NEW YORK

Engineering and Mining Journal

INDEX TO VOLUME CX

July 1 to December 31, 1920

EXPLANATORY NOTE

Illustrated articles are denoted by an asterisk (*); book notices by a dagger (†).

This index is made comprehensive but concise. Pains are taken to bring together matter belonging to the same subject so that when a reader looks up an article he will be cited to related data. Series of simple page numbers following names of mines or companies usually refer to news notes. With a major entry or series of entries may be placed several minor ones relating to the same subject in order that its history may be followed. If the author's name be known it is the simplest means of reference. Productions are indexed under names of metals and countries or states. The mere juxtaposition of a mineral and geographical name usually signifies an output but may cover other statistical or news matter. Not all news are indexed but a liberal selection of news items is made.

Following is a list of the pages included in the several numbers of the volume by date:

July	3	Pages	1-48
"	10	"	49-98
"	17	"	99-146
"	24	"	147-194
"	31	"	195-244
Aug.	7	"	245-292
"	14	"	293-342
"	21	"	343-391
"	28	"	392-440
Sept.	4	"	441-504
"	11	"	505-554
"	18	"	555-602
"	25	"	603-652
Oct.	2	"	653-700
"	9	"	701-750
"	16	"	751-798
"	23	"	799-846
"	30	"	847-890
Nov.	6	"	891-934
"	13	"	935-978
"	20	"	979-1022
"	27	"	1023-1068
Dec.	4	"	1069-1112
"	11	"	1113-1156
"	18	"	1157-1200
"	25	"	1201-1244

Finding Fault With the Pittman Act

THE metropolitan newspapers, and we refer particularly to the *New York Tribune* and the *New York Evening Post*, attack the Pittman Silver Act, the former asking that it be repealed at the next session of Congress. Says the *Tribune* editorially: "The Pittman law contained a curious 'joker.' This required the Treasury to purchase for every dollar melted up an equivalent amount of bullion at the fixed price of $1 an ounce. The Treasury has begun to make such purchases, with the result that American-produced bullion now commands 99½c. an ounce, while foreign bullion is selling for only 91½. The Pittman law is thus operating as the Bland-Allison and Sherman acts operated, to put a fictitious value on silver bullion—if mined in the United States. The error made in 1878 and 1890 is being repeated. Silver is not needed as a basis for currency, especially when purchased at more than market value. The 'joker' in the Pittman measure should be eliminated at the next session of Congress."

The inference which the ordinary reader would gain from the editorial mentioned is that the naughty silver producers, by a piece of sharp legislation fathered by the Senator from Nevada, are now mulcting the people, as represented by the Government, of 8c. an ounce on all silver produced. Should this price differential be maintained until the entire 207,000,000 ounces is purchased, the total amount would be close to $17,000,000.

However, as most of our readers know, the Government is not losing one cent on the transaction. The price of silver began to skyrocket in 1918. India, a producer of wheat, jute, and other articles necessary for the prosecution of the war, demanded that she be paid in this metal, a large amount of which was lying dead in the Treasury vaults. By the Pittman Act, which was passed by the Senate on April 18, 1918, 207,000,000 ounces of silver was sent to the Far East to settle trade balances, for which the Government received an equivalent to $1 per ounce. This increase in the supply acted as a stabilizing influence on the market, and without doubt prevented silver producers from reaping as great profits as would have been the case otherwise. Now, with the rapid decline in the price of this metal, the act again exerts a stabilizing influence, the silver producers now being protected from incurring possible losses, just as they were checked in taking inordinate profits from a rapid rise, two years ago. The Government buys back at the same price at which it sold.

To say that the bill contained a "joker" is unfair. This so-called "joker" was introduced by Senator Fall, of New Mexico, and its probable effect fully pointed out in the Senate discussion. The fixed $1 price was forecast by Senator Owen, chairman of the Committee on Banking and Currency, who said, "When the Government fixes a definite price for silver the miners can make their plans accordingly, and, seeing for several years ahead a fixed market at $1 an ounce, it will stimulate the production of silver in this country and replace the idle silver which is now in the Treasury merely in storage."

Senator Lodge, whose opposition to price-fixing is well known, studied the bill very carefully and said, "The bill is safe as framed," later voting for it. In fact, the bill was passed without the formality of a roll-call, so insignificant was the opposition. It is interesting to note that one of the opponents of the act was Senator Thomas, of Colorado, one of the big silver producing states.

The Pittman Act has apparently been confused by the press with various price-fixing legislative enactments, which have been generally condemned. Any one with a knowledge of the bill will understand that it is radically different in principle. It also has nothing to do with the schemes for free coinage with which it has been unjustly linked.

This country will need all the stabilizing influences which it can muster in the next few years, to prevent disastrous panics. The silver producers have made their plans, which include extensive and expensive mining development, predicated on a price of $1 for silver for several years to come. To repeal the act would be unjust, the Government profiting at the expense of legitimate industry. One dollar an ounce is not an exorbitant price for silver. The yearly average has never fallen below 50c., and the present quotation is much less than the advances over 1914 prices in many other commodities. Since the Civil War, the price of silver has averaged over $1 per ounce during twenty-two years, but of recent years has been under that figure.

We believe that when the conditions are understood, the movement for the repeal of the Pittman Act will disappear. American mining interests must, however, not be caught asleep and must see that the fullest publicity is secured, in order to protect their rights.

Cornwall's Tin Troubles

THE vagaries of the metal markets and the unusual economic conditions existing in the world today have severely chastised many mining industries. The most conspicuous recipient of this punishment is the gold-mining industry, owing to the unvarying price of gold; but almost every one of the metals has suffered from its unsettled future prospects—as the pronounced fluctuations in the metal markets testify. The latest addition to the list of affected mining industries is tin mining in England.

The recent pronounced drop in tin prices has seriously affected the old and stable tin-mining district in Cornwall, and has placed many of the producing properties in a precarious position as regards present and future

operating possibilities. Tin is a metal that admits of wide speculation. Last February the London price was around £420 per ton, whereas early June quotations have dropped to around £225, chiefly the result of frenzied finance.

Considering the present cost of production, the latest quotations are too low for profitable operation of these mines. Normally, a price of £200 per ton would have represented a fair return to the mining companies, but with today's high cost of labor and materials a price of £350 per ton would be none too adequate.

In commenting upon this situation, which has disturbed one of the world's historically interesting mining centers, and an important tin-producing area, the *Financial Times* states that "if the government temporarily held out a hand to the most deserving mines to tide them over the present crisis they would doubtless be able to carry on by themselves, once trade conditions all over the world have become stabilized."

The help referred to, financial assistance, would enable the mines to undertake further exploration, development, and experimental work to improve their properties, something which was not sufficiently attended to during the stress of the war. This is a logical method of attack to such a problem. Instead of speculating as to when the price of tin will become normal, an adjustment to the existing conditions through an attempt to lower production costs is not only more philosophical and sensible but more likely to achieve quicker results.

The McFadden Gold Bill

THE failure of Congress to pass the McFadden Act leaves the question of gold production where it was —in the hands of chance. The gold miners are the chief "goats," who must expiate the economic sins of a world that has found out how to live on credit instead of cash. The plan of the bill had certain defects, but it appeared the best that could be devised. Although it was generally supported, cold water was thrown on it by Frank A. Vanderlip, just before his departure for Japan. He told its supporters that the possession of more gold in this country would only be an excuse for more inflation. No remark could be more thoughtless and untrue; but from a financier of Vanderlip's standing it doubtless had a deterrent effect upon the great majority who shrink at innovations in any case.

The current financial happenings, the fluctuations of exchange dependent upon the transfer of gold from one country to another, show beyond doubt that the basis for the world's currency is metal, and the more substantial the basis the less the relative inflation. National financial systems that have been obliged to expand their paper currency have done so despite an insufficient gold reserve, as in the case of Europe. Experience has shown that when a nation —even the United States —must have a certain amount of money, it goes ahead and prints it, and considers the metal basis later. Increase of gold production would hasten deflation by meeting it part way.

We hope the matter will not be allowed to rest. The people who buy gold jewelry in this country so recklessly will only enjoy paying a little more for it, as a tax to partially compensate the gold miner so that it will pay him to keep on digging; and the general condition of the country will unquestionably be made healthier thereby.

Miami Copper and Minerals Separation

WHETHER the Miami Copper Co. is now infringing Minerals Separation patents is still an open question. The motion for the reopening of the old case to admit additional testimony was denied by the U. S. Circuit Court of Appeals at Philadelphia on June 17. However, the court stated that the denial was made without any expression of opinion which would preclude the use of such of the newly found matter as may prove to be pertinent in questions arising in the accounting now going on. The case was sent to the master for accounting without any determination as to whether the present operations of the Miami company are of an infringing nature, so it would appear that this new evidence may now be presented in the accounting proceedings at Wilmington.

We can hardly blame the court for "passing the buck," as with a Philadelphia summer coming on, even lawyers are sufficiently human to wish to avoid going through with the intricacies of this case once more. We sympathize with the "master," and do not envy him his job.

The Contract System in Mining

OUR news columns recently announced that a plan of having underground work performed by contract had been placed in effect in the Bingham, Utah, district with good success. Contract systems are by no means new, for the practice dates back to the earliest days of mining and includes practically all of the features embodied in the mine contract of today. Briefly, the contract system as applied to underground mining covers the principle that a certain price per foot or per car is paid for the work. The price may, or may not, include the cost of supplies. The establishment of a rate or price per foot, per car, or whatever unit is decided upon, is usually based on actual company account performance for a period of time which is sufficient to determine a compensation that will be fair and equitable. Different heights of stope, varying conditions of ground, length of tram, accessibility of working place, and other considerations are also determining factors in the rating of the contract.

Advantages that may be claimed for the contract system are: The efficient men are enabled to make a wage in proportion to their ability—in other words, a premium is paid for efficiency; the difficulty of adequate supervision of the work covering a large area in underground operations is obviated, as the men are placed on their own initiative; if a charge is made for supplies, which are paid for at a nominal rate by the contractor, there is a tendency on the part of the men to be more conservative in their use, the actual production costs are lowered, and the men who are good workers and have a thorough knowledge of the work receive the benefit. A further consideration, and one which will particularly appeal to the younger men, who naturally seek up-to-date methods for the performance of their tasks, is the fact that the contract plan enables the worker to apply his originality and ingenuity to his own advantage.

Among the reasons given for shortages of labor in underground operations is the fact that many young men formerly available for mining operations are turning to other pursuits. By the adoption of an equitable contract system not only is the opportunity offered for the full development of the miner's earning capacity,

but methods which conform to modern business practices and are applicable in all lines of endeavor are introduced. The result is that there is less tendency on the part of men primarily inclined toward mining to enter other fields.

Combining Business With Vacation Pleasures

TWO of the national engineering societies are adopting a sensible course in combining the maximum amount of pleasure with their general meetings this summer. The A. I. M. E. will enjoy a boat trip on the Great Lakes and a visit to one of the most attractive mining districts in the world. The Chemical Engineers will go north into Canada, visiting many interesting plants in Ontario and Quebec, and taking such attractive side trips as the one up the Saguenay River to Chicoutimi. These trips will take the place of vacations for many of those who are going, and, as planned, should prove more enjoyable than the average holiday intended for pleasure only.

The principal reason for the ordinary kind of annual meetings is that they provide an opportunity to become acquainted with our fellows, and to exchange ideas which, for one reason or another, we do not care to make public in the *Transactions*. How much better we can do this under the conditions which will prevail on the trips already mentioned!

The Divining Rod

BELIEF in the divining rod dies hard. The frequency with which requests are made for information regarding this and similar devices for detecting the presence of minerals underground is astonishing. We had supposed that these devices were fast going the way of the gold brick, used in the past for separating the foolish from their money. We were coming to think that all were so well versed in the tricks of swindlers and fakers, thanks to the liberal course afforded in the J. Rufus Wallingford stories, that comparatively few could be victimized or deceived except by something new. The foolish, of course, would still be with us to the end, but none so simple as to try to divine the presence of minerals by other than legitimate prospecting methods based on principles of geology.

The magnetic needle will detect the presence of iron, of which all are well aware, and this is the only device of which we know that can be used successfully for such purposes. Columbus sought a short-cut to India, and all of us would like to find the quick road to wealth. So it is not strange that some means of disclosing earth's hidden treasure without cost or effort should dance in the imagination along with the fairies of one's childhood. One rub of the lamp placed all things at Aladdin's disposal. But lamps are old-fashioned now, and science reigns.

Traditions linger, and it is half-baked education, in our opinion, that is largely responsible for the seemingly widespread belief concerning divining rods. A short course in physics and courses in perhaps a dozen other subjects have their place in the curriculum of every high school throughout the country, and here in the metropolitan district have invaded even that of some of the grammar schools. These may be well enough as stepping stones to something higher, but, if study end with them, the student is in the proverbial dangerous position of the possessor of a little knowledge. Dangerous it is, he will agree, after spending his money for the latest thing in divining rods and failing to get results.

The man with money that is burning a hole in his pocket and who desires to lay bare the mineral secrets of the district in which he lives can better invest his capital in the good old-fashioned way of grub-staking a prospector or by putting it into an exploration or a development company.

The airplane, radio, and a dozen other inventions invite the optimistic to believe that all things are possible, and thus it is that swindlers having new devices are treated with greater tolerance than they deserve. The U. S. Geological Survey, in *Water-Supply Paper 416*, issued in 1917, has already undertaken to educate the uninformed as to the foolishness of attempting to discover oil or other mineral deposits by waving, as it were, a magician's wand. This paper, entitled "The Divining Rod," by Arthur J. Ellis, may be had for the asking, unless by chance it be out of print. In an introductory note, by O. E. Meinzer, it is said: "It is difficult to see how, for practical purposes, the entire matter could be more thoroughly discredited." But, nevertheless, the superstition persists.

Sign on the Dotted Line

WE HAVE before us a ballot from the Harvard Engineering Society, to vote for officers. There is to be elected a president, a first and second vice-president, a secretary, a treasurer, and five governors. In the case of all but the governors, we are instructed to "vote for one." There is in each instance only one to vote for. In voting for the board of governors we are instructed to "vote for five." Only five candidates are given. We can go through the formality of voting the excellent ticket, which has been carefully selected by someone for us, or of throwing the documents in the wastebasket. In the interests of efficiency we shall do the latter.

According to the way of looking at it, this sending out of ballots, with no choice of candidates, to free and independent Americans, to ascertain their choice, is a meaningless courtesy of the Spanish type, a piece of stupidity, or an impertinence. What a waste of costly paper, perfectly good stamps, and clerical work there is here!

Engineers should stand for efficiency. If they get a Department of Public Works they are going to show the folks what efficiency is. Also, they should stand for honesty. Cut out, then, such meaningless ballots. If the form of your society (we are speaking to all engineers) is oligarchic—if a small group selects the officers and decides what the society shall do—simply advise those of us who are too busy to indulge in false motions who the officers are to be, and do not insult our intelligence as engineers and Yankees by asking which is our choice of one.

We do not intend to criticise the oligarchic system as practiced by preference by engineers and scientists—although we should like each society some day to experiment with democracy. We are speaking now only from the standpoint of conservation of energy, and of efficiency. In the organizations in which we hold membership, we hereby appoint the secretary of each society which follows this system to cast our vote by proxy for all the candidates who will be appointed (elected) anyhow; and this proxy is permanent.

WHAT OTHERS THINK

Why Hoover Was Not Nominated

Now that the Republican convention is over, and Mr. Hoover was not nominated, his friends have been explaining what was the matter. One or two of the engineering magazines have said that the trouble lay in the stupidity of the politicians and the rabble that they represent; that the intellectuals or prematurely bald young men who amateurishly advocated Mr. Hoover underestimated the power of political machinery and "the bosses." The *New York World*, which was one of the strongest supporters of Mr. Hoover, suggests that he made a mistake in entering the primaries in California, and that, just when he was beginning to worry the "Old Guard," he injured his own chances by committing himself where he had not time for a real test of strength.

My own opinion is that possibly Mr. Hoover was a bit too gloomy and heavy in his speeches. He is a serious-looking man, anyway, and after the strain of war people prefer not to be depressed too much. Mr. Hoover realizes the tremendous questions facing the nation and understands how to solve them as probably no one else does; but perhaps he was a little too lugubrious in his attitude. For instance, I recently talked with an engineer who said that he was enthusiastic for Hoover until he came to New York for the dinner of the Institute at which Mr. Hoover made an address. Although this engineer is not lacking in nerve, he said that he was somewhat alarmed by the gloom in the new president's expressions.

However, one of the chief considerations for Mr. Hoover's lack of strength at Chicago was undoubtedly his disinclination to wage a bitter fight for the nomination and resort to all the tricks of the self-seeking politician. He chooses to give his efforts to the nation as they are asked for, and to retain his own sincerity and decency, rather than flare up and campaign eagerly for office.

P. B. McDONALD.

New York City.

The Troubles of a Cyanider

In your issue of May 29 Mr. Carpenter misinterprets my statements in a former issue of the *Engineering and Mining Journal*, in an effort on my part to help the, to me unknown, unfortunate cyanider, who set forth his woes in the issue of March 20. Therefore, I desire to further elaborate my statements.

First, let me refer the interested reader to my article entitled "Effect of Air in Cyanidation," printed in the issue of *Engineering and Mining Journal* dated March 22, 1919. That shows two of the absolutely essential conditions of the art, namely, that air (meaning its oxygen constituent) must be present in the cyanide-solvent for efficient dissolution of the gold and silver contents of the ore so treated, and that it must be absent from the pregnant solvent for efficient precipitation by means of zinc, in the form of either shavings or dust.

The troubled cyanider notes conditions under which the zinc shavings had ceased to act as a precipitant, and the inflowing solution was re-dissolving the precipitated gold, so that the outflowing solution had more gold per unit. That is to say, the tailings assayed higher per unit than did the feed. The additions of cyanide, alkali, and of lead acetate failed to remedy the bad conditions beyond a short time, and after that complicated the perplexing problems.

The fact that gold was being re-dissolved shows that it could all be re-dissolved by a cyanide-solvent, and thus separated from the coated zinc. Because it is not practicable to continue to run pregnant solution through the precipitation vat for that purpose, I advised that the metallic contents of the vat be removed to a proper receptacle for treatment with a newly prepared non-pregnant, aërified cyanide solution to remove completely the gold from the zinc. Obviously, the zinc may be restored to commercial form if such restoration be profitable. The siur about running the solution from this treatment is sufficiently answered as follows: The aërified solvent might as well be run through the freshly supplied zinc precipitation vat with the, also more or less, aërified mill solution, "to meet again the conditions complained of," as I stated.

The troubled cyanider removed the coated zinc shavings from numbers 1 and 2 of the compartments of the precipitation vat, the contents of the other compartments were moved up toward the head, and compartments 4 and 5 were filled with new lead-coated shavings. There was a temporary improvement in precipitation, probably due to this addition, and then precipitation ceased. He did not say what he did with the inactive shavings, though they undoubtedly had gold on them.

The usual treatment is to wash them thoroughly and return the "longs" to the vat. The "shorts" are variously treated to separate the zinc from the gold, either by acids, by smelting, or by both. Mr. Carpenter advises the use of hydrochloric acid to clean the "longs," and to dissolve the zinc from the "shorts." Troubled cyaniders know the amount of labor, time, space, expense, and loss of zinc, gold, silver, acids, and other chemicals that are chargeable to such manipulation. I do not here calculate the money value of the losses, but they are serious.

The detached gold and undissolved loosened coatings have to be washed from the zinc as effectively as may be, and the washings filtered to secure the precious metals for smelting, but these are not all recovered in this way from the "longs," which are returned to the vat. If the acid be not thoroughly washed away, or neutralized by an alkaline wash, they should not be returned. In any event, this treatment is ineffective for securing untarnished zinc shavings, owing to oxidation resulting from exposure to corrosive liquids and air. Certainly they are not as effective as are freshly cut zinc shavings.

Mr. Carpenter's remarks as to possible pre-conditions and their remedies are useful as far as they go, and if they can be put in practice.

For bag-filtration, a sufficient number of doubled bags of proper size, each unit consisting of a bag of light, twilled muslin, inclosed in an outer one of heavier and stronger canvas, are securely connected to the main pipe carrying a de-aërified pregnant solution, into which is fed, continuously, the zinc dust in requisite quantity, while forced under, say, ten pounds pressure into the bags. The bags are hung from the main pipe in close order, above one or more launders which conduct the filtrate back to the mill stock-solution tank. The precipitates and the surplus of zinc dust are caught by the inner bags.

The double bags are removed when enough precipitate has been collected, one at a time, after closing a cock in the branch pipe connecting the bag with the main pipe. They are allowed to drain and then the double bag is removed and another empty couple are substituted. Or the bag may be moved, without draining in place, to a position above another launder having a like discharge to the stock-solution tank. The bags are allowed to drain until their contents assume a consistency which permits the removal of the inner bag. Then a new inner bag is fitted within the outer, thus made ready to take its place in the routine of operations.

The contents of an inner bag are not directly removed, but bag and all are submitted to acid for removal of surplus zinc, if the latter be necessary, or directly dried, calcined (which removes the bag material by combustion), then mixed with fluxes, and melted to obtain the bullion. The cost of the inner bags is only a fraction of what would otherwise be expended if attempts were made to clean the bags of adhering precipitates, so that they might be used again.

The method of precipitating gold and silver from pregnant cyanide solutions which consists in de-aërifying the solutions and precipitating the values by zinc dust as they pass to the filters, either press or bag, saves more than one-half of the zinc, cyanide, other chemicals, labor, and wastes, which are incident to precipitation by zinc shavings. The cost of suitable vacuum and solution pumps and of accessory apparatus is small when the advantages of the above-outlined methods are considered.

Theft can be the more easily prevented by isolation of the housing of the precipitation department, locks, and safe. N. S. KEITH.

Philadelphia, Pa.

Foreign Oil Fields Closed to Americans

Under this caption, in the *Engineering and Mining Journal* of May 29, 1920, appears what is reported to be a comprehensive summary, from the New York *Times*, of the Presidential message regarding the restrictions imposed by foreign countries in connection with the acquisition of oil lands. In this article, referring to Canada, the following paragraph occurs:

> In Canada, by Order of the Council of Jan. 29, 1920, any company acquiring a lease for oil development must be registered or licensed in the dominion and have its principal place of business there. Under leases on crown lands companies acquiring oil and gas rights must be British, and if a company ceases to be British its lease is subject to cancellation.

This is not a correct interpretation of the Order in Council referred to and leaves a wrong impression on the public mind. To remove this impression and the stigma cast upon Canada, allow me to quote *verbatim et literatim* a portion of the Order in Council referred to, a part of it which evidently has not been carefully read by the compiler:

> Thursday, the 29th day of January, 1920.
>
> And whereas by Order in Council dated the 19th of January, 1914, the regulations for the disposal of petroleum and natural gas rights then in force were rescinded, and new regulations substituted therefor, Section 40 of which regulations contains the following provision:
>
> "Any company acquiring by assignment or otherwise a lease under the provisions of these regulations, shall at all times be and remain a British company, registered in Great Britain or Canada and having its principal place of business within His Majesty's Dominions, and the chairman of the said company and a majority of the directors shall at all times be British subjects, and the company shall not at any time be or become, directly or indirectly controlled by foreigners or by a foreign corporation.
>
> "Any alteration in the memorandum of articles of association, or in the constitution of the company, or in the bylaws of the company, shall be reported to the Minister, provided that two months' previous notice of the intention to make any alteration which might conceivably affect the British character of the company shall be given in writing to the Minister, and if, in the opinion of the Minister, the said alteration shall be contrary to the cardinal principle that the lessee company shall be and remain a British company under British control, the Minister may refuse his consent to such alteration.
>
> "If the company which may acquire a location under these regulations shall at any time cease to be a British company, or shall become a corporation under foreign control, or shall assign any of the rights acquired under the lease without the consent in writing of the Minister being first had and obtained, the lease shall be subject to immediate cancellation in the discretion of the Minister."
>
> And whereas the Minister of the Interior reports that it is now apparent that the insertion in the regulations of the above restriction does not give to the government of Canada any more effective control over the oil which may be produced from locations acquired under these regulations than if the provision had not been so inserted, and as there would appear to be no doubt that this restriction has had the effect of discouraging the introduction of foreign capital so essential to the exploration and testing of vacant Dominion lands thought to contain oil,
>
> Therefore His Excellency the Governor General in Council, on the recommendation of the Minister of the Interior, is further pleased to order that Section 40 of the petroleum and natural gas regulations, as above quoted, approved by Order in Council dated the 19th of January, 1914, be and the same is hereby rescinded, and the following is substituted therefor, viz:
>
> "Any company acquiring by assignment, or otherwise, a lease under the provisions of these regulations shall be a company registered or licensed in Canada and having its principal place of business within His Majesty's Dominion."

The above is self-explanatory, and further comment is unnecessary. I might add, however, for the benefit of those whose education regarding Canada has been somewhat neglected, that any Order in Council of the dominion government, referring to mineral rights, affects only the newer provinces and territories. The original, or confederation, provinces control their own mineral resources and make their own laws and regulations regarding them. W. F. JENNISON.

Truro, Nova Scotia.

PANORAMIC VIEW OF LA LUZ AND LOS ANGELES PROPERTY IN NICARAGUA. AT THE LEFT IS THE OPEN-

The La Luz and Los Angeles Mine, in Nicaragua

Ore, Which Occurs in One Body, Mined From Surface Benches—Present Milling Includes Stamps, Ball Mills, and Classifier, Amalgamation and Cyanidation Having Been Found the Best Practice—Flotation Not Suitable

By Jesse Scobey
Written for *Engineering and Mining Journal*

RELATIVELY little definite working data have been printed on the few established properties of the east coast of Nicaragua. No large-scale operations claim particular outside attention, but a mine that is merging into the second generation becomes interesting. After twenty-three years of continuous production, the La Luz and Los Angeles ownership is permitting, for the first time, the publication of its experience, in the belief that this may be of help to other pioneers, and may benefit a new and promising country.

With the discovery of gold at grass roots, one 3½-ft. Huntington mill was started at the La Luz and Los Angeles mine in July, 1897, by local Spanish prospectors. It was provided with inside amalgamation, and the usual outside plates, to treat the hillside dirt, which was found to pan free gold in paying quantity. There was no outstanding ledge and no defined vein or quartz cropping, with the normal trappings of hanging and foot wall on which to measure the strike and dip, so essential to well-trained mines. According to the technique of the profession, it was not even a prospect, except that gold was there in the tangled jungle.

By December, 1898, about 4,800 tons of material had been shoveled through the one Huntington, producing $38,400. To December, 1900, the dirt was worked with one arrastre and one Huntington mill at the rate of twenty-two tons per day. Through 1901 to October, 1904, two Huntingtons were used, and from October, 1904, to February, 1905, three Huntingtons were running on ore of about $10 per ton.

A party of Pittsburgh men, headed by the late Thomas B. Riter, purchased the property in July, 1905, from the Nicaraguan owners, of whom the chief stockholder was the late Senor José Aramburu, of Bluefields, Nicaragua. The latter, a discoverer, had incorporated the Compañia Minera La Luz y Los Angeles in 1896, under the laws of the Republic of Nicaragua. The present La Luz & Los Angeles Mining Co. was incorporated Feb. 8, 1916, under the laws of the State of Delaware, by the same original holders of stock, with J. Gilmore Fletcher, of New York City, as the company's president.

Record Justifies Early Estimates

When purchased in 1905, the valuation was made by engineers, and was based on their judgment of a prospect. No positive, possible, or probable ore was in sight, except as might be interpreted from a fairly comprehensive plan of surface trenches and pits. It was then estimated that the pay-orebody would be 750 ft. long by 400 ft. wide, and could reasonably be anticipated to extend to a depth of 100 ft., and would approximate a grade of $10 per ton. The record of the property sustains the early prospectus fairly well. The ore mined over the nineteen-year period from 1901 to 1920 amounts to 540,145 tons broken, of an average grade of $8.15 per ton, amounting to total gross value of $4,399,334.

It is unusual to be able to report the record of a mine with continuous mint certificates, month by month, over a period of nineteen years on bullion from mine workings in one body wholly on the surface and at no point over 60 ft. in depth. An open quarry is now

CUT WORKING OF THE MINE AND AT THE RIGHT CAN BE SEEN THE MILL ON THE SHORE OF THE LAKE

exposed about 1,000 ft. long, with a maximum width of 300 ft., with the floor all in ore.

TABLE I. MINT BULLION RETURNS BY YEARS.

Year	Oz. Bullion	Average Value per Oz.	Mint Returns
1901	716.10	$17.12	$12,283.39
1902	2,159.50	17.10	36,944.60
1903	2,796.97	16.85	47,015.93
1904	3,813.40	16.90	64,466.22
1905	4,136.61	17.35	71,657.18
1906	6,584.62	17.48	114,125.55
1907	6,304.91	16.90	106,292.44
1908	6,351.54	17.12	108,942.86
1909	8,929.67	16.10	143,614.37
1910	11,323.84	17.15	194,425.41
1911	15,926.25	17.50	278,572.78
1912	15,888.07	17.60	278,886.60
1913	15,178.75	17.60	267,022.32
1914	10,360.08	17.61	182,732.01
1915	11,845.43	16.95	200,854.47
1916	7,578.27	17.30	131,132.17
1917	6,364.17	17.55	111,703.39
1918	13,782.35	17.45	240,233.65

In the process of milling, the grinding units graduated from Huntington mills to stamps and tube mills, due to the change of material treated, from soft surface dirt to hard, unoxidized rock. In this transition period a considerable part of mine-dump rock was sorted out as being too hard for the Huntingtons, and this, with the normal mine waste of low grade, amounts to about 25 per cent of the total ore broken.

The mill-head value is determined by adding the average tailing assay to the monthly bullion return. The average grade of ore sent to the mill over a period of nineteen years is $9.20 per ton, of which, by amalgamation, the average extraction has been about 66 per cent. A total of 440,145 tons of ore has been milled, from which precious metals to the value of $6.07 per ton have been extracted, a total of $2,671,259.29.

TABLE II. SUMMARY OF ELEVEN YEARS, MILL REPORTS, AMALGAMATION.

Year	Tons of Ore Treated	Assay per Ton	Extraction	
1909	26,423	$7.92	68.6	Five Huntington mills.
1910	34,312	8.13	69.8	Five Huntington mills.
1911	38,742	9.68	74.5	Six Huntington mills.
1912	44,518	8.12	77.2	Six Huntington mills.
1913	43,223	9.09	68.0	Six Huntington mills.
1914	49,933	5.80	63.0	Six Huntingtons and five stamps.
1915	35,131	9.25	62.0	Ten stamps and old Huntingtons.
1916	26,459	7.90	61.5	Ten stamps and one 8-ft. Hardinge. (Reconstruction)
1917	32,957	5.65	60.0	Ten stamps, one ball mill, one pebble.
1918	57,947	6.90	60.6	Ten stamps, one ball mill, two pebble.
1919	11,235	10.33	69.0	Ten stamps only (no power) (Hard ore).

The average of ore milled for the last eleven years has been $7.11 per ton.

No attempt was made to keep detailed mill records previous to 1909; or, if so, they were lost. The work then outlined was to carry the mill-level tramway into the hill, following the surface excavations and thereby providing mill holes from which the "manta" (covering) could be drawn off in cars. Prospect pits were dug in front of the trend of the most highly mineralized area, but in the main the operations were directed by the foreman in charge panning his dirt daily, and guiding his laborers into anything assaying more than $5, and away from anything less. In the strict sense of the word, miners were not employed nor needed. All ore to the mill was from open surface benches, from which the dirt was barred down and shoveled into cars to the mill holes. At times 25 per cent dynamite was used in 1¼-in. holes churned to 10- or 12-ft. depths to break up the benches.

High Cost of Power vs. Low Labor Costs

The pay dirt made up by the oxidation of the surface rock to a depth of about 20 ft. was easily broken in Huntington mills. The greatest difficulty was experienced in attempting to pass the always wet dirt or mud through grizzlies, to eliminate any hard oversize not suitable to the Huntingtons. Labor was cheap, and there was a merited aversion to mechanical equipment, particularly because of limited and expensive power. Furthermore, it was recognized that an entirely different mill would be required for the harder unoxidized ore, and plans were under way for a modern plant of stamps and tube mills. Accordingly, there was little attempt at refinements or betterments. The additions made were all for the purpose of testing the comparative merits of stamps and ball mills, and trying out pebble mills under different conditions.

The extraction secured by amalgamation has doubtless been uniform throughout the period of operations. The results reported in Table II are complicated by the difficulty of obtaining consistent assays, and by the variable personal factor of four different superintendents. Taken day by day, the tailing assay will vary

by 100 per cent, but by the end of the month the average will settle down to normal. On oxidized surface ores the extraction ranges from 60 to 70 per cent, and in 1920, on hard unaltered ore—and similarly for the whole of 1919—the average extraction is taken at 70 per cent.

A serious effort was made in 1914 and 1915 to reach a satisfactory determination of extraction, with the following result, the "apparent" extraction being calculated from head and tailing assays, and the "actual" extraction made up from tailings assay and bullion returns:

TABLE III. TABULATION OF MILL EXTRACTION BY AMALGAMATION

1914	Extraction—Apparent	Extraction—Actual	1915	Extraction—Apparent	Extraction—Actual
Jan.	69 70	65 38	Jan.	63 54	64 43

Dec.	72 97	67 06	Dec.	46 80	62.20
	Average for year, 63 per cent.			Average for year, 62 per cent	

In 1912, a serious attempt was made thoroughly to groove the exposed open cut and to sample regularly over 5-ft. sections. So much has been said and written about sampling gold mines, and of the propriety of resampling when erratic neighboring assays are returned, that Table IV is submitted as interesting. The management is convinced that a resampling and reassaying of the same territory would not check any one particular 5-ft. section, and that there would be individual variations of over 100 per cent, but that, in the final averaging of five hundred assays, the results might check satisfactorily.

Actual mill tests with ten stamps over a period of thirty days' running have been found to be the only reliable method of ascertaining mass valuations. Of the complex results reported in Table IV, the average of exposed ore assayed was $6.50 per ton. Taking the final result of eleven years' milling throughout this same territory, and adding the tailing assays to the mint returns, the feed to the mill shows a value of $7.11 per ton, which is an apparent variation in favor of actual results, over those obtained by mine sampling, of 10 per cent.

TRANSPORTATION METHODS AT LA LUZ AND LOS ANGELES ARE PRIMITIVE ALTHOUGH EFFECTIVE

All that can be said of the results indicated, and of the value of deductions from monthly returns, is that the record is a remarkable demonstration of the law of averages, and that over a period of time the figure will be approximately 60 per cent. The average of all data over nineteen years is 66 per cent. It has been impossible to obtain evidence that the oxidized ore yielded a higher extraction than does the unoxidized part.

The deduction is drawn that the gold is metallic, and that surface oxidation only alters the mass rock, without affecting the gold.

To determine a satisfactory mill-head assay, or a basis for the valuation of the ore in place, has been difficult. With metallic gold erratically distributed in any single cubic yard, it has never been possible to make the final subdivisions sufficiently accurate to check assays, even on the same general sample.

Pyrites Free From Gold

The ore occurs in a highly fractured contact-metamorphic limestone with intrusions of basic porphyry and monzonite porphyry, the mass highly altered and having been subjected to repeated crushing. It is unusually low in sulphides. The most highly iron-stained gossan at one edge of the open cut contains no pay gold, and pyrite in the ore mass is not welcomed, as it indicates absence of valuable minerals.

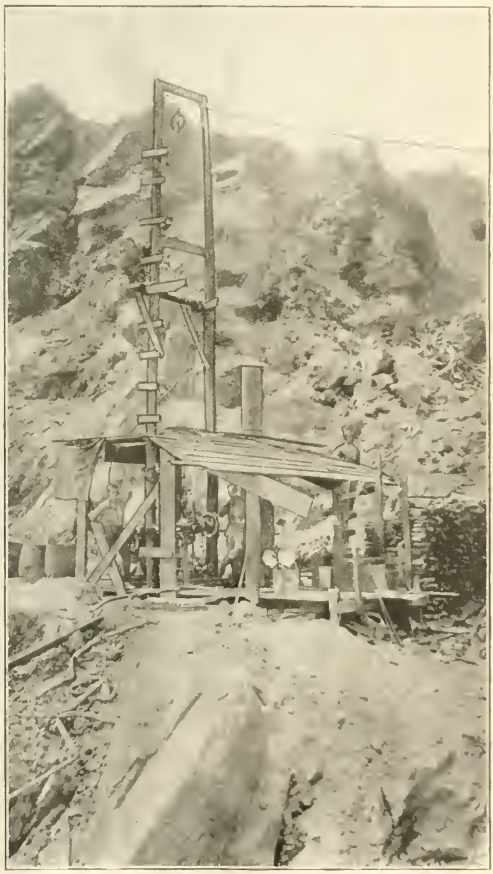
Final average of 592 assays—$6.50 per ton.

In the early operations little thought was given to developing ore in depth. The mine was extending in area, by natural growth, with a satisfactory monthly output. It was recognized in 1913 that a horizontal limit would soon be reached, and although some new tunnels have since been opened, the deposit is now practically defined in length and breadth. Three shafts were planned at 200-ft. intervals, and two were completed, but the third encountered more water than could be handled economically by windlass. This work established the impossibility of drifting at 100-ft. depth, or of sinking deeper without power for hoists, pumps, and air compressors.

The cost of steam and gasoline engines was prohibitive, as demonstrated by experience, and a proposed hydro-electric plant could not be built without a heavy investment. There seemed to be no alternative for determining ore in depth except to prospect with diamond drills. A No. 12 American hand drill was tried, and one vertical hole of 350-ft. depth proved the territory to be fair drilling rock, but with high diamond cost and slow progress. The information gained, however, was used as a basis for soliciting a contract to sink ten holes of 500 ft. each, and a bid was accepted at $3.50 per foot, the company paying the expenses of transportation and board of the men while at the mine.

The work was begun in February, 1916, and concluded in August, 1916, with about 6,000 ft. of drilling. The information gained settled many points, and demonstrated no change in the formation and a continuity of average grade of ore to the depth explored. The



PROSPECTING DRILL AT LA LUZ AND LOS ANGELES MINE

results cannot, of course, be considered conclusive, but when studied without bias they are all that could be desired.

Shattered Ground Shows Higher Mineralization

The maximum drilling progress for twenty-four hours was 88 ft. A fair average shift's work of ten hours was 20 ft. advance. In any one hole the best recovery of core amounted to 33 per cent, with the average considerably lower. The sludge samples were found to be consistently richer than the core, and in final summation were about 47 per cent higher. The

ALONG THE WATER TRAIL TO LA LUZ MINE

final cost to the company amounted to $5.26 per foot for all holes.

It is characteristic of the deposit to exhibit better gold values in the more shattered ground, and with a low percentage of core for assay in broken ground the core samples could not be free from doubt as being representative of the section. They will be accepted as a guide and justification for sinking the final working shaft.

Huntington Mills Give Good Service

Early milling operations on the decomposed surface rock were with six Huntington mills with 24-mesh screens, using approximately five horsepower each and treating, over monthly periods, an average of twenty tons per twenty-four hours. They were entirely satisfactory and well understood by native labor. On the La Luz and Los Angeles type of gold ore they are excellent inside amalgamators, and are the best possible prospecting machines for that country. When the machines became old, after service of three or four years, the repairs and renewals amounted to 16.8c. per ton, exclusive of labor and lost time.

The average of several years shows that, of the total amalgam collected, 64.8 per cent was taken from the mill wells and 35.2 per cent from the plates. Over a period of five years, the quicksilver loss has amounted to 0.0097 lb. per ton of ore milled. With Hardinge mills and plates the mercury loss has been 0.01187 lb. per ton of ore. The summation of quicksilver loss over eight and one-half years has been 0.01025 lb. per ton of ore, which amounts to 0.03324 lb. per ounce of bullion recovered.

Flotation tests are not encouraging, and flotation treatment cannot be applied to a metallic gold ore of this character. A representative sample of the unaltered sulphide ore was sent to the General Engineering Co., and it may be conclusive to give a digest of that company's report:

Test No. 1:

Ore crushed in ball mill to 100 mesh. Treated on Callow pneumatic flotation machine with an oil mixture of G.E. No. 1, 40 per cent; No. 2, 40 per cent; No. 8, 20 per cent (1¼ lb. per ton).

(N.B.—Concentration 16 to 1; product not a shipping value)

Test No. 5—Amalgamation, Flotation and Concentration:
Ore crushed to 80 mesh, treated direct to plates.

	Weight, per Cent	Au	Ag	Recovery, Au, per Cent
Crude ore assay	100	0.286	0.32	
Amalgamation tailings		0.137	0.16	
Amalgamation extraction		0.148		51.77
Amalgamation tailings emulsified with No. 2 Na_2CO_3, and No. 2 Na_2S and oil mixture of G.E. No. 8, 50 per cent; No. 132, 33 per cent; and G.E. No. 2, 17 per cent (1½ lb. per ton); treated in Callow pneumatic flotation machine.				
Flotation concentrate	5.86	1.19	1.9	24.38
Flotation tailings sent to Wilfley table				
Table concentrates	1.30	3.82	3.4	17.36
Total recovery				93.51%

(N.B.—Combined concentration 13.96 to 1; and product is nnt a shipping value)

The concentration and flotation tests are valuable only by elimination. Other mines near La Luz and Los Angeles would not necessarily have similar experience, but the record is published as a guide against anticipating merit in flotation on similar neighboring ores.

Cyanidation tests have been made and checked. In 1912 the Henry E. Wood Ore Testing Co. made a careful examination of ore and tailings sent to them, with the following conclusion:

(a) Treatment of actual mill tailings after amalgamation, which had passed Huntingtons with 24-mesh screens: As received, the tailings were separated into "sands" and "slime," and each subjected to normal percolation or air agitation, with a final combined recovery of 83.6 per cent.

(b) The same material reground in tube mill to pass mechanical classification, and treated in Pachuca tank with air agitation, gave (tailing assay, trace gold) plus 98 per cent recovery.

More modern tests were made in 1916 on true sulphide ores as then uncovered, with the result shown on the chart.

The ideal treatment for this ore is amalgamation and cyanidation, but considering the simplicity of direct cyaniding, and the greater security of the recovered metal, the decantation treatment in weak cyanide solution will probably be installed at the La Luz and Los Angeles mine.

When in 1916 it became necessary to break into the harder ore below the surface "manta," the original Huntington mills were found to be inadequate. The vibration, wear, and tear were so excessive that all Huntingtons were finally abandoned.

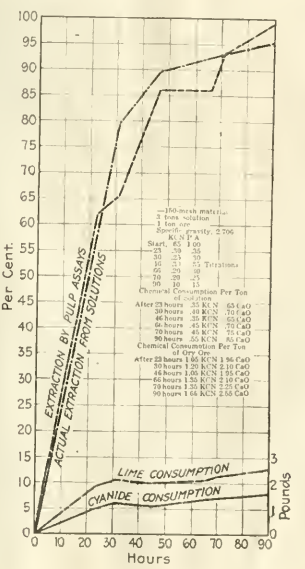
Production was never stopped, and the present half unit of a new milling plant was erected over the old mill. Five 1,050-lb. stamps on concrete foundation were first put in, crushing to 4 mesh and delivering to several Huntingtons, but the latter could not be adapted to the ore.

Stamps Retained, Because of Lack of Comparative Data

The stamps were increased from five to ten for fine crushing to minus No. 421 ton-cap screens, direct to plates. Inside mortar amalgamation was attempted, but was discontinued. With a larger milling plant in view, it was desirable to test the ore under working conditions with a Hardinge 6-ft. ball mill in competition with the ten stamps. Several factors could not be isolated to decide definitely the respective merits, and without substantiating figures it was decided to retain stamps. During the war period, a good supply of balls was not to be obtained, and the mill could not be operated with a fair full charge of metal. On a soft ore the Hardinge ball mill would take all the tonnage that could be delivered through a 6-in. feed scoop; but with no adjustment would it deliver a finished output under the conditions stated.

Using the ball mill in a closed circuit with an Akins classifier was tried, but with soft feed and sand return the ore charge did not offer sufficient resistance to the balls, with the result that the liner wear was excessive and renewals were abnormal. During a period when balls were not at hand, an attempt was made to use scrap iron of discarded Huntington mill roller heads, or pieces of 4-in. shafting, cut to 6-in. lengths, or the necks of stamp-mill shoes. With hard ore this material was not satisfactory, and there was a noticeable decline in the capacity of the mill when anything but round steel balls was used.

In this period one 8-ft. Hardinge pebble mill was installed to take the product of stamp mills at 4 mesh, together with the output of the ball mill in its office of a coarse crusher, using an Akins classifier ahead of the pebble mill. The 8-ft. Hardinge pebble mill delivered a finished product, without further classification, direct to the plates. Although not orthodox, the practice seemed to show the best results in this particular instance. Some slight oversize would show on the plates, but inasmuch as it was of low tailing assay, the mill could be crowded to a higher tonnage output per horsepower than could have been done in a closed circuit.



TESTS ON LA LUZ SULPHIDE ORES

The situation was complicated by power costing $750 per horsepower-year, with, moreover, not sufficient engine capacity to run a second 8-ft. Hardinge pebble mill to test a closed circuit. With ten 1,050-lb. stamps at 100 drops per minute, and one 6-ft. ball mill at 27 r.p.m., and two 8-ft. pebble mills at 26 r.p.m., the plant could not be run to speed with 200 hp. The driving pulleys on the two pebble mills were increased to reduce their speed to 20 r.p.m. each, and the advantage was at once apparent in reducing the power to less than 200 hp., and within easy limit of the engine capacity, with no apparent lessening of the mill tonnage. In net result the plant attained a maximum output of 250 tons per day, and an average, for thirty days, of 210 tons. The net mint production was raised from 1,200 oz. per month to an average of 1,500 oz., with a maximum thirty days' run of 1,700 oz. bullion output.

The 8-ft. x 36-in. pebble mills used mine rock in place of imported pebbles. In the mine are small patches of hard, close-grained flint or chert, which, when

sorted out, generally gave an assay of $3 to $4.50 per ton. This material was shot down and selected in blocky pieces of five to six inches, delivered to a special mill bin, and was charged out on the reports as ore. It was thrown into each pebble mill by hand from a car on a track above the mill. A rough four-side iron chute of ½-in. plate iron as a gooseneck was so secured as to project the stones directly into the pulp-discharge end of the Hardinge, and did not interfere with the free discharge of the finished pulp. It was the work of one man per shift to feed two mills, cobbing the irregular stones to size to enter the mill. Of the total mill tonnage the rock used to form pebbles amounted to 4.3 per cent, or 86 lb. of rock to the ton of ore treated.

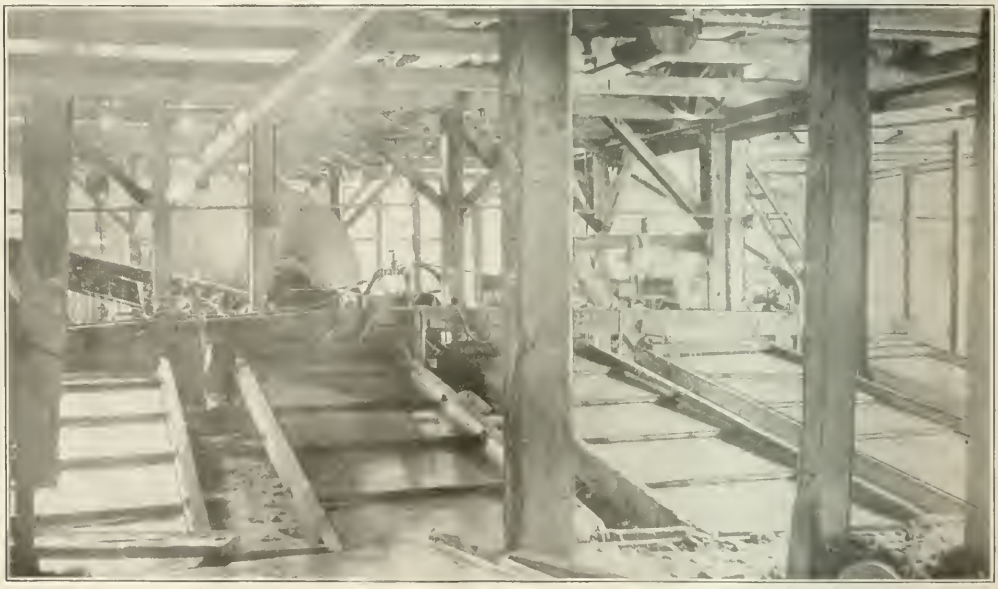
With the pebble mill running in open circuit, delivering a finished product, the practice developed of making a very wet discharge direct to the plates. An excess of water permitted a classification in the mill that held back the oversize.

The second 8-ft. Hardinge mill was installed in 1918 for either open or closed circuit. This unit takes 4-mesh product from the ten stamps, and, operating in closed circuit with a 48-in. Akins classifier, the work is done at about eighty to ninety tons per twenty-four hours on hard ore. At this point the stamps are operating about to capacity, unless the ore can be crushed finer than 2-in. to 2½-in. size; and the Akins classifier return to the Hardinge is about the limit of the classifier blades. Any greater tonnage would necessitate doubling the classifiers, and doubtless require the use of steel pebbles in the Hardinge, with, of course, more power consumption.

The mining districts of the east coast of Nicaragua are all in tropical jungle. Growth is phenomenal. A telephone line, built a few years ago, is now a continuous row of growing trees, starting from the original poles. Naturally, this wood is worthless as fuel or timber. In the older growth are scattered trees of superb hard wood and sufficient soft wood, as cedar and mahogany, for normal building purposes, but no new mine prospect can depend on wood fuel in quantity to maintain a boiler plant of over 25 hp. Also, for mining work, the hard grades cannot be excelled for underground timbering, for shafts or drifts, but it would be unwise to count on square-set stoping timbers, except as they might be brought in from the lower coast savanna pines.

Naturally, hydro-electric power is the only solution for mining work, and it can be developed for all the districts if capital is invested. No development in depth can be obtained to show mining stability without considerable power for hoisting, pumps, and compressors. A vicious circle is established, in that no company can be fully warranted in building an expensive first-cost power installation until the mines are developed to show stability.

With a receding wood supply at the La Luz and Los Angeles mine, a 25-hp. gasoline engine was first installed, which gave satisfaction but with high fuel costs. Gasoline was imported from New Orleans at a freight cost of 50c. a gallon. To combat the rising cost of gasoline, a 50-hp. Diesel engine for crude oil was tried out in 1915. The experience over a period of twelve months was costly. From day to day practically every casting in this engine was broken, until a decision was reached to meet the local conditions with an engine that the labor could understand. In 1917 a 150-hp. vertical three-cylinder engine, built to burn distillate, was successfully installed, and by using the light distillate fuel in the Diesel engine no further running trouble was experienced.



INTERIOR OF PRESENT MILL AT LA LUZ

With the swollen prices and freight rates during the war period, and to date, even these engines are impracticable except as expedients to develop the mines to a point where they will warrant hydro-electric plants. The table indicates the power source and the cost per horsepower-year:

POWER IN 1913.

	Per Cent Used	Cost per Hp. Year
Gasoline	22.99	$606.48
Steam	17.36	581.13
Water (Pelton wheel)	59.65	141.06

Wood, five cords per 25 hp. day—$5.20 per cord.
Gasoline, 50 gal. per 21 hp. day at $0.75

Power Costs in 1918

Using a 150-hp. Fairbanks Morse engine and a 50-hp. Diesel engine (distillate), to secure an average of 200 hp. per day, the combined consumption was 350 bbl. of distillate per month, at $0.74 per gallon. The cost per horsepower-year was $777. With the distillate engines the cost per ton of ore milled was $2.16, a most abnormal charge.

With a rainfall of about 120 in. per year concentrated in six months of the season, the trails and roads are bad. The mine freight is carried by river in pitpans for 175 miles, to within five miles of the mine. Mule-back haulage is used to some extent, but the more accepted method is by pack oxen, which, unshod, are better able to navigate the swampy roads. Loads were formerly limited to 150 lb., but with the development of mud sleds the largest piece yet handled was an engine base weighing 5,000 lb. Any necessary part of reasonable weight can be transported. Freighting may be variously estimated as follows:

	Per Ton Mile	Limit
Women carriers	$2.00	80 pounds.
Pack oxen	4.00	150 pounds.
River pitpans	0.25	5,000 pounds.
Coast schooners	0.07	5 tons.

Government control is excellent, and the officials are courteous and efficient. There is no record with this company of the oppression or graft so commonly charged against many of the struggling Central American republics. Strikes are unknown, and theft is rare. Revolutions have occurred in Nicaragua, but the La Luz and Los Angeles mines have not been molested or threatened.

There is a nominal tax of $0.40 gold per year per hectare mining claim. On timber and grazing land the tax is $0.16 gold per hectare. A separate and additional tax of $5 gold per $1,000 invested capital is collected on all property, stores, supplies, and accounts. Bullion exported is taxed at $17 per kilogram of pure gold, the assessment being made subject to final mint returns. On the La Luz and Los Angeles bullion, running about 830 fineness, the export duty amounts to approximately 3.12 per cent, or $0.53 per ounce of bullion.

Wild Tales From the Hills

Possibly the premier assay ever reported came from the old Black Warrior mine, in the Bradshaw Mountains of Arizona, back in the days when silver was worth just a bit above a dollar an ounce. It reported a silver value of $30,000 a ton, or a little more than the solid metal would have then been worth. On a par with this is the tale of the California pioneer who boasted that when he was express agent in one of the early camps he often shouldered and dumped into the daily stage a sack that contained $100,000 worth of gold dust—a load that a pack mule could not carry.

Hand vs. Machine Development

By G. L. Schmutz

Written for *Engineering and Mining Journal*

THE data here given in the tables covering comparisons between hand and machine development were obtained from one of the largest mines in the Southwest. The total amount of footage used in computing averages applies respectively to the years 1917 and 1918. The rock encountered in the development was principally latite, andesite, and monzonite. The average wage of labor per day was $2.

TABLE I. AVERAGE DEVELOPMENT COSTS PER FOOT OF ADVANCE

	Drives		Saving Hand Over Machine	Winzes		Saving Hand Over Machine
Year	Hand	Machine		Hand	Machine	
1917	6 93	9 71	2 78	8 31	11 22	2 91
1918	7 38	8 89	1 51	8 33	10 88	2 55

	Raises		Saving Hand Over Machine
Year	Hand	Mach.	
1917	6 96	7 55	0 59
1918	6 83	7 42	0 59

Estimated Saving for All Hand-Driven Development

Year	Footage of Machine Drives	Hand vs. Machine Saving	Savings in Drifts	Footage of Machine Winzes	Hand vs. Machine Saving
1917	10,982 50	$2 78	$30,531 35	1,445 0	$2 91
1918	11,332 50	1 51	17,112 07	165 5	2 55

Year	Saving in Winzes	Footage of Machine Raises	Hand vs. Machine Saving	Saving in Raises
1917	$4,204 95	9,893 5	$0 59	$5,837 16
1918	432 22	10,206 0	59	6,021 54

TABLE II. PERCENTAGE DISTRIBUTION OF FACTORS ENTERING INTO DEVELOPMENT COST

	Drives		Winzes		Raises	
	Hand, Per Cent	Machine, Per Cent	Hand, Per Cent	Machine, Per Cent	Hand, Per Cent	Machine, Per Cent
Labor	67	49	72	45	71	52
Explosives	27	38	24	40	24	35
Forge and drills	6	13	4	15	5	13
Totals	100	100	100	100	100	100

The figures given in Table I indicate that, at this mine, hand is considerably cheaper than machine development. However, there are instances wherein this difference in cost must be sacrificed for speed. Some of the advantages accruing from the practice of running development by hand rather than by machine are as follows: A smaller cost per ton of ore extracted chargeable to exploration and development; employment can be given to more men; less water is required for machines; less power is required for compresors; there is less dust.

[Cost comparisons of hand and machine drill work are not numerous, as, under the wages which have ruled in the Western states, there has been little inducement to employ all hand labor. Each increase in output per unit of labor has been won at additional expenses for power, lubricants, and overhead where mechanical equipment is employed. There is a point where the increased costs, when superimposed on a given labor wage, increase the unit cost of the work. Increased wage rate makes it possible to add such increased charges in greater proportion without increasing unit costs as compared with hand work. Mr. Schmutz's labor cost of $2 per day, and his comparative unit costs for development work, indicate that with labor at this wage, unit costs are increased by machine drilling. With labor at $4 per day, the unit costs would be lower in the case of machine mining than with hand labor with the same wage.—Editor.]

Investing in Mining Prospects

Chances for Success Are Gaged Largely by the Business Ability of the Personnel, Sufficient Finances, the Manner in Which the Property Is Operated, and the Presence of Ore in Paying Quantities

By Kirby Thomas
Written for *Engineering and Mining Journal*

THE risks of investing in any business enterprise at its inception, or in its first stages, are greater than in the later stages, when the undertaking is established and perhaps earning a profit. This is true with mining ventures to a greater degree than with most other commercial or industrial undertakings. There are, too, certain features in connection with all mining investments, increasing this risk, often not duly considered by the prospective investor, who, at the time of investing, is likely to be under the spell of the mine vender or the stock salesman and self-blinded by the promise of a large gain in the transaction.

It is seldom that mineral deposits are found which can be determined without much expensive labor to be of sufficient commercial value to justify a mining operation. A mineral deposit the extent and value of which are unproved is termed a "prospect"—an obvious designation. The value of a prospect is difficult to measure, and its profit possibilities, if there be any, are latent. It is in this prospect stage that much money is lost in mining, not only by investors but by skilled and experienced miners and engineers.

The Risk of Investing in a Mine Prospect

A prospect mining venture is essentially and inherently hazardous. The mining engineer and the mining man will not deny this; in fact, they recognize it by offering to the investor a large interest at a low figure, or by associating with others in the cost of the development, so as to divide the risk. This great risk is evidenced, also, in the low price of the shares in prospecting and developing companies. There is a chance either of a failure and total loss, or of a success which may mean a many-fold gain for all.

If the investor goes into prospect mining with his eyes open to the risks, which risks he takes for the chance of the great gain expected, no blame should be attached to anyone if a loss ensue. However, because of the great physical risks in a mining prospect, proper business precautions should be taken.

Securing a Clear Title Essential

The first consideration is the title. It should hardly be necessary to mention such an elementary matter, but the fact is that mining-stock investors often have no knowledge of and make no inquiry as to the title under which the company holds the property. Mining property in the Western United States and in Mexico may be held under "location" or "denouncement"—that is, the title is in process. Companies frequently offer stock when the title to their properties is in this stage. Ordinarily, this is reasonably safe, but there is a chance of the full title failing to issue on a technicality or an irregularity. Therefore, it is best for the investor to insist upon the protection of full fee title to the property, or upon a guarantee, or to hold a "string" on his money until the title is perfected—ordinarily a matter of a few months.

Many stocks are sold by companies which hold their properties under a form of contract, customary in the mining business, known as a "lease and bond." The owner gives to the company, or to the promoter, a lease with the right to develop and operate the property for a given period, usually one or two years, and an option to purchase for a stipulated price and terms during the period of the lease. The purpose of this negotiation is self-evident. The purchaser of the property has opportunity to prove to his satisfaction that it is worth the price.

Ordinarily, it is stipulated that development and exploration shall be done. This form of contract is sound, and is usually resorted to by experienced men in negotiations for undeveloped and unimproved properties. On the other hand, the mining investor is often unfamiliar with the business risks involved in a lease and bond proposition. The investor often does not know that the property, encouraging reports of which may be before him, does not belong to the company offering him its stock, and this fact is sometimes not impressed upon him unduly. He does not know that should the expensive work that is necessary, part of which he is to pay for, prove the property to be of value, the company must then pay many thousands, or a million or more, for the property; and he does not consider that if the prospect should prove to be very valuable, his associates in the transaction may not be financially able to complete the deal, or the conditions of the negotiation may be such that the money to purchase the property cannot be raised.

The investor who goes into a company which owns only a contract or a lease on a mine should recognize that, aside from taking the usual physical risks of mining, he is taking, also, great business risks in respect to the ability of his company, or of its backers, to carry out the terms of the contract and acquire the property for the company.

In the purchase of a stock interest in a property held under lease and bond it should, however, be borne in mind that if the company can raise enough money to prove up the property, and to give it a measurable value greater than the contract price, the transaction is reasonably safe within itself, for even though the first investors may not be able to raise the purchase price, there is always a market for developed and proved mining properties.

Usually, in a prospect mining proposition the owner takes a part of the stock of the company in exchange for his property, the remaining stock going mostly into the treasury of the company, to be sold for development purposes, and thus make all the stock valuable. The prospective investor should inquire as to the proportion of the issued stock which the owner receives, and

also what part certain intermediaries, called promoters or stock agents, acquire as their profit. There is no set rule or guide as to how much stock should be issued for the property, but the amount and all conditions should always be critically considered.

Other primary points in a prospect mining investment relate to capitalization of the company and the amount of stock in the treasury. If an investor purchases mining stock which is not from the treasury of the company, he is simply making a trade. If he purchases stock from the company's treasury, his money goes to his company and is, or should be, used in making his property more valuable. Consequently, other things being equal, it is more advantageous to buy treasury stock than individual stock, a matter often overlooked. The number of shares in the treasury is vitally important, for if there is only a small amount of treasury stock the company may have difficulty in raising the money needed for the development and purchase of the property, and to borrow on company notes or bonds is ordinarily, for evident business reasons, not practicable in the development or management of prospect companies.

Avoiding the "High Commission" Stock

Extravagant impositions in the form and guise of commissions to the stock salesman, brokers, and intermediaries for raising the funds often accompany mining flotations, and this point should be scrutinized carefully. Often the investor considers the stock on its own merits, without inquiring as to what part of the dollar which he pays is to go into his property. In some notorious instances the cost of raising money for mining enterprises has been from 50 to 90 per cent of the sum obtained—a condition obviously and glaringly wrong from a business standpoint, and a forerunner of failure of the enterprise saddled with such incompetency or dishonesty.

In financing a prospect mining company it is customary to pool the owner's and the promoter's stock. The stock investor should usually insist on such an arrangement, and should know of the details of the pool agreement. If the owner and the promoter cannot sell any of their stock until the mine is profitable, they are likely to have a lively and continued interest in the success of the undertaking, and such a plan makes them carry the full risk along with the man who furnishes the money. The pooled stock, too, is taken off the market, and thus the financing is easier and surer.

Carrying a "Padded" Directors' List

The mining-stock investor is often influenced by the eminent respectability and high financial standing of the board of directors, but he should bear in mind that sometimes bankers, lawyers, and others lend their names to mining corporations without first having thorough knowledge of the undertaking, and that they sometimes do not give the attention to the business which is morally, at least, incumbent upon company officers. Not infrequently fine-feathered directors have been given their stock free for the use of their names.

A mining-stock offering should always be accompanied by a report from a disinterested mining engineer or other competent expert. Statements by the owner or the agents should be designated as "venders' reports," as is the British practice. Mining reports are not infallible, either as to competency or integrity. The reputation and experience of the man making the report is always a wise and proper subject for inquiry. Most reports on prospects are opinions only, and should be taken as such. The prospective stock buyer should study the reports and weigh the facts and conclusions in all their bearings, for manipulation of reports by overzealous venders is one of the tricks of the business. If the technical parts of the report are beyond the knowledge or experience of the investor, he should consult some one with mining experience, or, better, seek directly the advice of a mining engineer in good standing, as he would consult a lawyer in any other business transaction.

Unscrupulous Promoters Prone to Exaggeration

Outward evidences generally indicate unsound companies to a wise and wary investor. Promises of immediate dividends from a prospect, extravagant claims and incomplete or misleading statements about the property, announcement of arbitrary stock advances, suggestions of philanthropy in the promotion, failure to present essential points, evidence of lax business methods or of financial incompetence, claims of the discovery of wonder-working ore processes, positive valuations of the undeveloped, and hence unknown, orebodies—these and other equally axiomatic indications of incompetency or dishonesty should automatically protect the public; but unfortunately they do not.

The purchase of stock in a mining prospect company is not an investment in the sense that the transaction may be expected to result in early regular dividends, but it may be, nevertheless, a good business speculation, and may become a source of profit. There is the chance for profits during the development period from the enhanced price of the stock as the prospect development progresses, and, of course, always the expectation that sooner or later the prospect will be a mine, and then the stock will have an intrinsic value many times greater than the price paid. Mining stocks are often bought solely on the chance that the price will rise or be raised, and that the holders can unload at a profit. This is a speculation, and is in the same class as speculation in stocks or with the markets.

Causes of Failure of Mining Investments

The chief cause of loss of investments in mining prospects is the failure to find valuable ore in commercial quantities. Not one in a hundred of the discoveries of outcrops or mineral indications which attract the prospector finally develops into a mine. Generally, the limited work of the prospector or of the owner determines this, and the "discoveries" die a-borning. Often a little work will give hope and encouragement and some definite facts as to the mineral conditions. The prospector comes to have faith in his property, the mining man thinks that it will make good, and the engineer makes a favorable report on it as a prospect. At this stage the proposition is likely to be offered to the investor, either in the form of an interest or as stock in a company, as usually much more money is needed than the owner has or can afford to risk.

Provision of sufficient funds for the company at this stage will not, however, insure success. The business must have honest and competent management, and probably, also, technical engineering guidance. The company must be financially able to carry out the necessary explorations and developments. These essential factors

for success being all favorable, there is reason to expect a profitable investment, barring, of course, the inherent physical risk of there not being enough valuable ore in the property to make a paying mine.

Mining Should Be Regarded as a Specialized Business

It should hardly be necessary to caution a business man as to the wisdom and necessity of skilled, competent management. Yet many mining companies, particularly those engaged in making mines from prospects, are woefully mismanaged, chiefly for the reason that many persons do not recognize the fact that mining in nearly all its phases is an intricate, specialized form of business activity, requiring special experience and technical training, as well as a high order of business ability and energy.

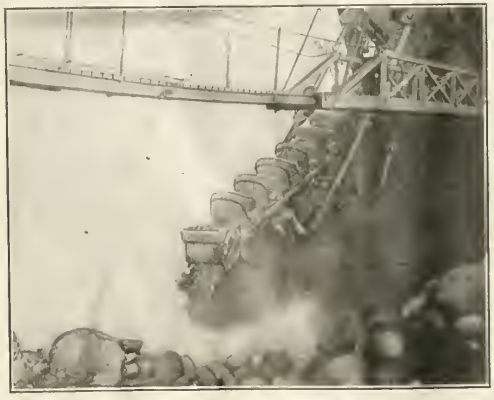
Most prospects require much more money to prove than the sanguine owner or promoter expects, or the stock buyer is led to believe. Lack of sufficient capital is the cause of many failures, for rarely can enough ore be taken from a prospect to pay for its development.

All of the rich mines now operating were once prospects, in most cases not many years ago, and each year many prospects are developed into mines, making many individuals and the community wealthy. Those who are prepared to take the money risks involved, who will use hard common sense and good business judgment, and who will study the business, will find as much interest and profit in investing in mining prospects as in most other business activities—especially if they are persistent.

Bucket-Line Troubles

Written for *Engineering and Mining Journal*

A not infrequent accident in dredge operation is for the bucket line to run off the lower tumbler. When the buckets ride up on the flange of the tumbler, the lower part of the bucket line slides out of its normal position on the rollers, and if operation is continued the buckets

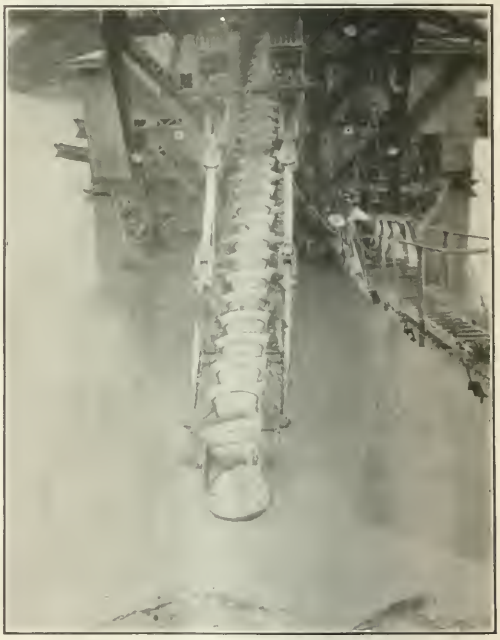


BUCKET LINE BEING SPRAGGED OVER

will ride off the lower tumbler completely. Usually the bucket line is stopped before this takes place. The ladder is raised, and the condition of the tumbler and buckets determined.

To get the bucket line back into position short sprags are inserted between the bow gantry post and the bucket line, and the buckets are started in the reverse or down direction. Sometimes spragging at the gantry will shove the bucket line over enough to get it back into the tumbler, but if the line is quite tight, spragging at the lower tumbler by placing a sprag reaching from the corner formed by the bottom of the tumbler flange and the tread up to the inside corner of the bucket bottom is an effective method of readjustment. In most cases several sprags of different length must be used before the bucket line reaches its position and the line of buckets is operated up or down, as conditions warrant.

In the illustration in this column the two lower buckets are riding the edge of the flange of the tumbler. The dredge-master is shown placing a steel bar, sprag, in the lowest position, as shown in the first illustration,



BUCKET LINE RIDING ON FLANGE OF LOWER TUMBLER

preparatory to finally throwing the buckets onto the tumbler. The sprag is secured to a rope which is made fast by the man on the bridge. Success attended this last maneuver, for, on the bucket line being slowly worked down, the buckets snapped into place with a great jar which shook the whole structure of the dredge.

The photos shown were taken of one of the dredges of the Yuba Consolidated Goldfields Co. at Hammonton, and were obtained through the courtesy of M. L. Summers, superintendent of the company.

Exportations of Iron Ore from Lorraine to Germany during 1919 amounted to 1,147,947 tons, according to *Commerce Reports*. The imports of coke into Lorraine from Germany amounted to 1,382,845 tons, and of coal 342,498 tons. These figures do not include the deliveries of coal and coke made in accordance with the application of the peace treaty.

The Salt Chuck Palladium-Copper Mine

A Unique Alaskan Copper Property Yielding Copper Concentrates Carrying Over 3 Per Cent Of Palladium per Ton—Unusual Local Geology Disclosed by Examination—Ore Concentrated by Flotation and Shipped

By J. B. Mertie, Jr.*
Written for *Engineering and Mining Journal*

THE Salt Chuck mine, formerly known as the Goodro, is about half a mile northeast of Lake Ellen and at an equal distance from the source of the Salt Chuck, at the head of Kasaan Bay, Prince of Wales Island, Alaska. Mining was begun originally on what was considered to be a low-grade copper deposit, but subsequently it was discovered that the ore was of more value for its content of platinum metals than for its copper, so that this mine is now more properly described at a palladium[1]-copper mine. It has been operated continuously since 1917, and in 1919 it employed about sixteen men.

The lode crops out at an elevation of 400 ft., upon a little knoll rising from one of the rounded ridges characteristic of this glaciated area. A few other surface outcrops have been found near by, but the general surficial configuration of the mineralized zone has not been determined, owing in part to the timber and dense vegetation of the surrounding area, but particularly to the irregular distribution of the mineralization, which gives no clew as a guide in prospecting. The ore zone however, or the zone within which the discovery of oreshoots may be expected, is believed to be at least 250 ft. wide and is thought to extend in a direction about N. 75 deg. W.

Unusual Local Geology Disclosed

This deposit, unlike most of the other commercial ore deposits of Kasaan Peninsula, occurs in an area of coarse-grained intrusive rock, which has been mapped by Wright[2] under the general designation granitic intrusives. Such intrusive rocks invade the Paleozoic sedimentary rocks of Kasaan Peninsula at many localities, occurring as small and large bodies of varying petrographic character. The normal type of these rocks is a diorite, low in quartz and orthoclase, but numerous other facies have been evolved by magmatic differentiation. In the acidic differentiates, low potassium and high soda content expresses itself through the formation of sodic granite and syenite, the chief feldspar of which is albite, in place of orthoclase, the normal type in such rocks.

Much diversification is apparent among the basic types of differentiated rocks, although few of these have been described in any detail. This differentiation is well illustrated at the Salt Chuck mine, where the country rock is in general a pyroxenite, with gabbroic and gabbro-pegmatic phases. Wright referred to the country rock at the Salt Chuck mine as a gabbro, but in his petrographic description he showed clearly that the plagioclase feldspar constitutes only from 5 to 10 per cent of the rock. It seems better, therefore, to designate the intrusive rock at the mine as pyroxenite, remembering, however, the gradual transition to the true gabbroic intrusives in this vicinity.

The chief rock-forming mineral is augite, and the subordinate constituents are biotite, iron oxides, plagioclase, apatite, and titanite, though not all of these are invariably present in any one specimen. Biotite in particular is variable in distribution, and much of it occurs as large splendent crystals. The pyroxene and plagioclase are in places much altered, the alteration resulting in the development of rocks rich in epidote and in chloritic and sericitic material.

Palladium and Platinum Found

The ore minerals consist of copper sulphides, distributed in grains and small patches as oreshoots in the pyroxenite. Bornite is the chief copper mineral, but a small proportion of chalcopyrite also occurs locally. Chalcocite and covellite are both present, as alteration products of the bornite and also of the chalcopyrite. Finely disseminated chalcocite and native copper have been reported by Knopf[3] as occurring in some drifts about half-way between the upper and lower tunnels, leading from a connecting winze. Practically no gangue minerals are found with the ore. In addition to copper, gold, silver, palladium, and platinum are recovered.

The metallic content of the Salt Chuck ores was shown in a table of analyses by Campbell[4], and this table, with the addition of three determinations of concentrates, is given herewith.

METALLIC CONTENT OF SALT CHUCK ORES

(Copper in per cent; other metals in ounces to the ton)

	Copper	Gold	Silver	Platinum: Platinum	Platinum: Palladium	Group: Palladium
Glory hole	1.92	0.07	0.17	....	0.41	.
150-ft. level	1.08	0.07	0.24	....	0.18	....
Bottom of winze	1.28	0.05	0.24	....	0.17	. .
Average of ore analyses	1.427	0.063	0.217	....	0.253	. .
Gabbro	0.06	0.01	0.10	....	0.01	. .
Chalcopyrite	27.66	0.11	2.08	....	1.01	. .
Concentrates	43.81	1.17	4.60	....	3.54	. .
Concentrates (*Eng. and Min. Jour.*, Sept. 27, 1919)	36.96	1.27	6.10	0.10	. . .	2.93
Concentrates	. . .	. .	. .	0.04	. . .	2.56
Concentrates	39.41	1.20	5.18	0.04	. . .	3.38
Average of concentrates	40.06	1.213	5.293	. . .	3.147	..

Platinum Occurrence Ratio Is Estimated

From these data it is possible to estimate the percentage recovery of the precious metals in the concentrates. If the concentrates average 40.06 per cent of copper, each ton of concentrate will contain 801.2 lb. of copper. Then, as the average copper content of the ore is 1.427 per cent, each ton of ore contains 28.54 lb. of copper; and the number of tons of ore used to produce 1 ton of concentrates, on the assumption of a copper recovery of 100 per cent, would be 801.2 ÷ 28.54 = 28.07 tons. The recovery of gold, silver, and platinum metals in ounces per ton is obtained by dividing their

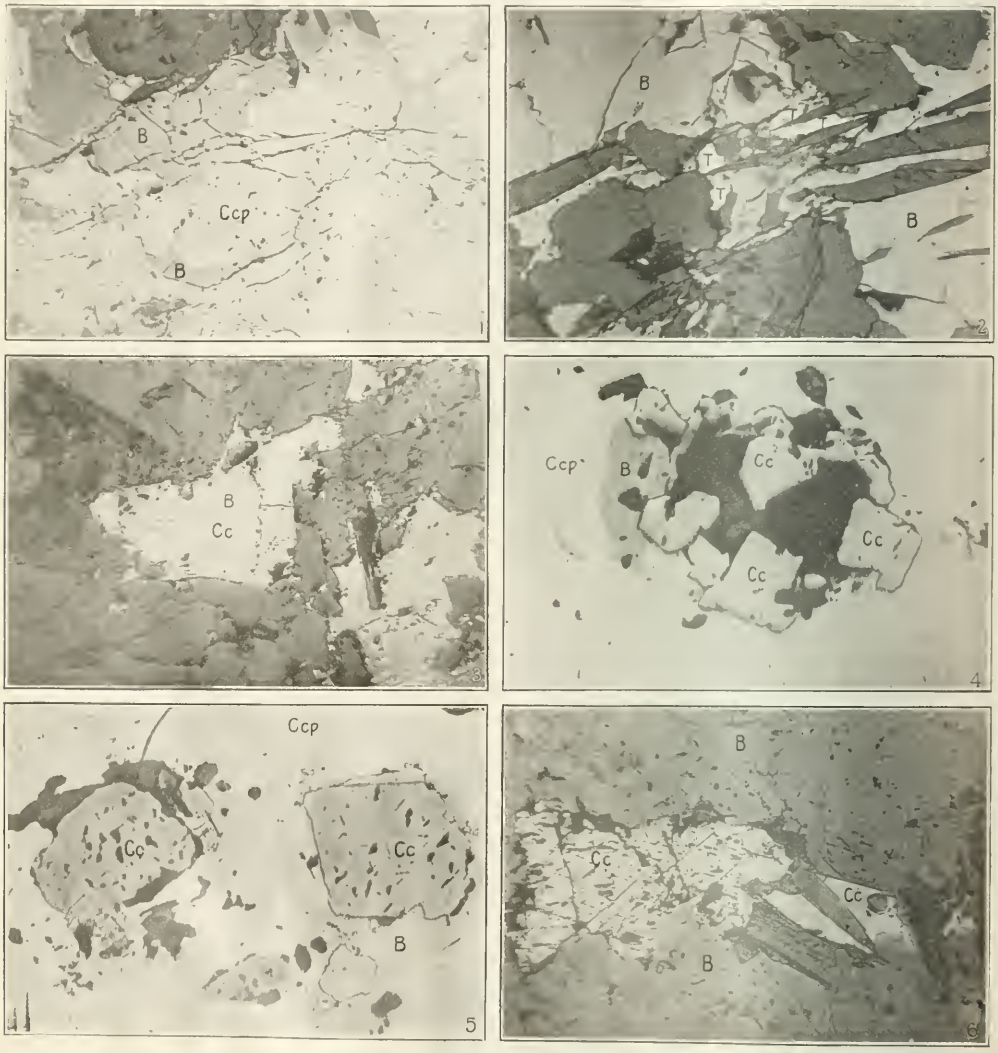
respective figures in the "average of concentrates" by 28.07; and the ratio of the resulting quantities to the corresponding quantities given in the "average of ore analyses" furnishes the percentage of recovery for the precious metals in terms of the assumed 100 per cent recovery of copper—that is, gold, 68 per cent; silver, 87 per cent, and platinum metals, 44 per cent. The exact percentages of precious metals recovered are obtained by multiplying these computed percentages by the true recovery of copper.

On reducing the copper percentage to troy ounces per ton, and comparing the result with the figures for the precious metals, it appears that the ratio of the copper to the gold, silver, and platinum metals is 6,607, 1,918, and 1,645 to 1, respectively, and that the ratio of the gold to the silver and platinum metals is roughly 1 to 3 and 4, respectively. Of course, an average of three assays affords no basis for exact deductions, but, nevertheless, these figures are useful in giving a general idea of the occurrence of these metals.

A little free gold may be seen in some of the ore, but the disparity between the recovery of gold and the recovery of platinum metals leads to the belief that a considerable part of the gold is chemically combined or



POLISHED SECTIONS OF SALT CHUCK ORES

Fig. 1—Typical intergrowth of chalcopyrite and bornite (Magnified 30 times). Fig. 2—Argentiferous tetrahedrite (?) (Magnified 125 times). Fig. 3—Bornite cut by indistinct veinlet of chalcocite (Magnified 30 times). Fig. 4—Chalcocite (with crystalline outlines) replacing chalcopyrite and bornite (Magnified 125 times). Fig. 5—Chalcocite replacing chalcopyrite and bornite (Magnified 125 times). Fig. 6—Chalcocite replacing bornite (Magnified 30 times).

mechanically held with sulphides. The high content of silver relative to gold suggests an additional source of silver besides that alloyed with gold; and the high silver recovery indicates that the silver is present as a silver or copper-silver mineral, probably a sulphide or sulpho-salt, which is highly adapted to the flotation process. Possibly it occurs in both these forms. The high content but low recovery of platinum metals, when considered in the light of the known relationship between copper and platinum metals in these ores, indicates that the larger part of the platinum metals is held mechanically by the copper minerals and liberated in the ball mill. The ratio of palladium to platinum appears to vary considerably, but is believed to average about 50 to 1.

Higher Gold-Silver-Platinum Ratio in Chalcopyrite

The analysis of the chalcopyrite is also of interest. Gold, silver, and platinum metals are found in the chalcopyrite, and although this fact does not permit inferences as to the state of existence of the precious metals, it serves partly to corroborate those already drawn. The ratio of gold to silver to platinum metals in the chalcopyrite is about 1 to 19 to 9, whereas in the average of ore analyses it is 1 to 3 to 4. The higher ratio of silver to gold in the chalcopyrite analysis is probably attributable in part to the lower content of gold in the chalcopyrite than in average ores, owing to the presence of a certain percentage of free gold in the country rock; but probably it is due more largely to the higher content of silver in the chalcopyrite as a result of the presence of intergrown silver or copper-silver sulphides.

The higher ratio of platinum metals to gold in the chalcopyrite analysis is interpreted as evidence that more of the platinum metals are associated with the copper minerals than occur free in the country rock, thus corroborating the relationship that appears to exist between the copper and platinum metals in the mine. The analyses above given show from 0.13 to 0.21 oz. of platinum metals to the ton for each 1 per cent of copper; the lower figure is more probably representative of the average.

The mode of formation of this deposit and the distribution of the ore present some puzzling features. The country rock, though mainly pyroxenite, shows gabbroic and gabbro-pegmatitic phases, and at the west end of the glory hole a basic dike 4 ft. thick cuts the pyroxenite. Considerable epidote also occurs, in part replacing the minerals of the country rock and in part as traversing veinlets. The ore is evidently later than the dike, for a bornite-chalcopyrite oreshoot cuts directly across the dike. The country rock is much fractured, but there is no particular system to the fractures, and there are no large displacements. The general trend of the zone of the fractured and faulted rock, however, is believed to be about N. 75 deg. W.

A cursory inspection would indicate that the bornite and chalcopyrite may be regarded as ores segregated from the gabbro mass. The copper minerals do not appear to follow the larger fracture planes to the extent that might be expected in an ore deposited from circulating waters. The ore occurs in shoots, which appear independent of the rock fractures, and the bornite is found as disseminated particles within these shoots, some of it in massive country rock at some distance from any apparent openings. Also, free gold was observed which had been drawn out and elongated by faulting subsequent to its deposition, showing that at least some of the fracturing movements occurred after the deposition of the ore.

On the other hand, some of the copper ore, particularly the chalcopyrite, lies along the fractures in such a manner as clearly to show that it entered the rocks and was deposited subsequent to the fracturing. Moreover, where the bornite occurs in massive unfractured pyroxenite, the rock-forming minerals of the pyroxenite are noticeably altered, chiefly to epidote with less chloritic material; and the degree of this alteration appears to be a function of the amount of ore present. Finally, the texture of the ore as seen under the microscope belies the appearance of primary character which is seen in hand specimens.

The country rock contains many minute cracks, adequate for circulating ore solutions, and the ore itself shows that it has entered the rock in this manner and replaced the rock minerals. Hence, though all the details of the ore deposition cannot be explained, it seems certain that this is at least an epigenetic deposit —that is, it was formed later than the containing country rock.

Unusual Example of Enrichment

The presence of chalcocite, covellite, and native copper points unmistakably to enrichment due to the action of meteoric waters working downward from the surface. The chalcocite and native copper observed by Knopf[6] were at a depth of about 200 ft. below the surface, and show that enrichment has occurred at least to this depth. This is rather remarkable for southeastern Alaska, for it has generally been believed that in that region the recent glaciation had removed the zone of oxidation and practically all of the secondary sulphide zone. It would be of interest to know whether this supergene enrichment is a remnant representing a preglacial secondary sulphide zone, or whether it has occurred in post-glacial time. In either case the theoretical conclusion is that the ore will be found to become leaner with depth, but it is doubtful if this feature will prove of much economic importance, as the percentage of secondary sulphides appears to be relatively small.

Polished Sections as Evidence of Genesis

A number of polished sections of the Salt Chuck ores were made and examined, primarily to discover the source of the high silver content of the ore. Other interesting features, however, were noted.

Fig. 1 shows the relationship between bornite and chalcopyrite, when these two minerals occur together. There is nothing in the photograph to indicate the formation of one of these minerals prior to the other. On the other hand, they appear to be primary hypogene intergrowths. Fig. 2 shows another occurrence of the same mineral. Fig. 3 illustrates a peculiar form of alteration from bornite to chalcocite. The chalcocite is present as a shadowy indistinct veinlet, cutting the bornite. Much chalcocite alteration of this type is seen in the ores.

Figs. 4 and 5 show other types of replacement of bornite and chalcopyrite by chalcocite. Fig. 6 also shows chalcocite replacing bornite, and it illustrates the well-known cleavage of the chalcocite.

[6]Knopf, Adolph: "Mining in Southeastern Alaska, 1910"; U. S. Geological Survey Bull. 480, p. 101, 1911.

One specimen of chalcopyrite ore from the Salt Chuck mine was observed to contain a large percentage of pyrrhotite, and some pyrite, but no photographs of this specimen were made.

Mine Development Shows Indefinite Mineralized Zone

The Salt Chuck ore deposit has been developed at the surface by a small glory hole and an open cut almost adjoining it on the east, and underground by a tunnel 300 ft. long, which at its face opens upward through a stope into the glory hole. Near the face of this tunnel a winze has been sunk 200 ft., connecting with a new lower tunnel, and the winze has been continued upward as a raise for 90 ft. A tram 2,200 ft. long has heretofore been used to transport ore from the mine to the mill. The new lower tunnel, 1,225 ft. long, has now been completed and will be used as the main oreway.

Ore is now being taken from the stope that connects the upper tunnel with the glory hole. One of the difficulties of mining operations at this property is the irregular distribution of ore stopes. Practically no data are available on which to base prospecting, for there is no vein or well-defined shear zone, and the stopes occur seemingly at random. There is a limit to the mineralized zone, which probably coincides with the limit of the faulted and fractured area of peridotite, but this is neither sufficiently definite nor sufficiently circumscribed to be of value in laying out the mine. That such a limit exists is shown in the new lower tunnel, which is 1,225 ft. long and in which no ore was seen until the tunnel had been driven 990 ft. The horizontal sequence in this tunnel from the portal inward is as follows:

SEQUENCE IN LOWER TUNNEL AT SALT CHUCK MINE

	Feet
Barren country rock	990
Zone of disseminated bornite	15
Barren country rock	15
Zone of disseminated bornite	30
Barren country rock	170
Zone of disseminated ore, chiefly chalcopyrite, subordinately bornite	5

It is not known in what manner the ore zones shown are cut by the tunnel, and the thicknesses given therefore may or may not represent true cross-sections of the shoots.

Ore Treatment Consists of Concentration by Tables and Flotation

The ore is reduced in a concentration and flotation plant on the property. Power for the mill and mine is generated partly by water and partly by means of a 75-hp. Fairbanks-Morse semi-Diesel engine. Water is taken from a 31-acre lake and delivered to the wheels in a 10-in. stream, under a head of 179 ft.; and when the supply is adequate, 220 hp. is generated by this means. The supply of water, however, is usually inadequate, and the engine has to be run much of the time. This constitutes one serious handicap to economical mining.

Ore is delivered at the mill into a 175-ton storage bin, from which it goes through two sets of jaw crushers and is reduced to about 2-in. size. This material is then dumped into a seventy-five-ton bin, whence it is fed automatically to a Worthington ball mill, with a rated capacity of sixty tons in twenty-four hours. Fine grinding is at present accomplished by this operation, but the ball mill is overtaxed, and it is planned to introduce rolls between the crushers and the ball mill, reducing the product to 1¼-in. size before delivery to the mill. This will be a great improvement. The pulp from the ball mill goes to a classifier, from which the oversize is conveyed back by a scraper belt to a trommel, and the fines flow off and are raised by a bucket-elevator belt to the flotation cells. The oversize from the trommel goes back to the ball mill, and the undersize to a Diester-Overstrom concentrating table.

The flotation plant consists of five cells, in which are used mixtures of oil of pine, pine tar, creosote, and coal tar. About 90 per cent of the ore is caught in the first two cells. From these the concentrate goes to Callow cones, where it is largely dewatered. Final drying is accomplished in filter presses, and a shipping product containing only 10 per cent of moisture is said to be produced.

Three Nickel Companies Operating in New Caledonia

The New Caledonian nickel industry is having somewhat of a boom at present, according to *Chemical Engineer and Mining Review*. Three companies are operating. The Nickel Co. is the oldest, and for that reason is better situated than the others in regard to its leases. Its smelting plant is at Thio. This company has recently taken over the electric furnaces installed by the Haut Furneaux Co. at Noumea, and will, it is stated, soon begin the production of ferro-nickel. Ballande & Son, which is the trading name of a Roman Catholic order of priests, also operate a furnace at Noumea. The most recent entrants into the field are the Japanese, who are erecting a smelting plant at Noumea to be equipped with up-to-date appliances for handling the ore at all stages. This is known as the Point Chaleix smelters. Nickel is found all over the island, and is almost invariably mined by open cut. It is hand picked so as to average the furnace charge at 5.5 per cent.

The entrance of Japanese capital is a new factor in the nickel industry. It is unlikely, however, that the Caledonian supply could ever make Japan independent of the British-owned deposits.

Results of Testing a Silver-Lead-Zinc Ore By Differential Flotation

The Simon Silver-Lead Mines Co., Mineral County, Nev., recently sent a sample of the sulphide orebodies that have been developed between the fourth and sixth levels of their mine, to the Minerals Separation North America Corporation, for testing. The ore is a complex lead-zinc sulphide, and the results secured may be of interest, even though made under laboratory conditions. The differential flotation process which was used has not been made public.

	Ag, Oz.	Per Cent			
		Pb	Zn	Fe	"Insoluble"
Feed	6.46	9.1	9.2	6.5	...
Lead conc.	39.0	67.6	9.6	2.8	2.0
Zinc conc.	8.2	3.2	46.8	9.0	2.6
Tailings	0.54	trace	1.6	5.7	...
Total recovery	93.9	97.3	71.3	...	...

The silver-lead concentrate contained 76.1 per cent of the silver in the ore treated, the zinc concentrate containing the remainder, 17.8 per cent. This is equivalent to 81 per cent of the recovered silver appearing in the lead concentrate.

Mining Engineers of Note

Bartlett L. Thane

JUST along about the time that the last century was getting out of the arena of activity, a football team was licked into shape on the Berkeley campus in California. It was a perfect machine. Every player acted and every play was "pulled off" with clock-like precision. No flock of birds ever moved more in unison than did this aggregation of clean-limbed, speedy players. Well—it "mopped up" the Stanford team with a conclusiveness and a dispatch that left the adherents of that university speechless and in consternation. The young quarterback of the winning eleven was a student in the mining department of the University of California. The same generalship which marked his management of that celebrated football game has been shown in his own affairs, for Bartlett L. Thane, while yet in college, made very definite plans for his future career as a mining engineer. When a senior student he wrote a short article on "Stoping With Machine Drills," which was subsequently published in the "Transactions" of the American Institute of Mining and Metallurgical Engineers. In the article, Mr. Thane called attention to the need for machine drills in stoping. Strange as it may appear to mining engineers now, it is a fact that at the time Thane wrote his paper only three mines in California were using stoping drills in their operations. As Thane obtained his first mining experience at the "chuck" of a "baby Ingersoll," he was in a better position than many older engineers of that day to appreciate the many advantages of light, readily portable drills in stoping work. His paper played an important part in helping the idea along.

BARTLETT L. THANE

Thane was first laborer, later miner, then shift boss, foreman, assistant superintendent, and, finally, engineer for the Sumdum and Bald Eagle mines, at Sumdum, Alaska. Evidently the individuals who controlled the destinies of the two mines decided to try him out in every imaginable position. In 1903-05, Thane was superintendent of the Wyndham Bay and Ebner gold mines. He next became superintendent of the Eagle River mine, where he stayed from 1905 to 1910. Next, he assumed charge of the Kensington gold mine, Eagle River mine, Perseverance, and then became manager for the Alaska Gastineau Mining Co., remaining in this position until 1919, when he became managing director.

For the last five years Thane has directed the affairs of the "B. L. Thane Exploration," a company organized for exploration work in connection with the development of raw-mineral products in the Pacific Coast states. He has retained certain operating positions at the same time. These have served to divide his interest between engineering and promotion. Probably one of the most successful enterprises which he succeeded in bringing to a vital position in the mining industry of the country was the Northwest Magnesite Co. Acting in the capacity of consulting engineer, Thane brought this company into the position where it became an active competitor with the Eastern refractories companies. He has proved his abilities along lines apart from engineering by his advocacy of tariff legislation for the protection of domestic magnesite, appearing before Congressional committees and holding his own as an expert witness in behalf of the domestic producers. Mr. Thane's interests have broadly covered the field of mining. Gold, silver, copper, lead, magnesite, and oil comprise the range of his work, and if an iron and steel industry ever becomes solidly established on the Pacific Slope, it will be due largely to his vision. Compared with his other enterprises, this is the biggest job he has tackled. He organized a working staff and painstakingly investigated iron-ore deposits, refractories, fuel and metallurgical methods pertaining to an iron and steel industry on the Pacific. In a clever way he drew all the lines together and welded his scheme into a reality as far as preliminary work could go. Only the business conditions incident to the war interfered with the consummation of the plan.

Like many another mining engineer, Thane has traveled extensively, having visited practically all of Alaska and the United States, Northern Mexico, England, Central Europe, and Western Canada. He is a member of the American Institute of Mining and Metallurgical Engineers, Mining and Metallurgical Society of America, and Alaska Engineering Society.

By The Way

A Douglas Memorial

The children of Dr. James Douglas have arranged for the erection in the plaza at Nacozari, in memory of their father, of a replica of Blondat's fountain at Dijon, France. The bronze figures are being cast, and after their arrival at Douglas, Ariz., a sculptor, Leslie Cauldwell, will come from Paris and fashion the fountain out of local tufa and erect it. It is planned that it shall face the main entrance of the library building.

A movement has also been launched at Bisbee by Hoval A. Smith to erect a monument in the Warren district to Dr. Douglas. Referring to this, the *Tucson Citizen* says:

> Bisbee is one of the most interesting mining cities in the country and is itself a great monument to Dr. Douglas. No shaft of granite is needed there to spread his fame among Arizonans of the present day, but it is fitting that some appropriate memorial should perpetuate his fame and what he did in establishing this great district. Nor was his work confined to the Warren district alone. Nacozari, Morenci, Tyrone, Dawson, the El Paso & Southwestern, and finally Douglas, the city which bears his name, are all his monuments.

Dr. Douglas made his one of the great names of the Southwest and it will endure long after a monument of stone has ceased to be significant. Monuments and memorials more often perpetuate the sculptor's fame than that of those to whom they are erected.

Overheard Today

1. The Amateur Geologist: "Do you know Dr. Ransmith of the United States Geological Survey? He wrote a monolith on the Divipah Mining District." The more we think this over the more hidden meanings we see in it.

2. The Amateur Optimist: "I ain't with the majority that is always tryin' to pull down what the other feller puts up: I'm with the majority that says, 'Sure, he made a poor job of it, but chances are ten to one the other feller would have done a damsite worse.'" A cheery faith in human nature will cure all evils.

A Losing Victor

Zinc operators of Baxter, Kan., are enjoying a little hard luck that recently befell Victor Rakowsky, when he wagered 10 to 1 that the Chanute Spelter Co. could not make 450 tons of concentrates in one week at its new mine on the Hartley land, just west of Baxter. He lost because the mine turned out about 475 tons for the week ended June 12. The wager is understood to have been $1,000 to $100, and the "easiness" of Rakowsky is explained by the fact that he gets a royalty out of all the earnings from the land and also has a large acreage of leases in the vicinity.

Bad News for Potato Bugs

According to the news section of the *Mining and Scientific Press* of June 19, "Alder Island, one of the smaller of the Queen Charlotte group, consists of one large deposit of metallic arsenic." Here is news that is news. Probably when another of the smaller islands is investigated it will be found to be of metallic silver, another of metallic antimony, another of metallic gold with the sovereign stamp partially developed, and another of that rare mineral punketite.

Cottrell's Philanthropy

A recent press bulletin of the Chamber of Commerce of the United States is rather unique in that it is devoted to a description of Dr. F. G. Cottrell's work in devising his precipitation process. It begins:

> The remarkable story of how Dr. Frederick Cottrell, head of the United States Bureau of Mines, took riches from the air and presented them as a gift to humanity is strikingly told by James B. Morrow in the July number of *The Nation's Business*. Mr. Morrow says that Dr. Cottrell is one of America's greatest philanthropists as well as one of its great scientists. The fine foundations of Rockefeller and Carnegie, in some respects, seem commonplace by comparison to what Dr. Cottrell has done for humanity.

"During the years that Dr. Cottrell toiled over his invention, he earned his livelihood by teaching," the bulletin says in concluding, "and when wealth was at hand he turned it away."

Unrewarded Zeal

"M'son," said Cap'n Dick, "did'st ever 'ear tell 'ow Jan Trembath come to loose h'out with Tom Tregillis' girl jus' as 'e 'ad made up 'is min' to marry 'er? Well, I'll 'ave to tell 'e, for it do show 'ow sometimes a chap may 'itten off wrong w'en 'e 'as tha bes' of h'intentions. Tom Tregillis lived h'over on east side o' town an' Jan's boardin'-house 'wuz t'other way, so h'each time 'e gaws to see Mary Jane 'e 'as to walk baout a mile an a 'alf. One evenin' w'en Jan wuz sittin' up with 'er h'it starts rainin', an', dam-me, the 'eavens h'opened jus' like these 'ere cloudbursts thee reads of. The h'ol outdoors wuz wetter than w'en we cut that vug sinkin' nummer six shaf', m'son, w'en we bloody near drowned tha mine. Tom, 'e comes in tha parlor w'ere wuz Jan an' Mary Jane, an' sez 'e to Jan, 'M'son, naw use thee gawin' 'ome along this night an' spoil tha Sunday clothes. Better for thee to put up 'ere in tha spare room.' An' 'e tells Mary Jane to fix tha room h'up a bit w'ile 'e gaws h'out to set tha rain barrel for to catch sof' water for washin'. W'en tha girl comes downstairs Jan wuz gone, but, dam-me, baout 'alf 'our in 'e comes. 'W'ere 'ast thee been?' sez 'er.' 'Been 'ome,' sez 'e. 'Wo't for did'st thee go 'ome?' 'Went 'ome to get my h'umbrella,' sez Jan, 'might be still rainin' w'en I gaws to work in tha mornin' an' I'm feared for to get my good clothes wet.' 'Oh, gos along, thee gert fool,' sez she, 'didn't thee get they all wet gawin' for tha h'umbrella?' 'Oh, dam-me,' sez Jan, 'never did'st I think o' that.' An' dost thee naw, m'son, that h'after that, 'er would 'ave nothin' to do with 'e?"

Oil and Mining Interlock

A. A. Hassan, formerly of the Great Falls Mine of Maryland, announces that he owns, controls and has under option to purchase about 100,000 acres of oil and gas leases in Texas, Louisiana, and New Mexico in about 100 counties, most of which territory he has examined personally. One-half of these holdings he will sell at reasonable prices, so as to obtain sufficient funds to start drilling on some of the remaining acreage. Mr. Hassan's offices are in Fort Worth, in the Westerbrook Hotel Building, where, according to his letterhead, there are "two entrances leading downstairs."

CONSULTATION

The Miner's Inch

"Does the miner's inch represent a definite flow of water? To one interested in measuring the flow, an answer to this question, and any other information you may give, will be appreciated. From my investigations there seems to be quite a difference of opinion as to what constitutes a miner's inch."

The miner's inch, being an orifice 1 in. square, will naturally allow varying amounts of water to pass through it, as the quantity depends upon the head. In using this hydraulic unit of measure, the head is usually arbitrarily fixed and measured to the center of the orifice. The head varies in the Western United States from 3 to 9 in., but 6½ in. is generally regarded as standard. The size of the plank through which the orifice is made may also vary from 1 to 3 in., and, furthermore, the method of cutting the hole, and its position, are subject to variation. The hole may be chamfered, flaring outwardly and placed flush with the bottom of the flume or box, or it may be raised a few inches above the bottom. All these variables greatly influence the quantity of water that is discharged by a miner's inch. From the ordinary formula, ($Q = K\sqrt{2gh}$, where Q = cu. ft. per min. discharged by the orifice, K is a constant depending upon the construction of the miner's inch, ordinarily about .2583; g = 32.2 ft. per sec., and h = head in ft.), the amount of water discharged under a head of 6.5 in. would be about 1.53 cu.ft. per min. from one miner's inch.

Various states have taken it upon themselves to establish legally the relationship between the miner's inch and the flow. Thus, California and Nevada have set 40 miner's inches as equivalent to 1 cu.ft. per sec.; in Colorado, 38.4 miner's inches = 1 cu.ft. per sec. In other Western states, such as Arizona, Idaho, Nevada, and Utah, 50 miner's inches seems to be commonly accepted as equivalent to 1 cu.ft. per sec. Frequently, when ditch companies supply the water, an arbitrary standard is set by them, to measure miner's inches.

Few Nickel Deposits

"Although I know that the United States is regrettably deficient in nickel resources, I understand that there are several localities in which nickel ore is found. Such a one is the district near Fredericktown, Mo. Can you give me the names of the other localities? Is there any duty on the imported ore?"

Though we do not claim to name in the following list every place in the United States where nickel can be found, it covers the most important discoveries and deposits: The old deposits at Gap, Pa.; the complex nickel ores at Fredericktown, Mo.; a deposit near Julian, San Diego County, Cal.; nickel-bearing veins forty-five miles from Lovelock, Nev., in the Stillwater Range; the deposits near Key West, Nev., and low-grade metal silicates near Webster, N. C. Some of these deposits are large, and only two of them, the Missouri, and Gap deposits, are known to have been exploited. There is one relatively important domestic source of nickel, however, that is frequently overlooked—the recovery as a byproduct from copper refining. About 950 tons of nickel per year are obtained from this source.

There is no duty on imported nickel ore and nickel matte, but the manufactured product, when imported in the form of nickel, nickel oxide, pigs, ingots, bars, rods, or plates or as the component part of an alloy, is subject to a tax of 10 per cent ad valorem. Sheet and strip nickel is taxed 20 per cent.

Small Arsenic Ore Market

"Will you please tell me where I can market arsenic-bearing ores and what the price is for ore containing 40 to 45 per cent arsenic? I note that you quote the price of prepared arsenic under the heading of 'Mineral Products,' but do note quote the price for ore."

So far as we know, there is no market for arsenic ores as such. So much arsenic is produced as a by-product to ordinary smelting that this is sufficient to supply the market, and, naturally, as it is a byproduct, it could always undersell any material which was prepared and offered as a primary product. Many ores of gold and silver and other metals are arsenical, and the arsenic, which is easily volatile, either goes up the chimney into the atmosphere or is precipitated from the fumes and marketed.

Possibilities of Mica Development

"We are interested in the mica market, and desire to know what the prospects are of successfully developing a property in this country that looks rather favorable to us."

Although mica is a common mineral, and is found extensively in the United States, the special grades that are required by the trade are not so plentiful. In fact, foreign mica, from India, Canada, and elsewhere, is imported and is generally able better to fill the rigid requirements demanded. If the mine is to be worked purely as a source of mica, a favorable location with regard to transportation and milling is essential. It is seldom that a mica property is worked for its available grindable product, and a good grade of sheet mica must usually be produced to make the operation profitable. But sheet mica, to be marketable, must yield rectangles that are at least one and a half by two inches and must split readily, and be reasonably free from foreign material and cracks. To yield this size of uncut sheet, the rough trimmed mine product must be much larger. The deposit should also contain mica that will furnish larger uncut sheets. In the ordinary mica prospect the mineral contains many imperfections, such as cracks, holes, and specks that render it unfit for commercial use. According to the U. S. Geological Survey, good sheet mica, a thousandth of an inch thick, can readily be bent into a cylinder one quarter of an inch in diameter without showing cracking. Before attempting to work your property you should endeavor to obtain all the information possible regarding the quality of your mica and the grade of mica that it is likely to produce. Prospective mica producers should proceed carefully about their enterprises.

THE PETROLEUM INDUSTRY

The Oil Shales of Estill County, Ky.

Laboratory Retorting Tests Disclose Lack of Coking Action, Which Is Prevalent in Western Shale Distillation—Simple Design of Retort—Absolute Heat Control Required for Treatment—Commercial Possibilities

BY C. S. CROUSE
Written for *Engineering and Mining Journal*

ALTHOUGH the Western oil shales have been widely advertised, and a great deal has been written about them in the last few years, little, if any, mention has been made of the vast deposits of shale in the State of Kentucky. The Kentucky shales are of Devonian origin, and outcrop extensively in a roughly semicircular formation, with Lexington as a center and an approximate radius of fifty miles, with smaller outcroppings in various places throughout the state. In addition, a large part of the state is underlain with the shale at varying depths and of varying thicknesses. In the western part of the eastern Kentucky coal field the shale is found at a relatively shallow depth, but, owing to the normal dip of the subsurface strata, it rapidly falls to deeper levels, with a thickness varying from twenty to two hundred and fifty feet, the oil sands of eastern Kentucky being found beneath the shale, which often contains gas.

Relatively little investigation has been done on the Kentucky shales. However, during the last year or more I have had the opportunity to do considerable research work on the shales coming from Estill County, in the eastern part of Kentucky.

The outcrop or weathered shale of Estill County is of brownish-black color on a fresh fracture, is often streaked with brown iron stains, and contains lesser content of oil than the unweathered shale. The latter has a velvety black appearance when freshly fractured, and, although both the weathered and the unweathered shale disclose bedding planes, the fracture does not necessarily follow these lines. The texture is fine grained, and the shale breaks easily, exhibiting no tendency to gum, as do many of the Western shales. A thin splinter ignites readily and burns with a yellow, smoky flame, and larger pieces held in the flame will crackle, emitting gas which will burn at various places over the surface. A true story is told of the man that built himself a new house, using the black shale as the building material for the chimney of his fireplace, with the result that on the kindling of the first fire the house burned down.

FAVORABLE SITUATION OF ESTILL SHALES

Large deposits of shale occur in this region along the Kentucky River, with little or no overburden, which offers a particularly advantageous condition for steam-shovel work, with plenty of water available for condensing and other refinery purpose. The nearness of the deposits to Lexington, Cincinnati, and Louisville, in connection with the necessarily good railroad service, because of the oil and coal developments of this region, makes the conditions most favorable with regard to transportation.

All of the samples which I have tested have come from various parts of Estill County, and include both weathered and unweathered material. Although none of the deposits has been thoroughly sampled, the unweathered shales from different parts of the county show a remarkable uniformity in oil content.

APPARATUS USED IN THE TESTS

The apparatus used in the tests consists of an ordinary cast-iron retort which holds about a pound of shale and is connected by means of a gooseneck to a five-foot, home-made, iron-pipe condenser. This discharges into a graduate and consists of a $\frac{3}{8}$-in. iron pipe running through a $2\frac{1}{2}$-in. iron pipe, the latter having two short lengths of $\frac{3}{8}$-in. pipe screwed into it, one at each end, for the ingress and egress of the condensing water. The inlet and outlet pipes are connected to the water tap and sink, respectively, by pieces of rubber tubing, the whole apparatus being supported by means of clamps from an ordinary ring stand. It will be noted that the retorting apparatus is of the simplest form, with no provision made for mechanical agitation of the shale or for the use of superheated steam, nothing being recovered but the crude oil.

METHOD OF TESTING SAMPLES

The sample is first crushed by means of a small jaw breaker or in a mortar with a pestle to a little smaller than walnut size. The selection of this size is the result of experiments on crushing and retorting material of 100-mesh and over and of various mixings of coarse and fine shale. Although no great difference in the amount of oil yield from the various sizes was noted, there was a considerable difference in the distillation or retorting time, both the very fine material and the very coarse material taking longer for total distillation than the size specified. The reason for this, in the fine material, is because it packs in the retort and, the heat being applied from the outside to the interior, a semi-insulating stratum of spent shale is soon formed, which retards distillation. In the treatment of the coarse material the reason is the same, in that the heat must travel from the outside of the lump to the center before all the oil gas can be expelled. In a retort in which the shale is subjected to agitation this difficulty will not be met

to such an extent, although very large pieces would be objectionable even then.

After the sample has been crushed and mixed, seventeen ounces are weighed out and placed in the retort. Seventeen ounces are taken merely for convenience, as, with this amount of shale, every two cubic centimetres of oil recovered represents one gallon of crude oil per short ton of shale. The cover, which is machined to fit tightly, and which, in addition, rests on an asbestos paper gasket, is then put on and forced tightly into place by means of a wrought-iron clamp and screw, care being taken to tap the cover down with a hammer several times after tightening, and then to tighten again and repeat. This is necessary because unless the retort is absolutely tight gas is bound to leak out and vitiate the results.

The retort is lifted into a ring which is supported on a stand and connected to the condenser by means of a union with an asbestos paper gasket between the end of the gooseneck and the end of the condenser tube. A large tin can with the necessary openings cut in it is then placed over the retort, so as completely to cover it, and thus conserve heat and make the temperature at both the top and bottom of the retort as nearly uniform as possible. A heavy piece of asbestos is also placed under the gooseneck where it joins the condenser, to prevent overheating and cracking of the gas. The water is then turned on in the condenser, a graduate is placed beneath its open end, a large bunsen burner is put in position beneath the retort and lighted, and the process begins.

Loss of Oil Caused by Too Rapid Distillation

At the end of fifteen or twenty minutes, if the retort is cold, or sooner if it is hot, water begins to drop into the graduate. The heat at this time should be applied slowly, to avoid any danger of cracking the first gases that come off or of driving them off too rapidly. A certain amount of non-condensable gas is evolved at all times during the distillation, but at no time should visible gas be driven off, as this indicates too rapid distillation for the condensing system, and a consequent loss of oil.

After about six cubic centimeteres of light-colored liquid (water) has collected, the oil begins to make its appearance. It is of a greenish black color, and lies on top of the water, a clear line of demarkation being visible at all times. For about three-quarters of an hour this will be condensed rapidly, and at times will drop fast enough to approximate a stream if the heat is carefully regulated. At the end of this time, or soon afterward, the evolution of oil, and with it the evolution of non-condensable gas, begins to slacken, until, between an hour and an hour and a half after the first appearance of oil, the distillation is complete.

During all of this time some water has been coming over with the oil, due to the fact that as the heat travels into the retort the oil gases are being driven off from the outside shale and at the same time the water is being driven from that nearer the center. The water generally amounts to about one-fourth of the total liquid obtained, and a separation can easily be made in a separatory funnel.

Toward the end of the distillation, or after the largest evolution of oil has taken place, the temperature may be increased somewhat, but a careful watch should be kept to see that no visible gas makes its appearance, and at no time should the retort itself show red. After the gas has been turned off, the retort is torn down, the spent shale dumped out, and the apparatus is ready for another run. The second, as well as the following runs of a series will be completed in a shorter time than was required for the primary operation, owing to the fact that the retort is hot and also more nearly representative of the shale, for the reason that after the condenser has drained over night or longer, it takes up some oil before it will flow. The amount of oil obtained from the first run will be low, whereas that from the last will be high if the condenser is allowed to drain after the last run, although an average of the two will be normal.

Results Obtained From Distillation

The results of several runs on unweathered Estill County shale show an average oil yield, excluding water, of about twenty-one gallons to the ton, or a half a barrel per ton of shale. Some of the shale runs a gallon or two higher and some a little lower, but at no time is there a great variation from the average. On the other hand, the weathered shale contains from three to five gallons less oil per ton.

I have said that a large volume of non-condensable gas is evolved during the entire distillation, the amount varying directly with the quantity of oil. No facilities were at hand to determine the amount of this gas, but it was conveyed by means of a two-branched glass tube to a bunsen burner, where it burned with a good flame and a strong smell of sulphur dioxide.

There are varying amounts of pyrite in the shale, and the decomposition of this is undoubtedly the source of the sulphur. A report from one of the commercial laboratories on the gas procured from shale similar to that under discussion indicates that one ton of shale contains sufficient non-condensable gas to give a fuel value of about three and a quarter million B.t.u.

The amount of nitrogen contained was not determined directly from the gas and water obtained in distillation, although both smelled strongly of ammonia. However, considering the nitrogen found on analysis, figuring 60 per cent of it as recoverable, and transposing this into ammonium sulphate, gives a result of about forty pounds of this product per ton of shale.

A number of samples of the spent shale were treated in both the hot and cold state with water, some with hot and some with cold, and this water was then tested qualitatively for potash. All the filtrates showed some water-soluble potash, the finer-crushed shale which was treated with hot water showing the most. No quantitative tests on potash were made, but an outside test has shown nearly four pounds of potash per ton of shale, which can be recovered by merely treating with water.

Fractionation of Oil

The total product from three runs, or from three pounds of shale, was taken for fractionation. The light-colored, heavy liquid was not drawn off prior to fractionation, as it was desired to determine whether or not this was all water. The liquid, amounting to a total of 163c.c. with 45.5c.c. light colored and 117.5c.c. dark, was placed in an ordinary glass distillation flask and connected to a twenty-inch glass condenser, the heat being applied directly through a wire gauze by means of a bunsen burner.

The liquid began to boil at 60 deg. C., the first cut being taken at 150 deg. and the second at 300 deg. C. The first cut gave a total of 74.5c.c. of liquid, of which 45.5c.c., or the exact amount of the light-colored liquid in the orignal sample, was water. Of the remainder, 19c.c. came off below 100 deg. C. and can be called naphtha, and 10c.c. between 100 and 150 deg. C., which can be called gasoline. The second cut gave 59.5c.c. of liquid, which contained the kerosene and light lubricating oils. The residue was a black viscous mass containing some lubricants and tarry materials, but it did not coke. No attempt was made further to analyze this tar. The oil has a paraffine base, and considerable amounts of a white wax-like substance came over at about 98 deg. C.

Not including the water, the total oil from three pounds of shale is 17.5c.c., which is equivalent to 20.7 gal. of crude oil per ton of shale. Of this total, 29c.c., or 24.7 per cent, is naphtha and gasoline, and 59.5c.c., or 50.6 per cent, is kerosene and light lubricating oils. Reducing this data to gallons per ton of shale, it is equivalent to 20.7 gal. of crude oil per ton of shale, of which 5.11 gal. is naphtha and gasoline and 10.48 gal. is kerosene and light lubricating oils, leaving 5.11 gal. as a residue consisting of some lubricants, and tars. Converting these figures to gallons per barrel, two tons of shale producing a barrel of crude, there results 10.38 gal. of naphtha and gasoline per barrel of crude oil and 21.25 gal. of kerosene and light lubricating oils, or a total recovery of 31.63 gal. of naphtha, gasoline, kerosene, and light lubricants from one 42-gal. barrel of crude shale oil, which is the product of two short tons of shale.

Spent Shale Shows No Coking

Up to this time no commercial application has been found for the spent shale, although a limited use as a black-paint base may be developed. However, indications point to the fact that the shale from shale plants will create the same sort of problem as that presented by the slag from metallurgical plants. In this connection it is important to note, in contradistinction to a great deal of the Western shale, that at no time did the spent shale coke nor were any signs of coking shown. A test run was made on 100-mesh shale and finer, with the heat carried high enough to show bright redness in the retort, and absolutely no coking was noted.

Suggestions as to the Proper Commercial Retort

As the oil obtained from shale does not occur in it as such—that is, it cannot be removed by any wet or solution method so far as known, but, rather, must be recovered in the form of the so-called "kerogen"—a destructive distillation process must be used in its recovery. This, in turn, necessitates a retort and very close temperature control, lest the oil gases formed shall be cracked into non-condensable gas or a complete distillation be not obtained.

The shale technicians in this country have practically no precedent, for, even though the industry has been extant in Scotland for sixty-odd years, the Scotch retort is held by most of those who have studied the subject not to be applicable to best advantage to American conditions. As a result, there are nearly as many retorts as there are men interested in the technical branch of the shale industry in America, and practically all have been designed with the Western shales in mind. However applicable these retorts may be to the Western shales—and I shall not, at this time, discuss the relative merits of the many retorts now on the market—I think that none of them precisely meets the requirements of the Kentucky shales.

These shales offer a splendid opportunity for a mechanically simple retort, and the fact that a retort should be as simple as possible cannot be too strongly emphasized, as it must run continuously, with a comparatively short distillation time, which will result in, as I have heard it put, "a stream of shale going in at one end and a stream of oil coming out of the other," for twenty-four hours in the day and for practically three hundred and sixty-five days in the year. Such a retort is indicated by the facts that the shale will not coke and that the gas is evolved easily, and, being so indicated, it is bound to be only a matter of a short time before it is designed.

Absolute heat control is necessary, beginning with a relatively low temperature at the feed end and gradually increasing this to the discharge end, so that all of the gas may be finally evolved without undue evolution at any one point in the retort or cracking of the gases first formed. To prevent this, the gas should be withdrawn as formed or as soon as possible. Provision must be made for the use of superheated steam, as this will not only increase the ammonia yield, and probably also the oil yield, but will greatly increase the non-condensable gas yield due to the formation of water gas through the action of the steam on the fixed carbon of the shale.

Commercial Possibilities of Estill Shales

The questions, then, are, "How can the data obtained be translated into commercial terms?" and "Can the Kentucky shales be worked at a profit?" I will try to show how the former may be done, and I think that the answer to the second question is "Yes," provided certain conditions, which I shall enumerate, are fulfilled.

First, as to how the data obtained in the laboratory will work out in practice. I feel positive that commercial recovery will show an increase of at least from four to five gallons to the ton over that shown by the laboratory method outlined. The reasons for this statement are as follows: A certain quantity of oil, probably mostly naphthas and gasolines, and amounting to several gallons per ton, is practically certain to be carried mechanically by the non-condensable gas. This was lost in the laboratory experiments, but can be saved in a commercial plant by scrubbing the gas. The use of superheated steam is almost sure to show an increase in the oil yield, and employing a continuous retort, which is always hot and in which the individual pieces of shale are in a state of agitation, will certainly cut down the distillation time and probably increase the ultimate oil yield.

As to gas, there will undoubtedly be a great abundance of non-condensable gas with which to run the entire plant, including mining and refining, and, especially with the use of superheated steam, a probable excess which may be sold for domestic purposes if the plant is situated favorably in that respect. The nitrogen and the potash have been mentioned, but this leaves a wide range of investigation yet to be pursued in the byproducts that may develop from the tarry residue left after the lighter oils have been removed.

As to commercial possibilities. Figuring conservatively on the basis of the known laboratory results,

which will undoubtedly be increased in practice, one ton of shale, which should be mined (steam-shovel methods being used), retorted, and the oil refined at the cost of a dollar to a dollar and a half a ton, will yield half a barrel of crude oil, which will refine to a little more than five gallons of gasoline and about ten and a half gallons of kerosene and light lubricants, about two and three-tenths gallons of which will be lubricating oils. Balancing the value of these products against the cost per ton, a favorable result can be obtained in figuring on oil values alone, which, I think, are the only ones that should be considered in a preliminary estimate. This is, of course, leaving out of the calculation entirely ammonium sulphate, potash, probable excess gas, and tar products.

Conditions for Low Costs Favorable

Of course no definite cost per ton can be given without a close study of the particular conditions involved, as they vary widely, but I have based my tentative figure of a dollar to a dollar and a half on these facts: The known character of the shale; the extremely favorable conditions under which Estill County shale is found as regards mining, water and transportation; no charge will have to be made for fuel, either for heating the retorts or for power, as sufficient non-condensable gas is practically sure to be evolved for all such purposes; such a plant would not require a large amount of expensive labor, and amortization would be spread over a number of years, as the shale supply is enormous.

However, in my opinion, three conditions are absolutely essential to the success of a commercial oil-shale plant in Kentucky, or elsewhere, for that matter; and these are: Sufficient capital to start with, so that operations may be conducted in a large way—say from two and a half million dollars up, depending on the size of the plant desired and the conditions, the minimum plant being one of five thousand tons per day; the proper retort, and the proper management.

With the above-named conditions fulfilled, I believe that the oil-shale industry will develop into a straight mining and manufacturing proposition, with the returns coming in regularly and for many years in the future. Of course, there will be many disappointments and apparent failures, as there always are in any new venture, but I feel positive that in the hands of men of capital, breadth of vision, and faith in shale, the oil-shale industry of Kentucky will eventually develop into one of the largest sources of wealth in the state and be of inestimable value to the nation.

News From the Oil Fields

Article 27 Claimed To Be Unconstitutional

Oil Interests Seek Final and Permanent Settlement of Questions Involved in Mexican Petroleum Laws

In presenting requests for the cancellation of all petroleum decrees promulgated by the late President Carranza, and the right of unrestricted exploration and exploitation of oil lands, foreign oil interests claimed that Article 27 of the Mexican constitution, nationalizing petroleum lands, was unconstitutional. General Jacinto B. Trevino, Secretary of Industry, Commerce and Labor, to whom the request was addressed, stated, according to *El Universal*, that he had no authority to discuss the constitutionality of the decrees. He asserted that both legislative and judicial authorities had taken part in their issuance, the first having granted the President authority to make the decrees in question and the second having refused on numerous occasions to entertain appeals from the provisions of the presidential orders with respect to the petroleum fields.

Upon the conclusion of the conference, the oil men are said to have declared they would consult again with their principals for the purpose of arriving at conclusions which would permit a final and permanent settlement of questions involved in petroleum legislation.

The reported presentation of these demands came as somewhat of a surprise, as provisional president de la Huerta, during his first conference with foreign newspaper men, said the petroleum interests were satisfied with the new government's program and had shown their satisfaction by beginning important work and anticipating certain payments that were required under the regulations.

Oil Swindlers Indicted

Charging misuse of the mails for purposes of defrauding investors, the Federal Grand Jury of New York City indicted four oil companies, ten brokerage concerns and more than fifty individuals on June 24. The four oil companies are the Ranger Oil Co., the W. P. Williams Oil Co., the Great Western Petroleum Corporation, and the Crown Oil Co. The brokerage firms indicted are Curtis, Packer & Co., United Securities Company, H. Kent Holmes & Co., H. Morgan Pollok & Co., Thompson, James & Co., Stickney, Rawlinson & Colclough, Crossman, Sherman & Co., George A. Lamb & Co., E. M. Fuller & Co. and Greenbaum, Bigelow & Greenbaum. Nearly all officers of the oil companies and brokerage concerns and the companies' stock salesmen also were indicted.

This action is stated by Jerome Simmons, Assistant U. S. Attorney General, to be only the beginning of extensive prosecutions against sellers of worthless stocks in oil and other industrial promotions.

Encouraging the Gasoline Supply

From Our Washington Correspondent

That the problem of obtaining greater supplies of gasoline will be solved primarily by the extraction of supplies from mineral matter, and that alcohols and other substitutes derived from vegetable matter can be but a minor factor in the situation for an indeterminate period, is the opinion of Van. H. Manning, expressed as he was leaving the directorship of the Bureau of Mines. At that time the matter of substitutes for gasoline was being agitated in Congress and resulted in the preparation of the following statement, recently available, which in brief is as follows: High prices and threatened shortage have been caused by an increase in the uses of gasoline. As a solution, every encouragement should be given to the acquiring of supplies abroad, and the Government should do its utmost to provide technical and scientific guidance for the domestic industry. Serious consideration should be given to encourage the development of gasoline and gasoline substitutes; (1) by increasing the recovery of oil from our oil fields, (2) by developing processes for making synthetic gasoline out of heavy oils, (3) by encouraging the development of processes for making gasoline and gasoline substitutes out of oil shales, coals, lignites, peats, and (4) by developing processes for making alcohols and ethers from waste vegetable matter.

Deep Drilling To Be Done in Pecos County, Tex.

Oil Discovered While Prospecting for Sulphur—New Productions in McCulloch and Harris Counties

From Our Special Correspondent

A lease on 6,400 acres northeast of Fort Stockton, Pecos County, Tex., has been granted by Judge W. W. Turney, of El Paso, to J. G. Grant, of Pittsburgh. Deep drilling will be done. A small quantity of oil was discovered at shallow depth in this locality several years ago when the Arizona Mining Co. drilled for sulphur.

A well completed recently, and of interest on account of its location, is the No. 4 White of A. W. Cooper et al, near Mercury, McCulloch County. It will pump about 20 bbl. from 381 ft. No. 3 well in the same district is also pumping about the same. A shallow field of some extent may be opened here.

No large producers were completed in the coastal fields during the third week in June, but several producing wells making from 100 to 300 bbl. were brought in. The No. 2 Luscher well of the Gulf and West Production companies at Blue Ridge, Harris County has been completed. This well made an initial production of 250 bbl. from 2,640 ft. It now appears as though Blue Ridge will finally prove to be an oil field. Several other companies are actively developing there. The Gulf Production Co. brought in a well at West Columbia, flowing 100 bbl. daily. This well is 1,200 ft. northeast of any producing well, and adds somewhat to the area of the field. Production from West Columbia decreased to 15,000 bbl. daily during the third week in June.

In the Kemp-Munger-Allen field, Wichita County, the wells that came in making a large flow have settled rapidly to what is considered a normal flow, and the production from the district has decreased in consequence. Several wells producing from 100 to 400 bbl. each daily have been completed recently, however, and it is believed that the production from this field will gradually increase again. The completion of the Borg, Ard & Maer wells in Block 41 may mean an extension of the field nearly two miles south.

Development of new territory north of Breckenridge, Stephens County, continues. Good wells have been completed recently by the Sapulpa Oil & Refining Co. and the Gulf Production Co. The Texas Co., Prairie Oil & Gas Co. and the Mid Kansas Oil & Gas Co. also have producing wells in this section. One of the largest wells near Breckenridge completed recently is the Ward well of the Plateau Oil Co., making 4,000 bbl. daily.

The Casmalia field, in Santa Barbara County, Cal., has developed into an important oil producer and the yield is now 150,000 bbl. per month, according to the Department of Oil and Gas of the California State Mining Bureau.

Kentucky Oil Districts

From Our Special Correspondent

Pipe line runs reported by the Indian Refining Co. for the month of April show 181,771 barrels from Allen, Lee, Powell, and Estill counties. This is an increase of 40,000 bbl. over the highest mark for 1919, and 29,000 bbl. more than in March of this year, the highest up to that time. Of the total in April, 82,202 came from Allen County alone. The pipe line is to be extended soon into Warren County.

A $50,000,000 syndicate is being formed to purchase the Atlantic Refining Co., and two Kentucky oil companies, the Log Cabin and the Flesher. R. M. Catts is said to have offered $200,000 for the Log Cabin and $500,000 for the Flesher, but neither has been accepted or even favorably considered. The new syndicate has already acquired the Old Dominion for $6,000,000, the Pyramid for $1,700,000, and has offered $800,000, for the Rex, but stockholders of the latter are holding up negotiations.

In Warren County, a 75-bbl. well was brought in on the Joe Perkins lease. The Harris well, seven miles west of Bowling Green, has developed into a big producer, but has not been rated yet. The well on the J. E. Burch lease in the McGinnis pool was shot and is good for 100 bbl. a day. The Balmer well, on the Tarrant lease, is now reported making 600 bbl. a day and is only 450 ft. deep.

Oil Drilling Near Bowie, Ariz.

From Our Special Correspondent

The United States Oil & Refining Co. is drilling fifteen miles north of Bowie, Ariz. A new standard rig has been installed and operations will be continued to a depth of 5,000 ft. unless oil is struck before. The lease includes four sections of state land and four sections of located land, a total of 4,800 acres. At present the drill is between 1,050 and 1,100 ft., in stiff clay and shale. The tools and bailer show oil, and the slush pit is covered.

No capping material has apparently been cut and the formation still seems to be unconsolidated. Lack of water has been annoying, but arrangements have been made to pipe slush water from a well near by, although boiler water will still have to be hauled in. L. R. Caulfield is geologist. The principal stockholders are Lem Shattuck, C. Brewster, Frankenberg Brothers, and Dr. Bledsoe and son, all of Douglas and Bisbee, Ariz.

Natural gas has been struck near Ramsayville, Russell Co., Ont., seven miles from Ottawa, on the farm of D. J. Wallace, who was sinking a well for water. At a depth of 120 ft. a pocket or vein of gas was encountered. The gas was lighted and a flame shot up six feet. After some unsuccessful attempts, a cap was placed on the pipe. The discovery has caused some excitement in the district.

California Oil Notes

Our Special Correspondent

In the Midway field four wells were begun near Taft, two by the Chanslor-Canfield Midway Oil Co., on Sec. 8—33-23, and two by the Fuel and Oil Department of the Southern Pacific, one on Sec. 27—31-23 and the other on Sec. 17—32-24. The Tennehil Oil Co. has spudded in its No. 10 well in the Sunset field, on Sec. 33—12-24, and the Associated Oil Co. has started its No. 57 well on Sec. 5—29-28. The Mohawk Oil Co. is drilling its No. 12 well in the Coalinga field for the second time. Five other companies are deepening or redrilling wells in this field.

Conference Urges Gas Conservation

From Our Washington Correspondent

As a result of the agitation in West Virginia and other states to have natural gas held exclusively for the use of residents of the state in which it is produced, a conference was held in Pittsburgh on July 2 between the Public Utilities Commissioners of Ohio, Pennsylvania, and West Virginia to discuss the steps Ohio and Pennsylvania are willing to take to conserve natural gas supplies. The commissioners present at the conference were John S. Rilling, of Pennsylvania; E. D. Lewis, of West Virginia, and Byron N. Glendenning, of Ohio. Representatives of the New York, Indiana, and Maryland Public Utilities Commissions were present, as well as of the Bureau of Mines.

Secretary Payne of the Interior Department has revoked the regulation limiting to 4,800 acres the acreage which any one oil operator is permitted to acquire in the Five Civilized Tribes in Oklahoma. When this question was first taken up it was decided that the acreage which any one person, firm or corporation would be permitted to lease would be limited to prevent a monopoly of the oil and gas deposits. The rule has been enforced for several years, with the result that a large number of persons and firms are interested as lessees in oil lands belonging to Indians in eastern Oklahoma so that many of the Indians have had the restrictions removed from their land, and at present only about 15 per cent of the land allotted to members of the Five Civilized Tribes remains under the jurisdiction of the Interior Department.

General Salvador Alvarado, Minister of Finance of Mexico, has formally requested the Mexican Congress to annul the settlement with the Tehuantepeo Ry. (formerly operated by S. Pearson & Son, Ltd., of London, England.) General Alvarado declares that the government lost more than 9,000,000 pesos by the transaction.

Seventy thousand barrels of crude oil were exported from Mexican Gulf ports during the month of May, according to an official announcement made recently.

ECHOES FROM THE FRATERNITY

SOCIETIES, ADDRESSES, AND REPORTS

Winning of Alluvial Diamonds Described by W. L. Honnold

Ground From Shallow Deposits Usually Dry-Screened in Field—Wet Treatment for Cemented Alluvium

W. L. Honnold, speaking on May 29, last, at Johannesburg, before the meeting of the Anglo-American Corporation of South Africa, gave an interesting account of the present methods of winning diamonds from the extensive alluvial deposits of Southwest Africa. The following is taken from the London *Financial Times* on June 2:

"It is usually the procedure in the case of shallow deposits to dry-screen in the field through hand-revolved trammels, thus eliminating the material above and below the range of normal size diamonds, then transport the remainder to a wet-treatment plant, where it is jigged and the concentrates are hand-picked for diamonds. Secondary picking follows in combination with magnetic separation of associated minerals. This treatment is not necessarily complete; the coarse material eliminated in the fields may include cemented gravel-carrying diamonds, and fine material hitherto discarded no doubt carries diamonds of size now profitable.

"The first clearing of ground is bound to leave diamonds in the superficial crevices of the rock below. These are released by further weathering, which is facilitated by incidental shifting of ground into heaps. The secondary working is often justified, as in certain places the ground is worked over as many as five times. Where cementation occurs, which is often, the material discarded in the first treatment may give profitable results when crushed and treated by the wet method.

"On the Bergbau properties, particularly in the deepest deposits, cementation is so prevalent as to call for wet treatment on a large scale. This involves transportation to plant of all of the material, which is there passed through successive stages of screening, crushing, jigging and hand-sorting, the concentrates being dried for magnetic treatment and final sorting. There is a plant of this type in the Northern Block of Bergbau, which is still in course of completion, but is already treating about 12,500 cu.yd. monthly, say one-third of its ultimate capacity, recovery now being at the rate of about 7,500 carats monthly.

"A plant on modified lines is under consideration for the South Block, but will not be undertaken until conditions are more favorable for construction. Sea water is used where required. Treatment and electric power are provided by a central generating plant located at Luderichtbucht. On the South Block of Bergbau over ninety miles of trenching and 800 ft. of test pitting have been done, with the object of proving by sampling the deposit of about 1,500,000 cu.yd. of diamond-bearing gravel, which is estimated to contain between four and five million carats of diamonds. On a portion of this block the payable ground is shown to a depth of 35 ft., although other portions are much shallower. The deposit is to a large extent suited to mechanical excavation, together with sluicing away of sand where practicable. It is in connection with this ground that new plant is planned."

Mining and Metallurgical Society Declares for American Rights

The *Engineering and Mining Journal* published in the issue of May 1 the text of a resolution ballotted on by the Mining and Metallurgical Society of America. This resolution was almost identical with the Curtis bill, then before Congress, demanding reciprocity and retaliation in mining laws, and barring foreign citizens and companies from such privileges in the United States as our own citizens are deprived of in countries discriminating against American nationals.

The canvas of the ballots by the society showed that of the 150 replies received, 123 favored the passage of such a bill, 4 opposed it, and 4 were undecided. The reasons given in opposition, as published on p. 133 of the Society's bulletin for April-May, 1920, indicate objections to the phraseology rather than the object of the bill; but one reply states "it is inadvisable to copy the bad laws of other countries."

Washington State Metal Mining Association Reorganizes

With the object of bringing about a closer relation among all the mining men of Washington by promoting harmony among them, of encouraging prospecting and development, and of correcting such abuses as may crop up in the mining industry of their state, the Washington State Metal Mining Association has recently met and reorganized. The association now plans an active campaign to establish county locals through the vice-presidents, one of whom represents each county of the state. Later the association will establish co-operation with the American Mining Congress by forming a new or reorganizing the present non-operative state chapter. The meeting elected L. K. Armstrong, president; E. H. Knight, first vice-president; and M. E. Poole, secretary-treasurer. The headquarters are in the Peyton Building, Spokane, Wash.

Fatal Blasting Accident Due to Careless Tamping

Need of Proper Tools Emphasized—Penalty for Disregarding Well-Known Safety Rules Severe

In the "Reports of Investigations" for May, 1920, issued by the U. S. Bureau of Mines, Oliver Bowles and J. E. Crawshaw report on an accident of unusual character.

On April 19, 1920, a fatal explosion occurred in a limestone quarry in Pennsylvania, causing the death of six men and injury to three others, under somewhat unusual conditions. The shot that was being prepared consisted of six 5⅝-in. churn-drill holes in a single row. The line of holes crossed a depression that had at one time been used for the bed of an inclined track. Thus, holes Nos. 1 and 2 were on a bench about twenty feet higher than the other four holes. The approximate depth of holes Nos. 1 and 2 was 73 ft., and of Nos. 3, 4, 5, and 6, 55 ft. On account of previous blasting operations, the rock was in a shattered condition, and hole No. 1 was found to be blocked with rock fragments, so that it could not be loaded. It seemed desirable, therefore, to load hole No. 2 with a heavy charge, to compensate for the absence of a charge in hole No. 1. As the blast under consideration was small, a blasting expert was not employed, though it is customary to employ an expert for all large shots.

A line of cordeau detonating fuse was placed in hole No. 2, no electric detonators being used in the hole. After twelve or thirteen cases of 40 per cent nitro starch powder had been poured into the hole in loose form, it was found that a space of only 17 ft. remained for stemming. It was then decided that space for an additional case of powder might be obtained by tamping the charge. The tamping was done with a plunger weighing 30 or 40 lb., about 3 in. in diameter and 10 in. long, made of lead with an iron core with an iron eye in the top, to which a ⅜-in. rope was attached. This weight was intended for use in sinking explosive in wet holes, and not for tamping. It is estimated that the tamping had continued at least ten minutes. The quarry superintendent had gone a considerable distance for a box of powder, returned, and reached a point about 10 ft. from the hole, when the charge exploded, instantly killing the man who was tamping and injuring the superintendent and the shovel runner, who was also near by. The rock hurled down killed five and injured another of a group of men bailing out the holes on the lower edge.

Important conclusions may be drawn from the accident to which careful con-

sideration should be given by every quarryman.

1. The explosion seems to have been caused by hard tamping with a heavy plunger. With a smooth and regular drill hole such tamping might be conducted without accident, but not in an uneven hole having jagged rock projections.

2. It is evident that for all purposes a wooden tamping bar should be used. This has been urged repeatedly by the Bureau of Mines. Even with a wooden tamping bar the tamping should not be continued beyond the minimum time necessary.

3. If it is found necessary to use a lead plunger to sink powder in wet holes, the plunger should be provided with a copper rather than an iron eye. Hammering an explosive with a heavy weight is dangerous practice.

4. A circumstance of extreme importance, in that it resulted in undue loss of life, was the employment of men on a lower ledge adjacent to a face back of which explosive was being placed. The holes of the lower bench should have been loaded first and all workmen removed from the lower bench before loading hole No. 2. Under such circumstances the premature explosion would have resulted in one fatality and two injuries rather than six fatalities and three injuries. Workmen should not be at the base of a quarry face after loading begins.

5. Every quarryman will observe that the conditions surrounding this shot were unusual. Quarry operators should give more careful supervision to blasts of unusual character than to regular blasts where all operations are standardized.

6. The Bureau of Mines has pointed out that the employment of thoroughly competent blasting experts is to be recommended. Such experts are employed for large shots in the quarry under consideration, but it seems advisable to extend this practice to include all primary blasts.

7. Quarrymen should familiarize themselves with the various safety rules promulgated by the Bureau of Mines and should endeavor on every occasion to put them into practice. Such rules may be obtained upon application to the Director of the Bureau of Mines, Washington, D. C.

Federal Reserve Board Comments on Mining Situation

In reviewing the general business situation for May, the Federal Reserve Board commented on the metal mining situation as follows:

"Metal mining has shown a slight improvement in Colorado, despite some shortage in labor, while lead and zinc have shown a price reaction on the Joplin market, although much of the output is still in cars and on the sidings. The average price for lead ores is one of the highest for many months, but the supply of ore is insufficient to meet demand. Production, however, is fairly well maintained."

American Engineering Council Indorses New F. A. E. S.

Engineering Council has in many ways aided and furthered the creation of a comprehensive representative body of engineers, and extended great assistance to the Organizing Conference held in Washington recently. The Council has now capped its past performances, writes its secretary, A. D. Flinn, with the following actions taken at its regular meeting on June 17, after hearing a report on that conference:

"Voted, that Engineering Council heartily indorses the plan of organization of the Federated American Engineering Societies and the American Engineering Council, adopted by the Organizing Conference of technical societies in Washington June 3 and 4, and authorizes its Executive Committee to proffer and perform on the part of Council such assistance as may be practicable in completing the work of the Organizing Conference and of the Joint Conference Committee of the Founder Societies in establishing the American Engineering Council.

"Voted, that Engineering Council authorizes its Executive Committee to deal with any question of co-operation with the Joint Conference Committee of the Founder Societies, relating to the permanent organization of the Federated American Engineering Societies, which may come up during the summer.

"Voted, that the secretary be instructed to invite to future meetings of Engineering Council delegates of the societies participating in the Organizing Conference in Washington, June 3 and 4, and editors of technical journals who may be interested."

Arsenic Content of Superior Copper Ores

Copper arsenides have been found in a number of the Lake Superior copper mines. At present Ahmeek is producing varying quantities of algodonite, domeykite and whitneyite, these three minerals occurring in rich pockets. In the Mohawk mine there are pockets of the same ores and, in addition, a fourth arsenide, mohawkite. Algodonite carries 83 per cent copper and 16 per cent arsenic. It must be handled in lots that will give a smelter furnace a full charge. Domeykite ordinarily carries 71 per cent copper and 28 per cent arsenic. Whitneyite was found on surface at the old Pewabic property, at the Cliff and at the Minnesota mine in Ontonagon County, now the Michigan.

The showing of this arsenical copper ore, to be distinguished from the native copper, keeps increasing at both Mohawk and Ahmeek and is a factor in their total output. At present much of it is stocked at the smelters awaiting its special treatment. Seneca is expected to find this sort of ore in paying quantities. The Copper Range mines, on the Baltic lode, have opened up some of it, indicating that it is not exclusively a Kearsarge lode product.

Conference Approves Distributing Plan for Natural Gas Conservation

The tentative resolutions on natural gas conservation which have been adopted by the National Committee on Natural Gas Conservation were approved by a conference of state and public utility officials in Washington on June 11. The resolution follows:

"Whereas, the National Committee on Natural Gas Conservation, appointed by the Secretary of the Interior to work out a constructive program in co-operation with the U. S. Bureau of Mines for the conservation of natural gas, has, at a conference of Governors and Public Utility Commissions of the natural-gas producing states, held at Washington, D. C., on June 11, 1920, submitted its report, wherein is set forth in detail the methods to be employed in the production, transmission and consumption of natural gas, in order that the failing supply thereof be properly conserved, therefore be it

"Resolved, That this conference approve the recommendations so made by the National Committee on Natural-Gas Conservation, acting in co-operation with the U. S. Bureau of Mines, and we hereby respectfully urge that the recommendations so made be carried out by all natural-gas companies and their patrons, to the end that this valuable natural resource may be conserved for public use over an extended period."

This conference was opened by Secretary Payne of the Department of the Interior, following the course of Secretary Lane, who initiated the matter. F. G. Cottrell, director of the Bureau of Mines, who presided, set forth the keynote of the conference in the following language:

"This is a matter not of individual concern of each state, and it was thought necessary to call this general conference rather than to take up the matter individually with the several state governments, as there are problems of mutual concern, and it will be far more effective if it will be possible to obtain unified action throughout the various natural-gas using states and communities."

As a result of the conference, a tentative agreement was reached that the state public-service commissions of Pennsylvania, Ohio, and West Virginia would meet with utility interests of the three states on June 29 in an effort to determine a mutually satisfactory plan for the development of distribution of the natural-gas supplies of the tri-state field. If some protective program is worked out for this territory it is hoped that a similar plan can be adopted for the Kansas, Oklahoma, Missouri situation.

M. L. Alexander, the conservation commissioner of Louisiana, also stated that he expected to introduce in the legislature of his state, now in session, appropriate measures to give effect to the program recommended by the resolutions here adopted.

Book Reviews

The Engineering Index, 1919. Published by the American Society of Mechanical Engineers, New York City; 6½ x 9½; cloth; pp. 528. Price, $4.

This book is similar to, and a continuation of, the annual indexes of engineering articles which have been published heretofore by the Engineering Magazine Co. The A. S. M. E. has now taken over the work, and the present book presents, in bound form, the references published monthly during the year in *Mechanical Engineering*, the journal of the society. The Engineering Societies' Library receives regularly about 1,100 periodicals, reports and other publications devoted to science and engineering, which have been reviewed for the purpose of compiling the present volume. Over 12,000 articles are here indexed, each item concluding with a note summarizing the article in a few words. All forms of engineering are covered, but necessarily some published articles of lesser importance, and those of specialized interest, have been omitted. The work has been well done, and the book will be valuable to those who are frequently required to consult references on various engineering subjects.

While on the subject, we might add that the Engineering Societies' Library, 29 W. 39th St., New York, makes a specialty of looking up published information on any given subject for engineers, its files being particularly complete. Abstracts or photostat copies of articles are made, the cost being commensurate with the work done. Those who wish to collect all available information on any subject will find it to their interest to get in touch with this organization. E. H. R.

Technical Papers

Copper in Slags—On May 19, 1919, the *Engineering and Mining Journal* published the results of some investigations made by Maier and Van Arsdale on the manner in which copper is held in slags. A further report on more extended investigations by the same authors may be found in the June 16 and 23 issues of *Chemical & Metallurgical Engineering* (New York, 25c. each). Like the former articles, these last are well illustrated by photomicrographs which show that the prills of matte are floated in the slag by minute bubbles of SO_2; the latter resulting from a chemical reaction between the sulphides of the matte and ferric iron (including magnetite) in the slag. The matte thus floated takes the form of white metal by this reaction. The present articles discuss the composition of converter slag as well as that from blast and reverberatory furnaces and show what happens when converter slag is poured into a reverberatory. For best results a reducing zone should be maintained in the latter in the region where the converter slag is poured. Or, preferably, a separate reverberatory furnace smelting a pyritic siliceous material and producing a low-grade matte should be used for the purpose, as is done at Anaconda.

Increase of copper in matte is generally thought to result in increased slag loss, but the connection is shown to be not truly causative. It is the highly oxidizing condition of the furnace, necessary to produce a high-grade matte, which is the direct cause of suspended copper sulphide loss, through the formation of ferric iron and its subsequent reaction with matte particles.

The average dissolved copper content of blast furnace slags is about 0.16 per cent, regardless of the grade of matte, and of reverberatory slags, about 0.21 per cent. Converter slags vary more, but the dissolved copper is around 0.50 per cent. Further justification is offered for the silver nitrate method of determining dissolved copper and a method is given for the approximate determination of ferrous and ferric iron in slags.

This paper is of importance as a guide to further experimental work on a practical scale, and as an explanation of hitherto little-understood phenomena, even though no concrete information is given which is likely to result in the immediate improvement of smelting practice.

Industrial Fellowships—The Seventh Annual Report on the Industrial Fellowships of the Mellon Institute, Pittsburgh, Pa., is now available. Anyone who has a problem requiring investigation may contribute a sum of money to the Institute which will be adequate for the purchase of any special apparatus required as well as paying the salary of the investigator. The Institute will select a proper person to carry on the work, give him laboratory and library facilities, and assure careful direction to the progress of the research. All results belong exclusively to the donor. Some of our readers will remember that it was while working on one of these fellowships that the late H. P. Corless developed the use of alpha-napthylamine in flotation. C. L. Perkins and R. E. Sayre are now doing similar work there, and G. A. Bragg is also engaged in experimentations into metallurgical methods of the copper industry.

Lake Superior Iron Ores—"The Future of the Lake Superior District as an Iron-Ore Producer," by Edward W. Davis, has recently been issued as Bulletin No. 7 by the Experiment Station of the Minnesota School of Mines, Minneapolis. This treatise deals with the necessity of utilization of low-grade ore materials if the district is to maintain its production. Various estimates place the time period for the removal of merchantable ore at from fifteen to thirty years, and this limit will terminate the usefulness of the district as an iron-ore producer unless successful economic methods can be devised for the handling and treatment of enormous tonnages of low-grade ores. A general review of the methods of concentration now used and of the experimental work being done are given. Attention is called to the operations of the Mesabi Iron Co. on the eastern end of the Mesabi Range, where this company is completing a plant for the treatment of low-grade magnetic ores, and to the importance that may be attached to the economic success of the experiment.

Iron-Ore Transportation—In the July issue of *Mechanical Engineering*, issued by the A. S. M. E., appears an article by William S. Mitchell, "Design of Ore Fleet for Upper Mississippi," an abstract of a paper presented at the spring meeting of that society. Two experimental trips which were made during the war for the purpose of determining the possibilities of the upper Mississippi River route for ore transportation are described. Following the success of these experiments, the United States Shipping Board, Emergency Fleet Corporation, appropriated a fund of $3,860,000 to cover the cost of construction of nineteen barges and four towboats, together with provision for adequate terminal loading and unloading apparatus. It is estimated that the annual capacity of such a fleet operating between St. Paul and St. Louis will be 576,000 tons, this figure including Minnesota iron ore on the down trip and coal or other commodities on the up trip. Details of construction of the barges and towboats are given and sketches shown.

Gypsum—Those interested in this subject should write to the American Society for Testing Materials, 1315 Spruce St., Philadelphia, for "Report of Committee C-11 on Gypsum." It is a thirty page pamphlet, giving proposed specifications for gypsum and gypsum plasters, and methods of chemical analysis.

Queensland Mining Industry—The April number of the "Queensland Government Mining Journal," (Brisbane, price 6d., postage extra) contains an excellent review of the mining industry of that province during 1919, with a map in colors. The most important minerals produced are copper, coal, gold, and tin.

Smelter Smoke Litigation—E. E. Thum has an illustrated article in the June 23 issue of *Chemical & Metallurgical Engineering* (New York, 25c.) on the smoke litigation in the Salt Lake Valley. The history of the suits is given briefly and the principal points in the decree recently issued by Judge Johnson are discussed. The A. S. & R. has reduced injury by closing down certain smelting units when conditions of light, temperature, humidity, and wind direction are unfavorable.

MEN YOU SHOULD KNOW ABOUT

A. G. McGregor, metallurgical engineer, of Warren, Ariz., is in New York on business.

E. C. Humphreys is inspecting the fluorspar properties of the Lordsburg, N. M., district.

I. T. Pardee will do work in glacial geology in Montana and Washington during the present field season.

M. C. Lake, geologist for M. A. Hanna & Co., is examining copper properties in the Lordsburg, N. M., district.

E. G. Sievers is engaged in an investigation of natural-gas gasoline in the Charleston, W. Va., and Tulsa, Okla. fields.

James G. Ross, mining engineer, of Milton Hersey Co., Ltd., Montreal, is examining properties in the Western States.

M. Stockder, of American Smelting & Refining Co., has been looking over copper properties in the Lordsburg, N. M., field.

James MacNaughton, general manager of Calumet & Hecla Mining Co., is in Boston.

C. E. Siebenthal has returned to Washington after visiting zinc mines in Wisconsin and lead mines in southeastern Missouri.

Frederick G. Shipley has been appointed chief engineer of the Moctezuma Copper Co. of Nacozari and Pilares, Sonora, Mexico.

Arthur J. Collier has completed an inspection of the Osage petroleum district, but will visit several small fields in Wyoming prior to his return to Washington.

William R. Todd, president, and **W. Parsons Todd**, vice-president, of Quincy Mining Co., 32 Broadway, New York City, are visiting the company's mine at Hancock, Mich.

Nelson H. Darton has been granted an extension of furlough by the U. S. Geological Survey, that he may continue to Nov. 30 on the private oil work he is doing in Mexico.

W. G. Mather, president of the Cleveland-Cliffs Iron Co., and **Samuel L. Mather**, president of Pickands, Mather & Co., are expected to return from Honolulu by June 30.

Errol MacBoyle, consulting and mining engineer, president of Durango Silver Mines, is in Mexico inspecting the company's property. His address is: Hobart Building, San Francisco, Cal.

T. Wayland Vaughan will examine the Tertiary strata at several points on the Pacific Coast, during the summer months, with the idea of making comparisons with Tertiary strata on the Gulf and Atlantic coastal plains.

Alan M. Bateman, professor of economic geology at Yale University, and editor of *Economic Geology*, New Haven, Conn., has gone to British Columbia and Alaska on professional business.

H. C. Plummer, former assistant superintendent of the Cananea Consolidated Copper Co. at Cananea, Sonora, Mexico, is mine superintendent for the Arizona Commercial Mining Co. at Globe, Ariz.

W. V. Van Camp, recently of the field force of the Consolidated Arizona Smelting Co. at Humboldt, Ariz., has taken charge of underground operations with the United Verde Copper Co. at Jerome, Ariz.

R. C. Brown has resigned as chief engineer for the New Cornelia Copper Co., Ajo, Ariz., and will open an engineering office in Los Angeles, Cal. He will be succeeded by **G. F. Coope**, of Ajo, Ariz.

G. F. Loughlin, who is in charge of the Mineral Resources Division of the U. S. Geological Survey, is conducting some field work in eastern Massachusetts. **J. P. Dunlop** is acting in his absence from Washington.

Morris P. Kirk, has resigned as general manager of Yellow Pine Mining Co., Goodsprings, Nev., effective July 1. Mr. Kirk plans to engage in the ore-purchasing business in the Southwest, with headquarters in Los Angeles, Cal.

Prof. J. C. McLennan, of the University of Toronto, who was scientific advisor to the British Admiralty at the close of the war, is in London arranging with the Admiralty for the establishment of a helium gas plant in Canada.

K. D. Koliasnikoff, resident manager of Kyshtim Corporation, Ltd., 7 Gracechurch St., London, E. C., and Kyshtim, Perm, Russia, is in San Francisco, Cal. He is preparing for a trip through the mining districts of western North America.

Horatio C. Ray, professor of ore dressing, University of Pittsburgh School of Mines, has resigned to accept a position with the Keystone Consolidated Publishing Co., Pittsburgh, Pa. His address after July 1 will be 711 Penn Ave., Pittsburgh, Pa.

John A. Dresser, consulting geologist of Montreal, will head a party including **Professor McLean**, of Toronto University, and **Edmond Speaker**, of the Department of Geology, Johns Hopkins University, to make investigations in the Peace River region for the British Columbia government.

Allen Murray Yonge, mining and consulting engineer, of 229 East Main St., Staunton, Va., has resigned his position with the Crimora Manganese Corporation, of Virginia. He is leaving this week on an inspection trip to the properties of the Keith-Marshall interests in the West Indies.

L. T. Buell, mining engineer, after several years in Chile and other South American countries, has been on an extended vacation in the United States. He is now accepting a position with the Phelps Dodge Corporation, in Douglas, Ariz. Mr. Buell's latest address was P. O. Box 100, Miami, Ariz.

D. G. Kerr, of New York, vice-president of the United States Steel Corporation; **M. Shiras**, ore agent for the corporation, and **A. Klingerman**, of Pittsburgh, together with president **W. J. Olcott** and other officials of the Oliver Iron Mining Co., have been making a tour of the Michigan and Minnesota iron ranges during the last ten days.

Gerald S. Lambert, assistant professor at Leland Stanford Jr. University, has been appointed associate professor of geology, and **Dr. A. E. Koenig**, assistant professor of chemistry at the University of Wisconsin, has been appointed associate professor of chemistry at the Montana State School of Mines.

Alfred James, of 28 Victoria St., London, S. W. 1, a past president of the Institution of Mining and Metallurgy, sailed from New York for England on June 26. Mr. James had been on an inspection trip through the United States and Mexico, and reported conditions in the latter country to be better than is generally believed.

Dr. E. P. Taylor, agricultural extension director at the University of Arizona, has resigned to take up commercial work in the agricultural department of the Anaconda Copper Mining Co. of Montana, which will engage in the manufacture of fertilizer from sulphuric acid produced at the Anaconda works and from Western phosphate beds. Dr. Taylor will have offices in Chicago.

J. Parke Channing, vice-president of the Miami Copper Co., was the principal speaker at a recent meeting of the Globe-Miami Chapter of the American Association of Engineers. **Arthur Crowfoot**, of the concentrating department of the Arizona Copper Co., Ltd., read a paper before the Clifton-Morenci Chapter, on the handling of low-grade sulphides in the company's experimental mill at Morenci, Ariz.

Benedict Crowell, mining engineer, president of the Rosiclaire Fluorspar & Lead Mining Co., and senior member of Crowell & Murray, 407 Perry Payne Building, Cleveland, Ohio, has resigned his position as First Assistant Secretary of War, effective June 30. Mr. Crowell, as First Assistant Secretary, was in charge of the munitions program during the war and of the adjustment of claims and contracts of munitions-making firms since the armistice.

Thomas H. O'Brien, formerly manager of the Dawson (N. M.) Coal Co., has been appointed general manager of Inspiration Consolidated Copper Co., Miami, Ariz. Mr. O'Brien assumes his new duties at once and relieves Dr. L. D. Ricketts, vice-president and general manager, of the additional work he undertook when Charles E. Mills, the previous general manager, resigned to go into public service. Mr. O'Brien will also be in charge of the International Smelting Co.'s smelter.

Second Prevention of Accidents Conference Held at Duluth

Representatives of Lake Superior Iron and Copper Companies Meet Again With Bureau of Mines Officials—Permanent Organization Effected, With George Martinson President—Operators Urged To Send Teams to Contest at Denver Next September

By ELLERY E. ANDERSON
Special Correspondence of the *Engineering and Mining Journal*

The second annual meeting of the Lake Superior Prevention of Accidents Conference was held at Duluth, Minn., June 23, 24 and 25. Like the first, it took place in the sun room of the Spalding Hotel, under the auspices of the U. S. Bureau of Mines. C. E. Julihn, district mining engineer of the Minneapolis district of the bureau, conducted the sessions. Representatives from practically all the important iron and copper companies were in attendance, as well as from the Bureau of Mines.

The morning of the first day was devoted to the registration of delegates and to brief introductory remarks by Mr. Julihn. At noon the delegates adjourned in a body to luncheon, renewing the session at two o'clock with the consideration of a paper written by Dan Harrington, supervising engineer of the U. S. Bureau of Mines, Golden, Col., on the subject of "Metal Mine Ventilation and Its Relation to Safety and Efficiency in Mining Operations." Mr. Harrington was unable to be present, so the paper was read by R. V. Ageton, of Houghton, Mich., also of the Bureau of Mines. A. A. Krogdahl, safety engineer of the Oliver Iron Mining Co. at Virginia, Minn., followed with a paper on "Mine Ventilation on the Mesabi Range." The technical features of the first day consisted entirely of these two papers on mine ventilation, a comparatively new phase of Lake Superior mining. Both papers emphasized the relation of mine ventilation to efficiency and both brought out interesting discussion. It was pointed out that, although mine ventilation is primarily a humane project, it can be justified as a business proposition in that it increases production and reduces accidents. Instances were cited of many mines and stopes where the air was considered to be pure but upon analysis was found to be impure. Good ventilation in many instances made the miners more alert with regard to both ore shoveling and safety.

At the close of the discussion the chairman announced that it was the desire of the Bureau of Mines that the conference should perfect its own organization and prepare to conduct future conferences under its own auspices. He expressed the entire willingness of the bureau to assist as far as possible in the conduct of future meetings, but explained that the movement should thenceforth stand on its own feet and be conducted with the support of the bureau but not under its direction. Accordingly, Steven Quayle, safety engineer of the Hanna Ore Mining Co., was elected chairman of a committee to be of his own choosing, to perfect plans of organization to be submitted for approval on the second day. In the evening the delegates were the guests of the Lake Superior Industrial Bureau at a dinner and vaudeville entertainment at the Kitchi Gammi Club.

Sebenius Discusses Mesabi Open-Pit Methods

On the following day the session was opened with a paper read by John Uno Sebenius, chief mining engineer of the Oliver Iron Mining Co., Duluth, on "Development of Mesabi Range Open-Pit Methods To Offset Labor Shortage." After a brief preface on Mesabi Range geology, Mr. Sebenius dwelt on the flexibility of open-pit methods used on the range and the quick expansion of production possible in them as exemplified by the great increase in shipments made necessary by the war. He also pointed out the increasing popularity of such methods and the fact that many orebodies formerly held to be workable only by underground development are now considered to be easily available by open-pit methods. He cited instances of properties partially depleted by underground methods, which have lately been stripped and developed as open pits. This tendency, he said, was partially owing to labor shortage and in part to the much smaller accident-per-ton factor possible by open-pit methods. Shortage of labor was also given as one of the principal causes of the development of labor-saving devices which, it was said, in the six years elapsed since the first marked scarcity, have been perfected to such a point that the operator can now proceed with 85 per cent of the number of men formerly required and this in the face of considerably increased production. The locomotive crane, the 300-ton shovel, the 30-yd dump car, the track shifter and the tie tamper were cited as instances of mechanical improvements.

W. A. McGonagle, president of the Duluth, Missabe & Northern Ry., gave an informal and brief history of ore transportation in the Lake Superior district, beginning with 1882. Byron D. Shove, safety engineer for the Oliver company, at Ironwood, Mich., then presented a paper on "Methods Employed in Maintaining Safety in Underground Mining on the Gogebic Range." In it he gave a detailed outline of the safety organization of the Oliver company on the Gogebic Range. The speaker enlarged on the success attained in interesting bosses in direct charge of the work in the safety movement and pointed out the absolute necessity of arousing the interest of these men before any results might be obtained. A very general discussion, bringing out the details of safety organization, followed the reading of the paper.

A paper, entitled "Safe and Dangerous Practices in the Use and Care of Explosives Underground and in Open Pits," was next presented by Spencer P. Howell, of the Bureau of Mines, Pittsburgh, Penn. Misfires and their prevention and the possibility of serious accidents through premature explosion caused by electrical storms were the principal points dwelt upon. The speaker submitted the record of experiments proving that three hours should be allowed to elapse before approaching a misfire.

Permanent Organization Elects George Martinson President

The organization committee, composed of Steven Quayle, Major E. L. Flynn, C. D. Chappell, George Martinson and E. L. Cochran, submitted a tentative plan of permanent organization, suggesting that the affairs of organization be concentrated in the hands of a president, vice-president and secretary; that arrangement be made for annual conferences similar to those of 1919 and 1920; that a shorter name be chosen for the organization; and that the Bureau of Mines be requested to submit these plans to the various operators for their approval. These suggestions were adopted by the conference. George Martinson was elected president, C. D. Chappell vice-president, and Steven Quayle secretary. The papers of the afternoon session were postponed to enable the delegates to accept an invitation to inspect the plants of the Minnesota Steel Co.

A. H. Trestrail, safety engineer for Pickands, Mather & Co., presented the first paper on the third day, entitled "Stench Test at Bennett & Caspain Mines of Pickands, Mather & Co." The tests were conducted by introducing ethyl mercaptan and amyl ethylate into the air lines leading to the working places, when by means of observation stations placed at varying distances from the point of introduction, it was demonstrated that the former was quicker to reach the working place, also more pronounced. Regular injectors for introducing ethyl mercaptan into the air lines are now installed as warn-

ing signals in case of mine fires or other general mine catastrophes.

CALUMET & HECLA EFFICIENCY METHODS DESCRIBED

Ocha Potter, chief efficiency engineer and superintendent of the experimental mine for the Calumet & Hecla Mining Co., presented a paper on "Recent History of Copper Mining in the Lake Superior District." A brief summary of conditions in the copper country, indicating the necessity of improved methods or a complete shutdown, prefaced the paper, after which the improvements which have been worked out were taken up at length. Chief among these was the introduction of the one-man drill, which was given the larger share of credit for the increase in production per man from 11.42 tons in 1912 to 26.92 tons in 1919, the cost per ton of rock in the meantime being reduced about 3 per cent in spite of doubled labor and supply costs. The development of the storage battery locomotive to the point where it trams 6.8 tons per kw.hr. an average distance of 800 ft. was also taken up, as well as the increase in mill recovery from approximately 17 lb. in 1918 to more than 22 lb. in 1919. It was pointed out that this large increase in recovery was not accomplished at the sacrifice of valuable material in any quantity whatever, but by the simple expedient of close supervision over the miners when placing holes for blasting. The tendency of the contract miner to edge his holes into the foot and hanging walls was discouraged, it was stated, by from four to six daily inspections of each stope, thereby slightly increasing the cost at the breast but decreasing the haulage, hoisting and crushing cost per pound of copper produced. The paper was delivered in sections covering drilling and blasting, tramming and slushing, timbering, hoisting, and mining, and each subdivision discussed at length by the conference before passing to the next.

At noon the conference adjourned to the lunch room of the Spalding Hotel, where the delegates were the guests of the subsidiary companies of the U. S. Steel Corporation. Afterwards D. J. Parker, chief of the mine rescue cars and stations division of the Bureau of Mines, Pittsburgh, Pa., spoke on the "Importance of Annual First Aid and Mine Rescue Contests," urging that wherever possible teams be sent to compete in the annual contest that is to be held at Denver, Colo., on September 9 next.

THE MINING NEWS

LEADING EVENTS

Car Shortage Causes Zinc Companies To Shut Down

Suspension Will Last Two Weeks—Move Will Be Followed by Effort To Curtail Output

Following a meeting held at Miami, Okla., on June 24, all the leading zinc ore producing mines of the Kansas-Missouri-Oklahoma district will be closed down from June 26 to July 10, the most notable shutdown in the history of the field. The explanation of the shutdown, as announced, is the inability of ore shippers to get cars for shipments, and also to permit the miners to participate in the wheat harvest.

In previous years attempts have been made to get the larger operators together on a shutdown program, and it was accomplished this time only after weeks of effort. In the past, one large interest in particular had proved a stumbling block, always refusing to agree to a shutdown program, but this time it has agreed, and it appears that the cessation of operations will amount to fully 90 per cent throughout the field. A few mines will operate on reduced schedules by special agreement.

It is understood that the shutdown will be followed by an equally serious effort to curtail output permanently in accordance with the actual demands of the smelters, and to allocate production to the different companies on some basis to be agreed upon. The move is considered locally as the most radical and most likely to produce permanent good results for the field of any in the history of the district. The effects of car shortage upon mining in other sections of the country are marked. In Alabama, some companies are buying their own cars.

WEEKLY RÉSUMÉ

The leading producers of zinc ore in the Joplin-Miami district agreed on June 24 to close down from June 26 to July 10 in consequence of the acute car shortage. Iron and steel companies in the Birmingham district of Alabama, similarly affected, are reported to be taking steps to acquire their own railroad cars to insure a steady supply of ore. Charles Butters, speaking recently in Nogales, Ariz., proposed an interesting plan for providing a silver coinage for Mexico; this plan calls for an arrangement between the silver producers and the Mexican government under which the mints will be rebuilt to mint part of the silver output. Great activity is reported in northern Manitoba this season, centering naturally at the Flin Flon property. In Washington, the War Minerals Relief Commission has handled 70 per cent of the claims made, the remainder including some of the largest. The engineering committees of the National Research Council have been named.

Arizona Mining Companies Seek Lower Assessment

Based upon the comparative inactivity of the copper market for the year past, a number of Arizona mining corporations are asking decreased valuations on their properties for purposes of taxation. The Arizona Copper Co. has asked at least a decrease of $1,000,000 from the tentative figures of $25,000,000 in the State Tax Commission's estimates. The commission also has been asked to lower the figures on the Grand Reef property in western Graham County, now operated by the Aravaipa Leasing Co. and secured from the John W. Mackay estate. It has been assessed at $200,000 and the company has asked that this be reduced 50 per cent.

Silver Coinage for Mexico Proposed by Charles Butters

Suggests That Producers Furnish Minting Facilities Under Arrangement With Government

"Mexico is absolutely devoid of coin," says Charles Butters. "Why should her silver be offered at a constantly falling price to the market when it is absolutely needed in Mexico to give a basis for business? As the need of 200,000,000 to 300,000,000 oz. of silver money is absolutely essential in Mexico, I should supply it in this way:

"Let the producers form an association to coin this under an arrangement with the Mexican Government by which the former supply the necessary minting facilities and issue the coins as desired. The producers in Mexico will pay all their Mexican bills in this silver, pay their laborers and for supplies bought in Mexico, which would immediately absorb more than half their output, diminishing to this extent the bullion to be marketed, which would so reduce the new supply that production would appreciate. The producer could buy export goods for his silver and export other commodities instead of silver if he had the coin to pay in.

"To furnish the coinage facilities I would say: Let the producer build the mints under a concession. Whatever profit was made in the coinage let that be credited to the cost of depreciation on the mint. When this amortization was completed by return of capital and interest, then turn the mint over for Government operation. The producers would have lost nothing; the Government would have lost nothing. The price of silver naturally under a plan of this kind would go to coinage value

eventually. Should such a value be reached before the amortization was complete, the mints could still remain under the concession for, say, a period of two years, to insure the producer his return of capital. In this case, as the producer would be getting coin value, he could consider that within at least two years the difference between a market of 80c. and, say, $1.25 would mean a return of capital.

"I propose a coinage uniform with that of the United States, of the same fineness and weight, but our 50 cent pieces would become pesos and our dollars two peso pieces, and so on, and when silver became coinage value in both countries, the money would be interchangeable.

"I see that the U. S. Mints refuse to give out coin for bullion sold to them. This position is untenable, because the function of the U. S. Mint is to coin according to demands, and if the demand is powerful enough and the American companies use their silver in the business, the Government will never be able to get its silver back, but that would make no difference, as the people would have the silver."

The subject of a silver coinage for Mexico was discussed by Mr. Butters on June 16 before the Nogales (Ariz.), Chamber of Commerce. In his speech he dealt with the matter at greater length than in the preceding remarks here given, which are from a letter written by him to his New York office.

"Mexico is practically stripped bare of metallic money and the nation's business is being halted for lack of small change to carry on trade with the smaller merchants," said Mr. Butters at Nogales. "Before Mexican retail trade can resume anything like normal conditions it will be necessary to provide the people and merchants and banks with metallic money.

"Mexican mints are not working, and this, coupled with the fact the revolutions and world markets' demand for silver during the late war sent billions in silver bullion out of Mexico, has left that country minus the needed medium of exchange in carrying on retail trade.

"Mexican mines are producing silver and ought to produce much more. The trouble is twofold. The silver output in Mexico today is practically all speculative in that the silver bullion is being shipped out of Mexico for export and sale in the markets of India and China, via San Francisco. An equal fault in the silver market is that the price of silver to producers is so low that it cannot be mined at a profit.

"We face, therefore, the three-way need in the Mexican silver market. First, the necessity for providing Mexico with hard money and plenty of small change. Second, the necessity of increasing the market value of raw silver from the mines so that production can be stimulated and the miners receive a profit on their production. Third, the creation of a market for Mexican silver right in the territory in which it is produced.

"With a home market made for the silver, and the demand created for silver in that home market by filling the need of Mexico for silver coinage, the price is bound to be better to the producers for their bullion bars.

"The silver mining men of Mexico are forming an association, the object of which is to re-establish and rebuild the mints of Mexico in the various states and that these mints then be used for the coinage in Mexico of the hard money in change necessary to supply the public, the banks and the merchants with the necessary metallic coin to carry on their trade and business.

"The plan in brief is that the silver men make a deal with the Mexican government to rebuild the mints and put them in operation for free and unlimited coinage in Mexico of silver bullion. The cost of the rebuilding of mints is to be taken from the 10 per cent production tax levied by the government on the silver output at the mines and by charging off each year a certain per cent of the 10 per cent federal production tax, the balance to be paid the government in cash as at present. Then at the end of a specified term of years when the mints shall have been rebuilt and are in full operation, these mints shall be turned back to the Mexican government without further charge."

Electric Smelting Planned on Large Scale in Norway

"In northern Norway," says a translation from *Verdens Gang* (June 12, 1920), "very large industrial undertakings are developing. Glomfjord will be first—if we leave out Narvik, which is virtually a shipping port for ore. At Glomfjord 150,000 hp. can be regulated for big industries. Of this about 45,000 hp. is on the point of completion. The first large industry is a large electric zinc smelting proposition, which is also nearly ready to make a start."

In *Bergverksnyt* (Kristiania) of Oct. 3, 1914, it was stated that "the Glomfjord company is the largest of its kind in the whole of north Norway. The company was the first to come under the new concession law for water power reguluation. It is computed that when the whole of the construction is completed some 60-70,000 hp. will be available. . . . What the power is to be used for has not yet been decided, but it is said that electric smelting on a large scale has been planned, and in several places in north Norway a number of ore beds have been secured."

Would Avert Closing of Cornish Tin Mines

Sir Edward Nicholl recently asked in the House of Commons whether, in view of the fact that notices had been given by several tin mines of Cornwall of their intention to close down, the government intended to take immediate steps to carry out the recommendations of the Non-Ferrous Mines Committee and make suitable grants from the funds in the hands of the development commissioners.

Fast Nearing Production Stage at Sacramento Hill

Phelps Dodge Expects To Start Mining Early Next Year—New Mill Ready Then—Remodeling Tyrone and Nacozari Plants

At the outset of the Sacramento Hill steam-shovel operations of the Copper Queen branch of the Phelps Dodge Corporation at Bisbee, Ariz., the total amount of waste to be removed before ore production starts, which will be early in 1921, was 6,167,000 cu.yd. Of this 4,370,000 cu.yd. was removed by the end of April so that 71 per cent of the waste stripping necessary before ore production starts was then complete. It is expected at present that steam shovel operations will be ready for steady production early in 1921.

It is anticipated that the new mill for handling the concentrating ore from the steam shovel pits will also be complete very early next year, the exact month being dependent on the supply of labor during the remainder of the year and also on steel deliveries. This mill is being designed by H. Kenyon Burch and is planned for the treatment of 4,000 tons of ore daily. A large part of the excavation and concrete work is complete. Erection of steel for the new machine shops and also for the carpenter shop and supply house was recently completed and is now proceeding over the ore bins at the head of the mill. During the last month some of the low-grade leaching ore taken from Sacramento Hill averaging between 0.5 per cent copper and 1 per cent copper has been heaped at the site of the proposed new leaching plant which is a little below the mill.

The remodeling of the Tyrone mill at the company's Burro Mountain branch, in New Mexico, is practically complete and operations are expected to be resumed there within thirty to sixty days. The new flow sheet will permit the treatment of 2,000 tons per day but it will be a few months before the mine will be able to adjust itself to this tonnage. The flow sheet consists of primary and secondary fine grinding with gravity concentration in between, and with pneumatic flotation following the secondary fine grinding, and tables following the flotation.

Construction work is under way in the mill of the Moctezuma Copper Co. at Nacozari, Sonora. To date this has consisted of tearing out the equipment and old foundations in the south half of the present mill. Later this year this side of the mill will be re-equipped on the lines of the latest flowsheet. It is expected that operations can start in this half during the first quarter of 1921. Two thousand tons of ore per day will be handled in half of the mill. In the meantime, current operations are continuing in the north half of the mill at the rate of about 1,500 tons per day. When the alteration of the south side of the mill is completed, it is expected that part of the north side will then be remodeled so as to provide a mill able to treat 3,000 tons daily.

NEW IDRIA QUICKSILVER MINING CO., IN CALIFORNIA, DELIVERS RED HOT CALCINES TO DUMP BY AERIAL TRAMWAY

Prospectors Drawn to Manitoba This Season

Flin Flon Development Progressing—Gordon Claims Being Drilled—Gold Strike Near Elbow Lake Causes Rush

Mining activity in Northern Manitoba is chiefly confined to three sections namely, the copper area, in which are the Mandy and Flin Flon properties, north of Schist Lake; the gold area in the vicinity of Cranberry and Copper lakes, which lie approximately 20 miles east of the Mandy; and 80 miles farther east the Herb Lake section of the gold area, which is reached from the Hudson's Bay Ry. From The Pas this railway maintains a trimonthly service to the Herb Lake district and adjacent points along the railway for 214 miles.

Northern Manitoba this year is attracting many prospectors and men looking for prospects that will warrant the expenditure of money in development. On a whole the country is comparatively free from wild-catting and a healthy development of different discoveries is under way.

Mining of high-grade copper ore at the Mandy has been completed. The Mandy machinery purchased by the Flin Flon Syndicate has been moved and installed at the Flin Flon property, and is now operating in conjunction with the plant which was purchased from the Beaver Lake Mining Co. and moved from Beaver Lake to the Flin Flon ground. The plant is now in full operation and two shafts are down 75 and 60 ft. respectively. These are being sunk 1,000 ft. apart on the foot wall of the orebody. Work is being rushed on them, but is somewhat retarded by excessive water from Flin Flon Lake. The sawmill, part of the Mandy plant purchased, has been set up on the north shore of Schist Lake, four miles from the mine, and is running to capacity cutting lumber for camps and mine timber. A passable wagon road from Schist Lake to the mine has been built. The underground development work at the mine is being done under contract by the Longyear company. At the present 120 men are employed in connection with this work.

The present work is being done by the Flin Flon Syndicate to check the results determined by diamond drilling during the last two years. Results from new development will determine whether the syndicate will take up its option to purchase during the latter part of this year.

In the gold area at Cranberry and Copper lakes, diamond drilling is being done by Smith & Travers, drilling contractors of Sudbury, Ont., on the gold property known as the Gordon claims. Sufficient drilling has been done to indicate a large tonnage of gold quartz carrying some sulphides. The third drill hole, cutting the orebody at the 150-ft. level, showed a width of 51 ft. of ore. Assay results from these have not been received.

Further northeast in this district in the Elbow Lake area, prospecting is being vigorously carried on, owing to a recent discovery of gold on the Webb claims. Very rich specimens have been brought out from this area, which has caused the prospectors in the surrounding country to concentrate there, in a stampede. The district has long been a promising one for exploration, but until this year prospectors in this large area met many difficulties.

Aerial Tramway Used for Handling Red Hot Calcines

New Idria Quicksilver Co. Carrying Discharge from Rotary Furnaces to Dump Through Air

The New Idria Quicksilver Mining Co., at Jamestown, San Benito County, Cal., has recently erected at its reduction plant a wire rope tramway for transporting the red hot calcine from the rotary furnaces to the dump. The furnaces are arranged in parallel 25 ft. apart. Each discharges into a small hopper from which the calcine is in turn discharged into a single 2-ton tramway bucket. The bucket, which is of the ordinary type, travels along the line of spouts. An arc gate at each spout controls the discharge of the calcine.

The tramway, which was erected by the Painter Tramway Co., of San Francisco, is 1,100 ft. long and is supported by two wooden towers, one an intermediate and the other a terminal tower. The latter is constructed so as to take up the pull of the stationary cable without guys. The spans are respectively 500 and 600 ft. The stationary or track cable is 2 in. in diameter and of "solid" or smooth-coil construction. The traction cable is ½ in. in diameter. The bucket weighs 900 lb. and is dumped automatically by a tripper. The rope speed is 600 ft. per minute and the capacity of the tramway 20 tons per hour. The terminal is 100 ft. higher than the loading chute.

Revision of Mining Law Expected at Next Session

That Proposed Calls for Changes Regarding Extralateral Rights and Size of Claims

It is expected that the effort to secure the revision of the mining law will be begun immediately on the convening of Congress in December. A great deal of thought and labor has been expended on a draft of the bill which has been placed in the hands of the Committees on Mines and Mining of the Senate and of the House. This draft was prepared by a committee consisting of W. R. Ingalls, Walter Douglas, J. Parke Channing, J. R. Finlay, John Hays Hammond, L. D. Ricketts, Horace Winchell, and James R. Jones. The committee, in preparing this draft of the bill, was governed largely by the returns from a questionnaire containing thirty-three specific questions regarding mooted points in the existing law.

The principal point of difference is the section of the law pertaining to extralateral rights. With minor differences the wording of the draft of the bill covering the ownership of minerals within the claim is that adopted by a large number of mining societies. That section of the proposed bill reads:

"Subject to the existing extralateral rights of mining claimants or patentees, the holder or patentee of a mining claim located hereafter *shall* have the exclusive right of possession and enjoymen of the surface held by him and of the minerals under it, bounded by vertical planes passing through *the* surface boundaries of said land, but *shall* not *have* the right to follow any mineral deposit beyond said planes. And the holders or patentees of claims heretofore located *shall* have similar exclusive possession of all the minerals in said claims that is not covered by any existing extralateral rights."

In that connection the Ingalls committee calls attention to the following:

"Inasmuch as the owner of unpatented mining claims does not at present possess 'exclusive right of possession and enjoyment of the surface' for purposes other than mining (see Teller v. U. S., 113 Fed., 273, 51 C. C. A., 230; U. S. v. Rizzinelli, 182 Fed., 685), it is suggested that it may be advisable to separate this paragraph in order to qualify the rights of the owner of an unpatented claim. For example, after the words 'shall have,' in the part relating to unpatented claims there might be inserted the words 'for mining purposes.' The construction at present given to the words 'exclusive right of possession and enjoyment of all surface' would not make it necessary to change the above paragraph, but the Forest Service may take the view that this proposed new legislation, if enacted, in the light of existing law might be construed so as to give the owner of an unpatented claim the right to the timber on his claim."

In the proposed bill mineral deposits on the public lands are declared to be free and open to exploration and purchase by citizens of the United States only. In that connection, the committee calls attention to the following:

"A Mr. F. W. Carnahan, who appears to be connected with the International Copper Co., of Clarkston, Wash., wrote to the Bureau of Mines from Leland, Ore., suggesting that the mining law should be changed so as to permit aliens to take up mining rights on the same terms as American citizens. His argument is that such privileges are conferred on Americans in Mexico and most of the other Latin American countries, and that if we do not reciprocate there will eventually be discrimination in these countries against Americans who wish to take up such rights. He was promised that the question would be put before the committee. There may be pointed out in this connection that mining on American public land is free while in the other countries which Mr. Carnahan has in mind, a charge of some nature is usually made for such mining and those countries are anxious to have foreign capital come in and develop mines. Moreover, to make any change will probably bring up the question of the privileges to be granted to Orientals, with resulting embarrassments."

The draft of the bill provides that all mining claims shall be located in the form of a square containing forty acres. The committee points out that this could be changed so as to make the form of the claim either a square or a rectangle or the provision might be made so that the claim could be of any size not exceeding forty acres.

The proposed bill does not change the requirement that the annual assessment work is to be at the rate of $5 per acre. The committee calls attention to the suggestion that, instead of requiring development work to be performed and proved in terms of money, some other index be used as, for example, that the claimant be required to perform 1,000 cu.ft. of excavation work annually for each claim and 5,000 cu.ft. in all, in order to obtain a patent.

In a recent opinion the Interstate Commerce Commission points out that tariffs on infusorial earth are not restricted to ground earth. In some cases higher rates have been applied where the earth is in blocks. The United Verde Extension Mining Co. was the complainant.

Large Claims Still Awaiting War Minerals Commission

Thirty Per Cent Remain To Be Handled —Anaconda Claim Voluntarily Withdrawn

Having made recommendations on 70 per cent of the cases before it, the War Minerals Relief Commission plans to wind up its work not later than January 1. Recommendations have been made in 850 cases, out of a total of 1,203. The commission has given some preference to the smaller claims on the assumption that the claimants were less able to wait for their money. The cases remaining include some of the larger claims. More than half of the original amount claimed is involved in the 30 per cent of cases still to be handled.

The claim of the Anaconda Copper Mining Co. for $500,000 to cover losses in connection with its manganese and ferro-manganese operations has been withdrawn voluntarily by that company. The improvement of the ferro-manganese market, if sustained for a few months, will give the Anaconda company an opportunity of recouping the losses it suffered.

Awards recommended by the commission during the week ended June 19, were as follows: (The name of the claimant, the mineral, the amount recommended and its percentage relationship to the amount claimed are shown), Pruitt, Conway & McGlawn, manganese, $4,802.38, 41 per cent; J. Paul Jones, manganese, $929.85, 73 per cent; James O'Brien, chrome, $815.30, 31 per cent; Strange Mining Co., manganese, $95,633.04, 33 per cent; Western Ore Co., chrome, $6,762.84, 35 per cent.

Name Engineering Committees of National Research Council

The personnel of the various committees comprising the division of engineering of the National Research Council has just been selected. The division of engineering is conducted under the immediate direction of Dr. Comfort A. Adams, Lawrence professor of engineering at Harvard University. He now is on leave and is giving his whole time and energy to the work of the division. With Dr. Adams on the executive committee of the division are G. H. Clevenger, Henry M. Howe, D. S. Jacobus, Charles F. Rand, H. H. Porter and Bradley Stoughton.

