In periods of political upheaval, mining is, from the isolated location of a large number of mining camps and from the nature of the industry itself, more liable to suspension but less susceptible to complete destruction than other enterprises imperilled by the same revolution. A stock of goods or a factory may be looted, the torch applied, and save for the possibility of insurance, the loss is total; a ranch may be raided, buildings destroyed, and cattle driven off—the disaster is almost as complete. A mine's surface structures may be demolished, workings flooded, *gambucinos* or local revolutionary leaders may rob the rich pockets (Zapata worked several mines to secure metal for his coinage), the shaft may be dynamited, but though any or all of these occurrences may cause extremely heavy loss, the great bulk of the property's values remain intact. Upon the return of peaceful conditions their existence may serve as security for a loan to replace the damaged structures. In the cases outlined above, however, the merchant or factory owner has no such asset. Governmental indemnification for losses sustained during revolution having remained to date in the theoretical stage, industries must absorb their losses and progress, suspend, or cease to exist in proportion to their ability to rehabilitate themselves through their earnings or assets.

The location of factories in or near large towns presumably well garrisoned permits them to operate safely and to secure supplies and an outlet for their products after the outlying regions that contain many important mining camps have been cut off. It is the history of Mexico that revolutions have their birth in the mountains, and the miners swell the rebel ranks, paralyzing the mines and making the mining camps the scenes of the first skirmishes. The original army of Don Miguel Hidalgo y Costilla was composed largely of miners from Guanajuato, and the revolution that overthrew Diaz started in the mountains of Puebla and in the foothills of the Sierra Madres, at Guerrero, Chihuahua. Villa was a miner, and a good one, having worked at Sta. Eulalia, and General Manuel Dieguez, a prominent figure in the Carranza regime, joined the Madero revolution from the mines at Cananea.

New Government Encourages Mining

Hundreds of mines have been abandoned throughout the republic as a result of conditions existing during all or part of the last decade, but it would be incorrect to claim that no progress has been made in mining during that period. The millions of dollars' worth of metals that have been exported in that time are proof of that progress. Many properties were worked with only slight interruption, new deposits were discovered, and the attitude of the present government is most encouraging. To give impetus to the re-establishment of mining, especially in the remoter regions that have lain almost idle under the sway of bandit leaders, the laws entailing the loss of property through non-payment of taxes have been suspended, so as to give the owner protection against the claim jumper looking for rich properties delinquent in taxes. A report issued by the Departamento de Minas shows that thousands of owners have availed themselves of this ruling, and mines are being reopened in every section.

Prospecting and denouncing of new tracts never ceased even during the most disturbed periods. In September, 1918, at a time when Villa still prevented operations in most of Durango and Chihuahua, when Paleaz, Arrellano, de la Llave, and Felix Diaz kept the east in a turmoil, and when the pacification of Morelos and Guerrero had not reached a point guaranteeing the safety of prospectors, 1,897 hectares were filed on, covering land in twenty states. The following month 2,010 hectares were denounced.

Since 1913 the export of Mexican oil has tripled, Tampico now occupying second place among the ports on the American continent in point of tonnage. This is a remarkable example of progress, the more so when the constant quarrels between the oil interests and the Mexican government are taken into consideration. The oil situation and controversy are too well known to require discussion here. To what point the exports

would have risen had there been no friction with Mexico City since 1913, only those on the inside can estimate.

The known gusher territory in the Huastecas is constantly being expanded, a supposedly wild-cat well in the southern extremity of the field having recently come in with a volume of oil equaling the largest of those already in exploitation. Since oil has become so important a factor in the life of industry, explorations have been pushed in every part of the republic, and it is announced that concessions amounting to more than 7,000,000 acres have been granted in Lower California, Sonora, Sinaloa, Tamaulipas, Chiapas, Coahuila, and Vera Cruz. Discoveries of seepages and other promising indications are reported from the lower Conchos River country, the southern part of the State of Chihuahua, Campeche, Jalisco, and some of the islands off the west coast.

The cost of producing oil has increased during the last decade but not as much as in other countries. Mexican products bring a high price in the world's markets, and as labor is still cheap by comparison with the United States, the operator finds the future offering a promise of recompense for the losses of the past. Statistics collected by one of the leading Mexican papers show that the cost of common labor, taken throughout the republic, averages only slightly in excess of one dollar gold per day, ranging from 30c. in Colima and Chiapas, and 75c. in Mexico City (the latter figure is paid by the Secretariat of Communications and Public Works for road laborers), to the highest figures in the north and in the oil fields.

Industry has made surprising progress during the period since the fall of Diaz, considering the difficulties and in some cases the hostility of the momentary rulers that it has had to endure. The perseverance displayed by the owners and operators during the most hopeless times will find its reward in the period now opening, for the election of General Obregon seems to ensure an "era of good feeling" in Mexico and augurs well for that country's future.

Gold Production of India

Although September was only a thirty-day month, the production of the Indian gold mines for the period, 35,497 oz., shows a further falling off of 1,878 oz. as compared with the August output. The production of gold in fine ounces for 1916 to 1920 follows:

	1916	1917	1918	1919	1920
January	45,214	44,718	41,420	38,184	39,073
February	43,121	42,566	40,787	36,834	38,872
March	43,702	44,617	41,719	38,317	38,760
April	44,797	43,726	41,504	38,248	37,307
May	45,055	42,901	40,889	38,608	38,191
June	44,842	42,924	41,264	38,359	37,864
July	45,146	42,273	40,229	38,549	37,129
August	45,361	42,591	40,496	37,850	37,375
September	45,255	43,207	40,088	36,813	35,497
October	45,061	43,041	39,472	37,138	..
November	45,247	42,915	36,934	39,628	..
December	48,276	44,883	40,149	42,643	..
Total	541,077	520,362	485,236	461,171	340,068

The individual Indian results for August and September, 1920, are as follows:

	August		September	
Company	Ore Crshd., Tons	Gold Prod., Oz.	Ore Crshd., Tons	Gold Prod., Oz.
Balaghat	3,300	2,363	3,200	2,468
Champion R	12,503	6,404	11,623	5,016
Mysore	20,120	13,193	18,485	12,851
N. Anantapur	800	962	800	952
Nundydroog	8,736	6,004	8,450	5,753
Oorgum	12,900	8,449	12,700	8,457

Japanese Copper Smelters

The following list of some of the more important Japanese copper-producing plants, together with names of officials, was recently sent us by a correspondent:

Kuhara Kogyo Co. (Kuhara Mining Co.)
- Mines at Ibarakiken, Tagagori, Hidachimura, Japan.
- Refineries at Oitaken, Kitauruibegari, Saganoseki, Japan; Chinnanpo, Korea, and at Hyogoken, Shikamagari, Yejima, Japan.
- Largest production in Japan. Highest chimney in the world.

Sumitomo Besshi Kogyosho.
- Mine at Ehimeken, Umagori, Besshiyamaura, Japan.
- Refinery at Ehimeken, Ochigori, Miyakubomura, Tomura, Japan (Generally called "Shikajima").
- Second largest production in Japan (20,000,000 lb. per year.)
- Owned by Baron K. Sumitomo. "Chief of Mine," K. Ohira.

Furukawa Mining Co.
- Mine and smelter at Ashio.
- Refinery at Nikko, Japan.
- Third largest production in Japan. (Has other plants besides the above.) Owned by Baron Furukawa. Head office at Tokyo. Chief Engineer at Tokyo, Kumatoro Nakai, M. E.; assistant chief engineer, at Tokyo, S. Hayashi, M. E. Superintendent at Ashii, Isdzu Sugimoto; assistant manager at Nikko, Juruku Kaku.

Kosaka Kozan. (Fujita Mining Co.)
- Mines and smelter at Akitaken Kazunogori Kosaka. Japan.
- Fourth largest production in Japan.

Hidaira Dozan.
- At Miyazakiken, Higashi, Usukigori, Kitakatamura, Japan.
- Owned by Viscount S. Naito. Chief engineer, Y. Kasahara.
- Production about 6,000,000 lb. per year.

Homanzan Kozan.
- At Shimaneken, Katarugori, Hatsakomura, Japan, and at Shimaneken, Yatsukagori, Iwasakamura, Japan.
- Owned by T. Hori. Chief engineer, O. Kuwabara.

Kinoshima Seirensho.
- At Hiroshimaken, Takeharakogai, Kinoshima, Japan.
- Head office at Osaka, Japan. General manager, M. Matsui. Manager at Kinoshima, M. Tsugaki.
- Production about 3,000,000 lb. per year.

Kunitomi Kozan. (Tanaka Kogyo Co.)
- At Hokkaido, Shiribeshi, Iwanaigori, Ozawamura, Japan.
- Chief of Mine, K. Tamura.
- Production, 3,000,000 lb. per year.

Yoshioka Kozan. (Mitsubishi Kogyo Co.)
- Mine at Okayamaken, Kawakamigori, Fukiyamashi, Japan.
- Refinery (Osaka Seirensho) at Osaka Kitaku Shinkawasakicho.

Note: Kozan = Mine; Kogyo = Mining; Kaisha = Company; Seiren = Refine; Seirensho = Refinery.

This list is not complete, nor is its accuracy guaranteed.

Ontario's Lead Production From One Locality

The entire output of pig lead in Ontario during the first half of 1920 came from the mine and smelter near Galetta, on the Ottawa River, operated by the Kingdom Mining, Smelting & Manufacturing Co. The product was consigned to the James Robertson Co., Ltd., of Montreal, manufacturer of plumbing supplies. A small recovery of lead from the silver ores of Cobalt is treated in the United States refineries, returns of which are received at the end of the calendar year.

Roman Mining in Wales

Wild Country No Barrier to Development of British Mineral Wealth Two Thousand Years Ago—Lead and Silver the Particular Objects—Little Known Regarding The Work Except From Remains

By W. B. Paley
Written for *Engineering and Mining Journal*

THE exact causes of the Roman invasion of Britain, perhaps the greatest event in British history, will probably never be known with certainty, but modern researches make it fairly clear that possession of its mineral wealth was a principal object sought. It is difficult to conjecture for what other reason the Romans immediately drove a road from the nearest part of Kent right across the country to the west coast of Wales at Carnarvon. The distance, by the route they took, was about 300 miles, and considering the absolutely wild state of the country, densely wooded, with choked-up overflowing streams, it was a remarkable work, worthy of the great people who undertook it. It brought them into a wonderfully rich mineral country where virgin ore lay on the surface ready to be gathered up by the first hand that wanted it. Branch roads were soon added, linking up the mining centers. Many portions of these roads, in the wilder parts of Wales, remain to this day.

The mineral traffic was conducted by pack-horses, carrying one or more "pigs" of metal. These were

THE PORTAL OF A ROMAN MINE

dropped, or lost in the snow perhaps, from time to time, but wherever they are found a Roman road is close by. That the lead mines of north and mid Wales produced them is shown by the name of a tribe called the Cangi, Ceangü, or Kiangi, cast upon them. This, with the sounding titles of the Emperor, giving the date, proves where they came from, as the Cangi are known to have inhabited a large district thereabouts.

The lead must have been smelted in the district, but the ashes of the furnaces are found more often than the furnaces themselves. The Roman furnaces of all kinds, however, were very small, probably often of a temporary character, so that their remains can be traced only in comparatively few places. Possibly fresh ones were set up as the source of wood fuel receded.

Charcoal was chiefly used. There was wood enough and to spare, but the mining operations of the Romans were continued to the end of their domination, and in 350 years a sensible clearing of the forest land must have been effected in some places. Lack of sufficient mechanical power to produce a strong blast, however, led to imperfect extraction of the metal, so much so that in the seventeenth and eighteenth centuries the beds of Roman slag were found well worth smelting over again. Some of these beds are of great thickness and extent, especially along the river Wye, where it separates England and Wales. The neighboring Forest of Dean contains plenty of coal, much of it in thin seams cropping out on the hillsides. To what extent, if at all, this coal was used in smelting the iron ores is difficult to say. Surface coal is generally poor stuff, but it is certain that the Romans used it as house fuel at several places where it lay ready to hand.

The method of mining the iron ore in the Wye Valley was simply to follow a vein or "pipe" of ore so far as a man could get, or so far as it remained profitable. Sometimes the miners started from the face exposed in a cavern dug in the hillside, as shown in the illustration, and sometimes from the bottom of a large shallow pit. When the vein became thin and only one man could work in it, he squeezed along, using a short iron crowbar to pull down the ore, while another man raked it up into a box or basket and passed it out. Oak shovels as shown in the cut, formed of split laminæ, have been found and seem to have been held in the right hand and filled with the left. The hole in the center may have been intended to let the water run through when working in wet ground. Wedges, chisels, and hammers were used. By their aid galleries were cut in all directions in the two hills, called the Great Doward and the Little Doward, near the Wye between Ross and Monmouth.

Iron was mined by the Romans in many other parts of the island, but the Forest of Dean and thereabouts seems to have been the principal seat of the industry. The iron is thought to have been shipped chiefly from a place near Southampton, now called Bitterne, to which suitable roads were made for the purpose.

Lead, however, was what the Romans wanted most. They employed it lavishly, if clumsily, in thick sheets, and seem to have used it for almost everything. Down below the streets of York, Colchester, London, and many other towns lie the remains of the citizens of the days of the Cæsars, each in a massive leaden coffin elaborately decorated with patterns of scallop shells and other devices. At Bath the leaden water pipes in the public baths, where the veterans of the legions used to reinvigorate their war-worn limbs, are of absurd massiveness. Not only north Wales but central Wales has extensive lead deposits, which have been worked ever since Roman times and are not nearly exhausted yet.

The county of Montgomery, especially, contains numerous traces of Roman mines and must have been extremely rich in ore at one time. The ore contains a good deal of silver, which the Romans well knew how to extract. Many of the leaden pigs bear inscrip-

tions stating that the silver has been separated. Copper is also found in the same neighborhood, and in the form of bronze was much used by the Romans. Both the copper and the lead were practically on the surface when first worked. On Llanymynach Hill, in Montgomeryshire, are extensive remains of Roman copper mines, the mineral being a green carbonate. Near the pits are signs of vitrification, showing that the ore was smelted on open hearths. Copper was worked at least so far down the north Wales coast as the Great Orme's Head.

The mines of Wales and the English counties bordering upon it were certainly fully worked before the end

11 inches by 8½. 16 inches by 8½

OAK SPADES FOUND IN ROMAN MINES

of the first century of the present era, although the subjection of Britain was not taken seriously in hand till A.D. 43 by Aulus Plautius.

Of the people who actually worked in the mines little is really known, but probably they were the aboriginal inhabitants, treated as slaves and forced to work whether they would or no. Guarded by soldiers drawn from various conquered countries, they could expect little sympathy or kindness from them or from the Italian experts who directed the mining operations and who saw that the fixed amount of tribute in metal was duly sent to Rome. In fact, they were treated much in the same way as the Spaniards treated the Incas of Peru, for the Romans, with all their great qualities, were a cruel and brutal race at heart.

Lookout Towers Used in Surveying

An essential task preliminary to the mapping of any area is that of covering it with a connected system of triangles in which each angle is accurately measured. Ordinarily this task is slow and expensive, but recently topographic engineers of the U. S. Geological Survey, while working in the heavily timbered area of northern Maine, saved great expense by making observations from the numerous steel lookout towers erected by the Maine Forestry Commission to aid in protecting the timber from fire. These lookout towers range in height from about forty to seventy feet, and in each of them a watchman is stationed day and night during the summer and fall. The Government surveyors found that these towers make admirable observing stations and by using them they were able to do work in five weeks which would otherwise have consumed four or five months. In this way they saved several thousand dollars and were able to cover a larger area than they could otherwise have covered with the funds available. The State of Maine thus derives a double benefit from its wise provision for the protection of its forests.

The Position of the French Iron Industry

In a recent article in the *Echo des Mines* the writer combats the optimistic utterances of some of his countrymen on the subject of France's iron ore position. The statements which have been current to the effect that France holds Germany by means of her ore, and will henceforth dominate the metallurgical industries of Europe, are described by the writer as altogether illusory. In proof of this contention figures are adduced showing the pre-war distribution of ore produced in the three regions—French Lorraine, annexed Lorraine, and Luxembourg. These figures demonstrate that of the total national production of 40,000,000 metric tons, 27,000,000 tons were consumed in France, Lorraine, and the Sarre, leaving for export 13,000,000 tons, of which 5,000,000 tons went to Belgium, 4,700,000 tons to Luxembourg, and 3,900,000 tons to Germany. Where, then, the writer asks, is the alleged immense German outlet for French ore?

It must not be forgotten that Westphalia and the Ruhr, the only metallurgical regions in Germany capable of consuming Lorraine ore, have always been large importers of the rich Spanish and Swedish ores (in 1913 the importations were 3,632,000 tons and 4,558,000 tons respectively), and that of the 8,500,000 tons of Rhenish-Westphalian pig iron only 1,500,000 tons (about 18 per cent) have been produced from Briey, Luxembourg, and Thionville minette. Thus, Germany has been dependent on France to the extent of only 18 per cent of her pig-iron production in normal times, and as the German works are not producing more than 50 per cent of their capacity, owing to the restriction in the coal supplies resulting from the Spa Convention, Germany's dependence on Lorraine ore is now correspondingly less. "The solution of the problem of our ore exports would," the writer concludes, "be perfectly simple, if it were merely a matter of exporting 13,000,000 tons out of the 40,000,000 tons we produce. Its complicated nature arises from the difficulty we shall experience in treating, as before the war, 27,000,000 tons in Meuthe-et-Moselle, Lorraine, and the Sarre; and if the output of ore increases, as it probably will do, or even if it remains stationary, it will not be 13,000,000 tons we shall have to export, but 15,000,000 or 18,000,000 tons. Should we propose to get over the difficulty by exporting pig iron instead of ore, we shall want coke, more coke, still more coke!"

Australia's Copper Manufactures

An agreement is under discussion between the Queensland Minister for Mines and the Copper Works at Port Kembla, in that state, according to *The Ironmonger*, which provides for the purchase, for two years, by the company, of Chillagoe blister copper up to 300 tons a month, and of the gold and silver it contains, at the market price ruling over a mean of seven days at the time of arrival of the copper at Port Kembla. A large quantity of copper is awaiting treatment at Port Kembla, for, by commonwealth regulation, copper must be refined before it is exported from Australia. With the exception of one works in the United States, the Port Kembla Copper Co., of Queensland, is the only works in the world where copper ore is smelted, then electrolytically refined, and finally rolled into wire. The manufacture of sheet copper is under consideration.

An American Engineer in Japan

First Impressions of the Land Where Every One Seems Happy—Predominance of Manual Labor Surprising—Transportation Facilities in Need of Modernization—Engineering Knowledge in Demand, but Practical Application Left to Mechanics

By Charles F. Mason
Written for *Engineering and Mining Journal*

FIRST impressions are frequently misleading; and it is not without hesitation that I am putting down my first impressions of Japan, with the hope, in some cases, and fear in others, that they may prove to be erroneous. Certainly no impression could be more pleasant to the impressée than that created upon steaming into Tokyo Bay on a perfect June day, with Fujiyama occasionally visible through the haze to the west. Rounding Treaty Point we find ourselves suddenly in Yokohama harbor, where we anchor only long enough for a brisk examination of the ship by the health authorities.

Being met at the pier by Japanese friends, the customs examination is no ordeal at all, and in the twinkling of an eye I am bundled bag and baggage into a waiting *takushi* and am on the way to the train for Tokyo, about eighteen miles distant. My regret at not having more time in which to enjoy the new thrill of being for the first time in Japan is tempered by the assurance of my friends that other places are of far more interest than this; and by my own still, small voice telling me that, after all, I am on business and not on pleasure bent. Later experiences convince me that no line can be drawn between pleasure and business in this land of pleasure—the two are inseparably connected in a thousand ways.

Prodigal Expenditure of Human Energy

Aside from the thrill at being for the first time in a strange land, my primary astonishment is at the apparently enormous expenditure of human physical energy on all sides of me. Each day, at first, I think, surely this must be a special occasion—these men (and women and children, too) tugging heavily laden carts through the streets, or poling ponderous barges along the canals single-handed at a snail's pace, or handling back-breaking steel billets by main strength in a rolling-mill—surely they must be putting a shoulder to the wheel to tide over a temporary rush! But as each new day fails to show any slackening up, I am forced to the conclusion that this is the every-day state of affairs here. And, later on, I see the carter and his wife enjoying a few quiet puffs in the shade of a tree by the roadside; the boatman at his ease at his tiller while a favorable breeze carries his cargo (and probably his home and family as well) nearer to his destination; the rolling-mill crew squatting in the shade outside of the mill fortifying themselves for the next task with tobacco smoke and hot tea. Human energy has its limitations here as well as anywhere else!

A walk at night through one of the popular streets in any of the larger cities is a trip through fairyland, in which one loses all sense of time or distance. And here again comes the thought: What special holiday has brought all these merrymakers out to participate in the gayety? Night after night, however, one sees the same scenes and comes to the same conclusion: This is different—this is Japan!

A predominating characteristic of all these gatherings, which strikes the Occidental visitor most forcibly, is the courtesy which prevails at all times. A smile always brings a smile in return; a scowl is never seen. I have yet to see a quarrelsome person on a street in Japan. This despite the fact (or because of it, perhaps?) that alcoholic beverages of all degrees of intoxicating power are plentiful and inexpensive.

Sartorial Freelancing

The matter of clothing apparently concerns Mr. Average Japanese Citizen not at all. Whatever appeals to his fancy or imagination he puts on and wears without a trace of self-consciousness. Anything goes, and goes unnoticed. Of course the kimono is still the national dress, for both men and women, the latter generally wearing the gayer colors, but Occidental garments are widely worn; often in, to us, at least, ludicrous combination with the native dress. The wooden shoe, supporting the feet of the wearer two or three inches above the ground, is practically a necessity on account of the condition of the streets, which are generally either very muddy or very dusty, and frequently both, within a few hours' time.

Transportation facilities here are certainly in urgent need of modernization. The waterways are used to an extent never dreamed of in our own fair land, but the roads are usually very narrow and crooked, making motor traffic slow and difficult. Practically all of the steam railways are narrow gage, which fact does not become very noticeable, unless in the comparative slowness of the trains, which rarely travel faster than thirty or thirty-five miles per hour, until a night trip in a sleeping car is undertaken. I am a man of slightly less than average stature, at home, but here I fill a lower berth to overflowing both ways. The government is preparing to widen the gage of some of the main lines, but it will be several years before any great changes are made—this is Japan! The railways, in common with all enterprises here, employ several times the number of operatives that would be considered necessary on American lines, and they are invariably courteous and cheerful.

University of Hard Knocks Not Popular

In meeting and talking to Japanese engineers during these last few weeks, I have been impressed with their expressed desire for information on all engineering subjects. If I may be permitted a mild criticism of their quest for information along engineering lines, after such short acquaintance, it is this: In very many cases they want only knowledge that comes in tabloid form, so to speak. Books without number are devoured, and lectures without end are listened to with rapt atten-

tion (I am told that all Japanese are inveterate lecture-goers), but apparently the good old University of Hard Knocks has a very small attendance. Whether this is owing to the inherent cleanliness of the race, making the idea of greasy hands and dirty clothes abhorrent, or merely to the idea that practical experience is unnecessary in the profession of mechanical engineering, I am not prepared to state. This is one of the impressions that I sincerely hope will prove to be wrong, although it applies to many who have received part of their training in foreign countries as well as others who have been educated entirely in Japan.

The variety of occupations existing within a few square yards, or even under the same roof, is amazing to us. Here a jinrikisha stand shares the same shelter as a jewelry store; there a blacksmith shop nestles close by the side of a tiny restaurant; over yonder is a small building whose first floor is shared by a stone cutter and a tailor, while a tea house does a flourishing business upstairs.

Osaka, as this is written (early August), is a very unattractive place for the pleasure-seeking tourist. Being the principal industrial city (it is called the "Pittsburgh of Japan"), it has little to appeal to the seeker for the æsthetic, although it figures prominently in the history of Nippon. The population numbers about two million, I am told, and, all things considered, Osaka should be the best place in Japan in which to get in touch with the industrial, and particularly the engineering, progress being made in this country.

The Wonbah Molybdenite Mine and Mill, Queensland, Australia

Mineral Occurs in a Pipe of Quartz—Ore, After Being Crushed by Stamps, Is Treated in Mechanically Agitated Flotation Machines

By J. H. Reid
Written for *Engineering and Mining Journal*

THE Wonbah Molybdenite Mining Co., Ltd., is the premier producer of molybdenite in Queensland and apparently also in Australia. The mining lease is situated at Wonbah, a siding on the railway to Mount Perry from Bundaberg, the latter being one of the largest sugar-growing centers in Australia. It is about sixty miles inland from the Pacific coast in the heart of the Coastal Range.

Geologically, the occurrence is of extreme interest, for it consists of an almost pure white quartz pipe in granite, close to a dike of quartz-porphyry and near the periphery of the *massif* in its contact with Paleozoic slates. The pipe, which is almost cylindrical, varies from 42 ft. to 60 ft. in diameter between the surface and a depth of 200 ft. It is not tortuous and has a regular inclination or dip of about 15 deg. from the vertical. Calcite is rather abundant and in the lower levels small masses of chalcopyrite, pyrite, galena, and blende have appeared. The outer zone of the pipe is the working area, being richer in molybdenite. The working face is 16 ft. across, leaving a central core standing about 25 ft. in diameter, which is relatively poor.

The ore consists of white milky quartz with coarse and fine flakes, and also masses, of molybdenite. The base sulphides mentioned occur as small segregations, which are discarded in mining, leaving quartz and a little calcite as the only gangue to be eliminated in the flotation treatment. The ore going to the mill averages 0.8 per cent MoS_2.

The mill comprises a battery of ten head of heavy quartz stamps in conjunction with a 12-in. unit oil-flotation plant (Minerals Separation Co. and De Bavay's patent). The flotation machine is driven by a 33 hp. Crossley suction gas engine with openhearth generator. Recently thirty to forty tons of ore have been treated per day (three shifts). The crude ore is broken to 1½ in. and passes to a plant storage bin (capacity fifty tons) on a slow conveyor belt which permits boys to hand-pick the material, all solid ore being thrown on to a dump, from which it is bagged and shipped direct.

The 1,000-lb. stamps, with ninety-eight drops per minute, crush the ore to pass woven-wire screens with 625 holes per square inch. The pulp is elevated to a Callow settling spitz, which feeds the coarser particles to the stirrer boxes while the slime overflow is carried by launder to a Dorr thickener (capacity 100 tons). The thickened slimes are laundered to a 4-in. elevator having a speed of 200 ft. per min., and elevated to meet the feed from the Callow settler.

The flotation machine is a 12-in., six-stirrer unit, and consists of six stirrer boxes at the back of the machine and six flotation boxes at the front. The stirrers, or mixers, have a speed of 450 r.p.m. The pulp from the Callow settler and Dorr thickener is introduced into the first stirrer box with four parts of water to one part of pulp, and eucalyptus oil is automatically added, ¼ lb. of oil to one ton of crushed ore. Extremely small quantities of kerosene, of unfixed amount, are also added periodically to assist frothing.

The comminuted ore is forced into the flotation box, where the floated MoS_2 overflows and is carried by launder to two concentrate bins 10 ft. x 5 ft. x 4 ft. 6 in. each. The non-floating gangue, with up to 10 per cent of unrecovered molybdenite, is passed through the remaining five flotation units, and from the last box the residues go to the tailing dump. The initial treatment gives a concentrate of 70 per cent MoS_2, but at the end of the month the whole of the concentrates are retreated, bringing the grade up to 90 per cent.

The concentrates are dried on a small openhearth furnace and bagged. The output is purchased and exported by Messrs. Dalgety & Co. on behalf of the British government. The following figures give the output of the mine and the value of the concentrates for the last two years:

Year	Crude Ore, Long Tons	MoS_2 Concentrates, 90 per Cent, Long Tons	Value, £
1918	2,435	13 95	6,052
1919	6,026	41 75	18,100

It will be seen that the production last year was considerably greater than in 1918.

Rumanian Mineral Resources

Minerals in Rumania which have not yet been fully exploited, according to *Commerce Reports*, are asphalt (the Germans exported 3,000 tons), mica (the Germans exported 400 tons), and graphite. Throughout the mountainous areas there are quarries of granite, quartz, sand, limestone, gravel, china clay, gypsum, and some minor minerals, which could be worked with advantage. It is only recently that this wealth has been exploited.

An Old Game With a New Angle

SAN FRANCISCO CORRESPONDENCE

THERE is a nice kettle brewing away out in the Far West. The Broken Hills Silver Corporation, Governor Boyle of Nevada, the Fidelity Finance Funding Co., of Reno, Nev., G. E. Arrowsmith & Co., of San Francisco, E. C. Bellows, State Commissioner of Corporations of California, the San Francisco Stock Exchange, Jacob S. Herzog, better known as George Graham Rice, a few lawyers and mining engineers, as well as the Blue Sky Law of California, several newspapers of San Francisco and that part of the public eager to thrust its money into every widely advertised mining project are the chief ingredients in the kettle. Needless to say, it is not a savory mess. The pot is so actively boiling that it is difficult to disentangle the relation between the good and bad ingredients.

As near as ascertainable the facts are these: The Broken Hills Silver Corporation was incorporated under the laws of Nevada to acquire and operate a silver prospect southeast of Fallon, Nev. According to accounts, the property in question is considered to be a likely prospect. Shipments of high grade have been made, and attracted considerable attention. The company was capitalized at 3,000,000 shares, par value 10c. each, treasury stock 2,000,000 shares, the stock being fully paid and non-assessable. Ed Malley, of Carson City, treasurer of the State of Nevada, is named as the president of the company. The 2,000,000 shares of treasury stock have been underwritten by the Fidelity Finance & Funding Co., of Nevada, reputed to be under the control of George Graham Rice. This company is said to have imposing offices in Reno. C. H. McIntosh is president.

It should not be overlooked that George Graham Rice once made Reno and Nevada the center of his activities before he moved to the richer fields of the East. According to an advertisement that appears in the *San Francisco Chronicle*, on Oct. 8, 1920, the Fidelity Finance & Funding Co., of Nevada, will pay the Broken Hills Silver Corporation $380,000 for this 2,000,000 shares of treasury stock. After this whole transaction is over, it appears from the same advertisement that the Broken Hills Silver Corporation will possess the mine and have left available assets of $247,500, which is presumably to be spent for mine development, equipment, and operation.

Under date of Oct. 7 the stock was sold at approximately 19.5c. per share on the San Francisco Stock Exchange. At this price the whole 2,000,000 shares would have a sales value of $390,000. This would indicate a profit of $10,000 to the Fidelity Finance & Funding Co. It is obvious that the dear public is to be stampeded into actively bidding up the stock so that its sales price will be forced upward without regard to intrinsic values. All such activity will swell the profits of the Fidelity company, although the mine itself will get no additional capital. It, the mine, has farmed out its stock for $380,000. The Fidelity company gets all above this that it can. It's an old story with new words.

G. E. Arrowsmith is the San Francisco broker handling the stock sales in San Francisco. He has placed an extensive advertisement in the *San Francisco Chronicle* of Oct. 7. This advertisement is cunningly worded and undoubtedly designed for stampeding the unwary, the ignorant, and the "suckers" into parting with their money. It appears from published accounts emanating from E. C. Bellows, State Commissioner of Corporations of California, that the Broken Hills Silver Corporation began in June to arrange to sell its stock without first applying for permission from the Commissioner of Corporations, as required by the California laws. When this was called to George Graham Rice's attention he filed a "statement of fact" with the commissioner. This was not an application for a broker's license. Rice later asked the commissioner to investigate his holdings in Nevada. This was done and it is stated that the findings of the commissioner's engineer, Fred M. Miller, were unfavorable.

To the surprise of the commissioner the stock was offered for sale on the floor of the San Francisco Stock Exchange. W. G. Deal, attorney for the San Francisco Stock Exchange, according to published statements, said that the San Francisco Stock Exchange listed the stock of the Broken Hills Silver Corporation after a formal application accompanied by a letter from a reputable Reno lawyer as to title and after examination had disclosed that reputable persons of Nevada were officers in the company and that Arthur Perry Thompson had made a report that the property was one of merit. Upon that showing the property was listed. The discovery was then made that the Commissioner of Corporations had no jurisdiction over sales made on the floor of the exchange between brokers. Thus a hole is punctured in the California Blue Sky Law.

Apparently now the only restraint upon the sales of miscellaneous stock is the good faith of the Stock Exchange with the public. The significance of these happenings will be appreciated when it is said that in 1919 the total of transactions in Divide stocks reached $50,000,000. The San Francisco Stock Exchange is made a party, unwittingly or otherwise, to the evasion of the laws of the State of California because it affords a market for stock speculation.

Governor Emmet D. Boyle of Nevada was drawn into the limelight by reason of a letter which he sent to C. H. McIntosh and in which he made indiscreet statements about the merit of the property. This letter appears in the stock-selling advertisements in the *San Francisco Chronicle* of Oct. 8. In sharp contrast, there is the effort of Commissioner E. C. Bellows to protect the public and enforce the California laws against questionable practices, and two officials of the State of Nevada lending their names to a company of questionable repute.

The situation is worth the attention of the mining industry for the reason that it introduces a new angle of an old game. In this case the prospect has some intrinsic value, but it is probably considerably less than $380,000, the sum for which it was underwritten. By questionable publicity it is being forced upon the public at an inflated value, the inflated value going to enrich the pockets of certain people who have little interest in the property as a mining proposition. Something for nothing. The public, or at least that part of the public that is not astute enough to distinguish an even break for its money, pays.

Mine Operators of Note

Walter Fitch, Sr.

BY GEORGE J. YOUNG
Western Editor *Engineering and Mining Journal*

A KEEN logical mind, close observation, and a knowledge of men and affairs, if coupled with initiative, constitute another recipe for success. Walter Fitch did not have a college education. Nevertheless he has made a success in the things he has attempted. Unlike some self-made men he is eager to concede the value of college training and has put his sons through that excellent institution, the Michigan College of Mines. In educating young engineers he believes that contact with bright minds is essential. He says "a man not possessed of an engineering education is unable to overrate its value." Walter Finch was born in London and had the usual education in the English private schools. He first went to work in a lawyer's office and then gravitated into the printers' and stationers' business. At the age of twenty, he became dissatisfied with the outlook that presented itself to him and decided to go to America. He went to Michigan and grubbed around in mines to secure a start. He accepted any employment that offered. At the end of five years he was superintendent of two mines and subsequently went from position to position as opportunity for advancement offered itself. In all he spent thirty years in the Michigan mines and as a result reached a high place in a mining region where there were many good men. At about the time he was thinking of retiring, he went to Utah. He became interested in the Tintic district and made a general study of mining conditions there. Securing the services of James R. Finlay, who, as Mr. Fitch said, knew more about "limestone mines" than he did, he made good use of that engineer's knowledge. With Finlay's help he visualized the geological conditions and formed definite opinions as to the continuity of the prevailing lines and zones of mineralization. Noting that the trend of these crossed some ground upon which a mine known as the Little Chief was operating with poor success, he interested himself in this mine. At the time the shaft of the mine was 800 ft. in depth and a large amount of work had been done west of a north-south line through the shaft. Despite twelve years' work and forty-three assessments, the mine had failed to find profitable ore in quantity. East of the shaft no underground work had been done, and Mr. Fitch reasoned that here was an excellent gamble. Half of the work had been done without success. There was only one other place to go. In spite of Mr. Fitch pointing out to the owners of the mine the conclusions of his studies, they were not enthusiastic nor did they at the time make any effort to follow them up. They finally asked Mr. Fitch to go in with them and test out his conclusions. Moved by the dominating motive of securing an opportunity for his two sons, who were completing their mining education, Mr. Fitch decided to go into the project. The general plan so roughly sketched out in the beginning was followed. Anticipation became a fact. The shaft was sunk from 800 to 1,400 ft. While sinking a crosscut was driven at the 1,000-ft. level and penetrated the ore zone. At this point no ore was discovered but the mineralized zone was definite. The 12th level yielded nothing. On the 14th level drifting was started upon the ore zone, and day by day the samples gave no encouragement, when one day a return of 1,700 oz. of silver per ton was received. A rich orebody had been discovered. This was in 1908, and since then a number of orebodies have been found. Up to the end of 1919 the amount of development totaled 125,038 ft. In 1909 the production was 75,849 oz. of silver, 120 oz. of gold and 146,028 lb. of lead from a total of 1,325 tons. In 1919 the production was 2,757,533 oz. of silver, 3,753 oz. of gold, 5,979,588 lb. lead, and 15,574 lb. of copper from 63,726 tons of ore. Walter Fitch had faith in his deductions. The mine which he was so fortunate in discovering is now being operated by his sons. Mr. Fitch believes in concentration of effort. He and his sons have settled in Utah, and are devoting themselves to Chief Consolidated.

WALTER FITCH, SR.

By The Way

Currency Exchange and Gold

In his account of travels and discoveries in North and Central Africa, from the journal of an expedition undertaken under the auspices of the British government in the years 1849 to 1855, Dr. Henry Barth made several references to the kinds of money used by the inhabitants of the regions extending from Tripoli southward. In describing a market place, he stated that though the women were profusely ornamented with strings of glass beads, the men were generally wearing a short black shirt and a small straw hat, their neck adorned with several strings of *kúngona* or shells. Continuing, he said "There is not at present any standard money for buying and selling; for the ancient standard of the country, viz., the pound of copper, has long since fallen into disuse, though the name, *rotl*, still remains. The *gábagá*, or cotton strips which then became usual, have lately begun to be supplanted by the cowries or *kúngona*. . . Eight cowries or *kúngona* are reckoned equal to one *gábagá*, and four *gábagá*, or two-and-thirty *kúngona*, to one *rotl*. Then, for buying larger objects, there are shirts of all kinds and sizes; from the *dóra*, the coarsest and smallest one, quite unfit for use, and worth six *rotls*, up to the large ones, worth fifty or sixty *rotls*. But, though this is a standard value, the relation of the *rotl* and the Austrian dollar, which is pretty well current in Bórnu, is subject to extreme fluctuation." Further on he says that Dr. Overweg, the geologist of the party, succeeded in purchasing a goat with his servant's shirt. "This article, even if much worn, is always regarded as ready money in the whole of Negroland, and as long as a man has a shirt he is sure not to starve." But what we started to tell about is that while exploring the headwaters of the Bénuwé River, south of Lake Tsád, Dr. Barth learned that the river carries gold in its sands. He made the discovery while bathing in the river, where the shelving bank and a swift current caused him to submerge involuntarily several times. The natives, as often as he dipped under water, cried out that he was searching for gold, the presence of which was known to them. Observing the shirtless condition of the doctor, and his dredging motions at intervals, their conclusion was both logical and obvious.

A Divining Rod With a Whang

It has taken C. A. Japhet, of Seneca, Kan., thirteen years to devise a magnet that is an infallible guide to the discovery of oil and gas wells, according to the *Seneca Tribune*. Though we would not belittle another's achievement, it seems that Mr. Japhet could have done as much in thirteen months. However, the instrument is said to be exceptional in that it will meet all the critical tests to which it may be subjected. It is described as a cone with a 4½-in. base and 7 in. high. A copper-coated plate surrounds the apex, reaching half way down the side. The cone is filled with chemicals whose nature, of course, cannot be divulged. "At the apex is a staple set in a leather whang. To the whang is tied a linen cord 9 in. long. At the end of the cord and supporting the cone so that it may swing freely is an ordinary clothespin." The whole thing weighs about 3 lb. and is seen to be quite simple in construction. According to Mr. Japhet, an oil pool or a gas pocket far below the surface of the earth causes this cone to swing in varying circles, though he admits he cannot tell why. The chemical combination inside the cone does the trick. Only one who has the gift of water-witching can work this magnet, says Mr. Japhet.

The Jack Pot Kitty

An interesting method of placer mining was proposed some years ago by an enthusiastic West Coast tourist or tropical wanderer, in the course of his efforts to interest a little development capital. Writing from the Republic of Potoma (sometimes referred to as the lost province), he expatiated on the advantages of La Recompensa mine, located on the Sisic River. His tale was almost literally as follows: "The Sisic River has been washing down mountains full of gold ore ever since Potoma exists, and there has been nothing done to it. The gold occurs in the plyers of the river, with 2 to 5c. gold in every shovelful. The river also has pusses every now and then, and the gold is washed down to the pusses, where it stays. La Recompensa mine holds two pusses, one 30 ft. deep and one 18 ft. deep. The Sisic River is 30 ft. wide on this mine and the pusses are situated between two mounds. It would be easy and inexpensive to build wooden flueses to carry water over the pusses. With the same water power a pump could be used to pump the water out of the pusses up to the bedrock; then smooth out the pusses with cement and put quicksilver on the bottoms, so in the rainy season we can take up the flueses and let the water that carries the gold run in again. So, every year we can pump it out and have a good deal of profit without any expense of labor." If the combing of the beaches or *playas* is done with a steam shovel, the estimate of values seems conservative. The mysterious "pusses" are probably *pozos* or potholes, popularly conceived to be repositories of untold wealth. Happy the man who may seek his hammock at the end of the dry season and enjoy an uninterrupted series of rummy siestas; while his faithful pusses purr contentedly as they seize the scurrying golden mice.

Relief for Magnesite Producers

We have been asked for the address of the gentleman who "recently wrote an article on the subject of manufacturing egg shells from magnesite." Our correspondent doubtless is thinking of the news item that we published in all seriousness some time ago to the effect that an official of a Washington magnesite company was giving his hens ground magnesite instead of lime, thereby improving the quality of the resulting eggshells, or so it was alleged. This may or may not be considered manufacturing, according to one's point of view. Possibly the magnesite is converted from the crude into the finished product on the hen's premises. On the other hand, the magnesite, which when pure is $MgCO_3$, may act simply as a pre-natal determinant or something of that sort. At present the Bureau of Mines has a co-operative agreement with the Northwest Magnesite Co., and it will be well if this subject is given careful study. One has only to consult the statistical reports of the National City Bank to learn the huge number of eggs laid in one year in the United States, and throughout the world, in fact. He will then see what a chance awaits the producer of magnesite.

CONSULTATION

United States Mining Laws

"I am interested in procuring a set of the mining laws of the United States, and have been referred to you as being able to suggest a proper reference. My idea is to have a pamphlet or small book, not one of those voluminous works on the thousand and one legal decisions rendered in mining litigation, but something giving all the laws."

An excellent paper covering the mining laws of the United States is issued by the General Land Office, Department of the Interior, Washington, D. C., and is entitled "United States Mining Laws and Regulations Thereunder." It is a 104-page pamphlet giving the laws and regulations regarding the reservation, exploration, location, possession, purchase, and patenting of the mineral lands of the public domain. No one interested in mining matters should be without it.

Although the pamphlet does not touch upon the interpretation which the courts have placed upon the various sections, clauses, and words of the legislation, it gives the groundwork of the country's mining laws. For a discussion of the working of the mining laws reference of course should be made to some work upon the subject, such as "Lindley on Mines," which is a voluminous compilation covering the interpretation of mining legislation by the courts.

For the mining regulations of the several states recourse can be had to the respective secretaries of state for information, as there are certain regulations which are subject to state control, such as the maximum width of a mining claim.

Besides the Congressional legislation enacted to cover the exploration of the public domain's mineral wealth, there are also the regulations of the various states covering principally safety work, mine inspection, and other matters concerning the operation of a mining property.

American Mining Capital in South America

"I am greatly interested in the extent to which American capital is involved in the development of South America's mineral resources (metallic), and would request you kindly to give me an estimate as detailed as possible covering the larger operations, with such other supplementary data as may make the matter more informative."

A surprisingly large amount of American capital is being employed in the development of South America's great mineral resources, and although it is difficult to obtain exact figures of the amount, an estimate can be readily made. With that idea in view, the following list of the largest and more important American mining and smelting companies in South American countries has been prepared, giving the capital invested in the operations and various outstanding features of each enterprise.

A conservative estimate of the total capital invested in the development of South American mines, disregarding the many millions of invested capital omitted from the table through lack of accurate information, would be $163,206,790. It would be safe to say that about $240,000,000 of American capital has found its way to South America.

The capital distribution so far as it can be ascertained is approximately as here noted:

Bolivia	
Guggenheim Brothers, 120 Broadway, New York, engaged in the development of tin properties. Capital engaged	(a)
International Mining Co., 7 Hanover Square, New York, owned by W. R. Grace & Co. and engaged in mining of tin and tungsten ores. Capital engaged	(a)
Chile	
Andes Copper Co., 42 Broadway, New York. A subsidiary of the Anaconda Copper Mining Co., developing an immense copper property in Chile. Capital	$50,000,000
Bethlehem Chile Iron Mines Co., 111 Broadway, New York. A subsidiary of the Bethlehem Steel Corporation, developing Chilean iron mines. Capital	(a)
Braden Copper Mines Co., 120 Broadway, New York. A subsidiary of the Kennecott Copper Corporation, with large copper holdings. Capital, approximately	$28,000,000
Societe de Minas y Fundiciones de Carrizal, owned by the American Smelting and Refining Co., and operating two smelting plants in Chile. Capital	(a)
Chile Copper Co., 120 Broadway, New York. a Guggenheim property developing an immense copper deposit. Capital engaged	$53,800,000
Fundicion de Guayacan, 61 Broadway, New York. A subsidiary of the American Metal Co., employed in copper smelting. Capital engaged	729,000
Santiago Mining Co., 42 Broadway, New York. A subsidiary of the Anaconda Copper Mining Co., developing Chilean copper properties. Capital	10,000,000
South American Metal Co., 61 Broadway, New York. A general trading company supervising exploration work in South America of American Metal Co. Capital	250,000
Colombia	
Breitung Mines Corporation of Delaware, 11 Pine St., New York. A holding company to own or control promising mining properties. Capital	1,127,790
Mammoth Gold, Silver, and Platinum Mines, Los Angeles, Cal. Placer holdings in Colombia. Capital	(a)
South American Gold & Platinum Co., 61 Broadway, New York. A holding concern for various shares of gold and platinum mining companies operating in Colombia. Capital	$ 9,500,000
Peru	
Cerro de Pasco Copper Corporation, 15 Broad St., New York. A large copper property in Peru. Capital engaged	49,000,000
Peruvian Copper & Smelting Co., 115 Broadway, New York. Development of copper-silver and silver-lead mines in Peru. Capital	4,600,000
Vanadium Corporation of America, 120 Broadway, New York. Extensive vanadium deposits in Peru. Capital	10,000,000
Total	$217,006,790

HANDY KNOWLEDGE

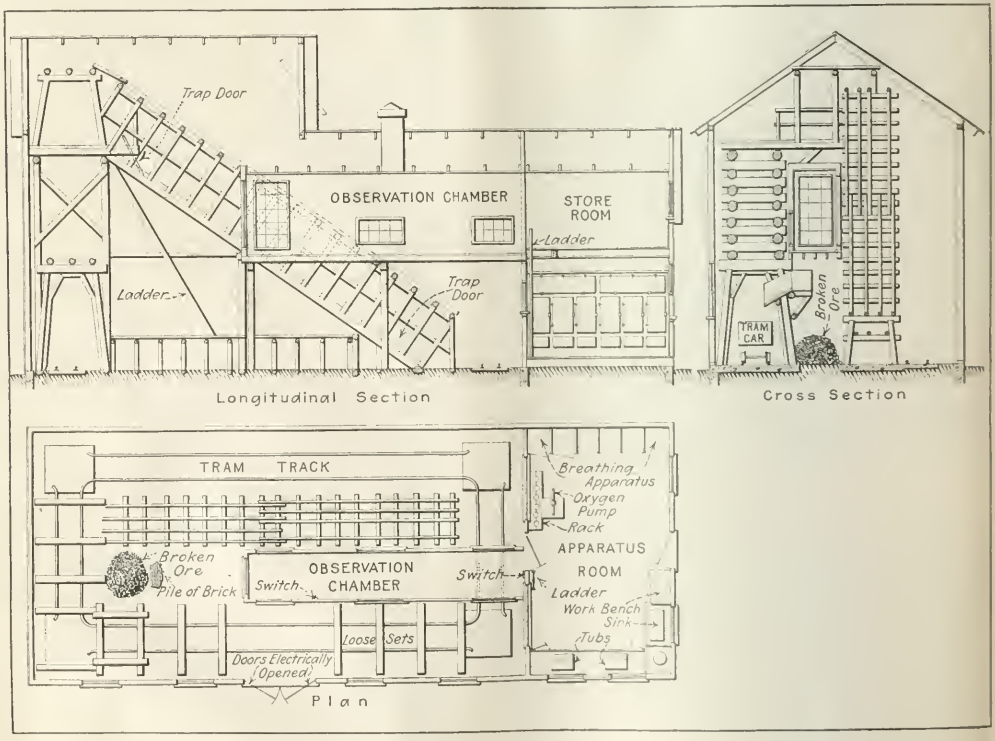
A Practical Mine Rescue Building*

By R. H. Seip

The first aid and mine rescue training quarters of the New Jersey Zinc Co. at Franklin, N. J., are shown in the accompanying sketch. This building was constructed for the purpose of securing for the men who are trained in mine rescue work, conditions similar to those met in the mine. The ground floor is divided into two rooms: an apparatus and instruction room 13 x 22 ft. and 8 ft. in height, from which a door gives access to the smoke room immediately adjacent to it, and the smoke room, 22 x 43 ft., varying in height from 20 to 28 ft., to permit the erection of the necessary timber. Double doors on one side open to the outside of the building. These doors are equipped with electric door openers, which may be operated from the apparatus room or the observation chamber. The doors are counterweighted, so that their operation in opening is entirely automatic. This feature, in addition to a window in the upper part of the building operated by a rope, provides for the rapid removal of fumes should an emergency make it desirable. The floor of the smoke room is cinder covered.

Above the apparatus room is a small storage room, from which an observation chamber projects into the smoke room for a distance of 24 ft. This is ventilated by a separate ventilator in the roof. Access to both the storage room and observation chamber is obtained by a vertical iron ladder from the apparatus room.

One end of the apparatus room is equipped with six vertical closets for the storage of the apparatus, each closet accommodating two sets of apparatus. Above these closets are two horizontal compartments for new first aid supplies, and below are six drawers for first aid practice materials and other useful paraphernalia. The opposite end of the room is equipped with two copper-lined wash tubs, an antiseptic solution container, and a white enameled sink. The drain boards of all of these receptacles are covered with sheet lead. Hot and cold water faucets are supplied for each tub and sink. A small work bench, with additional cupboards above and below the sinks, completes the equipment, with the



FIRST AID AND MINE RESCUE BUILDING OF THE NEW JERSEY ZINC CO., FRANKLIN, N. J.

*Abstracted from a paper, "Requirements of Rescue Training for Metal Miners," presented at the Ninth Annual Safety Congress of the National Safety Council, Milwaukee, Wis., Sept. 30, 1920.

exception of the charging pump and six oxygen tanks in a rack.

A standard mine car has been installed on standard mine tracks extending around the four sides of the room, with turnplates at each corner. On one side and end of the room are standard mine timber sets, four sets of which are loose for erection or removal in training. Over the rack a vertical cribbed raise has been constructed with a standard chute at the bottom for loading the car. At one side of the center of the room an inclined timbered raise or manway connects with a platform at the top of the vertical raise. Another means of access to this platform is by a ladder beneath the inclined raise to a trap door at the top. A low timbered passageway directly beneath the inclined raise is reached through a trap door at the bottom of this raise. The opposite end of the passageway is left open. Pipe lines have been installed for practice work, as well as the necessary tools, such as axes, hammers, bars, wrenches, and ropes. Smoke or fumes are generated by means of a smudge pot.

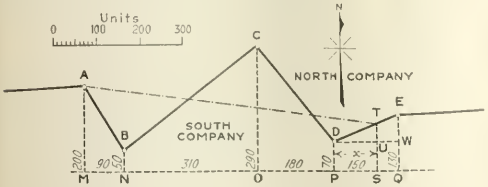
Straightening a Crooked Boundary

A Neat and Accurate Method of Solving a Troublesome Survey Problem—Mathematical Work Greatly Simplified

By Alex Richardson[1]

Written for *Engineering and Mining Journal*

It is sometimes desirable, to facilitate surface or underground work, to smooth the zigzag outline of a joint boundary by substituting an equivalent straight line which will preserve the respective total areas intact. The problem is commonly solved by tedious trigonometrical methods; and the following solution is accordingly offered, as being equally accurate and far more simple:



The method is applicable to boundaries that have been established by chain and offset surveying, but in the case now to be considered it is assumed that the best modern practice has been followed, and that the co-ordinates of all the monuments are available.

CO-ORDINATES OF MONUMENTS

(In feet, yards, meters, or similar unit)

Monument	Latitude (Northing)	Departure (Easting)
A	700	1000
B	550	1,090
C	790	1,400
D	570	1,580
E	630	1,730

Let AT be the desired line to straighten and equalize the irregular joint boundary $ABCDE$. It is required to determine the co-ordinates of the point T.

At any suitable distance from the boundary, here 200 units south of A, take an east-west datum line. The distance of this datum line from the east-west axis of co-ordinates is then $700 - 200 = 500$. The distance BN is therefore $550 - 500 = 50$; CO is $790 - 500 = 290$, and so on.

The distance MN is departure of B — departure of $A = 1{,}090 - 1{,}000 = 90$; NO is $1{,}400 - 1{,}090 = 310$, and so on.

Let x be the departure of T with respect to $D = DU$.

The latitude of T with respect to $D = TU$.

By similar triangles, $TU : DU :: EW : DW$.

$$\text{Therefore,} \quad TU = \frac{x\,(EQ - PD)}{\text{dep. of } E - \text{dep. of } D} = \frac{x\,(130 - 70)}{1{,}730 - 1{,}580} = \frac{2x}{5}$$

$$\text{And} \quad TS = PD + TU = 70 + \frac{2x}{5}$$

By the conditions of the problem, area of figure $MATS$ = area of figure $MABCDTS$. Area of $MATS$

$$= (90 + 310 + 180 + x)\left(200 + 70 + \frac{2x}{5}\right)\frac{1}{2}$$

$$= 78{,}300 + 251x + \frac{x^2}{5}$$

Area of $MABCDTS$ =

$$\left[(250 \times 90) + (340 \times 310) + (360 \times 180) + \left(70 + 70 + \frac{2x}{5}\right)x\right]\frac{1}{2}$$

$$= 96{,}350 + 70x + \frac{x^2}{5}$$

$$\text{Equating,} \quad 78{,}300 + 251x + \frac{x^2}{5} = 96{,}350 + 70x + \frac{x^2}{5}$$

$$181x = 18{,}050$$

$$x = 99.72$$

$$\text{Latitude of } T \text{ from } D = \frac{2x}{5} = 39.89.$$

Total latitude of $T = 570 + 39.89 = 609.89$.

Departure of T from $D = x = 99.72$.

Total departure of $T = 1{,}580 + 99.72 = 1{,}679.72$.

CO-ORDINATES OF NEW MONUMENT

Monument	Latitude	Departure
T	609 89	1, 79 72

The result can be checked by entering the value of x in the equation, and ascertaining if both sides agree. A more complete check is to calculate the areas of the two figures by means of the co-ordinates of their angular points; the results should balance. If the agreement is desired to extend to decimals, it may be necessary to carry out the value of x a little further. For ordinary tabulations of co-ordinates, however, two decimal places are usually sufficient.

DT, the distance to be measured along the line DE to fix the position of T on the ground, can be readily obtained from the right-angled triangle TUD, of which the sides TU and DU are known.

In the case of a boundary whose general trend is north-south, a north-south datum line would be taken. Whether to assume a north-south or east-west datum, what distance it shall be taken from and on which side of the boundary are matters of convenience for the surveyor to decide; the principle on which the solution is based is not affected thereby.

THE PETROLEUM INDUSTRY

Oil Shales of Indiana

Advantages of Location and Homogeneous Character of Raw Material Warrant Expectation of Commercial Possibilities When Experimental Data Determine Satisfactory Method of Recovery—Results of Dry and Steam Distillation Tests

BY JOHN R. REEVES
Indiana Geological Survey

Written for *Engineering and Mining Journal*

THERE is no doubt in the minds of those who have studied the status of the petroleum industry of the United States today that the increase in demand for gasoline, crude fuel oil, and lubricants cannot be met satisfactorily in the future unless recourse is had to other sources of supply than the present production from the oil fields. In the last few years attention has naturally been directed, as a means to relieve this situation, to the oil shales of this country. The success of this industry in Scotland has more than ever made this source of supply seem the logical successor to the waning oil fields. Much experimental work, both laboratory and commercial, has been done on oil shales of some of our Western States, and it seems eminently possible that they will soon be a reliable source of oil.

THE NEW ALBANY SHALE

In Indiana there is a large deposit of oil shale known as the New Albany shale. This body of shale is Mississippian and Devonian in age. The outcrop covers approximately five hundred square miles in Floyd, Clark, Scott, Jefferson, Jennings, and Jackson counties. The outcrop covers a strip of territory about fifty miles long and ten miles wide, from the Ohio River at New Albany north to North Vernon, in Jennings County. The shale lies practically horizontal, but actually dips to the west at the rate of thirty feet per mile. Near the western border of the outcrop the shale is thickest, in many places being more than one hundred feet thick. The total thickness of the shale is about one hundred and forty feet. From the western border of the outcrop the shale gradually becomes thinner toward the eastern border, where only the tops of the hills are capped with shale. The terrain of the area of the outcrop is rolling, but in places the shale stands in bluffs along the streams.

During the last year I have studied this formation and have collected a large number of samples, many of which have already been tested in the laboratory for their oil content as well as for the byproducts, ammonium sulphate and potash. In collecting the samples, a miner's pick was used to dig into the fresh shale, as the weathered shale on the face has lost much of its bituminous content. Each sample is a composite representative of the outcrop from which it was taken, as small parts of the sample were collected from each vertical six inches. Some samples were collected where the shale had been freshly blasted from a face and where wells were being dug, thus being representative of the shale that would be used in a plant operation.

The apparatus used in the determinations is the same as that designed by Woodruff and Day and used by the U. S. Geological Survey. (See Bulletin 641.) To compare the results obtained by dry distillation with those attained in using steam, this same retort was fitted so that steam could be used in the distillatory process. The results are given in gallons of oil, pounds of ammonium sulphate, and cubic feet of gas, per ton of shale. The table below shows the results obtained from samples taken at random. Results with and without the use of steam in distillation are shown.

INDIANA SHALE DISTILLATION WITH STEAM

Gallons of Oil	Cubic Feet of Gas	Pounds of Ammonium Sulphate	Per Cent Fixed Carbon	Per Cent Volatile Hydrocarbons	Per Cent Ash

From a commercial point of view there are several valuable features of these shales. In the first place, quarrying will be a comparatively simple matter and of the cheapest type. It may be done by blasting and steam shovel, the material being fed to the plant by gravity. The shale is so homogeneous in texture that the sorting out of foreign material will be practically unnecessary. It is much easier to crush than limestone, and as its hardness and other physical characteristics are the same throughout the formation, this will be an easy operation to handle. These shales do not coke in the retort, and the distillation may be carried on at a low temperature. Potash may be extracted by hot water and evaporation. A great and expensive acreage will not be necessary if the plant is built where the shale is thickest. There are several places close to railroads and water where there is ninety feet of shale above the level of a valley.

Although the Indiana shales are not as high in oil content as some others, the excellent yield of byproducts in the distillation, as gas, ammonium sulphate, and potash, as well as the valuable byproducts from the refining of the crude oil, the ease and low cost of mining, homogeneous character of the shale, good water supply, and very good railroad transportation will com-

pensate for this comparative deficiency. The retort that will be used will be probably one of a large capacity, simple but scientific in construction. This will have to be developed by experimental work on a commercial scale.

U. S. Oil Production for September Registers Decrease

Record Figures Shown in Monthly Consumption and Imports—California Takes First Place In Daily Production

THE following statistics of petroleum production in the United States east of California in September, 1920, and the two preceding months, based on reports filed with the U. S. Geological Survey, show the quantity of oil received from producers by pipe line and other marketing companies and by refineries that receive petroleum through private pipe lines or in tank cars directly from the wells. Data concerning oil consumed on the leases and producers' storage cannot be obtained in time for use in the monthly reports, but are used in compiling the annual figures showing production. The production reported for California is the average shown by figures collected by the Standard Oil Co. and by the Independent Producers' Agency and includes all petroleum brought to the surface.

PETROLEUM PRODUCED IN THE UNITED STATES IN JULY, AUGUST, AND SEPTEMBER, 1920.

(Barrels of 42 U. S. Gallons)

State	September, 1920 Total	September, 1920 Daily Average	August, 1920 (a) Total	August, 1920 (a) Daily Average	July, 1920 Total	July, 1920 Daily Average
California	9,128,000	304,267	8,997,000	290,226	8,583,000	276,871
Oklahoma	9,084,000	302,800	9,371,000	302,291	9,328,000	300,903
Central and Northern Texas	5,766,000	192,200	(b) 6,148,000	198,322	6,009,000	193,839
Coastal Texas	2,114,000	70,466	2,264,000	73,033	2,160,000	69,678
Kansas	3,629,000	120,967	3,721,000	120,032	3,621,000	116,806

Montana	37,000	1,233	(c) 9,000	290	8,000	258
Colorado	9,000	300	10,000	323	9,000	291
Total	37,845,000	1,261,500	39,397,000	1,270,871	38,548,000	1,243,484

(a) Revised. (b) Includes some petroleum drawn from producers' storage, which was produced in previous months but not heretofore credited to production. (c) Cat Creek field not included.

GAIN OF 353,000 BBL. IN AMERICAN STOCKS OF MEXICAN OIL

Production of petroleum during September, amounting to 37,845,000 bbl., decreased slightly, the daily average being 1,261,500 bbl., as compared with 1,270,871 bbl. in August. Consumption, however, increased to the record figure of 48,670,000 bbl. The deficiency in domestic production was offset by net imports of 10,914,000 bbl., the largest ever recorded in a single month, so that, although there was a decrease of stocks of domestic petroleum of 264,000 bbl., there was a gain in stocks of Mexican petroleum held by importers of 353,000 bbl. Therefore, estimated consumption during September was slightly less than the domestic production plus imports, a condition which has existed since June.

The slight decrease in production recorded for September is due to decreased returns from central and north Texas and north Louisiana. The decrease in both states, however, was more apparent than real, because production for August was credited with some petroleum drawn from producers' storage but produced in previous months and not heretofore credited to production. Increased production is reported for the other states, excepting Colorado. California attained the record daily production of 304,267 bbl., supplanting Oklahoma as first in rank. The report of production from the Cat Creek field, in Montana, places that state ahead of Colorado.

DOMESTIC PRODUCTION SHOWS INCREASE

The net decrease of domestic stocks was contributed to by withdrawals from stocks of California, north Louisiana, and Appalachian grades. The continued increase in stocks of Mexican petroleum held by importers reflects the increased imports.

During the first nine months of 1920 domestic production increased in round numbers fifty million barrels compared with the first nine months of 1919, and imports increased thirty million barrels. This record indicates that production plus imports in 1920 will exceed five hundred and twenty-five million barrels. In view of the greatly increased consumption, however, it is not yet evident whether the increased supply will make possible a net addition to the stocks on hand by the end of the year.

Petroleum Refining in Dutch West Indies Exhibits Important Development

The most important industry of the Dutch West Indies, according to Consul William Bardell, is the refining of petroleum at Willemstadt, where the plant of the Curacao Petroleum Co. keeps more than 1,000 hands employed. The establishment up to this time has cost nearly $2,000,000. This company for a while was greatly handicapped in obtaining crude oil from its wells in Venezuela, because of the lack of appropriate vessels. This difficulty, however, has now been practically overcome, and the refinery receives large quantities of crude oil, not only from its own wells in Venezuela, but also from Mexico.

The plant is at present working day and night. Machinery for the manufacturing of tin cans to hold the gasoline has recently arrived from the United States, and the company hopes, within a short time, to be capable of turning out about 5,000 cans of gasoline daily, which it expects to sell to all of the West Indies and the northern part of South America. Many oil-burning vessels now stop at this port for fuel oil furnished by this company.

NEWS FROM THE OIL FIELDS

Cat Creek Field Output Estimated at 10,000 Bbl. Daily

From Our Special Correspondent

The Frantz Corporation, operating in Cat Creek field, Montana, recently brought in a third well, an offset to its No. 2, showing a flush output of 2,000 bbl. The Frantz, Mid-Northern and Forbes interests also brought in a well with a flush output of 1,500 bbl. Output of the Cat Creek field now is approximately 4,600 bbl. daily, not including the production of the last two named wells, and the field now is estimated to have a capacity for an output of 10,000 bbl. daily, which is larger than that of the Salt Creek field, in Wyoming. The well being drilled by the Anaconda Copper interests has a production of 150 bbl. and the deeper sands have not yet been reached. The Carter Oil Co., a Standard Oil subsidiary, has started drilling in the Duck Creek section, near Billings, Mont., and has reached a depth of several hundred feet with a 22-in. hole. It is proposed to go at least 4,000 ft. here in exploratory work, and about 3,000 ft. of casing is already on the ground. The size of the well is larger than the general run of wells being drilled. The Dutch Shell interests also have representatives in the Cat Creek field.

Oil Prospectors Seeking Claims in Arctic Country

From Our Special Correspondent

As a result of the oil strike at Norman, at the confluence of Great Bear River and Mackenzie River, N. W. T., by the Imperial Oil Co., several parties are leaving Edmonton by dog team for the new field, to stake claims in advance of the other prospectors who will go north by the river route in the spring. Owing to the prospective rush of next season, all available berths on steamers plying to the north have already been reserved. The prospectors now starting out with a view of reaching Norman this winter are likely to be turned back by the Mounted Police at Fort Smith, on the Slave River, unless they can show that they have sufficient food supplies and are otherwise equipped to encounter the severity of the Arctic winter.

Shortage of Oil-Well Equipment Hampers Production

With the advent of the recent land-leasing bill additional petroleum production may be looked for provided the operators can secure the necessary equipment to drill, according to the Independent Oil Producers' Agency. Owing to the enormous demand for drill pipe and casing in Texas, Wyoming, and other fields, California has experienced difficulty in getting needed supplies. The American Petroleum Institute has secured through the Interstate Commerce Commission the allotment of sixty cars per day for the shipment of oil-well material from the mills to the fields. This co-operation should ameliorate local conditions to some extent, but California is in dire straits, due to an insufficient supply of material at a time when it is needed most. If this allotment is maintained there remains but one other factor: Can the mills supply the needed equipment? If they cannot, conditions must be remedied immediately by expansion and the output increased.

So acute has this shortage of oil-well equipment become that casing and material of wells which do not net a fair return because of the present insufficient price of oil are being used in further development work.

Completion of Bowling Green Refinery Expected Jan. 15

From Our Special Correspondent

Shipment of material for the new 1,500,000 bbl. refinery at Bowling Green, Ky., is rapidly progressing. Completion is expected by Jan. 15. This refinery has contracted for 2,000 bbl. of crude daily, with options on 2,000 bbl. more, as it is expected that the refinery will have to be enlarged.

Well No. 6 on the John Covington lease, estimated at 100 bbl., between the Three Springs and Nashville pikes, Warren County, has been completed. The five other wells on this lease are producing. Well No. 2 on the Brownfield lease, west of Bowling Green, flowed twice last week. It is estimated that this well will produce between 50 and 60 bbl.

The White Plains Oil Co. has a well on the John Strait lease in the Halifax pool of Allen County, pumping 100 bbl. The well on the Bailey lease, shot last week, is reported by Joe Hicatt good for 250 bbl.

September reports show Lee County still head of the production column with 443,157 bbl.; Estill, 97,667; Allen, 74,009, and Warren County, 44,454 bbl.

Blue Ridge Tracts Bring High Figures for Texas Leases

From Our Special Correspondent

Blue Ridge, Fort Bend County, Tex., is now attracting more attention than any other Gulf Coast oil field. First, the Gulf Production Co. brought in two wells on the northeast side of the dome, and these were followed by the Texas Co.'s No. 1 Robinson on the west side, flowing several thousand barrels a day initial production. This well, following the completion of the Gulf Co.'s producing wells, indicates the possibility of a large acreage of oil-bearing territory; at least, the oil scouts believe so, and leases on tracts of any acreage are in demand.

One of the largest deals reported so far was on a seventeen-acre tract divided into one-acre lots adjacent to the Texas Co's No. 1 Robinson. Prices for the leases, it is stated, ranged from $10,000 to $17,000 per acre bonus plus one-sixth royalty.

Successful Cementation Completed in Wyoming

From Our Special Correspondent

Well No. 30 of the Buck Creek Oil Co. in the Lance Creek oil field, Wyoming, which was cemented a short time ago by Government cement experts in an effort to cut off the water, is now flowing about 300 bbl. of oil per day, with no water. No. 38 well, an offset to No. 30, has since been cemented and is ready to be drilled in.

The company will conduct other drilling operations in the Lance Creek field. Its total production from this field is now 460 bbl. daily. Since the discovery of oil in the southeast anticline of the Mule Creek oil field, it is believed that deeper drilling in the western and more prominent anticline will show oil to exist there in the Dakota sandstone. The wells of the Mule Creek field are small producers, 150 bbl. a day being about a maximum, but the oil is of high grade.

Salt Water Intrusions on Lot 114

From Our Special Correspondent

The week ended Oct. 23 has proved to be one of the most important in the history of the Mexican oil fields. In the last seven days no less than five gushers have been reported to be showing signs of the intrusion of salt water. The center of action is the lower Chinampa field, in the vicinity of the famous Lot 114. (This lot contains more huge gushers than any other piece of land of its size in the known oil world.)

Thompson's No. 1 has been entirely closed in, due to the high percentage of water. The well was brought in about the first of the year, and has been flowing between 30,000 and 40,000 bbl. every day since that time. The Union Oil Co.'s well, also on Lot 114, has been showing salt, and will soon be shut down. This well was completed on July 17 and was rated at 85,000 bbl. daily production.

Other wells reported to have gone to salt are owned by the International Petroleum Co., the Texas Co., and the Freeport Mexican Petroleum Co., with an aggregate production of 200,000 bbl. per day. The salt-water intrusion on Lot 114 is not dampening the efforts of the drillers on that lot, as no fewer than ten wells are being rushed to completion.

Book Reviews

The Manufacture of Sulphuric Acid in the United States. By A. E. Wells and D. E. Fogg. Paper, 6 x 9; pp. 216. Published as Bulletin 184, Bureau of Mines, and obtainable from the Superintendent of Documents, Washington, D. C., for 40c.

This is a more pretentious book than many of the Bureau publications. Although not to be compared, of course, to the classic work of Lunge on this subject, it is an excellent review of recent developments in the industry and of the equipment and methods used in sulphuric-acid manufacture. A discussion of the supplies of sulphur-bearing raw materials and mention of the uses of the acid are included. The information given is generally known among acid manufacturers, for it was obtained from them, and confidential matter of course has not been published, but others will find much that is new and of interest. It should make an excellent college textbook.

Sulphuric acid is being made from roaster gases at the following copper smelters: Garfield Smelting Co., Garfield, Utah; Anaconda Copper Mining Co., Anaconda, Mont.; American Smelting & Refining Co., Perth Amboy, N. J.; Mountain Copper Co., Martinez, Cal.; and Calumet & Arizona Mining Co., Douglas, Ariz. Waste gases from copper blast furnaces are used at the Tennessee smelters of the Tennessee Copper Co., and the Ducktown Sulphur, Copper & Iron Co. At all of these plants the chamber process is used; in fact throughout the country, except in the South, chamber plants outnumber those using the contact process two to one. In the South, every plant—and there are nearly a hundred, with the exception of a government powder plant at Nashville, Tenn.—uses the chamber process. Most of the patents for the contact process will expire in 1923, and after that time that process may increase in popularity, as it produces acid more economically, although requiring highly trained operators and pure ores.

We understand that no free copies of this book are available. E. H. R.

"The Limestone and Phosphate Resources of New Zealand." Part I, Limestone, by P. G. Morgan, New Zealand Department of Mines, Geological Survey Branch. Bulletin No. 22 (new series). Wellington. 1919, 11 x 8½ in., 316 pp. 14 plates, 6 text figures, 2 maps.

The chief purpose of the report is to describe limestone deposits that may be used for agricultural purposes. The application of lime and limestone to the soil, and problems relating thereto, are given in detail. The remainder of the introductory part is devoted to a discussion of the constituents of limestone, chemical composition, geology, origin, and sampling. On pages 35 to 289 detailed description is given of the limestone deposits by counties. The descriptions are comprehensive and include numerous chemical analyses, but many of the limestones described are very impure. The author emphasizes the broad field to be covered in a bulletin of this character, and, assuredly, the task is so tremendous that one is led to question the wisdom of including with it, as the author does, an elementary treatise on chemistry and geology. O. B.

Graphite. By Hugh S. Spence, M.E. Paper, 202 pp., 56 plates, 43 figures, 6 maps. Mines Branch, Department of Mines, Ottawa, Ont.

During the war attention was directed to graphite to a greater extent than in former years, and the belligerents sought information in regard to their available resources of this mineral. In Canada this led to the restudy of the graphite deposits and the preparation of a new report to replace that of F. Cirkel, published in 1907, and now out of print. The work has been well done by Mr. Spence, and the comprehensive report on the various phases of the graphite industry will be much appreciated.

The introductory chapters consist of discussions on the history, properties, geologic occurrence and origin of graphite. Other general chapters describe the uses of graphite, the manufacture of the artificial variety, the occurrence of graphite in foreign countries, and methods of analysis of graphite and its ore. The more specific portions of the report are concerned with its various occurrences in Canada and of the processes employed in concentrating and refining the graphite flake.

The principal deposits of Canada lie within the provinces of Ontario and Quebec, although some graphite, mainly of the amorphous variety, occurs in British Columbia, New Brunswick and Nova Scotia. Graphite mining was first carried on in Quebec, where a deposit was worked about 1846; not until 1870 was any mining done in Ontario. Since then numerous deposits in these two provinces have been worked intermittently, but the industry has never attained much prominence and most of the projects have been unsuccessful. The most common modes of occurrence are in the form of disseminated flakes in the sillimanite gneiss or in the crystalline limestone. The ore which has been worked is said to contain from 10 to 20 per cent graphite, and there are undeveloped deposits of lower grade but as rich as many of the deposits that have been worked in other countries.

The numerous methods and machines employed in the concentration of the flake graphite are clearly described. Many typical flow sheets are given. The author concludes that "frothing oil flotation would appear to offer the cheapest and most efficient means of concentrating graphite that has yet been devised," a conclusion that seems to be in agreement with the opinions of the majority of the graphite producers at the present time. B. L. M.

Technical Papers

Requests for papers herein mentioned should be addressed to the publisher, whose address, together with the postpaid price, is given when it is known.

British Statistics—Production and accident statistics for the mineral industry of Great Britain and Ireland for 1919 have been published (twenty-five pages), and can be obtained from H. M. Stationery Office, 28 Abingdon St., London, S. W. 1, for 3s.

Oil Shale — *The South African Journal of Industries* (Pretoria, price 6d.) in its August issue, contains an article entitled "An Oil-Shale Industry for South Africa," by T. G. Trevor, Inspector of Mines, at Pretoria. This paper outlines the occurrences of oil shales in the Wakaerstroom and Ermelo districts and gives some economic facts concerning the activities of the African Oil Corporation in the former district.

A. A. E.—The *Arizona Mining Journal* (Phoenix, Ariz., price 25c.) devotes the greater part of its October issue to the activities and purposes of the American Association of Engineers. The growth of this organization among mining men, particularly in the Southwest, is notable. Articles prepared by C. E. Drayer, Secretary of the A. A. E.; Bradley Stoughton, of the A. I. M. E.; G. M. Butler, E. B. Miller, and Leroy K. Sherman are included.

Power Plants—The new 7,000-hp. steam power plant of the Associated Smelters, at Port Pirie, South Australia, is described in a six-page article in *Chemical Engineering and Mining Review* for September (Melbourne; price 11d., post free). The description will be of interest to American smelter power-plant designers in the opportunity which it gives to compare ours with the latest Australian practice. Two Fraser and Chalmers Rateau blowers, each having a capacity of 32,000 cu.ft. of free air per minute at 5 lb. pressure, and one Parsons turbo blower, with a capacity of 36,000 cu.ft. at 4 lb. pressure, furnish air for the furnaces.

Flotation at Anyox P. E. Peterson, superintendent of concentration at the Granby mill, at Anyox, B. C., has a four-page paper in the *Bulletin of the Canadian Institute of Mining and Metallurgy for October* (Drummond Building, Montreal), on flotation practice at that mill. An unusual feature is that 19 per cent of the flotation feed is coarser than 40 mesh. To handle this coarse feed the Peterson flotation machine has been devised and is illustrated. Air is admitted through a porous hose instead of a flat canvas mat.

Oklahoma Oil—Bulletin 686-X of the U. S. Geological Survey, Washington, D. C., is an eight-page pamphlet describing the structure and oil and gas resources of the Osage Reservation.

ECHOES FROM THE FRATERNITY

Hydro-Electric Power to Play Large Part in Future of South America's Mining Industry

The great potential water power of South America and the projects to develop it by hydro-electric power plants which will supply energy to furnaces, railways, and metallurgical works is discussed in a recent bulletin by the Guaranty Trust Co.

In Argentina the Iguazu of the northeastern corner of the country and the great group of water-power resources in northwestern Patagonia, Neuquen, Rio Negro and Chubut, are capable of producing enormous quantities of hydro-electric power. The falls of the Iguazu afford the best single resource in Argentina and one of the best in the world. Accordingly, the Argentine government is making a preliminary survey for a power plant there. An international power plant, with a capacity of 150,000 hp., will be erected jointly by the governments of Argentina, Uruguay and Brazil. At present La Compañia Hidro-electrica de Tucuman (English) is the only power plant actually established.

Brazil has extensive plans for the development of interior transportation, including the construction of power plants for industries and the electrification of railways. A power plant of 30,000 hp. is to be built on the river Jacuhy, under a thirty-year concession, at the expiration of which the state will take over the installations. Rio de Janeiro is to have a 270,000-hp. plant in the near future by an international company with American interests.

The Itabira Iron Ore Co., Ltd., recently secured a concession from the Brazilian government to construct and exploit high-temperature furnaces, a steel factory, reducing and like apparatus, and plans to electrify the Victoria-Minas railway. An electric smelting plant, the first of its kind in South America, will be built in Ribeiro Preto, Province of São Paulo, by the Companhia Electrica Metallurgica Brazileira. The construction of the mill, seventy-five miles from the iron mines of Minas Geraes, will be started as soon as the American contractors can get their engineers on the ground.

Bolivia is a country of mines, though other resources exist, and the present field for street railroad and power transmission material is restricted. The greatest hydro-electric resources are those in the vicinity of La Paz, Tres Cruces, and Colquechaca, and plans for their exploitation have been made. The three initial power plants will entail an expenditure of $10,000,000 and will require large quantities of other machinery and electrical accessories in addition.

The La Paz-Yungas government electric railroad now being constructed, the Corocoro copper mines and the city of La Paz will use power from the Yungas River near La Paz. The progressive mining section of Tres Cruces requires power and tramways; the wealthy mining district of Colquechaca lacks electric power and needs to extend the railway to Uncia, another mining center.

Hydro-electric power is beginning to be utilized by the tin and copper mines of Bolivia. The Guggenheims of New York have acquired rights to three tin mines, comprising more than 4,000 h., in the Department of La Paz. Water and power rights to some six streams in the vicinity of the mines have been secured, and a hydro-electric power plant is to be built, and an electric smelting plant is under consideration.

The Bolivian Government has been for some time contemplating the electrification of all railways and has declared as public domain the waters of rivers with power possibilities.

In Peru most of the important cities and towns have electric light and power systems. Various sections of the Peruvian railways also are being electrified, especially the interurban lines near Lima. The mines of Peru are beginning to appropriate the hydro-electric resources of the Peruvian Andes. The Cerro de Pasco Copper Corporation of Cerro de Pasco is now installing a large up-to-date smelter at Oroya and providing modern facilities for its workmen. A vanadium ore-reducing plant for the mines of Minasgra is to be built at Jumasha, Peru, by the Vanadium Corporation of America, of Pittsburgh, Pa. A 20,000-kw. hydro-electric plant for treating the ore is to be constructed about twenty-five miles from Jumasha.

In Ecuador public utility development has been very slow. Chile has vast hydro-electric resources, which have been only slightly developed, chiefly by German and British capital. The Chilean Government will electrify all the state railways. An international company (Anglo-Chileno-Americano) in Valparaiso plans a 100,000-hp. power plant for that region, and the British-owned Antofagasta-La Paz Railway in the nitrate region of northern Chile is to electrify its lines at a cost of $7,500,000, which will call for a power plant.

Colombian cities are becoming modernized with the development of Colombia's industries, and her mineral resources are being exploited actively.

A number of the larger Venezuelan cities and towns have electric lighting and tram service, and the Caroni Falls will be harnessed to provide power for the new electric railway from San Felix, on the Orinoco River, to the Guasipati goldfields.

Gold and Silver Questions Discussed by Butters, Lawrie and Other A. I. M. E. Members

The regular monthly meeting of the New York Section of the A. I. M. E., held at the Machinery Club on Nov. 4, heard addresses by Charles Butters on "How Can We Stimulate the Demand for Silver?" and by H. N. Lawrie, of the American Mining Congress, on "The McFadden Bill."

Mr. Butters called attention to this innovation in Institute discussions, urging a wider interest among mining men in matters affecting markets. Drawing on his own extended experiences in silver mining in Mexico, he recalled the difficulty Mexican mine managers had in obtaining silver to pay their labor and the advisability of increasing the supply of Mexican silver pesos. He advocated a silver producers' association and made an estimate that the world's silver consumption in 1920 would greatly exceed the production.

Mr. Lawrie outlined the purposes and proposed working of the McFadden Bill and was kept busy replying to many interrogations regarding its operation. W. C. Ralston, A. J. Clark, Kirby Thomas and J. E. Spurr were all called on for a discussion. Mr. Spurr pointed out the difficult position of gold and silver producers—they had to study a combination of marketing and monetary problems which led them into all sorts of difficulties. He emphasized the wide divergence of opinion in banking and economic circles regarding the status of the precious metals and the McFadden Bill and the tremendous importance of the gold reserves in the world. D. M. Liddell deplored the lack of general propaganda behind the McFadden Bill as compared with strength of the propaganda opposing it.

Whence France Draws Her Fuel

The French Minister of Public Works has published the following figures, according to *L'Echo des Mines et de la Metallurgie*.

The total coal production by France between Jan. 1 and July 31, 1920, amounted to 13,246,339 tons (of 1,000 kg.) including 12,695,193 tons of soft coal and 551,146 tons of lignite. During the same period her fuel importations amounted to 13,700.079 tons coal, 2,317,412 tons of coke and 1,005,775 tons as follows:

	Coal	Coke	Agglomerate
Saare	2,581,819	.	.
United Kingdom	7,771,338	550,183	541,257
Belgium	686,554	.	.
U. S. A.	612,919	..	
Germany	1,990,255	1,690,409	332,870
Other countries	57,194	.	.

MEN YOU SHOULD KNOW ABOUT

Arthur E. Kitts is leaving the Isle of Man as conductor of a mining expedition to the southern Sudan.

John H. White, of Denver, Col., has been making examinations in the old Steeple Rock district in western New Mexico.

R. L. Chase, mining engineer of Denver, Col., is spending November in oil-shale work at Grand Valley and De Beque, Col.

Donald M. Liddell, metallurgical engineer, has moved his offices to Room 330, No. 2 Rector St., New York City.

Stewart Campbell, mining engineer and United States mineral surveyor, of Hailey, Idaho, was elected Idaho State Mine Inspector on Nov. 2.

Dr. Henry Mace Payne, formerly assistant to the president of Bertha Coal Co., is now associated with Andrade-Eyre, Inc., 80 Broadway, New York City.

Spencer C. Browne and **Karl F. Hoffmann**, consulting mining engineers, have both opened offices at 2 Rector St., New York City.

F. H. Moffit has returned to Washington after five months' geological field work on the western shore of Cook Inlet and in the Copper River region of Alaska.

H. Foster Bain, formerly of U. S. Bureau of Mines, who has been doing consulting work in China, is returning to the United States. He is expected early in December.

Frank L. Hess, geologist of the U. S. Geological Survey, who went to South America last December on a special mission, has returned to Washington.

Fred B. Ely, of Fort Worth, Tex., is leaving for a stay of several months in northeastern Mexico. Mr. Ely will examine a considerable area in that section for its possibilities in oil and natural gas.

Andrew M. Fairlee, chemical engineer, of Atlanta, Ga., and specialist in sulphuric acid, has been retained by the Baugh Chemical Co., as consultant in connection with the operation of its acid plants at Baltimore, Md.

Walter E. Clark, president of the University of Nevada, was in Washington recently in connection with the cooperative work which the University of Nevada is carrying on in connection with several of the Federal bureaus.

Louis D. Huntoon, mining engineer, of 115 Broadway, New York City, and **G. D. Van Arsdale**, now of Los Angeles, Cal., have formed the partnership Huntoon & Van Arsdale, consultants in mining, geology and hydro-metallurgy.

V. Dolmage, of the Geological Survey of Canada, recently completed geological field work from Barclay Sound north to Quatsino that makes possible a geologic map of the whole of the west coast of the island of Vancouver, B. C.

R. C. Emmons, a graduate in geology of the University of British Columbia and assistant geologist with Dr. V. Dolmage on the west coast of Vancouver Island, is taking a post-graduate course in geology at the University of Wisconsin.

Walter Harvey Weed, geologist and mining engineer, announces that he has severed all connection with Harris & Co., stockbrokers, 25 Broad St., New York City. Mr. Weed's addresses are Tuckahoe, N. Y., and 29 Broadway, New York City.

M. W. Potterfield, who has charge of the Boston Hill manganese properties at Silver City, N. M., is making an exhaustive study of the manganese situation in the East, as it applies to the grade of ferromanganese ores mined on his properties.

A. T. Thompson, assistant to the president in the east; **P. G. Beckett**, general manager, and **Gerald Sherman**, consulting engineer, of the mines department of the Phelps Dodge Corporation, are inspecting company properties in the Southwest.

O. B. Perry, general manager of the Yukon Gold Mining Co., a subsidiary organization of the Guggenheim interests, returned recently from a visit to the company's mining properties in the Mayo district and near Dawson, both in the Canadian Yukon.

H. E. Bierce, formerly managing director of Gibson Consolidated Copper Co., Bellevue, Ariz., announces that he has resigned to assume charge of the mining department of Wellman-Lewis Co., engineers, of Los Angeles, Cal. His address is 900 Hibernian Building, that city.

L. E. Ives, formerly business manager of *Engineering and Mining Journal*, and more recently assistant advertising manager for the Penton Publishing Co., is now manager of sales for Clement K. Quinn & Co., miners and shippers of iron ores, Kirby Building, Cleveland, Ohio.

Frank M. Sylvester, of Vancouver, B. C., formerly general manager for the Granby Con. M. S. & P. Co., has been appointed president of the Moose Group Mining Co., owning mining property situated in Alice Arm district, British Columbia. P. W. Racey is in charge of mining operations.

John Borg, of New York, president of the Consolidated Interstate-Callahan Mining Co., recently spent two weeks at Wallace, Idaho, familiarizing himself with the company's operations. This is his first visit since his election to the presidency of the company, succeeding the late John A. Percival.

C. W. Purington, consulting mining geologist, wrote under date of Oct. 3, at Hakodate, that during the summer he had examined a quartz gold mine in Japan, visited the goldfields of the Kuktui near Okhotsk, and had been wrecked off Sakhalin. His address is now 5 Sodomsky Pereulok, Vladivostok, Russia.

Prof. R. W. Brock, of the University of British Columbia, formerly director of the Geological Survey of Canada, has returned to Vancouver, B. C., after having made a geological and topographical survey of country west of Burns Lake, near the Grand Trunk Pacific Railway, in the interior of British Columbia.

Kirby Thomas, consulting mining engineer, has returned to New York City after several weeks spent in Colorado, examining mining properties in San Juan district and in Gilpin County, and in investigating the uranium and vanadium deposits of Utah and Colorado and the oil-shale deposits and processes in western Colorado.

Gilbert H. Cady, geologist with the Geological Survey of Illinois for some years, and recently returned from a year spent in professional business in the Far East, has been appointed professor and head of the department of geology of the University of Arkansas, at Fayetteville, Ark. He also becomes State Geologist of Arkansas, succeeding N. F. Drake.

J. D. MacKenzie, who succeeds the Deputy Minister of Mines, Charles Camsell, as head of the British Columbia branch of the Geological Survey of Canada, was graduated in mining engineering from the Massachusetts Institute of Technology in 1911, and five years later received the degree of doctor of science from the same institution. He recently returned to Vancouver, B. C., after having spent three months investigating iron-ore deposits in the Taseko Valley and Bridge River regions of the province.

OBITUARY

Thomas W. Clarke, mining engineer, who went to Tampico, Mexico, last spring in the interest of the Standard Oil Co., died there on Oct. 27 from malaria, according to word received Nov. 2 from the Mexican government. Mr. Clarke, who was only forty-seven years old, had resigned from U. S. Shipping Board to accept this mission to Mexico.

Alexander J. McCone, of Los Angeles, Cal., founder and president of the Fulton Engine Works there, died in San Francisco on Oct. 26, at the age of sixty-one. Mr. McCone was also one of the founders of Harron, Rickard & McCone, of San Francisco. He and his father were pioneers of the Comstock district, Nevada, where the father built the first foundry, afterward merged with Nevada Engineering Works of Reno, Nev. About ten years ago Alexander was Speaker of the House of the Nevada Legislature, and five years ago he moved to Los Angeles, Cal.

THE MINING NEWS

The Mining News of ENGINEERING AND MINING JOURNAL is obtained exclusively from its own staff and correspondents, both in the United States and in foreign fields. If, under exceptional conditions, material emanating from other sources is published, due acknowledgment and credit will be accorded.

LEADING EVENTS

Many Speakers Scheduled for Mining Congress Convention

Representative L. T. McFadden To Talk on Gold Question—Taxation, Flotation and Standardization To Be Discussed

At the convention of the American Mining Congress to be held at the Albany Hotel, Denver, Col., Nov. 15 to 20, the industrial situation will be discussed by speakers of national prominence, among whom are Governor Henry J. Allen, of Kansas, whose subject will be "The Right of Labor to Strike"; and Dr. Charles A. Eaton, editor of *Leslie's Magazine*, who will have as his topic the "Present and Future Relations Between Labor and Capital." James Lord, president of the mining department of the American Federation of Labor, will speak on "Organized Labor and Its Attitude in the Present Industrial Crisis"; Charles A. Chase, on "The Colorado Open Shop Declaration"; and Senator Charles S. Thomas, on "Industrial Honesty." Carl Scholz, at one time president of the American Mining Congress and now manager of the Raleigh-Wyoming Coal Co. of West Virginia, will discuss the recent decision of the Appellate Court of West Virginia through which the historic permanent injunction was issued restraining the United Mine Workers of America from pernicious activity within the jurisdiction of that court.

The Gold Conference will have an equally interesting list of speakers, including Congressman Louis T. McFadden, whose subject will be "The Financial Reconstruction of the Nation." Among the other speakers are Governor Emmet D. Boyle, of Nevada; Hon. Fletcher N. Hamilton, State Mineralogist of California; Dr. Milnor Roberts, dean of the College of Mines, University of Washington; Dr. Henry M. Fox, director of the Oregon Bureau of Mines and Geology; George E. Collins, of Denver, governor of the Colorado chapter of the American Mining Congress; B. C. Yates, superintendent of the Homestate Mining Co. at Deadwood, S. D., and Dr. Harold N. Lawrie, chief of the division of rare and precious metals of the American Mining Congress.

The Tax Conference will be in charge of Robert G. Wilson, director of the tax division of the American Mining Congress, and a committee, composed of Paul Armitage, of New York, chairman of the tax committee of the Mining Congress; Dr. R. C. Allen, vice-president of the Lake Superior Iron Ore Association, Cleveland, and Dr. George E. Holmes, author of "Holmes on Taxation." It will take the form of a "round table" discussion.

On the general program of the convention, H. J. Pierce, of Seattle, will speak on "The Utilization of Western Water Power," and Edwin Terrell, executive director of the Water Power League of America, will discuss "The Reduction of Mine Operating Cost Through Use of Mountain Streams." General L. C. Boyle, former attorney general of Kansas, will speak on "The Effect on the Western Industry of the New Freight Schedules Recently Adopted."

There is also an interesting list of speakers on the subject of oil flotation, including Gilbert H. Montague, of New York, and George L. Nye, attorneys for the American Mining Congress, and Alfred D. Cook, director of Minerals Separation North American Corporation.

War minerals will be discussed and it is expected that the three-day Standardization Conference will be productive of good results. In all about sixty speakers are scheduled for the various meetings of the convention.

WEEKLY RÉSUMÉ

Five smelters in northern Mexico have suspended operations, and railroads and various mining companies have been crippled by the act of coal operators of Coahuila in shutting down their mines as a result of the deadlock in the labor situation. It is reported that officials of the de la Huerta government have taken over some of the coal properties in consequence. At Pachuca 3,000 men were laid off the last week in October. In this country the financing of the zinc ore storage warehouse project in the Joplin-Miami district is reported to have been arranged. In Arizona, Iron Cap has brought suit against the Arizona Commercial at Globe, in an effort to have the pending litigation between the two companies heard in the district where the properties are located. At Jerome the United Verde has cut its force owing to the condition of the copper market. The Penn-Arizona, at Bisbee, has shut down. In Colorado the Gem Mining Co. has acquired the holdings of the Argo Reduction & Ore Purchasing Co., including the Newhouse tunnel. In Canada the case of Stewart vs. Molybdenum Mining & Reduction Co. has been decided in favor of the defendant, whose property is in the Alice Arm district of British Columbia. The suit over the ownership of the Engineer Group at Atlin, B. C., is now being heard; the claims are alleged to have been fraudulently jumped by the late Captain Alexander. In Ontario the power situation is easier.

The scope of the work of the new Mississippi Valley experiment station of the U. S. Bureau of Mines has been decided upon and a program for the future drawn up.

Five Mexican Smelters Closed Owing to Coal Strike in Coahuila

Coal Operators Shut Down—Mines Flooded—Many Miners Leaving for U. S.—Railroads Crippled

The most discouraging condition in the mining situation throughout Mexico at the beginning of November is the collapse of all efforts of the government to harmonize the differences between the mine owners and strikers of the coal fields in Coahuila. After the appointment of various special representatives by the President, whose efforts have all failed, the companies decided to close, some of them announcing a suspension of six months. All the mines are now flooded and even if an agreement were reached it would require several weeks at best to reopen effectively. In the meantime the mine workers are emigrating in large numbers, many hundreds having crossed into the United States in search of work.

The first result of the closing was the shutting down of the smelters at Aguascalientes, Torreon, San Luis Potosí, Saltillo and Monterrey, throwing over 30,000 men out of employment, in addition to the 8,000 mine workers. The closing of the smelters will naturally be followed by the closing of a number of mining properties in the north. Another feature is the crippling of the railways, as all the lines in the north use coal from these mines. The first step by the government to secure relief was an order removing, temporarily, the duty on coal and coke, but even with this exemption it is impossible to secure equipment for bringing these commodities into the country in sufficient quantities to better the situation.

The mine operators blame minor government officials for the situation. It is claimed that even agents of the government sent to arbitrate the strike incited the men to hold out and by their attitude made it impossible for the contending parties to get together.

Tax Delinquent Mexican Mines Listed for Re-denouncement

The mining department of the Ministry of Commerce and Industry of Mexico is preparing a formidable list of mining properties which the government has declared forfeited because of the failure of owners to avail them-

selves of the special exemption decree which ended Oct. 31. The list is being sent to the various mining agents throughout the country advising them that the properties in question are open to re-denouncement.

Suit Over Engineer Group at Atlin, B. C., Before Court

The suits predicted with reference to the Engineer mine, at Atlin, B. C., are before the courts. W. L. Goodwin and eleven other prospectors have taken out a *lis pendens* to prevent the sale of the property until their claims can be brought before a grand jury, it being suggested that a sale for $3,000,000 to Cobalt interests is in negotiation.

Mr. Goodwin and his associates assert in effect that they and not the estate of the late Captain Alexander are the lawful owners of the mine. Twenty years ago, it is declared, they staked the claims now known as the Engineer Group and Captain Alexander, it is alleged, staked over them, altering the lines and making the eleven claims which afterward were known as the Engineer claims. It is, therefore, set up that their property was fraudulently jumped and recorded and that Crown grants were wrongfully issued to the Alexander party.

The second action against the estate of Captain Alexander is brought by W. Pollard Grant, of Vancouver, who claims a one-fifth interest in the mine and affirms that documents in his possession will prove that Captain Alexander was his trustee for the one-fifth interest in the mine referred to. Mr. Grant states that one of the business matters bringing Captain Alexander south when he met death through the foundering of the "S. S. Princess Sophia" was to arrange for the transfer to him of this interest.

Iron Cap Brings Suit in Globe Court Against Arizona Commercial

The Iron Cap Copper Co. has instituted action in the Superior Court at Globe, Ariz., against the Arizona Commercial Mining Co., seeking to quiet title to the property in the Globe district claimed by the complainant. This suit counters against apex claims made by the Commercial to the effect that substantially all the ores mined by the Iron Cap came from veins that have surface showings on Commercial ground. The litigation started in an equity suit brought by the Arizona Commercial in a Massachusetts court in February, 1919. This was followed in September of the same year by an ordinary suit in the Massachusetts courts, alleging substantially the same causes of action. Both suits were dismissed for lack of Massachusetts jurisdiction. Thereafter the Commercial filed its suit in Maine. The Iron Cap suit seeks to bring the trial of the dispute to Arizona in the same district in which the mines are located.

Oklahoma Ore Storage Project Financed

Warehouse at Tar River Ready To Open, Others To Follow—Producers Said To Be Well Disposed

There is a revival of interest in the Joplin district in the proposal to store zinc ore as a result of the formal announcement of officials of the Oklahoma Ore Storage Association that a well-known Pennsylvania and New York warehouse company, after sending two representatives to this field and making a careful study of the situation, has agreed to advance money on warehouse certificates to the extent of $9,000,000 in cash at present and with an ultimate limit of $30,000,000.

Several ore bin warehouses were erected in this district in the last year but no attempt has been made to use any of them. When one of them was partially wrecked by a cyclone last spring it was immediately rebuilt. One of the warehouses, that located at Tar River, Okla., will open at once and the other four at intervals of a week or two weeks until all are in operation, provided the ore producers are willing to try out the plan.

The larger operators of the field are said to be quite ready to have the plan given a thorough trial. Some of them express the opinion, however, that the proposed scheme is quite likely to be tried by the smaller companies only and so result in keeping some of them producing ore when they ought to be closed down.

Utah Con. Turns Disputed Ground Over to Utah Apex

The Utah Consolidated Mining Co., of Bingham Canyon, Utah, which recently lost the decision in its celebrated apex suit against the Utah Apex Mining Co., has stopped mining ore in the Highland Boy limestone under Utah Apex territory since Oct. 20, when the court's decision was handed down. The workings in question were immediately turned over to Utah Apex without the necessity of a court injunction. Within thirty days of the entry of the decree the Utah Consolidated must file a statement of the ores extracted from below the surface of the Utah Apex giving the tonnages and value.

Mineral Resources of Ungava, Quebec

The return to civilization of H. L. F. Blake, civil engineer, and his party, which had spent the summer in exploration work in the Ungava region of Quebec, has caused it to be known that a British syndicate will spend a large sum in developing that region. Mr. Blake left last March, and on arrival at St. Felicien, Quebec, collected supplies and a party of Montagnais Indians, with dogs, sleds and canoes. They proceeded north to Chibougamou, en route to Lake Misstassini, thence north to Lake Nichinsen, and then into the unknown. Ungava has been found rich in minerals.

Some Austrian Iron-Working Industries Stagnant

Former Customers in Newly Created States Can in Some Cases No Longer Import

From Our Vienna Correspondent

Vienna, Oct. 12 Many branches of the iron working industries show no signs, as yet, of interrupted productivity, but complete stagnation has prevailed in some groups for some time past. There are various reasons for this. Thus the armature industry is very dull, because many of the newly erected states are beginning to supply themselves in part, while no deals can be concluded with some other foreign districts, such as Poland. In most of the cases where the machine y trade complains of stagnant conditions, the trouble lies in the high price, which hinders domestic sales and makes foreign traffic quite impossible. This is the trouble with certain types of machine tools.

Some branches of the Austrian iron-working industry, whose products have a world-wide reputation, can no longer deliver their goods abroad because the new national states are already prepared to manufacture the same things. This is the case with railway axles among other things. The Austrian heavy-duty-axle business, which is almost wholly within the confines of Austria, until recently delivered its products to Silesia and Moravia, Hungary, the Balkan countries and to the South. Today some enterprises in Czecho-Slovakia are prepared to manufacture car axles, and the government at Prague now draws from them and refuses import permits for this line. Also in Jugoslavia a firm has taken up the manufacture of freight axles. In Hungary the demand for these articles is now chiefly supplied by the Rima Muranyer Ironworks Co. The prospect is also poor for exports to the Balkans.

The danger to Austrian industries arising from possible development of special industries in the new national states to compete with hitherto Austrian specialties is felt in other lines of the German-Austrian iron and metal wares. Just at present it is specially acute, since the slugishness in the usual domestic products of the new states is diverting energy to the manufacture of articles not previously produced there.

In yet other branches of the iron industry it is lack of material that is interfering with industry. This is particularly true of the wire-working industries. Because of wire shortage in Austria it is necessary to bring in German material at high prices Therefore some forms of wire, for example, wire nails, continue very scarce.

Burma Corporation produced 2,790,000 lb. refined lead and approximately 251,550 oz. refined silver in September, compared with 4,424,000 lb. refined lead and 243,340 oz. refined silver in August.

Tonopah Section of A. I. M. E. Holds Third Annual Meeting

John G. Kirchen Elected Chairman—Reno Selected for Next Year's Session—Tonopah Divide Mine Visited

BY E. R. BENNETT

The third annual meeting of the Nevada Section of the American Institute of Mining and Metallurgical Engineers was held at Tonopah, Nev., on Oct. 26-27, 1920. Owing to war conditions in 1918 and labor troubles in 1919 no meeting has been held since the session at Ely, Nev., in June, 1917.

Thirty-four members registered at the opening meeting at the Elks' hall at 9:30 a.m. on Oct. 26. The meeting was called to order by Prof. J. C. Jones, vice chairman of the Nevada Section. In his opening remarks Professor Jones spoke of the advisability of holding meetings at least once a year in order to facilitate an exchange of ideas on practice and methods. After reading the minutes of all previous meetings Henry M. Rives, secretary of the local section, stated that President Herbert Hoover and Secretary Bradley Stoughton had wired their regrets.

The selection of officers made by the nominating committee was unanimously approved and the following were elected: John G. Kirchen, Tonopah, chairman; Prof. J. C. Jones, Reno, vice chairman; Henry M. Rives, Reno, secretary-treasurer. Executive committee: John G. Kirchen, Tonopah; Prof. J. C. Jones, Reno; Governor Emmet D. Boyle, Carson City; R. A. Hardy, Virginia City; W. S. Larsh, Ruth; F. D. Bradley, Goldfield; J. L. Dynan, Tonopah; W. H. Blackburn, Tonopah, and Alexander Wise, Virginia City.

It was the sense of the meeting that the next annual session be held at Reno, Nev., from which place side trips will be taken to Virginia City and Dayton.

At the conclusion of the business session the following papers were presented: "Operating Conditions at Tonopah Extension Mine," by John L. Dynan; "Surface Plant at Victor Shaft, Tonopah Extension Mine," by J. P. Hart; "Mine Pumping in Tonopah District," by Homer L. Williams; "Crushing and Agitating Practice at Tonopah Extension Mill," by H. A. Burk; "Precipitation and Refining Gold-Silver Precipitates at West End Mill," by Fred Ninnis and Walter Anderson; "Tonopah Extension Assay Office," by George L. Christian, and "Mine Accounting," by F. D. Bradley.

An interesting statement in connection with Mr. Dynan's paper was to the effect that the Tonopah Extension Mining Co. during its operating period had marketed 15,267,216 oz. of silver, which returned $10,057,426.50, for an average value of 65.87c. per oz.

The new surface plant at the Victor shaft was described in detail by Mr. Hart, who in his paper explained the difficulties encountered in constructing the plant during war times. In his paper Mr. Williams drew a comparison between pumping practice with turbine and plunger pumps.

After a discussion of the different agitators in use in the several Tonopah mills, Mr. Burk stated that in his opinion the ideal agitator should be of a mechanical type wherein atmospheric air, rather than compressed air, could be introduced by a blowing device. In his opinion impurities, such as engine-oil and CO, in the compressed air, have a deleterious effect that could be eliminated by the use of atmospheric air.

Mr. Anderson, in presenting his paper written jointly with Fred Ninnis, described the general practice of precipitation and refining in the Tonopah district. Some very interesting comparisons have been made in this paper.

Mr. Christian's paper described a well-designed assay office. Numerous labor-saving devices were described in detail. Several different systems of mine accounting were discussed by F. D. Bradley, whose paper proved him to be a close student of the subject.

After the presentation of the papers a recess was taken and the members and guests adjourned to the Mizpah Hotel for lunch. At 2 p.m. the members were taken to the Belmont mill in automobiles, where the party was taken on a tour of inspection by Albert Silver, superintendent of mills for the Tonopah Belmont Development Co.

On the morning of Oct. 27 the members were taken through the Victor mine of the Tonopah Extension Mining Co. The new surface plant at this property also proved of great interest.

Following a luncheon at the Mizpah Hotel an automobile trip was taken to the Tonopah Divide mine at Divide, where an inspection of the underground workings was made. The type of ore deposit at this property was of particular interest to the visiting members. Specimens of the mineral powellite found in the mine were eagerly searched for. The meeting concluded with a dinner at the Mizpah Hotel followed by an informal dance.

Canadian Engineers Meet at Winnipeg

Mineral Resources of Manitoba and Alberta Described in Numerous Papers—Possible Government Royalty on Copper Discussed— Dominion's Attitude as to Provincial Natural Resources Denounced

SPECIAL CORRESPONDENCE

THE growing importance of the mining industries of Manitoba and Alberta was reflected in the highly interesting and successful gathering held at the Fort Garry Hotel, Winnipeg, on Oct. 25-27, on the occasion of the second annual western convention of the Canadian Institute of Mining and Metallurgy. There was a large attendance, including a number of members from eastern Canada. Thomas H. Johnson, attorney general of Manitoba, extended a cordial welcome to the delegates on behalf of the province. President O. E. S. Whiteside in the course of his address said that it was only within the last few years that Manitoba had been regarded as anything but a wheat-growing area. But it had been proved to contain mineral deposits of great value and had the beginnings of what it was hoped would become a flourishing mining industry. He enlarged upon the function of the Institute in educating the public in respect to mining in order that the industry should as far as possible be retained in the hands of Canadians.

The principal feature of the opening session was an address by F. W. Gray, of Toronto, on the coal fields of the West. The gap of 2,000 miles between the eastern coal fields and those of the western provinces could be bridged by an extension of the Great Lakes Waterways to enable Nova Scotia coal to enter Lake Ontario by water carriage, and by the railways adopting a comprehensive program for the transport of coal from the western coal fields. The objective of the Canadian coal mines was to limit the importation of American coal to the smallest area possible. The coal resources of Nova Scotia were not large, while those of the western coal fields were as large as it was desired to make them. The world need for coal was so pressing that it might be that an export trade in coal would precede the development of the western coal field to provide fuel for local industries. He considered that the position of the Alberta collieries with reference to Vancouver, and those of British Columbia with reference to Prince Rupert, were not dissimilar to the relation of West Virginia collieries to the Atlantic ports. The opportunity to enter British markets was open to any coal field in North America that could get its coal to tidewater within commercial limits of cost of rail haul. The real role of the western field, however, would be filled when it had become the site of industries based upon bituminous coal.

Duncan McDonald, inspector of mines of Calgary, Alta., read a paper on mine rescue and first aid work. He stated that voluntary mine rescue training in Alberta had met with very satisfactory results, and was of opinion that this system was much preferable to compulsory training. He pointed out the importance of a knowledge of first aid, lives having been frequently lost where injured persons had been discovered by those ignorant of it.

H. A. Mackay, chief engineer of the Manitoba Bridge and Iron Works, gave an address on the use of powdered coal in the company's rolling mills at Selkirk. Pulverized coal was used in the furnaces for heating billets and scrap for rolling, and also for operating open-hearth furnaces for making standard grades of mild steel from scrap. With the installation of powdered coal a Canadian coal was substituted for the American coal previously used.

A smoker was held in the evening at which moving pictures were shown illustrating the development of water power and other natural resources.

MINERAL RESOURCES OF MANITOBA AND ALBERTA DISCUSSED

On the second day Dr. J. A. Allan, of Alberta University, spoke on the mineral resources of Alberta, emphasizing the need of more accurate information with regard to them, especially now that the province seemed to be on the verge of a great oil boom. In several cases mineral development had been retarded by overestimated reports of the value of deposits. He described the grades of coal in the different basins and pointed out that there was no anthracite in Alberta with the exception of occasional irregular pockets. Among other mineral resources dealt with was the sodium sulphate which occurred as a remarkable deposit on the western margin of Saskatchewan, which was greatly in demand in the pulp industry. In the absence of N. C. Pitcher, professor of mining engineering in Alberta University, a paper prepared by him on the more efficient utilization of Alberta coal was read by Dr. Allan.

J. A. Richard, acting chief inspector of mines of Alberta, briefly outlined the methods of collecting coal samples for analysis and the endeavors made to standardize the analysis.

D. King, of Winnipeg, dealt with the problems in connection with the marketing of western coal, stating that the main difficulty was the prejudice against it. He contended that there were steam coals in the west equal to any coming from the Eastern states and that with different methods of firing some of the western coals would give equal satisfaction.

In the afternoon Prof. F. J. Alcock, of Ottawa, described the various properties in the Herb Lake gold district of Manitoba, stating that a number of them offered good possibilities of being worked at a profit. The present high cost of labor and transportation had been a drawback to development. The amalgamation of several of the more important properties lying close to each other on the east shore of Herb Lake was suggested as a means of reducing the cost of separate management and operation.

J. F. Gordon, the discoverer of high-grade gold deposits in the Copper Lake district of Manitoba, described the geological formation of the area and the development work done on his properties.

ENGINEERS SEE NEED OF RAILWAY FOR FLIN FLON

Dr. R. C. Wallace, commissioner for Northern Manitoba, dealt with the Flin Flon ore deposit and stated that the recent visit of a number of members of the Manitoba Legislature had made them acquainted with the situation and caused them to realize that the property could not be properly developed without a railway. If the deal for the property was completed before the opening of the Legislature the question of a railway would be considered, with a view of leasing it, when built, to the Canadian National Railway Board.

Prof. J. S. De Lury, of Manitoba University, contributed a paper on the Rice Lake district, stating that wonderfully rich pockets of free gold had been discovered. While rich samples were encouraging they must be supplemented by careful sampling of the whole mineral deposit before mining operations were warranted. Such sampling was the most pressing need of the district.

In the evening Dr. R. C. Wallace gave an illustrated lecture on northern Manitoba, laying much stress on the importance of completing the Hudson Bay Ry. as soon as possible to hasten the development of the territory. He regarded the mining industry as the main factor in the opening up of the country. A railway to the Flin Flon property would develop a copper industry and with this would be created a gold mining industry throughout The Pas mineral belt.

POSSIBLE GOVERNMENT ROYALTY ON COPPER DISCUSSED

The following session was largely devoted to a discussion regarding the royalty on copper which the Canadian government may see fit to impose after Jan. 1, 1921. Several speakers expressed strong opposition to the imposition of any royalty on copper for some time to come. A resolution was

adopted which, after reciting that the matter of royalties is left to the discretion of the minister; that valuable orebodies have been discovered which can only be developed by the expenditure of large sums of capital, and that it is important that investors should know with reasonable certainty the government's attitude with respect to royalties, concludes as follows:

"That this convention strongly urge the government of Canada to so amend the said regulations as to set out specifically what are to be the royalties charged on the different minerals produced, and particularly that the time for which copper shall be exempt from such royalty shall be extended for a period of ten years."

Dr. Fahrenwald Talks on Non-Corrosive Steels

Dr. E. A. Fahrenwald, of Cleveland, Ohio, the inventor of non-corrosive steel and rhotarium, gave an instructive address on "Non-Corrosive Steels." The day of the old-time pioneers, he said, had passed and new pioneers of a different type were required—men equipped with modern scientific tools and training. Dealing with industrial and scientific research in relation to future development he stated that knowledge regarding chemical combinations was limited. As soon as a new element is discovered some new industrial application will be found for it. Scientists, by taking advantage of newly discovered relationships of elements, can provide alloys meeting special requirements. Explaining the advantages of non-corrosive steel he cited the non-corrosive gun barrels which would before long come into general use.

H. E. Knobel outlined the possibilities of creating a western iron and steel industry based on purely domestic sources of iron and coal. He claimed that Ontario iron ores and Alberta coal could be utilized for steel to supply western Ontario and the prairie provinces.

Data Presented on Operation of Mandy Mine

G. R. Bancroft, superintendent of the Mandy mine of northern Manitoba, presented some interesting details in regard to the discovery and operation of that deposit. The gross value of the production from the Mandy up to the present was $2,000,000, and a large tonnage of ore remained untouched which was of too low a grade to stand the transportation charges, but could be handled to good advantage by a smelter at Flin Flon.

D. C. McArthur, of Winnipeg, gave an address on the non-metallic deposits of Manitoba.

In the afternoon a visit was paid to the rolling mills of the Manitoba Bridge & Iron Works and the plant of the Manitoba Steel Foundries at Selkirk.

The convention was brought to a close by a banquet in the evening, the principal speaker at which was Hon. E. Brown, provincial treasurer of Manitoba, who said that the position taken by the Dominion government with regard to provincial ownership of the natural resources was an outrage and an injustice and in every way indefensible. The Dominion government had expressed a willingness to turn over the natural resources to the province, subject to the approval of the other provinces. They had met in conference with the other provinces but without result, and it was unfair that the provinces which controlled their own resources should have anything to say against the western provinces getting control. They had hopes, however, that a settlement would be reached and some redress obtained but until that time came it would be folly for him to seek to outline a mining policy. Speaking of the Flin Flon property, Mr. Brown said that the construction of a railway was properly a matter for the Canadian National Ry., but it had turned it down. The province would probably build the road, but officials were waiting for a guarantee from the holders of the options that the products of the mine would be sufficient to justify the outlay of $8,000,000 which would be required to build the railway.

More British Capital Needed, Says Winnipeg Mayor

Mayor C. E. Gray, of Winnipeg, said that while he was glad to see American capital come in, he would like to see the introduction of more British capital. He advocated the appointment of a commission of industry to give correct information concerning the natural resources of the province to the British public. The opening up of the north country was largely in the hands of the mining engineers, who could do much to give capital faith in its development.

J. A. Campbell, M. P., thought that the transfer of the natural resources from the Dominion to the control of the provinces was the most important question at the present time. The western provinces should get together and demand a settlement, he said.

T. R. Deacon spoke of the need of developing natural resources to their fullest extent as a means of rectifying the adverse balance of trade which resulted in the depreciation of Canadian currency.

Blast Furnaces in Switzerland To Smelt Swiss Iron Ore

Special Berlin Correspondence

After systematic prospecting iron ore deposits of importance have been discovered in Switzerland which promise to be an important factor in the economical development of the country. They are located near Herznach in the valley of the River Frick and estimated to contain at least 15,000,000 tons of phosphorus iron ore averaging approximately 31 per cent iron. The mining conditions are favorable. Preparations are being made for the erection of blast furnaces. The Federal government of the republic has submitted to the legislature a bill for financial support by the state of the new enterprise.

Molybdenum Mining & Reduction Wins Against Stewart

Supreme Court of British Columbia Decides in Favor of Alice Arm Company

The question of ownership of the Molybdenum Mining & Reduction Co.'s property in the Alice Arm district of British Columbia has been closed as far as the Supreme Court of the province is concerned. The action is known as Stewart vs. the Molybdenum Mining & Reduction Co., Ltd. Chief Justice Hunter, who finds for the company, says in his judgment:

"I think that the plaintiff Hayes had no right of action against the company. As to the other plaintiff, I am of the opinion that the Conundrum claim (one of the claims of the group) lapsed on June 13, 1915, and was not revived by the Exemption Act, 1915. The Conundrum ground was relocated and recorded by Riel and his associates, who conveyed it to the company, but the plaintiff rests his action mainly on the agreement of Aug. 19, 1915, by which the co-owners of the Conundrum and Hayes, the owner of the Blackwell, agreed to sell those claims for $35,000 to Riel.

"Moreover it appears to me that the action of Riel in locating and dealing with the new claims was acquiesced in by the plaintiff and this view is strongly corroborated by the giving of the subsequent agreement to Riel pending the litigation.

"At any rate the plaintiff stood by while large sums of money were expended on the ground without notifying either the Stilwells or the company that he had any claim against them or it and the principle applies that if a man is silent when in fairness he ought to speak he must remain silent when in fairness he ought not to speak."

Recent Production Reports

Old Dominion produced 2,912,000 lb. copper in October compared with 1,957,000 in September.

Inspiration produced 7,000,000 lb. copper in October compared with 6,506,000 in September.

Anaconda produced 11,000,000 lb. copper in October compared with 11,100,000 in September.

Greene Cananea produced 3,500,000 lb. copper in October, the same as in September. The October production of silver was 156,200 oz. and of gold 895 oz.

Kennecott produced 8,878,000 lb. copper in September (including Braden's output) against 11,268,000 in August.

Interstate-Callahan's shipments in October increased about 20 per cent over those in September. Comparative figures are: Zinc concentrates, 5,000,000 lb., as against 4,230,000 in September; lead concentrates, 2,600,000 lb., compared with 2,180,000 lb. in September; and silver, 26,000 oz., which compares with 21,800 oz. in September.

U. V. Extension produced 3,864,756 lb. copper in October, compared with 3,327,644 in September.

Scope of Mississippi Valley Station's Work Agreed Upon

Improvement in Zinc Smelting One Important Objective—To Maintain Office in St. Louis

As a result of the conference last month in St. Louis with the zinc and lead operators, the following program has been agreed upon for the Mississippi Valley experiment station of the U. S. Bureau of Mines:

Mining problems: (1) Underground handling and haulage of dirt, (2) drill steel problem in co-operation with the North Central Station of the Bureau at Minneapolis, Minn.

Ore-dressing problems: (1) Careful study of the milling problems met with in each of certain districts; namely, Wisconsin, Illinois, southeast Missouri, and Joplin.

Metallurgy: That an intensive study be made as far as the funds of the station will permit of processes other than retort processes applicable to the treatment of zinc ores found in the Mississippi Valley and which will enable the metal to be obtained from the ore at a lower cost than do present-day processes.

In addition to the personnel already announced, Prof. C. R. Forbes, professor of mining in the Missouri School of Mines and Metallurgy, has been appointed consulting mining engineer, and has been asked to direct that part of the drill steel investigation which has to do with the actual use of drill bits, their proper sizes, shape, etc.; this work to be carried on in co-operation with the North Central Station of the bureau at Minneapolis, Minn.

Through the courtesy of the Chamber of Commerce of St. Louis, the bureau has been given office quarters in room 713, Chamber of Commerce Building, corner of Broadway and Locust Street. This office will not only serve as headquarters for the Mississippi Valley Station, but for the bureau's activities in that part of the country as well, and will also serve as the St. Louis office for the Missouri School of Mines and Metallurgy, and for the Missouri State Geological Survey.

In this connection, Dorsey A. Lyon, supervisor of stations, said: "The object of establishing this office in St. Louis is to permit the bureau to maintain more readily a contact with the industry. It is hoped that the industry will feel free to visit this office and become acquainted with F. F. Rutledge, the superintendent, and his assistants. The Mississippi Valley mining experiment station has been established for the benefit of the lead-zinc industry of that region. However, it will fail utterly in its purpose unless it has the hearty support and co-operation of those interested in the lead-zinc industry. It is, therefore, earnestly hoped that the industry will take an active interest in the work of the station and will not hesitate to offer any suggestions in regard to the work of the station that will enable it to best serve the industry."

It is regarded as probable that the state of Missouri will follow the example of Alabama and add to the appropriation of the station an amount equal to that appropriated by the Federal Government. If, in addition to that, co-operative agreements may be effected with some of the operators some very comprehensive work on zinc and lead can be undertaken.

It has already become evident that there is an unusually favorable opportunity existing for technical study of the mechanical means for handling dirt in the mines of the Mississippi Valley. Another important phase of the station's work is a study of the metallurgical problems. This is pointed out by Prof. Charles H. Fulton, the director of the Missouri School of Mines and Metallurgy. He says:

"Looking on the metallurgy of zinc from a broad viewpoint, the fact stands out that present practices and principles are ancient. Present-day practice is essentially what it was 150 years ago. In modern times this ancient practice is met with certain great disadvantages. It requires a large amount of hand labor and consumes an enormous amount of fuel for the results obtained. It differs in principle from the metallurgy of other metals, in which labor-saving devices have been long employed and in which large units are used in the production of metal. Even the largest zinc furnace is small because it is within the retort. Since fire clay is the refractory material used increase in the size of the retort is limited. I am a firm believer that the electric furnace is the solution of the problem."

New Import Classification Needed

It is very generally recognized that there is the greatest need for a revised classification covering imports and exports of commodities. The Bureau of Foreign and Domestic Commerce, which compiles import and export statistics, is being relied upon more and more by the industries for this information which is so necessary to the intelligent conduct of nearly every enterprise. There also is the greatest need, in the opinion of students of the question, for placing under a single management the Bureau of Customs Statistics in New York and the Bureau of Foreign and Domestic Commerce in Washington. Whether this reform can be put into effect January 1 depends entirely upon securing the necessary appropriation before that date. Otherwise it must go over for a full year.

War Mineral Awards

A total of $75,039.06 was recommended for award by the War Minerals Relief Commission for the week ended Oct. 30. The recommendations, showing the name of the claimant, the mineral, the amount recommended and its percentage relationship to the amount claimed, are as follows: Liberty Manganese Co., manganese, $4,851.75, 30 per cent; Baker Hot Springs Manganese Co., manganese, $789.26, 30 per cent; J. J. Appel, manganese, $2,375.41, 36 per cent; Georgia Iron & Coal Co., manganese, $55,404.01, 32 per cent; Layton and McCormick, manganese, $1,459, 58 per cent; Needles Mining Co., manganese, $4,561.66, 25 per cent; P. S. Dean, chrome, $1,856.50, 33 per cent; J. K. McCloy, chrome, $300, 75 per cent. Further awards have been recommended in the following claims which had been acted upon previously by the committee: Charles L. Cole, $1,669.49; J. E. Higgins, $814.40; Adama & Woodward, $957.50.

Survey and Bureau of Mines Men on Standards Committee

Responding to an invitation of the American Engineering Standards Committee, the Department of the Interior has appointed three members to serve with that committee. They are P. S. Smith, of the U. S. Geological Survey; E. A. Holbrook, of the U. S. Bureau of Mines, and O. P. Hood, of the Bureau of Mines. Messrs. Holbrook and Hood also become members of the subcommittee on mining equipment.

Mine Experiment Station Heads To Meet in San Francisco

Dorsey A. Lyon, supervisor of experiment stations for the U. S. Bureau of Mines, has called a meeting of all superintendents of stations west of the Mississippi River to be held in San Francisco January 17, 1921. The principal object of the meeting is to coordinate plans for future investigations.

A total of 148,338 tons of nitrate of soda moved through the Panama Canal during August. All but 46,569 tons, which went to European ports, was destined to American Atlantic and Gulf ports. Two cargoes of chrome ore destined to New York also passed through in August.

NEWS BY MINING DISTRICTS

Special London Letter

Recent Developments on the Rand—West African Diamonds Reported in Blue Ground at 12 Ft.—Dolcoath Tin Mine To Shut Down

BY W. A. DOMAN

London, Oct. 26—Internationally, the gold supply is of so important a character that the latest developments reported from Johannesburg are creating a very considerable degree of interest. It is generally believed that as a whole, and certainly where the central part of the field is concerned, the Witwatersrand has seen its best days. So far as regards production of the metal the mines of the Far Eastern section are affording, and seem likely to afford still further, ample compensation for the shortcomings of the older areas. What were originally the finest properties have become virtually exhausted, so that now eyes are turned to the great Modder trio, namely, New Modderfontein, Modderfontein B, and Modderfontein Deep, and to Geduld, Springs, Van Ryn Deep, Brakpan, and others. There is considerable activity all over this district, and the finance houses are using their utmost endeavors to maintain the supply of gold. Several new shafts are being sunk, and development is being pushed forward as rapidly as the supply of native labor will permit. There are two outstanding events of the current week. The New State Areas, a mine under the management of the house of Barnato, has encountered the reef in the south shaft at a depth of 3,676 ft., and the Geduld Proprietary has announced some capital values disclosed in development work during the September quarter. The significance of these two items of news lies in the fact that the properties are contiguous, the southern boundary of Geduld forming the northern boundary of the New State Areas. In the shaft of the latter mine twelve sections taken over the whole bottom give an average assay value of 89.8 dwt. over 18.9 in., the dip of the reef being 8 deg. This is almost flat, and consequently does not make for a great tonnage per claim, through the reef in this part of the Rand is very undulating, so that no real conclusions can be drawn. The result is nevertheless highly encouraging. It is not often that a shaft sunk, so to say, in the veldt, strikes a rich patch as in the case of New State Areas, though it has happened previously on the Rand. The orebodies in the Far Eastern section run in shoots, and the Geduld Proprietary in its east drive at No. 7 level of No. 3 inclined shaft has driven 3,219 ft., of which 2,820 ft. have been sampled. Of this 64 per cent is payable, and assays 17.6 dwt. over a stoping width of 66 in. It must be admitted that such a length and value are good, and create hopeful views as to the gold content of the reef in the ground as yet unproved between the workings of the two companies. Another interesting point is the cutting of the reef in the Daggafontein ground, in the same vicinity, at a depth of 3,951 ft., assaying 26.1 dwt. over 14.5 in.

An interesting rumor is current that a private undertaking called the West African Diamonds has struck blue ground at a depth of 12 ft. Usually yellow ground is first encountered in a diamond pipe, but possibly there may be no yellow at all. The work on the property is in charge of a diamond prospector from the neighborhood of Kimberley, a fact which makes people place more reliance in the report than they would otherwise do. Alluvial diamonds, up to ½ carat per load, are said to have been found in the vicinity. This, if true, is distinctly high, for De Beers and even the prolific Premier yield nothing approaching this figure.

The Nundydroog, a leading Indian mine on the Kolar field, finds itself in want of funds. It has reached a depth of 4,000 ft., and the management, John Taylor & Sons, wish to sink 2,000 ft. lower, because at that depth the Ooregum mine to the south is meeting with high-grade ore. A reconstruction is proposed, one new 10s. share carrying the heavy liability of 6s. per share being exchanged for each existing 10s. share.

The directors of the famous old Dolcoath tin mine in Cornwall have given notice to the employees to stop work, owing, it is believed, to the financial uncertainty caused by the coal strike. The china clay industry is also seriously affected on account of the shortage of bunker coal affecting shipping.

CANADA

British Columbia

Diamond Drilling Discontinued on Gloucester Group at Franklin

Grand Forks—Diamond drilling on the Gloucester Group and the G. H. claim of Franklin camp, near Grand Forks, which has been in progress for some months under the supervision of the provincial department of mines, has ceased on account of winter weather. A total of 2,888 ft. of drilling has been done in the camp, most of it on the two properties named.

Trout Lake—The Mansfield Mining Co. has uncovered a large vein of $12 silver-lead ore at a depth of 350 ft., according to M. R. Leahy, manager.

Ontario

Few Tax Delinquent Claims Restaked—Power Conditions Improved

Cobalt—In the Cobalt and Lorraine sections twenty-five claims that were thrown open last week because of the defaulting on taxes have been restaked. In the Larder Lake district less than fifteen claims have been restaked. As far as can be learned about 14,000 acres have been thrown open, but apparently, with the exception of a few of the more promising properties, no great activity was shown in restaking which is not considered surprising.

Power conditions in Cobalt and Porcupine have decidedly improved during the last week, owing to the open weather and the considerable amount of rain and snow which has fallen. In Porcupine conditions, although bad, are better than in Cobalt. The power company has only started to draw on its storage within the last two weeks, and without any additional precipitation has sufficient water to carry the mines through at full capacity for about sixty days. The officials of the company endeavored to have the Porcupine operators co-operate and cut the amount of power consumed. It was difficult, however, to get the operators together, so the power company has decided to keep running at full capacity and take a chance on the rainfall later.

In Cobalt also rain has fallen, and in addition to this the mines have been co-operating and have decreased their power consumption about 20 per cent. The same conditions apply in Kirkland Lake.

There is still little evidence of the freeze-up, and operators are hoping that they will get enough water to carry them through the winter. Practically none of the Cobalt mines have had air compressors in operation for several years and have depended entirely on the air supplied through the power companies. Although some of these compressors could be put in commission at short notice, it is probable that the coal supply is not sufficient to enable them to operate for more than two months.

The Crown Reserve is dewatering the North Cobalt mine in Bucke Township, and also has claims under option in Gillies Limit, South Lorraine, Larder Lake and Northwestern Quebec, which properties the company intends to prospect.

Kerr Lake has installed a crusher and is ready to start shipping its 75,000-ton dump to the Dominion Reduction Co. The three veins discovered on the surface while installing the crusher will be developed from the 90 and 150-ft. levels.

H. H. Sutherland, of Toronto, has left for England to conclude the deal for the disposal of Davidson stock to English interests. About $1,000,000 is involved.

It is understood that the Murray-Mogridge gold mine will endeavor to arrange in England the financing of further operations.

MEXICO

Claimed Taxes Must Be Reduced If Silver Output Is To Be Maintained

City of Mexico—The mining department of the Ministry of Commerce and Industry of Mexico has issued a statement to the effect that the decline in the price of silver has not, as yet, affected the production of that metal in Mexico. During the first six months of 1919 the output for the entire republic was 30,538,000 oz., compared with which the production for the first six months of 1920 was 32,958,000, an increase of 2,420,000. The statement adds that thus far the production for the last six months of the year is considerably in excess of the output for a similar period last year.

The president of the Industrial Chambers of Industry takes issue with the statement of the Minister, although no attempt is made to refute the actual figures given. The former points out, however, that by far the larger portion of the silver producing properties of Mexico carry low-grade ore which was worked extensively during the first part of the year but cannot continue to be worked profitably under present prices unless the government comes to the relief of the silver miners by a reduction in general taxes and also a considerable reduction in the export tax. The facts are that up to this date none of the silver camps have actually suspended work. The larger concerns are holding their bullion confident of a reaction.

It is reported from Mexico City that coal mines in the northern states were taken over by officials of the de la Huerta government on Nov. 5. Government ownership is not intended.

State of Mexico

San Miguel Tlaxpampa Puts Mill in Operation

Zacualpam—The San Miguel Tlaxpama, district of Zacualpam, started milling late in October on good grade ore and the management is pushing the output despite the unpromising price of silver. The San Miguel is an old property, recently reopened and reorganized with strong backing. S. J. Lewis is in charge.

A number of small properties in the same district are preparing to open up. The principal drawback to the development of the district is the lack of railway transportation.

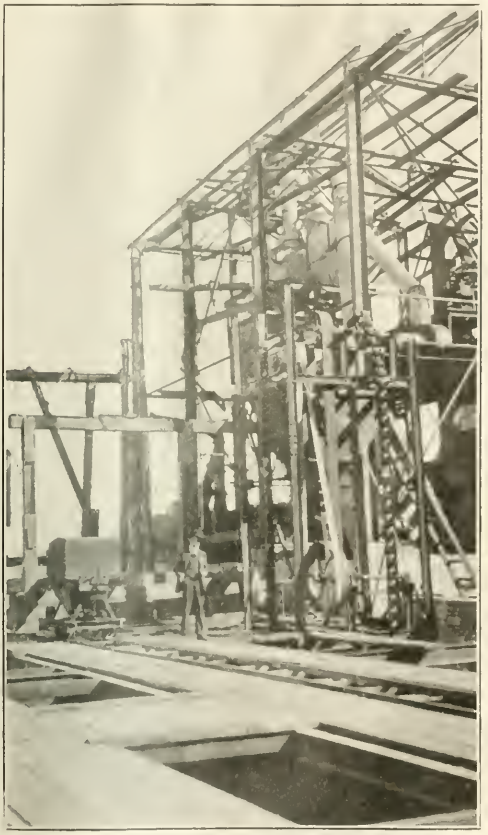
Guanajuato

Guanajuato — J. Walker, formerly manager of the Bank of London and Mexico, now heavily interested in mining here, held a very satisfactory conference with the President of the Republic relative to the removal of the heavy export taxes on the output of low-grade properties. A very large portion of the mines in this state come under this head. Mr. Walker reports that assistance was promised along the line outlined and that an effort will be made to secure rolling stock to remove the congestion here.

Hidalgo

3,000 Workers Laid Off at Pachuca

Pachuca—Three thousand men were laid off the last week in October, ostensibly because of the low price of silver. All the large properties here are working on low-grade ores. Probably the real reason for letting the men out was to forestall a strike which had been threatened on a large scale that would have resulted in a complete paralysis of the entire camp.



EQUIPMENT FOR DRYING AND PULVERIZING CHARCOAL USED FOR FIRING REVERBERATORY FURNACE OF FAMATINA MINING CO., SANTA FLORENTINA, ARGENTINA

ARGENTINE REPUBLIC

Operations of Famatina Mining Co. in Chilecito Region

Santa Florentina — The Famatina Mining Co. in the Argentine Republic, is operating at Santa Florentina in La Rioja province, Department of Chilecito. Santa Florentina owes its existence to the mining activity of this region. The town is situated at the foot of Famatina Mountain, at the top of which, about 15,000 ft. above the sea, are located the rich copper deposits which have been known for years.

The mines can be worked only during the summer months. For transporting the ore the national government has built an aerial tramway, 21 miles long, with eight stations from the mines to the smelter, which may be used by private individuals on payment of a very small freight charge per ton.

For many years the ore was treated in small smelters equipped with water jacketed furnaces which used almost all the available wood of the near-by forests. These although not very large, gave life at least to those regions that today are completely arid and desolate.

Owing to the high-grade ore, the Famatina company was formed and installed a smelter with reverberatory furnaces having a capacity of 200 tons per day. The smelter has been working since Aug. 18 of this year. There are also two converters each with a daily capacity of 10 tons of blister copper carrying a little gold and silver, also equipment for drying and pulverizing charcoal which was bought in Detroit, Mich., and all the accessories required in a plant of this kind. A low-grade gold quartz will be used for lining the converters.

In addition to what has been mentioned the equipment includes two turbines, boilers and two water jacketed furnaces with a capacity of 100 tons.

In spite of the fact that charcoal does not give a high efficiency in the reverberatory furnaces owing to the fact that it has a low percentage of volatile matter, nevertheless the company hopes to get good results and has undertaken to build a similar smelter. The heat of combustion passes under a series of waste heat boilers which generate steam for operating air compressors that supply air to drills in the mine.

The ore averages 5.5 to 6 per cent copper, 28 to 30 grams of gold per ton and from 300 grams to 1 kilogram of silver per ton. The mineral is found in the form of oxide, sulphide and carbonate.

The Chilecito region has an abundance of minerals and there are silver mines which yield 70 kg. per ton. There are also gold and lead mines. Leo W. Michel, an engineer, is trying to organize a company with Chilean capital to exploit a wolfram mine which according to all reports can supply a fair tonnage of wolfram ore.

Mendoza—The owner of the mines of Paramillo de Uspallata, Benito Villanueva, who is vice president of Argentina, has recently sent Zako S. Béyl, Lester W. Strauss and Dr. E. H. Bergeat into this field for the purpose of making reconnaissance and laying out a working plan. It seems that these engineers are going to re-establish a company with Dutch capital to exploit silver properties of this region where ores are found that contain 1 to 2 per cent silver. This is without doubt one of the most important mines of the Argentine Republic, and is situated close to the city of Mendoza. The orebody is about 4 kilometers in dimensions north and south and 4½ kilometers east and west. Galena is the commonest mineral and is found in all of the veins, at times mixed with considerable blende. Chalcopyrite is found in all of the veins and is generally mixed with iron pyrites, which causes considerable variation in the silver and copper content. Tetrahedrite and antimony and arsenic minerals also usually occur. The Paramillo ore is very complex and refractory to smelting, which is the method commonly used for reduction, and to date has not given very good results.

It is proposed to install a concentrator. There is over $400,000 (U. S.) worth of machinery, tools and buildings at the mine. All the veins have been sufficiently worked to make it possible to estimate the available ore approximately. There is also about 30,000 tons of ore in stock.

In the region south of Mendoza exploration permits have been solicited for 1,000,000 hectares (2½ million acres) with the idea of locating rafaelite, vanadium ore and petroleum. The people making the investigations are Argentinians, Chilians and North Americans.

Sandstones have been found which contain 1 to 2 per cent of molybdenum according to analysis by the Division of Mines of Mendoza Province, and this has no doubt created some excitement.

CALIFORNIA

Control of Plumas-Eureka Said To Have Changed Hands

Quincy—W. J. Gruss, president and operating manager of the Gruss Mining Co., reports that he has struck the east and west vein at the point where it crosses the Gruss vein, about 350 ft. north of the shaft on the 200-ft. level. The vein was entered on the footwall and though it has been crosscut for a distance of 30 ft., the hanging wall has not been reached. Mr. Gruss plans to install a 200-ton mill and to buy power from the Great Western Power Co. whose line passes within 1,600 ft. of the property on its way to the Walker mine. Regular shipments of concentrates to the smelter are planned.

Colfax—Activity at the Rising Sun mine near Colfax is increasing. The mill is running twenty-four hours. The ore coming from the mine is of excellent grade and it is thought that the company will soon enter the ranks of dividend payers. The ore recently cut on the 6th, 7th, 8th, and 9th levels is being developed, and enough ore to keep the mill in operation for some time to come is said to have been blocked out.

Sutter Creek—Operations at the Central Eureka mine are progressing steadily. The ore coming from the newly opened level is improving as the crosscut advances. Most of the new machinery is in place, adding to the efficiency of the plant.

Yreka—The Roxbury Mining Co. has completed preparations for extensive hydraulic operations and will place three giants in commission as soon as water is available. Much profitable gold-bearing gravel is in sight.

It is rumored in mining circles that the Plumas-Eureka gold mine, near Johnsville, has passed into the control of the Guggenheim interests. The property is near the Plumas copper belt, and has been a great gold producer for many years.

NEVADA

Ely District Shipping Manganese Ore

Ely—The Jennie A mine at Hamilton, near Ely, will continue development work during the winter, though the trucks will stop hauling ore to Kimberley. Five cars of silver-lead ore have recently been sent to the Utah smelters. John W. Nice is in charge.

Shipments of manganese ore are being made from the Ely district at present. Increased demand and better prices are reported, but increased freight charges menace the activity.

