Art world, in this department, at work for him, and prizes to the amount of upwards of £2000 to be given away, the Government will yet not consider itself under any obligation to have the monument executed by the author of the best design. Now, truth to say, it is because we read these reservations by the light of former official doings, that they assume a significance which would not of necessity have attached to them in a more transparent atmosphere. There is about them a flavour of previous transactions that struck unwholesome roots in

the ground of official dogmatism, and grew up unpleasantly in the air of ministerial irresponsibility. We have here the First Commissioner in an attitude of which our recollections are far from satisfactory. We have certain familiar propositions repeated over again, which led before, as we remember, to very bad logic. As for the question of the judges:—we have already insisted on the importance of their being a court removed from all suspicion of extrinsic influence, and so endowed and constituted as to give to their decisions the character of unquestionable authority. It is urgent to have it understood, that a First Commissioner of Works, with all his staff, are not *ex officio* a competent Art-tribunal. We will not repeat our argument here, but refer back to it at page 296 of our October number for last year. The First Commissioner has done a wise thing in reference to this competition, in summoning the public to Westminster Hall as his assessors; and we wish that, in the same spirit, the names of the judges had been amongst the guarantees offered by him to competitors. In the case of a work of such mark and magnitude as this Wellington Monument, there is very much to tempt an artist into the lists; otherwise, we must express our surprise that sculptors of rank should consent at all to enter into any Art-trial in which it is not declared beforehand who are the parties to arbitrate on what they do. Confidence in the court can alone make their voluntary appearance therein a reasonable proceeding.

With Sir Benjamin Hall's declaration, that no obligation can be incurred as to the final concession of the commission even amongst the prizemen, there seems perhaps some difficulty in dealing at first sight:—yet, it opens a vista over very dangerous ground. Through the door thus left ajar we get a glimpse of some of the worst official abuses that have beset the path of the Arts. Of course, we have no intention to contend that, under any circumstances, a minister is bound finally to erect a National Monument which would be discreditable to the nation. If the case be made to rest absolutely on that issue, there is not a word to be said in the matter. That is a round proposition, presenting an angle of attack nowhere. Let us see, nevertheless, where this reservation of the ministers will land us, if it be maintained and acted on. We overlook for the purpose, and for the moment, the extravagance of the supposition, that a challenge which has summoned all the sculpture chivalry of Europe shall bring into the lists no knight of the chisel who must not go down before the critical lance:—that out of three hundred competing models, contributed from all the cities where Art has a home, by men many of whom are famous for what they have done, there shall not be one which can have acceptance before a *competent tribunal*. Let us, we repeat, see where the ministerial proposition itself will leave us. What, in the case supposed, will the minister do? Will he pay off his prizemen,—and declare that there can be no monument? Will it be proclaimed, that, two continents having been appealed to for an Art-memorial to the Duke of Wellington, it is found that no such memorial is possible, and the £20,000 must go back into the pockets of the people. Or, will the First Commissioner—somewhere in the background, hanging about the back stairs, it may be—find some retiring sculptor who did *not* compete, and whose non-competition is the pledge of his ability to perform? Will the minister *give*, on his own responsibility, to some favoured artist what the congregated Art of the world, omitting that one, could not win? If the first of these courses would be a stultification, the second would be—something worse than we choose to name:—yet, the history of Art-commissions in this country protects us against any just charge of gratuitous alarm when we suggest the possibility of the last-mentioned conclusion to a case of competition.—For ourselves, we confess, it seems to us, that the work which shall be good enough to deserve a prize of £700 will be good enough to be executed, in default of a better. We think it clear, that the competition, should it not result in a direct selection, should go finally amongst the prizemen, or the chief of them; and that these should furnish models or modifications, in the manner formerly explained by us [*Art-Journal* for October, 1856, p. 295], until that result shall be obtained. Out of that system Sir Benjamin Hall may be quite certain of getting a work which will be satisfactory to the nation. Meantime, we feel, as we have said, that the artists

have cause to be dissatisfied with the attitude of a minister who reserves to the future the constitution of the tribunal which is to try them,—and, as to any positive issue of the competition itself, keeps a veto in his pocket.—We shall soon have the opportunity of accompanying our readers in an examination of the models themselves; and we ask, we repeat, our readers, in and out of Parliament, to stand by us in the maintenance of the principles which should preside elsewhere over the same examination.

THE KALOTROPE.

A NEW optical arrangement, invented by Mr. Thomas Rose, of Glasgow, and named by him the Kalotrope, or *beauty-turner*, is one of the novelties recently produced at the Royal Polytechnic Institution. The design of this instrument is to show the ordinary illusions of the thaumatrope to an entire audience, and also to exhibit a succession of pleasing and instructive changes on any *one* disc of devices submitted to the action. The effects are the result of the persistence of vision; but this simple principle is presented under various conditions. The mechanical arrangement of the kalotrope consists of two wheels, to which a considerable range of velocity is given by a series of pulleys in connection with a first motion. The wheels are placed one behind the other, and move in contrary directions; the hinder wheel carrying a disc charged with certain devices, and the one in front, a disc with a number of radial perforations. This double-disc action is not in itself a novelty, various forms of it having been contrived by Duboscq-Soleil, Plateau, and other ingenious men; but we believe that its adaptation, in the present instance, to the production of a series of illusive changes on a single disc of devices, is both new and interesting. To understand the action and its effects, it is necessary to mention one or two simple facts in connection with them. The devices can no otherwise be seen than through the apertures of the front disc, and their appearance to the eye is affected by the angular motion of the apertures, or the space they travel in passing over any figure. Now if the devices were stationary, and the apertures only moved, the latter must travel a space equal to the full width of the figures, in order to pass them; but as both wheels are moving with equal velocities, and in contrary directions, the figure and the aperture meet each other, and the latter clears the figure when it has passed over a space equal to one half its diameter. So long, then, as the velocities of the wheels are equal, the figures are only narrowed to one half of their breadth; but when differently perforated discs are applied in succession, the figures are multiplied in proportion to the apertures; and if there is not room for these repeats of the devices to stand out singly, they involve and overlay each other. The inventor's discs are contrived with a view to this effect, and the most remarkable illusions of multiplication, combination, involution, and motion, are produced. We may give one instance as a general illustration of the action. A disc is charged with twelve intensely black balls, arranged in a circle, and nearly touching each other. Under simple persistence a delicately shaded ring is produced; the second wheel is then applied in front, and its spokes allowed to play over the balls, when they become a ring of twenty-four segments; a disc of twelve perforations is placed on the front wheel, and twenty-four oval figures are seen; a disc of twenty-four perforations is next applied, and forty-eight involved figures, beautifully varied in tint, are produced; lastly, a compound-perforated disc is used, when an intricate lace-work device is shown. The perforated discs might easily be extended to a series of twelve, or even a larger number, and of course the two wheels might have various velocities in relation to each other. If advantage were taken of all the varieties of action of which the kalotrope is capable, not fewer than a hundred changes could be brought over one disc of devices. Whilst the effects of this optical arrangement are beautiful as mere spectacles, many of them are of high value as illustrations of scientific principles. The instrument may claim to be admitted into the drawing-room as a philosophical recreation, and into the lecture-room as an exponent of scientific truth.

THE MEMORIAL CHURCH, AT CONSTANTINOPLE.

THE designs which were submitted to the judges in the recent competition for this most interesting edifice have been exhibited gratuitously to the public during the last month at King's College; and we have observed, with much satisfaction, that very many persons have availed themselves of the opportunity thus afforded them for examining these drawings, which are invested, after so peculiar a manner, with a national interest.

Whatever results an all-wise Providence may appoint to issue from the permission that a church of the English should be erected at Constantinople, this one condition in the construction of that church must be of primary importance—that the church itself be, in itself, true to English feeling, to English tradition, to English faith. In its essentials, it must be on the shores of the Bosphorus what, on English ground, would be an English church: and, happily, we possess in our own England a style of architecture which, while being eminently English, is also so versatile in its spirit, and so comprehensive in its range of expression, that it will admit of every such modification in details as a Western church would require when erected in the East, and yet it would not fail to retain the characteristic impress of its own genuine identity. To build an English Gothic church in Constantinople in all respects after the same model as we should build such a church in England, would indeed denote a poverty of resources, both in an architect and in the style at his disposal; and so, on the other hand, to adopt an Eastern type, or any type not essentially English, for this English church, and to orientalise its architecture instead of adapting to the East the architectural treatment of its details, would be to sacrifice truth to an imaginary expediency, and to deprive the building at once of its appropriateness as an English memorial, and of its character as an English church.

The foregoing considerations prescribe to the architect a definite train of thought and course of action: there is that, however, in the definition which demands the exercise of the highest genius and the most consummate skill. He has to design an English Memorial Church for Constantinople. Let us consider in what manner the designs submitted for competition, and exhibited at King's College, will supply what we require. Here are some (so-called) Gothic churches, which certainly are nullified by any excessive sympathies with the East; and here are other (so-called) churches, which might, without any serious difficulty, be converted into mosques, so fraternally mosqueish they are in the first instance. Then there are a few designs respecting which it is impossible to say what ideas they were intended to convey, and a few others in which we may suppose that their authors never did intend to do more than demonstrate their own ingenuity, without at all having regard to any particular or definite aim. All these, and certain others also, may be set on one side, while we search with more minute carefulness for our Memorial Church. We now find our attention attracted by Mr. Trucfitt's most original and expressive conception, so effectively embodied in his earnest and telling group of drawings; Mr. White's Byzantinised pointed church, with its glow of colour within and without, its excellent ground-plan, domical lantern, and spired campanile; Mr. Gray's Early English Gothic church, also Byzantinised, and that to such a degree that all traces of the original style have been obliterated from the exterior, while within, in the fine, spacious, vaulted interior, they yet linger in native beauty. The brothers Francis, also, have placed before us a cruciform church, such as the fourteenth century produced in England, with the exception of the west front and western tower and spire, which can claim no affinity with that noble period of Gothic art. Mr. Thrupp has another church cast in the type of the same period, with two towers towards the west; this design, while good and pleasing when contemplated from the south-east, degenerates rapidly as the eye passes on westwards. Mr. Slater appears with the honours of an "extra prize:" perhaps the award may be a sound one, but yet we are of opinion that this extra prize, if it must have been awarded, might have been more appropriately divided amongst some other

candidates than given as it has been. Mr. Slater's details, particularly his buttresses and arches, are very good; yet, as a whole, his design is to us far from satisfactory. Having mentioned Mr. Slater's buttresses, we are reminded of the circumstance that that characteristic feature of our national Gothic is almost discarded from these designs, except in one case, to be presently particularly noticed. Why is this? Was the buttress too Gothic for the Byzantine bearing of the prevailing tone of architectural feeling, or would the earthquakes of the East threaten a buttressed edifice with any peculiar peril? Messrs. Weightman, Hadfield, and Goldie, have produced a noble design, consisting of a cruciform church with an open atrium or arched quadrangle to the west. A fine tower, somewhat heavily finished, rises above the intersection of the transepts, which end in half hexagons, and bold turrets flank the western façade. The interior deserves careful study, and cannot fail to elicit warm approbation. The several drawings also are worthy of their subject: one we cannot pass over without especial notice—it represents a bay of the nave as seen from without. Of the three prizes which were proposed to be given, the third has been assigned to the design by Mr. G. S. Bodley. His church consists of a nave with aisles, a choir of two bays, with chapels to the north, a massive tower at the west end of the south aisle, and a porch carried still farther to the west. The whole is striking, and evidently has resulted from careful thought. The Byzantine influence, however, has unfortunately been permitted to overpower the expressions of the true Gothic spirit: this, as in other instances, is particularly the case with the exterior; the interior is very fine, and it appeals more readily to our sympathies than any other example which we have yet noticed. Mr. Street comes next as the second prizeman, and then follows the victor in the competition, Mr. Burges. We have studied the churches of both these gentlemen with the most anxious care, and no less carefully have we read much that has been written respecting them. Objections have been raised against Mr. Street's design, because of its assumed excessive magnitude, and its consequent excessive cost; such objections are not just, simply because not founded upon fact. Mr. Street's noble church would be indeed worthy of its object, but it would not of necessity involve anything extravagant either in its own size or in the cost of producing it. If larger than Mr. Burges' church, it is much simpler; if more majestic, it is less intricate. We should have liked an aisle carried round the apse, as in Mr. Burges' design; and we should have been glad to have substituted for one of the two very beautiful turrets a thoroughly English tower—otherwise this design is as perfect in itself, and as perfectly suited to the special requirements of the case, as we could have desired. The presence of the Gothic element is everywhere to be felt, and it is always the Gothic of England; yet such Gothic would not be suited to England, and it is suited exactly to Constantinople. The western façade is singularly beautiful and appropriate; and the external deeply-arched canopies to the windows, which crown the boldly projecting buttresses, with the skilful adjustment of the different pitch of the roofs, and the treatment of the details throughout, all combine to confirm the favourable impression produced by the first glance at Mr. Street's always beautiful drawings. The great drawback from the value of Mr. Burges' church is, that it is the Gothic of Italy and not of England, while even this Italian Gothic has been freely Byzantinised. The plan demands the highest commendation, and the feeling and spirit of a true architect are evident throughout the design, with the sole exception of the penthouse, which cuts the west front into two divisions, and overhangs the portals. This may be all very well for obtaining a shade, but assuredly a similar result might have been obtained after a more artistic fashion, and without so serious an injury to the architecture of the edifice. Mr. Burges has shown in his details his intimate acquaintance with the best examples of Italy, and he has also demonstrated his own power as an architect; had that power been put forth in illustration of English rather than of Italian tradition, we should have felt more of satisfaction and less of anxiety about the church which we may expect will be actually erected.

THE CRYSTAL PALACE:

A TEACHER FROM ANCIENT AND EARLY ART.

BY THE REV. CHARLES BOUTELL, M.A.,
Hon. Sec. of the London and Middlesex Archaeological Society,
and of the Architectural Museum, &c.

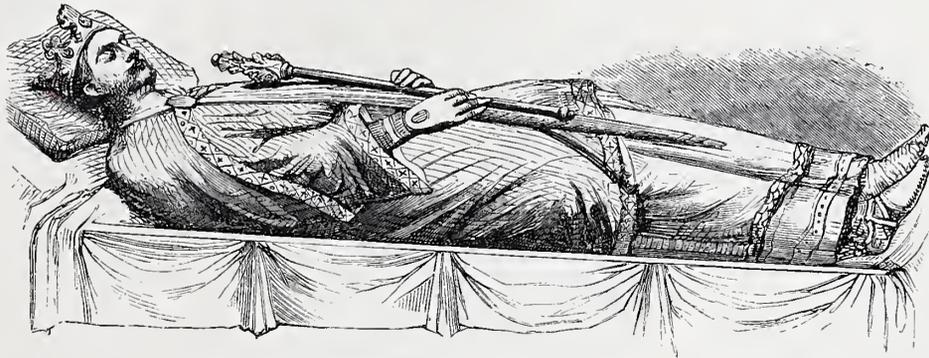

PART III.—ROMAN AND ROMANESQUE ART.

IN constructing the Fine-Art Courts of the Crystal Palace, in accordance with the object and the plans of their projectors, it was absolutely necessary to render each member of the group complete in itself as a structure. A good general effect was thus obtained, but it was obtained at the cost of sacrificing the full capacity of the several Courts as Exponents and Teachers of Art. The collection of details from which each Court was to be formed, required to be worked together into a definite composition, and to be so blended one with another as to avoid, as far as possible, all appearance of incongruity and want of harmony. Such adaptation and adjustment of various examples would, however, involve the exclusion of all that precise classification which is so essential to the student who aspires to investigate the principles of Art; and consequently, in treating of the teaching of these Courts, it becomes essential to associate with them certain auxiliary instructors, in order at once to avoid a confused and prejudicial generalisation, and to attain to a sound system of study in Art. Amongst the most valuable of such allies, as Art-teachers, would be collections of Photographs from original works. These collections, if judiciously selected and accurately classified, would not require to contain a great number of examples. Their object would be, in each Court, to carry out and give both completeness and exact accuracy to what may be learned from each Court in itself. Very brief historical and descriptive statements might accompany the photographs, and then all that would remain to be desired would be courses of short lectures, to be delivered periodically in the several Courts.

The English Gothic Court will appear to stand in especial need of some additional means for conveying true impressions of the various phases, under which this great form and expression of Art appeared amongst our ancestors in the middle ages, and also of the various purposes to which it was then adapted and applied. I have already noticed the absence from the Romanesque Court of such examples of our own Anglo-Norman as would elucidate the development of the style, and illustrate its characteristics in successive periods. Those works which exhibit the English Romanesque in its maturity have been considered sufficient to illustrate the style in this country. Upon the same principle, the general character of the Lombard Romanesque and of the Spanish, has been left to be gathered from the same types which exemplify the Romanesque of England. The Byzantine, also, as a distinct style, or at least as a distinctive expression of the comprehensive Romanesque style, requires much more illus-

trative teaching than the Court supplies; and this is needed, as well to give their full effect to the examples which the Court actually contains, as to convey just ideas of Byzantine Art. An examination of the Greek and Roman Courts will lead to the same results; they teach much, and they also fail to teach much, from the circumstances and the necessities of their own constitution. But before we concentrate our attention upon the examples which have been here brought together, as Teachers of Art, while in the hands of the Romans, it will be well to examine the group of monumental effigies which occupies the central area of the Romanesque Court. All the other works of this class I propose to consider hereafter, collectively and by themselves; but these memorials appear to be associated so

at least has been made to preserve portraits, in the proper acceptation of that term, of the several individuals. The originals have been several times painted and adorned with gilding, and they appear to have been subjected to this process, for the last time, in the year 1638: they still retain much of the colouring which they then received, and traces of their earlier decoration by colour may also be distinguished from beneath the work of the seventeenth century. Henry II., and Richard I., with Eleanor of Guienne, Queen of Henry, Isabel of Angoulesine, third Queen of John, and Berengaria of Navarre, Queen of Richard, are the personages thus at once commemorated and represented: all are habited in royal robes, and wear jewelled diadems. The draperies, when contrasted with other works of sculpture of the period, exhibit much of artistic feeling and power, though, with the exception of the Berengaria, they still are impressed with the Byzantine influence, and consequently fall far short of the dignity and grace which distinguish the first effigies of our Edwardian age. The early artists have, however, succeeded in imparting a truly royal character to their works; and in these same works they have

SKETCH FROM THE EFFIGY OF RICHARD COEUR-DE-LION, AT FONTEVRAULT, A.D. 1199.

closely, as works of Art, with the Court in which they rest, and they are also distinguished by characteristics so peculiarly their own, that it will be in every respect preferable to notice them at once.

The group consists of seven effigies, in a recumbent position; of the originals, one only is in England—that of King John, at Worcester: four were discovered at Fontevault, and one at the ruins of the Abbey of l'Espen, near Mans, in Normandy, in the year 1816, by the late Charles Stothard, and they are engraved and fully described in his noble work on Monumental Effigies: the seventh effigy which, like one of those at Fontevault, is to

left a no less truly honourable memorial of themselves in the history of Medieval Art. In the effigy of Berengaria is apparent the work of an artist who had studied in a school where the free energy of the West had been uninfluenced by the traditions of Byzantium. Between this figure and the monumental effigies, both sculptured and engraven, of the two succeeding centuries, there exists a remarkable sympathy in general feeling and in artistic character. Every effigy in this group will abundantly repay a most careful study, both in its own treatment, execution, and expression, and also in comparison with later works of the same class and with the draped sculpture of Rome.

The effigy of Richard I., at Rouen (where his heart was buried), is in every respect inferior to the companion memorial at Fontevault; and that of his brother and successor, John, which is the earliest royal effigy known to be still in existence in England, differs very considerably in its artistic style and character from the effigies at Fontevault. This difference becomes strikingly apparent from a comparison between the effigies of King John and of his consort, as they may be studied, lying side by side, in the Romanesque Court. While greatly inferior in execution, and devoid altogether of the delicacy of the Fontevault sculpture, the figure of John is boldly and effectively rendered, and it harmonises well with the prevailing character of the carved-work of its age. The accompanying sketches will serve to convey a general idea of these very remarkable memorials.

SKETCH FROM THE ROYAL MONUMENTAL EFFIGIES AT FONTEVRAULT.

Richard I., was discovered in Rouen Cathedral, in the year 1838, by M. Deville. Saved by some unexplained good fortune from the destruction that devastated the churches within which they had originally been placed, these effigies furnish us with most important examples of the highest condition of sculpture at their period in Northern France, and at the same time they carry back to the era of the second Henry the series of contemporary representations of our English sovereigns. In all these figures the costume, without doubt, exhibits the actual dress worn by the royal personages themselves; and there is also good reason to believe that, with the exception of the Rouen effigy, an attempt

When, with the culmination of its power, the grandeur and magnificence of imperial Rome attained to their most exalted elevation, Art was the great agency which embodied and gave material expression to the pride of the world's conquerors, and which promised to record in imperishable memorials,

for all future time, how powerful they were, how grand and magnificent. Art, in its Roman form and condition, may indeed be said to have grown with the growth of the Roman greatness, and to have spread more widely its influence amongst the Romans themselves, as the arms of the Romans extended over a continually increasing area the authority and the control of Rome. And yet the Romans cannot be regarded as essentially an artist-race. Art in Italy died with the last ante-Roman Etruscan; and after a long and stormy interval, it had to be reanimated on Italian soil by a transmission of the vital element from Greece. And this introduction of Art from fallen Greece into rising Rome was, in fact, a true reanimation of Art in that Italy, where she before had flourished, and from whence she had passed away. Art, at a remote period, had spoken the same language in Greece and in Etruria; and now that her voice was to be again heard in Italy, speaking in the dialect of Rome, she would not fail to cherish the remembrance of her earlier career in the same region. At the same time, the lapse of ages and the distinctive characteristics of the Romans would naturally, and indeed necessarily, impress upon Greek Art, when naturalised as Roman, the attributes of Rome. And such we find to have been the fact, now that we look back, through the long vista of fifteen hundred years, upon Roman Art as a subject for careful and contemplative study. We see the Greek principle everywhere adjusted to the Roman feeling and the Roman requirement: in other words, the principle of Roman Art is seen to be essentially Greek. Greece herself, as a Roman province, continued to be the centre of Roman Art-study, and probably of Roman Art-practice also. The best Roman artists were still Greeks—the natives of the Grecian province of Rome. In Roman sculpture, as it has come down to us, the tone and sentiment and the very touch of the chisel are almost universally Greek, though the influence of those traditional attributes of Rome herself, of which I have already spoken, rarely fails to be also apparent; and in the portrait and national sculptures, the true Roman type is most faithfully preserved. The architecture of the Greeks, in like manner, exhibits to us certain new conditions when we find it to have been translated to Rome, and used for Roman edifices: and in combination with the true Greek elements of Roman architecture, we find that the Romans themselves introduced that all-important member, the arch, the value of which both in construction and ornamentation they appear to have clearly understood. The introduction of the arch by the Romans, and its combination with them with their versions of the Greek columns and columnar orders, involved a general remodelling of the architecture which they had learned from Greece, as a practical Art: and hence the architecture of Rome, in its maturity, is found apparently to retain little more than certain forms and members, both constructive and decorative, which are actually true (though themselves considerably modified) to the character of their Greek parentage. And yet the Greek principle continued to affect, and, to a certain extent, even to control, the architecture of Rome, until, with the dissolution of Rome herself, Roman Art declined and fell. The column, which the Romans received from Greece, continued to the last, and under all its Roman modifications, to be a true column; and consequently, in the hands of the Romans the column never ceased to be by far better adapted to the Greek entablature than to the Roman arch. The Romans set the arch upon columns, but they failed so to adjust their columns to the arch as to blend into a single architectural member the curves of the arch itself, and the vertical lines of its supports; and so the columns of the Romans continued to be columns still: instead of masonry horizontally disposed, they might carry arches, but there was no artistic assimilation between the column and the arches.

The Greek influence is no less manifest in the decorations and decorative accessories of Roman works, than in their architecture properly so called. The conventional rendering of forms, which may be presumed once to have been studied from nature, but in which all that is really natural has long ceased to exist, transmitted through Greece from the East to Rome, was preserved throughout the entire period of Roman Art; and Nature herself was consequently disregarded, both as the source of

all that is beautiful for ornamentation, and as the authority for such artistic treatment as alone can lead to the most excellent results. Roman ornament is found to consist, in addition to certain established architectural conventionalities, for the most part of scroll-work, in which a series of scroll convolutions is usually developed from a single branch, the leafage being strictly conventional; and with this scroll-work figures are not unfrequently associated, the figures themselves being often actually incorporated with the scrolls on their foliated offsets, as in the illustrative example which I have here introduced.

ROMAN SCROLL-AND-FIGURE CARVED ORNAMENTATION.

The Roman Court and Corridors of the Crystal Palace are surrounded by enclosures decorated with columns and pilasters, and pierced at intervals with half-circular arches; these arched communications, with some corresponding roof-vaultings, constituting the chief constructive distinction between this group and the Greek Court adjoining to it. The singular circumstance that the Greeks should not have employed in their edifices the arch, with the principles and use of which they were certainly familiar, becomes the more remarkable from an examination of these two Courts: and certainly such an examination leads us to attribute special honour to the Romans for having introduced, not indeed the knowledge, but the practical application of the arch into the architecture of Europe. Where it seemed to be desirable the Roman corridors are vaulted, and the ceilings are decorated with paintings from ancient examples, of which some relics yet linger among the remains of that Rome which belongs to the past. The Romans evidently delighted in decorations obtained through the agency of colour: and they employed marbles of various hues, gilding, mosaic-work and paint, as the vehicles for producing the desired polychromatic effects. Hence the similar processes in the Byzantine style of Medieval Art would naturally be derived: and from this same source also such coloured ornamentation as was in use throughout the entire range of Romanesque Art would, in the same manner, have come into use. I do not propose here to enter upon any consideration of the still vexed question of the free use of polychrome (colour obtained by painting) in the Gothic of our own day—the great style which, having attained to a royal dignity amongst the styles of the middle ages, promises, if fairly dealt with, to hold an equally exalted rank in Art in our own times: I content myself with a general expression of my deep sense of the value and importance of colour in all Art; and while I would also add that both this value and this importance of colour in all Art will ever be measured by the manner in which colour is obtained and used under different circumstances, I must request the Art-student to observe and to reflect upon the decorative painting which, in the Fine-Art Courts of the Crystal Palace, has its own especial teaching prepared for him. Let him study the coloured cast from the Parthenon frieze, and the other casts from the same noble work where there is either a simple background of blue or no colour whatever; let him not pass over without careful notice and much thought all the colour and gilding of the Roman Court and corridors, and of

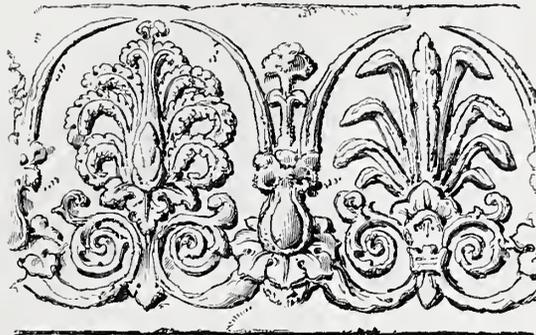

the Greek Court, and also of the Romanesque Court; particularly, in this last named Court, let him remark upon the painted doorways from Shobden and Kilpeck; and with these let him associate the similarly decorated doorway from Rochester, in the Gothic Court: let him also no less carefully study the effigy of King John, in the Romanesque Court; and, if possible, while the impressions thus produced are fresh in his mind, let him go at least to Rochester and to Worcester, that he may bestow an equal amount of study upon the doorway, as it stands in the one cathedral without colour, and in the other cathedral upon the marble effigy from which the original colouring has now well-nigh disappeared. I am persuaded that the power to pronounce a decision as to the use of paint in our own productions in architecture and sculpture, rests exclusively with examples of polychrome, and of stone and marble and wood untouched with colour. The use in architecture of marbles and other precious materials of various colours is altogether a different consideration: in this case there can be no question as to the value of such materials: it remains, however, for the true artist to determine, through the judicious application of them, how great that value shall be.

The architectural composition of the Roman Court, with its corridors, is not calculated to convey any vivid impression of either excellence in Art, or of splendour and grandeur; and, indeed, such impressions could scarcely be expected from the peculiar conditions under which these structures were erected. And yet, with the important exception of such architecture as the Romans employed in designing and building their temples, and such other edifices as were constructed after the temple type, there is here a faithful representation of the prevailing application of Roman architecture. But it was not possible here to exhibit the architecture of Rome on a vast scale, or to add one broad pile of edifices to another, until the very mass of the whole should become in itself an impersonation of the grand, and its component parts, from their very multitude, should rise into splendour and impressiveness. And this is the secret of the architectural magnificence of ancient Rome. Like Rome itself, it grew into magnificence through the continued amplification of scale and accumulation of mass. A single temple, had it been reproduced in the Roman Court in its original completeness, would have afforded but a very imperfect idea of what this same temple contributed to the group of buildings, of which in Rome it was but one unit amongst many others. It would have been the same with a complete cast of a basilica, an arch of triumph, a column, a portico, a portion of a palace, or of a bath, or of a theatre. In their style of architecture, excellent in themselves, and executed with equal skill and feeling, they were grand as parts of that grand city; and we can then only approximate to a correct estimate of their full grandeur, when in imagination we contemplate them as a whole. The Roman Court, accordingly, aims only at showing in actual practice the Roman use of the arch and of ceiling-vaulting, and of wall and ceiling decoration; and, leaving it to its colleague, the Pompeian Court, to illustrate more directly, as well as more fully, the domestic architecture of the Romans, it is content to teach us how well suited to the great city of ancient Italy were such building and such decoration, while for our own use it provides also its appropriate lessons. And it is more especially with reference to the present practical utility of "Ancient and Early Art," that we study the collections of the Crystal Palace; indeed, to this point tends also all our study of the expressions of Art in past times and in various countries: from this History of Art, which Art herself has written with her own hand, we gather that weight of authority and that influence of example, which are so eminently calculated to exert a salutary and improving impulse upon ourselves in our own practice of Art. This Roman Court shows how speedily in classic architecture original design is of necessity exhausted. Columns, when carrying a horizontal superstructure, admit of but little more than modifications of a single idea. With the arch, either in the place of the entablature, or in combination with it (as in this Court), the architect had more freedom; still so long as the arch was not pointed, and so long as it continued to be associated with other architectural

members which were absolutely Greek in their type, so long the arch itself failed to put forth its full power, and to demonstrate the versatility as well as the range of that power, as an architectural element. The models of the Coliseum itself, which are placed in this Roman Court, serve but to prove the fact of Roman architectural magnificence arising almost exclusively from the greatness of Rome. The Coliseum shows the same single idea, expressed on a grand scale, and repeated until calculation as to number becomes lost in the multiplicity of the arches and the magnitude of the mighty amphitheatre. It was the same with the Forum. The most interesting model which, in this same Court, shows us the Forum of to-day, leaves us to meditate upon the ancient splendours of that unrivalled spot, as upon a vision of which but a few faint traces can be now discerned. The heaped up surface of the ground tells of buried witnesses to the realities of that centre of Roman power, which may one day, perhaps, be permitted again to see the light, and to give some definite form to our imaginings. But, assuredly, the very Forum itself would repeat the tale of the Circus Maximus, and would confirm our conviction that this grandest of groups of Roman architecture derived its supremacy from the number and from the greatness of its component *fora*, and temples, and basilicæ, and various edifices. There is one element in Roman architecture, and, indeed, in all noble Roman Art of which we have any knowledge, that here demands from us especial notice—and this is their admirable execution. Whatever may be the merit of the design, the workmanship was, with rare exceptions, of a very high order. When we pass on from considering Roman architectural works in their capacity as works of the art of architecture, to a consideration of their details, and more particularly of their ornamentation, and of the manner in which both details and ornamental accessories were produced, we have in these Roman Courts lessons in Art of peculiar value. The Romans ensured for their works a high and a lasting reputation, through the consummate skill with which their artists carried out their designs, coupled with a precision, firmness, and expressiveness of execution that all artists would do well to emulate. It is, indeed, strange that the men who worked out Roman designs after the Roman manner, should never have aspired to a nobler style of design—a style more worthy of themselves. They were, however, for the most part, content with the forms and with the modes of expression which had become stereotyped for their use; and though they sometimes elaborated upon these forms, and modified these expressions after various methods, no new system was introduced. Thus, the noblest of the Roman works are, at the best, splendid and splendidly executed conventionalities. But there is another circumstance connected with the entire system of Roman ornamentation, which stamps upon this entire system a character at once peculiar to itself, and in no respect possessing any claim upon either our respect or our admiration; this is the strictly superficial and supplementary nature of Roman decorative sculpture and carving. The acanthus leaves cluster around a Corinthian capital, and adorn it after their own fair fashion; but they are not integral parts of the capital itself: gather them all together and remove them, and there would still remain a complete capital, and one well adjusted in its general form to the shaft below. It is the same with every variety of Roman ornament: all are ornamental accessories—additions to,

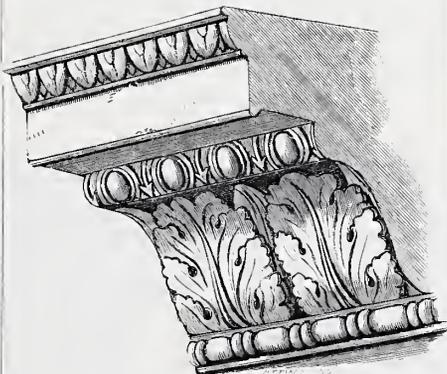

not parts of the work which is ornamented. This want of identity, and this absence of the appearance of an inseparable union between the actual building or the constructive member and the ornamentation, detracts, in Roman works of Art, from their impressiveness, in no less a degree than that impressiveness in the actual works is enhanced by their admirable execution. The Crystal Palace casts convey to us, in the most satisfactory manner, these characteristics of Roman Art; and they do this the better, because they appear before us exactly as the originals might do: they are true to the originals, and no attempt has been made to give them a fictitious effect, through imaginary combinations. The

only subjects for regret are, that these casts are not more numerous, and, as usual, that they are not classified on some definite principle. The examples which are here present are not to be surpassed in individual merit, or in the capacity of Art-teachers. I have selected three other specimens for the illustration of characteristic Roman conventional ornament: the first exhibits the honeysuckle ornament, in such great and universal favour with the Roman artists, and, as it would seem, with the Roman people in

ROMAN HONEYSUCKLE ORNAMENT.

general; the second exemplifies some of the peculiar forms which are found to have no less generally prevailed in the decoration of Roman cornices—here is the "egg-and-anchor" ornament, with a series of leaves of seroli-foliage; the third cut shows another application of the scroll-foliage, which is eminently characteristic of Roman artistic feeling

ROMAN CORNICE ORNAMENT.

and usage. These examples all demonstrate that superficial and adventitious character in Roman decorative work, of which I have spoken; but, though faithful to the originals, as far as their capacity of woodcuts would admit, these sketches do not aspire to render the effectiveness and the execution of the originals in their full power. This can only be done

ROMAN SCROLL ORNAMENT.

by actual facsimiles of the originals themselves; and, therefore, I refer the Art-student to this Roman Court and its corridors, or, better still, to the Greek and Roman departments of the British Museum. There is one publication, devoted especially to such works of decoration, to which I here would also refer the student of ancient Art, as to a rich treasury of valuable teaching—Mr. Owen Jones's "Grammar of Ornament." The plates of Greek and Roman ornament are peculiarly excellent; and in the latter are comprised some of the same examples, from which the Crystal Palace collections possess casts, and of which I have here given sketches.