The pulverizing committee, which is a joint committee of the milling committee of the A. I. M. E., consists of the following:

Robert H. Richards (honorary chairman), professor emeritus of mining engineering, Massachusetts Institute of

Technology; G. H. Clevenger (chairman) consulting metallurgist and vice-chairman of the division of engineering, 29 West 39th St., New York; Frederick Laist (first vice-chairman) Anaconda Copper Mining Co.; Charles E. Locke (vice-chairman) professor of mining engineering, Massachusetts Institute of Technology; Paul Avery, E. S. Bardwell, John W. Bell, C. H. Benedict, A. L. Blomfield, F. S. Bosqui, F. W. Bradley, H. K. Burch, Charles Butters, W. A. Caldecott, D. S. Calland, John M. Callow, Robert C. Canby, J. Parke Channing, Charles A. Chase, A. J. Clark, David Cole, E. W. Davis, J. V. N. Dorr, Arthur S. Dwight, H. W. Fox, C. H. Fry, H. W. Gepp, Rudolph Gahl, H. A. Guess, R. S. Handy, Frank Janney, A. H. Jones, R. T. T. Kiliani, C. B. Lakenan, W. P. Lass, Luther W. Lennox, Robert S. Lewis, A. D. Marriott, Jr., Charles W. Merrill, L. D. Mills, B. S. Morrow, Walter Neal, E. H. Nutter, T. M. Owen, C. Q. Payne, John B. Porter, Elmer R. Ramsey, L. D. Ricketts, W. M. Roseberg, Lewis G. Rowland, T. B. Stearns, E. A. C. Smith, W. G. Swart, A. F. Taggert, Arthur Thacher, George D. Van Arsdale, Thomas Varley, A. P. Watt, Bulkeley Wells, Albert E. Wiggin, George H. Wyman, Jr., and R. B. Yerxa.

The committee on uses of tellurium and selenium is: A. E. Hall (chairman), American Smelting & Refining Co., Omaha, Nebraska; H. D. Greenwood, V. Lenher, Oliver C. Ralston, E. W. Rouse, S. Skowronski, and A. W. Smith.

NEWS BY MINING DISTRICTS

ALABAMA

Iron and Steel Companies Buying Rolling Stock To Ease Transportation Situation

Birmingham—Transportation is now proving one of the greatest difficulties in the production of iron ore in Alabama, though labor is not as plentiful or efficient as might be expected. Pig iron and steel manufacturing companies, which must have a regular supply of ore, are purchasing railroad cars themselves to put in a service between their mines and their furnaces. The Alabama company is among the latest to put in this service, buying eight ore cars which will come near caring for a steady production at one of their smaller mines. This company has two blast furnaces in operation at Gadsden, Ala. The Tennessee Coal, Iron & Railroad Company will have two more cars with which to handle its ore.

For several years the Tennessee company has been considering an ore railroad from its mines at Fossil, on Red Mountain, to the blast furnace plant at Ensley. At one time it was reported that an aerial tramway was planned and, later on, an overhead railway line. Recently rights of way were obtained through the Federal Court to build an overhead railway line over the tracks of the Birmingham Railway, Light & Power Co., which concern is in the hands of a receiver. This was thought to mean that steps are being taken to build the proposed ore railway in the near future. Estimates of costs, however, made at intervals since the first consideration of the plans, give larger and larger figures until, it is heard, that the expenditures at present appear to be a little excessive. The development of the Tennessee company's ore mines on Red Mountain is such that an aërial or overhead railway would not only expedite the handling of the ore but would ease the situation at the furnaces as to ore supply.

The Gulf States Steel Co. is losing but little time in developing its deep ore mining proposition at Shannon, where, after several years of hard work, the slope was driven to the ore. Drifts on the ore must still be driven. A little ore is being taken out but it will be several months before the expected daily output will be attained. This is one of the biggest developments in years for this district.

H. L. Brittain, of New York, and associates are said to have looked at ore and coal properties on what is known as Pigeon Mountain, north of Gadsden, Ala., and south of Chattanooga, Tenn., in Georgia, to the west of Rome, Ga. Henry L. Brittain is at the head of the Mobile Shipbuilding Co., which has as subsidiary the Birmingham Steel Corporation, a steel fabricating plant in Birmingham. The ore on Pigeon Mountain is reached by the Tennessee, Alabama & Georgia Railroad, which at present extends from Chattanooga to Gadsden. No positive or definite information is as yet given out by the promoters though property owners in the vicinity are hopeful that plans looking to the development will be consummated.

ARIZONA

Globe—George Wilson and H. Woodward, of Globe, have purchased the claims of Howard Gravelle, near Superior, for $50,000. The property was located two years ago.

Greaterville—The St. Louis mine at Greaterville has been taken over by the Liberty Silver Mines Co., a corporation headed by J. C. Forney. The former owner, J. B. Anderson, retains a large interest. C. H. James has been retained as consulting engineer. The shaft, now in 3 ft. of good ore at 145 ft., is to be deepened.

Ajo—Cornelia Extension, near Ajo, is reported planning a reduction plant and a narrow-gage railroad to connect with the Gila Bend broad gage.

The New Cornelia Copper Co. has given a building lot and $500 in cash and General Manager J. C. Greenway has given $250 to the American Legion post at Ajo, Arizona, as the start of a building fund.

Tombstone—Here about 40 leases are being operated. Monthly shipments of about 100 carloads are being made to El Paso of ores that sample from $10 to $50 a ton.

CALIFORNIA

Mammoth Reserves Increased—Keystone Mine for Sale—Silver Ore Found in Alcalde Mines

Portola—The mill of the Gruss Copper Co. is now being remodeled and in the next forty days should be ready. Orebodies on the 200 and 400 levels are improving in width and values.

Kennett—Active work is being carried on in some of the mines operated by the Mammoth Copper Co. It is expected that the smelter will be blown in early in 1921. Ore reserves in the Mammoth have been greatly increased in the last year.

Shawmut—The output of the Belmont Shawmut Mining Co. is keeping 70 stamps dropping. A full crew is working at the mine and the management is experiencing little labor trouble. The Shawmut is controlled by the Tonopah Belmont Development Co.

Amador City—Negotiations for the sale of the Keystone mine are under way. The mine has exhausted its facilities for storing tailings, and has been unable to secure additional adjoining ground at a reasonable price. Limited prospecting will continue.

Grass Valley—High-grade silver ore has been found in the Alcalde creating much interest. At present the silver is occurring in small shoots, accompanied by gold. Developments are continuing on the main gold ledge and the mill is reported to be crushing ore of medium-grade.

The operators of the Boundary group have acquired the Black Hawk 5-stamp mill and are transfering the plant to their own property, where it is expected to be in commission inside of two months. Development work has reached a depth of 150 ft. and much decomposed quartz, rich in gold, has been opened.

Kelsey—A 3-ft. ledge of gold quartz is reported to have been cut in a virgin section of the North Star mine. It is planned to push developments on a larger scale. The mine has been idle for several years.

Idria—Fire destroyed part of the New Idria Quicksilver Mining Co.'s plant recently. The extent of the loss is not known.

COLORADO

Ouray-Silverton Road Now Open

Ouray—The Ouray-Silverton road is now open and traffic is passing both ways. This will allow of a much-belated opening up of the Ironton, Red Mountain and Chattanooga sections.

The Eurades Mining Co. finished installation work and began drilling on June 20, ten days ahead of schedule. A long cross cut west will be driven through the andesite, as well as several drifts on veins. A number of types of drill are being tried out thoroughly with the intention of standardizing on the drill found best suited to the ground. Raising on veins will also be done later.

Golconda Mines Cons., Lake City, has resumed work at the Golconda mine, where ore is being mined for shipment. Headquarters are being finished at Rose's Cabin at Henson Creek and the work of building a new mine plant in Hurricane Basin is starting. The company will buy an air compressor, drills and equipment for drifting and raising at this plant.

The Barstow lease has just finished its mill run of gold ore mined last winter but is unable to ship because the Silverton Ry. has not yet run its first train of the season. The mill run yielded enough 16-oz. gold concentrates to ship.

The Silver Mountain Mines Co. has abandoned mining ore in the winzes and old upper workings, although considerable time and money were spent in equipping these workings. Work has been resumed in the new workings below in the Concave tunnel, which should have been continued from the first.

Davis and Kinley have reported a strike of good gold ore in the B. B. property up Corbett Creek near the old Teller mine. This has not been developed and may be only a pocket; but very good ore has been produced in this neighborhood in times past and many prospectors believe that adequate work will develop some good bodies. The district has been neglected for years.

Labor conditions at Ouray have improved much in the last ten days and are now much better than for a long time.

Mayday—Lon Wigmore and associates have secured a lease on the Lucky Moon and have started a tunnel to cut a vein along a fault where good ore was mined a few years ago. This property has been idle for several years.

Lessees are reported to have taken over the Mountain Lilly above La Plata and have begun work there.

Thomas Welborn and Joe Clark are making an examination of the Tomahawk, with the view of taking a lease on it. They are also working the Idaho dump and have shipped two cars of $40 ore from it.

Fred Marr has secured a contract at the Ten Broeck and has started work with a small force.

William Graflin has a force at work on the Copper Queen.

IDAHO

Chicago-Boston Makes New Discovery on Surface—Paragon at Murray To Sink Below Creek Level

Wallace—On the west side of the gulch, about 500 ft. from the shaft and 400 ft. above it, a ledge has been uncovered on the Chicago-Boston property. It is 22 ft. wide with streaks and bunches of galena the full width, making a remarkable showing practically at grass roots. It is believed that this is a continuation of the Chicago-Boston vein, although it is quite probable that it may be the Kill Buck vein, which lies south of the Chicago-Boston and belongs to the same company, control of which is under option to John A. Percival, of New York, president of the Callahan Zinc-Lead Co. A crosscut is being run to the Kill Buck vein from the bottom of the 200-ft. shaft on the Chicago-Boston, and preparation is being made to deepen the shaft 200 ft. A splendid showing of lead-silver ore has been developed on the 100 and 200 levels.

William Fahle, manager of the Independence Placer Co., accompanied by nine men, has gone to the company's ground on the North Fork of the Clearwater River, near the old camp of Moose City, where he will build a bedrock flume and also a ditch a mile and a half long to provide water for hydraulic mining. The property is remote and all supplies must be packed 55 miles from Rivulet, Mont., the nearest railroad point. The ground has been held for years, for lack of money. Funds are said to be available now. The ground has been thoroughly prospected.

A meeting of stockholders of the Leslie Copper Mining Co. will be held in Wallace on July 8 to vote on the proposition to transfer all property of the company to the Amazon-Dixie Mining Co. in exchange for 1,000,000 shares of stock, the plan being to increase the capital stock of the latter company to that extent, making its total capitalization 2,500,000 shares. The holdings of the two companies join and cover the same vein.

The main tunnel of the Amazon-Dixie is being extended into Leslie ground. In the Amazon-Dixie proper considerable ore has been exposed in the main tunnel, from which a shaft has been sunk 400 ft. On this level a good grade of lead-silver ore has been opened for 350 ft. Preparations are being made to sink 400 ft. further, and a complete electric equipment is being installed for the purpose. The company is controlled in Cleveland, Ohio. The property is situated at Sildix, Montana, just across the state line.

Murray—The Paragon Mining Co., which recently purchased the claims owned by the Murray Hill Mining Co., together with a 100-ton mill, is overhauling the mill and expects to have it running about July 15, taking lead and zinc ore from the Murray Hill mine. At the same time the shaft on the Paragon, now down 60 ft., will be deepened 300 ft. This company has shipped considerable lead and zinc, from ground above the level run from the bottom of the shaft. The sinking of this shaft will be the first attempt to test the orebodies of that section below the creek level, and the result is therefore being watched with unusual interest.

MICHIGAN

Gogebic Range

Pabst Mine Down Temporarily Owing To Accident

Ironwood—Most of the mines on the Gogebic Range were shut down on June 24 because of the celebrations of midsummer day by the various nationalities. There has been no change in the general operating conditions. The movement of ore from the mines continues to be far below normal.

The Pabst mine was shut down several days due to an accident to the electrical haulage system. For three years or more this mine has had great difficulty in keeping its levels open for haulage. Although new ground, it is very heavy, due to operations in the Newport mine adjoining, and in several places the bottom comes up and the back comes down. About seventy men are employed in this non-productive repair work.

MINNESOTA

Cuyuna Range

Cuyuna—Wiston Dear Co. has started to load manganiferous ore from the Sagamore with a drag-line excavator. The drainage drift, 95 ft. below the lowest point of the pit, has been advanced 300 ft. north under the orebody.

JOPLIN-MIAMI DISTRICT

Oklahoma-Missouri-Kansas

Baxter Springs, Kan.—The Tampa Mining Co. has purchased the Brown Bros. lease and concentrator, located just southeast of the U. S. Smelting Co.'s mill about five miles west of Baxter. The mine was opened and the mill built in 1917 by J. Wise Brown, of Tulsa, and Frank Brown, of Kansas City, and was first known as the Brown-Head mine. It has been a steady producer, though not notably rich. G. C. Warren, of Tampa, Fla., is the principal in the Tampa company and will be general manager.

The Chanute Spelter Company's new mine on the Hartley land, west of Baxter, Kan., is proving the best of the year in the district. It is just being opened up, so its recent feat in turning out 475 tons of concentrates in the week ended June 12 is worthy of note. The company, which is a subsidiary of the American Metal Co., has spent over a million dollars in development work on the land, most of this amount going for pumping operations, so the success is deserved. It is expected that four or five other mines will be opened in the vicinity before winter.

Joplin—Drury Adams, of Batesville, Ark., has taken over the controlling interest in the Louisiana mine, four

miles southwest of Joplin, and will actively manage the property. Steam power will be changed to gas at once. The mine is located in an entirely new field in the Joplin camp, and though not fully developed, has given promise of being a steady producer. Operations are carried on at 150 ft., where faces 7 ft. in height have been developed.

Picher, Okla.—To aid the district in its trouble with frequent car shortages, the Mineral Belt R.R., with headquarters in Miami, has recently ordered 300 new freight cars and expects deliveries to start immediately.

MONTANA

Anaconda Continues To Bar I. W. W.—Men More Efficient at North Butte

Butte—Little improvement in production is looked for this month from Anaconda as compared with May when the output showed a falling off of 6,100,000 lb. of copper as against the yield for April. If so disposed, Anaconda could employ more men, but such a course might entail a departure from its announced policy of barring employment to all the I. W. W. and other radicals, and it is proposed to worry along to weed out the reds, as it is believed that they cannot continue to agitate in the Butte district if they are unable to live there.

The high-grade orebody recently uncovered during the sinking of the Stewart shaft will be crosscut from the 3,800-ft. level.

The orebody which the Davis-Daly has opened on the 2,500-ft. level of the Colorado mine is attracting much attention locally in view of its high grade. This ledge strikes into the property of the Butte & Ramsdell for 250 ft. and the Davis-Daly has concluded a satisfactory arrangement whereby it will hoist the ore. Notification has been given the Butte & Ramsdell to assemble its working forces and start production. Cutting of the No. 2 vein on the 2,700-ft. level is expected soon.

Stoping operations on the 500-ft. level of the Main Range mine of the Tuolumne has opened a 5-ft. body of native silver ore. Crosscutting for the Rory O'More vein on the 1,200-ft. level has been suspended temporarily, the face being about 25 ft. from the fissure.

A marked increase in efficiency is the outstanding feature of the operations of the North Butte company, it being estimated that 700 men now are doing the work formerly done by 1,000. Retimbering of the Speculator shaft in sections is in progress. The company plans to sink this to the same depth as that of the Granite Mountain, which is down 3,800 ft., and to connect the two shafts. Concreting of the Speculator shaft is also proposed. A part of it has already been fireproofed.

Shipments from the Crystal Copper's Goldmsith mine are ranging around 500 tons monthly, with the ore running well in silver. The ore is principally coming from the 600-ft. level and the workings above.

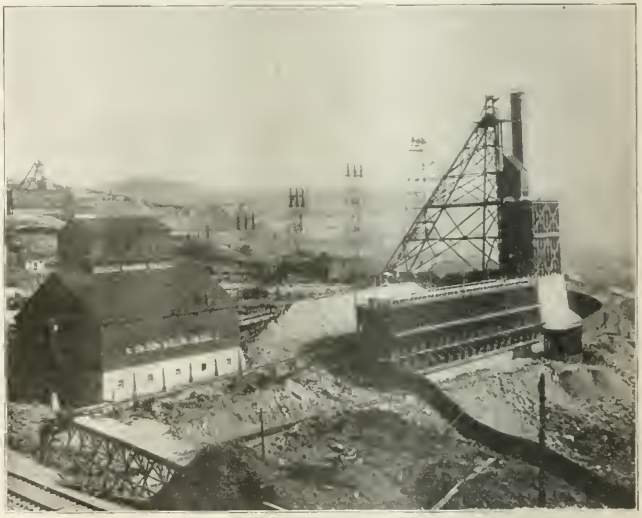
What appears to be a good deposit of copper ore has been opened at the Butte-Duluth property, which is being operated by the Mines Operating Co. Shipments are being made to the Anaconda leaching plant.

Sinking of the Plutus shaft of the Butte & Plutus is under way from the 200-ft. level to the 400 at which depth it is planned to drive the first crosscut to the Norwich orebody.

Champion district—High-grade silver ore recently cut at a depth of 450 ft. in a tunnel being driven to reach a point under the workings of the old Champion mine is showing a width of four feet, and carrying about 200 oz. of silver and a comparatively high gold content. The orebody thus far has been cut at two points 50 ft. apart. from where laterals will be run north and south, with east and west crosscuts at intervals. This is one of H. G. Humphrey's allied corporations. It is capitalized at 2,000,000 one dollar shares.

Battle Mountain—Ten shafts have been sunk to bed rock in the Copper Basin placers and from the bottom of one a crosscut is being run to determine the channel's width. Water is scarce and machinery is being installed to pump from a deep shaft in a nearby quartz mine. This property has been idle for six or more years owing to litigation.

Pioneer—Consolidated Mayflower and other companies using distillate for generating power have been notified by the Standard Oil Co. and other concerns that a sufficient supply of distillate will not be available in future; therefore it is necessary to remodel the distillate-burning engines at the Mayflower to burn crude oil. The work of making these changes has been started.



Schoettner Studios, Butte

GRANITE MOUNTAIN MINE PLANT, NORTH BUTTE MINING CO., BUTTE, MONT.

Elkhorn—Foundations for the 500-ton mill of the Boston & Montana company have been completed.

Corbin district—The property of the Alta-Montana has been leased to L. S. Roper, of Helena, who will continue driving a crosscut on the 1,300-ft. level with the old Alta vein the objective.

Unwatering of the 400-ft. shaft of the Corbin Copper King claim is to begin shortly.

Helena—A compressor plant and ore bins have been installed in the Soler Mining Co.'s Stemwinder property.

NEVADA

Paramount Comstock To Work Central Group

Virginia City—The Paramount Comstock Mines Co., recently incorporated, has secured the mineral rights to a depth of 1,000 ft. on the ground owned by the Best & Belcher, Gould & Curry, and the Savage, collectively known as the central group. A tunnel will be driven to the center of the orebody,

Manhattan—A drift from the White Caps shaft has cut the vein east of the fault on the 800-ft. level. The shaft will be sunk 200 ft. deeper.

Hamilton—J. D. Tilford, who is working a lease on the Midvale, has contracted with the smelter at Midvale, Utah, to treat 200 tons of silver-lead ore a month. The Midvale is equipped with a 75-ton concentrator.

Eureka—The receiver of the defunct Bank of Eureka, which failed ten years ago, has given an option on the Ricco Homestead mine to W. A. Simpkins, of San Francisco. One of the provisions is that $1,000 must be expended monthly on development work.

Winnemucca—The new compressor at the Rexal mine is now in commission.

Pioche—The Black Metals is sacking 50 tons of ore daily from the 325 north level. The last carload shipped averaged 285 ozs. of silver per ton, 25 per cent lead, with some gold and copper.

Tule Canyon — The Silver Hills Nevada Mines Co. has exercised its option on the Jaggers mine and has also met the first payment on the Ingalls mine, adjoining. A 5-stamp mill is working on the oxidized surface ores taken from both properties in sampling. These have averaged $20 a ton.

Ryepatch—Six feet of ore on the Boardinghouse vein has been uncovered in virgin ground on the Ryepatch mine, below the old workings.

NEW MEXICO

Lordsburg—The fluorspar industry in this vicinity has received an impetus through the firm of H. C. Humphreys & Co., of Chicago, which has contracted for all the fluorspar produced. This includes the output of the Great Eagle mine here, the Luckey properties near Duncan, Ariz., and mines near Hatch, N. M., where a representative, M. C. Myers, formerly of Pittsburgh Pa., will be stationed, to handle spar from the Rio Grande Valley.

PLANT AND DUMP AT PORTAL OF MAIN TUNNEL OF BOSTON & MONTANA COMPANY AT ELKHORN, MONT.

Two old copper properties, the Cobre Negro and the Nelly Bly, both patented, have been taken under a lease and bond by parties identified with large iron and coal interests of Cleveland, Ohio. A geologist is on the ground making an examination. This ground joins the 85 mine on the west and the Bonney-Consolidated property on the north.

SOUTH DAKOTA

Homestake To Send First Aid Team to Denver Meet

Lead—The Homestake Mining Co. will send a first aid and mine rescue team to the Bureau of Mines Meet at Denver this September.

Galena—The Horseshoe Comet mine has been leased to Grimshaw and Koenigsberger, of Deadwood. Work has been started putting the property in shape and shipments of lead-silver ores will be made to the smelter soon.

Deadwood—Work has been resumed at the Ironsides on Squaw Creek. Extensive development work will be started immediately and the company is preparing to continue work.

The Elder tunnel is nearing completion and should tap the workings of the Iron Hill mine during July. It will be over 1,300 ft. long and will drain the old workings, making them accessible to lessees. The mine was once one of the richest silver properties in the district.

CANADA

British Columbia

Road To Be Built Beyond Premier—Consolidated's Copper Smelter to Resume

By ROBERT DUNN

Stewart—Great activity is reported at the towns of Hyder and Stewart, respectively the American and Canadian gateways to the Salmon and Bear River mineral zones of Alaska and northern British Columbia. Real estate values have climbed and accommodation is at a premium. Every northbound vessel from Seattle and Vancouver has brought in many newcomers.

George Clothier, government mining engineer, has recently pointed out emphatically that there are but three actually proven mines in the northwest district, namely, the Premier, in the Salmon River section; the Dolly Varden, in the Alice Arm section, and the Engineer, in the Atlin district. There are many properties of an extremely promising character under development.

It is apparent that Mr. Clothier would warn operators and prospectors not to take too much for granted. Claim holders, he thinks, are apt to hold out for too high prices for prospects.

The construction of a road by the British Columbia Government from the Premier mine, Salmon River, to the Joker Flats and the reported decision of the United States authorities to expend about $100,000 this summer in opening up the American section of this mineralized zone should have important results in rendering the Portland Canal district of British Columbia accessible to prospectors and in facilitating the development of those properties on which work already is under way.

It is indicated that this road will meet the needs of a number important mining enterprises, among which are the Big Missouri Group, on which work has been in progress for over a year and which still is being vigorously prosecuted, the company intending to do about 12,000 ft. of diamond drilling within the next few months; the Mineral Hill, on which there has been nearly two years' work; the Hercules, which is to be opened up this summer, supplies already having been forwarded; the Silver Tip and Silver Crest, being developed by Vancouver City interests; and the several groups of claims of the Algunican Development Co.

The latter company controls a subsidiary known as the Northern Light Consolidated Group, with claims adjacent to the Premier mine, and it is planned to diamond drill this season. The company also has the Spider Group under option. It is situated on the west side of Long Lake, is equipped with an air compressor and other plant and will be opened up to a considerable extent as soon as weather conditions permit.

The Monitor group of claims, Salmon River, is reported to have been bonded by Vancouver interests.

Nelson—The annual meeting of the California Mining Co. was held recently at Nelson. Officers were elected as follows: President, John R. Cassin, Spokane, Wash.; vice-president, J. B. Schieger of La Crosse, Wis.; secretary-treasurer, W. B. Orndorff, Spokane; auditor, John Fraser, Nelson; mine superintendent, W. H. Turner, Nelson. Installation of new equipment in the Athabasca mill is progressing.

Trail—The site of the Consolidated's new concentrator has been definitely selected. It is between the towns of Rossland and Trail, on the hillside and within reach of an adequate and certain water supply. A spur line is to be built by the C. P. R. from Warfield to the new mill site, following a line surveyed by one of the Consolidated staff. This road will be down grade from Warfield.

The company's copper smelter is expected to resume operations immediately with one furnace. The Canada Copper will not be ready to ship concentrates to Trail before September.

The magnetic test mill, operated for some time on the Sullivan ores in competition with the Sullivan flotation mill, is being dismantled.

Ore shipments received at the Consolidated smelter during the week ended June 14 were as follows:

Mine	Location	Gross Tons
Bluebell	Rio [illegible]	192
Bell	Beaverdell	70
Emerald	Salmo	31
Electric Point	Boundary	110
Florence	Princess Creek	35
Jone	Rossland	115
North Star	Kimberley	345
Spokane Trinket	Ainsworth	20
Company Mines		5986
Total		6,913

Phoenix—The mining camp of Phoenix is gradually being dismantled. The Granby Consolidated has a crew of men removing its plant and shipping it to Grand Forks and elsewhere, twenty or thirty cars having been forwarded already. This work will not be finished before August, when the C. P. R. will remove its steel. Its depot is being taken away. The Great Northern has been busy in dismantling its railway line for the last month. Several buildings in the town also are being taken elsewhere.

H. S. Munroe, the newly appointed general manager of the Granby Consolidated Mining & Smelting Co. in British Columbia, before leaving to take up his work at Anyox made a public statement, which, in part, is as follows:

"I have just made an inspection of the Cassidy coal holdings on Vancouver Island. Cassidy is a miniature Gary and we expect to continue and expand our coal holdings at that point. The Granby company has achieved prominence in the mining world under its former management and our policy will continue to be one of progress. We hope to increase copper production at Anyox and to mine more coal at Cassidy.

"As to the Granby operations at Anyox it may be stated that the difficulties at the coke plant, incident to new operations of this character, are rapidly being overcome and in the course of a few weeks a satisfactory solution will be found which will make Granby entirely independent, as far as its coke supply is concerned."

Ontario

The Ontario Bureau of Mines will make a re-survey of the geological conditions of Cobalt this summer. The former survey by Prof. Willet G. Miller was found to be of very great benefit in the development of the mines, and it is believed that the extensive amount of underground work done since that time will prove of material aid in carrying on the re-survey. Cyril W. Knight, assistant Provincial Geologist, has been given charge of the work and is now in the field. He has selected the Beaver-Temiskaming area as a point of beginning. A careful examination will be made of surface and underground works, linking up each property, as the survey proceeds. It is hoped to complete the work this year.

It is stated that the British America Nickel Corporation, which blew in its new smelter at Nickelton in January, has found the cost of labor and supplies much higher than estimated. As the company's only certain market was in England, the government guaranteeing to take a certain tonnage for a certain number of years, the exchange situation is also no doubt a determining factor. The company is employing about 800 men and recently purchased a large number of water-Leyner drills.

Gowganda — At the Trethewey's Castle property a vein of good ore has been found to run directly under the office. The vein recently found near the lake edge is being developed, four shipments of ore having been made since operations were started.

Cobalt — Work has begun on the Ruby, adjoining the old Green-Meehan in Bucke Township, operations on which were discontinued in 1907 owing to financial difficulties. The workings have been dewatered. A strong calcite vein carrying milling ore is in evidence in the shaft.

The Victory has increased its capital from $500,000 to $2,000,000. M. R. Cartwright, formerly manager of the Adanac, has been appointed manager.

South Lorrain — An encouraging quantity of good silver ore has been cut on the lower levels of the Keeley. Drifting operations have been carried into the adjoining Beaver Lake property, which is under option to the controlling interests of the Keeley.

VENEZUELA

The Venezuelan government has granted a contract to an American citizen for the construction of an electric railway from San Felix, on the Orinoco River, to the Guasipati gold fields, as well as the rental of the Caroni River Falls to furnish the necessary hydroelectric power.

SIAM

Two dredges, which the Yukon Gold Co. formerly used in its Alaskan operations, have been received at the company's tin property in Siam. These will be set up as soon as possible and production should start toward the end of this year. The Yukon Co. has to date invested a large sum in its Siamese tin venture, from which it hopes to recoup some of its losses in gold mining and meet its outstanding obligations. The company will confine its Siamese activities to tin mining.

SMELTER OF GRANBY CONSOLIDATED MINING, SMELTING & POWER CO. AT ANYOX, B. C.

THE MARKET REPORT

Published in part in San Francisco and mailed from there to our Western subscribers as a special service without charge pending the arrival of the *Engineering and Mining Journal*

Silver and Sterling Exchange

June	Sterling Exchange	Silver: New York, Domestic Origin	Silver: New York, Foreign Origin	Silver: London	June	Sterling Exchange	Silver: New York, Domestic Origin	Silver: New York, Foreign Origin	Silver: London
24	396	99½	90	50¼	28	396	99½	93	53
25	396	99½	90	50¼	29	394½	99½	92	52½
26	396	99½	90	50½	30	394	99½	91	52

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

On the authority of the Secretary of the Treasury, we quote 100c. per oz. for silver, 1,000 fine, delivered at the option of the Director of the Mint to the New York Assay Office or to the mints in Philadelphia, Denver, or San Francisco, and proved to the satisfaction of the Treasury Department to have been mined, smelted, and refined in the United States. This quotation is retroactive to May 13.

Daily Prices of Metals in New York

June	Copper: Electrolytic	Tin: 99 Per Cent	Tin: Straits	Lead: N. Y.	Lead: St. L.	Zinc: St. L.
24	17.85	45.50	47.00	8.15	7.90	7.40
25	17.85	45.00	47.00	8.15	7.90	7.40
26	17.90	45.50	47.75	8.15	7.90	7.40
28	18.00	45.50	48.75	8.15	8.00	7.45
29	18.10	45.50	48.75	8.25	8.10	7.50
30	18.10	45.00	48.00	8.40	8.20	7.55

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for prompt and nearby deliveries constituting the major markets, reduced to the basis of New York, cash, except where St. Louis is the normal basing point. All prices are in cents per pound.

Copper is commonly sold on terms "delivered," which means that the seller pays the freight from refinery to buyer's destination. The delivery cost varies, and it would be confusing to figure net prices on individual transactions. Consequently, an average deduction is made from the "delivered" price. At present the average cost of delivery from New York refineries is 0.15c. per lb., and that deduction is made to arrive at the New York price. When copper is sold f.o.b. or f.a.s. New York, of course no deduction is made.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of spot American tin, 99 per cent grade, and spot Straits tin.

London

June	Copper: Standard Spot	Copper: Standard 3 M	Copper: Electrolytic	Tin: Spot	Tin: 3 M	Lead: Spot	Lead: 3 M	Zinc: Spot	Zinc: 3 M
24	84½	86½	99	247½	250½	32¼	33½	39¾	41½
25	83¼	86	99	245	247¾	31	32¾	39¼	41¼
26	....	....	...	....	....	...	...	...	...
28	84¾	87¼	99	244¾	246¾	32	33¼	38¾	40¾
29	85½	88	99	246¼	250¼	32¾	33¾	39½	41½
30	86½	89	99	246	251	33	34¼	40½	42½

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York, June 30, 1920

But little real change can be chronicled in the metal market for the last week. The volume of sales was even less than usual. However, a more hopeful feeling seems to be in evidence, no doubt inspired by the stronger tone of the London market during the last three days.

Copper

Second-hands seem to be momentarily fairly well sold up, and there was a disposition, both with them and on the part of the smaller producers, to raise prices about ⅛c. over those quoted last week. Whether or not the price will be allowed to drop back in July remains to be seen. The position of the large producers is unchanged. The principal consumers overbought early in the year, for they were unable to use as much metal as they expected, owing to unsettled industrial conditions.

Export business is little changed. It amounts to something like 40 per cent of domestic production, compared with about 50 per cent before the war.

Lead

Lead is decidedly quieter. Prompt metal is still in demand, and the price we quote holds in general for July deliveries. August lead has been sold as low as 7.50c., St. Louis, but is in no great demand. A 1,000-ton lot of Penarroya lead has been offered for prompt shipment from Spain at 7¼@7⅜c., duty paid, New York, but found no takers. This could doubtless be delivered here early in August, but the quantity seems to be too large to be assimilable.

Monthly Average Prices for June

Copper:	
New York Electrolytic	18.065
London Standard	87.864
London Electrolytic	101.909
Lead:	
New York	8.323
St. Louis	8.169
London	34.330
Silver:	
New York	90.957
London	51.096
Sterling Exchange	393.663
Zinc:	
New York	7.815
St. Louis	7.465
London	41.193
Tin:	
99 per cent	46.125
Straits	48.327
London	250.614

Zinc

London accounts seem to be nearly liquidated, and the price is slowly improving, a tendency which is expected to continue. It may not be long before London again will be a buyer in the local market. A decreasing supply, due to partial stoppage of work in the Joplin mines, will also tend to better prices. On the other hand, the sheet mills have a demand for unionization of all shops which they must meet, and are likely to decide on closing down as an alternative to taking this step. Should this occur consumption would be decreased considerably, at least temporarily. Also, it must be remembered that we are away above London parity, today's London price being equivalent only to about 6.80c., St. Louis.

Tin

This metal has been inactive, and there seems to be no reason for the daily fluctuations. Spot Straits is none too plentiful. A boat arrived yesterday with 1,350 tons, but it is stated that most of this has been sold to tin-plate mills in the Pittsburgh district. Some of it, however, may be resold in case of a shortage. Electrolytic has been unusually quiet, marked discounts over Straits not tempting consumers. The strike at the A. S. & R. tin refinery was quickly settled.

Straits tin for future delivery: June 24th, 46¼@46½c.; 25th, 45¾@46¼c.; 26th, 46¼@47c.; 28th, 46½@47c.; 29th, 46½@47c.; 30th, 46½@47c.

Arrivals of tin in long tons: June 23d, Bristol, 235; Rotterdam, 200; 24th, Liverpool, 25; 25th, London, 75; 28th, London, 50; 29th, Straits, 1,350; London, 100.

Silver

Eastern exchanges still show lack of firmness. The future of silver depends to a large extent on the China situation. The export trade still continues dull, with no movement of bullion of importance to the East. Shanghai stocks remain unchanged. Tenders of "domestic" silver to our Mints at $1 per oz. 1,000 fine are now in operation.

Mexican Dollars, June 24, 68⅜c.; 25th, 68¾c., 26th, 68¾c., 28th, 70c.; 29th, 69¾c.; 30th, 68¾c.

Gold

Gold in London on June 24th, 104s.; 25th, 103s. 7d.; 28th, 103s. 7d.; 29th, 104s.; 30th, 104s.

Foreign Exchange

No outstanding changes mark the foreign money market during the last week except a decline in Indian rupees from 38.25c. a week ago to 35.25c. yesterday and a decline of Brazilian rios from 26½c. to 23.62c. In units to the dollar, francs were quoted on Tuesday at 12.20 and lire at 16.97. German marks, 2.60c, and New York funds in Montreal, 12⅝c. premium.

Other Metals

Aluminum—Ingot, 33c. per lb., with 32@32½c. open market for 98@99 per cent virgin.

Antimony—Market continues weak. Spot, 7½@7¾c. per lb.; Cookson's "C" grade, 14c. Chinese and Japanese brands, 7¾@7¾c. W. C. C. brand, 8c.

[1]**Antimony, Needle**—Chinese needle antimony, lump, firm at 9½c. per lb. Standard powdered needle antimony (200 mesh), 12 to 15c. per lb. Unchanged.

Bismuth—$2.70 per lb., 500-lb. lots. Market very quiet.

Cadmium—Nominal, $1.40@$1.50 per lb. Unchanged.

[1]**Cerium Metal** — Ingot form, $8@$9 per lb.

Cobalt—Metal, $2.50 to $3 per lb.; black oxide, $2 per lb.

Iridium—Nominal, $300 per oz. No business.

Magnesium—Metallic, 99 per cent or over pure, $1.60@$1.85 per lb., f.o.b. Niagara Falls.

[1]**Molybdenum Metal** in rod or wire form, 99.9 per cent pure, $32@$40 per lb., according to gage.

Nickel—Ingot, 43c.; shot, 43c.; electrolytic, 45c.; Monel metal, shot, 35c.; blocks, 35c., and ingots, 38c. per lb.

Osmium—Open market, $50@$75 per troy oz.

Palladium—$75@$85 per oz.

Platinum—Market weak at $80@$90 per oz. Little business transacted.

Quicksilver—Market steady; $90 per 75-lb. flask. San Francisco wires $85. Steady.

Ruthenium—$200@$220 per troy oz. Unchanged.

[1]**Selenium**, black, powdered, amorphous, 99.5 per cent pure, $1.75@$2 per lb.

[1]**Thallium Metal**—Ingot, 99 per cent pure, $18@$20 per lb.

Metallic Ores

Bauxite — Containing about 52 per cent alumina, less than 2 per cent iron oxide and up to 20 per cent silica, and artificially dried to contain not more than 4 per cent free moisture, $10 per gross ton at mine; 54 per cent alumina and about 15 per cent silica, $11; averaging 57 per cent alumina, 8 to 12 per cent silica, less than 3 per cent iron oxide, $13 on basis of 8 per cent free moisture. Ores of very low silica content suitable for manufacture of aluminum oxide and hydrate of alumina command a fancy price.

Chrome Ore—Guaranteed 50 per cent Cr_2O_3 foreign ore with a minimum of 6 per cent silica, 72@80c. per unit, New York. California concentrates, 50 per cent Cr_2O_3 and upward, 60@65c. per unit, f.o.b. mines.

Iron Ores—Lake Superior ores, per ton, delivered at Lower Lake ports; Old Range bessemer, $7.45; Old Range non-bessemer, $6.70; Mesabi bessemer, $7.20; Mesabi non-bessemer, $6.55. Producers and consumers are protesting proposed increased freight rates.

Manganese Ore—85@90c. per unit, 50 per cent Mn content, c.i.f. Atlantic seaport; chemical ore (MnO_2) $75@$85 per gross ton.

Molybdenum—85 per cent MoS_2, 85c. per lb. of contained sulphide.

[1]**Tantalum Ore**, guaranteed minimum 60 per cent tantalic acid, 65@70c. per lb. in ton lots.

Titanium Ores—Ilmenite, 52 per cent TiO_2, 2c. per lb. for ore. Rutile, 95 per cent TiO_2, 20@25c. per lb. for ore, with concessions on large lots or running contracts.

Tungsten Ore—Scheelite, 60 per cent WO_3 and over, per unit of WO, $7 f.o.b. mines; wolframite, 60 per cent WO_3 and over, per unit of WO_3, $6.50@$7.50 f.o.b. mines.

Uranium Ore (Carnotite)—$2.75@$3 per lb. for 96 per cent of the contained oxide (U_3O_8). Ores must contain a minimum of 2 per cent U_3O_8.

Vanadium Ore—$1 to $2.50 per lb. of metallic vanadium content.

Zircon—Washed, iron free, 10c. per lb. Zirkite—$90@$100 per ton, carload lots. Pure white oxide, 99 per cent, is quoted at $1.15 per lb. in ton lots.

Zinc and Lead Ore Markets

Joplin, Mo., June 26—Zinc blende, per ton, high, $48.10; basis 60 per cent zinc, premium, $46; Prime Western, $45; fines and slimes, $42.50@$40; calamine, 40 per cent zinc, $36. Average settling prices: Blende, $42.32; calamine, $36.78; all zinc ores, $42.25.

Lead, high, $101.60; basis 80 per cent lead, $92.50@$90; average settling price, all grades of lead, $100.36 per ton.

Shipments the week: Blende, 10,310; calamine, 127; lead, 2,169 tons. Value, all ores the week, $658,710.

Shipments for six months: Blende, 297,580; calamine, 4,978; lead, 46,349 tons. Value, all ores six months, $19,894,930. The shipment is an increase of 26,419 tons blende and 8,060 tons lead; decrease, 2,262 tons calamine. The increased value is $6,660,000 over the first six months of last year.

Buyers held out until 10 o'clock today on offerings of $43.50 basis Prime Western, but advanced to $45 since that hour, sellers declining to accept less.

Producers claim 90 to 95 per cent of the production will be down the next two weeks. Buyers acknowledge there will be 60 per cent reduction in output. Mine owners have organized a two weeks' holiday, and it is claimed that it will be nearly general.

Platteville Wis., June 26—Blende, basis 60 per cent zinc, $49 base for high-grade. Lead ore, basis 80 per cent lead, $90 per ton. Shipments for the week: Blende, 1,076; lead, 267; sulphur ore, 65 tons. Total shipments of blende and calamine for the first half of the year show a decrease of 26 per cent from the corresponding figures of 1919. Shipped during the week to separating plants, 2,982 tons blende.

Non-Metallic Minerals

Asbestos — No change since last issue.

Barytes — Crude, 88 to 94 per cent barium content, $8@$10 per net ton; ground (white) $22@$25 in bags, carload lots; (off-color) $18@$20 in bags, carload lots; all f.o.b. Kings Creek, S. C. Crude, 88 to 94 per cent, $12 per gross ton; ground (white) $25@$25; ground (off color) $16@$19 per net ton, f.o.b. Cartersville, Ga. Crude, 88 to 94 per cent, $23; ground (white) $40.50; ground (off color) $27 per net ton, less than carload lots, f.o.b. New York.

Chalk—Domestic, extra light, 5@6c. per lb.; light, 4½@5½c.; heavy, 4@5c; English, extra light, 5@7c.; light, 5@6c.; dense, 4½@5c. per lb., all f.o.b. New York.

China Clay (Kaolin)—Imported lump, $25@$35; imported powdered, $30@$60; domestic lump, $10@$20; domestic powdered, $25@$30, all per net ton, f.o.b. New York. Crude, $8@$12 net ton, f.o.b. Virginia points; ground, $15@$40 net ton, f.o.b. Virginia points.

Feldspar—Crude, $7.50@$8 per gross ton, f.o.b. Maryland and North Carolina points; $7.50@$10 f.o.b. Maine; ground, $22@$25, car lots, f.o.b. Baltimore; ground, $16@$20, f.o.b. North Carolina points; $16 to $20 per ton, No. 1 ground, f.o.b. New York State.

Fluorspar—Standard grade, domestic washed gravel, f.o.b. Illinois and Ken-

[1] Furnished by Foote Mineral Co., Philadelphia, Pa.

tucky mines, $25 per ton; lump, $17.50, f.o.b. Tonuco, N. M.

Fuller's Earth—Domestic, granular, $25; powdered, $18, f.o.b. mines, Florida; imported, powdered, $35@$40 per ton.

Graphite—Crucible flake, 85 per cent carbon content, 8c.; 88 per cent, 9½c.; 90 per cent, 10½c., all f.o.b. New York. Mexican, amorphous, $45@$55 per short ton; Korean, 3¼c. per lb.; Madagascar, 8c.; Ceylon, 4¾@15½c. There has been no change of note in the Alabama graphite market since the last report. Demand for small quantities of lubricating grades continues to come in, and a large number are repeats. The prevailing price of this material in packages is 25c. per lb. Car lots can be sold at any time, with the tendency toward higher prices. Dust grades continue about as previously quoted.

Gypsum—Raw crushed rock, $3.50@$4 per ton; raw ground fine, $4@$4.50; calcined stucco, $9, all f.o.b. works. Containers extra. Wholesale, plaster of paris, carload lots, $3.75 per 250-lb. bbl., alongside dock, New York.

Kaolin—See China Clay.

Limestone—For fluxing, $1.65@$1.75 per net ton, f.o.b. Howellville, Pa. Dolomite, 1@2 man size, $1.60@$1.65; 2@8 in., $1.55@$1.65 per net ton, f.o.b. Plymouth Meeting, Pa

Magnesite Brick—See Refractories.

Magnesite, Calcined — High-grade caustic calcined, lump form, $35@$40 per ton, carload lots, f.o.b. California points. Freshly ground calcined, suitable for flooring trade, $65@$75 per ton, f.o.b. Eastern points.

Magnesite, Dead-Burned—$32.50 per net ton, Chewelah, Wash.; $50@$60, Chester, Pa.

Mica—Imported block mica slightly stained, per lb.: No. 6, 50c.; No. 5, $1.20 @$1.40; No. 4, $2@$3; No. 3, $4.25@ $5; No. 2, $5.50@$7; No. 1, $8. Clear block: No. 6, 55c.; No. 5, $2; No. 4, $4; No. 3, $5.75; No. 2, $7; No. 1, $9; A1, $14; extra large, $25, all f.o.b. New York; ground, $85@$100 per ton, Philadelphia.

Monazite — Minimum of 6 per cent thorium oxide, $42 per unit, duty paid.

Phosphate Rock—Per long ton, Florida ports, 68 per cent tricalcium phosphate, $6.85; 70 per cent, $7.35; 74 to 75 per cent, $10; 75 per cent minimum, $10.50; 77 per cent minimum, $12.50.

Pumice Stone—Imported, lump, 4@ 5c. per lb.; domestic lump, 6c.; ground, 4@7c., all f.o.b. New York.

Pyrites—Spanish, fines, per unit 12c. c.i.f.; furnace size, 16½c.; run of mine, 12@14c.; domestic, fines, f.o.b. New York, 12@14c.

Quartz—(Acid tower) fist to head, $10; 1¼ to 2 in., $14; rice, $17, all net ton, f.o.b. Baltimore; lump, carload lots, $5@$7.50 net ton, f.o.b. North Carolina mines.

Sulphur—Unchanged; $18 per ton for domestic; $20 for export, f.o.b. Texas and Louisiana mines.

Talc—Paper making, $9.50@$14 per ton; roofing grades, $8@$9; rubber grades, $9@$15, all f.o.b. Vermont. California talc, $20@$35, talcum powder grade. Southern talc, powdered, carload lots, $12 per ton; less than carload, $15, f.o.b. cars. Freight to New York, $5.25 per ton, carload lots; less than carload lots, $9.25. Imported, $60 @$70.

Mineral Products

Arsenic—White arsenic, 14@15c. per lb.; sulphide, powdered, 20@21c. per lb., f.o.b. works.

Nitrate—Soda, $3.85 per cwt., ex vessel, Atlantic ports. Market quiet.

Potassium Sulphate—Domestic, $2.25 @$2.50 per net ton, basis 90 per cent, f.o.b. New York.

Ferro Alloys

Ferrocarbontitanium—For 15-18 per cent material, $200@$250 per ton, f.o.b. Niagara Falls, N. Y. Unchanged.

Ferrocerium—Per lb., $12@$15. Foreign conditions as affecting the price of American goods remain unchanged.

Ferrochrome—Carload lots, spot and contract, 60 to 70 per cent chromium, 6 to 8 per cent carbon, 19@20c. per lb. of chromium contained; 4 to 6 per cent carbon, 20@21c.

Ferromanganese—For 76@80 per cent, $250 spot; $225 prompt; $200 contract, freight allowed; Spiegeleisen, 18 to 22 per cent, $75, f.o.b. furnace.

Ferromolybdenum—Standard grades, carrying from 50 to 60 per cent molybdenum metal, with low sulphur, phosphorus, and arsenic, $2.25@$2.75 per lb. of contained metal.

Ferrosilicon—For 10 to 15 per cent, per gross ton, f.o.b. works, $60@$65; 50 per cent, $80@$90; 75 per cent, $150 @$160.

Ferrotungsten—70 to 80 per cent W, 90c.@$1.10 per lb. of contained tungsten.

Ferro-uranium—35-50 per cent U, $7 per lb. of U contained.

Ferrovanadium—Basis 30-40 per cent, $6.50@$7.75 per lb. of V contained.

Metal Products

Copper Sheets—No change in Jan. 7 price of 29½c. per lb.; wire, quoted 22@22½c.

Lead Sheets—Full lead sheets, 12¼c.; cut lead sheets, 12½c. in quantity, mill lots. Unchanged.

Nickel Silver—Unchanged at 39½c. per lb. for 18 per cent nickel.

Yellow Metal — Dimension sheets, 26¾c.; sheathing, 25¾c.; rods, ⅜ to 3 in., 23¾c. Unchanged.

Zinc Sheets—$12.50 per 100 lb., less 8 per cent on carload lots, f.o.b. smelter; zinc plates, 12c. per lb. Unchanged.

Refractories

Bauxite Brick—56 per cent alumina, $145 per 1,000, f.o.b. Pittsburgh.

Chrome Brick—9-in. straights and sizes, $80@$90 per net ton, Baltimore;[1] 9 x 4½ x 2½ in., $90, Chester, Pa., carload lots.

Chrome Cement—45 to 50 per cent Cr_2O_3, in sacks, $50 per net ton, Chester, Pa., carload lots.

Clay Brick — First-quality fireclay, per 1,000, $45@$55, Pennsylvania; $40 @$50, Kentucky; $40@$50, Ohio; $45, St. Louis; $75, New Jersey; second quality, per 1,000, $35@$45, Pennsylvania; $30@$40, Ohio.

Magnesite Brick—9 x 4½ x 2½ in., $90 per net ton, Chester, Pa.; 9-in. straights, $90, Baltimore; 9-in. sizes and shapes larger than 9 in., regular extras. (For dead-burned see Magnesite.)

Silica Brick—Nine in. and 9-in. sizes, per 1,000, $51@$55, Birmingham, Ala.; $50@$55, Mount Union, Pa.; $55, Chicago district.

[1]Furnished by Foote Mineral Co., Philadelphia, Pa.

Iron Trade Review

Pittsburgh, June 29, 1920

The Amalgamated Association at the last moment made overtures to the sheet and tin mills that have hitherto signed its scale, for another conference, and the conference begins its sessions today at Columbus, Ohio. The change of front is presumably due to many of the men assuring the officials that they did not wish a strike. Another factor probably was the reported compromise whereby the A. F. of L. will give the Amalgamated Association a 51 per cent representation on the new iron and steel industry organizing committee it is to set up, pursuant to resolution at the recent Montreal convention.

All branches of the iron and steel market continue quiet. Except for buying from the Steel Corporation, consumers preserve a conservative attitude, limiting their commitments to such early deliveries as they feel they must have. Prices for prompt shipment continue to soften, lessening the premiums over late deliveries, which show practically no decline. Most buyers evidently feel that eventually the whole steel market will decline to the Steel Corporation prices, which are those of the Industrial Board schedule of March 21, 1919.

Pig Iron—A sale of 2,000 tons of bessemer, delivery over two or three months, sets the market at $44, Valley, as minimum, or $1 advance, and a somewhat similar sale of basic sets that market at $44, Valley, a 50c. advance. Foundry remains at $45, Valley. The market remains quiet.

Steel—The market continues quiet, with prices nominal, at $60@$65 for billets and $75 for sheet bars.

Charcoal and Coke

Charcoal—Willow, 7c. per lb. in bbls.; hardwood, 4½c. per lb., in 250-lb. bbls.

Connellsville — Furnace, $14@$16; foundry, $15@$17.

New River — Furnace, $12.50@$15, and foundry, $12.50@$14 per ton.

Pocahontas—Furnace, $12.50@$13.50 per ton.

Wise County — Furnace, $12.50@$15 per ton; foundry, $12.50@$14 per ton.

COMPANY REPORTS

Chile Copper Co.

Copper; Chile

The outstanding feature of the fourth annual report of the Chile Copper Co. for the year ending Dec. 31, 1919, is the deficit of $287,794.78 on the books, in contrast to the surplus of $2,002,862.80 on Dec. 31, 1918. The report shows that this large American copper-mining enterprise in South America was by no means immune to the adverse influences bearing upon the industry, despite the ability of the company to produce low-cost copper. This poor showing would have been tempered considerably had the large unsold stocks of copper on hand Dec. 31, 1919, been disposed of at any price above the cost of production.

There was produced during the year 1919, 76,717,872 lb. of copper, compared with 102,136,658 lb. in 1918, a decrease of about 25 per cent in production, and of this copper 54,556,229 lb. was sold at 18.972c. per lb. The total book cost of this copper was 18.35c. per lb. compared with 17.56c. in 1918 and 21.23c. in 1917. The following comparative table indicates the composition of these costs.

The company's large stock of refined copper is carried at cost, which is according to the 1919 rulings of the Bureau of Internal Revenue, although, to a considerable extent, sold prior to the end of the year for delivery after Dec. 31. It is significant that had these sales been booked for future delivery at the sales price the year's operations would have shown a substantial profit for the Chile Exploration or operating company, instead of a loss of $1,762,703.96.

The combined statement of the Chile Copper Co. and the Chile Exploration Co. shows at the end of the year a surplus of quick assets over quick liabilities of $25,223,199.06 as against $22,924,058.42 at Dec. 31, 1918, an increase of $2,299,140.64.

The detail of quick assets and quick liabilities for 1919 is as follows:

QUICK ASSETS

Steamship investment	$458,991 27
Materials, merchandise, on hand and in transit	8,284,202 35
Deferred accounts	216,476 31
Accounts receivable	1,460,445 69
Ore and copper in process, 12,476,396 lb. at 5.953c.	742,372 11
Copper on hand and in transit, 56,329,835 lb. at 11.572c	6,518,377 26
Liberty loan bonds	2,000,000 00
Call loans	5,100,000 00
Cash	4,114,279 65
Total quick assets	$28,895,144 64

QUICK LIABILITIES

Accounts payable (including accrued interest on bonds)	$3,288,957 30
Deferred credits	302,929 92
Reserve for taxes	80,058 36
Total quick liabilities	$3,671,945 58
Net quick assets	$25,223,199 06

If the copper on hand and in transit were booked at say 18c. instead of at cost, the quick assets would be increased $3,620,993.04, an indication of the showing had these conditions prevailed.

The combined statement of Income and Surplus accounts summarizes operations as follows:

Operating revenue:		
Copper sold and delivered, 54,556,229 lb. at 18.972c		$10,350,167 44
Operating costs:		
Costs, f.o.b. plant yards (including depreciation)	$7,643,990 70	
Delivery and selling expense	1,085,965 20	8,729,955 90
Operating profit		$1,620,211 54
Other income:		
Dividends—Chile Steamship Co.	$500,000 00	
Interest and discount received	343,783 69	
Miscellaneous	25,093 63	868,877 32
Total income		$2,489,088 86
Charges against income:		
Taxes and miscellaneous charges	$395,556 67	
Interest on bonds of Chile Copper Co.	2,823,043 27	3,218,599 94
Loss carried to surplus account		$729,511 08
Charges against 1919 surplus:		
Amortization of discount on bonds	$140,000 00	
Depletion of ore reserves	1,355,507 63	
Plant superseded or abandoned, 1919	65,638 87	1,561,146 50
Loss from 1919 operations		$2,290,657 58
Surplus from operations previous to 1919:		
Balance Dec. 31, 1918, as stated	$2,787,881 69	
Less miscellaneous adjustments	785,018 89	
Net balance Dec. 31, 1918, as adjusted		2,002,862 80
Net deficit Dec. 31, 1919		$287,794 78

COSTS IN CENTS PER POUND

Copper Produced

	Pounds Produced	Plant Cost	Taxes, General Expenses and Miscellaneous	Estimated Selling and Delivery	Cost Expended, Selling and Delivery Included	Depreciation	Depletion	Total Book Cost
1916	41,305,477	11 75	0 61	3 10	15 46	3 48	2 94	21 88
1917	88,370,188	11 56	1 85	3 34	16 75	1 75	2 53	21 23
1918	102,136,658	10 22	0 85	2 23	13 30	1 75	2 51	17 56
1919	76,717,872	9 21	1 73	1 99	13 01	2 94	2 40	18 35

Copper Sold

Pounds Sold	Total Cost Development	Depreciation	Depletion	Total Book Cost
34,961,956	15 42	3 48	2 75	21 65
(a) 71,636,989	15 78	1 75	2 39	19 92
84,695,299	13 62	1 75	2 52	17 89
54,556,229	15 10	2 19	2 49	19 78

(a) In addition to the 71,636,989 lb. shown in copper sold in 1917 there was 14,074,317 lb. of 1916 production sold.

This statement shows the elimination of the net surplus of Dec. 31, 1918, of $2,002,862.80 and the substitution of a deficit amounting to $287,794.78, due chiefly to the fact that the large unsold stock of copper was carried at cost upon the books. The financial condition of the company would have appeared much brighter had this copper been sold above the cost of production or carried at a higher cost.

The calculation of ore reserves shows that there are 694,550,886 tons of positive and probable ore carrying 2.12 per cent copper in the company's property. The low value of the ore mined and milled during 1919 (1.62 per cent copper per ton) as compared with the estimated average value of the oxidized orebody as a whole, is due to the fact that the ore gradually increases in value with depth and that mining is still taking place in the comparatively poorer upper part of the orebody.

The plant is now capable of producing between 145,000,000 and 155,000,000 lb. of copper per year under normal operating conditions, but it is planned to enlarge this capacity when conditions warrant, in three stages: the first stage to approximately 194,500,000 lb. per year; the second to 214,500,000 lb. per year; and the third to about 303,500,000 lb. per year.

The per cent of net copper recovery in 1919 was 86.0, compared with 82.2 per cent in 1918.

America an International Miner

THE international aspect of American statesmanship has been preceded by a steady development of international character in the intellectual, social, and economic life of the United States. The machinery of government is only trying to adjust itself, with vast creakings of rusty and inactive parts, to a national condition. No truer example can be shown of the fact that the government does not direct the people, but that the people lead the government, in a democracy, than is disclosed by consideration of this fact.

We are an international people—probably no nation more so. We are international in our population and in our sympathies; we represent in a way within our own borders a prototype of the sometime World Republic, for men of all creeds and of all tongues live here together and work together in harmony. Whatever strivings and jostlings we may endure are not based upon national or racial prejudices or advantage.

Our business enterprise, the use of our capital, the play for the genius of our constructive builders and organizers, have long since leapt our boundaries. This is shown strikingly in our mining industry, which has become within a decade almost as international as that of England, and will be inevitably so in the future. In this national growth we want only fair play and equal rights, such as we expect at home: no American has any desire to have his government help him "hog" a province or a state, or help him to a monopoly anywhere. Our intrepid adventurers in mining are at work in all the continents: even in old Europe they are developing mines with American-born experience and with American breadth of operation.

Everywhere American capital and mining enterprise are welcomed by the peoples, because our record show that behind these there does not tread the ominous shadow of political domination. Jugo-Slavia sends to us an invitation and appeal for us to develop her mines. China trusts us, and looks to us as a model. Even distracted Siberia calls for our capital and our engineering skill in developing her great mineral wealth. We shall soon publish original articles embodying these requests. Not only Armenia has called for us, but even the Turks trust our fairness above that of all other nations, and would gladly welcome our guidance and our enterprise.

We can be, through our pioneering skill, the missionaries of the new democratic order of the world, more than we can with books or with statecraft. For the clear vision there can be no doubt, if one looks through the confusing murk of personalities and the back-and-forth swirling of imperfect political activities, of the forward progress of America, expressed, not by this President or that, but by the great powerful mass of Americans, evolving out of what seems at times confusion, a continually better and stronger form. We are reaching out for trade and for fields for our enterprise in all parts of the world, not from unworthy motives, but because it will be the spirit of the world for all nations to do this: for thus only can the greatest average efficiency and the maximum individual welfare be obtained. Our future development in South America will be most marvelous, and the result will be that the South American republics, instead of being put under a protectorate, governed and restricted for foreign political purposes, will become more powerful, advanced, and independent. That is the trend of our special genius, which no other country has yet attained. However much the tantalizing chaos in Mexico may have tried our patience we must conserve this ideal for Mexico also—that our influence (which should be stronger than we have made it) must be directed toward ultimately building up the dignity, stability, and independence of our sister republic. We want no more territory.

American capital is now developing vast copper deposits in South America, which may ultimately switch the world's center of copper production to that continent; and it is active in silver mining and in tin mining. In Asia it is reaching out in dredging fields for gold and tin, and planning the development of other mineral resources.

Our mining people should realize fully this international nature of our industry, and consider well whether tariffs protective of those portions of our mining industries which lie within our political boundaries are going to be beneficial, or prejudicial, to the whole industry in the long run. What would England gain by tariffs designed to force at an unnatural pace the mineral wealth of Great Britain—by putting a big tariff on the importation of tin from outside of England, for example? It would be a step toward commercial and national ruin. In the new rôle into which we have grown, the same principle will often apply. Rather the question of absolute efficiency will be found to be paramount—where can we buy or produce a certain metal cheapest, and where can we dispose of it to the best advantage?

It is not a question of cheap or high-priced labor: this is a minor element in these problems. A great American company operating in South America is engaged in far-sighted plans of educating its workmen to better things—to more expensive tastes, in a way—knowing and planning that this development will mean increased wages; but those directing it know that the increased efficiency of better and stronger men will more than offset the outlay. It is a question of full utilization of natural advantages—volume of ore, available power, ease of transportation—all inanimate things, which it is for the good of mankind to exploit to the maximum.

The Major Metal Quotations

WE HAVE before editorially sketched out the problem of the quotations of the major metals, and described the ways in which the various more or less independent quotations are obtained. We have described the method by which the *Engineering and Mining Journal* quotations are reached, why they are by far the best approximations of the actual average prices, and why they are necessarily lacking in perfection. We do not need to recur to this exposition, referring the readers to our issues of Feb. 7, 14, 21, and 28.

Journalism and the metal market were apparently relatively primitive when the *Journal* was founded. To this day, quotations for the minor metals and minerals are necessarily computed by consulting those dealers who are familiar with the market, and reflecting the average of the information obtained from them. In some instances, only one organization has the necessary data and oversight of the whole situation. Apparently, the major metal market was in somewhat this stage of development when the *Journal* was founded, and we understand that in the beginning its quotations were practically obtained from a single source. This situation obtained, we believe, virtually up to the administration of our immediate predecessor, who undertook to broaden the range of sources, so as to make it representative, and by averaging up data from various sources to arrive at an independent quotation. This system has been inherited and followed by the present administration, and has been expanded by the addition of further sources and checks. Thus a better and better approximation is being achieved. We have been successful in quoting prices which have been approved as substantially correct by those familiar with the market, both sellers and buyers.

In the long run, however, no approximation is satisfactory to our desires as engineers, and the trend of our efforts has been toward making the quotations exact. For this there is no machinery; moreover, we find certain sectors of the market, particularly in copper and lead, shut off (as they always have been) by the secretive policy of some powerful groups of producers. That is, certain elements which make up the market, and constitute in fact the majority factor in metals, co-operate closely with the *Engineering and Mining Journal;* but certain important factors avoid adequate and accurate co-operation.

We have carried this matter of increased accuracy as far as we can, and we do not regard the situation as satisfactory.

We recommend most strongly to the component factors in the metal market that they devise a method of establishing exact quotations. The *Engineering and Mining Journal* need not be considered in any such arrangement. We shall continue to quote metal prices—we have always done it, and we always shall; but we honestly would prefer not to quote as an "original authority." We shall proceed without interruption on our established methods; and if our prices are still accepted as authoritative, and official, we can only approve, as they are by far the best that can be had; but we earnestly recommend the establishment of a statistical clearing-house among metal producers, whereby the exact daily average of the metal markets can be computed statistically, without the gaps which dissatisfy us. The *Engineering and Mining Journal* would take pleasure in quoting figures so determined, and would take more pleasure in pointing out any defects in such an outside estimate than it does in criticising its own. There is no sufficient reason, it seems to us, why we should indefinitely continue to assume the responsibility of appraising the market.

Nickel Coinage in Australia

A RECENT message from Sydney states that Australia is about to join the great majority of the nations and colonies not only of the Northern but of the Southern Hemisphere, and introduce nickel coins in her subsidiary currency. A dispatch published in the New York *Journal of Commerce* indicates that the new pennies and half-pennies of nickel will go into circulation concurrently with the present copper coins, but that no more of the latter will be minted.

All who have had practical experience in the relative neatness, cleanliness, and convenience of small nickel versus clumsy copper coins—and those who have traveled first in England and then in Belgium or Germany could hardly escape it—will congratulate the Australian public on this great improvement.

However, the new Australian coins are to follow the general lead of India, Ceylon, and the Straits Settlements, where the corresponding coins are cut square, with rounded corners. It is supposed that Australia's choice of a square shape was in consideration of the economy it offers when cutting blanks from the metal sheets and in packing better when boxed. But blanks of hexagonal shape do not waste much metal, pack just as closely as squares, and offer a blunter angle than the square pieces. Perhaps the Indian government recognized the disadvantageous features in the square 2-anna nickel piece, for in 1908 the government minted its wavy-edged 1-anna nickel coin, which has twelve curved corners in place of four.

Incidentally, Australia's decision to use nickel for subsidiary coins will increase the demands on New Caledonia and British America nickel mines, at the same time relieving somewhat the copper situation in Australia. According to the large work published by the Mond Nickel Co., Ltd., in February, 1918, the economy that would be effected by decimalizing and substituting nickel for bronze in the coinage of the British Isles would give a profit of over half a million pounds sterling annually.

The Vanishing Gold Premium

NOT so very long ago the gold miners of South Africa were jubilant over the substantial premium they were receiving for their gold product. They had good reason for rejoicing, as one of the peculiar results of the economic readjustment following the war left them in a position to take advantage of the depreciated currency of their mother country. By selling their gold in a free market they were indirectly able to obtain more of their own depreciated paper currency in return for their gold bullion, a gold premium, so to speak, the amount depending upon, and see-sawing with, the foreign exchange value of the pound sterling. That this premium was not intangible, the increased value of the Rand mining stocks and the steady or increased gold output from that region attested.

The premium started at about 16 per cent, and, as the value of the pound sterling diminished, increased to 44

per cent—a gratifying compensation for the lean war years. Of late, sterling has been advancing, and consequently the premium has dropped, although it is still an appreciable factor.

Jubilation has turned into concern among the gold producers who are affected, for, faced with a possible further rise in the exchange value of sterling, the gold premium may conceivably become a negligible factor in stimulating production in the near future. Should this take place, the South African gold-mining industry will again be faced with the familiar gold miner's difficulties encountered during the war. Whether resort could then be had to legislation similar to that proposed in the United States at the present time, creating an excise tax on gold entering into the arts, is problematical.

The gold question was thoroughly discussed in South Africa by various commissions appointed for the purpose during 1918 and 1919, with no plan for substantial relief suggested. In fact, one of the strong points made in a report upon the subject laid considerable stress upon the advantage gold miners possessed in normal times in the steady price for their product.

The local South African technical press does not suggest, so far as we know, any plan like that embodied in the McFadden Bill, favoring the gold bonus. Instead, governmental assistance to lighten the gold miners' burden through easing of taxes is proposed. Appeals are addressed to the gold miners themselves, to increase the efficiency of their work, for South Africa has not been immune to the lamentable and universal decrease in labor efficiency during the last few years, and undoubtedly an increase in the willingness of labor to do its share, coupled with governmental aid in lowering taxes, will go far to cure existing troubles in this critical and absorbing situation in the world's foremost gold-producing district.

Public Schools and the Mining Camp

FOLLOWING the cry raised by many salaried workers in protest against inadequate compensation, the U. S. Bureau of Education points out the seriousness of conditions in the public schools and insists that they must be given consideration if the schools are to continue their present high standard. From the replies to inquiries made by the Bureau we learn that not fewer than fifteen thousand teaching positions in public high schools will be without properly qualified teachers next September.

It is fair to assume that the greater proportion of the shortage is due to the fact that more adequate compensation is offered in other branches of employment, and that many who might choose teaching as a vocation have been attracted elsewhere. For this, of course, there can be but one remedy unless the alternative of employing persons below the standard prescribed by experience and general practice is adopted. And this at best would be only putting off the evil day.

To a mining community the public school represents a power for good, and embodies the opportunity for the development of the highest type of citizenship. It is doubtful if any individual institution exerts a greater influence, and a tendency to keep this influence on anything but a high plane should not be condoned. Diversified interests are of course to be expected, and a mining community, in common with any other, embraces its cliques, its divisions, and its groups, all of which form combinations that make for separate lines of thought and detract to a great extent from the "get together" idea. Public-school activities have always offered the opportunity for a common ground; the school is the open forum, the nucleus of democracy, and the means whereby all factions can combine in a mutual purpose—that of the up-building of the citizen.

Probably no other industry contains a greater percentage of different nationalities than does mining, and this fact makes it all the more necessary that those who have the responsibility of the public-school guidance in mine communities should realize that the personnel must be of the best in order to meet conditions, which differ from other communities where the population is less mixed. It is a commendable fact that in districts where the mine operators have adopted a broad policy, and have taken a lively interest in public affairs, the schools are of a high order and every effort is made to procure high-grade teachers. The increased expense which has been necessary to maintain the schools under present-day conditions has been met cheerfully, with the realization that such institutions are most essential to the promotion of the public weal. In other districts where the tendency has been to curtail public-school expenses in anticipation of a recession of living costs, it is to be hoped that a realization of such a "penny wise, pound foolish" policy will come before it is too late.

The White-Collar Boys

A WHIMSICAL writer in one of the New York dailies observed that he found the economic problem simple for himself, if frankly viewed: If houses are high, don't buy them; sell them. If wages are too high, go to work and earn them. If stocks are too low, buy them; if they are too high, sell them.

Possibly some of this whimsical philosophy might help some of the white-collar class who find themselves between labor and capital, receiving lower wages and obliged to live more expensively than the class commonly denominated labor. If the clerk finds the house painter is getting double his pay, and can work in overalls, according to our writer's philosophy, he would see in it only an opportunity. Moreover, if he looks into the opulent labor class, he would find that many of these well-paid men have work that requires more training, skill, and intelligence than the work he himself does. He would find, in short, that the law of supply and demand is still working, and not a violation of it; and when there are more volunteers for a certain class of work, the price comes down. Most of the jobs he will, however, not volunteer for—although they may require more intelligence than his own job. He will find them, frankly, too strenuous.

This is the philosophy of a lot of our red-blooded college boys these days, in vacation time and after graduation. Finding labor well paid, they are reaping the benefits exultantly, and building thereon for their future career.

Money is only part of the consideration of any job. You are paid also, in certain jobs, by protection from the weather, or from dirt, by freedom from physical exertion, by convenient arrangement of work hours, and by the association with polite people. If all or any of these, plus the wage, isn't enough, the young man can usually get a larger wage by substituting cash for one of the valuable perquisites of his former job.

WHAT OTHERS THINK

The Lena Gold Mining Co., Siberia

I note in the issue of Jan. 10, 1920, of the *Engineering and Mining Journal*, statements by R. S. Botsford, in his article, "Mining Conditions in Russia," concerning the Lena Gold Mining Co.

I want to make clear the reference to the above-named property. The English company is known as "The Lena Goldfields"; the Russian company is "The Lena Gold Mining Co."

In 1915 I was employed by the Russian company to sample and advise with a view to improved methods of operation, i.e., using more mechanical and up-to-date methods. During 1916 and 1917 I was acting as consulting engineer in this work.

The facts are these: We proved during the three years 98,000,000 cu.yd. of dredgeable material, averaging value 31.2c. per cu.yd. The estimated costs were as follows:

	Cents per Cu.Yd.
Labor	.006
Power	.03
Amortization	.059
Repair	.024
Management	.05
Total	.169

This is about three times our costs at Dawson for the same kind of work.

The amount of proven ground would be equal to three 18-cu.ft. dredges with a life of thirteen years each. These were recommended, and one was ordered, and at last accounts was lying at Milwaukee, Wis., with the Bucyrus people, crated ready for shipment. The other two were advised, but, owing to conditions in Russia, orders were not placed.

These are the facts in the case, and I hope you will publish them. W. E. THORNE.

Maraguta, Northern Nigeria.

The Shannon Tailings and SO_2 Leaching

Referring to Mr. van Barneveld's letter published in your issue of May 22, I desire to state on behalf of the Shannon Copper Co. that that company is in no way responsible for any statements appearing in the article on "Leaching of the Shannon Tailings," contributed by W. L. Maxson, or, therefore, for deductions based thereon, in your editorial in the issue of April 10. I desire, however, to add that Mr. Maxson had the company's sanction to write an article, for publication, on his own views of the subject.

What appears to be known as the SO_2 process was tried on Shannon tailings by Messrs. Leaver and van Barneveld. The results were encouraging. Over 90 per cent of the *oxidized* copper contents was easily extracted. I thought so well of the possibilities of this process, in solving our very difficult problem, as to obtain permission of the directors of this company and enter into an understanding with the Bureau of Mines to erect a twenty-five-ton experimental plant. The fact that such had not been constructed before closing our operations in the Clifton district had no relation whatever to my opinion of the merits of the process.

The statement made in the same editorial regarding the Slater process is also misleading. This process was the most successful, metallurgically, of all that had been applied to the treatment of the Shannon tailings and low-grade semi-oxidized ores. That no experimental plant was erected was due entirely to the fact that in my opinion it did not offer possibilities of being commercially successful under our conditions, and did not reflect on the adaptability of the process to the treatment of our ores and tailings.

J. W. BENNIE,
General Manager
Gleeson, Ariz. Shannon Copper Co.

[The editorial referred to in this and Mr. van Barneveld's letters stated that none of the processes formerly tried on the Shannon ores had been successful. What was meant was that they had not been *commercially* successful, or that the tests had not offered sufficiently attractive possibilities of commercial success to be adopted.—EDITOR.]

More Hints to the Troubled Cyanider

In reference to your article by J. A. Carpenter, entitled "The Troubles of a Cyanider," in your issue of May 29, 1920, I wrote a short article which was published in *Mining & Scientific Press* in December, 1918, in which I tried to point out the fact that a cyanide solution will attack copper phosphate, taking the copper into solution and the phosphate forming an alkaline phosphate.

The action of nascent hydrogen in the zinc box, formed at the time of precipitation of the precious metals, tends to form a phosphine from the alkaline phosphate. This phosphine attacks the gold solution, precipitating the gold in a fine amorphous state and also, in combination with phosphorus and oxygen, as a flocculent grainy precipitate.

In many plants there is a selective precipitation in the zinc boxes; i.e., at the head of the box the gold precipitates out, then the silver, next copper, antimony, arsenic and other metals, which I believe is caused by the presence of these alkaline phosphates.

In three different plants with which I have been associated there has been serious trouble with the precipitation. I know that ore from parts of each mine carried considerable copper phosphate, and whenever that was encountered, our trouble was plenty.

My tests, using these solutions in a small test plant where the pregnant solution was pumped up into a storage tank (an emulsion of zinc dust being also fed to the intake of the pump), showed that the precious metal was practically all removed, together with nearly all of the copper and most of the other base metals, and I think those having precipitation troubles will be a long way on the road to freedom from such if they try to utilize zinc dust instead of the shavings.

Phoenix, Ariz. GEO. D. DIEHL.

The Swedish Iron Mines of Kiruna and Gellivare

Large Reserves of High-Phosphorus, High-Iron, Magnetic Ores, Situated Above the Arctic Circle Offer Favorable Mining and Marketing Conditions—Open-cut and Underground Methods Followed by Crushing and Magnetic Separation

By Charles W. Boise
Written for *Engineering and Mining Journal*

In OCTOBER, 1919, it was my privilege to make a casual visit to the famous Swedish iron mines of Kiruna and Gellivare. The following summary describes the main aspects of the deposits, and presents a record of recent operations in that renowned district.

GENERAL VIEW OF THE TOWN AND DOCKS, NARVIK, NORWAY

The Kiruna and Gellivare mines are situated in northern Lapland, Sweden, above the Arctic Circle. The two deposits are analogous in many respects. The ore at both mines is principally magnetite, with small amounts of apatite. The Kiruna deposit forms a dike-like mass which lies at a steep angle between walls of quartz porphyry and syenite porphyry. The Gellivare deposit occurs under similar general conditions, except that the rocks have been metamorphosed and have developed a schistose character.

The railway connecting the port of Narvik, on the Norwegian coast, with Luleä, on the Gulf of Bothnia, passes by both mines. This line connects at Boden with the line from Stockholm to Haparanda. Gellivare lies nearer Luleä, through which the majority of its output is shipped. Narvik is the shipping point for Kiruna ore. Both mines are controlled by the same group, the Trafiktiebolaget Grängesberg-Oxelösund.

The annual output of the mines is limited by law to a maximum of 1,300,000 tons for Gellivare, and 5,000,000 tons for Kiruna. The statute was promulgated in 1907, and continues in force until 1932, unless previously repealed.

Gellivare is the older mine, having been worked first in 1869. The output has become of importance, however, only since 1902, when the present company took control. The total production is about 25,000,000 tons, practically all of which has gone to Germany. The ore is exported through the port of Luleä, which is 127 miles from the mine. The port is ice-bound for about six months, from the latter part of November to the latter part of May. The annual output before the war was the maximum permited by law, 1,300,000 tons, but since 1915 the production has been much below this figure.

The Gellivare ore occurs in a series of connected lenses inclosed in schists of igneous origin. The length of the zone is three miles, and the average width of the lenses is about 180 ft. The general trend of the orebody is east-west, and the average dip is S. 65 deg. The developed reserves are estimated at 250,000,000 tons, with a further considerable amount of ore remaining to be developed by deeper boring. The lenses are mined to an average depth of 150 ft. by open-cut methods, below which shrinkage stoping is employed. At present, 25 per cent of the output is obtained from open cuts, and 75 per cent from underground mining.

Of the total amount mined, 75 per cent is clean ore ready for shipment, 15 per cent is concentrating ore carrying 45 per cent Fe, and 10 per cent is waste.

The clean ore is divided into three classes, A, B and C, according to phosphorus content. The A grade carries from 0.8 to 1.0 per cent P and from 61 to 62 per cent Fe. C grade carries under 0.3 per cent P and contains 65 per cent Fe, and B is a grade intermediate between A and C. The concentrating ore is reduced to 2 mm. by crusher and ball and tube mills, and is concentrated by magnetic separators of the drum type. This process yields a concentrate carrying about 0.3 per cent P. To reduce further the phosphorus content of the concentrate, arrangements are being made for finer grinding. The concentrate is shipped direct, without briquetting, to Germany.

PANORAMA OF THE ORE DUMPS, NARVIK, NORWAY. THI

High-Phosphorus Ore Salable to Germany

The dependence of the iron mines on Germany for the market of certain products brings out in sharp relief a phase of German pre-war industry which sometimes passes unnoticed. Not only did German manufacturers suit the finished product to the particular demand in the country of eventual market, but German industry accepted its raw materials in whatever form they could most conveniently be delivered by the producers. Thus the German steel industry readily purchased the high-phosphorus ores of Kiruna and Gellivare, which are undesired in other countries, and it furnished a good market for the unbriquetted iron concentrate, a product salable with difficulty elsewhere.

Kiruna lies 56 miles nearly due north of Gellivare, and 105 miles from the port of Narvik. Its deposits have been known for many years, but active work dates from the opening of the railway to Narvik, the shipping point, in 1902. Narvik is an ice-free port, where extensive docks and storage yards are maintained. It has an advantage over Luleä, the shipping point for Gellivare ores, in that it is open to navigation throughout the year, and is nearer to the markets of England and America.

The Kiruna orebody outcrops in two large hills which rise prominently above the glacial plain making up this section of Lapland. The hills are separated by a small lake, on the north shore of which the railway station and town of Kiruna are located. The orebody trends in a general north-south direction. The main outcrop occurs in the southernmost hill, which rises to an elevation of 800 ft. above the lake. To the north, the deposit passes under the lake and outcrops again prominently in the second hill, about 600 ft. high, which lies northwest of the town.

The orebody is a dike-like mass of magnetite, with small amounts of apatite, about three miles long, and averaging 300 ft. in width. The deposit dips 55 to 60 deg. E. between a foot wall of syenite porphyry and a hanging wall of quartz porphyry. The consensus of recent geological opinion is that the orebody is a true igneous dike.

The deposit has been exhaustively surveyed by dip needle, observations being taken at the corners of 10-metre squares over a large area. Development has been by diamond drilling. The deepest hole penetrated

the orebody at 2,600 ft. below the level of the lake (or 1,000 ft. below sea level), and 3,400 ft. below the highest outcrop. The deposit maintains a uniform width in depth, and is reported to be appreciably freer from apatite, and consequently less in phosphorus content, in the lower levels.

The developed ore is estimated at 750,000,000 tons, but this by no means exhausts the possibilities of the deposit. Mining is carried on exclusively by open-cut methods. Operations are confined to the north slope of the main hill (called "Kiirunavaara," or Kiruna Mountain), just south of the lake and in full view from

STRUCTURE IN THE LEFT FOREGROUND IS PART OF THE ORE DOCKS

the railway station. At present, there are twelve benches of 66 ft. each. Drilling is done with hand machines using compressed air.

The ore, after blasting, is loaded into eight-ton cars by electric shovels. The main working level is 400 ft. above the lake. The loaded cars are brought to this level and dumped into vertical shafts leading to a tunnel at the lake level. The tunnel is provided with ore pockets, from which standard-gage railway cars of thirty-five ton capacity are loaded. The ore is divided, as mined, into four grades based on phosphorus content, a shaft being provided for each class. The highest grade ore carries less than 0.04 per cent P, and 68 per cent Fe; the lowest contains over 2.5 per cent P and is somewhat lower in iron.

About 15 per cent of the ore now mined is of the first grade, the remainder being about equally divided among the other classes noted.

The amount of stripping required in cutting away the hanging wall and trimming back the foot wall is comparatively small. It is estimated that, for the entire orebody above the lake level, only 35 tons of waste must be removed for every 100 tons of ore.

The first shipment of Kiruna ore was made from Narvik in January, 1913. By 1913 the output reached 3,100,000 tons, and the maximum annual output permitted by law, 5,000,000 tons, would probably soon have been reached had not the war cut off the market. During the war period, shipments were practically suspended, and for the first half of 1919 the export was only 137,000 tons.

In pre-war days, important amounts of Kiruna ore were sent to England and America, though the major portion of the production was shipped to Germany. The high-phosphorus ores found an especially favorable market in Germany, where basic converters yielded a slag which was valuable as a source of phosphorus for fertilizers.

Kiruna ranks as one of the most northern mining industries of the world, the latitude being N. 67° 50'. In spite of its situation well within the Arctic Zone, open-cut methods are employed, with comparatively little decrease in efficiency under conditions that exist during the winter period.

The aspects of the Gellivare and Kiruna mines which most impressed me are: The tremendous reserves, in excess of a billion tons; the richness of the ores; the comparatively favorable mining and marketing conditions, despite location well within the Arctic Circle, and the efficiency of the management, which is thoroughly technical and operates under a policy that is soundly progressive.

Electrical Precipitation of Cyanide Solutions

Process Considered Worthy of Further Investigation, on Account of Its Simplicity and Cheapness—Lead Cathodes May Be Shipped as Base Bullion, or Paper Cathodes Used—Solutions Must Be Clear

By Douglas Lay

Written for *Engineering and Mining Journal*

THE conclusions expressed herein are based upon the results obtained from actual mill runs and "clean-ups" with electrical precipitation. They represent a somewhat exhaustive investigation of the process in its application to both unclarified and clarified solutions.

Such commercial success as has attended electrical precipitation has been in the use of the method with clarified solutions only. Attempts simultaneously to dissolve and precipitate muddy solutions during agitation, generally introduced to the mining public as "electro-cyanide" processes, have been numerous, but have not shown much evidence of commercial possibilities. In fact, many extravagant statements have been made concerning this type of precipitation, which have been followed by failures in practice. This appears to have had the effect of discrediting electrical precipitation generally, and so discouraging investigation. At any rate, electrical precipitation rather seems to lie under a cloud of suspicion, and it is generally taken for granted that it has been tried in the balance and found wanting.

As successful electrical precipitation necessitates preliminary clarification of mill solutions, either by filtration or decantation, it is obvious that in this respect it offers no advantage over standard methods of precipitation by zinc, aluminum, or charcoal. In my opinion its advantages lie in its simplicity, as it requires the minimum of skilled attention; its low cost, and the ease with which the monthly "clean-up" may be effected.

The principles underlying electrolysis of mill solutions must first be thoroughly grasped, and in this connection an ounce of fact is worth a ton of theory, because mere study of the laws of electrolysis is likely to lead to erroneous conclusions as to what may happen in the treatment of mill solutions.

Cyanide solutions constitute an extremely dilute electrolyte, as they are weak and contain a very small percentage of precious metals to be deposited. Consequently, much of the energy of the current is wasted in decomposing the water, resulting in the generation of oxygen at the anodes and hydrogen at the cathodes. As mill solutions are not electrolytes, within the textbook meaning of the word, a common mistake arises from the erroneous impression that the rate of precipitation of precious metals can be readily controlled, within wide limits, by varying the current strength. Accordingly, if it is found that a precipitation tank is not robbing the solution adequately of its precious-metal contents, the current density is frequently increased, in the largely futile expectation that precipitation will thereby be rendered more complete, whereas, for reasons subsequently given, only a weak current is necessary or permissible.

It must be borne in mind that the rate of precipitation is directly dependent upon the current strength only when the latter finds abundant metal to deposit and when the percentage of metal is kept constant in the electrolyte. Such would be the condition were soluble anodes employed that were of the same composition as the metal deposited, as in lead and copper refining; or were constant additions of the metal deposited being made to the electrolyte, if insoluble anodes were used. In the electrolysis of *mill solutions*, different conditions from those last described prevail, and for all practical purposes the percentage of the precious-metal contents of the mill solution which is precipitated depends upon the rate of flow of the solution through the tank, and also upon the cathode area, and not upon the current strength or the amount of precious metals present in the solution. The rich solution from the purely milling point of view is extremely poor from the electrolytic standpoint.

To illustrate a concrete case: Suppose a solution assaying $2 per ton in gold is passed through a precipitation tank at such a rate that the tailing solution assays $1 per ton in gold. If this tailing solution is again passed through the same tank at the same rate as before, the tailing solution from the second operation will still assay 50c. per ton in gold, and not zero, as at first might be thought. In other words, in the electrolysis of *mill solutions*, provided the rate of flow and cathode area remain constant, the percentage of precious metals in solution which is precipitated also remains practically constant, regardless of the *amount* (within the limits of ordinary mill solutions) of precious metals present.

The following empirical formula will apply to the electrical precipitation of mill solutions.

If R = the rate of flow of solution through the precipitation tank, expressed in *tons per hour*,

and K = the cathode area necessary to secure complete precipitation of precious metals, expressed in *square feet;*

then $K = 1750 \times R$.

By "complete precipitation" is meant a tailing solution such that when ten assay tons of it are taken, only a "trace," or a few cents per ton, are returned by the assayer.

The above equation will hold provided that: (1) The electrodes are connected up in multiple; (2) The anode and cathode areas are equal. (The effective area of deposition on a cathode is equal only to that of the anode opposite; consequently, no useful purpose is gained by having a cathode larger than the corresponding anode.) (3) The distance between anodes and cathodes is 1½ in. This distance will be found in practice the most convenient spacing for anodes and cathodes.

By means of this formula, the necessary cathode area to cope with any given flow of mill solutions can be calculated readily. For instance, a flow of two tons per hour will require a cathode area of 3,500 sq.ft., if pre-

cipitation is to be approximately complete. Deposition takes place on both sides of the cathode; consequently, in the formula, "*K*" signifies the sums of the areas of both sides of the cathodes. The cathode area being known, and also the spacing between anodes and cathodes, it is manifest that a simple calculation will determine the size of the tank required.

If, then, any given tank fails adequately to precipitate the precious metals, the remedy is either to decrease the rate of flow or to increase the cathode area, and not to increase the current density.

It is perhaps superfluous to say that the strength of the cyanide solution, in terms of free cyanide, has no bearing upon electrical precipitation, except as it affects the electrical resistance of the circuit. The stronger the solution, the less the resistance, and the greater the amperage with any given voltage.

Reasons for Using Only a Weak Current

As has been demonstrated, in the treatment of mill solutions, to all practical intents and purposes the percentage of precious metals deposited is independent of the strength of the electric current employed. Certain factors are, however, essential to the success of the process, which are directly dependent upon, and entirely governed by, the current strength. Careful attention must be given to them, for they constitute the reasons that only a weak current can be employed successfully. These factors are:

1. *Wear of Anodes*—The electrolyte being extremely dilute, decomposition of the water takes place. The generation of oxygen at the anodes results in the oxidation and wearing away of the latter, if they be metallic, or in disintegration, if they be non-metallic. The wearing process is slow or rapid, according as the current is weak or strong. This wear of anodes constitutes the only appreciable item in the cost of electrical precipitation, and, as it is directly dependent upon the current density, this is one good reason why only a weak current must be used.

2. *Precipitation of Calcium Carbonate on the Cathodes*—This is inseparable from electrolytic action, as lime almost certainly will be used to neutralize the acidity present in the ore. The hydrogen generated at the cathodes, in the presence of calcium hydrate and free cyanide, causes a precipitate of calcium carbonate on the cathodes, the carbon atom being taken from the cyanide. With a low current density of from 0.02 to 0.04 amperes per sq.ft. of cathode surface, the receptive quality of the cathodes, so far as the precious metals are concerned, is not impaired. Conversely, a high current density causes a heavy precipitation of calcium carbonate, closely resembling boiler scale, stopping precipitation of precious metals almost completely.

3. *Nature of Deposited Metal*—It is of the utmost importance that the precipitated metals should adhere firmly to the cathodes, and that there should be no chance of the deposit being rubbed off. The voltage must not fall below three volts, or black oxides of the precious metals may be deposited. These black oxides form a soot-like deposit, which is easily rubbed off.

For the foregoing reasons, a current density of 0.02 to 0.04 amperes per sq.ft. of cathode surface should be used, and the voltage should not fall below three or rise above five.

The commercial success of electrical precipitation undoubtedly depends in large measure upon the selection of the best material for the cathodes and anodes, more especially for the cathodes.

Obviously, base metal or carbon anodes must be employed. Only three substances, practically speaking, are suitable for the purpose: carbon, sheet iron, and lead. Of these, carbon or graphite anodes are not satisfactory, as they are somewhat fragile and cannot be procured of reasonable thickness and at the same time exposing sufficient surface area. Sheet-iron anodes have been generally used because of their cheapness, and also for the reason that they are suitable for making water-tight compartments.

It is generally good practice to baffle the flow of solution through the precipitation tank, by letting alternate anodes extend to the bottom of the tank from a point, say, one inch below the surface of the liquid. Alternate anodes again extend from a point about one inch above the level of the liquid to a point about two inches above the bottom of the tank, so that the flow is over the top of one anode and under the bottom of the next. With this arrangement, alternate anodes together form a practically water-tight compartment. Anodes are sometimes covered with cheesecloth to prevent accidental short-circuiting, but this is not strictly necessary, as, because of the weak current used, no danger can result therefrom. A short-circuit immediately stops electrolytic action, and can therefore readily be detected and remedied.

It must be bore in mind that anodes and anode connections below the level of the liquid are oxidized and gradually worn away by the action of the current. In the use of iron anodes, the anode oxidation product may be either mainly ferric hydrate or prussian blue. I have found that by keeping the protective alkalinity at about 0.03 per cent CaO, the anode product consisted almost entirely of ferric hydrate. This is desirable, because ferric hydrate floats and is readily disposed of in a manner to be described subsequently; whereas, prussian blue is heavy, and sinks to the bottom of the anode compartments. Aside from impeding the flow of solution, any accumulation of anode product is undesirable in the precipitation tanks, because it invariably contains high precious-metal values. These are loosely held and rapidly pass into solution again in the sump tank.

Metal From Oxidation of Lead Anodes May Be Recovered

Iron, once oxidized, is no longer available, and it is manifest that if iron anodes are used, their depreciation, although not a heavy item, must nevertheless be written off as a direct charge against the cost of electrical precipitation. Not so with lead. A lead oxidation product can be readily converted into lead again, at comparatively small cost. Or, if so desired, the lead anode product could be sold as such to any smelter. Whichever expedient be adopted, the cost of precipitation would receive credit. Although my experience has been confined mainly to the use of sheet-iron anodes, trial of lead anodes has convinced me of their great possibilities. Nevertheless, the thorough baffling of the flow of solution through the precipitation tanks before described, and which I adopted, could hardly be made as effectual with lead as with iron anodes. However, this could be offset readily by increasing the cathode area. It must not be understood that the use of iron anodes is detrimental to the high efficiency and low cost of electrical precipitation; I merely wish to point out that lead

anodes merit further investigation. It is possible that their use might have a beneficial action on the cyanide solutions, in increasing their solvent action upon the precious metals contained in the ore.

NATURE OF CATHODE IS IMPORTANT

The deposit must be made upon a cathode of such nature that the precious metals can be easily recovered from it. One of the reasons that electrical precipitation has not been more widely adopted is the difficulty of recovering the precious metals from the cathodes, after precipitation. Many expedients have been tried in the attempt to overcome this, among them amalgamated plates. These were unsuitable, because the amalgam, under the influence of the current, became extremely hard and brittle. Another expedient was to coat a metallic surface with graphite, so that the deposit of metal would not adhere firmly and could be scraped off for the purpose of a "clean-up." The last named operation involved too much labor to be practicable.

So far, lead is the only substance which has proved a commercial success as a cathode. In South Africa, where electrical precipitation was first tried, very thin lead sheets were used, and recovery of the precious metals was effected by cupellation, which added greatly to the cost. I once adopted the simple expedient of shipping the lead cathodes as base bullion to a custom refinery after a month's run.

The total cost of the month's "clean-up" was about $45, and 100 per cent of the gold contents was paid for. As custom refineries are fairly plentiful in America, this practice should be satisfactory for most mines, except those in remote districts. Such a "clean-up" is cheap, involves no trouble, and solves the vexed question of the recovery of the deposited precious metal from the cathodes. Incidentally, there is no danger of theft of bullion.

Lead sheets, whether for anodes or cathodes, can be readily and cheaply made at the mill, by Miller's process, which is fairly well known. The apparatus is simple, and consists of a trough at the head of an inclined slab of cast iron. Molten lead is poured into the trough, which is suddenly tipped up, causing the lead to flow down over the inclined slab of cast iron. Solidification takes place immediately, and the result is a sheet of lead, the thickness of which can be varied by varying the angle of inclination of the cast-iron slab.

Great care should be taken that the surface of the cathodes is clean and free from oxide before immersion in the precipitation tanks. They may be dipped in a solution of zinc chloride, rinsed in water, and then immediately immersed in the precipitation tanks. After immersion in zinc chloride, it is most important that the sheets should not be allowed to dry, and thus to oxidize before being placed in the precipitation tanks.

As has been mentioned previously, the precipitation of calcium carbonate on the cathodes, along with the precious metals, is inevitable. If the weak current specified is employed, the receptive qualities of the cathode will not be impaired for a period of at least thirty days. After this time there is a perceptible roughening of the surface of the cathodes, due to calcium carbonate, and it is advisable to replace them with new sheets.

I obtained most promising results from the use of paper cathodes, which gave high promise of solving the difficulty connected with recovery of precious metals from cathodes. Unfortunately, other matters engaged my attention before a conclusive test was possible, and the opportunity of further investigation has not presented itself. However, such information as I have had is given in the hope that it will be of service to others.

By employing a substance such as paper for a cathode, when the precious metals have been deposited, simple incineration and melting will result in a high-grade bullion, without the intervention of a refining process. Any reasonably stout paper of smooth surface, such as the cover of the *Engineering and Mining Journal*, serves well. It is cut into strips of the desired size, and waterproofed by momentary immersion in melted beeswax. Before the wax has solidified, the paper is dipped into Dixon's coarse flake graphite, and the latter is well rubbed in until the entire surface of the paper is covered with a uniform coating of graphite, which is, of course, a conductor of electricity. If this cathode is now placed in the precipitation tank, and suitably connected to the cathode cross-bar, it will receive a deposit of precious metal, just as though it were wholly metallic.

The following simple method of connection answered well: A small piece of copper foil about 1 in. square was doubled in half and clamped to the centre of the top of the cathode strip by an ordinary tie clip. The latter was soldered to a piece of copper wire, the other end of which was bent to form a hook, by means of which the cathode was suspended from the cross-bar. Such a cathode appeared to receive a deposit just as readily as a metallic lead cathode, and after a day or so became similar to a metallic strip in physical properties.

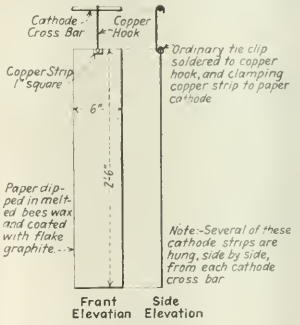

FIG. 1. DETAILS OF PAPER CATHODE

The investigation which I conducted consisted of suspending these paper cathodes at various points in a precipitation tank treating mill solutions, but in which the cathodes consisted mainly of sheet lead. Promising as were the results obtained with paper cathodes, I cannot give the results of an actual month's "clean-up," and further trial is of course necessary. They do, however, unquestionably merit investigation, and seem likely to solve what has been a somewhat knotty problem in connection with electrical precipitation.

Unless the solution contain sufficient protective alkali, there seems to be appreciable loss of free cyanide in passage through precipitation tanks. Solutions containing a trace of protective alkali, passed at the rate of two tons per hour through a tank containing 3,500 sq.ft. of cathode surface, were found to lose about 30 per cent of their free cyanide; but solutions containing a protective alkalinity of 0.03 per cent CaO disclosed no appreciable loss of free cyanide. A loss of protective alkalinity in course of passage through precipitation tanks must always occur, owing to the action of the current in precipitating calcium carbonate on the cathodes, as has been described. The regeneration of cyan-

ide caused by splitting up double cyanides prior to precipitation counterbalances the loss of cyanide caused by precipitation of calcium carbonate.

Advantages of Electrical Precipitation

Attractive features are:

1. The small amount of skilled attention required.

2. The ease and cheapness with which a "clean-up" can be effected. No stoppage of operations is entailed. Cathodes may be removed at any time and replaced by new sheets, without switching off the current. Granted

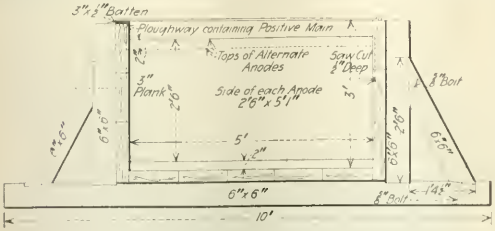

FIG. 2. CROSS-SECTION OF PRECIPITATION TANK SHOWING ANODES

that the efficiency and commercial success of such a cathode as that made of paper have not been thoroughly proved, the expedient of employing lead sheets, made by Miller's process, for cathodes, and shipping these once a month as base bullion, is an inexpensive way of making the "clean-up," and appears thoroughly sound commercially.

3. The consumption of electrical energy is very low, in fact little more than nominal. For each ton of mill solution to be precipitated per hour, 1,750 sq.ft. of cathode surface is required. With a current density of, say, 0.03 amperes per sq.ft., and a voltage of, say, 5, approximately three-eighths of one electrical horsepower will be sufficient.

The only appreciable item in the cost of the process is the wear of the anodes. Even in using iron anodes, this is not formidable. If lead anodes are used, the anode oxidation product can be readily re-converted into lead, or sold as such without reduction. This would reduce the cost of the process to small amount.

Precipitation Tanks Handled Two Tons Per Hour

The tank which I designed and used is illustrated in the accompanying sketches. Its dimensions were 35 ft. long by 5 ft. wide by 3 ft. high. It contained 3,500 sq.ft. of cathode surface, as it was designed to precipitate mill solution flowing through it at the rate of two tons per hour. Anodes were of sheet iron approximately ¼ in. thick, and were fitted into saw cuts in the sides of the tank. Every other anode extended to the bottom of the tank, the top of one anode being below the solution surface level, and the next anode to it raised 2 in. above the bottom of the tank, so that its top projected above the surface of the solution. With this arrangement the solution flowed under the bottom of one anode and over the top of the next. The distance between anodes was 3 in., and the size of each anode was 2 ft. 6 in. by 5 ft. 1 in.

The positive electric main was laid in a ploughway extending along the top of one side of the tank. Electrical connection with each anode was established through a ¼-in. hole bored vertically downward from the bottom of the ploughway to the top corner of the anode. Therefore, no anode connections were submerged and so exposed to wear. A wooden batten tacked down on top of the side of the tank covered the positive wire.

Cathodes were of sheet lead, about $\frac{1}{8}$ in. thick, and were of approximately the same size as the anodes, but, for convenience in handling, were divided into three strips. They were suspended from the cathode cross-bar by copper hooks. The distance between anode and cathode was 1½ in. Cathode cross-bars were of ¾-in. round common iron. One end was swaged to a semicircle, to engage the No. 1 gage circular ¼-in. copper negative main which was tacked on the top of the side of the tank. Paper cathodes, as mentioned, were tried in this tank, under the same conditions as the lead cathodes.

Long Tank Assures Thorough Ionization

The purpose of having a tank of great length in relation to its width is to secure as thorough ionization of solution as possible. In normal working, evidence of electrolytic action shown by evolution of oxygen at the anodes, and of hydrogen at the cathodes, is most marked at the outlet end and least noticeable at the inlet end, the reason being that as ionization becomes more complete, electric resistance is diminished and more current automatically flows.

The normal outlet for solution is by a pipe at the outlet end of the tank placed at the level of the submerged anodes. By closing the valve on this pipe, the level of the solution is raised to the level of the outlet lip of the tank, which is placed just above the level of the anodes which project above the surface of the solution in normal working. This operation causes any floating anode product to be floated off to the sump tank. The operation, which occupies only two or three minutes, was performed once a day.

The mill solutions treated averaged $2 per ton in total precious-metal values before precipitation (the weight of gold and silver per ton being about equal). After precipitation, tailing solutions assayed from a "trace" to a few cents in total per ton, the precipitation being as nearly as possible complete.

So-called electro-cyanide processes differ in details of design and equipment, but all have the same underly-

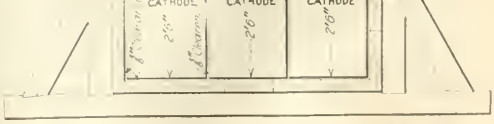

FIG. 3. CROSS-SECTION OF PRECIPITATION TANK SHOWING CATHODES

ing feature, viz., precipitation during agitation of finely ground ore and solution in a pan or agitator. An attempt is thus made simultaneously to dissolve the precious metals from the ore, and to precipitate them.

A twofold claim is generally made: (1) That precipitation is complete, or nearly so, during the period of agitation. (2) That the electric current exerts a beneficial action in aiding the dissolving of the precious

metals present in the ore. Exhaustive trials have convinced me of the impossibility of substantiating these claims, for the following reasons:

1. *Percentage of precious metals precipitated.*

Assume that an agitator, or pan, holds twenty tons of pulp and thirty tons of cyanide solution, and that the period of agitation is eight hours. To secure complete precipitation in this time, a cathode area of 30 × ¼ × 1,750, or 6,563 sq.ft., would be required. In the agitator specified it will not be practicable to suspend more than 650 sq.ft. of cathode surface, or, at most, 1,000 sq.ft. If a smaller agitator be assumed, the cathode area will be still further reduced. It follows that that proportion of the total precious metals present in solution which will be precipitated will be represented by the fraction 650/6,563, or, say, one-tenth. In fact, in my experience, the tailing solution after agitation frequently assayed more in precious metals than the feed solution, owing to solution taking place more rapidly than precipitation.

2. *Possible beneficial action exerted by electric current in aiding in the dissolving of precious metals.*

Any beneficial action must result either from generation of oxygen at the anodes, from regeneration of free cyanide caused by the splitting up of double cyanides resulting from electrolytic action, or from the simultaneous influence of both. It already has been demonstrated that only a weak current is practicable; consequently, generation of oxygen cannot be active, and therefore too much emphasis must not be laid on this factor. Again, it has been shown that only a small percentage of the precious metals present in solution can be precipitated; consequently only a small percentage of the double cyanides can be decomposed. Further, any liberation of free cyanide is counterbalanced by that destroyed by the reaction which results in the precipitation of calcium carbonate on the cathodes.

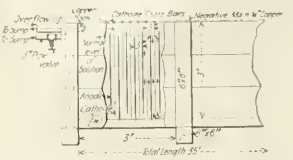

FIG. 4. SIDE ELEVATION OF PRECIPITATION TANK, OUTLET END

Frequently, the addition of salt is specified during agitation. The effect of this is of course to reduce the electric resistance, and to increase the current. Adding salt has no material effect, as has been previously pointed out, in increasing the percentage of precious metals deposited, and serves merely to cause an undue and prohibitive wear of anodes, and to deposit calcium carbonate so heavily upon the surface of the cathodes that their receptive qualities for the precious metals are seriously impaired.

Precipitation in an agitator or pan is open to serious objections:

1. The surface of the cathodes must be kept free from oxide; a surface once so prepared must not be allowed to dry. However little time is occupied in discharging and recharging an agitator or pan, the surface of the cathodes will dry and oxidize to some extent, and the receptive quality will be correspondingly impaired. The drying of any slime on a cathode might effectually insulate a part of it.

2. Anode connections below the surface of the solution are gradually eaten away by the action of the current. Precipitation in an agitator necessitates complete submergence of anode connections and renders their insulation difficult.

3. Inasmuch as there must be at some stage in the cycle of the cyanide process a separation of solid from liquid matter (otherwise there is prohibitive loss of cyanide), no justification would appear to exist for attempting to precipitate until this separation has been accomplished.

I have tried repeatedly most of the expedients usually adopted but failed to find evidence of the likelihood of the practical commercial success of precipitation during agitation.

Automobiling by Rail

Written for *Engineering and Mining Journal*

Many mining communities have good rail connections but poor automobile roads. In such cases quick transportation over short distances for from one to five persons can be obtained by mounting an automobile on trucks with flanged wheels suitable for running on a railroad track, as shown in the accompanying illustration. The car is more comfortable than the ordinary motor-driven "hand-car," and can be put back on rubber tires for ordinary use at any time. Such equipment is used on the Amador Central, in California, where, in going from the mines on the Mother Lode at Jackson and Sutter Creek to the main line at Galt, the traveler starts his railroad journey at Martel in a flivver with flanged wheels, which carries him over the first twelve- or fourteen-mile stretch. The International Nickel Co. also uses a car of this type on the Algoma Eastern Ry. to carry passengers from its Creighton mine to the O'Donnell roast yard; and over a private rail line from the Canadian Pacific Ry. at Turbine to the hydro-electric plant at High Falls. The photograph shows the car used on the latter line.

EQUIPPED FOR RAILROAD TRAVEL

Asbestos Can Be Fine Spun

The earliest industrial application of asbestos was for spinning and weaving, to make non-combustible thread, yarn, rope, and cloth, and this has continued to be the most important use of asbestos ever since the days of the Greeks and Romans. Only the best grades can be used for this purpose, according to J. S. Diller, of the U. S. Geological Survey. Thread can now be spun so fine that the fiber will run about 32,000 ft. to the pound.

Unwatering by Air Lift in Grass Valley, California

Idaho-Maryland Property Has Now Been Successfully Opened Up to the 1,000-ft. Level By Air Lifts and Pumps—Details of Installing Lift Pipes in Old Shaft And Practical Operating Suggestions

By George J. Young
Written for *Engineering and Mining Journal*

THE old Idaho-Maryland mine, slightly over a mile east of Grass Valley, Cal., inactive since 1914, is being reopened by the Idaho-Maryland Mines Co. As a preliminary to mining, the old workings are being unwatered, and the surface plant is being reconstructed and put in first-class condition. Practically all of the old buildings have been torn down, a new compressor building and shops have been constructed, and a permanent wooden headframe and hoist are being installed.

FIG. 1. TEMPORARY HEADFRAME AND SHAFT COLLAR

Two belt-driven, two-stage compressors with a combined capacity of 2,200 cu.ft. of free air per min. are in operation. The compressed air is being used for removing the water from the mine and for the operation of the temporary hoists.

Unwatering is being effected by an air lift. The capacity of the air lift averages about 900 gal. per min., but it has attained 1,400 as a maximum. The water is discharged through a drainage adit 23 ft. vertically below the collar of the shaft. The air lift, consisting of 10-in. oil-well casings, is installed in one of the hoisting compartments. A bronze foot-piece on the end of a 4-in. standard compressed-air pipe line is held in a central position in the 10-in. casing by suitable cages and lowered as the water in the mine is removed, so that proper submergence may be maintained. While the main air lift was being installed the shaft was unwatered to 208 ft. by dropping a 4-in. pipe down the old Cornish pump column, a distance of 300 ft. and drawing the water up through the pump valves. The end of the pump column is shown on the right in Fig. 2.

The method of installing the air lift is of considerable technical interest, as the details of such installations have seldom been published. The procedure, after ascertaining that the upper part of the compartment to be used was free from obstruction, was first to assemble all necessary pipe and equipment at the surface. For this purpose 900 ft. of 10-in. oil casing, 200 ft. of 12-in. machine-wound redwood stave pipe, and 1,200 ft. of 4-in. air pipe were secured and piled on the surface at a convenient distance from the shaft collar. The temporary wooden headframe, Fig. 1, was strengthened by an outer four-post frame and a single-drum, air-driven hoist placed in position. In the meantime a number of wooden crossheads were constructed. The plan was to place a crosshead every 100 ft. along the pipe line.

A crosshead, Fig. 2, consists of an upper and lower skid piece, each 7 ft. long, with curved ends, engaging with the upper and lower side of each guide; two additional skid pieces are provided for the inner faces of

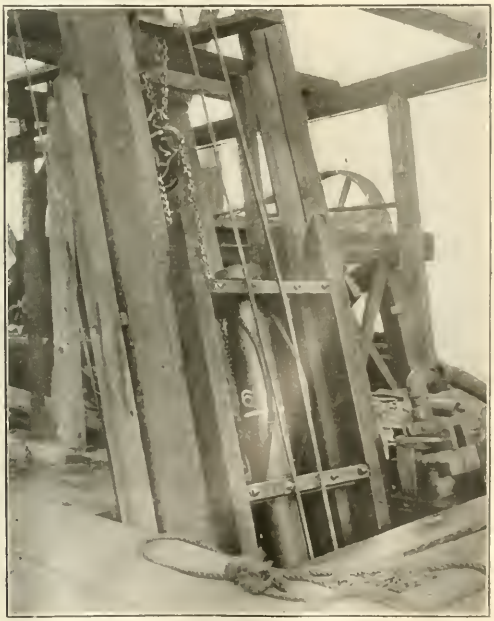

FIG. 2. CROSS-HEAD USED TO SUPPORT PIPE IN SHAFT

the guides. Thus, each shaft guide has three skid pieces on the three faces. The six skid pieces are held together by upper and lower platforms, each of which consists of two boards which are gained into the skids to hold them securely. A semicircular opening is cut in each board for the pipe. Rods extend through the boards, and four rods extend from side to side, binding the whole into a compact structure.

The crosshead is made in two parts, so that it can be slipped into place on either side of the pipe at the shaft

collar. When it is in place, the tie rods in the platform boards are inserted and tightened up. Ample clearance is allowed between all parts coming in contact with the guides. The crosshead is placed just below a pipe coupling, so that the weight of the pipe will be taken up by the coupling bearing on the upper platform of the crosshead.

To support the weight of the pipe and the attached crossheads, a piece of 1-in. wire rope is looped around the pipe, the ends of the rope being secured by a crosby clip. The loops are placed above and beneath the pipe, and below the upper and lower platforms of each crosshead, respectively. The looped rope is attached by clips to the two 1-in. cables, which are used in lowering the pipe and which must support a considerable part of the weight. Just how effective such a fastening is raises an interesting point, but inspection of the crosshead which became exposed as the water was lowered showed everything to be in good order, and no trouble of any kind was experienced with this method of fastening as further depth was reached. The illustration Fig. 2 shows one of the crossheads, the rope loop, and the two supporting cables, from which the rope clips have been removed.

The total length of the pipe that it was planned to use was 1,100 ft. With a weight of 22.75 lb. per ft., the total pipe weight of this length would be 25,000 lb. As the shaft is inclined at an angle of approximately 70 deg., the weight carried by the ropes may be roughly assumed to be the weight of the pipe, leaving the weight of the crossheads to be taken care of by the guides. The two weight-carrying ropes pass twice around a 12-in. steel shaft in the headframe and back to two heavy posts, which are wedged down in an opening between two old foundation blocks, Fig. 3. Each rope is wrapped six

FIG. 3. WIRE-ROPE ANCHORAGES FOR TAKING UP WEIGHT OF AIR LIFT PIPE

times around a single post and extends to a wooden reel, from which it is payed out as lowering necessitates. As additional depth was obtained, a greater number of wraps became necessary. One or two additional turns at a time made it possible easily to control the weight.

The method just described was successful in lowering the pipe to a depth of over 700 ft., at which point an obstruction was encountered. In spite of releasing the whole weight of the pipe, further lowering could not be accomplished, and it was decided to remove the upper portion, 160 ft. in length, connect the 12-in. stave pipe in its place, and then operate the lift, recovering as much of the mine as the submerged length would permit. To remove the upper portion, the pipe was disconnected at a flange coupling, a hoisting rope attached, and the pipe lifted, each pipe length being removed as it reached the surface. This was being done at the time the photographs accompanying this article were taken. As an upper length reached the surface, it was secured by chain and triplex block, unscrewed, swung away from the shaft, lowered onto a small carriage, and removed to the pile.

FIG. 4. MEASURING WEIR AND DRAINAGE ADIT

Although the length of pipe planned for was 1,100 ft., the greatest length used at any time was 700 ft. When the lift pipe stuck in the shaft, the water was lowered to the 400-ft. level, where a pump was installed. By air lifting to this level, the trouble point was reached at 686 ft., and the lift pipe was slid from this point to a point 1,013 ft. from the surface. From this position the 800 level was unwatered and a pump installed on this level. From the 800 level down, the mine was unwatered to a point 47 ft. above the 1,000-ft. level by means of an air lift in the 10-in. Cornish pump column extending from the 800 to the 1,000-ft. level. At this point the air lift could just handle the incoming water, so that three compressed air pumps and two weeks' time were required to remove this depth of 47 ft. and unwater the 1,000-ft. level.

The upper main air lift unwatered the mine to a point 560 ft. on the slope, or 519 ft. vertically, in just about one month's time. The maximum capacity attained was 1,450 gal. per min., with 49 per cent submergence with 97 lb. of air. The capacity dropped off to about 250 gal. per min. with 60 lb. of air with 18.3 per cent submergence. The shaft flattened from 72 deg., at surface

to 62½ deg. at the bottom of the 10-in. lift pipe. The lower air lift was unwatered from 560 ft. on the slope to 886 ft., a vertical distance of 282 ft. The capacity varied from about 1,500 gal. per min. with 77 lb. of air to about 200 gal. per min. with about 50 lb. of air and 19 per cent submergence. The shaft through this portioned flattened from 62½ deg. to 49 deg.

As has been stated, the water from 886 ft. to 1,068 ft. was removed through the 10-in. Cornish pump column, which extended from the 1,000 to the 800 level. This lift had enormous capacity, as upon starting there was a heavy submergence with small lift, and in one twenty-four hour period the water was lowered a total distance of 50 ft. on the incline.

The discharge from the shaft is measured by a weir, which is shown in Fig. 4. This weir is provided with a sliding gate, by means of which a constant height of discharge can be maintained.

The plan has worked out excellently, and the mine has been unwatered rapidly, with none of the discomforts and inconveniences incident to the use of pumps for work of this kind. A large amount of repair work was necessary, and while this was being done the water did not interfere at any time with the shaft repairs, as it was a simple matter to keep it well below the point where the work was being done. In this way alignment and grade were more easily kept, there were no pumpmen traveling up and down the shaft for supplies; and, besides, there was entire freedom from the excessive noise which accompanies most pumping operations.

For permission to visit the work and for much of the foregoing data I am indebted to John A. Fulton, manager of the Idaho-Maryland Mines Co., and I take pleasure in here making due acknowledgment.

Density Determination of Semi-Hard Ores

By R. H. McHARDY
Written for *Engineering and Mining Journal*

FOR purposes of estimating the tonnage of iron ore removed from drifts and raises at the Harold mine, Hibbing, Minn., a modified method of determining the density factor was devised. Formerly the practice in determining a density factor was to use the "oats method," which is described as follows: The floor of the drift is leveled off, a hole carefully excavated and the ore weighed as it is removed. Oats are poured into the hole, and the volume necessary to fill it is carefully measured. Having the weight of the ore removed, and the volume of the hole (or volume of oats necessary to fill it), the density of the ore may then be calculated. It has been found that the size of the sample which can be taken by this method is limited to about one hundred pounds. The reason for this is that the top of the hole is kept as small as possible, a pear-shaped excavation being made so that the error in leveling off the oats will be negligible.

Upon examination of certain drifts in the Harold mine it was apparent that the ore removed in drifting was very different from that in the bottom of the drift. This was especially true where the drifts were driven along the hanging wall, due to layers of sand lying between layers of ore. Therefore, in order to obtain accurate results, a test had to be made of the ore on the sides of the drift. After many suggestions, the following method was proposed by R. H. Bassett, chief engineer for the M. A. Hanna Co., and upon trial was found to be very satisfactory:

A box was constructed of one-inch lumber, as illustrated in Fig. 1. Channels were cut in the sides of the drift, and the box was grouted in with clay, as shown in Fig. 2. The door was then closed, and oats were poured in the top, filling the space between the rough wall of the drift and the inside of the box. The oats were carefully measured as they were poured, the door opened and the oats removed. A sample of ore was then cut from between the channels inside the box, care being taken to get the weight of all that was removed. The door was again closed, and a measured quantity of oats used to fill up the space inside the box. The difference between the volume of oats used before and after the sample was removed gives the volume of the sample. From the weight of the sample and its volume the density of the ore can be calculated.

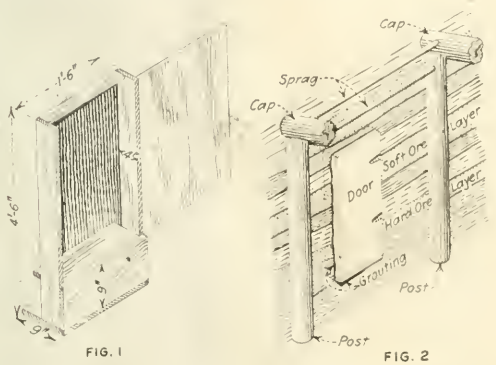

FIG. 1 FIG. 2

DEVICE USED TO DETERMINE DENSITY OF IRON ORES

For accurate results certain precautions were necessary. Three containers for measuring and pouring the oats were used—a gallon measure, a quart measure, and a small tin cup. The larger measure was for speeding up the pouring at first, the smaller ones being used toward the end, so that the error in measuring up a portion of a cup for the final pouring would be negligible.

Although the oats run freely and fill all crevices, they have a tendency to pack. There is considerable difference in the quantity a measure will hold, depending on how thoroughly the container is shaken when filled. In pouring the oats in the box, the quantity necessary to fill it increases as the box is tapped, so that to obtain accurate results a regular system of shaking the container and tapping the box was established. If the box is fixed strongly in place, the accuracy increases with the increased packing of the oats in the pouring container and box.

The advantages of this system are that a more representative sample of the ore to be tested can be taken, and the size of the sample may be increased without accompanying decrease in accuracy.

Lake Superior Iron Ore Shipments during 1919, according to official figures issued by *Iron Trade Review*, totaled 48,812,522 tons. Of these shipments, 47,177,395 tons were Lake shipments, rail shipments being 1,635,127 tons.

Government Officials Who Influence Mining

William Sloan

FAVORED with a robust constitution, and imbued with the spirit of adventure, William Sloan and three associates started for the Yukon in January, 1896, attracted by the vast and then comparatively unknown wilderness of the last Great West. The usual hardships and privations were encountered and overcome, and, after a fruitless summer spent in prospecting on the headwaters of the Stewart River, the party decided to try their fortunes on the lower Yukon. Luck was with them. The rush to the Klondike had just begun, and they were among the first to locate claims in that region, Sloan himself staking No. 15 on Eldorado Creek, one of the banner claims. Their shaft was the first to reach bed rock, and, striking "pay," they were amply rewarded for their efforts. So it is that, when Mr. Sloan, who is the present Minister of Mines of British Columbia, can be induced to talk of his Yukon experiences in the early days, he says, "the North has been good and kind to me." Sloan is one of the interesting personalities of British Columbia, and is a man of marked individuality. His early years were passed in his native Province of Ontario, where he was born, of Scotch descent, in 1867. His education was acquired in the public schools and collegiate institute at Seaforth, Ont. Upon terminating his student days he went to Shangahi, China, to join his father, Dr. R. J. Sloan, who at that time was one of the port physicians there. In 1887, the younger Sloan returned from the Orient to Canada and settled in British Columbia.

WILLIAM SLOAN

Following his big strike in the Yukon, Sloan mined for two seasons, and then returned to Nanaimo, B. C., where he built his present home. Two years later, in 1900, in the Canadian general election, he entered public life as a candidate for Parliament on the Liberal ticket, but was defeated. In 1904 he was a candidate for the district of Comox-Atlin, and was elected by acclamation and was re-elected in the same fashion in 1908. He resigned his seat in 1909. In the general elections of 1911, owing to repeated efforts of many of the influential members of his party to have him again enter the field, he issued an emphatic statement that he was not a candidate for re-election. As a member of Parliament from Comox-Atlin, the district embracing the larger portion of the coast line of British Columbia, he was successful in securing needed aids to navigation, including the hydrographic survey, as well as extension and improvement of the postal and telegraphic service. His attitude on the Oriental question has been that "Canada should control her immigration from within, and not be dictated to from without." At the general provincial elections in 1916, Mr. Sloan was elected by an overwhelming majority for Nanaimo Riding, and was confirmed by acclamation upon accepting the portfolio of Minister of Mines in the government formed under the premiership of the late H. C. Brewster. As might be expected in one who has lived so rugged a life, Mr. Sloan finds his chief recreation in hunting and fishing, in both of which he excels, and has traveled extensively in the wilds of Canada, from ocean to ocean, in pursuit of these pastimes. His home at Nanaimo contains many trophies from his hunting experiences. He is an ex-president of the Nanaimo Caledonian Society and is prominent in Masonic circles. For several years he was Liberal organizer for Vancouver Island and treasurer for the British Columbia Liberal Association, but resigned these offices on his election for Comox-Atlin. He is a member of the Rideau Club of Ottawa, the Union Club of Victoria, and the Vancouver Club of Vancouver.

For a man who is still comparatively young, Sloan has had a most interesting and varied career, as it has embraced many experiences of the pioneer, prospector, and politician. The office he holds seems a fitting climax to all that has gone before, as one traces his rise by successive steps from the prospector of the Klondike to the Minister of Mines.

The Minister of Mines and others holding similar positions should above all things have an intimate knowledge of the mining industry and the problems that confront it. The situation in British Columbia is in marked contrast with that in Ontario, and there will be few to deny that the western province is the more fortunate.

By The Way

Between Two Evils

News comes from California that Cox is the Democratic nominee. Speaking of the long deadlock between Palmer, McAdoo and Cox, Bryan said that the convention was looking for a man who would "respond without protest to every demand that comes from the White House, from Wall Street, and from the liquor interests." Not being able to get all three, they finally decided on one. With cheer leaders, shouting prolonged by prearranged plan, and other devices that school boys are familiar with, our two great conventions have been held, while Europe watched. "The Palmer people" said a dispatch, "assisted by the band and the great pipe organ, started a demonstration with a view to holding their lines fast." Were it not so comic the spectacle of the utter collapse and failure of our primary system would be seen for the national tragedy that it is.

Need for Restraint

"Don't thee think for a minute, m'son, that Jan Trembath be a fool, even though 'is affairs of tha 'eart be, as I mus' h'admit, far from brilliant," said Cap'n Dick. "Times 'e wuz smart enough for anyone, as super to tha Warrior foun' h'out one day. Jan at that time wuz workin' as shif'boss on sixth level o' tha Warrior, an' one Tuesday—or per'aps it were Wednesday—Jan 'e brings tha 'ol crew to surface baout 'leven-thirty in tha moornin'. So 'appened w'en they wuz steppin' h'off tha cage along comes tha super. 'W'ot tha 'ell do'st thee mean by comin' h'up this time o' day?" sez 'e. An' Jan sez, 'Mister 'Atch, tha h'air is so bad in nummer two stope tha bloody cannels won't burn. Mert Morcom 'ere, 'e pretty near got knocked h'out—h'asfixiated, as tha doctors say—an', dam-me, Mister 'Atch, I won't work no man in h'air as bad at that.' 'H'air 'ell,' sez 'Atch, 'You're fired. Go to tha h'office an' get your time!' An' Jan sez, 'H'all right Mister 'Atch, I'm fired, but I 'ope thee will not fire Mert Morcom—'e's got a wife an' twelve children an' 'e needs tha job.' 'I'll 'fire 'oo I damn please,' sez 'Atch. 'I naws thee will,' sez Jan, 'but I wuz jus' h'askin' thee not to fire 'e, an' please don't fire Si Johns, tha surface boss. An' there's Tommy Williams—no better blacksmith h'ever put h'iron in the fire than 'e. An' before I get my time, Mister 'Atch, will 'e do me a bit o' a favor?' 'W'ot do'st thee want?' sez 'Atch. 'Will thee please go to Tommy Williams an' h'ask 'im to take a piece o' h'iron 'alf by three an' forge a ring out'en about so big around?' 'W'ot for?' sez 'Atch. 'So thee can wear it for a 'at band an' keep your damn 'ead from bustin,' replied Jan."

It Pays To Advertise

Bulletin No. 7 of the Minnesota School of Mines Experimental Station, entitled, "The Future of the Lake Superior District as an Iron-Ore Producer," and compiled by Edward W. Davis, concludes in this pungent paragraph:

"If there is any criticism to be passed upon the mining men of the Lake Superior district it is that they have kept their achievements too much to themselves. They have been satisfied to make a large amount of worthless land extremely valuable, and have not taken the trouble to explain their work to the people at large. This is a period of great publicity and wide advertising, and the mining industry must realize this fact to keep abreast of the times."

Smelter Smoke

Miami, Ariz., led all the rest of Gila County in births registered in the month of May. Globe came second and Hayden third. Smelter towns are usually noted for their high birth rate, the sulphur fume apparently affecting only vegetation. Copper Cliff, Ont., was reputed to have the highest rate in Canada. Some interesting statistics could be gathered on this subject. To study the health and welfare of the workers is of the highest importance.

The Amateur Geologist

A report on certain lands in Texas, by Bagnall and Daniel, geological engineers, of Chillicothe, Tex., according to the version given in the *Wichita Oil Reporter*, gives several reasons why oil should be found in the area, one of which is that "Oil is always found at or near *anticlinical* domes which run parallel to mountains or hills," and another, "The surface conditions and principal earmarks as found in the same." We imagine the clinical (or anticlinical) problem has to do with the earmarks. "The structure," they say in summarizing, "is of the Permian formation, and one of the most perfect structures we have ever examined. We have found the rock exposures dipping from the structure at various angles and in all directions. The surrounding hills form a semicircle around the dome, thus completely inclosing and hermetically sealing the structure." The poetry of petroleum will seep out. We imagine the stage is set at night—yes, it must be night. In the center is the mysterious and perfect Structure, the most perfect yet dimly viewed by man—so Perfect that the rock exposures (we knew some day they would be exposed) dip and duck away from It in all directions and in confusion. And well they may, for the silent cordons of hills have formed a protective semicircle around the perfect Structure, thus completely inclosing it. When they have gathered still closer, and formed a complete circle—what shall we say? Apparently they can do no more than completely inclose it, but we feel some unthought-of climax will come. What is the dénouement? How can we wait for the continuation of the reel next Saturday night?

Variety the Spice of Life

In the long run diversified industry is best for any mining district. Occasionally, however, the mine manager whose company has to compete with other industries for its labor supply may wish that he were not so happily conditioned. Recently, operators of the Joplin-Miami district have been greatly hindered by car shortage, and to make matters worse many of the miners have left to work in the wheat fields. The result is curtailment of operations. But it is a good thing for the men, and indirectly a good thing for the companies, even though not appreciated. That which is best is not necessarily pleasing. A maternal castigation is said to be good for the soul, though painful.

CONSULTATION

Important South African Gold Mines

"Can you let me have a list of the twenty largest gold-producing companies in South Africa and figures showing the current rate of production?"

The principal gold-mining companies in South Africa rank in the following order in point of production. In each the production is given for the month of March, which is the latest month for which these figures are available. The compilation is made from figures furnished by the Transvaal Chamber of Mines:

Name of Company	Ounces of Gold Produced in March, 1920	Name of Company	Ounces of Gold Produced in March, 1920
Crown Mines	59,402	Springs	7,524
Government Areas	51,521	Robinson Deep	17,207
New Modderfontein	46,206	Consolidated Main Reef	17,033
Randfontein	40,712	Knights Deep	16,194
E.R.P.M.	33,389	Geduld Proprietary Mines	15,990
Van Ryn Deep	28,385	Nourse Mines	15,106
City Deep	25,317	Rose Deep	14,680
Modderfontein B.	23,396	New Kleinfontein	14,100
Modderfontein Deep	23,512	Village Deep	13,823
Brakpan	21,093	Geldenhuis Deep	13,060

Infusorial Earth Market Possibilities

"I have been referred to you by our State Bureau of Mines and Geology for information regarding the possibilities of marketing diatomaceous earth which I have here in large quantities. This is quite pure on analysis and contains little else than silica and water. Can you advise me of the best method of getting in touch with prospective purchasers?"

Infusorial or diatomaceous earth has many uses, all of which combine to influence the market for this product. An enumeration of these applications would include the use of the material as a cleanser and polisher in the form of a powder or mixed with soap, as a non-conductor of heat, either alone or in conjunction with other materials; as a covering for boilers, steam pipes, furnaces and stoves; and in the manufacture of fireproof cements. The great absorbent quality of infusorial or diatomaceous earth makes it suitable for water filters. Owing to this characteristic it was formerly employed in the manufacture of dynamite. It is used in the manufacture of talking-machine records when boiled with shellac. Another use is as an absorbent for liquid manures to make them more adaptable as a fertilizer. The manufacturers of water glass, various cements, tile glazing, artificial stones, pigments of alizarine, and aniline colors consume much infusorial earth. Minor uses include paper filling, for sealing wax, in fireworks, matches, papier-maché, as liquid bromine containers and other miscellaneous purposes. Its use as a building stone in California is worthy of note, as well as its employment in the manufacture of plaster.

Infusorial earth is of widespread occurrence, although we believe that the largest domestic deposits are found in the Western United States. On the other hand, the greatest demand for this material is in the East, so that the price received for the Western product is lower, because of the heavy transportation charges to the principal markets. Prices vary considerably and depend upon the quality of the infusorial earth—as in most non-metallic products—and upon the location of the deposit.

Prices range widely from $6.50 to $10 for the Western grade, and from $13 to $30 for the Eastern product, f.o.b. mines.

In marketing your product you would have the choice of using dealers or communicating directly with consumers. In the latter event it would be well to cultivate a local market as far as possible through communication with local manufacturers of products consuming infusorial earth. The list of uses given above will serve as a guide to this end. The other alternative, marketing through dealers, is easier but naturally has its disadvantages.

Western Acid Producers

"Can you tell me if there are any manufacturers of sulphuric acid extracted from sulphide ores in Arizona or other points west of Denver?"

To the best of our knowledge no sulphide ore is being mined in Arizona for its sulphur content alone. The sulphur, when recovered, as at the smelter of the Calumet & Arizona Copper Co., at Douglas, is produced as a byproduct from the smelting of copper ores. Under existing conditions the numerous pyrite deposits would undoubtedly have difficulty in marketing their product profitably, owing to heavy mining and transportation costs to the chief markets.

California has extensive pyrite deposits, but because of their great distance from the East, where sulphuric acid is chiefly consumed, their development has been retarded. California's greatest pyrite producer is the Mountain Copper, at Keswick. Manufacturers of sulphuric acid in the Far West are small in number. We believe that the Barbour Chemical Co., Stauffer Chemical Co., Union Superphosphate Co., Leona Chemical Co., and Mountain Copper Co., all of San Francisco, comprise the list.

The Molybdenum Ore Market

"Will you kindly advise me as to the price and present demand for molybdenum ore? How can I get in touch with parties who will buy this ore?"

The present demand for molybdenum ore is small, and hence the market is dull. The technology of molybdenum is not sufficiently understood to warrant alloy-steel manufacturers employing large quantities of this metal. Other uses for molybdenum, such as in electrical apparatus and the manufacture of chemicals, are too unimportant to help sustain the market. As in some other metal markets, the dealings in this class of ore are frequently attended with an inordinate amount of secrecy, inquirers and buyers alike maintaining reticence on their dealings. Owing to the small trade in the ore, accurate metal quotations are difficult to obtain, and at present the sole offerings seem to be foreign molybdenum ore at 60@65c. per pound of MoS_2 contained.

THE PETROLEUM INDUSTRY

Probable Oil Resources of New Mexico

A Summary of the Stratigraphic and Structural Geology of the State, With Particular Reference To Possible Sources of Petroleum—Some Oil Has Been Discovered, And a Few Localities Are Promising

BY JOHN K. KNOX*

THE interior of the United States west of the Mississippi River is commonly divided into three great, major topographic provinces, the Great Plains, the Cordillera, and the High Plateau. Each of the three regions is represented in New Mexico. The state is divided into three sub-equal parts by the Rio Grande and the Pecos rivers, and these three areal subdivisions correspond roughly with the topographic subdivisions. East of the Pecos are the Great Plains. Between the Pecos and the Rio Grande, and extending into the southwest corner of the state, is the Cordelleran area. To the west of the Rio Grande is the High Plateau.

The three great provinces are distinct topographically, and are well defined geologically, both in stratigraphy and structure. In the Great Plains region of New Mexico a thin covering of Tertiary formations unconformably overlies beds of early Mesozoic and Paleozoic age. The Tertiary formations lie nearly flat, and the subjacent beds normally dip gently eastward from the Cordillera into the great syncline which runs north and south through western Texas. This region may be divided conveniently into three districts: (1) an area in northeastern New Mexico where the surface formations are Tertiary or Cretaceous; (2) the area around Santa Rosa and Tucumcari, and in the Pecos Valley, where most of the surface formations are Permian or Triassic; and (3) the Llano Estacado, where the surficial beds are Tertiary.

The rocks outcropping in the Cordilleran area range in age from pre-Cambrian to Tertiary, but Pennsylvanian formations probably are most widespread. The beds are much folded and faulted and stand at angles ranging from a few degrees to more than ninety degrees from horizontal.

The High Plateau is underlain by a great thickness of nearly horizontal strata, ranging in age from Tertiary to Pennsylvanian. Streams have cut deep gorges across the plateau and have dissected it into a network of mesas of widely differing area and height. The plateau is more nearly a unit geologically than is either of the other major areas, but it may be divided conveniently into two parts, the San Juan Basin, in the north, and the Magdalena district, in the south.

The Tertiary formations of the Great Plains, consisting of poorly cemented sand, clay, and gravel, outcrop over much of eastern Union County. It is not known with certainty what formations underlie the Tertiary in this region. One hundred miles to the southeast on Canadian River, in the Texas Panhandle, similar Tertiary rocks overlie Triassic and Permian. In western Union County the Dakota sandstone appears from under the Tertiary, which lies unconformably upon it, but it is not known how far east the Dakota extends under its Tertiary cover. This is not of great importance, however, as the Dakota is not an oil-bearing horizon. The Tertiary area in northeastern New Mexico is not of great interest to the oil producer.

West of the Tertiary area in Union County, the Dakota and Purgatoire sandstones outcrop over a large tract in Union, Colfax, Mora, and San Miguel counties. These rocks have been deformed and folded, and at least one anticline of considerable size is present, but despite these facts, the area where they outcrop is not attractive as a prospective oil field.

Even more important than the character of the Dakota is the lithology of the underlying formations in which oil would be expected. If 4,000 ft. is accepted as being about the greatest depth to which a well can be drilled profitably at present, there is little chance of finding valuable petroleum deposits by drilling in the areas in northeastern New Mexico where the Dakota and Purgatoire sandstones appear at the surface, because the 4,000 ft. of beds immediately underlying the Dakota do not offer much chance of production. A number of wells have been drilled, and some are being drilled now, in the neighborhood of Des Moines, but none of them have shown signs of commercial production.

When examining structures in northeastern New Mexico with oil development in view, it is necessary to make sure that the structural form is not caused by an igneous body of the laccolithic type. Certain determination of this condition is not always possible, but the possibility must be given greater weight when evaluating a structure in this region. If the laccolith is buried deeply enough, and has not pierced the productive oil horizons, oil will collect on the structure if other conditions are favorable, and the fact that a structure is of laccolithic origin need not necessarily condemn it as a possible producer of oil. In this region, however, the chances are that if a laccolithic structure is sufficiently marked to be determinable as a structure, the igneous rock is probably so close to the surface as to make the likelihood of obtaining oil very remote.

West of the outcrop of Dakota sandstone, younger Cretaceous formations are exposed in a broad belt in the valley of the Canadian River. This Cretaceous area, sometimes spoken of as the "Raton field," is the most promising area for future oil production in northeastern New Mexico.

*Published by permission of the council of the American Association of Petroleum Geologists. Read at the Dallas meeting in more extended form.

The plain of the Canadian River Valley is underlain by the great shale series of the Upper Cretaceous, which includes beds ranging in age from Dakota to Pierre. The shale of the Benton and Pierre groups is of the type which commonly produces oil, and it is probable that a well drilled into these shales at almost any point would show traces. In Wyoming, where the same formations have an almost identical appearance and composition, they produce oil.

Unfortunately, a careful search of the Cretaceous section in the Canadian Valley, from the top of the Pierre to the base of the Benton, has failed to disclose a single bed of sandstone which could act as a reservoir for the oil produced by the Benton and Pierre shale. It is possible that lenses of sand are present in the area, but no such lenses are known to outcrop. The only reservoir horizons in the Cretaceous section in this district appear to be the Timpas and the Greenhorn limestones. In these formations the limestone is thin-bedded, and the individual beds of limestone are separated by thin beds of impervious shale. Such a lithologic condition does not produce a good oil sand, but it does not make the storing of oil impossible, and oil may be present in these limestones somewhere in the district. It should be noted that nowhere along their outcrop, so far as I have observed, do these limestones show traces of oil or gas, and although this fact does not prove that they are barren everywhere, they may be assumed to be so over considerable areas.

In the absence of good reservoir horizons, it becomes of the utmost importance that any well drilled be situated on a favorable structure, so that it may have some chance of success, but the absence of sandy horizons in the shale makes it difficult indeed to detect such structures. In most places the surface is mantled by from two to twenty feet of weathered shale or river deposits, which yield no information concerning the subjacent structures, and even where the unweathered shale is exposed, no definite beds can be traced. The Cretaceous area in the valley of the Canadian River is the most promising territory for oil in northeastern New Mexico, but even it does not offer good prospects of becoming an important producer.

Raton Mesa District Geologically Unfavorable

The Raton Mesa district, west of the Canadian Valley, is underlain by Tertiary formations which are not likely to produce petroleum. Beneath the Tertiary, and overlying the Pierre shale, are 525 ft. of sandstone and shale belonging to the Trinidad and Vermejo formations, which are Cretaceous in age and younger than the Pierre. The Trinidad sandstone is 100 ft. thick and lies immediately on top of the Pierre, so it is not improbable that oil which may have originated in the Pierre shale might, under favorable structural conditions, collect in this sandtone. There is no competent bed of impervious rock above the sandstone, however, and it is more than likely that any petroleum which may have migrated to the sandstone has already escaped. A well to test the Trinidad would be justified, however, if placed on an especially favorable structure.

Large anticlinal structures bring Cretaceous rocks to the surface in a number of places in the Raton Mesa district. Vermejo Park, which is probably the best known of these, is a large and well-defined anticline, and would be an attractive drilling site were it not for the doubt as to the presence of reservoir horizons in the Cretaceous formations underlying it. Structurally it is satisfactory, and it is probably the best place in which to test the Cretaceous formations of the district if anyone is willing to drill such a test in face of the unfavorable lithologic conditions. A well 3,500 ft. deep would afford a good test of the Cretaceous.

Santa Rosa-Tucumcari Region Unexplored

Throughout the Santa Rosa-Tucumcari region the surface formations belong to the great "Red Bed" series of central New Mexico. No part of this district has been studied in detail geologically, and the exact age of many of the formations is not known. The Dakota-Purgatoire sandstone at the base of the Cretaceous, and the underlying Morrison shale, are readily recognizable, and the boundary between them and the subjacent formations has been traced with approximate accuracy. The 4,000 ft. of sediments immediately underlying the Morrison belong to the Triassic, Permian, and Pennsylvanian systems. The Magdalena limestone at the base is definitely known to be Pennsylvanian, but on account of the paucity of fossils the upper beds are not readily classifiable as to age.

A massive sandstone, for which I propose the name "Pecos Canyon," divides the "Red Beds" which overlie the Magdalena into two groups: (1) the upper "Red Beds" and (2) the lower "Red Beds." The upper "Red Beds" are probably Triassic; the lower "Red Beds" are Permian or Pennsylvanian or both.

Lithologically, the "Red Beds" are unpromising as a source of petroleum. Nowhere in the series is there an appreciable thickness of marine shale or other bituminous, oil-forming lithologic type, and, except in one locality a short distance north of Santa Rosa, no evidence of the presence of petroleum in the sandstones is to be noted.

Favorable-looking structures are plentiful in all the Santa Rosa-Tucumcari region, and on account of the similarity of the formations, and of the surficial conditions, to formations and conditions at Burkburnett, operators have devoted much attention to the district within the last year. During 1919, a well was drilled on Los Estaritos dome in T. 11 N., Rs. 18 and 19 E. Judging from surface indications, this dome is almost perfect. It is regular in shape, is of good size, has ample closure, and should contain oil, if oil is present in the district. The well spudded in in "Red Beds" and drilled through "Red Beds" until it passed into granite between 1,900 and 2,000 ft., without finding oil. This well brought out two significant points: (1) that the Magdalena limestone is not present on Los Estaritos dome, although it is 1,800 ft. thick only thirty-five miles to the northwest; and (2) that the domal structure possibly owes its origin to renewed movement along an old line of granite hills which are now concealed by only a few thousand feet of Paleozoic sediments.

The presence of granite under Los Estaritos dome at the comparatively shallow depth of 1,900 ft. suggests that many, if not all, of the numerous structures lying between the Sangre de Cristo foothills and the Texas line may owe their origin to renewed movement along an old line of mountains, and that they may be as barren of oil as is Los Estaritos. It is worthy of note that the folds which are producing gas in the Texas Panhandle, due east of Santa Rosa, have a general east-west elongation, and some geologists are suggesting that a range of eroded and buried mountains extends from the Sangre de Cristo into Texas.

In view of the non-petroliferous character of the lower and upper "Red Beds," the probable absence of the Magdalena limestone from much of the disturbed area east of Los Estaritos dome, the non-bituminous character of the Magdalena even where found, and the probability that the observed anticlinal structures in this district are underlain at shallow depths by granite or very old metamorphic rocks, the "Red Beds" area in the Santa Rosa-Tucumcari region is not an attractive oil prospect.

The Lower Pecos Valley Not Commercially Productive

Oil in less than commercial quantities has been found for many years in shallow wells in the Pecos Valley between Roswell and Carlsbad. The central part of the valley is floored by a thick mantle of Quaternary river deposits, flanked on the east by "Red Beds" and on the west by porous limestone of Permian age. The "Red Beds" are so unfossiliferous that certain determination of their age is difficult, but some part of the series is Permian, and part is possibly Triassic. Under the "Red Beds" is an immensely thick series of Pennsylvanian and Permian limestone.

The regional dip of the sedimentary series is to the east, decreasing from more than ten degrees at the crest of the Sacramento Mountains to nearly zero on the plains. Small anticlinal folds are not plentiful where the consolidated rocks can be studied on the long slope from the mountains to the Pecos, and in the central part of the valley, floored by Quaternary formations, it is not possible to determine by surface indications whether such structures exist or not.

A considerable number of wells have been drilled in the Pecos Valley during the last fifteen years, and, although none have been commercially profitable, enough oil has been found to keep hope alive, and interest and drilling still continue. The wide area west of the Pecos where limestone is the surface formation is unpromising territory, because any oil that may have been in the limestone has probably escaped, and the limestone itself is so thick that it cannot be pierced. The area mantled by Quaternary deposits is difficult prospecting ground, and, apparently, most of the drilling has been done blindly. Old methods can probably be improved, however, for a careful study of the logs of the numerous water wells that have been drilled in the valley should make possible a fairly close approximation to the sub-surface structure.

A favorable structure can be more easily located in the "Red Beds" area east of the river, and a favorable structure in this district would certainly be worth a test. The present small production is obtained from porous beds in the upper part of the limestone series which underlies the "Red Beds," and if even a small production could be maintained it would be profitable, as the wells are shallow and inexpensive to drill. Oil is a widely distributed mineral, however, and nothing so far found proves that commercial deposits of it are present in the Pecos Valley.

Llano Estacado Region Unfavorable

The surface formations of the Llano Estacado are Tertiary in age, and beneath them lie the Triassic, Permian, and Pennsylvanian beds, which outcrop to the east and west of the Staked Plains. The continuity of the older rocks is fairly well established.

There is no reason to suppose that oil will be found in the Tertiary deposits themselves, and before drilling is undertaken in an effort to discover sub-Tertiary structures, it should at least be known that the sub-Tertiary formations contain oil. Nothing indicating the possibility of commercial production from these beds has yet been found, and at the present time the Llano Estacado must be regarded as one of the least favorable regions in New Mexico in which to prospect for oil.

The High Cordillera Probably Barren

The High Cordilleran area of New Mexico is a region of high mountains, in which the predominating rock type is Pre-Cambrian granite. At the south end of the Sangre de Cristo Range Magdalena limestone lies on the granite, and the younger formations appear in their respective order and dipping gently to the south. The chances of obtaining oil in the High Cordilleran area or on its immediate borders are so small that the district may be considered as valueless as a prospective oil field.

The southern Cordilleran area of New Mexico comprises the mountainous region which extends through the centre of the state from the main line of the Santa Fe south to the boundary of Texas and Mexico, and southwest to the boundary of Arizona. This region is characterized by the "bolsom-fault-block" type of structure, which sharply differentiates it from the higher Cordillera to the north. The northern ranges are, commonly, great anticlinal folds modified by faulting. The sedimentary beds are steeply upturned in many places, and are altered where deformation has been most intense. In southern New Mexico there are no long ranges, the mountains are monoclinal rather than anticlinal, in only a few places are the beds steeply tilted, and metamorphism is rarely seen. The southern Cordillera consists of a series of short, relatively low mountain blocks which owe their origin to faulting, arranged in three fairly continuous north-south lines east of the Rio Grande. Except in the disturbed blocks, the formations dip gently to the east or southeast or lie nearly horizontal.

As possibly productive areas, the fault-block ranges themselves are not of interest, for in most of these blocks granite is exposed at the foot of the fault scarp, and the broken and upturned edges of the sedimentary formations outcrop. Oil is found elsewhere in mountainous areas where the rocks are closely folded, as in Ventura County, Cal., but the monoclinal fault-block structure of the New Mexican ranges has afforded no opportunity for oil accumulation.

West of the mountains is the debris-filled plain of the Rio Grande. Between the individual mountain blocks lies a series of shallow undrained basins known as "bolsoms," of which the larger and more important are Tularosa Basin, Estancia Basin, and Jornada del Muerto. These basins, and the valley of the Rio Grande, were once rather deep, but now they are filled to a depth of hundreds of feet by loose, unconsolidated Quaternary gravels and sands washed from the surrounding hills. However, if oil is found anywhere in south-central New Mexico, it is most likely to be found on minor anticlinal folds or along the fault line in the down-thrown and buried fault-blocks which lie concealed beneath the Tertiary valley fill.

Formations ranging from Pre-Cambrian to Quaternary outcrop in the southern Cordilleran region, but Pennsylvanian and Tertiary rocks are most widely distributed at the surface. In the El Paso region rocks

representing parts of Cambrian, Ordovician, Silurian, Devonian, Mississipian, and Pennsylvanian time are present.

The outstanding difference in the Paleozoic series in the northern and southern parts of the region is one of lithology. North of Socorro the Paleozoic section contains many thousands of feet of sandstone and shale, and a relatively small thickness of limestone. South of Socorro the thickness of sandstone and shale decreases rapidly and the limestone content increases even more rapidly as progressively older rocks appear below the Pennsylvanian.

The sandstone, shale, and gypsum which outcrop north of and around Socorro belong to the Manzano group of the Pennsylvanian. The rocks are for the most part red in color, and give absolutely no evidence of included bituminous materials. A careful study of the whole Manzano group has convinced me that it offers little or no chance of being an original source of petroleum.

The limestone which is present in great thickness at the base of the Paleozoic section in southern New Mexico does not contain an appreciable amount of bituminous material except in a few thin beds in isolated localities, but the future of this region as a producer of petroleum appears to be bound up with the limestone series. Structures favorable for the accumulation of oil exist in the basins, although they will be hard to find, and if the limestone or the shale included in it is an original source of petroleum, the probabilities for a large production of oil are good. On the other hand, if the limestone beds have not themselves produced petroleum, and serve merely as storage for oil which has migrated from some outside source, the prospects are discouraging. Most observers consider that marine shale is the original source of the greater part of the world's petroleum, and marine shale is conspicuously absent from the Paleozoic section in south-central New Mexico.

Comparison With Oil Fields of Mexico

Lithologic conditions in southern New Mexico are in some measure analogous to those in the oil fields of the Mexican coast. The Tamasopo limestone of Mexico is an immensely thick series, and enormous quantities of oil have been produced from the upper beds of this formation. The rock itself is not more bituminous than are many of the Paleozoic limestones of southern New Mexico, and it is reasonable to suppose, if the Tamasopo limestone produced the oil which is found in it, that oil may be found in the Magdalena or underlying limestone in New Mexico.

The important question is, Did the oil found in the Tamasopo limestone originate in the limestone itself? Over the Tamasopo limestone in Mexico lies a thick series of marine shales such as produce oil in many regions of the earth. The solution of the question as to the origin of the oil is dependent on determination of whether oil ever migrates downward from a superjacent shale to an underlying porous horizon. Opinion is divided on this subject, and proof, one way or the other, is difficult to establish, but it is certain that evidence of downward migration is rare. Probably the majority of operators believe that the oil found in the Tamasopo limestone originated in the overlying shales, but although this implies downward migration in a stratigraphic sense, it is doubtful whether it also implies downward migration gravitatively. The theory of the migration of oil is in a state of change at present, and many geologists are accepting the conclusion that petroleum does not migrate long distances, either horizontally or vertically, and that, in most instances, it is found not far from where it originated.

If those observers who believe that oil originates only in shales are correct, there is little hope that southern New Mexico will ever produce an oil field. In this region there is no marine shale lying over the limestone, but in its place there is a thick series of "Red Beds," which are not bituminous.

Conversely, if it were definitely known that oil originates in limestones, southern New Mexico would be well worth prospecting. The presence of small quantities of oil in the porous beds at the top of the thick series of limestones in the Pecos Valley has an important bearing on the prospects of the Cordilleran region farther west. If this oil did not originate in the limestone itself, no source for it is evident, and, whatever be its origin, it is reasonable to expect oil at least in similar quantity in south-central New Mexico, where lithologic conditions are entirely comparable.

A number of wells have been drilled in the basins of southern New Mexico, but most of them appear to have been located on acreage rather than on a favorable structure. Tularosa Basin recently has been a favorite haunt of the wildcatter, but as the valley fill is hundreds of feet thick over much of that basin, most of the wildcats are doomed to failure. I have made a rather careful examination of the Paleozoic section in southern New Mexico, but so little bituminous material was found in the rocks that I am inclined not to be optimistic over the possibilities of finding oil in commercial quantities in this region.

Plateau Province Should Prove Productive

In my opinion, the Plateau Province, west of longitude 106 deg. and north of latitude 34 deg., is the most promising region in the State of New Mexico in which to prospect for oil and gas. It is essentially an area of Cretaceous rocks. Pennsylvanian formations outcrop in many places, and Permian and early Mosozoic formations have a more limited distribution, but Cretaceous rocks predominate. When measured over long distances, the sedimentary beds are found to lie flat, or nearly so. Small faults with a moderate throw are numerous, and locally small well-defined anticlines afford excellent collecting areas for petroleum contained in the deformed beds.

If oil is found in the Plateau region it will probably be discovered in Cretaceous rocks, and chances of finding oil in these formations are bright. Great quantities of oil are being obtained from Cretaceous rocks in Wyoming, and the Wyoming Cretaceous is similar in all important respects to the Cretaceous of northwestern New Mexico. The Cretaceous areas in the San Juan Basin and the smaller Cretaceous areas northwest and west of Magdalena are probably the most favorable localities in the state.

The oldest rocks found in the district around Magdalena are Mississippian in age, and they are exposed over only a limited area. The Pennsylvanian formations are similar lithologically to the Pennsylvanian formations east of the Rio Grande, and the probability of finding oil on structures in the Paleozoic in this district is neither greater nor less than of finding it on structures in the Tertiary-filled valleys of south-central New Mexico. The surface of the Plateau is not

everywhere buried under a mantle of Tertiary debris, however, and chances of locating a favorable structure are much better than in the basins to the east and south. The Manzano group is probably considerably thinner than it is in the Rio Grande Valley, and on many structures a well 3,500 ft. deep would test the lower Pennsylvanian and the Mississippian. Operators who wish to test the Paleozoic horizons in this region should devote careful attention to the areas of Pennsylvanian outcrop around Puertecito and Magdalena.

The Cretaceous rocks exposed in the Magdalena district belong to the older formations of the Cretaceous group, no beds younger than Mesaverde probably being present. The rocks are similar to the corresponding formations in the San Juan Basin, and the district where they outcrop should share attention with the Cretaceous areas to the north.

San Juan Basin Worth Investigation

The San Juan Basin region includes the San Juan Basin and a fringe of territory extending on the east nearly to the Rio Grande and on the south to Mount Taylor Mesa and the Zuni Mountains. The northern boundary lies along the San Juan Mountains in southwestern Colorado, and to the west the basin extends into Arizona. The basin comprises the area drained by the San Juan River. In New Mexico this includes a circular area lying immediately west of the Continental Divide, and embraces the whole of San Juan County and parts of Rio Arriba and McKinley counties.

South of Gallup is another small basin, bounded by the Zuni Mountains on the east and drained to the west by Zuni River. This area, known as Zuni Basin, is geologically similar to the larger basin to the north and is commonly associated with it. The combined areas of the two basins is about 140,000 square miles.

The San Juan Basin is a basin both structurally and topographically, and on all sides the formations dip gently inward from the borders toward the centre. In the center of the basin is a broad outcrop of Tertiary rocks, approximately circular in outline, and around the Tertiary in bands of varying width and completeness are the Cretaceous and Pre-Cretaceous formations. Not all of the formations outcrop in complete rings around the Tertiary, but the similarity of the formations to a nest of decreasingly smaller saucers, piled one inside the other, holds. The Pre-Cretaceous formations in the San Juan Basin do not offer great promise of being productive of oil, and although they range in thickness from 1,300 to nearly 6,000 ft., they are of little interest to the oil producer.

The Cretaceous formations, on the other hand, give promise of yielding petroleum and merit careful study. They are commonly divided into five formations, the Dakota, Mancos, Mesaverde, Lewis, and Laramie. The Dakota sandstone commonly consists of a heavy band of sandstone at the bottom, a similar band at the top, with alternating beds of sandstone and shale and some poor coal between.

The Mancos is a marine shale of considerable thickness and wide distribution, similar in many ways to the Benton-Pierre shale series east of the Front Range. In many places the Mancos is very black, and in general is more carbonaceous than the Pierre, although less so than the Benton. Oil is found in many places in the Benton-Pierre series, and under structural conditions favorable for accumulation the Mancos ought to be as promising a primary source of oil as the Benton-Pierre group. In its type locality the Mancos shows no sand. In the neighborhood of Gallup the upper part of the Mancos consists of several hundred feet of alternating beds of sandstone and shale, with some coal, but the main body of the shale below shows no sandy members that can be traced, although lenses are found.

In its type locality on Mesaverde, in southwestern Colorado, the Mesaverde formation consists of a heavy sandstone at the base, a similar heavy sandstone at the top, and between these a thick series of alternating beds of sandstone, shale, and coal. The formation becomes thicker, more arenaceous, and coarser grained as it is traced southward across the San Juan Basin from its type locality, but it maintains the same general lithologic character. The whole series of upper Mancos and Mesaverde sediments indicate rapidly oscillating conditions of sedimentation in the lagoon or littoral zone of the sea in which the beds were laid down.

The Lewis shale is a greenish or greenish-gray sandy shale about 1,000 ft. thick in southwestern Colorado, but less than 100 ft. thick in the central part of the San Juan Basin. The shale is of marine origin, but does not appear to be highly carbonaceous.

The Laramie consists of a series of soft, friable, brown, tan, or buff sandstones and some shale and coal of both fresh-water and brackish-water origin. The Tertiary also consists of sandstone and shale. The rocks are coarse grained, soft, and friable, and have a characteristic greenish-white, greenish, or gray color, with some shade of tan in the sandstones.

If oil is found in the San Juan Basin it will probably be in the Cretaceous formations, because the Pre-Cretaceous formations do not exhibit any of the common evidences of oil, and are too deeply buried over most of the basin. Farther west, in the San Juan River field of northern Arizona, Pre-Cretaceous formations are yielding oil, and the Pre-Cretaceous section of that district merits a closer study than it has yet received.

Character of Prospective Oil Territory

It has been shown that two types of horizons are necessary before an area can be considered good prospective oil territory: bituminous horizons which supply the petroleum, and porous horizons in which the petroleum may be stored. The Cretaceous area in northeastern New Mexico is rich in shale which might be expected to produce oil, but it is almost destitute of storage horizons. The Pennsylvanian area of south-central New Mexico has a wealth of storage horizons, but bituminous oil-producing horizons are unknown. The San Juan Basin does not possess ideal conditions for the production and storage of petroleum, but conditions are more promising there than in any other part of the State of New Mexico.

Included in the Mancos, Mesaverde, and Lewis formations in the San Juan Basin there is from 800 to 4,000 ft. of marine shale, much of it black carbonaceous shale such as is abundantly petroliferous elsewhere in the Rocky Mountain region. The upper part of the Mancos and the Mesaverde together contain from 400 to 800 ft. of sandstone sufficiently porous to form admirable storage for migrating petroleum. Anticlinal structures favorable for the accumulation of petroleum are by no means rare, and it might be expected that, with both shale and sandstone present in adequate amount, oil will be found in commercial quantity under some of the best of these structures.

The chief infelicity in conditions lies in the dis-

tribution of the sandstones, which are all concentrated near the middle of the area, and it has been argued that the Cretaceous of the San Juan Basin will be unproductive, because no continuous and widespread beds of sandstone have been found in either the Mancos or Lewis.

A similar condition exists in Wyoming, where the chief production is obtained from the Wall Creek sandstone member of the Benton. The Wall Creek sand lies above a thick bed of Benton shale similar to the Mancos, and is overlain by an even thicker series of Pierre shale, which does not differ in any essential respect from the Lewis. The sandstone varies in thickness from less than 100 to more than 500 ft., but the best production has been obtained in areas where the Wall Creek is of moderate thickness. The Wall Creek is divided into a number of productive horizons—known in the oil fields as the First Wall Creek, Second Wall Creek, Third Wall Creek—by beds of shale which separate the sandstone beds from one another.

Even a brief examination will indicate that the situation in the San Juan Basin closely resembles that in Wyoming. At the base of the Mesaverde is a bed of sandstone nearly 200 ft. thick and sufficiently porous in most places to form a good storage horizon. A similar sandstone lies at the top of the Mesaverde immediately underneath the Lewis, and separated from the lower sandstone by a considerable thickness of shale. Even if no oil has migrated downward from the Lewis into the underlying sand, the shale serves as an adequate and impervious seal for the possible oil horizons below.

Enough oil has been found in the Mesaverde along the south side of the San Juan Basin to encourage further drilling. The Mancos shale may never have produced large quantities of oil, and the overlying sandstones may be barren, but until this has been conclusively proved by several tests drilled on good structures, I am inclined to regard the San Juan Basin as the best prospective oil territory in the State of New Mexico.

The Boulder, Col., Oil Field

Extensive Exploration of Old Petroleum District Planned—Improper Methods Caused Declining Production—Oil Is of Good Quality

SPECIAL CORRESPONDENCE

THE Boulder oil field, which in 1902 and 1903 was the scene of great activity, and the source of a considerable production during succeeding years, is to be extensively explored during the coming summer by some of the larger oil companies whose geologists have been studying the formations and the records of the old wells.

Oil was first struck in paying quantities in January, 1902, about three miles northwest of Boulder. Following this discovery, the usual excitement incident to the opening up of a new district is recorded. During the year over one hundred wells were sunk in various parts of the county, but most of them in the immediate vicinity of the first well. The wells brought in the first year were all small producers, probably none exceeding 20 bbl. per day.

Oil was struck at varying depths, ranging from a little less than 1,000 ft. to about 2,300 ft. The production the first year was 1,100 bbl. During the following years, until 1908, the production continued to increase. That year the output reached 75,000 bbl. Drilling was carried on extensively, but results seemed to indicate that the producing area was confined to a narrow strip extending parallel with the foothills and comprising a territory about three miles long and one mile wide.

The largest producing wells were found in the northern part of the field, some of them yielding over 100 bbl. daily and one over 200 bbl. daily for several years. Since 1908 there has been a gradual decrease in production, last year the output being less than 2,500 bbl.

Development of this oil field from the start was almost without exception conducted in a haphazard way, with absolutely no regard for the future life of the field. In the absence of legal requirements regarding the plugging or capping of abandoned wells, water was permitted to flood the oil measures, and gas escaped unrestrained, with the inevitable disastrous results.

The oil is of a high grade, with a paraffine base. Bulletin No. 265 of the U. S. Geological Survey says: "The quality of the petroleum from the Boulder field is superior to that of any west of the Mississippi River."

For some time the Midwest Refining Co. has been securing leases on acreage in and adjoining the old producing field, and the company has announced that it will begin sinking a well in the northern end of the old field.

It is the theory of the company's geologists that the oil hitherto produced in this district has been migratory from an undeveloped source. The records of early wells would indicate that this source might underlie the limestone strata encountered in previous wells at about 3,000 ft. It is the purpose of the Midwest company to sink through the limestone formation, where it is believed a more prolific source will be found.

North of the old field, the Frantz Corporation has leased over 3,000 acres in Townships One and Two, and its geologists estimate that the oil strata here will be encountered between 2,200 and 3,500 ft. Both tests to be made this summer are for the purpose of seeking the primary source of the oil found in the old field.

Evaporation of Crude Oil in the Mid-Continent Field*

The evaporation of crude oil causes one of the largest single losses to which the oil is subjected after it is taken from the ground. The few days during which crude oil is stored on the lease before being taken by the pipe line involves an aggregate loss per year from evaporation estimated at 122,100,000 gal. of gasoline in the Mid-Continent field alone. This has a value, at 22c. per gal., of $26,880,000 and represents about 3 per cent of the total gasoline produced in the United States from all fields and all sources.

Companies handling crude oil have always realized that losses take place, but the proportion lost under any given condition has not been even approximately known. Sporadic efforts have been made to determine this loss, but no co-ordinated results have been published. In order to gain some definite information as to the magnitude and the causes of these losses, this problem was taken up at the Bartlesville experimental station and at the San Francisco office of the Bureau of Mines. In a bulletin which will be published soon, the results of investigations at the Bartlesville station will be presented in detail.

*U. S. Bureau of Mines, "Reports of Investigations."

NEWS FROM THE OIL FIELDS

Gulf Production Disposes of Holdings in Somerset Field

Sales in Burkburnett District and Morgan's Point—North Extension of Homer, Louisiana, Field Indicated

From Our Special Correspondent

The Grayburg Oil Co., of San Antonio has obtained an option on all the holdings of the Gulf Production Co. in the Somerset field near San Antonio. The property consists of about five thousand acres in the heart of the field, and on which are twenty small producing wells. In addition, there are rigs, camp buildings and power plant. The consideration, it is stated, is about $500,000. The Grayburg Co. already has over fifty wells on its own ground in this field, making an average production of 10 bbl. daily.

The Texhoma Oil & Refining Co., of Wichita Falls, has filed an amendment to its charter increasing its capitalization from $3,000,000 to $6,000,000.

On the Texas Gulf Coast, a large well was brought in during the fourth week in June, the Morris-Phillips No. 4, at Hull, Liberty County, drilled jointly by the Texas and Gulf Production companies. It came in making an initial output of 4,000 bbl. daily from 2,550 ft.

Two large sales of property in the Burkburnett district have been made recently. The Montrose Oil and Refining Co., of Ft. Worth, has purchased the oil property of the Touman Oil Co., of Okla., in Block 96, Northwest Burkburnett field. There are eight producing wells on this land. A one-half interest in 23 acres in Block 18 was sold by H. P. Pennington to T. O. Shappel for $23,000. This tract is near the Borg-and-Maer well, about two miles south of the Kemp-Munger-Allen discovery well area.

It was announced in Houston that Howard Walker had disposed of his entire holdings in the Walker Oil and Refining Co. to Eastern interests. The refinery is at Morgan's Point, on the Houston Ship Channel, and is in operation. The officials of the company have made no formal statement of changes in ownership or policy. Walker has taken an option on 35 acres above Morgan's Point, and, it is stated, will commence the construction of a 1,500-bbl. refinery in July. This will treat Gulf Coast and Mexican crude oils and manufacture lubricating oils and asphalt.

In the Homer district, Louisiana, six wells were completed on June 25 on the Garrett lease, making a total initial production of 3,950 bbl. In addition to these a new well on the Smith land, two and one-half miles north of the lease, is reported making oil by swabbing. This indicates an important northerly extension of the Homer field.

Deep Drilling Near Old Gainesville Pool, Kentucky

From Our Special Correspondent

An unverified report is current among oil men here that an 800-bbl. well has been found at a depth of 1,900 ft. on the old Jake Moulder lease on the Warren-Allen County line three miles north of the Gainesville pool. This pool was abandoned a year ago after it had produced lavishly from a shallow depth, few of the wells being over 150 ft. deep. Recently the Swiss Oil Corp. began work there, announcing they would drill to considerable depth. Their operations, as usual, have been conducted in secrecy, with a high board wall built entirely around the drilling rig. It is understood they have been successful, one estimate placing the production of the new well at 840 bbl.

Well No. 13 on the George Sledge lease in Warren County has been completed and a test made showing it to be good for 120 bbl. a day. No. 6 on the Willoughby lease a half mile east of the Sledge wells has been completed at 435 ft., 13 ft. under the shale. The well filled nearly to the top, and is reported good for 200 bbl. a day.

In Allen County, Holder & Parker have completed No. 3 on the Brown lease, estimated to be equal to No. 2, which filled two tanks of 250 bbl. each in 48 hours, and is pumping 100 bbl. at the present time.

Peace River Field

From Our Special Correspondent

Following a visit of inspection by W. C. Goffat and Thomas A. Cain of Toronto, to the western properties of the Peace River Petroleums Ltd., it is reported that as a result of the progress made crude oil will be delivered to purchasing companies before the end of the season. At well No. 1 in Peace River town, the operation of enlarging the bore from 6 to 8 in. has progressed for over 1,000 ft. Everything is in readiness to begin drilling at well No. 2 situated 2½ miles below Tar Island. Three new drilling equipments will be operated at Hudson's Hope, the Upper Smoky, and the Lower Smoky. Applications have been received from two Alberta companies for a supply of 20,000 bbl. of crude oil per month. The plans of the directors include the production of both gas and gasoline as well as oil. It is estimated that there is at this time 20,000,000 cu.ft. of gas per day blowing out of the wells in the district and going to waste. As this gas is wet it is possible to separate the gasoline from the gas, leaving a burning gas suitable for light, heat and power purposes. It is proposed to undertake this work and in the meantime a casing-head plant will be installed.

Oil Shipments to Georgia To Be Inspected

From Our Special Correspondent

The Federal District Court has refused the Texas Co. an injunction to prohibit the State of Georgia from inspecting oil shipments and collecting fees on such inspections. It was held that inspection could not be made on shipments of oil to Georgia consumers when delivered in the original containers, but that the state could inspect, and charge, therefore, all shipments for indefinite storage or sold in other than the original packages. If the Supreme Court sustains this decision, the annual fees collectable by the state will be approximately $600,000.

Coast District of British Columbia To Be Drilled

From Our Special Correspondent

There is considerable prospecting for oil and drilling in the coast districts of British Columbia. The oil shales of the Queen Charlotte group of islands long have inclined many to the belief that oil exists there in commercial quantities. George Clothier, resident mining engineer, made a superficial examination two years ago and recommended that a specialist should be engaged to make an inspection and submit a report. Prior to that one or more Canadian geologists had been over some of the ground but their reports were more or less indecisive. A company was organized recently and drilling has commenced near Lawn Hill, Graham Island. It was closed down temporarily owing to labor trouble, but, no doubt, will be resumed as soon as conditions are more favorable. It is announced that a company has been incorporated at Ottawa, known as the British Controlled Oil Fields, Ltd., with a capital of $40,000,000, which will begin an investigation of various Canadian properties. British Columbia oil possibilities will be given attention, it being stated that expert oil engineers are being sent West to look into the conditions on Graham Island.

The Kamloops Natural Gas and Oil Co. has recently been incorporated to prospect and drill for oil in the Kamloops district of British Columbia. Its capitalization is $500,000. The purpose is to undertake the search for and development of possible oil and coal fields.

A commission is to be appointed by the Department of Labor and Industry of Mexico to study the oil problem in conjunction with a commission representing American interests, according to the New York Times. The recommendations of these bodies will probably provide an amicable settlement of the present difficulties.

COURT DECISIONS IN MINING CASES

By Wellington Gustin

MONTANA

Appeals Court Sustains Day and Finley

Judgment for Return of Properties Denied—Defendants Doing Important Development Work

The Circuit Court of Appeals, Ninth Circuit, has affirmed the judgment of the District Court of the United States in the suit brought by the McCaffreys against Harry L. Day, J. D. Finley and others for rescission of a mining contract. The bill alleged failure and refusal of Day to comply with the terms of the contract, and that such refusal by him was arbitrary and in bad faith. The trial court found for defendants, and plaintiffs appealed.

The contract related to the mining property consisting of the Heron lode mining claim, the Cabinet lode mining claim, the Galena lode mining claim and the Cabinet Mill site, situated on Callahan Creek, in the Troy mining district, Lincoln County, Mont. This property belonged to the Big Eight Mining Co., but during 1910 it was leased to R. C. McCaffrey by the company, with an option to purchase for $50,000, deeds therefor being deposited in escrow, to be delivered upon the payment of the purchase price.

McCaffrey was a prospector and miner, and began working the property under the lease, shipping a number of cars of lead and zinc ore. The McCaffreys opened negotiations, through Mr. Finley, vice-president of the Exchange National Bank of Spokane, Wash., with the Grasselli Chemical Co., for the advance of the $50,000 with which to make the purchase, and for development work. But it appears that defendant Day was preferred by Finley, for the reason that he was an experienced and competent mining man, as well as one of abundant means, and the contract sued upon resulted.

Day had been manager of the large Hercules mines. He went to examine the property, and regarded it as a good prospect and agreed with Finley to advance $50,000 to make the purchase, and $50,000 more for development of the mines. The McCaffreys made deeds passing the property from the Big Eight Mining Co. through them to Day and Finley, in the proportion of 51 per cent to Day, 14 per cent to Finley, retaining 35 per cent in themselves. There was an additional contract executed by the parties for the purpose of putting up the money for development. Day and Finley retained an option to purchase the McCaffrey interests, and it was provided that Day, or some person designated by him, should, at all times, have the general management and control of the property.

The McCaffreys insisted that this contract was an essential part of the consideration for the deeds from the McCaffreys, which failed in a material part by reason of Day's refusal "arbitrarily and in bad faith, and not in the exercise of his judgment or of any discretion conferred upon him by the agreement," to advance the money or to do anything required of him thereby, in consequence of which the McCaffreys should have the contract rescinded and reconveyance of the property.

The court found the evidence insufficient to show the contract was part of the consideration for the deeds and that Day acted in bad faith or arbitrarily. Proof shows both Finley and the McCaffreys insisted that he proceed promptly to install machinery and erect a mill. The court said the complete answer to such suggestions was that by the agreement the development and operation was left to the honest judgment of Day. And Day testified to important and necessary preliminary development work. To save heavy costs for the production of power, independently, for mill operation, he had made arrangements for electric power through a near-by friendly operator who had erected a plant costing $350,000. All these things were good and sufficient reason for any delay, and judgment in his favor was sustained.

COLORADO

Ward Recovers Possession of Calamity Lodes

Court Holds That Location Certificate of Nos. 2 and 8 May Be Perfected by Additional Certificate

In the various actions brought by A. H. Ward and another against Andrew Nylund and another, claiming location and ownership of Calamity Lode No. 2, situated in the Blue Creek mining district, in Mesa County, Col., the Supreme Court of Colorado has affirmed the judgment against defendants, who had ousted the plaintiffs and claimed ownership of the ground by location of their Sunrise lode. Dispute over Calamity Lode No. 8 and the Cracker Jack lode has been determined in favor of plaintiffs.

The defendants contended that the original location certificate of Ward and the other did not purport to tie the claim to any natural object or monument, and for such reason was void, and that the additional location certificate correcting the original did not cure the defect. In deciding the question, the Supreme Court of the state held that an imperfect certificate was not void, but that when it is amended it has full life, the amendment taking effect with the original.

WASHINGTON

Relocation Notice Must Cite Facts

Newport Mining Co. Wins Suit Against Bead Lake Gold-Copper Mining Co. — Abandoned Property Not Properly Relocated

The Supreme Court of Washington has affirmed judgment in favor of the Newport Mining Co. in its action against the Bead Lake Gold-Copper Mining Co. These parties were rival claimants to a tract of mining ground located in the Newport mining district, in Pend Oreille County, Wash. The former company claims the Snowbird mining claim, which overlaps to the extent of about three acres the Comstock Fraction lode mining claim, owned by the latter.

The Newport Mining Co. claimed the right to the disputed territory under a relocation notice dating from April 25, 1907, and through having held adverse possession, doing the annual assessment work for a period of more than eleven years. The rival company claimed under a location notice of prior date, and under an amended and relocation notice that had been issued under date of Oct. 24, 1914.

The court said that a location notice which fails to recite that the property is located as abandoned property does not comply with the statute requiring that, when quartz or lode mining claims are located as forfeited or abandoned property, the location certificates shall state if the whole or any part of the new location is located as abandoned property; and that such notice is therefore invalid and insufficient.

Both parties were at fault in this regard, and the Newport company's contention was upheld through its claim of adverse possession of eleven years.

OREGON

Powder River Gold Dredging Co. Again Denied Redress

For the third time the case of Thomas Bessler against the Powder River Gold Dredging Co. has been brought before the Supreme Court of Oregon and the judgment in favor of Bessler upheld.

Plaintiff brought this suit to recover possession of three acres of land, claiming title by having held adverse possession for ten years. In a supplemental complaint he alleged that since the commencement of the action the gold-dredging company wrongfully entered upon the land, dredged and mined therefrom all the gold deposits, and entirely destroyed the property. Damages of $15,000 were awarded Bessler.

ECHOES FROM THE FRATERNITY

SOCIETIES, ADDRESSES, AND REPORTS

Production Must Be Increased by Preventing Accidents

Standardized Methods Efficient—Accidents Prevent Regularity—Safety Inspection Saves

At the meeting of the National Safety Council in Chicago recently, Sidney J. Williams, secretary and chief engineer, addressed the Engineering Section on the subject "How Can We Increase Production?" He spoke in part as follows:

"Production depends primarily on two factors—machines and men. Production also requires materials and capital; but machines and men are the immediate producers. They and they only can increase or decrease production. The things that cause them to do the one or the other are the things that we must study.

"The basis of modern production, with respect to both machines and men, is standardization. But we do not stop with standardizing machine operations. We standardize also the operations of men. The motion study specialist determines the one best way to do a job, and we find that by following his method we not only increase production but we decrease fatigue. Anything which interferes with absolute regularity of operation is inefficient and uneconomical, and it is one of the chief functions of the engineer and the executive to hunt out these disturbing influences and eliminate them.

"The things which thus interfere with regular production are many and varied. Some of them are external to the plant itself—such as a war, or a nation-wide strike, or a railroad tie-up. The prevention of these is largely a function of government.

"Then there are catastrophes within the plant: a strike, a disabling fire, a break-down in the power plant. Everyone knows that it is the function of management to prevent such occurrences and that a management which does not in general prevent them cannot be permanently successful.

"Then there is a third group of apparently minor disturbances. A laborer pushing a truck strikes an uneven place in the floor, a casting falls off the top of the load, and a resulting chain of delays wastes twenty minutes of the shop's day. The up-to-date foreman realizes that when his laborers each lose twenty-five cents' worth of time a day it is up to him not to bawl them out for it but to find out what is wrong and correct it. The superintendent and higher executive officers also must supply what the foreman may lack in this regard.

"In machine operations it is even more obvious that regularity is the essence of modern production. The greater part of present losses is positively preventable through the use of simple and inexpensive automatic or semi-automatic devices for placing and removing the material. The fact is that, with comparatively few exceptions, even in the most efficient plants, we have not had time to study these little things—the castings falling off the truck, the material sticking to the punch press—causing in the aggregate a loss running undoubtedly into many millions of hours and many millions of dollars. Modern production is built absolutely on standardized regularity of operation, and anything which happens unexpectedly, whether it is a coal strike or a casting falling off the truck, or other accident, is bound to interfere with our regular program and therefore to cut down our production.

"Some of the 'accidents' which I have mentioned result in personal injury. From the standpoint of the man interested only in production, the accidents which happen to injure someone are no more and no less important than those which do not. It is true that from other standpoints the accidents causing personal injury are much more important. No engineer or executive living can afford to say 'I am not interested in accident prevention' unless he is willing to say 'I am not interested in efficiency.' Every accident is an indication that there is something wrong with men, methods, equipment, or material. Those which cause injury have for the engineer a peculiar importance, because they serve as danger signals to warn him of the inefficiency that is undermining his output.

"The manager of one of the largest paper mills included in the membership of the National Safety Council once said to me, 'Before we had a safety committee, every little while we would have to shut down our machines because of a belt breaking or something of that sort. Now our safety inspection catches these things before they happen, and we have no more shutdowns. Our safety work has more than paid for itself through the increase in production, aside from cutting down our compensation costs.'

"On the human value of safety, I leave each of you to judge for himself. The rough-shod methods of American industry a generation ago, which left a trail of human wreckage, were not only inhuman—they were inefficient. They and the men who stood for them are gone on the scrap heap, and will never return."

Six hundred graduates and undergraduates of the Missouri School of Mines entered active service during the great war, 38 per cent of them going across. Nine made the supreme sacrifice.

Handling Explosives Underground and in Open Pits

Misfires, Lightning Risk and Liquid Oxygen Discussed

An address on "Safe and Dangerous Practices in the Use and Care of Explosives Underground and in Open Pits," was made by S. P. Howell, explosives engineer, U. S. Bureau of Mines, at the second annual meeting of the Lake Superior Prevention of Accidents Conference, held at Duluth, Minn., on June 24.

Mr. Howell stated that accidents due to explosives are not frequent, but include a high fatality rate which is due to the fact that many accidents claim two or more victims. In setting forth some of the precautions to be observed in the storage, handling and use of explosives and blasting supplies, he dealt in particular with the following:

1. How should misfires be handled?
2. Accidents due to lightning setting off explosives.
3. Liquid oxygen explosives.

In addition, the necessity for well-ventilated storage magazines, situated at prescribed distances from buildings, roads and railroads; proper practice in transportation of explosives, and the correct manner of charging and firing blasts were emphasized.

The name, "liquid oxygen explosive," is applied to a mixture of carbonaceous and absorbent materials with liquid oxygen, and the whole partly enclosed in a heat-resisting cartridge. The carbonaceous material may be crude oil, petroleum, paraffin, charcoal, cork dust, coal dust, wood pulp and many other substances. All of the carbonaceous materials mentioned, except coal dust, crude oil, petroleum and paraffin, are also absorbing materials, but the most efficient material for its absorbing properties alone is diatomaceous earth (kieselguhr), and it is a non-combustible material.

Liquid oxygen is produced in a special apparatus, the units of which may be small, is transported in spherical shaped, double-wall containers, the space between the walls being a vacuum and the materials of construction of brass.

The Germans used liquid oxygen explosives extensively in non-gaseous coal mines, quarries, iron mines, as well as for destructive purposes in French steel plants, and installed equipment for the production of liquid oxygen at several Lorraine minette iron ore mines. In Bureau of Mines Technical Paper 243, "Development of Liquid Oxygen Explosives During the War," George S. Rice has reviewed the literature and the results of a number of tests made at the Pittsburgh Experiment Station.

Low Prices of Copper and Zinc Part of the General Post-War Trend

Recent declines in the prices of a few commodities are not to be regarded as isolated instances, but are part of a gradual and general movement that has been under way for a considerable time, the National Bank of Commerce in New York says in a discussion of current business conditions. The statement continues:

"It has generally been conceded that prices would ultimately seek a lower level than that maintained during the war and immediately thereafter. Such decline has always followed the overstimulation of commerce and industry produced by war. Under these circumstances, a downward price movement, if gradual and orderly, is to be welcomed, both as an evidence of the return of more orderly conditions and as a factor in accomplishing that return. Such a movement in the prices of basic commodities is now clearly evident. Sharp recent declines in a few commodities, however, are likely to cause the business public to lose sight of the fact that in a number of other commodities a gradual decline has been under way for a considerable time. The prices of copper and zinc have been at low levels ever since the armistice."

Ainsworth Mining Camp, B. C., Surveyed and Described

"Geology and Ore Deposits of Ainsworth Mining Camp" is the title of a well-illustrated report by S. J. Schofield, just issued by the Canadian Geological Survey. The area covered is about fifteen square miles, bounded by Woodbury Creek on the north, Coffee Creek on the south, Kootenay Lake on the east, and the contact between the sedimentary rocks and the Nelson granite on the west.

Despite poor transportation over tortuous trails and roads in the early days, this camp, since 1896, has produced more than 100,000,000 lb. of lead, 5,000,000 lb. of zinc, and 6,000,000 oz. of silver. Prior to 1909 the zinc was not only not saved but was considered detrimental to the ore.

Mr. Schofield finds two classes of ore deposits in the Ainsworth camp, namely, true fissure veins, and replacement deposits in limestone. Most of the silver-lead deposits are associated with the limestone bands in the Ainsworth and Slocan series, although some of the important mines are in the schists, and others are in quartzites. The ores consist of galena and zinc-blende, associated with pyrite, pyrrhotite, occasionally chalcopyrite, and, in the Highland, marcasite, in a gangue of calcite, siderite, quartz, and fluorite. The fissure veins and replacement deposits are held to be contemporaneous.

A colored geological map, a contour map on a scale of 2,000 ft. to the inch, and sixteen colored diagrams showing the underground workings and local geology are in a pocket at the end.

Developments in Lake Superior Copper Mining Practice

"The outstanding feature of the situation in the Michigan copper district is the fact that the market price of copper is insufficient to more than barely meet operating costs, leaving nothing with which to meet depletion, depreciation, etc., or to attempt a much needed program of mining development, exploration or new territory and improvement in mechanical equipment." This statement was made by Ocha Potter of the Calumet & Hecla Mining Co., in a paper read by him at the second annual Lake Superior Safety Conference, held at Duluth, Minn., on June 25.