Pioche—Ore shipments from the Pioche district for the week ended Oct. 28 totaled 2,955 tons. Shippers were: Prince Con., 1,750 tons; Virginia Louise, 650; Con. Nevada Utah, 200; Bristol Silver Mines, 160; Black Metals, Inc., 105; Bristol Battles Lease, 45, and Bristol Campbell Lease, 45.

COLORADO

Gem Mining Co. Acquires Argo's Holdings, Including Newhouse Tunnel

Idaho Springs—The tunnel, mill and mining properties of the Argo Reduction & Ore Purchasing Co. have been acquired by the Gem Mining Co. By this transaction the Gem Mining Co. secures control of the Newhouse tunnel with its numerous tributary properties in Clear Creek and Gilpin counties, including the Gunnell mine, which is tapped by the tunnel at a point over 4½ miles from the portal. Recently the Gem Co. secured the properties of the Idaho Mining, Tunnel & Transportation Co., which, together with the original Gem holdings, will materially increase the company's field of operations. The Gem and Silver Age mines are working a crew of about forty men, and as soon as the results of development warrant the working forces will be increased. The production from these properties is now being treated at the Newton mills, but it is probable that the Argo mill will be placed in operation as the tonnage from the newly acquired properties is increased. The Gem Mining Co. is engaged in custom milling, in addition to treating ores from its own properties.

Telluride—Shipments for September were as follows: Tomboy, 31 cars; Smuggler, 33; Liberty Bell, 4; total, 68, all concentrates. Shipments were curtailed by reduction in output of the Smuggler as a result of fire destroying important milling equipment, and on account of a rock slide which temporarily stopped operation of the Tomboy tramway.

Durango—The Esmeralda property is being developed under the direction of W. B. Cauble. Several pockets of rich silver ore have been opened recently. A small trial shipment to the smelter returned over 300 oz. silver per ton.

Leadville—Development is under way in the Fanny Rawlins property, and the first level is being advanced into oxidized ground. On the 4th level some high-grade ore has been developed and is being shipped to the local smelter. About fifteen men are employed.

Alma—Rich ore has been opened recently in the old Dolly Varden property. Assays as high as 400 oz. per ton are reported. A. E. Moynahan is manager.

Gladstone—The Bandora mine has been reopened, and is being developed and operated under the management of E. D. Lycoff. Shoots of silver-lead ore have been opened. The boarding house is being remodeled and two new bunkhouses built, so that work can continue throughout the winter.

Gilpin County—The Topeka and Frontenac mines, formerly operated by the late Henry P. Lowe, have recently been examined in the interests of a New York syndicate, which is supposed to represent British capital.

Ouray—Lessees and small operators have nearly all suspended, owing to high freight and treatment costs. A few have survived and are putting in supplies for the winter. A storm bringing one to two feet of snow has temporarily stopped hauling to and from the mines, but though this is somewhat unusual, all mines will yet have time to make their usual preparations before winter sets in.

The Paymaster Mines Co. has completed the cleaning out and repairing of the Virginia tunnel and is laying track therein preparatory to continuing the drive to cut the ore body recently encountered on Paymaster ground. This will probably be done by contract.

The Mountain Top, Atlas, and Camp Bird remain the only larger mines in operation, the Red Mountain Mines Co. having suspended operations for an indefinite time, chiefly on account of adverse external conditions. The Moun-

tain Top is connecting an air lift and will shortly begin unwatering the shaft to reach the main high-grade body. Plans for a drainage and haulage adit lower down are being perfected.

Among the smaller operators, the Eurades Mining Co. has completed buildings, coal bins and the like and is beginning to haul supplies for a vigorous development campaign during the winter. James A. Lannon, in charge of the Guadaloupe, is installing machinery and supplies for development through a new and lower adit level. Lessees at the Barstow have opened a large body of good milling ore and are putting in supplies for the winter; the winter's accumulation of ore will be milled next summer, as usual. The Paymaster Mines Co. has begun work in the lower crosscut on the Silver Bell and will soon reach the Silver Bell "break," which will be followed to the Paymaster shaft. The Ouray Consolidated M. & R. Co. has been reorganized under K. MacDermid and is taking options on good property near its mill in Ironton, expecting to begin exploration and development on this property this fall.

The test runs at the Gold Crown mill in Ouray by the Pony Express company are about completed and have demonstrated several things of interest locally. About 100 tons of Beaver Belfast ore, carrying considerable lead and much zinc, was successfully treated; high-grade lead concentrates and zinc concentrate were produced in a small mill using only a ball mill, one flotation machine and a few tables. Pony Express ore is now being treated with good results; this is a semi-oxidized siliceous silver ore, regarded as impossible of treatment by flotation. This is the first attempt in years to do any experimental work on such a scale and demonstrate the possibilities of these ores, which have been untreated for years. The success of these tests is inducing serious consideration of other tests on various ores, likely to result in some of these mines being reopened.

Mayday — The Ten Broeck, seven miles above Mayday, on Lewis Mountain, has opened a new vein in the 3,000-ft. tunnel. It is 4 to 5 ft. wide and assays from $12 to $25 per ton in gold and silver.

Another lime orebody has been opened at the Esmeralda. This is the sixth stratum of lime opened here and makes a total of 9 ft. of ore assaying 22 oz. per ton in silver. A shipment made to the Durango smelter brought returns of 320 oz. per ton in silver. A 25 ton mill is to be erected.

Lessees have taken over the Mayday, one of the largest producers of high-grade ore in the district, and will begin work at once.

The Bessie G. shipped 32 sacks of high-grade gold-silver ore, which was packed by burro from the mine to Mayday, then hauled by truck to the Durango smelter. Paul Dalpra and associates have secured a lease on the Idaho and have a carload of ore which is expected to bring $50 per ton.

UTAH

Daly Mine Taken Over by Interests Close to Judge M. & S.—To Open Naildriver From Ontario

Eureka—Ore shipments from the Tintic district for the week ended Oct. 30 amounted to 129 cars, as compared with 174 cars (an unusually heavy tonnage) the week preceding.

The Iron King is doing considerable development on its lower levels and shipping about a car of fluxing iron ore daily from its tunnel level.

At the South Standard, southeast of the Tintic Standard, power connections have been completed to the site of the new shaft and machinery moved over. Buildings are to be erected, after which active development of the property is expected. The shaft of the Central Tintic Standard is down 600 ft. and drifting is expected to start soon on this level. The Copper Leaf has been working for some time to reach the northern extension of the Tintic Standard oil zone. This property is closing down for the present, but is expected to resume work about the first of the new year. The Pinion Queen, also in "east" Tintic, has its shaft down 800 ft., where some mineralization, mainly in silver, has been encountered. Drifting for a cross fissure will be started from the bottom of the shaft in the hope of opening a paying body.

Alta—The Emma Silver at its annual stockholders' meeting elected the following directors: A. L. Hoppaugh, J. E. Galligher, C. S. Burton, J. Herlihy and F. B. Cooke. George H. Dern resigned as manager. A report on the property by M. M. Johnson submitted to the stockholders advised the cessation for the present of work below the Bay City tunnel, owing to heavy expense due to water, and the undertaking of work on levels higher up to locate the faulted segments of orebodies to the north of the Emma body. Work in this section successfully prosecuted would give data for operation later on below the Bay City tunnel.

Park City—Shipments for the week ended Oct. 29 amounted to 1 634 tons of ore and concentrates, as compared with 1,718 tons the week before.

The Daly mine has been taken over by men closely allied with the interests in control of the Judge Mining & Smelting Co. G. W. Lambourne is president and Oscar Friendly mine superintendent. The Judge company is giving employment in its mine and mill to old employees released by the closing down of its electrolytic zinc plant, owing to the increased power costs allowed by the State Public Utilities Commission. Experimental work is being continued until more normal conditions return and the plant can be reopened.

Arrangements have been completed whereby lower levels in the Naildriver can be opened from the Ontario. A drift started in the Ontario and passing through unprospected ground here also will cut the Naildriver at about 1,300 ft., giving an additional depth of 450 ft. below the present workings.

The New Quincy has purchased a compressor and hoist, the latter electrically driven. A lease on the shaft and workings of the Little Bell will permit of work being done on a larger scale than heretofore. At present five or six men are being worked, and as soon as the new equipment is installed the number can be added to.

ARIZONA

United Verde Cuts Force—Denn-Arizona Shuts Down—Arizona Copper Curtails

Jerome—United Verde, now that it has its development work well advanced, has made a cut of 75 per cent in employment of unmarried men, curtailing its force by 30 per cent, which became effective Nov. 1. Arizona-Binghampton, east of Mayer, has also cut its force.

Bisbee — Denn-Arizona has shut down, laying off about 100 men, on account of the copper market. Shattuck-Arizona will continue to operate mine and mill.

Clifton—The Arizona Copper Co. has laid off a large number of men, mainly Mexicans.

Winslow—Heavy drilling equipment is being installed by the Crater Mining Co. on the lip of the meteoric crater New housing has been provided and a water line has been brought in from Canyon Diablo. The first hole is to be in the upraised limestone crater lip on the south side, it being believed that the meteor sought came on a decided angle from the north. A number of years ago a company headed by D. M. Barringer, of Philadelphia, spent a large sum in trying to reach the nickel-iron mass assumed to be buried deeply in the bottom of the crater, which is about 3,800 ft. in diameter, with shattered walls uplifted 600 ft. above the floor. The lip is 130 ft. above the level of the surrounding plain. Below the earth of the crater floor is found what is locally termed "rock flour," so fine that it will sift through a 200-mesh screen. Shaft sinking proved impracticable and was abandoned at 200 ft. Drilling was prosecuted within the depression, but was hindered by the character of the material penetrated. Several of the twenty-five drill holes were bottomed on iron and others went through to the unaltered red sandstone. Chippings brought up had the same constitution as tons of fragments found on the plain, 92 per cent iron, with the balance mainly nickel, with platinum and iridium present to the extent of three-fourths of an ounce to the ton of metal. Estimates of the probable size of the meteor vary greatly. Fragments have been picked up more than five miles away. One of the largest pieces, weighing about half a ton, is in the Field Columbian Museum in Chicago.

Parker—A 125-ton leaching plant is being installed by T. J. Carrigan at

the Arizona Standard Copper's property to work a copper deposit said by Carrigan to have a large tonnage of carbonate and oxide ores that sample from 3 to 7 per cent.

Globe — Diamond drilling on the Castle Dome property is reported to have outlined an extensive sulphide deposit sampling 1.4 per cent copper, with a 20-ft. carbonate capping carrying 2½ per cent. Work has been suspended.

The Mine Operators Co. is installing an experimental leaching plant in the Mineral Creek section, where there are bodies of carbonate ores, capping the deeper sulphides.

Ajo—A cyanide plant is to be installed by A. W. Bramwell at the New Gunsight property.

A new hoist has been installed at the Copper Ridge property, formerly known as the Ajo-Cornelia.

NEW MEXICO

Snake & Opportunity Mines Stop Prospecting at Hillsboro

Silver City—The Maggie claim, located in Shingle Canyon, three and one-half miles from Fierro, is under option to Colorado zinc interests, represented by J. D. Harlan. The property will be drilled under contract by R. H. Hodge.

Hillsboro—The Snake & Opportunity Mines Co. have stopped prospecting and will ship all machinery to Helena, Mont. It is understood that the results of diamond drilling have not proven satisfactory. Nick C. Wallace, who has been in charge, will leave soon for Wallace, Idaho, to take charge of the Midnight property.

Rincon—The Ore Production Co. will start work on a tunnel to cut the vein on their fluorspar property at a depth of 300 ft. A. S. Sears, of San Francisco, who is interested, arranged for the financing of the work with Eastern parties.

MICHIGAN

The Copper District

Flotation To Be Tried on Amygdaloid Slimes—Geological Survey of Franklin Under Way

Houghton—For some years the shortage of trammers has been a serious condition in the copper district. Much thought and attention has been spent in developing mechanical devices which would decrease the manual labor involved. This has resulted in the use of mechanical haulage and mechanical shovels for some purposes. One of the largest operators in the district has developed a "stope scraper" which gives such promise that they are now building them on quite an extensive scale. This machine is built of a size to be operated by two men and will do the work of about eight trammers.

Some of the amygdaloid mines are planning to test the flotation process on their slimes soon. The flotation of the copper in the conglomerate slimes of the Calumet & Hecla and the shale formation of the White Pine Copper Co. has been a success. At the Calumet & Hecla the Minerals Separation process is used.

The Seneca Mining Co. has cut the lode with its 5th level crosscut.

The Franklin Mining Co. is having a geological survey made of its property. It has been shut down for considerable time except for the operation of the pumps. The result of this examination will determine the company's future policy, which will probably be announced soon.

MINNESOTA

Pickands-Mather May Deepen Rowe Shaft

Crosby—At the Portsmouth mine of the Gordon Mining Co. a drainage shaft has been sunk from the bottom of the present ore pit a depth of 75 ft. and a contract has been let for driving 200 ft. of drift from the bottom of shaft to drain the ore pit.

The Rogers-Brown Ore Co. has completed the loading of No. 1 and No. 2 grade stockpiles at its Meacham mine and has transferred its shovel to Cuyuna for loading the balance of Kennedy Mine stock.

Riverton — Pickands-Mather & Co. are considering deepening the Rowe mine shaft to the 375-ft. level and developing the orebody on this level. The shaft was completed to within 40 ft. of the proposed new level last spring, but since that time all work has been confined to active mining of the 220-ft. level.

JOPLIN-MIAMI DISTRICT

Oklahoma-Kansas-Missouri

Commonwealth Concentrator Ready—Federal S. & R. Closes Farmington Mine

Baxter, Kan.—The Commonwealth Mining Co. has completed the erection of its new concentrator just south of the Oklahoma-Kansas state line, south of Baxter Springs, and plans to start it at once. Only one shaft will be used for the present and the mill shaft, which is down only 40 ft., will probably not be completed before spring. The company has a 40-acre lease running for twenty years and is in no hurry to extract ore. Operations will be started at a depth of 150 ft.

Just north of this property a company, in which Charles M. Schwab is said to be interested, is drilling and good strikes have been unofficially reported.

Hockerville — The Federal Smelting & Refining Co. has temporarily closed its Farmington mine at Hockerville to curtail production. It is continuing to prospect by drilling on the Lucky Jenny and Choctaw Chief leases, which it recently took under option.

Miami, Okla.—Brick work has been started on the main building of the $100,000 School of Mines for Oklahoma located at Miami.

ILLINOIS

Strike Called Off at Hillside Fluorspar Mines

Elizabethtown—The strike has been called off at the Hillside Mines near Elizabethtown, Ill. The men wished to return to work and were told they could provided they would turn in their cards to the manager. The mines refused to recognize the union.

Chronology of Mining

October, 1920

Oct. 1. National Safety Congress closed 9th annual session at Milwaukee. —Independent Oil Men's Association meeting at Denver, Col., adjourned.

Oct. 4. New Mexico chapter of American Mining Congress organized at Silver City, N. M.

Oct. 9. Zinc and lead interests of the Mississippi Valley confer with Bureau of Mines officials at St. Louis concerning objectives of experiment station at Rolla, Mo.

Oct. 11. Lowell, suburb of Bisbee, Ariz., partly destroyed by fire.—Miners of Asbestos Corporation in Quebec strike.

Oct. 12. Colorado Metal Mining Association asked Western Trunk Line Committee to restore old freight rates within state.

Oct. 14. Oil producers and refiners meet big gas companies at American Petroleum Institute headquarters, New York City, to discuss oil supply.

Oct. 15. Joplin, Mo., zinc ore producers voted shut-down for two weeks. —St. Louis Section of A. I. M. E. held Fall meeting in the southeastern Missouri "Lead Belt"—General coal strike began in Great Britain.

Oct. 16. Copper Queen branch of Phelps Dodge Corporation announced layoff, effective Nov. 1, of part of steam-shovel force working on Sacramento Hill, Bisbee, Ariz.—Colorado Metal Miners Association filed application with Western Trunk Line Committee for hearing on re-adjustment of bullion rates between Colorado smelters and seaboard refineries.

Oct. 18. Canada Copper Corporation's new 2,000-ton concentrator at Allenby, B. C., began operation.—Canadian iron ore producers ask bounties of the Canadian Tariff Commission.—Subcommittee on standardization of petroleum specifications held open session at Washington, D. C., adjourning on Oct. 20.

Oct. 20. Utah Apex-Utah Consolidated suit decided in favor of former by Judge T. H. Johnson at Salt Lake City, Utah.—Ownership of Engineer group of claims in Atlin district, B. C., brought before courts.

Oct. 23. Judge Mining & Smelting Co., Salt Lake City, Utah, closed electrolytic zinc plant because of low prices and increasing costs.—Increased rates for power in Utah went into effect by order of Utah Public Utilities Commission.

Oct. 27. Two hundred jurymen drawn in the Bisbee, Ariz., deportation case.

THE MARKET REPORT

Daily Prices of Metals

Nov.	Copper, N. Y. net refinery* Electrolytic	Tin		Lead		Zinc
		99 Per Cent	Straits	N. Y.	St. L.	St. L.
4	14.60@14.75	38.00	38.75@39.00	6.75	6.50@6.75	6.80
5	14.60	37.75	38.50@38.75	6.75	6.50@6.75	6.75
6	14.60	37.50	38.25@38.50	6.75	6.50@6.75	6.75
8	14.60	36.00	37.00@37.50	6.50@6.75	6.50@6.75	6.70
9	14.60	36.00	37.00@37.50	6.50@6.75	6.50@6.75	6.65
10	14.60	36.25	37.25@37.75	6.50@6.75	6.50@6.75	6.50@6.60

*These prices correspond to the following quotations for copper, "delivered": 14.75 @14.90, 14.75, 14.75, 14.75, 14.75 and 14.75c.

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for deliveries constituting the major markets, reduced to the basis of New York, cash, except where St. Louis is the normal basing point, or as otherwise noted. All prices are in cents per pound. Copper is commonly sold "delivered," which means that the seller pays the freight from the refinery to the buyer's destination.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. Tin is quoted on the basis of spot American tin, 99 per cent grade, and spot Straits tin.

London

Nov.	Copper			Tin		Lead		Zinc	
	Standard		Electrolytic						
	Spot	3 M		Spot	3 M	Spot	3 M	Spot	3 M
4	92½	91⅝	100	259¼	263½	35¼	35⅛	38	39⅜
5	90¼	89½	100	259	262¾	35⅜	35	37⅜	39¼
6	...	...	...	...	...	...	...	...	...
8	90¼	89	100	251⅜	256½	35¾	34¼	37½	38⅞
9	90½	89½	100	245⅜	251¾	35⅝	34⅝	36⅞	38¼
10	90	88¾	100	242½	247	35⅛	34½	36¾	38

The above table gives the closing quotations on the London Metal Exchange. All prices in pounds sterling per ton of 2,240 lb.

Silver and Sterling Exchange

Nov.	Sterling Exchange	Silver			Nov	Sterling Exchange	Silver		
		New York, Domestic Origin	New York, Foreign Origin	London			New York, Domestic Origin	New York, Foreign Origin	London
4	342	99½	82⅜	54⅛	8	334	99½	80¼	53⅝
5	341	99½	82	53⅞	9	336	99½	80¾	53¼
6	338	99½	82	54⅜	10	338½	99½	82¼	54⅜

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Metal Markets

New York, Nov. 10, 1920

Reports of further price cutting in various industries and a decided slump in the stock market have made the metal market weaker during the last week, and it is difficult to find a note of optimism. Costs now have absolutely no bearing on prices, and the fact that zinc and copper are selling below the present cost of production does not make them a bargain in the eyes of possible buyers. The better feeling which we roported last week seems to have been largely a sentimental one following the election. It is now the general opinion that better prices can hardly be expected before next spring.

Copper

The rather general buying of the last two or three weeks is subsiding, and the present sales are mostly of small volume to customers who were slow in getting into the market. Copper can be bought freely now, even from the large producers, at 14.75c. delivered. Speculators are showing a tendency to come into the market at present levels, and it is likely that if the price were further reduced a large speculative demand would develop. Producers consider that the recent reduction from 18½ to 15c. was a good move, inasmuch as it not only resulted in selling considerable copper but also proved that the sellers were willing to do their share in the general price reduction movement.

Metal for forward delivery is nominally held at ¼c. advance over the prices which we quote, but it is likely that, on orders of any size, sellers would not insist on this premium.

Export demand has been a little better, but the reports of large tonnages sold in Europe are said to be exaggerated, and circulated purely for stock-market purposes.

Lead

On Monday, Nov. 8, the A. S. & R. official price was reduced from 7¼c. to 7c. New York. The St. Louis price remains at 7c., the smelting company feeling that under present conditions, with imported lead arriving here, the St. Louis price is on a parity with that in New York. St. Louis is not a large market for desilverized lead, dealing there being more in chemical lead, which is now commanding a premium of about ¼c., as we mentioned last week.

Less lead has been sold during the last few days than for some time.

Zinc

Demand has been even weaker than usual, and daily concessions in price had to be made to attract purchasers. Many producers continue unwilling to sell at current levels.

Correction: The average price of zinc, St. Louis, for October was incorrectly given as 7.650c. last week. The correct figure is 7.150c.

An Appreciation

THE United States Geological Survey would like to express its appreciation of the improvement in the section "The Market Report," under which is given most helpful information on an increasing number of mineral products. Another section of particular interest to the Survey is "Current Prices of Materials and Supplies." Your publication has long been of great assistance to this bureau, but is found to be of greater use than ever before.

Yours very truly,

GEORGE OTIS SMITH,

Director

Tin

On a declining market, business has been fairly active, with some consumer demand. Futures continue to be preferred to near-by delivery. Banca tin is now very scarce, and is reported commanding a slight premium in London, whereas a few months ago the market was flooded with this variety. Demand for 99 per cent grades has been fairly good, and some electrolytic has been sold at approximately the same prices as for Straits.

Straits tin for future delivery: Nov. 4th, 40.75@41c.; 5th, 40.25@40.50c.; 6th, 39.75@40c.; 8th, 38.75@39.25c.; 9th, 38.50@39c.; 10th, 38.50@38.75c.

Arrivals of tin in long tons: Nov. 1st, Straits, 230; China, 15; 8th, Straits, 1,900; China, 5.

Silver

For the last week the London quotation has remained fairly steady at about 54d., until Nov. 10, when it advanced to 54⅝d. on account of China buying, according to reports. Sterling exchange has played an important part in the New York price. China banks have continued to buy at a premium over the London parity, but the inquiry from this quarter narrowed considerably at the higher level. Up to the close of business Nov. 6, purchases by the U. S. Government under the Pittman Act amounted to 22,527,231 oz.

Mexican Dollars Nov. 4th, 62⅞; 5th, 67½; 6th, 62½; 8th, 61½; 9th, 61½; 10th, 62¾.

Gold

Gold in London: Nov. 4th, 119s. 6d.; 5th, 120s.; 8th, 122s. 4d.; 9th, 122s. 4d.; 10th, 121s. A considerable quantity of gold is now arriving here from Europe. Bankers are buying South African gold in the open London market.

Foreign Exchange

Almost all foreign money declined materially during the last week, in several instances touching new lows. The declining tendency is, in general, the result of a continued preponderance of American exports to Europe over imports. On Tuesday, francs were 5.86c.; lire, 3.42c.; and marks, 1.15c. New York funds in Montreal, 11⅛ per cent premium.

Other Metals

Aluminum—For 50-ton lots: ingot, 99 per cent and purer, 33.1c.; 98@99 per cent, 32.90c. Outside sales reported at 31c. for both grades.

Antimony — Chinese and Japanese brands, 6½@6¾c.; W. C. C. brand, 8c. per lb. Cookson's "C" grade, 12½@13c. Chinese needle antimony, lump, nominal at 6@6¼c. per lb. Standard powdered needle antimony[1] (200 mesh), 9c. per lb. Market dull.

White antimony oxide, Chinese, guaranteed 99 per cent Sb_2O_3, wholesale lots, 9½@10c.

Bismuth—$2.55 per lb., 500-lb. lots, and $2.57 per lb., 100-lb. lots.

Cadmium—Nominal, $1.40@$1.50 per lb. Market steady.

Cobalt—Metal, $6 per lb.; black oxide, $4.10 per lb.; sulphate, $1.60.

Iridium—Nominal, $350@$400 per oz.

Magnesium—Crude, 99 per cent or over pure, $1.75 per lb. for 100 lb. lots and over, f.o.b. Niagara Falls.

[1]**Molybdenum** Metal in rod or wire form, 99.9 per cent pure, $32@$40 per lb., according to gage.

Nickel—Ingot, 43c.; shot, 43c.; electrolytic, 45c., f.o.b. Bayonne, N. J.

Monel Metal—Shot, 35c.; blocks, 35c., and ingots, 38c. per lb., f.o.b. Bayonne.

Osmium—Open market, $50@$75 per troy oz.

Palladium—$80@$85 per oz. Dull.

Platinum—Firm at $85@$90 per oz.

Quicksilver—Market quiet; $58@$60 per 75-lb. flask. San Francisco wires $55@$63. Market quiet.

Ruthenium—$200@$220 per troy oz.

[1]**Selenium**—Black powdered, amorphous, 99.5 per cent pure, $2@$2.25 per lb. Demand strong.

[1]**Thallium Metal**—Ingot, 99 per cent pure, $20 per lb.

[1]**Tungsten Metal**—$35@$60 per kilogram, according to purity and gage.

Metallic Ores

Chrome Ore—Guaranteed 50 per cent Cr_2O_3 foreign ore with a maximum of 6 per cent silica, 65@75c. per unit, New York. California concentrates, 50 per cent Cr_2O_3 and upward, 70@75c.

Manganese Ore[1]—60@70c. per unit, seaport; chemical ore (MnO_2) $70@$80 per gross ton, lump; $80@$90 per net ton, powdered.

Molybdenum Ore—85 per cent MoS_2, 65@70c. per lb. of contained sulphide, New York.

[1]**Tantalum Ore**—Guaranteed minimum 60 per cent tantalic acid, 55@65c. per lb. in ton lots.

[1]**Titanium Ores**—Ilmenite, 52 per cent TiO_2, 1½@2c. per lb. for ore. Rutile, 95 per cent TiO_2, 15c. per lb. for ore, with concessions on large lots or running contracts.

Tungsten Ore—Scheelite, 60 per cent WO_3 and over, per unit of WO_3, $6 f.o.b. mines; wolframite, 60 per cent WO_3 and over, per unit of WO_3, $4.50@$5.50, in New York.

Uranium Ore (Carnotite)—$2.75@$3 per lb. for 96 per cent of the contained oxide (U_3O_8). Ores must contain a minimum of 2 per cent U_3O_8.

Vanadium Ore—$2 per lb. of V_2O_5 (guaranteed minimum of 11 per cent V_2O_5), New York.

[1]**Zircon**—Washed, iron free, 5c. per lb.

[1]**Zirkite**—According to conditions, $80 @$90 per ton, carload lots. Pure white oxide, 99 per cent, is quoted at $1.15 per lb. in ton lots.

Zinc and Lead Ore Markets

Joplin, Mo., Nov. 6—Zinc blende, per ton, high, $47.90; basis 60 per cent zinc, premium, $41; Prime Western, settling, $47.50@$40; buying, $40; fines and slimes, $37.50@$35; calamine, basis 40 per cent zinc, $35. Average settling prices: Blende, $45.21; calamine, $38.96; all zinc ores, $45.02.

Lead, high, $104.25; basis 80 per cent lead, settling, $100@$65; buying, $65, average settling price, $94.25 per ton.

Shipments for the week: Blende, 10,025; calamine, 173; lead, 926 tons. Value, all ores the week, $546,600.

With the mines closed down and the bulk of the lead loaded from advance purchases, the average settling price was advanced in the face of a weak buying market. Zinc buying aggregated 6,700 tons, practically the same as last week. Producers claim the output is being kept under 8,000 tons per week, but that exceeds sales, and is not reducing the stock.

Platteville, Wis., Nov. 6—Blende, basis 60 per cent zinc, $45 base for high grade. Lead ore, no sales reported. Shipments for the week: Blende, 854 tons. Shipments for the year: Blende, 57,925; calamine, 2,504; lead, 4,428; sulphur ore, 1,342 tons. Shipped during the week to separating plants, 2,080 tons blende.

Non-Metallic Minerals

Asbestos—Crude, No. 1, $2,000@$3,000; No. 2, $1,400@$1,700; spinning fibres, $400@$800; magnesia and compressed sheet fibres, $325@$400; shingle stock, $110@$150; paper stock, $60@$75; cement stock, $17.50@$30; floats, $8.50@$15, all per short ton, f.o.b. Thetford, Broughton, and Black Lake mines, Quebec, Canada; 5 per cent to be added as Canadian royalty export sales tax.

Barytes—Crude, 88 to 94 per cent barium content, $10@$12 per net ton; ground (white) $24@$30 in bags, carload lots; (off-color) $22@$26 in bags, carload lots; all f.o.b Kings Creek, S. C. Crude, 88 to 94 per cent, $23; ground (white), $45; ground (off color) $30@$32 per net ton, less than carload lots, f.o.b. New York. Crude, first grade, $10 per ton, f.o.b. cars, Missouri; floated, $28 per ton in bbls.; $26.50 per ton in 100-lb. bags; extra charge for bags, f.o.b. St. Louis.

Chalk—English, extra light, 5@7c.; light, 5@6c.; dense, 4½@5c. per lb., all f.o.b. New York.

China Clay (Kaolin)—Crude, $9@$12; washed, $12@$15; powdered, $18@$22; bags extra, per net ton, f.o.b. mines, Georgia; crude, $8@$12; ground, $15@$40, f.o.b. Virginia points. Domestic lump, $10@$20; powdered, $25@$30; imported lump, $25@$35; powdered, $30@$60, f.o.b. New York.

Feldspar—Crude, $8@$14 per gross ton, f.o.b. Maryland and North Carolina points; $7.50@$10, f.o.b. Maine; ground, $27@$30, car lots, f.o.b. Baltimore; ground, $17@$21, f.o.b. North Carolina points; $17@$21 per ton, No. 1 ground, f.o.b. New York State; $21@$23 per ton, ground, f.o.b. Maine. Crude spar very scarce.

Fluorspar — Gravel, guaranteed 85 per cent calcium fluoride and not over 6 per cent silica, $25 per ton, f.o.b Illinois mines, and $27.50, f.o.b. Kentucky; ground, suitable for acid, chem-

[1]Furnished by Foote Mineral Co., Philadelphia, Pa

ical or enameling purposes, $60; lump, $17.50, f.o.b. Tonuco, N. M. In Canada 85 per cent calcium fluoride sells for $20 per ton f.o.b. Madoc; output limited. Canadian price generally $18 (Canadian currency) per ton, f.o.b. mines; market inactive.

Graphite—The 90 per cent crucible grade is held in Alabama for 9c. per lb. and 85 per cent grade is practically unobtainable, prices being 7@9c. The higher lubricating grades sell for 11@40c., according to carbon content.

Gravel—No analysis guarantee, f.o.b. Roseview, Ill., $25 per ton; gravel suitable for acid, chemical or enameling purposes, $60.

Gypsum—Plaster of paris in carload lots sells for $4.25 per 250-lb. bbl., alongside dock, New York. Raw crushed rock, $3.50@$4.50; calcined stucco, $9; f.o.b. works, Illinois.

Kaolin—See China Clay.

Limestone—Dolomite, 1@2 man size, $1.60@$1.65; 2@8 in., $1.55@$1.65 per net ton, f.o.b. Plymouth Meeting, Pa.; fluxing, $1.65@$1.75 per net ton, f.o.b. Howellville, Pa.

Magnesite, Calcined — High-grade caustic calcined, lump form, $35@$40 per ton, carload lots, f.o.b. California points. In Chicago district, $57.70; Atlantic seaboard, $61@$63.

Dead-Burned — $32.50 per net ton, Chewelah, Wash.; $52@$58, Chester, Pa. Austrian grade, $52@$55 per ton, t.o.b. Baltimore. (Magnesite brick—See Refractories.)

Mica—India block mica slightly stained, per lb.: No. 6, 50c.; No. 5, $1.20@$1.40; No. 4, $2@$3; No. 3, $4.25@$5; No. 2, $5.50@$7; No. 1, $8. Clear block: No. 6, 55c.; No. 5, $2; No. 4, $3.50; No. 3, $5, No. 2, $6.50; No. 1, $8; A1, $10; extra large, $25, all f.o.b. New York; ground, $150 per ton, Philadelphia. Domestic, uncut, f.o.b. Franklin, N. C., as follows: Scrap, $45@$50 per ton; punch, 10c. per lb.; circle, 15@25c.; 1½ x 2 in., 75c.; 2 x 2 in., $1.15; 2 x 3 in., $1.65; 3 x 3 in., $2.10; 3 x 4 in., $2.50; 3 x 5 in., $2.75; 3 x 6 in., $3.75; ground 165 mesh, $240 per ton; ground roofing mica, $60; mica washers, 75c.@$2 per lb.; 1¼-in. disks, No. 1, $1.60 per lb.; No. 2, $1.30. The foregoing domestic prices obtain also in the Chicago district.

Monazite[1] — Minimum of 6 per cent thorium oxide, $35 per unit, duty paid.

Phosphate Rock—Per long ton, Florida ports: 77 per cent tricalcium phosphate, $13; 75 per cent, $11.50; 75@74 per cent, $11; 70 per cent, $8.35; 68 per cent, $7.85; 68@66 per cent, $7.60. Finely ground Tennessee rock sells for $8.50 per net ton for 13 per cent phosphorus content, agricultural application; for acid-making, 14 per cent, $9; both prices f.o.b. Centerville, Tenn.

Pumice Stone—Imported, lump, 4@50c. per lb.; domestic lump, 6c.; ground, 4@7c., all f.o.b. New York.

Pyrites—Spanish fines, per unit, 12c., c.i.f. Atlantic seaport; furnace size, 17c.; Spanish lump, 14@16c.; domestic fines, f.o.b. mines, Georgia, 12@14c. Market improving.

Quartz—(Acid tower) fist to head, $10; 1½ to 2 in., $14; rice, $17, all net ton, f.o.b. Baltimore; lump, carload lots, $5@$7.50 net ton, f.o.b. North Carolina mines.

Sand (Glass)—Dry glass sand, $4 per net ton, f.o.b. cars Mapleton, Pa. Sand, f.o.b. Ottawa, Ill., is $3 per ton; $2.50 on annual contracts. Sand at Klondike, Gray Summit and Pacific, all in Missouri, is $2.50 on contract; some outside sales have been made at $4. St. Louis, open market, at $3.50; contract price on large quantities, $2.50; on small quantities, $3.

Sulphur—$18 per ton for domestic; $18@$20 for export, f.o.b. Texas and Louisiana mines. Market quiet.

Talc — Paper making, $12@$22 per ton; roofing grades, $9.50@$15; rubber grades, $12@$18, all f.o.b. Vermont. California talc, $20@$45, talcum powder grade. Southern talc, powdered, carload lots, $12@$15 per ton; less than carload, $25, f.o.b. cars; freight to New York $5.25 per ton, carload lots; less than carload lots, $9.25. Imported, $60@$70; Canadian, $20@$40 per ton.

Mineral Products

Arsenic—White arsenic, 14@14½c. per lb.; sulphide, powdered, 18@19c. per lb. in carload lots.

Sodium Nitrate—$3 per cwt., ex vessel, Atlantic ports. Market quiet.

Sodium Sulphate—For 95 per cent material, $22 per ton, f.o.b. mines, Idaho and Arizona, spot and six months' contract.

Potassium Sulphate—Domestic, $225@$250 per net ton, basis 90 per cent, f.o.b. New York.

Ferro Alloys

Ferrocarbontitanium—For 15 to 18 per cent material, $200@$225 per ton, f.o.b. Niagara Falls, N. Y.

Ferrocerium—Per lb., $12@$15. Foreign conditions as affecting the price of American goods remain unchanged.

Ferrochrome—Carload lots, spot and contract, 60 to 70 per cent chromium, 6 to 8 per cent carbon, 18@19c. per lb. of chromium contained; 4 to 6 per cent carbon, 17@18c., f.o.b. works.

Ferromanganese—Domestic 76 to 80 per cent, $175, freight allowed; $170, f.o.b. seaboard bases; English, $165@$170, c.i.f. Atlantic seaports. Spiegeleisen, 18@22 per cent, $75@$80, f.o.b. furnace.

Ferromolybdenum[1]—Standard grades, carrying from 50 to 60 per cent molybdenum metal, with low sulphur, phosphorus, and arsenic, $2.25@$2.50 per lb. of contained metal, f.o.b. works.

Ferrosilicon—For 10 to 15 per cent, per gross ton, f.o.b. works, $60@$65; 50 per cent, $80@$85; 75 per cent, $160.

Ferrotungsten[1]—Domestic, 70 to 80 per cent W, 75@90c. per lb. of contained tungsten, f.o.b. works. Foreign, 70c.

Ferro-uranium—35 to 50 per cent U, $7 per lb. of U contained, f.o.b. works.

Ferrovanadium[1]—Basis 30 to 40 per cent, $6.50@$8 per lb. of V contained, f.o.b. works.

[1]Furnished by Foote Mineral Co., Philadelphia, Pa.

Metal Products

Copper Sheets — Current New York price, 25½c. per lb.; wire, 19c.

Lead Sheets—Full lead sheets, 10½c.; cut lead sheets, 10¾c. in quantity, mill lots.

Nickel Silver—Unchanged at 36½c. per lb. for 18 per cent nickel.

Yellow Metal — Dimension sheets, 23¼c.; sheathing, 23¼c.; rods, ¾ to 3 in., 20¼c.

Zinc Sheets—$12.50 per 100 lb., less 8 per cent on carload lots, f.o.b. smelter; zinc plates, 12c. per lb.

Refractories

Bauxite Brick—56 per cent alumina, $160 per 1,000, f.o.b. Pittsburgh.

Chrome Cement—40@45 per cent Cr_2O_3, $55@$60 per net ton, and $65 in sacks, carload lots, f.o.b. eastern shipping points.

Fire Brick—First quality, 9-in. shapes, $55@$60 per 1,000, Pennsylvania, Ohio and Kentucky. Second quality, $45@$50.

Magnesite Brick — 9-in. straights, $110 per net ton; 9-in. arches, wedges and keys, $121; soaps and splits, $134.

Silica Brick—9-in., per 1,000: Chicago district, $65@$70; Birmingham, Ala., $56@$61; Mount Union, Pa., $55@$60.

Iron Trade Review

Pittsburgh, Nov. 9, 1920

The decreased demand for steel which has been the feature of the market for some time is reflected more in decreasing mill operations than in declines in prices of the independent manufacturers. Prices for sheets are constantly falling, 6c. being now possible on black sheets for prompt shipment by some independent mills, galvanized being about 1.50c. higher, and heavy gages of blue annealed sometimes sell down to 4c.

Prices of independent steel producers will hardly be down to the Steel Corporation level, in all cases, before March or April.

Pig Iron—Bessemer has been offered at $42 Valley, or $3 further decline. Basic sold in a 2,000-ton lot at $38.50, or $1.50 decline. On an inquiry for 1,000 tons November and December foundry, as low as $41 was quoted by producers. We quote: Bessemer, $42; basic, $38.50; foundry, $41, f.o.b. Valley furnaces, with $1.96 freight to Pittsburgh. A common expectation is that pig iron will find a stable level at within $1 or $2 either way of $30 Valley, though the process may possibly require several months.

Semi-finished Steel—The market is altogether stagnant, with prices practically nominal at $55 for billets, $65 for sheet bars, and $70 for rods.

Charcoal and Coke

Charcoal—Willow, 7c. per lb. in bbls.; hardwood, 6c. per lb., in 250-lb. bbls.

Connellsville — Furnace, $16.50@$17; foundry, $18

Market for Feldspar

Kinds and Grades—Where Produced—Heavy Demand and High Quotations—Prices Now Ruling

FELDSPAR, used principally in the manufacture of pottery, chinaware, porcelain, enamel ware, and enamel brick and tile, is of three varieties: potash feldspar, containing potash as well as aluminum; albite, containing soda and aluminum; and soda lime feldspar, containing a mixture of soda and lime, as well as aluminum. In the trade, feldspar is divided into two classes, potash and soda. A typical potash feldspar contains eight to eleven parts K_2O, and two to three parts soda; whereas soda spar has three or four parts less of potash and more of soda. Each kind of feldspar is subdivided into two grades. The first grade is hand picked, and the impurities are removed; the second grade, sometimes called "regular," is run-of-mine. Occasionally, there is a medium grade. North Carolina is the largest producing state, with Maine, New York, Maryland, Connecticut, Pennsylvania, and California about in the order named. The United States is the largest producer, with the United Kingdom, Scandinavia, and Canada following.

World production in 1913 amounted to 210,870 long tons, of which the United States is credited with 108,000. In 1918 this country produced 88,498 in a world total of 161,075 long tons. The decrease was caused by scarce labor, curtailment of fuel supply to the pottery industry, and shortage of railway cars.

Heaviest Demand Ever Known

The demand for feldspar was never before so strong as now, and producers are ever on the lookout for new deposits. There are numerous discoveries of small quantities of spar, but, except where transport facilities are exceptional, the dimensions of a deposit should be such as to make possible the simplest quarrying methods. In fact, the deposit should be at least 25 ft. thick and free from such deleterious minerals as mica, garnet, pyrites and other minor substances. Anyone discovering a deposit of feldspar should ascertain its dimensions before trying to find a market.

Crude feldspar is sold by the long ton; ground feldspar by the short ton. At present, North Carolina crude is quoted at $7 to $8 per ton, f.o.b. mines; Canadian crude sells for the same price at mines, Canada. In the Ohio district ground feldspar sells for $24 to $26 per ton f.o.b. cars at mill. Ground feldspar sells for $25 per ton in Maine, and $21@$23 per ton in New York. Contracts used to be entered into between producers and purchasers for a year's supply; then the period was reduced to six months, and at present the general practice seems to be to charge the price effective at the time of shipment. This is indicative of the present heavy demand for feldspar and of an insufficient supply.

Mines of Huanchaca-Pulacayo, Bolivia

The mining district of Huanchaca-Pulacayo lies in the Province of Porco, Bolivia, and consists of some of the oldest and most famous mines of that country. The deposits according to Commerce Reports, were worked by the natives before the coming of the Spaniards, and were later exploited on a large scale by the Spaniards themselves. After a period of suspension, work was resumed in the 80's of the last century by a French company, which eventually disposed of the properties to the present Chilean owners. The production of ores, which run from 5 per cent and upward of silver, is between 1,500 and 2,000 metric tons per month. Most of the ore is sold to American interests. Enormous dumps below the mouth of the mine at Pulacayo contain about 22 oz. of silver to the ton, and several companies, including British and American interests, are understood to have made proposals recently for working them by modern methods of recovery.

Movements of Ores and Metals In September

Imports and exports of the more important metals and ores, to and from the United States, as reported by the Department of Commerce for September, 1920, and the figures for September, 1919, as finally revised, are as follows:

IMPORTS, SEPTEMBER, 1919 AND 1920

(In Pounds Unless Stated Otherwise)

	Sept., 1919	Sept., 1920
Antimony ore, contents	28	685,581
Antimony matte, regulus or metal	393,070	1,020,012
Copper:		
Ore, contents	3,712,966	5,368,657
Concentrates, contents	2,789,346	3,151,503
Matte, regulus, etc., contents	6,445,780	1,612,617
Imported from (in part):		
Canada	2,194,122	2,374,342
Mexico	9,396,950	4,032,912
Cuba	87,392	127,680
Chile	891,200	2,619,099
Peru	55,868	30,165
Unrefined, black, blister, etc	22,686,470	16,059,779
Refined, in bars, plates, etc	869,157	2,786,177
Old, etc., for remanufacture	199,324	1,509,444
Composition metal, copper chief value	1,896	73,466
Lead:		
Ore, contents	1,414,137	6,396,981
Bullion, contents	21,476,853	14,998,560
Imported from (in part):		
Canada	1,531,828	576,427
Mexico	21,359,162	15,595,599
Chile		1,057,048
Pigs, bars and old	2,622,636	17,125,245
Manganese ore, long tons	19,601	88,422
Imported from (in part):		
Brazil, long tons	16,786	61,800
British India, long tons	500	7,100
Cuba, long tons	275	75

COMPANY REPORTS

Kerr Lake Mines, Ltd., Ore Reserves Decreasing

Silver: Canada

The report of Kerr Lake Mines, Ltd., for the fiscal year ending Aug. 31, 1920, states that because of the gradual exhaustion of the reserves of both high- and low-grade ore at the Cobalt property, the amount of silver produced during the past year has been considerably less than during the previous year, and the cost of production higher.

Gross production for the year amounted to 956,049.92 oz. of silver, 42,654 lb. of cobalt, and 34 lb. of mercury. There was 23,151 tons of ore hoisted, at a mining cost of $10.52 per ton. Costs of production per ounce on the basis of entire production amounted to

Mining and development	25.48c.
Shipment and treatment	26.69c.
Administration and general expense	3.87c.
Total	56.04c.

A subsidiary company, the Kerr Lake Mining Co., reports:

KERR LAKE OPERATING AND PROFIT AND LOSS ACCOUNT

Cost of production and development		$243,627.23
Shipment, treatment and other charges		115,654.38
Administration and general expense		36,981.80
Expenses in lake drainage		5,580.79
Exchange		21,386.20
Estimated for taxes		50,000.00
Balance being profit transferred to balance sheet		618,052.08
Total		$1,091,282.54
Proceeds of ore sales		$1,236,859.84
Less: Ore on hand Aug. 31, 1919	$320,285.47	
Plus: Ore on hand Aug. 31, 1920	82,174.65	
Interest		92,533.52
		$1,091,282.54

Dividends paid by Kerr Lake Mining Co. amounted to $1,000,000, all of which was paid to Kerr Lake Mines, Ltd., which transferred $916,089.23 to profit and loss account in the following manner:

Dividends received from Kerr Lake Mining Co	$1,000,000.00
Interest	11,743.12
Total	1,011,743.12
Less:	
Administration and general expense	39,606.17
Sundry mine examinations	56,047.72
Balance	$916,089.23

Kerr Lake Mines, Ltd., now has $432,000 invested in the Tahoe Mine, Utah, and has advanced $278,986.15 to the Rimu Gold Dredging Co., New Zealand.

New Jersey Zinc Co. Shows Surplus of $31,873.68 for Third Quarter

Zinc; New Jersey

A report of the New Jersey Zinc Co. for the quarter ending Sept. 30, 1920, shows a surplus after payment of dividends amounting to $31,873.69. The statement follows:

Income (including dividends from subsidiary companies) after deductions for expenses, taxes, maintenance, repairs and renewals, betterments, depreciation and contingencies		$1,826,873.69
Deduct:		
Interest on first mortgage bonds	$40,000.00	
Reserve for retirement of bonds	75,000.00	115,000.00
Balance		$1,711,873.69
Dividends:		
Quarterly 4 per cent, payable Nov. 10, 1920		1,680,000.00
Surplus for the quarter		$31,873.69

NOTE: Reserve for Federal taxes has been sufficiently covered by the sums reserved in the first and second quarters of this calendar year.

Wallaroo & Moonta Records Deficit

Copper: Australia

The thirty-first annual report of the Wallaroo & Moonta Mining & Smelting Co., a British corporation, shows a deficit for the fiscal year ending June 30, 1920, of £38,914 2s. 8d. The Wallaroo Smelting Works produced 2,302 tons of refined copper, 301 oz. of gold, and 2,430 tons of sulphuric acid, from a total of 23,731 tons of ore mined or purchased. The output of copper was sold to the Copper Producers' Association.

Two dividends totaling 3s. per share were declared during the year on the 160,000 shares of £2 par value each outstanding. The surplus of £150,661 7s. on June 30, 1919, was reduced to £87,747 4s. 4d. on June 30, 1920.

The profit and loss account for the fiscal year follows:

DEBIT

	£	s.	d.
Working expenses	311,563	0	0
Adelaide office expenses, including directors' and auditors' fees, salaries, rent, and general business charges	4,979	15	2
Special charges	2,030	14	3
Royalty on mineral leases for 1919-20	200	0	0
State income tax, 1918-19	508	13	11
Interest and discount	3,773	4	8
Total	£323,055	17	0

	£	s.	d.
Balance of trade accounts	266,060	14	2
Federal income tax (refund account, 1917)	5,130	13	11
War-time profits tax (refund account, 1915-16)	12,950	6	3
Balance-reserve of accumulated profits	38,914	2	8
Total	£323,055	17	0

International Nickel Co. Shows Profit

Nickel; Canada, United States

A report of the International Nickel Co. for the six months ending Sept. 30, 1920, shows a profit of $2,262,017.89 on $8,912,600 of preferred and $41,834,600 common stock outstanding. Profit and loss statement follows:

Is the Mining Industry Classifiable Under Public Works?

ONE of the questions which will come up before the next Congress and the next Administration is the creation of a new Department of Public Works. Engineers as a whole are strongly behind this movement, believing that the establishment of such a department would be a concrete recognition of the dignity and importance of the engineering profession, and that it would make for greater co-ordination and efficiency in the government at Washington.

What should be our attitude on the subject? First, let us say, believing that public-spiritedness begins at home, that we are primarily interested in our own industry. This industry—the mining industry—has not been overburdened with champions; and when we speak for any special interest, it will be on behalf of our own.

Our most immediate care in the government organization, therefore, is for the two bureaus in the Interior Department that represent the mining industry, the Bureau of Mines and the Geological Survey. It is planned to incorporate these in the new Department of Public Works. Is the mining industry a branch of public works? What connection has it? Considering the subject analytically and honestly, we find the industry of mining remote from the problem of public works. Mining is a great and basic industry, producing raw materials: in this it is analogous to agriculture, the other great basic industry. Is it, then, proposed to merge the Department of Agriculture, which represents farming, into the Department of Public Works? Of course not. Who ever suggested such a thing? Why, then, incorporate the Bureau of Mines and the Geological Survey, which represent mining, into such a classification? Is the Bureau of Fisheries, which covers a third, though smaller, similar basic industry, going into the Department of Public Works? What a foolish question! Why, then, the Bureau of Mines?

The answer is very simple, and the reason is very stupid. A man educated to all the needs of the mining industry is called a mining engineer: but a man educated to all the needs of the agricultural industry is not called an agricultural engineer (although he might be, with great propriety) but an agriculturist. The fact that the educated miner is called an engineer created in his mind a supposititious nearest adherence to all engineers—to the electrical and mechanical and civil engineers—rather than to his own industry. Now, the electrical and mechanical and civil engineers are not concerned primarily in the production of raw material, but in construction: and it is they in whose field falls the whole subject of Public Works—construction of public buildings, irrigation, reclamation, dam building, government railroads, canals, river and harbor improvements, and the like.

If we were electrical or mechanical or civil engineers, we would probably be enthusiastic for the proposed Department of Public Works. We do not know; we cannot thus project our personality. But with that possibility in mind, we do not oppose the plan. Unless we greatly mistake, we have, as being concerned with the mining industry, no great interest in it; and the main reaction that we have is of the impending misfortune of having the bureaus representing the mining industry in the government swallowed up in it, under a ridiculously and palpably false classification. We of the mining industry would gain nothing from the change: it would be changing horses crossing a stream, and to a less reliable nag. Our position in the Interior Department is more genuine and distinctive than it would be in a Public Works Department. We are better off as we are. And if the two bureaus could be guided and co-ordinated under a single Assistant Secretary of the Interior, we should be as well off as we can perhaps hope to be, unless we could secure the creation of a special Department of Mines.

The Bureau of Mines, we believe, has no activities which fall under the head of Public Works. The Geological Survey has had and has such activities, but they are collateral, or are homeless orphans that are temporarily sheltered by the Survey, and do not cover the mining industry; and we take it that the economic justification of the Geological Survey is first and last its benefit to the mineral industry. Such an orphan is the Super-Power Survey—and if a Department of Public Works should be created the Super-Power Survey should be transferred to it.

The reclamation work of the government was likewise started under the Geological Survey, but was pruned away from it in recognition of its essentially alien character. There is even no reason why the construction of the base maps of the Geological Survey should not be taken over by a Public Works Department if one were created. It belongs there: the Geological Survey has to make these maps because it finds no base maps ready for its use. But in perceiving the proper classification of some of the collateral jobs of the Geological Survey as belonging to Public Works, let us not make the blunder of grouping the mining industry under that category!

The Broken Hills Silver Corporation

THE Broken Hills Silver Corporation of Nevada, which was the subject of an article in our issue of Nov. 13, is sending out monthly mine reports for the purpose of selling stock. These are signed by Mr. Arthur Perry Thompson as consulting geologist and engineer.

In the report for October we note that the first car of ore has been shipped—thirty-five tons averaging $216 a ton. Mr. Thompson states quite frankly and conspicuously that "This shipment represents results of *high-grading operations*, for a period of twenty-five

days, in the rich stopes," etc. "Stopes were started along the vein at points where high-grade ore was most plentiful." "The extraction of high-grade ore . . . has required constant care in sorting the high-grade product from a much greater volume of low-grade, *milling ore generally comprising the bulk of the vein.*"

"From one to two tons of high-grade ore are now mined daily from the Belmont Incline stopes."

With these thoroughly honest and tempered facts, Mr. Thompson embarks on that most difficult of all things, a forecast: "It is not too much to expect that, with the complete development of the cross-vein at the 150-ft. level *and the downward continuation of rich ore* such as is being mined on the 75-ft. level, a production of ten tons or more per day of $240 ore, or at the rate of $72,000 per month, *may be* attained. *Favorable developments on the 150-ft. level* will even increase these figures."

Here, then, is where the consulting geologist and engineer gets off the pathways of conservatism. *If* the cross-vein development is favorable; *if* the rich ore, *if* developed further on the 75-ft. level, goes down, we *may* be able to high-grade ten tons a day, picking the eyes out of the milling-ore vein.

If wishes were horses, beggars might ride. The experienced mining engineer will not detect evidence of anything that looks like a mine in reading this report. Granted that this consummation is reached, that ten tons of $240 ore—where does Mr. Thompson get that figure of $240?—is mined out, how much will the total cost of that ore be, with all the sinking, crosscutting, and drifting necessary?

Mr. C. H. McIntosh, president of the Fidelity Finance & Funding Co. (which is the George Graham Rice organization), solves the question of cost and profit easily in a circular letter offering stock for sale. Quoting Mr. Thompson's report, as above, Mr. McIntosh says: "It *may be estimated* that net annual profits on a gross production at the rate of $72,000 a month would be at least $600,000 a year. This would be equal to 200 per cent per annum on the par of the entire capitalization of the Broken Hills Silver Corporation."

Therefore, "we feel sure you will agree with us that the speculation now inherent in the stock at such a low price as 13c. a share is extraordinary."

We do most heartily agree: it is a most extraordinary speculation to invest at 13c. a share, on the evidence of this report: so extraordinary that we should call it a thousand-to-one shot that we should never see our 13c. again. Any man who buys mining stock on the strength of thirty-five tons of ore, high-graded from rich chlorides and sulphides near the surface, belongs manifestly to the classification concerning which an erstwhile contemporary sagely declared that one was born every minute.

Mr. Thompson's report contains no misstatement, although his forecasts are optimistic. But his report is evidently intended to play into the game of George Graham Rice, McIntosh, and others, to unload the stock at a profit. It will also be observed that Mr. McIntosh makes no false statement—he quotes certain assumptions only, and then remarks that the stock is a speculation.

So we submit to Mr. Thompson, as a geologist and engineer, that his position in co-operating with a plan to sell stock in a prospect, on the glittering figures of unwarranted assumptions, is not professionally an ethical one.

Aiding Coal Conservation

THE effect in this country of the British coal strike, although temporary, was significant and emphasizes the necessity for the careful consideration of our own coal problem. Extended limitation of coal production abroad naturally places a greater demand on our export tonnage, with the result that the competition forces higher domestic prices, and we face a condition which, judged at least by our household standards, is highly undesirable.

According to figures given by the *Statist*, the aggregate world's shortage of coal in the coming year, without reckoning the British shutdown, will be about 72,000,000 tons. The present normal production of the United States is stated by this same authority to be 30,000,000 tons in excess of its consumption of 600,000,000 tons. Although it is gratifying to know that we are credited with being on the safe side of the ledger, statistics are not always to be taken at their face value, and other factors, such as transportation, labor conditions, and a possible increase in foreign demand, are to be considered.

In some quarters the appointment of a National Coal Controller and the prompt limitation of coal exports are advocated; others are of the opinion that we should "keep our coal at home." The latter idea we reject on general principles, believing that the acceptance of the plan for "prompt limitation" is more in accordance with American ideals. The foregoing suggestions deserve immediate consideration, and undoubtedly offer a solution of the coal problem as we have it today. However, it is not with legislative matters alone that coal consumers must concern themselves, for such measures can relieve the situation only in part. The immediate need is for the conservation of what we already have, and it is to that effort that industry must bend its energy.

In an address recently delivered before the American Iron and Steel Institute, Mr. George Otis Smith characterized coal as "the staff of life to the industrial world," and demonstrated the need for fuel economy in every branch of industry. It is a notable fact, as pointed out by Mr. Smith, that the motors used in the steel industry aggregate nearly one-third of the power of all the motors installed in the United States. Such a statement makes pertinent the question, To what extent can electric power be further utilized in other undertakings?

The mining industry has already successfully effected the substitution of electric power in many instances, and the central power station idea is gaining ground. There remains, however, much to be done in this direction. For example, we still have, in some sections, the small hand-fired boiler, wasteful in the use of more than its rightful share of coal, which stands as an example of needless extravagance and represents a serious drain upon the coal production of the country.

Perhaps it is not generally known that 30 per cent of the fuel burned in the ordinary mine boiler plant is absolutely wasted. But such is the fact, and this waste does not include the losses in power that are incurred through leaks and defective connections. Furthermore there is the low average load, caused by intermittent hoisting and other operations, to which is due the real plant loss. With power furnished by a central steam or electric plant, such a loss would be compensated, and not only a saving effected in coal but in plant operation as well.

A Little Knowledge Is Dangerous

IN OUR news columns we gave a short account of a mine accident which took place on Sept. 30 in the mine of the Calaveras Copper Co., at Copperopolis, Cal. The successive stages, according to an accurate account, were, first, a fire in the mine buildings in the near vicinity of the Union shaft; second, the spread of the fire to the shaft collar; third, the withdrawal of all of the men from the mine. The fire spread to the upper part of the shaft and extended downward a sufficient distance to fill the mine with gas. In the morning an ex-soldier wearing an army gas mask attempted to reach the 1,200 level of the Discovery shaft, the main working shaft of the mine. His purpose was to open an air valve. This man did not return, and two men, wearing ordinary dust respirators, started for the 1,200 level to rescue the first. One of these men got back alive, but suffering from the effects of the gas.

In a previous editorial we have pointed out the limitations of the army gas mask. It will not remove carbon monoxide gas. Carbon monoxide gas exists in greater or less amount in all gases resulting from mine fires. Only a person who has had experience with mine fires understands the rapidity with which the air in a mine is polluted with poisonous gases resulting from the more or less incomplete combustion which is characteristic of all mine fires. Carbon monoxide is extremely toxic in small amounts. It is quickly fatal in large quantities. The only safe apparatus is the oxygen breathing apparatus, and this is safe only when in proper condition, with an adequate supply of oxygen, and in the hands of experienced persons.

We cannot point out too emphatically the imperative necessity that all managers and superintendents of mines prohibit the wearing of army gas masks, respirators, and all other apparatus except the oxygen breathing apparatus where mines filled with gases resulting from a fire are to be entered.

Marketing Non-Metallic Minerals

METAL miners have a superior advantage in marketing their ores. Many custom smelters are willing to take odd lots of ore, even though they are sometimes pitifully small. Nevertheless, the custom smelter is anxious to get long-term contracts, as the fulfillment of such contracts tends to stabilize his business to a marked degree. As a rule he is sympathetic with the small producer and finds it good business to help him.

The marketing of non-metallic minerals, on the other hand, with some exceptions, is not so easy for the small or occasional producer. Their value rests to a considerable degree in the control of the market that has been established either for the minerals or for the products manufactured therefrom. Manufacturers and marketers of such products are primarily interested in securing steady flows of raw mineral, as the demand for their products is often severely restricted. Thus, long-term contracts are in vogue. Three years or even five years is not uncommon as a length of contract.

Again, processes of manufacture are not easily adjusted to take care of variations in the quality of raw materials. An established operation producing a raw mineral of uniform quality is in an excellent position to dispose of its product, and usually does so on the basis of a contract. The discoverer of a new deposit may find the market completely closed, either because it is dubious whether he can supply the mineral continuously or for the reason that his prospective customers fear a variation in quality. He may know that the mineral is selling for a certain price, but it may require persistent effort for him to dispose of his fifty-ton lot. To get into a more favorable position—granting that other factors, such as proximity to markets, transportation facilities, labor supply and general operating conditions, are not adverse—he must develop his deposit sufficiently to sustain a steady production for a period of years. He is then in a position to bid on contracts or has the alternative of entering into the manufacture and sale of the products from his mineral. The latter involves a manufacturing plant and a sales organization. It is obvious that a business of this kind requires time for its development, as it usually competes with concerns already established.

The important point to the discoverer of a non-metallic mineral deposit is the control of sufficient capital fully to develop the tonnage possibilities of his deposit as well as to establish thoroughly its quality. Even then he may be unable to break into the existing market, on account of the presence of long-term contracts. There is the possibility of doing business through the principals owning a contract, but, needless to say, this can be done only at the sacrifice of some of the profits. It may thus be necessary for him to wait for more favorable conditions or to embark into the manufacturing business himself. It is worthy of note that there are mineral brokers or agents who deal in odd lots of certain non-metallic minerals. By persistent search the small producer can get in touch with them, and may sell a small lot to advantage. Certain chemical manufacturing companies are also interested at intervals in different non-metallic minerals, and correspondence may be effective in leading up to a sale.

Specie Payments

THE Commercial Trust Co. of New York City recently refused the request of a depositor for a ten-dollar gold piece, saying that the company was not paying out any gold, but was keeping what it had in reserve. The Corn Exchange Bank, on the other hand, acceded to the request of a depositor for a twenty-dollar gold piece.

What is the attitude of your bank, friend reader? If gold is so scarce with the bankers, should they not assist in increasing the production? Yet their association refuses to consider a large production necessary.

If a gold reserve is good for a bank, is it not good for its clients? If the banks regard gold as more precious than paper, do they not acknowledge the cheaper value of the currency which they do hand over the counter?

Our Market Reviews

AMONG the various features which have been introduced into *Engineering and Mining Journal* during 1920, one of the most appreciated is our reviews of metal markets and prices. As an example, our page discussion on the copper situation in our issue of Oct. 30 was copied, with appropriate credit, either in full or in part, by the *New York Commercial*, the *New York Journal of Commerce*, and the *American Metal Market*. Shorter summaries of our copper market news in the same issue were made by the *New York Tribune* and the *New York Post*, among other papers.

WHAT OTHERS THINK

A Desperate American

Your editorial discussions of economic and political matters are very sane and interesting. Recent issues have touched on the immigration question as well as the need for the assimilation of foreign immigrants. It must be conceded that in normal times the supply of native labor is insufficient to perform the necessary work of the country and therefore it is necessary to make up the deficit from foreign countries. In the earlier times our immigrants came mostly from the British Islands, Scandinavia, and Germany, and, due to the enormous areas of unsettled lands available for free appropriation, and also to a natural taste for rural life, these newcomers soon scattered and became an integral part of their communities and of the nation.

Latterly this increment to our society has been chiefly made up of Slavs and southeastern Europeans. They, as well as the newcomers from the north European countries, have been drawn from a lower class of society than formerly. The conditions they meet on arrival here are very different from those that obtained twenty years ago. Nearly all go into industrial communities and form colonies with others of their own race. From a selfish standpoint, the fact that they form colonies or the economic conditions in which they live is immaterial (most of us have arrived at the point of exasperation, where we do not care what their moral, physical, or spiritual condition may be), but in addition to the fact that they form colonies is the more alarming fact that they form political groups. Our office seekers, for the most part business failures and self-seekers or themselves foreign born, pander to these groups and combine them all against the native-born American.

Those of us who live in industrial centers are ruled by a wild ignorant mob of half-matured foreigners, the scum of their own countries. In this community the vote of the American is scattered and unorganized, and he has no voice in the conduct of the local government. A roster of the office holders, both elective and appointive, will show 90 per cent of one foreign race. The people of this race that now come here are ignorant, bigoted, intolerant, and lawless. Revolution is a common word in their mouths. In the coming election it is almost a foregone conclusion that the most vile, radical, and anarchistic element in the whole country is about to be voted into power in the county, if not in the whole state. It is commonly stated that an American has no chance here in a controversy or in court against a foreign-born citizen. When the latter gets into trouble his political broker gets on the job immediately and pulls the wires to his own, and all other, foreign potentates in power. This discrimination extends to the public schools and to a great extent to the salaried positions in commercial life.

Such conditions are intolerable to people of decent upbringing, and if the Bolsheviki ticket is elected it will probably mean that all of us who can do so will leave this splendid prostrate carcass for the jackals to fight over, or else that we must combine against our elected officers and their rabble of foreign vermin and protect our families and property by violence.

There seems to be no immediate remedy for such a condition, but there is a very potent remedy against its recurrence. Let us have needful immigration but restrict the franchise. No foreign-born resident should ever be given a vote, no matter what his length of residence, unless he distinguishes himself in some line of endeavor. In this way citizenship would be a prize, and all desirable foreigners would work and conduct themselves to the end that they might receive such a reward.

It is not important whether the foreigners are assimilated or not if we can outvote them and control our own institutions.

I would like to see this matter advocated in your editorial page. AN AMERICAN.

Butte, Montana.

Mining Opportunities in Siberia

In the article entitled "The Mining Opportunities in Siberia," appearing in the issue of *Engineering and Mining Journal* of Aug. 14, 1920, the suggestion appears to be made that mining in Siberia was formerly conducted on "concessions," particularly where foreigners were concerned. Speaking for the metal-mining industry, I am not aware that metalliferous land concessions have ever been granted to foreigners in Siberia, with possibly one exception. In certain areas, namely south Altai, and in the Nerchinsk district, Cabinet Lands have been leased to foreigners through the medium of Russian companies specially formed for the purpose. Concessions so leased would not have totaled 1 per cent as compared with the mineral lands opened for location by private persons in Siberia during the early part of the nineteenth century.

The Russian law allowing of the locating and patenting of mineral lands by individuals is a just and fair one, based presumably on the Spanish law. It is not saddled by the law of the apex. In 1898 and 1899 I located and patented in my own name several claims for gold dredging on the Serebranka Creek, Perm Government, at nominal expense and with no particular difficulty. Any Siberian or Russian peasant possessing the ordinary civil rights could have done the same.

The gold-mining enterprises with which I have been associated in Siberia have been on mineral territory to which titles were held by the law of claims regularly staked, surveyed, and patented. In the principal east Siberian goldfields the larger enterprises were initiated by private individuals or small groups. These men, Siberian merchants and miners, were no more assisted by government concessions or subsidies than is the American metal miner in the Western States or in Alaska. Claims located in the "Northern Taigá" district of Yenesei, and in the Olekma district of the Lena drainage, in the 40's are still held and operated under the laws of the Mining Department, or at least were worked up to 1916.

It is doubtful if Sibiryakof, Trapeznikof, Bazanof, Gromof, Bazilevsky, and others of the fine old pioneers of the Yenesei and Vitim gold districts ever heard of "concessions." They merely took advantage of the Mining Law applicable to the public lands of Siberia.

Your correspondent, Mr. Narodny, and his authority, Mr. Leonoff, appear to be correct in their contention that "co-operation" appeals to the Siberian mind. Most of the ventures of groups of Siberian miners were denominated "partnerships," the Russian word being built up from the root "tovarish," meaning a pal or comrade. These "partnerships" were not only recognized by the Mining Law, but in some cases their shares were dealt in on the St. Petersburg stock exchange. These associations had an interesting prototype in the groups of Irkutsk merchants of the eighteenth century, which fitted out ships at Okhotsk and Petropavlovsk for the purpose of obtaining furs on the Alaska coast. The furs were brought back overland from the Pacific ports to Irkutsk, and then sent to Kiakhta, on the Mongolian frontier, where they were sold to Chinese merchants.

Thus it would appear that the apologists responsible for the article, in the instance of "concessions," attack a position which is practically non-existent, and as regards "co-operation" they at considerable length defend an axiom which is not opposed. At least this criticism applies so far as their remarks concern the mining industry.

Hakodate, Japan.

Amalgamation in Tube Mills

Having recently seen considerable discussion concerning amalgamation in tube mills, the following may be of interest:

Since the use of cyanidation and flotation has become so successful, amalgamation has gradually been placed in the discard. However, there are still many who advocate it. In a great many cases even now amalgamation should undoubtedly be used. In general, if it is possible to get an extraction of 60 per cent or more it may be best to consider this method. This is particularly true if the gold is contained in coarse particles.

It is often claimed that amalgamation is not possible because the gold is "rusty." Rusty gold can be amalgamated if given the proper treatment. Rusty gold is gold coated with an oxide, not alloyed with another metal, as I understand it. Such gold may be amalgamated if given a good scouring and immediately exposed to quick [quicksilver] under proper conditions.

At the Gold Hill & Iowa Mines, Quartzburg, Idaho, it has been definitely proved that amalgamation can be successfully done in tube mills. I think, also, that the days of the stamp mill are numbered. There are certain factors, however, that should be brought to the attention of the tube mill amalgamator.

The ore at this plant is an antimonial gold-bearing quartz contained in a rhyolite porphyry gangue. Small stringers of quartz are interwoven throughout the ground mass. The ore carries very little zinc, no lead, no copper, very little silver, and from 2 to 3 per cent concentrates, which are principally iron pyrites. The antimony is less than one-tenth of 1 per cent. It is soft and easily crushed. Panning tests show very little free gold unless the particles are first rubbed briskly in a pan, preferably with an iron rod. The antimony is always a sure sign of good ore in this property.

Former treatment with stamps, with inside amalgamation, never gave an extraction to exceed 55 per cent. Fine screens were used, but the resulting amalgam was composed of the coarser particles, whereas the fine gold generally went into the tailings. The gold is often coarse, but there is always some fine. When examined under the glass, or sometimes even with the unaided eye, it will be noted that the gold is coated with a film of antimony or with a combination of antimony and sulphur. This coating is glassy, hard, and brittle.

In treating this ore for the last ten years, during which time we have handled a large tonnage, certain points have been brought to our attention forcefully. First, and important, is the fact that the gold *must be scoured*. This should not be confused with hammered. It was noted that the old arrastres gave good extraction on these ores. We have therefore, in a way, tried to imitate these old-fashioned machines. This has led to the use of the tube mill run on arrastre schedule. By this I mean run at such a speed that the charge will slide. We have found the Hardinge conical mill especially adapted to this class of work. It is possible to crush over 175 tons per day through an eight-foot mill when used as a secondary crusher and amalgamator. We pay special attention to feeding a certain quantity of grits into this mill with the charge. These grits are simply pieces of hard ore which are allowed to by-pass the ball mill which is used as a primary crusher ahead of the Hardinge mill. They are pieces of ore of from ½ to 1¼ in.

The flow sheet of the mill (See Fig. 1) is: Grizzly, Blake crusher set to two inches, rolls set to ¾ in., cylindrical tube mill 5 x 4, lined with Komata lining and using Adamantine pebbles, which come from Sioux City, Iowa. This mill discharges a product of about 8 or 10 mesh into the Hardinge mill, which also has the same lining and uses the same charge, with the exception that the pebbles are smaller. Both tube mills are run at a speed that allows the charge to slide, the Hardinge being run at 18 r.p.m. only. Quick is fed into

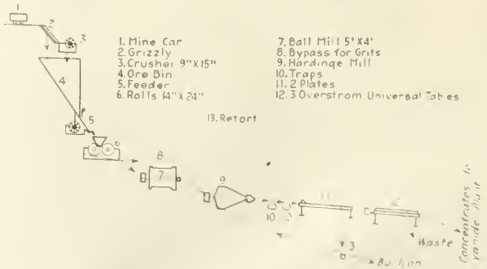

FIG. 1. MILL FLOW SHEET GOLD HILL & IOWA MINES CO.

the scoop of the Hardinge. No amalgamation is attempted in the cylindical mill, and that is considered as a crusher only.

The discharge from the Hardinge is through an amalgamator bolted on the discharge trunnion. (See Fig. 2.) A brief description of this amalgamator, which is a modification of the regular Hardinge amalgamator furnished with the mill, is as follows:

A copper plate (*A*), which the millmen call the "stovepipe," is put into the discharge end. This plate is bolted by three small bolts that allow it to be easily taken out for cleaning. When the bolt is out it is possible to spring the plate enough to allow its easy removal. This is accomplished by making it like a stove-

pipe before riveting and making the bolt that acts as one of the bolts that hold it on pass through both thicknesses of copper. Also, inside this so-called stovepipe we use four or five riffles of about ¾ in. height. These are placed parallel to the axis of the machine. We use no screen. The stovepipe passes back four or five inches into the amalgamator. Amalgam forms at *C*, also at *X* and *Y*. Some is found also inside the tube at *A* and back of the riffles, *B*.

From the amalgamator the pulp runs through traps and then over stationary plates as in the ordinary stamp mill. There is nothing special concerning the plate amalgam excepting that we run the plates comparatively hard and use Sapolio to dress the plates every eight hours. The method of using this is to give the same treatment as in cleaning a window, but allowing the white lather to remain until the water is running over the plate and then finishing with a whisk broom used so that the brushing is done lengthwise of the plate. This prevents the fine concentrates from sticking to the plates. A safety box is used when dressing the plates to catch any loose amalgam that may escape.

From the plates the pulp passes over Overstrom Universal concentrating tables, where a small portion of

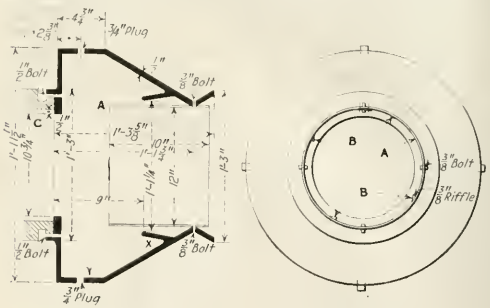

FIG. 2. HARDINGE AMALGAMATOR AT THE GOLD HILL MILL

the sands is allowed to go into the concentrate. This allows a closer saving of the gold to be made and helps in the cyanide plant by supplying grits for the tube mill where fine grinding is practiced. Excellent results are shown in the cyanide plant on this concentrate after agitation in Pachuca tanks.

Returning again to amalgamation, quick is fed into the scoop of the Hardinge. This quick is "doped" with sodium, by adding enough metallic sodium to make it amalgamate the end of a small file, then diluting it a little with quick. This quick is prepared daily, and must be fresh.

Frequent pannings of the feed going into the Hardinge serve as a guide to the quick feed. The condition of the head plates acts as a direct indicator of the feed. When the plate is hard and white more quick is needed, which should be applied by more frequent feeding instead of feeding in large doses. Should the plates be too dry free gold will show on the concentrators.

The pulp is run much thinner for amalgamation than for ordinary fine grinding. We have tried running the mill in closed circuit, but got poor results. A spray of water shot into the discharge end of the mill at the point where the pebble charge comes to the trunnion will help the capacity.

The shape of the conical mill is especially adapted for amalgamation, as classification is always going on. The particles of gold have to climb the incline before being discharged. This gives a chance for them to receive the grinding action similar to the arrastre. They come into contact with the quick in the amalgamator when they are free from oxidation and bright. The quick fed into the mill also finds its way up the incline until it reaches the point of the cone where action is less violent, and the result is that a pasty amalgam is formed, which goes into the larger opening of the amalgamator, where it is trapped until ready to be cleaned up. This pasty amalgam catches fine gold or other amalgam that tries to get by.

One of the most interesting points noticed in this practice is the fact that when steel balls were tried for amalgamating the results were unsatisfactory. Amalgamation was then a failure. Investigation showed the following conditions: If a particle of gold is laid on a polished anvil and hit with a smooth-faced hammer, and the resulting particle is then put into a bath of quick, it will not amalgamate. Again, if a similar particle of gold was laid on a piece of grindstone and rubbed with another rock, the surface of the gold was brightened and roughed so that amalgamation was instantaneous. In running with steel balls and steel liners the gold discharged was hammered and small disks were discharged which would not amalgamate under any condition that we were able to produce. Careful examination under a strong glass showed that the particles had a hard shell which prevented direct action of the quick on the gold.

In practice now we use Jasper Stone Co. pebbles and use lifter bars in the Hardinge. A large portion of the amalgam is taken from the back of these bars. We found after trying speeds of from 29 to 18 r.p.m. that we got best results with the slower speed, 18 r.p.m.

Objection has been made that it is hard to clean up a system such as we suggest. We find that we can make a thorough cleanup every month within three or four hours. The running time of the mill will exceed 90 per cent. A more thorough cleanup is made when replacing the lining, which is generally once a year. Very little amalgam remains in the charge after it is run down. Comparatively little amalgam remains behind the lining plates, as these are backed by one-inch boards, which act as a pad and allow little to get behind. The door is opened once a month and amalgam is scraped from the cracks, but the charge is not removed, as the mill can be rocked enough to allow practically all the inside to be reached. Part of the coarser pebbles are removed to make more room during this operation. Nothing is done with the sands during monthly cleanups, but when relining, the sand charge is fed into the scoop after putting in new liners. An extraction of better than 85 per cent is made by these methods, which I think will compare favorably in cost with any cyanide or flotation process.

Boiled down, our experience has shown that the gold should be scoured and not hammered; that immediate union with the quick is essential before oxidation takes place; that pasty amalgam should be thrown into a quiet place away from too violent action of the pulp; that quick must be kept active; that a thin pulp acts better for amalgamation; and that one must grind lots of good ore to make a living these days, when gold values are placed below those of spuds and candy.

Tin Mines of the Quimsa Cruz Range In Bolivia*

The Geology and Mine Workings of a Promising Area, in the Development of Which American Enterprise Is Taking a Prominent Part—Geological Conditions Comparatively Simple, With the Veins Occurring in Both Igneous and Sedimentary Rocks

BY JOSEPH T. SINGEWALD, JR.
Written for *Engineering and Mining Journal*

THE Quimsa Cruz Range is a series of high, glacier, and snow-covered peaks forming the crest of the eastern range of the Andes in Bolivia between La Paz and Oruro (see sketch on following page). It is bounded on the north by the gorge of La Paz River, where it cuts its way through the Andes at an elevation of 6,500 ft., and on the south by a pass 15,000 ft. in elevation between it and the less lofty Santa Vela Cruz Mountains. Between these two passes is an almost uninterrupted series of icy peaks, many of them exceeding 20,000 ft. in elevation. So rugged is the topography and so rigorous the climate that, though highly mineralized, the region is one of the least developed and least explored of the Bolivian tin-bearing areas. It is now, however, attracting much attention, and promises to become one of the leading tin-mining regions of Bolivia.

GEOLOGY AND MINES OF THE RANGE

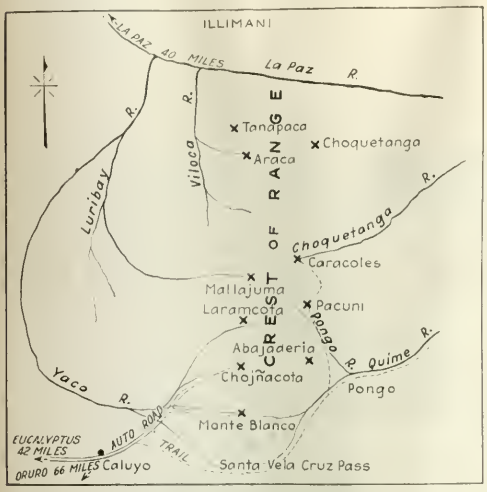
In its general features the geology of the range is relatively simple. The crest and the upper part of the eastern slopes consist of granite. The whole of the western slopes and the lower part of the eastern slopes are made up of Silurian and Lower Devonian highly metamorphosed shales, with intercalations of quartzites and sandstones. The range has been subjected to considerable tectonic disturbances, and both granite and sediments have been highly fractured. Many of the fractures are the seat of tin veins and occasionally of tungsten veins.

The ores are of the normal tin type, characterized by the presence of cassiterite and, in some of the veins, wolframite, as the only ore minerals of value. The argentiferous sulphides of the more complex type of Bolivian silver-tin ores are lacking, and there is little or no bismuth. The pneumatolytic minerals are represented by an abundance of tourmaline.

The active mines on the west side of the range are, from north to south, the Tanapaca, Araca, Chojñacota, and Monte Blanco; on the east side the Caracoles and Pacuni. Less important mines are the Mallajuma, Laramcota, Choquetanga, and Abajaderia. The Tanapaca and Araca mines are sixty-six miles from La Paz by a trail that follows La Paz River. The other mines have their outlet by way of Caluyo to Eucalyptus, a station on the Antofagasta and Bolivia railway between La Paz and Oruro. Between Eucalyptus and Caluyo, a distance of forty-two miles across the high plateau, is an automobile road, which continues beyond nearly to Monte Blanco and Chojñacota. Mines on the east side of the range have their outlet through the Santa Vela Cruz pass to Caluyo. This trail has been rather poor, but since the Guggenheim Brothers have entered that region they have greatly improved the trail and are constructing a road to Caracoles.

*George Huntington Williams Memorial Publication No. 2.

The Empresa Minera Tanapaca represents a consolidation of two small mines which belonged to Louis Pando and Hugo Zalles and is now under option to the International Mining Co., which is closely identified with W. R. Grace & Co. Two veins, the Potosí and the Alliança, are being worked. They lie on the slopes of the first group of peaks west of the main ridge of the Choquetanga Range. The latter peaks consist of granite, and, judging by the huge boulders that have been



SKETCH OF QUIMSA CRUZ REGION, BOLIVIA

carried down from them, the rock is a biotite-tourmaline granite porphyry. The country rock of the Tanapaca mine is hard, highly metamorphosed shale or slate with interbedded quartzite.

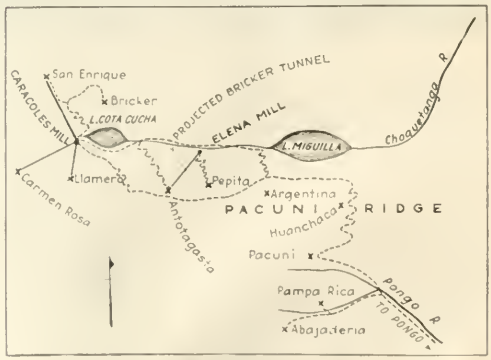
The Potosí vein has a width of from 18 in. to 3 ft. The filling consists of soft, iron-stained material, or "llampu," with an average tin content of 4 to 5 per cent. The ore is treated in the Tarujhumaña mill, which is equipped with two water-driven arrastres and a series of buddles for each. The tailings of this mill carry 2 per cent tin. The production is at the rate of twelve tons of concentrates monthly. The elevation of the mine and mill is nearly 15,000 ft.

A mile south of the workings on the Potosí vein are those on the Alliança. The vein filling consists chiefly of cassiterite, quartz, and iron hydroxides, and some pyrite in the lower part of the workings. The orebody has a width of as much as 2½ ft. and an average tin content of 10 per cent. It follows a contact of slate and quartzite, with the former on the hanging wall. Often the hanging wall part of the vein consist of mashed shale with many quartz stringers. On the foot wall is a band of solid quartz. The relative importance of these two members varies from point to point, and at many places one or the other is entirely lacking. A short distance south of the Alliança vein is the Mocoya mill, in which the ore is treated. The mill is equipped with a Chilean mill, jigs, Ferrari tables, and buddles. Scarcity of water in the winter months prevents the utilization of part of the machinery in that season, and the ore is then sent direct to the buddles from the Chilean mill. The production is ten to twelve tons of concentrates per month.

The property of the Empresa de Estaño de Araca is about three miles south of the Tanapaca mine near the head of a deep valley, immediately beneath the snow and glacier-covered Choquetanga peaks. The mill and administration buildings are situated at an elevation of about 13,500 ft., in a branch of the Viloca River, and the mines lie 2,000 ft. higher, on the north side of the stream. The Central vein was the first tin vein worked in this region. It was discovered in 1900 by José Bueno, a gold miner of the Araca district, from whom it was acquired by Harrison and Boettiger. The operation of the blacklist during the war caused a reorganization as a Chilean company under the name Empresa de Estaño de Araca. Nevertheless, the mine was kept on the blacklist, and its production consequently was considerably hampered. Whereas the pre-war production had reached 150 tons of barilla[1] monthly, in 1919 the mine was producing at the rate of only 100 tons. Nearly one-half of the production comes from the operations of contractors, who concentrate with the crude native quimbaletes (crude ore mills) maritatas, or hand jigs, and buddles.

The country rock in the immediate vicinity of the veins is a thick series of Lower Devonian shales, in which a few sandstone and quartzite beds are interstratified. The veins are not far distant, however, from the granite constituting the summit of the range. The shales are cut by a network of veins, the principal ones being the Central and the Pireo. Southeast of the Pireo are several veins on which little work has been done, and between the Pireo and Central are other subordinate veins. A number of veins northwest of the Central have been more productive, notably the Esperanza and Jinebra.

The Pireo and Central veins have been followed several hundred meters along the strike. The maximum width of stopeable ore has been 50 ft.; and it generally is more than 3 ft. For the most part the vein walls are not well defined, though in some places the mineraliza-



SKETCH MAP OF CARACOLES AND VICINITY

tion is confined between definite fracture planes. Much of the ore resembles slate at first glance, but it has a higher lustre and a cassiterite brown color. The typical ore is consequently extremely fine-grained and compact. Nevertheless, there are druses with excellent cassiterite crystals, some an inch or more in diameter. In fact, these veins are noted above all other Bolivian localities

[1] A 60 per cent tin concentrate.

for the occurrence of crystallized cassiterite. Intersections of the principal veins and secondary veins are generally the loci of large and rich oreshoots. The mode of occurrence of the cassiterite is, therefore, as wide bands or streaks of "guia," that is, high-grade ore, as minute veinlets penetrating the shale, and as a replacement of the shale. Associated with the cassiterite are quartz, the hydroxides of iron, and country rock. No tourmaline was seen, but this mineral is said to be encountered occasionally in small quantity.

The San José mill is connected with the mine by aërial tram. After crushing, the ore is ground with stamps and Krupp ball mills and concentrated on jigs, Humboldt and Ferrari tables and buddles to a final concentrate carrying 60 per cent tin. About one-half of the concentrate is recovered on the jigs and one-fourth each from the tables and buddles. The average tenor of the crude ore is about 4 per cent tin.

The veins are inclosed in a thick series of shales which vary in character from hard, thick-bedded shales like those at Araca to thin-bedded, fissile, black shales. Interstratified with the shales are sandstones and quartzites. Northeast of the veins the dip flattens as the crest of an anticline is approached. Fragments of the granitic rock that come down from the neighboring peaks of the main range consist of a uniformly medium-grained rock, unlike the coarse porphyrite rock seen at Araca.

Two principal veins are being worked, the Ferrecio and the San Luis. The two veins are separated by an E.-W. fault, and the San Luis lies on the north side of the fault. Adjoining the Ferrecio vein are five smaller veins, but most of the development work has been done on the San Luis vein, which averages 4 to 6 ft. wide. In general it is wider and richer in the soft fissile shales and narrower and poorer in the hard shales. It is not a fissure filling, but a zone of crushing in which the fractures have been filled with the ore minerals. The vein minerals are white quartz, which is commonly well crystallized; cassiterite, which is prone to occur in grains intercrystallized with the quartz; considerable black sphalerite, chalcopyrite, which is widespread but not abundant in amount; a little arsenopyrite and pyrite, and the hydroxides of iron. The fragments of shale are not usually mineralized as at Araca, so that the ore is distinctly brecciated in texture and much more coarsely crystallized. Younger than the previously mentioned minerals is siderite. It occurs chiefly in veinlets outside of the vein walls and as crystals superimposed on quartz within the vein.

THE TARUJHUMAÑA MILL AT TANAPACA, A BOLIVIAN TIN MINE IN ITS INFANCY

THE CHOJÑACOTA TIN VEINS, THEIR EXPLOITATION AND GEOLOGY

The mine and mill of the Compañía General de Minas en Bolivia, a Bolivian company, are in the Chojñacota Cañon (Green Lake), a branch of the Yaco River, at the foot of an immense glacier which flows from Jachacunocollo Peak (The Great Snow Mountain). The elevation of the mill is 15,700 ft., and that of the mine 17,000 ft. Chojñacota lies about twenty miles south of Araca. The first veins to be worked here were on the ridge on the south side of the canyon, but they are now abandoned. The veins on the north side were discovered about six years ago. Four years ago a small mill was erected, and it is now being remodeled and considerably enlarged. In 1919 the daily production was increased to twenty-five tons of ore running 10 to 12 per cent tin, which yielded 2½ tons of concentrate with a tin content of 70 per cent. The company expects to increase the output to 150 tons of ore daily.

The mine is connected with the mill by a 4,000-ft. aërial tram. The ore is crushed and then ground in Hardinge mills. The mill pulp is concentrated on jigs, tables, and buddles. Wilfley, Deister, and Ferrari tables are in use.

The Monte Blanco property was acquired by the

Empresa Minera Monte Blanco, a Chilean company, soon after the discovery of the veins, and a mill was erected fifteen years ago. The mill is situated in the next canyon south of the Chojñacota mine, known as Soracachi, at an elevation of 16,000 ft. It lies between two glacial lakes, Huallatani and Iscayuni. The upper lake, Huallatani, has a length of 1½ miles, a width of about 1,000 yards, and a fall of 450 feet, so that it is capable of supplying an enormous amount of power. The monthly production of the property is thirty tons of concentrate with a tin content of 66 per cent. The average grade of the ore treated is only a little over 2 per cent tin.

The country rock of the Monte Blanco veins is identical with that at Chojñacota. The veins are in a ridge on the south side of Lake Huallatani, which forms the divide between the Soracachi canyon and a canyon which flows on the eastern side of the Quimsa Cruz Range, that is, at the southern extremity of the high snowy ridge of that range. The mine workings are at elevations of 17,000 to 18,000 ft. The active workings are divided into three sections or mines, called respectively the Santa Fé, Serreno, and San Luis.

In the Santa Fé there are three principal veins, the average width of which is 1 ft., and which follow well-defined fracture planes cutting shales and quartzites alike, and are either simple fissure veins or lode fissures. There is much vein quartz and considerable tourmaline occurring in tufts of radiating crystals in the quartz and cassiterite. Some of the cassiterite is dark in color, but most of it is chocolate brown to lighter. But little pyrite occurs in these veins.

Markedly different in character is the Serreno orebody, which has a maximum width of 130 ft., the ore occurring in a white quartzite, interbedded in hard shales. The orebody is a stockwork in the white quartzite and has a very irregular shape and transitional boundaries. Its long direction seems to be parallel to the strike of the strata. The quartzite has been shattered into a network of minute fractures which are filled with the ore minerals. Locally, the fractures are parallel and give rise to an ore with sheeted structure. Where such fractures are minute and closely spaced, the ore has a banded appearance. Some of the fractures are filled with cassiterite, others with tourmaline, and in many the two minerals are mixed. Tourmaline also occurs in small bunches with cassiterite disseminated through them. Recently, a similar orebody, called the Donoso, has been discovered northeast of the Serreno.

Connection between the mine and mill is by a 2,000-yd. tramway along the ridge and an aërial tram between the mill and the terminus of the tramway. Shorter aërial trams bring the ore down from the mines to the tramway. The ore is ground in Huntington and Chilean mills, and concentrated on jigs, Butchart, Overstrom, and Deister tables, and buddles. The mill tailings carry 0.8 per cent tin, and are reworked in a small separate mill and finally discharged into Lake Iscayuni with a tin content of 0.5 per cent.

The Caracoles Veins Occur in Granite

The Empresa Minera Caracoles embraced a large group of claims at the head of one of the branches of the Choquetanga valley, directly across the range and a little to the north of Chojñacota. The property was being developed by Bricker and Guzman until purchased by the Guggenheim Brothers about eleven months ago. The country rock of the vicinity is a medium-grained biotite granite which also carries a little pyrrhotite. The granite is characterized by a well-developed system of parallel joint planes or sheeting. In places the fractures are only a few inches apart, and rarely is the interval more than a foot or two.

The tin veins cut the main system of fractures at a very acute angle and are numerous. They are usually grouped in systems and are not as a rule the filling of a single isolated fissure. These veins and the Pacuni veins are distinct from the rest of the veins in the Quimsa Cruz Range, in that they occur in the granite instead of in the sedimentaries. The characteristics of the fissures in the sedimentaries are lack of persistence and a tendency to split up, due to the variation in the physical character of the beds of the sedimentary series. The greater homogeneity and brittleness of the granite are believed to be factors favoring more persistent and well-defined fracturing. The veins of this part of the range are, consequently, regarded as more promising than those of the rest of the range. Another feature of many of the veins is that they show up far better underground than is indicated by their outcrops.

The principal veins, or vein systems, are the Huanchaca, the Pepita, the Antofagasta, the Llamero, the Carmen Rosa, and the San Enrique. A little work has also been done on the Bricker vein. The Antofagasta vein is connected by an aërial tram with the Elena mill, and the San Enrique, Carmen Rosa, and Llamero veins are connected with the Caracoles mill. The two mills are in the valley about a mile apart. The Elena mill has been dismantled by the new owners. The Caracoles mill is equipped with crusher, two Hardinge mills, three tables, and buddles. The production of the two mills in 1919 was thirty to forty tons of tin concentrates monthly. The Caracoles mill is at an elevation of nearly 16,000 ft., and the mine workings are still higher. The relative positions of the mills and mines are shown on the sketch on page 987. A new mill to serve the entire property is to be erected at a lower elevation in the Choquetanga valley.

ENTRANCE TO THE ANGOSTURA, A GORGE OF LA PAZ RIVER, WHERE IT SAWS ITS WAY THROUGH THE MAIN RANGE OF THE ANDES BETWEEN THE CHOQUETANGA PEAKS AND ILLIMANI

The San Enrique vein is being developed by an adit. Several branch veins leave the main vein, the width of which varies from 1½ to 6½ ft. Tourmaline with a little quartz and arsenopyrite are the principal gangue minerals. Hand-sorted ore is said to contain 10 per cent tin. The vein walls are decomposed granite, which is usually tough and gouge-like, but still preserves the granitic texture.

THE MONTE BLANCO MILL. A MODERN TIN MILL AT AN ALTITUDE OF NEARLY 16,000 FT. LOWER DEVONIAN SHALES CONSTITUTE THE COUNTRY ROCK

The Carmen Rosa vein is being developed by two adits. Its width is quite irregular and reaches a maximum of over 6 ft. in one shoot. The filling is essentially tourmaline, in which are veinlets of quartz with much sphalerite and some pyrite. The tin content of the ore is said to average 8 per cent.

The Llamero vein has been but little developed and is frozen to the granite walls. At the entrance to the adit the vein is about 6 ft. wide, but it includes some granite horses. The filling is chiefly tourmaline, though there is also drusy quartz and some sphalerite. The ore is said to average 8 per cent tin.

The three veins just described were being actively exploited in 1919. The new owners regard them with less favor, however, and are concentrating their attention to the vicinity of the Antofagasta and Pepita veins, where a deep crosscut tunnel is to be driven from the bottom of the valley a short distance above the old Elena mill.

The Pacuni Veins Contain Tungsten and Tin

The property of the Empresa Minera Pacuni Blanca N. Dillon is located on the southern slope of the Serrania de Pacuni and has also been purchased by the Guggenheim Brothers. The mill is at an elevation of about 15,000 ft. The mine is still higher and the vertical interval between the lowest and highest workings is about 1,500 ft. The veins are tungsten veins, and at the height of the tungsten boom the mine produced thirty-five to forty tons of 70 per cent tungsten oxide concentrates monthly. The concentrates contain about 2 per cent tin. The mill has been completely dismantled since the acquisition of the property by the Guggenheims, and the ore will be treated at the new mill to be erected in the Choquetanga valley.

The principal veins are the Blanca and the Inca. They are cut at right angles by a tin vein, the Veta Grande, which is now also being developed. The tungsten veins are nearly parallel to the main system of sheeting in the granite. The Blanca vein averages 2 to 2½ ft. in width. The filling is chiefly coarsely crystallized quartz and wolframite, with a little tourmaline and pyrite. The Inca vein lies east of the Blanca. Its width ranges between 10 in. and 1½ ft. Its filling is like that of the Blanca in some places, but in others it is softer and iron-stained, and even consists of "llampu," or soft oxidized ore. The average grade of the Pacuni ore is given at 12 per cent tungsten oxide.

The Potash Industry of India

Potash production in India, according to *Commerce Reports*, is a fairly old-established industry, and in the last ten years the annual production has varied between 15,000 and 25,000 tons. This yield might be increased by the adoption of improved plant and the concentration of the salt manufacture, as well as by the recovery of potash from the mother liquors and from the blast-furnace gases.

So far no good quality of phosphate of lime has been found in India suitable for the production of superphosphates, most of the phosphate having been found in the form of nodules containing a high percentage of carbonate. These, consequently, are unsuitable for the usual sulphuric-acid treatment.

The deposits of mixed phosphates of lime and aluminum found in parts of Bengal are also not suited for the acid treatment. There are, however, particularly rich and suitable deposits along the Red Sea, which could be shipped to the west coast ports, and these would supply all, or at any rate a large part, of the demand, provided suitable plant were obtainable and ample supplies of sulphuric acid were forthcoming.

Smelter Laboratory of the United Verde Extension

Most of the Disagreeable Features of Older Construction Eliminated — Large Windows and Glass Partitions Assure Ample Light — Filtrate Launders and Stands for Dispensing Burettes Convenient Accessories

By H. O. Hammond
Chief Chemist, United Verde Extension Mining Co., Clemenceau, Ariz.

Written for *Engineering and Mining Journal*

ONE of the newer smelter laboratories in the West is that at the United Verde Extension Mining Co. smelter, situated in the Verde Valley, approximately seven miles from Jerome, Ariz. Operations here were begun in July, 1918. The smelting equipment includes one blast furnace and two pulverized-coal reverberatories, with a three-stand converter installation. There are also six roasting furnaces.

The laboratory is one of a group of brick buildings at the entrance to the plant, comprising, in addition, a general office, change house, and time office. It has a single story, with basement and flat roof. The inside dimensions of the building are 44 x 70 ft. Much time was given to the design of the interior, particularly to the arrangement of rooms and placing of apparatus, so that maximum convenience and accessibility would be assured for the routine laboratory operations. All the rooms have ample windows, and to a large extent the partitions between them are glass paneled. The walls and ceilings are of plaster, tinted in buff and light blue-gray, with the exception of the main chemical laboratory and fire assay room, which are ceiled with wood. The woodwork was given three coats of Toch Bros. laboratory enamel, ivory tint. This gives a very pleasing effect, does not discolor, and can be kept immaculate. The floors are of pine, stained. The fire, assay and furnace rooms have concrete floors.

Hot and cold water is available at each sink, and the distilled water used for analysis is heated by electric immersion coils in five-gallon nickel-plated urns with block tin lining.

The outstanding features of the laboratory include down-draft hoods, solid concrete balance tables, waste-liquor launders under filtering stands, large revolving stands for dispensing burettes, a special room for use as a research or experimental laboratory, unusually large storage rooms in the basement for various supplies, and a lunch and locker room for the chemists.

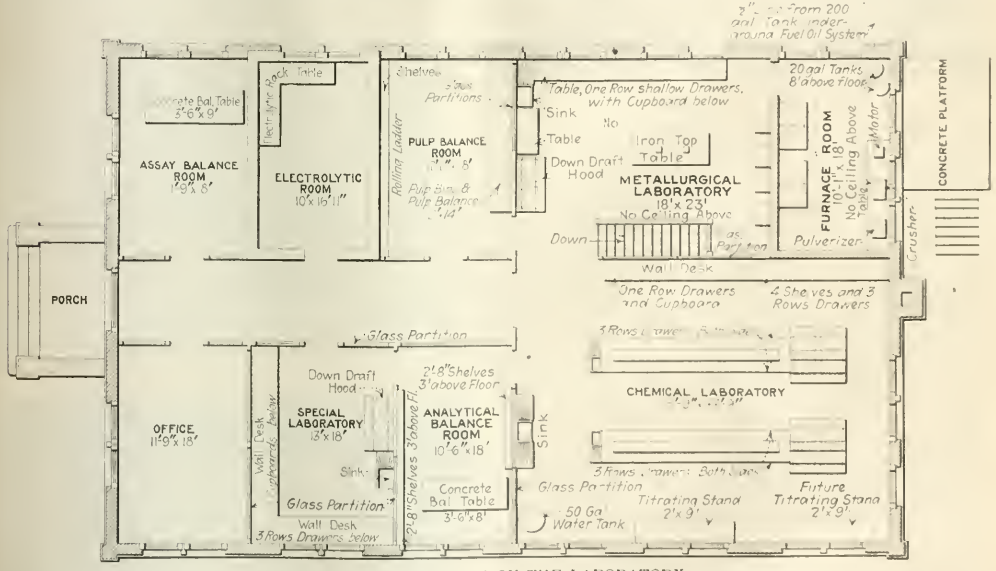


FIG. 1. FLOOR PLAN OF THE LABORATORY

Fig. 1, a floor plan of the laboratory, shows the general layout of the rooms. Upon entering the building, at the right of the hall is the office. Across the hall, to the left, is the fine-balance room. The equipment here consists of Heusser, Keller and Becker balances, placed on an all-concrete balance table, surfaced with neat cement, with foundation pier in the basement. In addition, this room contains the recording apparatus for the meteorological station instruments, which are mounted out of doors. These instruments give a continuous record of wind direction and velocity, sunshine, rainfall and barometric pressure. The outdoor station includes a hygro-thermograph, maximum and minimum thermometers, stationary and sling psychrometers, and a rain gage.

Adjoining the balance room is the electrolytic room,

with tables and rack for copper electrolysis. Stationary electrodes only are used. A motor-generator set, switchboard, and meter panel complete this room. The plant circuit is alternating current, and the motor generator charges direct current to a group of twenty-two storage battery cells (placed in the basement), which supply the current for electrolysis. This room is a vault, with solid concrete walls, roof, and floor. Bars are placed at the windows, and the door is of plate steel with Yale deadlock. These precautions were taken as a means of protection for the laboratory supply of platinum.

The special laboratory is completely fitted with a

FIG. 2. A VIEW IN THE MAIN CHEMICAL LABORATORY

down-draft hood for two 18 x 24-in. electric hot plates, tables, filtering racks, burette stand, stoneware sink, and ample drawers, cupboards, and shelves. Special glassware and chemicals are conveniently kept in a small cupboard with glass doors. Further equipment consists of a bomb calorimeter, gas apparatus, lamp bank, filter pump, and Thwing pyrometer. This room provides space for the conducting of research or investigation work without obstructing or interfering with the regular analytical work of the office. A swing door leads from the special laboratory into the analytical weighing room, which also has a large, solid concrete center table, upon which are the balances. This room leads into the main chemical laboratory through a glass-paneled swing door.

Directly across the hall from the analytical weighing room is the assay pulp room, where the crucible charges are weighed and prepared for fire fusion. A long table against the wall provides room for the pulp balance, for mixing charges, and like operations. Underneath a portion of this table are large bins for the storage of crucibles, and above is the flux box, divided into compartments and fitted with hinged lids. Along the entire wall, adjacent to the vault, are shelves, subdivided into compartments, for storage of sample pulps. A traveling ladder makes them accessible. This room opens into the metallurgical laboratory and furnace room, which is separated from the main chemical laboratory by a glass partition with a double, open doorway between.

The main chemical laboratory is a room 35 x 26 ft. The two work tables are set lengthwise with the room, with a double down-draft hood at the end of each table, containing two 18 x 24-in. electric hot plates for each side of each table. These tables (see Fig. 2) are fitted with drawers and cupboards, and have small stoneware sinks (12 x 18 in.) at the ends opposite from the hoods. These sinks catch the flow from the waste-liquor launder, which is of ½-in. lead, painted with asphaltum, and which passes directly under the stationary filter rack. The waste liquor passes out through a lead pipe ¾ in. thick into a tile sewer main. Light wooden strips fit over the launder, flush with the table top. These strips can be inserted when the filtrate is to be saved or removed when the filtrate is not desired. Provision is made for flushing these launders, which have a slight gradient, with tap water. A light shelf is mounted along the center of the table, two feet above the table top, for keeping at hand solution and reagent bottles. Above the shelf is placed a hot-water urn for distilled water, which is conducted along the table through a ¾-in. block tin pipe.

At the table end adjacent to the hood is set the revolving stand for dispensing burettes (see Fig. 3), and it has proved a most useful adjunct. There is only one stand to each table, as it is equally accessible from either side. The stands are of wood, 24 in. in diameter, and hold twelve 250 or 500 c.c. dispensing burettes. The use of the dispensing burette has proved to be far superior to the system using reagent bottles and graduates. It is quicker, easier, and less wasteful. The burettes rest in slots, cut into the edge of an upper and lower circular wooden section. A small fiber catch on the upper section holds each burette in place. The upper section is adjustable for height, thus accommodating burettes of different lengths. The lower one is fixed. A circular lead pan, 3 in. deep, is set beneath, to catch any drippings or accidental flow.

The down-draft hoods are constructed of ½-in. asbestos transite board, mounted on steel angle-iron construction. The floors of the hoods are of concrete. No glass is used. An exhaust flue 3 in. wide extends along the back, inside the hood, and opens near the top. The draft, connecting all the hoods in the building, is maintained by a No. 5 Buffalo blower, mounted in the basement and operated by electric motor at a speed approximating 1,400 r.p.m. Each hood exhaust flue is provided with a damper, which is kept closed when the hood is not in use, thereby increasing the draft in the others. The connecting flues, which are run under the flooring,

FIG. 3. REVOLVING STAND FOR DISPENSING BURETTES AND DOWN-DRAFT HOOD

are of transite construction, coated on the interior with paraffin paint, to prevent corrosion. The joints of the flues were sealed with an asbestos fiber cement. A brick stack at the rear of the building serves to lead off the fumes of the exhaust from the blower.

Along one wall is a wall desk with drawers and cupboards, surmounted at one end by a large cabinet with glass doors, which is kept stocked with all chemicals and smaller supplies in current use. Acids are

dispensed from the regulation three-quart bottles furnished by the manufacturer. These are fitted with glass delivery tubes and aspirator bulbs. These bottles are kept on a small table with a lead top.

Further equipment in this room consists of a titrating burette stand of seven burettes. The standard solutions in use on this stand are kept in cupboards beneath and away from the light, being forced into the burettes by bulb pressure. There is a 30-gal. copper water tank, tin lined, for distilled water, and a large main sink of stoneware with drain boards at each end. Samples are dried in a Freas automatic electric drying oven.

The fire assay laboratory (see Fig. 4) has four Case muffle oil-burning furnaces. These are set up in the rear of an 8-in. brick wall, thereby reducing the heat radiation. The muffle apertures, only, appear in this room. An iron table, with shelf below, serves the assay operations. At one side of the room is a down-draft hood, with electric hot plate for the parting operation. Adjoining is a wall table with filter stand and a stoneware sink; also a small wall desk with drawers and cupboards. The hood has also mounted in it, and separated by a partition from the hot plate, a Hoskins electric muffle furnace, F. D. No. 204. The heating of this furnace is varied and controlled by a wall rheostat.

FIG. 4. THE FURNACE ROOM

The draft can be regulated by a damper set in the hood flue.

A swing door leads into the furnace room proper, where are the Case furnaces, burners, low-pressure blowers, motors and oil tanks, and pipe connections. A 26-deg. Bé oil is used and has proved satisfactory with no pre-heating. A 200-gal. steel tank is buried in the ground outside the rear of the building at a shallow depth and is connected with a filter pipe from the surface. The fuel oil is pumped from this tank by a small rotary hand pump, situated in the basement, to two 20-gal. service tanks in the furnace room, which are placed slightly higher than the top of the furnaces. A 60-in. stack takes the waste gases from the furnace hoods. An increased draft was obtained here by placing swing aprons of sheet iron from the sides of the hoods and fitted close down about the top of the furnace body. This room also contains an Iler cupel-making machine and shelf cabinet for cupel storage. The room has a concrete floor and ceiling and is well ventilated.

The basement contains a lavatory and shower-bath room; also a locker and lunch room, roomy and well lighted. A small room is used for the storage battery mounted under a hood connecting with the down-draft system. One large room the total width of the building serves as a general storeroom for all supplies and heavy bulk stock not in current use. The samples and chemicals are kept in a separate dark vault. Additional space is devoted to a small crusher and pulverizer, power driven, a hand grinding mill for fluxes, a large revolving mixer, a bucking board, and long workbench.

The building is heated throughout with steam, supplied from the power plant to radiators in each room on the main floor. The basement is heated sufficiently from the exposed steam mains.

After two years' use, this laboratory has proved in every way to be entirely satisfactory for the purposes for which it was designed.

Fluorspar in 1919

PRODUCTION

Reports received from most of the principal producers of fluorspar, according to Hubert W. Davis, of the U. S. Geological Survey, indicate that the total shipments from domestic mines in 1919 amounted to about 122,000 short tons, valued at $3,102,000, as compared with 263,817 tons, valued at $5,465,481, in 1918. These figures show a decrease in quantity of 54 per cent and a decrease in value of 43 per cent. The general average price per ton f.o.b. at mines or shipping points for all grades of fluorspar in 1919 was $25.43, which is $4.71 per ton more than the average price received in 1918. The average price received in 1919 was higher than the average quoted price during the year, because a considerable quantity of gravel spar was so'd in 1918 for delivery in 1919 at prices between $30 and $35 a ton. On the other hand, the average price reported in 1918 was lower than the average price quoted during that year, because a considerable quantity of gravel spar was being delivered on old contracts at prices between $5 and $10 a ton. Kentucky and Illinois fluorspar was quoted during practically the whole of 1919 at $25 a ton f.o.b. at mines for 85 per cent washed gravel spar, and at $22.50 a ton for 80 per cent similar material, but according to reports these prices were often shaded.

IMPORTS

The imports of fluorspar into the United States in 1919 were 6,943 short tons, valued at $107,631, as compared with 12,572 tons, valued at $169,364, in 1918, a decrease in quantity of 45 per cent and in value of 36 per cent. The value at the foreign ports of shipment assigned to the imports in 1919 averaged $15.50 a ton, as compared with $13.47 in 1918, an increase of $2.03 a ton. Of the imports in 1919, England furnished 6,041 tons, valued at $94,099 or $15.58 a ton at the British port of shipment, and Canada furnished 902 tons, valued at $13,532, or $15 a ton.

The imports of fluorspar into the United States during the first three months of 1920 amounted to 3,820 short tons, valued at $37,233, or $9.75 a ton at the ports of shipment. During this period a small quantity of fluorspar was received from Germany.

Reported Diamond Deposits in British East Africa

A recent report from Nairobi, British East Africa, says that within thirty miles of the consulate what three experts pronounce as diamonds have been found. All the claims of the negotiators have been pegged out.

Transportation in Sze-Chuan, China

Development of Possible Industries Retarded by Adverse Conditions—Railroads Lacking—All Machinery and Supplies Carried by River, Coolie or on Pack Animals—Labor Scarce in Some Districts in Consequence

By J. A. T. Robertson
Written for *Engineering and Mining Journal*

ANY expansion in China's mining industry must come largely from further development of known deposits. This will require a change in economic conditions. I confess that I went to China with the impression that the introduction of Western machinery and methods would decrease costs sufficiently to permit the opening of deposits that cannot be worked under present conditions; but I soon found that many the greatest possibilities of expansion. But although the Chinese have never developed a suitable pump they have been familiar with foreign pumping machinery for a long time, and that they have not used it more extensively is solely because of present economic conditions. It appears to me that improvement in transportation will be one of the biggest factors in changing economic conditions in China.

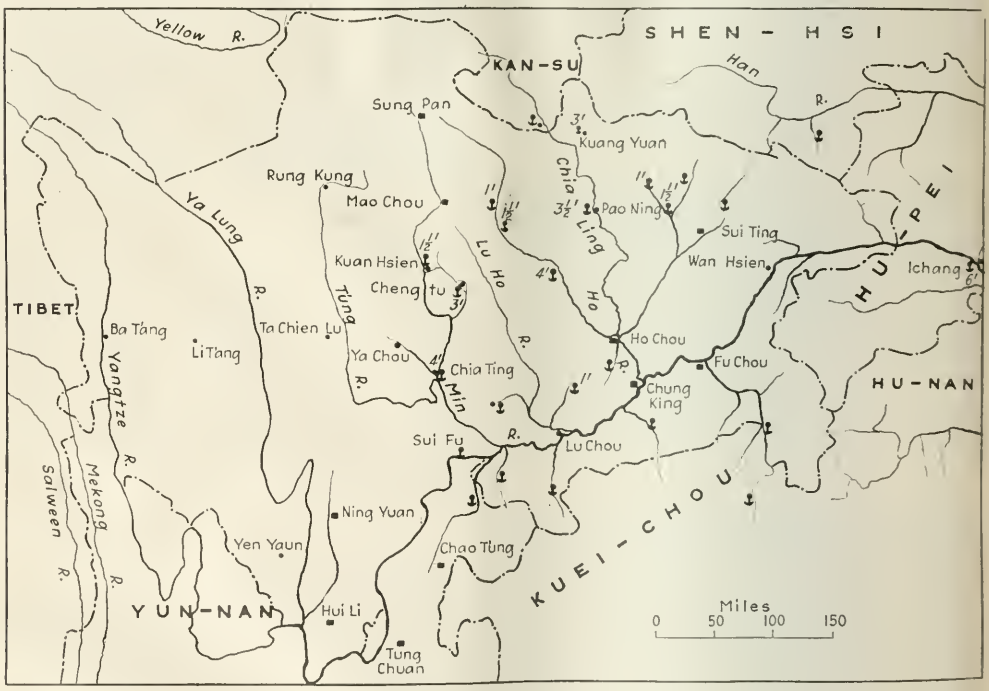

FIG. 1. MAP OF SZE-CHUAN PROVINCE, CHINA

deposits are being successfully worked on a small scale that are obviously too small to justify capital expenditure for a modern plant. Also, in a great many operations the methods employed are far more economical than would appear to the casual observer. For example, after seeing the Chinese recover silver by direct cupellation from lead bullion containing only about 15 ounces per ton, and washing gold from gravel that an American miner could hardly dredge, it did not take long to force the realization that the wholesale application of foreign machinery is not what is needed.

The Chinese have never been able to contend with any volume of water below the natural drainage levels; therefore very little is known of the possible extension of ore with depth. In my opinion this offers one of

North of Chung King there are some very promising iron deposits that have been worked over a large area. The ore is smelted in charcoal furnaces near by. When the wood has been used up in an area within which the charcoal can be profitably transported to the smelter the workings are abandoned and a new mine is developed and furnaces are built at some other place on the range where wood is available for charcoal burning. This is only one of numerous instances that could be cited in which present transportation costs prevent the development of possible mining industries.

The copper smelter at Peh-Hsui-Ho operated only about half time because of lack of ore. The smelter was built as near to the mines as possible, but it was found impossible to get enough carriers to bring down more

than half the tonnage of ore that the smelter could treat. It sounds funny to talk of labor shortage in China, but I have known it to be quite acute in numerous mining districts of the Province of Sze-Chuan, which has a population of from sixty to seventy millions. Bishop James W. Bashford, who was an authority on things Chinese, estimated that 15 to 20 per cent of male Chinese are engaged in transportation. When this is compared with conditions in Great Britain, which is somewhat of a common carrier, where 6 to 8 per cent of adult labor is engaged in transportation, and with countries such as Austria, that transport only their

FIG. 2. A JUNK BEING TOWED UP-STREAM

own goods, where 2 or 3 per cent of the adult labor is thus engaged, it is not hard to understand the high cost of transportation or the shortage of labor in other industries.

Because transportation costs are such a vital factor in mining I am presenting these notes for the benefit of those interested in mining development in China. Although they refer specifically to Sze-Chuan, they represent conditions in a large part of the interior. The costs given are those obtaining in the summer of 1916, the last year I was in China, and are in United States currency figured on a value of 50c. for the Chinese silver dollar, which was the rate of exchange at the time. Since then the Chinese silver dollar has appreciated greatly in value, actually exceeding the United States dollar for a while in 1919; and even conservative China has not escaped the general increase in cost of everything during the last four years. Therefore present costs would be much higher than the figures given.

No Railroads in Sze-Chuan—River Transport Instead

Sze-Chuan, the largest of the eighteen provinces of China, is practically cut off from the rest of the country by mountain ranges. There is not a mile of railroad in the province, nor even anywhere near its borders. The only connection with the outside world is by way of that great highway of Central China, the Yang-tze River. Fortunately, the province, whose name means Four Rivers, has been well provided with waterways navigable for native craft. The accompanying sketch map shows some of the principal streams and head of navigation for boats of various draft. It will be noticed that this does not apply to the western part of the province, which is very rugged and whose streams flow so swiftly that it is often difficult to even ferry across them in their quieter stretches. However, in some cases, such as from Chia Ting to Ya Chow, bamboo rafts are used to extend navigation beyond the limits of any kind of boat.

Most freight is transferred to river steamers at Shanghai, although ocean freighters do ascend the river to Hankow, 600 miles from the sea. Here all freight is again transferred to smaller river craft, whose destination is Ichang, about 1,100 miles from Shanghai. Freight on crated machinery, sent from New York to Ichang, was $22 per ship's ton. From Ichang to Chung King, a distance of about 500 miles, there are a number of shallow-draft steamers plying about eight months of the year. Most heavy freight goes up from Ichang by native junk, requiring one month or more, depending on the height of the water and the prevailing winds, as against from four to six days by steamer. At Chung King it must again be transferred to smaller native boats and may be transferred once or twice again before it reaches its destination. This is exceedingly slow, and the risk of loss on the river is great.

Anything that will be damaged by water should be packed in tin-lined cases or cans and hermetically sealed, for not many wrecks in the smaller streams are total losses. I remember one instance when a boat which happened to have my year's supply of sugar and white flour was wrecked just below Chia Ting. It had fallen behind the other boats, and our representative was not there; so the captain walked up to Chengtu, four days' journey, to ask if we wanted him to fish the cargo out of the river and transfer to another boat. Although the cargo was under water about ten days, I lost only one 10-lb. tin of sugar, and it had had a nail driven into it in boxing. But one is exceedingly fortunate if his freight can be delivered by river, for then weight of the individual piece is not so important. If the destination is any distance from a navigable stream the

FIG. 3. A TOWING PARTY OF COOLIES

weight and size of the largest piece is of the utmost importance, a fact that is demonstrated by numerous heavy pieces of machinery I have seen rusting by the roadside where they were abandoned. The following costs per ton mile represent conditions:

TRANSPORTATION COSTS PER TON MILE IN SZE CHUAN IN 1916

Trip	Cost Per Ton Mile
Ichang to Chung King, by steamer	$0.0128–$0.0635
Ichang to Chung King, by native junk	0.0275
Chung King to Chia Ting, by native junk	0.011
Chung King to Chengtu, by native junk	0.012
Chung King to Tzu Liu Ching, by native junk	0.012
Chia Ting to Ya Chow, by bamboo raft	0.065
Down river freight	0.007– 0.01

The province where not actually mountainous is so hilly that in four years' travel I never saw a wagon road where an ox cart could be used, and even the wheelbarrow is limited to local use in a few of the valleys and basins. After leaving the waterways one has the choice of transport by coolie or pack animal, although in many districts the "Union of Carrying Coolies" will not allow the pack animals to come down out of the more mountainous sections, so one must choose coolies. For pack animals the limit for a single piece is 250 lb., but the usual loads vary from 160 to 220 lb., which the natives prefer to have divided in two equal parts.

With coolies probably the cheapest method is the back load or "beh." I have seen one man carrying well over 300 pounds in this way over rough mountain trails, but it is very slow. The quickest method of transport by coolie is the carrying pole, by means of which a man will carry 100 lb., 50 lb. on each end of the pole, from twenty-five to thirty miles a day. Where the roads are very hilly the load should be reduced to not over 40 lb. on each end. The maximum weight of a package to be carried by coolies is usually a question of cost. If one can afford to use enough men large

FIG. 4. REPAIRING A JUNK EN ROUTE. THE CARGO IS STOWED ON THE BANK UNDER THE SAIL

pieces can be carried. One man carries 100 lb.; two men, 160 lb.; three men 210 lb.; four men 260 lb.; and so on in about that proportion. But the greatest expense comes in the extra time needed by a large number of men. For example, from Ya Chow to Ning Yuan is considered a twelve-day trip, although it is usually made in ten days; but a load requiring ten or twelve men takes sixteen to twenty days.

Transportation by pack mule costs $0.088 to $0.15 per ton mile, depending on roads and load. Transportation by coolie, carrying on back, costs $0.10 per ton mile and up; by coolie, carrying a 100-lb. load on a pole, $0.125 to $0.20. Native express (coolie), the limit of weight being 90 lb., costs $0.129 per ton mile; heavier pieces are accepted at increasing rates, which soon double and treble.

Ontario's Siderite and Pig-Iron Production

Shipments of siderite ore from the Magpie mine by the Algoma Steel Corporation, and of briquettes produced from magnetitic ore by Moose Mountain, Ltd., Hutton Township, Ontario, totaled 13,962 short tons, valued at $74,073, from Jan. 1 to June 30, 1920, according to the Ontario Department of Mines. The first-mentioned used its entire output in the blast furnaces of the corporation at Sault Ste. Marie; the latter shipped its product to Quebec and the United States. The new Helen mine of the Algoma Steel Corporation has been diamond drilled, and it is estimated that over 100,000,000 tons of siderite are available for mining.

The pig-iron output by the Algoma Steel Corporation at Sault Ste. Marie, the Steel Co. of Canada at Hamilton, and the Canadian Furnace Co. at Port Colborne was 321,826 short tons, valued at $8,255,916. Only 58,387 tons, or 8.94 per cent of the total of 653,137 tons of ore charged to the seven furnaces in blast, was of domestic origin, the remainder being imported from the United States. Furnaces of the Midland Iron and Steel Co., the Parry Sound Iron Co., and the Standard Iron Co. were not operated during the period. The output of steel from pig iron was 337,048 tons, valued at $1,661,570. These figures do not include any secondary steel produced in the electric furnace from scrap iron and turnings.

Spain's Mineral Production

The output of the principal Spanish minerals during 1913, 1917, and 1918 was as follows, according to Consul General Carlton Bailey Hurst:

Minerals	1913 Metric Tons	1917 Metric Tons	1918 Metric Tons
Iron	9,861,668	5,551,071	4,692,651
Soft coal	3,78[illegible],214	5,047,213	6,134,986
Copper ([illegible])	2,26[illegible],691	1,90[illegible],341	1,007,707
Iron pyrites	92,913	37[illegible],918	590,008
Common salt	60,429	781,10[illegible]	320,531
Lignite	27[illegible],791	637,841	726,348
Lead	279,078	240,3[illegible]8	21[illegible],133
Anthracit	232,517	324,756	37[illegible],216
Zinc	117,831	122,845	10[illegible],958
Sulphur	6[illegible],653	84,929	7[illegible],3[illegible]0
Quicksilver	1,950	18,65	1[illegible],537
Manganese	21,594	57,74	7[illegible],714
Silver-bearing le[illegible]d	23,600	13,218	[illegible],505
Ocher	600	780	700
Silver	402	96	9[illegible]2

a Includes copper ore and ferrocupreous pyrites
b Includes rock salt and products of salt works

Iron ore was mined in nineteen provinces of Spain during 1918, comprising a total of 430 productive concessions, 107 of which were located in Vizcaya. Great Britain was the chief purchaser of iron ore from Spain before the war, and, with Germany, The Netherlands, and France, took large shipments. However, owing to the blockade, this export was reduced, Great Britain remaining practically the only purchaser. The result is that, although less ore has been mined, large stocks have accumulated. The chaotic condition of European iron industries in 1919, and restriction placed on the export from Spain of unmanufactured iron and steel, have tended to reduce production in the local iron mines.

It is conservatively estimated that the output of copper pyrites in Spain represented about 60 per cent of the world's production in 1918, and the Spanish mines are now in a position to produce more than before the war. Domestic consumption, which decreased owing to the limited development of chemical industries, promises in the near future to be greater through the establishment of new chemical enterprises.

The lead crisis resulting from the war threatened to paralyze lead mining, and early in 1919 the government authorized a committee to fix selling prices each month. It also granted a loan of 6,000,000 pesetas to the federated lead miners to meet the deficit caused by selling at the fixed price below the cost of exploitation. The demand for the suppression of the tax of 3 per cent on sales of lead ore was not conceded, but the export tax on certain lead ores was abolished.

Metallurgists of Note

Dorsey A. Lyon

By Paul Wooton

DORSEY A. LYON, supervisor of the experiment stations of the U. S. Bureau of Mines, is said to know more mining and metallurgical men than any other individual in the United States. Throughout his entire career his duties have required travel between mining centers. The cumulative results are that literally thousands of men engaged in the mining industry have a personal acquaintance with Mr. Lyon. Practically his entire life has been spent in the Far West. He was thirty years old when he made his first trip east of Chicago. Mr. Lyon was born in Bureau County, Ill., in 1871. His early years were spent in western Kansas, where his parents moved soon after he was born. In this frontier environment he was reared. He received his entire elementary education from his mother. Later the family moved to Texas and then to New Mexico. Young Lyon studied at Drury College, in Springfield, Mo., and later at Stanford University, from which he was graduated in 1898. During his senior year he was student-instructor in chemistry. Following his graduation Mr. Lyon accepted a position as instructor in the geology of mining at the University of Washington. Later, when the school of mines was started in connection with that institution, he was its first dean, being succeeded by Milnor Roberts, the present dean. Mr. Lyon then took post-graduate work at Harvard University, where he obtained his master's degree in metallurgy in 1902. Immediately thereafter he accepted employment with the U. S. Mining & Smelting Co. in Utah, which was building its plant at Midvale—then called Bingham Junction. At this plant his first practical experience was in what Mr. Lyon terms "muscular metallurgy." He assisted with the construction of the plant and later was placed in charge of the feed floor.

DORSEY A. LYON

To fill an urgent vacancy at the staff of Stanford University, Mr. Lyon was borrowed until an instructor could be found. His stay proved longer than he had intended, lasting from 1903 to 1908. During the summers of 1905 and 1906 he conducted large-scale experiments with the electric furnace in connection with the smelting of copper ores. Later he began work with the electric furnace in the treatment of iron ores. He was in charge of extensive work of this character from 1907 to 1911. In the latter year he went abroad to study the use being made of the electric furnace in Sweden. On his return he spent some time in the Harvard laboratory studying the possibilities of reducing iron ore by oil. It happened that Mr. Lyon was doing his electric furnace work at the same time that Dr. F. G. Cottrell was developing his electrical precipitator. Each was much interested in the work of the other and they frequently collaborated in efforts to work out certain of the problems which they were meeting. When the Bureau of Mines was established, Dr. Holmes had Mr. Lyon slated as the Bureau's metallurgist. It happened just at that time that Mr. Lyon was working under contract for an English company, but at the expiration of this contract in March, 1912, he accepted a detail from the Bureau on some metallurgical experiments, which he conducted at the Harvard laboratory. On July 1, 1913, he received a Presidential appointment as metallurgist in charge of the Bureau's electric-furnace work.

In 1914 the Bureau of Mines undertook its first co-operative work. An agreement for metallurgical research was made with the University of Utah. One of the conditions of the agreement was that the investigations be supervised by a metallurgist of the Bureau of Mines. This work, which paved the way for the extensive co-operative investigations being directed by the Bureau, occupied most of Mr. Lyon's attention until 1917, when he was made superintendent of the Seattle Experiment Station. Later he became supervisor of the experiment stations, the position which he still retains.

Mr. Lyon, besides being a co-author of several bulletins of the Bureau of Mines dealing with the use of the electric furnace in metallurgical work, has written from time to time for various technical publications. He is a member of the A. I. M. E., the Mining and Metallurgical Society of America, the British Iron and Steel Institute, the Cosmos Club, and other societies.

By The Way

Confusing

"If the casual reader ran across the words 'lepidolite' and 'amblygonite' in a theological paper, he might mistake them for the names of tribes of the Philistines," says a Little Rock paper; "if he found them in a paper on fossils he might suppose they meant some kinds of armored reptiles that ranged the swamps of the Cretaceous period. A companion word, 'spodumene,' though it ends with 'mene,' would mean nothing to him." To these names of lithium minerals may be added "natalite," which is something new and not a mineral. It is a liquid manufactured in Natal from refuse of sugar-cane mills and is used extensively as a motor fuel in South Africa to meet the shortage of gasoline there. Natalite has possibilities, to judge from its description. There is no reason why it could not be manufactured in the sugar-cane fields of Louisiana.

A Gas Explosion

Something new in the manner of shuffling off this mortal coil was mentioned in the columns of the *Rocky Mountain News* recently. A peculiar explanation is given of the death at Gunnison, Col., of a certain George W. Johnson, a former resident of Pueblo. "At the time of his death," says the *News* item, "Johnson was believed to have died from heart failure. Now physicians say he was killed by an explosion of gas in his throat. Johnson had gone to the Sawtooth mine, in which he was interested, to examine a new ore found there. Early in the morning two shots had been fired within the mine, workers planning to stay away for nine hours until the gas would clear. At 2:30 p.m. Johnson entered, and shortly after an explosion was heard. He staggered from the mine and died soon after. Gas is supposed to have remained in the man's throat and to have exploded as he came into the pure air." It is not seemly to make light of such an occurrence. But, if such a thing can be, it is somewhat surprising that many accidents of the same sort did not take place all over the country just before election.

The Simple Life

In the very early days of gold diggings, miners did not require much outfit or many tools; and, under the circumstances, locomotion was easy. A single suit of clothes, consisting of woolen shirt, thick pantaloons, heavy boots, and slouch hat, often served for a long time without changing. Add to this the leather belt, usually carrying a revolver and always a bowie or butcher knife, and the man was in full dress. If he traveled on foot, he carried a roll of blankets for his bed, a knapsack of provisions consisting generally of pork and beans, a little flour and salt, perhaps a little coffee or tea, a dish or two for cooking, a large iron or tin pan for washing gold, a shovel and sometimes a pick. If he traveled with a horse or mule, and particularly if he had an extra pack animal, his outfit was more extensive, embracing larger and more varied supplies of provisions, more cooking utensils, more clothing and bedding, and many other tools and implements. When several traveled together and had pack animals, they ordinarily carried a tent; but often they were satisfied with brush booths hastily thrown together, or slept in the open air around their campfire.

Gold

E. Gould Buffum is quoted in Hittel's "History of California" as giving the following animated description of working a crevice on Weber Creek in the early part of December, 1848: "I shall never forget the delight with which I first struck and worked out a crevice. It was the second day after our installation in our little log hut—the first having been employed in what is called 'prospecting' or searching for the most favorable place at which to commence operations. I had slung pick, shovel, and bar upon my shoulder and trudged merrily away to a ravine about a mile from our house. Pick, shovel, and bar did their duty, and I soon had a large rock in view. Getting down into the excavation I had made, and seating myself upon the rock, I commenced a careful search for a crevice, and at last found one extending longitudinally along the rock. It appeared to be filled with a hard, bluish clay and gravel, which I took out with my knife; and there at the bottom, strewn along the whole length of the rock, was bright, yellow gold, in little pieces about the size and shape of a grain of barley. Eureka! oh, how my heart beat! I sat still and looked at it some minutes before I touched it, greedily drinking in the pleasure of gazing upon gold that was in my very grasp and feeling a sort of independent bravado in allowing it to remain there. When my eyes were sufficiently feasted, I scooped it out with the point of my knife and an iron spoon and, placing it in my pan, ran home with it much delighted. I weighed it and found that my first day's labor in the mines had made me thirty-one dollars richer than I was in the morning."

What Is a Bureaucrat?

Anything that ends in *crat* is not a popular term to apply to one nowadays, whether it be bureaucrat, aristocrat, plutocrat—even, possibly since the election, Democrat. Still, when we read our Washington correspondent's write-up of Dorsey Lyon, the energetic superintendent of our mining experiment stations, we feel that he can hardly escape the first if not the last of these terms. When a man is born in Bureau County (Ill.), dined, possibly, off the bureau after parental correction (not being tall enough for the mantel piece), punched a burro in the Far West, burrowed into the electric furnace at Harvard, was borrowed from Harvard by Stanford, and finally joined the Bureau of Mines, which, from the custom of transmitting the directorship from father to son (spiritually speaking) has been compared with the pocket boroughs of England, can he hope to escape this classification?

Improving Arizona

Following the example set by James Douglas in bestowing the name of "Clemenceau" on his townsite camp in the Verde Valley of Arizona, John C. Greenway has named the New Cornelia swimming pool at Ajo "Dauville." The spelling of this new name will probably be Anglicized into "Doughville" in the course of time, and all will readily understand that it was given in honor of the doughboys whom Colonel Greenway led over the top.

CONSULTATION

Money in the United States

"Although I realize that the *Engineering and Mining Journal* is not a purely financial organ, I shall appreciate it if you would give me an idea of the stock of money in the United States at the present time, and how it compares with a similar period in 1919?"

The following table is taken from the circulation statement of the Treasury Department, and furnishes a comparison between present monetary conditions and those of a similar period last year:

	Nov. 1, 1920	Nov. 1, 1919
Gold Coin (including bullion in Treasury)	$2,739,043,566	$2,872,525,066
Gold Certificates	.....	.....
Standard Silver Dollars	269,857,494	308,145,759
Silver Certificates	.....	.....
Subsidiary Silver	264,697,830	245,127,765
United States Notes	346,681,016	346,681,016
Federal Reserve Notes .....(a)	3,663,517,685	2,958,700,375
Federal Reserve Bank Notes	238,601,900	267,986,800
National Bank Notes	732,549,629	722,394,325
Total	$8,254,949,120	$7,721,561,106

(a) Includes own Federal Reserve Notes held by Federal Reserve Banks.

Mining Bonds and Leases

"Will you be good enough to advise me concerning the method of operation of a 'bond and lease'? I very frequently see this term used in connection with mining properties, and I would appreciate knowing in full detail just what this means and how it is worked out practically."

The term "bond and lease" as applied to mining operations is a common expression covering a contract in the industry whereby the owner of a mining claim or claims contracts to sell his property at a stipulated price and to deliver a valid deed therefor at any time before the expiration of the lease.

The ordinary mining lease is merely a simple contract by which the mine owner grants to the lessee, with perhaps some restrictions, the exclusive right to do a certain piece of work, for which the lessor is to receive payment in the form of a proportion of the net returns. The distinction between a mining lease and an ordinary business lease is that the mine owner shares risk as well as profit. The "bond" element of a "bond and lease" is the supplementary provision by which the purchase of the property can be effected. A bond and lease usually gives the lessee ample time in which to determine the merits of a property, and in the event of disappointment in its character the contract may be terminated. From the owner's or lessee's standpoint a lease will help to develop the mine through someone else's efforts, whereas a bond and lease will insure a sale should the development prove satisfactory. Furthermore, profits or royalties to the owner are net.

The question of royalties is usually decided upon a sliding-scale basis; that is, varying with the gross value of the ore produced and sold, and is computed on the net smelter returns after the necessary haulage, freight, and treatment charges are deducted. Thus, in the Leadville district, Colorado, ore running under $10 per ton may be subject to a royalty of 10 per cent; ore running from $10 to $15 per ton, 15 per cent; $15 to $20 per ton, 20 per cent; over $20, 25 per cent.

Frequently, clauses are introduced in the contract covering the question of forfeiture or abandonment of the work, so that there may be included a specification that a certain minimum amount of work shall be done each year. The ownership of plant or improvements erected upon the mining premises, the disposal of the dumps remaining on the property; that is, the time allowed to lessee in which to dispose of his ore after the expiration of his lease; the size of workings, such as shafts and drifts and other regulations covering mining, are in a definite lease all carefully considered and an equitable contract is drawn up.

There are no hard and fast or accepted rules which a standard lease may be said to follow. Mining customs vary greatly, and what may be considered a proper stipulation and agreement in Cripple Creek may provoke considerable criticism in Grass Valley.

The following is a specimen form of a mining lease:

A SPECIMEN MINING LEASE

This Indenture, Made this ..... day of .... A. D., 19.. *between* ..... of ..... lessor, and .... . of ....., lessee;

Witnesseth: That the said lessor, for and in consideration of the royalties hereinafter reserved, and the covenants and agreements hereinafter expressed, and by the said lessee to be kept and performed, ha.. granted, demised and let, and by these presents do.. grant, demise and let, unto the said lessee, all the following described mine and mining property, situated in ..... mining district, county of ....., State of ....., to wit: (Here follows description of the property) ..... Together with the appurtenances, to have and to hold unto the said lessee for the term of ..... from the date hereof, expiring at noon on the ..... day of .... 19...., unless sooner forfeited or determined through the violation of any covenant hereinafter against the said tenant ..... reserved.

And in consideration of the said demise the said lessee does covenant and agree with said lessor as follows, to wit: To enter upon said mine or premises, and work the same in the manner necessary to good and economical mining, so as to take out the greatest amount of ore possible, with due regard to the development and preservation of the said premises as a workable mine, and to the special covenants hereinafter reserved. (Here insert special conditions and agreements of lease, work to be done, royalties and other reservations.)

In Witness Whereof, etc., the said lessor and lessee have hereunto set their hand and seal . . . . . the day and year first above written.

Signed, Sealed and Delivered
in the Presence of

..... [Seal]
..... [Seal]

If it is desired to incorporate into the lease an option covering the sale of the property, the following form of a working bond may be used at the end of the mining lease given above and before the concluding paragraph:

A SPECIMEN OPTION

And in consideration of the foregoing lease and the expenditures to be made thereunder and the well and faithful keeping of the covenants thereof, the said lessee shall have the right to purchase the said premises, together with all improvements, etc. for the sum of ..... dollars ($.....), to be distributed in the following payments: On or before the ..... day of ..... 19..... the sum of ..... to be paid (designate manner and place of payment), and on or before the ..... day of ..... 19..... the sum of ..... (Here insert conditions of payment.)

Time being of the essence of this contract as to such payments, and upon the tender of such payments the lessor will execute, acknowledge and deliver at his own cost, good and sufficient deeds to the lessee, or such person or company as the lessee shall nominate, conveying the said premises clear of incumbrance. (Deeds to the property are generally placed in escrow with some bank or responsible party, to whom payments are made when due under the agreement, and who delivers the deeds when payments are completed.)

The forfeiture, surrender, or termination of the above lease for any cause shall render the option void, and the above mentioned payments may not thereafter be tendered.

It is expressly agreed and understood that this agreement shall be considered as an option to purchase only, and not as obligating the said lessee to purchase said property.

In Witness Whereof, etc. (See close of Mining Lease.)