In the same corridor with the casts of scroll-work and of architectural details, are other casts from small works in bas-relief, in which various figures are introduced. Here is a wide field for study. The historical or legendary character of the groups, and also of the single figures, together with the method of their association with certain architectural compositions, are eminently suggestive, while peculiarly characteristic. The costume, action, and general character of the figures, show how powerfully the Roman type of architectural figure-sculpture was impressed upon the revivers of Art in the Romanesque, after Roman Art itself had passed away, and had ceased to exist as a living reality. The same observation is equally applicable to the case of the draped statues of the Roman artists, in the capacity of models for the study of the Romanesque sculptors. Let the Art-student in the Crystal Palace walk over from the effigies in the Romanesque Court to the small figure bas-reliefs in the Roman Corridor, and to the statues of Romans which also stand there and in the adjoining Court, and he will not fail to trace out the school in which the Romanesque sculptors studied. And if he extends his comparison to all the decorative works, of whatever class, which are assembled in the Romanesque Court, the student will at once be led to form a just estimate of Roman influence upon

GERMAN ROMANESQUE CAPITAL AND SHAFT, GELNHAUSEN.

Romanesque Art; and, at the same time, he thus will more adequately appreciate the worth of what the Romanesque artists effected in their own art, by their own genius and their own judgment. The Roman system of surface ornamentation is everywhere apparent in the works of the Romanesque styles; and however these styles may have become affected by the altered circumstances of place and associations, there are almost invariably found at least traces of Roman feeling and usage in the prevailing ornamentation. Thus, in the richly carved pillars at Gelnhausen, in Suabia, the distinctive characteristics of the German Romanesque are blended with no less evident influences of Roman Art. In these fine works the florid enrichments of the shafts are deeply and boldly cut, so that they appear rather to form an enriched casing to the true shafts, than to be carvings wrought upon the shafts themselves. The Roman use of variegated marbles, and also of enrichment by mosaic, we have seen to have become an element of the Romanesque wherever the materials for producing this class of decoration were to be obtained. Even in the later works of the Romanesque, the Roman influence is occasionally to be seen with

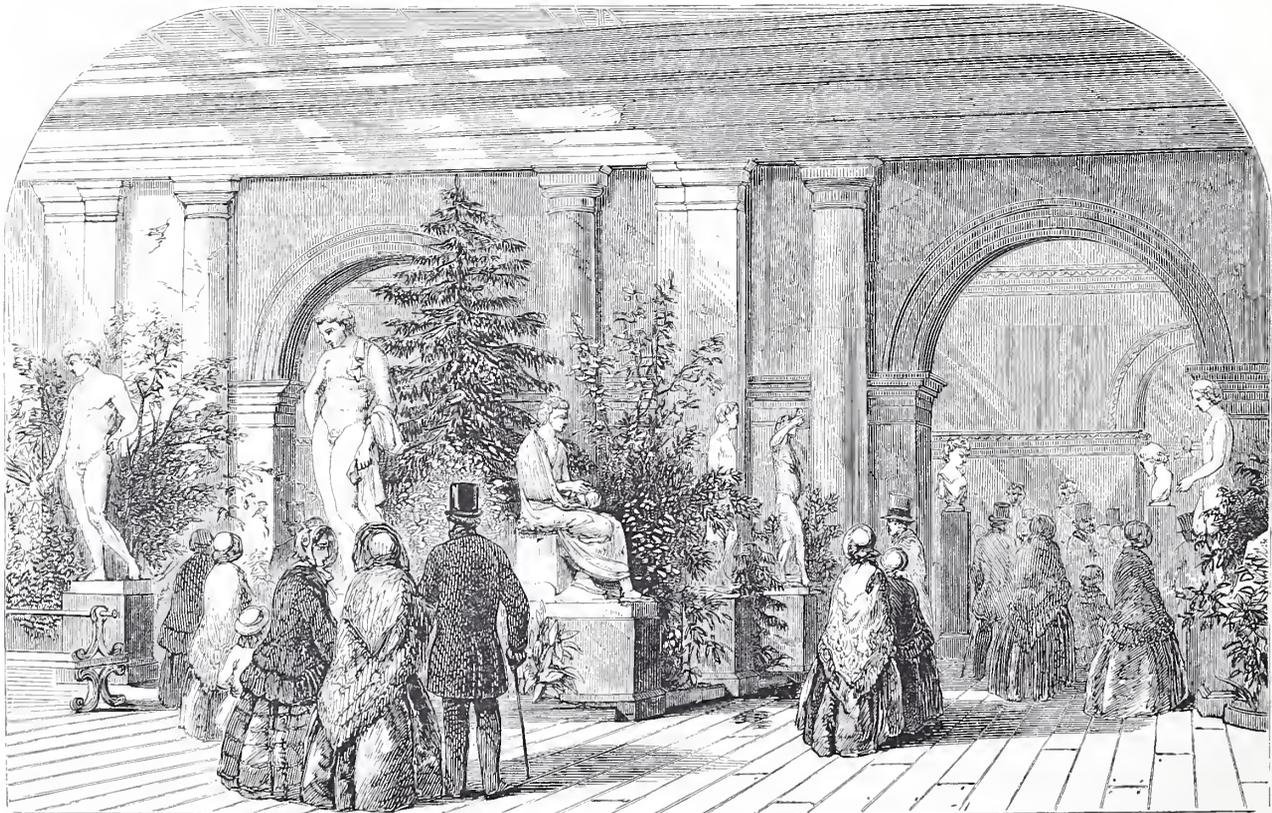

remarkable distinctness. The cloisters of the Church of St. John Lateran, at Rome, which were executed in the first half of the thirteenth century, have supplied the central arcade between the Romanesque Court and Corridor, and in this arcade the student will observe a very singular exemplification of Roman treatment late in the Romanesque period: indeed, the antique model has evidently guided the artist in his design throughout, from the plinth of the coupled and mosaic-wrought shafts to the massive and complete entablature, with its appropriate architrave, frieze, and cornice, which crowns the curves of the arches; the details, also, no less than the general composition, are adjusted to the same classic model. Hereafter it will be necessary for us to carry this comparison much further, when in the Renaissance we examine into that reproduction of ancient forms and details which arose, not merely through the influence of the ancient spirit acting upon a fresh style, but from a direct and definite aim at reproducing the very styles of antiquity. It will be seen that the Romanesque artist who yielded almost unconsciously to the power of Roman Art, without any direct desire to be affected by that power, accomplished a far more excellent and successful revival than the deliberate copyist of the Renaissance.

Of Roman painting, in the highest acceptance of that term, as one of the grand divisions of works of Art, we know but little experimentally; and the Roman Court, like the Greek, is silent upon this point, except, indeed, as far as its wall and ceiling painting can be admitted to rank under such a denomination. But in Roman sculpture this Court and its corridors abound in fine and characteristic examples. As I propose to treat in another of these papers exclusively upon ancient sculpture, I now may be content with the general observation, that these collections of sculpture-casts, with the other great Roman works of the same class which are scattered through various parts of the whole building, constitute in themselves a museum of which every true artist understands the value. With the Roman

sculpture must be grouped the casts from engravings and cameos, which invariably abound in points of great interest. Unfortunately, the collections of casts of this kind are at present placed where they are but seldom seen—in one of the galleries. They would form an addition of no trivial importance in the Roman Court. And here also, as in the Romanesque Court, and, indeed, in every one of these Fine-Art Courts (except, perhaps, the Pompeian and the Alhambra Courts), a small collection of photographs would be found by the Art-student to be endowed with a practical value to which elsewhere it would be scarcely possible for them to attain. Certain remains of what may be perhaps designated examples of the Art-manufactures of the Romans might be advantageously introduced amongst the subjects of such photographs, with others of a higher artistic character. The Arts of Rome, in their entire range, are so replete with historical associations, in which all the modern nations of Europe, with the great new nation of America, are directly and personally interested, that we cannot refrain from entertaining a desire to see concentrated in and about this Roman Court every possible illustration and elucidation of these Arts as they flourished in the flourishing days of Rome. The Romanesque, the Renaissance, and the Modern Italian, have each their own illustration and elucidation to contribute to the more direct historical essay which we expect to find in the Roman Court itself. So, also, to pass to the earliest periods of the general history of Art, Greek and Egyptian Art will not be found silent, when we seek to bring together everything which may bear upon the Art of Rome. Derived through ever-wonderful Greece, from the still more wondrous valley of the Nile, Roman Art extended its influence, and it worked out its designs, after its own strong method, throughout the civilised world. What the Arts were at Rome, they were also, in their degree at least, in every city of the empire. In many cities, not built on the soil of Italy, the relics of Roman Art are scarcely inferior to those which at Rome carry us back to

their own grand era. In our own country, once highly estimated as a Roman province, Roman Art worked freely and nobly; but the evil days came, with a searching severity, exceeding even what befel the imperial city herself; and now we find in Britain but little that Roman Art produced above the surface of the ground. But the Romanesque reached us when the storm had been blown away; and it grew up in strength and nobleness amongst us, and we still love well its deep arches and massive masonry. And then, from the Romanesque, the Gothic carried away the prize of excellence, that, in its turn, it might yield to a novel species of Romanesque—the so-called Renaissance of the classic revival. And now we have before us all these forms of “Ancient and Early Art,” and we are removed to a sufficient distance from them all to contemplate and to study them with dispassionate candour. The public mind has been awakened to a sense of the value of Art, in its pure and noble condition; but there yet remains much for us to accomplish as a nation, before we may justly advance the national claim to being a people who both love Art and understand and appreciate it. Meanwhile, in these Fine-Art Courts, whither we have directed the Art-student, there is already much which may contribute to our general advance in the knowledge and appreciation of Art—much which, from the peculiar circumstances of these Courts, is not elsewhere to be found. If we show, as a nation, that we desire to make the most of this teaching, as it now is, we may feel assured that not only the Roman Court, but every other Fine-Art Court in the Crystal Palace, will be made more and more worthy to teach us, as we become continually better qualified to receive instruction in Art, and more anxious to obtain it.

A sustained advance towards a high standard of perfection in the several departments of the great Art-museum entrusted to his care, is the acknowledged aim of the Art-director of the Crystal Palace; and he will, without doubt, provide that practical improvements should be continually effected, as he finds himself encouraged by sympathy and appre-

ENTRANCE TO THE ROMAN COURT, CRYSTAL PALACE.

ciation on the part of the public. Such an allusion to improvements in these Fine-Art Courts of the Crystal Palace may, perhaps, appear to imply something resembling an imputation upon those persons

by whom they were originally planned and produced, to the effect that they failed to render their work as complete as they ought to have done, and as they might have done: this would be no less

ungenerous than unjust, since the ultimate attainment of true excellence in these Courts will really result from the ability, judgment, and care which have made them what they are.

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY.—We have been not a little startled of late by rumours of certain projected doings within the walls of the Royal Academy, which, if credible at all in the form in which they reach us, could be so only on the supposition of their denoting foregone conclusions in a matter in which the public have a very serious interest, or a desire to have such conclusions supposed in behalf of the parties more directly concerned. We have satisfied ourselves by inquiry that there is at least enough of truth in the substance of these rumours to demand the vigilance of our readers, and of those who act for them; and, earnestly soliciting the attention of our parliamentary subscribers to certain views and statements respecting this important Art-institution, and its prospects, which we published in our leading article for September last, we do hope that some member will now put such questions from his seat in the House as will save the country from one more job enacted behind cover of a false pretence, and one more abuse made permanent in the name of the provisional. Our readers know, that the mean and narrow accommodations provided for the exhibition of sculpture within the walls of the Royal Academy have been a crying grievance to the sculptors and the public for years, and discreditable to the Academy generally; and that no amount of protest and remonstrance, year by year repeated, has been effectual to produce even an attempt at amelioration. It is, therefore, somewhat startling to find, without any apparent change in the conditions of the case, the Academic conscience suddenly awake, and loudly proclaiming that something must be done within the walls of the Academy for sculpture. We are of the same opinion as the Royal Academy as to the necessity; but, then, we have been strongly of that opinion for a great many years, whereas the Royal Academy has arrived at a conclusion which involves expensive alterations in its house *only* at the moment when there is some possibility that it may have notice to quit. What is it that, according to the rumour, the Royal Academy purposes now to do, with the avowed object of meeting the difficulty to which it has thus become preternaturally enlightened? The large entrance hall which divides the National Gallery from the Royal Academy has, our readers know, been lying all but unused for years; and out of this hall, it is said, a gallery is to be found for the Turner pictures above, and the Academy is to get a sculpture gallery—with the present sculpture room, which is immediately behind it, thrown in—below. Now, that the scheme in the terms here stated is the actual scheme, of course we do not believe,—because, architecturally, it seems impossible. If a Turner Gallery—and its new dome, we suppose—are to be above, where is the architect to get his lights for the sculpture room below? Is it that the Royal Academy, having once carried its point and effected its lodgement, proposes to fall back upon its old neglect of its Art-Cinderella, and be content with the “darkness visible” borrowed from the chamber behind? The argument would, in that case, be that the light, having been utterly insufficient for the little den, could only be insufficient, as before, for the big den; and the sculptors would simply be as badly off as they were, with more room in which to be so. Seriously, however, though we have no doubt there is some mistake in the terms, we *know*, as we have said, that something of the kind mentioned is in contemplation; and what we desire emphatically to point out, is, that alterations so extensive and important—especially as the remedy of a grievance which has been borne with exemplary patience for so many years—are not the acts of a body who contemplate a possible removal, or have even any doubt as to the conditions of their future tenure. There is in this scheme something, we apprehend, like a dealing with the entire building; and it indicates either an understanding with the minister as to the future disposal of this building, to which the public are no parties, or a determination on the part of the Academy to take up, while it can, a position in respect thereof, from which it will be difficult for the minister to dislodge it. We have had instances before—and are warned by them—in which this sort of provisional occupation has been made afterwards the express ground for conversion into a freehold. But, our finest metropolitan site is too valuable to be

occupied by *squatting*; and we trust by means of this notice to secure the interference of Parliament in the matters which it involves, while yet it is not too late.

THE ART-TREASURES EXHIBITION, MANCHESTER.—The public receive daily information concerning the progress of this great work in the columns of the *Times* newspaper; we should but occupy space uselessly by repeating these details. It will suffice to say that plans have been enlarged, that contributions have been increasing, and that the real difficulty to be encountered arises not from the paucity, but from the over-abundance, of materials. The committee are indefatigable in their labours; they have obtained the services of competent assistants in all the departments; and the anticipated opening, on the 5th of May, under the auspices of the Prince Consort, cannot fail to be a brilliant affair—next in importance only to that which, on a 1st of May, rendered memorable in the annals of this country the year 1851. The building is so far completed as to remove all dread of its being ready “in time;” and preparations have been made in Manchester to receive the hosts of visitors who must be accommodated “somewhere and somehow;” but large as the city is, there will be no doubt difficulties in the way of “lodgings.” We do not know whether the committee have yet directed attention to this necessity, but probably they will do so. We hope to prepare a sufficiently lengthened report of the proceedings, as well as such accounts of the contents of the building, as will convey to our more distant readers a proper “portraiture” of the scene and its attractions; but our space will be necessarily too limited to enter into such details as will be supplied by the London and Manchester papers, where, no doubt, notices will be given daily, descriptive of the enormous mass of the rare, beautiful, and valuable “furnishing” of the structure.

THE NATIONAL GALLERY.—The famous picture by Paul Veronese, representing the family of Darius before Alexander, which has for three centuries been the property of the Pisani family, is said to have been purchased by the British Government for the large sum of £14,000 sterling.

THE ARTISTS' BENEVOLENT FUND.—The Anniversary Dinner, will take place at the Freemasons' Tavern on the 16th May, under the presidency of Sir Robert Peel.

THE NEW READING-ROOM AND LIBRARY IN THE BRITISH MUSEUM.—The reading-room and library, that now occupy what was formerly the central area of the British Museum, are being prepared for use. It is from this use that its form and character have directly sprung, and it is a remarkable structure. The reading-room is a domed expanse, clear of tie-beams, and wholly constructed of iron, and the proportions of the roof are simple and agreeable. It is of the same span, within a fraction, as that of St. Peter's at Rome. The problem to be solved was to produce those arrangements which would give the best conveniences for reading, and the readiest facilities for the supply of books, and the construction is the material rendering of this thought. In the centre of the great circular area is, so to speak, the embouchure of the stream of knowledge, where the books are delivered, and flow out to irrigate the desks that radiate from this point, which stream is supplied from springs, *alias* libraries, which rise all round the central space. These rise tier above tier, and, unseen from within, form the walls of the reading-room and square the circle—that is, occupy the space left by the circular form of that structure within the square area of the original court. These cells and galleries are, perhaps, the most original part of the edifice. They are constructed mainly of galvanized-iron, light but strong; and the floors being all open-work, the stories are lit all through from the top, not a particle of room is lost; and all possible facilities are afforded to the attendants who convey the books to and fro, and who are nearly the only persons who visit this part of the building. The report as to the capacity of these arrangements is one that one hardly ventures to repeat, viz., that they alone are capable of accommodating a million and a half of books—the whole library of the museum not containing at the present time much over five hundred thousand volumes! This announcement took us quite by surprise, and makes us believe in the possibility of even the catalogue of the present collection being completed, if the same genius apply itself to that

question:—we say the same genius, inasmuch as for the above peculiar arrangements the structure is indebted to the suggestions of Mr. Panizzi. But to return to the reading-room itself. Its great size offers full accommodation to more than the number of readers that at present attend the museum. The light is good, and we see no reason at present why the ventilation and regulation of the temperature should not be equally satisfactory. The minor arrangements we have not space to enter into, but the reading public will, no doubt, at no great distance of time derive full benefit from them. Fancifully, the whole affair appears a great organism for the arterial and venous circulation of knowledge, and its plan a Kantian diagram of its subtle flow. At present we have nothing to give it but all praise, except in regard to the lobby access in front of the entrance hall, which is contracted and meagre.

THE MUSEUM, AND SCHOOLS OF ART AND SCIENCE, AT SOUTH KENSINGTON.—The Museum is being rapidly filled with objects of varied attraction—legacies from the '51 Exhibition, hitherto warehoused in Kensington Palace, and other contributions of interest and instruction. Among these will be the first steam-engine ever in action in this country—the little grandfather of all the great grand-children; also, we understand, Wren's original model for St. Paul's, belonging to the Dean and Chapter, a design differing considerably from the edifice actually erected—simpler in plan and character, and of one architectural order instead of two. It is of wood, and some twenty feet long. Rooms of access and refreshment are being erected close to Cromwell Road, and form an entrance to the museum. Everything about the place is better than the original “boilers,” which are now painted, so as to look like an edifice of striped linen. They have evidently not known what to do with it. We should suggest an extensive wiring and growth of climbers over it, to shade its eccentricities. There are some fine trees in the area in front, and the garden is being nicely dressed with shrubs and flowers, and with the green mantle of summer will have a pleasing aspect enough. It will be Art and Science among the roses; a Brompton—we beg pardon—a South Kensington “Grove of Academus.” It must be allowed, however, that the buildings altogether have a temporary character, with the exception of that erected for the Sheepshanks Collection, which is fireproof and substantial, and consists of a group of four well-proportioned rooms excellently lighted. Advantage has been taken of some old houses near, to convert them into offices and residences in connection with the schools that were removed from Marlborough House. These are convenient and well arranged, and afford excellent light and facilities for study. The department has also lately taken possession of an outwork on the opposite side of Cromwell Road, in the shape of a house and garden, by means of a mine under the road. This has been some of the day work of the corps of the “Sappers” on the premises, whose broad red backs may, however, be seen in the evening bending over the drawing-boards of the schools, their owners being as intent as any others of the students in acquiring powers of the pencil. The training schools for masters are regularly and well attended, and the Museum itself is expected to be open very shortly to the public.

EXHIBITION OF SCULPTURE OF THE UNITED KINGDOM AT SOUTH KENSINGTON.—A proposition, emanating from the Sculptors' Institute, is being brought to bear at the Buildings of the Department of Science and Art. A portion of the museum has been set aside by the grant of the Lords of the Privy Council for Trade, for a collection of select works of British sculpture. This will consist not only of works by living artists, but is intended to include those of past time, as casts from the best and most characteristic works of Banks, Bacon, Nollekens, Flaxman, Chantrey, &c. The collection comprising works of the British school, past and present, will illustrate its history, and present a wholly new feature to the public and lovers of Art, differing from that of other exhibitions of this art. To draw this line more clearly, it is the intention, we understand, not to receive, except in special cases, any works of living artists that have not been previously exhibited at some one of the annual public exhibitions. The committee for conducting it consist of three members of the Institute, and two other gentlemen. The space set apart for the purpose is the further and

northern portion of the gallery, between the architectural collection and the building that is shortly to contain the magnificent donation of Mr. Sheepshanks. So that Painting, Sculpture, and Architecture will be *en suite*. The situation has somewhat of a Crystal Palace character from the nature of the building, but the light is far better suited for the display of the works, than that either in the building of '51, or at Sydenham, being more concentrated, and wholly from the roof. Also there are no intersecting pillars. The warm grey colour, of an atmospheric character, that was adopted in the British Sculpture-room of the Exhibition of '51, also in that in Paris, in '55, lately in the Crystal Palace at Sydenham, and also, we understand, this year in the Belvidere portion of the Vatican, containing the Apollo, Mercury, and Laocoon, has been again selected on this occasion, but of a rather lighter tint, and other enhancements of colour will appear on the walls and floor. The works will be well seen, and the recognition of the desirability of such a collection is timely to the opening to the public of the new establishment. It is also a valuable acknowledgment on the part of Government, important as a precedent, and calculated, we trust, to produce good fruit.

CAST OF THE COLOSSAL STATUE OF DAVID, BY M. ANGELO, AT SOUTH KENSINGTON.—A cast of this work has been lately set up in the ground-floor of the Department of Art and Science. It is the gift, as we have heard, of the Grand-duke of Tuscany to her Majesty. Vasari gives the following account of the original, which stands in the Piazza del Grand Duca, at Florence, having been set up there in the month of September, 1504:—"A large piece of marble had for many years lain neglected in Florence, embossed for a gigantic statue, but with so little skill, that it was thought spoiled for any purposes of sculpture. This ill-shaped block Michael Angelo wished to convert into a statue, and the *gonfaloniere* gave him permission to do the best he could with it. He then composed a figure accommodated to the irregular shape of the marble, and in eighteen months produced a colossal statue of David, which was placed in the piazza, in front of the Palazzo Vecchio, where it now stands." The block of marble was nine braccia long (sixteen feet six inches), and the statue is of the same height; on the top and at the base the rude surface of the marble yet remains. This statue is inferior to other works by the same hand—as the Moses, and the wonderful sketches of the Medici tombs. This is no doubt attributable in degree to the unusual difficulties arising from the half-spoilt character of the block when it came into the artist's hands. Some of its incongruities, however, cannot be thus accounted for—as, for instance, the great size of the head, and of the limbs for the trunk—a similar defect to that of the Perseus of Cellini, that stands near it in the same piazza, in Florence. These proportions of the David might be advocated by some as peculiar to a youth, but that the members themselves and the extremities have not a youthful character, the hands, especially, being those of an old man. The original does not appear to have added to the great master's reputation in his own country, nor will the east of it in this; nevertheless, it is a work of much interest, both from its size, when we consider that it is hewn out of one block, and from the great reputation of its author. This interest is enhanced in the Museum of the Department from that establishment also possessing it in embryo, as it were, in the shape of the little first study for it, a sketch in wax about a foot high; also some anatomical studies of the limbs, all which formed part of the Gherardini Collection, recently purchased by the Department. Thus, it appears that any deficiencies that may exist in the statue do not arise from want of study. Although, however, the parts are incongruous—a defect into which Greek Art never falls—yet some are admirable. The torso by itself, for instance, is fine, and the back especially beautiful; indeed, the back view altogether is the best, as being that in which the lines of the figure present the finest contour, and in which the head does not appear so large. The choice of subject for so colossal a work is more than doubtful. We picture to ourselves David as a slim, earnest youth, an enthusiastic boyish hero—not as a giant, for that would lessen his exploit in destroying him who "defied the armies of the living God." As it is, the first impression is rather of him of Gath than of Israel. The head is finely and vigorously cut, though not

especially a head of David. It resembles somewhat that, by the same hand, of Giulio di Medici, on his tomb. M. Brucciani, of Little Russell Street, Covent Garden, having a mould, is able to furnish casts of the bust and other portions of this remarkable specimen of the Florentine school.

THE ANNUAL FESTIVAL of the Artists' General Benevolent Institution was held on the 4th of last month at the Freemasons' Tavern; when Lord Dufferin, a young Irish nobleman, who has on several occasions manifested great interest in the Fine Arts, presided, and eloquently advocated the claims of the society on artists and the public. We confess disappointment when we saw his lordship supported at the table by two only of the Royal Academicians, Sir C. L. Eastlake and Mr. Cockerell, the former also the President of the Institution, the latter its treasurer. The associates mustered in sufficient strength; of these we noticed Messrs. Frost, Goodall, Egg, F. Stone, and F. R. Pickersgill. Seventy-three cases have been relieved during the past year out of the funds of the society, to the gross amount of £1019. The subscriptions announced during the evening reached £650, including £50 from his Royal Highness Prince Albert, and £20 from Lady Chantrey. Middle. Rosa Bouheur, and M. Ary Scheffer, contributed each 100 francs, through the hands of Mr. Gambart. When we think of the large sums annually collected in aid of other societies of a similar exclusive nature, the thought will be uppermost in the mind, that artists, as well as literary men, do not receive such assistance from those who have the means of doing good as they are entitled to. On looking over the last year's list of subscribers—and a lamentably short one it is by comparison with many others—we may venture to assert it does not contain thirty names independent of those of artists, or of gentlemen directly or indirectly connected with Art. This is not as it should be.

PANORAMA OF MOSCOW.—The approach of the Easter holidays generally brings with it some new panoramic picture in Mr. Burford's rooms, in Leicester Square: this season he invites the public to a view of Moscow, taken from a point near the Kremlin, with the procession of the Emperor and Empress passing to the Cathedral of the Assumption of the Virgin, where the sovereigns of Russia are crowned. The city of Moscow, with its "half-barbaric" minarets, as Byron calls them, is, perhaps, still the most singular in Europe, although a large portion of it is of recent origin, having been built since 1812, when it suffered such terrible losses by fire at the hands of the Russians themselves. It is a place so little visited by English travellers that we have no doubt Mr. Burford's picture, so beautifully and truthfully painted, will prove a highly popular exhibition. The coronation "show" is a gorgeous pageant, completely harmonising with the gay and glittering architectural decorations which are characteristic of the various edifices contained within the Kremlin, while this side of the river Moskwa contrasts strangely with the quietude and the simple style of building that prevails on the other, the modern part. The whole forms a most interesting picture.

MR. H. RICHTER, one of the oldest members of the Society of Water-Colour Painters, died on the 9th of April, at the advanced age of eighty-five. The best of his works, chiefly illustrations of the works of our dramatists and poets, peculiar both in character and style of execution, are little known to the present generation. Mr. Richter, at one time, was extensively engaged in making drawings for the "Annuals," and other pictorial publications. Almost to the last he retained his artistic faculties, for he exhibited last year a small drawing of the head of a child.

A PORTRAIT OF GENERAL WILLIAMS, the hero of Kars, will shortly be placed in the council-chamber of the Guildhall of London; the commission was intrusted to Mr. G. E. Tuson. It is a full-length picture representing the general leaning on the sword lately presented to him by the Corporation.

THE NATIONAL COLLECTIONS.—A measure which has also in view the popular education in matters of Art and Science, and the best means of making our national treasures subservient thereto, comes before us in the form of a return which was moved for by Mr. Ewart in the last parliament. Our readers know, that the national collections fail of a large amount of their teaching power without the help of

catalogues,—and that the catalogue is at once a serious imposition on the means of that part of the public which needs their teaching most, and a cumbersome mode of reference, involving constant interruption and serious loss of time, to all. To remedy this, the House of Commons has been desirous to see carried out in all the museums in the United Kingdom the plan adopted in the Museum of Irish Industry,—where, as the readiest means of conveying to the visitors the greatest amount of useful knowledge, full descriptive labels are attached, individually, to all the specimens. The object of Mr. Ewart's motion was, to ascertain how far this recommendation of the House had been carried out; and it is satisfactory to know that—to say nothing of our botanic and other scientific treasures—as regards our collections of Art much has been done in this useful direction. In the Museum of Art at Marlborough House the rule of affixing a label to every work of Art appears to have been acted on from its commencement, in 1852, as fully as the varying arrangement of the collections would permit. The monuments in St. Paul's and Westminster Abbey, of course, carry their own inscriptions; and the objects of artistic and historic interest in the Tower are explained by the warders. In the British Museum the large Egyptian sculptures have now generally the names attached,—and soon there will be none of them which have not. The Assyrian sculptures, and the Greek and Roman sculptures, have descriptive labels; and objects of curiosity in the other departments are to a great extent labelled and inscribed. In Hampton Court Palace this work of interpretation proceeds but slowly. There are a few labels; but such as there are give only imperfect information, and 204 pictures are without any written description at all. In the National Gallery, descriptions have been attached to all the pictures,—announcing, in each case, the subject, the master, the date of his birth and that of his death, the date of the picture itself, and the school to which it belongs.—We dare say Mr. Ewart will keep his eye on this matter,—and see that a parliamentary recommendation involving such an amount of public convenience, to give it its lowest character, is fully carried out.

DIFFUSION OF ART-EDUCATION.—After due notice and discussion, a resolution has been adopted, and circulated, by the Society of Arts, which aims at the diffusion, as far as can be arrived at, for educational purposes, of those national treasures, the first law of which is, of necessity, centralisation,—and is of sufficient significance in itself and in its possible results to claim the attention of our readers. The resolution runs thus:—"That the Secretary be instructed to inquire of the Institutions in union whether they consider the time has arrived when, in order to give just facilities throughout the United Kingdom for acquiring knowledge in Art and Science, it is expedient that the museums situate in the metropolis and elsewhere, such as the National Gallery, the British Museum, the Museum of Ornamental Art, the Museum of Practical Geology, and the public Museums in Ireland and Scotland, &c., which have already acquired, or may hereafter acquire by parliamentary votes, specimens of Art and Science, should be rendered, as far as may be practicable, useful to the local institutions, promoting Art, Science, and Literature throughout the United Kingdom,—especially the Mechanics' and Literary Institutions in union with the Society, and free Libraries. Should it be the opinion of the Institutions that the time has arrived, the Council of the Society of Arts request that they may be favoured with opinions as to how the object may be best carried into effect, and the Council will be prepared to afford facilities for the discussion of the subject. That a copy of this resolution be sent, not only to the institutions in union, but also to the Provincial Museums which may not be in connection with the Society, and to the Free Libraries in the United Kingdom."

PHOTO-GALVANOGRAPHY.—His majesty, the Emperor of Austria, has conferred on Mr. Paul Pretsch, the inventor of this art, the grand gold medal for Arts and Sciences. The grant is described as being in recognition of the artistical perfection exhibited in the specimen prints submitted by Mr. Pretsch to his majesty.