A careful analysis of conditions, said Mr. Potter, leads to the inevitable conclusion that leaving aside the question of the decrease in the selling price of copper, the best chances for remaining a factor in the business of producing copper lie in the possibility of the economy and greater production due to improvement of underground methods.

The greatest improvement during the last ten years was the development of the so-called one-man drilling machine. The co-operation of the Calumet and Hecla underground organization and the Ingersoll-Rand Co. in 1911 and 1912 resulted in the almost complete abandonment of the use of reciprocating drills and solid drill steel, and the substitution therefor of the various types of the so-called hammer drills and hollow drill steel that has followed. Had the efficiency of the drilling machine runners been as low in 1918 as it was in 1912 with the old-type piston drill, approximately 3,000 more miners would have been required in the district in order to secure the production which was finally obtained. Stope miners of the Calumet and Hecla mines produced 11.42 tons per man per shift in 1912, at a cost of 35c. per ton for supplies and labor. In 1919, this same class of labor produced 26.29 tons per man per shift, at a cost of 34c. per ton, with an increase in wages and supplies of over 100 per cent.

The following is a brief summary of Copper Country methods with respect to drilling practice: Drilling machines are of the mounted hammer type, using water, and weighing from 125 to 150 lb.; hollow hexagon drill steel of ⅞-in. and one-inch diameter is almost universally used; bits are of the Carr type, either single or double; maximum length of drill steel varies from 10 ft. to 16 ft.; air pressure varies from 70 lb. to 100 lb.; most of the mines pipe water for drilling purposes directly to the machines, the water lines being laid with the air pipes; ammonia explosives are used almost entirely, and for stoping purposes 40 per cent to 45 per cent is most common. Some of the mines make a practice of using 60 per cent powder for drifting and shaft sinking.

Haulage practice includes the use of trolley locomotives, rope haulage and storage battery locomotives. As far as practicable large cars have been adopted and these dump directly into the skip by means of air lifts.

The use of chute loading from stopes has become general with the adoption of larger cars. Mr. Potter states that probably 60 per cent of all ore hoisted at the present time in the district is loaded by means of some type of chute or high collar.

Several of the mechanical loaders now on the market have been tried out but with little success, owing to the fact that the limited tonnage available at any one level makes a large expensive machine impracticable, while the coarseness of the broken ore is such that the smaller types cannot handle it.

Slushers of various designs are being given an extensive trial and they appear to be successful in high, flat stopes, where the broken ore will not run freely to the level.

The practice of exercising close supervision over the drilling of the individual holes in the ordinary process of stoping has resulted in an increase in the average recovery of the rock mined and it is probable that better results may be obtained by a more rigid application of this method.

Contract prices and bonus requirements have been the subject of careful study and today practically all mining and tramming is done either on a contract or bonus system, the old Cornish fathom basis for stoping contracts being abandoned in favor of the ton. For drifting the foot of drift is, of course, the unit and for tramming, the pay is usually based on the number of cars filled.

It is an interesting observation that the fact that conditions in the copper industry are unsatisfactory, has led to a closer co-operation among the engineers and executives and this may prove somewhat of a blessing in disguise. There are enormous tonnages of low-grade copper rock just as there are of low-grade iron ore, which may some day be made available through an application of some of the methods now being evolved by the pressure of stern necessity.

Officials Start Federal Club in Washington

Over a hundred members of the Government service who are in responsible administrative and technical positions met on June 17 and perfected a tentative organization which is to be known as "The Federal Club." The purpose of the organization is to care for many of the general service problems which are common to several departments by facilitating interchange of views, and, where appropriate, by joint action. Franklin D. Roosevelt, Assistant Secretary of the Navy, and Democratic nominee for Vice-President, is the chairman of the temporary body and Dr. E. B. Rosa, chief physicist of the Bureau of Standards, is chairman of the committee on organization and constitution.

Among the problems suggested for the action of the club are: Classification and salaries of the technical services of the Government, and budget matters affecting the executives of the various bureaus.

Book Reviews

Sources of Industrial Potash in Western Australia. By Edward S. Simpson, I. H. Boas, and T. Blatchford. Western Australia Geological Survey, Bull. No. 77, 46 + VIII pages, 2 plates, 4 figures, 8¼ x 5½ in. Perth, 1919.

A definition of terms and a brief account of potash as a plant food and its minor uses is followed by a review of the pre-war sources of world supply. This discussion of well-known data is introductory to Part III, devoted to the sources of potash in Western Australia. Wood ashes, it is pointed out, constitute a potential source of considerable potash, but no recovery has yet been attempted. Pegmatite feldspars (microcline) are also abundant, and have a K_2O content of 10.65 to 12.56 per cent. A large deposit of glauconite occurs at Gingin, but its low content of K_2O (2 to 3 per cent) discourages its utilization. A rather unusual source of supply noted by the author consists of the minerals jarosite and natrojarosite, which occur in sufficient abundance to promise a commercial source of potash. The potash is rendered soluble by roasting, and the iron residue may be utilized as a pigment. Alunite and natroalunite are possible sources.

In Appendix I analyses are given of kelps found on the coast of Western Australia. Calculated on the basis of dry matter in the weeds, the potash content varies from 2.81 to 7.97 per cent being somewhat poorer in potash than American kelps and about equal to those in Scotland. The Australian kelps are, however, comparatively rich in iodine.

Appendix II is devoted to a description of the alunite deposits of Kanowna. The mineral occurs in horizontal or flatly-inclined veins, varying from mere threads to two feet in thickness. The potash content varies from 3.1 to 9.3 per cent. That the material is present in commercial quantities still remains to be demonstrated. O. B.

Final Report of the Munition Resources Commission, Canada. By Thomas Cantley, chairman. 7 x 10; cloth; pp. 260. Published by the Canadian government.

This commission was formed to enquire into the supply of raw materials in Canada required for the production of munitions of war, and the best methods of conserving them. The subjects covered include 25 pages on aluminum, 47 on manganese, 29 on molybdenum, and 60 on platinum. The chapter on aluminum is devoted to a description of the field work carried on in British Columbia, and is beautifully illustrated. No bauxite deposits have yet been discovered in Canada, but the work done shows attractive possibilities for the future. Chromium deposits in the Black Lake district of Quebec are described briefly. Magnesite deposits near Grenville, Que., offer attractive possibilities if developed. Canadian magnesite has a high lime content, but shippers can turn out a product containing 85 per cent $MgCO_3$ with less than 13 per cent CaO, which has been found to be satisfactory for furnace linings. The numerous manganese deposits are carefully described. The bog ores found in New Brunswick are of particular interest.

Canada was of considerable prominence as a producer of molybdenum during the war. In 1918 she produced about 15 per cent of the world's supply, as did Norway and Australia, the United States producing a little over 50 per cent. Deposits have been found in Ontario, Quebec, British Columbia, and Nova Scotia. The first two named are of most importance. The possibilities of British Columbia as a platinum producer are discussed in considerable detail, and those interested in this metal will find some of the remarks particularly illuminating. No important tungsten developments have been made since the publication of Dr. Walker's bulletin on the subject in 1909.

An appendix to the book contains an interesting article on the planning and cost of construction and operation of an electrolytic copper refinery with a capacity of 50,000 tons per year. This refinery was never built. The result of an investigation of Nicu steel is also given.

The commission has produced a highly creditable report. E. H. R.

The Magnesite Deposits of Bulong, Northeast Coolgardie Goldfield, by F. R. Feldtmann. Western Australia Geological Survey, Bull. No. 82. 38 + VIII pages, 7 figures, 2 maps, 8¼ x 5½ in. Perth, 1919.

In the introduction a brief history is given of developments in the magnesite deposits of Western Australia, where chief activity dates from 1913. A description of the properties and uses of magnesite is followed by a discussion of the magnesite deposits of other countries, but no reference is made to the deposits in the State of Washington, U. S. A. Australian production in 1917 included over 9,000 tons from New South Wales, and nearly 200 tons from Victoria. Small deposits exist in Queensland, Tasmania, and South Australia. Although magnesite occurs in several localities in Western Australia, particular study was given to that in the Bulong area.

The magnesite is associated with greenstones, porphyries, and breccias, and is confined chiefly to an area about 2¼ miles long and covering about 359 acres. The mineral occurs in serpentine in the form of irregular veins varying from mere threads to a maximum width of two feet. In certain decomposed areas the veins are sufficiently numerous to occupy a greater volume than the enclosing serpentine. Hand picking of the rock would probably be necessary. The magnesite is comparatively free of lime and contains moderate amounts of silica and iron.

Present development is confined to three quarries and several test pits. Total production from 1914 to the time of writing was about 1,344 tons. No attempt is made to estimate the extent of the deposits except the general statement that a large tonnage of material carrying 90 to 95 per cent magnesium carbonate evidently is present. O. B.

Technical Papers

Sand Dune Tunneling—A paper, "Tunneling in the Sand Dunes of the Belgian Coast," by Capt. H. Tatham, published in the *Bulletin of the Institution of Mining and Metallurgy* for May, 1920, (1, Finsbury Circus, London, E. C. 2) outlines the methods used by English army engineers during the war for the purpose of establishing numerous observation posts in the described sections. The dunes in which the excavations were made consisted of dry sand, so that although the actual excavating entailed little work, considerable care was required in timbering and otherwise keeping the workings open. The caisson method and the spiling system, both of which are described, do not differ greatly from methods in general use, but the description of the sinking of "elephant" shelters, or trench cupolas, includes some interesting differentiation from regular tunneling practice.

Mining Education — The Federal Board for Vocational Education, Washington, D.C., has issued Bulletin No. 38, 168 pages, entitled "General Mining" (free). More than a million men in the continental United States are employed in mines and quarries. Many of the jobs require specialized knowledge to secure the best results. This book is an interesting résumé of what is being done and what should be done to educate those who expect to make their living in the mining industry.

Assaying Chrome Ores and Brick—The American Society for Testing Materials, 1315 Spruce St., Philadelphia, has issued a "Report of Committee C-8 on Refractories," which contains the details of a tentative method for the ultimate chemical analysis of chrome ores and chrome brick. Criticisms of the method are invited.

Government Control Over Prices. By P. W. Garrett. Published as W. I. B. Price Bulletin No. 3, by the War Industries Board, Washington, D. C. Paper, pp. 834, 5½ x 9. This voluminous book sets forth the complete history of prices during the war. It will be chiefly of interest to statisticians and to students of the subject covered.

Mine Dust—The U. S. Bureau of Mines in its *Reports of Investigations* for May, issued a 7-page mimeographed pamphlet on the method of collecting and examining samples of dust-laden air from metal mines.

MEN YOU SHOULD KNOW ABOUT

J. Leonard Replogle, president of Replogle Steel Co., sailed for England on July 1.

E. R. Bennett, of the Tonopah, Nev., School of Mines, will spend the summer in professional work.

Bruce White is at the head of a geological party that will do oil work in central Montana this summer.

Geo. R. Koik, has been examining silver properties in the Lordsburg, N. M., district for Arizona capitalists.

A. E. Fath has been assigned to oil and gas geologic work in the Lost Soldier and Ferris mountains of Wyoming.

Edwin E. Chase, of Chase & Sons, mining and geological engineers, Denver, Col., is in Wyoming on professional work.

Roy Hatch, mining man of Juneau, Alaska, has returned to Salt Lake City, Utah, after a four years' absence in the north.

George E. Easley, mining engineer, of La Paz, Bolivia, was in New York on June 26, on his way home to Lee Summit, Mo.

Bruce C. Yates, superintendent of the Homestake Mining Co., at Lead, S. D., is in New York City on company business.

John Kiddie, division superintendent of the Arizona Copper Co. has returned to Clifton, Ariz., much improved in health.

R. C. Wells, of the U. S. Geological Survey, will examine the deposits of natural soda in Western states during the summer.

C. E. Van Orstrand will devote the remainder of the summer to observing deep-well temperatures in the oil fields of various states.

A. E. Sargent, formerly superintendent of the Mogul Mining Co., Terry, S. D., has accepted the position of general superintendent of the Akron mines, White Pine, Col.

F. G. Cottrell, director of the Bureau of Mines, has been designated to succeed Van. H. Manning as a member of the Interdepartmental Defense Board of the Council of National Defense.

Lewis G. Westgate will spend two months studying the gold lodes recently discovered on the Alaska side of the international boundary in the Portland Canal region of southeastern Alaska.

Edward Sampson will continue J. S. Diller's work on the asbestos deposits of the Apache and San Carlos Indian reservations. Mr. Diller is now able to resume his office duties at Washington, D. C.

Charles Butts has returned from a field trip to the Appalachian valley, where he has been gathering paleontologic and stratigraphic data for the better correlation of the Mississippian and Devonian formations of eastern Kentucky.

Clive Seymour Newcomb, metallurgical engineer, has resigned his position with the Dorr Co., to become consulting engineer with the Mutual Chemical Company of America and, the Phosphate Mining Co. His address is No. 55 John St., New York city.

George Otis Smith, director of the U. S. Geological Survey, has been given the honorary degree of LL.D. by his alma mater, Colby College, Waterville, Me. The degree was awarded in recognition of his services as Director of the U. S. Geological Survey.

ELMER ALLEN HOLBROOK

Elmer Allen Holbrook, who succeeds Dr. F. G. Cottrell as Assistant Director of the U. S. Bureau of Mines, is a native of Pittsfield, Mass., and a graduate in mining engineering of the Massachusetts Institute of Technology. Prior to his graduation in 1904 he worked in mines in Montana and was a member of one of the locals of the Western Federation of Miners. Mr. Holbrook's first position after leaving college was as sampler and underground surveyor with the Standard Ore Co. in Montana. After serving as superintendent at Zortman and at Gould, Mont., he was made general superintendent of the Daly Reduction Co., at Hedley, B. C., in 1907 when the Daly company was the largest gold producer in the Dominion of Canada. After three years with this company, Mr. Holbrook took up general practice and also for a time was in charge of the Mining Department of the Nova Scotia Technical College. In 1913 he became associate professor with the mining department of the University of Illinois and remained until 1917, when he was made supervising mining engineer of the U. S. Bureau of Mines in charge of the station at Urbana, Ill.

Mr. Holbrook was acting chief engineer of the Bureau of Mines during the first half of 1919. In July of that year he was made superintendent of the Pittsburgh Experiment Station, and had been in charge of that work until called to Washington to assume the duties of assistant director as of July 1.

Guy C. Riddell, consulting metallurgist, formerly in charge of metallurgical and mining problems for the U. S. Tariff Commission, is now secretary and consulting engineer of the Wah Chang Trading Corporation, 233 Broadway, New York, N. Y.

Alfred H. Brooks will accompany the Secretary of the Navy and the Secretary of the Interior on their Alaskan trip. Dr. Brooks will not return with the Secretarial party, but will remain in Alaska to do geologic work in the Prince William Sound region and in southeastern Alaska.

J. P. Buwalda, of the staff of the U. S. Geological Survey, has been assigned to the co-operative work with the Idaho State Bureau of Mines and Geology in the study of the Tertiary basins of the western part of that state. He will give particular attention to the areas more favorable for the occurrence of oil and gas.

F. H. Newell, head of the department of civil engineering, University of Illinois, Urbana, Ill., has been appointed director of field forces by the directors of American Association of Engineers. Dr. Newell is also delegate from A. A. E. to the Great Lakes-St. Lawrence-Tidewater Congress meeting at Detroit, Mich., July 22-24.

OBITUARY

Judd Stewart, of the accounting department, American Smelting & Refining Co., died July 3 in his 54th year, at Watkins Glen, N. Y.

John Albert Percival, a former president of the Consolidated Interstate-Callahan Mining Co., died suddenly of apoplexy at the home of Fred E. Stillman in Bridgeport, Conn., on July 4. Mr. Percival was a native of Jericho, Vt., and will be buried there.

Thomas Sneddon, superintendent of the Anaconda Copper Co.'s mines at Diamondville for the last 21 years, died suddenly from an aneurism at his home in Diamondville, Wyo., on June 3.

Mr. Sneddon was born 64 years ago in Scotland, and had been identified with coal mines about 54 years. Forty years ago, Mr. Sneddon brought his family to this country and settled at Almy, Wyo. In 1893 he went to Diamondville and in 1898, when the Anaconda Copper Mining Company bought out the Diamond Coal & Coke Company, Mr. Sneddon was kept on as mine foreman. He was made superintendent in 1899. Mr. Sneddon was a leader of men, fair and impartial in all his dealings and of unquestioned integrity. The Anaconda company has lost an official whose place it will be hard to fill.

THE MINING NEWS

LEADING EVENTS

U. S. Mining Experiment Station In Colorado Ousted

Action of State Officials Causes Indignation—Station May Be Moved To Nevada

The Golden Experiment Station of the Bureau of Mines has been forced to move from its quarters in the Colorado School of Mines by the action of the school board. No notice of the intention of the school to remove the station was given until a few weeks ago when the board paid a visit to Dr. Lind, superintendent of the station, and inspected the whole building. Dr. Lind states he thought it was simply a friendly official visit such as had never been made before. It was only on leaving that a member of the board intimated that they would probably need some of the space in the building for the new courses in chemical, electrical, mechanical and civil engineering which had been decided upon.

It seems that the Bureau of Mines had a contract with the school for the space which they occupied on the school grounds and that this contract expired July 1. Regarding the renewal of the contract, the school trustees took the stand outlined as follows:

Superintendent U. S. Bureau of Mines,
Golden, Col., June 11, 1920.

Dear Sir:

At a meeting of the board of trustees held this day, it was decided that the contract between the Bureau of Mines and the Colorado School of Mines would not be renewed with the inclusion of the use of Engineering Hall. We shall be very glad to renew the contract, offering you the use of our metallurgical research plant for your headquarters to be used in conjunction with the Metallurgical Research Department.

Prof. Low will confer with you and arrange the details so that the vacating of Engineering Hall will discommode you as little as possible.

Very truly yours,
I. A. PALMER, Acting President.

The contract which was sent over to Dr. Lind and which the board stated they would approve involved moving to the Experimental Mill, a building unsuited to the requirements of the station, and further specified that all work done by the Colorado Station of the Bureau of Mines would have to be done in Golden. It is believed that the latter clause was prompted through the jealousy of the School of Mines toward the University of Colorado, the institution at which the U. S. Bureau of Mines has been conducting its oil-shale investigations, fostered by appropriations made by Governor Shoup.

The U. S. Bureau of Mines at Washington, D. C., has decided to move the Colorado station, and the Colorado School of Mines officials, notably Dr. Alderson and the board, are being sharply criticised for their summary action. Colorado loses a valuable experiment station by this action—one that expends about $150,000 annually in the interests of mining research in the state, particularly in complex and rare ores. The station is being taken out of the State of Colorado entirely and will be moved to some other locality, where the work will be more welcome. It is very likely that Reno, Nev., will be the place of transfer. Reno has offered to float $30,000 of State Bonds in order to erect a building for the Nevada Bureau of Mines Station. It is a good location for the continuation of the rare-metal work initiated in Colorado.

The mining men of Colorado have resented the action of the School Board and severely condemned the body for the action which it has taken in forcing the Bureau elsewhere.

WEEKLY RÉSUMÉ

The Golden Station of the U. S. Bureau of Mines has been ousted by the action of officials of the Colorado School of Mines, and will be moved to another state. The American Bankers' Association, in a report just made, opposes the McFadden Gold bill as inimical to the gold standard. An investigation has disclosed that Salt Lake Valley smelter smoke is not a factor in the local smoke problem. The Desert Power & Water Co., of Kingman, Ariz., has asked for an increase in its rates on the plea of higher costs. A continued car shortage is hampering iron-ore shipments in the Lake Superior district. The Interstate Commerce Commission upholds freight rate increases that were contested by the Anaconda Copper Mining Co. and others. The War Department will furnish aeroplanes for Alaskan survey work by the U. S. G. S. Plans are being perfected for North Atlantic seaboard power survey. The progress of new mining legislation is outlined in this week's pages.

The bill now before the Ontario Legislature to amend the Workmen's Compensation Act, and which it is expected will pass, will raise the rates of compensation for injuries to 66⅔ per cent instead of 55 per cent as at present. Pensions will also be increased and in the case of widows will be made retroactive to the commencement of the present act. An attempt was made to have the retroactive feature apply to all pensions, but the labor members were unable to get this through.

Gold Miners' Bonus Opposed

American Bankers' Association Says McFadden Bill Would Menace Gold Standard

The McFadden gold bill has been studied by a committee appointed by the American Bankers' Association for that purpose, and a report made public expressing the unalterable opposition of the committee to the legislation favoring a bonus of $10 per ounce on newly mined gold. The committee consists of George M. Reynolds, Lawrence E. Sands, and A. Barton Hepburn, who state that one objection to the McFadden bill is the possibility of fraud being practiced upon the Government through the difficulty of distinguishing virgin gold from old gold melted down. "Gold which differs from other gold merely in having a special history, and which, by virtue of that special history rather than its intrinsic qualities, commands a high premium, presents an anomaly inconsistent with the normal functioning of a free gold market and the normal functioning of the gold standard. The temptation to manufacture history instead of mining gold would be very great.

"Again, the provisions in the McFadden bill introducing the index number of commodity prices as a basis for fixing the rate of taxes on gold manufacture and of premium on gold mining constitutes an opening wedge for the general introduction of the index number as a standard of value in the United States in accordance with Professor Irving Fisher's plan for 'stabilizing the dollar.' It is beyond the province of this paper to deal with that plan in extenso. Your committee believes in the gold standard and does not believe in tampering with it or interfering with it in the present critical condition of the world's monetary affairs. There is, moreover, another committee of the American Bankers' Association which is to make a detailed report upon the project. We shall content ourselves for the present with pointing out that if this index number standard is to be adopted it should be considered on its own merits and not introduced 'by the back door' as a feature of the McFadden bill.

"The greatest objection of all, however, lies in the danger which this measure would involve for the gold standard itself. Nearly all of the European states are on a paper basis. Only a few of the smaller countries of Europe are even approximately maintaining the gold standard. The United States, par excellence, and Japan as well, stand out conspicuously as nations

maintaining the gold standard. All the world believes that our dollars are as good as gold. All the other nations of the world are struggling and hoping to get back to the gold standard. We enjoy a proud pre-eminence in this respect, and it should be zealously guarded and maintained. The belief which obtains in the world today that our dollars are as good as gold must be maintained. The whole world must be convinced that money can be deposited in this country at any time and withdrawn at any time in any form which the depositor may elect.

"Increase of gold mining will return with normal conditions. It must not be forgotten, however, that part of the automatic working of the gold standard depends upon an increase in gold production when prices are low and upon a decrease in gold production when prices are high. Increased gold production in a period of low prices and low costs makes it easier for prices to rise again, while diminished gold production in periods of high prices and high costs tends to reduce prices and costs again.

"Moreover, the industrial consumption of gold tends to increase in a period of high prices, since the price of gold does not rise as other prices rise, while in a period of low prices the prices of gold manufactures are relatively high, and purchases of gold manufactures consequently tend to diminish. Variations in the consumption of gold thus also work toward diminishing the supply of free gold when prices are too high, and toward increasing the supply when prices are too low, thus tending to correct both the rise and the fall of prices. In this feature of gold production and consumption we have one of the stabilizing factors in the gold standard. The McFadden bill proposes to strike at this automatic regulator and corrective. It would aggravate the very conditions which it seeks to remedy."

Utah Deposits To Be Utilized for Paints

The Mineral Paint Products Co. has been organized and will take over the holdings and business of the Utah Wall Tint Co. Directors and officers of the new company are Michael Morrissey, president and general manager; Jacob Karlen, Jr., treasurer and vice-president; Canute Peterson, secretary and general manager. The capitalization of the company is $300,000, divided into 300,000 equal shares.

The new corporation will operate a four-story factory situated in North Salt Lake near the Utah Oil Refining Co. plant, and will secure their raw materials from the deposits of talc and red iron oxide near Clear Lake, Millard County. The talc is used in making calcimines, chalks and paints. The red oxide is used for making mineral paints. Both of these deposits, which are but a short distance from the Salt Lake & San Pedro railroads and which are easy of access, can be worked at a small expense on a large scale.

Smelter Smoke Diffused Before Reaching City

Engineers' Investigation Finds Smoke Nuisance Attributable to Local Causes and Not to Smelters

That smoke from Salt Lake Valley smelters is not a factor in the smoke problem, which confronts Salt Lake City in the winter months is announced by the U. S. Bureau of Mines, which, in co-operation with Osborn Monett, a fuel engineer of Chicago, has been investigating the smoke situation here. Smoke from the smelters is diffused before it reaches this city, and so the problem becomes a purely local one. The problem here differs from that in other places inasmuch as the topography of the region enters largely into the question. Smoke clouds are held fast in the valley between the mountains in the winter time, unable to escape owing to the low velocity of the wind at that season. Smoke from furnaces starting before daylight, and in most places dispelled in the early morning hours continues to hang over the city, when the smaller plants and household furnaces are starting up. The first step toward betterment recommended is the elimination, as far as possible, of this particular blanket of smoke,—by better firing methods, the elimination of out-of-date and run-down plants, and the introduction of smoke-reducing apparatus. The problem is largely one of education, and the investigators state that if their recommendations are followed the nuisance will be largely reduced in two years. The yearly cost of this work is estimated at $15,000.

Car Shortage Hampering Iron Ore Shipments

The coal situation in the Lake Superior districts is much better than it was, but the mine operators are proceeding cautiously in order that fuel may be conserved. The Oliver Iron Mining Co. stopped all stripping on the Mesabi range and is only operating those shovels which are working in ore. The ore loading is not going ahead very rapidly, due to the congestion at lower lake ports, and it is now certain that the 1920 shipments will be below the average. The chief difficulty is in moving ore from the Lake Erie docks to the furnaces, there being a shortage of cars, and likewise it is difficult to get coal from the mines to the lake ports. Vesselmen complain that they are frequently forced to wait for a week at some Lake Erie port before the boats are unloaded, as it is not the practice to place ore in stock at the docks at this season of the year. There are plenty of boats to take care of the ore that the mines desire to move, but shipments will not be increased until conditions are improved in the East. The operators have made large contracts for 1920 delivery which cannot be filled unless a change for the better takes place soon. Now is the time of the year when the lake fleet should be making its best record as many of the vessels will be diverted to the grain trade in the fall.

Power Company Seeks Permit To Charge Higher Rates

Increasing Difficulties in Securing Materials and High Costs of Operation Demand Adjustment

The Desert Power & Water Co. of Kingman, Ariz., has asked the Arizona Corporation Commission for a large increase in its rates. It has been charging the mines of Oatman, Chloride and other Mohave County camps 1.09c. per kw. hour and alleges that the present actual cost, with consideration of higher wages, increased cost of fuel oil and material, combined with depreciation, is not less than 3.3 cents. In Arizona considerable power for mining operations is secured from commercial electric lines. Jerome, Clarkdale and the districts near Prescott and Mayer and in the Bradshaw Mountains are served by the Arizona Power Co., which lately extended its lines to Phoenix past the Kay and other central Arizona mines. Its power has generation at two hydro-electric plants on Fossil Creek and in a large oil-fuel plant near Clarksdale. The Inspiration, at Miami, secures much power from the Roosevelt hydro-electric system, as does the Magma. Ray has its central power generating system at Hayden and Bisbee at Douglas, in connection with smelting plants. It is understood that the wires of the Southern Sierras Co. are to be extended from Yuma to Gila Bend and Ajo, to the New Cornelia works. Large power development is promised, possibly to the extent of 50,000 kw., in connection with the Verde River water conservation plans lately approved by the Interior Department. Power development of this sort is considered of large importance to mining industry in Arizona, owing to the rising difficulty in securing fuel for power at whatever cost.

Interstate-Callahan Purchases Coeur D'Alene Properties

John A. Percival, late president of the Consolidated Interstate-Callahan Mining Co., announced prior to his death on July 4 that the company has completed the purchase of controlling interest in the Chicago-Boston Mining Co. and the Killbuck Mining Company, both of which own large silver and lead properties in the Coeur D'Alene district, near Wallace, Idaho.

Officers and directors of the new additions will be chosen from the personnel of the Callahan company, and an aggressive development campaign is planned to place the properties on a production basis as soon as possible.

The Nevada Attorney General has rendered a decision to the effect that construction costs cannot be deducted from the gross income of mines in arriving at the net profits, for the purpose of levying taxes. Most of the heavier producers in the state have refused to pay their taxes on this basis and a test case is now before the courts in Nye County.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Interstate Commerce Commission Uphold Freight Rate Increases

Voluminous Opinion Rendered—Rates on Smelter Products from Washington and Idaho Unduly Prejudicial

With certain exceptions, the complaint of the Anaconda Copper Mining Co. and other corporations engaged in mining, concentrating and smelting copper, lead, zinc and other ores, against the all-rail and rail-and-water rates from numerous Western points of origin was not upheld by the Interstate Commerce Commission. A voluminous opinion in the case has just been handed down. The Commission found, however, that rates on smelter products from points in Washington and Idaho have been unduly prejudical. The same is true of the rates on smelter products from points in Arizona and Texas to Galveston, Texas. Reasonable rates were prescribed. The Commission also ruled that failure on the part of the carriers to establish a refining-in-transit arrangement at Baltimore, Md., was not unreasonable. In the course of its opinion, the Commission says:

"Complainants in the instant cases deny that the increased price was intended to cover the increases in transportation charges and claim reparation from the date when the increased rates were established. There are no figures of record which give the cost of producing a unit quantity of copper or other smelter product. In any event it must be presumed that the price-fixing activities of the government were fairly conducted, and the presumption is strengthened by the fact that there is no showing that the price fixed for copper did not cover the cost of production plus a reasonable profit. It may also be observed that while an increase of more than 25 per cent was imposed upon the bullion traffic, smelter products were not alone in taking increases, in many instances, of more than 25 per cent under General Order No. 28. Low-grade commodities such as coal and coke, moving for short distances, were subjected to increases of more than that percentage and the application of the provisions of the general order referred to resulted in increases of 80 to 100 per cent on sugar and more than 100 per cent on certain commodities of less value than bullion that move for substantial distances, notably corn, oats, rye and barley. Many other articles of commerce have been subjected to successive increases of 5, 15 and 25 per cent and complainants' argument that the bullion rates should not have been increased a greater percentage than were the rates on other commodities would lead logically to a holding that bullion should have been subjected at least to those successive increases instead of having been maintained on substantially the same level for more than 10 years."

In connection with the shipments of smelter products from Arizona and Texas points to Galveston, the Commission prescribes the following maximum rates:

To Galveston, Tex., from:

Hayden, Ariz.	$11.50
Miami, Ariz.	10.25
El Paso, Tex.	8.75
Eagle Pass., Tex.	7.00
Laredo, Tex.	7.00
Brownsville, Tex.	7.00

Another extract states:

"We are of opinion, and find, that under all the circumstances the maintenance of rates on smelter products, including pig lead and lead bullion, from points in the states of Washington and Idaho to points on and east of the Missouri and Mississippi Rivers higher than the rates contemporaneously maintained from points in Montana, Utah, and Arizona to the same points of destination was and is unduly prejudicial to such points in Washington and Idaho."

With regard to the matter of refining in transit, the Commission says:

"The evidence fails to show that the rates from points of origin to Baltimore, or on refined copper from Baltimore are or have been unreasonable. Reasonable routes now exist in connection with which transit services are accorded on the basis of the through rates, and in the absence of any violation of the requirements of the act to regulate commerce or the federal control act complainants' prayer for transit service at Baltimore must be denied."

War-Minerals Relief Awards

Awards recommended by the War Minerals Relief Commission during the week ended June 26 are as follows: (The name of the claimant, the mineral, the amount recommended and its percentage relationship to the amount claimed, are shown) Pillsbury, Crowder and Kay, chrome, $3,682.35, 66 per cent; James A. Drennan, chrome, $412, 49 per cent; A. C. Epperly, chrome, $496.86, 49 per cent; Helen Hildredth, chrome, $252, 88 per cent; Daniel Wilson, chrome, $265.20, 91 per cent; Franklin Mining Co., manganese, $2,074.44, 30 per cent; Elberg, Mills and Maine, chrome, $1,489.80, 41 per cent; Watson, Williams and Wadleigh, chrome, $1,682.92, 25 per cent; Olympic Smelters Co., manganese, $5,437.05, 21 per cent; Emily M. Pletz, chrome, $100, 100 per cent.

Government Aeroplanes For Alaskan Survey Work

In announcing a flight from New York City to Nome, Alaska, the War Department gives as one of the reasons for the utility of this expedition co-operation with the Geological Survey in the photographing of inaccessible areas in Alaska which have not been mapped heretofore. A paragraph from the War Department announcement is as follows:

One area in particular which the Geological Survey especially desires to have photographed from the air comprises 3,500 square miles, lying north of the 66th parallel between Fort Hamlin and Circle. This area includes the upper Yukon flats and is a district which can only be surveyed by ground methods with extreme difficulty. Representatives of the United States Geological Survey have estimated that it would cost as an absolute minimum over $10,000 and would take one surveying party at least three seasons which would mean three years to accomplish this work by the present ground methods and it would then only be partially accurate. Allowing for a 50 per cent overlap of the photographs from the air this area can be photographed from one airplane in ten hours of flying or approximately three days' time at a cost of about $1,500 and the data assembled from such a photographic map would be more accurate than could be obtained from the ground in the short time available each year.

North Atlantic Seaboard Power Survey

Plans are taking shape rapidly for the power survey of the North Atlantic seaboard between Boston and Washington, which is to be conducted by the United States Geological Survey. William S. Murray, of New York, has been appointed chairman of the engineering staff which is to make the investigation and the report. In addition to the engineering staff, there will be an advisory board. Professor L. P. Breckenridge, head of the Department of Mechanical Engineering of Yale University, will be chairman of the advisory board. E. G. Buckland, vice-president of the New York, New Haven and Hartford Railroad, and James H. McGraw, president of the McGraw-Hill Publishing Co., Inc., are the other members of the committee selected. Other appointments will be announced later.

In order to direct the work more effectively, the Geological Survey has opened New York offices which will be the headquarters of the engineering staff. The officers are in the Buckley-Newhall building at 709 Sixth Avenue.

Progress of New Mining Legislation

Bills of direct interest to the mining industry, which were enacted into law during the Sixty-sixth Congress, the second session of which recently adjourned, are as follows:

Mineral Leasing Act (Public Law No. 146); assessment work on mining claims suspended during 1919, Public Resolution No. 10; assessment work suspension extended to Alaska for 1919, Public Resolution No. 20; mining on Indian reservations, Public Law No. 3. In addition, there were a few laws enacted of minor interest, such as authorizing the detailing of medical officers of the Public Health Service to the Bureau of Mines; the sale of the mine rescue station site at Billings, Mont.; and legislation pertaining to Government fuel yards. Much important legislation of a mining nature is carried in the appropriation bills. These measures, which were duly enacted into law during the Congress, provided the funds with which the government work on mining subjects is conducted and provides for two new mine experiment stations.

While no great amount of mining legislation was enacted into law, numerous mining bills made progress along the tortuous legislative course. Since the recent adjournment did not mark the end of the Congress, but only of one of its component sessions, such progress as was made by these bills is retained.

The status of mining legislation, which was pending at the time of the adjournment, is as follows: Tariff on magnesite ores, passed the House, October 7, reported favorably to the Senate, March 2; Senate refused to consider, June 3; tungsten tariff, passed House, August 21, reported favorably to the Senate, March 23; zinc tariff, passed House, September 2, reported favorably to the Senate, April 9; War Minerals Relief Act liberalization bill, passed Senate, May 31, reported favorably to the House, March 25; mining for metalliferous metals on Indian reservations, reported favorably to the Senate, September 22; bill authorizing cutting of timber for mining purposes, by corporations organized in one state and operating in another, passed Senate, October 8, reported favorably to the House, April 30.

The trip of the Secretary of the Navy and the Secretary of the Interior to Alaska, while primarily for the purpose of looking into the coal situation, will include a visit to the metalliferous area centering at Fairbanks. The Bureau of Mines experiment station at that point will be visited. Despite the fact that the experiment station had to be closed for a time during the influenza epidemic, it will be able to show an extended record of work done on Alaskan mineral problems.

New California Assignment By Geological Survey

For a long time, there has been a demand for a geologist in the San Francisco branch office of the United States Geological Survey. Many requests for examinations and reports are received from the Pacific Coast which hardly justify the dispatch of a geologist from Washington across the continent. By having a geologist in the San Francisco office, more attention can be given to this class of requests. This need has been met by assigning J. M. Hill to the San Francisco office, where he will be associated with Charles G. Yale.

It is stated at the Geological Survey that no duplication of work being done by a state organization such as is the California State Mining Bureau will be permitted. The work will be carried on in full co-operation with the local organizations in the states in which Mr. Hill will work. It even is regarded as probable that the reports on field investigations will be turned over to the state mining bureaus or surveys for publication. This is in line with the publicity policy announced by the Director of the Survey in his last annual report, in which he said, "The guiding test in choosing the place of publication is where promptest issue and widest circulation can be given the results of federal scientific work. Publicity under the best auspices is the sole aim."

NEWS BY MINING DISTRICTS

ALASKA

Anchorage—The Gold Bullion Mine in the Willow Creek District has a crew of men engaged in the construction of a cyanide mill. It has been necessary to remove an excessive amount of snow preparatory to excavation work. The mill site is now excavated and the thickeners and agitating tanks are being placed.

ARIZONA

Bisbee—The new Copper Queen mill near Don Luis will have an ample water supply from a strike just made on the 1,700 level of the Calumet & Cochise at Warren, at a point 400 ft. southeast of the shaft that was sunk from the 1,000-ft. level for water. The flow has been bulkheaded till proper pumping provision has been made. The main pumping station will be on the 1,800-ft. level and is to be in operation by December 1. There also is to be drifting at depth in the hope of finding an orebody.

Calumet & Arizona will sink its Junction shaft down 500 ft. from the present 1,800-ft. level. The work, including concreting, installation of ore pockets on the several new levels and the cutting of stations, is expected to take two years. A heavy safety platform is to be placed at the 1,600-ft. level and below that depth there will be no mining until the completion of the new work. The deepest shafts in the district are the Junction 1,800, Denn 1,800, Sacramento 1,700, Oliver 1,600, Briggs 1,500 and Cole 1,400 ft. There is to be connection of the Junction and Denn on the 1,800-ft. level.

Hayden—Three trucks are hauling ore to the Hayden smelter from the Magma Chief property, formerly the old Sombrero Butte, in the Mammoth section on the San Pedro. The ore-testing plant of the University of Arizona at Tucson is engaged in the study of samples of Magma Chief ore, to determine methods for a mill the management is preparing to erect. Frank T. Pomeroy is in charge.

Wolverine has suspended work in new ground and is retimbering old workings, which are to be extended into proven ground. No ore has been shipped for ten months past.

Douglas—Peace in Mexico is having its effect upon the mining industry of Sonora. There now are being received at this port of entry about ten carloads a day of concentrates and ores. Two-thirds of the imports are from the Moctezuma Copper Co. of Nacozari, billed to the Phelps-Dodge smelter, though the Tigre is averaging nearly a carload a day. At Nacozari the Phelps-Dodge interests are spending about $1,000,000 in improvements on the Moctezuma reduction and power plants. The present 2,000-ton mill is being doubled in capacity. Seven new Diesels are being installed in the Nacozari power house to provide for the new demands. H. T. Hamilton is general manager at Nacozari and Frank Ayer is in charge at Pilares.

The North Tigre Leasing Co., operating the North Tigre mine in northern Sonora, has a new 50-ton mill in operation. Frank Holmes is manager and J. A. Hobbs in charge at the mine. In Ures district a cyanide mill is handling about 50 tons a day from the Progresso mine, a gold-silver property. A. McFarland is manager. One hundred men are employed. The Santa Barbara mines, near the Cananea railroad, again are being worked and two shipments of high-grade silver ore have been made to El Paso. The old Providencia silver mine, near the Sultana, is to be unwatered and worked, after years of idleness. W. R. Beatty, of Patagonia, has been placed in charge.

Johnson—The Mammoth, owned by the Arizona United Mining Co., is being equipped with a 40-hp. Western hoist and an Ingersoll-Rand compressor. The Keystone Copper Mining Co. have finished two large concrete tanks for water, to be used by the concentrator. This company has unwatered the O. K. shaft and started sinking. H. S. Wien, who recently took a lease on the old Hagin-Hearst property in the Winchester Mountains, twelve miles north of Johnson, is shipping a car a week of ore assaying twenty ounces in silver. The property has been closed down since 1885. The orebody recently struck in the Arizona-Texas still continues to increase in value, the last car shipped showing 50 per cent lead and 50 oz. in silver.

Oatman—United American is drifting east and west on the 500 level on the hanging wall of the Aztec ledge.

PART OF TOWN OF OATMAN, ARIZ., SHOWING MILLS IN BACKGROUND

Crosscutting from the shaft showed the vein to be about 38 ft. wide. West face is in 180 ft. with $15 milling ore showing the entire distance. Present face has considerable high-grade ore from which selected samples have run as high as $400. New east face just breaking into another shoot of good milling ore. Crosscutting to footwall from the west drift will be started soon.

Stockton Hill—C. O. D. shaft down 376 ft. on the vein, has opened up three feet of $45 rock. From this is being sorted a high grade of ore for test shipment. Raising on the vein is being continued north and south of the shaft from the 300 level. The 100-ton pilot mill will be in readiness for operation about October 1. New road to Berry, nine miles distant is completed. General progress underground somewhat handicapped by shortage of satisfactory labor.

The I. X. L. south drift on the 250 level is in high-grade shipping ore. This ore carries 200 oz. silver, 29 per cent lead, $2 gold with no zinc. Mine making about 10,000 gal. of water daily which is handled by jack head pump.

Duncan—It was the intention of the Ash Peak mine to contract for electric power from the Arizona Copper Co. at Clifton, a distance of about 18 miles. In view, however, of the fact that the latter have a deal pending that may mean eventually the taking over of their interests by the Phelps-Dodge Corp., the Ash Peak company declined to enter into any long-time power contracts at this time. As a consequence the American Smelting & Refining Co. did not exercise their option to purchase the property.

The Duncan Mining & Milling Co. are showing up some good orebodies recently encountered in their development work, and are working the mill steadily. J. S. Johnson, superintendent, has resigned.

The New Year's Gift group are contemplating building a 100-ton mill. Jesse Hardy is manager.

Patagonia — The Bachman-Merritt Metals Co. has purchased and is now operating the World's Fair mine. The mine is being unwatered and the new 150-ton concentration and flotation plant will be placed in operation as soon as possible.

CALIFORNIA

Grass Valley—The ten-stamp mill recently acquired by the Alcalde Mining Co. from the Golden Gate Exploration Co., has been transferred to its new location, and will soon be placed in commission. The plans of the Alcalde management is to increase the capacity of the mill to twenty stamps, in order to expedite underground developments that are planned.

Colorado operators have interested themselves in the Red Ledge mine in the Grass Valley district. They plan to explore the wide areas of country adjacent to the productive belt, and will also continue development of orebodies, already proven, to greater depth.

The Penn-California gravel mine has driven its tunnel to 1,300 ft. and it is expected that the main channel will be struck soon. A raise recently driven from the tunnel, opened up gravel deposits showing considerable gold values. A fifteen-stamp mill is on the property, and ample water for the working of the mill is available.

Jackson City—The consolidation of the Boston, Easy Bird and Mosher mines in the Mokelumne Hill district has been announced. It is reported that New York interests are responsible for the consolidation and that extensive developments are planned.

The de-watering of the Fremont Consolidated near Amador City is proceeding rapidly, and mining will soon be resumed. Plans are to sink the shaft deeper, and electric equipment has already been installed. The property was once a ranking producer of the Mother Lode, but for the past two years has been idle.

COLORADO

Telluride—The Smuggler-Union Mining Co. lost its new flotation mill at Pandora, three dwellings, a grocery store and several carloads of mine supplies, by a fire on June 24, which is believed to have started at a short-circuited switch in the mill. General Manager Bulkeley Wells was on the ground and so directed the efforts of the firefighters that the crushing plant and ball mill were saved. He estimates the total loss at about $150,000, covered by $120,000, and has already begun preparations to rebuild in the form of a concrete fireproof oil-flotation installation at an estimated cost of $250,000.

IDAHO

Coeur d'Alene District

Wallace—The Silver Triumph Mining company, near Hailey has found a body of ore 6 to 15 feet wide. A foot to two feet is solid galena containing high values in silver. The first samples contained $140 in silver and lead to the ton. The ore was disclosed in clearing an old cave, and has been found to a height of 70 feet above the upper tunnel and its dip indicates it can be found in a raise of 200 feet from the main tunnel. Three parallel veins lie in a zone 100 ft. wide.

The Bear Creek Mining Company, in the Cœur d'Alenes, is rapidly removing ore from its workings. The first carload of concentrates contained 61 per cent lead and six ounces of silver to the ton. Shipments will be made at the rate of a carload a week.

The Swastika Mining Company, in the Dixie camp of central Idaho, has widened its orebody from a fraction of an inch to six feet of good ore at a 150-foot point in the new drift. The major portion of the six feet of ore carries paying values.

Field parties from the State Bureau of Mines and Geology will be at work in many parts of the state this summer, according to Francis A. Thomson, dean of the school of mines at the University of Idaho, Moscow. Examination of ore deposits and the treatments of ore will be made.

The Montana-Idaho Copper Company, operating at Adair, has reached the

6,800-point in its drive into the mountain range. At this point the tunnel lacks less than 3,000 feet of its objective which is a point under the Monitor shaft. The mine is operating two shifts and advancing 9 to 10 feet a day. The tunnel is being driven outside of the vein. Ground is good and needs no timbering, although considerable timbering was done before this point was reached.

Kellogg — The Highland-Surprise Consolidated Mining Co. expects to be shipping again before the summer is over. The company has been idle for the past two years, but prior to that time had shipped concentrates that netted the company $78,435. There is a mill of 125-ton capacity and all necessary equipment for operation. A few men are now employed in the mine and this number will be increased as rapidly as conditions permit. The property is on Pine Creek.

ILLINOIS

Fairview—The Fairview Fluorspar & Lead Co. have almost completed the overhauling of their mill in which a number of changes in machinery and equipment have been made.

They are in the market for a 500- to 600-hp. Heine water tube boiler.

Cave in Rock—The Cave in Rock Fluorspar Co. has just sold and loaded out part of 700 tons of washed gravel fluorspar. The mine is located just outside the city limits of Cave in Rock and one-half mile from river loading point. Total cost to tow, haul and load this ore on cars is $1.75 per ton, which includes hauling from mine to river loading point. F. W. D. truck is now being used to haul from mine to river loading point.

The Spar Mountain Co. moved about sixteen thousand tons of ore from their works about five miles west of Cave in Rock, Ill. The ore occurs in a blanket formation and is from 3 to 15 ft. thick, outcropping on the surface.

MICHIGAN

Gogebic Range

Rains Impede Process of Open-Pit Operations

Heavy rains recently interrupted operations in the open pit of the Wakefield mine for a few days. Two of the steam shovels were drowned out and in places the water was about fifteen feet deep.

The Palms-Anvil mine between Bessemer and Wakefield has in the last year or two come to the front as one of the largest producers on the range. In May they established a new record for themselves, hoisting 103,000 tons.

At the Davis mine the shaft has reached the 26 level and the station is being cut out. This will be the bottom level and will be extended to intercept the orebody which is believed to follow down the dyke from the Newport mine. A considerable flow of water is expected, so a large pump house to accommodate four 400 gallon plunger pumps will be constructed on this level.

Menominee Range

Iron River—Cleveland-Cliffs Iron Co. has added a night shift at the Spies mine. One shift was inadequate to get out sufficient ore to meet the mine's contracts for 1920.

Escanaba—The Escanaba Iron Range Development Co. has discontinued drilling operations on its lands near Escanaba. Three holes were put down and the formation was cut, but no ore was encountered. It is believed by many that the Escanaba field is an extension of the Menominee range, but Wauceda, some miles away, is the nearest point to Escanaba where ore was found.

MINNESOTA

Cuyuna Range

Former Open-Pit Property Deepens Shaft and Employs Underground Methods

Cuyuna—The Rowe shaft at Riverton is being deepened 125 ft. from the present 220-ft. level and is now being worked by underground methods. Last year the milling system was employed and electric haulage replaced by the use of mules underground. Hoisting and pumping are done by steam. One hundred men are employed and shipments of 150,000 tons are scheduled for the year. Property is being operated by Pickands-Mather Co. for the Pittsburgh Steel Ore Co.

At the Sagamore pit at Riverton, a John A. Savage property, Winston-Dear and Co. are loading manganiferous ore with a dragline excavator. Shipments will be increased. The new drainage shaft to 150 ft. depth has been completed and is handling water in the pit. One shovel has started on pit clean-up.

M. A. Hanna and Co. are shipping from the Cuyuna-Sultana stockpile at Ironton and expect to load the entire pile of 40,000 tons this season. The Hanna company had a lein on the ore against the Oneida Mines Co., the former operators. The property has been idle since the winter of 1918-1919 and the Oneida Mines Co. has been in serious financial difficulties.

The Northern Minnesota Ore Co. is pumping at the Northland mine north of Cuyuna. Bulkheads have lately been put in the drifts and the probabilities are that the drifts at least will be allowed to fill. The company is contemplating entering the Batesville manganese field, and has an option on a property east of Cushman, Ark.

MONTANA

Metal Trades Threaten Wage Advance —Anaconda Slightly Increases Production

Butte—Metal trades employed in the mines are threatening to demand a wage increase, but they are not extending the threat to the point of a strike, and labor leaders are of the opinion there will be no walkout. A year ago the metal trades struck, but lost their strike. Outside electricians may cause trouble, but the mines are well prepared to continue operations despite this craft, which is in a small minority and their efforts can be dispensed with for a period without any serious trouble resulting, and it is considered doubtful if any trouble at all would result of a character serious enough to embarrass mine operation. Butte gradually appears to be drifting toward the open shop, or the American plan as it is designated here. At the present time non-union mechanics are working alongside of union men and radicalism has received a decided setback. The I. W. W. are endeavoring to dispel their responsibility for the riot on Anaconda road last April, in which 16 men were wounded and one died from the wounds received, alleging that the persons who fired the shots were in the employ of the company. A suit for $125,400 has been brought by one of the wounded men against the company and in the case of the man who died it is stated in the application for letters of administration of the estate that the estate consists of an action against the murderers of the man. At the coroner's inquest nothing whatever was brought out to show who fired the shots, except that deputy sheriffs were present and some of them fired shots into the air.

ORE CHUTE AND BINS AT BOSTON & MONTANA PROPERTY

Production of the Anaconda Copper Mining Company is being slightly increased, orders having been given to some of the mine foremen to spur up output somewhat. Washoe reduction works at Anaconda have been operating at a little more than one-third of capacity with the Boston and Montana plant at Great Falls, Mont., less than this. Labor situation as it pertains to miners is showing an improvement.

The group insurance plan started at the Elm Orlu, the first trial in the Butte district, is believed to be exercising a potent influence upon the miners, the Elm Orlu enjoying a larger shift comparatively than any other mine, despite its remote location from the city.

NEVADA

Mina—Jack Anderson has shipped by express 19 sacks of ore that carried 5,000 oz. of silver to the ton. This property, located on the south slope of Mount Mono, was discovered two years ago while he was prospecting on a grubstake furnished by Mrs. A. B. Crownore, assistant postmistress at Mina. They have refused a large amount of cash for the claims.

SIMON SILVER-LEAD MINE, MINA, NEV., SHOWING SHAFT EQUIPMENT AND EXPERIMENTAL FLOTATION PLANT

The Simon Contact mine has entered a body of ore in a crosscut from the 350-ft. level that carries values in silver and lead of $145 a ton. This shoot was also found on the 200-ft. level, but the values were not so high.

The Simon Silver-Lead Co. has found the ore on the 700-ft. level. It is claimed that between the fourth and sixth levels more than 500,000 tons of commercially profitable ore are now blocked out.

Austin—Last summer William Easton and J. B. Dinston located some claims in San Jean canyon of the Toyaba range, 30 miles south of Austin. Recently in running a tunnel, 160 ft. from the portal, a three-foot ledge was cut that carries 100 oz. of silver. This is a new district in which no mining has been done heretofore.

Arrowhead—Every day strikes of more or less importance are reported in this youngest Nevada silver camp. The latest and most sensational is that in a drift from the 100-ft. level of the Arrowhead mine, after going through 33 ft. of ore 3 ft. wide running 130 oz. to the ton, an 18-in. shoot was encountered that "goes as high as" 1,000 oz. in silver and 7 oz. in gold.

NEW MEXICO

Lordsburg—The Calumet & Arizona (85 branch) are sinking the main shaft 300 ft deeper which will give a total depth of 1,000 ft. below the zero level. Shipments are going forward regularly to Calumet & Arizona smelter at Douglas.

The Octo has commenced shaft work, sinking from the present 270-ft. depth to 300 ft. where crosscuts will be driven and the main shaft carried to 400 ft. at an early date. W. T. Bill and E. E. Forrester of El Centro, J. E. Davis of Long Beach and Geo. W. Foreman, of Los Angeles, Cal., all directors, visited the property recently. Fred C. Semmek is manager.

J. W. Jackson, formerly mine superintendent of the 85 mine, will continue to work his lease on the Superior claim of that property.

M. M. Crocker has a car of high grade silver ore ready for shipment from the Bonanza vein on the J. B. Foster property, which lies on the south side of the Bonney.

The Parks-Allen-Lurky silver property is under examination by Messrs. Koik and Wilson for Arizona interests.

Mogollon—Operations of the American Silver Corpn. have been unexpectedly suspended by orders from the eastern office. About two months ago this company took over the property and assets of the Socorro Mining & Milling Co., which had been in receivership, and commenced operations. D. B. Scott, general manager of the old company, continued in the same capacity with the American Silver Corp. The sudden shut-down came as a surprise and was followed by the resignation of Mr. Scott and the entire office force. Considerable difficulty had been experienced in building up a mining force on account of the inaccessibility of the camp.

SOUTH DAKOTA

Homestake Company Makes Changes in Hoisting Equipment

Lead—The Ellison hoist of the Homestake Mining Co. is being changed from steam to electric power. The cages will be replaced by skips. Room has been made for the new installations, but it is not expected that the new equipment will be in operation before 1921.

Hill City—The Golden Summit mine is being unwatered. Work has been started on the first level and will be extended to the other levels as soon as the water is lowered. The First National Gold Mining Co., with offices at Detroit, Mich., have taken an option on the property and the work is being done under their direction.

The National Tin Corp. have started the development of the Manitowac, which is near the concentrator and has railroad connections. The Cowboy has been closed down. At the Tin Boom the shaft has been sunk to 100 ft. and lateral work was started. The work at this mine has also been temporarily suspended. At the Mohawk, stoping has been started. The concentrator has again been placed in commission but the transportation facilities are such that the plant is operated at greatly reduced capacity.

Pringle—The Kirk quarries have been reopened under lease to Edward Manion. The limestone is shipped to the sugar refineries and a daily output of 100 tons will be maintained as soon as a full crew is obtained.

Deadwood—The Cutting Mining Co. have completed the sinking of the shaft to 500 ft. and lateral work is now under way.

The Echo Gold Mining Co. at Maitland have completed their shaft to a depth of 400 ft. and drifting has been started on this level.

UTAH

Juab County—Tintic shipments for the week ended June 26 amounted to 149 cars, as compared with 122 cars the week preceding.

The southern end of the Eureka Hill property, which is under lease to the recently organized Keystone Leasing Company is being opened through the adjoining Centennial Eureka, work starting from the 900 level of this mine. At the Plutus—now a part of the Chief Consolidated holdings—drifting is being done at a depth of 1,750 ft., starting from the winze sunk from the 1,000, where some time ago, mineralization was encountered warranting further work. Better ore is expected to be opened by deeper work. At the Chief itself, the new concrete-lined double-compartment shaft has reached the 1,400 level.

Bingham—Utah Consolidated will immediately begin work on the construction of a 1,000-ton milling plant to treat low-grade ores. For some time the company has been making experiments at a small mill leased for the purpose. The mill will be at Tooele, four miles distant, and the ore will be transported over the tramway at present in use. Recent development work is opening low-grade copper ore on the lower levels.

Toquerville—It is reported that control of the Silver Reef Consolidated Co., which owns the Silver Reef mines, has been secured by the Alvarado Mining & Milling Co.

WASHINGTON

Mining Activity in Okanogan County —Aerial Tram from Northwest Magnesite Co.

Nighthawk—There is considerable mining activity this summer in the Oroville-Nighthawk District of northern Okanogan County. At the Kaaba mine, a crew of men, under the direction of J. W. Douglas, are carrying on extensive development work on the vein in order to block out extensive reserves for future milling. The Four Metals Mining Company has deepened its shaft on the Alice claim to 150 ft. and on the Shamrock claim now has a shaft down 100 ft. and expects to soon encounter the vein on its dip.

Newport—The Bead Lake Mining Company has a crew of 20 men engaged in the construction of a 100-ton mill. The company is operating its own sawmill to supply lumber for the construction work.

Boundary—The Electric Point Mining Company reported that it has opened a new chimney of high-grade galena. The new ore is located just on the line between the Electric Point and Gladstone mines, it was encountered in a drift from the 150 ft. level of the Electric Point workings.

Chewelah—The Northwest Magnesite Company, at Chewelah, Stevens County, is building six miles more of aerial tram, adding approximately $100,000 to the million-dollar plant now producing 8,000 tons of calcined product monthly.

CANADA

British Columbia

Low-Grade Prospects in Salmon River District To Be Diamond Drilled— Placer Miners Active in Cariboo

Stewart—Contract diamond drilling has been commenced by Boyle Bros. on the Province claim of the Big Missouri group. Last year the same form of development took place on the E Pluribus claim of the same group. This property is one of the most extensive of the low-grade prospects of the Salmon River section, Portland Canal district.

Col. T. A. Hiam, the representative at Stewart of Sir Donald Mann, expects the Northwestern Railway up the Bear River to be in operation this season. The bridges and right-of-way are being repaired and the gasoline locomotive to be used has arrived. As there are a number of properties up the valley to be developed, Col. Hiam is confident that the road will be kept very busy.

Alice Arm—The Taylor Engineering Co. is reported to have awarded a contract for the installation at the Dolly Varden Mine of a hydro-electric power plant. The cost is said to be $65,000.

Hazelton—The Kitselas Mountain Copper Co.'s concentrator at Usk has been successfully operated since early in June.

Ontario

Cobalt—The Nipissing has declared a dividend of five per cent payable July 20, to shareholders of record as of June 20.

The past few weeks have shown a decided improvement in the labor situation in Cobalt. Men are coming in from many districts and there is now no trouble in getting sufficient labor. Closing down of the big Chippewa power project at Niagara Falls, and laying off men in the automobile centers, has released a considerable amount of labor, which is drifting back to Northern Ontario.

All men at the Dome Lake mine in Porcupine have been laid off and the mine is being allowed to fill with water.

The Miracle mine near Porcupine plans several thousand feet of diamond drilling this summer. The property was developed and financed by a group of spiritualists.

The Kirkland Lake camp is showing more activity than any other part of Northern Ontario. A number of new operations are starting up and the producing properties are working to capacity. Excavation has been started for the Ontario Kirkland mill although the machinery has not yet been ordered. Development on the 400 foot level is stated to be very satisfactory and the oreshoot is longer than on the 300 foot level. The Lake Shore is sinking a new three compartment shaft to the 800 foot level and cutting stations every 200 feet. The Wright-Hargraves is suffering from a shortage of power and is carrying on mining operations by steam. The machinery for the mill is on the ground and construction is proceeding. The Granby Kirkland and the Chapat Hughes have both started development near Gull Lake and the Munroe Kirkland has started work to the North. Development on the Bidgood is stated to be very satisfactory and in the immediate vicinity, the Wood Kirkland and Lebel Oro have started work.

Manitoba

Herb Lake—Work on the Rex which had been discontinued since the fall of 1918 has been resumed.

At the Bingo a shaft is being sunk in the center of a mineralized belt 60 ft. wide, containing five veins. Rich ore, showing free gold, is being taken out and stored for treatment at the Rex mill.

CHRONOLOGY OF MINING

June, 1920

June 1.—Calumet & Arizona Mining Co. formally took over the Eighty-five mine at Lordsburg, N. M.—Senate amended the War Minerals Relief Act by conferring jurisdiction on the Court of Claims; this failed to pass the House of Representatives.—Judge Bourquin dismissed the Minerals Separation, Ltd., proceedings against Butte & Superior Co. for contempt, in the U. S. District Court at Butte, Mont.

June 7—Miami Copper Co. cited before the U. S. District Court at Wilmington, Del., to answer contempt charges brought by Minerals Separation, Ltd.

June 10—Secretary of the Interior promulgated regulations for operating in oil lands under the "Land Leasing Law."

June 11—Conference of State and Public Utility officials at Washington approved the resolution adopted by the National Committee on Natural Gas Conservation.

June 12—Secretary of the Interior declared void the first leases of the Welch Mining Co., on Indian-owned lands near Douthat, Okla.—Metals Extraction Corporation started their new-process zinc oxide plant near Joplin, Mo.

June 14—Union Mine Workers held their State convention at Birmingham, Ala.

June 15—Hearing of Minerals Separation, Ltd., contempt proceedings against Miami Copper Co. at Philadelphia, Pa.

June 16—Third sale of Choctaw and Chickasaw coal and asphalt deposits.

June 18—U. S. Circuit Court of Appeals, Philadelphia, Pa., denied petition by Miami Copper Co. to re-open its case with Minerals Separation, Ltd., in order to admit new evidence.

June 19—The Salt Lake Valley smelters raised their week-long embargo on shipments of certain kinds of ores.

June 23—Lake Superior Prevention of Accidents Conference opened at Duluth, Minn.

June 24—Mason Valley smelter-rates hearing began before the Interstate Commerce Commission at Reno, Nev.—Smuggler-Union Mining Co.'s new flotation mill at Pandora, Col., destroyed by fire.—Leading zinc mine operators met at Miami, Okla., and decided on a two-weeks' shut down of the leading zinc ore mines of the Kansas-Missouri-Oklahoma district, beginning June 26.—"Midsummer Day" celebrations among the Gogebic range miners caused most of the mines there to close on this day.

June 26—Kansas-Missouri-Oklahoma zinc mines shut down until July 10.

Recent Production Reports

Chile Copper produced 10,300,000 lb. copper in May against 8,172,000 in April.

Granby Con. M. S. & P. Co. produced 2,131,219 lb. copper in May against 2,105,400 in April.

THE MARKET REPORT

Published in part in San Francisco and mailed from there to our Western subscribers as a special service without charge pending the arrival of the *Engineering and Mining Journal*

Silver and Sterling Exchange

July	Sterling Exchange	Silver: New York, Domestic Origin	Silver: New York, Foreign Origin	Silver: London	July	Sterling Exchange	Silver: New York, Domestic Origin	Silver: New York, Foreign Origin	Silver: London
1	394	99½	90½	....	5	....	....	....	52
2	395	99½	89⅝	51⅛	6	393	99½	90	51½
3	394½	99½	89⅝	51⅛	7	393½	99½	91⅞	52½

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

On the authority of the Secretary of the Treasury, we quote 100c. per oz. for silver, 1,000 fine, delivered at the option of the Director of the Mint to the New York Assay Office or to the mints in Philadelphia, Denver, or San Francisco, and proved to the satisfaction of the Treasury Department to have been mined, smelted, and refined in the United States. This quotation is retroactive to May 13.

Daily Prices of Metals in New York

July	Copper: Electrolytic	Tin: 99 Per Cent	Tin: Straits	Lead: N. Y	Lead: St L.	Zinc: St L.
1	18.20	46.00	49.00	8.25	8.10	7.60
2	18.35	46.75	50.00	8.10	8.00	7.60
3	18.35	46.75	50.00	8.10	8.00	7.65
5	....	....	....	....	....	....
6	18.50	45.50	48.25	8.10	8.00	7.75
7	18.60	45.50	48.00	8.10	8.00	7.70

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for prompt and nearby deliveries constituting the major markets, reduced to the basis of New York, cash, except where St. Louis is the normal basing point. All prices are in cents per pound.

Copper is commonly sold on terms "delivered," which means that the seller pays the freight from refinery to buyer's destination. The delivery cost varies, and it would be confusing to figure net prices on individual transactions. Consequently, an average deduction is made from the "delivered" price. At present the average cost of delivery from New York refineries is 0.15c. per lb., and that deduction is made to arrive at the New York price. When copper is sold f.o.b. or f.a.s. New York, of course no deduction is made.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of spot American tin, 99 per cent grade, and spot Straits tin.

London

July	Copper: Standard Spot	Copper: Standard 3 M	Copper: Electrolytic	Tin: Spot	Tin: 3 M	Lead: Spot	Lead: 3 M	Zinc: Spot	Zinc: 3 M
1	87	89½	103	249½	254	34¼	35	41½	43½
2	89¾	91¾	105	260	264	35¼	35¾	43¾	45¼
3	....	....	....	....	....	....	....	....	....
5	88¼	90¼	105	250½	256	34½	35½	44	45½
6	87	89¼	105	246¼	253½	34¼	35¼	42½	43¾
7	87¼	89½	105	247½	255	33¼	34½	41¾	43

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York, July 7, 1920

Business continues of small volume, though with a firm undertone. The week-end holiday depressed sales considerably, almost no metal being sold on Friday or Saturday. Yesterday and today inquiries have been more numerous, but current industrial conditions prevent consumers from contracting for large lots of any kind of metal. The railroad situation continues gradually to improve, but prompt shipment does not yet mean delivery within any reasonable time in the majority of cases. Mexican conditions under the new government are reported improved.

Copper

The long-awaited buying movement does not yet seem to have begun, the large producers reporting only the usual insignificant sales, as has been the case for two or three months. The amount of metal in the hands of outside interests has dwindled considerably, and nothing is now heard of the Japanese copper which was offered at low prices two or three weeks ago. The price has therefore shown a pronounced tendency to approach that asked by the large interests, and almost nothing can be had at less than 18¾c., delivered. It is improbable that any buying movement as large as that of the early spring will occur. Rather, under present uncertain conditions, consumers are likely to buy comparatively small lots and more often. Nothing new is taking place in the export market, as far as can be learned.

Lead

The demand for lead for July delivery or shipment which existed last week, and, in conjunction with an improved London market, caused a rather sharp rise here, seems to have died down, and practically all the metal sold since last Wednesday has been for August delivery. Spot metal still commands a premium, as little is on the market. On the other hand, consumers are, in general, well supplied for current requirements. Lead for late July and early August delivery can be obtained at the prices which we quote, and late August metal at slightly under our prices.

The scarcity of prompt lead in the West and Middle West, the reduced production in that section, and the fact that New York is now a port of entry for Mexican lead, combine to bring the New York price approximately to the same figure as that quoted for St. Louis. In fact, it is not impossible for the New York price to fall even below that quoted for Middle Western delivery.

Consumption continues good, paint and storage-battery makers using large quantities.

Zinc

Prices continued to trend firmer during the last week, although little buying took place. A considerable amount of cheap spelter found its way into strong hands recently, when the price was less than 7½c., and it is unlikely that this will be unloaded at less than 8c. The fact that production has been curtailed at the mines will have a bullish influence, and, also, conditions in Europe seem to be somewhat improved.

Tin

Tin has been absolutely dead the past week. When the London market advanced on Thursday and Friday, some inquiries developed on the part of consumers who did not wish to have the price get away from them. The European market has again weakened, however, so that prospective buyers feel that they can wait a while longer. Quotations are nominal. Banca tin continues to be sold at a marked reduction over the price for Straits, the difference being about 1c.

Straits tin for future delivery: July 1st, 47½@48c.; 2d, 48¾@49c.; 3d, 49@49¼c.; 6th, 47@47½c.; 7th, 48c.

Arrivals of tin in long tons: Total for June, 4,730. July 1st, Hongkong, 125; 6th, Liverpool, 65; London, 165.

Silver

The London market has been comparatively steady but quiet over the holiday period. Limited supplies from the Continent seem to be sufficient so far to satisfy the requirements of the London market. It is an open question whether the supplies will continue to meet the English demand, and there does not yet seem to be any way of developing that fact. The Continental accumulations are in large part in the hands of the peasants, and it would take time to gather in the hoardings in quantity.

Mexican Dollars—July 1, 67⅞; 2d, 67⅞; 3d, 67⅞; 5th, holiday; 6th, 67⅞; 7th, 69½.

Gold

Gold in London on July 1st, 2d, and 5th, 104s.; 6th and 7th, 104s. 1d.

Foreign Exchange

Price changes were narrow again during the last week, no fluctuations of any moment taking place, though sterling has been slightly weaker. In units to the dollar, francs were quoted on Tuesday at 11.70 and lire at 16.20. German marks were 2.63c. New York funds in Montreal were quoted at $130.87 premium per $1,000.

Other Metals

Aluminum—Ingot, 33c. per lb., with 32@32½c. open market for 98@99 per cent virgin; unchanged.

Antimony—Market continues weak. Spot, 7¾c. per lb.; Cookson's "C" grade, 16@17c. Chinese and Japanese brands, 7¾c. W. C. C. brand, 8½c.

[1]**Antimony, Needle**—Chinese needle antimony, lump, firm at 9½c. per lb. Standard powdered needle antimony (200 mesh), 12 to 15c. per lb.

Bismuth—$2.70 per lb., 500-lb. lots. Market quiet.

Cadmium—Nominal, $1.40@$1.50 per lb. Unchanged.

[1]**Cerium Metal**—Ingot form, $8@$9 per lb.

Cobalt—Metal, $2.50 to $3 per lb., black oxide, $2 per lb.

Iridium—Nominal, $300 per oz. No business.

Magnesium—Crude, 99 per cent or over pure, $1.75 per lb., for the metal in 100 lb. lots and over, f.o.b. Niagara Falls.

[1]**Molybdenum Metal** in rod or wire form, 99.9 per cent pure, $32@$40 per lb., according to gage.

Nickel—Ingot, 43c.; shot, 43c.; electrolytic, 45c.; Monel metal, shot, 35c.; blocks, 35c., and ingots, 38c. per lb.

Osmium—Open market, $50@$75 per troy oz.

Palladium—$75@$80 per oz.

Platinum—Market weak at $80@$85 per oz.

Quicksilver—Market weaker; $90@$92 per 75-lb. flask. San Francisco wires $85. Firm.

Ruthenium—$200@$220 per troy oz.

[1]**Selenium**, black, powdered, amorphous, 99.5 per cent pure, $1.75@$2 per lb.

[1]**Thallium Metal**—Ingot, 99 per cent pure, $18@$20 per lb.

Metallic Ores

Bauxite—Unchanged from last issue.

Chrome Ore—Guaranteed 50 per cent Cr_2O_3 foreign ore with a minimum of 6 per cent silica, 72@80c. per unit, New York. California concentrates, 50 per cent Cr_2O_3 and upward, 60@65c. per unit, f.o.b. mines.

Iron Ores—Lake Superior ores, per ton, delivered at Lower Lake ports: Old Range bessemer, $7.45; Old Range non-bessemer, $6.70; Mesabi bessemer, $7.20; Mesabi non-bessemer, $6.55. Shipping condition is getting serious with respect to ores, but coal conditions are improving.

Manganese Ore—85@90c. per unit, 50 per cent Mn content, c.i.f. Atlantic seaport; chemical ore (MnO_2) $75@$85 per gross ton.

Molybdenum—85 per cent MoS_2, 85c. per lb. of contained sulphide.

[1]**Tantalum Ore**, guaranteed minimum 60 per cent tantalic acid, 65@70c. per lb. in ton lots.

Titanium Ores—Ilmenite, 52 per cent TiO_2, 2c. per lb. for ore. Rutile, 95 per cent TiO_2, 20@25c. per lb. for ore, with concessions on large lots or running contracts.

Tungsten Ore—Scheelite, 60 per cent WO_3 and over, per unit of WO_3, $7 f.o.b. mines; wolframite, 60 per cent WO_3 and over, per unit of WO_3, $6.50@$7.50 f.o.b. mines.

Uranium Ore (Carnotite)—$2.75@$3 per lb. for 96 per cent of the contained oxide (U_3O_8). Ores must contain a minimum of 2 per cent U_3O_8.

Vanadium Ore—$1 to $2.50 per lb. of metallic vanadium content.

Zircon—Washed, iron free, 10c. per lb. Zirkite—$90@$100 per ton, carload lots. Pure white oxide, 99 per cent, is quoted at $1.15 per lb. in ton lots.

Zinc and Lead Ore Markets

Joplin, Mo., July 3—Zinc blende, per ton, high $48.90; basis 60 per cent zinc, premium, $46; Prime Western, $45; fines and slimes $45@$40; calamine, basis 40 per cent zinc, $36. Average settling prices: Blende, $42.87; calamine, $36; all zinc ores, $42.62.

Lead, high, $101.35; basis 80 per cent lead, $100@$90; average settling prices, all grades of lead, $100.73 per ton.

Shipments for the week: Blende, 10,919; calamine, 387; lead, 1,634 tons. Value, all ores the week, $646,650.

The mine close-down may be considered complete. Sellers claim the production is lessened 95 per cent and buyers concede 85 per cent. In thirty years' endeavor to get together on a proposition this is the first time over 50 per cent have complied. Most sellers have sold on the market, but a few are withholding ore. One company has 15,000 tons holding since the price declined below $60, and one company has 600 tons holding since the price dropped under $65 per ton. Outside these two lots the unsold ore aggregates approximately 6,000 tons, most of it simply withheld. Salable ore is about cleaned up. Cars were a little easier and the shipment was increased. The purchase this week was under 3,500 tons.

Platteville, Wis., July 3—Blende, basis 60 per cent zinc, $48 per ton for high-grade. Lead ore, basis 80 per cent lead, $90 per ton. Shipments for the week: blende, 1,454; calamine, 60; lead, 40; sulphur ore, 45 tons. Shipments for the year: blende, 36,027; calamine, 2,240; lead, 3,334, sulphur ore, 988 tons. Shipped during week to separating plants, 2,997 tons blende.

Non-Metallic Minerals

Asbestos—Crude, No. 1, $1,800@$2,500; No. 2, $1,100@$1,500; spinning fibres, $400@$700; magnesia and compressed sheet fibres, $300@$400; shingle stock, $100@$150; paper stock, $60@$80; cement stock, $17.50@$30; floats, $8.50@$15, all per short ton, f.o.b. Thetford, Broughton, and Black Lake mines, Quebec, Canada; 5 per cent to be added as Canadian royalty export sales tax. Freight rate from mines to Sherbrooke, Quebec, over Quebec Central R.R., 20c. per cwt.; from Sherbrooke to New York, 27½c., carload lots; freight to New York for crude No. 1, f.o.b. Thetford mines, $8.45 per ton, carload lots.

Barytes—Crude, 88 to 94 per cent barium content, $8@$10 per net ton; ground (white) $22@$25 in bags, carload lots; (off-color) $18@$20 in bags, carload lots; all f.o.b. Kings Creek, S. C. Crude, 88 to 94 per cent, $12 per gross ton; ground (white) $23@$25; ground (off color) $16@$19 per net ton, f.o.b. Cartersville, Ga. Crude, 88 to 94 per cent, $23; ground (white) $40.50; ground (off color) $27 per net ton, less than carload lots, f.o.b. New York. Crude, not less than 98 per cent, $11@$11.25 per ton, f.o.b. cars, Missouri; floated, $28 per ton in bbls.; $26.50 per ton in 100-lb. bags; extra charge for bags, f.o.b. St. Louis.

Chalk—Domestic, extra light, 5@6c. per lb.; light, 4½@5½c.; heavy, 4@5c; English, extra light, 5@7c.; light, 5@6c.; dense, 4½@5c. per lb., all f.o.b. New York.

China Clay (Kaolin)—Crude, $9@$12; washed, $12@$15; powdered, $18@$22; bags extra; per net ton, f.o.b. mines, Georgia; crude, $8@$12; ground, $15@$40, f.o.b. Virginia points. Domestic lump, $10@$20; powdered, $25@$30; imported lump, $25@$35; powdered, $30@$60, f.o.b. New York.

Feldspar—Crude, $7.50@$8 per gross ton, f.o.b. Maryland and North Carolina

[1] Furnished by Foote Mineral Co., Philadelphia, Pa.

points; $7.50@$10 f.o.b. Maine; ground, $22@$25, car lots, f.o.b. Baltimore; ground, $16@$20, f.o.b. North Carolina points; $16 to $20 per ton, No. 1 ground, f.o.b. New York State.

Fluorspar—Standard grade, domestic washed gravel, f.o.b. Illinois and Kentucky mines, $25 per ton; lump, $17.50, f.o.b. Tonuco, N. M.

Fuller's Earth—Domestic, granular, $25; powdered, $18, f.o.b. mines, Florida; imported, powdered, $35@$40 per ton.

Graphite—Crucible flake, 85 per cent carbon content, 8c. per lb.; 88 per cent, 9¼c.; 90 per cent, 10¼c., all f.o.b. New York; 80 per cent, 5c.; 90 per cent, 10c.; 30 per cent (dust polish grade), 1c.; 50 per cent (dust facing grade) 2c.; f.o.b. Ashland, Ala. Mexican, amorphous, $45 @$55 per short ton; Korean, 3¼c. per lb.; Madagascar, 8c.; Ceylon, 4¾@15½c.

Gypsum—Raw crushed rock, $3.50@ $4 per ton; raw ground fine, $4@$4.50; calcined stucco, $9, all f.o.b. works. Containers extra. Wholesale, plaster of paris, carload lots, $3.75 per 250-lb. bbl., alongside dock, New York.

Kaolin—See China Clay.

Limestone—For fluxing, $1.65@$1.75 per net ton, f.o.b. Howellville, Pa. Dolomite, 1@2 man size, $1.60@$1.65; 2@8 in., $1.55@$1.65 per net ton, f.o.b. Plymouth Meeting, Pa.

Magnesite. Calcined — High-grade caustic calcined, lump form, $35@$40 per ton, carload lots, f.o.b. California points. Freshly ground calcined, suitable for flooring trade, $65@$75 per ton, f.o.b. Eastern points.

Dead-Burned — $32.50 per net ton, Chewelah, Wash.; $50@$60, Chester, Pa. Magnesite brick—See Refractories.

Mica—Imported block mica slightly stained, per lb.: No. 6, 50c.; No. 5, $1.20 @$1.40; No. 4, $2@$3; No. 3, $4.25@ $5; No. 2, $5.50@$7; No. 1, $8. Clear block: No. 6, 55c.; No. 5, $2; No. 4, $4; No. 3, $5.75; No. 2, $7; No. 1, $9; A1, $14; extra large, $25, all f.o.b. New York; ground, $85@$100 per ton, Philadelphia.

Monazite — Minimum of 6 per cent thorium oxide, $42 per unit, duty paid.

Phosphate Rock—Per long ton, Florida ports, 68 per cent tricalcium phosphate, $6.85; 70 per cent, $7.35; 74 to 75 per cent, $10; 75 per cent minimum, $10.50; 77 per cent minimum, $12.50.

Pumice Stone—Imported, lump, 4@ 50c. per lb.; domestic lump, 6c.; ground, 4@7c., all f.o.b. New York.

Pyrites—Spanish, fines, per unit 12c., c.i.f. Atlantic seaport; furnace size, 16½c.; run of mine, 12@14c.; domestic, fines, f.o.b. mines, 12@14c.

Quartz—(Acid tower) fist to head, $10; 1¼ to 2 in., $14; rice, $17, all net ton, f.o.b. Baltimore; lump, carload lots, $5@$7.50 net ton, f.o.b. North Carolina mines.

Sulphur—$18 per ton for domestic; $20 for export, f.o.b. Texas and Louisiana mines; unchanged.

Talc—Paper making, $9.50@$14 per ton; roofing grades, $8@$9; rubber grades, $9@$15, all f.o.b. Vermont. California talc, $20@$35, talcum powder grade. Southern talc, powdered, carload lots, $12 per ton; less than carload, $15, f.o.b. cars. Freight to New York, $5.25 per ton, carload lots; less than carload lots, $9.25. Imported, $60 @$70.

Mineral Products

Arsenic—White arsenic, 14@15c. per lb.; sulphide, powdered, 20@21c. per lb., f.o.b. works.

Nitrate—Soda, $3.85 per cwt., ex vessel, Atlantic ports. Market quiet.

Potassium Sulphate—Domestic, $2.25 @$2.50 per net ton, basis 90 per cent, f.o.b. New York.

Ferro Alloys

Ferrocarbontitanium—For 15-18 per cent material, $200@$250 per ton, f.o.b. Niagara Falls, N. Y.

[1]**Ferrocerium**—Per lb., $12@$15. Foreign conditions as affecting the price of American goods remain unchanged.

Ferrochrome—Carload lots, spot and contract, 60 to 70 per cent chromium, 6 to 8 per cent carbon, 19@20c. per lb. of chromium contained; 4 to 6 per cent carbon, 20@21c.

Ferromanganese—For 76@80 per cent, $250 spot; $225 prompt; $200 contract, freight allowed; Spiegeleisen, 18 to 22 per cent, $75, f.o.b. furnace.

Ferromolybdenum—Standard grades, carrying from 50 to 60 per cent molybdenum metal, with low sulphur, phosphorus, and arsenic, $2.50@$3 per lb. of contained metal.

Ferrosilicon—For 10 to 15 per cent, per gross ton, f.o.b. works, $60@$65; 50 per cent, $80@$90; 75 per cent, $150 @$160.

Ferrotungsten—70 to 80 per cent W, 90c.@$1.10 per lb. of contained tungsten.

Ferro-uranium—35-50 per cent U, $7 per lb. of U contained.

Ferrovanadium—Basis 30-40 per cent, $6.50@$7.75 per lb. of V contained.

Metal Products

Copper Sheets—No change in Jan. 7 price of 29½c. per lb.; wire, quoted 22¼@22½c.

Lead Sheets—Full lead sheets, 12¼c.; cut lead sheets, 12¼c. in quantity, mill lots. Unchanged.

Nickel Silver—Unchanged at 39½c. per lb. for 18 per cent nickel.

Yellow Metal — Dimension sheets, 26¾c.; sheathing, 25¾c.; rods, ⅜ to 3 in., 23¾c. Unchanged.

Zinc Sheets—$12.50 per 100 lb., less 8 per cent on carload lots, f.o.b. smelter; zinc plates, 12c. per lb. Unchanged.

Refractories

Bauxite Brick—56 per cent alumina, $145 per 1,000, f.o.b. Pittsburgh.

[1]Furnished by Foote Mineral Co., Philadelphia, Pa.

Chrome Brick—$90@$100 per net ton, Chester, Pa., carload lots.

Chrome Cement—45 to 50 per cent Cr_2O_3, in sacks, $50 per net ton, Chester, Pa., carload lots.

Clay Brick — First-quality fire clay, 9-in. shapes, $45@$53 per thousand, f.o.b. Pennsylvania, Ohio, and Kentucky works; second quality, $40. First quality, St. Louis, $45; New Jersey, $75.

Magnesite Brick—$90@$100 per ton, f.o.b. Chester, Pa.; 9-in. straights, $90 per net ton, Baltimore; 9-in. sizes and shapes larger than 9 in., regular extras.

Silica Brick—Nine in. and 9-in. sizes, per 1,000, $51@$55, Birmingham, Ala.; $50@$55, Mount Union, Pa.; $55, Chicago district.

Iron Trade Review

Pittsburgh, July 6, 1920

The sheet and tin-plate tonnage wage scales, governing the sheet and tin mills that are operated as union, have been settled between the manufacturers involved and the Amalgamated Association, a few minor concessions being made to the men. As to the general organizing campaign for the iron and steel industry, the present prospect is that none will occur, at least in the near future.

Car supplies for shipping pig-iron and steel products have been poorer in the past fortnight than formerly, owing to the diversion of many open top cars to the coal movement. The industry is better supplied with coal, for fuel and byproduct coking, and hopes soon to have some of the cars back.

Pig Iron—Relatively small sales of bessemer and basic iron have been made, for early delivery, at $1 advance, or $45, Valley, and this seems to be the market. There is no interest in deliveries for late in the year, buyers apparently expecting a decline. We quote bessemer, basic and foundry all at $45, f.o.b. Valley furnaces, freight to Pittsburgh being $1.40. W. P. Snyder & Co. report average prices in June, computed from tonnage sales reported, at $43.494 for bessemer and $44.0075 for basic, Valley furnaces. Foundry was quoted at $45, Valley, throughout the month.

Steel—The market is quiet. Quotations, largely nominal, are: Billets, $60@$65; small billets, $65@$70; sheet bars, $75.

Charcoal and Coke

Charcoal—Willow, 7c. per lb. in bbls.; hardwood, 4½c. per lb., in 250-lb. bbls.

Connellsville — Furnace, $17.50@ $18.50; foundry, $18@$19.

New River — Furnace, $12.50@$15, and foundry, $12.50@$14 per ton.

Pocahontas—Furnace, $12.50@$13.50 per ton.

Wise County — Furnace, $12.50@$15 per ton; foundry, $12.50@$14 per ton.

The Relief of the South African Gold Mines

What the Rand Low-Grade Mines Commission Recommends To Ease the Critical Situation in The World's Leading Gold-Producing Center

IN VIEW of the strenuous attempt being made to help the gold miner out of his difficulties in the United States, an important contribution to the subject of relief for the industry elsewhere is contained in the report of the Rand Low-Grade Mines Commission presented to the Union Houses of Parliament, and issued the latter part of May. This is the commission that was appointed about one year ago by the South African government to study the critical situation in the low-grade gold mines of the Rand—the most important gold producing area in the world—due to the steady rise in working costs since the beginning of the war. Although preliminary statements were frequently made by the commission, the final report has just recently been issued.

Recommendations Summarized

The report contains no startling or unexpected recommendation or suggestion, the principal advocation being the importation of cheap colored labor from the tropics north of 22 deg. S. latitude to help reduce the high labor costs. The report deals at length with the disposal of gold, the procedure necessary to obviate the closing down of the mines, and the steps to be taken should abandonment of the work actually occur.

The effect of the vanishing gold premium was not as marked at the time the report was printed and issued (April of this year) as it is at the present time and the situation is continually becoming more acute.

Greatly Increased Costs

It is estimated that during the first half of 1915 working costs on the Witwatersrand mines averaged 17s. 5d. per ton; in the third quarter of 1919 they had advanced to 22s. 7d. and in the final quarter to 23s. 9d. An allowance of 1s. 8d. is made to bring the cost up to date, which indicates the steady upward trend.

The following comparative table reflects the increase in white and black labor costs, in general commodities, and the decrease in efficiency.

	First Half of 1914		First Quarter of 1919	
	Per Ton Milled			
White salaries and wages	5s.	1d.	7s.	1d.
Native wages	3	9	4	2
Stores and materials	5	5	7	10
Administration	0	5 7	0	6 3
Gold realization	0	3 1	0	6 3
Cost of development per foot	54	1	81	5
Tons handled per white employee	115 2	0	101 2	0
Tons handled per native employee	15 5	0	13 7	0

Elimination of Group Control

Opinion had been frequently expressed that costs could be materially lowered by elimination of group control—a feature of the South African gold mining industry—and that several shillings per ton could be economized in that manner. Evidence which the commission has gathered controverts this idea—the total administrative costs due to this arrangement being only about 6.3d. per ton milled. Economies to be effected in this direction "cannot possibly affect the position of the low-grade mines."

The charge that undue or hidden profits were being made by companies through the purchase of supplies for the mines and an overcharge for the service was unsubstantiated by the investigation.

Gold Marketing Costs

The commission deals at length with the gold premium the effect of which was first felt just after the commission had been appointed and a free gold market established. It recommends that the Union government approach the Imperial and Indian governments with a view to the free sale of South African gold in India—a great gold as well as silver consuming country. By this means it is hoped to compensate for the heavy discount—amounting to some 7 per cent—which under present arrangements is exacted by the banks in return for their service in marketing the gold. The seven per cent discount rate cuts heavily into the gold premium. The commission emphasizes the merely temporary nature of the premium and the transient respite given to the industry and is strongly in favor of the establishment of a mint in the union, rendering the producers less dependent upon outside assistance, and avoiding excessive refining charges in disposing of bullion through one channel.

The Abandonment of Operations

The effect of the closure of the mines and a curtailment of the industry is carefully considered, and that it would be a national calamity is well understood. The direct consequences would mean that some 250,000 white and a like number of blacks would be thrown out of employment and a means of livelihood. The loss in general revenue is estimated at £1,800,000 per month while that to the railways and harbors would at least be equally great.

On the other hand, it is assumed that a partial closing down of the mines will, to a certain extent, aid the operating ones by relieving the chronic shortage of native labor, enabling them to run at greater capacity. However, the exact extent to which such a step can be taken with beneficial results is a question, and can be easily overdone. It is a natural tendency for the low-grade mines in the most vulnerable condition to shut down first under the prevailing adverse conditions—just as in the United States those gold mines which were producing at or below cost were the first to close.

Government Subsidy

The matter of subsidizing the gold mines has been repeatedly advanced and as many times rejected. Save in exceptional circumstances the commission disfavors such subsidies. This recommendation is made on the grounds that support of a struggling gold mine would entitle the support of a struggling copper mine in a similar position, an argument that may be extended ad infinitum. It is held that economical principles regard unsound a policy which supports unpayable industries, diverting funds from profitable and permanent enterprises.

The Commission suggests exhaustive inquiry into general native labor policy and states that the well being of the native is not being sufficiently considered by the white population. The chief consideration is the profit and convenience of the European and the native is beginning to feel, and to say with considerable justice, that he is being exploited. The sooner such a feeling is eradicated the better for all concerned.

Notification of Closure

In the interests of maintaining mining operations wherever possible, it is suggested that at least three months' notice be given before shutting down a mine so that government inquiry may determine the merits of the individual case and assist operations as far as possible, and when mining operations are to be continued with a certain measure of government control, it is assumed that economy and efficiency of working require the utilization of the existing administration as far as possible.

On the whole the report has gone rather thoroughly into the handicaps which the South African gold mining industry is sustaining. All the measures of relief that are suggested remain to be tried out and what full measure of the burden will be removed by thorough action upon the recommendations is problematical. In the meantime the situation is continually becoming more critical.

COMPANY REPORTS

West End Consolidated Mining Company

Silver; Nevada

The thirteenth annual report of the West End Consolidated Mining Co. for 1919 summarizes operations at Tonopah as follows:

		Total	Per Ton
Dry tons ore to mill		33,140	
Containing: Fine ounces gold	6,114 61		
Fine ounces silver	580,445 10		
Total ounces	586,559 71		
Average value per ounce	$1.33		
Gross value West End ore milled		$780,786 49	$23 54
Mill costs, direct and indirect	130,106.53		3 93
Mill losses	64,483 44		1 93
Bullion marketing costs	11,452 83		34
Mining cost, direct and indirect	167,971.41		5 07
Mine development costs	57,371.29		1 73
Ore transportation costs	8,285.00		25
Written off for depreciation	11,868 38		35
Total costs and losses		451,538 88	13 60
Profit from mining and milling ore from West End mine		$329,247 61	$9 94
Profit from West End operations in Jim Butler ground, under lease		5,217 39	
Profit from milling sand tails, custom ore and miscellaneous rents and earnings		17,534 73	
Interest		3,000.000	
Profit from West End operations in Jim Butler territory under "Fraction" vein agreement		33,000 00	
		$387,999 73	
Deduct: Strike expense	$20,072 38		
Loss on motor-truck operations	260 73		
Mine examinations outside Tonopah	457.56		
Deferred charges of years prior to 1919, writtenoff in 1919	4,031.98	24,822 65	
Net operating profit, 1919		363,177 08	

The balance of receipts over disbursements amounted to $17,838.67. Disbursements included dividends to stockholders amounting to $162,538.98 on the 1,788,486 shares of $5 par value outstanding. On Dec. 3, 1919, assets totaled $7,750,188.50 and liabilities $2,855,590.77 exclusive of depletion and adjustment accounts; surplus totaled $957,029.83.

On April 1, 1920, the West End Chemical Co., operating at Searles Lake, California, and the West End Opoteca Mines Co. operating in Honduras, C. A., were formed from the parent company by the distribution of one share of stock in each company as a dividend to stockholders in the property owning and parent company, the West End Consolidated Mining Co.

Poderosa Mining Co., Ltd.

Copper; Chile

The eleventh annual report of the Poderosa Mining Co., Ltd., a British corporation, shows a debit balance of £21,977 2s. 1d. for the year's operation. The net receipts from the sales of ore, interest, and transfer fees, amounted to £58,003 9s. 4d., and, after providing for mining, management, and general expense in Chile, London office expenses, depreciation of investments, and income tax amounting to £59,602 17s. 8d., there is a resulting debit balance of £1,599 8s. 4d., to which have to be added the following items: depreciation of building, machinery and plant, £3,208 10s. 4d.; mine development, £12,169 3s., 5d.; Bolivian property, £5,000, thus increasing the debit balance for the year to £21,977 2s. 1d. Deducting this amount from the balance of £29,266 11s. 3d. at credit of revenue account, there remains to that account a credit balance of £7,289 9s. 2d.

During the year 1,498 tons of copper ore of an average assay of 31 per cent copper and 12.97 oz. of silver per ton was shipped to the smelters, as compared to 3,309 tons, assaying 30.7 per cent copper and 12.45 oz. of silver per ton, in 1918.

Buena Tierra Mining Co., Ltd.

Silver-Lead; Mexico

The annual report of the Buena Tierra Mining Co., Ltd., a British corporation, for the year ending Dec. 31, 1919, shows a loss for the period of £11,507 9s. 6d. During the year 9,067 tons of ore was sent for treatment to the smelter, the average content of which was 11.73 oz. of silver and 12.92 per cent of lead, the net smelter return being $97,587, an average of $10.76 per ton. Working costs amounted to $143,611, or $15.40 per ton, which, however, includes $7.48 per ton for development. The profit and loss account for the year shows a net deficit of £4,727 4s. 3d. on Dec. 31, 1919.

Granite Gold Mining Co.

Gold; Colorado

The annual report of the Granite Gold Mining Co. shows a loss of $24,674.22 incurred by operation during 1919. Income from ore sales, royalties, leases, and interest amounted to $56,187.15. Mine expense was $28,123.22, leaving a profit on mine operations of $28,063.93. General expenses totaled $16,760.90 and depreciation charges were $35,977.25, giving a loss chargeable to surplus account of $24,674.22.

June, 1920, Mining Dividends

The following is a partial list of mining dividends paid during June, 1920:

U. S. Mining and Metallurgical Companies	Situation	Per Share	Total
Ahmeek Mining, c	Mich.	$0 50 q.	$100,000 00
Amer. Sm. & Ref., com.	U. S.-Mex.	1 00 q.	609,980 00
Amer. Sm. & Ref., pfd	U. S.-Mex.	1 75 q.	875,000 00
Caledonia Mining, l. a	Idaho	01 m.	26,050.00
Callahan Zinc & Lead	Idaho	.50 q.	161,651.50
Calumet & Arizona, c	Ariz.	1 C0 q.	642,520 00
Calumet & Hecla, c	Mich.	5 00 q.	500,000.00
Chino Copper	N. M.	37½ q.	326,242 50
Copper Range, c	Mich.	50 q.	200,000.00
Cresson Consol. Gold	Col.	10 q.	122,000 00
Federal M. & S., pfd	Idaho	1 75 q.	210,000 00
Grand Central, g. s	Utah	01	15,000 00
Hecla Mining, l. a	Idaho	20 q.-x.	200,000 00
Kennecott Copper	Alaska, etc	50 q -c.	1,393,530 00
Nevada Consol. Copper	Nev.	25 q.	499,864 25
Oroville Dredging, g	Cal.-S. A	9 d.	£25,745.175
Osceola Consol., c	Mich.	50 q.	48,075 00
Ray Consol., c	Ariz.	25 q.	394,294 50
St. Joseph Lead	Mo.	50 q.-x.	704,734 00
Tintic Standard, l. c	Utah	10 q.	117,470 00
United Verde Copper	Ariz.	1 50 q.	450,000.00
Utah Copper	Utah	1 50 q.	2,436.735.00
Yellow Pine, z. l. s.	Nov.	.03 q.	30,000.00

Canadian, Mexican and South American Companies	Situation	Per Share	Total
Cerro de Pasco Copper	Peru	$1 00 q.	$898,229.00
Hollinger Consol. Gold	Ont.	05 bm.	246,000.00
Lake Shore, g	Ont.	.02	40,000.00
Mexico El Oro, g	Mex.	4 sh.	£36,000
Mining Corp. Canada, a Holding Company	Ont.	12½	$207,506.00
St. Mary's Min. Land	Mich.	2 00	320,000 00

Rand Mines, Ltd., which is now listed on the New York Exchange, declared its thirty-fourth dividend of 60 per cent on its common 5s. shares. The Caledonia Mining and the Golden Cycle companies announced a change from monthly to quarterly dividends beginning this month, and Calumet & Hecla has this month resumed the quarterly payments, dropped in December, 1919. Federal Mining & Smelting resumes with this month's disbursement the old rate, dropped a year and a half ago, of $7 per annum. Isle Royale Copper Co. again passed its dividend. The last one was 50c., in September, 1919. New Jersey Zinc Co. stockholders authorized an increase in the capital stock to $50,000,000, and on June 10 received a stock dividend of 20 per cent on $35,000,000.

National Lead Co., of New Jersey, paid its regular quarterly dividends of $1.75 on the preferred and $1.50 on the common stock.

1-lb. can	20 50	22 00	16 00	17 50	20 50		16 00	

MINING AND MILLING SUPPLIES

HOSE—

	FIRE	
Underwriters' 2½ in.	.....	$0.85 per ft.
Common, 2½-in.	.....	30%

	AIR		
	First Grade	Second Grade	Third Grade
¾-in. per ft.	$0.60	$0.40	$0.30

STEAM—DISCOUNTS FROM LIST

First grade..... 20% Second grade.... 30% Third grade..... 35%

LEATHER BELTING—Present discounts from fair quantities (½ doz. rolls):

Light Grade	Medium Grade	Heavy Grade
30%	30%	20%

RAWHIDE LACING—For cut, best grade, 25%; 2nd grade, 30%. For laces in sides, 79c. per sq. ft.; 2nd, 75c. For semi-tanned: cut, 20%; sides, 83c. per sq. ft.

MANILA ROPE—For rope smaller than ¼-in. the price is ¼ to $0.02 extra while for quantities amounting to less than 600 ft. there is an extra charge of $0.01. The number of feet per pound for the various sizes is as follows: ¼-in., 8 ft., ⅜-in., 6; ½-in., 4½; ⅝-in., 3; ¾-in., 2 ft. 10 in.; ⅞-in., 2 ft. 4 in. Following is price per pound for ¼ in. and larger, in 1200-ft. coils:

Boston	$0 30½	Kansas City	0.305
New York	.29	New Orleans	.29
Cincinnati	.27	Seattle	.28
Chicago	.275	St. Louis	.265
St. Paul	.275	Atlanta	.295
San Francisco	.27		

PACKING—Prices per pound.

Rubber and duck for low-pressure steam	$1.00
Asbestos for high-pressure steam	1.70
Duck and rubber for piston packing	1.00
Flax, regular	1.20
Flax, waterproofed	1.70
Compressed asbestos sheet	.90
Wire insertion asbestos sheet	1.50
Rubber sheet	.50
Rubber sheet, wire insertion	.70
Rubber sheet, duck insertion	.50
Rubber sheet, cloth insertion	.30
Asbestos packing, twisted or braided and graphited, for valve stems and stuffing boxes	1.30
Asbestos wick, ½- and 1-lb. balls	.85

RAILWAY TIES—For fair size orders, the following prices per tie hold:

Material	7 In. x 9 In by 8 Ft. 6 In.	6 In. x 8 In. by 8 Ft.
Chicago—Plain	$1 75	$1 60
Chicago—Creosoted	1 95	1 80
San Francisco—Douglas fir, green	1 74	1.24
San Francisco—Douglas fir, creosoted	3 36	2 38

Prices per tie at Missouri mills—St. Louis prices about 25c. higher.

Untreated A Grade White Oak	6x8x8	Untreated A Grade Red Oak	6x8x8
No. 1	$0 70	No. 1	$0.55
No. 2	.80	No. 2	.65
No. 3	.90	No. 3	.75
No. 4	.98	No. 5	.87
7x9x8 white oak	1 05		
7x9x8 red oak, No. 4	80		

FLOTATION OILS—Prices of oils for flotation, in cents per gal. in bbls.:

	New York	Chicago	
		In Bbl.	Carloads
Pure steam-distilled pine oil, sp.gr. 0.93 0.94	$1.80	$2 00	$1 95
Pure destructively distilled pine oil	1.60	1.90	1.85
Pine tar oil, sp.gr. 1.025-1.035	.48	.45	.43
Crude turpentine, sp.gr. 0.900 0.970	1.75	2.25	2 18
Hardwood creosote, sp.gr. 0.96–0.99*	.35	.....	.....

*F. o. b. Cadillac, Mich.

COTTON WASTE—The following prices are in cents per pound:

	New York		Cleveland	Chicago
	Current	One Year Ago		
White	11 00 15 50	13 00	16.00	11.00-14 00
Colored mixed	7 00–10 50	9.00–12.00	12.00	9.50–12.60

WIPING CLOTHS—Jobbers' price per 1000 is as follows:

	13½x13½	13½x13½
Cleveland	$55 00	$65 00
Chicago	41.00	43.50

EXPLOSIVES—Price per pound of dynamite in small lots and price per 25 lb keg for black powder:

	Low Freezing	Gelatin			Black
	20%	40%	60%	80%	Powder
New York		$0.3425	$0.3425	.....	$2 30
Boston	$0.225–24	.245–28	.25–31	.3525	2 40
Kansas City	.2475	.27	.30	.3425	2 45
New Orleans	.2425*	.2825	.2825	.38	2.45
Seattle	.18	.2175	.2475	.29	2.60
Chicago	.2175	.2525	.2975	.34	2.45
St. Paul	.185	.2275	.2525	.2950	2.25
St. Louis	.2175	.26	.285	.295	1.90
Denver	.205	.2475	.2725	.315	2 50
Dallas	.265	.275	.3025	.....	2 60
Los Angeles	.22	.27	.31	.....	2 95

Texas (except E. Paso)	124 00	119.00	1.74	1.71
El Paso, Texas	126.00	121 00	1 77	1.73
Denver, Colo	124 00	119 00	1 74	1.71
West Coast	129.00	124 00	1.81	1 77

INDUSTRIAL NEWS

Oliver Continuous Filter Co., Hooker-Lent Building, San Francisco, Cal., is opening a London office to be in charge of J. F. Mitchell-Roberts.

Albert E. Jenkins, connected for many years with the technical staff of the Grasselli Chemical Co., Cleveland, Ohio, died of heart disease Tuesday, June 22.

Western Electric Co., Inc., has opened a supply sub-warehouse at 930 West Rayan Ave., Youngstown, Ohio. C. A. Strauss is in charge of sales, and H. B. Bergman in charge of stores.

Refinite Company, Omaha, Neb., has purchased ownership and control of **L. M. Booth Co.**, New York, N. Y., makers of Booth Lime-Soda water softener for large steam power and central heating plants.

General Briquetting Co., 25 Broad St., New York, N. Y., announces that Henry Schoch, of that company, has been elected vice-president of **Nukol Fuel Co.**, Toronto, Ont., and now has headquarters in Toronto.

National Industrial Traffic League, Chicago, Ill., announces that on June 1, Joseph H. Beck, of St. Paul, Minn., assumed the duties of executive secretary, vice Guy M. Freer, deceased. His address is 411 Tacoma Bldg., 5 North LaSalle St., Chicago.

Nordberg Manufacturing Company, Milwaukee, Wis., announces that B. V. E. Nordberg has been appointed sales manager. H. W. Dow, former sales manager, recently resigned to become vice-president and engineer of the Forest Products Chemical Co., Memphis, Tenn.

Worthington Pump & Machinery Corporation, 115 Broadway, New York, N. Y., has purchased from the Platt Iron Works, Dayton, Ohio, drawings, patterns, good will and name on the latter's lines of oil mill machinery, hydraulic turbine line, feed water heaters, and high pressure air compressors.

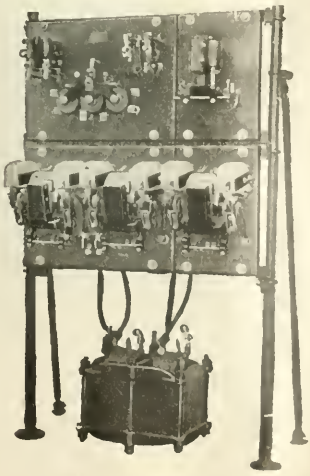
Metal & Thermit Corporation, New York, N. Y., announces the appointment of Charles F. Lederer to its rail-welding department. Mr. Lederer was recently superintendent of the way of the Milwaukee Electric Railway & Light Co., a company he had been with since 1908, and has had extensive experience in the application of Thermit in solving way department problems.

Dwight P. Robinson & Co., Inc., 125 East 46th St., New York, announce consolidation with Westinghouse, Church, Kerr & Co., Inc., under the former's name. Dwight P. Robinson is president and A. K. Wood, a vice-president and treasurer of the consolidation. H. H. Kerr is a vice-president in charge of the Chicago office, and W. L. Murray is secretary. Among the members of the directorate are Paul D. Cravath, John R. McGinley, and Harry T. Peters.

Edward Dauble, president of Union Tool Co., Torrance, Cal., died suddenly May 27 following an operation. Mr. Dauble was a native of Titusville, Pa., in his forty-sixth year. He early began to develop oil well drilling tools and machinery. In 1898 he went to Santa Paula, Cal., but soon moved his well-tools plant to Los Angeles, and in 1908 he consolidated his own great factory with the American Engineering & Foundry Co., forming the present Union Tool Co. This is one of the great plants of the southwest and now has works at West Chicago, Ill., Carnegie, Pa., and Torrance, Cal.

Starter for Mine-Fan Motors

The Cutler-Hammer Manufacturing Co., Milwaukee, Wis., has developed a control panel for the automatic starting of polyphase squirrel-cage induction motors driving loads of great inertia, such as mine fans, which require several minutes to come up to speed. This controller is essentially an automatic starter of the auto-transformer type, and consists of three double-pole magnetic contactors, two auto-transformers, a current-limit relay, and a time-limit relay, with the necessary auxiliary magnetic switches. The switch equipment is mounted on slate panels carried on a floor frame, with the transformers mounted separately. One contactor acts as a main-line switch, and the two other contactors connect the motor to the starting taps of the transformers and to the line respectively. The interval between the closing of the second and third contactors, which is the time given the motor to come up to speed, is governed by the series-current relay and the dash-pot relay, either of which is externally adjustable for current of time values. The starter may be controlled from remote points; and, the adjustable feature of its two relays adapt it to almost all operating conditions.



AUTOMATIC STARTER FOR MINE FAN MOTORS

The Balanced Skip-Hoist Transporter

An Improved Coal-Handling Equipment Hoists and Distributes Materials at Half Previous Cost

BY WARREN TRAVELL

So much attention has been given during the last few years to the design and construction of material-handling apparatus, that a radical improvement in this line is hardly to be expected, and, when made, is a matter of interest to many. Such an improvement has recently been patented by the writer and is now being manufactured by the Exeter Machine Works, Inc., 30 Church St., New York.

Of all the many forms of hoisting equipment which have been developed and used for the saving of labor, the skip-hoist probably holds the first position as regards priority. The earliest type consisted simply of a windlass with a tub or bucket; later, guide rails were added, and a cage structure was adopted, resulting finally in the modern passenger elevator and the deep mine hoist of great speed and capacity.

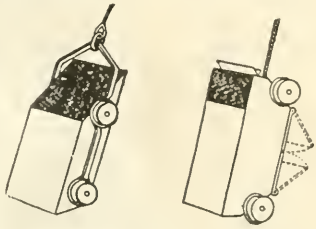


FIG. 1. EXETER MACHINE WORKS IMPROVED SKIP

One branch of this development dating back more than a hundred years produced the inclined skip-hoist having a skip with four wheels running on a pair of inclined rails. To automatically dump the skip, the tread of the upper pair of wheels was made narrower than that of the lower pair, and the track for these wheels was curved at the upper limit of hoist, and a wider gage track carrying the lower wheels was continued straight on for a short distance. This gave a simple and efficient hoisting machine and one which in thousands of installations has proved entirely satisfactory.

An important improvement has recently been made by which the same skip which elevates the material also transports the material horizontally, a single device doing the work which previously required two machines.

That the skip may be able to carry its load both vertically and horizontally without spilling, a radical change has been made in the form of its construction. The ordinary skip is simply a box with open top and equipped with four wheels and a hinged bale. The improved skip, as Fig. 1 shows, has an opening in the upper portion of the front side for receiving its load and

single- or double-hinged doors on the opposite side for discharging the load when the skip is running on a horizontal track.

The filling of the skip is accomplished preferably by a chute from a hopper.

The doors or valves of the skip are held in closed position by a latch. Discharging of the skip's load is accomplished by the tripping of this latch. The latch trip may be easily shifted along the track as required. A further improvement consists in having the trip carried on a traveling frame, which is moved back and forth by a hand winch conveniently placed.

The entire weight of the skip and half of its load is balanced by a counterweight which operates only during the vertical motion of the skip. In lowering the empty skip, the motor works to raise the counterweight, doing the same amount of work as in hoisting. As the weight of the skip is frequently as great as that of the load itself, this arrangement in such a case makes it possible to reduce the size of the motor and the unbalanced strains in the hoisting machine to one-quarter, in the ordinary unbalanced hoist, or to one-half of that for the less common type of double hoist.

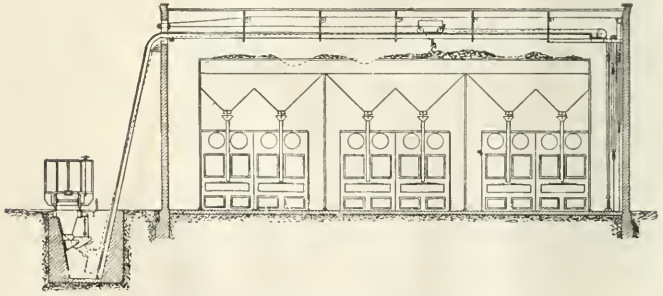

FIG. 2. BALANCED SKIP-HOIST TRANSPORTER

On reaching the top of the vertical rise, the skip engages and carries along with it a bar which is connected by cable to a third counterweight which operates to pull the skip backward after being discharged.

Automatic switches reverse the motor at both ends of the skip's run. By this means, in combination with the automatic filling device, the skip-hoist is made entirely automatic in operation and requires only the occasional services of an operator to keep the machinery oiled and to shift the traveling tripper when this is used.

The skip may be of any suitable capacity and the height of lift and length of run of any reasonable distance, and a skip of two tons capacity will handle 150 tons of coal per hour. The equipment is extremely simple, the cost of maintenance and repairs is reduced to a minimum, and the amount of power wasted by friction is very small. The size of the motor is reduced by one-half, its current demand evened up, and automatic operation reduces the expense required for its attendance to a minimum.

Non-Destructive Belt Joining Solves Unusual Problem

The problem of handling of hot cement clinkers at a temperature of 200 deg. and over was solved at the plant of the Standard Portland Cement Co., Leeds, Ala., in an interesting and cost-reducing manner, by using Goodyear Hy-temp rubber conveyor belt running at an incline of 12 deg., so that the lower pulley dipped into a trough of water, thus carrying a film of cold water upon the belt, on to which the hot clinker from the loading hopper was deposited.

In order to join the belt so that the belt's full strength would be retained, and in a way which would withstand the extremes of temperature, the wear on the pulleys, and the abrasion of the clinker, Crescent belt fasteners were adopted. These brought the belt ends tightly together in a snug joint, which made the belt practically endless on the pulley side, so there was no opportunity for clinker ash to get into the joint and abrade the belt ends. By this method of joining, no metal came in contact with the pulleys to cause wear, and a permanent joint was thus assured. Moreover, the exceptional strength of the heads of the Crescent rivets and the formation of "Crescent Plates" prevented destruction of belt joint through abrasion by the clinker. In six months of operation this conveyor has carried 61,000 tons of clinker, and the Standard Portland Cement Co. credits it with a saving of $300 in belt cost alone.

Not alone on heavy drives, such as tube mill drives, Griffin mills, crushers, and heavy conveyors, are Crescent belt fasteners successfully used, but also on lighter drives of all kinds where dependability is an economic factor, as they assure continuous production. The Crescent Belt Fastener Co., 381 Fourth Ave., New York, has published a new handbook illustrating Crescent belt fasteners in use on many different kinds of belting and under different conditions, and giving full data regarding their use. It will be gladly sent upon request.

TRADE CATALOGS

Hand Drills.—Ingersoll-Rand Co. are offering a fourth type of their "Jackhamer" drills, which is smaller and lighter than others of similar construction. Its weight is but 21½ lb., and it is recommended for bench work in soft stone quarries, trimming in metal mines and pop-hole work in open-pit workings. It is listed as BAR-33.

Brass—The Bridgeport Brass Co., Bridgeport, Conn., has issued an illustrated book of 78 pp., entitled "Seven Centuries of Brass Making." The book describes and illustrates in detail the art of brass making from early times up to the most modern practices, including the electric casting shops. The important steps in the making of tubes, sheets, rods, and wire are also shown. Following the description of the Bridgeport shops, the properties of brass as affected by composition, cold-working, and heat treatment are discussed. The arrangement of the material is excellent, and the issue constitutes a valued contribution to the history of the brass-making industry.

Centrifugal pumps of the single-stage and multi-stage types for various services are described in a handsomely illustrated catalog just issued by the De Laval Steam Turbine Co., Trenton, N. J. Manufacture is on an interchangeable basis, permitting of the supplying of finished repair parts made to accurate dimensions. The present publication describes these and other details, and also explains fully the use of pump characteristic curves in adapting pumps to various services, the adaptation of centrifugal pumps to different types of drives, and give the information required by the manufacturer in order to design a pump to meet given conditions. Formulas and tables for calculating horsepowers, efficiencies, the readings of Venturi meters, friction in pipe lines, and similar data ore also given.

Lighting Industrial Interiors

The Detroit Graphite Co., Detroit, Mich. has recently issued a bulletin, "Lighting Industrial Interiors," which calls attention to the adoption of many fixed principles by illuminating engineers and executives in relation to industrial lighting. As a means of reducing the costs of artificial lighting and accidents, and as an aid to sanitation and general conditions, the use of white paint for interiors is highly commendable, and the excellent qualities which are attributed to "Sta-White," a product manufactured by the Detroit Graphite Co., will be of considerable interest to operators of various industrial plants. In the mining field, the use of such a paint has proved very successful at laboratories, shops, mills, charge houses, and hoist and boiler rooms.

The Bankers and the McFadden Bill

THE report of the special committee of the American Bankers' Association on the McFadden bill is about what we could reasonably expect. Bankers have always shown themselves strong in practicing their art, but weak on the insight into its workings. Now they are afraid of tampering with the "gold standard." They say, "Nearly all the European states are on a paper basis. Only a few of the smaller countries of Europe are even approximately maintaining the gold standard. The United States, par excellence, and Japan as well, stand out conspicuously as nations maintaining the gold standard."

Surely this shows surprising lack of comprehension or candor. All countries of Europe are on a gold basis, but the value of their paper diminishes as their gold basis shrinks. The United States is on a similar basis, and its paper money is relatively more valuable, because of the larger amount of gold security underlying it. But it is still inflated, and that is one of the reasons for high prices; the bankers themselves admit that in general talk, and the necessity for deflation is recognized.

Again, "All the world believes that our dollars are as good as gold. We enjoy a proud pre-eminence in this respect, and it should be zealously guarded and maintained. The belief which obtains in the world today that our dollars are as good as gold must be maintained." There is the mi'k in the cocoanut. We know quite well that our dollars are not as good as gold, but we must not admit it to the world. England also maintains that her five-pound notes are as good as gold, but exchange rates show that America does not admit this, and reflect the different grade of underlying gold security. Were there a country having a larger percentage of gold to paper than the United States, the dollar wou'd be at a discount in it. Actually, our dollar is now at a discount in Argentina and Japan. The Argentine peso, nominally worth $0.96 of our money, is quoted at $1.07; and the Japanese yen, nominally worth a little less than $0.50, is quoted around $0.51.

The report reiterates the same old economic principle, true of business on a gold basis, but which bankers do not seem to realize is not true of business on an inflated, semi-paper, or paper basis; and therefore absolutely inoperative in most countries at this time. It is that "diminished gold production in periods of high prices and high costs tends to reduce prices and costs again." Apart from the obvious lack of application of the theory, the facts at present sufficiently show this law inoperative. Otherwise, why the continual skyrocketing of prices, while the amount of gold relative to currency and credit diminishes? It is because we do not transact our business on a gold basis, and the elemental textbook laws which our bankers quote are not operative, except so feebly as to be powerless; nor will they operate according to specifications till we close up the gap between gold and credit. One way is to increase production of gold; another is to reduce credit and thus promote deflation. We should do both.

An increased production of gold in this country—in all countries—is most desirable and necessary, and the McFadden bill provides a method which might well be adopted. Let us be honest and say that it does recognize the existing difference between a paper dollar and a gold dollar, which is in a less degree like that between a paper franc and a gold franc, the latter being worth as much as ever. But any remedy must admit this: even the measures of the Federal Reserve Bank to reduce inflation admit it.

Keeping Step With Progress

ROUTINE, at best, secures a productiveness that is dependent on manipulative skill, either of labor, machines, or both, and the output, or result, is necessarily limited by capacity. To exceed this limit—in other words, to increase capacity, reduce costs, or bring about greater efficiency—it is necessary to break away from a former routine and to adopt other methods, which may include the installation and usage of new equipment, a different order in the performance of the work, and certain changes that necessarily follow deviation from former accepted practice. Often the change is a slight one, although the degree of variation is indeed no measure of what may be accomplished, for it is a truism that the smallest alteration of a detail may be productive of great results.

One of the fundamental purposes of the great technical societies is to encourage the interchange of ideas and opinions, and this is also true of the smaller local organizations of a similar nature, each performing a function that is most necessary if the industry represented is to flourish and keep in step with the ever-changing order.

The technical press plays no small part in spreading the gospel of development and improvement. Reaching out, as it does, in many directions, and obtaining new ideas from a number of sources, it is able to present from different angles the opinions and methods of the practical man as well as the theorist.

Mining and smelting companies make it a practice to encourage their men to visit other districts and plants, realizing that by so doing the employees come in contact with many new practices, many of which can be adopted to advantage in their own establishments.

All of these ideas are progressive—the society membership, the technical press, the inter-plant visit; each presents its opportunity for the expression of opinion and for profitable observations.

Without a certain order or routine, real accomplishment is impossible. It is essential that the most efficacious method be found, and that routine, when adopted,

should be the best that can be devised under the circumstances and conditions.

The best results in mining or in any other operation are seldom attained by "snap judgment." They flow from a careful selection of some practical method, or a modification of it, which has already proved to be satisfactory and efficient.

The Future of Mining

LIVING in a mining camp in its initial stages is to live in an atmosphere of hope; for, discounting the few pessimists that are always present, there is the buoyant spirit of youth, the elemental outdoors, and the absence of the cluttering fussiness of the city. Turning forward the hands of the clock to the time when half the stamps are hung up, and the dawn is broken by a few lonesome whistles where formerly a medley stirred one to action, it is not difficult to see why an air of pessimism should pervade the streets of the camp. Consciously or unconsciously, the dweller in such an atmosphere expresses the thought that mining is dead.

The state of mind induced by the closeness of the local condition is unhealthy for the individual thus inflicted. Mining has its ups and downs locally, nationally, and internationally. A single mine may discover a bonanza after a heart-breaking period of purse-emptying prospecting. A decade may disappear without a new Cripple Creek or a Goldfield. But bear in mind that all industry is subject to similar vicissitudes. Mining is a bedrock industry.

Our civilization is a metal- and mineral-consuming civilization which is growing at a pace that can scarcely be realized by the puny individual. The per-capita consumption of the different metals increases year by year.

The situation in the petroleum industry (which is the subject of continued discussion) is illuminating. The rapid increase in the use of automotive appliances and internal-combustion engines raises the important question not only of where future supplies of petroleum are to come from, but awakens concern respecting the use and conservation of even present needs and resources. Admitting the rapid development in every oil field, the prospective supply can hardly keep pace with the increasing demand.

In sharp contrast is the existing condition in the copper industry. Restricted production due to a torpid market, with consequent low prices, has caused the more timid in the mining industry to inquire anxiously as to the future of the copper-mining industry. The future is assured. The present condition is only a passing phase, a temporary ebb in the demand tide. A decade or more may produce a condition in the copper market similar to that now existent in the petroleum industry. We appear to have now a sufficient number of copper mines to supply the demand, but some will be worked out and disappear, and it is problematical whether new mines can be brought to production fast enough to cope with the per-capita increase in the consumption of copper. When we look at the ever-growing electrical power development, the ever-increasing market for electrical appliances, we can visualize a greater and greater per-capita consumption of copper. It is so with many other metals and with minerals. Mining is inevitable.

The kind of civilization now existent is not going to change materially, but rather will it extend itself in the direction now indicated. The miner will be hard put to meet this ever-increasing demand.

Mineral discovery is not as easy as it once was. Metal and mineral prices may be expected to increase materially as a consequence. Just as the "porphyry coppers," once thought to be too low-grade to work, have by improved and new methods become profitable, so will other metalliferous deposits, under the stimulus of high prices, become workable. Viewed broadly, the mining industry affords little opportunity for pessimism.

Lubrication of Air Drills

THE importance of lubrication in the economical operation of machines of various kinds has gradually won recognition. In steam engines, pumps, and particularly in high-speed machinery of all kinds, efficient lubrication by a system which will be continuous in its operation and almost entirely automatic is an accomplished fact. In hard-rock mines the air drill is preeminently important. With the former type of piston drill, lubricants were applied at two points. One was at the rotating mechanism. By removing a screw plug the lubricant could be applied at intervals, the movement of the mechanism carrying the oil to all parts. The other was by means of a small cup placed on the air pipe close to the valve chest. By filling this with lubricant and opening the valve, the lubricant was swept into the valve mechanism and carried into the cylinder. By applying the lubricant at sufficient intervals, the drill could be efficiently operated. Everything, however, depended upon the alertness of the drill runner.

With the advent of the hammer type of drill, a high-speed machine, the method of lubrication just described was inadequate. Some of the earlier and, in fact, fairly successful types of hammer drills failed to give all the service that was possible, on account of this all-important lubrication. Inadequate lubrication increased power requirements and repairs. A system that would be continuous with only occasional attention on the part of the drill runner was essential.

In the development of hammer drills the manufacturing companies did not overlook this important feature of lubrication. An exhaustive investigation of available lubricants has been made, and exact specifications for suitable lubricating media have been determined. The kinds of lubricant suitable for different machines and purchasable on the market are specified. Drilling machines as they are sold are provided with a tag, which gives definite information as to the kind of lubricant and the method of lubrication best suited to the machine. The waste in power, labor, and repair parts in a mine employing twenty-five to fifty machines or more, due to neglect or carelessness in the selection and use of lubricants, is undoubtedly large unless provision is made to prevent such losses.

The condensed epitome of information on the subject of lubricating drill machines which may be found on the tag accompanying the drill when it is shipped by the maker indicates that a great deal of thought has been put into the preparation of this card. Back of the card there was an immense amount of research and experimentation, to evolve the important conclusions which appear on its face. Just a tag tied to a machine—but how often are the conclusions placed on this card carried out? We are well aware that many mining companies have gone into the study of air-drill lubrication and its application with the same thoroughness that has

characterized their other operations. But do all drill runners, master mechanics, superintendents, and purchasing agents realize the endless experiments required to secure this important information and do they take advantage of the knowledge which drill manufacturing companies have so generously and freely given them?

Technical Journalism

THE *Engineering and Mining Journal* is not a one-man paper. There are eight editors who contribute editorials. That is why irregularities will creep in and editorials or paragraphs which may not please will inadvertently be admitted. Any editorial or other feature which appears to you particularly sound and brilliant you may credit the editor-in-chief: that is one of his perquisites. The editorial which you find so punk or offensive is the work of the jail editor. The jail editor may be defined as that editor who wrote the editorial which offends you: he is also that editor who is off on his vacation. The custom developed in ante-bellum days in Germany, where the newspapers were continually subject to imprisonment penalties for references to the Kaiser and the government; so that the custom grew up of having an editor to assume the sentences. Other editors were apt to be discreet until he got out of jail—and to become very daring immediately thereafter.

We are not sure whether our subject should be "technical journalism" or "technically journalism." In either case, it is perplexing to plain engineers. Shall we try to be all things to all men, or shall we be known as speaking "the truth, the whole truth, and nothing but the truth"? We have got far enough to know that though the latter sounds fine, we musn't do it. Truth will ruin anybody.

Years ago, as a cub reporter on a small-town daily, we were sent out to report an accident. Being then truthful we wrote it up as follows: "Our respected fellow-townsman Mr. Eliphalet Yokum, while drunk, fell off a sidewalk on Center St., and broke his leg." The editor remarked, "What in ———, etc., is this? Ain't you got any better sense than to say that?" "But it's true," we argued, "and everybody on the street knows it." The chief grabbed a pencil and wrote "Our esteemed fellow-townsman, Mr. Eliphalet Yokum, narrowly escaped a serious accident last Wednesday. While hurrying from his office, a protruding curbstone tripped him, and he fell heavily, resulting in a compound fracture of his right femur. As his benevolence is well known, he will not sue the city; but this calls attention once more to the disgraceful condition of the city streets under the present administration."

No; our ideal is to skate as near the truth as we can, without breaking through. We know when we are near enough when the ice cracks and subscribers write in and call us names; and we skim off on the other foot. We enjoy, however, hearing her crack. One of our contemporary technical journals remarked concerning us that as we were catering to a certain group we had better be careful how we expressed certain sentiments. The idea that we were caterers hadn't occurred to us, but we are thankful for the conception and the advice. Off-hand, though, we should think a caterer should have the privilege of grilling a politician or of roasting a subscriber now and then for the delectation of our other readers. It is all for the common good; and a little unselfish altruism on the part of the subject is what we think we have a right to expect.

The Practical Miner

THE successful miner, be he drill runner or shift boss, and the successful engineer, must have one characteristic in common—horse sense. No amount of study on the part of the latter will make him successful if he is not fundamentally well balanced, keeps his feet on the ground and has his eye always open for the significant details which are of vital importance at one stage or another of a mining operation. Nor, in the case of the miner, mill man, or smelter employee, will discontent with the social system, nor even—on the other hand—any amount of hard and faithful back-breaking work, make him successful and open up his way to large responsibility and prosperity unless he "uses his nut."

Did you ever see a job where brains wouldn't help—where brains were not the chief thing? There is none. Brains plus muscle reared the pyramids, up-ended the obelisks, flung the Brooklyn Bridge across the river; but without practical sense these things could not have been done—nor could the men who did them have found out how by consulting textbooks and encyclopedias.

Every day in mining operations some man who is working in the mine or the mill has an idea—he has seen a better way to do this or that than has been tried before. When we visit mines in certain remote countries or mines in this country run by greenhorns, we are astonished to see how many entirely evident things could be improved. We have in mind a mine which was operated on a basis of, say, $20 a ton cost. A new manager came on, with a bent for practical details, and by tinkering up this detail and that he brought the cost down to $12. Same mine, same mill, same power plant, same men and same wages; same staff. What was the difference? Nothing tangible; just that invisible and imponderable quality—horse sense. He didn't reduce wages or fire the force. The latter process is the elementary idea of economy, and is usually very expensive.

It would be fine practice if every man who has a job around a mine or a plant would sit down at the close of the day, look over the good bit of work he has done during the day, and spend half an hour or so in trying to figure out *how he could have done the job with less work*. We have known men who were regular hogs for work; but their energy needed expression in their muscles, and to use their thinkpieces bothered them and was painful. We heard of a lad in a plant the other day who complained because his work was too varied; he wanted to get on piecework, and turn out a certain part of the work on a certain piece of a certain machine all day and every day. Then he knew where he was at. That lad, of course, is worth the standard price for a man from the shoulders down; but a lad who studies how to do this or that quicker, easier, and better, and is interested in learning some new thing each day, needs no college, and the world has no reward that is not available to him. That is why we see so many men in big and responsible jobs who rose from the ranks and know all the practical details of their business from bottom to top, because they have plodded systematically up the whole road.

George the Third, according to Carlyle, never could figure how the plums got into the pudding. The same dullness lost him the American Colonies.

Hats off, then, to the man of plain common sense! We need him around the mine and the plant, and if all the world were like him it would run more smoothly.

WHAT OTHERS THINK

The Litigation Geologist Protests

I have read with much interest your editorial comment upon apex litigation in the *Engineering and Mining Journal* of June 19. I note with interest and some amusement that you characterize me as "a geologist pure and simple." I am glad to be considered pure, and I quite acknowledge my simplicity. I am a little regretful, however, that you join with others in slamming geologists who testify in apex suits. I detest apex law or apex litigation as cordially as anyone, but the law is an inescapable fact, and controversies do arise in the presentation of which to the court testimony is required, and in connection with this work geologists must be employed.

It is not a fact, as you imply, that there is always or generally contradiction as to facts between the geological witnesses of the two respective litigants. On the contrary, there is usually and almost invariably a remarkable agreement as to facts. It is seldom, indeed, that a statement of fact by a witness on either side is questioned, and when it is there is a prompt and unanimous exodus to the controverted place by witnesses for both sides at the earliest opportunity for the purpose of establishing the truth, and if some witness discovers that he has inadvertently testified wrongly, he is the first to take the stand and correct his testimony. The differences come in the interpretation of the facts.

Now, it seems to me that our critics are generally men of little experience in such matters. They do not know, for instance, that a geological witness of any standing whatever customarily reserves the right to investigate the premises in question and to decide on his own examination whether or not he can and will espouse the cause of those who offer him employment. Our critics are certainly not aware of the fact that engineers and geologists who have some reputation as expert witnesses in such matters are frequently offered employment by both sides, and that they visit the property and make their examination before deciding in their own minds the merits of the case, and that they frequently decline to accept employment by those whose cases they feel unable to advocate.

We are represented as a pack of wolves roving around, seeking whom we may devour, and eager to stir up trouble and avid for employment regardless of the facts and the merits of the case. Our critics do not know that we settle out of court more cases than we contest, and that our advice and influence constantly tend toward compromise and the avoidance of the expense associated with litigation. Those of us who have gone through the mill in such matters, experienced the uncertainties, the annoyances, and the expense of apex litigation, are constantly endeavoring to settle controversies and frequently are successful in so doing. For all this we receive no credit whatever. Neighbors will persist in squabbling; covetousness is inherent in the human animal; large orebodies within the range of different claimants are generally the inspiration for efforts to gain title through the courts; lawyers will advise clients that their chances for victory are bright, and litigation thus becomes unavoidable.

Nor would your suggestion of a selected body of engineers and geologists chosen by the court alleviate the situation. No such body will ever agree among themselves as to the interpretation of the facts in the light of apex law. The volume of legal decisions is so vast, and the complexities of geological structure in large mines are so numerous and so great, that even the keenest analysts and the most experienced geologists seldom agree on all points. Even when the facts are admitted, no two mining lawyers will agree as to many points which have not yet been decided by the highest court. Nor is there any limit to the number of such questions, for new cases constantly present new features, and the only method of final determination is through judicial decision.

It seems to me, therefore, poor taste constantly to impugn the good faith of those of us who are called in to advise in matters of this sort. We spend weeks and months in careful study. We learn the mines as no geologist ever learns them otherwise. We prepare plans, cross-sections, and models of unsurpassed accuracy and perfection of detail and presentation. We frequently succeed in developing valuable information which leads to the opening of unsuspected ore reserves. As a result of such careful study we reach conclusions which are so firmly fixed in our minds that we naturally become advocates and partisans with respect to our views; and I can say to you as a result of long experience that the correctness of the decisions reached by the courts is usually admitted by even the defeated litigant after the period of disappointment has passed. Thus, for example, in Butte the correctness of the Blue Vein theory, which was bitterly assailed at the time of trial, has now been universally admitted, and has led to the discovery of millions of tons of ore in that camp.

It is not perhaps surprising that there is a natural antipathy to the use of scientific testimony in connection with litigation. It is not surprising that the outside spectator who witnesses the spectacle of opposing scientists in such cases immediately jumps to the conclusion that they cannot both be right, and that therefore they are not both strictly honest. But it must be remembered that we are endeavoring to apply scientific facts to the statutes and that there is always room for a difference of opinion.

It never occurs to me to question the entire honesty of witnesses on the opposite side. I can see perfectly their point of view and understand thoroughly their mental processes in upholding their position. I should be sorry indeed to feel that my opponents in such litigation credit me with evasive or dishonest testimony or thought. Such being the case, I trust that you will no longer remain a member of that group of critics who are from time to time casting aspersions upon the integrity of men whom in other occupations they trust implicitly.

We all admit that the situation is unfortunate; that the system is wrong; that the law is inadequate; that it was never calculated to cover situations which have

arisen. But it is on our statute books, it regulates mining rights, and it must be interpreted in the light of the best information which can be obtained.

Minneapolis, Minn. HORACE V. WINCHELL.

Mining Reports of the Bureau of Foreign And Domestic Commerce

Your editorial on page 1,247, in the June 5 issue of *Engineering and Mining Journal*, and the letter of Olof Wenstrom, on page 1,250 of the same number, interested me greatly, for on or about May 19 I asked, by postcard, for the Confidential Circular FE-130, "Copper Mines in Western Manchuria," and received a letter of the same tenor as that sent to Mr. Wenstrom, asking me to call at the Custom House in San Francisco and explain why I wished a copy of the report. Instead of this, I wrote to the Far Eastern Division, Department of Commerce, on June 3, stating that I am a mining engineer who has been in Manchuria and that it appeared to me also that as secretary of the San Francisco Section, A. I. M. E., I was entitled to a copy. I also inquired, if not outside of the regulations of the department, for information as to the harm likely to be done to the Government by publication of the report.

In reply, a copy of the report was sent to me on June 11, and also a copy of the department's letter to you of same date. You will doubtless deal with this matter in your paper, and I wish to say that in the opinion of a number of engineers with whom I have talked, and in my own opinion, the department is making an error in treating these reports as "confidential." With regard to the particular report of Dr. Clement's it seems to have been improperly marked as "confidential." Be that as it may, it is clear that if any persons are entitled to priority on these mining reports it is mining engineers; and I hope that your influence and that of the A. I. M. E. will be powerful enough to see that these reports are given full publicity.

In writing with reference to the withholding of these reports, Frank Harding (page 1,348 in the issue of June 19) mentions his desire to prospect in "Chinese country." I have not been in China for a good many years, but from all that I hear it is about the poorest place possible for a prospector, chiefly because of the difficulty of obtaining title to mining property. I think it would be useful if some of your readers who are familiar with present conditions in China would tell us if there are any inducements for an American prospector to try his fortune in China.

Palo Alto, Cal. W. H. SHOCKLEY.

What Is a Living Wage?

When laborites, I. W. W.'s, bankers, and economists (amateur, professional and of the common or garden variety) have exhausted the subject as to what constitutes a Living Wage, some patient and simple soul with a high-school equipment in arithmetic, convinced that the truth has not yet been proclaimed, may perhaps retire to the woods for an hour or so and apply the same acumen to the problem that a successful farmer requires in computing the life of his red barn.

The human individual, mechanically, is a machine. In the creation, operation, maintenance, and replacement of machinery, these charges must be met: cost, interest on investment, insurance, maintenance, depreciation, and replacement. The principles of scientific business management can be applied to the solution of the wage question as to all industrial problems. Why not attack the Living Wage on that basis?

No one has the courage. The most just and philanthropic employer, under a competitive system, would speedily go broke if he were to pay his employees a wage to keep the machine—the man—housed, clothed, and fed, plus an amount to amortize the mortgage of old age, plus the sum needed for repair (sickness), plus a 6 per cent profit on labor turnover, and an equal share above that percentage for the workers' allotment of the profits of the industry over and above all financial and industrial charges. And about 90 per cent of the working class—and that includes almost all of us—if we were to receive the custody of such sinking funds, would blow ourselves to all manner of luxuries, work only part time, and attain sixty poor and dependent, in strict accordance with age-old tradition and present practice.

Th se being the facts, there can obviously be no other solution to current and prospective industrial and social questions and difficulties than a more intensive education in thrift, industry, and common sense, and as wide a dissemination of the truth of the situation as is possible and as the patients can be made to accept and the world afford. O'Ho.

New York City

A Message to Hoover

Mr. Herbert C. Hoover,
Washington, D. C.

My dear Herbert: I think the G. O. P. made an error in judgment in not placing you at the head of its ticket. However, I realize that my viewpoint on political questions is not very important, because, even if I had political sagacity, I have never had political training.

It is my conviction that the element of prominent political position is not a material factor in the "hoover" movement. You told me some years ago that you were in the position and had the inclination to do something for the public good. I feel sure that the vast majority of the men in the Hoover clubs of Colorado are inspired by the same spirit and will support you in your patriotic efforts whether you are in or out of office.

If I remember correctly, I believe that some of your greatest successes have occurred where the other fellow was the titular figurehead.

So here's to Harding and Hoover. Harding may adorn the prow of the ship of state, but I am sure that Hoover will have a lot to do with the operation of the rudder.

Sincerely,

Denver, Col. GEORGE R. BANCROFT.

Truth and Fiction

In an interesting work of fiction entitled "The Wandering Blacksmith," one of the characters states that when men study other people's business they get lots of new ideas and are able to give good advice to the other people. Modern engineering practice often proves the truth of this philosophical assertion. A designer of ore-concentrating machinery has recently perfected a process for the separation of clams obtained by dredging. It is necessary to produce clean clams, free from broken shells and other rubbish. This is now being done at low cost. The details of the process have not been divulged.

An Economic Method of Thawing Dynamite

Utilization of Heat Supplied by Lunch Room or Change House Stove Provides Hot-Water Coil in Thawing House at Safe Distance—Arrangement Eliminates Danger From Fire Hazard and Provides Economical Construction

By Douglas Lay
Written for *Engineering and Mining Journal*

A SIMPLE, economic, and safe method of thawing dynamite, and incidentally one which greatly adds to the comfort of miners on shift, is herewith described.

A change house or lunch room of sufficient size to accommodate the miners and others on shift is erected close to the portal of working tunnel, or shaft collar, as the case may be. A large box stove in this building is supplied with a hot-water coil, by means of which a horizontal water coil is heated in a thawing box, situated in a small building about one hundred yards from the change house and placed at as great an elevation above the latter as the profile permits. The two water pipes between the two buildings are placed in a wooden box filled with hay or straw, the box being buried about eighteen inches below the surface of the ground.

The essential idea in the placement of the two buildings is that if the change house catches fire, the latter cannot possibly spread to the thawing house. At the same time, although the method of thawing

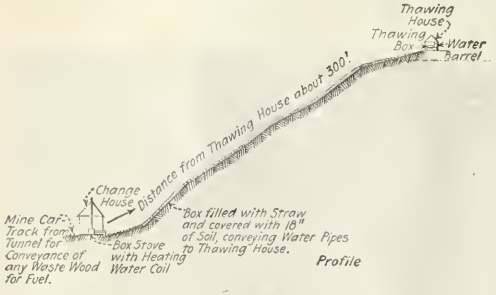

FIG. 1. GENERAL ARRANGEMENT OF CHANGE AND THAWING HOUSES

dynamite is comparatively safe, such a building as the thawing house should always be placed in an isolated spot, taking advantage of any natural protection afforded by ground contour, so that any untoward happening therein is not likely to cause loss of life. The above general arrangement is illustrated in the profile sketch, Fig. 1.

The size of the change house and lunch room depends, of course, upon the number of men it is desired to accommodate. Around the sides of the interior is a seat 15 in. wide, with a foot rest in front 21 in. in width. With this exception the building contains no floor, the soil being merely leveled off, with perhaps a layer of fine waste scattered over it. This ensures absence of danger from any hot ashes from the stove. A brick chimney for the latter is highly advisable, but if a stovepipe is used care should be taken to insulate it thoroughly. Most stovepipes are a constant menace unless run into brick chimneys. In the centre of the building is a large box stove, the larger the better, which contains a heating coil. The top of the stove serves to heat tea and coffee. The building contains no ceiling boards. It is preferable to place the building at the side of a mine track, so that any waste wood from the mine or timber shed, e. g., ends of timbers, old wedges, and similar materials, may be readily conveyed to the change house and utilized as fuel. The general arrangement is shown in Fig. 2.

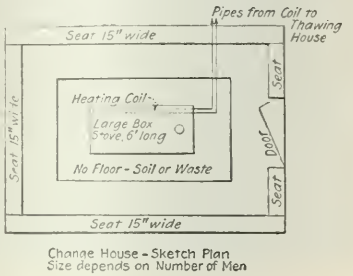

FIG. 2. PLAN OF CHANGE HOUSE

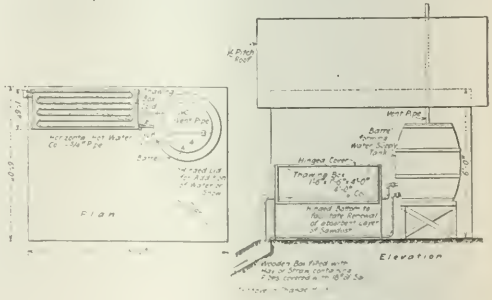
A convenient size for the thawing house is 8 x 6 ft., with 6-ft. walls and half pitch roof, sufficient to accommodate thawing box, water barrel, and a few unopened boxes of dynamite. (See Figs. 3 and 4.) The thawing box is made of 2-in. plank, and is 18 in. wide by 18 in. deep by 4 ft. long. Filling the bottom is a coil of $\frac{3}{4}$-in. pipe, over which a layer of sawdust, which acts as an absorbent of any exuded nitroglycerine, is sprinkled. The box has a hinged, tightly fitting cover. The sticks of dynamite are put in the box without any definite order, the idea being that they will criss-



FIGS. 3 AND 4. PLAN AND ELEVATION OF THAWING HOUSE

cross and so permit of efficient distribution of heat from the coil. The bottom of the box is hinged and opens downward, so that the sawdust may be renewed periodically. With this arrangement, the operation of removing old sawdust and putting in fresh occupies two or three minutes only. Obviously, attention should be paid to this matter of changing absorbent. The

bottom of the thawing box is set 18 in. above the floor of the building. The water-supply tank consists of an old oil barrel, which is provided with a vent pipe to outside, so that no steam is liberated in the building. A hinged cover permits of ready addition of water to compensate for evaporation. If the weather is sufficiently cold to require the thawing of dynamite, there is usually an abundance of snow adjacent, so that it is convenient to use this for the purpose instead of water.

Advantageous features of the method are as follows: (1) The high measure of safety; (2) inasmuch as it is frequently necessary in any event to provide some sort of change house or lunch room close to working tunnel or shaft, little extension is necessary to provide a thoroughly practical method of thawing dynamite in large quantities (the heat required for the change house is also used for thawing purposes); the fuel consumption is in any event not material, as odd bits of wood from the mine can be utilized, which would otherwise go over the dump; (3) if the man appointed for the purpose forgets to stoke up the stove before going on shift, it is morally certain that others on shift will see that there is a supply of fuel on hand for the purpose, otherwise they will have to eat their lunch in a cold building.

I have used this method for some years, and am impressed with its good points. There was always an abundant supply of thawed powder on hand, with the minimum of trouble.

Mining Industry of Abyssinia

THE mining industry in Abyssinia is undeveloped. There are evidences of commercial deposits of coal, iron, oil, sulphur, gold, silver, copper, and potash, but none of these deposits, excepting the potash, are now being worked on a commercial scale, according to Consul Addison E. Southard, of Aden, Arabia. However, the Abyssinian Development Syndicate, Ltd., a British concern, is planning to undertake the exploitation of Abyssinian mineral resources.

The potash deposits now being worked are in northeastern Abyssinia about six miles from the Eritrean frontier and about forty-six miles from the Red Sea coast. An Italian company, the Societa Mineraria Coloniale, of Asmara, Eritrea, is working the deposit and shipping the product overland to the small port of Mersa Fatimari, on the Red Sea, and thence to Massowah. The potash deposit has been worked since 1915, but the amount taken out in any one year has not equaled 4,000 metric tons. In 1917, the latest year for which statistics are available, 3,578 metric tons of potash salts from this deposit were exported. The potash produced is said to be 90 per cent pure, and 1,000,000 metric tons are estimated to be available.

Gold, Silver and Other Mineral Deposits

Alluvial gold is found in several river beds in western Abyssinia, principally at the edge of the Sudanese plain. Natives wash gold from the beds of the Blue Nile, the Dabus and its tributaries, the Beni Shongul, and the Tumat rivers. This gold reaches Adis Abbeba, usually in the form of small rings and ingots, and much of it is exported through the Bank of Abyssinia. Officials of this bank estimate the total exports as averaging a quarter of a million dollars in value per annum.

Quartz gold deposits are also found in western and central Abyssinia, but none are at present worked on a commercial scale. Under ordinary circumstances the government of Abyssinia demands and collects a royalty of 50 per cent on all Abyssinian gold brought into the market.

Silver is said to be found in the district south of the Baro River, southwestern Abyssinia. No deposits are known to be worked at this time.

Iron is widely distributed, and some rich ore deposits are known. In the Province of Tigre the Abyssinian peasants smelt the richer ores over wood fires. The comparatively small quantities of iron thus produced are used by native blacksmiths to make plowshares and various cutting tools of simple pattern. This industry may be regarded as one of the primitive native sort and cannot be said to be of commercial importance in the present stage of its development.

Copper, Asbestos, Oil, Salt

Prospectors have found evidences of copper and nickel deposits in the Walego Province. Aluminum clays are also said to have been found in this same province.

Oil and sulphur indications are reported from the vicinity of Ankober, Shoa Province, but no development work has been done.

Asbestos is reported from various sources, but this mineral has not yet been mined and marketed.

Salt deposits are found in the lowland desert plains between the Abyssinian Plateau and the Red Sea north of the Straits of Bab-el-Mandeb. Natives quarry this salt for use in plateau trading centers. The total quantity thus handled is probably not great, and there is no way of obtaining figures as to the actual amounts which enter into the inland trade of the country.

The Abyssinian government does not collect statistics and there are available no official publications or other forms of statistics.

New Paint Mine in New Jersey

By S. H. Hamilton

Written for *Engineering and Mining Journal*

The Pequest Co., of Butzville, N. J., is operating a new pigment plant under the direction of Herbert Cox. The raw material comes in part from the old Ahles iron mine, which formerly supplied the furnace at Pequest. The ore is soft, earthy, and composed of several minerals. Owing to its physical condition, and the presence of considerable manganese, it was not a desirable furnace ore. However, the deposit is large, with well-defined walls of Franklin limestone. It was found that by means of Dorr classifiers a 200-mesh product can be separated, making a desirable pigment, and the coarser material can still be used for iron ore.

Italy's Small Mineral Resources

As is well known, the mineral resources of Italy are relatively of small importance. The country produces no high-class steam coal, little more than half of its requirements of iron ore, and neither gold nor silver. The slender mineral output of the peninsula is supplemented, however, by the products from adjacent islands under the Italian flag. The bulk of Italy's iron ore is mined in the Island of Elba; rich lead deposits are worked in the Island of Sardinia; and for generations the Island of Sicily has held first place as the center of European sulphur production.

Charts for Computing Blast-Furnace Performances

Determination of Slag Production, Matte Fall, and Tonnage Smelted Per Square Foot At Copper Queen Smelter Is Aided Considerably by Graphical Methods — Much Arithmetical Work Eliminated

By HAROLD L. FICKETT
Written for *Engineering and Mining Journal*

CHARTS are investments that pay large dividends. The investment is spare time and odd moments, and the returns are valuable moments saved, when time is at a premium. When once made and put into use, charts are capable of yielding returns far in excess of the original investment. To be most useful they must be simple, legible, and accurate. A failure in any one of these prerequisites may be disastrous.

It is remarkable how great a field of variations can be covered easily and accurately by means of a few simple calculations and a piece of standard cross-section paper. Routine calculations of furnace performances

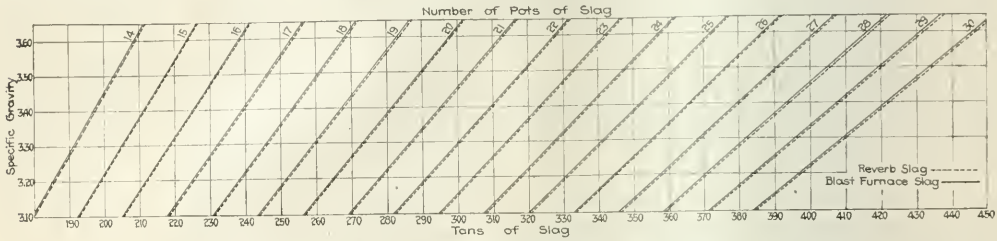


CHART FOR COMPUTING WEIGHT OF BLAST-FURNACE AND REVERBERATORY SLAG

offer great opportunities for using charts, and it is the purpose of this article to show how such aids are used in making up the daily blast-furnace reports at the Copper Queen smelter.

I. CHART TO DETERMINE THE WEIGHT OF SLAG PRODUCED

(a) Basic Data

A Copper Queen slag pot will hold 4.13 tons of slag the specific gravity of which is unity. A specific gravity determination is made on every composite daily slag sample, and used in calculating the slag production. As an example of the importance of considering the specific gravity in these determinations, a reference to the accompanying chart will show that, for 25 pots of slag, a difference of 0.10 in the specific gravity will make a difference of ten tons in the amount of slag produced.

On the daily blast-furnace log, the furnacemen record the number of pots of slag produced by each furnace. Experience has shown that, in blast-furnace computations, the specific gravity of the slag varies between 3.10 and 3.60, and that the number of pots of slag varies between 14 and 30. Hence, in making the chart, these become the limiting values.

The weight of slag produced may be expressed as

$$W = CSN$$

where,

W = weight of slag produced,
S = specific gravity of the slag,
N = number of pots of slag,
C = weight of slag whose specific gravity is unity.

As C is constant, the equation becomes the equation of a straight line for varying values of S. Therefore, it is necessary to solve the basic equation but twice for each value of N in order to obtain sufficient data to construct the chart.

(b) Construction of the Chart

If the horizontal co-ordinates represent the specific gravity, and the vertical co-ordinates represent the tons of slag produced, the pots of slag must be represented by a series of straight lines, in which series each line represents a certain number of pots. The basic equation must be solved for each value of N represented; once where $S = 3.10$ and once where $S = 3.60$. These values are taken because they lie at the extremities of each line in this particular chart.

When the specific gravity is 3.10, the equation for $N = 14$ becomes

$$W = 4.13 \times 3.10 \times 14 = 179.242$$

The equation for each succeeding value of N may be solved by adding the constant $4.13 \times 3.10 = 12.803$ to W for the preceding value of N; thus:

14 pots	=	179.242
plus		12.803
15 pots	=	192.045
plus		12.803
16 pots	=	204.848

and so on as far as it is desirable to go. In the same manner points on the 3.60 specific gravity line are located.

The points thus obtained are plotted on standard cross-section paper, and corresponding points on the extreme specific gravity co-ordinates are joined by straight lines. Each line will then become the locus of the equation for each value of N. With the indicating of the co-ordinates, the locating or plotting of the points obtained from the calculations, and the joining of corresponding points by straight lines, the chart is ready for use.

(c) The Use of the Chart

Follow the horizontal line corresponding to the specific gravity of the slag whose weight is desired, to its

intersection with the diagonal line representing the number of pots produced. Vertically under this intersection will be found the tonnage.

II. Chart to Determine the Per Cent of Matte Fall

(a) Basic Data

In the usual method of computing the per cent of matte fall, the tons of matte produced is divided by the sum of the matte and slag produced. With the aid of a chart it is possible to read the per cent of matte fall at a glance.

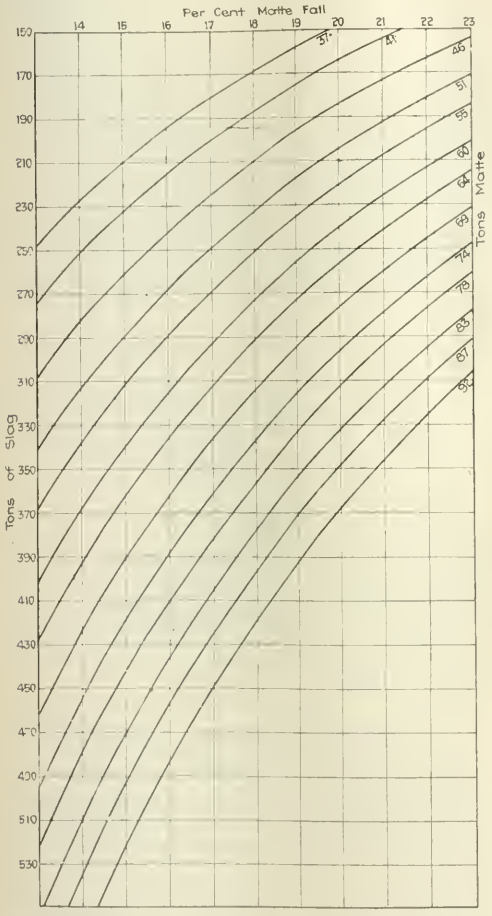

CHART FOR DETERMINING PERCENTAGE OF MATTE FALL

The tons of matte and of slag are figures which are obtained from calculations made in the office, from data reported by the furnacemen. It has been determined that a pot contains, on an average, 9.2 tons of blast-furnace matte. It is the custom of the furnacemen to report the matte produced to the nearest one-half potful. Therefore, in the construction of this chart, it is convenient to locate the curves at intervals equivalent to one-half pot of matte.

Unlike the other, this chart is composed of a series of irregular curves, which intersect the X-axis only at infinity. The basic equation may be stated thus:

$$M = \frac{X}{X + Y}$$

where M = per cent of matte fall,
X = tons of matte produced,
Y = tons of slag produced.

In the making of this chart the limiting values of X are 37 and 92; and the limiting values of M are 0.13 and 0.23. It must be borne in mind that M is less than unity in all these calculations.

(b) Construction of the Chart

At intervals of 2 per cent it is necessary to solve the basic equation, in order to locate sufficient points for each value of X. When these points have been determined from the computations, corresponding points for each value of X are joined by lines, drawn with the aid of a French curve. Many short-cuts may be used in compiling the necessary data for the chart.

The matte lines are spaced at intervals of four or five tons, and it is possible to determine a constant for each set of intervals and reduce the mathematical work largely to additions. The work of compiling the intersection of the 37, 41, 46, and 51 tons of matte curves with the 13 per cent matte fall co-ordinate may be outlined as follows:

$$\frac{X}{X + Y} = M; \quad Y = \frac{X - MX}{M} = \frac{X - 0.13X}{0.13} = 6.6923X$$

First solve:

4-ton interval = $6.6923 \times 4 = 26.7692$
plus constant 6.6923
5-ton interval = 33.4615

Then solve:

When $X = 37$, $Y = 6.6923 \times 37 = 247.5161$
plus 26.7692
$X = 41$, $Y =$ 274.2853
plus 33.4615
$X = 46$, $Y =$ 307.7468
plus 33.4615
$X = 51$, $Y =$ 341.2083

In order to use the chart, locate the tons of slag on the horizontal co-ordinates, then follow that co-ordinate to its intersection with the curve representing the tons of matte produced, and the vertical co-ordinate nearest the intersection will be read as the per cent matte fall.

Tons Smelted per Unit of Hearth Area

The most satisfactory method of comparing blast-furnace performances, in case of different size furnaces especially, is by comparing the tons of charge smelted per square foot of hearth area. At this plant are three sizes of blast furnaces, those with 66 sq.ft. of hearth area, 73.3 sq.ft. of hearth area, and 100 sq.ft. of hearth area, which are locally called small furnaces, medium furnaces, and large furnaces, respectively. The use of charts for determining the tonnage smelted per square foot of hearth area has been found a time-saving expedient. In the ordinary plant where all furnaces are of one size the preparation of such charts is comparatively simple. Subsidiary curves should be plotted for cases where the furnace is delayed for 10, 20, 30 or more minutes during the twenty-four hours.

Laying Flanged Pipe on a Steep Hillside

By Douglas Lay

Written for *Engineering and Mining Journal*

THE profile survey of a pipe line will determine the various points at which the surface of the ground departs from a straight line. Obviously, minor local sags are disregarded, as they can best be overcome by blocking the pipe up at these points. Care will distinguish between such points and those at which there is a change of grade for a material distance. In the latter case, in the actual construction of the pipe line, the alternative lies between insertion of metallic taper gaskets between pipe flanges and excavation. In rocky ground excavation will prove expensive, and in loose ground may be inadvisable.

Again, the exterior of the pipe will require re-painting periodically, and this cannot be done if pipe is buried. Most steel-riveted pipe leaks more or less, when the water is first turned in, and it is advisable, therefore, to have all portions of the pipe open to inspection.

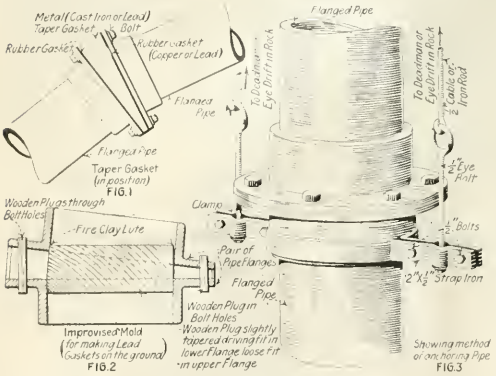

FIG. 1. TAPER GASKET IN POSITION
FIG. 2. IMPROVISED MOLD FOR MAKING LEAD GASKETS
FIG. 3. PIPE ANCHORAGE AND CLAMPS

The advantage undoubtedly lies with the use of taper gaskets, on the score of cheapness, if for no other reason. The dimensions of the majority of those required can be ascertained from an accurate profile survey, and the best plan is to have them made of cast iron by the company supplying the pipe, so that they will arrive on the ground simultaneously with the pipe. The thin end should be approximately one-quarter inch, and the thick end may be three inches. Assuming a flange diameter of eighteen inches, the stated dimensions will give a deflection of 4° 20′ at each flange face, or a total of 8° 40′ at the joint. The taper gaskets must match the pipe flanges, in respect to diameter and bolt holes. When the gasket is in position the bolts are not quite at right angles to the flange faces. This places a limit on the maximum thickness of the gasket. It is well, therefore, to specify bolt holes of liberal diameter, so that when the gasket is in position, the bolts can be readily passed through. A rubber gasket (copper or lead is preferable) is placed on each side of the taper gasket, as shown in Fig. 1. It will be obvious that by means of these taper gaskets, the pipe line can be deflected not only up or down, but also laterally.

To avoid any chance of error, the taper gaskets are sometimes made of lead on the ground, as the pipe is being laid. By laying two adjoining lengths of pipe in position at the required deflection point, the dimensions of the necessary taper gasket are accurately indicated. A satisfactory mold for casting lead gaskets can be readily improvised out of a pair of companion flanges. A slightly tapered wooden plug, about four inches long, of diameter equal to that of the pipe, is driven into one flange, so that it fits tightly, the smaller end of the plug pointing upward. The other flange is now pressed down over the projecting end of the wooden plug, at such an angle as to give the required taper to the gasket, as shown in Fig. 2. Any movement is prevented by inserting two pieces of wood, of the lengths respectively required, at two diametrically opposite points between the flange faces, and by inserting a small wedge between the wooden plug and the side of the flange.

The tapered end of the wooden plug is now luted with fireclay, after wooden plugs have been inserted in bolt holes in order to "core" bolt holes in the resulting gasket. Two or three plies of building paper are then wired tightly round the circumference of the flanges, a suitable opening being left for pouring at the thick end of the gasket. The mold is now ready for pouring, but it is a good precaution, and one which occupies little time, preventing chance of mishap, to bury the mold up to the pouring hole, before pouring the molten lead. Needless to say, when once pouring has started it must proceed continuously until the mold is full; otherwise the gasket will be made in two pieces and will be useless. Sufficient lead must be kept melted. It is also essential that the molten lead must not be too hot, or the wooden plugs will char.

A pipe line on a steep slope must be securely anchored at intervals, either to I-bolts in rock or to deadmen, depending upon the nature of the ground. A good method of attachment is by means of a clamp at the flanges, as shown in Fig. 3. For attaching the clamp to a deadman or I-bolt, either iron rods or cable may be used. The I-bolts connecting anchor lines to clamp should have a fairly long thread, so as to afford considerable "take-up."

Use of Glue in Electrolyzing Zinc-Sulphate Solutions

To retard the deleterious effect of certain impurities in zinc-sulphate solutions, such as cobalt, U. S. patent No. 1,322,071, granted to Royale H. Stevens, covers the use of glue in the solutions that are about to be electrolyzed. The inventor states:

"In adapting this invention to the current practice in the electro-deposition of zinc, I add a certain small proportion of glue in solution either to the electrolyte before passing into the cells or to the electrolyte in the cells. The amount of glue added is determined by the amount of impurities present in the solution, and such amount increases as the impurities increase, within limits, owing to continuous circulation of the solutions. Moreover, when manganese is present in the electrolyte in the form of manganese sulphate, a scale of manganese dioxide is formed on the anodes, which, in the presence of glue, is deposited in more coherent form, which inhibits corrosion of the anodes."

Time-Saving Devices in an Assay Office

Proper Distribution of Compressed Air Around a Disk Pulverizer—Sheet-Iron Holders for Flasks—Water Spray in Sink for Quick Cooling—Hoods Without Sides—Individual Cyanide Burettes

By F. L. Smith

Written for *Engineering and Mining Journal*

A CONCISE description of a few labor-saving arrangements used in the laboratory of the Nevada Consolidated Copper Co., Ruth, Nev., and found indispensable for combining speed with accuracy, is here presented:

Compressed air is used for blowing out the grinder in two different ways, as follows: First, a foot lever (see Fig. 1) is used to release a strong blast of air from beneath the machine. This completely cleans the grinder, except the drawer, the inside of the disks, top of disks, and lid. These places are then cleaned by a ½-in. air nozzle attached to a short rubber hose, which is hung at a convenient distance above the feed hole of the grinder by a fine wire spring. This holds the nozzle out of the way, but allows it readily to be grasped and pulled in any direction.

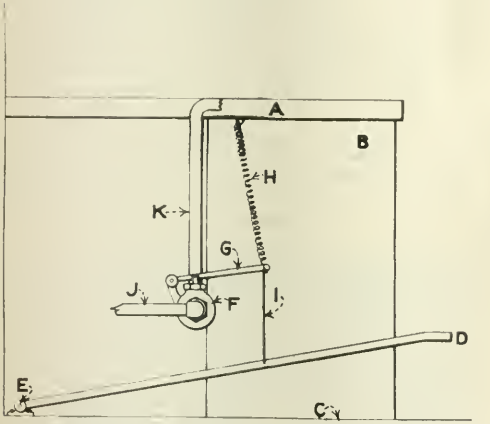

FIG. 1. SIDE VIEW OF FOOT LEVER AND CONNECTIONS

To direct the air beneath the grinder, a receptacle was made of heavy sheet iron (see Fig. 2) welded at the seams, round underneath, and slightly convex on top. This was let flush into the bench under the drawer of grinder, which is a Braun, type "U. A." The top was drilled with rows of holes so placed as to attain greatest cleaning effect. A 1½-in. lock-nut was welded on to a hole in each end, that in front being fitted with a plug to admit of cleaning out; that behind being connected by a pipe to a 1½-in. quick-opening throttle valve operated by the foot lever. (See Fig. 1.)

Some advantage might be gained by adding to this equipment a receiver made of, say, a 4-ft. length of 12-in. pipe, fitted with a small pet-cock underneath. This would serve the double purpose of increasing the volume of the sudden blast of air, and of obviating trouble caused occasionally by water in the air pipe during damp weather.

The dust thus stirred up is effectively restrained by a hood (see Fig. 3), which completely incloses the grinder except in front, leaving just enough room for the work to proceed without hindrance. This hood, made of sheet iron, is 18 in. wide, 20 in. deep, and 33 in. high, and is fastened to the bench with pieces of angle iron riveted on to its lower edge. It fits close to the body of the grinder on the right-hand side, whereas on the left a space of 1 ft. is provided. The front is inclosed for about 9 in. from the top.

FIG. 2. DEVICE FOR DISTRIBUTING COMPRESSED AIR UNDER GRINDER

An 8-in. pipe (see Fig. 3) connected with the top of this hood leads to the intake of a blower installed in the attic. The blower is of 1,500-cu.ft. capacity with 18-in. fans and ¼-oz. pressure, and is driven at about 2,000 r.p.m. The 8-in. pipe to the blower was fitted with a "T" in the attic, one branch connecting with the grinder, as described, the other leading from a hole in the center of the bucking-room ceiling. Each branch was fitted with a damper, so that full suction can readily be obtained for either. The hole in the ceiling is used for carrying away the dust when blowing out the room with a hose.

The net results of the foregoing are (1) that respirators are no longer required, and (2) that one man easily grinds 150 samples of porphyry ore per hour, the average weight of samples being 50 g., and average screen test, 99 per cent minus 80 mesh, and over 90 per cent minus 100 mesh; and this with the assurance that the grinder is thoroughly cleaned out after each sample. This rate of speed will probably just about occupy one average man at the balances.

Most of the copper determinations are made by the slop KCN method without filtering. By paying sufficient attention to details, the error is reduced to within

about $\frac{7}{100}$ of 1 per cent on a simple low-grade ore, when checked against the best custom-office umpire work. The samples are weighed into flasks set in trays with a capacity of forty flasks each (see Fig. 4). These trays, which save much time and eliminate confusion and accidents, were each made of two pieces of sheet iron, 19 x 30 in., 1¾ in. apart, held together by bolts. Each has five rows of eight holes, 3½ in. from center to center. For ordinary 250-c.c. flasks, 3¼-in. holes in the top sheet, and 3-in. holes in the bottom sheet are found suitable. Handles are provided on top at each end.

Acid having been added, the tray containing the flasks is placed on the 18 x 30-in. hot plate. It is

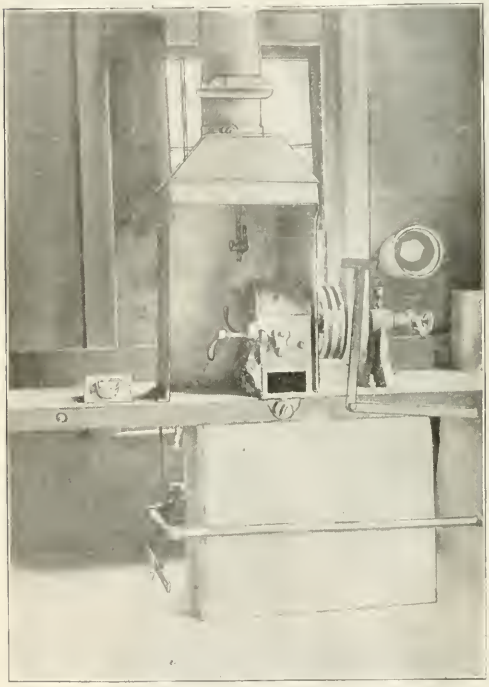

FIG. 3. GENERAL VIEW OF GRINDER, SHOWING HOOD

advisable to have another tray of the same pattern ready to receive the flasks as they are removed from the hot plate, as they may not all boil evenly. After removal from the hot plate, water and ammonia are added, and the tray, with its batch of forty flasks, is placed in a lead-lined cooling tank. The outlet hole of the latter was made of a 1-in. sleeve into which is screwed a nipple. This projects upward about ½ in., keeping the water at a suitable depth.

Water for cooling is supplied by the following contrivance (see Fig. 5). Four pieces of ½-in. pipe, 21 in. long, with a cap screwed on one end, were arranged parallel with each other, 7 in. apart from center to center, and connected with "T's" to one main pipe. This latter rests on the back wall of the tank, and is fitted with an elbow joint, which serves as a hinge and enables the apparatus either to be folded back out of the way or brought down level for use. The elbow joint was treated with white lead, and has never leaked. The four arms come exactly between alternate rows of flasks, and each of them was drilled with two rows of five pin-sized holes on the lower side, in such a manner that, when the water is turned on, each of the forty flasks receives a fine stream, thus cooling the whole batch to the desired temperature

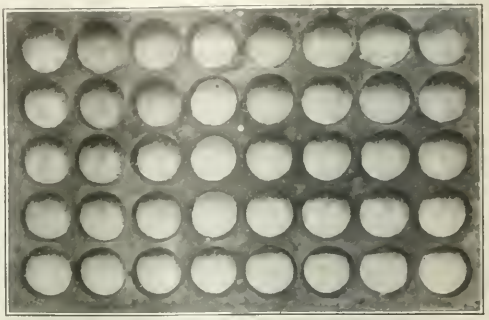

FIG. 4. SHEET-IRON TRAY FOR FORTY FLASKS

quickly and evenly. The pipe is fitted with a plug for rapid draining.

To expedite the work connected with the hot plate, the hood was made without sides or front, but with practically only a top. To insure that the fumes would go up instead of into the room, a ¼-in. compressed air pipe was inserted into the chimney about 3 ft. above the hood, and made to point upward. A valve in this pipe, placed conveniently near the hot plate, enables the operator to turn on the air whenever required, creating an upward draught, which effectually carries off the fumes.

The cyanide solution is kept in the attic in two lead-lined tanks, which were burned at the seams and not soldered. It comes down by gravity through a 1-in.

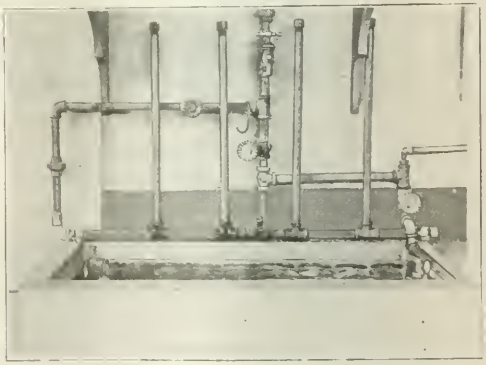

FIG. 5. PIPES FOR DISTRIBUTING COOLING WATER

iron pipe into the line of forty burettes, corresponding to the number of flasks in a tray. The 1-in. pipe was fitted with forty ½-in. nipples, 5 in. apart, to which the burettes were connected with rubber tubing and Mohr's clamps. Valves of iron, and not of brass, must be used for this pipe line. The slight yellow discoloration of the solution caused by the iron pipe is no detriment, though a valve for draining the pipe is found necessary at times.

A Picturesque Mining Experience

II. The Diamonds of Mitrovitza

By J. E. Spurr*

THE other day I was looking over a map of the new kingdom of Jugoslavia, and somewhere in the center I traced out in strange Slavonic letters the name Mitrovitza. I knew that town, although it has wandered far and wide geographically since my brief sojourn there. I had to get out of that town, before daylight, for my health. I own it without shame.

This happened some time ago—I hate to say how long; in fact, on reflection, I won't. I was sent out from Constantinople by special edict of the Sultan, Abdul Hamid, whose chief mining engineer, geologist, and adviser on mining matters I had become, on the recommendation of our Secretary of State, John Hay. I had various specific jobs cut out for me, all of which turned out picturesquely enough, and finally I drove many miles over country roads in an open carriage to Mitrovitza. I had with me two military aides and protectors—both Albanians, as we were to pass through Albania and it took an Albanian to protect an unintroduced stranger in Albania. It was no job for a Turk. Both were from the Palace Guard in Constantinople—one a terrible little major, an aide-de-camp of the Sultan, the son of a powerful vali or governor, and a little devil; the other a big stupid captain who had two wives, and much domestic trouble in consequence. Also, I had an interpreter.

It was a raw country through which we drove and tossed for two days. Not a man that we met but was hawk-eyed, free in action, and armed to the teeth. We stopped at night at a miserable little inn, where we lay on rude pallets on the sides of the low stone structure, floored with earth. The stove was a great affair of stone, in which open fires cooked food, when there was any to cook. There was none to cook that night—no bread—nothing but sour milk and raw cucumbers; and I regretted that I partook heartily of these. The house was crowded with great somber fellows in short embroidered jackets, embroidered silk shirts, thick knee trousers, and flat fezes. In the sashes at their belts were wonderful long inlaid pistols and great daggers; and each kept close to him a rifle of slender breech and prodigious length of barrel. Take any description by Scott of such a scene in the time of the Crusaders, and, save for the firearms, you will not have to alter a detail of local color.

The next evening, tired, we crossed a bridge over a river, and rolled down the principal street of a considerable town—Mitrovitza. The street was dense with people, who had to part to let us drive on, and they cheered and shouted wildly as we went through. This was "nuts" for my Albanian officers, proud of the Sultan's insignia on their uniforms, and they smiled and bowed paternally.

At this stage, I recall that it is necessary to explain the job on which I had been sent to Mitrovitza. It was such a secret that I almost told my story without betraying the confidence with which I was sent there. I had been advised by the Sultan's First Secretary, Tassin Bey, the most powerful man in the empire, that diamonds had been reported from Mitrovitza, and I would receive further information from the head man of the city. In the meantime, mum was the word. Therefore, none of my companions knew my mission.

Arriving at a rude hotel, where the mayor or head man and other members of the city government met us with great courtesy, curiosity, and inexplicable disappointment, I was eagerly preparing to eat something and rest my jolted bones, when it was translated to me, out of Albanian into French, by my interpreter, a Hebrew attorney from Constantinople, that they regretted an appearance of inhospitality, but I must turn right around and go right back again. I demanded to know the reason, and they hesitated to explain; whereupon I informed them that there was "nothing doing." They pleaded with me, and at last explained.

Mitrovitza at that time was on the borders of Albania, nominally under Turkish rule, and Bosnia, nominally under Austrian rule; and had a sort of dual government, with representatives of both the Turkish and the Austrian sovereigns. I was informed that the chief local ruler had been appointed from Constantinople, a "civil governor" and dear to the heart of the people. Probably he did not collect and send enough taxes to Constantinople. At any rate, the Sultan had dismissed him, and installed a "military governor," whose measures the fierce Albanians would have naught of. They had so informed the Sultan, and as no corresponding action had been taken, they had sent word that unless the military governor were removed and the civil governor were reinstated on a certain day, they would pull off a first-class revolution, and would not recognize Constantinople at all. It was on the evening of this certain day (I protest I am telling the plain truth) that we drove into Mitrovitza, and the people, seeing the Sultan's uniforms, and the benevolent countenances, concluded that the Sultan had been kind. All this the mayor explained; also, that the town was full of armed men who had flocked in from the province around—I now understood—and that if they found out that, instead of noticing their request, the Sultan had sent us to Mitrovitza for diamonds, our lives would not be worth that much. He did not apprehend that; he could promise it to us of a certainty.

Life suddenly turned stale and flat; but I valiantly swore that I had come to examine diamonds and I would not go back without having done so. They conferred, and then told me that the diamonds were in the river sands at the edge of the town. Why not go right down and expert them p.d.q.?—or Albanian to that effect. So into the carriage I went, and drove back across the bridge and down onto the sandy shore of the river, where the women were doing their laundry.

The officials washed some sand for me, and glittering crystals, brilliant gems, came out of it. Secretively a

*This "Picturesque Mining Experience," and the first one by Lieutenant Colonel Binckley, are designed as "decoy ducks" to induce the wild ducks of engineers and mining men to come across, each with an informal yarn. Will you please send in yours?—Editor.

bottle containing some that had been already washed out was stuck before my nose. They were certainly beautiful. With my hand-lens I looked at them, and saw that they were double hexagonal pyramids—all perfect dihexahedra of quartz, wth no prisms—as like a finely cut diamond as you might wish. I have never seen anything like it before or since.

Looking around, I soon found the matrix, a quartz porphyry, out of which these crystals were residual. My job was done. We drove back to the inn. To the eager queries of my military aids and the city council, I made no reply. I confiscated all the "diamonds" I could lay my hands on, as evidence, and insisted on dinner and bed, promising to clear out before daylight. Everybody took great care that we did so—a stealthy breakfast, and we drove back down the deserted main street of Mitrovitza hours before daylight, and were far away when the sun rose. As we fled, we met continually shadowy groups of the warlike country folk, armed to the teeth. Every group stopped us. "Who are you?" "Albanians — comrades — brothers!" proclaimed my guard. "Are you for the military governor?" "Surely not—may the devil take him!" "If that is so, yell for the civil governor." And we all yelled for the civil governor, by name—yelled cheerfully, even happily, and lustily; and so we fled merrily and yelled all the morning.

There are times that I hold the telephone and telegraph in slight esteem; and the blessing of having none was exhibited to me that day: for Mitrovitza closed behind me and I never heard of it again. What dramatic events took place that day in the city I do not know; for neither telephone, telegraph, nor newspapers chronicled such events in those days in Turkey; and it was impolitic as well as useless to inquire.

Formulae for Obtaining Haulage Efficiency

By Paul S. Couldrey
Written for *Engineering and Mining Journal*

In determining the gradient to be adopted in the main haulage drifts of a mine, allowance is, or should be, made for the kind of equipment to be used. This refers more particularly to the style of car wheels, because the gradient of equal traction for roller or ball bearings would be much too small for other types of wheel. Conversely, in old mines, with existing irregular or steep grades, the advantages of roller-bearing wheels might not be so great as would appear at first consideration. For example, a wheel with a brass bushing (also having a small frictional resistance) might be found equally serviceable. Up to the present time ball bearings have not met with much favor for rough mine work, especially where there are sharp curves or where much handling of cars on turn sheets is required.

Assuming that roller bearings (and the gradient that goes with them) can be adopted, the question of interest is, How flat should this gradient be made to take advantage of the bearings? Any gradient in excess of actual requirements will affect not only the haulage but also, eventually, the pumping and hoisting costs, noticeably so in long tunnels and scattered workings.

To answer this question it is necessary to know the coefficient of traction under average working conditions. With Hyatt roller-bearing wheels, under ideal conditions, this figure has been brought down as low as 3.9 lb. per ton, but a working figure usually quoted is 13 lb. per ton.

If w is the weight of an empty mine car; W, the weight contained in a well-loaded car; k the coefficient of traction going up hill empty; K, the coefficient of resistance going down hill full; a, the gradient of equal traction, and P, the drawbar pull per car necessary on this gradient—then after acceleration period is over, and car is going at uniform speed,

$P = kw \cos a + w \sin a$ going up hill empty and

$P = K(w + W) \cos a - (w + W) \sin a$ going down hill full, so that $kw \cos a + w \sin a = K(w + W) \cos a - (w + W) \sin a$

$$\text{or } \tan a = \frac{KW - (k - K)w}{2w + W}$$

$$\text{or, since } a \text{ is small, } a = \frac{K - (k - K)\frac{w}{W}}{2\frac{w}{W} + 1}$$

Assuming the coefficient of traction of the loaded car to be 75 per cent of that of the empty car, the above equation becomes

$$a = \frac{K\left(1 - \frac{1}{3}\frac{w}{W}\right)}{2\frac{w}{W} + 1}$$

It is obvious that the difference in value between k and K is of secondary value compared with K itself.

The ratio $\frac{w}{W}$ depends upon the design of the car and the nature of the ore, and will be made as small as practicable to obviate the hauling of dead weight. Assuming a value of $\frac{1}{4}$ for $\frac{w}{W}$ and 13 lb. per ton for K,

$a = 0.29$ per cent or approximately 3 in 1,000

Drainage grades have been made as flat as 1 in 7,200, and though it is not suggested that the gradient of equal traction could ever be brought to such a low figure, there is still a margin left for further improvement. On the other hand, mines equipped with roller-bearing wheels are probably not reaping the full benefit of their equipment if grades approximating 0.5 per cent are still being used, though sharp curves and high starting resistance may prevent a strict adherence to the calculated figure.

The loss of efficiency due to the adoption of the 0.5 per cent grade when one of 0.29 per cent only is called for is expressed by the fraction $\frac{(0.5 - 0.29)\ 1\ 100}{k + 5\ 100}$ i. e., about 15 per cent in the above instance.

The smaller the value of k, the greater the percentage loss due to heavy grades. This loss could be remedied in part if the factor $\frac{w}{W}$ could be still further reduced.

In Roasting Sulphide Ores in furnaces of the McDougal type it is sometimes advisable to reverse certain of the rabble blades. This gives longer roasting on any desired hearth and at the same time stirs up the ore bed more than could be accomplished by dropping some of the rabbles entirely.

Transporting Dredging Parts By Barge and Truck

Written for *Engineering and Mining Journal*

AT HAMMONTON, Cal., the Yuba Consolidated Gold Fields Co. operates eight gold dredges, scattered over a large area. Transportation of parts and supplies to and from the dredges has been worked out in an interesting way. A system of roads is maintained which gives access to points near by the dredges. As the dredges are continually advancing these roads have to be extended from time to time.

Some of the dredges are not readily accessible to the roads, and must be reached by canals which are connected to the dredge ponds. For transportation in the canals and in the dredge ponds, light steel barges of 20-ton capacity are provided. These are towed by a 60-hp. Holt caterpillar, which is used for heavy service.

Loading and unloading heavy parts is a necessary feature of transportation. At the shops a boom derrick is used for loading the parts on the trucks. At each road head a small derrick of the same type unloads from the truck and transfers to the barge. Transference from the barge to the dredge is accomplished by the two derricks which are a part of the dredge structure and are placed close to the bow of the dredge.

Power is used on all of the derricks, and loading and unloading are rapidly and conveniently effected. The steel barges are also used as working platforms where repairs are required upon the bucket line.

For transporting major parts of the dredge, such as the steel spuds, weighing up to forty-five tons apiece, the upper tumbler, twenty tons, and the lower tumbler, fourteen to fifteen tons, special trucks are employed. Tractors are used for haulage. The weights given are

TRANSPORTATION OF DREDGE PARTS

(1) Wagon trucks used to haul dredge buckets (each bucket weighs approximately 4,200 lb.). (2) Steel barge, launch and derrick at road head. (3) Auto truck carrying dredge supplies. (4) Dragging dredge buckets by caterpillar tractor.

power launch, or, where the distance between dredge and road head is small, the barge is pulled to and from the dredge by a wire rope operated from the dredge and also from the derrick which is placed at each road head.

Small parts are transported by boat and launch; larger parts are loaded on the barges. All small parts and supplies, such as lubricating oils and other necessary commodities, are loaded into a one-ton auto truck and carried to the road head. Large parts, such as dredge buckets, pins, tumblers and gears, are placed on wooden trucks, which are hauled singly or in trains to the road head. Two tractors are provided for this service, one a Yuba ball tread for light and the other for the parts of an 18-cu.ft. steel dredge. An 18-cu.ft. dredge bucket weighs 4,200 lb. complete, and is the heaviest piece that requires frequent handling. The capacity of the different derricks is: Weight capacity of dredge bow derricks, 2 tons; weight capacity of traveling crane, 15 tons; weight capacity of road head derrick, 25 tons; weight capacity of shop derrick, 25 tons.

Iron Ore has been discovered in the canton of Aargan, Switzerland, between the villages of Herzuash and Wolflinsivil, according to the *Iron Trade Review*. It is claimed to contain from 23 to 35 per cent iron, without appreciable amounts of phosphates or sulphur, and therefore should be of as good quality as the Lorraine product.