THE PETROLEUM INDUSTRY

The Overdrilling of Oil Fields

Discontinuation of a Practice Which Results in the Early Exhaustion and Reduced Productivity Of Wells Advocated

Written for *Engineering and Mining Journal*

OVERDRILLING in an oil field—that is, the drilling of too many oil wells in a given area—produces such seriously detrimental results to the field that it should be prohibited by legislation. Its affects are, first, to cause the oil pressure over a much larger area to subside rapidly, necessitating pumping where wells would otherwise have flowed; second, it causes the oil-bearing stratum or strata within the drilled area to be so rapidly exhausted that a maximum recovery of oil cannot be made; third, it usually permits the salt water to break into the field prematurely, and once there it irresistibly encroaches on the area still underlaid by oil-bearing formations, causing producing wells to go to water much sooner than they should under normal conditions, thus greatly lowering the total production of the field. To these losses must be added the big expense of drilling wells that are unnecessary for the economic working of the area.

CAUSES OF OVERDRILLING

Following an oil-field boom the control of the land is usually split up among a number of companies, each holding leases on many tracts of small acreage. Drilling on one tract nearly always necessitates offset drilling on others, and when oil is discovered there is a rush to obtain a share of the liquid mineral. As a result, a whole field may be overdrilled in a short time. Many of the north Texas oil fields have been most injuriously affected by this bad practice. Burkburnett may be cited as a specific instance of an entire field being in considerable degree harmed through overdrilling.

A different situation appears to be developing at West Columbia, Brazoria County, Tex. The area referred to is a fifty-acre tract lying over a mile northwest of the main field, and although it cannot now be said that this area is overdrilled, the development work under way appears to indicate that it may be in the near future. The history of this small outlying tract is unusual. On July 30, 1920, the Texas Co. brought in its No. 1 Abrams well, on the Abrams lease tract of about 1,380 acres, and about a mile northwest of the main field. The well came in flowing approximately 15,000 bbl. of oil daily, and later increased to a maximum of about 27,000 bbl., from which it later declined to 7,500 bbl. It is rumored that the Texas Co. was not "ready" for this well to be brought in, and the whole crew was discharged.

THE RUSH FOR LEASES

Naturally, this great oil discovery created a new demand for leases, and lease bonuses, even on areas a considerable distance away, rose abnormally. But the only "close-in stuff" consisted of a fifty-acre patch on the north edge of the Abrams ground at a distance of nearly a quarter of a mile north of the Abrams well. Nine different companies, exclusive of the Texas Co., each acquired part of this area, the Humble Oil & Refining Co. holding the largest part, or eighteen acres.

Six companies immediately began drilling as fast as derricks could be built and rigs hauled to the ground. Already the Humble company has completed two wells, the first making an initial production of 1,000 bbl. and the second 1,500 bbl. daily, and is drilling a third. The Monarch Oil & Refining Co. has completed one well making 1,000 bbl. initial production, and is drilling a second well, and the Gulf Production Co. has completed its No. 1 Masterson well, which came in flowing at the rate of 10,000 bbl. per day for a short time, soon sanded up, and later came back flowing 2,000 bbl. daily. In addition to these wells several others are being drilled on the tract, and immediately across the line to the south the Texas Co. is already drilling two offset wells.

This is an instance where, in a few weeks, almost the maximum number of wells for the economic extraction of the oil from this acreage has been drilled or partly drilled, and where several oil companies are pitted against each other in an effort to obtain the maximum amount of oil possible in the shortest space of time. It presents a condition that will almost inevitably lead to overdrilling, and which can be averted only by agreement among the companies or by state or national regulation. Already water in large quantity has appeared in the Monarch company's well. This well has been killed and will be cemented, as it is believed the water is coming in from the bottom.

If this small acreage were the entire field, the damage by overdrilling here would not be so serious, but, as pointed out, the life of the entire field, or at least much of it, can be shortened and the total production reduced by this bad practice. By all means let there be enacted regulations governing overdrilling.

The Japanese Oil Monopoly

Commercial Attaché James F. Abbott, at Tokyo, advises that no proposal looking toward a Japanese government monopoly of petroleum will be made until parliament convenes in January. While nothing definite has been decided upon, the proposed monopoly is likely to affect all Japanese possessions as well as the oil fields in Japan proper.

Japan produced only about one-half of 1 per cent of the world's crude petroleum in 1919, and its production has shown a steady decline since 1916, when 123,558,416 gal. were produced. The production for 1917 dropped to 119,576,223 gal. and that for 1918 to 102,110,650 gal.

The figures for the full year 1919 are not yet available, but basing estimates on the first nine months' production of 67,737,796 gal., the total production for 1919 will not reach much more than 90,000,000 gal.

The oil monopoly is being proposed largely to guarantee supplies for the navy, and new wells have been bored at Nairya and Kosenho, in Formosa, with rather

indifferent results. The Echigo fields, which produce about 60 per cent of Japan's supply, showed a decline of about 10 per cent in production during 1919. Decline in production is attributed somewhat to increased difficulty of importing well-boring apparatus since the armistice, and this has undoubtedly impeded the development of new resources.

Bureau of Mines Petroleum Experiment Station at Bartlesville, Okla.*

Investigations by Oil Technologists Cover Wide Scope And Are of Great Assistance to Operators Engaged In Production and Refining of Petroleum

THE Secretary of the Interior in the early part of 1918 approved the establishment of the Petroleum Experiment Station at Bartlesville, Okla., upon the condition that the city furnish the site and guarantee $50,000 for the erection of the buildings. A site of five acres and the necessary construction fund were furnished by the Bartlesville Chamber of Commerce.

The buildings consist of an administration and laboratory building, both of brick construction. The former is a two-story structure of eight rooms. A large room occupying over half of the main floor is devoted to the library, reception room, and clerical force. The remaining rooms comprise a drafting room and six offices occupied by the staff assigned to this station. The laboratory is a one-story brick building and contains a well-equipped chemical and physical laboratory; also a machine shop and mechanical laboratory. In addition to the main buildings there now are on the property an experimental refinery, a blueprint house, and a storehouse. These latter buildings are all of sheet-iron construction.

Oil-Field Development Problems

The petroleum experiment station at Bartlesville was established by the Bureau of Mines for the purpose of co-operating with those actively engaged in the petroleum industry. It might be termed a laboratory for practical research and for solving problems, devising new methods, preventing wastes, effecting economies, and for collecting and disseminating information. Investigations are not limited to any one branch of the industry nor to any one part of the country. Wherever opportunities appear for increasing efficiency, whether in the drilling of wells, in the producing or transportation of oil and gas, in the storing, refining or utilization of oil and its products, they may be considered. With the funds available, an effort is made to select problems in which a maximum number in the industry will be affected, and it is not possible to work on minor problems of interest to one company only.

Congress provides $25,000 annually for salaries and operating expenses of the station. In addition, certain men are headquartered there and are paid from other funds, so that the Government appropriates annually close to $35,000 for support of the station. At present it receives an annual appropriation of $12,500 from the State of Oklahoma. In addition, during 1920 the Bureau received $1,000 from the Ardmore Chamber of Commerce for continuation of an investigation in the Hewitt oil field, near Ardmore, Okla., thus making a total of approximately $50,000 which is expended each year through this station. This money provides for fifteen employees, ten of whom are technically trained men.

With its limited personnel and funds, the Bureau has considered that in connection with oil-field development problems the greatest benefit can be derived by working up a new field and turning the results of the investigation over to the operators and then moving to another new field. This work consists of gathering available information, making maps showing well locations and elevations, structure contour maps, geologic cross sections, peg models, and similar work, all of which helps to reveal the underground conditions of the oil fields. From these the stratigraphic location of the oil, water, and gas sands is determined, so that it is possible to predict the proper depths for landing casing to keep the water from the well and to avoid drilling too deep. By a study of the casing depths in wells already drilled, it may be found that water cased off may have access to upper oil or gas sands, thereby doing great damage. Likewise it may be discovered that an oil or gas sand has been cased off behind the pipe, and that the oil or gas is migrating between the wall of the hole and the pipe into barren sands, or sands where the oil, gas, or water is under less pressure, where it is wasting. This work often demonstrates the manner in which corrective measures may be applied; also, how to avoid wastes in the future. It includes a study based on engineering principles for increasing production, conserving oil and gas, and the economic development of the field. This work is of an educational nature, with the object of pointing out to the operators the advantages to be derived by applying engineering principles to underground operations. The Bureau engineers have worked on the Comanche, Walters, and Hewitt oil fields. An investigation of the underground conditions in the Walters oil and gas field was completed in the early part of the year, and a report made up and distributed through the Bartlesville Chamber of Commerce. Recommendations were made on efficient methods of operation, designed to increase the ultimate production of this field.

It is conservatively estimated that approximately 80 per cent of the oil remains in the sands and is not recovered by present production practices. Too little attention has been given to the proper methods of increasing the production in old wells and for learning best production practices under varying conditions to obtain a greater recovery. An investigation is being made covering both natural and mechanical factors affecting production, with the object of ascertaining methods which may be of value for increasing the percentage of oil recovered from the oil sands.

Evaporation Losses Investigated

An extensive investigation of the evaporation losses on Mid-Continent crude oils has just been completed, and the information so obtained will be published by the Bureau of Mines. As a continuation of this, work will be carried on to devise practical means for preventing and saving the evaporation losses. These particular losses can be materially reduced at a nominal cost, and the problem is now being attacked so as to provide practical means for avoiding the bulk of this waste.

During the last year the Bureau of Mines at Bartlesville has done considerable work on the recovery of gasoline from residual gas of compression plants. The

*Abstracted from an article by A. W. Ambrose in *Monthly Reports of Investigations* (October), Bureau of Mines.

report of this investigation has recently been published as Technical Paper 232, of the U. S. Bureau of Mines. In thirty compression plants in Oklahoma there was found to be an average of 0.337 gal. of gasoline per thousand cubic feet. This amounted to more than 5,000 gal. of gasoline a day that was not recovered by these plants. Following this investigation certain recommendations were made to some companies, which installed equipment at a nominal cost that perhaps will increase the gasoline output of this state practically 600,000 gal. during 1920. It is important to note that this increase will be from residual gases, which heretofore had gone to waste.

Refinery Investigations of the Bureau

A part of the experimental refinery at the Bureau of Mines station has been completed, and a series of experiments have been started to determine the best operating methods in order to obtain results corresponding to those obtained in large-scale plants; also, to check the efficiency of large-scale operation. It is planned to vary operating conditions to obtain data on the rates of distillation, temperature of condenser, fuel consumption, methods of treating, and like matters.

It is proposed to complete the experimental refinery now in operation at the Bartlesville station; to complete investigations now going on for recovering gasoline from waste tail-house gases and for making cleaner separation between gasoline and kerosene; to carry on experiments on the cracking of light fuel oils in order to obtain more gasoline from the crude; to experiment on methods of reducing refining losses, and to improve the quality of refined products; and to determine if high-grade lubricating stocks cannot be obtained from Mid-Continent crude oils, because of the shortage of lubricating stocks from Pennsylvania oils. In general, the purpose of these investigations is to increase the recovery of the more valuable products from crude oil and to improve their quality, particularly as to the crude oils of Kansas, Oklahoma, Texas, and Louisiana, from which state approximately two-thirds of our present production is obtained.

Queensland Gas Expected To Give Higher Yield of Petroleum

Special Correspondence

In *Engineering and Mining Journal* of Nov. 6, 1920, some particulars were given of the efforts that have been and are now being made to find petroleum at Roma, in Queensland, and of a heavy flow of gas, showing undoubted evidence of petrol, that was encountered last August. Later advices show that this gas, on being tested by the government analyst at a comparatively light pressure, gave 1.2 pints of petrol per 1,000 cu.ft. of gas. When the bore has been further cleared and arrangements have been completed for obtaining a pressure and temperature which are considered in America as giving the best results it is almost certain that the petrol content will be found to be considerably higher.

Some wild estimates have been made as to the quantity of gas that is escaping, and equally inaccurate calculations are being made as to the value of the late development, but these estimates are pure guesses, as nothing has been done to prove the quantity of the flow. In fact the volume of the flow is not considered material, as at present it is occurring only under conditions that are temporary, and can no doubt be increased, possibly to an almost unlimited extent, by further boring. What can be stated, however, is that in America, where petrol is selling at one-third the price now ruling in Australia, large quantities have been profitably extracted from gas carrying no more than 1 pint per 1,000 cu.ft. of gas, and there is little doubt that in the gas at Roma the state has an asset that can at any time be turned to profitable account, even if oil should never be found. This is the opinion of W. E. Cameron, the local government geologist, who has made a special study of the subject and has had charge of the geological side of the Queensland oil prospecting from the inception of the state bore at Roma.

It is a notable coincidence that of four bores put down at Roma—the first two for artesian water—three have become obstructed, and two of them have been abandoned for this reason. When the flow of gas that was lighting the town from No. 2 bore suddenly gave out, and attempts were then made to carry this bore deeper, the hole was found, mysteriously enough, to be choked at several places with some large pieces of solid iron that defied all efforts to remove it.

Excessive Use of Oil for Ships Opposed by Pirrie

Lord William James Pirrie, chairman of the shipbuilding firm of Harland & Wolff, recently gave out an interview regarding the future of oil as a fuel for sea-going vessels.

Lord Pirrie urged American shipowners to go slow in converting their steamers into oil burners, and said that in view of the present limited supply of this type of fuel it would not surprise him if this Government placed restrictions on the use of oil when other fuels were available.

"Until Mexico gets into a more settled state," said Lord Pirrie, "I feel that there is great insecurity in launching too large a program calling for vessels using oil as a fuel.

"Every possible step should be taken to prevent waste and to conserve the supply. This can only be done effectively by the adoption of the internal-combustion engine. It is, however, a great responsibility for any shipbuilder to advocate this type of propulsion under present conditions, for if oil could not be obtained in the trades in which such vessels were employed, they would be absolutely useless."

French Tariff on Prospecting Machinery Temporarily Suspended

At the request of the French commissary general for motor fuels and petroleum, the Ministry of Finances has just issued a temporary authorization for the free admission of prospecting machinery used in searching for petroleum, writes the *Écho des Mines et de la Métallurgie*. This measure is designed to encourage the initiative of all who desire to take an active part in the exploration of France's subterranean resources with a view to presenting France with a home supply of oil and of the products derived from it.

Photographs From Oil Fields

A FOREST OF OIL DERRICKS IN THE GOOSE CREEK FIELD IN TEXAS

NEWS FROM THE OIL FIELDS

Christian County Takes Place in Kentucky Producing Districts

From Our Special Correspondent

Christian County, Ky., is the newest field to announce development. Two wells have been drilled in the northeast corner to about 400 ft., with a third hole just south of White Plains. The two which are completed will produce about five barrels each. Three wells have been drilled near Crofton, in the northern part of the county, one to a depth of 1,580 ft. and the two others to 600 ft. The shallow ones have a good showing of oil, and the deep well will pump about ten barrels a day. In all there are nine wells recently completed in Christian County, with several rigs expected to move in within the next few months. Wayne County, which was one of the first counties in the state to produce crude oil in paying quantities, has recently brought in a 300-bbl. well.

Well No. 1 of the Future Oil & Gas Co. in Warren County, after being shot, developed into a gusher and is now producing 250 bbl. a day. Well No. 3 on the Whittaker-Kelley lease was shot and 150 ft. of oil stood in the well the following morning. This well is estimated at 30 bbl.

The well of the Major Jones Oil Co., No. 3, on the W. H. Hobbs lease in Lee County, pumped 30 bbl. in twelve hours. In the Mount Aërial section of Allen County activities continue, and some good wells will soon be brought in. The Texas Granite Oil Co. brought in its best well in the White Quarry section on the Harold W. Bublett lease.

In the Kentucky-Tennesse fields during October, 257 wells were completed, with eighteen dry holes and two gas wells, the new production being 8,606 barrels.

Progress Notes From Arkansas

From Our Special Correspondent

The Heilborn Oil Co., of Tulsa, Okla., has let a contract for a well to Messrs. Bewley & Bell, of Little Rock, Ark., to be located in the N. E. ¼ of S. E. ¼, Sec. 30-9-14, Dallas County. Actual drilling started the first week in November.

Home Oil & Gas Co. of El Dorado, Union County, Ark., is to drill on E. ½ of N. W. ¼ Sec. 1-18-16, Union County, Ark. This is the same section on which the Constantin Refining Co. brought in a gas well in May of this year.

The White Oil Corporation is to drill on the N. ½ of N. W. ¼, Sec. 12-18-16. A derrick has already been erected.

Well No. 2 of the Constantin Refining Co., in N. W. ¼ of N. E. ¼, Sec. 12-18-16, cemented 10-in. casing at 1,300 ft. The Arkansas Light & Power Co. is using gas from Constantin No. 1 well for fuel in its El Dorado plant.

Order Defines Royalties on Dominion Petroleum Leases

From Our Special Correspondent

Representations have been made to the Canadian government that owing to the uncertainty as to the amount of the royalty to be paid on the products of petroleum and natural gas locations, under dominion leases, development was retarded, as investors hesitated to increase large expenditures without knowing what tax might be placed upon the oil. An Order-in-Council issued Oct. 29 modifies the former order of Dec. 3, 1919, which provided that after Jan. 1, 1930, royalties might be fixed by the government from time to time, by enacting that for a period of five years after the date upon which the Minister of the Interior may decide that oil in commercial quantity has been discovered the royalty shall not exceed 5 per cent of the output, or the sales of the products of the location as may be decided by the minister, nor less than 2½ per cent of such sales; that for a further period of five years the royalty shall not exceed 10 per cent of the sales of the products of the location, nor be less than 5 per cent, and that thereafter the royalty shall be 10 per cent of the sales.

Wyoming Operators Anticipating Reserve Opening

From Our Special Correspondent

New rigs are being placed in the Salt Creek field, Wyoming, daily by various companies, to be ready to drill if the Government opens the reserve area to leasing.

The Big Muddy field pipe lines are handling an average of over 5,000 bbl. daily from the following companies: Merritt Oil, 3,100 bbl.; Ohio Oil, 1,160 bbl.; Midwest Refining, 345 bbl.; Texas Co., 150 bbl. Parts of these productions belong, through lease ownership, to other companies.

The Petrogras Corporation reports the sale of all its holdings in the Dry Piney field, Lincoln County, to Clinton & Lackey, who have started drilling. The Petrogras Corporation is acquiring leases in the Osage field.

A well of the Pyramid Oil Co. in the Fossil field of Lincoln County has just been completed and is now standing full of oil. The well will be bailed as soon as storage capacity is provided.

The first test of the Producers & Refiners Corporation in the Williams Park district, Routt County, Col., has proved dry at a depth of 1,200 ft. It is probable that the well will be abandoned and a second well drilled elsewhere on the 16,000-acre lease. This land is twenty miles southwest of Steamboat Springs on what is known as "Twenty-Mile Dome."

Texas First Oil Producing State During October

From Our Special Correspondent

During October Texas produced at the rate of over 350,000 bbl. of oil daily and advanced to first place among the oil-producing states. The big gain is due largely to the two great Texas Co. wells at West Columbia, Brazoria County, and the north-extension wells of that field, and to the general gain all over Stephens County, especially in the Breckenridge district. Stephens County is now the leading oil-producing county of the state. The total production for the month would have been larger if lack of storage and transportation facilities in the Breckenridge field had not necessitated slowing down of drilling operations.

The United States Shipping Board has accepted the bids of the Texas Oil Co., of New York, to furnish one year's estimated supply of lubricating oils, amounting to 2,770,870 gal., at prices ranging from $0.47 to $0.78 per gal. Deliveries are to start at once and are to be made at Atlantic and Gulf ports.

The Gulf Export & Trading Co. lost its barge "Ankla" near Tampico in the recent Gulf hurricane, while in tow of the seamer "Colonel Roosevelt." Both boats were blown ashore, but the steamer was refloated. Another barge of 1,100-ton capacity will be built to replace the one lost.

The Attorney General's department has handed a decision to Land Commissioner J. T. Robinson that all oil and gas royalties and rentals received on "State Land" consisting of islands, salt-water lakes, bays, inlets, marshes, and reefs within tide-water limits and the Gulf, shall be divided, two-thirds to the permanent school fund and one-third to the general revenue fund. Also that royalties and rentals on land belonging to the permanent fund of the University of Texas shall be apportioned to that institution.

A spectacular fire occurred in the West Columbia oil field on Nov. 2, when the gas escaping from the Texas Co.'s No. 51 Hogg well became ignited by the heat generated by friction. The reflection of the fire in the sky could be seen for over fifty miles. This well, 300 ft from the flow pit of the No. 49 Hogg well, blew in unexpectedly at 2,254 ft The No. 49 Hogg is flowing thousand of barrels of oil daily, but it was saved from ignition.

Blue Ridge, Fort Bend County, i still of paramount interest on the Gul Coast, and the scramble for leases con tinues, although the big well of th Texas Co., west of the dome, choke and quit flowing after having bee pinched down to 500 bbl. daily. Storag facilities will now be provided and th well cleared.

Book Reviews

A Textbook of Geology. Part I. Physical Geology. By Louis V. Pirsson. Second, revised edition. Cloth; pp. 470; 6 x 9. New York. John Wiley & Sons, Inc., 1920. Price, $3.

This noteworthy volume puts in its appearance after the death of the able author, whose preface is dated May, 1919. It is a fitting memorial, and we recommend it for the use of colleges and schools, and for the general reader who desires a grasp of geologic thought. The language of the book is delightfully clear, unnecessary technical words are omitted, and those which are used are carefully defined: yet the treatment is painstaking, thoughtful, and thorough. If any one wishes to be inducted into the principles of geology, this is decidedly the book to recommend. The principal geologic processes, so far as worked out by investigation, are explained thoroughly and patiently.

The author, himself known principally as a petrologist, has not emphasized the igneous rocks especially in this volume: possibly he has leaned over backward a little in this respect, and emphasizes somewhat the simple and picturesque phenomena of physiography, glacial geology, and the other divisions of what has been humorously called "superficial geology." A conservative and judicial attitude is maintained in the presence of conflicting views concerning any problem, as is fitting in the case of a textbook. The author has, rather, the habit of observing, after citing divergent views, that the cause of the phenomenon in question is probably complex, and that each explanation may apply in different cases. We are inclined to regard this in several instances as undue optimism, and to believe that in most instances one or the other of the views is correct and the other wrong.

A textbook is a difficult thing to manage, on account of the vast ground to be covered and the necessity of familiarity with each division. The chapter on ore deposits is perhaps unduly short (forty-three pages). Possibly the author has gone as far as the scheme of the volume warrants, but the student or reader will need other literature to form any adequate idea of ore deposits.

Certain ideas which are textbook habitués and are borrowed from one to the other are inevitable, especially in a book written by a university professor. An example of this is the reproduction, in a modified form, of the diagram originally published by Leconte (p. 377) showing the origin of the Sierra Nevada, the Wasatch Range of Utah and the intervening desert ranges, as the result of relatively recent collapse into faulted blocks of a great arch or geanticline which, before the collapse, reached over this whole span. Now, it is well known that the Sierra Nevada fault-block originated as early as the close of the Cretaceous, and has been repeatedly subdued by erosion and uplifted again, since that time: so that the broken-arch theory is quite without foundation and opposed to facts.

No study is more essential to general culture than geology, as taught by a volume of this admirable type. The study should be a prescribed one, not only in universities, but in preparatory schools. It is more essential to a general education than many of the subjects at present prescribed. J. E. S.

The Mineral Industry. Its Statistics, Technology and Trade During 1919. Edited by G. A. Roush and Allison Butts. Cloth, 6½ x 9½; pp. 902. McGraw-Hill Book Co., New York. Price, $10.

The twenty-eighth volume of this important book has just been issued. Like the previous volumes it contains comprehensive reviews of about fifty of the most important mineral industries during the year covered. Statistics for preceding years are also given. The information presented is international in character, though, being an American publication, of course domestic activities receive the most space. It is an extremely handy reference book, largely a condensation of published statistics and technical information.

Technical Papers

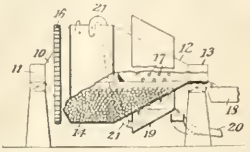
Talc—The method of mining and milling employed at the talc deposits of George H. Gillespie & Co. at Madoc, Ont., is described in the U. S. Bureau of Mines *Reports of Investigations*, Serial No. 2,162, five pages. It may be obtained by addressing the Bureau at Washington, D. C. Bolting through silk cloth is successfully done at this mill.

Theory of Flotation—In the August issue of the *Journal of the Chemical, Metallurgical and Mining Society of South Africa* (Johannesburg, price 3s. 6d.) is published a seven-page article entitled "A Resumé of Literature on the Theory of Flotation, With Critical Notes." The phenomenon of flotation cannot be said to be understood, but this article gives a good summary of the opinions held by writers on the subject.

Philippine Mineral Resources—The Bureau of Science of the Philippine government, at Manila, has issued a 75-page illustrated booklet entitled "The Mineral Resources of the Philippine Islands for the Years 1917 and 1918." The principal mineral products are gold, coal, sulphur, asbestos, and manganese. Iron and asphalt may exist in commercial quantities. Much of the archipelago is unexplored, and the known mining fields are undeveloped. Foreign capital is required. The pamphlet would be much easier to look over if the pages had been cut. The illustrations, on heavy paper, are particularly clear, though at least two are printed upside down.

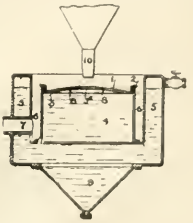
Recent Patents

Conical Mill—No. 1,355,474. Harry W. Hardinge, New York, N. Y. Perforations are made in the conical part of a Hardinge mill through which the pulp discharges into an outer drum, rotating with the mill. The fine material



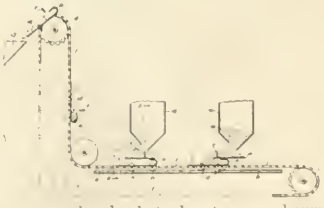
overflows from this drum and the oversize is returned to the mill for further reduction.

Concentrating Jig. No. 1,354,550. Georg Glockemeier, Luderitzbucht, South Africa. A jig with a sieve



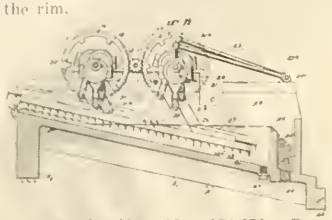
domed upward and a concentrate discharge in an annular zone near the center.

Conveyor—No. 1,355,180. David W. Starkey, Chicago, Ill. A system which combines the features of a belt con-



veyor and a bucket elevator, as shown in the illustration.

Thickener. No. 1,355,071. Charles Allen, El Paso, Tex. This type of Allen cone has a float, actuated by the density of the pulp, which controls the amount of discharge passing over the rim.



Drag Classifier. N. 1,354,676. Benjamin A. Mitchell, Garfield, Utah. An apparatus of the Dorr type with a different mechanism.

ECHOES FROM THE FRATERNITY

Mining and Metallurgical Society Gold Medal Awarded to E. A. Cappelen Smith

A. L. Walker and H. F. Guggenheim Discuss Life and Work of Chuquicamata's Master Metallurgist

The award of the Mining and Metallurgical Society gold medal for the year 1920 was made to E. A. Cappelen Smith for distinguished service in the art of hydrometallurgy on Wednesday evening, Oct. 10, at a dinner held at the Hotel Commodore in New York, in the presence of over 150 members, guests and their families. The toastmaster was Dr. E. P. Mathewson, and speeches were made by Dr. Arthur L. Walker and Harry F. Guggenheim, and on the presentation of the medal by Waldemar Lindgren, president of the society.

Dr. Walker told of the coming of Mr. Smith to this country from Norway, his native country; his wanderings, following his profession as a metallurgist, to Anaconda and other parts of the West; then finally back to the East Coast; how he built up a reputation as a progressive and courageous metallurgist, which finally led to his being selected to solve the treatment problems of the great Chuquicamata orebody, in Chile. Dr. Walker's speech was freely interspersed with witty remarks and kept the audience in good humor during the not too circumstantial account of Mr. Smith's professional history.

Harry F. Guggenheim sketched briefly and vividly the fact that the ore deposit at Chuquicamata had been known for hundreds of years; that it had first been worked by the Incas and, after the conquest, by the Spaniards; that the rich ores had been exhausted, and though the color of the rock proclaimed to every comer "Here is copper," it awaited the touch of adventurous science to transform the desert into the abode of industry. This had been accomplished by the scientific staff of M. Guggenheim's Sons, and in this the solution of the metallurgical problem by Cappelen Smith was one of the most important features. As the result, plants capable of treating 10,000 tons of ore a day, from an ore reserve that would last over a hundred years, have been constructed; 4,000 workers are employed in the enterprise; and a modern mining town had taken the place of the empty waste. In short, Mr. Guggenheim remarked, a soul had been born in the desert.

Mr. Lindgren, in presenting the medal to Mr. Smith, acknowledged his own unfamiliarity with metallurgy, although he claimed once to have, by superhuman efforts, kept a lead furnace running for three days. "Eventually," he remarked philosophically, "she froze."

In accepting the honor conferred by the society, Mr. Smith displayed both modesty and humor, pointing out that the achievements at Chuquicamata had been the result of enthusiastic team work on the part of the staff, under the captaincy of Pope Yeatman, and recounting some of his experiences since coming to the United States. He paid a feeling tribute to the equal opportunity and generous appreciation given foreigners in this country, only provided they would work. He had found it difficult to convince people that he had not changed his name from what it was in Norway; and had noted with amusement the struggles of his friends in this country with the geography of Europe. He had been dubbed "Swede Smith" in Anaconda, to distinguish him from the rest of the family; and finally, as a concession to his tales about the rugged mountains of his native land, "that Swede from Switzerland."

GOLD MEDAL OF MINING AND METALLURGICAL SOCIETY OF AMERICA

At the speakers' table, besides the above mentioned, were G. P. Bartholomew and Dr. R. H. Richards.

Site for National Academy of Sciences Building Secured

National Research Council Will Have Share in the Home To Be Built by the Carnegie Corporation

A site for the new building in Washington which is to serve as a home for the National Academy of Sciences and the National Research Council has recently been obtained. It comprises the entire block bounded by B and C Sts. and Twenty-first and Twenty-second Sts., N. W., and faces southward on the Lincoln Memorial in Potomac Park. The Academy and the Council have been enabled to secure this site, costing about $200,000, through the generosity of about twenty friends and supporters. Funds for the erection of the building have been provided by the Carnegie Corporation of New York.

American Engineering Council Representatives Named by A. I. M. E.

F. A. E. S. Membership Increasing But A. S. C. E. Decides To Stay Out

At a meeting of the executive committee of the American Institute of Mining and Metallurgical Engineers on Oct. 28, 1920, the following were designated as representatives of that institute on American Engineering Council: Herbert C. Hoover, J. Parke Channing, Arthur S. Dwight, Edwin Ludlow, Allen H. Rogers, Philip N. Moore, J. V. W. Reynders and Joseph W. Richards.

At its recent regular meetings the Grand Rapids Engineering Society, of Michigan, accepted the invitation to become a charter member of the Federated Societies; and the advisory council of Iowa Engineering Society made unanimous recommendations that that society also accept. The council designated J. H. Dunlap as its representative to the meeting of American Engineering Council in Washington, D. C., Nov. 18, 19 and 20.

The American Society of Civil Engineers' referendum on the question recently decided by 3,300 to 2,300 to refrain from becoming a charter member of the Federated American Engineering Societies. Already seventeen organizations have definitely accepted charter memberships and more than forty-five representatives are entitled to seats on American Engineering Council.

Utah Chapter of A. A. E. Hears C. J. Ullrich at Annual Banquet

About two hundred engineers of Salt Lake and other Utah cities attended the annual banquet of the Utah Chapter of the American Association of Engineers in Salt Lake City, Utah, Oct. 17.

W. A. Richmond, president of the Utah Chapter, was master of ceremonies and introduced C. J. Ullrich, assistant state engineer, who spoke on the growth of the American Association of Engineers from its first meeting in 1915 until today, when it has a membership of 21,000. It is dedicated, he said, to service—service of the engineering profession, of the community, and of the nation. Its purpose is unity

A Copy of the Temporary Mining Laws of Persia, dated Oct. 2, 1917, is in the hands of the U. S. Bureau of Foreign and Domestic Commerce, Washington, D. C. *U. S. Commerce Reports* for Oct. 22, states that it will be made available on applying to the bureau or its district co-operative offices and referring to File No. NE-15.

COURT DECISIONS IN MINING CASES

By Wellington Gustin

Maine Courts To Adjudicate Arizona Conversion

Claims of Arizona Commercial Mining Co. Against Iron Cap Copper Co. Before Supreme Judicial Body

Two Maine corporations operating mines on contiguous claims in Arizona have taken their controversy over ore into the Supreme Judicial Court of Maine. The same controversy was first brought into the Massachusetts courts, and after hearing there dismissed because the parties were non-residents.

In the suit the Arizona Commercial Copper Mining Co. alleges that the Iron Cap Copper Co. has taken, converted, and sold some 250,000 tons of its ore and asks for the money had and received by the defendant for same.

Complainant's bill charges the Iron Cap Co. with taking the ores during the preceding six years by way of the Iron Cap shaft, the Williams shaft, and other shafts on the property occupied by the latter, and underground workings, said ores coming from those portions of the veins, lodes and ledges which had their top or apex upon the mining claim owned by the complainant, and wholly within the complainant's surface lines, such veins, lodes, or ledges being at the time in the actual possession of complainant.

Defendant denied that it had taken any ores except those extracted from veins, lodes, and ledges in Arizona, as to which it has in good faith at all times openly and to the knowledge of complainant claimed title and ownership; and contended that the workings and all means of access thereto have been in the exclusive occupation, possession, and control of the defendant.

The court said that in Maine the landlord owns all within the limits of his land from the center of the earth to the high heavens. His bound areas are planes produced by projecting his boundary lines vertically downward and upward. But in the case of mining claims derived from the public domain the boundaries are governed by the "apex law" (Rev. Statutes U.S. 2322). This law is stated to be that one who secures a mining claim on a public domain is entitled not only to the exclusive enjoyment of the surface but to all veins and lodes throughout their entire depth, the top or apex of which lies inside the surface lines, although such veins and lodes may so far depart from the perpendicular in their course as to extend outside the vertical side lines of the surface location.

On the question of the court's jurisdiction it was said that no suit can be maintained in one state to determine directly the title to real property in another state. But the Maine courts have jurisdiction of a suit between Maine corporations arising out of conversion of ore in Arizona where title to the land was only incidentally involved and the action, being one for money relief, was transitory.

The court found that the complainant presented a good cause of action against defendant.

California District Court Dismisses Government's Bill

Holds Development Work of Oil Companies Was Made in Good Faith—Work on Claim for Benefit of Group Sufficient

In the suit of the United States against the Standard Oil Co., Syndicate Petroleum Co., Pyramid Oil Co., and a number of others, to restrain waste and depletion of the oil contents of certain California oil lands included in the area described in the Presidential withdrawal order of Sept. 27, 1909, the District Court dismissed the Government's bill. No discovery had been made at the date of this withdrawal, but the court finds that defendants were bona fide occupants or claimants of the property, diligently searching for oil at that time, and therefore protected by the saving clause of the Pickett Act (Comp. St. No. 4523-4525). It found that at the date of withdrawal defendant had twenty-four strings of tools in operation, as many as the available water supply would permit, had expended in developing and preparing to develop the property $500,000 and had 183 men on its payroll and $280,000 worth of tools and materials on hand, $36,000 of which was received and unloaded on the day of withdrawal. Its operations were continued unceasingly after the withdrawal date, the force was increased, additional material assembled, the water plant enlarged and extended along with completion of gas mains and telephone system, and defendant prepared for the drilling of twenty additional wells, prosecuting all such work to a discovery of oil.

No work was being done on the identical quarter section of land in controversy at the time of the withdrawal; but the court was convinced that the work being done on the contiguous claims was intended to and did directly benefit all the claims.

The established law respecting such claims was stated to be "that where two or more contiguous ones are held by the same person or persons work done in good faith upon any one of them, or outside the boundaries of either of them, which directly tends to the development or benefit of all of the claims for mining purposes, should be held applicable to each and all of such claims." (245 Fed. 523.)

Loses Suit Against North American Oil Consolidated

California Lands Held Valid Locations Prior to President's Order of Sept. 27, 1909, and Protected by Pickett Act

The United States Circuit Court of Appeals, Ninth Circuit, has affirmed the decree of the District Court for the Southern District of California, dismissing the suit by the United States against the North American Oil Consolidated, Pioneer Midway Oil Co., the Union Oil Co. of California, and the Producers' Transportation Co., and a rehearing was denied the Government.

The Government had sought a decree adjudging that the defendants had no right or interest in a certain section of the then public land of the United States known as Section 2, Township 32 South, of Range 23 East of the Mount Diablo base and meridian, or in any of the oil, gas, or other mineral contained therein, for the appointment of a receiver of the property, or for an injunction and an accounting.

The court found that the lands involved were valid locations under the mineral land laws at the time the President made the withdrawal order of Sept. 27, 1909 (36 Stat. 847) and were therefore excluded from such order, and, further, that the lands and their contents were protected by the Pickett Act.

Missouri Court Disallows Claim of Breach of Warranty

Judgment against the Adams-Hicks Zinc & Lead Corporation for the full sales price of shells sold it by the Central Foundry Co. has been affirmed in the Missouri Court of Appeals in Springfield. The shells were bought for use in its mining plant as part of the machinery for crushing mineral-bearing rock. The mining company alleged that these shells were sold to it under a warranty that such shells would each crush not less than a specifield number of tons of rock, and agreeing to make reductions in the price in proportion to any failure in that respect.

The mining company filed a counterclaim for the alleged failure of the warranty as to the shells or rolls. The jury denied these claims and gave verdict for plaintiff for the full purchase price as agreed. The agent selling the rolls testified that he made no representation or warranty as to the shells crushing any particular amount of rock. The mining company appealed from the holding of the trial court that the burden of proof was upon it to prove that the seller warranted the shells sold to buyer would each crush the quantity of rock as claimed by it. This holding was affirmed on the appeal.

MEN YOU SHOULD KNOW ABOUT

C. L. Graves, mining operator of Cusihuriachie, Mexico, has been to Chicago for two weeks on business.

J. T. Pardee has returned to Washington after making a geologic study of glacial placers in western Montana.

Eugene Stebinger again is in Washington after an extended visit to Bolivia, where he did geological work.

F. C. Calkins has returned to Washington after several months' field work in the Cottonwood district of Utah.

F. Leslie Ransome is on his way to Arizona for several months' field work in the Oatman and other districts in that state.

George C. Martin has completed geologic field work in the mining region on the Kuskokwim and lower Yukon rivers, Alaska.

L. M. Prindle has completed a study of the geology of the Bennington and Hoosick quadrangles for the U. S. Geological Survey.

William B. Milliken, mining engineer, and graduate of Colorado School of Mines, has an office in Mining Exchange Building, Denver, Col.

S. H. Cathcart, who spent the field season investigating the mineral deposits of Seward Peninsula, Alaska, has returned to Washington.

Anna I. Jonas has returned to Washington after having made a study of the limestone in York County, Pennsylvania, for the U. S. Geological Survey.

John H. White, field engineer for the American Metal Co., Ltd., of London and Denver, Col., was in Reno, Nev., for several days the last of October.

E. E. McCarthy, of New York, an official of the Yukon Gold Co., recently visited the company's dredge operating on Prichard Creek, near Murray, Idaho.

C. E. Van Ostrand has returned to Washington after having taken records of deep temperatures in thirty-four oil wells in Wyoming, California, and Texas fields.

Ernest N. Patty, of the Washington State Geological Survey, has been investigating some manganese deposits in the Olympic Range of northwestern Washington.

Wilbur A. Nelson, State Geologist of Tennessee, was in Washington recently in connection with the economic survey which is being made of the basin of the Tennessee River.

Ira B. Joralemon, of Bisbee, Ariz., geologist of the Calumet & Arizona Mining Co., passed through El Paso, Tex., recently from examining mining properties in Mexico.

Wm. H. Paul, mining engineer of New York City, formerly in Chihuahua, is now in charge of chrome mines in Guatemala controlled by United Fruit Co. interests. His address is Guatemala City.

Lapsley W. Hope has resigned his position as superintendent of the Eureka-Holly Mining Co., Nevada, to accept a similar position with the Ocoee Copper Co., at Ducktown, Tenn.

F. W. Draper, general manager of the Louisiana Consolidated Mining Co., of Nevada, has returned to the mine at Tybo after spending a month in New York in consultation with the directors.

George Clothier, government mining engineer of Stewart, B. C., has returned from his final tour of the Salmon River section, Portland Canal Mining Division. He now is preparing his annual report.

Col. H. H. Yuill, of Bainbridge, Seymour & Co., mining engineers, 645 Salisbury House, London Wall, London, returned to England about Nov. 1, after his trip to examine properties in British Columbia.

Dr. J. W. Beede, professor of geology in the University of Texas, has returned from the Mackenzie River valley, where he spent the summer prospecting in the interest of independent oil operators.

Herbert Hoover and **Theodore Hoover** will move their San Francisco offices on Dec. 1, from the Mills Building to the Balfour Building. Associated with them are Jas. M. Hyde, David McClure, and H. W. Turner.

F. W. Bradley, of San Francisco, president of the Bunker Hill & Sullivan Mining & Concentrating Co., is at Kellogg, Idaho, where he will remain about two weeks, inspecting the mining and smelting operations of the company.

R. H. Sutton is now general superintendent of a group of mines near Concepción del Oro, Zacatecas, Mexico, for Cia. Minera Nazareno y Catasillas, S. A. Mr. Sutton was formerly assistant mine superintendent for Cananea Consolidated Copper Co., at Cananea.

E. H. Hamilton and **E. A. Anderson**, general manager and chief engineer respectively of the U. S. Smelting, Mining & Refining Co., Midvale, Utah, have been inspecting various processes in use at the Anaconda Copper Mining Co's. Washoe reduction works at Anaconda, Mont.

Prof. G. A. Overstrom, who sailed from San Francisco in September, is now at Tul Mi Chung, Suan Concession, Korea, in the interests of the Seoul Mining Co. Professor Overstrom visited Honolulu and Yokohama on his way to Korea and is not expected to return before January.

Archie H. Jones, metallurgical engineer, of Salt Lake City, Utah, is in New York City on business connected with a large mill that his company has designed for a New Mexico property. Mr. Jones recently organized the A. H. Jones Co., metallurgical engineers, of Salt Lake City, which has taken over the business of Charles Butters & Co.

A. B. McCallum, who a short time ago resigned as chairman of the Research Council of Canada, has been appointed to a professional chair at McGill University, Montreal, Quebec. Dr. McLennan, of Toronto University, is named as Dr. McCallum's successor on the Research Council, which is to be reorganized. His work as a scientific adviser to the British Admiralty during the war attracted wide attention.

SOCIETY MEETINGS

The 1920 Annual Meeting of the American Society of Mechanical Engineers will be held at Engineering Societies Building, 29 West 39th St., New York City, on Dec. 7 to 10. The keynote of the meeting will be Transportation and the foremost authorities in its various fields will discuss its problems. Other engineering problems will also receive due attention.

The Utah Section of the American Institute of Electrical Engineers met on the evening of Tuesday, Nov. 16, in the assembly room of the Commercial Club, Salt Lake City. P. A. Jeanne discussed inductive interference problems, and E. G. Holding, manager of the Holding Electrical Co., spoke on "Early Electrical Experience in Utah." Joseph F. Merrill was chairman of the meeting.

OBITUARY

Robert H. Remington, a junior engineer on the staff of the U. S. Geological Survey, was drowned on Nov. 8 while trying to cross a river on the island of Maui, of the Hawaii group.

Captain Charles Kendall, head mining captain for the Quincy Mining Co., dropped dead at his home on Oct. 26. He was born in Cornwall, England, 65 years ago, coming to the United States when a young man and entering the employ of the Franklin Mining Co. at their Pewabik mine. He went to the Quincy Co. when it purchased the Pewabik property.

Captain Thomas Hooper, a pioneer mining man of the Michigan copper country, died suddenly on Oct. 28, in his 79th year. He was born in Cornwall, England, and came to the United States in 1859, when he entered the employ of the Quincy Mining Co. as a miner. He later took up mine development in Ontonagon County, where he was associated with the Union mines, Ontonagon Silver mine, Ironsdale Copper Co., White Pine Co., and from 1899 to 1906 the manager of the Victoria Copper Co. Since 1906 he had spent his time in mine examination, making his headquarters at his home in Cresco, Iowa.

THE MINING NEWS

The Mining News of ENGINEERING AND MINING JOURNAL is obtained exclusively from its own staff and correspondents, both in the United States and in foreign fields. If, under exceptional conditions, material emanating from other sources is published, due acknowledgment and credit will be accorded.

LEADING EVENTS

Calumet & Hecla Reduces Wages

Low Prices, Excess Production and High Costs Force Retrenchments in Michigan Copper Country

A 15 per cent reduction in all wages and salaries, effective Nov. 16, was announced Nov. 12 by Calumet & Hecla and its subsidiary companies. The Osceola branch of the Calumet & Hecla at White Pine and La Salle, Mich., will be closed down and the forces of that company's other mines reduced. Low price of copper, limited market, unsold surplus, excess production and costs are responsible, and it is estimated that 1,500 men will be thrown out of work.

Such a step was not taken without due deliberation, but it is the only corrective move that can be made to put the Lake district on a normal basis

Bisbee Deportation Case Abruptly Dismissed

Prosecution of the defendants in the Bisbee deportation cases was ended Nov. 4, when charges of kidnapping, filed last year against 206 men, were dismissed by Judge Sam L. Pattee of the Superior Court at Tombstone, Ariz., upon the motion of County Attorney Robert N. French.

Inability to get many of the deported men to appear as witnesses and the fact that hundreds of Cochise County residents had asked him not to put the county to the expense of further prosecutions, said Mr. French, had made it necessary for him to at last ask for dismissal of the indictments.

The indictments dismissed included 159 men named in the "blanket case," which was to have been started Nov. 8, and individual indictments naming forty-seven defendants. Since the prosecution of the cases was started four of the defendants have died.

Schuylkill Mining Majority Stockholders Win Decision in Arizona Court

The Mohave County, Ariz., Superior Court recently rendered a decision in favor of F. A. Garbutt and the majority stockholders of the Schuylkill Mining Co. in the long squabble concerning the Tennessee mine, which was purchased from the Wallapai Mining Co. in March, 1918. If the minority stockholders under Burke do not take an appeal, which seems probable, this will close the long dispute and bring an early resumption of work in the old mine.

WEEKLY RÉSUMÉ

Calumet & Hecla, because of the continued low copper prices, has cut wages 15 per cent in an effort to bring cost of production nearer sales prices. Dismissal of the Bisbee deportation cases was ordered by the Superior Court at Tombstone, Ariz., on Nov. 4. International Nickel Co. has announced a reduction in output amounting to 25 per cent, due to the general business depression in the country, which brings production practically on a pre-war basis. Interstate-Callahan closed down, due presumably to the low price of zinc and a strike at the company's smelting agency, the Grasselli Chemical Co. The Tom Reed Gold Mines Co. has brought suit against the United Eastern Mining Co. over an important apex right. The largest known hoisting engine is now in operation for the Quincy Mining Co. In the Gogebic Range ore shipment has ceased for the season. Labor supply in the Porcupine district, Canada, has become more plentiful. The survey of a railroad location into the Flin Flon district has been authorized by the Manitoba government. A U. S. Government committee declares the erection of a smelter in Alaska inadvisable, because of an inadequate supply of fuel and ores. The Controller of the Treasury has refused to allow further payment on a War Minerals Relief claim after the award of the commission has been accepted.

International Nickel To Reduce Output One-Fourth

Announcement was made Nov. 6, by Vice-President J. L. Agnew of the International Nickel Co., Copper Cliff, Ont., of a twenty-five per cent reduction in the output of the company, or from 4,000 to 3,000 tons of nickel matte per month. One furnace is to be closed down, and the gradual general cutting down of the working force had already begun. Between two and three hundred men, a payroll reduction of $25,000 or $30,000 a month, are affected.

A general depression in business all over the United States is given as the reason for the reduction, and this latest decision of the company practically brings production to a pre-war basis.

Interstate-Callahan Mine Closes for Indefinite Period

The Interstate-Callahan mine closed down on Oct. 31, with the exception of twenty-five or thirty men retained on development work. This action was taken by the company on the request of the Grasselli Chemical Co., purchaser of the zinc product of the Interstate-Callahan, the Grasselli company smelting plants being tied up through a strike. The shutdown is for an indefinite period. The company employed about 350 men.

Tom Reed Sues United Eastern

Apex Rights in Faulted Big Jim Orebody Cause Dispute—Prominent Experts Called—Models Introduced

The suit over apex rights in the Big Jim orebody at Oatman, Mont., brought by the Tom Reed Gold Mines Co. against United Eastern Mining Co. in April, 1919, came to trial on Nov. 8 before Judge T. Elmo Bollinger of the Mohave County Superior Court, Arizona. The attorney for the Tom Reed company is Judge Curtiss H. Lindley, of San Francisco, Cal., and the United Eastern company has retained John P. Gray, of Cœur d'Alene, Idaho.

The dispute between the two companies has arisen through a confusion due to the fault system revealed in the Tom Reed mine, whereby the Big Jim orebody, which was purchased in 1917 by the United Eastern, has been dislocated and its northwestern prolongation has been obscured. A number of elaborately executed mine maps and models have been brought forward in connection with the testimony being heard. The witnesses called include prominent engineers and geologists, such as Andrew C. Lawson, Dr. W. H. Emmons of the Minnesota Geological Survey; H. V. Winchell, Oscar H. Hershey, Albert Burch, Walter H. Wiley, and J. A. Burgess, who is a former superintendent of the United Eastern mine. Testimony by the Tom Reed representatives was heard from Nov. 8 to 11; the United Eastern Mining Co. finished its testimony on Monday, Nov. 15, after which the summing up and the arguments by the two sides were heard. The decision is not to be expected for some time.

Copper Country Now Has Largest Hoist Known in Operation

Quincy Mining Co., at Hancock, Mich., on Nov. 10 placed the largest known hoisting engine in operation at No. 2 shaft. It is a Nordberg duplex cross-compound, condensing, steam hoist, with a total winding capacity of 13,300 ft. of 1⅛ in. steel cable, operating in balance at a maximum rope speed of 3,200 ft.-min. The four engines of the hoist are set at an angle of 45 deg. on a triangular frame with the 516,000 lb. drum at the top. The two high-pressure engines are connected to the crank pin on one end of the drum shaft and the two low-pressure engines on the other end, thus eliminating all vibration or pulsation of the hoisting cable. A

floor space of 60 x 54 ft. is required by the engine, which stands 60 ft. high, and weighs, with the condensing equipment, 1,765,000 lb. Its horsepower will vary from a normal of about 2,000 to a maximum of about 6,500. The building is particularly pleasing architecturally.

Shipping Season Closes on Gogebic Range

The shipping season has been closed for this year by cold weather and snow. On the Gogebic Range the thermometer has been down to 8 deg. F. several days so the ore was freezing in the cars, and the snowfall has amounted to about one foot. At the docks at Ashland, thirty-five miles from the range, the weather is always much milder but the storms have interfered with navigation on the lakes. Considering the delays during the first half of the shipping season the tonnage forwarded this year has been good, not record breaking, but as good as the average of recent years.

The Odanah Iron Co. has received a Presscott-Menominee duplex 6½-in. plunger pump to be driven through herringbone gears by an electric motor. It is to be placed on the seventeenth level of the Ottowa mine, but will not pump to surface.

Flin Flon Railway Survey Authorized

The Manitoba government has given the Canadian National Railways authority to proceed immediately with a survey for a railroad into the Flin Flon mine district north of The Pas. The survey will include an estimate of the cost of construction of the road, to be submitted to the Legislature at its next session. The survey is expected to be completed in three months.

Mukden District Rich in Minerals

The Mukden consular district has an area of about 89,000 square miles, a population of nearly 10,200,000, and comprises the greater part of South Manchuria, the principal trading centers being Mukden, Newchwang, Kirin, and Changchun. The climate is similar to that of Minnesota.

"The mining possibilities of this section of Manchuria are enormous" writes Consul General A. M. Pontius, "but present developments are limited. There have been reported coal, iron, gold, silver, copper, lead, zinc, asbestos, and magnesite. Coal is extensively mined, both by Japanese and Chinese. The Japanese are working large deposits with modern machinery, but the Chinese are still using crude native methods. The Japanese also are developing large deposits of iron ore. Copper ingots are produced at one mine with modern methods. Both alluvial and quartz gold are found in a number of places, but no large mines are in operation. Lead and zinc occur mainly as lenticular masses in limestone.

"Mining is still in a comparatively backward state in Manchuria. With more extended railway and road building it is certain that intelligent and extensive prospecting will be undertaken, and the chances for developing mines and industries allied to mining are good. Capital is needed, and the services of experienced engineers, and with these two prime requisities at hand the future of mining in this district should be bright."

Recent Production Reports

Miami Copper produced 4,582,293 lb. copper in October, compared with 4,549,140 in September.

Arizona Copper produced 2,800,000 lb. copper in October, compared with 3,000,000 in every other month thus far this year.

Cerro de Pasco produced 4,698,000 lb. copper in October, compared with 4,444,000 in Sepember.

Shattuck Arizona in October produced 206,772 lb. copper, 790,149 lb. lead, 39,254 oz. silver, and 436 oz. gold. Copper produced in September was 166,513 lb.

Phelps Dodge smelter at Douglas, Ariz., produced 7,126,000 lb. copper in October, compared with 7,998,000 in September. The Copper Queen yielded 4,366,000 lb. in October, Moctezuma 1,817,000, Burro Mountain 546,000 and custom ores 397,000 lb.

United Verde Extension Mining Co. produced 3,864,756 lb. of copper in October, compared with 3,327,644 in September, and with 3,760,892 lb. in October, 1919.

Utah Copper in October produced only 8,000,000 lb. copper, compared with 8,420,000 lb. in September; this is the lowest monthly production of the company since 1916.

Chino Copper produced in October, 3,933,435 lb., compared with a September figure of 5,161,894 lb.

Ray Consolidated's October output of 3,990,800 lb. of copper falls below its September production of 4,502,000 lb.

Nevada Consolidated produced 3,850,000 lb. of copper in October, compared with its September production of 4,650,000 lb.

Calumet & Arizona produced 2,484,000 lb. of copper during October, compared with 3,038,000 lb in September.

The Bureau of Foreign and Domestic Commerce reports that United States importations of Alaskan products for the month of October, 1920, included:

	Quantity	Value
Copper ore, matte, etc., tons	3,956	.....
Copper contents, lb.	4,984,219	$946,128
Platinum, oz.	17	1,955
Palladium, oz.	83	9,515
Gold ore	.....	282,706
Gold bullion, oz.	40,596	729,785
Silver ore	.....	62,429

North Butte Mining produced 1,390,829 lb. of copper in October, 55,306 oz. of silver, and 82 oz. of gold.

Kennecott Copper produced 10,816,000 lb. during October, compared with 8,878,000 lb. in September, and 9,789,320 lb. a year ago.

Rand Gold Production

The gold output of the Rand for October totaled 662,000 oz. fine, as against 682,000 oz. in September.

Special Australian Letter

Broken Hills Mines Still Idle—North Broken Hill Strong Holding Company

Melbourne, Oct. 18—The Broken Hill mines have not yet resumed operations. The special tribunal has given its decision but doubt exists as to the meaning of several passages, and although both parties have agreed to abide by the award neither side appears willing to give way until the chairman explains the meaning of the clauses in dispute.

Although no productive work was done at the North Broken Hill mine during the twelve months ended June 30, 1920, £68,144 was received from sales of products of previous terms and £37,264 from interest, rents and dividends. A sum of £9,038 was brought forward from previous account, £13,400 was transferred from debenture sinking fund reserve, and £1,498 out of provision for expenditure on a new plant remained in hand, making the available total £49,665, which was appropriated as follows: Debenture sinking fund reserve, £13,333; provision for new plant, £25,000, leaving £11,332 to be carried forward. The assets showed a surplus over liabilities of £469,777, as against £547,492 at the beginning of the term. The company now holds £150,000 worth of shares in the Electrolytic Zinc Co. and £20,000 in British Australian Lead Manufacturers Pty., Ltd. In all, shares in other companies (not included in the assets mentioned above) held on June 30 totaled £356,750.

The Gold Producers' Association, Ltd., sold 100,539 oz. of standard gold in September, including 17,232 oz. sold to manufacturing jewelers during the quarter ended Sept. 30. The average net price (estimated on the month's sales abroad) was £5 4s. 9d. per oz. standard, or £5 14s. 3d. per oz. fine.

The business of the Electrolytic Zinc Co. of Australasia Pty., Ltd., is to be taken over shortly by a limited liability company, which will have a nominal capital of £3,000,000. This reconstruction is being made with the object of extending the company's operations and providing capital for carrying out the agreement recently made with the Mt. Read and Roseberry Mines, Ltd., under which the Electrolytic Zinc Co. will undertake the mining and treatment of complex sulphide ores from the Read-Roseberry properties.

Trail Smelter Receipts

The ore received at the Trail, B. C., smelter during the week ending Nov. 7, 1920 amounted to 11,149 gross tons, distributed as follows:

Mine	Situation	Gross Tons
Florence,	Princess Creek	104
Horn Silver,	Similkameen	48
Iron Mask,	Kamloops	46
Josie,	Rossland	286
Knob Hill,	Republic	41
North Star,	Kimberley	173
Sally,	Beaverdell	40
White Bear	Rossland	61
Company mines	.....	10,350

Special London Letter

Credit Rationing Restrains Mining Ventures—Tin Mines Depressed—Lead Prospect Proved

London, Nov. 2—We are still in the throes of the coal strike, and the whole country is on the tiptoe of expectation as to the outcome of the ballot. South Wales and Lancashire seem opposed to the sliding scale as proposed, though other coalfields are reported to be in favor. The uncertainty created by this position has given a decided check to business. A few of the best-known industrial undertakings are bold enough to appeal to the public for additional capital, but mining companies in need of funds prefer to wait until the position is less obscure. With the rationing of credit by the banks, mining directors are compelled to move cautiously.

The Santa Gertrudis is ready to make an issue of notes—has been prepared, in fact, for some time—but failure cannot be risked. The proposition, however, is an attractive one, and there is not likely to be much difficulty. A further cablegram from the Esperanza reports satisfactory developments in different parts of the mine, but as the values are low relatively to the phenomenal gold and silver content of the Descubridora vein that caused the sensational advance in the price of the shares, the public and market speculators are disappointed. Had there been no Descubridora values the property would still have shown merit.

A few weeks ago I reported certain mineral discoveries in the Peak District of Derbyshire. Further exploration there has uncovered a lead vein, concerning the prospects of which hopeful views are entertained. As the deposit exists under some pleasure grounds, there does not seem much prospect at the moment of its being worked in this particular locality, though its extension is being proved outside the prohibited area.

The tin-mining industry in Cornwall is still in the dumps, owing to the fall in the price of the metal—which, by the way, has recovered several pounds per ton—and the difficulties created by the coal strike. One point is worth noting in connection with the Tincroft. This is a shallow mine, and the workers, in order to enable the company to tide over the present unfortunate position, voluntarily and spontaneously offered to contribute a substantial sum monthly toward making good any deficiency. Since the abolition of the "cost book" system of mining in the Duchy, this is the first instance of such co-operation on record. It is stated that the East Pool and Agar Company, which broke away from the tin ticketing, has temporarily returned to this system of disposing of its produce because the smelters who had been buying its production had ceased to do so. The principal buyers at the ticketings now are apparently Cornish smelting undertakings.

The National Mining Corporation, which, as its name implies, embraces a wide field of operations and has quite a hatful of propositions with which to deal, has issued a statement that there is no intention of making a further call on the shares, which are 10s. paid out of £1. The price is at a discount, largely because of the depreciation in some of the holdings.

The Village Main Reef is a London company owning a number of claims on the Witwatersrand. Last week an earthquake occurred, resulting doubtless from the tremendous excavations that have been made, and the fall of rock was so great that it has been officially decided to close down the mine for good. The profitable ore was all but exhausted, though the gold premium would have permitted operations for a few months longer. The capital is only £472,000, and the shareholders have received over £4,000,000 in dividends.

Queensland Notes

Brisbane, Oct. 15—Operations at the mines and smelters of the Mount Cuthbert Co. were resumed on Oct. 11, after having been idle since last June. As there have been promising developments recently in the company's mines the smelters are expected to have a successful run. The Mount Elliott Co., another of the three big concerns operating in the Cloncurry district, is still in a state of idleness. The Queensland gold mines—or what are left of them—continue to receive much assistance from the Gold Producers' Association, which distributes amongst its members the proceeds derived from the current premium on the sale of Australian gold. The net premium thus realized during the six months ended June, 1920, amounted to £752,623, and of this sum Queensland received £64,500, which is very acceptable at a time when the gold producer is much in need of help. Twice this year there have been increases in the monthly return of gold now in this state. These have been small, but any improvement at all has been such a rare thing for years past that it is not likely to escape notice. The operations of the once famous and the premier goldfield of the state have now been reduced to those of one company and a few small parties of tributers working on their own account in old mines. One Charters Towers company that has a brilliant past—the Brilliant Extended—has turned its attention to tin mining on the Kangaroo Hills field, north of Townsville. On the Gympie goldfield—which used to rank next to Charters Towers—two more companies "went bung" (as the Australian aboriginal would say of anything that is dead), and the monthly output of the field is now under 300 fine oz., as compared with some 6,000 oz. ten years ago.

On the Kangaroo Hills field, which is a tin-mining center, some Charters Towers people have for several months past been developing the Sardine tin mine. In the main shaft of this mine highly "payable" ore has been mined down to 120 ft., and levels taken out from a little lower than this are yielding ore up to 20 per cent of metal. In six months 264 tons of material crushed gave a return of 81 tons of black tin, equal to an extraction of 30¾ per cent—nearly all this ore being obtained from development work. Already the Sardine Tin Mining Co. has paid three dividends of 2s. each per share on 40,000 £1 shares.

Some are apt to look upon Queensland mining as dying because gold mining in the state is at a low ebb, but what is being brought forth in the Sardine tin mine is only another of many proofs which often crop up that in tin, copper, silver, lead, wolfram and molybdenite, the potentialities of the state are still great. At present, however, the mining industry generally, like most other industries, is greatly handicapped by the high cost of materials and high wages, with the added drawback of a scarcity of explosives.

The Palmer, one of the oldest and formerly a very rich goldfield in the extreme north of Queensland, is about to be reopened after lying dormant for many years. Gold was first discovered on this field in 1873, and, as an alluvial area, the extent, amount, and diffusion of its rich deposits transcended anything previously or since discovered in Queensland. Subsequent efforts to work the reefs from which the alluvial is supposed to have been derived failed because the crude methods adopted and the limited means available were quite inadequate to cope with the water difficulty, which proved greater here than in any other field in the state. About £1,000,000 worth of gold has been won from the field, mostly from alluvial workings. In the early days of reefing, picked stone yielded as much as 10 to 15 oz. per ton, but the average from 1877 to 1881 was 2 oz. 5 dwt., the yield over these five years showing a uniformity remarkable if not unprecedented. Some recent attempts to pump out some of the old mines and further prospect the reefs have failed for various reasons. Now, the government has taken the matter in hand and started operations. The plant of a company that did some work with government aid a few years ago has been taken over and a beginning made in dewatering the Louisa, the principal of the old mines. Reefs which gave such consistent yields over a number of years and were abandoned only because the water overwhelmed the crude means of coping with it, ought to be worth a thorough test with up-to-date appliances, especially in view of the falling gold yield of the state. This test, the government states, it is determined to prosecute.

The Canadian Advisory Council for Scientific and Industrial Research has made an appropriation to permit an investigation into the treatment of the silver-lead-zinc ores of British Columbia.

Alaskan Smelter Inadvisable

Government Committee Finds Shortage of Fuel and Ores Precludes Operating Successfully a Local Smelter

A special investigation of Alaskan copper ores made at the request of the Secretary of the Interior, John Barton Payne, was recently completed by Oliver C. Ralston, one of the Bureau of Mines metallurgists. His formal report has just been completed. His conclusions are.

1. Costs of mining and land transportation in Alaska are at present the principal items of expense in the treatment of its copper ores.

2. Under existing conditions, metallurgical treatment of some kind is necessary at localities as near the mines as possible.

3. Conditions are not favorable for a copper smelter in Alaska at present, although with the development of greater supplies of ore it is possible that other adverse conditions could be overcome.

4. Concentration mills or hydrometallurgical plants at the mines are recommended as the logical solution of existing difficulties.

Mr. Ralston's investigation leads him to think that not enough ores are mined and shipped in Alaska at present to support even a small smelter. He found that the type of ores in sight, which are not shipped, is of such character as not to encourage the immediate building of a smelter for their treatment. Conditions generally are such that smelting within the confines of the territory is almost certain to be expensive. He points out, further, that the higher grade fuels have not been developed to the point where a smelter could be assured definitely of a continuous supply of coal. At present, lignite is the only local fuel which can be obtained in sufficient quantities and at a reasonably low cost. He calls attention to the fact, however, that the region is one of excellent prospects and that conditions likely will be different at some future time.

The special examination is an outgrowth of the recommendation to the Secretary of the Interior by the Alaskan Advisory Committee, of which Alfred H. Brooks was chairman. The recommendation was made as a result of pleas put forward by many small mine owners that they could not develop their mines unless they could dispose of their ores to greater advantage. Some mining men in Alaska were of the opinion that a smelter in the territory would be very helpful. Mr. Ralston had not gone far with his investigation when it became evident to him that the chances for a smelter in Alaska are not particularly promising at this time. As a consequence, he looked into the matter of what should be done metallurgically with the copper ores of Alaska as developed at present.

Mr. Ralston reports that the only copper-mining operations which meet with much success in Alaska are those in which the ore is concentrated at the mine before shipment. Some problems in concentration are involved, such as separating chalcopyrite from the heavy pyrrhotite ores or from the massive magnetite ores, but Mr. Ralston gathered the information that flotation treatment of both these types of ores had been tested, with encouraging results. He advises that ores of that type, which do not yield to flotation concentration, should be tested by hydrometallurgical methods.

In discussing the matter of a smelter, Mr. Ralston eliminates the Ketchikan district, as its present production is small and it is within a short distance of a large smelter with relatively low smelting charges. The location which comes nearest to qualifying for a smelter, in Mr. Ralston's opinion, is at tidewater on Prince William Sound. There the question would be whether the ore could be smelted more cheaply at that point than in Tacoma. The freight rate to Tacoma probably does not average much over $4.50 per ton. Moreover, the total ore supply at present is hardly large enough to keep a single reverberatory furnace in operation. That fact alone would make for a high cost. Practically 95 per cent of the ore that is mined is shipped to the Tacoma smelter by the interests that own that plant. Mr. Ralston regards it as probable that this concern would not be interested in building another smelter, even if a slight saving in cost of operation were possible. Owing to the size and facilities of the Tacoma smelter, Mr. Ralston has doubt as to whether a small smelter in Alaska could compete, even with the great differential in its favor.

More War Minerals Awards

Payments aggregating $111,715.18 were recommended by the War Minerals Relief Commission during the week ended Nov. 6. The Southern Manganese Mining Corporation was given an award of $62,898.35, which was 67 per cent of the amount originally claimed. Cummings, Bender, Mahoney, and Corbett were given an award of $2,146.39 in their manganese claim. The amount awarded was 72 per cent of the amount asked. The Clark-Montana Realty Co. was awarded $43,535.60 on its manganese claim, 64 per cent of the amount originally requested. A review of the claim of Webb & Galbraith resulted in an award of $3,050.84, 38 per cent of the amount originally claimed. The claim had been disallowed in June. A. J. Schmidt was allowed an additional $84 on a review of his claim, on which $2,175.42 had been awarded previously.

Income-Tax Deductions for Depletion Allowed Only to Holders at Discovery

Based on an opinion rendered by Acting Attorney General Frierson, the Commissioner of Internal Revenue has rendered an income-tax decision to the effect that the deduction for depletion in the case of mines, oil and gas wells, as the result of discovery on or after March 1, 1913, is allowed only to the party or parties in possession at the time of the discovery, and not to subsequent purchasers

He also holds that the value which may be set upon the case of the discovery of mines, oil and gas wells, pursuant to the second proviso of Section 234 (a) (9), Revenue Act of 1918, to be depleted in accordance with such reasonable rules and regulations as the Commissioner of Internal Revenue and the Secretary of the Treasury may prescribe according to the peculiar conditions in each case, is, in the case of a lease, to be equitably apportioned between the lessor and the lessee.

Acceptance of W. M. R. Awards Prohibits Later Adjustment

No adjustment of errors in War Minerals Relief claims can be made after the award has been accepted. A decision to that effect has been handed down by the Controller of the Treasury. In the claim of Samuel H. Dolbear, an award of $10,955.15 was made and accepted, full payment having been made Jan. 16, 1920. Later it developed that an item of $2,845.37 should have been included in the award. The Secretary of the Interior issued a settlement certificate in favor of Mr. Dolbear for that amount on June 5, 1920, but the auditor refused to honor the certificate. The matter was carried to the Controller of the Treasury, who held that "if the Secretary of the Interior may reopen settlements made by himself or by his predecessors, it will be necessary to continue the appropriation on the books of the Treasury Department indefinitely." The controller holds that the additional amount due Mr. Dolbear should be passed upon by Congress as a regular claim against the Government.

Purchases of silver under the Pittman Act at the close of business, Nov. 13, totaled 23,075,231 oz.

NEWS BY MINING DISTRICTS

MEXICO

State of Coahuila

Increase in October Shipments From Guadaloupe District

Torreon—Shipments of ore from the San Juan de Guadalupe district to the Torreon smelter increased considerably during October. The San Acasio mine is being operated by T. E. Guzman, and is producing some high-grade silver ore. John Gibson has just shipped in a car of silver-lead ore from the Santa Cecilia mine adjoining it, and Luis Andiffered, a well-known French mining man of Mexico City, is preparing to operate the Recompensa group in the same district.

Dinamita—A practically new mining district is being opened up near the station of Dinamita, about 30 miles west of Torreon. Two groups of mines have been filed on in this vicinity during the last week, one known as the Cornisa and the other the Dinamita group. Some good values in silver, lead, iron, and manganese have been found, and considerable excitement prevails in the camp.

Reyes—Ezequiel Gallegos, representing some German miners, has applied for titles to several groups of mines in the Reyes district, which is becoming quite active. Several shipments of ore were received by the Torreon smelter last week from that camp.

The coal strike in the northern part of this state threatens a coal shortage at the smelters and mines of this district, unless the miners return to work soon. The strike leaders and mine owners are in conference with government officials in Mexico City at the present time.

Jalisco

Canada Mine May Sink Shaft Deeper

The development of the Canada mine is proceeding favorably on the 200-ft. level, and it is now necessary to sink the shaft another 200 ft. to ascertain if the values continue in depth. Broken ore in shrinkage stopes has increased from 52,174.5 tons June 13 to 59,245 tons Sept. 5.

Amparo Mining Co. reports that during the period June 14 to Sept. 5 the mill ran 84 days out of a possible 84 days, treating 34,357 tons, or 409 metric tons per day, with an average gross value of $12.51 per ton, U. S. currency. During this period $58,635.37 was expended for construction, development, and prospecting.

In Globe a suit for foreclosure of a lien and for $400,000 has been filed against the Inspiration-Miami Copper Co. by Joseph Kleinfelder and associates. It is claimed that certain contracts have not been kept.

CANADA

Ontario

Cornish Miners Find Employment at Dome Mines

Porcupine—Labor is now becoming more plentiful, many of the unemployed seeking work in the mines. The Dome mines has increased its force by the arrival of 109 Cornish miners brought out under a four-months contract, which may be renewed.

The McIntyre has developed a large orebody below the 1,000-ft. level. The deposit appears to be a continuation of the Hollinger vein No. 84. Should the Hollinger vein persist to a depth equal to that attained on the McIntyre it will mean a very large addition to the Hollinger ore reserves.

The Little Pet, on which nearly $100,000 had been spent in development, and the Porphyry Hill, both within half a mile of the Dome Mines, have been re-staked.

Ore in sight on the Porcupine Vipond-North Thompson, including that opened up by development down to the 600-ft. level, is estimated at 130,000 tons, valued at over $1,250,000. It is planned to sink to the 900- or 1,000-ft. level, open up main haulage levels, and remodel and extend the present 100-ton mill, increasing its capacity to 150 tons daily.

Kirkland Lake—At the Kirkland Lake, a drift started on the 400-ft. level has been halted on account of labor shortage. The 900-ft. level, the lowest in the camp, is being opened up. The mill is treating 125 tons per day.

A wide vein has been encountered in a crosscut 86 ft. from the shaft at the 300-ft. level of the Bidgood.

Calabogie—The warehouse and packing room of the Black Donald graphite mine, filled with refined graphite ready for shipment, has been destroyed by fire, with a loss of about $30,000, partly covered by insurance.

Cobalt—The Nipissing during October mined ore of an estimated value of $184,578 and shipped bullion and residues from Nipissing and customs ores of an estimated net value of $316,475.

The Bailey mine appeared on the list of shippers for the first time during the week ended Nov. 5, when it sent out a car of 87,116 lb. of ore.

The Kerr Lake crusher alongside its dump of low grade ore is nearly completed. The ore will be treated at the Dominion reduction mill. The veins discovered in digging for the foundation are being tested underground and will be developed on the 90- and 150-ft. levels.

A winze on the Ruby now down 30 ft. has encountered good ore, including some high grade stated to carry 1,000 oz. to the ton. The wall rock shows leaf silver.

The McKinley-Darragh is closing down its Savage property until more labor is available. A fair tonnage of low grade remains to be taken out.

Ontario Kirkland Gold Mines will build a new mill at Tough Oakes.

High-grade ore has been encountered at the Lumsden in a raise from the 225-ft. level. The vein is about 8 in. wide and the ore is stated to carry about 2,000 oz. to the ton.

Gowganda—The Miller Lake Silver Lodes has been taken on option by Montreal interests. A mining plant has been installed and drifting is being undertaken on the 100-ft. level.

West Shining Tree—Hamilton B. Wills & Co., Ltd., on behalf of themselves and other stockholders, have applied for an injunction to prevent the Wasapika Gold Mines, Ltd., from issuing stock to the Wasapika Consolidated Mines, Ltd., in the manner proposed, on the ground that it is not in accordance with precedent, and would tend to deprive innocent purchasers of the stock of their rights.

Elk Lake—The National Mining Corporation, Ltd., of England, with a capital of £2,500,000, has secured an interest in the White Reserve mine in the Maple Mountain district. A comprehensive diamond-drilling program will be carried out under the direction of J. B. Tyrrell, of Toronto.

CALIFORNIA

Old Mines in Calaveras County Reopen—Gasolene-Driven Stamps at Grass Valley Successful

San Andreas—The old Demarest quartz mine, a few miles southeast of San Andreas, may be reopened and further developed. This property was worked several years ago and at that time showed great promise, but, like all true fissure veins on the Mother Lode, the necessity for attaining greater depth became apparent and there was a difficulty in securing the necessary funds for that purpose.

Angels Camp—Work in the Finnegan mine, south of Angels Camp, is going on actively and cross-cutting to tap the eastern vein which has been in progress for several weeks has been completed successfully. The Finnegan adjoins the celebrated Morgan mine and it is claimed to have the north extension thereof.

For the first time in nine years the shrill tones of the whistle at the Rainer gravel mine on Bald Hill, about a mile north of Angels, echoed through the hills. It was the announcement that another one of the long silent gold mines of this locality will resume operations. Water skips are now running and will continue to do so day and night until the underground workings are unwatered. The Rainer mine is

situated on what is generally known as the Valecita channel and which, before reaching the Rainer mine, was fed into by many rich tributary streams. The property is owned by the Rainer Mining Co., Inc. J. Montreeville is general superintendent.

Grass Valley—The test run of the gasoline-driven stamp mill at the Boundary mine was successful. The ore already mined will require two or three weeks to crush and in the meantime the water will be pumped out of the shaft and drifts will be put in order for work resumption. M. J. Brock is manager and principal owner.

The mill at the Alcade mine has been overhauled under the supervision of Lloyd Root. There are now ten stamps at this property and there is a considerable quantity of ore in the bins and on the dumps that will pay to run through the mill.

The labor situation in the Grass Valley district is clearing, although there is a surplus of men seeking places and few experienced miners.

Sacramento—The report of the mineral production of California for 1919 compiled by the state statistician showed that counties that formerly ranked high have in the last year sought lower places. Yuba now ranks first in production, Nevada County second, and Amador third, while Plumas, which was near the tail end for many years, now holds fourth place, due to the development of the copper belt. Sacramento, although considered to be primarily an agricultural county, ranks sixth in mineral production.

The total production of gold, silver and copper has declined from $31,187,807 in 1918 to $22,201,898 in 1919. Gold made a small gain while the production of copper decreased from 47,674,660 lb. in 1918 to 21,732,507 lb. High cost of material did much to keep down mineral production.

San Francisco—No suspension of activity at the property of the Engels company will be caused by the low price of copper, reports E. E. Paxton, president of the company. Mr. Paxton stated that development work upon a greater scale was being planned along with copper production so that when the prices return to normal the mine will be in a position to deliver ore upon a larger scale. Four hundred and fifty miners are employed at the mine.

The Walker mine will lay off most of the force of 170 men and only development work will be carried on during the winter. The reasons given for cessation of production are the low copper prices and high labor, power and transportation costs.

Downieville—Work at the City of Siz quartz property at the head of Slug Canyon ceased for the season on Nov. 1, due to the fact that there are no adequate winter housing facilities. During the summer a raise from the upper tunnel to the surface was completed. In the lower tunnel several crosscuts were run and raises put up, with the result that both foot and hanging wall have been definitely located. Crosscuts driven both east and west at one point in the lower tunnel show the walls at the particular place to be 70 ft. apart.

Sutter Creek—With thirty stamps dropping at the Central Eureka and high-grade ore being found on the 3,900 level conditions at the mine are favorable.

Quincy—The Walker Copper Co. announced on Nov. 2 that high cost of power, high freight rates, and high labor costs, with declining prices for copper, caused it to lay off most of its miners and stop production for the winter. Only sufficient labor will be retained to carry on development and construction work.

Idria—The New Idria Quicksilver Mining Co. announced on Nov. 4 the temporary closing of its large plant as the result of the stagnant metal market. This action leaves but three small quicksilver producers operating in the state. This company's plant has been rebuilt since it burned down in June last.

Colfax—The Crusader mine, a famous property of El Dorado County, now under lease to the Plymouth Consolidated Gold Mining Co., is to developed. The property is owned by Seymour Hill of this county. W. H. Buys is the superintendent in charge.

LOOKING DOWN SAN MIGUEL RIVER, COLORADO, FROM FALL CREEK MINE

COLORADO

Durango—The discovery of a new orebody at the Ten Broeck has changed the plans of the company, which will continue operations through the winter. The vein is 5 ft. wide and assays well in gold and silver. It was discovered while drifting in the 3,000-ft. crosscut. If it continues to the surface it will give about 1,600 ft. of stoping ground.

The Esmeralda, on South Fork Lightner, has closed down for the winter. The property was being placed in shape for the erection of a thirty-five-ton mill, when an unexpected heavy snowfall prevented further operations.

The Jumbo Mining Co. has discontinued operations at the Jumbo temporarily, due to a pending deal for the sale of a controlling interest in the mine. The principal silver ore of the Jumbo is in a lime stratum 5 ft. thick.

The Co-operative Mining & Milling Co. has opened a 4-ft. vein of good-grade ore. Work on the road has been discontinued, but it is planned to operate the mine all winter. Lessees on the Idaho have shipped a carload of gold and silver ore to the Durango smelter, which is expected to run about $50 per ton. Lessees on the Mayday are laying track in No. 2 tunnel. Work is progressing at the Cumberland, under the supervision of E. B. Miller. The vein here, in the lower tunnel, is 5 ft. wide and carries about 11 oz. per ton in silver, with a small amount of gold. In the upper workings the vein has an average value of about $60 per ton in gold and silver.

Cashin—Michigan-Colorado Copper Mining Co. stockholders have asked for a receiver in a petition filed Oct. 29 in Detroit, Mich. Petitioners allege the company to be insolvent, and that they purchased stock as the result of misrepresentations.

Freeland—The Gum Tree property has been leased to W. B. Stewart, who will reopen and develop it.

Telluride—Shipments of concentrates from Telluride during the month of October were as follows: Tomboy, 70 cars; Smuggler-Union, 25 cars; Liberty Bell, 14 cars; total, 109 cars. Shipments have been lower than usual recently owing to the fact that the capacity of the Smuggler-Union has been reduced about 30 per cent since the flotation plant was destroyed by fire.

Pandora—The foundations for the new flotation plant of the Smuggler-Union Mining Co. are being laid and the structural steel is arriving. The new building will be about 200 x 300

ft., and will be fireproof. The new plant will increase the company's treatment capacity to about 700 tons per day. The company is in urgent need of good carpenters, miners, and laborers.

Idaho Springs—Lessee Charles Johnson has opened a pocket of high grade silver ore in the Silver Age property, the ore assaying about 4 per cent lead and over 100 oz. silver.

The Shafter mine, one of the old producers of high-grade gold ore in this district, will be reopened and developed under the direction of Lee Gilson.

Cripple Creek—The new orebody in the property of the Modoc Consolidated Mines Co. has been opened for a distance of 120 ft. and over a width of 25 to 30 ft. The ore is filled with seams of sylvanite, and is averaging about $30 per ton at the mill. About 75 per cent of the material broken and hoisted to the surface is ore. October production was about 2,500 tons, with a gross bullion value of about $75,000. A winze sunk from the 1,300-ft. level indicates the continuity of the ore below this level. Crosscuts are being driven toward the oreshoot from the 1,200-ft. and 1,400-ft. levels. Electric hoisting equipment is being installed at a cost of about $30,000. With this equipment the property's tonnage will be substantially increased. A. H. Frankenberg is general manager.

Breckenridge—The Wellington mines will either curtail operations or close down completely during November on account of an increase in railroad freight rates amounting to $3.50 to $3.75 per ton. The grade of ore produced by the mine cannot stand this increased transportation charge and it is not likely that the company will do more than keep the property unwatered and continue mine development. The Wellington is one of the large producers of zinc ore in Colorado, and the largest employer of labor in Breckenridge.

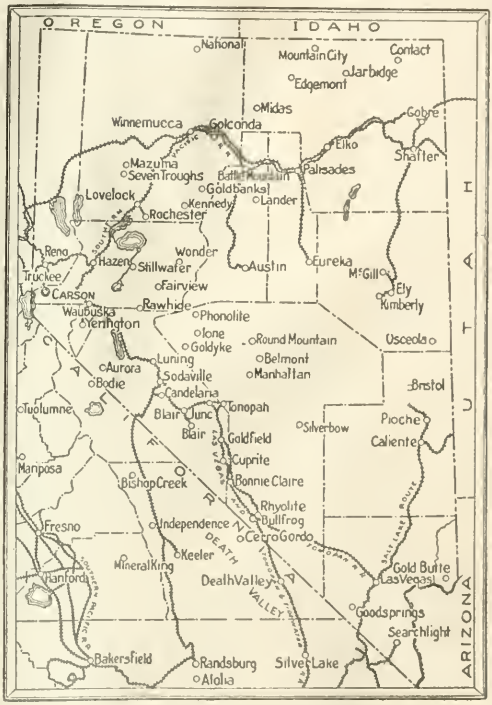
NEVADA

Tonopah—Bullion shipments for the second half of October are as follows: Tonopah Belmont, $95,700; West End, $62,370; Tonopah Extension, $53,000. Shipments from the Tonopah Mining and the MacNamara companies have not been reported as yet.

No new discoveries or important developments have been made in this district during the past week. Regular development work was performed in the Tonopah Belmont on several veins from the 550, 700, 800, 900, 1,000, and 1,100 levels. Mine tonnage is about 400 tons per day, the balance of the mill tonnage being custom ore. In the Tonopah Extension total development work for the past week was 182 ft., most of which was performed on the 1,540, 1,601 Intermediate, 1,680, and 1,760 levels. Progress in sinking the Victor and McCane shafts was only fair. In the West End development on the West End and Ohio veins was satisfactory. Tonnage for the past week was 1,500 tons. West End operations in Tonopah "76" territory from the Ohio shaft 800 level are progressing satisfactorily in favorable formation. The Tonopah Mining Co. report no changes, regular development being performed in the Mizpah and Silver Top sections of the mine and tonnage to mill was normal. The California Tonopah is making regular shipments which more than pay operating expenses. This company is sinking a winze from the 700 level, which is the lowest shaft level, to the 950. Conditions are reported favorable and the there being no milling plant on the ground.

Blair Junction—The Western Chemicals Inc., owning a potash-alum and sulphur property near Blair Junction, have completed their plant and expect to start operations soon.

Virginia City—One of the biggest ore productions for a single week since the old bonanza days was indicated by the official report of the Consolidated Virginia mine for the week ended Oct. 21. Most of the ore is coming from



MINING CAMPS OF NEVADA

station will be completed and crosscutting begun in about two weeks.

Divide—Although the report of J. H. Farrell on the Tonopah Divide mine showing present reserves of assured and probable ore as 53,158 tons, with a gross value of $21.78 per ton, and a total gross value of $1,158,733, may be disappointing to stockholders, it nevertheless gives them something definite to base their hopes on; at least so far as present available tonnage is concerned. This report checks the one made by E. A. Julian quite closely.

Belle-Helen—There is a revival of interest in this district, located about 50 miles east of Tonopah. The main property has produced about $125,000 gross from a fissure vein in rhyolite, and it is claimed that there is considerable ore of milling grade on the dump and in the mine. All ore produced to date has been shipped to Tonopah or to smelters, the north drift from the winze below the 2,150-ft. level, which is now out 70 ft., having advanced 24 ft. during the week. From this work 67 tons was extracted, which is said to have averaged several hundred dollars per ton.

Pioche—The Virginia Louise Mining Co. will increase its output immediately. Fifty tons of fluxing ore will be sent to the American Smelting & Refining Co., Salt Lake City, which in addition to the contract for 75 tons per day entered into with the U. S. Smelting Co., will materially increase the company's revenue.

Ore shipments from the Pioche district for the week ended Nov. 4 were on a reduced scale, but with assurances of fair future treatment from the officers of the Salt Lake route it is hoped that the shipments will soon be increased. The tonnage amounted to

2,080 tons, distributed as follows: Prince Consolidated, 1,250 tons; Virginia Louise, 510 tons; Bristol Silver, 100 tons; Consolidated Nevada Utah, 175 tons; Ida-May mine, 45.

Ely District.—A contract for the monthly shipment of 200 tons of high-grade manganese ore was recently secured by Joseph Vietti, the ore to be shipped to the Steel Corporation's mills at Pittsburgh, Pa. The Vietti mines are situated near the Coppermines Ranch, in Steptoe valley, and the ore will be hauled by motor trucks to the railroad at East Ely. Mining operations are still being carried on by the Nevada Consolidated Mining Co., but on a greatly reduced scale, only three steam shovels being operated in the big pits.

MICHIGAN

The Copper District

Calumet & Hecla Haulage Level Cemented—Mohawk Company Using Stope Scrapers and Back Filling

The long haulage level which the Calumet & Hecla Mining Co. is driving between the Red Jacket shaft and No. 12 South Hecla shaft has now reached a point 1,000 ft. south of Hecla No. 7 shaft, which leaves about 2,000 ft. of drifting to be done before the south terminal is reached. This haulage level is nine feet high by twelve feet wide and is entirely coated on the sides and back with gunite. This cement coating protects the drift from the damp and smoky atmosphere.

The Arcadian Consolidated Copper Co. is about to cut the seventh level plat in its New Baltic shaft. This leaves 200 ft. of shaft sinking yet to be done before the ninth level is reached from where drifting is to be started toward the old Arcadian shaft. The decision to do this work at the present time has not yet been reached.

The Mohawk Mining Co. in the 25th level of their No. 4 shaft are entering the zone where the Kearsarge amygdaloid lode has proved to be much wider than normal. This phenomenon has been observed on the 22d, 23d, and 24th levels, having a lateral extension of about 400 ft. and is about 40 ft. wide, maintaining good stoping ground for the entire width. In mining the lode for such a width the backfilling method is used. This company is using the recently developed stope scrapers which have proved of much value. The Mohawk Mining Co.'s stamp mill is treating all the ore from the Wolverine mine as well as its own. This arrangement will continue during the present period of decreased production.

Menominee Range

Iron Mountain—Operations have been suspended at the Indiana mine. Work was started there only about two months ago, but the cancellation of several of the ore contracts caused a shutdown.

Crystal Falls—The stockpiles at the McKinney Steel Co.'s mines—the Dunn, Tobin and Odgers—have all been moved and shipments are now being made from the pockets. New equipment will be added at all three of these mines during the winter season, most of it being electrical. The Amasa-Porter and Werner properties will have to carry over considerable ore, as will the Bristol. However, sufficient ore has been shipped to permit stocking room during the winter. The M. A. Hanna Co. has moved all of the ore which was in storage at the Carpenter and Monongahela mines. It is reported that the Judson mine is to pass to the Balkan Mining Co., a subsidiary of Pickands, Mather & Co. The M. A. Hanna Co. is at present operating the mine for the fee owners, but it is stated that the owners desire to place the property outright.

Iron River—Preparations are being made to resume operations at the Fogarty and Baltic mines of the Verona Mining Co. When these mines open up again it is planned to suspend work temporarily at the Caspian in order to permit the shaft being concreted from surface to the ledge. The Fogarty and Baltic have been idle for two years. A complete new electrical equipment has been installed at the Fogarty. The work of concreting the Tully shaft is going ahead steadily. New electrical equipment will be added here. It is planned to reopen the Tully in the spring. Most of the Iron River mines are operating to capacity right now, but several of them will have to carry over considerable ore.

Marquette Range

Diorite—The American-Boston Mining Co. is to close down the American mine at an early date. There is too much water coming in for the pumps to handle and the owners claim that the mine is not making money for the stockholders.

Palmer—The Richmond, Maitland and Empire mines have almost completed shipments and will close down this month. The Isabella is the only property in the Palmer district which will work throughout the winter. There is some talk that the American Steel & Tube Co. will take over this mine from the Cascade Mining Co.

MINNESOTA

Cuyuna Range

Rescue Station Cost Largely Subscribed —Rowe Mine Closed Down

The annual report of August Swanson, Inspector of Mines for Crow Wing County, just published, shows a decrease in fatal mine accidents for the year ending June 30 to six, as against eleven for the preceding year. Sixteen mines were operated. Twenty-eight were inactive, and 1,746 men were employed.

The average daily wage for underground miners during the period was $7.55 for contract work and $5.56 for company account. In the open pits wages varied from $11.56 per day for steam-shovel engineers to $5.17 for common labor; and on surface work from $8 per day for electricians to $4.49 for changehousemen.

A rescue station for the Cuyuna Range is to be built by subscriptions from the mining companies at an estimated cost of $6,000, of which amount $4,500 has been subscribed. The plans call for a building 15 x 30 ft., with two rooms, one for instruction and training in first aid, and the other for storing rescue apparatus, with a man always in charge.

Crosby—Rescue Car 10 of the U. S. Bureau of Mines is scheduled to be stationed on the Cuyuna Range from Nov. 15 to Jan. 8 for purposes of instruction in first aid and mine rescue work. The Portsmouth and the Mahnomen, open pits, have completed shipments for the season.

Riverton—The Rowe mine, operated by Pickands, Mather & Co. for the Pittsburgh Steel Ore Co., has closed down, and the present holders may relinquish their lease on it. Ore blocked out and available to present working levels has been practically exhausted. The operators of the Rowe mine were pioneers in the stripping of overburden from iron mines by the hydraulic method. One and half million yards of overburden was removed at this property at a total cost of 6.7c. per yd.

John A. Savage & Co. plan a screening, crushing, and drying plant at its Sagamore manganiferous iron mine. The drying plant will be two units handling 4,000 tons per day. A portion of the machinery has been contracted for. A Worthington Glendora-type deep-well pump of 100-gal. capacity has been installed at the Sagamore drainage shaft.

IDAHO

Cœur d'Alene District

Tungsten Minerals Discovered in Gold-Bearing Vein

North Fork—High-grade tungsten ore of unusual value has been struck on the property of the Kennon Mining Co. in Pony gulch. The ore was assayed to determine its gold content and it was discovered that 80 per cent of it was tungsten. The tungsten is a vein 8 in. wide in a ledge that is 5 ft. wide; the ledge carries $5 to $6 in gold.

The Ajax mine recently struck a full face of good milling ore in the east drift. The company some time ago sunk a shaft 200 ft. from the Moonlight vein and sunk a winze 120 ft. on the vein. From the bottom of the winze it drifted 150 ft. Most of this distance the tunnel followed a 1-ft. vein of good milling ore. The work was turned to an east drift on the same vein. The ore pinched out but soon came in again better than ever, giving the full face of ore reported. Two shifts are employed.

Wallace—Whatever may be the terms of the settlement between the Hecla Mining Co. and the Federal Min-

ing & Smelting Co., respecting their rights to the apex of the Hecla "east vein," they can have no bearing on the ownership of the main vein of the Hecla. This great orebody is now being explored at a depth of 2,000 ft. from the collar of the shaft and approximately 3,500 ft. from the surface. The drift has been advanced six or seven hundred feet in the ore, showing five feet of solid shipping lead-silver ore without a trace of zinc and an equal amount of good milling ore. This is pronounced the best showing that has been exposed in the mine. On the 1,600 level this oreshoot was 1,800 ft. long and averaged 6 to 10 ft. wide. The opening of 2,000 level adds 400 ft. of vertical depth on the ore.

Mullan—The Federal Mining & Smelting Co. has awarded a contract to sink the main shaft of the Morning mine 200 ft. deeper, making its total depth 1,450 ft. below the main working tunnel. There has been a pronounced improvement in the grade of ore with each succeeding level, and the amount of lead as compared with zinc has steadily increased. The orebody continues very large.

ILLINOIS

Elizabethtown—On Saturday, Nov. 6, the magazine on the 300 ft. level of Fairview Fluorspar & Lead Co.'s mine was found burning. Several hundred pounds of dynamite was stored in this magazine. Rescue men put on gas masks and went into the mine, bringing all overcome by the smoke and fumes to the surface. One man was taken to the hospital, others will recover within a few days. This is one of the mines at which the strike is still on. Several of the striking miners have been taken back and put to work, they turning in their union cards at the office before going to work. It is not known how the magazine caught fire, it being in a damp, cool place, and being, also, a stone-wall room. There was no explosion. The mine is running full force regardless of the union strikers.

MONTANA

Butte—Davis-Daly Copper Co. drifting operations on the 2,700-ft. level of the Colorado mine continue. The improved showing on this level is suggesting sinking the Colorado shaft an additional 200 ft.

Plans for the active participation of the Anaconda Copper Mining Co. in the fertilizer industry are going forward steadily. Experiments at the Washoe works in the manufacture of fertilizer are proving instructive for its economical production. Anaconda continues to do a fair amount of silver ore development together with its repair work and general copper ore development.

President C. F. Kelley of the Anaconda company has publicly denounced as untrue the statement circulated by labor agitators to the effect that the company intends to bring about a reduction of wages.

Tuolumne Copper Co. shipments from the Main Range mine continue about 100 tons per day. Development work is chiefly drifting on the 1,200-ft. level.

Development work has been cut down at the Black Rock mine of Butte & Superior, and the principal work underground aside from production is the raising out from the 2,300-ft. level to connect with the No. 3, the main shaft.

Development work by the North Butte is being slowed down. The Edith May vein on the 3,600-ft. level is being driven for as fast as it is possible, heat conditions interfering somewhat.

Elkhorn—Boston & Montana expects to cut the Park vein on the 300-ft. level within the next two weeks. Drifting on the Blue Jay is said to be showing further milling ore. Union Pacific system is negotiating for the Montana-Southern Railway, the ore-carrying line of the Boston & Montana.

Grass Valley—Stemwinder Mining Co. plans a boarding house, a bunkhouse and a leaching plant at its property near Helena. An assay office already has been installed. Ore runs high in silver, and two shafts have been sunk, one to 110 ft. and the other to 85 ft.

Marysville—The Philadelphia Mining Co. has resumed operations at the Bell Boy property, with lead-silver ore uncovered in the Nile claim. Drifting is under way.

Neihart—Reports again are in circulation that the Silver Dike company plans a 500-ton concentrator to treat the Silver Dike ores, and that the plant will be either on Carpenter or Belt Creek.

Saltese—An intrusive dike has been entered by the Long Montana-Idaho tunnel being driven to reach a point under what is known as the Monitor orebody, and the indications are regarded as good for an ore showing. The Wilson Mining Co. will resume operations on a group of fourteen claims, through which strike two strong parallel veins with evidence of a silver-lead content.

Philipsburg—The owners of manganese properties are developing silver properties. At the Sweet Home there was recently opened a body of ore which has assayed 900 oz. to the ton.

JOPLIN-MIAMI DISTRICT

Oklahoma—Kansas—Missouri

Aurora, Mo.—Fire of unknown origin destroyed the concentrator of the Red Wasp Mining Co., two miles north of here, on Nov. 11. The mill had been idle for some months, but was recently purchased by Larry Brunk, who intended to start it up in the spring. He had contracted for prospect drilling on the lease, which formerly was a good producer. He carried $5,300 insurance on the mill, and had recently refused an offer of $16,000 for it. It was built in 1916 and was fully equipped with modern machinery with the exception of the electric motors, which were removed some time ago.

Flat River—The machine shop of the Federal Lead Co. at their No. 1 shaft was destroyed by fire recently. In it was one of their latest improved underground power shovels. While the accident will temporarily cripple them, their other machine shops, the Nos. 3 and 4 mills will enable most of the work to be carried on as usual.

UTAH

Salt Lake City—Increased freight rates coupled with the lowered price of zinc, mark the retirement, for the time being at least, from the Utah field of the Grasselli Chemical Co., for the past twenty years continuously represented by buyers in Utah. The company will devote its energies to the Joplin district. In general, much anxiety is felt here regarding the increase in freight rates, especially within the state, as allowed by the Interstate Commerce Commission and opposed by the Utah Public Utilities Commission. The output of Utah mines will be further cut if the proposed increases are allowed to stand. H. W. Prickett, Walter Fitch, president of the Chief Consolidated Mining Co.; Jackson McChrystal of the Gemini, Ridge & Valley, and Godiva mines, representatives of the Grand Central Mining Co., of Tintic, and A. G. MacKenzie all exhibited statistics and letters demonstrating great present profits by the railroads and the already disastrous effects to mines and smelters as a direct result of the increase in freight rates of June 25, 1918. Mr MacKenzie pointed out what might be expected if the proposed increases asked were allowed to stand. The hearing on in Salt Lake City before Examiner Disque was concluded Nov. 5, and Dec. 10 has been set as the date for the filing of briefs, after which the case will be referred to the commission at Washington, with such findings and recommendations as the examiner may see fit to make.

Bingham—The directors of the Bingham Mines company—owning the Dalton & Lark and Yosemite mines at Bingham and Victoria at Tintic, and controlling the Eagle & Blue Bell, at Tintic—propose with the consent of the stockholders, to purchase 50,000 shares at $10 per share, to be held as treasury stock.

Eureka—The Tintic Standard during October shipped 150 cars of an average tonnage of 55 tons, the ore coming from three different stopes. More ore could have been shipped with more railroad cars available.

Park City—Park City shipments amounted to 1,843 tons, as compared with 1,634 tons the week preceding. The Silver King Coalition plans a company store providing supplies to its employees at cost. Labor conditions at the camp are improving, and the company has opened a new ore zone of promise. The Judge Mining & Smelting Co. will add coal to its store's commodities expecting this to reduce the price of fuel to its employees by about $4 a ton.

THE MARKET REPORT

Daily Prices of Metals

Nov	Copper, N Y net refinery* Electrolytic	Tin 99 Per Cent	Tin Straits	Lead N Y	Lead St. L	Zinc St. L
11	14.50@14.60	36.25	37.00@37.50	6.50@6.60	6.50@6.60	6.45
12	14.45@14.60	36.00	37.00@37.25	6.50	6.50	6.35
13	14.45@14.60	36.00	36.75@37.25	6.50	6.50	6.35
15	14.40@14.60	35.00	36.00@36.25	6.25@6.50	6.25@6.50	6.30
16	14.35@14.60	35.50	36.50@37.00	6.25	6.25	6.20
17	14.35@14.60	36.75	37.25@37.75	6.00@6.35	6.00@6.35	6.15@6.20

*These prices correspond to the following quotations for copper, "delivered": 14.65 @14.75, 14.60@14.75, 14.60@14.75, 14.55@14.75, 14.50@14.75, and 14.50@14.65c.

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for deliveries constituting the major markets, reduced to the basis of New York, cash, except where St. Louis is the normal basing point, or as otherwise noted. All prices are in cents per pound. Copper is commonly sold "delivered," which means that the seller pays the freight from the refinery to the buyer's destination.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. Tin is quoted on the basis of spot American tin, 99 per cent grade, and spot Straits tin.

London

Nov.	Copper Standard Spot	Copper Standard 3 M	Copper Electrolytic	Tin Spot	Tin 3 M	Lead Spot	Lead 3 M	Zinc Spot	Zinc 3 M
11	87⅞	87	99	244	249	34	33⅞	36	37½
12	87¼	86¾	99	244¾	249¾	34½	33½	36	37⅜
13	....	....	....	....	....	....	....	....	....
15	85¾	84½	96	236½	242½	34½	32½	34¾	36¼
16	84½	83⅝	95½	239	242½	33½	31½	34	36⅛
17	84	83¾	95	242¾	246	32	31⅜	35	36⅝

The above table gives the closing quotations on the London Metal Exchange. All prices in pounds sterling per ton of 2,240 lb.

Silver and Sterling Exchange

Nov.	Silver Sterling Exchange	Silver New York Domestic Origin	Silver New York, Foreign Origin	Silver London	Nov	Silver Sterling Exchange	Silver New York, Domestic Origin	Silver New York, Foreign Origin	Silver London
11	336½	99½	80⅞	54⅛	15	336	99½	76½	51⅜
12	336	99½	80⅜	53⅞	16	339	99½	76⅝	51
13	336	99½	79⅜	53½	17	345	99½	78¾	51⅜

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Metal Markets

New York, Nov. 17, 1920

The downward trend of metal prices has continued during the last week. Many producers are unwilling to sell at current levels, and the market is made by those interests willing to cut prices to make sales. Demand is very weak, and only small lots are being sold. Manufacturers are unwilling to carry large stocks on their year-end inventories, and there is little hope of improvement before the holidays.

Copper

Most of the large producers are willing to sell copper for any delivery at 14.75c. delivered, but buying is of small volume. Some sellers are glad to get rid of spot metal at 14.50c. delivered. What little export demand existed has fallen away to a large extent with the recent decline in exchange rates.

Wages and salaries have been reduced 15 per cent and production has been curtailed by the Calumet & Hecla company. The movement is likely to spread to other producers, with copper at present prices, and further programs of curtailment are being definitely planned.

Lead

Monday afternoon, Nov. 15, the A. S. & R. reduced the price of lead from 7c. to 6.50c. for both New York and St. Louis delivery. This was in line with the general price movement here, and no doubt was also influenced by the continued fall in London. The A. S. & R. official price in St. Louis, it will be noted, remains on a parity with that in New York.

The price of lead in London was expected to fall, as it was considered too high, but it is rumored that the decline was hastened by American selling of futures in that market. The London price might be steadied by a combination of the Australian and Spanish producers, but then there would be the possibility of Mexican lead going to London. Production in Mexico has been much curtailed recently on acount of the strike of the coal miners, but this is expected to be settled in a few days; mining will then be resumed.

Chemical lead continues to command a premium, particularly for delivery this year, and can hardly be obtained under 7c. in either St. Louis or New York for November metal.

Dealers are showing an interest in lead at current prices, and the speculative element may soon come into the market.

Zinc

The gradual decline continues. To make predictions in these times is hazardous, but it is considered likely that this metal is near the bottom. Metal for forward delivery commands a premium of about 10 points.

The price of zinc is so far below the cost of production that output is being markedly reduced. Several weeks ago most of the mines in the Joplin district closed down for two weeks, and operations are still much curtailed. The Butte & Superior Co., which had been producing about 7,500,000 lb. of zinc a month, has entirely suspended, Anaconda is reported to have cut production from 10,000,000 to 5,000,000 lb. per month, and the Interstate-Callahan company is closed down. As this country probably now produces close to three-quarters of the world's zinc, the domestic curtailment should have a marked effect in steadying the market.

Tin

Traders continue anxious to buy for forward delivery, but there is no large consumer demand, and the market is quiet. The stocks of tin are now fairly well liquidated and in stronger hands, and the feeling is that the price is likely to rise. Whether temporary or not, there was a pronounced strengthening today, inspired by an advance in London and the higher rates of sterling for the last two or three days.

A few sales of electrolytic have been made, but the market is very quiet at approximately the same prices as for Straits.

Straits tin for future delivery: Nov. 11th, 38.50@39c.; 12th, 38.25@38.50c.; 13th, 37.75@38.25c.; 15th, 36.75@37.25c.; 16th, 37.50@38c.; 17th, 38.50@39c.

Arrivals of tin in long tons: Nov. 9th, Australia, 50; 10th, Straits, 40; China, 15; 13th, Straits, 125; China, 25.

Silver

Since our last report, the London price has fallen daily until the 17th, when it reacted to 51⅜d. The New York quotation also dropped in sympathy with London until the 16th, when the improvement in sterling exchange brought about an advance in the New York market, despite the lower price in London. Sterling exchange advanced again sharply on the 17th, and these violent fluctuations have a marked effect on silver prices. The fall in silver is due to the weakness of the Eastern exchanges and the dullness of the export trade.

Mexican Dollars — Nov. 11th, 61⅝; 12th, 61½; 13th, 60½; 15th, 58½; 16th, 58½; 17th, 60⅜.

Gold

Gold in London: Nov. 11th, 121s. 4d.; 12th, 121s. 11d.; 15th, 121s. 6d.; 16th, 120s. 9d.; 17th, 118s. 9d.

General Stock of Money in the United States Nov. 1: Gold coin (including bullion in Treasury), $2,739,043,566; gold certificates, none; standard silver dollars, $269,857,494; silver certificates, none; subsidiary silver, $264,697,830; Treasury notes of 1890, none; United States notes, $346,681,016; Federal Reserve notes, $3,663,517,685; Federal Reserve banknotes, $238,601,900; National banknotes, $732,549,629; total, $8,254,-949,120.

Foreign Exchange

A weak tendency in European exchanges generally, continued through last week, but for the last three days a rebound has been in evidence, though how long it will persist is problematical. On Tuesday, Nov. 16, francs were 5.91c.; lire, 3.56c.; and marks, 1.39c. New York funds in Montreal, 12¼ per cent premium.

Other Metals

Aluminum—For 50-ton lots: ingot, 99 per cent and purer, 33.1c.; 98@99 per cent, 32.90c. Outside sales reported at 31c. for both grades.

Antimony — Chinese and Japanese brands, 6¼@6¾c., market very quiet; W. C. C. brand, 8¼@8¾c. per lb. Cookson's "C" grade, 12¼@13c. Chinese needle antimony, lump, nominal at 5¾@6¼c. per lb. Standard powdered needle antimony[1] (200 mesh), 9c. per lb. Market dull.

White antimony oxide, Chinese, guaranteed 99 per cent Sb_2O_3, wholesale lots, 10c.

Bismuth—$2.55 per lb., 500-lb. lots, and $2.57 per lb., 100-lb. lots.

Cadmium—Nominal, $1.40@$1.50 per lb. Market steady.

Cobalt—Metal, $6 per lb.; black oxide, $4.00 per lb.; sulphate, $1.60.

Iridium—Nominal, $350@$400 per oz.

Magnesium—Crude, 99 per cent or over pure, $1.75 per lb. for 100 lb. lots and over, f.o b. Niagara Falls.

[1]Molybdenum Metal in rod or wire form, 99.9 per cent pure, $32@$40 per lb., according to gage.

Nickel—Ingot, 43c.; shot, 43c.; electrolytic, 45c., f.o.b. Bayonne, N. J.

Monel Metal—Shot, 35c.; blocks, 35c., and ingots, 38c. per lb., f.o.b. Bayonne.

Osmium—Open market, $70@$80 per troy oz.

Palladium—$85 per oz. Dull.

Platinum—Firm at $85@$90 per oz.

Quicksilver—Market quiet; $58@$60 per 75-lb. flask. San Francisco wires $55@$62. Easy.

[1]Rhodium—$200@$225 per troy oz.

Ruthenium—$175@$200 per troy oz.

[1]Selenium—Black powdered, amorphous, 99.5 per cent pure, $2@$2.25 per lb.

[1]Thallium Metal—Ingot, 99 per cent pure, $20 per lb.

[1]Tungsten Metal—$35@$60 per kilogram, according to purity and gage.

Metallic Ores

Chrome Ore—Guaranteed 50 per cent Cr_2O_3 foreign ore with a maximum of 6 per cent silica, 65@70c. per unit, New York. California concentrates, 50 per cent Cr_2O_3 and upward, 70@75c.

[1]Manganese Ore—50c. per unit, seaport; chemical ore (MnO_2) $60@$70 per gross ton, lump; $80@$90 per net ton, powdered.

Molybdenum Ore—85 per cent MoS_2, 65@70c. per lb. of contained sulphide, New York.

[1]Tantalum Ore—Guaranteed minimum 60 per cent tantalic acid, 55@65c. per lb. in ton lots.

[1]Titanium Ores—Ilmenite, 52 per cent TiO_2, 1¼@2c. per lb. for ore. Rutile, 95 per cent TiO_2, 15c. per lb. for ore, with concessions on large lots or running contracts.

Tungsten Ore—Scheelite, 60 per cent WO_3 and over, per unit of WO_3, $6 f.o.b. mines; wolframite, 60 per cent WO_3 and over, per unit of WO_3, $4.25@$4.50, in New York.

Uranium Ore (Carnotite)—$2.75@$3 per lb. for 96 per cent of the contained oxide (U_3O_8). Ores must contain a minimum of 2 per cent U_3O_8.

Vanadium Ore—$2 per lb. of V_2O_5 (guaranteed minimum of 11 per cent V_2O_5), New York.

[1]Zircon—Washed, iron free, 5c. per lb.

[1]Zirkite—According to conditions, $80 @$90 per ton, carload lots. Pure white oxide, 99 per cent, is quoted at $1.15 per lb. in ton lots.

Zinc and Lead Ore Markets

Joplin, Mo., Nov. 13—Zinc blende, per ton, high, $47.45; basis 60 per cent zinc, premium, $39; Prime Western, settling, $45@$37.50, buying, $37.50; fine sand slimes, $35@$32.50; calamine, basis 40 per cent zinc, $35. Average settling prices. Blende, $45.16; calamine, $38.96; all zinc ores, $45.05.

Lead, high, $103; basis 80 per cent lead, settling, $110@$65; buying, $65; average settling price, all grades of lead, $83.83 per ton.

Shipments for the week: Blende, 10,698; calamine, 194; lead, 1,680 tons. Value, all ores the week, $627,380.

Seventeen mines are reported as not having resumed following the voluntary cessation of operations by 85 per cent of the producing mines. These are reported as closed indefinitely. It is estimated the mines in operation will produce 7,500 to 8,000 tons per week. Stock in bins is estimated at 45,000 tons, 30,-000 unsold, 15,000 sold, and 2,800 tons sold ahead of production. One company is holding 16,000 tons of the unsold ore, the balance being widely distributed.

Reports have been received here that smelters at Van Buren, Blackwell, and Bartlesville had closed down or would be closed soon.

Platteville, Wis., Nov. 13—Blende, basis 60 per cent zinc, $43.50 per ton for high grade. Lead ore, no sales. Shipments for the week: Blende, 596; calamine, 30 tons. Shipments for the year: Blende, 58,521; calamine, 2,534; lead, 4,428; sulphur ore, 1,342 tons. Shipped during the week to separating plants, 2,014 tons blende.

Non-Metallic Minerals

Asbestos—Crude, No. 1, $2,000@ $3,000; No. 2, $1,400@$1,700; spinning fibres, $400@$800; magnesia and compressed sheet fibres, $325@$500; shingle stock, $110@$150; paper stock, $60@ $75; cement stock, $17.50@$30; floats, $8.50@$15, all per short ton, f.o.b. Thetford, Broughton, and Black Lake mines, Quebec, Canada; 5 per cent to be added as Canadian royalty export sales tax.

Barytes—Crude, 88 to 94 per cent barium content, $10@$12 per net ton; ground (white) $24@$30 in bags, carload lots; (off-color) $22@$26 in bags, carload lots; all f.o.b. Kings Creek, S. C. Crude, 88 to 94 per cent, $23; ground (white), $45; ground (off color) $30@$32 per net ton, less than carload lots, f.o.b. New York. Crude, first grade, $10 per ton, f.o.b. cars, Missouri; floated, $28 per ton in bbls.; $26.50 per ton in 100-lb. bags; extra charge for bags, f.o.b. St. Louis.

Chalk—English, extra light, 5@7c.; light, 5@6c.; dense, 4½@5c. per lb., all f.o.b. New York.

China Clay (Kaolin)—Crude, $9@ $12; washed, $12@$15; powdered, $18@ $22; bags extra, per net ton, f.o.b. mines, Georgia; crude, $8@$12; ground, $15@$40, f.o.b. Virginia points. Domestic lump, $10@$20; powdered, $25@ $30; imported lump, $25@$35; powdered, $30@$35, f.o.b. New York.

Feldspar—Crude, $8@$14 per gross ton, f.o.b. Maryland and North Carolina points; $7.50@$10, f.o.b. Maine; ground, $27@$30, car lots, f.o.b. Baltimore; ground, $17@$21, f.o.b. North Carolina points; $17@$21 per ton, No. 1 ground, f.o.b. New York State; $21@ $23 per ton, ground, f.o.b. Maine. Crude spar very scarce.

Fluorspar — Gravel, guaranteed 85 per cent calcium fluoride and not over 6 per cent silica, $25 per ton, f.o.b Illinois mines, and $27.50, f.o.b. Kentucky; ground, suitable for acid, chem-

[1]Furnished by Foote Mineral Co., Philadelphia, Pa

ical or enameling purposes, $60; lump, $17.50, f.o.b. Tonuco, N. M. In Canada 85 per cent calcium fluoride sells for $20 per ton f.o.b. Madoc; output limited. Canadian price generally $18 (Canadian currency) per ton, f.o.b. mines; market inactive.

Fuller's Earth—$18 per ton carload lots, f.o.b. New York.

Graphite—The 90 per cent crucible grade is held in Alabama for 9c. per lb. and 85 per cent grade is practically unobtainable, prices being 7@9c. The higher lubricating grades sell for 11@40c., according to carbon content.

Gypsum—Plaster of paris in carload lots sells for $4.25 per 250-lb. bbl., alongside dock, New York. Raw crushed rock, $3.50@$4.50; calcined stucco, $9; f.o.b. works, Illinois.

Kaolin—See China Clay.

Limestone—Dolomite, 1@2 man size, $1.60@$1.65; 2@8 in., $1.55@$1.65 per net ton, f.o.b. Plymouth Meeting, Pa.; fluxing, $1.65@$1.75 per net ton, f.o.b. Howellville, Pa.

Magnesite, Calcined — High-grade caustic calcined, lump form, $35@$40 per ton, carload lots, f.o.b. California points. In Chicago district, $57.70; Atlantic seaboard, $61@$63.

Dead-Burned—$36.50 per net ton, Chewelah, Wash.; $58@$64, Chester, Pa. Austrian grade, $55@$60 per ton, f.o.b. Baltimore. (Magnesite brick—See Refractories.)

Mica—India block mica slightly stained, per lb.: No. 6, 50c.; No. 5, $1.20 @$1.40; No. 4, $2@$3; No. 3, $4.25@ $5; No. 2, $5.50@$7; No. 1, $8. Clear block: No. 6, 55c.; No. 5, $2; No. 4, $3.50; No. 3, $5, No. 2, $6.50; No. 1, $8; A1, $10; extra large, $25, all f.o.b. New York; ground, $150 per ton, Philadelphia. Domestic, uncut, f.o.b. Franklin, N. C., as follows: Scrap, $45 @$50 per ton; punch, 10c. per lb.; circle, 15@25c.; 1½ x 2 in., 75c.; 2 x 2 in., $1.15; 2 x 3 in., $1.65; 3 x 3 in., $2.10; 3 x 4 in., $2.50; 3 x 5 in,, $2.75; 3 x 6 in., $3.75; ground 165 mesh, $240 per ton; ground roofing mica, $60; mica washers, 75c.@$2 per lb.; 1¼-in. disks, No. 1, $1.60 per lb.; No. 2, $1.30. The foregoing domestic prices obtain also in the Chicago district.

[1]**Monazite** — Minimum of 6 per cent thorium oxide, $35 per unit, duty paid.

Phosphate Rock—Per long ton, Florida ports: 77 per cent tricalcium phosphate, $13; 75 per cent, $11.50; 75@74 per cent, $11; 70 per cent, $8.35; 68 per cent, $7.85; 68@66 per cent, $7.60. Finely ground Tennessee rock sells for $8.50 per net ton for 13 per cent phosphorus content, agricultural application; for acid-making, 14 per cent, $9; both prices f.o.b. Centerville, Tenn.

Pumice Stone—Imported, lump, 4@ 50c. per lb.; domestic lump, 6c.; ground, 4@7c., all f.o.b. New York.

Pyrites—Spanish fines, per unit, 12c., c.i.f. Atlantic seaport; furnace size, 17c.; Spanish lump, 14@16c.; domestic fines, f.o.b. mines, Georgia, 12@14c.

Quartz—(Acid tower) fist to head, $10; 1¼ to 2 in., $14; rice, $17, all net ton, f.o.b. Baltimore; lump, carload lots, $5@$7.50 net ton, f.o.b. North Carolina mines.

Sand (Glass)—Dry glass sand, $4 per net ton, f.o.b. cars Mapleton, Pa. Sand, f.o.b. Ottawa, Ill., is $3 per ton; $2.50 on annual contracts. Sand at Klondike. Gray Summit and Pacific, all in Missouri, is $2.50 on contract; some outside sales have been made at $4. St. Louis, open market, at $3.50; contract price on large quantities, $2.50; on small quantities, $3.

Sulphur—$18 per ton for domestic; $18@$20 for export, f.o.b. Texas and Louisiana mines. Market quiet.

Talc — Paper making, $12@$22 per ton; roofing grades, $9.50@$15; rubber grades, $12@$18, all f.o.b. Vermont. California talc, $20@$45, talcum powder grade. Southern talc, powdered, carload lots, $12@$15 per ton; less than carload, $25, f.o.b. cars; freight to New York $5.25 per ton, carload lots; less than carload lots, $9.25. Imported, $60 @$70; Canadian, $20@$40 per ton.

Mineral Products

Arsenic—White arsenic, 14@14½c. per lb.; sulphide, powdered, 18@19c. per lb. in carload lots.

Sodium Nitrate—$3 per cwt., ex vessel, Atlantic ports. Market quiet.

Sodium Sulphate—For 95 per cent material, $22 per ton, f.o.b. mines, Idaho and Arizona, spot and six months' contract.

Potassium Sulphate—Domestic, $225 @$250 per net ton, basis 90 per cent, f.o.b. New York.

Ferro Alloys

Ferrocarbontitanium—For 15 to 18 per cent material, $200@$225 per ton, f.o.b. Niagara Falls, N. Y.

Ferrocerium—Per lb., $12@$15.

Ferrochrome—Carload lots, spot and contract, 60 to 70 per cent chromium, 6 to 8 per cent carbon, 18@19c. per lb. of chromium contained; 4 to 6 per cent carbon, 17@18c., f.o.b. works.

Ferromanganese—Domestic 76 to 80 per cent, $175, freight allowed; $170, f.o.b. seaboard bases; English, $165@ $170, c.i.f. Atlantic seaports. Spiegeleisen, 18@20 per cent, $70, f.o.b. furnace.

[1]**Ferromolybdenum**—Standard grades, carrying from 50 to 60 per cent molybdenum metal, with low sulphur, phosphorus, and arsenic, $2.25@$2.50 per lb. of contained metal, f.o.b. works.

Ferrosilicon—For 10 to 15 per cent, per gross ton, f.o.b. works, $60@$65; 50 per cent, $80@$85; 75 per cent, $160.

[1]**Ferrotungsten**—Domestic, 70 to 80 per cent W, 75@90c. per lb. of contained tungsten, f.o.b. works. Foreign, 70c.

Ferro-uranium—35 to 50 per cent U, $7 per lb. of U contained, f.o.b. works

[1]**Ferrovanadium**—Basis 30 to 40 per cent, $6.50@$7.50 per lb. of V contained, according to silicon content, f.o.b. works.

Metal Products

Copper Sheets — Current New York price, 24½c. per lb.; wire, 19c.

[1]Furnished by Foote Mineral Co., Philadelphia, Pa.

Lead Sheets—Full lead sheets, 10½c.; cut lead sheets, 10¾c. in quantity, mill lots.

Nickel Silver — Unchanged at 35¾c. per lb. for 18 per cent nickel.

Yellow Metal — Dimension sheets, 22¼c.; sheathing, 22¾c.; rods, ⅝ to 3 in., 19¼c.

Zinc Sheets—$11.50 per 100 lb., less 8 per cent on carload lots, f.o.b. smelter; zinc plates, 10½c. per lb.

Refractories

Bauxite Brick—56 per cent alumina, $160 per 1,000, f.o.b. Pittsburgh.

Chrome Cement—40@45 per cent Cr_2O_3, $55@$60 per net ton, and $65 in sacks, carload lots, f.o.b. eastern shipping points.

Fire Brick—First quality, 9-in. shapes, $55@$60 per 1,000, Pennsylvania, Ohio and Kentucky. Second quality, $45@ $50.

Magnesite Brick — 9-in. straights, $110 per net ton; 9-in. arches, wedges and keys, $120; soaps and splits, $130.

Silica Brick—9-in., per 1,000: Chicago district, $65@$70; Birmingham, Ala., $56@$61; Mount Union, Pa., $55 @$60.

Iron Trade Review

Pittsburgh, Nov. 16, 1920

Demand for steel products in the open market continues extremely light, with not enough inquiry, running into tonnage, to develop the lower prices some of the independent producers would probably be glad to quote for the purpose of securing more business. Demand against contracts has decreased little in the last week, the period of cancellations and postponements being nearly ended.

Predictions that the iron and steel industry will witness a buying movement next April or thereabouts, with a stiffening in prices following the decline now in progress, are made with less confidence than recently, it being observed that the readjustment promised for other industries must be extensive and require time for consummation. Occasionally, predictions are made that the decline in steel prices will not stop with a decrease in independent prices to the level now maintained by the Steel Corporation.

Pig Iron—Foundry iron has been offered by furnaces at $40, Valley, or $1 decline from last week's quotation. Bessemer remains at $42 and basic at $38.50, Valley, both being quite inactive. Freight to Pittsburgh is $1.96. Two additional merchant furnaces in the valleys are blowing out.

Semi-Finished Steel—The market remains stagnant, with no inquiry to test values. Sheet bars could probably be obtained without difficulty at $60, against the nominal quotation of $65 last week, and billets remain quotable at $55 and rods at $70.

Charcoal and Coke

Charcoal—Willow, 7c. per lb. in bbls hardwood, 6c. per lb., in 250-lb. bbls

Connellsville — Furnace, $10@$12; foundry, $8@$10.

The Position of Silver

Domestic Producer Favored by a Fixed Price—Exports Going Mainly to China and Not to India—Asiatic Conditions None Too Bright—India Now on a New Rupee Rate

THE Treasury, under authority of the Pittman Act, has purchased over 23,000,000 oz. of domestic silver at $1 per oz. since the repurchases were first authorized—May 13, 1920. At this rate of buying it will take about four and one-half years to complete the purchase of the entire 207,000,000 oz. In the meantime the American silver producer is placed in a favorable position, for whereas the general economic tendency in commodity prices is downward, the silver producer will realize a fixed price for his product for some time to come.

The average price of foreign silver since its drop below $1 and up to Nov. 15 amounts to about 90c. It would thus seem that the American silver producer on his sale of 23,000,000 oz. of silver to the Government has realized about 10c. above the market, equivalent to about $2,300,000 above the outside market prices. As the price of mining supplies drops, the cost of silver mining should decrease. This is an important consideration for the silver miner, as, even with the price of silver at $1, frequent complaint is heard about the high cost of production.

The average monthly price of foreign silver has declined in steps since the first of the year, and, judging from the declines that occurred in other commodities, the reputation of silver as an economic barometer is strikingly sustained. The drop in silver took place several months before the general commodity price decline, but was greatly retarded by the stabilizing effect of the Pittman Act, with its resultant withdrawal of American silver from the market.

1920 AVERAGE PRICES OF FOREIGN SILVER AT NEW YORK

In Cents per Troy Ounce, 999 Fine

Jan.	132 827	June	90 957
Feb.	131 295	July	91 971
Mar	125 551	Aug	96.168
Apr.	119 779	Sept	93.675
May	102.585	Oct.	83.486

During the first nine months of this year there was imported into the United States almost $73,500,000 in silver, and at the same time about $98,700,000 in silver was exported, as compared with imports amounting to $64,000,000 and exports of $177,100,000 for a similar period in 1919, which is a decided drop in exports. It is of interest to observe from the following table the different destinations of the exported sillver in 1920 as compared with that sent abroad in 1919. During the first nine months of last year India received the greatest amount of silver from the United States, $109,000,000, and China, including Hongkong, less than one-third as much as India, $34,000,000. In 1920, over a similar period, China, and Hongkong, took about $76,000,000 in silver, whereas India imported only $223,000 from the United States. This fact forcibly illustrates the great influence Chinese buying has had lately in sustaining the market. At present Chinese support is about all that is preventing a further sharp decline.

MOVEMENTS OF SILVER TO AND FROM THE UNITED STATES, NINE MONTHS ENDING SEPTEMBER, 1920 AND 1919

EXPORTS

To	1920	1919
China	$55,977,000	$29,528,000
Hongkong	20,015,000	4,784,000
Canada	6,119,000	2,808,000
England	4,520,000	13,055,000
India	223,000	108,877,000
Mexico	2,840,000	988,000
France	33,000	6,588,000
Others	8,955,000	10,476,000
Totals	$98,682,000	$177,104,000

IMPORTS

From	1920	1919
Mexico	$44,795,000	$ 45,173,000
Peru	9,786,000	6,610,000
Central American States	6,023,000	2,683,000
Canada	3,068,000	5,560,000
Chile	2,607,000	1,459,000
B. E. Indies	2,290,000	971,000
Others	4,893,000	1,530,000
Totals	$73,462,000	$63,986,000

Asiatic conditions are none too rosy. The report of an impending famine in China will not be conducive to trade movements. As Samuel Montagu & Co. aptly point out, "China unfortunately is not in the position of India, where, should drought and distress prevail, the government is able to organize relief on a large scale and possesses the financial resources necessary for methods involving considerable expenditures." China's export trade is almost at a standstill, and exporters are having exchange difficulties concurrent with the decline in silver. The large silver imports of China are ascribed not only to a replacement of the silver shipments made during the war to India but to the ill repute into which paper money has fallen in the interior of Asia, where Russian currency normally figured. Samuel Montagu & Co. estimate that 50,000,000 to 60,000,000 oz. of silver may be absorbed annually by China for use in the interior of Asia.

India has changed the value of the rupee from Rs. 15 to the £1 to a rate of Rs. 10 to the £1. This step was considered earlier in the year, being the result of the recommendations of the India Exchange and Currency Commission appointed to study the reorganization of India's currency. The great rise in silver last winter forced the face value of the rupee above its bullion value and made the coinage of rupees highly unprofitable to the government. At the time the commission's report was made, silver commanded a high price, over $1.30 per oz., and the step to reorganize the currency was taken not only to bring back the token character of the coin but to prevent as far as possible a recurrence of conditions under which the intrinsic value of the rupee exceeded its face value. Two alternatives were open—to reduce the fineness of the coin or to reduce the rupee rate, that is the number of rupees which could be exchanged for a given weight of gold—the sovereign. The commission recommended the latter course, and the reorganization was put into effect, after proper notice had been given, on Oct. 1. In so doing India took a remarkable step in monetary finance and one which has provoked both favorable and unfavorable comment. The following table compares the old and new rates:

	Old Rate Rs. 15 to £1	New Rate Rs. 10 to £1
Par value of rupee in English currency	1s. 4d.	2s
Par value of rupee in U. S. currency	32 44c.	48 66c
Face value rupee @ 80c. silver	27 50	27 50
Face value rupee @ 100c. silver	34 37	34.37

Besides the Asiatic consumption of silver, there has been introduced another consuming quarter. Mexico is reported to be continuing to purchase silver for coinage purposes, but in relatively small amounts, at an average price 4¾c. above the New York foreign quotation for silver, and used about 1,450,000 oz. in July for the purpose. As the power of Mexico to absorb silver is controlled largely by the number and wealth of the population, it is interesting to note that the amount of money in circulation in Mexico, according to S. R. Wagel, is 28,655,000 pesos, or at the rate of 1.91 pesos—95½c.—per capita. In the United States the money circulation on Nov. 1 amounted to $6,393,140,000, or $59.48, on a per-capita basis. Mexico is on a sound metallic basis, with little paper money, whereas the United States has in circulation large amounts of paper.

Although Mexico is coining silver and the United States is operating its mints to capacity in the coinage of subsidiary silver, it is not very encouraging to note the tendency in many countries to get away from the use of silver coins. Germany is reputed to be using everything from porcelain to zinc. Aluminum and iron coins are stated to be common there. Other nations whose currency has greatly depreciated cannot of course keep silver in circulation. Bad money drives out good money, and so some other expedient has to be instituted. Hence Germany's abandonment of silver.

The Mining Congress at Denver

THE Twenty-third Annual Convention of the American Mining Congress had fine and bracing weather and other favorable settings for its meeting in Denver. It was said that the attendance was quite satisfactory as to numbers, and unusually pleasing as to the representative character of those present; for although the Congress is an open forum, it is most successful when it attracts naturally those who represent the real elements of the industry. At the opening session a telegram was read by Mr. Bulkeley Wells from the President of the United States, congratulating the Congress on the work it had accomplished in the past and commenting on the expected good which would result from its further deliberations. Again, Mr. Clay Tallman, Land Commissioner and Special Representative of the Secretary of the Interior, paid a voluntary compliment in his speech to the representative of the Congress in Washington, Mr. Callbreath, declaring that, after careful study, the officials in Washington had come to look upon him as an institution, and that they had always found he stood for the good of the mining industry as a whole, and not for some special interest in it. Such tributes must be gratifying and encouraging to the officers of the Congress, which is to mining what the Chamber of Commerce is to trade.

The looseness in selecting the state delegates to the Resolutions Committee, which we pointed out editorially last year in connection with the St. Louis meeting, was remedied at the Denver session by giving the state delegations plenty of time to meet and elect their representatives; and the adoption of the resolutions was further safeguarded by each resolution being passed upon by a committee of the directors of the Congress before being referred to the Resolutions Committee.

Possibly, the greatest interest in the convention centered around the gold-mining situation and the McFadden Bill as a remedy; and approval of this remedy was more unanimous and confident than when the plan was proposed a year before at St. Louis. The flotation conference was also an occasion of special interest.

We again recommend these annual meetings to mining engineers as well as to the mine operators of the country. The free discussions of questions of vital interest to the welfare of the mining industry are bound to be productive of much good; and the officials have the wholesome ideal of carving out a record in things accomplished, as well as illuminating the problems by debate.

Church and State

THE main deliberations of the Mining Congress in Denver were held in the First Baptist Church, across the street from the Albany Hotel. Sitting in a pew and listening to a speaker behind a pulpit, with the pipes of the great organ above his head, called back so strongly the association of ideas with countless Sabbaths, that many fumbled around nervously for hymn books, when the organist rendered his contribution to the proceedings, and felt in their pockets for change against the eventual collection. The gentle snoring of a man on the eighteenth row of pews on the right (who had doubtless been put to sleep by the same powerful association of ideas) heightened the impression. Even the speakers, behind the pulpit, naturally fell into those rhetorical and rhythmic swings and cadences of voice which preachers employ; and the temptation to thump the pulpit was frequently noted. Speakers were observed to develop a tendency to divide their speeches from firstly to sixthly and lastly; and when the first meeting of the convention was over the audience rose and lingered a moment, standing waiting for the benediction.

Surely, this year we may look to see something especially righteous shine out of the mature deliberations of the Congress.

Employer and Employee

INDUSTRY, including the mining industry, is depressed; times are becoming hard; profits are vanishing; wages are high; living costs are still high; the employer faces a shut-down and the employee a lay-off. What should be done?

We are not fond of the antithetic terms Capital and Labor: they are academic and obscure the issue; they are in any event abstract words applied more or less clumsily to concrete human groups whom the terms employers and employees fit simply and accurately. It is the principle of leader and follower which is exemplified in this relation, a principle beloved of mankind in all ages and inevitable to it.

The wise leader will give much thought to the comfort and prosperity of his followers: and they to his. As an employer, he will wish for them the best working conditions and the highest feasible wages; and they will wish for him and for the capital (either his own or borrowed) which he puts into the enterprise, on which they all subsist, as high a profit as is feasible and proper. Each must, therefore, put his mind on the job to be done. Efficiency of management (on the part of the employer) and efficiency of labor (on the part of the employee) is what both parties have the right to expect, for without either the one or the other both must suffer.

The problem of mine managers is, therefore, the maximum increase of efficiency and the minimum decrease of wage. This efficiency should be studied in all departments, and can hardly be properly attained without sympathetic co-operation throughout; and this extends to mine and mill workers, the production department, or, as sometimes quaintly termed, the labor

department. (Does not every man on the job, from the manager down, labor? If not, he should be fired.)

Sympathetic co-operation is not possible without intelligent appreciation; therefore it is good policy, here as everywhere else, to turn on the light. Experience has proved that in many places workmen will decide reasonably and helpfully when shown a company's real condition, whereas their moods and demands will be heartbreaking to a manager if they are left for enlightenment to the cock-and-bull tales of the ignorant professional agitator. Let each manager remember his true position as a leader, and that each leader must tie his followers to him by personal loyalty and confidence, if he and they would succeed.

Examples of the increased efficiency which has been made possible by this policy are cropping up in numerous places, and many business enterprises are feeling out inquiringly along these lines. The main thing is to give every man an interest in his work, so that he can feel that it is *his* work, and that he is working for himself as well as for others. That principle must underlie all plans.

All this is working toward a new type of co-operation in industry—the natural human type which we have just sketched. We do not think any intelligent man will disapprove of the principle of labor unions, or deny what they have done for the betterment of the condition of the workingman. Nevertheless, the abuse of power by widespread organizations is always to be guarded against; and the making of rules to insure equality of earnings is against efficiency and an average high scale of wages. Moreover, the system carried to excess creates a lack of interest or even a hostility between employer and employee—an unnatural condition. Therefore, without abandoning our favor of unions, we are in favor of the open-shop policy for all enterprises, without which the closer union of employer and employee, so essential for mutual prosperity, cannot be accomplished; for this union should be a more intimate one than any other. Mining enterprises have perhaps progressed further in this direction than most enterprises; and, we believe, are almost without exception on the open-shop plan. These mines will henceforth find their chief problem in bringing about increasingly closer co-operation and teamwork within their own organizations.

Another Call for Hoover

WE NOTE an advertisement of the Harriman National Bank in one of our New York papers, entitled "Hoover," and in which is expressed the desire, with appropriate arguments, to have Hoover act as head of a great corporation supposedly to organize under the Edge Act and to foster our international trade. Much has been said lately about the unprecedented opportunity before the country in its export trade. The American Manufacturers' Export Association recently held an important meeting to discuss the salient features of this opportunity, as constructive legislation now upon the statute books—the Edge Law—permits properly incorporated banks to finance foreign trade, and the commercial and general press has given much publicity to the possibility of entering a field of trade hitherto practically closed to the country and still largely in the hands of British financial interests.

Copper producers, cotton growers, and hundreds of other interested parties are tremendously concerned in the steps our country is taking to stimulate its exports. An Edge Law corporation which would perform this function undoubtedly needs executive ability of the highest standing and the keenest business knowledge, to say nothing of a sound knowledge of international affairs. No wonder the call for Hoover. "Would the South, its warehouses bulging with cotton, object to Hoover? Would the farmer of the West, with his record crops? Would the manufacturer of the East, with his raw materials waiting to be turned into goods? Would the financial expert?" So runs the plea, and concludes, "Who would object to Hoover, and who can offer a better name to bring together the consumers of Europe and the producers of America?"

We had not thought of Hoover in this light, but are forcibly struck with the singular appropriateness of his war record to the task of building up our foreign trade through foreign good will. The executive head of an Edge Law corporation with an international reputation possesses an invaluable asset. We have a suspicion that there are other jobs in store for Hoover which would to an even greater extent call upon his ability, and although, as Secretary of the Interior or Treasury, he would preside over some vital department of our Government, and indirectly be concerned in foreign affairs, his counsel in the deliberations of President-elect Harding's Cabinet should exert a pronounced influence in shaping the foreign policy of the nation. Without a definite foreign policy and firm, whole-hearted governmental approval and moral support, an Edge corporation cannot fulfill its mission to the utmost, for the ultimate foundation of success in foreign trade lies in our Government.

Lawlessness, of Domestic or Foreign Origin

IN A RECENT NUMBER a correspondent writing from Butte called attention to the lawless and revolutionary foreigners in that mining center, who threaten, by their preponderance at the polls, to take the reins of government away from the native born, and administer the affairs of the community according to their own wild and selfish ideas. As a remedy against the threat of being engulfed by foreigners who do not understand our ideals, and are unfit for our institutions, he suggests the withholding of the franchise from the foreign born, except where some foreigner by exceptional merit is granted that distinction.

Butte has long been a center of social discontent, and, indeed, one of the rotten spots in the United States, in the mining world not unlike what Paterson, N. J., has been in the industrial world. The bandits of radicalism were pitchforked out of Colorado, and later out of Nevada; but Butte has always been their strong fortress.

The case is serious enough to warrant fearless treatment. What is to be done? Shall we deny the franchise to the foreign born? There is no question that the foreign born, lumping them as a class, are a heavy liability for us to carry. In the large cities, as the centers of industrial activity, they congregate, and their numbers and lack of sense of responsibility make them easily marshalled by political machines; and thus they dominate and often help to make rotten the politics of cities like New York and Philadelphia. The foreign born, we are told, predominate in our police courts, and in our prisons. Assimilation in the melting pot of so much refractory material is at times a difficult process.

On the other hand, we recently heard a coal producer—a high-class type, himself of foreign birth—describe his difficulties in operating in West Virginia, on account of the lawless mountaineers of that region. Making and selling poisonous moonshine whisky, robbery, shooting, and killing are commonplace occupations which have been handed down among these people from generation to generation. Concerning this situation, a moral cowardice characterizes the whole state, and there are no authorities that have the courage to deal with them as hardened and habitual criminals should be dealt with. This portion of West Virginia, we are convinced, is far more rotten than Butte. These West Virginian mountaineers are of old-time American stock—originally of English extraction. We have heard that they are the descendants of English refugees from justice who fled to the wilds of America and made their lairs in the mountains of the state.