CANADIAN EXHIBITION AT THE CRYSTAL PALACE.—An addition of great interest is just about to be made to the gradually expanding attractions of the Crystal Palace, at Sydenham,—an addition of a

nature indicating the spirit which may one day, under more ripe arrangements, make of this place of marvels a world's museum in a more large, systematic, and educational sense than any that has ever yet been founded. In the last session of the Canadian Parliament a sum of £2000 was voted for the object of commencing an exhibition, in this unparalleled show-room, of the products, raw and manufactured, of that great colony, and a collection of models of all the important works there executed. A sum of £500 a year is, the Canadian papers say, to be applied to the maintaining and enlargement of this collection; and a large space has already been allotted to the scheme by the directors of the Crystal Palace Company. In its outset, the exhibition, it is promised, will exceed in extent and interest that displayed by Canada at the great Paris Exposition, in 1855.

ST. MARTIN'S DISTRICT SCHOOL OF ART.—A very gratifying proof of the successful progress of this Institution was afforded by the complete success of the first conversazione given by the students, which took place on the 3rd of April last. The spacious school-rooms in Castle Street, Long Acre, were filled with an assemblage who evinced the deepest interest in the collections of works of Art which surrounded them, and in the prosperity of the school itself. The chair was occupied by the reverend Vicar of the parish, and characteristic and excellent addresses were delivered by Mr. George Cruikshank and Mr. Ruskin. The latter gentleman delighted his audience with one of his brilliant addresses, in which he mingled much of simple and useful instruction with equally valuable encouragement in the pursuit of the study of Art. Mr. Ruskin was followed by Mr. Burchett, the head-master of the Government School of Design, who adverted to the high character of this particular institution, and paid a deserved tribute to its able master, Mr. Casey. We shall expect much from this School of Art, and we entertain no fears that our expectations will have to experience disappointment.

IN LIVERPOOL, the first stone has been laid of one of those monuments of private munificence which have grown, and are multiplying, out of that doctrine of the day, the first sowing of whose seeds the men of this generation can remember, and which is more and more earnestly maintained as the beauty and value of its fruits are seen—the doctrine that the true discipline for the masses is education. Mr. William Brown, the member for South Lancashire, has, at the request of the citizens of that great commercial town, taken the leading part in the ceremony of inaugurating the new building for the Free Library and Museum which the town owes to his own unaided donation. The facts deserve a word of record. The building in Duke Street which contains the historical and ornithological collection presented by Lord Derby to the town, and which formed the nucleus of the institution in question, having become too small for the students which it had helped to create, Mr. Brown, in consultation with the then Mayor as to what could be done to meet this wholesome growth, expressed his intention to assist any such effort with a gift of £6000. It would seem as if noble action grew by its own exercise; for, subsequently, Mr. Brown announced that his donation of £6000 had expanded into £12,000—and, finally, he took the whole cost of the new edifice on himself, involving, it is said, a liability of not less than £30,000. All the associations in Liverpool which represent Art and Literature put on record their individual testimonials to this magnificent act of fosterage of objects similar to those which they have themselves at heart. The address of the Historic Society of Lancashire and Cheshire, in particular, was emblazoned in the highest style of the Art, as borrowed from examples in ancient manuscripts, and framed in a manner to correspond. The trowel, which passes as an honourable heir-loom into the family of the founder, represented among its rich embossings, “a classic figure presenting the drawing of the new building to Education, with Fame overhead crowning the donor with a wreath of flowers.” Mr. Brown said, that, Providence having crowned his labours with wealth, he looked on this devotion of a portion of its bounty as his fitting acknowledgment. We trust his reading of the duty which success involves may spread; and we believe it will, since it is, happily, in the nature of beneficent example to propagate itself. Throughout the whole

of Liverpool the day of inauguration was observed as a holiday, and the festival aspect of that busy, practical town, under the influence of the occasion, was itself a striking proof of the progress already made by the cause to which this gift of Mr. Brown makes so magnificent a contribution. Among the honours showered by a grateful population on the living head of the donor, two are more especially designed to represent him and his enlightened liberality to posterity. One is a portrait of him, by Sir Watson Gordon, destined for the building which is about to arise at his cost; the other is a statue of him, for which Mr. MacDowell has received a commission from the town and corporation, and which is to convey his lineaments to future generations from a pedestal in St. George's Hall.

THE NEW GOVERNMENT BUILDINGS.—The designs for this grand group of buildings are now in course of arrangement for public exhibition in Westminster Hall. We shall not fail to notice them carefully and at length in our next month's number.

EQUESTRIAN STATUE OF LORD HARDINGE, BY FOLEY.—This fine work improves on acquaintance. A second visit is even more pleasing than the first. The horse is admirable—a noble specimen of an Arab, and the attitude judicious, though novel. It is a really good horse, not cat-hammed or over-necked, but one that would live across country; with a good flank to drive him over timber, and well ribbed-up—fiery, but not peppery. We have seen no equestrian statue of late in England in which we have liked the horse so well. With all this, he is duly subservient to his rider, not only in the riding-school point of view, of being well in hand, but as a matter of Art—a consideration of great importance in equestrian statues, in which, too often, the horse is the more attractive and impressive animal of the two. This rock is thoroughly avoided in the statue in question, in which, if we were to remark one excellence as more emphatic than the others, it would be the admirable manner in which the rider seems to occupy the horse, which is evidently but his moving pedestal. Altogether, the simple and quiet domination and fine presence of this portrait-statue is remarkable. The eye of the spectator goes at once to the features of Lord Hardinge. The arrangement of the drapery and details is judicious and easy. Our earnest hope is that we shall retain a duplicate of this fine work in England, as the original bronze is going to India; and we trust that the unexpected objection which has met this desire of the friends of the late Lord Hardinge, to have such erected by subscriptions in London—viz., that the relations of the late commander-in-chief wish no second copy to be made (which seems about as reasonable as that a fine literary work should be confined to a first edition)—will be satisfied by some minor modification in the second statue, which, without deteriorating it, will stamp both statues as originals.

LONDON AND MIDDLESEX ARCHEOLOGICAL SOCIETY.—This active and energetic society proposes to hold meetings during the approaching summer months at the Tower and Hampton Court: it is also intended, in accordance with a suggestion from the Dean, to hold another meeting in July at Westminster Abbey. We were present at that held last year in the abbey, and are pleased to hear that there is a probability of the visit being repeated, as a single day is barely sufficient to have a glance at half the interesting objects there to be seen and talked about. The Rev. Charles Bontell has recently been appointed secretary to the society, and there is but little doubt that under his able superintendence its progress will be greatly advanced: we know of none better qualified for the discharge of such duties as will devolve upon him.

THE MONUMENTS AT ST. HELENA.—Naturally enough, under present circumstances, the French Government have taken charge of one of the places of historic pilgrimage. They are about to enlist the services of Art for the maintenance and embellishment of the shrine which keeps, amid the solitudes of a lonely island in the far seas, the great memories of the founder of that dynasty which it is France's pleasure to acknowledge to-day. It appears, that, the intervention of the British Government has obtained from the East India Company the cession to the Emperor of the French of the house in which the first Napoleon spent the long years of his captivity, and the tomb which received the mortal covering of the captive when he broke his chain at last.

The house, which has, strangely enough (since, seen from whatever national point of view, it is a relic of extraordinary interest), been suffered to go to decay, is to be immediately repaired,—the tomb restored to the appearance and condition which it had when—up to 1840—it held the remains of him whose vassals—like theirs who represented the Roman greatness of old—were kings,—and a funeral chapel is, it is said, to rise by the side of the latter. All the visible points in that wild and majestic episode—an episode incomparably exceeding in its expression of grandeur and desolation that of Marius seated among the ruins of Carthage—are to be marked by Art for the future reading of the pilgrims. The hill from which in fine weather the captive looked out on the great waters that lay, like a symbol of the coming eternity before, between him and the mighty fortunes he had left behind,—and the point of the road at which he turned in those unimaginable rides when, attended by a long train of phantom memories, he went abroad, to taste the accidents of his dungeon and take the measure of his chain.

THE CRIMEAN MONUMENT AT TURIN.—To the angry correspondence which has recently taken place between the ministers of Austria and Sardinia, Count Buol and Count Cavour, and which has led to the rupture of diplomatic relations between the two states, we owe some curious particulars relating to this monument. The project is not, as we had imagined, that of the Sardinian Chambers themselves in honour of their own army,—but the proposed work is a tribute of sympathy and admiration from the Milanese, and as such was first offered by them for the acceptance of the Sardinian Government. Of course, the reasons are obvious enough why the Piedmontese minister at Turin could not, as matters stand, accept this expression of their sentiments from subjects of Austria; and the offer was next made to the Municipal Council of Turin. In Sardinia, as Count Cavour says, the municipal councils do as they like,—very much as they would in England:—and so, Turin will have her new monument, let Count Buol, as the Austrian “Hercules, say what he may.”

LADY-ARTISTS' EXHIBITION.—Arrangements are in progress for opening an exhibition of paintings and drawings by ladies, professional and amateur. It will be, we understand, of a high order, and manifest a truth which is becoming every day less questionable—that in the Fine Arts women are capable of great achievements. All our exhibitions of late years contain abundant proofs in support of this belief; and although it may be expedient to gather their works into one collection, we cannot consider they have been unfairly or even “ungallantly” dealt with in any of the existing exhibitions. We shall probably be, ere long, better enabled than we now are to report on this novel project—a project which cannot fail to be interesting and agreeable.

ARCHEOLOGICAL INSTITUTE.—The proceedings at the last meeting were opened with a warm and feeling eulogium upon the late J. M. Kemble, as an antiquary and man of letters, by the chairman, his veteran fellow-labourer in the same field of inquiry, Mr. Hunter. Various Roman and Romano-British discoveries at Drayton Beauchamp and Chepstow were subsequently described, and specimens of the objects discovered were exhibited. An elaborate and curious paper on “Horns of Tenure,” by Mr. Walford, followed, together with a letter from Prince Labanoff, accompanying a proof impression of an engraving of an unpublished portrait of Mary Queen of Scots. This Russian nobleman has devoted his attention to investigating the history of Mary Stuart, many letters from whom, addressed to various persons, were discovered by him at Moscow.

WESTMINSTER ABBEY.—The south-western arch of the choir has very recently been closed in towards the choir itself with a screen of oak, designed to harmonise in its general character with the stalls that occupy a position to the westward of the transept. The design of this screen is truly admirable, and its very adaptation to the design of the stalls, while giving evidence of the purest taste, serves to render still more palpable than heretofore the unfortunate circumstance that the stalls themselves were not produced under the direction of the same artist. The carving of this screen is of the highest order of excellence, and the entire work forms a happy commencement to the series of practical improvements in this glorious church, which we confidently anticipate from the present Dean.

REVIEWS.

MISCELLANEA GRAPHICA; a Collection of Ancient Mediæval and Renaissance Remains, in the possession of the Lord Lonsborough. Illustrated by F. W. FAIRHOLT, F.S.A. Part XII. Published by CHAPMAN & HALL, London.

Mr. Fairholt has, in this part of the MISCELLANEA GRAPHICA, brought his labours to a close,—and a most beautiful, curious, and interesting work is now in the hands of the public entire. We have reported its progress as the successive numbers were brought out, so that little else remains for us to do than to announce their completion. The last part—that which is now before us—is devoted to a history of what, in the phraseology of our day, would be termed Mediæval “Manufacturing Art,” as it is exemplified in the various objects which Lord Lonsborough has collected with so much taste and antiquarian knowledge, and at a vast cost; for the rarity of these objects, no less than the valuable materials—gold, silver, and precious stones—of which many of them are composed, could not have procured them for their possessor except on the terms of a very liberal expenditure. The historical introduction is from the pen of Mr. T. Wright, F.S.A., than whom no one could be found whose acquaintance with the subject is more erudite, or who has a readier faculty of compressing a large amount of information into a comparatively narrow compass: the essay is accompanied by numerous woodcuts, drawn by Mr. Fairholt; and, as a frontispiece to the volume, is a most elaborate engraved plate, by the same antiquarian artist, of a remarkable silver book-cover, of Italian workmanship, executed in the fifteenth century—a production as beautiful as it is unique.

The entire volume contains forty-four plates, most of them having several subjects on each sheet, copied from objects that had their origin in almost every civilised country in the mediæval ages. The subject of mediæval Art is one that now engrosses so large a portion of public attention, that every work which adds to our stock of information, and helps to develop the taste, ingenuity, and skill of the Art-workmen of antiquity, is a book to be welcomed: to such a greeting this is eminently entitled.

BILDER BREVIER DER DRESDNER GALLERIE. Von JULIUS HÜBNER und H. BÜRKNER, Dresden.

This is a charming little volume, containing twenty-five etchings after celebrated pictures in the Dresden collection. Each is accompanied by a sonnet, alluding to some characteristic of the painting or the master, much in the way of the “Sketches of Painters,” which Henry Reeve published with Murray some years ago. But it is chiefly with the engravings that we have here to do. The “Madonna Sistoria” and the “Holy Family” of Holbein are literally gems: they are etchings about four inches high, and are masterpieces in this style of engraving. There is a delicacy in the expression of each countenance, small as it is, which we have hardly seen equalled. The “Magdalen” of Correggio, the “Madonna della Sedia” of Raphael, then a Titian, an Everdingen, and a Vandyke, the “Children of Charles I. of England,” are all the most delightful *souvenirs* any lover of Art can well have of a sojourn in Dresden.

LAYS OF A LIFETIME: THE RECORD OF ONE DEPARTED. Published by DANA & Co., New York; S. Low & Son, London.

These lays were sung by one who dwelt in the remote highlands of the Hudson, near a small town called Walden, which the father of the writer had reared, and caused to flourish, amid the solitude. Of the name of the songstress we are left in ignorance—the editor of the book, who tells us much of the history of the lady, speaks only of “Sophia:” a pure-minded and gentle being was Sophia; we should have judged her to be so by her poems, even had not he who has ushered her thoughts into the world recorded the fact in his narrative, over which the spirit of the heroine seems to have flung her own soft and ethereal shadow, for he writes tenderly and enthusiastically. The poems are not many in number; three or four playful and humorous, the others sad, solemn, and sacred; most of them penned when the writer was suffering under an acutely painful disease, that laid her, a young mother, in an early grave. The work has a tone of pensiveness throughout, which, allied as it is to pleasant thoughts and natural expression, will find admirers, and not undeservedly. The printing, on thick cream-coloured paper, and the binding, would do credit to the most renowned publisher in London. It is a very pretty

gift-book, which the youth of England and America may alike read with advantage to themselves, and gather from it lessons of the true and the good.

CHRISTIAN MEMORIALS; being Working Drawings of Headstones and Tombstones, designed by Professional Members of the Worcester Diocesan Architectural Society. Published by the SOCIETY, and by PARKER, Oxford & London.

The first part of this work promises to supply a desideratum long felt and generally acknowledged. The engravings are large, clear, and expressive; the designs are generally appropriate, and throughout there is apparent much of artistic feeling, with the expression of a pure Christian sentiment. The designs are varied in style, and they comprise in their proposed materials both stone, wood, and iron. With the plates there is given a simple prefatory notice of the general subject of modern sepulchral memorials, with a table showing the cost of the several designs. The price of this work places it within the reach of every person who is interested in the subject of which it treats—and who is not interested in it? We congratulate the Worcester Society on having produced a work that is calculated to prove eminently useful, and which establishes the practical utility of the society itself.

LESSONS ON TREES IN WATER COLOUR, from Drawings by VICAT COLE. Parts I. & II. Printed and Published by W. DUFOUR, London.

Mr. Cole is a very excellent landscape-painter, whose pictures have frequently called forth our commendation; but we have very strong doubts whether the method he has adopted in these books will much assist the student in acquiring the art of drawing and painting trees. In the endeavour to simplify his subject, he has left it almost barren: a mere list of the colours used in painting a particular object, without the least reference as to how and where they should be employed, is, we think, to leave the learner as much in the dark as ever. In fact, the examples require explanation. The mistake of most writers who would teach Art, through the medium of books, is, that they say too much, and thereby confuse the young student by the multiplicity of words; Mr. Cole's error is that he says too little—in truth, nothing. In another edition this omission might be easily rectified, for the examples are quite of sufficient merit to justify the additions, and then the work would be really useful.

LES VASES CHINOIS ET LES VASES GRECS. Par M. BEULÉ. Published by J. CLAYE, Paris.

By bringing together the opposites in Art, M. Beulé has here argued so much in disfavour of Chinese mental capacity, that their claim to be considered “celestial” is much damaged thereby. Should any mandarin assume to himself extra importance, after the somewhat extraordinary sympathies and compliments of some of our politicians, he might be calmed by M. Beulé's *brochure*. He starts from first principles, and has no misgivings, but boldly propounds the theory of mental inferiority in the Chinese as one of the results of race. He thinks with Hamlet, it is “not to consider too curiously to consider so.” He begs you to look at the colour of their skins, the conformation of their heads, the expression of their eyes; and, taking these as indications of a particular mental conformation, denies the name of Art to works from Chinese pencils: it is only a *bizarre* industry, which imitates nature slavishly in flowers or insects; and if it reach the imaginative, only disports itself in grotesque forms calculated to dispel the *ennui* of an opium-eating race. The Greeks, on the contrary, elevated man, and their ceramic works were devoted to beauty of form and grandeur of idea; they were infinitely inferior in material to the Chinese, but as infinitely superior in design: and this argument, deduced from the potter's clay, M. Beulé would bring to bear on the “human clay” all the world over; hence we have a few sly hints at the lugubrious tints of the German painters, and the *tristesse* of all northern nations. The argument is an old one with French philosophers; but by thus contrasting such extremes as Greek and Chinese Art, M. Beulé has made out a strong case, and certainly proved the vast difference in the mental organisation of both.

ADULTERATIONS DETECTED; OR, PLAIN INSTRUCTIONS FOR THE DISCOVERY OF FRAUDS IN FOOD AND MEDICINE. By A. H. HASSALL, M.D. Published by LONGMAN & Co., London.

This volume is supplementary to a former work by Dr. Hassall on “Food and its Adulterations,” in

which the exposures of what the public are accustomed to eat and drink almost “frightened the isle from its propriety.” Such revelations are a lamentable reflection on the commercial morality of the age, and are even more to be deprecated than the mischievous results in the public health to which they lead; for the conscience of the adulterator must be seared, his honesty of principle thrown to the winds, to induce the commission of offences so dark and destructive. We cannot, for the life of us, see the smallest distinction between the utterer of a base coin or a forged note, and the trader who sells knowingly an adulterated article either of food or clothing; in the case of the former, as being more prejudicial to the community, we would go so far as to make it a penal offence; a few convictions under such a statute would do more to cure the evil than any other power we might bring to bear upon the offender. Until, however, some measures, legal or otherwise, are in force to curb practices so notorious and prejudicial, there is nothing to be done but to submit to them; a knowledge of the evil will not mend it, when it is, as it seems to be, everywhere prevalent. Dr. Hassall's book may be advantageously consulted to detect imposition; we only wish he could tell us with equal clearness and certainty how to avoid it. Perhaps after all we may truly say as regards the matter—

“Where ignorance is bliss, 'tis folly to be wise,—”

at least, till, with our knowledge of the bane, we have also learned the antidote, and how to apply it. This knowledge has yet to be acquired, and Dr. Hassall is doing most effectually his part in keeping the subject before the attention of the public; we hope and believe with some ultimate benefit to us all.

PERSONAL NARRATIVE OF THE ORIGIN AND PROGRESS OF THE CAOUTCHOUC OR INDIA-RUBBER MANUFACTURE IN ENGLAND. By THOMAS HANCOCK. Published by LONGMAN & Co., London.

A new class of literature has sprung up within the last few years: the specialities of trade are taking their place on the shelves of the shops in Paternoster Row, side by side with the specialities of science and the liberal Arts. We have the “Book of the Feet; or, the History of Boots and Shoes;” the “History of the Umbrella;” in the March number of this Journal we noticed an elaborate treatise on “Locks and Keys;” and Mr. Hancock now presents us with the story of the India-Rubber Manufacture. The use and varied application of this substance has now become so general and so important a feature in manufactures, as to render it quite worthy of a book devoted to its history and progress; and Mr. Hancock, as the “father of this wonderfully-increasing branch of the Arts,” as he has been termed, and as a partner in the well-known firm of Charles Mackintosh & Co., is undoubtedly the fittest person to write such a history. The subject is one we need not discuss; it has already been the text of several articles in our pages, from the pens of Mr. Robert Hunt and other contributors; Mr. Hancock enters, of course, more fully into the matter, and dilates upon it in all its various ramifications and statistics. His volume is filled with engravings of the numerous articles in which caoutchouc is used—their name is “legion.”

THE CHURCH OF ST. THOMAS, NEWPORT, ISLE OF WIGHT. By S. B. BEAL. Published by DALTON, London; ETHERIDGE, Newport; BRIDDON, Ryde.

This little work possesses something more than a local interest; for, in addition to a history of the late Church of St. Thomas, pulled down in 1854, and a description of the new one, it contains a brief but interesting memoir of the Princess Elizabeth, second daughter of Charles I., whose remains were interred in the chancel of the church, and whose death has been commemorated in the monument recently erected as “a token of respect for her virtues, and of sympathy for her misfortunes, by VICTORIA R.,” as the description on the panel of the tomb indicates. We spoke of this memorial a short time since; it is by Baron Marochetti, and represents a full-length effigy of the young princess, clad in the dress of the period; it is thrown back into the wall, and behind it the stone-work is carved in imitation of the bars of a prison-grating, and also in the front, depending about twelve inches from the top. The fact of the royal lady dying in captivity at Carisbrook Castle renders the design most appropriate. Mr. Beal's book contains engravings of the monument and of the new church.

THE ART-JOURNAL.

LONDON, JUNE 1, 1857.

THE EXHIBITION
OF THE ROYAL ACADEMY.

EAR after year the age of the Academy is chronicled in the catalogue—this is the Eighty-ninth Exhibition: in eleven years more the first century of its existence will be complete. There may be those still living who remember Reynolds; there are un-

questionably those who have known some of his contemporaries and friends. Nineteenth of a century is relatively a long or a short period; it is a period sufficiently long to admit of numerous and great changes in many things, but not in Art. Antithetically to the shortness of life, it is well said that Art is long. Since the time of the first Academicians, the change is indeed great; but the great change has only of late years become confirmed. Could Reynolds, or even those of his more recently deceased friends, make a shadowy tour round these three rooms in Trafalgar Square, and could they express themselves intelligibly to mortal ears, they would say that Art in England was ruined. West might speak in mild but earnest language; but George Morland would not hesitate to say, in the coarsest terms, that all was gone to where—

“A dark
Illimitable ocean, without bound,
Without dimension, where length, breadth, and height,
And time, and place, are lost.”

Reynolds was a great authority in Art, and is still so, but we cannot agree with him in what surely would be his absolute dictum. When the principle of the three lights was propounded, nobody thought of painting pictures with more or less than three lights; and the highest light in every picture was, according to prescription, warm, and every landscape without a brown tree was unendurable. But now we see unexceptionable pictures with any number of lights—with cool principal lights, and without brown trees. We admire now landscapes with a quantity of green that would set Fuseli's teeth on edge, and perilously shake the nerves of Sir George Beaumont. We reverence the ansterities of our ancestors: we respect their virtues, but we absorb them in our enlarged principles. We receive as truths all they advance in the limited sphere to which they confined themselves; but we develop truths of which they did not dream. If there be any theorists living who deny that Art does not advance, we simply ask them, if it be not advancement to receive all the sound prescriptions of those who have gone before us, and to add to them others more strictly natural? Eighty-nine years ago—nay, less than that—our painters generally studied Art with too little Nature; now they study Nature with too little Art. We become by

custom so habituated to certain things that we cease to be sensible to their new impressions. It was only when the French artists of all classes saw with amazement, and discussed frequently with contempt, the extent to which our school had carried finish, that we ourselves recognised the distance that we had insensibly, but enthusiastically, travelled in that direction. Everybody has eagerly sought out the Pre-Raffaellite essays in each exhibition of late years; but more from curiosity than love. They have been the lions of the exhibitions, and the worst and most extravagant have always been the most fruitful source of public pleasure and amusement. Photography has done much for Art in the smaller works,—it is recognisable everywhere in small landscapes, and small figure pictures; the finish of some of these is beyond all praise. We still feel the effects of the decoration of the Houses of Parliament, in occupying certain of our most distinguished painters, who would otherwise contribute to the Royal Academy; many artists who have frequently contributed important works, have this year contented themselves with sending pictures smaller than usual, though not less careful as to execution than their larger productions. The number of oil pictures is 641, but the last number in the catalogue is 1372; the difference is, therefore, made up of miniature drawings, engravings, and sculpture. The Academicians and Associates who exhibit are, Mulready, Maelise, Stanfield, Roberts, A. E. Chalon, Cooper, Creswick, Sir J. W. Gordon, Grant, Pickersgill, F. W. Pickersgill, Redgrave, Uwins, Leslie, Dyce, Witherington, Cope, Jones, Sir W. C. Ross, Thorburn, Millais, Weekes, &c.; but, notwithstanding this array of names, there are very few productions in the highest class of subject: the pictures of Maelise and Cope are the two most ambitious and earnest productions; Mulready's picture for the Vernon Collection has cost him an immensity of labour, but it is of a domestic character. The names of E. M. Ward, Webster, Lee, Gibson, &c., do not appear in the catalogue as exhibitors. Millais contributes some works of which we shall speak in their place in the catalogue; but Pre-Raffaellism—*quoad* figure pictures—is not this season so prominent as it was last. The best spirit of landscape painting may be said to be entirely unrepresented in the Academy: and it is deeply to be lamented that, in the place of subjects of interest, so much of the space should be occupied by portraiture, of which so great a proportion is unqualified by any marked excellence. There are, we repeat, many small works of rare merit, but they must be sought out by taste and experience; several of these we shall particularise in the following notes.

No. 8. 'Life and Still-life,' J. C. HORSLEY, A. We are introduced here “an sixième, Paris,” according to the catalogue—perhaps in the Rue des Petits Bossus, Quartier Montmartre. The “life” is a *couturière*, and the “still-life” one of those wooden heads on which women's caps and bonnets are made. The style of the figure is successfully French; she is one of the lower order of seamstresses, but she is personally “in good case”—a contrast to the shadows of women of the same class in London. The head is most satisfactory. This excellent artist has been gradually improving from year to year.

No. 10. 'Spanish Oxen,' F. W. KEYL. There are two of them—wild-looking animals with enormous horns, very like the cattle of the Roman States; they have been studied very searchingly as to the distinctive points of their race, and they strike the observer at once as of foreign breed.

No. 13. 'Mont Blanc from Servoz,' H. MOORE. This has the appearance of having been painted on the spot—being characterised;

the “manner” could scarcely have been suggested by the ideal. In the valley the sun has set, but the light yet lingers on the sides of the mighty mountain mass. There is no undue attempt at grandeur, but yet the scene is grand in its simple tranquillity.

No. 14. 'Narcissus,' W. E. FROST, A.

“For him the Naiads and the Dryads mourn,
Whom the sad echo answers in her turn.
And now the sister nymphs prepare his urn:
When looking for his corpse, they only found
A rising stalk with yellow blossoms crown'd.”

This is the story of the sorrowful surprise of the nymphs at finding only the flower instead of the body of Narcissus. It grows at the brink of the pool, and is regarded with wonder by a mournful triad, representing the nymphs of the rivers and the groves. To the classical reader the subject is patent, but to others the aid of the quotation may not be unacceptable. The figures are very skillfully manipulated; and there is great power, as well as grace and beauty in the work.

No. 15. 'Her Majesty the Queen,' E. BOUTIBONNE. An equestrian portrait of her Majesty in the costume worn at reviews at Windsor and Aldershot. The horse on which the Queen is mounted is white, and in the distance troops are seen manœuvring. The resemblance is striking; and the picture is carefully painted.

No. 16. 'Burial of King Charles I.,' C. LUCY. A large picture, from the composition of which is judiciously excluded everything that could injuriously affect the solemnity of the occasion. The coffin is just disappearing in the vault, being lowered by men at the head and feet. There are few mourners present, but all the few who are there are not mourners; for there are some of the officers of the Commonwealth in attendance, one of whom rudely lays his hand on the book from which the bishop reads the burial service. The picture is not advantageously seen because the varnish is chilled. It is, however, perhaps the most meritorious work that has been produced by this artist.

No. 24. 'H.R.H. Prince Albert,' E. BOUTIBONNE. A pendant to the portrait of the Queen already noticed. His Royal Highness is represented also on horseback, in the uniform of a Field-marshal. He is mounted on a black horse, and circumstanced in an open composition, in which at a short distance is seen a review of the household cavalry. The features are like those of the Prince, but we think they make him appear older than he is.

No. 25. 'A Yorkshire River-bank,' H. F. WITHERBY. This is a study of the tangled greenery of the river-side and the hedgerow, made out with the most exemplary patience—a confusion of docks, grass, ivy, dog-rose, diverse foliage, and a variety of small salad, realised in a manner to which no praise can do justice.

No. 27. * * * * MISS R. SOLOMON.

“'Tis better to be lowly born,
And range with lowly lovers in content,
Than to be perked up in glistening grief,
And wear a golden sorrow.”

Such is the quotation from Shakspeare, standing in the place of a title. The story is of a gentleman of the time of Charles II., who, having been playing cards and dice, appears to have lost very considerably. He is sitting in deep despondency; his wife standing in sorrow near him. The narrative is clear enough, and the picture is generally well executed.

No. 28. 'A Crab and Lobster Shore,' E. W. COOKE, A. This picture has much the appearance of having been painted from a photograph; but it surpasses photography because the detail of the shaded portions is as perfect as that of the light passages. The pith of the picture lies in the wondrous painting of the shingle, every individual stone of which is represented. The entire shore, moreover, is brought forward

under bright daylight, which, with one or two darks, is worked into good effect. We do not, however, coincide in the geology of the composition.

No. 29. 'Portrait of a Lady,' Mrs. W. CARPENTER. She is seated, and the figure has been studied in profile in a pose easy and natural. The features are clear in colour, and well drawn: the work is one of high merit.

No. 38. 'The View,' F. W. KEYL. A small picture, of which the subject is a lady and her horse; she has dismounted, and stands by the animal, contemplating the expanse of country which lies below her. The horse is drawn with a perfect knowledge of the form of the animal.

No. 39. 'A Syrian Sheik,' J. F. LEWIS. The costume of this figure is such as we may believe the prophets and patriarchs of old to have worn; the Arab costume of to-day is the same as that of three thousand years ago. There is something grand in the breadth and forms of the classic draperies; but with our improved knowledge of the costume of sacred history, it is an impertinence to use them now in religious art. This is a small picture, in which the sheik appears at half-length. The appearance of finish is not so obvious here as in the painter's water-colour works.

No. 40. 'Captain McClintock, R.N., late commanding H. M. discovery-ship *Tatreeid*,' S. PEARCE. A small portrait worked into extreme softness of surface.

No. 41. 'Interior of the Duomo, at Milan,' D. ROBERTS, R.A. It has often been a source of surprise to us, that this magnificent interior is so rarely painted. We feel here, perhaps more than in the place itself, the full importance of the two great pillars which support the octagon, with the bronze and silver pulpits by which they are encircled—works begun by Carlo Borromeo and completed by the Cardinal Frederick. The bassi-relievi by which they are enriched were executed by Andrea Pellizone, and the caryatides which support them represent the symbols of the four Evangelists and the four doctors of the Church,—St. Gregory, St. Jerome, St. Ambrose, and St. Augustine,—modelled by Brambilla and cast by Busea. A procession ascends the steps leading to the choir, and a rather thin attendance of visitors and devotees is distributed in the area. It is a noble production, painted with the true feeling for giving effect to this kind of subject; and such as few artists, living or dead, have surpassed.

No. 48. 'An Arab of Mocha,' T. PICKERING. A study of a head rendered with a softness of line and imperceptible gradation, which rounds the features with the closest imitation of nature. The face is full of animated character.

No. 50. 'News from Home,' J. E. MILLAIS, A. The trenches before Sebastopol form the scene of this composition, wherein is introduced a principal figure, that of a soldier of the 42nd, who, on his post and with supported arms, very attentively peruses a letter, in which is conveyed to him the "news from home." Mr. Millais' small pictures have generally, of late, been his best, but this is much inferior to his minor works of last year.

No. 51. 'Sir Roderick Impey Murehison,' S. PEARCE. A small portrait rivaling enamel in the softness of its textures and gradations.

No. 53. 'From the early Life of Queen Elizabeth,' W. J. GRANT. During the harsh imprisonment of Queen Elizabeth in the Tower, the only kindness she received was from a little child, who used to run into her room every morning with a present of fresh flowers. We find, therefore, the princess caressing the little boy as she receives the flowers. It is an original subject, but the background is too black; the figures would have been quite as

well supported by a background of greater depth and transparency. The work has, however, very considerable merit; and adds to the well-earned repute of the painter.

No. 54. 'A Salmon Leap,' T. CRESWICK, R.A. This "leap" is formed by a fall in the watercourse, over which the stream rushes with foaming impetuosity. The picture has not the spirit of earlier works.

No. 55. 'Mrs. Creyke,' T. S. HEAPHY. The lady is in full dress, and presented at half-length; the figure is graceful, and the features are animated and intelligent.

No. 61. 'Fort Socoa, St. Jean de Luz,' C. STANFIELD, R.A. The fort is a round Roman tower, situated close to the water's edge, machicolated, and bearing an armament limited to one gun, pointing seawards. This picture, as to subject, classes with the "Ancona,"—the Spanish coast scene of two years ago,—and others in which, as a *point d'appui*, a shred of the coast is given with its actual and probable incident, and with all the solidity of reality. Beyond the tower the eye is led to the line of coast which trends to distance, until lost behind a brig and a felucca—primary objects in the composition. The shore is lashed by a heavy sea, the volume of which is painted with this accomplished artist's usual felicity.