Oxygen in Cyanide Solutions

Its Determination, by White's Method, May Be Made With More Precision if Caramel Is Used As a Coloring Medium

By E. M. Hamilton
Written for *Engineering and Mining Journal*

READERS of *Engineering and Mining Journal* may be interested in an experience I had recently in working the new method for estimation of oxygen in cyanide solutions devised by H. A. White, of Johannesburg. (*Jour. Chem. Met. & Min. Soc. of S. A.*, June, 1918.) The method depends on the degree of coloration imparted to a cyanide solution by the addition of pyrogallic acid and caustic soda.

A set of color standards is prepared, taking as the tint for the first of the series the color produced by the addition of the reagents to a known volume of distilled water previously saturated with atmospheric oxygen. The quantity of dissolved oxygen present at saturation point is determined for any temperature and barometric pressure by reference to Roscoe and Lunt's table. (See Sutton's "Volumetric Analysis").

The first color in the series having been thus determined, five or six more bottles are prepared containing the proper proportions of the original color solution (diluted up to volume with water) to represent amounts of oxygen per liter of solution in quantities diminishing by 1 mg., the series finishing with ½ mg. of oxygen per liter.

Making Standard Color

For the standard colors White recommends "Diamond" brown dye shaded to a match by addition of methyl orange, acid, and potassium chromate, or, as an alternative, a solution of pyrogallic acid and caustic soda oxidized to saturation and then diluted to the shade required. By the first of these methods it is difficult to obtain a match, whereas, in the second, the color produced seems to fade in daylight, which, of course is detrimental to its use as a standard for more than a brief time.

I have found that a perfect color match without experimenting can be obtained by the use of a solution of caramel, and the tint appears to be permanent as far as could be observed in a period of three to four weeks. This solution, however, produced a slight fungoid growth after ten or twelve days, but this could probably be prevented by the addition of a preservative, such as formaldehyde.

At a mill in Mexico where I recently tried the method I found that the details as given by the inventor must be modified to make it workable. The difficulty was that immediately on addition of the reagents to the cyanide solution to be tested, a color was produced that was many degrees darker that that shown by the standard of distilled water saturated with oxygen. This first color, however, faded so rapidly that comparison of shades was impossible. At the end of five or six minutes the fading had retarded sufficiently to be able to make the comparison, though even at this point the density of color was equivalent to two or three times the oxygen content shown in saturated distilled water.

Why was the fading not allowed to continue to the point at which it matched the saturated distilled water, may be asked. The reason was that after standing for six or even minutes the solution began to cloud, and before the tint had time to approach that of the standard, the test was so murky that any comparison was impossible.

At the end of five or six hours a heavy ocher-colored precipitate settled out, leaving the supernatant solution almost colorless. I did not have an opportunity to analyze this precipitate, but as the solution contained silver to the amount of about 1 oz. or over per ton, and as White makes no mention of such a precipitate in gold solutions on the Rand, it is probable that the silver was responsible for the condition noted. That the dissolved oxygen is a factor in the phenomenon is shown by the fact that unprecipitated but de-aërated solution gave no sign of a precipitate on standing, whereas with the precipitated and aërated solution, a distinct cloudiness was apparent after about half an hour, though not to the same extent as in the pregnant solution.

Procedure

The procedure finally adopted was as follows: I took a sample of precipitated solution, and, after saturating it with atmospheric oxygen, placed it in one of the stoppered test bottles of 250-c.c. capacity, filling to a point such that the stopper could be inserted without leaving an air bubble. I then added 100 mg. of crystallized pyrogallic acid and 1 c.c. of twice-normal NaOH, as recommended by White, and after shaking down the crystals, inserted the stopper, and agitated until dissolved. I then allowed it to stand for exactly six minutes, and the color observed at that point was taken as the standard color corresponding to a saturated solution of oxygen in distilled water. This color was then matched with a solution of caramel which formed the first of a series of color standards.

The saturation point of oxygen in distilled water at a temperature of 18 deg. C. at the altitude of the mill was found by the table to be 6.25 mg. of oxygen per liter. A series of colors was then prepared by diluting the original caramel solution to represent respectively 5, 4, 3, 2, 1, and ½ mg. per liter. All that then remained to be done was to take any sample of plant solution to be tested, with proper precautions to prevent additional aëration during the manipulation; place in one of the stoppered test bottles so that no air bubble would be left on inserting the stopper; add the reagents, and after stoppering and shaking to dissolve the crystals, allow to stand for exactly six minutes and then compare the color with the set of standards, picking out the shade with which it most nearly matched and which was taken to indicate the oxygen content of the test.

Some of the determinations resulting from this method may be of interest:

OXYGEN CONTENT BY MODIFIED WHITE METHOD

	Oxygen, Mg. per Liter
Mill solution from storage tank	6.0
Mill solution overflow from pulp collecting tank	5.0
Pregnant solution, precipitation head before de-aërating	5.0
Pregnant solution after de-aërating by the Crowe process	0.5
Barren solution, effluent from precipitation presses	trace
Barren solution in barren storage tank	6.0

Variations of 1 mg. of oxygen per liter may be detected easily.

Carbon tetrachloride, used in fire extinguishers, has too high a freezing point, and so is usually mixed with chloroform. When the latter was scarce, during the war, the Bureau of Standards found gasoline or turpentine could be used instead, the resulting mixture being a fire-extinguishing liquid.

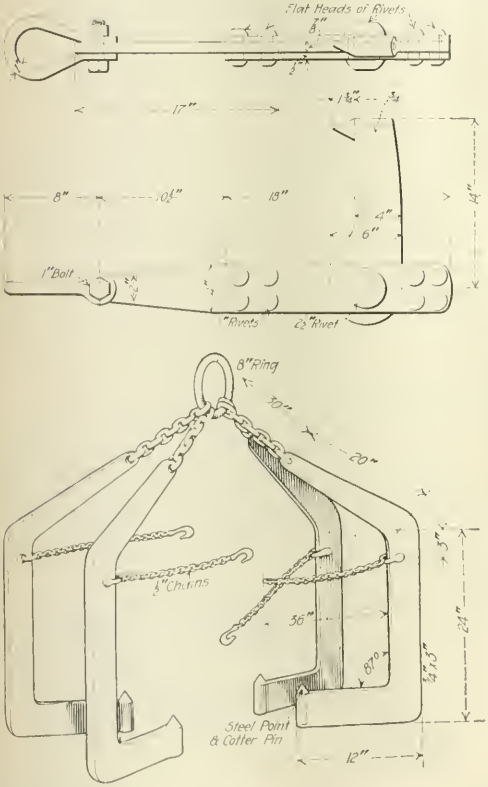
Handling Broken Rock and Ore Chunks

By H. H. Hunner

Written for *Engineering and Mining Journal*

IN THE operation of most rock crushers handling hard ore or rock there is considerable delay each shift due to extra large chunks of rock blocking the mouth of the crusher. Though blasting will usually remove or displace them at the first attempt, it should be avoided as much as possible on account of the increased maintenance cost on crusher and building caused by blasting.

At the Cornwall Ore Bank Co., Cornwall, Pa., where a hard magnetite ore is mined, a hook has been devised for use with a five-ton air lift over the crusher mouth and over dump cars. The hook seldom fails to take hold of a rock mass, and retains its grip long enough to at least shift the lump into a new position after



UPPER FIGURE IS DETAILED DRAWING OF A ROCK HOOK USED IN ROCK CRUSHING. LOWER FIGURE, A HOOK USED IN OPEN-PIT MINING FOR HANDLING LARGE ROCK MASSES AT THE OPEN PIT OF THE CORNWALL ORE BANK CO., AT CORNWALL, PA.

each try. On account of the sharp steel point, the hooks cannot slip off the most irregular chunks until the strain is sufficient to cause it to gouge itself out. Quite often, on an extra large slab that is either too heavy to lift or is keyed in with other lumps so solidly that it cannot be shifted by pulling it near the middle with the full five tons, the slab will fail in the center. The steel point is held in place by a cotter pin and the operator keeps a few sharp points on hand.

In blasting by drill holes on 70 or 80 ft. banks, the large area that is covered by the scattered rock at the toe of the bank is difficult to clean up by using a derrick and loading buckets by hand. An effective practice is to lay the loading track about 50 to 60 ft. in from the outside chunks and use a ten-ton derrick to clear the roadbed and sweep up the outside chunks. In handling the big chunks of rock with the derrick, heavy tongs were first tried out, but the workmen were reluctant to use them, on account of their weight and because they dropped the chunks about half the time, having only two points of support on the chunk. Lately a four-point grab that has lifted chunks weighing over eight tons has been tried out and has several good points to recommend it. It is easy to make, convenient for two men to handle, and is quickly attached to irregular chunks lying at random in a pile. Four times out of five it will release itself when the chunk is deposited on the stockpile. The material for the legs is ¾ x 3 in., but I would recommend using ⅞ x 3 in., or 1 x 3 in., when the apparatus is designed to handle chunks weighing more than seven tons, as hooks of the size shown in the figure have in practice required to be straightened out once or twice.

The chunks may be blockholed before or after moving with the derrick, as they are always set down on the stockpile in the same relative position. The jackhammer work can be done before the derrick is advanced far enough to reach the chunk. The foreman marks the chunks he thinks the derrick can handle, and they are not blasted unless the derrick fails to lift them. In this way, most of the large chunks are moved above the loading track without breaking them up and loading the small pieces into buckets by hand. The lower chains, three of which have hooks on the end, are pulled up snug and cross-tied after the legs are worked under the chunk at points convenient to get at. On round chunks, three legs are usually sufficient to make a lift, but in moving long slabs the four points of support are necessary.

Repairs to Rotary Pumps

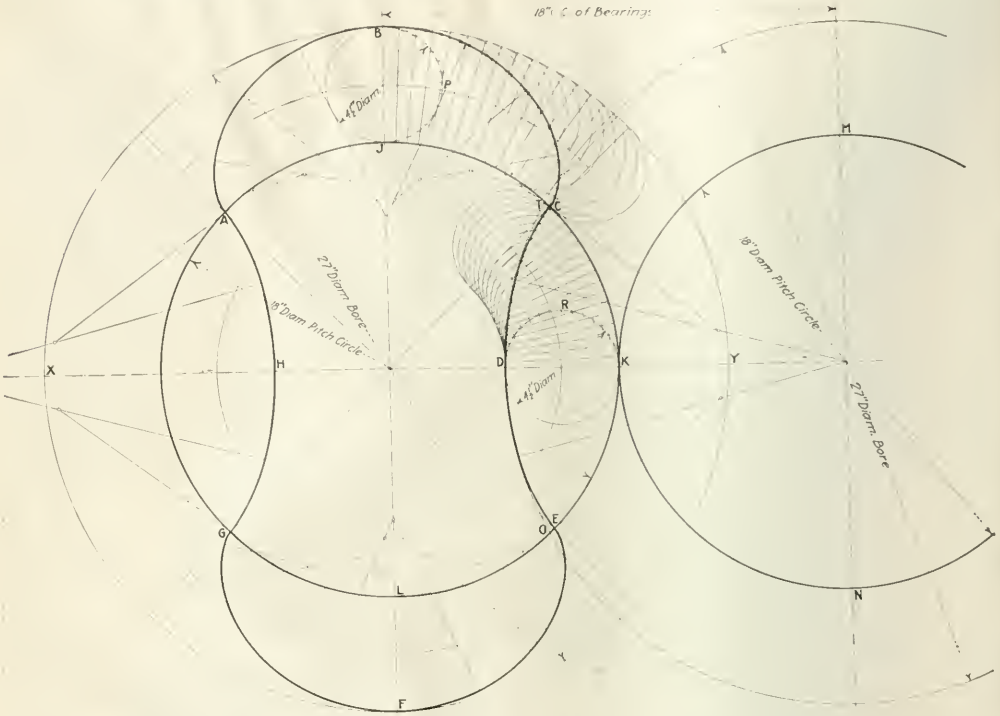
By Robert C. Baker

Written for *Engineering and Mining Journal*

THE repair of rotary pumps which have become so badly worn that their efficiency is impaired is a comparatively simple matter if one bears in mind that there are certain definite relations which must be maintained between the bore and the distance between centers.

When it was recently decided to repair one of the rotary pumps in service at a plant in Nacozari, Mexico, the first thought was to rebore the barrel of the pump, which had become badly worn, making it 27⅛ in. in diameter, instead of the original 27 in. The pump was a Connersville, with a capacity of 39 gal. per revolution. This would have entailed, of course, the casting of new impellers, which it was thought would be a simple matter, necessitating only the putting of additional stock on the ends of the impellers and making the throat sufficiently smaller to allow for the change. However,

this was found to be impossible, as a rolling fit could not be secured. Investigation developed the fact that, with the original distance between the centers in the pump 18 in., a bore of only 27 in. could be used.



LAYOUT OF PITCH CIRLES IN READJUSTING IMPELLERS OF ROTARY PUMPS

The repairs were therefore made in the following manner: The barrel of the pump was first relined, and then rebored to the original dimension of 27 in. The impellers were then developed as per the accompanying sketch, and cast. This gave a perfect rolling fit, with the pump in practically as good condition as new. The impeller, which is in outline wholly a series of developed curves, was laid out in the following manner:

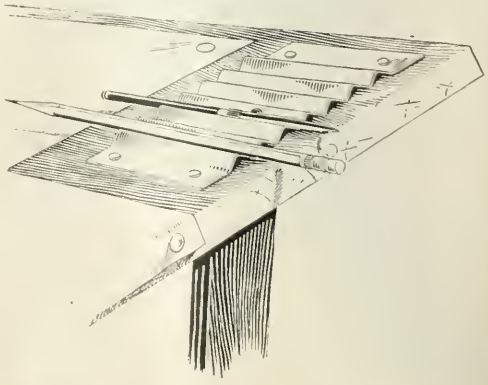
First, lay out the pitch circles, as shown. Next, lay out the bore circles, as shown, and intersect the pitch circle with diagonals at 45 degrees, as *AE* and *GC*. The curve *ABC* is then developed as an epicycloid by means of the generating circle *BPJ* on the arc of the pitch circle *AJC*, as director. The curve *EDC* is also developed as a hypocycloid by means of the generating circle *DRK* on the arc of the pitch circle *EKC*. The remainder of the impeller is laid out in a similar manner.

It is, of course, apparent, that to secure a perfect rolling fit it is necessary for the curves *ABC* and *CDE* to join on the pitch circle at the diagonal 45-degree line. Thus it is seen that the arc *BPJ* of the generating circle must equal the arc *JC* of the pitch circle; likewise the arc *DRK* must equal *KC* of the pitch circle. Therefore, it follows that *the circumference of the generating circle is one-fourth the circumference of the pitch circle*, and likewise that *the diameter of the generating circle is one-fourth of the diameter of the pitch circle.*

From the above it will be apparent that the bore will be 1½ times the distance between centers, or 1½ times the diameter of the pitch circle.

Drafting Table Rack

When the drafting board was on the incline and the draftsman found himself picking up things one after another, his patience slowly began to give out. His ruling pen became a rolling pen, and rolling tools gather a loss. This "uplift" work began to rack his nerves, and he began to rack his brain for a rack to hold his



RACK FOR DRAFTSMAN'S TOOLS

things in place above board. A simple rack which he devised did the trick and restored his equilibrium.

A sheet of heavy paper about five inches by eight inches was folded, as illustrated and tacked near the top of the drawing board. This simple rack afforded a berth for every tool, checked the gravity of the situation, and prevented further waste of time.

Feed and Product Size Diagram

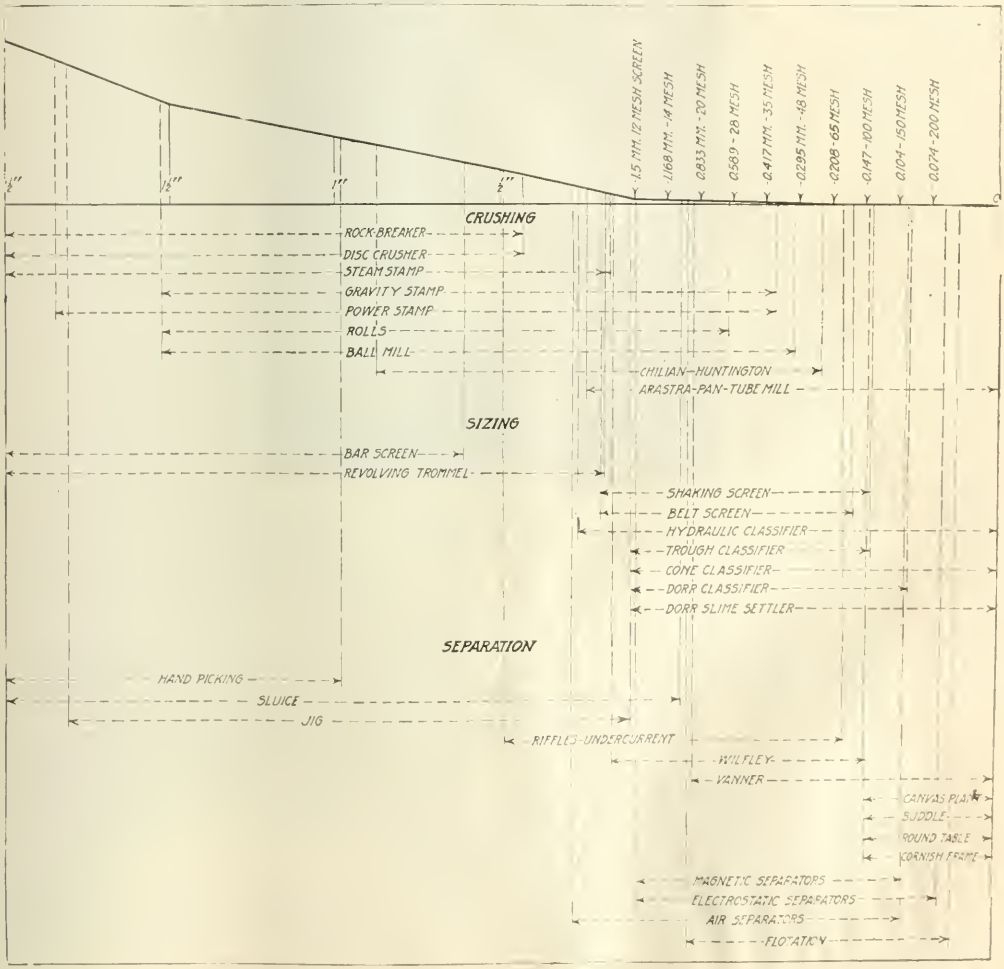
By George J. Young

Written for *Engineering and Mining Journal*

In the accompanying cut a diagram is shown which illustrates the approximate limitations of size of material fed to and delivered from crushing and grinding machines, classifiers, and separators. It is, of course, not to be considered as exactly accurate or comprehensive or to take into consideration the practices prevailing under abnormal or subnormal circumstances, but the chart will be found useful as a guide to average operations.

The Pace That Kills

When the late T. S. Austin was superintendent of the El Paso plant of the A. S. & R. Co. he became thoroughly accustomed to the policy of eternal vigilance. The type of intermittent-tap lead furnaces employed there also kept subordinate employees rather busy. Upon being transferred to the Aguascalientes plant, Mr. Austin endeavored to familiarize himself as rapidly as possible with all the technical details of the plant and also with the precise duties and normal activities of each and every man and boy on the payroll. Scurrying about under the guidance of his predecessor, he reached the tapping floor and inquired, "Who looks after things here?" A gesture indicated a Mexican who at the moment was languidly rolling a corn-husk cigarette as he strolled from one furnace to the other. "What is he doing now?" demanded Austin, nervously. "Nothing," was the reply. "Nothing, eh? Who is that fellow lying there half asleep?" "Oh, that is Pedro, Juan's helper."



APPROXIMATE LIMITATIONS OF SIZE OF MATERIALS FED TO AND DELIVERED FROM ORE-DRESSING MACHINES

Leaders in Metallurgical Practice

Arthur L. Walker

IT IS rather strange what little things influence young men in the selection of their careers. Were it not for the fact that Arthur L. Walker, after graduating from Morris Academy back in 1879, had been intimately acquainted with a member of the victorious Henley crew of Columbia University, his decision to attend the Columbia School of Mines would have been problematical. However, no one doubts that he would have exhibited in any other career the same amount of inventive capacity and general ability that he has displayed in mining and metallurgy. Upon being graduated from the School of Mines in 1883 he was tendered a position by Prof. Pierre De P. Ricketts as assayer for the Old Dominion Copper Co. at Globe, Ariz. In those days it took seven days to make the trip to the West, two days of which were spent in stage-coach travel, and despite hazy notions as to just where Arizona was, he jumped at the chance to work on the attractive Western borderland. After service for three years with the Old Dominion Copper Co. as assayer, chemist and underground engineer, Walker resigned to accept a position with the Silver King company, only to return to the Old Dominion Copper Co. a short while later as the new superintendent of the enterprise—inwardly admiring the company's courage in appointing so young an engineer to this responsible position. Yet (mining companies take note), during the six years of his stay there an entirely new smeltery was built, an aërial tramway—the first in the Southwest—erected to connect mine and smelter, and other extensive improvements were made.

ARTHUR L. WALKER

In 1893 this young engineer went to Baltimore to take charge as general manager at the Baltimore Electrolytic Refining Co., now the Baltimore Copper Works, and while there invented the first successful machine used to supplant the old laborious hand ladling of casting copper—the Walker casting machine. There were many difficulties to overcome in designing and introducing this machine, but the result was most satisfactory, and the machine is now used all over the world. Considerably more than one-half of the copper that is now produced in the world is cast on these Walker machines.

The next jump was to Perth Amboy, N. J., where Mr. Walker was placed in charge of the copper operations of the Guggenheims. Inventive talent again asserted itself—this time it was the idea of combining the advantages of the series system and the advantages of the multiple system for electrolytic copper refining that yielded what is now known as the Walker system of electrolytic tank and conductor arrangement, a plan that was first introduced in 1902 at the Perth Amboy Electrolytic Refinery and which has been adapted in all but one refinery subsequently built. In 1906 Walker was elected a director in the American Smelting & Refining Co. and a member of the executive committee. His duties were very general, but carried him to operations principally on the Pacific Coast. Two years later he severed connections with the American Smelting & Refining Co. to accept the chair of metallurgy at Columbia University, bringing to the School of Mines the benefit of the wealth of experience he had accumulated in twenty-five years of practical association with mining and metallurgical work. Professors as a class are often accused of being too theoretical and of subordinating the practical aspects of their teachings, but Prof. Walker's record is quite a contrast to such generalization. In the war he was first consulting metallurgist to the Chief of Ordnance, then attached to the Small Arms Division, and later to the Metallurgical Branch of the Inspection Division.

Prof. Walker claims that, to him, the two outstanding achievements of his professional work are his position as general superintendent of the Old Dominion Copper Co., when only twenty-four years old, with the eminently successful operating results under his régime, and the special inventions he was able to introduce in copper metallurgy.

Oh, yes! Prof. Walker has always been interested in athletics—his particular hobby being the great American pastime. He organized a ball team at Globe, and he plays golf. Incidentally, his son Arthur L. Walker, Jr., is able to meet almost anyone at the game.

By the Way

Cuba Prosperous

More than the high prices of sugar and the presence of great numbers of thirsty American tourists is responsible for the superlative degree of prosperity that is being enjoyed in Cuba, declares D. F. Hewett, who has just returned from the island, where he made examinations of manganese properties for the War Minerals Relief Commission. The additional reason for this prosperous state of affairs is the entry of new capital into mining. In Cuba, a tax is levied upon production only, and many Americans who object to the taxation policy pursued at home are making investments in Cuban mining properties.

Canitopsis

The supply of tin cans is below normal and probably the smallest, relative to demand, it is said, that the country has ever experienced. Our predicament is really becoming serious. The tin can has played an important part in our national life, and we have taught the world to use it. Called a wasteful people, we have nevertheless shown man how to preserve his surplus fruits and vegetables. To the engineer, prospector, and miner and to him who seeks the uttermost parts of the earth, the can has especial significance. To him, sordid and rusty though it be at times, it is the symbol of existence, and after he has passed along it remains a monument to his passing. Take the wings of morning, pierce the Barcan wilderness, wherever it may be, and the cans will be found mutely dotting the landscape, their metal once won from earth now cast aside to be resolved to earth again. The desert whirlwinds swirling through the abandoned camps make of them their plaything, and their clanking furnishes a rude music, which there is none to hear. The can, too, has played its part in the world of metallurgy and in the precipitation plant has aided in recovering copper from the waters of the mine. Thus the can through silent service has won for itself honorable mention. When we read, therefore, that the supply is diminishing, we wonder if it, too, like so many other things of recent years, is to become scarcer and scarcer until finally it disappears. Then, perhaps, we shall be taking our food in pellets, and the question of containers will be of less importance.

Inaugural Exercises; or, Arizona on Tiptoes

"An eager and expectant crowd stood about the well site of the United States Oil & Refining Co., in the Bowie oil basin last Sunday, to witness the inaugural exercises that set in motion the new Imperial Ideal Standard rig that all southeastern Arizona confidently expect to unlock nature's treasure vault and shift Arizona into the column of oil states," said a Bisbee daily recently.

"All day the stream of visitors came and went and all day the big machine worked with the even and smooth precision of a perfect mechanism, and every one who saw it knew at a glance that it was fit for the job and put away from his thoughts any brooding doubt that the public will get a run for its money.

"Five hundred feet of water was bailed from the well, —the accumulation of two months while the rig was being set up—and as the bottom of the 860-ft. hole was reached the slush water carried visible evidence of liquid oil that rode down the slush ditch into the sump. This phenomenon has marked the last 200 ft. drilled in the well, before suspension of work, to a greater degree than was exhibited Sunday, as the pressure of 500 ft. of water had tended to chill the oil and retard its flow into the well. Drilling was begun Monday morning, and, as the ponderous bit smashed its way downward, cutting new ground, larger quantities of oil appeared in the slush as work advanced—this is the hopeful factor.

"Representatives of the important towns of southeastern Arizona made up the list of visitors. They appeared more than satisfied with what they saw and went home to impart their confidence to their local communities. Manager Washburn was tireless in his efforts to entertain his guests and tell them everything they wanted to know. He indicated that it would be his fixed policy to encourage visitors to the well and keep no secret from the public. He says that only some cataclysm of nature can balk the progress of the work and he looks for a speedy proving of the Bowie oil basin."

The Divining Rod Again

Evidence continues to pile up that there is money in divining rods. We have had this hunch for a long time, but have hesitated to give voice to it lest some unprincipled person should see a copy of the issue in which the tip was given and should attempt to turn our surmise into cash. We exercise great care in these matters, having the welfare of others at heart. But the news seems to have got around anyway, so there is no longer any need for us to keep silence. Let the innocent beware! If they would lose their money, let them invest in such devices.

A Riddle

"Congress is now made up of 531 men, endowed by their Creator with such mental powers as He intended them to have, and with such breadth of view, sanity and judgment, and knowledge of world affairs as their earthly environment has vouchsafed," said George A. Post, chairman of the railroad committee of the Chamber of Commerce of the United States. "Ninety-six of them sit in the Senate, and 435 sit in the House of Representatives. While the numerical size of Congress has increased, from time to time, its quality is about the same as it has always been."

In the light of the recent Congressional adjournment and the political effort to defend or criticize the status of legislation, can this safely be regarded as a condemnation of our national legislators, or should it lead us to believe that, after all, even a dilatory Congress is not going to get us into trouble if history can safely be taken as a precedent?

The Basement Complex

Modern children are precocious, and it is only natural that they should pick up words and phrases used by their elders. The seven-year-old daughter of an erstwhile geologist, playing with a bedraggled but cherished kitten, was asked what her pet was called. "Well," she replied, with a pedantic air, "there is considerable divergence of opinion. Daddy calls her a segregation from an intrusive magma of doubtful genesis; mother refers to her as the basement complex; sister Bessie insists that she is a typical example of secondary impoverishment; but I just call her my dear little Kitty."

CONSULTATION

Native Quicksilver

"Has native quicksilver ever been mined in the United States? It is our impression that the source of the metal is rare."

Although native quicksilver is an ore, it furnishes a relatively insignificant supply of the metal. Over 95 per cent of the domestic quicksilver comes from the bright-red sulphide of mercury, cinnabar, a very rich quicksilver mineral. In the native form quicksilver usually occurs as tiny globules—small amounts have frequently been found in mining exploration and occasionally in cavities of considerable size.

Cadmium Prices

"Will you please tell me how the present price of cadmium compares with its value for the past five years? Has this metal any broad application, or is its use in the manufacture of fusible alloys the principal one?"

The present quotation of $1.40 to $1.50 per lb. for cadmium is merely nominal. There is little business being done in this minor metal. As it is obtained mainly as a byproduct from zinc and lead refining, the supply of the metal is mainly dependent upon the output of those two major metals. Present quotations are about 25c. higher than the average for 1919 and about equal to the price during 1916, 1917, and 1918. The value was around $1.20 in 1915 and 90c. in 1914.

Cadmium's chief use is in alloy manufacture—mainly in fusible alloys— and as a substitute for tin in solders. The compounds of cadmium are used in paints and pigments and as salts to give luster to glass and porcelain.

Mining Oil Shales

"We are interested in the development of the oil-shale industry and intend to undertake the mining of the shale. Can you give us any information regarding the features of this particular variety of mining?"

When the oil-shale industry is developed, mining will necessarily have to take place on a large scale and will have problems peculiar to itself to solve. Open-cut methods, or quarrying, will be found satisfactory in some conditions, along the general lines of practice in this country. Underground mining will no doubt find wide application, and the method used will possibly follow coal-mining practice, as the conditions are similar. Not much mining or experimentation has been done, and there is little to guide in planning an attack on the problem. Standard methods of coal and metal mining will probably find applications, with modifications necessitated by the characteristics of oil shale. In coal mining the matter of fines usually defines the method of mining used, but in oil-shale mining there is no restriction as to fine material, as the substance will necessarily have to be crushed for redistillation purposes. However, the problems of ventilation will resemble those of coal mining—gas and dust explosions must be guarded against. The best type of drill and the most appropriate explosive remain to be determined for this embryonic industry. The physical character of the shale is such that percussion drills do not seem to work advantageously. In general, oil-shale mining will resemble coal mining more than metal mining. Incidentally the problem illustrates the consanguinity existing between the oil industry and mining.

Lithopone

"Will you kindly inform me as to how barytes is used in lithopone and what other substances combine to make up the composition of that material? Is lithopone of much commercial importance?"

Lithopone is a useful pigment manufactured from barytes and zinc. It is essentially an interior dull-finish wall paint, and has both advantages and disadvantages when compared with its rival pigments, zinc oxide and white lead. It is not affected by sulphur or hydrogen sulphide as white lead is, and is non-poisonous —a decided advantage. Furthermore, it is whiter than white lead. However, as an exterior paint, lithopone is not as satisfactory as other materials, owing to its tendency to discolor under direct sunlight, producing checks and a chalky surface. Mixtures of lithopone with other pigments such as zinc oxide are said to have removed this difficulty.

Lithopone is usually made by mixing and heating a solution of barium sulphide with a solution of zinc sulphate obtained from the chemical treatment of barytes and zinciferous products, respectively. A reaction takes place with the formation of a precipitate containing about 70 per cent barium sulphate and 30 per cent zinc sulphide intimately mixed, which is heated to a high temperature and quenched in water, rendering the powder more opaque and white. The process is a delicate operation and its success is dependent greatly upon careful manipulation. Some of the zinc sulphide is converted to the oxide in the heating process, usually from 1 to 10 per cent. Naturally, with a manufactured compound such as lithopone, trade secrets concerning the manufacture of the product are often carefully guarded.

The composition varies widely, and frequently another material, such as flake white, is added to enable the manufacturer to claim exceptionally meritorious qualities for his lithopone. Although there are many trade names for the pigment, such as Ponolith, Zincolith, and others, a graduation such as is indicated in the following table is frequently used:

	Zinc Sulphide	Barium Sulphate
Green Seal	1 part	2 parts
Red Seal	1 part	3 parts
Blue Seal	1 part	4 parts
Yellow Seal	1 part	5 parts

Green Seal is the best grade of the product, and the others follow in the order named. The lithopone industry is still in an infant state and is an important barytes consumer. It has been estimated that about half of the domestic production of crude barytes enters into the manufacture of lithopone.

THE PETROLEUM INDUSTRY

The Petroleum Section of Engineering and Mining Journal

THERE has been some question as to how far the old subscribers of the *Engineering and Mining Journal* found the Petroleum Section interesting and approved of it. The Petroleum Section was initiated on account of the frequent close and common interest between metal mining and petroleum mining, as expressed in our editorial of April 24, 1920, and with the belief that most of the metal-mining men were interested in the petroleum industry.

To get statistical data upon the situation, questionnaires were sent out to a representative and varied list of subscribers. To those subscribers the following questions were put:

1. Have you any interest in the Petroleum Section of the *Engineering and Mining Journal?*

2. If you are interested, is your principal interest in the metal mining or petroleum mining?

3. Do you approve of the Petroleum Section in *Engineering and Mining Journal?*

4. Would you be interested in seeing the Petroleum Section of *Engineering and Mining Journal* expanded, provided the amount of space and attention and metal mining is not reduced?

The answers received were carefully studied. A tabulation shows that 75 per cent, in answer to question 1, were interested in the Petroleum Section; 20 per cent were not interested; and 5 per cent were indifferent.

Of the 75 per cent who are interested in the Petroleum Section, it is illuminative to note that three-quarters of these, or 75 per cent, are interested principally in metal mining, only 10 per cent are interested primarily in petroleum, and 13 per cent are equally interested in both. These figures support, even more strikingly than we had anticipated, the close connection of metal and oil mining, and prove that most of our old subscribers find in the Petroleum Section something which touches their business or their interests at one point or another.

In answer to question 3 as to whether the subscriber approved of the Petroleum Section in *Engineering and Mining Journal,* we find even a larger proportion, due to the fact that many who are not interested in petroleum approve of the Petroleum Section; so that only 10 per cent disapprove of the Petroleum Section and 90 per cent give it their emphatic approval or their tolerance.

In regard to question 4, dealing with the expansion of the Petroleum Section, we find that there is a general feeling of satisfaction with the present size of the section; nevertheless about two-fifths of all the replies favor the expansion, providing it were not at the expense of the other mining interests. The general trend of votes, therefore, was in favor of very cautious expansion, if any were undertaken.

Of those in question which expressed an interest in the Petroleum Section, about 37 per cent were mining engineers; 19½ per cent mine executives; 13 per cent lawyers, bankers, brokers, capitalists, investors, metal merchants, and persons in general business; 13 per cent metallurgical engineers, chemists, and assayers; 11 per cent mining men; 4½ geologists; and 1½ per cent college professors.

The Scramble for Oil

Under the above heading, the *Compendium,* published in London, discusses the British petroleum policy, as follows:

"That country which controls the petroleum supply will control the trade of the world." So said the chairman of the Standard Oil Co. to the Foreign Trade Convention at San Francisco a fortnight ago, not without a note of regret that the British were the first to recognize this fundamental fact. It is as true today that the future lies with oil as that in the past the industrial greatness of Britain has been built up on coal. But coal is king no longer. The war, government control, and the miners have effectively dethroned it. It has become too scarce and too dear to hold undisputed sway. Very soon the world will no longer turn its eyes to Britain for coal, but rather to the tropic lands for oil.

There are no illusions on the subject among the leaders of British trade and industry. They see clearly that coal has a rival. With equal clarity they see that Britain's commanding position in trade is lost if she cannot secure oil wells commensurate with her coal measures. The world scramble for oil has already commenced, only, however, to find that Britain has been there beforehand. Thanks to the initiative of private enterprise, this country has secured over a wide area the rights to supplies which will to some extent, if not altogether, adequately safeguard her maritime and trading interests for a generation to come.

There is no need to retell when and how these oil fields have been opened up—that in Mexico, Central America, Trinidad, Persia, India, Burma, Egypt, the Straits Settlements, Russia and Rumania, British companies have acquired and are operating oil fields on an ever-extending scale; that the Anglo-Persian Oil Co., only latterly assisted by the government, has secured and is developing immensely valuable resources in South Persia, and that now North Persia is to be exploited. All this is well known. What is new and what has, unfortunately, raised a political controversy at home and abroad is the action of the government at San Remo in establishing its claim on the oil fields of Mesopotamia, in association with the Royal Dutch and Shell group.

Briefly stated, the position is this: In the peace settlement, Great Britain was given mandatory rights over Mesopotamia, which was formerly Turkish territory and in parts of which great oil fields were supposed to exist. But, before the war, a company in which Dutch, British, and German interests were represented received oil concessions expected to be of considerable value from the then Turkish government. The question of dealing with these concessions after the war naturally arose, and, though it was admitted that the German interests must no longer be considered, those of the Dutch were in a different category and must be recognized.

Then France was admitted to have a special interest in the Mosul area, which brought another group of interests into the case. Hence the understanding which has just been arrived at between the government and the Shell and Royal Dutch companies for the exploitation of the Mesopotamian oil fields. The exact detail of the arrangement have not yet been announced, but the broad fact that they sufficiently safeguard British interests may be accepted without hesitation. In the East, therefore, with Mesopo-

tamia and Persia added to the far-reaching resources of these companies, large supplies of oil are insured for this country, and in the west, as is known, such supplies have been in existence for years.

The Colombian Petroleum Law of December 29, 1919

To the Editor:

I have read with considerable interest the authoritative and timely study by J. W. Thompson of the recent Colombian oil legis'ation and your editorial comment which appeared in *Engineering and Mining Journal* of May 22. I have had occasion myself to go into this matter extensively and to examine the new law in its original, Spanish version.

I find that in certain important respects Mr. Thompson's article does not cover the ground as fully as, to me, seems desirable for a clear understanding of the conditions as now fixed by this law and which deserve to be discussed freely in the best interests both of Colombia and of the American investors.

I am advised that some American oil operators who are new to this field have taken exception to sundry features of this law, and it should be remembered, in this connection, that a large portion of the prospective oil resources of the country already have been acquired by powerful. foreign corporations under more liberal concessions that are not affected by the present law.

From a private communication on the subject I quote an abstract of the more important, novel features of this law:

Oil deposits, in public and private lands *alike*, when not alienated through an earlier government oil concession, are subject to the regulations of this new law and to payments to the government, as *royalties* on the gross output of oil (from both public and private lands), and, also, as *rentals* for the surface of the ground occupied on public lands. Classifications and provisions are:

Land Classification:

A. Public lands, "terrenos baldios," and all lands, including grants of lands recovered to or repurchased by the government, but not lands under navigable waters.

B. Private lands held under grants from the government of later date than Oct. 28, 1873.

C. Private lands under grants of later date than Oct. 28, 1873, and antedating Oct. 28, 1903.

D. Private lands under grants antedating Oct. 28, 1873.

Exploration for Oil:

On Class A lands, on "terrenos baldios," permitted without license.

On all other Class A lands, permitted only under government license.

On Class B and C lands, permitted only under government license and after previous notice to actual land owner.

On Class D lands, permitted without license, but only after filing a sixty days' advance notice with the Minister of Public Works.

Exploitation of Oil:

On Classes A, B and C lands, permitted only under government concession or contract.

On Class D lands, permitted only after filing notice of exploration, as above, and map of location, report of operations, and other details, within one year after beginning operations, with the Minister of Public Works.

Licenses for Exploration:

Issued for tracts of not less than 1,000 hectaras and not more than 5,000 hectaras. (One hectare approximates 2.5 acres.) Licenses cannot be issued to one applicant for more than three tracts in each department, and in frontier districts not more than one to each applicant.

On lands of Class C actual owners of the land have preference in the issue of licenses during the years 1920 and 1921.

The government may retire or cancel licenses at any time, and licenses do not convey any legal title or claim whatever.

Concessions or Contracts:

Size of tracts and number for each concessionaire, the same as for licenses.

Duration of contract, twenty years, with a renewal period at the option of the government for another ten years.

Bond: A minimum bond of $20,000 required for each concession.

Transferable only with the approval of the government and not at all transferable to foreign governments or foreign corporations in which foreign governments are interested financially.

On lapse and forfeiture of contract, all machinery and all other installations within the area of the concession become the property of the Colombian government without payment.

Forfeiture of contracts will be declared for a number of the usual causes, such as non-payment of royalties, rentals, or other charges, and also for failure to prove commercial deposits of oil within five years after date of contract, and for suspension of operations, without legal cause, during one entire year.

Concessions cannot be taxed by departments and municipalities.

Contracts do not need approval by Congress.

Payments to the Government—Royalties on the gross output of Oil:

For Lands in Classes A, B and C

Zone.	Base Minimum Per Cent.
A. Atlantic Coast frontier	20
B. Ecuadorean frontier	20
I. Within 200 kilometers of the coasts	10
II. Within 400 kilometers of the coasts	8
III. Beyond 400 kilometers of the coasts	6

For Lands in Class D.

I. Within 200 kilometers of the coasts	8
II. Within 400 kilometers of the coasts	6
III. Beyond 400 kilometers of the coasts	4

The above minimum base royalty applies to the first period of ten years; after which, for each subsequent ten-year period, the minimum base royalty will be increased by one "unit." Whether this "unit" means the entire base royalty or only 1 per cent, is difficult to understand. Possibly the official English translation may make this point clear. If it should be the former, it must be considered as excessive and confiscatory.

Annual rental on Area Covered by Concession:

		Cents per Hectare.
On lands of Class A.	First year	10
	Second year	20
	Third year	50
	Fourth year	$1

After the fourth year until the expiration of the contract, $1 per hectare.

Indemnities to Land Owners:

On lands of Classes B and C, according to stipulations of the Colombian Mining Law, Chapters 12 and 13.

On lands of Class D, according to private agreement.

Rights of Foreigners:

Foreign governments and foreign corporations in which foreign governments are interested cannot acquire oil concessions.

Foreign individuals and foreign corporations can only acquire oil concessions by declaration of submission to Colombian jurisdiction.

Rights of Private Land Owners:

Oil-bearing lands in private ownership which have not been developed within twenty years of the date of this law, will be penalized by a special land tax of $5 per hectare, until explored and developed, if proved oil bearing.

General Working Conditions:

The government reserves the right of inspection of operations and of records of production, and accounts.

At least 50 per cent of the workmen employed must be of Colombian nationality.

The fundamental novel feature of the law is that the Colombian government now asserts its right of eminent domain over oil deposits in all lands, public and private alike, in accordance with the old European principle of regal ownership to all mineral deposits (from this our own term "royalty" has been derived). This principle has prevailed in all Spanish-American countries since the time of the Spanish dominion as to all deposits of metallic minerals, and the new Colombian oil law now also extends it to oil deposits, by taxing all production a certain royalty, whether from private or public lands, and also by penalizing certain private lands with excessive taxes after a stated period until developed.

There could be no objection on the part of the foreign operator to this principle, as the royalties in a majority of cases are reasonable, if the new law were only consistent, but this is not the case. Though collecting production royalties on oil from all classes of private lands, on certain lands the government alone issues permits for exploration and grants working concessions, and in these cases the actual land owner is not concerned whatever, except in his right to a nominal indemnity for the surface actually occupied. On certain other private lands, however, the government, while collecting production royalty, does not require official licenses and concessions, but leaves the question of permit for exploration and contract or lease for operation to be settled with the land owner. Thus, in this class of land there is established a dual ownership to the oil deposits, which in practice probably will result in the collection of a double royalty, one by the government and another, equally large or larger, by the land owner.

In my opinion, either the royalty principle should apply only to public lands, or, if to all classes of lands, to all private lands alike, with the entire elimination of the land owner in the ownership of oil deposits.

Another unfavorable feature is the uncertain guarantee provided by the licenses and the fact that a license need not necessarily be issued to the first applicant. The original prospector thus may be spending his time and money in locating a tract of favorable oil lands, merely to furnish gratuitous information to a favored third party.

The anti-foreign clauses, as to jurisdiction and nationality of workmen, may also be objected to by many American operators. For myself I believe that these clauses will prove of small practical importance. In the last instance all these matters will rest entirely upon the goodwill of the parties concerned and their disposition to co-operate, and ultimately, also, on the state of friendly relations existing between the respective governments.

However, Colombia is a country that needs the co-operation of foreign capital, and therefore it ought to facilitate, by most liberal legislation, instead of hinder, the early development of its natural resources, including oil deposits.

OLOF WENSTROM.

Boston, Mass.

NOTE: Our readers, especially those interested in the oil problem in Colombia, are requested to communicate to the *Engineering and Mining Journal* their opinion of the Colombian mining law, that there may be a full discussion.—EDITOR.

Cementation in Sandstone

Deposition of Chemical Compounds From Solution in the Pore Space an Important Factor in Limiting the Extent of Oil Pools

BY ROSWELL H. JOHNSON*

Specially contributed to *Engineering and Mining Journal*

THAT the lateral limitation of many oil pools is the result of a more thorough cementation of the sandstone, rather than the occurrence of water, or a thinning of the bed, or of an increased fineness of the grain, is now well established. It becomes important, therefore, to know as much as possible of the progress of cementation, and especially of its distribution. The literature on the subject is not particularly helpful to the oil and gas geologist, as it has been written principally from the standpoint of the metalliferous deposits.

Thus, in his classic treatise on metamorphism, Van Hise places the greatest stress upon the zone of weathering or solution, which is said to lie above the zone of cementation. It is evident that the cementation is considered as the result, to a large degree, of the deposition of material dissolved in meteoric waters which have descended to lower levels.

As a matter of fact, in most oil and gas reservoirs, the inclosing rock has never been exposed to meteoric water. The oil or sand, when deposited, was covered almost at once by increasing depths of shales and other deposits, so that the deposits in question were taken far below the reach of meteoric waters. As a consequence, the history of the cementation must be worked out from a consideration of the connate and other fossil waters. These waters have produced far more cementation on the whole than that caused in Van Hise's zone of deposition from descending meteoric waters.

RECORDS OF CEMENTATION

The history of cementation falls into five phases:

1. The water which is deposited with the sand (the connate water) may carry material in solution which under some conditions may be deposited as a cement. Geologists know that coquina of quite recent origin will nevertheless be somewhat cemented, and it is probable that the connate water enriched by solution was the active factor. However, on the whole this phase cannot be considered important, for the reason that as the deposit in question becomes covered by a heavier and heavier overburden, the pressure on the water is therefore also increased, which increases its solvent action, so that, instead of deposition taking place, it would appear that cement might be actually redissolved were connate water alone considered.

2. The invasion of fossil water is a second phase. The compacting of the strata, especially the shale, is

*Presented at the Dallas meeting of the American Association of Petroleum Geologists, and published in *Engineering and Mining Journal* by authority of Council of the Association.

bound to extrude great quantities of water. Such water, in its migration, will, of course, follow the lines of greatest porosity, so that sandstone beds will receive water connate to the shale beds, which would be richer in dissolved material, owing to the less siliceous and more finely divided state of its particles. Cementation in this phase would therefore seem to be greater than in the first phase. However, as the depth from the surface is for the main part increasing throughout this phase, there is the same difficulty met before in that the waters are capable of holding in solution more and more material as the pressure increases.

3. As the heat and pressure become greater with increasing overburden, and stresses make themselves manifest, hydrocarbons are produced and enter the sandstone reservoirs in increasing amounts, there to be held by differential capillarity. Gas is more abundant at first, because thus far Quarternary deposits are found giving gas only where oil has not been contributed from below. Eventually oil, too, invades. But if the beds undergo such a history as to have their contained coal rank higher than 65 per cent in fixed carbon, the end of the invasion is solely by gas. The earliest invasion, as the drift gas of Iowa shows, has relatively more nitrogen and carbon dioxide, thus approaching marsh gas. It is largely of bacterial origin. The gas which follows, termed second-stage gas, ordinarily has some higher hydrocarbons, and the gas entering last (third-stage gas), if the area enter this stage, is more nearly pure methane, as at Poteau and Red Oak, Okla. The importance of this invasion is that water is displaced from the reservoir and cementation thereby arrested. Therefore, to study the distribution of closer cementation, the history of the hydrocarbon-filled volume must be known. This necessitates adding to existing knowledge the paleogeographic record of the formation, the history of its folding and stresses.

Importance of Record of Primary Hydrocarbon Lodgment

The places of early lodgment of hydrocarbons in the reservoir are of especial importance as indicating greater porosity. In homoclinal reservoirs these are at the original upper end and along the upper portion. They are also in the earliest anticlines. Conversely, ancient basins will be unduly cemented. Domes and anticlines formed only in the later history of a region will find the reservoirs already somewhat cemented, and hence have both the accumulation and the quantity of the hydrocarbon reduced.

Note that, as the percentage of gas relative to oil increases with time, late folds will entrap an excessive proportion of gas relative to oil. Is there not here one of three explanations for "gas-only pools"? The others are individuality of the source bed and the fact that any small dome in a general homocline has its catchment so gas filled as to spill on up the dip much of its earlier trapped oil.

The increasing proportion of gas in late invasions helps to explain some accumulations of gas on basinward sides in some pools where complete gravitional separation has been effected. Mills has shown that the loss of water vapor to gas reservoirs concentrates fossil water density, but this factor is relatively slight in this connection.

4. Phase of Increasing Solution—As the weight of overburden and other stresses increases the temperature and pressure, the waters become increasingly enriched. This has been shown in the deep Geary well. Cementation, therefore, is not only not increased, but is actually decreased in this stage.

5. Eventually, as drilling is done on land areas, elevation of the reservoir begins. Now, decreased temperature and pressure reduce the solubility and so increase the deposition of the materials which are of very slight solubility. Where the temperature and pressure have been great enough, even quartz is taken into solution in pure water, to be later deposited when temperature and pressure diminish.

The word phase has been used, but these items are not strictly successive phases, as they overlap to some extent and also oscillate as elevation and stresses oscillate. These oscillations are especially important, because the expansion of the gas leads to movement back and forward, facilitating the segregation and the separation of the oil and gas.

Bunker Fuel Oil Required

Fuel-oil tenders have been invited by the U. S. Shipping Board for one-, three-, or five-year periods, beginning Sept. 1. Bids were opened on July 15. The Shipping Board's statement in this connection reads as follows:

The Division of Supply and Sales, U. S. Shipping Board Emergency Fleet Corporation, invites tenders for furnishing such quantities of "C" grade bunker fuel oil as may be required for periods of one, three, or five years beginning about Sept. 1, 1920, for use by all ships under its ownership or control at ports, and in approximate quantities as follows:

Name of Port	Quantities — Barrels of 42 U. S. Gallons — Month	Year
Boston	77,000	925,000
New York	775,000	9,300,000
Baltimore	125,000	1,500,000
Norfolk	290,000	3,475,000
Philadelphia	250,000	3,000,000
Charleston	33,000	400,000
Savannah	100,000	1,200,000
Jacksonville	31,000	375,000
Mobile	31,000	375,000
Pensacola	15,000	175,000
New Orleans	96,000	1,150,000
Port Arthur	19,000	225,000
Galveston	40,000	475,000
Panama Canal	125,000	1,500,000
St. Thomas, V. I.	40,000	480,000
Bermuda	10,000	120,000
Ponta del Gada, Azores	31,000	375,000
Brest, France	83,000	1,000,000
Bizerta, Tunis	18,000	216,000
Durban, S. A.	15,000	180,000
St. Vincent, C. V. I.	23,000	275,000
Rio de Janeiro, Brazil	42,000	500,000

In addition to the above-mentioned ports, tenders will be considered at all other United States domestic and adjacent ports from which bidder is prepared to make delivery.

The buyer agrees to place at the disposal of the successful bidder, tank-steamer tonnage, at the Government time-charter rate of $6.50 per D.W.T. per month, in the amount necessary.

1. To move crude petroleum from producing terminals to refining centers and,

2. To move fuel oil supplied at any port from successful bidder's nearest refining center to such port or ports.

World's Largest Oil Well

The largest oil well in the world is believed to be in Mexico. It is known as the Cerro Azul No. 7, and is reported to yield 370,000 bbl. of oil every twenty-four hours.

NEWS FROM THE OIL FIELDS

Mexican Oil Law Will Provide Protection

President de la Huerta Says New Decree Will Give More Liberal Interpretation of Article 27

A decree, soon to be issued, will, it is believed, settle the Mexican oil situation permanently and provide protection of the rights of American holders of oil property in Mexico. In a recent interview, President de la Huerta of Mexico stated that the Mexican government will insist upon the principle of national ownership of soil, and added that controversies now existing would be settled in a manner satisfactory to all. He declared this would be done by issuing a decree granting owners of oil properties a five-year period to file claims to land that is theirs either by direct sale or lease. If such claims were not filed within a required period, others would then have the right to file claims to the same property. When claims were finally awarded, the right to drill for oil would become exclusive and perpetual prerogative of claimant.

De la Huerta said the forthcoming decree would supersede those issued by Carranza regime, which oil operators had declared were confiscatory. He said Article 27 of the constitution would not be changed, but this would be given a much more liberal interpretation than in the past. He admitted the Carranza decrees contained many unjust provisions. He said the new decree would give oil-property owners preference in development, whether their property was acquired before or after the 1917 measures were enacted. He said rentals would be charged for the lands, but that the rentals to be fixed would be materially reduced.

De la Huerta will act as judge and final arbitrator. He said the solution above suggested was only his personal opinion, but added his belief that this principle would prevail. He said that there was little doubt General Obregon would agree to this solution. De la Huerta will formulate an oil law which he will present to the Mexican Congress when that body meets next September.

The oil-well supply industry of United States has not been able to keep up in last few years with demands of petroleum industry for drilling equipment, according to the *Wall Street Journal*. In 1919 it is estimated that approximately 30,000 wells were drilled in the United States, and in 1918 the number was 25,700. Based on the estimate of a prominent oil man, the average cost of drilling a well is $20,000.

Kentucky Oil Fields

From Our Special Correspondent

Latest reports from Bowling Green, Warren County, state that the well completed recently by Jorstatter and associates in the Davenport pool is believed to be the biggest producer in the field. It is estimated by reliable oil men to be larger than the famous Tarrant well in the same pool, and only about 500 ft. away. The Tarrant well is said to be yielding $25,000 worth of oil a month.

The Big Sandy district of Eastern Kentucky is showing a creditable production. In the Johnson-Magoffin field, several new wells have been developed, producing from 20 to 75 bbl. per day from the Weir sand at a depth of about 1,000 ft. The Cumberland pipe line has been taking oil from this field for several weeks. One of the best of the late discoveries was the Bed Rock Oil Co's Griffith No. 3 which started flowing when the sand was entered. Along the Magoffin-Morgan border, an advance test drilled by the Kenton-Morgan Oil Co. on the Howard farm is rated as a 100-bbl producer. In Floyd County, the Upper Big Sandy country, the first well to be drilled through the corniferous sand has just been completed on Bull Creek at a depth of 2,400 feet. This deep sand showed two pay streaks and is considered a profitable strike.

Nevada Corporation Closes Books

From Our Special Correspondent

The hopes of a number of business men and residents of Elko, Nev., who recently incorporated the Elko Oil Corp., were dashed when Prof. Frederick J. Pack, of Utah, informed them that there was an entire lack of indications pointing to the existence of oil on their holdings at Adobe Flat, six miles north of the city. It was believed that there were good possibilities for the finding of oil in the field and those interested deposited $100 each for the purpose of determining the merits of the holdings. The company will return to its members the amounts paid in, less expenditures to date, and with the disincorporation of the company, one of the cleanest oil promotions will come to an end.

Professor Pack stated that his report of the Elko field by no means indicated a lack of oil in other sections of Nevada. It is his belief that Nevada has better indications of oil than Utah, where oil was found some years ago along the San Juan river, and more recently at Moab, though the well at the latter place does not show oil in such quantity as to justify hope of commercial exploitation.

State of Texas Awarded Stevens County Lands

Gulf Production Co. Pays Royalty on Oil Produced — News from Other Counties

In the case "The State of Texas vs. The Gulf Refining Co. et al," the Fifty-third District Court recently awarded the state 160 acres of oil-bearing land in Stephens County, valued at $8,000,000, and royalty amounting to $80,000. P. K. Shuler, of Waco, a co-plaintiff, was awarded $200,000 as his share of the royalty on oil produced from this land by the Gulf Production Co., as he holds the mineral lease.

In Mitchell County, the well of the Underwriters Oil & Gas Co., two miles west of Westbrook, has oil standing 160 ft. in the well. It is believed that to the southwest, between this well and the McDowell well in Glasscock County, twenty miles southeast of Big Springs, an oil field will be opened. Oil standing in the McDowell well was not appreciably lowered by bailing. Later, it is claimed that several hundred barrels of oil daily are being produced by swabbing.

Seven wells are being drilled in Brewster County. The Presidio Oil & Gas Co. will test its well for oil, a showing having been obtained near 1,700 ft. In Pecos County, the Montezuma Oil Co., of California, will drill for oil, having leased a large acreage.

The total oil produced in the state of Texas during the month of June was approximately 8,000,000 bbl. Divided into sections, North Texas and Central West Texas produced about three million bbl. each, and the Gulf Coast about two million bbl. During the month 522 completions were made, and of these 340 were productive, making an initial daily production of 72,000 bbl. as compared with 139,000 bbl. initial production for wells completed during May.

The largest producing well in the Texas coastal fields completed during the week ended July 3 was the No. 3 Jones-Stateland of the Humble Oil & Refining Co. at Goose Creek, flowing 1,000 bbl. daily. This well is on submerged land, and is over 2,200 ft. deep. At West Columbia, three producing wells were completed during the week, No. 37 Hogg, Texas Co., making 550 bbl. daily from 3,000 ft.; No. 38 Hogg, same company, making 300 bbl. from 3,285 ft., and the No. 4 Marmion, Crown Oil & Refining Co., pumping 100 bbl. from 3,425 ft.

At least two wells at Goose Creek now drilling are reported to be below 3,700 ft. The deepest oil-bearing stratum found in the field so far is 3,400 ft., but rock salt has not yet been struck and there is a possibility that deeper oil may exist.

ECHOES FROM THE FRATERNITY

SOCIETIES, ADDRESSES, AND REPORTS

Geologists as Expert Witnesses Are in Scientifically False Position

Dr. Ransome Suggests the Court Call in Unattached Experts Paid From the Public Treasury

In an editorial in the current number of *Economic Geology*, Dr. F. L. Ransome discusses at length the question of geologists as expert witnesses. He mentions the tendency toward disapproval of the present practice and adds:

"Nor is disapproval confined to the lay public; many judges, sorely tried by the conflict in testimony that should be impartial, have been tempted to exclaim with Mercutio, 'A plague o' both your houses!' and some have even instructed the jury to disregard the expert testimony entirely. Unquestionably, the modern practice in mining lawsuits of employing numerous highly paid geological experts on each side, has enormously increased the costs of the litigation, not only by the fees paid but by greatly swelling the bulk of the testimony and by protracting the hearings."

Dr. Ransome points out that the frame of mind of a scientific investigator and that of an expert witness who is retained by one party in a controversy are fundamentally different and opposed. He qualifies this situation by stating:

"In view of the fact that many eminent and honorable men of science have accepted positions as expert witnesses, it is not justifiable to assert roundly and without qualification that such acceptance is morally wrong. Certainly, the intent of wrongdoing has usually been absent, and many such witnesses may have been thoroughly convinced of the inherent righteousness of the cause espoused. Nevertheless, I believe that it must be admitted that the geologist who becomes an expert witness for one side in mining litigation places himself in a scientifically false position."

Dr. Ransome sums up the case as opposed to the practice as follows:

"It is admitted that such work is not only profitable but is often intensely interesting, and may give opportunity for scientific observations of value. The temptation to engage in it may be very strong. Can a man who cherishes the highest ideals of scientific work afford to yield to it, under the existing practice of employing expert witnesses? Opinions on this question will differ, but my own belief is that in general he cannot. . . . It has been said that a witness before he undertakes a case may be sure of his ground. As a rule no geologist can tell in advance what all the developments in a suit will be, and it is doubtful whether a geological expert witness can escape being a partisan witness when he is employed by one of the litigants with the obvious intent that he shall help to win the case."

Dr. Ransome is inclined to favor the plan "that the judge himself, on any issue involving expert scientific knowledge or opinion, should call in one or more experts, such expert or experts being merely additional to those called by the litigants." Such unattached experts would presumably be paid from the public treasury, as part of the official expenses of the trial. He observes that "there is nothing in the proposal to prevent each party to the suit from having its own geological experts in court or from having its evidence prepared under the direction of geologists, who need not appear as witnesses. It is believed that the tendency would be to keep the litigants' geologists out of court proceedings, and in any event their number should be limited to three or less on a side."

Congress Grants a Pittance

The Sterling-Lehlbach bill which provides for the retirement of Government employees has just become effective, and those in the Federal service above 62, 65 or 70 years of age, according to the branch of the service, are to be retired on a pay which is pitifully small, especially for those who have occupied responsible positions. After thirty years of service retirement is on the basis of 60 per cent of the salary, but a maximum of $720 per year limits the retirement pay. Those who have been fifteen years in the service retire on a 30 per cent basis, but here again the maximum retirement pay is limited to $360 per year.

It is certainly gratifying to know that Congress has at last recognized the principle of retirement provision for superannuated civilian employees. However, it is not pleasant to consider the situation of a technical expert who has been in the service for thirty years and under the new law required to surrender two and one-half per cent of his basic salary, being provided with the munificent (?) reward of $60 per month when he retires for old age. The professional men of the country cannot look with any degree of satisfaction on such an arrangement.

It is incumbent on our technical men and organizations to get busy and see that a more nearly adequate arrangement is made for the retirement of specialists. Particularly for those in technical and other professional lines the retirement should be upon a basis comparable with the dignity of the position which they have occupied. This is essential to restore the Federal services to self-respect and reliability.

Liquid Oxygen as Explosive

Its Development Before and During the War Traced and Discussed

Advantages and disadvantages of liquid oxygen explosives are discussed by George S. Rice, the chief mining engineer of the U. S. Bureau of Mines, in Technical Paper 243, just issued. Mr. Rice's report goes minutely into the development of liquid oxygen explosives during the war. The paper describes the results of experiments conducted by the Bureau at its explosives testing station near Pittsburgh, Pa., and gives an account of the methods of use as developed in Germany, observation on its use by the Germans for destroying French iron and steel plants, and an abstract of a German military paper on instructions for using liquid air explosive.

During the war the growing scarcity of glycerine and ammonia greatly increased the cost of dynamite. This caused the Bureau of Mines to investigate the possibilities of liquid oxygen explosives, which do not require nitrates. Results of the preliminary testing begun in April, 1917, were decidedly favorable. Mr. Rice, while in Europe, in 1919, as a member of a committee to observe progress in post-war industries, paid special attention to liquid-oxygen explosive. The Germans were found to have used the explosive, known as "oxyliquit," extensively in non-gaseous coal mines, in excavating subways and tunnels, in quarrying, and in iron mines, as well as for destroying French steel plants.

The explosive was first tested at a coal mine in Germany, in 1897, following Linde's invention of his liquefying apparatus in 1895. Trials made in driving the Simplon Tunnel are said to have been favorable.

In 1900, Claude, of France, patented the rectification principle. Linde, in 1902, designed his rectification apparatus. Both types of apparatus are extensively employed in liquefying gases. In 1904, Dewar, of Great Britain, invented the Dewar flask—a container for liquefied gases. Further development of liquid oxygen for blasting purposes was inconsequential until the war began.

The Allied countries, being able to import nitrates from Chile, did not take up its use, but if the war had continued the United States would probably have been compelled to do so. The method will now have to depend on its merits and on commercial conditions.

The experiments of the Bureau of Mines have shown that a liquid oxygen explosive can be prepared which has a blasting strength greater than 40 per cent straight nitroglycerin dynamite. This was shown by tests in the stand-

ard testing apparatus of the Bureau, as well as in blasting.

The procedure adopted was to place a No. 6 detonator in the inner cartridge, a cheesecloth sack containing carbonaceous material. The cartridge is soaked in liquid oxygen ten to fifteen minutes in an improved container devised by the Bureau. The cartridge, frozen stiff, is slipped into a pasteboard container, placed in the hole, a wad of cotton placed on it, a brass tube inserted, and clay tamped around the tube. The hole left by the tube provides an outlet for evaporating oxygen, until the shot is fired.

The advantages, as compared with dynamite and black blasting powder, are lower cost per ton of material blasted, elimination of dangers in transportation, from premature ignition, misfires, or unexploded sticks in ore or coal, in handling and thawing, or in storage magazines.

The disadvantages are: the liquid oxygen, because of its rapid evaporation, must be used quickly after charging, thus limiting the number of shots. A liquefying plant must be maintained near the mine. The explosive cannot be used in gaseous coal mines.

Its introduction into mines is difficult, because miners are not accustomed to it. The method offers great possibilities for lessening blasting costs in non-gaseous coal mines, and in metal and mineral mines using a chamber method where only a few shots are fired at one time. The chief cost is that of the oxygen, but there is hope of a decided reduction in cost through promised improvement in liquefying machines.

Manitoba Branch of Canadian Mining Institute Elects Officers

At the annual meeting of the Manitoba branch, C. M. I., the following officers were elected: Prof. R. C. Wallace, chairman; W. J. Dick and B. Stewart McKenzie, vice-chairmen; J. S. DeLury, secretary-treasurer; and L. G. Thompson, assistant secretary. J. W. Harris, G. B. Hall, E. W. Jackson, R. C. W. Letts, A. M. Stewart, R. Kerr and J. A. Campbell were elected to the council.

Engineering Section of National Safety Council held its summer meeting in co-operation with the Western Society of Engineers recently in Chicago, Ill.

The morning session heard the reports of the committees on education, on safeguarding machinery at the source, and on codes. In the afternoon all the discussion centered about safety for power-press operators, and the fundamentals of a safety code for metal-working power presses.

An informal dinner was held at Hotel La Salle in the evening. Among the speakers were W. G. Nichols of American Manganese Steel Co., who spoke on "The Engineer and Production," and S. J. Williams, whose subject was "Safety and Engineering Efficiency."

Holmes Safety Association Awards Gold Medals

Presentation Next September at Denver —Three Lost Their Own Lives but Saved Others

The Joseph A. Holmes Safety Association announced on June 29, the award of gold medals and diplomas to four Western miners and to the nearest surviving relatives of three others who lost their lives in attempting to rescue other miners from death. The formal presentation of the medals will be made by Dr. F. G. Cottrell, director of the United States Bureau of Mines and president of the association during the First Aid and Mine Rescue contest at Denver, Col., next September. The men who will be awarded gold medals and diplomas and the deeds they performed are as follows:

John L. Boardman, of Butte, Mont., safety engineer for the Anaconda Copper Co., who lone-handed saved three miners from death by gas in the West Colusa mine during a fire in the Leonard copper mine adjoining. He entered the gas-filled mine four separate times to save life.

Daniel Bionvich, of Biwabik, Minn., employee of the Balkan Mining Company, who drove his electric locomotive through smoke and gases in the burning Belgrade mine three times, bringing out helpless men. A fourth time he descended the shaft ladder and brought out a fellow-worker.

James Collins and **James Dilimirk**, both of Mullen, Idaho, employees of the Gold Hunter Mining & Smelting Co. While endeavoring to reach two entombed men in the mine, they themselves were caught by a cave-in, buried to the shoulders, and imprisoned for fifteen hours. The other two entombed men were finally brought out alive after fourteen days.

The following three miners sacrificed their lives in trying to save others:

Michael Conroy and **Peter Sheridan**, of Butte, Mont., both employees of the North Butte Mining Co., started down into the mine to save their fellow-men from the burning Speculator shaft, but before they reached the men at the 2,200-level the fresh air which had been coming down the shaft reversed, allowing hot and poisonous gases to come up the shaft. When the cage was hoisted to the surface, the bodies of the two brave men were found on the cage burned to a crisp.

James D. Moore, another miner at the same North Butte Mining Co. fire, collected seven men to bring to the surface, then he was driven back by smoke. He led them into a blind drift, built a bulkhead against the gases and kept up the spirits of the eight men until rescued. Sixty hours after the completion of the bulkhead, rescuers wearing apparatus found the barricade and broke through and found six men alive, though Moore and one other were dead. The six men were brought safely to the surface; they all gave credit to Moore for saving their lives.

The awards were decided upon by a committee of the Association, composed of James W. Paul, representing the Mine Inspectors' Institute of America; William Green, of the United Mine Workers of America; and John Turner, of the Mine, Mill and Smelter Workers. Others who participated in the making of the awards were James Lord, United Mine Workers of America; George S. Rice, American Institute of Mining Engineers; David White, National Academy of Sciences; O. P. Hood, Society for the Promotion of Engineering Education; Arthur E. Holder, representing Samuel Gompers, President of the American Federation of Labor; Charles D. Walcott, vice-president, and David T. Day, secretary of the Association.

Company Stores Barred on Rand —Only Act of Parliament Can Legalize Them

The institution of the company store is meeting difficulties in South Africa. The London *Financial Times* recently printed the following:

"From the onlooker's point of view it seems a pity that the appeal in the test case as to the legality of the Rand mining companies supplying goods to their native employees on favorable terms should have been dismissed. Only action by the Union Parliament could now legalize the innovation. The following is a report of the original hearing:

"'In the South African Supreme Court (Transvaal Provincial Division) case—Isaac Feinstein vs. the Modderfontein Deep Levels and the Native Recruiting Corporation—in which application has been made for an interdict against respondents on the ground that they were interfering with him by trading on mining ground, Sir John Wessels, in the course of his judgment, said: "The essential idea underlying trade is buying and selling. We may say with certainty that if a person buys and sells with the intention of making a gain out of his transaction he is carrying on a trade. He may, however, be carrying on a trade even though he does not contemplate a profit. If a charitably disposed person sets up an establishment for baking and selling bread to the poor at cost price he is certainly carrying on the trade of a baker." The Judge came to the conclusion that respondents were carrying on a trade or business, saying, "The company sells the goods at cost price because it is to its advantage to do so. It keeps its natives contented by enabling them to get the goods cheaper. This advantage is a gain to the company."

"'His Lordship further held that the goods sold by the company to their employees were not incidental to mining. An interdict was granted restraining the respondents from trading in such goods as shirts, trousers, socks, tunics, blankets and similar articles, with their native employees. Costs were granted to the applicant.'"

Book Reviews

Mining and Preparing Domestic Graphite for Crucible Use. By George D. Dub and Frederick G. Moses. Paper; 6 x 9; pp. 80. Published as Bull. 112 by the U. S. Bureau of Mines. For sale by the Superintendent of Documents, Washington, D. C., for 20c.

The graphite industry in this country normally cannot compete with that in Madagascar and Ceylon. There the deposits are large and of very high grade; also labor is cheaper than here. During the war, domestic graphite production boomed, on account of a shortage of imports, but since that time many companies have suspended operations, though many are still making money, recent reports from Alabama being particularly encouraging. Alabama and New York have the principal deposits, production from the former ranking first. Alabama is under the disadvantage, however, of being at some distance from the principal market, and from the low grade of the deposits, as the average extraction is only 19 lb. of No. 1 flake per ton. Pennsylvania has produced some graphite, and Texas contains large high-grade deposits which could be worked at a profit if marketing conditions were better.

Mining, concentrating, and refining methods are described in this book. Open-pit mining is general in Alabama, but underground working also is carried on in New York. After crushing, the ore is concentrated by one of several methods: skin flotation, the pneumatic process, the log-washer process, tabling, the Huff electrostatic process, and froth flotation. The log-washer plant is the cheapest to install and to operate. The concentrates are dried, ground in a buhr mill and screened, the graphite remaining on the screen. To treat 10 tons per hour, a complete plant would cost fom $40,000 to $70,000.

Tests conducted by the Bureau showed that two other finishing processes might be used: (1) Treating the crude concentrates in an electrostatic separator, followed by grinding in a buhr mill and screening. (2) Grinding the wet concentrates in a pebble mill, followed by froth flotation, drying the flotation concentrates, regrinding in a buhr mill, and screening. Each type of concentrates was found to be a problem in itself.

E. H. R.

A Vocabulary of Russian-English and English-Russian Mining Terms. By C. W. Purington. Cloth; 4 x 3½ in.; pp. 128. J. B. Lippincott Co., Philadelphia, Pa.

This little book contains about 1,600 words, compiled as a result of the author's engineering experience in Siberia. It should be helpful to those who have occasion to carry on work in Russia without a good knowledge of the language, and to those who are called upon to translate English-Russian engineering matter. Russian characters are of course used in spelling the words in that language. We do not know the price of the book, but, being very small, it is probably inexpensive.

Technical Papers

Natural Hydrocarbons — In its *Reports of Investigations* for May, 1920, the Bureau of Mines discusses the occurrence, mining, treatment and utilization of the natural hydrocarbons, such as gilsonite, elaterite, wurtzilite, grahamite, and ozokerite. A bibliography is appended.

Western Australia Statistics—The Pocket Year Book of Western Australia, for 1920, has been issued by S. Bennett, government statistician, Perth, presumably free of charge. It contains 117 pages of miscellaneous statistics, and is of vest-pocket size.

Sulphur Smoke—"Sulphur Dioxide as a Factor in the Smoke Problem of Salt Lake City" is the title of one of the mimeographed Bureau of Mines *Reports of Investigations* for May. (6 pages.) A considerable number of SO_2 determinations are given. Some of the samples were collected with an airplane.

Zinc—"Zinc in 1917" has reached us. A list of smelters is given and general data pertaining to the industry. The pamphlet is published by the U. S. Geological Survey and will later be incorporated in "Mineral Resources."

Lead Smelting—The June issue of the *Bulletin of the Institution of Mining and Metallurgy* (No. 1 Finsbury Circus, London, E.C. 2) contains twenty pages of discussion of Rigg's paper on Broken Hill practice which we reviewed on June 19.

Belgian Metallurgy—The May 15 number of *Revue Universelle des Mines* (16 Quai des États-Unis, Liège, price 5 frs.) contains a 50-page illustrated article on the metallurgical industry of Belgium before, during and after the war.

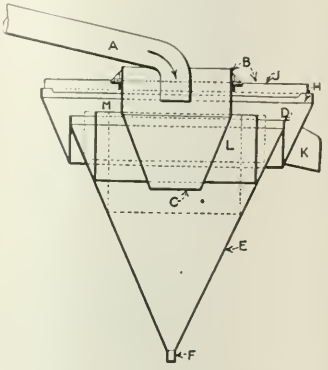
British Mineral Production—A brief history of the mineral production of the British Empire, by Frank Merricks, occupies twenty-seven pages in the May *Bulletin of the Institution of Mining and Metallurgy* (No. 1, Finsbury Circus, London, E. C. 2). Complete statistical tables of the value of the principal minerals produced by each of the various dependencies from 1893 to 1917 are appended.

Carnotite—Some hints to the prospector and a description of conditions in the Utah-Colorado carnotite fields are given in an illustrated article in the *Salt Lake Mining Review* for June 30. (Salt Lake, Utah. Price, 15c.).

Recent Patents

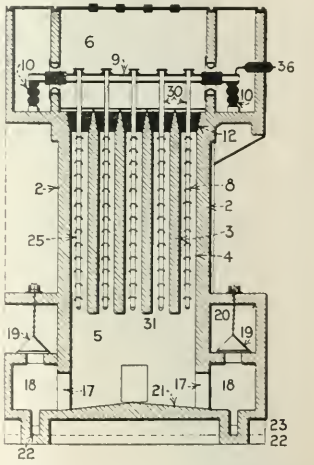
1,339,683. Upward-Current Separating Process and Device. Charles Allen, El Paso, Tex. Filed July 3, 1917.

A method of varying the upward movement of a liquid carrying solid particles overflowing the top of the tank in a settling device by varying the length of the overflow periphery, whereby the velocity of the overflow of the liquid over the overflow lip is controlled.



1,339,480. Art of Separating Suspended Particles from Gases. Walter August Schmidt, Los Angeles, Cal., assignor to International Precipitation Co., Los Angeles, Cal. Filed Aug. 27, 1917.

In the art of precipitating suspended particles from gases by electrical action, the method of maintaining a clean



electrode surface for receiving the precipitated material, which consists in distributing a liquid in a film, over a porous surface constituting a receiving electrode.

MEN YOU SHOULD KNOW ABOUT

H. G. Ferguson is examining potash deposits in the vicinity of Silver Peak, Nevada.

Elmer A. Holbrook, assistant director of the United States Bureau of Mines, took the oath of office on July 10.

C. F. Kelley, president of Anaconda Copper Mining Co., is in Butte on an inspection of the corporation's properties.

A. K. Knickerbocker, of Cuyuna, Minn., has been examining properties in the Batesville, Ark., manganese district.

G. C. Martin will make geologic surveys and investigations of mineral resources in the lower Yukon and Kuskokwim regions of Alaska.

A. G. Burritt, geologist, of Salt Lake City, Utah, has recently completed examinations of oil lands in Fremont, Sweetwater and Lincoln counties, Wyo.

J. B. Tyrrell, mining engineer and geologist, of Toronto, has gone to the Rice Lake gold district of Manitoba, to examine the Gold Pan and other properties.

Harold A. Linke, mining engineer, 226 Dooly Building, Salt Lake City, Utah, has just returned from an examination of oil lands in western Utah near Great Salt Lake.

Robert Linton, president of North Butte Mining Co., 120 Broadway, New York City, is in Butte, Mont., making his periodical inspection of the company's property there.

Bart L. Thane recently passed through Seattle on his way to Juneau, Alaska, where he will visit the property of the Alaska Gold Mines Co., of which he is managing director.

Frank A. Hughes, consulting engineer, of Philadelphia, Pa., has gone to Arizona to make examinations in the interests of the Arizona United Mining Co., Johnson, Cochise County, Ariz.

John E. Bergh, of Sturtevant & Bergh, mining engineers, Salt Lake City, Utah, has gone to Chesaw, Washington to commence development on a mining property in that district.

Frank L. Hess, of Washington, D. C., has returned from his trip to South America for private interests; but will not resume his work with the Geological Survey until later in the summer.

W. C. Hudson, mining engineer, returned to New York City recently from Ecuador, where he had been during the last two years as exploration engineer in the interests of the South American Development Co.

Charles William Wright, mining engineer, of 28 Via Parlamento, Rome, Italy, and his brother, **C. A. Wright**, who was formerly with the U. S. Bureau of Mines, sailed from New York for Italy on July 8.

E. P. Mathewson, consulting metallurgist, who has been studying the Granby smelter at Anyox, B. C., left there about July 1. After a brief vacation in Montana, Mr. Mathewson will return to New York City about July 17.

John L. Malm, of the Malm-Wolf Co., sailed on July 6 from New York for England and the Continent. Mr. Malm will visit metallurgical establishments in England, Belgium and France before returning to New York early in September.

Thomas Turnbull, of Crosby, Minn., superintendent of the Croft mine, has been appointed Cuyuna Range superintendent of the John A. Savage properties, the Croft and Sagamore, to fill the vacancy caused by the death of John F. Murphy.

JAMES M. HILL

J. M. Hill, who has been placed in charge of the San Francisco office of U. S. Geological Survey, was born in Chicago, Ill., Feb. 14, 1884. His education was obtained in that city. He was graduated from the University of Chicago in 1906, and there attained the senior scholarship in geology. In addition to post-graduate work in the University of Chicago, he studied at Armour Institute and at the Michigan School of Mines. Practically all of Mr. Hill's experience has been with the U. S. Geological Survey, which he joined thirteen years ago. He has done geological reconnaissance work in practically all the Western states and has been engaged in several detailed geological studies in the West. Since 1912 he has been attached to the Mineral Resources Division of the Survey, and most of that time he has spent in specializing in platinum, gold, silver, and other precious metals.

J. B. McIntosh, superintendent of construction at the Murray plant of the American Smelting & Refining Co., has resigned to accept the position of chief mechanical and construction engineer for Cia. de Real del Monte y Pachuca. Pachuca and Hidalgo, Mexico, and left for Mexico on July 15. Mr. McIntosh acted as civil engineer for the Anaconda Copper Mining Co. for many years, having a prominent part in the construction of the Washoe smelter. In 1907 and 1908 he was engineer in charge of construction for the company's Tooele smelter, but resigned to go to Bisbee, Ariz., where he directed the preliminary work on the Clarkedale smelter. For the last eight or ten years Mr. McIntosh has been attached to the engineering division of the Utah department, A. S. & R. Co., and has executed several notable improvements in that company's plants.

OBITUARY

Enos A. Wall, mining man of Salt Lake City, Utah, died there on June 29 at the age of 81 after a long illness. Mr. Wall was one of the prominent mining men of Utah for many years, being particularly identified with the Utah Copper Co. holdings which brought him great wealth. He was born at Richmond, Ind., on June 23, 1839, went to Colorado in 1860, and in 1863 was prospecting for gold in Montana where he engineered the short-cut from Fort Bridger, Wyo. In 1889 Wall, whose inventive mind had already produced a number of new designs in mining machinery, recognized the possibility of concentrating and recovering value from the low-grade copper ores at Bingham Canyon and he at once started to secure the property which later formed the foundation of Utah Copper Co. prosperity. The law suit over the finances of that company, which he started in 1906, was later withdrawn and it passed under the Guggenheim interests. In recent years he had undertaken the rejuvenation of an old Park City property.

SOCIETY MEETINGS ANNOUNCED

Nevada Section, American Institute of Mining and Metallurgical Engineers, has postponed indefinitely the meeting previously scheduled for June 25-26 at Tonopah, Nev. Probably the session will be held in November.

It has just been definitely announced that **Third International Mining Convention** at Nelson, B. C., will be held on July 20 to 24. The officials in charge of arrangements plan that, in addition to a very interesting program and mineral exhibits, there shall be an enjoyable and instructive excursion to the leading mines of the Slocan district. Those interested should address Fred A. Starkey, Associated Boards of Trade, Office of the Commissioner, Nelson.

Flotation Inquiry Resumed in San Francisco

Latest Testimony Before Federal Trade Commission Reveals Little Not Already Known

The Federal Trade Commission hearing in the Minerals Separation case, transferred from New York to San Francisco, was resumed on July 6 and continued until July 10, Commissioner Huston Thompson presiding. G. R. Hawkins and C. R. Porter appeared as counsel for the commission and Alfred A. Cook for Minerals Separation, with C. B. Allen as secretary.

E. H. Nutter, the chief engineer for the flotation company, was the first witness. He testified as to his duties and to the work of his technical staff. Some of the sources of information were given, whereby lists of probable infringers were compiled. Some of the company's instructions to field employees were made clear, and the practice of maintaining a complete file of clippings was explained. Licensees were given the benefit of any new ideas secured by Minerals Separation as part of the service for which they paid. No entrance to licensee's plants was demanded without permission. Mr. Nutter mentioned the matter of charging infringers a double royalty for the period of infringement and defended the company's policy by saying that it would be unjust to licensees if those who had not taken out licenses were treated no better than those who had evaded payment for the privilege of using the process. The relation of the favored licensee was also explained.

J. A. Pearce, a metallurgist of Berkeley, then testified as to the restrictions which he encountered from the Minerals Separation company, when he attempted to introduce a flotation machine of his own invention. W. B. Shores of the Stimpson Equipment Co. told of his attempts to introduce Janney flotation machines into the mill of the Engels Copper Co. and of the opposition encountered from M. S. James L. Freeman of Chicago testified as to the royalties paid to Minerals Separation for the use of their process on Alaskan gold ore.

Cordial relations had always existed between his company and the flotation concern, according to D. E. Paxton of the Engels Copper Co., who said that the success of his company depended upon the use of the flotation process. However, he considered that under the present circumstances the royalties to Minerals Separation were burdensome.

Theodore J. Hoover testified concerning his employment with the defendant company and introduced the Sulman and Picard manuscript on the theory of flotation by surface tension. After argument by counsel this was allowed to go into the record. The witness believed the Minerals Separation royalties to be excessive and their restrictions on the publication of information in connection with the development of flotation, onerous. Being criticised for his ethical position in publishing information obtained while in the employ of M. S, he stated that he considered it a public service for him to make known such information. On cross examination, Attorney Cook introduced the terms of Mr. Hoover's employment contract and showed that Hoover was in the employ of the Miami Copper Co. from July, 1919, to April, 1920.

The general phases of the situation were discussed by T. A. Rickard, who gave the opinion that Minerals Separation had only contributed to the development of flotation, and that much of the work had been done by others. W. B. Shores was then recalled and testified as to the comparative tests of Janney and M. S. machines and related what he considered unfair statements of Minerals Separation relative thereto. J. B. Quigley and A. Roberts of Minerals Separation told of their field duties and instructions.

The whole hearing really developed little which was not known before.

WEEKLY RÉSUMÉ

The Federal Trade Commission holds hearings in San Francisco reviewing flotation litigation. The testimony presented reveals little that has not been disclosed by court procedure elsewhere, although much information is forthcoming from both sides. The Northern Minnesota Ore Co. transfers its manganese operations from Cuyuna, Minn., to Batesville, Ark., due to prohibitive Minnesota mining costs and a small manganese market. The Minnesota mines are permitted to be flooded. The mines of the Dolores Company, at Dolores, Chihuahua, Mexico, are to be opened after an inactive period of five years. Extensive repairs and remodeling will be necessary.

The Colorado Experiment Station of the U. S. Bureau of Mines, which was recently removed from Colorado, will find its new home in Reno, Nevada, where extensive experimentation is planned. Bare-metal work is to be continued, and a comprehensive scheme is advanced covering work upon Nevada's most pressing mining and metallurgical problems. More War-Minerals' Relief awards are made. U. S. Bureau of Mines plans a non-metallic experiment station in the South.

The five Dominion Steel Corporation interests headed by J. H. Plummer, who issued a call for proxies to oppose consolidation with other companies in British Empire Steel Corporation pending fuller information, were recently dropped from the directorate.

Minnesota Company Transfers Activities to Arkansas Field

The Northern Minnesota Ore Co. closed down its Northland mine, an underground manganiferous property north of Cuyuna, Minn., on July 10, and allowed the shaft to fill with water. No mining had been done since October 28, 1919, but the shaft and drifts had been kept unwatered. No ore has been shipped, and property has a stockpile of about 5,000 tons. Inability to sell the ore at satisfactory prices is given as reason for the shutdown. The company has purchased 600 acres of manganese land in the Batesville district, Arkansas, and will transfer its immediate activities to this field. The property lies about 1½ miles east of Cushman, in Sec. 10-11-14, and Sec. 15-14-7. A power scraper will be used in the shallow clay areas, where chert is absent, and mining will be done by hand. At the same time the company will carry on intensive prospecting with the idea of blocking out a steam shovel area and later erecting a washing plant.

Dolores Company to Open Chihuahua Mines

The mines of the Dolores-Esperanza Co. at Dolores, Chi., on the Mexico Southwestern railroad, will be opened within a short time after an inactive period of five years, according to a recent announcement by the officials of the company in El Paso. Extensive repair work will be undertaken before the opening of the mines, including timbering and repairs to equipment. A modern power plant will be constructed at Madera and power will be transmitted to the plant by means of a power line.

A special session of the South Dakota State Legislature was recently called by Governor Norbeck. Matters of importance are to be taken up, among which is that of state-owned and operated industries. The state-owned power plant utilizing the waters of the Missouri near Mobridge has been investigated by engineers and their report will be acted upon at this session. The project will call for an expenditure of about $3,000,000. The state-owned cement plant is another industry which has been thoroughly investigated but the site for the plant has as yet not been decided.

The electrical engineering department of the University of Arizona lately received a number of electric motors as gifts from the United Verde Copper Co. and the Ray Consolidated.

Colorado Station To Be Moved To New Home at Reno

Many Varied Problems To Be Solved in Connection With Mining Activities in Nevada

The experiment station of the Bureau of Mines, which has been located for a number of years at Golden, Col., has been moved to a definite location at Reno, Nev. In the future, the station will be known as the Rare and Precious Metals station. The station is to be conducted in co-operaton with the University of Nevada, which has obligated itself to construct a new building for the housing of the station. This building is to be erected at a cost of not less than $30,000 and is to follow plans drawn up by the Bureau of Mines. The construction of this station will embody the experience of the Bureau in the conduct of its various experiment stations.

The location of the station at Reno was not made until the ground had been gone over very carefully by Dorsey A. Lyon, the supervisor of stations. Mr. Lyon spent several weeks in the West engaged exclusively on the problem brought out by the necessity of moving the station from Golden.

It is admitted that Nevada has a long list of problems which are in urgent need of the attention which can be given them at this station. The results of this work will have an application over a much wider field than the state of Nevada. The problems, which are regarded as being in need of immediate study, are as follows:

1. A study of mining methods in narrow veins and the determination of the limiting factors of the various methods with regard to inclination of vein, pitch of ore shoot, strength of walls, width of vein, etc. Especially good opportunities are presented for the study of this type of mining in Nevada. In some cases, as many as three different mining methods are in use simultaneously in the same mine.

2. An investigation of diamond drilling in Nevada porphyry and the invention of a suitable drill for this purpose. At the present time it is practically impossible to use the diamond drill in western Nevada because the porphyry has alternate hard and soft streaks that render its operation uncertain and expensive. Other states have the same problem in individual instances but it is more serious in Nevada than anywhere else.

3. An investigation of the cyanidation of silver ores with a view to reducing the losses. This would be a fine problem for Nevada since Nevada is the greatest producer of straight silver ores in the United States. Low extractions mean great annual losses. They are due in some cases to unknown factors, as at Rochester where but 88 per cent can be obtained in place of 93 per cent, at Tonopah, and to known factors such as the presence of manganese which reduces the extraction at Candelaria and elsewhere. There is no other station doing work of this character.

4. Discovery of a cheap method of extracting lead and silver from low grade oxidized ores. There are great quantities of such ores throughout Nevada, as for example in the neighborhood of Eureka.

5. Investigation of processes for the extraction of oil from shale.

6. Discovery of a cheap method of extracting copper and silver from low grade oxidized ores. There are immense quantities of such ores throughout Nevada and in Mono and Inyo Counties, California, which would be tributary to the Reno station.

7. Commercial methods of treating low grade lead-zinc sulphide ores like those at the Simon Lead mine. These ores are fairly widely distributed in Nevada and in adjacent parts of California.

8. Investigation of methods for the extraction and recovery of all metals of value in base ores, i.e., ores containing gold, silver, copper, lead, zinc, and iron.

9. Slime settlement, use and conservation of lime, regeneration of cyanide, problems of fouling solutions, improved methods of precipitating silver, and of treating material swept up on tailing ponds.

10. Treatment of antimonial and arsenical ores carrying gold and silver. A large amount of this type of ore is reported to exist at Manhattan and at Northumberland, Nevada.

11. The treatment of low grade silver-lead ores. These are said to occur in large amounts at Eureka, Nevada, also in the Yellow Pine district in Clark County.

12. Treatment of the concentrate produced in such mills as those at Tonopah. A similar problem would be the treatment of flotation concentrate.

13. Treatment of complex sulphide ore which is found at Buckhorn, Nevada. A large tonnage of about $8 or $10 ore is reported in this camp which has resisted all attempts to work it.

14. Leaching of oxidized copper ores. These occur in large amounts in the following districts: Ely, Yerington and Luning, and in smaller amounts in many other districts of the State. The best figures from the Ely district indicate that over 30% of the copper entering the concentration passes out in the tailing. As this plant in normal operation treats per day as high as 15,000 tons of ore running nearly 2% copper, a loss of 30% of this copper would amount to a loss of between $30,000 and $40,000 in a single day. If this ore problem could be successfully solved, it would save in one day and in a single copper mining plant in Nevada approximately the whole cost of operating the Mining Experiment Station for a whole year.

15. Concentration of mercury ores. Applicable to several small districts for example, Battle Mountain, Winnemucca, near Rochester, and Mina.

16. Increased recovery from sulphur ores. Applicable to Sulphur, Nevada, and near Cuprite.

17. Production of rare metals. Applicable to platinum from Goodsprings and Bunkerville.

18. Conservation in the concentration of tungsten ores. Applicable to mills in the following districts: Lovelock and Mill City (three mills), Mina (one mill), Ely District.

19. Study of the utilization of the non-metallic resources of the State.

20. General investigations of waste in metallurgical industries in the State.

21. General study of co-operation between the small mine operators in the State.

22. Study of the methods used in crushing ores and a comparison of results secured by different machines.

It is pointed out that a few thousand dollars annually applied successfully to the solution of such problems as the above would result in the addition of many millions of dollars for the mining industry.

Recent War-Minerals' Relief Awards

Awards recommended by the War Minerals Relief Commisson for the week ended July 3 are as follows: (The claimant, the mineral, the amount recommended and its percentage relationship to the amount claimed are shown) T. F. Adams, manganese, $393.10, 11 per cent; Paga Mining Company, manganese, $5,002.70, 43 per cent; Dubakella Mining Company, chrome, $2,981.80, 68 per cent; Cypress Chrome Company, chrome, $2,738.73, 73 per cent; J. A. Nichols, chrome, $592.81, 29 per cent; Shiell and Prattie, $662, 100 per cent; Haynes and Mullen, $867.78, 37 per cent.

On July 1, the War Minerals Relief Commission had acted on 880 claims in which the total amount asked of the government was $9,621,363.90. The administrative expenses of the Commission to that date aggregated $261,786.68, or 2.72 per cent of the amount of the claims handled.

To meet the demands of its work, the Bureau of Mines is strengthening the chemical side of its investigations. This work will be conducted principally by O. C. Ralston, the superintendent of the experiment station at Seattle; L. H. Duschak, at Berkeley, Cal.; C. M. Bouton, at the Salt Lake station; Dr. Thomas B. Hine, at Tucson, and Dr. S. C. Lind, at Reno.

Non-Metallic Experiment Station for the South

Chapel Hill, N. C.; Atlanta, Ga.; Birmingham, Ala.; Tuscaloosa, Ala., and Knoxville, Tenn., are contenders for the non-metallic experiment station which is to be established in the near future by the Bureau of Mines. Each of the places mentioned claims to be situated advantageously in regard to non-metallic raw materials which are becoming of increasing importance with the rise of the chemical industry.

Mid-Year Production Reports

The mid-year reports on metal mining in the western states will be issued by the Geological Survey during the week beginning July 19. These reports will give estimates of production for the first six months of the current year. In the past, these estimates have come within one or two per cent of the exact output as shown by the final figures. It is expected that the estimates will show a very considerable falling off in both gold and silver production.

Vocational Plans Under Way

Plans are maturing rapidly for the vocational rehabilitation of persons disabled in industry. This activity is made possible by a law enacted at the recent session of Congress. It provides that the Federal Government shall pay half and any state that elects to co-operate must pay the other half. During the first year, the Federal appropriation is limited to $500,000. This is increased to $750,000 the second year, with $1,000,000 as the maximum amount in the third year.

NEWS BY MINING DISTRICTS

ARIZONA

Tucson—Complaints are made that the State land-lease law in a number of instances has been operating to the detriment of the miner, though every lease is given subject to any rights there may be upon the land in the way of mineral, including oil. It is said that a lease for grazing may be uncomfortable for the miner who happens to be working a claim within the tract that may be inclosed and stocked. The miner must make proof that he has mineral, and that his claims may be excluded from a lease—this proof often is expensive.

In Oro Blanco district, near the Mexican line, there has been a return to pioneer processes in the working of gold ore from decomposed croppings. J. C. Holden has a claim he calls the Grubstake, from which he is making about $10 a day by the primitive method of crushing in a mortar and washing in a gold pan. There is available only a seep of water and washing can be prosecuted only a few hours each day. In the same section other miners, similarly operating, pack their ore to a creek at a distance and there wash it.

Patagonia—A late rainstorm exposed very attractive croppings on open ground immediately south of the famous World's Fair mine. The ground has been located by Frank Huntington, Edward T. Sheehy, and Frank Powers and the claim has been named the Hiram Johnson, possibly because the vein trends into the nearby Roosevelt mine. The new vein is about 25 feet wide and carries high copper values in bornite.

Clifton—The American Silver Corp., which for two months has been operating the Socorro property at Mogollon, N. M., has ordered discontinuance of all activity, throwing out of employment a large force of men, headed by D. B. Scott.

Willcox—The 50-ton mill of the Dives Co. at Dos Cabezas is operating steadily with two shifts and a third shift is to be added. A force of 25 is employed, under Frank F. Friant.

Bisbee—The Phelps-Dodge and Calumet & Arizona Cos. are making especial inducements to employees for homebuilding. Money for homes is loaned for gradual repayment within 100 months, at 6 per cent interest.

Miami—The wonderful vegetable garden system of the Inspiration Co.'s employees has been damaged to possibly $20,000 by a late hailstorm, according to expert W. A. Sandige, in charge. Melons were about ripe and were ruined by hailstones that drove through their sides. There also was large damage to tomatoes, corn and peppers.

Yuma—Very rich silver ore is being exhibited here by D. M. DeLong, taken from the Black Rock and Silver Glance mines, north of Yuma, on the western side of the Colorado River, across from Picacho. At 200 ft. dept in the Black Rock the ledge is 12 ft. wide and at 350 ft. depth 30 ft. wide.

Nogales—The Animas mines at San Javier on the Mexican West Coast are reported bought by the United States Smelting, Refining and Mining Co. of Boston. The same corporation operates the Real del Monte mines in the Mexican State of Hidalgo and mines in Arizona, Utah and California.

Jerome—A mill of at least 50-ton capacity is to be built on the property of the Verde Mines Co., seven miles south of Jerome. Mill runs made on the company's ores gave returns of from $25 to $40 a ton in gold and silver. A double-compartment shaft is to be sunk, to cut the ore on the dip at 600 feet, probably in sulphides. President W. F. Burns has been in charge at the camp.

Kingman—The 400-level of the Catherine mine has been flooded and operations will be concentrated on the 300-level until proper pumping facilities have been provided.

Crosscutting in the Thumb Butte has cut the main vein and also has found a heavy flow of water.

United American has drifted nearly 200 ft. on a vein of milling ore believed to be a continuation of the Tom Reed orebody.

Arizona Mossback stockholders have authorized issuance of $500,000 in bonds to cover the cost of installing a mill on the property at Oatman.

The Arabia property in Union Pass is reported taken over by the El Tigre corporation, operating in Sonora, south of Douglas.

Activity is promised this fall on the well-known White Hills mines, northwest of Chloride.

Safford—The Grand Reef mine in the Aravaipa mining district of Graham County, owned by Richard V. Dey of New York has been purchased by the Aravaipa Leasing Co., which is controlled through stock ownership by the American Lead and Zinc Co.

Morristown—The Plomo King mine is hauling in lead-silver ore for shipment to the El Paso smelter. Recently the property was equipped with a hoist and compressor. A shaft is being sunk to a depth of 300 ft. The shipping ore comes from ground opened up last winter.

Kelvin—The Ray Verde Copper Co. developing the Tillman copper group in the Ripsy mining district, nine miles south of here is installing a hoist and compressor. The old shaft has been abandoned and a new one is to be sunk. Albert Hoch is in charge. The No. 1 diamond drill hole on the old Kelvin Sultana property now being prospected by the Ray Boston Copper Co. has reached a depth of slightly over 1,200 ft. It is expected that the ore shoot will be cut in the next 200 ft.

Ray—The Ray Lead Development Co. has resumed operations. About forty men are employed at present.

CALIFORNIA

Engelmine—John Reinmiller, former superintendent of the Engels Copper Mining Co., has recently taken over the Milcaller group, located about two miles northwest of the upper mine of the Engels company in Plumas County, and is developing a vein in which the average values are high. A winze being sunk on the vein is now down 65 feet and it is all in ore that averages

eight per cent copper, four ounces silver, and $2 gold per ton. The full width of the vein at this point is not known as all four sides are in ore of the same grade.

Sutter Creek—The 3,500-ft. shaft of the Old Eureka group has been completed and a station is now being completed on the 3,000 level. Extensive developments are planned, promising veins have been exposed, and rich orebodies are indicated.

Tuolumne—The sinking contract let by the Central Eureka Co. is nearly finished, and the company reports that several promising veins have been uncovered. The ore production continues to amount to about $40,000 monthly.

The Grizzly mine has been dewatered and preparations are being made to sink the shaft an additional 100 ft. It is now down 1,650 ft. A 4-ft. orebody has been exposed at the bottom of the incline shaft.

Grass Valley—In the Grass Valley district the new wage scale went into effect on the first of July, and the labor situation is already showing signs of improvement. The new scale ranges from $4.75 for muckers to $5.25 for timbermen, with an extra 50c. daily when the work is unusually hard or hazardous.

Redding—The Shasta Zinc & Copper Co. is to erect a zinc-oxide and zinc concentrator plant at Delamar. Recent reports from the Bully Hill mine state that a large deposit of high-grade zinc ore has been exposed in the lower workings of the Rising Star shaft. The ores also carry much copper and some gold and silver.

The Mammoth Copper Co. is doing considerable development work on the orebodies recently uncovered, and is replacing the tonnage depleted by heavy drains during the war.

IDAHO

Kellogg.—Raising is in progress from the main tunnel level of the Nabob Consolidated mine, near Kellogg. The raise has attained a height of 20 ft. and will be continued to the next level above, which is 220 ft. higher than the main tunnel. The work will be completed in six weeks.

The Orogrande Gold Mining Co. near Stites has increased the capacity of its mill to 500 tons daily. The designed capacity was 360 tons. Changes and improvements will be made in the method of ore dressing.

Workings of the Baltimore vein of the Silver Triumph Mining Co. in the Coeur d'Alenes have been entered for the first time in 30 years, ore containing 39 ounces in silver to the ton, 20 per cent lead and 18 per cent zinc. The discovery is 60 ft. from the surface. The old workings honeycomb the ground on two tunnel levels. The orebody between the main tunnel level and a point 150 ft. deeper is 6 ft. wide and gives promise of a greater width. Development in several parts of the mine disclosed mineralization that exceeds expectations.

MICHIGAN

Copper District

Calumet—The coal situation continues to be the most important problem for every copper mine in Michigan. The mines now are running from week to week. The solution of the problem is in no wise helped by the knowledge that there is no hope for any reduction in coal prices and that there is doubt that coal in sufficient amount may be secured even at the present prices. To add to the general pessimism there is the continued shortage of labor and the fact that there is little evidence in copper shipments of any great demand for the product of the mines.

Wolverine is showing a slight improvement in contents this month, and the rock, which is being sent to the Wolverine mill, averages 20 lb. to the ton. Wolverine No. 4 shaft is shut down temporarily although the tonnage is increasing from No. 3. The Wolverine stamp mill is out of commission for a few weeks so that repairs can be made to the rock bins. Meanwhile ore is being stamped at the Mohawk mill. The bulk of the ore is being obtained from the 38th level and the four levels above, including footwall arches and pillars. It is no longer necessary to handle the extra water which has been coming through from the South Kearsarge as Wolverine now is holed through to North Kearsarge.

The Seneca shaft is approaching the fifth level. The third and fourth level drifts are being pushed to the proper limits in order to secure greater lateral distance before further stoping is done. Under existing metal conditions this is a consummation not entirely objectionable. The Gratiot shaft development is showing much barrel and small mass copper.

MINNESOTA

Cuyuna Range

Cuyuna—The Merritt mine has been fully unwatered, and two shifts have been placed at work. A third shift will be added soon. The company has sold its season's output of high manganese ore to the Carnegie Steel Co., averaging from 18 to 20 per cent.

The Hanna Ore Mining Co. will construct a new concrete block engine house and change house at the Feigh mine. New equipment will include an electrically driven drum hoist, an air compressor and a generator and two 125-hp. boilers for auxiliary power.

Mesabi Range

Nashwauk—Operations have been resumed at the Pearson and will be conducted on the day shift only for the present although it is expected to put on the double shift later. The Pearson was one of the first operations in this district but has been idle for a number of years. Two years ago it was taken over by Clement K. Quinn and associates who are now operating it. The mine equipment includes a washing plant.

Gilbert—The old Mariska mine has been leased by the Mariska Iron Co. from Robinson & Flinn and dewatering will be commenced soon. New equipment will include electrical machinery and additional buildings as well as a new washing plant designed to handle 1,000 tons per 24 hours. The headframe will be remodeled to adapt itself to washing practice so that the ore may be conveyed through the plant or shipped direct or stockpiled. The Mariska was opened by the Republic Iron & Steel Co., in 1907, and abandoned by them in 1911 after making a total shipment of 133,685 tons.

MISSOURI

Southeast Lead District

Labor shortage is quite a serious factor in St. Francois County and all the large mines are more or less crippled for lack of full crews. The Leadwood property of the St. Joe Co. and the Elvins property of the Federal Lead Co. are running at about 50 per cent capacity.

The St. Joe Lead Co. is drilling in Crawford County, near Westover, some forty miles west of Bonne Terre, where they have optioned a tract on which the "Bonne Terre" limestone outcrops. They have also optioned the Schulte tract, near Fredericktown, in Madison County, where considerable lead and mixed copper-cobalt-nickel sulphides have been found. The property is near the North American mine.

The Milford tract on Big River which adjoins the Desloge mine has been purchased by Jack Elledge, who will drill soon.

The Annapolis Lead Co., at Annapolis, on the main line of the Iron Mt. R.R., recently lost its new shaft at a depth of 60 ft. through caving and this is now being recovered and concreted. Work on the surface plant is proceeding slowly as it has been decided to delay completion until the orbody has been developed by the new shaft.

The Picher Lead Co. have purchased the Fisher lead mine, near Anaconda, Franklin County, where a small but rich shallow run of sheet lead ore has been found on each side of a draw, the pay streak showing 6 to 16 in. of solid galena.

A new shaft is being sunk at the Beulah pyrite mine, in Franklin County.

MONTANA

Conferences Between Company Officials and Labor Elements at Butte—Wisconsin Mining Students in Montana

Butte—The Metal Trades Council at a conference of the different mining companies presented their demands for what amounts to an all-round increase in wages of $1 a day and five and a half days as a week's work. The representatives of the companies operating in this district listened to the demands of the men and at the conclusion C. F. Kelley, president of the

Anaconda Copper Co., speaking for all companies, said that the increase asked could not be granted as conditions in the metal market were such as not to warrant any change from the wage scale and working conditions existing under the contract at the present time. The representatives stated that they would report the decision of the companies to their respective unions. Before the contract can be terminated by either side 30 days' notice must be given. The organizations asking for increases include the machinists, engineers, pipe-fitters, blacksmiths, electricians and other metal trade crafts. One of the leaders in the metal trades council has stated that there would not be any strike. The men would stay on the job, he said, but would govern themselves in the amount of work performed by the wages received.

The 500-ton mill being erected at the property of the Boston & Montana Development Co. is expected to be in operation by early this fall, according to the announcement of Manager John D. Pope. The machinery is practically all in position and the work of enclosing the building is now going ahead.

In view of the close relations existing between the Davis Daly Co. and the Butte-Ramsdell Co. it seems to be generally accepted that the option given a short time ago on the latter property is in favor of the Davis Daly.

Benjamin B. Thayer, vice-president of the Anaconda Copper Mining Co., and Mrs. Thayer are at Swan Lake, the guests of Mr. and Mrs. C. F. Kelley, at their summer home.

A party of Wisconsin mine students from the University spent a week in this city going through the leading mines of the district in both copper, silver, zinc and manganese and later went to Anaconda where they spent a couple of days looking through the big Washoe smelter and other plants of the Anaconda Co. From here the party went into the Coeur d'Alene district to inspect the lead and silver properties.

The mines in the Phillipsburg district are turning out 500 tons of manganese a day which is being shipped east. In addition to the manganese the district is producing about 400 tons of silver ore a day, and altogether in the various mines employment is given to about 1,000 men, which makes this old-time mining district assume a lively aspect.

Between the treatment of ore of the company's own mines and the custom ore received the Washoe smelter is working about 60 per cent capacity. The zinc and manganese ore is treated at the plants at Great Falls.

The Davis Daly miners in the Colorado have cut through into the Butte-Ramsdell ground to follow a rich body of ore uncovered within 30 feet of the Colorado-Butte-Ramsdell dividing line. There is an arrangement with the management of the Butte-Ramsdell whereby the Davis Daly people can follow the orebody, which is said to be rich in both copper and silver. The Colorado is hoisting 150 tons of ore a day and having it treated at the East Butte smelter.

NEVADA

Talapoosa—Major W. H. Ferguson has let two contracts for some preliminary development work which he has started on the Talapoosa mine, located about sixteen miles east of the Comstock. There is a large mineralized area at the Talapoosa of much promise, which has never been prospected at depth and it is the intention of the company which Major Ferguson represents to do this. In about two months it is expected to have a considerable force employed and extensive operations under way.

Nevada Douglas—Henry I. Moore, manager of the Nevada-Douglas Consolidated Copper Co.'s mine in the Yerington district, states that the refinancing of the company has been completed, the bonds all sold, and active operations will begin within the next few weeks. The erection of a flotation plant has been considered, but negotiations for treating Nevada Douglas ores in the Bluestone plant are under way and if successful it is probable that the Nevada Douglas company will install a reverberatory furnace to treat the concentrates from both mines.

Spruce Monarch—The Spruce Monarch mine at Spruce mountain in Elko County is shipping an average of 50 tons a day of ore that nets the company $30 per ton, according to Sam C. Soupcoff who has recently visited the property. This is coming from a new orebody on the 450-ft. level which has been drifted on for a distance of 175 feet. The ore is hauled to Tobar on the Western Pacific R.R. and goes to the smelter at Murray, Utah.

Gold Circle—The Gold Circle Queen Mining Co. is crosscutting to the vein on the 315-ft. level, which will be reached within a few feet if there has been no change in its dip below the 230 level. If the improvement noted at the latter level is found on the 315-ft. level the company expects to build its own mill for treating the ore.

Virginia City—D. Hayden Collins, of Pittsburgh, Pa., who is interested in the Standard Metals Co.'s mine near Reno, Nev., has bought the Virginia Silver mine near Virginia City, Nev.

Dun Glen—The Buena Vista Del Oro company has commenced operations on the property which it acquired last fall. They have completed a wagon road and are said to be arranging for the building of a 100-ton mill.

Mina—Crosscut 701 on the seventh level of the Simon Silver-Lead Mining Co. property, Simon district, Mineral County, has penetrated an orebody 30 ft., according to the last report received from the mine. Indications point to this orebody being the downward extension of the ore opened at the surface north of the Copper shaft and not the principal orebody developed on the fourth, fifth and sixth levels.

Drillers sinking the well to develop water for milling purposes report the hole which will take a 12-in. casing, down a distance of 455 ft. when work was stopped to allow the men to celebrate the holidays. Water struck at 151 ft. rapidly rose to the 130-ft. level where it continues to stand.

NEW MEXICO

Lordsburg.—A. J. Stockridge, who has a lease and bond on the Ben Hinds gold property known as the Rocky Trail, has purchased a complete 50-ton concentrating mill from F. Fornfelter of Lordsburg, N. M. The mill will be moved to the mine and set up at once.

Brock, Weston & Kern are down 170 ft., showing a four-foot vein with a 12-in. streak of very high grade carrying gold, silver, lead and copper. They will move the old Brock mill to a point in the valley just below the mine and distant three miles. Concentrating tables to complete the mill will be purchased at once.

Central—Juan Padilla, who is operating a property owned by Clark Rodgers and Col. H. H. Betts at Lone Mountain shipped 10 cars of silver ore to the El Paso smelter during June.

Tyrone—The old Telegraph mine on the Gila River, 30 miles southwest of here, is being worked by Dorsey and Spencer. They are working on an old shaft that showed valuable ore in the early operations. The inaccessibility of the property prohibited the handling of anything but the highest grade in those days, consequently great quantities of low-grade ore are looked for in the present operations.

Silver City—Some good silver indications have been struck at the bottom of the Silver Spot shaft. It was necessary to stop work on account of an inrush of water. This is being satisfactorily handled by a 200-gal. sinker.

UTAH

Increased shipments from most Utah camps, as well as the somewhat larger dividend returns made during the first six months of 1920, as compared with the same period of 1919, are reflecting the better prices being received for silver, lead, and zinc, and this in spite of the handicaps of high costs and labor shortage. Dividends from Utah mines for the first half of 1920 were $5,706,171, as compared with $5,586,083, a gain of $120,083. A larger amount of low-grade ore with silver content than usual was shipped, and it is hardly likely that since the drop of the metal to a somewhat lower level, so much ore of this character can be utilized. Park City shipped 53,443 tons of ore and concentrates as com-

pared with 35,368 tons the first six months last year, but a part of this increase must be laid to more favorable operating conditions, as the camp did not suffer any inconvenience comparable to the I.W.W. strike of 1919 year. Tintic, which last year did not suffer from I.W.W. activities to any appreciable extent was this year handicapped somewhat by the switchmen's strike of two weeks and a smelter embargo of about two weeks on some of the mines, so that shipments are a very little lower than last year, the difference in favor of the first six months of 1919 amounting only to 95 cars, when 3,632 cars of ore were shipped as compared with 3,537 thus far in 1920. Returns from Bingham are not yet in, but shipments are expected to show a small increase.

royalty is naturally higher than when the miners must seek out their own ore, in some cases up to 75 or 85 per cent, and the groups working in each stope are privileged to oust any of their number who does unsatisfactory work and take in another miner. The plan is practically, as it works out, in the nature of extra compensation for efficient work, and is said to be proving profitable to both the company and the men. This mine during the first six months of 1920 shipped 981 cars of ore, being by 407 cars the heaviest shipper in the district.

Summit County

Park City—The Naildriver Mining Co. reports that the ore of shipping grade they recently opened has widened to 3 ft. There are good showings silver-lead ore on three levels and in three veins," says W. E. Seelye, vice-president of the property. "On the No. 2 level ore has been followed for 127 ft. The maximum value of the high grade is 106 ounces of silver and $60 in lead to the ton. About 85 per cent of the values of the mine are silver. The width of milling and shipping ore is from 5 to 9 feet on one level. Four carloads of ore have been shipped to the smelter and several hundred tons of milling and shipping ore are on the dump, ready to be sorted for shipment."

CANADA

Ontario

Kirkland Lake—Work has been started on the excavation for the

INTERNATIONAL SMELTING CO.'S PLANT, TOOELE, UTAH

Juab County

Tintic—Tintic Standard Mining Co. during the first six months of 1920 shipped 574 cars of ore. In June 100 cars were shipped, and the tonnage could be considerably increased if more miners were available. A part of this ore is coming from the lowest or 1,450-ft. level of the mine, and a winze will be sunk below this level, preparatory to further shaft sinking later. At the south end of the property, in which a shaft was recently sent down, drifting is being done on the 1,000- and 1,200-ft. levels. One of the drifts on the latter level, which has 1,200 ft. still to go, will connect with the large stopes now productive and is driven chiefly for ventilation, although it is expected that ore will be developed before reaching the stopes in question. Good progress is being made in building the experimental mill for low-grade ores. Shipments from the camp for the week amounted to 148 cars, as compared with 149 cars the week preceding. There were twenty shippers.

The Chief Consolidated Mining Co. is granting some of its old employees the privilege of working in stopes under a co-operative plan whereby the miners are allowed to work the ore under a group leasing system. The on the 900-, 700-, 600- and 500-ft. levels. The company has entered into a hauling contract, and it now expects to ship up to 200 tons of ore weekly. Work intermitted for a few days at the Ontario Mining Co. property, due to the breakdown of the large compressor and to make other repairs, was resumed after the holiday over the Fourth of July, and conditions at this property are as usual. The Judge Mining & Smelting Co. is opening a store which will sell goods to its employees at cost. The Silver King Coalition Mines Co. is working 190 men and could take on more if they were available.

WASHINGTON

Spokane—The shipment of ore has been resumed from the Roosevelt mine, in Stevens County.

A concentrating mill has been installed on the Lead Trust mine and placed in commission. The plant is of 75 tons daily capacity and designed to dress lead ore. Operations have disclosed ore 6 to 14 ft. wide on two levels. One of these levels is 200 ft. above the mill and the other 350 ft. Values are mainly in ore of milling grade.

"The Silver Mountain Mining Co., four miles east of Daisy, has opened foundation of the Ontario Kirkland mill. It is hoped to have the foundations completed before the winter sets in. Drifting on the 450-ft. level is being pushed as the ore shows greater enrichment than at the upper levels.

At the Wright-Hargreaves mill construction work has reached an advanced stage and some of the heavier machinery is now being installed. Owing to shortage of electric power, steam equipment is being used for underground work.

The shaft on the Ridgewood property is down 200 ft., at which level a crosscut is being driven to cut the 12-ft. vein opened up on the 100-ft. level.

Gowganda—This camp has come increasingly into prominence owing to recent rich discoveries on the Trethewey locations. There are now 16 properties being operated. The mill of Reeves-Dobie Mines, Ltd., with a capacity of from 25 to 30 tons daily, will be altered to increase its capacity to 50 tons.

South Lorrain—At the Keeley mine No. 3 shaft is being put down to 400 ft. Drifting on Wood's vein at 230 and 300 ft. has opened up a considerable tonnage of milling ore. The new mill of about 80-ton capacity is nearing completion.

West Shining Tree—The Wasapika Consolidated has decided to offer 2,000,000 shares of treasury stock, par value $1, for subscription at 10c. per share "in view of the speculative nature of the enterprise." Some 200,000 shares have been taken up during the last few months at this rate, mostly by President George B. Rogers, to provide funds for current expenses. The new offering is being made to raise about $50,000 for the installation of a mill capable of treating 50 tons of ore per day.

Beaver House Lake—Samples of remarkably rich ore from the find recently made at the Argonaut gold mine have been received at the head office of the company in Montreal. President J. H. Rainville states that the vein in which the find was made has been opened for a length of nearly 900 ft. and is still carrying heavy gold content. The new 12-drill compressor and electric hoist are in operation to sink to 500 ft.

Butt Township—The Mining Corporation of Canada has taken an option on eight mining claims supposed to carry pitch blende, staked last fall by Hamilton, Flynn and Rankin. They surround the McConnell property, where pitch blende occurs in encouraging quantities. The claims are now being explored.

Cobalt—The Kerr Lake Mining Co., Ltd., has let a contract to Dominion Reduction Co. for the treatment of between 75,000 and 100,000 tons of low-grade milling ore.

The mill of the Peterson Lake Silver Cobalt Mining Co. has been closed down temporarily owing to shortage of power.

British Columbia

Placer Law Amendments Effective—Alice Arm Growing—Copper Ore Discovered Near Usk

By ROBERT DUNN

Victoria—The amendments to the Placer Mining Act of British Columbia, passed at the last session of the Provincial Legislature, came into effect on the 1st of July. Holders of placer leases, however, have until the 1st of January, 1921, to make such arrangements as are necessary to hold their property. They may do one of two things, viz., pay up arrears on their leases and continue annual payments as laid down by the old Act or consolidate the arrears and pay a proportion of the whole amount together with the current annual fees. Those failing to do either one or the other will be dispossessed of their holdings, the act as amended providing for automatic forfeiture of their leases under such circumstances.

Stewart—Arrivals from Stewart, B. C., declare that there is no mining boom in the Portland Canal District, but that there is much solid development. Nine diamond drills now are in operation, two on the Premier, two on the Northern Light Group, one each on the 49 Group, the Big Missouri, the Mother Lode, one on Goose Creek and one on the B. C. Exploration Company's property, Marmot River. It is stated that the snow is rapidly disappearing from the higher reaches and that there still is employment for good miners.

Activity is apparent through the country contiguous to the Bear River Valley. Men are engaged in putting the line of the Canadian Northwestern Ry., owned by Sir Donald Mann, in shape for operation, and a gas locomotive has been bought, together with some rolling stock, in order that the transport of supplies to the various camps may be undertaken as soon as the repairs to the road render it feasible.

Some of the mining operations in this section that may be instanced are the development of the Q. & L. Group held under bond by J. Tretheway, of Cobalt, consisting of surface stripping which has resulted in the exposure of a vein carrying good values and the driving of a tunnel on the vein the ore of which on assay gives returns in galena, zinc-blende, and silver; the opening of the Red Top Group by G. Seivert; further work on the Tower Mountain Group by K. P. Matheson, who found promising leads of silver-lead galena last year; the exploration of the Goose Creek Group by the Algunican Development Co., who have it bonded; the development of the L. L. & H. on Bitter Creek; and the vigorous development of the Lakeview Group, Glacier Creek, by P. Welch, of Spokane, and H. J. Fletcher, of Seattle, Wash.

Alice Arm—The Taylor Mining Co. Ltd., successors to the Dolly Varden Mining Co., are now hauling two hundred tons of ore per day from the mine to tide water and this amount is expected to be increased steadily as fast as new rolling stock and development will permit. The company have let a contract for the installation of a complete hydro-electric plant at Trout Creek adjoining their large Wolf property three miles up river from the Dolly Varden mine.

A concentrator and cyanide plant will also be constructed, if present tests prove satisfactory.

An important strike of high-grade silver ore has been encountered in the North Star mine adjoining the Dolly on the north and a large ore body has also been recently discovered on the Royal Group adjoining the Dolly on the south. This property is under option to Capt. McLennan of Vancouver.

Several properties have been optioned or purchased from the original owners during the past month. The season has been late and snow still covers many of the properties at about three thousand feet elevation. There is no boom but a very healthy and normal growth is noticeable.

PROSPECTING IN NORTHERN ONTARIO (BLACK FLIES AND MOSQUITOS TOO SMALL TO BE VISIBLE)

Usk—High-grade copper ore is reported to have been discovered on Nicholson Creek, near Usk, northern British Columbia, by Albert Baxendale, a prospector. As a result the Crescent Group of mineral claims has been staked. Stripping is said to disclose a fissure vein, one foot to six feet wide, for a distance of 700 feet carrying bornite and chalcopyrite, much of which is of sufficient high grade to ship.

Slocan—That the Utica mine will be re-opened at once and put on a shipping basis as soon as possible is announced by C. F. Caldwell, vice-president and managing director of the Utica Mines, Ltd. The old Sunset property, situated near the Utica, also is to be developed. The latter has not been worked for fifteen years. During its operation over $500,000 worth of ore was shipped, some 2,000 tons averaging $250 a ton at the former price of silver. It is proposed to continue the existing crosscut to strike the vein at new depth. The mine, it is hoped, will be shipping by fall.

Work on the Evening Star mine, Dayton Creek, is proceeding with satisfactory results. The crosscut being driven at depth has reached an advanced stage, its face now being somewhere near the line of the shaft and below it. The workings will be unwatered before an attempt is made to connect the two. As the workings radiating from the shaft are quite extensive the latter work will take some time. Hugh Sutherland, of Winnipeg, Man., formerly executive agent for the Canadian Northern Railway, is the owner of the Evening Star and also of the Silver Nugget, in the same vicinity, which is to be developed.

Ainsworth—Construction of another unit of the power plant of the Florence-Silver Mining Co. at Ainsworth has commenced. About 60 men are employed, the mine operating two shifts and the mill one. There is reported abundance of ore in sight.

Trail Smelter—Receipts at the Trail smelter for the seven days ended June 30 were 8,755 tons, as follows:

Mine	Gross Tons
Anna mine, Slocan City	26
Emerald, Salmo	34
Electric Point, Boundary, Wash.	205
Florence, Princess Creek	117
Josie, Rossland	370
Mandy, Le Pas	313
Maestro, Ainsworth	11
North Star, Kimberley	125
Providence, Greenwood	49
Stemwinder, Fairview	2
Loon Lake, Loon Lake	22
Lookout, Skagway	27
Company Mines	7,354

Nelson—The Florence Silver mine, near Nelson, B. C., is in operation and the installation of another unit for the power plant is under way. The mine is working on a two-shift and the concentrator on a one-shift basis. There is said to be an abundance of ore in sight, both the Fisher and Replacement veins looking splendid.

About 150 tons of mill feed is coming down daily, and it is expected that the mill will be able to ship 300 tons of concentrates a month.

Another deal is reported in connection with the Granite-Poorman mine, Eagle Creek, it being stated that a syndicate has been formed to take over the property from the Vincent Development Co. As a result the Granite-Poorman property will resume operation immediately, a crew of men already having been put to work.

A preliminary map of the International Boundary Region between Portland Canal and Stikine River, Alaska-British Columbia, has been issued by the International Boundary Commission of the United States and Canada. During the present summer there is to be a slight change in the line near Gracey Creek, south of the Unuk River, and on the other portions additional monuments will be erected.

Manitoba

Flin Flon—J. W. Callinan of Pittsburgh, who has been associated for some time with the development of the Flin Flon copper mine, states that the work of exploration has proceeded rapidly this spring with about 140 men employed. William Koerner is engineer in charge and associated with him is Thomas Tighe, both of whom were formerly with the Inspiration Copper Co. The work is being done under contract by E. J. Longyear & Co. Two shafts are being sunk to a depth of 400 ft. Flin Flon Lake will be drained to Ross Lake by a tunnel 4,700 ft. long and having a drop of 50 ft. Much depends on arrangements for a smelter and railroad connections. The Manitoba government has agreed to build the railroad on receiving assurances that a smelter of at least 2,000 tons daily capacity will be erected. A conference will be held in August by the engineers acting for the W. B. Thompson interests when it is expected that a definite policy as regards the building of a smelter will be adopted. In the meantime search for a suitable water power is being made and several are in view, one having 34,000 and another 60,000 hp.

In the Herb Lake section three gold properties are under development. Two of them have machinery installed, and the third is under active development by hand.

MEXICO

Coahuila

Sierra Mojada—Sierra Mojada district is the terminus of the Mexican Northern Railroad, 125 km. from Escalón, Chihuahua. This camp has been a constant producer of lead silver and limy silver ores, for the past thirty years. A geological examination by a prominent American firm of mining geologists, several years ago, revealed the presence of zinc ores and since that time, the camp has produced zinc carbonate ores in increasing quantities. In common with all mining camps located off of the main line of the railroad, Sierra Mojada has suffered lately for lack of transportation facilities.

American Smelting & Refining Co.,

VIEWS OF THE VILLAGE OF ALICE ARM, BRITISH COLUMBIA

operating the Trinidad claim of Cia. Minera La Trinidad, S. A., are shipping limy copper ores to their Asarco smelter at Velardeña, and to their Number 3 smelter, at Monterrey.

Cia. Minera La Parreña, S. A., operating the San Salvador, Parreña, Nuevo Almaden and Encantada claims, are shipping several thousand tons per month to the Mapimi and Torreón smelters. It is stated that this company has discovered the continuation of the Trinidad ore shoot in the Nuevo Almadén claim.

Cia. Minera La Constancia, S. A., of Saltillo, continue to operate on a reduced scale, in spite of their large and important holdings in the camp. This company is shipping to the Torreón and Monterrey smelters of the Cia. de Minerales y Metales, S. A.

Hilario Martinez and associates, of Monterrey, have leased the Exploradora claim of Cia. Minera La Exploradora, S. A., and are shipping several hundred tons of 4 per cent copper ore containing good silver values, to the Torreón smelter.

Cia. Metalurgica Mexicana continues to make a good production of silver ores from its Veta Rica claim. This company has entered the ranks of the zinc producers and shipments will start shortly.

The operators of the Sierra Mojada district await with interest the decision of the railroad authorities, concerning the completion of the railroad which

was to connect Sierra Mojada and Cuatro Ciénegas. This road, begun under Carranza, would make the Sierra Mojada mines as close to the Monterrey smelters as to the Torreón and Chihuahua smelters. It should also decrease the cost of fuel, due to shorter distance to the Coahuila coal fields.

Zacatecas

Zacatecas—At present only two concerns are actively engaged in milling operations, the Fresnillo Mining Co. and the Bote Mining Co.

Fresnillo lies some 20 miles north of the State Capital and, in the epoch of the Patio process, was the largest of its kind in the world. Toward the end of 1919, the Mexican Corporation, Ltd., Hugh Rose was then general manager, acquired interests in the old Fresnillo company and this now ranks as one of the units of the Mexican Corporation. In 1917 with S. N. Cook in charge, reconstruction of the plant was commenced, and operations resumed toward the end of 1918, with an approximate capacity of 300 tons daily.

This camp ranks first in size and capacity in the state, and since the conclusion of arrangements with the Mexican Corporation, it promises to rank as one of the large plants of the world. Construction of an entirely new modern 1000-ton mill is being rapidly pushed and further units will probably be added. A standard gage track has been laid between the station of Fresnillo on the Mexican Central Ry. and the property, a distance of approximately 7 miles. The new equipment will consist of stage gyratory crushers, Sturtevant ring roll mills and rod mills, with Dorr agitators and a combined counter current agitation and Butters filters, Merrill presses and zinc dust precipitation. Power will be electrical throughout obtained from steam turbine plant and generators. The nature of the ore deposit is peculiar for Mexican silver-gold deposits, being simply a hill of mineral several hundred feet high. It is well developed, several million tons are in sight, extraction is by open cut system with gravity tramming to mill. The ore is low-grade silver carrying a small proportion of gold and is economical and amenable to cyaniding.

S. N. Cook is manager and T. S. Butler superintendent.

The Bote Mining Co. is one of the oldest concerns in the district; operations were suspended in 1914 due to conditions in the country and were resumed in 1919. Dump ores exclusively are being milled, little or no mining being carried on at present. The mill equipment consists of gyratory and jaw crushers, roughing rolls and slow-speed Chilean mills, Wilfley concentrators, agitators and Kelley filters. Electrical power throughout is generated by producer gas engines of the Koerting type. Enlargements to this mill are contemplated.

La Fé Mining Co., Ltd.'s large new plant completed and barely tried out prior to the general disorganization in 1914, is still inactive with no indications of a resumption of operations. E. A. Strout is manager.

The customs mill belonging to the San Cristobal company is still idle and in an abandoned condition; the same applies to the City Customs mill of Cia. Metalúrgica y Beneficiadora de Zacatecas, although indications are that the latter may shortly resume operations.

Veta Grande—This famous old camp a few miles north of Zacatecas, has been optioned to a group of Spanish capitalists, but work is limited to the extraction and shipping of small lots of argentiferous lead ores. These properties have been examined in turn during the past few months by several of the prominent Anglo-American and Anglo-Mexican corporations in Mexico without, however, anything being done.

An Anglo-Mexican corporation prominent in Mexico has taken an option on the famous old Los Campos mine.

The attractive price of silver has induced several of the smaller property owners to resume development and considerable new ground has been taken up. More active development in the copper belt is also evident; the largest of the copper mines, the Magistral, is still closed down through litigation; the Parroquia, belonging to W. C. Palmer and the San Roberto belonging to C. Bently, are showing greater activity. A new local company, the Piedras Negras Mining Co., are acquiring and developing properties in a limited way.

The inability of operators to obtain a sure and steady supply of fuel is hindering development in the district. Metallurgically, the silver-gold ores are not refractory to treatment, and by concentration and cyaniding render up between 80 to 90 per cent of their values. High power costs and unavoidably high consumption of cyanide are the great drawbacks. Zinc, lead and copper ores carrying varying silver values are also exported.

AUSTRALIA

New South Wales

Broken Hill—In deploring what he termed "the record strike of the world" at the half-yearly meeting of the Broken Hill Block 10 Co., held in Melbourne on May 31, chairman Alex. Campbell, expressed the hope that the commission appointed by the New South Wales Government to seek a way out of the existing labor troubles, would find some reasonable solution and that the wheels of industry would revolve again before long. In his opinion, if the Barrier mines were nationalized, or handed over to the labor section to operate for themselves, the properties would never be made to yield sufficient money per week to equal one half of that which the companies now offered to the workers. So far some £2,000,000 wages had been lost to the employees through the strike, apart altogether from non-production losses to investors and to the states directly concerned, New South Wales and South Australia. A round table conference is now being held in Sydney.

Kingsgate—Kingsgate Molybdenite, a Victoria company, acquired an area of land at Kingsgate, N. S. W., containing 54 molybdenite pipes. One or two have been worked to depths approaching 500 feet without showing any signs of cutting out. After long delays the mill is now capable of treating over thirty tons of ore per day, but drought is still restricting operations For every 1,000 tons of matrix mined 400 to 500 tons of milling ore is produced, containing approximately 0.5 per cent bismuth and 1 per cent molybdenite. The first run with the new mill was not a financial success, but the material was low-grade, and included a large proportion of hopperings. The percentage extraction of molybdenite was 53.8 per cent.

Astrolabe Copper Field—The New Guinea Copper Mines, Ltd. has been registered to take over the property of the Laloki (Papua) Copper Mines, No Liability, on what is known as the Astrolabe copper field, eighteen miles from Port Moresby, Papua. The company has entered into a contract with the Electrolytic Refining & Smelting Co., Port Kembla, for the purchase of 6,000 tons of pyritic ore per annum from the Laloki and Dubuna mines. The railway from the Laloki mine to Bootless Inlet, a distance of fifteen miles, is in course of construction. This will be the first railway in the Commonwealth's island territory of Papau. Up to December 31 the Laloki Co. and spent £60,681 on development, viz., £50,168 at Laloki, £9,973 at Dubuna, and £540 at Mt. Chalmers (the old Great Fitzroy mine in Queensland). Percy R. Osborne is general manager.

TASMANIA

Risdon—It is officially stated by the board of directors of Electrolytic Zinc Co. that within a few weeks the output of electrolytic zinc will be increased from 100 tons to 140 tons per week by the use in portion of the new plant of an extra 1,750 hp. of electric energy to be supplied under arrangement with the Tasmanian government hydro-electric department. The construction of the first half of the new 100-ton-per-day zinc plant is being steadily advanced, and work on the buildings and plant for the treatment of by-products and the development of subsidiary industries is also proceeding. Further consideration has been given by the directors to the production of caustic soda, chlorine, and chlorine products. It is the intention of the board to proceed as soon as practicable with the production of 6,000 to 8,000 tons annually of caustic soda, with a corresponding quantity of chlorine and chlorine products. For this purpose the company will use the plant of the present 10-ton zinc plant which has been found to fit in with the requirements of the new industry.

THE MARKET REPORT

Published in part in San Francisco and mailed from there to our Western subscribers as a special service without charge pending the arrival of the *Engineering and Mining Journal*

Silver and Sterling Exchange

July	Sterling Exchange	Silver: New York, Domestic Origin	Silver: New York, Foreign Origin	Silver: London	July	Sterling Exchange	Silver: New York, Domestic Origin	Silver: New York, Foreign Origin	Silver: London
8	394	99½	94½	54	12	393	99½	92⅞	53⅛
9	394	99½	91¾	52¼	13	392	99½	93⅛	53⅝
10	394	99½	92⅛	52⅝	14	390½	99½	93	53¼

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

On the authority of the Secretary of the Treasury, we quote 100c. per oz. for silver, 1,000 fine, delivered at the option of the Director of the Mint to the New York Assay Office or to the mints in Philadelphia, Denver, or San Francisco, and proved to the satisfaction of the Treasury Department to have been mined, smelted, and refined in the United States. This quotation is retroactive to May 13.

Daily Prices of Metals in New York

July	Copper: Electrolytic	Tin: 99 Per Cent	Tin: Straits	Lead: N. Y.	Lead: St. L.	Zinc: St. L.
8	18.60	45.00	48.75	8.10	8.10	7.70
9	18.60	46.50	50.00	8.10	8.10	7.70
10	18.60	46.50	50.00	8.10	8.10	7.70
12	18.65	47.25	50.50	8.10	8.10	7.75
13	18.65	46.25	49.75	8.10	8.10	7.80
14	18.65	45.75	49.25	8.10	8.10	7.85

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for prompt and nearby deliveries constituting the major markets, reduced to the basis of New York, cash, except where St. Louis is the normal basing point. All prices are in cents per pound.

Copper is commonly sold on terms "delivered," which means that the seller pays the freight from refinery to buyer's destination. The delivery cost varies, and it would be confusing to figure net prices on individual transactions. Consequently, an average deduction is made from the "delivered" price. At present the average cost of delivery from New York refineries is 0.15c. per lb., and that deduction is made to arrive at the New York price. When copper is sold f.o.b. or f.a.s. New York, of course no deduction is made.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 55c. per 100 lb. above St. Louis. Tin is quoted on the basis of spot American tin, 99 per cent grade, and spot Straits tin.

London

July	Copper: Standard Spot	Copper: Standard 3 M	Copper: Electrolytic	Tin: Spot	Tin: 3 M	Lead: Spot	Lead: 3 M	Zinc: Spot	Zinc: 3 M
8	89⅛	91⅜	105	249	256⅛	33¼	34¾	41¾	43¼
9	89¾	92¼	105	258½	263¾	33¾	35½	42	43¼
10	..	....	...	....	....	....	....	....	....
12	91⅛	93¾	105	264½	271	34½	36	43¾	44
13	90⅜	93	105	266	271½	34¾	36½	42½	43¾
14	90	92½	105	265¾	271½	34½	36	41¾	43

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York, July 14, 1920

A better feeling is in evidence throughout the market, although sales are in anything but large volume. Transportation is improving slowly, and some shipments can be made today that were impossible a week ago. No new strikes of any moment have been reported, and the labor situation gives evidence of improvement in the fall. Immigrants are coming in larger numbers. Many large industries are laying off men, the woolen companies in New England, for example, and the automobile industry in Detroit. Agents of the larger mining companies are having better success in securing men in the large industrial centers. It is true, many wish to take vacations and others to work in the harvest fields, but by the first of September labor conditions in the mining districts should be better.

Copper

Buying has been on a larger scale than for two or three months, but has not reached the volume of the last buying movement, nor is it likely to. Producers are obtaining their asked price of 19c. delivered, but are willing to sell at this price regardless of the point of delivery. However, this price cannot be considered as firmly established, for business has been lost at this figure. Wire mills have been the chief buyers. Most of the metal sold has been for third-quarter delivery; for fourth-quarter delivery, ¼c. premium is being asked.

One big producer reports foreign inquiry and sales excellent, England, France, Germany, and Italy being in the market. It has been a long time since sales have been made to Italy, and the general opinion was that her stocks were ample.

Lead

No marked change has occurred the last week in the lead market, and conditions continue quiet. The tendency for the St. Louis price to be as high or higher than New York continues. The reasons for this were mentioned last week. July and early August metal seem to be scarce in the vicinity of St. Louis, and it is extremely doubtful if much could be obtained at the prices which we quote. Most of the metal now being sold is for September delivery, but the price differential between prompt and future lead is not as great as it was. Offers of lead for prompt delivery went begging in New York yesterday at 8½c. One fairly large cancellation has freed some metal, which has eased the market.

Zinc

The firm undertone continues, but business is quiet, especially for Prime Western. Brass special commands about 20 to 25 points premium, which is considerably greater than it was six months ago, and electrolytic is also in demand. No runaway market can be expected, for London today is more than a cent below St. Louis parity, the equivalent being about 6.70c.

Tin

Prices have shown an upward tendency, but little business has been done. Manipulation seems to account for the London variations, which are not always reflected in the local market. Fluctuations here are the result more of an extremely narrow market; Chinese No. 1 particularly seems entirely independent of London. Almost no electrolytic has been sold.

Straits tin for future delivery: July 8th, 48.75@49c.; 9th, 49.75@50c.; 10th, 50@50¼c.; 12th, 50.50@50.75c.; 13th, 49.75@50c.; 14th, 49@49¼c.

Arrivals of tin in long tons: July 3d, Straits, 150; China, 75; 6th, Australia, 200; 7th, Hongkong, 125; Singapore, 425; Liverpool, 50; 8th, Singapore, 50; London, 200; 12th, Liverpool, 25; London, 75.

Silver

The silver market continues dull and quiet, with only moderate demand from London, mostly for account of India Bazaar buying. The fluctuations in price have been quite out of proportion to the amount of business done, the very smallness of the business perhaps making the market unusually sensitive.

Reports from India are that the monsoon conditions are favorable, and if the rainy season continues, and good crops are assured, the demand for silver from India may bring about some improvement in price.

On the other hand, the China market continues dull, with exchange rates unchanged and at a level which does not warrant silver purchases by China banks at current quotations.

If the negotiations for the international loan to China are successful, this should help the demand for silver from the Chinese banks.

The demand for silver in the arts in this country continues dull.

Mexican Dollars—July 8, 71½; July 9, 63⅜; July 10, 69½; July 12, 70¼; July 13, 70⅜; July 14, 70¼.

Gold

Gold in London on July 8th, 104s. 1d.; 9th, 104s. 1d.; 12th, 104s. 3d.; 13th, 104s. 6d.; 14th, 105s.

Foreign Exchange

Sterling has weakened. Other foreign funds have been quiet. On Tuesday, in units to the dollar, francs were 11.92 and lire, 16.77. German marks, 2.58c. New York funds in Montreal, 13⅞ per cent premium.

Other Metals

Aluminum—Ingot, 33c. per lb., with 32@32½c. open market for 98@99 per cent virgin.

Antimony—Market continues weak. Spot, 7½c. per lb.; Cookson's "C" grade, 14c. Chinese and Japanese brands, 7⅝@7¾c. W. C. C. brand, 9c. Chinese needle antimony, lump, firm at 9@10c. per lb. Standard powdered needle antimony (200 mesh), 10@12c. per lb.

Bismuth—$2.70 per lb., 500-lb. lots. Market quiet.

Cadmium—Nominal, $1.40@$1.50 per lb. Market dull.

Cobalt—Metal, $2.50 to $3 per lb.; black oxide, $2 per lb.

Iridium—Nominal, $300 per oz. No business.

Magnesium—Crude, 99 per cent or over pure, $1.75 per lb., for the metal in 100 lb. lots and over, f.o.b. Niagara Falls.

[1]Molybdenum Metal in rod or wire form, 99.9 per cent pure, $32@$40 per lb., according to gage.

Nickel—Ingot, 43c.; shot, 43c.; electrolytic, 45c.; Monel metal, shot, 35c.; blocks, 35c., and ingots, 38c. per lb.

Osmium—Open market, $50@$75 per troy oz.

Palladium—$75@$80 per oz.

Platinum—Market weak at $80@$85 per oz.

Quicksilver — Market weaker; $90@$92 per 75-lb. flask. San Francisco wires $85. Firm.

Ruthenium—$200@$220 per troy oz.

[1]Selenium, black, powdered, amorphous, 99.5 per cent pure, $1.75@$2 per lb.

[1]Thallium Metal—Ingot, 99 per cent pure, $18@$20 per lb.

Metallic Ores

Bauxite—About 52 per cent alumina content, less than 2 per cent iron oxide, up to 20 per cent silica and artificially dried to contain not more than 4 per cent free moisture, $10 per gross ton at mine; 54 per cent alumina and about 15 per cent silica, $11; averaging 57 per cent alumina, 8 to 12 per cent silica, less than 3 per cent iron oxide, $13 on basis of 8 per cent free moisture. Ores of very low silica content suitable for the manufacture of aluminum oxide and hydrate of alumina command a fancy price.

Chrome Ore—Guaranteed 50 per cent Cr_2O_3 foreign ore with a minimum of 6 per cent silica, 72@80c. per unit, New York. California concentrates, 50 per cent Cr_2O_3 and upward, 60@65c. per unit, f.o.b. mines.

Iron Ores—Lake Superior ores, per ton, delivered at Lower Lake ports: Old Range bessemer, $7.45; Old Range non-bessemer, $6.70; Mesabi bessemer, $7.20; Mesabi non-bessemer, $6.55. June ore shipments were 9,233,566 tons; it is expected that July shipments will show an improvement.

Manganese Ore—75@80c. per unit, 50 per cent Mn content, c.i.f. Atlantic seaport; chemical ore (MnO_2) $75@$85 per gross ton.

Molybdenum—85 per cent MoS_2, $1 per lb. of contained sulphide.

[1]Tantalum Ore, guaranteed minimum 60 per cent tantalic acid, 65@70c. per lb. in ton lots.

Titanium Ores—Ilmenite, 52 per cent TiO_2, 2c. per lb. for ore. Rutile, 95 per cent TiO_2, 20@25c. per lb. for ore, with concessions on large lots or running contracts.

Tungsten Ore—Scheelite, 60 per cent WO_3 and over, per unit of WO_3, $7 f.o.b. mines; wolframite, 60 per cent WO_3 and over, per unit of WO_3, $6.50@$7.50 f.o.b. mines.

Uranium Ore (Carnotite)—$2.75@$3 per lb. for 96 per cent of the contained oxide (U_3O_8). Ores must contain a minimum of 2 per cent U_3O_8.

Vanadium Ore—$1 to $2.50 per lb. of metallic vanadium content.

Zircon—Washed, iron free, 10c. per lb. Zirkite—$90@$100 per ton, carload lots. Pure white oxide, 99 per cent, is quoted at $1.15 per lb. in ton lots.

Zinc and Lead Ore Markets

Joplin, Mo., July 10—Zinc blende, per ton, high, $51.10; basis 60 per cent zinc, premium, $46; Prime Western, $45; fines and slimes, $45@$40; calamine, basis 40 per cent zinc, $35. Average settling prices: Blende, $43.02; calamine, $34.47; all zinc ores, $42.92.

Lead, high, $98.95; basis 80 per cent lead, $95@$90; average settling prices, all grades of lead, $97.37 per ton.

Shipments for the week: Blende, 9,404; calamine, 118; lead, 1,521 tons. Value, all ores the week, $556,830.

The mines all resumed operations this morning, though some were very short handed. The miners who dispersed to the harvest fields have not all returned. Operators are expecting more to return tonight and tomorrow.

Efforts of sellers to spring the market by holding out against $45 basis until 11 o'clock today are reported a maneuver to prevent price reductions. It is reported that a number will not resume night operation in the mines.

Platteville, Wis., July 10—Blende, basis 60 per cent zinc, $49.25 base for high-grade. Lead ore, basis 80 per cent lead, $90 per ton. Shipments for the week: Blende, 1,653; lead, 30 tons. Shipments for the year: Blende, 37,680; calamine, 2,240; lead, 3,364; sulphur ore, 988 tons. Shipped during the week to separating plants, 2,060 tons blende.

Non-Metallic Minerals

Asbestos — Crude, No. 1, $1,800@$2,500; No. 2, $1,100@$1,500; spinning fibres, $400@$700; magnesia and compressed sheet fibres, $300@$400; shingle stock, $100@$150; paper stock, $60@$80; cement stock, $17.50@$30; floats, $8.50@$15, all per short ton, f.o.b. Thetford, Broughton, and Black Lake mines, Quebec, Canada; 5 per cent to be added as Canadian royalty export sales tax. Freight rate from mines to Sherbrooke, Quebec, over Quebec Central R.R., 20c. per cwt.; from Sherbrooke to New York, 27½c., carload lots; freight to New York for crude No. 1, f.o.b. Thetford mines, $8.45 per ton, carload lots.

Barytes — Crude, 88 to 94 per cent barium content, $10@$12 per net ton; ground (white) $22@$25 in bags, carload lots; (off-color) $18@$20 in bags, carload lots; all f.o.b. Kings Creek, S. C. Crude, 88 to 94 per cent, $12 per gross ton; ground (white) $25@$25; ground (off color) $16@$19 per net ton, f.o.b. Cartersville, Ga. Crude, 88 to 94 per cent, $23; ground (white) $40.50; ground (off color) $27 per net ton, less than carload lots, f.o.b. New York. Crude, not less than 98 per cent, $11@$11.25 per ton, f.o.b. cars, Missouri; floated, $28 per ton in bbls.; $26.50 per ton in 100-lb. bags; extra charge for bags, f.o.b. St. Louis.

Chalk—Domestic, extra light, 5@6c. per lb.; light, 4½@5½c.; heavy, 4@5c; English, extra light, 5@7c.; light, 5@6c.; dense, 4½@5c. per lb., all f.o.b. New York.

China Clay (Kaolin) — Crude, $9@$12; washed, $12@$15; powdered, $18@$22; bags extra, per net ton, f.o.b. mines, Georgia; crude, $8@$12; ground,

[1] Furnished by Foote Mineral Co., Philadelphia, Pa.

$15@$40, f.o.b. Virginia points. Domestic lump, $10@$20; powdered, $25@$30; imported lump, $25@$35; powdered, $30@$60, f.o.b. New York.

Feldspar—Crude, $7.50@$8 per gross ton, f.o.b. Maryland and North Carolina points; $7.50@$10 f.o.b. Maine; ground, $22@$30, car lots, f.o.b. Baltimore; ground, $22@$30, f.o.b. North Carolina points; $17 to $20 per ton, No. 1 ground, f.o.b. New York State; $21@$23 per ton, ground, f.o.b. Maine.

Fluorspar — Gravel, guaranteed 85 per cent calcium fluoride and not over 6 per cent silica, $25 per ton, f.o.b. Kentucky and Illinois mines; ground, suitable for acid, chemical or enameling purposes, $60. Lump, $17.50, f.o.b. Tonuco, N. M.

Graphite—Crucible flake, 85 per cent carbon content, 8c. per lb.; 88 per cent, 9½c.; 90 per cent, 10½c., all f.o.b. New York; 80 per cent, 5c.; 90 per cent, 10c.; 30 per cent (dust polish grade), 1c.; 50 per cent (dust facing grade) 2c.; f.o.b. Ashland, Ala. Mexican, amorphous, $45@$55 per short ton; Korean, 3½c. per lb.; Madagascar, 8c.; Ceylon, 4½@15½c.

Gypsum—Raw crushed rock, $3.50@$4 per ton; raw ground fine, $4@$4.50; calcined stucco, $9, all f.o.b. works. Containers extra. Wholesale, plaster of paris, carload lots, $3.75 per 250-lb. bbl., alongside dock, New York.

Kaolin—See China Clay.

Limestone—Dolomite, 1@2 man size, $1.60@$1.65; 2@8 in., $1.55@$1.65 per net ton, f.o.b. Plymouth Meeting, Pa.; fluxing, $1.65@$1.75 per net ton, f.o.b. Howellville, Pa.

Magnesite. Calcined — High-grade caustic calcined, lump form, $35@$40 per ton, carload lots, f.o.b. California points. Freshly ground calcined, suitable for flooring trade, $65@$75 per ton, f.o.b. Eastern points.

Dead-Burned — $32.50 per net ton, Chewelah, Wash.; $50@$60, Chester, Pa. (Magnesite brick — See Refractories.)

Mica—Imported block mica slightly stained, per lb.: No. 6, 50c.; No. 5, $1.20@$1.40; No. 4, $2@$3; No. 3, $4.25@$5; No. 2, $5.50@$7; No. 1, $8. Clear block: No. 6, 55c.; No. 5, $2; No. 4, $4; No. 3, $5.75; No. 2, $7; No. 1, $9; A1, $14; extra large, $25, all f.o.b. New York; ground, $85@$100 per ton, Philadelphia.

Monazite — Minimum of 6 per cent thorium oxide, $42 per unit, duty paid.

Phosphate Rock—Per long ton, Florida ports: 77 per cent tricalcium phosphate, $13; 75 per cent, $11.50; 75@74 per cent, $11; 70 per cent, $8.35; 68 per cent, $7.85; 68@66 per cent, $7.60. There is no price schedule for spot for domestic uses.

Pumice Stone—Imported, lump, 4@50c. per lb.; domestic lump, 6c.; ground, 4@7c., all f.o.b. New York.

Pyrites—Spanish, fines, per unit 12c., c.i.f. Atlantic seaport; furnace size, 16½c.; run of mine, 12@14c.; domestic, fines, f.o.b. mines, 12@14c.

Quartz—(Acid tower) fist to head, $10; 1½ to 2 in., $14; rice, $17, all net ton, f.o.b. Baltimore; lump, carload lots, $5@$7.50 net ton, f.o.b. North Carolina mines.

Sulphur—$18 per ton for domestic; $20 for export, f.o.b. Texas and Louisiana mines.

Talc—Paper making, $9.50@$14 per ton; roofing grades, $8.50@$9; rubber grades, $9@$15, all f.o.b. Vermont. California talc, $20@$35, talcum powder grade. Southern talc, powdered, carload lots, $12 per ton; less than carload, $15, f.o.b. cars. Freight to New York, $5.25 per ton, carload lots; less than carload lots, $9.25. Imported, $60@$70; Canadian, $10@$20 per ton.

Mineral Products

Arsenic—White arsenic, 14@15c. per lb.; sulphide, powdered, 20@21c. per lb., f.o.b. works, carload lots.

Nitrate—Soda, $3.85 per cwt., ex vessel, Atlantic ports. Market quiet.

Potassium Sulphate—Domestic, $2.25@$2.50 per net ton, basis 90 per cent, f.o.b. New York.

Ferro Alloys

Ferrocarbontitanium—For 15-18 per cent material, $200@$250 per ton, f.o.b. Niagara Falls, N. Y.

Ferrocerium[1]—Per lb., $12@$15. Foreign conditions as affecting the price of American goods remain unchanged.

Ferrochrome—Carload lots, spot and contract, 60 to 70 per cent chromium, 6 to 8 per cent carbon, 19@20c. per lb. of chromium contained; 4 to 6 per cent carbon, 20@21c. f.o.b. works.

Ferromanganese—For 76@80 per cent, $225, freight allowed; Spiegeleisen, 18 to 22 per cent, $75, f.o.b. furnace.

Ferromolybdenum—Standard grades, carrying from 50 to 60 per cent molybdenum metal, with low sulphur, phosphorus, and arsenic, $2.50@$3 per lb. of contained metal, f.o.b. works.

Ferrosilicon—For 10 to 15 per cent, per gross ton, f.o.b. works, $60@$65; 50 per cent, $80@$90; 75 per cent, $150@$160.

Ferrotungsten—70 to 80 per cent W, 85c.@$1.10 per lb. of contained tungsten, f.o.b. works.

Ferro-uranium—35-50 per cent U, $7 per lb. of U contained, f.o.b. works.

Ferrovanadium—Basis 30-40 per cent, $6.50@$8 per lb. of V contained, f.o.b. works.

Metal Products

Copper Sheets—No change in Jan. 7 price of 29½c. per lb.; wire, quoted 22½c.

Lead Sheets—Full lead sheets, 12½c.; cut lead sheets, 12½c. in quantity, mill lots.

Nickel Silver—Unchanged at 39½c. per lb. for 18 per cent nickel.

Yellow Metal — Dimension sheets, 26¾c.; sheathing, 25¾c.; rods, ⅝ to 3 in., 23¾c.

[1]Furnished by Foote Mineral Co., Philadelphia, Pa.

Zinc Sheets—$12.50 per 100 lb., less 8 per cent on carload lots, f.o.b. smelter; zinc plates, 12c. per lb.

Refractories

Bauxite Brick—56 per cent alumina, $145 per 1,000, f.o.b. Pittsburgh.

Chrome Brick—$85@$90 per net ton, carload lots, eastern shipping points.

Chrome Cement—45 to 50 per cent Cr.O., $50 per net ton, and $55 in sacks, carload lots, eastern shipping points.

Clay Brick — First-quality fire clay, 9-in. shapes, $45@$53 per thousand, Pennsylvania, Ohio, and Kentucky works; second quality, $40. First quality, St. Louis, $45; New Jersey, $75.

Magnesite Brick—$90@$100 per ton, eastern shipping points; 9-in. straights, $90@$100; 9-in. arches, wedges and keys, $95@$105; soaps and splits, $110@$120.

Silica Brick—Nine in. and 9-in. sizes, per 1,000, $51@$55, Birmingham, Ala.; $50@$55, Mount Union, Pa.; $55, Chicago district.

Iron Trade Review

Pittsburgh, July 13, 1920

The iron and steel industry is complaining more loudly of car shortage, as to shipments of its products rather than the securing of raw materials, and blames the decreased supply of open-top cars on I. C. C. Order No. 7, relating to car preference to coal mines, but on the other hand the coal operators claim they have experienced little if any increase in their car supplies.

Production of steel ingots in June was at the rate of about 42,400,000 gross tons a year, against rates of 41,050,000 tons in May, 37,550,000 tons in April and 45,200,000 tons in March, the last named being the highest rate since October, 1918. Production in the half year was at the rate of 42,100,000 tons a year.

Pig Iron — The market is one of prompt shipment only, consumers being interested solidly in deliveries, not in making commitments for the future. Bessemer, basic and foundry all remain quotable at $45, Valley, freight to Pittsburgh being $1.40, but a higher price might be paid occasionally by a consumer in particular distress, for immediate shipment. The production of coke and anthracite blast furnaces in June, according to *Iron Age*, amounted to 3,043,540 gross tons, or an average of 101,451 tons per day, as compared with 2,985,682 tons, or 96,312 per day in May.

Steel — The market is quiet, with large stocks of unshipped billets and sheet bars at mills. Quotations are practically nominal at $60@$65 for billets, $65@$70 for small billets and $75 for sheet bars.

Charcoal and Coke

Charcoal[1]—Willow, 7c. per lb. in bbls.; hardwood, 4½c. per lb., in 250-lb. bbls.

Connellsville — Furnace, $17@$18; foundry, $18@$18.50.

Gold Movements

Their Recent Trend and Purpose—Marked Effect Upon the Gold Reserves—Interesting Relation Between Trade Balances and Bullion Movements—South America And the Orient Still Consuming United States Gold

THERE are two principal methods of settling a debt in a foreign country; the first is through the medium of buying "foreign exchange" and the second by the shipment of gold or silver coin or bullion. This latter method is almost exclusively used in settling international trade balances. It is a certain way of assuring the payment of a debt in a foreign country, but the incidental trouble of packing, carting, and insuring heavy shipments of bullion makes it an expensive expedient. At present the embargo on gold exports from foreign countries is prohibitive. Large banking houses are usually the only parties indulging in this mode of settlement. Nevertheless in view of the importance of gold movements upon foreign exchange, upon the gold reserve, upon the gold premium, and upon the policy of deflation which is being followed by many nations, their significance is marked and interesting.

The United States is the only country that has directly maintained the free gold market, and it is able to do this only by allowing the free movements of gold to and from this country. Other countries have taken advantage of this fact in frequently insisting upon payment in gold—witness the great drop in our gold reserve during the last twelve months. But preventing this condition through an embargo upon gold would immediately place our own currency on the same level with the depreciated currency of other nations.

Trade Balances and Bullion Movements

In 1919 it was noticeable that our largest gold exports were made to the Orient. The following important table strikingly brings out the close relationship between our gold and silver exports to the Orient and the adverse trade balance of the United States; that is, the excess value of the goods imported into, over those exported from, the United States:

RELATION BETWEEN U. S. ADVERSE TRADE BALANCES AND BULLION SHIPMENTS TO THE ORIENT IN 1919

Country	U. S. Excess of Exports Over Imports, 1919	Silver Shipments	Gold Shipments	Total Bullion Shipments
India	$240,633,415	$92,661,317	$28,756,570	$121,417,887
China	48,638,789	74,117,074	62,783,480	136,900,554
Japan	43,488,620	3,946,453	82,098,015	86,044,468
Dutch East Indies	5,016,067	.....	7,365,111	7,365,111
Philippine Islands	.....	.....	100,000	100,000
Totals	$337,776,891	$170,724,844	$181,103,176	$351,828,020

The Far East is spoken of as the great silver-consuming sponge, yet the gold absorption in 1919 from the United States was greater than the silver consumption.

The table indicates that with a total adverse trade balance in the Orient of $337,776,891 in 1919, there was shipped to the Far East $351,828,020 in bullion as a counterbalance. Thus the bullion exports for the year exceeded the adverse trade balance by $14,051,129. That the individual shipments do not balance, illustrates a general feature of gold movements—considerable gold and silver may be exported from the United States for the settlement of adverse trade balances accumulated by other countries, such countries using their credit to purchase gold here and ship it to the Orient, or frequently to South America.

The Purpose and Results of Gold Movements

The normal effect of gold movements is to bring foreign exchange rates back to mint par. Thus, bankers who engage gold for shipment to a foreign country do so to create balances against which more foreign exchange can be sold, and, by adding to the supply, pull the rate down. In normal times the cost of shipping gold limits the foreign exchange rates within so-called "gold points," a few cents greater or less than the mint value of the currency.

Often gold movements are undertaken to strengthen home gold reserves, and in such event the condition of the foreign exchange rate is a secondary consideration—as it was at the beginning of the war—and conversely the exports of gold often imperil the gold reserve.

Effect Upon the Gold Reserves

The recent heavy imports of English gold into the United States have had a perceptible effect upon the gold reserves of the United States and England. Lately the gold reserve of England dropped to the lowest point in half a century, due partly to this condition, and at the same time the gold reserve of the United States increased. At the end of April our gold reserve stood at $1,937,000,000, whereas $1,972,000,000 is recently reported. In June, 1919, the gold reserve was $2,202,000,000, but as the embargo on gold exports was then lifted, the gold reserve gradually declined, due to the insistent demand for payment in gold and the desire of the United States to strengthen exchange rates in several countries, until a few months ago, when it began to increase again.

Recent movements of gold to and from the United States are indicated by the following table:

IMPORTS OF GOLD

From	March	April
United Kingdom—England	$9,368,700	$48,353,408
Canada	6,370,387	364,492
Dutch East Indies	494,530	107,298
Mexico	334,584	388,492
Central American States	109,313	94,833
Philippines	106,714	.....
Colombia	1,002	150,049
Other Nations	199,992	766,606
Totals	$16,985,222	$50,225,178

EXPORTS OF GOLD

To	March	April
Argentina	$23,345,000	$29,850,000
Uruguay	9,750,000	2,000,000
China	3,457,179	1,764,950
Mexico	3,365,960	1,269,467
Hongkong	2,169,785	4,235,045
British fndia	1,453,673	1,533,300
Dutch East Indies	1,000,000	2,302,956
Japan	555,766	.....
Canada	425,348	461,783
Other Nations	1,526,515	706,078
Totals	$47,049,226	$44,123,579

Our heaviest gold imports are coming from England and Canada and the largest exports are going to South America and the Far East.

England's Heavy Shipments

Although in March the exports of gold from the United States exceeded the imports by $30,064,004, in April the direction of the movement was reversed, the excess of imports over exports being $6,101,599, which is the first time in a year that the imports of gold have exceeded the exports. Detailed figures for May and June (not yet available) are expected to show even greater "favorable" balances. The unusually heavy gold shipments that have been coming to the United States from England as part of England's financially courageous policy to extend her credit regardless of her slim gold reserve account for the excess of gold imports. This British attitude will also aid in restoring a free gold market in London, a result that would beneficially help sterling exchange. England's large gold exports to the United States have also been considered part of the plan to pay off the Anglo-French loan maturing next October.

That England is shipping the greatest percentage of her gold exports to the United States is shown by the following figures of the gold movements during April, 1920.

MOVEMENTS OF GOLD FROM THE UNITED KINGDOM

Country	Imports	Exports
United States	£520	£6,032,895
British India		1,620,213
Argentina, Uruguay and Paraguay		1,419,721
Straits Settlements	5,246	1,204,763
Transvaal	3,190,547	
Others	421,659	428,150
Totals	£3,617,972	£10,705,747

In spite of England's relative small gold reserve, there is a marked excess of gold exports over imports. Considering the financial position of the country and the heavy gold exports that have recently taken place, it is not strange that the gold reserve fell during July to the lowest point in half a century, 8½ per cent.

The Indian demand for gold has always been a big factor in drawing gold from London, but, as the demand has slackened, greater amounts of gold can move to the United States. The free gold movements to and from India were restricted until recently by the British government, the ban being lifted in June.

World's Gold Production Decreasing

Preliminary figures showing the production of gold throughout the world in 1919 have been made by the U. S. Geological Survey. The production in the United States was $58,285,196; Canada is reported to have produced $14,687,000; India, $10,028,000; Australia (not including New Zealand or the Islands), $29,268,000; the Transvaal, $171,640,123; Rhodesia and West Africa, $18,631,070. There was probably a large decrease in the production of gold in Russia and Siberia in 1919. Some increase was probably made in the output of Central America and South America, which, however, was doubtless offset by decreases in the output of other countries. The incomplete returns now available indicate that the world's production of gold in 1919 was between $345,000,000 and $350,000,000. The world's production in 1918 amounted to $380,924,500.

Information received during the first six months of 1920 indicates a still further decrease in the production of gold in the United States and that the output for the year will probably be less than $50,000,000. The production in Alaska, Colorado, California, Oregon, and Montana will be much less in 1920 than it was in 1919, because water is very short for placer mining and many stamp mills are closed. Canada as a whole may increase its output, although the production of the Yukon districts will be smaller than last year. The output of Russia can not be estimated. That of Australia will show a decrease. That of South Africa and South America will probably show no radical decrease. Indications point to a decrease in the world's production of gold in 1920 not so great as in 1919.

Latest Rand Gold Production

During June, the gold production of the Rand, in South Africa, amounted to 715,957 oz., an increase in output over the May figure, 699,041 oz. A table summarizing production since 1917 follows:

RAND GOLD OUTPUT 1917 1920
(Fine Ounces)

	1920	1919	1918	1917
January	670,503	676,059	714,182	782,634
February	625,330	636,728	659,759	721,321
March	707,036	712,379	696,281	787,094
April	686,979	694,944	717,099	742,778
May	699,041	724,995	741,217	729,385
June	715,957	702,379	727,696	759,724
July		725,497	736,199	757,890
August		706,669	740,210	756,658
September		698,558	708,206	738,231
October		723,722	679,764	751,290
November		677,970	658,701	722,839
December		650,191	641,245	722,419

Current rate of production is below the war rate, despite the effect of the "gold premium."

COMPANY REPORTS

Alvarado Mining & Milling Co.

Silver; Mexico

The annual report of the Alvarado Mining & Milling Co. for the year 1919 shows a surplus, after payment of taxes, and reserves for depreciation and depletion, of $411,307. This is equal to 45c. per share earned on the $4,452,515 capital stock outstanding on Dec. 31, 1919. Gross earnings amounted to $2,741,774, from which was deducted mining costs, development expenses, and other charges amounting to $1,225,875 and taxes totaling $220,749, leaving an operating profit of $1,295,150. Further deductions due to a contract adjustment with the American Engineering & Operating Co. and to miscellaneous items, resulted in giving a net profit of $941,038. Allowing $442,787 as a reserve for depletion, and $86,944 as a reserve for depreciation, the surplus remaining amounted to $411,307.

During the year the company paid all of its floating debt, other than current operating accounts, and has arranged for the conversion of the $852,500 first mortgage 6 per cent convertible gold bonds. The par value of capital stock was changed from $5 a share to $20 a share and the shares were reduced from 1,200,000 to 300,000. The report states that the daily capacity of the milling plant will be increased from 600 tons to approximately 1,200 tons, and the mines will be equipped to supply the additional tonnage. The balance sheet shows that current assets are $931,041 in excess of current liabilities, representing an increase for the year of $636,064.

In a summary of operations it is stated that development work resulted in the discovery of new and large orebodies, which materially increased ore reserves. In the Alfarene and Presena mines large bodies of ore were discovered in the hanging walls, which are being stoped over widths varying from 25 to 60 ft. Development of a new vein in the Las Cruces mine has also begun.

Assets and liabilities are indicated as follows:

ASSETS	
Real estate and mines	$5,534,218
Buildings and equipment	1,055,640
American Engineering & Operating Co. stock	$5,210
Cash and U. S. Government securities	318,265
Accounts receivable	394,589
Bullion and ores	260,602
Supplies	198,304
Total	$7,486,835
LIABILITIES	
Capital stock (908,503 shares)	$4,542,515
First-mortgage convertible 6s; due 1926	$52,500
Reserves for conversion of bonds, depletion, and depreciation	1,944,146
Accounts payable	240,725
Surplus	266,949
Total	$7,846,835

Great Northern Iron Ore Properties

Iron; Minnesota

More than 4,000,000 tons of iron ore was shipped from the Minnesota properties of the Great Northern Iron Ore Properties Co. during 1919, and $6,000,000 was distributed to holders of Certificates of Beneficial Interest, according to the annual report of the company for the year 1919, just made public by the trustees.

This company is a trust created by directors and approved by shareholders of the Great Northern Railway Co. and controls the iron output of ten subsidiary companies.

The Mahoning mine at Hibbing, Minn., produced practically one-fourth of the total tonnage. The receipts from the proprietary companies for royalties and rents made a total of $5,844,249; administration costs amounted to $93,616. The report also shows that the trustees have on hand undistributed funds in the amount of $352,911, in addition to which each of the proprietary companies has ample emergency reserve funds. Since 1906 the trustees have received $28,002,833 and distributed $26,625,000 to certificate holders, the administration cost over that period being $1,024,922.

The Fixed Price of Silver

HOW much better it is to act than to argue was illustrated by Senator Pittman when he quietly put through the legislation under which American silver is now selling at the fixed price of a dollar an ounce, a condition which will probably last for four years or so under the existing act. The Government mints will buy gold at $20.67 and silver at $1; and a fixed ratio is established, after many years of the single standard, a ratio of 20 to 1. The silver so bought will be minted into coins or placed in the Treasury vaults as a reserve against the silver certificates, outstanding or to be issued. Silver is, therefore, remonetized, and all American silver will be turned into currency. The silver that goes into the arts will be foreign silver, purchased on account of its cheaper price in the New York market. Should the world price of silver go above a dollar, our Government would automatically cease to buy, for none would be offered it; but at any fall below a dollar domestic producers could take advantage of the Government-fixed price.

Government price-fixing in general is artificial and injurious, as the war experience demonstrated. But one thing must be fixed—a standard on which all other prices are calculated. Hence the inevitable fixed price of gold. But silver is also a necessary currency metal; its principal use is as a medium of exchange. Hence, the fixing of its price appears proper.

In view of the political and forensic war that has been waged over the question of bimetallism, the fixed silver ratio, and free coinage of silver, no deliberate presentation of a proposition to again fix a ratio in this country would have been listened to for a moment. But the thing is done.

Is there anything but benefit in it? We are of the opinion that other nations would do well to follow suit. France has suffered the loss of most of her silver coins because they were worth more as bullion, for the use of the arts. Most countries are so poor in gold that their financial systems are shaky, and the restoration of exchange rates is one of the world's principal problems. Meantime the operation of gold mines is becoming more and more difficult, and the production of gold ever less. The firm knowledge that all of our silver, as well as all of our gold, was definitely back of currency and bonds would help this country, and the same principle would help the world more than us.

The system is working with us now. We will not call it bimetallism, or any other word by which it was formerly discussed—words are more obnoxious, and more fatal, than ideas. But we actually have a gold standard supported by a silver currency at a fixed ratio to the gold. All the single-standard exponents of the stability of our national system of currency point out that the silver notes are sound, being secured, dollar for dollar, by silver deposited in the Treasury; thereby acknowledging silver as a basis of exchange. We have the system in practice, then. Is there anything injurious about it? We shall have plenty of opportunity to study it during the next four years; for although some of the theorists who wake up to the fact that something has been "put over" on them are clamoring for a repeal, the act will not be repealed, as there is no sensible reason for doing so. We shall find it to be a stabilizer, rather than a disturber; and at the expiration of the period provided for in the Pittman Act we assume that Senator Pittman will move for an extension of the fixed price.

The Bureau of Safety First

IF YOU, Mr. Engineer or Mining Man, were asked to lay out a program for a Government institution devoted to the mining industry, you would among other things establish a weighted ratio between different parts of that industry; i.e., so much time and money for mining problems, so much for ore-treatment, so much for marketing problems, so much for problems involving national policy and assistance. Whether you would make these proportions 30, 30, 30, and 10 per cent, whether you would make a more careful and more varied assignment, is beside the point; but you would lay out the work, as the first thing to do. You would devote so much to metal mining, so much to coal, so much to oil, and so much to the other non-metallic minerals. In short, you would have a program.

Has the Bureau of Mines a program? Looking over the appropriations, both for 1920 and 1921, it is conservative to say that it has not. The fault may be with the Bureau administration, or with the committees on mines and mining, but most citizens would be induced to think that the responsibility lies in the former place. We do not as a rule expect much from Congress or a Congressional committee. Plans and estimates are laid before them by the bureau chief, and they approve some, whittle down some, and reject others. Each Representative or Senator will approve of anything which feeds into his particular home district; therefore items of appropriation which have a local color are easier to obtain than those of only general interest. The initial planning and balancing is the province of the heads of bureaus, who alone have a clear oversight over their own field.

The accompanying graphs show the Bureau of Mines allotments for the fiscal year 1921, which differ only in detail from those for 1920, and also further back. The biggest allotment, it will be seen, is for mine accidents, constituting one-third of the whole; but the third largest appropriation, for mine rescue cars, is also for mine accidents, which brings up the total to 43 per cent, as shown in Fig. 2. Sixth in the list of allotments, in

proportion to magnitude, comes mineral mining, with $125,000, constituting only 19 per cent of the whole. When it is considered that this allotment is for coal mining, metal mining, and the mining of the earthy minerals, the percentage devoted to the dominant metal-

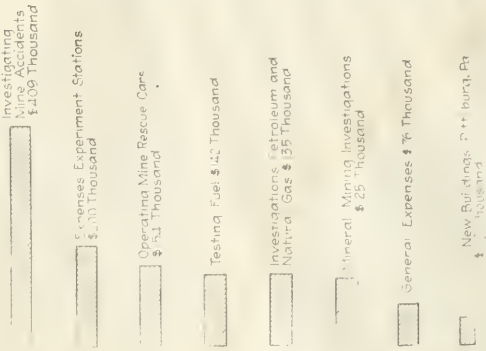

FIG. 1.

mining industry is seen to be small. Actually, attention to coal mining has always exceeded that of other mining in the bureau.

One allotment that will not offend our sense of proportion is that for petroleum investigations, which stands fifth on the list; and the petroleum division of the Bureau has always been considered efficient and creditable.

As for experiment stations, their multiplication is not in the interest of economy and efficiency; but is intended to secure the support, political and financial, of certain regions. Such support may savor of the pork-barrel, but it appeals more to the Representatives and

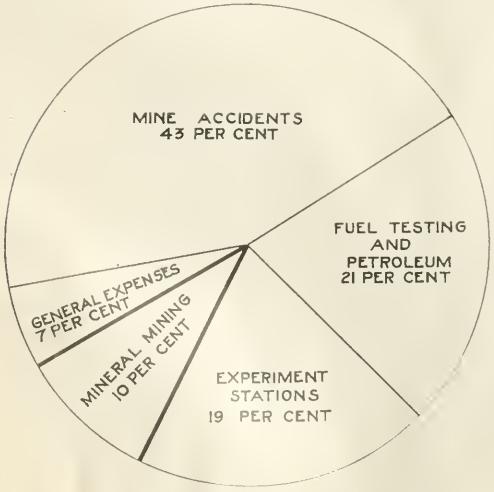

FIG. 2.

Senators of the region involved than do appropriations for general Federal purposes. The multiplied administrations involve heavy overhead and general charges, and loose co-ordination. Work of similar character is often carried on at two or more stations; and the required co-operation, which involves close arrangements with local institutions, especially state universities and mining schools, injects the element of state politics into the management of each, to further complicate the situation. We do not favor the system.

In Fig. 2 we have not only grouped the two mine-accident appropriations, but have joined the two fuel appropriations, to give a general view of how the money that represents the mining industry is segregated. Frankly speaking, is not this graph a deformed monstrosity? The first thing that should be done is to call in an expert from outside to lay out a program; the second, to have the courage to "hew to the line, let the chips fall where they may."

The Engineer in Politics

IN A RECENT communication to the *New York Times*, Dana W. Robbins, referring to the defeat of Herbert Hoover as Republican nominee for President, says that "the advent of the engineer into high political places is once again postponed." The choice of the word is a particularly happy one, and the sentiment expressed by its use is one with which most engineers heartily agree. Our good friend Webster defines "postponed" as merely a putting off; an eventuality which shall some time be realized.

In the meantime it is not improbable that the events immediately preceding and terminating in the Chicago convention will be given careful consideration, and, likely enough, by engineers.

Organization is a well-balanced arrangement, depending on certain vital principles for its proper functioning, whether it be an industrial or a political concern. Any successful engineering enterprise requires the services of an organization, part of which, at least, is made up of engineers. The actual engineering work is not planned and executed by lawyers, by professional politicians and orators, but by engineers. These others may contribute their share toward the entire undertaking, and generally —nay, always—receive their full share of credit.

Engineering was recognized as a profession, but purely as such—if at all—by the great bulk of the people until the affairs of the Great War showed in a startling manner the vital need for engineers. In general, the engineering profession was regarded as a necessary evil, an outlet for the youths of the country who displayed some desire to dabble in science and were unwilling to enter the medical or kindred professions. Engineers did their work well and in an unostentatious way. Rivers were spanned, buildings were erected, transportation systems devised, mines developed and the industrial life of the nation progressed, while the engineer, intent on his individual problems, paid little heed to other affairs which depended so greatly upon the conscientious performance of his task.

But an awakening has come, and the engineer of today feels that "the best is none too good." He requires more than a mere pat on the back; he demands a recognition that is compatible with his accomplishment. And so it was that Herbert Hoover was proposed as the candidate best fitted to represent the profession, in the "highest of the high political positions."

Mr. Robbins continues:

"Nevertheless, a glorious opportunity was shamefully disregarded. That opportunity was the chance for an engineer to demonstrate to the world that if the profes-

sion was not to be recognized in the choice for high office it was because the members of the profession were not accustomed to the light casting aside of their conviction to obtain any office or to ingratiate themselves into the good graces of any group of men, however powerful."

Engineering, as a profession, recognizes no forces save those of nature, and if it is true, as Mr. Robbins says, that "the great problems before the country today are engineering problems—pure and simple," there is little reason to suppose that engineers can be expected to "ingratiate" themselves for the sacrifice of a principle. Such a transition *may* come gradually, as the engineer learns more of the inner workings of the "system," but, on the other hand, there is an insistent demand, ever increasing, for principle in politics. Subservience to the wishes of those who would further their own interests to the detriment of the state does not conform to true engineering ethics.

The Joy of Doing

MUCH of the so-called unrest of the present is due to the loss of the sense of relative values. There is joy in accomplishment, whether it be large or small. The late Theodore N. Vail, out of a lifetime of experience, said in an interview a short time before his death:

> Any man who is not doing his level best is stunting his mental, moral, and spiritual development, to say nothing of his ability. Great heavens! The very greatest satisfaction that a man can get out of life is the knowledge that he is accomplishing something worth while. It makes me impatient to hear and read the utter nonsense so common about money and what its possession can mean and do for a person.
>
> By accomplishing something I do not mean that you must necessarily have done something great, something big, or something unusual. Accomplishment is relative. The boy who delivers messages, the girl who types letters, the mechanic who turns a lathe, the worker who walks the railroad tracks, the telephone operator at the switchboard, the man stringing wires, can earn this feeling of satisfaction that comes from worthy accomplishment just as much, just as keenly, as the chief executive of the great industrial enterprise or the president of a railroad or the famous author.
>
> One's sphere matters little. Everybody wants to feel that he or she has accomplished something. Go into any family in the land, no matter how humble, and before you have been talking very long with them they are sure to begin to tell you of something that either the head of the house or some other member of the family has done. If there is no accomplishment, if none of them has *done* anything they can talk about, then they will at least tell you of something bright or clever that some relative of the family has said.

It is refreshing to hear this sound philosophy from one who has accomplished so much. There is a real joy in work, whether it is barring down a loose slab from the roof of a dangerous working, or pouring bullion into molds. Workmen formerly took pride in their own work; and many of them now, if the truth were known, do have that same feeling toward the tasks that fortune has brought to their hands. We fear that there has been a considerable destruction of this wholesome feeling without an equivalent replacement by something equally substantial. There is too much looking ahead without appreciating what is closest at hand. It is those things which are a part of our every-day life that will bring the joy to each day and produce, as Mr. Vail so well expressed it, "the very greatest satisfaction."

Platinum vs. Gold vs. Silver Monetary Bases

IT IS customary, in speaking of the currency reserve, to picture heavy yellow bars of gold acting as the bulwark and foundation of the monetary system. Hence any announcement which presents another conception of metallic base for exchange mediums is novel—yet according to a recent news item the currency reform law of the Zemstvo government, a Russian provincial administrative assembly, the new money is to be backed by a combination gold, silver and platinum reserve, valued at 71,000,000 rubles. This is an interesting departure, to say the least, and one wonders what prompted the step.

Of the two really noble metals, gold and platinum, the latter is by far the more valuable, and has characteristics that would make it ideal for coinage purposes were it not so scarce, and consequently expensive. Platinum coins are by no means novel—in 1828, after the discovery of platinum in the Urals, the Russian government issued a platinum coinage. At that time the metal had a value a little over one-third that of gold, or about $7.15 per troy ounce. Three-ruble, six-ruble, and twelve-ruble pieces were issued, and the system worked splendidly until the middle of the last century, when the coinage was stopped, for platinum had risen so much in value that the platinum coins were exported for their metallic or bullion content. No doubt the great demand for platinum in industrial uses which was just then beginning to be felt caused the value of the metal to ascend rapidly enough to disturb the existing Russian currency system.

A very few months ago platinum was worth around $150 an ounce—contrast this with $7.15 in the year 1828—and present quotations are between $80 and $90. There is no doubt that platinum admits of great variation in value—so does silver, for that matter—and it would be of particular interest to know what ratio of valuation is to be adopted in the utilization of the platinum reserve or platinum-gold-silver reserve. The introduction of platinum will involve many complexities of a financial nature, but it is far better to build upon platinum than upon paper, which has characterized the procedure of so many European nations, to the detriment of their prosperity.

Safety in Cities

THERE is a vast amount of safety propaganda, and the organization of safety-first associations, committees, and the like goes on apace. All such bodies are doing a good work, and they should call attention to the unnecessary wholesale killing and maiming of pedestrians in our cities. Last year 1,400 persons were killed by automobiles in New York; in June, 1920, the deaths so caused totaled 100, which indicates a lull. Injuries are not taken into account. The pity of it is that it is unnecessary. Except on a few corners of New York, no regulation of its traffic with a view of protecting pedestrians is attempted. On many a corner the "traffic cop" rules over the cross-stream of motor traffic, pedestrians dodging the cars as best they may.

Certain thoroughfares might be reserved for pedestrians, and no vehicles allowed on them. In the ideal city, the sidewalks will be on the second story, on which all retailing will be done; bridges will provide for crossing the street, and the ground floor will be given up to delivery and receiving and general business in which the public does not participate.

WHAT OTHERS THINK

Making Miners Out of Farmers

What a Colorado miner finds when he comes to Arkansas to do work for a company engaged in prospecting is told in the story of W. A. Roderick when he pumped and cleared out the 225-ft. shaft of the old Confederate mine, about eleven miles north and east of Little Rock.

The old mine had been idle for thirty years, and had filled with water. It was virtually covered over when Mr. Roderick arrived on the scene and began to work. That was last December, and it was not until early in June that the water was pumped out and the shaft cleared, all the work having been done by Mr. Roderick alone.

It was amusing to hear Mr. Roderick tell of his experiences with Arkansas miners. He advertised for help, asking for men who had experience in mines. Several answered, but when he took them to the shaft and told them what was to be done, the "miners" developed a strong and fixed determination to remain on top of the earth.

After spending several days in coaxing and persuading, Mr. Roderick began work himself. He used one or two men on the surface to care for the engine and let down proper material to him, but the real work had to be done by himself.

Men stood back from the shaft and laughed at him for going down in the "hole." A "durn fule," a "reckless feller" and "he thinks less of his life than I do of mine," were told him repeatedly, but the 200 or more pounds of Mr. Roderick went down the shaft, tended the pump as it was lowered, noosed heavy timbers, built levels and ladders, endured floods of rain-water that came in the shaft after heavy rains, and never faltered one minute. There were times when the one-man fight against floods and troubles was almost too much for him, but he persisted with grim determination, and about the first of June the original bottom was reached.

The next problem was to get men down to the bottom of the shaft to commence the drifting. Mr. Roderick advertised again, but men would come only to the shaft, crawl to the edge, and look over. After that it was useless to ask them to go down. They had never before heard of mining by digging holes in the ground and never expected to get that far away from sunshine and light.

It would have been a bad job for Mr. Roderick had not a young man appeared who had some courage. Together they descended to the bottom. For three days Mr. Roderick stayed with him to keep him from becoming frightened, and then, just as he thought him to be accustomed to being underground, a pebble fell. Had tons of loose back fallen in the mine, it could have been no worse. The young man wanted to get out immediately, so Mr. Roderick had to repeat the process all over again.

Another three days of training, and he stayed down by himself. After that others went down, and thus it was that a Colorado miner introduced underground mining to Arkansas. If nothing happens, Mr. Roderick believes that he has really made underground miners out of Arkansans.