Thus, we see that there are undesirable foreigners and also that there are undesirable Americans. On the other hand, our country could not well have spared the help it has received from those foreign-born citizens who love our institutions and our ideals and who have advanced our welfare—and every reader can enumerate many among his friends. It is not important whether a man is foreign born or native born, whether he is a native son in California, or a tenth-generation American in New England—the question is whether he is worthy or unworthy.

What shall be done, therefore, with conspicuous congregations of the unworthy like those at Butte and in the West Virginia mountains? Shall we take away their franchise? That would be simply to outlaw these half-wild children whom we wish to reclaim. Rather, perhaps, they should be given further civic responsibilities; but held vigorously to their faithful discharge of them. What they lack mainly, even if not exclusively, is enlightenment. Frequently, what is most needed is a higher morale and higher planes of thought and conduct for those classes of citizens who consider themselves superior. For example, considering the prompt and painless handling of the police strike in Boston by Calvin Coolidge, is it not likely that had he been Governor of West Virginia he would have given these mountaineers new conceptions of law and order? How long would the hill billies terrorize the surrounding country in the presence of a state constabulary like that of Pennsylvania, or like that model of all police organizations, the Royal Northwest Mounted Police of Canada, and with honest and fearless courts of justice to complete their work?

The Morale of Operating Crews

"SAY, Bill, don't you know that one of your five pumps is taking twice as much power as the others?" said the electrician to the pump boss. "Well, it's working," said Bill. "You'd better leave it alone."

Two phases of human nature are epitomized in this incident. One, that of inquiry or the desire to get at the fundamentals; the other, a complaisant acceptance of a bad condition although specific information is at hand to throw doubt upon the desirability of maintaining that condition. How often do we realize that matters of importance require our attention, yet fail to act on available knowledge? A hot journal usually commands prompt attention, a heavy leak in a pump column or a leaking gland on a pump would start Bill into action. But the unseen flow of energy through a conduit or a pipe and its utilization in a motor or otherwise are in a way mysterious to Bill, and he does not have to pay the added expense due to its inefficient application. If the comparative operating costs of the five pumps were placed before him he might take notice, but just as likely as not he would be only casually interested.

Too often the attitude of bosses, foremen, and workers is the one of "getting by" with minimum physical and mental exertion. This attitude applies to all forms of waste that occur in a mining operation. Close supervision and inspection are important ways of preventing excessive wastes both in materials and in energy, but of as great importance is the stimulation of morale in the organization. If Bill's attitude had been one of active co-operation with the electrician one kind of waste would have been speedily stopped.

We believe that it would be a good plan to persistently spread the data obtained by inspection before individuals directly responsible. A follow-up plan would be a necessary feature. Supplementary cost data would serve to make the effect of wastes in enegy flows, such as electricity, compressed air, and steam, more real than could otherwise be possible. We must visualize for Bill and his confreres. They should be made to look upon individual operations in some such way as the manager does. Cost sheets and cost analyses are placed before the manager, but how often is a pump foreman given the cost data of his particular division? The bulletin board can be used to advantage, and if Bill were required to visualize the money outgo on his particular job he might be induced to feel somewhat as he does when he figures out his personal expense budget or when he looks at his grocery bill and counts out the money with which to settle it.

At the bottom of morale is a live interest in the job. Every employee should have such an interest, although much has been done to break that down. Continuity of employment is dependent on the success of an enterprise. Excessive waste and indifference can wreck an enterprise that under more favorable conditions might furnish continuous and remunerative employment for a long time. A management fair in its dealings with its employes and exacting in the sense that it keeps closely in touch with details will develop morale even under unfavorable conditions, but a careless and indifferent management cannot develop it even under the most favorable. Thus, as we see the lesson in the incident quoted, there should be close control, visualization of cost and operating data for the details of operation, and a certain amount of bulletin boarding to keep all concerned in touch with the facts.

Sound Money

MEXICO is sound at least in one important particular. It claims to be the only country in the world where the sole circulating currency is gold and silver. There may be those that claim that 40 per cent money is as good as 100 per cent money, among many who believe the contrary, but there are none who will not agree that gold and silver coin is money of the quality that cannot be improved. It is the real material which banknotes "promise to pay." When in doubt on the monetary question, fall back on the real money concerning the value of which there is no difference of opinion.

Mining Congress Holds Annual Convention At Denver

W. J. Loring Elected President—Flotation Conference Marked by Debate Between Operators' Representatives and Minerals Separation Officials—Sessions on Taxation, Standardization, Tariff and Gold Keep Delegates Busy—McFadden Bill Indorsed

STAFF CORRESPONDENCE

"IT IS ALTOGETHER appropriate that a convention of the American Mining Congress is again held in Denver," said Bulkeley Wells in his presidential address at the organization's Twenty-third Annual Convention that met in the Western city during the week of Nov. 15. "Here, twenty-three years ago, the organization was created. From 1896 to 1907 its working force consisted of the secretary and one stenographer. In so recent a year as 1910 the income amounted to but $5,000, while in the last year its

JOHN T. BURNS
Assistant Secretary of American Mining Congress and in Charge of Convention Arrangements

receipts have reached the substantial sum of $150,000." Thus the Congress upon this occasion returned to the place of its birth, full grown.

This convention faced many of the problems that were subjects of consideration by the last one held in St. Louis a year ago. The questions of relief for gold producers and for war mineral claimants, of mine taxation and of standardizing mining equipment, as well as of development of an oil-shale industry in this country, were again on the program. In the year elapsed, the plight of the gold-mining companies had steadily worsened, the producers of war minerals remained, for the most part, as dissatisfied as ever, and mine taxation was still a subject of debate. No better place than Denver could have been chosen in which to discuss these matters, for in Colorado the gold mines of Cripple Creek are in dire straits, and an effort is under way to make the mining industry within the state pay a larger share of taxes than ever. Denver is also the natural place for a conference on oil-shale development. But, whatever the object of the delegates in coming, the convention opened promptly on the afternoon of Nov. 15, with a large attendance, this despite the fact that the convention hall was the Baptist church. Indeed, one speaker remarked that, without doubt, many of the mining men present were in church for the first time in their lives, which accusation no one saw fit to deny. The headquarters of the convention were at the Albany Hotel.

CONVENTION CALLED TO ORDER BY T. B. STEARNS

The convention was called to order by Thomas B. Stearns, chairman of the Committee on Arrangements. The delegates were welcomed to Denver by Mayor Bailey and by George E. Collins, governor of the Colorado Chapter. President Bulkeley Wells then took the chair and introduced E. P. Mathewson, who responded in behalf of the Mining Congress. "Wherever and whenever the American Mining Congress convenes, there will be found E. P. Mathewson," said Mr. Wells.

The spirit of the occasion, together with the solemn surroundings, perhaps aided by the music of the church organ, so affected Mr. Mathewson that he then and there announced his conversion. His father had been a prominent member of the Methodist Church, he said, and had constrained him to go to church in his youth, where he learned something about conversion. On entering the business of copper smelting, Mr. Mathewson said, he learned more about conversion. A year ago, he confessed, he had been the one discordant note in the convention, but now was thoroughly converted on the gold bonus question. "The ease with which the Pittman Act was put across opened my eyes," said Mr. Mathewson, "and from now on my motto is 'let the man that uses the gold pay the bill.'"

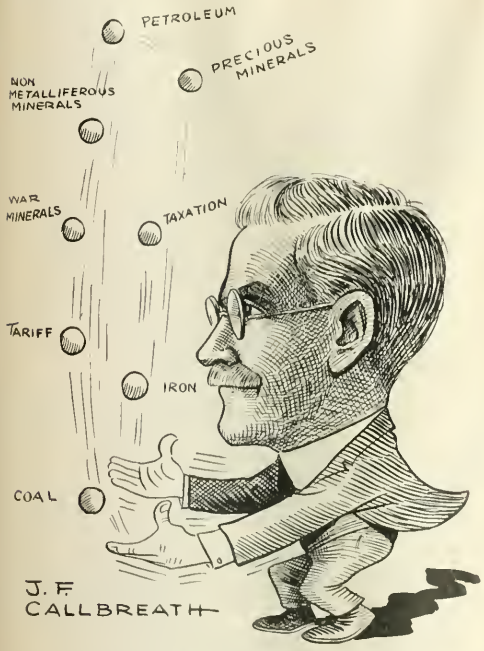
Judge John F. Davis, responding on the behalf of the mining industry of the West, said that this was a producers' convention and not a political convention.

The features of this the first session were an address by Eugene Meyer, Jr., on the subject of the "War Finance Corporation and Its Possibilities as an Assistance to Foreign Trade"; also an address on the new Mineral Land Leasing Law by the Hon. Clay Tallman, General Commissioner of the U. S. Land Office.

In clear forcible language Mr. Meyer explained the origin, work and present object of the Finance Corporation, of which he is chairman. He expressed the hope

that the convention would, in a resolution, declare itself as being in favor of continuing the Corporation.

The Mineral Land Leasing Law, in Mr. Tallman's opinion, marked a departure in the Government's public land policy as great as was the Homestead Law of 1862, prior to which time land was simply sold to those who had money to pay for it. He said that it had taken ten years of agitation to secure its passage. He explained that, in effect, it is a series of compromises due to



many conflicting views and therefore has many inherent defects, but withal is basically sound.

At the evening session, at which Mr. Wells again presided, Governor Shoup of Colorado was the first speaker. In a brief address, which elicited laughter frequently, the Governor discussed the resources of Colorado, and, passing to the subject of the sad condition of mining in the state, said jestingly that practically the only paying mines today were those owned by George Taylor and Bulkeley Wells.

Mr. Wells then delivered his presidential address, briefly describing the accomplishments of the Mining Congress during the year just passed.

The Kansas Industrial Court Law was discussed at length by the Hon. Frank Dumont Smith, of Kansas, speaking as the representative of Governor Henry J. Allen of Kansas. In explaining how this beneficent law had actually been passed, Mr. Smith said that it so happened that the Kansas Legislature this year had had a smaller infusion of jackrabbit blood than any Kansas Legislature that he had ever seen before.

Mr. Smith was followed by Dr. Charles A. Eaton, editor of *Leslie's Magazine*, who in a long address on the subject of the "Present and Future Relations Between Capital and Labor" succeeded in holding the close attention of the audience by his witty and brilliant handling of his subject.

The real business of the convention began on the second day, Nov. 16, when the conferences on gold and taxation were opened. These subjects were discussed at morning and afternoon sessions. An account of the proceedings is given elsewhere in this issue. At noon, the oil-shale men got together at a luncheon given by the oil-shale section of the American Mining Congress, over which Dr. Victor C. Alderson presides.

In the afternoon, the metal-mining section of the Standardization Committee, under the chairmanship of Charles A. Mitke, of Bisbee, Ariz., met to consider the reports of the various subcommittees. The report on the standardization of machine-drill parts, presented by Arthur Notman, superintendent of the Copper Queen, at Bisbee, was noteworthy. A number of other papers had been prepared, including one by T. O. McGrath, auditor of the Shattuck-Arizona Copper Co., on standardization of cost accounting, but lack of time prevented their consideration.

Dr. F. G. Cottrell Addresses Convention

A large audience assembled in the main convention hall in the evening at the third general session. Many had been drawn thither by their desire to hear Dr. F. G. Cottrell, Director of the U. S. Bureau of Mines, and Representative Louis T. McFadden, father of the gold bonus bill. Mr. McFadden was unable to be present, however, to the disappointment of those who had come to hear him.

Dr. Cottrell, who was introduced by Bulkeley Wells,

read a long paper dealing with the work and plans of the Bureau. "The Bureau of Mines has now been in existence for ten years," said he. "This seems an opportune time and place to take account of stock, to look over ground already covered, and to note the direction in which we are headed. It is right, also, to give to the mining and to the general public an accounting for the moneys spent, and to gain from them ideas and suggestions as to how, within our funds and organic

powers, present and probable future needs can best be met."

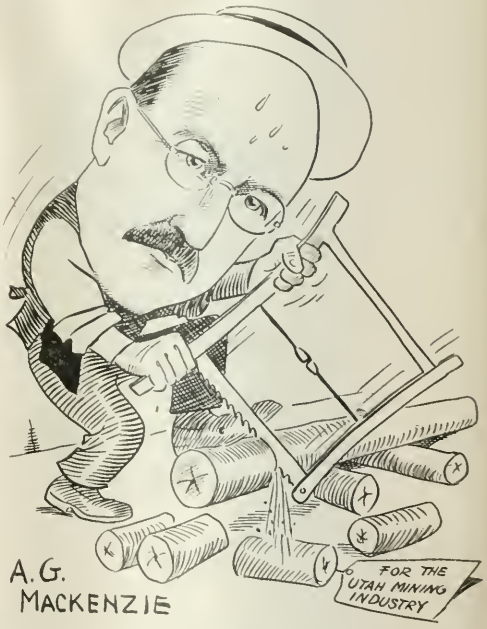
The manner of spending the Bureau's appropriation was described by Dr. Cottrell at some length. Continuing, he said: "The records show that in the beginning the American Mining Congress was vitally interested in and as an organization helped very prominently in creating the Bureau. From your continued co-operation, I am led to believe the results have been at least encouraging."

In talking of the Bureau's research work, Dr. Cottrell expressed the hope that the service of furnishing information as to particular metals, which was rendered the Government, producers, consumers and the interested public during the war, might again be undertaken, at least in certain of its features.

Dr. Cottrell touched briefly upon the co-operative agreements of the Bureau with governmental, state and private agencies. He said in concluding, "The apparent success and increasing call on the Bureau for co-operative work of this character lead me to the belief that its expansion will go far to answer the question so frequently asked, 'What is the Government going to do to foster research?' May not the answer be: 'As much as the industries themselves have enough demand for, and confidence in, to share part of the burden of the work.'"

A subject dear to Dr. Cottrell's heart is what he calls the "Public's Interest in Patents of Invention." He discussed this briefly, after concluding the main portion of his address, and read to his hearers a resolution to be presented to the committee, providing that "the American Mining Congress appoint a committee on patents of invention to co-operate with the proper governmental bureaus and committees of other business and technical organizations in working out methods for insuring to the patentee, to industry, and to the public more comprehensive and adequate guidance of public education and policy in the interpretation of patent rights."

Following Dr. Cottrell's remarks, an address on "Industry and the Government" was made by Gen. L. C. Boyle, of Washington, D. C. Industry needs less governmental control and more team work between capital and labor, stated General Boyle. The need for co-operative effort is great. This nation must first solve its own problems before it can help Europe. The speaker claimed that faulty taxation was one of the main causes of present conditions. Business cannot return to normal, he said, until the tax burden is equitably distributed. The evils of the excess-profits tax and the surtax are penalizing industry, and capital is seeking



the shelter of non-taxpaying bonds. Capital will, therefore, not be available for the development of industry if it remains as highly penalized as at present.

The Sherman Law should be amended so that curtailment and price adjustment by agreement might be permitted under Government supervision, said General Boyle. In this way, he said, waste will be avoided and great natural resources conserved. "Organization is not wrong, but the abuse of it is," he said.

Numerous conferences marked the program of the third day of the convention. These were the War Minerals Conference, presided over by Herbert Wilson Smith, chief of the war minerals division of the American Mining Congress; the continuation of the Gold Conference, which had started the day before; and the Conference of Flotation Users. The proceedings at all of these meetings are given elsewhere in this issue. By far the most important event of the day was the Conference of Flotation Users, the conference room being crowded at both morning and afternoon sessions by delegates expecting a tilt between representatives of

Minerals Separation and those of operators employing flotation, in which they were not disappointed.

In the afternoon, the fourth general session came to order in the main convention hall under the chairmanship of Carl Scholz. First on the program was the reading of a report made on blue-sky legislation by a special committee of the Mining Congress. A. G. Mackenzie, of Salt Lake City, chairman of the committee read the report, which was signed by himself and Sidney Norman of Spokane, the latter a member of the committee.

Judge Finney Discusses U. S. Mining and Leasing Laws

"The Mining Laws of the United States" constituted the subject of the next speaker, Judge E. C. Finney, of the U. S. Board of Appeals, who also represented the Secretary of the Interior. Judge Finney stated that it has been the policy of Congress from the time of the enactment of the first mining laws to encourage the finding and production of the country's mineral resources. This is shown, he said, by the liberal terms and conditions of the general lode and placer mining laws, and the latest enactment by Congress changing the policy of disposition as to oil, gas, coal, phosphate, and sodium is entitled "An act to promote the mining" of the deposits.

The general mining laws, he continued, although they contain no limitation as to the number of claims which might be taken or held by citizens, did require work to be done thereon annually, and authorized relocation by others as a penalty for the failure to perform such work. Newer laws, such as the potash and the oil land leasing laws, continue this policy and extend it. They require a specified amount of work to be done each year until discovery, authorize the Secretary to insert conditions in leases issued after discovery to insure reasonable continuous extraction of the minerals, and impose some limitations not contained in the old mining laws, namely, the fixing of the maximum acreage which may be held by an individual, association, or corporation.

With a few exceptions, Judge Finney explained, the Department of the Interior has been liberal in its construction and administration of the general mining laws, and, subject to the restrictions and limitations imposed by Congress, is disposed to be likewise liberal in the administration of the leasing laws. The department is particularly anxious to be practical and businesslike in its supervision of the working of coal mines, oil and gas wells, and other natural resources, and to that end has welcomed and will welcome suggestions by the American Mining Congress and by mine operators. Judge Finney further said:

> It is sensible and right that none of our resources shall be wasted, and that is particularly true of limited and exhaustible minerals, such as oil and gas, and to this end it is the duty of the department to prevent waste and to encourage better methods of mining, handling and reduction. In this respect the American Mining Congress and the mining operators can perform a valuable service in aiding the department, in their own interest and that of the general public.
>
> Captious criticism and petty fault-finding are of no benefit to the department, to the public, nor to the operators. Suggestions or criticisms should be constructive, and in that form cannot fail to be advantageous to all concerned.
>
> The American Mining Congress occupies a peculiarly favorable position to be of service both to the Government and the mine operators. Its organization permits it to gather information promptly from the entire mining area, to use that information for the general good, to thrash out and harmonize difference of opinion, and to render a real and lasting benefit to all the people. On the occasion of its twenty-third annual convention it merits and receives our esteem and congratulations.

An address on the subject of "State Taxation of Metal Mines," by James G. Fitch, of Socorro, N. M., was next on the program. This was followed by a paper of interest to coal men, entitled "A Powderless Mechanical Process for the Mining of Coal," by D. Vance Sickman, of Denver. The session closed with the presentation of a paper on "The Application of Industrial Medicine and

Health Conservation in the Development of Mine Labor Efficiency," by Dr. Arthur L. Murray, of the U. S. Bureau of Mines. Dr. Murray pointed out that miners should be selected for physical ability and adaptability and placed at work for which they are mechanically and temperamentally fit. The living conditions at any mine, he said, largely determine the type of labor that seeks employment and remains at that mine. The surroundings under which a man is forced to work react on his mental attitude and his labor output in proportion to whether they are helpful or harmful, safe or unsafe. Safety devices and properly directed safety supervision more than pay their cost in decreased loss of labor through lessening of accidents and saving in compensation. On large operations a safety engineer is as great a necessity as a mining engineer, in Dr. Murray's

opinion. Employers who desire intelligent and efficient men must make their working conditions as safe and wholesome as possible. The purpose of industrial medicine is to keep the working force as near physically par as possible by preventive, corrective, and curative measures, the first two being known as industrial hygiene.

Another general session was held on the evening of Nov. 17, T. T. Brewster, of St. Louis, presiding. R. N. Miller, a former solicitor of the Bureau of Internal Revenue, was the first speaker, his talk being on the subject of "The Problem of Next Year's Taxes." Mr. Miller sketched the situation confronting the Commissioner of Internal Revenue. Two things should be done, he said, if the enormous accumulation of work was to be properly and speedily handled. First, it is necessary to provide the commissioner with funds sufficient to enable him to secure an adequate number of men of sufficient calibre to do the work properly. Also, some method must be provided by which taxpayers may be informed, without undue delay, how much they owe the Government, so that such cases may be definitely closed.

The remainder of the evening was given over to the consideration of subjects bearing on various phases of the coal industry. Dr. E. W. Parker, of Philadelphia, chairman of the Anthracite Bureau of Information, delivered an address, "What Happened to the Anthracite Industry in 1920." J. D. A. Morrow, of the National Coal Association, presented a paper on the "General Coal Situation." The meeting then adjourned.

There were many conferences on the fourth day of the convention. Sessions of the conferences on Standardization, Gold, and Taxation were continued. In addition, two conferences were held on Education and Public Service; one on Oil Shale and one on Tariff. All of these are described elsewhere in this issue.

In the morning the annual members' meeting was held. The following directors retired: Walter Douglas, Samuel A. Taylor, L. A. Friedman, Carl Scholz, and Charles S. Keith. The following were elected directors: James A. Douglas, Robert Linton, W. J. Loring, Carl Scholz, and Hugh Shirkie, the last named of Indiana.

A nominating committee was appointed to name officers for the ensuing year. Later in the day the election of W. J. Loring as president was announced. A committee of three was appointed to revise the bylaws, including dues. The income of the Mining Congress during the past year was given at $150,432 and the cash on hand as $9,232. The members, of which there are 2,500, were declared a liability and not an asset.

The annual dinner on Thursday evening was marked by the presence of ladies, who were not invited last year at St. Louis. One diner who had been present at both banquets declared in favor of the St. Louis system, but others differed. Not only was satisfactory material refection provided for the inner man and woman, but spiritual as well. A jolly feature was a corps of young lady singers, gaily if not completely garbed, who wandered singing among the tables, and tarried here and there in the well-known cabaret style.

Thomas B. Stearns was the toastmaster. Senator Charles S. Thomas, as first speaker, spoke somewhat cynically of "Industrial Honesty and Dishonesty." He stated that the prohibition law and other restrictive legislation had made 50 per cent of the population government agents and spies, and its other 50 per cent liars and scoundrels. He laid the present debauch of dishonesty, grafting, and profiteering to the breakdown of morale following the Great War, and said that a similar period followed the Civil War. At present, he said, there were in Washington 125 organized lobbies, of which the Mining Congress was one; and none of them cared for any interest but the one it represented. He stated that every Representative and Senator cared only for the interests of his own constituency, so that nobody represented the United States but the President: hence the people looked to the President alone for broad statesmanship.

Governor Boyle of Nevada, in a few well-chosen and witty remarks, presented to the retiring president a watch as a souvenir of his services.

T. A. Rickard, introduced as a former state geologist of Colorado, made a witty little speech in which he referred to the frequent comparison of himself with Tex Rickard, and the disappointment of his son when he found that they were unrelated.

The toastmaster called upon Carl Scholz as the next president of the Congress, but Mr. Scholz, in correcting the speaker, gave a little sketch of the moonshiners

of West Virginia, with whom he had to deal in his coal-mining operations. W. J. Loring, the new president, next spoke briefly, and asked support for a successful year.

Additions to the program made it necessary to hold two general sessions on the last day of the convention, instead of one, as originally planned. The morning session was given over to addresses by Arthur Notman, mine superintendent of the Copper Queen at Bisbee, Ariz.; Charles A. Chase, manager of the Liberty Bell mine, at Telluride, Col.; L. Ward Bannister, of Denver; and W. G. Bierd, president of the Chicago & Alton Ry.

Mr. Notman's paper, entitled "Conditions of Operation and Production in Open-Shop Districts in Arizona," proved to be a presentation of the conditions of operation at the Copper Queen branch of the Phelps Dodge Corporation. Other Bisbee companies, said Mr. Notman, are working along similar lines, as are companies in other camps in the state.

Mr. Chase in the course of explaining why Colorado mining engineers had adopted the open-shop movement, said that industrial peace had reigned in the metal-mining districts of Colorado in recent years because mining was so stagnant that there was nothing to be gained by labor warfare.

"Denver and the Open Shop" was the subject of Mr. Bannister's remarks, and Mr. Bierd, who had spoken

CHARLES A. CHASE

at the dinner the night before, talked on what he termed the "Relation of Industry to Industry."

The afternoon session was the most important one of the convention, as it was then that the report of the Resolutions Committee was presented to the Congress. This was preceded by an address on the gold situation in California by Fletcher Hamilton, state minerologist of California, and by a brief talk by Arthur F. Fisher, delegate to the convention from the Philippine government. The chairman, Bulkeley Wells, also read excerpts from a paper by James Lord, president of the mining department of the American Federation of Labor, in Mr. Lord's absence.

In all, twenty-five resolutions were adopted by the convention, only one of them being debated. The complete text of these resolutions follows:

Introduced by Bulkeley Wells;
Relating to War Finance Corporation

Whereas, the sharp contraction during the past few weeks in domestic demand for American products has been so acute as to bring about a serious business situation and as to threaten even more unfortunate conditions in agriculture and commercial business and the mining industries; and,

Whereas, the European market has in the past under ordinary world conditions served in large measure as an outlet for the American producer; and,

Whereas, Europe, although desperately in need of American raw material and food products today, both for the purpose of feeding and clothing its population and of giving them employment, is unable to do a large volume of business with the American producer by reason of the need on the part of the European buyer for long-term credits; and,

Whereas, the War Finance Corporation, for the purpose of meeting the world emergency, was vested by Congress in March, 1919, with the power (which has not yet expired), either out of funds heretofore appropriated by Congress or out of funds to be obtained from the public by the sale of its bonds, to make advances on good security to American exporters and American banks to assist in the sale and exportation of American products to foreign purchasers on credits up to five years in duration; and,

Whereas, the War Finance Corporation did, up to May 10, 1920, demonstrate its usefulness to the country by assist-

ing in the exportation of American products on credits of from six months to five years; and,

Whereas, the Secretary of the Treasury in May, 1920, caused said corporation to suspend such exercise of its powers in the preservation and stimulus of American export trade, although such powers still exist under the law, so that said corporation is today inactive at a time when the American people have the most urgent need for its activity; and,

Whereas, this meeting of the American Mining Congress in Denver, Col., Nov. 15, 1920, is informed that said corporation could resume the exercise of its said functions with reference to export trade if the Secretary of the Treasury would consent thereto;

Now, therefore, be it resolved, that this meeting does hereby most earnestly urge upon the Secretary of the Treasury that he now cause the War Finance Corporation to resume the exercise of its powers under Section 21 of the War Finance Corporation Act to make advances in aid of the exportation of American products until such time as its said power in that behalf shall have expired under the law, or until the present dire emergency shall have passed; and, further,

Resolved, that the chairman of this meeting be and he is hereby authorized and requested to forward these resolutions to the Secretary of the Treasury, and a copy to Hon. William M. Calder, chairman of the Senate Committee on Reconstruction and Production.

Introduced by Bulkeley Wells;
On Public Interest in Patents of Invention

Whereas, patents on inventions represent a monopoly granted fundamentally in the public's interests; and

Whereas, in the case of similar monopolies such as public franchises it long ago became evident that some form of public administrative machinery such as public service commissions was necessary to function in a way between the issuing of franchises and final appeal to the courts; and,

Whereas, the extension of these same principles to the study and guidance of public policy with regard to the interpretation and control of patent rights appears to have distinctly lagged behind that of other less technical aspects of trade and industry; and,

Whereas, a broad, intelligent and equitable public policy with regard to patents of invention is of vital importance to the whole mining and mineral industry;

Now, therefore, be it resolved, that the American Mining Congress appoint a committee on patents of invention to co-operate with the proper governmental agencies and committees of other business and technical organizations in working out methods for insuring to the patentee, to industry, and to the public more comprehensive and adequate guidance of public education and policy in the interpretation of patent rights.

Introduced by Carl Scholz;
Against Abolition of Interior Department

Whereas, more than one-half of the acreage of the United States west of the north and south line drawn through the eastern border of Colorado is now owned by the Federal Government; and,

Whereas, the enactment of the Public Lands Leasing Bill creates a continued responsibility upon the Federal Government in handling the public lands of the West; and,

Whereas, this vast expanse of territory contains more than 3,000 million tons of coal, untold oil reserves, oil-shale deposits of unmeasured value, water-power measured in productive force many times greater in value than its oil, oil-shale and coal reserves combined, and immense deposits of phosphates and other minerals; and,

Whereas, the administration of these vast resources will require an increasing service from that department which is charged with the work of supervising the development of the Rocky Mountain and Pacific Coast Western States, namely, the Department of the Interior; and,

Whereas, a proposal has been made looking to the discontinuance of the Interior Department and the creation in its stead of a Department of Public Works;

Now, therefore, be it resolved, that the American Mining Congress in its twenty-third annual session assembled in Denver, Col., Nov. 15-19 inclusive, enters its protest against the abolition of the Interior Department and urges that the Interior Department shall be continued for the above weighty duties and as that department through which the mining industry of the United States shall function in Federal affairs.

Introduced by Carl Scholz;
Approving Henderson Bill, S. 4,369

Whereas, the importance of the mining industry of the United States has been better appreciated during the days of the war when it was realized that the production of minerals was essential to the carrying on of the nation's contests in the great world war; and,

Whereas, the relative importance of mining is shown by the fact that during the year 1919 the railroads of the country received from the transportation of freights approximately 576 millions of dollars, while from the transportation of manufactured products the total amount paid to the railroads was approximately 168 millions of dollars; and,

Whereas, those two activities of the Federal Government which have rendered most specific service to the mining industry are the U. S. Bureau of Mines and the U. S. Geological Survey; and,

Whereas, it is desired that these agencies, with such other agencies as render service to the mining industry, shall be co-ordinated in a more effective way than is possible through the present organization of the Interior Department; and,

Whereas, Senate Bill 4,369, known as the Henderson Bill, provides for the creation of a Division of Mines and Geology within the Interior Department under an Assistant Secretary of the Interior to be appointed for that specific purpose by the President;

Now, therefore, be it resolved, that the American Mining Congress in twenty-third annual session assembled at Denver, Col., Nov. 15-19 inclusive, hereby expresses its approval of the principles contained in the Henderson Bill and urges the enactment by Congress of a bill embodying the principles therein contained.

Introduced by Carl Scholz;
On Bureau of Public Works

Whereas, the enormous burden of taxation which must be met by the industry of the nation requires greater economy in the conduct of governmental affairs, the abolition of all useless expenditures, the highest efficiency in every governmental agency, and the prevention of all duplication of service and expenditure; and,

Whereas, the engineering and construction services of the government are now lodged in various bureaus of the several departments;

Now, therefore, be it resolved, that the American Mining Congress in twenty-third annual session assembled in Denver, Col., Nov. 15-19 inclusive, hereby expresses its belief that a Bureau of Public Works should be created, under the direction of which, so far as feasible, all engineering and construction features of the government service should be consolidated, to the end that greater economy, higher efficiency and more effective service shall be rendered, and all duplication of effort shall be prevented.

Introduced by G. P. De Beque;
On Oil Shale

Whereas, for the past several years the domestic production of petroleum has been insufficient to satisfy the domestic requirements of the United States; and,

Whereas, the deficit between domestic production and consumption of petroleum is estimated to be more than 100 million barrels for the year 1920, making it necessary to import enormous quantities of oil from Mexico and to draw continually on our rapidly waning stocks of petroleum; and,

Whereas, the present rate of increase of consumption of petroleum in the United States makes it appear that in the near future the nation will be largely dependent on foreign sources for its petroleum supplies, a condition which will place the nation in a dangerous position in time of

war and tend to a loss of commercial supremacy in time of peace; and,

Whereas, the nation's enormous deposits of oil shale represent a resource which, when properly developed, will give the nation a practically inexhaustible domestic source of petroleum; and,

Whereas, the commercial development of those oil shales can be immeasurably facilitated by properly conducted scientific research; and,

Whereas, the U. S. Bureau of Mines, a Federal agency properly qualified to conduct such investigations, has requested of the Congress of the United States an appropriation for the construction, equipment and operation of an experimental station for such investigations;

Therefore, be it resolved, that this, the twenty-third annual convention of the American Mining Congress does hereby approve of the plans of the U. S. Bureau of Mines for investigations on oil shale and further urges upon the Congress of the United States the necessity of favorably considering the appropriation requested.

Introduced by George Wolfe;
Against Federal Control of Bituminous Mines

Whereas, for the past eleven months in certain sections of the United States there has existed a shortage of bituminous coal; and,

Whereas, it has been charged that certain tonnage of bituminous coal in certain sections of the United States has been sold by the producers at excessive and exorbitant figures; and,

Whereas, today in the minds of certain of our lawmakers exists a strong belief that government supervision and control of the bituminous coal industry is of earnest consideration,

Therefore, be it resolved, that the fuel supply problem, in so far as bituminous coal is concerned, is one of transportation and that the recent evils of coal speculation were the result of such transportation shortage, and should not be charged against the coal producers who were helpless in this emergency; and,

Be it further resolved, that we feel that no condition exists in the bituminous coal industry at this time calling for Federal control of the bituminous coal mines of our country such as has been advocated by Senator Calder, of the Senate Committee of Reconstruction, and that, if the industry is let alone, the present co-operation between transportation, producers and labor will continue, and the present high tonnage production will be maintained, which will necessarily clear away certain evils heretofore complained of.

Introduced by M. B. Tomblin and Robert J. Kerr;
Against Pending Federal Blue-Sky Legislation

Be it resolved, by the delegates to the twenty-third annual convention of the American Mining Congress, held at Denver, Col., Nov. 15-19, 1920, that we are opposed to all proposed enactment now pending in Congress providing for so-called "blue-sky" legislation.

This was the only resolution presented by the Resolutions Committee that was debated on the floor of the convention. As first presented it read, ". . . providing for so-called 'blue-sky' legislation, and that it is the sense of this convention that state regulatory measures now in force in the several states are sufficient in form, with slight modification, to meet all requirements." The amendment was made on motion by A. G. Mackenzie, of Salt Lake City. The resolution favoring a Federal Blue-Sky Law that is referred to in the account of the fourth general session on another page was defeated in committee.

Introduced by H. W. Seamon, E. P. Mathewson and W. J. Loring;
Endorsing the McFadden Bill

Whereas, the Government of the United States is justly committed to the gold standard; and,

Whereas, the maintenance of a healthy, gold-mining industry is absolutely essential to the maintenance of a gold standard; and,

Whereas, the gold-mining industry of the United States is in deplorable straits, having almost ceased to function, and it is necessary to apply immediate measures for relief; and,

Whereas, the McFadden Bill, HR 13,201, offers the best present solution of the problem;

Resolved, that the American Mining Congress, in convention assembled, heartily indorses the McFadden Bill and pledges its support to the measure, and urges a like support on the part of all our citizens who have at heart the maintenance of the gold standard and the common welfare of the country.

Introduced by H. H. Schwartz;
Proposing To Amend Oil Shale Section of Leasing Law

Whereas, in various parts of the West, particularly in the states of Utah, Colorado and Wyoming, there exist bedded deposits of sandstone, limestone and other rocks impregnated with bituminous or similar organic matter in solid or semi-solid form which may be utilized commercially and which are not oil shales; and,

Whereas, no provision for prospecting, developing, or leasing such deposits is made under the existing laws;

Therefore, be it resolved, that the American Mining Congress recommend to the Congress of the United States that Section 21 of the Act of February 25, 1920 (Public 146), known as the Oil Shale Section of the Leasing Law, be amended so as to include all lands containing valuable deposits of bituminous or similar organic material in solid or semi-solid form.

Introduced by Tax Committee;
Proposing Creating a Bi-Partisan Taxation Board

Whereas, the immediate need of the present moment is a definite fixing of the past tax liability for each taxpayer, especially for the war years, 1917, 1918 and 1919, and this need is emphasized by the present unstable business conditions; and,

Whereas, this need for prompt final tax determination for the war years is so vital as to require immediate provision for final settlement of all unsettled cases for the years 1917, 1918, 1919,

Resolved, that the American Mining Congress recommend to the Federal Congress the enactment of a statute authorizing the President to appoint, by and with the consent of the Senate, a bi-partisan board of ten men, composed of lawyers, accountants, engineers, and business men, who will sit for a period of one year to pass upon and settle the cases of taxation arising during or consequent upon the wartime period of 1917 to 1919, both inclusive. The powers of such board to be of the broadest character; to summon witnesses, to compel the production of books and papers, to determine questions of fact and law, and to make assessments under both the general terms of the statutes and those special remedial provisions embodied in section 210 of the Revenue Act of 1917 and sections 327 and 328 of the Revenue Act of 1918.

The board to be given power to compromise taxes in cases where the need arises, and should be given a power which is not now provided for in our statutes; namely, to postpone the payment of taxes for reasonable periods, or to provide for their payment in installments where the board deems it necessary in order to prevent undue hardship on the taxpayer, requiring, of course, adequate security from the taxpayers to safeguard the interests of the revenue.

We strongly urge that the board shall be an independent body separate and apart from the Bureau of Internal Revenue and the Treasury Department.

The board should have authority to remand the case to the Bureau of Internal Revenue, with instructions how to close it, or on the other hand to summarily dispose of the case and determine the final assessment.

If, however, a determination and assessment is made in the case of any taxpayer and an agreement in writing signed by the taxpayer and the board that such determination and assessment shall be final and conclusive, then

(except upon a showing of fraud or malfeasance or misrepresentation of fact materially affecting the determination or assessment thus made) the statute shall provide that the case shall not be reopened or the determination and assessment modified by any officer, employee, or agent of the United States, and no suit, action or assessment shall be entertained by any court of the United States.

The board to be a large board, one composed of ten members, since the work it will perform may be divided into three or four general classes. The full board should not be required to sit in every case; three members should constitute a sufficient quorum to hear and determine the case, although more members may sit on complicated or important cases. The decision in each case should be subject to the written approval of a majority of the board, including those members who sat on the case.

The board shall have the power to refuse to hear any appeals that they may deem frivolous or vexatious. It shall prescribe rules and regulations for its procedure and the hearing of cases. Proper recourse to the courts to lie from any decision of the board by any taxpayer dissatisfied with the decision of the board.

A sufficient appropriation should be made to adequately compensate the members of the board and to enable the board to employ an adequate staff of clerks and assistants. In addition, it should have power to call upon the Bureau of Internal Revenue for such auditing or other assistance as it might require in any particular case.

We believe the energetic, impartial operation of such a board, clothed with broad and ample powers suggested, would result in the settlement of practically all the cases of war taxation within a year, and leave the department free to carry on its current work. The expeditious settlement and assessments accomplished through the medium of such a board would save in interest alone many times the appropriation needed therefor.

Introduced by Tax Conference;
Urging Repeal of War-Profits and Excess-Profits Taxes

Whereas, the burdens created by the War Excess-Profits Tax Law have become an excessive burden upon business and a deterrence to investment and the undertakings of new business enterprises,

Now, therefore, be it resolved, that we most earnestly urge upon Congress the immediate repeal of the war-profits and excess-profits taxes.

Presented by Tax Conference;
On Deduction for Depletion

Whereas, the Department of Internal Revenue, having under the 1909 Tax Law contended that the net proceeds of mines constituted profits and were all taxable without any deduction for depletion, basing such contention on the general practice of the mining industry at that time, and having succeeded in establishing that view in the courts,

Be it resolved, that it is the sense of this Congress that the rule now adopted by the Bureau of Internal Revenue in ascertaining the invested capital of mining corporations by which a deduction is made from profits for each unit of minerals removed since the commencement of mining operations down to the year 1916, regardless of actual conditions, actual facts and valuations of the mining property, is inconsistent and unfair; and,

It is further resolved, that this Congress take steps to present its reasons to the Bureau of Internal Revenue supporting an abrogation of such rule.

Introduced by A. G. Mackenzie;
Proposing Metal and Mineral Import Tariff

Be it resolved, by the American Mining Congress in twenty-third annual convention assembled, that we favor the imposition at the earliest possible date of such United States customs duties or tariffs on metals, minerals and metalliferous and mineral products, presented for entry into the United States from foreign countries, as shall be sufficient to enable United States producers of like or similar metals, minerals and metalliferous and mineral products to meet such foreign competition and continue to maintain American standards of wages and living conditions.

Presented by California Metal and Mineral Producers' Association; Colorado Chapter American Mining Congress; Colorado Metal Mining Association; Idaho Mining Association; Montana Mining Association; Nevada Mine Operators' Association; New Mexico Chapter American Mining Congress; Utah Chapter American Mining Congress; and Washington State Metal Mining Association;
On Reduction of Ore Freight Rates

Whereas, the continued production of metals and, consequently, the employment of large numbers of men as well as the profitable operations of the ore-carrying railroads are all dependent to a very large extent upon reasonable and living freight rates; and,

Whereas, due to the peculiar character of the rate structure under which ores are moved, the rate advances of June 25, 1918, and of Aug. 26, 1920, have resulted in placing an undue proportion of the burden of furnishing additional revenue to the carriers upon the metal mining, smelting and refining business;

Therefore, be it resolved, that in the opinion of this Congress immediate steps should be taken by the carriers and ore producers and shippers, jointly, to secure such readjustment and revision of the present ore rates as will permit of the continued operation of the metal mines and at the same time will give to the carrier a just and reasonable compensation for the services rendered by it.

Introduced by Gilbert H. Montague;
Commending Proceedings Against Minerals Separation

Whereas, on Nov. 12, 1918, the Federal Trade Commission commenced a proceeding against the British corporation, Minerals Separation (Ltd.), its subsidiaries and its agents, particularly its controlled American subsidiary, Minerals Separation, North American Corporation, charging them with stifling and suppressing competition, and monopolistic and oppressive practices, and violations of the Clayton Act and the Federal Trade Commission Act, in that their contracts and methods have tended (a) to prevent independent inventors and independent manufacturers from licensing and selling independent processes and independent apparatus; and (b) to prevent mine operators from using independent processes and independent apparatus; and (c) to require independent inventors and independent manufacturers to pay to Minerals Separation exorbitant commissions as the condition of licensing and selling their own processes and apparatus; and (d) to discriminate unfairly as between manufacturers and inventors similarly situated in respect to the commissions thus exacted by Minerals Separation; and (e) to compel mine operators, metallurgists and engineers to surrender their own inventions to Minerals Separation; and (f) to prevent mine operators, metallurgists and engineers from publishing data regarding flotation; and (g) to compel mine operators, metallurgists and engineers to withold information regarding flotation in event of litigation; and (h) to exact from mine operators an exorbitant royalty for the use of the processes of Minerals Separation; and (i) to exact from mine operators royalties upon the use of processes and apparatus in which Minerals Separation have no rights whatsoever; and (j) to discriminate unfairly, as between mine operators similarly situated, in respect to the royalties thus exacted by Minerals Separation; and (k) to disparage, falsely and maliciously, independent processes and independent apparatus, independent inventors, and independent manufacturers, and the users and patrons of such independent processes, independent apparatus, independent inventors, and independent manufacturers; and (l) to claim, falsely and maliciously, exclusive rights in excess of those actually possessed by Minerals Separation; and (m) to threaten, with malice, patent infringement suits based upon claims of exclusive rights exceeding those actually possessed by Minerals Separation (Ltd.), its subsidiaries and its agents; and (n) to intimidate and coerce mine operators to refrain from using or patronizing independent processes, independent apparatus, independent inventors, and independent manufacturers by threatening to withhold from such mine operators licenses under Minerals Separation (Ltd.), processes and apparatus; and (o) to

coerce independent inventors and independent manufacturers, through the tactics above described, to enter into oppressive agreements with Minerals Separation (Ltd.), its subsidiaries and its agents; and,

Whereas, the testimony thus far taken by the Federal Trade Commission in support of these charges tends to show, largely from the correspondence and admissions of Minerals Separation officials themselves, that the British corporation, Minerals Separation (Ltd.), its subsidiaries and its agents, particularly its controlled American subsidiary, Minerals Separation, North American Corporation, have suppressed technical information, made indiscriminate charges of infringement, required independent inventors and independent manufacturers to pay commissions on sales of their own apparatus, charged excessive royalties for the use of Minerals Separation processes, falsely disparaged apparatus of independent inventors and independent manufacturers, compelled engineers in the employ of Minerals Separation to sign illegal and iniquitous contracts, made excessive claims regarding Minerals Separation's patent rights, retarded generally the development of the art of flotation, discriminated unfairly between Minerals Separation's licensees in respect of royalty charges, demanded royalties in perpetuity for the use of Minerals Separation processes on which the patents will soon expire, requiring Minerals Separation's licensees to assign their inventions to Minerals Separation, threatened lawsuits to coerce numerous mine operators, seduced and corrupted with bribes the employees of various mine operators for the purpose of obtaining secret, confidential information, and threatened scores of mine operators with infringement suits without pointing out the particulars of such infringement or making any adequate investigation before issuing such threats; and,

Whereas, from the report submitted to this convention by the counsel of American Mining Congress, it appears that the mining industry of the United States, now and for all future time will be in bondage to the British corporation, Minerals Separation (Ltd.), its subsidiaries, and its agents, and particularly its controlled American subsidiary, Minerals Separation, North American Corporation, unless the proceeding brought by the Federal Trade Commission is prosecuted to a successful conclusion;

Now, therefore, be it resolved, by the American Mining Congress in convention assembled, with members and representatives present from every mining state in the Union,

That the American Mining Congress hereby indorses and commends the proceeding of the Federal Trade Commission against the British corporation, Minerals Separation (Ltd.), its subsidiaries and its agents, particularly its controlled American subsidiary, Minerals Separation, North American Corporation, and indorses and approves the action of the officers and counsel of the American Mining Congress in supporting the commission's proceeding; and be it further

Resolved, that the American Mining Congress hereby pledges the assistance of its officers, its counsel, its chapters and its members to assist the Federal Trade Commission in its proceeding to terminate the intolerable bondage which Minerals Separation have now imposed, and hereafter in perpetuity threaten to impose upon the mining industry of the United States.

Presented by War Minerals Conference;
On Appropriation for Relief

Be it resolved, that the American Mining Congress urge the retention in *statu quo* of the appropriation provided in section 5 of the Act of March 2, 1919 (40th U. S. Statutes, p. 1,272) until such time as further Congressional legislation be enacted and the claimants under this said act of March 2, 1919, shall have received the relief intended to be granted thereunder, and that the executive committee of the board of directors of the American Mining Congress are empowered to take such action in this behalf as they deem necessary and proper.

Presented by War Minerals Conference;
Urging Passage of H. R. 13,091

Whereas, in section 5 of the Act of March 2, 1919 (40th Statutes, p. 1,272), provision was made to pay producers of chrome, tungsten, manganese and pyrites net losses suffered by them in an effort to comply with the requests or demands of the governmental agencies mentioned therein to produce the said minerals required by the exigencies of the war and appropriating the sum of $8,500,000 therefor; and,

Whereas, under the constructions which have been placed upon this law many claimants thereunder protest that they have not received the relief this law was intended to administer;

Be it resolved, that the American Mining Congress urge the immediate passage of H. R. 13,091 by the House of Representatives, which bill has already been passed by the Senate, and been favorably recommended to the House by unanimous report of the Committee on Mines and Mining, and accords to claimants who have not received adequate awards under this act the right of appeal to the Court of Claims from the decision of the Secretary of the Interior.

Presented by Tariff Conference;
Urging Passage of Timberlake Bill

Be it resolved, that the American Mining Congress favors the speedy passage of the Timberlake Bill (H. R. 4,437) for the protection of tungsten and its products, which has passed the House and is now pending upon the calendar of the Senate, with a favorable report from the Senate Finance Committee.

Presented by Tariff Conference;
Supporting Anti-Dumping Legislation

Be it resolved, that the American Mining Congress support legislation to prevent the dumping of the products of foreign mineral industries on the shores of this country at prices so far below the cost of domestic production as to make competition of domestic mineral industries impossible.

Introduced by A. G. Mackenzie;
Favoring Collection of Information on Mines and Quarries

Resolved, by the American Mining Congress in convention assembled, that we favor and will co-operate with such joint action by the Federal Congress, the Bureau of the Census and such other governmental agencies as may beneficially participate therein to the end that more informative data than those now available be collected, compiled and published by the national government, and that if found necessary to accomplish this result a special census of mines and quarries be authorized and made.

Introduced by W. J Loring;
Recommending Reduction of Prices of Supplies and Freight Charges

Be it resolved, that in order to bring about a return to normal conditions as rapidly as possible it is the judgment and request of the American Mining Congress that the manufacturers and sellers of mining supplies and equipment reduce prices and public carriers reduce freight charges in accord with the present economic trend to the end that the mining industry may resume its normal activity.

The customary resolution of thanks to the city and county of Denver, the state of Colorado, and to all contributing to the success of the convention was adopted.

George W. Nye, counsel for American Mining Congress, succeeded in securing the adoption of a resolution in support of the Near East Relief Work, after the resolution had been turned down by the Resolutions Committee.

Of all the conferences, the sessions of the Flotation Conference, or the Conference of Flotation Users, as it was officially designated, drew the greatest number. The proceedings at these meetings are briefly described in the following article. One of the most important sub-

jects discussed at the convention was that of standardization. At the conference on this subject, which is described hereafter, the reports read by the various subcommittees of the metal mining section were indicative of the study that has been given the matter. Before closing this account of the general sessions of the convention, it should be said that *Engineering and Mining Journal* is indebted to the American Mining Congress for the cartoons published in this report.

After some discussion as to the best place for holding the twenty-fourth annual convention, a matter to be decided by the directors, in the course of which Chicago, Pittsburgh and Atlantic City were named, the convention adjourned.

The Flotation Conference

THE Flotation Conference was held on Wednesday, Nov. 17, George E. Collins of Denver, presiding. A considerable number of interested members were present, including three members of Minerals Separation, A. A. Cook, counsel and director; E. H. Nutter, chief engineer, and C. B. Allen, secretary, who were present by special invitation. In his opening speech, Mr. Collins spoke of "The Progress of the Art of Flotation." He declared that Dr. W. K. Everson was the true discoverer of flotation, but neither he nor his widow, Mrs. Carrie Everson, was able to bring it to a commercial success. Dr. Everson came to Denver with his idea in 1886-87. Mr. Collins detailed the subsequent history of the idea, through the use of the process at Broken Hill, in Australia, to its practical introduction into America by Sulman and Picard and Minerals Separation, Ltd.

EDWARD H. NUTTER

A paper by W. C. Russell was read by another. It was entitled "Has the Attitude of Minerals Separation Retarded the Progress of Flotation?" Mr. Russell quoted from various publications the universal indictment of Minerals Separation on the ground of suppression of information. He also called attention to the Minerals Separation policy of securing to itself by contract with the licensee the fruits of the latters' inventions. He pointed out that although the application of flotation to Cobalt ores was largely the result of local inventive genius, the excessive royalty of 2½ per cent of the gross value of the concentrates was demanded.

George L. Nye, of Denver, counsel for the American Mining Congress, spoke on the subject of "Particular Practices of Minerals Separation Which Mining Men Have Criticised." Mr. Nye recalled that four flotation processes came into use at about the same time at Broken Hill, in Australia: the Potter-Delprat process, the De Bavay, the Minerals Separation, and the Elmore vacuum process; shortly after which Sulman and Picard introduced commercial flotation into the United States. Mr. Nye, in a stirring direct manner, quite without gloves, charged the administration of Minerals Separation with various practices injurious to the progress of the art of flotation and to mining; such as the suppression of technical information, indiscriminate charges of infringement, and the requiring of inventors to pay royalties on their own inventions. In general, he said, the Minerals Separation claims amounted to this: that "Minerals Separation controls flotation in general." He cited the cases of makers of flotation machines, like Janney, Ruth, and others, who were forbidden to sell their machines without the consent of Minerals Separation.

Mr. Nye charged that the royalties imposed were excessive, being based upon gross recovery and not on net profits; and instanced the case of a mine which in one year made a loss of $70,000, and nevertheless had to pay Minerals Separation $32,000 in royalties. Such a policy at times prevents the operator from using the process. He referred to the fact that Minerals Separation forced its licensees to sign a contract whereby they assigned all their future discoveries in flotation to Minerals Separation; and under the terms of which they agreed not to use any invention without the approval of the same company. According to their contracts, employees were bound to secrecy not only during their employment but forever afterward. Mr. Nye also charged Minerals Separation with breaking and entering to secure evidence of infringement, and of making use of a spy system to the same end, quoting, in support of this, testimony of the president of the company, John Ballot.

The next speech was made by Gilbert H. Montague, of New York, associate counsel in assisting the American Mining Congress in presenting the evidence on behalf of the mining industry to the Federal Trade Commission. Mr. Montague stated that the law of the United States was to the effect that the purpose of granting patents was to advance science and the useful arts, and that the courts have held that where patents

do not do this, they are illegal. Mr. Montague went on to enumerate the chief Minerals Separation patents, and the principal litigation cases which have arisen under each.

In the afternoon session, Mr. Cook took up the case for Minerals Separation. He refuted a charge of German ownership of Minerals Separation, which he stated Mr. Nye had made in his speech last year, and for which he blamed the American Mining Congress, although later it had apologized. He accused those attacking Minerals Separation with having made fragmentary quotations, leaving out portions which would have given the whole a better significance for the company. He referred to a passage in Mr. Montague's address where the latter stated that although the oil patent expires in 1923, licensees were required, according to the contract which they had been forced to sign, to pay royalty indefinitely beyond that period; and stated that this was not his understanding. He understood that there would be no further royalty on account of the oil patent; but if the licensee is using another Minerals Separation patent, he of course continues to pay royalty. He further stated that since December, 1917, the manufacturer of flotation machines may sell his machines to a Minerals Separation licensee; the licensee must ask Minerals Separation for its consent, which the latter is obliged to give. In general, Mr. Cook asserted that many of the accusations of Mr. Nye and Mr. Montague were based upon the old contract, now supplanted. He was interrupted by Mr. Montague, who stated emphatically that all the charges made had been based upon the latest contract.

Mr. Cook, resuming, stated that although the contract stipulates that all inventions by the licensee shall become the property of Minerals Separation, and that this includes the inventions of employees of licensees in their capacity as employees, yet it does not apply to inventions made by employees in their individual capacity; anyhow, he said, no patents arising from the inventions of licensees had yet been acquired. He explained the ruling of Minerals Separation to the effect that makers of flotation machines must sell only to licensees and not to infringers, by stating that the law makes the vendor of the machine to an infringer a contributory infringer. He claimed that many of the earlier restrictive agreements had now been withdrawn. Concerning the charge of lack of literature covering flotation, he referred to the history of Minerals Separation's patents, which was supplied to every licensee. He called attention to the fact that every discovery made by any licensee belongs to every other licensee, without increased royalty. He cited the fact that the Supreme Court of the United States had decided the right of Minerals Separation to the patents for air-froth flotation, which they had been the first to introduce into this country, and thought that that should settle it.

Mr. Cook cited the benefits which flotation had brought to the American mining industry, as in the case of Butte & Superior and the porphyry copper companies; and enumerated the principal cases of what he regarded as infringement. He declared that no definite proofs were given of Minerals Separation policy having hampered the mining industry. Referring to the charge that the Anaconda Copper Mining Co. had a better contract than other licensees could obtain, he said that was true, and was a recognition by Minerals Separation of generous treatment received by John D. Ryan before the Minerals Separation claims were fully established. Finally, Mr. Cook suggested that the American Mining Congress appoint a committee to take up and discuss the various problems with Minerals Separation.

The conference ended with some little tension, Mr. Cook being asked for a definite assurance by Oscar Rohn, a licensee, that he would not be obliged to pay royalties under his contract, after the expiration, in 1923, of the Minerals Separation oil patent; and Mr. Cook responded that, not being a patent lawyer, he was not absolutely certain. Mr. Montague thereupon commented forcibly on the circumstance that the counsel and a director of Minerals Separation did not know the meaning of the company's contract with licensees. This plainly nettled Mr. Cook, who declared he had no more to say.

Mr. Nye made a last speech in which he took up and replied to points in Mr. Cook's speech, and reiterated points already made by himself and Mr. Montague. Dr. Cottrell, Director of the Bureau of Mines, took the occasion to cite the case under discussion as an evidence of the necessity of his own patent program.

The conference was resumed on Thursday morning. Mr. Cook announced that he had wired to the president of the company, John Ballot, concerning Mr. Rohn's question as to whether licensees would be required under their contracts to pay royalties on the oil patent license after the expiration of the patent, and had received the answer "No." This answer was hailed by Mr. Montague as a great victory for the American Mining Congress. Mr. Nutter, chief engineer for Minerals Separation, taking the floor, denied that it was a victory, since, as early as 1914, the matter had been decided that Minerals Separation could not collect royalties after the expiration of the patents involved, and had so advised licensees; concerning which Mr. Montague afterward commented that though Mr. Nutter had known this for six years, Mr. Cook did not know it the night before. Proceeding, Mr. Nutter described the laboratories of the company in San Francisco, and stated that all testing was done free; and instanced the advances in metallurgy that had been "initiated" there.

Mr. Montague, taking the floor, stated that the next thing the American Mining Congress wanted to know was whether, in Mr. Rohn's case for example, after the oil patent had expired but the licensee was still operating under, or could be charged with operating under, any of the other fifty or sixty patents of the Minerals Separation, the licensee was free to litigate concerning being bound by these lesser patents, or was withheld from litigation by the terms of his contract. Mr. Cook again urged the appointment of a committee to discuss and ascertain all these points.

T. A. Rickard scouted the idea that anything had been accomplished by the telegram from New York, declaring that licensees had been in the soup, and were now in the mulligatawny. He proposed the plan of buying out the rights of Minerals Separation, and payment of the purchase price out of royalties; after being paid for, the processes and rights to belong to the public.

A very brief technical session was held after the termination of the forensic debate above described. Philip Argall, of Denver, read a brief paper on the history and technique of flotation; and another was presented by Dr. Francis A. Thomson. Dr. Thomson advanced some interesting figures as to the relative tonnages of ore treated by the different metallurgical processes.

The Standardization Conference

THREE conferences, over as many days, were held from Nov. 16 to Nov. 18 by the metal-mining section of the standardization committee, under the chairmanship of Charles A. Mitke, of Bisbee, Ariz. Arthur Notman, mine superintendent of the Copper Queen branch of the Phelps Dodge Corporation at Bisbee, read an interesting paper on standardization of machine drill parts that had been prepared by a member of the company's engineering staff. This, together with the discussion that followed, occupied the entire time of the first session.

At the second session on the following day the program was more varied. Mr. Mitke, the chairman, after calling the meeting to order, read a paper prepared by himself on "Relation of Standardization to Mine Management." Mr. Mitke summarized conditions existing in the mining industry and told of efforts being made to standardize equipment.

Too much dependence is placed on practical experience, he continued, and too little on scientific principles in mining. Speaking of equipment, Mr. Mitke said that the mining industry is using many different rock drills and the effort to keep up to date causes frequent scrapping. These drills are designed to keep up with the needs of the industry, but the trouble is that they represent the varying ideas of many individuals. In closing, Mr. Mitke said that standardization does not preclude innovations. He then introduced Dr. P. G. Agnew, of New York, secretary of the American Engineering Standards Committee.

Dr. Agnew discussed the work of the committee, the scope of which, he said, was very broad. The old definition of standardization, he said, was crystallization and stagnation. This, he asserted, is now untrue. Taking the incandescent lamp as an example, he claimed that the public would never have profited by the research work spent on the lamp if it had not been for standardization.

A paper on the standardization of mine accounting was read by T. T. Brewster, of St. Louis. Colonel Milliken, of the Industrial Car Manufacturing Institute, of Pittsburgh, had his address put in the record without reading. He suggested that the committee should not try to cram standards down people's throats, but, instead, should recommend practices. He remarked that it was noticeable how few standards there are in building mine cars.

At the third and last session, Dr. George K. Burgess, chief of the division of metallurgy of the U. S. Bureau of Standards, described the functions and scope of work of the various divisions of the Bureau.

Committee's Work to Include Operation

Following Mr. Burgess' remarks, the chairman announced that it had been decided by the American Mining Congress, and by other societies which had allied themselves with the Standardization Division, that the scope of the various working committees of both the coal and metal sections be enlarged to cover operation as well as equipment.

T. O. McGrath, chief accountant of the Shattuck-Arizona Copper Co., of Bisbee, Ariz., read a paper on "Standardization of Metal Mine Accounting," in which Mr. McGrath confined his discussion to the fundamental principles of general accounting and to a recommendation for cost accounting which can be adopted as standard by all metal-mining industries. An interesting feature of this report was a chart giving what Mr. McGrath termed a flow sheet of the mining business.

The preliminary report of the timber committee was to have been presented by John Kiddie, superintendent of the Arizona Copper Co.'s mines at Morenci, Ariz., in the absence of Norman Carmichael, chairman of the committee. Mr. Kiddie was unable to be present, however. The final report is expected to be out next year. It will cover the operations of seventeen companies handling a quantity of timber estimated at 114,000,000 ft. per year.

CHARLES A. MITKE

Will Counibear's report as chairman of the committee on fire fighting equipment was read by another in his absence.

Dr. F. G. Cottrell, Director of the U. S. Bureau of Mines, addressed those present on the standardization work of the Bureau, giving a résumé of the work that had been prepared by O. P. Hood, who is the engineer in charge of the mechanical department of the Bureau.

Norman Braly, general manager of the North Butte Mining Co., and chairman of the committee on steel, expressed his opinion that the standardization of rock drills will necessarily be slow. Three companies have grown up, he said, that have records of which they are proud, and it will be difficult to get them to change their designs. He also pointed out that many operators on buying new machines strip them and put their own fittings on. Manufacturing companies have been asked

if they cannot work out standard fittings. In his opinion, operators are not capable of designing a machine drill.

A paper on mine accounting by Lawrence Diffenderfer was presented by title by T. O. McGrath. Joseph F. Merrill, director of the School of Mines and Engineering of the University of Utah, and representing the World Metric Standardization Council, introduced into the record a paper entitled "Why Not Adopt the Meter-Liter-Gram."

National Mine Tax Conference

THE practical and constructive character of the convention was emphasized by the action of the National Mine Tax Conference, which convened as part of the Denver meeting. The most important findings of the tax conference were embodied in resolutions calling for national legislation to enable the President to appoint a bi-partisan board of special commissioners of revenue to effect prompt determination of accumulated war taxes, and in resolutions urging the immediate repeal of the excess-profits tax and pointing to unfair administrative regulations under the existing revenue act. The text of these resolutions is given elsewhere in this issue.

The conference was conducted by the Tax Committee of the Mining Congress, headed by Paul Armitage, of New York, and by Robert G. Wilson, chief of the tax division of the Mining Congress. The successful effort to confine the proceedings exclusively to practical discussions was due in large measure to the participation of J. C. Dick, chief of the subdivision of natural resources of the Bureau of Internal Revenue, and Robert N. Miller, former solicitor of Internal Revenue.

Other authorities who responded to the inquiries and suggestions of the delegates were Paul Armitage, R. C. Allen, George E. Holmes, William B. Gower, T. O. McGrath, Robert G. Wilson, and Cass Fisher.

The resolution recommending the creation of a board of ten men at a salary of $25,000 each, to sit for one year, was criticized during the conference by some of the delegates on the ground that it would be impossible to get Congress to authorize the appointment of such a committee. This resolution, with the specification as to salary omitted, was later reported to the convention and adopted. The report made on it by the Committee on Taxation, headed by Paul Armitage, of New York, is given in part as follows:

Many large taxpayers, employing expert talent to present and argue their cases, have been able to settle their taxes with the department for the war period and up to the present date. But thousands of smaller taxpayers find their cases still unsettled, even so far back as 1917, and are either worrying over the amount of additional taxes they may be called upon to pay, or are blissfully unconscious of the claim which the Government may at any moment assert against them.

The Revenue Act of 1918 contains several extraordinary relief provisions such as the provision for inventory losses, amortization of war facilities and the treatment of net losses arising within the period beginning Nov. 1, 1918, and ending Dec. 31, 1919. These special provisions are peculiar to the problems of taxation arising during the war period and immediately thereafter. Their administration is throwing an additional and extraordinary burden upon the Bureau of Internal Revenue. The questions arising in the course of their administration, together with the difficulties of valuation that enter in the computation of invested capital, require the keenest intellect, the soundest judgment and the widest discretion for their proper solution.

We propose, therefore, that the American Mining Congress recommend to the Federal Congress the enactment of a statute authorizing the President to appoint, by and with the consent of the Senate, a bi-partisan board of ten men, composed of lawyers, accountants, engineers and business men, who will sit for a period of one year, to pass upon and settle the cases of taxation arising during or consequent upon the wartime period of 1917 to 1920, both inclusive.

Your committee believes that men of the character and ability required to perform the important duties of this board could be found if the work would not last for a period of more than a year and the compensation were commensurate with their ability. We therefore strongly urge that the compensation to each member of this board should be fixed at a sum not less than $25,000 per annum. It must be borne in mind that this board will have an exceptional and extremely difficult task, to which the very best talent should be directed, and men of the stamp required must be paid at a rate somewhat approaching the current market value of their services, and that to take less able men or to attempt to attract able men by offering compensation ridiculously below the value of their services would be a short-sighted policy certain to doom the whole plan to failure.

The Gold Conference

THE National Gold Conference opened on Tuesday morning, Nov. 16, with Harold N. Lawrie, the economist of the American Mining Congress, in the chair. It seemed as if little could be said that had not already been spoken on the subject of relief for gold producers. The meeting, however, was well attended by representative men of the gold mining industry.

Mr. Lawrie, in a few preliminary remarks, pointed out the need of increased production of gold, in order, as he put it, to bind up the financial wounds of the country. As chairman he then introduced the first speaker, George E. Collins, of Denver.

Mining conditions in Colorado today are at their worst, according to Mr. Collins, who reviewed the general situation in the state. The production of metals is steadily decreasing, he said. He was not optimistic as to the outcome unless measures of relief for gold producers could be devised. The situation as affected by railroad freight rates was improving somewhat, he said, thanks to co-operation between producers and traffic managers of the various roads.

An address by Dean Milnor Roberts of the College of Mines of the University of Washington was scheduled, but as he was not able to be present, his paper was read by Horace F. Lunt, State Commissioner of Mines for Colorado.

The next paper was read by Dr. H. M. Parks, director of the Oregon Bureau of Mines and Geology. In Oregon the gold production of 1920 will not be more than one-

fourth of that of 1916, as many of the mines have shut down and more are shutting down.

W. H. Seamon, W. J. Loring, and E. P. Mathewson were appointed a committee to draw up resolutions as the result of the conference.

E. P. Mathewson acted as chairman at the afternoon session. Bruce C. Yates, general manager of the Homestake Mining Co., of Lead, S. D., described the condition of the gold industry in South Dakota. Four years ago, he said, there were forty-two producing mines in the Black Hills—now there are only two, the Trojan and the Homestake.

W. H. Seamon, president of the Trojan Mining Co., of South Dakota, presented a resolution favoring the MacFadden Bill.

Governor Emmet D. Boyle of Nevada was called upon, and confessed that after having been one of the most ardent supporters of the McFadden Bill he had been drawn into a position of doubt. The bankers, he said, had economic arguments, and there was little doubt that to date they had somewhat the better of the argument. In a later speech he noted that there were several classes of bankers, one of which favored methods for increasing the gold basis of currency; but there was a possibly larger class who accepted from the economists the quantity theory of money, to the effect that the rise in prices in the period preceding the war had been due to the unprecedented gold production.

T. A. Rickard, of California, declared himself as in a position of seeking enlightenment, and said he was anxious to be converted. He explained the British gold "premium," illustrating it by saying that the premium, which resulted simply from depreciated exchange, was greater in Italy than in England. He emphasized the point that the problem was an international one and must be looked at in that way.

E. C. Voorheis, of California, suggested the passage of a law prohibiting the sale by the Mint of gold for use in the arts, as a means for conserving the metallic basis of currency; this would have the effect, he said, of driving consumers to purchase in the open market, where a premium would actually be established.

Mr. Collins' Resolution Causes Sensation

Somewhat of a sensation was produced by George E. Collins, of Denver, who proposed, in case the bankers opposed measures for the relief of gold miners, that the program should call for the following resolution:

Whereas, The gold producers of the United States are in urgent need of assistance to maintain their properties and organizations in such condition as shall permit them to maintain production, in the event that the Congress of the United States shall, through the McFadden Bill or other means, provide assistance such as shall enable them to operate; and,

Whereas, The opposition by certain interests to the McFadden Bill suggests the possibility that this sound and well-considered measure may be delayed in passage through Congress; therefore, be it

Resolved, That the Directors of the American Mining Congress immediately take such measures as may be necessary, in the event of the failure of passage through the forthcoming short session of Congress of the McFadden Bill, to organize the gold producers of the United States and Alaska for the following purposes:

A. To deposit the gold produced by them in the Mint and demand coined gold in exchange therefor.

B. In the case of gold ore sold through smelting companies, to arrange for the equivalent of the gold contained to be deposited in the Mint, withdrawn as coin by the smelting company, and delivered to the producer in settlement for the ore.

C. To place such gold in circulation, by using it in liquidation of payrolls, in payment of supplies, etc.

D. To arrange with local bankers in gold-producing localities to furnish gold in all withdrawals to an amount equivalent to deposits of gold made locally with them.

E. To provide for cases where local banks are unwilling to adopt this course, by the organization of a central Gold Bank, with branches in various mining camps organized under the state banking laws.

F. To conduct a concerted propaganda in favor of the use of gold and silver, or gold or silver certificates, in preference to Federal reserve notes.

The Tariff Conference

At the tariff conference on Thursday, Nov. 18, Nelson Franklin presided. He stated that legislation was needed to protect the little industries of the country. He had been in Washington trying for seven months to get a tariff on tungsten. This bill had passed through the house, but in the Senate, to his great disappointment, had been crowded out by consideration of the League of Nations. It would come up at the next session. The bill providing for a zinc tariff was also on the calendar of the Senate. He feared that it would be difficult to get legislation on any other metals before March 4; but he believed that the first session thereafter would see tariff bills on all war minerals. As for tungsten, the cost of production was $13.60 per unit of 20 lb.; while Chinese tungsten was being delivered in American ports for $5 per unit. The present bill provides for a tariff of $9 per unit, which would allow producers to reopen their mines. At present there is no tungsten mine in operation in the United States.

E. C. Voorheis, of California, owner of the Atolia tungsten mine, said that tungsten mines cannot be operated in the United States without a tariff. Enough Senators were pledged to pass the bill, and he hoped for favorable action by the President.

Congressman Charles B. Timberlake, of Colorado, the author of the tungsten bill, gave as his interest in the matter the necessity for this country to protect itself in the event of future wars by supplying itself with war minerals.

Judge John F. Davis, of California, urged for the cessation of cheap criticism of Congressmen and Senators. A. Cressy Morrison described the ferro-alloys and their uses, and pleaded for the protection of the ferro-alloy industries.

Herbert Wilson Smith spoke in favor of protective tariffs on the lesser minerals, and against the theory of the conservation of their supply in this country.

The Oil Shale Conference

Discussions of cost of mining and method of treating oil shales characterized the Oil Shale Conference, which was held on Thursday afternoon, Nov. 18, in the Albany Hotel. Dr. Victor C. Alderson occupied the chair. A paper entitled "The Next Mining Problem," by M. G. Gavin, of the U. S. Bureau of Mines, was read in the author's absence. Mr. Gavin said that the mining of oil shale is likely to be the greatest item in the total cost of placing refined shale oil products on the market. A reduction of 10 per cent in the cost of mining is likely to be equivalent to a reduction of as much as 25 per cent in the cost of retorting or oil refining operations.

The problem of securing and housing mine labor for the American oil-shale industry, according to Mr. Gavin, deserves serious consideration, as ultimately the labor employed will be comparable with that of the present coal-mining industry.

G. B. Morgan, state geologist of Wyoming, discussed Wyoming oil shales. At present there is very little prospecting for shales in that state, he said, but there was likely to be in the near future. He gave a brief description of the geology of these formations. They had been sampled, he said, by the Geological Survey and some analyses running 23 to 60 gal. oil per ton had been received in the state geologist's office. Wyoming will run Colorado a close second in the oil shale drive ahead, he prophesied.

Horace F. Lunt, state commissioner of mines for Colorado, spoke on "Mining for Oil." He was followed by Dr. Alderson. The cost of mining Scotch oil shales was covered briefly by the chairman, who said that the Scotch miner, working on the equivalent of the ordinary leasing system, received $1.14 per ton of shale mined from the company. There was some disagreement between Messrs. Lunt and Alderson as to the cost of mining shale, which was apparently settled finally to the satisfaction of each.

J. B. Jensen, a petroleum geologist of Salt Lake City, had prepared a paper on "Colorado and Utah Shale Fields," but was unable to present it.

Dr. David White, of the U. S. Geological Survey, was present, and, though not on the program, gave a short talk on the shale deposits of the East and the West at the invitation of the chair. Such deposits, Mr. White said, were fairly widespread in the United States, but those in the Eastern States rich enough to be worth distilling are restricted in area. Following this the meeting adjourned.

War Minerals Conference Reviews Work of Past Year

The delegates to the convention of the American Mining Congress who were interested in the War Minerals Relief Act and its administration met in informal conference Wednesday morning, Nov. 17. Judge John F. Davis, of San Francisco, presided at this meeting, which was devoted to a consideration of a year and half's administration of the War Minerals Relief Act, and the further remedies, through legislation and otherwise, necessary for claimants whose claims have not been adequately adjusted.

Herbert Wilson Smith, chief of the war minerals division of the Mining Congress, made a statement of the organization's activities on behalf of war minerals claimants, covering the first session which led to the passage of the act, the appearances before Federal Congressional committees, and before the Secretary of the Interior, and concluded his statement by presenting the brief submitted by the American Mining Congress to the Attorney General of the United States, on the question of the existing ruling on the validity of a request or demand.

John H. Haak, of Oregon, made a statement concerning his own experience in Washington in the presentation and collection of his own claim. Mr. Haak said in part: "I have had my claim adjusted, and am satisfied with the adjustment made. It was, however, a tremendous strain. Many claimants in Oregon received nothing, others very little. The same is true in California."

To meet this situation the American Mining Congress is now urging the enactment of a bill providing for an appeal from the decision of the Secretary of the Interior for dissatisfied claimants to the Court of Claims. This bill has already passed the Senate, and the claimants in conference moved that a resolution be drafted urging the immediate passage of this legislation.

At the close of its conference the following resolution, introduced by A. Cressy Morrison, was adopted:

It is the desire of the War Minerals Conference to give expression to its recognition that the work performed by Herbert Wilson Smith in behalf of the war minerals claimants has called for a broad knowledge, diligence, patience, poise, and withal a common sense which is the outgrowth of an exceedingly well-ordered mind.

All of these qualities are manifested to a high degree in his report; in the result so far obtained, in the superb marshalling of facts in his brief, filed with the Attorney-General, on the purpose and application of the law, and his plans for future action.

The Educational and Public Service Conference

When the Educational and Public Service Conference met, a paper was presented, written by H. H. Stoek, dean of mining at the University of Illinois, Urbana, Ill., on the importance of English in the curriculum of engineering students. A lively discussion arose as to the importance of having English taught by engineering professors and in such a way as to couple it up closely with professional needs. Those present were strongly against regarding English as a cultural subject and emphasized that it should be taught merely as a tool for the engineer's use. It seemed to be the general consensus of opinion that engineering students strongly resented spending any time in the study of English.

The Columbia School of Mines, New York, had appointed Thomas B. Stearns and Edward W. Parker as its representatives, Robert Peele, professor of mining at the same school, sending a paper on the importance of mathematics in the engineering curriculum, which was read by A. X. Illinski, president of the New Mexico School of Mines.

After a lunch at which A. Bruce Minear, secretary of the mines division of the Denver Y. M. C. A.'s industrial department, and others spoke, the meeting proceeded to organize, and Charles H. Fulton, director of the Missouri School of Mines, Rolla, Mo., was elected chairman, the vice-chairmanship going to A. X. Illinski. Francis A. Thompson, dean of the Idaho School of Mines, was elected secretary. Mr. Thompson had been presiding officer of the conference. The executive committee members appointed were C. H. Clapp, president of the Montana School of Mines, and Dorsey A. Lyon.

Morton F. Leopold, safety engineer of the U. S. Bureau of Mines, Washington, D. C., talked on the educational work of the Bureau. Edward Higgins discussed the mine-accident prevention work in California. Dr. David White, chief geologist of the U. S. Geological Survey, made an address on the work of the Survey, and Dr. F. L. Ransome, also of the Survey, presented other considerations of like character. Dr. Henry Landes, state geologist, Seattle, Wash., described the work of his department, which is run in co-operation with the Geological Survey. During this conference other addresses were also delivered, including one by I. A. Palmer, professor of metallurgy in the Mackay School of Mines, Reno, Nev.

Government Officials Influential in Mining

Louis T. McFadden

By Paul Wooton

SINCE Louis T. McFadden, who represents the Fourteenth Pennsylvania District in Congress, has been at the head of the Banking and Currency Committee of the House of Representatives, that committee has been one of the most active in the House. An idea of its activity may be obtained by glancing through its record during the last Congress. The following bills which came within the jurisdiction of the committee were enacted into law: Amendment to the Federal Reserve Act relating to financing exports; amendment to Federal Reserve Act to permit banks to invest in stocks of corporations engaged in financing exports; amendment to Federal Reserve Act relating to rediscounts and excessive borrowing; amendment to revised statutes relating to discounting of commercial paper secured by warehouse receipts; various amendments to the Farm Loan Act; purchase of farm-loan bonds by the Treasury; gold certificates of the United States made payable to bearer on demand, legal tender; negotiation of and signatures for circulating notes; private bankers permitted to accept directorship in export finance corporations; investigation of short-time rural credits; and abolishment of subtreasuries.

LOUIS T. McFADDEN

Mr. McFadden is widely known for his efforts to prevent the confirmation of John Skelton Williams as Controller of the Currency. He has vigorously pushed his bill providing for a premium on gold, and has been actively interested in various pending measures having a bearing on the currency system.

Of all of the measures initiated by Mr. McFadden, none has attracted the attention of bankers, financiers, economists, miners and the public in general so much as the bill providing for a premium on domestic gold production. The fixed price for gold placed a serious handicap upon the gold producer. Increasing costs for both labor and materials decreased his margin of profit until many gold mines were compelled to shut down, others to curtail, and still others, more courageous, to operate at a loss. The bill provides for a tax of 50c. per pennyweight of fine gold contained in all gold manufactured, used, or sold for other than coinage or monetary purposes. A premium of $10 per fine ounce is to be paid to the producer of new gold in the United States or its possessions for a period of five years after May 1, 1920, from the proceeds of this tax. The manufacturing jewelers and certain financiers have opposed the bill, but it has been looked upon more or less favorably by many not especially included in the gold-mining industry. Needless to say, a substantial proportion of gold producers in the United States and Alaska favor the bill. The unfavorable report by the gold committee of the American Bankers' Association was ably answered by Mr. McFadden, who said: "Particularly, in view of the fact that Congress has fixed the price of gold, it seems that Congress has now the power to stimulate the production of gold by creating the machinery whereby the consumer of gold in the industrial arts may pay more nearly the cost of production for his raw material, thereby enabling the producer of new gold to increase his output to meet the industrial requirements of the arts and trades and protect the monetary gold reserves from further industrial depletion."

Mr. McFadden was born in Troy, Pa., on July 25, 1876; was educated in the public schools of Bradford County, and was graduated from Warner's Commercial College, Elmira, N. Y. In early life he worked on a farm. At the age of sixteen he entered the employ of the First National Bank, Canton, Pa., as office boy; in 1899 was elected cashier of that bank; in 1906 elected treasurer of the Pennsylvania Bankers' Association; in 1914 elected president of the same banking organization; and in the same year was appointed by the agricultural societies of Pennsylvania as a trustee of State College to fill a vacancy caused by the death of ex-Governor James A. Beaver of that state. In 1915, Mr. McFadden was elected to represent his Congressional district in the national House of Representatives. Since that time he has been returned to Congress with increasingly large majorities at each succeeding election.

By the Way

The Lone Prospector

I

The Lone Prospector he come a-trampin' up the track,
Come a-trampin' up the track, as spry could be,
Punchin' ahead of him his twinkle-legged little jack,
Loaded down with two months' bacon, beans and tea.

"Durn ye, Jack, me boy," says he, "we're off to the hills—so smile!
And we'll camp at the spring we know a month or more
Where the water's fine, and the grass is green, and we look a hundred mile,
And the country looked bully when we were there before.

"I'm a natural prospector," he says, "with a natural nose for ore,
Not like them spectacled hobbled half-blind fellers you see
Havin' a nose for books and whys that puzzle 'em all the more,
And that there mountain looks pretty gosh-blame good to me.

"Hi you, Jack, you cuss, wake up and chase yourself, back on the trail,
Or I'll bust your head, next rock I have to throw—
You can betcher sweet life this time I'm bringin' home the kale,
When we come a-loaded with samples, down below:

"Won't old Silberstein look up from sellin' his pants, and grin,
When I show him the quartz with the gold stickin' out all roun'—
Lucky day fer him when he grubstaked the pair of us in—
Now he can build the swellest palace for pants in town!

"Me—I'll build me a house with twenty rooms and a cellar of wine,
Buy me a auto or two, and a orchard planted to fruit;
Dagoes and hunkies can do all the work, while I set under me vine,
Wearin' my slippers and puffin' away at the big cheroot;

"Handin' of em out to the boys when they come hikin' along,
Tryin' to find out the facts of what they heered might be true,
How I struck it so rich, and how the lode I found was so strong,
Searchin' in these here hills that we're jest a-comin' up to.

"You, Jack —— hi, there! Git back on the trail
You —— —— —— —— —— —— —— ——!
We want to git *some* place to camp before the sun goes down!

II

"One side falls the canyon, on the other is the cliff,
And the sun is bright, and the air is free and fine—
Wait till we strike that limestone contack, and foller up that float
Where the granite shows, not far above timber-line.

"There's no tellin' how big that lode, nor tellin' how much she will run;
Comstock was located by men with sagebrush in their hair:
Look at Butler, Stratton, or Frenchy that lit on the Flin Flon—
Yet the puttee-legged experts had damned 'em all fer fair!

"All the bonanza mines has been found by some poor prospectin' dub,
Sometimes a drunk, or a burro in other cases yes:
Therefore you and me, Jack, and the bottle in the pack
Surely combines the three—and here's to our success!

"Listen! we've got to get above timber-line, Jack, me lazy lad,
Where it's harder to live is where the mineral's more;
God A'mighty figured where he couldn't raise no grass,
Should be somethin', so he seeded it down to ore.

"Stuck in the quartz and the free, and soaked in the whoopin' veins
Needin' us to find, then capital and a mill—
Needin' a lot of water—and we'll pump it from the plains,
And we'll have a railroad zigzaggin' up that hill.

"Down there in the canyon we've got to build a bridge—
Hell! what's that, with a lode so big and rich and bold?
Millions of tons—bet the Guggies 'll try to buy me out—
Nothin' doin'! Silberstein and me will hold.

"Raise a little dough and build a dandy hoist and mill
Sell some stock, and lay the rails, and make a winner—
I'll be railroad president, and git a pass to Frisco,
Sittin' in the smoker till the n'gger calls fer dinner!

"So hi, there, Jack! Git back on the trail
You —— —— —— —— —— —— —— ——
—— —— —— —— —— —— —— ——
"We got to git *some* place to camp before the sun goes down!"

An Obituary

"Come 'ere, m'son," said Cap'n Dick, "Ere's a bit of a story I read in one o' they Western papers h'other day. Told by a chap named Crowley, an', dam-me, 'e's some beauty too. 'Ere's tha way she goes: "T'wuz daown on Mo'arve desert, nigh h'on ten year h'ago,—I wuz nothin' moor'n a bloke then, putterin' raoun' Grass Valley—Bill an' Dick 'ad been prospectin' together, 'avin' a bit o' luck naow an' again. I 'appened to be in Barstow with feyther, one time, w'en they come h'off tha desert. Tidy bit o' money they 'ad, I 'eard feyther say. An', min' you, 'ot h'ol town wuz Barstow them days, too—dancin' 'alls an' poker playin' tha 'ol bloody night. Splendid drinkin' men they were, too. Stony broke in less'n a week, so back they gaws to tha 'ills. Some years later Dick died, so I 'eard. Sleepin' in tha tent long side o' 'is partner w'en one o' they tarantulas, or scorpions, or some h'other bloody reptile, bit 'e on tha 'and, an' w'en Bill went for to call un nex' moornin' 'e were dead. So Bill 'e brings tha remains to Grass Valley. Church-goin' people there wouldn't look at un, for don't suppose poor Dicky 'ad been h'inside a church for twenty year, nor 'ad Bill. 'E 'ad devil's h'own time for to get six men to pack un to tha cemetary—w'ot dost thee call un, pall-bearers? H'at tha grave Bill h'asked some one to say a few words or read sumthin', but, dam-me, nobody sez nothin', so Bill takes h'off 'is 'at an' sez, 'Afor' we puts un daown I mus' remark that h'our friend 'ere wuz a 'andy man with a 'ammer, an' as tasty raoun' a set o' timber as h'ever I 'opes to see. 'E loved 'is glass o' beer an' 'is shot o' 'ooch so well as h'any man present. Give un two bells.'"

Nome Deserted

The housing situation is said to be easier in Nome. Recent reports state that only 200 persons remain in this once famous mining camp, which in 1898 boasted a population of 15,000.

CONSULTATION

The Pumice Industry

"Will you please give me some information in regard to the pumice-stone business—its supply and demand. Is there a market for it? What is it worth? Any other information which will furnish an idea of the situation in this country will be greatly appreciated."

Before the war those trades which used the best grade of pumice, that is, lithographic work, copper, silver, and other finishers who polished metals with pumice before plating, depended almost wholly on imports of Italian pumice, which could be supplied in lumps of very fine even texture containing no extraneous material. As imports of Italian pumice were prevented in 1918 by an embargo, consumers in the United States had to rely upon available stocks and domestic supplies. The domestic production came chiefly from California, near Mount Shasta and the Salton Sea. Although not as high grade a material as the imported varieties, the domestic supplies satisfied ordinary requirements. According to the U. S. Geological Survey, the domestic product is not properly called pumice, as it consists almost wholly of finely comminuted volcanic dust or "ash" composed of minute fragments of pumiceous, glassy lava, but it differs little from the product made by grinding the imported lump or black pumice, and may be substituted for it.

Besides the difference in quality between the domestic and foreign pumice, there is the higher cost of production for the American variety. The lower production cost that most Italian pumice possesses is an advantage in competition with the American material that is augmented by the foreign exchange situation, which virtually acts as a premium to the Italian producer. Foreign pumice can thus stand increased ocean freight rates and higher labor costs and still compete with American material. For these reasons and high domestic costs, the deposits of lump pumice in California which were worked during the war have been abandoned.

In 1918, six states produced pumice for abrasive purposes. They were, with the counties responsible for the output, California, from Humboldt, Inyo, Imperial and Siskiyou counties; Kansas, from Harper, Meade, Morton, and Phillips counties; Nebraska, from Furnas, Lincoln, and Harlan counties; South Dakota, Custer County; Idaho, Cassia and Power counties; and Utah, Willard County.

The pumice produced and sold in the United States, as given by the U. S. Geological Survey, follows:

Year	Quantity (Short Tons)	Value	Price Per Ton
1910	23,271	$94,943	$4 08
1911	21,689	88,399	4 08
1912	27,146	86,687	3 19
1913	24,563	55,408	2 26
1914	27,591	59,172	2 14
1915	27,708	63,185	2 28
1916	33,320	82,263	2 47
1917	35,293	84,814	2 40
1918	30,637	91,178	2 98

The demand for pumice is now about on a war level. Prices vary widely. Domestic lump is quoted in the market report at 6c. per lb. f.o.b., New York; imported grades 4@50c. per lb., New York.

Copper Yield and Most Important Producing Districts

"I would like to know how the average grade of copper ore treated by the copper mines and mills of the country has varied during the last ten years or so, and also how the largest copper-producing districts, not states, rank in order of production."

The average copper content of the copper ores produced in the United States has shown an almost unbroken decline. In 1906 it was 2.50 per cent; in 1918, the last year for which the U. S. Geological Survey has furnished complete statistics, the yield was 1.51 per cent. The following table brings out the rate of decline:

	Copper Ores Produced in Tons	Per Cent Yield in Copper
1906	18,000,000	2 50
1907	20,253,000	2 11
1908	22,290,886	2 07
1909	27,932,618	1 98
1910	28,497,238	1 88
1911	29,988,235	1 82
1912	35,656,414	1 71
1913	36,336,682	1 67
1914	35,175,541	1 60
1915	43,404,182	1 66
1916	57,863,365	1 70
1917	58,482,694	1 60
1918	62,289,069	1 51

The ten most important copper-producing districts, in the order of importance, are (1) Butte, Mont.; (2) Lake Superior, Mich.; (3) Bingham, Utah; (4) Globe, and Miami, Ariz.; (5) Bisbee (Warren District), Ariz.; (6) Jerome, Ariz.; (7) Ely, Nev.; (8) Ray, Ariz.; (9) Santa Rita, N. M.; (10) Morenci-Metcalf, Ariz.

Electrolytic Purification of Clays

"Have you any information regarding the electrolytic treatment of clay in order to eliminate certain impurities such as iron compounds, feldspar, and other compounds? This is a new angle to clay purification to me, and I am anxious to get all the references possible."

Clays are ordinarily purified by washing and gravity separation. The electrolytic purification of clay is a recent development upon which little has been published. The South African *Journal of Industries* in its September, 1920, issue calls attention to the utilization of electrolysis for the separation of impurities in china and other clays. According to this publication, the clay is mixed with water, certain alkalies are added to the solution, and the mixture is allowed to settle and become more liquid. The passage of an electric current through the solution causes the particles of clay to collect at the anode while the impurities, mica, feldspar, quartz and iron compounds, are either precipitated or migrate to the cathode.

On an industrial scale the process is carried out in a large vat, in which slowly rotates a metal cylinder, forming the anode and near which the cathode is placed. The clay paste, after the electrolyte is added, is left to clarify in other tanks, and is then passed into the electrolyzing vat for final purification, when it is collected by special rakes.

In addition to being pure, it is stated that clay thus treated has a lower temperature of agglomeration, moulds more easily, and is more plastic and refractory.

THE PETROLEUM INDUSTRY

A World View of the Oil Supply

Considerations Governing a System of Priority in Uses of Petroleum — Advocation of Open-Door Policy in Development of Future Resources — Need for Thrift in Safeguarding Production and Consumption, and for an Adequate Distribution Plan*

BY GEORGE OTIS SMITH
Director, U. S. Geological Survey

THE present realization of the world's interest in its supply of petroleum has naturally led to estimates of recoverable resources, first in the United States and then in other countries; and whether we dignify these quantitative measurements of oil reserves by terming them official estimates, or describe them by calling them scientific guesses, they are the best we have, and they will serve fairly well in guiding national and international action.

It may be noted that the U. S. Geological Survey's estimate of the petroleum resources of the world shows that the distribution, while unevenly balanced among nations, is evenly balanced between the eastern and the western hemispheres, although the northern hemisphere appears to have at least five times as much oil as the southern. This preponderance of the oil supply of the northern hemisphere should, however, be discounted by a fact and a possibility: the land area of the northern hemisphere is three times that of the southern, and the larger unexplored areas are in South America, Africa, and Oceania.

Accepting the Stebinger-White distribution of the world's oil reserves, we may roughly set down the continents in order of wealth in oil as North America, Asia, South America, Europe, Oceania, and Africa. In terms of regional distribution, more than half the world's oil reserves are believed to be concentrated in the two intercontinental areas; one of these oil-rich provinces includes the North American and South American countries bordering the Caribbean Sea, and the other includes the countries of western Asia and southeastern Europe, with the Caucasus as an axis. On these two areas, then, each comprising only about 2 per cent of the earth's surface and each containing about 30 per cent of the world's future supply of oil, is focused the attention of the great nations that most need oil.

OIL SHALES CONSTITUTE REAR DEFENSE

The resources of the world's oil shale are far too large to be lost sight of as a substitute source of oil. The United States alone is believed to possess deposits of oil shale that contain at least ten times as much oil as there is natural petroleum available in North America, but oil won by mining and distilling these shales, situated in the interior of a continent, cannot enter the world's markets as labor-cheap as the petroleum that flows from Mexican wells close to the coast. Such resources must therefore be regarded as a rear line of economic defense and as a source of power that will be of greater value to other generations than to this, even if a more general utilization of oil shales begins in the near future. No other continent is known to have resources of oil shale at all comparable with those of North America.

In this rapid review of the world's sources of energy we see North America taking first rank among the continents, with Asia a close second and Europe a poor third, although we should remember that Europe has a much smaller area than either of the other two.

COAL REPLACEMENT BY OIL IMPOSSIBLE

If we should put the whole burden of power production on our coal mines, not using even the water power now used, we would find that by adopting the best steam practice of today the present power requirements of this country could be met with coal for 57,000 years, although we know that long before the end of that period the greater depth of the coal mines and their increased distance from market would alone create power demands for mining and transportation that would considerably cut down the amount of power available for other uses.

A comparison between three sources of energy—water, coal, and oil—becomes striking and instructive when we consider the adequacy of the petroleum reserves of the United States to drive the prime movers of the country. Adopting the best steam practice of today, as known in the largest public-utility stations where fuel oil is used, and trying to carry the whole power load of the country with oil alone, we find that the oil reserves of the United States, although measured by billions of barrels, would last only nine years and three months. Without allowing for the fact that steam raising for power is but one of the many uses of coal, these two figures—57,000 years and 9¼ years—are sufficiently impressive to make us fairly receptive to the general truth of Mr. Eckel's statement in his recent book "Coal, Iron and War": "We have just as much real chance of replacing coal by oil as we have of finding enough gold to use it in place of steel."

Granting that we have not enough oil to permit its utilization where either coal or water power can be had, we face the question of priority in use. First in any priority list must stand essential uses, in which there are no adequate substitutes. In view of the rapid increase in the employment of machinery, first thought should be given to the unique function of oil—that of saving power. The world will always need a supply of

*Abstract of an address delivered at the meeting of the American Petroleum Institute, Washington, D. C., Nov. 17, 1920.

lubricants, and as the demand will be an increasing one, no adequate substitute for the lubricating oils and greases now derived from petroleum appears to be available. The claim of illumination for priority is less well established if we regard the future, for the kerosene lamp and even the fixtures burning oil-gas or enriched water-gas must eventually give place to the electric light as this world of ours is more and more covered with a network of transmission lines. At least we may set down this use of petroleum products as of larger importance at present than in the future.

Priority Use in Motive Power

The "flash point" in any discussion of priority in the use of petroleum products is reached when any curtailment in the use of gasoline by pleasure automobiles is suggested. Yet by every known rule of determining priority, the non-essential use is the first to be regulated, and this use of a petroleum product as a luxury can find no economic justification in comparison with its commercial use. A more logical plea for motor fuel can be made, however, by the trucks that already form so large a part of our distribution system and the tractors that by the million will soon be helping to meet the world's increased demand for food. Truck and tractor must be given the first places in the long line of automobiles seeking motive power at the gasoline station.

Fuel oil has won favor as a source of power for transportation because it has been relatively cheap, is easier to handle, and occupies less space than the equivalent heat units in the form of coal. In these respects fuel oil is superior for use in transportation, and this use deserves priority over that for firing stationary boilers, for which coal should be substituted. Indeed, thoughtful regard for the future leads us to disallow even the claim of steam locomotives for fuel oil, for electrification of the railroads by water power alone or from water-power stations and steam stations linked together is now the obvious way to make the best use of our resources of expendable fuel. Austria, bankrupt in fuel, having lost her coal and oil, has begun to electrify half her railway mileage. Shall other nations wait until they too are bankrupt in oil before awakening to the need of a change in sources of power?

Yet in acknowledging the superior claim of the marine use of fuel oil, this priority must be qualified by the condition that even on the seas the best use should be made of the invaluable fuel. The marine steam engine, even of the turbine type, must give place to the heavy-oil engine, under the rule of getting the most out of a limited resource. The very facts that support the argument for the marine use of fuel oil—greater efficiency and economy of space and labor—can be cited in favor of the internal-combustion engine of the Diesel type as against the steam engine. The increased thermal efficiency of the new engine, with its resulting addition to available cargo space or to cruising radius, is more than 2½ times that of the steam engine. The experience of the Bethlehem Steel Co. is that its new oil-engine ore-carrier, the "Cubore," in continuous service between Cuba and Sparrows Point, Md., uses only 36.7 per cent of the fuel oil consumed by a sister ship differing only in that it has the most modern type of steam plant. The tremendous economy thus possible in the marine consumption of fuel oil demands the immediate adoption of internal-combustion engines if the world wants to make the largest use of its oil resources for the longest time.

The monthly consumption of crude petroleum in the United States and the exports of refinery products, taken together, have but once in the last two years been less than our domestic production, and for about half of the time the consumption has exceeded both the domestic production and the imports. This living beyond our means makes the question of our present oil supply not only a national but an international problem. And the outlook is not improving; indeed, never was the gap between consumption and production wider than it is now. Our monthly statistics take on the importance of danger signals, which must be read "Run Slow." Perhaps these figures can be best grasped if they are stated in terms of a daily balance sheet. In September of this year, as in August, the daily output of the United States oil wells was slightly over 1¼ million barrels, but the daily consumption rose to 1⅝ million barrels. This daily deficit of three-eighths of a million barrels was met by imports from Mexico. To this extent, then, we are already dependent upon a foreign supply of oil, and even our accumulated stocks of domestic oil at tank farms, although a reminder of the days of plenty, afford too small a promise of relief, for the oil really available in storage is less than that which will be imported from Mexico this year. Although reputed to be the nation richest in oil, the United States cannot stand alone.

The standing of this nation as the world's leading oil merchant has been based upon its plentiful supply of the raw material, to which have been added skill and ingenuity and courage at every step of oil production, oil manufacture, and oil finance. American methods and equipment and supplies have found world-wide acceptance, and the standing of the American industry is indicated by the fact that a dozen of our oil companies can show aggregate assets of over three billion dollars. However, the past and even the present division of the world's oil output among nations is but the background for our vision of the future. Whence must we expect the world's supply of oil?

With the oil fields of the United States perhaps 40 per cent exhausted, it is not reasonable to assume that 60 per cent of the world's output will continue to come from wells in the United States.

Open-Door Policy Advocated

Our present knowledge of the facts of world supply and demand is amply sufficient to warrant us in continuing to advocate the open-door policy. Much can be gained for all nations by pooling the world's resources of so essential a raw material as petroleum. With about 60 per cent of the world's future supply concentrated in two regions, and by far the greater part of the demand outside those oil-rich regions, there must be a world commerce in oil. The United States has given to all comers, whatever their nationality, opportunity to acquire oil lands within its territory, and the new leasing law puts no limit upon foreign participation in operating the public oil lands unless there is an absence of reciprocal treatment. Of course, any nation realizes that the adoption of the open-door policy need not involve throwing away the key.

Not only has the United States been generous in welcoming foreign capital to our domestic oil fields, but it has been prodigal in marketing the products of the

American wells and refineries. Whatever our motive has been in winning so large a share of the world's oil trade, the record of the past fully justifies the United States in asking for reciprocity in the future from all other nations.

There is urgent need of pioneering the world for oil to meet requirements of this generation, but there is no warrant for regarding this advance into new fields as beginning a contest whose aim is world conquest. The present need of the United States for oil from abroad can be met only by world-wide exploration, development, and operation by American companies backed up by our Government; and we should expect other nations that are embarrassed by a similar or even greater discrepancy between consumption and production to adopt the same policy.

However great our own exigencies, we may set down this principle: The rights of the company that discovers and develops a foreign oil supply are subject to national rights, and even a mandatory is created to develop the weaker nation, not to exploit it. If the nations of the world shall join to bring about a changed order, one that expresses the spirit of peace rather than of war, there can be no place in the international scheme for special partners or preferred stock, even though the Argonauts of today, in their search for a flood of oil, are seeking a treasure of far greater value than any golden fleece.

Oil Thrift Essential in World Policy

A world policy, if it is to safeguard the future, must draw up a program that will favor thrift in the use of the oil currently produced, and in that program also there must be a joining of the nations in continued effort for the common good. When the world runs short of oil, all nations will suffer, regardless of the geographic location of the remaining wells. America has led in teaching the world to use petroleum, whether in lamp or automobile or tractor, and it should be America's special duty to teach the world to use petroleum most efficiently. No longer is there any need to make a market for oil; the task is to find the oil to supply the demand already created.

Plainly, the common interest in a limited resource is not served simply by regulation of price. It is of greater consequence to the public, either the people of a single nation or humanity as a whole, that the best use rather than the freest use be made of an invaluable resource. The danger that lies in cheapness is the wastefulness of today that will lead to the consequent scarcity and corresponding high prices of tomorrow. Wise action, therefore, in behalf of this and other generations does not include the encouragement of small units in production, simply to provide competition, where large units are more efficient and economical; nor, on the other hand, should the public interest permit unlimited monopolization of any process or device that makes possible a larger utilization of a natural resource, for it is well to remember that the Constitution recognizes the "patent" idea only as a means to an end, and that end is progress of the useful arts. Whatever retards progress and fails to promote general welfare is without constitutional defense.

The application of these principles to the petroleum problem is obvious. Our plans for the future must include every possible economy in the handling of this limited resource of unlimited usefulness. We should exercise economy in the development of the resource by avoiding all the wastes of the past and present, wastes largely inherent in the small unit system of operation, with competition and mismanagement running wild. There should be also economy in use; the whole of the petroleum ought to be used, and each part put to its highest use—a purpose that is not easily attained but that should be clearly set forth and publicly accepted. No process that promotes the more efficient operation of wells or that effects larger recoveries in the refineries should be so monopolized that the economy is applied to only a part of the nation's resources; for though the owner of the patent can rightfully claim the profit to be received from the use of his invention, the public also should profit in the larger utilization of its resources as a whole, not limited to such part only as may be controlled by any one interest.

Distribution Program Should Be Planned

Economy in the transportation of oil is a topic that especially deserves the world view. As in the interstate traffic in coal, so in the world commerce in oil, cross hauls are to be avoided. Economy on a large scale demands that the oil come from sources as near at hand as possible. The conception of American tankers encircling the world with cargoes of Texas fuel is more picturesque than practical if other and nearer supplies are available. The western and eastern hemispheres should be as independent as possible, for it is indefensible waste to burn oil to carry oil across the Atlantic or the Pacific in both directions. The ideal plan for fuel-oil bunkering will provide well-distributed stations, backed up with near-by reserves of oil, and such a system seems to be an essential part of any shipping program, whatever the flag of the oil-burning ship. This type of thrift in oil would mean foreign supplies of oil with which to bunker American ships.

With five-sixths of the world's output of oil coming from the western hemisphere, however, it is too soon to expect the economy in the transportation of oil that has here been suggested, yet it is not too much to seek to make the rest of the world more self-supporting in oil and less of a drain upon the Caribbean region. A kind of oil-zoning system for the world may some day not be too extreme a proposal if we are to give full force to plans for economy in oil. So, too, a question that may sometime be asked is whether national or international oil bunker stations are better justified.

The oil problem can be solved only through a keener realization of the world's future needs and a stronger determination to serve future interests. Any taking over of the rules of war into the economic competition for new supplies of oil or for markets for oil products will waste a limited resource as well as threaten world peace. If a high executive of one of the largest steel companies can address the American Iron and Steel Institute on the Golden Rule in Business, the same thought may well be given this wider application before the American Petroleum Institute.

Diplomacy—whether Old World or New World—can offer no better guide in these questions of world economies than is found in the Golden Rule. No other theory of international conduct is so worthy of a democratic nation or can be so easily applied to practical issues, and its application to oil is absolutely necessary if we are to make the world's oil serve the greatest number of generations.

NEWS FROM THE OIL FIELDS

Deepest Mexican Well Anticipated

From Our Special Correspondent

The Aztec well, on Lot 188, Amatlan, is drilling in the limestone and is showing considerable gas and a small amount of oil. The well is being watched with great interest, as it is at a depth of over 3,700 ft. If it is brought in, it will probably mean that a deeper pool has been discovered, as the oil is reported to be of a heavier grade than that formed at shallower depths in the vicinity. It will be the deepest producing well in Mexico.

The "wildcat" well which was drilled on Lot 24, Zacamixtle, by the Huasstica Petroleum Co., on Oct. 8, was deepened 10 ft., this increasing the production to over 75,000 bbl. daily. The final depth of the well is 2,435 ft.

The Union Oil Co. drilled in its second well on Lot 114, Chinampa, on Oct. 28, and it is reported to be good for about 80,000 bbl. per day. This well was drilled to pay in two months, which is a good record for Mexico.

The Agwi Co.'s well, which is located in the federal zone of the Tancochin River near Naranjos, and which was brought in about the middle of October, has been sealed by the government pending the result of litigation between the Cias del Agwi and the Mexican Petroleum, "El Aguila." This well affects the Agwi No. 3 well on Lot 251, Amatlan, and Aguila well No. 6, on Lot 260.

The Transcontinental Co. drilled in another large gusher on its Lot 134, Chinampa, Nov. 5. The well was brought in at a depth of 1,985 ft. and is estimated at 60,000 bbl. daily flow.

Much activity is being shown in the vicinity of lot 114, Chinampa, during the last few weeks. Several wells are setting casing at depths of about 1,800 ft. and at least three others have changed from rotary to standard tools. The Pierce Oil Co. abandoned its hole at a depth of 1,200 ft. and the derricks on the Jones & Buchanan well 7 and the Buckley, Woolett & Thompson well 3 have been taken down, owing to the intrusion of the salt water. The Metropolitan and the Transcontinental rigs offsetting this lot have also been closed down. The life of this pool is estimated to be about three months more. Within the next two weeks at least three of the wells being drilled will reach the limestone if no ill luck overtakes them.

The rainy season has set in, and the roads are fit for traffic only two or three days a week. Automobile trucks and tractors are being used to advantage on the good days and they manage to keep the string of material moving which is necessary to carry out the big drilling program in Zacamixtle and lower Amatlan.

Largest Wyoming Well Is in Rock Creek Field

From Our Special Correspondent

During October 37 wells were completed in Wyoming, producing a total of 4,540 bbl. oil daily and 133,000,000 cu.ft. of gas. Of the 37 wells 29 were oil producers, 2 gas producers and the rest failures. The largest well was in the Rock Creek field, producing 1,000 bbl. daily. From this the production ranged down to 10 bbl.

The California Pipe Line Co. will build a refinery at Grenville, on the Union Pacific Ry. Material is now being received. Oil from the Lost Soldier field will be treated. This oil is now piped to Fort Steele and shipped to Salt Lake.

In the Rock Creek field the Ohio Oil Co. is drilling 25 wells. Two of these are each over 2,800 ft. deep.

The Western States Oil & Land Co. completed three producing wells during October in the Mule Creek field.

Decrease Shown in Louisiana Fields

From Our Special Correspondent

The Claiborne field of northern Louisiana is showing a decline in production. Furthermore, there is also a decrease in the number of wells being drilled, so that the drop in production may soon be considerable. Only a few wells are being completed in the deeper sand, most of the production coming from the shallow sand. Bull Bayou field is at a standstill, though Caddo has been increasing slightly. The daily production of the coastal fields of this state is about 6,000 bbl., with Vinton the largest producing field.

New Completions in Kentucky

From Our Special Correspondent

New production made by Kentucky fields during October is reported at 257 wells, of which 18 were failures, showing an increase of 34 wells over the record of the preceding month. Several completions are credited with big yields in Warren County. Future Oil Co. made a strike which started at 200 bbl. A flowing well at the first test is reported on the Tyler lease. The Davenport Oil Co. has a flowing well as its latest strike with an estimated yield of 100 bbl. A showing of 100 bbl. at the start is reported by the Elk Basin Oil Co. on the Gum lease. A total of 23 new completions in Warren County was reported.

Well 3 on Will Miller lease was struck with pay sand at 983 ft. and has flowed steadily since being brought in. No. 2 on the same lease, brought in at 486 ft., continues to flow.

Texas Companies Required To Have Pipe-Line Certificates

From Our Special Correspondent

The oil and gas division of the Texas Railroad Commission has ruled that every oil company must have a pipe-line certificate before it will be permitted to make pipe-line connections. All pipe-line companies have been advised regarding this ruling, which applies except in case of emergency and then only for a reasonable length of time. Two weeks from Nov. 13 is the time granted present operating companies in which to obtain certificates.

Texas City is rapidly becoming an oil-shipping station of the first magnitude. During October about 1,250,000 bbl. were handled through this port. Of this 980,000 bbl. were Texas coastal crude shipped to the Eastern seaboard, and 116,000 bbl. were imported from Mexico. Bunker oil to the amount of 152,000 bbl. was also loaded out during October.

In the north Texas fields Stephens County has been increasing its production by leaps and bounds. A few months ago it was in second place among the oil-producing counties of Texas, with less than 80,000 bbl. daily production, and now the daily output is over 150,000 bbl. At the same time the Burkburnett district of Wichita County, formerly the largest oil producer in the state, has steadily declined in production until now it is making little over 60,000 bbl. daily. Many wells are being drilled, however, and there is much undrilled acreage on the larger lease tracts, owing to the fact that most of the wells were drilled at first as offsets around the boundaries, so the field will continue as a large producer for some time to come. The North Extension and the Kemp-Munger-Allen sections are the most active

On the Gulf Coast big producers are still being completed in the north extension of the West Columbia field, Brazoria County. On Nov. 10 the Texas Co. brought in its No. 2 Abrams well as an offset to the No. 1 Robinson well of the Humble Oil & Refining Co. It came in at 3,125 ft., making 350 bbl., but later by the use of air the production was increased to 1,500 bbl. The Texas Co.'s No. 1 Abrams and No. 49 Hogg wells were closed in when No. 51 Hogg, a gas well, caught fire recently, but upon being reopened resumed flowing at 5,800 bbl. and 26,000 bbl. respectively.

The Canadian government has given permission for the prospecting for natural gas and petroleum and their development in the forest reserves of Western Canada, subject to certain regulations.

Annual Meeting of American Petroleum Institute

Discussion of the Financial, Political, and Utilization Problems of the Oil Industry Characterizes Sessions Held at Washington Separate Group Meetings Co-operation and Conservatism in Production, Distribution, and Use Urged

THE opening session of the annual meeting of the American Petroleum Institute was held in the ballroom of the New Willard Hotel, Washington, D. C., at 9:30 o'clock on Thursday morning, Nov. 17. Thomas A. O'Donnell, president of the Institute, outlined the purposes of the organization and the objects of the meeting. Following this, various group meetings were held in rooms of the New Willard and Washington hotels. These group meetings, of which there were seven, consisted of conferences on the following subjects: Taxation, Uniformity in Testing Methods, Utilization of Fuel in the Petroleum Industry, Transportation, Statistics, Laws and Regulations and Utilization of Fuel Oil, Motor Oil and Lubricants, etc. The meetings were well attended and many important features concerning the various phases of the industry were discussed.

At the first general session, which was held in the afternoon, the speakers were W. C. Teagle, president of the Standard Oil Co. of New Jersey, and George Otis Smith, director of the U. S. Geological Survey. In speaking on the topic "The World Petroleum Problem," Mr. Teagle stated that if foreign governments pursued the policy of nationalizing oil lands and keeping their petroleum deposits for their own future benefit, while depending upon the United States for their current supplies, it would be necessary for this country to consider the adoption of reciprocal methods to conserve its own petroleum resources. Although the United States might compel a new allotment of foreign oil territory, Mr. Teagle does not believe that such a step would be necessary.

Dr. Smith's address on "A World View of the Oil Supply" is reproduced in abstract elsewhere in this issue. A continuation of the discussion of the world petroleum problem was held at the evening session, and the speakers were Richard Airey, vice-president of the Roxanna Petroleum Corporation of the Royal Dutch group, and Frederic R. Kellogg, general counsel of the Pan-American Petroleum Co. Mr. Airey, who spoke on the attitude of Great Britain toward the petroleum problem, stated that his remarks were to be taken as merely a personal view and not as an expression of the international viewpoint. He referred to the importance of petroleum supply during the war and stated that at the end of the conflict Great Britain found her supplies so greatly depreciated that it was necessary to take decisive steps to replenish her stock. He is of the opinion that in so doing Great Britain will respect the legal rights of the United States and will work out a policy which will be fair and non-discriminatory.

One of the spectacular features of the convention was the address of Mr. Kellogg. He made scathing allegations as to the petroleum policy of the Mexican government and so sensational were these charges that the special representative in Washington of the Mexican government, R. D. Pesquiera, sought and obtained special permission from

THOMAS A. O'DONNELL

the Institute to reply. Mr. Kellogg stated that Carranza respected no rights or supposed rights of stockholders, bondholders, or others interested in railroads and other enterprises, but appropriated such utilities for his own purposes as he saw fit. However, these policies did not affect the petroleum interests, owing to certain existing conditions. Later, by means of Article 27 of the Mexican constitution, it was possible to secure the same hold on the petroleum interests.

Mr. Pesquiera, replying at a later session, denied most emphatically that Article 27 of the new constitution is retroactive. However, his defence was largely confined to generalties.

The morning of the second day's sessions was devoted to the continuation of the group meetings. At the general session held at 2:30 p.m. three speakers discussed the general subject of "Production." R. D. Benson, president of the Tidewater Oil Co., pointed out the reasons for the present high place of petroleum in industry, and stated that in his opinion it was impossible to separate the production of crude oil from its market price.

Thomas A. O'Donnell, president of the American Petroleum Institute, in speaking on the topic, "The Future," stated that one of the important factors in the extraordinary development of petroleum resources of the United States has been the opportunity for all people to participate in development.

Henry L. Doherty, of Henry L. Doherty & Co., spoke on the future of the oil industry, particularly in regard to regulation and finance. "General business conditions are inauspicious," stated Mr. Doherty, "and problems that seem no more a matter of concern to the general business of the country are in reality a greater threat to the petroleum industry than to most industries."

The general session of the evening was given over to a discussion of the subject "Consumption." Admiral W. S. Benson, chairman of the U. S Shipping Board, in speaking of the demands of shipping for oil, stated that he had found that comparatively little was known concerning the requirements for fuel oil and that considerable difficulties were experienced by the Shipping Board in securing sufficient amounts.

C. F. Kettering, of the General Motors Co., spoke on consumption as relating to the automotive industry. The final sessions were held Friday, beginning at 9:30, when the annual meeting of the Institute for reports of officers and election of officers and directors took place. All officers and directors were re-elected for the ensuing year as follows: Thomas A. O'Donnell, president; S. Messer, vice-president; Henry L. Doherty, vice-president; J. W. Van Dyke, vice-president; H. F. Sinclair, treasurer; R. L. Welch, general secretary and counsel; C. C. Smith, assistant general secretary and assistant treasurer.

At the afternoon general session, an address on the subject of conservation was delivered by Mark L. Requa, vice-president of the Sinclair Consolidated Oil Corporation, and formerly United States Oil Administrator. Mr. Requa stated that in his opinion the American Petroleum Institute was well fitted for the task of coping with the several problems which are essential if co-operation and conservation are to be secured in the industry.

At the banquet held in the ballroom of the New Willard Hotel, the speakers were: Hon. Thomas A. Le Breton, Ambassador from Argentina; Hon. Victor Murdock, of the Federal Trade Commission, and Pat Malloy, president of the Western Petroleum Refiners' Association. The president of the Institute, Mr. O'Donnell, acted as toastmaster.

Hoover Chosen President of Federated Societies

By PAUL WOOTON
Washington Correspondent

THE FEDERATED AMERICAN ENGINEERING SOCIETIES is a reality. The council of that body perfected the organization at its first meeting, held in Washington, Nov. 18 to 20. Herbert Hoover was chosen as president of the federation. Washington was selected as its headquarters. The immediate guidance of the affairs of the organization will be in the hands of an executive secretary. A revised plan of the scope of the society's activities was suggested by President Hoover. It follows:

1. To serve the public interest by investigation and advice to all public governmental and voluntary bodies, dealing with national economic problems.
2a. Department of Public Works.
2b. Conservation of natural resources.
3. Co-operation with other national organizations, technical, industrial and commercial.
4. Technical education.
5. Transportation, particularly highways.
6. Advice to state regional and local societies.
7. National Bureau of Economic Research.
8. Public fire protection.
9. Patents.
10. National Board of Jurisdictional Awards.
11. International affiliation of engineers.
12. State organization of local affiliations.
13. Licensing and local registration of professional engineers.
14. Classification and compensation of engineers.
15. Engineering societies' service bureau (employment bureau).

Realizing that the executive secretary will be the mainspring of the organization, the executive board appointed a special committee of its members to go carefully into the matter, so that a man thoroughly qualified for the position might be selected. The new organization will begin to function Jan. 1. The officers selected were:

President, Herbert Hoover.

Vice-presidents, two-year terms, Calvert Townley (A. I. E. E.) and William E. Rolfe (Associated Engineering Societies of St. Louis).

Vice-presidents, one-year term, Dexter S. Kimball (A. S. M. E.) and J. Parke Channing (A. I. M. E.).

Treasurer, L. W. Wallace (The Society of Industrial Engineers).

The executive board is to consist of thirty members, in addition to the six general officers of the society. Each of six sections of the country is to have a representative on the board. There will be twenty representatives of founder societies. Only fourteen of these latter representatives were named, four vacancies being left for societies which may take advantage of the privilege of becoming charter members if they elect to join the Federated Societies before Jan. 1.

The representatives of the districts are as follows.

District 1 (New England and New York)—E. E. White, of Utica, and W. B. Powell, of Buffalo, one-half vote each.

District 2 (Michigan, Wisconsin and Minnesota)—B. A. Parks, of Grand Rapids, and D. J. Sterrett, of Detroit, one-half vote each.

District 3 (Ohio, Indiana and Illinois)—J. F. Oberlin, Cleveland.

District 4 (New Jersey, Pennsylvania, Delaware, Maryland and District of Columbia)—W. W. Varney, of Baltimore.

HERBERT HOOVER

District 5 (All South including Texas)—O. H. Koch, of Dallas, Tex.

District 6 (All states west of Mississippi River)—L. B. Smith, of Topeka, Kan.

The representatives of the individual societies were designated as follows:

A. I. E. E.—H. W. Buck, William McClellan, C. F. Scott, and L. B. Stillwell.
A. I. M. E.—A. B. Dwight, Edwin Ludlow and Philip N. Moore.
A. S. M. E.—L. P. Alford, A. M. Greene Jr., E. S. Carman, and F. J. Miller
Am. Inst. Chem. Eng.—H. E. Howe
The Taylor Society—M. B. Cooke
Am. Soc. Agric. Eng.—S. H. McCrory

The committee charged with the selection of an executive secretary consists of: L. W. Wallace, chairman; Philip N. Moore, Charles F. Scott, L. P. Alford, Calvert Townley, John F. Oberlin, and ex-officio Herbert Hoover.

Resolutions were adopted pledging support of the following projects:

(1) The compilation and preparation of critical tables of physical and chemical constants, as undertaken by the National Research Council. (2) In support of the proposed Federal Department of Public Works, as advocated by the Engineering Council. (3) Indorsing the proposal by Mr. Hoover for the investigation of industrial waste and authorizing him as president to form an organization under the auspices of the federation to work immediately to this end.

It is estimated that the income of the federation during the first year will not be less than $59,000 and probably not more than $80,000. A budget was made on the basis of the minimum income, which allots $27,000 for the salary of the executive secretary and office expenses; $12,000 for service bureau; $7,500 for committee work; $7,000 for traveling expenses; and $3,000 for office equipment, thus leaving a small balance for other incidental items.

The opening address at the first meeting, on Nov. 18, was made by Richard L. Humphrey, chairman of the Joint Conference Committee. After summarizing the work of this committee, Mr. Humphrey stated that he was confident that the new organization would uphold the high ideals of engineering and would add to the traditions of the professions, and so justify the confidence that had been placed in it. He urged that the organization guard against the possibility of promoting special interests and those that are not for the general good of the profession.

J. Parke Channing, chairman of Engineering Council for the last three years, and one of the newly elected vice-presidents of the Federated Societies, delivered an address on "Engineering Council" at the afternoon session on Thursday, Nov. 18. Mr. Channing outlined the several accomplishments of Engineering Council.

Herbert Hoover, speaking at the evening session on Friday, Nov. 19, outlined three sources of waste in production and suggested means of combating each. Those sources mentioned were intermittent employment, unemployment that arises in shifting industrial currents, and strikes and lock-outs. Mr. Hoover stated that engineers were best qualified to undertake the great task outlined, inasmuch as they had no special economic interests for themselves in constructive solution of the problems, their only interest being in creating a force for public service.

MEN YOU SHOULD KNOW ABOUT

N. H. Darton, who has been doing geologic work in Mexico, has returned to Washington.

C. E. Weed, superintendent of the Hancock Consolidated Mining Co., has left for Arizona.

Dr. L. M. Williams, of Long Beach, Cal., has been elected vice-president of the Nacozari Consolidated Copper Co.

J. H. Reeder, former superintendent of the Naumkeag Copper Co., has accepted a position with the Miami Copper Co. in Arizona.

A. E. Flynn, superintendent of Rand Consolidated Mine., Ltd., of Goudereau, Ont., has moved to Ambler, Pa., since the mines closed down.

David White, chief geologist of the U. S. Geological Survey, has returned to his Washington office after an extended trip through the West.

G. R. Airth, of London, England, managing director of Anglo-French Exploration Co., Ltd., is in Toronto, Ont., as the guest of J. B. Tyrrell.

Walter Douglas, president of the Phelps-Dodge Corporation, is visiting the companies' properties in the Southwest. He is at present at Douglas, Ariz.

J. Parke Channing, of New York City, vice-president of Miami Copper Co., of Arizona, has been recently elected president of Seneca Copper Corporation.

Louis D. Huntoon, consulting mining engineer of New York and Los Angeles, Cal., left for the Southwest on Nov. 17, and expects to return East about Jan. 1, 1921.

S. S. Sorenson, vice-president of Braden Copper Co., and general manager at Rancagua, Chile, for several years, has returned to the offices at 120 Broadway, New York City.

Dr. McLaughlin of the U. S. Geological Survey, and **C. M. Gary**, assistant in the office of V. C. Heikes, have been visiting various mining camps in the vicinity of Salt Lake City.

Dr. W. H. Collins, who for fifteen years has been connected with the Department of Mines at Ottawa as a geologist, has been appointed Director of the Canadian Geological Survey.

W. E. Thorne, mining engineer, of the New Consolidated Goldfield, Ltd., staff in Africa, is at his home in Santa Cruz, Cal., on a short vacation. Mr. Thorne expects to return to Africa early in 1921.

H. Herman, director of the Geological Survey of Victoria, has resigned that position to become engineer in charge of briquetting and research on the staff of the electricity commissioners.

Herbert Hoover, mining engineer, was called into conference on Nov. 16, by the executive council of American Federation of Labor in New York City during its discussion of economic and industrial conditions.

Gerald G. Dobbs, formerly with St. Louis Lead Co., and at present general manager, Southern Mineral Co., Winnfield, La., has resigned to accept the position of general superintendent of the ore mines and quarries of the Tata Iron & Steel Co., Ltd., Bengal. Mr. Dobbs will sail from New York on the "Imperator" on Dec. 23, to assume his new duties in India, where he may be addressed in care of Tata Iron & Steel Co., Ltd., Gurumahisani, via Tatanagar & B. N. Railway, Bengal, India.

RICHARD LEWIS HUMPHREY

Richard Lewis Humphrey, consulting engineer, and former concrete expert of the Geological Survey, has taken a prominent part in the movement for federating the engineering organizations of the United States. As chairman of the Joint Conference Committee of the national engineering societies, Mr. Humphrey presided over the preliminary session of the initial meeting of American Engineering Council, at Washington, and made the opening address.

Dr. W. L. Goodwin, formerly Dean of the Faculty of Applied Science at Queens University, Kingston, Ont., has been appointed principal of the schools of instruction for mining prospectors to be established at Cobalt, Sudbury, and other centers in northern Ontario.

Sir Douglas Mawson, leader of the Australasian Antarctic expedition, 1911-1914, has been appointed professor of geology and mineralogy at the Adelaide University, Australia, where he has been lecturer since 1905. Sir Douglas, who was born in 1882 at Bradford, Yorkshire, England, conducted a geological exploration of the New Hebrides in 1902-1903, accompanied Sir Ernest Shackleton on his Antarctic expedition in 1908, and was knighted on returning from his own expedition in 1914. Besides a number of home distinctions and decorations Sir Douglas is a gold medallist of both the Chicago and the American Geographical societies of the United States.

Bradley Stoughton, secretary of the American Institute of Mining and Metallurgical Engineers will spend Thanksgiving week and the week thereafter in the Lake Superior district. While in the district, Mr. Stoughton, will meet the members of the Institute in the various towns at subscriptions dinners, at which organizations will be formed which will afford more direct communication between the mining engineers of the district as a unit and the headquarters of the Institute. This organization would also afford the members of this district as a unit an opportunity to influence national affairs through the newly formed federated American Engineering Societies. Such organizations are being formed all over the country.

OBITUARY

Chester A. Thomas, mining engineer of San Francisco, and formerly manager of the American Smelters Securities Co., died at Dawson, Yukon Territory, on Nov. 11, of heart failure.

Mr. Thomas had been revisiting Alaskan sections familiar to him during the years he was in charge of the Guggenheim interests there. Later he also had charge of Guggenheim interests in California and Arizona. Mr. Thomas left San Francisco last August and soon after his arrival in Dawson he suffered a breakdown in health. He was a veteran of the Spanish-American War, a member of the Bohemian Club of San Francisco, and had been elected to membership in the A. I. M. E. in 1902.

Curtis Holbrook Lindley, of San Francisco, Cal., eminent authority in mining jurisprudence and chief counsel of U. S. Food Administration in 1917, died at San Francisco on Nov. 20. Judge Lindley had just returned from Arizona, where he had been acting as counsel and attorney for the Tom Reed Gold Mines Co. in its apex suit against United Eastern Mining Co. This was the last of many important mining law contests in which he played a leading part. He was born in Marysville, Cal., in December, 1850, was graduated from University of California, and had been honorary professor of jurisprudence there since 1900. Judge Lindley's most important published work is the "Treatise on American Law Relating to Mines and Mineral Lands," the highest authority in its field in this country. This great work has already seen three editions (last in 1914-15). His eminence in mining law made Judge Lindley a valued member of A. I. M. E. He was a member, also, of the California Academy of Sciences, and of several clubs.

THE MINING NEWS

The Mining News of ENGINEERING AND MINING JOURNAL is obtained exclusively from its own staff and correspondents, both in the United States and in foreign fields. If, under exceptional conditions, material emanating from other sources is published, due acknowledgment and credit will be accorded.

LEADING EVENTS

Federal and Hecla Settle Apex Litigation Out of Court

Under the terms of the settlement of the apex litigation between the Federal Mining & Smelting Co. and the Hecla Mining Co., operating near Burke, in the Cœur d'Alene district, Idaho, the Hecla company pays the Federal $450,000 for title to the Russell and Mono Fraction claims and a release of all claims against it for trespass. Announcement of the settlement has been officially made by both companies. The Russell and Mono claims are under lease to the Marsh Mines Consolidated, and it was while prosecuting development work under the lease that Marsh discovered what was claimed to be the apex of the "east vein" of the Hecla within the lines of the Russell claim. Suit was instituted by the Federal company against the Hecla in the Federal court to establish its title to the vein and to recover the value of all ore removed by Hecla, nominally placed at $6,000,000. An array of talent, legal, geological and engineering, was engaged by both companies, and the stage was set for another of those long-drawn-out controversies which have marked the history of mining in the West and particularly in the Cœur d'Alene district. The Federal took over the work started by Marsh and continued the shaft on the vein to prove by physical demonstration that the vein within the Russell claim and the "east vein" of Hecla were identical. At the same time Hecla was occupied both underground and on the surface making similar showing that the vein had its apex within the Hecla lines. The Russell shaft had been sunk 370 ft. and the dip had carried the bottom within the Hecla side lines, leaving about 600 ft. to go to connect with the Hecla workings, if the Federal theory was correct, when both companies suspended work on the same day. No official announcement was made regarding a settlement until Nov. 12, when the terms of the settlement were made public as stated above. At the same time it was announced that the Hecla company had purchased from the Federal the Old Tiger-Poorman group for the sum of $300,000, although it is understood that this deal was entirely independent of the litigation settlement. This property joins the Hecla on the north, and while it was abandoned many years ago by the Federal on account of the increased expense of mining after having been developed to a depth of 2,200 feet by shaft, it is known that much ore was left in the mine which will be accessible from the Hecla workings, and is regarded as a valuable acquisition.

Following the filing of the suit by the Federal company against the Hecla in the Federal court, the Marsh company entered the case as an intervenor to protect its rights as lessee of the ground in controversy. It appears from a statement from the Marsh that the company was ignored in the negotiations and final settlement. In the official statement issued by Federal and Hecla immediately following the settlement, this paragraph occurs: "The Federal company will endeavor to make an adjustment of such claims as the Marsh company may have by virtue of its lease of these claims from the Federal. Failing to make such adjustment, the Marsh company will, of course, be at liberty to continue the litigation on its own account." The Marsh lease is for ten years and runs until July, 1926, about five years and a half. The transfer of the Russell and Mono claims does not affect its rights under the lease, and it is privileged to continue work under its terms. While it may be assumed that in settling with the Federal, the Hecla company concedes the trespass and the apex contention of the Federal, as a matter of fact, so far as the public knows at least, no such concession has been made. It would seem, therefore, that March is confronted with the necessity of proving its rights in the courts.

WEEKLY RÉSUMÉ

By paying the Federal Mining and Smelting Co. $450,000 for title to two mining claims in litigation the Hecla Mining Co. settled the suit of these two companies out of court and ended what promised to become a long-drawn-out apex controversy. According to a ruling of the Commissioner of Indian Affairs, minor and otherwise incompetent Indians owning lead and zinc lands in Ottawa County, Okla., may lease their land for any period approved by the Secretary of the Interior, Competent Indians may lease for a term not longer than ten years. Interstate Commerce Commission authorized special ore freight rates, which will enable the Bunker Hill smelter to bid for British Columbia ore. The Nickel Plate mine of the Hedley Gold Mining Co. is closing down at Hedley, British Columbia, because of the high cost of producing gold. Hoover addresses Washington A. I. M. E. members and calls attention to the advantage of Washington as engineering society headquarters. Bituminous Coal Stabilization Committee concludes in its report that the bituminous industry is inefficient and points to the co-operation necessary to remedy this condition.

Commissioner of Indian Affairs Regulates Leases by Indians Owning Zinc-Lead Lands

Minor and otherwise incompetent Indians owning lead and zinc lands in Ottawa County, Okla., may lease their lands for any period of years approved by the Secretary of the Interior, but competent Indians may lease for a term not longer than ten years, according to regulations recently established by Cato Sells, Commissioner of Indian Affairs.

The regulations were announced by Sells after a recent visit to the Tri-State field. It is expected that local protests will be made against his ruling with reference to lands already under lease, which is to the effect that, though it is believed many of such leases may be and will be renewed, it will be within the power of the Secretary of the Interior, when he finds such renewal would not be to the best interest of the Indian land owner, to refuse renewal and advertise the lease for sale at public auction.

It is provided that royalties belonging to the owner of the land must be paid to the superintendent of the Quapaw agency by the 15th of each month. Also, the superintendent is required to forward to the Indian commissioner a list of all outstanding lead and zinc mining leases covering restricted lands of all minor or otherwise incompetent Indians, executed prior to the dates when such Indians were declared to be incompetent. A list of outstanding leases executed by competent Indians where such leases are for a longer period than ten years, must also be furnished.

These reports are expected to show just how far development has gone on these leases, the purpose being to bring such lands within the operation of the new regulations. On leases offered by sale under the new regulations, the royalty to be paid by the lessee shall be 10 per cent of the gross proceeds of all lead and zinc ores extracted from the leased premises. On leases not offered for sale at public auction, royalty shall be not less than 10 per cent and in some cases may exceed this amount. Publication in a newspaper for four weeks is required before an Indian may lease his land, after which public auction will be held. Bids must provide for a fixed royalty and a bonus. At least 25 per cent must be paid at the sale, the remainder to be paid in three yearly installments. All bids may be rejected if not acceptable to the acting authority.

Bunker Hill Smelter After British Columbia Ore

Through the efforts of Frank M. Smith, managing director of the Bunker Hill smelter, the Interstate Commerce Commission has authorized the Oregon-Washington Railway & Navigation Co., the Spokane & International R.R. and the Canadian Pacific to make special rates on ore shipments from the mines of British Columbia to Bradley, Idaho, the railway station for the Bunker Hill smelter at Kellogg. This matter was taken up by Mr. Smith soon after becoming connected with the Bunker Hill company and the final favorable ruling of the commission is expected to result in diverting much British Columbia lead-silver ore to the Kellogg plant. Similar rates were authorized for the shipment of British Columbia ore to Utah smelters, but the shorter haul to the Bunker Hill will give that plant a decided advantage. This ore will be shipped in bond and the bullion derived from it used in supplying the export demand, although it is possible that it might be sold in this country at a profit in spite of the tariff on account of the adverse exchange rate to which Canadian money is subjected.

Nickel Plate Gold Closes Down Indefinitely

It has been officially announced that the Nickel Plate mine of the Hedley Gold Mining Co. is closing down. Only enough men are being retained to put the plant in such condition that it will be ready for the resumption of operations when the time comes. The management in a statement given publicly in British Columbia explained that during the war the mine was continued on a producing basis because the gold was needed, and after the armistice it was thought that economic conditions would so improve that it would be possible to pay dividends on the capital invested. This anticipation has not been realized. It is added that the shutdown is only temporary, that it will last probably for one year, and that the mine and plant will be in good condition to resume work when times improve. It is felt that under prewar conditions or even 20 per cent thereof "we can earn good dividends."

The closing of the Nickel Plate is to be regretted by reason of the effect on the mining industry of the province as a whole, and the prosperous little town of Hedley, B. C., has received a blow that it hardly can survive. The miners are leaving their families there while hunting work to tide over the winter, but they will move away as the breadwinners adjust themselves to the changed conditions.

Lake Iron Ore Shipments Slowing Down

Freezing weather at the head of the Lakes has caused a slow-down on ore shipments. The railroads have been compelled to deny cars for transportation to several shippers because of the fact that their dock space is already filled and that the ore, if accepted, must stand in the cars awaiting dumping at docks and then be thawed out by steam.

Ore shipments were delayed and one boat was wrecked by a severe storm, which swept Lake Superior last week. After a subsidence of the storm thirty-eight boats arrived in the Duluth-Superior harbor in less then ten hours. There were approximately one hundred thousand tons of coal among the cargoes that came in and this can be used to good advantage.

Although most Mesabi Range mines have either begun their winter work or are preparing for it a few of the mines are shipping. Decrease in shipments of ore from Minnesota state-owned mines is shown in the state mine report for the week ended Nov. 13, the tonnage shipped being 124,409 tons. Indications are that in spite of the coal and car shortage which hampered work to some extent this season the total shipments from the Mesabi Range will compare favorably with previous years.

It is estimated that 3,000,000 tons will go forward from the Lake Superior docks in November. This will bring the total shipments for the year to 56,000,000 tons. The season's shipments will bring the grand total of production for the Lake Superior district over the billion ton mark for the first time.

Hoover Addresses Washington A. I. M. E. Members

Points to Advantages of a Headquarters in Washington and Work of Engineering Societies

The hope that the headquarters of the American Institute of Mining and Metallurgical Engineers eventually would be transferred to Washington was expressed by Herbert Hoover in the course of an address before the Washington chapter of that organization, which gave a luncheon in his honor Nov. 19. He spoke of the national capital as being the center in which the moral strength of the newly formed Federated American Engineering Societies should be concentrated, in close touch with the Federal Government and able to act on the occasion of any emergency.

Just prior to the luncheon, Mr. Hoover had been elected president of the Federated American Engineering Societies. He pointed out that the United States is undergoing great economic changes and that the national service organizations are realizing opportunities for service. Their influence can develop an economic system without crushing individualism.

With regard to the societies of engineers, he pointed out that engineers are particularly qualified for public service, since they are accustomed to separate facts from the distortions which often surround them and correlate them in a way which enables the public to have at its disposal correct basis information.

Bradley Stoughton, in the course of his remarks at the luncheon, expressed the opinion that the federation of engineering societies is one of the big things of the century in engineering.

E. S. Carmen, of the American Society of Mechanical Engineers, congratulated the mining engineers on having furnished the president of the Federated American Engineering Societies.

Coal Stabilization Committee Draws Important Conclusions

Causes of Inefficiency in Bituminous Industry and the Proper Relief Are Embodied in a Report

Preparations are being made by the Committee on the Stabilization of the Bituminous Coal Mining Industry of the American Institute of Mining and Metallurgical Engineers for active work looking toward the realization of certain conclusions drafted by Herbert Hoover. The conclusions are as follows:

1. That the bituminous industry functions inefficiently. Employment in the industry averages less than 220 days per annum, with a minimum district average of less than 200 days. From this flow a high daily wage, a considerable portion of the just complaints of labor and a higher cost of coal to the consumer.

2. The causes are very largely (a) intermittency in seasonal demand, (b) irregularity of car supply, and (c) the lack of storage facilities and incentive for their use.

3. The cure lies in:
   (a) The establishment of seasonal differentials in rates.
   (b) Increased transportation facilities and a more efficient and equitable distribution of cars.
   (b) Increased use of central and interconnected electric power plants.
   (c) Lower selling prices in dull seasons made possible by differentials in profits, rates, and wages.
   (d) Recognition by the larger consumers that they must provide adequate storage to be replenished in the dull season.

4. Such storage is feasible and can be made financially remunerative.

5. No adequate solution can be found, except through organized cooperation of operators, labor, railroads, and large consumers.

Coal Strike Off, but Industries Feel Its Effects—Banks Discouraging Loans —Scottish Spitsbergen Forms Subsidiary Undertaking

By W. A. DOMAN

London, Nov. 8—From a mining standpoint, little of importance has occurred during the last week. The coal strike has been called off, and work has been resumed. This does not mean that the vexed question of miners' wages is definitely settled, but that work will be continued on the lines suggested until the National Wages Board is established, and the whole matter thoroughly investigated. The influence of the dispute has permeated all branches of industry, and it is to this fact that the quietness of metal-mining business is largely attributable. With unrest in every direction, there is little encouragement to boards of mining companies to attempt to raise much-needed capital, for they fear but a meager response. Accommodation from the banks can be obtained only on very onerous terms, seeing that the amount of currency is limited, and credit is strictly rationed. The banks are doing their utmost to meet legitimate and pressing claims, but it would appear from their balance sheets that they have already lent pretty well to the extent of their ability.

Notwithstanding present conditions, one or two mining companies are about to try their luck. If they put forward attractive proposals they may meet with success, as money which during the period of depression has been invested in gilt-edged stocks will be made liquid on the prospect of higher returns. The Scottish Spitsbergen company, which owns a large coal area in Spitsbergen, claimed to have been more thoroughly tested geologically than any other property in the island, is about to form a subsidiary undertaking with a nominal capital of £1,000,000. This is interesting in view of rumors that Hugo Stinnes is endeavoring to get control of the mineral resources of the island through formerly neutral sources.

The Burma Corporation, which for years was an English registered company, has now been put on the file as an Eastern company with a capital of 180,000,000 rupees in 18,000,000 shares of 10 rupees each. Besides various technical advantages attaching to a locally registered undertaking, removal to the East affords a capital opportunity for interesting Indian investors.