No. 62. 'The Well-known Footstep,' R. REDGRAVE, R.A. The cottage and garden described here exists, we think, in some private collection as a sketch, but here it is so assiduously worked out as to form a picture of itself; there is now, however, a story—that of the return of a wounded soldier, whose home it is, and whose wife sits in the little porch, listening momentarily to the familiarity of the footfall, without being able to see her husband.

No. 63. 'Reading the Psalms,' W. C. T. DOBSON. In this work are introduced two children of tender years reading, the upper part only of whose persons are shown. In character and expression the little heads are spiritualised beyond the cast of children of that age; and, although this is strictly inappropriate, it is yet a conquest in the field of the beautiful. The work is an essay in the "aesthetic" walk (like Gratiano, we are thankful for this word), that is, the children are set before us as *on* this earth, but not *of* it. The picture is of high merit—simple, forcible, and suggestive.

No. 64. 'The Jew's-harp,' C. ROSSITER. This study, although illustrating the commonplace of domestic life, is a finished example of the successful study of direct and reflected lights. The truth is pursued with as much tenacity of purpose as if the subject had been of the worthiest and most elevated kind. The figures in the composition are a boy sitting near the window playing the Jew's-harp for the amusement of a child held on its elder sister's knee.

No. 65. 'At Rest,' A. J. STARK. The composition contains two horses standing at a barn-door; they are well drawn and substantially painted.

No. 69. 'A Highland Interior,' D. W. DEANE. Discomfort and the picturesque are almost essentially conjoined: the houses we prefer to paint are not often those we desire to inhabit; and the habiliments we select for painting are seldom those in which we should choose to appear. The very desolation of this hotel is most valuable on canvas; the depth and subdued lights of its darker passages are precisely what they should be; the light from the window, broken on the girl seated at the cradle, is perhaps a trifle exaggerated, but time will reduce it.

No. 70. 'The Marquis of Lansdowne,' F. GRANT, R.A. This is a head and bust of the Marquis, the features of which are pointedly expressive. His Lordship is dressed according

to the taste of the commencement of the present century—in a blue coat with plain gilt buttons, and a buff waistcoat,—a combination discountenanced by Brummell, because it was worn by the Prince Regent.

No. 71. 'The Rev. Dr. Adler, the chief Rabbi,' S. A. HART, R.A. A life-sized portrait, in which the subject is presented in the costume, we presume, of his degree. The portrait is unaffected and life-like.

No. 72. 'The Evening Saunter,' G. P. GREEN. A portrait—that of a young lady wearing a grey dress; it is a graceful performance, reminding the spectator of the earlier school of our portraiture.

No. 77. 'Scene on Brae Mar—Highland Deer, &c.,' Sir E. LANDSEER, R.A. This large picture takes rank by the side of the best works of the artist of the same class of subject. The deer are placed on one of the peaks of the mountain, above the eye of the spectator, so as to bring them in relief against the sky. The principal of the group is an old antlered stag with limbs very deficient in grace, but they are of course represented as they appeared. It is a family party,—there are does and fawns, two of which are attentively looking at what appears to be, for it cannot be very distinctly seen, an eagle, that has risen into the air with prey in its talons. The point of the work is the movement and character of the stag's head.

No. 78. * * * * D. MACLISE, R.A. We know not whether a redundant or a defective imagination be the greater evil in the practice of Art: the former we always observe derogates from the solemnity of grave subjects, while the latter is frequently right in the abnegation of superfluous and injurious accessories. The observation is suggested by the bewildering plenitude of objects, which in this really splendid picture importune the eye. The subject is a visit paid by William III., attended by Lords Carmarthen and Shrewsbury, to Peter the Great, in the winter of 1697-8, when working as a shipwright in the dockyard at Deptford. The Czar is attended by Menschikoff, Golownin, Galitzin, and Prince Sibirski; he has also in his train a dwarf, a negro boy, a young actress of Drury Lane, and a monkey, the familiarity of which caused some alarm to William on the occasion of a later visit to Deptford. It is generally asserted that Peter not only worked hard himself, but made all about him exert themselves with equal industry. We find him accordingly in the act of sawing a rudder or stern-post, momentarily resting from his work to address William, who has placed himself in a somewhat formal attitude, while gravely receiving the Czar's salute. Two more opposite characters cannot well be imagined. Peter is a jocund and hilarious personage as we encounter him here, but nothing in life can be more sad or solemn than William in expression, dress, and demeanour. The attention of the entire Russian party is fixed upon William, with that happy persistence which Mr. MacLise always evinces in indicating the points of his subject. Near Peter his three officers are working; one of them with an adze, but handling it so awkwardly that it cannot be well determined whether he is aiming at the head of one of the group or at some unseen block of wood. On the left are three women—one of them the actress aforesaid; on the right, behind William, are the Lords Carmarthen and Shrewsbury; and in the centre, near the base of the composition, are the dwarf, the negro boy, and the monkey, with an endless diversity of tools and scientific instruments; while yet farther on the left—a quiet allusion to Peter's predilection for the bottle—is an assemblage of bottles and glasses, with an accompaniment of fruit, which simply and alone would form a picture, so

wonderfully is the texture of the orange-peel imitated. The enumeration of this material would furnish an auctioneer's catalogue, and the drawing and painting of the items are a kind of perfection in Art which it is difficult to describe. But these are the injurious particles of the picture, with all their excellence of delineation; it is these that induce a doubt whether we are most to admire the life or the still-life of the picture; and we cannot leave the canvas without remarking the linear hardness of the execution. But, withal, we know of no other painter of our school who could send forth such a composition. We know not the destiny of the picture, but the subject is national, and it is well worthy to form one of the historical series in the New Houses of Parliament.

No. 79. 'Marlborough Forest,' J. STARK. We can scarcely venture to allude to improvement in speaking of the works of this veteran artist. Nevertheless, this is the best production we have ever known him exhibit.

No. 80. 'Sir C. L. Eastlake, P.R.A., D.C.L., &c.,' J. P. KNIGHT, R.A. This head and bust of the President is a presentation to the Royal Academy. The likeness must be at once acknowledged; it is an excellently painted work, and a valuable acquisition to Art, in more senses than one.

No. 87. 'The Duke Orsino and Viola,' F. R. PICKERSGILL, A.

Viola. My father had a daughter loved a man,
As it might be, perhaps, were I a woman,
I should your lordship.

Duke. But died thy sister of her love, my boy?

Viola. I am all the daughters of my father's house,
And all the brothers too,—and yet I know not.

This is Viola's famous confession in the fourth scene of the second act. The Duke is seated—Viola stands by him, looking on the ground, in maidenly diffidence at having proceeded so far in her declaration. The sentiment of the features is perfectly in accordance with the literal expression. She has excited the attention of the Duke, who does not understand, nor does he care to understand her answer to his question, but at once returns to the subject of his thoughts. The picture is excellent in that best quality which is the essence of true Art—expression.

No. 88. 'The Piazza Navona at Rome,' D. ROBERTS, R.A. This large picture illustrates a subject less pictorial—more architectural—than the interior of the Cathedral of Milan; it is, however, highly interesting, as affording an example of the modern ecclesiastical architecture of Rome. It is admirable in execution.

No. 89. 'Slender's Wooing of Anne Page,' A. M. MADOT. The fatuity of Slender, and the aversion of Anne, are distinctly pronounced here. In this we say enough for the figures; and it is hoped that a word in favour of the brick wall behind them will be considered no disparagement of the impersonations.

No. 91. 'Scene in a Welsh Valley,' F. W. HULME. This is very like the Conway, with its alternate streams and pools flanked with river shingle and green trees—rendered here with the finest feeling: like all the works of this excellent artist, it is pure and true, and very carefully manipulated.

No. 92. 'The Photographer,' G. SMITH. The deficiency of the picture is, that we cannot see a subject of interest sufficient to engage the attention of the photographer; nevertheless his camera is set, and he is adjusting his lens. The theatre of his operations is a village, the entire youthful population of which is come forth to wonder at the magic of his doings. The picture is remarkable for careful finish.

No. 93. 'Rough and Ready,' Sir E. LANDSEER, R.A. This is a portrait of a pony—a quiet, sensible, and very safe animal. The accessories of the picture are simple and common-

place, but yet they are adjusted with the taste and feeling of a master. There is nothing that could be expunged without a sensible hiatus; nor could anything else be introduced without a sense of repletion.

No. 102. 'To Let,' J. COLLINSON. The point of the title is not very clear; the picture shows a lady in a dark dress, in the act of drawing up her Venetian blind, at a window well furnished with flowers. The figure is round and well drawn.

No. 103. 'Sacred Song,' S. A. HART, R.A. Extremely chaste in treatment, containing two figures singing from a slip of music which they hold before them. The expression in the features of each is of pure and elevated character.

No. 104. 'Upon the Mountain,' T. S. COOPER, A. The subject is a small society of goats and kids upon the summit of a hill sparse with pasture, and hard with the cropping out of the limestone rock. Goats are not the forte of this painter; it would appear that he paints them with difficulty; certainly not with the same felicity that he paints sheep and cows. The composition does not hold well together.

No. 107. 'Titian preparing to make his first Essay in Colouring,' W. DYCE, R.A. "Ridolfi states that Titian gave the earliest indication of his future eminence as a colourist by drawing a Madonna, which he coloured with the juices of flowers"—such is the legend which follows the title in explanation of the picture. This picture is what would have been called Pre-Raffaellite before the inconsistencies and extravagances presented in the works so called. But it differs from such productions in two very important particulars, which are—the accurate drawing of the figure, and that it represents what might have been a living creature. The boy is seated on a chair, looking over the back of it in contemplation at the marble figure of a Madonna, which resembles more one of the beautiful Nuremberg Madonnas than anything we have seen in Italy. His hand rests upon the paper on which he has been drawing, and he is surrounded by flowers strewed upon the ground. Everything in the picture is worked out with the utmost refinement of labour; the leaves are individually represented, and every crack in the bark of the trees is made out in the spirit of the most perfect imitation. The expression of the boy is intense; he looks as if he had not succeeded.

No. 108. 'The Rev. G. T. Marker, Rector of Uffculme, Devon, and Mrs. Marker,' J. P. KNIGHT, R.A. The two portraits are painted on the same canvas, the figures being seated side by side. The features of both are animated and agreeable.

No. 114. 'Flowers,' T. GRÖNLAND. A small study consisting principally of yellow roses, rendered with the truth which usually distinguishes the works of the artist.

No. 116. 'A Portrait,' A. BOXALL, A. It is that of a lady wearing a white dress; the features, which are turned full towards the spectator, are painted with the utmost softness, but the chin is out of drawing. This artist is, perhaps, the last of the sketching school—upon him the new movement has no influence. We do not mean that the head is in anywise loosely executed; but the dress is sketchy, and the left hand, which rests in the lap, is only indicated; it is, however, a production of much elegant simplicity.

No. 117. 'The First of October,' A. COOPER, R.A. This picture contains portraits of the painter and his son, who are resting at the skirt of their cover after their sport; for it is scarcely necessary to say that "the first of October" means pheasant-shooting. Mr. Cooper, Sen., is in conversation with a lady who has ridden up to the party on a grey horse, which is extremely well painted.

No. 118. 'Clearing Off,' J. MEADOWS, Sen. A small marine subject, in which the sea is described with spirit, while the aspect of the sky is co-incident with the title.

No. 122. 'God Save the Queen,' Mrs. E. M. WARD. We listen here to a chorus of small voices singing the national anthem, the performance being conducted by a lady who presides at the piano. This is, we presume, a composition of family portraiture, rendered interesting from the manner in which the youthful characters are introduced. It is a picture of very great merit, and of general interest: indeed, there are not many better works in the collection than this production of a lady—whether we regard the composition or the execution.

No. 123. * * * * F. GOODALL, A.

"Vieux-tu la tendresse, me volla Jenny;
Vieux-tu la richesse—nenni."

We have here a Breton youth and maiden seated on a grassy bank which rises behind them, so as to form the background to the picture. He advances his suit with the questions constituting the distich that forms the title. He leans back, so that the girl is the prominent figure, and she comes forward many degrees more brilliant than her lover. The colour and sentiment of the head rivet the attention. She is a most *piquante* impersonation; the felicitous relation of the figures tells the story in terms plain enough.

No. 125. 'Kate Nickleby at Madame Mantalini's,' W. P. FRITH, R.A. The particular passage here illustrated is as follows:—"Kate's part in the pageant was humble enough, her duties being limited to holding articles of costume until Miss Knag was ready to try them on." We find Kate, accordingly, standing with a mantle thrown over her arm, and we learn from the reflection in a cheval glass, that Miss Knag is in the act of trying on another, but not within the field of view. The picture is low in tone, and sober in colour, and the flesh tints are not of those bright hues to which we have been accustomed in the works of this painter; the subject is also of a lower order than subjects that have preceded it.

No. 126. 'Mrs. Markham,' F. GRANT, R.A. This is a portrait of a lady equipped for a winter walk in "a wide-awake" and dark cloak. There is much more of pictorial quality in this treatment than if the subject had been presented in the costume of the drawing-room, with her hair *à la Semiramis*.

No. 130. 'The Right Honourable Sir George Clark, of Pemyeuk, Bart.,' Sir J. WATSON GORDON, R.A. This painter possesses in a high degree the art of concentrating the interest of his portraits in the heads. The force and vitality of this head approximate to the life as nearly as Art can to Nature.

No. 132. 'Early Summer,' W. F. WITHERINGTON, R.A. There is a greater degree of breadth in this work than in many other pictures of its author, which, with the utmost nicety of elaboration, have nevertheless been injured by a reckless distribution of light.

No. 133. 'A Welcome Arrival,' J. D. LUARD. We are here introduced into a hut in the Crimea, the dwelling of one, or it may be two, cavalry officers, one of whom has received a ease from home containing a variety of necessaries and luxuries, among which there has been a packet of illustrated newspapers, the cuts whereof have been clipped out and pasted on to the sides of the hut. We conceive there may be truth in the picture rather from what the hut wants in comfort than what it contains.

No. 134. 'In Sussex,' J. STARK. The composition strongly resembles those scenes which find favour with this painter—that is, it consists of a few trees, well and carefully painted, with a portion of distance. There is, within the shade of the trees, a ruin of an abbey or a

monastery—an association which must, we conceive, exist in reality.

No. 135. 'Thoughts of the Future,' R. CARRICK. The title is not so appropriate as many others that might have been given to this work, which shows a mother contemplating her sleeping boy. The window of the room is at the head of the bed, and the manner in which the light breaks upon the figure communicates to it roundness, force of tone, and substance. The effect is admirably managed; there is nothing to distract the eye, and in execution the work is very skilful.

No. 136. 'The Mountain Path,' J. T. LINNELL. As an expression of sunshine, this is among the most successful works we have ever seen. The *locale* is a section of upland pasture, with a footpath leading over it definitely marked by the current of the rain-water which has flowed down the hill. It would be difficult to discover in the place itself anything worthy of being painted; but everything in Nature, faithfully brought forward, will become a picture qualified by some feature of the beautiful. The colour is powerful, yet it is well supported, and is, therefore, not crude; but in the distance there are certain passages of purple shade which are altogether inharmonious with the rest of the composition—these are dull and opaque spots.

No. 138. 'The Young Brother,' W. MULREADY, R.A. This picture has, we believe, been long on Mr. Mulready's easel, and has cost him much anxiety; but this, to a casual observer, is not at all apparent. It was commissioned by the late Mr. Vernon, and is to be added to the Vernon Gallery. It contains only three figures, which are larger than any we have ever seen from the easel of this eminent painter. The three figures are a child in the arms of its elder sister, or mother, shrinking in play from an elder brother, who is about to pinch its ear. The back of the woman is turned to the spectator, and the child rests upon her left shoulder, while the youth on the right passes his arm in front of the principal figure. Beyond this there is no narrative, no allusive incident; the beauty and power of the work lie in its execution and colour—the former is marvellously mimetic, the latter brilliant and most harmonious. The principal breadth of the woman's dress is Mars orange, in proximity with which there are powerful and positive reds and blues. There is also a strong green, in the shape of foliage, overhead, which, under certain circumstances, would look cruder and greener than anything that Nature has in her ample stores, but it is reduced to harmony with masterly power. Looking closely at the hand of the child, and other hands in the picture, it would appear that some of these parts have been painted from photographic pictures. This may or may not be; but such is the appearance of these extremities. Fine as this picture is, we confess we would rather have seen a work with smaller figures and more of a story. It is exhibited by the executors of the late Mr. Vernon.

No. 145. 'In Lyndale, North Devon,' W. F. WITHERINGTON, R.A. This, it may be presumed, represents a passage of the course of the river Lynn; it is very like Devonshire scenery, but perhaps not the most paintable *morceau* that might have been selected.

No. 146. 'The Lonely Hearth,' A. RANKLEY:—

"Weep not, she says, at Nature's transient pain,
Congenial spirits part to meet again."

We are here introduced to the humble home of an aged cottager, who sits at his hearth in widowed loneliness. The crape band on his hat tells us that he has lately lost his wife; and that his loss weighs heavily upon him, we learn from a shadowy vision in which the wife is seen to be borne away by angels. The poor old man's position is very clearly set forth.

No. 150. 'Ye Banks and Braes,' C. DUKES.

A rustic group, somewhat in the sentiment of "The Gentle Shepherd." A youth is playing on the pipe the air, it may be supposed, mentioned as the title. The figures are natural and well rounded.

No. 151. 'Margaret and Lizzy with Pitehers at the Fountain,' Mrs. M. ROBINSON. This is the scene between the gossips at the fountain, in Faust:—

Lieschen. Hast nichts von Barbelehen gehört?
Gretchen. Kein Wort. Ich komm' gar wenig unfer Leute.
Lieschen. Gewiss, Sibylle sagt' mir's heute, &c.

The fountain is placed in an open space, and the two figures are immediately in front of it, engaged in their earnest scandal. But this picture is drawn and painted with all the masculine vigour of a student who had graduated in every Art-school in Europe. The execution evinces power and knowledge, and the expression of the women accords with the spirit of the text.

No. 152. 'A London Flower Girl,' W. P. FRITH, R.A. This is, we believe, the first time this picture has been exhibited, although we have seen it, or a replica, in a private collection. The girl stands holding before her a number of flower-pots, in which are growing various plants, and looking up at some neighbouring window.

No. 153. 'Heat Showers in August,' T. S. COOPER, A. This is not essentially a landscape, as the title might be supposed to signify; it is a cattle picture, but in every respect superior to recent works of the artist; it approaches the quality of his early master, Verboeckhoven. It represents the everlasting knoll with sheep and a cow, very carefully painted.

No. 154. 'Mrs. Peel,' F. GRANT, R.A. The lady is introduced in a plain walking-dress, holding before her a round hat. It is a portrait of much grace and sweetness.

No. 157. 'Dressed for the "Kermesse" (village fête), Antwerp,' E. H. HARDEN. A single figure,—that of a woman,—apparently well executed, but hung so high that it cannot be inspected.

No. 158. 'The Holy Family before Jerusalem,' E. KIRCHBACH. An example of the German school, but referring directly to those of the old masters, who, before the time of Masaccio, knew not that much of the beauty of composition lay in variety of line and quantity. The three heads are in profile, and all are turned one way.

No. 160. 'A Signal in the Horizon,' J. C. HOOK, A. We are introduced here to the family of a pilot, or boatman, living on the cliff somewhere, perhaps, about the Isle of Wight. All the figures are on the steps by which the cliff is ascended to the boatman's dwelling; and there he is himself, looking searchingly through his glass, his wife dragging the tanned mainsail out of its resting-place, his son standing on the steps a little higher up, and, above all, a child at the door of their cottage. No artist describes these humble sea-side realities with so much truth.

No. 161. 'A Sea Nymph,' W. E. FROST, A. She stands in the water adjusting her hair. The picture is one of those miniature-studies of which this painter exhibits one or two every year; all being of great beauty and value.

No. 162. 'The Confidante,' W. GALE. This is a small picture, in which appear two ladies in earnest conversation on a subject which it is not necessary to mention. The scene is a grove, which, with the figures, is exquisitely manipulated.

No. 167. 'Rather Fractions,' G. SMITH. A group of a mother and child, the former washing the latter. The figures tell forcibly, relieved by a plain wall, with somewhat of a Dutch simplification of taste.

No. 171. 'The Author of "The Pleasures of Memory" in his Dining-room,' G. JONES, R.A. A small, sketchy picture, in which we see an old gentleman, which may represent the late Mr. Rogers, seated at a table. The room looks out upon the Green Park.

No. 172. 'Breakfast-time—Morning Games,' C. W. COPE, R.A. These "morning games" are something in the spirit of "Open your mouth and shut your eyes," &c. A child stands on a chair with eyes closed and mouth open, receiving from her mother a piece of sugar. The scene, as may be inferred from the title, is a breakfast-room of very comfortable appearance; the subject is interesting, and the work supplies ample evidence of power.

No. 180. 'Youth and Age,' J. C. HORSLEY, A. The contrast here is sufficiently obvious—a poor old widow in a red cloak, having been collecting sticks, is resting on her way home; she is in the shade; near her stands a party of village children, one of whom, with infantine simplicity, offers the old dame a flower: they are in the light, and the light and the shade, in this case, have a pointed signification. The place in which youth and age thus meet is a descending road, flanked by high banks and shaded by trees. The life of the picture has been successfully studied, and the secondary passages show an equally satisfactory result.

No. 181. 'Faces in the Fire,' J. BRETT. The subject is by no means worthy of the execution. The picture is small, containing one figure—a youth sitting at his ease contemplating the glowing embers.

No. 186. * * * * Miss E. TURCK:—

"I'll sit me down and muse
Beneath you shady tree," &c.

The practice of substituting a poetical quotation for a title is becoming very common. Where there is any difficulty in finding a title, this may be intelligible, but it cannot otherwise be understood. This picture shows a female rustic figure seated under a tree, but she comes entirely out of the picture. The ferns and undergrowth are very carefully painted.

No. 188. 'At Berncastle, on the Moselle,' G. C. STANFIELD. This work is more interesting from its execution than the agreeable nature of the subject. The prominent feature of the view is a crucifix in the nearest site, placed over an arch, under which a rapid stream flows. It is painted with a substantial success that gives to every object the weight and hardness of nature.

No. 189. 'The Cradle of the River,' R. REDGRAVE, R.A. One of those sylvan subjects which this artist realises with much feeling. The cradle of the river is a woodland pool—a spring in the hill-side supplying, it may be supposed from the title, the nascent rill of some important stream. The entire site is covered with trees, and it rises so as to close immediately without distance. From the appearance of the whole it seems to have been painted on the spot.

No. 190. 'Margaret,' F. STONE, A. This is the scene from "Faust," in which Margaret, sitting at her spinning-wheel, and alone, thus laments:—

"Meine Ruhe ist hin,
Mein Herz ist schwer;
Ich finde sie nimmer
Und nimmer mehr."

She is seated, her head resting on her hand, and the tears falling from her cheeks. It is so different in manner from the usual work of the artist that we should not have attributed it to him. The change seems to result from the new influence. It is very beautiful in character and in execution.

No. 191. 'Mrs. Gisbourne,' J. LUCAS. A life-sized figure representing a lady in a coloured dress, agreeable in expression, and without affectation.

No. 196. 'The Rev. Henry Cooke, D.D.,

LL.D., D. MACNEE. A characteristic portrait of an elderly gentleman, presented at full-length, and wearing a gown and bands. He rests his left hand on some papers and books; the pose is easy, and the features animated.

No. 197. 'Sophia Western,' A. E. CHALON, R.A. She is reclining in an arm-chair, in deep meditation, and near her lies a nuff, from which a Cupid is creeping with the evident intention of wounding her with an arrow, which he grasps in his hand. The picture, to speak mildly, is sketely, and not up to the average of the present day.

No. 198. 'Sketching from Nature,' W. HEMSLEY. The study is made by an artist surrounded by a group of village children, from one of whom he is drawing. The model, amid the jokes of his companions, looks as grave and collected as he can. Each figure has been drawn and painted with a resolution to carry it out to perfection. The colours are strong and effective; the work is one of rare excellence.

No. 201. 'A Swiss Meadow in June,' H. MOORE. If this be true, the meadows in Switzerland are more flowery than our own. The site is a gentle slope, covered with long grass, enriched with flowers of a variety of hues. There is nothing remarkable in the subject as to striking feature; the beauty of the work is entirely due to the extreme tenderness and fulness of the elaboration, which has repeated the grass and flowers blade for blade, and leaf for leaf.

No. 204. 'Port na Spania, near the Giant's Causeway, Autrim, Coast of Ireland,' C. STANFIELD, R.A. In this grand picture there is more of dignified and serious narrative than in the others generally of Mr. Stanfield's recent works, with the exception of "The Wreck"—the lone ship. The picture sets forth the destruction of certain of the ships of the Spanish Armada, that were cast upon this part of the coast of Ireland. These vessels, driven on shore in the mist, and supposing the isolated rock, called the Chimney-tops, to be in reality the chimneys of Dunluce Castle, wasted their powder in firing at them. The gale increased and they were totally lost. We see, therefore, two of these redoubted vessels lying shattered on the rocks; portions of their crews, that have escaped the waves, are clambering up the rocks; and drifting on the shore is a large boat full of people—priests, soldiers, sailors, and officers, who have crowded into her without order. All this passes immediately beneath the famous basalt rocks of the Giant's Causeway, the base of which is lashed by the billows of a heavy sea; the right is enveloped in the fatal mist which accelerated the destruction of the ships. This is a picture which should be possessed by the nation as an ornament of the Houses of Parliament, for the subject is unquestionably historical. More might have been made of the ships.

No. 210. 'The Lady North,' H. WEIGALL. The head and bust of a lady painted in a manner extremely simple and graceful.

No. 212. 'General Sir James Simpson, G.C.B., Sir J. W. GORDON, R.A. This is a full-length portrait, in which the subject is introduced, standing, and in uniform, relieved by a dark smoky background, with a slight allusion in the rear to the operations before Sebastopol. The background, without being at all forced upon the eye, is extremely significant of movement and action.

No. 213. 'Sir Roger de Coverley in Church,' C. R. LESLIE, R.A. The subject is from the 112th number of the "Spectator," the text runs thus:—"As Sir Roger is landlord to the whole congregation he keeps them in very good order, and will suffer nobody to sleep in it besides himself; for if by chance he has been surprised into a short nap at sermon, upon

recovering out of it he stands up and looks about him, and if he sees anybody else nodding either wakes them himself or sends his servant to them." In this instance one of his humble tenantry is dozing, and a servant in a very white wig and bright yellow livery is about to wake him. This picture is less finished than others exhibited lately by the artist, but the alternations of the light and shade are effectively disposed, and the whole is very true.

No. 214. 'A Quiet Nook,' A. J. STARK. The nearest site exemplifies a small brook-side wilderness of those rank aquatic plants that are so rich in pictorial composition—docks, sedges, rushes, long grasses, and tangled weeds. The remoter trees and distance are not less successful.

No. 215. 'Craig Duly, Caernarvonshire,' J. W. OAKES. The strength of this picture also lies in the immediate foreground, wherein a large boulder, abounding in moss and lichens, forms a prominent object, where also we have the utmost wealth of the rank weeds; while beyond the foreground section is presented a view of a wild and broken country. This is the most profitable—the most earnest—kind of study for improvement in landscape art. We cannot praise the picture too highly.

No. 216. 'Heaven,' P. LEVIN. An absurd title to give to a study of a uun, without any further accessory, and looking rather a daughter of earth than heaven: it is a pendant to another work, No. 218, entitled "Heaven," patched and costumed as in the time of Louis Quinze.

No. 219. 'Autumn Morning—Where Brook and River meet,' T. CRESWICK, R.A. The title is assisted by a quotation from Tennyson:—"O, bubbling brook," says Edmund in his rhyme, "Whence come you?" and the brook "Why not?" replies, "I come from haunts of coot and hern; I make a sudden sally; And sparkle out among the fern To tinkle down a valley," &c.

The foreground is rich and solid, as are generally such passages in the works of this painter; the stones and shallow water—the latter repeating the sky—are highly satisfactory. A small foot-bridge crosses the brook, beyond which the bank rises and intercepts the view. On the right flows the river in a bright stream, its banks shaded by trees. Trees rise also in the nearer passages, but they seem rather to have been improvised than painted from Nature, and on the left the ruins of an abbey are seen through the trees, an object in the composition which does not aid it.

No. 225. 'The Prison Window, Sevilla, 1857,' J. PHILIP. The title is suggestive; there are many ways of illustrating it, but perhaps none more touching than this direct appeal to our humanities. A prisoner is seen at the window, to which his wife, on the outside, lifts their child to kiss the father, whose anxiety to meet the embrace, causes him to press eagerly against the iron bars, inasmuch as to distort his features. The mother looks down weeping while holding up the child. The vigorous execution of the figures, and their simple, even rude, nature gives emphasis to the incident.

No. 227. 'The Dame's Absence,' A. RANKLEY.

"Forewarn'd if little bird their pranks behold,
Twill whisper in her ear, and all the scenes unfold."

The little bird is a robin, which has made his appearance at the door, and his advent seems to have effected a temporary suspension of the "pranks" alluded to in the distich. We know not which most to admire in this composition—the children, or the garden that we see in summer sunshine, for the door is open. As may be supposed, the children are busied in every possible way but the preparation of their lessons; some are brought forward into the light, others are in the shade, but all are eminently successful as constituting a pictorial whole.

No. 229. * * * * A. E. CHALON, R.A.

" . . . The isle is full of noises—
Sounds and sweet airs that give delight and hurt not."

These lines tell us that the subject is from the "faerie" of the "Tempest," and we are introduced to some of the spiritual essences—the authors of these sweet noises. They are sporting in a sunbeam—dancing merrily to their own music. Grace and poetry are in the conception, but the canvas is too full; the composition is confused, and the idea is not worthily carried out.

No. 230. 'On the Coast of France, in the Autumn of 1853,' J. R. HERBERT, R.A. This study presents nothing very remarkable or attractive in coast scenery. The purpose of the artist has been a truthful version of nature. From an elevation, the spectator traces the line of the shore until it is lost in distance. There is but little of life; the broad sea is rippled only by such waves as simply assist its colour. The whole is a tranquil breadth of sunshine, described with much intensity of feeling.

No. 232. 'An American Gentleman in the Costume of a Bedouin Sheik—Mount Sinai in the background,' M. K. KELLEGG. This is a striking figure, and, if it be a portrait, it must be admitted that the personage is admirably adapted to the character. The dress is one which, with every propriety, might be introduced into religious art, and with more truth than classical drapery.

No. 234. 'Vintage Time,' J. A. HOUSTON. This presents a graceful and effective arrangement; but the picture hangs high, and nothing more can be said of it.

No. 236. 'Eleaor,' L. W. DESANGES. A head and bust of a young lady, life-like, well relieved, and beautifully painted.

No. 237. 'Langford Bridge, Staines, from my Study Window,' T. UWINS, R.A. A small picture, painted with much firmness of touch.

No. 238. 'The Moorland Child,' R. REDGRAVE, R.A. A small picture, containing a study of a child standing at a stile. She is in shade, and comes in forcible relief against the bright sunshine which lights up the field behind her. The little figure and all the auxiliary objects are rendered with earnestness and truth.

No. 245. 'The Court, Palace, and Gardens of Alcinoüs—A Ruddy Morning,' F. DANBY, A.:

"Close to the gates a spacious garden lies,
From storms defended and inclement skies;
Four acres was the allotted space of ground,
Fenced with a green inclosure all around."

This picture alludes to the entertainment of Ulysses by Alcinoüs, King of Phæacia, and Nausicoa, his daughter, after the shipwreck of the wandering king, caused by Neptune in revenge for the extinction of the sight of Polyphemus. The palace, a spacious edifice, stands on an eminence which is ascended by flights of wide steps from a sheltered creek, in which are seen the ships of Ulysses, who is about to embark once more for Ithaca, and is conducted down to the ships by Alcinoüs, his daughter, and a train of attendants. Corfu may not be far to go for a subject, but we have seen better pictures painted by this artist from subjects nearer home. The effect seems timidly subdued, and the general colour of the light, instead of being ruddy, is copper-coloured.

No. 246. 'Lady Jenkinson,' R. BUCKNER. The lady is presented at full-length, attired in black. The portrait is effective, but we cannot help thinking that the figure is, like many of those of this painter, taller than life.

No. 253. 'A Christmas Party,' F. D. HARDY. One of those humble interiors which this artist paints with such minute finish; but we find here, as in antecedent works of a similar kind, that the shaded passages are black. The party consists of a society of village gossips.

No. 254. 'The Message,' G. B. O'NEIL. A boy is dispatched with a basket containing,

perhaps, a present, and he is strictly charged to deliver "the message" as he receives it. The pose of the boy and the action of the woman are sufficiently definite; but he is a spot in the picture—had his jacket been dark instead of white the feeling of the whole would have been improved.

THE MIDDLE ROOM.

No. 257. 'Incident in the Massacre of the Saint Bartholomew,' E. B. MORRIS. This incident is the rescue from death by Queen Margaret of a man who was pursued by the archers into the apartments of the queen, and wounded there by them. They were followed by their captain, who censured their indiscretion, and this is the moment represented in the picture. The lines in the draperies contend in force with the lines formed by the figures, which look rather formal than accidental.

No. 262. 'Mrs. Robert Smith,' E. KAULBACH. This figure, which is of the size of life, seems to have been executed with some reference to the feeling of the "old masters"—an extremely difficult and unsatisfactory method of treating portraiture.

No. 264. 'The First Break in the Family,' T. FAED.