GEORGE ALLEN.

Little Rock, Ark.

Hot Times in Ciudad Juarez

I hear a good deal of talk and see many articles in the daily papers relative to a "revival of interest" in Mexican mines, owing to a confidence in the new government, but I have no knowledge of any new work that would tend to confirm these statements. An occasional scout is seen here, but I have heard of no deals resulting from the recent visits of any of these gentlemen.

A few months ago, several buyers of manganese appeared here, but it seems that the deposits of this mineral in Arizona and New Mexico are too low grade to be profitable. Two properties are being worked on the Mexican Northwestern Ry., between here and Casas Grandes, by local people. Shipments of ore between 40 and 42 per cent Mn, and low in silica, have been made. It is planned to ship twenty-five tons per day from each of these properties, but one of them is already in trouble, and I expect operations to be suspended, owing in part to incompetent management. Another manganese property is being worked at Arados station, on the Mexican Central, between El Paso and Chihuahua City.

Some silver and silver-lead prospects are being worked along the line of the Mexican Northwestern Ry., and in the vicinity of Villa Ahumada, on the Central.

The country is quiet, but, on the whole, mining is almost at a standstill in northern Chihuahua. Little interest is manifested in El Paso in either oil or in mining.

The only lively section of the country, hereabout, is Ciudad Juarez, Mexico, across the line from El Paso. Aside from many El Paso residents who have the habit, even staid church-going tourists "de peso" and relatives, even to the third and fourth generations, seem to be carried away by the liberty and license of Juarez to such an extent, that the very many saloons can pay divers and heavy taxes and still make money, while the gambling hall, which furnishes craps, faro, roulette, stud-poker and other games, pays $50,000 U. S. currency per month for the mere privilege of being permitted to do business.

No celebration was staged in El Paso on the Fourth, so that Juarez was jammed with a wet and happy crowd; saloons—gambling hall—bull ring and auto races being generously patronized. The H. C. L. bothers everyone, but I venture to say that Juarez gets an average of $500,000 U. S. currency per day which El Paso would be glad of the opportunity to garner from our sturdy "Give me liberty or give me death" compatriots."

Ancient Principles of Modern Machinery

By K. S. Twitchell

THE FORERUNNER OF THE BEVEL GEAR

The horizontal wheel is revolved by donkey or mule power, the vertical pins engaging the horizontal pins of the vertical wheel, causing it to revolve. Attached to the latter is an endless chain provided with earthenware water buckets. This prototype of the bucket elevator has been used in its present form from time antedating the records of man.

PART OF ANCIENT ROMAN WATER SYSTEM, CYPRUS, SHOWING CISTERN AND PIPE

THE EMBRYO DISK CRUSHER. REVOLVING DISKS ARE USED IN THE NEAR EAST FOR CRUSHING GRAIN

The engineer who visits the countries bordering upon the Mediterranean is often forcibly reminded of the fact that many of the principles involved in machinery and construction of the present inventive age were practically applied hundreds or even thousands of years ago. Perhaps it would be more appropriate to call our period the age of rediscovery rather than the age of invention. The cracked and broken concrete roadways laid during the summer of 1919 around New York City stand in strong contrast with the Roman concrete water systems. The cistern shown in the foreground of the upper left-hand illustration was absolutely uncracked when recently uncovered. To the right of the concrete trough lies a terra-cotta pipe, so similar in type to some of the modern cast-iron water pipes that one might imagine himself standing at the brink of a New York subway excavation. Perhaps the disk crushers which are now on the market are, after all, merely patterned from the flour mills of the Near East. The mill shown in the upper right-hand corner has the disks revolving on each other with the center slightly coned to take the feed from the central feed opening. The crushing of wheat in the Near East is done mainly in similar but larger mills driven by water power. The water, however, is not applied in the old over-shot or under-shot method, but as in the impulse type of wheel. The ancients may not have used the counterpart of our hydraulic presses, nor developed machines for testing materials, but they evidently knew how to develop a considerable squeeze, as is evidenced by the primitive screw shown below, which is a part of a press used in making the famous "Commanderia" wine of Cyprus.

WINE PRESS AT KYKKO MONASTERY, POLEMI, CYPRUS. AT THE LEFT IS SHOWN THE WOODEN SCREW, BY MEANS OF WHICH THE NECESSARY PRESSURE IS OBTAINED

AN ANCIENT GANG SAW IN ACTION

KEYWAYS AT THE TEMPLE OF THE SPHINX

The modern gang saw is seen in the upper left-hand picture in its primitive form. This explains why southern Europe still has timber that will square two feet. Of even more ancient origin is the idea of keying together heavy stonework. At the right is shown the keyways used for the purpose of holding in place the huge granite blocks in the Temple of the Sphinx, which is supposed to have been built about 2800 B.C. The gyratory crusher is another mechanical device of antiquity, its ancestor being shown below. These mills were constructed of a very hard eruptive rock which served admirably for the crushing of grain. The shell revolved upon a stationary spindle, the wheat being fed upon the center of the spindle, while the flour discharged at the periphery between it and the shell. There was no gyratory motion, but this is a mere detail of the modern crusher.

Alaska Tin Deposits

Steep-Dipping Quartz Porphyry Dikes in the York Mountain District Show Presence of Cassiterite Near Contacts—Deposits, Still in Prospective Stage, Are of Low Grade and Would Require Large-Scale Operations To Be Profitable

By Frederick C. Fearing
Written for *Engineering and Mining Journal*

AMONG the raw materials sorely needed during the critical days of the war, tin should be placed among the most important, but despite this fact it is doubtful if more than a handful of laymen realized prior to 1914 how much modern civilization owes to this metal, whose early technical history is lost in the mists of antiquity.

Before the war the United States consumed annually nearly half of the world's production without itself augmenting the supply by more than a few insignificant lots of medium-grade tin concentrates. Nowhere in this country are there producing tin mines of even passing consequence. It therefore soon became apparent to those in charge of war industries that every effort should be made to counteract this defect by finding and developing new deposits, if possible within the territorial boundaries of the United States.

Presence of Tin in Alaska Previously Known

The existence of tin outcrops in Seward Peninsula, northwestern Alaska, had been a matter of record with the U. S. Geological Survey since 1900, and by the time of this country's entry into the European conflict a point had been reached in the development of some of these prospects which made examination and study of marked importance and advantage. Accordingly, through the efforts of James F. Halpin, of Nome, Alaska, an extensive expedition was organized by private capital to examine and report upon the possibilities of the situation.

The tin areas which are the subject of this paper are located in the heart of the York Mountain district, Seward Peninsula, Alaska, about seven miles inland from Bering Sea, on Cassiterite Creek, a tributary of Lost River. The location of the district and the available steamship route are shown on the accompanying map of Alaska.

History of Claims in Lost River District

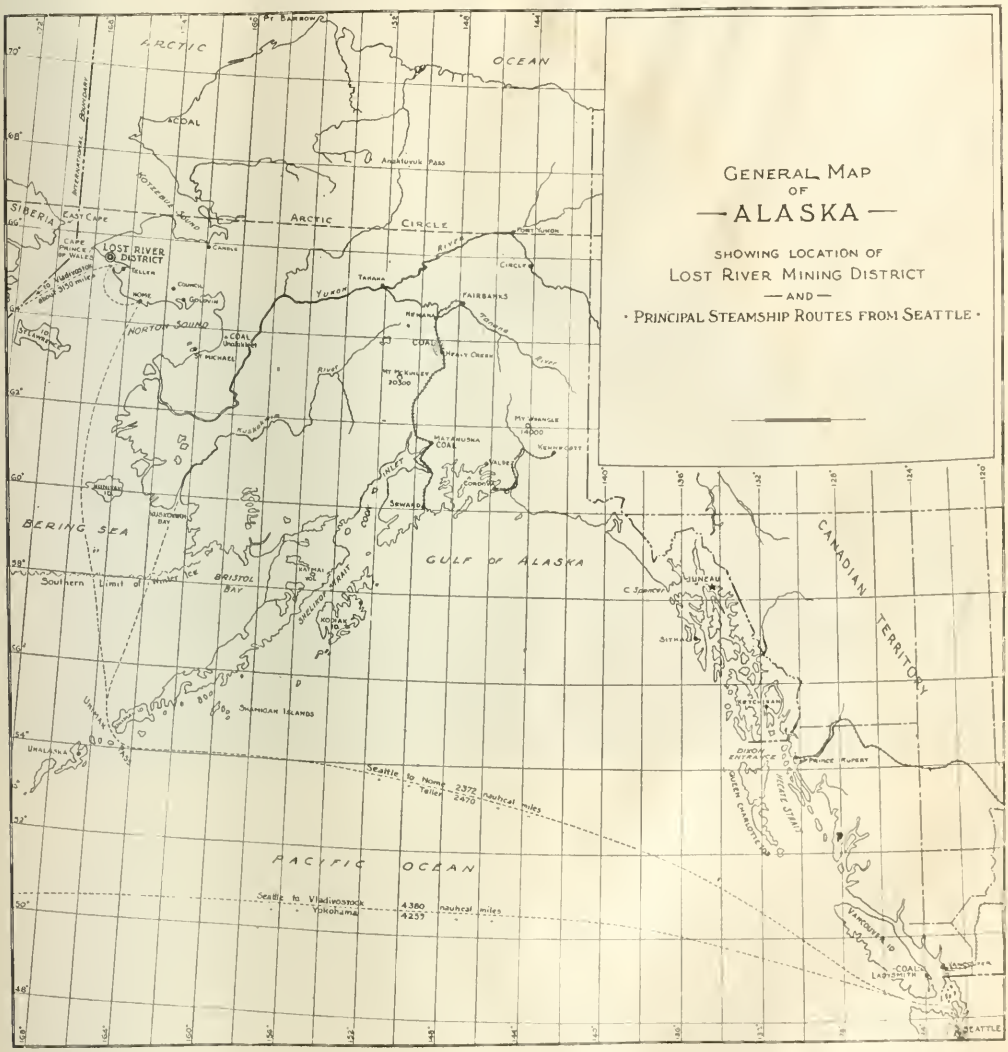
Soon after the discovery of tin in the York region, three prospectors, Leslie L. Crim, Charles Randt, and William O'Brien—with a horse, worked their way through the defile just above the mouth of Lost River and finally staked a group of claims. They found themselves in a country entirely devoid of timber and capable of supporting only a few sporadic patches of rank Arctic grasses and reindeer moss in some portions of the valleys. Sharp, frost-cracked rubble covers the slopes of the mountains, which look as though some giant crusher had been at work throughout the region. Arctic hurricanes of breathless suddenness, long duration, and extreme violence, with wind velocities as high as 120 miles an hour, frequently sweep down from the North. During the summer months, when the slope detritus has thawed out, wind erosion can be observed hard at work moving tons of debris from the heights down into the valleys. Except when frozen, many portions of the hillsides are continually on the move.

Nevertheless, the district is a decidedly healthful one, with excellent water and good drainage. Often, in June, July, and early August, come wonderful days, when the sun eats up the last remaining snowdrifts, and the streams are flooded and the deep violet tones characterizing the Arctic landscape make one forget that the distant hills are not forest-clad. There are still other compensations, for even the athletic Alaskan

mosquito finds the Lost River "chow" exceedingly scarce, and in consequence makes himself conspicuous by his comparative absence.

A small cabin, shown in one of the photographs, was erected by the three prospectors from driftwood packed in from the Bering Sea beach, and mine timbers were similarly obtained. Powder, fuse, caps and supplies were brought from Nome, and development work was started by means of adits and carried on under the most difficult conditions of hardship and financial strain.

One day in 1908, in the dead of winter and while an Arctic blizzard was raging, O'Brien went up the side of Cassiterite Mountain to No. 1 adit, leaving Randt in the cabin and Crim at work on the greenstone. While O'Brien was kneeling over the thawing kettle, eleven sticks of 40 per cent gelatine exploded. It blew out one eye and temporarily blinded the other; it tore the flesh from the thigh to ankle; it crippled one hand. Why it did not kill him Heaven only knows. In this condition he managed to grope his way back down the mountain through the storm, and was finally found by his partners and taken to the cabin. Then followed a 120-mile journey to Nome strapped to a dog sled, and months in the hospital there, with more months recovering later in Seattle; but O'Brien finally returned to the mines to begin again. Crim died, Randt died, and their heirs began a legal battle for control of the property. The old horse which had accompanied the original prospecting party was finally pensioned off. Without adequate financial backing, but with grit enough to spare, O'Brien fought it out alone. By the time of our visit nearly 2,000 ft. of underground work had been accomplished entirely by hand, in spite of all obstacles covering a period of 18 years, and O'Brien was still on the job.



still the hopeful, determined, dignified, and honorable gentleman that the mining engineer not infrequently meets on the frontiers of civilization and remembers always with pleasure and respect.

Geological Formations in the Lost River District

The sedimentary rocks of the district consist primarily of the Port Clarence limestones, of Ordovician Age, whose thickness has been estimated by Knopf[1] at 2,000 ft. That this figure should not be increased is probably wise, for the reason that greater estimates have been found subsequently to have been based on traverses wherein considerable faulting was overlooked. The Port Clarence limestones rest comformably upon a series of older slates, into which argillaceous, banded horizons comprising the more basal limestones, appear to grade. These slates, however, have not yet been encountered in any development work at Lost River, granite[2] itself contains 0.3 per cent of tin and, further, as the intrusive is cut by a later quartz-porphyry dike showing considerable marginal chilling and devoid of mineralization, it is thought probable that this particular granite body is of small size; that it was subjected to rapid cooling through contact with the invaded limestones, and that consequently all but a small amount of its dissolved tin content was "frozen" in the original magma without having had a chance to separate from it and form orebodies.

The probable order in which the igneous rocks were intruded in this region were: First, the granites, or perhaps the feldspar-porphyries, and finally, the basalts.

Though reverse faulting of some magnitude characterizes the district, none of it has been observed as having offset any tin-bearing occurrences. In one instance, a tin vein cuts directly across a well-defined fault plane without showing displacement. Similarly, an in-

HEADQUARTERS, ON CASSITERITE CREEK. CABIN OCCUPIED BY THE THREE PROSPECTORS FOR MANY YEARS, SHOWN AT RIGHT

and no outcrops of them are known to exist in the immediate vicinity.

Igneous rocks have invaded these sediments at many points, of which the most important are a series of quartz-porphyry dikes, striking generally east and west and having steep dips. A few of these carry tin, but the majority are entirely barren. They are persistent, however, and vary in width from a few feet up to thirty feet. Some of them have been found to intersect, and hence they cannot all be considered as of strictly contemporaneous origin. One of these dikes, named the Cassiterite Lode, has cut through an older feldspar-porphyry along a portion of its course.

Throughout the world, tin ores are closely associated with granitic rocks, and the top of such a formation, laid bare by erosion, is found southeast of the mine cabin. Here, tin occurs in veins in the limestone, near the contacts, but in small amounts only. As the area of contact metamorphism is not great, and as this trusive rock, from which some tungsten-bearing veins reach out into the limestones, has re-cemented the breccia of a fault outcropping along the bed of Cassiterite Creek. Again, a quartz-muscovite dike has occupied a reverse fault. One slip, of normal type, which is probably of small displacement, has cut off the mineralized intrusive rock exposed in the greenstone workings, and is the only one observed. It is thought that the larger slips, which might otherwise have caused dislocation and high development costs, being older than the tin mineralization, should not be expected to have an adverse effect upon the economical extraction of the ores.

Variety of Minerals Abundant

The locality exhibits a surprising number of minerals. Fifty-two varieties, of which sixteen had not been found previously in Alaska, were reported by Knopf in 1908, and two of these were then new to science. All but a

[1]U. S. Geological Survey Bull. No. 358, p. 12.

[2]U. S. Geological Survey Bull. No. 229, p. 22.

few on the list have already been identified within the Lost River area. Such a variety as this not uncommonly accompanies tin deposits. In the area under discussion the ore-forming solutions were unusually rich in fluorine, chlorine, boron, lithium and potassium, arsenic, sulphur, aluminum, iron, manganese, silicon, calcium, tin, and tungsten, and carried also small amounts of copper, lead, zinc and, in one case, a considerable amount of silver.

These elements gave rise to abundant topaz, fluorite, tourmaline, sericite, albite, cassiterite, and wolframite, which are representative of intense hydrothermal and pneumatolitic genesis. Many of the crystals, especially the quartz, contain liquid and gaseous inclusions. Fluorite and tourmaline are usually intimately interwoven, and sericite mica is prominently developed in close association with both topaz and fluorite.

Thin sections from the more highly mineralized areas invariably show that the original constituents have been completely destroyed, leaving but the faintest pseudomorphic outline, and that this took place before the advent of the tin mineralizer epoch. Other evidence of more than one stage of mineralization was obtained from the veinlets cutting the limestones. Many of these are of contact metamorphic origin, containing principally fluorite and topaz, with no tin, and some were noted to have been cut by a later veinlet rich in tin and carrying also some tungsten. In this further connection the Geological Survey has noted similar contact phenomena elsewhere in the Seward Peninsula tin region—at Ear Mountain—where contact limestones exhibit large quantities of fluorine, chlorine and boron minerals, originally unaccompanied by tin, the metal coming in at a later date.

Tin Occurrence in Dike Walls Shows Contact Effect

From the foregoing outline it is thought that the relatively small amount of cassiterite in the highly fluoritized walls of the dikes is indicative of early contact effects, doubtless produced at the same time that the barren fluorite-topaz veins were forming in the limestone, and that these wall-rocks were thus previously rendered unfavorable for the deposition of tin and tungsten minerals that subsequently took place along the old channels.

The situation may be summed up as follows:

1. The injection of the main quartz-porphyry dikes represents the final intrusive effort of an underlying magma.

2. Following this, aqueo-igneous gases and vapors carrying principally fluorine, chlorine, and boron, but very little tin or tungsten, became active along lines of weakness, both within the solidified dikes—especially along their walls—and also in contraction fissures in the cooling and shrinking limestone. Destruction of many of the original minerals encountered, together with marked contact alteration effects in the sediments, is the principal feature of this period of mineralizer activity.

3. Meanwhile, concentration of tin and tungsten was taking place in the underlying parent intrusive, and finally, as cooling and contraction progressed, these were forced out under heavy pressures and at high temperatures and formed minute vein and impregnation deposits of cassiterite and wolframite within the dikes and rich tin veins in the younger cracks within the limestones.

4. The ores show that a great abundance of mineralizer agents were present during their period of formation and that unusual combinations of minerals resulted; that the deposits vary greatly in texture and composition within short distances, vertically as well as horizontally; that they are of striking pegmatitic habit and might perhaps be best described in the language of Dr. Charles P. Berkey, of the Geological Department of Columbia University, who examined the specimens through the miscoscope, as "aqueo-igneous origin," accompanied by "important pneumatolitic effects."

Metallic Content of the Ores

Up to the time of our visit, the Cassiterite Lode had been developed by adit levels, raises, and winzes, comprising about 1,500 lineal feet, and resulting in the opening up of about 80,000 tons of ore averaging 1.5 per cent tin. For a distance of 363 ft. in No. 3 level, samples, taken at five-foot intervals, showed the presence of an ore-shoot containing 1.75 per cent tin and 0.423 units of tungstic acid per ton. Tin assays as high as 5.48 per cent. were obtained. Nevertheless, this is low grade, and the mine would have to be worked on a large scale before attractive earnings could be expected.

Preliminary milling tests showed that crushing should be carried to about 50-mesh, at which point a clean table concentrate of tin and tungsten can be obtained. The percentage of slimes was encouragingly low. Magnetic separation of the wolframite from the cassiterite should be included in any treatment program. It might be advisable, also, to re-grind the tin concentrates, to break loose small amounts of copper and lead sulphides and arsenical pyrites with which the cassiterite is intimately associated, and then to eliminate these impurities by means of flotation.

Cassiterite has generally been looked upon by geologists as a deep-seated mineral. In Cornwall, England, the lower limit of economical tin mining has nearly been reached at 3,000 ft. below the outcrops. In Bolivia a few of the lodes were first worked for their silver, but as depth was gained silver decreased and the tin content increased. Though the Lost River deposits cannot be said to resemble the Cornwall ores, their complexity of mineralization and mode of occurrence, together with the finding of a rich silver-lead stringer-lode in the vicinity, carrying appreciable amounts of tin and tungsten, impart to them a degree of similarity to a few of the Bolivian mines. On the other hand, in its contact metamorphic aspect, there is quite a resemblance to a secondary impregnation deposit of tin at Schwartzenberg, Saxony. In any event, there appears to be no suitable criterion outside of Seward Peninsula itself from which analogy may be drawn as to the probable depth of the ores in question.

Mode of Occurrence

Evidence gathered by Knopf from Cape Mountain, at Cape Prince of Wales, however, is considered pertinent. In this locality cassiterite occurs, as at Lost River, in quartz-porphyry dikes and in quartz veins cutting limestones. What is perhaps of more importance is that it has also been found within the main intrusive granite mass near the contact borders and as impregnations in the granite walls of fault planes. This latter mode of occurrence is the normal one in the principal tin-producing districts of the world. As it is probable that the Seward Peninsula tin deposits owe their origin to granite intrusions of approximately

the same age, and as the instance mentioned shows that tin ores have been found in this region in the underlying parent rock, as well as above it in the invaded sediments, a continuation of the Lost River ores to and even into the underlying magma could not be surprising. The further fact that the tin in the Cassiterite Lode is associated most intimately with the oldest and most persistent of the existing primary minerals lends additional strength to the possibility.

Depth Rather Than Lateral Development Recommended

The Lost River tin lodes present features of unusual geologic interest and display oreshoots of considerable size. The ores are low-grade, and would have to be mined on a large scale to be interestingly profitable, assuming an average base price of 39.5c. per lb. for tin and $7 a unit for tungstic acid. The deposits are still in a prospective stage and will probably remain so until something definite has been made known through exploration at depth. If prospectors, endeavoring to develop mineralized dikes, would change their tactics and do five feet of sinking for every foot of drifting, in place of doing all of their development by means of adit levels and raises, it is thought that they would benefit materially thereby. If half of the existing development at Lost River had been in the form of a winze, a definite economic status might have been assignable to the lodes long ago. It is hoped that more work of this nature will be done, and that the region's prospects as a tin producer will be further investigated and determined.

Disposal of Used Explosives Containers

There is an element of danger in the use of wooden boxes which have contained high explosives, for very often nitroglycerin exudes from the dynamite sticks and is absorbed by the wood of the box. Although a box that has not absorbed nitroglycerin is safe, yet there is always the danger that a person will get a box that is partly saturated, writes C. L. Colburn in the U. S. Bureau of Mines *Reports of Investigations*.

On account of this danger, all mining companies should use extreme care in giving away used explosives containers. A box that shows any stain of nitroglycerin should be destroyed by fire. Other boxes that are free from nitroglycerin or dynamite can be used.

The condemned boxes, together with the paper linings of all boxes, should be burned in a place sufficiently removed from all buildings.

Care should also be exercised in the disposal of black blasting powder kegs in which loose powder has been shipped. It is difficult to get the last few grains and the dust of black powder out of the keg, and serious accidents have occurred by these kegs coming into the possession of children and others unacquainted with black blasting powder. All used black blasting powder kegs should be thoroughly washed with water before giving them away or utilizing them for other purposes.

Japan's Graphite and Tungsten

Japanese transactions in tungsten and graphite show a marked falling off. Figures available up to Sept. 30, 1919, show a decrease of $747,750, compared with 1918 in the export of tungsten, and for the same period graphite shows a decrease of $254,235.

Porcelain Crucible Recommended For Bullion Assaying

Boiling, Parting and Washing Operations Can Be Performed Most Conveniently and With Absence Of Bumping by This Means

By Roscoe Wheeler

Written for *Engineering and Mining Journal*

IN MAKING bullion assays considerable trouble is often encountered from bumping in the flask, even when means are taken to prevent it. The standard platinum cups and tray are not a solution of all difficulties, for gold cornets can break up in platinum cups as well as stick to them, if not manipulated with the utmost care. I have found from experience that the boiling and parting, as well as the washing of the cornet, can best be carried on in a high-form porcelain crucible or cup, glazed inside and outside. The crucible should be at least 1¾ in. in diameter across the top, 1⅝ to 1½ in. high and of at least 30 c.c. capacity. The upward outward sloping sides allow the bubbles free egression, thus preventing any serious bumping or upsetting. With the flask the top is the narrowest part; the gases and bubbles on ascending are compressed, strike the sides, and bumping sets in no matter how many burnt peas or lentils are used.

One trying such a cup for bullion assays will wonder why it was not thought of before. I can guarantee that the results will rank with the best when such a minimum-sized porcelain cup is used. It is the result of my own practice as well as that of a number of young and old-time assayers whom I have induced to use it. Try it. No regrets will follow.

The British Iron-Ore Situation

Great Britain has for some time been dependent on foreign ores to maintain its production of pig iron, according to *Commerce Reports*. The importation of these ores during the war was curtailed because of the shortage of cargo space, and the country was obliged to fall back on its own low-grade ore and the manufacture of larger quantities of basic iron from these ores. Pig iron cannot today be obtained in adequate quantities from the blast furnaces, because imports of ore are still greatly restricted. A slight improvement in this respect can be noted by a study of the import figures for the last three or four months, and a larger number of ore-laden vessels has arrived from Spain. Despite this, supplies are still below the demand.

Here again, the shortage of British coal is largely responsible. The export of coal from Great Britain and the import of ore from Spain and northern Africa are, in a sense, a form of barter. The same British vessels which take homeward-bound cargoes of ore take outward cargoes of coal. The ore is necessary for the country which exports the coal, and the coal is essential to the ore-producing countries; but when Great Britain cannot produce adequate supplies of coal for export the barter system must necessarily break down. Because of the diversion of vessels to trades on which they obtain cargoes both ways, there is not sufficient tonnage available, even when there is ore for shipment, as, if such vessels remain in the ore trade, they are obliged to go in ballast on the outward voyage and thus raise the shipping cost on the home cargo of ores.

Stories From a Laboratory—II

Salting

By Albert R. Ledoux

Written for *Engineering and Mining Journal*

THE devious ways of the man who would falsify samples and take advantage of the buyer have often been enumerated, and many of them, of course, were tried on our laboratory. One day a man came in with the statement, which we have often heard, that gold existed much more widely distributed than was realized, but in a form which did not permit of its detection or determination by fire assay. This man stated that even the ordinary granite used in the paving stones of New York City contained gold which he could save by his special process. He wanted us to test this process, and, if it was demonstrated that he was correct, to give him a certificate to that effect. He stated that he wished to be present during the testing, but would not in any way interfere.

Under the pretense of wanting to familiarize ourselves with the process, we got from him his complete formula, which seemed utterly foolish from a scientific point of view. We arranged with him to make the test at a certain hour on a certain day, and he brought in an ordinary paving block from the street. Before the appointed time we went through the test exactly as the instructions prescribed, and, of course, got no gold whatever. The remainder of the rock was set aside, and the next day, when the alleged inventor appeared, we repeated the test exactly as before. The man did not wait until we had actually finished the final clean-up, but paid his bill and asked us to send our certificate, whatever it might be, to the old Astor House.

Very much to our astonishment the second test produced a large button of gold. Two of our assistants had done nothing but watch the man; he had not gone near the test or the furnace, and it did not seem possible that he could have salted the sample before our eyes. However, we sent him a certificate something to the effect that we had tested Mr. So and So's process twice, using the same chemicals and apparatus; that the first test was made in his absence, and no gold whatever was found; that the second test, run while he was present, yielded gold to the value of so much per ton of granite. The man never came back, nor did he write us.

One of the most amusing things was our assay of "Gabriel's Sword." The *New York Herald* and the *Kingston Freeman* published a statement, which excited a great deal of interest, to the effect that two residents of Kingston or vicinity who were out late one night and were passing by a pond were startled by a bright light in the sky, and in a few seconds saw a brightly illuminated object fall into the water near the edge of the pond, with a hissing sound. They had concluded that it was a meteor, and the next day had gone back and had found a strange sword. It was five or six feet long, two edged, with a guard above the handle about eight inches long. It was somewhat bent and very much rusted, but on rubbing off some of the rust strange characters and hieroglyphics were observed upon the metal.

Some time after this a man came into our office, carrying on his shoulder a long box, and asked to borrow a screwdriver. On opening the box he produced this sword. He stated that he was one of the discoverers; that he was exhibiting the sword, charging admission to see it, and that he had been a blacksmith and knew a good deal about metals. He wanted the sword analyzed and a certificate given as to its composition. He was sure it was of celestial origin, "Perhaps dropped by Gabriel," because it was an alloy of iron and silver.

He suspended it and called my attention to the fact that when struck it had a ring like steel, although, as stated, he had reason to believe that instead of being steel it was an alloy of silver and iron. He said he would be satisfied if our certificate would show that it contained any considerable quantity of silver. He showed me the hieroglyphics and letters, which looked like imitations of Chaldean or other ancient script; on running my finger over the characters I could feel a little roughness, and they looked as if they might have been made by penetrating the metal with some fine-pointed tool. They were outlined just as one might outline a diagram on a piece of paper by consecutive pin pricks.

My visitor asked for a file. He said that, of course, he would not ask me to assay filings from the surface of the sword or its handle, because the suspicion might lurk in my mind that he had coated the exterior with some chemical containing silver. He called attention to the fact that the guard was apparently forged or cast as part of the blade and handle, and differed in no respect in appearance from the rest of the sword. He stated that if it would satisfy me he would file off one end of this guard; that we could then put it into a crucible and melt the whole thing and report to him as to its silver contents.

When he took the file I noticed that he examined the two ends of this guard critically before he decided which he would cut off. The file went through the metal with ease, and he handed me a cube, bright where the cut had been made but brown with rust on the other five sides. This was sent to the assay room, and the assayer, fearing that something might happen to the crucible and the assay be lost, as a precaution put the cube on an anvil and cut it in half with a cold chisel, expecting to assay half at a time. To his astonishment he found that the cube had been drilled through by a ¼-in. drill, a plug of silver had been inserted in the drill hole, and where the ends protruded the surface had been smoothed off and smeared with iron rust so that the difference between these two and the other sides did not show.

When the man came for his report we showed him this plug of silver and told him that we regretted we could not give him a certificate and feared that the spirits or someone had been fooling him when they intimated that he had to do with a new alloy and not with a steel which had been forged in some blacksmith's shop in the Catskills.

Of course we all know of innumerable instances of samples salted by vendors. We have detected in placer concentrates the milled edges of gold coins which had

been cut up and added to the sample. We have found the interiors of bags which had been sent to us carefully sealed, all black with nitrate of silver which had been squirted into the sample by inserting the point of a syringe between the meshes of the bags without breaking the seals.

Some of our problems did not have to do with ores or metals, and we were often called upon to do what seemed impossible things. For instance, the agents of a large importing house in Newfoundland sent us a sample of molasses and asked us to determine whether it was New Orleans or Barbados in origin. What we did not know about the comparative characteristics of these commodities would fill a book! We made an inquiry from the New York agents of the shippers as to what, if anything, was the matter with the molasses. They stated that the Newfoundlander of those days sweetened his tea with molasses instead of sugar; that he had always preferred Barbados molasses; that this particular shipment turned the tea black, and that, therefore, the Newfoundland fishermen and farmers refused to buy it. The trade knew very well that New Orleans molasses, though of better flavor and of higher price than Barbados, would turn the tea black, whereas Barbados would not. The analysis showed considerable iron in the sample, and later I learned that the man who had received the order for this commodity had thought to please his new customers by mixing with the cheaper Barbados article a large proportion of the New Orleans product, because he thought it would give a better flavor and would secure for him a continuance of patronage. The Louisiana refiners in those days used iron kettles; the Barbados refiners, copper.

We were once waited upon by a committee of prominent New Yorkers, among whom I remember were General Grant, S. B. Eaton, and Norvin Greene, with the request that we should make a test of a special process for extracting gold from certain southwestern deposits. The committee told this interesting story: They were operating a mine in the Southwest, and had sent their engineer to make some further locations and to register the claims. This engineer, when he went to the local land office, was asked if by any chance he spoke French; as a French count was there with a private car and his countess and servants, and was trying to do some business with the registrar, but could not make himself understood. The engineer called upon the count in his car and offered to be of service. To his surprise the count wanted to register certain locations in an alkali desert, where the engineer knew that very little existed below the sage brush excepting sand and alkali and gypsum. These claims were to be located for gold. The engineer was invited to dine with the count, and in the intimacy of the hour the latter told him this story:

His daughter had married a well-known French engineer. This man had been in the war of 1870, had lost an eye, and, returning to civil life, had done some discreditable things in Paris, had disappeared, and had not been heard of for several years. One day, the count received a letter from the man, postmarked in Arizona or New Mexico, stating that he had been in America experimenting with a process of his invention to save "volatile gold," and had discovered a great area where gold existed in large quantities theretofore unsuspected. It could not be detected by fire assay, but could be got by his process. He inclosed a description of his process and was mailing some of the samples. He desired his father-in-law to divide these samples and first have them assayed by any reputable French assayer, and then, when the latter reported—as he would—that there was no gold present, to give him the sealed envelope containing a description of the process and ask him to repeat the tests.

The count followed these instructions, receiving the report in the first instance that no gold was present and in the second instance that, much to the surprise of the assayer, the samples had yielded a very considerable quantity of the precious metal. Upon reporting these facts to his son-in-law by mail, the latter wrote that he wished his father-in-law would come out and see what he was doing; that their everlasting fortunes were made. The count therefore had arrived with his cook and valet and his charming wife, and in gratitude for the assistance which had been given by the engineer he offered to show him these properties and let him locate some claims for himself or his employers. The engineer had gone out into the desert with the count, found the son-in-law in a little shack surrounded by various chemicals, and this Frenchman produced buttons of gold before the eyes of the engineer. The latter had fallen for the swindle, had located a lot of claims for his employers and taken samples from them. These had been sent to an assayer in the West, who reported gold in all of them by ordinary processes, although the report of the son-in-law, who had kindly assayed these samples for the engineer by his alleged process, showed much larger results. So the engineer came back to New York and reported what he had done, and they had come to consult me.

I told them that of course the chances were a thousand to one that the whole thing was fake, but that I believed the engineer to be honest even if not shrewd. As these claims had been located, I advised that they get a man from Los Angeles or somewhere to go out and take other samples and bring them away without going near the French assayer or giving him an opportunity in any way to salt them. In due time the samples came, and in the presence of a distinguished sub-committee of the owners, and of the engineer, we went through the form of testing the process, particulars of which had been furnished, and of course got no gold whatever; nor did we by fire assay. It was a plain case of salting or sleight-of-hand in the previous development of the scheme.

In the meantime the French count had gone home, and when the American engineer, or his employers, reported to the count the result of this independent sampling and test, very much to their astonishment a cable came back saying that the count had absolute faith in his son-in-law's wonderful discovery; that if the New Yorkers would cable him the amount of money they had expended on the locations, sampling and our test, and would send him assignments of the claims, he would reimburse them in full. This was done, and these lucky New Yorkers got their money back, and the count must later on have discovered that he and such friends as may have joined him were victims of a swindle.

The old gold-brick swindle has not passed us by. A reputable physician from Albany came to us with some borings, which, while he waited, were tested for gold. Asked by him to calculate the value of a bar of such-and-such dimensions, assuming its fineness to be that of the borings we had assayed, we made it up in the thousands of dollars. The doctor said that he had

met a red-shirted miner who had come from the West with all his savings in this bar of gold. He needed money and would sell it for $5,000, but of course did not expect the doctor to pay for it without a test. He proposed that they come to a machine shop where the bar should be bored through. The doctor could take the borings to an assayer and upon his return pay for it if satisfied as to its value.

I warned this doctor that he was on the edge of being swindled, but nothing would convince him. Back he came in a few hours, carrying a satchel and triumphantly produced the bar. One look at it showed that it was brass, and an assay yielded no gold. Later, the victim discovered at the machine shop that while he was away getting our assay the "miner" had taken another bar out from his bag, of the exact dimensions of the original gold bar, and had had the second bar drilled through with holes exactly duplicating in location those made in the previous bar.

I had the curiosity to communicate with the doctor some months later, and found, as was to be expected, that neither through the police nor otherwise was he able to discover who had swindled him.

Ontario's Metal Production

METALLIFEROUS mines, smelters, and refining works of Ontario show an increase in the value of output for the first quarter of the year of nearly $1,000,000 over the corresponding quarter in 1919. Returns received by the Ontario Bureau of Mines for the three months ending March 31, 1920, are tabulated below. For purposes of comparison the quantities and values are given for the corresponding period in 1919.

SUMMARY OF ONTARIO'S METALLIFEROUS PRODUCTION, FIRST QUARTER OF 1920

	Quantity		Value	
	1919	1920	1919	1920
Gold, oz.	98,188	142,840	$2,026,536	$2,953,036
Silver, oz.	3,105,002	2,280,665	3,152,700	2,954,695
Platinum metals, oz.		100		7,172
Copper, blister, lb.	1,724,631	1,508,014	270,493	242,630
Copper in matte exported, tons	2,674	1,976	588,280	553,280
Nickel in matte exported (a), tons	5,610	4,571	2,692,800	2,285,500
Iron ore exported, short tons	4,840	44	41,118	322
Iron pig (b), tons	14,170	13,428	399,963	344,241
Cobalt, metallic, lb.	13,594	46,479	20,889	108,430
Cobalt, oxide, lb.	127,954	213,024	186,036	340,232
Nickel oxide, lb.	5,070	1,788,183	1,421	413,944
Nickel, metallic, lb.	1,830,569	2,159,316	756,062	753,169
Other nickel compounds, lb	33,716	159,183	5,804	15,308
Other cobalt compounds, lb	14,189	1,417	9,827	1,417
Lead, pig, lb.	567,716	509,075	34,684	48,278
Totals			$10,186,613	$11,021,654

(a) Copper in matte was valued at 11c. and nickel at 24c. per lb. in 1919. For 1920 the values have been placed at 14c. and 25c. per lb., respectively. The total matte produced contained 7,038 tons of nickel and 3,631 tons of copper.
(b) Total output of pig iron was 152,022 tons, worth $3,897,211. Figures in the table represent proportional product from Ontario ore.

Gold

Owing to Ontario's contribution, Canada was the only country able to report an increased output of gold in 1919. Production for the quarter shows an increase of nearly 46 per cent over the first three months of 1919. Of the total output of $2,953,036, Porcupine contributed $2,694,665; Kirkland Lake, $247,339; and the balance, $11,032, came from the Argonaut mine, in Gauthier Township, and from refining of nickel-copper matte. The output from Porcupine came from the following mines: Hollinger Consolidated, McIntyre, Dome, Dome Lake, Porcupine Crown, and Davidson Consolidated. At Kirkland Lake the producers in order were Lake Shore, Teck-Hughes, and Kirkland Lake. Production is still hampered by insufficient labor, and, although the wage scale has been increased to equal that at Sudbury and Cobalt, the effect has not been appreciable. In addition, gold mines produced 24,913 oz. of silver, valued at $31,373. The total tonnage of ore milled was 360,327 tons. As regards mill equipment, the producers report 5,485 tons' daily milling capacity, which includes 210 stamps, capable of treating 3,880 tons. Ball and tube mills installed have a capacity of 1,605 tons daily.

Silver

The quantity of silver marketed during the period shows a falling off, despite the high price of the metal, which averaged $1.30 per fine ounce. When the price began to recede, some of the larger producers held a considerable proportion of their output in the hope that the market would recover. The course, however, has continued downward, the present level being about $1 per ounce. The average price was $1.01 for the corresponding period in 1919. Of the total of 2,280,665 oz., Cobalt and Gowganda contributed 2,244,709 oz., and 11,763 oz. was recovered from nickel-copper refining and 24,193 from gold ores. In addition, certain silver producers were paid $7,111 for 54,518 lb. of cobalt contained in the ores and concentrates sold.

Refineries: At Deloro, Thorold, and Welland the three operating silver-cobalt refineries treated 219 tons of ore, 655 of concentrates, and 626 of residues, for a total recovery of 829,142 oz. of silver, in addition to arsenic, cobalt, and nickel in various forms. Only 5,535 lb. of nickel oxide was marketed in this form, the major part of the output, as noted in the table, coming from the Port Colborne nickel-copper refinery. Metals Chemical, Ltd., at Welland, has sold its plant to Ontario Smelters & Refiners, Ltd., which will carry on the business in future, using a different process. The new company also owns the plant at Chippawa formerly operated by the Standard Smelting & Refining Co.

Nickel-Copper

During the quarter, 301,133 tons of ore was raised and 238,700 tons smelted, as compared with 229,822 and 226,954 tons, respectively, for the corresponding period in 1919. Shipments of matte totaling 10,168 tons were made to the refineries in Canada, United States, and Great Britain. The British America Nickel Corporation is producing matte at Nickelton and shipping to the refinery at Deschenes, Quebec. The latter is now in operation, although there was no output for the first quarter of the year. A considerable part of the nickel oxide produced at the Port Colborne refinery of the International Nickel Co. of Canada is marketed in that form in England. Precious metals—gold, silver, platinum, palladium, rhodium, ruthenium, osmium, and iridium—were recovered at Port Colborne.

Iron Ore and Pig Iron

The Algoma Steel Corporation and Moose Mountain, Ltd., carried on iron mining, 53,754 tons being raised. Only a small tonnage of briquettes was shipped. No shipments of ore were made.

Seven blast furnaces owned by the Algoma Steel Corporation, Canadian Furnace Co., and Steel Co. of Canada were in operation. These smelted 28,608 tons of Ontario ore (8.8 per cent of the total) and 295,273 tons of foreign ore, producing therefrom 152,022 tons of pig iron, worth $3,897,211. The steel product was 179,244 tons, valued at $6,035,308.

The Electrolytic Copper Assay—A New Modification

Proposed Method of Special Advantage in the Presence of Impurities Such as Arsenic, Antimony, Bismuth, Selenium, and Molybdenum—Simplicity and Accuracy Features—Precipitation of the Iron by Novel Process

BY F. G. HAWLEY*

Special contribution to *Engineering and Mining Journal*

WHEN assaying copper ores and products, the analyst has the choice of several methods, varying in speed and accuracy. If accuracy is of prime importance, the merits of the electrolytic method are so great that all bullion, and a great deal of ore and matte, are sold with the specification that this method shall be used in determining their value.

Used on ore containing no interfering elements, the method is simple and satisfactory. A greater weight of sample can be used than with most processes; and this is a great advantage on samples of concentrates that contain a variety of minerals, rendering it difficult to get a small sample to represent the whole. This is especially true with flotation concentrates, which are difficult to mix thoroughly.

Unfortunately, the electrolytic method is subject to a serious limitation. A number of metals will, if present, precipitate wholly or in part with the copper, and vitiate the assay. The most common of these are arsenic, antimony, bismuth, selenium, and molybdenum. These metals are seldom found in large quantities associated with copper minerals, but many ores contain small amounts. Flotation concentrates usually contain much more of the metals mentioned than jig and table concentrates made from the same ore. Silver, tin, and mercury also precipitate, but are usually absent, or present in insignificant amounts. They can be eliminated in a number of ways, but all are tedious and require much care and attention. A slight loss of copper is probable, either chemically or mechanically. This loss may not be great enough to be objectionable for some work, but where the greatest accuracy is required would not be permissible.

Most of the interfering metals do not begin to precipitate until nearly all of the copper has been deposited; then they precipitate with, and on, the last portion of the copper. For this reason, a little impurity usually can be seen easily. However, until one has had considerable experience, it is difficult to judge how much the accuracy of the assay is impaired. Sometimes a cathode which is considerably discolored will contain only a little impurity, whereas a cathode having a much lighter and better-looking deposit may contain several times as much.

EFFECT OF IMPURITIES ON APPEARANCE OF COPPER

If the deposited copper has a smooth, even surface, the different metals form a coating that may vary considerably in appearance, and which is sufficiently characteristic to identify the metal. This does not occur if the copper deposit is rough, for then all impurities give about the same dark color. The precipitation differs with the acids and salts present, but as the almost universal practice is to have the solution contain small amounts of both sulphuric and nitric acid, with some ammonium nitrate, precipitation from this solution only will be discussed.

When arsenic is present in the sample, in amounts less than from 0.2 to 0.3 per cent, little or none of it will precipitate. If present in larger quantities, a few tenths of 1 per cent will remain in solution and the rest will precipitate on the copper. Small amounts give the copper a light grayish appearance somewhat like fine dust, which might easily escape notice even when from 0.10 to 0.15 per cent is present. With larger amounts the color is much darker.

EFFECT OF ANTIMONY AND MOLYBDENUM

Antimony acts much like arsenic, part of it remaining in solution and part precipitating. It will give the copper much the same appearance as arsenic does. The color is somewhat darker, but still a little may escape notice easily.

Molybdenum, in small quantities, is found much more frequently in copper ores than generally is supposed. In the electrolytic assay it acts like arsenic and antimony, part precipitating and part remaining in solution. When too much is not present, the addition of a small amount of any chloride will prevent its precipitation entirely. One milligram of sodium chloride will prevent about six milligrams of molybdenum from precipitating. This small amount of chloride is insufficient to injure the copper deposit. When molybdenum precipitates, the color varies with the amount present. With very little, the color is a chocolate brown that rarely extends to the edge of the cathode. With still more, an iridescent, steel-blue color is evident, that approaches black as the quantity is increased.

When an electrolytic copper deposit that is good otherwise is contaminated with any, or all, of these metals, to an amount not exceeding 0.10 to 0.15 per cent, generally the copper may be purified in this manner:

Place the cathode in a tall 150-c.c. beaker containing enough boiling water to cover the copper. Cover the beaker with a watch glass containing a notch in the side, or a hole drilled through, to let the cathode stem project. Add 10 c.c. of a mixture of equal parts of nitric acid, sulphuric acid, and water, and let stand until all copper dissolves. This takes place so slowly that no copper can be lost by violent action of the acid. Rinse off the watch glass, cool, and again electrolyze. This deposit should be practically pure.

When bismuth is present in the copper assay it does not act like the metals just mentioned. Practically all of it precipitates with the copper, and a second solution and deposition will not improve the assay. When only small amounts are present, the copper has a brick-red color and is covered with small black spots with little streaks projecting from them. These streaks, which average about $\frac{1}{8}$ to $\frac{1}{4}$ inch in length, point in various directions—up, down, and sideways. Under some conditions, finely divided sulphur and some sul-

*A paper read at the Ajo meeting of the Arizona Section of the A. I. M. E.

phur compounds will cause dark spots with streaks, but these are different from the bismuth streaks, as they always point upward, and are much longer. When more bismuth is present, the whole deposit is very dark, and the spots do not show.

When selenium or tellurium is present they precipitate at the beginning of the electrolysis, so if an assay darkens at the start, one may suspect the presence of these elements. As when bismuth is present, redepositing the copper is of no avail.

Several procedures have been evolved for removing interfering elements from copper previous to electrolysis. All are rather tedious, and none are as satisfactory as could be desired. One method used extensively is to precipitate the copper from an acid solution by sodium thiosulphate; then filter, ignite, and again dissolve and electrolyze as usual. As a means of eliminating impurities, not much can be claimed for this method, for nearly all of the interfering elements are also precipitated by the thiosulphate. On igniting the precipitate, most of the arsenic is volatilized, with possibly a very little antimony and selenium. All of the bismuth and most of the antimony will remain with the copper. A possibility of loss of copper by oxidation during filtering must be considered, and also a chance for mechanical loss while igniting the precipitate.

Another method frequently employed is to precipitate the copper as cuprous thiocyanate; filter, and either dissolve the precipitate directly or after ignition; then electrolyze. The separation is usually complete, but small losses of copper are to be expected, as cuprous thiocyanate is slightly soluble, and there is a slight tendency to run through the filter and to creep up the filter on to the funnel. If it is decided to dissolve the cuprous thiocyanate in acid without igniting, it will be necessary to boil almost to dryness completely to decompose cyanogen compounds, for if even a little cyanide remains, it causes the copper to deposit in a loose, spongy form that does not adhere well to the cathode.

Precipitating Copper With Hydrogen Sulphide

Another method sometimes used is to precipitate the copper with hydrogen sulphide; filter and dissolve out the arsenic and antimony with sodium sulphide, then separate the copper and bismuth sulphides by potassium cyanide, and proceed as before. This method is tedious, and mechanical loss is likely to occur.

All of these methods eliminate iron from the assay, which is an advantage, as an excessive amount exerts a disturbing influence on the copper precipitation. Small amounts of iron are not objectionable, and, in fact, may be advantageous, as iron somewhat retards the precipitating of arsenic and antimony. In a standard method for assaying impure copper bullion, a little ferric iron is added to the assay. An excess of ammonia is added and the solution filtered. The precipitated iron hydroxide will retain all arsenic, antimony, bismuth, and selenium, leaving the solution free from these metals. The hydroxide is dissolved and reprecipitated once or twice, to free it from all retained copper, after which the combined filtrates are electrolyzed.

Working according to the procedure indicated, I have formulated a new method for the electrolytic assay of impure ores. I consider this to be the most accurate for the determination of copper in impure ores with which I am acquainted. The time required is about the same as that of any other process in which impurities are removed. It is eminently suitable for control assays, umpire work, and any determination in which the greatest accuracy is required. It has been used for two years in two laboratories, and has always given satisfaction.

Details of the Proposed Method

The method is as follows:

Weigh 1 to 3 g. of the sample into a tall 300-to 400-c.c. beaker. I prefer a Phillips form, but it is not essential. Add approximately 1 g. of sodium bisulphate, 1 g. of ammonium sulphate, and 5 c.c. of 70 per cent sulphuric acid, and shake gently to mix. Add about 5 c.c. of nitric acid saturated with potassium chlorate; after waiting a minute or two, add 10 c.c. more. Cover beaker and set in a warm place for a short time; then gradually heat to boiling and boil off most of the nitric acid. Remove the watch glass, or, better still, set it on edge in the beaker, using the lip to make it stand upright. This is more easily done if a small segment is cut from the watch glass by an emery wheel.

The beaker is placed in a somewhat cooler place, evaporated to sulphuric fumes, and then heated a little stronger until the residue is so pasty it scarcely will flow. Remove and cool. The iron now exists as anhydrous ferric sulphate, which is insoluble in concentrated sulphuric acid, and only slowly soluble in dilute acid. Add about 1 c.c. of water and immediately follow with 50 c.c. of an alkaline mixture made as follows: Ammonia, 2 l.; water, 4 l.; and ammonium nitrate 100 g. Be sure that the pasty acid residue and the ammonia are mixed, then heat to boiling for a few seconds, cool slightly, add 5 c.c. of ammonia, and filter through a 12½-cm. filter into a 250-or 300-c.c. tall beaker; wash once with a little water, then once with warm ammonia diluted with an equal amount of water, and again with water. The main part of the copper is now in the filtrate, whereas a little copper and all of the interfering metals are retained by the iron hydroxide.

Place a watch glass on the beaker, heat to boiling, and continue until most of the ammonia is expelled. If loss is feared from spraying, the solution may be evaporated instead of boiled. Cool the solution and acidify, using an excess of 3 c.c. of sulphuric and 3 c.c. of nitric acid, and place in a cooling trough. While the boiling and cooling is being done, extract the small amount of copper retained by the hydroxide in the following way: Rinse it into the original beaker and place under the funnel. Pour dilute nitric acid around the edge of the filter to extract traces of copper which may combine with the cellulose of the filter and which will not wash out entirely unless acid is used. Wash once, then heat the solution somewhat to dissolve the hydroxide; add an excess of ammonia to re-precipitate the iron and enough 2 per cent solution of potassium cyanide to combine with most of the copper. From two to eight drops will be sufficient. Transfer the solution with the hydroxide to a 200-c.c. tall beaker and electrolyze warm on a rotating electrolytic machine at 0.2 ampere for from twenty-five to thirty-five minutes. All copper, with possibly a little zinc, will be deposited on the cathode, but the impurities remain with the hydroxide.

The next step is to unite all copper in one solution. Switch off the current and remove the beaker con-

taining the hydroxide, but leave the cathode in place. The main part of the copper is still in the beaker containing the original filtrate, which has been boiled and acidified. Put this on the electrolytic stand in place of the one just removed. Switch on the current again, but in the opposite direction, which will dissolve the small amount of copper on the cathode in a few seconds. Switch the current again to the original direction, increase to 1 to 1.5 ampere, and electrolyze until all copper is deposited; which takes from one to one and one-half hours. Remove the cathode, dry with alcohol, and weigh as usual. The deposit should have all the characteristics of perfectly pure copper, showing no signs of impurity. If the sample contains much oxidized mineral it may be necessary to treat with hydrochloric acid before adding the nitric.

If the sample does not contain four or five times as much iron as impurities, it may be necessary to add a little to be sure of removing all interfering elements; however, this is seldom necessary.

The method as given does not remove molybdenum. If this is present, add a small amount of a soluble lead salt just before adding the ammonia solution; then proceed as before.

Necessary Operations Are Numerous But Simple and Quick

The operations required in this method, though numerous, are all simple, easy of execution, and require little time. The possibility of loss of copper, either chemically or mechanically, is, I think, less than with other methods. The complete precipitation of the small amount of copper from the alkaline solution containing the iron hydroxide is done quickly and easily, and the copper in the main solution is precipitated faster and better than it would be if the iron had not been removed.

One of the novel features is the way in which the iron hydroxide is precipitated. When ammonia is added to a solution of iron sulphate, the normal gelatinous hydroxide is precipitated, but if the ammonia is added, as directed, to the pasty residue in which the iron exists as anhydrous ferric sulphate, it is changed to a dense, granular hydrated oxide whose volume is only about one-third as much as the normal hydroxide. It is much easier to filter and wash and does not retain as much copper as does the hydroxide precipitated from solution.

The mixture of sodium bisulphate and ammonium sulphate has several functions to perform. Besides aiding in decomposing the ore, it helps the iron to crystallize out and also has a tendency to prevent spitting, which often occurs with samples high in iron. If much water is present in the assay, the ferric sulphate will form with water of crystallization. This is expelled violently when the temperature rises, and is one cause of spitting. Were it not for this, the addition of water would be beneficial, as it causes the ferric sulphate to crystallize out in larger particles. On adding ammonia, this would result in a more granular ferric oxide, which would be easier to filter and wash.

The nitric acid should not be boiled off too rapidly at the beginning, for if that be done some particles of sulphide might become coated over with insoluble sulphate before they were entirely decomposed.

The reason for adding potassium cyanide is twofold: First, it aids in the extraction of all copper from the alkaline solution, for copper combined with cyanide is not occluded by ferric hydroxide. Second, copper deposits better from a cyanide solution than from one containing only ammonia and ammonium salts. An excess of cyanide should be avoided, as potassium ferrocyanide then would be formed, which has a disturbing effect on the assay. One or two drops excess would not be enough to cause trouble. Although the precipitation of small amounts of copper from a cyanide solution is complete and satisfactory, large amounts cannot be deposited practicably in this way.

If the alkaline solution contains zinc, some of it may precipitate with the copper, but this does no harm, as it is held in solution later, when precipitating from the acid solution.

If no rotating machine is available, the work can be done with stationary electrodes, provided the iron hydroxide present is not enough to interfere with the free circulation of the solution. The alkaline solution should be electrolyzed for an hour or two in the afternoon, with occasional stirring; then changed for the main solution and electrolyzed all night.

Many tests were made to prove the accuracy of the method, but only a few representative ones will be given. The first tests were made on known amounts of pure copper to which impurities were added:

TEST No. 1

In each case 0.2 g. Fe was present

No.		Cu Taken	Cu Found
1	.....	0.2606 g.	0.2607 g.
2	.....	0.2589	0.2591
3	.....	0.2996	0.2996
4	0.030 g. As	0.1459	0.1461
5	0.050 As	0.1286	0.1288
6	0.030 Sb	0.1221	0.1221
7	0.050 Sb	0.1378	0.1379
8	0.030 Bi	0.1279	0.1281
9	0.050 Bi	0.1353	0.1356

TEST No. 2

Each of the following was added: 0.25 g. Fe, 0.05 g. Al_2O_3, and 0.05 g. CaO.

No.	Sb	As	Bi	Cu Taken	Cu Found
1	0 g.	0 g.	0 g.	0.1432 g.	0.1432 g.
2	0	0	0	0.1415	0.1413
3	0.01	0.01	0.01	0.1302	0.1301

5	0.01	0.01	0.01	0.1322	0.1322

TEST No. 3

In each case 0.2 g. Fe was present.

No.	MO_3	Se	Pb	Cu Taken	Cu Found
1	0 g.	0 g.	0 g.	0.1094 g.	0.1095 g.
2	0	0	0	0.0966	0.0965
3	0.04	0	0	0.0906	0.0914
4	0.02	0	0.03	0.0957	0.0958
5	0.04	0	0.10	0.0923	0.0923
6	.	0.01	0	0.0861	0.0863
7	....	0.02	0	0.0940	0.0943

The next tests were made on pure ores, which were assayed by the regular acid method and also by the new method. Other portions also were weighed out, to which impurities were added, and these also assayed by the new method:

PERCENTAGE OF COPPER FOUND BY TWO METHODS

Cu in Ore No. 1, Acid Method	Cu in Ore No. 1, New Method	Cu in Ore No. 1 + 10 mg. Each of Bi, As, and Sb, New Method
22.20	22.20	22.21
22.19	22.19	22.21
....	22.18	22.19
Ore No. 2, Acid Method	**Ore No. 2, New Method**	**Ore No. 2 + 10 mg. Each of Bi, As, and Sb. New Method**
5.66	5.65	5.64
5.66	5.64	5.66
5.64	5.64	5.64

When determining copper on impure ores containing from 5 to 10 per cent of copper, I have frequently assayed the same pulp six times, using 2 g. portions, and found that the difference between the highest and

lowest result of the six was only 0.01 to 0.02 per cent. These same samples could not be assayed satisfactorily by the regular acid method, because the deposited copper was very dark, and the results were from 0.15 to 0.30 per cent too high.

Early Days in North Arkansas Zinc District

Zinc Carbonate First Taken for Silver Ore and Smelter Erected on Morning Star Property In 1882

By TOM SHIRAS

Written for *Engineering and Mining Journal*

WITHIN a stone's throw of each other, on the Morning Star property at Rush, Ark., are two plants that aptly illustrate the progress of development in the north Arkansas field during the last thirty-eight years. The first is a small crude stone smelter, built on the same plan as a lime kiln, with which a group of early-day prospectors tried to extract supposed silver values from zinc carbonate ore. The second is a modern 200-ton zinc concentrator which has milled thousands of tons of carbonate ore.

The stone smelter marks the first attempt ever made in the field to construct a plant that would actually yield a marketable product. At that time zinc carbonate had no value in the field, owing to the fact that the nearest railroad was seventy-five miles away. It is a common story in the district that the men who constructed the smelter thought the zinc carbonate was silver ore. John Wolfer, one of the oldest prospectors in the Buffalo River country, who located the property, denied that this was true, however, in an interview given just before he died, eight years ago. He had been a member of the group that was working the property as a claim when the smelter was erected in 1882.

MODERN 200-TON CONCENTRATOR HANDLING ZINC CARBONATE ORE AT RUSH, IN NORTHERN ARKANSAS

Wolfer stated that they had their ore assayed, and that the returns showed that along with the zinc it carried $8 per ton in silver. As the zinc had no value then, he said, they built the smelter in an attempt to save the silver, which could be easily transported in bullion form. They were woefully disappointed, however, for there was no silver in the ore.

In making this test the furnace was charged with charcoal and ore, and a sand mold made at the bottom for the silver to run into. Then the owners stood back and waited expectantly. After a short time they noticed beautiful rainbows playing in the air over the blast. This was the zinc going off in fumes. No silver flowed from the bottom. They were so discouraged that they offered to trade the claim, furnace and all, to Carter Gutherie, a prospector, for a can of cove oysters, but he turned them down cold.

OLD STONE SMELTER AT RUSH, ARK., BUILT TO TREAT SILVER ORE FOR WHICH ZINC ORES OF DISTRICT ARE SAID TO HAVE BEEN MISTAKEN

Later Captain George Chase, of Fayetteville, Ark., developed a large body of carbonate on the property, which is still being mined. The majority of stock in the company has been acquired by Pittsburgh interests.

Old John Wolfer, the original locator, died poverty stricken within a few miles of Rush, at a time when the mine was making big money for its owners.

The New Geology

In connection with recent earthquakes in Mexico a darky preacher down in Texas is said to have evolved a remarkable theory, which seems to fit in very well with certain existing circumstances, according to the *C. W. Savery Market Letter*. He promulgates his theory of the earthquakes as follows:

"We has received anudder warnin' not to go pe'ticatin' into de ways ob Providence. De earf, my breddren, revolutes on its axels, as we do now all know, and we all know dar mus' be sumefin to grease dem axels and it takes a right sma't ob grease to do it. So de good Lord done put de 'troleum inside de earf to keep de axels greased. Den byme bye 'long come all dese hyah oil companies, punchin' holes down into the bearin's and de oil all come squirten' out. Fust thing we know dar's a hot box, and de earf squeaks and jolts and rumbles and dat's de earfquake, and if dey don't quit pretty soon dere won't be no moah grease left and the earf will stick tight on its axels and won't go round no moah!"

Mining Engineers of Note

William Wallace Mein

THE first settlements in the vicinity of Nevada City and Grass Valley, Cal., were made in 1848, and were trading posts. Placer mining became active, and resulted in the beginnings of a mining community. In 1850, gold was discovered in quartz veins near Oroville, and speedily thereafter in the immediate neighborhood of these two rapidly growing towns. In 1853, quartz mining interests, after their initial campaign, became prostrated, and it was not until 1864 that the returning miners from the Washoe district of Nevada caused an active resumption in gold-quartz mining. The gold mining industry took on its swaddling clothes in this region. The first sluice was used in 1850, hydraulic mining was discovered in 1853, and the first quartz mill was put in operation on "cemented gravel" in 1857. From that time on the stamp mill was developed steadily. The auriferous sulphides presented a difficulty which was overcome by the introduction of the Plattner chlorination process. In 1873 a survey for a narrow-gage railroad was made of the territory lying between Nevada City and Grass Valley. It was in this mining atmosphere that William Wallace Mein was born about the time that the railroad between the two mining villages began to be constructed. His father, Thomas Mein, achieved a high reputation as an engineer and manager among a group of engineers who found ample opportunity for their capabilities in the gold mines of California. Thomas Mein was general manager of the Alaska-Treadwell mine, of the Robinson Gold Mining Co., Johannesburg, South Africa, and consulting engineer for the Alaska Treadwell group of mines, the Oneida, Mariposa Grant, and many others. Mr. Mein, Sr., was associated with Hamilton Smith, H. C. Perkins and Hennen Jennings and was identified with the London Exploration interests and Wernher Beit & Co. He was a prisoner with many other mining men in the Jameson raid in Johannesburg.

WILLIAM WALLACE MEIN

William Mein is a modest man and only his immediate associates and friends know of his technical and executive ability. In the beginning he was not averse to starting at the bottom, as he took a "mucking" job in Alaska and then worked on shift in the chlorination plant of the Robinson Mine, South Africa. Subsequently he returned to California and entered the University of California, from which institution he was graduated from the mining department. A year later he became manager of the Durban Roodeport Deep, at Johannesburg, South Africa, and after three years in this position accepted a similar post at the Robinson Gold Mine, where he remained for three years. He then became consulting engineer for the Robinson, New Modderfontein, City Deep, Ferreira, Village Deep, and other large mines in the South African gold field. During his managerial administration he never lost sight of "Treadwell Costs," and succeeded in reducing operating costs to such a figure as to command general attention. This is the more noteworthy when the number of able engineers in that field at the time are considered. Jennings, Hammond, Webb, Honnold, Yeatman, Hellman, Seymour, and Behr need only to be mentioned to show that real ability and character were quite essential in the running with such team mates. South Africa at that time was the greatest technical experience school in mining in the world.

California supplied many engineers with their initial impetus in gold mining. Those who went to South Africa found a bigger problem. There was greater extent and more uniformity to the gold deposits. There was opportunity to consolidate smaller mines into larger units, with resultant economy in operation. In the midst of much of this activity Mr. Mein played his part well and when he returned to the United States in 1910 he was qualified indeed to take up his professional practice as a mining engineer. He at once became identified with California mining interests, and in 1912 became consulting engineer for the Dome Mines, in Canada. The International Nickel Co. and the Canadian Mining & Exploration Co., during its period of greatest activity, received the benefit of Mr. Mein's technical knowledge.

Mr. Mein has traveled extensively in Alaska, Canada, South Africa, Central America, and the United States.

BY THE WAY

Safety First

A kick of the Widow Leary's cow upset the lamp that started the Chicago fire, and again it was the kick of a cow that recently exploded a box of dynamite on a ranch at San Ramon, Cal., where the powder was used for blasting stumps. The primary cause of the accident was one Tahw, a Hindoo employee, who struck the cow that kicked the box, which blew up, thereby cutting short the nursery rhyme. Tahw was thrown about 200 ft. and badly injured. The rancher suffered in similar manner and several buildings and five animals were destroyed. Here is meat enough for a sermon a yard long on "Safety First." There is nothing new in the use of dynamite for blasting stumps, breaking up log jams and similar purposes. There is also nothing new in the saying that "familiarity breeds contempt."

At Nelson

Talking about kicks, it is noted that the committee in charge of the Third International Mining Convention, which has been in session the past week at Nelson, B. C., has advertised very prominently that

There's a Kick in every Smile—at Nelson!
There's Dew in the mountains Still!

Under the circumstances the attendance at the convention has probably been excellent.

Purse Strings and Shoe Strings

The man who holds the purse strings in a mining enterprise may be and often is a manufacturer of shoe strings or other commodities. This is one of the things often not at once apparent to the young engineer, but which he speedily comes to recognize. To him who would become prominent as a mining magnate we suggest that first he accumulate a fortune in some other line, such as editorial work, for example, and then enter the mining game from the top. Such is our intention. There is always room at the top, as one finds when he gets there. The latest to enter by way of the top is Mack Sennett, of movie fame, who, with associates, has recently acquired a group of quartz claims not far from Grass Valley, California. The scenery there is not displeasing, and perhaps Mack is looking simply for a realistic background for some thrilling scenarios.

The Higher the Fewer

"Thee mustn't think, m'son," said Cap'n Dick, "that this 'ere Jan Trembath wuz a fool. Any'ow no more so than some o' these young h'engineers o've been to college an' then try to learn old chaps like I 'ow to dig tha h'ore. With h'out boastin,' m'son, mos' o' this 'ere minin' I naws I didn't learn un, it jus' grawed, an', dam-me, didn't come from any bloody book either. Well, any'ow, Jan, 'e figgered to put a bit by for to take a trip back long way sometime, so to begin savin' 'e built 'imself a log 'ouse an' started batchin'. Made 'imself a chair or two h'out o' some boards, an' a table, an' all tha res' o' tha fixin's. Then 'e 'ad a stove set h'up baout four feet from that floor—sort o' foundation it were. One day h'in come two o' these 'ere young h'engineers to get theyselves warmed h'up a bit, an' w'en they saw tha stove, set h'up on tha foundation, they started h'arguing as to w'y Jan 'ad putten there. One chap, 'e sez it wuz to get tha 'eat near tha roof w'ere tha col' wuz, an' tha h'other called tha firs' a bloody fool cause tha 'eat would go h'up any'ow. An' they were snappin' away at h'each h'other jus' like a couple o' fishwomen or some o' these 'ere Polish women w'en one thraws a h'ol tin can h'over tha fence h'in tha h'other's yard—thee naws 'ow it gaws. One o' they chaps talked 'is 'ead off baout tha laws o' thermodam somethin,' an' w'y 'eat makes things 'ot, an' tha h'other told all 'e nawed baout British thermal h'units. Then in comes Jan, an' they h'asked 'im. An' Jan sez, 'I put tha stove h'up cause tha pipe wern't long enough if I putten daown.' So, you see m'son, Jan didn't 'ave to 'ave no schoolin' to naw that."

Blister Copper

"A British syndicate proposes to set up a £10,000,000 copper refinery at Newton Abbot, in Devonshire, on a site where the requisite electric energy can be generated from the lignite deposits at Bovey Tracy," says a contemporary: "There is at present no electrolytic refinery in Great Britain, 90 per cent of the copper used in British industries being imported from the United States. It is hoped that the new refinery will produce 100,000 tons of copper annually, using as far as possible British copper in blister form—an English process of copper-smelting which raises blisters on the white metal after calcination."

Nobody Has Nominated the Kaiser

Most Americans will vote this fall, with mental reservations and by the process of elimination. As a little helper in the process of elimination, we note that Governor Cox declared at Cincinnati in October, 1916:

"Two of the leading sponsors for Justice Hughes are Elihu Root, of New York, and Theodore Roosevelt, of Oyster Bay. In his first speeches Mr. Root declared that the President should have intervened when the Germans went into Belgium. Theodore Roosevelt said this Government shou'd have seized every ship in American harbors. Both have criticized the President for not doing the things which would have embroiled us in a war with Germany.

"The Germans are getting their eyes opened, and about one more speech from Teddy and the German-Americans will join in a triumphal victory for Woodrow Wilson in November."

In the same month, Governor Cox's newspaper, the *News*, said:

"Every indication now is that, with tens of thousands of these splendid people [Germans] still sympathizing with the fatherland, still believing in the righteousness of the German cause, still hopeful that Germany will win, there is every evidence that they will vote for President Wilson for re-election as the best means of aiding Germany, as well as because the re-election of President Wilson will be an aid to the United States."

We are entirely non-political, and reflect the opinions of each subscriber. All of our German and pro-German friends who are on our subscription list will perhaps be enlightened as to how to vote by the above; and those of the opposite persuasion may, if they wish, charitably realize that Cox was after the German vote, and didn't mean it. He says so himself. Certainly, he cannot catch the American vote this year with the same bait.

CONSULTATION

Radium Resources

"The mineralogical scheme I have used for the determination of minerals is not satisfactory for carnotite ore. Is there any regular method of detecting this ore? What is its chemical composition? Do you think the resources of radium-bearing ores will increase throughout the world? Any other information that you may give me about this fascinating mineral that will enable me to become more familiar with its uses will be greatly appreciated."

Carnotite is difficult to classify in any mineralogic scheme for the determination of minerals, hence it is frequently omitted in tables systematically composed for that purpose. Its chief distinguishing feature is its canary yellow color and its usually pulverulent form in minute scales; although often it is compact and wax-like. The greatest carnotite fields in the United States lie in Montrose, Mesa, and San Miguel Counties, Col.; and in Moab and La Sal Counties, Utah.

The three metals, radium, uranium, and vanadium, are found closely associated in carnotite ore, which has the chemical composition as generally given, $K_2O.2UO_3.V_2O_5.3H_2O$ (the radium content, although most important, is too infinitesimal to appear in the formula).

The market value of carnotite therefore will depend not only upon the radium contained in the ore, but also upon the value of the vanadium and uranium constituents. Considering the probable future of radium first, the world will have to turn more and more to the United States as the chief source of this element. The Austrian deposits are almost entirely depleted and the pitchblende deposits of Cornwall have not given any great promise of important development. Outside of the small known deposits in Australia and Portugal, a rare radium-bearing mineral occurs in Russian Turkestan and is called a hydrous-calcium-uranium vanadate, which may prove to be an important foreign resource.

The vanadium content of carnotite is of growing importance as the increasing use of that metal in alloy steel manufacture bids fair to create a steady demand for vanadium-bearing ores—witness the monopoly which one large steel company has obtained over the most important vanadium-bearing area in the world in an endeavor to procure an adequate supply of this important metal for steel manufacture. It is strange to consider vanadium as a byproduct in the extraction of radium from carnotite ore when the quantity of radium in the ore is so small, yet such it really is, being separated as oxide or iron vanadate and reduced in the electric furnace to ferrovanadium.

Enormous concentration of carnotite is required to produce a perceptible amount of radium. Authorities have estimated that about one million pounds of ore will yield only a grain of radium. The effort expended in producing a relatively small amount of the metal is stupendous. First the ore has to be concentrated by either wet or dry methods, which give no exceptional difficulties, the ore merely requiring crushing and agitation with water to separate the finely ground carnotite from the associated silica particles. The metallurgical treatment of the concentrates is the laborious part of the procedure, considering the large amount of material that must be handled. This part of the process may take place in the laboratory. There are several methods of extracting the radium, more or less complex. Experimentation is continually progressing in an attempt to perfect the extraction of radium from its ores. A discussion of any of these methods would be too involved to be detailed here. Briefly, there are acid and alkaline leaching methods and fusion methods. Alkaline leaching employs hot sodium carbonate to eliminate the vanadium and uranium, while the acid leach uses hydrochloric or nitric acid to extract the radium, vanadium, and uranium from ores free from sulphates. In the fusion methods sodium carbonate has been used as a flux, followed by a sulphuric acid leach.

The future of radium-bearing ores in general appears particularly bright, due to the limited world resources and the great demand for both radium, on account of its remarkable properties, and its associated metal, vanadium. Unlike many other ores the market is stable, as it is not subject to the great fluctuation characterizing the trading in the more common and easily obtained minerals.

Getting a Market for Arsenic Ore.

In our issue of July 3, we advised that we did not know of any market for arsenic ore. We have, however, a letter from our Western Editor, who advises that there is an inquiry at his office for an arsenic supply. Miners of arsenic ore in the Far West who wish to market their product should address George J. Young, Western Editor, *Engineering and Mining Journal*, Rialto Building, San Francisco, Cal., or communicate with the companies mentioned below.

We also have several other communications, one of which, from the U. S. Smelting, Refining & Mining Co., says in part: "I note in the July 3 issue of *Engineering and Mining Journal*, page 23, a letter regarding a market for arsenical ores. Our company has recently begun the manufacture of insecticides at our Midvale, Utah, plant, and we need more arsenic. Could you let me have the address of this party?" (Signed) F. B. Weeks, 900 Newhouse Bldg., Salt Lake City.

A statement from L. G. Eakins of the American Smelting and Refining Co., 120 Broadway, New York City, has also been received, who states, "It so happens, owing to peculiar conditions, that our company might be in a position to handle ore such as is described, depending of course upon its location and other important conditions."

The American Metal Co., of 61 Broadway, New York City, is also in the market for this material and states through Edward K. Judd, "If the deposit appears to be of suitable character and conveniently located, we might be interested in looking further into the matter."

Interested arsenic ore producers would do well to get in touch with the above means of disposal for their product, as indications point to an unusual demand for suitable material.

THE PETROLEUM INDUSTRY

Prospecting for Oil at Fallon, Nev.

Tertiary Lake Beds in Vicinity of Stillwater Range Scene of Wildcat Drilling—Scanty Evidences Of Oil—Lake Beds Occur in Many Localities in Western Nevada—Few Indications of Oil Discovered

SAN FRANCISCO CORRESPONDENCE

FALLON, NEV., is the center for a number of companies which are prospecting for oil in Tertiary formations occurring at and close to the southwestern end of the Stillwater range east and southeast of Fallon. Present operations are distinctly of a wildcat nature, as no conclusive indications of the presence of oil in commercial quantities have yet been discovered. It is claimed that oil has been found in two wells, one being put down by the Fallon Oil & Gas Co. and the other on the George B. Williams ranch, by the Churchill County Oil & Gas Co. Over fifty-six companies have been formed or are in process of formation. Local business men, both in Fallon, Reno, and other Nevada localities, are principally interested, although a few from San Francisco have gone into the gamble. Apparently no important oil companies are interested in a direct way. A representative of the *Engineering and Mining Journal* visited the locality. Conditions at the rigs visited are as follows:

Silver State Consolidated Oil Co.—Portable well rig; down 90 ft., with a 12½-in. casing. Claim an "oil shale," and a carbonaceous clay streak at 65 ft. Expect to drill 1,000 ft.

Fallon Oil & Gas Co.—Portable rotary well rig; down 660 ft. Have cemented well and expect to resume drilling soon. Claim to have struck oil. No existing evidence at surface.

Weaver Oil Co.—Wooden derrick, portable rig; 300 ft. in depth. Still in wash.

Lahonton Oil Syndicate—Portable rig, wooden derrick,

SILVER STATE CONSOLIDATED CO.'S RIG

WELL OF LAHONTON OIL SYNDICATE

350 ft. deep, 340 ft. 12½-in. casing. Claim to have struck first water, a 20 ft. water sand containing salt water. Still in surface wash.

Diamond Oil Co., southeast of Lahonton Oil Syndicate—Building derrick.

El Petrolia Development Co., Stillwater—Preparing to work. Small wooden building constructed.

Big Four Oil & Gas Co.—Building a wooden derrick.

Fallon Pioneer Oil Co.—Wooden derrick, portable rig; down 95 to 100 ft.

Wheeler Oil Syndicate—Wooden derrick, portable rig, down 360 ft.; cased 300 ft. Have struck a flow of hot water.

Churchill County Oil & Gas Co.—Portable rig; 12½-in. casing. Claim to have struck oil seepage.

Of the operations listed, all excepting the last two are close to the edge of the Stillwater range, they being out on the flat well away from the range. The Lahonton Oil Syndicate's well is on a small divide in a north-south valley between the Stillwater range and an outlying low range of hills. To the north the valley extends to Stillwater and to the south toward the depression formed by Four Mile and Eight Mile flats. The list of companies reported as drilling, or preparing to drill, or on the properties of which derricks have been erected, taken from a local compilation, is given in the table.

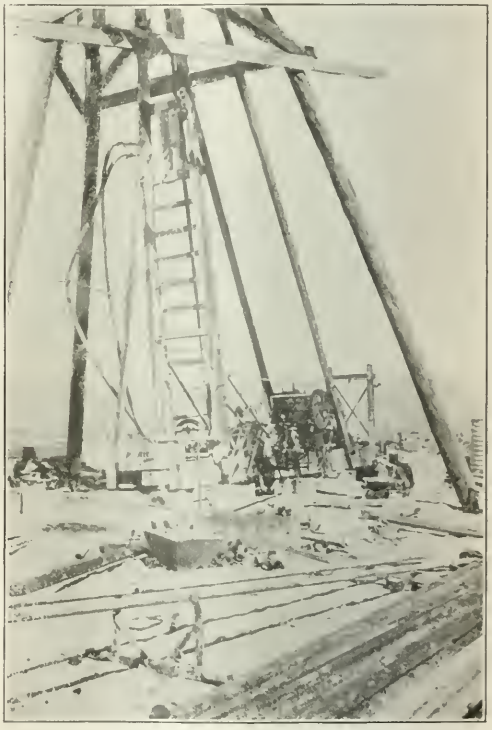
COMPANIES REPORTED AS PREPARING TO DRILL OR ON THE GROUND, AND WHICH HAVE ERECTED DERRICKS

	Township	Range
Fallon Oil & Gas Co.	18 N	31 E
Fallon Pioneer Oil & Gas Co.	19 N	32 E
Churchill County Oil & Gas Co.	19 N	29 E
Big Four Oil & Gas Co.	19 N	29 E
Diamond Oil Co.	18 N	31 E
Lahonton Oil Syndicate	18 N	31 E
Silver State Consolidated Oil Co.	18 N	31 E
Weaver Oil Co.	18 N	31 E
Wheeler Oil Syndicate	18 N	31 E
Carson Sink Oil Co.	17 N	28 E
Indian Lands Petroleum Co.	19 N	30 E
Paramount Oil & Gas Co.	18 N	31 E
Astra Development Co.	19 N	31 E
Ranier Oil Co.	20 N	32 E

Offices for the sale of stock in the various companies are plentiful, and the simple machinery for separating the money from the many to provide the wherewithal for financing the various companies appears to be working in the usual fashion, although one stock seller was heard to remark: "It's just a little bit dull, a little bit dull." Some of the promotion literature is decidedly misleading and contains the usual balderdash, such as "Read the report of an expert"; "Others have made millions—you can too"; "This is your big opportunity"; "See the point?" Nevertheless, there is discernible some degree of sincerity, and not all of the companies are merely selling stock. A fair proportion are legitimately spending money conclusively to test the oil possibilities of the locality.

In the *Nevada State Journal* of April 18 there appear three reports, one by E. P. Osgood, another by Lawrence W. Crehore, and the third by A. E. Wiley, all of which review the general possibilities of oil discovery in the Fallon district. There is a fourth article in the same paper by A. J. Moore. All of these reports are optimistic in tone, and there is much that savors of promotion in them. In the *Nevada Mining Press* of April 10, Charles F. Spilman has an article on "Oil Structure and Petroleum Gas Attract Operators to Fallon." In the same issue are two short articles, one by A. E. Wiley and another by Orlando D. Barton, both giving a crude idea of various geological features. Other articles of a news nature by A. J. Moore have appeared in the *Salt Lake Mining Review* of May 15 and May 30. A. L. Robinson is quoted in promotion circulars. By and large, the impression is created, at least in the minds of the unwary, that there are many favorable oil indications in the Fallon district.

To test opinion, six thoroughly qualified geologists, all of whom are taken as authorities in oil geology, were interviewed, and the question of whether geological conditions favored the occurrence of oil in western Nevada or not was put to them. Two geologists were not familiar with the field, and could give no positive opinion. Four were familiar with the field, and expressed doubt that oil would be found in commercial quantity. One of the four said that he had found some oil indications, one indication being the odor of oil at a water well in the district and the other a chloroform



ROTARY RIG, FALLON OIL & GAS CO.

test at a locality a considerable distance removed from the district.

The important question is not the incidental occurrence of oil, but its occurrence in commercial quantity. It is not improbable that some oil will be found in the Fallon district and in other localities where Tertiary lake beds are found.

Lake beds tentatively placed at different horizons in the Tertiary, the Pliocene, Miocene, Oligocene or Eocene, are in evidence at many points in western Nevada. The Truckee beds, west of Reno, the sedimentaries near Fallon, the area east of Mina, the Esmeralda formation, in the Silver Peak area, and west of this area; the Siebert formations at Tonopah and Goldfield, the Furnace Creek area, and an area in the Mohave Desert,

in California, are important localities of Tertiary lake sediments. The correlation of these occurrences has not been thoroughly demonstrated. The most extended résumé is given by F. L. Ransome in Professional Paper 66, p. 95, in his review of the work of King, Hague, Lindgren, Turner, Spurr, Ball, Gilbert, Fairbanks, and Campbell. Ransome says:

There is in western Nevada extending from the 40th parallel down to about the 35th parallel, a chain of remnants of Tertiary lacustral deposits. These deposits are of great volume, estimates of total thickness in the various places where beds are well represented ranging from a minimum of at least 600 ft. (183 meters) at Tonopah to 14,800 ft. (4,511 meters) at Silver Peak. The materials vary from place to place, but are preponderantly volcanic. They include true tuffs, largely rhyolitic, and detrital rocks of a wide range of coarseness derived from all the prelacustrine rocks and probably also from volcanic masses piled up and eroded during the lake period. Diatomaceous beds appear to be rather characteristic of the deposits north of the Death Valley region, while in and south of Death Valley descriptions indicate a greater abundance of clays, with associated beds containing gypsum and borax. Lignitiferous beds, apparently in all cases in the basal part of the deposits, occur from Truckee River southward to the Mohave Desert. The beds are everywhere folded and faulted, and in many places sheets of basalt have flowed over their eroded edges. It is clear that since the period of lacustrine deposition, the region has undergone such deformation and erosion as to entirely remodel the topography; lake beds, for example, now forming the summit of Montezuma Peak, west of Goldfield.

Indications which favor the possible occurrence of oil in these formations are: the presence of diatomaceous beds, "oil shales" (not bearing oils but from which oil may possibly be obtained by distillation), combustible gas (whether marsh gas or derived from petroleum, not being clearly definable in all cases), and a few isolated tests of sedimentaries, which tests appear to show oil. In addition, oil has been reported in a few localities. A well put down in 1907-08, southwest of Reno, in the Truckee beds, reached a depth of 1,890 ft., and in the log (U. S. Geological Survey, Bulletin 381, p. 475), a blue shale showing a little oil was reported at a depth of 1,270 ft.; at 1,545 streaks of coal, and at 1,710 ft. blue shale and a little sand, with water and a little oil. No gas was struck in this well. The log of the Timberlake well, put down by the U. S. Geological Survey, includes indication of oil. To these may be added whatever oil occurrences have been encountered in the Fallon district, although these are susceptible of further proof.

The occurrence of thin lignitic beds at several horizons in the Truckee beds, in the Esmeralda and at other places, may or may not have significance. Robert Anderson, in Bulletin 380, U. S. Geological Survey, describes an occurrence of asphaltite in Eureka County, fifteen miles south of Palisade, in the Pinon range. The asphaltite exists as a filling in fractures within steeply dipping Carboniferous strata. Mr. Anderson says: "There is little doubt that strata in this region at one time contained considerable petroleum. Owing to disturbed conditions of the beds . . . it is likely that almost all, if not quite all, of such oil has escaped or become altered in the derived form of asphalt. Strata of probable Paleozoic age elsewhere in this portion of Nevada are reported to be petroliferous, and it is not impossible that careful study might reveal areas in which conditions are more favorable than in the one here discussed." This occurrence is not of importance with respect to the Fallon area, but is mentioned as having a bearing on the subject of oil possibilities in the Great Basin region.

On the other hand, the fact that the sedimentaries belong to a fresh-water series, and not to readily defined marine strata, may be taken as unfavorable. The occurrence of the diatomaceous beds at upper instead of lower horizons is looked upon by some geologists as unfavorable. The fact that the diatomaceous beds are in many instances intercalated with beds of volcanic ash, and that there exists in the diatomaceous beds often a large proportion of contemporaneous ash and glass, is considered unfavorable. The paucity of organic life and the prevailing volcanism accompanying or preceding sedimentation are other unfavorable factors. Faulting is conspicuous in the occurrences of these lake beds. Despite many exposures of tilted strata, there have been surprisingly few discoveries of seepages and other well-known forms of surface indications of the presence of petroleum.

DERRICK USED WITH ROTARY RIG

On the whole, the unfavorable overbalance the favorable factors, but it is worth while to prove or to disprove conclusively the commercial oil possibilities of the Tertiary lake beds. In the present activity at Fallon there is an excellent opportunity for co-operative work. Little will be gained by indefinitely multiplying companies or in farming the public for money which may be uselessly spent. Let the companies which have started

wells push a sufficient number to a depth to prove the presence or absence of oil in commercial quantity. Let them prorate the expense for this work in an equitable way. They will best serve their own and conserve their stockholders' money by this procedure. If they are successful—and everyone wishes for their success—they will have the satisfaction of knowing that they have extended greatly the productive oil areas of the country.

Comodoro Rivadavia Field, Argentina

State Has Practically a Monopoly on All Oil Produced—Oil Discoveries in Other Sections

THE petroleum trade of Argentina, according to *Commerce Reports*, is controlled by three distributing agencies: La Comisiôn Explotadora del Petróleo de Comodoro Rivadavia, whose headquarters are at Buenos Aires; the Anglo Mexican Petroleum Co., with headquarters at Buenos Aires, and the West India Oil Co., whose main storage tanks are at Campana.

In addition to the output of the state-owned wells, small amounts of petroleum are produced by private companies in the Comodoro Rivadavia field, which is situated about 850 miles south of Buenos Aires, in the vicinity of the Patagonian port of the same name.

In 1907, when oil was discovered, a decree was issued forbidding private exploitation within a certain radius of Comodoro Rivadavia, and exploration was begun by the General Board of Mines, Geology, and Hydrology of the Argentine government. Development proceeded slowly, however, and by the end of 1910 only seven wells had been sunk, four of which were not producing. By June, 1918, the number of wells actually producing had increased to forty, in addition to which number fifteen had been abandoned or were temporarily closed for repairs, and twenty-one were being bored. The operations of the several private companies in the Comodoro Rivadavia field are still largely experimental. Extracts from recent reports of these companies show that practically all the oil which they produce is shipped north to the consuming markets in government tankers and sold by the government distributing agency, thus enabling the government virtually to maintain a monopoly on all of the oil produced in the country.

The Comodoro Rivadavia oil is heavier than the better grades of oil produced in the United States and has heretofore been used almost entirely as fuel, although the statement has been made that it will distill readily. It has an asphalt base and a specific gravity ranging from 0.922 to 0.940, according to the U. S. Geological Survey, and on distillation yields 1.5 to 3.5 per cent of naphtha and gasoline, 15 to 19 per cent of illuminating oils, and 77 to 85 per cent of lubricants, fuel, and coke.

Oil has been discovered in three sections of Argentina besides the Comodoro Rivadavia field. One of these deposits, known as the Salta Jujuy field, is in the Provinces of Salta and Jujuy near the Bolivian border, and is entirely inaccessible at present except over the long, single-track government railway from Tucuman north to the Bolivian border. Another of these deposits, known as the Cacheuta field, is a few miles southwest of Mendoza, near the Chilean border. The third is the Neuquen field, where the government is planning to undertake some exploration work during the present year. This last is considered the most promising of the three fields.

Wells Drilled Near San Diego, Cal.

A number of wells that were carried to depths of more than a thousand feet have been drilled around San Diego, according to the U. S. Geological Survey. One of the first of these wells was the Chula Vista oil well, which reached a depth of 1,812 ft. without striking oil. A few years ago a deep well was put down on the south side of Otay Valley by the Otay Oil Co. About the same time the Lo Tengo Oil Co. sank a well 3,400 ft. deep on the south side of Otay Mesa. Both these wells afforded showings of oil and gas. The Tia Juana well, which was lately taken over by the Community Oil Co., went 1,405 ft. without encountering oil except a questionable show.

Two wells were put down by the San Elijo Oil Co. at Sorrento. The first well was sunk 1,599 ft., the second 1,303 ft. Oil and gas are reported to have been noted in both wells. The Puterbaugh well, at Morena, is reported to have gone 1,200 ft. without affording encouraging results. The Clark well, about five miles northeast of Encinitas, in Sec. 26-12-4, penetrated Eocene strata for 2,125 ft. without showing any satisfactory indications of oil.

A well recently abandoned was the Balboa, in Mission Valley, which was drilled to a depth of 5,625 ft. This well disclosed the interesting fact that sedimentary beds more than a mile thick underlie this part of San Diego County. The greater part of these beds belongs to the Cretaceous system, but whether they lie approximately flat, as do the overlying Eocene beds, has not been determined. Possibly they are somewhat folded, so that the distance drilled is more than the actual thickness of the beds.

Mexican Pipe Lines Nearing Completion

The Mexican Gulf Co.'s 10-in. pipe line from the lower Tepetate fields to its terminal at Prieto, a distance of sixty-five miles, is nine-tenths completed, according to the July issue of *Oil Trade Journal*. The line parallels its 8-in. line, which covers the same distance. In addition, the company has completed two 8-in. lines from Tepetate to Los Naranjos, giving a continuous run from the Prieto terminal to Los Naranjos. There is also being built a 10-in. line from Tepetate to Tolteca and an 8-in. line from Los Naranjos to Lot 146, Amatlan district. Four temporary pumping stations will soon be finished.

With the construction of the pumping station at Prieto the company will have a loading facility of 7,500 bbl. an hour. By July, according to an official, deliveries in Tampico should be at the rate of 2,000,000 bbl. of oil a month, for which there will be facilities for exporting.

The Huasteca Petroleum Co.'s new 10-in. pipe line from Tampico to Cerro Azul, a distance of sixty-five miles, is expected to be completed by Aug. 1. Twenty-five miles have already been laid and the pipe has been distributed along the way for about sixteen miles in addition.

NEWS FROM THE OIL FIELDS

Storms Damage Properties in Burkburnett Field

Texas Company Building Houses for Employees—Other Activities from Texas Districts

From Our Special Correspondent

Lightning struck a big oil tank of the Texas Pipe Line Co. in the Burkburnett field recently, igniting the contents. The loss was complete. Two bad storms also blew down many derricks. In spite of this, however, the production increased 5,000 bbl.

At Port Arthur, the Texas Co. has begun to solve the housing problem of its employees. It has purchased 100 residence lots in one of the better sections of the city, and has started to build twenty houses for office employees. More will be added later. In another section of the town the first unit of forty-two houses for Mexican workmen has been completed. These are three or four-room houses, with modern conveniences. This Mexican settlement will cover three city blocks, and will contain community centers as well as the dwelling houses.

A new well being drilled by the Republic Production Co. in the Breckenridge field, Stephens County, recently blew the tools out of the well and damaged the casing. Gas at the rate of 10,000,000 cu.ft. daily went to waste, and the initial flow of oil was over 2,000 bbl. daily, it was reported. The casing is so badly damaged that it is doubtful if the hole can be cleaned. Just north of Breckenridge, the Humble Oil & Refining Co. has brought in a well on the Dickey tract, flowing by heads. As the sand has barely been penetrated, it is believed the well would make a much larger production if drilled deeper, but the pipe-line facilities are not sufficiently large to handle any more oil at present. The No. 3 well of the Oklahoma Petroleum Co., on the Walker-Caldwell land, three miles east of Breckenridge, has made a head of oil. The well will be drilled deeper.

Deep drilling on the southern Gulf Coast section is being done by the Kleeberg County Oil & Gas Co. in its No. 2 Ross well, now below 3,600 ft. It is also reported that the No. 1 Champion well of the Grande & Gulf Oil Co., twenty miles north of Brownsville, Cameron County, will be sunk to a depth of 7,000 ft. if oil is not found before that depth is reached. The well is now 2,000 ft. deep.

In Brazoria County several new wildcat wells are being sunk east and northeast of Angleton. Gas in water wells in this section was discovered several years ago. In this same county, at Stratton Ridge, the Freeport Sulphur Co., Humble Oil & Refining Co., Texas Co, and others still continue to drill wildcat wells. West Columbia, in this county, still continues to make the largest oil production of the coastal domes.

At Goose Creek, Harris County, the daily production during the week ended July 10 increased to 17,000 bbl., compared with about 15,000 bbl. during the preceding week.

Natural Gas Production Figures

From Our Washington Correspondent

The U. S. Geological Survey has just reported the 1918 production and consumption figures for natural gas. These figures show that a little over 720 billion cu.ft. was produced and marketed that year. The value of this production at 21¼c. per M. is a little over $153,000,000. As usual, West Virginia, Oklahoma, Pennsylvania, and Ohio lead in the production, ranking in the order named. Pennsylvania, Ohio, West Virginia, and Oklahoma is the order of consumption, showing, as usual, the large export of gas from West Virginia to Pennsylvania and Ohio, and the considerable exports from Oklahoma to Kansas and adjacent territory.

There is a wide range in the average price at which natural gas is sold by the producer in various parts of the country. The figure for Wyoming is 3.59c. per M.; in New York 67.05c., and Michigan 89.08c.

There is a decided tendency toward an increase in the percentage of gas sold for domestic users and a corresponding decrease in the percentage used industrially. This is in line with the recommendations of the Conservation Commission which has recently been studying the subject, the natural result of the gradual increase in the price at which gas is sold tending to make its use industrially less advantageous than formerly. This report shows that the 7,100 producers supplied 2,500,000 domestic consumers and 16,500 industrial consumers. The average price paid by the former group is 31.35c. per M. and the latter 15.23c. The total volume of gas used industrially is, however, still considerably greater than that consumed in domestic equipment, amounting to about 60 per cent of the total. Of this manufacturing takes slightly more than the production of industrial power.

Although about 30 per cent of the wells drilled in 1918 were dry the total number of wells productive at the end of the year had increased by about 1,000 over the number productive at the beginning of the year. The total productive Dec. 31, 1918, was 40,369.

The discovery of oil in Southern and Southwestern Alaska has been reported, and it is stated that 35,000 acres has been filed upon by prospectors.

Operators Leaving Lee County, Ky.

Activities Transferred to Other Oil Sections of the State—Eastern Districts Expect Development

From Our Special Correspondent

A movement of oil operators from the Lee County fields to Johnson, Magoffin, Morgan, and others of the more eastern counties of Kentucky is beginning, according to oil men returning from that district. They report that the frenzy of development there is over, and almost every train carries away one or two drilling rigs to Paintsville, county seat of Johnson County, and other points in that region. The wells in these eastern counties are the deepest in the state, none finishing short of 1,500 ft., and the production is from a "second sand."

Two important transactions have taken place in the eastern territory. A tract of 500 acres, with two producing wells, averaging 30 bbl. each, was sold for $350,000. Another tract of 90 acres, with one producing well, good for 50 bbl., sold for $90,000. The latter is considered an exceptionally high price. Both tracts are in Johnson County. The purchaser is not known, but is understood to be one of the larger oil companies. Considerable development is anticipated in consequence.

In Warren County, M. Roulen, of Paris, France, has drilled in a large producing well on the Kirby farm. He has put up three 250-bbl. tanks and two 100-bbl. tanks for the output, and is running two machines which are drilling Nos. 2 and 3 A modern pumping house has been installed.

No. 5 on the Wainscott lease in Allen County is reported completed at 321 ft., 80 ft. under the shale. It is rated at 200 bbl. flush production.

Gas Shortage Predicted in Oklahoma

From Our Special Correspondent

Warning has been sounded by the Oklahoma Gas & Electric Co., of Oklahoma City, Okla., to the public to make preparations for a fuel supply during the "gasless" months next winter or there will be greater suffering than in 1919. Gas companies throughout the state have launched propaganda campaigns to this effect, but so far to little avail.

The Frantz Corporation is preparing to sink a test well about nine miles northeast of Boulder, Col. The company's geologists anticipate that oil will be found at a depth of 2,500 to 3,000 ft. Leases on several sections of land have been secured by the company, and drilling equipment is being assembled.

COURT DECISIONS IN MINING CASES

By Wellington Gustin

PENNSYLVANIA

Copper Process Co. Loses Bond Suit

Judgment of Lower Court Sustained—Parties Accused of Fraud and Connivance by Bonding Company

Judgment against the Copper Process Co. in its five actions against the Chicago Bonding and Insurance Co., rendered in the U. S. District Court for the Eastern District of Pennsylvania, has been affirmed in the Court of Appeals, Third Circuit. The actions were on five bonds of the defendant company, each for $52,400, given the copper company to assure performance by the Bird Coal & Iron Co. of five contracts for the sale and delivery of pig iron.

The record in the case is voluminous. Each contract, as set out by the Copper company, provides for the purchase by it and the sale by the Iron company of 4,000 tons of Talladega pig iron of a given analysis during a given month at the price of $13.10 per ton delivered f.o.b. Talladega, Ala. The defendant pleaded two defenses, and introduced evidence tending to show (1) that its indemnity bonds did not cover contracts for purchase monthly of 4,000 tons of pig iron at $13.10, but for the purchase monthly of 2,000 tons at $26.20, and that the contracts covering 4,000 tons at $13.10 had been substituted; (2) that it was induced to enter into the bonds by fraud of the Iron company with the knowledge and connivance of the Copper company.

That it was induced to enter into its undertakings by fraud and gross misrepresentations of the Iron company was not seriously disputed by the Copper company, whose position was that it was not a party to the fraud and was ignorant of it.

The substance of defendant's testimony was that the Copper company was not at any time concerned in any business other than its transactions with the Iron company; and that the Iron company had as its one asset an interest in an option or arrangement with Ladenburg, Thalman & Co., of New York, for the operation of a blast furnace at Talladega, Ala., which had long been out of use. When the Iron company was practically without funds or tangible assets, it entered into the five contracts at $13.10 a ton, a price in the Birmingham district, little, if any, above the cost of production. With these contracts made, the two companies entered into another contract, called the "Underlying Agreement," reciting the five contracts and providing for an advance or payment by the Copper company to the Iron company of $75,000, with numerous other details. The curious feature of this agreement was that it contained no provision for the return or repayment to the Copper company of the money so advanced.

To induce the bonding company to enter into the bonds, an officer of the Iron company supplied defendant with certified copies of what purported to be its pig-iron contracts with the Copper company, but not for 4,000 tons a month at the suspiciously low price of $13.10 a ton, as actually called for by the contracts, but 2,000 tons a month at $26.20 a ton, or about market price. Defendant's agent was shown what purported to be an engineer's report of the property, and an inventory and a financial statement of the Iron company. He was informed that the Iron company had $75,000 to its credit, verified by letter from the depository bank, which was represented as money from the sale of stock; that it owned 2,511.5 acres of ore land; and possessed total assets of $1,360,650.

When the transactions were reported to its home office within a few weeks, it immediately made disclaimer, this being about May 1. The Iron company breached its first contract in June; in fact, it delivered no iron under any of the five contracts. There was evidence that the two companies were controlled by the same officers, that the president of the Copper company assumed control of the funds of the Iron company on its failure to perform its sales contracts; stopped payment on checks at will; controlled its directorate by his nominees; and in July and August caused it to vote for his protection a bond issue of $500,000 and notes to the amount of $750,000.

The questions of fact were presented to the jury, which found against the Copper company, upholding contentions of the defendant, and judgment was rendered accordingly, and this was affirmed on appeal.

KENTUCKY

Virginia Iron Loses Suit To Quiet Title to Mineral Lands

The decree for A. S. Webb and G. B. Hoppin, defendants in the suit brought against them by the Virginia Iron, Coal & Coke Co. to quiet title to the minerals underlying certain parcels of land in Perry County, Ky., has been affirmed by the United States Circuit Court of Appeals for the Sixth Circuit. This court held that a grantee of mineral lands was charged with constructive notice of the rights of other persons then in possession of and living on the land and claiming under deeds without mineral reservations, which were recorded, to the extent of the boundaries in such deeds.

ARIZONA

Judgment Against Calumet & Arizona Reversed

Facts Held to Establish Contributory Negligence of Deceased Employee of the Company

On its appeal to the Supreme Court of Arizona, the Calumet & Arizona Mining Co. has secured from that court a reversal of the judgment rendered against it for death of its former employee, Jesse Gardner, in its smelter at Douglas, Ariz. The case has been remanded to the trial court, with directions to that court to dismiss the action.

In its opinion, the court lays down the measure of damages for death of an adult son, where death is caused by negligence of the employer, as being the reasonable expectation of the parent of pecuniary benefit from the son had the son lived. Where the workman, experienced and skilled in handling electric switches in controlling machinery for pouring copper and skimming the slag, is killed when he reached for a switch safety handle without looking, and grasped a live blade, the court held the company entitled to a verdict, on the ground that deceased was guilty of contributory negligence, for which, under the conditions, the company properly could not be held responsible.

CALIFORNIA

Calaveras Copper Co. Must Pay Compensation

Andy Jordan Held by California Supreme Court To Be Acting Within Scope of His Employment

The Supreme Court of California has denied a hearing to the Calaveras Copper Co. in its petition to reverse the award of compensation made to Andy Jordan, an employee, under the Workmen's Compensation Act, thus making the award for the injuries sustained by Jordan final.

Jordan was employed by the copper company as a truck driver about its property at Copperopolis, Cal., and at the date of the injury had been instructed to do some hauling for one of the company officials. In order to haul a bigger load, Jordan concluded to put additional sideboards on the truck, and to secure the materials he went to the company's saw mill and started a ripsaw. Here he was injured by the ripsaw. The company contended that Jordan was injured while acting outside of his scope of employment and thereby not entitled to compensation, but the court held that his injury resulted from causes incident to his employment.

ECHOES FROM THE FRATERNITY

SOCIETIES, ADDRESSES, AND REPORTS

Joint Conference Committee of F. A. E. S. Clears Up Some Points

Object, Name, Representation, Finances and Machinery Are Discussed in Some Detail

OBJECT OF FEDERATION

The object of The Federated American Engineering Societies as declared in its Constitution, and as has been repeatedly stated,

> "Shall be to further the public welfare wherever technical knowledge and engineering experience are involved and to consider and act upon matters of common concern to the engineering and allied technical professions."

Notwithstanding this, the statement is repeatedly made that the organization does not deal with the interests of the individual engineer and of the allied technologists. The purpose of the organization is that of service first to the nation, state and community, and second, to the profession, which obviously must include the interests of the individual. While it is true that it does not deal with the interests of the engineer and technologist as does a labor union for its member, nevertheless its work will do more ultimately to advance the interests of the individual than a labor union could possibly do, because the advancement of the profession through a greater recognition by the public of the engineer and allied technologist, and the greatly increased solidarity and higher standards of these professions, must unquestionably work for their ultimate good.

NOT A NEW ORGANIZATION

The Joint Conference Committee, among others, has referred to The Federated American Engineering Societies as a "new" organization. This is not strictly correct. While the name is new, the organization will be a successor to the existing Engineering Council, whose work will be amplified and carried on on a much more extended plan as to scope and membership.

HOW AND WHY THE NAME WAS SELECTED

There has been considerable comment on the name of the new organization. Probably no detail caused the Committee on Constitution and By-Laws of the Organizing Conference more serious thought than the question of a suitable name. The purpose was to secure a short title that could readily be used, and many suggested names were rejected for good and sufficient reasons. The Committee decided that the name of the organization should be indicative of its character, based on the fundamental resolution of the Organizing Conference, that it should consist of societies and not of individual members. The words "Association," "Confederation," "Federation," and others were suggested and considered and all were rejected and finally as a compromise the word "Federated" was unanimously agreed to. In view of the fact that other countries are looking with interest on this movement with the probability that there will be similar organizations formed in those countries, it was felt desirable that some distinctive name should be given the organization in this country, and so the word "American" was inserted. Objection to this was made on the ground that this country is the "United States of America" but the answer was that the soldiers of this country fought in Europe as "The American Expeditionary Forces" and have been internationally so recognized. It was thought undesirable to use so long a name as Engineering and Allied Technical Societies, especially in view of the fact that engineering as defined in the preamble of the Constitution is an all-inclusive word, and it was, therefore, decided to use only the word "Engineering" in the title. Hence the name "The Federated American Engineering Societies."

It is probable however, that when the organization begins to function it will be referred to rarely as The Federated American Engineering Societies but will be called the American Engineering Council which is the executive body of the organization.

BASIS OF REPRESENTATION

There seems to be difficulty in understanding what the basis of representation should be where a state organization exists and where there are also strong local organizations and affiliations. The Constitution provides that a state council or organization, representative of the engineers and allied technologists in the state, can be represented on the American Engineering Council on the basis of all the engineers and allied technologists in the state. If, however, there exists a strong local organization or affiliation which elects to have its own representative or representatives on the Council, then the state council or organization is entitled to representation on the basis of all the engineers and allied technologists in the state, less the engineers and technologists that are to be represented through their local organization or affiliation. This will not prevent the local organization or affiliation from participating in the work of the state council or organization in the consideration of matters affecting the state only.

NO PROVISION FOR DUES

The Joint Conference Committee has received several letters inquiring as to the provisions for dues. The Constitution and By-Laws provide for funds contributed by the Member-Societies for the support of The Federated American Engineering Societies. Inasmuch as it would be unreasonable for a small local society to pay as large a contribution as a national society, the Constitution provides that the contribution shall be on the basis of the number of members in the organization at the rate of $1.50 per member for national societies and $1 per member for local, state and regional organizations or affiliations. The individual, therefore, does not directly pay any dues but the Member-Society of which he is a member contributes to the support of The Federated American Engineering Societies on a per capita basis of its membership. It, therefore, follows that any one who is a member of several organizations which hold membership in The Federated American Engineering Societies will be counted in the total membership of each society as a basis of its contribution.

ORGANIZATION NOT CUMBERSOME

It has also been stated that "the machinery proposed is somewhat elaborate and appears to be cumbersome and expensive." The Joint Conference Committee can see no basis for this statement. The By-Laws provide that

> "Any Society or organization of the engineering or allied technical professions whose chief object is the advancement of the knowledge and practice of engineering or the application of allied sciences and which is not organized for commercial purposes, is eligible for membership."

The Federated American Engineering Societies will function through the American Engineering Council, which will meet either annually, or biannually, as it will determine. This American Engineering Council will consist of representatives from the Member-Societies on the basis of one representative for from 100 to 1,000 members and an additional representative for each additional 1,000 members or major fraction thereof. From this body of representatives will be formed an Executive Board of thirty, consisting of six officers and twenty-four other members selected in part from the national societies and the remainder from the local, state or regional organizations or affiliations. The plan reported by the Committee on Constitution and By-Laws provided that the representation on the Executive Board

should be based on the ratio of the total number of members in the national societies to the total number of members in the local, state and regional organizations or affiliations. The Organizing Conference however changed this to the ratio of the number of representatives from the national societies to the number of representatives from the local, state and regional organizations or affiliations, on the American Engineering Council. This Executive Board will meet monthly or as often as may be found to be necessary to properly transact the business of The American Engineering Council. There will be an executive officer who will also be the secretary of these bodies and who will be entrusted with carrying out their instructions.

As a matter of fact, the American Engineering Council thus created is less cumbersome or unworkable than the present Engineering Council; furthermore it has the distinct advantage of being more democratic and broader in its scope and membership.

ORGANIZATION CONSERVATIVELY FINANCED

As to the statement that the organization is expensive, it is pointed out that on the basis of the present membership of Engineering Council the income from the contributions provided in the Constitution of The Federated American Engineering Societies would be about $75,000. At no time in the history of its existence has the budget of Engineering Council exceeded $50,000. Provision is made, however, that

> "The Executive Board shall, whenever practicable, provide for the whole or a part of the expense of members or of representatives attending its own meetings and those of the Council."

On the basis of past experience, it is estimated that if the expenses of all the representatives on American Engineering Council and of the members of its Executive Board were paid to each meeting of these bodies, there would be involved an annual expense of about $25,000. The purpose of these expenditures was to secure a full attendance of the representatives of The American Engineering Council and of the Executive Board, especially during the earlier years of the organization. As will be noted in the excerpt from the Constitution the expenses of representatives of the Council and members of the Executive Board will be provided from such funds as may be available. If, in the judgment of the Executive Board, this money should be required for more urgent work, the expenses of the representatives and members would not be provided for. It seems to the Joint Conference Committee that it would be highly desirable to have sufficient funds to pay the expenses of this representative body of men who contribute their time for the good of the engineering and allied technical professions. The payment of these expenses is the only part of the organization that can be said to be expensive.

ORGANIZATION DEMOCRATIC

It has also been stated that the form of organization that has been set up is "autocratic, not democratic."

If a democratic organization is taken to mean one in which its constituents have a voice in its affairs, then the Federated American Engineering Societies is truly a democratic organization. Member-Societies of this organization are represented on the American Engineering Council, which has full power to control and to direct the activities of the American Engineering Council and of its Executive Board and can determine whether it is necessary for the former to meet annually, biannually, or tri-annually, or how frequently the latter shall meet.

THE OPPORTUNITY

The Joint Conference Committee is unqualifiedly of the opinion that an opportunity has been created for bringing about a solidarity of the engineering and allied technical professions that has never heretofore been available and that the success of the movement will depend on the whole-hearted support of each American engineer and of each technologist, who, if determined that this movement shall succeed, will obviously not bother with the details or the form of organization, in his effort to secure the end desired.

The First Citizen of America

The Manchester Guardian (England) said recently, referring to the Presidential nominations in the United States: "It is impossible for European observers of the American scene to refrain from speculating upon the profoundly significant difference that would have been made in the outlook had either of the two great parties bestowed the Presidential nomination upon the one great American citizen, apart from President Wilson, whose name is familiar to the whole world. There are millions of America's well wishers in Europe today who will ask with keen interest and deep concern: 'What is to be the decision of that great body of instructed, earnest American opinion, of which Herbert Hoover was the chosen leader?' "

Mining Engineers at the Conventions

Probably there were a number of mining men in attendance at the great Presidential nominating conventions; so far three have come to the knowledge of the *Engineering and Mining Journal*. Among the delegates to the Republican Convention at Chicago were O. C. Davidson, general superintendent of the Oliver Iron Mining Co., from the Twelfth Michigan District, and John C. Greenway, general manager of the Calumet & Arizona Mining Co., of Arizona. Among the delegates to the Democratic Convention is C. H. Benedict, of Lake Linden, Mich., mill metallurgist of Calumet & Hecla Mining Co.

Madagascar's Graphite Industry Growing Since 1914

Madagascar's graphite deposits are very numerous and are marked by lines of outcrop running eastward to the center of the island pretty much throughout its length, from Cape Amber on the north to Fort Dauphin in the south.

Madagascar graphite is much sought after for metallurgical crucibles because of the following properties: It has a very high carbon content; its flakey texture gives the crucible a woodlike structure, yet increases its strength and prevents cracking; the iron and silica contents are very low. In fact this graphite should prove a desirable substitute for the best Ceylon graphite, according to *Écho des Mines et de la Métallurgie*, Paris.

During the period between the beginning of rational exploitation of the Madagascar deposits in 1905 and the year 1913, the exploiters sought to perfect concentrating machinery, but the consumers of graphite were not familiar with the Madagascar article and it proved very difficult to bring them to appreciate its true value. Therefore progress had been slow; but the great demand and consumption induced by the war made it possible to perfect the mining and preparative methods and made the product better known. In 1917 35,000 tons (metric) were produced on the island and 26,000 tons were exported; in 1918 the exports fell to 16,000 tons by reason of the halt in transportation means during August and the complete cutting off of the American market. Otherwise the 1918 production would have amounted easily to 50,000 tons.

A study of the Madagascar graphite deposits and industry was contributed by Mr. Lavila to the *Bulletin Économique de Madagascar et Dependences, 1919*, giving in considerable detail the exploitation, treatment, and mechanical concentration by dry and by wet methods, by electrostatic separators, and by oil flotation.

Breakfast by French Engineers

The officers of the Féderation des Ingénieures gave a breakfast on June 19 at Langer's to their colleagues and friends in the French Parliament and to the directors of the great schools of civil enginering, says a report in *L'Écho des Mines et de la Métallurgie*. During the dessert M. Paul Petit, one of the presidents, set forth the origin, the purposes, and the aspirations of the Féderation, which now embraces more than 10,000 engineers. The dean of the Senate, by seniority, M. Denis, replied by praising the advantages of the organization; and M. Bochet, director of the École Centrale, congratulated the country on the lively interest shown by the great engineering associations in the moulding of their young colleagues and in the part they are summoned to take in the economy of the industrial and social future of France.

Technical Papers

Use of Oil Fuel.—The July number of *Industrial Management* (120 W. 32 St., New York, 35c.) contains an article entitled "The Efficient Burning of Fuel Oil, a Summary of Good Practice." Many engineers are shifting from coal to oil burning. Too often the fireman thinks that all that is necessary is to turn on the oil valve and admit enough air to prevent heavy smoke. This article points out some of the things which must be watched to secure maximum economy. The oil should be filtered through about 40 mesh and heated to about 125 deg. F. for steam- or air-type burners, and to 150 deg. for mechanical burners. Air for combustion should be regulated by the damper or blower and the ash-pit doors left wide open. The oil pressure depends on the type of burner: about 30 to 50 lb. for steam-jet burners and 100 to 150 lb. for mechanical pressure burners. Several types of burners are described; rotary burners are coming more and more into use; 200 to 350 lb. of oil per burner hour are commonly used in stationary practice. A well-constructed furnace and proper care of burners are essential to the best work.

Helium—The Mines Branch of the Department of Mines, Canada (Dr. Eugene Haanel, Director, Ottawa), has issued a "Report on Some Sources of Helium in the British Empire," by J. C. McLennan and associates. The report covers investigations made of the helium content of various natural gas supplies in Canada, where, it is stated, the largest sources of supply in the empire are available. Experiments on a semi-commercial scale were made, followed by the working out of the technical details in connection with large-scale production and purification of helium. It is estimated that the gas can be produced at less than 25c. per cu.ft. at normal pressure and temperature. The natural gases of Ontario, Alberta, and British Columbia were examined.

Safety Lamps—Although written primarily for use in the trade-extension classes organized in coal-mining communities, "Safety Lamps," (Bulletin No. 42, Trade and Industrial Series No. 12, issued by the Federal Board for Vocational Education), will be found suggestive for discussion purposes and instruction in the metal-mining field. The principles of safety lamps, construction, and requirements are detailed, with descriptions of the various types.

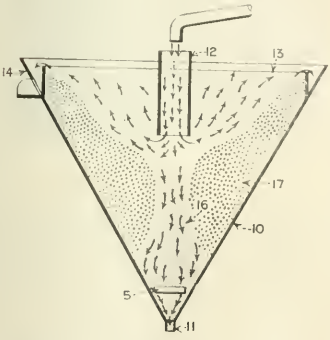
Mine Safety Standards—Bulletin No. 9 of the Colorado Bureau of Mines includes a number of rules dealing with the above-named subject. Although the standards contain nothing new, and in general follow the rulings outlined by most operating mining companies, it is commendable that the state has placed its sanction on the work that is being done in accident prevention. Many of the standards are applicable to quarries, mills, and smelters as well as to mines.

Talc and Soapstone—A list of some 79 uses for these materials is contained in a 9-page pamphlet of the U. S. Bureau of Mines *Reports of Investigations* series, for May.

Recent Patents

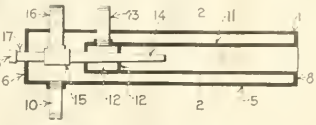
1,339,682. Settling-Basin Separating Device. Charles Allen, El Paso, Tex. Filed July 3, 1917.

A method of preventing irregularity in the discharge of solid particles through the outlet orifice of a dewatering settler adapted to accumulate a substantial bulk of settled material which consists in filling the space centrally above the orifice and below the level of the settled material in a manner to leave an attenuated passage for the settling solids extending from and above the discharge orifice for an appreciable distance.



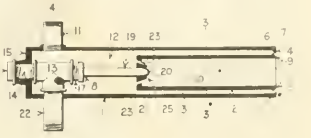
1,339,580. Combustion-Gas and Crude-Oil Burner. Benjamin F. Runyan, Houston, Tex. Filed Sept. 6, 1919.

A burner comprising a pressure fluid casing open at one end, a combustion casing open at one end, having a plurality of atomizing apertures, said combustion casing being disposed within the fluid pressure casing and connected at its open end to the fluid pressure casing, the remainder of the combustion casing being spaced from the inner walls and end of the pressure fluid casing, a pressure fluid inlet member communicating with the pressure fluid casing adjacent its closed end, an oil inlet member extending through the pressure fluid casing diametrically opposite the pressure fluid inlet, a nozzle carried by said oil inlet member, said nozzle extending through the end of the combustion casing, a perforated plate surrounding the nozzle within the combustion chamber adjacent the closed end thereof, said plate co-operating with said closed end to form a gas chamber, and a gas inlet extending through said pressure fluid casing and into the gas chamber.



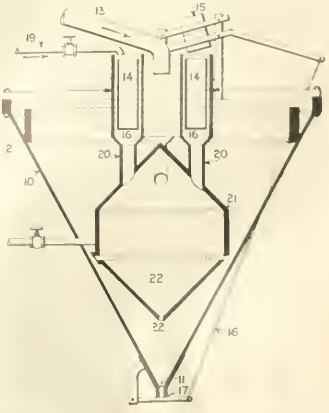
1,339,579. Crude-Oil Burner. Benjamin F. Runyan, Houston, Tex., assignor of one-half to Joseph O'Donnell Decuir, Houston, Tex. Filed June 25, 1919.

In a crude-oil burner, the combination with a casing having steam and oil chambers and provided with a mixing chamber, of means adjacent the opposite ends of the mixing chamber for spraying the oil and the combined oil and steam at angles toward each other, whereby the sprays may impinge at a point tangentially to the oil spray.



1,339,681. Slime-Pulp Thickener. Charles Allen, El Paso, Tex. Original application filed June 9, 1917. Divided and this application filed Oct. 5, 1918.

In a thickener for slime pulp, a settling tank having a controllable orifice for the discharge of thickened material, a fluid column in hydrostatic balance with the thickening material and adapted to contain fluid of fixed density whereby variations in the density of the thickening material will cause a change in the elevation of the fluid in said column, means actuated by the rise and fall of the height of the fluid in said column to control the sizes of the discharge orifice, and a cone-shaped baffle member at the bottom of the fluid chamber overlying the discharge orifice for the purpose mentioned.



MEN YOU SHOULD KNOW ABOUT

Sidney Paige has gone to South Dakota to continue his study of the Homestake orebody.

Lewis A. Levensaler, mining engineer, has opened offices at Suite No. 902, Hoge Building, Seattle, Wash.

C. M. Weld, mining engineer of New York City, is in West Virginia for a fortnight on professional business.

Philip S. Smith, administrative geologist of the U. S. Geological Survey, arrived at Fairbanks, Alas., July 14.

W. J. West, general superintendent for the Oliver Iron Mining Co., in the Virginia district, is recovering from an operation at Pocono Manor, Pa.

Donald M. Liddell, chemical engineer and metallurgist, 66 Broadway, New York City, who was in Joplin, Mo., recently, has returned to New York.

Henry M. Parks, director of the Oregon Bureau of Mines, who has been in New York recently on professional business, has returned to Corvallis, Oregon.

Bulkeley Wells, general manager, was at Pandora, Col., when the Smuggler-Union flotation mill was burned. He lost his own house and its contents in that fire.

F. W. Farnsworth, of Cincinnati, Ohio, president of the Chippewa Iron Mining Co., has completed an inspection of the company's Vermilion Range property.

Donald D. Smythe, of Bisbee, Ariz., geologist on the staff of the Phelps Dodge Corporation, recently examined mining properties near Ajo and Gunsight, Ariz.

William A. Clark, president, and **Chas. W. Clark**, general manager, were recent visitors to the United Verde Copper Co.'s mines at Jerome, and the smelter at Clarkdale, Ariz.

Karl Baumgarten, mining engineer of San Diego, Cal., examiner of U. S. War Minerals Relief Commission, has returned to Washington, D. C., from a month's trip to Oregon and California.

Hoyt S. Gale, who has been in South American for several months engaged in potash and nitrate investigations, is en route to the United States. Mr. Gale is expected to arrive in New York, July 28.

Charles D. Kaeding, vice president and general manager of the Candelaria Mines Co., of Reno, Nev., and consulting engineer of the Rochester Nevada Silver Mines Co., of Rochester, Nev., was in Reno, Nev., on July 5.

Harvey B. Small, mining engineer, who has returned from Colombia, South America, has left New York to examine mining properties in Tennessee, and will go thence to California to look after personal mining interests.

George L. Kaeding, in charge of operations at the Cortez Consolidated mine, was brought to Reno July 3 suffering from an attack of ptomaine poisoning. He quickly responded to treatment and will soon be out.

Sam C. Soupcoff, engineer with the American Smelting & Refining Co., was in Reno, Nev., July 4 on his return from a professional trip to the Yerington district. He has returned to his headquarters at Salt Lake City, Utah.

D. B. Scott, general manager of the American Silver Corporation, Mogollon, N. M., has resigned and left for California. Mr. Scott was also general manager for the Socorro Mining & Milling Co. before it was acquired by American Silver Corp.

G. F. LAUGHLIN

G. F. Laughlin, who was assigned as chief of the Mineral Resources division of the U. S. Geological Survey some months ago, though just now free to assume those duties, has been with that bureau since 1906, and has had a wide experience with both metals and nonmetals. He is better known as a specialist in building materials. He was formerly engaged entirely on the metallic resources of the country, and has been in charge of both the sections of the division he now heads.

Dr. Laughlin was born in Hyde Park, Mass., in 1880 and after graduation from Boston Latin in 1898 he studied sciences at Massachusetts Institute of Technology, receiving his Sc.B. from her in 1903. Later he earned a Ph.D. from Yale University. From 1906 to 1912, while instructor in economic geology at Yale, he devoted his summers to work for the Federal and the Connecticut geological surveys. During this time he studied the clays and clay industries of the state and assisted in preparing an educational series of the rocks of the state. He has done metalliferous work in the zinc-bearing sections of Leadville, Col., and Eureka, Nev., in Oregon and other western states.

During the war Dr. Laughlin prepared, from information at hand in Washington, a very satisfactory map classifying the road metals of France, which was early in the hands of the American Expeditionary Force.

W. P. Snyder and **C. D. Dyer**, president and vice-president respectively of the Shenango Furnace Co., have completed a visit to the company's Minnesota mines, making the trip on the steamer "W. P. Snyder Jr.," flagship of the Shenango fleet.

Lieut. Col. William Kelly, U. S. Engineer Corps, has been appointed by the President to serve with the Federal Power Commission as Engineer Officer. Much of Col. Kelly's experience in the Engineer Corps has been in California, where he has been brought in contact with water power problems.

E. R. Shorey, professor of mining and metallurgy, University of Wisconsin, is studying the mines and mills of the Black Hills, S. D. Prof. Shorey is accompanied by a number of mining students of the university, and before they return the class will visit mines in Montana, Idaho, and Arizona.

R. T. Walker, manager of U. S. Smelting & Refining Co.'s ore-purchasing department at Salt Lake City, has been promoted to their exploration department, and **M. Wallace Wooley** becomes office manager of the ore-purchasing department. **J. C. Brumblay**, the company's representative in Nevada and California for some years, will do ore-buying in the field.

W. Pellew-Harvey, of Pellew-Harvey & Co., London, England, is in Victoria, B. C., and will spend some months in a general survey of the mining development and possibilities of the province. Mr. Pellew-Harvey practiced engineering in the Canadian West twenty years ago and later moved to London. He is said to be in America on behalf of a syndicate of British capitalists.

P. G. Beckett, general manager for the Phelps Dodge Corporation, has announced discontinuance of the position of manager of the industrial relations division of that company, following the resignation of **T. H. O'Brien**. Mr. O'Brien, who has become general manager for the Inspiration Consolidated Copper Co.'s properties at Miami, Ariz., had been connected with the Phelps Dodge interests for twenty years, including ten years as manager of the corporation's coal mines at Dawson, N. M.

OBITUARY

Adolphe Carnot, chemist and mineralogist, died in France recently at the age of eighty-two. Carnot was honorary director of Ecole Nationale Supérieure des Mines, a retired Inspector General of Mines, and a Member of the Institut de France. He was a prominent French analytical chemist and author of "Traité d'Analyse des Substances Minérales."

LEADING EVENTS

Arizona Copper Companies Seek Lower Assessments

Reduction of Over $25,000,000 Asked in 1920 Valuation—Total for Forty-three Producers $389,000,000

The present condition of the copper market, together with the fact that many small mines have ceased to operate altogether and the additional fact that all properties are operating at from 35 to 60 per cent of normal capacity is given as the reason for a reduction of more than $25,000,000 asked in the valuation of mines in Arizona for 1920. The Arizona State Tax Commission has just announced its assessment on the operating mines for 1920 as $389,029,918.57 as against $414,236,-636.90 for 1919. This valuation represents the forty-three producing mines in the state but does not include the smelters, or non-producing properties.

In dealing with the surplus stocks of copper on hand the commission has assessed such stock at 18.60c. per lb, which is subject to change depending upon what is actually obtained for this metal when sold.

The highest valuation was placed on the Copper Queen branch of the Phelps-Dodge Corporation, the valuation being $65,394,204.49, an increase of $1,767,-402.02 over that in 1919. In the case of Inspiration Consolidated the valuation shows a decrease of $8,071,494, the assessed value this year being $65,372,-690. The Calumet & Arizona also shows an increase in valuation, being rated at $42,163,006.94 this year as against $40,432,317.29 in 1919. The United Verde Copper Co. is rated at $40,095,-385.25 for 1920 as against $43,822,275.40 in 1919. The United Verde Extension is assessed for 1920 at $34,561,479. Last year the valuation was $36,972,224.26. The Ray Consolidated is assessed at $39,834,159.15, an increase of $315,490.38 over the valuation of 1919.

Northwest Magnesite Dividends Involved in Suit

By Telegraph

To compel payment of dividends of $500,000 suit was brought at Spokane, Wash., on July 19, by R. S. Talbot, of Spokane, against William H. Crocker, of Crocker National Bank, San Francisco. Talbot was one of the first men to appreciate the commercial importance of Washington magnesite. He alleges in the complaint that Crocker is seeking by unfair means to secure control of the Northwest Magnesite Co., of Chewelah, Wash., which company Talbot promoted by securing financial aid from Crocker, R. N. Bishop, S. F. B. Morse, Wellington Gregg, Bart Thane, and the Sperry Flour Co., all of San Francisco.

WEEKLY RÉSUMÉ

Contempt proceedings against Miami Copper in the Minerals Separation case have been dismissed by the U. S. Court at Wilmington. Minerals Separation has been permitted to make the North American Corporation a party to the suit. The investigation of the Federal Trade Commission into the company's affairs has been resumed, this time in Salt Lake City. The president and two trustees of the Colorado School of Mines have been accused of unethical conduct in a report by a committee of the American Association of University Professors. In Arizona, the Swansea Lease, Inc., has suspended operations. In Utah, stockholders of the Montana-Bingham Consolidated are suing the directors for conspiracy and violation of agreement. In Washington, D. C., the U. S. Geological Survey has decided to expand its work of collecting copper statistics. In Nevada, the Tonopah Divide is reported to be developing a promising strike of good ore. The coal situation is said to be bad in Northern Ontario, and low water there is also causing power shortage.

Montana-Bingham Directors Sued by Stockholders

Conspiracy and Violation of Agreements Charged—Company's Funds Said To Have Been Wasted

Directors of the Montana-Bingham Consolidated Mining Co., of Bingham Canyon, Utah, which has been operating for the last five years the old Fortuna holdings, long owned by the Bambergers, are being sued by a number of stockholders, who are charging conspiracy and violation of agreements. A request for an accounting has been made. Plaintiffs in the suit are: Murray Carleton, J. Benton Leggat, B. E. Calkins, F. L. Melcher, C. R. Mower, and R. W. Grant. The defendants are: The Henry Waterhouse Trust Co., R. W. Shingle, A. N. Campbell, J. A. McCandles, John Watt, J. Jorgenson, C. G. Ballantyne, C. G. Bockus, L. R. Eccles, J. M. Eccles, E. A. Vail, J. B. Mossman, Imer Fett, and L. B. McCornick.

The complaint charges that the group in control has secured its control so as to use the funds for its own benefit in the way of excessive salaries and bonuses; that an inexperienced man had been hired as president and general manager at an exorbitant salary; that $105,000 was paid in five years to C. G. Ballantyne as president and general manager. It is also charged that the directors in return for positions on the directorate had promised that the company would be financed by the sale of 500,000 shares of stock at 50c. a share, and that not more than 265,000 shares had been sold. The property has been worked for five years by the present company, which includes Salt Lake and Honolulu interests.

Miami Copper Not in Contempt in Flotation Case

Minerals Separation May File Bill To Make North American Corporation Party to Suit

The petition of Minerals Separation asking that the Miami Copper Co. be judged in contempt of court and enjoined from further use of the former company's flotation process was ordered dismissed on July 13 by Judge Morris, in the U. S. District Court, at Wilmington, Del. In doing this, the court has sustained the contentions which were made upon the part of the Miami company at the hearing before the court on June 15. (*Engineering and Mining Journal*, June 26, 1920, p. 1426). Judge Morris' order is as follows:

"This cause was last before this court upon an application by the plaintiff for leave to file a supplemental bill. 264 Fed. 528. The plaintiff now charges by petition that the processes employed by the defendant since it stopped using the three processes heretofore adjudged to be infringements are also infringements and prays that the defendant be adjudged guilty of contempt and/or that further injunction be issued specifically enjoining and restraining the defendant from using such processes.

"The defendant by its answer denies that the new methods infringe the patents sued upon and moves that the rule to show cause be vacated and the petition dismissed upon the ground that, due to the character of the new processes, the present procedure is inappropriate for the determination of the questions raised. The plaintiff contends that it appears from the facts alleged that the new methods are the same in principle as those adjudged to infringe and that the defendant has made only a substitution of equivalents resulting in a mere colorable change in the process, while the defendant contends that those facts disclose that it no longer uses the agitation of the patent. Much testimony touching the processes in question has been introduced by the plaintiff before the master upon the accounting now being had. In fact, it is conceded that little testimony of any other nature has so far been presented.

"The present issues do not seem to make necessary a review of the cases upon contempt or those in which the procedure by supplementary injunction has been recognized. Although embarrassed by the fact that I do not possess the full knowledge of the intricate facts of this case that might have been gained had the testimony and argument in the main cause been heard

by the court as now constituted, I am, nevertheless, satisfied that the facts set up by the petition are not of the character required to sustain a judgment of contempt. Nor do I find that the practice of enlarging an injunction or granting a supplementary injunction has been adopted in this circuit. But, be that as it may, in view of the nature of the new processes used by the defendant as charged by the petition, the questions raised thereby, and the decision of the Circuit Court of Appeals in this case, 244 Fed. 752, I am of the opinion that the plaintiff must obtain the relief to which it is entitled, if any, touching the new processes, either through the proceedings now being had before the master and the decree to be entered thereon, or by a new bill and not otherwise. Which of these procedures is the proper one under all the circumstances or whether both must be resorted to, one as to some of the processes and the other as to the remaining processes, need not now be determined.

"An order vacating the rule and dismissing the petition may be submitted."

As to the petition for permission to file a supplemental bill making Minerals Separation North American Corporation party plaintiff to the suit, submitted with the motion setting up the filing of a disclaimer, Judge Morris expresses the opinion that it would be in furtherance of justice to grant leave to file, but without prejudice to the Miami company to renew its objections.

This matter was so very hurriedly argued at the time of the hearing upon the contempt proceedings that the granting of right to further argument appears reasonable. The important bearing of this feature of the case, it is said, seems to be that it has the possibility of so affecting the disclaimer as to the three claims of the patent No. 835,120, which were found invalid by the Supreme Court, that the present infringement suits might all lose their standing before the courts.

Ontario Government To Instruct Prospectors This Winter

Harry Mills, Ontario's Minister of Mines, announces that short winter courses of instruction for prospectors will be opened at several mining centers in Northern Ontario, including Haileybury, Sudbury, Timmins, Swastika and some point at the head of the Great Lakes. It is proposed that the courses last six weeks, including such teaching by competent geologists as will enable the student to judge the economic possibilities of a district by its rock formations, and a general training in sampling and testing the value of ore. The courses, which will begin next winter, will be free to prospectors. Mr. Mills has also decided to open a government assay office at Kirkland Lake, which will make assays at cost.

Swansea Lease, Inc., in Arizona Suspends Operations

Would Also Shut Down Railroad Permanently—Old Planet Copper Mine Affected

The Swansea Lease has suspended operations and the Swansea railroad has applied to the Arizona Corporation Commission for authority to suspend operation. There apears to have been no trouble in finding an ample supply of ore of good grade or in handling it well in the new mill, which, it is claimed, made a better recovery than any other copper concentrator in the Southwest. It is said to have been demonstrated that a new mining method will have to be employed before profit can attend operation at the present price of copper. It was discovered that the shaft had been sunk at the wrong point. It was necessary to handle the ore from three to five times before it was dumped into the mill bin. The ore is a sticky material, needing much shoveling. A new shaft, possibly 1,000 ft. deep, is required, it is stated. This expensive work the leasing company is not prepared to take up.

The shutdown of the railroad has affected also the old Planet copper mine, on which operations had been started with expectation of heavy shipments. The Planet was the first copper mine of northern Arizona and was worked in the early sixties. Its ore was then rich enough for shipment by river steamboat to the Gulf of California and thence by sailing vessels to San Francisco and Wales. It has been badly "gophered" for its rich surface ores, but deeper explorations have found continuation into the sulphide zone of a body of good commercial ore.

HEADFRAME AT NO. 7 SHAFT, SWANSEA LEASE, INC., SWANSEA, ARIZ. THIS COMPANY HAS JUST SHUT DOWN

Many British Columbia Claims Revert to Crown

List of Properties Forfeited for Non-Payment of Taxes Surprisingly Large This Year

Lists of Crown-granted mineral claims which have reverted to the Crown, because of non-payment of taxes and are now subject to lease under the terms of the taxation act have been forwarded to the gold commissioners and mining recorders throughout British Columbia. This publication is of surprising size, containing thirty-odd pages. Every mineral district of British Columbia figures in the tables it contains. As would be expected, the sections best known to miners have contributed to the Crown the greater number of delinquent mineral claims. The Rossland assessment district, for instance, has provided over 800 such properties, all of which, as stated, may be leased after compliance with the statutory formalities, the particulars of which will be furnished on application to the assessor. The Slocan assessment district, also, is well represented, with about 300 such claims advertised for lease. Nelson has about 328; Fort Steele, about 90; Kettle River, 170 odd; and, coming to Vancouver Island, it is found that Nanaimo has some 28 of these, presumably abandoned, claims; Cowichan, 18; Comox, 33; and Alberni, 45.

The Vancouver Chamber of Mines is engaged in assembling an exhibit of British Columbia ores that will be representative of the mineral wealth of the various mineral districts of the province.

Lake Superior Iron-Ore Shipments Increase in June

Shipments of iron ore from the head of Lake Superior during June showed an increase of 1,727,694 tons over May and are now within approximately one-half million tons of equalling the shipments as of July 1, 1919. Coal shipments for the week ending June 19, the first week under the revived pooling arrangement, showed an increase of 43,000 tons over the preceding week but are still only half as great as during a similar period last year. Lake dumpings to July 3 total 2,923,000 net tons, as compared with 8,136,000 tons on July 3, 1919. Below are details of iron ore shipments:

Dock	June, 1919	June, 1920
D. M. & N., Duluth	2,947,651	2,528,446
D. & I. R., Two Harbors	1,136,833	1,448,547
C. & N. W., Ashland	787,351	1,081,659
Soo, Ashland	163,936	218,161
N. P., Superior	66,404	106,604
Soo, Superior	201,047	217,683
G. N., Superior	1,621,397	1,931,963
	6,984,619	7,533,063

Dominion Steel Votes To Enter British Empire Merger

At a special general meeting of the shareholders of the Dominion Steel Corporation held at Halifax, N. S., the proposal to merge the company in the British Empire Steel Corporation was ratified without a dissentient vote. The Nova Scotia Steel & Coal Co. has already accepted the merger. The Canada Steamship Lines has yet to vote on the question.

Roy M. Wolvin, president of the Dominion Steel, made the announcement that the British Empire Steel Corporation had made a gift of $250,000 to Dalhousie University to be used for the purpose of providing more professorships in research work in connection with the natural resources of Nova Scotia.

El Paso Mica Co. Operating Mine in Petaca District, N. M.

The El Paso Mica Co., of El Paso, Tex., is operating a mica mine in Rio Arriba County, Petaca district, New Mexico, and shipping its crude product to a sorting and finishing plant on the outskirts of El Paso. Five carloads have been shipped to the plant already but three carloads of crude mica ready to be shipped have been greatly delayed due to high water in the vicinity of the mine. The result has been to temporarily shut down the finishing plant.

The deposit, which is a pegmatite vein reaching 30 ft. in width, affords a muscovite mica of excellent grade. Three drifts with connections, totaling 965 ft., have been extended into the deposit. The mine is at an elevation of 9,300 ft. At the finishing plant, sheet mica up to a maximum size of 8 x 10 in. is selected, packed in barrels and shipped. The residual mica is shipped in bulk as scrap mica. It sells for approximately $27 per ton. The clear sheet mica is practically all profit as the scrap mica brings in a return sufficient to repay mining and shipping expenses. About 35 girls are employed on finishing work. About three weeks are required to sort a carload of 55,000 lb. The coarse scrap mica is used for the manufacture of roofing material, the fine mica for rubber and the highest grade for making wall paper. At present the Richmond Mica Co. and the U. S. Mica Manufacturing Co. are receiving the output from the producer. There are other occurrences of mica in the district which appears to give considerable promise of increased production.

Farmers Complain of Trail Smelter Smoke

Fifty-two claims have been made by farmers against the Consolidated Mining & Smelting Co. of Canada for damages to crops caused by the fumes from the Trail smelter. The allegations of those who seek compensation from the company are being investigated by Judge J. A. Forin and a party of advisers, some with legal and others with agricultural experience as their qualifications. Before setting out on a tour of the farms said to have been affected Judge Forin and party made an inspection of conditions in an adjacent valley outside the smoke area.

Civil Service Examinations

Those interested in the following examinations should apply at once to the Civil Service Commission, Washington, D. C., for the form indicated, stating the title of the examination desired.

Metallurgist, $10.80 per diem, both sexes. An open competitive examination August 3. A vacancy at Navy Yard, Norfolk, Va., and similar positions, may be filled from results. Not required to report at any place for examination; request Form No. 1312.

Associate physicist qualified in physical metallurgy, $2,000-$2,800; assistant physicist qualified in physical metallurgy, $1,400-$1,800; both sexes in both cases. An open competitive examination on application, until further notice. Vacancies in U. S. Bureau of Standards for duty at Washington or elsewhere, may be filled from results. Not required to report at any place for examination; request Form No. 1312.

Junior mining engineer, $1,500, both sexes. An open competitive examination on August 3. A vacancy in the Bureau of Mines for duty at Seattle, Wash., may be filled from results. Not required to report at any place for examination; request Form No. 2118.

Metallurgical laboratorian, $4.80 per diem, both sexes. An open competitive examination on application, until further notice. Vacancies at the Engineering Experiment Station, U. S. Naval Academy, Annapolis, Md., and elsewhere, may be filled from the results. Not required to report at any place for examination; request Form No. 1312.

Metallurgical chemist, $6.88 a day; assistant metallurgical chemist, $5.12 a day, both sexes. Open competitive examination, Aug. 10, 1920. Vacancies at the U. S. Naval Ordnance Plant, South Charleston, W. Va., and in positions requiring similar qualifications may be filled from the results.

Recent Production Reports

North Butte produced 1,616,822 lb. copper in June compared with 892,118 in May.

Butte & Superior in June produced 8,250,000 lb. zinc in concentrates and 160,000 oz. silver, compared with its output in May of 5,900,000 lb. zinc in concentrates and 103,000 oz. silver.

Granby Cons. M. S. & P. Co.'s output in June was 2,079,000 lb. copper, compared with 2,131,219 lb. in May.

Anaconda produced 12,700,000 lb. copper in June against 9,700,000 in May.

Shattuck Arizona produced in June 198,327 lb. copper, 661,746 lb. lead, 33,702 oz. silver, and 397 oz. gold in June.

Phelps Dodge produced 7,552,000 lb. copper in June against 7,902,000 in May.

Old Dominion's June output was 2,999,000 lb. copper compared with 2,287,400 in May.

Arizona Copper produced 3,000,000 lb. copper in June as in May.

Miami's output in June was 4,400,000 lb. copper; in May 5,054,760.

Utah Copper's June output was 10,000,000 lb. copper compared with 9,904,781 in May.

Chino produced 4,010,069 lb. copper in June compared with 3,930,728 in May.

Ray Con.'s June production was 4,520,000 lb. copper against 4,260,000 in May.

Nevada Con. produced 4,650,000 lb. copper in June against 4,350,000 in May.

Inspiration's output in June was 7,300,000 lb. copper; in May 7,500,000.

Greene Cananea produced 3,750,000 lb. copper in June compared with 4,300,000 in May.

Cerro de Pasco produced 3,944,000 lb. copper in June.

U. V. Extension produced 2,828,020 lb. copper against 3,219,934 in May.

Oriental Consolidated's clean up for June was $80,000 compared with $95,500 in May.

Calumet & Arizona's June production (available for company) was 3,812,000 lb. copper.

New Cornelia produced 3,664,000 lb. copper in June.

Kennecott Copper produced 10,120,000 lb. copper (including Braden's output) in June compared with 9,311,000 in May.

Calumet & Hecla produced 9,022,879 lb. copper in June compared with 8,803,811 in May. Output by subsidiaries in June was as follows: Ahmeek, 1,773,200; Allouez, 333,800; C. & H., 5,097,594; Centennial, 86,000; Isle Royale, 878,508; LaSalle, 0; Osceola, 661,500; Superior, 32,200; and White Pine, 160,077.

Shipments of domestic copper ore, matte, etc., from Alaska to the United States in June were 9,146 gross tons, containing 7,213,820 lb. copper.

Katanga's June production was 4,323,221 lb. copper compared with 3,847,027 in May.

Burma Corporation produced 4,733,120 lb. refined lead in June and 265,620 oz. silver.

Colorado School of Mine Officials Charged with Improper Conduct in Office

Committee of American Association of University Professors Reports After Prolonged Investigation

The president of the Colorado School of Mines, Victor C. Alderson, and two trustees, H. M. Rubey and James T. Smith, are scathingly arraigned in a report that has just been made by a committee appointed by the American Association of University Professors, in which it is charged that Dr. Alderson "repeatedly violated the essential principles of sound educational administration and of professional ethics." In preparing this report, the committee began its work in November, 1918, since which time they have been collecting evidence sustaining charges made against the school administration. The school board was again approached by the committee in 1919, but maintained that it was not responsible for the mistakes of the administration in previous years, although Dr. Alderson was still president, as he had been previously. "The principal charges on which the committee based its investigation," states the report, "were made by former professors of the school and were:

"1. That trustees intervened in matters of student discipline.

"2. That President Parmelee's dismissal was chiefly due to the stand he took in resisting the attempt of trustees to intervene in the question of discipline which arose at the time of the students' strike.

"3. That a number of teachers of professional rank were dismissed, mainly during the administration of President Alderson, without charges, hearing or adequate warning.

"4. That President Alderson discouraged high standards of scholarship and brought pressure to bear upon instructors to cause them to raise the marks of students.

"5. That President Alderson used his power of reappointment to secure support in the faculty of his personal policies."

The committee's report was signed by M. J. Lihby, chairman; Herbert S. Hadley, ex-governor of Missouri; J. M. Coulter, H. O. Hoffman and A. A. Potter.

In the course of the investigation, witnesses were heard who recounted incidents sufficient to show interference by both Messrs. Rubey and Smith, with the authority of the faculty in administering the discipline of the school. The committee found that this intervention was made in such a way as to weaken the authority of the faculty and to encourage disorder and grave breaches of discipline in the institution. In summarizing the result of the investigation, the report asserts "the trustees of the Colorado School of Mines do not seem to realize the impropriety and the evil influence of their interference in the routine affairs and educational problems of the institution," and it warns "that the conditions brought out by the investigation unless remedied without delay will prove most disastrous to the future of the school." The state authorities are urged to appoint trustees who are competent to select and support a president who has proper educational ideals.

Rio Tinto Mines in Spain Cease All Work

The mines in the Rio Tinto region have ceased work completely and hundreds of the striking workmen have decided to migrate to other parts of the country or to go abroad, according to a press dispatch dated July 13. Many families are suffering from hunger. The entire district affected is in distress, owing to lack of articles of prime necessity.

The striking miners have maintained a quiet attitude, and up to the present the Government forces have not been required to intervene in the dispute. The directors of the English company controlling the mines still decline to concede any of the demands made by the workmen. On the other hand, the miners are remaining firm in their attitude.

Minerals Separation Hearing Renewed in Salt Lake City

After conducting its hearing in San Francisco in the course of its investigation into the methods of Minerals Separation, the Federal Trade Commission resumed its inquiry at Salt Lake City on July 13. Thomas Varley, of the local station of the U. S. Bureau of Mines, in testifying, stated that in his belief the effect of the license rates of Minerals Separation was to restrict the production of minerals by oil flotation. V. P. Strange, president and general manager of the Utah Leasing Co., testified as to his experience in the matter of royalty to be paid and the delivery of machinery, when his company undertook the treatment of the 800,000-ton tailings dump of the old Cactus mine near Newhouse, Utah. Delivery of machinery was refused when objection was made to an increase in the royalty beyond the amount agreed upon in negotiation with an official of the company. By means of a replevin bond the company secured its machinery, and for a time operated before a license was secured.

Geological Survey To Expand Its Work on Copper

Capt. Jenison, Succeeding B. S. Butler, Plans Exact Study of World's Production

Capt. H. A. C. Jenison is now in immediate charge of the U. S. Geological Survey's work on copper. He succeeds B. S. Butler, who recently entered private employment. Capt. Jenison is a mining engineer who has had ten years of very active and intimate association with copper mining in the United States, Mexico, Chile and Alaska. It is the intention of the Geological Survey, so far as conditions will permit, to expand its work on copper. In this connection Capt. Jenison has submitted a program which has been approved by Dr. George Otis Smith, the Director of the Survey. This work, of course, will be in addition to that of gathering the material which goes to make up the regular chapters on domestic and foreign production and the preliminary estimates which are made in July and January of each year. In order to make possible a more exact study and analysis of the world copper production and trade figures will be collected on reserves of all important lines in all countries. It is intended to calculate the ratio of reserves to present production and to production over a long period. A calculation will be made of the ratio of consumption to production and reserves over the same period. In connection with the foregoing work, "least squares" and "probability" curves will be developed to show past, present and probable future tendencies of production, consumption and reserves.

With regard to the domestic industry, it is the intention to collect monthly figures of production, stocks and sales from the principal producers from which data approximate figures indicating the condition of the industry can be prepared for publication at least once a quarter. This will allow the determination of when and where peak and minimum load occur and will make it possible to determine reasons of changes of the rate of mining and of transportation. This is expected to make it possible to indicate in advance where, under normal circumstances, prices may change due to probable excess and deficient production. It is intended to maintain

tabulated, confidential sheets for each important mine, smelter and refinery. This is in addition to the sheets for each state. The confidential sheets for each company will show the following: Production and character of ore; percentage recovery of metal from ore; tonnage treated at smelters and refineries; production and cost of refined copper, gold and silver from the mine and the names of the purchasers of the refined metals. Accurate account will be kept of exports and imports of copper ore, matte and metal, showing kinds and quantities, as well as sources and destination. This same plan will be carried out as far as is possible with regard to exports and imports of copper from foreign countries.

A card index and bibliography will be developed to cover exhaustively information pertaining to the geology, technology, reserves and development of copper mines.

Bill for Revising Mining Law Not Yet Approved by Ingalls Committee

The draft of bill providing for certain revisions of the mining code, which is in the hands of the chairmen of the Committees on Mines and Mining of the Senate and of the House, has not been approved by the committee headed by W. R. Ingalls, according to Dr. F. G. Cottrell, Director of the Bureau of Mines. The bureau is co-operating in the effort to present to Congress the draft of a revision-of-laws bill, along with copious notes showing wherein certain changes may be controverted. Dr. Cottrell explains that the draft, which has been prepared, is for submission to the members of Mr. Ingalls' committee and has not been approved by them. They are to go over the draft between now and the opening of the new session of Congress and Dr. Cottrell points out that it is altogether probable that many changes will be made in the document as it now stands.

The draft of the bill was sent to the chairmen of the Committees on Mines and Mining at the same time that it was sent to the members of Mr. Ingalls' committee, so that they might be kept informed as to the work being done. Every effort will be made to present a revised draft to these Congressional committees with the hope that they will find it possible to take up the consideration of the matter soon after the convening of Congress.

War Mineral Awards Average One-third of Claims

Awards have been recommended as follows by the War Minerals Relief Commission during the week ended July 10 (the name of the claimant, the mineral, the amount recommended and its percentage relationship to the amount claimed are shown): H. T. Stiles, manganese, $2,954.90, 79 per cent; Thomas H. Green, manganese, $792.75, 77 per cent; Wells & Pollock, chrome, $993.21, 64 per cent; A. G. Green, chrome, $2,152.38, 47 per cent; Alexander R. Shepherd, tungsten, $1,025.75, 35 per cent; Scherer & Wall, manganese, $768.42, 14 per cent; Neely Bros., Inc., chrome, $23,040.98, 17 per cent; C. H. Palmer, manganese, $489.82, 100 per cent.

Up to July 10 the commission had acted on 904 claims in which $9,909,093.06 was asked by the claimants. The average percentage recommended for payment on all the claims is 33.07 per cent.

Outlook Unpromising in Nevada Districts, Ferguson Reports

Labor conditions and costs are such in the Manhattan and Round Mountain districts of Nevada as to give no particular promise for early resumption of gold mining operations on a large scale. Much of the ground of the larger companies is being turned over for leasing and not operated for company account. This report on conditions is brought back by H. G. Ferguson, of the U. S. Geological Survey, who has been doing geologic work in those camps. Mr. Ferguson also visited the property near Silver Peak, Nev., where a mill is being put up for handling potash alum by the Silver Peak Chemical Co.

NEWS BY MINING DISTRICTS

ARIZONA

Dripping Springs Copper Buys Broken Hills Equipment—Little Treasure Group at Winkelman Sold

Bisbee—The ventilating shaft that is being sunk by the Calumet & Arizona Mining Co., southeast of the Briggs shaft, has reached a depth of 310 ft. This means that an average of more than 8 ft. per day has been made since the work started. The shaft was deepened 54 ft. in six working days recently. The work is being done on contract. When completed the shaft will be about 800 ft. deep.

The company is installing two more boilers which will give the boiler plant an equipment of 15 instead of 13 boilers. The increased flow of water that is expected to be encountered when the Junction shaft is deepened is the reason for increasing the boiler capacity. Plans for sinking the Junction shaft from the 1,800 to the 2,200-ft. level are now underway.

Winkleman—The Dripping Springs Copper Co. has purchased the mining equipment of the Broken Hills Mining Co., at Ray, and moved it to its property near here. This will greatly facilitate development through the long crosscut tunnel. Pending the installation of this equipment a raise is being driven for ventilation. Improvements are being made in the roads to facilitate shipments of ore to the Hayden smelter.

The most important transaction in mining property this year in Pinal County, Ariz., took place on July 10 when the Arizona Silver Consolidated Mining Co. acquired the Little Treasure Group, from N. H. Mellor. The property consists of nine claims, situated in the Saddle Mountain mining district about five miles east of Winkleman. It has never been worked extensively but has produced some very high-grade silver ore.

The new company is headed by John Hartnett, Jr., of Washington, D. C., who has been auditor to the General Staff of the War Department. Dr. Hartnett is president. Captain Walter E. Purvis is secretary-treasurer, to be in charge of the eastern offices. C. T. Carpenter, of Phoenix, will be secretary in the Arizona office. E. T. Herrmann is general manager and G. G. Wald, of Phoenix, is consulting engineer. The company has begun construction of a camp and will improve the roads leading from the main highway at once. It plans to start development of the Little Treasure vein system on August 1 along the lines laid out in the original report on the property made by Arthur L. Flagg, consulting engineer.

ARKANSAS

Good Demand for Batesville Manganese Ore Reported

Batesville—There is renewed activity in the manganese industry in the Batesville district. The demand is good for ore at a price on which operators can make a profit. High-grade ore is most in demand but some as low as 30 per cent is moving.

The National Manganese Co., which owns property near Anderson, is preparing to construct a dam across Lafferty Creek, which will create a large reservoir of water to be used for ore washing. It is intended to erect a large washing plant and install hydraulic mining machinery at once. A tram will also be built from Anderson to Penters Bluff, the shipping point, four miles away.

Joe Magness and associates, who have a lease on the Manganese Cave property at Penters Bluff, have completed a switch and built chutes to it from the adit on the mountain side. Ore is thus

dumped directly into the car. From one to two cars a week is being produced.

Tom Shell has a large crew of miners at work on his property near Cushman and is making a good production.

Case and Wilson are opening up a fine body of high-grade ore on their property at Penters Bluff.

E. C. McComb, of the Independence Mining Co., has one steam shovel and the washing plant in operation at the Polk-Southard Mine near Cushman and will start operating a small washer at Penters Bluff soon.

CALIFORNIA

Idaho-Maryland Gets Golden Gate Stamp Mill—Rising Sun's New Mill Running—North Star Abandons Champion

Portola—The Engels and Walker companies are shipping large tonnages of copper concentrates from their flotation plants. New development has added extensively to the reserves of both properties. At the Engels group recent work has opened up rich deposits and the grade of ore is said to exceed any ever discovered previously in the district.

All other mines in the Plumas copper belt are doing extensive development work. Practically every company reports development of profitable ore, with new work materially extending the dimensions of the proven ore belt.

The Gruss company has just acquired two claims lying to the east of its former holdings. The new acquisition is considered important.

Nelson Creek—An unexpected cloudburst wrecked the equipment of the company employing a diving method at Nelson Point. Several sluices and other devices recently set in place were washed away.

Benton—Several shipments of rich silver ore have been made by companies and lessees in the Benton district in Inyo County. Many new interests are seeking to acquire holdings in the camp.

Grass Valley—The Idaho-Maryland has acquired the ten-stamp mill formerly in commission at the Golden Gate group.

The Mayflower Mining Co. at Canada Hill has purchased the mine plant and headframe of the Golden Gate, which will be moved to the Lily property.

The Empire Mines Co. has 80 stamps dropping on high-grade ore taken from the Empire and Pennsylvania. The mine force has been increased and the development of new territory below the 4,500-ft. level is proceeding satisfactorily.

Nevada City—The North Star company has announced that all work has been abandoned on the Champion group at Nevada City. The Champion was bought several years ago by the company but proved a losing venture despite every endeavor to develop commercial ore at greater depth.

Work at the Alcalde, Boundary and other local properties is progressing, and the several managements are quite pleased with the showings. The North Star's Central mill is running steadily.

Colfax—The Rising Sun company has completed installation of the ten stamp mill and the plant is now in commission. The ore being taken from the mine is of high grade. The shaft is now down to the 900-ft. level. No development of consequence has been done below the 400-level, but $2,000,000 has already been taken from the mine.

COLORADO

Smuggler Union Preparing To Rebuild Flotation Plant—Drilling Contest at Idaho Springs

Idaho Springs—The Fourth of July celebration included an old fashioned miner's drilling contest, in which the double-hand event was won by W. H. Keelor and Frank Cramer, who drilled a hole 20⅛ in. in ten minutes, in hard Silver Plume granite. The single-hand contest was won by Tony Zancanelli who drilled a hole 15 in. in ten minutes in Silver Plume granite.

Telluride—The Smuggler-Union Mining Co. continues milling operations as well as possible without its flotation plant, which was recently destroyed by fire. Arrangements are being made to rebuild the plant. As much material as possible will be purchased in Colorado. About 100 workmen and several teams are engaged in clearing away the fire rubbish, preparatory to laying foundations for the new buildings. The new office building is under construction. The new mill buildings will be of steel and concrete.

Boulder—The Nil Desperandum Mining Co. has been reorganized, with a capital of $500,000, divided into 500,000 shares of a par value of $1. The company plans to list its stock on the New York Curb. Considerable new development work is under consideration.

The Boulder County Mines Co. has installed flotation equipment in its mill and is planning to resume development work in its lower tunnel.

The Caribou mine has resumed active operations. The 1040-ft. shaft has been repaired, and ten sets of lessees are mining ore between the surface and the 840-ft. level. Some of the ore is high grade, and a recent shipment averaged 397 oz. silver per ton. A block of ground on the 10th level will be developed on company account. J. G. Clark is manager.

The Telegraph mine is being equipped with a 25-ton mill. The plant is rapidly nearing completion and will probably be in operation this month. The equipment includes crushing rolls, a ball mill, electrolytic amalgamating tanks and flotations cells. The management plans to treat the fines and slimes separately in Ogden amalgamating tanks. The pulp from these tanks will be passed to the flotation cells.

Gypsum Valley — The Cummings Chemical Co. is increasing its operations in Gypsum Valley, San Miguel County, Col. Carnotite ore is being shipped via Placerville to the Rare Ore Sampler at Montrose, and thence to Eastern buyers. O. B. Willmarth is manager.

The Carbonero mine is being operated by Ruutilla & Brown, who are shipping high-grade silver-lead ore, some of the product going to Midvale, Utah, and some to the Pueblo smelter.

The San Bernardo mine is being developed and equipped by the Valley View Leasing & Mining Co. Most of the machinery for the new mill is on the ground and the plant is rapidly nearly completion. Underground development continues with promising results.

Cassells—Operations are being resumed for the summer at the mine and mill of the Whale Mines Leasing & Reduction Co. A. C. Dart is superintendent.

IDAHO

Coeur d'Alene Syndicate Drops Option on Black Bear—Big Creek Company Offering 50-cent Bonus

Mullan — Arrangements are being made to resume operations on the American-Commander about Aug. 15, by which time it is expected that a compressor will be in position and all other equipment necessary. A good showing of lead-silver ore was exposed many years ago and a crosscut has been run 3,000 ft., but without finding the ore. A few months ago the West Hunter company, joining the American-Commander on the south, started a crosscut south from the American-Commander tunnel and at a distance of about 150 ft. cut a strong vein and a shoot of good ore about 8 in. wide on the west side of the crosscut and 18 in. on the east side, indicating an important orebody lying to the east. It is now planned to drift east on this ore.

Kellogg—T. S. Welch, of Butte, has secured an option on all outstanding stock of the Blue Star Mining & Milling Co. and is preparing to begin work by Aug. 1. A shaft has been sunk 500 ft. A crosscut at 300 ft. and a drift have disclosed some promising lead-silver ore, particularly in a winze 40 ft. deep, in which a small stringer of ore has widened to about 2 ft. A crosscut has also been started from the bottom of the shaft and has about 150 ft. to go to reach the vein. The extension of this crosscut will be the first work undertaken by Mr. Welch and if results are satisfactory the shaft will be sunk 300 ft. further. The property is favorably located, being only about 1,000 ft. from the railroad.

Gem—After many years of idleness another effort is to be made to find a commercial orebody on the Bell. A lease and bond has been taken on the property by Axel Swan, who, after a careful examination, believes he can solve the problem by driving a crosscut about 100 ft. from No. 2 tunnel. The

property is owned by the Bell Mining Co., control of which is held by the estates of Finch and Campbell. The surface showing is one of the best in the district and indicates a large orebody, which Mr. Swan will now make another attempt to find.

Wallace — The option held by the Cœur d'Alene Syndicate on the control of the Black Bear Mines Co. has been surrendered. The first payment on the option was due June 30. A few weeks prior to that date a request was made for an extension, and this being refused the option was given up. The syndicate has an option on control of the Flynn Group Mining Co., adjoining the Black Bear, and has an easement which gives it the right to use the Black Bear tunnel as a means of entering the Flynn ground. This right is not affected by giving up the Black Bear option and the development of the Flynn is proceeding as usual.

The Big Creek Mining Co., which normally employs about 25 men under ground, in order to overcome the difficulty in holding employees, is offering a bonus of 50c. per day to all men who remain on the job 30 days, the bonus to continue as long as they remain. This makes a daily wage of $6.25. The larger companies experience much difficulty in holding men and some of them pay a bonus in special cases. At the Morning mine the contract system prevails, the men making from $7 to $11 per day.

MINNESOTA

Mesabi Range

Steel Corporation Gets Polk & Jackson Interest in Walker Iron Mine

Coleraine—The Polk and Jackson mining companies, subsidiary to the Great Northern Iron Ore Properties, have turned over their one-half interest in the Walker iron mine to the U. S. Steel Corporation receiving in exchange therefrom the one-half interest of the corporation in the Hill mine. Several other smaller properties are involved in the exchange, bringing the total estimated tonnage up to 90,000,000 tons.

One shovel is stripping and one shovel mining ore at the Mahnomen mine, Ironton.

The stockpile of 4,500 tons at the Algoma mine, a former property of the Onahman Iron Co., has been shipped.

Buildings and equipment at the Ferro mine near Trommald have been advertised for sale at sheriff's sale July 10, sale having been postponed from June 19. Sale is advertised by the Gorham-Garbett Co. of Minneapolis, fee owners of the property, who hold mortgage against the property for unpaid royalties in the sum of $14,000. Property is completely equipped and developed. It was operated during 1917 and 1918 by the Onahman Iron Co., an Omaha concern which also operated the Algoma mine and which lately went bankrupt. During 1918 it shipped monthly about 4,000 tons of manganiferous ore to the Algoma Steel Co. The property has been idle since the fall of 1918, at which time work was started to sink the shaft an additional 140 ft. from the 145-ft. level to develop the ore lenses at depth. The ore is a hard, silicious, low phosphorus and moisture, manganiferous iron ore, and will average over 20 per cent natural manganese, with 18 to 20 per cent silica. The reserve tonnage is not large.

The Mangan No. 1 stockpile near Ironton, amounting to 7,000 tons has been shipped by Clement K. Quinn & Co. The property has been idle since the winter of 1918-1919.

The Maroco mine of the Marquette Ore Co. at Trommald, an E. N. Breitung enterprise, is sinking an inclined shaft to the 200-ft. level, for drainage of the orebody preparatory to stripping and open pit mining. Shaft is now at 150 ft. and good progress is being made. The sand sucker and other hydraulic stripping equipment has been set up on the property for over a month, but orders have not been given to go ahead. Property contains several million tons of ore, about one-half of which is washable. Contract has been let for the erection of a one-half unit washing plant for which Allis-Chalmers Co. are furnishing the machinery, and the timbers for the structure are on the ground.

MISSOURI

New Zinc Oxide Plant Damaged by Fire —Butte-Kansas Mill Ready Soon

Waco—The Acme mine and mill have been turned over to lessees. The management has two drill rigs outlining new orebodies.

The new Butte-Kansas mill, replacing one that caved into the mine, should be ready about August 7.

Joplin—The baghouse at the newly completed plant of the Metals Extraction Corporation was burned on July 9. The walls are intact. Reconstruction is to begin at once and should be completed by August 15.

MONTANA

Davis Daly Mining High Grade on Butte & Ramsdell Ground

Butte—Ore production from North Butte's Granite Mountain and Speculator properties is being increased slightly and a larger output is looked for in July. The showing on the lower levels of the Edith May vein continues favorable.

The recent ore shoot disclosed on the 500-ft. level of Tuolumne Copper's Main Range mine continues steady at about 40 oz. of silver per ton with up to 2 per cent and more of copper. Resumption of sinking of the winze from the 1,200-ft. level, where there appeared to be a good ore, is planned by the company.

The development drift on the vein near the station on the 2,700-ft. level of the Colorado mine continues in ore. A body of ore more than 400 ft. long and about 8 ft. wide has been opened, all being of a commercial grade.

Sinking of the Plutus shaft is under way with the object of opening on the 400-ft. level an orebody found near the surface of the Norwich claim adjoining.

Further underground development has been temporarily suspended by the Butte Metals company.

Mining of the high-grade ore from a fissure striking through the Butte & Ramsdell property on the 2,500-ft. level of the Ramsdell claim has been begun by the Davis-Daly company under a profit-sharing arrangement with the Butte & Ramsdell. The latter has approximately 250 ft. on the strike of a vein showing about 6 ft. of 20 per cent copper ore.

Marysville—Operations at the Piegan-Gloster mine are expected to be suspended soon. Operation of this property last year cost the Barnes-King approximately $88,000. The Shannon mine is showing up well. The new orebody opened on the 500-ft. level having a width of 6 ft., the ore running $14 per ton. Barnes-King invested $17,000 in an oil well venture thus far without success. This well is located in the northern part of Montana, in the Winifred field and drilling has been interrupted by considerable casing trouble.

Elkhorn—Drifting by Boston & Montana on the 300-ft. level of the Blue Jay vein is still in ore and has been exposed. This drift is being driven away from the big fault. Housing of the new mill is under way, the foundation having been completed about three weeks ago.

NEVADA

Promising Ore Reported on 375 Level of Tonopah Divide—New Vein Cut in Combination Mine at Goldfield

Tonopah—The final June clean-up of the Tonopah Belmont was 87,846 oz., valued at $96,630. Development and stoping are being done on fifteen veins of this property. The principal tonnage is being mined from the Rhyolite veins, and the Belmont, Rescue and South veins. There is more ore in sight than a year ago and development possibilities are good.

In the Tonopah Extension the work of sinking the Victor shaft from the 1,760 to the 1,880-ft. point is progressing. There is considerable water to handle but surface equipment and pumping facilities are capable of handling it. Reports indicate that developments on the Murray vein on the 1,760 level continue good and great hopes are entertained for the next level. Sinking of the McCane shaft to the 1,540 level of the Victor workings will soon be started, and connection made with them.

The last shipment for June from the West End was 50,830 oz., with a value of $55,900. Development is satisfactory with no changes of importance.

The latest bullion shipment from the Tonopah Mining Co. mill at Millers was valued at $40,000. Development for the last week totaled 163 ft. with no changes. Conditions are reported good in the Silver Top and Mizpah shaft workings.

The Rescue Eula is making regular shipments of ore. Development work on the Rescue vein is producing good results and some tonnage is being blocked out.

Divide—Very favorable reports are being circulated regarding developments in the Tonopah Divide mine on the 375 level. A drift started on a small stringer of ore on this level now shows a full face of ore of good grade, with only one wall in sight. The drift is now in about 50 ft. and all material is reported to have averaged $40 per ton for the last week. This is welcome news to stockholders and if the showing continues good will undoubtedly renew interest in the whole Divide district.

Goldfield—A new vein, in the footwall of the Combination vein, is reported to have been discovered on the 480 level of the Combination mine. The drift is in milling ore. The Goldfield Development is operating 20 stamps and expects to increase production soon. When complete the mill will have a capacity of 2,000 tons per day.

The Goldfield Deep Mines Co. expects to start sinking its projected 3,000-ft. shaft on July 16. The hoisting plant of the Goldfield Merger will be used and is now being moved to the site of the new shaft. A special meeting of the Atlanta, C. O. D., Goldfield Merger, Blue Bull, Goldfield Combination, and Milltown companies will be held in Goldfield on July 16 to ratify the combination.

Hilltop—Roy J. King, formerly with the Tonopah Belmont Development Co. but now consulting engineer for the note holders of the Kimberley Consolidated, is doing development work on the latter company's property at Hilltop, in Lander County.

Taylor—The 100-ton cyanide mill of the Wyoming Mining & Milling Co. at the old camp of Taylor, White Pine County, is running steadily and is said to be making a high extraction. There is about 30,000 tons of ore on the dumps, which was expected to go 12 oz. in silver to the ton, but the average so far is said to be nearer 17 oz. The water for the mill is piped five miles from Connors Canyon springs.

Golconda—The compressor at the Adelaide mine near Golconda has been bought by the Cortez Consolidated and will soon be installed. This will facilitate work in extending the Arctic tunnel which is being driven to get under the orebody from which the big production was made in the early days.

Cherry Creek—John Carlson, Herman Brest and Joe Carpen are sacking ore running well in gold and silver from a strike they recently made at the mouth of Silver canyon, four miles from Cherry Creek. The shaft is down 16 ft.

Hamilton — Ed. Wilson recently shipped a carload of ore sampling $125 per ton from the Great Valley mine at Hamilton, the shipment going to the smelter by way of Ely.

Osceola—Clyde Tilford and brother, who are placer mining at the old camp of Osceola, recently found some good-sized nuggets.

Gold Circle—William J. Cleary and associates, who recently closed a deal for the Esmeralda mine, have secured options on the Bamberger and Coalition mines in the northern end of the district.

So much water came from the last holes drilled in the crosscut on the 315-ft. level of the Queen mine that it was decided to plug them and await the installation of a pump before shooting and opening up the vein.

Virginia City—The south drift from the main crosscut on the 150-ft. level of the Comstock Phoenix is being advanced in ore that is said to average $30 per ton.

NEW MEXICO

Porterfield Bros. at Silver City Shipping Large Tonnage of Manganese Ore

Lordsburg—At the 85 mine the C. & A. company is down 815 ft. Work is being pushed by 21 men working in three shifts.

The Octo main shaft has reached the 300-ft. level and a station, 10 x 20 ft., will be cut. A sump, 10 x 10 x 20 ft., will also be put in. A drift to the east will be run and the shaft carried to the 400-ft. level at once.

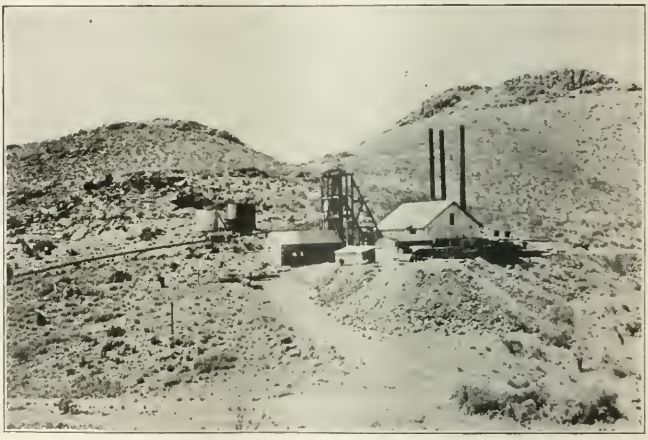
Silver City—During June Porterfield Bros. shipped from the Amory Stevens properties on Boston Hill a large tonnage of manganiferous iron ore, although they were without cars for eleven days because of the washout on the Santa Fe line near San Marcial. The Santa Fe will build a new ore-loading platform to accommodate this business.

Hachita—The Little Hatchet Mining Co. has established a camp 12 miles southwest of Hachita and will sink two shafts upon some promising copper deposits recently opened up. Head frames and hoists are being installed and a compressor will be purchased.

UTAH

North Standard Stockholders Seek To Change Control, Charging Irregularity in Administration

Park City—The Park-Utah has followed a vein of shipping ore for 450 ft. and has 150 tons ready for shipment as soon as arrangements have been completed for taking it out through the 1,500 level of the Ontario, through which the Park-Utah is working.



SURFACE PLANT OF OCTO COPPER MINE, LORDSBURG, N. M. SHAFT IS 300 FT. DEEP. LEE'S PEAK IN BACKGROUND

The Keystone, which is resuming work after the settlement of litigation with the Silver King Coalition, shipped a car of ore the week ended July 9. The Naildriver shipped two cars the same week. The Ontario is short about 50 men and more could be used at all of the mines.

Eureka—The Grand Central at Mammoth is receiving its water from wells near Diamond instead of Eureka. The water runs down from Diamond to Mammoth by gravity, and is then pumped to the mine. Regular shipments are being made of ore coming from between the 540 and 2,100-ft. levels.

At the North Standard the shaft is down 600 ft. An effort is being made to effect a change in the control of the property on the part of some of the stockholders, who accuse the present management of irregular methods of administration. The officers of the company have prepared a financial statement, and have called a meeting for

August 2. The opposition has called a meeting for July 17.

Marysvale—A four-mile paved road is proposed from Marysvale to Alunite to be built by means of county funds and contributions from the mining companies chiefly interested, in this case the Mineral Products and the Deer Trail. It is proposed that the county finance three miles of the road and the companies one mile.

WASHINGTON

Northwest Magnesite Co. Plans New Six-Mile Tramway to Keystone Deposit

Chewelah—The Northwest Magnesite Co. is planning the erection of a six-mile aerial tramway to connect the Keystone magnesite deposit with the present tram between the Finch deposit and the company's large calcining plant at Chewelah. Up to the present practically the entire production of the company has come from the Finch deposit, which has been worked intensively and the other holdings kept in reserve. The Keystone deposit is well developed and fully as large as the Finch deposit and it is evidently the plan of the company now to extend operations to the Keystone quarry.

The American Refractories Co. is employing a crew of 60 men at the Double Eagle magnesite deposit, which it now operates under lease and bond. It is burning the magnesite in shaft kilns located on the property and the finished material is shipped by auto trucks to the railroad at Valley, 13 miles distant.

CANADA

British Columbia

Trail—Ore shipments received at the Consolidated M. & S. Co.'s smelter during the week ended July 7 were as follows:

Mine Location	Gross Tons
Bluebell, Riondel	138
Crescent, Greenwood	2
Emerald, Salmo	47
Electric Point, Boundary, Wash.	135
Florence, Princess Creek	35
Josie, Rossland	172
Monarch, Field	31
Mandy, Le Pas, Man.	1006
North Star, Kimberley	216
Sally, Beaverdell	42
Company mines	7213
Total	9035

Victoria — The British Columbia department of mines has sent two reconnaissance parties into the Unuk River country, north of the better-known section of the Portland Canal district, this summer. They were organized by George Clothier, resident engineer at Prince Rupert, B. C., and will work along lines laid down by him. One of Mr. Clothier's parties on reaching the Unuk River will work in a southeasterly direction, eventually meeting the other explorers, who will go in by the Salmon River, over the divide to the Naas slope and northwesterly along the line of contact.

Word received recently by mail from Dawson, Y. T., appears to confirm the recent report of a new silver strike in the Mayo district. The latest discoveries are on the slope of Mount Hinton, opposite Keno Hill. They are about five miles from Keno Hill, where the first excitement occurred, the waters of Lightning Creek separating the two. When the news reached Mayo there was a stampede and the ground has been thoroughly staked. As to the Keno Hill properties it is stated that one company has found a rich new silver deposit near where they have been working.

A pioneer prospector writing to a prominent resident says: "I've been up Keno prospecting. I located three claims and hope to prospect for the remainder of the summer. I got in on the new stampede. It is located near the head of Lightning Creek and shows gold and galena. Everyone is away stampeding. Middlecoff Hydraulics are about closed and the men are staking. They are opening up the biggest thing yet on Keno Hill, taking the ore out of the mud, five feet wide and had it stripped over 200 ft. in length two days ago. It runs 1,000 to 2,000 oz. to the ton, and they take it down to the frost about one foot deep and there must be a big lead under. The worst drawback at present is too many stakers and too few prospectors."

Ontario

Coal Situation Worrying Operators—Lower Water Causes Power Shortage

Colbalt—The coal situation is causing serious concern to operators in Northern Ontario. The majority of the mines have contracts for coal at prices considerably below what coal is now selling at, but, so far this season, very little coal has arrived and there is a good deal of uncertainty as to whether or not this contract coal ever will arrive. Local dealers are quoting up to $18 per ton, f.o b. the cars in Cobalt, and state they cannot get much, even at that price. As it will be necessary to start the boilers for heating purposes in about three months, the necessity for some assurance of coal supply is evident.

The exceptionally low water this season is having its effect on the power company in Cobalt, and has resulted in a drop in the pressure of the air supplied. Ordinarily air is supplied at 100 lb. pressure, but recently it has dropped as low as 50 lb. To complicate the situation further the power company has had several breakdowns lately. The Kirkland Lake camp is also suffering from a shortage of power, which is supplied by the same company that furnishes power to Cobalt. The Wright-Hargraves is forced to use steam power for underground work, and the Teck-Hughes is operating at about two-thirds capacity.

Premier Drury of Ontario, speaking recently, stated that the investigation of the Department of Lands and Forests had shown the timber industry to be rotten to the core. As soon as the inquiry is finished, the mines will be investigated to see if the public has been defrauded there.

The Bailey Silver Mines, of Cobalt, will build a railway spur to the property to permit the shipment of low-grade ore to the mill. A considerable quantity has been developed, and, in addition some high-grade is being mined.

The Colonial, idle for several years, has been re-opened. The property is equipped with a small mill, but it is doubtful if this will be operated.

The Right-of-Way mine is shipping 50 tons of mill rock a day to the Northern Customs concentrator.

South Lorraine—The Keeley mine has developed a shoot of high-grade milling ore at a depth of 300 ft. The 80-ton mill is rapidly nearing completion.

Gowganda—The Bonsall property in Gowganda, now owned by Sir Clifton Sifton and George Glendenning, is being operated.

The Trethewey property in Gowganda is making another shipment of high-grade ore. Conditions at the property are very satisfactory.

Porcupine — The McIntyre fiscal year ended June 30 and, although the annual report is not ready, it is understood that production will be about $2,250,000 and net profits about $1,000,000.

Diamond drilling on the Porcupine Crown has shown ore at 1,100 ft. This is either a new vein or the faulted portion of the old vein.

The New Imperial Mines Limited is to be opened up. A permanent liquidator will be appointed July 26.

Manitoba

The Pas—The Board of Trade of The Pas, Manitoba, are planning a special trip to mining districts of northern Manitoba on Sept. 1. The party will start from Winnipeg and will probably arrive at The Pas Sept. 2, leaving there on "S. S. Nipawin" on Sept. 3 for Sturgeon Landing. From there the party will proceed by canoe and Evinrude motors to the Flin Flon and Mandy properties.

An invitation is being issued to every member of the Manitoba provincial government and it has been intimated that most of the members of the House will avail themselves of this opportunity to become familiar with the need of this mining district and particularly as the government will be called upon to vote for a new railway from The Pas to Flin Flon at the first session of the new parliament. The proposed new railway will pass through the Elbow Lake section, also through the Cranberry Lake, Copper Lake, Athapapouskow Lake, Schist Lake and Flin Flon Lake districts.

Recent discoveries in the Elbow Lake section have caused considerable interest being taken in the district and prospectors and mining men have concentrated there.

THE MARKET REPORT

Published in part in San Francisco and mailed from there to our Western subscribers as a special service without charge pending the arrival of the *Engineering and Mining Journal*

Silver and Sterling Exchange

July	Sterling Exchange	Silver			July	Sterling Exchange	Silver		
		New York, Domestic Origin	New York, Foreign Origin	London			New York, Domestic Origin	New York, Foreign Origin	London
15	387½	99½	92½	53⅜	19	384	99½	88⅜	52
16	388	99½	90½	52½	20	382	99½	89½	52¾
17	387	99½	89⅜	52	21	383	99½	94	55¼

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

On the authority of the Secretary of the Treasury, we quote 100c. per oz. for silver, 1,000 fine, delivered at the option of the Director of the Mint to the New York Assay Office or to the mints in Philadelphia, Denver, or San Francisco, and proved to the satisfaction of the Treasury Department to have been mined, smelted, and refined in the United States. This quotation is retroactive to May 13.

Daily Prices of Metals in New York

July	Copper	Tin		Lead		Zinc
	Electrolytic	99 Per Cent	Straits	N. Y.	St L.	St. L.
15	18.55@18.75	45.75	49.50@50	8.20@8.35	8.20@8.35	7.75@7 85
16	18.50@18.75	46.25	49.75@50.25	8.25@8.30	8 25@8.30	7.75@7.85
17	18.50@18.70	46.25	49.75@50.25	8.30	8.30	7.70@7 80
19	18.50@18.70	46.00	49@50	8.30	8.30	7.70@7.80
20	18.50@18.70	45.50	49.25@49.75	8.35@8.65	8.35@8.65	7.70@7.80
21	18.50@18.70	45.00	48.75@49.25	8.50	8.50	7.70@7.80

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for prompt and nearby deliveries constituting the major markets, reduced to the basis of New York, cash, except where St. Louis is the normal basing point. All prices are in cents per pound.

Copper is commonly sold on terms "delivered," which means that the seller pays the freight from refinery to buyer's destination. The delivery cost varies, and it would be confusing to figure net prices on individual transactions. Consequently, an average deduction is made from the "delivered" price. At present the average cost of delivery from New York refineries is 0.15c per lb., and that deduction is made to arrive at the New York price. When copper is sold f.o.b or f.a.s. New York, of course no deduction is made.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of spot American tin, 99 per cent grade, and spot Straits tin.

London

July	Copper			Tin		Lead		Zinc	
	Standard		Electrolytic	Spot	3 M	Spot	3 M	Spot	3 M
	Spot	3 M							
15	90⅛	92⅛	106	265⅝	271½	34	35½	41	42½
16	90	92½	106	267¾	272¾	33½	35	40¾	42¼
17	..	....	...	....	....	....	....	....	....
19	90¼	92⅝	106	268½	273	34¼	35¾	41½	43⅛
20	91⅛	93⅜	109	268½	272	34⅜	35½	41¾	43⅛
21	90⅜	93⅛	109	262½	267½	34⅜	36	41	42⅜

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York, July 21, 1920

No change of importance has taken place in the copper, tin, or zinc markets in the last week. Lead is the only active metal. Labor conditions in New England seem better, and if the Connecticut and Rhode Island wire and brass mills resume normal operation, sales of copper and zinc may pick up. Manufacturing interests in many cases are holding off to see if railroad employees will strike for wages higher than those just announced by the Railroad Labor Board.

Copper

The incipient buying movement proved of meager proportions, and the market during the last week has been dull. The large producers continue to hold for 19c., delivered, for September and October metal, and several million pounds have been sold at this figure. Smaller producers and outsiders are accepting down to 18¾c, delivered, and small lots of spot metal can be obtained at 18½c., delivered. The London price for electrolytic has advanced owing to low sterling exchange. It is now more nearly comparable to New York.

Lead

None of the large producers has a pound of lead for July or August delivery, and the scarcity of prompt metal has extended to deliveries in September. Sensing this, consumers and dealers became somewhat alarmed, and many inquiries developed at the end of last week, with several sales for September and October delivery at advancing prices. Production, both abroad and at home, is below normal, but demand continues good. With these conditions, and with the London price firm, the A. S. & R. advanced its New York contract quotation to 8½c. this morning. This augurs well for the future, and the price should increase rather than decrease during the next few months.