With the further fall in the value of sterling in relation to the dollar, an attempt is being made once more to draw attention to African gold-mining shares. On the present occasion a greater degree of success is expected, for the movement is said to be a concerted one among the finance houses, which have taken shares at pretty well their own prices on the way down, though the profits which the mining companies are earning seem to warrant a higher level of quotations. A further favorable point is that for remittances from London to South Africa the banks are paying a bonus to the mining companies.

The premium is stimulating gold production elsewhere, and rather more activity is reported in West Africa. One mining company operating there—the Abbontiakoon—has greatly surprised its shareholders by declaring a dividend of 5 per cent, the first for some years. One or two abandoned properties are being subjected to renewed investigation, and if reports are favorable the capital required for opening out and equipment will be found.

Efforts are still being made to settle the dispute at the Rio Tinto. Some of the miners have returned to work, but others are withholding their services in the belief that the company can and should pay a higher scale of wages.

Mexican Letter

Government Fails To Take Over Coahuila Mines—Export Taxes for November Fixed

City of Mexico, D. F., Nov. 11—The order of the federal government to take over the coal mines in the State of Coahuila and work them on government account, because of the inability of miners to come to an agreement, was nullified by the failure of the government to get a sufficient number of skilled workmen to unwater the properties and start the plants. At this date the government has made no further efforts to take physical possession of the mines and situation has become decidedly acute. Lampacitas, property of Cia. Minerales & Metales; Agujita, of the same company, with a capacity of 35,000 tons a month; Rosita, belonging to the American Smelting & Refining Co., also with an output of about 35,000 tons; New Sabinas, an English property; Cloete and Rio Escondido, independent American mines, totaling about 30,000 tons monthly, are all under water, and it would be impossible to put them in operation short of several weeks, even if an agreement were reached. Agujita recently installed a 1,000,000 pesos modern plant, which has been seriously damaged by the strikers. As these concerns control the entire output of Mexican coal, and the smelters and founderies as well as many of the larger mining properties in north depend on them absolutely, the gravity of the situation may be understood. Coal is selling at the mines, or was before the strike, at $4.25 per ton. The owners insist that it is absolutely impossible to meet the demands of the strikers for 100 per cent advance in wages, this on top of several advances already made during the last eighteen months, and operate their plants. The probability is that no settlement will be reached until after President Obregon is installed Dec. 1.

The Treasury Department has fixed the following export tax of minerals and bullion for the present month. The prices are in Mexican currency, and by kilograms.

Gold bars	93.12
Gold concentrates and ores	106.67
Copper matte, over 50 per cent, carrying more than 300 g. of silver and 5 g. of gold (per ton)	2.548

Dredging Interest at Cariboo Reviving —Premier Mine Finds Ore—Development and Exploring at Quatsino Sound

Salmon River—The Premier Mine, Portland Canal, is reported by H. A. Guess as having disclosed ore and a possibility of greater tonnage than has yet been proved. Winter shipments across the snow are planned and will be by caterpillar tractor hauling sleds as soon as the trail freezes hard. Water-power plant is expected in operation within a month, and the new cyanide mill will be in running order early in 1921.

Vancouver Island—The Consolidated Mining & Smelting Co. proceeds with the development of its Vancouver Island properties. On the Sunloch group, Jordon River, diamond drilling is in progress. At Quatsino Sound considerable exploratory and development work still is under way. The company is experiencing no difficulty at present in finding the labor needed for the work in hand. This changed condition in labor supply is common to the mining camps of the entire province.

Cariboo—New York interests are said to have been favorably impressed by reports of engineers on the Barkerville field and are expected to begin dredging operations in that section. The Imperial group of claims, Prosperpine Mountain, on which a shaft has been sunk 21 ft., is reported to have shown up a vein carrying values averaging $17 to the ton.

Vancouver—Fifty gold bars, valued at over $500,000, have been shipped from the Dominion Assay Office here

to Ottawa. This represents the takings of the year up to date. Water shortage has hindered lode and placer mining in British Columbia and Yukon Territory during 1920.

Trail Smelter Receipts

Ore received at Trail Smelter, during the week ending Nov. 14, 1920, amounted to 8,187 tons, gross, and was derived as follows:

	Gross tons.
Bluebell, at Riondel	208
Emerald, at Salmo	31
Josie, at Rossland	220
Krao, at Ainsworth	21
North Star, at Kimberley	128
Paradise, at Athalmer	41
United, at Ainsworth	11
Company mines	7,527

Ontario

Porcupine—A block of claims 14 miles square, situated in the sand plains of Mountjoy Township west of Timmins, have been taken over on option by English interests. The heavy overburden makes surface prospecting almost impossible, but drilling is being actively carried on. Five diamond drills are in operation under the direction of E. Loring, engineer in charge.

A report by R. C. Fielding on the Davidson Consolidated addressed to the chairman and directors of the General Mines Investment (1920) Ltd., of England, in connection with the proposed sale of a controlling interest, estimates the tonnage, including "probable" ore disclosed by the work done, at 350,000 tons, averaging $11 per ton extractable. Working costs under normal conditions are estimated at $4 per ton.

The McIntyre is now doing a considerable amount of development on a new vein reported cut by diamond drill some months ago. Work is being carried on at the 1,375-ft. level. A dividend of 5 per cent, payable Jan. 1, 1921, to shareholders of record of Nov. 19, has been declared. This will bring the total payments up to 65 per cent of their capital issued. It is understood that on account of the power shortage in Porcupine, the Dome and the McIntyre have been forced to turn their recently imported Cornish mines on to hand steel work.

Boston Creek—Work has been started on the Hughes-McElroy property containing approximately 360 acres held under option by Henden's Trust, Ltd., of London. Frank C. Loring is consulting engineer.

At the Miller Independence a systematic exploration of the 500-ft. level is being carried on at three points. A vein encountered on this level by crosscutting 250 ft. from the main shaft is being followed up.

West Shining Tree—The injunction asked for by Hamilton B. Wills & Co. to restrain the Wasapika Gold Mines from transferring its shares to the Wasapika Consolidated has been dismissed by the court, and the distribution of stock will take place.

At the Atlas, where the proved-up mineralized zone has been considerably extended, a 4-drill compressor will be installed.

UTAH

Good Supply of Carbonate Zinc Ores—Park City Shipments Lower—Daly Mine Being Developed—Ontario Silver Opens New Orebody

Salt Lake City—The plant of the Utah Zinc Co., between Salt Lake City and Murray, is rapidly approaching completion. This company will take carbonate zinc ores from surrounding mining camps, and relieve to some extent the situation created by the high freight rates, which prevent the shipment of other than the highest-grade zinc ores from Utah to the only market at present open at eastern and midwestern points. There is still no local market for sulphide zinc ores. The electrolytic zinc plant of the Judge Mining & Smelting Co. at Park City treats sulphide ores from its own mine, but no custom ores and is closed down for the time being. The Scranton mine, at North Tintic, under lease to J. W. Wade and associates of the Utah Zinc Co., is producing 15 tons daily of high-grade lead-free zinc ore. In general, there is a considerable tonnage of carbonate zinc ore in the Tintic district relatively free of lead. As the Utah Zinc is not equipped for the treatment of zinc ores carrying lead, this district will be largely drawn on for ores. It is stated that the company has already purchased and stockpiled at its plant a considerable tonnage of ore, a part of it from the Chief Consolidated at Eureka, and some from the Scranton. Other Tintic properties with available ore of the kind required are the Bullion Beck, May Day, and Lower Mammoth.

CALIFORNIA

Bunker Hill Stockholders Protest Assessments—Airplane for Transportation of Supplies Feasible

Amador City—Much interest and dissatisfaction has been evidenced of late in matters pertaining to the Bunker Hill mine at Amador City. The failure to locate pay ore as early as expected and consequent inability to keep the mill profitably employed has resulted in a number of assessments being levied. Dissatisfied stockholders took exception to the directors of the company disposing of the bulk of their stock and claimed that a meeting should be called to elect a new board of directors. A stockholders' meeting was called by N. W. Hyler, O. D. Rolphs and other heavy stockholders without waiting for the secretary of the company to call such meeting. When the stockholders intending to hold the called meeting arrived at the mine in a body on Nov. 5, they were informed that the secretary and members of the board of directors would not participate in the meeting in any way, claiming that such meeting was illegally called and that any action taken would not be expressive of the wishes of a majority of the stockholders. Messrs. Hyler and Rolphs and their attorneys insisted that they had more than a majority of the stock represented in person or by proxy and demanded that the secretary produce the records of the company. Upon refusal of this demand the stockholders withdrew from the office and held a conference on the log pile near by. Later the incumbent board were informed that a new board of directors had been duly elected but the demand to turn the property over to the new board was refused. The old board insisted that indebtedness which they had incurred for the company must be met before they would be willing to resign and then only with the sanction of the stockholders at a properly-called meeting. A meeting of stockholders is now advertised for Nov. 22.

Grass Valley—The water is being lowered steadily at the Idaho-Maryland mine and is now down below the 1,300 level. The condition of the canyon shaft is better than was to be expected and little repairing is necessary to put it in shape for mining. A large new Taylor electric pump is being installed at the 1,000-ft. level and a huge sump is being sunk to care for the accumulation of water that will permit the pump to work only part of a day keeping that level clear of water. This pump will be augmented with other pumps at the 700 and 400 levels. Exploration work is going on at the 1,000, 700, 400 and 300 foot levels, driving in different directions with the idea of exploring the country to the east, particularly the old Eureka workings, where rich ore was taken out in the early days. Leasers are going to work in the 400 levels and it will be but a short time now before the mill is dropping its stamps on the ore that will come from the old stulls in the upper workings.

On Nov. 13 an airplane made a test of the feasibility of serving a circuit of mines in this region with light supplies and mail, a project which has been discussed by local men for some time. With Pilot Eldredge at the wheel and carrying two passengers the plane made a circuit of approximately 60 miles over a mining region, landing just 51 minutes from the time of starting. Heading first for Colfax the plane passed over the following places where mining is being conducted: Morning Star, Iowa Hill, Birds' Flat, Little York, You Bet, Red Dog, Nevada City and Grass Valley district. Most of these places are off the railroad and on poor roads, and it is estimated that it would require eight hours to reach them with the most powerful automobile. The cost of fuel and oil for the trip was calculated at $3.18. It is stated that it will be possible to deliver machinery and small parts, thus preventing the shutdowns which at present always accompany breakage of machinery parts.

Sutter Creek—With thirty stamps dropping on good ore and indications pointing to the raise from 3,900 to the 3,700 level being in ore all the way, the outlook is extremely bright at the Central Eureka. The mill bins are full of ore and since Nov. 8 thirty stamps have been constantly falling. Some station

timbers of the 2,300 level South Eureka failed and allowed rock to drop into the shaft. The water column was broken and stopped the operation of the 2,700 South Eureka pumps. The broken timbers have been replaced and the break will not interfere with mining operations in the Central.

NEW MEXICO

Jim Crow Contest Closed—85 Mine Opens Fine Ore—Lepidolite Coming From Taos County

Hatchita—The Durango Mining, Milling & Exploration Co. is pushing development work on the old American mine. A new pumping plant has been installed and the property unwatered. Work on the lower levels is exposing some good orebodies carrying lead, zinc, silver and iron, with small amount of gold. Two cars of ore were shipped to the El Paso smelter on Nov. 10. Edward Rockman is superintendent in charge.

Santa Fe—The Latawana Mining Co., with a capital of $300,000, has been incorporated by C. F. Wilson, Eva Wientage, and R. P. Fullerton, all of Santa Fe.

The Montclaire Mining Co., of Delaware, has amended its articles to increase its capital stock to 2,000 shares at $10 par and 20,000 shares of common stock without nominal or par value. F. C. Wilson, of Santa Fe, N. M., is agent.

Interests associated with Drachenfels & Co., of New York, have taken an option on a large deposit of lepidolite in southern Taos County about 40 miles north of Santa Fe. Work has already started, and the crude ores will be shipped to the grinding plant at Wheeling, W. Va. This ore is to be used as a constituent of a so-called unbreakable "glass."

Lordsburg—Sinking on the main shaft of the 85 Mine has reached 1,006 ft. A drift has been started upon the 950-ft. level that has opened a strong vein of fine ore; 75 carloads were shipped to the Calumet & Arizona smelter at Douglas, Ariz., during October. The contest on the Jim Crow claim has been settled by the Warner interests, original owners of the 85 property, paying the bare court expenses of the contestants, thereby clearing up the title of the whole 33 claims that were sold to the Calumet & Arizona Mining Co., last June.

The Great Eagle fluorspar mine has started foundation work on the 200-ton concentrator which will be installed on their property. This work will be under the direction of Frank Groh. A three-compartment Hartz jig with other equipment has arrived and will be hauled out at once. Mining work will be under the immediate direction of James Bell. General Manager Alfred Roos will make his headquarters at this camp, directing work upon their other properties from here. Few shipments, except of acid grade spar, will be made until the equipment is installed.

For the same interests Mr. Roos has just taken possession of another spar deposit near the southern border of New Mexico, 25 miles north of El Paso, already establishing a camp under the charge of R. J. Monahan of Tucson. Two large veins, a mile long, are being prospected.

OREGON

Almeda Mine to Install Flotation

Galice—The Almeda mine, owned by the Almeda Mines Co., with head office at Portland, Ore., will soon resume operation. The mine has been inactive since 1916, except for general development work and repairs. The company has been sampling and testing the ore to determine the most practical methods of ore treatment and announce that oil flotation gives the higher percentage of recovery in values. It will erect a reduction plant within the next few months. The ore in this mine contains copper, gold, silver, lead and a little zinc. The deposit occupies a zone of faulting along a contact between dacite porphyry and argilite, being confined to the former. The argillite or slate has been assigned to the Galice formation of the Jurassic period by means of fossils found in the mine.

The Almeda mine is more fully developed than any other mine in southern Oregon; this is due in part to the fact that it is remarkably well situated for systematic development, being in the narrow but traversable canyon of Rogue River which gives a natural transverse section of the lode to a depth of at least 500 ft. The development consists of over 6,000 ft. of underground work. Drift adits at five different levels are supplanted by a vertical shaft reaching a depth of 500 ft., with levels at each 100 ft. They open the deposit for 1,000 ft. horizontally and 800 ft. vertically.

The present reduction equipment consists of a 100-ton matting furnace, erected in 1908. The mine is equipped with three gasoline engines of 175 hp. and two air compressors having a capacity to run 23 drills, as well as an engine at the shaft to operate the hoist.

The starting up of the Almeda mine and the reopening of smaller mines, both placer and quartz, look favorable for a general resumption of mining in the Galice district. The most important resumption of placer mining in the district will be the Old Channel Hydraulic Mining Co., who control a large area of "high level" placer deposits near Galice.

IDAHO

Coeur d'Alene District

The east drift from the bottom of a winze, 300 ft. below the Moonlight tunnel through which the property is being developed, shows practically a full face of lead-silver ore of fair milling grade, according to an announcement by A. C. Bixby, manager of the Ajax Mining Co. The Ajax is near Burke and joins the famous Hercules on the east, presumably having the same vein.

A rich strike of scheelite has been made by the Kennan Mining Co. on Poney gulch, about ten miles north of Wallace, consisting of eight inches of ore that is estimated to carry 80 per cent tungsten. The shoot is found in a quartz vein five feet wide that averages between $5 and $6 in gold. Besides this rich shoot there is much scheelite scattered through the quartz. A. B. Ward is in charge of the property and the control of the company is held by Col. Chester T. Kennan, E. J. Roberts and others of Spokane.

The Jim Blaine Silver Syndicate, which owns a group of twenty-five claims covering the triangle formed by the east and west forks of Pine creek, has started a crosscut tunnel which will be extended 1,500 ft. to cut several veins which have promising surface showings. The tunnel is a short distance below the Nabob mill and half a mile from the proposed railroad.

The Nabob Consolidated Mining Co., control of which is held by the Stewart Mining Co., is now operating its 150-ton mill full time. The mill is on Pine creek, about six miles from the railroad, and two motor trucks are used for delivering the concentrates for shipment, the two trucks handling ten tons a day. The ore is both lead-silver and zinc, the mill making a satisfactory separation and recovery of each.

ARIZONA

Jerome-Del Monte Assessment Work Progresses — Rich Ore Found on Mineral Creek—High School Students Trained in Assaying

Globe—The output of the Arizona Asbestos Association approximates two tons a day of sorted crude material, this shipped from Rice station on the Arizona Eastern R.R. to the Johns-Manville Co. in New York. The mine is in the Ash Creek section, forty miles north of Globe. Transportation is difficult, and in rainy weather burros have to be used to get the product down to the Fort Apache-Rice road. The labor is mainly Mexican.

J. S. Hubbell, a pioneer prospector, has found rich gold-silver ore near the head of Mineral Creek. The Old Dominion also has reduced its working force.

The Globe High School is doing assaying for local miners and prospectors. This new departure will be under charge of A. C. Swinson, assistant in the department of vocational education, and is intended primarily as training for the students.

Miami—Inspiration has further decreased production, shutting down another 4 units of its mill which now runs 10 units, and suspending all Sunday work. About 150 men have been dropped from the payroll. Most of the men are foreigners and single.

Kingman—The Gold Ore mine at Gold Roads is drifting on its 650 level toward its No. 1 shaft, under which it is expected to cut a large body of commercial ore. In shallower openings this ore body was developed along 100 feet and showed value of $40 in gold. The ore

shoot is only one of several that have had partial development.

Oatman — United American at Oatman has crosscut five feet of good ore on its 665 level. The ore is believed to be a continuation of that found on the 400 level of the Tom Reed.

Jerome—Jerome-Del Monte is building a road from the Verde valley to its camp and will charge this work against its annual assessment development. Thomas Woods, president of the company, has come from Boston to supervise construction. He states that the company has no immediate intention of resuming mining development.

Stockholders of the Jerome Superior company have applied to the Arizona Corporation Commission for an investigation of the company's management. A hearing has been called at Los Angeles, Cal., where much of the stock is held. A reorganization will be attempted.

U. V. Extension has appealed to the Interstate Commerce Commission for a rehearing on the subject of coal rates from Gallup to Clemenceau. The same $2.50 a car for switching done by it for the Santa Fe lines at a time when the United Verde smelter at Clarkdale was closed.

MONTANA

Anaconda Production Half of Normal—Davis-Daly Driving a Raise to Surface from 1,700 Level—F. M. & S. Secure Neihart Interest

Butte—Closing of the Poulin, East Gray Rock and Alice properties, silver-zinc producers, has served to emphasize further the depressed condition of the zinc market. Anaconda is continuing its copper production at slightly under 50 per cent of normal, but there is little guarantee that this rate of output will continue.

Development work at the Colorado mine of the Davis-Daly company has been suspended, but a raise is being driven from the 1,700-ft. level to the surface for airshaft purposes. Production is at 70 per cent of capacity. The output of silver ore at the Hibernia is normal. Its new 500-hp. boiler plant is installed.

Output at Granite Mountain mine is at the rate of 70 per cent, according to the local office of the North Butte company. Development work is being slowed down.

Neihart—The Neihart silver mines have been closed temporarily, according to the announcement of the president of the company. It is necessary to complete some financial arrangements before proceeding farther with the mining and treating of the ore. The Guggenheims have become interested in the Silver Dike property, which covers ten claims. The deal has been completed through Frederick Burbridge, president and general manager of the Federal Mining & Smelting Co.

Development work is progressing on the Tuolumne Copper, Crystal Copper, and Butte-Plutus properties.

NEVADA

The Ely District

At the Ruth mine of the Nevada Consolidated Copper Co. the orebody opened up on the 700 ft. level on the contact of the lime and porphyry, proved to be 150 ft. long, 50 ft. wide and 60 ft. high, averaging over 7 per cent in copper content. Across ten feet lying next to the porphyry the ore carried values of 12 per cent copper, while small areas averaged 18 per cent of copper value with some gold and silver. The orebody is a secondary enrichment of the pyritic mass on the limestone side of the lime-porphyry contact. Drilling from the surface is already under way to prospect for such other similar bodies as may be present and a drill is now being designed for installation underground. When completed, this equipment will be used on the 700 ft. level of the mine to explore the downward extension of the orebody already opened up on the contact. The milling plant of the company at McGill is still being operated, although at greatly reduced capacity. The tests for flotation treatment have proved satisfactory.

The Pioche District

Pioche—The Black Metals Mining Co. have opened up a body of high grade carbonate ore on the 300 ft. level of the Day mine along the fissure. Muck samples of the broken ore assayed 29.7 oz. in silver; 15.7 per cent of lead and half of one per cent in copper content. Twenty-five tons of this ore have been broken down and while the extent of the discovery remains to be proven, a large tonnage of good ore is now in sight on that level.

The Hamburg Mines Co. has a car load of silver-lead ore ready for shipment. This ore will not be shipped under the present freight rates, according to Manager Pitts but will be left there till a more favorable tariff on ores is put in effect. Development work is being continued on the property although operations are being hampered by the heavy fall of snow in the Highland district.

The Silver Prince Consolidated Mining & Smelting Co. shipped a car of ore from the property at Mount Irish, near Hiko, this week. The lot was shipped through the agency of the Pioche Assay Office to the plant of the American Smelting & Refining Co. at Salt Lake City. According to R. P. Jones, superintendent of the property, additional shipments will be made soon should the conditions of the road permit the use of motor trucks throughout the winter months. High-grade ore has been struck in the main fissure opened up by the incline shaft on the Rosario mine, assays from this vein show 51.3 oz. of silver to the ton with 22.5 per cent lead, and a small amount of copper. Increased work will be done in the Hiko district as a result of the successful operation of the company in opening up ore of shipping grade.

COLORADO

Much Assessment Work Under Way—King Soloman Co. at Work—Vanadium Corporation Laying Off Men

Sawpit—The Vanadium Corporation of America has shut down its reduction plant and has laid off most of its miners. It is reported that the company cannot market its product from this district in competition with foreign vanadium products, which are richer than those mined in the United States, and it appears that steel men are giving the foreign product preference.

Utah Junction—The Ferro Alloys Co. is operating two of its furnaces on manganese ore from Mexico and chrome ore from its Wyoming property. The company is now in the market for local ore running high in manganese and low in iron and silica. The silica should not exceed 5 per cent. The company will test ores free of charge for producers operating in Colorado, New Mexico, and Wyoming. Nelson Franklin is general manager.

Montezuma—The King Solomon Mining Co., of Montana, is developing the old Dominion property, and has recently opened a pocket of high-grade ore carrying gold, silver, copper, and lead. The assay value of the material is over $250 a ton. James H. Myers is president and general manager.

Other properties that have recently been reopened in the district are the Bell, and Denver mines, and the Penn concentrating mill is in operation. There is a labor shortage in the camp, and it is reported that good miners are in demand at wages ranging from $5 to $6 per day.

Ouray—Recent developments seem to indicate that a good deal of substantial mining will be done here this winter, in spite of the general depression.

The Hidden Treasure silver-lead mine, which has done little for a long time, is to be operated. A company, unusually well financed and managed, is to operate the property. Development will begin promptly, and in all probability a mill will be built next year. Mining machinery is being bought in Ouray. E. R. Baur is at present in charge in Ouray.

Unusually well authenticated rumor says that the Camp Bird, drifting west from the main crosscut tunnel out under the zone of the big gold ore bodies above, has encountered a very large shoot of silver ore which has shown substantial dimensions already. The product of drifting is being kept in a special ore-dump outside. Milling may be resumed by next spring.

The test runs at the Gold Crown mill in Ouray by C. R. Wilfley and Delta associates have given interesting results and will probably result in the formation of a stock company to operate the Pony Express silver mine. A semi-oxidized silver ore was treated with good metallurgical results by simple flotation, although failure by this method with such ore was predicted.

JOPLIN-MIAMI DISTRICT

Oklahoma-Kansas-Missouri

Further Fires Reported—Mont B. Lawsuit Settled—New Hoisting Records Established

Several expensive fires have occurred in this district in the past fortnight. The Otis L. mill, southeast of Commerce, was completely destroyed on the morning of Nov. 12. The loss of about $50,000 was partly covered by insurance. Origin of the fire is unknown. It was owned by Otis L. White of Joplin, and it is understood it will be rebuilt on a smaller scale. The mine had been in successful operation for several weeks previous to the fire.

The Georgia concentrator, located northwest of the town of Picher, was burned on Nov. 15, with an approximate loss of $75,000, partly covered by insurance. The mine formerly was known as the Tiger No. 1 and had been owned by Carthage, Mo., investors. It was sold several months ago to Georgia people, who had been operating it. An odd circumstance was that the mill caught fire twice on Sunday, the day previous to its burning, both times the fire being extinguished.

The Skelton Lead & Zinc Co. lost its mill shaft No. 8 on Nov. 13, but by hard work the mill, known as the Lucky Kid, was saved.

Rolla Experiment Station will take up improvements in mill concentration.

Webb City—A quarter of a million dollars in cash was turned over to W. A. Rhea of Carthage this week by receivers in the Mont B. mining case, for five years a notable mining suit in this district. An appeal to the U. S. Supreme Court for a new trial was recently turned down and the long legal fight was at an end. When the Ananias Mining Co. failed in 1911 Rhea, the former superintendent, leased the land it had been working and other additional lands between Carterville and Webb City, and in the fall of 1913 began to accumulate a pile of zinc ore. At the time the war started in 1914 he had in excess of 5,000 tons, and inside of a year he had profits in excess of $330,000. Some of the former members of the Ananias company, however, filed suit against him, alleging that they were still interested in the property, never having signed away their interest. They obtained judgment to this effect in the district Federal court, but lost in the U. S. Circuit Court of Appeals.

Picher, Okla.—Hoistmen of this district have been engaging in informal contests for new records recently. On Nov. 9 Charles Howard and "Mike" Dougherty, hoistman and hooker, respectively, for the Eagle-Picher Lead Co.'s No. 9 mine, hoisted 909 cans, 1,250 lb. capacity each, in one 8-hr. shift. The distance lifted was 270 ft. This record had been beaten in 1919, but on Nov. 15 N. D. Wolf, hoistman, and L. Baccus, hooker, of Howe Mining Co., sent up 1,034 cans, of 1,250 lb. capacity, in an 8 hr. shift, the hoisting distance being 264 ft.

ARKANSAS

New Manganese Properties Starting—Southern Hill Planning Large Washer—Outlook Improving

Batesville—Interest continues in manganese mining in the Batesville field and the tonnage is increasing. A number of new properties have started up. W. A. McCurry has started operations on a tract near Penters Bluff and is making a fair production of boulder ore. The Eureka and Southern Hill properties have been consolidated and extentive improvements in equipment for the Southern Hill is planned. One of the largest washing plants in the field is contemplated for that place. Stanley Hanford, who has been operating the Rogers mine, has also opened up a property near Pfeiffer. He shipped 200 tons of ore last week that averaged 40 per cent metallic manganese.

J. R. Wilson, in charge of the Ball mine near this place, is already equipped with a modern washing and concentrating plant and is encouraged by the experimental work he has been doing. Besides the log washers this plant is equipped with rolls, rougher and cleaner jigs and tables. With this equipment a considerable part of the silica in the ore is eliminated.

The field began to recover from the slump caused by the armistice about May 1, and operations have slowly increased since that time. The production since that time has been roughly estimated at 10,000 tons. The outlook for near year seems promising, but prices are the big factors. If they hold operations will continue and increase.

MICHIGAN

The Copper District

Hancock Consolidated Dam Complete—New Baltic Bottoms in Vein—Mohawk, Michigan and Wolverine Cut Wages

The construction of the concrete dam at the 53d level of the Hancock Consolidated Mining Co.'s property has been completed and all activities both underground and on surface have ceased. Resumption work will depend entirely on the metal market and cost of supplies, and at this time seems to be a remote contingency.

The New Baltic shaft of the Arcadian Consolidated Copper Co. is bottomed at the 700 ft. level. It is in the vein, which appears to be as well mineralized as where tapped in the upper levels. It is now proposed to keep on sinking to the 750 level before cutting a plat.

The last few tons of coal are being removed from the old Union Coal dock at Dollar Bay, preparatory to abandoning this equipment. This dock was erected about 25 years ago by the Tamarack Mining Co. to serve all the then existing Bigelow mines. It was included with other Tamarack property purchased by the Calumet & Hecla some five years ago. All coal for the Calumet & Hecla and subsidiaries will in the future be handled by the large plant at Hubbell which is equipped with the most modern coal handling machinery.

The Mohawk Mining Co., the Wolverine Copper Mining Co. and the Michigan Copper Mining Co. have announced a general cut in wages and salaries of 15 per cent effective Nov. 16, 1920. The management also announce that they will bring production up to the normal pre-war rate as rapidly as possible. Their output has been subnormal for a number of years, due to labor shortage. They are now operating at about 80 per cent of maximum but should rapidly reach 100 per cent, as the Calumet & Hecla group of mines are reducing production, thus releasing labor that will be available to these mines.

MINNESOTA

Cuyuna Range

Crosby—All producers on the Cuyuna have suspended shipments, owing to the freezing weather, with the exception of the Bonnie Belle mine at Ironton, operated by the Marcus Fay interests, which is an all-rail shipper to the Zenith Furnace Co., Duluth. Several of the operators have not yet completed their season's contracts, and with an ease-up of congestion at the docks or a mild spell in the weather, some of these may make further shipments before navigation is closed.

Ironton—Orders have been received from the American Managanese Manufacturing Co. to close down their Cuyuna-Duluth mine for the winter season. This action comes as a surprise, as stock-pile trestles were being constructed and preparations made for continuous operation this year.

Mesabi Range

Hibbing—The Rogers Brown Ore Co. are driving a drainage drift from the present drainage shaft to connect with a new shaft which they are sinking on on the south side of their pit. This drift will allow all pumping to be done by the present installation of pumps in the old drainage shaft. The progress of the drift has been delayed by the encountering of large quantities of water. From this new shaft all underground development will take place as at present, most of the ore is mined by open-pit methods.

Chisholm — The Oliver Iron Mining Co. has started two diamond drills at the Duncan mine. Work has been started on the development of the Frazier pit. At present tracks are being laid to the approach of the pit and it is contemplated to sink a drainage shaft and drive drainage drifts this winter, preparatory to stripping next summer.

Nashwauk — The Hill Trumble mine of the Cleveland Cliffs Iron Mining Co. have completed their shipments from their washing plant and open pit. The steam shovels are now busy stripping to uncover additional ore for next season.

Virginia—Properties of the Oliver Iron Mining Co. in this district received notice to increase their shipments the first part of last week.

THE MARKET REPORT

Daily Prices of Metals

Nov	Copper, N. Y. net refinery* Electrolytic	Tin 99 Per Cent	Tin Straits	Lead N. Y.	Lead St. L.	Zinc St. L.
18	14.35	36.00	37.00@37.25	6.00	6.00	6.05
19	14.25	35.00	36.00@36.25	6.00	6.00	6.00@6.05
20	14.00@14.25	35.50	36.50@36.75	6.00	6.00	6.00
22	13.85@14.00	35.25	36.25@36.50	5.65	5.65	5.95
23	13.85	35.00	36.25@36.50	5.50	5.50	5.80
24	13.60@13.85	35.00	36.25@36.50	5.50	5.50	5.80

*These prices correspond to the following quotations for copper, "delivered": 14.50, 14.40, 14.15@14.40, 14@14.15, 14, and 13.75@14c.

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for deliveries constituting the major markets, reduced to the basis of New York, cash, except where St. Louis is the normal basing point, or as otherwise noted. All prices are in cents per pound. Copper is commonly sold "delivered," which means that the seller pays the freight from the refinery to the buyer's destination.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. Tin is quoted on the basis of spot American tin, 99 per cent grade, and spot Straits tin.

London

Nov.	Copper Standard Spot	Copper Standard 3 M	Copper Electrolytic	Tin Spot	Tin 3 M	Lead Spot	Lead 3 M	Zinc Spot	Zinc 3 M
18	83⅛	83⅜	94	246½	249⅝	32⅞	32¼	35⅜	36⅛
19	81¼	81¼	93	239½	243¾	32½	31¼	34¼	35½
20	....	....	...	..	....			...	
22	78½	79	90	231	234	30¾	29¾	33½	34⅞
23	78½	79	90	230¾	234⅜	29	29	33½	34⅞
24	78½	79	90	231	235	28¾	29	33⅜	34¾

The above table gives the closing quotations on the London Metal Exchange. All prices in pounds sterling per ton of 2,240 lb.

Silver and Sterling Exchange

Nov.	Sterling Exchange	Silver New York, Domestic Origin	Silver New York, Foreign Origin	Silver London	Nov	Sterling Exchange	Silver New York, Domestic Origin	Silver New York, Foreign Origin	Silver London
18	346	99⅛	78	50⅜	22	348	99⅛	74	47¾
19	344	99⅛	76⅛	49⅞	23	350	99⅛	73⅜	47⅛
20	345	99⅛	75	49	24	347½	99⅛	72	46¼

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Metal Markets

New York, Nov. 24, 1920

Almost a total lack of demand from consumers, coupled with the necessity of selling on the part of producers and traders, has had the inevitable result of continuing the decrease in metal prices. In fact, the downward tendency has been even more noticeable the last week than before. At the current prices of copper, lead, and zinc, many producers are refusing to sell, and the metal is obtainable only from certain interests who are willing to reduce prices sufficiently to tempt buying. Naturally, practically no business is being done by others, so that these sales fix the market regardless of other quotations, which are purely nominal and which are likely to vary over a wide range on the same day.

With the Thanksgiving holiday tomorrow, and with the market as weak as it is, practically no business is likely to be done before Monday.

Copper

Not for some time have sales been as small as during the last week. Consuming demand has utterly vanished. One or two inquiries have been made for second-quarter delivery next year, but producers do not care to go so far ahead, and, in fact, many producers will not consider business for any delivery at less than 14.50@14.75c. delivered. Some second-hands have been selling small amounts at 14.25c. delivered. On Monday, one fairly large lot, for these times, was sold for delivery early in the year at 14c., and yesterday another lot at the same price, so that we consider the 14c. price to have been established. In fact, large lots of spot metal could be obtained today for 13.75c., and in London American copper was today offered f.a.s. New York at considerably under this figure.

Note—The quotation for New York Electrolytic Copper for Nov. 17 was incorrectly stated, in our issue of Nov. 20, as 14.35@14.60. The correct quotation for Nov. 17 is 14.35@14.50.

Lead

Following the market trend, the American Smelting & Refining Co. again reduced its official price of lead late Monday afternoon, Nov. 22, from 6.50 to 6c. New York and St. Louis.

Lead has been very weak, with business insignificant, as is bound to be the case with a rapidly falling market which shows no signs of stopping. Those who customarily buy carloads are buying in five-ton lots. Larger consumers, in general, have stocks sufficient to carry them over the year-end. The prospect of the Broken Hill production of 7,000 tons per month, which will begin in February, has had a depressing influence, particularly in London, where about three-quarters of this metal will be marketed. Here, the statistical position continues good, which is the most that can be said. The market is not burdened by any large stocks such as exist in copper, and producers are generally in a good financial position, owing to recent prosperity. Producers of chemical lead are particularly independent at present prices, and exact considerable premiums for small orders. Should inquiries of any size come into the market, the premium would rapidly fade, as some plants can easily shift over to the production of chemical lead at no extra expense.

Zinc

With the further decline in London, expected support for the domestic market has been lacking, and the decline of close to five points a day, on an average, continues. The forced selling of a few hundred tons a week is largely brought about by the necessity for cash by the smaller producers.

Tin

A definite change has come about in the tin situation. The bankrupt metal which was pressing on the market seems to have disappeared. A large tonnage is reported to have passed into the hands of one consumer. With tin in stronger hands, the decline in London was met by firmness here, and it is unlikely that the New York spot price will continue much longer under the import cost. Sellers of forward tin are hard to find.

Banca tin has almost disappeared from the market and electrolytic is now held at a slight premium over Straits. Chinese No. 1 is somewhat scarcer, but offerings of this grade are still being made.

Straits tin for future delivery: Nov. 18th, 38.50@39.00c.; 19th, 37.25@37.75c.; 20th, 38.00@38.25c.; 22d, 37.75@38.00c.; 23d, 37.50@38.00c.; 24th, 37.50@38.00c.

Arrivals of tin in long tons: Nov. 20th, Singapore, 75; 22d, London, 100; 23d, China, 150.

Silver

The New York "Foreign Bullion" official quotation of 72c. on the 24th is the lowest figure since March 27, 1917, when the price was 71⅜c. Continued weakness in China exchanges is responsible for the sagging market. If still lower prices are reached, it is probable that India will become a buyer.

Gold

Gold in London: Nov. 18th, 117s. 2d.; 19th, 118s. 4d.; 22d, 117s.; 23d, 115s. 10d.; 24th, 117s. South African gold in excess of the requirements of the British and Indian treasuries is coming to this country and serves to make possible a further expansion of credit rather than to increase the gold reserve against outstanding notes. Previously during the year exports have been considerable. Between Jan. 1 and Nov. 10, total gold imports amounted to $333,836,965, whereas our gold exports were $297,300,783.

Foreign Exchange

The decline in European exchanges seems to have been arrested, and a much stronger tendency has been observed during the last week. On Tuesday, francs were 6.19c.; lire, 3.84c.; and marks, 1.44c. New York funds in Montreal have advanced to a premium of 13⅛ per cent.

Mexican Dollars—Nov. 18th, 59⅜; 19th, 58⅜; 20th, 57⅜; 22d, 56⅝; 23d, 56¼; 24th, 55.

Other Metals

Aluminum—For 50-ton lots: ingot, 99 per cent and purer, 33c.; 98@99 per cent, 32c. Outside sales reported at lower prices than quoted above.

Antimony — Chinese and Japanese brands, 6c; market very quiet; W. C.C. brand, 8¼@8½c. per lb. Cookson's "C" grade, 12½@13c. Chinese needle antimony, lump, nominal at 5½c. per lb. Standard powdered needle antimony[1] (200 mesh), 9c. per lb. Market dull.

White antimony oxide, Chinese, guaranteed 99 per cent Sb_2O_3, wholesale lots, 10c.

Bismuth—$2.55 per lb., 500-lb. lots, and $2.57 per lb., 100-lb. lots.

Cadmium—Nominal, $1.40@$1.50 per lb. Market steady.

Cobalt—Metal, $6 per lb.; black oxide, $4.00 per lb.; sulphate, $1.60.

Iridium—Nominal, $350@$400 per oz.

Magnesium—Crude, 99 per cent or over pure, $1.75 per lb. for 100 lb. lots and over, f.o.b. Niagara Falls.

[1]**Molybdenum Metal** in rod or wire form, 99.9 per cent pure, $32@$40 per lb., according to gage.

Nickel—Ingot, 43c.; shot, 43c.; electrolytic, 45c., f.o.b. Bayonne, N. J.

Monel Metal—Shot, 35c.; blocks, 35c., and ingots, 38c. per lb., f.o.b. Bayonne.

Osmium—Open market, $70@$80 per troy oz.

Palladium—$85 per oz. Dull.

Platinum—Firm at $85 per oz.

Quicksilver—Market quiet; $58@$60 per 75-lb. flask. San Francisco wires $55. Weak.

[1]**Rhodium**—$200@$225 per troy oz.

Ruthenium—$175@$200 per troy oz.

[1]**Selenium**—Black powdered, amorphous, 99.5 per cent pure, $2@$2.25 per lb.

[1]**Thallium Metal**—Ingot, 99 per cent pure, $20 per lb.

[1]**Tungsten Metal**—$35@$60 per kilogram, according to purity and gage.

Metallic Ores

Chrome Ore—Guaranteed 50 per cent Cr_2O_3 foreign ore with a maximum of 6 per cent silica, 60@65c. per unit, New York. California concentrates, 50 per cent Cr_2O_3 and upward, 70@75c.

[1]**Manganese Ore**—45c. per unit, seaport; chemical ore (MnO_2) $55@$65 per gross ton, lump; $75@$85 per net ton, powdered.

Molybdenum Ore—85 per cent MoS_2, 55@60c. per lb. of contained sulphide, New York.

[1]**Tantalum Ore**—Guaranteed minimum 60 per cent tantalic acid, 55@65c. per lb. in ton lots.

[1]**Titanium Ores**—Ilmenite, 52 per cent TiO_2, 1½@2c. per lb. for ore. Rutile, 95 per cent TiO_2, 15c. per lb. for ore, with concessions on large lots or running contracts.

Tungsten Ore—Scheelite, 60 per cent WO_3 and over, per unit of WO_3, $6 f.o.b. mines; wolframite, 60 per cent WO_3 and over, per unit of WO_3, $4.25@$4.50, in New York.

Uranium Ore (Carnotite)—$2.75@$3 per lb. for 96 per cent of the contained oxide (U_3O_8). Ores must contain a minimum of 2 per cent U_3O_8.

Vanadium Ore—$2 per lb. of V_2O_5 (guaranteed minimum of 11 per cent V_2O_5), New York.

[1]**Zircon**—Washed, iron free, 5c. per lb.

[1]**Zirkite**—According to conditions, $80 @$90 per ton, carload lots. Pure white oxide, 99 per cent, is quoted at $1.15 per lb. in ton lots.

Zinc and Lead Ore Markets

Joplin, Mo., Nov. 20—Zinc blende, per ton, high $47.30; basis 60 per cent zinc, premium, $36; Prime Western, settling, $45@$35; buying $37.50@$35; fines and slimes, $32.50@$30; calamine, basis 40 per cent zinc, $35. Average settling prices: Blende, $45.20; calamine, $38.62; all zinc ores, $45.05.

Lead, high, $104.05; basis 80 per cent lead, buying, $55; settling, $110@$55. Average settling price, all grades of lead, $76.26 per ton.

Shipments for the week: Blende, 9,427; calamine, 181; lead, 1,876 tons. Value, all ores the week, $575,910.

It is requiring no concerted effort now to get operators to shut down the mines. One after another is closing down as fast as the business can be satisfactorily adjusted.

A reaction toward heavier buying was initiated this week, with the decline to $35 basis, one concern taking 1,000 tons $37.50 and 3,400 on $35 basis. Another bought 1,500 tons $35 basis.

Platteville, Wis., Nov. 20—No quotations are available for lead and zinc ore. The market is demoralized. Only one roaster, the National, made shipments of finished blende during the week. Further curtailment of overhead expense and reduction in wages are being tried, to avert a complete shutdown of mines still in operation. Shipments for the week: Blende, 291 tons. Shipments for the year: Blende, 58,812; calamine, 2,534; lead, 4,428; sulphur ore, 1,342 tons. Shipped during the week to separating plants 2,177 tons blende.

Non-Metallic Minerals

Asbestos—Crude, No. 1, $2,000@$3,000; No. 2, $1,400@$1,700; spinning fibres, $400@$800; magnesia and compressed sheet fibres, $325@$500; shingle stock, $110@$150; paper stock, $60@$75; cement stock, $17.50@$30; floats, $8.50@$15, all per short ton, f.o.b Thetford, Broughton, and Black Lake mines, Quebec, Canada; 5 per cent to be added as Canadian royalty export sales tax.

Barytes—Crude, 88 to 94 per cent barium content, $10@$12 per net ton; ground (white) $24@$30 in bags, carload lots; (off-color) $22@$26 in bags, carload lots; all f.o.b. Kings Creek, S. C. Crude, 88 to 94 per cent, $23; ground (white), $45; ground (off color) $30@$32 per net ton, less than carload lots, f.o.b. New York. Crude, first grade, $10 per ton, f.o.b. cars, Missouri; floated, $28 per ton in bbls.; $26.50 per ton in 100-lb. bags; extra charge for bags, f.o.b. St. Louis.

Chalk—English, extra light, 5@5½c.; light, 5@6c.; dense, 4½@5c. per lb., all f.o.b. New York.

China Clay (Kaolin) — Crude, $8@$12; washed, $12@$15; powdered, $18@$22; bags extra, per net ton, f.o.b. mines, Georgia; crude, $8@$12; ground, $15@$40, f.o.b. Virginia points. Domestic lump, $10@$20; powdered, $25@$30; imported lump, $25@$35; powdered, $30@$35, f.o.b. New York.

Feldspar—Crude, $8@$14 per gross ton, f.o.b. Maryland and North Carolina points; $7.50@$10, f.o.b. Maine; ground, $27@$30, car lots, f.o.b. Baltimore; ground, $17@$21, f.o.b. North Carolina points; $17@$21 per ton, No. 1 ground, f.o.b. New York State; $21@$23 per ton, ground, f.o.b. Maine. Crude spar very scarce.

Fluorspar — Gravel, guaranteed 85 per cent calcium fluoride and not over 6 per cent silica, $22.50 per ton, f.o.b. Illinois mines, and $25.50, f.o.b. Kentucky; ground, suitable for acid, chem-

[1]Furnished by Foote Mineral Co., Philadelphia, Pa.

ical or enameling purposes, $60; lump, $17, f.o.b. Tonuco, N. M. In Canada 85 per cent calcium fluoride sells for $20 per ton f.o.b. Madoc; output limited. Canadian price generally $18 (Canadian currency) per ton, f.o.b. mines; market inactive.

Fuller's Earth—$18 per ton carload lots, f.o.b. New York.

Graphite—The 90 per cent crucible grade is held in Alabama for 9c. per lb. and 85 per cent grade is practically unobtainable, prices being 7@9c. The higher lubricating grades sell for 11@40c., according to carbon content.

Gypsum—Plaster of paris in carload lots sells for $4.25 per 250-lb. bbl., alongside dock, New York. Raw crushed rock, $3.50@$4.50; calcined stucco, $9; f.o.b. works, Illinois.

Kaolin—See China Clay.

Limestone—Dolomite, 1@2 man size, $1.60@$1.65; 2@8 in., $1.55@$1.65 per net ton, f.o.b. Plymouth Meeting, Pa.; fluxing, $1.65@$1.75 per net ton, f.o.b. Howellville, Pa.

Magnesite, Calcined — High-grade caustic calcined, lump form, $35@$40 per ton, carload lots, f.o.b. California points. In Chicago district, $57.70; Atlantic seaboard, $61@$63.

Dead-Burned—$36.50 per net ton, Chewelah, Wash.; $58@$64, Chester, Pa. Austrian grade, $55@$60 per ton, f.o.b. Baltimore. (Magnesite brick—See Refractories.)

Mica—India block mica slightly stained, per lb.: No. 6, 50c.; No. 5, $1.20@$1.40; No. 4, $2@$3; No. 3, $4.25@$5; No. 2, $5.50@$7; No. 1, $8. Clear block: No. 6, 55c.; No. 5, $2; No. 4, $3.50; No. 3, $5, No. 2, $6.50; No. 1, $8; A1, $10; extra large, $25, all f.o.b. New York; ground, $150 per ton, Philadelphia. Domestic, uncut, f.o.b. Franklin, N. C., as follows: Scrap, $45@$50 per ton; punch, 10c. per lb.; circle, 15@25c.; 1½ x 2 in., 75c.; 2 x 2 in., $1.15; 2 x 3 in., $1.65; 3 x 3 in., $2.10; 3 x 4 in., $2.50; 3 x 5 in., $2.75; 3 x 6 in., $3.75; ground 165 mesh, $240 per ton; ground roofing mica, $60; mica washers, 75c.@$2 per lb.; 1½-in. disks, No. 1, $1.60 per lb.; No. 2, $1.30. The foregoing domestic prices obtain also in the Chicago district.

[1]**Monazite** — Minimum of 6 per cent thorium oxide, $35 per unit, duty paid.

Phosphate Rock—Per long ton, Florida ports: 77 per cent tricalcium phosphate, $13; 75 per cent, $11.50; 75@74 per cent, $11; 70 per cent, $8.35; 68 per cent, $7.85; 68@66 per cent, $7.60. Finely ground Tennessee rock sells for $8.50 per net ton for 13 per cent phosphorus content, agricultural application; for acid-making, 14 per cent, $9; both prices f.o.b. Centerville, Tenn.

Pumice Stone—Imported, lump, 4@50c. per lb.; domestic lump, 6c.; ground, 4@7c., all f.o.b. New York.

Pyrites—Spanish fines, per unit, 12c., c.i.f. Atlantic seaport; furnace size, 17c.; Spanish lump, 14@16c.; domestic fines, f.o.b. mines, Georgia, 12@14c.

Quartz—(Acid tower) fist to head, $10; 1½ to 2 in., $14; rice, $17, all net ton, f.o.b. Baltimore; lump, carload lots, $5@$7.50 net ton, f.o.b. North Carolina mines.

Sand (Glass)—Dry glass sand, $4 per net ton, f.o.b. cars Mapleton, Pa. Sand, f.o.b. Ottawa, Ill., is $3 per ton; $2.50 on annual contracts. Sand at Klondike. Gray Summit and Pacific, all in Missouri, is $2.50 on contract; some outside sales have been made at $4. St. Louis, open market, at $3.50; contract price on large quantities, $2.50; on small quantities, $3.

Sulphur—$18 per ton for domestic; $18@$20 for export, f.o.b. Texas and Louisiana mines. Market quiet.

Talc — Paper making, $12@$22 per ton; roofing grades, $9.50@$15; rubber grades, $12@$18, all f.o.b. Vermont. California talc, $20@$45, talcum powder grade. Southern talc, powdered, carload lots, $12@$15 per ton; less than carload, $25, f.o.b. cars; freight to New York $5.25 per ton, carload lots; less than carload lots, $9.25. Imported, $60@$70; Canadian, $20@$40 per ton.

Mineral Products

Arsenic—White arsenic, 13@14c. per lb.; sulphide, powdered, 16@17c. per lb. in carload lots.

Sodium Nitrate—$3 per cwt., ex vessel, Atlantic ports. Market quiet.

Sodium Sulphate—For 95 per cent material, $22 per ton, f.o.b. mines, Idaho and Arizona, spot and six months' contract.

Potassium Sulphate—Domestic, $225@$250 per net ton, basis 90 per cent, f.o.b. New York.

Ferro Alloys

Ferrocarbontitanium—For 15 to 18 per cent material, $200@$225 per ton, f.o.b. Niagara Falls, N. Y.

Ferrocerium—Per lb., $12@$15.

Ferrochrome—Carload lots, spot and contract, 60 to 70 per cent chromium, 6 to 8 per cent carbon, 17@18c. per lb. of chromium contained; 4 to 6 per cent carbon, 16@17c., f.o.b. works.

Ferromanganese—Domestic 76 to 80 per cent, $150, freight allowed; $145, f.o.b. seaboard bases; English, $145@$150, c.i.f. Atlantic seaports. Spiegeleisen, 18@20 per cent, $65, f.o.b. furnace.

[1]**Ferromolybdenum**—Standard grades, carrying from 50 to 60 per cent molybdenum metal, with low sulphur, phosphorus, and arsenic, $2.25@$2.50 per lb. of contained metal, f.o.b. works.

Ferrosilicon—For 10 to 15 per cent, per gross ton, f.o.b. works, $60@$65; 50 per cent, $80@$85; 75 per cent, $160.

[1]**Ferrotungsten**—Domestic, 70 to 80 per cent W, 75@90c. per lb. of contained tungsten, f.o.b. works. Foreign, 70c.

Ferro-uranium—35 to 50 per cent U, $7 per lb. of U contained, f.o.b. works.

[1]**Ferrovanadium**—Basis 30 to 40 per cent, $6.50@$7.50 per lb. of V contained, according to silicon content, f.o.b. works.

Metal Products

Copper Sheets — Current New York price, 24½c. per lb.; wire, 19c.

[1]Furnished by Foote Mineral Co., Philadelphia, Pa.

Lead Sheets—Full lead sheets, 10½c.; cut lead sheets, 10¾c. in quantity, mill lots.

Nickel Silver — Unchanged at 35¾c. per lb. for 18 per cent nickel.

Yellow Metal — Dimension sheets, 22¼c.; sheathing, 22¼c.; rods, ⅜ to 3 in., 19¼c.

Zinc Sheets—$11.50 per 100 lb., less 8 per cent on carload lots, f.o.b. smelter; zinc plates, 10½c. per lb.

Refractories

Bauxite Brick—56 per cent alumina, $160 per 1,000, f.o.b. Pittsburgh.

Chrome Cement—40@45 per cent Cr_2O_3, $55@$60 per net ton, and $65 in sacks, carload lots, f.o.b. eastern shipping points.

Fire Brick—First quality, 9-in. shapes, $55@$60 per 1,000, Pennsylvania, Ohio and Kentucky. Second quality, $45@$50.

Magnesite Brick — 9-in. straights, $110 per net ton; 9-in. arches, wedges and keys, $120; soaps and splits, $130.

Silica Brick—9-in., per 1,000: Chicago district, $65@$70; Birmingham, Ala., $56@$61; Mount Union, Pa., $55@$60.

Iron Trade Review

Pittsburgh, Nov. 23, 1920.

Operations at the independent steel mills continue to decrease rapidly. Many of the larger and smaller independents are operating at 60 per cent or less. The almost universal decrease in operations is not what was expected a few weeks ago, by reason of the independents being so variously situated as to the volume of business on books, but it now seems that those with the larger quantities of business were subject to correspondingly more cancellations and postponements. As to the Steel Corporation, it is of course operating as formerly up to the limit of fuel and car supplies.

A moderate improvement over the present stagnation in markets is expected after the turn of the year.

Pig Iron—On a 500-ton sale, foundry iron has declined $1 to $39, Valley, and further inquiry would probably develop lower prices. In basic, the offerings of steel works formerly using all their output themselves is a factor. Basic has been offered at $35, Valley, and bessemer at $37.50, with little or no tonnage taken, representing declines in the week of $4.50 and $3.50 respectively.

Semi-finished Steel—The market is too inactive to develop definite prices. The nominal quotation of $55 has yielded to definite information that $50 could be done by buyers. Sheet bars, nominally quoted by mills at $60, are understood to have been sold by one independent at the Steel Corporation price of $47.

Charcoal and Coke

Charcoal—Willow, 7c. per lb. in bbls.; hardwood, 6c. per lb., in 250-lb. bbls.

Connellsville — Furnace, $10@$12; foundry, $8@$10.

The Effect of Imported Lead

Unusually Large Amounts of Foreign Origin Have Arrived Recently, Whereas Exports Have Dropped—Lead Production Costs Lowered by Cheaper Fuel—Importance of the Resumption of Operations at Broken Hill—Demand for Lead Dull

ONE of the chief causes for the recent decline in the price of lead from 9c. in August to 5½c. toward the end of November is the surprisingly large amount of lead that has been lately imported into the United States. The table of movements of lead to and from the United States given below has been prepared to show exactly how the foreign commerce in lead has varied during the first nine months of the year.

In the first half of 1920, the largest quantities of imported lead came, as is ordinarily the case, from Mexico. In August heavy imports of pig lead bars and old lead from Europe set in, and though an unusually large amount for that class of material, the quantity was more than doubled by similar imports in September. The table clearly brings out the rapid increase in lead imports.

At the same time, exports of lead have materially fallen off. Earlier in the year they averaged about 5,000,000 lb. monthly from foreign and domestic ores. In August and September they had dropped to about 700,000 and 2,260,000 lb., respectively. These figures are all the more significant when comparison is made with the record of previous years. Thus in 1919 a total of 141,813,127 lb. of lead was imported, of which pigs, bars, and old lead accounted for only 10,214,753 lb. In 1920 in the months of August and September alone, more pig, bar, and old lead was imported than in 1918 and 1919 put together. Pre-war importations of pigs, bars, and old lead averaged about 3,190,000 lb. annually.

That the heavy importations of lead have altered the complexion of the market there can be no doubt, but their effect can also be overestimated, as the lead industry is singularly free of surplus stocks, and there is no overproduction in the trade. In fact, it would appear that production this year will be smaller than that of last year.

The drop in lead prices is somewhat cushioned by the general drop in the price of some commodities which go to make up the cost of production. Coal in particular, for which one large operator in southeast Missouri paid $8 per ton, has dropped to $5, and as the smelters in this district use about three tons of coal per ton of lead produced, the saving amounts to almost half a cent. However, high freight rates are working to the detriment of lowered costs. The Rocky Mountain lead producer is hardest hit by the high rates, and considering the effect of the increased charge on the materials entering into the manufacture of lead and the transportation of the product, in all probability about ¾c. is added to the cost of production.

One serious indication in the industry is the decided drop in the demand for certain lead products for which the sale has been at times very brisk. Paint consumption continues good, but lead pipe, lead cable, and battery lead consumption has dropped about one-half. A revival of building construction upon a scale which is necessary to relieve the acute housing shortage will undoubtedly help the lead market considerably. A little lead is accumulating, but the closing down of several properties both in the United States and Mexico will tend to keep the surplus as low as possible.

The settlement of the protracted Broken Hill, Australia, strike which began in May, 1919, introduces another factor in the lead situation, and although Broken Hill lead is not expected upon the market before February, it is well to realize the strength of lead production from that part of the world. The following table gives the production of New South Wales for the ten years ending 1919, and as the Broken Hill district is by far the largest producing area, the figures may be considered representative of Broken Hill production:

	Lead Produced Within Australia in Short Tons	Lead in Lead Concentrates Exported From Australia in Short Tons
1910	94,818	85,035
1911	94,966	111,795
1912	101,811	92,736
1913	106,432	117,903
1914	99,925	88,173
1915	101,090	9,819
1916	128,438	16,428
1917	138,006	6,181
1918	155,306	3,178
1919	80,175	2,425

Australia is one of the world's chief lead-producing countries, ranking second or third in importance (its position cannot be accurately placed because of the unusual conditions of the past five years); in 1913 it ranked fourth, and the table illustrates how independent the continent has become of foreign smelting services. The Broken Hill Associated Proprietary, Ltd., possesses one of the largest lead smelters in the world, with an annual capacity of 175,000 tons of pig lead. The Sulphide Corporation, Ltd., Cockle Creek, N. S. W., has a lead refinery of 60,000 tons' annual capacity.

The supply of Australian lead may force the market down, although there is a possibility of Spanish and Australian producers being so placed that they will be able to control the European market. In such an event, Mexican lead must also be considered, as it could be marketed in Europe as well as here.

The London market on Nov. 16 and 17 took a pronounced drop from £34½ to £32 for spot metal. There had been an unwarrantedly high premium on prompt metal, which did not reflect the true condition of the London market. Too great a disparity was beginning to appear between the levels of the London and New York markets. At 5½c., New York lead is quoted at the lowest price so far this year, although it is still above the average pre-war price of 4.65c. per lb.

MOVEMENTS OF LEAD TO AND FROM THE UNITED STATES IN 1920

COMPANY REPORTS

Consolidated Interstate-Callahan Shuts Down

Lead, Zinc: Idaho

The report of operations of the Consolidated Interstate-Callahan Mining Co. for the third quarter of the year 1920 follows and indicates a deficit for the period:

Net value of shipments	$320,076.25
Miscellaneous receipts	1,849.22
Total income	$321,925.47
Production costs, expenses, taxes, etc.	339,310.79
Loss from operations	$17,385.32
Cost of improvements	10,986.49
Deficit for the period	$28,371.81

There were 50,379 tons mined and 36,441 tons milled of an average ore content of 12.27 per cent zinc, 6.62 per cent lead, and 2.43 oz. silver. Total zinc in zinc concentrates shipped was 6,875,296 lb.; lead, 3,607,242 lb.; silver, 61,190 oz. Cost of mining, crushing and sorting was $4.646 per ton mined; cost of milling and flotation royalties per ton milled, $2.306 per ton.

During the third quarter of the current year shipments of zinc and lead-silver ore and concentrates were 1,770 dry tons less than for the preceding quarter, this falling off being accounted for by the continued scarcity of miners, which condition obtained until the last half of September. During the month of October this condition showed a marked improvement, and as a result shipments during last month were 600 tons higher than the monthly average of the quarter ending Sept. 30. Mining and milling costs have remained practically unchanged during the period.

The company has completed the purchase of an additional amount of Killbuck Mining Co. stock, giving total holdings of approximately 80 per cent of the outstanding capitalization of this company. The development work on the Chicago-Boston property has been vigorously prosecuted, the shaft having been completed to the 400-ft. level, and the crosscut is well under way to intercept the orebody which was encountered 200 ft. above. Work on the Nipsic crosscut is progressing rapidly, as is also the work on the No. 8 and No. 10 levels of the Interstate-Callahan mine, but it has not yet reached the point where the full extent and value of these orebodies have been definitely determined.

Owing to labor troubles at the plants of the Grasselli Chemical Co., the purchasers of Interstate-Callahan zinc product, and that company's request that zinc shipments be suspended for an indeterminate period, the general manager was instructed to suspend milling operations and shipments on Oct. 31. Until shipments are resumed, mining and developing operations, as outlined above, will be continued with a reduced working force.

Lena Goldfields, Ltd.

Gold: Siberia

The tenth annual report of Lena Goldfields, Ltd., a British corporation operating in Siberia, reflects in its accounts for the year ended Sept. 30, 1919, the disorganized state of affairs in that vast region. No accounts were received from Russia during the fiscal year, the postal service between Petrograd and London being closed. The issued capital remains at 1,405,000 shares of £1 each, the full amount authorized. The assets of the company increased in value during the year by £154,895 8s. 11d., bringing them to £759,275 8s. 8d. At the same time rouble assets diminished by Rs. 4,673,649.99 to Rs. 41,705,397.18. There were purchased 45,000 shares of Altai Mines, Ltd., for £1,122,616 13s. 4d., representing 45 per cent control of that property.

An account "Loss on Exchange," amounting to £496,691 16s. 2d., was made to adjust the sterling values shown in previous balance sheets to the latest ascertainable nominal rate for the rouble. In the absence of an accurate report, C. W. Purington forecasts the gold output of the Lenskoie mines for 1919 at about 245,000 troy ounces, from 600,000 cu.yd. of drifting gravel. In May, 1919, there were said to be 1,500 men working on the property, 50 per cent being Russian, 25 per cent Chinese, and 25 per cent Korean.

Utah Copper Has Large Deficit

Copper: Utah

The fiftieth quarterly report of the Utah Copper Co., covering the third quarter of 1920, states that the gross production of copper contained in concentrates for the quarter and the preceding quarter was 24,740,734 lb. and 28,697,127 lb., respectively. In addition to the above, there was produced a total of 59,277 lb. of copper contained in precipitates shipped from the mine, and 531,206 lb. in precipitates from the leaching plant. The net production of marketable copper derived from this gross output for the quarter after allowing for smelter deductions was 24,103,161 lb., as compared with a net production of 27,793,114 lb. for the quarter ended June 30, and of 26,057,667 lb. net for the first quarter of the current year.

During the period there were treated at the Arthur plant 1,497,900 dry tons, being 69,300 tons more than the preceding quarter. The average grade of the ore was 1.0786 per cent copper and the average recovery was 76.57 per cent, as compared with 1.2130 per cent copper and 82.80 per cent, respectively, for the second quarter. The decrease in production and the lower percentage of recovery were because of the lower copper content in the headings. The low headings were due to the large quantity of very low-grade ore necessarily shipped from the intermediate and upper steam-shovel levels.

The average cost per pound of net copper produced, including plant depreciation and all fixed and general charges, but excluding Federal taxes, and without credit for gold and silver or miscellaneous income, was 17.156c., as compared with 13.697c. for the previous quarter, calculated in the same way. The value of the gold and silver in the concentrates totaled $178,683, and the miscellaneous income, including Bingham & Garfield Ry. Co. dividend, amounted to $403,167. These items combined are equal to 2.414c. per net lb. of copper produced, which, being deducted from the operating cost above stated, results in a net cost of 14.74c. per lb. The following tabulation shows the financial results of operations for the quarter, as compared with the previous quarter:

	Third Quarter 1920	Second Quarter 1920
Net profit from copper production only	$329,022	$1,254,033
Miscellaneous income, including payments for gold and silver	581,850	736,312
Income from Nevada Cons. Copper Co.	250,125	250,125
Total net profit	$502,953	$2,240,470
Disbursements to stockholders	2,436,735	2,436,735
Net deficit	$1,933,781	$196,265
Loss		

The earnings for the quarter are computed on the basis of 15.971c. for copper, as against 18.209c. for the previous quarter. The low carrying price is due to the small sales of the metal made during the period and the increase in the amount of copper unsold and carried at 13.5c. per lb. The total net income for the nine months of the year to Sept. 30 inclusive was $5,614,013, or $3.45 per share. A quarterly distribution of $1.50 per share was made to stockholders on Sept. 30.

A daily average of 18,362 tons of ore and 2,325 tons of other freight was transported over the Bingham & Garfield Ry., making a total of 20,687 tons per day, as against 19,068 tons per day for the previous quarter. This increase was due to heavier shipments of ore from the Utah Copper mine.

Notable Machinery Exhibit at Denver Convention Of American Mining Congress

THE exhibit of mining and milling equipment that featured the convention of the American Mining Congress held at Denver Nov. 15 to 20 was, in its way, one of the best displays of the kind ever assembled. All available space, including the lobby and ballroom, on the ground floor of the Albany Hotel, was utilized, and the sidewalk outside was also ingeniously made use of to provide room for a large number of booths. The prominence and accessibility of the exhibit insured that the public, and in Denver this means the mining public, gave it due attention.

Several new things were displayed. A feature of the exhibit of the Ohio Brass Co. was a new electric arc welder of the dynamotor type, designed for 250-v. mine service and for 600-v. rail-

EXHIBITS OF CHARLES A. SCHIEREN CO. AND THE MINE & SMELTER SUPPLY CO.

way or mine service. The apparatus is an adaptation of the Wilson Welder & Metal Co.'s plastic arc system of electric welding. It is designed for delivering constant uniform current at the arc, regardless of the wide trolley voltage fluctuations met with in service. The metallic arc method of welding, which has proven most suitable for rail bonding, is used. The machine is designed for all kinds of shop welding, heavy and light. It is light enough to be handled by the ordinary bonding crew. The dynamotor unit, which is handled separately from the truck, weighs 370 lb. and the truck 275 lb. The machine is so designed as to be readily adjusted to any track gage.

The Denver Rock Drill & Manufacturing Co.'s display, of which a view is shown, gave prominence to the new Model 250 "Waughoist." This was mounted on the column seen at the extreme left of the accompanying cut. Another machine stripped of its casing may be seen on the table in the center. Both machines were operated from time to time for demonstration. This hoist weighs 325 lb., has a capacity of 3,000 lb. and uses 60 to 100 lb. air pressure. Its speed is 72 ft. per min., with a 1,000-lb. load at 60 lb. pressure; 95 ft. per min. at 80 lb. and 104 ft. per min. at 100 lb. The drum will hold 800 ft. of ½-in. steel cable; 500 ft. of ⅝-in. steel cable and 400 ft. of ¾-in. steel cable.

The same display also included several stopers, one of them being the new Model 75 self-rotating wet stoper; also five drifting machines, featuring the "Turbro," with independent rotation and hammer action. The new No. 90 combination auger sinker and the No. 95 dry rock sinker were also featured. A Sinclair portable tractor compressor, a Sinclair sharpener, and a Model 8 Waugh drill sharpener with dolly, dies and punching machine were also displayed.

Hendrie & Bolthoff Manufacturing & Supply Co. showed an Allen Vibrating Screen of the wet type. This consisted of three superimposed screens, making three finished sizes and an oversize and capable of handling 150 to 200 tons per 24 hours. About ¼ hp. is required to operate. The wet screen has a slope of 30 degrees against one of 12½ to 15 degrees for a dry screen, the latter being good for 15 to 20 tons per hour. The display also included a 22-hp. Vulcan electric hoist, a G. E. arc welder, a Universal crusher and a Beaudry "Champion" power hammer.

One of the largest exhibits was that of the Stearns Roger Manufacturing Co., of Denver, agents for Ingersoll-Rand, as well as for "Duriron" products. The display included a Model 5H Little Tugger hoist of 2,000-lb. capacity, as well as the older Model 1H Little Tugger of 1,000 lb. capacity. The new 1-R No. 50 sharpener with machine type pin-punch attachment was also exhibited. "Duriron" products, such as pumps, blowers, fan valves, and fittings, all made of this non-corrosive metal "Duriron," were shown. "Duriron" is thought to have possibilities as a material for making flotation machine impellers. A Stearns Roger overhung ball mill was also shown. This has a rough cast drum of hard white iron used without liners. The chief feature of this mill is the short length of the drum, which is one-half the diameter, thus giving a quick discharge. This mill is designed for closed circuit operation.

The Colorado Iron Works, of Denver, showed an interesting model, about 3 ft. long, of a Lowden dryer. The manufacturers claim that this is the only machine that will successfully handle without dust loss flotation concentrates and other extremely fine materials which form a sticky mass when wet. An Akins laboratory flotation and aëration machine was also displayed. This machine, the makers state, makes use of an entirely new principle in aëration and diffusion with a separate and accurate froth regulation for each cell. A 30-in. Akins classifier, capable of handling 100 tons of 48 mesh per 24 hours, was also to be seen. This is used for separating sand from slime and for dewatering and counter-current washing of granular material. An interesting model of an M-Z mine car was displayed. This is an automatic swivel dump car without any of the locking mechanism projecting from the body to be jammed or broken. This feature, it is said, will eliminate 75 per cent of the repairs on mine cars. A Colorado diaphragm pump, of a special type for handling thick pulp, was included in the exhibit. This has a straight line motion, adjustable stroke,

improved and accessible valves and other features. A special worm-gear reduction set, used on Portland filters, was also displayed.

A Butchart flotation machine was displayed by the inventor, W. A. Butchart, of Denver. This is a horizontal impeller machine, the action of which is based on a minimum of agitation and a maximum of aëration, resulting, it is claimed, in low power consumption and simplicity. A standard Butchart table was also shown.

The Crandall Packing Co., of Palmyra, N. Y., manufacturers of all kinds of packing, displayed samples of their many products. These included flax packings, pump valves, asbestos brake lining, valve discs, hose, waste, belting, matting and other products.

The Mine & Smelter Supply Co. had one of the most attractive booths in the exhibit. The varied nature and wide assortment of their stock of mining and milling equipment and supplies was well indicated by their display. Their booth, together with some of its attractive attendants, is shown in the accompanying illustration.

Brunton pocket transits, Ainsworth transits, together with Ainsworth precision balances, featured the display of William Ainsworth & Sons, which is to be seen in one of the cuts on this page.

Many other companies were represented by exhibits. The Hardinge company had its customary display of a 20 x 5-in. Hardinge mill and a glass model used for demonstrating the action of the balls and particles of ore that takes place within the mill during crushing. As usual, this interested many.

The Dorr Company showed models of the Dorr agitator, thickener and classifier. Their display was prominently located close to the spot where all delegates registered. Supplies for the assay office and laboratory, including mufflers, crucibles, scorifiers and the like, featured the exhibit of the Denver Fire Clay Co. Of all the displays that of the E. I. du Pont de Nemours company, showing mining explosives, had the most prominence, being situated in the center of the hotel lobby. This exhibit included "Minefab" (for covering concentrating tables and other purposes), ventilating tubing, high explosives, ivory pyralin, blasting accessories, "Fabrikoid" and flotation agents. The Hercules Powder Co. was also represented by an exhibit of explosives, blasting supplies and flotation oils. Its display included an educational exhibit of the raw materials going into explosives.

The W. S. Tyler Co., of Cleveland, Ohio, made its presence known by the aid of one of its 6-ft. unit Hum-mer electromagnetic vibrating screens. The vibration of this screen is produced by electromagnetic means, the intensity being readily controlled by varying the distance between armature and magnet. This display also included a Ro-tap testing sieve shaker and samples of wire cloth.

Charles A. Schieren Co.'s booth is shown in one of the accompanying illustrations. "Duxbak" waterproof leather belting was one of the features of this display. Adjoining this was the exhibit of the National Fuse & Powder Co., of Denver, part of whose booth may be seen in the cut on the preceding page.

Groping for the Light

THE discussions at the meetings of the Gold Conference in Denver disclosed clearly the mist that hangs in the minds of most persons concerning so complex a subject as the gold problem. Many of the speakers recited the decay of gold mining in various districts from which the speakers came, without analyzing how far this decay was due to the exhaustion of ore reserves by mining, and how far it was to be attributed to cost inflation brought on by the Great War. Certainly, no legislation can restore worked-out mines to vigor. Other speakers voiced the plaint that, during the war, the Government had urged the production of gold as a war necessity, and now should protect those enterprises which had so nobly and unselfishly rallied to the protection of their country. Of course this is bunk, and unconscious hypocrisy. The Government simply failed to put the gold industry on the black list, and Secretary McAdoo declared openly his recognition of the need for continued gold production. That any call was ever made that influenced the policy of gold producers in the least is not true.

But it was the economic and especially the monetary aspects that the conference was called upon to consider which proved to be of the tanglefoot variety. One gentleman wanted to know if it was not true that "Wall Street" was buying British gold for $27 an ounce and selling it for $32. Oh, you Wall Street! Naughty, naughty Wall Street! Even such a profound student of the problem as Gov. Boyle of Nevada was, it seems to us, unduly impressed by the theory of the "economists" that the rise of prices before the war was due to enormously increased gold production. The economists, like the rest of us, are groping for the light; and there were certainly other causes for the pre-war rise, notably the flow from the rural districts to the cities and the consequent decrease of production of raw materials per capita—if indeed the increased gold production was at all contributory in view of the also vastly increased volume of business. And in any case, the main inflation of prices, during the war, was certainly brought on by paper, and not by gold.

There was, in short, no clear conception as to the justification for the proposed measure—whether it was a war mineral relief measure, a measure designed to be protective of a domestic industry, a measure for the amelioration of the national currency, or one for the betterment of world economic conditions.

There is only one justification that can properly be urged upon Congress as an adequate reason for the passage of the McFadden Bill—that it is a relief measure to supply gold to help bolster up the dreadfully insufficient reserves on which rests the outstanding currency of the world: and this puts it upon a national and international basis. Believing it would have this effect, and be beneficial as a temporary measure, we support it.

Gold and High Prices

THE reason prices are so high, according to the opinion of a certain variety of common or garden economists, including several financial missionaries of current writers who undertake to educate the public through the popular magazines, is that we have so much gold. The gold reserve of the United States has doubled since 1913; also, prices have increased about 200 per cent since 1913. It is an economic axiom that the more the gold the cheaper it is, and the less it will buy; so that commodity prices rise. Therefore, the rise of prices since 1913 has been due to the vastly increased stock of gold. *Quod erat demonstrandum.* Throw away the gold, and prices of shoes and flour will fall. So runs the propaganda.

Well, let's see. Let us take the case of Austria. According to the London *Statist,* Austria's gold stocks fell from 51 million pounds in 1913 to 9 million in 1920. But prices, as the Viennese tell us, are fantastic. It takes a suitcase full of money to buy a drink, and a wagonload to buy a horse. In fact, prices are so high that they have gone beyond all rule and measure. In the case of Germany the country has also succeeded in keeping out the noxious cheap gold. Gold is not cheap in Germany: the stocks are somewhat less than they were in 1913. Yet it takes a thousand marks, or something like $240 par value, to buy a pair of shoes.

Nor is gold in other countries proving itself so common as to be cheap, or a thing to be reduced in the future. The gold reserves of France, according to the *Statist,* are 50 per cent greater than they were in 1913; even in Italy they are around 20 per cent larger. Yet all parties agree that the trouble with France and Italy is that they have not enough gold; that if they had more the franc and the lire would be worth more, and prices would come down.

The real determining factor as regards the relation between cheap money and high prices is evident, and was pointed out in a previous editorial. It is true that abundant money produces high prices for commodities, but in the world today—the whole world, practically—the cheap money is mainly paper. Prices of commodities will tend to decrease as the ratio of paper to gold reserve or "cover" decreases; and this can be accomplished by reducing the paper, or increasing the underlying gold security, or both. The most expeditious way is to do both; in fact, for countries like France and Italy, which are in a desperate condition of inflation, the double remedy is imperative, and is being eagerly sought by the countries in question.

To apply this remedy to the disordered financial world an added beneficial factor would be the maximum production of new gold, in addition to the supply of existing gold. When the critical stage of the inflation fever is passed—if it does pass without the bankruptcy of a number of European countries—will be time enough

to consider the relation of the volume of gold to existing commodities, and its effect on their price. We doubt if there will be any too much. The wealth and population of the "civilized" world have increased rapidly in recent decades, along with the building up of the world's gold reserve.

Minerals Separation at Denver

THE Flotation Conference in Denver was an interesting one. We have purposely avoided commenting on it editorially till now, in order to get the proper perspective lent by distance. For the first time, perhaps, an association of mine owners, many of whom were licensees of Minerals Separation, met the officials of that company for discussion, outside of a court of law. As it was, the meeting partook too much of the nature of a court proceeding, because the Mining Congress side was presented by two able attorneys, Mr. Nye and Mr. Montague, and because Minerals Separation also chose for its representative an attorney, Mr. Cook, its chief counsel.

The grievances of the Mining Congress against Minerals Separation were presented vigorously by the attorneys of the Congress, and in scathing terms. The reply of Mr. Cook consumed the entire afternoon of one session, and was good-humored, conciliatory, but vague. He described in general terms the fairness of the American public, the broad and liberal policies of his own company, the wrongful and wicked slanders under which his company had had to suffer, and the annoying tactics of the opponents of the company, without getting down to brass tacks. When his opponents immediately took the floor, and at once informed him that he had contributed nothing definite to the discussion, he was plainly disappointed and angry, and informed the Congress in effect that he had been exceedingly generous with it, and if it wanted to fight, why, come on.

Doubtless some explanation may be found for this attitude in the sharp attack—perhaps unnecessarily sharp and bitter in opening a conference between two parties—under which his adversaries in the debate had forced him to smart. Mr. Cook, however, made one helpful suggestion—perhaps the most constructive suggestion made at the conference—that the American Mining Congress should appoint a committee to confer with Minerals Separation and have a frank understanding as to how far they could agree, and a clear definition of the points on which they disagree. We understand that this will be done, and believe it a step in the right direction. This and possibly a better and more friendly understanding of each other by the opposing parties, due to each having expressed its opinion of the other frankly, were the chief points of progress; but no real advance, we believe, was made toward a satisfactory settlement of detailed points of difference.

To an observer who here studied the problem without conscious prejudice, it seemed that the Minerals Separation problem is a new and important one in our economic history. It is not a patent problem at all. To Minerals Separation belongs the credit of having invented a new thing. This discovery is, that by the aid of a multitude of interlocking patents and contracts, each carefully fitted to the other so as to make a coherent structure, a perpetual monopoly may be created, and yet the organization be quite within its legal rights—unless indeed it be deemed to come under the Sherman Anti-Trust Law. Minerals Separation, to defend its patent rights, early had to lean strongly upon its lawyers, and—this is the house that Jack built. It is really an architectural success, but one that the mining industry will look upon with increasing disfavor, and that it will continue to seek means for demolishing.

Anything that approaches exclusive power and the arbitrary exercise of that power is repugnant to the American spirit, and cannot long survive, however firmly entrenched in law.

There are two ways out of it. The better way is for concessions to be made on both sides: and for Minerals Separation to condemn its new invention, which, however fascinating in the model, will not work long on an operating scale; on the other hand, for users of the essential Minerals Separation process to recognize its fair (rather than its legal) patent rights. The other—the less desirable—will be to fight it out, with all the hostile forces of attempted strangling monopoly on the one side, and bitter near-socialistic feeling on the other; in which case there is no doubt that Minerals Separation will ultimately lose in its main contentions, and have to foot its campaign bills as well.

Locating a Bureau of Mines Station

THE decision some weeks ago to place the new Southern Station of the Bureau of Mines at Tuscaloosa, Ala., came, it is believed, as a disappointment to the Bureau itself. Placing it at Tuscaloosa determines its principal work as on iron and steel problems, and the Bureau is already in possession of iron and steel stations, such as the one at Minneapolis, which is given over entirely to those investigations, and the expensive plant at Pittsburgh, originally at least intended as the main iron and steel station.

It had been hoped that the Southern States station would be assigned to the interests of non-metallic mining, to whose broad problems no experiment station has yet been devoted; and that in this connection the chemical phase of the Bureau's work would here be centralized. Special political influence, it is understood, namely the efforts of Senator Oliver and Representative (now Senator-elect) Underwood, of Alabama, finally attached the station to Alabama's chariot wheel; and the indications are that the Bureau of Mines is having difficulty in knowing just what to do with it now that it is there. The Bureau's own choice for a location, we believe, was in Tennessee, a favorable situation for work on non-metallic minerals: but the Tennessee statesmen were not sufficiently awakened to what was going on before the station had found its resting place on the broad bosom of the steel corporations operating at Birmingham.

It is difficult to visualize and state these problems nicely and justly; but if it is true that, from motives of the ever-present and sometimes necessary but always dangerous expediency, the Bureau felt obliged to trade its own conviction for the political support of the powerful Southern Democrats, the subsequent landslide of Election Day, putting these same powerful politicians very much on the away back row, must have led to some philosophical reflection by the Bureau chiefs on the uncertainty of politics and the vanity of all things earthly.

The Futility of "Cribbing"

NOT infrequently we note in current publications an article which seems strangely familiar, and, upon closer scrutiny, we find that it is in fact an abstract, excerpt, or material which is skillfuly rewritten but nevertheless can be recognized as having appeared originally in our columns. There is missing, however, the usual credit line, and to this we take exception.

It is our practice, and one which is followed in most publications, we believe, to credit sources of information when they can be obtained. In some instances, we admit, there is the possibility of omission, for it must be obvious that we cannot be held entirely responsible for the sins of plagiarism committed by our contributors.

Early in the year we announced that it was not our intention to follow a "scissors and paste-pot" policy, and pledged ourselves to present to our readers as much original material as possible. Realizing, also, that there is much general and technical information of interest that appears elsewhere, we have not hesitated to publish extracts from other periodicals, reports and the like, but in rational amounts, and we have been only too glad to give full credit where credit was due.

Certainly we are glad to see our "stuff" in print—even editors have their vanities—for it not only affords a personal satisfaction but offers suggestions as to possible ways of improving the service we wish to render.

We do not believe ourselves incapable of error, and, therefore, we welcome all reasonable criticism and are only too glad to rectify such mistakes as may appear in our columns. There seems to be no hesitancy on the part of our contemporaries to attribute to us such faults as we may make; therefore, we ask, why not full credit for other material that they reprint, even if a different phraseology is used?

The discernment of reprinted information which is not properly credited may not be visible to the average reader, but to one who has prepared material for publication the effect is usually evident, and the futility of "cribbing" quite apparent.

Stamping Out a Dread Disease

THE questions of dust abatement and proper ventilation in mines have been extensively investigated by the Bureau of Mines, other organizations, and the individual companies, and it is hardly necessary to state that where measures have been taken to secure these and other healthful conditions the spread of pulmonary diseases has been in a large degree prevented.

In the metal-mining and related industries the death rate from tuberculosis is stated to be higher than that for other workingmen, and this is particularly true at copper, silver, and lead mines. The reason for this large number of deaths and greater amount of sickness in the mining industry is apparent, as conditions surrounding most phases of mining are accompanied by considerable dust, particularly hard, sharp, flinty particles. These enter the lungs and set up an irritation that makes fertile soil for the development of the tuberculosis germ.

It is also true, in this connection, that over 80 per cent of the miners are between the ages of fifteen and forty-four, when tuberculosis is always most prevalent. According to statistics, every third man who dies between these ages dies of tuberculosis, so that the problem of preventing this dread disease in industry is not alone one of humanitarian value, but also that of saving man power and millions of dollars in wasted production.

In an editorial published on Nov. 2, 1918, referring to the use of respirators in mining, we said: "Dust prevention may properly be considered as much a part of the duties of a mining engineer as mine surveying. The mine office should be equipped with dust-sampling apparatus, and regular surveys of dust conditions should be made a part of the routine work of a mine where there is a conspicuous or dangerous amount of dust. There is no panacea for dust, but by intelligent application of the various methods of prevention that mining practice has evolved, its pernicious effects may be greatly lessened, if not eliminated." This, of course, refers particularly to the suppression of the dust evil, but the responsibility for other healthful conditions is also incumbent upon the mine manager, and much may be done by him and his associates, not only in the actual work of pulmonary-disease prevention but in the spread of propaganda concerning tuberculosis.

The National Tuberculosis Association and its 1,200 affiliated agencies are fighting a winning war against tuberculosis. They have clearly demonstrated that proper community organization will control the disease. It costs money to develop community organization. The sale of Christmas seals furnished the funds. From Dec. 1 to Dec. 11 this annual sale will take place. By buying and using liberally the seals and health bonds, any mining man will help not only himself but his community.

Eating With Foreign Knives

THE editor of *The Canadian Mining Journal* complains that food eaten by Canadians "is cooked by Pennsylvania coal in a stove made from United States ore and served on a platter that came from Europe, or Japan, maybe. It is eaten with a Sheffield or Connecticut blade, and the platter is washed with soap from Chicago."

We do not think the situation is as black as painted. Would it not be better to say, for example, that the food is eaten with spoons and forks, rather than knives, plated with Ontario silver on base metal made up of Canadian copper, British Columbian zinc, and Ontario nickel? Furthermore, the food, even if partly foreign, is paid for with Ontario gold or with credit secured by the export of Quebec pulpwood or Saskatchewan wheat.

With the domestic population profitably employed, it is no disgrace to purchase what someone else can produce more cheaply, provided the supply is adequate. In the case of coal, we admit, it is not.

A Case of Depreciated United States Paper Currency

THERE was related to us at the Mining Congress the recent instance, which we believe, from our sources of information, to be entirely authentic, of a Colorado dentist who a few weeks ago bought $2,000 worth of gold in twenty-dollar gold pieces, paying $22 an ounce. The explanation given was that he would have had to have gold notes in order to secure gold from the Mint, and that the Colorado banks were not paying out gold on any other notes. Therefore, this dentist paid $22 in United States paper currency other than gold notes, for $20.67 in gold. Are there other authentic instances?

WHAT OTHERS THINK

Conserving the Rights of Inventors

In one of your recent editorials entitled "The Government Employee and His Discoveries," objections are raised to the Cottrell Bill, providing for the taking over and licensing of inventions of Government employees by the Federal Trade Commission, on the ground that Government employees who have aspirations to invent, will under the provisions of this bill become unduly favored individuals. You say:

"He would be in an enviable position—nothing to lose for the time spent in his researches, for the Government would support him comfortably and indefinitely, and everything to gain. We can imagine what a horde of hungry inventors, who have had experience of being on the losing side of the gamble, would apply for the government jobs."

The same sentiment is expressed by David Wesson in the discussion on the bill. Quoting from the *Chemical & Metallurgical Engineering* article to which you refer, he is reported as saying:

"In the first place, it is well established by decision and precedent under United States patent law, that inventions by an employee using information and facilities of the employer belong to the latter. This, of course, would put employees of our great U. S. Corporation in a separate and privileged class."

It may be proper to say at this time that the authorities will not support the statement of law put forth by Mr. Wesson. It is well settled that when an employer, even the U. S. Government, hires an inventor to make improvements and to invent, unless there is an express agreement whereby the employee undertakes to turn over to the employer any inventions he may make, as well as the patents based thereon, the only right that the employer acquires is an implied license to use the invention, or what is otherwise designated as a shop right.

On the other hand, if an employer suggests the main plan of an invention, any inventions ancillary to the main plan devised by the employee will inure to the benefit of the employer, and the employer's patent may be drawn to cover them. The employer and employee in such cases, however, stand in the relationship of co-operating inventors.

The ruling of the courts on the first proposition is in accord with a pronounced tendency, which they have always exhibited, to conserve the rights of inventors. It is not with a spirit of charity for the inventor that they have taken this position, but, after having weighed all the factors, they have decided that such a policy is in accordance with the purposes for which the patent system was founded.

Our patent system has had its great success owing to its liberality to the inventors, with the consequent stimulus to invention. Might it not be possible still further to stimulate invention by further liberality toward the inventor? At least, Thomas A. Edison seems to think so. In a hearing last year before the Congressional Committee on Patents, he authorized his representatives to say:

"You might say that if there is any possible way whereby the law would in actual practice work out so that the inventor would be protected from the capitalist either by the impossibility of alienating his interests or in that a fixed per cent should always be his in spite of himself, it would be of great value to the people of the United States. The United States has very little interest in having inventions operated almost wholly for the benefit of the capitalist. Their interest is in providing money for the inventor to permit him to continue to invent, which he certainly will do as long as he commands a dollar. This is a natural peculiarity of the inventive mind."

It was stated at the hearing that the idea of Edison was not to benefit the inventor, but to benefit the people by making it possible for the inventor to continue his experiments, thereby developing new inventions which would not be developed under the present system.

In reaching a decision on the merits of this bill, therefore, it is to be hoped that proper consideration will be given to the policies and objects of the patent system. Is the principle underlying the bill a correct one and will it stimulate invention? Bearing on this question, Professor Elihu Thompson, the celebrated inventor, has recently said:

"Publish an invention freely, and it will almost surely die from lack of interest in its development. It will not be developed, and the world will not be benefited. Patent it and, if valuable, it will be taken up and developed into a business."

Having decided that the objects sought to be accomplished by the bill are in general accord with the policy of the patent system, the next question to be answered is, Is the bill properly drawn? If it is not properly drawn to carry out these objects, redraft the bill.

The tendency for the discussion to drift off from the real merits of the bill on to questions of patent policy that have been considered as well settled, is unfortunate. It is with the object of directing attention to the necessity of intelligent consideration of the untried features of the bill that this communication is written.

Washington, D. C. JOHN BOYLE, JR.

Specie Payments

Recently you called attention to the inability of one of your editors to obtain gold coins at the bank to which he applied for them. You made the very pointed statement that if there isn't enough gold to enable it to be fairly distributed, the banks can at least assist in stimulating production. Of course, the reason that it is difficult to obtain gold at any bank in spite of the enormous amount of gold in the country is the relatively low percentage of metallic gold reserves to the amount of paper money in circulation, and no doubt it is the desire of those in authority to conserve all the gold possible. So long as faith in our present system is unshaken the present condition will work, but it is mighty fortunate for us that there are no countries that we are indebted to, for our currency would then surely reflect its depreciation. F. G. ADAMSON.

Expenditures of the Bureau of Mines

An Official Explanation of the Use of the Bureau's Appropriations, With Special Reference to Recent Editorial Comment—Question Raised Whether Metal Mining Is Not Receiving More Than Its Proper Share of Attention

By Dr. F. G. Cottrell, Director
Written for *Engineering and Mining Journal*

THE editorial in the *Engineering and Mining Journal* of July 24, 1920, pp. 147-48, relating to the work and organization of the Bureau of Mines, asked if the Bureau was expending perhaps an undue portion of its funds in the interest of safety and at the expense of economic mining and metallurgical investigations. In addition, an analysis of the Bureau's appropriations was given, and the belief expressed that certain phases of the industry were receiving undue attention at the expense of others.

Frankly, it is probable that the Bureau appropriations are not balanced from the point of view of many men engaged in particular divisions of the industry. For example, attention has been forcibly directed to the fact that the appropriation for carrying out the work in petroleum and natural gas, supposedly falling within the Bureau's sphere, is entirely inadequate in proportion to the importance of the industry. It is equally true that the Bureau recently has been urged to devote more time and money to research in fuel testing, economic mining problems and to problems in the metallurgical and chemical industries. However, to get a clear perspective from the Bureau's point of view, it is necessary to go back to the beginning and ascertain what the Sixty-first Congress specifically had in mind when in 1910 it created the Bureau of Mines.

Attitude of Congress in Establishing the Bureau

For many years prior to this, efforts had been made to have the mining industry represented by a department in Washington, which would function in a manner similar to that of many foreign countries which have a cabinet officer directing a department which represents the mining and mineral industry. Specifically, however, the matter did not progress toward completion until 1907 and 1908, when a series of mine disasters occurred in America which took such an unusual toll of lives that the public and Congress were thoroughly awakened to the necessity of creating a bureau which could help in making the mines safer.

Statistics were presented which showed that the death and accident rate in the mining industry in America was greater than in European countries. Reports and hearings before Congress brought out clearly that mine operators felt they did not have the knowledge which would help them avoid similar disasters, and, perhaps of most significance, they felt that the problems involved such sums for their solution and the results were of such importance to the mining industry in all parts of the country that a central Federal agency was the best means of carrying out the needed work. Thus, in the organic law creating and continuing the Bureau the investigations relating to the safety of miners and prevention of accidents were particularly emphasized.

For these reasons the appropriations for mine accidents have consistently been the largest single appropriations given the Bureau. As stated in the editorial, including the appropriation for mine rescue cars and stations, this amounts to 43 per cent of the total money received. It is, perhaps, natural that the public should associate this appropriation with the first-aid and mine rescue training and its attendant slogan of "Safety First."

Many Branches of "Mine-Accident" Work

However, the term "Mine-Accident Appropriation" is only an abbreviated term used for convenience to cover an appropriation which reads as follows: "For investigations as to the cause of mine explosions, methods of mining, especially in relation to safety of miners, the appliances best adapted to prevent accidents, the possible improvements of conditions under which mining operations are carried on, the use of explosives and electricity, the prevention of accidents and other inquiries and technologic investigations pertinent to the mining industry," and this in turn covers both the coal- and metal-mining industries.

Thus, out of this fund comes not only about $112,000 for expenses of mine rescue cars and stations and direct first-aid and mine rescue training and disaster work, but more than $297,000 in addition which is devoted to the expenses of testing and research into explosives and the use of electricity and mechanical appliances underground, ventilation, coal- and metal-mine dust, and their relation to the health and safety of miners; the operation and maintenance of the fifteen Bureau schedules of approval for explosives and safe equipment underground, and the extensive field and experimental mine investigations relating to the prevention of explosions from coal dust and gas. In short, this appropriation not only supports the basic investigations of the fundamental problems pertaining to the improvement of health and safety conditions in the whole mineral industry but investigations which have the widest economic importance. Safety in mining has a significance today which is inseparably linked with efficiency and economy.

Of the $154,000 appropriated for operating mine rescue cars and stations, $126,000 is spent for the regular work of training and the remaining $28,000 for investigative work on subjects relating to the health and safety of the miner, which studies can be best carried out by the personnel of the rescue cars. Thus, of a total of $563,000 appropriated for "mine accidents" and "operating mine rescue cars," $238,000 is spent in so-called regular first-aid and mine rescue training and stations and cars and $297,000 is devoted to the investigational work as just described.

Concerning the mining experiment stations, of which there are ten distributed in mining districts throughout the country, and for which there is an annual expenditure of $200,000, it is a fair question for dis-

cussion as to whether the industry is better served by this number of stations, each small in itself, and by reason of their location peculiarly in touch with local needs and industries, or by having an equal amount of money spent in the construction of a single central large station, where, as at the Pittsburgh station of the Bureau, a trained corps of specialists is available on any problem. It is a fact that local industries prefer to have their problems worked out locally. Furthermore, the distributed stations are far more closely in touch with the general industry than a central station could be. At the same time, as brought out in the editorial, there is the possibility of multiplying overhead expenses, of loose co-ordination and possible duplication of work at the several scattered stations. The Bureau is trying to avoid these faults by close liaison and supervision of the stations through the central office of supervisor of stations. The Bureau believes that the results of the last year justify the continuance of the work at the individual stations. Furthermore, it believes thoroughly that certain industries, as, for example, the coal industry, have enough great and general problems to justify the building up of central stations of a larger magnitude than those represented by the so-called "Foster" or "Mining Experiment Stations Act," which receive only $25,000 per year.

Fuel testing and petroleum are subjects so definitely defined as to offer little chance of discussion as to the purposes of their expenditure.

The editorial states that mineral mining, including both coal and metal mining, receives 10 per cent only of the appropriations. Again there may possibly be misapprehension due to the use of the abbreviated term "mineral mining." Actually, none of the mineral mining appropriation money is expended in coal mining. The full estimate of the appropriation reads as follows: "For inquiries and scientific and technologic investigations concerning the mining, preparation, treatment and utilization of ores and other mineral substances, with a view to improving health conditions and increasing safety, efficiency, economic development and conserving resources through the prevention of waste in the mining, quarrying, metallurgical and other mineral industries." This includes a broad field, recognizing the need for economic work in the whole mineral mining, metallic and non-metallic, ore dressing, and allied fields of the treatment and utilization of the metals and minerals contained therein. Thus, many ore-dressing, metallurgical and economic studies are supported from this fund.

"Mineral Mining" Does Not Cover Coal Field

There has been a prevalent idea that the Bureau of Mines spends more of its money in the coal industry than in the general mineral, metallurgical, and economic fields. Without discussing the relative merits of the question, an analysis has been made of the past year's expenditures of the Bureau of Mines in these fields, which shows approximately the following:

Expenditures chargeable to coal mining and combustion:

1. For mine accidents, including mine rescue cars and stations	$333,126
2. Testing fuel	142,510
3. Engineering experiment stations	5,000
Total	$480,636

Expenditures chargeable to mineral mining, ore dressing, metallurgy and to mining and preparation of earthy minerals:

1. For mine accidents, including mine rescue cars and stations	$142,892
2. Mineral mining	125,000
3. Engineering experiment stations	170,000
Total	$437,892

Thus, if fuel testing (which is mostly mechanical engineering) is deducted from coal mining, a larger amount was spent for work and investigations in the metal- than in the coal-mining industry, and the question may be raised whether metals are not receiving more than their share of attention. The answer to that question is that it is more expensive to investigate a number of subjects than it is one subject; the ore-dressing of the different metallic minerals offers more problems than the washing of coal, for example. Moreover, it is highly desirable to investigate problems in the area in which they exist, so far as possible, to maintain close contact with the industry, and it is less practicable to centralize investigations of metal-mining problems than it is of the coal-mining problems.

Altogether, the field functionally within the activities of the Bureau is broad, and there are many spots as yet cultivated not at all or only casually. If the work under way is or will be of value to the industry it is reasonable to suppose that funds may continue to be apportioned to the Bureau until all branches of mining and metallurgy shall receive their just dues.

Malaria Control

The methods followed by the American Bauxite Co. at its plant in Bauxite, Ark., for malaria control by anti-mosquito measures, as described in *Bauxite News* for October, 1920, are as follows:

The control measures employed consisted of draining and oiling all streams thought to influence the incidence of malaria by producing a sufficient number of mosquitos to become of sanitary importance. Areas were cleared and regraded or otherwise treated, so as to insure rapid run-off of normal waters. Such major obstructions were removed from the bottom of streams as would retard the normal flow of waters or prevent the formation of complete films during subsequent oilings.

In clearing the streams of obstructions, special efforts were made to remove all overhanging brush that by coming in contact with the normal flow of water could produce favorable places for the mosquito to rest and deposit eggs. As a rule it was necessary to remove the underbrush from one side of the stream only, as this was found to give free access to the water during inspection and oiling wherever practicable.

Narrow ditches were cut in the bottom of wide ditches so as to confine the receding water after heavy rains to narrow banks. New ditches cut for the purpose of draining known breeding places were constructed as narrow as possible, remembering that cattle are less likely to trample the bottoms of deep narrow ditches while in wide bottoms. Ditches where cattle are permitted to roam and small isolated areas due to hoof prints can often be seen in which mosquitos may breed without fear of being molested by any of their natural enemies. Mosquitos will deposit eggs in almost every conceivable artificial container, water barrels, cisterns, cans, cellars; in fact, any receptacle that will hold water.

Copper Losses in Slags

Investigation of Methods for Determining Amounts of Sulphide and Oxide Present—Analyses Of Characteristic Slags and Their Interpretation—Wisdom of Pouring Converter Slag Into Blast-Furnace Settlers

By FRANK E. LATHE
British America Nickel Corporation, Deschenes, Quebec
Written for *Engineering and Mining Journal*

FOUR ARTICLES published in technical journals during the last ten years have given the results of investigations to determine the condition in which copper exists in slags. Considering them in order of publication they are:

1. Thomas Kiddie, *Jour. Can. Min. Inst.*, 1911, Vol. 14, p. 487. Using dilute sulphuric acid as a solvent, Mr. Kiddie determined the copper in the oxidized condition in a number of slags, and concluded that, at least under the conditions investigated, this constituted more than half of the total copper.

2. Frank E. Lathe, *Eng. and Min. Journ.*, 1915, Vol. 100, pp. 215, 263, and 305. In my investigation I followed to a large extent the lines laid down by Mr. Kiddie, for although the limitations of the sulphuric-acid method for oxidized copper were recognized, this appeared to be the best reagent of the purpose. The results obtained on Granby and Anaconda slags were similar to Mr. Kiddie's, most of the copper being soluble in acid.

3. C. G. Maier and G. D. Van Arsdale, *Eng. and Min. Journ.*, 1919, Vol. 107, p. 815. Messrs. Maier and Van Arsdale made a careful microscopic examination of slags, and also treated finely pulverized samples with 1 per cent silver-nitrate solution. The copper dissolved by the reagent they called suspended sulphide copper, and that insoluble was believed to be dissolved sulphide. Oxides and silicates they considered to be absent.

4. C. G. Maier and G. D. Van Arsdale, *Chem. and Met. Eng.*, June 16 and 23, 1920, Vol. 22, pp. 1101 and 1157. This was chiefly the results of an investigation to determine the effect of magnetite on slag losses. Magnetite was found to increase the losses due to sulphide flotation by attached gas particles. The authors reaffirmed their faith in the silver-nitrate method for determining suspended sulphide copper, and again assumed that copper oxides or silicates were absent under ordinary smelting conditions.

On account of the contradictory conclusions reached in the above investigations I decided to begin another series of experiments, using new methods, and including a sufficient variety of slags to cover most of the conditions commonly met in copper smelting. To the results of these experiments I have added various observations made since the publication of my previous article.

First I wish to acknowledge the courtesy of those companies which have provided samples for these experiments and have consented to the publication of the results obtained. In no degree are my remarks intended to imply a criticism of the practice of any company, nor with the facts at hand could a fair criticism be made, for a slag loss which might indicate admirable practice under one set of conditions frequently would not be permissible under those prevailing in another district.

The method for determining oxidized copper in ores using sulphurous acid as solvent was developed by Messrs. van Barneveld and Leaver,[1] of the U. S. Bureau of Mines, and is highly satisfactory. This reagent completely dissolves oxidized copper, whether present as silicate, carbonate, or cuprous or cupric oxides, but does not under any condition attack the sulphides. As distinguished from the sulphuric-acid method, here the presence of metallic iron, frequently introduced in pulverizing samples, does not interfere with the solution of the copper, for metallic copper, which might be precipitated by it, is itself soluble in sulphurous acid. Neither do ferric compounds have any effect, for if these go into solution they are immediately reduced by the reagent.

As already noted, Messrs. Maier and Van Arsdale claim that silver nitrate, acting on finely pulverized slags, dissolves only the sulphide particles which were suspended in the molten condition.

Assuming, then, that these two methods were all that was claimed for them, it seemed possible to determine directly both the oxidized and suspended sulphide copper, and if the total of these was less than the gross amount of copper present, the difference must occur in another chemical combination or physical condition—probably as true dissolved sulphide. These methods were therefore made the subject of a careful and painstaking investigation.

My experiments on the sulphurous-acid method fully confirmed the results obtained by Messrs. van Barneveld and Leaver. The reagent does readily dissolve oxidized copper, but has no action whatever on the sulphides. As for the limitations of the method, its originators noted that very fine pulverizing of samples was required to insure complete solution of the copper in a reasonable time. To this slight disadvantage I would add two more serious ones, at least as applied to slags. First, the 3 per cent solution of sulphur dioxide recommended does not thoroughly decompose all slags, especially if these have been air-cooled. Second, in the presence of considerable iron sulphide either the oxidized copper is incompletely soluble or copper already dissolved is afterward precipitated as sulphide. Both of these disadvantages tend toward low oxide results.

THE SILVER-NITRATE METHOD

Upon trying the silver-nitrate method of Messrs. Maier and Van Arsdale I was much disappointed at the results obtained. It was claimed[2] that silver nitrate would completely dissolve the copper sulphide which was in the molten slag as suspended matte particles, but that it would not attack dissolved sulphide, oxides or silicates. The presence of metallic iron was said to be detrimental. Taking these points one by one I found: (1) That silver nitrate does usually dissolve copper sulphides, but not in all combinations. (2) That the assumption that copper sulphides dissolved in the

[1] *Eng. and Min. Journ.*, 1918, Vol. 105, p. 552.
[2] *Eng. and Min. Journ.*, 1919, Vol. 107, p. 815.

molten condition will not be attacked is not justified, as such sulphides would probably not be equally soluble in the solid slag, and might therefore be found in the latter as small sulphide particles, readily soluble. (3) That cupric oxide is slightly attacked by silver nitrate. (4) That cuprous oxide is readily attacked, though it does not appear to be completely soluble. (5) That the presence of metallic iron is not detrimental, except in consuming more of the reagent.

When silver nitrate was tried on slags peculiar results were obtained. Some yielded only traces of their copper to it. On the other hand, one converter slag, in which nearly 60 per cent of its copper was soluble in sulphurous acid, nevertheless yielded 90 per cent of it to silver nitrate. It was evident that part of the copper was soluble in both reagents, and as the sulphide had been proved to be insoluble in sulphurous acid, it followed that the silver nitrate must be dissolving oxidized or metallic copper. That the latter was not present in appreciable quantity seemed probable from the fact that the sample had been passed through a 200-mesh screen without any appearance of metallics. Moreover, metallic copper is not found in converter slags in quantity except in the unusual case of an overblown charge. After many experiments I was therefore compelled to abandon the use of silver nitrate as unreliable. It is worthy of note that this was also done by Wanjukov[3] in his elaborate series of experiments.

Effect of Hydrofluoric Acid

As was noted before, sulphurous acid does not completely decompose all slags. The addition of a sufficient amount of hydrofluoric acid would decompose the silicates, so the effect of a combination of sulphurous and hydrofluoric acids was thoroughly investigated. Results showed that under the conditions of the experiments the only action of the hydrofluoric acid was to break up the silicates and liberate some copper for possible solution by the sulphurous acid. Even chemically precipitated copper sulphide is not attacked by a copper only one gram was taken for the experiment, and where decomposition appeared to be slow a further addition of 5 c.c. of hydrofluoric acid was made. After filtration of the residues, which contained all the copper sulphide, the sulphur dioxide was boiled out of the filtrates, and copper precipitated therein by hydrogen sulphide, being afterward determined by the electrolytic method.[4]

As in the original sulphurous-acid method for ores, under ordinary conditions results will be sufficiently accurate, and such difficulties as may be found, e.g., the presence of much iron sulphide or incomplete decomposition, tend toward low rather than high results for oxidized copper. In no instance are copper sulphides attacked.

Slag Analyses

The results of the experiments are shown in Tables I, II and III, for blast-furnace, reverberatory-furnace and converter slags, respectively. For the sake of comparison the copper soluble in sulphurous acid alone is also given, though it should be clearly borne in mind that this does not usually represent the total oxidized copper, owing to poor decomposition of the samples. It is believed that the copper soluble in hydrofluoric and sulphurous acids represents closely the total of oxide, silicate, and metallic copper in all samples analyzed.

An examination of Table I shows that both the actual amount of oxidized copper and the percentage of that to the total vary greatly. With a high percentage of sulphur on the charge and no oxidized copper present, as at Nickelton, Trail, Anyox, and Ducktown, the amount of oxidized copper in the slag is almost negligible. At Douglas and Globe, on the other hand, partly oxidized ore is smelted to a high-grade matte, and the conditions are not sufficiently reducing to eliminate all the oxide, although the low percentage of sulphide copper indicates efficient settling.

Matte concentration at Ducktown considerably increased the amount of oxide in the slag, but did not

TABLE I. BLAST-FURNACE SLAGS

Sample No.	Company	Location of Plant	Nature of Charge	Per Cent Total Cu	Per Cent Cu Soluble in H_2SO_3	Per Cent Cu Soluble in HF and H_2SO_3, "Oxidized Copper"	Per Cent Oxidized to Total Cu

combination of these reagents, although in experiments on this material precautions had to be taken to avoid oxidation by the air during filtration.

The general method followed was to treat two grams of the sample, ground through 200 mesh, with 100 c.c. of a 3 per cent solution of sulphur dioxide and 10 c.c. of hydrofluoric acid in a stoppered bottle at room temperature and with occasional agitation—continuous until the silicates had sufficiently decomposed not to stick to the bottom. Decomposition was nearly complete in twenty-four hours or less, but the treatment was continued for from five to ten days. There was some action on the glass bottles, but this merely increased the consumption of acid. Of certain samples high in do so at Anyox, on account of the less strongly oxidizing conditions there. The sulphide loss in both operations noted increased considerably over that normal to ore smelting, no doubt partly because of the composition of the slag and the grade of the matte, but also indicating that when so much copper is present on the charge, careful attention should be paid to the settling facilities.

Under the more uniform conditions of reverberatory smelting one would expect less variation of oxidized copper content than in blast-furnace practice. Sufficient samples were not available to prove this point, although the Anaconda and Phelps Dodge slags gave similar results, showing that three-quarters of the total copper present is in the oxidized condition. Regarding the

[3] *Metallurgie*, 1912, Vol. 9, pp. 1 and 48.

[4] *Eng. and Min Journ.*, May 1, 1920, Vol. 109, p. 1010.

Cananea slag, both the low total copper and smaller percentage of oxidized copper are accounted for, in part at least, by the lower grade of the accompanying matte, which averages 15 to 20 per cent.

The results obtained with the slag from the furnace treating converter slag at Anaconda are peculiar. Although the total copper is considerably higher than in ordinary reverberatory smelting, the oxidized copper is not, which shows that the conditions for the reduction of the oxidized copper (see also No. 15, Table III) were better than those for the separation of the sulphides. It is probable that in this instance gas flotation of sulphides, as observed by Messrs. Maier and Van Arsdale[5] in the presence of magnetite, was responsible for a considerable loss. To retain such a slag in the furnace until much of the gas had escaped and the accompanying copper sulphide had settled might be metallurgically possible but commercially inadvisable, owing to the reduced tonnage of the furnace.

Converter slags show a wide variation in their oxidized-copper content. This is attributable to a number of different factors, of which a few may be mentioned. The chief factor is the protective effect of iron, which oxidizes in preference to the copper, although the periods of oxidation overlap somewhat. From this it follows that, other things being equal, the average converter slag produced at a plant treating low-grade matte will contain a lower percentage of oxidized copper than the slag from one treating high-grade matte. The figures in the second-last column of Table III show that this is actually so, and that the variation is considerable.

Nickel, like iron, has a protective effect on the copper,[6] so that the slag produced even while a copper-nickel matte approaches white metal will not contain much oxidized copper, the nickel slagging first. Some of the variation is probably due to different samples representing different parts of the blow, as detailed information regarding the samples analyzed is usually not available. It is only another phase of the protective effect of iron, already mentioned. Although no samples from straight copper converting were available to show this, Nos. 16 to 18 of Table III illustrate the regular but moderate increase of oxidized copper during the progress of the blow in copper-nickel converting.

The amount of magnetite formed, the kind of flux used, and the temperature and composition of the slag produced are all factors which doubtless have some influence on the condition as well as on the amount of copper in the slag.

Pouring Converter Slag Into Settlers

The practice of pouring converter slag into blast-furnace settlers seems to be increasing. When one can thus dispose of a troublesome intermediate product without raising the copper content of the blast-furnace slag by more than a few hundredths of a per cent, the temptation to do so is strong. The practice is justified by some metallurgists on the theory that the copper is present as sulphide of metal, and will therefore settle if given a chance. Others[7] believe that much of the copper is in the oxidized condition, and that therefore settling alone cannot recover it; and from the results given in Table III it will be seen that this opinion has usually sound foundation in fact. It must be remembered, however, that when converter slag is poured into a settler it falls through the lighter blast-furnace slag to the surface of the matte, and, particularly if the matte be of low grade, the chances for the reduction of some oxidized copper are good. Further investigation of this point is desirable.

The difficulty in calculating the actual loss in pouring converter slag into blast-furnace settlers is increased by the above-mentioned tendency of the heavy converter slag to settle to the surface of the matte and thus find its way out of the settler only very gradually, so that its influence is felt over a long period of time. A method I have used of calculating the actual loss will now be illustrated by an example.

The Mond Nickel Co.[8] has given the following figures

[7] John W. James, *Eng. and Min. Journ.*, 1914, Vol. 97, p. 1114. Lathe, *Eng. and Min. Journ.*, 1915, Vol. 100, p. 266.

[8] Report of the Royal Ontario Nickel Commission, p. 451.

regarding its practice of pouring converter slag into settlers:

	Cu	Ni	Fe
Blast-furnace slag	0.17	0.22	26.6
Converter slag	0.7	1.3	45.4
Settler slag (b. f. + conv.)	0.20	0.29	29.9

According to the micrographic work of Messrs. Maier and Van Arsdale,[9] the amount of iron sulphide suspended in slags is small, so I shall assume for the purpose of this calculation that the iron settled from the mixture of blast-furnace and converter slags may be neglected. The settler slag may then be considered as simply a mixture of the other two with a portion of the copper and nickel removed. Let

x = per cent blast-furnace slag in settler slag,
$100 - x$ = per cent converter slag in settler slag.

Then, considering the iron content of each,

$$26.6x + 45.4(100 - x) = 2{,}990,$$

whence the settler slag consists of 82.5 per cent of blast-furnace slag and 17.5 per cent of converter slag.

Now, of the 0.20 per cent Cu in the settler slag, 0.17×0.825, or 0.14 per cent, belongs to the blast-furnace slag, so that 0.20 — 0.14, or 0.06 per cent, belongs to the 17.5 per cent by weight of converter slag, giving the settled converter slag alone a copper content of 0.34 per cent. This indicates that 0.36 per cent of Cu has been settled, a recovery of 51.4 per cent. Similarly, it may be shown that 0.63 per cent of Ni belongs to the settled converter slag alone, a recovery of 51.5 per cent.

Instead of calculating the proportions of the two slags, it is of course better to use the actual weights, if these are available over a considerable period of time. In making such a calculation two points should be remembered. First, that the samples of slag taken at the furnace spout have not had the opportunity of settling that they would have had if they had gone through the settler. To be correct, the assay of the blast-furnace slag when settled alone should be used instead of that of the spout sample. Second, if the converter slag were resmelted in the furnace, the copper content of the blast-furnace slag would also be increased somewhat. The calculation, nevertheless, shows how much lower the actual recovery is than one might suppose from the low assay of the mixed slag.

Some Practical Applications

In Table IV are given some analyses of slags produced at the Grand Forks plant of the Granby company which show how the determination of oxidized copper may be used as a check on furnace conditions. All the oxide determinations were made several years ago by the sulphuric-acid method, and my experiments since then with sulphurous and hydrofluoric acids indicate that the results given are slightly high, but they are certainly comparatively and, I believe, approximately correct.

TABLE IV. EFFECT OF VARIATION IN BLAST-FURNACE CHARGES UPON THE COPPER CONTENT OF THE SLAGS PRODUCED

	Copper			Per Cent of Oxidized to Total Copper					Approx. Temp. of Slag in Deg. C.
No.	Total	Oxide	Sulphide		SiO_2	Fe	CaO		
1	0.19	0.12	0.07	63	47.0	13.3	22.2		1,275

[9] *Eng. and Min. Journ.*, 1919, Vol. 107, p. 815.

Explanation of Table IV

Sample 1. Slag produced in normal smelting operations, the charge consisting wholly of a calcareous ore containing a small amount of chalcopyrite and pyrite, but no oxidized copper.

Sample 2. The result of addition to the regular ore charge of about 25 per cent of an ore containing a little oxidized copper, resulting in more oxide in the slag.

Sample 3. Similar conditions to No. 1, except that the furnaces were run with lower coke, resulting in a colder slag containing the ordinary amount of oxidized copper but more sulphide.

Sample 4. A very abnormal slag from a furnace in bad condition. It was so cold as to prevent satisfactory settling of matte, prills of which were plainly visible to the naked eye in the chilled slag. Oxidized ore was again on the charge, with consequent increase of oxidized copper in the slag.

Sample 5. Same ore charge as No. 1, but with 30 per cent of its weight of 10 to 12 per cent matte. The larger amount of sulphur present prevented the oxidation of much copper. The higher specific gravity of this slag allowed a less perfect separation of matte particles than under the more favorable conditions of No. 1 to 3, with resultant higher sulphide.

Samples 6 and 7. Similar conditions to No. 5, except that these charges contained converter slag in the proportion of 10 and 20 per cent respectively. Only a part of the oxidized copper in the converter slag was reduced in the furnaces, a little being carried through into the blast-furnace slag and raising the oxidized copper content of that in proportion to the amount of converter slag added.

Condition of Copper in Slags

Enough has already been said of the widely varying proportion of oxidized copper to the total copper content. It may be added, however, that copper oxide need not be expected in slags as a separate constituent, visible to the naked eye, or even under microscopic examination of the solid slag. It will naturally combine, as do the other bases, to form complex silicates, in which no one constituent can be determined except by chemical means.

The determination of suspended sulphides, as distinguished from those chemically dissolved, can best be made indirectly, by means of the copper-gold ratios of the matte and accompanying slag. The calculation is based on the assumption that only the suspended sulphide carries gold into the slag. To illustrate such a calculation, suppose that the matte has 45 per cent Cu and 15 oz. gold per ton; the slag, 0.30 per cent Cu and 0.02 oz. gold. The matte has thus one ounce of gold for each 3 per cent of copper, the slag one ounce for each 15 per cent, indicating that only 3/15, or 20 per cent, of the copper in the slag carries its normal amount of gold, or, that 20 per cent of the copper is present as suspended sulphide. It is of no importance whether the suspended sulphide is in the form of original matte particles or of pure copper sulphide left after oxidation of the accompanying iron sulphide.[10] The iron may be oxidized, but the gold will be concentrated in the remaining copper sulphide.

Chemically dissolved sulphide remains for consideration. In my previous experiments, using sulphuric acid as solvent for the oxidized copper, I found no indication of its existence, the sum of oxide and suspended sulphide (calculated from the gold content) corresponding with the total copper in the slags. But as my recent work indicates that the former results for oxidized copper were slightly high, it is probable that a little dissolved sulphide was present even in the low-

[10] Maier and Van Arsdale, *Eng. and Min. Journ.*, 1919, Vol. 107, p. 819.

iron slags on which experiments were made. Iron sulphide is certainly soluble in slags, especially in those of high iron content, and it is altogether likely that copper sulphide also dissolves to some extent, although in most operations the loss of copper in this condition is the least important of the three mentioned. It may be expected to increase in slags high in iron and zinc, especially if these be low in silica.

Possible Improvements in Present-Day Practice

Blast-Furnace Slags.—It is customary to place immediately below the furnace spout one large settler, the overflow from which goes to waste. Although the necessity for matte storage may require a settler of large size, it will often be found that two or more smaller ones in series[11] will more effectively clean the slag; or the large settler may be followed by small ones. The fall of slag from one settler to another probably allows the escape of a certain amount of gas, which may have caused the flotation of matte particles. Such a treatment is especially desirable when analyses show that the percentage of sulphide copper in the slag is high, as may be true in matte concentration or in other cases with a high percentage of copper on the charge to the furnace.

If the oxidized copper in the slag be high, some may be reduced by the addition of coarse pyrite to the second-last settler of a series. This was done at the Grand Forks plant of the Granby company with some success. The coarse pyrite added settles to the matte, and the sulphur driven off by heat stirs up the slag and has an excellent chance to reduce oxides. The lower-grade matte produced in this way also has a tendency to cause the precipitation of dissolved sulphides, if present.

Reverberatory Slags.—Owing to the presence of oxidized copper in the charge, and the comparatively neutral atmosphere in reverberatory smelting, the loss as oxide or silicate is likely to be high. To reduce this loss to a minimum I know of no method more promising than that suggested to me some years ago by E. J. Carlyle, and described in my previous article.[12] I repeat it here, as I am confident that the saving secured by this means would many times repay the cost of the experiment. Mr. Carlyle thought that if a wall of refractory material were built across a reverberatory furnace near the skimming end, high enough to keep back the main body of matte, but low enough to allow the slag to flow over it, pyrite could be charged through the roof between this wall and the skimming door, thus bringing about a material reduction in the copper content of the slag. A separate tap-hole could be provided for the low-grade matte as well as a side door behind the dam for the removal of floaters. Such a practice would not involve radical changes in construction, and would appear to be of general application in reverberatory smelting. The low oxide copper in the Cananea slag (No. 13, Table II) is an indication of the great possibilities of this method.

If converter slag forms a large proportion of the charge, the sulphide content of the slag may increase, as at Anaconda (No. 12, Table II). In such results, if the loss be due to sulphides floated by gas bubbles, the low-grade matte treatment may reduce magnetite introduced in the converter slag, and consequently bring down the sulphide loss, as well as reducing the oxides. To lower the sulphide content a succession of small settlers might also be effective, as suggested for blast furnaces. In all such instances the amount of settling which can be done outside the furnace is dependent principally upon the degree to which the slag has been superheated before leaving the furnace.

Converter Slags.—Metallurgically speaking, it may be wasteful to pour converter slag into blast-furnace settlers, but one cannot say that such a practice is never justified. As in all other industries, smelting and converting are governed by commercial considerations, and these must be the deciding factors. This much may be said, however: In most plants possessing both converters and blast furnaces, at least a part of the converter slag is resmelted, and when this is done the slag to be poured into settlers should as far as possible be that produced in the early part of the blow, when oxidized copper is at a minimum. If the suggested modification of reverberatory furnaces should, upon trial, prove commercially successful, that would appear to be the logical outlet for whatever converter slag is not required for fluxing purposes.

New Process Saves Coal Otherwise Lost in Ash

The Gruson Werk, a branch establishment of Krupp, has developed a new process for saving unburned coal out of combustion residue which, so it is claimed, is much simpler and quicker than the methods formerly known, which are based on the different specific gravities of coal and clinker. The new process makes use of the magnetic qualities of the oxides of iron into which the sulphurous pyrites are transformed by the burning and which are retained in the clinker. The basic principle of the process is the fact that owing to the contents of ferro-oxides, the clinker responds to electro-magnetic action, whereas the coal does not.

Production of Minerals in Mexico

The average Mexican monthly production of copper has reached 4,681,020 lb., according to reports of the Bureau of Mexico, of the Department of Industry, Commerce, and Labor. The average monthly production of gold, according to the same authority, is now 1,965 oz. and of silver 170,824 oz. At the present time there are in Mexico 60,569 denounced mining claims, 2,017 of which were denounced prior to 1892. Taxes are being paid on 30,990 claims, and 3,867 claims are now being worked. Metals extracted in Mexico are smelted in Monterrey, Aguascalientes, Torreon, Chihuahua, San Luis Potosi, Velardena, Saltillo, Boleo Teziutlan, Mapimi, Matehuala, and Mazapil.

Iron Ore in Victoria, Australia

Mount Nowa Nowa, at the head of Lake Tyers, Gippsland, Victoria, is stated in a recent *Melbourne Age* to be the richest and largest repository of iron ore in Victoria. Recent exhaustive tests have justified this statement. A charcoal test of 14½ lb. of ore returned 11 lb. of pig iron, and the iron when tested has been adjudged to be of splendid quality. An unlimited supply of limestone, which is required for smelting purposes, as well as an ample supply of firewood, which will provide the stocks of charcoal required, are present in the district.

Effect of Erosion on Mineralized Areas In Northern Sonora

The Removal of Rock Material Has Lessened the Depth of Mineral Deposits in This Section To a Considerable Extent

BY GRAHAM JOHN MITCHELL
Written for *Engineering and Mining Journal*

THE extent to which erosion has degraded mineralized areas in northern Sonora, Mexico, is a factor to be considered when prospects in that region are examined. The millions of tons of rock débris washed down from the surrounding mountains and filling neighboring valleys impress even the most casual observer. An examination of these gravels shows rocks containing varying amounts of metallic minerals which formerly occupied veins and other types of deposits in the adjoining mountains.

Fig. 1 is a panorama looking west across the Moctezuma River valley from the Transvaal Copper Co.'s smelter at Cumpas, Mexico. The outline of the Paloma Mountains, the highest peaks of which are approximately six thousand feet elevation, can be seen on the right in the distance, with low hills in the foreground. The low benches in the immediate foreground are made up of material washed from the higher range and from other mountains to the north. These benches have been further dissected by the Moctezuma River and its tributaries.

The Paloma Mountains contain a variety of mineral deposits, principally copper, silver, and lead. The ore occurs in veins and brecciated areas in igneous rocks, chiefly andesite and granite. An examination of these mineralized areas shows them to be but the remnants of formerly more extensive deposits. What is left of the veins represents lower portions of ore formed at intermediate depths. In some of the copper ore in breccia, the ore does not outcrop, but is within a short distance of the surface. Such ore in breccia, in which tourmaline, molybdenite, chalcopyrite, and pyrite are characteristic, indicates deposition at greater depth and higher temperatures than the vein deposits. The depth to which mineral has been mined in this region is comparatively shallow, most of the mines showing decreasing values and extent of mineralization in deeper workings. The best ore has been found to range from the surface to approximately five hundred feet.

Photo by H. C. Beauchamp

FIG. 1. LOOKING WEST FROM TRANSVAAL COPPER CO.'S SMELTER, CUMPAS, MEXICO

The common mineral association in the vein deposits is chalcopyrite, pyrite, tetrahedrite, bornite and galena. In some deposits tetrahedrite and galena predominate, whereas in others chalcopyrite and pyrite are more abundant. In "breccia ore" chalcopyrite, tourmaline, and molybdenite are the prevailing minerals. Oxidation has developed some secondary minerals, such as covellite and chalcocite, from chalcopyrite and bornite, but the region as a whole is typically one of primary sulphide minerals.

Fig. 2 is a photograph of the maturely dissected region a few miles south of the central portion of

Photo by H. C. Beauchamp

FIG. 2. COPPER-TOURMALINE PROSPECT SOUTH OF ARCHIPELAGO MINE, SONORA, MEXICO
Mineralized breccia outcrops along creek in central foreground.

Paloma Range. Deposits of chalcopyrite and tourmaline are found in these hills in brecciated and silicified zones of andesitic rock, though such zones are small and scattered. Only a little surface work has been done, but very good specimens can be secured in which chalcopyrite and tourmaline form a crystalline aggregate cementing the breccia. This region, like that further north, has also undergone extensive erosion.

The fact that erosion has removed such large volumes of rock material from these mineralized areas, together with the knowledge that the remaining deposits are of the types formed at intermediate and greater depths and are only remnants or "roots," affords data upon which one may judge similar deposits in the region. Were it not for geological evidence disclosed in the developed mines of the district, deposits of the character indicated might be expected to extend much deeper. It is therefor apparent that erosion has removed a considerable volume of the mineral veins in the Paloma Mountain area, and such a condition will most likely be found to exist in other sections of northern Sonora.

Laws Regulating Mining Concessions in Serbia

By Capt. Gordon Gordon-Smith
Written for *Engineering and Mining Journal*

THE statutes governing mining rights and concessions in Serbia are clear and liberal in terms. The principal law is that passed by the Serbian Parliament in 1898. The following is a summary of its most important provisions:

The Serbian state is the owner of the subsoil of its territory. It disposes of the mineral wealth and lays down all the necessary regulations concerning prospecting and exploitation. (Article 15.)

Prospecting. The prospecting rights are of two kinds, the *simple* right and the *exclusive* right. The *simple* right lasts for one year but may be prolonged for two years. It is limited to the maximum territory of three communes. The *exclusive* right lasts also one year, but it is renewable each year according to its necessity. It may extend over an indefinite number of mining fields each of 500,000 square meters. (Articles 21 to 30.)

For one field of operations, the prospecting rights, either simple or exclusive, can be accorded to only one single prospector. The obtaining of the two rights is subject to the conditions that the prospector has the legal disposition of his property. In addition, for the exclusive right, it must be shown that the mineral deposits in question are worth examining. These rights are hereditary and transmissible. (Articles 25 and 26).

The minerals obtained by the work of prospecting cannot be treated or sold, except with a special administrative authorization. (Article 37.)

Mining Concessions. The state accords concessions for fifty years on a sufficient number of mining fields, of 100,000 square meters, which are delimited by a competent commission. To obtain a concession, in addition to possessing the necessary prospecting rights, proof must be furnished that the deposits are exploitable, that the prospector disposes of sufficient capital and that he possesses competency as a miner, and he must present a plan of the proposed work. (Article 40 to 46.)

The concessionaire becomes owner after fifteen years of uninterrupted working, but he continues to pay the mining taxes, and is obliged, as before, to observe the dispositions of the Mining Law. (Article 47.)

Duties of the Prospector and the Concessionaire. For the prospector, as well as for the concessionaire and the owner, the law imposes the following obligations: Regular work, the assuring of the general safety and the safety of the workmen employed, an annual report on the work done, and the plan of the work for the following year. It is forbidden to mine under public roads, buildings, cemeteries, and other public works. (Article 32, 76 to 81.)

Duly constituted mining companies must keep books and hold annual meetings of shareholders as laid down in the Commercial Law. (Article 74.)

The priority, after the conditions for prospecting or exploitations have been fulfilled, belongs to the first comer. (Article 39.)

All prospecting rights and all concessions lapse if the specified works have not been undertaken the first year or if they are interrupted for any cause not approved by the Minister of Mines, or in case of bankruptcy. (Article 144.)

Rights to Concessionaires. The concessionaires or owners of mines have the right to divide or unite mining fields or their working plants, to suspend work for a certain time, if difficulties are met, and later to resume work. (Article 68.)

The mining privilege covers all kinds of minerals found in the territory conceded. (Article 67.)

The concessionaire has the right of establishing for the use of his mines all the necessary installations and constructions, machines, buildings, foundries, workshops, warehouses, roads, bridges, railways, and like complementary appurtenances. He may abandon exhausted mining fields. (Article 68.)

The state will favor importation of machines, tools and materials as well as the exportation of mineral products. (Article 69.)

The concessionaire may purchase the neighboring properties, either by private agreement or by expropriation. (Article 52.)

In case of the death or bankruptcy of the concessionaire the competent Tribunal of First Instance appoints a curator for the mines and informs the Minister of Agriculture, Commerce and Industry. (Article 87.)

Funds for the Mutual Aid of Mine Workers. The assurance of mine workers is obligatory. There are two kinds of funds for miners: (1) a fund for invalids and pensions; (2) a fund for the families of the miners, in case of the sickness or death of the latter. The first fund is common to all the mines; the other is for each particular mine. For the first 3 per cent and for the second 2 per cent is deducted from the miner's wages. The concessionaires pay into these funds an amount equal to 50 per cent of the amounts paid by the workers. Miners who work regularly in the mines are exempt from all taxes on their wages. (Articles 103 and 104.)

Mining Dues. The exclusive right is subject to the payment of a fixed due of 10fr. per annum for each mining field of 500,000 meters. For the concession a fixed due of 12fr. per annum for each mining field of 100,000 square meters is levied, and a proportional due, equal to 1 per cent of the gross revenue of the mine. The Minister of Agriculture, Commerce and Industry may suspend the imposition of this proportional due in case the enterprise, at the start, does not make any profit. (Articles 108 to 111.)

Moving Pictures in the Mining Industry

Apart From Meeting the Demand for Entertainment at Mining Camps and Villages, There Is Growing Development of Film Presentation in Safety and First Aid, Interdepartmental Organization, Promotion, and Educational Work

Written for *Engineering and Mining Journal*

THE need for diversion and the innate desire in humanity for new forms of amusement are chiefly responsible for the great development of the moving picture. As businesses, both the making and the presentation of the finished picture have proved to be highly remunerative. The use of the movie film for educational purposes is developing, but not as fast, for the money returns are moderate.

Industry has also turned to the moving-picture film, and there is at present a greater and greater tendency to resort to this popular method of exposition where it is necessary to "put over" an idea to any considerable group of humans. It is decidedly in style to increase the interest in a lecture by using the moving picture as an accessory. Not so long ago, the stereopticon was generally accepted both for illustration as well as to popularize an otherwise dull subject. It is now difficult to "get a rise" out of even an intelligent audience by means of ordinary lantern slides, however good they may be. Jaded humanity wants its "movie." The necessary thrill must apparently come through the eye, although the practical showman makes considerable use of the ear of his audience as well.

The Movie in Promoting "Safety First"

The mining industry has not escaped the prevailing tendency, and is taking some of its "thrills" by the "movie route," although it is perhaps more conservative than other industries and has as yet only started. The U. S. Bureau of Mines was among the first to recognize the potent appeal of the movie. Under its direction, a number of educational films have been prepared and systematically loaned to educational institutions. The films have served a useful purpose in making possible a wider dissemination of knowledge of the mining industry. They have been exceedingly useful in visualizing different phases of the industry for mining students in the various colleges and universities of the country. As a means for bringing the "safety-first" principle to groups of miners and other workers, probably one of the most important educational methods is the moving-picture film. The larger mining companies can co-operate with the Bureau of Mines in the preparation of suitable films, but the relatively large expense and the requirement for systematic distribution where the film story will do the most good puts the burden of this work, as well as the expense, upon the Bureau of Mines.

The inculcation of the principles of Americanization, of proper living conditions, better work methods, the visualization of motion-study to workers, and the explanation of the operation of intricate machinery to the men who must either operate or repair such machinery are important fields for the moving-picture film. These subjects are educational and apply to the mining as well as to other industries.

Of more special interest to mining is the motion picture film applied to the needs of workers in advancing the lessons of "safety first" and "first aid." Elementary principles can be presented to large numbers simultaneously, and if accompanied by a concise and clear description, the result is better than can ordinarily be secured by other methods. Great care is essential in the preparation of the film, and the expense is justified, as a good film can be used in many different districts and repeatedly shown to the same audience. There will undoubtedly be a certain amount of standardization in such pictures, and in this as well as their preparation the Bureau of Mines is the most competent body to direct the work.

The introduction of new or highly specialized machinery into the mining field will undoubtedly be considerably facilitated by the use of moving-picture films, which can be used, first, more thoroughly to acquaint a prospective buyer with the machine; and, second, to instruct the men who may have to operate the machine in the details of its erection, operation, and adjustment. A complete "film story" showing the shop erection of a gyratory rock crusher, its dismantling and loading on a freight car, its removal and haulage to the place of erection, its final erection, and the adjustment and replacement of wearing parts would in itself be exceedingly interesting not only to the ordinary worker but to the engineer as well. A film story could be developed for almost any piece of machinery in a similar manner.

Engineers would be better acquainted with the erection and handling of heavy machinery if "film stories" on this subject were available. Considerable improvement in prevailing practice would necessarily result.

Danger in Use for Promotion Purposes

Who has not had an adventure with an inventor? Inventor, invention, and capitalist can be brought together by means of the movie film. Intricate processes as well as mechanical appliances can be explained accurately to capitalists and investors. This use of the movie film for promotion purposes has attained some recognition. Movie films have been taken of initial operations and the geological formations in Western oil-shale districts. It will not be surprising to hear that these films are being used actively in promoting stock sales. No special objection is to be made to the use of the movie film in the promotion of sound, legitimate enterprises, but there is danger that unsound and fraudulent projects may seek this persuasive avenue to the pocketbooks of the unwary.

It is not improbable that mining engineers will make occasional use of the movie film where important examinations are made in far-distant countries. Transportation and operating difficulties can be presented and made accurately known to directors, stockholders, and engineers. Topographical and surface obstacles that have to be overcome in plant construction can be made clear. Machinery manufacturers are also better able to appreciate the conditions to be met.

Dr. C. P. Berkey, professor of geology of Columbia University, says: "Many of the processes representing the operation of a successful mine are not very readily made clear to the non-technical board or untrained class. Nothing, of course, can wholly bridge the gap between these complicated operations on one hand and inexperience on the other, except actual contact with the work itself. But such contact is not always possible or expedient, whereas it often happens that a better comprehension of a problem or proposed change or special set of difficulties must in some way be given.

"It is usual to depend upon careful description and the imagination of the hearer to make this connection, but certainly with variable success. Perhaps at this very point the motion picture might be of special service in bridging the gap for inexperience. The imagination, unchecked by some better method than a description furnishes, sometimes pictures an impossible or a quite inadequate operation. In either case the chief object of the explanation may be lost. With a little true-to-life help in the form of a moving picture of the essential factors of the operation, however, not only may the case be made more clear but much time may be saved for all in reaching an adequate understanding."

Lieutenant William W. Hosp, an aviator, says: "Airscape views in 'stills' and moving pictures are playing a more important part every day in commercial and industrial developments by affording impressionable evidence of the association of objects, crossroads, river, bridges and buildings upon the ground and registering the advancement of large improvements."

In the larger mining companies there is a field for the moving picture in interorganization work that has for its major objective co-ordination and increased efficiency. The interrelation of the various departments of a large business organization, however far apart they may be in a geographical sense, can be presented to the separate groups by the "movie." Both the manager and his audience can visualize the business to increased advantage.

Examples of Mining and Industrial Stories

The New Jersey Zinc Co. is in an exceptional position for a mining company, in that it not only mines and dresses its ore, but also smelts and prepares various market products therefrom. A sales organization has been developed to dispose of its products. One of the products is zinc oxide, and to extend the use of this product among paint users a single reel film has been prepared which shows the various steps in its manufacture. The film has already been shown before forty organizations in different parts of the country. These organizations consist largely of paint superintendents, large users of paints and paint manufacturing materials. Requests for the use of the film have been numerous.

Bureau of Mines Petroleum Picture

The U. S. Bureau of Mines, at the recent annual convention of the Independent Oil Men's Association in Denver, exhibited a four-reel moving picture of the petroleum industry. The film had been prepared in co-operation with the Sinclair Consolidated Oil Corporation. Prospecting, production, refining, distribution, and ultimate use of petroleum were shown. A comprehensive view of the petroleum industry was thus obtainable which would have required several weeks of journeying and access to a number of plants. A moving-picture "story" of this kind, apart from its special interest to those in the petroleum industry, has considerable value in educating the public in the importance of the industry.

The Safety Committee of the U. S. Steel Corporation realized at an early period in the organization of its safety-first campaign that the moving-picture film was of special value in quickly and economically securing contact with the alien worker who could not easily comprehend the English language. In 1912, the first motion picture for the use of the Corporation was taken. It is entitled "An American in the Making." In addition to showing many safety devices, it also brought to its audiences the opportunities afforded the alien to better his condition. A second picture, "The Reason Why," was taken in 1917. It consists of two reels, 1,000 ft. each, showing safe and unsafe methods of doing work. A third picture taken in 1918 was entitled "Why." It is a continuation of the second picture. All three pictures have been shown to thousands of employees, and without doubt have well served the objectives of the safety committee.

The Province of Ontario, Canada, with the objective of making better known its resources, had a number of moving picture films made. These included the nickel industry, the Cobalt silver district and the Porcupine gold-mining district.

New Cornelia Operations Shown

The moving-picture film of the operations of the New Cornelia Copper Co., at Ajo, Ariz., will be remembered by members of the New York Section of the A. I. M. E., before whom it was shown, as a particularly good picture. It was complete in that it showed the open-pit mining operations, the transportation of the ore to the leaching plant, the charging, leaching, and discharging of vats, and the electrolytic deposition of copper. Housing and living accommodations were also included.

It is unnecessary to quote other examples. In the aggregate, there has been a moderate use of the moving picture in the mining industry. The expense for the preparation of a picture is relatively high, and unless a definite measure of value in return for the expense involved can be figured out in advance, only the serving of an exceptional purpose would lead to the preparation of a film. As an example, the cost of the 1,000-ft. picture prepared for the New Jersey Zinc Co. was approximately $2,000. Present prices are about $1.30 per foot, plus the cost of the operator. A positive cost 10c. per foot or $100 per 1,000-ft. reel. Another estimate of cost is $1.50 per foot, which is a minimum, the arrangements for any special lighting and operator being included in this figure.