"Oho! drear dawn'd the morning, and dark lower'd
the sky,
When our moorland cottage the mail coach cam bye;
And grief at our cotthy hame made his first ca;
When that coach bore our bonnie young Willie awa.
* * * * *
We gazed till the coach faded far ower the moor,
When a rainbow stream'd down ower our auld cottage
door,
And we hail'd the blest omen, as Hope's happy day,
That Heaven would shed blessings on Willie awa."

The story of the departure is very graphically and circumstantially told, and literally according to the text of the verses quoted above. The vehicle is seen in the distance, and the entire family—mother, father, and sisters—have come forth from their cottage home to watch the departing coach. The mother on her knees implores blessings on her son, and in her prayer every member of the family joins. The expression of the entire party points directly to the loss they have sustained. The figures are very firmly painted, and in the detail there is greater breadth and less fastidiousness of detail than in antecedent works.

No. 265. 'French Fishing-lugger at Anchor off Hastings,' J. WILSON. She is scarcely "off" Hastings, being some half mile from Hastings on the Brighton side. It is not credible either, that, with a breeze off the sea, any seaman would come to an anchor within the break of the waves, for the cliffs are within hail.

No. 268. 'A Stream from the Hills,' B. LEADER. The light and shade of the remoter portions of this work are highly satisfactory.

No. 269. 'Half an Hour at Noon,' T. S. COOPER, A. The principal in the picture is a grey horse, which is well drawn and painted, insomuch as to supersede his companion—a boy, resting also for the "half-hour at noon." On the left there is a bank, rich with docks and rushes, on which as much care has been bestowed as on the horse. Although only a horse, it is at least a *variorum* from the unique series of late works.

No. 270. 'Susannah,' R. TAIT. This is a full-length *quasi* nude figure about, we presume, to descend into a bath. She is not a Susannah, nor is the figure of sufficient elegance for a picture of this kind.

No. 278. 'A Widow's Son going to Sea,' J. C. HOOK, A.

"Sail forth into the sea, O ship!
Through wind and wave right onward steer;
The moisten'd eye, the trembling lip,
Are not the signs of doubt or fear."

The compositions of this artist, that is, his recent figure pictures, are at least extremely

original. They are generally such as enable him to place one figure above another. The widow's son is on the ladder of a landing-place, about to swing himself into the boat below, which is to convey him to his ship. His mother stands above him. The substance and reality which he gives to his accessories frequently, as in this case, deprive the figures of their due importance.

No. 279. 'The Scheldt from the Quai Vandyke, Antwerp,' E. HAYES. We know the Scheldt well, but we have never seen it so rough as it is here represented, so high up as Antwerp.

No. 281. 'Place des Grandes Fontaines, Auxerre, France,' L. J. WOOD. One of those street-views which this painter executes with so much taste. But this is not one of the most favourable examples of the "paintable" material of Auxerre: there are more advantageous points, which comprehend the cathedral and also the river.

No. 283. 'A Dream of the Past—Sir Isumbras at the Ford,' J. E. MILLAIS, A. "The Metrical Romance of Sir Isumbras" is mentioned as the source of this subject. After eleven lines in praise of the gallant "Dextrier," the broad-backed, powerful horse of Sir Isumbras, then follow the lines which more immediately supply the incident:—

"And als he wente by a wood schawe,
Came mette he with a lyttill knave,
Came rymande him agayne—
'Gramerey, fair Syr Isumbras,
Have pitie on us in this case,
And lifte us uppe for Maric's sake!'
N'as never childre so fayre."

The rhyme proceeds to mention a "mayden," also, as being desirous of crossing the river, and Sir Isumbras, in his good-nature, places the girl before him and the boy behind, and so crosses the river, in which act he is represented. Mr. Millais has quitted the beaten track in search of subject, but his success is not proportioned to the distance he has travelled. But, to describe the picture:—It is larger than any he has yet exhibited, the man and horse being nearly of the size of life. Sir Isumbras wears a tilting suit of gilt armour, of about the period of our Henry VIII.; his head is uncovered, and he carries his helmet suspended from his saddle; behind him sits the little boy, with the faggot of sticks which he has gathered, and before him the girl, and thus he crosses the ford, the water reaching nearly to the horse's chest, and his body being but a very little removed from the lower portion of the frame—a disposition of very unseemly appearance. The time is evening, and on the opposite side of the river there are two muns, and, at a greater distance, buildings among the trees. Mr. Millais usually proposes a sentimental solution to every passage in his compositions, but we can discover nothing here beyond a common-place act of a kind-hearted man. If there be any lofty didactic interpretation involved in the picture, it is too obscure for common understandings. If it be proposed to exemplify the protection of the weak by the strong, we have seen it better illustrated with simple materials. The armour we think we have seen before; it is of the square-toed period, and has been frequently painted by Mr. Corbould; it may be his property, but it seems to have been gilt for this occasion. This artist professes extreme accuracy in every minute circumstance. This metrical romance is a production of the thirteenth or fourteenth century, it is, therefore, not enough to appeal to the allegorical tendency of the picture to account for this. The horse, moreover, is imperfectly drawn, and is of a purple bronze colour—a hue unknown in reference to horses. The features of the knight are full of benevolence, but the expression of the girl is that of vulgar idiotic wonder. It was not usual for knights to ride with the head uncovered, they generally, having

removed the casque, substituted the beret; there are many other inaccuracies in the work to which we might allude, but we cannot devote more space to the picture; indeed, it is not entitled to occupy space—its merits are not to be discovered, while its defects are palpable.

No. 285. 'La Pensée,' T. G. GOODERSON. The head of a young lady; the face is animated by much sweetness of expression.

No. 294. 'Parted Streams,' T. CRESWICK, R.A.:—

"That meet again,
And mingle as of old."

There are here more of nature and of the colour of nature than in others of the late productions of the painter. The strength lies in the description of the nearest site, which abounds with stones, each of which is individualised, together with the weedy incidents of the river-side. The rivulet divides into two streams, and beyond this there is a line of trees traversing the picture, the whole shut in by high ground. Nature is most closely followed in the nearest passages of the work.

No. 296. 'Orchids,' Miss A. F. MUTRIE. They are east, as it were, on a mossy bank, which, with the flowers themselves, constitutes an agreeable picture.

No. 297. 'Portrait of a Lady,' S. COLE. A miniature in oil, of much excellence in execution.

No. 299. 'Nameless and Friendless,' Miss E. OSBORN. This subject is extremely well carried out; and, in execution and drawing, it is much firmer than the works of ladies generally. A poor girl has painted a picture, which she offers for sale to a dealer, who, from the speaking expression of his features, is disposed to depreciate the work. It is a wet, dismal day, and she has walked far to dispose of it; and now awaits in trembling the decision of a man who is become rich by the labours of others. The incident is narrated with feeling and emphasis.

No. 300. 'Landscape and Cattle,' A. BOXHEUR. This is a picture of much excellence; it is definite and clear in manner, without the slightest affectation. The water exhibits the closest imitation of nature in its reflection, and the trees and rising ground are a very literal transcript from nature. There are, however, two objects which would have been better omitted—these are nondescript mounds, or heaps, in the foreground.

No. 301. 'Lord Bridport,' J. P. KNIGHT, R.A. This head is successful in the best qualities of portraiture.

No. 307. 'Major Cumming Demar, Bengal Army, in the uniform of the First Irregular Cavalry, Gwalior Contingent,' C. SMITH. This is a life-sized portrait, man and horse. The expression is penetrating, and the entire figure conveys the impression of a dashing officer.

No. 308. 'Calais Fishermen taking in their Nets—Squall coming on,' C. STANFIELD, R.A. The principal object is a fishing-lugger, which is rolling heavily over the seas, and, secondarily, a boat hauling in the nets; the sky, to the left, is rainy, and looks threatening. The breadth of the water surface, and the rolling volume of the waves, are painted with the usual masterly power of the painter.

No. 309. 'Cottage Interior—Woman Ironing,' W. NICOL. The interior has been followed out brick by brick from some snug cottage, but it appears to have been set in order to be painted,—there is no picturesque accident. The principal figure—a woman—is standing at a table occupied according to the title; there is much reality in this figure.

No. 312. 'The Never-failing Brook—The Busy Mill,' W. F. WITHERINGTON, R.A. The trees in the works of this artist are very carefully wrought, but they are often spotted with lights, which distract the eye and are otherwise fatal to the composition. The water, the little mill, and the banks of the stream are perfect in exe-

caution, but the locality is nothing like the scenery described in "The Deserted Village."

No. 314. 'Ploughing in the Campagna,' G. MASON. The interest of the composition centres in the yoke of oxen that are working in the plough; they are fine long-horned animals of the Spanish breed.

No. 315. 'H.R.H. the Prince of Prussia,' C. SCHMIDT. The Prince is standing; he wears the blue Russian uniform turned up with red; he is sufficiently well known to enable us to recognise a resemblance, not only to the prince, but also to the King of Prussia.

No. 321. 'Contemplation,' S. S. MORRIS. A study of the head and bust of a girl painted with much firmness, but wanting delicacy of tint.

No. 323. 'The First Lamb,' J. THOMPSON. The picture presents a neatly manipulated section of mountainous scenery, like that of Scotland. In the nearest site a country girl is seated, holding on her lap a lamb, near which stands the mother, little satisfied with the attentions shown to her offspring.

No. 324. 'Dumbarton Castle,' W. E. BATES. The castle is seen at a little distance, but the cliff on which it is perched is unmistakable.

No. 325. 'Turf—The entrance to Exeter Canal,' J. H. DELL. There is but little subject here, but it is rendered interesting by good colour and nicety of pencilling.

No. 327. 'O'Donohue's Mistress,' W. E. FROST, A. The well-known legend has supplied many pictures:—

"When the last April sun grows dim,
Thy naiads prepare his steed for him
Who dwells, bright lake, in thee."

The picture is small, yet it contains enough to satisfy the conditions of the subject. O'Donohue appears mounted on his white horse, attended by a company of nymphs. The figures have been worked out with the same assiduity that distinguishes all the works of its author.

No. 328. 'Coaxing,' W. E. FROST, A. This is a miniature containing two figures—one a husband, who sits poring, with an expression of anger, over a newspaper before him, while his wife looks up in his face with gentle words to charm away his discontent.

No. 331. 'Scene from Thackeray's "History of Henry Esmond, Esq."—Esmond returns after the Battle of Wynndel,' A. EGG, A. There is nothing attractive in this subject; there are excellent qualities in the working of the picture, but the figures and their disposition tell no story.

No. 334. 'Hassman, the Arab Interpreter,' J. S. CAVELL. A very effective study, but placed too high to admit of any examination of the merits of the execution.

No. 338. 'Hide and Seek—Found,' J. C. HORSLEY, A. The argument of this story is principally in the figure of a young man, who having concealed himself behind a tree out of the sight of a couple of maidens, is discovered by a spaniel, which by its barking announces the discovery to the young ladies, who are at a little distance. The dress of the youth is that of the time of Elizabeth; he stands erect, shrinking against a tree, and in his grimacing menaces to silence the dog, lies the gist of the story, which is told with much gusto. The scene is a grove of well-grown forest trees.

No. 339. 'Beilstein, on the Moselle,' G. C. STANFIELD. This view of Beilstein is given at a little distance from the place, so as to show the town, dominated by the mountain crowned by the ruined castle, which constitutes a striking feature in the landscape. The effect is extremely simple, the nearer portions of the composition being in shade, and contrasting very forcibly with the sunny distance. In this picture it is felt that the more distant parts are detailed with as much severity as the nearest: had they been painted with greater breadth

and softness, the work would have been unexceptionable.

No. 343. 'Peep-bo!' W. J. GRANT. The title may be supposed to be the gratified exclamation of a mother who raises from her boy the veil by which he had been covered during sleep. The feeling of the work is that of the earlier schools; that is, the subject is relieved by a perfectly black background. The colour of the principal figure is bright and fresh.

No. 344. 'A Picnic,' H. O'NEIL. The subject is not interesting; the point of the composition seems the dissection of a pigeon pie. The figures are numerous, well drawn, and well painted; but in an assemblage of people sitting down to eat—*sub viridi fronde*—there is neither story nor anecdote.

No. 345. 'Uncle Tom and his Wife for Sale,' Sir E. LANDSEER, R.A. This picture is brought up to that kind of sentiment which transcends the limits of canine intelligence: we know not whether to admire the work more in its canine relation, or as a caricature in reference to human kind. The work has all the breadth, firmness, concentrated point, and character of Sir E. Landseer's best works, which have always been those of the most simple composition. Uncle Tom and his wife are two black pugs, or mastiffs, seated together in melancholy companionship. The cast of Uncle Tom's features contain a ridiculous allusion to some configurations of the African face, and the doleful sympathetic look of the wife we have seen as well in human as in canine life: not only in the faces, but also in the limbs and bodies do these animals refer immediately to humanity. It is not too much to say that no painter that has ever lived could have painted a dog-picture at once so full of truth and whimsicality.

No. 346. 'In the Church of San Francesco, at Assisi,' S. A. HART, R.A. One of those subjects on which this painter built his early reputation; it is well drawn, and we doubt not an unexaggerated picture of the locality.

No. 347. 'The Spring in the Wood,' M. ANTHONY. This is a large picture, with every appearance of having been painted *foliata* from nature. It is not a subject that we should compose, but it has every appearance of a reality. The spring is the smallest feature in the picture, the substance being a dense grove of forest trees, with a preliminary section of rough bottom, in which is "the spring." The picture is broad, earnest, and forcible, with little deviation from a rather low uniformity of tone.

No. 353. 'Miss Edwards,' T. Y. GOODERSON. The lady is seated, having before her a sketch-book. The simplicity of the work assists very much its pictorial quality.

No. 355. 'Bon Jour, Messieurs,' F. STONE, A. The tone and feeling of this work are so different from everything we have heretofore seen under this name, that we have seriously supposed some typographical error. To take it, however, as we find it, we are reminded, by the spirit of the narrative, of that class of French artists who have suspended themselves between truth and caricature. The description is literally French—of a party going to market in a long cart drawn by a single miserable horse.

No. 356. 'Mules Drinking, Sevilla,' R. ANSDALL. As there is an English name for this place, it would be in much better taste to write it as it is commonly known. The mules are drinking at a way-side spring, being laden with goods and merchandise in the manner still practised in Spain. That the animals, with their gear and their drivers, are most accurately described cannot be questioned.

No. 357. 'Scene at a Ghaut, on the Banks of the Ganges,' M. CLAXTON. The subject is a description of the ceremony of committing to the waters of the Ganges a woman, who is about to die. The picture shows a striking power of colour.

No. 363. 'The Hon. Lord Murray, one of the Senators of the College of Justice in Scotland,' Sir J. W. GORDON, R.A. This is really a magnificent portrait. The pose might be a little more dignified; but in significant expression and concentrated power we have never seen anything finer than this portrait.

No. 364. 'The Wedding Dance, Brittany,' F. GOODALL, A. We are reminded here of the qualities of Teniers. The subject is not of the elevated character of the picture of last year, but it is wonderfully spirited, and most circumstantial in its description of Breton costume and character. It is an open-air scene; the musician stands on a raised platform on the right, and the wedding party dance the *chaine longue* before him, not in the languid movements of a modern drawing-room, but the dancing here is a very subduing kind of exercise. The picture is generally low in tone, with shaded passages of much transparent purity. The bride is dressed in white, and brought forward as a brilliant focus in the composition, to which all other tones are subject in their degree. It is a work in which the principles of effect have been consulted with the most satisfactory results.

No. 365. 'The Tombs of the Sheiks at Assouan, Upper Egypt,' F. DILLON. These desert scenes are so much alike, that they all look but a transposition of the same material. It is, moreover, a great distance to travel for subject-matter of inferior interest. We doubt not, however, the perfect truth of the representation.

No. 366. 'A Village School,' W. H. KNIGHT. A village school is a hazardous subject,—every puerile enjoyment has been already set forth under this title. The pedagogue here is apparently above his position; he wears a green velvet waistcoat and black continuations; he has risen, and forms the prominent quantity in the composition, as about to inflict chastisement on a delinquent pupil. The figures and accessories have been most assiduously worked out.

No. 368. 'Roses,' Miss A. F. MUTRIE. Original in composition, and very brilliant in effect.

No. 369. 'Scene on the West Lynn, Lynnmouth, Devon,' J. GENDALL. The passage of scenery forming the subject of this essay could be represented in no other form than in an upright picture. The river being sunk, as it were, in a cleft between perpendicular sides of rock, which, with the trees that shade them, constitute interesting material for study; the artist has transferred to canvas a beautiful "bit" of nature—and that with considerable ability.

No. 371. 'Calm in the Gulf of Salerno,' C. STANFIELD, R.A. If there were no more seen than the fragment of sand at the base of the picture, it would be enough to determine the artist. That serves to break the water with an idle ripple. All the rest is perfectly smooth,—an English bank with varieties of nondescript craft. The mountainous shore commences on the left of the picture, and retires until gradually lost in distance. The effect is that of a breadth of unbroken daylight, which is everywhere beautifully sustained.

No. 372. 'Derwentwater—The Vale and Town of Keswick, and the Mountains of Newlands and Buttermere, from the banks of the Greta, below the Penrith Road,' W. LINTON.

"To Nature's pride,
Sweet Keswick's vale, the Muse will guide;
The Muse who trod th' enchanted ground,
Who sail'd the wondrous lake around."

This is a large picture, and, we doubt not, is a literal transcript from the beautiful locality which it assumes to represent; but the picture wants delicacy of colour and atmosphere; the distances seem to have been wrought with the same strong colours as the foreground, and

the whole seems to have been finished with a universal stipple.

No. 382. 'Morning,' H. WEIGALL. The head and bust of a young lady, sparkling and graceful.

No. 384. 'Water-fowl,' A. COOPER. A small picture, containing a composition of duck, snipe, and other birds, which have been very successfully studied.

No. 388. 'Did it pout with its Bessie?' E. NICOL. A further illustration of the *agreements* of the married state, by the same gentleman and lady who figure in the button-sewing scene by this painter; and there is another, No. 390, 'The Ryans and Dwyers'—calumniated men.

No. 391. 'A Field Conventicle,' P. F. POOLE, A. The subject is one which has been already frequently treated—that is, the open-air preaching of the Covenanters in Scotland. This instance, we are told, has been suggested by Wodrow's "History of the Sufferings of the Church of Scotland," which accords with every other work in its details of these persecutions. As a mere essay in colour, the picture is powerful to a degree. Colour seems to have been the aim of the painter, and he has not carried his picture further than that. In the figures there is but little of Scottish character; were it not that we see a bonnet here and there, the scene might be in Hungary. The preacher is erect, delivering his exhortation in the centre of the composition to an audience singularly in contrast with what we know of the materials which constituted these hyphenated meetings in the hills. The figures are few, distributed, and want earnestness; they are but indifferent listeners. All the beauties in the work we have already oftentimes contemplated in other works. For such a subject the heads want vigorous drawing, thought, argument, and soul.

No. 392. 'The Exile,' W. GALE. Apparently a Frenchman, who sits thoughtfully in his little room holding in his hand *La Presse*, which he has been reading. The subject is, perhaps, of a class too ordinary to be executed in a manner so exquisitely refined. It is a charming production.

No. 393. 'Luna,' G. JONES, R.A. A small picture representing the moon as a crescent, with a female figure resting within the curve.

No. 394. 'Affronted,' C. W. COPE, R.A. The aggrieved one is a little girl, whose dinner is placed before her, but she declines touching it, and looks extremely dignified. This painter is eminently successful in this class of subject.

No. 404. 'Master Henry Lionel Bathurst,' J. SANT. The perfect simplicity of this portrait constitutes its charm. The figure is but little distinguished from the dark background, by which it can scarcely be said to be relieved. There is but little colour in the work—the head, with the flaxen curls, constituting the one high light in the picture.

No. 408. 'The Escape of a Heretic, 1559,' J. E. MILLAIS, A. This work professes to describe the escape of a young lady who was imprisoned as a heretic at Valladolid. Two monks, familiars of the Inquisition, were appointed her confessors, and on the morning on which her execution at the stake was decreed to take place, one of these visited her in prison. Having obtained access to her cell, he found there already a person in the monastic habit, whom he supposed to be his coadjutor in the good work, but he was attacked and gagged by this person, who with the prisoner effected his escape. Such, we are told, is the incident which the artist has proposed to himself to illustrate; but from the composition it is impossible to collect any intelligible story. There are two principal figures—a man and a woman engaged in a struggle; the former holds a dagger over the head of the latter, but whether

he threatens her life or that of a third person, indistinctly seen in the background, is by no means clear. If this third person is gagged, we cannot see the force that restrains him; if the man struggling with the woman be the person by whom her release is effected, we cannot see the advantage of making this struggle the point of the picture. As to narrative, we have never seen a less intelligible picture; the drawing and proportions of the figures are the same as those which we have already often had occasion to censure.

No. 409. 'Osier whitening, or Wither peeling,' G. E. HICKS. The figures here are numerous and well painted, but there is an absence of effect.

No. 410. 'The World Forgetting,' J. C. HORSLEY, A. The title applies to a novice, who, it may be supposed, is entering her first profession of religious life. The ceremony seems to be concluded, and she returns from the chapel to the cloister. She is attired in white, and followed by a procession of nuns. The appropriate conditions under which the relation is made, and the felicitous result, place this among its author's best works.

No. 411. 'Lady Eastlake,' J. R. SWINTON. The expression is thoughtful; but the resemblance determines the identity.

No. 412. 'Miss Drummond Davis,' L. W. DESANGES. This is a full-dress portrait, presenting the lady erect, and at three-quarter length. There is a pendant to this, No. 428, 'Mrs. Henry White,' also a full-dress figure, both ladies being attired in white lace dresses. The heads of both are full of animated expression, especially that of the latter.

No. 418. 'Interior of the Church of St. Gommaire, at Lierre, in Brabant,' D. ROBERTS, R.A. The screen which partially traverses the composition is extremely beautiful. The church was much injured by the iconoclasts, in 1580; but perhaps the most remarkable of the pictures has been preserved—that representing the marriage of Philip the Handsome, of Burgundy, to Johanna, only child of Ferdinand and Isabella. The other parts of the church are without ornament; but the interior is full of interest from the masterly style of treatment whereby it is brought forward.

No. 421. 'Sabrina releasing the Lady,' J. WOOD.

"Brightest lady look on me;
Thus I sprinkle on thy breast
Drops that from my fountain pure
I have kept of precious cure."

The lady is seated, having at her right hand the brothers, and on her left Sabrina, in the act of disenchanting her; and in the water, near the principal agnoment, there is a company of nymphs, the attendants of Sabrina. The subject is sufficiently perspicuous, but the figures are superseded by the undue hardness of the manner in which the trees are painted.

No. 425. 'The Vision of Queen Katherine,' H. LE JEUNE.

"Saw you not, even now, a blessed troop
Invite me to a banquet; whose bright faces
Cast thousand beams upon me, like the sun?
They promised me eternal happiness;
And brought me garlands, Griffith, which I feel
I am not worthy yet to wear; I shall
Assuredly."

The Queen still sleeps, and in a pose extremely uncomfortable. Griffith sits near reading. The dream follows rather the feeling of the representation at the Princess's Theatre, than the descriptive text in the play. We see, therefore, the angels hovering over the Queen, the nearest presenting the crown of which she speaks to Griffith. These impersonations are as palpable as the Queen herself, or Griffith. They had, we submit, been much more according to the feeling of the poet had they been less substantial. Griffith is a very successful study.

No. 426. 'Repose after the Bath,' W.

GOULD. She who reposes is a Turkish lady; she rests upon a couch enveloped in white drapery, but disposed in an attitude by no means graceful. She is in the act of receiving a cup of coffee from a black slave. From the absence of accessory the picture is very effective.

No. 433. 'Roland and Edith, children of R. C. L. Bevan, Esq., and the late Lady Augusta Bevan,' J. SANT. The two children are seated looking at a book. The figures are brought forward with much taste, relieved by a wooded background.

No. 434. 'Lesbia,' W. J. GRANT. This is a head and bust, the features of which are worked up to a high degree of brilliancy; but the impersonation is of a character too domestic to represent the Lesbia of Moore's verse.

No. 436. 'On the Norfolk Coast,' A. J. STARK. A small landscape through which runs a road, by the side of which, at a little distance, stands a farm-house, and beyond we have a glimpse of the sea. It is a work of much merit.

No. 438. 'The Blackberry Dell,' H. JUTSUM. A picturesque fragment containing, on the left, a pool of water lying in shade, the deep tone of which is carried into the picture; on the right is a descending road leading to the lower site. The drawing and painting of the trees, and all the undergrowth, afford a masterly representation of Nature.

No. 442. 'Morning after a Heavy Gale—Weather Moderating,' E. W. COOKE, A. An Indian man has run on the Goodwin in the gale, and the men in charge of the floating light have fired signal guns, which have been heard by the crews of the life-boat, and also of a pilot-boat,—both are bearing up for the sinking ship, of which the crew has perished: the captain, who would not forsake his vessel, is still on the quarter-deck. The pilot nears the light-boat, and further to the right, the life-boat makes for the ship, which went down soon after the rescue of the captain. The sky falls on the sea like a black curtain. It is a large picture; the circumstances are very strikingly set forth, but the sea is thin, lincy; it wants softness and volume.

No. 446. 'On the Conway, North Wales,' P. W. ELEN. All the scenery of the Conway is available for painting. This is a bright and broad picture, but we cannot see it distinctly enough to speak particularly of it.

No. 447. 'Frederick Perkins, Esq., High Sheriff of Kent, 1843,' J. G. MIDDLETON. The subject is presented in court dress; the features are earnest and thoughtful.

No. 448. 'Charity—Sevilla, 1857,' J. PHILIP. This is the appeal of a poor Spanish beggar-woman with a child in her arms, to a well-conditioned priest, who passes on with a red umbrella under his arm, and his hands folded before him, deaf to the poor woman's wail. To render more pointed the appeal, there is bread exposed for sale on a stall—an addition which in a ten-fold degree makes the woman's importunity the more urgent, and the priest's refusal the more uncharitable. The woman and the child are very firmly delineated, and the man, we presume, is a burly type of his community. It is a very powerful and characteristic production.

No. 449. 'The Rehearsal: Scene—the Gardens, Elvaston, Derbyshire,' J. D. WINGFIELD. A goodly company of dames and cavaliers assembled in a garden, which sorts well with the style of the party—that of the cavalier period. There is much elegant taste in the composition.

No. 450. 'In the Welsh Meadows—Morning,' A. W. WILLIAMS. The picture is divided into two quantities—a breadth of grassy foreground and a mountain range—each very much assisting the other; the nearer portion, with the cattle grazing on it, is a beautiful passage of Art.

No. 452. 'Sir James Scarlett,' F. GRANT, R.A. This officer is mounted, and may be supposed to be at Balaclava; he wears over his uniform a plain dark morning coat, the dress, it may be supposed, which he wore in the Crimea. He is introduced in a landscape which represents, perhaps, a portion of the scene of the famous charge. Behind him, and in line, are the Fifth Dragoon Guards, and the Scots Greys.

No. 453. 'Apollo and Clytie,' G. PATTEN, A. This is a large picture, in which both figures are introduced nude. The colour of the flesh is too ruddy.

No. 457. 'Rev. Dr. Wellesley, Principal of New Inn Hall, Oxford; President of the Oxford Art Society.'

No. 458. 'Sculptor's Work-shop at Stratford-on-Avon, A.D. 1617,' H. WALLIS. In this picture we find a sculptor at work, at the bust of Shakspeare, which is in Stratford Church. The bust is before him, and a gentleman stands near holding a plaster mask, and suggesting some improvement. The subject is at once clear, but the picture is not so forcible as the Chatterton picture of last year.

WEST ROOM.

No. 467. * * * * W. LINNELL.

"Where the nibbling flocks do stray."

A magnificent composition, but not of the kind contemplated by Milton when he wrote that line. The flock is climbing, not straying, on a dry bank, but little relieved in colour by the parched herbage on its sides. The extreme left of the foreground is closed by a stunted oak, near which is a figure with a donkey. A low belt of trees crosses the bottom of the descent, and thence opens an expanse of richly-wooded country, such as we see in some parts of Surrey or Sussex. The colour of the bank and that of the distances is too much opposed, but it is nevertheless a masterpiece.

No. 470. 'Thomas Henry Wyatt, Esq.,' GEORGE LANDSEER. This is a small portrait of a gentleman engaged in drawing a ground-plan. The pose is not well suited for the determination of resemblance.

No. 471. 'Interior, North Wales,' A. PROVIS. It is impossible to carry more colour or finish in a story of this kind: the value of the execution here is to show the raggedness of the dwelling.

No. 472. 'Fruit, &c.,' W. DUFFIELD. A tankard, with a goblet and fruit—equal to the best of the artist's works.

No. 473. 'Dew-drops,' E. V. RIPPINGILLE. This is a large picture, presenting a group of two girls, circumstanced in a landscape; one is seated on the grass, from which the other gathers the dew, which she sprinkles on her seated companion. The conception is qualified with a vein of poetry, which is sustained in the realisation.

No. 481. 'Flower-market, Rouen,' J. O'CONNOR. The representation is very like the place, but the houses are too well-conditioned for the reality.

No. 483. 'Sabbath,' A. JOHNSTON. The scene is the home of a Scottish farmer, whose family, with himself, are assembled at the breakfast-table, and he is in the act of asking a blessing. The heads and features are warm, life-like, and rich in colour, inasmuch as to support themselves in the proximity of powerful reds and yellows.

No. 489. 'The Drachenfels, on the Rhine,' Mrs. G. E. HERING. This well-known peak, with its crown of ruins, comes nearly into the centre of the little picture, rising into the light of the setting sun, while the river and the lower part of the rock are already in shade.

No. 497. 'An Indian Summer Morning in the White Mountains, America,' J. F. CROP-

SEY. This is the work of an excellent American painter recently settled in London: it is highly coloured, and every incidental line in the mountains has been signalised. The water is extremely well rendered, being distinguished in an eminent degree by that which is wanting in other parts—breadth.

No. 498. 'The Chamber Scene from "Hamlet,"' W. S. HERRICK. The ghost is a very felicitous conception; the shadowy phantom realises Hamlet's descriptions of his father. Hamlet is also successful, but the queen is a failure. The apartment and the auxiliary composition are unexceptionable.

No. 499. 'David Cox, Esq.,' W. BOXALL, A. The resemblance is at once acknowledged.

No. 500. 'A Bit of English Coast,' E. W. COOKE, A. In looking at the shingle of this painter we feel as if pelted with stones; we have here, however, a fragment of cliff, chalk, and gravel, with innumerable attempts at rude breakwaters below, all of which are most conscientiously painted. Simplicity of colour is carried too far—the picture is too grey, it wants a stimulus.

No. 501. 'Montaigne—The Library, from Studies made at Montaigne's Château, in Gascony,' H. WALLIS. The head of Montaigne, in this picture, is as successful with respect to the manner in which it is lighted as any similar study can be; the shaded passages are somewhat too warm, but the head is a speaking reality. Montaigne is introduced in his library, into which a young lady has penetrated, and on her knees supplicates that he will adopt her as his daughter. In every passage it merits the highest eulogy.

No. 503. 'The Pilgrim Fathers—Departure of a Puritan Family for New England,' C. W. COPE, R.A. The event took place in July, 1620, from Delft. This was the party that embarked in the famous and good ship *Mayflower*, after a residence of twelve years at Leyden. The composition shows two parties—the pilgrims, who are embarked in the boat that is to convey them to the *Mayflower*, and their friends, who are assembled on the shore to take leave of them, one of whom has fallen on his knees to supplicate God for their safe transit to their new home. The narrative is perspicuous and circumstantial; the valediction is emphatic on both sides.

No. 504. 'The Source of the Thames, near Cheltenham,' H. W. PEARSALL. The subject is a shallow pool shaded with trees, and deriving interest as being the earliest current of the metropolitan river.

No. 506. 'The Fisherman's Family,' W. UNDERHILL. A group of figures relieved by a dark background. The entire composition is painted with great firmness.

No. 507. 'Crossing the Stream,' F. UNDERHILL. The feeling of this work is very like that of the preceding.

No. 511. 'Driving Cattle to the Alps, near Hasle,' R. KOLLER. This picture is executed in the manner of a foreign school; the heads of the cattle appear to be well drawn, but the subject is injudiciously closed in with trees.

No. 514. 'The Harvest-field,' R. REDGRAVE, R.A. The perfect realisation of the stubble and the sheaves in the foreground of the view cannot be surpassed. The composition may be somewhat formal, and the lines too continuous, but it is most conscientiously worked out.

No. 517. 'Tartuffe at Supper,' W. M. EGLEY. This is derived from the scene in which Orgon so particularly inquires for Tartuffe, but asks nothing about his wife. Dorine tells him that Madame was extremely indisposed, but Tartuffe discussed for supper two partridges and a part of a leg of mutton hashed. We find, therefore, Tartuffe at supper, and Orgon's wife lying on a couch. The execution is careful,

even to extreme hardness; and the characters want point.

No. 520. 'The Love Test,' T. M. JOY. This is much the best production we have ever seen exhibited under this name. The story is related of two girls who test the fidelity of their lovers by the trial of the two floating lights. In this case one is extinguished, to the dismay of her who has made the trial. It is the most finished picture we have ever seen under this name.

No. 522. 'The Patriot,' Miss FOX. The scene is a vaulted prison, not unlike the vaults of Chillon; a prisoner is chained to one of the pillars. The conception is touchingly carried out.