Spot metal sold late last week for 8.70c., St. Louis. Most of the inquiries for near-by positions are from dealers and speculators.

Conditions are very bad in Mexico again, labor strikes, dynamiting of railroads, fever epidemics, shortage of ships, and general disturbances attending the latest revolution. As a result, Mexican lead is not being received here, and about 1,200 tons has been engaged from England during the last week to make up the deficiency which will exist on contracts already made, based on the usual Mexican production.

Zinc

No change in conditions can be detected. The market has been quiet, and London seems to be pretty well liquidated. Production in Missouri continues below normal. The zinc situation is discussed on page 191.

Tin

Little business has been done, and dealers have given up guessing the market. They feel, however, that consumers will have to come in soon. The prevailing unstable condition of silver and sterling exchange has considerable effect on the price of tin. Sales of electrolytic picked up slightly, at a discount of 1⅜@2c. per lb. under Straits.

Straits tin for future delivery: July 15th, 49.50@50c.; 16th, 50@50.25c.; 17th, 49.75@50c.; 19th, 49.50@49.75c.; 20th, 49.25@49.50c.; 21st, 48.75@49.25c.

Arrivals of tin, in long tons: July 14th, Hongkong, 10; Straits, 150; 15th, Hongkong, 10; Batavia, 200; Liverpool, 65; London, 25; 16th, Straits, 100; 19th, Liverpool, 50.

Silver

The domestic demand continues limited. The general undertone, however, for the silver market has improved, and with the U. S. Government buying all

our domestic production under the Pittman Act, and with the Mexican government now buying approximately 1,000,000 oz. per month of the Mexican product for Mexican mintage, the offerings of silver are more limited.

The New York quotation for foreign silver has been depressed this last week, owing to the lower quotation from London as well as to the sharp decline in sterling exchange.

Mexican Dollars—July 15th, 69½c.; 16th, 68⅜c.; 17th, 67⅞c.; 19th, 67¼c.; 20th, 67⅞c.; 21st, 71c.

Gold

Gold in London on July 15th, 106s. 6d.; 16th, 106s. 6d.; 19th, 107s.; 20th, 107s. 9d.; 21st, 107s. 3d.

Foreign Exchange

Increased European exports during the current month, particularly of wheat, have brought an unusual number of foreign bills on to the market, which has consequently depreciated exchange rates.

Pursuant to a new custom which has been introduced, we will hereafter quote francs and lire, as well as other foreign money, in cents to the unit. On Tuesday francs were 8.19c.; lire, 5.79c.; marks, 2.54c.; and New York funds in Montreal, 13⅛ per cent premium. South American exchanges broke violently. Yesterday Argentine exchange was 90.4c., compared with 107.9c. a week ago, and Brazilian, 22.0c., compared with 23.5c last week.

Other Metals

Aluminum—Ingot, 33c. per lb., with 32c. open market for 98@99 per cent virgin.

Antimony—Market continues weak. Spot, 7½c. per lb.; Cookson's "C" grade, 14c. Chinese and Japanese brands, 7⅞c. W. C. C. brand, 9c. Chinese needle antimony, lump, firm at 9@10c. per lb. Standard powdered needle antimony (200 mesh), 10@12c. per lb.

Bismuth—$2.70 per lb., 500-lb. lots. Market quiet.

Cadmium—Nominal, $1.40@$1.50 per lb. Market dull.

Cobalt—Metal, $2.50 to $3 per lb.; black oxide, $2 per lb.

Iridium—Nominal, $350 per oz. Heavy demand, but small supplies.

Magnesium—Crude, 99 per cent or over pure, $1.75 per lb., for the metal in 100 lb. lots and over, f.o.b. Niagara Falls.

[1]**Molybdenum** Metal in rod or wire form, 99.9 per cent pure, $32@$40 per lb., according to gage.

Nickel—Ingot, 43c.; shot, 43c.; electrolytic, 45c.; Monel metal, shot, 35c.; blocks, 35c., and ingots, 38c. per lb.

Osmium—Open market, $50@$75 per troy oz.

Palladium—$80 per oz.

Platinum—Market weak at $80@$85 per oz.

Quicksilver — Market weaker; $90@$92 per 75-lb. flask. San Francisco wires $85. Firm.

Ruthenium—$200@$220 per troy oz.

[1]**Selenium**, black, powdered, amorphous, 99.5 per cent pure, $1.75@$2 per lb.

[1]**Thallium** Metal—Ingot, 99 per cent pure, $18@$20 per lb.

Metallic Ores

Bauxite—About 52 per cent alumina content, less than 2 per cent iron oxide, up to 20 per cent silica and artificially dried to contain not more than 4 per cent free moisture, $10 per gross ton at mine; 54 per cent alumina and about 15 per cent silica, $11; averaging 57 per cent alumina, 8 to 12 per cent silica, less than 3 per cent iron oxide, $13 on basis of 8 per cent free moisture. Ores of very low silica content suitable for the manufacture of aluminum oxide and hydrate of alumina command a fancy price.

Chrome Ore—Guaranteed 50 per cent Cr_2O_3 foreign ore with a minimum of 6 per cent silica, 77@85c. per unit, New York. California concentrates, 50 per cent Cr_2O_3 and upward, 60@65c. per unit, f.o.b. mines.

Iron Ores—Lake Superior ores, per ton, delivered at Lower Lake ports: Old Range bessemer, $7.45; Old Range non-bessemer, $6.70; Mesabi bessemer, $7.20; Mesabi non-bessemer, $6.55. Congestion at Lake Erie ports due to car shortage has resulted in decreased tonnage. Other ports show gain in shipments.

Manganese Ore—75@80c. per unit, 50 per cent Mn content, c.i.f. Atlantic seaport; chemical ore (MnO_2) $75@$85 per gross ton.

Molybdenum—85 per cent MoS_2, 60@85c. per lb. of contained sulphide, New York.

[1]**Tantalum Ore**, guaranteed minimum 60 per cent tantalic acid, 65@70c. per lb. in ton lots.

Titanium Ores—Ilmenite, 52 per cent TiO_2, 2c. per lb. for ore. Rutile, 95 per cent TiO_2, 15c. per lb. for ore, with concessions on large lots or running contracts.

Tungsten Ore—Scheelite, 60 per cent WO_3 and over, per unit of WO_3, $7 f.o.b. mines; wolframite, 60 per cent WO_3 and over, per unit of WO_3, $6.50@$7.50, in New York.

Uranium Ore (Carnotite)—$2.75@$3 per lb. for 96 per cent of the contained oxide (U_3O_8). Ores must contain a minimum of 2 per cent U_3O_8.

Vanadium Ore—$1.25 per lb. of V_2O_5 (guaranteed minimum of 11 per cent V_2O_5), New York.

Zircon—Washed, iron free, 10c. per lb. Zirkite—$90@$100 per ton, carload lots. Pure white oxide, 99 per cent, is quoted at $1.15 per lb. in ton lots.

Zinc and Lead Ore Markets

Joplin, Mo., July 17—Zinc blende, per ton, high, $51.40; basis 60 per cent zinc, premium, $48.50; Prime Western, $47.50; fines and slimes, $45@$42.50; calamine, basis 40 per cent zinc, $35. Average settling prices: Blende, $42.98; calamine, $34.46; all zinc ores, $42.94.

Lead, high, $98.50; basis 80 per cent lead, $90@$92.50; average settling price, all grades of lead, $96.33 per ton.

Shipments for the week: Blende, 8,682; calamine, 150; lead, 1,454 tons. Value, all ores the week, $521,450.

Blende was freely negotiated today on $47.50 basis, with several buyers holding back until noon on $45 basis offerings. Lead ore was advanced $2.50 per ton today.

By not operating night shifts the production is lessened to the demand, and with no ore for sale on $45 basis buyers compromised the demand of sellers for $50 basis, and the sellers let it go.

Platteville, Wis., July 17—Blende, basis 60 per cent zinc, $51 to $52 base for high grade. Lead ore, basis 80 per cent lead, $90 per ton. Shipments for the week: Blende, 1,229; calamine, none; lead, 130; sulphur ore, 110 tons. Shipments for the year: Blende, 38,909; calamine, 2,240; lead, 3,494; sulphur ore, 1,098 tons. Shipped during the week to separating plants, 2,016 tons blende.

Non-Metallic Minerals

Asbestos — Crude, No. 1, $1,800@$2,500; No. 2, $1,100@$1,500; spinning fibres, $400@$700; magnesia and compressed sheet fibres, $300@$400; shingle stock, $100@$150; paper stock, $60@$80; cement stock, $17.50@$30; floats, $8.50@$15, all per short ton, f.o.b. Thetford, Broughton, and Black Lake mines, Quebec, Canada; 5 per cent to be added as Canadian royalty export sales tax. Freight rate from mines to Sherbrooke, Quebec, over Quebec Central R.R., 20c. per cwt.; from Sherbrooke to New York, 27½c., carload lots; freight to New York for crude No. 1, f.o.b. Thetford mines, $8.45 per ton, carload lots.

Barytes — Crude, 88 to 94 per cent barium content, $10@$12 per net ton; ground (white) $22@$25 in bags, carload lots; (off-color) $18@$20 in bags, carload lots; all f.o.b. Kings Creek, S. C. Crude, 88 to 94 per cent, $12 per gross ton; ground (white) $23@$25; ground (off color) $16@$19 per net ton, f.o.b. Cartersville, Ga. Crude, 88 to 94 per cent, $23; ground (white) $40.50; ground (off color) $27 per net ton, less than carload lots, f.o.b. New York. Crude, not less than 98 per cent, $10@$11.25 per ton, f.o.b. cars, Missouri; floated, $28 per ton in bbls.; $26.50 per ton in 100-lb. bags; extra charge for bags, f.o.b. St. Louis.

Chalk—Domestic, extra light, 7c. per lb.; light, 4½@5c.; heavy, 4@5c.; English, extra light, 7@7½c.; light, 5½@6c.; dense, 4½@5c. per lb., all f.o.b. New York.

China Clay (Kaolin) — Crude, $9@$12; washed, $12@$15; powdered, $18@$22; bags extra, per net ton, f.o.b. mines, Georgia crude, $8@$12; ground, $15@$40, f.o.b. Virginia points. Domestic lump, $10@$20; powdered, $25@

[1] Furnished by Foote Mineral Co., Philadelphia, Pa.

$30; imported lump, $25@$35; powdered, $30@$60, f.o.b. New York.

Feldspar—Crude, $7.50@$8 per gross ton, f.o.b. Maryland and North Carolina points; $7.50@$10 f.o.b. Maine; ground, $22@$30, car lots, f.o.b. Baltimore; ground, $22@$30, f.o.b. North Carolina points; $17@$20 per ton, No. 1 ground, f.o.b. New York State; $21@$23 per ton, ground, f.o.b. Maine.

Fluorspar — Gravel, guaranteed 85 per cent calcium fluoride and not over 6 per cent silica, $25 per ton, f.o.b. Kentucky and Illinois mines; ground, suitable for acid, chemical or enameling purposes, $60; lump, $17.50, f.o.b. Tonuco, N. M.

Graphite—Crucible flake, 85 per cent carbon content, 8c. per lb.; 88 per cent, 9½c.; 90 per cent, 10½c., all f.o.b. New York. Crucible grades of Alabama graphite sell as follows, f.o.b. Ashland, Ala.: 80 per cent, 5c.; 90 per cent, 10c. Good demand for lubricating grades at 20c. upward, in less than car lots. Stove polish grades (25 to 30 per cent carbon), 1c., in car lots. Facing grades (45 to 50 per cent carbon), strong at 2@2½c. per lb. Mexican, amorphous, $45 @$55 per short ton; Korean, 3½c. per lb.; Madagascar, 8c.; Ceylon, 4¾@15½c.

Gypsum—Raw crushed rock, $3.50@ $4 per ton; raw ground fine, $4@$4.50; calcined stucco, $9, all f.o.b. works. Containers extra. Wholesale, plaster of paris, carload lots, $3.75 per 250-lb. bbl., alongside dock, New York.

Kaolin—See China Clay.

Limestone—Dolomite, 1@2 man size, $1.60@$1.65; 2@8 in., $1.55@$1.65 per net ton, f.o.b. Plymouth Meeting, Pa.; fluxing, $1.65@$1.75 per net ton, f.o.b. Howellville, Pa.

Magnesite, Calcined — High-grade caustic calcined, lump form, $35@$40 per ton, carload lots, f.o.b. California points. Freshly ground calcined, suitable for flooring trade, $65@$75 per ton, f.o.b. Eastern points.

Dead-Burned — $32.50 per net ton, Chewelah, Wash.; $50@$60, Chester, Pa. (Magnesite brick — See Refractories.)

Mica—Imported block mica slightly stained, per lb.: No. 6, 50c.; No. 5, $1.20 @$1.40; No. 4, $2@$3; No. 3, $4.25@ $5; No. 2, $5.50@$7; No. 1, $8. Clear block: No. 6, 55c.; No. 5, $2; No. 4, $4; No. 3, $5.75; No. 2, $7; No. 1, $9; A1, $14; extra large, $25, all f.o.b. New York; ground, $85@$100 per ton, Philadelphia.

Monazite — Minimum of 6 per cent thorium oxide, $42 per unit, duty paid.

Phosphate Rock—Per long ton, Florida ports: 77 per cent tricalcium phosphate, $13; 75 per cent, $11.50; 75@74 per cent, $11; 70 per cent, $8.35; 68 per cent, $7.85; 68@66 per cent, $7.60. There is no price schedule for spot for domestic uses.

Pumice Stone—Imported, lump, 4@ 50c. per lb.; domestic lump, 6c.; ground, 4@7c., all f.o.b. New York.

Pyrites—Spanish, fines, per unit 12c., c.i.f. Atlantic seaport; furnace size, 16½c.; run of mine, 12@14c.; domestic, fines, f.o.b. mines, 12@14c.

Quartz—(Acid tower) fist to head, $10; 1¼ to 2 in., $14; rice, $17, all net ton, f.o.b. Baltimore; lump, carload lots, $5@$7.50 net ton, f.o.b. North Carolina mines. F.o.b. Wausau, Wis., the price is $16 per ton in car lots, and $20 in less quantities, including bags.

Sulphur—$18 per ton for domestic; $20 for export, f.o.b. Texas and Louisiana mines.

Talc—Paper making, $9.50@$14 per ton; roofing grades, $8.50@$9; rubber grades, $9@$15, all f.o.b. Vermont. California talc, $20@$35, talcum powder grade. Southern talc, powdered, carload lots, $12 per ton; less than carload, $15, f.o.b. cars; freight to New York $5.25 per ton, carload lots; less than carload lots, $9.25. Imported, $60 @$70; Canadian, $10@$20 per ton.

Mineral Products

Arsenic—White arsenic, 15½c. per lb.; sulphide, powdered, 20@21c. per lb., f.o.b. works, carload lots.

Nitrate—Soda, $3.85 per cwt., ex vessel, Atlantic ports. Market quiet.

Potassium Sulphate—Domestic, $2.25 @$2.50 per net ton, basis 90 per cent, f.o.b. New York.

Ferro Alloys

Ferrocarbontitanium—For 15-18 per cent material, $200@$250 per ton, f.o.b. Niagara Falls, N. Y.

[1]Ferrocerium—Per lb., $12@$15. Foreign conditions as affecting the price of American goods remain unchanged.

Ferrochrome—Carload lots, spot and contract, 60 to 70 per cent chromium, 6 to 8 per cent carbon, 17@18c. per lb. of chromium contained; 4 to 6 per cent carbon, 19@20c. f.o.b. works.

Ferromanganese—For 76@80 per cent, $225, freight allowed; Spiegeleisen, 18 to 22 per cent, $75, f.o.b. furnace.

Ferromolybdenum—Standard grades, carrying from 50 to 60 per cent molybdenum metal, with low sulphur, phosphorus, and arsenic, $2.50@$3 per lb. of contained metal, f.o.b. works.

Ferrosilicon—For 10 to 15 per cent, per gross ton, f.o.b. works, $60@$65; 50 per cent, $78@$85; 75 per cent, $150 @$160.

Ferrotungsten—70 to 80 per cent W, 85c.@$1 per lb. of contained tungsten, f.o.b. works.

Ferro-uranium—35-50 per cent U, $7 per lb. of U contained, f.o.b. works.

Ferrovanadium—Basis 30-40 per cent, $6.50@$8.25 per lb. of V contained, f.o.b. works.

Metal Products

Copper Sheets—No change in Jan. 7 price of 29½c. per lb.; wire, quoted 22½c.

Lead Sheets—Full lead sheets, 12½c.; cut lead sheets, 12½c. in quantity, mill lots.

[1]Furnished by Foote Mineral Co., Philadelphia, Pa.

Nickel Silver—Unchanged at 39½c. per lb. for 18 per cent nickel.

Yellow Metal — Dimension sheets, 26¾c.; sheathing, 25¾c.; rods, ⅜ to 3 in., 23¾c.

Zinc Sheets—$12.50 per 100 lb., less 8 per cent on carload lots, f.o.b. smelter; zinc plates, 12c. per lb.

Refractories

Bauxite Brick—56 per cent alumina, $145 per 1,000, f.o.b. Pittsburgh.

Chrome Brick—$85@$90 per net ton, carload lots, eastern shipping points.

Chrome Cement—45 to 50 per cent Cr_2O_3, $50 per net ton, and $55 in sacks, carload lots, eastern shipping points.

Clay Brick — First-quality fire clay, 9-in. shapes, $45@$53 per thousand, Pennsylvania, Ohio, and Kentucky works; second quality, $40. First quality, St. Louis, $45; New Jersey, $75.

Magnesite Brick—$90@$100 per ton, eastern shipping points; 9-in. straights, $90@$100; 9-in. arches, wedges and keys, $95@$105; soaps and splits, $110 @$120.

Silica Brick—Nine in. and 9-in. sizes, per 1,000, $51@$55, Birmingham, Ala.; $50@$55, Mount Union, Pa.; $55, Chicago district.

Iron Trade Review

Pittsburgh, July 20, 1920

Transportation affecting the shipment of pig iron and steel products has continued to grow worse, in general, although there may have been some improvement in spots. The worst conditions were in the latter part of April. In May and perhaps the first week or two of June there was improvement, conditions growing worse since then. Largely at the instance of the steel mills and blast furnaces, the Interstate Commerce Commission has defined a coal car, for interpretation of Service Order No. 7, giving car priority to coal mines, as excluding flat-bottom gondolas under 36 in. high, inside measurement, and this will help the iron and steel industry somewhat, as some roads were calling coal cars any gondolas over 30 in.

Pig Iron—Sales of several thousand tons each of bessemer and basic have been made, for early shipment, at $46, Valley, or $1 advance, foundry remaining quotable at $45, Valley, with $1.40 freight to Pittsburgh. Late deliveries do not interest buyers at any price. The question before the market is whether a buying movement or a selling movement will come first.

Steel—Mills show more readiness to sell semi-finished steel, presumably on account of their accumulations. Billets are still quotable at $60@$65, but are easier at that range. Sheet bars can be had at $70, against $75 formerly quoted.

Charcoal and Coke

Charcoal—Willow, 7c. per lb. in bbls.; hardwood, 4½c. per lb., in 250-lb. bbls.

Connellsville — Furnace, $17@$18; foundry, $18@$18.50.

The Unsatisfactory Zinc Situation

Metal Has Recovered Slightly From Recent Drop, Production Generally Being Maintained — Foreign Business Decreasing, According to Recent Figures — Belgium Making Rapid Recuperative Progress — Future Outlook Not Very Bright

THE middle of June witnessed the lowest zinc quotation of the year, 7.30c. per lb., St. Louis. Quotations since then have gradually risen, and a month later a price of 7.85c. had been reached—a gain of over half a cent in the interval. Nevertheless, the price of zinc is far from satisfactory, and is generally below the cost of production for all but the most-favored operators. It is not likely that the serious problem presented by this condition can be met by shutting down operations, although the zinc mines in the Middle West could close with less trouble than larger Western mines.

Production Increased

Curiously enough, the low price of zinc has had little detrimental effect on production. Instead of a decreased output, as might be expected, production in the Joplin, Mo., district has actually increased. Shipments of zinc concentrates were 64,150 tons greater for the first half of 1920 than for the corresponding period in 1919, demonstrating that the productive power of the district was not diminished by any difficulty with labor or the high cost of supplies.

One of the main reasons given for maintaining production in the face of adverse conditions is the peculiar short-time leasing system in vogue in the Middle Western zinc and lead mining districts, whereby short-term leases on mineral-bearing Indian land necessitate quick development and ore extraction before the expiration of the lease. Naturally, an operator will not feel himself justified in abandoning operations which have entailed considerable expense in development, especially when no assurance is given that the lease will be renewed. Hence extraction occurs in feverish haste before the lease expires.

Those companies with large developed ore reserves which face the possibility of losing their land in the next two or three years will necessarily make every effort to secure the greatest possible return in the shortest possible time. Owing to this condition, any reduction in output except by arbitrary and concerted action by all the operators is not to be expected. Recently, voluntary action on the part of the Joplin operators resulted in a fortnight's respite from the recent heavy production. It is noticeable that, concurrently with this step on the part of the producers, the price of zinc stiffened, advancing slightly, but not sufficiently to warrant much optimism.

Another reason that production has been maintained or increased is the large demand for zinc in paint manufacture, in lithopone, and in the manufacture of zinc oxide for the rubber-tire industry.

At the same time that production has been increasing—with occasional relapses—there is little indication that domestic consumption of the metal itself is being accelerated, owing, no doubt, to the still serious railroad and coal troubles, which have also been such a detriment to prosperity in the copper and lead industries.

Foreign Business Diminishing

Export business has fallen off. For the month of April the exports of zinc amounted to 32,982,956 lb. and imports to 7,011,322 lb., leaving a net balance for the month of 25,971,634 lb., but in May the favorable balance dropped appreciably, as exports were only 19,610,210 lb., the imports being 4,046,418 lb., giving a net favorable balance of 15,565,791 lb. For the four months, February, March, April and May the favorable balance of exports has been gradually dwindling. Although this situation cannot be viewed with satisfaction, it must be accepted as a logical tendency, as the United States in normal times is accustomed to take care of its own production of zinc, consumption and production nearly equaling each other, the foreign demand being met mainly through foreign resources.

MOVEMENTS OF ZINC TO AND FROM THE UNITED STATES
(In Pounds)

Exports		
To	April	May
United Kingdom	18,373,026	13,896,975
France	11,159,962	2,548,674
Japan	168,059	511,617
Canada	68,052	92,686
Italy		850,757
Argentina		361,273
Belgium		470,400
Others	131,732	877,828
Totals (pigs, slabs)	29,900,771	19,610,210
Rolled zinc	3,082,185	
Imports		
From	April	May
Mexico	4,510,839	2,653,621
Canada	34,935	124,707
Chile		1,264,299
Others	2,447,280	
Totals (from ores)	6,993,054	4,042,627
Miscellaneous	18,268	3,791

It is worth noting that the lower price of zinc in London is not conducive to betterment in the falling export business, as European requirements can be more cheaply filled in London. Fortunately for the zinc producer, his business is not so dependent upon foreign orders as is that of the copper producer.

The following table, compiled from figures of the U. S. Geological Survey, indicates what the apparent consumption of zinc has been in the United States, compared with the production and the total available supplies for the last nine years:

U. S. ZINC PRODUCTION AND CONSUMPTION
(In Tons)

	United States Production Primary Zinc	Apparent United States Consumption	Total Available Zinc
1910-1913 (Average)	310,298	290,413	327,255
1914	353,049	299,983	394,588
1915	489,519	364,855	510,518
1916	668,343	459,317	683,280
1917	669,573	413,643	687,428
1918	517,927	423,792	571,683
1919	465,743	323,964	507,054

The extraordinary conditions arising out of the war created an unusually large demand for United States zinc; hence the big discrepancy between consumption and production during the war years. The fact that some sources of zinc are still unavailable to Europe—notably Australian zinc—would be a boon for America were it not for the temporarily satiated European requirements and the stagnation in the market there. Some dispatches indicate that this condition will prevail for the next six months, which presents not a very bright prospect for the zinc business.

Belgian and Australian Labor Compared

The attitude of labor in the world's zinc industry is strikingly contrasted by conditions in Australia and those in Belgium. The little European nation is exhibiting remarkable recuperative powers, and no small measure of the credit for this turn of affairs is due to the willingness of labor to co-operate eagerly and assume its share of responsibility in placing the Belgian zinc industry upon its feet again. The Australian situation is a sorry spectacle by comparison. The Broken Hill strike, which has caused millions of dollars' loss to capital and labor, seems no nearer settlement. Lately a round-table conference has been in session to help adjust matters, and the opinion is gaining that nationalization of the mines or operation by labor would not result in the benefits fancied. Last year Belgium is estimated to have produced 18,000 tons of zinc, and during the first four months of this year to have produced the metal at the rate of 80,000 tons per annum. This is a rapid advance considering that the pre-war produc-

tion was about 200,000 tons yearly. Increased Belgian output will have a tendency to offset the declining British production.

With the low price of zinc, the English smelters are having their troubles, and there is talk of governmental assistance to help them out of their difficulties. No satisfactory solution to the labor problem has been found, and the large smelter at Avonmouth, in which the government is interested, and which is expected to handle Australian concentrates formerly sent to Germany and Belgium, is neither operating nor exhibits any likelihood of being operated for some time. Germany is finding herself able to export an appreciable tonnage of zinc and has lifted the export ban to enable the traffic to proceed.

From Norway comes the news that the new electrolytic zinc refinery at Glamfjord which has been under construction will soon begin to operate. This will be the first refinery of its kind in Norway. In Tasmania the electrolytic zinc refinery at Risdon is considering increasing the output of electrolytic zinc from 100 tons to 140 tons per week. It is significant that electrolytic zinc and some special brands have been maintaining a higher price differential than is normal. Prime Western brands are not in their customary favor.

The Future of Zinc

What the future of zinc will be is difficult to prophesy. An optimistic view would be that the metal bottomed in June, and that it is in for betterment, but there are so many vicissitudes to the market, and so many adverse factors which must be overcome against the general economic trend to lower prices, that substantial improvement would appear to be a slow process.

The price of lead is still higher than that of zinc, and whether the return to a normal ratio will progress through a lowering of the lead price or an advance in zinc cannot be foretold. The London market bids fair to remain below the United States market for several months, and this condition alone would tend to prevent material improvement in the quotations. There is the question, of course, as to whether the London price will try to reach the United States quotation, or vice versa. In the meantime, commendable and successful attempts are being made in the United States to educate the people to new uses for zinc, and so to create a wider domestic consumption.

Copper Production in Norway

The copper deposits of Norway are similar to those of Spain, and are chiefly massive cupriferous pyrite. Their value lies not only in the copper content of the mineral but also in the iron, nickel, and sulphur contained. The latter element is frequently of more importance than the copper, owing to its application in the manufacture of sulphuric acid.

Recent figures on the copper production of Norway are not easy to obtain. Consul General Marion Letcher, at Christiania, reports that the raw copper produced in Norway from non-pyritic ores and from nickel-copper ores in 1916 and 1917 was as follows:

Smelter	1916, Pounds	1917, Pounds
Christiansand Nickel Refinery	1,221,382	758,755
Roros Copper Refinery	531,314	901,690
Sulitjelma Works	1,333,102	2,092,090
A/S Birtavarre Grüber	473,531	238,015

The production of copper ore in 1916 is given as 19,398 short tons, and in 1917, as 43,318 tons.

The production of copper pyrites for the years 1916 and 1917 was 325,571 and 362,323 short tons, respectively.

Norwegian Potash Manufacture

A local Norwegian paper calls attention to the fact that the Dalen portland cement factory expects soon to begin the manufacture of potash. This factory is situated at Dalen, near Brevik, in Norway. It was established in 1916, and is capitalized at 3,200,000 crowns ($857,600).

Movements of Metals and Ores

Imports and exports of the more important metals and ores, as reported by the Department of Commerce for May, 1919, and the figures for May, 1920, as finally revised, are as follows:

IMPORTS MAY, 1919, AND MAY, 1920

(In pounds, unless otherwise stated)

	May, 1919	May, 1920
Antimony ore, contents	58,880	26,625
Antimony matte, regulus or metal	526,400	2,296,000
Copper:		
Ore, contents	3,159,699	5,449,040
Concentrates, contents	1,870,957	4,720,868
Matte, regulus, etc., contents	2,915,904	437,463
Imported from (in part):		
Canada	2,342,065	2,277,313
Mexico	4,537,982	2,778,787
Cuba	793,632	1,453,742
Chile	None	1,469,999
Peru	94,781	539,129
Unrefined, black, blister, etc	15,997,164	23,920,357
Refined, in bars, plates, etc	853,436	18,580,986
Old, etc., for remanufacture	14,995	665,121
Composition metal, copper chief value	None	87,076
Lead:		
Ore, contents	2,565,390	5,623,742
Bullion, contents	6,683,731	3,258,425
Imported from (in part):		
Canada	801,786	202,880
Mexico	6,940,331	8,413,133
Chile	1,507,004	91,336
Pigs, bars and old	5,440	3,170,707
Manganese ore, long tons	19,644	56,586
Imported from (in part):		
Cuba, long tons	195	118
Brazil, long tons	12,212	30,100
British India, long tons	None	14,300
Tungsten ore, long tons	285	96
Pyrites, long tons	33,263	25,329
Imported from:		
Spain, long tons	29,951	17,629
Canada, long tons	420	7,700
Tin ore, long tons	2	3,120
Tin bars, blocks, pigs, etc	449,064	9,102,341
Imported from (in part):		
Straits Settlements	224,870	4,286,663
Dutch East Indies	None	187,043
United Kingdom	224,000	3,065,287
Australia	None	236,241
Hongkong	None	973,011
Zinc:		
Ore, contents	584,619	4,042,627
Imported from:		
Canada	77,000	124,707
Mexico	507,619	2,653,621
Blocks or pigs, and old	66,898	None

EXPORTS OF COPPER, LEAD AND ZINC

(In pounds)

	May, 1919	May, 1920
Copper:		
Ore, contents	161,500	None
Concentrates, contents	None	None
Unrefined, black, blister, etc	None	111,880
Refined, in ingots, bars, etc	18,686,929	72,107,577
Exported to (in part):		
France	None	17,803,625
Italy	1,368,267	81,364
United Kingdom	10,053,311	14,810,044
Canada	1,854,518	3,877,894
Japan	1,120,000	9,184,000
Germany	None	7,055,336
Sweden	1,456,112	6,458,806
Switzerland	1,925,482	336,087
Composition metal, copper chief value	20,900	61,524
Old and scrap	45,583	13,698
Pipes and tubes	433,908	364,719
Plates and sheets	856,089	4,883,671
Wire, except insulated	3,971,415	5,248,746
Lead:		
Pigs, bars, etc.:		
Produced from domestic ore	370,883	364,086
Produced from foreign ore	1,905,041	4,785,752
Exported to (in part):		
Canada	369,651	62,674
United Kingdom	1,568,146	1,021,144
Argentina	11,212	448,000

Great Fall in Metal Prices in Germany

From Our Vienna Correspondent.

Dated June 24, 1920.

The trade crisis in metals has become still more acute in Germany. As a result of their high value and the quantity imported for industrial purposes, metals are at present the most important subjects in the list of German imports. The copper consumption has fallen to about one-half of that needed in the pre-war period, as the result of labor difficulties, lack of fuel coal and the prevailing trade crisis, but as a result of the increase in prices its value has increased almost fourfold. The value of the present copper import of Germany may be safely placed at tenfold that of the pre-war importation. The general fall in prices will bring about further weakening in metal prices, and only the most necessary needs will be covered.

The effect of exchange naturally is most noticeable in the drop of the Berlin quotations as they fell from their maximum of 4,700 marks per metric ton in February to 1,609 marks at the end of May, that is, a drop of almost 65 per cent. Since then they have recovered to the level of 1918 marks.

In zinc, German trade is quiet; only small quantities exchange hands. Since the maximum of March it fell 68 per cent, or from 1,675 marks to 525-550 per hundred kilos, and has since risen to about 600 marks.

Tin prices have been subject to great variations. The domestic price for Germany, at 5,100 and 5,200 marks, still stands considerably above the London par, and at the end of January tin had reached a level of 16,000 marks per hundred kilos, indicating a decrease of 71 per cent.

German prices of lead have generally stood below the international market price since January and particularly below the New York quotations. From the maximum price of 1,800 marks, which was reached at the end of February, it dropped to 500 marks in June, a fall of 80 per cent.

The world's market price for silver has been higher than the German domestic price. The German quotation for aluminum has been more than counterbalanced by the fall in exchange rates, so that in Germany it has fallen by one-half since February. The Eisenwirtschaftsbund, in consideration of a cheapening in comparison with foreign ores and as a result of the rise in the value of the mark, have reduced prices per ton (1,000 kg.) as follows: Hematite by 200 marks, down to 2,150 marks; steel of low copper content, by 200 marks, to 2,140 marks; foundry pig iron No. 2, by 50 marks, to 1,740 marks; foundry pig iron No. 3, by 50 marks, to 1,739 marks; ferromanganese, 50 per cent, by 570 marks; ferrosilicon, 10 per cent, by 200 marks; tempered pig iron, by 182 marks.

The general market situation and particularly the reduction in prices of other products also has resulted in an oversupply.

Spain's Metal Production

The latest authoritative figures available regarding the metal production of Spain are those for the year 1918, published by the "Chambre Syndicale Francaise des Mines Metalliques." A table summarizing the production in metric tons follows:

Metal	1916	1917	1918
Iron and steel	322,931	470,242	303,206
Copper	32,880	38,526	45,104
Zinc	8,523	10,155	15,900
Lead	147,407	172,909	169,709
Mercury	795	827	567
Silver (kilograms)	110,521	114,312	98,988

A comparative table of exports of metals from Spain follows:

	1917	1918
Iron and steel	32,848	29
Copper	30,660	20,492
Zinc		3,828
Mercury	650	705
Lead, pig	133,460	127,120
Argentiferous lead	21,219	16,110
Silver (kilograms)	62,408	47,951
Gold (kilograms)	11	55

With but two exceptions, the exports materially decreased during the last war year.

COMPANY REPORTS

Oroville Dredging Co., Ltd.

Gold; Colombia

The annual report of the Oroville Dredging Co., Ltd., a British corporation, for the fiscal year ending Sept. 30, 1919, states that the American Oroville Co.—the original operating company—having gone into liquidation, and dredging in the properties having ceased through exhaustion of the gravel reserves, the receipts from the liquidation of the company, amounting to £36,181 14s. 6d., are written off the valuation of the 686,531 shares of $5 each, reducing it to £650,349 5s. 6d.

There are held in the Nechi Mines (Colombia), Ltd., 125,993 ordinary shares of 10s. each and in the Pato Mines (Colombia), Ltd., 73,918⅝ shares of £1 each, fully paid. During the year under review dividends were received from the company's holdings in Nechi Mines (Colombia), Ltd., amounting to £59,846 13s. 6d., and in Pato Mines (Colombia), Ltd., £11,087 15s. 6d. Including other fees, and after debiting all charges in London, the balance to credit of profit and loss account for the year is £69,653 14s. 8d. Four quarterly dividends of 6d per share were paid during the year, and totaled £68,653 16s. 0d. A balance of £25,367 7s. 5d. remained to the credit of profit and loss account on Sept. 30, 1919.

During the year, 1,379,331 cu.yd. were dredged by the Pato company, compared with 1,345,215 for the previous year, the gross value of the gold recovered being $489,953 (average 35.5c. per cu.yd.), with an average depth of gravel dredged of 31.4 ft., against $266,062 (average 20c. per cu.yd.), for the previous year, with an average depth of 33.2 ft. The field cost for the year was 8.77c. per cu.yd., compared with 11.16c. for the previous year. The yield was 27.3 per cent greater than the prospecting estimate for the area dredged.

The London accounts of the Pato company show a profit of £29,723 19s. 3d. after providing for £26,206 1s. 10d. depreciation. The credit to profit and loss at Sept. 30, 1919, amounted to £195,475 1s. 5d.

There were dredged in the Nechi company's property 1,042,464 cu.yd. for the last nine months of the fiscal year, the gross value of the gold recovered being $450,763, averaging 43c. per cu.yd., with an average depth of gravel dredged of 46.3 ft. The field cost was 7.75c. per cu.yd. The London accounts of the Nechi company show a net profit for the year of £61,994 19s. 8d.

Chile Copper Co.

Copper; Chile

The thirteenth quarterly report of the Chile Copper Co. covering operations for the first quarter of 1920, indicates a production of 25,390,987 lb. of copper, compared with 22,916,710 lb. during the fourth quarter of 1919. There was sold 32,704,110 lb. of copper during the first quarter of 1920, or almost twice as much as in the previous quarter (16,466,812 lb.).

The financial outcome of the Chile Copper Co. and the Chile Exploration Co. combined (earnings being based upon copper actually sold and delivered) shows the following comparison:

	Quarter [illegible]	Quarter [illegible]
Net profit on copper delivered after deducting depreciation	$1,84[illegible]	$500,[illegible]27
Miscellaneous income	58,[illegible]0	423,[illegible]7 07
Interest on cash [illegible] bank balances of Chile Copper Co	147,7[illegible]2	[illegible] 444 56
Total	$2,036,09[illegible]88	$223,200,[illegible]
Amortized [illegible] year 6 per cent convertible bonds	$3,[illegible]0	$[illegible]0
Accrued bond [illegible] Chile Copper Co	788,490 35	785,858 00
Expenses of [illegible] Co	1,555 22	701 20
Balance undistributed profits, both companies	$1,243,036 31	$ 590,916 38

Old Loss.

Human Engineering in Mining

WE DO NOT KNOW who invented the term "Human Engineering," but it was a happy phrase, and has been used a good deal during the last year. It is, indeed, the same as welfare work, and all welfare work is human engineering, but the latter phrase puts the science on the square man-to-man basis where it really belongs.

It pays the employer to look after the working conditions of the employee; it pays the mining company to study and improve underground conditions. Bad ventilation, for example, is expensive: men often cannot work a full shift, and can do only half the usual work, if the air is bad. Properly heated and equipped changehouses and shower baths are as much the business of the good mine manager as taking care of his powder and other supplies.

Proceeding further, progressive companies find that it is not enough to take care of the miner or millman when he is working, if he is not well situated during the sixteen hours of the day that he is not on the job. He must live in sanitary conditions, have a contented mind, eat well and sleep well, and have healthful recreation; otherwise his wage is likely to turn out a poor investment to the company. Eternally unsatisfied and restless, he wanders from job to job, seeking contentment—a tramp miner.

It is, therefore, the soundest of business principles for employers to consider their employees' welfare, not only as regards wage but also as to the far more important living conditions for which the employee gives up his wage. Unless there are perquisites of good surroundings, the wage in itself is generally insufficient pay, no matter how high it runs in dollars. Miners on the Mother Lode in California usually work for a less wage than other precious-metal miners, because they can have a permanent pleasant home and garden, and education and social standing for their children; and miners on the desert and in the mountain tops must be paid higher, so that they can save and move on, if the homing instinct cannot be properly satisfied.

No corporation whose stock is held wisely has the right to do anything with its funds that is not strictly good business, and helping toward profits, unless (which is unlikely) by a special vote of the stockholders. A mine or a corporation is a business enterprise; the charity, if there is to be any, is the affair of the stockholders after dividends are disbursed. Therefore, miners owe no servile gratitude to mining companies for any and all money expended for their welfare: it is a business proposition, and no thanks are in order on either side; but each side (employee and employer) owes the other the respect of man for man—the respect that one square, able man, doing his share of the common job and a little more for good measure, owes the other. It makes toward a sound partnership, in which each side helps himself and the other.

Americans are by theory and by nature independent; and are apt to style extensive projects for the common welfare, in which the individual has small part, as paternalism, and therefore weakening. This is a false conception as applied to work like that which has been done by the Steel Corporation, the Homestake Mine, the Chile Copper Co., the Ajo company in Arizona, and the Wallaroo & Moonta in Australia—it is not paternalism, but robust common sense and healthy self-interest. And in no other way can these steps toward good living be accomplished than by large capital expended for the well-being of all.

In cities without water works and sewerage, the individual cannot help himself, no matter how able: the city treasury, or, as often, some adventuring outside corporation, must supply the funds to bring him the larger comforts and safeguards. In towns given up entirely to mining, such as those clustering around some of the colossal mines which the economic development of the times has brought into being, there is no force strong enough to put in public works but the mining companies themselves. Part of their job, and their responsibility—for the conservation of the humanity which has drifted under their strong influence is part of their duty to the commonwealth—is to do what should be done, in the way of houses, sanitation, streets, parks, schools, churches, education, and amusement. If they do not do it, nobody will; and both they and the employees will be so much the worse off.

True everywhere, this is especially true of countries less advanced than the United States, where American or British enterprises are pioneering. Their economic penetration can be made the most effective human uplift that can be devised. A recent writer advocated the United States sending an army of teachers into Mexico to solve the Mexican problem. It has been the special genius of American political administration of less fortunate countries to advance the native development and prosperity in a way that no other country has attained. American and British mining companies have not always done what they could or should do in this respect. It is true, for example, that they have not done much in Mexico; and they should look into this at once, and follow their own advanced example, as set forth in developments like those described in this issue. Nor have the great companies in the United States always accomplished enough in this regard. A mining engineer from Australia told us recently that he found conditions especially unsatisfactory in Bingham Canyon. We have not seen Bingham Canyon, and we cite this with hesitation. If we are wrong, we want to be corrected. But there are many properties that we have seen where improvement is in order.

The Reputation of the Colorado School of Mines

THE administration of the Colorado School of Mines, at Golden, has, it appears, been under investigation since November, 1918, by the American Association of University Professors, through the Committee of Academic Freedom; and after rigid investigation and deliberation that committee has made public its report. The committee's report is signed by M. J. Libby, chairman; Herbert S. Hadley, ex-Governor of Missouri; J. M. Coulter, H. O. Hofman, and A. A. Porter. Those who are not familiar with academic circles will at least recognize the name of ex-Governor Hadley, who was put forward as a Progressive candidate for president at the Republican Convention of 1912, and, who, if Roosevelt (as was hoped) had indorsed him instead of bolting the party, would doubtless have been elected President of the United States.

The report of the committee is as blunt and unvarnished as could be desired. There is, at least, no doubt as to the verdict. It is frankly condemnatory of the School of Mines administration, particularly of the president, Victor C. Alderson, and the controlling element of the board of trustees.

The committee charges that President Alderson lowered the standards of scholarship "by compelling members of the faculty to change grades of students, especially those with influential relatives," and that in this and other ways he "repeatedly violated the essential principles of sound educational administration and of professional ethics."

The principal charges on which the committee's investigation was undertaken were made by former professors of the school; and the committee now sustains their charges. Various former professors swore that "Alderson arbitrarily raised the grades of some men," and that he "dominated and coerced individual members of the faculty as a whole in the matter of grades." One professor testified that "President Alderson insisted on seeing all quiz papers before they were returned to the students, but after they were marked by instructors, and Alderson warned him to change a student's grade to a passing grade or he (the professor) would get into trouble." An alumnus of the school swore that "many students at the school during Alderson's administration were allowed to pass, after having failed in their studies, because they were either athletes or relatives of influential men of Colorado."

The first charge of the ex-professors of the School of Mines was that "trustees intervened in matters of school discipline," and in finding this true, the committee of the American Association of University Professors observes: "The trustees of the Colorado School of Mines do not seem to realize the impropriety and the evil influence of their interference in the routine affairs and educational problems of the institution."

The American Association of University Professors is a nation-wide institution, and, we believe, a final and trustworthy court in such matters.

Such a report, however, does not come as a surprise or a shock to us. We have to advise the excellent people of Colorado that the conduct of their School of Mines has for years been a by-word wherever it was discussed. It has been for years a matter of common talk and consent that in Colorado politics dominated the administration at Golden; that students could and did dictate to the professors, and that the latter could not enforce discipline, except in so far as they truckled to cheap political influences. We must apprise the people of Colorado that no mining school in the country has for years borne so dubious a reputation in this respect, as being the playground for politicians, as has that at Golden. This must mean a good deal, for we have no doubt that much of this evil exists in other state mining schools; but at least nowhere else have we had it so repeatedly thrust on our attention that it reeks to heaven.

Colorado is a great state. It is a great mining state. Like California, it is the mother of miners. It has one of the most advantageous locations on earth for a mining school, and its school should rank among the highest. It does not. One needs more than air and scenery and mines and great miners and notable engineers and husky students and devoted professors for a great school. A high academic standard of ethics and of scholarship is the indispensable thing, far greater than all else; and, according to all common report, understanding, and evidence, these essentials Golden has not had.

What we say is explicit, because we should like the mining people of Colorado to clean house. They cannot afford such continuous evil rumors. To play politics in an institution of learning is to play Hell: keep them apart—the two are as essentially separate as night and day.

The Opportunity of the Reno Experiment Station

THE Rare and Precious Metals Station of the Bureau of Mines, which has been driven away from Golden by the authorities of the Colorado School of Mines, and which is to be re-established at Reno, has outlined an elaborate program of work. A résumé of the problems regarded as being in need of immediate study was given in our columns two weeks ago. If only a small percentage of the dreams and hopes of the directors come true, the mining industry will benefit greatly. The work outlined is along metallurgical rather than mining lines, as is natural, for that field offers more opportunities for research.

An investigation into the cyanide process with a view to reducing the losses is announced. With continued high prices of silver assured for some years, this is a matter of considerable importance. The old chloridizing roasting process preceding cyaniding may offer possibilities under present conditions. Or the Western Precipitation Co's. volatilization process may be attractive if not too expensive.

There is room for much experimenting. It is to be hoped that private investigators will make known what they have done either through the columns of the technical press or by direct consultation with the Bureau, so that work will not be needlessly duplicated. Experiment-station activities are of the most benefit to the industry when co-operation exists in the fullest degree.

Another important problem is that of extracting the copper and silver from the many low-grade oxidized ores in the country. Few high-grade deposits are left; the U. V. X. is one. At many properties, not only has the cream been skimmed off, but the cow has stepped in the milk-pail. Considerable work has been done by some of the large companies such as the New Cornelia, Chino, Miami, Anaconda, and Utah Copper, but the results are not in general available to the smaller operator. To be

sure, operations of this kind are pre-eminently large-scale problems, but the Bureau can do much in bringing the latest facts concerning leaching before the mining public, so that all interested may have a better understanding of what is and what is not possible. The cheap production of sponge iron for precipitation may well be studied.

One of the twenty remaining lines of investigation is to be a study of the methods used in crushing ores and a comparison of results secured by different machines. This would give exceedingly interesting data. Many excellent crushing and grinding machines are on the market, claims for which are most conflicting. Then the new types of rod mills which have been devised by F. E. Marcy and David Cole should be given immediate attention. Under what circumstances are they better than ball mills? Practically every reduction plant, no matter how small, has a fine-grinding mill, and will be thankful for guidance.

As we mentioned last week, the Bureau of Mines experiment stations have not always been unqualified successes. We hope at a later date to be able to say some nice things about this latest installation. We hope that the new Reno station will eclipse for efficiency the reputation of the city's divorce mill.

The Company Store and the Co-operative Store

THE central store in a mining camp in its various phases has been both the worst and the best of institutions. The company store in its old-fashioned form was often a means of exploitation, if it did not so originate. In some cases miners who did not trade at the company store would be discharged, a clear evidence of the profiteering nature of the undertaking; especially since the only reason that a miner could have had for trading elsewhere was that he could thus do better. In some mines, especially those in remote places, where a central store was clearly advisable, the profits from the company store were used to cover up sloppiness in the mine management. It was of less importance how much was paid out for operating expenses, if all, minus the wholesale cost of a certain amount of food and clothing, came back to the company's coffers. It so came about, therefore, that the company store acquired in many places a dubious reputation; and for that reason many companies declined to venture into such an institution, which was sure to be suspected even though properly conducted.

The lack of a central store, however, has proved in many places as bad as the rapacious company establishment. For the one big concern, which may or may not be profiteering, comes a horde of little ones, with high operating costs, and all profiteering to the best of their ability, according to the general principle of retail trade. Especially in these days of high cost of everything, the high overhead expenses of such little stores have contributed to bringing prices so high, not only in mining camps, but elsewhere, that they have become well-nigh intolerable; and the general trend of advanced thought has been toward larger central stores, with a less percentage of overhead, and a less margin of profit. Even before this, many if not most of the company's stores, established by necessity, for the convenience of miners, in remote camps, had completely reacted from the money-making idea; and the store had been managed like any other department of the mine, and required only to pay its actual cost of maintenance, as, for example, at the Eden mine in Nicaragua. The margin of retail profit in such cases was fixed so as just to cover the cost of administration, say at 10 per cent, while the outside retailer's profits would have been 20 or 30. In this form the central store becomes an unmixed economic blessing. As an example of the change of the feeling against the central store is the recent action of the striking miners at Tonopah. Becoming convinced that the Tonopah companies could not afford to pay the increased wages which they felt they needed, to cover the high living costs, they agreed to a central store operated by the companies, in order to reduce to a minimum the retailer's profits.

But how shall miners know how to distinguish between the company store which is established, like the hospital, as part of the necessary plant, and the grafting store? The company must not only avoid profiteering in goods essential to plain living, but the suspicion of profiteering. And the development of the company store in the direction of a co-operative store has solved this difficulty. A margin of profit is fixed more than sufficient to cover running expenses and the net balance is repaid to purchasers at the end of the year. This is the solution at Ajo, where in addition a committee of workmen inspects the functioning of the store and helps advise concerning it. The institution then becomes ideal. In many cases, in foreign countries, the character of the population may be such that this co-operative plan, which presupposes intelligence of the native American type in the purchasing class, would not work out satisfactorily: and the stores must be run as they are at Chuquicamata, with an endeavor to break even. According to the article by Mr. Guggenheim in this issue, so far they have lost money. Therefore, the co-operative plan is the more accurate, where it is feasible.

It is not at all impossible that the co-operative store may be so perfected in our mining camps that it will become more practicable than it has hitherto proved, in older and more diversified communities.

Anti-Metric Propaganda

THE anti-metric propaganda people are sending out stuff that we could improve on ourselves for effectiveness. The latest batch contains a letter from a man who has been in Norway, where the metric system has been legitimized. He observes:

"From my experiences in Norway and Sweden, I am much averse to changing the system in use in this country, because of the confusion due to the conglomeration of terms that creep into use." Also, he says, "I later discovered that the Swedish metal industries use no less than four systems of measurement: in Norway, there are three systems." He evidently prefers to retain the old confusion rather than follow the universal and logical system into the light of simplicity.

Also, the propagandist relates this fable: "A lady on being told how easily the metric system could be learned, replied, 'I do not believe I could ever learn the meter, so as to think of it other than one yard, three inches, and a little more.'" Enough! We are convinced by the fable of the "Lady and the Meter." We are tempted to put it into a limerick:

A lady who could not be sweeter,
Remarked to a writer named Peter,
"I know what's a yard,
But a meter is hard."
Said Peter to us, "You should meter."

Welfare Work at the Homestake Mine

Avoidance of Paternalism, a Lively Interest in Clean Amusement, and Development of the Community Spirit Have Been the Guiding Influences in Shaping the Human Engineering Plan Followed by the Homestake Mining Co.

By B. C. YATES*
Written for *Engineering and Mining Journal*

MEN and women, to be happy and contented, should have definite work to do, have amusement, and must be allowed to develop their home and community life largely in their own way. Welfare work, to accomplish the most good, must help the people of a community in their daily work, their amusement, and their home life. It should be developed gradually and naturally as the needs of the community are manifested and should never be conducted along fixed lines laid down by a single individual who perhaps lacks full appreciation of human nature. Paternalism should be avoided as far as it is possible to do so in a community where a single business interest dominates. The needs of the people should be carefully studied and anticipated; and the one central idea that each individual employee is a part of the organization—that he is not a machine but a human being with the usual characteristics of the species—must govern if the work is to be successful.

Although the management of the Homestake Mining Co. has always possessed an active interest in the general welfare of the community, it has never undertaken to furnish houses for its employees. It has, however, encouraged the building of homes by giving free permits to occupy company ground and by advancing the purchase price and allowing the employee to pay on the monthly payment plan, with a low rate of interest on deferred payments. After forty years of continuous operation as the sole industry of the community there are few company-owned houses in Lead. Under this policy the town has grown from a typical mining camp, with its log cabins and board shacks, into a modern small city, with paved streets, sewer and water-supply systems, electric lights, and beautiful homes, owned largely by their occupants. The grocer, the butcher, the hardware dealer, the clothier, and the real-estate man carry on their business in this mining camp as in any ordinary town of equal size. Keen competition keeps up healthy trade conditions and maintains prices at a reasonable level.

DURING THE PLUNGE PERIOD. SWIMMING TANK IN THE HOMESTAKE RECREATION BUILDING

No part of the welfare work at the Homestake has met the needs of the people more fully than the Free Library, originally a Christmas gift from the late Phoebe A. Hearst in 1894. It was maintained by her beneficence until her death, and is now carried on through the generosity of her son, William Randolph Hearst. The library was first installed in the Miners' Union Building, moved in July, 1896, to a room over the Hearst Mercantile Co. store building, where it remained until 1914, when it was moved to its present quarters on the second floor of the recreation building.

The first volumes placed on the shelves were such as would appeal to the average reader to be found in an early-day mining camp. The number of volumes has

*Superintendent, Homestake Mining Co., Lead, S. D.

been increased yearly, and the standard of the literature has been consistently raised until now the library contains approximately 13,000 volumes. In the reading room are eighty periodicals, of which two are foreign, and twenty-two newspapers, of which two are foreign.

The close proximity of the high school enables the library to render valuable assistance to teachers and pupils, and the grade teachers use the library freely for reference work. Much assistance is also given to the literary clubs of the town. The magazine collection, with its adequate guides, is especially useful in this work, and each year makes this section more valuable. The library is also used extensively by non-residents from surrounding towns.

KINDERGARTEN AND YARD AT LEAD, S. D.

When the library was opened forms of amusement were scarce in Lead, so it was, in a measure, made a community center. Musical programs were given at intervals and musical organizations and literary clubs used the room as a meeting place. Its use by all nationalities and ages has grown until now the services of a trained librarian and two assistants are required to care for the needs of its patrons.

Besides the excellent collection of books, there are a number of beautiful paintings on the walls. A smoking room is provided for the men, and the children have an alcove for their particular use, provided with low tables and suitable chairs. One end of the stack room is used for mineral exhibits, especially the minerals of the Black Hills region. In short, this is the most complete and best-housed library in South Dakota.

Influence of the Kindergarten on Americanization

The kindergarten, opened in 1900, is also maintained by the generosity of the Hearst family. Sessions are held five days in the week, from the the first of April until the Christmas holidays. A trained kindergartner with from two to three assistants is employed. Children between the ages of four and six are admitted, the older ones attending the morning session and the younger the afternoon. The work is carried out on the latest approved lines, and the school is well supplied with models, sand tables, piano and other aids to interest children.

A small but well-kept park nearby provides a place for outdoor play during the summer months. The kindergarten has been an inestimable aid to the public school by giving the children of foreign birth a start in the English language and teaching them something of American ways and manners, thus relieving them of the handicap resulting from their foreign parentage. It has also proved a large factor in Americanizing the parents by both direct and indirect contact with the teachers. Entertainments are given frequently by the pupils, to which the parents are invited, and these are always well attended, especially by the mothers. Frequent visits to the homes by the teachers also tend to awaken and keep up the interest of the parents in things American. The average attendance under normal labor conditions at the mine is about 125 for the two sessions.

The Public School in Welfare Work

Although the public schools of Lead are supported by general taxation in the usual way, it is not out of place to mention them in connection with the welfare work of the Homestake company, inasmuch as it pays the larger part of the taxes for their maintenance and has always favored a liberal policy for the schools. The Lead public schools are second to none in the state from the viewpoint of excellence of teaching force, equipment and work accomplished.

In the department of science the school is especially strong. Scientific schools of the country bear evidence to the high quality of its graduates, one state school testifying that no Lead graduate has ever failed to make a high record in the institution. Manual training, domestic science, music and art are taught by special instructors, and a complete business course is given. An instructor in athletics is also employed, and the interest in football, basket ball and track meets is most active, the basket-ball team having won the state tournament in 1918. The school maintains a library of about 13,000 volumes in addition to the Hearst Free Library and employs a professional librarian to facilitate consultation.

The attendance in the high school has increased more than 100 per cent in the last three years. This increase comes almost entirely from Lead, as few attend from

AUDITORIUM IN THEATRE, RECREATION BUILDING

surrounding territory. The number of graduates who attend higher educational institutions is also large in proportion to the attendance.

The Homestake company, in supporting a liberal policy toward the schools, feels that it is fully repaid by the stabilizing influence on its working force, due to the fact that men with families are attracted to Lead on account of its educational advantages. Many of the young men now holding important positions in the shops, mills, assay and engineering departments are graduates of the Lead high school.

From 1879 until 1906 the hospital department was conducted under the contract system. Each employee paid $1.10 into the hospital fund and was furnished free hospital and surgical care in case of injury and a reasonable amount of medical and other surgical care for himself and dependents. Under this plan the company engaged the chief surgeon and he employed his assistants. There were frequent dissensions over charges for border-line cases; and, inasmuch as the employees who furnished the funds for maintenance had little or nothing to say about the management, much dissatisfaction was constantly manifested. On Jan. 1, 1906, the Homestake company discontinued the hospital assessment against its employees and assumed the entire cost, thus initiating what is believed to be the first free complete industrial medical service for employees and their dependents. All employees and their dependents are furnished free medical, surgical and obstetrical service of every nature.

Because of lack of room, uncomplicated obstetric cases are not admitted to the hospital, but any other type of case, either medical, surgical or obstetric, demanding hospital care, is furnished, free of charge, whatever is necessary. Employees may employ outside doctors and pay for such services themselves. To carry on this work seven physicians are employed, all graduates of high-class medical schools and experienced both in industrial medicine and general practice. (Recently one of the assistants has been appointed chief surgeon for a large copper-mining company in South America.)

The hospital building is getting old, and in the near future will be replaced by a more commodious and up-to-date one. The equipment is, however, modern and complete. Among the special features of the equipment to be noted is the X-ray outfit, which is now considered one of the necessities in a present-day industrial hospital. Twenty beds are maintained and seven graduate nurses are employed to look after the patients. The medical work is done entirely by doctors, the nurses not being permitted to do routine dressings, give anæsthetics, do X-ray or perform or other laboratory work. It is the opinion of the management that this method is more satisfactory to the employee and is certainly safer from a medico-legal viewpoint. The company spends annually about $60,000 in keeping the hospital service at the highest degree of efficiency.

In addition to the regular duties, the medical staff devotes much time to the general welfare of the community, the chief surgeon having served as city health officer for many years, and to his faithful work in this office is due in large measure the generally clean and sanitary condition of the town. Among the other duties may be mentioned physical examination of all applicants for employment, medical supervision of the employees, mutual-aid association, locally known as the Homestake Aid Fund; promotion of first-aid and safety work in an organization employing normally about 2,500 men, and giving expert medical assistance in handling the welfare work of a modern industrial city of eight thousand population.

INTERIOR OF HOMESTAKE CHANGE HOUSE, SHOWING LOCKERS AND CLOTHES-DRYING SYSTEM

The Homestake recreation building, built and equipped by the Homestake Mining Co. at a cost of $250,000, was opened to the public on Aug. 31, 1914. It is a three-story brick-and-stone structure of the latest design, and is well lighted, heated and ventilated. No expense was spared to make this the recreation home of the employees and their families, and all residents of Lead are given the same privileges as employees, so that it is a community house in the fullest sense. No membership fee is charged and no card or number used. Everybody is welcome and all are treated as special guests by the attendants. The building has always

been conducted on the open-house plan, no hard and fast rules have ever been made, and each guest is allowed perfect freedom so long as his conduct is not objectionable. The only rules posted are those governing the length of time one set of players may use the various tables and games, and specifying the days when the men, women and children may use the plunge. The results from this method of handling the building have proved most gratifying to the management and seem to be appreciated by the patrons, as the average monthly attendance is about 25,000.

On the first floor of the building is a large rest room furnished with easy chairs and lounges, with tables for chess, cards and other games, and directly in the rear of this room is the billiard room, with two regulation billiard and two pocket-billiard tables. In alcoves of the rest room are three tables for children between the ages of six and sixteen. About 2,500 persons play on these tables during a month.

Below the rest room is the gymnasium and a bowling alley of six alleys equipped with automatic pin setters. Over 2,000 persons use these alleys each month, including the ladies, who have one day each week. The gymnasium is well equipped and is also used by two bands as a practice room.

In the rear of the rest room and with a separate street entrance is a well-furnished theatre with a seating capacity of 1,000. Moving pictures are shown, both afternoon and evening, with road shows and vaudeville when available. The average monthly attendance is about 20,000.

Under the theatre auditorium and directly in the rear of the bowling alley is a tank 25 by 75 ft. with a depth of water ranging from 4 to 9 ft. The plunge and floor are lined with white tile. Change rooms, shower baths and hair driers are provided for the bathers. The water is heated, filtered, disinfected and changed frequently. The plunge is patronized by approximately 1,800 persons per month, about equally divided among men, women, boys and girls.

A TWO-BED ROOM IN THE HOSPITAL

A small room called the sun room, because of its particularly sunny exposure, is used as a meeting place by various clubs, societies and committees.

There is no charge for the use of any part of the building to Homestake employees and their families or to residents of Lead, except for the theatre, where a nominal charge is made to cover cost of pictures and other attractions.

A manager of the building, who is also in charge of the theatre, with assistants in the various departments, is always on hand to look after the needs of the patrons. The use of the building by all nationalities and ages has been most gratifying, and it has become a great welfare center where Americanizing and humanizing influences are constantly at work.

MACHINE SHOP, WASH AND LUNCH ROOM

EMPLOYEES' MUTUAL AID ASSOCIATION

After a careful canvass of the sentiment of the employees, the Homestake Aid Fund Association was started in 1910. A board of five directors was elected by ballot and held their first meeting July 16, 1910. These five directors, elected annually, with the superintendent of the company as treasurer, and the chief clerk as secretary, direct the affairs of the Aid Fund, receive applications for aid and direct payment of claims. Its decisions are final in cases of dispute. All employees of the company contribute $1 per month, and, up to the time the South Dakota Compensation Law went into effect, the Homestake company contributed $1,000 per month. Benefits were paid for both accidents and sickness until the state law made it obligatory upon the mining company to pay all compensation for accidents, after which time the Aid Fund has been used to pay sick benefits only.

Originally $1 per day was paid for loss of time from either sickness or accidents, beginning the day of the accident or after the sixth day, in case of sickness, and continuing for a period of six months from date of disability. Later the time was extended to nine months and the benefits were increased to $1.50 per day if the sickness continued beyond three months. The sum of $800 is paid to the beneficiaries in case of death and $200 if a member commits suicide or falls a victim to insanity.

Benefits paid up to April 1, 1920, are as follows: Account of death, $195,200; suicide, $1,000; insanity, $1,400; sickness, $91,183.11; injury, $75,498.25; making a total of $364,281.36.

At the time of the influenza epidemic in the latter part of 1918 the fund carried a balance of approximately $40,000, but this was entirely wiped out, and the fund now has a deficit of about $7,000, which the Homestake Mining Co. has assumed.

Although the Homestake company does not now contribute regularly to the Aid Fund, it does pay to all injured employees $1 per day for all time lost from accident up to the tenth day, at which time regular compensation payments begin in accordance with the state law.

The Ladies' Auxiliary to the Aid Association is a purely charitable organization, liberally supported by the Homestake company, and was organized in 1909 to assist the Aid Association in taking care of the families of employees, who by reason of sickness or other misfortune are unable to care for themselves. This auxiliary has a paid-up membership of about 150, and the work is supported by all residents of Lead and the surrounding communities which are more or less dependent on the Homestake industry. A membership fee of 25c. and monthly dues of 10c. furnish a small income, which is augmented by donations and receipts from the annual Labor Day picnic, which is given under the auspices of the auxiliary, and from other entertainments given during the year.

A relief committee consisting of two members from each ward is appointed annually, whose duty it is to visit the sick and needy and furnish relief when necessary. An average of thirty-five families are helped each month, and the work has grown until any needy family, whether employees of the company or not, is given aid. Since the end of the Great War, the local Red Cross organization has turned over to the auxiliary the work of taking care of those families left destitute by the death of the bread-winner, either while in the service of his country or from the influenza during the epidemic of 1918 and 1919.

The company began the practice of retiring its old employees, on account of old age or physical disability, July 1, 1917. The basis of computing rate of pay after retirement is as follows: 25 per cent of last full year's pay plus $10 per year for each year's service with the company, but not to exceed $600 per year.

An employee may make application for a pension, in which case the application must be approved by the head of the department in which he works, or he may be retired upon request of his foreman.

There are now forty-two men receiving pensions of from $350 to $600 per year. The average age of those receiving pensions, at the time of retirement, was over sixty-five, and the average years of service nearly thirty-one. Nine pensioners have died and one pensioner was re-employed. A pension is also paid to widows of employees who lost their lives by accident prior to the enactment of the state compensation law. Each woman entitled to this pension is paid $30 per month, with an additional $5 for each child under sixteen years old.

At a meeting of Homestake employees of twenty-one years of actual service, held in December, 1905, an organization was effected and a constitution adopted. This organization is known as the Homestake Veterans' Association and was formed for the following purposes: To gather together the older employees of the Homestake Mining Co.; to make a record of past incidents relative to the mine and its first employees; to extend such voluntary aid to needy members of the association as may be determined by majority vote, and to cultivate and keep alive a more lasting acquaintance among its members. The qualifications for membership are as follows: At the time of making his application, the applicant must be in the employ of the Homestake Mining Co. and shall exhibit satisfactory proof that he has been in the active service of the company or associate companies for not less than twenty-one years. He must bear a good moral character and be recommended by two veterans in good standing.

The association started with a charter membership of 103, and the membership at the present time is 157. Employees who have been retired on pensions do not lose their membership. In charity work, not alone among its members, but throughout the community, the association has spent over $6,000, which does not include substantial subscriptions to the Red Cross. The treasury holds $2,100 in Liberty bonds and cash.

The employment department was started in 1904. Previous to that time, men were hired by the foreman and bosses. For several years men for the mine only were hired through the employment office, as there were no rules or precedents to follow. At first only the name, nationality, age and experience of the applicant were recorded. Later, the work was enlarged, until now all labor is hired by the employment office and an application blank is filled out and signed by the applicant, physical characteristics, date and place of birth, weight, height, color of hair and eyes, condition of health, personal history, religious and political affiliations, name of nearest relative, and at least one good reference being recorded. Later, when the employees' insurance was put in force, all applicants were required to pass a physical examination. This serves to insure getting only physically sound employees and to protect the members of the mutual insurance association.

UNDERGROUND DRINKING FOUNTAIN AT THE HOMESTAKE

Early in the work it was found that men are greatly influenced by their first reception. The employment office is the company's front door, and the applicant is made to feel at home and given to understand that he is employed as an individual and not a mere part of a mass, and that the humblest position is just as essential as the highest. The rules of work are explained, and a printed book of rules is handed each successful applicant. He is asked whether he has a place to room and board, and if he has none is directed to several where he can make his choice.

All employees' records are numbered and condensed on cards, which are filed alphabetically, one group for employees and one for ex-employees. When a man leaves the service of the company he gives his reasons when he draws his time. His immediate boss also makes a statement, which is recorded, as to why the man left. Both reasons are copied on the man's card for future reference. When a request is made by some future employer for a man's record, a notation with the address is made on his card, and like requests are made of former employers, especially if the man's work is not entirely satisfactory.

At the end of each month a report is made showing number of men hired for the month, with certain statistics such as nationalities, ages, married or single, and under what bosses placed; also the number of time checks issued for men leaving each boss and the reasons for leaving as given by the man and boss. This department has hired 19,250 men since its organization.

Outside of the regular work of employment, the office keeps a list of all employees who are not full citizens of the United States, and gives all assistance possible in completing their citizenship papers.

In keeping with the policy of the company of looking after the welfare of its employees, a safety engineer was added to the staff in 1917, and a regular organization effected to look after matters pertaining to safety. A workman's committee, made up of men from all departments, with the safety engineer as chairman, meets once a month. The members of this committee report any unsafe practice or condition which they may have observed during the month and discuss matters pertaining to safety. If the condition needs immediate attention, the safety engineer is notified and the remedy is applied without waiting to report to the committee. A central committee, consisting of the superintendent, as chairman, and the heads of departments, meets the week following the workman's committee to act upon the recommendations of the workman's committee, and also to consider safety measures on its own initiative.

The importance of the safety movement is impressed upon the employees by posting bulletins of the National Safety Council, and local bulletins, and by publishing the Homestake Safety Bulletin, containing timely remarks, clippings from other safety publications, and records showing injuries sustained during the month in each department. The mine department is divided into six competitive divisions to stimulate inter-department competition. Shift boss records are also given showing accidents under each one.

Every month each foreman in charge of a mine division receives a slip showing his standing and a comparison with the total mine record for the previous month, together with remarks on practices observed and injuries sustained in his territory during that period. Each shift boss also gets a monthly tabulated comparison of all bosses together, with remarks on practice observed and injuries sustained by men under his supervision. The general mine foreman gets a copy of all these letters.

All dangerous places and mechanical appliances are properly safeguarded, both underground and on the surface. Goggles are furnished free to all men working under conditions hazardous to the eye. First-aid material is available on each level of the mine and in shops and mills. Safety suggestion boxes are placed at accessible points around the works. Men are trained in the use of mine rescue apparatus and in first aid to the injured. During 1919, 127 men were trained in mine rescue work and 204 received first-aid training. This work was under the supervision of the staff of the U. S. Bureau of Mines Car No. 5, and those successfully completing the work hold a Government certificate.

All major accidents are thoroughly investigated by the safety engineer as soon as possible after the accident. The accident severity rate has been materially reduced and the frequency rate slightly reduced, although the labor turnover has been rapid. On the whole, the results of the safety work have been satisfactory, and demonstrate that if each individual workman can be interested much more can be accomplished.

Sanitary Measures

Every effort is made, both in the mine and in the surface plants, to provide sanitary working conditions. Bubbling drinking fountains are placed in convenient places both underground and in the mills and shops, and provided with clear, cold, wholesome water. Clean, well-heated and ventilated change rooms are provided with hot and cold water and individual lockers for clothes. A special underground latrine is used in the mine, which is brought to the surface frequently and thoroughly cleaned. At convenient places near the shops and mills special toilet rooms are placed, which are kept clean by the constant attention of an attendant, who gives his entire time to this work.

Ventilation of the underground workings and dusty crusher rooms is carefully supervised. Much time and attention have been devoted to the introduction of water machines for drilling, until at this time only a small percentage of the men underground are working in dusty places. In these and in many other ways the Homestake company is daily doing something practical to better the working conditions of its employees.

Many religious denominations are represented in Lead and most of them have an organization and a place of worship. The Homestake company makes a yearly contribution of $200 to each church holding regular services, and renders other material aid in various ways. Though impracticable to cease all operations on Sunday, it has been the practice for some time to allow one-half of the force of certain departments to lay off on alternate Sundays and individuals may take their Sundays off if so desired. Church services are well attended and the financial condition of the churches is generally good.

[Note: The author wishes to thank publicly the members of the staff, F. A. Henderson, superintendent of schools, and Miss M. E. Livingston, librarian at the Hearst Free Library, for their valuable assistance in preparing this article. All photographs are by Art Lease, of the engineering department.]

MAIN AVENUE OF AMERICAN TOWN SITE, BRADEN, CHILE

Building Mining Cities in South America

A Detailed Account of the Social and Industrial Benefits Flowing From the Human Engineering Work of the Chile Exploration Co. and the Braden Copper Co.—Organization, Administration and Conception of the Objects Sought

By Harry F. Guggenheim*
Written for *Engineering and Mining Journal*

IN EVERY department of human affairs, "practice long precedes science." To this dictum of John Stuart Mill the welfare movement in the so-called Guggenheim companies has been no exception. The welfare work of the Chile Exploration Co. and of the Braden Copper Co. in Chile is approaching what might colloquially be called a science, which has been preceded by and is the result of experience gained in "common-sense" welfare work practised over a long period of years in mining camps in different parts of the world. These two companies, on account of their isolation and the magnitude of the operations centralized at one point, have lent themselves to the development of welfare work similar to that practised in some of the large progressive industrial works but unusual in mining camps.

The Braden property is situated in a steep mountainous region at an elevation of from 7,000 to 8,000 ft. It was a region without permanent inhabitants. The mines originally were worked in a small way during the summer, but owing to the rigorous climate and the very heavy snowfalls, which cut off communication with the outside world, the region was practically deserted in the winter months.

The Chuquicamata Property

The property of the Chile Exploration Co., known locally as Chuquicamata, is on a high plateau with much less precipitous mountains in the background. The elevation is 10,000 ft.; the climate dry and without seasonal extremes of temperature. It was not a settled country, because of absence of fresh water in the vicinity.

From this it will be seen that these companies had not only to develop and equip their mines, but they had to build railroads and to establish towns, or if you please, cities, complete, sufficient to house from 10,000 to 15,000 inhabitants, and to supply them with food, water, and other necessaries, as well as to keep them clean, healthy, and content.

*Vice-president (in charge of operations) and chairman of executive committee of the Chile Exploration Co. Vice-president Braden Copper Co.

Work at the Braden property began in 1908. It was first developed and equipped for the production and treatment of 3,000 tons of ore daily. In 1915 it was found that the property warranted greater production, and the necessary plant and housing which will place the mine on a basis of a daily production of 10,000 tons of ore is rapidly nearing completion. It has normally at present a population of about 12,000.

Preparations for working Chuquicamata began on a large scale in 1914, and operations were at first on

TYPE "C" ADOBE HOUSES AT CHUQUICAMATA

a basis of the production of 5,000 tons of ore daily. This was rapidly increased to 10,000 tons, and at the present time the plant has a capacity of 15,000 tons per diem. The eventual capacity will be 30,000 tons daily.

Organization of Welfare Work

The important steps in the evolution of the welfare movement in these South American properties grew from conditions of sufficient practical value to warrant a summary. The welfare problems at these properties are divided into two classes, one for the so-called "staff" employees, consisting of Americans, Chileans, and Europeans, and the other for the workmen, who are in the very great majority Chilean and who have had few of the advantages enjoyed by citizens of rich and more industrially and culturally developed American and European countries.

The first attempts at welfare were made by the general managers of the properties with funds appropriated for specific purposes as the necessities became evident. The base of this work was hygiene and amusement for the Chilean workmen and recreation for the staff. Early in 1915 it was realized that, although much more money had been spent for welfare construction by the Chile Exploration Co. than by the Braden Copper Co., at the latter property the spirit of contentment and the real progress of the community, which should be the end in all welfare work, were much more marked. The conclusion reached was that the success at Braden was in a large measure due to the efforts of Mr. B. T. Colley, who was then smelter superintendent and who in addition to his regular duties was in charge of welfare.

Selecting a Welfare Manager

The results of the right man spending but a part of his time on welfare were so successful that it was decided to employ a welfare expert to devote his entire time to this work at the two properties. At that time the field from which to draw for welfare experts was very limited; and the writer, after spending much effort in the search for a welfare expert with knowledge of Latin American people, and with the personality needed in a mining camp, decided that the "expert" qualities, though desirable, were less essential than personal qualities. Mr. Colley possessed the personal qualities; and, heretical as it then was to make of a smelter superintendent a "welfare manager," he was put in charge of the welfare development at the two properties. He knew the Latin American laborers through many years' experience with them; appreciated their abilities and their weaknesses; and primarily had a real interest in their development and a profound faith in the general proposition that humanity progresses.

After several years in the welfare development at the two properties, local organizations were evolved and became a part of the general organization of the plants, with department heads reporting to the respective general managers of the properties. Mr. Colley was then placed on the headquarters staff in New York of the firm of Guggenheim Brothers, that he might act in the same capacity for properties under the management of the firm in regard to welfare problems as the heads of the engineering departments act for their respective subjects. The following is a summary of the duties of the Welfare Department of Guggenheim Brothers as set forth in the organization circular of that firm:

"To make a continuous study of the development of welfare methods in all parts of the world.

"To maintain an organization capable of performing the following functions for and through the chief executive of any of the companies under the management of the firm:

"1. Advise regarding welfare policy.
"2. Study welfare reports.
"3. Study requisitions and tenders for welfare work.
"4. Decide on the selection of welfare personnel.
"5. Supervise requests for welfare appropriations."

Development of Welfare Departments

The last step in the development of the welfare movement has been the amalgamation of the welfare and personnel departments. The personnel department had its origin as a part of the headquarters organization

TYPE "A" ADOBE HOUSE AT CHUQUICAMATA

with the function of carefully selecting "staff" personnel for the properties. With the fund of experience that has in very recent years been accumulating, based on the multifarious profit-sharing plans and the even more recent plans which might be classified under the head of "Industrial Democracy," the function of the personnel department was extended to an investigation of these experiments for the purpose of adapting to South American conditions the good results that had

elsewhere been obtained. The functions of the welfare and personnel departments soon overlapped; and they were accordingly consolidated.

The welfare work in the field consists, first, in the construction of welfare facilities, and, second, in the operation or proper use of these facilities. The plan may be outlined as follows:

The cost of construction work at the Braden Copper Co. has been about $2,500,000, and at the Chile Exploration Co. about $3,600,000. Prior to undertaking the extensive construction of the housing and welfare program determined upon in 1915 the local conditions at the respective properties were carefully studied and plans prepared for standard types of houses for various classes of employees as follows:

Official Houses—Occupied by heads of departments. One-story cottages having six rooms, two baths, and a kitchen. The total floor space in each is 1,500 sq.ft.

Type "A" Houses—Occupied by general foremen, assistant engineers, and senior office employees. One story, with four rooms, kitchen and bath. Total floor space in each is 1,250 sq.ft.

Type "B" Houses—Occupied by sub-foremen, skilled mechanics, and junior office employees. One story, with three rooms, kitchen, and bath. Floor space, 750 sq.ft. each.

Mess Houses—Occupied by bachelors employed as junior engineers and office employees. One-story rectangular buildings of the inclosed patio type, with a living room and dining room in the patio and from nine to eleven bedrooms, a kitchen, baths and servants' room surrounding the patio. The average floor area of this type is 3,020 sq.ft.

Type "C" Houses—Occupied by high-class native foremen and mechanics. One-story, with two rooms, kitchen, and bath. These are semi-detached, built in rows of ten houses each, and the floor area of each house is 560 sq.ft.

Type "D" Houses—Occupied by native laborers and their families. One story, with either two or three rooms. The first 325 of these houses built were detached, two-family houses. All houses of this type built subsequently are in rows of ten. The floor areas are 242 and 363 sq.ft. for the two- and three-room houses respectively. Authority has been granted recently to add shower baths to a certain number of these houses that are occupied by natives that can be classed as permanent employees who have shown more than the usual interest in raising the standard of their homes.

Staff Quarters—Occupied by bachelors holding subordinate staff positions. One-story buildings, having a longitudinal hall with bedrooms on both sides. At one end is a general lounging room and near the middle there is a bathroom with a number of showers. Each of this type of building contains from sixteen to twenty bedrooms, provided with running water.

The standard types have been followed at Chuquicamata and wherever possible at Braden, but the fact that the mine and mill town-sites for the latter property are located on the side slopes of a mountain with limited space for buildings, has necessitated constructing a large number of two- and three-story apartment houses that will accommodate from four to eighty native families. The allowance of space per family is practically the same in both cases.

Plans were also made of schools, club houses, churches, hospitals, sanitary sewers, and potable water supplies. At Chuquicamata a site was selected for the native village, west of the plant, where there is ample room for enlargement, and the area has been laid out in regular blocks and streets around a large central square, which is to be utilized as an amusement park for the native employees.

The execution of these plans was begun early in 1916, at which time the most economical materials available were framing lumber and corrugated iron. The type of construction selected was wooden frames with corrugated iron roofing and siding and beaver-board partitions for the better class of houses, and sheet-iron partitions for the laborers' quarters. This type of construction was not entirely satisfactory, as the houses proved difficult to heat, especially at Chuquicamata, where the difference in temperature between day and night averages as much as twenty-four degrees Centigrade. In addition, the building operations were seriously delayed, due to the increasing scarcity of lumber and corrugated iron supplies as the late war progressed.

Utilizing Tailings in Making Bricks

With a view of securing a suitable building material for Chuquicamata, adobe bricks were manufactured locally of various mixtures of screened tailings, pampa dust and cement, and it was demonstrated that a mixture of these in proportions of 13:4:1 respectively produced adobes that were entirely suitable at a reasonable cost. Since this discovery all of the houses have been built of adobe, and the corrugated iron on a number of those built previously has been replaced with adobe. The adobe houses have proved most satisfactory. They blend attractively with the pampa landscape, maintain a more even temperature and the fact that they can be manufactured locally enables the management to add to the housing facilities as necessity demands without keping a large stock of building materials continually on hand.

At Braden, metal lath and plaster has been extensively used in place of the corrugated iron, especially in the better types of houses.

The building construction that has been done at Chuquicamata from 1916 to date inclusive is shown in the following table:

TABLE A. BUILDING OPERATIONS AT CHUQUICAMATA

Type	Number Built	Under Construction	Average Cost per House	Total Expenditure
Official, 8 room, frame and corrugated iron	7	....	$8,191	$57,337
Type "A," 10 rooms, frame and corrugated iron	11	....	3,287	36,162
Type "A," 9 rooms, adobe	5	....	8,221	41,104
Type "B," 6 rooms, frame and corrugated iron	59	....	2,119	124,990
Type "B," 6 rooms, adobe	17	....	4,580	77,854
Type "C," 4 rooms, frame and corrugated iron	24	....	1,936	46,452
Type "C," 4 rooms, adobe	28	....	3,092	86,577
Type "D," 2 rooms, frame and corrugated iron	557	29	366	204,033
Type "D," 3 rooms, adobe	336	270	802	269,491
Mess houses, total 52 rooms, frame and corrugated iron	8	....	7,025	56,198
Mess houses, 19 rooms, adobe	1	....	14,721	14,721
Staff house, total 20 rooms, frame and corrugated iron	4	....	2,565	10,259
Staff house, total 80 rooms, adobe	4	....	20,229	80,916
American club, frame and corrugated iron	1	....	128,870	128,870
American school, frame and corrugated iron	1	....	2,763	2,763
Police station, concrete and sheet steel	1	....	3,493	3,493
Native church, frame and stucco	1	....	44,966	44,966
Bakery, adobe	1	....	48,283	48,283
Native market, wood and corrugated iron and adobe	1	....	16,510	16,510
Native market place, frame and corrugated iron	1	....	8,101	8,101
Hospital extension	....	....	31,264	31,264
Converting frame and corrugated iron houses to adobe, additions to houses, and miscellaneous items of welfare construction				531,656
Total				$1,922,000

The buildings erected at Braden from 1916 to date inclusive are shown in Table B.

TABLE B. BUILDING OPERATIONS AT BRADEN

Total			... ..	$2,225,000

SCHOOLS

At Braden the population is somewhat scattered and a number of small schools, conveniently situated, has proved the most practical solution. At Chuquicamata,

NATIVE SCHOOL AT CHUQUICAMATA

where the Americans and Chileans are collected in their respective villages, central schools for each have been erected. The number of American children of school age is comparatively small, and school facilities have been provided accordingly.

There are 888 Chilean school children enrolled on the property, and a modern school constructed of a wooden framework covered both on the exterior and interior with metal lathing and plaster has been erected. It consists of a front 280 ft. long, with wings at each end extending back 38 ft. at present, but designed for further extension where required. The present building contains four classrooms for boys and four for girls, with the necessary coat rooms and other modern facilities, including a central steam-heating system.

HOSPITALS

The hospital at Chuquicamata had its beginning in one building and has grown with the other features of the plant. At present it consists of six one-story buildings conveniently grouped, which contain an operating room, a dispensary, a sun porch and complete modern equipment, with ward space for seventy-five patients.

Braden is provided with emergency hospitals at isolated communities and a central hospital at Sewell. The latter consists of two stories and basement and contains a well-equipped operating room, dispensary, consultation room, a sun porch and ward accommodations for fifty patients. The building and equipment cost approximately $300,000.

CLUBS

No buildings especially for club purposes have been erected at Braden, the entertainments being held in the Sewell gymnasium or other suitable buildings.

A very handsome American Club has been erected at Chuquicamata at a cost of $128,000. This building contains a large reception hall, a ballroom with a stage at one end, billiard room, reading room, dining room and kitchen, a bowling alley and a swimming pool 20 by 50 ft.

POTABLE WATER SUPPLIES

The general water supply at Braden is suitable for both domestic and industrial purposes, and all that has been necessary is to extend the distributing system and put in house connections as required.

At Chuquicamata the main water-supply system originally installed carries water in which the salt content is too large for drinking purposes, and for a number of years fresh water for domestic use was purchased from the Antofagasta & Bolivia R.R. Co.

The Chile Exploration Co. has now completed a fresh-water supply system consisting of intake works and a pipe line sixty miles long, which connects concrete storage reservoirs at Chuquicamata with the Toconce Springs, situated in the mountain range east of the property. The system delivers 800,000 gal. a day to the plant and cost $1,600,000.

On the Braden property the town-sites for the mine, mill, and smelter are now at Sewell. A new smelter and town are being erected at Caletones, and there are also towns for the company employees at Coya and Pangal. At Sewell the sewage is carried down the steep mountain slopes to the stream below in open or closed drains. At all other town-sites sanitary sewerage systems have been installed.

Chuquicamata is situated on a comparatively flat pampa and a complete sanitary sewerage system has been installed. The system has a modern treatment plant consisting of Imhoff tanks that are capable of treating the sewage for a population of 10,000. The collecting

SURGICAL OPERATING ROOM IN HOSPITAL, CHUQUICAMATA

system can dispose of the sewage from a population of 20,000 and arrangements have been made to install a duplicate Imhoff unit should it become necessary.

SUMMARY OF EXPENDITURES

The total expenditures at the respective properties for welfare since 1915 have been as indicated below:

	Braden	Chuquicamata
Housing	$1,775,000	$1,475,000
Sanitation	125,000	214,000
Hospitals	321,000	34,000
Schools and churches	27,000	141,000
Stores	64,000	89,000
Amusements	17,000	166,000
Miscellaneous	50,000	17,000
Total	$2,379,000	$3,136,000
Additional housing authorized and under construction, but not completed	210,000	500,000
Grand total	$2,589,000	$3,636,000

The cost of operation or use of the so-called welfare facilities is from $400,000 to $500,000 U. S. currency per annum at each property. The following is a brief summary of the more important activities:

Housing

In the beginning, houses were supplied to all without charge. The first three types were entirely equipped with heavy pieces of furniture. At Braden, where hydro-electric power was cheap, these houses were

CATHOLIC CHURCH BUILT BY COMPANY

heated free of charge by electricity. The fourth type was partially furnished and the fifth type not at all.

Experience has shown objection to this system because of a tendency to abuse the free privileges. There was an ever-increasing difficulty in satisfying the employees in the allotment of the houses, and the single men objected that the married men should receive in the grant of a house so much greater real wage in addition to their money wage. At the Braden Copper Co. "staff" wages have now been increased to cover a charge for rent which is made for all staff houses. At the Chile Exploration Co. some of the objections to the free rent system have been overcome by a strict reservation of types of houses for positions in the organization. The problem, as indicated by the different systems in force at the two properties, has not yet reached its ultimate solution.

Single men were at first assigned a room and a house at which to board, but it has been found that greater contentment results from a variety of eating places from which to choose and from homes for small groups. The most popular development has been a special house to accommodate groups of from eight to sixteen men, each man having his own bedroom, with a common living room, dining room, and kitchen.

Complete statistics, which are used in the assignment of houses, are kept both of the proficiency in their occupation and suitability as tenants of the individual Chilean workmen. Prizes are offered to encourage cleanliness in Chilean workmen's homes and beauty in their garden plots.

Sanitation and Hospital Service

The sanitation corps inspect the water, the sewerage systems and the houses of the employees constantly. Garbage is collected daily and is either buried in the tailings dumps or flushed off in open canals to the river.

The hospital service is equal to that of our best American hospitals. Doctors and nurses are both Chilean and American trained and are of the highest type obtainable. The service includes a limited control of the personal habits of the Chilean laborers, who are encouraged to bathe and wash their clothes, and are obliged to be free from parasitic insects. To assure this, appropriate bathing and washing plants have been erected.

The death rate of the community compares favorably with that of other parts of the world, except in the case of the Chilean children. Even in this case the death rate is very low in comparison with other communities in Chile. Much is being done toward the education of Chilean mothers through contact with the American and Chilean nurses who visit the Chilean families regularly as a part of their routine work.

There is probably no other section of the welfare department upon which the contentment of the community is so much dependent as the medical section. The importance of the personality and ability of the chief surgeon in communities of this kind cannot be overestimated. Both Dr. William F. Shaw, of the Chile Exploration Co., and Dr. R. W. Richardson, of the Braden Copper Co., not only have the absolute confidence of the staff employees and their families, but the Chilean laborers have a respect and admiration for them, both as medical advisors and as their friends, which is a powerful and beneficial influence at the respective properties.

Churches

At one of the properties a picturesque Catholic church has been erected. At both the properties Catholic and Protestant services are held in the schools.

Education

There are two school systems, one for the children of foreign employees, the other for the children of Chilean workmen. The school for foreign children begins with the kindergarten and ends with the grammar-school course. Courses in Spanish are available to the foreign employees and their families.

For the Chilean children, native teachers, who are selected with great care, are employed, and although the schools (owing to lack of available government funds) are operated partly at the expense of the respective companies, they are under government supervision. Attendance and interest in these schools are rapidly and constantly improving. The progress that the second generation is making, the outward sign of which is an extraordinary improvement in cleanliness and dress, is quite a remarkable indication of the success of the educational work.

THE CHILEX CLUB AT CHUQUICAMATA

As auxiliary to the school system there have been organized brigades of boy scouts and a corps of girl scouts.

Night schools have been established to instruct the more ambitious Chilean workmen. The instruction in these schools begins with reading and writing and extends to mechanics and languages.

Amusements

It was early recognized that ample and varied diversion is necessary for the employees and their families if they are to be content. Clubs, moving pictures, festivals, bands, games, athletics, and horse races have been provided, and are kept going as actively as possible. They are an offset to the temptations of the various forms of vice which have appeared just outside the companies' properties, especially at Chuquicamata. In so far as it has been possible to do so the management of all clubs and amusements has been turned over to the employees. Wherever there has been the proper leadership in these individual undertakings they have become completely successful and in most cases self-supporting. A most unusual feature to be found in a mining camp is the Chilex Club at Chuquicamata. When one crosses its threshold on a dance night one feels that the ministering genius of the Andes has transported one from the desert to a gay ballroom in some big city of the United States or Europe.

Stores and Markets

The companies operate stores and markets at both properties. Of all the human problems arising in the operation of these properties probably the store problem is the most vexatious and difficult. The companies provide and operate stores of necessity, either because no one else provides them in these isolated communities or else as a protection to the employees from profiteering by independent merchants. The stores at both properties have made heavy losses. It is the aim at both places to operate them without profit or loss.

A recent experiment in connection with the store at Chuquicamata is proving very successful. A committee of ladies, expert in household craft and economy, has been formed to both assist customers in purchasing and to give advice on household matters. The committee has a permanent representative in the employ of the company.

Policing

The police are of two kinds, watchmen and government rural police. The watchmen have no authority and serve little purpose other than to watch for trouble and report to headquarters. On the other hand, the government rural police were generally recruited from the ranks of ex-soldiers and are commanded by regular army officers, who have great authority and succeed in maintaining excellent discipline and order.

A national savings bank has been established at each one of the properties. Deposits of workmen are constantly increasing.

Safety-first work as it has been perfected in the most modern industrial works in the United States has been applied to the full extent in these two South American properties. Perhaps the only deviation from modern United States practice is the difference in the sense of humor between the United States safety-first cartoonist and his Chilean disciple.

NATIVE CHILEAN HOMES AT CHUQUICAMATA BEFORE IMPROVEMENTS BY AMERICANS

The welfare problems at these two properties are made up of conditions that are perhaps unique, in a general subject that is as yet little understood, and from which little empiric information is available. Great strides have been made forward. The Chilean laborer, who five years ago lived in a hovel in filth, with all the mental degradation that is concomitant with such surroundings, today lives in a small but comfortable home, enjoying the fundamental facilities that modern hygiene affords. Instead of the ragged, barefooted, irresponsible laborer of five years ago, there is a well-dressed, well-shod workman with the spark of ambition burning within him. Great as has been the improvement with the men, it has been even more marked with the women and children. The latter, in

their school house, compare favorably in appearance with the children in the public schools of the United States.

With this social change the Chilean laborers have developed great intelligence and adaptability and have advanced rapidly in efficiency. They have been made expert miners, mechanics, smelter, and mill men, steam-shovel and locomotive operators, all through their work at these plants and through the social progress that they have made. Experience at these properties has taught that so-called welfare work is worth while, not only from the human but from the economic results to be achieved. These companies have now a skilled, permanent class of employees instead of the roving, unambitious class of laborers, from which they formerly had to draw.

An analysis of accomplishment evinces two factors that stand out as worthy of consideration in the work that has been done. The first is that the old saw, "What is everybody's business is nobody's business," applies with particular force to welfare development. So-called welfare work is perhaps the most important means to the end of the successful operation of any industry in which, after all, the human factor is the most important agent, and the best leadership and exceptional personality is needed to direct it. Because of this leadership, the staff employees, and more recently their wives, are evidencing a growing interest in the government of their mining cities and in the well-being of their inhabitants. It is the development of this community interest and the widespread feeling of responsibility for the less fortunate by the more fortunate that is the greatest indication of real progress.

The second is that welfare work needs more than a bank check to achieve success. The welfare movement is essentially a human one and unless it is approached in a human way will not thrive. Unless the work has for its foundation principles based upon the firm conviction that humanity progresses, that human progress means efficiency, and, last and first, that commerce is a means and not the end, that there is only one end—humanity—then the welfare movement may become a whirlpool of anarchy, and like a torrent behind an insecure dam may break loose, carrying everything with it to destruction.

Signaling Mine Hoists From Moving Cages

The problem of signaling to the hoisting engineer from a moving cage in the shaft has been considered by many mine operators, says C. A. Allen.[1] Several methods are in use, and it is believed that they have been further developed in Utah than in any other state. The latest installations are of interest because they use a very low-voltage circuit for the shaft wires and also because the wiring can be so arranged that the hoist can be stopped from the cage, if so desired.

The first installation in Utah was placed in the shaft of the Centennial-Eureka mine, and has been in continuous and satisfactory operation for twenty-one years The arrangement consists of two bare wires in the shaft carrying a current at 60 volts potential, with a device on the cage for making connection between the two wires. This device is simply a short piece of wire which is thoroughly insulated from the cage and is operated by a short lever. Whenever the cage rider wishes to signal the engineer he pulls down the lever, forcing the short wire out against the two bare wires, thus making a circuit which rings the bell in the hoist room.

Later a similar system was placed in the shaft of the Eagle and Blue Bell mine, at Eureka, but dry batteries were substituted, reducing the voltage to about 10. This shaft is wet in places, but no trouble has been experienced. The hoist is a double-reel modern electric machine with oil-operated clutches and brakes. The clutch and brake for each reel are actuated by different movements of the same control lever. The hoist has the usual safety devices, such as limit switches in the headframe, position switches for each reel, and ball-governor control. These safety devices are operated by what may be termed the control wiring, which is in series with a no-voltage release on the switchboard. Should the circuit in the control wires be broken, the no-voltage release acts, which cuts off the power and automatically applies the brakes. For example, if the cage should be pulled up to the limit switches, the circuit would be broken, automatically stopping the hoist. This arrangement of wiring for the safety devices is not materially different from that used on other electric hoists.

In the Eagle and Blue Bell shaft there are two No. 4 bare copper wires, one on each side of the shaft guides. One of these wires is used for signaling from the levels, the second wire forming the return. The second wire is also used to make the circuit for ringing the bell from a moving cage.

As regards signaling from the cage, it may be assumed that there is only one bare wire in the shaft, this wire extending into the hoist room and through an ordinary Western Union relay switch to the ground. On the cage is a battery of six dry cells inclosed in a piece of iron pipe for protection. One terminal of the battery is connected to the hoisting cable and is thus grounded through the hoist. The other terminal is connected with an ordinary push-button switch and a piece of curved copper plate which, by means of a small lever, can be pushed out against the bare wire. The push button is on the same lever. When the cage rider pulls the lever, at the same time pressing the button, current flows from the dry cells through the bare wire, through the relay into the ground, thence through the hoist cable back to the cells. The current flowing through the relay closes a separate electrical circuit, which rings the signal bell. The current for the bell circuit is supplied by thirty dry cells in the hoist room, but connection could be made with a direct power or lighting circuit.

The important feature of this arrangement is that the dry cells, placed on the cage, give a low-voltage current, only ten or twelve volts, eliminating all possibility of danger, such as would be present were higher voltage used. Also, if the contact lever should be accidentally struck and contact made with the bare wire, the circuit would not be completed, because, to close it, the button must be pushed at the same time the lever is thrown. The use of the relay in the hoist room is also important, because it permits the use of a low-voltage current in the shaft and a higher voltage to ring the bell.

To stop the hoist from the cage by the same wiring system, it is only necessary to place in the control circuit of the hoist another relay so arranged that when the circuit is completed in the shaft this relay will *open* the hoist-control circuit. As soon as this circuit is open the no-voltage release on the hoist switchboard will be operated, cutting off the power and stopping the hoist.

Books in Coal and Metal Mining Towns

A Real Need in Most Mining Communities for Libraries—American Library Association To Undertake an Enlarged Program in Providing Reading Rooms for Industrial And Mining Centers—Scope of the Work

By T. S. da Ponte
Written for *Engineering and Mining Journal*

A SPLENDID field for welfare work and for the promotion of better citizenship is to be found among the men who devote their lives to mining. This despite the fact that some mining communities are "model" places in which to live, having modern libraries and schools, as well as other advantages. An infinitely larger number of mining camps and towns, however, possess no such attributes.

It is to the last described communities that the American Library Association desires particularly to extend a helping hand by urging that libraries be installed which shall contain not only books that are American through and through, that tell of the greatness of this country and the advantages of living in it, but which also provide special and technical books from which employees can learn all the details of mining work and processes. In this way those engaged in the mining industry may acquire a broader outlook and become more efficient and capable of advancing in the work in which they are engaged.

An investigation by George S. Rice, chief mining engineer of the U. S. Bureau of Mines, at the request of the American Library Association, has shown a void in the lives of miners and mining engineers which can be filled only by the proper kind of books. As an example, a report from C. A. Herbert, district mining engineer, at Vincennes, Ind., says: "As far as I can recall, the only mining towns in the Central District that offer library facilities to miners are the mining towns of considerable size. I do not recall a single mining camp in this field where the mining companies maintain a library or reading room for the benefit of the miners. I am inclined to believe if efforts were made along this line that a number of the larger companies would be

PERIODICAL AND GENERAL READING ROOM OF THE COPPER QUEEN LIBRARY AT BISBEE, ARIZ.
Maintained by the Phelps Dodge Corporation not only for employees but for residents of the community, which includes five [illegible] and surrounding farms. Books and magazines on trades and industries and special books on mining are pro[illegible]

very willing to furnish a small library, with the necessary reading room, for the benefit of their men."

J. J. Rutledge, mining engineer of the Bureau of Mines, at McAlester, Okla., sent me a letter saying: "In my judgment, library service is needed in Krebs, Carbon, Lehigh and Colgate, Pittsburgh, and Dow, Okla.; in Hartford, Huntington, and Russellville, Ark., and in Frontenac, Franklin, and Baxter Springs, Kan." However, Mr. Rutledge makes a more encouraging report from other localities, saying: "There is a very good city (Carnegie) library in McAlester, which is used, I believe, to some extent by members of miners' families living in McAlester. There is an excellent technical library in the mining town of Wilburton, Okla., where the Oklahoma School of Mines is situated. I have known of this library being consulted frequently by young engineers in search of technical information."

Writing from Golden, Col., D. Harrington, of the Bureau of Mines, says: "Mining camps in which libraries are needed are numerous, though it might be somewhat difficult in many places to establish a library, on account of the smallness of the camps." In the section in which Mr. Harrington is situated, however, he finds that "nearly all the larger mining localities have libraries, and in some of the smaller ones traveling libraries are found. Butte has a well-stocked public library, and at Miami, Ariz., the Y. M. C. A. has a library which is accessible to the miners." Mr. Harrington named Red Lodge, Mont.; Globe, Ariz., and Rock Springs and Sheridan, Wyo., as other districts in which libraries are accessible.

The report made by Carl A. Allen, chief mine inspector of the Department of Mine Inspection, Salt Lake, Utah, says, "In the metal mining districts there are libraries available at Bingham, Park City, and Eureka," and gives the following list of communities "which might be interested in obtaining library service: The Deer Trail mine, Marysville, Utah; the Mineral Product Corporation, Marysville, Utah; the South-Hecla, Alta, Utah; the Cardiff Mining & Milling Co., Sugar House Station, Salt Lake City, Utah; the Salt Lake Copper Co., Tecoma, Nev.; and the Vipont Silver Mining Co., Oakley, Idaho."

Mining communities are a particularly difficult field in which to instill the reading habit, because so many of the miners and their families are newcomers to the United States, and are without a knowledge of English. The American Library Association, however, purposes to surmount this obstacle by urging, as one feature of its enlarged program, the translation into foreign languages and publication of books which tell of American ideals and aims, so that our new citizens may come to know us better, and without the delay that would be inevitable if the information were not available until after the foreign-born worker had acquired a knowledge of English.

DELIVERY DESK IN REFERENCE ROOM OF COPPER QUEEN LIBRARY

Another feature, and one in which the Special Libraries Association is heartily co-operating, is encouraging the installation of special and technical libraries in industrial plants, merchandising establishments, banks, and in fact in all organizations where they will be found useful by both employers and employees. Also, the adoption of the county library system, which is designed to put books within easy reach of the people everywhere, is being strongly urged. The Association is continuing its service to the merchant marine, coast guards, light-

house stations, and men in the Public Health Service Hospitals, and is increasing its efforts to supply the blind with reading matter.

During the war the American Library Association did a great and helpful work in supplying more than 7,000,000 books to the men in service at home and overseas. General Leonard Wood has complimented the Association on its war service and has indorsed its enlarged program. In a letter he said: "I have read with interest the enlarged program of the American Library Association. During the war I followed the work of the Association closely, both at Camp Funston and in the Central Department. It performed invaluable service to our men, both as a means of recreation and education. I wish the Association the heartiest success."

P. P. Claxton, U. S. Commissioner of Education, has written: "I am greatly interested in the proposed plan for the enlargement of the activities of the American Library Association, and I wish for the Association the very fullest possible success in them all. . . . But I am most interested in the establishment of county libraries. Studies recently made by the Bureau of Education indicate that a very small portion of the people who live in the open country and in villages and small towns have access to any adequate collection of books. In more than two-thirds of all the counties of the United States there is no library with as many as five thousand volumes. It is, however, just these people of the small town, the village, and the open country who have most time for general reading and who would use good libraries to best advantage. I sincerely hope the American Library Association may be able to carry forward a plan which has long been dear to me: that of establishing public libraries in good buildings and with trained librarians in the county seats of all the counties, and then establishing branch libraries in the other towns and villages of the county, and using the public schools as distributing centers."

To carry on the work of the enlarged program, the Association, which has been in existence forty years, and which is composed of 4,000 librarians throughout the country, is now raising $2,000,000. This fund, however, will not be raised by an intensive campaign or drive, but will be obtained by library trustees, friends of libraries, and the librarians themselves.

The Potash Deposits of Alsace

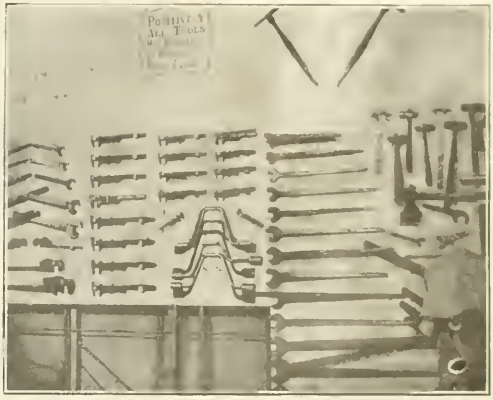
Potash salts were discovered in upper Alsace in 1904, in drilling for oil. Subsequent exploration and development, according to the U. S. Geological Survey, Department of the Interior, indicate that the deposits underlie an area of more than seventy square miles, and that the workable beds have a depth of about 2,000 ft. and range in thickness from 6 to 30 ft. The salts consist essentially of sylvinite, a mixture of sylvite and rock salt. Estimates place the quantity of potash salts in the deposit at 1,472,058,000 metric tons, which gives more than 300,000,000 tons of potash (K_2O).

The first mining shaft was completed in 1909 and production began in 1910. In 1913, a total of 40,707 tons of potash (K_2O) was produced from this source. The German Kali Syndicate, which controlled these mines as well as those at Stassfurt, determined the proportion of potash to be produced by the Alsatian mines at about 4 per cent of the total annual production from Germany. The main object in limiting the output was to prevent overproduction and thus a lowering of the price. When the Armistice was signed in November, 1918, the Alsatian mines were transferred to French control and apparently were in a very bad condition.

Tool Racks

Written for *Engineering and Mining Journal*

The problem of keeping track of tools in such a way as to permit of their being readily obtainable and quickly returned is one that every mine superintendent has had to face. The illustration shows how this troublesome detail is handled on the dredges of the Yuba Consolidated Goldfields Co.



TOOL RACK IN GOLD DREDGE

The number of tools in use on a dredge is large, and a tool board, such as the one shown, though not new in principle, effectively solves the problem. This tool board is placed on the main deck of the dredge on the starboard side and on the wall of the ladder-well close to the digging end of the dredge. Most of the tools too large to go in a rack are also kept at this place. Cleanliness, order, and the prompt return of tools are the invariable rule.

Molding Sands

Steel-molding sand is a white or yellowish clean quartz sand high in silica. It has no bond, and in order to make a mold with it a small quantity of fire clay, molasses water, or other material is added for binder. The size of the sand grain varies with the work to be done, according to the U. S. Geological Survey.

Iron-molding sand or foundry sand is siliceous sandy material used in foundries for making molds and cores for casting molten iron. It is usually of some shade of brown, may be clayey, loamy, or sandy, fine or coarse grained, and has strong bond when moist. From 3,000,000 to 5,000,000 tons is used annually.

Brass-molding sand includes sand used for molding brass, bronze, and aluminum. This is a very fine-grained sand with strong bond which will take sharp detailed impressions.

The Manufacture in Canada of Metallic Magnesium has been undertaken by the Shawinigan Electro Metals Co., Ltd., at Shawinigan Falls, Que., according to the Department of Mines.

Group Insurance Plan Popular

Meets Wide Application in Michigan Copper Country, First by the Calumet & Hecla, and Has Extended to Other Mining Districts—How It May Be Introduced, and The Approximate Cost to Employers

By Ballard Dunn*
Written for *Engineering and Mining Journal*

James MacNaughton, vice-president and general manager of the Calumet & Hecla Mining Co., has earned a reputation as a man of affairs. Like many American business executives who have been successful in a big way, there is an intensely human side to his character—in addition to being a practical business man, he is an apostle of practical humanity. The interests and welfare of the employees of those companies of which he has charge has always been the subject of his solicitude.

Workers in copper mines do not usually carry much life insurance, and the lack of it at the death of the bread-winner early attracted the attention of Mr. MacNaughton. He discovered that much misery commonly followed the death of one of the miners, and an investigation revealed the startling truth that about 20 per cent of his employees could not get life insurance if they desired it, because for one reason or another, they were not able to pass the necessary physical examination. He also found that approximately another 20 per cent could secure insurance if they wished, but had not provided for the contingency of death.

The result of these investigations was an arrangement with the Equitable Life Assurance Society for a policy of group life insurance, covering all employees in the Calumet & Hecla properties, an insurance policy amounting to nearly $10,000,000 and protecting the beneficiaries of between 9,000 and 10,000 employees.

Every employee who has served six months with the Calumet & Hecla Mining Co. is given an individual life insurance certificate for $1,000. At the end of the first year this certificate is increased to $1,100, and for every year of completed service thereafter an additional $100 is provided, until at the end of five years it has reached a total of $1,500. This maximum of insurance continues throughout the employee's services.

To make this arrangement, the entire number of employees was insured without medical examination and regardless of age, sex, or nationality. The premium for the entire program of insurance is paid by the Calumet & Hecla Mining Co.

Within a few days after the insurance went into effect, five deaths occurred among the older employees, upon which insurance benefits were promptly paid. This, in the language of Mr. MacNaughton, "did more toward making the insurance acceptable and appreciated by their employees than anything else could have done."

Employees Appreciative

One of Mr. MacNaughton's friends, speaking about his attitude toward group life insurance and his interest in it, said:

"Mr. MacNaughton is very enthusiastic about the group plan, and says that he has received several letters of appreciation from his employees. He also states that this is very unusual, as in all his experience in the handling of men, and he has had considerable, he has never received appreciations of this kind."

The most interesting side of the entire group plan, however, is in its effect upon the problems of employment. Mr. MacNaughton, expressing himself upon this point, says:

"I feel very confident that in order to compete with us in the employment of men, the other mining companies in this district will eventually have to adopt this or a similar plan."

This prophecy has in a large measure been fulfilled. Most of the mines in the northern peninsula of Michigan have introduced a similar program of group life insurance, among them the Seneca and Gratiot mines of the Lewisohn interests, the Michigan Copper Mining Co., the Mohawk Mining Co., and the Wolverine Copper Mining Co.

In addition to these copper mines in Michigan, the program has been extended to the Tonopah district of Nevada, where the employees of the gold and silver mines of the Tonopah Mining Co. are thus protected, and to the Ontario nickel district, where the International Nickel Co. has adopted the plan.

Group Insurance Was First Introduced Ten Years Ago

The Equitable introduced group insurance about ten years ago. It is based upon the principle that the selection necessary in securing proper employees furnishes the safety essential in all well-founded insurance programs. The business of issuing group insurance has grown rapidly, and today about one million industrial workers are protected by group life insurance, with a total insurance risk of nearly a billion dollars. It has been extended to such substantial concerns as the Union Pacific System, the Standard Oil Co., the DuPont companies, the American Sugar Refineries, the Skinner & Eddy Shipbuilding Corporation, the American Woolen Co., Montgomery Ward & Co., the General Electric Co., and the Thompson-Starrett Co.

The plan has been adopted by practically every character of business enterprise, from banks to foundries, and only recently the city of Albuquerque, N. M. has arranged for the insurance of all municipal employees, including the members of the fire and police departments and the teachers in the public schools.

The great mail-order house of Montgomery Ward & Co. was one of the first institutions in the country to cover its employees with this form of insurance. It has been in successful operation in that organization for nine years. Another organization which was a pioneer in group insurance is the Pantasote Leather Co., where the plan has also been in force for nine years.

*Equitable Life Assurance Society, 120 Broadway, New York.

Now for the practical side of the question: First, what is its cost, and, second, what is the basis of the plan upon which such a program can be introduced? I will consider the last of these propositions first, for the reason that the matter of cost, in a sense, depends upon the kind of plan adopted.

Broadly speaking, three general plans have been introduced and have been found effective: First, a flat sum for all employees, such as $1,000 or $1,500, to be paid to the beneficiary of deceased workers. Second, a sum predicated on the annual salary. Third, an amount graded according to length of service.

In all three programs a probationary or waiting period is usually provided before an employee becomes entitled to protection. This is for the purpose of making certain that the employee is really earnest in his desire to remain in employment. This waiting period varies from three months to one year, depending on the character of employment in the industry adopting the program. In both the plan based upon salary and the plan based upon service, a minimum is provided, as well as a maximum. The minimum has in many cases been set at $500, but, because of the increasing cost of living, the tendency is to make this minimum more nearly approach $1,000. Under the service plan, the usual program is to add to the minimum established, $100 for each year of completed service, until the maximum reaches the amount which has been set, which may be as high as $3,000.

A higher level of insurance is provided, if insurance be in the second form noted, for executives and department heads. A safe rule is to stipulate a level two and one-half times the level of the average of the general group. Here, too, there is a maximum of $5,000, but this higher maximum will be possible only in large groups. In fact, the maximum in all instances is regulated mainly by the total number of lives covered in the group.

Cost 1 to 1¼ Per Cent of the Annual Payroll

The cost of group insurance can be determined accurately only upon the statistics within the industry, the number of employees to be covered, the ages of these employees, and the amount of insurance at risk in each individual case. If the program is based upon length of service, this further fact must be taken into consideration, as it may involve increased amounts of insurance to those longer in service, who, in most instances, are also the older lives. It may be fairly stated, however, that the cost of a program of group insurance ranges from 1 to 1¼ per cent of the annual payroll. If the service program is adopted, the amount of insurance at risk is often less than the amount of the payroll, and in these instances, of course, the cost is predicated on a like percentage of the amount of insurance at risk. The cost will be somewhat reduced if the insurance is taken in companies issuing participating forms, as this program guarantees to each employer the benefit of any superior mortality which may be experienced in his industry as an outgrowth of improved working conditions.

The law provides that those to be covered under a program of group insurance must all be employees of one employer, and the number of employees to be covered in any one group may not be fewer than fifty. It is possible, however, to insure all of the employees in any one or more of the departments of a business, if these employees number at least fifty. It is also provided that in determining the amount of insurance, or the individuals to be entitled to it, the basis of selection must not rest upon the individual selection of the employees themselves or the employer. In other words, all employees in a given class must be covered, without regard to the individuals themselves.

Osmiridium Production in Tasmania

The mining of the rare mineral osmiridium in Tasmania is attracting widespread attention, and it is said that the island promises to be the world's chief producer for some time.

For months the Tasmanian Mines Department has been investigating the osmiridium fields of the west coast. The work includes a complete geological survey of the various fields in which osmiridium occurs, from Nineteen Mile Creek, in the north, to Wilson River, in the south; and the manner of the occurrence and distribution of this precious metal, which is now worth about £40 [$195 at normal exchange] per oz., has been carefully investigated. The publication of the complete bulletin is expected to throw much light on a highly interesting mineral occurrence.

It was not until 1910 that the Tasmanian Mines Department officially took notice of osmiridium among its mineral resources, and then efforts were made to ascertain values and outputs. These have since been carefully placed on record, thus enabling the state to enter the world's markets and attract attention to its new and promising source of mineral wealth.

The Department of Mines ascertained in 1910 that 120 oz. had been produced in that year, and by its assistance the output in the following year was more than doubled. In 1912 the output rose to 778 oz., and in 1913 it was 1,261 oz. This figure would have been far surpassed in 1914, it is stated, but for the war, and actually stood at 1,018 oz., despite the check the industry received. Under the influence of the war for the next three years the output was 247, 222, and 332 oz., respectively.

As osmiridium was a precious metal requisite for munitions of war, manufacturers, finding their usual sources of supply cut off, turned their attention to Tasmania. This resulted in keen buying, which sent the output up to 1,606 oz. in 1918. With the close of the war the rush collapsed, and for the first quarter of 1919 only 209 oz. was produced, but more stable conditions set in, and the production for the year reached the record total of 1,669½ oz.

The Tasmanian Mines Department recently published a highly interesting bulletin on osmiridium mining in Tasmania, prepared by Campbell Brown, who personally investigated the fields. According to this bulletin, the precious metal is found in various districts in the west of Tasmania, all of them more or less remote and somewhat distant from each other, yet bound together by a common invariable feature, namely, the occurrence in the neighborhood of great masses of serpentine rock. On the brow of Bald Head, in the Savage River district, facing Nineteen Mile Creek, there occurs an osmiridium mine which is unique. Here a well-known miner, according to the official bulletin, has been quarrying solid serpentine rock for over six years, and by crushing it obtained a high grade of metal. He is the first and only miner in the world, so it is officially noted, to find the precious metal actually occurring in the solid rock.

A Specialist in Human Engineering

Charles L. Close

SHAKESPEARE said, "The man that hath no music in himself, nor is not moved with concord of sweet sounds, is fit for treasons, stratagems, and spoils . . . Let no such man be trusted." The modern philosopher decrees that a man need not necessarily possess a fondness for music to merit the esteem of his associates, but he should at least acquire a hobby. And in this respect Charles L. Close is indeed fortunate, for he has two—fishing, and the study and administration of welfare work. Vacations are few in the life of a man as active as Mr. Close, but to one who is fortunate enough to listen to a recital of one of "Charlie's" fishing trips there remains little doubt as to the keen enjoyment which he obtains from his visits to the haunts of the finny tribe during his holidays. Certainly Izaak Walton never had a more ardent disciple. But thoroughness is characteristic of the man and his work, and so it is that C. L. Close is recognized today as one of the foremost figures in the development of safety, sanitation and welfare work in the iron and steel industry. Probably the first attempt at a concerted study of the human side of industry in this country was instituted in 1906 when the United States Steel Corporation initiated activities which resulted in the appointment of committees to investigate welfare matters. This action was followed by the appointment of a safety committee, comprising officials of the corporation and representatives of the larger subsidiary companies who had already given some study to the subject of accident prevention. Finally, in March, 1911, the Bureau of Safety, Sanitation, and Welfare was organized. This bureau carries on the administration work of the various committees dealing with these subjects. Although established primarily for the benefit of the corporation, the Bureau is constantly in touch with state and national authorities, other employers of labor, representatives of foreign countries, and many other individuals interested or actively engaged in this work. Such co-operation has been of great benefit not only to labor but to the operators as well.

CHARLES L. CLOSE

Space does not permit more than the most condensed statement concerning the accomplishment of the welfare movement as developed by the United States Steel Corporation. During the last eight years the company has spent over seventy-one million dollars in welfare, sanitation, accident prevention, relief, pensions and stock-subscription plans. That this expenditure has been justified is evident from the facts that the work is being continued and other companies have instituted similar organizations. The mining industry in particular has gained from the example set by the corporation in the splendid work of humanizing industry. The two metal-mining subsidiaries, the Oliver Iron Mining Co., operating in the Lake Superior region, and the Tennessee Coal, Iron & R.R. Co., in Alabama, in carrying out the general plan instituted by the Bureau, have set the safety standards now followed by several other mining companies, so that the industry today is free from many of the former hazardous conditions. Healthful and pleasant surroundings, better housing conditions, education, and Americanization have supplanted earlier ideas in regard to mining communities. Charles L. Close was born at Shelby, Ohio, in 1874, and at the age of nineteen entered the employ of the Shelby Steel Tube Co. Later he was transferred to the position of assistant superintendent of the company's plant at Greenville, Pa., following which he was made superintendent. In 1908, as safety inspector for the National Tube Co., he became an active figure in the safety movement, which was then beginning to receive attention in this country. Upon the formation of the Bureau of Safety, Sanitation, and Welfare by the United States Steel Corporation, Mr. Close was made manager, and he still remains in active charge of that work. It is through his efforts and those engaged with him that the conditions under which the employees of the iron and steel industry work and live today are superior to those in any other basic industry in this country or throughout the world.

Mr. Close's service to the mining industry is well illustrated by the interest in human engineering, some examples of which are detailed in this issue.

By The Way

"The Term Is Archaic"; Excuseitplease

The *Canadian Mining Journal* takes exception to our reference to "British American" nickel deposits. The editor says: "'British America' is correctly used to cover Canada, the British West Indies, British Guiana, and Honduras, from a geographical point of view, but applied to Canada today the term is archaic, if innocently used; and if deliberately chosen it is not well chosen."

On the Welfare of Bees

State bee experts of Arizona, well known, of course, like all experts, have found a very sickly condition to prevail among the bee colonies of the Verde Valley. This is attributed by the bee owners to the smelter smoke from Clarkdale and Clemenceau, the resulting mortality among the bees being so great as to be expressed in terms of hives instead of lives. Thus, perhaps, begins a new chapter in the smoke-nuisance history. It is said that, in consequence, chemists at the smelters referred to are running around taking samples of air about the plants, though there is nothing new about this practice. Perhaps the bee experts can breed a bee that will thrive on SO_2 and even give a sulphuretted honey. Springtime users of sulphur and molasses may be glad to make a change. This is a better course for the bee owners to pursue than that of suing the smelters, which policy has been followed somewhat to extremes.

Oil Behind Donnelly's Store

The *Kennebec Journal* reports oil on the water behind Donnelly's store in a town up river from Augusta. "Much interest," it says, "is being shown in the mysterious finding of some form of oil along the river banks and in the water behind the Donnelly store and above there for some distance. During the week," it adds, "a chemist has worked on it but has found no solution. The further it is investigated the greater seems the mystery." Truly, here is a subject for a dime thriller. "The Donnelly Store Mystery or Who Upset the Oil Can?" We are not experts on Kennebec oil, but our guess is that, year in and year out, they will get more ice than kerosene back of Donnelly's store.

Yo Tambien

A little knowledge of foreign languages is often of advantage, but there are times when silence ranks second best to absence. In the old days, before New Mexico attained statehood, a garrulous follower of mining became stranded in the Red River camp, in Taos County. This genius tried his hand at everything, from soliciting trade for an expiring assay office to acting as capper for a clique of poker sharps, careful always to seek what promised the minimum of actual physical labor. As the county election approached, there seemed a faint chance of getting nominated for sheriff. One of his own party in camp advised him to get solid with the Mexican element; coached him for two days in common phrases of salutation, and together they set out to contribute their society and a gallon of fire-water at a *junta* over in Taos. Arriving at nightfall, they tied their mounts and approached a large adobe building where waving pine-knots indicated that several Mexicans were conversing about something important. To each shrug and muttered curse, Barkis responded with bobbing courtesy and a cheerful "*buanus tardus, ahmeego,*" or "*salood, hairmanno*"; while his escort made a slower but more diplomatic progress with the jug. With a growing feeling of importance, Barkis crowded his way toward the platform, where a grimy and impassioned orator was reaching the climax of a denunciation of all *gringos*. Finally the speaker cast down his mantle, tore open his shirt, suddenly flashed a long knife from some place of concealment and vehemently pounded his chest as he declaimed, "*Si tuviera yo el conocimiento que aun una pequeñissima gota de sangre gringo atravesaba este humilde corazón, con este puñal me abro el pecho para arrancar de mi cuerpo tal mancha vergonzosa**." The silence of the ensuing dramatic pause was broken by the prospective candidate, who pounded his own chest as he reverberated "*Yo tambien*†!"

Dangerous Ignorance

A fire boss at some Eastern mine recently asked for information regarding the nature of explosives, temperature of detonation, and the like. The desire to inform himself is praiseworthy in the man. But it seems as if he ought to have known some of these things before he got the job. How many fire bosses are there underground in our coal and metal mines who are similarly ignorant?

Local Color

The *Press Bulletin* of the U. S. Geological Survey is a staid sheet that deals with statistics and gives advanced digests of geological reports and activities of the Survey. One does not look for high lights except in figures, and something more than a liberal education is needed to appreciate such high lights when they do occur. Probably one of the least promising in this way of interest is the description of a topographical map. We must confess that we would find it difficult were we put to the task of describing one. But not so with a recent description of a new Government map of an area in southwestern New Mexico. The writer of this description is indeed one who is not held down by the four walls of a government office in Washington, as the following short quotation will show:

> It is typical of the desert region of the Southwest, where the flats are very flat and the mountains are very steep; where all the year's rain comes down at once in a torrential flood; where, for more than ten months of the year, few clouds fleck the copper dome of the sky; where the intense glare of the afternoon sunlight gives way to a rich golden sunset, which is in turn followed by a soft, purple twilight. Here the summers are long and the days are hot, but the nights are invariably cool. No trees grow here except the hardy mesquite—which produces more wood for fuel from its roots than from its trunk and branches—and a stunted juniper, which is found in the hills. Turbulent creeks come tumbling out of the Tres Hermanas Mountains, in the western part of the quadrangle, but on reaching the level lands, overcome by the heat, they vanish into thin air or crawl underground.

Cochise County, Ariz., was named for the famous chief of the Chiricahua Apaches, according to H. H. Bancroft. But wherefore "Cherry cow" for "Chiricahua"?

*If I knew that even the least drop of gringo blood coursed through this humble heart, with this dagger would I open my breast, to tear such a disgrace from my body.

†So would I.

CONSULTATION

Resources and Commercial Application of Iceland Spar

"Several ledges containing Iceland spar have been discovered recently in the Warner range of mountains in Modoc County, Cal. These ledges are not made up entirely of the Iceland spar but are a mass of calcite crystals in which the Iceland spar occurs in kidneys.

"A portion of the spar in one of these kidneys may be perfectly transparent and show marked double refraction while another part of the same crystal will be cloudy. I will appreciate any information as to how this stuff is mined, where the crystals large enough for lenses can be sold and also where the smaller fragments of clear material can be disposed of.

"My information is that there is only one other deposit of this stuff in the U. S. and that is in Montana. Can you tell me whether or not this is being mined at this time and just where it is located?"

Iceland spar is a variety of calcite, clear and transparent and unusually free from imperfections and impurities. Transparent crystals or cleavage pieces of calcite of any appreciable size are very rare, and as Iceland has furnished almost all of such material used, the name Iceland spar has been given it. Optical uses consume the highest grade of Iceland spar.

Elongated cleavage rhombohedrons of Iceland spar are used in the manufacture of nicol prisms, which are an essential part of optical instruments requiring plane polarized light, as, for example, certain microscopes, dichroscopes, and saccharimeters. The material, on account of its simple chemical composition and purity, finds application in chemical standardization. Iceland spar is also used in the manufacture of some kinds of glass, and some of it is sold as mineral specimens.

Pieces of Iceland spar, according to the U. S. Geological Survey, either in single untwinned crystals, or parts of such crystals, or in homogeneous untwinned cleavage rhombohedra, which are large enough to yield a rectangular prism at least 1 inch long and half an inch thick each way and which possess the properties described below, are suitable for optical purposes. The colorless material must be so clear and transparent that it is limpid and pellucid. It must not be partly opaque on account of numerous cracks or fractures, must not show any internal, iridescent, or rainbow colors due to incipient cracks along fracture lines, nor any cleavage, nor twinning planes. Neither can there by any capillary or larger tubelike cavities, nor cavities or bubbles of any shape, nor inclusions, as isolated particles, veins, or clouds, composed of minute crystals of some other mineral or of any kind of foreign substance. The spar should not be discolored or stained by the presence of any clay, iron oxide, or other material. It should be noted that many of the inclusions and imperfections of Iceland spar are not always scattered irregularly through the mineral or even segregated in distinct masses, but frequently lie in a distinct but very thin plane which can hardly be seen if looked at on edge. In examining a piece of Iceland spar for defects the piece should therefore be turned in all directions while held to the light.

The material suitable for optical uses naturally brings the highest prices, as it has to be at least of the dimensions already given. Specimen material is generally of a larger size. The material used for standardization, chiefly chemical, need be of no special size, and the smaller pieces are as usable as the larger ones.

The optical variety of Iceland spar produced in the United States, sold, per pound, for $3 to $4 in 1914, about $8 in 1915, as high as $20 in July, 1918, and in 1919, according to the U. S. Geological Survey, was worth $15 per pound. The specimen variety sells for considerably less, and material for standardization sells for from $1 to $2 a pound.

The following firms are buyers of Iceland spar suitable for optical use: Bausch & Lomb Optical Co., Purchasing Department, Rochester, N. Y.; Central Scientific Co., 460 Ohio Street, East Chicago, Ill.; Gilbert S. Dey, Superintendent Optical Department, Eastman Kodak Co., Rochester, N. Y.

The market for specimen spar is irregular, as the demand is usually very light. The best market will probably be found with some of the larger mineral dealers.

Standardization material may be sold to large dealers in general chemicals as well as to mineral dealers.

Although calcite is, next to quartz, the commonest mineral, the only locality outside of Iceland known to produce the variety Iceland spar in commercial quantity is in Montana, about 9 miles from Greycliff, Sweet Grass County, on the main line of the Northern Pacific Railway. The spar occurs in a nearly vertical fissure vein from 3 to 8 feet thick, which strikes northwest, traversing a gneissic rock for several miles, and has been produced by Dr. J. P. Rowe, Hissoula, Mont., and R. H. Cartwright, Greycliff, Mont.

Uses of Feldspar

"Will you kindly tell me if there are any other uses for feldspar than for ceramic purposes? What does the demand depend upon?"

Although most of the high-grade feldspar is used in the manufacture of pottery or the ceramic industry it also finds application as an abrasive in the manufacture of scouring soaps and window wash. A special use of exceptionally fine quality feldspar is used in the manufacture of artificial teeth. The cheaper and inferior grades of the material find use as a binder in the manufacture of emery and corundum wheels, in roofing material and concrete work and in the manufacture of glass.

The demand for feldspar is almost directly dependent upon the ceramic industry and hence closely follows the prosperity of that industry. During the latter part of the war the demand for pottery experienced a sharp decline because of the non-essential character of the pottery industry. With the return to peace, however, the consumption of feldspar will very likely increase, continuing the trend exhibited in the pre-war years from 1908 to 1914. Present prices for both crude and ground feldspar are higher than in 1917 of 1918.

THE PETROLEUM INDUSTRY

The Economic Importance of Oil Shales

BY MARTIN J. GAVIN*

It is the opinion of many that the oil shales of Utah, Colorado, Wyoming, and Nevada, and possibly other states, are extremely important as new sources of petroleum products similar to those now obtained from oil-well petroleum. Oil shales have been worked in Scotland and France for upwards of sixty years. In the former country the industry has been a successful one from a financial standpoint, especially of late years, although it is passing through a difficult period at present. The industry in France has not been nearly so successful as that in Scotland. The success of the Scotch shale industry has been partly brought about by the development of cheap processes for treating the shales and the oils produced from them, but mostly by local conditions, such as competition only with high-priced petroleum products, low labor costs, and the fact that the industry grew up in a densely populated region where a ready market for oil and ammonium products was available. A recent reorganization of the Scotch shale companies, combining them into one organization, is hoped to better the present condition of the industry in Scotland.

Oil shale contains little or no oil as such, but it contains substances which when the shale is subjected to destructive distillation yield gas, crude oil, and nitrogen-containing compounds, notably ammonia, as well as other products in small and probably of unimportant value for the most part. Oil shale as a rule must be mined much as coal is mined, crushed, and heated to a relatively high temperature in closed retorts which may operate continuously or intermittently. These steps are necessary to produce the gas, crude oil, and ammonia, the latter of which is in solution in the water obtained along with the oil.

The ammonia water is then distilled and the released ammonia passed into sulphuric acid, producing ammonium sulphate. The crude oil must be refined, much as petroleum is refined, to produce the various commercial products. The refining of shale oil is more complex and in all probability more costly than the equivalent refining of petroleum. However, undoubtedly the shale oils can be refined and can be made to yield many products similar to those produced when petroleum is refined. The oils produced from the oil shales of this country will yield gasoline, burning oils, and paraffin wax, all of which when properly treated will undoubtedly be satisfactory commercial products. Whether the more viscous grades of lubricating oils, such as lubricants for internal-combustion motors, can be produced from shale oils is doubtful, but it may be possible to do so.

Our immense oil-shale deposits practically assure us that, come what may, this country will still have its own sources of petroleum products. We should never have to be wholly dependent on foreign countries in this respect. From another standpoint the shales are also of great economic importance. The oil shales, especially of the Rocky Mountain country, occur in sparsely settled regions. Their development on a large scale means the bringing into these regions of a great number of miners and other laborers, often with their families, who will earn their living in the shale fields and spend their money in the same locality. Millions of dollars must be spent in erecting plants, developing mines and the like, much of which will be spent in the states where the oil shales occur. The shale-oil refineries will require sulphuric acid and other chemicals and supplies, which logically will be produced as near to the shale fields as possible, thus bringing in more capital and labor. Transportation facilities will be extended to meet the requirements of the shale operators, thus benefiting the regions now inadequately supplied in this regard. Prices of petroleum products in the regions contiguous to the shale operations can be expected to be relatively lower than they would be if similar petroleum products had to be shipped in.

It should again be emphasized, however, that development of an oil-shale industry to a scale sufficient to be of so much economic importance will require much study, time, and money. The oil-shale industry is no business for the man of little experience and small capital. It may be compared with the development of the low-grade copper ores of the West, in that it is a large, low-grade, chemical manufacturing enterprise, requiring capital, time, and trained men. The investor in oil-shale operations should know that he will probably have to wait for a long time for a return on his investment and that returns in all probability will be conservative. In spite of this, the day of the oil-shale industry is coming. When, it is difficult to predict, but some day it will undoubtedly be one of great importance.

*U. S. Bureau of Mines, Reports of Investigations.

Shipping Board Bids Meet With Slight Response

WASHINGTON CORRESPONDENCE

The outstanding feature of the oil situation as it pertains to the Shipping Board, as described by the recent bids, is that practically no bids were received from the older and well-established companies. With requirements of 30,000,000 bbl. per year on the Atlantic Coast and European ports, only one bid, that of the Mexican Petroleum Co. for 4,465,000 bbl., is considered to be satisfactory. No announcement of the attitude of the board has been made, but it is believed that some action must be taken by the board itself to control its own sources of supply. The needs of the Pacific Coast have been cared for through a contract with the Department of the Interior for the purchase of oil obtained as royalties under the oil lands leasing bill. Most of the bids contained stipulations for the loan of funds by the board for the construction of terminal and pipeline facilities and for the development of oil fields.

NEWS FROM THE OIL FIELDS

Welfare Plan Prevents Strike at Bayonne Plant

Demands of Men for Higher Wages to Await Return of Department Manager

An excellent example of the appreciation of welfare work by employees was furnished on July 28 at the Bayonne plant of the Standard Oil Co. of New Jersey, when the men declared themselves as unwilling to strike during the absence of W. B. Koehler, general manager, who put in the welfare department and is now on his vacation. Twenty pilers employed in the case and can department quit work after making a demand for more pay.. Several hundred laborers at the plant stated that they were dissatisfied with their wages.

The demand of the pilers for more pay will be presented to the officers of the company in New York by Superintendent Thomas R. Parker.

It is expected other workers in the Constable Hook plant will present a request for increased pay to Mr. Koehler upon his return. The welfare plan, instituted at the time Mr. Koehler took charge for the company, provided that the men should appoint representatives to treat with the company on all matters involving welfare or wages.

The welfare department is said to have been popular with the employees, and has been responsible for the formation of a band, baseball, and other athletic teams and many entertainments.

Rising Star District Proved

New Well Places Field Fourth in List of Eastland County Producers

From Our Special Correspondent

The Hilburn No. 2 well, in the Rising Star district of Eastland County, Tex., is reported by the Humble Pipe Line Co. to be making a good flow of oil from 3,100 ft. after having been shot. This is the second producing well in the district and proves the fourth oil field in the county. Hilburn No. 1 well, the first producer, was completed some time ago, and is one-half mile to the north of No. 2 well. The other fields in the country are the Ranger, Desdemona, and Pleasant Grove, brought in the order named. In the latter field, the Texas Co. reported two completions recently on its Littleton lease, making 500 and 200 bbl. of oil respectively.

Oil-field workers' unions are being organized in Texas by delegates of the Oil Field, Gas Well and Refinery Workers' Union of America. Local unions have been organized at Wichita Falls, Burkburnett, and Bridgetown, and an attempt is being made to induce all oil field and refinery workmen to join. No statements have been made yet as to the changes the union will demand.

Anglo-French Oil Agreement Announced

Co-operation between Great Britain and France with respect to Anglo-French oil interests in Rumania, Asia Minor, Russia, Galicia, and the French and British colonies is provided in an agreement the text of which recently has been made public by Parliament. The agreement provides for an equal division of interests in Rumania and for an equal share in the capitalization, management, and exploitation of such interests. In Mesopotamia France will receive, upon development, 25 per cent of the net output of crude oil at current prices; Great Britain agrees to support France in getting 25 per cent of the Anglo-Persian Co.'s oil piped from Persia to the Mediterranean through territory under French mandate. In consideration thereof, France agrees to the desire to construct two special pipe lines and adjunctive railways for the transport of oil from Mesopotamia and Persia through French spheres of influence to the Eastern Mediterranean. France generally renounces royalties and export and transit dues on such oil.

Boundary Disputes To Be Surveyed by Airplane

From Our Washington Correspondent

Twelve square miles and $200,000 worth of oil afford the basis for a dispute between the states of Texas and Oklahoma which will result in original proceedings before the U. S. Supreme Court during the December term. The territory along the Red River for several hundred miles eastward from the 100th Meridian to Texarkana is affected by the vagaries of this stream, which fluctuates from season to season. Twelve counties of Texas are thus uncertain as to just where their northern border lies. However, the present suit affects only twelve square miles where the oil rights are of such great value as to make the difference between the two states of serious consequence.

The preliminary engineering and mapping work which has been necessitated by this dispute is being arranged for by Arthur A. Stiles, State Reclamation Engineer of Texas. Mr. Stiles has been in Washington for about two weeks engaged in the necessary conferences looking to co-operation with the U. S. Geological Survey, U. S. Land Office, and the Air Service of the Army. It is anticipated that mapping by airplane under the latter service, together with topographic and land surveying work of the former two, will all be required by the Attorney General of the state, who is in direct charge of the suit.

Arkansas Proved as Oil Producer

Important Transfer Covering Large Acreage in Ouachita County Completed — Development in Other Counties

From Our Special Correspondent

The bringing in of the Hunter well in Sec. 13-15-19, Ouachita County, has proved the existence of commercial oil in Arkansas. Late in April the well had a show of oil at 2,121 ft. Immediately the Standard Oil Co. of Louisiana and the Louisiana Oil and Refining Co. jointly purchased this property, and operations were suspended, pending the perfecting of the title to the land on which the well was situated. The leases transferred by S. S. Hunter, the owner of the well, to the companies covered 21,410 acres in Ouachita, Union, and Columbia counties, for which the consideration was as follows: $850,000 cash; $1,000,000 to be paid for one-quarter of the first $4,000,000 saved and sold from the wells drilled on the properties, and an additional consideration of one-twenty-fourth of all the oil produced after the deduction of the one-eighth royalty. After the companies resumed operations about July 5, they decided not to drill further, as the mechanical condition of the hole was uncertain. The well was bailed and swabbed, and it was decided to put it on the pump, estimating that it would produce between 150 and 200 bbl. of oil daily of 38 deg. oil.

In Cleveland County materials are on the ground for a well near New Edinburgh, and a rig is in place for a well near Rison. The Arkansas Natural Gas Co. is going to drill near Hampton, Bradley County. Drilling is to be started near McGhee, Desha County, by the Shaffer Co.

Probably the next production in Arkansas will be the Humphries Petroleum Corporation well No. 1 in Sec. 23-15-19, Ouachita County. The present depth of this well is 2,940 ft. and it is being drilled in with standard tools. It is expected that the oil sand will be picked up at about 3,100 ft., this depth being correlative with the depth of the Straughan and Crawford well No. 2, Sec. 15-12-18. The latter well is now about 3,100 ft. and is in the producing oil sands.

June production of [illegible] bbl. per day, as reported by the Standard Oil Co. of California, shows a decrease of 5,254 bbl. daily as compared with May. June shipments were 313,769 bbl. per day, an increase of 18,660 bbl. daily as compared with May. Stocks were decreased 1,220,994 bbl. during the month. Thirty-six new wells were completed during June, with an initial daily production of 6,455 bbl.

ECHOES FROM THE FRATERNITY

SOCIETIES, ADDRESSES, AND REPORTS

Efficiency of Mine Labor from the Surgeon's View

Dr. Murray of the Bureau of Mines Lays Down Some Pertinent Principles

In a recent bulletin of the United States Bureau of Mines,* Dr. Arthur L. Murray points out very pertinently that the inefficiency of mine labor is often not the fault of the men but of external circumstances, some of which the employer can improve.

"During recent months," he says, "much criticism as to the efficiency of mine labor has been heard from various sections of the country. No doubt much of this criticism has been well founded. The present lack of efficiency and of stability is due primarily to a spirit of restlessness and partial irresponsibility engendered during the transition from war conditions to peacetime conditions.

"Besides this important element of war restlessness there are others which the intelligent employer must pay attention to. First, if they are to get satisfaction from men they must select them intelligently for the work which is to be done.

"In the selection of men the two main considerations are physical ability and adaptability. The laws of mechanics should be applied in the selection of men as in the selection of machinery. If a machine is required for a certain class of work, the type of machine known to be mechanically fit for such work is selected. Likewise, men should be selected with regard to their physical and temperamental fitness for the kind of work expected of them.

"So far as possible men should be selected for their stability. Frequent labor turn-over is costly in many ways. The cost of breaking new men in, the disrupting of mine crews, the increased office work of opening and closing accounts, to say nothing of the effect on morale, can be measured in dollars and cents."

Also, once the employee is selected and on the job, all previous precautions are useless unless he is handled right. Dr. Murray's remarks on this score are not new, but they will bear an endless amount of repetition.

"The successful and continuous operation of a mine is just as much dependent upon proper supervision of its manual labor as upon its mechanical equipment and technical supervision. Supervision of mine labor, if the desire is to build up an intelligent and efficient force, must be firm but sympathetic and understanding. The old type of boss characterized by his ability to drive men rather than direct and lead them is passing. Today we look more to intelligent leadership, technical training, and sympathetic understanding as attributes of successful supervisors of labor. Generally, workers will exert greater effort and accept direction from a man they respect and admire more readily than from a man whose chief claim to a superior position is his driving power."

Naturally, the physiological safeguards which must be provided for the employee, as well as the psychologic content, are present in the minds of the surgeon in full force. Dr. Murray observes on this score:

"Industrial medicine is one of the most potent means of promoting labor efficiency and has application to every branch of mining operations. In the selection and planning of camp sites, the sanitary engineer is indispensable in determining adequate water supplies; methods of drainage, including proper sewage disposal; suitable housing arrangements as regards light, ventilation and overcrowding; and provisions for the disposal of refuse and waste. Through medical welfare work, especially by popular instruction in personal and public hygiene, much sickness with its resultant suffering and time loss may be prevented. The average loss of time due to illness among the workers of the United States is nine days per year, or 900 days per 100 employees (about 2½ years). The greater part of this illness, with its time loss, is due to preventable causes."

This medical care, he points out should be prompt to be efficient.

"The medical and surgical care for workers should be as good as can be provided. The time loss from disabling sickness and injury can be materially lessened by prompt and efficient medical attention.

"This leads to the question, not only of remedial medicines, but of disease preventatives.

"Drinking fountains and sanitary latrines underground are recognized necessities of large mining operations and add much to the comfort and health of the men. The general care of underground workings in respect to keeping them clean and free from débris has a marked effect on the men. The sight of débris in passageways, drifts and tunnels encourages shiftlessness and carelessness."

Next to actual illness prevention comes the necessity of keeping men not only up and about, but fit.

"As a man lives so is he liable to work. The living conditions at any mine largely determine the type of labor that seeks employment and remains at that mine. A camp where housing conditions are poor, where sanitary conditions are below standard, where the general morale has been permitted to become lax, does not attract the best element.

"Not only is good food and good sleep necessary, but a man must have relaxation and that of a healthy kind.

"Approximately one-third of a man's time is employed at his labor. Another third is usually given over to sleep. The remaining third a man seeks diversion through recreation. This spare time through environment may be influenced for good or for evil. Every mining camp, if it desires to progress, must recognize that wholesome and health-building facilities for recreation are a necessity."

*Monthly Reports of Investigations.

Human Engineering by New Cornelia Company at Ajo

Modern Town and Dividend-paying Co-operative Store in Arizona Desert

The booklet description of the plant of the New Cornelia Copper Company at Ajo, Ariz., describes not only the mine and the reduction plant, but the human engineering works whereby the desert was made habitable for the employees.

The report states:

"To accommodate the employees of the New Cornelia Copper Co. and their families a new town was built. This town is located on the edge of the desert, within convenient reach of the mine and the plant. The attractive mission architecture preserves the traditions of the Spanish fathers whose hardihood made possible the development of the desert."

The artistic designing of this unusual mining town is shown in the accompanying illustration.

The life of the town, according to the report, "centers about a plaza, 360 by 200 feet in size, with bandstand, walks, trees and spacious lawns. On summer evenings dances are held on the broad concrete walks, and the shady lawns are the favorite meeting places for the citizens.

"On the east side of the Plaza is the railroad station. The large co-operative store, bank, restaurant and other business and amusement places occupy the modern business block, behind its broad arcades. Around the Plaza are grouped the attractive tile or frame dwellings of the American employees, and the new school building. A complete water, lighting and sewer system was installed before the town site was occupied."

The Mexican employees have their own town.

"Over the hill toward the mine is the Mexican town site, with its one-,

two- and six-family hollow tile houses, all harmonizing with the general architectural plan. The Mexicans have taken great pride in their clean and attractive homes."

The hospital is a substantial modern building of the best type.

"On a hilltop overlooking the desert is located the hospital. This has been the particular pride of the New Cornelia management. There are beds for thirty-five patients, and all the equipment is of the most modern type. Based on their earnings, employees are charged $2.00 and $1.50 per month for medical and hospital service for themselves and families. For this fee they receive all necessary treatment, including operations, hospital care and medical visits."

The problem of supplying food and other necessities to employees at a reasonable price, and frustrating the profiteering of the small merchants who so often infest a mining camp, was met by a co-operative store financed by the company.

Since there were no adequate stores at Ajo, the New Cornelia Co-operative Mercantile Co. was organized to sell merchandise to the employees of the New Cornelia Copper Co. and allied companies. The New Cornelia Copper Co. advanced money to erect the store and buy the stock, and assumes all risks. The store is managed by a store manager appointed by the New Cornelia company. A committee of seven workmen, representing the various departments, meet with the store manager once a month, making suggestions for the betterment of service, and presenting complaints which have been brought to their attention.

"The store carries a large and well-assorted stock. Prices are at the same level as in other Southwestern mining camps. At the end of each year, after deducting for depreciation on store equipment and fixtures, and a proper sum for surplus account, the rest of the profits are divided among the employees of the company in proportion to the amount of their purchases.

"To participate in store profits, employees must have been in the employ of the New Cornelia Copper Co., or allied companies for at least four months previous to the distribution of profits, which is made on December 20 of each year. This rule promotes the stability of the working force."

Actually the profit-distributing plan has worked, and resulted in substantial dividends.

"The following profits have been distributed by the Co-operative Store up to the present:

1917 (9 months)	$12,062.60 to 172 employees
1918	32,777.71 to 773 employees
1919	40,825.06 to 618 employees

"The average discount has been 15 per cent on total purchases by those who receive a share in store profits."

A STREET IN AJO, ARIZ., THE MINING TOWN BUILT BY NEW CORNELIA COPPER CO.

Lens Mines Resume Production

Pumping out of the coal mines of the Lens district is still in progress, as many of the mines are still flooded. The first coal brought to the surface there since the armistice in November, 1918, was hoisted July 20, 1920, according to an Associated Press report.

Plan New Token Money in France

Subsidiary Coin Supply To Be Reinforced and Safeguarded

Ever since the war began French currency has been reinforced by paper money of small denomination issued by, or rather guaranteed by, deposits at the Bank of France by the French Chambers of Commerce. These small bills were limited to circulation within the district of the Chamber of Commerce issuing or guaranteeing it. Today the steady and rapid disappearance of France's new silver coinage is compelling that country to adopt a similar policy for the protection of her supply of small change. According to a Paris correspondent of the *New York Evening Post*, the French mint has announced that metal counters, secured in the same manner as the small bills mentioned above, are to be issued and used as fractional currency throughout the republic. It is stated that:

"The new counters are to represent two francs (forty cents at par), one franc (twenty cents), and fifty centimes (ten cents). It will be impossible to make them a subject of illicit trading either for melting down or smuggling across frontiers, and they are not likely to be hoarded. They are to be made of an alloy nearly gold color, which will not tarnish like copper or bronze. They will have even the metallic ring associated with money."

In this connection it is interesting to note that a very recent advice from London states that in Germany the porcelain factory at Meissen is preparing, for the use of the cities of Meissen and Hamburg, porcelain tokens.

Good Lighting in Industry

It Fosters Safety, Contentment and Loyalty—The Cost Is Small for Results Attained

"Some one has said that light is a tool which adds to the efficiency of every other tool. The modern industrial manager goes a step farther, for he realizes that adequate lighting, both artificial and natural, is indispensable not only to efficiency but also to safety. He knows that the dark plant is the dangerous plant," writes C. W. Price, of National Safety Council, in a recent communication.

One of the large insurance companies made a careful study of the reports of 91,000 accidents and discovered that 10 per cent—9,100 accidents—were caused directly by the absence of proper lighting and that in 13.8 per cent—more than 12,000 accidents—inadequate lighting was a contributing cause.

The British government, in an extensive investigation of accidents, found that stumbling and falling are the most frequent causes of accidents resulting from the absence of light; and the report of the United States Census Bureau for 1918 says, "The greatest number of deaths charged to any one accidental cause, 10,330, is shown for falls." The investigation of the British government also revealed that during the four winter months deaths and serious injuries resulting from falls were 39½ per cent greater than during the four summer months, thus showing the bearing of light on accidents.

In all of the industries where efficient safety work is being done and where large reductions in accidents have been made, strong emphasis is placed on good general illumination of all departments. Investigations conducted by one of the leading illuminating engineers of America in 200 plants in which modern lighting systems were installed revealed that where rough work is being done, as in foundries and steel mills, the total output was increased 2 per cent, while in textile mills, shoe factories, machine shops and other industrial plants where fine work and close application are required, production has been increased 10 per cent by the installation of proper lighting equipment.

The economic value of good lighting becomes readily apparent when it is known that the overhead cost of adequate lighting is not more than one-half of 1 per cent of the payroll. In other words, a workman who is being paid $4 a day can be made a more efficient and a more careful workman through the expenditure of approximately 2c. a day for adequate lighting. Any plant manager appreciates that only a slight increase in production is necessary to add 2c. to the daily earning power of a workman.

Industrial managers are coming to realize that light not only increases output and decreases accidents, but also plays a most important part in making the plant a cheerful and pleasant place in which to work. In these days when management is giving the most serious attention to the attitude of men toward their work, and to questions of contentment and loyalty, a plant that is light, cheerful, and attractive no doubt has a great advantage over the dark, cheerless, and unattractive establishment.

Light has a positive influence in encouraging orderliness, cleanliness, and efficiency. In a plant where the windows have been washed, the walls whitened with paint specially designed to reflect light, and effective lighting installed, there has followed, almost invariably, a housecleaning on the part of both foremen and workmen—all of which makes for efficiency, safety, and contentment.

United States Mint at Manila Begins Operations

Complete Outfit Made at Philadelphia Mint—Coining Presses the First Ever Built at Any U. S. Mint

The United States Bureau of Insular Affairs is advised that the Philippine Islands mint at Manila commenced operations on July 15 and that the first coins minted there were bronze one-centavo pieces. The complete coining equipment at Manila is electrically operated and all its machinery has been constructed at our Philadelphia mint. The machinery as listed in the *Report of the Director of the Mint for the Fiscal Year 1919*, comprises 2 coining presses, 2 rolling mills, 1 cutting press, 1 topping machine, 1 strip shear, 1 upsetting machine, 2 tumbling barrels, 1 coin-reviewing machine, 1 automatic weighing machine, 1 six-foot bullion balance, 4 hand balances, 1 rotary annealing furnace, 6 oil melting furnaces, 5 sets of punches and beds, 5 ingot molds, and all accessories needed for the coinage of silver, nickel, and bronze.

The patterns of the coining presses are at the disposal of the United States, and these Manila presses, which have been built in the machine shops of the Philadelphia mint, are the first coining presses ever built in any mint in the United States. The accomplished task of designing, building, taking down and reassembling the equipment for the Manila mint, constitutes in itself a sufficient commentary on the ability and resources of the machine shop at the Philadelphia mint.

Students Flocking to French Mining Schools

There is a great congestion of applicants for admission to the French mining schools this year. The École Centrale has 3,000 candidates for about 540 vacancies; more than 900 are applying to the École Nationale Superieure des Mines, where there are but sixty-odd places; and for the sixty-five permissible admissions to the École des Mines de Sainte Etienne there are 250 candidates.

Breathing in Abnormal Atmospheres

Dr. A. Mavrogordato, M.A., M.R.C.S., of the South African School of Medical Research, recently lectured before the School of Mines, Johannesburg, Union of South Africa, on "Breathing in Abnormal Atmospheres." The follow abstract is from the *Financial Times* (London).

"Temperature, humidity and stagnation all entered into every atmospheric question. They were common factors in all work carried out in enclosed spaces, and were bound to have effect on breathing if ventilation were not properly attended to.

"For the purpose of his lecture Dr. Mavrogordato classified abnormal atmospheres into four groups: (1) Where the abnormal atmosphere was due to alterations in pressure, as shown in mountain climbing, aviation and in circumstances surrounding the work of the diver, and of men who worked in diving bells and deep caissons. The local effect of such alterations in pressure was felt by South Africans coming from the coast to the Rand, and vice versa by those who left this high altitude and went to a lower one. Mountain sickness and aëroplane sickness were quite common with many people.

"(2) The abnormal atmosphere obtained where air altered in composition. The normal constituents of air were oxygen (one-fifth), a trace of carbonic acid, and the remainder nitrogen. If the oxygen were removed the air would not support life; neither would it if the carbonic acid was increased. Sometimes they had both these things happening with fatal effects, as in the case of a recent fatal sewer accident. In that instance there would be present only a small amount of oxygen in the sewer and a very large amount of carbonic acid, and that was sufficient for a fatal effect. It was not due to any abnormal condition caused by sewer gas. It was, in fact, the 'black damp' of the mines, and was one of the great difficulties met with in the early days of the submarines—the presence of an abnormal quantity of carbonic acid formed in the process of the using up of the air within the submersible.

"(3) Then there were abnormal atmospheres caused by the fumes from burning explosives, introducing into the air the abnormal carbon monoxide. Coal gas was instanced by the lecturer, as were also the gases used in war—chlorine and phosgene.

"(4) The last abnormal atmosphere indicated was that caused by suspended particles in the air, reference being made to the dust problem, coal dust in coal mines and the harder and fatal dust of the Rand mines. According to the particular industry people were engaged in, where dust was prevalent, so there prevailed a particular type of trouble, instances being given of the diseases associated with the cotton and grinding industries and of the deadly fibrosis associated with quartz mining on the reef."

Book Reviews

Silver. By Benjamin White. Cloth, 5 x 7; pp. 144. Published by Isaac Pitman & Sons, Ltd., New York. Price $1.

We admire the compact form in which this handy little volume is issued. It is essentially the same book that appeared a few years ago under the same title in much greater and more impressive bulk. The present size is no criterion of its valuable contents, for although the size and price have decreased the value of the text has been enhanced by recent additions and changes to the pages.

The production, industrial consumption and utility of silver as money are dwelt upon at considerable length. Several chapters are devoted to descriptions of the silver minefields of the world and the modern methods of extracting silver from its ores. The historically interesting facts about silver used as an ornament, and in the arts generally, receive much attention. The evolution of British coinage is traced and the important part played by the Indian rupee and the Chinese tael and syece in the demand and consumption of silver is interestingly and clearly expounded. Many tables and illustrations are interspersed throughout the text.

Not the least important feature in the book is the section describing the marketing of silver and the control over the silver market exerted by four London brokers. The author, from his lifelong association with the silver market, is well qualified to write upon this phase of his subject.

The book is well worth the attention of anyone interested in silver, whether producer, seller or observer. F. E. W.

Technical Papers

Nickel Mining—There may be single ore deposits somewhere in the world of greater value, extracted and potential, than that of the Creighton mine, in Ontario, but we do not know where they are. To the end of last year, the mine has produced nearly nine million tons of about $35 ore, and the end is not in sight. The shoot of chalcopyrite and nickeliferous pyrrhotite dips at about 45 deg., and its cross-section varies in form from oval to narrow lenticular. The system of mining is shrinkage stoping, with main drifts in the foot wall, crosscuts in ore, and the use of rib pillars. The system of mining and the underground and surface equipment devised by J. C. Nicholls are scientific and modern, and the mine is one of the show places of America. It is described in an interesting manner in a thirty-six-page paper appearing in the "Bulletin of the Canadian Institute of Mining and Metallurgy" for July. (503 Drummond Building, Montreal; price not stated.)

Waste-Heat Boilers—The May issue of the "Proceedings of the Engineers' Society of Western Pennsylvania" (Union Arcade Building, Pittsburgh, Pa.; price 50c.) contains a thirteen-page article on this subject by members of the Babcock & Wilcox staff. Eight pages of discussion follow. Formerly, waste-heat boilers were constructed with a large gas-flow space to interfere as little as possible with the draft of the furnace to which they were attached. They were solely an appendage. As now designed, they are an integral part of the furnace installation and are generally provided with suction fans in the flue to maintain the draft to the stack. The article discusses the best arrangement to use, the subject of economizers, overload capacities, temperatures, and other interesting topics.

Potash—"Potash Deposits in Spain," (U. S. Geol. Survey Bulletin 715-A, 16 pages) and "The Potash Deposits of Alsace" (Bulletin 715-B, 38 pages) have been issued and may be obtained on application to the Survey at Washington, free of charge. In Alsace, mining began in 1909, and it is estimated that the known deposits contain the equivalent of about 300,000,000 tons of pure K_2O. The Spanish deposits were only discovered in 1913, and their extent is problematical. Suria and Cardona are the principal localities where the salts are found, and optimistic engineers report a potential production of 200,000,000 tons of pure K_2O at the former place.

Powdered Coal—Thirty pages of the May issue of the "Proceedings of the Engineers' Society of Western Pennsylvania" (Union Arcade Building, Pittsburgh, Pa.; price 50c.) are devoted to a paper on powdered coal and subsequent discussion. The subjects covered are: the conditions justifying the use of powdered coal; the cost of installation; the cost of handling and preparing coal; thermal efficiency; combustion; furnace and flue-gas temperatures; radiant heat; non-combustible matter; refractories; upkeep; human element; cleanliness; and safety. In an appendix, several pages of valuable data are given, including costs, comparing powdered coal against stoker firing of a 22,000-hp. boiler plant.

Australian Statistics—The Official Year Book of the Commonwealth of Australia, No. 12, brings up to the end of the year 1918 statistics on all manner of things connected with the commonwealth. It is a book of over 1,200 pages, containing a 29 x 39-in. orographical map of the country. Obtainable from the Commonwealth Bureau of Census and Statistics, Melbourne; price not stated.

Centrifugal Pumps—The mechanical principles underlying centrifugal pumps, their testing and practical operation, choice of motors for driving, and the methods of measuring head and discharge are described by Prof. R. S. Lewis in the *Mining and Scientific Press* for July 17. (420 Market St., San Francisco; price 15c.)

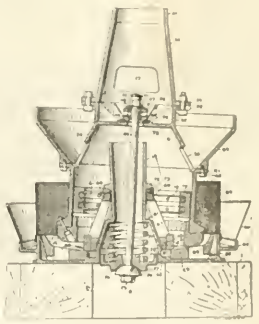
Recent Patents

1,341,686. Process of Extracting Platinum and Similar Metals from Their Sands and Ores. Russell Thayer, Philadelphia, Pa. Filed June 26, 1919.

A process for the recovery of platinum and similar metals from granular ore, which consists in commingling, with a charge of ore, a halogen compound of an alkali metal; subjecting the charge to the action of heat, whereby the metal is volatilized and removed from the ore; and collecting the volatilized metal, substantially as set forth.

1,341,581. Gyratory Crushing Mill. William W. Gibson, San Francisco, Cal. Filed Feb. 18, 1918.

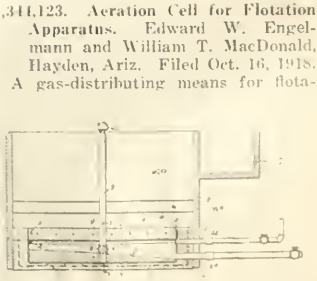
In a gyratory crushing mill, the combination of a die, a muller, means for gyrating said muller, a spring for pressing the muller toward the die, a



centrally located tension device for receiving said pressure from said spring, and rollers for receiving said pressure from said device and transmitting it to said muller.

1,341,123. Aeration Cell for Flotation Apparatus. Edward W. Engelmann and William T. MacDonald, Hayden, Ariz. Filed Oct. 16, 1918.

A gas-distributing means for flota-



tion apparatus comprising a cell having impervious concrete sides and a porous concrete top.

MEN YOU SHOULD KNOW ABOUT

L. F. Noble is preparing reports on nitrate deposits of southeastern California.

E. P. Mathewson, mining engineer, 42 Broadway, New York, N. Y., returned from Anyox, on July 17.

F. E. Downing, assistant general manager of the Shenango Furnace Co., is visiting the iron region of Alabama.

W. J. Loring, of San Francisco, Cal., was in Washington late in July. He was expected in San Francisco again by July 31.

Frederic R. Weekes, mining engineer, 233 Broadway, New York City, has returned from examination work in Montana and California.

Harold A. Linke, mining engineer, 266 Dooly Building, Salt Lake City, Utah, is at Hailey, Idaho, examining lead-silver properties.

Adolph Knopf and Mrs. Knopf, geologists, are at Mina, Nev., where they are engaged in a study of the ore deposits of the Simon district.

Frank M. Wichman, mining engineer, of Salt Lake City, announces that he is now at his new address, 307 Newhouse Building, Salt Lake City, Utah.

Mowry Bates, petroleum and mining geologist of Tulsa, Okla., will be in Wyoming and Montana on professional work during August and September.

George S. Rice, chief mining engineer, U. S. Bureau of Mines, is making a trip through western mining states during this and next month.

P. A. O'Brien, mining engineer, formerly manager of Constancia-Siempre viva mines, Pispis district, Nicaragua, was in New York City recently on a visit.

Jay Carpenter, formerly with the West End Consolidated and other Nevada companies, is now conducting a metallurgical testing works at Los Angeles.

K. C. Parrish, mining engineer, has established himself permanently in Barranquilla, Colombia, S. A., where he will engage in general engineering practice.

Col. John C. Greenway, general manager of the Calumet & Arizona Mining Co., is visiting the Eighty-five Mine, recently purchased in the Lordsburg, N. M., district.

Sir James Loughhead has recently been selected to succeed the Hon. Arthur Meighen as Canadian Minister of the Interior and head of the Department of Mines of the Dominion.

D. E. Winchester has completed his report for the Geological Survey on the oil shales of the Rocky Mountain region and now will devote his entire time to the direction of the oil shale operations of the Carter Oil Co.

Edwin E. Chase and **R. L. Chase**, mining engineers, Denver, Col., were making examinations of mining properties at Lake City, Ouray, and Rico, Col., during the third week of July.

A. C. Dart, of 1722 Williams Street, Denver, Col., is superintendent of the mine and mill of the Whale Mines Leasing & Reduction Co., at Cassells, Col., where he should be addressed.

Marshall O. Leighton, **C. T. Chenery**, and **A. C. Oliphant** have formed a copartnership under the name of M. O. Leighton & Co. with offices at 700 Tenth St., N. W., Washington, D. C.

Robert Linton, president of North Butte Mining Co., who has been in Butte, Mont., for a week in July looking over the company's properties, has gone to Nevada to inspect properties there.

ROYD R. SAYERS

Royd R. Sayers, past assistant surgeon in the Bureau of the Public Health Service, who has recently been appointed chief surgeon of the U. S. Bureau of Mines, completed a health survey of the Joplin, Mo., district shortly before his appointment in the Bureau of Mines. Dr. Sayers, who was born at Crothersville, Ind., in 1889, and obtained his primary schooling there, is a graduate in electro-chemistry of the University of Indiana. After completing that course he was graduated in medicine from Buffalo University and completed post-graduate medical courses at Chicago and New York. Immediately on finishing his schooling, Dr. Sayers joined the staff of the Public Health Service. His first assignment was at the Immigration Station at Ellis Island, New York. From there he was transferred to the Coast Guard cutter service which was engaged in ice patrol. He studied rural sanitation in Missouri and Oklahoma and was attached to the Hygienic Laboratory in Washington. At the request of the Bureau of Mines, the Public Health Service sent Dr. Sayers to the Butte district to study industrial hygiene. The assignment was extended so as to include several months' work in the Lake Superior region. Later he was put in charge of the study of the physiological effects of war gases. With the appointment of Dr. Sayers as chief surgeon, the Bureau of Mines is developing increased activity in the study of sanitation and general health conditions at United States mines. At present there is in progress a health survey of the iron district of the Lake Superior region, in which Dr. Sayers is himself taking some part. A similar survey is also being made in Utah. Dr. Sayers retains his commission as past assistant surgeon in the Bureau of Public Health Service.

Victor C. Heikes, of the U. S. Geological Survey, Salt Lake City, Utah, and **H. L. Williams**, of the Empire Zinc Co., Denver, Col., recently visited the Simon Silver Lead Mines Co. property in the Bell district, Nevada.

E. H. Gould, mining engineer with the Co-operative Mining Co., Lordsburg, N. M., has resigned to accept a similar position with the Duncan Mining & Milling Co., of Duncan, Ariz., whose general manager is **J. M. White**.

Arthur Crowfoot, superintendent of concentrators of Arizona Copper Co., has been spending a few days in Chicago and New York. On his way back from the East he visited Houston, Tex., to investigate the fuel-oil situation.

T. R. Arnold, chief electrician of the mining department of Arizona Copper Co., Ltd., Morenci, Ariz., has resigned to accept the position of electrical engineer for Southwestern Portland Cement Co., of El Paso, Tex., and Victorville, Cal.

Gerald G. Dobbs, safety engineer, St. Joseph Lead Co., Bonne Terre, Mo., has resigned to accept the position of general manager with the Southern Mineral Co., Winnfield, La. His present address is with the latter company at Winnfield, La.

L. A. E. Sauvage, professor in Ecole Nationale Supérieure des Mines, and Inspector General of Mines, Class II, has been retired at his own request. The decree of June 11 granting the request sets Aug. 16, 1920, as the date of retirement.

Rudolf Gahl, mining and metallurgical engineer, has been retained by Cerro de Pasco Copper Corporation, of New York, as consulting metallurgist in connection with that company's milling projects. Mr. Gahl sailed from New York on June 30 for Peru.

C. E. Carlson has been elected first vice-president of the Duluth, Missabe & Northern Ry. **Joseph Seifert** succeeds him as secretary of the railway. The new board of directors is: W. A. McGonagle, C. E. Carlson, J. W. Kreitter, J. W. Kempton, Joseph Seifert, W. H. Hoyt and C. W. Kieswetter.

J. Leonard Replogle, president of Vanadium Corporation of America and chairman of board of Replogle Steel Corporation, has been elected director of Berg & Hutton Steel Corporation in Teschen, Czecho-Slovakia, according to a *Sun and New York Herald* copyright Paris cable. Schneider Co. of Creusot, France, controls Berg & Hutton company.

Third International Mining Convention Held at Nelson, B. C.

Representatives of Mining and Allied Industries of Pacific Northwest Meet for Third Time This Year—Huge Market for Steel Declared To Exist on Coast by Nicol Thompson—Many Exhibits of Minerals and Manufactured Products

By L. K. Armstrong
Special Correspondent *Engineering and Mining Journal*

LOCAL and outside delegations, including about five hundred representatives of mining and allied industries, assembled in Nelson, B. C., on July 20-24, for the most notable convention yet held in this section of the Pacific Northwest. This, the Third International Mining Convention, held under the auspices of the Nelson, Slocan and Eastern British Columbia Mining Association, assisted by numerous other affiliated bodies, was also the third convention to be carried through to a successful conclusion this year in the territory mentioned. The first at Spokane was followed by one at Seattle and then, as if with the old German proverb in mind that "all good things are three," the third was arranged at Nelson.

About one hundred and fifty exhibits of the minerals and manufactures of the Northwest mining and manufacturing districts, together with displays of furs, publications, maps and reports of the Mines Department of the province were housed under one roof in the convention hall. The addresses and discussions in many cases bore upon these and on the opportunities for investment in the Pacific Northwest. The sessions were followed by excursions through Slocan, Ainsworth and other camps, thus affording the delegates abundant opportunity to inspect the mining and metallurgical operations at first hand. Delegations from local camps, Vancouver, Victoria, Seattle, Portland, Spokane and other points on both sides of the international boundary were in attendance.

Prominent among the visitors were R. F. Green, a member of the Dominion Parliament; Dr. W. O. Rose and J. H. Schofield; William Sloan, the Minister of Mines of British Columbia; and A. G. Langley and T. E. Freeland, resident engineers of the provincial Bureau of Mines.

After preliminary ceremonies of the usual sort in which Mayor J. A. McDonald, of Nelson, Mr. Sloan and others participated, the first session of the convention came to order with Sidney Norman, of Spokane, in the chair. Mr. Norman formally thanked Nelson and the citizens of British Columbia for the opportunity afforded those on the American side of the border to express their good will.

The first paper was presented by A. G. Langley, who gave a résumé of the mining industry in the Nelson district and dwelt on the important role filled by the prospector. J. W. Mulholland, president of the British Columbia Prospectors' Protective Association, followed. Mr. Mulholland pointed out the necessity for better roads and more of them, even though the province is unusually generous in the matter of road building. Following this was a luncheon served to about two hundred at the Strathcona Hotel, at which M. J. Carrigan, of Seattle, spoke on the subject of mining conventions.

The afternoon session was presided over by S. S. Fowler, manager of the Blue Bell mine. Nicol Thompson, chairman of the mining committee of the Vancouver Board of Trade, had for his subject the iron deposits of the Northwest in their relation to the manufacture of steel.

NELSON, B. C., ON WEST ARM OF KOOTENAY LAKE

Mr. Thompson stated that having been commissioned by a group of British and American capitalists to collect information on the iron resources of the Pacific Coast, he had found markets on the Coast for over two billion tons of steel per year, the Orient absorbing much of this in forms of final manufacture. There were abundant raw materials and manufacturing sites within the borders of British Columbia, and British ships to deliver the final products wherever desired. He was followed by H. J. Brown, of the Brittania Steel Rope Co. Mr. Brown spoke of the new wire rope company which he represents as being able to make and deliver at competitive prices to the Northwest markets.

Glenville A. Collins, of Seattle, spoke on the subject of financing the prospector whose ideals and ambitions, he said, should be fostered and whose ideas of finance must be remedied and corrected. He stated that stock selling methods are being succeeded by syndicating which requires grouping of prospects in concert with grouping of capital in order to determine financial sufficiency and competent management, both of which qualities, according to Mr. Collins, are foreign to the prospector.

At the session on the morning of the second day, L. K. Armstrong, of Spokane, occupied the chair. Mr. Armstrong cautioned patience in the present strained conditions of the mining business, and advised that a policy be pursued of stricter adherence to the principles of conservation of resources, as well in their use as in their preservation. S. S. Fowler addressed the delegates upon the subject of oxidized lead ores. He supplemented his speech with an exhibit of types of ores procured from the Blue Bell mine and vicinity, and cited the geological and mineralogical influences which produce such ores. Mr. Fowler stated that although prospectors do not usually regard these ores as important, a considerable tonnage had been produced from the Blue Bell and North Star mines, of British Columbia, and from the Electric Point mine, of Washington. In touching upon ore-dressing methods as practiced at the Blue Bell mine, W. Penick, who discussed the subject, cited the present practice in Arizona, where modern methods have been adopted after long research, with good results.

W. Pellew Harvey, of London, a member of the council of the Institute of Mining and Metallurgy, who at present is in the Northwest to look over the mining situation, met many old friends of his in British Columbia and consented to address the meeting. He stated that he has been engaged for some years in examining and estimating the mineral resources of other countries, and has now returned to look into the possibilities of aiding the development and preparation of minerals in British Columbia.

The afternoon session opened with Nicol Thompson, of Vancouver, in the chair. A short résumé was given of the recent advance in metallurgical practice. Special reference was made to the plans of the Consolidated Mining & Smelting Co. of Canada at its Trail smelter, where efforts are being made to increase production at this, the most complete metallurgical plant in America.

F. M. Smith, manager of the Bunker Hill & Sullivan smelter in the Cœur d'Alene district of Idaho, invited shippers to test the facilities of the plant when suitable rates can be obtained and conditions warrant the diversion of the surplus tonnage of lead ores elsewhere than to the local smelter. William Sloan, Minister of Mines of British Columbia, addressed the meeting on the potentialities of the mineral resources of the province, as only a man who is perfectly familiar with the subject can do. C. W. Beale, the British Trade Commissioner, entertained the delegates for a brief period with a discussion of inter-empire trade development. In his speech he indicated the usual British determination to convert war enterprises into others equally efficient but for commercial purposes.

Resolutions were passed condemning local bolshevism, and recommending that the Dominion government discourage it by legal action. Another resolution was introduced asking that all minerals found upon any reservations be made available to location and development by prospectors. The usual resolutions of thanks to all those responsible for the success of the convention were made a part of the record by unanimous consent. The success of the convention was in large measure due to the efforts of Fred A. Starkey, of Nelson, the secretary manager.

The mineral exhibits included many unusual specimens, such as manganese from Kaslo, mica from Tetejaune, bismuth-gold ore from Lardeau, native silver from the Boundary district, zinc ores from H. B. mine, and oil shales and crude petroleum from Flathead. Typical minerals were exhibited by A. G. Langley and another collection including about two hundred specimens was shown by A. H. Adam. Larger and more comprehensive displays have been shown before, but the exhibits reflected the trend of public inquiry.

Minerals Separation Hearings End at Salt Lake

Letters From Company's Secretary at New York to E. H. Nutter Read Into Testimony

The last hearing in Salt Lake City in the investigation by the Federal Trade Commission into the methods practiced by Minerals Separation has been concluded. The hearings will be continued in Denver, and later in the east. Letters exchanged between C. B. Allen, secretary of the company at the New York office, and E. H. Nutter, chief engineer at San Francisco, were read into the testimony and afforded further evidence as to the way in which possible infringers were checked up, as well as to the process of elimination by which, according to a letter from Mr. Allen, certain enterprises were classed as "useless and juiceless," and others as preferred infringers, which were to receive "prompt attention and plenty of action when the harvest time arrives." The term "coyote howlers" is used to designate licensees making complaints. Correspondence placed in the records showed that a local ore buyer had been employed to receive reports from men detailed to secure information in regard to operations at big plants, such as would be of value to Minerals Separation company. Most of the letters to the ore buyer were reports of the activities of two agents employed at the Butte & Superior and Miami mills, and reports of money disbursements made by him to them for Minerals Separation.

WEEKLY RÉSUMÉ

The new Mexican government is reported to be taking steps to collect delinquent mining taxes. A concession for a railroad in Sonora to San Jorge Bay on the Gulf is said to have been granted to promoters at Ajo, Ariz. In the Joplin-Miami district, the lead-zinc operators have succeeded in effecting a curtailment of 25 per cent in production. In the Cœur d'Alene district of Idaho, the Federal M. & S. Co. has insured all its employees. An option on the control of the Senator Mining Co., owning the east Flynn group, has been secured by the Cœur d'Alene Syndicate. In Canada, the amendments to the Yukon Placer Mining Act have been made effective. From Australia, it is reported that Great Cobar's assets are to be realized.

In Washington, the practice of using Pittsburgh as a basing point for steel prices has been upheld by the Federal Trade Commission. A hearing on the War Minerals Act before Secretary Payne has been scheduled for Aug. 10; Cuban claims for relief are now being studied.

Mexican Concession for Road to Gulf Reported

A concession has been granted by the new Mexican government to railroad promoters of Ajo, Ariz., for the construction of a railroad from the Mexican line in Sonora to San Jorge bay, located on the Gulf of Mexico, according to news received in Juarez recently. The railroad will start at Ajo, connecting with the line from Gila Bend to Ajo, which in turn connects with the Southern Pacific. It is understood that a survey of the proposed road will be made in the near future by the interests concerned.

A Letter from Mexico City

The Prospects for Silver Mining in Mexico

Special Correspondence

The pyrotechnic fall of silver frightened some people in Mexico, but does not appear to have left many scars. In some few cases certain heavy buyers were caught with $1.30 silver and were glad to unload at 90c. but these unfortunates were isolated and far between. The legitimate industry is still very much in the ring. For the last ten days silver has hung around 90 and 95c. an ounce and mining interests in which the white metal plays a predominent part have had a chance to catch their breath.

Last year Mexico produced 62,500,000 oz., more than 35 per cent of the silver output of the world, and it is predicted that the output this year will reach, possibly exceed 75,000,000 oz. This increase is expected because many properties heretofore abandoned are now being exploited by the most modern methods and literally hundreds of forgotten dumps and mines of low values are being optioned and preparations are under way for their intense exploitation. As an example, lively interest is now being shown in the old mining camp of Zacatecas where it was generally believed that its mines had been "bottomed" or exhausted. It is now found that ores on old dumps and those near the surfaces which could not be treated or handled with profit in former times, exist in abundance, and are profitable under any price of silver

above 90c. an ounce. In consequence all vacant mining ground in the Zacatecas district is being redenounced and options are being taken on nearly all the old abandoned properties which have been considered practically worthless.

Regarding the recent silver flurry it is the opinion of one of the most successful mining operators in the Republic that the drop in silver was about the best thing that could happen to the silver industry. His view is based on the argument and experience that we have had to the effect that the price of other commodities follow more closely the price of silver than any other metal. In common parlance, the squeezing of water out of any sort of stock does the legitimate operator no harm. The gentleman quoted cites for example that 40 per cent dynamite at present sells for about 35 pesos a case. The price of dynamite when silver was 50 to 60c. an ounce was about 15 pesos per case. This is a single item. Miners were better off with 56c. silver and 15 peso dynamite than they were with $1.30 silver and all the extraordinary costs of mining and treatment. According to this gentleman's views, if the silver miner in Mexico can obtain 90c., or better, on fine silver bullion, the industry is not only assured but production will break all records within the next few years. The sudden drop has, of course, caused some interruption among small miners, but with reasonable aid on part of the government, at least a friendly lift, the industry will strike a steady gait.

The government has already shown its friendly disposition by a reduction in the output tax and the presentation of a scale for material reduction in the tax on *pertenencias* or claims. Regarding the former, under special Presidential decree, silver at 60c. an ounce pays 5 per cent; from 60 to 75c., 5½ per cent; from 70 to 80c., 6 per cent; from 80 to 90, 6½ per cent; from 90c. to $1, 7 per cent; from $1 to $1.10 8 per cent; and from $1.10 to $1.20 9 per cent; and from $1.20 to $1.40, 10 per cent. Should silver exceed the price of $1.40 the tax will be 12 per cent. In addition to the above production tax, the amount paid in national currency is duplicated in old revolutionary currency paper which is worth 10c. on the peso, or an additional 10 per cent tax. This has been done for the purpose of retiring the last paper currency issued by the Carranza government. Aside from a reduction in production taxes the government has expressed its willingness to consider a substantial decrease in the yearly tax on *pertenencias* or claims. At present, the progressive system worked out by some astute mathematician under the immediate former regime has seriously affected the mining industry and has not produced the anticipated favorable results for the treasury, as many large companies forfeited their claims rather than submit to what they considered an imposition that was unwarranted. As an example, X mine with 347 hectares pays 6 pesos a hectare on the first 5 hectares; 9 pesos a hectare on the next 45 hectares; 12 on the next 50 and 18 on the following 247. Much of the time during the last five years the X mine has been unable to work because of brigandage, strikes incited by radical local officials, shortage of dynamite and other materials, not to mention extraordinary loans assessed or requested by either the ins or the outs, or both. With a frank desire on the part of the government to assist the miners, it will not be difficult to place the industry in general on its feet despite fluctuations in prices.

The principal feature affecting the mining industry at this writing is the strike at the smelters of A. S. & R. in Aguascalientes, Matehuala and Velardeña, the big steel plant in Monterrey and the Minerales y Metales smelter at Monterrey. Apparently the situation has been satisfactorily arranged at Aguascalientes by C. L. Barker, in charge, and there is a confident feeling that the entire strike problem will be settled. At Aguascalientes the pay of peons was advanced from one peso to one peso forty cents a day, and the rest of the employees receive an advance in wages of 25 per cent. At Monterrey, the question of recognition of the unions is one of the principal points of difference.

New York State Buys Radium for Medical Research

The purchase by New York State of two and one-quarter grams of radium, the largest commercial transaction of its kind ever made and the first purchase of radium by any state for a purpose of social utility, was announced by Governor Smith on July 26.

The acquisiton of the radium was made possible through an appropriation of $225,000 by the 1920 Legislature. The radium will be used for research work in behalf of the New York State Institute for Malignant Diseases, under the direction of Dr. H. R. Gaylord and his staff at Buffalo.

Elbow Lake District, Manitoba, Drawing Prospectors

Some Gold Discovered—Many Quartz Veins But Few of Promise—Section Held To Merit Investigation

The chief rocks of the Elbow Lake district of northern Manitoba, which is attracting attention at present, appear to have been originally for the most part intermediate or basic flows, with here and there tuffs and pyroclastics. These rocks have been highly metamorphosed and at present consist of massive green stones and chlorite-schists. In some places narrow bands of sericite schist occur, which were probably originally dykes of more acid composition. In a few places fairly large areas of these rocks occur. The whole complex has been referred to the Amisk series of rocks. Granite is intrusive into all the rocks of this area, though there are few occurrences actually on the lake. The mineralization has been generally ascribed to the later granitic intrusions. Near these the rocks of the Amisk series often look like diorites, but are probably greenstones impregnated with granitic material.

OUTCROP OF GOLD-BEARING VEIN DISCOVERED BY T. WEBB IN ELBOW LAKE DISTRICT, NORTHERN MANITOBA

There are a large number of quartz veins in this district but so far few give promise of sufficient values. At the north end of the lake, however, T. Webb has discovered a small vein in which gold occurs plentifully. Indeed, he has already collected about $1,000 worth of gold with pestle, mortar and pan. On a large island about two miles away he has located a fairly large dyke which carries some values. This dyke appears to have consisted of quartz and felspar. Considerable shearing has taken place. The felspars have been crushed and foliated, and only a few phenocrysts of quartz remain visible. There has been considerable development of secondary quartz, with which some galena occurs; the original dyke material is fairly well mineralized with iron pyrites. Some arsenopyrite is present, but whether in the original

dyke or the later mineralization was not ascertained. There is on the same property a remarkably irregular quartz vein, which is very well mineralized with pyrite, galena and some chalcopyrite or arsenopyrite. This vein pans freely and assays indicate a probable average of about $20 to the ton.

About two miles west of Webb's discovery of high-grade A. Forrest has located a quartz vein, pannings from which give indications of good values. Altogether the district would appear to be well worth investigation, though the large number of barren veins is apt to discourage the average prospector.

Novel Safety Contest in Butte

Much interest has been aroused in the Butte district over a safety first contest in which all the mines are participating. The contest started July 20 and will conclude Aug. 21. Daily results are being displayed on an "accident-o-meter," placed in the central part of the city and arranged with large glass tubes holding a colored liquid which rises and falls in accordance with the standings of the mines as they are kept free from accidents, all of which are recorded, no matter how trivial. The winning mine will be awarded a large banner at a miners' field day to be held at the Columbia Gardens in Butte sometime in August. The contest is designed to promote efficiency and curtail accidents. At a recent contest held in Cleveland, Ohio, a reduction in accidents of 35 per cent was shown.