Unimportant Rumanian Gold Deposits

The beds of the rivers rising in the Carpathians produce gold, but have as yet not been prospected. Grains of gold up to 2.35 carats have, however, often been found in the washings of the Oltul. In the district of Ramnicu-Valcea, Rumania, workings of an experimental nature were begun in 1912. The ore gives from 15 to 30 grams of gold per ton, and the known reserves of these bearings is about 3,000 tons. The deposits present only a scientific interest, as no serious work has been undertaken to determine their practical importance.

HYDRAULIC MINING ON BILLITON ISLAND, DUTCH EAST INDIES

Mineral Resources of the Dutch East Indies

Important Production of Tin, Coal, and Petroleum — Gold Mining Is Developing — Petroleum Exploitation Closely Controlled by Government — Prospecting Licenses and Concessions Granted and Are Not Completely Restrictive*

Written for *Engineering and Mining Journal*

TIN ore, coal, bauxite, and petroleum are the important minerals mined in the Dutch East Indies. The government tin mines are on the Island of Banka; the privately owned tin mines on the Island of Billiton. Tin was discovered on Banka in 1710. Mining operations were first carried on by the native population, but the Chinese entered into the locality and the primitive native methods were displaced by the "Captain of Chinese," Assing, who organized a stable industry by introducing several important technical improvements. Since that time Chinese have largely remained in control.

In the middle of the second half of the eighteenth century the annual production sometimes reached from 30,000 to 35,000 piculs, and probably the same quantity was exported by smugglers. In 1812, Banka was ceded by the Sultan of Palembang to the British, and the tin mines came under European supervision, although the Chinese remained in the industry. On the restoration of Dutch rule, the European control gradually extended.

In 1852 the Dutch government organized a "Bureau of Mines" to extend geological and mining investigations and to put the mining industry on its feet. When the bureau was established it included ten engineers, and since that time it has grown until it now has more than sixty chief engineers, ordinary engineers, and geologists, in addition to many assistants. Its headquarters are at Batavia. Each year a Year Book is issued, one part being devoted to administrative, technical, and statistical details and the other part to scientific articles.

In developing the Banka tin-mining industry, the government engineers introduced important improvements in tin-smelting furnaces, in drainage of open pits, and in stripping, until at present the industry has reached a high state of development.

Character of Banka Tin Deposits

Banka has an area of 12,240 sq.km. and a population of 100,000, three-eighths of the population being of Chinese origin. The exposed geological formations of Banka are granites and sedimentaries consisting of sandstone, quartzites, and shales of Paleozoic age. Strata are compressed into steep folds. The older rocks appear in the hills, the valleys and plains being filled with alluvial material. The tin ores are found in alluvial deposits along the northern and eastern coastal regions. Small veins of tin ore occur in the granite, but are not of commercial importance. The overburden is clay, sand, and gravel of varying thickness, the "pay" gravel ranging from 0.1 to 0.4 in. thick, in exceptional cases reaching a meter in thickness. The tin ore is from 2 to 4 per cent of the ore stratum, reaching in some cases as high as 10 per cent. It is mixed with pieces of sandstone, shale, and such uncommon things as fossils, shells, quartz crystals, topaz, monazite, and gold, as well as minerals ordinarily found in similar formations.

*Compiled from the Year Book of the Netherlands East Indies Exporters Directory and a bulletin of the Department of Agriculture, Industry and Commerce, Dutch East Indies Government.

Lead, copper, iron, manganese, and tungsten ores are found, but in extremely small quantities. The ore particles range from fist-size down to a finely divided powder. The clean ore from the sluices is reduced in simple blast furnaces, each mine having its own reduction plant. In three districts there is a central reduction plant. Preparations have, however, been made for a central plant to handle all of the tin concentrate produced on the Island of Banka.

Chinese coolies are employed, and a part of the actual mining is under government supervision. Introduction of modern machinery has decreased the amount of manual labor required. Banka tin is sold almost exclusively by auction in the Netherlands, every other month alternately at Amsterdam and Rotterdam. Small quantities, however, are offered at auction in Batavia. Since the war, however, most of the tin has been sold in Batavia. The product is shipped and sold by the Nederlandsche Handel Maatschappy, agents for the Netherlands Indian government. In 1910 there were 361 tin ore from Singkep is smelted in Singapore. The Singkep company produced 834 metric tons in 1914. Later information is unavailable.

The Coal Mines of Sumatra and Poeloe Laut

Two coal mines are operated by the government, the Ombilin and the Poeloe Laut groups. The Ombilin mines are in Sumatra above Padang, on the west coast. The coal was discovered in 1868, and mining began in 1892. The coal field is 9 x 10 km., the bed reaching a thickness of 23 m. Poeloe Laut is on the small island of Poeloe Laut, lying off the southeast coast of Borneo. Mining began by private enterprise in 1903, but in 1913 the government took over the work. The center of the coal-mining operations is Stagen. In 1914 the production from the Ombilin mines was 443,141 metric tons and from the Poeloe Laut mines 110,238 metric tons.

Gold is found in Sumatra, Borneo, and Celebes in beach, alluvial, Tertiary gravel, and vein deposits. In 1914 fifty-eight concessions had been granted for pros-

MAP OF NETHERLANDS EAST INDIES. IMPORTANT OIL FIELDS IN BLACK

mines; the total production being 270,170 piculs; in 1914 the production was 234,725 piculs.

The geological conditions and the occurrence of tin ore on the Island of Billiton are similar to those on Banka, but, in addition to the alluvial deposits, several tin veins are large and rich enough to be worked. The principal operating company is the Billiton Maatschappy. A concession was granted to this company in 1852, and in 1892 it was extended a further period of thirty-five years. The company receives five-eighths of the annual profits. The industry and operations, excepting the lode mines, are organized along lines similar to those of Banka. Chinese contract laborers dominate. In 1914 there were forty-seven mines operating, and the production reached 5,194 metric tons. In 1918 the output was 11,555 metric tons of tin and 5,253 metric tons of tin ore.

The Singkep Tin Co. is another private enterprise which is operating on the Island of Singkep, in the Rhiau Archipelago. A concession was granted to this company in 1889. The occurrence of the tin ore is similar to that at Banka and at Billiton, and mining operations are similar. In the hills the mines are operated through adits. Near Singkep tin ore is found in the bottom of the sea and is worked by dredges. All

pecting and working gold and silver mines, but alluvial mining and dredging have met with little success. Natives carry on desultory operations in certain portions of Sumatra and work the Tertiary beds by primitive methods. The important gold-mining companies are operating vein deposits. The greatest quantity of gold is produced in the residency of Bencoelen, Sumatra. Three gold mines are operating and in 1914 produced 2,108 kg. of gold and 9,910 kg. of silver, respectively, 60 and 30 per cent of the total production of these metals.

Description of Gold Area

The gold area is known as the Lebong district and is 75 km. north of Bencoelen. The best known mine is the Redjang Lebong. The formations are granite, slate, and limestone, with accompanying andesite, trachyte, and dacite. Veins are sometimes of important extent, in some cases strongly faulted. The gangue is finely banded quartz with small quantities of calcite. Sulphides vary in amount. Selenium is invariably present.

Treatment is by stamp and tube mills and cyanide after separating sands and slimes. Decantation and filtration are practiced. A second gold mining-district is in the northern peninsula of Celebes. There are

three producing mines. At the Totok mine the gold is found in white quartz forming pockets and stringers in metamorphic limestone. A third gold-mining center is in Central Sumatra, Padang. Development is, however, only in its initial stage.

Iodine is extracted from the hot springs of Java and is shipped to Europe as copper iodide. Wolframite, sulphur, and manganese in small quantity are also produced. Diamonds are found in the district of Martapoera, in the south and east division of Borneo. There is some activity in diamond mining, the production reaching 1,258 carats in 1914. Large-scale exploration in these minor minerals has as yet not taken place.

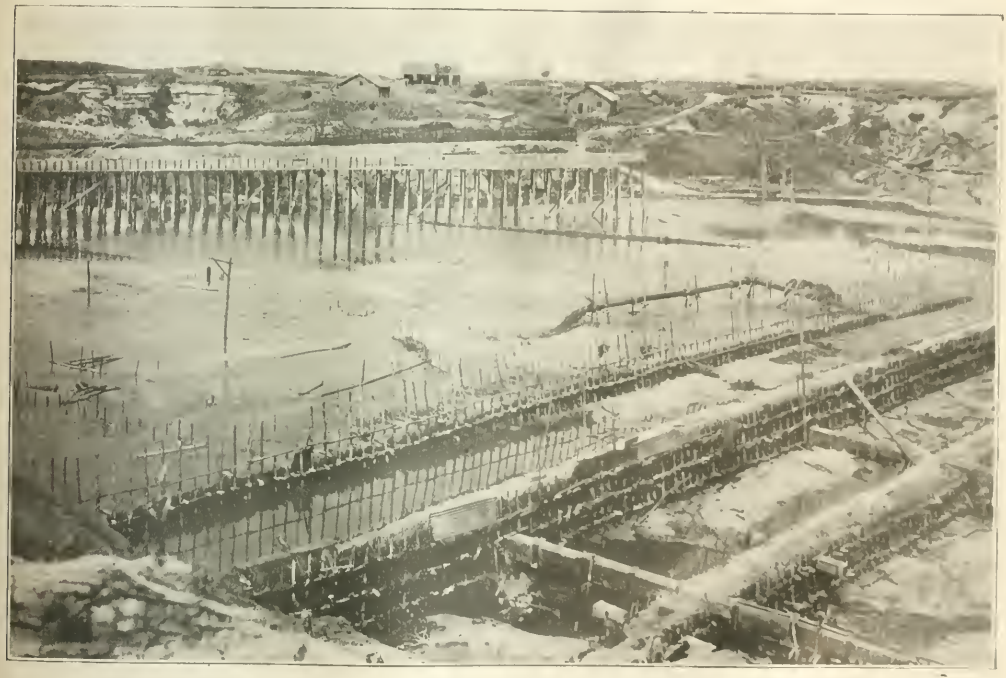
Petroleum Production

The centers of petroleum production are the Langkat and Perlak districts, in North Sumatra; the residency of Palembang, in South Sumatra; the residencies of Rembang and Sourabaya and the northeastern part of Java, the district of Koetei, in Borneo, and the Island of Tarakau. The oil-bearing formations occur in the Miocene and Pliocene of the Tertiary, the depth of the wells ranging from 200 to 600 m. The deepest well is 1,000 m., and is in East Java. Cable, steel-rod, and rotary systems of drilling are used. Refining of the crude petroleum is carried out at six establishments, respectively situated at Pangkalan Berandan (North Sumatra), Pladjoe and Bangoes Koening (South Sumatra), Tjepoe and Wonokromo (East Java) and Balik Papau (East Bornea). The products are benzine, kerosene, turpene, dieseloil and solaroil, liquid fuel, asphalt and coke, batching oil, lubricating oil and greases, paraffin-wax, and batils-wax. Gas in some instances carrying gasolene is encountered in drilling. Nearly all of the Sumatra crudes are especially rich in light products, and, generally speaking, contain little or no paraffin. The Borneo crudes vary considerably in composition, and it is no uncommon thing to find oils of an entirely different composition in the same field. The Java oils yield, as a rule, little benzine. Some crudes do not even contain kerosene; others are of a strong paraffin base.

History of Development

The Royal Dutch Company was formed in 1890 and completed its first well in 1890 in the district of Langkat. A refinery was completed at Pangkalan Berandan in 1892. The district in which this first oil enterprise was established was a tropical wilderness almost unpopulated. In 1900 the company drilled at Perlak and brought in several wells, all spouters. In 1910 the company acquired the Shanghai Laukat Co., which owned oil fields near Tandjong Poera, in the Langkat. Work was started in Borneo in 1901. In 1907 the Bataafsche Petroleum Maatschappy was formed by the amalgamation of the Royal Dutch and the Shell Transport & Trading Co. In 1905 the Royal Dutch extended its operations to Java, and in 1911 secured control of the Dordtsche Petroleum Maatschappy. The Bataafsche Petroleum Maatschappy is the dominant company now in the Dutch East Indies.

Most of the crude petroleum is transported by pipe lines to the refineries. The most important pipe lines are four and five-inch lines, 76 miles long, from Perlak to Pangkalan Berandan; two four-inch lines, 87 miles long, from Kamp Minyak to Pladjoe; a four-inch line, 141 miles long, from Melamoen to Pladjoe, and a five-



SLUICES FOR WASHING ALLUVIAL MATERIAL, BILLITON

inch line, 65 miles long, from Sanga Sanga to B. Papan (Borneo). Many smaller lines are in operation. Steel tanks are used for storage. Eight hundred whites, mostly Europeans, and 23,000 natives and Chinese are employed. Maximum production reached 13,000,000 bbl. in 1911.

The mining enactment of 1899 clearly distinguished between surface and subsoil rights. Prospecting licenses are required for exploration, and concessions for working mineral deposits. These are restricted to Dutch subjects, inhabitants of Holland or Netherlands East India, and to companies incorporated in Holland or Netherlands East India. Prospecting licenses are issued by the chief official of the province in which work is proposed, and are valid for three years. They can be twice extended for a further period of a year. The area is restricted to 10,000 hectares.

Discovery gives the holder of a license the right to a concession as soon as he has proved his discovery to the satisfaction of the Governor General. Concessions are for a maximum period of seventy-five years. The

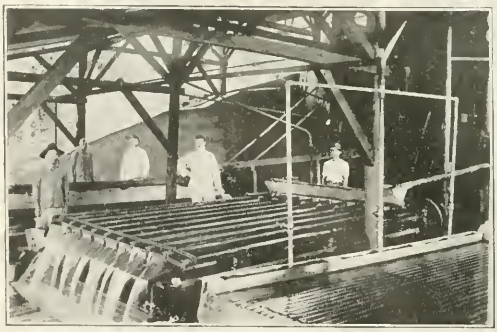


TABLE DRESSING OF TIN VEIN STONE AT KLAPPA KAMPIT MINE, BILLITON

maximum concession for working any kind of solid or liquid bituminous substance is 2,000 hectares in the islands of Java and Madura and a portion of Sumatra, 4,000 hectares in the remaining portions of the archipelago, and 1,000 hectares for any other minerals.

Prospecting license holders must pay to the government a fixed land tax of 1c. per hectare; concession holders, 10c. per hectare. In addition, the license holder must pay a royalty of 4 per cent of the market value of production obtained in the course of prospecting, of which amount a portion is free from royalty. Concession holders pay in addition to fixed land tax a royalty of 4 per cent of the gross proceeds. Mining regulations also provide for safe operation.

From a later publication it appears that prospecting licenses for petroleum are confined to an area not more than 25,000 acres, and several licenses may be applied for simultaneously. The holder of the license is compelled to prove diligent effort at the end of each year. Concessions are confined to an area of not more than 10,000 acres, the whole of which must be confined within one prospecting area, but several concessions may be granted within the same license after proving the existence of petroleum in commercial quantities. The legislation is not prohibitive to foreign interests, as foreign capital has established successful enterprises. Most of the petroleum mining has, however, been brought almost entirely under Dutch control.

Gold Mining in Venezuela and British Guiana

By KIRBY THOMAS.
Written for *Engineering and Mining Journal*

INTEREST has been revived in a new gold-placer district in southeastern Venezuela, which first became known to the outside world in 1915. It is about 250 miles directly south of the Orinoco delta on the border of British Guiana, and extends into British Guiana where the district is as yet entirely virgin. It is claimed that General Fernandez, one of the discoverers of the new district, took out over $300,000 of gold in three months, and other sensational strikes were reported.

Señor Quenza, a merchant of Calloa, the location of a famous gold mine of the same name, has a large concession for the new district and is directing operations there. So far, all the work has been done by natives, although some American engineers have made investigations.

The district is remote from main lines of travel. The itinerary advised is from Trinidad up the Orinoco to San Felix, and from there a three and one-half day mule-back trip to Calloa, from which point a two-day mule trip takes one to the Cayuni River. Here canoes are secured, and if lucky the remaining fifty miles to the objective is covered in one week.

The climate is reported to be bad. One engineer records in his report that "the mosquitos begin work at 5 p.m. to work all night." He also advises a formidable list of netting, and remedies. All food must be taken in from Calloa. The region is in the foothills of the little-known Usupamo Mountains. The labor available is mostly Trinidad negroes, speaking English.

According to the Department of Lands and Mines for British Guiana, the gold production of the colony covering a period of thirty years has been over $50,000,000, practically all from river and stream placers.

The great interior highland of British Guiana is comprised almost entirely of granite and metamorphic rocks, and the streams in this formation are nearly all gold bearing. On the Cayuni River the gold is exceptionally coarse and of great purity. Many nuggets of several hundred ounces have been produced. The gravel is shallow, from a few inches to six feet in depth, and easily washed by simple methods. Pay gravel is generally narrow, though sometimes up to 200 feet wide.

The Cayuni River has many rapids and is of little avail for transportation of supplies or materials. One of the main tributaries of the Cayuni River, the Yuruon, receives the waters of the Yuru River, which flows from the Venezuela highlands, in which is located the well-known Callao gold mine, which, under an American-British company, yielded upward of $20,000,000 in gold. These streams also drain the new rich gold-placer district in Venezuela.

Japanese Imports of White Zinc

The quantity and value of the imports of white zinc into Japan during the last five years are shown in the following table:

Years	Pounds	Value
1915	632,958	$52,133
1916	557,941	65,379
1917	97,026	5,143
1918	497,112	26,146
1919	1921 .2	220,995

Mining Engineers of Note

Arthur Thacher

A. I. M. E. members who have been fortunate enough to attend the annual meetings in New York need no introduction to Arthur Thacher, for his is a familiar figure, and it is doubtful if any one has shown a keener interest in the activities of the Institute than he. Mr. Thacher is at present on the Board of Directors of that body. Judged by modern-day standards, he may be regarded as one of the "old boys," but this, mind you, refers only to his membership of forty-four years in the Institute, for he would loudly disclaim any other allegation; and rightly so, for we know he loves a good story, can set the pace for many of the younger men on a sight-seeing trip, and in several other ways demonstrate the fact that despite his sixty-three years, he is as youthful as the best of them. His affability and conviviality have frequently been remarked upon, particularly by the newer members of the Institute. Concerning his membership in the A. I. M. E. it may be remarked that in joining that organization at the age of nineteen Mr. Thacher set an example which should serve as an excellent one for young mining engineers to follow. Arthur Thacher was born in Newtonville, Mass., on May 8, 1857, and was graduated from the School of Mines at Columbia College with degrees in mining and civil engineering in 1877. In December of that year he went to San Francisco and from there to Triumfo, Baja California, Mexico, for the Progreso Mining Co., which was operating the large silver mines that are still being worked. The treatment was dry crushing, roasting, and lixiviation. From there he went to New York. Since then he has been in most of the Western States. In 1887 he took up his permanent residence at St. Louis, and there assisted Prof. W. B. Potter in his private work and also gave lectures in metallurgy at the Washington University. In 1892 Mr. Thacher took charge of the Central Lead Co. in southeast Missouri, as president and general manager, and continued in that capacity until 1905, when the property was sold to the Guggenheims, who are still operating it under the name of the Federal Lead Co. For the next eighteen months he was connected with the Guggenheim interests under John Hays Hammond. In 1906 he entered the employ of the New Jersey Zinc Co. as Western manager of mines, and has since remained with that company. His principal work has been at the Wisconsin zinc mines of the New Jersey Zinc Co., where his interest has been largely with the treatment of the low-grade zinc ores, although he has also paid considerable attention to the low-grade lead ores of Missouri. In addition to the personal concern that Mr. Thacher has always shown in the progress of mining and metallurgy, he has also found time to interest himself with public affairs, and so we find that he rendered valuable service in 1899 as chairman of the Board of Arbitration for the New Orleans Drainage Commission and the National Construction Co. Were we to seek a friendly nickname for our friend it would be most fitting to dub him "Golden Rule" Thacher, for it is one of the strongest tenets of his industrial religion that the remedy for industrial problems lies in the simple application of the Golden Rule. It is not merely a theory with him, moreover, for he has substantial exhibits to demonstrate the practical expediency of the plan as he has practiced it, in cost-sheets showing a constant lowering of mining costs in mines under his charge, while operating costs in general were steadily mounting, and also in a record free from strikes. His cost reduction was not effected by cutting wages, for wages were steadily and voluntarily advanced from time to time, but by increased efficiency. Under the influence of the brotherly feeling engendered by the Golden Rule, his miners got unbelievably busy with the muck-stick. Such a doctrine as this is sorely needed in our mine operations of today, for it can do much to draw together the operator and employee, and by that means secure the best co-operative effort. More power to his gospel!

ARTHUR THACHER

Mr. Thacher is also a member of the Mining and Metallurgical Society of America and the St. Louis Academy of Science, and of the following clubs: Engineers', University, Round Table, Noonday, Country, and St. Louis, of St. Louis; Engineers' Club of Chicago, and the Rocky Mountain, of New York.

BY THE WAY

Commercializing the Weakness of Palladium

We suggest a profitable side line for the manufacturers of divining rods: Palladium, as is well known (by some) will glow to the point of ignition when exposed to alcoholic fumes. In this it resembles some animate bodies. In fact this property of palladium has been used in the manufacture of automatic cigar lighters. The value of a device containing palladium to Prohibition Enforcement Officers is, of course, obvious. The nearer they get to the source of supply, the warmer they would become, a literal interpretation of one of our childhood games. They could really be hot on the trail. An added advantage is that the palladium becomes as excited about wood alcohol as any other kind, so would play no favorites as to brands of liquor. We hesitate to make things easier for the said P. E. O., but we feel that those who manufacture divining rods should have a little encouragement after some of the mean raps we have given them. Also, of course, we are anxious to develop new uses for the metals.

A Problem in Commercial Algebra

A certain applicant for relief under the War Minerals Relief Act put in an item of expense for building a mill of something over $80,000. The Bureau of Mines accountants, on investigating the case, found that he had put the cost of the mill at something over $10,000 in making up his income-tax statement. Question: What was the cost of the mill, and why?

The Glories of Knowledge

The *Bornite Sentinel*, of the Davis-Daly Copper Co., publishes the following, which we reprint for the benefit of our Cousin Jack devotees:

An old-time Cornish mining captain in the Lake Superior iron country had a collection of minerals of which he was very proud. Some years ago a party of students from the Michigan College of Mines at Houghton came down to Cap'n Jan's mine on an inspection trip and were invited to his home for dinner. The boys arrived at the house before their professor, and Cap'n Jan was proudly showing them his specimens. "I suppose, m'son," he said to one of the students, "thee naws a mineral an' thee can tell 'er name right h'off, can thee?" "Well, Captain, I don't know if I can, but I've studied mineralogy some and know the majority of the common minerals," answered the youngster. "Let's see 'ow thee's learned, m'son. 'Ere, naow, 'ere's a bit o' mineral [holding up a specimen of iron pyrites], w'ot's this 'ere?" "Why, that's iron pyrites, Captain." "H'iron pyrites! Dam-me! I nawed I'd get thee, but did'nt think to catch thee firs' crack h'out o' tha box. W'ot's this then [holding up a piece of cassiterite]?" "Why, that's cassiterite." "Cassiterite! W'y dam-me, 'oo ever 'eard tell o' cassiterite? Thee's wrong m'son, thee's wrong. I be afeared tha bloody college h'edication 'as'nt 'elped thee one bit. 'Ere's tha professor naow; let's see if 'e naws w'ot is un. Professor, w'ot's this 'ere bit o' stone [holding up the piece of pyrites]? Tha boys don't seem to naw tha name o' this bloody rock at all. W'ot dost thee call un?" The professor did some quick thinking. He knew, as it was iron pyrites and would be easily seen to be that, that the boys had named it right, and therefore the Cornishman did not know the correct mineralogical name. "Why, Captain, that's *maundic* [The Cornish name for iron pyrites]." "Dam-me, w'ot's think o' that," cried the delighted captain, "I nawed bloody well thee would naw, an' these 'ere young chaps try to call un h'iron pyrites. Naow, 'ere Professor, [holding out the cassiterite] w'ot's this 'ere? She's a 'ard one, so take thy h'own time." "Well, Captain," the professor replied, "that's a bit of tin stone." "Professor, shake 'ands," shouted the Cornishman. "Dam-me, I wuz afeared w'en these 'ere young fellers did'nt naw tha names o' these minerals that thee wouldn't naw them h'either, but naow I see thee h'art an h'edicated man."

An Appeal

Conspicuous efforts are being made by New York druggists to market large quantities of epsom salts, or magnesium sulphate. This commodity is being offered in four-pound tins at an attractive price. But who wants four pounds of epsom salts all at once? Answer: Those who have avoirdupois. Bathe in it and reduce. Dissolve it in the bath, plunge in, dissport, and at last emerge, almost as stout as you were before but not quite. Continued treatment is bound to show results, if not in reduced weight, at least in the greater consumption of epsom salts. Remember, every little bit helps. Pity the poor producer of magnesite, left high and dry when the war tide went out, and go take a bath at once—in epsom salts.

How To Get a Gold Medal

Doubtless the Chile Copper Co. staff has now received its full complement of gold medals from the M. & M. Society. Pope Yeatman, on receiving his medal, gave most of the credit to his staff, including primarily Cappelen Smith; and Cappelen Smith gave most of the credit to Mr. Yeatman. Both, we believe, yield the main honor to the foresight and faith of Daniel Guggenheim. But it is not expected that Mr. Guggenheim will be honored with the medal just yet. The initiation of dividends on the common stock would be a suitable occasion. Our West Coast friends may well feel discriminated against because no medals have been awarded to the pioneers of the great enterprises of Alaska Gold and Alaska Juneau; but the passage of the McFadden bill may better their chances.

A Welfare Hint

We recently introduced our readers to the Marcy collar, bound to find favor with millmen. We now take pleasure in bringing to the attention of geologists and those interested in geology the latest Ide collar, known as the Moraine. This is not an advertisement. Space in these columns cannot be bought.

Handy Knowledge

Spectacles with lenses made of optical fluorite will enable one to see double, as in the days of old. According to a bulletin issued by the State Geological Survey Division of the University of Illinois, a specimen of fluorite for optical use must contain a portion at least one-fourth of an inch in diameter, free from flaws, and colorless or nearly so. There is no way, however, of getting the old sensation along with the old vision except the old-fashioned way.

CONSULTATION

United States Mining Laws

In the Nov. 13 issue of *Engineering and Mining Journal* reference was omitted in the article "United States Mining Laws" to Bulletin 94 of the U. S. Bureau of Mines, "United States Mining Statutes Annotated," by Judge J. W. Thompson, published in two parts and containing 1,772 pages, which covers the subject thoroughly and in a different manner from both that of the publication of the General Land Office and that of the late Judge Lindley, to which references are made. It may be obtained in cloth-bound form from the Superintendent of Documents, Washington, D. C., for $2.50.

The pamphlets of the General Land Office give a bare statement of the Federal Mining Law. "Lindley on Mines" is a compilation essentially for lawyers, and, although a standard work on the subject, its usefulness is limited practically to attorneys, its price is almost prohibitive to the ordinary miners or locators, and it is arranged without particular reference to the various sections of the mining code. The treatise of the Bureau of Mines seems relatively little known among mining men, and was prepared at the authorization of Dr. Holmes, a former director of the Bureau, in the belief that the development of the best mining law for the United States must necessarily be founded on a comprehensive and exact knowledge of existing laws. It contains every act of Congress relating to mining or the mineral industries.

"United States Mining Statutes Annotated" has the advantage that every section in the work—numbered the same as in the Revised Statutes of the mining law—is followed by simple and plain extracts from the decisions of the various courts, supplementing and making clear the statutory requirements.

As an illustration of the importance of its orderly arrangement, the following example is poignant: The question arises as to what constitutes the performance of annual labor on a mining claim to the extent of $100 in value. This is the simple requirement of Section 2324 of the Revised Statutes, but a person without experience in the performance of the annual assessment work, and without a reference to the holdings of the courts, would be at a loss to know the nature of the work to be performed, the time when, or the place where, such work must be done. By reference to page 233 of the bulletin, under the section containing the requirement, he would find twenty pages devoted to every phase of this particular subject.

Judge Thompson has stated that Bulletin 94 has become very popular with miners and prospectors and has continued since its publication to have a remarkable sale through the Superintendent of Documents.

The Bureau of Mines is publishing annotations of the mining statutes of the different states: California and Illinois annotations have already been published; Pennsylvania is in press, and the Colorado annotations and statutes are ready to be printed. All the bulletins mentioned are valuable additions to the mining library of the prospector, engineer, or other interested party.

Chemical Lead

"Will you kindly inform me what constitutes chemical lead; that is, what impurities are inadmissible in this grade of lead and for what it is chiefly used?"

Chemical lead is a "soft" lead used in sulphuric-acid chambers and processes using sulphuric acid. It usually contains a small percentage of impurities, copper and antimony, which serves to make it more resistant to the effect of acids. The production of chemical lead is dependent upon the presence of impurities in the ore from which it is made. There are no fixed specifications for chemical lead, and doubt has been expressed as to the most efficient composition of this material. Barrs has found an increase in the purity of lead corresponds with an increase in the power of resisting acid attacks, but recommends the addition of 0.02 to 0.05 per cent copper to insure maximum resistance.

During the war experiments were made by D. W. Jones to determine the best quality of chemical lead by heating chemical lead in sulphuric acid. The results of his experiments are recorded in an article, "Chemical Sheet Lead," published in the *Journal of the Society of Chemical Industry* for July 31, 1920. It was found that lead refined by the Parkes process without further treatment is unsuitable for use in many operations using chemical lead. To test the effect of impurities on the chemical properties of lead, additions of pure metal were made. It was observed that the presence of antimony in lead to the extent of 0.01 per cent renders it unfit for use as chemical lead and that some corrective agent is required to prevent the breakdown of such lead under sulphuric acid.

The effect upon the decomposition temperature of the addition of copper to a Parkes process lead was found to be most beneficial. Copper also counteracted the harmful effect of antimony. With between 0.02 and 0.03 per cent of copper and antimony there seems to be a rise of temperature of initial attack.

That zinc, when present in lead in even small amounts, is supposed to destroy the power of withstanding the corrosive action of acid was not borne out by the experiments. Mercury was found to have a deleterious effect upon the quality of chemical lead. Tin had a degrading influence, but as it is easily removed from lead by modern refining methods it is not usually found in lead in more than minute traces. Bismuth is decidedly injurious if present above 0.04 per cent, but the addition of small amounts of copper partially counteracts its effect. The poor chemical quality of some Parkes lead is ascribed to the effect of the proportion of bismuth and antimony contained in it.

Jones concludes that of the elements used for additive purposes there are only two which consistently exert a beneficial influence upon the chemical properties of lead—copper and sodium. Of other additions it may be said that they are injurious in effect, though in most instances not to the extent supposed. Antimony, if present in quantities which a commercial metal may contain, will effectively debar its use as "chemical" lead.

HANDY KNOWLEDGE

Repairing Broken Cam Shafts

BY GEORGE J. YOUNG

A considerable amount of discard material always accumulates about a stamp mill, and ordinarily it cannot be salvaged. The distance of most mining districts from iron-working centers has usually prohibited the marketing of scrap metal, and, as a consequence, such discard material represents a total loss.

The advent of the oxy-acetylene welding torch, the electrical welding outfit and thermit has greatly extended the possibilities of reworking scrap and salvaging broken parts. The matter is primarily a question of comparative costs. The distance of the plant from manufacturing centers determines the cost of freight and the time required for the receipt of repair parts. Both are important considerations. Where plants have favorable freight rates, there is often little justification for undertaking anything more than urgent repairs, as wages for skillful repair men are high. Nevertheless, it is important for at least one or more repair men to be maintained, and the minimum volume repair work should be done to keep such men comfortably busy. The time required for shipment of parts is often excessive, whereas the time for repair, though it may represent in money an excess over replacement by shipment, is so much less that repairs

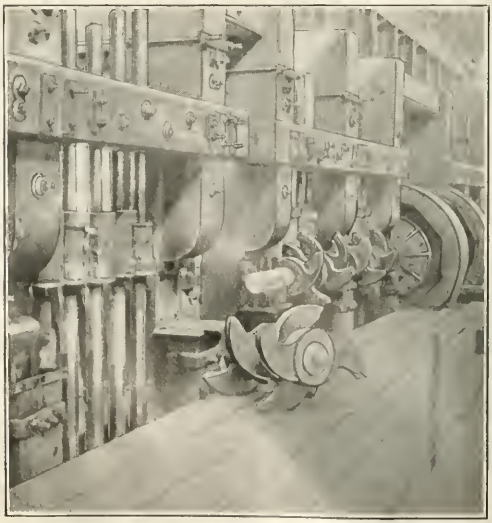

FIG. 1. BROKEN CAM SHAFT AT BELMONT MILL, TONOPAH, NEV.

are best made at the plant. A well-equipped plant necessitates the availability both of the portable welding outfits for small parts and minor repairs and thermit for heavy repairs.

At the mill of the Tonopah Belmont Development Co., which through the courtesy of the company I visited during the fall of 1919, cam shafts were being repaired instead of consigned to the scrap heap when broken. A single shaft is used for two batteries, and when broken represents somewhat over $300 in value.

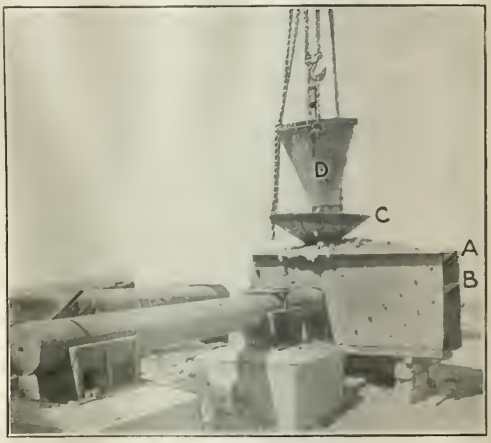

FIG. 2. READY TO IGNITE THE CHARGE OF THERMIT

Thermit is used for welding the broken ends of the shaft. A special stand consisting of four concrete pedestals each supporting an ordinary cam shaft box is used for the job. The broken ends are trimmed off and the shaft ends placed in the boxes, the ends of the shaft being brought within five-eighths of an inch apart. The shaft is then securely clamped at the two inner boxes, as shown in Fig. 2. The sheet-steel box shown in the figure is slipped onto the shaft before the shaft is set in the boxes. It is then bolted together. The illustration shows clearly the construction of the box.

Wax, softened by heat, is then forced into the space between the ends of the shaft and built up into a collar about three-quarters of an inch on each side of the ends. The weight of the container and wax is taken before and after use. All parings of wax are returned to the bucket, and the difference in weight represents the actual weight of wax used in filling the space between the ends and in forming the collar. In the specific instance two pounds ten ounces of wax were required. On the bottom of the box and the inclined steel partition fire brick is placed. Moulding sand is then rammed in, three wooden plugs being put in position. The lower one, horizontal, being so placed as to be tangent to the under side of the shaft, is called the torch hole, the middle inclined plug is the vent, and the upper one is the pour hole. These are respectively *E*, *F* and *G* in Fig. 3. Moulding sand is then thoroughly rammed about the plugs, and the box filled. While this is being done, partition *B*, Fig. 2, is out. The three plugs are then removed and an oil-compressed air torch is adjusted so that the flame passes through the lower

hole *E*. In this way the wax is burned out and the ends of the shaft are brought up to the highest heat obtainable.

In the meantime, the thermit change, 33 lb. thermit mixture for each pound of wax, is prepared and placed in the crucible, *D*. It requires about three hours for the torch thoroughly to heat the ends if it is working properly. As soon as the desired temperature is reached, the torch is removed, an iron plug placed in the torch hole, partition *B* placed in position and moulding sand rammed in back of the iron plug to keep it in position. A funnel *C* is then placed in position, the thermit charge ignited, and the pour made. The shaft is removed on the following day. When machined the junction of the broken shaft ends is hardly visible.

To facilitate handling of the shaft and thermit crucible, a small jib crane and chain block are conveniently erected near the pedestal blocks. The entire job required two men approximately one and a half shifts, or from sixteen to twenty-four hours' time. For

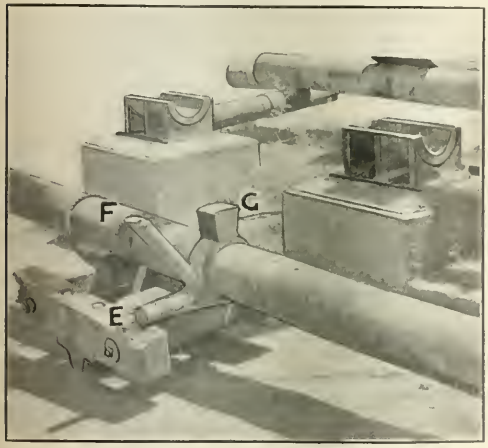

FIG. 3. THE CAM SHAFT REMOVED FROM BOX AND READY FOR MACHINING

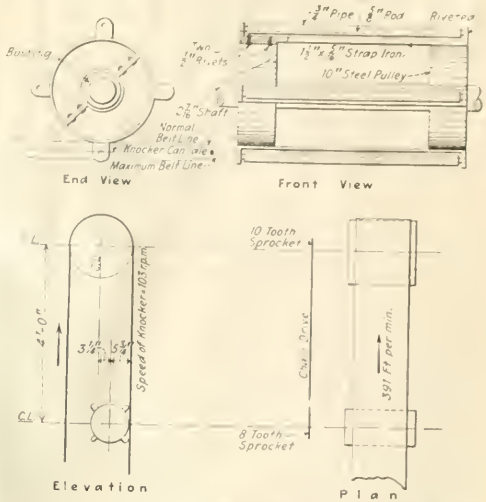
success, the shaft ends must be perfectly aligned and the whole job carefully handled. Acknowledgment for the notes from which this article was prepared is made to F. J. O'Neill, who carried out the work described.

Knocker for Cleaning Conveyor Belt

By W. R. Canton

Upon starting the wet concentrating mill at the Replogle Iron Mine, near Wharton, N. J., some difficulties in handling the wet tailings arose. Drag classifiers delivered a product containing 24 per cent water to the belt conveyors. This product does not act like a dry material, and a large percentage adhering to the belt is dragged back on the return and some is thrown off at each idler. To eliminate this difficulty the knocker shown in the illustration was installed. Although the idea was not original, no data on the operation of this device were available. How hard to hit the belt and how often were points to be determined. A good sharp blow gave the best results. This was obtained by driving the knocker at 103 r.p.m. by means of a chain drive. This resulted in 412 strokes against

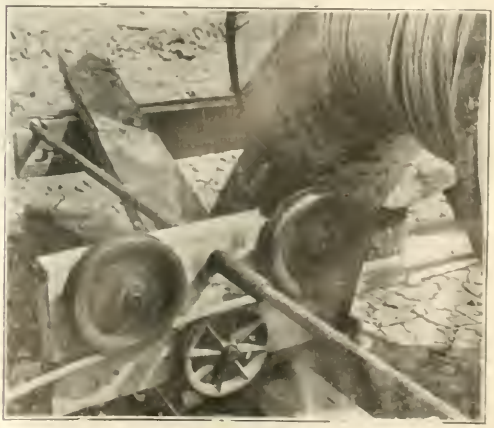


DETAIL OF "KNOCKER WHEEL" USED TO PREVENT WET MATERIAL FROM ADHERING TO THE RETURN BELT OF A BELT CONVEYOR

the belt per minute. The belt was struck every 11.38 in., and with the knocker so adjusted worked excellently.

Removing Reel Kinks From Wire Rope

A device for removing reel kinks from wire rope is described in *Engineering News-Record*. It was used in preparing wire rope for concrete block revetment at vulnerable places on the improved Miami River channel at Dayton, Ohio. This rope, cut to lengths of 20 ft. or more, was threaded through holes in precast concrete blocks, and it was important that it should lie straight to facilitate the threading operation. As indicated by the illustration, the reel of rope is suspended on an axle on a timber frame so as to unwind from the bottom. In front of the reel three pulleys attached to an axled plank, as shown, constitute the straightening device. The entire arrangement cost little and served its purpose excellently.



METHOD OF STRAIGHTENING WIRE ROPE BY MEANS OF THREE PULLEYS

THE PETROLEUM INDUSTRY

Draining Oil Reservoirs

The Mining of Oil Sands by Shafts and Tunnels in Shallow Fields Permits the Application of a Method for Determining Certain Production Estimates and the Calculation of Drainage Area

BY SETH S. LANGLEY
Written for *Engineering and Mining Journal*

OIL production is essentially the mining of a liquid. The oil reservoir is an ore which, when drilled into, is self-concentrating, and, until the gas pressure is exhausted, it will mine its concentrate. After exhaustion of the gas pressure the ore still concentrates itself and is mined by pumps. Eventually concentration is too slow to be profitable, although more than half of the original oil may still remain in the reservoir.

In a recent issue of *Engineering and Mining Journal* A. H. Fay called attention to the possibilities of draining oil reservoirs by the application of metal-mining methods. Intrenched in their ignorance, some seemingly intelligent operators scorn the idea on the time-worn argument, "it has never been done." It has been and is being done in Alsace, as reported in *Engineering and Mining Journal* of June 12, 1920, on p. 1320. The article states: "Three shafts, with 4,000 meters (13,000 ft.) of subterranean galleries, produce more than 25,000 tons (164,000 bbl.) of crude petroleum per year."

DETERMINING PRODUCTION IN OIL SANDS

Even were the precedent of this example lacking, the problems to be overcome are known and can be solved. Production by shafts and tunnels is applicable to comparatively shallow fields whose gas pressure has been exhausted and in which production by wells is no longer profitable. Data from which to base conclusions should be available. The character of the reservoir is known from the drilling records, and the porosity of the sands can be closely calculated.

Referring to "Oil and Gas Production," by Huntley and Johnson, on p. 37, "Calculations show that there are 7,758 bbl. of sand in a bed 1 ft. thick and an acre in area—assuming 15 ft. of pay sand and 4.5 per cent extractable. In Equation 1, $0.045 \times 7{,}758 = 5{,}236.55$ bbl. of oil per acre."

The above gives 349 bbl. per acre-foot. The first and third factors of Equation 1 are the variables. The first is dependent upon the porosity of the sand, and can be determined by samples from the wells. The third can be calculated from the well logs. With the original oil content known, the present content can be obtained by deduction of the total past production. All of the remaining oil will not be recovered by drainage into tunnels, but the rate of drainage per foot of exposed area should be the same as in the wells, and can be estimated on that basis.

Fig. 1 is presented as an example and represents actual subsurface conditions below the 350-ft. level. The water-bearing sand is assumed to meet a possible condition. The field map shows twenty-five wells that are distributed throughout the area represented by a lease of ninety-three acres.

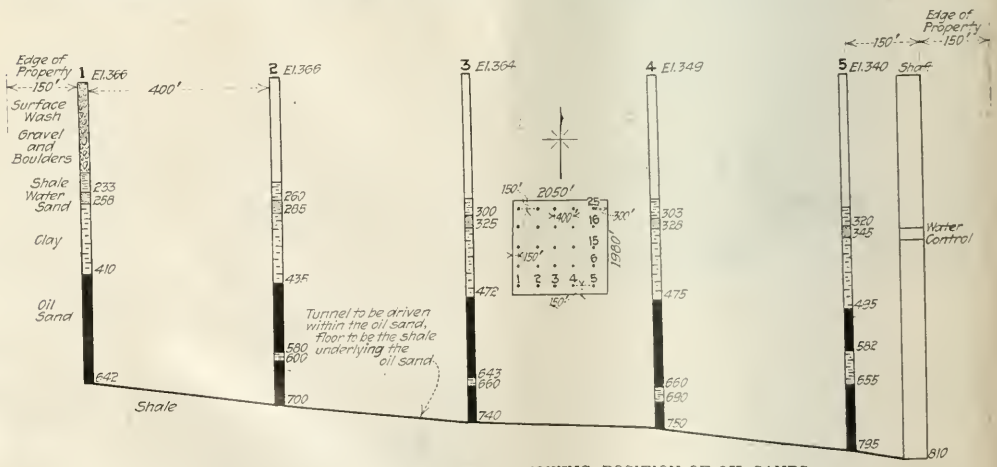


FIG. 1. CROSS-SECTION OF WELLS SHOWING POSITION OF OIL SANDS

By Equation 1:

$0.03 \times 7{,}758 \times 239 = 55{,}624$ bbl. per acre.

$93 \times 55{,}624 = 5{,}173{,}032$ bbl. total original oil.

Passed production 2,000,000 bbl.

Oil remaining in reservoir 3,173,032 bbl.

The present production is two barrels per well per day. The wells are all finished as 6-in. holes. Hence 6-in. $\times$ 3.1416 $\times$ 239 = 375 sq.ft. of draining area per well. $\frac{375}{2} = 187.5$ sq.ft. drainage area per bbl. of oil.

It is known from the well logs that the oil sands dip to the southeast. A tunnel west and drifts north would form a gravity drainage system to the sump of a shaft sunk in the southeast corner. A shaft 850 ft. deep will provide a 40-ft. sump. From the 810-ft. level drive a 7-ft. x 6-ft. tunnel west 1,750 ft., and from the tunnel five drifts north, each 1,680 ft. in length and 7 ft. x 6 ft. in cross-section. The floor of the tunnel and drifts will not be figured as drainage area, as it will be in the underlying shale. The total drainage area of the shaft, tunnel, and drifts will be 231,480 sq.ft., and if the drainage is in proportion to the exposed area the production will be approximately 1,235 bbl. per day.

Method of Water Control Must Protect Sands

The well logs—Fig. 1—show a water sand lying between the shale strata. This water must be controlled, the method outlined by G. G. Wald in the *Engineering and Mining Journal*, Dec. 28, 1918, p. 1129, being applicable. Whatever the method used, it must provide protection of the oil sands from foreign water, both for the property in question and its neighbors. This water need not be carried to the bottom of the shaft. A pump station should be cut at as high a level as possible. The experience gained in controlling the water can be applied to the oil sands encountered in sinking. When the shaft is completed it would be well to devote a month or two to the study of production per unit area of exposed oil sands. The size of the tunnel and drifts will depend upon this data.

There are probably no field records to show what percentage of the oil will be retained in the sand by capillary attraction. When the production has declined materially it may prove profitable to increase the drainage area. There will come a time when this is not profitable, and then the question of mining the entire orebody will be decided by the same factors that control all mining. The probable oil remaining can be estimated from the sands in place in the same manner that the value of any orebody is determined. The sands available for sampling will certainly be no richer than those unexposed.

In an operation such as illustrated in Fig. 1 it may be necessary to upraise through the lowest shale break shown in wells Nos. 2, 3, 4, and 5, or to drive a tunnel from the shaft to cut the shale in No. 4 at 660 and drift from this tunnel north. The local experience will decide.

Development should be done by contract, as few if any oil companies maintain technical staffs trained in this sort of work. On the other hand, as it is, in all essentials, the mining of a liquid rather than a solid ore, large mining companies with proper technical facilities would not encounter new problems.

Shortage of Fuel Oil in Vancouver

Consumers of fuel oil in Vancouver, B. C., were recently notified that the Imperial Oil Co.'s sources of supply would soon be cut off and that there is no hope of securing more oil until June 1, 1921, when two tank steamers, now building, will be ready to carry oil from the Mexican fields to Vancouver. The company announced that, after Dec. 31, 1920, all delivery wagons and tank cars will be withdrawn.

The lack of fuel oil, states Consul General Frederick M. Ryder, may force many of Vancouver's office buildings and apartment houses to convert their heating plants to the use of coal; and as most of these heating plants were not constructed with such conversion in mind at the time of installation, this announcement is likely to cost local consumers thousands of dollars. The Grand Trunk Pacific, the Terminal Navigation Co.'s steamers, the North Vancouver ferries, and a number of small boats depend on Imperial fuel oil, and considerable agitation is visible in marine circles.

It is estimated that the withdrawal of the Imperial Oil Co. from the field will necessitate an increase in the production and distribution of coal in Vancouver to the extent of 3,000 tons per month. However, according to the general sales manager of a locally prominent coal company, there need be no fear of a shortage of coal in Vancouver this winter, as the recent announcement of the oil company had been expected and the coal companies were prepared to take up at once the burden of supplying the people of this city with coal. The pulp and paper plants have announced that the new order, notifying them of a cessation of oil deliveries for six months, would have no ill effect on their operations.

American Company Secures Oil in Trinidad

On drilling a well to a depth of 1,100 to 1,200 ft., within four or five miles of the asphalt lake at Brighton, Trindad, an American company, states *Commerce Reports*, recently secured a "gusher" which had a flush product of 30,000 bbl. of petroleum oil within twenty-four hours, and has settled down to a daily production of about 1,000 bbl. Up to the present time the drilling operations of this American company in Trinidad have been mainly for the purpose of securing petroleum to use as a flux in connection with asphalt for road paving and other purposes, although some fuel oil has been exported independently. The company is also, through a constituent company in Venezuela, extensively interested in petroleum oil deposits near Lake Maracaibo, in Venezuela, and in an oil refinery at Curacao, Dutch West Indies.

California Report Covers Field Operations

The available supply of gasoline in California and other states varies with demand at different seasons of the year. The amount stored usually increases during the winter months and falls off rapidly during the summer. Regularly compiled statistics are useful to consumers who desire to follow the situation. The monthly report of the California oil and gas supervisor contains the latest available figures collected by the Bureau of Mines and may be obtained by addressing the State Mining Bureau, Ferry Building, San Francisco. The last report issued contains a report on all oil field operations passed upon by the oil and gas supervisor during September.

NEWS FROM THE OIL FIELDS

United States Demands Equal Treatment in Mandates

A demand for the application of the principles of equality of treatment of all nations, irrespective of mandatory power, with special reference to the petroleum resources of the territories involved, and a protest against the exploitation of these resources by any nation to the discrimination of others, constitute the salient points of a note signed by Secretary of State Colby and delivered to the British Foreign Office on Nov. 24. Although dealing particularly with the distribution of the oil resources of Mesopotamia, the American protest also sets forth the right of the United States, as one of the powers associated in the victory over the Central Powers, to be consulted as to the terms of mandates and other decisions, the right to make which accrued to the Allies as a result of their common victory.

Limit Placed on Oil Claims

From Our Special Correspondent

Consequent on the discovery of oil fields in the neighborhood of Mackenzie River, the Canadian government has passed an Order-in-Council limiting the maximum area which may be staked to 640 acres. Notice is also given that the Mackenzie River Petroleum Co., Ltd., will apply for incorporation at the next session of Parliament. The company seeks all powers incident to the production and storage of oil and natural gas, the marketing and transportation thereof, except by rail. In particular, the company will seek authority to construct a pipe line for the transportation of oil and gas from a point near the mouth of the Rat River, at its junction with the Peel, a tributary of the Mackenzie, thence to the international boundary.

Up to Nov. 1 7,500 applications for permits to prospect for oil on the public lands had been filed with the General Land Office. Applications for permits to prospect for coal numbered 254. Six have made application for permit to prospect for sodium. There have been two requests for leases of oil shale lands and five applications for leases on phosphate lands.

That the Government may expect a considerable income from the operation of the leasing law is indicated by the estimate that oil lands leased under the act, in Wyoming and California alone, promise during the next fiscal year a production of 14,000,000 bbl. If that production is achieved, the Government's share will amount to more than $6,000,000 at present prices.

France Defers Making Oil Law

According to authoritative reports, schemes for revision of the French petroleum laws may not take shape before next spring, says a recent issue of the New York *Sun*. The proposal by M. Eynac for state control of importations and exportations of petroleum and petroleum product is regarded by many well-informed persons as embodying anything other than a liberal, open-door policy in connection with American oil interests.

If the Eynac proposal is favorably acted on by Parliament, which now is considered unlikely in view of the growing antipathy on the part of the public to a continuation of what is virtually a monopoly in the hands of the Royal Dutch Co., American oil interests and particularly the Standard Oil Co., which recently formed a French branch with Paul Cambon as president, will have to beg for a special permit before they can bring in even small quantities of crude oil for refining here, while the selling price of oil will always be subject to the control of a special department assigned to the Ministry of Public Works.

Notes from Trinidad, B. W. I.

From Our Special Correspondent

George R. Airth, managing director of the Anglo French Exploration Co., and Walter Maclachlan, chairman of the British Borneo Petroleum Syndicate, Ltd., arrived from London via New York Oct. 6 to attend a meeting of the directors of the Apex (Trinidad) Oilfields, Ltd., and to obtain a first-hand view of the company's operations. They were met by the local general manager, Colonel Hickling, and their geologist, Dr. Miller.

The gusher brought in by the Petroleum Development Co. on their new lease near Brighton has produced over 175,000 bbl. to date and is still producing at the rate of 1,500 bbl. per day.

A local press report states that Well No. 3 of the Apex Oilfields, Ltd., caught on fire on Nov. 5 through unknown causes. The derrick engine and drill equipment were quickly destroyed. The fire spread down the ravine on which the well was located and caused considerable damage to a cocoa plantation in the valley below.

On the afternoon of Nov. 21 Anaconda Copper Co., drilling in the Cat Creek field in central Montana in what is known as the West Dome, brought in a well having an estimated output of 1,000 bbl. Anaconda has acquired from ten to twelve thousand acres in this field and a second well is being drilled.

Warren County, Ky., Leads in New Work

From Our Special Correspondent

The result of developments in the Kentucky oil fields for the month of October shows that in new work under way Warren County takes the lead, followed by Allen, while it is a race between Lee and Johnson-Magoffin Counties for third place.

Drilling activity continues unabated in the Johnson County field, and recently a number of good producing wells were brought in. No. 1 Hayden Williams made 12 bbl. in four hours' pumping. This well is in the Weir sand. The Cumberland Petroleum Co.'s No. 2 on the Oliver Wheeler tract is estimated to be good for 30 bbl.

One of the largest wells in Simpson County was brought in by C. H. Upper on the George Slate lease. In addition to the regular sands found in that section, 15 ft. of light porous sand was encountered, giving forth a large quantity of oil. The bringing in of this well fully determines that the eastern part of Simpson County and the western part of Allen County will prove probably the largest and most consistent field in Kentucky, as the sands are uniform.

In Todd County, the Kentucky Producing Co., is starting a deep test near Elkton, planned to go 3,500 ft.

Mexican Wells Showing Decline

From Our Special Correspondent

The Transcontinental well on Lot 97 has been shut in entirely. It was showing emulsion and two-tenths of 1 per cent clear salt water. Thus the end of many of Mexico's largest wells is approaching rapidly. The new field in Zacamixtle will follow the same fate, as derricks spring up like mushrooms in this vicinity. An entirely new field will have to be found when this goes, as it is the last piece on this huge underground fold that has been supplying Mexico's oil for the past few years.

Over seventeen million barrels of oil were shipped from Mexico during the month of October; this figure being just a little over two hundred thousand barrels short of the record month, September, 1920.

The Metropolitan well No. 1 on Lot 135, Chinampa, was showing two-tenths of 1 per cent and the flow was pinched down. Their well on Lot 114 has been abandoned at a depth of 1,750 ft. also.

The Mexican Gulf well on Lot 95 has been shut in entirely as it has been showing emulsion for over a month now. Their two wells on Lot 251, Amatlan, have also been checked, as they were showing two-tenths of 1 per cent sediment.

Book Review

Industrial Housing — By Morris Knowles. 6½ x 9¼; cloth; pp. 408; illustrated. Published by McGraw-Hill Book Co., Inc., New York. Price, $5.

In the preparation of this book the author has drawn from an extensive experience with the housing activities of the Emergency Fleet Corporation, U. S. Shipping Board, of which he was chief engineer. The industrial housing idea, although practical to some extent, was, in the early stages, characterized "by incorrect social hypotheses and a complete lack of consideration of the problem." Also the suggestion of paternalism acted as a deterrent to the full progress of the movement. Later there were some notable examples of successful housing programs, but under the stimulation of a stringent need for industrial housing during the war, the movement grew rapidly and has now reached a high stage of development. The reader cannot fail to be impressed with the comprehensiveness of the author's treatment of his subject. Mr. Knowles states that not all of the features discussed are applicable to one locality, but that the consideration of them is advisable, and the mere providing of the house does not complete the industrial housing plan. There is necessary, also, "the appropriate planning of streets, blocks and lots; parks and recreation facilities; the utilities, such as drainage, sewerage, water supply, gas and electricity, transit and transportation, health and sanitation." A number of excellent examples of industrial housing projects and pertinent details connected thereto are given. Although there is but slight reference to mine "locations" or mining "camps," there is ample "food for thought" for the mine manager who has not provided an adequate and successful plan for the housing of his employees. D. E. A. C.

Mineralogy. An Introduction to the Study of Minerals and Crystals. By E. H. Kraus and W. F. Hunt. First edition; cloth; 6 x 9; pp. 561. McGraw-Hill Book Co., New York. Price, $4.50.

Many books on this subject have been published, all of them inclined to be dry and uninteresting, but, however, of high scientific value. The authors of this book have taken pains to enliven it, to make it attractive enough to the reader so that, although he may not read it in preference to the latest *Saturday Evening Post*, he will at least not be repelled by the appearance of the text. To accomplish this, they have evidently worked with the enthusiastic co-operation of the photographer and the typographer. Photographs of crystal forms are shown instead of the conventional line cuts. A positive hemiorthodome does not seem so forbidding when we can see an actual picture of it. Photographs of prominent mineralogists, of equipment, and of natural minerals are generously scattered through the pages. We know that the piece of magnetite illustrated is magnetic, because half of the keys of the University of Michigan mineralogical laboratory are hanging on to it, to say nothing of a couple of worn-out safety-razor blades.

The first part of the book is devoted to crystallography and to equipment connected with that subject. Then comes a brief chapter on the formation and occurrence of minerals, followed by forty pages on qualitative blowpipe methods. Those without training with the blowpipe often will go to the trouble and expense of having a chemical analysis made, or merely make a guess at sight, when, by the use of the most simple blowpipe equipment, a sufficiently accurate qualitative analysis may be obtained. The most important blowpipe tests are given in this book. The remainder of the volume is devoted to descriptive mineralogy and tables for the determination of 150 minerals.

Professors Kraus and Hunt have produced a book which should have a wide appeal to men in the field as well as being valuable as a text for students beginning work in college, for which most of the matter has been used at Ann Arbor for several years. It has been ten years since the authors gave us a "B," or maybe it was a "C," in the course, and we still remember quite a few facts about the subject. It must have been well presented. E. H. R.

"The Limestone Deposits of New South Wales." By J. E. Carne and L. J. Jones, Mineral Resources No. 25, New South Wales Department of Mines, Geological Survey, Sydney, 1919, 6 x 9½ in., 411 pp., 67 illustrations, 31 maps.

This volume deals with the limestone deposits, and with the limestone, lime, cement, and marble industries of New South Wales. A historical review of the discovery and early development of the limestone deposits is followed by a discussion of the origin, composition, varieties, and uses of limestone, and a fairly complete treatment of the process of manufacture and uses of lime. Forty-six pages are devoted to a discussion of hydraulic cements, their properties, raw materials, processes of manufacture, and plant operation. In the general discussion of limestone, lime, and cement, voluminous reference is made to the literature on the subjects, particularly that of America, and thus a summary is presented of present available information. The discussion of marbles is accompanied by five well-executed colored plates of typical New South Wales marbles. Pages 131 to 352 comprise descriptions of the limestones and dolomites by counties in alphabetical order. These descriptions are supplemented by nearly 700 chemical analyses. In appendices I and II the gypsum and phosphate deposits are described. O. B.

Technical Papers

A Desert Guide Book—Water Supply Paper 490-A has just been issued by the U. S. Geological Survey, and is the most generally interesting one of the series which we have seen. It is entitled "Routes to Desert Watering Places in the Salton Sea Region, California." Part B is to be devoted to the district around Barstow; Part C to the area between Phœnix and the Colorado river, and Part D to the region around Ajo, but only Part A has yet been published. Much of the matter is in the form of an Automobile Blue Book. The maps are excellent, and enough descriptive matter about the area is given to provide Eastern authors with sufficient local color for several desert stories. The Salton Sea, as many of our readers know, is an artificial lake about thirty miles long and two or three hundred feet below sea level.

Oil Well Drilling—"Casing Troubles and Fishing Methods in Oil Wells" (Bulletin 182, Petroleum Technology 57), by Thomas Curtin, has been issued by the Bureau of Mines, Washington, D. C. (Price 15c. from the Superintendent of Documents, Washington, D. C.) In this paper the author has outlined the methods that have been evolved in the various oil fields for combating casing difficulties.

Workmen's Compensation Act—The subject of medical aid under the Workmen's Compensation Act is discussed in the *American Machinist* for Nov. 4, 1920 (three pages, price 25c. McGraw-Hill Co., N. Y.). The employer is generally conceded the right to name the physician. The workman must in general submit to a necessary operation if it does not endanger his life.

California Minerals—Bulletin No. 87, entitled "Commercial Minerals of California" has just been issued by the State Mining Bureau, Ferry Building, San Francisco, Cal. The bulletin is a compilation of descriptive data on metalliferous and non-metallic minerals. The industrial applications, properties and uses of the ores, distribution and association, common tests, and metallurgy are given in brief paragraphs. Not all of the minerals and ores described are commercially important in California.

U. S. Rights in Mexico—The National Association for the Protection of American Rights in Mexico, 347 5th Ave., New York, has published an eighteen-page pamphlet setting forth the points requiring adjustment in our relations with that country.

Colorado Mining—The Annual Report of the Colorado Bureau of Mines for 1919 has been issued and may be obtained by addressing the Bureau at the State Capitol, Denver, Col. It is a sixty-seven-page pamphlet, and includes a list of all the operating mines in the state, with the name and address of the operator and character of the product.

ECHOES FROM THE FRATERNITY

Mica Deposits of Madagascar Are Attracting Much Attention

Phlogopite of Good Grade in Large Slabs Plentiful in Southern Section—Deposits Accessible and Hundreds of Natives Now Employed

A correspondent of the London *Mining Journal* writes in part as follows:

"After the slump in the graphite market Madagascar, which easily reached and retained a premier place as a producer of that mineral, found it difficult to recover from the blow, and many a claim was abandoned, while others were prospected for other minerals, with the result that some interesting discoveries were made and attention was directed to their development.

"In southeastern Madagascar the occurrence of mica attracted particular attention, and while muscovite is practically absent, the deposits of phlogopite or amber mica have given some astounding results, and exportation on a large scale has begun, the month of July seeing the shipment of several hundred cases. In many instances the sizes are considerably above those actually found on the London market; the writer saw some slabs of 25 inches square without a stain or crack. The occurrence near a village called Ambatohabo is now giving employment to several hundred natives, and the depth reached is about ninety feet. There is no sign of the deposit giving out; on the other hand, fresh pockets and well-defined reefs are constantly met with.

"The abundance of the mineral, its perfect condition and easy cleavage have given rise to the making of fancy articles in mica, such as trays, cigar boxes, fans, and sailor hats entirely in mica which the natives sport occasionally in town. The latter, if improved on, should prove of some value for certain specified purposes.

"There can be no doubt that the importance of this region as a mica producer will maintain itself in the future, as every day from various places reports of fresh occurrences come to light, and no doubt a careful study of the geological features of the district will help considerably in proving the existence of other minerals either associated with occurrences of mica or lying in their vicinity.

"The central mountain backbone of the country terminates in this vicinity, where some of its highest peaks are situated. The transition from plain to mountain is very rapid, and the various formations are here easily approached and can be carefully studied without any particular difficulty. The forest vegetation which formerly covered them densely has practically all disappeared under the axe of the woodman or the fire of the old dwellers. As soon as the primitive methods of extraction are abandoned in favor of a properly organized and up-to-date system of working, southeastern Madagascar alone will be able to supply all the world's wants in mica, and the wastage will disappear. As it is now the streets of this little town [Fort Dauphin] are often strewn with mica sheets of good size and commercially valuable.

War Memorial Given by Utah Copper and Bingham & Garfield Ry.

The Utah Copper Co. and the Bingham & Garfield Ry. Co. have presented a memorial bronze tablet to the employees of the two companies, commemorating the parts taken by 775 of their number in 1917-1918 in the Great War. The tablet was dedicated on Nov. 3, at the offices of R. C. Gemmell, general manager of the Utah Copper Co. in Salt Lake City, Utah. The office employees of the two companies in that city were present at the ceremonies.

Petroleum Engineering and Oil Geology Taught at M. I. T.

The Massachusetts Institute of Technology has recently established a course on oil and gas production, to supplement those courses on oil geology already established. Paul Paine, consulting petroleum engineer of Tulsa, Okla., and formerly production manager of the Gypsy Oil Co., has been appointed special lecturer on petroleum engineering and gives a course of thirty lectures on oil and gas production.

Other courses given are a general course on the geology of petroleum, a course on the valuation of oil properties, and a course on the construction and interpretation of oil maps. In the department of chemistry are given courses on oil and gas analysis and the distillation of oils.

Ontario Will Train Prospectors

The Minister of Mines has announced that early in the new year "Instruction Classes for Prospectors" will be established at the various mining centers in northern Ontario, where enough interest is shown to justify the undertaking. Dr. W. L. Goodwin, formerly Dean of the School of Mines at Kingston, Ontario, will be in charge. It is the intention to place at the various centers a competent instructor who will give an outline course in geology and mineralogy. Mineral collections will be provided, and an endeavor will be made to familiarize the prospector not only with the more common types of minerals, but also with such minerals as might reasonably be expected to be found in this country.

Treatment for Refractory Silver Ores To Be Sought

Canadian Research Council Appropriates Funds for Experimental Work—Mines Resumed Use of High-Grade Cyanide

The Canadian Advisory Council for Scientific and Industrial Research has made an appropriation for experimental work to devise a method of treatment for the refractory silver-lead-zinc ores which are to be found throughout British Columbia, but especially in the Kootenays. Horace Freeman, secretary of the British Columbia branch of the council, has been given charge of the work. It was Mr. Freeman who devised the process for the manufacture of low-grade cyanide indirectly from atmospheric nitrogen that is in use at Niagara Falls. Last summer the Hollinger and Dome mines, in the Porcupine district, purchased car-load lots of this cyanide and tried it for the extraction of gold from the ores of the respective mines.

So far as is known no report has been made, but the fact that the mines have reverted to the high-grade Scotch cyanide indicates that no worth-while saving was made over regular practice. This really was only to be expected. Pound for pound the value of cyanide as a gold solvent is directly proportional to the cyanogen content, and unless dollar's worth for dollar's worth the low-grade cyanide contained more cyanogen there would seem to be no possible reason for using it. Should the latter prove to be the case then, of course, everything would depend on the nature of the impurities and their influence on the solvent action of the cyanide. Mr. Freeman will commence his research on the British Columbia ores immediately.

Kinds of Briquettes Used by France

In the mining, metallurgical, and fuel literature of contemporary France one frequently meets with the term "agglomerés" as a form of fuel. An authoritative source issues the explanation that this seems to be "a general term for briquetted fuel, of all sizes and shapes. Common sizes used in France are: *briquettes*, weighing 6 to 9 kg., large rectangular brick-like blocks, usually made from washed coal and supposed to run 5 to 10 per cent ash; *briquettes perforées*, weighing about 900 g., and perforated; and *boulets*, egg-shaped, and weighing 40 to 50 g."

This explanation will assist in understanding the table published in these columns Nov. 13, last, p. 958. It might be added that the lignite fuel of north central Europe is also commonly compressed into briquettes of about 50 g.

MEN YOU SHOULD KNOW ABOUT

Lester E. Grant is manager of the Braden Copper Co., succeeding S. S. Sorenson, who is now at the company's New York City office.

Prof. Herbert E. Gregory, of the Connecticut Geological Survey, has returned from Hawaii and is resuming his duties at Yale University.

S. Ford Eaton, engineer in charge of Dardanelles Mining Co. operations in the Chloride, Ariz., district, is in New York City on business for the company.

Max Barber, general superintendent on the Mesabi Range for the Cleveland-Cliffs Iron Mining Co., has returned to Hibbing, Minn., after a business trip to Ishpeming, Mich.

Forest Rutherford, consulting metallurgical engineer of New York City, has returned to New York after spending several months in Colorado on mine examinations and milling problems.

E. H. Gould, recently superintendent for the Co-operative Mining Co., at Lordsburg, N. M., is now assistant general superintendent of the Advance-Rumley Mfg. Co. at Battle Creek, Mich.

C. M. Weld, D. M. Liddell, and **P. H. Lazenby** have formed a partnership as consulting engineers and economists under the firm name Weld, Liddell & Lazenby, at 2 Rector St., New York City.

L. L. Wilcox, superintendent of the Republic Iron and Steel Co.'s mines at Hurley, Wis., and **E. W. R. Butcher**, of Duluth, chief engineer of the company, recently spent a few days in Negaunee, Mich., attending to business.

F. H. Newell, who recently resigned his position as head of the department of civil engineering in the University of Illinois, Urbana, Ill., is retained as consulting engineer for a Western project. Prof. I. O. Baker is acting head of the department built up by Dr. Newell.

H. A. Guess, managing director of the mining department of the American Smelting & Refining Co., and now head of the Premier Gold Mining Co., arrived at Prince Rupert, B. C., from New York recently to visit the latter property. He was accompanied on his trip by H. MacDonald, mine foreman.

Wm. Thomlinson, of New Denver, B. C., who was in charge of Canada's mineral exhibit at the Panama-Pacific International Exposition in San Francisco several years ago, early in November was in the Similkameen mining district of British Columbia collecting minerals and other economic substances for the Canada Department of Mines, Ottawa, Ontario, which is preparing a comprehensive mineral exhibit for display at the National Exposition of Chemical Industries, to be held in New York City during 1921.

It is of interest to note that after March 4, 1921, Congress will include five senators who are closely associated with mining. They are as follows: Senator F. R. Gooding of Idaho, who was for many years a mining contractor; Senator R. H. Cameron of Arizona is also interested in mining; Senator Tasker L. Oddie of Nevada is a mining engineer and was one of the first developers of the Tonopah mines; Senator Samuel D. Nicholson of Colorado is a gold and silver mine operator, and Senator J. W. Harreld of Oklahoma is interested in oil development.

Harris & Ewing, Photo

H. S. MULLIKEN

Harry S. Mulliken, of San Antonio, Texas, has been appointed a metallurgical engineer in the Bureau of Mines, and assigned as special technical assistant to Director F. G. Cottrell. The creation of this position is an innovation. Mr. Mulliken will not report to any division chief but will have an important voice in the technical mining matters which come before the Bureau.

Mr. Mulliken, who is a native of Lexington, Mass., is a graduate of the Worcester Polytechnic Institute, Worcester, Mass. He began his industrial metallurgical work with the Chicago & Aurora Smelting & Refining Co. While with that company he specialized in the refining of silver and lead. Other positions he has held are: superintendent of the lead smelter at Pilot Bay, B. C.; assistant superintendent for the American Smelting & Refining Co., Perth Amboy, N. J.; superintendent of the Aguas Calientes and Monterrey smelters of American Smelting & Refining Co. in Mexico; general superintendent and plant manager of the Penoles company at Mapimi, Durango, Mexico; and in charge of all metallurgical operations of the American Metal Co. in Mexico. For the last several years he has been consulting engineer in metallurgy for the same company with offices at 61 Broadway, New York City.

B. M. Concklin, chief engineer of the Arthur Iron Mining Co., has returned to Hibbing, Minn., after a trip of several weeks in Montana.

S. R. Capps, who has been engaged in geologic work in European Turkey, is en route to the United States. He is expected to arrive late in December.

A. S. Agnew, general manager of the Rogers Brown Ore Co. and of the Mahoning Ore Co., has returned to Duluth, Minn., from his recent business trip to Hibbing, Minn.

E. K. Soper, geologist, of New York City, has gone to Trinidad, as manager of Trinidad-Tarouba Oil Development Co. His address will be P. O. Box 283, Port of Spain, Trinidad, B. W. I.

E. W. Shaw and a party of geologists including **R. H. Sargent, G. L. Harrington, Edwin Kirk** and **C. P. Ross** are expected to reach New York City on Dec. 10, returning from a geologic survey made in eastern Bolivia.

SOCIETY MEETINGS ANNOUNCED

American Society of Mechanical Engineers holds its annual meeting Dec. 7 to 10, at Engineering Societies Building, W. 39th St., New York City, in conjunction with its **Fuels Section.**

Montana State Assembly of American Association of Engineers meets on Dec. 11, in Butte, Mont. The keynote of the meeting will be "Engineers for Engineering Jobs." The president, W. J. McMahon, announces that there will come up for endorsement by the assembly, a petition to the governor, and others responsible, requesting that the offices of state engineer, mine inspector, forester, and similar places be filled by engineers.

The American Association for the Advancement of Science holds its annual winter meeting this year at Chicago, Ill., during the week Dec. 27 to Jan. 1. At the same time and place meet a number of related or affiliated societies, including the **American Physical Society** (Dec. 28-31), **Geological Society of America** (Dec. 31-Jan. 2), and the **American Metric Association.** Prof. B. J. Livingston, Johns Hopkins University, Baltimore, Md., is permanent secretary of the A. A. A. S., and on request will furnish information concerning programs and accommodations.

OBITUARY

The body of Robert H. Remington, drowned while engaged in work for the U. S. Geological Survey, has been recovered and has been sent to Watertown, N. Y., for burial.

THE MINING NEWS

The Mining News of ENGINEERING AND MINING JOURNAL is obtained exclusively from its own staff and correspondents, both in the United States and in foreign fields. If, under exceptional conditions, material emanating from other sources is published, due acknowledgment and credit will be accorded.

LEADING EVENTS

Columbia Section of A. I. M. E. Meets at Kellogg, Idaho

Northwest Engineers Visit Bunker Hill Plant—Meeting Pronounced Most Successful Ever Held

The annual meeting of the Columbia Section of the American Institute of Mining and Metallurgical Engineers was held at Kellogg, Idaho, on Nov. 19 and 20. The afternoon of the first day was devoted to an inspection of the Bunker Hill smelter and concentrating mill. In the evening a banquet was served by the Bunker Hill & Sullivan company and the business men of Kellogg, at which were seated 147 guests, a large number of business men and others connected with mining outside the technical class being present from all parts of the Coeur d'Alene district. Following the banquet Stanly A. Easton, manager of the Bunker Hill & Sullivan company, delivered a brief address of welcome on behalf of his company and the people of Kellogg. The meeting was then formally opened by James F. McCarthy, manager of Hecla Mining Co., president of the Columbia section. James M. Porter, of Spokane, dean of Northwest mining engineers, responded to the address of welcome. The following formal papers were read and discussed:

"The Federal Income Tax and Mine Valuation," by W. Earl Greenough, of Spokane; "Precipitation of Smelter Fumes in Series Treatment at the Bunker Hill Smelter," by J. P. Schuttenhelm, of the Bunker Hill staff, Kellogg; "Hydraulic Classification and Table Riffling at the Bunker Hill Concentrator," by G. Y. Garber, of the Bunker Hill staff, Kellogg; "Considerations in Relation to Flotation," by Thomas M. Owens, assistant manager of the Federal Mining & Smelting Co., Wallace; "Mechanical Shoveling in the Bunker Hill Mine," by William McDougall, superintendent; "Electrical Drying of Flotation Concentrates," by W. C. Clark, of the Bunker Hill staff, Kellogg; and "Treatment of Zinc-Lead-Silver Ores of the Coeur d'Alene District," by W. G. Woolf, of the Bunker Hill staff, Kellogg.

After the reading of these papers the following officers were elected for the ensuing year: President, Ivan De Lashmutt, of Spokane, manager of the Standard Silver-Lead Mining Co. at Silverton, B. C.; vice-president, Paul S. Couldrey, of Rossland, B. C., manager of Le Roi No. 2 mine; secretary, L. K. Armstrong, of Spokane. This closed the formal business of the meeting. The next day was devoted to visiting the Morning mine at Mullan, the Hecla and the Hercules mines at Burke, and the Tamarack on Nine Mile. The meeting was one of the best ever held by the Columbia Section.

WEEKLY RÉSUMÉ

The Cananea Consolidated Copper Co., of Cananea, Sonora, Mexico, the operating company for the Greene Cananea Copper Co., has announced its intention to shut down its mines, mill and smelter on Dec. 15 owing to present economic conditions. In order to aid producers in Mexico the Mexican government, it is stated, is about to issue a more favorable tariff on metal exports. According to word from Melbourne, the Electrolytic Zinc Co. of Australia is issuing 1,500,000 new £1 shares. In this country zinc producers continue their policy of curtailment owing to market conditions. As far as copper is concerned the list of smaller companies that are shutting down is steadily lengthening. A number of operators in the Kentucky fluorspar district have also been forced to suspend. Iron ore shipments by water from the Lake Superior district are practically completed; estimates of the 1920 output are now somewhat below those of a month ago. From Washington it is announced that the new experiment station of the U. S. Bureau of Mines at Reno, Nev., will open Jan. 20.

Cananea Con. Copper To Suspend on Dec. 15

Mines, Mill and Smelter To Shut Down —Action Forced by Present Economic Conditions

The mines, smelter and concentrator of the Cananea Consolidated Copper Co. at Cananea, Sonora, Mexico, will close down indefinitely on Dec. 15 because of present economic conditions, according to official statements. The company will continue to operate practically all the public utilities in Cananea and to furnish light and power for this purpose. The mines will be kept unwatered and some development work may be done. This company is the operating company for the Greene Cananea Copper Co. Increased costs of supplies and labor together with the present market situation as well as the increased cost of shipping bullion are responsible for the shutdown. Cananea is about forty miles from the border.

Lake Shipments Practically Completed for Season

Recent Estimates of Year's Tonnage Lower Than Those of Month Ago —1921 Ore Prices Awaited With Interest

The movement of iron ore from the Lake Superior district for 1920 has about come to a close and very little will be sent down the Lakes during December. It is figured that the total tonnage for the year will be in the neighborhood of 56,000,000, about 2,000,000 tons less than the estimates of a month ago. Cold weather and storms on the Lakes interfered with shipments during November and schedules could not be maintained. Considerable time was lost because of ore freezing in the cars and much time was consumed in thawing operations. Most vessel owners do not care to have their boats on the Lakes in December and the insurance on most of the boats expires on Nov. 30, so it is certain that there will be little transporting of iron ore by water during the remainder of the year. About the only ore that will not be stocked when raised to surface will be that which goes from the Mesabi Range to the plant of the Minnesota Steel Co. and that from the Michigan ranges which goes to charcoal iron furnaces in northern Michigan and northern Wisconsin. Most of the pit mines have already suspended operations for the year.

There is considerable uneasiness through the Lake Superior district regarding the iron ore business, but it is not expected that there will be any new developments until the 1921 prices are announced about the first of the year. When the reports were received that some of the copper companies had reduced wages, laid off many employees and put the surface men on part time, the miners on the iron ranges commenced to talk about the iron ore outlook. The only men laid off to date are those employed in the open pit mines, but they are always released at this season of the year. Wages are higher than ever before and up to a short time ago there was a scarcity of men for underground work. Of late, however, many have returned from the manufacturing centers, particularly Detroit and vicinity, and there is little employment to be had. Some of the operators do not look for a cut in the price of iron ore, putting forth the argument that they were hard hit this fall by the increases in rail and Lake freights.

It is believed by some, however, that if the demand for iron and steel products does not hold up it is likely that the iron ore business will have to suffer, in which event wages would have to be lowered and some mines forced to curtail or to close.

Surveys Started for Railroad to Flin Flon

Manitoba Government Probably Will Ask Syndicate First To Guarantee Erection of Smelter

Surveys have been started for a railway running from the Pas to the Flin Flon property in northern Manitoba, a distance of 85 miles. It is probable, however, that before the government will decide on the actual construction of the road guarantees for the building of a smelter will be demanded from the Flin Flon syndicate. The present option on the property expires next March, and while the syndicate would, no doubt, refuse to take over the property unless they were assured of a railroad, mutual guarantees would settle this difficulty.

Such a railroad, in addition to serving the Flin Flon property, would open up a territory of large mineral possibilities. There is still a considerable tonnage of ore in the Mandy mine which could be treated by a smelter on the ground. In addition to this there are a large number of gold properties within a few miles of the Flin Flon.

Lake Ore Boats Suffer Mishap

Two Lake ore carriers were badly damaged recently. The "J. H. Sheadle" of Cleveland-Cliffs Iron Co.'s fleet, a 500-ft. freighter, was driven on the rocks by wind and current while backing away from the Presque Isle ore dock and sank in 24 ft. of water. The other boat to suffer mishap was the "D. M. Clemson," a 600-ft. boat of the Pittsburgh line, which ran aground two miles off Jackson Park, Chicago, on the night of Nov. 24. This freighter was carrying 13,000 tons of iron ore from Duluth to Gary, Ind.

To Establish Sick Benefit Fund for Cobalt Employees

Arrangements are being made to establish a sick benefit fund for employees of mining companies at Cobalt, Ont., the administration of which will be in the hands of the committee representing the Central Council of Workmen and the Timiskaming Mine Managers' Association. The men are to contribute 75c. monthly, the companies paying an amount equal to that contributed by their employees. The benefits of $2.75 per day will be paid to claimants who are ill seven days or more over a period of thirteen weeks, and in case of more protracted illness the beneficiary will receive half the specified amount for the next thirteen weeks.

Chile Copper produced 9,420,000 lb. copper in October, against 9,496,000 in September.

Closing Month Finds Leadville Operations Dull

Abnormal Conditions Hit Camp Hard —Projects of Promise Fail To Materialize

The last month of 1920 finds the Leadville district operating on a scale lower than ever before in its history despite the outlook that seemed so bright early in the year and in the latter months of 1919. Early in January announcement was made that a million-dollar corporation, the C. & H. Mining Co., had been organized to develop the Graham Park section. It was expected that this company would prove a heavy producer but owing to the adverse conditions this has not been the case. Following the consolidation of the Leadville Zinc Co. and the Western Zinc Concentrating Co., the new corporation, the Western Zinc Oxide Co., announced the installation of furnaces of a new and improved type which would exactly double the production of the plant, but owing to the failure of eastern markets the new unit has stood idle for several months. The National Mining & Development Co., financed by Chicago men and holding control of large areas throughout the district, announced their arrival into the district and hinted at the erection of a $25,000 molybdenum mill, a railroad into the Iowa Gulch territory and other development projects. The extent of their operations, however, has included only the driving of the main bore of the Big Chicago tunnel in Iowa Gulch by a small force of men with no shipments resulting. With the coming of more prosperous times, they maintain, their prophecy of a mill and a railroad will become a reality.

It was also expected that the Climax Molybdenum Co., forced to close by post-war conditions, would resume normal operations but the failure of conditions to right themselves has kept the property idle. Numerous other properties prepared to resume work in the spring but only a few of these are still in operation at present. The most consistent shippers of the district have been the Yak, Down Town, Garbutt, Ibex, Dinero, Hilltop, Chrysolite, Fanny Rawlins, and Cramer & Co., while the Griffin and other properties in the Sugar Loaf section have succeeded in maintaining a fair tonnage during most of the past year.

On the Ibex a strike reported to be the richest made in the district for many years was announced in February by Austrian lessees working on No. 2 shaft. The ore is said to run as high as $10,000 per ton and shipments of the high-grade gold have continued steadily.

The Prospect Mountain project, a plan for boring into the unscratched areas of the Canterbury section, has been continually postponed owing to the inability to secure capital for financing the proposition. At present the Chamber of Commerce of Leadville is considering the matter of forming a home mining company with activities centered on this project.

Northport Smelting Co. Loses Lone Pine-Surprise Suit

Action Brought To Quiet Title to Last Chance Claim at Republic Dismissed at Spokane

The suit of the Northport Smelting & Refining Co., of Northport, Wash., against the Lone Pine-Surprise Consolidated Mining Co. has been dismissed by Judge Rudkin in the Federal Court at Spokane. It was brought to quiet title, for an injunction and for an accounting to obtain $100,000 for ore removed. The property involved was a segment of a vein or lode, bearing gold and silver, within the surface boundaries of the Last Chance claim at Republic, Wash., occupied by the defendant.

"The Northport company, as owner of the Lone Pine claim, claimed extralateral rights in ore beneath the Last Chance claim," it was explained by Fred S. Duggan, an attorney for the defendant, in the *Spokesman-Review* recently. "It was averred that the ore was in a vein having its apex in the Lone Pine.

"The decision of the court is that the Lone Pine claim has no extralateral right in the direction of the Last Chance claim for the reason that the discovery vein of the Lone Pine crosses both of its side lines. This was one of the main points in the controversy, and the decision sustains the Last Chance's contention on that point."

Hanna Furnace Co. Organized

The Pennsylvania Iron & Coal Co., Detroit Iron & Steel Co. and the United Iron & Steel Co., have been organized into one company under the name of the Hanna Furnace Co. The new organization also has lease interests in other furnace companies. Besides the holdings of the furnace companies, the Hanna Furnace Co. has acquired a 37-per cent interest in the Hanna Ore Mining Co. and a 100-per cent interest in the Hollister Mining Co. The latter company operates several iron mines on the Menominee Range in Michigan. The Hanna Ore Co. operates many large iron ore properties in Minnesota.

Recent Production Reports

Cie due Boleo, in Baja California, produced 617,120 lb. copper in October.

Calumet & Hecla produced 7,943,502 in October, as follows: Ahmeek, 1,759,100; Allouez, 0; C. & H., 4,596,959; Centennial, 0; Isle Royale, 831,700; La Salle, 14,413; Osceola, 627,264; Superior, 38,066; and White Pine, 76,000. September production was 7,288,214.

Butte & Superior produced 7,000,000 lb. zinc in concentrates, and 193,000 oz. of silver in October compared with 7,800,000 lb. and 140,000 oz., respectively, in August of this year.

New Cornelia's copper production was 3,450,000 lb. in October and 3,314,000 lb. in September, compared with 3,878,000 lb. in October a year ago.

Calumet & Arizona produced in October 2,484,000 lb. of copper, as against 3,038,000 lb. in September and 4,244,000 a year ago.

Investigation of Drill Steel Undertaken

Bureau of Mines Co-operating With New Jersey Zinc Co. in Studying Causes of Breakage

The Bureau of Mines is taking up actively an investigation of drill steel. Many users of drill steel feel that the improvements in that product have not kept pace with the improvements in drilling machines. The matter has been the subject of recent conferences between Dr. F. G. Cottrell, the director of the Bureau of Mines, D. A. Lyon, supervisor of experiment stations, and Bureau specialists with representatives of various types of mining enterprises. The testimony of users in the districts where the rock is hard is wholly to the effect that the failure of steel has become a very serious problem, due to the loss of time on the part of high-priced labor.

B. F. Tillson, of the New Jersey Zinc Co., has made a special study of the causes of breakage in drill steel and will co-operate with the Bureau of Mines in the study of the problem. Mr. Tillson's investigations lead him to believe that the blows of the drill hammer set up vibrations comparable to sound waves and that nodes are caused by the concentration of these waves at certain points in the drill. This leads to prompt fracture. When a flaw or sand hole comes within the area of concentrated wave effect, the failure of the drill takes place almost immediately.

The Bureau's specialists, who are to be assigned to this problem, will be sent to the manufacturing plants to discuss the matter with officials there. A collection is to be made of broken steel so that the breaks may be studied.

Over Half of Railroad Tonnage Product of Mines

Fifty-six per cent of the tonnage handled on the larger railroads of the country during the quarter ended June 30 consisted of products of mines. Class 1 railroads are those having annual operating revenue in excess of $1,000,000. They carry more than 90 per cent of all freight transported. Figures just compiled by the Interstate Commerce Commission show the following tonnages for products of mines:

	Tons
Anthracite coal	19,300,597
Bituminous coal	83,152,797
Coke	6,032,255
Iron ore	24,183,287
Other ores and concentrates	6,355,047
Base bullion and matte	144,060
Clay, gravel, sand and stone	25,867,455
Crude petroleum	1,600,870
Asphaltum	335,672
Salt	832,403
Other products mined	1,722,822
Total	169,627,265

War Mineral Awards

Awards totaling $18,032.45 were recommended during the week ended Nov. 20 by the War Minerals Relief Commission. The details of the recommendations are as follows:

Walter M. Long, tungsten, $1,687.93, 62 per cent; estate of H. and William Rich, pyrites, $3,461.27, 40 per cent; A. H. Layton, chrome, $886.58, 50 per cent; Akin & Stilwell, chrome, $474.50, 65 per cent; J. G. Murphy, manganese, $5,896, 39 per cent; Tungsten Development Co., tungsten, $4,766.42, 76 per cent; Leadville District Mining & Milling Co., manganese, $456.75, 12 per cent; T. H. Williams, tungsten, $424, 60 per cent.

The award in the claim of the estate of H. and William Rich was recommended by Senator Shafroth only. Commissioners Moore and Pomeroy recommended the disallowance of the claim because the losses could not be traced to Government stimulation.

In addition to the above awards the payment of $746 on the chrome claim of Noel and Johnson which had been disallowed was recommended.

At the close of business on Nov. 13, $2,640,802.15 had been expended or recommended for award by the War Minerals Relief Commission. This leaves $5,859,197.87 of the original appropriation unexpended. The administrative expenses of the Commission to that date totaled $322,646.82. Claims were filed under the War Minerals Relief Act for a total of $16,655,481.94. This was the aggregate of 1,203 claims. Action has been taken on 1,104 of these claims but awards were recommended on only 267. The amount involved in the 99 claims still under consideration is $1,172,302.13.

During the week ended Nov. 13, awards totaling $104,499.31 were recommended. They were as follows (the name of the claimant, the mineral, the amount recommended, and its percentage relationship to the amount claimed are shown): W. H. Shewan, tungsten, $13,759.38, 35 per cent; F. M. Doak, manganese, $14,023.56, 71 per cent; Crimora Manganese Corporation, manganese, $76,616.37, 16 per cent; Charles E. Wilcox, chrome, $100, 14 per cent.

Additional amounts were recommended in the following claims which had been acted upon previously: George and William Pedro, $1,253.35; Lehigh Valley Manganese Co., $2,369.22.

Reno Station To Open Jan. 20

The experiment station of the U. S. Bureau of Mines at Reno, Nev., will be opened formally on Jan. 20. The opening is to be the occasion for fitting ceremonies.

Problems of Zinc Industry Receiving Attention

Improved Methods of Treatment Sought With View to Lowering Cost of Production

A series of conferences has been held by Bureau of Mines officials in several centers of the zinc mining industry in the Middle West. The idea has been to learn more about the problems which are facing this industry. It develops that there is a widely held opinion that the most helpful thing that can be done at this time would be the development of cheaper reagents for use in flotation. Recent experiments have shown that the cost of ammonia and sodium sulphite equals the value of the recovery. In the Illinois-Wisconsin district the concentrate averages 33 per cent zinc. With a smelting cost around $30 the chances of profitable operation are small at present prices.

Some operators in the Illinois-Wisconsin district believe magnetic separation could be utilized to greater advantage and would like to see the Bureau of Mines undertake experiments to that end. The opinion was expressed at one of the conferences that magnetic separation could be made after a dead roast, utilizing the sulphur for sulphuric acid. A middling product, running as high as 14 per cent zinc, could be expected, which might be used for oxide making. On a basis of $6 to $7 per ton for oxidizing the middling product this method figures $3.75 better than the margin on 33 per cent zinc concentrate.

Experiments in the production of electrolytic zinc and in making standard brasses are also being urged. It has been suggested that under the new Water Power Act hydro-electric power could be developed which could be utilized to advantage in the making of electrolytic zinc. Sentiment was in favor of the electro-thermic process.

The electro-thermic smelting of zinc ore could not be undertaken, it was admitted, with power costing two cents per kilowatt. It is believed, however, that hydro-electric power can be produced for one-half cent per kilowatt. It is thought that this would enable the saving of at least $3 a ton over the retort process.

In the Kansas, Missouri and Oklahoma districts means must be found, it was declared, for the recovery of ore left as pillars. As much as 20 per cent of the original ore in the mine is contained in these pillars. It is believed that other support can be provided and these pillars removed with a profit. All concerned in that district, however, are anxious that concentrated attention be given to underground haulage.

NEWS BY MINING DISTRICTS

SPECIAL LONDON LETTER

Surprising Assays Reported at Globe & Phoenix—Russo-Asiatic Shareholders in Luck—Broken Hill Strike Over

BY W. A. DOMAN

London, Nov. 16.—Work having been resumed at the coal mines a slight feeling of something akin to confidence is manifest in the financial and industrial spheres. This is noticeable in the appeals made to the public for millions sterling for new working capital. Matters, however, are not proceeding so smoothly as could be wished owing to the Russian military situation and the further depreciation in the French franc. Both of these disturbances have a reflex action on mining business as shares are continually coming on offer, with results disastrous to prices. Especially is this the case with those descriptions that enjoy—"enjoy" is scarcely the correct word, perhaps, at the moment—an international market. The incipient upward movement in South African gold mining shares has received a check, though the gold produced in the Transvaal last month was estimated as sold at £5 17s. 6d. per fine oz. This compares with £5 15s. for September, and £5 12s. 6d. for August. The total output of 662,472 oz. is poor, and is the lowest since February last, when 625,380 oz. was obtained. Working expenses have risen, and it is quite clear that apart from the gold premium many mines would be compelled to shut down as profits would vanish. Profits are not declared in any standard form, and it is consequently not easy to contrast results obtained by one company with those by another. Native labor seems to be a perennial trouble. A fresh outbreak of influenza is reported, while it is suggested that the Kaffirs are less inclined than formerly to follow any underground occupation.

Whether Fortune's wheel is making a favorable turn for the Globe & Phoenix mine in Rhodesia is still not quite clear, but some rather high assays over fair stretches of ground, at depth, are reported. Few people are able to comprehend the position seeing that a mining engineer of repute a few months ago had virtually written "Finis" to the prospects of discovering further profitable ore in the mine. The 5s. shares are now quoted at 20s. 6d.

Shareholders in the old Russo-Asiatic Corporation have had a bonne bouche. When the company went into liquidation and the Russo-Asiatic Consolidated was formed the Inland Revenue authorities demanded £147,458 as excess profits duty. This matter has been fought in a very strenuous manner, and after months of argument the company has won its case. The distribution of assets can consequently now proceed, and for every Russo-Asiatic Corporation share previously held 5½ Russo-Asiatic Consolidated shares will be given.

News has come to hand from Melbourne that the strike of miners on the Barrier Range has terminated, after being in existence since May, 1919. The cost to the Broken Hill mines and the miners is estimated at approximately £12,000,000. Work is being resumed, but owing to the fall in the price of the metals there can hardly be a return to the former scale of profits. Just at the moment the Colony cannot buy shares on the London market as the balance of trade is against Australia and the government has prohibited the export of gold. This, by the way, does not apply to the production of the gold mines, but to the stock of metal held by the banks.

Holders of diamond shares were rather perturbed a few weeks ago by reports that German scientists had discovered a method of fabricating diamonds. The Hamburg firm of Nobels has tested the invention and rejected it, which is the result generally expected.

AUSTRALIA

Electrolytic Zinc Co. Issues 1,500,000 Shares Carrying 8 Per Cent

Melbourne, Oct. 25—The Electrolytic Zinc Co. of Australia, Ltd., is issuing 1,500,000 £1 cumulative participating preference shares carrying 8 per cent. Of this number 900,000 will be available to share-holders of the companies constituting the original "proprietary" company, 150,000 to the shareholders of the Mount Read & Rosebery Mines Ltd., and the Mount Lyell Mining & Ry. Co. Ltd., and 50,000 to the staffs of the various companies. The remaining 400,000 preference shares are held in reserve. The authorized capital of the new company will be £3,000,000 comprising 1,500,000 preference and 1,500,000 ordinary shares. Of the ordinary shares 1,100,000 have been issued to the following companies as payment for the investment: Amalgamated Zinc (De Bavay's) Ltd., 300,000; North Broken Hill Ltd., 150,000; Broken Hill South Ltd., 150,000; Zinc Corporation Ltd., 150,000; and Mount Read & Rosebery Mines Ltd., 350,000. The shares issued to Mount Read & Rosebery Mines Ltd. are in consideration of the company's leases and assets, and they are "deferred" as to any dividend payable before July 31, 1925, but thereafter will rank with the other ordinary shares.

The present issue is being made to provide funds for the completion of the company's works at Risdon, Tasmania. The enlarged plant is estimated to produce 100 tons electrolytic zinc per day together with substantial tonnages of various by-products. It is anticipated that the first half of the plant will be ready before the end of 1921 and the whole of the plant twelve months later. The following from the report of the general manager, H. W. Gepp, is of general interest:

"The site of the works at Risdon (near Hobart) is from every point of view ideal, and being situated on one of the finest deep sea water ports in Australia insures to the company ability to draw raw material for this and other industries from any part of Australia, or, indeed, from any part of the world. The company's wharf now in course of erection, and which will be 60 ft. wide and 1,000 ft. long, will be available for use within six months from date. There is 30 ft. of water at low tide at this wharf, and no dredging of any kind is required in the channel between the works and the Southern Ocean—thirty miles to the southward.

"Good progress is being made with the construction of the first half of the 100 tons a day plant. A large portion of the new cell room is practically completed, and work has been started on the erection of a new leaching building and other necessary divisions of buildings and plant. The unit will, it is anticipated, be in operation before the end of 1921, by which time a minimum of 15,000 horsepower will, under the contract with the Tasmanian Government, be made available. By the end of 1922 the whole of the plant is expected to be in operation, utilizing 30,000 horsepower and producing 100 tons of zinc daily with corresponding quantities of the various by-products and also considerable amounts of rolled zinc, zinc dust, etc.

"In England today the cost of labor is more than 100 per cent higher than pre-war, and the increase in the price of coal is considerably more than 100 per cent. Producing and operating costs the world over have increased enormously. As these factors must be reflected for many years to come in the selling price of zinc, it is my opinion that £30 per ton London is a conservative and safe price upon which to base estimates of profits.

"Accepting this price £30 with corresponding prices for other zinc products and by-products, and basing the price of raw material on the cost of zinc concentrates obtained from the Broken Hill companies, I estimate that the net profits of the company, after making all necessary provisions for depreciation and amortization, will be £413,000 per annum."

CANADA

Ontario

Power Situation Little Changed—Small Surplus of Labor Reported

Cobalt—The power situation in Northern Ontario still remains about the same. During the last few weeks there has only been a small amount of moisture, and although this has proved a great benefit to the power company, there has not been sufficient yet to jus-

tify the hope that the mines will be able to operate during the winter. Fortunately, however, the weather still remains mild. Kirkland Lake camp is supplied from the Cobalt power companies. Porcupine is in a little better position than Cobalt, but the condition there is also serious. This shortage of power, together with a considerable influx of labor has provided sufficient men and gives a small surplus of labor for the first time in four years.

Cobalt—Ore shipments in October from Cobalt mines over the T. & N. O. Ry. totaled 1,739 tons of 2,000 lb. Shippers were as follows: Coniagas, 96; Dominion Reduction, 77; Hudson Bay, 32; Kerr Lake, 31; La Rose, 44; Mining Corporation, 520; McKinley-Darragh, 184; Nipissing, 555; O'Brien, 32; H. F. Strong, 30; and Temiskaming, 140. These shipments went to the following plants: Deloro S. & R., 1,391; Coniagas Reduction, 161; Ontario S. & R., 30; Pueblo plant A. S. & R., 65; and Perth Amboy plant A. S. & R., 93.

Porcupine — The McIntyre Consolidated has done considerable drifting on the new vein discovered on the 1,375-ft. level. The silver content is irregular, one section of the vein 60 ft. in length showing high values, while it is lean in other places. The 1,500 level is being opened up and operations have so far confirmed the reports of diamond drill results.

It is proposed to sell 100,000 treasury shares of the Schumacher to finance the resumption of operation in the spring.

Kirkland Lake—The Lake Shore during October treated 1,570 tons of ore with a recovery of $47,077, an average of $29.98 per ton, the highest in the history of the mine. The mill ran 89.11 per cent of possible running time, some loss of time being due to power interruptions.

Copper Cliff — The International Nickel Co. of Canada, Ltd., is building a 60-ton experimental mill here for concentrating low-grade copper-nickel sulphide ore. It is expected to be in operation next spring. H. E. T. Haultain, professor of mining engineering at the University of Toronto, has been engaged in the capacity of consulting engineer.

British Columbia

Trail—Ore shipments from the Consolidated smelter during the week ended Nov. 21 totaled 10,664 tons coming from shippers given in the following table:

Mine	Location	Gross Tons
Bluebell.....	Riondel	179
Bunyan.....	Lake Windermere	30
Canada Copper	Allenby	107
Emerald.....	Salmo	33
Helldriver	Lake Windermere	36
Horn Silver ...	Similkameen	39
Josie.....	Rossland	164
Knob Hill	Republic	54
North Star....	Kimberley	150
Providence....	Greenwood	40
Ptarmigan....	Lake Windermere	4
Rambler.....	Caribou	42
Velvet.....	Velvet	23
White Water..	Retallack	30
Company mines		9,733

MEXICO

New Tariff on Metal Exports To Aid Producers

City of Mexico—The Secretary of the Treasury announces that a new tariff on metal exports will be promulgated the coming week in order to assist the mining industry in general, but more particularly silver bearing properties. The government's decision to make haste, was brought about by the shut down of the Velardeña Mining Co., of Durango. This was preceded by the shutting down of the mines at Matehuala, some in the El Oro district and a number of less important companies. In speaking of the new tariff the secretary said:

"It is difficult to arrive at a just tax on ores at this time, and no general law can be applied. All of the mining properties are not in the same category. Some of them are working exclusively on low-grade ores, some on low and high-grade and others are confining themselves to high-grade shipping ores. My department has been making a careful study of individual cases with the idea in view of meeting the urgent demands of the miners and at the same time conserving the interests of the government. Owing to the urgency of the situation a new tariff will be presented within the next few days."

In addition to the continued depression of silver, the conditions as to copper and zinc have been slumping at an alarming rate and threaten to effect the operation of many of the important concerns, especially in the northern part of Mexico.

The market situation, taken with the coal shortage, due to the continued strikes in the northern coal fields of Mexico, has cast a gloom over mining interests. During the second week in November seventy-nine important mines were obliged to close for lack of fuel and if the strike is not settled by the end of the month it is more than probable that there will be a practical complete tie-up of the northern mines.

At the end of October taxes were being paid on 28,618 distinct properties covering a surface of about 900,000 acres. Many properties have been abandoned in the past sixty days because of refusal on the part of owners to stand for back taxes accumulated during the riotous days of the revolutionary period.

Durango

Officers of Monterrey Steel Co. Inspect Iron Mountain Property at Durango

Durango — Adolfo Prieto, president and one of the controlling stockholders of the Cía. Fundidora de Fierro y Acero de Monterrey, México, William G. Moler, representative of the same company in the United States, and Miller, their counsel, arrived in Durango recently on a special train. Upon the report of their chief engineer here, Manuel Rangel, they proceeded to make an examination of the property owned by the Callahan Estate on the Iron Mountain (Cerro Mercado), north of the city of Durango. A deal was closed whereby the Callahan Estate, represented by its executors, J. B. Rowns, James Callahan and Gowen, transfers to the Cía. Fundidora de Fierro y Acero de Monterrey all of its holdings in the Iron Mountain, consisting of mineral rights on approximately 300 acres of ground, and about 150 acres of land adjoining the mountain suitable for the erection of buildings and improvements. The Cía. Fundidora had formerly acquired about eighteen pertenencias on the mountain, known as "Bracho & Creel" group.

Mr. Prieto, who has been in the directorship of his company since 1908, with a whip-hand in the management of the same, has outlined his program as follows: First of all they will have to study the mountain thoroughly by making a complete sampling thereof, using drills for the purpose of ascertaining the mean percentage of phosphorus in the ores; should this grade be less than 1½ per cent the Bessemer process could not be employed and they will have to find out the best kind of treatment. The grade of iron (60 per cent as a minimum) has been found satisfactory; the problem of treatment involved is due to the silica and phosphorus content. The company has a staff of engineers in Austria, Germany and France studying the treatment process fit for ores too low grade in phosphorus.

The present system of working the deposit will be greatly improved, and as soon as the treatment problem is solved they will study the most convenient place for the erection of a smelter. This Cía. Fundidora has also acquired some big iron deposits located in Hercules, near Laguma de Jaco, in the Sierra de las Cruces, about 120 kilometers north of Sierra Mojada mining camp, State of Coahuila. As soon as the National Railroads finish the Cuatro Ciénegas line to Sierra Mojada, the Cía. Fundidora will build a branch to the Hercules iron mines. Mr. Prieto will proceed to Mexico City to close the Hercules deal.

Sinaloa

Fuerte M. & S. Co. Preparing to Blow In Smelter

Culiacan—In the Fuerte district of Sinaloa the Fuerte Mining & Smelting Co. is preparing to blow in its smelter and will be making a high-grade copper matte about Jan. 1. The Fuerte company is the company operating the mines of the Choix Consolidated Mining Co. A. M. McDermott is general manager.

The Potrero Mining Co. has its new power plant installed and is progressing with its new shaft. This is in the Mocorito district.

The Palmarito Leasing Co., also in the Mocorito district, is crushing about 80 tons daily in its 20-stamp mill and in spite of the low silver price is making both ends meet.

SURFACE WORKINGS AND HEADFRAME, OLD EUREKA MINING CO., SUTTER CREEK, CAL.

CALIFORNIA

Harvard Mine at Sonora Sold—Carson Hill's New Stamp Unit Ready—Suit Against Mammoth Copper Transferred to Federal Court

Sonora—The old Harvard mine has been sold to John Ferguson, of Berkeley. Until a few years ago this mine was in steady operation. However, labor conditions grew so bad that the mine was forced to shut down, and after having remained idle for three years the mill was dismantled and moved to the Angels Deep mine at Angels Camp. At a meeting of the stockholders in Boston it was voted to sell the Harvard holdings for $5,000. The vote represented 18,871 shares of the company stock and a majority of the total shares.

The transfer includes besides the Harvard mine property several adjoining claims and mine rights, among which are the Jamestown claim on Whiskey Hill, the Consolidated Gold & Silver Mining Co.'s claim, the Preston & Garrison claim, Capp's & Mussel claim, including a 10-stamp mill, the McCann quartz mine, the Vulture, Donovan & Clark quartz mine, the McKinley quartz mine, the Erin-Go-Bragh quartz, the Cloudman quartz claim, and the Sabrante quartz mine and all machinery and equipment of all the claims controlled by the Harvard company. Ferguson will not work the property. It is reported that he has closed the deal for other interests who will reopen the famous old producer.

Angels Camp—The construction of a new 10-stamp unit at the big mill of the Carson Hill Gold Mining Co. has been practically completed and the battery will go into commission in about two weeks. The addition will increase the capacity of the mill to approximately 15,000 tons per month, according to advices from the property. During October 10,500 tons of ore was treated at the mill.

In the issue of November 20 the Rainer Mining Co. is erroneously referred to as owning the property now being unwatered on Bald Hill near Angels Camp. This mine belongs to the Victor Land & Mineral Co. with offices at 512 Commercial Bldg., St. Louis, Mo.

Placerville—The Wiedebusch gold mine, near Georgetown, has been purchased by Edward Spencer, of Vallejo, who with associates has been operating the property under lease. A 5-stamp mill was installed. The ore is of fair grade with the vein showing indications of persisting to good depth. The new owners are planning further development.

Sutter Creek—At Central Eureka mining operations are rapidly approaching normal, now that the power regulation is withdrawn, and labor conditions have improved.

Kennett—The suit filed against the Mammoth Copper Co. by the Shasta Copper Exploration Co. has been transferred to the Federal Court by order of the Superior Court of Shasta County. Both companies claim ownership of valuable copper claims in the Kennett field.

Randolph Flat—The South Star mine, which was recently re-opened by A. W. Johnson, is giving encouraging signs and the shaft is down only seventy-five feet. There are three men employed and Mr. Johnson believes that more will soon be employed.

NEVADA

Conditions Improving in Tonopah District—Arrowhead Company Gets New Equipment

Tonopah—Reported bullion shipments from mills of the Tonopah district, representing operations for the first half of November, indicate a gross production of the district for the month of about $550,000 in gold and silver. The latest shipments are: Tonopah Belmont $91,960; West End $57,585; and Tonopah Extension $48,500. Shipments from the Tonopah Mining and MacNamara have not been reported as yet.

Conditions in the district are good. Labor is not as scarce as in previous months and as a whole is more reasonable. Living conditions are good, due principally to the existence of "The Miners Mercantile Co.," a corporation organized and financed by companies of the Tonopah and Divide districts to reduce living costs, which sells practically all necessaries at cost. The method of operation, including all books of account, is open for inspection to a committee of the mine workers, and the few complaints made are seriously considered by the management.

The larger mines, including the Tonopah Belmont, West End, Tonopah Extension and Tonopah Mining, report normal and satisfactory development and ore production, with no new discoveries of importance.

In the Rescue Eula, in the southeast portion of the Tonopah district, a very promising ore shoot has been cut on the 1,100 level. This is thought to be a downward continuation of the vein as developed on the upper levels. Drifting is being done to the east and west, the west face being low while in the east face there is exposed 5 ft. of ore averaging $50 per ton.

Divide—As the management of the Tonopah Divide had predicted, no ore values were encountered when crosscutting the vein on the 800 and 1,000 levels. Drifting on the hanging wall, to the southeast, has been started on both these levels with the expectation of driving several hundred feet before

MINE OFFICE, ADIT AND COMPRESSOR HOUSE AT MORGAN MINE, CARSON HILL GOLD MINES, INC., CARSON HILL, CAL.

reaching the ore shoot as projected from the levels above. The only other development performed during the last week was on the 165 level, drift 101 being driven ahead 30 ft. and raise 107 32 ft. with no change of importance.

At the Kernick Divide, where work is being done from the 900 level (which corresponds approximately to the 1,300 level of the Tonopah Divide mine), no special changes in conditions or formation are reported. The crosscut being driven toward the Hasbrouck is out 60 ft. from the shaft and the crosscut is out 55 ft.

Arrowhead—Regular development is being accomplished in several properties in this district. New surface machinery for the main Arrowhead company has arrived in Tonopah and is being transferred to the mine by motor truck. The new equipment includes a hoist, a 40-ft. steel headframe, and a blower. In this property shaft sinking and drifting to the west are being done, and conditions are reported favorable.

Candelaria—Underground work has been suspended for the winter, excepting for sampling and mapping of the Lucky Hill workings. More than 8,000 samples have been taken in the Mt. Diablo, Argentum and Holmes mines, proving several hundred thousand tons of mill ore. Designs are being prepared for a large mill, according to C. D. Kaeding, manager.

Virginia City—The North End mines, namely, the Con. Virginia, Ophir, Mexican, Union and Sierra Nevada, will reduce wages from $6 to $5 on Jan. 1. The South End mines have paid only $5 and all report an abundant supply of good labor. The Con. Virginia is producing rich ore from the recently discovered orebody below the 2,150-ft. level. A drift north from the sub-level at 2,200 ft. has advanced 140 ft., in rich ore and in a distance of 24 ft. it produced 67 tons, assaying $553 per ton. The Mexican mill, operated by the North-end group, is treating 100 tons daily, assaying from $15 to $50 per ton. Storage bins contain 1,000 tons of high-grade ore, which is mixed in milling with ore from stopes on the 2,050, 1,950 and 1,650-ft. levels. At the south end of the lode the United Comstock, embracing a dozen of the old bonanzas, has advanced its haulage tunnel over 100 ft. underground, besides building 100 ft. of snow shed over the open grading. The large compressor house and shops are completed and 8 faces from old shafts are being driven to the survey line of the tunnel, in the foot wall of the lode. The tunnel will be 10,000 ft. long and 8 by 8 ft. in the clear. A spur line has been extended to the millsite, and work will begin at once on the 2,000-ton cyanide mill. This enterprise is controlled by Bulkeley Wells, representing Harry Payne Whitney and associates. Roy A. Hardy is engineer in charge.

Jarbidge—Options on three groups of claims in the district have been secured by the Tonopah Mining Co. but it is unlikely that any new work will be started before spring.

Pioche—Ore shipments from the Pioche district for the week ended Nov. 18 were as follows: Prince Con, 1,355 tons; Virginia Louise, 660; Combined Metals, 240; Bristol Silver Mines, 150; Black Metals, 105, and Bristol Walker Lease, 45; total 2,555.

Notification of the much discussed change in freight rates on Pioche ores has been received by the larger shippers The new schedule is based upon the smelter returns to the mine or owner before deducting transportation charges, which amount is divided by the gross weight of the ore as found at destination. The new rates are as follows:

Ore Not Exceeding in Value	Old Rate	New Rate
$6 50	$2.75	$2 20
7 50	2.75	2.75
8 50	3.50	2.80

For ore exceeding $8.50 in value the new rate is the same as the old. Three per cent war tax must be added to the total freight.

This new tariff will shortly be published, as request for short notice publication has already been made to the Interstate Commerce Commission. Immediately on completion of publication the new rates will become effective.

ARIZONA

Producers in Johnson District Forced To Close—Gila Copper Sulphide Suspends

Johnson—The Arizona United and all other producing properties of this district have been forced to close down, being unable to produce copper at the present price. The Johnson Development Copper Co. continue development work on the eighth level. Lessees on the Arizona-Texas have repaired the compressor and are drifting to cut the orebody on the third level.

Dragoon—The Cochise Marble & Granite Co. has been incorporated to take over the sixty claims owned by L. R. Ligier, on which marble of all colors can be found in large quantities. This property has been tied up by litigation for several years.

Bisbee—Shattuck-Arizona is reported to have laid off 100 men on Nov. 23. It is also said that mining operations will be suspended Jan. 1.

Phoenix—The Arizona Corporation Commission has granted the application of the Ray Electric & Telephone Co. to establish a rate of 2.75c. per kw.-hr. for industrial uses. The case came up on complaint from the Gila Copper Sulphide Co., which previously had been receiving power at 2c. from the American Smelting & Refining Co.'s Hayden smelter.

Arizona shippers are opposing an application made by the railroads to the State Corporation Commission for new demurrage charges of $3 a day after 48 hours, $6 a day for the next three days and $10 a day thereafter. These rates are more than double those now in force.

Christmas—All mining operations have been suspended here by the Gila Copper Sulphide Co., which has been furnishing about 250 tons daily of concentrating ore to the Hyden smelter for several years. With the present price of copper and slack demand, no profit could be had through operation.

Duncan—Creditors representing an indebtedness of $35,000 have petitioned the Grant County, N. M., court for a receivership for the Duncan Mining & Milling Co., which has been working the Mount Royal property in the Steeple Rock district. Bonds to the amount of $100,000 on the property were issued to bankers in east Texas. The representative of these parties has been operating the property recently. It is claimed that the bondholders intend to foreclose and thus block payment for supplies sold the company. This is a gold property, the ores being treated satisfactorily by the cyanide process. The mill, however, was operated but a short time.

COLORADO

Indiana-Colorado To Erect Mill at Lake City

Idaho Springs—The Denver tunnel is being cleaned out and retimbered, preparatory to resumption of development work. The tunnel has been advanced 1,800 ft., and will be continued as soon as new equipment is installed.

Cripple Creek—The Rittenhouse, International, and Lexington properties on Gold Hill, have been acquired by the Moonlight Gold Mining Co., recently organized by Hildreth Frost, C. W. Hays, and J. S. Anderson. The Rittenhouse shaft has been sunk to a depth of 700 ft. Electric hoisting equipment will be installed.

Ouray—The Loyal Mining & Milling Co. will resume operations at the Mickey Breen property. Development work is in progress under the supervision of E. G. Holden. A new power line will be built to the property either this winter or early in the spring. The company is planning the installation of a new mill. Thomas P. Mitchell is manager.

Lake City—The Indiana-Colorado Mining & Milling Co. is developing and operating the Golconda property, and has opened some high-grade ore. The company will erect a 200-ton mill, the machinery for which has been delivered on the ground.

Cripple Creek—The Modoc Con. Mining Co. is installing a new electric hoist, capable of hoisting from a depth of 2,000 ft. The new equipment will be ready for operation on Dec. 1. The cost of the hoist was $35,000.

Leadville—Joseph T. Terry, holder of patents on a selective flotation process for treating low-grade complex ores, is preparing to install his process at the old Leadville District mill here. Satisfactory tests have been made on such ores, it is said.

MONTANA

North Butte Curtails Further—A. S. & R. To Cut Wages at East Helena

Butte—North Butte, which has been operating on a 70 per cent basis, has made a further cut in production and will hold its output within a half million pounds of copper monthly.

John Gillie, manager of Anaconda's mines, has announced that no further reduction in output is to be made for the present.

The quarterly report of Barnes-King for the period ending with September shows a net loss of $17,795.54. The directors passed the third quarter dividend.

The American Smelting & Refining Co., which recently cut wages 50c. a day at its Tacoma, Wash., plant, will shortly reduce wages at its East Helena plant.

ALABAMA

Second Manganese Ore Shipment Due at Mobile from Brazil

Birmingham—Sixty-two hundred tons of manganese ore from Brazil was due at Mobile Nov. 29, on the S. S. Bantu, and will be loaded on barges en route to the Birmingham district via the Warrior River. The ore is being brought up by the Tennessee Coal, Iron & R.R. Co., a subsidiary of the Steel Corporation, and is the second shipment of manganese ore received from Brazil in the last three months. The other shipment was handled from Mobile half by river and the other half by rail, but the shipment just arriving is to be brought up the river on barges operated by the government.

Independent ore producers of the Birmingham district are feeling the big slump in the pig iron market, the closing down of furnaces cutting off many contracts. Even those mining companies which a few weeks ago were happy over the fact that contracts had been made for stipulated tonnages instead of selling on tonnages alone and for immediate delivery are now feeling the effects of the general depression.

Y. A. Dyer is interested in a small brown ore property at Cave Springs, Ga. The product is being hauled in auto trucks to one of the charcoal furnaces of the Birmingham district.

MINNESOTA

Mesabi Range

Six State Leased Mines Suspend Shipping—Morrow Mine Reopened

Chisholm—The Morrow mine has been reopened by the Kingston Mining Co. This property was opened by the Sellwood interests in 1902 and over 100,000 tons of ore has been shipped. A new shaft has been sunk and all ore from drifting is being stockpiled.

The M. A. Hanna Ore Co. plans to deepen the Alexandria shaft and to cut a new station 76 ft. below the present station. There will be 2,690 ft. of drifting in rock at this level which has been selected as being below the ore. This will allow the mining of all ore on the Alexandria's forties and the south Snyder forty.

Buhl—The No. 300 electrically operated shovel at the Wabigon pit of the M. A. Hanna Ore Co., which is being operated with a drag line, removed 40,000 cu.yd. of stripping in its first month's work. It is equipped with a 5-yd. bucket and it is anticipated that under ordinary circumstances it will remove 60,000 cu.yd. per month working two ten hour shifts per day.

Nashwauk—The central repair shop of the Cleveland-Cliffs Iron Co.'s properties is practically complete. The structure is of brick with rolling steel doors and steel frame windows and has a floor space of 11,613 sq.ft., which is divided between three shops, a machine, forge and blacksmith and a carpenter shop. All heavy or special work will be done at this new plant.

Hibbing—The state mine inspector's report for the week ended Nov. 20 shows that six state leased mines have suspended ore shipping.

Small shipments comparatively are recorded as only a total of 64,359 tons was shipped. The Missabe Mountain pit, usually the largest state shipper, reported only 19,200 tons shipped during the week.

MICHIGAN

Gogebic Range

Steel Corporation Mines Stop Shipping for Season

Ironwood—The mines of the U. S. Steel Corporation on the Gogebic Range have definitely stopped shipping for the season. The total tonnage shipped during the season was about 2,036,000 an increase of about 22 per cent over the previous season, when the company's shipments totaled about 1,663,000 tons.

The Steel & Tube Co. of America are still shipping, several cargoes being loaded the week of Nov. 27. They have, however, begun to reduce their working forces. A few hundred men have been laid off at their Anvil-Palms and Newport mines. A number of shop men and timekeepers have also been laid off.

The Wakefield Iron Co. has completed its shipping program for the year at the Wico pit, having forwarded about 980,000 tons, a big increase over last year's shipments. Most of the other mines on the range have stopped shipping, and some have reduced forces.

With the close of the shipping season No. 10 shaft of the Tilden mine was temporarily shut down on Nov. 22. The old wooden shafthouse is being torn down and the steel frame taken from "A" shaft of the Aurora mine is being erected. This practically stops production.

Marquette Range

May Reopen Breitung-Hematite Property at Negaunee

Ishpeming—The Truscon Steel Co., of Youngstown, Ohio, has completed a new warehouse here for the Cleveland-Cliffs Iron Co. The building is 60 ft. by 200 ft. in size and will be used for storing heavy mining supplies. Part of the old warehouse has been turned over to the electrical department.

Negaunee—The Marquette Ore Co. has suspended mining at the Mary Charlotte mine for a week while repairs are being made to the shaft. It is reported that the same company is shortly to reopen the Breitung-Hematite property.

Menominee Range

Cardiff Surface Plant To Be Completed This Month

Iron River—It is expected that the surface improvements at the Cardiff mine will be completed in December. These include a new steel headframe, change house, engine house, boiler house and a few smaller buildings. The shaft, which is bottomed at 560 ft., has been concreted. The timbered shaft was found inadequate because of water, but the pumps have handled very little since concreting was completed. The mine is owned by the Wickwire Mining Co., which also has the Homer, adjacent. The surface equipment at the two properties is much alike. A concrete tunnel connects the engine house, change house and the shaft, and all steam and air lines and electric wiring go through the tunnel. Power is secured from the Peninsular Power Co. The engine house contains a 1,300-ft. I.-R. and two Nordberg electric hoists.

KENTUCKY

Many Fluorspar Mines Shut Down Owing to Lessened Demand

Marion—Owing to slackened demand, many of the Kentucky fluorspar mines have suspended operations during the last month. The only large producers now running are the Franklin mine of the Fairview Fluorspar & Lead Corporation, the Mary Belle mine of the Kentucky Fluorspar Co., the Tabb mine of the West Kentucky Ore. Co., the Lucile mine of the Guggenheim Mining Co., the Haffaw mine of the Aluminum Ore Co., and the Blue & Marble mine of the Keystone Fluorspar Co. There has been no tendency toward lowering of prices, operators simply shutting down to await more settled conditions.

The Aluminum Ore Co. have lately made considerable improvement at their Haffaw mine near Mexico, the latest being the addition of a large generator.

An experiment, the outcome of which has been awaited in this district with considerable interest, has just been brought to an apparently successful conclusion at the Big Four mine of Avery H. Reed. In order to handle the drainage of his mine more economically than by means of pumps, Mr. Reed has installed a four-inch air lift; the surplus air from his compressor now handles all of the water which formerly kept two 2 in. pumps busy, without in any way affecting the operation of drills, and with almost no expense. The successful result of this innovation will probably lead to the adoption of the same methods by other mines of the district.

THE MARKET REPORT

Daily Prices of Metals

Nov.	Copper, N. Y. net refinery* Electrolytic	Tin 99 Per Cent	Tin Straits	Lead N Y	Lead St L.	Zinc St L
25	.....	.....	.....	....	...	....
26	13.50@13.75	33.00	35.00@35.50	5.40	5.40	5.75
27	13.50	33.00	34.75@35.00	5.40	5.40	5.70
29	13.25@13.50	32.00	33.00@33.50	5.15	5.15	5.60
30	13.25	31.75	33.00@33.25	5 00	5.00	5.55
Dec. 1	13.25	32.00	33.00@33.50	5.00	5.00	5.55

*These prices correspond to the following quotations for copper, "delivered": 13.75@14, 13.75, 13.50@13.75, 13.50, and 13.50c.

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for deliveries constituting the major markets, reduced to the basis of New York, cash, except where St. Louis is the normal basing point, or as otherwise noted. All prices are in cents per pound. Copper is commonly sold "delivered," which means that the seller pays the freight from the refinery to the buyer's destination.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. Tin is quoted on the basis of spot American tin, 99 per cent grade, and spot Straits tin.

London

Nov.	Copper Standard Spot	Copper Standard 3 M	Copper Electrolytic	Tin Spot	Tin 3 M	Lead Spot	Lead 3 M	Zinc Spot	Zinc 3 M
25	78¾	79	90	229¼	229½	28¼	29¼	32¾	34¼
26	78	78¼	90	221¼	225	28	28⅞	32¼	33¼
27	...	...	...	...	...	...	...	...	...
29	77¼	77¾	87	208¾	212½	25½	25¾	29½	31
30	75½	75¾	84	207½	212	25	26	29⅜	31¼
Dec. 1	76¾	77¼	85	208¾	213¾	26¼	27	29¾	31½

The above table gives the closing quotations on the London Metal Exchange. All prices in pounds sterling per ton of 2,240 lb.

Silver and Sterling Exchange

Nov.	Sterling Exchange	Silver New York Domestic Origin	Silver New York, Foreign Origin	Silver London	Nov	Sterling Exchange	Silver New York, Domestic Origin	Silver New York, Foreign Origin	Silver London
25	Holiday	Holiday	Holiday	47⅛	29	348	99½	71¾	40⅛
26	347½	99½	75½	48¾	30	347½	99½	68⅛	43⅜
27	348	99½	76	49⅛	Dec. 1	347¾	99½	69¾	44⅜

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Metal Markets

New York, Dec. 1, 1920

The meager selling at declining prices which has characterized trading in the last few weeks has continued, and no hope for an improvement is offered before the new year. Buying is only hand-to-mouth on the part of consumers, and speculative demand is absent.

A comparison of present prices with the average for 1913, the last full year before the war, indicates that, with costs now far higher than at that time, the prices of copper, tin, and zinc are near the bottom. The first figure given is the 1913 average and the second the current price: Electrolytic copper, lb., 15.27c., 13.25c.; Straits tin, lb., 44.25c., 33.25c.; zinc, lb., 5.50c., 5.55c.; lead, lb., 4.37c., 5.00c.; iron, basic, ton, $15.57, $36.96; silver, oz., 59.79c., $1 (domestic), 69¾c. (foreign). Prices can hardly be expected to go much lower for copper and tin, although the large stocks of the former will have a bad influence. Zinc production is being rapidly curtailed, so the present price is probably near the bottom. Lead has been held up by under-production, but with the present decreased demand, is rapidly falling into line with the other metals. It has not much further to go to reach the 1913 prices, but has acquired considerable momentum. Iron would seem to be due for a big drop. Artificial conditions, of course, enter into the silver market with the Pittman act in force.

Monthly Average Prices for November:

Copper:	
New York Electrolytic	14.257
London Standard	84.807
London Electrolytic	94.614
Lead:	
New York	6.159
St. Louis	6.127
London	32.489
Silver:	
New York, foreign	77.734
New York, domestic	99.500
London	50.952
Sterling Exchange	342.333
Zinc:	
St. Louis	6.247
London	35.028
Tin:	
99 per cent	35.667
Straits	36.854
London	241.080
Antimony	6.109
Quicksilver	58.417

Copper

Large producers report that they are not willing to sell for less than 14c. delivered, and a small amount of scattered business was done early in the week at that figure. Others have been willing to shade this price considerably, and a little business was done, U. S. Steel being among the buyers.

At present prices, curtailments, shutdowns, and wage reductions can be expected in constantly increasing numbers. As reported elsewhere, Cananea has closed down; wages have been reduced at Tacoma; and Inspiration has further curtailed production. These are only the opening guns. No resumption of activity at many of these properties can be expected until not only the demand improves, but the surplus stocks of copper metal are largely dissipated. Then the copper industry will be in excellent position for a long prosperous period.

With this week we are increasing the differential between the price f.o.b. refinery and delivered to consumer's plant, from 15 to 25 points. This is more nearly in accord with present conditions, due largely to increased freight rates.

Lead

On Tuesday, Nov. 30, the A. S. & R. reduced its official price of lead, New York and St. Louis, from 6 to 5½c. The move was anticipated, as the outside market was well under the former price.

Those who follow the market closely feel that with the present statistical condition of lead, the metal is worth 5c. a pound and unlikely to go lower, unless the London price falls sufficiently to make importation profitable. Current London quotations are equivalent to 5.50@5.75. New York, so a con-

siderable fall in London would be necessary before this condition would exist. Many producers would stock lead rather than sell should prices drop further.

Mexican lead is now being sold here, as it is cheaper to pay the duty than to ship to Europe. A deduction from the New York price, equivalent to the freight and selling expense, is made by the government to arrive at the Mexican price, on which the 25 per cent duty is levied.

Zinc

The market in St. Louis is firmer today, and unless selling pressure appears from a new quarter, further price reductions may not be expected. Demand is confined to galvanizers.

No demand for forward delivery exists.

Tin

Conditions are unchanged from last week, and only small lots have been purchased.

Straits tin for future delivery: Nov. 26th, 36.50@37c.; 27th, 36@36.50c.; 29th, 34@34.50c.; 30th, 34.50@35c.; Dec. 1st, 35@35.50c.

Arrivals of tin in long tons: Nov. 24th, Straits, 400; China, 40.

Silver

The market has showed continued weakness, although there has been a slight improvement today. Yesterday's figure for foreign bullion is a new low. China is the dominant factor in the market, with India a potential support at low prices.

Mexican Dollars: Nov. 26th, 57⅜; 27th, 58¼; 29th, 54⅜; 30th, 52⅜; Dec. 1st, 53¼.

Gold

Gold in London: Nov. 25th, 117s.; 26th, 117s. 7d.; 29th, 117s. 1d.; 30th, 117s. 6d.; Dec. 1st, 117s. 5d.

Foreign Exchange

On Tuesday, Nov. 30, francs were 6.065c.; lire, 3.66c. and marks, 1.425c. New York funds in Montreal, 13⅛ per cent premium.

Other Metals

Aluminum—For 50-ton lots: ingot, 99 per cent and purer, 33c.; 98@99 per cent, 32c. Outside sales reported at lower prices than quoted above.

Antimony — Chinese and Japanese brands, 5⅞@5⅞c.; market very quiet; W.C.C. brand, 8¼@8½c. per lb. Cookson's "C" grade, 12½@13c. Chinese needle antimony, lump, nominal at 5c. per lb. Standard powdered needle antimony[1] (200 mesh), 10c. per lb. Market dull.

White antimony oxide, Chinese, guaranteed 99 per cent Sb_2O_3, wholesale lots, 10c.

Bismuth—$2.40 per lb. 500-lb. lots, and $2.42 per lb., 100-lb. lots.

Cadmium—Nominal, $1.40 per lb. Market steady.

Cobalt—Metal, $6 per lb.; black oxide, $4 per lb.; sulphate, $1.60.

Iridium—Nominal, $350@$400 per oz.

Magnesium—Crude, 99 per cent or over pure, $1.75 per lb. for 100-lb. lots and over, f.o.b. Niagara Falls.

[1]**Molybdenum Metal** in rod or wire form, 99.9 per cent pure, $32@$40 per lb., according to gage.

Nickel—Ingot, 43c.; shot, 43c.; electrolytic, 45c., f.o.b. Bayonne, N. J.

Monel Metal—Shot, 35c.; blocks, 35c., and ingots, 38c. per lb., f.o.b. Bayonne.

Osmium—Open market, $70@$80 per troy oz.

[1]**Palladium**—$75 per oz. Dull.

Platinum—Firm at $75 per oz., nominal.

Quicksilver—Market quiet; $50@$60 per 75-lb. flask. San Francisco wires $53@$55. Weak.

[1]**Rhodium**—$200@$225 per troy oz.

Ruthenium—$175@$200 per troy oz.

[1]**Selenium**—Black powdered, amorphous, 99.5 per cent pure, $2@$2.25 per lb.

[1]**Thallium Metal**—Ingot, 99 per cent pure, $20 per lb.

[1]**Tungsten Metal**—$35@$60 per kilogram, according to purity and gage.

Metallic Ores

Chrome Ore—Guaranteed 50 per cent Cr_2O_3 foreign ore with a maximum of 6 per cent silica, 55@60c. per unit, New York. California concentrates, 50 per cent Cr_2O_3 and upward, 60@65c.

[1]**Manganese Ore**—45@50c. per unit, seaport; chemical ore (MnO_2) $65@$70 per gross ton, lump; $75@$80 per net ton, powdered.

Molybdenum Ore—85 per cent MoS_2, 55@60c. per lb. of contained sulphide, New York.

[1]**Tantalum Ore**—Guaranteed minimum 60 per cent tantalic acid, 45c. per lb. in ton lots.

[1]**Titanium Ores**—Ilmenite, 52 per cent TiO_2, 1½@2c. per lb. for ore. Rutile, 95 per cent TiO_2, 15c. per lb. for ore, with concessions on large lots or running contracts.

[1]**Tungsten Ore**—Scheelite, 60 per cent WO_3 and over, per unit of WO_3, $5, f.o.b. mines; wolframite, 60 per cent WO_3 and over, per unit of WO_3, $4.25@$4.50, in New York.

Uranium Ore (Carnotite)—Ore containing 1½ per cent U_3O_8 and 5 per cent V_2O_5 sells for $1.50 per lb. of U_3O_8 and 75c. per lb. of V_2O_5; ore containing 2 per cent U_3O_8 and 5 per cent V_2O_5 sells for $2.25 and 75c. per lb., respectively; higher U_3O_8 and V_2O_5 content commands proportionately higher prices.

Vanadium Ore—$1.50 per lb. of V_2O_5 (guaranteed minimum of 11 per cent V_2O_5), New York.

[1]**Zircon**—Washed, iron free, 5c. per lb.

[1]**Zirkite**—According to conditions, $80 @$90 per ton, carload lots. Pure white oxide, 99 per cent, is quoted at $1.15 per lb. in ton lots.

Zinc and Lead Ore Markets

Joplin, Mo., Nov. 27—Zinc blende, per ton, high, $45.35; basis 60 per cent zinc, premium, $33.50; Prime Western settling, $45@$35, buying, $35@$32.50; fines and slimes, $30@$27.50; calamine, basis 40 per cent zinc, $35@$32. Average settling prices: Blende, $43.07; calamine, $36; all zinc ores, $42.97.

Lead, high, $111.75; basis 80 per cent lead, settling, $110@$55; buying, $55; average settling price, $84.34 per ton.

Shipments for the week: Blende, 6,918; calamine, 98; lead, 1,738 tons. Value, all ores the week, $448,030.

Tuesday will end the contracts of a number of purchases of zinc made on $45@$40 basis, and lead $110 basis, with perhaps nearly all deliveries on these contracts in at the end of next week.

With offerings today leaning heavily downward on zinc, the mines are closing indefinitely as fast as they can arrange business details.

Platteville, Wis., Nov. 27—No market quotations are available for lead and zinc ore. Shipments for the week: Blende, 161; lead, 45 tons. Shipments for the year: Blende, 58,973; calamine, 2,534; lead, 4,473; sulphur ore, 1,342 tons. Shipped during the week to separating plants, 2,724 tons blende.

Non-Metallic Minerals

Asbestos—Crude, No. 1, $2,000@ $3,000; No. 2, $1,400@$1,700; spinning fibres, $400@$800; magnesia and compressed sheet fibres, $325@$500; shingle stock, $110@$150; paper stock, $60@ $75; cement stock, $17.50@$30; floats, $8.50@$15, all per short ton, f.o.b Thetford, Broughton, and Black Lake mines, Quebec, Canada; 5 per cent to be added as Canadian royalty export sales tax.

Barytes—Crude, 88 to 94 per cent barium content, $10@$12 per net ton; ground (white) $24@$30 in bags, carload lots; (off-color) $22@$26 in bags, carload lots; all f.o.b. Kings Creek, S. C. Crude, 88 to 94 per cent, $23; ground (white), $45; ground (off color) $30@$32 per net ton, less than carload lots, f.o.b. New York. Crude, first grade, $10 per ton, f.o.b. cars, Missouri; floated, $28 per ton in bbls.; $26.50 per ton in 100-lb. bags; extra charge for bags, f.o.b. St. Louis.

Chalk—English, extra light, 5@5½c.; light, 5@6c.; dense, 4½@5c. per lb., all f.o.b. New York.

China Clay (Kaolin) — Crude, $8@ $12; washed, $12@$15; powdered, $18@ $22; bags extra, per net ton, f.o.b. mines, Georgia; crude, $8@$12; ground, $15@$40, f.o.b. Virginia points. Domestic lump, $10@$20; powdered, $25@ $30; imported lump, $25@$35; powdered, $30@$35, f.o.b. New York.

Feldspar—Crude, $8@$14 per gross ton, f.o.b. Maryland and North Carolina points; $7.50@$10, f.o.b. Maine; ground, $27@$30, car lots, f.o.b. Baltimore; ground, $17@$21, f.o.b. North Carolina points; $17@$21 per ton, No. 1 ground, f.o.b. New York State; $21@ $23 per ton, ground, f.o.b. Maine. Crude spar very scarce.

Fluorspar — Gravel, guaranteed 85 per cent calcium fluoride and not over 6 per cent silica, $22.50 per ton, f.o.b. Illinois mines, and $25.50, f.o.b. Kentucky; ground, suitable for acid, chem-

[1]Furnished by Foote Mineral Co., Philadelphia, Pa

ical or enameling purposes, $60; lump, $17, f.o.b. Tonuco, N. M. In Canada 85 per cent calcium fluoride sells for $20 per ton f.o.b. Madoc; output limited. Canadian price generally $18 (Canadian currency) per ton, f.o.b. mines; market inactive.

Fuller's Earth—$18 per ton carload lots, f.o.b. New York.

Graphite—The 90 per cent crucible grade is held in Alabama for 9c. per lb. and 85 per cent grade is practically unobtainable, prices being 7@9c.

Gypsum—Plaster of paris in carload lots sells for $4.25 per 250-lb. bbl., alongside dock, New York. Raw crushed rock, $3.50@$4.50; calcined stucco, $9; f.o.b. works, Illinois.

Kaolin—See China Clay.

Limestone—Dolomite, 1@2 man size, $1.60@$1.65; 2@8 in., $1.55@$1.65 per net ton, f.o.b. Plymouth Meeting, Pa.; fluxing, $1.65@$1.75 per net ton, f.o.b. Howellville, Pa.

Magnesite, Calcined — High-grade caustic calcined, lump form, $35@$40 per ton, carload lots, f.o.b. California points. In Chicago district, $57.70; Atlantic seaboard, $61@$63.

Dead-Burned — $38 per net ton, Chewelah, Wash.; $58@$64, Chester, Pa. Austrian grade, $55@$60 per ton, f.o.b. Baltimore. (Magnesite brick—See Refractories.)

Mica—India block mica slightly stained, per lb.: No. 6, 50c.; No. 5, $1.20 @$1.40; No. 4, $2@$3; No. 3, $4.25@ $5; No. 2, $5.50@$7; No. 1, $8. Clear block: No. 6, 55c.; No. 5, $2; No. 4, $3.50; No. 3, $5, No. 2, $6.50; No. 1, $8; A1, $10; extra large, $25, all f.o.b. New York; ground, $150 per ton, Philadelphia. Domestic, uncut, f.o.b. Franklin, N. C., as follows: Scrap, $45 @$50 per ton; punch, 10c. per lb.; circle, 15@25c.; 1½ x 2 in., 75c.; 2 x 2 in., $1.15; 2 x 3 in., $1.65; 3 x 3 in., $2.10; 3 x 4 in., $2.50; 3 x 5 in., $2.75; 3 x 6 in., $3.75; ground 165 mesh, $150 @$170 per ton; ground roofing mica, $60; mica washers, 75c.@$2 per lb.; 1¼-in. disks, No. 1, $1.60 per lb.; No. 2. $1.30. The foregoing domestic prices obtain also in the Chicago district.