No. 532. 'In Time of War,' J. ARCHER. This is a domestic subject, in praise of which there is much to be said, but it does not support the title.

No. 533. 'The Clergyman's Widow,' E. T. PARRIS. In this composition we read a lengthened narrative of past happiness and present woe. The clergyman, a country pastor, is recently dead, and his widow is compelled to vacate the vicarage in which the happiest years of her life have been passed. The most affecting incident is the removal of her late husband's portrait. This is the composition of a practised *raconteur*.

No. 534. 'The Water Carrier, Sevilla,' R. ANSDALL. Why "Sevilla?" in preference to Seville; had the artist condescended to use the English, we should have had no doubt about the *locale*; or had the title been "El Agnador, Sevilla," we should have been at no loss about it, although the affectation would not have escaped us; but these kind of hybrid titles are more than absurd. It is an admirable picture; the water carrier, with his donkeys and jars, looks every whit a wealthy proprietor. The insertion of the cane into the fountain-spout is not well explained, and the effect is enfeebled by the desire of showing a veritable suburb of "Sevilla;" but the old man's head is original—invaluable.

No. 535. 'A Thunder-cloud passing over the Dutch Coast—Tide on the turn,' E. W. COOKE, A. The place described here is very like the neighbourhood of Schéveling. We see nothing but a sand-bank shore,—a minutely painted foreground, with a fishing-boat and figures. It may, however, be observed that this artist paints the sea very much more naturally in his small than in his large pictures.

No. 537. 'John Gibson, Esq., R.A.,' Mrs. W. CARPENTER. The resemblance will be at once recognised.

No. 541. 'The Last Day of the Sale,' G. B. O'NEILL. This picture is very full of figures, all of which have been conscientiously studied, inasmuch that we are immediately at home with all the characters. Amateurs of this kind of subject will find it full of interest.

No. 542. 'Rydal, Westmoreland,' J. M. CARRICK. The amount of work represented by this comparatively small surface is really equal to the labour and anxiety of a large historical picture. To an artist who professes to deal honestly with nature, nothing is more difficult than to secure any given effect, so mutable and capricious is the face of any terrene expanse. We look across the lake, the surface of which, as a picture of lustrous reflection, has never been surpassed; and on the other side rise the mountains, which are painted with the nicest *finesse* of execution. The effect is that of a broad and sunny daylight, painted on the spot, touch for touch.

No. 543. 'The Vale of Bettwys, North Wales,' F. W. HULME. This is an extremely romantic subject, brought forward under the shade cast down from a clouded summer sky. That portion, however, that we see of the sky is bright and sunny, contrasting forcibly with the lower section of the composition.

No. 545. 'The Ship-boy's Letter,' J. C. HOOK, A. We often feel, in looking at the works of this painter, that the landscape or the accessories supersede the figures. It is so here; the father and mother of the young sailor are reading his letter in the garden of their cottage; both figures are painted with much earnestness of purpose, but they lose importance in opposition to the vividness of the landscape.

No. 549. 'Going to the Fair,' G. W. HORLAR. This is a group of rough colts, apparently very well executed.

No. 551. 'Villa Chiatamone Naples,' H. J. JOHNSON. An interesting and romantic subject, agreeable in effect, but hung so high that its manner cannot be seen.

No. 552. 'Cordelia Disinherited,' R. NORBURY. This is the moment when the King of France declares his purpose of making the disinherited Cordelia his queen. All the characters of the scene are present in the picture. There is good intention in many of the heads; but Lear, who is placed in the background, is not sufficiently important.

No. 553. 'A Group in Belgium,' H. WEEKES, JUN. Consisting of donkeys; the animals appear to be well drawn, but the picture wants force.

No. 554. 'The way by the Beach at Sunrise, Neven Sands,' H. MOGFORD. In the subject there is nothing remarkable, but it is treated with a power of colour which enhances the brilliancy of the proposed effects, without in anywise compromising its truth.

No. 556. 'The Child Jesus going down with his Parents to Nazareth,' W. E. T. DORSON. The purity and sweetness of this work, with its exquisite colour and the chastity of its expression, render it a production of rare excellence; but after looking at it many times, we cannot feel otherwise than that the child Jesus is too much grown to be carried in the arms of Joseph. The composition is extremely simple, the group are relieved only by a background of trees; but its force of relief is its least quality; the high tone of the picture is such as is rarely attained.

No. 558. 'Art Treasures,' J. D. WINGFIELD. The scene is the section of a studio containing casts—as the Clytie, Cupid and Psyche, and other paintable material: these are the still-life of the composition, but its life is a young lady quietly seated, as if set for painting, in the midst of these so called "art treasures." This is the best picture of this kind we have ever seen.

No. 559. 'A Devonshire Fishing Village at Evening,' H. JUTSUM. We look down upon the village from the land side, with a wide expanse of the sea, and a commanding view of the line of coast. It is a darker picture than those which this painter has recently exhibited, but its simple and impressive truth appeals at once to the feelings.

No. 562. 'Waiting for the Verdict,' A. SOLOMAN. This is an earnest and profoundly pathetic passage of Art. The title is unnecessary, for we see the court; but we are especially affected towards those who are "waiting for the verdict." These are a family—the wife, father, mother, and children of one who has, by some unexplained act, outraged the laws of his country. The despair of the father, the bitter grief of the wife, the unspeakable distress of the mother, are set forth in terms the most touching. Every portion of the canvas teems with expression contributive to the theme.

No. 568. 'Infancy,' J. SANT. A picture of a child lying dressed upon a bed. The head is an admirable study.

No. 569. 'On the Lake of Lugano,' G. E. HERING. One of those enchanting Italian lake views, which, for appropriate effect, require a certain treatment in which few painters succeed. The purity of tint in the mountains, and

the success with which the water is painted, are co-incident with all our impressions of Italy.

No. 570. 'The Minstrel,' A. JOHNSTON. This is Beattie's minstrel:

"Dainties he heeded not, nor gande, nor toy,
Save one short pipe of rudest minstrelsy."

He is seated on a point of rock which raises him in relief against the sky; the light of the sun falls upon the further cheek, and touches upon the figure with the most charming effect. It is altogether a masterly essay.

No. 581. 'Bruce in his Adversity,' H. C. SELOUS. The idea of adversity is not well sustained here: we find Bruce and his wife, with some attendants, boating on a sunny lake, and the king reading to his attendants. If tone and colour assist narrative, the brilliancy of the hues here bespeaks the highest condition of prosperity. The figures are well drawn, and very skillfully manipulated.

No. 589. 'Houda,' F. WYBARD. The figure is in shade; she lies on a couch extemporised for her on deck, and shaded by the richest draperies of the eastern looms. It is impossible to excel the imitative surfaces shown in this composition.

No. 591. 'The Courtship of Shakspeare,' T. BROOKS. The picture, we are told, was painted in the cottage of Anne Hathaway—therefore the truth of the circumstance is indisputable; but the impersonation of Shakspeare is not happily conceived—that of Anne Hathaway is the preferable of the two.

No. 595. 'Highland Poachers,' R. H. ROE. These poachers are a pair of eagles, which, from their rocky eyrie, survey the country below them. The movement and vitality given to the birds are the result of anxious and close study.

No. 596. 'Caeruarvonshire Hills from Anglesea,' J. W. OAKES. The treatment of this foreground evidences great power in dealing with nature in what form soever she presents herself. The tendency to hardness, which frequently accompanies very careful execution, is entirely obviated here.

No. 597. 'Ploughing—Sevilla, 1857,' R. ANSDALL. The date is affixed here; but for this we should doubt the authenticity of a plough that would disgrace the days of Hesiod. It is drawn by a pair of well-conditioned cows, attended by a calf; and these animals form the interest of the picture. The agriculturist behind them consorts with the plough, for he is equally original. The picture is large, and it cannot be doubted, accurately descriptive.

No. 599. 'March of the May Garlands, Isle of Wight: Time—Charles I.' R. T. STOTHARD. Both the name and the picture call up a multiplicity of ideas associated with the past of our school.

No. 601. 'Broken Vows,' P. H. CALDERON. The composition is suggested by the verse of Longfellow—

"More hearts are breaking in this world of ours
Than one would say."

The story is told of a lady who, being on one side of a garden paling, hears, on the other side, the flattering attentions paid by her lover to a rival. From the little that we see of the two figures on the other side, the subject might be liable to misrepresentation. There is, however, nothing left to desire in the principal figure; it is unexceptionable.

No. 604. 'Tautallon Castle and Bass Rock, Frith of Forth,' J. W. CARMICHAEL. This romantic ruin is frequently painted, especially by our northern artists; but we have never seen it brought forward with feeling so appropriate and elegant as we see it here. It is high-water, and the sea washes the base of the rock with a succession of heavy waves, and, at the same time, the ruin is in shade, opposed to a bright sky. We cannot understand why a work of such quality should be placed almost out of sight.

No. 608. 'Canute listening to the Monks of Ely,' W. C. THOMAS. The king, and those with him in the boat, are listening to the chanting of the monks; but the singers are too far from the king. We believe he was passing immediately under the windows of the monastery when he remarked the chant.

No. 613. 'Shades of Evening on the Glyn, North Wales,' H. J. BODDINGTON. The fading light on the mountains is painted with much truth and tenderness. The whole of the lower breadths are in subdued tones, which confer an enhanced value on the upper part of the subject.

No. 614. 'Adopting a Child,' F. B. BARWELL. In sentiment, and also in execution, this is a production of much excellence. An elderly couple in wealthy circumstances desire to adopt a child, which, with its mother, constitutes the key-group of the picture. But the child clings to her mother, a young woman who appears to have seen what are known as "better days;" the repugnance of the child to its new protectors makes the poor woman falter in her determination. The narrative comes at once home to the feelings.

No. 616. 'The Sick Child,' J. CLARK. The quality of this picture is of a very unusual kind; it contains but little colour, or, rather, that which it does contain is so harmonised by neutrals that nothing but the substance and character of the figures are felt. The subject is unassuming, but the manner of its treatment is worthy of the warmest eulogy.

No. 617. 'Among the Wild Flowers,' J. D. WATSON. An agroupment of children circumscribed in an open scene, playing on the grass, and decorating each other's heads with flowers. In movement and feeling the figures have been studied with much precision; but a little more refinement of colour would have given increased value to them.

No. 622. 'Fair and Fruitful Italy,' G. LANCE. A very rich collection of fruits, rendered with all the truth with which this painter qualifies this department of subject.

No. 635. 'Bacchus, Silenus, Fannus, and Pomona,' G. PATTEN, A. After some of the sadder and severer scenes which we have just quitted, we find ourselves here in a right jovial company. It is a large composition, in which the figures are the size of life; the absorbing idea of the painter has been colour, but a final glaze has deprived the figures of their proper roundness, and given to them a hue unnaturally red.

No. 336. 'Sir Henry Holland, Bart., M.D.' In this portrait there is an unconventional individuality which at once arrests the eye of the visitor.

No. 637. 'Sunny Pastures in Sussex,' H. B. WILLIS. This is a large picture, in which a group of cattle is thrown up against the airy distance and the lighter sky—a very common form of composition in animal painting. But this is a work of the highest quality; the animals are palpable realities, and the light and shade are expressed with a felicity equal to that of the very best essays in this *genre* of Art.

No. 638. 'On Ockham Common, Surrey,' W. S. ROSE. A piece of rough and broken bottom, enclosed by a belt of trees; there is great richness in the nearer section of the work.

No. 639. 'Thomas Landseer, Esq.,' G. LANDSEER. An identity unvitiated by any affectation of taste or refinement.

THE NORTH ROOM.

The North Room contains many valuable pictures, of which we have space to give only the titles. It is in this room that are exhibited a marvellous series of drawings, by Maclise, illustrating the story of the Norman Conquest. These works are forty-two in number; we say

of them, without fear of contradiction, that had Maclise lived and given to the world a couple of centuries ago such a history, they would have achieved for him an immortality had he done nothing else. That he has consulted the Bayeux tapestry is perfectly true, and we should have had no faith in any artist who treating the subject had not gone to that authority. In these drawings we see Harold mounted, and with his hawk on his wrist, as we see him in the tapestry, but this is only an indication of the artist's desire to see his heroes with the eyes of the industrious lady by whom the tapestry was made. The invention and imagination shown in these drawings are really marvellous; there is usually a superfluity of material in the pictures of Mr. Maclise, but generally, here, there is greater chastity, with an irresistible force of expression and extreme propriety of composition and adjustment. The costume is more accurate than usual, and the reading and research must have been extensive, that could suggest a set of subjects strictly in accordance with historical authority. A few of these subjects we may mention, being the prominent features of the history of those times:—"Harold, departing on a visit to William of Normandy, takes leave of Edward the Confessor;" "Harold and Duke William meet;" "William confers on Harold the dignity of a Norman Knight;" "Harold's Oath of Fidelity to William, sworn over the concealed Reliques of the Saints;" "Edward the Confessor's Death;" "The Coronation of Harold as King of England;" "William, bent upon invading England, begs at St. Germain's the aid of Philip I. of France, and in Flanders the assistance of his Father-in-law, Baldwin the Earl;" "William, in a procession, displays the Relics of St. Valery to allay the discontent of his Troops at the proposed Invasion;" "Duke William in his Galley, and accompanied by his Fleet, crosseth the English Channel;" "Harold the Couqueror at Stamford, and wounded, sits at a Banquet in York—a Herald announces the landing of William." Thus every remarkable circumstance is made the subject of a picture, the last being the discovery of the body of Harold after the battle of Hastings. Many of these compositions contain material enough for three ordinary historical pictures.

There is always a considerable proportion of works of much excellence in this room, a few of which we can only name on this occasion, as—No. 992, 'The Green-hill Battery—Heavy Bombardment, April, 1855,' E. A. GOODALL; No. 996, 'Waiting for the Stage-coach—Seventeenth century,' J. M. CARRICK; No. 997, 'The Deserted Village,' J. SEVERN; No. 999, 'A Fresh Breeze,' E. C. WILLIAMS; No. 1096, 'The Moated House,' E. J. NIEMANN; No. 1137, 'A Way through the Wood,' W. W. GOSLING; No. 1141, 'Cowper receiving his Mother's Portrait from Norfolk, the gift of his Cousin, Anne Bodham,' C. COMPTON; No. 1148, 'On the Scheldt, North Holland,' J. J. WILSON; No. 1149, 'Gathering Fern on the Welsh Hills,' S. R. PERCY; No. 1150, 'The Child's Grave,' J. H. S. MANN; No. 1156, 'Cloveley,' H. JUTSUM; No. 1158, 'A Summer's Afternoon,' A. J. LEWIS, &c.

THE MINIATURES AND DRAWINGS.

High-class miniatures are this year less numerous than they have been of late; and we observe more immediately the decadence of some of those artists who have, during a long period, deservedly enjoyed the highest public estimation. By that unhappy coincidence of casualty, of which we have sometimes to complain in all things, not only are some of the most eminent miniaturists unequal to themselves, but the contributors of this class of Art generally, are below the usual standard.

Sir W. C. Ross exhibits—No. 774, 'H.I.M. the Empress of the French,' a head and bust in which the face fronts the spectator. The features have a close resemblance to the Empress, and the inclination of the head gives much relief to the pose. There are, also, by the same artist—No. 773, 'The Lady Mary Cecil,' a sweet and sparkling miniature; No. 775, 'The Dowager Viscountess Hardinge;' No. 777, 'The Marchioness of Exeter;' and No. 792, 'Mrs. Cairnes,' an exceedingly full composition, of much richness and beauty.

No. 725, 'The Rev. Dr. McCulloch,' T. CARRICK. The figure is introduced in the pulpit, and in the act of preaching. The pose and expression constitute an appeal full of earnest piety, and without the slightest approach to severity; the purity and breadth of this miniature are charming. There is, also, by the same—No. 702, 'The Rev. Dr. Candlish,' a work of much interest, in which the subject is seated, and in ordinary costume; and No. 818, 'Country Cousins,' two heads of children, of the most fascinating sweetness and simplicity; also No. 798, 'W. Wilson, Esq.,' and others.

No. 738, 'The Countess of Kintore,' R. THORBURN, A. This is one of those full-length portraits circumstanced in a landscape composition, the romance and sentiment of which so much assist the figure. Another similar work is No. 762, 'Lady Scott,' who is represented resting her left arm on a sundial, and adjusting her veil—equal in power and sentiment to the best of the painter's works: not less charming is No. 795, 'Mrs. Manners Sutton,' also a full-length of infinite brilliancy.

No. 701, 'John Timbs, Esq., F.S.A.,' T. J. GULLICK, is a miniature, in which only the head and face are given—it is elaborated with extreme softness and breadth; No. 747, 'Miss Julia Hay Cameron,' H. T. WELLS, is distinguished by singular sweetness of colour, but the white sleeves in some degree supersede the person; No. 746, 'Portrait of an Officer,' Sir W. J. NEWTON, presents the subject in full military dress; No. 744, 'Mrs. A. Mordan,' H. T. WELLS, the working of this miniature is truly masterly, though in character and expression not so successful as others by the same artist; No. 742, 'Nino,' Miss E. MACKENZIE, is a head of a little boy, well drawn and rounded, but the foliage placed round the figure is an injudicious addition; No. 796, 'Mrs. Colonel W. Cartwright,' Sir W. C. ROSS, R.A., is a very full composition, in which is seen a lady seated, having a dog on each side of her—it is finished with infinite neatness, but not so rich in colour as are usually the works of Sir W. Ross; No. 805, 'The Right Hon. Lady Suffolk and Child,' E. MOIRA, is a miniature in which the lady appears at full-length, holding the child in her arms—the face in this work looks too large for the figure, but otherwise it is well executed; No. 812, 'A Portrait,' C. EARLES, that of a lady leaning on a pedestal with a background partially closed by trees—the composition is much in the feeling of Reynolds. There are, also, worthy of honourable mention—No. 724, 'Midshipman A. H. Turner, of H.M.S. *Indus*,' Miss A. DIXON; No. 728, 'Grace Frances Cline,' F. CRUIKSHANK; No. 743, 'Mrs. Giles,' R. H. GILES; No. 748, 'Mrs. Arthur Brown,' Mrs. MANNING; No. 772, 'Charles, son of Charles Henry and Lady Louisa Mills,' H. GRAY; No. 797, 'Mrs. W. Cosmo Trevor,' Mrs. H. MOSELEY; No. 917, 'Portrait of a Lady,' Miss H. CARPENTER; No. 925, 'Miss Pope,' H. WEIGALL; No. 926, 'Ensign Julian Yorke Hayter, Bengal Army,' J. HAYTER; No. 928, 'Mrs. Heywood,' J. C. MOOR; No. 944, 'Miss Louisa Maclean, daughter of Sir Charles Maclean, Bart.,' S. B. GODBOLD. Many of the enamels are works of much beauty, as—No. 656, 'Enamel Portrait of David Gar-

rick, after the picture by Gainsborough,' W. ESSEX; No. 661, 'The Duchess,' after Leslie, G. GRAY; No. 662, 'Returning from the Fair,' enamelled from the picture by Mulready, in the Vernon Gallery, G. GRAY; No. 670, 'Brooch Enamels from Life,' J. HASLEM; No. 672, 'Enamel Portrait of a Gentleman from Life,' W. ESSEX. And among the larger drawings in chalk and in water-colour, there are not a few of great merit. The former, which now occupy the upper lines in this room, constitute a feature of much interest: many of them are slight and sketchy, but a slight manner is more suitable for chalk than any attempt to rival engraving. No. 692, 'The Lady Harriet Stonor,' by J. HAYTER, is a drawing of very elegant feeling; and by the same artist there is No. 786, 'The Lady Bury;' No. 737, 'John Ruskin, Esq.,' G. RICHMOND; No. 810, 'Sir W. Forbes, Bart.'—the name of the artist is omitted; No. 954, 'The Daughter of the Late Mrs. Maglin Theed,' J. GILBERT; No. 958, 'Portraits of Viscount Loftus and the Lady Marian Loftus, children of the Most Noble the Marquis and Marchioness of Ely,' T. HEAPHY; No. 930, 'Mrs. Edmund Hornby and Child,' No. 905, 'The Hon. Mrs. Denison,' H. TIDEX, &c.

Subject-works in oil and water colour are always distributed in this room, so as to fill up the space, which might otherwise be vacant. Of such drawings and pictures, may be mentioned—No. 642, 'Atrani, on the Gulf of Salerno,' H. J. JOHNSON; No. 645, 'A Rocky Coast, Sunset,' G. F. BUCHANAN; No. 730, 'Loch Leven, with the Burying Island of St. Maun in the distance, Argyleshire,' A. STANLEY; No. 824, 'A Quiet Nook,' W. N. DOVE; No. 825, 'Kit's Katty House, Kent,' J. FAHEY; No. 826, 'The Lesson,' Mrs. W. CARPENTER; No. 861, 'Sheep of the Valley,' A. PENLEY; No. 863, 'Hoppicking at Seven Oaks, Kent,' S. F. HEWETT; No. 864, 'Portrait of a Lady,' A. E. CHALON, R.A.; No. 865, 'The Muir on Fire, Highlands,' A. STANLEY; No. 869, 'Wells Cathedral,' S. RAYNER; No. 871, 'The Battle of Dubba,' G. JONES, R.A.—whatever pictorial quality this drawing may want, it is assuredly an accurate representation of the defeat of the Beloochees, at Dubba, as the drawing was made under the direction of Sir Charles Napier; No. 887, 'Spanish Card Players,' F. W. TOPHAM, has been suggested from the life, and worked out in strict accordance with truth; No. 880, 'An Effect at Haddon,' S. READ; No. 888, 'Waiting for a Partner,' KARL HARTMANN, is a drawing of great power and effect; No. 912, 'King Richard III.'s Corner, Bow Bridge, Leicester,' T. UWINS, R.A.; and, by the same, No. 916, 'Slate Quarry on the Groby Road, Groby, Leicestershire.'

Among the engravings, which are much more numerous than they have hitherto been, there are—'His Imperial Majesty Napoleon III., Emperor of the French,' engraved from the picture by F. Winterhalter, S. COUSINS, R.A.; No. 975, 'Sir James Weir Hogg, Bart., M.P.,' from a picture by E. U. EDDIS, R. J. LANE, A.E.; No. 981, 'Her Imperial Majesty Eugenie, Empress of the French,' engraved from the picture by F. Winterhalter, S. COUSINS, R.A.; No. 977, 'Helen Faucit,' from a drawing by F. W. BURTON, R.H.A., R. J. LANE, A.E.: as also, in the passage, a very varied and interesting collection of engravings in various manners by some of the most eminent artists in these departments.

THE SCULPTURE.

A collection of sculptural art so meagre as the present has never perhaps been seen within these walls. The works occupying the centre are thinly distributed, and the entire space at the wall opposite the window, which is usually over crowded, is now blank; but it is not sur-

prising that it should be so, for sculptors will content themselves with exhibiting their productions in their own studios, where they can be seen, in preference to sending them to a room in which they cannot be seen. Of those which we notice, the first is—

No. 1207. 'H.M. the Queen'—executed for the late Earl of Ellesmere—marble bust, M. NOBLE. Her Majesty wears a small tiara, with a light drapery on the left shoulder. The features are those of the Queen, and to them has been communicated an expression of much dignity.

No. 1209. 'Adam consoling Eve after the Evil Dream,' E. H. BAILY, R.A. Eve is seated on Adam's knee, and rests weeping on his bosom. In his head an idea of the Greek conformation seems to supersede that tone of tender emotion, which ought to be the feeling, in the face. Like all the female figures of this sculptor, that of Eve is an elegant conception.

No. 1210. 'Model of the statue of the late Charles James Fox, M.P.,' executed in marble, and erected in St. Stephen's Hall, Westminster, E. H. BAILY, R.A. This is very like our traditions of Charles James Fox, and no doubt is a faithful resemblance of what his person was; it will, nevertheless, be—though among the most energetic—the least graceful of the figures of the series.

No. 1211. 'Beatrice Cenci,' Miss H. HOMER. We notice this life-sized marble figure as doing infinite honour to the efforts of a lady; it has been engraved for the *Art-Journal*.

No. 1214. 'Innocence,' marble figure, G. FONTANA. Impersonated by a little girl holding a dove. The observer will be at once struck by the gilding of the hair and a portion of the drapery. The Greeks carried this practice to a great extent; how much soever we may follow them in other things, this we submit, was an enrichment about which they themselves were divided; and we would rather see our own sculpture without it. Nothing can be more chaste than the marble, but it is difficult to preserve the gilt from a meretricious tendency.

No. 1215. 'The Young Naturalist,' H. WEEKES, A. This is a statue of a girl supposed to be on the sea-shore, collecting what are vaguely called "specimens." The wind is blowing about her dress and hair.

No. 1216. 'The Bather,' W. C. MARSHALL, R.A. A nude figure in plaster, represented dipping her foot into the water, and at the same time shrinking. A small work of much natural grace.

No. 1217. 'Massacre of the Innocents,' G. G. ADAMS. This is a marble group executed, we believe, from a competitive work exhibited at the Royal Academy some years ago.

No. 1218. 'The Mother's Kiss,' H. WEEKES, A. The mother simply raises her child in her arms, bending over it with a fondness which only a mother can feel. The drapery falls so as to show the right side, the line of which is extremely rich, in opposition to the drapery on the left side.

No. 1219. 'Titania,' T. EARLE. She is sleeping, and Puck is seen near her head, as about to quit her. There is much beautiful modelling in the figure, which is sufficient without Puck, whose presence enfeebles the composition.

No. 1220. 'Model for the Statue of the Earl of Chatham, executed in marble for St. Stephen's Hall, in the New Palace of Westminster,' P. MACDOWELL, R.A. Lord Chatham is represented in his peer's robes, and in the act of speaking. The action of the figure is most earnest, and the features are animated with impressive argument.

No. 1221. 'Triumphant Cupid,' J. GEEFS. This is a composition of two figures—Cupid and Psyche, in a pose descriptive of flying. There

is poetry in the conception, but the Psyche is a heavy figure.

No. 1224. 'The Descent of Pandora,' a model, J. BELL. She holds the casket in her right hand, and may be supposed to be descending by a movement so easy as in nowise to disturb the draperies.

No. 1225. 'The Bard,' W. THEED. The subject is suggested by the verse of Gray—

"Ruin seize thee, ruthless king,
Confusion on thy banners spread," &c.—

and is embodied by a wild figure grasping in the left hand a harp, and which we may suppose to be pronouncing the curse against Edward from a lofty cliff. The figure corresponds with the tone of the poetry: it is intended to be executed in marble for the Egyptian Hall, in the Mansion House.

No. 1228. 'Proserpine,' M. WOOD. She rests her left hand on a tree, and looks round as if Pluto were at hand: it is distinguished by many graces.

No. 1230. 'Emily and the White Doe of Rylstone,' F. M. MILLER. This is from Wordsworth: a small *basso relievo* executed with infinite taste and feeling.

No. 1232. 'Hippocrates,' model of a statue to be presented by John Ruskin, Esq., to the new museum at Oxford, A. MUNRO. The head of this figure is rather *soldatesque* than philosophic; it is, however, profoundly thoughtful.

No. 1236. 'A Vision,' a bas-relief executed in marble, J. EDWARDS. This composition presents, as principal figures, two angels holding between them a scroll, on which is inscribed, "In holiness and purity live, &c." The work is small; but we have never seen a more exalted and spiritual feeling expressed in any similar work—equal to the Greeks in form, beyond them in expression; and not less excellent is the bas-relief, No. 1238, entitled 'Suspiria.'

Among the busts there is one of especial merit—that of Mrs. H. B. Stowe, by Miss DURANT. We have seldom seen a work of more entire excellence; it is a striking likeness of the famous lady—simple and unaffected in style and character—charmingly modelled, and very skilfully wrought.

Other works worthy of honourable mention are—No. 1241, 'Hypatia, daughter of the Theban, the Mathematician,' by Miss R. L. LEVISON; No. 1242, 'King David,' J. D. CRITTENDEN; No. 1244, 'The late Mrs. Mitchell,' a bust in marble, T. BUTLER; No. 1248, 'Group representing Miss Nightingale supporting a wounded Crimean Soldier in the Scutari Hospital,' T. PHYFFERS; No. 1250, 'A Scotch Lassie,' A. H. RITCHIE; No. 1252, 'Washington,' a bronze statuette, T. THORNYCROFT; No. 1255, 'Colonel Brownrigg,' J. E. JONES; No. 1265, 'Bust of a Gentleman,' H. ADON; No. 1280, 'H. W. Acland, M.D., F.R.S.,' marble bust, A. MUNRO; No. 1287, 'Bust of a Lady,' marble, Mrs. E. W. EDWARDS; No. 1288, 'Admiral Lord Lyons, G.C.B.,' marble bust, M. NOBLE; No. 1313, 'Charles Kean,' T. BUTLER; No. 1325, 'Martin F. Tupper,' J. DURHAM; No. 1326, 'His Grace the Duke of Beaufort,' J. EDWARDS; No. 1328, 'General Viscount Gough, K.G., G.C.B.,' bust, J. E. JONES; No. 1339, 'General Sir G. Brown, K.C.B.,' marble bust, J. E. JONES; No. 1342, 'Sir H. Stracey, Bart.,' together with other similar works by BEHNES, T. CAMPBELL, W. BRODIE, WOOLNER, T. G. LOUGH, E. DAVIS, and others; the quality of which in some degree compensates for the imperfections of the larger works; but we repeat that we have never seen a sculptural exhibition so unsatisfactory.

THE ROYAL PICTURES.

BLOWING BUBBLES.

F. Mieris, Pinxt. J. Bein, Sculpt.
Size of the Picture, 9 $\frac{3}{8}$ in. by 7 $\frac{1}{2}$ in.

SPEAKING of the pictures in Buckingham Palace by this celebrated Dutch painter, Dr. Waagen observes:—"The specimens here of this master are not fortunate; for of almost all there are better examples elsewhere. That which I like best is a boy at a window blowing bubbles, inscribed 1663; for though there are admirable repetitions of it in the Gallery of the Hague and elsewhere, this one is worthy of the master in warmth and clearness of tone and delicacy of touch." It certainly presents the qualities of excellence by which the works of Mieris are distinguished,—accuracy of drawing, extraordinary minuteness of finish, combined with the most perfect freedom of penciling, seen in the delicate curvature of the lines, and breadth of light and shade. What knowledge of effect may be traced in the introduction of the trailing vine-leaf, which, with the high light upon it, throws back the figure of the female into its proper place! and how sparkling is the group to the right of the picture, where the subbeams irradiate here and there the edges of the leaves, the flowers, and the other objects that form this part of the composition! The amount of thought and study which must have been given to this work, ere it was completed, can only be estimated by close examination.

The old painters of the Low Countries certainly belonged to the naturalistic school; and it is a subject of regret that, with such powers of imitation as they possessed, and with such a disposition only to paint what was before them, they had not more captivating and delicate models. One can scarcely accuse them of "setting down aught in malice;" and yet, if Nature has not been far less bountiful to the female part of the community, especially, there than elsewhere, it might almost be assumed that the artists belied the sex; for who ever saw in a Dutch picture, except as a kind of *rara avis*, a really pretty or handsome woman? We are not speaking of those painters, such as Teniers, Ostade, Bega, and others, who rarely studied any other than the lower classes, but those who, as Mieris, Metz, Terburg, Douw, &c., were the artists of the aristocracy, and found their models in the drawing-rooms of the Dutch cavaliers and the wealthy burghers. Suppose that either Mieris or Terburg had been able to employ his pencil in representing

"The dark-eyed daughters of the South,"

or the fair and expressive features of the Saxon race of women, or the graceful forms and animated countenances of the ladies of the French court,—how much more acceptable would their pictures be; for no beauty of painting can compensate for the absence of personal beauty: but the union of the two, as we should then have seen it, would have rendered their works perfection in Nature and in Art.

Most of the best galleries in England possess pictures by F. Mieris. In the collection of Sir Robert Peel—one eminently rich in the works of the Flemish and Dutch painters—is a picture of a woman seated at a window, feeding a green parrot; a subject often repeated by Mieris. At Bridgewater House, the Earl of Ellesmere's, are two: one, a highly-finished portrait of the artist; the other, a young lady in the act of tying her cap. Mr. T. H. Hope possesses one spoken of by Dr. Waagen as among the painter's "greatest masterpieces." Mr. T. Baring's collection abounds in good specimens of these two schools. It includes an example of Mieris's best time,—the subject, a woman reading music. Mr. Holford has one,—a man with a flask, in an open landscape.

Since the completion of the plate of "Blowing Bubbles," we have heard, and with much regret, of the death of M. Bein, the engraver, at the age of sixty-seven. He was born at Gozweiler (Bas Rhin), and was pupil of Reinault and David; his principal plates are "Saint Appoline," and the Virgin and Child, called "Verge Niollin," both after pictures by Raffaele, the latter in the gallery of Lord Cowper. His latest work, executed for the French Government, is "Herodias receiving the Head of John the Baptist," after the picture by Luini, in the Louvre. M. Bein was much esteemed in Paris, both as a man and an artist.

BLOWING BUBBLES.

FROM AN ENGRAVING IN THE ROYAL COLLECTION.

THE EXHIBITION
OF THE SOCIETY OF PAINTERS
IN WATER COLOURS.