Yukon Placer Mining Amendments Now Effective

Amendments to the Yukon Placer Mining Act, passed at the last session of the Canadian Parliament, have been brought into operation. The most important provision enables a man to secure prospecting rights on five miles of abandoned claim for a three-year period, or on one mile of virgin territory for one year. It is expected that this change will induce many mining men and prospectors who would otherwise have gone to Alaska to remain.

National Copper's Equipment To Be Sold

An inventory of all machinery, movable equipment and supplies owned by the National Copper Mining Co. of Mullan, Idaho, has been completed and several parties are understood to be figuring on buying the entire outfit, the estimated value of which is between $160,000 and $175,000. The equipment includes a modern 500-ton concentrator, flotation plant, electric motors, compressor, hoist, tool-sharpening outfit, and in fact everything necessary in the operation of a mine and mill employing 100 or more men. The appraisement does not include mine or mill buildings. In addition to these assets, the National company owns nine patented claims, four in process of patenting, a water right which with flume cost over $20,000, and 160 acres of land in the flat adjacent to the mill site.

Federal M. & S. Co. of Wallace, Idaho, Insures Employees

Another Large Company Adopts Practice Now Becoming Popular—Amount Ranges from $500 to $1,500

The Federal Mining & Smelting Co. of Wallace, Idaho, has insured the lives of all employees as from July 1 for the benefit of their families and dependents, the entire expense being paid by the company under a contract with the Metropolitan Life Insurance Co. of New York. The amount of insurance is graded according to length of service. All employees on July 1 who had been with the company less than one year were covered with $500 insurance and new employees will be covered with the same amount after three months' service. Employees with the company more than one year and less than two receive $600 insurance, and $100 is added each year thereafter up to the maximum sum of $1,500. The adoption of this insurance policy by the Federal company was announced by Frederick Burbidge, general manager, in a circular letter delivered to each employee.

Curtailment of Output Succeeds in Joplin-Miami District

Success that is gratifying to the mine operators of the Joplin-Miami district has attended the recent efforts to hold down production of zinc ores in this field. The present car shortage and the slackness in the zinc market ordinarily would have meant a rapidly accumulating surplus of ore in the bins, but this is being avoided by the combined effort of a majority of the leaviest producers in the field, who are putting into effect a systematic and carefully planned curtailment.

This curtailment was begun following the two weeks' complete shutdown starting June 26. During this shutdown the operators got together and decided that to meet the situation properly a curtailment of not less than 25 per cent should be put into effect, and proceeded to make plans for it. Contrary to the predictions of many in the field, it has been a complete success and careful estimates place the curtailment at fully 25 per cent. It will be maintained for several weeks, according to present plans, and should result in holding down the ore surplus that the car shortage would otherwise naturally cause.

Silver mining throughout Montana is beginning to decrease at a fairly rapid pace in consequence of the slump in the price of the metal. Leasing in the Butte district at the present quotation of the metal is said to be unprofitable and operations in this direction are showing a slowing up.

Unless there is a material enhancement in the silver price within the next three months it is said that silver mining operations aside from the larger companies will come to almost a standstill throughout the state.

Mexico To Collect Delinquent Mining Taxes

Companies May Secure Remission of Additional Charges by Paying Up for First Half of 1920

The *Diario Official* of Mexico City published on July 20 an executive decree relating to the payment of delinquent mining taxes in Mexico. Regulations covering the payment of taxes due are set forth in the decree, which provides that additional charges will be remitted to companies complying with the present laws and paying the taxes for the first two quarters of 1920.

"1. All the additional charges owed by those liable to the annual tax on mining property are hereby remitted, provided the parties interested pay the first and second quarters of the present year before Aug. 31 next.

"2. The proprietors of mines who were owing quarters previous to 1920 and shall have paid the two quarters of the year in conformity to the preceding article shall have the right to pay quantities (amounts) quarterly which they are in arrears in as many installments as there are quarters that they owe and thus settle the amount of one quarter in arrears every time they make payment on the regular taxes.

"3. If the parties involved do not take advantage of the exceptions established by this decree or do not make payment on the dates on which the respective periods for such payment expire this failure shall give occasion to the declaration that their respective titles are revoked without leaving room for any further recourse.

"4. The owners of mining properties who complied with the articles of the decree of June 28, 1919, shall continue to meet their obligations in accordance with that decree.

"5. The main tax officers are authorized to receive in conformity to the present decree the payments which those owing the annual tax on mining property may wish to make, but they should include at the end of the monthly accounts which they render to the Department of Hacienda a report in which they express the customary data with a notation as to whether the interested parties have complied with the exemptions referred to in the foregoing article.

"Transitory articles three, four, five, six and seven of the decree of June 27, 1919, are revoked."

Recent Production Reports

Compagnie du Boleo, Santa Rosalia, Baja California, produced 802,474 lb. copper in June against 650,908 in May.

G. F. Loughlin of the U. S. Geological Survey has just returned to Washington after visiting the old Chipman mine at Newburyport, Mass. He reports that the mine is being cleaned out rapidly. Five levels have already been reopened and some shipments of silver-bearing galena already have been made. Development, however, has not gone beyond the exploration stage.

Administration of War Minerals Act To Be Discussed

Mining Congress To Ask Changes at Hearing Before Secretary Payne—Cuban Claims Being Studied

The outstanding feature in the war minerals relief situation is the hearing scheduled for August 10 before the Secretary of the Interior, at which the American Mining Congress will request certain modifications of the policies of the War Minerals Relief Commission. At that hearing, it is expected that the whole question of the administration of the law will be discussed.

The Cuban claims under the War Minerals Relief Act are now being studied by the commission. A report on these claims is being submitted by D. F. Hewett, who made a personal examination of the property. An opinion by the solicitor of the Department of the Interior, which was confirmed by the Attorney General, admits the Cuban claims on the same basis as the domestic claims. The claims are mostly clear-cut as there is no question as to Government stimulation. At least two Government engineers visited Cuba during the war and urged increased production of manganese.

In the whole matter of stimulation, the commission is attempting to be particularly liberal. In all cases where the claimant admits that he had no direct stimulation, the commission inquires specifically if by any chance he attended a meeting addressed by a representative of the U. S. Bureau of Mines, the Geological Survey or any other Government agency, at which miners were urged to increase production of war minerals.

Awards recommended by the commission for the week ended July 17 are as follows (the name of the claimant, the mineral, the amount recommended and its percentage relationship to the amount claimed are shown): C. H. Plumb, manganese, $213.14, 3 per cent; Pillsbury, Crowder & Kay, chrome and manganese, $3,760.83, 67 per cent; Manganese Associates, manganese, $32,551.73, 13 per cent; Puterbaugh & Touhy, chrome, $5,993.88, 75 per cent; Charles Puterbaugh, chrome, $266.35, 41 per cent.

W. R. Crane, the chief engineer of the Commission, is in the field making personal examinations. Engineer Examiner Van Sicklen has left for the field to do similar work. Engineer Examiner Eddingfield is back at his desk after a leave of absence without pay to undertake private work.

The total amount of silver purchased up to July 15 under the Pittman Act was 7,165,130 oz.

Decision on Federal Taxation Regulations Soon

The Commissioner of Internal Revenue is expected to rule within a short time whether or not certain sections of the tax regulations applying to mines are to be amended or are to remain as they are. The discovery and depletion portion of the regulations are those most likely to be amended. With the exception of these clauses, the regulations are working out quite to the satisfaction of the specialists in the national resources subdivision of the income tax unit.

J. C. Dick continues as active head of the natural resources subdivision. He has made arrangements so as to be able to continue directing this work until January 1. C. F. Powell is in charge of the oil and gas section; O. R. Hamilton of the metals section; and G. M. S. Tait of the coal section.

Chief Engineer Visiting Bureau of Mines Stations

George S. Rice, the chief mining engineer of the U. S. Bureau of Mines, has left Washington on an important tour of the western experiment stations for the bureau. On this trip, Mr. Rice expects to call the attention of mining engineers to the possibilities of using liquid-oxygen explosives. During a trip in Europe after the war, he made a careful investigation of the uses to which liquid-oxygen explosives are being put. They were used successfully by the Germans as a military explosive, in addition to their extensive use in mining and quarrying operations.

Mr. Rice intends to discuss with Daniel Harrington, the supervising engineer of the bureau at Denver, the matter of ventilation in metal mines and the prevention and laying of siliceous dust. Mr. Harrington has been investigating these matters for several years. In this connection Mr. Rice will also confer with the bureau's representatives and other engineers at Butte.

Another object of Mr. Rice's trip is to look into matters pertaining to the leasing regulations relating to oil shales and coal. At Salt Lake City, Berkeley and Seattle, he will discuss with the station superintendents the program for mining investigation during the coming year.

On his return, Mr. Rice will attend the meeting of the American Institute of Mining Engineers at Houghton, Mich. He expects to call into conference on that occasion the bureau's mining engineers stationed in the Lake Superior district. At this conference the various mining problems in that region will be discussed.

Dismiss Protest in Pittsburgh Steel Basing Point Case

Federal Trade Commission Upholds Practice as Fair to Fabricators—One Member Dissents

The practice of using Pittsburgh as a basing point for steel prices has been upheld by the Federal Trade Commission in dismissing the protest of the Western Association of Rolled Steel Consumers. The vote on the dismissal of the case was 3 to 2. Commissioners Murdock, Colver and Gaskill voted for dismissal. In handing down the decision each commissioner made a statement. An extract from that of Commissioner Murdock is as follows:

"Those steel companies which have plants in the Pittsburgh section and elsewhere, under the practice in question, have sold steel at a less price at Pittsburgh than elsewhere. Steel made at Gary, or Duluth, has been sold to fabricators in or near those cities at higher prices than the Pittsburgh fabricators pay. Similarly, the fabricators tributary to Birmingham have been charged a higher price for steel than Pittsburgh price, although there is a differential which modifies the charge against Birmingham fabricators to a certain extent. This, taken alone and viewed separately, is discrimination on the part of a selling corporation having plants in and away from the Pittsburgh district, in the ordinary acceptation of that word. Its practice appears, at first blush, arbitrary.

"But there is a second approach to the problem—the consideration of supply and demand—which opposes the conclusion that it is an arbitrary discrimination such as is forbidden by the statutes herein invoked. It is not disputed that the Pittsburgh section is now the point of heaviest surplus production of steel in the United States. In the steel industry, the point of heaviest surplus production under the operation of the law of supply and demand necessarily must influence strongly the price in other markets with excess demand. Viewed in this light, a base price plus freight device is not discrimination, arbitrarily determined, and such as the statutes forbids. Approaching the problem from this side, it would appear to follow that the force, functioning in the creation of a base price plus freight device, is the market-place law of supply and demand, not contrary to law but rather confusedly applied herein by differentials expressed in terms of freight rates."

A paragraph from Commissioner Colver's statement is as follows:

"The practice is not unfair competition with respect to the manufacturers of steel, nor does it inject an unfair

competitive element into the business of the fabricators. If the base price system were abolished, it might result in giving some advantage not now enjoyed to certain fabricators, but it would place other fabricators at a corresponding disadvantage. Thus, at best, the shifting of the boundaries of competitive fields probably would not affect the fabricating industry as a whole, except to throw it into confusion. The Pittsburgh base price was an established thing in the theory and practice of steel manufacture and sale when the steel fabricating industry came into being. It was one of the factors taken into consideration by fabricators when they selected the sites for their plants. It is no new thing; no unforseen factor imposed upon the fabricators. Therefore it does not project any new method of competition, fair or unfair, into the industry of steel fabrication."

Commissioner Gaskill, among other things, says:

"Whatever evil there may be in this base-plus practice and however great may be the inequalities which result, I fail to find in the powers of the Federal Trade Commission any remedy therefor. An unfair method of competition, according to the definition laid down by the U. S. Supreme Court in the Gratz case, must be opposed to good public morals or contrary to public policy; the former because characterized by deception, bad faith, fraud or oppression, the latter because tending unduly to hinder competition or create monopoly. If any principle is to be applied to the corporate ownership of a number of plants, differing from that applicable to the operations of a real person, and the location of the several corporate enterprises is to give rise to a different basis of price determination which will recognize a local price right, it will be necessary for Congress so to declare."

In his dissenting statement, Commissioner Thompson says in part:

"The strife caused by two competitors in seeking the business of a consumer, in the natural course, should reduce the price, whereas it is contended here that the price is never reduced but is increased in an artificial and arbitrary way in respect to steel manufactured in Chicago by taking the Pittsburgh price at which the corporation sells the material and adding on a 'fictitious' freight charge to that price. In my opinion, a *prima facie* case of an unfair method of competition has been made out sufficient upon which to issue a formal complaint. It may very possibly be that when the disputed claims have been subjected to the test of evidence and cross examination of witnesses, with a formal hearing before the Commission, the *prima facie* presented will fail."

Definite Program for Alaska Expected

With the return of the Secretary of the Interior from Alaska, it is expected that immediate steps will be taken to put into effect a more definite program looking to the stimulation of the industries of that territory. As the matter of improving transportation conditions between Alaska and the United States is regarded as the most acute factor in the situation, an effort is being made to work that out first. This task has been assigned to J. Y. Saint, of the Shipping Board, who is expected to enter upon the work at once.

NEWS BY MINING DISTRICTS

MEXICO

Planned To Unwater Soto Mines at Guanaceví—Asarco Smelter Running Two Furnaces

Durango

Guanaceví — Wilber Judson, representing Col. William B. Thomson's interests, has just been in Durango visiting their Guanaceví holdings, the properties that once belonged to Mexico Consolidated Mining & Smelting Co. The Soto Mines Co., one of their companies, is operating a 200-ton flotation plant. Unwatering of the mines is planned now. The erection of an 800-hp. electric plant in San Pedro, Guanaceví, and the driving of a big tunnel to Todos Santos and Predilecta are subjects of careful study on the part of the Soto people.

San Dimas—The San Luis Mining Co. is working its Tayoltita properties at full capacity. It has built a large hydroelectric plant for electrifying both mines and mills. The Mexican Candelaria Co. is following the same program; this company is the one controlled by Daniel M. Burns.

Otaez—The Basis Gold & Silver Mining Co. has been operating in the camp uninterruptedly for the last three years. It is working the mines and running its smelting plant, the bullion being shipped via Durango.

The properties of the Santa Cruz Mining Co. are being worked under the management of George Stoker with Lorenzo Elder as superintendent. A new manager is expected soon at the mines.

Topia—This camp has been idle for the last few years; but the Topia Mining Co. is now taking steps toward resumption of operations.

Avino—The properties of the Avino Mines, Ltd., are being worked by gambusinos. Gerald E. Norton is in charge.

Velardeña—The American Smelting & Refining Co. has started working the mines and mill. Its Asarco smelter is running with two furnaces.

Mexico

El Oro — The Esperanza company, which has been opening up a group of gold properties near Las Penas, in the state of Jalisco, is completing a 1,000-ton plant.

The Mexico Mines of El Oro are also spending a large amount in developing properties in the same vicinity. The revolutionary conditions that have interfered with operation in other sections of the country have apparently not affected work in this section.

Michoacan

A considerable force has been at work for some months on Las Truchas, one of the largest iron properties on the Pacific Coast, diamond drilling and sinking pits to demonstrate the extent of the fields.

Mescalhuacan—A French syndicate which has been working on gold properties near Mescalhuacan, Michoacan, has completed a 5-stamp test mill.

ARIZONA

Ray Verde Installing New Equipment To Deepen Shaft—U. V. Copper's Coke Bins Burned

Kelvin — The Cowboy mine, in the Dripping Springs district, is being reopened by its owner, C. W. McGraw. In the past the property has been worked for gold and at one time there was a small mill on it. At present the ores being mined are those of vanadium. A Moyle crusher and two Card tables have been installed. As soon as the gas engines are received milling will be started on the ore accumulated during the spring.

The Ray Verde Copper Co. has recently installed a hoist and compressor. The new equipment will be used in deepening the present two-compartment shaft. About fifteen men are employed.

Ray Boston Copper Co.'s No. 1 diamond-drill hole is down over 1,300 ft. Some ground had to be cemented off at about 1,260 ft., the formation having become softer and much more broken.

The old Bobtail and Copper King groups south of Ray have been taken over by eastern people, who are preparing to begin operations August 1. Considerable development was done years ago on the Bobtail group, which is now known as the South Ray. The Copper King, sometimes called the Alma group, joins the Ray Consolidated ground on the south and is owned by John A. Tillman.

Winkelman—The Antelope Peak company has had to suspend shipments

recently for a short time owing to a shaft accident. The last hundred feet of the shaft has been rendered unsafe by swelling and caving ground. Recently several sets of timbers went out. Development will be carried on at the 300-ft. level in the meantime.

The Continental Commission Co., operating the "79" mine, is rapidly completing the last stretch of new wagon road. This last section has been especially difficult to build, being all rock work and over a mile in length. For the present, shipments have been kept at a minimum and only a small force is at work in the mine. About 60 men are working on the road which should be open for use by August 1. Trucks will be put on to haul the ore to Burns from whence it is shipped to El Paso.

Sombrero Butte—The Magma Chief continues development and the management is having ore tests made preparatory to putting in a small concentrator.

Sonora — D. Durazo is installing a Gibson mill and concentrating table on the Saus property southwest of Ray, near Copper Butte. The property has been developed slowly during the last two years with a small force. The shaft has been sunk 100 ft. on a 2-ft. vein of gold ore. Some drifting has been done at 50 ft. and in all a considerable tonnage blocked out. The property is reached by wagon road from Ray Junction.

Miami—Certain employees of the Miami Copper Co. and Inspiration Consolidated recently asked through the grievance committees of their respective companies a general increase of $1 per day. The petition was based on the claim that the cost of living has advanced from 80 to 150 per cent since 1917, while wages have increased very little. The Miami company refused the request on the ground that the decreased price of copper made an increase in wages impossible.

Prescott—Settlement of accounts due from the Verde Apex Mining Co is sought in a blanket suit filed on July 20 in behalf of Charles A. Raible, assignee for claims aggregating over $24,000.

Jerome — The old coke bins of the United Verde Copper Co. were destroyed by fire on July 14. The breaking of a pipe leading from fuel oil tanks at the same time caused a loss of several thousands gallons of oil which also caught fire.

Black Canyon District—In the Black Canyon mining district, Yavapai County, practically all properties are under bond. The Thunderbolt has 20,000 tons of good milling ore blocked out, and has recently made shipments of high-grade.

The Silver Zone, a promising prospect next to the Thunderbolt, is down about 140 ft. and is drifting in a northerly direction. The vein is 3 to 4 ft. wide and carries milling values of about 14 oz. silver per ton.

The Silver Cross company, with two groups of three claims each, is developing its Southern Cross group. A hoist and a three-drill compressor have been installed, and two shifts are working. The vein is 5 ft. wide in the narrowest place and the ore being mined averages 16 oz. of silver per ton. The company is controlled by Lawton Mines Finance Co., which also controls the L. T. S. Milling Co. operating a 50-ton custom mill nearby.

The Howard Silver Mining Co., which is developing the extension of the Southern Cross vein, has opened up good ore. A hoist is being installed. The Howard Copper Co., an affiliated corporation, is developing a copper prospect two miles away. The orebody was cut recently, and found to be about 18 ft. wide.

Kingman — William Neagle has brought suit for $50,000 against Hackberry Consolidated and G. S. Holmes on account of the conversion of stock in that corporation.

Chloride — During the first half of July three cars of ore have gone from Chloride to the Humboldt smelter. These were from the Altata, Rainbow and Dardanelles. The new cross cut to the shaft on the 100 level of the Dardanelles has been completed and the pump installed. Sinking to the 225 level is under way.

The Pay Roll has a day shift of five men at work getting ready for sinking the main shaft another lift.

Cerbat — The Dudley interests have closed down the Daisell. After a period of steady development for the last three years this property has a large tonnage of milling ore blocked out and is ready for a mill. As the management is busy with the final steps in equipping its C. O. D. property with a mill it was thought best to suspend operations at the Daisell for the time being. As soon as the C. O. D. plant is in operation, work will be started on the Daisell plant.

Hilltop—Construction by the Southern Pacific of a branch line from San Simon station to the property of the Hilltop M. & M. Co., in the Chiricahua Mountains, 26 miles away, is under consideration. Under the plan proposed, the mining company will pay the cost of construction.

CALIFORNIA

Central Eureka Shaft Completed—Mason Valley Mines Enters Engels District

Engelmine—The Uncle Sam group of 18 claims, located a half mile from the Engels Copper Co.'s property, has been taken over by John Reinmiller, formerly superintendent of the latter. There has been little development on the Uncle Sam, but it is said to have an unusually good surface showing. It adjoins the group of the Reinmiller Copper Mining Co., where the bottom of the 60-ft. shaft is in ore that averages better than 8 per cent copper. Reinmiller is driving a tunnel which will attain a depth of 110 ft. If the ledge is cut at this depth it is intended to drive another tunnel from the bottom of the hill and tap the vein at 450 ft.

The Mason Valley Mines Co. has also entered the Engels district and has taken over a promising group owned by Murphy & Barnes.

Sutter Creek—Sinking of the Central Eureka shaft was completed on July 18, and all timbers have been set in place. The main track will be extended and the 3,900-level station will be cut in hard rock without timbering. Because of labor shortage only twenty stamps are dropping this month in the mill.

Downieville—The Gold Exploration Co. has made a promising strike of gold ore. The orebody is said to be over 30 ft. wide and has been proved so for 200 ft. on the strike.

Oroville—The Table Rock Mining Co. near Howland Flat is steadily pushing development, despite labor troubles. A large deposit of excellent gravel has been reported.

A five-stamp mill at the Rose property near Rackerby has been purchased by the Horseshoe mine at Challenge, and will be erected at the Horseshoe.

Sonora—The Jones-Tarantula has uncovered high-grade gold ore in virgin ground. The property adjoins the Shawmut mine.

Nevada City—Litigation between the Twenty-one and Sixteen-to-One mining companies here has been closed by the Sixteen-to-One acquiring all of the property of the Twenty-one. The purchase price is stated also to liquidate the $60,000 judgment secured by the Sixteen-to-One against the Twenty-one in Federal Court a few months ago on the showing that ground belonging to the former had been worked by the latter. The mines of the two companies are located near Alleghany and are adjoining. Operations will continue through both tunnels.

At the Bunker Hill ore from the 600-ft. winze from which so much was expected is so low in value that it goes over the dump.

Some months ago the Pacific Gas & Electric Co. made application to the California Railroad Commission for permission to divert all water used for power in the Grass Valley district to the Bear River plant, for the generation of electricity for power. Opposition was raised from every user and principally by the Empire and North Star companies. The commission recently decided in favor of the water users.

The Golden Gate mine near the Idaho-Maryland has been permanently closed.

Because of a lack of pay ore and high costs the North Star Mines Co. has decided to abandon the Champion mine near Nevada City and dismantlement is in progress. There are two hoists and a 40-stamp cyanide mill.

The Alleghany M. Co., owners of the Tightner mine at Alleghany, have taken over the Gold Canon mine below Moore's Flat.

COLORADO

Mountain Top at Ouray Finds Faulted High Grade—Less Activity Owing to Drop in Silver

Ouray—A real "find" has been made by the Mountain Top Mining Co. Suspension of work on its high-grade orebody below the tunnel level, pending arrival of larger pumps, permitted development and prospecting of other ground above, where an unexplained disappearance of the ore streak had long been a subject of speculation. A small crosscut showed that the ore had been faulted about 18 in. and continued strong beyond the fault. Although this is not fully explored, it seems certain from previous development that the new ore is simply a continuation of the main high-grade body. Rough estimates are that this will add at least $300,000 in high-grade ore to the output in the near future. The ore is shipped crude and yields $100 to $300 per ton, most in silver.

Camp Bird continues active development, though with a small crew. The work consists principally of drifting west on the new tunnel level, with results not known to the public. No work on the mill is in evidence.

The Guadaloupe Leasing Co. is shipping its winter's accumulation of high-grade copper-silver ore and active work at the mines is temporarily suspended.

The Whitecloud M. & M. Co. continues development in the Monas Queen and Paymaster mines and is shipping its winter's stock of lead-silver ore. This comes from the orebody discovered in the Monas Queen.

E. R. Baur, of the Hidden Treasure, has opened the road and is shipping the large pile of excellent lead-silver ore mined last winter.

The only mills in operation are at the Atlas, Mountain Top, Red Mountain Mines, and Barstow; the last two are making summer runs only. Outside of active development on the Eurades, no other mining operations of importance are in progress. Silver Mountain Mines Co. continues development, driving a raise, with a small crew. The genuine activity in a preliminary way which was in evidence last spring has dwindled greatly; the fall in silver without doubt killed many embryo projects, although the more substantial ones are in active operation and the San Juan country is the most active and substantial mining district in the state.

IDAHO

Cœur d'Alene Syndicate Acquires Other Flynn Group

Wallace—The Cœur d'Alene Syndicate has taken an option on control of the Senator Mining Co. The Senator owns or controls what is known as the east Flynn group of claims joining another group owned by the Flynn Group Mining Co., control of which is already under option to the Cœur d'Alene Syndicate. In taking over the Senator the syndicate gains possession of all the ground between the Frisco on the west and the Morning and Star on the east aggregating forty claims divided about equally between the two Flynn groups. Under the direction of Rush J. White, mining engineer of Wallace, the Black Bear tunnel on Canyon Creek is being extended into the Flynn ground, a new compressor of large capacity is being installed and all necessary equipment provided for rapid development. Men prominent in mining affairs are associated in the Cœur d'Alene Syndicate and it is stated authoritatively that $225,000 has been set aside for the development of the Flynn ground. The trustees of the syndicate are Colonel S. W. Mudd and Phillip Wiseman, of Los Angeles. Others interested are D. C. Jackling, Horace V. Winchell, the North American Exploration Co. and its representative in this country, Carl O. Lindberg.

What appears to be an important ore shoot has been cut by a diamond drill in the Nipsic, owned by the Callahan Zinc-Lead Co. and which is being explored from the 600 level of the Callahan mine. The drill core, besides several feet of low-grade ore, shows about 2 ft. of high-grade lead-silver ore and about the same amount of high-grade zinc. Crosscutting to the strike is going on, the distance to go being nearly 400 ft.

The Bullion company in the St. Joe section of the Cœur d'Alene district, will build a 100-ton mill next year, according to James H. Taylor, manager, who states that sufficient ore is available to keep such a mill running for years. The ore is said to average better than 2 per cent copper and carries 6 or 7 oz. of silver and some gold. The mine is about 7 miles from the Milwaukee railroad, along the St. Joe River.

MICHIGAN

The Copper District

Wolverine Discarding Concrete Pillars for Timber on Lower Levels—C. & H. Shipping Copper Abroad

Calumet — Seneca Copper should reach the elevation of the terminal within ten days as sinking is now progressing at the rate of 20 ft. a week, and the fifth level is in sight. The third level has reached the southern boundary. The fourth level to the south will go 125 ft. further before reaching the boundary. The laterals to the north are continuing in the same good-looking high-grade Kearsarge lode. The second level, to the north, went to the boundary at 350 ft., but the lower levels, to the north, go an interminable distance. The thirteenth level of the Gratiot is now in 400 ft. and the copper runs about the same as formerly. Frederick Lewisohn, president; Walter Lewisohn, treasurer, and directors, W. F. Bartholomew and Thomas F. Cole, visited the mine last week.

Calumet & Hecla is shipping 1,500 tons of copper to France in one order, 500 tons to Montreal by rail, for foreign shipment on another order, and 1,600 tons of copper left Sunday by water for the East. The French order is billets and wire bars, a special order. Kenosha, Wis., took 320,000 lb. of Calumet copper during the week.

Houghton—Isle Royale is utilizing No. 3 hoisting plant from Tamarack, which is being set up at No. 5 shaft.

Mayflower's south drift has been opening good ground since the resumption of work in that direction. The raise to the west crosscut has been started and is breasted in trap. It is hoped that this work will cut the Mayflower lode. The north crosscut continues in the conglomerate, the same formation that was entered by the crosscut 140 ft. further west and 520 ft. from the shaft. Mayflower's development program at the 1,700-ft. level is far from complete and is continuing along practical and sensible lines.

Kearsarge—Wolverine is reopening No. 4 shaft with a limited working crew following suspension for twenty days, during which time concrete pillars on three lower levels, 26, 27 and 28, have been discarded and replaced by timber. All mines in the Lake Superior district that have tried the concrete experiment have come to the conclusion that it will not do as the shifting of the ground breaks the concrete.

Gogebic Range

Ore Shipments Improving But Coal Continuing Scarce—Large Coal Dock for Pabst Mine

Ironwood—The shipping situation continues to be the prime question with the mine operators. Ore shipments are now going forward at a slightly better rate, but coal is as scarce as ever. In June the ore shipped from this range was about 350,000 tons more than was shipped in June 1919, totaling about 1,300,000 tons.

Some of the steel for the Pabst-Puritan transmission line has arrived on the ground. The 50-ft. towers are to be erected on steel footings or anchors, instead of the usual concrete footings.

At the Pabst mine a coal dock is being built which will have a capacity of 35,000 tons. The coal will be stored in three or four parallel piles for safety from fire and will be loaded by locomotive cranes equipped with grab buckets and dumping into a movable hopper under which the small coal cars will run. An electric locomotive will haul these to the crusher, whence the coal will be taken by bucket elevator to the hoppers above the stokers in the new boiler house. This dock was made necessary by the uncertainties in the coal supply the last few years, and by additions to the load carried by this power plant.

The underground work at the Pabst mine was again stopped for a day recently by a breakdown in the haulage burned out.
system. The rotary converter had

Officials of the Steel & Tube Co. of America were on the Gogebic Range the week of July 22 visiting their Newport and Palms-Anvil mines.

JOPLIN-MIAMI DISTRICT

Missouri-Kansas-Oklahoma

New Development at Galena May Be Abandoned—Kansas Line Mill Started

Galena, Kan.—A pseudo mining revival in this veteran zinc-lead camp has apparently been knocked to smithereens by an old, old failing in mining communities. The Eagle-Picher Lead Co. had become interested in the stories of deep-ground deposits in the camp and is understood to have decided to make a careful investigation by drilling, provided something like 1,500 acres of leases could be secured as a preliminary assurance of a chance to get the development money back if deep-ground ore were found. To date about 800 acres of leases have been obtained for the company, but the proposition has been checked and possibly defeated by land owners who decline to give leases or else ask unreasonable bonuses. The officials of the Eagle-Picher company are known to be on the point of abandoning the whole project, which would necessitate extensive drilling and drainage work.

Baxter Springs, Kan.—The Kansas Line Mining Co. has started its 250-ton mill which is about three miles southwest of Baxter Springs. Early development is reported as promising. The principal production will be zinc. The plant is owned principally by J. C. Nichols, of Kansas City, and George C. Meese, of Joplin.

Picher, Okla.—The Cosmos mine of the Lucky Tiger Combination Mining Co. has recently completed a second field shaft and is now getting ore from it. A quarter-mile surface railway is used, with a gas locomotive, about 15 tons being taken each trip. The new shaft proves up ore deposits over the entire lease.

MONTANA

Barnes King Negotiating for Black Hawk Claim in Marysville District

Butte—Unofficial reports are to the effect that the No. 2 vein has been picked up on the 2,700-ft. level of the Colorado mine of the Davis-Daly company and that 9 ft. of good ore is in evidence.

Shipments from the Tuolumne Copper's Main-Range mine are ranging from 100 to 150 tons daily. A winze sunk from the 1,200-ft. level to a depth of about 50 ft. has afforded sufficient showing to warrant sinking the shaft, according to the management. This work will start Sept. 1 with the 2,000-ft. level the objective.

Sinking operations by the Butte & Plutus are disclosing well mineralized ground in the Plutus claim. The shaft on this property will be sunk to the 400-ft. level and a fissure in the Norwich claim adjoining crosscut.

Negotiations are in progress by the Barnes-King company to acquire the Black Hawk claim in the Marysville district of Montana. This property is in the neighborhood of the Shannon mine, the company's chief producer at present. It would occasion no surprise were the Barnes-King to suspend operations at its Gloster property, also in the Marysville district.

A statement will be issued soon by this company in connection with the opening of a high-grade orebody on its 2,500-ft. level by the Davis-Daly Copper, which company is working the deposit through a profit-sharing arrangement with the Butte & Ramsdell. The ore is said to run up as high as 20 per cent and to have a width of 5 or 6 ft.

NEVADA

Retimbering Broken Hills Shaft—Claims in Tolicha District Attracting Attention

Broken Hills—Arthur Perry Thompson, consulting engineer, has announced that three shifts will be put to work retimbering the main shaft of the Broken Hills mine to the 150-ft. level, after which the shaft will be continued on the vein and levels run every 100 ft. A new shaft, known as the Belmont, has been started on a newly discovered vein 500 ft. southeast of the main shaft.

The Utah, Nevada & Idaho Telephone Co. will extend its line from near the old camp of Fairview to Broken Hills, a distance of about 15 miles.

Virginia City—Three hundred tons of ore is being hauled from the West End mine in the Flowery district to the Fisher mill in the Sixmile Canyon section of the Comstock district. The vein from which this ore came is 20 ft. wide at a depth of 40 ft.

Plans for a new and extensive campaign of development on the Comstock-Phoenix have been agreed upon, according to George H. Drysdale, superintendent. The new plans call for additional work on the 800 level, and also for sinking a winze from the 800 to 1,200 level.

Eureka—The Eureka Holly shipped to the smelter last month 300 tons of ore averaging about $75 per ton. The main orebody averages 10 ft. in width.

The Eureka Climax is building a chute from the tunnel portal to ore bins on the road about 40 ft. below to handle the high-grade ore recently encountered. The tunnel, which is to crosscut the mountain, is in 1,100 ft.

Tybo—The smelter which was recently blown in at the Tybo mine is running smoothly and is said to be doing excellent work. The company has large reserves of crude ore, as well as concentrates from the 125-ton mill which has been in operation for some time. F. W. Draper is general manager.

Tolicha—Considerable interest has been attracted to the Tolicha district by the excellent showing which has been made on the property of Jack Jordan and "Jumbo" Yeiser. When the vein was tapped in a tunnel the values were not very high, but a drift found ore of better grade. The best showing is in a winze where at 10 ft. depth the entire bottom is in high-grade.

An option on the Southey and Staplin groups, two miles east of Tolicha on Quartz Mountain, has been taken by the W. J. Loring syndicate. There are big ledges on the properties and the new owners hope to develop large bodies of low-grade ore.

Osceola—Four feet of silver-lead ore of commercial grade has been encountered in a crosscut from the main working shaft of the Lucky Boy company near Osceola in White Pine County.

Goldfield—The Goldfield Deep Mines Co. has started to sink its 3,000-ft. vertical shaft on the Blue Bell section. This is intended to develop the Goldfield construction vein at depth below the proven ore-bearing area.

NEW MEXICO

Operations in Lordsburg District

Lordsburg—Ore shipments in June from the Lordsburg district totaled 97 cars, or 4,715 tons, of an approximate value of $75,725. The bulk of this went to the C. & A. smelter from its 85 mine. Fluorspar shipments were delayed owing to the operation of the Great Eagle mine changing hands, Bell & Wright having taken a lease and erected a new ore crusher at the S. P. Ry. ore platform.

The Bonney Con. is doing considerable work preparatory to installing new machinery. A topographical survey of the company's 700 acres will be started at once. Fifteen claims will be patented, making 22 claims so held.

Columbus—The Romaho Mining Co. in the Tres Hermanas Mountains, is erecting a new head frame at the Waterloo shaft and will install a new hoist, already on the ground. New buildings have been erected, a water supply established and by August 1 everything will be ready for development to the 300-ft. level. Robert L. Howze is president and J. Peter Mack superintendent.

UTAH

Miners Still Scarce in Most Camps—Ontario Silver To Resume on 2,000 Level

There is at present a scarcity of metal mine workers in Utah owing to various reasons. A good many of the men are supposed to have saved wages earned during the war, when their earnings were large, and to have applied the funds thus gained to the purchase of farms or to have entered into other enterprises. In the case of foreign labor many of this class have returned, after the prosperous years of the war, with their savings to their native countries. A considerable number of miners also are engaged in leasing.

Park City—The stock of the New York Bonanza, owning ground adjoining the Naildriver, and formerly included in the assets of the Merchants Bank, now defunct, has been acquired by Salt Lake men, who are planning to finance the company with eastern

capital for active development. The Naildriver is said to have developed an orebody within 50 ft. of the Bonanza line.

The Ontario Silver, after doing no work on the 2,000 level for 20 years, is planning to resume work there owing to its successful operations on the 1,700 and 1,800 levels, where persistent and strong shoots of shipping ore have been opened.

There were eight shippers from the Park City district in the week ended July 16, Ontario Silver heading the list with 1,450,000 lb. of ore and concentrates; Judge M. & S., 854,110 lb. ore and 412,000 lb. zinc; Silver King Coalition, 674,000; Daly West, 485,820; Daly Mining, 201,500; Naildriver, 230,000, and Keystone, 220,000; total, 4,528,430 lb.

In the case of the Western Securities Co. as assignee of H. P. Clark, formerly president of the Merchants Bank, against the Silver King Consolidated, Solon Spiro, John Pingree, C. E. Kaiser and L. R. Eccles in regard to the sale of stock in the Silver King Consolidated given by Mr. Clark as security for money owed the mining company, the state supreme court has reversed the decision of the district court, which found in favor of the plaintiff, and declared the sale to have been valid, ordering the dismissal of the suit. Mr. Clark was indebted to the Silver King Consolidated to the amount of $50,000, for which he gave four notes, delivering 29,089 shares of capital stock in the company as security. In default of the payment of these notes the stock was sold by the mining company.

Eureka—Tintic shipments for the week ended July 16 amounted to 136 cars from 16 shippers, the Chief Consolidated heading the list with 36 cars. Others were: Tintic Standard, 30 cars; Eagle & Blue Bell, 10 cars; Grand Central, 9 cars; Dragon Consolidated, 8; Iron King, 7; Victoria, 7; Centennial-Eureka, 6; Mammoth, 6; Iron Blossom, 6; Gemini, 2; Tintic Drain Tunnel, 2; Colorado Consolidated, 2; Bullion Beck, 2; Gold Chain, 1, and Swansea Consolidated, 1 car.

WASHINGTON

American Arsenic Co. Has Small Mill Ready—American Mineral Production Board Reorganized

Index—The American Arsenic Co. has completed a 15-ton concentrator at its property four miles north of Reiter, a station on the Great Northern Ry. The ore is to be crushed by a jaw breaker and Hardinge mill, and then floated. It is principally realgar which occurs as a filling through a fractured zone in granite. A small production of high-grade red arsenic may be expected in the near future.

Valley—A reorganization of the Board of the American Mineral Production Co has been effected. Howard F. Wierum has tendered his resignation as vice president and hereafter will serve as general manager and director.

WISCONSIN

Operations in Zinc-Lead District

Linden—C. W. Stoops and others have proved up the Jerry Rule lease adjoining the Fearless mine on the north. Seventeen drill holes indicate a good lode of high-grade blende at the average depth of 110 ft.

J. H. Dugdale and others have drilled the Optimo No. 3 property, which is equipped with a 150-ton mill, and plan to re-open it together with the Hinkle & Wicks, two other former producers.

Mifflin—Piquett & Altenburg have unwatered the old Squirrel, which is taken under sub-lease, and have begun mining.

CANADA

British Columbia

Road Work Started in Portland Canal District—Unwatering Blue Bell at Riondel

By Robert Dunn

Stewart—The road work to be undertaken by the provincial government in the Portland Canal district will be started under the supervision of G. A. Young, of the Public Works Staff. Repair work on the Bear River road has already begun. Special attention is being given the tributaries of the Bear, along which there is much prospecting and mineral development.

Good ore is said to have been struck on the Unicorn Group, Salmon River, and ore of high grade has been brought into Stewart from the Glacier Creek property. An open cut 20 ft. long on the latter is in ore carrying galena and iron sulphides.

Nelson—Four of the levels of the Blue Bell mine, at Riondel, are being unwatered by a pump recently installed. Last year the Blue Bell shipped to Trail 1,249 tons of crude ore and 36 tons of concentrates.

Sandon—In order to sidetrack the famous slide on the Cody road to the Noble Five mine, a "cut-off" is to be constructed, work on which will start soon. The Washington, Argo Fraction, Majestic, Hope, Black Colt, Silver Hill, Cinderella, Chicago and Climax are properties in the Sandon district on which development is in progress.

Princeton—The Princeton Mining & Development Co. is working to put its property, situated five miles east of Princeton on the Great Northern Ry., on a shipping basis. There are three full claims on which the ledge has been opened by three tunnels. The operators assert that they have a large body of concentrating ore averaging 4 per cent in copper and 1 oz. in silver. A three-drill steam-driven compressor is in use and another is to be installed.

Ontario

Cobalt—The Gillies timber area, lying south of the Cobalt silver district, was thrown open to prospectors on July 20 with some reservations at the southern portion, which is heavily timbered. Many prospectors have gone in.

La Rose Mines has entered an action against the Mining Corporation of Canada and the Cobalt Reduction Co. to recover damages for the alleged conversion by the defendants of tailings from La Rose ore deposited by the Northern Customs Concentrator on the bed of Cobalt Lake, or on lands leased by the Cobalt Townsite Mining Co. and the Northern Customs Concentrator. As an alternative the plaintiff company asks that it receive a proper proportion of the tailings deposited on these lands.

Butt Township—The Mining Corporation of Canada has started work on its radium ore locations in Butt Township, where camp buildings are being erected preparatory to carrying on exploration work. Pitchblende has been found at three points in the district. It is stated that the ore occurs in patches throughout the main dyke, and that the commercial value of the discovery depends on whether these patches occur often enough.

AUSTRALIA

Great Cobar's Assets To Be Realized

From our Melbourne Correspondent

Melbourne—A representative of Great Cobar, Ltd., recently visited Australia and instructions have now been received to realize the assets on behalf of the debenture holders. This step will mean a big blow to Cobar and district and it is hoped that some steps will be taken so that the mine and works will not be altogether abandoned. Cobar is the center of an extensive copper mining area and there should be scope for a customs treatment plant to handle the ores from the smaller producers. It is unlikely that the property of the Great Cobar, Ltd., which comprises not only the Great Cobar mine but also the Cobar-Chesney copper mine, the Peak & Conqueror gold mines, and the Cobar gold mines will be worked again on the same scale, but the field is one that has still many years of life before it and justifies large scale operations on the lower grade deposits.

The Great Cobar, Ltd., which was floated in 1906 with a capital of £1,000,000, and in addition raised debentures for £750,000, fell on evil days in 1914, a receiver being appointed in April of that year. Subsequently Mr. Pellew-Harvey was sent to Australia by the English debenture holders to report on the property, and in order to carry out his recommendations the sum of £102,000 was raised, £40,000 of the amount being advanced by the New South Wales government. During the war period operations were profitable and the whole of this money, with interest, was refunded, but no interest was paid to the original debenture holders whose holdings were valued at £667,000. The ordinary shareholders had, of course, lost all their interest in the concern by this time. Operations ceased in March, 1919, owing to the low prices and the embargo on the export of copper.

THE MARKET REPORT

Published in part in San Francisco and mailed from there to our Western subscribers as a special service without charge pending the arrival of the *Engineering and Mining Journal*

Daily Prices of Metals in New York

July	Copper	Tin		Lead		Zinc
	Electrolytic	99 Per Cent	Straits	N. Y.	St. L.	St. L.
22	18.50@18.85	45.50	48.00@48.75	8.60	8.25@8.75	7.75
23	18.50@18.85	46.00	48.50@49.25	8.60	8.25@8.75	7.75
24	18.50@18.85	46.00	48.50@49.25	8.60	8.25@8.75	7.75
26	18.50@18.85	46.00	48.50@49.00	8.60	8.25@8.75	7.65@7.75
27	18.50@18.85	45.25	48.25@48.50	8.60	8.25@8.75	7.65@7.75
28	18.50@18.85	45.25	48.50@49.00	8.60	8.25@8.75	7.65@7.75

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for deliveries constituting the major markets, reduced to the basis of New York, cash, except where St. Louis is the normal basing point. All prices are in cents per pound.

Copper is commonly sold on terms "delivered" which means that the seller pays the freight from refinery to buyer's destination. The delivery cost varies, and it would be confusing to figure net prices on individual transactions. Consequently, an average deduction is made from the "delivered" price. At present the average cost of delivery from New York refineries is 0.15c. per lb., and that deduction is made to arrive at the New York price. When copper is sold f.o.b. or f.a.s. New York, of course no deduction is made.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of spot American tin, 99 per cent grade, and spot Straits tin

London

July	Copper			Tin		Lead		Zinc	
	Standard		Electrolytic						
	Spot	3 M		Spot	3 M	Spot	3 M	Spot	3 M
22	91	93¼	107	263½	268	35¼	36	41½	43¼
23	91¼	93¾	107	270	275	37	38	42¼	44
24	.	.	.	.	.	.	.	.	.
26	92	94¼	108	270¼	275¾	37⅛	37⅝	42	44
27	92	94¼	108	267	271	36¾	36¾	41¾	43½
28	91	93½	108	267	271½	36¼	36¼	41½	43¼

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Silver and Sterling Exchange

July	Sterling Exchange	Silver			July	Sterling Exchange	Silver		
		New York, Domestic Origin	New York, Foreign Origin	London			New York, Domestic Origin	New York, Foreign Origin	London
22	380	99⅜	93½	55⅛	26	378	99⅜	95	56⅜
23	377½	99⅜	91½	54⅜	27	378	99⅜	93¼	55⅜
24	377¾	99⅜	91⅜	54⅛	28	377¾	99⅜	94¼	56⅛

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

On the authority of the Secretary of the Treasury, we quote 100c. per oz. for silver, 1,000 fine, delivered at the option of the Director of the Mint to the New York Assay Office or to the mints in Philadelphia, Denver, or San Francisco, and proved to the satisfaction of the Treasury Department to have been mined, smelted, and refined in the United States. This quotation is retroactive to May 13.

Metal Markets

New York, July 28, 1920

Whether caused by the midsummer business lull or not, the metal markets are certainly lifeless, and no business of any magnitude has been done during the last week. Prices have shown little variation. Producers are seriously considering the effect of the expected increase in freight rates, which are variously prophesied to be from 10 to 40 per cent. These will affect costs all along the line. Copper will feel the increased burden most, for this metal is sold delivered. The cost to the sellers will, therefore, probably be from one-half to one cent more than under present conditions.

Transatlantic freight rates on metal are now about as follows: England, $13 per long ton; Hamburg, $12; Rotterdam, $8; and Havre, $7@$8. There has been a slight reduction recently in the rate to Havre. Transpacific rates to Hongkong and Kobe are $11 per long ton.

Copper

The large producers are selling some metal to regular customers at 19c. delivered, but copper may be obtained of smaller producers and traders at from ¼@½c. less. Most of that sold now is for August-September delivery. Producers do not care to quote for anything later than October. Copper for shipment from Japan was offered last Thursday for 18½c. On Monday, English inquiry for electrolytic developed, and several hundred tons were sold at ¼c. under the domestic price. Export demand has, however, been only fair.

Small buyers have no difficulty in getting spot copper at 18½@18⅝c. delivered.

Lead

This metal continues scarce for all positions, but inquiries have not been as numerous, particularly the last two or three days. Small quantities, one or two cars, are in demand for spot and early August shipment, at 9@9.25c. New York and 8.75@9c. St. Louis. No one wants to sell futures, but one producer reports that 8.75@9c. has been realized for October lead. Another large interest is offering October lead in large quantities at 8½c. without finding buyers. Practically all sales have been on a contract basis, so that our price is largely governed thereby.

The storage-battery business is evidently booming, judging from the demand in that quarter.

Zinc

Business continues dull. Galvanizers apparently refuse to buy unless they can pick up a bargain. Producers who held for 7.80c. in the closing days of last week did no business, and a price of 7.75c. on Monday failed to prove attractive. A small amount of business was done at slightly under these figures.

Practically no price differential exists between spot and future delivery. The London price is now equivalent to about 6.50c. St. Louis.

Tin

Tin has been even more lifeless than usual, and only small amounts have been sold. Buyers in general want immediate shipment, and no demand exists for futures. Small quantities of electrolytic have been sold for whatever they would bring, from 46c. to 47c. Dealers hope for, rather than expect, an improvement by mid-August.

Straits tin for future delivery: July 22nd, 48.25@48.75c.; 23rd, 48.50@49c.; 24th, 48.75@49.25c.; 26th, 48.75@49.25c.; 27th, 48.25@48.50c.; 28th, 48.50@49c.

Arrivals of tin, in long tons: July 14th, Hongkong, 25; 21st, Liverpool, 10; 23rd, London, 420; 24th, Singapore, 225; 26th, Straits, 240; China, 125; 27th, Liverpool, 25; Singapore, 125; China, 225.

Silver

The general undertone of the London market has improved on Indian demand and a cessation of offerings from the Continent for the present. The China demand continues flat.

Our local market for foreign silver follows closely the London price, subject to fall in sterling exchange. Domestic demand is only moderate. The Mexican government is now buying from 1,000,000 to 2,000,000 oz. monthly for mintage purchases at about 4c. premium over N. Y. quotation. The U. S. Treasury continues to purchase domestic production, and has so far bought a total of about 8,500,000 oz. under the Pittman Act.

Mexican Dollars—July 22, 70¼; 23d, 68¾; 24th, 68¾; 26th, 71¼; 27th, 71; 28th, 71¼.

Gold

Gold in London on July 22d, 107s. 9d.; 23d, 108s. 3d.; 26th, 108s. 9d.; 27th, 108s. 9d.; 28th, 108s. 9d.

Foreign Exchange

Unsettled political conditions in Europe and increased exports from this country, caused by the slackening of domestic demand and the recent more favorable exchange rates, have combined to depress somewhat the value of foreign money during the last week. On Tuesday, francs were 7.85c.; lire, 5.54c.; marks, 2.45c. and New York funds in Montreal, 13⅛ per cent premium. Argentine exchange has declined further to 88.15c.

Other Metals

Aluminum—Ingot, 33c. per lb., with 32c. open market for 98@99 per cent virgin.

Antimony—Market continues weak. Spot, 7½c. per lb.; Cookson's "C" grade, 14c. Chinese and Japanese brands, 6¾c. W. C. C. brand, 9c. Chinese needle antimony, lump, firm at 9@10c. per lb. Standard powdered needle antimony (200 mesh), 10@12c. per lb.

Bismuth—$2.70 per lb., 500-lb. lots. Market quiet.

Cadmium—Nominal, $1.40@$1.50 per lb. Market dull.

Cobalt—Metal, $2.50 to $3 per lb.; black oxide, $2 per lb.

Iridium—Nominal, $350 per oz. Heavy demand, but small supplies.

Magnesium—Crude, 99 per cent or over pure, $1.75 per lb., for the metal in 100 lb. lots and over, f.o.b. Niagara Falls.

[1]Molybdenum Metal in rod or wire form, 99.9 per cent pure, $32@$40 per lb., according to gage.

Nickel—Ingot, 43c.; shot, 43c.; electrolytic, 45c.; Monel metal, shot, 35c.; blocks, 35c., and ingots, 38c. per lb.

Osmium—Open market, $50@$75 per troy oz.

Palladium—$80 per oz.

Platinum—Market weak at $80@$85 per oz.

Quicksilver—Market steady; $88@$90 per 75-lb. flask. San Francisco wires $85. Weak.

Ruthenium—$200@$220 per troy oz.

[1]Selenium, black, powdered, amorphous, 99.5 per cent pure, $1.75@$2 per lb.

[1]Thallium Metal—Ingot, 99 per cent pure, $20 per lb.

Metallic Ores

Bauxite—About 52 per cent alumina content, less than 2 per cent iron oxide, up to 20 per cent silica and artificially dried to contain not more than 4 per cent free moisture, $10 per gross ton at mine; 54 per cent alumina and about 15 per cent silica, $11; averaging 57 per cent alumina, 8 to 12 per cent silica, less than 3 per cent iron oxide, $13 on basis of 8 per cent free moisture. Ores of very low silica content suitable for the manufacture of aluminum oxide and hydrate of alumina command a fancy price.

Chrome Ore—Guaranteed 50 per cent Cr_2O_3 foreign ore with a minimum of 6 per cent silica, 80@85c. per unit, New York. California concentrates, 50 per cent Cr_2O_3 and upward, 60@65c. per unit, f.o.b. mines.

Iron Ores—Lake Superior ores, per ton, delivered at Lower Lake ports: Old Range bessemer, $7.45; Old Range non-bessemer, $6.70; Mesabi bessemer, $7.20; Mesabi non-bessemer, $6.55. Congestion at Lake Erie ports due to car shortage has resulted in decreased tonnage. Other ports show gain in shipments.

Manganese Ore—75@80c. per unit, 50 per cent Mn content, c.i.f. Atlantic seaport; chemical ore (MnO_2) $75@$85 per gross ton.

Molybdenum—85 per cent MoS_2, 60@85c. per lb. of contained sulphide, New York.

[1]Tantalum Ore, guaranteed minimum 60 per cent tantalic acid, 65@70c. per lb. in ton lots.

Titanium Ores—Ilmenite[1], 52 per cent TiO_2, 2c. per lb. for ore. Rutile, 95 per cent TiO_2, 15c. per lb. for ore, with concessions on large lots or running contracts.

Tungsten Ore—Scheelite, 60 per cent WO_3 and over, per unit of WO_3, $7 f.o.b. mines; wolframite, 60 per cent WO_3 and over, per unit of WO_3, $6.50@$7.50, in New York.

Uranium Ore (Carnotite)—$2.75@$3 per lb. for 96 per cent of the contained oxide (U_3O_8). Ores must contain a minimum of 2 per cent U_3O_8.

Vanadium Ore—$1.25 per lb. of V_2O_5 (guaranteed minimum of 11 per cent V_2O_5), New York.

Zircon—Washed, iron free, 5c. per lb. Zirkite—$90@$100 per ton, carload lots. Pure white oxide, 99 per cent, is quoted at $1.15 per lb. in ton lots.

Zinc and Lead Ore Markets

Joplin, Mo., July 24—Zinc blende, per ton, high $51.50; basis 60 per cent zinc, premium, $48.50; Prime Western, $47.50; fines and slimes, $45@$42.50; calamine, basis 40 per cent zinc, $36. Average settling prices: Blende, $44.24; calamine, $37.04; all zinc ores, $44.16.

Lead, high, $102.95; basis 80 per cent lead, $92.50@$100; average settling price, all grades of lead, $99.85 per ton.

Shipments for the week: Blende, 6,777; calamine, 78; lead, 1,839 tons. Value, all ores the week, $431,950.

Two consecutive weeks' buyers responded to the demand of sellers for an advance each week of $2.50 per ton, but declined flatly to consider another advance of $2.50 this week, prices of zinc blende remaining, therefore, unchanged. Calamine was advanced $1 per ton and lead $7.50 per ton.

Platteville, Wis., July 24—Blende, basis 60 per cent zinc, $51@$53 base for high grade. Lead ore, basis 80 per cent lead, $95 per ton. Shipments for the week: Blende, 1,314; lead, 151 tons. Shipments for the year: Blende, 40,223; lead, 3,645; calamine, 2,240; sulphur ore, 1,098 tons. Shipped during the week to separating plants 2,032 tons blende.

Non-Metallic Minerals

Asbestos — Crude, No. 1, $1,800@$2,500; No. 2, $1,100@$1,500; spinning fibres, $400@$700; magnesia and compressed sheet fibres, $300@$400; shingle stock, $100@$150; paper stock, $60@$80; cement stock, $17.50@$30; floats, $8.50@$15, all per short ton, f.o.b. Thetford, Broughton, and Black Lake mines, Quebec, Canada; 5 per cent to be added as Canadian royalty export sales tax. Freight rate from mines to Sherbrooke, Quebec, over Quebec Central R.R., 20c. per cwt.; from Sherbrooke to New York, 27½c., carload lots; freight to New York for crude No. 1, f.o.b. Thetford mines, $8.45 per ton, carload lots.

Barytes — Crude, 88 to 94 per cent barium content, $10@$12 per net ton; ground (white) $22@$25 in bags, carload lots; (off-color) $18@$20 in bags, carload lots; all f.o.b. Kings Creek, S. C. Crude, 88 to 94 per cent, $12 per gross ton; ground (white) $25@$25; ground (off color) $16@$19 per net ton, f.o.b. Cartersville, Ga. Crude, 88 to 94 per cent, $23; ground (white) $40.50; ground (off color) $27 per net ton, less than carload lots, f.o.b. New York. Crude, not less than 98 per cent, $11@$11.25 per ton, f.o.b. cars, Missouri; floated, $28 per ton in bbls.; $26.50 per ton in 100-lb. bags; extra charge for bags, f.o.b. St. Louis.

Chalk—Domestic, extra light, 5@6c. per lb.; light, 4½@5½c.; heavy, 4@5c; English, extra light, 5@7c.; light, 5@6c.; dense, 4½@5c. per lb., all f.o.b. New York.

China Clay (Kaolin) — Crude, $9@$12; washed, $12@$15; powdered, $18@$22; bags extra, per net ton, f.o.b. mines, Georgia; crude, $8@$12; ground, $15@$40, f.o.b. Virginia points. Domestic lump, $10@$20; powdered, $25@

[1]Furnished by Foote Mineral Co., Philadelphia, Pa.

$30; imported lump, $25@$35; powdered, $30@$60, f.o.b. New York.

Feldspar—Crude, $7.50@$8 per gross ton, f.o.b. Maryland and North Carolina points; $7.50@$10 f.o.b. Maine; ground, $22@$30, car lots, f.o.b. Baltimore; ground, $17@$20, f.o.b. North Carolina points; $17@$20 per ton, No. 1 ground, f.o.b. New York State; $21@$23 per ton, ground, f.o.b. Maine.

Fluorspar — Gravel, guaranteed 85 per cent calcium fluoride and not over 6 per cent silica, $25 per ton, f.o.b. Kentucky and Illinois mines; ground, suitable for acid, chemical or enameling purposes, $60; lump, $17.50, f.o.b. Tonuco, N. M.

Graphite—Crucible flake, 85 per cent carbon content, 8c. per lb.; 88 per cent, 9½c.; 90 per cent, 10½c., all f.o.b. New York. Crucible grades of Alabama graphite sell as follows, f.o.b. Ashland, Ala.: 80 per cent, 5c.; 90 per cent, 10c. Lubricating grades in increasing demand, with price ranging from 11c. for the 85 per cent guaranteed grade in car lots to 30 and 40c. for higher grades. Mexican, amorphous, $45@$55 per short ton; Korean, 3½c. per lb.; Madagascar, 8c.; Ceylon, 4¾@15½c.

Gypsum—Raw crushed rock, $3.50@$4 per ton; raw ground fine, $4@$4.50; calcined stucco, $9, all f.o.b. works. Containers extra. Wholesale, plaster of paris, carload lots, $3.75 per 250-lb. bbl., alongside dock, New York.

Kaolin—See China Clay.

Limestone—Dolomite, 1@2 man size, $1.60@$1.65; 2@8 in., $1.55@$1.65 per net ton, f.o.b. Plymouth Meeting, Pa.; fluxing, $1.65@$1.75 per net ton, f.o.b. Howellville, Pa.

Magnesite, Calcined — High-grade caustic calcined, lump form, $35@$40 per ton, carload lots, f.o.b. California points. Freshly ground calcined, suitable for flooring trade, $65@$75 per ton, f.o.b. Eastern points.

Dead-Burned — $32.50 per net ton, Chewelah, Wash.; $50@$60, Chester, Pa. Austrian grade, $52@$55 per ton, f.o.b. Baltimore. (Magnesite brick—See Refractories.)

Mica—Imported block mica slightly stained, per lb.: No. 6, 50c.; No. 5, $1.20@$1.40; No. 4, $2@$3; No. 3, $4.25@$5; No. 2, $5.50@$7; No. 1, $8. Clear block: No. 6, 55c.; No. 5, $2; No. 4, $4; No. 3, $5.75; No. 2, $7; No. 1, $9; A1, $14; extra large, $25, all f.o.b. New York; ground, $85@$100 per ton, Philadelphia.

Monazite — Minimum of 6 per cent thorium oxide, $35 per unit, duty paid.

Phosphate Rock—Per long ton, Florida ports: 77 per cent tricalcium phosphate, $13; 75 per cent, $11.50; 75@74 per cent, $11; 70 per cent, $8.35; 68 per cent, $7.85; 68@66 per cent, $7.60. There is no price schedule for spot for domestic uses.

Pumice Stone—Imported, lump, 4@50c. per lb.; domestic lump, 6c.; ground, 4@7c., all f.o.b. New York.

Pyrites—Spanish, fines, per unit 12c., c.i.f. Atlantic seaport; furnace size, 16½c.; run of mine, 12@14c.; domestic, fines, f.o.b. mines, 12@14c.

Quartz—(Acid tower) fist to head, $10; 1¼ to 2 in., $14; rice, $17, all net ton, f.o.b. Baltimore; lump, carload lots, $5@$7.50 net ton, f.o.b. North Carolina mines. F.o.b. Wausau, Wis., the price is $16 per ton in car lots, and $20 in less quantities, including bags.

Sulphur—$18 per ton for domestic; $20 for export, f.o.b. Texas and Louisiana mines.

Talc—Paper making, $9.50@$14 per ton; roofing grades, $8.50@$9; rubber grades, $9@$15, all f.o.b. Vermont. California talc, $20@$35, talcum powder grade. Southern talc, powdered, carload lots, $12 per ton; less than carload, $15, f.o.b. cars; freight to New York $5.25 per ton, carload lots; less than carload lots, $9.25. Imported, $60@$70; Canadian, $10@$20 per ton.

Mineral Products

Arsenic—White arsenic, 15½c. per lb.; sulphide, powdered, 20@21c. per lb., f.o.b. works, carload lots.

Nitrate—Soda, $3.85 per cwt., ex vessel, Atlantic ports. Market quiet.

Potassium Sulphate—Domestic, $2.25@$2.50 per net ton, basis 90 per cent, f.o.b. New York.

Ferro Alloys

Ferrocarbontitanium—For 15-18 per cent material, $200@$250 per ton, f.o.b. Niagara Falls, N. Y.

[1]Ferrocerium—Per lb., $12@$15. Foreign conditions as affecting the price of American goods remain unchanged.

Ferrochrome—Carload lots, spot and contract, 60 to 70 per cent chromium, 6 to 8 per cent carbon, 17@18c. per lb. of chromium contained; 4 to 6 per cent carbon, 19@20c. f.o.b. works.

Ferromanganese—For 76@80 per cent, $225, freight allowed; Spiegeleisen, 18 to 22 per cent, $75, f.o.b. furnace.

Ferromolybdenum—Standard grades, carrying from 50 to 60 per cent molybdenum metal, with low sulphur, phosphorus, and arsenic, $2.50@$3 per lb. of contained metal, f.o.b. works.

Ferrosilicon—For 10 to 15 per cent, per gross ton, f.o.b. works, $60@$65; 50 per cent, $80@$85; 75 per cent, $150@$160.

Ferrotungsten—70 to 80 per cent W, $1.10@$1.15 per lb. of contained tungsten, f.o.b. works.

Ferro-uranium—35-50 per cent U, $7 per lb. of U contained, f.o.b. works.

Ferrovanadium—Basis 30-40 per cent, $6.50@$8.25 per lb. of V contained, f.o.b. works.

Metal Products

Copper Sheets—No change in Jan. 7 price of 29½c. per lb.; wire, quoted 32½c.

Lead Sheets—Full lead sheets, 12½c.; cut lead sheets, 12½c. in quantity, mill lots.

[1]Furnished by Foote Mineral Co., Philadelphia, Pa.

Nickel Silver—Unchanged at 39½c. per lb. for 18 per cent nickel.

Yellow Metal — Dimension sheets, 26¾c.; sheathing, 25¾c.; rods, ⅝ to 3 in., 23¾c.

Zinc Sheets—$14.50 per 100 lb., less 8 per cent on carload lots, f.o.b. smelter; zinc plates, 14c. per lb.

Refractories

Bauxite Brick—56 per cent alumina, $145 per 1,000, f.o.b. Pittsburgh.

Chrome Brick—$90@$95 per net ton, carload lots, eastern shipping points.

Chrome Cement—45 to 50 per cent Cr_2O_3, $50 per net ton, and $55 in sacks, carload lots, eastern shipping points.

Clay Brick — First-quality fire clay, 9-in. shapes, $45@$53 per thousand, Pennsylvania, Ohio, and Kentucky works; second quality, $40. First quality, St. Louis, $45; New Jersey, $75.

Magnesite Brick — $100 per ton, eastern shipping points; 9-in. straights, $90@$100; 9-in. arches, wedges and keys, $95@$105; soaps and splits, $110@$120.

Silica Brick—9-in. per 1,000, $51@$55, Birmingham, Ala.; $50@$55, Mount Union, Pa.; $55, Chicago district.

Iron Trade Review

Pittsburgh, July 27, 1920

The shortage of gondola cars for shipping steel mill products, as well as pig iron, has grown still greater in the last week. In box cars there is no appreciable improvement, but there has hardly been any change for the worse in several weeks. The gondola car shortage is due, of course, to the preference being given the coal mines. Strong hopes are now entertained that this preference will soon be found to have performed its function.

Pig Iron—The strained situation in the pig-iron market is still more pronounced, with many furnaces piling iron, stocks being now fairly large. A few consumers are seeking to buy actual deliveries, almost regardless of price. If transportation conditions should permit the sudden moving of a large quantity of iron the market situation might be entirely reversed. We quote: Bessemer, $46; basic, $46; foundry, $45, f.o.b. Valley furnaces, freight to Pittsburgh being $1.40.

Steel—A sale of 3,000 tons of sheet bars for early shipment is reported, for conversion, at $75, buyer's option, bessemer or openhearth, and this seems to be the prevailing market for conversion bars, but some mills believe they could buy from regular sources at $70. Billets are inactive, and practically nominal at $60@$65, buyers being interested in getting deliveries, already long delayed, against old purchases.

Charcoal and Coke

Charcoal—Willow, 7c. per lb. in bbls.; hardwood, 4½c. per lb., in 250-lb. bbls.

Connellsville — Furnace, $17@$18; foundry, $18@$20.

The Outlook for Silver

Foreign Silver Remains But Little Below "Dollar Silver"—Dullness of Chinese Business and Reversion of India's Trade Balance to Pre-War Tendency Have Depressed Prices—Pittman Act Has Removed United States Silver From the World's Supply

ON JUNE 16 silver was quoted at the lowest price for the year, 80c. per oz., but since that date has gradually risen to the present (July 25) quotation of 95c., which is only 5c. below the price of "dollar silver" established by the Pittman Act. For the last few weeks foreign silver has reach a stable level close to the firm domestic price, with daily fluctuations that do not seem warranted by the amount of business done, although this circumstance itself is likely to make the market unusually sensitive in price changes. That the speculative influences at work in the silver market, caught in the recent big drop, have partly worked themselves out is indicated by the recent advance to the 95c. quotation, and might be explained by the absorption of the large accumulated stocks formerly in the hands of speculators who had played for a rise, but who have been consistently unloading their silver since the beginning of the decline. It is also not unlikely that the paucity of general supplies is being felt, helping to raise the price relatively close to dollar silver.

One Effect of the Pittman Act

The direct effect of the Government's purchases of silver produced in the United States is to withdraw from the world's available silver production fifty to sixty million ounces for the next four years, provided, of course, that silver generally does not rise above one dollar an ounce. The burden of meeting the entire world's requirements is therefore thrown upon other silver-producing nations, such as Mexico and Canada. Even the United States' consumption in the arts will likely be met by foreign silver, as no silver consumer will purchase dollar silver when lower priced foreign silver is available.

The Pittman Act has withdrawn about one-third of the world's total annual silver production and directed it into the United States mints. The result of this step would undoubtedly be more marked were it not for the unprecedented action of European nations in recently placing on the market large quantities of silver coin and bullion, thereby balancing the effect of the American withdrawals. One bullion broker has estimated that in the last three months fifteen million ounces of Continental silver were marketed, because silver is one of the few commodities in the possession of European nations with greatly depreciated currency that commanded a relatively high value and that could be readily and satisfactorily marketed for relatively enormous realizations in depreciated currency. According to Gresham's law the depreciated currency would have a tendency to displace the silver coinage. The European meltings were one of the great contributing agencies to the recent demoralization in the market.

The world's production of silver from available accounts has shown a decline during 1919. An estimate for that year follows:

	Production in Ounces
United States	55,300,000
Mexico	62,500,000
Australia	5,900,000
Canada	15,675,000
Others	37,000,000
	176,375,000

In 1918 production was estimated by the Bureau of the Mint at 197,394,900 oz.; in 1917 at 174,187,800 oz., and in 1916 at 168,843,000 oz.

The 1919 output, despite the high price of silver, exhibits a marked decrease in the world's production from 1918, and can be explained as being caused first by the unsatisfactory copper situation, with the consequent decrease in byproduct silver production, and second by a sharp decrease in Canadian production.

Considering the smallness of the silver market covering the arts in the United States and in the world in general the major interest in this country is probably on the side of the producer in maintaining high silver prices, although there are instances where a low silver price is desirable. This inclination toward the market is characteristic of practically the whole North American continent, as it produces most of the world's silver. On the other side of the fence is presumably the dominating consumption of India, controlled by the British government through the London market, whose interests do not lie in a high price for silver. China, another silver-consuming country, finds it advantageous to maintain silver at a high value, thus permitting enlarged imports and high prices for exports. This condition, however, is not favorable to European interests controlling Chinese markets, who do not like to see the volume of trade affected by high silver prices, as high silver implies a costly settlement for a favorable trade balance.

Conditions in the Far East

Exporters have keenly observed the effect of present silver prices upon the Far East. Business conditions in China are reported dull, with an improvement in the silver market necessary to encourage business. It has been estimated that the fall in silver has resulted in a loss of about $70,000,000 to Chinese merchants, in settlement for goods bought from them, and has put a strong brake to import trade, with export trade continuing dull.

The situation in India is none too bright, the balance of trade having turned against India. Normally India has an adverse trade balance of $90,000,000, and although there was a favorable balance that reached unusual proportions during the war reversion has now set in to the pre-war tendency. The financial difficulties of Japan have affected the exports of cotton from India, and the exports of raw produce have come to a low point. India is still refraining from making extensive silver purchases.

India's Enormous Silver Consumption

The following official figures as given by Samuel Montagu & Co. show the powerful absorption of gold and silver by India:

NET IMPORTS OF GOLD

	Average of Five Years 1909-10 to 1913-14 (Pre-War Average)	1917-18
On private account	£19,242,000	£13,292,000
On government account	476,000 (net exp.)	3,483,000
Total net imports	£18,766,000	£16,775,000

The following year the movement of gold was reversed and net exports were recorded as follows:

	Net exports 1918-19
On private account	£1,656,000
On government account	2,053,000
Total	£3,709,000

NET IMPORTS OF SILVER

	Average of Five Years, 1909-10 to 1913-14 (Pre-War Average)	1917-18	1918-19
On private account	£4,806,000	£ 457,000	£678,000
On government account	2,346,000	12,238,000	44,601,000
Total net imports	£7,152,000	£12,695,000	£45,279,000

It will be noted that in the last year almost seven times as much silver was imported as for the average pre-war rate, which is a gage of India's tremendous silver accumulation.

The Outlook for Silver

The future position of silver will be influenced by the same consideration that holds for most commodities, supply and demand, but the enigmatical behavior of silver makes

prophecy unusually risky. The world's supply will reflect the ability of Mexico to provide for any increased demand for silver, something which that country is well able to do, if the Mexican government firmly exercises its authority. Production in the United States for the next few years need not be considered as it is being taken care of under the Pittman Act.

The world demand is exceedingly difficult to judge. Continental European coinage demands will have to be satisfied at some future date to replenish the exhausted stocks, but this is not to be looked for until silver rules at a lower price. India's puzzling requirements are as much a matter of whim as of trade, and reasoning along the latter line may lead to an erroneous conclusion. The consumption of silver by India for the past fifteen years in per cent of the world's production is given by the director of statistics for India as follows:

	Per Cent
1904-5 to 1913-14	35
1909-10-11-12-13-14	26
1914-15	32
1915-16	17
1916-17	53
1917-18	40
1918-19	112

During the last year China imported gold estimated at $300,000,000, and as China is a silver-standard country there is a possibility that this gold may be converted into silver, but to facilitate this exchange the Chinese must be induced to believe that silver is relatively cheap, and the question arises as to when the Chinese will consider silver cheap. Chinese exports are now at a standstill, and the only absorption of appreciable amounts of silver would seem to be in exchange for this Chinese gold.

July, 1920, Mining Dividends

The following is a partial list of mining dividends paid during July, 1920:

U. S. Mining and Metallurgical Companies	Situation	Per Share	Totals
Am. Smelt. Sec., pfd. A	U. S.-Mex.	$1.50 q.	$146,071 00
Am. Smelt. Sec., pfd. B	U. S.-Mex.	1.25 q.	39,855 00
Caledonia Mining Co., l. o	Idaho	.01 m.	26,050 00
Camp Bird, Ltd., pfd., g. s	Col.	8 2/5 d. s-a	£38,502
Daly Mining Co., s. l	Utah	.10 q.	$15,000 00
Daly West Mining Co., s. l	Utah	.25 q.	62,500 00
Electric Point Mining Co., l	Wash.	.03 k.	23,812 50
Inspiration Consol. Copper	Ariz.	1.00 q.	1,181,967 00
Judge Mining & Smelting, s. l	Utah	.12½ q.	60,000 00
Phelps Dodge Corp	U. S.-Mex.	2.50 q.	1,125,000 00
Portland Gold Mining Co	Col.	.01½ q.	45,000 00
Tintic Standard Mining Co., l. s	Utah	.10 q.	117,470 00
Tonopah Extension Mining Co., g. s.	Nev.	.05 q.	64,140 00
United Eastern Mining Co., g	Ariz.	.15 q.	204,455 00
U. S. Smelt. Ref. & Min	U. S.-Mex.	1.50 q.	526,671 00
U. S. Smelt. Ref. & Min., pfd	U. S.-Mex.	.87½ q.	425,555 00
Vanadium Corp. of Amer	Col.-Peru	1.50 q.	560,001 00

Canadian, Mexican, Central and South American Companies	Situation	Per Share	Totals
Alvarado Mining & Milling, s. g	Mex.	$0.50 q.	$17,500 00
Asbestos Corp. Canada, Ltd.	Quebec	1.50 q.	45,000 00
Asbestos Corp. Canada, Ltd., pfd.	Quebec	1.75 q.	70,000 00
Consol. Mining & Smelt Co., Canada	B. C.	.62½ q.	263,342 00
Dome Mines Co., Ltd., g	Ont.	.25 q.	100,000 00
Frontino & Bolivia Gold Mining Co.	Colombia	5% k.	£7,000
Frontino & Bolivia Gold Mining, pfd	Colombia	5 % k.	£10,000
Howe Sound Co., c	B. C.-Mex.	.05 q.	$99,208 00
McKinley-Darragh-Savage, Ltd., s.	Ont.	.03 q.	67,431 00
N. Y. & Honduras Rosario M. Co., s g.	Honduras	50 q.-x.	100,000 00
Nipissing Mines Co., Ltd., s	Ont.	.25 q.	300,000 00
St. John del Rey Mining Co., Ltd., g.	Brazil	1 sh. 3 d.	£6,250
St. John del Rey Mining, Ltd., pfd	Brazil	1 sh.	£5,000
Santa Gertrudis Co., Ltd., g. s	Mex.	1 sh. k.	£75,000

m, monthly; q, quarterly; s.-a., semi-annual; k, occasional; x, includes extra dividend.

The comments made in this column on p. 1147 of our issue of May 15 still indicate present tendencies. Inspiration Consolidated Copper and United Eastern Mining both show decreases in their quarterly dividends. Caledonia Mining changes with this month from a monthly to a quarterly dividend. Daly West is the only company increasing its dividend, but Electric Point appears with its second disbursement and Vanadium Corporation makes its second quarterly payment. There are a number of changes in the list of companies outside the United States.

COMPANY REPORTS

St. John Del Rey Mining Co., Ltd.

Gold; Brazil

The eighty-ninth annual report of the directors of the St. John Del Rey Mining Co., Ltd., a British corporation operating the deepest mine in the world, states that 105,537.59 oz. of gold was produced during the year ending February, 1920, having a value of £447,028; silver was produced to the value of £7,549.

The average value of the ore milled per long ton was 54s. 9½d. Working costs for the year were £365,382; development costs, £12,207; London expenses, £14,160; a total of £391,749.

Total realization from ores and bullion, less government duties, was £500,354, giving a favorable balance of £108,605, to which was added the amount brought forward from the last account, £19,255, and an excess profits duty refund of £32,269, bringing the balance to £160,129. From this amount was paid £14,268 in the form of a 10 per cent preference share dividend and tax; £54,626 in ordinary share dividends and tax; £23,781 in the form of an income tax; and £500 to war funds; or a total £93,193, leaving a balance of £66,936. Of this amount £50,000 was transferred to capital works account and the balance, £16,936, was carried forward.

The decreased output for the year was due to the delay, caused by the war, in the delivery of the plant necessary for cooling the mine; the heat at the lower horizons seriously affecting the efficiency of the labor.

Indications as to the value of mineral in depth continue favorable. The assay value for the year was 59s. 3d., as compared with an average of 54s. 8d. for the two preceding years.

Howe Sound Co.

Copper; Silver; Lead—British Columbia and Mexico

The annual report of the Howe Sound Co. for the year 1919 states that its holding of all the outstanding stock of the Brittania Mining & Smelting Co., Ltd., remains unchanged. During the year there was shipped to the Tacoma smelter 70,009 tons of concentrate containing 4,349.85 oz. gold, 99,863.0 oz. silver, and 17,330,844.0 lb. copper from the British Columbia operations.

In Mexico the high cost of silver facilitated operations There were shipped during the year 159,060 dry tons of ore, classified as follows:

	Tons	Average Silver Oz	Average Lead Per Cent	Average Zinc Per Cent
Lead carbonates	108,784	13 75	5 15	
Lead sulphides	21,592	22 55	7 06	
Iron sulphides	26,329	32 35	0 85	
Zinc ore	2,355			27 78

Mining costs covering all operations were $1,915,034.04; milling, $479,550.63; smelting and marketing, $2,303,945.77; transportation, $237,667; taxes, $223,482.96; and other expenses totaled $85,329.38. Depreciation and depletion amounted to $1,583,605.25, and interest to $231,102.63. Deducting these expenses from the total smelter return of $6,936,069.42 plus a miscellaneous income of $143,011.75, a profit balance of $19,363.51 is obtained, which, when added to the balance of Dec. 31, 1918, of $3,597,847.88, and deducting therefrom four dividends totaling $396,830 00, gives a balance on hand Dec. 31, 1919, of $441,738.72.

Seoul Mining Co. Passes Dividend

Of mining companies working in Japan the report of the Seoul Mining Co. for the year 1919 states that for the first time in the history of the company the expenditures for the year will exceed the receipts and that it would therefore not be possible to distribute any dividends from the 1919 earnings.

The Oriental Consolidated Mining Co., an American company operating the Unsan mine, was able to declare a dividend of only 2½ per cent for the year, whereas the dividend for 1918 was 5 per cent.

INDUSTRIAL NEWS

Barglebaugh & Whitson, consulting engineers of El Paso, Texas, and elsewhere, announce the association with them of Arthur F. Barnes, formerly with New Mexico State College. Mr. Barnes will manage their New Mexico-Arizona district.

Westinghouse Electric & Manufacturing Co. stockholders, at the recent annual meeting, unanimously re-elected the following directors, to serve three years: Guy E. Tripp, chairman of the board; Joseph Marsh, of Pittsburgh, Pa.; H. H. Westinghouse, of the air brake company; A. H. Wiggin, of Chase National Bank; and George W. Davison, of the Central Union Trust.

Stephens-Adamson Manufacturing Co., Aurora, Ill., has opened a branch store, assembling shop and sales office at 412-414 E. Third St., Los Angeles, Cal. A large stock of S-A belt conveyors and other standard S-A transmission and screening machinery is carried there. R. C. Pierce, the Los Angeles district manager, is in charge.

Electric Furnace Co., Alliance, Ohio, has opened a Middle Western office at 301 Frisco Building, St. Louis, Mo., to accommodate the increasing demand for Baily electric furnaces in that region. W. E. Prosser is in charge of the St. Louis branch.

Wright Manufacturing Co., Lisbon, Ohio, maker of hoists and hoist-trolleys, is reaching out for oriental trade in a logical manner. In Japan the company distributes catalogues printed for it in Japanese by the General Commercial Co., Ltd., of Yakohama, Japan. Its catalogues appeal not only through the fact that they are in the vernacular, but also because they explain the principles embodied in the manufacture of the hoists.

Howard N. Eavenson has resigned as chief engineer of U. S. Coal & Coke Co., at Gary, W. Va., and Lynch, Ky., to open a private office as mining engineer at 230 Fifth Ave., Pittsburgh, Pa. (Telephone Court 559.)

Bessemer Gas Engine Co., of Grove City, Pa., announces the opening of a new sales office and service station at 615 Market St., Shreveport, La. A. K. De France will be in charge.

Ray T. Middleton, former general sales manager of the Standard Steel Castings Co., Cleveland, Ohio, has been elected vice-president and director of sales and advertising for Kelly Metals Co., Chicago, Ill., Detroit, Mich., and Los Angeles, Cal. Mr. Middleton's headquarters will be Chicago, where the Kelly Metals Co. is establishing its principal production plant.

Arthur D. Little, Inc., chemists and engineers, Cambridge, Mass., announce the recent addition of Earl Stafford to their engineering staff. Mr. Stafford is a graduate of Tufts College, 1908.

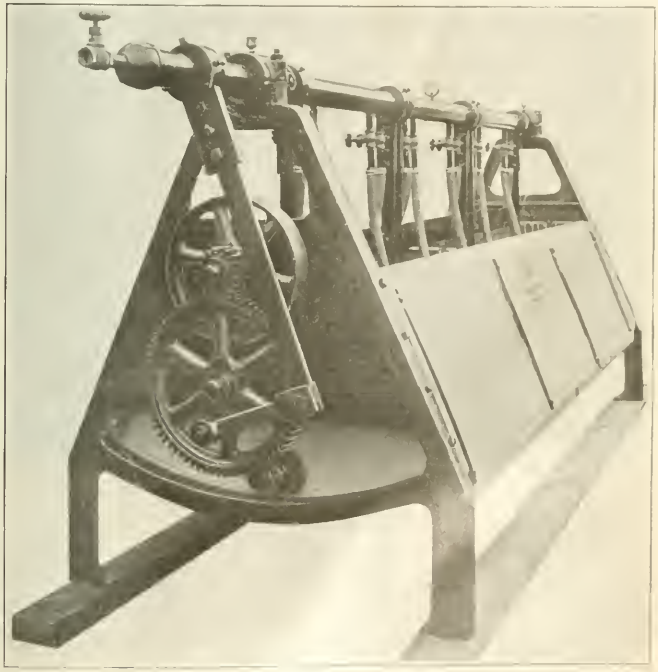
Oscillating Flotation Machine Cleans Mats

Sloping Sides Give Excellent Froth—Stirring Swing Yields Desired Uniform Pulp Depth

By E. I. MILLS

An oscillating cell type of flotation machine for the separation of minerals, has recently been made by John Allingham, of Los Angeles, Cal.

In this design all parts of the machine are subject to the control of the operator while the machine is in operation. Parts to be replaced are simple and may be found at any milling store house, and the horsepower required is much less per ton of ore treated than in any of the other standard machines, not exceeding ½ hp. for either the [illegible] 9 ft. size.



ALLINGHAM'S [illegible] FLOTATION MACHINE

The tank or container bottom is curved on an arc of the proper radius to accommodate the oscillation of the mat carriers from side to side. The sides of this tank converge slightly at the top, thus reducing the froth area, which results in a heavier and stronger froth of the proper mineral-carrying consistency.

The mats are hung from a manifold which is suspended from the ends of the tank, permitting a free movement sufficient for the oscillation of the mat carriers attached thereto. This oscillation is accomplished by a connection of the manifold to a spur gear by means of a connecting rod, this gear in turn connecting with a spur pinion attached to a pulley, thus reducing the speed sufficiently to allow the driving of the machine from a comparatively fast running line shaft. The number of oscillations per minute can be regulated absolutely to suit the amount and weight of minerals contained in the ore. The usual range is from 25 to 45 oscillations per minute. The air from a blower of the positive type is supplied through the manifold by hose pipes each arranged with a valve for close regulation. The quantity of air required is about 1 cu.ft. per minute per ton treated in twenty-four hours.

The oscillation cell produces a uniform, consistent froth. The passing of the cell from side to side through the pulp keeps the mats constantly clean and prevents banking of the sands, and at the same time keeps the channel of the rising bubbles broken and the ore in gentle suspension, thus making an ideal condition for the attachment of oil to the mineral and the raising of the mineral by the bubbles. These conditions are caused by the [illegible] ture of direction of travel of the mats. This travel of oscillation is at right angles to the flow of pulp.

It has long been the desire of flotation machine builders to get a machine having an equal depth of pulp throughout, as it is generally known that an equal hydrostatic pressure above the cells is conducive to the best results. This, I believe, is the first machine of this kind that embodies this feature.

New and Simple Tunneling Machine

What seems to be an efficient tunneling machine of simple construction and economical operation is shown in the cut below, which illustrates a device perfected and built by W. E. Dean, of the Dean Tunneling Machine Co., 1311 Ogden Ave., Superior, Wis.

As a close inspection would show, the machine consists of a gang of eight heads mounted in line on an oscillating cross-frame supported by a curved rack and the quadrangular I-beam frames filling the tunnel as cut.

The eight heads are nine inches in diameter, have a ten-inch stroke and each throws its 700-lb. weight 150 times per minute. The piston pressure for each stroke is 3,000 lb. and drives, in all, 420 tons of steel against the rock each minute. The motive power is compressed air used expansively on both strokes. The whole machine, operating and shifting, is controlled by one man riding on the iron seat which is attached to the drill cross-frame. With the aid of a second man mucking into the conveyor loader, the machine has been known to make a headway of one foot per hour. Those interested should write to the above address for further details.

DEAN TUNNELING MACHINE AT WORK

Complete Mill Unit on Exhibition

Negotiations have just been closed for the purchase of one of the units of the Hackberry Mines, in Arizona, by Rosenburg & Co., of Los Angeles, Cal. The complete unit purchased by the Los Angeles distributors has never been used, but was installed merely as a reserve plant. It is the intention of Rosenburg & Co. to transport the equipment of this unit to its Los Angeles warerooms for inspection by the mining trade.

The Los Angeles company also announces the opening of a new warehouse in Phoenix, Ariz. A lease has been taken for a large warehouse, 420 East Jefferson St., Phoenix, and it is the intention of the company to install a large stock of machinery at that place immediately. This is the third warehouse opened by Rosenburg & Co. Eighteen months ago a warehouse was established at Congress Junction, Ariz., being a branch of the Los Angeles warehouse. The new warehouse at Phoenix, which will open between June 20 and July 1, will carry a $500,000 stock of mining and milling machinery and equipment, and, in addition, will house a large quantity of electrical goods. The Allingham flotation machine, manufactured by Rosenburg & Co., will also be represented at the new Phoenix warehouse.

Pump Makers To Enter Marine Engine Field

The Worthington Pump & Machinery Corporation announces that it has completed preparations for the production of motor ship machinery and is now prepared to execute orders for complete engine-room equipment. Its entrance into this field is a natural result of the development of an old-established business of building auxiliary machinery of all kinds for steam plants, both stationary and marine, and of the company's parallel experience in the field of large internal-combustion engines. Already one type has been built at the Snow Works of this company—a 2,400-hp. six-cylinder, marine-Diesel engine, 26-in. bore, 46-in. stroke, 120 r.p.m.—and this type will be followed by such other sizes as may be required.

TRADE CATALOGS

Hoisting and Mining Machinery—The Wellman-Seaver-Morgan Co., Cleveland, Ohio, in Bulletin No. 44, shows reproductions of photographs, together with sectional drawings, of electric and steam hoisting equipment, cages and skips, revolving car tipples, mine car loaders, and Akron Chilean mills. The sectional drawings are novel, inasmuch as they give the effect of blueprints.

Mechanical Loading—The Lake Superior Loader Co., Duluth, Minn., has issued a recent bulletin which describes the construction and operation of the "Shuveloder." The increasing interest shown in mechanical loaders that are suitable for underground work is evidenced by the fact that an extensive field for this and similar types of loaders has developed during the past few years. Comparative performances of hand shoveling and the work done by the "Shuveloder" are tabulated in the bulletin and illustrate the excellent results that have been obtained by means of this machine.

Thermit Welding—The Metal & Thermit Corporation, 120 Broadway, New York, N. Y., has issued a third and revised edition of its pamphlet "Laboratory Experiments With the Thermit Process of Welding." This pamphlet is useful as a guide for acquainting students with the substance, characteristics, and results of the Thermit reaction. The pamphlet illustrates and describes experiments intended to show the speed of the reaction, the heat produced thereby, and the effects obtained by the superheated liquid slag and the superheated liquid steel.

A Combustion Recorder That Registers Both CO_2 and CO

The Mono Corporation of America, 48 Coal & Iron Exchange, Buffalo, N. Y., announces a recorder that enables the fireman constantly to see that no CO is present and that CO_2 is always maintained at a maximum.

Bonus systems based on percentages of CO_2 only have failed because the boiler-room force soon learns how to so manipulate the dampers that a high CO_2 reading is obtained. Yet combustion is incomplete and the object of the bonus system is defeated.

Now that both CO_2 and CO can be recorded, the fuel must be so burned that the percentage of CO_2 is as high as possible and at the same time there must be no CO. The device embraces two recorders, the Mono Monoxide recorder with records CO_2 and CO on the same chart, and "Monoxide Auxiliary Type K," which records CO on a second chart. Together the two records show combustion conditions. As the Mono Monoxide Recorder will also register SO_2, this device is valuable in pulp and paper mills.

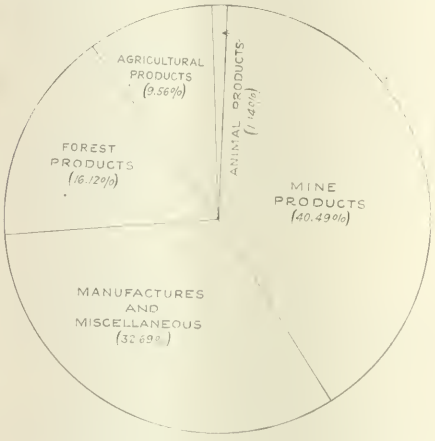
The Mining Industry In the South

HOW important do you think the mining industry is in the South as compared with other industries? Off-hand, probably you would say that it was subordinate to agriculture and timber. Yet the figures of the tonnage hauled by the Southern Railway in 1918 show that



THE INDUSTRIES OF THE SOUTH

the products of the mines formed 40.49 per cent of the total. Next come manufactures and miscellaneous, with 32.69 per cent; then forest products, with 16.12 per cent; agricultural products make up only 9.56 per cent, and animal products, 1.14 per cent. Who would have thought it? King Cotton made up only 1.56 per cent of the grand total.

The Major Southern Mining Industries

ORDINARILY the South is not thought of as a mining section, the agricultural, timber and manufacturing industries of that region of the United States being so great as to obscure the industry of the mining of raw ores from the rock. Nevertheless, it is by no means poor in this respect. There are certain mining industries in the South that are of the first order of importance, and which are growing and prosperous.

Most people are familiar with the important Southern iron and coal industry, especially that which centers around Birmingham, Ala. The iron ores of the South constitute a vast reserve, according to Eckel, which will become increasingly important as the richer ores of the Lake Superior district are mined. Iron mining at Birmingham is treated in a special article in this issue.

The sulphur-mining industry is one of the most important among the mining industries of the Southern states. The development of sulphur mining has been phenomenal, and now this Gulf district is by far the most important and most productive in the world, eclipsing Sicily, which earlier held the predominance. The sulphur is one of the products of those remarkable humps or domes which rise like blisters from the Tertiary strata which fringe the coast of the Gulf of Mexico. From these domes not only sulphur but much petroleum has been obtained (although not from the same dome), and they contain as well vast quantities of gypsum. The extraction of the sulphur from them was made possible by the invention of the "Frasch process," by which superheated steam is pumped down through a pipe into the sulphur deposit (which is inaccessible for ordinary operations, on account of mining conditions), and the steam liquefies the sulphur so that it can be drawn off in liquid form. This process, and the consequent production, have given the United States not only a vast supply of sulphur, but, at will, the control of the world's sulphur market.

It is especially propitious that in an agricultural region another of the principal fertilizer minerals—phosphate rock—is found in vast quantity. The phosphate rock deposits of the South (especially those of Tennessee, South Carolina, and Florida) are very extensive, and with the vast deposits of our Northwestern states (such as Idaho, Utah, and the neighboring region) give the United States by far the largest reserves of rock phosphate possessed by any nation in the world. With sulphuric acid, the acid phosphate used as fertilizer is made, and recently it has been found that raw phosphate rock, ground fine, lends its needed phosphorus to assimilation by the soil, although more slowly; but the cheapness recommends the plan. The practically inexhaustible phosphate deposits of the Northwestern states are retarded in development by the relative remoteness from the main fertilizer markets, but those of the South are well situated.

Another mining industry, of less importance, but far from being unimportant—the barytes industry—is centered in the South. The chief barytes state is now Georgia, which recently wrested the leadership from the other important producer, Missouri. The deposits of Georgia are extensive, and the demand for use in various industries is steady and increasing. Like some others of the non-metallic minerals, the barytes-mining industry seems destined to increase, and when mines are located not too far from the manufacturing districts where the products are used (and this is the case with the barytes industry of the South), the future is excellent. Geographic location plays a much larger part with deposits of non-metallic minerals than with most deposits of metallic minerals.

The clay-mining industry is of great importance to a country. Clays are essential to many industries, and the manufactured products are varied. Especially are the higher-grade varieties of great importance. They

are used in pottery, tiles, glazing, electrical apparatus, as fillers for paper, and a multitude of every-day uses. High-grade clays formerly came mainly from England, and to a large extent still do. But American clay is being developed and graded so that it is being more and more extensively employed; and the industry centers in the South and the South-Middle states. The Northern part of the United States, particularly the glaciated area, is unfavorable to the geologic development of these valuable clays; but the geologic history and climate of the South have been favorable to their accumulation, as the result of saprolitic disintegration of pegmatitic and other favorable rocks.

The dominant aluminum industry of America, which is the largest in the world, owes its existence to the bauxite ores of the Southern states, which are extensive, as in Georgia, Arkansas, and Tennessee; and, as mined chiefly by the Aluminum Company of America and its subsidiaries, constitute an important industry. Though aluminum is one of the commonest elements of the earth's crust, it is recoverable easily only from its oxide, bauxite: the usual silicate is refractory.

Altogether, we are justified in regarding the South, from many angles, as a mining region of much past, present, and future importance, and one rich in those large deposits of minerals whose exploitation will probably outlive that of many more spectacular metal-mining districts in other parts of the world.

The Varied Lesser Southern Mining Industries

IN THE preceding editorial we have alluded briefly to those mining industries in which the Southern states excel the rest of the United States, and in the case of sulphur, at least, the rest of the world; and which, as a consequence, are of major present importance. Besides these outstanding examples, however, the mineral industries of the South are varied.

The gold-mining industry of North America had its first real beginning in the Appalachian gold belt, which runs from Virginia through North and South Carolina and Georgia into Alabama. In this region are gold-quartz veins in schist, associated with siliceous (granitic) intrusive rocks. Geologically, they are very similar to the gold-quartz veins of Canada, as seen, for example, in Ontario: and, like these, are often of uncertain persistence and spotty as to values. Nevertheless, the gold production of this region was in the first half of the nineteenth century very considerable; and a mint was in operation at Charlotte, N. C. The California rush of 1849 diverted the Eastern miners to richer fields, and they have never returned. Efforts to revive mining in this region have almost invariably proved disappointing; nevertheless, the region is not without hope. The "saprolitic ores," or the results of surface disintegration of the gold-bearing schist, frequently contain gold in considerable quantities from the point of view of the placer miner; but treatment has proved difficult on account of the clay in the ores, which coats the amalgam and obstructs amalgamation.

Copper is found in the same general geologic province as the gold in the southern Appalachians, just as copper occurs in California in the same general region as the gold-quartz veins, and for the same reason—namely, that there exists the same genetic connection between the two metals in each province. The copper deposits of Virginia, especially at Virgilina, have had considerable production, but are now deserted; and occasional attempts to reopen them have usually had the same discouraging results as the attempts to revive gold mining. Nevertheless, the success of the mines at Ducktown, Tenn., in the same geological province, is a well-known present-day exception. This ore is highly pyritic, and the sulphuric acid is now being extracted as a valuable byproduct.

There is a large quantity of similar pyritic ores in the South, consisting of pyrite or pyrrhotite, although usually the copper content is not a commercial factor or is wanting. Therefore, when the supply of cheap pyrite ores from Spain was interrupted by the shipping shortage during the war, many of these deposits, such as that at Chestatee, in Georgia, became hopeful sources of pyrite supply. The development of the pyrite deposits as sources of sulphuric acid was interrupted by the termination of the war, and by the rapid development of the more cheaply produced sulphur of Texas and Louisiana; but it was established that there exists in the southern Appalachian region an adequate reserve of this material.

There was a rapid development of the manganese of the southern Appalachians during the war, when shipment from Russia and India was cut off and the supply from Brazil was threatened with interruption by the lack of shipping and by the German submarine warfare. Ordinarily, the Appalachian deposits cannot compete with the more abundant and richer ores of these foreign fields, being smaller and often relatively inaccessible; but in the emergency it was found that they constituted a very important reserve, especially of the higher-grade manganese, in which this country is deficient. The subject of the Appalachian manganese ores is treated in a special article in this issue.

In the early part of the nineteenth century the chromite deposits of Maryland were the most productive in the world, till they were eclipsed by those of Turkey. During the Great War, the old mines were reopened and the fact was established that not all the ore had been extracted; but it was also established that these ores cannot now compete with cheaper ores from newer discoveries.

In the mountains of North Carolina and the adjoining territory are vast amounts of valuable abrasives—corundum, emery, and garnet. Only the relative inaccessibility militates against the extensive development of these deposits, and the consequent difficulty in competing with more accessible domestic deposits, with emery from Greece and corundum from India, and with the artificial abrasives being manufactured in increasing quantity, especially from bauxite, by electric treatment.

During the war it was found that the most available deposits of zircon, rutile, and monazite were in the South. Pablo Beach, Florida, contains these minerals in the sands, and although not in quantity to compete with the phenomenal deposits of Brazil and India, they form a reserve which may be of value to the nation. North Carolina formerly had a monazite industry, working the mineral by placer methods from the streams; but with the best of the deposits worked out, it became impossible to compete longer with the foreign deposits. Also, probably the most productive of the accessible American deposits of rutile exists in Virginia. Monazite, it will be remembered, is the source of thorium,

the luminous material in the Welsbach gas mantles, and recently, also, of mesothorium, a substitute for radium, both in its therapeutic and its luminescent qualities. Zircon was sought during the war, especially as an element for a special steel alloy; and also rutile as a source of titanium for a titanium steel alloy, as well as for chemical uses.

The Federated Engineering Societies

THE Federated Engineering Societies, which was organized in Washington some time ago, is a going concern. It is not a proposed movement—it has a constitution and bylaws, and several societies have already joined the federation.

The American Engineering Council has voted hearty endorsement of the plan of organization and authorized its executive committee to render any assistance possible. It also voted to invite to future meetings of Engineering Council, delegates of the societies represented at Washington when the Federated Societies were organized, and also editors of technical journals who were interested.

The next move will be for more engineering societies to join the Federated Societies. Local societies, we understand, should not stand back waiting for societies of larger geographic scope. It is entirely fitting and advisable that they should consider making application independently and promptly.

Airplanes for Alaskan Surveying

THE developments which will make the airplane an every-day practical factor in surveying, exploring, and preliminary exploiting of mineral lands are moving with perceptible speed. On July 15 four army airplanes left Long Island for Alaska and return, a trip of 9,000 miles. The trip has a double purpose—to establish an aerial route to Alaska, and to make a photographic survey of certain typically unknown portions of Alaska. Photographers will form part of the crews.

It has been reported that at least a preliminary photographic survey would be attempted of the Yukon Flats, an immense flat alluvial area at the great bend of the Yukon, where it desists from its course in the direction of the Arctic, turns an angle, and heads for the Bering Sea. The great area is of fertile river-built soil, and is wooded, and it is traversed by many river channels. Its survey, with the outlining of its waterways, would help to open it up for settlement and the raising of hardy crops, which grow with very great rapidity in the almost or quite incessant daylight of the Arctic summer. By the ordinary methods of ground surveying, a district like this will take a great length of time, much labor and expense, and much mathematics to check closed traverses. It is safe to say that in the ordinary course of events the work would be postponed for years. It is believed that an airplane can photograph it so as to make an accurate map in a few days, at a relatively small cost. The question of vertical angles does not enter here, it will be observed, as the region is quite flat; and the two dimensions as viewed from an airplane is all there is to it. The route follows:

Mitchel Field to Erie, 350 miles; Erie to Grand Rapids, 300 miles; Grand Rapids to Winona, Mich., 310 miles; Winona to Fargo, N. D., 320 miles; Fargo to Portal, N. D., 290 miles; Portal to Saskatoon, Sask., 280 miles; Saskatoon to Edmonton, Alta., 300 miles; Edmonton to Jaspar, Alta, 200 miles; Jaspar to Prince George, B. C., 200 miles; Prince George to Hazelton, B. C., 220 miles; Hazelton to Wrangell, Alaska, 210 miles; Wrangell to White Horse, 300 miles; White Horse to Dawson, 250 miles; Dawson to Fairbanks, 275 miles; Fairbanks to Ruby, 240 miles; Ruby to Nome, 300 miles.

Among the supplies carried are concentrated food, fishing tackle and firearms, and precautionary supplies in case of delay or accident. The machines are equipped with 400-horsepower Liberty motors.

Judging from developments, the reconnaissance plane survey by airplane photographs is destined within the next few years to become one of the most active departments of surveying.

We may expect that the detailed map of the United States, which the Geological Survey has on hand, and which under ordinary conditions will be completed in some future generation, may become complete as to the reconnaissance plane survey within a few years. There is no reason why such a map as this should not precede the topographic surveys and the more detailed surveys, which will also be rendered far simpler by the airplane, carrying the surveyor swiftly to this or that peak of observation, and bringing him supplies. It is to be expected—indeed it may with confidence be prophesied —that Arctic Canada will be very soon mapped similarly, and an intimate and accurate knowledge of the thousands of waterways—lakes and streams—of this great region will assist immensely in the forming of plans for its further exploration and development.

Altogether, surveyors have now an instrument that will shorten their work as the invention of the harvester shortened the work of farm hands and increased the crops. But there is no reason for the surveyor to go on strike against this labor-saving machine; for a new school of surveyors will result. Are our engineering schools keeping abreast of the times, and instituting courses and training men in aerial plane surveying?

The Major Metal Quotations

WE ARE publishing this week in "What Others Think" a valuable and suggestive letter from a representative of one of the large factors in the lead-mining industry, a man who is a recognized expert in metal prices. The mining public, as well as ourselves, will enjoy this technical discussion and possibly other experts may contribute to it, for in this department of human knowledge, as in all others, the experts do not always agree.

New Coinage

CERTAIN journals have recently printed statements to the effect that a new 2-cent copper coin was authorized by Congress, and that the U. S. Mint is now preparing to strike such a coin. This information is incorrect. The Senate bill providing for a "Roosevelt 2-cent piece" failed to receive action by the House before adjournment, and therefore did not become a law.

The Congress did authorize, and the President approved, limited issues of three memorial 50-cent silver coins. One is to commemorate the centennial of the admission of the State of Maine (1819), another will commemorate the centennial of the admission of Alabama (1820), and the third is in honor of the tercentennial of the landing of the Pilgrims on the shores of Massachusetts Bay.

WHAT OTHERS THINK

The Major Metal Quotations

I have read with interest the editorial entitled "The Major Metal Quotations" published in the July 10 issue of the *Engineering and Mining Journal*.

I sincerely trust that the *Journal* will continue to publish original metal quotations in spite of any criticisms that may be received from disappointed miners, custom smelters, producers, traders, or consumers[1]. The *Journal* renders a great service for which I believe it derives no direct benefit.

As my interest is solely in lead I would like to enumerate the reasons why I hope the *Engineering and Mining Journal* will continue to quote lead prices, and also some of the difficulties in ascertaining the average price.

First, I believe that producers and consumers derive a great benefit from selling and buying lead at a monthly average price. The proof of this is the very large quantity of lead sold at the average price, and the large quantity of lead products sold, based on the average price of pig lead. To my mind the American business man does not adhere to a system year after year unless a decided benefit is derived from the operation of that system.

Second, the average market price of pig lead should be determined by some agent or agency situated in the city of New York. New York City has become the market place for non-ferrous metals: the sellers of over 90 per cent of the pig lead made in the United States and Mexico have their main sales offices in New York, and by far the largest tonnage of lead bought is bought by buyers with offices in that city. During the last ten years many large corporations have moved their purchasing departments to New York, and many others obtain lead quotations through their New York sales offices.

Third, the average price of lead should be determined by some agency that is not controlled or influenced by either producers, consumers, traders, or brokers.

Fourth, the daily price of lead should be determined on some day following the day under consideration, as quotations are usually not made until the noon hour, and acceptances seldom received before 4 or 5 p.m., and often, when by wire, not until the following morning.

Fifth, the price should be made by an agency determined to arrive as closely as possible at the truth; an agency that is willing to devote time, thought, work, and expense unsparingly, and that will go to the extent of calling on producers and consumers personally, and if necessary asking to see their sales books or contracts.

The staff of the *Engineering and Mining Journal* has its principal office in New York City, and it is neither controlled nor influenced by any group of producers, traders, or consumers. Its policy is to determine the price for one week on the last day of said week, and in my opinion it has spared neither time, thought, nor expense in determining the price by personal visits to producers, traders, and consumers.

From the standpoint of the trade I therefore consider that the *Journal* is the best-fitted agency to determine the average price of lead, and I sincerely hope that from the standpoint of the *Journal* you will decide that the high ideals and reputation of the paper make it the logical medium for determining this information.

The difficulties of ascertaining the average price of lead are numerous. In the first place there is the spot price, the price for the current and succeeding month, the future price, calling for shipment from two to six months ahead, the price of the A. S. & R. Co., the outside price for all domestic lead, the prices for duty-paid lead from Mexico, Australia, London and Spain, and the prices of special brands, all of which should receive a certain amount of consideration. The situation is further complicated by the necessity of having the two basing points, namely, St. Louis and New York.

Taking these prices in order: The spot price is the price that must be paid for lead already at the point of delivery. This price recently has been much higher than shipment lead, although there have been times in the last eighteen months when spot lead sold at a considerable discount. Small consideration should be given to spot prices, as when spot sells at a premium it is obviously unfair to penalize a consumer, which in October, 1919, for instance, contracted for its entire 1920 requirements at the *Journal's* monthly averages, by making this forehanded consumer pay the premium that must be paid by the consumer that waited too long for the price to go down before ordering its requirements.

The price for shipment lead, thirty to sixty days, I believe should be the main basis for the average, as the majority of consumers who buy at a fixed price buy lead for shipment in the current month or that following.

The future price should be given little consideration, as the average for July is the price that the producers are to receive, and that consumers are to pay, for the lead that is actually shipped in July. If September-October shipment lead is selling at a discount I do not think that that fact should reduce the price that the producer is receiving for daily shipments in July. It might be well to follow London's custom, quoting two daily prices, prompt and future shipment.

The price of the A. S. & R. Co. is a price that should receive consideration, especially if this company is selling lead for prompt to sixty-day shipment at this price. Some of the daily trade papers, as you know, quote two prices, one referring to the A. S. & R. Co. price, and one to the "outside price." As your price is the average price, and is not given as a daily market guide to buyer and seller, but as a record of actual sales over a period that has passed, it seems impossible to dodge the issue by quoting two prices for delivery at the same point.

The "outside price" should receive consideration depending on the tonnage sold, in comparison with the total sales. The price for duty-paid lead is very important, as at present large tonanges of it are sold for domestic consumption. The price of special brands should figure in the average after deducting the usual premium.

The temptation of the daily trade papers, I think, is to overquote the market, as it pleases the buyer to think he has bought below the market, and a seller never seems to object to seeing high prices quoted by the daily press. This tendency, of course, is likely to bring criticism of your prices from the mining fraternity.

My suggestion to you would be to quote the market on Wednesday only up to the Tuesday preceding, and my advice to producers, sellers, and consumers is to give you all the information they have concerning sales and purchases, including all the conditions of same, and to assist you in every way to do the valuable and thankless task that you have undertaken. X.

New York.

[1]Or mudslinging editors?—EDITOR.

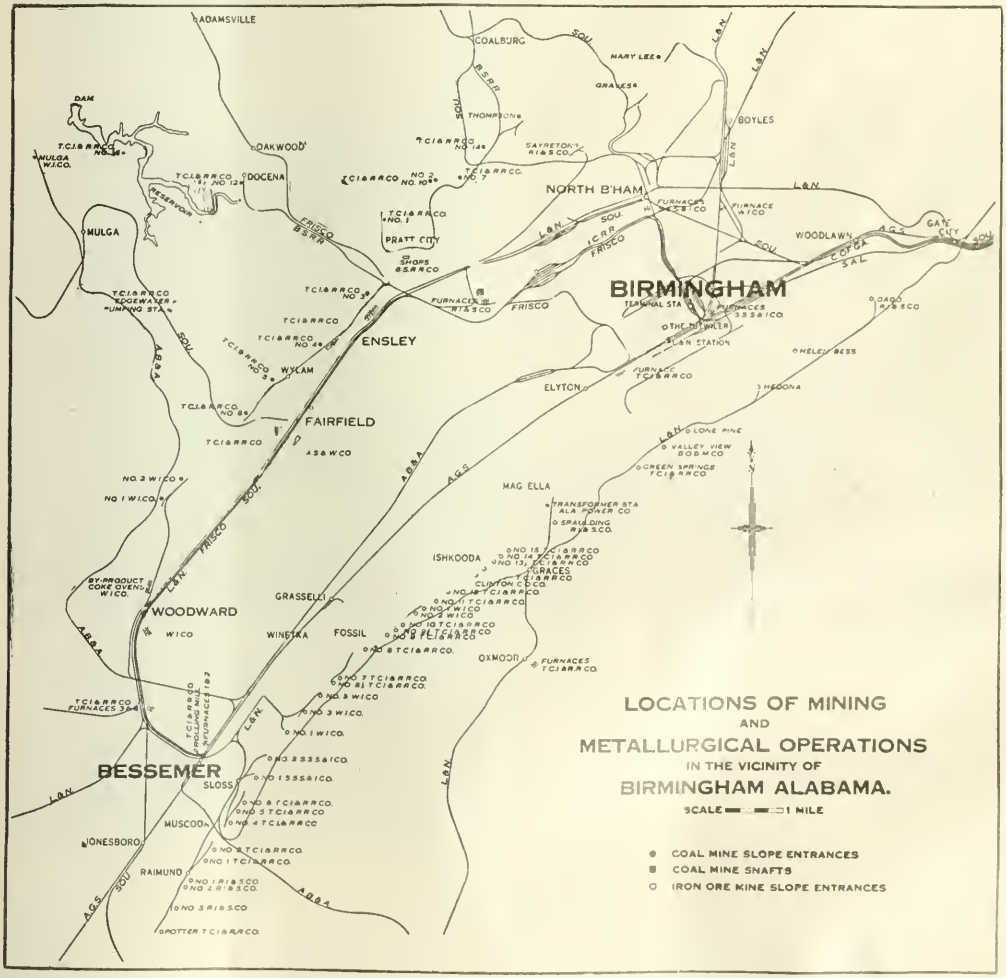
Iron Mining in the Birmingham District

Region Is a Raw-Mineral Producing and Manufacturing Center—Products Are of Varied Nature And Include Pig Iron, Coke, Coal, and Dolomite—Mining Methods Undergoing Changes

By George J. Young
Written for *Engineering and Mining Journal*

THE region in and about Birmingham, Ala., is attractive. The relief is low, wide valleys and ridges of moderate height predominating. The country is well wooded, and to a mining engineer accustomed to the more accentuated and scantily clothed topography of the West a visit to the district leaves the impression that the region is an ideal one both in the beauty of the surroundings and the ease of living.

Few mineral regions are as self-contained as is the mineral-bearing area of Alabama. A methodical chemist before undertaking a campaign of work surveys his field, determines what reagents and apparatus he must use, and then assembles them as close as convenient to his work bench. He is then ready to turn out his results with a minimum of footsteps and a maximum of celerity. In the vicinity of Birmingham there are extensive workable beds of iron ore, the edges of which outcrop on Red Mountain; thick beds of dolomite and limestone, which reach the surface at convenient places; and extensive coal fields which supply an excellent



metallurgical coke. All four of these fundamental reagents occur within an area which can be and is readily served by railroad transportation. The remaining two necessary reagents, enterprise and a population sufficient to yield the required labor, are also present.

Pig Iron and Steel Principal Products

The output is pig iron and steel. Industrial development has reached a point where a considerable part of the raw iron and steel production is placed upon the freight car in the form of manufactured products. It is an industrial principle to advance a basic raw product as far as practicable on its course into finished or salable products as close to the point of production as possible. Birmingham places pig iron and steel of various grades upon the freight cars, but each year increasing quantities of iron are placed on these same cars in the form of cast-iron pipe, structural steel shapes, fabricated steel, stoves, radiators, bolts, nails, wire and wire products, machinery and many other manufactured articles. There are 348 manufacturing firms in the Birmingham district, and the list of manufactured articles issued by the Birmingham Traffic Association is a formidable one.

History of the Birmingham Iron District

The iron industry of Birmingham is an old one and is passing into its second childhood; and a vigorous, youthful growth it is, in the form of new establishments, greater mechanicalization of existing works, manufacturing plants, and improved facilities of all kinds. In 1818 the first blast furnace in Alabama was blown in at Russellville; in 1827 the first coal was mined in the Warrior coal field; in 1854 the first coke was made from Alabama coal for foundry use; in 1858 the first rolling mill was built at Shelby; in 1864 red hematite from Red Mountain was first used; in 1871 Birmingham was founded; in 1878 the first coke pig iron was made at Oxmoor, on the south side of Red Mountain, eight miles from Birmingham; in 1879 the first rolling mill was built in Birmingham; in 1888 the first steel was made in Birmingham, and in 1895 basic iron was first made. The present decade is marked by the conspicuous introduction of byproduct coke ovens and numerous manufacturing plants as well as the material improvement and modernizing of those in operation.

Two important sources of information on this district are to be found in Bulletin 400, U. S. Geological Survey, written by Ernest F. Burchard, Charles Butts, and Edwin C. Eckel, and Geological Folio No. 175, written by Charles Butts. Both were published in 1910, and are exhaustive in their respective fields. In *Mineral Resources* production statistics can be found for different periods.

The hard and semi-hard ore mined in the Birmingham district is of non-bessemer grade and shows the following range in composition: Iron, 32 to 35 per cent; lime, 5 to 20 per cent; silica, 2 to 25 per cent; alumina, 3 to 5 per cent; magnesia, 1 to 3 per cent; phosphorus, 0.25 to 1.25 per cent, and sulphur, from a trace to 0.5 per cent. According to the U. S. Geological Survey Bulletin 400 "the ore beds are usually overlain and underlain by comparatively impervious shales. Near the surface the calcium carbonate has been leached out, leaving a richer ore. Below water level the ores carry a higher per cent of calcium carbonate. The Clinton (Rockwood) formation, in which red ores occur, consists, within the Birmingham district, principally of overlapping lenticular beds of sandstone and shale, with four well-marked horizons of iron ore, generally in the middle one-third of the formation." The following description covers the two more important "seams" and is taken from the bulletin just mentioned:

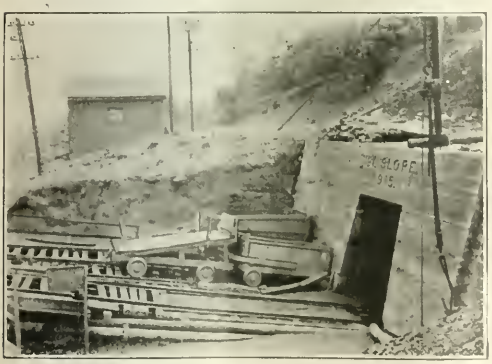
OPEN-PIT WORKINGS IN THE BIRMINGHAM DISTRICT

The Big and Irondale seams are considered together. The ore, however, is different in quality, and the beds are

so sharply separated by sandstone or shale that they may be mined independently. The thickness of the Big seam varies from 16 to 30 ft. It exists on Red Mountain for practically the whole length of the mining district; notwithstanding the great thickness there are rarely more than 10 or 12 ft. of good ore in a single bench, and at most places only from 7 to 10 ft. are mined. From northeast to southwest the total thickness of the ore-bearing sediment gradually decreases, without, however, altering greatly the thickness of the workable portion. About the middle of

TYPES OF UNDERGROUND ORE CARS

the district the bed becomes separated into two benches, either by a well-defined parting along the bedding plane or by a shale bed, thin at first but thickening gradually to the southwest. The middle of the Big seam is the workable part in the northeast end of the district, but the upper bench is of the most importance throughout the rest of the area. In the southwest portion of the district the lower bench, which farther northeast is composed of ore that may be eventually mined, becomes a series of thin strata of lean ore and shale, and is consequently of no possible value; and, finally, the upper bench itself becomes shaly



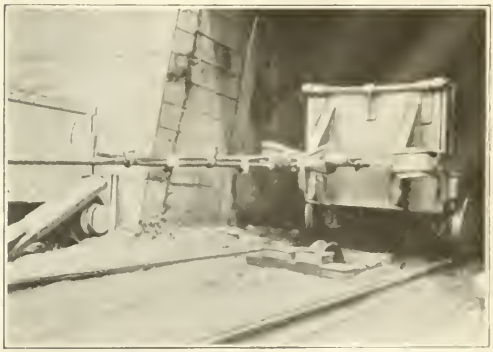
ENTRY TO RAIMUND NO. 1 SLOPE

and carries only a very low-grade ore. The Irondale seam is of most value along Red Mountain between Pilot Knob on the northeast and Lone Pine Gap on the southwest.

The merchantable ore seam averages ten feet in thickness and dips to the southeast at angles varying from 12 to 45 deg. Red Mountain lies southeast of Birmingham and Bessemer and extends northeasterly and southwesterly. Mining extends from a short distance southwest of Raimund to a point east of Birmingham. This distance is approximately fifteen miles. The Clinton formation occurs at other points in the state, and iron ore is mined where the ore beds reach a mineable thickness.

Bulletin 400 presents an estimate of the iron ore available. Of ore of a minimum workable thickness, or within a maximum distance from the outcrop practicable for mining, there is 458,470,700 long tons. In this estimate the distance measured along the dip for purposes of estimation ranged from 3,100 to 6,000 ft. The estimated red-ore reserves in the lower bench of the Big Seam in Red Mountain and Shades Valley is 146,024,700 long tons. The distance on the dip used in this estimate ranges from 5,200 to 6,000 ft. The estimated red-ore reserves, not at present available, in the eastern part of Shades Valley is 292,401,400 long tons. The distance on the dip used in this estimate ranged from 3,500 to 20,000 ft. The computed length of outcrop in all three classes of ore reserves measured respectively 167,200, 60,900, and 161,900 ft. The grand total is 796,896,800 long tons. A more recent compilation would probably enhance this total.

There are three coal fields, the Warrior-Plateau, the Cahaba, and Coosa. The Warrior field is the most



THE SKIP COMING UP THE INCLINE

important and covers an area of 7,845 square miles. This field supplies the coking coals. The Pratt and Blue Creek seams, which range from three to six feet in thickness, are the important producing seams. The coal is washed to obtain a low-ash coke. Analyses are as follows:

	Ash, Per Cent	Volatile, Per Cent	Sulphur, Per Cent	Fixed Carbon, Per Cent
UNWASHED COAL				
Pratt	8 27	30 10	1 53	61 60
Blue Creek	15 76	23 97	0 86	60 27
WASHED COAL				
Pratt	5 29	30 80	1 28	63 90
Blue Creek	7 03	25 61	0 79	66 46

The Cahaba and Coosa fields are of less importance. According to the annual report of coal mines of Alabama for 1918 there were 7,269 coke ovens, both beehive and byproduct. Of these over 847 were byproduct, and in that year 2,611,215 tons of coke was produced by byproduct ovens and 1,733,511 by beehive ovens.

Both dolomite and limestone occur in beds of minable thickness. Dolomite is used largely as a flux. A representative analysis is as follows: Silica, 0.55 per cent; alumina, 0.41 per cent; lime, 31.48 per cent; magnesia, 20.11 per cent; iron, 0.10 per cent. At Ketona and Dolcito, seven miles north of Birmingham, are large quar-

TIMBER PROPS IN ROOMS

ries. The quarry work is on a large scale, and the deposits are such that high benches are broken and little stripping is necessary.

Production of iron, steel, and coke is given in Table I.

TABLE I. IRON, STEEL AND COKE PRODUCTION OF THE BIRMINGHAM DISTRICT

	Tons Produced		
	Iron	Steel	Coke
1913	2,025,378	778,390	3,526,624
1914	1,826,929	525,770	3,092,771
1915	2,049,453	715,485	2,780,976
1916	2,762,895	1,099,649	4,298,589
1917	2,953,705	1,188,074	4,892,589
1918	2,587,852	1,074,324	4,344,726
1919	2,130,092	1,045,115	4,000,000

The total iron ore mined in Alabama (U. S. Geological Survey) in 1917 was 7,101,586 long tons, of a value of $13,049,535. In 1918 the tonnage dropped to 6,121,087, but the value reached $15,334,561. Of the total ore mined in 1918, a total of 4,985,557 long tons was hematite and 769,067 long tons was brown ore. The Birmingham district supplied 5,728,862 long tons of hematite ore in 1917 and 4,763,057 long tons in 1918. In the U. S. Geological Survey's list of iron-ore mines in the United States that produced more than 50,000 gross tons each in 1918 the following mines in Alabama are recorded:

IRON MINES IN ALABAMA IN 1918

Rank	Name of Mine	Nearest Town	Quantity Mined, Long Tons
2	Red Mountain Group	Bessemer	2,376,974
21	Woodward 1, 2 and 3	Lipscomb	718,237
32	Sloss Nos. 1 and 2	Bessemer	502,069
68	Songo	Songo	242,549
77	Russellville (a)	Russellville	516,611
96	Spaulding	Birmingham	168,195
118	Raimund No. 1	Bessemer	128,379
133	Hammond	Hammond	118,464
138	Greeley (a)	Greeley	113,203
142	Steiman	Steiman	109,222
148	Attala No. 1	Attala	102,938
158	Raimund No. 2	Bessemer	94,347
189	Ironaton (a)	Ironaton	57,530

(a) Brown ore.

At present twenty-six blast furnaces are in operation in Alabama, and during May the blast furnaces in the Birmingham district reached a production of 18,000 tons of pig iron per month. The largest company is the Tennessee Coal, Iron & R.R. Co., which had in May five blast furnaces producing basic iron at Ensley, one on basic at Alice, and one on foundry pig at Alice. The Sloss-Sheffield has five active blast furnaces, one each at North Birmingham, Sheffield, and Florence, and two in Birmingham. The Woodward Iron Co. has four active blast furnaces, one on basic and three on foundry pig. The Alamaba Co. is operating two blast furnaces at Gadsden. The Central Iron & Coal Co. at Holt, the Jenifer Coal & Iron Co. at Jenifer, and the Woodstock Iron & Steel Corporation at Anniston are each operating single blast furnaces at the respective points named. The Republic Iron & Steel Co. has three blast furnaces at Thomas. The Woodward Iron Co. has three blast furnaces at Woodward and two at Vanderbilt. All of these companies operate iron mines and practically all work coal mines also.

Mining in Birmingham District

Mining in the Birmingham district involves the winning of a deposit of comparatively uniform thickness ranging from eight to ten feet, dipping at an angle varying from 15 to 45 deg., averaging between 18 and 30 deg. The ore is of medium hardness. The roof and floor conditions are usually good. Faults occur at different places, interfere with the regular system of mine layout, and necessitate auxiliary hoisting and rehandling of ore. Drainage and ventilation involve no special problems.

Mining methods fall into four groups, the sequential order of which represents their development in point of time. The first method, stripping overburden and mining the ore by open-pit, is practiced to some extent, but is relatively unimportant now. The second method, consisting of a combined open-cut and underground operation, is taken advantage of where topographical conditions admit of the construction of an incline tramway in conjunction with entries or drifts extended along the strike of the ore bed. The third method is systematic underground mining, in which entries or drifts are

HEADFRAME AT NO. 1 RAIMUND MINE

turned off at intervals of sixty feet from a slope. The drifts are driven narrow for a distance of 75 ft. and then widened out to 30 ft. In the more recent examples of this method the slope is sunk in the foot wall, ten feet below the ore seam, as a single-track skipway, a manway being provided alongside or in a parallel slope. In this arrangement the cars used for transportation on the entries are dumped directly into the skip. The skips are from ten- to twelve-ton capacity. In still more

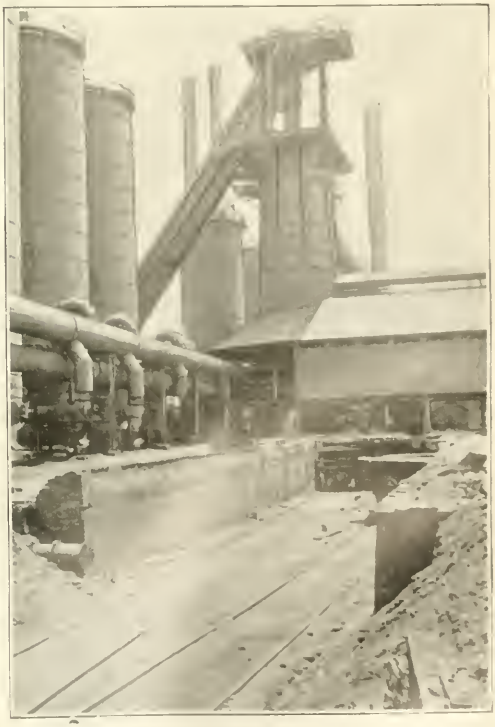
COKE AND IRON ORE AT SKIPWAY OF FURNACE

recent slope installations pockets are put in at slope loading points and skips are loaded from chutes. The fourth method, which utilizes a vertical shaft for working purposes, is just coming into vogue. The Woodward Iron Co. has recently constructed a vertical shaft.

T. C. I. & R.R. Co. Has Standardized Plants

The Tennessee Coal, Iron & R.R. Co. has fourteen active mines and has standardized both its equipment on surface and underground and its mining methods. A brief description of the surface plant of No. 4 mine will indicate the most advanced plant practice in the district. The output of this mine is 3,000 to 4,000 tons per day, about 1,300 men being employed. Power is supplied by the Alabama Power Co. at a line voltage of 44,000 volts reduced to 2,200 volts. Two Nordberg steam-driven air compressors have been converted to electrically-driven compressors by disconnecting the steam cylinders and placing a 700-hp. synchronous motor on the flywheel shaft. The hoist is single-drum (single hoisting rope), steam-driven, and direct-connected. The steam cylinders have been disconnected and a motor connected up by a single reduction Wuest gear to the crank pin of the drum by means of a short drag-link. This method of converting a steam-driven into an electrically-driven hoist involves the minimum change in the mechanism of the unit. The acceleration period is eleven seconds and the full rope speed is 2,700 ft. per minute. Only sufficient boiler capacity to supply steam for heating and that required in the change house has been retained. A change house, one section for blacks and one for whites, is provided close to the shaft mouth.

The shaft is timbered and divided into a footway on the left and a hoisting compartment on the right. The skip track is of five-foot gage. The skips are twelve-ton capacity (this size is used in all mines of the T. C. I. & R.R. Co.). The skip has a wire safety rope arranged as a bridle around the body of the skip. Hoisting ropes are $1\frac{3}{8}$ in. in diameter. Men are handled to and from their work in the skip. Electrical haulage is not used underground. Small 100-gal. pumps are electrically-driven triplex, but the standard 1,500-gal. pump is an electrically-driven horizontal duplex plunger machine. In ten of the mines of the company the pumping has



BLAST FURNACE AND HOT BLAST STOVES

been electrified, but in only one has the surface plant been electrified, all of the others being steam driven and provided with the necessary boiler plants.

At the Muscoda No. 2 two shafts are served by a single boiler plant, which is placed midway between the two outlets. Both hoists are placed at the boiler plant, and the hoisting ropes are conducted on sheaves to the respective headframes.

The handling of the ore at the surface is done by

dumping into a chute leading to a No. 8 gyratory crusher, which discharges directly into railroad cars. Jackhammers, piston, and hammer drills are used underground. The company rolls its own drill steel, which is solid. Blasting is done at the end of the shift, and 35 per cent gelatine dynamite is used.

At the Raimund No. 1 and No. 2 mines, operated by the Republic Iron & Steel Co., both of the surface plants are steam driven. First-motion hoists, single-drum and single-rope operated, are used. At the Raimund No. 1 the headframe is of steel construction. A ten-ton skip is used, and eight tons is hoisted at a load. At a station the cars are dumped by means of a cradle dump, which discharges into a pocket, from which the skip is loaded by means of a measuring pocket. The trackage arrangement is similar to that used in a coal mine. The loaded cars approach the dump on a down grade and are shunted back over a switch and short curved track on a down grade to the empty track, from which they are hauled back into the workings by mules. From the main drifts the cars are lowered and raised on auxiliary slopes to the working levels by electrical or air hoists. Grades to the main shaft station vary from 2 to 3 per cent in favor of the load. Wooden cars of a type similar to those found in coal mines are used.

Mining Method at Raimund Mine

Rooms are run parallel with the strike and are 30 ft. wide, 60 per cent of the ore being removed on the first working and 40 per cent being left as pillars. The roof breaks clean. Two lines of props without headboards

A LITTER OF PIGS IN THE BIRMINGHAM DISTRICT

BREAKING PIGS AND SOWS APART

are used in the rooms. The roof does not show pressure. The ore thickness mined is eight feet. Tripods are used for the support of the machines in all room work. Leyner-Ingersoll, Dreadnaughts, and Turbos are used for drilling. Jackhammers are used for blockholing and drifting. At this mine preparations were being made for underground trolley transportation. Only one mine, the Spaulding, owned by the same company, is equipped with trolley-wire transportation underground. At the Raimund mine a number of faults have made the workings more irregular than at other properties. Repeated handling of the ore is frequently the outcome of the necessity for working isolated lengths of ore bed, elevated out of the normal dip line by a fault.

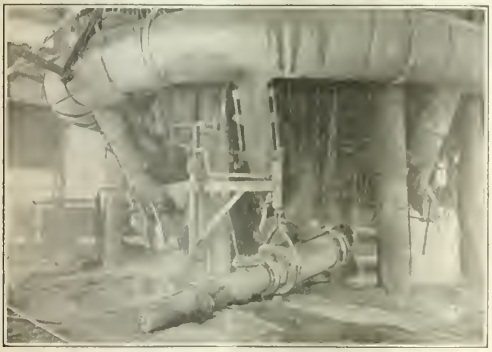
Opportunity for Use of Power Appliances Underground

The mining methods in the Birmingham district are noteworthy, from the viewpoint of the metal-mining engineer, for their simplicity and close relationship to methods used in coal mining. Only in breaking and skip haulage is there any considerable departure from coal-mining methods. The necessity for the use of negro labor and proximity to coal-mining areas greatly influenced present methods. Undoubtedly the succession of changes will lead to greater introduction of power appliances underground, with a reduction in the proportion of hand labor. This will throw upon the companies the necessity for training their raw labor in the use of such appliances.

Mucking machines and underground electrical haulage will be introduced to expedite underground handling of

ore. The use of chutes from intermediate levels and the concentration of hoisting from main-level pockets instead of from all working levels will increase hoisting capacity. The introduction of two-compartment skip hoisting will increase shaft capaicty, and in conjunction with underground electrical haulage will enable a greater area of bed to be served by one shaft.

Complete electrification of surface plant and underground haulage and pumping will obviate the necessity of the individual steam plants which are largely used at present. A central power plant to serve the area should prove economical. Vertical shafts will be used to a greater extent in this district. At present development and mining proceed from the slope or shaft outward. The future mining will be be to push broad-scale development to the limits of the individual mining unit and to adopt a retreating system of mining in which all of the minable ore will be removed instead of leaving pillars, representing 40 per cent of the ore, to be subsequently won. The foregoing are features which



IRON TAP BLAST FURNACE, SLOSS-SHEFFIELD PLANT

appear to me to represent the improvements which higher wages and increasing costs will necessitate. The great limitation to the introduction of systematic mining of the kind indicated is the employment of negro labor, and improvement in practice will depend in large measure upon its ability to respond to the more highly specialized demand that will of necessity be put upon it.

The Gulf Sulphur Region*

Until 1904, the production of sulphur in the United States was considerably less than 10,000 tons per year, and the bulk of our requirements had to be imported from Sicily. From 1904 to 1914 the United States produced enough for its own use, and at the end of this period was supplying Canada, had begun actively to enter the French and German market, and, in addition, had accumulated a reserve stock, in the hands of the producers, of approximately one million long tons. Figures recently made public in connection with litigation over patent rights show that half of this stock was accumulated in a single year, 1912, when production reached 790,000 long tons, of which only 300,000 tons was marketed and the balance of 490,000 tons went into storage. The United States production has exceeded that of Italy since 1912, although the sales have been less, because sulphur was being withdrawn from stocks in Italy while stocks in the United States were being increased. The net effect of the war was a four-fold increase in the amount of sulphur sold in the United States, without any reduction in stocks, while in Italy production fell off 50 per cent, and stocks on hand were reduced by the same percentage.

From 98 to 99 per cent of the United States production has come from the Gulf coast region of the states of Louisiana and Texas. A number of other localities in west Texas, Colorado, Wyoming, Idaho, and Nevada have surface deposits, usually of limited extent, which have been worked on a small scale, but have declined in importance with the development of the better-grade and more accessible deposits of the Gulf Coastal region.

The occurrence of sulphur in the Gulf Coast region is in connection with a peculiar formation known as "saline domes" or "mounds." Over twenty of these domes have been located, scattered in an area 200 miles long, extending through western Louisiana and eastern Texas, and generally within fifty miles of the Gulf of Mexico. Commercial deposits of petroleum, sulphur, and salt have been developed in connection with the domes, but so far not more than one of the minerals has been developed to commercial degree in a single dome. Sulphur was discovered when drilling was being carried on for oil. So far, three domes have been developed for sulphur, namely that owned by the Union Sulphur Co., at Sulphur, La. (1903), that owned by the Freeport Sulphur Co., at Freeport, Tex. (1912), and that of the Texas-Gulf Sulphur Co., near Matagordo, Tex. (1919). Two other domes are under exploration and a number of others may possibly contain sulphur.

The sulphur occurs at a depth of 300 to 1,200 ft., and is associated with limestone and underlain by gypsum. The surface area of the producing domes varies from 200 to 1,500 acres. Exploration is done by drilling at a cost of $200,000 to $300,000, and the cost of a complete plant is several million dollars. The sulphur cannot be mined by shafts, owing to the quicksands and the poisonous gases encountered. The deposit at Sulphur, La., remained unworked for almost forty years after its discovery before a satisfactory process was developed to mine it. This is known as the "Frasch process" and consists of the sinking of wells to the sulphur deposit, each well being lined with a 10- to 12-in. pipe. Smaller pipes are placed inside, so that superheated water can be brought in contact with the sulphur ore, which is melted and forced to the surface by compressed air. The sulphur on cooling is ready for market and is over 99 per cent pure.

Each of the three plants in operation is equipped with a boiler capacity of over 20,000 hp. for superheating the water, and requires about a million and a quarter barrels of fuel oil per year. The origin of these domes is believed to be due to deep-seated igneous intrusions resulting in the alteration of gypsum and the crystallization of salt and sulphur which has caused an upbowing of the strata. Because of the nature of the formation and the irregularity of the deposits it is impossible accurately to estimate the reserves of sulphur.

With the addition of two new plants since 1912, the United States now has a sulphur-producing capacity of about 1¼ million tons per year, or four times the normal sales before the war.

POLK SOUTHARD MINE, OPERATED BY STEAM SHOVEL, IN RESIDUAL CLAY OF FERNVALE LIMESTONE. BATESVILLE DISTRICT, ARKANSAS

Manganese Ores of the Southern States

Their Combined Output Greater Than Half Total Production of This Country—Character of the Deposits and Mode of Occurrence of Ores in Southern Appalachian and Arkansas Districts

BY GEORGE W. STOSE*
Written for *Engineering and Mining Journal*

DEPOSITS of manganese ore in commercial quantities occur in several of the Southern states, chiefly in Virginia, Georgia, Tennessee, and Arkansas. A small quantity of manganese ore was mined as early as 1840, but it was not until 1866 or 1867 that production in any of the Southern states was appreciable. Deposits in Virginia, Georgia, and Arkansas were early exploited, and up to 1914 their combined output was 94 per cent of the total manganese ore produced in the United States, with the bulk of it coming from Virginia. From 1903 to 1914, 90 per cent of the production of the United States came from Virginia alone.

Since 1914 the increased demand for domestic ore due to the World War gave renewed stimulus to the industry and excited the search for manganese ore deposits throughout the United States, which resulted in the development of mines in many other states, particularly those in the West. A market was also created by the war for low-grade manganese and manganiferous iron ores, and such ores were mined in considerable quantity also in the Southern states. Table I shows the production of manganese ore in the Southern states as compared with the total production of the United States.

The prices of ores which obtained during the war rose to between $35 and $55 a ton for the general run of ore of this region, and some of the highest grade of metallurgical ore commanded as high as $75 a ton. At the close of the war, the steel manufacturers and dealers in ferromanganese refused to buy domestic manganese ore at any price, and the domestic manganese industry thereupon practically collapsed. Considerable mining was continued until July 1, 1919, in Virginia and some in Arkansas under war contracts. Since the first collapse of the market the price of ore has increased, and at the present rate of 80 to 90c. a unit for high-grade ore, manganese mining has been revived in many parts of the Appalachian states and in Arkansas, whereas few of the Western mines have been able to operate profitably. So, Virginia and others of the Southern states will probably again become the chief producers of manganese ore in the United States.

Practically all the commercially developed manganese deposits in the Southern states are oxide. A few deposits in Arkansas and Tennessee are in part carbon ores, and several small silicate deposits are known in the Appalachian Mountains or Piedmont Plateau. Most of the manganese oxide deposits are mined by open-cut methods, underground working being limited to a few mines. In most plants the only machinery employed is a log washer, although a few are equipped with jigs and tables. Practically all of the mining rights are acquired

*Published with permission of the Director, U. S. Geological Survey.

by lease. The royalty paid generally ranges from 25c. to $1 per ton, but as much as $4 a ton was paid during the war for some high-grade lump ore in Bradley and Monroe counties, Tenn.

ganese carbonate ores which resemble rhodochrosite but contain also calcium and magnesium carbonates, and some manganese silicate minerals.

The manganese deposits occur chiefly in the eastern

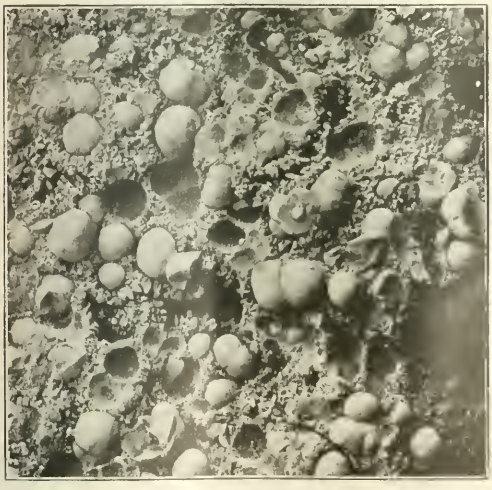
(*a*) Production began in 1866. (*b*) Production began in 1867. (*c*) Georgia includes North Carolina. (*d*) Included in "Other States." (*e*) Virginia includes Tennessee and other states. (*f*) 1910 to 1918, marketed production is recorded. (*g*) Virginia includes other states. (*h*) Virginia includes South Carolina and other states. (*i*) Included in "Other States."

The manganese minerals are chiefly oxides, four of which—psilomelane, manganite, pyrolusite, and wad—are commonly present, and two others—hausmannite

part of the southern Appalachians and in Arkansas. I am personally familiar with only the deposits of the Appalachian region, and so have drawn on the reports



SPHEROIDAL NODULES OF PSILOMELANE, INCLOSED IN CRYSTALLINE MANGANITE. FROM ORISKANY SANDSTONE, POWELLS FORT MINE, MASSANUTTEN MOUNTAIN, VA.

CONCENTRICALLY BANDED DENSE PSILOMELANE AND COARSELY CRYSTALLINE MANGANITE FILLING CAVITIES FROM CLAY OF FORT PAYNE CHERT, COOK MINE, WALNUT GROVE, ALA.

and braunite—occur in certain districts. Some ores are mixtures of manganese and iron oxides which are not definite minerals. There are also present certain man-

by Miser for Arkansas for much of the data secured.

The manganese deposits of the southern Appalachians may be divided into oxide ores, carbonate ores, and

silicate ores. The oxide ores predominate and are the only ones that have been extensively mined. They occur almost exclusively in residual clay or clayey sand derived from the weathering of sedimentary rocks. Most of them lie on the east side of the Appalachian Valley, but some occur within the open part of the valley and others among the ridges on the western side. Nearly all may be classed as secondary replacement deposits, but there have been recognized by geologists, who have recently studied the deposits, ten different modes of occurrences of oxide deposits, depending chiefly on the geologic formations with which the ore is associated.

DRY RUN MINE, NEAR BUTLER, TENN.

The rocks of the southern Appalachian region comprise a thick series of sedimentary origin, chiefly limestone, shale, and sandstone, overlying older crystalline rocks. In general the crystalline rocks occur only in the Piedmont Plateau, including the Blue Ridge and Appalachian Mountains, and the sedimentary rocks chiefly in the Appalachian Valley and Appalachian Plateaus. The oldest sedimentary rocks lie nearer the Appalachian Mountains, and successively younger beds appear toward the northwest, the youngest forming the Appalachian Plateau, but this order is varied greatly by folds and faults which locally reverse and repeat the order many times. The sequence of these rock formations is shown in Table II.

As previously stated, ten different modes of occurrences of manganese oxide deposits in the southern Appalachians have been recognized. Eight of these are directly associated with beds in the geologic formations. The modes of occurrences thus recognized, arranged in the order of their stratigraphic occurrence, with the oldest rocks at the bottom, are as follows:

Deposits along fault planes (in any formation); in terraced stream gravel (Tertiary or Quaternary); in Fort Payne chert (Carboniferous); in Oriskany sandstone (Devonian); in Tellico sandstone and Holston marble (Ordovician); in Knox dolomite (Ordovician and Cambrian); in Watauga shale (Cambrian); in residual clays of the Shady dolomite (Cambrian); in Erwin quartzite (Cambrian), and in old sedimentary schists (probably Paleozoic). The general distribution of areas in which manganese ore occurs in the formation above mentioned is shown in the accompanying map.

The Piedmont Plateau, which lies at the east foot of the Appalachian Mountains, is composed largely of crystalline rocks which inclose narrow belts of sedimentary schists, probably of Paleozoic age, that are manganese bearing. Manganese has been mined along a narrow belt of such schists in Nelson, Buckingham, Amherst, Appomattox, Campbell, and Pittsylvania counties, Va., and to a less degree along similar belts in North Carolina, South Carolina, and Georgia.

At the Piedmont mine recently described by Hewett,[1] the ore is largely pyrolusite, with some psilomelane and wad, lies between a hanging wall of schist and a foot wall of limestone, and has replaced parts of the schist. Large lenses of high-grade ore have been mined to a depth of 170 ft. below water level.

Deposits in Erwin Quartzite

A few deposits occur in the Erwin quartzite, which generally forms the westernmost ridges of the Blue Ridge. (See map, p. 259.) This quartzite dips under the Shady dolomite of the Appalachian Valley to the west, and in places where the rocks are nearly vertical the

[1]Hewett, D. F., "Some Manganese Mines in Virginia and Maryland," U. S. Geological Survey Bull. 640, pp. 49-54, 1916.

TABLE II. COMPOSITE TABLE OF GEOLOGIC FORMATIONS IN AREAS WHERE MANGANESE DEPOSITS OCCUR IN THE SOUTHERN APPALACHIANS

	System	Formation	Character of Rocks
This pertains to South Tennessee, Northeast Ala. and Northwest Georgia	Carboniferous	Fort Payne chert	Thin bedded chert or cherty limestone. Manganese-bearing in places.
	Devonian or carboniferous	Chattanooga shale	Black carbonaceous shale.
	Silurian	"Rockwood" formation	Sandstone and shale of Medina and Clinton age.
		Sevier shale (*a*)	Yellow argillaceous shale, shaly limestone, and oolitic marble.
		Tellico sandstone (*b*)	Red sandstone and sandy granular limestone. Manganese bearing in southern part.
	Ordovician	Athens shale (not present in southern part)	Fissile shale, absent where Tellico is ore bearing.
		Holston marble (in Chickamauga limestone)	Pinkish and white marble. Ore bearing where Tellico overlaps upon it.
		Chickamauga limestone	Light blue to light gray limestone and shaly argillaceous limestone.
		Knox dolomite	Massive dolomite and limestone containing chert, which carried manganese ore in places.
This part of section pertains chiefly to East Tennessee and south-central Virginia.		Nolichucky shale	Shaly and platy limestone with thin argillaceous layers.
		Honaker limestone: Maryville limestone; Rogersville shale; Rutledge limestone	Limestone, dolomite, and shales.
		Watauga shale	Purple sandy shale, impure limestone, and calcareous sandstone. In places impregnated with ore.
		Shady dolomite	Massive light gray dolomite, and impure argillaceous beds at base. Carries manganese ores in most places.
	Cambrian	Erwin quartzite ..... Hesse quartzite	Hard quartzite and some shale. Brecciated quartzite carries ore in places.
		Hampton shale: Murray slate; Nebo quartzite; Nichols slate	Dark shale, slate, and quartzite.
		Unicoi formation: Cochran conglomerate; Hiwasee slate; Snowbird formation	Coarse arkosic sandstone, quartzite, conglomerate, slate, and a little limestone. Manganese carbonate ore associated with the limestone at one place.
	Pre-Cambrian	Granite and schist	Chiefly granite and schist.

(*a*) In western Virginia a thick series of Devonian rocks is present and the Oriskany formation, composed of sandstone, chert, and limestone, rests on limestone of Helderberg age, or unconformably on sandstone and limestone of Cayuga age. It carries manganese ore in places. (*b*) The so-called Tellico sandstone of Bradley County, Tenn., and adjacent part of Georgia is apparantly a thin bed of sandy ferruginous limestone at the base of the Sevier shale.

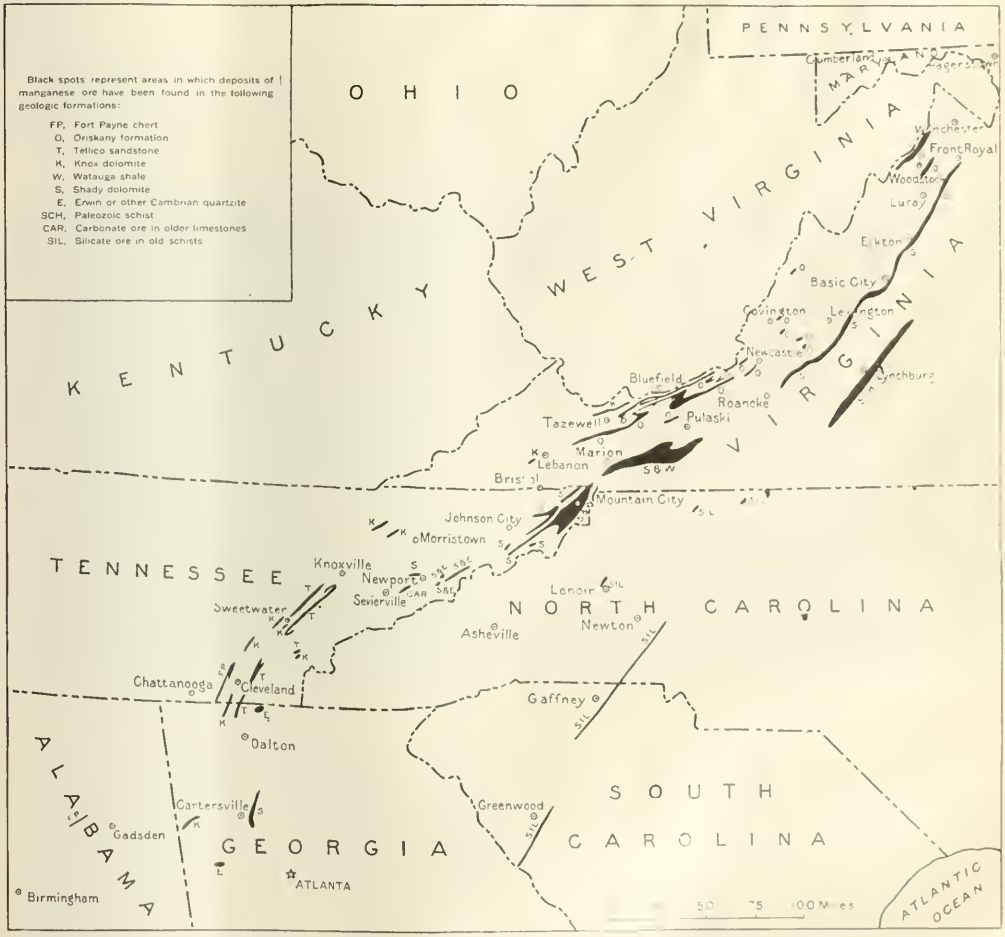
quartzite beds are broken into a coarse breccia by the intense folding and are healed by manganese oxide. The mineral is believed to have been derived from manganese-bearing beds near the base of the Shady dolomite.

Few deposits of this type are workable. At the Dry Run mine, near Compton, Va., seams up to three inches thick of psilomelane concentrically banded with manganite occupy a fractured zone about twenty feet wide. In east Tennessee, east of Newport, several mines were formerly operated in the quartzite.

Throughout the Appalachian Valley in Virginia, in parts of east Tennessee, and in northwest Georgia manganese ores occur in the clays that are residual from impure limestone beds near the base of the Shady dolomite, and these have been the most important source of manganese in the region. Deposits of this kind have been described in detail in several recent reports.[2]

The manganese ore is composed largely of separate small pieces of psilomelane, largely nodular in form, and some manganite and pyrolusite. Nearly all the ore in the Shady dolomite clay must be washed to free it from adhering sticky clay.

The manganese is believed to have been originally in a soluble form, probably the carbonate, in porous transition beds at the base of the formation, from which it was dissolved by meteoric waters and concentrated as oxide in adjacent, less pervious, residual clays which they have partly replaced. In most cases the ore accumulated on the bevelled edges of outcropping inclined beds of the Shady dolomite at the foot of the Erwin quartzite ridges, but where the rocks are gently folded at the surface the deposits are more highly concentrated at the bottoms of synclines. Manganese deposits



SKETCH MAP OF THE SOUTHERN APPALACHIAN REGION, SHOWING DISTRIBUTION OF AREAS IN WHICH MANGANESE DEPOSITS OCCUR IN CERTAIN GEOLOGIC FORMATIONS

[2]Hewett, D. F., *op. cit.*, pp. 37-71, 1916; Hewett, D. F., Stose, G. W., Katz, F. J., and Miser, H. D., "Possibilities for Manganese Ore on Certain Undeveloped Tracts in Shenandoah Valley, Va.," U. S. Geological Survey Bull. 660, pp. 271-296, 1918; the same authors, "The Manganese Deposits Along the West Foot of the Blue Ridge in Virginia," Geological Survey of Virginia, Bull. XVII, 1919; Stose, G. W., and Schrader, F. C., "Manganese Deposits of East Tennessee," Res. of Tenn., Vol. VIII, Nos. 3 and 4, 1918; Hull, J. P. D., La Forge, Lawrence, and Crane, W. R., "Manganese Deposits of Georgia," Geological Survey of Georgia, Bull. 55, 1919.

in the Shady dolomite clay occur at many places along the west foot of the Appalachian Mountains in Virginia, east Tennessee, and northwestern Georgia, where the Shady dolomite lies at the foot of the steep slope of the Erwin quartzite ridges and on both sides of limestone coves and re-entrant valleys within the mountains where the Shady has been infolded in minor plunging synclines.

The principal mine of the Shady dolomite type is the noted Crimora mine, Virginia. The ore here occurs in a minor southward plunging syncline between the mountain front and a low outlying quartzite spur in which the Shady dolomite is inclosed. The mine has produced over 200,000 tons of ore.

In the Cartersville district, Georgia, manganese deposits in the Shady are of large size, and over 100,000 tons of manganese ore have been mined. The manganese ore is here generally associated with iron ore and barite.

In northeastern Tennessee and in the adjoining part of Virginia workable deposits of manganese ore in Watauga shale have been prospected and mined. The ore is largely psilomelane, but in part dense compact wad, which occurs in pockets and seams in disintegrated yellow sandstone, which it has partly replaced, forming a breccia cemented by manganese oxide.

Deposits in Knox Dolomite

Chert in the Knox dolomite is in places impregnated with manganese oxide to such an extent as to form an ore, but none of the deposits have been profitably worked. Brittle chert layers have apparently been broken into small fragments by the rock folding, and in favorable situations have been cemented and partly replaced by manganese oxide. The chert and ore are set free by the weathering of the dolomite and are found in the residual soil on the slopes of chert hills.

Several prospects of this type have been opened in Tazewell and Bland counties, Va., and at many places in the valley of east Tennessee. Deposits near Rutledge, Tenn., and in Tazewell County, Va., which have been mined on a small scale, did not prove profitable.

Deposits in Tellico Sandstone and Holston Marble

Some of the best manganese ore in the region is found at the contact of the Tellico sandstone and Holston marble in southeastern Tennessee. The ore has been concentrated by solution of disseminated iron and manganese carbonates from red calcareous sandstone of the Tellico where it rests unconformably on the Holston. Some of the beds replaced by the ore preserve impressions of the fossils that were in the original rock. Most of the ore occurs in loose masses in the residual sandy clay which fills depressions in the surface of the unweathered marble. The ore is an intimate mixture of psilomelane and hausmannite, and averages over 50 per cent manganese. Productive mines are in the Sweetwater and Cleveland districts, southern Tennessee, and in the adjoining part of Georgia.

Deposits in Oriskany Sandstone

In the western part of Virginia workable deposits of manganese occur in the Oriskany sandstone. In Bland and Giles counties, where the Oriskany lies unconformably on sandstone of Cayuga age, large deposits of moderate-grade ore occur. The two principal properties are the Round Mountain and Flat Top mines, both of which are at the fractured crests of broad anticlines on the tops of high mountains. Deposits along the outcrop of the Oriskany sandstone have been prospected and mined northeastward to Allegheny and Bath counties, Va., but the ore is generally of medium grade and associated with iron ores.

In Shenandoah and Frederick counties, Va., deposits of high-grade ore occur and have been mined chiefly at Powells Fort mine, on Massanutten Mountain, where large quantities of pyrolusite used in dry batteries has been obtained. Here the purest ore replaces sandstone blocks in a breccia that fills a solution cavern.

Most of the ore in Oriskany sandstone is believed to have been derived from beds at the base of the sandstone that originally contained disseminated manganese associated with glauconite, phosphate nodules, and rounded quartz grains.

Deposits in Fort Payne Chert

The Fort Payne chert of Carboniferous age carries some high-grade manganese ore in the southeastern part of Tennessee and adjacent part of Alabama. The chert was apparently broken during folding and impregnated with manganese oxide derived from the weathering of interbedded limestone. The ore fills cracks and crevices in the cherts and replaces some of it, but the high-grade chemical ore is a soft powdery pyrolusite, containing 82 per cent MnO_2, in surficial clay and sand on an old peneplain surface. This high-grade ore is mined only around Walnut Grove, Ala., where the ore-bearing layer is two to three feet thick and lies between fifteen to twenty feet of barren surficial sandy clay.

Only a few mined deposits fall strictly into this class, although nearly all manganese deposits in residual clays of the Shady dolomite on the valley floor bench include in their upper part surficial clay and mountain wash, in which ore occurs. The only known manganese ores deposited primarily in stream gravel in this region are those at the Midvale and Kennedy mines, in Virginia, and at Silver Lake mine, northeast of Mountain City, Tenn.

Although many workable bodies of iron ore are known to occur along fault planes, only a few such deposits of manganese ore have been discovered in this region. One of these is at the Taylor Valley mine, northeast of Mountain City, Tenn., which is on a fault between pre-Cambrian schist and Shady dolomite. A fault breccia filling a zone about twenty feet wide is partly replaced by ore. The manganese-bearing solutions probably came from basal beds in the Shady dolomite cut by the fault. The only other manganese mine in the region known to be located on a fault is the Dargan mine, on the Potomac River, in Maryland, described by Hewett.[3] This deposit is also in a fault breccia adjacent to a limestone of the same age as the Shady dolomite.

Résumé of Southern Appalachian Deposits

Summing up the results of the study of the manganese oxide deposits in the southern Appalachians, the following conclusions have been reached:

1. Most of the oxide ores were derived from certain sedimentary layers which were originally richer in manganese than sediments in general, but which in no sense were concentrated deposits.

2. The original mineral was probably a carbonate of calcium, magnesium, iron, and possibly manganese.

[3]Hewett, D. F., *op. cit.*, pp. 69-71, 1916.

3. The beds that originally contained the disseminated manganese mineral occur at definite horizons, and several of these are associated with unconformities at the base of a sedimentary series or with marked changes in character of sediments, as those at the base of Shady dolomite, the Oriskany sandstone, and the Tellico sandstone. The manganese in these occurrences is believed to have been derived, with other unusual materials, such as glauconite, phosphate, iron, and rounded glassy quartz grains, from the disintegration of rocks on an old land surface.

4. The oxide ores were in nearly every instance concentrated by the solution of the disseminated manganese and its redeposition in the form of oxide in adjacent disintegrating rock or in overlying wash. In porous sandy layers, which afforded good channels for circulation, the sand grains were replaced by manganese oxide, and in impervious quartzites and clays the oxide was deposited on joints and in fractures and also more or less replaced the rock.

5. The purity of the ore is controlled largely by the purity of the rock replaced. The purest ore is formed by the replacement of a pure quartzite, chert, or limestone, whereas an argillaceous quartzite or limestone gives rise to argillaceous ore.

6. The concentration of ore into deposits took place most extensively on the surface of old peneplains where weathering had gone on for a long time and the rocks were deeply disintegrated. Meteoric waters containing the minerals dissolved from the weathering rocks migrated slowly downward through the disintegrated rock and met conditions which caused the precipitation of the ore near the base of the weathered zone.

Manganiferous carbonate ore occurs at several places in the partly metamorphosed sedimentary rocks of the Appalachian Mountains, but has been mined at only one place, near East Fork, Sevier County, Tenn. The ore occurs in lenticular layers in a zone three to ten feet wide along the contact of dolomite and slate of probable Cambrian age. The ore is in part a crystalline mineral composed of calcium, magnesium, and manganese carbonates crystallized in rhombic form, and in part a secondary enrichment of banded dark-brown uncrystalline manganiferous carbonate and thin intercallated laminæ of manganese oxide. The ore-bearing zone has been prospected for a length of about 4,000 ft., and has been opened up by a tunnel and a shaft 50 ft. deep. The ore is said to be self-fluxing.

Manganese Silicate Deposits

Many manganese-bearing silicate minerals occur in the rocks of this region, but seldom in sufficient quantity or concentration to constitute an ore of manganese. Manganese oxide deposits derived from silicate minerals, chiefly manganese-bearing garnet, in schist have been prospected at several places in the Piedmont Plateau of North Carolina and South Carolina, chiefly in a narrow northeast-southwest belt near Kings Mountain, N. C. and Blacksburg, S. C. None, however, appear to be of workable size. Veins of rhodonite of considerable size have been reported in the region, and were seriously considered as a source of manganese during the war, but the high cost of its reduction is prohibitive under normal conditions.

MAIN OPEN CUT FOLLOWING ORE BED, HAMBRIGHT MINE, SWEETWATER DISTRICT, TENN.

The manganese deposits of Arkansas lie in two districts, the Batesville and the West-Central. Those of the latter district are of little or no commercial value, and practically all of the production in the state has come from the Batesville[1] district.

High-grade manganese ore has been mined in the Batesville region since 1849, but mainly during two periods, 1885 to 1898 and 1915 to 1919. The total production of high-grade manganese ore from 1849 to 1918 inclusive was about 76,000 long tons, and in the same period about 70,000 long tons of ferruginous manganese ore was marketed. The manganese deposits lie in an east-west belt twenty miles long and four to

[1] Description is abstracted from a report by H. D. Miser, "Preliminary Report on the Deposits of Manganese Ore in the Batesville District, Ark." U. S. Geological Survey, Bull. 715, in manuscript.

eight miles wide, mainly in Independence County, but also in Sharp, Izard, and Stone counties, in the north-central part of the state.

The rocks of the Batesville district are all sedimentary, ranging from Ordovician to Carboniferous age, which dip gently southward, so that successively older rocks appear to the northward. The manganese ore is associated nearly everywhere with the uppermost Ordovician formation, the Cason shale, or the immediately subjacent Fernvale limestone. The shale is absent in many places, and the overlying St. Clair limestone, of Silurian age, or more generally the still higher Boone chert, of Carboniferous age, rests unconformably on the Fernvale limestone. The unconformable relations have an important bearing on the ore deposits, for manganese and phosphate were apparently partly concentrated in the residual materials on the old land surface represented by the plane of unconformity.

Although the deposits occur at all elevations, most of them are found on or near the tops of even-crested ridges which are remnants of an old peneplain. Most of the ore was probably concentrated in deeply disintegrated rock on this old peneplain when it formed the general surface of the land.

OPEN CUT OF McGUIRE MINE BEFORE TUNNEL WAS DRIVEN. SWEETWATER DISTRICT, TENN.

The deposits may be grouped into four types, depending partly on their mode of origin and partly on the rock formations with which they are associated, as follows:

Replacement deposits in Cason shale; replacement deposits in Fernvale limestone and residual deposits therefrom; replacement deposits in clay, and transported deposits in stream gravel.

The ore in the Cason shale is largely ferruginous manganese, composed of a mixture of psilomelane, braunite and red and brown iron oxides, which occurs as "buttons," layers, and irregular masses in the shale or its residual clay. The "buttons" are replacements of calcareous nodules of organic origin, and are so numerous in places that the shale which contains them forms a low-grade ore. Most of the buttons are composed of manganese oxide, but some are manganese-bearing carbonate. At the Cason mine, which has produced the largest quantity of low-grade ore in the district, the residual clay, and even some of the solid shale, with inclosed buttons, are mined and shipped without treatment, such ore averaging 20 per cent Mn and from 6 to 10 per cent Fe. The manganese is believed to have been derived from the manganese-bearing carbonate in the Cason shale by rock weathering, and then concentrated by redeposition as oxide.

Manganese oxides occur in irregular masses and lenticular bodies parallel to the bedding of the Fernvale limestone, especially in its upper part. The oxides are superficial and pass downward into manganese-bearing carbonate in the limestone. Manganese-bearing limestone has been mined at only a few places, most of the ore in this formation coming from concentrations as residual deposits.

Residual deposits derived from the weathering of the manganiferous Fernvale limestone have yielded the greater part of the high-grade manganese ore obtained in the Batesville area. The Southern mine alone has produced 36,500 tons of ore. The ore is chiefly psilomelane, hausmannite, and braunite inclosed in residual clay. This manganese-bearing clay fills deep solution depressions in the underlying formations.

Clay, derived from the weathering of any of the limestones or shales in the region, may be replaced by manganese oxide derived from the manganiferous Cason shale or Fernvale limestone. The replacement of the clay is generally not complete, resulting in a low-grade ferruginous ore. Only a few such deposits have been mined on a small scale.

Transported Deposits in Stream Gravel

Some hard masses of psilomelane and hausmannite set free by the decomposition of the Fernvale limestone and Cason shale have been transported by streams and deposited in stream gravel on terraces and in alluvial cones. The deposits are of small size, but contain high-grade ore.

The deposits of the west-central district, which extends from Pulaski County, in the center of the state, westward to Polk County, at the west border, have been mined only on a small scale. Except for recent revival, the mining was done chiefly between 1885 and 1889. Recent work beginning in 1915 has been confined largely to the mountainous area in the western part of the district, and has been in part described by H. D. Miser,[5] from whose report the following is abstracted.

The mountainous area is part of the Ouachita Mountains. The rocks range from Cambrian to Carboniferous. The manganese deposits are all associated with the Arkansas novaculite, of Devonian and possibly in part Carboniferous age. Because of its hardness the novaculite forms the ridges, and numerous repetitions of these hard beds at the surface by tightly compressed folds have produced many nearly parallel east-trending straight ridges separated by narrow valleys.

Manganese deposits occur chiefly at two horizons, near the base and near the top, so that the ore-bearing belts are repeated many times in the area. The manganese originally disseminated throughout the novaculite probably occurred in somewhat greater quantity at these two horizons and was dissolved as the rock weathered and was redeposited along joints and cracks, and in crevices of brecciated beds below. The ore is psilomelane, pyrolusite, manganite, and wad. Although the ore averages about 45 per cent manganese it is so scattered that no deposits have been worked with profit.

The Virginia Gold Belt

Previous to the Civil War, Gold Production in the State Had Reached an Appreciable Figure for That Period— Geology of the District.

By Marshall Haney
Written for *Engineering and Mining Journal*

GOLD was discovered in Virginia in the year 1782. Thomas Jefferson described a lump of ore, weighing four pounds and yielding seventeen pennyweight of gold, which was taken from the north side of the Rappahannock River about four miles below the falls. This evidently was a piece of float, for Jefferson states that he heard of no other indication of gold in that section. The first deposit discovered was in the year of 1830 in Orange County.

The first gold-mining company in Virginia was incorporated on March 10, 1832, under the name of the Virginia Mining Co. and was backed by New York people. They purchased a one-half interest in a lease on a five-acre tract, for which they paid $30,000. About 1836 much prospecting and mining was being carried on in this belt. The production was steady from 1831 to 1850 and increased until 1860, when the Civil War stopped mining operations in the South.

During this period of activity the annual production ranged from $50,000 to $100,000 per year, which was considered a heavy production at that stage of gold mining. Immediately after the close of the war considerable activity was manifested in this section, several milling and reduction plants being erected at various points. Many of these attempts turned out to be failures, and in most instances they were abandoned.

The principal gold belt in the state begins in Montgomery County, Md., and crosses Virginia in a southwesterly direction to the North Carolina line. The belt varies in width from 20 to 30 miles and is 200 miles long. The area covered is about 4,000 square miles, with the best developed portion in Fauquier, Stafford, Culpeper, Orange, Spottsylvania, Louisa, Fluvanna, Goochland and Buckingham Counties.

PART OF A MILL BUILT ONE STORY OF STONE

OPEN-CUT PROSPECT TRENCH, SHOWING WIDTH OF VEIN

Micaceous schists and gneisses are the principal rocks of the belt, which also includes altered sediments and igneous masses. The strike is north 20 to 30 deg. east and the dip is toward the east and southeast at varying angles, generally very steep and in places practically vertical. Masses of granite and dikes of basic igneous rocks frequently occur in the region.

The gold-bearing veins are quartz and vary from large crystalline masses to very fine grains. The principal metallic content is auriferous pyrite.

Early mining was confined to the oxidized portions of the veins, in which the ore was free milling, and below the ground-water level the gold occurs as sulphurets. The quartz gold-bearing veins, which vary in width from a few inches to ten feet, conform to the strike and dip of the inclosing rock. Some of the veins are remarkable for their persistence and continuity; for example, the Fisher vein, in Louisa County, has been opened along its strike for a distance of five miles and to a depth of 250 ft.

Mining in Georgia

The largest producers of barytes in Georgia are Thompson, Weinman & Co. They are both miners and finishers, and are situated at Cartersville, where are also established W. C. Satterfield and W. S. Peebles, other important producers.

The largest producer of bauxite in Georgia is the General Bauxite Corporation, which has a large quarry at Toomsboro.

Gold in McDuffie County, Ga.

Old District First Opened Early in the Nineteenth Century Now Making Irregular Production — Local Interest Dormant

By Paul T. Bruhl
Written for *Engineering and Mining Journal*

ALMOST a century ago attention was directed to the possibilities of McDuffie County, Ga., as a gold producer, by the presence of rich pieces of float. Even now, after the cream has been skimmed, the practised eye is afforded an occasional opportunity to select a piece of float that would revive in the most disillusioned prospector his early belief in the existence of bonanzas. One rich specimen, however, does not make a gold mine. Conversely, a rich specimen need not occasion an acute fit of depression. Float lies in a belt about two miles wide, and can be seen scattered over the cotton fields and patches of corn. It consists of lumps of quartz, as big as a man's fist on an average, stained brown and traversed by cracks.

Mining in McDuffie County has had many vicissitudes. It has been affected by the lack of experienced labor, by undue optimism accompanied by a lean purse, by the failure to "come back" after temporary depression, and by the fact that the "native" looks with more favor on cotton crops, which represent tangible wealth, than he does on a mine, which he regards with suspicion because he does not understand it. Local capital can be so profitably invested in farming that the lure of gold mining is not strong. Hence, the industry, lacking local support, is at a disadvantage[1].

The Georgia gold output has totaled approximately $18,000,000. Auriferous veins at or near the surface proved profitable, but successive operators, finding that the oxidized zone did not extend indefinitely, became discouraged. No systematic work has been attempted, and, as each lessee has endeavored to pick out the highest-grade deposit, the average value of the ore has diminished. Continuous development would have given better results. Milling practice has passed successively through amalgamation and the amalgamation plus concentration stages, until a counter-current decantation flow sheet now represents the point to which local metallurgy has progressed.

Of the mines in McDuffie County, the most productive have been the Columbia and the Parks. The former was a small but profitable venture, worked as long ago as 1833, and is reputed to have yielded $1,500,000 from the oxidized portions of the veins. The topography about the mine is one of gently rolling hills, the average elevation being about 500 ft. The rainfall averages thirty inches. The roads are in fair condition, though in the wet months they become (at times) impassable for trucks. Hence a fuel supply sufficient for several weeks is necessary. It has been estimated that water power equivalent to 300 hp. could be developed from Little River by means of a dam 15 ft. high.

The ore is auriferous quartz occurring in a succession of pinches and swells, with an occasional layer of gouge between the vein and walls. About half of the gold is free-milling, the remainder being associated with iron pyrites, galena, and, here and there, with chalcopyrite. Some pyromorphite has been found in the zone of oxidation, which extends to a depth of 100 ft. from the surface and is 50 ft. below ground-water level.

The galena is rich in gold, though its value varies within wide limits in different portions of the same vein. The pyrite is much poorer in gold. Associated with each ounce of gold is approximately one-fifth of an ounce of silver. The vein walls are well defined, and the gold contents are scattered somewhat irregularly along the line of strike. In the oxidized portions, the country rock contains a little gold, the foot wall being usually appreciably richer than the hanging wall. Panning adjacent rock yields a small amount of sulphides, with an occasional speck of free gold.

The McDuffie belt forms part of the South Appalachian gold district, which extends northeasterly and southwesterly. The veins occur in Pre-Cambrian formations, which have been subjected to considerable shearing stresses, as is evidenced by the structure of the gneisses and sericitic mica-schists of which the country rock is largely composed. It is considered probable that the vein material was derived from hot solutions rising from great depths and that most of the gold was deposited, according to G. F. Becker, "at the close of the great volcanic era or during the Algonkian."

Bearing in mind the enormous erosion to which the formations have been subjected, it is assumed that the veins, when originally formed, must have extended to considerable depth. Secondary enrichment is inconspicuous. The McDuffie deposits are only a short distance north of the line separating the crystalline belt of rocks from the Cretaceous and Tertiary rocks on the south. They extend through the northern part of the county and are most valuable in the vicinity of Little River, about twelve miles north of Thomson.

In the opinion of S. P. Jones, the country rocks "show evidence of having been derived from rather basic porphyritic granites or from granodiorites." He is of the opinion that part of the gold was derived from granite magmas and that a specially rich deposit was favorably influenced by a contact zone "where basic rocks at present containing large amounts of hornblende, were associated with more acid rocks."

[1]NOTE—To give all sides to the question we quote from a letter recently received from a mining engineer:
"One of the old niggers came to me after we had shut down, and said, 'Say, boss, we niggers has seen mining here fo' a long time, and when the stamp mill starts the mine shuts down.' This is true in McDuffie County, Ga. A great many mines have started up here and then shut down. If you ever hear of any one trying to invest money here, warn them. There are as many abandoned mines and mills around here as in a boom camp after the boom is over."—EDITOR.

Bauxite in the South

The bauxite industry is one of the principal of mining industries in the Southern states, the principal sources of supply being central Arkansas, northwestern and central Georgia, northeastern Alabama, and southeastern Tennessee. From these fields there was produced in 1917 a total of 568,690 long tons of ore.

The principal use of bauxite is in the manufacture of metallic aluminum. It is also used to a large extent in the manufacture of a refractory brick for surface linings, as well as in the manufacture of artificial abrasives. In 1917 nearly 65 per cent of the domestic output of bauxite went into aluminum; 13 per cent into the manufacture of alumina salts, such as alum, for use in water purification, dyeing, and tanning; 19 per cent was consumed in the manufacture of abrasives; and 3 per cent in the manufacture of refractories.

The bauxite deposits of the United States have resulted from the alteration of kaolin, which is residual from the weathering of rocks.

Prominent Mining Geologists

Joseph Hyde Pratt

THE Engineer Corps of the Army, during the Great War, performed so brilliantly that its record is bound to stand out notably in the pages of American military history. The work of the engineers took them into the most dangerous areas, and in case of attack they were often called upon to handle a gun on the same footing as the infantry. But little time was allowed for training, or, rather, it was allowed, but was rarely obtained. Colonel J. H. Pratt, commanding officer of the 105th Engineering Regiment, was allowed just eight days in France before word came that the British forces in Flanders needed help. Three days of marching took the regiment to Terdeghem, where, under shellfire, the men went to work tangling up barbed wire to the best of their ability. This was in August, 1918. On the last day of that month the first advance in the Canal sector, since the big push of the Germans, was made by the Thirtieth Division, of which Colonel Pratt had been made Division Engineer. This was the beginning of the end for the Germans. More important work, however, soon developed elsewhere. On Sept. 5, the 105th Engineers, together with other units of the Thirtieth Division, started for France, and on Sept. 24 became a part of the Second American Corps attached to the Fourth British Army in front of the Hindenburg line between St. Quentin and Cambrai. Five days later Colonel Pratt's engineers were in the thick of the fight which resulted in the capture of Bellicourt and Nauroy. Later, in the battle of the Selle River, they were called on to build three bridges, which is not the pleasantest job in the world with the business end of several thousand guns pointed your way. Each time the division was withdrawn from the front line for rest and reorganization the Engineers were kept in the forward areas building roads and railways.

At the time, Colonel Pratt wrote: "I had several narrow escapes and never did get used to the shelling. I would shy a good deal, but I was always able to make my legs take me where I wanted to go." He doesn't say which way that was, but those who know him can make an intelligent guess, and the general direction wasn't west.

Colonel Pratt is just the kind of a man most any one would have picked for the difficult work in France, for he already had the habit of doing things on this side.

JOSEPH HYDE PRATT

Born fifty years ago, his life has been a full one. After being graduated from Yale, he was instructor in mineralogy there for two years, after which he went to North Carolina. There he has been prominently identified with most of the mineralogical and geological activities of the state. After being mineralogist of North Carolina for nine years, he was made State Geologist, and since 1904 has been professor of economic geology at the University of North Carolina. His exhibit of North Carolina gems and gem minerals will be remembered by many who attended the Pan American and Charleston exhibitions. Like some other engineers whom we might mention, Colonel Pratt's activities have not been confined to his profession. He has been greatly interested in good roads, in swamp drainage, and in the conservation of the forests and water powers of his state. He is responsible for the creation of the State Highway Commission and prison reform legislation. He was even president of the National Association of Shell Fish Commissioners!

Colonel Pratt belongs to a Congregational church of New Haven, Conn., and the Episcopal church of Chapel Hill, N. C. What stronger evidence could be adduced that he is catholic in his tastes? The list of societies and clubs to which he belongs is a long one. Included are the A. I. M. E., the Mining and Metallurgical Society of America, the Yale Club of New York City, the Cosmos Club of Washington, D. C., the Capitol Club of Raleigh, N. C., the A. T. O. fraternity, and the Sigma Xi.

Joseph H. Pratt is not a southerner by birth but by adoption. The southern spirit was no doubt bequeathed to him by his father, who was captain of a Louisiana regiment in the Civil War. Perhaps this is where he acquired those qualities that have distinguished his most creditable military career.

By The Way

The One Thing Needful

All's well that ends well. The Tonoph-Divide mine has the complete endorsement of George Graham Rice, according to a Tonopah paper. Mr. Rice recently visited the property, after an absence of fully ten years from southern Nevada, and is quoted as saying:

If one thing was more apparent to me than another, after going through thousands of feet of underground workings, it was that one of the biggest and most promising silver mines in the whole state has been "black-jacked" and besmirched as no other great property ever was before.

My impression from the reports I read prior to entering the property was that the mine had been bottomed at the 585-ft. level, and yet, on the 585-ft. level, I was shown 15 ft. of ore extending for 75 ft. on the strike of the vein that the company officials say averages better than 30 oz. of silver per ton; *and assuredly I did not need the word of anybody that it was rich silver ore, because it had the aspect of a strong silver orebody which could not possibly be mistaken.* I had some of the rock assayed, and the returns I obtained were better than 100 oz. to the ton. . .

It is quite true that on this level there are lean spots, and that for a considerable distance in the drift the values are low, but the significance can hardly be that the orebody has pinched out at the 585-ft. level. *It is certainly a truism that every bonanza mine has its lean spots, and it follows very logically that the bigger the mine the bigger the lean spots will be wherever they are encountered.*

It follows with equal logic that the biggest mine of all will be the one where the ore is entirely lean. Doubtless, a proposition even more attractive to Mr. Rice would be a mine where there was no ore at all.

On Raising Chickens

It is not often that an engineer goes outside his chosen profession to seek renown in poultry raising. H. F. Wierum, general manager of the American Mineral Production Co., one of the large magnesite companies of Washington, has started the farmers of eastern Washington guessing. He tried an experiment of feeding his hens ground magnesite instead of lime, and is now out with the claim that the resultant egg shell has far superior insulating and wearing qualities than does the common variety.

But who wants an insulated egg? we ask Mr. Wierum. We would rather have them fresh, and, next to this, less fragile. Mr. Wierum should try feeding his hens a little cement along with the sand and gravel that they normally swallow and see if he cannot produce an egg with a concrete shell. This would stand shipment anywhere without crates, and thus lower the price by a fraction to the consumer. Some experimenting would, of course, be necessary, as cement ordinarily will give a chicken hardening of the arteries or the like. But engineers have overcome greater obstacles than this.

Surface Tension

An English correspondent sends us the following abstract from a paper presented before the Academy of Sciences, Paris:

The authors have found that anæsthetics and analgesics possess the well-marked property of diminishing the surface tension of serum. On the other hand, it has been proved that all the substances used for the prevention of anaphylactic phenomena, such as lecithin, the alkalis, and soaps, also have the property of lowering the surface tension. Experiments are given on the suppression of anaphylactic shock by anæsthetics. The results obtained confirm the view that it is not the nervous system which is mainly affected by the anaphylactic shock, but a reaction of colloidal flocculation leading to asphyxia from the obstruction of the capillary networks.

We don't understand the exact meaning of all this, in our medical ignorance, but it would seem that anyone thinking of having a leg off had better take out a license from Minerals Separation to be on the safe side, or on as safe a side as possible.

Vulture's Exit

The original camp of Vulture, Ariz., disappeared long ago under remarkable circumstances. W. A. Farish had a lease on the old bonanza. This lease was abandoned as the ledge matter proved too lean for profit, but not until Farish had run through the mill the walls of the camp cabins. They had been built of rock from the mine outcrops.

Geologists We Do Not Recommend; L. H. Colyer Submits a "Geilogical Report"

The report of another Texas representative of the tribe of Metalliferous Murphy has been sent to us. It states:

The general typography and glossary of horizon stone will be taken up first. Character of stone in this district is of sand, the greater portion being of the sand carbonate family, however much carbonate carboniferous standstone is exposed. I note limestone magnesia on surface and deep lental exposures. Sandstone folds in this zone are in perfect place.

So far, all correct. It is a relief at least to know that the character of the stone is what it ought to be and that it comes of good family. Later it appears that the stone is of Permian age; moreover:

The cretitious action and disintegrated matter that exist here shows every necessary element to land petroleum oil may be expected at this point. There being much carbon in all stone and likewise sulphur, and carbonate of sodas are contained in substances. Saline products are also much in evidence.

Apparently, there is a little too much soda-water in this ancient stone, of good character and family.

We feel confident that when this great eruption that caused this wonderful fold to be placed in the position that it now lies, there existed a great southern drift of decomposed matter which was carried from the surface of this structure by the Devonian waters and left bare the form of this beautiful body in such a way that one cannot be misled as to the exact and correct contours as they exist.

Oh fie now, Mr. Geologist. What do you call character anyway? And to make matters worse you report:

A large pool of water just below the riffle, which is very deep, and while our party was exploring this place we noted the water kept a continuous blubbering in many places in this pool, and upon inquiry from Mr. ——— —— and others, we were informed that this blubbering was continuous and had been noticed ever since the settling of the country.

Was this a nice thing for your respectable stone to do to the water? It is all very perplexing to be sure, but now come the fireworks:

Small lental spherical bodies, surface gashes, that have been caused by the many ages of waterfall, all show a correct affinity, and a great nucleus of evidence that petroleum oil and a natural gas exist in this zone.

We shall not proceed. We are not quite sure that this is just what our readers should have. The *Engineering and Mining Journal* goes into the most refined homes.

CONSULTATION

Dollar Silver Perplexities

"In recent issues of the *Engineering and Mining Journal*, New York quotations for silver have been given separately for silver of domestic origin and for silver of foreign origin and a statement has been appended to the effect that 'on the authority of the Secretary of the Treasury we quote 100c. per oz. for silver, 1,000 fine, etc.' Smelters have been making settlement on the basis of a quotation of 99⅝c. per oz. and we presume that the deduction of ⅝c. is to give the equivalent price for silver 999 fine instead of 1,000 fine. Is this correct?

"The appended statement also recites that the quotation is retroactive on silver of domestic origin to May 13. On page 1292 of the *Engineering and Mining Journal* the average price of silver for the month of May is given as 102.585c. per oz. Will you please advise me whether this average is for silver of domestic origin, and whether in making settlement for domestic ores shipped to the smelter to be paid for on the basis of the average monthly quotation for May, such settlement should be based upon a price of 102.585c. or upon some other figure? I presume that since the lowest quotation for silver during the month of May was 99⅝c. there would be no change in the average for this month.