[1]**Monazite** — Minimum of 6 per cent thorium oxide, $30 per unit, duty paid.

Phosphate Rock—Per long ton, Florida ports: 77 per cent tricalcium phosphate, $13; 75 per cent, $11.50; 75@74 per cent, $11; 70 per cent, $8.35; 68 per cent, $7.85; 68@66 per cent, $7.60. Finely ground Tennessee rock sells for $8.50 per net ton for 13 per cent phosphorus content, agricultural application; for acid-making, 14 per cent, $9; both prices f.o.b. Centerville, Tenn.

Pumice Stone—Imported, lump, 4@ 50c. per lb.; domestic lump, 6c.; ground, 4@7c., all f.o.b. New York.

Pyrites—Spanish fines, per unit, 12c., c.i.f. Atlantic seaport; furnace size, 17c.; Spanish lump, 14@16c.; domestic fines, f.o.b. mines, Georgia, 12@14c.

Quartz—(Acid tower) fist to head, $10; 1¼ to 2 in., $14; rice, $17, all net ton, f.o.b. Baltimore; lump, carload lots, $5@$7.50 net ton, f.o.b. North Carolina mines.

Sand (Glass)—Dry glass sand, $4 per net ton, f.o.b. cars Mapleton, Pa. Sand, f.o.b. Ottawa, Ill., is $3 per ton; $2.50 on annual contracts. Sand at Klondike, Gray Summit and Pacific, all in Missouri, is $2.50 on contract; some outside sales have been made at $4. St. Louis, open market, at $3.50; contract price on large quantities, $2.50; on small quantities, $3.

Sulphur—$18 per ton for domestic; $18@$20 for export, f.o.b. Texas and Louisiana mines. Market quiet.

Talc — Paper making, $12@$22 per ton; roofing grades, $9.50@$15; rubber grades, $12@$18, all f.o.b. Vermont. California talc, $20@$45, talcum powder grade. Southern talc, powdered, carload lots, $12@$15 per ton; less than carload, $25, f.o.b. cars; freight to New York $5.25 per ton, carload lots; less than carload lots, $9.25. Imported, $60 @$70; Canadian, $20@$40 per ton.

Mineral Products

Arsenic—White arsenic, 13@14c. per lb.; sulphide, powdered, 16@17c. per lb. in carload lots.

Sodium Nitrate—$3 per cwt., ex vessel, Atlantic ports. Market quiet.

Sodium Sulphate—For 95 per cent material, $22 per ton, f.o.b. mines, Idaho and Arizona, spot and six months' contract.

Potassium Sulphate—Domestic, $225 @$250 per net ton, basis 90 per cent, f.o.b. New York.

Ferro Alloys

Ferrocarbontitanium—For 15 to 18 per cent material, $200@$225 per ton, f.o.b. Niagara Falls, N. Y.

Ferrocerium—Per lb., $12@$15.

Ferrochrome—Carload lots, spot and contract, 60 to 70 per cent chromium, 6 to 8 per cent carbon, 17@18c. per lb. of chromium contained; 4 to 6 per cent carbon, 16@17c., f.o.b. works.

Ferromanganese—Domestic 76 to 80 per cent, $150, freight allowed; $145, f.o.b. seaboard bases; English, $135@ $140, c.i.f. Atlantic seaports. Spiegeleisen, 18@20 per cent, $60@$65, f.o.b. furnace.

[1]**Ferromolybdenum**—Standard grades, carrying from 50 to 60 per cent molybdenum metal, with low sulphur, phosphorus, and arsenic, $2.25@$2.50 per lb. of contained metal, f.o.b. works.

Ferrosilicon—For 10 to 15 per cent, per gross ton, f.o.b. works, $60@$65; 50 per cent, $80@$85; 75 per cent, $160.

[1]**Ferrotungsten**—Domestic, 70 to 80 per cent W, 65@75c. per lb. of contained tungsten, f.o.b. works. Foreign, 65c.

Ferro-uranium—35 to 50 per cent U, $7 per lb. of U contained, f.o.b. works.

[1]**Ferrovanadium**—Basis 30 to 40 per cent, $6.50@$7.50 per lb. of V contained, according to silicon content, f.o.b. works.

Metal Products

Copper Sheets — Current New York price, 23½c. per lb.; wire, 18c. Even lower quotations are heard.

Lead Sheets—Full lead sheets, 9½c.; cut lead sheets, 9¾c. in quantity, mill lots.

Nickel Silver — Unchanged at 35½c. per lb. for 18 per cent nickel.

Yellow Metal — Dimension sheets, 22½c.; sheathing, 22½c.; rods, ⅜ to 3 in., 19½c.

Zinc Sheets—$11.50 per 100 lb., less 8 per cent on carload lots, f.o.b. smelter; zinc plates, 10½c. per lb.

Refractories

Bauxite Brick—56 per cent alumina, $160 per 1,000, f.o.b. Pittsburgh.

Chrome Cement—40@45 per cent Cr_2O_3, $55@$60 per net ton, and $65 in sacks, carload lots, f.o.b. eastern shipping points.

Fire Brick—First quality, 9-in. shapes, $55@$60 per 1,000, Pennsylvania, Ohio and Kentucky. Second quality, $45@ $50.

Magnesite Brick — 9-in. straights, $110 per net ton; 9-in. arches, wedges and keys, $120; soaps and splits, $130

Silica Brick—9-in., per 1,000: Chicago district, $65@$70; Birmingham, Ala., $56@$61; Mount Union, Pa., $55 @$60.

Iron Trade Review

Pittsburgh, Nov. 30, 1920

Last Friday several large independent mills, which had previously been quoting 3c. on bars, shapes and plates, came down to the Steel Corporation prices of 2.35c. for bars, 2.45c. for shapes and 2.65c. for plates. Previously 3c. had been shaded by some mills on particularly desirable orders and by a few Western mills on all business. Yesterday a large independent maker of wire products came down to the Steel Corporation prices.

Finished-steel prices are now quotable as follows: Bars, 2.35c.; shapes, 2.45c.; plates, 2.65c.; tin plate, $7 per base box; steel pipe, 57½ to 54 per cent basing discount; blue annealed sheets, 3.55@4.05c.; black sheets, 4.35@4.85c.; galvanized sheets, 5.70@6.20c.; plain wire, 3.25c.; wire nails, $3.25.

Independent mill operations have continued to decline, though the Steel Corporation fully maintains its production and seems well provided with orders for several months.

Pig Iron—Foundry iron is down $2 to $37, Valley, bessemer and basic remaining nominally at $37.50 and $35, respectively, Valley, with $1.96 freight to Pittsburgh.

Semi-finished Steel—The first sale of semi-finished steel at the Corporation price, 6,000 tons of sheet bars at $47, Pittsburgh, has not been followed by others. Billets are nominally $50 and sheet bars $55.

Charcoal and Coke

Charcoal—Willow, 7c. per lb. in bbls.; hardwood, 6c. per lb., in 250-lb. bbls.

Connellsville — Furnace, $10@$12; foundry, $8@$10.

[1]Furnished by Foote Mineral Co., Philadelphia, Pa

Existing Conditions a Challenge to Engineers

THE existing stagnation in the major metal markets, together with the partial curtailment in some of our important mining industries, is not, in our judgment, a reason for particular discouragement. The adjustment in prices in other important manufacturing industries has produced more or less uncertainty with respect to the immediate future. Nevertheless, the mining industry has had the advantage of other industries in that for the period succeeding the armistice it has been compelled to operate on a rock-bottom basis. There has been some bread and butter, but comparatively little butter. Some mining companies have been in a better financial condition than others, but all have made prompt readjustment to meet existing conditions. In some cases the readjustment has been superficial, in others fundamental.

We mean by this that some properties have simply curtailed, closed down, or taken the most obvious steps to decrease money outgo and conserve resources. This, in our opinion, is a superficial readjustment. By a fundamental readjustment we mean the thorough analysis of operating conditions with a view to putting them in such form as to meet present circumstances. This may mean a radical change in mining methods, the introduction of improved equipment or the complete overhauling of metallurgical methods and equipment. In our opinion, this getting down to the dregs of the problem is of vital importance to the mining industry.

Necessity is the mother of invention. Adverse economic conditions are in themselves a challenge to managers, superintendents, technical staff, and operating men. This fact is of importance to the mining industry. We venture to say that every live organization is getting down to cases.

We know of one mining engineer who has an important gold-producing property under his direction. War conditions practically eliminated all profit margin. Apparently there was nothing to be done except to shut down, which would have been a serious blow to the stockholders and the workers. Operations were, however, continued, and this engineer is calling all his ability into play to improve operating conditions and reduce his costs. He told us that he could not improve either mining or transportation methods, but that he had hopes of so changing milling operations as to cut his milling cost in two. We like the spirit of this man. He is asking no favors from anyone. He is putting his brain into his work.

American mining engineers and metallurgists have won an eminent position by reason of their courage in breaking away from precedent and building up the mining industry upon a substantial and low-cost basis. By meeting the present economic situation the mining industry will be in a stronger position to compete in the world's markets.

Reorganization for Washington

THIS is the open season for gunners who wish to reorganize the executive departments at Washington. We have had our little shot at this, and do not begrudge the sport to others. The most ambitious and thoroughgoing plan we have seen is that put forward by the Committee for Governmental Economy, representing a number of other weighty organizations. Here, apparently, is the last word in efficiency. We have only gotten far enough in the elaborate and complete chart of the new organization to see that the Geological Survey will be incorporated in the Department of Public Works, and the Bureau of Mines in the Department of Commerce. The War Minerals Relief Commission of the present Interior Department (the engineering and auditing staffs of this commission are under the Bureau of Mines) will be transferred to the Department of Public Works.

Read no further, gentle stranger.

Great is the reformer when he gets really serious and attempts to unscramble the egg, as in the present case, by making egg nog out of it. The mining industry—did the National Committee for Governmental Economy ever hear that the United States had a mining industry?—is thus hanged, drawn, and quartered. We think that, as they have gone that far, they should have so scattered the remains as to leave no clue to their crime. For example, the department of the Geological Survey that deals with the mineral resources of foreign countries should go to the Department of State, the Petroleum Division of the Bureau of Mines should go to the Shipping Board, the Division of Statistics in the Geological Survey should go to the Census Bureau, the Safety First work of the Bureau of Mines to the Bureau of Medicine and Surgery in the Navy Department. Dr. Cottrell should be assigned to the Patent Office and Dr. George Otis Smith to the Red Cross. A final grand disorganization banquet would be a proper and dignified finis.

The Opportunity of the Labor and Trade Unions

A TREND to the open shop in industry is going hand in hand with a gradually increasing labor supply. The tendency receives added impetus from the unpopularity of some of the strikes engineered by radicals among the unions, which have offset much of the good that has been accomplished by saner elements in labor groups during the last few years. The public has been quick to realize that in some cases where the closed shop has prevailed, too great opportunity is offered to squeeze out all the traffic will bear, regardless of agreements and contracts. Grafters, safely ensconced as union officials, not only demand blood money from employers, but sometimes also collect it from union members themselves. The disclosures in the building trades investigation in New York City exhibit a rottenness which shows to what lengths the vicious system may be carried.

The fairly conducted unions need have no fear of the open shop. If the union can offer any advantages to the worker he will join; if not, there is no excuse for its existence. Perhaps in no district has the open shop idea spread faster recently than in Montana, and more particularly in Butte. There, union and non-union men are now working side by side, and conditions are peaceful as compared with the time when the I. W. W.'s, or, as more commonly termed, "Wobblies," held control.

That some of the radical union activities have had an effect on public sentiment is also shown by the present unpopularity of the boycott. Striking placarded pickets wasting their time parading before their former employer's place of business are coming to be good advertisements and to engender a feeling that we must all stand together to protect ourselves from unjust demands.

The unions have done too much good to be allowed to be run into the ground. The open shop will give them a good opportunity to show what they can offer and how they can act, as compared with unorganized labor. With good leadership they should continue to prosper.

The Mines of Asia

ASIA has large mineral resources. Much of her mineral wealth has never been worked and what has been worked has never been exploited with that ravaging thoroughness and intensity which modern mining has invented, and which in the course of a few years guts from the richest mine its concentrated wealth of all past eternity. On such metallic framework, on metal so scientifically won, is our power built; and Asia will learn this among other secrets.

The urge toward mining in the East is already striking. Japan has a highly developed mining industry, especially in copper, where she ranks third among the world's nations. China is rich in coal and iron—possessing, after the deposits of the Eastern United States, and, second, the long-fought-for borderlands between France and Germany (including Alsace and Lorraine), the greatest coal and iron deposits in the world. If England's power depended largely upon her coal and iron, if the strength of France and Germany had this basis, if the great power and wealth of the United States rests mainly upon its being richest in coal and iron of all nations, what deduction may we draw from the future development of the wealth in coal and iron of China? Surely, that here will be concentrated the strength of the Pacific region. Whether it will be the Chinese, the Japanese, the Americans the Russians or the British who will wield this power remains to be seen.

Struggling China would gladly have American capital and resourcefulness open up her mines, since in the co-operation by every other country, including Japan, she sees political conquest following upon the threatened commercial domination. British, American and French companies actually have large mining interests in China and in other countries of Eastern Asia, and at present an active movement is going on in this country looking toward further investigation and acquisition. None of these movements, however, have the strength and swiftness of that of Japan, which behind its commercial and competent technical enterprise has the force of a definite government policy. Japan, cramped and active, with discrimination against her race and her citizens by the United States, Canada, Australia and Europe, can hardly be expected to be anything but unsympathetic to increase of Caucasian power in the Mongolian continent. The discrimination in question, as all fair thinkers must acknowledge, is based on purely economic grounds, rather than conceptions of fundamental racial superiority. What we have we would keep for ourselves, and without too strenuous a competition against the lean bellies of Asia or anywhere else.

The tin industry of Asia and Australasia is controlled, either by ownership or trade relations, by Great Britain—indeed, through this and other trade relations, and the possession of her own Cornwall tin mines, Great Britain substantially controls the tin of the world. The substantial petroleum supplies of the East Indies are controlled by British and Dutch capital, now apparently welded together under British direction. Tungsten is an important product of China and other Far Eastern countries, and Chinese antimony dominates the markets of the world. Till recently under British control, it has been under Chinese direction since the establishment in New York of a selling agency of the Wah Chang Co., which controls, through a government concession, the Chinese output. It is the only strictly Chinese-controlled mining industry in China.

India, not a great mining country, has important mines of manganese, and gold mines which are of some moment, and has, with Brazil, the most important deposits of monazite and zircon. Ceylon produces perhaps the best graphite in the world. It is probable that Siberia is, in respect to gold and many other metals, the richest undeveloped country on earth; and certainly the vast interior mountainous regions of Asia, now little explored, will yield much mineral wealth. The struggle over Asiatic Turkey and Persia is emphasizing the great resources of these countries, in petroleum, copper and many other minerals. England and France have agreed to divide the petroleum. France apparently has the approach to the main copper district, that of Diarbekir; and Greece and Italy are quarreling about the coastal belts of Asia Minor, rich in emery, chromite, and other minerals.

Above and back of all, like a formless cloud, a vast inchoate Russia threatens all: China, India and Persia; Mongolian and Caucasian.

Who will develop the mines of Asia?

Fair Play for the Mine Cost Sheet

THE closing down of certain mining properties and curtailment at others causes even the ordinary observer to question the reasons for such action. We have discussed the causes so frequently that our readers should know them by heart. In brief, surplus supplies of metal, a stagnant market, and high costs.

We have not been free to predict the time period of the depression, for the reason that many economic conditions necessarily have considerable bearing on the situation, and until the adjustment of these is completed the resumption of former activities cannot begin. However, there is little reason to believe that a delay is necessary in some quarters, and in view of the fact that we are beginning to see recessions in commodity prices, and even greater drops are predicted, it is reaonable to suppose that we may look for reductions in other markets.

A short time ago, in the same issue of one of the Western newspapers which announced the closing down of a prominent quicksilver mine, we noted with some

curiosity a statement of the earnings of a well-known powder company for the first nine months of 1920. The gross receipts showed an increase of over three hundred thousand dollars and the net earnings more than double that amount *above* the corresponding period for the year before.

The item "mining supplies" occupies no unimportant part on the cost sheet of any mine, and of the different charges that are included, blasting powder is by no means the smallest. Nor is the total amount of powder used in the mining industry of such insignificance that it compares unfavorably with that used in other fields. During the war the story was somewhat different, but, even though we are still, politically speaking, at war with Germany, the consumption of explosives for military purposes has slackened materially. So, as we have already remarked, it is interesting to observe that at this period, when all the mines are having such a difficult time, the powder companies are making net earnings twice as large as last year. In other words, notwithstanding the very low price of their raw materials, such as glycerine and other essential commodities, they are still charging war prices for their product.

Such a condition as this demands a remedy, and the sooner the better if the mining industry is to resume its former activity quickly.

A Siberian Incident

WASHINGTON D. VANDERLIP, stated to be a mining engineer, has recently figured considerably in international press dispatches, since he arrived in London with a mining concession for eastern Siberia, including Kamchatka, where, among other things, he is going to mine oil. Figuratively speaking, he laughs hoarsely at the United States for failing to recognize Soviet Russia, and get Russia's trade, and believes that England will beat us to the trough. Later dispatches state that Mr. Vanderlip was awarded Siberia by the Russian Soviet Government (our latest news is that this government does not control Siberia) because it supposed him to be a cousin of Frank A. Vanderlip.

Washington D. Vanderlip has a good front and rear name, and his middle initial is the same as John D's; also his business deals, as he himself admits in tones sufficient to be detected over two continents, are Napoleonic. We do not find him on the membership list of the American Institute of Mining and Metallurgical Engineers. We shall look for further news from Washington.

Botany Applied to Mining

THE letter of Mr. Wichman's on page 1116 brings up a subject which has never been properly treated —the relation of botany to geology, and the use of the former in the determination of facts appertaining to the latter. We recommend the subject as affording an appropriate thesis for some of our graduating university students.

As is well known, certain marine plants concentrate in their structures iodine from sea water, and potash; and are important commercial sources of these chemicals. Similarly, in Spain a plant which secretes soda was long cultivated and harvested for that chemical; the ash being known as *barilla*. A "mineral farm" therefore, is not necessarily an absurdity.

Students of geology are quite accustomed to the help of vegetation in following and mapping the bi[illegible]er facts of that science. Frequently, in a series of limestones and shales, for example, a different type of vegetation, even diverse tree species, will be characteristic of the different outcropping zones, the variations being due in part to the different chemical character of the soil, and in part to the variable permeability of the rocks by water. Similarly, fault zones are often easily traceable with the eye, by a line of more luxuriant and greener vegetation, due to the fault being a natural watercourse. This may often be observed in the desert region, where the color and size of the desert shrubs may be striking. Similarly, certain veins may likewise be watercourses, as zones of persistent sheeting, and be traceable with the eye by differences in vegetation.

The relation of various plant species to the different chemical properties of the rocks out of which they grow, however, has not yet been thoroughly summarized. We hope to see it done.

Shoving the Queer

AS CHAMPIONS of the metal-mining industry, the editors of *Engineering and Mining Journal* are in the habit of securing, when possible, a few gold pieces from their respective banks, and putting them into circulation Of course, they get right back to the banks and stay there, because the merchant hastens to bank them for fear that they may not be legal tender. However, some of our missionaries complain that they are regarded with more or less suspicion, first by the bankers and more especially by the merchants whom they pay in gold. The majority of the latter—or their clerks—say they have never seen a gold piece before, and hesitate to accept it.

New York has been defined as a place where a thousand people live on an acre of land which they never have seen. It is also a place where a thousand people do business on a few ounces of gold which they have never seen. But if the acre of land, or the few ounces of gold, should be withdrawn—what a cataclysm!

French Pronunciation of Bauxite

ALTHOUGH some time ago we closed the discussion as to the pronunciation of the word bauxite, the following communication is too important not to be added to the discussion:

Quebec, Nov. 17, 1920.

Monsieur le directeur:

Avec tous le égards dus à M. McDonald, je me permets de ne pas partager son opinion au sujet de la prononciation française de "bauxite." Je crois pouvoir l'assurer qu'en français l' "x" est toujours dur (ks.). Donc, nous avons toujours prononcé, prononçons maintenant, et prononcerons toujours "bokseet" et n[illegible] "bozeet." THEO C. DENIS,
Service des Mines de la Province de Quebec.

Mr. Theo C. Denis, of the Quebec Mining Bureau, the writer of the above communication, informs us in it that the word is pronounced in French "bokseet," and not "bozeet."

In this connection, we may quote from a private letter recently received from a specialist on bauxite. He states that he has visited every working bauxite mine in the country, and that in all his field travels he has never heard the "French" pronunciation of the word. He continues "so that you can count me with those who pronounce the word 'boxite.'"

According to Mr. Denis, the difference between the Anglicized pronunciation and the proper French pronunciation is less than we have believed.

WHAT OTHERS THINK

The Forked Stick and Structural Geology

I have read with interest the occasional articles in which the divining rod as an indicator of water, mineral, or anything else has been held up to ridicule. The article in one of the late issues in which some Australians took a punch at it has shown that the matter is still open to discussion.

A few facts on the divining rod from personal investigation might be of interest to engineers. At the age of fourteen, with an extremely skeptical mind upon all subjects either material or spiritual, with a supreme contempt for anything savoring of the supernatural or magical, and a desire to smash all such things, I challenged a well smeller "to show me," and he did.

The forked stick worked better for me than it did for him. There was no question that it worked, and the psychological element was totally lacking. I had a desire that it would not work, it would not work in places where I wanted it to do so, and in fact my state of mind had nothing to do with it.

After I had satisfied myself of this beyond peradventure of a doubt I set to work to make a map of the indications obtained on about twenty acres covering the crest and side of a hill. I have the original of this map showing the lines and indications of supposed watercourses as indicated by the forked stick. At that time I had only an elementary knowledge of geology and little or none of the structure of the area covered.

There was one well on the property, and its watercourse could be traced easily on the surface. Some years later I had to clean this well out. I then found that it was located on a slip or minor fault, the strike of which was identical with the bearing as traced on the surface. Later, a second well was dug on another of the indications, water was obtained, and another slip of identical bearing with surface indications was found. A third well was drilled on another, and in this instance a clear case of fault was encountered. Two other wells were put down, and these checked up the forked stick.

Upon my return after graduation from a technical school, I found this old plan, and set to work to ascertain the exact geological conditions of the area mapped. The result was that the forked stick had correctly located ten slips in the Cambrian shale and one large fault between the shale and the overlying limestone. This is a fact that can be verified.

That the psychological element had nothing to do with it and that lack of slips meant no indications or negative evidence are proved by the fact that it was particularly desirable to obtain water at a certain place. I wanted to find it there, but the stick would not turn. The nearest point was four hundred feet away. An old quarry at the point I wanted to obtain the indication, when cleaned out at the time I made the geological examination, showed no signs of slip or fault whatever.

It has been ten years since I have tried the forked stick. In that case I worked out the geology first and then tried the forked stick and checked it in a search for water in Arizona. Water was obtained, but it was too alkaline to be of any use. I do not know if I could do it now, but it can be done.

This is no claim for the forked stick as an indicator of ore, but the statement of an indisputable fact that it did indicate structural geological conditions in rocks which were fully verified by independent study of the rocks themselves.

All of which goes to show that there are many things in heaven and earth that engineers never dreamed of or hypothesized about, and there is more fact and less guess with the forked stick than in many of the theories concerning the genesis of orebodies. J. H. EBY.

Spokane, Wash.

Botany Applied to Mining

I have read with much interest an article in *Engineering and Mining Journal* of Oct. 30, entitled "Desert Prospecting," by Leroy A. Palmer. His reference to the occurrence of gold invariably associated with a certain yellow flower reminds me of those divining-rod stories (or shall we call this a "Golden Rod" story?) which you have been printing recently.

However, I do not doubt Mr. Palmer's assertions in the slightest, except that I beg to differ with him in his theory that hematite in the rock is in any way responsible for the growth of the plant. I do not claim to be a botanist, but I do remember being taught once that plants required for their sustenance potassium, phosphorus, and nitrogen. All other elements are of secondary importance, but certain ones, particularly iron, have the property of rendering characteristic colors to fruits and flowers. All who have visited beautiful Grass Valley and Nevada City, Cal., in the late summer, have noticed the brilliant coloring of the normally yellow Bartlett pears which grow so abundantly in that locality. This has been attributed to the high percentage of iron in the decomposed granodiorite soil.

In my wanderings over the hills in search of dip and strike, I have often been impressed with the peculiar relationship between plant life and certain rocks. In an area comprised largely of hard limestone and quartzite it is often comparatively easy to trace the outcrop of a dike of basic or subsilicic rock by the heavy growth of vegetation overlying it.

This affinity of vegetation for certain types of rock may be due to one or several causes. The basic rocks usually weather and disintegrate more rapidly than the sedimentaries. The result is a deeper soil, which not only offers more favorable opportunity for root growth, but acts as a reservoir for water, the supply of which is being continually added to by drainage from surrounding areas into depressions on the surface where the outcrops have weathered.

Of still greater importance, however, is the fact that nearly all igneous rocks contain orthoclase, leucite or some other potash-bearing mineral, and apatite, the commonest of the phosphates. It is therefore reasonable to expect a more luxuriant growth on rocks containing such high plant food value than on the leaner quartzites and limestones.

If any of your readers are botanists as well as geologists it would be interesting to hear of their experience with flowers as divining rods. Anyway, if it comes to

a showdown, I'll bet on the little yellow flower against the "whip handle with a spring in it" any day.

Salt Lake City, Utah. F. M. WICHMAN.

An Advocate of Bimetallism

I have read with much interest the comment of the *Engineering and Mining Journal* on the "McFadden Gold Bonus Bill," together with Mr. McFadden's arguments on other pages of your paper. I thoroughly appreciate your remarks regarding an "elementary knowledge of economics" as being "a dangerous thing," and for that reason wish to state before going further that I do not wish to open a discussion as an authority on the subject. However, the onlooker can often see things that those in the midst of a fight do not observe. Being accustomed to looking on all subjects with an analytical mind, and from both sides, I am taking the liberty of asking you a few direct questions regarding your stand, as well as Mr. McFadden's, on his gold bonus bill, as you state that mining men should uphold only such measures as would promote the national welfare.

Now, first, don't you think that our national welfare depends on international welfare? Yes, I know you do, when you say, "We can hardly expect a return to stable prosperity until Europe again becomes a buyer as largely as of old." Every word of the paragraph in which the above sentence is copied is true and an excellent argument for increased metallic money (page 891 of the *Engineering and Mining Journal*), but I contend that future gold production is limited. I further believe that even if the gold miners get a bonus, the increased production due to that fact would not materially help the situation of world financing. I believe that Mr. McFadden's argument giving as an example the increased production of gold on England's part, which he attributes to gold producers receiving the benefit of an exchange premium, is not based on facts altogether. Of course, the premium exchange would attract some attention to gold mining, however, and the financiers of England are wise enough to know that gold is one of their nation's biggest assets. With it they can buy silver at a much lower rate and use it as a medium of exchange in the East to much better advantage.

Mr. McFadden ends his argument by saying: "Are we going to continue to ignore the problem of gold production in the United States, thus permitting the British Empire to gain an unquestioned supremacy?" Natural resources alone determine this, and although a premium will help some, it will also disturb the only standard that we have today; and in the long run do more harm than good. I would like to ask how much longer the mining men and bankers of America are going to sit blindly by and let England control our silver market? The United States today is paying $1 per ounce for silver England buys for about 80c. and when she trades it in India it is difficult to determine just what profit she makes, but every one has an idea.

This brings to the front the old so-called worn-out story of bimetallism, Bryan's hobby of a generation ago. Bryan's other two hobbies, prohibition and suffrage, never died. The only thing that killed bimetallism was that it could not be used permanently and successfully by any one or two nations. International bimetallism is the foremost issue before the world today Why? Because, first, the gold supply is insufficient, and to increase the value of gold is like playing with fire. Second, silver is recognized the world over as the next best metal for monetary purposes so far as its value and physical and chemical characteristics are concerned. Third, it is geographically more widely distributed by nature, and the mining of it in turn aids a larger number of people, and does not, as with gold, tend to favor a few. Fourth, through the findings of the international commission working recently in Brussels (see *Literary Digest* of Oct. 16, 1920, pages 20-21), we learn that steps and plans are under way for solving financial and monetary problems, indicating clearly the pressing need to increase the world's medium of exchange.

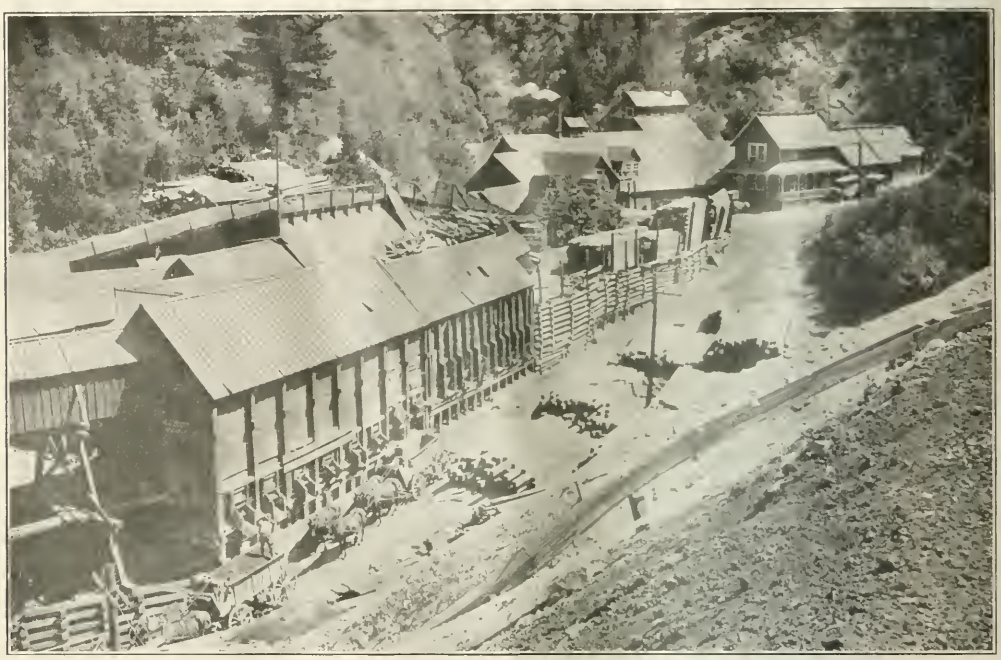
We read that the national debt of the ten leading nations of the world for 1920 totals $210,000,000,000, more or less. In 1918 the gold and silver stocks, including those of practically all the nations of the world, were approximately $8,000,000,000 in gold and $1,500,000,000 in silver. Assume that in 1920 these figures increased to $10,000,000,000, then the entire stocks of gold and silver of the world would only be about one-twentieth of the national debt of the ten leading nations, to say nothing of the debts of the nations aside from these ten. The payment of a premium for gold and the taxes on gold used for other purposes than money will probably increase the gold stocks to some extent. However, it seems apparent that this has its limit, and an insufficient one, even if carried out by all nations, as suggested by Mr. McFadden.

An international agreement to use silver at a definite ratio to gold, weight of pure metal for weight of pure metal, using a 900 fine alloy in every case, would eliminate at one stroke the trouble of international exchange, as, no matter what money of any nation one had in his possession, all that would be necessary would be throw it on the scales, figure 90 per cent of its content for the pure metal, and make the change accordingly. Of course the use of bulky and weighty silver coins has its handicaps, but this could be offset by the different nations issuing gold and silver certificates which would certify that the national vaults held the amount of silver specified, and these would in turn become international currency.

Mr. McFadden figures that the $80,000,000 in gold withdrawn from a possible coinage for industrial purposes meant a contraction in the credit structure of $1,600,000,000. It would be well to limit by international law this expansion to some definite ratio, as one financier has so thoughtlessly exposed the depravity of some of the banking institutions' credit expansions. Now let him figure how much of the approximately 13,000,000,000 ounces of silver which statistics show the world has produced could be turned back to coinage and what expansion this would mean in the credit structure, and the many advantages it would have over meddling with the gold standard or the favoring of one class.

Of course it would be hard for England to see the advantages of it. From a selfish "Rule or Ruin" point of view she would be against it. However, in the long run, by increase of trade with the Far East, she would carry on a safer and surer business, as well as with the whole world in general. Thus it comes to the point whether or not the different nations are going to work out a co-operative scheme of dealing with one another, to the benefit of mankind as a whole, or whether the old competitive system is going to be patched up in some way so that a few will reap the benefits of the toil of the many. HUGO W. MILLER.

Nogales, Ariz.



SURFACE PLANT OF THE JUDGE MINING & SMELTING CO. IN EMPIRE CANYON

The Judge Electrolytic Zinc Plant

Main Features of the Process as Now Conducted—Concentrates Averaging About 38 Per Cent Zinc Roasted and Leached—Electrolyte Purified by Zinc Dust and Zinc Plated On Aluminum Sheets—Purified in Small Reverberatory

By George C. Heikes
Written for *Engineering and Mining Journal*

TO SEPARATE the zinc from the other metals contained in the concentrating ores from the mines of the Judge Mining & Smelting Co., Park City, Utah, has been found a difficult problem. These ores contain from 4 to 12 per cent of lead, 4 to 15 oz. of silver, 6 to 15 per cent of zinc, and from 4 to 10 per cent of iron. The oil flotation process has been tried recently on a small scale, but has not proved successful. At present,[1] gravity methods of wet concentration are used, the zinc concentrates, consisting of jig and table products, being roasted and leached, and the zinc recovered electrolytically. Gravity concentration separates the zinc blende from the galena, but does not separate the zinc blende from the chalcopyrite and pyrite, the differences in specific gravity being too slight. The lead concentrates are shipped to the Salt Lake smelters; so it is with the zinc product that this article will be concerned. A separate electrolytic zinc plant has been erected by the Judge company near the mines and mill, to which the zinc concentrates are hauled in wagons.

The zinc concentrates contain about 38 per cent of zinc, 3 to 5 per cent of lead, 9 to 10 oz. of silver, 30 per cent of sulphur, 8 per cent of iron, 0.2 per cent of manganese, and small quantities of antimony, copper, cadmium, and arsenic. The different sizes are kept in separate bins, as the jig product is too coarse for efficient roasting without crushing. The table concentrate is hoisted to the top of the roaster by a skip-hoist, which dumps it into a feed hopper. The flow is regulated by extensions on the rabble arms of the drying hearth pushing the desired amount of concentrate from the spout of the hopper onto the hearth. The jig product is carried from the bin by a belt conveyor to a cylindrical drier, and thence to a Hardinge ball mill, where it is ground fine enough to roast. It is hoisted to a bin above the roaster by a bucket elevator and fed onto the drying hearth of the roaster by a belt conveyor.

The roasting is done in a 25-ft. seven-hearth Wedge roaster, which is heated by two coal-fired combustion chambers situated at opposite sides of the roaster and entering the sixth hearth. The heats of the hearths average 700 deg. C. The rabble arms of the hottest hearths are cooled with water, whereas the remaining arms are cooled with air supplied from a motor-driven fan. The seventh hearth is used to partly cool the calcine before it flows by gravity to a Baker cooler. From

[1]The plant was temporarily closed down last month, owing to the present low price of zinc being below cost of production.

THE JUDGE MILL IN EMPIRE CANYON

the cooler it is hoisted to a 400-ton storage bin by means of a bucket elevator, and from there in a skip-hoist to small charging bins built over Pachuca tanks.

There are three Pachuca tanks, made of 3-in. redwood, 10 ft. in diameter and 22 ft. high, each holding thirty-five tons of solution. The tanks are filled with acid electrolyte and enough 60 deg. sulphuric acid to bring up the acid content to the right amount. Calcine is added until the acidity is about 1.5 gm. per liter. Pulverized lime rock is then used to neutralize any excess acid. Enough iron sulphate, from two small tanks where scrap iron is agitated with sulphuric acid, is added to bring the iron content in the solution up to 0.3 gm. per liter. Manganese dioxide is sometimes added in sufficient quantities to oxidize the ferrous iron to ferric iron. Calcium hydrate coagulates the solution and precipitates such impurities as antimony and arsenic. An agitation cycle generally requires about three hours to complete.

A centrifugal sand pump transfers the neutral pulp to a drag classifier. The sand from the classifier is washed with water and run by gravity to a smaller drag classifier that drops it into a storage bin for shipment to the smelter. The overflow from the large classifier goes to a 30-ft. Dorr thickener. When the thickener overflow becomes clear it is pumped into one of three purifying Pachuca tanks. The spigot product of the Dorr thickener is piped to an air lift, where it is raised and run into the hopper of an 11.5 x 6-ft. Oliver filter. The vacuum on the filter averages seventeen inches and the wash water nine gallons per minute. The filtrate is pumped back to the large Dorr thickener, which is used as a storage tank for the purifying Pachucas.

The Oliver filter cake falls by gravity into a rectangular-shaped mixing trough, where it is mixed with an acid wash water to wash out the soluble zinc. The pulp is pushed along by paddles which are fastened to a rotating shaft running lengthways over the middle of the trough. The overflow from the mixer is pumped to a small Dorr thickener 20 ft. in diameter. By the time the washed cake has reached the overflow of the mixer it is neutral or preferably contains a small amount of acid. The overflow from the small Dorr thickener is pumped to the leaching Pachuca tanks.

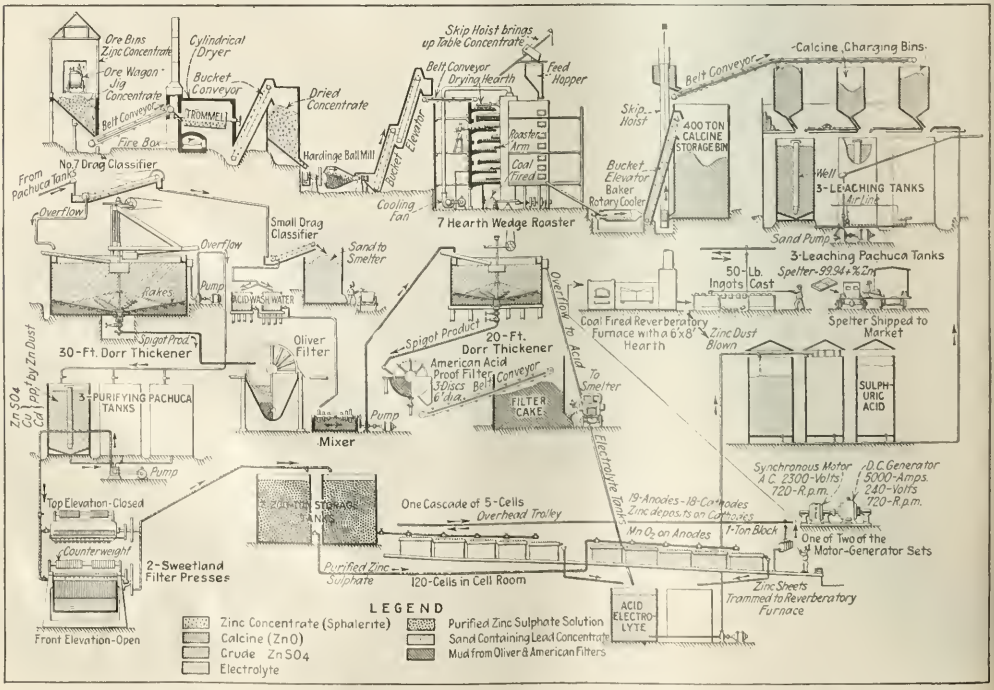
The spigot product flows to an acid-proof American filter, which was especially designed for this plant. It has three disks 6 ft. in diameter and a filter surface of 140 sq.ft. A good cake results when the pulp contains at least a trace of acid. The American filter cake drops onto a belt conveyor, which delivers it to a storage bin. The sand from the drag classifiers and the American filter cake are shipped to the lead smelters and contain 20 oz. of silver per ton, 10 to 20 per cent of zinc, and 8 per cent of lead. Trouble in filtering has resulted from zinc hydrate, calcium sulphate, and ferrous hydrate clogging the pores of the filter bags. This is partly remedied by using stronger acid in leaching to do away with the zinc hydrate, and by employing high air pressure on the filter bags to clean out the other insolubles.

Purification is carried on in the three purifying Pachuca tanks by agitating zinc dust with the solution. The quantity of zinc dust required depends upon the amount of impurities present in the solution, which are determined by analysis. On the average, 70 lb. of zinc dust is used for every twenty-five tons of solution. The zinc dust is made at the zinc plant by allowing a fine

LOADING ZINC CONCENTRATES IN 7½-TON LOADS

stream of molten zinc metal to pass in front of a nozzle from which compressed air with at least 100 lb. pressure per square inch is being blown. The dust is collected in a tank-like, galvanized iron receptacle, sacked, and carried to the purifying department. The purifying cycle of each tank containing 25 tons is 45 minutes. It takes 40 minutes to pump the purified solution through two Sweetland filter presses. Each press has 36 leaves 3 ft. in diameter. The presses are opened, and cleaned every other day by water from a high-pressure line. The filtrate is nearly pure zinc sulphate and is pumped into two 200-ton storage tanks situated at the head of the cell room. The Sweetland filter cake is carried out and dumped into a field near the plant, where it is being stored for future refining, as it contains 30 to 50 per cent of zinc, 4 to 7 per cent of copper, and 3 to 6 per cent of cadmium. Effort is made to hold the solution in the cell room at 60 gm. per liter of zinc, and not over 0.002 gm. per liter of any other impurity. Any solution from the various filters or tanks that overflows runs into a sump in the filter room, where it is saved and pumped to the large Dorr thickener. The floor of the filter room is washed with solution, either purified or unpurified, in order that all the solution and pulp may be saved.

SLIME CAKE RESIDUES BEING LOADED FOR SHIPMENT



DESCRIPTIVE FLOW SHEET OF THE ELECTROLYTIC ZINC PLANT OF THE JUDGE MINING & SMELTING CO., PARK CITY, UTAH

The cell room is divided into two sections of sixty cells each. The cells are made of 2-in. redwood, 4.5 ft. deep, 3 ft. wide, and 7 ft. long, and are arranged in cascade. Each cascade consists of five cells, which differ three inches in elevation. The overflow from each cell flows over a chemical sheet-lead chute which extends two inches past the end of the following cell and delivers its flow one inch above the solution, which is kept two inches below the top of the cell. At the inlet end of each cell is a cooling coil made of 45 ft. of 1-in. chemical sheet-lead pipe and coiled into five 4-ft. loops. The coils are cooled by water, which is pumped through an outdoor spraying system to reduce its temperature.

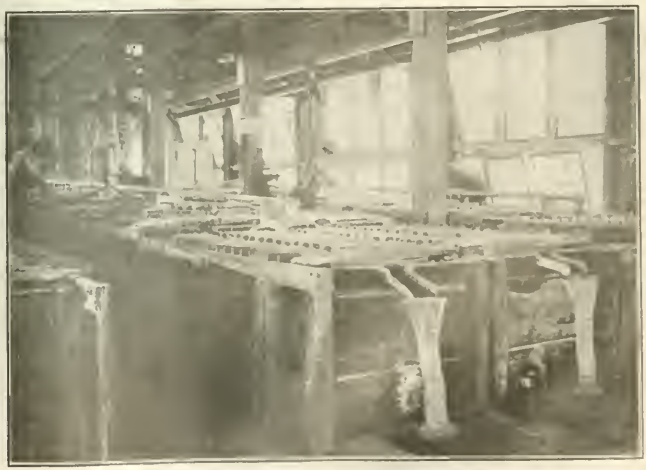
CUTTING OUT CONDUCTOR BARS FROM SPENT ANODES

The zinc-sulphate solution is delivered to the head of each cascade by iron pipes, and the amount of flow regulated by gate valves. Provision is made for fresh solution to be run into each separate cell. The overflow from the last cell in each cascade is delivered to one of two acid electrolyte storage tanks situated outside the cell room, from which it is pumped to the acid storage tanks for use in the leaching process. Twenty grams of zinc per liter are left in the cell tailing solution. The manganese dioxide already mentioned as being used to precipitate the ferric iron becomes manganese sulphate in leaching and remains in solution with the zinc sulphate. The manganese deposits on the anodes in the form of manganese dioxide. The anodes are taken from the cells when the deposit becomes too thick for efficient use and scraped with small triangular steel scrapers. The residue scraped from the anodes, together with the manganese dioxide which has precipitated at the bottom of the cell, is collected in a bin outside of the cell room, where it is sacked and taken to the leach room to be used again.

Each cell has nineteen anodes and eighteen cathodes, which are kept two inches apart center to center. The anodes are cast at the zinc plant, of chemical lead ¼ in. thick, 21 in. wide, and 34 in. long. They are cast over a 1-in. square rolled steel bar 41-in. long and a piece of tinned No. 00 copper wire which runs along the top of the supporting bar and through the bar close to the busbar end, where it is riveted to make a good contact. The iron bar is used for its supporting strength and the copper for its conductivity. The copper is tinned to prevent the zinc sulphate solution from creeping between the wire and the lead.

The cathodes are made of sheet aluminum ⅛ in. thick, 23.5 in. wide, and 37 in. long, and are supported by two copper bars ⅜ in. thick, 1.5 in. wide, and 44 in. long, which are riveted together with the aluminum sheet between. Two hook-shaped sheet-steel lugs are riveted between the copper bars at the edges of the aluminum sheet. These serve as a means to pull the cathode from the cell. Each square foot of the cathode area in the cell has a current density of twenty amperes. The cathodes are removed every twenty-four hours and average 210 lb. to the cell. The strippers pull six cathodes from the cell at one time by means of a one-ton chain block hooked to a frame which fits under the hook-shaped lugs and tightens up under them when the frame is raised. The "pull" of six cathodes, as it is called, is carried to a stationery steel stripping frame at the lower end of the cell room by means of the block running on an overhead steel trolley. The cathodes are held in the stripping frame while the stripper inserts a sharp chisel between the zinc and the aluminum cathode and peels off a sheet of zinc about ⅜ in. thick. These sheets are piled near the stripper and then trammed to the furnace room. Wooden strips which stick tightly to the edges of the cathode are used to stop irregular deposits and make the zinc easier to handle.

Because the amount of current carried by the cell busbars decreases with the increase in the number of anodes and increases with the number of cathodes, it is possible to save copper by tapering the busbars, and this has been done. The busbars are 1.25 in. thick, 4 in. wide, and taper to ½ in. wide in the length of the cell. The busbars holding the electrodes are on the outside of the cell, the anode bar being on the inside



THE TANK ROOM IN THE ZINC PLANT

STRIPPING CATHODES IN THE ELECTROLYTIC ZINC PLANT

RABBLING THE DROSS IN A ZINC FURNACE

and one-half inch lower than the busbar for the cathodes. The busbars are insulated from each other and from the cell by means of heavy plate glass one inch thick. The opposite ends of the supporting bars of the electrodes rest on wooden strips insulated from the cell by pieces of ¾-in. plate glass. At present, experiments are being made using the heavy forty-eight-hour sheet-zinc deposit as a cathode. It is planned to then melt the whole cathode. The sheet is held between two heavy pieces of copper wire and clamped. The wires are riveted to the same style of supporting bar now in use for cathodes. The main difficulty at this time is the breaking of the sheet zinc when the deposit becomes heavy; so this cathode is still an experiment.

The zinc sheets are trammed to the "melt" room, where they are weighed and thrown into a small coal-fired reverberatory furnace with a 6 x 8-ft. hearth. The temperature is kept between 600 and 750 deg. C. Every twenty-four hours dross is pulled. Ammonium chloride is added to the dross, the furnace doors are opened, and the dross is carefully raked into perforated wheelbarrows. More ammonium chloride is added and mixed with each wheelbarrow load while the dross is hoed back and forth in the wheelbarrow to push the metal through the holes. The remaining dross is weighed, screened, and hoisted into a storage bin by a bucket elevator. The metal which was pushed upon the floor is gathered together and thrown back into the furnace. When the bath is sufficiently hot, a small door at the back of the furnace is opened; this is just large enough to admit a ladle which will hold 150 lb. of zinc. The ladle is suspended by a steel rod from an overhead steel trolley, and the molten zinc poured into cast-iron molds. The average weight of the finished ingots is 50 lb. The zinc, analyzing 99.93+ per cent, with very small amounts of cadmium, copper, iron, and lead, is weighed and shipped.

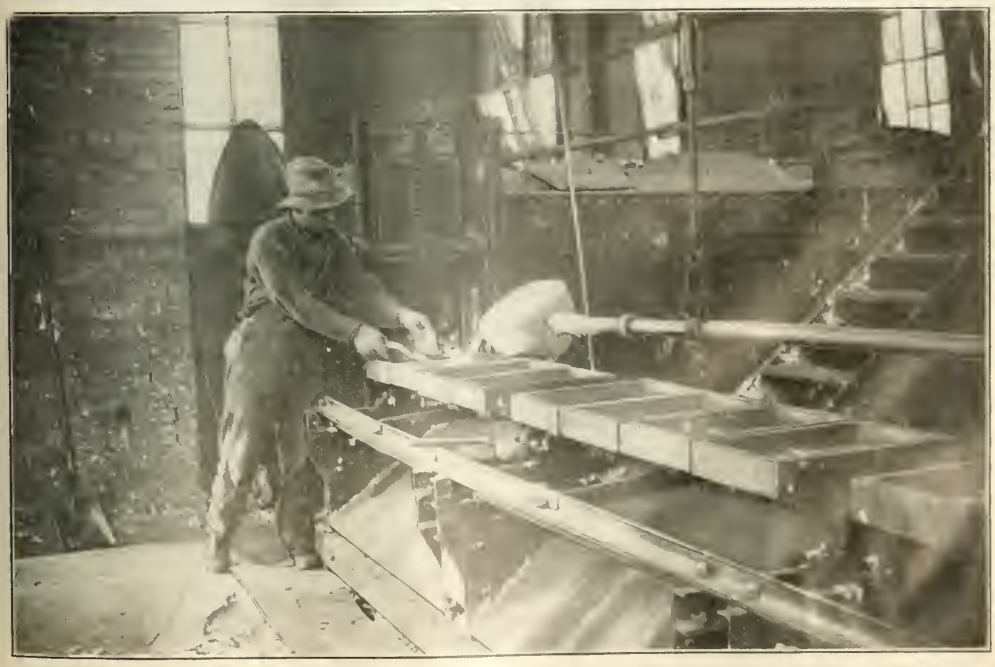
At present the plant is producing between seven and nine tons of zinc a day. The plant was originally planned for fifteen-ton daily capacity, but the roaster and the filters have not reached that tonnage.

Two motor-generator sets are so arranged that either set may run on either side of sixty cells in the cell room.

WORKING DROSS IN PERFORATED WHEELBARROWS

The cells are connected in series and the electrodes in parallel. Ten pounds of zinc is produced for every horsepower of electricity used and five tons of zinc for every ton of coal consumed.

My best thanks are due to G. W. Lambourne for permission to publish these notes and also to John T. Ellsworth for helping me obtain the data.



POURING ZINC INTO MOLDS AND SKIMMING

FLOTATION MILL OF ENGELS COPPER CO., ENGLEMINE, CAL.

Miners' Dormitories at the Engels Mine*

By E. G. Gardner
Mining Engineer, U. S. Bureau of Mines Rescue Car No. 1
Written for *Engineering and Mining Journal*

THE Engels and Superior mines of the Engels Copper Mining Co. are situated in the mountains of Plumas County, Cal., at an elevation of 5,200 and 3,800 ft., respectively, above sea level. The Superior mine is at the end of the Indian Valley R.R., and the Engels about three miles up a canyon. The mill and general offices are at the lower mine.

The mining company officials are Elmer E. Paxton, general manager, Mills Building, San Francisco, Cal.; Robert A. Kinzie, supervising engineer, First National Bank Building, San Francisco, Cal.; W. R. Lindsay, superintendent, Engelmine, Cal.; J. J. Barrett, foreman, Engels mine, Engelmine, Cal.; W. E. Kyle, foreman, Superior mine, Engelmine, Cal., and W. I. Nelson, mill foreman, Engelmine, Cal.

The company is mining and milling about 450 tons from the Engels mine and 250 tons of ore from the Superior mine per day. One hundred and seventy men are employed in the Engels and 60 in the Superior mine. Including all on the payroll, about 200 men are employed at each camp.

At the upper camp there are twenty dwelling houses, six lodging houses containing a total of sixty rooms, a new dormitory, a boarding house, a hospital, a store, a club, and the foreman's residence, besides the mine buildings. The family houses contain three and five rooms and rent for $6 and $10 respectively. Water is piped to each house, but no bathtubs are yet installed and the latrines are outside the buildings. Formerly the mine had bunk houses, but the present management, believing that better living quarters, with personal privacy, increase a man's self-respect and also attract a better class of workers, subdivided the bunk houses into rooms and installed on each floor a lavatory, with the necessary sanitary accommodations and shower baths. The sewage drains into a septic tank. The rooms in the bunk houses are 8 x 12 ft. in size, where occupied by one man, and 10 x 12 or 12 x 14 ft. where occupied by two. The company furnishes beds and mattresses, and the men supply their own bedding and take care of their own rooms. A janitor employed by the company takes general care of the buildings. The men are not charged rent. The management has also recently built the new thirty-three room dormitory, which is modern in every respect. The floor plans are simple and elevations free from architectural complication. The rooms are 12 x 14 ft. in size, are occupied by two men each, and are furnished with two single beds, tables, and chairs. The company furnishes bedding, linen, and janitor service, and makes a charge of 15c. per day per man. This building and all the lodging houses are steam heated. The buildings are kept free from vermin by treating the rooms with live steam, monthly.

After the dormitory was completed, for a time the miners seemed to prefer the old quarters, but now it is filled to capacity, and there is a waiting list of applicants.

*Published by permission of the Director, U. S. Bureau of Mines.

At the lower camp there are fifty-two five-room and eight three-room company houses, which are rented to the miners with families at $6 and $10, respectively, per month. At this camp the old bunk houses have also been remodeled and subdivided into rooms 8 x 16 and 12 x 14 ft. in size, which are occupied by two men. These rooms are furnished in a manner similar to those in the lodging houses at the upper camp, and no charge is made for them. Plans have been drawn for a dormitory like the one at the upper camp, and all the buildings are being improved and painted.

Photo by Bureau of Mines

STREET OF COMPANY HOUSES IN LOWER CAMP, ENGLEMINE, CAL.

Board is furnished to 160 men in the lower camp at $1 a day and to 135 men in the upper camp at the same rate. As it costs the company about $1.60 a day to board a man, the company loses 60c. a day on each man's board.

The company maintains a store at each camp to supply the needs of the miners. No profit is desired by the company from this establishment, but the goods are marked to pay interest on the capital furnished. Men are not required to buy at the stores, and no discrimination is made against those who buy from mail-order houses.

Photo by Bureau of Mines

THE MEN'S CLUBHOUSE AT THE LOWER CAMP

About 35 per cent of the miners are Americans, 30 per cent Italian and Spanish, 30 per cent Mexicans, and 5 per cent other nationalities.

At each camp the company maintains a clubhouse, containing a reading room with papers and magazines, card and pool tables, barber shop, and soft-drink stand. No club dues are charged, and the rooms are open to all. The Plumas County Circulating Library has a branch at the camps. Moving-picture shows and dances are given weekly. Mr. Baker, the manager of the store, is also in charge of the clubs. The boarding houses are run by a steward.

The company owns all of the town site and there are no private buildings in the camps.

The men at the upper camp work from 7:30 a.m. to 12 noon and from 1 p.m. to 4:30 p.m. on day shift, and from 6:15 p.m. to 11 p.m. and 11:45 p.m. to 3 a.m. on night shift. They come to the surface for a hot dinner or supper on their own time on each shift. Until recently the men carried a cold lunch in buckets on night shift, but the company offered to put a night shift in the boarding house if the men would come out to supper on their own time. This was agreeable to the men, and the change was made.

Wages at Engelmine camp (August, 1920) are $4.50 for shovelers and $5 for miners. This compares favorably with the scale at the Nevada camps with which the mine competes for men. A miner at Tonopah, for instance, will pay $60 per month for accommodations which are furnished at Engelmine for $30, and this lower rate of living costs offsets the difference of $1 per day in wages.

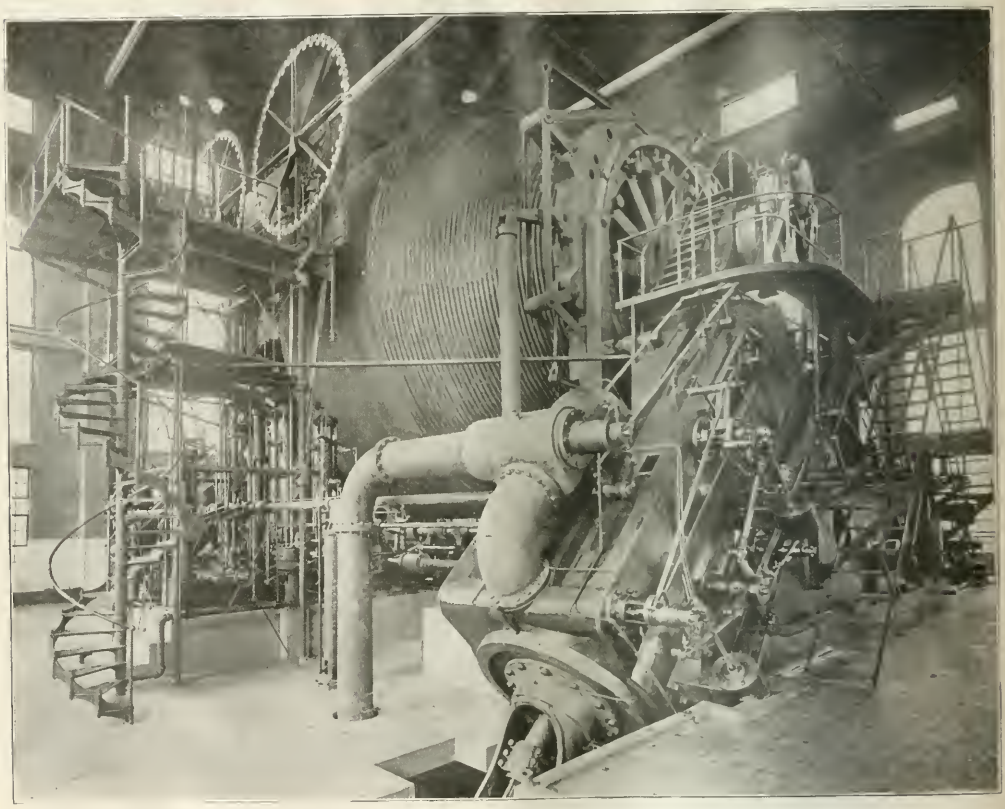
HEADFRAME AT SUPERIOR MINE OF ENGELS COPPER CO.

The efficiency of the men at the Engels mines is estimated at about 80 per cent by pre-war standards, which is very high. The labor turnover is comparatively small for these times. The mine has a full crew of laborers and shovelers, but is short of miners. The employment agents at Sacramento and San Francisco have a standing order for miners, who are shipped in at company expense. However, the labor shortage is not as serious as has been reported in most Nevada or Arizona camps.

Though the company's books show a loss on board, and it furnishes living quarters free or at a very reasonable cost, the lower living cost attracts men to the camp at a correspondingly lower wage than is offered in other camps, and when the cost of living comes down to a level more nearly normal, the loss in the boarding houses will decrease.

I believe that this camp is a good example of how consideration for the welfare of the men by the mine management is reflected in a lower cost of mining the ore, as well as more general satisfaction in operating conditions.

The Quincy Hoist



COMPOUND, CONDENSING STEAM-DRIVEN HOIST—A NOTABLE ACHIEVEMENT IN MECHANICAL ENGINEERING

AT THE Quincy company's No. 2 shaft at Hancock, Mich., the largest steam-driven hoist as yet constructed has just been completed. The hoist operates in balance and is designed to raise a load of ten tons of rock at a rope speed of 3,200 ft. per minute. The drum is of the cylindro-conical type, with a maximum diameter of 30 ft., minimum diameter 16 ft., and a rope capacity of 10,000 ft. of 1⅛-in. rope, sufficient to attain a vertical depth in the incline shaft of 6,600 ft. By winding the rope down on the opposite cone the rope capacity reaches 13,300 ft., equivalent to a vertical depth of 8,600 ft. The drum is carried by two main bearings 28 in. in diameter by 54 in. long, upon triangular-shaped castings, which, in turn, rest upon the concrete foundation and also support the four engine frames and cylinders.

A cross-compound steam engine, with two high-pressure and two low-pressure cylinders on each side respectively, is attached to the cranks of the drum. Each engine is set at 45 deg. to the vertical, and both engines on a side are attached to a common crank pin 15 x 15½ in. in diameter. High-pressure cylinders are 32 in. in diameter, low-pressure 60 in., and stroke is 66 in. The low-pressure pistons are supported by crosshead and tail guides. High-pressure piston rods are 6 in. and low-pressure 10 in. in diameter. Crosshead pins are 8 x 12 in. Between each high-pressure and low-pressure cylinder a reheating receiver is placed, the pressure within which is under the control of the operator.

The condensing equipment is designed to handle 1,460 lb. of steam per trip of 10,000 ft. The low-pressure cylinders exhaust into a steam drum 8 ft. in diameter and 17 ft. long, from which the exhaust steam passes to the air pumps.

The hoisting drum weighs 516,000 lb., exclusive of the shaft. It is constructed in forty-eight sections, which are bolted together. Inner trussing prevents any deflection. Light impulses per revolution together with the great mass of the hoist eliminate all pulsations in the rope. Post brakes of an improved type, 16 ft. in diameter, are attached to each end of the drum. Each pair of brake shoes is operated by an oil cylinder which receives its oil from a loaded accumulator. The oil cylinders are controlled by special poppet valves, one controlling the lift and the other the drop of the piston, and so arranged that both valves cannot be opened at the same time. Throttle and reverse mechanism are handled in the same way.

All of the mechanism is operated by a floating lever gear and is under the control of the operator. By means of an improved safety stop the throttle can be automatically closed as the skip approaches the landing. Overwinding applies the brakes automatically, and the control is so arranged as to prevent starting the hoist in the wrong direction. A speed governor controlling the cut-off cams of the valve gear prevents overspeeding.

The total weight of the hoist with condensing equipment is 1,765,000 lb.; floor space covered is 60 x 54 ft., and vertical height from foundation to top of drum is 60 ft. The weight of 10,000 ft. of 1⅛-in. rope is 41,500 lb.; weight of skip, 10,000 lb.; time required for one trip of 10,000 ft., 4 min. 8 sec.

The Nordberg Manufacturing Co., of Milwaukee, Wis., designed and manufactured the hoist.

The Administration of the McFadden Bill

A Discussion of the Tax-Collection Problems in the Proposed Gold Bonus Act, the Possibility of Distributing Larger Premiums Than Taxes, and the Provisions Made for Export And Import Trade in Gold Used in the Arts

By S. L. Willis
Written for *Engineering and Mining Journal*

DOMESTIC gold producers occupy a unique position as the only producers of a raw material who have not realized an increased price for their product as a result of the advance in the cost for labor and materials incident to the war. This fact, coupled with the exhaustion of many high-grade mines and rich placer deposits, has caused an alarming decrease in production, which, if permitted to continue, will undoubtedly result—and that in the near future—in an output so small that the arts will be obliged to import metal to supplement that obtained from domestic sources. The effect upon the domestic gold-mining industry will be disastrous, because many large, low-grade producers, with an assured long life under pre-war conditions, are even now facing the alternative of shutting down or continuing to operate at a loss. If the former course is pursued, cave-ins and water will terminate the careers of some of the nation's largest mines.

Foreign producers, situated in countries having a depreciated currency, are in a better position, because labor and materials are paid for in depreciated currency, and the product is sold at par. The resulting premium amounts to from 15 to 20 per cent in Canada, and even more in other countries.

Domestic gold producers assert that domestic manufacturers using gold in their product have been subsidized, in that the raw material has remained at a fixed price, permitting them to realize an increased profit on the finished product. Someone has certainly profited, but, leaving profiteering out of the discussion, the consumer has benefited rather than the manufacturer. Jewelers, gold beaters, and other consumers of gold have been subject to heavy exploitation on the part of their labor, this fact justifying larger price increases than were necessary in many industries. Wages in the gold-beating trade, for example, have increased from $15 to $44 per week, and advances in other trades have been in proportion.

It may be claimed by producing interests that the tax provisions of the McFadden Bill do not concern them directly, but as each objection creates opposition to the whole bill, a careful analysis of the tax provision is absolutely necessary if arguments of the consumers are to be met with any degree of success.

Features of the McFadden Bill

House Bill 13201, submitted by Mr. McFadden, aims to provide financial help for the gold-producing industry, by means of an excise tax levied upon all gold consumed in the arts and on all gold contained in imported articles of foreign manufacture. In an amendment, submitted at a later date, all gold contained in articles exported is exempted from payment of the tax. The premium and tax are equal, although figured on different units of weight; the tax being fixed at 50c. per pennyweight and the premium at $10 per oz.

The bill provides explicit rules and conditions governing payment of the premium, but is vague regarding administration of tax provisions, that matter being left to the Treasury Department in general and the Collector of Internal Revenue in particular. It does provide, however, that materials, or packages containing them, shall be suitably stamped on payment of the tax, and all articles manufactured, but not in the hands of the ultimate consumer at that time, shall be so stamped before further sale.

Discussion of the McFadden Bill may be conveniently divided under seven heads:

First. Is the bill practical?

Second. Comparison between the probable tax receipts and premium requirements, as indicated by past production and consumption statistics.

Third. The best time for imposing the tax; whether at the mint on withdrawal, after the last manufacturing process, or when sold to the ultimate consumer.

Fourth. Treatment to be accorded old jewelry and worn-out material containing gold.

Fifth. Treatment to be accorded scrap metal produced during the manufacturing process.

Sixth. Tax administration upon manufactured material in the hands of wholesalers and retailers, and imported materials containing gold.

Seventh. Procedure for safeguarding our export trade by refund of the tax on materials exported.

It is well to state at this point that the writer owes allegiance to neither the gold producers nor to the industrial consumers, except that, as a mining engineer, he regrets that the proud record of the United States as a producer of gold is in danger of becoming a memory. The following remarks are based upon facts, and refer to the bill as framed, and not to the principle involved:

First. Is the Bill Practical?

France places an excise tax upon all gold consumed in the arts. No mention is made of gold contained in imports, and, so far as can be learned, that factor is covered by the normal tax upon imports. The French tax is for revenue purposes and amounts to a luxury tax, figured on a specific instead of an ad valorem basis. There is, therefore, no reason for assuming that legislation of this character cannot be enforced if properly drawn up.

Second. Tax vs. Premium

Statistics for the domestic production of gold and its consumption in the arts, as combined in the following table, clearly demonstrate the fact that the bill in its present form will inevitably result in a steady and considerable drain upon the Treasury. In 1918, although the total apparent consumption of gold in the arts amounted to 76.3 per cent of the domestic production of new metal, 28.4 per cent, or more than a third of this, was old metal, largely manufacturers' scrap returned for refining. The value of this material must be deducted

from the apparent consumption when figuring the net amount of new gold used. The net consumption of new gold in the arts was therefore probably little more than 50 per cent of the domestic production of new metal. Assuming the bill to have been in force, the Treasury would have been drawn on to the extent of nearly eighteen million dollars in 1918, and this in a year when production was decreasing rapidly, and consumption was at a high peak, due to high wages throughout the country.

The figures for 1919 will probably be more favorable,

RATIO BETWEEN DOMESTIC GOLD PRODUCTION AND THAT USED IN THE ARTS (a)

Year	Domestic Production	Consumption New Metal	Per Cent Production	Consumption Old Metal	Per Cent Production	Consumption Total	Per Cent Production	Probable Tax Def (b)
1880	$36,000,000	$8,811,047	24 5	$1,294,385	3 6	$10,105,432	28 1	$14,100,000
1885	31,801,000	9,653,650	30 4	2,171,092	6 8	11,824,742	37 2	11,050,000
1890	32,845,000	13,025,462	39 7	4,630,498	14 1	17,655,960	53 8	9,500,000
1895	46,610,000	10,954,419	23.5	4,474,666	9 6	15,429,085	33.1	17,800,000
1900	79,171,000	17,061,553	21.6	5,086,589	6 4	22,148,142	28 0	31,100,000
1905	88,180,700	25,475,192	28 9	7,733,423	8 8	33,208,615	37 7	31,350,000
1910	96,269,100	34,160,874	35 5	7,626,278	7 9	41,787,152	43 4	31,050,000
1915	101,035,700	29,599,507	29 3	8,220,520	8 1	37,820,027	37 4	35,700,000
1918	68,646,700	32,892,395	47 9	19,517,345	28 4	52,409,740	76 3	17,850,000
1919	58,488,800	.....	....	.....	....	.....	...	.....

(a) Official figures from report of U. S. Mint, 1918.

(b) Assuming value of gold $20 per oz., then deficit = $\frac{\text{domestic production} - \text{domestic consumption new metal}}{2}$

but when consideration is taken of the fact that any bonus would result in an immediate expansion of production, and that price increases on top of an already sluggish luxury market would result in decreased consumption, it will readily be seen that the 1918 ratio is probably representative of actual results.

The natural remedy lies in a decreased premium or increased tax, or both, and with Congress in its present economical mood, one course or the other must be resorted to if the bill is to receive serious consideration.

Third. Methods of Imposing the Tax Proper

The old milling axiom regarding recovery of the values at the earliest possible point in the manufacturing process is as true when applied to tax collection as it is when applied to ore concentration. Consumers, however, strenuously object on the ground that collection at the mint imposes a serious financial burden upon all the manufacturers involved.

The most important consumers of gold are jewelers, gold beaters, and dental supply and pottery manufacturers. Gold beaters and the manufacturers of solid gold jewelry know exactly how much gold is contained in every unit of product, because the gold value is a considerable part of the total cost. They make little or no waste in the process, and the tax could be collected with equal facility at any point, except that the cost of collection from retailers would be greater than it would be if collection were made at the mint.

Pottery and plated jewelry manufacturers, and gold-leaf consumers, buy the gold they use in the form of liquid gold, decalcomanias, gold-plated sheets and wire, and gold leaf, and figure their costs in terms of these products, rather than in terms of the actual gold content. In fact, it is extremely doubtful whether the average consumer of this class has even a general idea of his gold consumption. The situation is further complicated by the scrap metal produced in the manufacturing process. This must be exempt from tax (if the collection is made at the mint), or a rebate allowed when the material is returned for re-smelting.

The very small amount of gold present in the manufactured articles renders collection by the retailer difficult and expensive, and the large amount of scrap produced in intermediate manufacturing plants discourages collection at these points. Collection when the metal is withdrawn from the mint can be easily and economically inforced, provided that rebates are allowed on returned manufacturers' scrap. Payment could safely be made to the manufacturer, because the tax would have been figured into his metal cost.

Dental-supply manufacturers produce pure gold products, such as gold dust, wire and foil, and gold teeth. They are able to consume all scrap produced, but the practicing dentist produces a certain amount of scrap which must be allowed for by rebate or other means when it is returned to the trade. Conditions in this case are not radically different from those obtaining in the jewelry industry, and collection of the tax at the mint is probably the most satisfactory method.

Fourth. Status of Worn-Out Material Containing Gold

Old jewelry and other materials containing gold re-enter the trade in considerable quantities through the medium of pawnbrokers and other dealers in scrap stock. This material is not entitled to rebate of the tax, and all such receipts must be kept separate from manufacturers' scrap. This requirement imposes some hardship upon refiners, because it will be necessary to hold old metal in stock until sufficient is collected for a separate furnace run.

Fifth. Treatment of Manufacturers' Scrap

The text of the bill provides that the tax be paid on "weight of fine gold contained in all gold manufactured, used, or sold for other than monetary purposes." This phraseology permits of three interpretations of the tax provision, but if the tax is to bear equally upon all consumers, it must be levied on the gold content of the material as sold to the ultimate consumer. Any other interpretation would result in a marked advantage to large manufacturers who are equipped to re-treat all scrap produced in process. The small producer, forced to buy gold at $30.67 per oz., and to sell his scrap at $20.67 per oz., would be driven out of business. If, therefore, the tax is collected prior to the manufacturing process in which scrap is produced, a rebate must be allowed covering all gold returned in this way to the trade. If, as is often the case, the scrap is sold to the original producer, payment may be made by crediting the shipper, and the material will be reissued without a second passage through the mint. When the scrap is sold to an outside refiner, on the other hand, cash payment will be made, equivalent to the monetary value plus the tax, and less the treatment charge. The refined bullion may be resold to the arts, in which case no additional tax should be collected by the Government; but if it is sold to the mint, a rebate equivalent to the tax is due the refiner to recompense him for his payment to the manufacturer.

SIXTH. TAX COLLECTION ON MANUFACTURED STOCK AND IMPORTS

Gold plays a widely varying part in the value of the products in which it is used. Enumeration of the articles affected reads like a list of the products of the United States, and includes jewelry, chinaware, picture frames, gold teeth, chemical apparatus, textiles, books, and other articles in common use.

No difficulty will be experienced in collecting the tax by weight upon bulk gold leaf, and manufacturers' stocks of liquid gold, dental gold, and plated wire and sheet, because the gold content is a considerable part of the value and accurate records are kept of the consumption per unit of product.

When gold leaf is the only decoration used, a fair idea of the quantity of gold on an article may be obtained by figuring the area covered. This method is feasible, but would require a large amount of work, and as the weight of gold used per article is generally very small, the returns would hardly justify the expense involved.

The same reasoning applies to the collection of the tax upon chinaware. Some expensive ware contains an appreciable amount of gold, it is true, but the amount of metal used in plain gold-band decoration is infinitesimal, and cannot be ascertained with accuracy, if at all.

Jewelry falls into three classes: solid gold, gold-platinum, and plated ware. The amount of gold in domestic solid gold and gold-platinum products can be determined in most cases by consulting the manufacturer, because he keeps such information as a matter of cost accounting. Plated ware contains only a very small amount of gold, and as the manufacturers have at best only a vague idea of the actual gold content under present conditions, all hopes of determining the taxable value are lost if the pattern has become obsolete.

The same difficulties are encountered when taxing gold imports. The foreign jewelry manufacturers operate small shops; in fact, a large part of the production is made in the homes of the workers. The operators buy semi-finished materials and figure costs in these units. An added difficulty is presented by the fact that a large part of the manufacturing process, as practiced abroad, is hand work, and for this reason the gold content variation will be more than is found in machine-made goods.

It seems advisable, therefore, to change the tax on jewelry stocks and imports from a specific to an approximately equivalent ad valorem rate. The rates could be fixed by a careful determination of the gold content of a large number of articles in each class. This system would obviate dispute and eliminate the necessity of an enormous amount of labor and expense.

SEVENTH. PROCEDURE FOR SAFEGUARDING THE EXPORT TRADE

The jewelry industry is the only domestic consumer of gold vitally affected by the export provisions of the bill. Determination of the gold content of solid goods would require little extra expense on the part of the manufacturer, but plated-ware manufacturers would be forced to maintain carefully divided establishments, so that the net consumption of gold in exports can be figured to the satisfaction of the collector. This course is expensive, due to extra clerk hire and warehouse charges, and would seriously handicap the domestic industry in competition with foreign manufacturers.

In conclusion, it may be said that the gold-mining industry needs and deserves financial help to combat the increased costs of labor and materials, and legislation of the type proposed is proved to be practical by foreign precedent. The McFadden Bill, as framed, however, will result in larger premiums than taxes collected. It proposes difficult conditions for tax collection, especially as regards finished stocks of manufactured articles and imports of those materials, and does not provide adequately for scrap material returned to the trade for manufacture. These tax provisions have created a powerful opposition from consumers of gold, which would be largely dissipated were the McFadden Bill revised to fit actual industrial conditions. The net result might be a smaller premium to the producer, but the chances of the bill becoming law would be greatly improved.

Recoveries of Metals by a Cottrell Treater

According to tests recorded by A. B. Young in a recent paper presented to the A. I. M. E., the metal recoveries at the Tooele plant of the International Smelting Co. on the flue gases from the McDougall roasting furnaces by a Cottrell treater were: Copper, 98.2; lead, 81.2; silver, 96.5, and gold, 96.4 per cent. The total metal recovery amounted to 93.97 per cent. The velocity of gases through the treater (actual conditions of temperature and pressure) was 21.45 ft. per sec., and the volume under the same conditions was 146,004 cu.ft. per min. The temperature at the outlet averaged 260 deg. F. (127 deg. C.) and at the inlet 280 deg. F. (138 deg. C.).

Analyses of the precipitated dust in the successive hoppers of the flue showed an interesting relation. Copper, gold, silver, insoluble iron, and lime were in greatest percentage in the first two hoppers at the intake and diminished to a marked extent toward the outlet. Lead progressively increased in percentage and was highest at next to the last hopper. The power input to the treater could not be accurately stated, but for volumes from 125,000 to 150,000 cu.ft. per min. the average power approximated 8.4 kv-a. for the first electrical section and 5.5 kv-a. for the second.

The first section accounted for about 85 per cent and the second for 15 per cent of the dust. Sphere-gap peak voltages ranged from 30,000 to 35,000. Each section contains two 10-ft. banks of plates of an effective length of 20 ft. The treater consists of a flue 10 ft. high, 12 ft. wide and 61 ft. long. Four banks of No. 20 corrugated iron plates, placed vertically and running longitudinally, give an effective treater length of 40 ft. Spacing between rows of plates is 9½ in., giving sixteen rows of plates to a bank. Midway between the rows is a vertical row of ¾-in. pipes running longitudinally. The vertical spacing between them is 6 in. The plates are grounded and the pipes are connected to the feed wires.

America's Share of the World's Gold

Of a total accumulation through the ages of $8,000,000,000 in monetary gold, the United States is estimated to hold $2,500,000,000, or 30 per cent of the world's supply. Gold holdings were increased greatly during the war because of the heavy shipments of gold made by other nations to the United States in payment for commodities.

Mining Engineers of Note

A. E. Bendelari

BY P. R. COLDREN
Written for *Engineering and Mining Journal*

WHEN the late O. S. Picher, president of the Picher Lead Co., decided that his company, long exclusively engaged in lead smelting, ought to enter the mining branch of the industry, he appreciated the importance of selecting the best man available to become manager of mines. After careful consideration he employed A. E. Bendelari, of Joplin. The venture turned out to be a bigger undertaking than even Mr. Picher had imagined. The flat prairie land north of Commerce, Okla., where Mr. Bendelari started sinking five shafts on March 11, 1915, quickly became a modern mining camp of 10,000 persons. Mr. Bendelari, by virtue of his position with the Picher company, encouraged and guided this phenomenal development, being at all times at the very center of its activities. His task was mining development primarily, of course. The Picher company entered the mining game in no halfway manner. Within three years it had eight concentrating plants in operation in the new field, and today it is handling over a million tons of rock annually; and at all times its leasing and sub-leasing activities have extended over the entire section. But besides the executive ability required, it was also demanded of Mr. Bendelari that he assume the responsibility that naturally falls to the guiding spirit of a new and rapidly growing municipality, such as Picher. Mr. Bendelari measured up to this responsibility in a manner highly satisfactory not only to the far-seeing and broad-visioned man who had employed him, but also to the people of the community.

A. E. BENDELARI

The Picher Lead Co. was consolidated with the Eagle Lead Co., of Cincinnati, in 1916, Mr. Picher becoming president of the new company, and the change meant only increased responsibilities for Mr. Bendelari. He continued as manager of mines in the Tri-state field, and in recent years has been supervising the company's zinc smelter at Henryetta, Okla., and the gas fields operated by his company near there. His record and ability were officially endorsed in February, 1920, when he was elected a vice-president of the Eagle-Picher company.

Mr. Bendelari has been engaged in the mining business since leaving college. He was born at Toronto, Ont., Nov. 23, 1879, and attended Upper Canada College there. He came to Joplin in 1900, and has been engaged in operating lead and zinc mines in this field ever since. Immediately before accepting a post with the Picher Lead Co. he was with the Underwriters' Land Co., and it was while employed by the latter company that he operated the Yellow Dog mine, at Webb City, one of the best-paying properties opened in that camp. Like many successful men, Mr. Bendelari ascribes his achievements to his ability to surround himself with capable and loyal men. Some of his assistants have worked with him for more than ten years; six men now in the employ of his company have been his associates for sixteen years, and the Rev. Wesley Post, who is known from one end of the district to the other, has been with him for eighteen years. Mr. Post, who is pastor of a Picher church, where he preaches every Sunday, has charge of all the Eagle-Picher sludge mills. Oddly enough, Mr. Bendelari has two other ministers on his payroll, the Rev. Fred De Mier, who is in charge of the company's flotation plants, and the Rev. Frank Bray, who is ore weigher at the company's plants and is also Boy Scout Master for the Picher field. Each of these ministers has a church in Picher, and Mr. Bendelari thinks he is the only mine manager in the country employing three regular clergymen.

Mr. Bendelari is a member of the A. I. M. E. His development as a mining man has progressed parallel with the growth of the company that employed him, and he has shown his eminent fitness for the position he holds. He is quiet and unassuming in manner, but there is never any question as to his authority. There is nothing of the old-fashioned, blustery "boss" about him. Bendelari's success has come through his ability to keep close to his men to have things go as he wants them to go without seeming arbitrary or dictorial. He is loved by his men, and his influence is steadily increasing in the Tri-state mining field.

BY THE WAY

Forty Redskins Bite the Dust

Foreign labor has generally been depended upon for underground work in this country. When scarce, Americans of foreign descent are mustered into service, but we had not heard of any real simon-pure Americans —American Indians—being engaged in such work, until recently. We understand, however, that forty full-blooded Navajo Indians have been employed in the Bullion tunnel workings of the Smuggler-Union Mining Co. at Telluride, Col. The management found labor so scarce that the experiment was decided on, and the redskins were persuaded to leave their homes in New Mexico. We await with interest the outcome, for the American Indian is particularly fond of the open air.

The Etymology of Siskiyou

A writer in the November *Sunset Magazine* relates how the rugged Siskiyou Mountains, the dividing line between Oregon and California, were so named. The story is substantiated by several old pioneer miners of Siskiyou County, Cal. These mountains recall the days when the only evidence of civilization in the Pacific northwest was represented by the old Hudson's Bay Company. It is said that the company had a trading post at the headwaters of the Sacramento River in California, where the stream was so narrow that it was crossed on six huge stepping stones. In the language of the French trapper, it was known as the post of the "six caillaux" (six stones), and the first American settlers quickly transformed the French word into American phonetic spelling as "Siskiyou."

Nature Still Supreme in Making Diamonds

Newspaper reports recently told of a German explosives firm which had secured the rights to a patent for the manufacture of diamonds and would produce several hundred carats daily. Later reports stated that the firm had found the diamonds were not equal to the natural product and had cancelled its contract with the discoverer. Artificial diamonds have been made, but only of microscopic size. However, the ruby, topaz, sapphire, amethyst and emerald, precious stones of the corundum class, are often made by artificial methods. The product is in many cases superior to the natural stone and of equal value in the market. When an imitation has all the qualities of the original it is no longer an imitation but the thing itself. Diamonds have so far been a stumbling block, owing to the difficulty of getting carbon into the liquid state from which the diamonds can crystallize. Even were a process discovered it is likely that its cost would be prohibitive.

Translating Mexican Prices

An easy way to convert Mexican prices per kilo into their American equivalent is given in *The Mexican Review*. Considering the rate of exchange as two pesos in Mexican coin equals one dollar in American coin, we have only to remember the magic number 23. For example: If frijoles are quoted at 35c. per kilo, their value per pound in American money would be 23 per cent of that, or 8.05c.

Wanted: A Shortstop To Mine Copper

Accomplished entertainers and skilled athletes are as welcome in most mining camps as in college fraternities. A dinky brakeman may have more knowledge of baseball than of railroad operation, and be hired for that reason. The following, which we clip from the New York *Sun*, illustrates the point:

"Can you play baseball, handle any musical instrument, or sing?"

This was the first question asked recently of an applicant for a position as a stenographer for a copper concern having mines in South America. The young man had the travel urge and was anxious to see something of the land to the south, but he looked dazed.

"Say, I want a job as a stenographer, not a ball player or a prima donna," he replied.

"Yes, yes, I know all that. But down there in Peru the men are living in a community separated from the rest of civilization by about one hundred miles of railroad track, running up the steepest grades in the world.

"To make good down there, where they have no amusements except the abilities of the men in the group, a man has to be able to do something else besides his job. There are movies, of course, and a club and occasional dances, but baseball and singing are the best forms of relaxation they get. And the superintendent wrote up last week and said he had lost the star shortstop for the upper mine team. He wants a man who can take his place."

"Well, now you put it in that light, I don't mind telling you," the applicant broke in, "that I do nothing else in my spare time but play baseball. That is, when I am not banging on the piano or singing in the glee club I formed in the last office I worked in."

He got the job.

Magnesium From Sea Water

That sea water contains small quantities of gold has been proved, and a large number of people, now sadder but wiser, have thought at various times that it could be profitably extracted. Gold will have to be worth considerably more than at present for this source to be utilized, but there is a possibility of other metals being obtained from sea water, magnesium for example. The new salt works which are now nearly ready for operation at Bergen, in Norway, it is said will produce 100 tons of metallic magnesium per year, the raw material being sea water, which contains about four-tenths of 1 per cent of magnesium chloride. In this country magnesium liquors obtained in the treatment of saline deposits have generally been wasted, as there was little demand for any product which could be made from them. Increased use of the metal in airplane construction, coupled with cheap electric power, no doubt induced the Norwegian company to undertake its manufacture. The company's "ore" reserves should be ample!

Stale News About the Weather

We have read a report of a certain rock in Mexico which changes color with the weather, thereby acting as a barometer for the neighborhood. The trouble with these color barometers is that they tell what we already know. When it is raining they say it will be wet, and when it is dry they indicate fair weather. It has also been our experience that ordinary barometers, as individual instruments, are poor weather forecasters. As the weather begins to look stormy, the barometer begins to go down. It is only when reports from different sections of the country can be compared that the reading is valuable. Even then the Weather Bureau has been known to make mistakes.

CONSULTATION

The Metallurgy of Ferromolybdenum

"Will you kindly tell me how ferromolybdenum and calcium molybdate are manufactured? Is there any literature upon the subject? Also, is there any market at this time for molybdenite concentrates containing 65 to 85 per cent MoS_2, and, if so, can you tell me where that market is, and what use is made of this ore, and about what price is obtained? What is the importance of the industry?"

Ferromolybdenum and calcium molybdate are generally manufactured in an electric furnace. During the early days of manufacture, the ferro-alloy was made from roasted molybdenite in a crucible, but this method has been superseded by reduction in the electric furnace. When the other source of molybdenum, wulfenite or lead molybdate is used, it is fused with soda ash and carbon to produce lead bullion and sodium molybdate slag. The slag is then treated in the electric furnace, carbon and suitable fluxes added, and the charge smelted to produce ferromolybdenum.

The principal methods of reducing molybdenum concentrates have been outlined by Keeney[1] thus:

1. Reducing the ore, concentrates running 60 to 70 per cent MoS_2 (molybdenite, wulfenite), or sodium molybdate slag, with carbon, excess of lime and fluorspar according to the reaction:

$$2MoS_2 + 2CaO + 3C = 2Mo + 2CaS + 2Co + CS_2$$

The reaction works out closely to the theoretical, and there is no difficulty in making a product containing about 0.1 per cent sulphur; the product will contain 1.3 to 3 per cent carbon. The crude metal may be broken up and refined with an oxidizing slag of iron ore, if a lower carbon alloy is desired. The quantity of iron in the ferromolybdenum is varied by the addition of iron turnings in the smelting furnace or iron oxide in the refining furnace.

2. Silicon metal may be used as a reducing agent according to the chemical equation:

$$MoS_2 + Si = Mo + Si + S_2$$

This method has been used in the production of 50 per cent ferromolybdenum, although when this grade of product is made ferrosilicon may be used. The addition of lime helps to slag the sulphur as calcium sulphide.

In using sodium molybdate slag to manufacture the alloy the following equation expresses the reaction:

$$Na_2 + MoO_3 + 3C = Mo + 3CO + Na_2O$$

According to Keeney, the use of sodium molybdate requires considerably more electric power than the other reactions, because very little reduction occurs until all free soda salts which may be in the slag are driven off. The regular grade of sodium molybdate slag used for this purpose contains 30 to 40 per cent MoO_3. The slag from the smelting of wulfenite crushed to about one-half inch pieces is smelted in a single-phase electric furnace of the Siemens type, lined with magnesite. Iron ore may be added to produce an alloy containing 60 to 65 per cent molybdenum.

[1]"Manufacture of Ferro-Alloys," R. M. Keeney, *Transactions* of the American Institute of Mining and Metallurgical Engineers, Vol. LXII, pp. 28-82.

If the ferromolybdenum contains 80 per cent molybdenum and under 1 per cent carbon it cannot be regularly tapped from the electric furnace, because of its high melting point. For this grade of alloy, a furnace of the knock-down variety must be used to facilitate removal of the bullion—slag being tapped out first and the metal dug out. A 50 to 60 per cent low-carbon product can be tapped and a considerable quantity of this grade is made in tapping furnaces.

The largest producer of ferromolybdenum in the United States produces two grades of ferromolybdenum, both containing 50 to 60 per cent metallic molybdenum. The "Regular" grade is guaranteed to contain a maximum of 2 per cent carbon and the "Special" 0.5 per cent. The "Regular" grade is the commoner. The calcium molybdate produced contains about 42 per cent of metallic molybdenum, with no free carbon or sulphur, the remainder being lime.

Ferromolybdenum is usually packed in kegs containing about 400 lb. net, whereas calcium molybdate is packed in sheet-iron drums or sacks.

Ferromolybdenum is added to the steel as a fixed addition. Nearly all of the molybdenum remains in the steel. It has been stated that the addition of ferromolybdenum produces the same effect as the addition of ferrotungsten, with the important distinction that lesser amounts of molybdenum are necessary. A high-speed steel ordinarily containing 18 per cent tungsten may require only 6 to 9 per cent of molybdenum and have the same properties. Proper heat treatment of the alloy-steel is necessary.

The production and sale of molybdenum concentrates has increased tremendously during the last six years, as figures given by the U. S. Geological Survey indicate:

	Quantity Sold, Pounds	Value
1914	1,297	$1,297
1915	181,769	114,866
1916	206,740	205,000
1917	350,200	495,350
1918	861,637	1,253,700
1919	(a)	(a)

(a) Survey not at liberty to publish figures, as there were less than three producers in 1919.

The molybdenum production of the United States is almost entirely confined to the large deposits of the Climax Molybdenum Co. at Climax, Col., near Leadville. The New York market for molybdenum at present is dull, and quotations made are purely nominal. Buyers maintain that 50c. is a reasonable market price for high-grade concentrates, whereas the seller's conception is 60c. per unit.

The literature on the metallurgy of molybdenum is scant. The article by R. M. Keeney, referred to elsewhere, is very informative. Bulletin 111 of the U. S. Bureau of Mines, "Molybdenum, Its Ores and Their Concentration," covers thoroughly the milling of molybdenum minerals, and contains a valuable and selected bibliography. It can be obtained for 30c. from the Superintendent of Documents, Washington, D. C. The U. S. Geological Survey in a pamphlet on molybdenum in 1918 gives a later bibliography upon the subject.

THE PETROLEUM INDUSTRY

The Diamond Drill as an Aid to Oil Prospecting

Methods Similar to Those Used in Determining the Extent and Value of Ore Deposits Offer Possibilities in the Petroleum Field—Considerable Saving Can Be Affected in Reducing the "Dry Hole" Hazard

By Albert H. Fay
Mining Engineer, Washington, D. C.
Written for *Engineering and Mining Journal*

THE diamond drill has been successfully used in prospecting for coal, iron, and copper deposits, and has made it possible to estimate closely the quantity, value, and actual dimensions of ore deposits having no surface outcrop. Therefore, why not use the diamond drill that has proved so successful in metal mining to locate geologic structures capable of containing oil?

The production of oil is rapidly approaching the stage where the best engineering talent must be brought into play. In the matter of recovery of oil from oil-bearing sands this industry lags far behind either coal or metal mining. Principles and methods that have been successful in actual mining must be extended to petroleum mining, so that the ultimate recovery shall be 90 per cent, instead of 15 or 20 per cent, as at present. Production costs per unit must be lowered by increased efficiency. Development costs can be lowered by reducing the number of needless dry "wildcat" wells, and this may be done by utilizing the diamond drill of the iron or copper country.

Lack of Surface Indications Hampers Exploration

The geologist and engineer realize the difficulty of tracing anticlines, domes, or terraces where surface outcrops are few or possibly not in evidence at all, as in the Red Bed country of Oklahoma, where the Red Beds are from a few hundred to 3,000 ft. thick. The oil companies also realize the excessive expense involved in thoroughly drilling a country so destitute of reliable surface indications as is central and western Oklahoma.

In checking up the logs of a few wells drilled in the Red Beds, it is noticeable that at varying depths of 300 to 800 ft. there is usually some one stratum that is sufficiently developed to be used as a horizon marker, at least over a small area, of four or five square miles, and perhaps as much as a township.

As examples of these reasonably reliable formations, may be cited the following: A well at Mulhall, Logan County, Okla., where 28 ft. of limestone was found at a depth of 335 ft.; near Oklahoma City, in Sec. 5-11-2, there is a 4-ft. bed of gypsum at 512 ft. and a 5-ft. bed of gypsum at 585 ft.; at Clinton, in Custer County, 12 ft. of gypsum was found at 102 ft. and 10 ft. at 402 ft.; in Sec. 23-18-4, Payne County, there is a 4-ft. stratum of hard limestone at 714 ft., and 10 ft. of hard limestone at 770 ft.; at Gate, Beaver County, is a gypsiferous limestone at 395 ft. followed by 12 ft. of white limestone; at Enid there is a limestone 2 ft. thick at a depth of 830 ft. Other instances could be cited, but the above data are sufficient.

Logs of Standard and Rotary Drillers Differ

It is not unreasonable to suppose that such distinct strata as are indicated above may cover an area of one to three miles in any direction from the drill hole as a center. However, other holes put down in the same section by a different driller may not show the same formation, by reason of lack of uniformity in the way drillers report their logs. A rotary driller would call gypsum a "soft" rock, whereas a standard driller would likely term it a "hard" or "tough" rock. Gypsum, being soft, cuts readily with the rotary type of drill, whereas with the standard tools progress depends upon the percussive effect of the drill upon the rock. A gypsum bed does not lend itself to shattering when struck, and especially so when confined under pressure, as in its original bedding. The true character of the rock may be established beyond doubt by the use of the diamond drill and a thorough study of the core which it is possible to obtain. There can be no mistake in the identification of rock specimens as obtained from drill cores; they are large enough to contain fossils if any are present and of sufficient size to be determined readily by the naked eye. Should this fail, the high-powered microscope will tell the truth, and the chemical laboratory may be used as a last resort. The diamond drill makes available a complete core from the surface to the bottom of the hole, except possibly where the formation is soft.

How can this be applied to structure study? A standard or rotary drill hole, at an enormous cost, reveals, at a depth of 3,000 ft., one of two things—a dry hole or an oil well. No structure is defined, for the hole represents only one point in a plane and a certain sand or rock at a specified depth. A second well near by may be a little deeper or shallower to show the same information. The two holes may indicate a monocline, or one limb of an anticline. It therefore requires at least another well of about equal depth to possibly show a structure, and the true structure may not be determined unless six or eight wells are drilled.

As pointed out in an excellent paper by George E Burton, of the Oklahoma Geological Survey, the money

spent for a standard or rotary drill hole 3,000 ft. deep is sufficient to put down twelve diamond-drill holes to a depth of 800 ft. This number of holes, judiciously placed, would determine with a reasonable degree of accuracy whether any well-defined structure existed, whereas with the churn drill it would be necessary to put down several additional deep holes to prove the territory good or bad. It will be seen, therefore, that by properly using the diamond drill for determining underground structure, a comparatively large area can be mapped at the cost of one deep test by standard or rotary drills.

Once a structure is outlined the standard or rotary drill would be brought into service and holes drilled according to underground conditions. It is not likely that the diamond drill would be used in drilling production wells, although the manufacturers are confident it is possible to make drills large enough to utilize a 3-in. casing at depths which extend from 3,000 to 5,000 ft.

Drill Holes Identify Stratum

The geologist should not relax his studies based on surface indications, but should assemble every evidence available that would indicate the possibility of a subsurface structure. This possible structure being partly identified, a series of four or five holes at intervals of 500 to 1,000 ft. apart, placed across the supposed structure, would be drilled by diamond drill to a stratum that could be considered as a reliable datum plane. The correct elevation of the horizon marker would be ascertained in each diamond-drill hole, and from these a fairly reliable contour or contours could be drawn and the structure defined. Two elevations would usually indicate an inclined structure, as a monocline or one limb of an anticline or syncline, and three or more would indicate the existence of an arch or dome. The stratum would, by reason of a good core, be identified absolutely, and the true structure indicated. If desired, holes at lesser intervals could be placed to determine still more detail and possibly identify and locate the crest of the structure, when production drilling would be initiated.

Diamond-drill work of this nature is being done in Illinois by some of the large companies, in co-operation with and under the direct supervision of the state geologist. It would seem that much money would be saved by adopting this method of prospecting instead of putting down so many "wildcat" wells where surface indications are unreliable. The Geological Survey of Oklahoma is collecting data on this subject by making a study of diamond-drill operations in exploring coal beds in the eastern part of the state. The Survey believes that such information will soon be of much value to the oil industry.

The sooner the operators realize the value of the diamond drill, just that soon will they reduce the "dry-hole" hazard, and thereby reduce development and production costs.

October Oil Production in U. S. Reaches Top Mark

THE following statistics of the production of petroleum in the United States east of California in October, 1920, and the two preceding months, based on reports filed with the U. S. Geological Survey, show the quantity of oil received from producers by pipe-line and other marketing companies and by refineries that receive petroleum through private pipe lines or in tank cars directly from the wells. Data concerning oil consumed on the leases and producers' storage cannot be obtained in time for use in the monthly reports, but are used in compiling the annual figures showing production. The production reported for California is the average shown by figures collected by the Standard Oil Co. and by the Independent Producers' Agency, and includes all petroleum brought to the surface.

Production of petroleum in the United States during October reached the highest mark yet attained, being nearly 40 million barrels, or 6½ million barrels more than in October, 1919. The daily average production exceeded that of September by more than 22,000 barrels. This increase in domestic production, however, was nearly offset by a decrease in net imports of Mexican oil, even though these exceeded 10½ million barrels. Fortunately, however, there was also a decrease in the daily rate of consumption, which resulted in an appreciable addition to stocks, amounting to more than half a million barrels during October. This net increase was nearly all in domestic stocks, the large losses in stocks of California, North Louisiana and Lima-Indiana grades being more than counterbalanced by increases in stocks of Oklahoma-Kansas and North Texas grades.

The production of Texas during October, amounting

PETROLEUM PRODUCED IN THE UNITED STATES IN AUGUST, SEPTEMBER, AND OCTOBER, 1920

(Barrels of 42 U. S. Gallons)

State	August, 1920 — Total	August, 1920 — Daily Average	(a) September, 1920 — Total	(a) September, 1920 — Daily Average	October, 1920 — Total	October, 1920 — Daily Average
California	8,997,000	290,226	9,128,000	304,267	9,459,000	305,129
Oklahoma	9,371,000	302,291	9,093,000	303,100	9,345,000	301,452

Kansas	3,721,000	120,032	3,615,000	120,500	3,605,000	116,290
Northern Louisiana	(b) 3,371,000	108,742	2,644,000	88,133	2,508,000	80,903
Coastal Louisiana	144,000	4,645	132,000	4,400	150,000	4,839
Wyoming	1,524,000	49,161	1,573,000	52,433	1,693,000	54,613
Illinois	924,000	29,806	903,000	30,100	870,000	28,064
Kentucky and Tennessee	775,000	25,000	766,000	25,533	760,000	24,516
West Virginia	688,000	22,194	672,000	22,400	673,000	21,710
Pennsylvania	640,000	20,645	626,000	20,867	646,000	20,839
Central and Eastern Ohio	469,000	15,129	453,000	15,100	446,000	14,387
Northwestern Ohio	189,000	6,097	187,000	6,233	182,000	5,871
Indiana	77,000	2,484	86,000	2,867	85,000	2,742
New York	76,000	2,451	78,000	2,600	82,000	2,645
Montana	(c) 9,000	290	37,000	1,233	56,000	1,807
Colorado	10,000	323	9,000	300	9,000	290
Total	39,397,000	1,270,871	37,889,000	1,262,966	39,838,000	1,285,097

(a) Revised. (b) Includes some petroleum drawn from producers' storage, which was produced in previous months, but not heretofore credited to production.
(c) Cat Creek field not included.

to 9,269,000 barrels, a daily average of 299,000 barrels, makes that state a close third in rank as compared with Oklahoma, whose daily average was 301,000 barrels, and California, with 305,000 barrels. Production increased during October in California, Wyoming, Montana, and New York as well as in Texas. Slightly decreased daily average production is reported for the other states.

Method for Determining Water in Petroleum*

The Pittsburgh petroleum laboratory of the Bureau of Mines has recently developed an improved method for the determination of water in petroleum emulsions which has been described in detail in an article entitled "A Convenient Method for the Determination of Water in Petroleum and Other Organic Emulsions," by E. W. Dean and D. D. Stark (*Jour. Ind. and Eng. Chem.*, Vol. 12, May, 1920, p. 486). It is a modification of the familiar procedure of "distillation with an immiscible solvent," the improvement consisting of the use of apparatus that is much more convenient than any previously employed. The method has been extensively employed for determining the water content of heavy fuel oils, but has been applied also to several other types of emulsions, including shale oils, tars derived from coal, greases, and mixtures of powdered coal, oil and water.

The equipment is, with the exception of two items, made of parts that are obtainable from the ordinary stock of chemical supply houses. The two exceptions are, (1) The so-called "distilling tube receiver," and (2) the electric heater. The former is an essential part of the equipment; the latter is a convenient accessory, but it can if necessary be replaced by a gas burner.

Evaporation of Petroleum Stored in Tanks

The results obtained from the many tank experiments, according to A. R. Elliott in the October number of *Reports of Investigations*, U. S. Bureau of Mines, emphasize the fact that evaporation of oil depends on its temperature and the amount of disturbance to which it is subjected. In open tanks much more oil will evaporate on a cool windy day than on a hot still day. A so-called "gas-tight" metal roof is better than one made of timber, because it is a better retainer of the gases that arise from the oil. The atmosphere above the oil in a tank is always saturated with oil vapors and absorbs more vapors only at the rate at which they are escaping through the roof. Therefore, in a tank with a gas-tight roof, as soon as the space above the oil becomes saturated, no more evaporation takes place.

When the sun heats the outside of an unprotected tank the oil and gas inside expand rapidly. In fact, in many of the oil fields the temperature is sufficient to distill the higher fractions from the oil while it is in the tank. This high temperature causes the expansion of the oil and gas and the generation of more gas, which in turn causes a pressure on the roof, resulting in the escape of gases through every accessible hole at a greatly increased rate of speed.

For maintaining a low temperature, the lagged or shedded tank was demonstrated to be the best protection, as it was surrounded by still air that made an excellent insulation. This tank, in consequence, also showed the least amount of loss by evaporation. The other kinds of protected tanks in the order of their low temperatures and decreased rates of evaporation were: (a) The water-sprinkled, white painted tank; (b) the water-sprinkled, black painted tank; (c) the glossy white painted tank; (d) the water-topped tank; (e) the black painted tank; (f) the oil-stained, loose-roofed tank. The rate of evaporation, it was noticed, decreased with the decrease in temperature of the oil under ordinary conditions.

The part of the oil that evaporates is gasoline, which is at the present time the most valuable part of the crude. Such data as were collected show the annual losses in large tankage to range from 5 per cent to as much as 25 per cent.

*Abstract of a paper by E. W. Dean and W. A. Jacobs in Bureau of Mines *Reports of Investigations*.

Recoverable Oil in Byproduct Sands*

A survey of the oil districts of California has been made by the Bureau of Mines, to ascertain whether the visible masses of wasted oil-bearing sands would be a profitable source of supply. From the data collected, it is estimated that 2,359,100 bbl. of oil, valued at more than $3,500,000, could be obtained from the sand piles about producing wells and from the outcroppings in the vicinity of the fields. Also, many times that amount of oil, scattered over nearly the total oil-producing area, might be recovered from seepage. Seepage, in this case, is the oil that is permitted to return into the ground or remain on the surface of oil-saturated ground.

As possible means of recovering a large amount of oil from these wastes, the following should be considered: Recovering oil left in the sand that is produced with the oil; reclaiming the oil that seeps into the ground through waste in production; and mining and treating the material in oil-bearing outcrops and asphalt beds that occur in some parts of the state.

*Abstract of a paper by A. R. Elliott appearing in Bureau of Mines *Reports of Investigations*.

Some Geography Maps Misleading

Geographers have long realized the advantages of making a series of maps of the world on a uniform scale. It is unfortunate for school children that the geographies do not show all countries by maps on a single, uniform scale, for unless a student observes carefully the figures showing the scale of each map or those showing the area of the country mapped, he is likely to get the impression that distant lands, which are generally mapped on a small scale, are smaller than those with which he is most familiar. For example, in maps of Australia most geographies show the country on a small scale—about one-third as large as that used for the map of the United States; yet Australia is in fact nearly as large as the United States—only about one-fortieth (2½ per cent) smaller. China is generally shown smaller in area than the United States, yet it is about one-third larger.

The preparation of maps of the entire world on a uniform scale of one to one million—that is, maps on which one unit (any unit—inch, centimeter, millimeter) represents one million like units on the ground—has been under way for several years, and the U. S. Geological Survey has made considerable progress in its work on the parts of this map that were assigned to the United States. The principle used in preparing these maps, if adopted by the publishers of school books, will make it possible to present to the student an accurate impression of the relative sizes of the countries of the world.

NEWS FROM THE OIL FIELDS

New Field in Texas Attracting Attention

From Our Special Correspondent

North Texas oil production is decreasing, the largest falling off being in the Burkburnett district and in Iowa Park, followed by Desdemona. This decrease is partly offset by an increase in the Eastland-Ranger district and by the new shallow wells in the Kemp-Munger-Allen section of Wichita County. These wells are only 1,500 to 1,600 ft. deep while the older wells produced from a sand at 1,750 ft. The new South Bend field in Young County is also producing, but has no pipe-line connections yet. Recently the No. 3 McClausky well of the Panhandle Oil & Refining Co. and the M. K. Graham well of the Oklahoma Petroleum Co. were completed, both making 800 to 1,000 bbl. per day. The McClausky No. 2 well is making 25,000,000 cu.ft. of gas daily. About 30 rigs are in place, several of them drilling. More than one sand is said to occur in this field between 1,875 and 2,250 ft.

The total production of the Texas Gulf Coast fields has decreased 20,000 bbl. from its peak of a few weeks ago. The major part of this decrease is in the West Columbia field. The big wells there are not only producing less oil but showing some salt water for the first time. The Hogg No. 49 well of the Texas Co. is making about 21,000 bbl., of which 25 per cent is salt water and sediment. All the wells in the Jackson 50-acre tract, or what is known as the north extension of the West Columbia field, are showing more or less salt water. The far east side of the old field continues to look good; there the production is found at about 3,600 ft. Productions from Hull and Goose Creek have also fallen off because no new wells have been brought in recently to offset the normal decrease. In general, development work on the Gulf coast is greatly hindered by wet weather and extremely bad roads.

Rock Creek, Wyo., Field Has 15 Producing Wells

From Our Special Correspondent

Well No. 4 of the Elk Basin-Ohio Oil Co. in the Rock Creek field came in recently making 600 bbl. and increased later to 1,200 bbl. This well is on Sec. 34, on land leased from the state. The field now has fifteen producing wells, four from the top sand, five from the middle, and six from the deepest sand, which is likewise the best producing.

The pipe line to Laramie is now carrying an average of 6,000 bbl. per day.

The Iowa-Wyoming Oil Co., now has a daily output of 1,000 bbl. from the Bolton Creek field south of Casper. Four more wells are being drilled by this company and four additional wells will be spudded in soon.

The Buck Creek well No. 29 in the Lance Creek field, at one time the largest producer in the field, gradually ceased flowing. Examination of the casing showed it to be choked with paraffin, and upon removal of this obstruction it began flowing again. A new joint well is being drilled here by the Buck Creek, the Ohio and the Western States Oil companies.

New producers have been completed recently in the Osage field by the Sinclair Co., Chugwater Oil & Gas Co., and the Arksarben Oil & Gas Co. The completion of the pipe line of the Illinois Pipe Line Co. has solved the transportation problem, and refining companies are now bidding for the field's production.

Mexican Oil Activities

From Our Special Correspondent

Another of Mexico's big producing wells have gone into the discard, Well No. 1 of the Empire Co. on Lot 114, Chinampa. This well has been showing a trace of sediment lately and on Nov. 21 went to 25 per cent salt water. The well was brought into production the later part of July this year and has been producing at the rate of 25,000 bbl. per day ever since that time. On the same day "Deacon" Thompson brought in his third well on Lot 114, Chinampa. This well is within eight hundred feet of the Empire well and will probably last about two months. The pay was struck at about 1,950 ft. When the lime was first encountered the well flowed under heads at irregular intervals, but at the end of four hours it was flowing quite steadily, throwing the oil several feet over the top of the derrick. The well was then shut in and a pipe line connected up to take the production at once. The well is good for a production of about 30,000 bbl. a day.

The Aguila Co.'s well on Lot 245, Amatlan, has been pinched in due to the showing of salt water. This well was good for 30,000 bbl. but is now flowing at the rate of 10,000 bbl. per day.

The Mexican Gulf Co. have the tools jammed in the hole on Lot 146, Amatlan, and it will be necessary to pull all the casing to withdraw the tools. The company was about ready to bring the well in when this accident happened. It will cause a delay of about a month in getting the production from the well, which will be a great handicap, as the Aguila Co. has a hole going down offsetting this well and the Cortez Corporation has a hole down 1,800 ft. on Lot 148 adjoining.

Lee County Leads in Kentucky Production

From Our Special Correspondent

A total of 746,818.61 bbl. of oil was produced in Kentucky during the month of October, according to a report recently issued by the Kentucky Oil Men's Association. This is the first complete report for one month's production that has been made in Kentucky, so no comparative estimate is possible. It is believed, however, that this represents the highest mark in production in the state thus far. Lee County led the list with 440,912.69 bbl.

Beverley & Ramsey struck a flow of gas on the Roberts farm in Johnson County and are nearing the sand with every indication for a big well. The well of J. K. Charles and associates on the Rice farm is in the sand with a good showing.

The well on the Waller lease, Warren County, is flowing at a rate of one and one-half barrels a minute. This lease is located southeast of the Madison lease. The Big Boone Oil Co. reports a good well on the Tarrants lease. The well flowed 400 bbl. the first twenty-four hours. Cramer and associates have drilled in their No. 2 well on the Bud Taylor lease, estimated at 100 bbl.

The Velvet Oil Co.'s No. 2 on the W. T. Bertram lease, Wayne County, came in and is estimated to be a 500-bbl. producer. This is the fifth big well that has been drilled in this territory in the past few weeks.

Heavy Flow Expected in Cat Creek Well

From Our Special Correspondent

West Dome Oil Co. financed by Con F. Kelley, president of the Anaconda Copper Mining Co., has brought in a production in the Cat Creek field of 350 bbl. daily, although the sands have not yet been reached. First reports were that the sands have been encountered, the oil rising to a heigth of 1,000 ft. in the casing. The bottom of the well is heaving heavily under the pressure shown and it is expected that the sands will be reached within 40 ft. Precautions are being taken to receive a heavy oil flow and until these are completed the sands will not be drilled into.

The Frantz Corporation, a subsidiary of the Elk Basin Consolidated, brought in its No. 4 well recently in the Cat Creek field, with an estimated production of more than 1,000 bbl. Some estimates placed its flush output as high as 2,500 bbl.

Ohio Oil Co., a subsidiary of the Standard Oil of Indiana, drilling in the Ragged Point field, southwest of the Cat Creek, has struck a heavy flow of wet gas.

Book Reviews

Political and Commercial Geology and the World's Mineral Resources. Edited by J. E. Spurr. First edition; cloth; 9¼ x 6; pp. 562. New York. McGraw-Hill Book Co., Inc., 1920. Price, $5.

This compilation is the fruit of a systematic, carefully thought out and applied study of the world's chief metal and mineral products, and of the political, industrial, and commercial factors controlling their production and distribution. The respective papers are by specialists in the technical subjects covered. In each chapter, the uses, geological distribution, geographical distribution, political and commercial control, and position of the leading nations are treated with respect to the metal or mineral discussed. During the war, the lack of such information in concrete, available form was keenly realized, and an effort was made under the direction of Mr. Spurr to compile the needed data. A series of confidential papers on the governmental and financial control of the world's mineral resources was published, but the information was not available to the general public. After the conclusion of hostilities, the papers were edited and condensed by Mr. Spurr, and are now published in this compact form.

Anyone who has had occasion, say, to investigate exactly what portion of the world's production of manganese Brazil is responsible for, or what the chief copper-producing interests in the United States are, or how deeply foreign capital is interested in Mexican lead production, has usually been forced to conduct exhaustive and time-consuming search in an effort to obtain such information; for most books, pamphlets, papers, and bulletins upon such subjects have failed singularly to give an all-inclusive and broad view. Usually, the information presented is of a dry statistical nature, and its correlation to the wider aspect of a world survey has ordinarily been disregarded.

The mineral resources of the world are presented in Mr. Spurr's book in logical order. First, a study of petroleum, an extraordinarily important fuel, is followed by coal and iron, "the backbone of all our mechanical achievements." Then come the metals used in steel making—chromium, manganese, and the rarer substances of the ferro-alloys. The major metals (exclusive of iron)—copper, lead, zinc, tin, antimony, and aluminum—follow. Next are presented the non-metallics, abrasives, and refractories — magnesite, corundum, mica, graphite, and others—followed by the important fertilizer group—phosphate, nitrogen, potash, pyrite, and sulphur. Last, but not least, the precious metals—gold, silver, and platinum—are treated; and a final survey, "Who Owns the Earth?" by Mr. Spurr, completes the volume.

The outstanding features of the book are its practicability and usefulness. With a minimum amount of effort at research, the business man or any one else interested in the world's mineral resources can quickly ascertain the principal economic features of any general mineral situation. It is a sound attempt at a practical adaptation of economic geology to commercial and general business uses, and it is unquestionably the only work of its kind extant. It should be upon the reference shelf or table of every man whose business or financial interests or professional needs require condensed and authoritative data on important commercial and financial matters with relation to the subjects treated, the volume being patently designed to serve both the commercial and professional requirements of all interested in the production, marketing, and utilization of commercially important metals and minerals, and in the political and commercial developments incident to the recurrent and recent attempts to direct their exploitation and control.

As with all pioneering, the hewing of a path is difficult, and it is only after the course has been definitely mapped and retrod that its roughness disappears. "Political and Commercial Geology" is essentially an initial attempt in a field untouched collectively by American authors, and for any minor shortcomings that the volume may possess, no apology is properly to be required.

No doubt, some users of the book may feel the need of a bibliography upon each subject, and others a few pages on minor minerals whose treatment is, by design, omitted in this first edition; or the lack of further information on an important subdivision of an article. To them, the brief notation on the title page of the work, "Royalties received from the sale of this book will be assigned to an institution of learning to finance further studies along the lines followed in this volume," should prove enlightening, as it furnishes an earnest that means will be provided for perpetuating the studies suggested by the work.

F. E. W.

Industrial Oil Engineering. By John Rome Battle. Limp binding, 5½ x 7½, pp. 1,131. J. B. Lippincott Co., Philadelphia, Pa. Price, $10 plus postage.

This book is a handbook of industrial oil engineering. It also deals with the practice of lubrication. Like many other handbooks, there is assembled in the volume a considerable amount of useful information related to the field. Of special interest to the mining industry are chapters on air compressors, mine-car lubrication, mine pumps, and air drills. Necessarily concise, treatment of these subjects is not sufficiently thorough to be of use in any more than a general way. It is a book, however, that should be of interest to the master mechanic as well as to the mechanical engineer.

G. J. Y.

Technical Papers

Colloids in Metallurgy—*Chemical Engineering and Mining Review* for October (90 William St., Melbourne, price 11d.) contains the first instalment (three pages) of an article entitled "Metallurgy From the Colloid Chemical Standpoint." Colloids are of more importance in physical chemistry than in metallurgy, but the author points out, among other things, the manner in which a study of this degree of dispersion of matter may help in reducing slag losses.

World's Zinc Trade—The November number of *Commerce Monthly* published by the National Bank of Commerce, New York, contains a six-page article on the "Zinc Trade of the World." America has become the world's chief source of zinc since Germany and Belgium have been practically eliminated.

Ontario Mining—Part III of the twenty-ninth annual report of the Ontario Department of Mines, Toronto, ninety-five pages, is devoted to the Ben Nevis Gold Area, the West Shiningtree Gold Area, the Matachewan Gold Area, the Argonaut Gold Mine and the Gowganda Silver Area. It is obtainable on request. Colored geological maps of the Argonaut Mine and West Shiningtree district are included.

Petroleum Bibliography — Bulletin 180 of the Bureau of Mines (for sale by the Superintendent of Documents, Washington, D. C., for 25c.) is a bibliography of petroleum and allied substances for 1917. The arrangement is similar to that of Bulletins 149 and 165 for the two preceding years, and includes references to published articles and patents throughout the world.

Alaskan Mineral Resources—U. S. Geological Survey Bulletin No. 712, 204 pages, obtainable upon request from the Survey, is a report of the investigations into the mineral resources of Alaska conducted in 1918. The first part of the book discusses the mineral production from the various fields in the years under review. Decreases are generally noted from the figures of preceding years. Other chapters are devoted to water-power investigations in southeastern Alaska; the Copper River nickel deposits; chromite on the Kenai peninsula; the Matanuska coal field; lode developments in the Willow Creek district; placer mining in the Tolovana district, and mining in northwestern Alaska. A few sketch maps are included.

Sewage Disposal—Bulletin No. 6 of the Purdue University Engineering Experiment Station (Lafayette, Ind.) is a thirty-five-page pamphlet discussing sewage disposal for small or isolated dwellings and small institutions. The information has a valuable application in many small mining camps.

ECHOES FROM THE FRATERNITY

Concrete Mixing Studies Summarized

Water Must Be Carefully Chosen and Proportioned — Thorough Mixing and Protection Early Demanded

[Lieut.-Col. H. C. Boyden's address to the Engineers' Club of San Francisco on "Recent Developments in Concrete" held the interest of so many engineers that we here present an all too brief abstract of his report on experiments in mixing concrete.]

The studies indicate that it is best to consider concrete's ingredients as cement, aggregate, and water. There is no particular advantage in dividing the aggregate into "fine" and "coarse," and it would be much better to consider the aggregate as a whole, with proper proportions of various sizes. The fine aggregate should be "hard" rather than sharp, as sharp sands give lower results than rounded or smooth sands. It is of great importance that the aggregate is actually clean, and free from vegetable matter. An appropriate test should be applied to determine this condition. Again fine sand behaves as coarse sand except that it requires more water to produce a plastic workable mixture. The excess of water reduces the strength of the concrete. Concrete with the same quantity of water, providing a plastic mix is obtained, would be of the same strength whatever the grading of the sand.

When studying the characteristics of the coarse aggregate one conclusion has been brought out sharply; namely, that the hardness of the aggregate is a secondary consideration as compared with other factors in developing high crushing strength in concrete, and of less importance than ordinarily supposed in developing wearing qualities.

The reason for high compressive results where a light, soft aggregate is used, is the reduced water content, due to the porosity of the aggregate. The water content is found to be the governing factor.

The remaining ingredient, water, is of equal importance with the cement in obtaining good concrete, and yet it is generally not mentioned in specifications and frequently not even reported in test data. It is safe to say, however, that strongly alkaline waters should not be used and marsh water should be looked upon with suspicion until tested in concrete and found satisfactory.

The temperature of the mixing water was found to have very little to do with the strength of the concrete at seven days to one year. Hot water may be safely used in removing frost from the aggregate.

Proportioning

The present method of using arbitrary volumes is wrong. There is one single proportion which will give the best results with a certain mixture of given fine and coarse aggregate. The water-ratio, the ratio of volume of water to the volume of cement, is the most important element of a concrete mix. If one cubic foot of water (7.5 gal.) is used for each sack of cement, the water ratio is 1:1. The use of more cement in a batch does not produce any beneficial effect except to reduce the water ratio for a workable mix.

Fineness Modulus

The fineness modulus is a very simple function of the sieve analysis of the aggregate used for any particular concrete. The sand and stone are analyzed with a set of Tyler standard sieves, each one of which has a clear opening double the width of the next smaller. The following sizes are used: 100, 48, 28, 14, 8, 4, $\frac{3}{8}$ in., $\frac{3}{4}$ in. and $\frac{1}{2}$ in. The percentages (by volume or by weight) of the total aggregate coarser than each sieve are added together, the sum of these percentages is divided by 100 and the result is the fineness modulus. The fineness modulus of any combination of the fine and coarse aggregates may be found in exactly the same manner.

In order to make this more easily available to the engineers of the country, Prof. D. A. Abrams has worked out a table[1] containing 135 proportions with different combinations of aggregates, which if used with materials acceptable as to quality, will give a concrete with a compressive strength, at twenty-eight days, of approximately 3,000 lb. per square inch. In conformity with present practice, the aggregate is divided in the table into fine and coarse, and covers combinations of five classes of fine aggregates with twenty-seven classes of coarse aggregates. This table shows a considerable reduction in the amount of cement required as compared with previously published tables, especially when combined with the larger sizes of aggregates.

Water Content

A study of the water content has brought the most radical change in the design of concrete mixtures. There is probably no other one factor which has so great an effect upon the strength as the water content. It has been found that the less water used, down to a certain point, the stronger will be the concrete, but in actual construction one may not reduce it to the point giving the maximum strength shown in laboratory tests. The workability of the mix must also be considered, and in general terms the lowest amount of water should be used that will give a workable mix. In a one-bag batch the addition of one pint of water more than is necessary to give a workable mix produces the same loss in strength as if we had left out two or three pounds of cement. On the other hand a very lean mix with a small amount of water will not give as strong a concrete as a rich mix with the same amount of water. This is because it will require a higher water ratio to produce a workable mix with the lean mixture, thereby causing a loss in strength.

The very wet, sloppy mixtures that are being used in building construction are extremely wasteful, 50 to 60 per cent of the possible strength of the concrete being thrown away. By cutting down the water to the proper ratio, a factor of safety of five or six can be secured, and the allowable unit stress raised.

Slump Test

A simple method for determining the proper consistency in the field is the slump test. A frustum of a cone 4 in. at the top, 8 in. at the bottom and 12 in. high has been adopted as a standard. This cone is filled with the concrete to be tested, which is carefully worked with a metal rod while it is being placed, the form is immediately lifted off, and the amount of settling or slump measured. The proper slump for a mixture to be used for a concrete road surface is from $\frac{1}{2}$ to 1 in.; for mass work, from 1 to $1\frac{1}{2}$ in., and for walls with reinforcing bars, $1\frac{1}{2}$ to 2 in. In some classes of reinforced concrete work it may be deemed advisable to sacrifice a portion of the compressive strength of the concrete in order to obtain increased plasticity, in which case a slump of from 4 to 6 in. may be used, but in no case should it exceed 6 in.

Manipulation of Ingredients

It is necessary to mix the concrete at least sixty-five seconds. There is no question as to the advisability of using a batch meter on the mixer, provided one can be found that cannot be tampered with, in order to avoid controversy over the time of mixing and to insure a full minute mix for all ingredients together. The speed of the mixer within limits of 12 to 25 r.p.m. has but slight importance.

The time that can be allowed between the time of mixing and the time of placing has not as yet been made the subject of extensive tests at the laboratory. It is undoubtedly governed to a certain extent by the kind of cement used, by the temperature of the ingredients, and by the temperature of the mixed concrete. The economical haul for the job will be the governing factor rather than the fixing of a time limit.

Protection

The proper protection of concrete during the early hardening period is too often overlooked and frequently indifferently carried out. The essential re-

[1] These tables are issued by Portland Cement Association, 111 West Washington St., Chicago, Ill.

quirements for proper hardening are warmth and the presence of moisture, especially the latter. The tests showed a less increase in wearing resistance and strength after twenty-one days have elapsed, and a constant rate of increase during this period. The forms and all exposed surfaces should be kept thoroughly wet, or at least very moist continuously for not less than fourteen days, and whenever possible for twenty-one days or more.

Barytes Market in England

Harrison Watson, Canadian Trade Commissioner in London, in reply to inquiries from Nova Scotia as to the feasibility of shipping Canadian barytes to Great Britain, states that several firms have expressed a willingness to handle Canadian barytes of a quality suited to the market, if prices are competitive. Before the war the chief source of supply was Germany, and though home manufacturers have since largely increased their output the domestic supply is far below the demand. Imports during 1919 amounted to 408,248 cwts., valued at £241,896, the principal sources of supply being Spain and the United States. The demand is solely for the ground and refined article, and although there are considerable deposits stated to be of high quality in the Maritime provinces and others parts of Canada development and production have so far been small. Were the industry developed competition in the British market at present prices is considered feasible, but with a drop in prices the cost of transportation would make it difficult for Canadian barytes to be laid down in England at a profit to shippers.

Geologic Instruction in Demand at Oklahoma University

The session of 1920-21 at the University of Oklahoma promises to be a banner year for the Department of Geologic Engineering, which reports an enrollment of a thousand students and the addition of three teachers to its faculty. Both laboratory and classroom space has become altogether too cramped for the purposes of good instruction. Additional accommodations will have to be provided in the immediate future if students are not to be inconvenienced. The quality of work is being improved in all courses this year, and new special courses are being offered. Director Joseph B. Umpleby announces, among other important innovations, instruction in special microscopic study of oil-well cuttings. The Roxanna Oil Co. has contributed a large number of cuttings from the Healdton field, and it is hoped to secure material from other fields through other companies. New courses by new instructors are the economic geography of the United States, Oklahoma, and Latin America, by C. J. Bollinger; economic geology and mineralogy, by O. F. Evans; and stratigraphy, by R. A. Wilson.

Eastern Canadian Provinces Desire Control of Natural Resources

The question of transferring to the Provinces of Manitoba, Alberta and Saskatchewan the control of their natural resources, now exercised by the Dominion government, is being brought prominently forward, and unless settled in the meantime will become an issue at the next general election. The Dominion government has expressed its readiness to make the transfer as soon as the terms can be agreed upon by the other provinces. The eastern provinces contend that they have an interest in the matter, having paid for the lands when they were taken over from the Hudson Bay Co., and that the western provinces now receive annual cash subsidies from the Dominion as compensation for the revenue which would otherwise be derived from the public domain. They claim that if the western provinces are granted control of their natural resources the subsidies received by the other provinces should be increased. Several inter-provincial conferences held from time to time have considered the question without coming to an agreement, and it is intimated that another conference will be called, in view of the action of the government of Alberta, which is preparing to press its claims by a law suit.

Mica from South America

The imports of mica from South America prior to the war were practically negligible, according to *The World's Markets*, relatively and as an item of trade exchange, but the war stimulus directed attention to the possibilities of securing regularly a part of the large imports of this special raw material from this new source of supply. The principal countries which are now known to have available deposits of mica of desirable quality and size for import are Brazil and Argentina. In Brazil the deposits, mainly in the contiguous states of Bahia, Goyaz, Minas Geraes, and Sao Paulo, are extensive and are now fairly accessible to railroads for transport to the ports. The quality is good and compares well with the Indian mica. Some of the large plates are 20 x 10 in., and large supplies of material 6 x 6 in. are procurable.

In the interior Province of Goyaz mica is so plentiful that the natives have used it for window panes from time immemorial. The output of the Brazilian mines is steadily increasing. The proportion coming to the United States has always been large and is becoming greater. There is a prospect of a steady and increasing supply of good mica from Brazil if the American buyers will take the trouble to encourage the relation and to seek out the producers, who are not well advised as to market requirements.

The Argentine mica deposits are mostly in the mountain provinces of Cordoba and San Luis. They are not systematically developed, and the shipments so far made have not been of so good a quality as those from Brazil.

Brazil produced from 1902 to 1913 about 113 short tones of mica. In 1916 the production was 59 tons; in 1917 106 tons, and in 1918 and 1919 the output was estimated at 135 tons yearly. The Argentine production began in 1908 and increased to 70 tons in 1917 and to 80 tons in 1918.

Small shipments of mica from Peru were made during the war, and irregular shipments have come from Guatemala for a number of years. The product of the latter country has a green shade and is not so desired for some purposes as other grades in the market.

Institute of Mining & Metallurgy Awards Two Medals

"In recognition of his eminent services in the advancement of metallurgical science, with special reference to the metallurgy of gold," writes C. McDermid, secretary, "the gold medal of the Institute of Mining & Metallurgy, London, England, has been awarded to Sir Thomas Kirke Rose, D.Sc., Assoc. R.S.M., M. Inst. M. M. This is the highest distinction in the power of the council to bestow.

"The gold medal and premium of forty guineas founded by the Consolidated Rand Gold Fields of South Africa, Ltd., the council has awarded to H. Livingstone Sulman for his paper 'A Contribution to the Study of Flotation,' which was published in the Transactions of the Institute, Vol. 29, 1919-20, and discussed in the Bulletin in 1919 and 1920."

Brief Course for Highway Engineers Offered by U. of P.

In anticipation of a greatly increased demand for engineers, as a result of the many millions of dollars now becoming available for highway construction, Towne Scientific School, of the University of Pennsylvania, is offering a "Brief Course in Highway Engineering," for men who have had experience in highway construction, and who desire to become familiar with recent methods in design, construction, and material testing. This course will be given from Jan. 24 to Feb. 11, 1921. The first two weeks of the course will be devoted to intensive instruction in highway engineering, a study of engineering materials, the design and construction of highway structures, and the testing of materials used in road construction. The third week of the course will be devoted to a Highway Engineering Conference, at which papers will be given by eminent specialists on all the phases of the design and construction of roads. A copy of the bulletin describing the course may be secured by addressing Prof. M. S. Ketchum, Department of Civil Engineering, University of Pennsylvania, Philadelphia, Pa. The program of the conference will be ready about Dec. 15.

MEN YOU SHOULD KNOW ABOUT

Representative Marion E. Rhodes of Potosi, Mo., has been selected as chairman of the Committee on Mines and Mining.

H. R. Robbins has been visiting iron-ore dressing plants in Minnesota, Ontario, and Pennsylvania.

J. M. Libbey, manager of the Arizona United Mining Co., has gone to Mexico to examine mining property.

Capt. C. G. Collins has been examining the C. Amory Stevens ferromanganese property at Silver City, N. M.

M. W. von Bernewitz has rejoined **W. H. Weed** in compiling Vol. 15 of "The Mines Handbook," at Tuckahoe, N. Y.

A. R. Gordon, manager of the New York & Honduras-Rosario Mining Co., San Juancito, Honduras, is in New York City.

Col. John C. Greenway, of the Calumet & Arizona, is inspecting recent developments at the 85 Mine, at Lordsburg, N. M.

H. Foster Bain, mining engineer, landed in San Francisco, Cal., on Nov. 27, and was expected to reach Washington, D. C., early in December.

James W. Swent, mining engineer of the State of Coahuila, Mexico, is surveying new claims in the San Dimas district for E. H. Townsend.

Errol MacBoyle, mining engineer, of San Francisco, Cal., went to Mexico early in November. He will examine a number of mining properties.

Robert Linton, president of North Butte Mining Co., who has been in Butte, Mont., looking over the properties of the company, has returned to the East.

Alfredo Frey, mining engineer, formerly of Mapimi, Mexico, has moved with his family to San Juan de Guadelupe. He is operating mines in the Reyes district.

Henry Hinds, petroleum geologist, formerly with the Geological Survey and more recently with the Sinclair Oil Co., is now with the Pantoteck Oil Co. of New York City.

G. F. Loughlin, head of the division of Mineral Resources of the U. S. Geological Survey, has completed a reconnoissance of the recent development in the Tintic district of Utah.

Andrew White Newberry, mining engineer, of New York City, is on a brief visit to his home prior to an early departure for Nicaragua, where he will examine some mining properties.

Enoch Henderson, superintendent of the Franklin Mining Co., has returned to Houghton, Mich., from Detroit, where he was temporarily connected with the Rockwood Silica Sand Co.

Rush T. and Harley A. Sill, mining engineers of Los Angeles, Cal., have gone to Arizona and Mexico to examine several properties. They expect to return to Los Angeles about Jan. 1.

F. W. Sperr, professor of mining engineering, Michigan College of Mines, has been selected as chairman of the recently formed informal organization of Copper Country mining engineers.

Lyman F. Barber, recently of Prescott, Ariz., is now in charge of the construction of the C. O. D. Mining Co.'s new mill at Kingman, Ariz., where he should be addressed, care of P. O. Box 173.

C. B. Holmes, formerly chief auditor for the War Mineral Relief Commission, has formed the firm of C. B. Holmes & Co., consulting mine, mill, and smelter accountants. His office is 434 Continental Trust Building, Washington, D. C.

Bradley Stoughton, of New York City, spent Nov. 28, 29, and 30 in Houghton, Mich., where he addressed a meeting of mining engineers at the Houghton Club. **L. D. Cooper**, of Minneapolis, Minn., accompanied Mr. Stoughton.

A. W. Tucker, consulting mining engineer, of Salisbury, N. C., has completed his work with the Bureau of Mines in connection with the War Minerals Relief claims, and is resuming private practice in matters relative to mineral deposits of the Southern Appalachians.

J. C. Hartness, formerly superintendent for the Bowe-Burke Mining Co., has resigned his position and will open an office in Eveleth, Minn., as a consulting engineer. For the last two years Mr. Hartness has had charge of the Burns, Moriska, and Morrow mines for the Bowe-Burke company.

Arthur Howe Carpenter, formerly of Denver, who was for some years assistant research chemist for the American Vanadium Co., Pittsburgh, Pa., and more recently metallurgist for the Colorado Vanadium Corporation, Sawpit, Col., has accepted a position as professor of metallurgy at the Armour Institute of Technology, Chicago, Ill.

Fritz J. Frank, vice-president of Iron Age Publishing Co., has been elected its president, following William H. Taylor, president and general manager for more than ten years, who is resigning because of ill-health.

William H. Taylor came to *Iron Age* as general manager when it was sold by David Williams. Mr. Taylor already had fifteen years' experience with trade and engineering publications. For a time he was vice-president of the McGraw Publishing Co., and, later, president of the Taylor Publishing Co., of Chicago, which consolidated *The Engineer* and *Steam Engineering*. He and his associates, on acquiring *Iron Age*, elevated the hardware department of that journal into *Hardware Age*.

Fritz J. Frank, who succeeds Mr. Taylor, has been with the Iron Age Publishing Co. since 1910, after an active association with other trade publications, including *Colliery Engineer* and *Mining & Scientific Press*.

SOCIETY MEETINGS

The Society of Economic Geologists holds its first annual meeting at Chicago, Ill., Dec. 28 to 30, 1920, in conjunction with the meeting of the Geological Society of America. Society headquarters and a registration book will be at Rosenwald Hall, University of Chicago.

OBITUARY

Emilio Stalknecht, mining engineer, of Parral, Mexico, and widely known throughout northern Mexico, died there the third week in November. Mr. Stalknecht had held important positions with various mining companies in Mexico, but met with a serious mine accident several years ago, injuring his health and eventually causing his death.

Regis Chauvenet, mining engineer and president emeritus of Colorado State School of Mines, died on Dec. 5, at Denver, Col., in his seventy-ninth year. Professor Chauvenet, who was born at Philadelphia, Oct. 7, 1842, graduated with the B.S. degree from Harvard in 1867; became chemist to the Missouri Geological Survey in 1872, and took the chair of chemistry and metallurgy at the Colorado School of Mines in 1883. From 1883 to 1902 he also served that school as its president, resigning in the latter year to resume private practice as mining engineer. In 1911 he published his volume "Chemical and Metallurgical Calculations."

While engaged in geologic work in northwestern India for S. Pearson & Son of London, **Ralph W. Howell**, formerly with the Land Classification Board of U. S. Geological Survey, was killed by savages in the Baluchistan-Punjab district. The British authorities have offered a reward of $5,000 for the arrest of those responsible for Mr. Howell's death. Mr. Howell served with the Geological Survey from 1913 to 1919. In October, 1919, he had been granted a leave of absence to accept a position offered him by the British oil concern, and had worked for them with D. Dale Condit, oil geologist, in British North Borneo early in the present year. Mr. Howell was a native of Washington, D. C., and the only son of the late Edwin E. Howell, a naturalist and geologist distinguished for his geologic relief maps of the chief physical features of the United States. Young Howell was a past student of Columbian College (George Washington University), at Washington, and was only thirty-four years old at the time of his death.

It is understood that **D. Dale Condit**, chief of Mr. Howell's party at the time of the attack, has escaped to safety.

THE MINING NEWS

The Mining News of ENGINEERING AND MINING JOURNAL is obtained exclusively from its own staff and correspondents, both in the United States and in foreign fields. If, under exceptional conditions, material emanating from other sources is published, due acknowledgment and credit will be accorded.

LEADING EVENTS

Annual Report of the Mint

Decrease in World's Gold and Silver Production—Mints of the Country Made a Record Coinage in 1919-1920

The annual report of the Director of the Mint, just made public, states that during the fiscal year ended June 30, 1920, the mints of the United States manufactured more coin than during any other year in their history; and Mr. Baker states that they are still running twenty-four hours a day to keep up with the enormous demand. The total number of pieces executed in the last fiscal year was over 809½ million, of which about 76 million pieces were for foreign governments, the balance, over 733½ million pieces, being domestic. The total exceeded by 43 million pieces the previous high record, made in the fiscal year 1918; it exceeded the record of 1915, a normal year, when 148 million pieces were made, by 446 per cent.

The seigniorage (profit incident to greater face value of coin than cost of metal contained) on silver coin below the dollar piece amounted to over $3,896,000, and on five-cent and one-cent pieces exceeded $8,218,000, giving total profits on coinage during the fiscal year of over $12,114,000. No silver dollars have been made since 1904. Gold coin to the value of $16,990,000 was made last year, this being the first domestic gold coin (other than memorial issues) minted since 1916.

The world production of gold during the calendar year 1919 is estimated by the Director of the Mint to have been $365,166,077, a reduction from that of 1918 by about $18,500,000. The production of the United States was $60,333,400, or about $8,000,000 less than in 1918. The gold consumed in the arts and industries of the United States during 1919 is stated to have been $75,490,349, of which $56,135,951 was new material. By far the larger part of gold consumed in domestic industries is purchased from the New York Assay Office, New York being the center for industries using gold. The electrolytic refineries of the Mint and Assay Service produce metal of very high fineness, above 999/1000 pure, much desired by industrial users.