THIS is the fifty-third exhibition of the society. The second moiety of the century is now fairly entered, with a degree of advancement in the art such as could never have been contemplated fifty years ago. The drawings of those days were generally small in size, and thin in execution, being rarely carried beyond simple tints and single washes; but now the works on these walls are paintings in water colour, rivalling pictures painted in oil, not only in all the best qualities of that material, but even in texture: moreover, many of these would be pronounced large for oil pictures. We have seen a greater number of figure pictures, but never have we known the exhibition so strong in other departments. There is a larger and an agreeable variety. Time was, and not many years since, when some twenty or thirty drawings were brought forward by one exhibitor, but now scarcely a single member contributes so numerous; for richness, depth, substance, and finish, are in these days indispensable, if reputation is to be achieved or sustained. We have had to record from time to time the loss of valuable members to the society, and we announced some time ago the return of two old members, Mr. Harding and Mr. Holland; and how amply they justify their re-election is seen in their exhibited works. The catalogue enumerates three hundred and seventeen drawings, of which we particularise the following:—

No. 3. 'Kilgaran Castle, South Wales,' C. BRANWHITE. This ruin is situated on the cliff of a small volcanic basin—a rugged framework, in which, mirror-like, lies a tranquil lake; the principal passages are those consisting of rocks, with which are blended the trees, rising from the accidental patches of vegetable mould that has collected in the fissures. It is a romantic subject, and realised with force of effect, and an agreeable low-toned harmony of colour.

No. 5. 'At Rotterdam,' J. BURGESS, Jun. Rotterdam is nothing in a picture without some portion of its quays and water-ways; with, however, some allusion to these, we have a highly picturesque gateway-tower, brought forward with even architectural fidelity.

No. 8. 'Going to School,' W. GOODALL. The scene is the door of a cottage homestead, and the 'Going to School' is most unwillingly performed by a naughty little boy, who, in the spirit of a free and independent elector, receives a bribe with his back turned to the donor—in this case not a candidate for senatorial honours, but an anxious mother. The reality of the draperies and objects, and the vital warmth and transparency of the flesh tones are highly commendable.

No. 11. 'Scene in Glen-Nevis, Inverness-shire,' T. M. RICHARDSON. *Sic itur ad nubes*—truly, in these Highland wilds we may at any time wear the Ossianic mantle of clouds. The subject is a cleft in the mountains, shaped and featured by some fearful throce of nature, and, in character, a wilderness by the jealous ravages of ten thousand hurricanes. It is a large picture, infinitely elaborate, to which the artist has succeeded in communicating—what he appears to have intended as the sentiment of his work—a wild and poetic grandeur.

No. 12. 'Venice,' J. D. HARDING.

"The moon is up, and yet it is not night,
Sunset divides the sky with her."

Such is the well-known text, in the spirit of which Mr. Harding discourses here. Venice lies in the distance, viewed from a point that, from the extreme left—the Dogana—opens the whole line of quays and buildings, over which arise the domes of St. Mark, and the various

oblique-like campanili, communicating to the whole so much of oriental character. Over the city the moon has risen, and shines with an accompaniment of grey clouds; the sun is not in the picture, but that he yet presides in the sky, we learn from the clouds overhead, which, by their orange light, yet assert his presence. The subject is interpreted in a vein of the purest poetry. It is now many years since we have seen the works of this eminent artist on the walls of this institution, and we cannot help congratulating the society and the public on his reaccession to the membership.

No. 22. 'A Lady of Albano,' CARL HAAG. This is a profile study of a figure in the holiday costume of the Campagna. There is more sweetness and refinement in the impersonation than we usually find in nature among the wearers of the costume.

No. 24. 'A Zouave's Story of the War,' F. W. TOPHAM. This Zouave is really a capital fellow, and as fine as any trumpeter, with his new shalwars and laced jacket. He is unaffectedly—*Zouaviler in modo* (pardon, gentle Hermes, god of all kinds of knavery, this vile and wicked jest!)—telling his Breton friends about the Malakoff and the Little Redan. It is an excellent figure; the action and pose of which, even without the attentive and wondering audience, sufficiently declare the proposed points of the picture. In this work there are earnestness and reality far surpassing the qualities of antecedent works.

No. 25. 'Scene in Blair Athol, Scotland,' J. D. HARDING. A section of wild mountain scenery, instancing the facility with which an interesting drawing can be wrought out of slight and apparently unattractive material.

No. 27. 'Venice,' J. HOLLAND. All lovers of water-colour art must be gratified again to see the name of Mr. Holland in the catalogue of this society. How distasteful soever may have been his retirement to those who were accustomed to look for his works here, it cannot have been otherwise than profitable to himself, judging from the force and freshness of the pictures he now exhibits.

No. 30. 'Barrack Entrance to the Château at Blois, Loire,' J. BURGESS, Jun. A perspective view of one of the fronts of the château, which was, we believe, one of the Renaissance glories of the Art-period of Francis I. In this drawing the character and interest of the place receive full justice.

No. 31. 'The Welsh Stile,' JOS. J. JENKINS. This is one of those simple incidents which this artist illustrates so gracefully, and frequently sets forth in the pathetic language of the affections. A country child is about to pass over a stile to which she has been followed by a kid, that looks in disappointment at the barrier it cannot pass. The relation between the child and her caprine friend is very pointedly established.

No. 42. 'Winter—Sheep-feeding,' E. DUNCAN. Here is a dismally cold mid-winter afternoon, the sun descending to the horizon, and mocking us with a light which serves only to show the promise of a bitter, bitter night. The ground is covered with snow, and we are in a sheep-pen, contemplating, with the sheep themselves, the operation, by the farmer's men, of slicing turnips for the evening meal of the flock. A beautiful passage in the picture, and one which materially assists the point of the subject, is the tameness of the rooks, which, subdued by the cold, and undeterred by the presence of man, are come to sup with the woolly people, even within the pen. It is a picture of extreme purity, and singular emphasis of description.

No. 45. 'Val St. Nicholas, Switzerland,' J. D. HARDING. This is a large upright picture, the subject of which is a view closed by a section of the most stupendous snow-clad

Alps, to which the eye is led through a mountain gorge. The nearest section of the work contains indications of the presence of humankind, the humility of which is in striking contrast with the awful majesty of these aspiring mountains. So masterly is the adjustment of this composition, that every point is a keystone, without which the entire structure would be endangered.

No. 57. 'Glenarm, County Antrim,' H. GASTINEAU. This is a large work, very full of incident, exhibiting everywhere the most patient elaboration, and really so suburban as to subject, that we may fancy we are in the vicinity of a populous and busy city. The sea, moreover, is as calm as a sunny lake. The material is varied and picturesque, but its qualities are not those generally understood as coast-scenery. It is, however, an important work, and distinguished throughout by the most scrupulous precision.

No. 59. 'Flowers,' V. BARTHOLOMEW. These are azaleas and others of our most brilliant hot-house productions, painted with the most refined imitation of nature.

No. 62. 'Rotterdam,' J. HOLLAND. The Church of St. Lawrence rises a principal object in the picture, the lower buildings being in a great measure superseded by the small craft in the canal. This is an unflinching, broad daylight interpretation—an extremely difficult rendering of any subject, from the liability to fall into flatness. The materials are by no means of elevated character, but they are brought forward in elegant taste.

No. 68. 'Glen Tilt—Otter Hounds questing,' F. TAYLER. Principally a group of three or four dogs, challenging the trail of the otter, at the brink of the famous Tilt. The character, action, and even the breeding of the animals, are described rather with the science of a naturalist, than the mere experience of a dog-fancier.

No. 71. 'Ischian Peasant Girl,' CARL HAAG. This is a small life-sized study of a head and bust, very minutely and legitimately worked in the most brilliant tints of the water-colour palette. The features are in profile, and surpassingly sweet in character and expression. In the head-dress there is an oriental taste almost regal in its style, and therefore far excelling all the known head-dresses of the Italian peasantry.

No. 79. 'Highland Drovers,' F. TAYLER. The scene is a rough and broken pasture, bounded only by the mountains, within which it lies inclosed. The men are driving a herd of black cattle—wild, mischievous-looking steers, with flashing eyes and very sharp horns; and on the left is a flock of sheep, under the conduct of a girl, assisted by two active and sagacious-looking collies. The drawing is sober in colour and sketchy in execution, but the animals are extremely spirited in description.

No. 86. 'The Duchess reading "Don Quixote,"' J. GILBERT. She is standing and holding before her the book she is reading, being plainly attired in black, according to the Spanish taste. The hands are too large, but when we consider the mellow vividness of the colour, this may well be forgiven. To paint so well in the spirit of Rubens, this artist must have been in the great master's studio when he so frequently portrayed his wife—that lady whom we all know personally so well.

No. 105. 'Schloss Elz,' W. CALLOW. The subject is one of those eyries which we see perched on the peaks that dominate the rivers, and culminate the mountains of Germany. It is an eccentric agglomeration of pent-roofed towers, telling with force and interest in the drawing.

No. 111. 'Pendennis Castle, Falmouth,' JOHN CALLOW. An edifice not very imposing, but well situated in the drawing; the interest of which arises from a storm that, coming

off the sea, has driven a ship on to the rocks. The tempestuous aspect is well supported by coincident circumstance.

No. 112. 'Roman Pilgrim,' CARL HAAG. This is a life-sized head of very impressive character. We may presume it to represent one of the devout peasantry who repair to Rome at certain seasons, in fulfilment of their vows. The vitality and earnestness of the features, and, in execution, the depth and clearness of the shades, and the life-like texture of the lights, are beyond all praise.

No. 121. 'A ride through the Heather'—painted from the Marquis of Lorn and the Lady Edith Campbell, the children of their Graces the Duke and Duchess of Argyll. The Hills of Dunagoich, Ben Bowie, Loch Fine, &c., in the distance, F. TAYLER. The Marquis of Lorn is mounted on a bright bay pony, and the Lady Edith rides a black, somewhat smaller. There is more light and colour in this than in others of the recent works of this artist, and the drawing is undoubtedly benefited by this treatment. The animals are spirited in their movement; and we must not forget a third figure, a Dandy Dimmont, doing duty as escort.

No. 122. 'Campagna Girgenti,' T. M. RICHARDSON. An Italian subject, but very different from those generally selected by *peintres voyageurs*. The trees are a masterly study in drawing and painting.

No. 130. 'Faust's first sight of Margaret,' F. W. BURTON. The characteristic points of this picture are so numerous as to suggest observations of diverse tendency. That part of the tragedy from which the subject is derived, is the street-scene, after that of the Witch's kitchen:

"Beim Himmel, dieses Kind ist schön,
So etwas hab' ich nie gesehen;
Sie ist so sitt und tugendreich,
Und etwas schnippisch doch zugleich."

Margaret is just come from confession, and Faust has addressed her in the street, at which, in alarm, she hurries onward, having declined his company; he looks after her in enthusiastic admiration. Margaret herself declines the courteous appellative "Fräulein:" but still her dress might have been more attractive—nothing can be less graceful than the gathering of the petticoat by the *taschengürtel*. The bust also may in its fashion be true, but it, too, is wanting in form; nothing, however, could be more successful than the face, in the reflection of that innocence over which Mephistopheles declared he had no power. The head and attire of Faust are unexceptionable, but the figure is heavy, and the lower limbs ungainly—the feet even turn in. It is an ambitious picture, and in execution beyond all praise.

No. 138. 'Highland Gillie with Deer-hounds,' F. TAYLER. This is a class of subject in which the artist excels. The animals are rough, wiry, and ready for their work, and their keeper is a true son of the heather.

No. 144. 'Old Bridge at Dolwyddelan,' J. J. JENKINS. As ragged an apology for a bridge as can well be conceived, but composing extremely well with the figures and cattle which pass over it.

No. 147. 'Bolton Abbey, Summer Evening,' J. D. HARDING. The most charming version we have ever seen of this subject—so romantically associated with wood and water that it seems to have been destined only to be painted. The stones of the water-course, the water itself, the near and more distant foliage, with its halo of glowing tints, are exquisite.

No. 150. 'Caught by the Tide,' W. GOODALL. The scene is a section of a rocky coast, brought forward under a dark, stormy aspect; and those who are "caught by the tide" are a small company of children, who, it must be supposed, have permitted the water to surround them. The last of the party—a girl—is in the act of

being assisted on to a rock, yet within reach of the spray of a heavy wave, which she but just escapes. The incident is described in a tone of much earnestness.

No. 157. 'The Harbour, Dort,' G. H. ANDREWS. The principal point in secondary importance in the composition is that famous old church which Albert Cuyp has so often celebrated. The tower rises in the centre of the picture, and we see it across the little harbour, which is thronged with sea-going doggers and river schuyts. The composition is large—the boats and all their properties are represented with singular constancy of purpose. It will, however, be considered that all the supporting secondaries of the work are too near to be so much reduced in tone.

No. 169. 'View of Spithead from the Isle of Wight,' E. DUNCAN. The Isle of Wight is familiar to us all: were it but the recent discovery of some enterprising navigator, its verdure-mantled shores would be sung as those of some other island of Calypso. We see Spithead over the trees, with a fair distribution of ships of many rates; but the great feature of the view is a rainbow, with a most felicitous accompaniment of a lowering and rainy sky: this phenomenon has never before been so simply and truly painted.

No. 173. 'Warwick Castle,' D. COX. These rolling clouds, the sullen water, and the scared jackdaws, all bespeak the imminent storm to which this painter treats his friends. From the absence of perilous detail, the ancient pile looks really more imposing here than in the reality.

No. 178. 'Evening Hour,' CARL HAAG. A study of an Italian peasant-boy pedestaled so as to be opposed to a clear evening sky. He is playing the large bagpipe of his country, illustrious with the warm light of the golden sky. It is really a charming drawing, minutely national and markedly characteristic.

No. 188. 'A Summer Afternoon's Diversion on the Terrace, Bromshill, Hants,' J. NASIL. The artist's knowledge, experience, and taste in matters of costume and ancient architecture always render his works most interesting. We are here introduced to a company (*temp. Carolorum*) engaged at sword-exercise on the terrace above named. A most spirited and sparkling drawing.

No. 193. 'Milan Cathedral,' SAMUEL READ. This is a large upright picture, distinguished throughout by the solicitude of its execution. The exterior of the cathedral is so attractive that the interior has been generally overlooked. This section shows the ascent to the altar, with certain of the vast columns which, in magnitude and tone, contrast effectively with the remoter detail; the whole deriving life from a procession of priests, and a considerable attendance of devotees.

No. 196. 'Parted Waters,' D. COX, JUN. A large composition, wherein a rapid stream flows in a bed shut in by lofty cliffs; the stream is divided by a rocky islet, from which rises an agroupment of trees. It is a romantic subject, brought forward with firmness and substance.

THE SCREENS.

No. 208. 'Rosalind and Celia,' MARGARET GILLIES. The third scene of the first act of the play supplies this situation, which is interpreted by the artist in spirit and in truth. The playful tone of the jesting Celia, and the melancholy cast of the love-lorn Rosalind, are well conceived as the essence of the scene. The figures are appropriately brought together, and the draperies and accessories are carefully drawn. A little enrichment of the left arm of Rosalind would be an improvement.

No. 218. 'Sunny Hours,' G. DODGSON. This is a worthy example of the refined and elegant taste of the artist in imaginative composition.

The material of the picture is a terrace in the grounds of a castle, animated by the presence of impersonations in picturesque costume. In this class of composition Mr. Dodgson stands alone; his productions are most fascinating.

No. 217. 'At the Fountain,' F. W. TOPHAM. It matters not, be it—

"At the fountain, church, or fair,"

the threadbare poetry of the language of love is the same, the verb *amo* is essentially the first conjugation. Here is Juanilla, with her water-vehicle about to overflow, and yet she continues to listen with a beating heart to every word that Manuel whisperingly pronounces; she must determine quickly, for her place will soon be taken. The background is assisted by some decaying *monceaux* of architecture, constituting in the whole a most agreeable picture, much more earnest and substantial than antecedent works of its author.

No. 227. 'The White Rose,' O. OAKLEY. A study of a lady seated, and holding before her a white rose. The features are warm and life-like in colour, and masterly in execution.

No. 244. 'Village Musicians, Brittany,' F. W. TOPHAM. Much of what we have said of other works by this painter applies to this drawing. It is a production of very high character.

No. 260. 'Visit to the Tomb,' J. NASIL. The excellence of this drawing makes the observer feel some regret that it was not executed on a larger scale. It represents the widow of a baron praying at the tomb of her late husband, accompanied by a knight who wears a complete suit of plate-armor, of about the time of Henry VII. This drawing is a gem.

No. 261. 'Primroses, &c.,' W. HUNT. The *etcetera* so modestly apparent after the "primroses" means a bird's-nest. Mr. Hunt, therefore, encourages idle boys in plundering little birds; and whom, for so doing, William Cowper, for one,

"Would not enter on his list of friends."

If there be anything in palliation of the robbery, it is the exquisite reality with which the nest is painted.

No. 302. 'Hhareem Life,' J. LEWIS. Such is the orthography of the word according to Mr. Lewis. The drawing is somewhat smaller than others he has recently exhibited, but there is no diminution of that laborious accuracy which distinguishes all his works. There are two figures—one, the khamum, odalisque, or what you will, reclines in a corner at the extremity of the divan, in the profound listlessness of oriental life. The casement is open, and she is playing with a cat, holding over it a feather-fan, from which the animal has torn portions of the feathers. The lady is not old, but already *enbonpointée*—the most charming characteristic in the eyes of a Turk. The attendant stands in profile, being seen at half-length; and beyond her is hung a glass inclined forward, in which her head is repeated; it is seen by the glass that the apartment is somewhat large, because it reflects the legs and feet of a third figure. We have always spoken of the works of this artist as instancing the ultimate perfection of finish. That patience is inestimable which can execute the monotonous arabesque on the wall whereon the glass hangs, or even the shawl round the waist of the lady—the last touch as mechanically accurate as the first. There is a very general use of body-colour in the drawing—no passage, we believe, is without it.

Smaller works of great merit are numerous, and even larger ones we are, unfortunately, compelled to pass over, especially some admirable landscapes by C. DAVIDSON, G. FRIPP, F. O. FINCH, D. COX, JUN., &c.

THE EXHIBITION OF
THE NEW SOCIETY OF PAINTERS
IN WATER COLOURS.

THIS Exhibition was opened to private view on Saturday the 25th of April, with a collection of 354 drawings, of which many are gems; but the majority are very similar to what we have been accustomed to see in late exhibitions of the same society. Many of the members advance, but their advancement is passive—it is unsupported by ambitious labour; they are distinguished, as it were, *malgré eux*—like the hero or martyr (which is all the same) of the famous French play. If, however, some of these members have not done what we know they could do, it must be observed that there are still many admirable works, as well in figure-painting as in landscape; those which we particularise are as follows:—

No. 2. 'Porch, Rouen Cathedral,' J. S. PROUT. English travellers are especially surprised at the manner in which foreign cathedrals are permitted to be built in and surrounded by wretched hovels. Rouen Cathedral is a remarkable example of this—a sad commingling of the sordid and the sublime. The porch is drawn with much spirit.

No. 8. 'The Fatal Meeting,' E. H. CORBOULD. This is the oft-painted story from Rogers—the origin of the feud between the Guelphs and the Ghibellines:—

"Patiently she stood and watched,
Nor stood alone, but spake not. In her breast
Her purpose lay, and, as a youth passed by
Clad for the nuptial, she smiled and said," &c.

The dramatic moment is, of course, when the mother lifts the veil that concealed her daughter's charms. The two are standing on a balcony, before which the youth has stopped, himself gaily attired, and his steed richly caparisoned. The subject is unmistakable, and the work is exemplary in the genius evinced in the adaptation of minor properties.

No. 11. 'Entrance to Boscastle, Cornwall—Pilot-boat going out,' S. COOK. This is a small drawing of great excellence, showing, on the left and towards the centre, the cliff and the castle, slightly veiled by a misty atmosphere, and harmonising perfectly with the sky and the water. The drawing and movement of the last are unexceptionable, but the colour is inexplicably metallic.

No. 14. 'Camelias,' FANNY HARRIS. The flowers are red and white; they are drawn and painted with the utmost delicacy.

No. 22. 'Don't tell any One!' W. LEE. A group of mother and child, it may be; the latter standing on a grassy bank, and listening most attentively to some communication of her mother. The incident is well conceived, and most naturally detailed.

No. 23. 'Hay-field,' W. BENNETT. There is in this drawing a screen of trees, which constitutes the striking passage of the work. In the foreground the shaded portions are opaque and heavy, and the colour and execution generally are deficient in warmth and freedom.

No. 27. 'Fountains Hall, Yorkshire,' JOHN CHASE. The spectator is at once struck by the substance and texture of this drawing. It represents the entrance to the house, with its porch, shrub-fence, and trees, all delineated with palpable reality. This artist excels as a representant of local habitation, where a reality unpoetical, unpoetical, may be desirable.

No. 37. 'San Pietro di Castello—Evening,' J. H. D'EGVILLE. It is refreshing to get sometimes to the outskirts of Venice—most wearisome to be continually promenaded between the Dogana and the Bridge of Sighs. This church is well worthy to form a subject for a drawing; we know nothing in these watery

suburbs more interesting. The proposed effect is satisfactorily realised.

No. 41. 'Love's Young Dream—An Incident in the Early Career of Van Dyck,' W. H. KEARNEY. This is the story of Van Dyck's attachment to Anna Van Opham, who induced the painter to repeat Rubens' "St. Martin dividing his Cloak," for the church of her native place. The lovers were separated by Rubens, who was instrumental in hastening his pupil off to Italy. In the drawing we see Van Dyck caressing the girl before the picture on which he has been at work, in which relation the lovers are surprised by Rubens. The personages are at once recognised, and the story pointedly told.

No. 48. 'Glen Nevis, Inverness-shire,' W. BENNETT. The materials of this composition are well selected for imposing effect, and the artist has invested the subject with a powerful interest. The glen is singularly romantic, it is divided by a river, which sweeps off to the left in a foaming waterfall. The shaded passage is a most successful adaptation, and although the touch with which the whole is made out is rather determined than firm, the whole is assembled under the eye without any degree of hardness. This admirable work is worthy of the highest eulogy in all its parts.

No. 51. 'Scenes at Haddon: The Drawing-Room—the Introduction; The Terrace—the Proposal; The Chapel—the Marriage,' JOHN CHASE. A new interest is here given to these well-known places. Of the three the drawing-room scene is the most agreeable.

No. 57. 'The Sudden Thought,' W. LEE. A study of a peasant girl standing in deep, momentary cogitation. The figure, with the best effect, rises against the sky. The drawing of the figure, and texture of the study throughout, are most successful.

No. 65. 'A Wet and Stormy Morning—Trebard Sands, near Tintagel, Cornwall,' S. COOK. This artist is learned in atmospheric effect; he describes here a section of rocky shore at high-water, with the wind off the sea driving in thin sheets of sea-mist, and a few figures fishing up wreck. The grey tone of the drawing assists very much the proposition in the title, but the sands are seen nowhere but there.

No. 71. * * * * * L. HAGHE. The subject of this brilliant performance is derived from Michiel's "Histoire de la Peinture Flamande Hollandaise," in which it is narrated that Cornelius Vroom embarked for Spain with some of his works, in the hope of disposing of them there more advantageously than at home. But Vroom suffered shipwreck on the coast of Portugal, and his pictures, having been washed ashore, were discovered by the members of a neighbouring community of monks, who are here assembled in examination of their merits. The scene is the porch of the monastery, where one of the pictures—a head of the Virgin—is held up by a monk to the admiration of his brethren. This group of figures is relieved against a lighted portion of the wall, while the entrance to the monastery and other passages are worked into deeper gradations of tone. There is not so much highly-wrought accessory here as we have seen in other works of this painter, but there is a greater degree of breadth than in many others, and greater force and concentration.

No. 78. 'Bacchanalian Cup, Grapes, &c.,' MARY MARGETTS. In this composition there is an *abandon* that is more pictorial than the formal arrangements in which we find compositions of this kind. The cup, geraniums, and grapes, are brilliant and beautiful.

No. 82. 'Scene at a Prussian Fair—the Birthday of the King Friedrich Wilhelm IV.—Der Königin von England und Ihrer Königl. Hoheit der Princess Royal ("Unserer künf-

tigen Königin") ausgebracht und mit besonderem Applaus getrunken.—(Extract from the *Westfälischer Mercur*, den 17 October, 1856.)' E. CORBOULD. Such is the title given to this drawing, which does ample justice to the subject. The work is so full of figures that there is no space in which one more can be introduced; and although it is a scene at a fair, it seems rather a ceremonial at which the loyal subjects of his Prussian majesty have assembled to drink continually to the health of the sovereign. The work is very happy in its description of German nationalities, and more satisfactory in its contributive passages than antecedent productions of the same artist, in which the field is thus thronged with figures.

No. 91. 'Pheasants,' MARY MARGETTS. A class of subject not often painted by ladies; the birds are, however, described with infinite fidelity.

No. 92. 'Peat-field, near Capel Arthoy, North Wales,' JOHN ABSOLON. The colour of this drawing is broad, fresh, and spirited, and it is animated by appropriate figures. The artist paints frequently open and daylight scenes of this kind, but he has never achieved such a success as this.

No. 97. 'A Public Letter-writer in the Remains of the Theatre of Marcellus, Rome,' L. HAGHE. His booth is a niche in this splendid ruin; he sits in the shade, writing from the dictation of a woman in the holiday costume of the Campagna, and near her are two men, also in rustic attire. This painter is unique in his particular walk of the art. We have seen his initiatory essays in oil, but it will be very long before he can attain in oil to the degree of excellence which qualifies these works.

No. 102. 'The Banks of the Wharfe—Bolton Abbey,' THOMAS SUTCLIFFE. This is a small upright study, in which great labour has been bestowed upon a foreground rich in all the idle and vagabond weeds that look so well in pictures. It might be argued that it is finished into a certain degree of feebleness, but this minute and accurate drawing compensates for much that the drawing might otherwise have been.

No. 104. 'Bodiam Castle, Sussex,' J. W. WHYMPER. This is the most compact remnant we know, of the baronial moated castle. It was built, we believe, by one of the followers of Edward III. The moat, the trees, the causeway, the gate-tower, all receive ample justice in the drawing. The subject is rarely entertained, because it is out of the beaten track of sketchers.

No. 108. 'Lincoln from the Canwick Hill,' JAMES FAHEY. The city is seen at some distance, yet sufficiently near that the houses are individually distinguishable, and the cathedral especially, which, in its commanding site, is seen from a great distance. This drawing is rendered interesting by the extreme care with which it has been elaborated.

No. 111. 'The Environs of Mesilah, with the Tomb of Sidi Bou Saad, Algeria,' CHARLES VACHER. The view may be in some degree attractive from the novelty of the scene it presents; but we can scarcely understand why so much really beautiful scenery should be passed by to seek in the wastes of Africa such subject-matter as this.

No. 115. 'Praise God from whom all Blessings flow,' JOHN ABSOLON. We are here introduced within a country church during divine service, performed to a full congregation of the latter part of the last century. It is a work of merit, but not so signal as that of the open-air scenes exhibited under this name.

No. 119. 'The Trysting-tree,' EDMUND G. WARREN. It is like a beech,—more so in the stem than in the foliage. Careful drawing cannot be carried too far, but sometimes, and

that frequently in foliage, a generous touch represents nature better than a stipple.

No. 123. 'Love Lightens Labour,' J. H. MOLE. The scene is a peat-moor, in which, as principals, there is a group of two figures—a man and woman, the former helping the latter to carry her basket of peat. The landscape is brought forward with infinite sweetness of colour.

No. 124. 'Margate Roads—A Dirty Day,' T. S. ROBINS. A fishing-lugger is here seen beating in under a reefed mainsail, and barely standing up against the freshening squall. In her wake appears a ship with a signal at her mast-head. This is the most spirited work we have for some time seen by the artist.

No. 128. 'The Stag Rocks, Lizard Point, Cornwall,' JAMES G. PHILIP. The subject is simple, but it is rendered with taste and feeling; it must, however, be observed that the near rocks importune the eye, and disturb the breadth by a certain injudicious spottiness.

No. 133. * * * * D. H. MCKEWAN.

"Day set on Norham's castled steep,
And Tweed's fair river, broad and deep."

These lines from "Marmion" stand in the place of a title to this drawing, which represents the ruin as seen from the river-side at the base of the cliff, a little below the site of the castle, and looking, of course, towards the village of Norham. The mass of trees and the ruin tell effectively against the western evening sky.

No. 141. 'Roses,' FANNY HARRIS. The composition is formal, but the flowers are well drawn and painted.

No. 159. 'The Pedlar,' HENRY WARREN. The scene is the forecourt of a farm-house, with all the accidents and incongruous items which may be supposed to be assembled in such a locality. These accidents, with the house itself, and the garden, are brought forward with a veracity equalled only by photography.

No. 160. 'An English Homestead,' G. H. LAPORTE. The subject is a farm-house and yard, with "live stock" of various kinds, among which the horses are the most remarkable. These animals are extremely well drawn. In this department the artist excels.

No. 163. 'Rivaulx Abbey, Yorkshire,' W. BENNETT. The landscape and the style are thoroughly English; that is, the former is fresh and woody, and the latter is like the earlier manner of water colour—free and firm in touch, but the objects, withal, are well rounded.

No. 168. 'The Chosen Blooms,' FANNY HARRIS. A small basket of camellias, showing the freshest and most brilliant hues of the flower.

No. 170. 'Sorrento, Italy,' T. L. ROWBOTHAM. This is carefully drawn, but it would appear that prettiness rather than nature has been the desideratum. Everything looks new and clean, and the water is too blue and opaque.

No. 175. 'Girthing-up,' G. H. LAPORTE. The horse which is subject to the "girthing-up" is in the stable, and, like most horses, is impatient under the infliction. The movement of the animal is perfectly natural—a result attainable only through great experience and close observation.

No. 179. 'Old Buildings, &c., at Harfleur,' G. HOWSE. It is high-water in the Seine, therefore, the dirty creek, which comes up to Harfleur, is full. The spire, the most elegant on the Continent, is entirely superseded by the crazy old houses: had the view been from the other side of the town, it could not have been otherwise than picturesque.

No. 184. 'Harvest-time,' H. MAPLESTONE. The near trees almost exclude the field which gives a title to the drawing. These trees are painted with force and solidity, assisting materially to keep the remoter parts in their places.

On the right, the view opens over a country richly wooded, resembling some of those parts of Sussex which are densely planted with oaks.

No. 189. 'Richmond Castle, Yorkshire,' J. W. WHYMPER. This ruin is effective from whatever point it is seen. We view it here from the river, which, winding round the base of the hill, forms a great feature in the composition. In colour the work is a faithful imitation of nature, and it is free in execution—as to the water, perhaps too much so.

No. 190. 'Early Spring,' THOMAS SUTCLIFFE.

"As yet the trembling year is unconfirm'd,
And winter oft at eve resumes the breeze."

The subject is a rough and rugged piece of bottom, with stones, weeds, and herbage. It is most exemplary in the patience with which nature has been followed, and so rich are the textures, that it looks much like oil.

No. 191. 'The Piazzetta—Venice from the Sea,' W. TELBIN. We are placed here just abreast of the Library, and see, of course, all the neighbouring buildings, as the palace, St. Mark's, the Campanile, &c. &c. The composition might have been worked into greater breadth.

No. 192. 'The Lagune, Venice—Burano and Mazzorlo in the distance,' J. H. D'EGVILLE. There is really much that is beautiful in these lagune, but they are overlooked for the Porto and the everlasting Piazzetta. This is a very sparkling picture, broad and tranquil, with a most effective adjustment of the objects.

No. 196. 'The Remains of the Portico of Octavia, now the Fish-market, Rome,' L. HAGHE. By the introduction of the columns on the right, the heavy arch is much relieved. The locality is at once recognisable.

No. 197. * * * * THOMAS SUTCLIFFE.

"I'll lead you where you may more near behold,
What shallow-searching fame hath left untold;
Which I full oft, amidst these shades alone,
Have sat to wonder at and gaze upon."

We copy these lines, because they have no earthly relation with the drawing; the gist of certain affectations are intelligible, but this is an enigma without a solution. The drawing, which represents a streamlet partially shaded by trees, and rich with pictorial plants, is an admirable performance; too green, it may be, but yet a triumph.

No. 200. 'Blowing hard in the Downs—Boulogne Luggers running for Ramsgate,' T. S. ROBINS. The sky is dark, and the sea is getting up, but these luggers carry too much sail to stand up against a coming squall; the intended effect would have been much assisted by close-reefed canvas.

No. 204. 'Streatham Common,' W. BENNETT. We have yet to learn how much valuable material lies still untouched around London. The oaks, with their undergrowth, and remoter trees in this composition, form one of the best of the artist's minor productions.

No. 212. 'Dorking Cock,' C. H. WEIGALL. A fine, stately white bird, with plumage very carefully elaborated.

No. 215. 'Ditteshaw, on the Dart,' JAMES FAHEY. A small drawing,—masterly in execution, and agreeable in effect. Others, by the same hand, not less attractive, are No. 220. 'Cologne,' and No. 222. 'Our Village.'

No. 217. 'The Vesper Hour—Italy,' CHARLES VACHER. This is a sunset, gorgeous in colour, and, as a subject, much preferable to the results of the artist's Algerian experiences.

No. 218. 'A Street in Cairo, with a Marriage Procession, &c.,' HENRY WARREN. A large picture, and, we submit, superior in very important qualities to any that the artist has of late produced. The procession fills the narrow street. The bride, enveloped in an In-

dian shawl, wears on her head a casket containing her marriage jewels, she is preceded by her unmarried sisters, before whom are the musicians. But the force of the drawing is the shop of the vendor of drapery, from whose shop we are permitted to view the procession.