"On pages 43 and 46 of the *Engineering and Mining Journal* for July 3, the monthly average price of silver is stated to be 90.957c. per oz. Inasmuch as many smelter settlements are being based upon the average monthly price of silver as quoted by the *Engineering and Mining Journal*, and in order to prevent disputes over technicalities, I would suggest that your journal should quote the monthly average prices for silver of domestic origin, independently of the price for silver of foreign origin. Such averages can be obtained by taking the arithmetical average of the daily quotations, which I believe would show 99½c. for the month of June, but nevertheless in order to make this important matter clear I would suggest that you should define these prices with exactitude, and upon the usual basis of silver, 999 fine."

Under the Pittman Act, the United States Government is now purchasing all silver offered, at $1 per oz., 1,000 fine, provided it can be proved to have been mined, smelted and refined in this country. This is equivalent to 99.9c. per oz., 999 fine, which is the purity heretofore quoted in the *Engineering and Mining Journal*. Delivery charges must be paid by the refiner, so that in making settlement, something must be allowed for them. Handy & Harman, who do a large part of the silver marketing in this country, about noon of each day decide on an official price based upon actual sales or bid and asked quotations during the morning. They have agreed that 0.4c. per oz. is a fair price for delivery to the mint, and have, therefore, established 99.9 minus 0.4, or 99.5c., as a fair price for domestic silver in New York, 999 fine.

Some American smelters have decided to make settlements on the basis of 99⅝c. per oz., thus allowing only 0.275c. per oz. for delivery charges. They may be so situated that this figure is a fairer one. However, as already explained, the 99½c. figure is the one quoted by Handy & Harman, whose price has generally been accepted as official.

The price of silver in New York did not drop below 99½c. until June 3, so that our average of 102,585c. as given for May is correct for either domestic or foreign silver. Our June average, 90.957c., of course represents foreign silver, the average price of domestic silver for that month being 99½c. To avoid confusion we shall quote the average monthly price of domestic silver hereafter, in addition to that for the foreign article, even though the former remains constant at 99½c., as is altogether likely as long as the Pittman Act is in force.

Oil Shale Machinery

"Our office is desirous of obtaining prices and full particulars of an apparatus for extracting oil from shale in large quantities. They state the shale contains about 10 per cent oil.

"Will you be good enough to advise us of the names of manufacturers of this equipment."

We do not know of any company manufacturing retorts for the distillation of oil shale in this country. The industry is so embryonic that there is considerable doubt as to whether any attempt has been made to manufacture this sort of machinery in the United States. Much experimentation has been made upon the distillation of oil shales, and processes devised which investigators have assiduously acclaimed as being eminently practicable for the purpose, but no demonstration, so far as we know, has been made upon a large enough commercial scale.

Estimates of the cost of a 1,000-ton retorting plant vary widely from $300,000 to $2,500,000 and up. The higher estimates include machinery for recovering by-products such as sulphuric acid and ammonium sulphate from the distillation. Last year a 1,200-ton plant in Colorado of the regulation continuous vertical type was figured at $1,200 per ton.

It is our impression that until the oil shale industry has become a commercial success in the United States and further large scale experimentation performed, no regular manufacturers of the distillation machinery will be available in the United States, and any apparatus ordered will be made from special designs.

No United States Cryolite Production

"Is any appreciable amount of cryolite produced in the United States?"

Cryolite, the double salt of sodium fluoride and aluminum fluoride ($3\,NaF.\,Al\,F_3$) is not commercially produced in the United States. It has been reported as a mineral discovered in certain parts of the United States, notably near Pike's Peak, Col., but not in sufficient quantities to warrant profitable exploitation. All of the cryolite used in this country comes from Greenland, and in 1917, 4,383 tons of this material were imported, the greatest amount since 1898. In 1918 imports dropped to 1,950 tons, having a value of $50 per ton. There is no import duty on cryolite.

THE PETROLEUM INDUSTRY

Graphic Representation of Oil-Well Decline

Use of Curves To Express Increased or Decreased Production From Oil Wells—More Consideration Should Be Given to Production Records of Individual Wells and an Attempt Made To Obtain an Estimate of Total Recoverable Oil

By S. S. LANGLEY
Written for *Engineering and Mining Journal*

GRAPHIC representation of the production of an oil property by periods, daily, monthly or yearly, will show only whether the production has increased or decreased. Fig. 1 is such a curve, computed from actual records, and an analysis of this curve will draw attention to the addition of thirty-three wells and eight hundred barrels' daily production on Oct. 1, 1919. On Sept. 30, 422 wells produced 10,500 bbl., and the influence of the new wells is seen in the production curve until Oct. 10, when it is apparent that the daily production decreased to a point little, if any, higher than it was during September. These are significant facts and raise the question as to their cause. The curve does not present a solution. The relation between the new and old wells could be shown by a graphic presentation of a per-well per-day production, but this would add nothing to the information as to why production decreased so rapidly after Oct. 10.

There is evidence that the decrease has been rapid, and the first impression is that the rate of decline has been abnormal. The production shown in Fig. 1 is a total of many leases in several fields, and a study of the production of each lease will disclose the source of the decline. It is then necessary to learn the cause, and this cannot be determined accurately until it is known whether or not the decline is normal.

Wells in different fields may not and probably will not follow similar rates of decline. This is also true of wells in different parts of the same field, and even of adjacent wells, but those in the same field of like initial production will have similar rates of decline. To determine the normal rate of decline, it is therefore necessary to divide the wells of each lease into groups of like initial production. A curve can then be computed for each group, and the comparison of any well with its group will show whether or not that well has followed a normal rate of decline.

TYPES OF CURVES

Fig. 2 is a comparison of "Production Decline Curve" (*A*) and "Per Cent Production Decline Curve" (*B*) for a group of wells whose initial production was between 3,000 and 3,500 bbl. per month. "*A*" represents the average production per month of this group, and "*B*" indicates the percentage of production for any month, up to the 20th, with respect to the maximum production. Each curve serves a distinct purpose. "*A*" can be used to forecast the production per month of a new well of this group, and "*B*" will serve as a means of comparison between per cent rates of the decline of different groups. The following is an example of the use of "*B*":

During a unit period, the total production of a group falls from 11,000 bbl. per day to 9,250 bbl., indicating a decline of 15.9 per cent, while during the same unit period another group declines from 1,000 bbl. to 750 bbl., or a decrease of 25 per cent. Such figures would cause one to examine the smaller group, as the lower the initial production the slower the per cent of decline anticipated. If desired, the per cent rate of decline of all the groups can be merged into a total property per cent decline curve, but to do so is of little or no value as an indicator of the cause of decline. It can lead to the failure to notice important changes. Had the figures of the previous examples been presented only as a combined per cent decline for the two groups, it would have appeared that 17.1 per cent was the average of the two groups, and there would have been nothing to indicate that the smaller had declined 25 per cent.

METHOD OF COMPUTING CURVES

Fig. 3 shows two curves of the same group. "*A*" was made up by introducing the wells of the group in the months in which they were completed. "*B*" represents all wells of this group as completed in the same month, with the result that each month is a true representation of the group decline. "*A*" shows an increase in production during the second month because there was but one well of this group producing, and it did not reach its maximum production until the second month. It is impossible to know from "*A*" what causes an increase of production, whereas it is known that any increase in "*B*" is due to an actual greater average production of the group. The method of computing "*B*" may appear objectionable, as the curve must be re-calculated each time another well of its group is completed. The accuracy of any curve depends upon the number of units making up its average, and the value depends upon the accuracy.

In Fig. 4 and Fig. 5 are presented the per cent decline curves of all groups of a lease. Those wells which would reach a maximum of between 4,000 and 3,500 bbl. per month were placed in the 3,500 group, and, following this method of division, all of the wells of the property were assigned to their respective groups. The average monthly production was then separated into successive periods of four months each, and an average found for the four months of each period. This average was referred to the maximum monthly average, to compute the per cent of production.

The comparative per cent decline of the groups is, perhaps, shown more clearly by Table 1, in which the amounts of the per cent decline below 100 are shown

rather than the per cent of 100. This table presents some unexpected facts. At the end of the first four months only the 500 group had declined less than the 3,500 group. At the close of the second period, the condition is more nearly what would be expected, although the 500 group. At the close of the fifth period, the groups approached the relative positions expected; that is, the groups of greatest initial production show the greatest per cent decline. The 500 group cannot be taken as a fair indicator after the sixteenth month, as

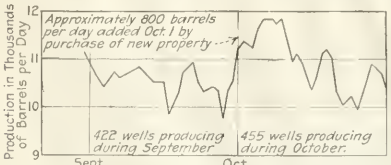

FIG. 1

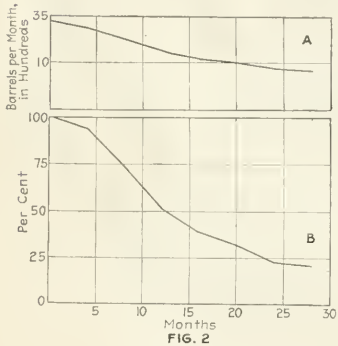

FIG. 2

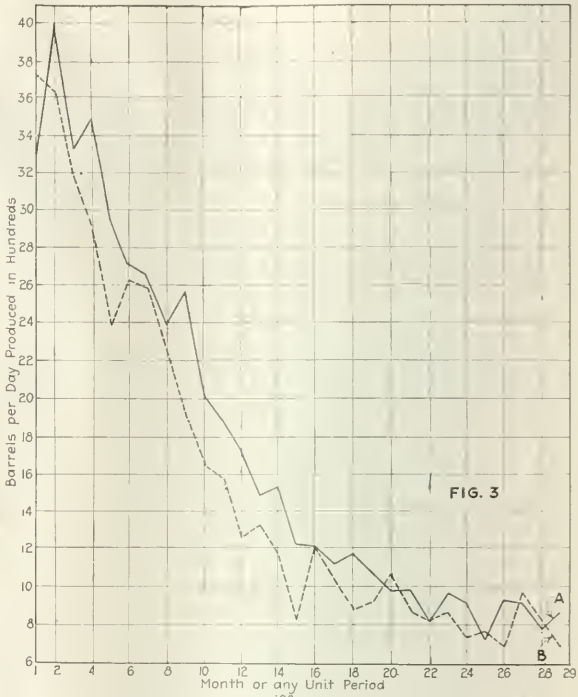

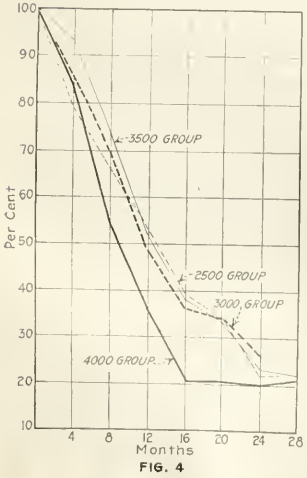

FIG. 4

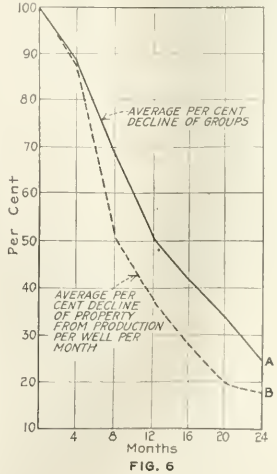

FIG. 6

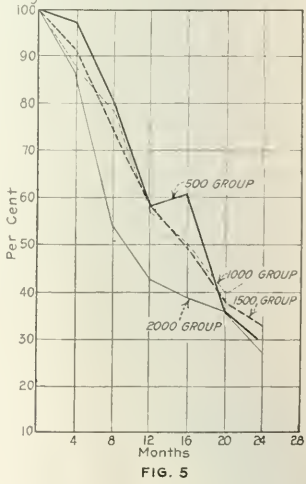

FIG. 5

CURVES SHOWING INCREASE AND DECLINE IN OIL-WELL PRODUCTION

the 2,000 group shows a greater per cent decline than any other. At the end of the third period, the 4,000, 3,000 and 2,000 groups had declined more than one-half of their maximum production, and by the end of the fourth period (sixteenth month) this is true of all but there was only one well producing after that period. Attention is drawn to the fact that the four larger groups require only two years in which to decline 75 per cent of their maximum production as indicated by the curves in Fig. 5.

In Fig. 6 is shown a comparison between the average per cent decline of the groups *"A"* and an average per cent decline of the production per well per month *"B."* *"A"* is a curve made up from the averages of the groups, as shown in Table I, and *"B"* is computed from the monthly production of the property. The comparison serves to show the error encountered in a curve such as "B." Due to the fact that wells of low initial production are completed and brought into the average while those of greater production are still in their early months, the average per well per month is low, although the total production has increased. As a further illustration of the inaccuracy of *"B,"* suppose a well of the 3,500 group is abandoned at the end of its eighth month of

TABLE I. COMPARATIVE PER CENT DECLINE OF OIL WELLS

End of Group	4th Mo.	8th Mo.	12th Mo.	16th Mo.	20th Mo.	24th Mo.	
4,000	16	45	64	79	79	80	
3,500	7	26	48	62	67	77	
3,000	14	30	51	64	66	74	
2,500	21	34	47	61	66	76 6	
2,000	14	46	57	61	64	73	
1,500	9	26	42	51	62	67	
1,000	13	22	43	50	60		
500	3	20	42	39	64		
	12	31	49	58	66	75	Average group per cent decline
	13	49	62	72	80	82	Average per well per month per cent decline

production. The per cent decline as shown by the curve of the 3,500 group (Table I) is twenty-six, whereas the per cent decline as represented by *"B"* Fig. 6, is forty-nine.

A great many of the large operators do not give sufficient consideration to the production records of the individual wells. It seems to be considered that the total production of the company, or, at most, the total production of individual leases, is all that is necessary. As each well is of importance in accordance with its possible maximum production, and the investment represented by it, corresponding attention is warranted. An investment of $50,000 on the payroll would most certainly be watched.

The per cent decline, or the production decline, represents depreciation of resources, just as production of ore represents depreciation of reserves.

Although it is not possible to predict with absolute accuracy the total recoverable oil, this is not sufficient reason for making no attempt to reach as trustworthy an estimate as possible.

The Osage-Newcastle Oil Field Of Wyoming*

OWING to the comparatively recent discovery of oil in commercial quantities near Osage, Wyo., many inquiries have been made of the State Geologist's office in regard to the oil possibilities of the area, and this article is issued for the purpose of giving a general idea of the conditions existing in the Osage-Newcastle region and is not the result of a detailed and comprehensive survey.

The Osage-Newcastle area lies southwest of the C. B. & Q. Ry., between Osage and Newcastle, and practically parallels the railroad. Prospecting and development are also extending to the northwest of Osage as far as Upton and Thornton and the southeast of Newcastle as far as Ardmore, S. D.

Structurally this district is a portion of the southwesterly dipping monocline which lies on the southwestern flank of the Black Hills uplift, which in itself is a huge, elongated dome containing a core of granite and metamorphic rocks and representing a vertical displacement of about 9,000 ft. The normal dip of the monocline is 4 or 5 deg., but in a number of places the dip is greatly increased, as, for instance, from two to four miles west of Newcastle, where it ranges from 50 to 60 deg. Also to the southeast of Newcastle very steep dips have been recorded.

It was noted that an outcrop of Greenhorn limestone marked a zone of steeply dipping rocks south and southeast of Osage and that the strata flattened both to the northeast and southwest of this zone. This change in dip, or terracing, probably is one of the controlling influences in the accumulation of oil, especially in the Osage portion of the area. Other structural changes were also noted, such as slight folding, especially northwest of Osage, and there is also the probability of considerable faulting in a zone of almost vertical outcrops near Newcastle.

Oil-Bearing Sands in Lower Benton Formation

The commercially oil-bearing sands in the district are confined, as far as is known, to the Graneros, or lower Benton, formation. The principal sand is from 25 to 40 ft. thick and lies near the base of the Granderos. Above this sand there are about 110 ft. of sandy shales overlain by another but much thinner oil-bearing sand. The lower sandstone outcrop lies northeast of the railroad and parellels it from Osage to Newcastle, and the same is true of the Dakota sandstone which comes to the surface a little farther to the northeast. At several points, notably a short distance west of Newcastle, there are occurrences of oil springs in the Graneros oil-sand outcrop. For many years oil has been obtained at these seeps for local use as lubricants.

It is believed that many of the shallow wells near Osage are obtaining the oil from the thin upper sand and the sandy shales, and that the deeper wells, especially the gushers in Sec. 19, T. 46 N., R. 63 W., have tapped the lower sand. It is not believed that any of the wells are producing from the Dakota or Lakota sandstones. It is probable that the Dakota sandstone will be found to be water bearing in this area. However, there is a possibility that the Lakota and lower sands may be oil bearing in places, and if so the oil will undoubtedly be a heavy black oil with an asphaltum base.

At first the field was largely prospected by the smaller wildcat companies and individual operators, but recently many of the larger companies have taken holdings and are rapidly putting down test wells. Among these are the Midwest Refining Co., the Carter Oil Co., the Ohio Oil Co., the Union Oil Co., the Producers and Refiners Corporation, the Sinclair Oil Co., and other companies and individuals.

The end of this season should see the limits of production fairly well defined in this particular district. A large territory is thus being tested out, and there are possibilities of other pools being developed in addition to the one near Osage. It is more reasonable to assume that there are several oil-bearing areas paralleling the outcrop of the formations and contiguous thereto than that the country will be one solid or continuous oil field, and it is not improbable that many of the deeper wells to the southwest will be outside of the limits of production.

*Abstract of Press Bulletin No. 6 of Wyoming Geological Survey.

NEWS FROM THE OIL FIELDS

Many Applications for Permits Sought Under Leasing Law

Land Classification Staff Busy Defining Geological Structures — Many Existing Maps Incomplete

From Our Washington Correspondent

Applications for prospecting permits and for leases are reaching the U. S. Geological Survey in such numbers as to make it extremely difficult for W. C. Mendenhall and the land classification staff to keep pace in the matter of defining geological structures. The new mineral leasing law provides that prospecting permits may not be granted to cover lands within the known geological structure of a promising field.

While the Survey has geological maps covering a large portion of the public lands, these often are not in sufficient detail. In addition, prospectors for oil are very active just at this time and are appearing frequently in just those spots which have not been mapped geologically. This necessitates prompt dispatch of a geologist to make a survey in the region covered by the application.

The law provides that one applicant may have as many as three leases in a state, but only one lease on a structure. If one person has applied for two leases in the same general region, it must be determined that they are on separate structures. A similar distinction is made with regard to prospecting permits. It is highly important, so far as operation is concerned, to have the line drawn sharply between the territory which is open for permit and that on which permits may not be had and only leases considered. With a permit, it is possible to prospect two years over 2,560 acres. When the permit expires, the holder has a preferential right to lease one-fourth of that area, with the royalty on a five per cent basis. To secure a lease within the structure of a proven field requires compliance with much less liberal conditions. The applicant has no preferential right. The department puts the land up for bids and the highest bidder gets the tract. He must pay a royalty of not less than 12½ per cent and must bid against everyone on the bonus basis.

The Survey already has defined the structures in twelve fields in Wyoming and Montana and six in California. Work is now in progress on six other California fields. The fields where the demand is the greatest are being taken up first. A great many prospecting applications are coming in from New Mexico. As yet, the situation is not intricate in that state, since it has no producing fields. The moment production comes in, however, the urgency of action on the part of the Geological Survey to indicate the boundaries of the structure is apparent.

Kentucky Shows Steady Production Increase

From Our Special Correspondent

Oil production in Kentucky during May reached 667,000 bbl., a new high record, according to figures recently announced by the State Geological Survey. March production was 610,000 and April 635,000 bbl., showing a steady growth. The increased production is due to the numerous wells being brought in in Western Kentucky, and, more recently, to development in Magoffin, Johnson, and Morgan counties.

The Armour Oil & Refining Co., of Pittsburgh, is unloading a heavy rig at Olmstead, in Logan County, for a deep test. A well, it is said, was drilled near Beachland to 700 ft., and the oil ran down the creek several days.

With the completion of pipe lines now under construction in Warren County, it is predicted by oil men that the county will rank first in oil production in Kentucky this month. It was second last month, with Allen County first.

Stein well No. 2 on the Tarrant lease, in the Davenport pool of Warren County, was shot and is reported to be making 50 bbl. per day. Leighty Brothers brought in a well at 450 ft. in 20 ft. of pay sand on the Clint Rigsby farm, a half mile from the Nashville Pike. It is rated at 25 bbl.

A report from Scottsville, Allen County, is that No. 3 on the Cooper lease has been completed at 310 ft. and is rated at 150 bbl. a day.

Oil and Gas in Dover Township, Ont.

From Our Special Correspondent

Further important progress is reported from the Dover oil field, in Western Ontario. The Petrol Oil & Gas Co. has let contracts for five wells, the completion of which will probably require eighteen months. Two of these are under way, one being down about 400 ft. The Vacuum Gas & Oil Co. has its first Dover well down about 1,300 ft. and reports favorable geological conditions. The Ajax Oil & Gas Co. is sinking its first well, and has secured additional leases on 130 acres, increasing its holdings to 160 acres. The Eureka and Inland companies are expected to begin sinking soon.

California crude-oil stocks were reduced 1,165,945 bbl. during June, 1920, according to statistics compiled by the Independent Oil Producers' Agency at Los Angeles, Cal. This daily shortage of 38,865 bbl. shows an increase of over twice the shortage of the previous month, which shows 16,698 bbl. per day.

Texas Well Shows Unexpected Big Flow

Exploration in New Territory Proves Extention of Gulf Coast Field— Other Texas News

From Our Special Correspondent

During the week ended July 24 several important wells were completed in the Gulf Coast fields. On July 20, No. 1 Abrams well of the Texas Co. came in unexpectedly at a depth of 2,780 ft., flowing 15,000 bbl. per day at the start, and increasing to 20,000 bbl., without a sign of water. The great importance of this well, aside from its big flow, is its location, about one mile northwest of the proved field, in practically wildcat territory. This is probably the most important completion of the week in Texas. In the same field No. 26 Japhet of the Humble Oil & Refining Co. was completed during the week, making an initial production of 8,000 bbl. daily. This well is on the west side of the field, and is about 3,300 ft. deep.

Other important completions in the Gulf Coast fields recently were: Humble field, No. 31 Koehler, Texas Co., 3,500 bbl.; Goose Creek field, No. 33 Ashland, Simms Co., showing of oil, now being tested; at Hull field, Empire Gas & Fuel Co., No. 3 Barngrover, 6,000 bbl. at start, but rapidly sanded; No. 33 Dolbear, Republic Production Co., 1500 bbl., No. 35 Dolbear, same company, 500 bbl., No. 19 Dolbear, same company, 400 bbl.; No. 13 Phoenix Gulf Production Co., 400 bbl.

Fire at Desdemona, Eastland County, on July 24 destroyed three business blocks in the center of town, including a bank, three hotels, three cafés, two drug stores and thirteen other stores. Total loss is estimated at $500,000. Desdemona is an oil town, formerly known as Hog Town, and has no fire protection. Dynamite was used to check the spread of the flames. In the Hog Creek field the Harris No. 2 well is flowing 300 bbl. daily, and No. 3 Harris is expected to be completed soon.

The Breckenridge district, Stephens County, production continues to increase. The Plateau well on the Ward tract is flowing stronger, making nearly 7,000 bbl. daily; The Buchanan well on the Gulf Production lease, three and one-half miles east of Breckenridge, is flowing 1,000 bbl. from 2,430 ft.; No. 2 well of Fensland Oil Co., on the Walker-Caldwell tract, was shot and is now making a good flow, not yet gaged.

In Coleman County, the No. 1 well of the Santa Anna Chief Oil Co., seven miles south east of Santa Anna, opened a gas flow of 4,000,000 cu.ft. daily at a depth of 1,540 ft. Deeper drilling may be done. Oil was found in the Pippin-Burke No. 2 well after a second shot.

ECHOES FROM THE FRATERNITY

Plant Devised for Recovering Gems at Burma Ruby Mine

Large Rubies Recovered and Many Small Ones—Test Stones Found in Concentrates Without Loss

Bernard Rance, the chief engineer of the Burma Ruby Mines, has in his annual report an interesting account of an experimental hydraulic sluicing plant, which has been tried on one of the company's properties, the Redhill, according to the London *Finaneial Times*. This plant was built to his design in the workshops, and made a fair start in August last year. Its object was to try a cheaper method of treating the gem deposits, but at the same time to produce the precious stones. Mr. Rance describes his plant as follows:

"We followed the usual practice, breaking down the bank with jets under moderate pressure, the water being taken from Pamadeik Channel about 500 ft. above the valley, and elevating the material to the top of the sluice by means of an hydraulic elevator under a working pressure of 400 lb. to the square inch, supplied from Redhill Channel. Although the pressure was ample for these duties the volume was restricted to the capacity of 6-in. mains only. The plant consisted of a vertical wooden frame, about 18 ft. in height and 9 ft. square, built immediately over the first bay of the sluice, which carried the screens that prevented the larger stones and pieces of rock from entering the boxes. These screens delivered their stuff on to extension tables, where it was hosed clean and sorted by the sorter in charge. All other sized gravel up to ¾-in. diameter passed through the screens and commenced its journey down the sluice, 100 ft. in length by 9 ft. wide, with riffles placed across at intervals.

"It was at once apparent to me that the methods used for catching gold and tin were of no use when applied to gems, their specific gravity being so much lower than the above metals. With gold having a specific gravity of about 19 it is a fairly easy matter to collect the large coarse grains in riffles and to wash away all sand, quartz pebbles and other undesirable material by using a large volume and rapid flow of water. With our deposit the riffles either packed solid with sand or were washed clean out, according to the flow and volume of water experimented with, owing to the closeness in the values of the specific gravity of corundum, quartz and limestone. After much consideration I then tried a series of boxes, arranging them to take the place of riffles, with rows of 2-in. pipes at the bottom and sides, drilled with numerous small holes to allow rising currents of water under variable regulated pressure to assist in the concentration of the gravel brought in by the sluice water. The results were better than anticipated, and quantities of sand-sized rubies were retained in addition to the larger ones, which tiny things we were prepared to lose altogether. Exactly the same procedure and care as in the sorting sheds was carried out in sorting the deposit, which was drawn out from the boxes by means of sliding doors at regular intervals. The deposit after several hours run was in appearance and character somewhat like that recovered from our pans, but there was certainly sand in excess, which cannot be got rid of without introducing revolving screens, and I particularly wished to bar all running machinery. Marked test stones thrown into the elevator sump were recovered every time. The plant could only deal with about 300 to 500 trucks per shift of ten hours, being limited to the water supply, and the labor required was one sluice man and fifteen to twenty coolies and one European sorter by day.

"The actual figures for the first month's run were: Stones mined valued at Rs9,100 and cost of labor and upkeep Rs1,000. As the total cost of erecting the plant and all materials used in so doing was only Rs6,000, this was a very fair start. . . . Of far more importance than devising a means of extracting the smaller stones is the fact that the plant will retain the large ones, which, after all, are the ones that really matter and decide the paying of dividends."

Will Teach Mineralogy and Blowpipe Analysis

The extension division of the University of California announces that its technical department has a new correspondence course in determinative mineralogy and blowpipe analysis by Arthur S. Eakle, professor of mineralogy. It is equivalent to the course given in the regular session of the university. Each of the ten assignments given in the course is based on portions of a text book which is sent out with the preliminary announcement sheets. The text is entitled "Determinative Mineralogy and Blowpipe Analysis," by Brush, revised by Penfield, 16th edition. The approximate cost is $3.50. With the assignment sheets are sent 100 different kinds of powders and minerals in sets of ten each for experimentation or determination.

The fee for this course is $12, payable in advance. Necessary apparatus for the course must be provided and will be furnished by the Associated Students' Store, Berkeley, Cal., on receipt of a check or money-order for $20.

The Engineer's Part in Industry's Evolution

The mining and metallurgical industry, says the *Écho des Mines et de la Métallurgie*, is evolving an amalgamation of enterprises of singular importance, financial, administrative, and industrial, whose direction had become burdensome and difficult. A single man at the head of a large corporation does not usually suffice for efficient administration.

The direction of these giant enterprises, that have but recently been created, is a large problem.

The head of a great metallurgical or mining company may no longer pretend to see everything and know all about everything connected therewith.

To attempt this would lead him straight to cerebral congestion or cerebral anaemia, and his company to paralysis, for the matters waiting their turn would go months without attention.

Today a chief should in a manner hover above the great business, leaving the cares of its effective direction to his various aides. Here the engineers find their special place, and their role assumes special importance as enterprises evolve toward great concentration.

The actual chief, from his upper plane, should arbitrate the conflicts between his lieutenants; but should leave to them the effective direction of the different branches in order that they acquire the habit and the taste for responsibilities. Without those qualities they will be incapable of successfully filling their own parts in the work.

It is thus incumbent on the head to give careful attention when choosing the chief engineers who are to become his immediate collaborators. Having made this choice, he should leave them to execute, command, and evolve.

Gold Question Discussed Before Salt Lake Club

A meeting in the interests of gold production was held July 23 at the Commercial Club in Salt Lake City by the Utah chapter of the American Mining Congress, which had as its guest at luncheon H. N. Lawrie, economist of the American Mining Congress. Mr. Lawrie discussed the plan for the encouragement of gold production of which he is the originator, according to which it is proposed to offer a premium of $10 per ounce on newly mined gold, and which is embodied in House Bill 13,201, introduced by Representative McFadden of Pennsylvania and now pending before Congress. Mr. Lawrie explained the working of the measure, and answered questions in regard to the various phases of its application.

Book Reviews

Popular Oil Geology. By Victor Ziegler. Composition leather; 5 x 7½; pp. 171; second edition; John Wiley & Sons, New York. Price $3.

The intention of the author in this little volume is to present a number of general facts for the benefit of the layman who may be interested in the subject, but in this he goes further and includes material that is well within the field of those who have gone more deeply into the subject. As stated in his preface, Prof. Zeigler has drawn liberally on existing petroleum literature, but his selection is excellent and the arrangement of the text is to be commended. It is questionable if the two chapters, "Petroleum Fallacies in Oil Geology" and "Oil Investments," will prove "popular" in certain quarters, as many of the "oily arguments" presented by unscrupulous oil-stock promoters are beautifully exploded. The chapter on "Oil Shales and Their Utilization" constitutes a valuable résumé on this subject, which just now is receiving considerable attention. D. E. A. C.

Exporter's Gazetteer of Foreign Markets. By Lloyd R. Morris. Cloth, 6 x 9, pp. 766. 1920-1921 Edition. Published by American Exporter, New York. Price, $10.

Detailed statistical information regarding foreign markets has been hard to procure heretofore, in compact form. This book has a separate chapter for each foreign country and gives just the data which experience has shown to be most needed by the international trader. Included are data on commerce, production and consumption, language, money, weights and measures, shipping routes, customs, tariff, cable rates, and mail time from New York. The book is up to date and contains chapters on the new states formed as a result of the war. A good index is essential in a work of this kind, and in this instance this feature seems particularly complete.

Technical Papers

Mineral Statistics — The following separate papers have recently been issued by the U. S. Geological Survey. They will later be incorporated in the annual volumes of "Mineral Resources of the United States": "Cadmium in 1919"; "Barytes and Barium Products in 1918"; "Cobalt, Molybdenum, Tantalum, Titanium, Radium, Uranium and Vanadium in 1918"; "Nickel in 1918"; "Feldspar in 1918"; "Lime in 1918"; and "Introduction and Summary of Mineral Production in the United States in 1917."

Sampling—The State School of Mines at Butte, Mont., has recently issued a seventy-one-page bulletin entitled "Mechanical Ore Sampling in Montana," which may be obtained on request. Montana has several large sampling mills, and in this report are described those of the Anaconda company at Butte and Anaconda, that of the East Butte company at Butte, and those of the American Smelting & Refining Co. at East Helena. Several test lots were run through the different mills, the samples checking remarkably well and proving the machinery and general procedure to be all that could be desired. The bulletin does not discuss sampling from the mathematical standpoint, but merely analyzes the sampling methods in use in Montana and suggests the most fertile fields for improvement. Many illustrations add to the reader's interest.

Molybdenum — The Climax Molybdenum Co., 61 Broadway, New York, has recently published an artistic and informative book entitled "Molybdenum Commercial Steel." Alloy steels in which molybdenum is used were developed largely under war conditions when other alloying materials were scarce, but they seem to have proved satisfactory for many purposes for which other types of steel were formerly used. This book will be of interest to molybdenum producers as suggesting outlets for their product, as well as to steel users who may profit by the use of this modern alloy.

Manganese—A report on the manganese deposits of the Australian Manganese Co. is contained in the Mining Review No. 31 of the South Australia Department of Mines, Adelaide. A large number of analyses and a detailed description of the workings are given. Some general information and data are also appended on the manganese deposits and industry in other parts of the world.

Economics of Gold—A discussion of "The Gold Premium" occupies about twenty pages of the May *Journal of the Chemical, Metallurgical and Mining Society of South Africa* (Johannesburg, price 3s.). Any one interested in the currency systems of the world should find it worth perusing.

Commercial Terms—In the May and June issues of *Anglo-American Trade* (8 Waterloo Place, Pall Mall, London, S.W.1, price 1s. each) are published articles discussing and defining the terms f.o.b., f.a.s., c.&f., c.i.f., and l.c.l. The English interpretation of these terms is sometimes different from the one to which we are accustomed and exporters and importers not already familiar with this matter should give the subject attention.

Missouri War Records—The School of Mines and Metallurgy of the University of Missouri, Rolla, Mo., has issued a bulletin containing the war records of all of its members.

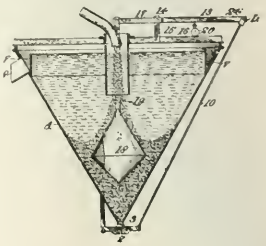
Recent Patents

1,346,642. Process for the Extraction of Lead and Zinc From Their Ores. Frank Edward Elmore, Boxmoor, England. Filed April 1, 1919.

Process for separating lead compounds from zinc compounds in lead-zinc sulphide ores, concentrates or the like, consisting in heating the pulverized ore with a sufficient quantity of strong hydrochloric acid until substantially the whole of the lead has been converted into lead chloride while the zinc remains substantially unattacked, cooling the heated mixture, washing the mass with a limited quantity of cold water to remove excess of acid and soluble impurities, then separating the lead chloride from the zinc by extraction of the former with a hot solution of lead chloride in water or in strong brine, separating the solution from the undissolved matter and cooling it to crystallize lead chloride, separating the mother liquid from the crystals and using it when reheated to leach a further batch of lead chloride from zinc sulphide, the process being repeated so that the same quantity of solvent serves repeatedly to convey purified lead chloride to the crystallizing vessel, while leaving zinc sulphide in a condition suitable for metallurgical treatment, heating the crystallized lead chloride with sulphuric acid, dissolving the evolved hydrochloric acid in water and using the solution for treating a further batch of the ore.

1,344,370. Automatic Density - Indicator for Slime-Pulp Separators. Charles Allen, El Paso, Tex. Filed April 3, 1919.

In a device for separating a feed stream into two products, each of a different density, a receptacle having a separate outlet for each of the products, a valve for controlling the outlet for the heavier product, means automatically responsive to the variations in the density of the heavier product to control the discharge valve, an indicator



operatively connected to the control means for indicating the density of the discharge material, and means in connection with the indicator to set the control means so that the discharge will occur only when a predetermined density is reached.

COURT DECISIONS IN MINING CASES

By Wellington Gustin

COLORADO

Right To Redeem Declared A Personal Privilege

Camp Bird Mining Co. Not Permitted To Acquire Mining Properties of the Brant Independent Mining Co.

The United States Circuit Court of Appeals, Eighth Circuit, has reversed the District Court for Colorado, which had issued an order allowing the Camp Bird Mining, Leasing & Power Co. to redeem from the foreclosure sale of the Brant Independent Mining Co. The trial court had no authority or evidence upon which to base a decision that the redemption of the Camp Bird Mining Co. was in the interest of the Brandt company, the mortgagor, whose properties, consisting of real estate, mining claims, mining locations, water rights, mill site, office building and furniture, assay offices and instruments, houses, stables, teams and mining and milling machinery, had been sold under foreclosure proceedings.

The only right or authority under which the Camp Bird company claimed a right to redeem the property was an agreement made in May, 1914, between the Brant company, as lessor, and T. R. L. Daughtrey & Co., as lessee. In this agreement the lessor leased to the lessee for the purposes of development and mining the following mining claims: Paonia, Morning Glory, London, Copper Sulphide, Protection, Option No. 1, Option No. 2, Option No. 3, Option Fraction, and Contec Lode, or Winnie Fraction, together with certain real estate and improvements and the ten-stamp mill at Bowerman. The lease was for ten years from Aug. 10, 1914. The lease was assigned to the Camp Bird company.

This agreement was an ordinary mining lease for the purpose of development, the consideration therefor being a royalty of the net profit. There was no conveyance of any interest in the property leased to the lessee. The Camp Bird company was owner of $44,100 of the bonds of the Brant mining company secured by the mortgage which was foreclosed. The total amount of the bonds issued under the mortgage was $87,000. The Camp Bird company was therefore holder of a majority of the bonds, and as such holder demanded foreclosure of the mortgage.

George Hetherington, as trustee, bid the property in for the minority stockholders and bondholders. The Camp Bird company was also a bidder at the sale. It attempted to redeem the properties from the trustee, claiming the right, under its lease, to treat the redemption as having been made by it for the Brant mining company.

The Court of Appeals said there was no evidence that the Brant company ever requested the Camp Bird company to redeem from the sale, and as the right to redeem was a personal privilege, the Brant mining company could not be compelled to exercise it by its lessee. The redemption of the Camp Bird company was in its own interest, and it had no authority under the Colorado statute to act. The trial court was, therefore, directed to enter a decree cancelling the pretended certificate of redemption.

SOUTH DAKOTA

Contract Need Not Be Reciprocal

Transcontinental Petroleum Co. Granted New Trial in Suit Against Inter-Ocean Oil Co.

Judgment for the Interocean Oil Co. in the action brought against it by the Transcontinental Petroleum Co. in the District Court of South Dakota has been reversed and new trial ordered by the Court of Appeals, Eighth Circuit, and a new hearing has been denied the parties.

The action arose out of contract between the parties for the sale by the Transcontinental company of the Republic of Mexico, to the Interocean company, of 1,200,000 bbl. of Mexican crude oil produced in the Panuco oil fields, near Tampico, Mexico. The contract provided that deliveries in any quantity were limited to the actual production of the oil wells owned or controlled by the seller, and that deliveries were to be at the rate of 50,000 bbl. per month from Jan. 1, 1914, to Dec. 31, 1915. The breach of contract claimed was the failure of the buyer and its assignee to take a large part of the oil contracted for. On trial the court gave judgment for the buyer, defendant, who sought to avoid the full obligations of the contract, claiming lack of mutuality in its terms.

The Court of Appeals, in reversing the judgment, said that a sale, where the quantity to be delivered or received is measured by the output or requirements of an established plant or business during a limited time, does not lack mutual obligation. Farther, it held a contract, by a corporation operating twenty oil wells, to sell a stated quantity of crude oil, to be delivered during two years, not invalid for lack of mutual obligation of the parties, because of a provision limiting its obligation to deliver to the production of its wells then owned or afterward acquired during the time. This provision also limits the buyer's obligation to receive such production.

WASHINGTON

Statutes Not Applicable to Exploitation Risks

Josevig-Kennecott Forced To Transfer Stock—Contracts Involving Uncertain Contingency Not Usurious

The United States Court of Appeals has affirmed the decree of the District Court for the Northern Division of the Eastern District of Washington, requiring the Josevig-Kennecott Copper Co. to transfer to the James F. Howarth Co. 260,000 shares of the Copper company's treasury stock.

The controversy arose out of a contract in writing entered into between the Howarth company and George Francis Rowe, therein represented to be the sales manager and fiscal agent of the Copper company, with power to sell 1,000,000 shares of its treasury stock. The Copper company asserted in the suit that it was not informed of this contract until several months after it was executed. Nevertheless, on July 17, 1916, the date of the contract, the Copper company, by its president, wrote to the Scandinavian American Bank, informing it that 1,000,000 shares of the Copper company's treasury stock were deposited with it, and that the bank was authorized to issue to the Howarth company 260,000 shares thereof, and on July 18, 1916, the latter company, together with all the stockholders of the Copper company, entered into a pooling agreement, in which the Howarth company was represented as holding 260,000 shares of the Copper company's stock.

The contract provided that the Howarth company should advance to the Copper company $10,000, "to be used in the exploitation of said copper company," that out of the proceeds of the sale of stock of the company 25c. per share should be set apart for the repayment of the Howarth company, that as additional compensation for services rendered the latter should receive 260,000 shares of the promotion stock, and that if the stock-selling campaign should prove unsuccessful the Copper company should not be obligated to repay the Howarth company the money so advanced.

The Copper company contended that this contract was usurious. But the court said the usury statutes "have no application to those uncertain transactions in which the person who furnishes the money needed incurs risk of losing in whole or in part the principal sum loaned." (39 Cyc. 943.) Here the money was loaned for the exploitation of undeveloped mining property, with the understanding that its repayment depended upon the venture's success.

MEN YOU SHOULD KNOW ABOUT

E. F. Hall is the new superintendent of the mine and mill at Leadville, Nev.

A. W. Newberry has returned to New York on the "S. S. Olympic" after an absence of two months abroad.

Arthur Keith has recovered from his recent illness and has gone to Greenfield, N. H., to do geologic work.

M. J. Gavin, who is in charge of oil shale work for the Bureau of Mines, is in Washington on official business.

Prof. H. H. Stoek is in Washington compiling figures pertaining to accidents in mines.

Charles Butts is studying Mississippian formations in the Frankfort, Ky., area.

E. E. Carpenter, for a number of years manager of the Nevada Wonder, is now in charge of active operations for the Candelaria Mines company.

Raymond Guyer, of New York, recently inspected mines at Ely, Battle Mountain, and Goldfield, Nev., for which he is consulting engineer.

G. B. Richardson will spend a month in Kentucky for the U. S. Geological Survey, collecting statistics on oil production.

John Edwin sailed July 27 for Dutch Guiana, where he will engage in exploration work for the Surinaamsche Bauxite Maatschapij.

F. H. Skeels has been appointed superintendent of the Ramshorn Mine of the Ramshorn Mines Company. The mine is at Bayhorse, Idaho.

H. W. Hardinge sailed for London and the Continent on business matters on the "S. S. Aquitania" July 31. He will return to this country about Oct. 15.

S. K. Bradford, for some time a field man for the West End Consolidated Mining Co., of Tonopah, Nev., is now located in Virginia City, Nev.

H. A. Linke, mining engineer of Salt Lake City, Utah, and **A. G. Burritt** are examining the fossil oil fields of Lincoln County, Wyo., and mapping the district.

H. H. Stoek, professor and head of the department of mining engineering at the University of Illinois, recently received the honorary degree of D.Sc., from the University of Pittsburgh.

Roy H. Elliott, chief engineer for Bulkeley Wells' syndicate, recently made an inspection of his client's Comstock properties, as well as the dredging operation near Dayton.

Arthur Crowfoot, superintendent of concentrators for the Arizona Copper Co., has returned to Morenci, Ariz., from a business visit to Chicago and New York.

Col. M. G. Baker, vice president of the Vanadium Corporation of America, sailed from New York on July 28th for the company's properties in Peru. He may be gone for several months.

Frederick B. Tough, of the U. S. Bureau of Mines, has been appointed supervisor, with headquarters at Denver, to look after matters pertaining to the regulations issued under the Mineral Leasing law.

Walter K. Mallette, a metallurgical engineer who has been in the service of the U. S. Bureau of Mines, has resigned to accept employment in the Cia. Carbonifera de Sabinas, Rosita, Chihuahua, Mex.

James Colquhoun, who some years ago was general manager for the Arizona Copper Co., and who when war broke out in Europe in 1914 was in charge of important mines in Russia for an English company, has just concluded a lengthy visit to Clifton, Ariz.

GEORGE S. RICE

George S. Rice, chief mining engineer of U. S. Bureau of Mines, is visiting the Western experiment stations of that Bureau. His itinerary includes Denver, Col.; Butte, Mont.; Salt Lake City, Utah; Berkeley, Cal., and Seattle, Wash. Mr. Rice will stop at Houghton, Mich., to attend the meeting of the American Institute of Mining Engineers.

T. H. Arnold, who has been in charge of the electrical department at the Arizona Copper Co.'s mines in Clifton-Morenci district, Arizona, has resigned to accept a position with a cement manufacturing company of El Paso, Tex.

Prof. Charles H. Fulton has resigned as professor of metallurgy at the Case School of Applied Science to become head of the mining department at the Missouri School of Mines at Rolla, Mo. Within the last few years Professor Fulton has perfected an electrical resistance furnace for smelting zinc ores.

D. H. Newland, formerly with the New York Geological Survey, has resigned to accept a professional position with Beaver Board Companies, Buffalo, N. Y. Mr. Newland recently examined the properties of the American Cement Plaster Co. taken over by the Beaver Board Companies.

G. E. Goodspeed has rejoined the staff of the Oregon Bureau of Mines for summer field work as mining geologist. He is at present completing a geologic report on the Blue Ledge mine in southern Oregon and will then make ar extensive study of the gold mines in the Cornucopia district of northeastern Oregon.

Robert N. Bell, state mine inspector of Idaho, has formally announced that he will not be a candidate for re-election, and that he will retire to give his attention to the practice of mining geology and engineering. He will maintain an office in Boise. With the close of his present term Mr. Bell will have served as mine inspector sixteen years, continuous with the exception of two years.

T. Nelson Dale, geologist, is the only member of the scientific staff of the U. S. Geological Survey who will retire at an early date under the recent Act for Retirement of Government Employees. Mr. Dale has been for a long period on the geological staff of the Survey, engaged particularly in economic geology studies of building stones. **F. W. Clarke**, chief chemist, and **William H. Dall**, geologist and paleontologist, are both of retirement age, but under the provisions of the act will be retained in active service for an additional period. No members of the scientific staff of the Bureau of Mines is affected by the act of retirement.

H. A. C. Jenison, the geologist who has just taken charge of copper statistics for the U. S. Geological Survey, was born at Roxborough, Ireland. His early education was obtained at the Blackwater preparatory school and at Harrow, England, where he was graduated in 1904. He continued his technical work at both the Universities of California and of Washington. He completed his work at the University of California in 1907, and left immediately for South America, where he entered the services of the Central Chile Copper Co., Ltd. Later he was sent to Ecuador to do copper exploratory work. Late in 1910, he returned to California and was engaged for a year in the copper mines in the northern part of that state. The next year he spent in British Columbia, after which he was engaged for a year at Santa Rosalia, in Lower California, and in the State of Sinaloa, Mexico. The copper industry of Alaska claimed his attention until the war broke out, when he entered the U. S. Army as a second lieutenant. He served in France until retired by severe injuries received in action. He was in the hospital until October, 1919, when he entered the service of the U. S. Geological Survey as an associate mineral geographer. His experience in copper led to his recent appointment.

THE MINING NEWS

LEADING EVENTS

Wide-Spread Strike in Mexico Settled by President

Over 30,000 Men in Mining Camps and Oil Fields Return—40 Per Cent Wage Increase Granted

What promised to be the most disastrous and wide-spread strike in the history of Mexico was settled at least temporarily on July 27 by the intervention of the President of the Republic, who asked the strikers to return at once and abide by the decision of a joint committee to be appointed to go over the whole situation involved. Ten thousand men were out in the oil regions of Tampico; 6,000 men of the A. S. & R. and the Cia de Minerales y Metales at Monterrey; 1,800 of the Mazapil Copper Co.; 5,000 at the Matehuala mines; and about 10,000 in various small mining camps throughout Durango and Chihuahua. As the strike had effected the fuel oil supply another five days would have thrown 300,000 men out of employment in the various mining regions of the country. Upon receipt of a telegraphic request by the President the miners' committees and representatives of the mines got together and a temporary advance of 40 per cent on the average was granted the workers.

The companies still refuse to recognize the unions and are standing out for the open shop. It is understood that the government will bring strong pressure to bear on the companies for a general recognition of the unions. The men are apparently satisfied for the present with the scale of wages that is being paid.

Federal Co.'s Shaft on Russell Claim One-Fourth Completed

Shaft sinking on the Russell claim to prove that the Hecla Mining Co.'s "east" vein apexes within its boundaries is progressing rapidly under the direction of the Federal Mining & Smelting Co., which took over the work from the Marsh Mines Consolidated. The work has reached a depth of 240 ft., the total distance to be sunk on the dip of the vein in following the latter into Hecla ground being about 1,000 ft. A new hoist has been installed by the Federal company, the shaft has been placed in a more workable condition and perfect ventilating facilities have been provided, the necessity for the latter having been tragically demonstrated by the death of three men in the shaft about two months ago through the presence of monoxide gas. The Federal company is the owner of the Russell claim and plaintiff in the case against Hecla.

WEEKLY RÉSUMÉ

A strike in the oil fields and mining camps of Mexico that threatened to become general was settled on July 27, the companies agreeing to a temporary wage increase of 40 per cent. The Democrata Mining Co. at Cananea has shut down owing to high costs. The Vanadium Corporation of America is further increasing its transportation facilities at its mines in Peru and has contracted for another railroad link. The Alaska-Treadwell's first shipment of ore from its claims at Nixon's Fork in the Kuskokwim Valley has reached Tacoma. The Federal Court has decided against the Chicagoff Mining Co. in the suit brought by John Tuppola. Canada Copper is to be reorganized.

In California, mine owners of Amador County have protested against the act of the Pacific Gas & Electric Co. in curtailing its power service. In Montana, Anaconda is reported to be planning to double the capacity of its rod and wire plant. In Utah, a sampling mill of the A. S. & R. Co. was burned at Murray.

Chicagoff Mining Co. Loses Suit in Federal Court

The U. S. Circuit Court of Appeals in Alaska handed down its decision recently awarding John Tuppola two mining claims valued at $500,000 and ordering an accounting for all profits made by the Chicagoff Mining Co., of Alaska, since 1914.

Fraud was charged against the Chicagoff company by Tuppola. He maintained that to gain complete possession of the four claims in which he was joint owner with the company, he was charged with insanity, tried and sentenced to an asylum and that subsequently the claims were sold by a guardian for $1,000. Tuppola was liberated from the asylum in December, 1917, and brought suit in the Alaska court to recover his holdings but was defeated. His victory in the Federal Court gives him possession of two claims near Sitka and one-half interest in the claims held by the defendant.

Judge Ellis, who handled the case for the mining company, states that a rehearing will be asked for. He asserts that the court found no evidence of fraud but that it was simply a matter of law as to the validity of a guardian's sale. W. R. Rust, Hugh C. Wallace, both of Tacoma, are among the principal owners of the company.

Copper Refinery Rumored for Miami District

A story has been given circulation in the Miami district of Arizona to the effect that a copper refinery and an acid plant are to be added to the International Smelting Co.'s plant there. The story was denied at the company's New York office.

Vanadium Corporation To Build Second Railroad Link

Will Supplant Motor Haulage—Construction of Small Power Plant Started—New Ore Located

A contract has been placed by the Vanadium Corporation of America with the Foundation Company for a railroad in Peru over the 25-kilometer stretch between Casa Laguna on Lake Pun Run and the Cerro de Pasco railroad at Ricran. Only recently a motor highway was completed between these points, making the use of llamas for transporting ore unnecessary. It is expected that the saving made by employing rail transportation instead of motor haulage from the lake to Ricran will be considerable. The new line, to be ready early in 1921, will give the company rail or water transportation all the way from its mines to this country. A narrow-gage road between the mines at Minas Ragra and the bluff overlooking Jumasha on the shore of the lake was completed a few months ago.

Construction of a 500-hp. hydro-electric plant on the Jumasha River between the mines and Lake Pun Run has been started. This will supply power for the mines and for diamond drilling. Recent drilling operations indicate the existence of another extensive body of vanadium ore lying some distance below the one already known.

At present the mine waters are carrying considerable vanadium ore into the lake where a deposit is building up at the point of discharge. Steps will be taken to recover this, though the method to be employed has not been announced. It is believed that the saving from this item alone will amount to about a quarter million dollars a year.

Ore from Alaska-Treadwell Co.'s Nixon Claims Reaches Tacoma

The motor schooner "Ozmo" arrived recently at the A. S. & R. smelter at Tacoma, Wash., with the first shipment of gold ore from the Alaska Treadwell's property near Nixon, Alaska, 60 miles from McGrath on the Kuskokwim River district. The ore was carried down the Kuskokwim River in small boats and loaded abroad the motor schooner at Bethel. It is stated that development work on this group of mining claims is proving decidedly encouraging and additional equipment is being ordered to supplement mining work. These are the claims on which an option was secured for the company last summer by Livingston Wernecke, geologist for the Alaska-Treadwell, while he was on a scouting trip.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Claims for War Minerals Relief Often Obviously Unjustified

In analyzing the claims disallowed by the War Minerals Relief Commission, it is surprising to note the number of claims made where it should have been obvious that the claimant had no case. For example, one claimant admits, in his questionnaire, that he had made a profit of over $70,000 in mining and shipping ore from his property but nevertheless he put in a claim of $1,700 for ore which remained in his hands unsold at the time of the armistice. Since he suffered no net loss, the claim naturally was disallowed upon examination by the commission.

In the accompanying illustrations is shown the plant of the Chestatee Pyrite & Chemical Corporation, at Chestatee, Ga., discussion of whose claim for a large sum occupied so much of the time of the House Committee on Mines and Mining during the last session of Congress. The Chestatee company was awarded a fraction of its claim, which it accepted under protest.

Awards were recommended by the War Minerals Relief Commission during the week ended July 24, as follows (the name of the claimant, the mineral, the amount recommended and its percentage relationship to the amount claimed are shown): P. H. Bray, manganese, $1,404.03, 14 per cent; Western Rock Properties Co., manganese, $14,-106.80, 24 per cent; Liberty Chrome Mines, chrome, $778,46, 34 per cent; Lydia Blakemore, manganese, $639.30, 36 per cent; Pacific Tungsten Co., tungsten, $92,590.01, 21 per cent; Butte Central Mining & Milling Co., manganese, $42,457.50, 24 per cent; Mrs. Ruth A. Scurlock, manganese and chrome, $1,456.77, 60 per cent.

Increased Freight Rates Hit Low-Grade Ores

Commission Holds Exceptions to General Percentage Increase Not Warranted Now

No exceptions were made of low-grade ores by the Interstate Commerce Commission in ordering its general percentage increases of freight rates. In that connection, the commission said in handing down its opinion:

"In some of the western states there is a considerable movement of low-grade ores, some of which are valued at $5 per ton or less. Shippers of these low-grade ores contend that further increases in the rates thereon will result in curtailing or destroying their movement. The evidence before us in this proceeding, however, does not warrant exceptions to the general percentage increases at this time."

NO CLAIM FOR RELIEF UNDER THE WAR MINERALS ACT HAS ATTRACTED SO MUCH ATTENTION AS THAT MADE BY THE CHESTATEE PYRITE & CHEMICAL CORPORATION, OF CHESTATEE, GA., VIEWS OF WHOSE PROPERTY ARE SHOWN HERE. 1. GENERAL VIEW OF MILL. 2. ADIT AT NO. 1 LEVEL. 3. RACEWAY, LOOKING TOWARD POWER HOUSE. 4. FORGE AND MACHINE SHOPS, LOOKING WEST

With regard to iron ore, the commission's opinion reads:

"A considerable proportion of the iron ore consumed in the United States originates on ranges in Minnesota and Michigan near the head of Lake Superior. This ore moves to furnaces on Lake Michigan and Lake Superior; to furnaces on Lake Erie and in Pennsylvania, Ohio, and other states. The movement is by rail to the upper lake ports, and when destined beyond, by lake vessels to the lower lake ports.

"Because of the keenly competitive situation between the respective furnaces, the Director General adopted a specific increase of 30c. per ton upon iron ore in lieu of a percentage, which was applied to the movement from the Michigan and Minnesota ranges to the upper lake ports, but not from lower lake ports to eastern destinations, thus resulting in an equal increase in cents per ton for the rail transportation to each of the competing furnaces. Under this plan the rates of the western carriers up to the lake ports were increased approximately 57 per cent, whereas the rates of the eastern carriers from the lower lake ports were not increased.

"In this proceeding the eastern carriers propose first to apply an increase of 22c. per ton and then impose thereon the general percentage increase. The testimony of ore shippers is conflicting, some proposing no further increases from the ranges to the lake ports, some favoring double increase in the rates from the lower lake ports, others proposing no exceptions to the general percentage increases proposed on traffic generally.

"The returns made by the principal ore-carrying roads from the Minnesota ranges to Lake Superior ports indicate that such lines are in a much more prosperous condition than the western carriers generally.

"It is concluded that at this time no increases should be made in the rates on iron ore from the Minnesota or Michigan ranges to Lake Superior or upper Lake Michigan ports. Other rates on iron ore may be increased according to the percentages herein approved."

Survey Defines Meaning of "Ore"

With a considerable portion of the gold ore extracted at the present time resulting in a loss to the operators, special significance attaches to the definition of "ore." The generally accepted definition implies that ore is a mineral or an aggregate of minerals from which one or more metals can be extracted at a profit. So far as the U. S. Geological Survey's statistical reports are concerned, the term "ore" will be held to mean minerals or aggregates of minerals containing one or more metals which have been shipped to treatment plants and for which the miner has received payment regardless as to whether or not the receipts cover the cost of mining and reduction. This applies to placer gold as well.

The Survey's records show that there are numerous cases where minerals have been extracted during the last year at a loss, but the operators have found it more economical in the long run to keep their properties in operation.

Federal Reserve Board Summarizes Industrial Conditions

Commenting on metal mining conditions during July, the Federal Reserve Board's summary of business conditions says:

"Metal mining conditions during the month have not been uniform. In District No. 10 (Kansas City) the half-year period ending June 30 shows an increase in the value of lead and zinc shipments over 1919 in spite of adverse productive conditions. Shipments of zinc ores declined during June and there was a tendency to decline both in price and volume of shipments of zinc. Metal mining in Colorado has suffered from a shortage of labor."

Nevada Gold Mining Continuing in Spite of Conditions

F. S. Schrader, of Geological Survey, Reports on Activity of Jarbidge and Other Districts

Gold mining operations are far from being at a standstill in Nevada, according to F. C. Schrader, of the U. S. Geological Survey, who just has completed a visit to several of the camps in that state. He is particularly impressed with the activity being displayed in the Jarbidge district. This district produced more gold in 1919 than did any other camp in Nevada and has produced more of the metal thus far in 1920 than it did during the corresponding months in 1919.

One of the distinct assets of the district, Mr. Schrader reports, is its cheap power, which is secured from the Thousand Springs Power Co., near Buhl, Idaho. Ample power is available at the Idaho state rate. A new power line has just been run into the district. Much development work is being done and a number of new veins are being opened. The principal companies operating the districts are the El Koro Mining Co., the Jarbidge-Buhl Mining Co. and the New York-Jarbidge Mining Co. In addition, there are a number of other companies working on a smaller scale.

In the Rawhide and Rand districts, only the higher grade gold ores are being worked, but Mr. Schrader found everyone taking a hopeful view of the situation. He also visited the new Broken Hills district, which is located near Rawhide in the outskirts of the Carson Sink region. He finds that the district has good surface showings of silver. The deepest working at the time of his visit was not lower than 150 ft. but the indications at that depth he regards as very favorable. There is good ore continuing from the surface to that depth. Sulphides begin at the 100-ft. level. The camp is dry. Water must be hauled fifteen miles across desert country.

NEWS BY MINING DISTRICTS

MEXICO

Sonora

Democrata Company Shuts Down—Calumet & Sonora Planning Changes in Mill

La Cananea—The Democrata Mining Co. at Cananea is closing down owing to the high cost of materials and labor. The smelter will be operated until all coke on hand has been used. There will probably be enough to keep its one furnace running until about the middle of August. The mine pumps will be pulled and the plant completely shut down. This property has been a small but consistent producer since 1912, operations having been suspended in 1917 when its new power plant was under construction. About 5,000,000 lb. of copper has been produced on the average for the last several years. The smelter has three blast furnaces and a converter. The mine will not be reopened until there is a more satisfactory price for copper. For some time operations have been extensively curtailed. At present about 300 men are being employed. The property is owned by C. E. Hoffman.

H. S. MacKay, superintendent of the Democrata Mining Co., has been appointed consulting engineer for the Calumet & Sonora Mining Co. Considerable development work has been planned at this property. The main shaft will be sunk below the 700 level and the Catalina shaft will be reopened. Certain changes in the mill will also be made.

The mine is producing about 300 tons of lead-zinc-copper ore. A lead concentrate and a copper-zinc concentrate are being made in the gravity mill. The copper-zinc concentrate is treated in an electrostatic mill which produces a clean copper and a zinc concentrate. The copper concentrate is shipped to the Cananea Consolidated Copper Co.'s smelter and the zinc is exported to the United States.

Mexico

Mexico City—In order to encourage a resumption of mining among the smaller owners, or at least induce small owners to resume payment of taxes, the government has issued a decree rescinding all previous decrees confiscating properties for failure to pay taxes, and will permit owners to make payment of back taxes on easy installments. The text of this decree was published in the last issue of *Engineering and Mining Journal*. The government was also induced to take this step as in many parts of the country mining records have been completely destroyed and the mining offices have no way of checking up ownership except where the owners voluntarily present themselves for tax payments. The decree has been well received and will probably be the means of getting several thousand mines on the rolls which have been dodging their taxes up to the present. More than three-fourths of the mine owners have not paid taxes in years, partly because of the unsettled conditions of the country, and partly because of extraordinary decrees and laws which discouraged many from a resumption of work.

ALABAMA

Woodward Company's Bessemer Mines Again Producing Regularly—Cars for Finished Products Scarce

Birmingham—The Woodward Iron Co. is again getting its regular supply of ore from its mines in the Bessemer district, Red Mountain, 12 miles south of Birmingham, where fire recently destroyed the boiler house, including machinery on which mine operations depended. The company has four blast furnaces in operation and a steady production of ore is necessary.

The operations of the Tennessee Coal, Iron & Railroad Co. on Red Mountain, between Birmingham and Bessemer, at Wenonah, Fossill and other points, are progressing steadily. Labor is being brought in and made as comfortable as possible. Electric lights, improved water service, better housing, schools and other improvements are being provided. Practically all the labor at the mines is colored.

The development of the deep-ore mining project of the Gulf States Steel Co., at Shannon, about 8 miles south of Birmingham, is being pushed and before January 1 it is expected there will be a production sufficient for present needs of the company and more. The company is at present getting ore from the Crudup mines, in Etowah County and elsewhere. Needs range between 750 and 800 tons daily. The ore that is to come from the Shannon mines will be of higher grade than that now used. At the Shannon the slope has reached the ore and an entry started. The slope has been concreted. Expectations are that within a year the daily output will be double the amount needed and that some may be offered on the open market.

Ore properties over the Alabama line in Georgia and in northern Alabama are being inspected with a view to development before long. Some negotiations are reported to be under way for the Trussville and Rome (Ga.) furnace propositions for which ore will be absolutely necessary.

Although there is dire need for railroad equipment with which to move finished products, pig iron, steel and steel shapes, there is but a slight interference in the intra-district haulage, the cars in the ore region not being very difficult to obtain, though a different kind is used in hauling ore. One or two of the pig iron companies in the Birmingham district have purchased railroad equipment for transporting ore to furnaces. Thousands of tons of pig iron and steel are to be seen in yards of the district, the railroads being unable to move them.

It has been announced that when the full equipment on the Warrior River is in service, in about 60 days, there will be steady shipments of Chilean ores from Mobile to the Birmingham district, providing a fairly good up-river traffic. As it is now there is very little or nothing coming up stream. Coal, steel shapes, lumber and other products in quantity are being shipped down river. The Chilean ores are being used in several industries of this district, at the manganese plant at Anniston in particular.

PLANT OF JEROME SUPERIOR COPPER CO., JEROME, ARIZ.

ARIZONA

Jerome Verde Planning for Further Development—Electrifying Jerome Superior's Surface Plant Completely

Jerome—The Jerome Verde is planning to raise funds for extensive development in the Main Top shear zone. It is considered important that development be continued on the 1,200-ft. level, which is 100 ft. deeper than any other working place and within a few hundred feet of the best ore shoots on the 1,100-ft. level. A failure of the present plan would endanger the rights of stockholders, for funds are insufficient to meet expenses of long idleness. H. P. Henderson is consulting engineer and John B. Harper manager.

Hopewell—Jerome Superior's surface plant is being electrified throughout. An additional compressor with a capacity of 1,125 cu.ft. per min. is to be installed, with a 200-hp. motor to drive it. A 75-hp. motor is being added to the hoisting equipment. This will increase the hoisting speed from 300 to 450 ft. per min. The shaft is down 860 ft. and will be sunk to 1,000 ft., at which level additional lateral work will be started. As the shaft gains in depth, the flow of water steadily increases. A new pump for the 1,000-ft. level has been delivered. A water softening plant will be installed. George Mitchell is general manager.

CALIFORNIA

Amador County Operators Protest Against Power Curtailment—Alta-California Discovers Old Channel

Sutter Creek—Drifting from the 3,850-ft. level of the main shaft of the Central Eureka has begun, and all efforts will be concentrated on opening several orebodies thought to lie within 50 ft. of the shaft. The mill continues to crush ore and the output is normal.

The Amador Queen has been taken under lease for 16 months by M. F. Thomas and preliminary work begun. The lease carries a nominal rental and a 25-per cent royalty on the gross output of gold.

The mine owners of Amador County have filed vigorous protests against the curtailment of electric power by the Pacific Gas & Electric Co. The delivery of power to the mines has been cut one-half and the companies forced to work with only night shifts. The action of the power company means a serious curtailment of gold production and increases the cost per ton of ore mined.

Marysville—Ten dredges are operating in the Yuba River field. They are owned by the Yuba Consolidated and

the Marysville companies and represent an investment of over two million dollars.

Grass Valley—The Alta-California company, operating in the Rough and Ready district about four miles below Grass Valley, has reported the discovery of the once famous Alta gravel channel. It is stated that the opposite rim of the channel remains untouched, although drifts have advanced 130 ft. from the point where the first rim was cut.

Alleghany—An option has been taken by the Alleghany Mining Co. on the bond held on the Gold Canyon group by W. H. Griffith. The shaft below the tunnel has been dewatered and preparations are being made to deepen it by sinking several hundred feet below the present point.

The Belmont property will install a small quartz mill soon. The vein is 12 to 18 in. wide, and considerable tonnage is in sight. The ore contains much free gold.

Portola—The Walker Mining Co., controlled by Anaconda, has under way a number of improvements which will materially cut production costs. The new tramway connecting the company's mill with Spring Garden, a station on the Western Pacific, will be completed in August and will do away with hauling concentrates and ore over almost impassable roads. The mill is 6,085 ft. high, Spring Garden 3,970, and the high point where the tramway goes over the mountain is 7,460 ft. Electric haulage is also being installed in the lower tunnel, bigger bunk- and cookhouses and homes for married employees are being built. A large tailings dam is being constructed. The company's saw mill is running steadily and over 200 men are employed on all operations. Complete details regarding the new tramway have already been published in a previous issue of the *Engineering and Mining Journal*.

The mine is opened up on three levels from the shaft, the deepest being 380 ft., but it is planned to do most of the future work through the tunnel that gains a depth on the vein of 1,000 ft. below the collar. The values on the tunnel level are about the same as on the 380. The orebody has been proved for 1,100 ft. north of the shaft and 1,600 ft. south. The tunnel is in about 4,750 ft. and a raise is being put up to connect with the fourth level. After this connection is made all ore will be dropped through the raise and run to the mill at the portal of the tunnel. Although a large tonnage has been developed in the mine workings and by diamond drilling, the vein has not been prospected southeast of the point where it was cut by the tunnel.

The Walker company's flotation mill is treating an average of 200 tons per day, but with improvements under way it is expected to handle about 275 tons daily. A high recovery is being made. V. A. Hart has directed operations since the Walker was first taken under option by Anaconda.

COLORADO

Smuggler-Union's Flotation Capacity Temporarily 400 Tons Per Day—Royal Tiger Mill Running

Ophir Loop—The Silver Bell property has been reopened and development work is being done under contract on two levels. Frank E. Trumble is manager.

Telluride—The Smuggler Union is installing enough flotation units to take care of 400 tons of ore per day. This will be the temporary capacity of the plant until additional equipment is delivered. The new office building, replacing the one recently destroyed by fire, is completed and in use.

Eldora — The Consolidated Leasing Co. has completed its mill, which will soon be running two shifts. C. E. Kahler is president and general manager.

Breckenridge—The Germania property on Little Mountain is being developed by lessees. Ore carrying 1 oz. gold per ton and some silver has been opened. Three carloads have been shipped recently to the Arkansas Valley smelter at Leadville.

The Missouri property on Shock Hill is being developed by George Robinson and associates. An electric hoist has been installed and shaft sinking resumed. The shaft will be sunk to the blanket vein of lead "sand carbonate" ore, which has been opened in the neighboring Iron Mask mine at a depth of 175 ft.

The Iron Mask is being operated under lease by Ostrom & Tillett. Raises from the main tunnel have opened a shoot of lead carbonate ore. The ore produced is being held temporarily in the hope that the silver market will improve. The pumps are handling about 500 gal. per min.

The Jessie property is being developed under the management of George Roth, with J. C. Warnecke as mine superintendent. Zinc-lead ore, carrying gold and silver, has been opened, and the concentration and amalgamation mill is in operation, with 20 of the 40 stamps dropping. The lead-zinc concentrate is shipped to Denver.

Tiger—The Royal Tiger property is being developed under the management of John A. Traylor. Several new buildings have been erected recently, and the small concentrating mill is in operation. The company has purchased the Cashier property, and a crosscut is being driven to cut the Cashier vein at a point several hundred feet below the old workings.

Idaho Springs—The Gem Mining Co. now owns the Gem Mines, the Freighters Friend property, the Newton mill, and the Gem electric plant and steam power plant. The Franklin Mines and the Silver Age Mines, owned by the Consolidated Franklin Mines Co., together with the Gem properties, will be operated by the Gem Mining Co., financed by a new syndicate, with the following officers: W. E. Renshaw, president; Sir Henry M. Pellett, chairman of the board; R. B. Lamb, consulting engineer; B. W. W. McDougall, general superintendent; and George C. Cochrane, mine superintendent. Capital has been provided for extensive development. The Gem shaft is being retimbered preparatory to resuming active operations.

Boulder—The Tungsten Products Co. is erecting a plant for treating radium ores from its property at Gateway, Col.

Rico—Shipments from the Rico Wellington have been resumed, two cars of $40 ore going out every thirty days. The ore is coming from the body found early this year. Shipments were suspended temporarily when the railroad was washed out.

IDAHO

Omaha Co.'s Compressor Plant Burned—Sabina Mines Co. Reorganized—Big Creek Building Long Flume

Wallace—Lightning struck the compressor building of the Omaha Mining Co. during a storm on July 18 and was followed by a fire which destroyed the building which contained the dry room and blacksmith shop, the loss being about $5,000. August Paulsen, one of the owners of the Hercules, is the owner of the Omaha. The plant will be rebuilt at once.

The Sabina Mines Co. is the name of a new corporation which succeeds the Sabina Mining & Milling Co. Certain shares of the old company were issued under agreement that they should be non-assessable and a test case in the district court sustained the agreement. The company being confronted with the necessity of levying assessments as the only means of providing funds for performing annual assessment work on eleven claims and otherwise developing the property, decided by a vote of stockholders representing more than two-thirds of the issued stock to organize a new company on an assessable basis which has taken over the entire holdings of the old. The party holding the non-assessable stock protested against the action and is expected to appeal to the court again.

The Big Creek Mining Co., which has been enjoined from discharging water containing slime and tailings from its mill into the creek from which the people of Kellogg receive their domestic supply of water, is building a flume that will convey all water and tailings from the mill to a point sufficiently removed from the creek to prevent anything foul reaching it. The injunction was issued by the district court upon application of the city of Kellogg and the Kellogg Power & Water Co.

The problem of separating the lead and zinc in the ores of the Coeur d'Alene district of Idaho and of making a closer recovery of both minerals has for over two years engaged the attention of the experiment station of the bureau of mines maintained in connec-

tion with the University of Idaho at Moscow. Much progress has been made in solving the problem in the laboratory and the process evolved is now being given practical tests in the mills of the Coeur d'Alene district under the personal direction of A. W. Fahrenwald, superintendent of the Moscow station.

The results of practical demonstration have so far proved satisfactory upon the same character of ore as that used in the laboratory tests, but as the lead-zinc ores differ in the various mines of the district and even in the same mine, much experimental work remains to be done to adapt the process to the varying conditions. However, the main problem seems to have been solved, and there appears to be little doubt but that the process can be adapted to the various classes of lead-zinc ores.

Mr. Fahrenwald has devised a flotation machine which has been in successful use in making laboratory tests in flotation. He will give practical demonstrations of the machine in connection with the present work in this district.

MINNESOTA

Mesabi Range

Assessed Valuations Increased in Chisholm District—Oliver Iron Building Houses at Leonidas Mine

Hibbing—Mahoning Ore & Steel Co. is conducting stripping operations along the north bank of the Mahoning pit using the new all-steel 30-yd. dump cars. The Oliver company has made the first shipment from the new Sweeny mine, an underground property with an estimated tonnage of 1,846,000 tons mixed bessemer and non-bessemer.

The office of the State Auditor announces that shipments from state mines this year will probably exceed those of last year. To July 17 the total shipments were 2,144,002 tons, of which 1,017,360 tons was shipped from the Missabe Mountain pit at Virginia.

Chisholm—The assessed valuation of mining property of the Oliver Iron Mining Co., in this district has been increased $7,400,000 by the local board of equalization. Increases were made in personal property amounting to $640,000 the principal items covered being location houses, warehouse supplies and mining timber. Increased valuations of stockpiles amounted to $1,500,000, the rest covering unmined ore. Other mining interests in the district have fared proportionately. It is understood that the local board is encroaching on the jurisdiction of the state tax commission and that the matter will be carried before that body.

The new Wellington shaft of the Oliver company is bottomed at 208 ft. The station for the main level has been cut at 170 ft.

Buhl—A factory expert has arrived at Buhl to take charge of erecting the new 300-ton electric shovel to be used in stripping the Wabigon mine of the Hanna Ore Mining Co. The base of the shovel has arrived and the rest is en route.

Shipments have started from the stockpile of the Frantz mine.

The Fort Henry Mining Co. is sinking an auxiliary timbered shaft at the Woodbridge mine.

Eveleth — The Oliver company is breaking ground at the Leonidas mine for 25 new houses, which have been planned for some time. One duplex, one triplex and 23 four-, five- and six-room dwellings are included. It is expected that many will be ready by winter.

Cuyuna Range

Trommald — The surface equipment and buildings of the Ferro mine of the Onahman Iron Co., at Trommald, were brought at the sheriff's sale on July 10 by the Gorham-Garbett Co., of Minneapolis, for $15,156.86. The latter company owns the fee of the property and was the only bidder.

Crosby — Shipping from the stockpile of the Croft, a John A. Savage property at Crosby, has been started and is proceeding at the rate of 60 cars per day.

Superior — It is reported that the Soo line is planning the construction of a steel and concrete ore dock at Superior to handle Cuyuna Range shipments and to replace the wooden dock now in use.

The Ida Mae mine of the Cuyuna-Minneapolis Iron Co. pulled its pumps on July 17, and allowed the mine to fill with water. This property was opened by the Merritt interests during the war, and had just started production when the armistice was signed. It remained closed during the winter of 1918-1919, and was opened last summer, a reorganization of the company's finances having been effected. Development on a small scale was carried on through the winter, but nothing but pumping has been done since March. The mine has a stockpile of about 18,000 tons of a good grade of manganiferous iron ore, low in manganese and silica. Inability to sell the product is given as a reason for the shutdown.

LOWERING HEAVY MACHINERY INTO SHENANGO PIT, CHISHOLM, MINN., TO BE USED IN CLEANING UP ORE

MISSOURI

St. Joseph Lead Co. Buys Jake Day Tract—American Metal May Re-enter St. Francois County

Leadwood—The Jake Day tract, near Leadwood, in St. Francois County, has been sold by the Baker Lead Co., of Boston, to the St. Joseph Lead Co. This property contains 357 acres, and was purchased ten years ago by the Boston interests for $357,000, or at the rate of $1,000 per acre, which at that time was regarded as a good price for a tract that had been repeatedly diamond drilled by all the large companies in the district and turned down every time. The first time the property was taken under option and drilled by the St. Joseph company, about 25 years ago, the price was only $100 per acre. The Baker company sunk one shaft on the tract on the edge of Big River that was about 400 ft. deep, but were not financially able to build a mill. From 300 to 500 tons of ore was mined daily for several years, and was hauled 12 miles over the M. R. & B. T. R.R. at an expense of 25c. per ton to the mill of the National Lead Co., where it was milled for 75c. per ton. The ore ran 7 to 10 per cent in lead by actual sampling and assay, under selection, and was decidedly profitable, in spite of this excessive burden of $1 per ton for milling and freight.

The St. Joseph Lead Co. has surrendered its option on the tract it recently drilled in Crawford County and has shipped its drills to Bonne Terre.

Interests connected with the American Metal Co. are examining several tracts in St. Francois County, as they desire to re-enter this district, where they formerly owned the Columbia property, which they later sold to the Doe Run company.

Pottersville — The discovery is reported of zinc ore of good grade on the farm of J. D. Ellison at Pottersville.

MONTANA

Anaconda Considering Doubling Capacity of Rod and Wire Plant—Potomac Mines To Have Rail Facilities

Butte—A program for doubling the capacity of the rod and wire plant at Great Falls, Mont., is said to be receiving consideration by Anaconda officials. This department has proved particularly profitable in the last two years and has been operated practically at capacity. Headway is being made in connection with the company's plans for working phosphate ground near Soda Springs, Idaho.

A second vein has been opened by the Davis-Daly on the 2,700-ft. level of the Colorado mine showing, it is said, 9 ft. of 6 per cent ore. It is believed to be a branch vein and not the No. 2 fissure, the objective of the cross cut on this level.

Sinking is progressing at a good rate at the Plutus shaft of the Butte & Plutus company, with three shifts at work.

Production has been maintained by North Butte at about the rate of about 2,000,000 lb. of copper per month since July 1, which shows practically full recovery from the effects of the I. W. W. strike in April.

Barnes-King's oil-drilling operations at the Kansas-Montana well in the Winifred district, in which the company is interested, are being delayed by a buckle in the casing. Bullion production for June decreased from that of May.

Shaft sinking has been started by the Roberts Minerals Co. on the Roberts claim, 3½ miles north-east of Butte and is down about 35 ft.

Electric power has been installed at the Honolulu and driving of the tunnel will be resumed. About two feet of ore has been cut.

Six mines only still hold a 100-per cent record in the Safety-First contest being held in the Butte district. An "ax-i-dent" meter daily registers the mines which have been free from accidents of any character.

Potomac District—It has been announced by the C. M. & St. P. that it will construct a line from Black Foot to Clearwater. This will bring the Potomac mines close to rail facilities which have been sadly lacking. Crosscutting for the Leonard veins and the Copper Cliff is still in progress.

Elkhorn—At the Boston & Montana the drift is now in the Blue Jay vein for nearly 500 ft. with milling ore continuing all the way and showing a width of more than 6 ft. Further development on the 1,000 level of the Idanha has been suspended. Ballasting of the Montana Southern railway has been completed.

Neihart—The state has instituted suit to prevent the Cascade company from dumping the tailings from its concentrator into a nearby stream on the grounds that it pollutes the water, killing fish and fouling the water.

NEVADA

Round Mountain Company Not To Close Down—Arrowhead Consolidated Pushing Development

Tonopah—Bullion shipments to date indicate a gross production of the district for July of about $500,000. Labor conditions are fair but there is still a shortage of steady men in the camp. The supply of men is adequate to operate all mines to capacity but the condition exists of intermittent working, which is probably due to the prevailing high wages of the district.

The Tonopah Extension company is making fair headway in sinking the Victor shaft from the 1,760 to the 1,880 level. The flow of water impedes operations to a certain extent but pumping equipment is adequate to handle even an increased flow of water. Cleaning up the old workings from the bottom level of the McCane shaft is progressing and it is hoped that within a short time actual development work can be started from this shaft. Tonnage for the last week was 1,550 tons. Development and stoping were satisfactory on the Murray and Merger veins from the 1,350, 1,540, 1,680, and 1,760 levels; and some ore was stoped from the Lower Contact vein.

The Tonopah Mining Co. reports no new developments of importance, tonnage of ore mined being normal and developments satisfactory. This company is making a determined effort to acquire new and promising prospects and is doing preliminary work on several prospects throughout the state.

Development by the West End company on the West End, Ohio and Footwall veins continues favorable, and the mill is operating to capacity on West End, Jim Butler Lease, and Halifax ore. Shipments from the West End mine totaled 1,300 tons for last week. The profit for June is announced as $43,124.42, from 4,425 tons of mine ore and 534 tons of Jim Butler lease ore. Prospecting in the Tonopah "76" ground, being done by the West End company under agreement with the "76" company, from the 800 level of the Ohio shaft, continues in favorable formation. Progress in "76" ground for June is given as 114 ft.

The Belmont tonnage is normal and development continues to prove large tonnage of mill ore both in the vicinity of old stopes, in hanging and foot-wall of the veins, and in new blocks. Narrow veins furnish grade and mine conditions are good. Bullion shipments for the first half of July are given as $83,600.

OLD SURFACE PLANT OF TONOPAH MINING CO. OF NEVADA, TONOPAH, NEV

Tonopah Divide—In the Tonopah Divide mine regular development is under way on the 1st, 3rd and 5th levels, with shaft sinking making good progress. Developments are encouraging and it is stated that the major portion of the 30 tons per day being shipped to the MacNamara mill in Tonopah is coming from development. Many smaller companies in both the Divide and West Divide districts are operating with no new strikes of importance reported.

Arrowhead—Crosscutting on the 300 level of the Arrowhead mine is being done and it is reported unofficially that ore of good grade has been encountered. Details are lacking. Favorable developments are reported in the Arrowhead Consolidated and work is being vigorously prosecuted.

Round Mountain—In spite of rumors to the contrary it has been officially announced that the Round Mountain Mining Co., operating at Round Mountain, has no intention of closing down its hydraulic and lode mines. The hydraulic season is over for this year and

gravel worked this season averaged about $1 per yd., the scale of operation having been about the same as in the previous year. Preparations are being made for impounding more surplus water which will mean a longer period of hydraulic operation during the coming year. The company has plenty of proved ground available for several years, with large areas not yet drilled.

The lode mine is being worked on a small scale only, selective mining being followed. It was not deemed possible to mine a large tonnage of the low-grade ore at a profit under existing conditions, so no increase in tonnage is anticipated at the present time. Gold is the major product, and like all gold mines this property is handicapped by the increased cost of production without a compensating increase in the price of its product. Relief by Governmental action has not yet materialized.

Rand District—There is considerable activity in the Rand district, formerly known as Bovard in the days of the Rawhide boom. For two months the Gold Pen Mines Co. has been operating a Kincaid mill, with a Senn pan amalgamator, treating 10 tons every 24 hours. The water for the mill is hauled 8 miles in trucks, 100 gal. per ton of ore being required. The mine is developed to the 250 level, and there is said to be a good tonnage of mill ore in sight in addition to the higher grade now being treated.

Hughes & Crabtree have made a promising find midway between the Gold Pen and the Walker Bros. ground. Eight feet on the surface averages $6.50 per ton.

Yerington—A transmission line from the high-tension line between the Bluestone mine and the Thompson smelter is being put in by the Walker River Copper Co. to its property opposite Yerington. The company has just completed a 50-ton experimental plant but will have enough power to operate the larger mill that it expects to erect eventually, as well as for more equipment at the mine.

Talapoosa—The camp at the Talapoosa is being moved to a point close to the main workings. It is planned to sink an old prospect shaft, now down 60 ft., to a depth of 300 and then crosscut to prospect the ground thoroughly on this level.

Barcelona — Work has been suspended at the Cons. Spanish Belt mine at Barcelona, near Manhattan, until the power transmission line to the property is completed, which will be several weeks. Hand work was proving too costly, according to the management. E. J. Schrader, superintendent, is now in the East.

Mina—A body of silver-lead-zinc ore has been drifted on for more than 50 ft. on the 350-ft. level of the Simon Contact property.

Contractors sinking the shaft on the Fagan Consolidated an additional 200 ft. have completed the first 100 ft. of the work.

NEW MEXICO

Manganese Mining Active in Little Floridas—Romaho Co. Installing Diesel Engine

Deming—There is considerable activity in the manganese field about 14 miles southeast in the Little Florida Mountains. The Humphreys lease on the Warren-Hoagland property, in charge of C. B. Allen, is working 15 men. The ground is opened in fair shape for production. One shaft, 100 ft. deep, three tunnels, 120, 100 and 40 ft. respectively, and a number of shallow pits, all of which show ore, constitute the development. An average of this ore shows 47.80 per cent Mn and 2.50 per cent SiO_2.

The Wayne Whitehill property, which is undoubtedly an extension of one of the Warren veins, shows about 4 ft. in width of solid ore. The opening is about 20 ft. long but of shallow depth. The Jim Finch property has an inclined shaft down about 40 ft., showing about 2 ft. of good ore. About a half car of sorted ore is on the dump at present. W. J. Summerville of El Paso has recently purchased a half interest in this property.

The New Mexico Metals Exploitation Co., of Santa Rita, N. M., has started to open up what seems to be the northeastern extension of the McClure & Hoagland manganese claims, high up on the easterly side of the Little Floridas. Superintendent Davis reports a 2½-ft. vein of high-grade ore showing upon the surface and traceable for three chains in length.

The ores from this district are shipped from Mesie station on the main line of the Southern Pacific, where the ore loading platform has been enlarged to take care of this tonnage. The distance is about 6 miles with good roads.

Gage—The Victor Mining & Smelting Co. has made a new strike of good lead-silver ore on the Wyman-Corbett property, which it is working under a lease and bond. This is one of the old Haggin & Hearst properties worked extensively during the '80s. Dr. Duryea and associates of New York are the principal stockholders. Norman T. Welch is superintendent.

The Gage Mining Co. has given up its lease on the old W. L. Bradley property and will retire from the district.

Columbus—The Romaho Mining Co. will finish timbering the Waterloo shaft to the 100-ft. level by August 7. A 50-hp. hoist is being installed and a 500-cu. ft. compressor will be purchased at once. A 50-hp. Diesel engine is now at Columbus ready to be hauled to the property.

OREGON

War Eagle Company To Erect 30-Ton Mercury Furnace

Gold Hill—The War Eagle Mining Co., of Medford, Ore., with the Utah group of quicksilver mines, 12 miles north of Gold Hill, has let a contract to W. H. Stickel, of Gold Hill, to burn 300,000 brick at the mines to be used in constructing a 30-ton Scott mercury furnace. The company has also acquired a right from the state to take two second feet of water from Morrison Creek, which will require two miles of 8-in. pipe, to be constructed by Oct. 1.

It is reported that the Chisholm group, adjoining the Utah group, will soon change hands and that a Scott furnace will be erected. This property is equipped with a pipe-type furnace, and has been worked in a crude way since 1878.

The Force group, adjoining, which is also equipped with the pipe-type furnace, has developed sufficient ore to justify a furnace of larger capacity. These properties have been operating only on cinnabar ore running better than 15 per cent mercury and dumping lower grade for future reduction.

UTAH

A. S. & R. Loses Sample Mill at Murray by Fire—Tintic Delaware Wins Suit Against S. L. F. & K. Railroad

Bingham Canyon—The Utah-Apex is successfully using the contract system in working some of its orebodies. The men are paid for the amount of work done, receiving from the company all necessary materials, power and powder. There are 285 men working at the property.

The old New England mine, owned by the Utah-Boston Development Co., is being reopened. It is said that the shaft is to be deepened from the 300 to the 800 level.

It is reported that the Montana-Bingham workings are to be connected with the Mascotte tunnel of the Ohio Copper for better transportation. Ore shipped recently is stated to have run 6 per cent copper; 2 to 6 oz. silver; and $1.50 in gold.

Murray—The destruction by fire of sampling mill No. 4 of the American Smelting & Refining Co. at Murray occurred early on the morning of July 27. The loss is estimated at $50,000. This mill built twelve years ago was the last in a series of four, and especially equipped.

Alta—The recent strike at the South Hecla is producing about half of the daily output of one car of ore. The new ore occurs about 700 ft. below the deepest workings of the old Rustler mine, and is believed to be the downward extension of the Rustler orebody.

Active work is being done at the Woodlawn property in Big Cottonwood Cañon, at which ore has been opened on the 100-ft. level in three places. The present average width of the shipping ore is given as 2 ft. The Columbus-Rexall at Alta in Little Cottonwood reports a large amount of shipping ore in sight.

American Fork—The tunnel of the American Consolidated, which has taken over the Bog and adjoining properties, is in 1,800 feet.

Park City—Shipments for the week ended July 24 amounted to 2,349 tons as compared with 2,267 tons the week

preceding. Again the Ontario, with 911 tons, was the heaviest shipper.

The Silver King Coalition followed with 645 tons.

The Ontario Silver Mining and London Guarantee Co. has been directed by the state industrial commission to pay Laura Cox for herself and for Laura Cox, a minor, $2,160 at the rate of $16 weekly for 135 weeks, to begin from April 27, 1920, and also to pay W. D. Richards, undertaker at Park City $150 for funeral expenses on account of the death of Stanley Cox, killed at the mine April 27.

Milford—There is renewed activity at a number of mines in this district. The Wild Bill, adjoining the Cedar Talisman, is being operated by lessees, who are making shipments. One car shipped recently is stated to have netted $4,000. It was the sixth car of high-grade shipped within three months. The ore was opened from a winze sunk from the bottom of an inclined shaft driven under by the company. There is no power equipment at the property, all work accomplished so far having been done by hand.

The lower tunnel of the Monitor, which is being driven to cut a north-south fissure productive in upper workings, is within 40 ft. of its objective. A thin sheet of ore is present in places in the tunnel roof, and where cut has proved to be 6 to 12 in. thick. The ore is lead-silver of high-grade.

The old Humboldt group is to be reopened by men interested in the Capital company. Equipment has been installed and shaft sinking started.

Eureka—Tintic shipments for the week ended July 24 amounted to 145 cars.

The Tintic Delaware in west Tintic has won a suit against the Salt Lake Fillmore & Kanosh railroad et al., to recover $5,000 and interest on money alleged to have been advanced to representatives of the railroad for building a railroad from the Salt Lake route in Millard County to the Deseret Mountain mine and other properties in the west Tintic district. The verdict is for $4,800 and interest at 8 per cent per annum from July 9, 1918, together with costs of the court. G. W. Craig, president of the company and Alva Craig Nelson, secretary, are held responsible under the decision.

The Tintic Milling will have a car of bullion ready for the market early in August.

The Eagle & Blue Bell is producing about 150 tons of ore daily. Drifting is being done on the 2,000 level, the lowest level, where work was discontinued for a time owing to labor shortage. Much development is being done, especially on the 1,500 and 1,800 levels.

Oakley, Idaho—The Vipont Silver Mining Co., situated in Utah near the Utah-Idaho line, is stated to be treating an average of 130 tons of silver ore in its mill, and shipping concentrates. The Idaho-Utah in this neighborhood is stated to show promise.

WASHINGTON

Northwest Magnesite Co. Operating at Full Capacity—Heavy Demand Reported for Calcined Product

Chewelah—The Northwest Magnesite Co. is producing upward of 300 tons of calcined magnesite daily. It has 3,000 tons ready for shipment. Consumers are offering a bonus of $4 a ton for immediate delivery and will accept shipments arriving in uncovered cars, a situation unprecedented owing to the loss from slacking sometimes suffered from moisture entering unprotected cars. The current price for magnesite at Chewelah is $28.50 a ton. The company is operating five steel kilns, each 136 ft. long. Its tramway brings 620 tons of crude magnesite daily from its quarries, which are working on two shifts. The kilns and tramway are operated continuously. Calcining reduces the weight of the magnesite by 50 per cent. Three hundred men are employed in all.

Invermere—The Silver King property, operated by the Toby Creek Mining Co., Ltd., of Vancouver, B. C., and near the Jumbo fork of Toby Creek, is showing up extremely well. At about 90 ft. from the surface a cross-cut is being driven to the hanging wall of the vein south of the tunnel. This has opened up a ledge about 80 ft. wide of silver-lead ore, running high in silver. There is considerable shipping ore already on the dump. A road is under construction.

Hedley—There now are employed at the Nickle Plate mine, Hedley, B. C., about 150 men, two-thirds of whom are underground and the rest at the mill and power plant. The company is mining $9 gold ore. As it costs about $8.50 a ton to mine, the profits are negligible.

SILVER KING CONSOLIDATED MINING CO.'S MILL ON CALIFORNIA-COMSTOCK SECTION OF PROPERTY, AT HEAD OF THANE'S CANYON, PARK CITY DISTRICT, UTAH

CANADA

Nickel Plate Working $9 Ore at $8.50 Cost—O. B. U. Demands Increase at Blue Bell

Stewart—The season's work has been well under way in the Portland Canal district for several weeks. With the snow gone and the prospectors and miners in the hills, the towns of Stewart and Hyder are almost deserted. On the various properties along the Salmon and the Bear rivers, however, activity prevails. The only notable new discovery reported is on the Georgia River, a few miles down the river from Stewart, where a number of promising gold-bearing claims have been recorded. The Marmot River is also being well prospected and many claims have been located. For the rest, development is continuing on all the better known mines and prospects of the Portland Canal, and road construction is in progress. The Unicorn Group is to be drilled, a contract having been awarded to Lynch Bros., of Seattle, Wash., and F. P. Stewart, familiarly known as "Pap," has returned to the camp to supervise plans for opening up the Mountain Boy group of crown-granted claims. "Pap" is a pioneer of the Portland Canal District, being credited with having directed the attention of Sir Donald Mann to the potentialities of the district.

Invermere—The Silver King property, operated by the Toby Creek Mining Co., Ltd., of Vancouver, B. C., and near the Jumbo fork of Toby Creek, is showing up extremely well. At about 90 ft. from the surface a cross-cut is being driven to the hanging wall of the vein south of the tunnel. This has opened up a ledge about 80 ft. wide of silver-lead ore, running high in silver. There is considerable shipping ore already on the dump. A road is under construction.

Hedley—There now are employed at the Nickle Plate mine, Hedley, B. C., about 150 men, two-thirds of whom are underground and the rest at the mill and power plant. The company is mining $9 gold ore. As it costs about $8.50 a ton to mine, the profits are negligible. Considerable development is planned in the hope that richer ore will be found. Ore is being mined on several levels, the upper one being 600 ft. below the surface and the lower 1,000 ft. Two-ton cars run on a narrow-gage electric railway for a mile out of the mine. The ore is then dumped into a tipple at the top of a steep side hill. From here it goes in cars to the mill.

Nelson—The Blue Bell mine at Riondel, B. C., is the latest property to come under the interdiction of the One Big Union. This organization has demanded for the workers in this mine a scale of wages which, it is said, amounts to an increase of 40 cents per day over what was being paid. The Blue Bell is the oldest mine in the Kootenays, dating back to 1895, and is operated by the New Canada Metal Co.

Salmo—Nugget Gold Mines, Ltd., is milling about 40 tons of ore daily which will continue until development is further advanced. The tails are running about 21c. a ton, the feed carrying $10 to $18 gold per ton. The mill is equipped to cyanide 150 tons daily.

Trail—Ore shipments received at the Consolidated M. & S. Co.'s smelter at Trail, during the week ended July 21, were as follows:

Mine	Location	Gross Tons
Bluebell, Riondel		69
Emerald, Salmo		33
Florence, Princess Creek		66
Mandy, Le Pas, Man.		313
North Star, Kimberley		78
Silver Bear, Kaslo		28
Velvet, Rossland		30
Company mines		6,444
Total		7,061

Victoria—Although no extensive development of the magnesite of British Columbia has taken place as yet, there are a number of large and noteworthy deposits. One of the most important is that situated near Atlin, in the northern section of the province. A few hundred tons of hydro-magnesite has been shipped from this point, but the freight charges have proved a handicap. The unusual purity of the magnesite in question, however, may permit its use for special high-priced work.

G. A. Young, of the Geological Survey of Canada, estimates that, within the various blocks, there are at present at least 150,000 tons of this hydro-magnesite which could be worked with the expectation of obtaining a product carrying between 41 per cent and 42 per cent MgO with about 3 per cent lime, iron oxide, alumina and silica. The thickness of the deposit is from 2 to 3 ft. The analyses show the material to contain about 2 per cent water that could be removed by drying and about 20 per cent combined water which could be driven off by roasting or calcining. Owing to transportation costs, it is considered desirable that the material be calcined before shipping. The material occurs in the form of a very fine powder when dried.

There are several magnesite properties in the central interior of the province, north of Ashcroft, none of which has been developed extensively, but there is no doubt that the deposits are large. The magnesite properties of this district have been described with analyses in the *Canadian Chemical Journal*, published 72 Queen Street West, Toronto, June and July, 1919, by L. Reinecke, of the Geological Survey.

The latest step taken by William Sloan, minister of mines, toward the acquirement of information bearing on the possibilities of the establishment of an iron and steel industry in British Columbia is the appointment of F. J. Crossland, of Vancouver, B. C., consulting mining engineer and geologist, to carry out a thorough inspection of the hematite and limonite ore deposits of the Clinton Mining Division situated in the Whitewater River region and to establish, as far as possible in one season's work, the tonnage of this mineral available.

At the last session of the Provincial Legislature, Mr. Sloan spoke of the possibilities of private enterprise or the government giving consideration to the taking of initial steps toward launching this industry. He spoke of a report received from William M. Brewer, government mining engineer, who made an examination of the deposits last year and was favorably impressed, figuring from an examination, necessarily superficial because of the limited time at his disposal, that there was a possible 50,000,000-ton deposit of limonite of good quality, eminently suitable for fluxing with the magnetite ores of the Coast in the production of pig iron by blast furnace, and so situated as to be easily mined. Mr. Sloan then stated that it was his intention to have the district well explored, and his engagement of Mr. Crossland is in line with that undertaking.

It is pointed out, in this connection, that the Provincial Government work is to be supplemented by that of the Geological Survey Branch, Department of Mines, Ottawa, which will have two parties in the field. One of these, under J. D. MacKenzie, will make a geological survey of the Taseko (Whitewater) Lake area and the other, under C. H. Freeman, will conduct a topographical survey.

As an instance of the utility of the amendment to the mineral act introduced by the Minister of Mines at the last session of the legislature, it is announced, coincidentally with Mr. Crossland's appointment, that a reserve has been declared on the drainage area of the Taseko (Whitewater) Lake, Chilko Lake, Tsuniah, Choilquoit, and the Chilko River and Big Creek, Clinton Mining Division. This reserve takes effect on the first of June. Claims already recorded will not be interfered with, as provided by the terms of the act, but all open iron properties, within the limits defined, will be held by the Crown until it is determined how far they need be used for the encouragement of the industry.

On the general question of the production of iron and steel from the iron ores of British Columbia, Mr. Sloan expresses the opinion that conditions were never more favorable for the successful establishment and maintenance of the necessary plant. If the limonite deposits of the Whitewater country turn out to be what reports appear to indicate, he says, there will be no problem to hinder the handling of the magnetite ores by blast furnace. The economic possibilities of the electro-thermic principle, however, are not being overlooked.

Ontario

Porcupine—Vein No. 5 of the McIntyre which has been opened up at the 1,125-ft. level is from 9 to 10 ft. wide and is said to average $18 gold per ton. It has been opened for nearly a quarter of a mile and found to extend into the Jupiter claim.

The shareholders of the Porcupine Vipond-North-Thompson on July 27 ratified the proposal to sell 600,000 shares of treasury stock to a syndicate in which English interests are prominent. Immediate delivery is to be made of 200,200 shares at 15c. with an option of 200,000 more at 30c. for six months; and a further option on another 200,000 shares for ten months at 50c. This transaction will secure funds for the re-opening of the mine.

The option that has been held by the Dome Mines on the Dome Extension expires Sept. 15 and whether it will be exercised or allowed to lapse is believed to be largely dependent on the result of operations now being carried on at the tenth level. A large orebody at a vertical depth of 1,150 ft. at the boundary line of the two properties, having a dip into the Dome Extension, has been indicated by diamond drilling. The core from the diamond drill hole was officially stated to show a gold content of $7.94 per ton for a distance of 93 ft., and $5.16 for an additional distance of 23 ft. The present work is being undertaken to verify these results. The orebody on the 850-ft. level of the Dome Mines shows a width of 43½ ft. and carries an average of about $7.60 to the ton, with an ore shoot stated to show much greater enrichment.

Kirkland Lake—Good progress is being made with the construction of the Wright-Hargreaves mill. The structure is almost completed and the mechanical equipment is in process of installation. Two crushers, a ball mill and two tube mills are in position.

The Orr Company has purchased the assets of the Kirkland Porphyry mines, which recently went into voluntary liquidation. Mining operations will be resumed immediately.

The Kirkland Combined mines has resumed work using the Sylvanite plant. The shaft is down 200 ft.

The Lake Shore Mines, Limited, during June recovered $37,546 from the treatment of 1,535 tons of ore, being an average of $24.46 per ton. The output for the first six months of the year was $244,710.

The shaft on the Kirkland Lake is down 900 ft., being 300 ft. lower than any other working in the camp. During the first four months of the year the total production was $107,700, the mill running at about two-thirds capacity and treating approximately 100 tons per day.

Cobalt—The Temiskaming has installed an oil flotation plant of the Callow type which is expected to be in operation about the middle of August.

At the Crown Reserve gold has been encountered at a depth of about 800 ft. occuring in the quartz. Assays are said to show $12 to the ton.

Sudbury—A large number of farmers in the neighborhood have brought actions against the International Nickel Co. claiming damage for injury to their farms from sulphur fumes.

West Shining Tree—The Wasapika Gold Mines proposes to sell part of 2,000,000 treasury shares at 10c. The capital of the company is $6,000,000.

THE MARKET REPORT

Published in part in San Francisco and mailed from there to our Western subscribers as a special service without charge pending the arrival of the *Engineering and Mining Journal*

Daily Prices of Metals in New York

July	Copper	Tin		Lead		Zinc
	Electrolytic	99 Per Cent	Straits	N. Y.	St. L.	St. L.
29	18 50	44.75	48.00@48.50	8.60	8.25@8.75	7.65@7.70
30	18.50	44.75	48.00@48.50	8.60	8 25@8.75	7.65@7 70
31	18.50	44 75	48.00@48.50	8.60	8.25@8.75	7 60@7 65
Aug.2	18.35@18.50	44.75	48.00@48.50	8.60	8.25@8.75	7.55@7.60
3	18.35@18.50	45.00	48.25@48.50	8.60	8.25@8.75	7.55@7.60
4	18.25@18.50	44 00	47.50@47.75	8.60	8.25@8.75	7.50@7.55

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for deliveries constituting the major markets, reduced to the basis of New York, cash, except where St. Louis is the normal basing point. All prices are in cents per pound.

Copper is commonly sold on terms "delivered" which means that the seller pays the freight from refinery to buyer's destination. The delivery cost varies, and it would be confusing to figure net prices on individual transactions. Consequently, an average deduction is made from the "delivered" price. At present the average cost of delivery from New York refineries is 0.15c. per lb., and that deduction is made to arrive at the New York price. When copper is sold f.o.b. or f.a.s. New York, of course no deduction is made.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of spot American tin, 99 per cent grade, and spot Straits tin.

London

July	Copper			Tin		Lead		Zinc	
	Standard		Electro-lytic						
	Spot	3 M		Spot	3 M	Spot	3 M	Spot	3 M
29	90⅜	93¼	110	265	270	36⅜	36⅜	41	42⅜
30	92¼	94½	110	268¼	273¼	37¼	37½	41¼	42⅜
31	....	....	...	....	....	...	...	...	...
Aug. 2	....	....	...	....	....	...	...	...	...
3	92½	94⅜	111	273	278	37⅜	38	41½	43
4	94⅜	96¾	111	275¼	279¾	38⅝	38¾	42¾	44½

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Silver and Sterling Exchange

July	Sterling Exchange	Silver			Aug.	Sterling Exchange	Silver		
		New York, Domestic Origin	New York, Foreign Origin	London			New York, Domestic Origin	New York, Foreign Origin	London
29	374	99½	93¼	56⅛	2	371½	99½	93⅜	
30	370½	99½	92⅝	56¼	3	367	99½	93¾	57
31	371½	99½	93⅜	56⅝	4	355	99½	92¾	57⅛

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

On the authority of the Secretary of the Treasury, we quote 100c. per oz. for silver, 1,000 fine, delivered at the option of the Director of the Mint to the New York Assay Office or to the mints in Philadelphia, Denver, or San Francisco, and proved to the satisfaction of the Treasury Department to have been mined, smelted, and refined in the United States. This quotation is retroactive to May 13.

Metal Markets

New York, Aug. 4, 1920

Inactivity still characterizes the major metal market. Buyers refuse to be interested except at cut prices. With money at the present high rates of interest, some producers are willing to shade prices, to relieve themselves of accumulating stocks of copper and zinc. Dealing in metal for forward delivery is discouraged, owing to the fact that costs will be increased on account of the recent 25 to 40 per cent increase in freight rates, yet, in the present buyers' market, no increase can be obtained.

Copper

Buyers refuse to pay the prices asked by the large producers, so that the latter's quotations are nominal. Some fairly large lots have been sold for delivery during August and September at about 18.50c. delivered. We have heard of no sales for later delivery, but it is likely that business would be refused unless a premium of ¼ to ⅜c. were paid. The market is decidedly weak, and improved European conditions, on which the hope of better copper prices is founded, seem even further away than ever.

Monthly Average Prices for July

Copper:	
New York Electrolytic	18.576
London Standard	90.148
London Electrolytic	106.455
Lead:	
New York	8.338
St. Louis	8,283
London	34.960
Silver:	
New York, foreign.....	91 971
New York, domestic	99.500
London	53 736
Sterling Exchange	385.538
Zinc:	
New York	8.070
St. Louis	7.720
London	41.886
Tin:	
99 per cent	45.798
Straits	49.154
London	261.886
Antimony	7.500
Quicksilver	90.333

Lead

No change can be reported. As high as 9c. has been paid for small lots of New York lead for September and October delivery. Larger quantities have sold for 3c. less, and the A. S. & R. contract price remains at 8.50c. A shipment of 250 tons of English lead on the dock here has been offered at 8.90@9c. during the week without anyone showing interest. The report of scarcity of prompt lead is almost certainly artificial, and consumers are in general well taken care of by contracts. Lead is coming out of Mexico again after a practical cessation for the last six weeks, and further English importations are unlikely. Cable manufacturers seem to be taking an interest in the market for a change.

Zinc

The dragging zinc market is largely due to the fact that galvanizers cannot get black sheets. Bad transportation conditions have limited the supply, and the steel mills can sell all they have at fancy prices to automobile manufacturers and others without galvanizing them. The galvanizers in the Pittsburgh district are operating at only 25 to 50 per cent capacity. The expected improvement in transportation conditions and the lessening activity among automobile manufacturers should help the zinc market.

Most of the metal sold last week was for nearby delivery, at decreasing prices, but forward delivery can be obtained at about the same figure.

Tin

Consumers have shown a little more interest the last day or two, but the market is dead. The unsettled foreign

exchange is a bad influence. Twenty-five tons of spot Straits was auctioned on the Metal Exchange yesterday for 47.80c.

Straits tin for future delivery: July 29th, 48@48.50c.; 30th, 48@48.50c.; 31st, 48@48.50c.; Aug. 2d, 48@48.50c.; 3d, 48.25@48.50c.; 4th, 47.50@47.75c.

Arrivals of tin in long tons: July 29th, Hongkong, 10; 30th, Rotterdam, 100. Total for July, 3,870. Aug. 2d, London, 85; Straits, 725; China, 175; Liverpool, 100; Aug. 3d, Liverpool, 25; London, 100; Straits, 425; Singapore, 275.

Silver

The trade conditions in China and India are still unsatisfactory, and much of the demand for silver is of a speculative character. Domestic demand for the arts is dull at this season of the year.

Mexican Dollars — July 29th, 71c.; 30th, 70¼c.; 31st, 71c.; Aug. 2d, 71c.; 3d, 71⅛c.; 4th, 70¼c.

Gold

Gold in London on July 29th, 109s. 9d.; 30th, 110s. 6d.; Aug. 3d, 112s.; 4th, 114s. 6d.

Foreign Exchange

Disturbed European conditions have caused a continued decline in exchange rates. Yesterday francs were 7.34c.; lire, 5.15c., and marks 2.19c. New York funds in Montreal, 12¾ per cent premium.

Other Metals

Aluminum—Ingot, 33c. per lb., with 32c. open market for 98@99 per cent virgin.

Antimony—Market continues weak. Spot, 7⅛c. per lb.; Cookson's "C" grade, 14c. Chinese and Japanese brands, 7½c. W. C. C. brand, 8¼@9c. Chinese needle antimony, lump, firm at 9@10c. per lb. Standard powdered needle antimony (200 mesh), 10@12c. per lb.

Bismuth—$2.70 per lb., 500-lb. lots, and $2.72 per lb., 100-lb. lots. Market quiet.

Cadmium—Nominal, $1.40@$1.50 per lb. Market dull.

Cobalt—Metal, $3 per lb.; black oxide, $2 per lb.

Iridium—Nominal, $350 per oz. Heavy demand, but small supplies.

Magnesium—Crude, 99 per cent or over pure, $1.75 per lb., for the metal in 100 lb. lots and over, f.o.b. Niagara Falls.

[1]**Molybdenum Metal** in rod or wire form, 99.9 per cent pure, $32@$40 per lb., according to gage.

Nickel—Ingot, 43c.; shot, 43c.; electrolytic, 45c., f.o.b. Bayonne, N. J.; Monel metal, shot, 35c.; blocks, 35c., and ingots, 38c. per lb., f.o.b. Bayonne.

Osmium—Open market, $50@$75 per troy oz.

Palladium—In sympathy with platinum jumped from $80 to $100 per oz.

Platinum—Sharp increase during the week from $80 to $105 per oz., caused by heavy demand of the jewelry trade. $95 per oz. in 100 oz. lots.

Quicksilver—Market steady; $88@$90 per 75-lb. flask. San Francisco wires $85. Unsteady.

Ruthenium—$200@$220 per troy oz.

[1]**Selenium**, black, powdered, amorphous, 99.5 per cent pure, $2@$2.25 per lb.

[1]**Thallium Metal**—Ingot, 99 per cent pure, $20 per lb.

Metallic Ores

Bauxite—About 52 per cent alumina content, less than 2 per cent iron oxide, up to 20 per cent silica and artificially dried to contain not more than 4 per cent free moisture, $10 per gross ton at mine; 54 per cent alumina and about 15 per cent silica, $11; averaging 57 per cent alumina, 8 to 12 per cent silica, less than 3 per cent iron oxide, $13 on basis of 8 per cent free moisture. Ores of very low silica content suitable for the manufacture of aluminum oxide and hydrate of alumina command a fancy price.

Chrome Ore—Guaranteed 50 per cent Cr_2O_3 foreign ore with a minimum of 6 per cent silica, 80@85c. per unit, New York. California concentrates, 50 per cent Cr_2O_3 and upward, 60@65c. per unit, f.o.b. mines.

Iron Ores—Lake Superior ores, per ton, delivered at Lower Lake ports: Old Range bessemer, $7.45; Old Range non-bessemer, $6.70; Mesabi bessemer, $7.20; Mesabi non-bessemer, $6.55. Congestion at Lake Erie ports due to car shortage has resulted in decreased tonnage. Other ports show gain in shipments. Slow delivery of coal and coke to furnaces has caused operators to reduce their iron-ore requirements.

Manganese Ore — 70@80c. per unit, 50 per cent Mn content, c.i.f. Atlantic seaport; chemical ore (MnO_2) $75@$85 per gross ton.

Molybdenum—85 per cent MoS_2, 75@85c. per lb. of contained sulphide, New York.

[1]**Tantalum Ore**, guaranteed minimum 60 per cent tantalic acid, 65@70c. per lb. in ton lots.

Titanium Ores—Ilmenite[1], 52 per cent TiO_2, 1¼@2c. per lb. for ore. Rutile, 95 per cent TiO_2, 15c. per lb. for ore, with concessions on large lots or running contracts.

Tungsten Ore—Scheelite, 60 per cent WO_3 and over, per unit of WO_3, $7 f.o.b. mines; wolframite, 60 per cent WO_3 and over, per unit of WO., $6@$7, in New York.

Uranium Ore (Carnotite)—$2.75@$8 per lb. for 96 per cent of the contained oxide (U_3O_8). Ores must contain a minimum of 2 per cent U_3O_8.

Vanadium Ore—$1.25 per lb. of V_2O_5 (guaranteed minimum of 11 per cent V_2O_5), New York.

Zircon—Washed, iron free, 5c. per lb. Zirkite—$90@$100 per ton, carload lots. Pure white oxide, 99 per cent, is quoted at $1.15 per lb. in ton lots.

[1] Furnished by Foote Mineral Co., Philadelphia, Pa.

Zinc and Lead Ore Markets

Joplin, Mo., July 31—Zinc blende, per ton, high, $50.90; basis 60 per cent zinc, premium, $48.50; Prime Western, $47.50; fines and slimes, $45@$42.50; calamine, 40 per cent zinc, $36. Average settling prices: Blende, $44.23; calamine, $36; all zinc ores, $44.03.

Lead, high, $103; basis 80 per cent lead, $100; average settling price, all grades of lead, $100 per ton.

Shipments for the week: Blende, 7,327; calamine, 172; lead, 1,108 tons. Value, all ores the week, $440,980.

Shipments for seven months: Blende, 340,589; calamine, 5,885; lead, 53,405 tons. Value, all ores seven months, $22,492,790.

Platteville, Wis., Aug. 1—Blende, basis 60 per cent zinc, $51@$53 base for high-grade blende. Lead ore, basis 80 per cent lead, $95 per ton.

Shipments for the week: Blende, 1,555; calamine, 60; lead, 35; sulphur ore, 44 tons. Shipments for the year: Blende, 41,778; calamine, 2,300; lead, 3,680; sulphur ore, 1,142 tons. Shipped during the week to separating plants, 2,545 tons blende. Owing to general unfavorable conditions mines continue to close. The Wisconsin Zinc Co. ceased producing operations this week.

Non-Metallic Minerals

Asbestos — Crude, No. 1, $2,400@$3,000; No. 2, $1,400@$1,700; spinning fibres, $400@$800; magnesia and compressed sheet fibres, $325@$400; shingle stock, $110@$150; paper stock, $60@$75; cement stock, $17.50@$30; floats, $8.50@$15, all per short ton, f.o.b. Thetford, Broughton, and Black Lake mines, Quebec, Canada; 5 per cent to be added as Canadian royalty export sales tax. Freight rate from mines to Sherbrooke, Quebec, over Quebec Central R.R., 20c. per cwt.; from Sherbrooke to New York, 27½c., carload lots; freight to New York for crude No. 1, f.o.b. Thetford mines, $8.45 per ton, carload lots.

Barytes — Crude, 88 to 94 per cent barium content, $10@$12 per net ton; ground (white) $22@$25 in bags, carload lots; (off-color) $18@$20 in bags, carload lots; all f.o.b. Kings Creek, S. C. Crude, 88 to 94 per cent, $12 per gross ton; ground (white) $23@$25; ground (off color) $16@$19 per net ton, f.o.b. Cartersville, Ga. Crude, 88 to 94 per cent, $23; ground (white) $40.50; ground (off color) $27 per net ton, less than carload lots, f.o.b. New York. Crude, not less than 98 per cent, $11@$11.25 per ton, f.o.b. cars, Missouri; floated, $28 per ton in bbls.; $26.50 per ton in 100-lb. bags; extra charge for bags, f.o.b. St. Louis.

Chalk—Domestic, extra light, 5@6c. per lb.; light, 4½@5½c.; heavy, 4@5c; English, extra light, 5@7c.; light, 5@6c.; dense, 4½@5c. per lb., all f.o.b. New York.

China Clay (Kaolin) — Crude, $9@$12; washed, $12@$15; powdered, $18@$22; bags extra, per net ton, f.o.b. mines, Georgia; crude, $8@$12; ground,

$15@$40, f.o.b. Virginia points. Domestic lump, $10@$20; powdered, $25@$30; imported lump, $25@$35; powdered, $30@$60, f.o.b. New York.

Feldspar—Crude, $7.50@$8 per gross ton, f.o.b. Maryland and North Carolina points; $7.50@$10, f.o.b. Maine; ground, $30, car lots, f.o.b. Baltimore; ground, $17@$20, f.o.b. North Carolina points; $17@$20 per ton, No. 1 ground, f.o.b. New York State; $21@$23 per ton, ground, f.o.b. Maine.

Fluorspar — Gravel, guaranteed 85 per cent calcium fluoride and not over 6 per cent silica, $25 per ton, f.o.b. Illinois mines, and $27.50, f.o.b. Kentucky; ground, suitable for acid, chemical or enameling purposes, $60; lump, $17.50, f.o.b. Tonuco, N. M.

Graphite—Crucible flake, 85 per cent carbon content, 8c. per lb.; 88 per cent, 9½c.; 90 per cent, 10½c., all f.o.b. New York. Crucible grades of Alabama graphite sell as follows, f.o.b. Ashland, Ala.: 80 per cent, 5c.; 90 per cent, 10c. Lubricating grades in increasing demand, with price ranging from 11c. for the 85 per cent guaranteed grade in car lots to 30 and 40c. for higher grades. Mexican, amorphous, $45@$55 per short ton; Korean, 3½c. per lb.; Madagascar, 8c.; Ceylon, 4½@15½c.

Gypsum—Raw crushed rock, $3.50@$4 per ton; raw ground fine, $4@$4.50; calcined stucco, $9, all f.o.b. works. Containers extra. Wholesale, plaster of paris, carload lots, $3.75 per 250-lb. bbl., alongside dock, New York.

Kaolin—See China Clay.

Limestone—Dolomite, 1@2 man size, $1.60@$1.65; 2@8 in., $1.55@$1.65 per net ton, f.o.b. Plymouth Meeting, Pa.; fluxing, $1.65@$1.75 per net ton, f.o.b. Howellville, Pa.

Magnesite, Calcined — High-grade caustic calcined, lump form, $35@$40 per ton, carload lots, f.o.b. California points. Freshly ground calcined, suitable for flooring trade, $65@$75 per ton, f.o.b. Eastern points.

Dead-Burned — $32.50 per net ton, Chewelah, Wash.; $52@$58, Chester, Pa. Austrian grade, $52@$55 per ton, f.o.b. Baltimore. (Magnesite brick—See Refractories.)

Mica—Imported block mica slightly stained, per lb.: No. 6, 50c.; No. 5, $1.20@$1.40; No. 4, $2@$3; No. 3, $4.25@$5; No. 2, $5.50@$7; No. 1, $8. Clear block: No. 6, 55c.; No. 5, $2; No. 4, $4; No. 3, $5.75; No. 2, $7; No. 1, $9; A1, $14; extra large, $25, all f.o.b. New York; ground, $85@$100 per ton, Philadelphia.

Monazite — Minimum of 6 per cent thorium oxide, $35 per unit, duty paid.

Phosphate Rock—Per long ton, Florida ports: 77 per cent tricalcium phosphate, $13; 75 per cent, $11.50; 75@74 per cent, $11; 70 per cent, $8.35; 68 per cent, $7.85; 68@66 per cent, $7.60. There is no price schedule for spot for domestic uses.

Pumice Stone—Imported, lump, 4@50c. per lb.; domestic lump, 6c.; ground, 4@7c., all f.o.b. New York.

Pyrites—Spanish, fines, per unit 12c., c.i.f. Atlantic seaport; furnace size, 16½c.; run of mine, 12@14c.; domestic, fines, f.o.b. mines, 12@14c.

Quartz—(Acid tower) fist to head, $10; 1¼ to 2 in., $14; rice, $17, all net ton, f.o.b. Baltimore; lump, carload lots, $5@$7.50 net ton, f.o.b. North Carolina mines. F.o.b. Wausau, Wis., the price is $16 per ton in car lots, and $20 in less quantities, including bags.

Sulphur—$18 per ton for domestic; $20 for export, f.o.b. Texas and Louisiana mines.

Talc — Paper making, $13@$20 per ton; roofing grades, $12@$15; rubber grades, $12@$45, all f.o.b. Vermont. California talc, $20@$35, talcum powder grade. Southern talc, powdered, car load lots, $15@$20 per ton; less than carload, $25, f.o.b. cars; freight to New York $5.25 per ton, carload lots; less than carload lots, $9.25. Imported, $60@$70; Canadian, $20@$40 per ton.

Mineral Products

Arsenic—White arsenic, 15½c. per lb.; sulphide, powdered, 20@21c. per lb., f.o.b. works, carload lots.

Nitrate—Soda, $3.85 per cwt., ex vessel, Atlantic ports. Market quiet.

Potassium Sulphate—Domestic, $2.25@$2.50 per net ton, basis 90 per cent, f.o.b. New York.

Ferro Alloys

Ferrocarbontitanium—For 15-18 per cent material, $200@$250 per ton, f.o.b. Niagara Falls, N. Y.

[1]Ferrocerium—Per lb., $12@$15. Foreign conditions as affecting the price of American goods remain unchanged.

Ferrochrome—Carload lots, spot and contract, 60 to 70 per cent chromium, 6 to 8 per cent carbon, 17@18c. per lb. of chromium contained; 4 to 6 per cent carbon, 19@20c. f.o.b. works.

Ferromanganese—For 76@80 per cent, prompt delivery, $225, freight allowed; last half, $200@$220; English, $200, c.i.f. Atlantic seaports. Spiegeleisen, 18@22 per cent, $75, f.o.b. furnace.

Ferromolybdenum—Standard grades, carrying from 50 to 60 per cent molybdenum metal, with low sulphur, phosphorus, and arsenic, $2.50@$3 per lb. of contained metal, f.o.b. works.

Ferrosilicon—For 10 to 15 per cent, per gross ton, f.o.b. works, $60@$65; 50 per cent, $80@$85; 75 per cent, $150@$160.

Ferrotungsten—70 to 80 per cent W, $1.10@$1.15 per lb. of contained tungsten, f.o.b. works.

Ferro-uranium—35-50 per cent U, $7 per lb. of U contained, f.o.b. works.

Ferrovanadium—Basis 30-40 per cent, $6.50@$8.25 per lb. of V contained, f.o.b. works.

Metal Products

Copper Sheets — Current New York price, $33.50 per ton; wire, quoted 31½c.

[1]Furnished by Foote Mineral Co., Philadelphia, Pa.

Lead Sheets—Full lead sheets, 12½c.; cut lead sheets, 12½c. in quantity, mill lots.

Nickel Silver—Unchanged at 39½c. per lb. for 18 per cent nickel.

Yellow Metal — Dimension sheets, 26½c.; sheathing, 25½c.; rods, ⅜ to 3 in., 23¾c.

Zinc Sheets—$12.50 per 100 lb., less 8 per cent on carload lots, f.o.b. smelter; zinc plates, 12c. per lb.

Refractories

Bauxite Brick—56 per cent alumina, $145 per 1,000, f.o.b. Pittsburgh.

Chrome Brick—$90@$100 per net ton, carload lots, eastern shipping points.

Chrome Cement—45 to 50 per cent Cr_2O_3, $50 per net ton, and $55 in sacks, carload lots, eastern shipping points.

Clay Brick — First-quality fire clay, 9-in. shapes, $50@$55 per thousand, Pennsylvania, Ohio, and Kentucky works; second quality, $45@$50. First quality, St. Louis, $45; New Jersey, $75.

Magnesite Brick—$100@$110 per ton, eastern shipping points; 9-in. straights, $90@$100; 9-in. arches, wedges and keys, $95@$105; soaps and splits, $110@$120.

Silica Brick—9-in. per 1,000, $51@$55, Birmingham, Ala.; $55@$60, Mount Union, Pa.; $55, Chicago district.

Iron Trade Review

Pittsburgh, Aug. 3, 1920

Pig Iron—The market continues dull in point of tonnage, and those who buy are only those who are insistent upon early deliveries. A little foundry has sold at $46, establishing the market at $1 advance, while bessemer on limited sales has gone at $47, involving $1 advance. We now quote: Bessemer, $47, basic, $46; foundry, $46, f.o.b. Valley furnaces, freight to Pittsburgh being $1.40.

Steel—Some offerings of sheet bars have been made by middle interests at $68, the former minimum having been $70. We quote: Billets, $60@$65; sheet bars, $68@$75; rods, $70@$75.

Birmingham, Ala., Aug. 2

That there will be need for large quantities of iron ore in the South for a long time is evidenced by the pig-iron and steel markets, sales having been made on which delivery can hardly be finished for six months and longer. Inquiries are being received daily now by the pig-iron manufacturers as to iron for 1921 delivery, and a few sales have been made. Quotations are showing a little more [illegible], sales having been made at $41 per ton, No. 2 foundry, 1.75 to 2.25 per cent silicon, and $42 has been the staple price for some time. Full production at blast furnaces can be looked for into the second quarter of next year at least.

Charcoal and Coke

Charcoal—Willow, 7c. per lb. in bbls.; hardwood, 4½c. per lb., in 250-lb. bbls.

Connellsville — Furnace, $17@$18; foundry, $18@$20.

The Southern Phosphate-Rock Market*

A Brief Statement of the Trade Activities in the World's Leading Phosphate-Producing Region—Possible Impending Fall Shortage

AFTER the usual heavy spring and winter business, the customary lull in the phosphate-rock market and apparent inability to sell this material took place in April, May, and June, with an accompanying speeding up of mining on the part of producers, an invariable occurrence as the better weather of summer advances, resulting in what might be considered a soft market. As a matter of fact, some concession in price below $10 for 70 per cent ground rock, down as low as $9 per ton for this grade of material, was made, but instead of the Florida producers making a rush for domestic business, the export business was so enormously speeded up that domestic consumers were unable to draw on the anticipated over-production of Florida, and about the middle of last month another heavy surge took place in the demand for phosphate rock, resulting in the price going up for 70 per cent ground rock to $11 and $11.50 per short ton.

Unfortunately the supply of cars furnished to the Tennessee field was considerably cut down by the retardation of shipments during the spring fertilizer season, and it seems almost impossible to get the flow of empties started back to the Tennessee producers, with the result that a possible rock famine again confronts the acidulators or fertilizer manufacturers for this fall and winter.

Review of the Industry for 1919

The phosphate-rock mining industry in the United States experienced a greater swinging of the pendulum toward high prices during 1919 than has ever before been attained in the history of the industry. This history has been a succession of such swings of the pendulum from very high to very low, but with the exception of 1914, in each case the high swing had been higher than before and the low swing had never gone so far back as before. The last high swing of the pendulum had culminated in 1907 with the panic of that fall and the selling price of 75 per cent rock took a sudden downward surge from $7 per ton to $3 or $3.50 per ton. Following the panic the swing was, as usual, slow and gradually toward another high point, until 75 per cent rock had reached a price at $4.75 per ton during July, 1914. The outbreak of the European war, by cutting off export shipments, caused the supply to be exactly double the immediate demand, as prior to 1914, about one-half of the total production of phosphate rock in the United States was shipped abroad. In this way, the phosphate rock business was affected as adversely by the war as it favorably affected other lines of chemical and metallurgical industry.

Growing Domestic Consumption

The following table shows for selected years from 1874 to 1918 the total sales of phosphate rock in each of the years named, the amount exported and the amount sold for domestic consumption.

SALES OF PHOSPHATE ROCK IN THE U. S. IN TONS OF 2,240 LBS.

Year	Total	Exported	Domestic Sales
1874	122,790	70,546	52,244
1887	480,588	199,735	280,853
1907	2,251,459	1,018,212	1,233,247
1913	3,111,221	1,366,508	1,744,713
1914	2,734,043	964,114	1,769,929
1915	1,835,667	253,421	1,582,246
1916	1,982,385	243,678	1,738,707
1917	2,584,287	166,358	2,417,829
1918	2,490,760	143,455	2,347,305

The year 1874 is selected as the first year for which complete statistics of both export and domestic shipments are available, 1887 as the high point of the period of recovery following the disturbed conditions of the 70's, and 1907 as the high point of the period terminated by the panic of that year. The year 1913 has been selected as the peak of the last full calendar year before the European war, and 1914 to 1918 inclusive are given to show the course while the European war was in progress.

Business in 1919 had been well on its way to a large increase over 1918, when the Florida strike, culminating in April, resulted in such a heavy decrease in shipments from that field from April to October or November as to bring the 1919 estimate of consumption slightly lower than 1918, notwithstanding the herculean efforts made by Tennessee producers to make up the deficit in the Florida output. The present activity and demand are somewhat of a reaction to the disturbing labor troubles of last year.

Changes in the Uses of Phosphate

The ordinary consumption of phosphate rock in the past has been practically entirely confined to the manufactures of acid phosphate for fertilizers, but in the last few years the development of phosphate baking powders, and increased amount of phosphorus and phosphorous compounds manufactured from phosphate rock have constituted a considerable factor in the demand. Added to this, the use of the low-grade soft phosphates of Florida and the high-grade soft brown phosphates of Tennessee for direct application to the soil without acidulation has greatly increased, and bids fair in a short time to outstrip acid phosphate as a chief application of phosphate rock.

Practically all of the phosphate plants in Tennessee have increased their productive capacity and several entirely new developments have been made which are just coming on the market.

If the Florida producers pursue the same tactics that they have in the past, of competing with their very large production against the comparatively small production possible from Tennessee, lower prices may be secured by the fertilizer manufacturers in new low-priced long-time contracts.

The steady course of the phosphate-rock market seems to be toward a price per unit of phosphorus equal to that paid for bones used in the manufacture of phosphorus.

Were the Tennessee fields to attempt production of any such large tonnage as Florida produces, the high-grade brown rock would be quickly exhausted; hence there should be no difficulty whatever in any owner of this material ultimately securing from $10 to $15 per ton for all he has left.

The tendency of many of the largest holders of phosphate-rock deposits, because they are primarily fertilizer manufacturers, has been to keep down the price of phosphate rock and thus show a greater profit in the manufacture of fertilizer, and it is a question whether the results brought about by this tendency have been in any way healthy for the industry. The fertilizer industry in general may find it advantageous to consider the basic raw material of their business on the same plane as sulphuric acid and other materials entering into the manufacture of the complete fertilizer, instead of, as in the past, keeping phosphate in a condition prejudiced to their general welfare.

During recent periods of depression, some large phosphate producers again made low-price long-time contracts covering future requirements. It is the opinion of an important producer in close touch with the market that those who have done so will be as regretful as they were during the last two or three years of advancing prices, with the old $4, $5 and $6 contracts in force. If the holders of phosphate-rock deposits will join in a wise policy of conservation of this most important basic commodity, it will be easily possible to maintain the market on the steady progressive plan which will redound to the greatest good of the general public interested in the transmutation of this important element into food.

H. D. RUHM.

*See editorial comment on phosphate rock in the United States on page 245.

Correction—In the issue of July 31, the balance of the Howe Sound Co. should have read $3,220,381.39, instead of $441,738.72.

The Sleeping Nations

ASIA, the birthplace, so far as we know, of the human race—certainly the birthplace of civilization—shows many signs of rousing itself from its long dormancy. There is an element of compensation in nature which opposes many popular conceptions of evolution. The sons and grandsons of supermen are noticeably often mediocre or inferior—hence the fallacy of the aristocracy or "best families" theory. Races and nations surge upward and forward so as to command the admiration of all subsequent mankind, and then the surge dies away, inactivity supervenes, then degeneration. Where, asks every rhetorical orator on some occasion, are now the glories of Assyria, of Egypt, of Carthage, Greece and Rome?

A field that has been well tilled should lie fallow for a period if it is to repeat its productivity. The apple tree that bears phenomenally this year will bear very little next: it has exhausted its vitality and must recuperate.

The civilization of China and Japan, of India and Persia, flourished while Europe was the hunting-ground of husky savages—our ancestors—and then lapsed into the sleep of centuries. Is there a natural cycle of recurrence of virility in races or nations? Do they ever "come back"? Japan would answer in the affirmative and attempt to prove it. Is all Asia sensing some long-accumulated pressure of forward development? There are signs which may be so read. Much of Asia, like China, may be interpreted as having been static for centuries, rather than having degenerated. If all these races adopted the mechanical secrets of power which the European races have discovered in such relatively recent times, the result would be stupendous.

Students generally agree that our modern European civilization has not exceeded that of Greece, for example, in moral development, or in point of artistic or literary achievement: indeed, many believe that it perhaps has not attained so far. We have, however, exceeded all history in science, in knowledge, understanding, and mechanical appliances, which quite recently have all been put to savage uses. Asia is learning these secrets rapidly; and a possible development would seem to be in the process of time the transfer of the world's chief arena of interest back to the Great Continent.

Asia and the Silver Miner

NO DOUBT a flight of fancy is required to catch the connection between the ability of a Nevada silver miner to operate his silver mine profitably with silver at one dollar an ounce—any other value will do—and the speculative proclivities of some Chinaman, the bedecking of a dusky bride in far-off India, the favorableness of the monsoon, or the possibilities of educating the Oriental to the use of modern methods in currency and finance. Yet the relationship of one to the other is very close and vitally important to the silver-mining industry, which, oddly enough, depends largely for its prosperity on the idiosyncrasies of the natives in the thickly populated Asiatic countries.

Ever since the adventurous and roving British and Spanish sailors several centuries ago began to venture to the Orient, exchanging silver pieces and bullion for the rich products and highly prized treasures of the East, an unabated stream of silver has flowed from the Occident to the Orient. Occasionally this stream would diminish in volume, as if the Oriental silver appetite were satiated, but more often this was only a lull in the vigor of the flow, and it continued in even greater volume. Practically all of the silver that finds its way to Asiatic parts is absorbed in the fullest sense of the word, and disappears from circulation as if removed entirely from the face of the earth, gradually percolating through the interior of India, China, and even Africa, finding ultimate lodgment no one knows where. The tremendous forces that account for what appears to us the enigmatical and peculiar behavior of the Asiatic native have been accumulating momentum through the years; they act ponderously yet surely, and a reversal of the flow would upset the habits and customs of generation after generation.

Silver enters into intimate daily association with the life of the Indian and Chinese native. Both have a striking fondness for the metal, and their handicraft, as exemplified by the painstaking ornamental work which they have produced, needs no eulogy here. Vast quantities of silver are consumed by the arts in the Far East, and comparatively trifling amounts of silver per capita assume staggering proportions when multiplied by the teeming millions of Asiatic inhabitants. China, with her enormous population, could account for 100,000,000 oz. of silver if the per-capita consumption were but ½ oz. annually. This would be about half the world's production. India, which is a greater silver sponge than China, has actually taken more silver than the entire world's production, and did this last year, or from June, 1918, to June, 1919. In fact, that country accounted for more than 112 per cent of the world's output. No wonder silver reached such high prices last year! However, on a per-capita basis, even this ratio is small, ¾ oz. of silver per person. For ten years prior to the war, India imported about 35 per cent of the world's silver production.

The Oriental mind is noted for its aversion to changes in habits and customs of centuries. Hence the difficulty attached to the attempts to alter existing conditions in Asiatic currency and finance. There is talk of Chinese currency reform—India's is being continually modified. It needs it, and the world would welcome the change. Unification of the currency on a silver basis is suggested

as a start, with a gradual conversion to a gold standard or modification thereof. But to do this it is necessary to overcome the inclination of the Chinese to the present intricate currency system, which lends itself admirably to the speculative characteristics of the native. Even should currency reform become a reality, weaning the Oriental away from the use of silver as a monetary medium will not be easily accomplished. The importance of Asiatic conditions to the white metal, and vice versa, is astounding.

Mining in Siberia And Russia

IT IS SO DIFFICULT to form a clear idea of political conditions in Russia and Siberia that we are publishing the latest Siberian point of view in an article in this issue. It is interesting in this: that the Siberians have totally abandoned communism, Bolshevism, and anti-capitalism, and declare for an equitable cooperation of labor, brain work and capital. Capital is invited to come to Siberia to assist in the development of mines, and fair treatment and guaranteed profits are assured.

The idealism of the Siberian and his fair intentions are evident; but the reaction against the autocracy of the Czar, although recovered from the Bolshevistic extreme, still probably goes too far. It is doubtful if any loose scheme of government can function or hold together. The idea that mineral wealth is the property of the local community in which it is found, rather than of the larger community, such as the province, is not a sound one; nor, in spite of the enthusiastic optimism of the Siberians, can it be expected that local dealings with ignorant men of small caliber can be productive of anything but an unusual amount of corruption and graft. Some more compact form of government will have to be devised before capitalists can be sure of fair treatment and protection.

It will be noted that Vanderlip characterizes the Siberian scheme of government as "literally no government." In a way this is true—the "ideal" plan is really the primitive scheme which obtained in countries like those of Europe before the independent villages, cities and rural communities banded together for efficiency and strength, with an organized common government.

The offer to guarantee profits to mining enterprises is a seductive one, which many companies would gladly embrace if it were feasible; but it shows the lack of experience of those who, in the goodness of their hearts, offer it. We are familiar in this country with the vendors of oil or metal-mining stocks, who guarantee 24 per cent a year on the purchase price of the stock; and their offer does not get many takers from the initiated. Mining is a hazardous business. In most cases there is no profit; and a very large profit must be possible to make the speculative business attractive.

The author observes that the government of Siberia is really very much like that of Russia at the present time. We do not gather this from the scraps of enlightenment which are available to us regarding the true conditions in Russia. In Russia, we have apparently the tyrannical dictatorship of Lenine and his henchmen, an organized tyranny, militaristic and imperialistic, in which not only the army, but labor, is under the order of the so-called state. It has been pointed out that labor under such conditions finds its prototype in the slave labor of Egypt; and it is also like the Belgian slaves which the Germans drove out of Belgium and put to forced labor, except that in Russia the slaves and the masters are both Russian.

Organized labor in the United States sees nothing but tyranny in Russia, and even Emma Goldman, prosperous and disturbing in America, has found that, so far from Russia being the land of liberty, liberty has totally abandoned it. The Russian leaders themselves have found out that the ideal democracy was impracticable, and they are frankly governing the moujiks "for their own good," as the Czar did. The chief difference between the old and the new autocracy, except for the disappearance of the nobility, is in the lack of any sense of moral responsibility or of business honesty in the new. This is a development that is characteristic of advanced demagogues and their followers the world over, even in the United States.

We do not know to what extent mining men are preparing to return to Siberia and to Russia; but it is plain that any government which refuses to recognize old titles is not trustworthy. In the United States we recognize the old titles to the Spanish land grants, given by the Kings of Spain, which grants became binding on the later government of Mexico, and still later on the Government of the United States, when the lands in question passed successively, by the fortunes of war, to these countries. Expropriation without compensation marks a dishonest government and people.

East Is West

WHEN Kipling wrote in his rhythmical strain that "East is East and West is West, and never the twain shall meet," it is quite probable that he was confining himself strictly to the meter and sense of the rhyme and concerned himself not with such a sordid matter as that generally known in business circles as foreign trade. At that period romance and business were regarded as separate, whereas today romance becomes more and more a part of everyday business. We are becoming more human in our dealings and broader in our vision. And with this gradual humanizing process comes a sweeping away of old prejudices, the approach to a common footing, and a keener appreciation of the value of co-operation. It is by this means that we approach and gradually reach the highest type of commercialism.

It may not be true that we of this country are suspicious of those with whom we deal in foreign lands, but we have at least been credited with "Yankee shrewdness," and that, after all, is not unlike certain characteristics shown by merchants of the Far East. But apparently this mutual shrewdness, or whatever we choose to call it, has not been detrimental to trade, for actual figures show a steadily growing commerce between the United States and our neighbors on the other side of the Pacific. So that in so far as the matter of exports and imports is concerned, there is little disposition on the part of the East or the West to establish an unsurmountable barrier.

Recent figures issued by the National City Bank of New York, state that our exports to Asia have increased from 113 million dollars in the year ended June, 1914, to 804 million in the fiscal year ended June, 1920. This shows a gain of 33 per cent above the figures for 1919, in which year they totaled 604 million dollars—particularly encouraging inasmuch as it was expected that

Asia would return to her former practice of dealing largely with Western Europe. Part of this increase is undoubtedly due to higher valuation and also to the fact that the supply of European stocks are depleted as a result of the Great War.

There is also an encouraging note in the fact that while exports have increased the same is true of imports, and such reciprocation lays the foundation for an amiable and lasting commerce between nations. Our imports from Asia for the fiscal year ended June, 1920, totaled 1,350 million dollars, as against 831 million in 1919.

It is interesting to note the increases and distribution of this trade. Sales to Japan for the fiscal year 1920 totaled 460 million dollars (51); to China, 115 million (25); India, 78 (11); Dutch East Indies, 45 (less than 4); Philippines, 72 (27); Hongkong, 20 (10); and to Straits Settlements, 15 million dollars (4). The figures in parentheses represent the totals for a similar period in 1914 in millions of dollars. Imports show corresponding increases, and are as follows: Japan, 500 million, as against 107 in 1914; China, 225, against 46; India, 180, against 74; Dutch East Indies, 97, against 6, and from the Philippines, 70 million in 1920, as against 18 million in 1914.

Truly, the order changeth and commercialism is wearing down the old barriers of racial prejudice.

A Great Eastern Enterprise

PROMINENT among the great mining enterprises of the Far East is that of the Burma Corporation, operating the lead-zinc-silver mines at Bawdwin. These have been worked for silver for centuries, though they did not attract the attention of Europeans until about 1795.

No one knows when it was that the Chinese began operations at Bawdwin. By some the date is placed at more than one thousand years ago, though others reduce this by half. According to J. Coggin Brown, of the Geological Survey of India, so little was known of the mines that in 1895, when the sixth edition of the quarter-inch topographical map was compiled, their position was not marked. The Chinese finally abandoned the district about 1868 as a result of the great Mohammedan rebellion in Yunnan. The first prospecting lease was applied for by Europeans about 1902, and the present operating company was organized about twelve years later.

"Bawdwingyi," as the Burmese call the mines, means "great silver mines," but neither they nor the Chinese have had any conception of their greatness. In the ignorance and unreadiness of the past lies the profit of today. Ignorance has played a greater part in conserving the world's resources than it has in wasting them, which probably even Gifford Pinchot will admit. Were it not for the backwardness of past generations, the search for raw materials might be even more difficult than it is.

Bawdwin is the only lead mine of importance that is being worked in the Indian Empire today, though it was never valued by the ancients for its lead. At the start, the company's smelting operations were directed to working over the slag dumps left by the Chinese. Today the chief tonnage smelted comes from the underground workings. Reworking old tailings has been profitable in this country in recent years. It is one of those pursuits in which men are glad to take some one else's leavings and willing to pay for the privilege. Modern metallurgy is endeavoring to make these leavings as small as possible.

As the bonanza becomes increasingly scarce and even the promising prospect is harder to find, the gaze turns westward to the continent where civilization first had its home and where men have lived for countless generations unmindful of their mineral wealth that perhaps lay at their doors. But gazing westward to the East would profit little. Already more than one exploring party is abroad looking for other Bawdwins.

"Yellow Peril" Was "Made in Germany"

THE World War proved to be earth's greatest melting pot. It produced a fusing of the nations—of flesh and spirit. The tragic aftermath, in which we live, and concerning whose outcome the veiled future vouchsafes no vision—cannot obscure the fact of the forging of that confraternity of peoples and of racial aspirations which will in history mark its great result.

Yellow men, fought side by side with white and brown in those terrible days of the spring of 1918—with the engineers. They were no "Peril" then—nor ever. Standing in the bright light flashing from the war, around the council table of reconstruction, China, Japan, America, England, France, and Italy may well clasp hands in mutual regard and self-respect.

In this new era, China and Japan are our next-door neighbors, and to erect spite fences and double blinds is the essence of folly. East needs West and West needs East. It has been ordained that we must live together on this acre of creation, and if statesmanship cannot contrive that we may exist in peace, it ought to go out of business.

China needs money. Japan has recently weathered a financial panic. The United States has so much money that its tokens have ceased to command their former respect. But with a plethora of wealth, America cannot obtain the labor needed to perform essential tasks—in mine and field, in forest, shop, and mill. Were it not for the bugaboos and ghosts of the past—Foreign Devils—that's us (we mean "we") and "Yellow Perils"—that's them (we mean "they")—the creation of mutually advantageous agreements would be both logical and easy.

The United States has the money and the technically trained men that the East must have to develop its vast mineral and other natural resources. The East possesses in great abundance that very class of labor which we most need to solve our present pressing problems. Common sense and business sense declare that arrangements could and should be made whereby the needed capital and technical labor might be afforded to the East, and the East supply our great need of human workers.

There is always a way to do that which ought to be done. Without sacrifice of ethnic pride or self-respect, with mutually acceptable agreements and guarantees, a way should be found—must be found, if peace, not chaos, is to rule—whereby the great financial and technical power of America can be placed where the world needs it most, and through which the labor that we must have may be made available.

We are conscious of the obstacles that have barred the consummation of such an arrangement as is here suggested. But what ought to be done ought to be done, and by those whose duty and destiny it is to do it.

WHAT OTHERS THINK

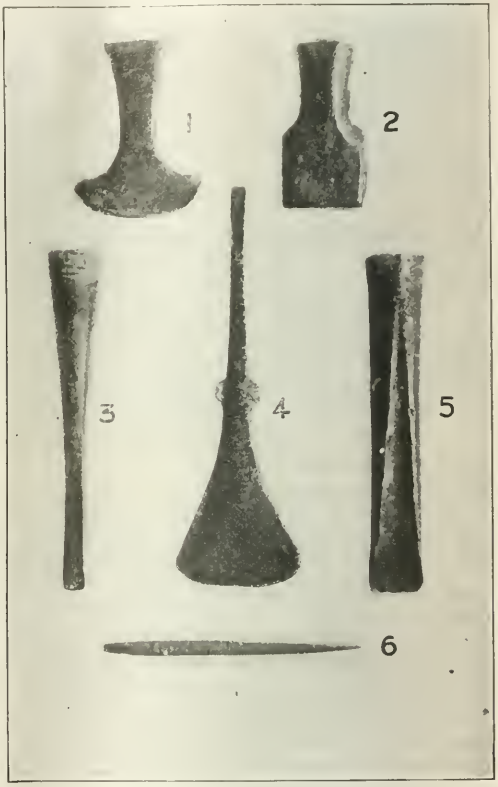
Ancient Principles of Modern Machines

Supplementing K. S. Twitchell's interesting photographs of ancient machines in *Engineering and Mining Journal* of July 24, the accompanying photographs of exhibits in the British Museum may be of interest. These stone and bronze instruments are believed to belong to the Bronze Age of England and Ireland, about 2,000 to 500 B. C.

The stone hammers, which do not look much unlike hammers used by modern miners, are four or five inches long. The sockets, as is evident, are well bored, with straight edges, as metal was available. In the previous neolithic period the perforation was affected from both faces by means of a stick revolving in wet sand. The resulting hole was more or less of hour-glass form. The ancient Egyptians, as can be seen in the Metropolitan Museum of Art, did not put a socket in their bronze battle-axes, but merely tied them to a wooden stick.

The bronze razors of perhaps 3,000 years ago have a tang for hafting. They are about three inches long.

STONE HAMMERS OF THE BRONZE AGE



BRONZE TOOLS, BRITISH MUSEUM

Shaving, fortunately, did not become popular until Alexander the Great, who wished to retain his youth, set the fashion, and by that time better razors were in the market. However, the ancient copper miners long retained control of the metal market, and iron was a minor metal until comparatively recent time.

The other bronze tools are from the best period of the Bronze Age, after the invention of the socket. No. 1 is a socketed chisel from Ireland, No. 2 a socketed hammer, No. 3 a socketed chisel from the Thames, No. 4 a tanged chisel, No. 5 a socketed gage, and No. 6 an awl.

H. G. Wells in his "Outline of History" says that gold was the first known of the metals, and appears among bone, jet, and amber. Then native copper was used. Lord Avebury has suggested that the secret of smelting was discovered by the chance putting of lumps of copper ore with other stones around a fire. "In China, Hungary, and Cornwall," Mr. Wells remarks, "copper ore and tinstone occur in the same veins, and so, rather through dirtiness than skill, the ancient

smelters, it may be, hit upon the harder and more fusible bronze." This view of the origin of bronze is that of Dr. Gowland, "The Metals of Antiquity" (Huxley lecture, 1912); but Lord Avebury quotes the verbal opinion of the late Lord Swansea against the view. Tin was little known as pure metal for implements, although the Egyptians imported tin in the fifteenth

BRONZE RAZORS OF EARLY TYPE

century B. C. "In India," says Mr. Wells, "where zinc and copper occur together, brass was similarly hit upon."

If any reader is especially interested in the subject of early machines, he should not miss reading the excellent article[1] on Leonardo da Vinci by Edward P. Buffet. That great artist and scientist filled his notebooks with sketches of lathes, drills, pumps, and war engines, at about the time of the discovery of America, besides painting several of the greatest pictures of all times.

P. B. McDONALD.

New York.

New Caledonia Nickel

In the July 3 issue of *Engineering and Mining Journal* you publish on p. 20, under the heading, "Three Nickel Companies Operating in New Caledonia," certain remarks to the effect that the firm of Ballande & Son is the trade name for a Roman Catholic order of priests, and also that the Société le Nickel has taken over the electric furnaces installed by the Hauts Fourneaux de Noumea.

We are the agents in this country of Ballande & Fils, of Bordeaux, and New Caledonia, and as a matter of fact Ballande & Fils are very closely connected with the United States Nickel Co. We in turn are closely connected with the Hauts Fourneaux de Noumea, which is one of Mr. Ballande's companies in New Caledonia. We know that Ballande & Son, or as the correct name should be, Ballande & Fils, are existant persons trading and doing business absolutely for themselves all over the world. Mr. Ballande's son, as a matter of fact, was a lieutenant in the French army and died in the war about the eighth of November, 1918. Mr. Ballande conducts all his operations for his own account and not for any order of Catholic priests.

With regard to the statement in your article that Société le Nickel has taken over the electric furnaces of the Hauts Fourneaux de Noumea, we know this to be an absolute inaccuracy, as evidenced by the fact that our matte is supplied us by the Hauts Fourneaux de Noumea and that we are continuing to receive such matte entirely from the Hauts Fourneaux de Noumea under our contract with that company, and also, to substantiate this statement, we have recently had a visit from some of our friends in New Caledonia, and no such question as allowing the Société le Nickel to take over the electric furnaces was ever thought of. Ballande & Fils or the Hauts Fourneaux de Noumea have no connection with the Société le Nickel or the other Japanese company which is said to be operating in New Caledonia at the present time.

We were inclined to disregard these statements in your magazine, but it seems that in preparing an article on "nickel" another magazine had taken this article bodily and incorporated it in its copy, and it is in this way that the small snowball may develop into an avalanche.

We wish that you would take steps to disabuse your readers' minds on the subject and if you will publish a correcting paragraph in one of your issues we shall be perfectly satisfied.

UNITED STATES NICKEL COMPANY.

New Brunswick, N. J.

The paragraph in question was copied from and credited to the *Chemical Engineering and Mining Review* of Melbourne, Australia. It is now up to our esteemed contemporary to explain the Australasian news.—EDITOR.

Ah Say Can You See?

An Essay

So much has been written about "Technical Writing" of late in some of the mining papers, and so much about the terms "Extraction and Recovery," that it may not be amiss to delve into the Pronunciation Department as well and educate the college-bred engineer so that when he enters the outside world of experience he will be able to spread the gospel of proper pronunciation as well as be a disciple of the gospel of the quill.

Many years ago I was taught to pronounce the word "assay" correctly, but I must own up to the fact that nearly all the mining men, of high and low degree, with whom I have come into contact, invariably mispronounce the word. It matters not whether they are from the "Hub" or from New York, or from the windy town of the Lakes, or from the mountains of Colorado; yes, from the far North to the extreme South, and even to the gentle Pacific; invariably my ears catch the same musical tone of the four-legged braying animal of the prospector—I am always reminded of the ass'-say, of the prospector's friend. Never once does any disciple of Noah Webster pop up with the musical rhythm of as-say'.

In every dictionary that I have examined—and I believe I have looked into some eight or nine of them—from Johnson down to the Standard, published by Funk & Wagnalls, strange as it may seem, there are no two ways given of speaking the word. There is one correct pronunciation and only one for the poor little word of three different letters of the alphabet arranged so as to make two syllables. Why a college man does not conquer it and pronounce it "as-say'," as in all dictionaries of the English-speaking nations, is beyond my understanding. Usage has no more right to claim as'-say than it has to claim that the word "ain't" should be used. So, may the overworked ass-sayers be brought into the proper realm of the as-say'ers!

Hedley, B. C. ROSWHEEL.

CHINESE STUDENTS WORKING IN THE ASSAY LABORATORY OF PEE YANG UNIVERSITY

Mineral Enterprise in China

Difficulties the Foreign Operator Must Contend With in Mineral Exploitation in That Country —Small Possibilities of Discovering Extensive Ore Deposits—Development of Properties Hindered by Lack of Transportation Facilities

BY THOMAS T. READ*
Written for *Engineering and Mining Journal*

IN THE *"K'ao Kung Chi,"* a work on the industries of the Chou dynasty (B. C. 1122-249), written during that period, six different bronze alloys are described in detail and their uses for the making of axes, hatchets, knives, spear and arrow heads, mirrors, bells, caldrons, gongs and a variety of utensils are carefully explained. A biographer of Lu-Tsu, who lived in the latter half of the eighth century, says that "among the eight stones he made most use of cinnabar, because from that he extracted mercury; and among the five metals he made most use of lead, because from that he obtained silver."

These historical references are introduced to illustrate that mineral enterprise in China is an art of ancient lineage, and as a result the search for mineral wealth in this part of the continent of Asia differs fundamentally from exploration in the continents of North and South America, where the natives before the coming of the white man were little interested in the mineral wealth of their country. Even the Aztecs and the Incas paid little attention to minerals other than gold, but the natives of eastern Asia had a well-developed metallurgical art when the countries that are now the principal producers of mineral wealth were inhabited only by people of the most primitive type of civilization.

This is a basic fact of great importance in considering the mineral wealth of China, for it indicates that, on the average, the possibility of developing profitable mineral enterprises there always involves some change in economic conditions, because for many centuries there have been available the necessary knowledge and skill for the working of deposits that could be profitably developed under the conditions then prevailing. An economic change to effect lower working costs by the application of modern methods naturally suggests itself, but its possibilities are almost invariably overestimated.

In a country where as recently as ten years ago the wage for skilled labor did not exceed 10c. per day few operations except those involving the expenditure of great power or special tools can be more cheaply performed by modern methods than in the primitive way. With the food costs and standard of living prevailing in China until recently the human mechanism was the most economical machine that could be employed. From the power standpoint it was cheaper to oxidize rice or millet in a coolie than coal under a boiler. Attempts to develop gold, silver, and lead mines in China under foreign direction have usually ended in nothing more profitable than a demonstration that working costs could not be lowered sufficiently to provide interest and amortization on the equipment investment.

An example of another aspect is the iron-mining and

*Chief, Division of Education and Information, U. S. Bureau of Mines.

smelting industry of Shansi. Next to agriculture this was and is still the principal industry of the province, but it offers no chance whatever for development by modern methods. The ore deposits are too small and irregular to permit of their being mined on a scale that would keep a modern blast furnace running. Yet they have been the basis of a considerable metallurgical industry, and before trade with the Occident made foreign iron available it was even an essential industry to the whole of North China. Another example is the quicksilver mining industry of Kwei-Chou, which had a somewhat similar local importance, but which, when made the basis of an Anglo-French mining enterprise, proved unremunerative. I will not further multiply instances.

It may be assumed that the large majority of mineral deposits existing in China have been the objects of a mining and metallurgical art that, though crude, is skillful and relatively economical. To make them the basis of a successful large-scale enterprise new economic conditions must be introduced. Provision of efficient means for handling water and working deep levels is one possibility, but the Burma enterprise at Bawdwin, in the Shan States, is about the only conspicuous example of success attained by this means. Though I have not personally examined the copper deposits of southwest China such evidence as I have been able to gather indicates that, like the iron deposits of Shansi, the ore deposits are probably not large and regular enough to be made the basis of cheap large-scale mining.

The tungsten deposits of South China are an instance of finding a use for a substance that the natives did not utilize, but this is a sporadic example, and scarcely likely to happen again. Perhaps, most commonly, transportation will be the new economic factor that is essential. This is especially true of iron-ore deposits, for except when they occur in close proximity to coal deposits they have not previously been worked by the natives to an important extent. All of the half-dozen or more iron-mining and smelting enterprises which have sprung up in China in the last decade are based on deposits which had not been worked in a large way by the natives. It is only fair to say, also, at this point that all these enterprises are as yet in the probationary stage of their existence, and it is by no means certain that they will be notably successful.

It was recently announced that the project for building a steel plant of 200,000 tons a year capacity at An-shan-chang, in Manchuria, has been abandoned, and the blast furnace plant, which was expected to have a capacity of 750 tons per day, at this time is turning out only about 200 tons per day, according to reliable reports. Ocean freight rates are low enough to permit iron and steel to be carried long distances in competition with the product of a plant whose working costs are high, and the transportation that makes a mineral enterprise possible may also prove its undoing.

Transportation is an economic factor in China that can scarcely be overemphasized, as it bulks so large in the development of mineral as well as every other form of enterprise. In the hills west of Peking excellent coal is mined, but it is not used even in the shops and restaurants of Tiensin, which is only fifty miles east of the mines as the crow flies. There the cooking operations in progress are being carried on in *kuo* (cast-iron pans placed over a clay or earthenware furnace), and the fuel used is all manner of vegetable refuse, stalks of jute, *kao-liang* (a species of broom corn), corn, marsh hay, stubble raked up from the fields—in short everything of the general nature of cellulose that is not more valuable for some other purposes than the production of heat units.

Ten years ago the cost of the fuel used in preparing the food of an average Chinese in the neighborhood of Tientsin amounted to roughly one-half the food cost, or about 40 per cent of the total living cost of the laborer. Remembering that homes of this class are practically unheated in winter, and that much of the food is either cooked in public shops, where cooking in large quantity utilizes the heat most efficiently, or else over a domestic furnace that utilizes all the heat not absorbed in cooking to heat the brick bed on which the family sleeps, it is evident that heat economy is a prime requisite in a Chinese household. In an American household fuel cost is about 5 per cent of living costs. The comparison is interesting and suggestive.

Coal production in China is roughly one-twentieth of one ton per capita per year, as compared to 6½ tons per

This is done by carrying the ore in baskets slung on the "*tan-tze*" or carrying pole. The open-cut stripping and mining costs on this operation were almost exactly the same as those of the open-cut "porphyry coppers."

capita per year in the United States, though the coal resources per capita are, like those in the United States, large. There is plenty of coal in China for everybody who can afford to use it, and the reason the people use so little of it as yet is because the transportation cost makes it too expensive.

Along the coast of China the coal market is absorbed to a marked degree by coal brought from Japan, because many of the Japanese mines are conveniently situated as regards water transportation. The Kailan Coal Administration is the only large coal mine in China that is conveniently situated with respect to tidewater and so far able to compete in any effective way with Japanese coal for the bunker and export trade.

J. W. Beardsley has recently published a study of transportation costs in China. It is not necessary to go into details here, and photographs of the *tan-tze*, or carrying pole, the wheelbarrow, and the springless two-wheeled cart are familiar to everybody. Beardsley estimates the following costs: "Coolie with carrying pole, 20 to 30c. per ton-mile; wheelbarrow, 6c. per ton-mile up, according to character of road; two-wheeled cart, average 40 to 50c. per ton-mile; may be as low as

6c. per ton-mile on good roads. Costs of transporting goods by canals has been estimated at ⅝ to ¾c. per ton-mile and by railroad at ⅜c. per ton-mile." Beardsley does not give the source of the estimate in the sentence just quoted, and I regard the figures as too low.

These figures are interesting approximations, especially when compared with railway transportation in the United States, which averages somewhere near 1c. per mile. The railways do most of our moving for us, but railways in China do not bulk large yet, for the total now in operation in China is less than 6,000 miles. China, on the other hand, is estimated to have over 200,000 miles of canals and improved waterways, or, roughly, about equal to our own railroad mileage. I hope I have made my point clear that transportation in China is, on the average, not cheap. The Shanghai papers for June 16 quote house coal (bituminous) in their market columns at $16 a ton and stove coal at $20 a ton.

Shanghai is a competing point for Australian, Japanese, and Chinese coal. Probably most of the Chinese coal comes about 1,200 miles by sea from the Kailan mines, and though it is true that these mines make large profits, there is also abundant coal along the Grand Canal, 500 miles from Shanghai, with all-water routes between. The figures given do not represent abnormal conditions such as now prevail in our own coal markets. West Virginia bituminous coal can ordinarily be dumped into bunkers at Hampton Roads at about $5.50 per ton,

A NATIVE GRAIN MILL

Exactly similar mills are used for crushing gold quartz. Sometimes the stone is pulled by a donkey, illustrating the close balance between the animals and men as a source of power.

total cost. This reminds me of the story of the man who sent a bale of rugs from China to New York. Ninety miles of the distance was by camel back, and the freight cost was $4.70; the 17,000 miles by sea cost $4.30, including one transfer charge. The example is rather extreme, but illustrates the point.

Another important factor in mineral enterprises in China is the title to mineral property, and this is so complicated a matter that general remarks regarding it are sure to be susceptible of misconstruction. Like some of the rules of grammar, there are as many exceptions as examples of the rules. Theoretically, mineral rights are independent of surface rights, belonging to the crown in the days of the empire, and now federal property under the republic. But in all the districts where mining is important complicated local customs prevail which I will not attempt to describe. Inaccuracy of survey and record add to the complication. Land taxes in China are based on the transfer records in what corresponds to our county clerk's office, and after a large tract of land has been sold off piece by piece the original owner not infrequently finds himself still in possession of a remainder, on the records, upon which taxes are still due, though all the actual land has passed into the possession of others.

Overspreading this basal complex is the laccolith of concessions. Concessions differ from one another in extent and location, but they are all much alike in being couched in terms which offer infinite scope for diplomatic skirmishing at Peking to secure everything possible for the concessionaires and to keep out would-be intruders. The Prichard Morgan-Standard Oil difference over rights in Szechnan is still fresh in mind.

An example of the extreme type of concession is that granted in 1898 to Cheng Monyuen and his associates, which was afterward the basis of the Anglo-French Q. & M. Co., Ltd. This gave to the concessionaires the development rights for all kinds of mining in the Province of Kwei-Chou for a hundred years, and naturally would prove an obstacle to any other enterprise desirous of entering the field in Kwei-Chou. All such difficulties can be overcome by employing time, diplomacy, and some money, but the delays and complications are a source of irritation to business men accustomed to more direct methods and are therefore a handicap to the development of mineral properties in China.

In negotiating the agreement with the government of China for exploration for petroleum, the Standard Oil Co. stipulated that all difficulties as to titles and rights should be assumed by the Chinese government. This makes it simpler for the foreign investor and also simplifies the problem somewhat, for the government can bring a good deal of pressure on the natives, and if the issue is simply one between itself and a concessionaire, instead of between two concessionaires, only one embassy is officially concerned instead of the representatives of two governments. Recent reports indicate that co-operative agreements of the kind just mentioned, where the government participates in the profits of the enterprise, are regarded with favor by those now in power, and as such agreements have many advantages it will be well for any persons interested in the mineral possibilities to shape their plans with this in view.

Investors in mineral properties who are in the habit of sending out their scouts to look for promising properties without revealing the identity of their principals until an agreement is about to be concluded should not suppose that it is possible to work along the same lines in China. Every foreigner in China is under the jurisdiction of his legation or embassy, as the case may be. As soon as he begins to exhibit any activity inquiry is at once made as to his character and what he represents, and unless the legation is able to make a satisfactory reply no further progress can be made. It is obvious that this should be so, for any dispute between foreigners and Chinese has to be submitted to the legations, and the Chinese principals naturally wish to know the circumstances and facts before committing themselves in any way.

The American investor sometimes thinks that his officials do not exhibit as much interest in himself and his plans as their importance deserves, but it is well to

keep in mind the fact that the forwarding of such projects is not the chief duty of a legation, even though the practice followed at times by some European legations would seem to indicate the contrary. Besides, the officials have been on duty a long while and have seen many ambitious schemes come to nothing in the end, so a Missourian attitude on their part would be both natural and excusable. In the circumstances it is remarkable that they are able to summon as much enthusiasm as they do. I do not believe that there is justice in the accusation, less frequently heard of recent years, that American enterprise abroad does not receive the official support it merits.

Co-operation in the development of mineral enterprises has many points of interest. The investor, knowing the great risk inherent in any mineral enterprise, naturally wants the full benefit of the odds as to possible profits, and the owner, overestimating the potential value of his property and underestimating equipment cost and risk, naturally desires to retain a good part of profits for himself. This is especially true in China, for travelers since the earliest days have been misled by native operations and almost invariably report them as indicating deposits much larger and richer than is actually the fact, with the result that general ideas as to the mineral wealth of China, both at home and abroad, are exaggerated, making it just that much harder for foreigners and Chinese to get together on an equitable agreement.

A story is told that in the early days in Wyoming, before much of organized activity had developed, a resident of one of the little towns conceived the idea of starting a bank, which he did by placing a sign reading "National Bank" over the door of a shack and then waited for results. Within an hour somebody came in and deposited $20, and soon afterward another deposited $100, whereupon the embryo banker gained such confidence in his enterprise that he put $50 in it himself.

I am reminded of this tale because Chinese investors are generally reluctant to put any money into mining enterprises. They will plunge on a straight gamble, such as speculating in rubber shares, or put money into a trading enterprise, because they know how to play that game, but it is hard to interest them in mining to the extent of putting their own money into it. There are a number of rather complicated reasons why this is so, but it is not necessary to pursue the matter further than to make the point that in planning a co-operative enterprise expectations of the procuring of capital in China are not likely to be realized.

Not infrequently the proposal is made that American firms furnish the equipment for a property, taking payment in notes to be paid out of the future profits of the enterprise, and the Chinese always prefers to be surprised that such a proposition is unattractive to those who are counted on to supply the equipment. The Chinese are usually good business men, and I have never quite decided whether the making of such a proposal indicates ingenuousness or ingenuity.

A word must be said as to the mining laws of China, in closing. Actually there are none, for the treaty of peace after the Boxer outbreak provided that a revised mining law should be drawn up that would meet the approval of the foreign legations as well as the Peking authorities. A number of drafts of proposed laws have been made, but none of them have yet met the approval of both parties. The principal difficulties are extraterritoriality and Japanese aggression. The Chinese are unwilling to concede majority ownership in a mining enterprise to the foreigner, for that at once puts the enterprise under the jurisdiction of the foreign legation; each property becomes a little *imperium in imperio*.

Within the last few years Japanese investors have been able to get most of what they wanted in the way of Chinese mineral deposits, so it will soon be unnecessary to provide a lock for the stable door. The latest mining law is in a sense the prevailing one, but so far as I can learn the native miners continue to operate in much the same way they always have; most foreign projects are the subject of special agreements, and the constitution bears much the same relation to friendship in China as it used to in Tammany Hall. If a responsible American company is willing to proceed with the development of a mineral enterprise in China there is little likelihood that satisfactory arrangements cannot be made at Peking as to the conduct of the enterprise.

UNLOADING A SHIP BY HAND

To summarize in conclusion, the thickly settled million and a half square miles that constitutes China proper has been well prospected by the natives, and there is not much likelihood of finding any Goldfield Consolidateds. Even a Utah Copper is improbable. Such properties are the rare exception even in America, but every now and then in China a fair-sized property will develop. Behind this area lies three million more square miles of territory, nominally under Chinese control, that is as remote from transportation as Wyoming was in the time of Brete Harte and Bill Nye. The chances are that it will prove more like Wyoming, from the mineral standpoint, than like Colorado and Montana. But Wyoming, long a mineral disappointment to the mineral seeker, has developed a good deal of wealth in coal and oil, and the "back blocks" of China may prove valuable in the end.

The great distances involved and the delays arising from the causes described are likely to make the acquiring of a mineral property somewhat expensive, especially if the investor proceeds on the theory of rediscovering first principles for himself. But with Russia cut off from intercourse with us by Bolshevism, China is the only important area on the Northern Hemisphere that provides a field for mineral enterprise on the "open-door" basis, and its possibilities in that regard should be neither overemphasized nor overestimated.

A GENERAL VIEW OF THE OOREGUM SECTION OF THE KOLAR GOLD FIELD, SHOWING THE MODERN EQUIPMENT AND UP-TO-DATE COMPANY HOUSES

The Romance of Gold Mining in the Mysore State

An Historical Review of the Discovery of Gold in the Kolar Gold Field and the Inception of Operations in This Important Gold-Producing Area, Together With A Description of the Industrial Conditions

By E. W. T. Slater
Written for *Engineering and Mining Journal*

A KANARESE proverb says that if gold is to be seen even a corpse will open its mouth. The search for gold has always held a keen attraction for mankind, and the story of how, in various parts of the world, men have been prepared to undergo every possible kind of suffering to obtain this precious metal is replete with romance.

The mining of gold in the Mysore State has not been associated with the hardships experienced in other fields, yet it affords romantic incidents. Few who now visit the Kolar gold field, with its up-to-date plant, and its advanced social life, can imagine that a hundred years ago the district was a wild, almost untrodden region. In a few years the field has become one of the most prolific producers of gold, and it is believed that there are still many reefs that are undiscovered, but which will yield handsome returns once they are exploited. Incidentally, while the mines have brought great wealth to the investors, the State of Mysore has greatly benefited through revenues received from the gold field.

Gold and Rice Plants

The beginnings of great industries are always full of interest, and some reference should be made to the early attempts to capture the hidden wealth of this district. It is generally believed that grains of gold found on the ears of the rice plants led to the discovery of gold here. An account of this tradition is given in one of the old records of the Mysore government. It appears that a Lieutenant John Warren, who was employed in surveying this part of the state in 1800, was told by a Brahman that "in the prosperous years, when the gods favored the village with an ample harvest of rice, now and then grains of gold were found on the ears of the plants grown under the tank lying close to the village."

The explanation is simple enough. The rice plants are usually grown in nurseries and transplanted in bunches of several plants, after which the fields are flooded. When there are heavy downfalls of rain the plants are often submerged, and no doubt grains of gold could have been deposited on the plants. As these grew the gold would naturally rise with them, and thus often be found adhering to the rough-coated rice-grain.

Being interested in the reports, Lieutenant Warren visited the places referred to, and he thus records what he found: "When the women of the village were assembled, and each being provided with a small broom and vanning basket, and hollow board to receive the earth, they went to a jungle on the west of a village. Here they entered some small nullahs, or rather breaks in the ground, and, removing the gravel with their hands, swept the earth underneath into their vanning baskets, by the help of which they further cleared it of the smaller stones and threw it into the hollow board mentioned above. Having thus got enough earth together they adjourned to a tank and placed the hollow boards containing the earth in the water, but just deep enough for it to overflow when resting on the ground and no more. Then they stirred the earth with the hand, but keeping it over the center of the board, so that the metal should fall into the depression by its own weight, and the earth wash over the edges. After a few minutes' stirring they put the metallic matter thus freed of earth into a piece of broken pot, but only after examining it for gold, which they did by inclining the board and passing water over the metallic sediment which adhered to it. They thus drove the light particles

before the water, leaving the heavier metal behind just at the edge, where it could easily be seen, however small the quantity." Nothing could be simpler or more primitive, but what he saw evidently impressed the survey officer.

Warren next inspected several places where small villages. Then they elect a duffadar, or head man, to superintend the work and sell the gold, and they subscribe money to buy lamp oil and the necessary iron tools. Then, partly from the knowledge of the ground, and partly from the ideas they have that the tract over which a peacock has been observed to fly and alight is

A COMPANY HOSPITAL IN THE KOLAR GOLD FIELD

mines has been dug and made a descent of one or two of these by means of small footholes which had been made in the sides of the mine. One mine was two feet broad and four feet long, with a depth of about thirty feet, and other mines were about forty feet deep, with a number of galleries. The miners passed the gold they extracted from hand to hand in baskets to men stationed at different points for the purpose of banking the stones. It was the work of women to take these stones to a large rock where they were pounded to dust. The panning process already described was then followed in the treatment of this dust.

It is also interesting to note the manner in which the Indian villagers organized for the gold search in their district. "When they resolve on sinking a mine they assemble to the number of ten or twelve from different

that of a vein of gold, they fix on a spot and begin to mine."

Some of the native workings are still to be seen on the gold field, and in the opinion of skilful miners these primitive workers showed great knowledge and ability in their work. Some of the mines are about 260 ft. deep, but for the most part these workings are now choked up. Large quantities of water were found, and it required continuous pumping by modern machinery to keep them clear. It is not known how the early workers

HEADFRAME ON THE EDGAR SHAFT OF THE MYSORE MINE

controlled the flows of water, but it is supposed they conveyed it to the surface by earthenware buckets, by passing them from hand to hand.

Having given this brief account of the way in which these workers carried on their limited mining it is of interest to review the events that have made this

district among the famous ones of the world. In 1873 a Mr. Lavelle applied for the right to carry on mining operations in the Kolar district, and the next year he entered into an agreement with the government. He was given the right to mine for twenty years, and it was stipulated that a royalty of 10 per cent on all metals and metallic ores should be given to the government. A small syndicate was formed, and though the work was carried on for some time it was later abandoned; but Mr. Lavelle was not without hope, and the next year he succeeded in initiating the formation of a number of companies.

In February, 1883, the Nundidroog mine was ordered closed, and practically every company was on the point of collapse. When one recalls the marvelous dividends disbursed by the Mysore Mining Co. it is interesting to remember that at this time the works were almost closed down. In 1884 ten or twelve thousand pounds of the subscribed capital remained and a meeting of the shareholders was called. Some were for closing down at once and dividing the balance of capital, but Messrs. Taylor & Co. advised them to hold on. Seldom has advice been so profitable. The 10s. shares were then sold at 10d., but within a short time a change took place and the value of the shares steadily rose until they could not be purchased under 100s. But apart from the direct gain to themselves, had the shareholders of this company not persevered there is little doubt all the other companies would have closed down and the industry would have been at an end.

Community Developments

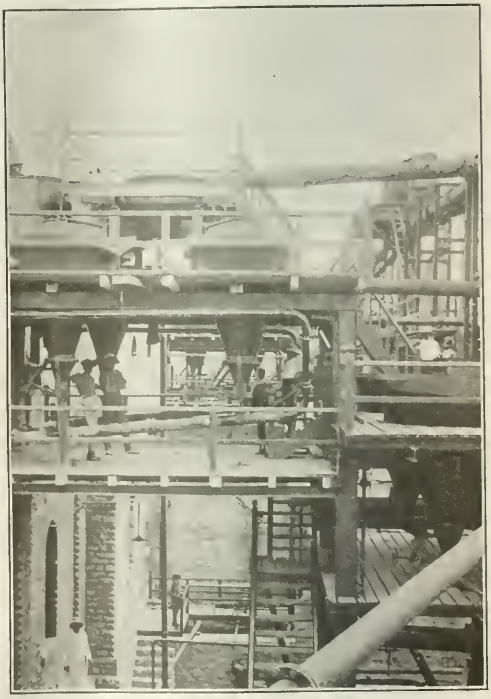
Turning to some account of the Kolar gold fields as they are at present, it is to be noted that the total length now covered by the mines is about seven miles, and the average width from two to three miles. The general appearance of the country all around is rocky and sterile, but the companies at work here have done much to improve the appearance of the area where the mines are situated.

A long, broad road has been cut out from one end of the field to the other, and this is always kept in splendid condition. There are smaller roads branching from the main roads to the bungalows and mines. The bungalows of the officers are well built, and in most cases the inhabitants have spent considerable time in making gardens around them. These are in marked contrast to the surrounding country, and were only made possible by bringing large quantities of fresh soil from a distance. In many cases rocks had to be blasted to give the necessary depth. The gardens on these gold fields are indeed a credit to the people, and they do much to give relief to a district the physical attractions of which are not many.

The companies realized that the occupation of the Kolar gold field would be of considerable duration, and wisely determined to house their men well and to introduce as many social amenities as possible. For many years no women were permitted to live on the field, but gradually, as the work developed, the officers were allowed to bring their wives. In many ways this has transformed the whole aspect of life there, and instead of the roughness usually associated with mining life there is a refinement and even suggestion of luxury that would surprise most visitors to Kolar for the first time.

A fine club has been built, and in connection with it arrangements have been made for tennis, golf, and other sports. The hospital is one of the best in South India, being manned by skillful British doctors, and provided with the latest surgical apparatus, no expense being spared in the care and treatment of either European or Indian workmen. This expenditure has more than justified itself, for it helps to create that sense of confidence between master and men that is so necessary in a work of this kind, involving considerable risk of life and limb.

For the high wages obtainable Indians are ready to risk the work underground, but they do so with full confidence that the authorities will use all care possible in the protection of their lives. Although their interests in connection with their work are not neglected, the companies are not indifferent to their comfort above ground. The provision made for the European workers is quite satisfactory, especially for those who are permitted to have their wives and families with them. The accommodation provided for the Indian coolies may not strike one as specially lavish, yet it does not fall behind the kind of house they would live in in their own districts.



PART OF THE CYANIDE PLANT

Geological Details

Without entering into details, a brief résumé may be given of the general occurrence of the gold on this important field. Dr. W. T. Smeeth, D.Sc., A.R.S.M., has written an interesting account of the subject, and I am indebted mainly to him for the following facts regarding the occurrence of gold here:

"The Main Champion Reef runs almost continuously through the Mysore, Champion Reef, Ooregum, and

Nundidroog mines. In places the quartz has been from thirty to forty feet wide, but the average of the parts worked is probably between three and four feet, although in places the lode is represented by mere stringers or veined schists. The quartz sometimes branches, and in several places there are occasionally parallel veins, from which a good deal of ore has been obtained. The veins strike north and south. The dip, or inclination, from the horizontal of the veins is to the west and is least in the Mysore mine, where it is about 45 deg.

"In recent years, as the mines have been sunk deeper, there has been a tendency for the veins to get steeper, so that at 4,000 or 5,000 ft. the dips are from 50 to 60 deg. in Mysore, and well over 70 deg. in the Champion Reef mine. The most important feature is the occurrence of the more valuable portions of the veins or shoots with intervening areas of poor quartz or lode matter, and the successful development of the Kolar gold field is due to the fact that these shoots are of considerable size and value, and sufficiently numerous to permit of new discoveries being made before the old ones are exhausted.

Veins Not Uniform in Character

"The steady progress of the mines is not due to the uniformity in the veins, as the distribution of the gold is uneven, but to the very extensive exploratory work which is carried on far below the points where ore is being extracted, and which permits of work being planned several years ahead of the milling requirements. The existence of slides or faults cutting the veins has received much attention in recent years, particularly in Mysore and Champion Reef. . . . The auriferous veins lie in a narrow belt of hornblende schists and are believed to be older than the gneiss which cuts off the schists on both sides and below, and will therefore be cut off along with the schists at some depth below. This depth represents the ultimate limit of the Kolar gold field, and there is no reason to apprehend that it will be less than 10,000 to 15,000 ft. from the surface."

These facts are important, in view of the anxiety that always exists respecting gold mines as to how long they will continue to produce. It has been said that work may be done to the level of 8,000 ft., and at the present rate of working there seems no likelihood that the ore will be worked out under thirty years. Yet there are many uncertainties, and an expert recently stated "The problem of the continuance of the Kolar gold field is, therefore, a speculative one, and in mining work the more unfavorable contingencies are wont to occur with undue frequency. However, it is opined that the Kolar gold field should continue for another twenty or thirty years at least, with a probable diminution of output in the later years."

Simple Amalgamation and Cyanidation Method Used

Though there is great similarity in the methods adopted in most mining fields, it may be said of this field in particular that the companies are keen to be abreast of every modern improvement, and their plants will probably compare favorably with those of any other mining field in the world. The head gears are of the latest type, the underground machinery is mainly electrical, and most of the surface work is electrically performed by current supplied by the generating plant at Sivasumudrum, and though there are differences in the various mines, some following more antiquated methods than others, on the whole it may be said that the plant is modern and adequate.

The ore is worked and sent to the surface in lifts, and immediately sorted and broken up into workable sizes. At some mines the sorting is done in the head gear, whereby the ore is passed through various grids and the waste rock eliminated. By this process about 18 per cent of the total ore is rejected. The ore then goes into the rock breakers or primary crushing machines, where it is prepared for secondary grinding in the stamp battery, a practice that is followed in many gold mills all over the world, and is next passed on to the stamp mills, where it is pounded with water into a fine sand, to pass through wire screens having about a thousand holes to the inch. The product is then treated on amalgamating tables in the customary manner.

The greater part of the gold is recovered on the plates, but cyanide treatment is used as a supplementary process. Fine grinding accompanied by leaching of the sands, agitation of the slimes, and precipitation of the gold in zinc boxes is practiced. The cyanide treatment for low-grade ore has made available a large tonnage of old tailings.

The Kolar gold field is certainly one of the most interesting places in India and is among the most important of the gold fields of the world. It has proved a most profitable investment for those who have possessed original shares of stock, and has provided labor at high wages for large numbers of Tamils. The government of Mysore has reaped great royalties from the Kolar gold-mining industry, and under the care of Messrs. Taylor & Co. this field has prospered and has many years of prosperity before it.

Belgian Plastic Earth Industry Active

Intense activity is reported by Consul General Henry H. Morgan in the plastic earth industry at Saint-Ghislain and environs, where these manufactories are established, as well as in the faience and porcelain industry and in refractory plants. Stoneware concerns in the region of Bouffioulx are also working at full speed, with the exception of two small plants whose production is used mainly in the arts. All the refractory industries at Tertre, Baudour, Jurbise, Hautrage, Sirault, and Saint-Ghislain are in full operation. A factory at Saint-Ghislain devoted to ceramic products has resumed work; two porcelain plants at Baudour are active, and there are reports of the establishment of a new enterprise at Quaregnon. The Usines de Sirault (tiles) are operating. Within a radius of several miles there are no fewer than twenty-five factories, some of which are not neglecting artistic production. Some of them have under consideration intensification of production and the question of better adapting their fabrication to present needs.

Graphite in Western Australia

The Western Australian Minister of Mines, according to the *Journal of the Society of Chemical Industry*, announces that an English company is making preparations to work the very extensive deposits of graphite in that state. He was advised that this deposit was one of the biggest in the world, and that in view of the fact that the world's requirements were about 300,000 tons per annum, and that most of the big sources of supply were dwindling, the enterprise should prove of great value.

The Mining Opportunities in Siberia Under the Present Régime of Zemstvo-Soviet Government

By Ivan Narodny*
Written for *Engineering and Mining Journal*

SINCE the overthrow of the Kolchak régime, Siberia has gone back to the same kind of half zemstvo, half soviet government that was established immediately after the first revolution in 1917. There are indications that this is going to be, in a modified form, the permanent government not only of Siberia and Central Asia but of all Russia.

While the news stories are still trying to paint Siberia in the grip of Bolshevik orators or those red-haired preachers of anarchy and absolute communism who marked the first era of the Bolshevik rule, the fact is that the economic-political conditions of this vast territory are as normal as they were in America when the states formed a union, if we disregard the bloody episodes in Russia of the past winter. Nearly all municipal and rural institutions are reorganized, and systematic reconstruction work has just begun.