No. 226. 'Glen Sannox, Isle of Arran,' EDMUND G. WARREN. The foreground of this composition is really a marvellous performance, with its rocks, ferns, grasses, flowers, and varieties of richly-coloured herbage; and not less meritorious are the hard rocky mountains which rise and break the sky. The manner in which the composition is cut up proclaims it an unquestionable transcript from the locality it professes to represent.

No. 229. 'Fine Weather,' C. H. WEIGALL. A whimsical title to give to a poultry picture. It is small, like all those exhibited under this name, but sufficiently well drawn and minutely wrought to suggest the wish that it were larger.

No. 233. 'The Terrace at Haddon,' JOHN CHASE. We believe this to be the most faithful representation of the place we have yet seen; there is an entire absence of those pretty exaggerations which are generally considered to confer interest and sentiment, but which in representations of known localities are highly objectionable.

No. 234. 'A new Pupil for John Ponds,' E. H. WEHNERT. The importance and earnestness with which the subject is invested—for it is a large work, and a very full composition—will induce the question, "Who was John Ponds?" He was a cobbler, who was born at Portsmouth in 1766, and was the "founder of ragged schools." Having adopted a nephew, and undertaken his instruction himself, he found that the child improved more in the society of others than alone; he received, therefore, other children, and derived so much pleasure himself from instructing them, that his pupils increased very considerably in number; but they were of the poorest class, for he received none whose parents were in circumstances to pay for their education. We find him, accordingly, surrounded by his pupils variously employed—the new pupil being a poor half-naked boy that he has picked up in the streets of Portsmouth.

No. 242. 'Jedburgh Abbey,' D. H. MCKEWAN. The immediate foreground is broken up by the little river, with all the usual water-side incident, which, we humbly submit, diminishes the significance of the noble ruin.

No. 249. 'Be Careful!' J. H. MOLE. The words of the title are the injunction of a mother to a child in crossing a brook by stepping-stones. The drawing is extremely harmonious in colour, and the landscape is executed with as much neatness as the figures.

No. 258. 'A Prayer for the Absent,' W. LEE. An agroupment of a child kneeling at its mother's knee in the act of prayer, treated with becoming feeling.

No. 294. 'Near Red Hill, Surrey,' W. WYLD. This is a small drawing, showing especially a row of trees, which shut in the foreground; but beyond these we have glimpses of the more distant country, which is all picturesque in that district.

On the screens there are many attractive drawings, as—No. 315. 'Who is it?' by E. H. CORBOULD. No. 317. 'Cromwell and Ireton reading the intercepted Letter of Charles I. in the Blue Boar, Holborn,' L. HAGHE. No. 321. 'Murder! Fire! Thieves!' E. H. CORBOULD. No. 326. 'The Studio,' G. HOWSE. No. 329. 'The Guard-room,' G. HOWSE. No. 310. 'The Trial,' LOUISA CORBEAUX. No. 305. 'The Well in the Desert,' H. WARREN. No. 327. 'Church near Blandford, Dorset,' JAMES FAHEY, with others of much merit.

BRITISH ARTISTS:
THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XXV.—JOHN CALLEOTT HORSLEY, A.R.A.

MUSIC and Painting, two sister arts, have long found a home in the families of which Mr. Calleott Horsley is a member; in fact, his name, to those who are acquainted with these arts, is associated with pleasant pictures and sweet sounds. His maternal grandfather, Dr. Calleott, acquired great distinction in the musical profession, and was the author of many of our most famous compositions; his father, William Horsley, Mus. Bac., now living, and in his eighty-third year, is no less honourably known in the musical world. Sir A. W. Calleott, brother of Dr. Calleott, and great uncle of Mr. J. C. Horsley, was, as it is scarcely necessary to inform our readers, the landscape-painter whose works are so justly admired; while Mr. W. H. Calleott, son of Dr. Calleott, and Mr. C. E. Horsley, brother of the subject of this notice, enjoy high rank among the English musicians of the day. It is a rare occurrence to find so many celebrated names in such close family union. Here is an aristocracy of talent of which all have good reason to be proud who can claim kindred with the lineage. It requires not the blazonry of heraldic quarterings, nor crests, nor coronets, to extort the homage which is due to the intellectually great.

John Calleott Horsley was born at Brompton, in 1817: of such parentage, and, from the earliest dawn of life, breathing, as it were, an atmosphere of Art,

it would have been strange indeed if a child so circumstanced had not grown up with some strong predilection in favour of one or other of those professions of which the influences surrounded and filled his home. His taste led him at a very early age towards drawing, and there are now, in the possession of his family, sketches executed by him when only eight or nine years old, that are regarded as very creditable for so young a hand, even considering the advantages which the boy-artist possessed. So soon as his friends determined that he should practise painting as a profession, he was placed, by his uncle's advice, at the academy conducted by Mr. Sass, where several of our most promising young artists received their elementary education. He next entered the schools of the Royal Academy, where he passed through the usual course of study, and gained a medal for his drawings from the antique. According to the custom which prevails very generally among students of Art, he varied his instructions in the schools of the Academy with painting portraits, and "perpetrating," to use a familiar phrase among them, the usual amount of historical designs. For some little time Horsley was undecided as to the precise point to which his future efforts should be directed; but a visit paid to a friend in Derbyshire, when he was about sixteen years of age, determined, at least for a considerable period, the matter to his own satisfaction, and that also of his friends. During his stay in that beautiful and picturesque county, he made a number of sketches of Haddon Hall—the fine old mansion which has for years past proved as attractive to our "home" painters of every class as the Ducal Palace of Venice has been to our travelling artists. On his return to London, Horsley commenced and completed a picture which he called "Rent-day at Haddon Hall in the time of Queen Elizabeth." It was exhibited at the British Institution, and was purchased by Mr. S. Cartwright, the eminent dentist and liberal patron of British Art, in whose possession it still remains. This work was most favourably criticised in the journals of the day; and being the production of a very young painter, and the first he had exhibited, his name became known in the Art-circles of the metropolis: Wilkie alludes to the picture in a letter published after his death.

The scene of Horsley's next work was also laid at Haddon Hall; it was a view of one of the apartments, in which two or three groups of figures are

Engraved by]

THE MADRIGAL.

[M. Jackson.

introduced—some elderly people playing at chess, and some young folk occupied in, to themselves, the more important matter of courtship; "Winning the Game," for such was the title it had, was bought by Mr. W. Brown, M.P., of Liverpool, the opulent shipowner, whose munificence with regard to that town we recorded last month. After this followed in succession, at the British Institution, "Love's Messenger," bought and still possessed by Mr. G. Vaughan,

Westbourne Terrace; and "Youth and Age," "Waiting for an Answer," and "The Rival Performers;" all of them in the collection recently presented by Mr. Sheepshanks to the nation. The last-mentioned work was exhibited in 1839, and was thus noticed by us at the time:—"The old poet's story of the nightingale who strove to out-do the minstrel's song, has evidently suggested the subject of 'The Rival Performers;' but, instead of the grove, we have an

antique chamber, and in lieu of the nightingale, a bird of the Canaries, who swells its little throat almost to bursting in jealous contest with the music of a loving youth, who sits beside a gentle maid. The picture is finely conceived, and very ably executed; the effect of light striking, but true; the sweet imploring look of the maiden, as, with a smile of half wonder and delight, she entreats her lover to save the life of his tiny rival, by relinquishing the contest, is especially happy. The draperies are managed with much skill: though the habits are of times long gone by, they are picturesque, free, and graceful. The colouring is rich, but by no means glaring." We reprint these remarks more for the purpose of showing what impression one of Mr. Horsley's earliest pictures made upon us, than by way of pointing to it as a work worthy to be honoured above his others of about the same period.

Having thus far gone through, with unusual success, the ordeal of the British Institution,—then, as now, a sort of probationary exhibition-room with young artists, though the works of the veterans were also to be seen there,—Horsley, in 1839, sent his first picture, "The Pride of the Village," to the Royal Academy: it was bought by the late Mr. Vernon previously to its public exhibition, and now forms one of the national pictures at Marlborough House: our engraving from it is, doubtless, in the recollection of most of our readers. Two small paintings, entitled respectively, "The Grandmother," and "Love's Messenger," were sent to the British Institution, in 1840, and fully sustained the reputation of the artist as a *genre*-painter whose subjects were popular, pleasing, and very carefully executed. In the same year he exhibited at the Royal Academy three pictures; one called "The Contrast," which had for its motto these impressive lines:—

"Youth in its dawn, daring
the thoroughfare
Of life, with fearless foot
and roving eye:
Age, in its humbled lustre,
breathing prayer
Upon the threshold of eter-
nity."

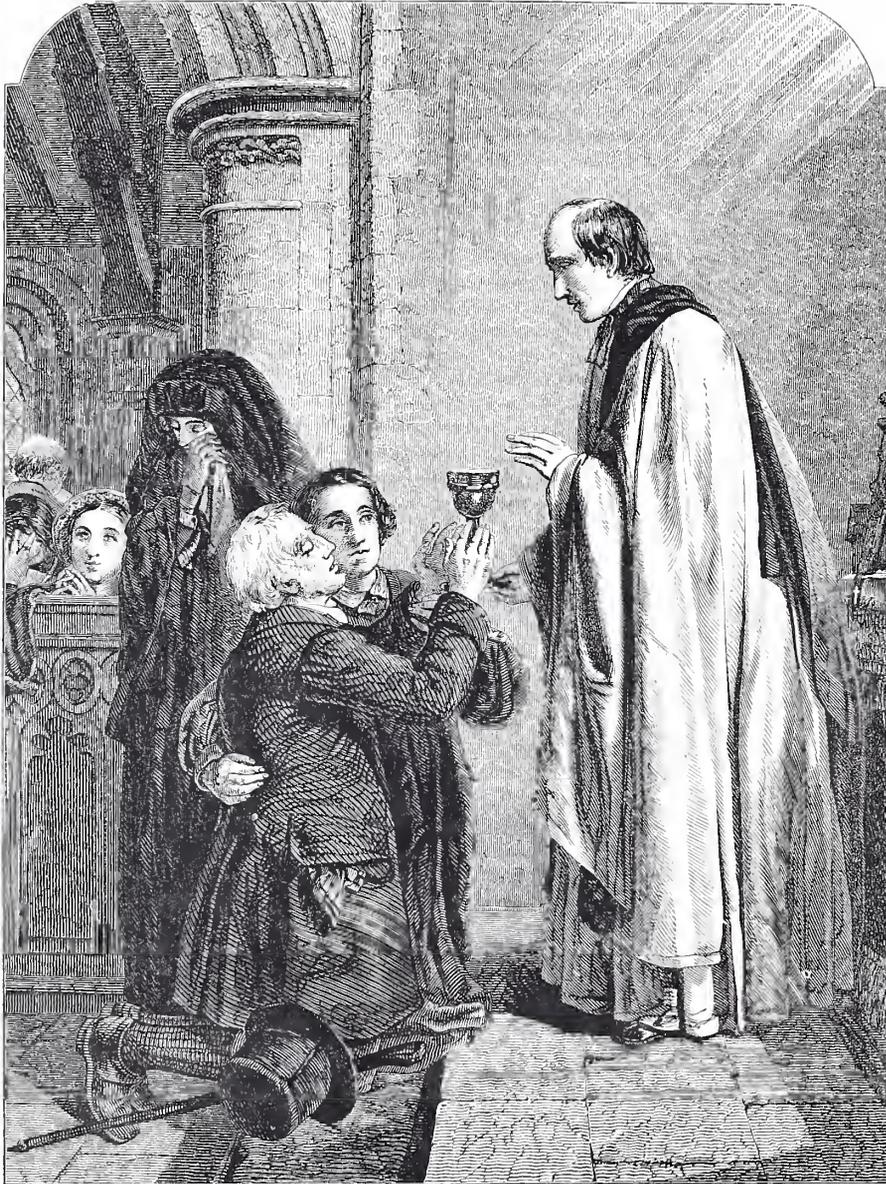

The second, entitled "Leaving the Ball," was purchased by Mr. Buckley, of Manchester, in whose collection, we believe, it still is. The subject represents a young military officer, in uniform, escorting a girl, probably his chosen partner of the evening's dance, down the steps of a mansion to her carriage; at the foot of the steps lies a wretched, houseless young female, who has passed the night—for day is breaking on the revel—like Lazarus at the gate of the rich man. This picture would have borne with equal propriety the same title as the preceding; there is the "contrast" of youth and age, here of luxury and squalid want. We remember the picture as a brilliant example of colouring, and the incident was well told; but it left, as a subject, an unfavourable impression on the mind, because we could trace in the gay couple no feeling of compassion for the poor outcast by their side; it manifested only pure heartlessness. We know not whether this was the sentiment which the painter intended; if so, it was a "mistake," and one to be regretted, for the subject might easily have been converted into a sound moral lesson. The third picture exhibited at that time was a graceful portrait of Mrs. I. Brunel, the artist's sister.

In 1841 Horsley contributed to the Royal Academy only a single painting—"The Pedlar"—very elaborately executed in all its details; it was purchased by the late Mr. Vernon, but does not now form a portion of the collection at Marlborough House. In 1842 he also sent but one picture—"Winning Gloves," a title significant enough of the subject to all who know how gloves are lost and won in moments of unconsciousness: it is a pretty composition, and free from affectation or vulgarity, though the subject is below the powers of this artist.

The picture was painted for the late Mr. Knott; at the sale of his collection, it passed into that of Mr. Baring. Another painting, exhibited at the Academy in 1843, indicates that Horsley's imagination, about this time, was not too fertile in the discovery of new themes:—we shall account for this presently, however. In this work—"The Father's Grave"—is seen a young widow, with her son of tender age, seated by the recently-closed grave of the husband and father; the figures are excellently drawn and delicately coloured, and the sentiment of the composition is most pathetic; common-place as the subject is, the picture has qualities amply sufficient to redeem it from insignificance. It was engraved shortly after its appearance, but not in a manner to do justice to its excellence.

Three years now elapsed ere Horsley again appeared as an exhibitor at the Royal Academy; his absence therefrom, as well as the charge we have just brought against his recent works, as deficient in original matter, may be thus explained:—when, in 1842, the Royal Commission of Fine Arts resolved "that it would be expedient for the furthering of the objects of their inquiry that

means should in the first place be taken to ascertain whether fresco-painting might be applied with advantage to the decoration of the Houses of Parliament," and also announced their intention of awarding premiums "to the artists who shall furnish cartoons which shall respectively be deemed worthy of one or other of the said premiums," Horsley entered enthusiastically into the arena of honourable artistic rivalry, and almost entirely relinquished his practice in oil-painting. The cartoon exhibition was opened in Westminster Hall in July, 1843, and to his drawing of "St. Augustine preaching to Ethelbert and Bertha, his Christian Queen," was awarded one of the second class prizes of £200—a distinction rightly earned by the generally effective character of the composition, and the powerful and truthful expression given to the individual figures. In the following year the exhibition of frescoes took place in the same edifice, when Mr. Horsley contributed two—"Prayer," illustrated by the head and bust of a female figure; and "Peace," a full-length female figure, "white-robed," pressing a dove to her bosom, and offering the olive branch, with a lion and a lamb at her feet,—a more beautiful allegorical conception we scarcely remember to have seen, even from the hands of those foreign artists who, in such works, are allowed to have pre-eminence over our own. The merits of this production induced the Royal Commissioners to select

THE ADMINISTRATION OF THE HOLY COMMUNION.

[M. Jackson.

its author as one of the six artists whom they appointed to execute each, respectively, an especial cartoon, with reference to its being reproduced in the House of Lords, and a sum of £400 was awarded to each painter for his work; but there was no stipulation that he would, as a consequence, be finally employed on the decorations of the edifice. The subject given to him was "Religion," which, according to the title appended to his work when exhibited, with a large number of others, in 1845, at Westminster, was, "Exemplified in the Faith and Hope of the Cross of Christ, in the subjection of all earthly Power and human distinctions to His Will, and in the common dependence of all Estates and Conditions of Men on His Word." It must suffice for us to state that a fresco of this subject ornaments the centre compartment facing the throne in the House of Peers.

At this period of Mr. Horsley's history he held for two years the appointment of one of the head-masters of the Government School of Art, to which he was nominated after the retirement of Mr. J. R. Herbert, R.A.

The announcement of the Royal Commissioners, issued in 1846, that artists were required to prepare pictures in oil, in competition for places in the houses

of legislature, once more stirred up Horsley to enter the field: he contributed the fine picture that forms one of our illustrations—"HENRY V. WHEN PRINCE OF WALES." The subject is supplied from the soliloquy which Shakspeare, in the second part of his "Henry IV.," causes the young prince to utter when, on entering the bed-chamber of his father, he takes the crown from the pillow, and places it on his own head, supposing that the sleep into which the monarch has fallen is the sleep of death. Throughout the whole of the writings of our great dramatist there are not to be found any passages evincing more tender and pathetic emotions, more noble sentiments, and greater powers of language than those contained in this scene and that which follows it, when the king awakes and misses from its place the "round and top of royalty." The initiatory incident which Mr. Horsley has painted is a fine subject for a picture, though limited almost to a single figure. We have in this self-coronation the first insight into that reformation of character which the future years of the prince developed; he places the crown on his brow, not as a glittering bauble to be the emblem of pride and power, but as an object that entails on the wearer a heavy responsibility with regard to the duties he is called upon to discharge.

"Uneasy lies the head
that wears a crown,"

Shakspeare says, in another place. Horsley's Henry V. is a personification in the true spirit of the poet's description; the figure is bold and manly, the face intelligent and thoughtful; all trace of "Prince Hal" is here lost, and, instead, we are in the presence of one conscious of his high calling, and nerving himself for the exercise of the dignity and powers of his station. The other parts of the composition are but subordinate to this, yet they are very carefully and picturesquely—if the term may be applied to such a subject—rendered. One of the three prizes of £200 each was awarded to Horsley for this work—a distinction which all who saw it admitted to merit.

These national competitions seem to have awakened in the mind of Horsley a desire to employ his time almost exclusively upon historical art adapted to public edifices; though certainly the attention of the public had not then—nor, indeed, is it now—been sufficiently roused to its importance to promise him much in the way of commissions; however, he engaged with a gentleman to execute in a parish church in Devonshire, which was being restored, some paintings in fresco of subjects from sacred history. He entered heartily into the proposal of his patron, from the works being congenial with his tastes, and because it had frequently occurred to his mind that, as the spandrels of the nave, arcades, and other parts of a church appropriate for decoration are frequently ornamented with texts of Scripture, so they might serve with equal utility as instructive lessons, and certainly with more propriety as decorative works, if the artist were substituted for the ornamentist, and the narratives of the Bible, expressed in pure and simple pictures, took the place of the verses, and this, too, without in any way disturbing the Protestant feeling of the com-

munity. The experiment, however, was not to be tried, in this instance at least; for, after Horsley had occupied considerable time in designs and preparations, including the storing of all necessary materials for his work into the vaults of the church, his patron suddenly became a convert to the Romish faith, and, though with right feeling towards those whom he had left, he completed the architectural restorations of the building, he naturally relinquished all idea of decorating it. The only other works in fresco of which we have to speak are—"Satan whispering evil Dreams into the ear of Eve," in the Hall of Poets, in the Houses of Parliament, and two paintings illustrating passages in the life of Alfred the Great, executed at Summerleyton, the mansion of Sir Morton Peto. Entertaining but slender hope of this department of Art taking deep root in the tastes of the British public, of its being adopted in ecclesiastical decoration, or

that it would be carried out by the Government to any considerable extent in the proposed adornment of the houses of legislature, Mr. Horsley turned back reluctantly, yet resolutely, to his easel and canvas and his oils, though he had not altogether relinquished them when occupied with his frescoes.

In 1846 he exhibited at the Royal Academy a scene from "Romeo and Juliet," illustrating the well-known passage commencing with—

"Look, love, what envious streaks," &c.,

addressed by Romeo to the lady. This picture, which was bought by Mr. I. K. Brunel, shows a composition of much elegance, taste, and feeling. The subject has been frequently painted, but rarely with so much success as in this instance. In 1847 his only contribution was a portrait of the late Earl of Shaftesbury, Chairman of the Committees of the House of Lords, painted for the Society of Parliamentary Agents. The picture presents an admirable and characteristic likeness of this nobleman. In 1848 he exhibited three works, of which two were portraits—one of Mr. R. B. Ward, of Bristol; the other of his brother-in-law, Mr. I. K. Brunel, the eminent engineer, who is represented on the canvas standing near a table covered with railway plans, &c. The third picture was a small oil sketch of "L'Allegro and Il Penseroso," painted for Prince Albert, and now at Osborne. An engraving from it—or rather, from the larger

and finished picture painted and exhibited at the Academy in 1851—by Mr. Garner, is now near completion, and will be published before very long among our "Royal Pictures," so that we shall reserve all remarks till it appears in the *Art-Journal*, except to say that the design is the artist's original idea for the fresco in the Poet's Hall, but the Commission having decided that the subject illustrating Milton must be taken from "Paradise Lost," the "Satan whispering," &c., was substituted for it.

"Malvolio in the Sun practising Behaviour to his own Shadow" is the title of the single picture sent to the Academy in 1849: when we speak of it as a truly "affected" picture, we consider the expression a compliment to the artist, for affectation should be, as it is here, the predominant characteristic of the chief

HENRY V. WHEN PRINCE OF WALES.

[M. Jackson.

actor in the scene, and it undoubtedly has never been better expressed without burlesque or vulgarity. There are other figures in the background, and the whole are painted with great force and brilliancy of colour.

Mr. Horsley's relative, Sir A. W. Calcott, having, at his decease, left unfinished a picture of "Launce reproving his Dog," it was finished by the former, and exhibited, under his name, at the British Institution in 1850. It is a most amusing and a well-painted work, but as we know not how much of the merit of it belongs to each artist, we must leave it unnoticed, and allow the honours to be equally divided between the two painters. To the Academy Horsley contributed, in the same year, an exceedingly attractive composition, which he called, "Hospitality—the Mote Ightham, Kent;" it represents a child offering relief to an aged beggar at the entrance-door of the mansion.

The year, 1851, that of the Great Exhibition in Hyde Park, which appeared to waken most of our artists into vigorous action, did not, we think, bring out Mr. Horsley in more than his usual strength: he exhibited a portrait, a small picture, "Youth and Age," in which an old woman is seated listlessly by her fire-side, while her daughter, it is presumed, is holding "sweet converse" with a youth through a window; and the "Il Penseroso" mentioned above.

The year following he sent to the Royal Academy two pictures, one, now in the possession of Mr. T. Miller, of Preston, a liberal collector of the works of

British artists, depicted a scene from the "Merry Wives of Windsor," where "Master Slender" is left sitting alone in the garden contenting himself with the imaginary idea that he "is not a-hungry," while he sees his friends enjoying their feast inside the house; "Slender," the point of the composition, looks the character of the dramatist's imagination. The other was "THE MADRIGAL," which we have engraved: it is in the possession of another wealthy collector near Preston, Mr. W. Bashall, and is, perhaps, one of the most successful works of the artist in this class. The picture was included among the number of those sent by Mr. Horsley to the Paris Exhibition in 1855: it has always been a favourite of ours from the truth with which each character is brought forward.

There was a charming little picture by Horsley in the Academy Exhibition of 1853, it was called "Florence and Boatswain,"—the former a young child, the latter a dog. Another work, "Lady Jane Grey and Roger Ascham," hung at the same time, must be classed among his best; it was also one of those contributed to the French Exhibition: it is the property of Mr. J. Hicks, of Bolton.

"The Pet of the Common," a young donkey carried in the arms of a village boy, is an unusual subject for Horsley to take up; it was exhibited, in 1854, with another picture called "Attraction,"—a servant-maid looking down from a window on a detachment of the Horse Guards as they pass the house. Both

Engraved by]

SCENE FROM DON QUIXOTE.

[N. Jackson.

are cleverly-painted works; but, as subjects, not quite worthy of the head and hand that produced "Henry V.," "Religion," "The Madrigal," &c. "Attraction" is in the possession of Mr. Bullock, of Handsworth, near Birmingham. There was a fine, life-like portrait of Archdeacon Sinclair, by Horsley, in the Academy in 1855, painted for the Vestry Hall of Kensington, as a tribute of respect from the parishioners. Along with it were exhibited "Auld Grannie and Wee Nan," situated in a bothie of the Highlands; and the "SCENE FROM DON QUIXOTE," engraved on this page, where the curate, the barber, the housekeeper, and her niece have entered into a conspiracy to dismantle the shelves of the knight, while he is asleep in an adjoining apartment, of the books which they consider to have been the means of "setting Don Quixote beside his senses." The curate is reading one of the volumes with mock gravity, the barber and the young female take down others and hand them to the housekeeper, who flings them out of the window. Mr. S. Cartwright is the owner of this humorous picture, and Mr. Longsdon, of Longstone, near Bakewell, of the other; both of them well calculated to justify the choice of the Royal Academicians in selecting Mr. Horsley this year to be an Associate. The elevation appears to have wrought in him a desire to augment his usual annual contributions, for in the following year he sent five pictures, the largest

number he had ever exhibited at one time. We can only enumerate them,—"THE ADMINISTRATION OF THE HOLY COMMUNION," engraved on a preceding page, and purchased by Mr. Bashall, "A Lancashire Witch," "The Novice," a "Portrait of Sir W. Donville," and "A jealous Eye."

A careful examination of the works of this artist must convince the observer that he produces nothing on which the utmost care and study have not been bestowed. It is to be regretted that any impediment stood in the way of his devoting his attention to subjects of high historical character, and more particularly to sacred subjects, suited to church decoration. We should not in all probability have seen from his pencil compositions that might vie with those of Cornelius, Bendemann, Vos, Kaulbach, Wach, Begas, and other great masters of the German school; but we might reasonably have looked for works of great interest, and manifesting high feeling united with skillful execution—works that would evidence a pure mind and a ready pencil. Thrown back upon such subjects as the taste of the public demands, he brings to his labours all those qualities of Art that are calculated to produce the most satisfactory result—pleasing imagination, truthful drawing, vivid colouring, effective *chiaro-oscuro*, and, when the subject demands it, great elaboration: his works are comparatively few, but they are valuable.

THE
EXHIBITION OF ART TREASURES,
AT MANCHESTER.

It is impossible, within limited space, to do justice to this wonderful collection of Art Treasures. The objects exhibited number many thousands; each is a "gem" of its class; perhaps there are not a dozen of the whole that it may be desirable to remove; they are seen under the best possible circumstances for display and examination—whether to gratify curiosity, to afford pleasure, or to supply instruction; the Exhibition is, therefore, a triumphant success, and will be unquestionably considered among the "great facts" of the age.

We may ask a moment's reflection before we introduce our readers into this marvellous assemblage of grand works of many ages and countries. They are all gathered from private sources; all, if we except the contributions of ancient armour from the Tower, those which are the property of the East India Company, those which belong to the universities, corporate bodies, and the London companies, the diploma pictures of the Royal Academy, and a few heir-looms of the Crown. It is, therefore, not among the least of the remarkable incidents connected with this subject, that so many noblemen and gentlemen should have been willing to intrust, and that for a long period, to the care of the committee and its officials, objects, for loss or injury to which no money could compensate—for a very large proportion of them are "priceless," and such as no amount of wealth could restore or replace.

Our first duty, therefore, undoubtedly is to give expression to public gratitude for that liberal and considerate desire to minister to public enjoyment and education by which this marvellous collection has been brought together. Happily, hitherto, there has been, we understand, no solitary instance of damage; but no one could have sent an article without the apprehension of injury; while a daily sacrifice of pleasure must have been made by every person who parted, though but for a time, with the treasures of his home. The results of this experiment are consequently matters of sincere congratulation; they show the "higher orders" as willing to share their enjoyments with the "humbler classes," and those who have inherited or acquired wealth as anxious to extend among all grades of society the gratifications that wealth obtains, and for which only wealth is desirable.

The Exhibition at Manchester, viewed in this light, therefore, while it contributes to social progress and promotes rational and intellectual pleasure, cannot fail to aid much in removing those barriers which have hitherto separated "the classes," by exhibiting the aristocracy—of rank and riches—not only willing, but desirous, that the people should, as widely as possible, participate in the enjoyments they themselves derive from their "treasures," and that, too, in a city which is understood to be the most democratic of the kingdom.

To the committee—a few enterprising gentlemen of Manchester—a debt of gratitude is as certainly due. It has been said that the fitting place for such an exhibition is the Metropolis; but we more than doubt that the project would ever have been entertained. Without a large "guarantee fund," the undertaking would have been a vision. Those who recollect the exceeding difficulty of obtaining—at the close of 1850—a much less sum than that "guaranteed" by some fifty or sixty gentlemen of Manchester, will not require to be told how hopeless would have been the effort to do in London that which has been so nobly and so effectually done in the commercial capital

of England. We believe that nowhere in the whole world could such a scheme have been so admirably perfected; and while we congratulate the committee, its associates, and its supporters, on having achieved, in a right and liberal spirit, all they designed, and all they could possibly have hoped for, we fully expect the results will be such as ought to follow, and usually do follow, any great and good work—a recompense of honour and profit to all who are entitled to it.

It does not lessen a whit the credit due to the committee that they resorted to London for the assistants they required. To select and then to arrange the mass of objects collected were tasks of great difficulty and delicacy, and ought to have been confided only to men of knowledge and experience. The selections of those who were to direct the several departments were eminently judicious: thus—

Mr. GEORGE SCHARF, Jun., F.S.A., has the superintendence of the works of Ancient Masters, and is responsible for that division of the catalogue.

The arrangement of the works of Modern Masters was confided to Mr. AUGUSTUS EGG, A.R.A.

To Mr. PETER CUNNINGHAM, F.S.A., was assigned the task of collecting and arranging the Portrait Gallery, and the collection of Historical Miniatures.

The Collection of Armour (perhaps the most interesting and instructive division of the whole series of ancient works) was intrusted to Mr. J. R. PLANCHÉ, F.S.A. (*Rouge Croix*), and he has been ably assisted by Mr. PRATT.

Dr. ROYLE, F.S.A., undertook the arrangement of the Indian and Chinese Works, contributed by the East India Company and "many private contributors."

The Sculpture has been most satisfactorily arranged by Mr. DUDLEY and Mr. REDFORD.

The Water-Colour Gallery—the arrangement of which must have been an immense labour—was confided to Mr. EDWARD HOLMES, M.A.; but he is understood to have been greatly assisted by Mr. JOHN SCOTT.

The Engravings have been also arranged by Mr. HOLMES; but here great results have been obtained from the personal exertions of Mr. DOMINIC COLNAGHI.

The collection of Photographs has been confided to the able superintendence of Mr. PHILIP DELAMOTTE.

"The Museum of Ornamental Art"—which supplies, perhaps, the most useful portions of the multifarious contents of the building—has been arranged, and "the materials of the catalogue furnished" by Mr. J. B. WARING, assisted by Mr. CHAFFEAS.

There are, no doubt, many subordinates to whom we owe much, but these names only are prominent in the undertaking.

We may not, however, forget to congratulate Mr. Crace, by whom the interior decorations were so judiciously planned and executed; Mr. Graham, by whom much of the "furnishing" was supplied; and especially the architect, Mr. Salomons, and the engineer, Mr. Dredge, by whom the building was designed, and to whose energy and ability we are indebted for its completion, effectually aided, as they have been, by the contractors, Messrs. Young & Co.

Especially, and above all, we must render to Mr. J. C. DEANE, the praise to which he is so justly entitled. As the "General Commissioner," it appears to have been his duty to superintend the arrangements for all the departments, directed by the several gentlemen whose names we have printed. It is not enough to say of him that he has been "indefatigable;" he seems to have been everywhere—always in the right place at the proper time; and it is certain that much of the general results must be attributed to the zeal, energy,

and never-ceasing industry of the General Commissioner.

These preliminary remarks may be closed by a list of the Executive Committee, to whose liberal enterprise and patriotic spirit the country is so largely indebted for an intellectual banquet such as no age or people of the world have ever enjoyed under one roof at one time, and such as it is not likely the present generation can ever enjoy again:—

THOMAS FAIRBAIRN, Esq., *Chairman*.
THOMAS ASHTON, Esq.
WILLIAM ENTWISTLE, Esq.
JOSEPH HERON, Esq.
EDMUND POTTER, Esq.
SIGISMUND J. STERN, Esq.

A short history of the undertaking, and a brief description of the building, will be necessary, in order that our readers may understand the several details into which it will be our duty to enter. It appears that early in 1856, Mr. J. C. Deane and Mr. P. Cunningham jointly issued a "private and confidential" letter to several of the magnates of Manchester, suggesting a plan for exhibiting in a "suitable building" the Art Treasures of Great Britain, which they were sanguine enough to believe would be "lent" for such a purpose by their owners. We extract one or two passages from this document, in order to show how little deviation there has been from the original plan:—

"In proposing to bring these treasures together, it must be understood that though painting and sculpture must necessarily form a large portion of the collection, yet the scheme contemplates a still wider scope of attraction. Fine Arts in all branches, judiciously selected, would be here displayed, subject to careful classification and arrangement. An opportunity, too, would thus occur of giving by examples a chronological history of British painting, which, in itself could not fail to be attractive, and particularly in a district where individuals have done so much to encourage Art. * * * * It would be easy to point out many other appropriate objects of attraction in Art which might be admitted within the building we contemplate—costume, armour, antiquities of all sorts, furniture, ancient glass, ancient china, works in the precious metals, and a thousand other objects, which will readily present themselves to any reflective mind. * * * * The scheme (so happily suggested by Lord Stanhope, sanctioned by Parliament, and recently approved by her Majesty in a message to the Lords) of forming a collection of the portraits of persons eminent in British history, may be materially assisted by an exhibition like that contemplated at Manchester in 1857."