The world production of silver in the calendar year 1919 is estimated to have been 174,517,414 oz., a reduction from that of 1918 by about 23,600,000 oz.; domestic production of the United States was 56,682,445 oz., a reduction of over 11,000,000 oz. from the output of 1918. It will be noted from the above that the United States produces about one-third the world's silver. Domestic silver consumption in the industries continues high, over 26¾ million ounces of new metal having been used during 1919.

The gold monetary stocks of the principal countries of the world at the end of 1919, as compiled from data available to the Director of the Mint, aggregate $8,339,185,000; silver totals $1,877,691,000; and unclassified metal, $576,208,000. Paper currency stock totals $69,929,698,000.

WEEKLY RÉSUMÉ

The annual report of the Director of the Mint estimated the world's gold production at $365,166,077 and silver production at 174,517,414 oz. in 1919, a decrease from the previous year. The mints of the country have been running to capacity. A labor and power shortage combined with low metal prices has caused a slump in Cobalt mining activities. The Temiskaming mine has ceased operations. The Lake shipping season is practically complete, and few boats remain to be loaded. The International Nickel Co. intends to cut production of bessemer matte to 2,000 tons monthly. The Minnesota Fair-Tax Association will protest the tonnage tax in Minnesota. Congress is being pressed by Colorado miners to increase the time for completing assessment work. International Mining Congress to meet in Portland early next year.

Unemployment is creating a problem in Arizona. Salt has been discovered in Northern Alberta. The students of the University of Utah have organized a mining society.

A Congressional effort is to be made to reduce the needlessly large number of Federal Agents in Alaska. The War Minerals Relief Commission is expected to conclude its work in three months, with an unappropriated balance of over $5,000,000. The Bureau of Mines and Geological Survey ask increased appropriations for the fiscal year 1921. Manufacturing and interest in the non-metallics is increasing in the West. American capital is urged to seize in foreign lands opportunities that are being captured by other countries.

I. C. C. Holds Up Increased Sulphur Freight Rates

Proposed increases in the rates on sulphur in carloads from Sulphur Mine, La., to the principal points of shipment have been held up by the Interstate Commerce Commission pending an investigation of the proposed increases. The proposed schedule reduces the minimum weight from 80,000 lb. to 40,000 lb. The increase amounts to 10c. per hundred pounds to representative destinations.

Slump Noticeable at Cobalt

Labor and Power Shortage, Combined With Low Metal Price, Causes Curtailment in Canadian Camp

The recent decline in the price of silver has had a serious effect on the Cobalt camp, and this, together with the shortage of power, is already showing results. The Temiskaming mine has ceased operations until spring. The company had developed a considerable tonnage of medium-grade ore, which was profitable at higher prices of silver, but which cannot be handled at a profit under present conditions.

The directors of the Mining Corporation have passed the regular quarterly dividend of 12½c. per share, which would ordinarily have been paid on Dec. 15. The directors issued a statement in which they said that the net earnings from Jan. 1 to the end of September were slightly less than the amount disbursed in dividends during the period and that the earnings for the current quarter would not be sufficient to justify paying a dividend for the quarter. The reduced earnings were due to a shortage of labor for the first nine months of the year and to a shortage of power in the last three months; also to a heavy decline in the price of silver without any decrease of the cost of production.

The McKinley-Darragh has also passed the regular quarterly dividend of 3 per cent, which would ordinarily have been paid on Jan. 1. This company has sold no bullion since last June, and, as a consequence, a considerable portion of the cash surplus has been tied up in this manner.

With the surplus of labor there has been a marked increase in efficiency, which has helped, to some extent, to offset present conditions, but, unfortunately, not enough to make operations at most of the mines profitable. As a matter of fact, probably not more than three mining companies in Cobalt can operate at a profit under present conditions.

Lake Shipping Season Practically Complete

The ore season is practically over for the Lake Superior iron mines, as few boats remain to be loaded at any of the docks. All insurance expires for the boats on Nov. 30, which officially closes navigation on the Great Lakes, although indications are that the closing of the season may be postponed for a period of ten days or more. Ex-

tension of insurance on Lake carriers depends upon weather conditions at the close of the official season.

At the Missabe docks of the Duluth and Superior harbor the last boat cleared on Nov. 30. Only three boats remain to be loaded at the Allouez docks of the Great Northern. The Northern Pacific and Soo docks in Superior have already closed their seasons. The Ashland, Wis., ore docks of the North-Western are still loading, and at present have fifteen boats to load before the close of the season. The boats of the Pittsburg Steel Co. generally close their season Nov. 15, but owing to the heavy demand for ore at the blast furnaces they are pushing their vessels later than usual. It is reported that the North-Western docks will keep their ore supply moving as long as boats can get in and out of the harbor. The Duluth & Iron Range docks at Two Harbors closed on Nov. 27.

The amount of ore handled this season at the Allouez docks of the Great Northern R.R., according to the officials of the Peppard and Fulton contracting firm, which handles the ore for the railroad, has been one of the greatest in the history of local maritime circles. The tonnage will exceed 12,500,000 of ore shipped during the season, exceeding the 1919 shipments by more than 3,500,000.

Extensive repairs and new construction are to be carried on this winter on the Allouez docks. The outer portions of dock No. 3 are being rebuilt and a new approach to dock No. 1 is under construction.

Further Cut in Production at Copper Cliff, Ont.

The International Nickel Co., Copper Cliff, Ont., has decided to curtail operations further. About a month ago the production of bessemer matte was cut from 4,000 to 3,000 tons per month and it is now to be reduced to 2,000 tons. Two blast furnaces will be operated, in addition to the one reverberatory. Curtailment will also be made at the Creighton mine to accord with the reduced smelter production. Labor is no longer scarce and the company is releasing the less desirable workmen. A great increase in labor efficiency has been noted since the supply became more plentiful.

Association To Protest Tonnage Tax in Minnesota

A strenuous campaign has been mapped out by the Minnesota Fair Tax Association, in southern Minnesota, to convince that part of the state that a tonnage tax is unjust and unfair to the entire state. G. H. Lommen, of Biwabik, Minn., is presenting arguments against the tonnage tax and meeting with various organizations in the southern part of the state, and it is the plan of the association to conduct an aggressive campaign until the Legislature meets. To this end a large force of speakers will be in the field in the near future throughout the lower half of the state.

Occurrence of Salt Proved in Northern Alberta

Drilling operations carried on under the direction of the Alberta government at Fort McMurray in the northern part of the province have definitely proved the occurrence of an extensive bed of high-grade salt, the well having been sunk through 30 ft. of pure salt at a depth of 650 ft. The well was begun about twelve months ago but the work has all along been attended with mechanical difficulties. At the present time with the drill in the salt vein to a depth of 35 ft. work has again been halted owing to trouble with the equipment. The strike bears out the opinion of geologists that a large field of salt occurs along the Athabasca River in the McMurray region.

Colorado Miners Petition for More Time

Petitions are being circulated and signed by mining claim owners in Colorado, asking Congress to extend the time for completing assessment work from Jan. 1, 1921, to June 1, 1921. It appears that it has been particularly difficult this year to secure miners to perform the necessary work to keep mining claim locations in good standing, because the men find it more congenial to work at lower altitudes, and where high wages are offered for less strenuous work. For example, coal-mining companies have been paying wages of $10 per day, and even more in some cases, and, as a result, the metal-mine operators have been unable to secure the men for assessment work. Metal mine owners do not ask for exemption from assessment work, but simply sufficient extension of time to protect their properties against mining claim jumpers, who are likely to be active in many localities under the present circumstances. It is understood that Congressman W. N. Vaile will prepare and introduce a resolution designed to secure relief.

Unemployment a Problem in Arizona

The local smelting plants at Douglas, Ariz., are receiving little custom ores, either in copper or silver. Small properties throughout southern Arizona are stopping operations, being unable to pay expenses on any but the best of ores, such as ordinarily would not be taken out in the course of development. All over the state a general shrinkage of mining operations is noticeable. For the first time in years unemployment has become a problem, hundreds of miners having been dropped in a season when there can be no relief further north. In Sonora the unemployment problem would be a serious one had not there been a draft of about 12,000 laborers for the cotton fields of the Salt River Valley and other Arizona points.

The Dolores and La Paz mines in San Luis Potosi, Mex., have been obliged to close, owing to a lack of fuel.

International Mining Congress Organized

Organization of the executive committee for the International Mining Convention to be held at Portland, Ore., early in 1921 has been completed. Henry M. Parks, director of the Oregon Bureau of Mines and Geology, is general chairman, and Robert M. Betts, general manager of the Cornucopia Mines Co., is secretary. The following sectional representatives have been chosen: Western British Columbia, Hon. William Sloan, Minister of Mines; A. M. Whiteside and Nichol Thompson; eastern British Columbia, S. S. Fowler, of Riondel; Fred A. Starkey, of Nelson, and J. P. McFadden, Sandon. Alaska is represented by G. T. Jackson, of Juneau, and Col. B. F. Millard; eastern Washington by L. K. Armstrong, of Spokane; western Washington, M. J. Carrigan, of Seattle; northern Idaho, Stanly Easton, of Kellogg; and southern Idaho, by Robert N. Bell. Chairman Parks in a communication says that exact dates have not been set, but early April may be selected.

Utah Students Organize Mining Society

Students of the school of mines of the University of Utah and the department of geology have organized a society, which is to be known as the Utah Mining and Metallurgical society. The organization will petition for affiliation with the American Institute of Mining and Metallurgical Engineers. Thomas P. Walsh, a junior associate member of the American Institute of Mining and Metallurgical Engineers, was elected president; John F. Byrne, vice-president; and R. R. Hall, secretary and treasurer. An executive committee was formed, consisting of Dr. R. H. Bradford, of the metallurgical department; Dr. F. J. Pack, of the geological department; Prof. R. S. Lewis, of the mining department; Thomas Varley, superintendent of the Salt Lake station of the United States Bureau of Mines; J. T. Norton, ore dressing engineer, Salt Lake station.

Alberta Coal Mine Quadruples Tonnage

It is understood that the developments at the Blue Diamond coal mines, in Alberta, which were purchased recently by the McIntyre and Temiskaming companies, have been satisfactory Within three months of taking over the property improvements made have resulted in the daily tonnage being increased from 200 to between 700 and 800 tons. It is understood that early in the new year the output will be increased to about 1,500 tons per day. New machinery is being installed and surface buildings and housing accommodation are being provided.

A vanadium property in Sinaloa, Mex., belonging to ex-governor Ramon F Iturbe, and known as the "Chichi," is under option to capitalists in Mexico City.

To Eliminate Red Tape in Alaska

Congressional Effort Is To Be Made To Reduce the Needlessly Large Number of Federal Agents

Much of the red tape which is hampering Alaska's development is to be done away with, in the opinion of Representative Charles F. Curry, of California. Mr. Curry is a chairman of the House Committee charged with the consideration of Alaskan matters. Mr. Curry says that thirty-five different Government agencies have jurisdiction over Alaskan interests of one kind or another, and as result the greatest difficulty is experienced, he declares, in establishing any type of enterprise large or small. Before a farmer can make sure of his title, an expenditure entirely beyond the resources of the average farmer is required, to make preliminary arrangements with the different bureaus. The same is true of the large enterprises, Mr. Curry says, and he cites an instance of an American wood-pulp manufacturing concern investing large capital in Canada after having become discouraged in its efforts to obtain a working arrangement in Alaska. Mr. Curry predicts the enactment of legislation at the extra session, if not during the short session, which will eliminate most of the existing red tape.

Mr. Curry is in favor of placing the government of Alaska in the hands of a board to be appointed by the President, but composed of residents of the territory. He says he is opposed to a continuation of a government of Alaska by Federal agents.

Increase in Manufactures in the West

Trend Believed To Be Partly Due to High Freight Rates

The West is emerging from the mining and agricultural stage of its development. Manufacturing is beginning to play an important part in its commercial activities. Present plans everywhere throughout the West include enlargement of manufacturing facilities. These are the observations of G. F. Loughlin, the head of the Mineral Resources section of the U. S. Geological Survey. Mr. Loughlin just has returned to Washington after an extended trip through the West. Though Mr. Loughlin believes this is due largely to the natural evolution in the development of the West, he thinks it is being hastened by various changes brought about by the new economic situation, the least of which is not the increase in freight rates.

The coming of many new manufacturing plants, Mr. Loughlin believes, will stimulate both mining and agriculture. Throughout the West, Mr. Loughlin found many signs of underlying strength in the position of the mineral-mining districts, induced largely by the decreases in commodity prices. The trend toward manufacture has aroused widespread interest in non-metallic resources. For the most part, the work of the Federal Government in the Western States has been on its metals. Now, with the promised rise of chemical industries and activities in connection with the construction industry, there is need for a more definite knowledge of the non-metals. In fact, the Los Angeles Chamber of Commerce has made a formal request that the Survey undertake a thorough study of the non-metals in the region tributary to that city. Mr. Loughlin is convinced that this work would be helpful to the public, and he will recommend that it be undertaken.

American Capital Urged To Enter Foreign Fields

Although throughout the world cards are falling in a new deal, American capital and American mining engineers, for the most part, are preoccupied with efforts to devise methods to make lower-grade ores pay and to increase operating efficiencies, to the exclusion of the opportunities that are offered in foreign fields. This seems to be the conclusion of numerous students of the present situation as it affects the mining industry. So far as oil is concerned, much is heard of the efforts of foreign countries and certain foreign governments to extend their acquisitions of petroleum lands.

Rapid progress is being made by English, Japanese, French and even Belgian capital in the acquisition of such deposits in China, Siberia, continental Russia, Africa, and even South America. Where one American dollar is looking for a foreign mineral investment, hundreds of foreign dollars are being exchanged for valuable mineral rights.

Some go so far as to predict that, within fifteen years, we shall lose our pre-eminent position in copper. Another prediction is that the next decade will make necessary a high import tariff, if our iron-mining operations are to continue at anything like their present scale. Lead and zinc are placed in practically the same category. To hold its own, it is declared, American capital must acquire rights and prepare to conduct large-scale mineral operations in those countries having practically virgin deposits, as well as proved properties, but whose present economic necessities have placed those resources on the bargain counter.

W. M. R. Commission Soon To Complete Awards

If Present Rate of Adjustment Is Carried to a Conclusion an Unused Balance of $5,500,000 of the Appropriation Will Remain

Two awards were recommended by the War Minerals Relief Commission during the week ended Nov. 22. The total of awards was $20,557.59. In the claim of the Mount Tory Mining Co., the award was $11,007.89. This was 25 per cent of the amount claimed. The company was engaged in a manganese operation. Another manganese claim was that of the Eagle Mine. In that claim $9,549.70 was awarded. This was 89 per cent of the amount claimed.

Up to Nov. 27, 1920, the War Minerals Relief Commission had made recommendations in 1,124 cases out of 1,203 legally before it, leaving 83 claims remaining for consideration. It has recommended awards of $2,357,491.35.

The total appropriation	$8,500,000.00
Awards and expenses	2,687,092.42
Balance	$5,812,907.58
The amount asked in the 83 claims yet remaining	802 703 83
Apparent balance	$5,010,203 75

If the same ratio of award (32.9 per cent) shall obtain in the 83 cases yet to be dealt with, as in the past, the amount yet to be awarded will be $272,412.76, in which event an unused balance of about $5,500,000 will remain.

The commission expects to complete its work within sixty to ninety days. The administrative expenses of the commission have been 2.07 per cent of the amount involved in the claims settled.

Bureau of Mines and U. S. Geological Survey Ask Increased Appropriations

Congress has been requested by the Bureau of Mines and the U. S. Geological Survey to appropriate $5,938,778 for their activities during the coming fiscal year. The total of the appropriations requested by the Bureau of Mines is $3,469,638. The Geological Survey's total is $2,469,140. The principal subdivisions of the Bureau of Mines appropriations are as follows:

For investigations as to the causes of mine explosions, methods of mining appliances best adapted to prevent accidents, improvements of conditions under which mining operations are carried on, the use of explosives and electricity and other inquiries and technologic investigations pertinent to the mining industry, $551,353. This is an increase of $142,288 over the amount appropriated for the current fiscal year.

For inquiries and technologic investi-

gations concerning the mining, preparation, treatment, and utilization of ores and other mineral substances, with a view to improving health conditions and increasing safety, efficiency, economic development and conserving resources through the prevention of waste in the mining, quarrying, metallurgical, and other mineral industries, and to inquire into the economic conditions affecting these industries, $352,271. This is an increase of $227,271 over the appropriation which was made for similar purposes during the current fiscal year.

For inquiries and investigations concerning the mining, preparation, treatment and utilization of petroleum and natural gas, $453,840. This is an increase of $318,840.

Expenses mining experiment stations, $270,000. This is an increase of $70,000 over the appropriation allowed for the current fiscal year.

Operating mine rescue cars, $198,650. This is an increase of $43,983 over the current appropriation. In addition, $45,000 is asked for the purchase and equipment of an additional mine rescue car.

For supervision of mining on the public domain, $132,390 is asked.

The subdivisions of the Survey estimates which apply directly to the mining industry are as follows:

Geologic surveys, $500,000. This is an increase of $148,000 over the appropriation for the current fiscal year.

For continuation of the investigation of the mineral resources of Alaska, $190,000. This is an increase of $115,000 over the current appropriation.

For preparation of the report of the mineral resources of the United States, $200,000. This is an increase of $75,000 over the current appropriation.

For chemical and physical researches relating to the geology of the United States, including researches with a view of determining geological conditions favorable to the presence of deposits of potash salts, $60,000. This is an increase of $20,000 over the money appropriated for the current year.

NEWS BY MINING DISTRICTS

Special London Letter

Shadow of Politics Brings Gloom to Mining Interests—Cornish Miners Migrating—Cape Copper Co. Floating 8 Per Cents at Par

BY W. A. DOMAN

London, Nov. 23.—Political and financial influences are upsetting the business world. It is scarcely credible that Russian, Greek, and Irish affairs should in any way affect the mining community; but such is the case. There is nothing whatever to engender confidence at the moment. Prices of metals are tumbling because of the slackness of trade and the difficulty of getting banking accommodation, and in the case of some metals because of the excessive stocks, the Allied governments apparently not having disposed of all they had contracted for while the war was in progress. Tin in one day fell £8 10s. per ton, and at the time of writing is quoted at £231 5s. At such a figure some of the Cornish mines find it very difficult to work at a profit. In fact, Cornwall seems to be getting in a bad way, and some of the tin miners are migrating to other and better-paid fields—to South Wales for coal mining, for instance. Various schemes are being worked out to set the tin-mining industry of the duchy on its legs again. One of them is a return to the old cost-book system, and another is an amalgamation of different companies in different districts, so as to avoid heavy overhead charges, and to introduce various economies that may be possible under certain combinations of big business.

The Cape Copper Co., which has invested a large amount of capital in a copper property in the Rakha Hills in India, has appealed for £120,000 in registered convertible 8 per cent debentures of £100 each at par. This is one of the few companies, whether mining or commercial, that has had the temerity to ask par for its new issue. The value of the assets in India is approximately £440,000, whereas the £120,000 of debentures offered to the public are covered by the Briton Ferry Smelting Works in South Wales alone. The issue deserves to be successful. Already there are proved in the reserves 11,370 tons of copper. Just at present, of course, the red metal is not the thing to conjure with as it was a few years ago. But there is a good local market that can take care of most if not all of the production.

The Nundydroog, another Indian mining company, has got its reconstruction scheme through. One of its neighbors, the Ooregum, is said to be considering additional capital outlay, but that the money will be found apart from reconstruction. The price of the shares, of course, has been unfavorably affected.

Since the Burma Corporation has become an Indian registered company, its shares have gradually fallen away in price, until now they are under 10s. Previous to conversion they reached £14, and at the time of conversion stood at £9 15s., the holders receiving 14 of the rupee shares as the allotted basis of the exchange.

As a star Esperanzas has faded for the time being. Speculators rushed up the price of the shares unthinkingly, and the public, ever keen on a gamble, got in and is now nursing the baby. Had it not been for the high Descubridora values, Esperanzas, in all probability, would be quoted above the present figure. But, once disappointed, the public is not keen to come along again.

The South African market is being upset not only by foreign selling but also by realization of enemy-owned shares, these latter being peddled out by the Public Trustee on this side and the Custodian of Enemy Property at Capetown. There would be no difficulty in forming a syndicate to relieve the officials of the shares, but apparently those gentlemen think they can do better by trickling them out. Each day means that they set the market against themselves still further and thus forestall a good margin of profit.

Austrian Industries Need Upper Silesian Coal

Germany Would Supply This If Abundant Saar Production Was Shared With Her

From Our Vienna Correspondent

Vienna, Austria, Nov. 10.—Recent reports have been to the effect that England was trying to persuade France to release coal from the Saar district for the use of German industries. This would enable Germany to deliver large quantities of coal to Austria from the fields of Upper Silesia. Arrangements with the Polish government are being discussed, also, with the object of furnishing from Austria the machinery and operating supplies needed by the still inactive Polish mines, that the latter may increase their yield. These are the only practical methods for relieving the coal situation in Germany so that the latter can deliver large supplies of coal to Austria.

So far, Germany has faithfully fulfilled her part in the Spa agreement, and as a result of the German coal deliveries to the Entente in recent months, her own industries have had to substitute large quantities of lignite for the missing coal. Of course the full amount of this loss can not be made up. Dispatches at hand indicate that France enjoys a superfluity of coal supply, and that the coal situation in Paris is particularly favorable. Thus it would be possible at any time for France to release coal to German industries from the steadily improving deliveries from the Saar district, thereby releasing larger supplies of Upper Silesian coal to Austria.

France's domestic coal production also is increasing, amounting to 2.40 million tonnes in September, as against 2.37 million in August, which is already at the annual rate of two-thirds of the normal peace-time yield. Furthermore, the conditions in the wrecked mines of northern France are steadily improving. The coal supplies now being taken out of the Saar mines by the French

amounted to 702,680 tonnes in August, to 860,108 tonnes in July (the decrease was due to the railway strikes), to 811,314 tonnes in September, 1920, and is steadily rising. In January, 1920, the deliveries amounted to only 727,465 tonnes. The Saar district needs but little coal for its own industries and disposes of nearly the whole yield by sale and export monthly, so that it is clear that the present coal situation in France permits that country to dispense with the greater portion of the Saar coal. In fact, several hundred thousand centner of coal are left monthly at the depots of the Saar district, which shows that France is not actually in urgent need of the Saar coal.

The prices of Saar coal for France, Luxemburg and Switzerland have been greatly reduced since Oct. 1, 1920, another fact testifying to the favorable condition of that district and its ability to support exportations. The prices are given below.

PRICES OF SAAR COAL SINCE OCT. 1, 1920, COMPARED WITH EARLIER QUOTATIONS

Kind	Today, Francs	Former Prices, Francs
Washed, lump	124 to 105	136 to 115
Nut, No. 1	124 to 100	136 to 110
Nut, No. 2	118 to 93	130 to 110
Unwashed, lump	116 to 93	128 to 108
Run-of-mine	85 and 75	83
Coke, broken	150	160

Concerning Poland, Austria could indeed aid in increasing the Polish coal yield by supplying machinery and blasting supplies, whereby there would also result advantages to the Austrian supply of coal.

MEXICO

Annual Production of Durango Listed —Encouraging Reports From Cusihuiriachi—New Export Duties Lower

City of Mexico—One of the last official acts of President de la Huerta was to sign the decree lowering export duties on all classes of minerals and also reducing the taxation on pertenencias (claims) as an immediate aid to the industry, which has been hard put these last weeks because of the low prices on silver, copper, zinc and lead. The new tax is not a fixed one but is applied differently in distinct camps and also according to the value of ores. It was devised with the assistance of committes from various mining centers, and it is believed that it will at least relieve the situation.

The new administration has under study a complete revision of the mining laws (including petroleum), but it will probably not reach Congress before the first weeks of the new year.

Chihuahua

Conception de Oro—It is claimed here that over 500 smaller mining properties have recently been obliged to close because of the low price of silver. Half of this number is in the Conception de Oro district. Within a radius of twelve miles of the center of this district there are not fewer than 300 mines, with an abundance of silver ores, but low grade, running from 6 to 900 gr. to the ton. At this assay 80c. silver produces only 45.80 (Mexican) per ton, and the miners claim that the actual cost of mining treatment and shipment amounts to 45.60. In addition to this dismal situation 540 other properties in this same district are about to be forfeited for failure to pay taxes. The owners apparently prefer to abandon their holdings under the circumstances.

Cusihuiriachi—On the other hand, reports from Batopilas, Santo Domingo, San Juan and the Cusi Consolidated, in the Cusihuiriachi district, are very satisfactory. All are high-grade ores. Increased activity is reported likewise from Parral and at San Pascual de las Adargas, near Jimenez, where a number of American companies are going in.

Durango

The state government has recently issued some interesting statistics regarding the mineral resources of that section, giving the following properties now in operation, with their approximate annual production in gold, silver, copper and lead (in thousands of pesos):

Penoles	1,796
Velardena	2,600
San Andreas	742
Promontorio	651
Avino	559
Vacas	494
Bacis	457
Candelaria	433
Soto	267
Ventanas	248
New Australia	240
Hilario Lozoya	183
Lustre	180
Nuevo Porvenir	179
Fundidora de Coahuila	150
Descubridora	134
Ambrosius Hermanos	127
Salvador Lopes Suc.	122
Huahuapan	120
San Luis Mining Co.	113
Carmen Copper Co.	106
Fundidora Mapimi	76
La Trinidad	72
Luis Guerrero	52
Animas	41
San Luis	40
El Potrillo	40
San Juan	37
Siderita	37

These with twenty-eight other properties running from 18,000 to 30,000 pesos make a total production of gold 1,664,000; silver, 11,031,000; copper, 864,000, and lead, 237,000 pesos. Many other mines are being prepared for development, but there has been a temporary let-up owing to the coal strikes and inability to get material or transportation. Expert opinion holds that with a reasonable restoration in the price of silver and other metals and with labor troubles settled the production ought to be doubled in 1921.

Guanacevi—Reports from this district are encouraging also. There are about a thousand tax-paying claims in this camp, twelve mills (in operation before the revolution) and enormous dumps of ore which, it is claimed, are profitable for treatment.

Topia—The Mines Selection Co., a development syndicate, including C. L. Despard, Frederick G. Corning, George B. Hutchings, all of New York City, and W. J. Loring, of San Francisco, has taken an option on La Perla mine, in the Topia district, Durango. This property is owned by a company in which Bernard and M. E. MacDonald, formerly extensive operators in Mexico, are largely interested.

Coahuila

Torreon — The Cia. Minerales & Metales, owner of the local Torreon smelter, has purchased a large portion of the Mercado iron mountain in Durango, the consideration being several million dollars. It is probable that a new smelter will be erected at the base of the mountain.

Owing to the low price of silver, high taxation of low-grade ores, and a general shortage of fuel, nearly every smelter in Mexico will be closed by the first of the year. As a natural consequence practically all of the producing mines will be forced to suspend operations. There are only a few smelters now in operation. Over six hundred producing mines in the northern part of the republic closed down during November.

David G. Farias, a prominent attorney of Torreon, has filed a group of silver-lead mines in the San Juan del Rio district. The properties adjoin the old producing mines La Palma, Otilia and El Chaiz.

J. P. Steele has suspended operations on the Trovador mine in the San Diego district. He has several cars of ore on the platform at Trinidad station and a large tonnage on the dump. His properties will remain idle until the smelters resume operations.

San Juan de Guadalupe—The district continues to add new shippers to its list and seems to feel no ill effects from the coal shortage or low price of silver. The ores carry considerable values in gold and are being received by the smelters regardless of the fact they are not operating at the present time. The most recent property taken up in this district is the Plateros group, in the Ramirez Mountains, which is being worked by Alejandro Gaitan.

Zacatecas

Zacatecas—In the mining agency at Conception del Oro 540 mining properties are listed for forfeiture on account of non-payment of taxes. Many of these delinquent mines are capable of producing large quantities of low-grade silver-lead ores which cannot be mined under the present conditions of the low price of silver and exorbitant taxation.

A number of new properties have been taken up in the Reyes district, in the northern part of the state, by Luis Campa. The mines are contiguous to the Escondida, which has produced large quantities of high-grade gold and silver ores.

Word has been received here from Mexico announcing an immediate reduction of taxes on low-grade ores as well as other advantages to be given the mining industry. Unless the coal mines in the State of Coahuila are operated within the near future the government will permit the importation of coal and coke free of duty.

CALIFORNIA

Another Gold Dredge Sent to Mexico—Yankee Hill Dredge at Work on the Stanislaus—Good Ledge at the South Star

Sonora—The Yankee Hill Mining Co. has placed a dredger in operation on the Stanislaus River between Oakdale and Knight's Landing. The company has about ten miles of the river channel under lease, and thorough tests made by the management show considerable gold.

Angels Camp—Work of unwatering the Victor Gravel mine, formerly called the Rainier, near Angels Camp, is being rushed day and night in the rehabilitation of the promising old property. Regardless of the heavy rains of the last three weeks work of carrying the water from the mine in tank-skips is progressing rapidly. The shaft will be dry in three weeks if present dewatering work continues unchanged. Superintendent Montreeville is planning on drifting and breaking out gravel as soon as the underground conditions permit. Hoisting operations are expected to begin by the first of the year.

Grass Valley—A. W. Johnson, principal owner and manager of the South Star mine, in the Deadman's Flat district, reports that a fine ledge has been cut in that property at a depth of about 100 ft. The ledge is stated to be from three to four feet in width and to carry free gold. Johnson believes that it will be possible to place the famous old mine on a record producing basis again. About two years ago several thousand dollars was taken out in shallow diggings, but work was soon afterward discontinued.

Oroville—Purchase of Exploration dredger No. 3, which operated in the Oroville field for a number of years, was made recently by W. H. Hyland, a representative of a Mexican dredging company. The dredge will be sent to Mexico, where it will again be placed in operation. This is the second dredge to be sent to Mexico in the last few months.

Amador City—At a regularly called stockholders' meeting of the Bunker Hill Consolidated Mining Co. the following were chosen directors: N. W. Hyler, O. D. Rohlfs, H. A. McQueen, T. G. Negrich and John Eudey. Charles E Bunker, who has been superintendent of this well-known property for several years, tendered his resignation, and the new directors appointed as his successor Robert Christensen, who filled the position of foreman heretofore.

Jackson—V. S. Garbarini has been appointed general manager of the Argonaut mine at Jackson. He fills the place vacated by N. S. Kelsey, who resigned to accept a position in Colorado. At present all endeavors at the mine are being concentrated on the removal of water from the underground workings.

The Kennedy mine is working steadily in dewatering the old workings. It is expected that mining will be resumed some time in the spring of 1921.

Happy Camp—Since the Legrange mine, in Trinity County, shut down, the Davis Consolidated mine at Happy Camp is believed to be the largest active hydraulic placer mine in the state. It is operated about nine months of the year with three giants, receiving water through a 32-in. pipe. Over 5,000 miner's inches of water is delivered through two ditches having their sources in Indian and Grider creeks respectively. The mine is now owned and operated by Reeves Davis, of San Francisco, who purchased it in 1908 from the estate of O. H. P. Belmont. The property consists of 1,200 acres of rich placer ground.

COLORADO

New Freight Rates on Dec. 20—Silver King Installs New Concentrating Table—Gold Rock Finds Rare Minerals

Idaho Springs—New freight rates on low-grade ore shipped from the Clear Creek district, over the Colorado & Southern Ry., will become effective on Dec. 20, 1920, as follows: On ore up to $20 gross value, $1.75 a ton; from $20 to $30 gross value, $2 a ton; from $30 to $41 gross value, $2.50 a ton; from $41 to $61 gross value, $3 a ton; from $61 to $100 gross value, $3.80 a ton. This rate is equivalent to a reduction of 75c. a ton on the first two classes of ore above mentioned, which include the bulk of the ore shipped from this district.

A drift on the 600-ft. level of the Gem mine has opened a pocket of sulphide ore about 5 ft. wide. The drift will be advanced to connect with the Franklin shaft.

The Lord Byron is being developed under the management of Kenneth Matheson. A 300-ton lot of milling ore has been shipped to the Hudson mill.

A new concentrating table, invented by Henry W. Bolthoff, has been installed in the Silver King mill, where tests have been made. The demonstration table is about 7½ ft. long by 30 in. wide. The top of the table is covered with linoleum, which in turn is covered with a layer of 12-gage, 20-mesh wire screen, set about $\frac{5}{8}$ in. above the top of the table. It has both a lateral and a vertical motion. The table is equipped with a 5/5 in. pipe arranged along the side, from which flows a steady spray of water. One-quarter horsepower is required to operate the table. The inventor claims an 80 per cent saving of the values in the ore fed to the apparatus.

The Gold Rock property is being developed by W. P. McLean and associates. Recently a streak of high-grade gold ore has been opened, and small shipments to the sampler assay 3 oz. gold. Milling ore is being shipped to the Hudson mill. A pocket of gold-copper ore was recently opened, and the material is reported to contain 16 per cent uranium oxide. Pitchblend has been identified, and the discovery is regarded with considerable interest by mining men who are on the alert for rare minerals. The vein is 12 in. wide and was opened at a depth of 450 ft.

Telluride — The Vanadium Corporation of America has shut down all of its works at Vanadium, Fall Creek, and Placerville, west of Telluride. About 350 men have been thrown out of employment.

IDAHO

Wood River—The Golden Glow mine at Boulder Basin has just completed and put in operation a very substantial 50-ton lead-silver concentrating mill, conveniently tied to the lower adit of the property. The property is situated near the summit of the Sawtooth range at an elevation of 9,500 ft. The steam power is developed with coal hauled in at an excessive cost but the company plans to install a hydro-electric plant on Boulder Creek next season, and thereby greatly reduce the operating cost.

Independence mine, owned by Federal Mining & Smelting Co., Wallace, Idaho, is working 75 men, and has been supplying an 80-ton concentrating mill for the last six months. This is an old plant that has been operated, however, at a decided advantage for several seasons with an extremely limited water supply of spring water. The mill was built to treat a very complex zinc ore during the war but has been shut down through lack of market for its product. It is now being overhauled and put in shape for the exclusive treatment of the Independence Mine and has a capacity of 200 tons per day. This property carries one of the cleanest and richest silver-lead ores ever mined in the Wood River district.

Soda Springs—The new phosphate mining and milling enterprise of the Anaconda Copper Co. on the main division of the Oregon Short Line in southeastern Idaho makes excellent progress. The grading for a railway has been completed and the steel is already laid for nine miles, or half the distance from Soda Springs to the mine. Machinery for a 1,100-cu.ft. compressor is on the ground and the concrete foundations are now being laid. A crosscut tunnel 9 x 9 ft. in the clear, to be laid with 60-lb. rails and equipped with 15-ton storage battery motors and 10-ton bottom dump cars, is already in 200 ft. and has already cut one of a series of rich phosphate veins. This tunnel is to have an ultimate length of two miles as a crosscut and will penetrate three separate ore courses of rich rock phosphate 70 per cent or better and each 5 to 8 feet wide that stand at angles varying from 45 to 70 degrees and are traceable at the surface for miles. The big tunnel will give stoping backs to a maximum height of 1,000 feet on the steep dip of the veins. Much of the machinery for the first 1,000-ton unit of a dehydrating mill is on the ground. An electric power transmission line from the main line of the Utah Power and Light Co., near Grace, has been completed to the mine and also an inde-

pendent telephone line. It is expected to have the first unit of the mill, with a daily capacity of 1,000 tons, completed by next August. The plans also involve the plotting of a model mining town on a desirable site in a sheltered cove in the mountains near the portal of the mine for the accommodation of the company's employees. Subsequent mill units are to be installed as the market for the product is created.

Montpelier—The American Phosphate Co. are installing a 500-ton milling plant for the crushing and drying of their phosphate rock, and are already shipping at the rate of 50 tons a day from their contingent mine development, principally to the Pacific Coast market. The Waterloo mine in the same section of Bear Lake County has been shipping 100 tons of rock a day for several months past to San Francisco. The ore is hauled on motor trucks 4½ miles at a cost of $1.25 per ton. Near Paris, Idaho, the Western Phosphate Co. have a 3-mile spur completed, also a 500-ton mill, and are shipping 200 tons of rock a day. The Bear Lake Mine, a new enterprise in the vicinity, has extended a double-track tunnel on a 5-ft. vein of high-grade rock phosphate 700 ft. This property has recently been equipped with a 500-cu.ft. angle compound air compressor and is making excellent development progress.

MONTANA

Some Developments Under Way—New Mill at the Alta—Western Power & Smelting Completes Matte Smelter

Butte—Though the Anaconda Copper Mining Co. has reduced its working forces somewhat since the closing down of three of its zinc properties about two weeks ago, there has not been further suspension of mining activities on any material scale and Manager John Gillie has announced that for the present the Anaconda would continue without further curtailment. No statement as to the future however was forthcoming.

Further curtailment of output to the extent of one-third by the North Butte company, which had been operating on a 70 per cent basis, emphasizes the depression prevailing in metal-producing circles in the Butte district. North Butte has been putting out about 1,500,000 lb. of copper monthly, and it was officially stated that production will be kept within 500,000 lb. monthly. The company is continuing development work but on a reduced basis.

Tuolumne Copper has started sinking at the Main Range shaft from the 1,200-ft. level with the 2,000 the objective, according to the local office of the company.

Aside from raising out of No. 3 shaft from the 2,300 level, little development work is being done at the Black Rock mine of the Butte & Superior, the suspension of production being necessary in view of the poor condition of the zinc market.

Davis-Daly Copper Co.'s development work is limited to raising an airshaft from the 1,700 level to the surface at its Colorado mine. Production had not been materially lowered below the 70 per cent point, but it may be further lowered unless the copper market improves.

Barnes-King directors decided to pass the dividend for the third quarter, the explanation being that it was desired to conserve the company's resources for the acquirement of new property.

Neihart—At the Moulton the concentrator is handling about 170 tons of ore daily and a number of surface improvements are being made.

Federal Mining & Smelting Co. is reported to have concluded a deal whereby it will take over the development of the Silver Dike property. Silver Dike is a large low-grade proposition embracing ten claims.

Clancy—Jefferson & Teton Mining Co. is installing new machinery and equipment at the Willard mine. Operations will continue throughout the winter.

Sinking is in progress on the Pay Back Mining's Old Timer mine and a good width of high-grade ore is reported.

Corbin—Foundations for a new mill for the old Alta mine are going forward. Old buildings are being torn down and remodeled.

Cooke City—Western Power & Smelting's smelter, with a capacity of 250 tons, was completed this year; it is of the copper matte type.

MINNESOTA

Mesabi Range

Pickands-Mather Co. Makes Safety Awards—New Washing Plant Commences Operation

Hibbing—The Pickands-Mather Co. each year awards prizes to the department officials of the mines in their districts who have the least number of disabilities at the end of the year. The rewards this year were watches, of which four hundred were distributed to the men employed at the Majorca and Albany mines. According to the system of marking, the two mines were so close that only a few points separated the winner. The Elba mine, on the eastern end of the range, won first prize for the least number of injuries. George Martinson has charge of the safety-first and mine rescue work for the company on the Mesabi Range.

The Boeing mine of the Cleveland-Cliffs Iron Co. has reduced its surface labor to a minimum, but an aggressive program has been outlined for all underground development and operation, as all ore shipped next season will be from underground operations.

Gilbert—The new washing plant of the Bowe-Burke Mining Co., at the old Mariska mine, has started to wash its first ore. Although the plant is only a small one, with a capacity of 50 tons per hour, great interest has been aroused, and its successful operation will be noted by many companies, as it will be the first installation of its kind in the immediate vicinity.

The flow sheet is simple, as the ore is dumped direct into the mill bin from the mine skips. From the mill bin it is carried by a belt conveyor to the trommel, the oversize from the trommel falling directly into a chute, from which it is fed to a conveyor belt below and conveyed to the railroad receiving bin from which the railroad cars are loaded The undersize from the trommel, which has one-half inch perforations, is fed to a Dorr classifier and the overflow from the classifier is laundered off as the tails; the underflow of the classifier is fed to the belt conveyor going to the railroad receiving bin. The trommel is of such construction that by reducing the diameter of the discharge end, a certain level of water is maintained which allows the trommel to be partly submerged. This arrangement permits a great saving in the consumption of water, as only 150 gal. of water are required per minute.

MICHIGAN

The Copper District

Reductions in Force and Wages Continue—Wolverine Copper Is Removing Shaft Pillars

Houghton—The Quincy Mining Co has announced a reduction in all departments of 15 per cent on wages and salaries, effective Dec. 1.

The Copper Range group of mines have also announced a cut in wages and salaries to take effect on Dec. 1. This reduction varies for the different classes of labor. In the case of trammers it amounts to about 24 per cent; with company account miners it amounts to 17 per cent. It is also announced that soft coal will be supplied to employees at $7 per ton instead of the prevailing rate in the district of $9 to $9.50 per ton.

The Wolverine Copper Co. is steadily increasing production and within a few weeks will be back to the pre-war normal. No. 4 shaft has been completely idle for several days, due to an accident in the shaft between the 29th and 31st levels. This is about repaired The Wolverine has started to remove the shaft pillars for about 100 ft. on either side of the shaft. When this work reaches some of the upper levels it should result in materially enriching the yield of Wolverine rock.

The Mohawk Mining Co. is also steadily increasing production. No. 1 shaft is now operating one shift after a year's idleness, and No. 5 shaft is again operating two shifts.

The Seneca Mining Co. is increasing its working force underground, and now has two shifts of miners working in the headings of the third, fourth, and fifth levels north, and the fifth level south and in sinking to the sixth level. They are not accumulating a stockpile at the mine, but are shipping all the rock to the Baltic mill of the Copper Range Co.

The management of the Arcadian Consolidated has decided to continue development work throughout the winter. It expected to cut the plat at the 750-ft. level early in December. A sump has been cut out at the 600-ft. level and will be bailed by means of the skip hoist.

Gogebic Range

Bessemer—The Charcoal Iron Co. of America, operating the Yale mine, has announced a cut in wages of 20 per cent, applying to all classes of labor and taking effect Dec. 1. It is understood that a similar cut has been made at the company's logging camps and at the mill in Marenisco, as well as at its furnaces. The local officials of the other large mines of the range deny knowledge of any wage reductions being planned by their companies. However, at a few of the small properties men have been let off and then rehired at lower rates.

Since the closing down of additional mines in the Copper Country, quite a number of miners have come to the Gogebic Range, and, added to those laid off at the local mines, furnish an adequate supply of labor. A number of the men leaving the mines have found employment in the woods, so there is no great amount of unemployment.

It is expected that the skips will be hoisted through H shaft of the Pabst mine some time this month. The last of the idler stands will soon be up, and the ropes are already being strung. The grading for tracks and stockpiles is about completed.

Marquette Range

Large Stocks Cause Labor Curtailment, Although Wages Are Maintained

Ishpeming—The Cleveland-Cliffs Iron Co. reduced operations on Dec. 1 by releasing several of the single men employed in the company's mines. This was done to make places for the married men and men with dependents who had to be transferred from the Mackinaw-Gardner mine, at Gwinn, which was closed. The working force at the Cliffs Shaft mine, Ishpeming, was reduced by 210. Large stocks of ore at most of the mines was given as the reason for the curtailment. The Cliffs has over 200,000 tons of hard ore in stock, with little demand for hard ores at this time. The Mary Charlotte mine of the Marquette Ore Co. has closed down for an indefinite period, instead of for a week, as announced at first. The high wage scale is being maintained.

Menominee Range

Alpha—Thirty-five miners and laborers were received by Pickands, Mather & Co. this week for work at their Balkan and Amasa mines. This is the first instance since the war that men have been imported for mining work.

Iron River—Although the Tully mine has been idle for three years, the property is kept in good condition. Men are now at work repairing the two shafts, and it is planned to erect a new steel headframe over the No. 1 shaft.

NEVADA

Nevada Silver Horn of Great Promise —Virginia Louise and Others Increase Output—Ely District Still Slowing Down

Pioche—Operations at Jackrabbit on the old Cutts property, owned by the Pioche Bristol Mining Co., have begun. The present two-compartment shaft will be sunk to the 100-ft. level where a drift will run to the fissure mined a few years ago. John Gilmer, who has a lease on the Onondago mine at Jackrabbit, is taking out ore carrying good values in silver and lead from a point about 100 ft. from the collar of the main incline shaft. He has about forty tons of ore now ready for shipment.

The Nevada Silver Horn property, situated twenty-three miles west of Pioche, has recently been examined by T. W. France and other mining engineers representing New York capital.

The results of the sampling have demonstrated that large sections of the big cropping carry satisfactory values in silver. The building of a 40-ton pilot cyanide mill will be deferred and an increased amount of development will be started on the property with a view to increasing and substantiating the reserves of milling ore.

Everett Wade and Earl T. Godbe, leasing on the Detroit and Iron mines of the Bristol Silver Mines Co., are now having their initial ore shipment hauled by wagon to the bins at Jackrabbit. The ore is a good lead carbonate. The recent strike of higher-grade ore at the property of the Black Metals Incorporated is holding up well. The high lead content carried by the ore when first struck has dropped to normal, but the silver content is greater. Operations at the Bristol mine have been curtailed on account of a breakdown of the compressor plant. Conditions underground continue satisfactory and an improved grade of ore is being mined. During the last three months seven lessees have ceased operations owing to the increased cost of mining, lower metal prices and increased freight rates. All the larger properties in the Pioche district are putting on men, however, and a brighter future can be clearly foreseen, but unless an equitable freight rate is granted on the higher-grade ores the small operator will perforce stay out of the game.

The Virginia Louise Mining Co. is now shipping an increased output of ore. A new stope in good fluxing ore was opened up this week on the 400-ft. level at the south end of the fourth-level drift.

The Prince Consolidated is shipping its entire product to the American Smelting & Refining Co. smelter at Murray, Utah. It has been arranged to discontinue shipments to the International smelter at Tooele, Utah. The promised restoration of the $2.20 freight rates on ores of $6.50 in value will give much needed relief to the future operations of the property.

Ore shipments from the Pioche district for the week ended with Thanksgiving Day showed a total of 2,910 tons, derived as follows: Prince Consolidated, 1,740 tons; Virginia Louise, 535; Black Metals, 310; Combined Metals, 200; Mendha Mine, 40; Bristol Silver, 45; Pioche Assay Office, 40.

Ely—A large number of men have been laid off in all departments of Nevada Consolidated Copper Co., the reason for this being naturally the low price in copper. The reduction in payroll is apparently still continuing.

The properties held by the Consolidated Copper Mines Co. at Ely are practically closed down. Pumping and maintenance work is still being done both in the Morris shaft at Kimberley and at the Giroux shaft over the Kimberley summit. The Giroux shaft is well equipped and the pumping station and machinery constitute one of the most expensive and complete installations in the West. Although little mining is being done it is necessary to retimber continually, as the ground is very heavy.

George H. Ryan, who is working a deposit of zinc ore on the Willard lease from the Consolidated Copper Mines Co., received returns on a car of zinc ore last week. The shipment averaged 47 per cent in zinc content with a small amount of gold and silver in addition. Ryan intends to ship one car a week of this grade of zinc ore, and will increase his tonnage should conditions permit.

Articles of incorporation were filed this week by the Penn Star Mining Co., which owns property in the Cherry Creek mining district near Ely and expects to start development in the near future.

The demolishing of the big trestle at Nevada Con.'s concentrator at McGill is now under way. This structure, which was recently condemned as unsafe, contains about $175,000 worth of lumber which will be utilized underground in the Ruth mine. The trestle has been replaced by a grade that runs back of the mill, the crushing plant being situated adjacent to this new grade and being connected with the mill proper by large conveyor belts.

Tonopah—The mines of this district are practically all working at capacity; the Tonopah Belmont is mining about 400 tons of ore per day and the Tonopah Mining, West End and Tonopah Extension mining about 150 tons per day each. In addition, regular development is being performed, with no discoveries of importance reported. The Victor shaft of the Tonopah Extension has reached a total depth of 1910 ft., leaving only 20 ft. to sink before starting to crosscut on the 1,885 level, where the station has already been completed. The Tonopah "76" Co. has announced that development work performed by the West End company in "76" ground totaled 107 ft. in October, all work being in West End rhyolite, which rocks at times forms the foot wall of the Ohio and West End veins. It is planned to prospect the rhyolite by

means of raises in the hope of encountering trachyte, and possibly a vein on the contact. West End profits for October were $48,043.98, derived from 4,897 tons of West End ore, of an average value of $21.82 per ton, and 552 tons of Jim Butler lease ore. In the Rescue mine the east drift on the new discovery on the 1,100 level shows ore for 30 ft. and in the face. The vein is not so wide as when first encountered but is of good grade.

Divide—On the 800 level of the Tonopah Divide mine the southeast drift shows no change. Crosscutting has been resumed on this level.

Manhattan—In the White Caps mine the west orebody has been cut on the 500 level. The ore so far developed has a width of at least 16 ft. and an average value of about $20 per ton. This ore is said to be of much less refractory character than the ore in the east orebody, which contains a high percentage of arsenic. The east orebody is being developed below the 800 level by a winze.

ARIZONA

Washing Plant to Treat Sodium Sulphate for Paper Manufacture

Jerome—The Western Chemical Co. has decided to erect a washing plant on the sodium sulphate deposit near Camp Verde, lately leased from the state. The material heretofore has been hauled to San Pedro, Cal., for cleansing before being shipped to Finland, where it is used in the manufacture of coarser grades of paper. The sulphate, after being ground, floated, precipitated and dried, is sawed into regular blocks and shipped by rail to the seaport. The deposit has been developed by a 50-ft. shaft and by open cuts and several tunnels.

Most of the water flowing from the U. V. Extension tunnel is said to come from the surface. At times the flow has amounted to 1,500 in. and now approximates 500 in. Copper is carried in solution, but so diluted that its recovery by precipitation is hardly practicable.

Bisbee—Stoping operations at the property of the Night Hawk Leasing Co. were discontinued Dec. 1. Development work is being continued on the contract system. Results at this property have been encouraging during the last two months, the ore shipments averaging about 9 per cent copper.

Thus far the Copper Queen and the Calumet & Arizona Mining companies have not laid off any of the men working underground. At the mine of the Arizona Bisbee Copper Co. the drift on the 400 level has passed from limestone into leached material. This ground lies under siliceous croppings on the surface, and further developments are being watched with great interest. At the property of the Higgins Development Co. shipments of ore have been discontinued, and work is being confined to prospecting.

Globe—It is stated that a high degree of success has attended experiments made at the Inspiration mill, at Miami, in handling low-grade carbonate and oxide-copper ores by a new process. It is described as practically a resulphurizing of the crushed ores by means of sulphurous gases, as the charge is passed through chambers. Thereafter, it is told, the ore may be handled successfully by flotation. The necessary surphuric acid is to be made at Miami, by a plant such as that operated by the Calumet & Arizona Co. at Douglas, primarily for the needs of the New Cornelia leaching works at Ajo.

A new vein, about 10 ft. wide, has been cut in the operations of the White Metal property at Pioneer, in the Pinal Mountains, on the line of the old stage road. Parts of the vein are claimed to sample 100 oz. silver. The ledge, the third cut by the new management, lies parallel to the Pioneer ore shoot and is believed even larger and richer. Pioneer camp has known little activity since about 1882, when it had two silver mills in operation.

The Warrior company, on its property beyond Miami, will drill at least three development holes, exploring the Diamond II group.

Humbolt—The 100-ton concentrating mill of the Big Ledge Copper Co. has had its first test run. As soon as metal market conditions warrant, mining and development operations will be resumed, and the plant put into commercial operation.

NEW MEXICO

Steins Pass—The Steins Copper Co., composed of local capitalists, is developing a promising property three miles south of town adjoining the Johnny Bull. C. G. Perry is in charge.

The D. & H. owners are opening a wide area of mineralized ground on the surface, showing good zinc ore. This property adjoins the McGee ground where the main shaft has been sunk to 300 ft. A crosscut of the orebody here shows a width of about 100 ft.

Pinos Altos—The work of dismantling the plant of the Cleveland mine of the Empire Zinc Co. is about completed. This machinery has been installed in the Hanover plant of the same company. It is reported that there are ample ores still in the Cleveland, but those coming in are unprofitable with the present mill.

The Calumet-New Mexico mill, which shut down some time ago on account of the dullness of the zinc market, has started up again, handling dump ores from the Manhattan mine. The ores carry gold, silver, copper.

Silver City—A syndicate of local capitalists has organized the American Fluorspar Co. to develop fluorspar property eighteen miles north of Hatch, N. M., where it holds 240 acres having good spar showings. C. A. Farnsworth, Santa Rita, N. M., is president, Judge Porterfield, vice-president, and C. B. Hickman, secretary-treasurer, both of Silver City. Joseph W. Bible is in charge.

Steeple Rock—Black sulphide of silver has been found 200 ft. from the mouth of the tunnel on the Billali property owned by George F. Utter. This mine adjoins the Norman King, which has produced some very high-grade silver ores.

UTAH

International Exchange Rates Upset Lead Exports—Chief Consolidated Finished 1,900-Ft. Shaft—Smelters Lack Usual Surplus

The Salt Lake Valley smelters, as stated by W. A. Howard, manager of smelters for the United States Smelting Co., have not this year received the usual surplus above capacity from production during the summer months. In other years the smelters have been able to stock fairly large tonnages to make up for the shortage in receipts during the winter months. During the war period of high metal prices most of the large mines marketed their developed ore as rapidly as possible, and development work—owing to the heavy expense—was largely allowed to lapse. The mines were therefore left during the year just ending in a condition such that production could not be much increased. For the same reason the prospecting for and development of new mines was neglected. Prospectors and miners have been unwilling to take up the work of opening up new ground, as the risk is twice as great as in normal times, and also it will cost twice as much to do the work, with a resultant loss—if ore is not found, which happens more often than not—twice as great. The recent advance in freight rates—25 per cent from points outside of the state and 33⅓ per cent on bullion from the smelters to the Eastern market, this latter having had to be charged back to the mining companies at the rate of 1c. for each ounce of silver in their ore and 3c. for each pound of lead paid for—has aggravated the situation and tended further to decrease shipments. The present rate of exchange has caused an influx of considerable lead ordinarily exported. The recent fall in the price of both this metal and silver is a result of the abnormal exchange rates.

Park City—Shipments for the week ended Nov. 5 were 1,843 tons, as compared to 1,634 tons the week preceding.

The Judge company's new office building and bunk house are expected to be completed by Christmas. The Judge properties—now including the Judge proper, the Daly West, Park-Utah and Daly—are furnishing a large weekly tonnage and doing much development work. Besides the ore produced on company account a considerable number of lessees are working in various blocks of ground.

Bingham Canyon—Ore is reported in a drift on the tunnel level of the Silver Shield, 200 ft. south of the old Miracle stope.

Alta—The Columbus-Rexall is developing its territory and saving ore for shipments, which will be made regularly as sooon as the roads are open.

Eureka—Tintic shipments for the week ended Nov. 5 amounted to 166 cars, as compared with 129 cars the week preceding. Those for the week ended Nov. 27 amounted to 173 cars. The increasing output reflects the better labor supply.

The new shaft of the Chief Consolidated has been completed to 1,909 ft. and sinking will be discontinued. Work on the shaft was begun two years ago. It is a double-compartment, concrete-lined shaft. The deepest level from the new shaft will be the 1,880 and drifting will be started soon.

JOPLIN-MIAMI DISTRICT

Oklahoma-Kansas-Missouri

Ontario Smelting Co. Changes Hands—Skelton Lead & Zinc Closes—Lucky Jew Company To Use Gas Engines

Joplin, Mo.—Jesse G. Starr, of Joplin, has purchased controlling interest in Ontario Smelting Co., whose smelter is near Hockerville, Okla. He will succeed O. Longacre, Jr., of Joplin, as president and manager. F. M. Sparks, of Galena, Kan., will continue as plant superintendent and Harry G. Stephens, of Joplin, will continue as ore buyer. The company will establish a new office in the Independent Building, Joplin, Mo. An investigation this week disclosed that 70 mines are still operating, as against 119 six months ago, and few mines are still operating double shift.

Picher, Okla.—The New York Mining Co. has about completed its new concentrator south of the Black Hawk mine and will start it in operation about Jan. 1. The sludge department includes twelve tables.

Douthat, Okla.—The Skelton Lead & Zinc Co. shut down its eight mills on Nov. 27 and will keep them down indefinitely. Most of the miners employed left the district for the Oklahoma coal fields. The Admiralty Zinc Co. is putting down a new shaft. It will erect a derrick and hopper and connect with its No. 3 mine by surface railroad.

Treece, Kan.—Miners of this section are raising a fund to be matched by the Lucky Jew Mining Co., the whole to be offered as a reward for the arrest and conviction of the murderer of Lloyd Cox, a miner at the Lucky Jew property.

Gas engines are being installed at the Lucky Jew property, replacing steam engines. New equipment includes a 200-hp. engine to operate mill, two 150-hp. engines with Ingersoll-Rand compressors to furnish air, and a 65-hp. engine that will be used to run sludge plant.

Miami, Okla.—A suit against J. F. Robinson and the Commerce Mining & Royalty Co. for $200,000 damages and recision of deed to a valuable tract of mining land in the Oklahoma field was thrown out of court on a demurrer without hearing the evidence of the defendants by Judge E. F. Laster, sitting as special judge at Miami on Nov. 26.

CANADA

Alberta

Edmonton—The existence of an extensive field of high-grade salt at Port McMurray has been definitely established by drillers operating under the direction of the provincial government of Alberta. The drill has been driven through 30 ft. of pure salt at a depth of 650 ft.

British Columbia

Princess Royal Island—Considerable excitement has been created by recent discoveries on Princess Royal Island. There has been quite a bit of staking. Development on some of these new properties will go forward throughout the winter.

Alice Arm—The Moose Group Mining Co., Ltd., of Vancouver, B. C., has done much work in the opening up of its properties and in the construction of a permanent camp. Development has been pushed forward by means of open cuts and the driving of tunnels. The upper tunnel is in 40 ft., with the face in ore. On Nov. 1 the lower tunnel, 310 ft. lower, was in 21 ft. and the vein is now being crosscut. The mineralization shows gray copper, a little galena, and a considerable amount of manganese.

Howe Sound—The Britannia Mining & Smelting Co., Ltd., will discontinue the shipping of concentrate from its mine at Howe Sound to the Tacoma, Wash., smelter until either the price of copper advances or working conditions so change as to make it possible to produce copper at a reasonable profit.

Nelson—Purchase of the Exchequer and Athabasca groups of gold-bearing mineral claims at Nelson, by the California Mining Co., operators of the California group of mines in the same region, was announced by J. W. E. Cassin, president of the California company. The negotiations for the merger of the properties, forming a solid block of claims on Toad Mountain two and a half miles from Nelson, has been in progress for two years.

With the Athabasca group was purchased a 10-stamp mill, cyanide plant, and compressor operated by water power. Mining and development work will be continued on the California and Exchequer groups, and a geologist will make a preliminary survey of the Athabasca group.

Windermere—Mining continues active in the Windermere district. Australian interests have opened the Isaac mine at Briscoe and the same people have reopened the Nip-and-Tuck. From the latter a considerable tonnage of high-grade ore has been packed down from the mine for shipment. The Paradise mine still is producing. It is the most consistent producer of the district.

Poplar Creek—Ores of the Poplar Creek region are being tested by the Tacoma, Wash., smelter. Returns have gone as high as 624 lb. of arsenic to the ton. Without considering the gold values this makes the material of commercial value.

Ontario

Cobalt—The Nipissing mine has shipped a special car of bullion direct to Shanghai. The car contained 193 bars and aggregated 250,865 oz. of silver.

It is understood that the Crown Reserve has decided to explore its claims in Larder Lake by diamond drilling.

The Beaver mine has again resumed operations at full capacity, following a short shutdown, during which the mill was overhauled.

Kerr Lake is sending dump ore to the Dominion Reduction mill at the rate of 3,500 tons a month. The ore averages about 8 oz. to the ton and, at the present rate of treatment, the dump will last two years. One of the veins recently discovered on the surface has been cut at the 90-ft. level, but the values are not encouraging.

The Lake Shore mine, at Kirkland Lake, is still maintaining an average tonnage.

The Ontario Kirkland has opened up some new ore at the 250-ft. level, and general conditions throughout the property are stated to be very satisfactory.

It is understood that plans are under way for the reorganization of the Teck-Hughes. This company had a considerable amount of bonds outstanding, which expired last October, and on which the interest had not been paid for some time. Fears were expressed by some of the shareholders that they would be squeezed out, but it is understood that the plans proposed will protect everybody. The mill is handling about 70 tons of $10 ore per day. This could be increased were it not for the curtailment of power.

Gowganda—The Sanderson Mines Syndicate, the head office of which is in Montreal, has taken over a group of ten claims in the Townships of Lawson, Nicol, Chown and Haultain. A company will be organized with a capital of $3,000,000.

Boston Creek—A. G. Burrows and P. E. Hopkins, of the Provincial Bureau of Mines, have been making an examination of the formation exposed by extensive development at the Miller Independence mine. Considerable attention was given to a study of the "faulting" to be seen at the 500-ft. level, which is probably the continuation of the fracture as found in the "D" or Telluride shaft, where rich showings of gold tellurides were opened.

Manitoba

Rice Lake—At the Gold Seal the shaft is down 182 ft. The vein, which came into the shaft at a depth of 160 ft. is 2 ft. wide. Lateral work will be done when the 210-ft. level is reached.

The survey for the railway to the Flin Flon copper mine, in northern Manitoba, has been begun, with Major Wilcox in charge. The route lies from Mile 7 on the Hudson Bay Ry., to Lake Athapapuskow, a distance of 53 miles, thence on the north side of the lake for 32 miles to the Flin Flon. Four miles of the railway are already built as a spur line of the Hudson Bay Ry.

THE MARKET REPORT

Daily Prices of Metals

Dec	Copper N. Y. net refinery* Electrolytic	Tin 99 Per Cent	Tin Straits	Lead N. Y.	Lead St. L.	Zinc St. L.
2	13.25@13.50	32.00	33.75@34.00	5.00	4.85@5.00	5.60
3	13.35@13.50	33.00	35.00@35.25	5.00	4.85@5.00	5.85
4	13.50	33.00	34.50@34.75	4.90@5.00	4.85@5.00	6.10@6.15
6	13.50@13.75	32.00	34.00@34.25	4.90@5.00	4.75@5.00	6.20
7	13.75	32.50	35.00@35.50	4.90@5.00	4.75@5.00	6.20@6.25
8	13.75	33.25	35.75@36.25	4.90@5.00	4.75@5.00	6.25

*These prices correspond to the following quotations for copper, "delivered": 13.50 @13.75, 13.60@13.75, 13.75, 13.75@14, 14, and 14c.

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for deliveries constituting the major markets, reduced to the basis of New York, cash, except where St. Louis is the normal basing point, or as otherwise noted. All prices are in cents per pound. Copper is commonly sold "delivered," which means that the seller paya the freight from the refinery to the buyer's destination.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.06c. per lb. is charged and there are other extras for other shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. Tin is quoted on the basis of spot American tin, 99 per cent grade, and spot Straits tin.

London

Dec	Copper Standard Spot	Copper Standard 3 M	Copper Electrolytic	Tin Spot	Tin 3 M	Lead Spot	Lead 3 M	Zinc Spot	Zinc 3 M
2	78½	78¾	88	214	219	28¾	29½	30½	32¼
3	79¾	80	88½	221	224½	27¼	28	31½	33¼
4									
6	79¾	79½	89½	218½	222½	26½	27½	30¾	32½
7	80½	80	90	223½	227¾	26	26¾	31¾	33
8	81½	81¼	91	225¾	229½	26¼	27	32½	33¾

The above table gives the closing quotations on the London Metal Exchange. All prices in pounds sterling per ton of 2,240 lb.

Silver and Sterling Exchange

Dec.	Sterling Exchange	Silver New York, Domestic Origin	Silver New York, Foreign Origin	Silver London	Dec	Sterling Exchange	Silver New York, Domestic Origin	Silver New York, Foreign Origin	Silver London
2	348	99½	69⅝	44⅜	6	346	99½	68	43⅞
3	347½	99½	70	44¾	7	342¼	99½	65⅞	43⅜
4	346¾	99½	69	44¼	8	344	99½	65⅞	43

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Metal Markets

New York, Dec. 8, 1920

A much better feeling exists in the metal market. There seems to be no definite reason other than a desire to discount better business conditions, which are expected by the end of next summer at the latest. Sales of metal have not in general been large, but have been satisfactory as compared with recent business, and prices have tended firmer. There has been considerable speculative demand for copper, lead, and zinc, which would indicate that those who follow the market closely do not expect further marked declines and believe the present strengthening to be not merely a flash in the pan. There is one governing factor, however, which must be kept in mind: European deflation has not progressed to the extent that it has in this country, and should metal prices go much lower in London they would act as a brake on any advancing market here. Zinc, for example, is already not far from the point where it would pay to make importations. London prices have been a little stronger recently, but that this strength will continue is by no means certain. It has also been offset partly by lower sterling quotations.

Copper

An occasional sale of 500 or 1,000 tons has been made recently, but most of the business has been confined to small orders. The total volume has not been great. Producing interests today are holding firmly at 14c. delivered for spot copper, and they are not willing to take less than 14¼c. for delivery in the first quarter. Outsiders have no copper to offer except small lots of spot, and are not cutting prices. Rather, are they anxious to buy at current prices, but producers of course prefer to sell direct into the hands of consumers, so that they are having some difficulty in picking up as much as they would like. Bids of 14¼c., f.o.b. refinery for February shipment, have been made in these quarters and turned down by producers.

Our prices represent metal for delivery during this and next month. For later deliveries a premium of ¼ to ½c would be asked.

Lead

On Friday, Dec. 3, the A. S. & R. official price was reduced from 5.50 to 5c., this being the fifth reduction in less than a month, from 7.25c. On receipt of the news, the outside market did not make the customary recession under the Smelting company's price.

Consumers have come into the market in a very satisfactory manner during the last week, and considerable business has been done. They feel the price to be a satisfactory one, even though they may not be getting in absolutely at the bottom. Electrical and cable companies are among those that have shown the most interest in providing for their requirements. There is little demand for forward metal, and the price is little if any different from that of spot. Supplies for immediate delivery are not large, but appear to be adequate for the present demand.

In St. Louis the market is reported as dull, and Granby and similar brands are offered slightly below the New York price, although from 5 to 5¼c. is asked for chemical lead.

Zinc

The price of zinc has suddenly bounded upward, and demand has been comparatively active at sharply advancing prices. Importation is again being thought of, and Belgian zinc could now be delivered here at 6c. or slightly under. However, it contains too much lead to satisfy most American consumers, and would have to be sold at a discount. Galvanizers are now the principal consumers on the open market. The brass business continues very depressed.

American production of zinc is probably now at the rate of about 250,000 to 275,000 lb. per year, which is somewhat less than the pre-war figure. Belgian production is gaining gradually, but in November was only about 9,000 tons, so the market should not be glutted by over-production even with the Australian metal coming on soon.

Tin

The situation in this metal is practically unchanged locally, though the action of the government of the Federated Malay States in contracting to buy all of the production of those states at not less than $110 per picul (equivalent to about £225, New York or London) is expected to have a stabilizing influence, for about one-third of the world's production will thereby be taken off the market should the price go lower than the present figure.

Straits tin for future delivery: Dec. 2d, 34.75@35c.; 3d, 36@36.50c.; 4th, 35.50@36c.; 6th, 35@35.75c.; 7th, 36@36.75c.; 8th, 37@37.50c.

Arrivals of tin in long tons: Total for November, 3,170. Dec. 1st, China, 10; 4th, London, 10; 6th, Straits, 700; 7th, Straits, 775.

Silver

The trade balance of India, which has been seriously adverse since June of the current year, continues to affect the exchange rate of the rupee, which was quoted today at a new low of 1s. 5¾d. China exchanges are also weak, with the result that demand from that quarter continues apathetic. Silver in New York fell to a new low today at 65⅝c.

Mexican Dollars—Dec. 2d, 53½c.; 3d, 53½c.; 4th, 53½c.; 6th, 52c.; 7th, 50c.; 8th, 50c.

Gold

Gold in London: Dec. 2d, 117s. 4d.; 3d, 117s. 6d.; 6th, 118s. 2d.; 7th, 118s. 9d.; 8th, 118s. 7d.

Foreign Exchange

A tendency toward a general decrease in the value of foreign money was evident during the last week, although the market was narrow. On Tuesday, Dec. 7, francs were 5.88c.; lire, 3.52c.; and marks 1.31c. New York funds in Montreal advanced to 15¾ per cent premium.

Other Metals

Aluminum—For 50-ton lots: ingot, 99 per cent and purer, 33c.; 98@99 per cent, 32c. Outside sales reported at as low as 22c.

Antimony — Chinese and Japanese brands, 5¾@5¾c.; market very quiet; W.C.C. brand, 6½@6¾c. per lb. Cookson's "C" grade, 11@12½c. Chinese needle antimony, lump, nominal at 4½c. per lb. Standard powdered needle antimony[1] (200 mesh), 7½c. per lb. Market dull.

White antimony oxide, Chinese, guaranteed 99 per cent Sb_2O_3, wholesale lots, 8c.

Bismuth—$2.40 per lb., 500-lb. lots, and $2.42 per lb., 100-lb. lots.

Cadmium—Nominal, $1.40 per lb. Market steady.

Cobalt—Metal, $6 per lb.; black oxide, $4.10 per lb.; sulphate, $1.60.

Iridium—Nominal, $350@$400 per oz.

Magnesium—Crude, 99 per cent or over pure, $1.75 per lb. for 100-lb. lots and over, f.o.b. Niagara Falls.

[1]**Molybdenum Metal** in rod or wire form, 99.9 per cent pure, $32@$40 per lb., according to gage.

Nickel—Ingot, 43c.; shot, 43c.; electrolytic, 45c., f.o.b. Bayonne, N. J.

Monel Metal—Shot, 35c.; blocks, 35c., and ingots, 38c. per lb., f.o.b. Bayonne.

Osmium—Open market, $70@$80 per troy oz.

[1]**Palladium**—$85 per oz.

Platinum—Firm at $85 per oz.; nominal.

Quicksilver—Market quiet; $48@$49 per 75-lb. flask. San Francisco wires $52@$55. Barely steady.

[1]**Rhodium**—$200@$225 per troy oz.

Ruthenium—$175@$200 per troy oz.

[1]**Selenium**—Black powdered, amorphous, 99.5 per cent pure, $2@$2.25 per lb.

[1]**Thallium Metal**—Ingot, 99 per cent pure, $20 per lb.

[1]**Tungsten Metal**—$35@$60 per kilogram, according to purity and gage.

Metallic Ores

Chrome Ore—Guaranteed 50 per cent Cr_2O_3 foreign ore with a maximum of 6 per cent silica, 55@60c. per unit, New York. California concentrates, 50 per cent Cr_2O_3 and upward, 60@65c.

[1]**Manganese Ore**—45@50c. per unit, seaport; chemical ore (MnO_2) $65@$70 per gross ton, lump; $75@$80 per net ton, powdered.

Molybdenum Ore—85 per cent MoS_2, 55@60c. per lb. of contained sulphide, New York.

[1]**Tantalum Ore**—Guaranteed minimum 60 per cent tantalic acid, 45c. per lb. in ton lots.

[1]**Titanium Ores**—Ilmenite, 52 per cent TiO_2, 1½@2c. per lb. for ore. Rutile, 95 per cent TiO_2, 15c. per lb. for ore, with concessions on large lots or running contracts.

[1]**Tungsten Ore**—Scheelite, 60 per cent WO_3 and over, per unit of WO_3, $4@$4.50, f.o.b. mines; wolframite, 60 per cent WO_3 and over, per unit of WO_3, $4@$4.25, in New York.

Uranium Ore (Carnotite)—Ore containing 1½ per cent U_3O_8 and 5 per cent V_2O_5 sells for $1.50 per lb. of U_3O_8 and 75c. per lb. of V_2O_5; ore containing 2 per cent U_3O_8 and 5 per cent V_2O_5 sells for $2.25 and 75c. per lb., respectively; higher U_3O_8 and V_2O_5 content commands proportionately higher prices.

Vanadium Ore—$1.50 per lb. of V_2O_5 (guaranteed minimum of 18 per cent V_2O_5), New York.

[1]**Zircon**—Washed, iron free, 5c. per lb.

[1]**Zirkite**—According to conditions, $80 @$90 per ton, carload lots. Pure white oxide, 99 per cent, is quoted at $1.15 per lb. in ton lots.

Zinc and Lead Ore Markets

Joplin, Mo., Dec. 4—Zinc blende, per ton, high, $35.25; basis 60 per cent zinc, premium, $32; Prime Western, $30 @$31; fines and slimes, $30@$27.50; calamine, basis, 40 per cent zinc, $35@ $30. Average settling prices: Blende, $36.73; calamine, $30; all zinc ores, $36.52.

Lead, high, $69.60; basis 80 per cent lead, $75@$47.50; average settling price, $69.27 per ton.

Shipments for the week: Blende, 6,154; calamine, 197; lead, 1,677 tons. Value, all ores the week, $349,150.

Lead dropped from offerings of $55 last week to $47.50 this week. The $75 basis noted was paid in some settlements. Blende dropped to $30 basis, with considerable ore sold, advancing to $31 basis yesterday under pressure of largely increased demand. Purchases were 2,100 tons larger than last week. Approximately 30 per cent of production is suspended owing to the lowest price since December, 1907.

Platteville, Wis., Dec. 4—No ore sales in open market were made this week. The National plant again made the only shipment of high-grade blende, four cars going to the Illinois Zinc Co. and two cars of Prime Western on contract schedule. The National has started its acid department again after three weeks' shutdown. Shipments for the week: Blende, 308; lead, 50 tons. Shipments for the year: Blende, 59,281; calamine, 2,534; lead, 4,523; sulphur ore, 1,342 tons. Shipped during week to separating plants 2,228 tons blende.

Non-Metallic Minerals

Asbestos—Crude, No. 1, $2,000@ $3,500; No. 2, $1,400@$2,000; spinning fibres, $400@$1,000; magnesia and compressed sheet fibres, $325@$500; shingle stock, $110@$150; paper stock, $60@ $75; cement stock, $17.50@$30; floats, $8.50@$15, all per short ton, f.o.b. Thetford, Broughton, and Black Lake mines, Quebec, Canada; 5 per cent to be added as Canadian royalty export sales tax.

Barytes—Crude, 88 to 94 per cent barium content, $10@$12 per net ton; ground (white) $24@$30 in bags, carload lots; (off-color) $22@$26 in bags, carload lots; all f.o.b. Kings Creek, S. C. Crude, 88 to 94 per cent, $23; ground (white), $45; ground (off color) $30@$32 per net ton, less than carload lots, f.o.b. New York. Crude, first grade, $10 per ton, f.o.b. cars, Missouri; floated, $28 per ton in bbls.; $26.50 per ton in 100-lb. bags; extra charge for bags, f.o.b. St. Louis.

Chalk—English, extra light, 5@5½c.; light, 5@6c.; dense, 4½@5c. per lb., all f.o.b. New York.

China Clay (Kaolin) — Crude, $8@ $12; washed, $12@$15; powdered, $18@ $22; bags extra, per net ton, f.o.b. mines, Georgia; crude, $8@$12; ground, $15@$40, f.o.b. Virginia points. Domestic lump, $10@$20; powdered, $25@ $30; imported lump, $25@$35; powdered, $30@$35, f.o.b. New York.

Feldspar—Crude, $8@$14 per gross ton, f.o.b. Maryland and North Carolina points; $7.50@$10, f.o.b. Maine; ground, $27@$30, car lots, f.o.b. Baltimore; ground, $17@$21, f.o.b. North Carolina points; $17@$21 per ton, No. 1 ground, f.o.b. New York State; $21@ $23 per ton, ground, f.o.b. Maine. Crude spar very scarce.

Fluorspar — Gravel, guaranteed 85 per cent calcium fluoride and not over 6 per cent silica, $25 per ton, f.o.b. Illinois mines, and $25.50, f.o.b. Kentucky; ground, suitable for acid, chem-

[1]Furnished by Foote Mineral Co., Philadelphia, Pa

ical or enameling purposes, $60; lump, $17, f.o.b. Tonuco, N. M. In Canada 85 per cent calcium fluoride sells for $20 per ton f.o.b. Madoc; output limited. Canadian price generally $18 (Canadian currency) per ton, f.o.b. mines; market inactive.

Fuller's Earth—$18 per ton carload lots, f.o.b. New York.

Graphite—The 90 per cent crucible grade is held in Alabama for 9c. per lb. and 85 per cent grade, 7@9c.

Gypsum—Plaster of paris in carload lots sells for $4.25 per 250-lb. bbl., alongside dock, New York. Raw crushed rock, $3.50@$4.50; calcined stucco, $9; f.o.b. works, Illinois.

Kaolin—See China Clay.

Limestone—Dolomite, 1@2 man size, $1.60@$1.65; 2@8 in., $1.55@$1.65 per net ton, f.o.b. Plymouth Meeting, Pa.; fluxing, $1.65@$1.75 per net ton, f.o.b. Howellville, Pa.

Magnesite, Calcined — High-grade caustic calcined, lump form, $35@$40 per ton, carload lots, f.o.b. California points. In Chicago district, $57.70; Atlantic seaboard, $61@$63.

Dead-Burned — $38 per net ton, Chewelah, Wash.; $58@$64, Chester, Pa. Austrian grade, $55@$60 per ton, f.o.b. Baltimore. (Magnesite brick—See Refractories.)

Mica—India block mica slightly stained, per lb.: No. 6, 50c.; No. 5, $1.20 @$1.40; No. 4, $2@$3; No. 3, $4.25@ $5; No. 2, $5.50@$7; No. 1, $8. Clear block; No. 6, 55c.; No. 5, $1.75; No. 4, $3.25; No. 3, $5; No. 2, $6.50; No. 1, $8; A1, $10; extra large, $25; all f.o.b. New York; ground, $150 per ton, Philadelphia. Domestic, uncut, f.o.b. Franklin, N. C., as follows: Scrap, $45 @$50 per ton; punch, 10c. per lb.; circle, 15@25c.; 1½ x 2 in., 75c.; 2 x 2 in., $1.15; 2 x 3 in., $1.65; 3 x 3 in., $2.10; 3 x 4 in., $2.50; 3 x 5 in., $2.75; 3 x 6 in., $3.75; ground 165 mesh, $150 @$170 per ton; ground roofing mica, $60; mica washers, 75c.@$2 per lb.; 1¼-in. disks, No. 1, $1.40 per lb.; No. 2, $1.25. The foregoing domestic prices obtain also in the Chicago district.

[1]**Monazite** — Minimum of 6 per cent thorium oxide, $30 per unit, duty paid.

Phosphate Rock—Per long ton, Florida ports: 77 per cent tricalcium phosphate, $13; 75 per cent, $11.50; 75@74 per cent, $11; 70 per cent, $8.35; 68 per cent, $7.85; 68@66 per cent, $7.60. Finely ground Tennessee rock sells for $8.50 per net ton for 13 per cent phosphorus content, agricultural application; for acid-making, 14 per cent, $9; both prices being f.o.b. Centerville, Tenn.

Pumice Stone—Imported, lump, 4@ 50c. per lb.; domestic lump, 6c.; ground, 4@7c., all f.o.b. New York.

Pyrites—Spanish fines, per unit, 12c., c.i.f. Atlantic seaport; furnace size, 17c.; Spanish lump, 14@16c.; domestic fines, f.o.b. mines, Georgia, 12@14c.

Quartz—(Acid tower) fist to head, $10; 1½ to 2 in., $14; rice, $17; all net ton, f.o.b. Baltimore; lump, carload lots, $5@$7.50 net ton, f.o.b. North Carolina mines.

Sand (Glass)—Dry glass sand, $4 per net ton, f.o.b. cars Mapleton, Pa. Sand, f.o.b. Ottawa, Ill., is $3 per ton; $2.50 on annual contracts. Sand at Klondike, Gray Summit and Pacific, all in Missouri, is $2.50 on contract; some outside sales have been made at $4. St. Louis, open market, at $3.50; contract price on large quantities, $2.50; on small quantities, $3.

Sulphur—$18 per ton for domestic; $18@$20 for export, f.o.b. Texas and Louisiana mines. Market quiet.

Talc — Paper making, $12@$22 per ton; roofing grades, $9.50@$15; rubber grades, $12@$18; all f.o.b. Vermont. California talc, $20@$45, talcum powder grade. Southern talc, powdered, carload lots, $12@$15 per ton; less than carload, $25, f.o.b. cars; freight to New York $5.25 per ton, carload lots; less than carload lots, $9.25. Imported, $60 @$70; Canadian, $20@$40 per ton.

Mineral Products

Arsenic—White arsenic, 12@12½c. per lb.; sulphide, powdered, 15@15½c. per lb. in carload lots.

Sodium Nitrate—$3 per cwt., ex vessel, Atlantic ports. Market quiet.

Sodium Sulphate—For 95 per cent material, $22 per ton, f.o.b. mines, Idaho and Arizona, spot and six months' contract.

Potassium Sulphate—Domestic, $225 @$250 per net ton, basis 90 per cent, f.o.b. New York.

Ferro Alloys

Ferrocarbontitanium—For 15 to 18 per cent material, $200@$225 per ton, f.o.b. Niagara Falls, N. Y.

Ferrocerium—Per lb., $12@$15.

Ferrochrome—Carload lots, spot and contract, 60 to 70 per cent chromium, 6 to 8 per cent carbon, 17@18c. per lb. of chromium contained; 4 to 6 per cent carbon, 16@17c., f.o.b. works.

Ferromanganese—Domestic 76 to 80 per cent, $150, freight allowed; $145, f.o.b. seaboard bases; English, $135@ $140, c.i.f. Atlantic seaports. Spiegeleisen, 18@20 per cent, $60@$65, f.o.b. furnace.

[1]**Ferromolybdenum**—Standard grades, carrying from 50 to 60 per cent molybdenum metal, with low sulphur, phosphorus, and arsenic, $2.25@$2.50 per lb. of contained metal, f.o.b. works.

Ferrosilicon—For 10 to 15 per cent, per gross ton, f.o.b. works, $60@$65; 50 per cent, $80@$85; 75 per cent, $160.

[1]**Ferrotungsten**—Domestic, 70 to 80 per cent W, 65@75c. per lb. of contained tungsten, f.o.b. works. Foreign, 65c.

Ferro-uranium—35 to 50 per cent U, $7 per lb. of U contained, f.o.b. works.

[1]**Ferrovanadium**—Basis 30 to 40 per cent, $6.50@$7.50 per lb. of V contained, according to silicon content, f.o.b. works.

Metal Products

Copper Sheets — Current New York price, 23½c. per lb.; wire, 18c. Even lower quotations are heard.

Lead Sheets—Full lead sheets, 9½c.; cut lead sheets, 9¾c. in quantity, mill lots.

Nickel Silver — Unchanged at 35¾c. per lb. for 18 per cent nickel.

Yellow Metal — Dimension sheets, 22½c.; sheathing, 22½c.; rods, ⅜ to 3 in., 19½c.

Zinc Sheets—$11.50 per 100 lb., less 8 per cent on carload lots, f.o.b. smelter; zinc plates, 10½c. per lb.

Refractories

Bauxite Brick—56 per cent alumina, $160 per 1,000, f.o.b. Pittsburgh.

Chrome Cement—40@45 per cent Cr_2O_3, $55@$60 per net ton, and $65 in sacks, carload lots, f.o.b. eastern shipping points.

Fire Brick—First quality, 9-in. shapes, $55@$60 per 1,000, Pennsylvania, Ohio and Kentucky. Second quality, $45@ $50.

Magnesite Brick — 9-in. straights, $110 per net ton; 9-in. arches, wedges and keys, $120; soaps and splits, $130.

Silica Brick—9-in., per 1,000: Chicago district, $65@$70; Birmingham, Ala., $56@$61; Mount Union, Pa., $55 @$60.

Iron Trade Review

Pittsburgh, Dec. 7, 1920

Wire products and sheets have followed tin plate, bars, shapes, and plates in the decline of the independent market to the Steel Corporation or Industrial Board level. The independent market on pipe remains at $7 a ton above the Steel Corporation level. The reductions have brought the independents little additional business, nor was it expected that they would.

The Steel Corporation continues to operate substantially as well as formerly, at 85 to 90 per cent of capacity. Independent operations hardly average over 50 per cent, and are declining. There will probably be extensive closings the last week or two of the year, to allow orders to accumulate.

Last Thursday the American Sheet & Tin Plate Co. (Steel Corporation) opened order books for the first half of 1921, at regular prices, $7 for tin plate, 3.55c. for blue annealed sheets, 4.35c. for black sheets and 5.70c. for galvanized sheets, but on account of about three months of work carried over, the new contracts will really be for approximately the second quarter.

Pig Iron—There are offerings of bessemer at $35, Valley, or $2.50 decline, and of basic at $33, or $2 decline. Foundry remains nominally $37.

Semi-finished Steel—The independent market is nominal at about $50 for billets or sheet bars.

Charcoal and Coke

Charcoal—Willow, 7c. per lb. in bbls. hardwood, 5½c. per lb., in 250-lb. bbls Barrel charge is 35c. additional.

Connellsville — Furnace, $10@$12; foundry, $8@$10.

[1]Furnished by Foote Mineral Co., Philadelphia, Pa.

Curtailment in the Copper Industry

Relatively Small Decrease in Output So Far—Tendency of Most Producers To Lower Costs Rather Than Production—Surplus Stocks Still Huge and Export Trade Poor

THE extremely low prices of copper are having their inevitable consequences. Operations are being curtailed by some of the country's largest producers, and there is a growing determination in the trade drastically to readjust the industry in an effort to meet the causes of the present depression in the market. This was to be expected, in view of the great forces that have been bearing down upon the price of copper and the impossibility of meeting today's prices by immediately lowering costs.

Ten years ago it was conservatively estimated[1] that no copper can be produced in North America at a profit for less than 10c. per lb. Copper today can be had at 14c. per lb. delivered, so that it is not difficult to realize the situation in which practically every copper company in the country finds itself. It was further estimated ten years ago that 11c. copper meant only half the production for the period; 12c. copper an interchange of a "new dollar for an old one," and at 15c. "the business is profitable and prosperous only to an entirely legitimate degree." Although this estimate should possibly have been slightly modified in 1913 and 1914 by the records of some of our great low-grade porphyry coppers and the results of improvements in the metallurgy of copper during the last ten years, the modification up to the beginning of hostilities would probably not have been large, but at this time an upward revision of perhaps 50 to 75 per cent is evidently necessary. Present costs, based, as they are, on a labor payment compatible with a war price for copper, are very much higher than ten years ago.

To meet the acuteness of the situation producers have taken a logical step. They have begun to curtail their output and to lower their costs through a readjustment of the elements that enter into the cost of production—chiefly labor. Greene Cananea has announced it will suspend operations indefinitely on Dec. 15; North Butte has dropped production two-thirds, or from 1,500,000 to 500,000 lb. monthly, and other announcements are momentarily expected. The desire has been more to decrease wages than to lessen production in meeting the situation. The Copper Range Mining Co. in Michigan has reduced wages about 17 per cent, but the reduction is slightly compensated by concessions in the price of fuel to employees. The American Smelting & Refining Co. has reduced wages 50c. per day at its Tacoma plant, and is considering similar action at the East Helena smelter. Quincy Mining Co., Michigan, has also made a reduction of 15 per cent in wages. Calumet & Hecla has already made a wage cut. The Lake Superior copper mines have no compensating silver production which would help to lower production costs, as in the Butte district, and are relatively high-cost producers. It was but natural that they should first feel the pinch of low copper prices.

Although labor is one of the items that is amenable to a reduction, transportation charges, which have been greatly increased during the last year, admit of only an indirect decrease. Not only have the increased freight rates added to the marketing cost of copper, but to a considerable extent to other items of production cost, as the prices of mine supplies also reflect the increased rail rates. A successful attempt has been made by western companies to ship their product by rail to Pacific Coast ports and then by boat via the Panama Canal to Eastern points.

Operating companies are naturally reluctant to abandon operations entirely, and it is largely a question of what entails the greater cost—a complete shutdown, partly curtailed operations, or production at a rate which produces copper at the cheapest figure but which nevertheless necessitates marketing copper at a certain loss per pound. It is no easy matter to decide exactly what procedure is best suited for the individual mine, particularly as the future price of copper is uncertain. Judging from the announcements of many important companies and partly referred to above, the copper producers in general prefer to decrease their costs by reductions in wages and other items rather than by drastic curtailment. This is not all to be desired, as neither domestic nor export business is upon a scale which bodes well for the industry; whereas production is still above the pre-war rate. In fact, an estimate of October production shows a rate slightly higher than that of September.

MONTHLY SMELTER PRODUCTION OF COPPER IN 1920

In Pounds

		Average New York Price			Average New York Price
Jan.	121,900,000	18.92	July	109,730,000	18.58
Feb.	117,450,000	18.57	Aug.	116,430,000	18.35
Mar.	120,310,000	18.33	Sept.	104,920,000	18.14
Apr.	116,100,000	18.66	Oct.	105,100,000	15.93
May	115,000,000	18.48	Nov.	.....	14.26
June	116,100,000	18.07			

AVERAGE MONTHLY COPPER PRODUCTION

Year	Average Monthly Production	Average New York Yearly Price	Year	Average Monthly Production	Average New York Yearly Price
1910	90,500,000	12.74	1916	162,000,000	27.20
1911	90,500,000	12.38	1917	160,300,000	27.18
1912	103,400,000	16.34	1918	161,500,000	24.63
1913	102,400,000	15.27	1919	100,800,000	18.69
1914	91,000,000	13.60	1920 (a)	114,300,000	
1915	118,600,000	17.28			

(a) Estimated.

A glance at the figures will show how slightly copper production has declined in the current year and that it is still above the pre-war rate.

It is well known that stocks of both refined and crude copper are still very large, and that despite the dent that was made in the copper surplus earlier in the year the stocks are still formidable—in fact, the key to the situation. Estimates vary widely as to their amount, but it is safe to say that there is enough copper in crude and refined form to be equivalent to three-quarters of the normal annual production in this country. Such large stocks carry an interest charge that serves to aggravate the effect of the supply. Consumers are fully aware of the existence of this surplus and the improbability of decreasing it in a short space of time.

It is hoped that foreign trade in raw copper will help to diminish the heavy copper surplus, but from the record made so far this year no hopeful impression is gained. Although earlier in the year exports of copper considerably exceeded imports, of late the trend has changed, and for the last two months reported more copper has been imported than has been exported. During the first ten months of the current year approximately 543,150,000 lb. of copper in various forms was exported. At the same time about 406,440,000 lb. was imported, which leaves a favorable net balance of about one and a half month's production that has been exported—not a very encouraging rate for the period.

How the present policy of the copper industry will meet the situation it is difficult to say. Economic forces have caused the industry to contract its production and will likely cause further contraction, no matter how distasteful the process. There has been a relatively small effort on the part of the country's largest producers to conserve their output by decreasing production, and further curtailment is not only logical but inevitable should present low prices prevail. Until the heavy surplus stocks of copper are lessened, or the foreign exchange situation rights itself, there is no need of producing on a basis which implies satisfying the wants of a world which is not prepared to purchase.

[1] J. R. Finlay's survey in "Cost of Mining."

COMPANY REPORTS

Chino Copper Co. Shows Deficit

Copper: New Mexico

A statement of the operations of Chino Copper Co. for the third quarter of the calendar and fiscal year 1920 shows that the gross production of copper contained in the concentrates from milling operations for this and preceding quarters of the year 1920 was 12,354,752 lb., 11,980,615 lb. and 10,621,276 lb. respectively.

In addition to the copper derived from the concentrating ores, there was a total of 221,462 gross pounds of copper in crude ore shipped direct to the smelter, making the total gross production for the quarter 12,576,214 lb., as compared with 11,989,451 lb. for the second quarter and 10,621,276 lb. for the first quarter. The net production of copper after smelter deductions for the quarter was 12,023,444 lb. as compared with 11,411,178 lb. and 10,159,566 lb. respectively, for the second and first quarters.

The total amount of ore treated for the three months was 498,376 tons, which is an average of 5,417 tons per day. This average daily tonnage is 257 tons per day less than for the second quarter of 1920. The average copper content of the ore treated by the mill for the third quarter was 1.82 per cent copper, as compared with 1.67 per cent copper for the previous quarter.

The recovery per ton of ore milled for the third quarter was 24.79 lb. gross, compared with 23.204 lb. gross for the second quarter. There was produced a total of 36,861 dry tons of concentrates averaging 16.76 per cent copper.

The cost per pound of net copper produced from all sources in the third quarter was 15.01c., compared with 15.90c. for the second quarter. This cost includes plant depreciation and all other items excepting charges for Federal taxes. Income from precious metals and miscellaneous sources amounted to $57,703.13, equivalent to 0.48c. per lb. of net copper produced, which being credited to the cost of producing copper reduces the net cost for the quarter to 14.53c. per lb.

The financial results of the company's operations for the quarter under consideration compared with the second and first quarters of 1920 are shown in the following table:

	Third Quarter 1920	Second Quarter 1920	First Quarter 1920
Net income from copper production only	$51,079.70	$260,031.67	$737,605 40
Miscellaneous income, including payments for precious metals	57,703.13	70,120.39	72,121 75
Total	$108,782 83	$330,152 06	$809,727 15
Distribution to stockholders	326,242.50	326,242 50	326,242 50
Net surplus		$3,909.56	$483,484 65
Net deficit	$217,459.67		

The earnings for the third quarter of 1920 are based on a price for copper of 15.43c. per lb., compared with 18.175c. per lb. for the second quarter of the year. The total net income for the nine months amounted to $1,248,662.04, or $1.435 per share. A distribution to stockholders, amounting to 37½c. per share, was made at the end of the third quarter.

During the quarter there was removed by steam shovels at the Santa Rita mine a total of 1,026,570 cu.yd. of material, equivalent to an average of 342,190 cu.yd. per month, compared with a total of 1,018,784 cu.yd. of material, or an average of 339,595 cu.yd. per month, for the second quarter. Of the total material removed, 688,580 cu.yd. were stripping, the remainder being equivalent to 662,609 tons of ore of an average grade of 1.68 per cent copper, according to mine sampling and assaying. The difference between the tonnage mined and the tonnage milled or shipped direct to the smelter during this quarter is due to oxidized and partly oxidized ore which it was necessary to remove in connection with stripping and mining operations and which was sent to ore stockpiles.

Ray Consolidated Copper Co.

Copper: Arizona

The thirty-seventh quarterly report of Ray Consolidated Copper Co. covering the third quarter of the year 1920 indicates that the gross production of copper contained in concentrates for the third quarter, as compared with the previous quarters of 1920, was 13,029,427 lb., compared with 12,880,605 lb. in the second quarter and 11,547,103 lb. in the first quarter.

The net production of marketable copper derived from this gross output for the quarter, after allowing for smelter deductions, was 12,631,222 lb., as compared with a net production of 12,553,623 lb. for the quarter ended June 30, and of 11,259,534 lb. net for the quarter ended March 31, 1920. During the quarter 443,100 dry tons was milled.

The cost per pound of all net copper produced was 15.47c., including the customary charges to cover depreciation of plant and equipment, all administrative and general expense, and also a fixed charge of 15c. per ton of ore treated for the retirement of mine development expense, and after crediting miscellaneous income (including gold and silver values) amounting to .486c. per lb.

The financial results of operations for the quarter, compared with the previous quarters of 1920, are as follows:

	Third Quarter 1920	Second Quarter 1920	First Quarter 1920
Operating profit or loss (o)	$113,518 89	$343,650 73	$587,165 50
Miscellaneous income	61,369 96	43,604 72	50,134 39
Total (o)	$ 52,148 93	$387,255 45	$637,299 89
Disbursement to stockholders	394,294 75	394,294 75	394,294 75
Net surplus for quarter			$243,005 14
Net deficit for quarter	$446,443.68	$7,039 30	

(o) Loss.

The average carrying price of copper for the quarter was 15.057c., as compared with 18.426c. for the previous quarter. All costs as shown and the financial results as stated are exclusive of any charge for or reserves set up to cover Federal income and profits taxes. A quarterly distribution to stockholders of 25c. per share was made Sept. 30, 1920.

Mining Dividends for November, 1920

The following is a partial list of dividends paid by mining companies during November, 1920.

Mining and Metallurgical Companies of U. S.	Location	Per Share	Totals
American Zinc, Lead & Smelting, pfd	U. S.	$1 50Q	$120,810 00
Anaconda Copper Mining	Mont.	1 00Q	2,331,250 00
Chief Consolidated Mining, c	Utah	10Q	88,422 30
International Nickel, pfd.	U. S.-Can.	1 50Q	133,689 00

Hollinger Consol. Gold	Ontario	05X	246,000 00

A, Annually. Q, Quarterly. X, Extra. K, Irregular.

American Zinc, Lead & Smelting Co. failed to declare a dividend on its common stock at this time, and the condition of the copper market has caused Calumet & Hecla to withhold a dividend declaration usually made, and Mohawk Mining to drop to $1, from the $1.50 paid in August. On the other hand, Utah-Apex Mining resumes after an interval of two years, and Amparo Mining maintains its extra of 2c. El Oro is still able to pay its annual shilling (tax free), and Hollinger Consolidated Gold Mines, Ltd., of Canada, is able to bring out 5c. extra, in addition to the regular bimonthly payment made in October. Arizona Copper Co., Ltd., voted on Nov. 17 not to pay an interim dividend.

The Close of the War Minerals Relief Commission

SECRETARY PAYNE of the Interior Department advises that up to Nov. 27 the War Minerals Relief Commission had made recommendations in 1,124 cases out of 1,203 legally before it, and in all has made awards of something over two million dollars on claims asking nearly sixteen million. The remaining eighty-three claims cover an asked-for amount of less than one million. The total amount appropriated by Congress as a figure which must not be exceeded, it will be remembered, was eight and a half million, so that at least five million dollars will remain unexpended when the commission is through with its work, which it expects to be within sixty to ninety days. It is to be hoped that the Secretary will at once return to the Treasury the five million credit remaining for him to draw on, and will a few months later add the odd change remaining, which will be probably in the neighborhood of half a million dollars. This will complete the record of prompt and decisive meeting of problems which has characterized this war minerals matter from the start.

Congress put the adjudication of these claims up to the Secretary of the Interior, without appeal, because it was of the opinion that if referred to the Court of Claims they would drag interminably. Beyond question, the Secretary and his appointees have justified the shrewd judgment of Congress. It is a highly creditable achievement to have disposed of over 1,100 claims in a little over a year, with adequate engineering, auditing, legal, and equitable investigation of each. The examining staff has consisted of experienced mining engineers and the auditing staff of especially selected and experienced mine accountants; and of the commission, two are mining engineers who make their living out of their profession, and the third is an old and tried favorite son of a mining state.

None of the commissioners had any hand in the Government's mineral policy during the war. A more ideal tribunal could not be imagined, and certainly not one to which the mining industry could look with more confidence. No doubt the claimants, with the characteristic sportsmanship of the profession, will thank the Secretary's organization for prompt and just awards, and forget the claims which the commission has found invalid. And we hope that the matter may be closed with a vote of appreciation to the Government for its equitably-meant handling of the war and post-war problems regarding minerals, and that claimants, individually or collectively, will not seek to prolong the matter indefinitely, by securing the permission of Congress to drag out a miserable existence in the Court of Claims.

The Court of Claims is, from the standpoint of fitness and intelligence for these special cases, an inferior tribunal, as it has not the special knowledge concerning the questions involved possessed by the organization which has handled them, and which will never again be available, since it is now breaking up. Furthermore, we are claiming nowadays that the engineer can solve general questions more promptly and equitably than the lawyer, who has long held the reins over us in public life. The record of the handling of the war minerals problem justifies the claim; therefore let us not turn the remains which the engineers have rejected over to the lawyers, to whom procrastination is a source of income.

The Price of Copper in Canada

RECENTLY we were drawn into a discussion as to whether or not the Canadian government paid a bounty on copper refined within the dominion. Several mining men here in New York were very sure that this was being done, and we were informed that it amounted to 1½c. per lb. and had been in effect for about one year. However, inquiry from the Minister of Mines at Ottawa brought the reply that no such bounty under that or any other name is paid by the dominion government or, as far as his information went, by any of the provincial governments. This, of course, proved that any federal bounty was a myth, but looking into the subject further, we found that a Canadian smelter or refiner who settles on a basis of the New York price does enjoy a premium, and we believe the true state of affairs should be known.

Each week the *Canadian Mining Journal* publishes the price of electrolytic copper in Montreal. On Dec. 1 this price was 18.75c. and the New York quotation on the same day was 13.25c. Why this great difference? It is accounted for in this way: Canada imposes an import duty of 1½c. per lb. on copper in blocks, ingots or pigs, and 10 per cent on semi-manufactured forms. As the country consumes, or did in 1918, three or four times as much refined copper as it produces, this 1½c. must be added to the New York price. Then there is the matter of exchange. On Dec. 1 New York funds in Montreal were quoted at approximately 13¼ per cent premium. This would be equivalent to 1.8c. on a pound of 13¼c. copper. Freight would be approximately ¼c. Also, we are reliably informed, though we have not confirmed it, there is an excise tax of 1 per cent on imported copper. This would amount to only about 0.1c. per lb. Summing these up, we have 3.9c. as a differential for copper in Montreal compared with New York, or, with the New York price 13.25c., we would expect the Canadian price to be 17.15c. This is not quite 18.75c., but we hear that Montreal dealers actually sell for less than the figure published by the *Canadian Mining Journal*, which is only supposed to represent less-than-carload lots. It would probably be safe to assume that with the current rates of exchange, Canadian producers would be able to sell their copper for about 4.5c. above the New York price. Freight, of course, say from the Trail

refinery to Toronto or Montreal would be an item of some importance, so that Western refiners would not net as large a premium as this over the New York price.

Curbing Cagliostro

THE way of the bogus stock promoter is hard, but, nevertheless, the field of this modern Cagliostro remains to a considerable degree fertile. His latest invasion is—by virtue of the fact that the unsuspecting public is still very much in the dark concerning it—the promotion of oil-shale stock. What argument could be more persuasive to the gullible prospect, than the mere statement that, though our petroleum resources are dwindling, untold quantities of shale oil await only the investments of those shrewd enough to get in "on the ground floor"? We are invited to take heart, to cease listening to the idle chatter of the pessimist, for, lo and behold, the opportunity of the ages has come, and oil shale—millions of tons of it—is to take the place of our "wasting resources." The prospective investor is shown magnificent mountain views, disclosing a veritable treasure-trove in the form of oil-bearing rock; also photographs of well-ordered plants in full operation, and, hypnotized by the dazzling prospect of out-rivaling a Standard Oil magnate, the stupefied victim subscribes. He is not advised, of course, that a direct air route between the Colorado mountains and the oil-shale refineries of Scotland has not yet been established.

After having pointed out the devious workings of the nefarious promoter for a number of years, we are inclined to take exception to the statement made by David Eliot Day, in his article "Oil Shale and the Engineer," on page 1182, that, "The time for promotion schemes has passed." True, as he says, it is "becoming more difficult"; but it is our general observation that the narrower the eye of the needle the thinner and smoother becomes the promoter. And it is unreasonable to suppose that those of the light-fingered gentry are going to lose the opportunity to make the most of this latest experimentation.

No doubt there will be ample opportunities in the oil-shale industry for legitimate stock issues, but at the present time there is little to attract the moderate and conservative investor, and the experimental and development work will necessarily have to be backed by large financial interests. Such concerns make haste slowly, and usually build on a firm foundation.

Philanthropically speaking, however, we wish that Mr. Day's paper might be accorded wide dissemination in the non-technical press, for he has outlined in excellent fashion the several problems that must be met before the commercial production of oil from shales in this country may be practicably realized. A careful reading is sufficient to convince the most skeptical as to the fallacy of the arguments produced by the spell-binders.

The Unreliability of Iron as a Trade Barometer

THE rapid and striking decline in the price of most commodities was initiated so swiftly that most people, unprepared for the sudden change, were dumfounded. Their unpreparedness might very possibly have been induced by an incorrect reasoning as to the state and effect of underlying economic conditions in this period of readjustment. In other words, their barometer didn't function properly and failed to indicate the advent of an impending storm. It could easily have been the fault of the barometer, as, judging from the indicators that are ordinarily used in forecasting the ups and downs in the general price trend of commodities, it is exceedingly easy to be led astray.

For example, pig iron has been hailed as the exponent of barometrical perfection. Yet glance at the present price of the several grades of pig iron. It has budged but slightly from its high of last September, and compared with copper, lead, zinc, wheat, cotton, leather, and a multitude of other materials, the decline is relatively small. It may be gainsaid that the present period is so abnormal that it is logical to find an exception to what is merely a generality. Perhaps there is something in such reasoning, but from our own observation, consisting, for one thing, of a comparison between the price of pig iron and copper for a span of years, copper has been much more sensitive than pig iron in reflecting impending market changes—and sensitiveness is the paramount essential of a good barometer.

On page 1197 will be found curves comparing the price of basic pig iron with that of New York electrolytic copper, from which the fluctuations in each are clearly apparent.

During the last ten years, pig iron has lagged from one to thirteen months in failing to reflect the market trend in the metals, as compared with copper. In the last twelve critical months, copper has come down in an almost unbroken descent. Pig iron delayed its decline until September of this year; and if pre-war conditions are any criterion of the limit of the drop in metals—it is difficult to determine what is a criterion these days—pig iron is due for a mighty fall.

No doubt it is hazardous to rely upon one single indication in predicting a general trend. Statistical organizations and banks which make a practice of forecasting a trade cycle study railroad earnings, bank clearings and bank conditions, crops, the prosperity of the iron and steel industry, and other economic factors which are considered fundamental. They feature a service founded upon a compilation of such information and call it a business barometer. The average man, however, is more interested in singling out one commodity which is most likely sensitively to reflect a price trend. The pig-iron "barometer" is either exceedingly sluggish or requires calibration—at any rate, our faith in its reliability has been sadly shaken and the reputation of copper considerably enhanced.

Many commodities are endowed with a barometrical halo. Silver is a common example, and it has borne this dignity unusually well. Singularly enough, the price of silver has fluctuated very sensitively with the price of other metals. We have confidence in silver. Its gradual price descent from its phenomenal high of last February not only began earlier than the decline in most other commodities, but has kept abreast of the trend. After the price descent crossed the dollar line, artificial conditions affected its capacity as a barometer.

There are other choices. We recently read in a Bureau of Mines bulletin that "In recent years in the United States, especially in the East, the demand for sulphuric acid for chemical and metallurgical industries has been an accurate and sensitive barometer of general business conditions. The demand for acid responds much more quickly to a general slump or boom in the industrial world than does the demand for iron and steel." Which would indicate that there are other pet barometers—and a lack of faith in pig iron. Which one do you use?

WHAT OTHERS THINK

The Reconciliation of Science and Law

YOUR editorial comment in a recent issue is an excellent illustration of the state of unpreparedness with which some of our editorial critics enter upon the discussion of apex litigation. Many of your readers are sufficiently familiar with the subject to perceive at once the unstable basis for your criticisms and to lay aside your strictures with a smile. But others not so well advised are liable to gain a false impression and to find real wisdom in your sophistries. For their benefit it seems advisable for me to reply.

Having in mind only the textbook definitions and imbued solely with scientific conceptions, you fail to realize that the Federal mining laws and the construction placed upon them by the courts have in many instances compelled the geologist to modify his preconceived and perhaps more scientific definitions.

Let us first glance at the statute itself and then read what the courts have said. The act of May 10, 1872, provides that "all mineral deposits in land belonging to the United States, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and purchase by citizens of the United States." Section 2 provides for the location of mining claims "upon veins or lodes of quartz or other rock in place, bearing gold, silver, cinnabar, lead, tin, copper, or other valuable deposits."

Section 3 provides "that the locators of all mining locations . . . on any mineral, vein, lode or ledge situated on the public domain . . . shall have the exclusive right of possession and enjoyment of all the surface included within the lines of their location, and of all veins, lodes or ledges throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward vertically, although such veins, lodes or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side lines of said surface locations." And that is the whole substance of the vexatious extralateral right law. But the courts have been called upon to interpret this law between conflicting claimants. They have given us definitions and rules for our guidance.

More than forty years ago we were told by Justice Field of the United States Supreme Court that "these acts were not drawn by geologists or for geologists; they were not framed in the interest of science and consequently with scientific accuracy in the use of terms. They were framed for the protection of miners in the claims which they had located and developed, and should receive such a construction as will carry out this purpose. The use of the terms 'vein' and 'lode' in connection with each other in the act of 1866, and their use in connection with the term 'ledge' in the act of 1872, would seem to indicate that it was the object of the legislator to avoid any limitations in the application of the acts which a scientific definition of any one of these terms might impose." This language has been frequently quoted with approval by other courts.

The statute refers to "any mineral, vein, lode or ledge" and grants the extralateral right to all such. The dictionaries define these terms in somewhat various ways, among which we find "ledge" defined by the Standard Dictionary as "a metal-bearing rock stratum; a quartz vein."

Von Cotta says, "Veins are aggregations of mineral matter in fissures of rocks. Lodes are therefore aggregations of mineral matter containing ore in fissures."

Dr. R. W. Raymond, many years ago, in one of the first great apex cases, testfied that "The miners made the definition first. As used by the miners, before being defined by any authority, the term 'lode' simply meant that formation by which the miner could be led or guided. It is an alteration of the verb 'lead,' and whatever the miner could follow, expecting to find ore, was his lode. Some formation within which he could find ore, and out of which he could not expect to find ore, was his lode." (Eureka case, 4th Sawyer, 302, 311.) He also refers to the fact that cinnabar is one of the minerals locatable under the statute, and this mineral occurs not in fissure veins but "as impregnations and masses of ore distributed through zones of rock."

Dr. T. Sterry Hunt, an eminent geologist and in 1877 president of the American Institute of Mining Engineers, testified in this same case as follows:

> That this whole mass of rock is impregnated with ore; that although the great mass of ore stretches for a long distance above horizontally and along an incline down the foot wall, as I have traced it, from this deposit you can also trace the ore into a succession of great cavities or bonanzas lying irregularly across the limestone and into smaller caverns or chasms of the same sort; and that the whole mass of the limestone is irregularly impregnated with the ore. I use the word "impregnation" in the sense that it has penetrated here and there; little patches and stains, ore-vugs and caverns and spaces of all sizes and all shapes, irregularly disseminated through the mass. I conclude, therefore, that this great mass of ore is, in the proper sense of the word, a great "lode," or a great "vein," in the sense in which the word is used by miners; and that practically the only way of utilizing this deposit is to treat the whole of it as one great ore-bearing lode or mass of rock.

Dr. C. Le Neve Foster in speaking of the Great Flat Lode in Cornwall says that it is in the main a band of altered rock and that perhaps half the tin ore of the country is obtained from tabular masses of stanniferous altered granite and concludes that "the term lode or mineral vein should include not only the contents of fissures but also such tabular masses of metalliferous rock."

Our great textbook writer on mining law, the late lamented Curtis H. Lindley, says that the terms lode and vein are legal equivalents, and quotes with approval Ross E. Brown's language as follows:

> Originally the word "vein" was narrow in its significance, defining a single clearly marked seam or fissure-filling in the country rock. The word "lode" was a broader term, applied not only to ore-bearing veins in a narrow sense but to various more complicated forms of ore deposits as well.
>
> Under the influence of the mining acts of Congress it has gradually become more and more customary to use the two terms synonymously and to give to the word "vein" the broad definition that would formerly have been regarded

as more properly applicable to the word "lode." Still, the custom is not rigid, and the miner, as a rule, continues to make certain distinctions in the use of the terms. For example, when his deposit contains separate parallel seams, or sheets, of ore, and he regards the whole as a unit, he may call it either a lode or a vein, but the separate sheets he designates as distinct veins within the limits of his lode. He calls the entire mass vein-matter, and his conception is that the word "vein" refers either to the entire mass or to narrow streaks within the mass, while the word "lode" always refers to the entire mass.

In a very general way a lode may be described as a mass of mineralized rock in place, the word "mineral" referring only to commercially valuable constituents. The form is usually more or less tabular or sheet-like, but occasionally too irregular to fit such description.

Now let us see how the courts have treated this subject: In the first place we note that they have been forced to admit that "what constitutes a lode, or vein, of mineral matter has been no easy thing to define." (116 U. S. 529.) One of the earliest court definitions was given in the Eureka case, decided in 1877 (4 Sawyer, 302, 311; 8 Federal cases 4548):

We are of the opinion that the term (lode) as used in the acts of Congress is applicable to any zone or belt of mineralized rock lying within boundaries clearly separating it from the neighboring rock. It includes' . . . all deposits of mineral matter found through a mineralized zone, or belt, coming from the same source, impressed with the same forms, and appearing to have been created by the same processes.

And as Judge Johnson points out in his opinion in the Highland Boy case:

There was a wedge-shaped zone of limestone dipping into the mountain for a distance slightly exceeding a mile lying between quartzite and shale beds which at the east end of the zone approach so closely as to be separated by a bare seam less than an inch in width. From that point they diverged until on the surface in the Eureka mine they were about 500 ft. apart, and on the surface in the Richmond mine about 800 ft. In this limestone zone at different places throughout its length and in various forms, mineral was found, sometimes in a series or succession of orebodies more or less closely connected, sometimes in apparently isolated chambers, and at other times in what would seem to be scattered grains. This limestone zone was broken up, crushed, disintegrated and fissured in all directions so as to destroy, except in places of a few feet each, so far as exploration showed, all traces of stratification.

From a consideration of all the court decisions Lindley finds that "a lode or vein is a body of mineral, or mineral-bearing rock, within defined boundaries in the general mass of the mountain. . . . With ore in mass and position in the body of the mountain no other fact is required to prove the existence of a lode or the dimensions of the ore. As far as it prevails the ore is a lode; and it is not at all necessary to decide any question of fissures, contacts, selvages, slickensides, or other marks of distinction in order to establish its character. . . . It has sometimes been contended that the lode must have a certain position in the earth; that is to say, it must be more or less vertical before this rule which is given in the act of Congress can be applied; but we have heretofore held, and we are still of the opinion, that it applies to all lodes which have an inclination below the plane of the horizon, whatever it may be." (Federal Cases, No. 8158.)

Judge Hawley in the Ninth Circuit Federal Court, after reviewing most of the decisions on the subject, spoke as follows:

This statute was intended to be liberal and broad enough to apply to any kind of a lode or vein of quartz or other rock bearing mineral, in whatever kind, character or formation the mineral might be found. (58 Fed. 106, 120.)

And in a later case, speaking for the Circuit Court of Appeals:

When a locator of a mining claim finds rock in place containing mineral in sufficient quantity to justify him in expending his time and money in prospecting and developing the claim he has made a discovery within the meaning of the statute, whether the rock or earth is rich or poor, whether it assays high or low. (77 Fed. 249, 255.)

In Steven vs. Williams is found the following by Judge Hallett:

As to the word "vein," or "lode," it seems to me that these words may embrace any description of deposit which is so situated in the general mass of the country, whether it is described in any one way or another; that is to say, whether in the language of the geologist we say it is a bed, or a segregated vein, or gash vein, or true fissure vein, or merely a deposit. . . . Whenever a miner finds a valuable mineral deposit in the body of the earth (in place) he calls that a lode, whatever its form may be, and however it may be situated, and whatever its extent in the body of the earth.

The same judge, in another case, held that an impregnation to the extent to which it may be traced as a body of ore is as fully within the broad terms of the act of Congress as any other form of deposit. (29 Fed. 347, 353.)

The Supreme Court of Colorado speaks as follows:

Many definitions of veins have been given, varying according to the facts under consideration. The term is not susceptible of an arbitrary definition applicable to every case. It must be controlled in a measure at least by the conditions of locality and deposit. The distinguishing feature between a vein and the formation inclosing it may be visible. It must have boundaries, but it is not necessary that they be seen. Their existence may be determined by assay and analysis. The controlling characteristic of a vein is a continuous body of mineral-bearing rock in place in the general mass of the surrounding formation. (47 Colo. 473.)

The Land Department of the United States says:

By the term "vein" or "lode" . . . it is not to be understood as having had in mind merely a typical fissure or contact vein, but rather any fairly well defined zone of mineral-bearing rock in place. (40 Land Dept. Rep. 271.)

In the case of Lawson against the United States Mining Co. the United States Supreme Court sustained the finding of the Circuit Court of Appeals couched in the following language, to wit:

A careful examination and consideration of the evidence clearly convinces us that the stratum of limestone constitutes a single broad vein or lode of mineral-bearing rock extending from the quartzite on one side to the quartzite on the other,

and goes on to say:

This stratum of limestone underlies the four claims of the plaintiff, and one of the contentions of the defendant is that there are several independent veins, one of which has its apex within the surface lines of the Kempton and another its apex in the Ashland, that these independent veins continue down through the stratum of limestone beneath the surface of plaintiff's claims, and that it was only from these independent veins that defendants were mining and removing ore. Of course this difference between the conclusions of the court and the contentions of the defendants affects materially the scope of the inquiry. If the limestone is not, strictly speaking, a vein, but a mere stratum of rock through which run several independent veins, then the inquiry must extend to the location of the apex of each sep-

arate vein; whereas if the stratum of limestone is itself a single broad vein, then the inquiry is narrowed to the location of its apex.

And further, with reference to veins so wide as to cover more than one claim at the surface, the same Supreme Court has held (*loc. cit.* p. 76; 11 Pac. 515):

Under the law of 1866 the surface ground was merely for the convenient working of the lode. The discoverer and first locator took the lode in its entirety. The law contemplated its segregation in its length, but not in its width. It refers to lodes between the end lines, not to a part of a lode. No expression can be found in it indicating an intention to limit the rights of a locator to a portion of the lode in its width. The discovery of any part of the apex of a vein is regarded by it as the discovery of the entire apex. And we think that the law of 1872, when all of its provisions are considered together, and in connection with the former law on the subject, as it should be, evinces the same intent. Under this law the discoverer of any part of the apex gets the right to its entire width, despite the fact that a portion of the width may be outside of the surface lines of his claim extended vertically downward. While he has no right to the extralateral surface, he has a right to the extralateral lode beneath the surface.

It may be remarked in passing that the mining claims referred to in the opinion just quoted are in Bingham. The Old Jordan claim, located under the law of 1866, is several thousand feet in length. The Jordan limestone, here held to be a lode, extended still further on the surface for some thousands of feet, containing fissures and scattered orebodies, and has been judicially held to be a lode on still other and more remote claims, such as the Red Rover.

In the case of Keeley against the Ophir Hill Consolidated Mining Co. the district judge of the Federal court also upheld the limestones as lodes against the contentions of surface owners on the dip of the limestone, although fissures containing ore extended from the surface downward into and through the limestone.

In the case of Star Mining Co. vs. Federal Mining Co., involving ore deposits in quartzite in the Cœur d'Alene district, the Court of Appeals for the Ninth Circuit cited with approval the findings of a former decision regarding the Bunker Hill lode (131 Fed. 579):

That within the Bunker Hill claim there is a vein or lode of rock in place, carrying silver and lead, commonly known in the district as the "Bunker Hill Lode," the apex of which is indicated by the outcrop of the foot wall, which traverses the claim in a general northwesterly course from where it cuts the south boundary; that the foot wall is the well-defined and persistent feature of this vein, and enters the Bunker Hill claim at a point on its south line about 300 ft. from the southeast corner, and, extending along its course at the surface northwesterly, passes out of the north line of the claim about 726 ft. from the northeast corner of the claim; that the Bunker Hill lode has no physical hanging wall, no marked line complement to the foot wall, in defining the limit of the fissure; that for its underlying boundary it has a well-defined, continuous bed of barren quartzite, but for its overlying boundary it has only an irregular and vague outline of the limit of mineralization, from which fact, and the peculiar geological formation of the lode, it is very difficult to define this limit with any degree of certainty, for which reason much confusion and some contradiction appears in the testimony upon this point; that the lode or ledge extending from the foot wall into the hanging wall country gradually fades in value until a point is reached 350 or 400 ft. out, where the rock is practically barren.

In the Star case last mentioned the court established by its finding and decision as a lode (under the meaning of the mining laws) a body or mass of quartzite from 100 to 300 ft. wide with a length of more than one mile and containing, according to the testimony, probably over 95 per cent of pure quartzite. From this lode has been taken ore valued at more than thirty million dollars. It is not an ordinary vein; it has no walls; it is not between boundaries of different kinds of rock; it is not continuous quartz; it is simply mineralized country rock. And yet it is a lode located and patented as such under our mining statutes, and no sophistries or pleasantries of theoretical geologists and editorial writers can make it anything else.

From the foregoing it is abundantly evident that, when mineralized, zones and strata of limestone and quartzite become lodes. The "other rock" referred to in my testimony which you have ridiculed so humorously is the monzonite or "porphyry" of Bingham. The Old Jordan lode lies south and the Highland Boy lode north of the great Utah Copper deposit. Fortunately, the holdings of the Utah Copper Co. have been so shaped and consolidated that its character as a lode has never been questioned. But does anyone, even a textbook geologist, in his most exalted mood and hyper-scientific abstractions, ever for a moment venture to question the propriety and common sense of the law under which it was located and patented in many claims and fractions as a mineral deposit, lode or ledge? And how about the other so-called "porphyry coppers"? Even the Calumet and Hecla conglomerate and the cupriferous amygdaloid flows of the Lake Superior region as well as the banket of the Rand would be lodes subject to the provisions of our mining law if situated within the territory to which that law applies. The Treadwell and adjacent gold mines are further examples of lodes of mineralized rock of large dimensions and low mineral content. In all of these the country rock constitutes by far the larger portion of the lode.

And now let us consider for a moment how much valuable mineral there is in these country-rock lodes:

According to the classic monograph on the Eureka district by Curtis, the Eureka-Richmond lode contained about 1 per cent of valuable and minable ground. The testimony in the various Bunker Hill and Star cases was to the effect that the ore minerals in the Bunker Hill and Morning-Star lodes constituted from 1 to 5 per cent of their volume. In the Highland Boy cases the figures were around 2 per cent. In the Utah Copper lode there may be from 2 to 5 per cent of sulphide minerals, but the average copper content is less than 1½ per cent. The Alaska Gastineau and the Alaska Juneau lodes average less than $1.50 per ton in gold, and contain, therefore, a small fraction of 1 per cent of valuable mineral. Under these conditions it would not seem to be a difficult task to "prove that the country rock is the vein."

And finally, it may not be amiss to request our critics to read more carefully the courts' opinions before writing their editorials. You state that "the quartzites which lie between the limestone" (heaven help us! How can quartzites get between a limestone) "in Bingham Canyon also are ore-bearing, as was shown by abundant testimony at the trial." The finding of the court is that "the ores and mineral in controversy in this action are found beneath the surface of the mining claims of the plaintiff in the Highland Boy limestone and only to a limited extent in the quartzite above or below it."

You proceed on the assumption that the court found that the Highland Boy limestone is not a lode, and upon

this supposition you ridicule me for claiming it to be one. The language of the court is as follows:

Up to the dip of the Highland Boy limestone, about one-fourth of a mile from the Leadville orebody, there has been developed and mined an immense deposit of ore. This deposit was made up of a great number of closely associated and related orebodies almost entirely in the limestone and extending in length for a distance of approximately 3,000 ft. in a northeasterly direction, roughly paralleling the Leadville orebody, and from 200 to as much as 1,000 ft. in width. . . . This great deposit. . . is admitted by the plaintiff to be a broad lode.

And further:

I conclude, therefore, that the Eureka case is authority for finding that the upper orebody found in the Highland Boy limestone, developed on its plunge and rake in the limestone, is a lode or vein within the meaning of the statute.

And again:

The orebodies which were the subject of litigation in the Lawson case were found in a body of limestone called the Jordan limestone, separated only a few thousand feet from the Highland Boy limestone, and (as) the Jordan limestone and the Highland Boy limestone are undoubtedly a part of the same sedimentary bed, uplifted at the same time and possibly mineralized from the same mass or similar masses of porphyry lying below.

Do these quotations from the court's opinion uphold your assumption?

Lead us not astray, Mr. Editor. Do not try to hold me responsible for definitions and conceptions which were fixed more than forty years ago. Do not accuse me of a "desire to twist the apex law" to my "own protection or profit." It was framed expressly for the protection and profit of the mining community, and if it be twisted it became so long before I laid my hand upon it. Come down out of the rarefied atmosphere of higher criticism. Get your feet on the firm basis of facts and established principles. You and I are too young to frame definitions and shape the structure of a growth of half a century. Your testimony comes too late. You should have been on the witness stand in 1877 with Rossiter Raymond, Clarence King, Sterry Hunt, and Dr. Newberry. "Geology applied to mining" is more effective if it be seasoned with less humor and better understanding of the mining statutes as already for many years interpreted and established.

Yours very truly,

HORACE V. WINCHELL.

Los Angeles, Nov. 27, 1920.

Cheapening the Mining Engineer

As a graduate and a trustee of the Massachusetts Institute of Technology I read with a good deal of concern the editorial in your issue of Oct. 30 entitled "Cheapening the Mining Engineer." I made immediate inquiries, and found that mining engineering had been used as a generic term to cover a number of things that are no more mining engineering than house wiring is electrical engineering. The University of Kentucky, for example, has a school for coal miners in which certain disabled men are getting training of great value to them, but with no thought, of course, of entering the profession of mining engineering. Again, our receiving school at Tulane University takes in disabled soldiers of all sorts of previous preparation and gives them "try-out" courses along a number of lines, including, I presume, certain elementary work in connection with such mining as is commonly performed in that part of the country.

On the other hand, many of the disabled soldiers for whose training we are responsible are men of high grade intellectually, whose college courses were interrupted by their enlistment in the war and who are now finishing those courses at the expense of the Federal Government. Those men will be competent not only in the ordinary sense of being well educated but in the higher sense of being engineers who have had the added privilege of military discipline and of strenuous war service.

I will ask that, in future statements as to the engineering students in training, closer distinction be made between real mining engineers and those men who are getting training in some particular phase of the mining industry.

You may be interested in seeing the list of schools and colleges in which disabled soldiers under Federal care are pursuing studies in the general field of mining.

Washington, D. C. JAMES P. MUNROE,

Vice-Chairman, Federal Board for Vocational Training

The list kindly sent to us by Mr. Munroe, issued in September last, follows:

SCHOOLS WHERE STUDENTS MAY STUDY MINING ENGINEERING IN THE UNITED STATES

District

1. Harvard University, Cambridge, Mass.; Huntington School, Boston, Mass.
2. Columbia University, New York City, N. Y.
3. Carnegie Institute of Technology, Pittsburgh, Pa.; I. C. S. Scranton, Scranton, Pa.; Lafayette College, Easton, Pa.; Lehigh University, South Bethlehem, Pa.; Mining and Mech. Institute, Freeland, Pa.; Penn. State College, State College, Pa.; University of Pittsburgh, Pittsburgh, Pa.
4. West Virginia University, Morgantown, W. Va.
5. Georgia School of Technology, Atlanta, Ga.
6. Tulane Rec. School, New Orleans, La.
7. Case School of Applied Science, Cleveland, Ohio. University of Kentucky, Lexington, Ky.
8. Michigan School of Mines, Houghton, Mich.; University of Wisconsin, Madison, Wis.
9. Rolla School of Mines Inst., Rolla, Mo.; University of Kansas, Lawrence, Kan.; Kansas State Normal School, Pittsburg, Kans.
10. Montana School of Mines, Bozeman, Mont.; Montana School of Mines, Butte, Mont.; South Dakota State School of Mines, Rapid City, S. D.; University of Minneapolis, Minneapolis, Minn.
11. Colorado School of Mines, Golden, Col.; New Mexico School of Mines, Socorro, N. M.; University of Utah, Salt Lake City, Utah.
12. Stanford University, Palo Alto, Cal.; University of Arizona, Tucson, Ariz.; University of California, Berkeley, Cal.; University of Nevada, Reno, Nev.; University of Southern California, Los Angeles, Cal
13. Oregon Agricultural College, Corvallis, Ore.; University of Washington, Seattle, Wash.
14. El Paso School of Mines, El Paso, Tex.; Receiving Station, Wilburton, Okla.; Texas A. and M. College, Bryan, College Station, Tex.

Where All Good Mules Go

In a Western mining paper of recent date we note the following ad:

FOR SALE—Good tunnel broke mule in excellent condition: now in Golden pasture.

MINE, MILL, AND SURFACE PLANT OF ROSARIO MINE

The Rosario Mines, in Honduras

By an American Engineer
Written for *Engineering and Mining Journal*

THE ROSARIO group of mines, operated by the New York & Honduras Rosario Mining Co., is in the Department of Tegucigalpa, Honduras, not far from Tegucigalpa, the capital. The port of entry is Amapala, on the Pacific side of Honduras. Tegucigalpa is ninety miles from Amapala and is reached by auto road. The mines are twenty miles from Tegucigalpa at San Juancito, and are reached from Tegucigalpa by pack trails and a rough mountain road. The altitude is 5,000 ft. The topography is accentuated and the hills are covered with tropical vegetation. Water is abundant, the rainy season starting about August and lasting until January. There is a heavy precipitation, and floods are not uncommon. A precipitation of five inches in six hours has been recorded. Living conditions are good, and the company has constructed substantial quarters, a clubhouse, hospital, ice plant, and other conveniences. A large library is maintained for the benefit of the employees. There are about fifty white employees on the staff, and the working force is composed of natives. Approximately 1,500 men are employed in and about the mines. Initial operations began in 1882.

Extent of Development

Operations are distributed over a considerable territory, as twenty veins have been worked at different times. During 1919, according to the last report of the company, development consisted of 10,904 ft. of drifts, 3,145.5 ft. of raises and 1,851 ft. of crosscuts, or a total of 15,900.5 ft. The ore broken in the veins was 92,167 tons, ore from development 12,117 tons, and stope-fill material 29,718 tons, making a total production for that year of 134,002 tons. The development ratio is 8.4 tons milled per foot of development. There was treated in the mill 133,900 tons, producing 1,584,579 oz. silver and 10,200 oz. gold, the ratio of silver to gold being 155 to one. Production was made from seventeen veins. The range of production was a maximum of 25,911 tons from the San Miguel vein (South) and a minimum of 213 tons from the Porvenir vein. Development was distributed over twenty-one veins and ranged from a minimum of 71 ft. to a maximum, in the San Miguel (South), of 5,362 ft. during the year in question

Ores Mainly Silver

The ores at the Rosario group are principally silver, the most important silver mineral being stephanite Some native silver occurs. The wall rocks are slate, andesite, and altered granite. The mines are worked through adits. There are over sixty miles of mine track, 20 and 24-in. gage, and forty miles of pipe underground, ranging from 10 to 2 in. in size, and used for compressed-air distribution. The workings are scattered. Shrinkage stoping is largely used. Where wall rocks are bad, overhand stoping on waste fills is practiced. Little timber is needed. Stopers and hammer-type drills are used. A few jackhammers are employed in sinking winzes. The native miners compare favorably with those of America. Labor conditions are good and strikes are unknown.

The ore is transported by electric locomotives of the trolley type. On the two haulage levels there are two six-ton, two five-ton and two seven-ton electric locomotives. In the last ten years the Rosario electric haulage has handled approximately 1,000,000 tons over a distance of about one and one-half miles.

The mill is of the all-slimming cyanide type Primary crushing is by twenty 1,850-lb. stamps to 1-in. screen size. Supplementary crushing is by one ball mill and three tube mills. Four Dorr classifiers are in use in closed circuit with the ball and tube mills. From the classifiers the pulp goes to Dorr thickeners, and the thickened pulp is treated in eight Pachuca tanks, each

CLUBHOUSE, ROSARIO MINE

of 100 tons' (dry) capacity. Merrill zinc-dust precipitation and presses are used. The Crowe process was installed in 1919. In the silver refinery two oil-fired tilting furnaces are in use. Good results are obtained from tube-mill pebbles manufactured at the mine by selecting and cobbing "nigger heads" from the ore. The capacity of the mill is 400 tons per day, and since its installation in 1912 a total of 845,758 tons has been treated.

Mining cost was $5.07 and milling cost $2.65 per ton during 1919. Silver recovery averaged 85.6 per cent; gold recovery, 94 per cent. The mill supplies used were, on the basis of pounds per ton milled: Sodium cyanide, 2.389 lb.; aluminum dust, 0.237 lb.; soda ash, 1.725 lb.; lead acetate, 0.011 lb.; lime (46.2 per cent available), 16.124 lb.; tube-mill pebbles (local), 18.273 lb. The use

SUPERINTENDENT PIERCE AND MEMBERS OF STAFF

of aluminum dust was discontinued. Steel balls are manufactured at the mine from worn-out battery shoes and dies. Another economy practiced is the redressing of the stamp dies in a special machine. This results in from three to six weeks' longer wear.

The power required in mining and milling operations is given in the table.

Two hydro-electric power plants, one at San Juancito, two miles from the mine, and one at Guadalupe, five miles from the mine, supply both mine and mill. The total power developed is approximately 1,200. Two air compressors, two-stage Ingersoll-Rand direct-driven by

ROSARIO MINES TOTAL POWER CONSUMPTION AND POWER REQUIRED PER TON OF ORE IN 1919

	Kw.-Hr.	Kw.-Hr. per Ton
Mill	3,621,716	27.048
Mine	2,167,459	16.187

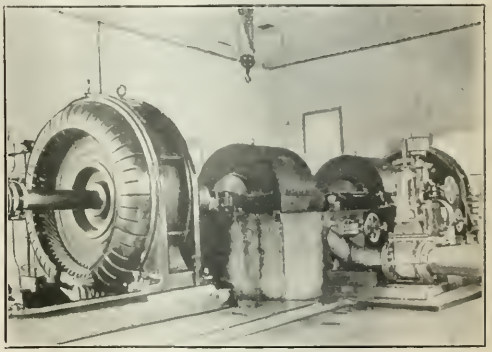
induction motors, supply compressed air for mining operations. A well-equipped machine shop, together with electric welding outfit, is an important adjunct to

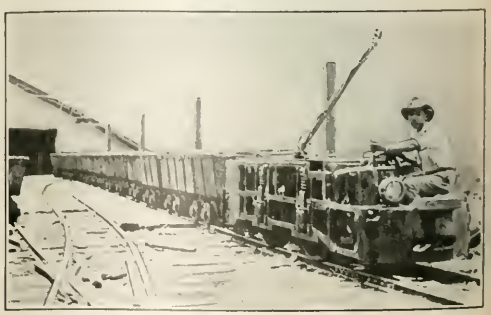


POWER PLANT, ROSARIO MINES

the mine plant. Two Leyner drill sharpeners and accessory equipment are used for tool sharpening. Native blacksmiths are employed. An assay office and laboratory is also part of the equipment.

Supplies are purchased in New York. Explosives are shipped from San Francisco. A six-months' stock is carried. Transportation is effected with difficulty. It is said that it required three months' time to deliver the compressor equipment to the mine, and that sixty bulls were killed in doing the job. Two months' time was needed to haul in the tube mills.

A. R. Gorden is general manager, L. F. Pierce mine superintendent, F. C. Devereux mill superintendent, H. Douglas master mechanic, and C. Walbrecht chief electrician.



ELECTRIC HAULAGE—DUMPING INTO MILL BINS

The Ebb Tide in Gold Mining

High Lights on the Economic Position of Gold and Conditions in the Gold-Mining States, by W. J. Loring, H. N. Lawrie, Fletcher Hamilton, George E. Collins, Milnor Roberts, B. C. Yates, Henry M. Parks and W. B. Phelps. Addresses* Made at Denver Meeting of the American Mining Congress, November 15-20, 1920

IN A LETTER addressed to Representative Louis T. McFadden under date of Nov. 26, 1920, W. J. Loring, president of the American Mining Congress, made the following comments with reference to the seriousness of delaying relief to the gold-mining industry:

The pity will be that if these mines are allowed to remain idle for a lengthy period of time, no matter whether the water is kept from them or not, there will be a collapse of the underground workings in many of them that will render their condition beyond repair, and should the water be allowed to rise in these mines, 80 per cent of them will be practically a total loss.

It must be understood that a mine deteriorates not only underground, but its equipment lying idle deteriorates with much more rapidity than when in operation. The reason for this is that the slightly acid water attacks the iron machinery, and when lying idle and dry, rust continues rapidly; while the woodwork, both underground and on the surface, when in operation is protected from rot through being kept damp; but timber work after being soaked with water and then allowed to dry rots rapidly.

With the passage of the McFadden Bill, the mines referred to, together with a host of others in the same condition, may be saved from ruin. When the McFadden Bill is passed, they will resume operations and produce hundreds of thousands of ounces of gold that will otherwise be a total loss.

It should be remembered that the mines in existence at the present time should be kept alive by all means within the power of this nation, because it is not easy to find a mine with payable ore in sufficient quantities to be classed as a payable concern; and it would appear to be a pity to allow the known gold producers of this country to cease to exist with millions of ounces of gold contained in their ore reserves, that cannot be extracted at a profit under present conditions but can be made to meet expenses under the relief that will be afforded them by the McFadden Bill.

If the known mines are allowed to permanently close down and become abandoned, it will be necessary to search for new mines, because the old mines have entirely perished. It will be greater economy to maintain the existence of the old mines that are known to contain large tonnages of payable ore under normal conditions than to attempt to find new mines.

Subsidy Paid by Gold Producers

BY H. N. LAWRIE

HAD the price of gold ascended to the average wholesale price of all other commodities during the five-year period (1915-1919) the gold producers would have received for the amount of gold they actually produced $218,280,000 more than the amount which they did receive of $404,509,000. Of the $218,280,000, the amount which would have been paid by the industrial consumers of gold would have been $133,686,000 for the gold actually consumed, while the Government would have paid $84,594,000 upon the monetary gold surplus. Inasmuch as the price of gold has been fixed, these respective amounts may be construed as subsidies paid by the gold producers to the industrial consumers of gold and also to the Government, which received the monetary surplus. Since there was no monetary surplus in 1919, the industrial consumers of gold benefited by the entire subsidy of $65,500,000. It is reasonable to assume that if the premium had been in effect during the entire period (1915-19), which would have insured a normal (1914) purchasing power of the ounce, the gold production of 1915 $100,000,000, would have been maintained throughout the period, in which event the gold producers would have received $500,000,000, the monetary price, plus $250,000,000, the premium, a total of $750,000,000, or $345,491,000 more than has been actually received.

IMPORTANT GOLD FACTS

Total U. S. gold stock May 1, 1919	$3,092,430,916
Total U. S. gold stock May 1, 1920	2,646,615,750
Decline in U. S. gold stock May 1, 1919, to May 1, 1920, 14.4	445,815,166
Exports of gold from the U. S., calendar year 1919	368,144,500
U. S. gold imports, calendar year 1919	76,534,000
Loss of gold by excess exportation, calendar year 1919	291,610,500
Exports of gold from the United States, Jan. 1 to Sept. 30, 1920	259,331,925
U. S. gold imports, Jan. 1 to Sept. 30, 1920	198,888,957
Loss of gold by excess exportation, Jan. 1 to Sept. 30, 1920	60,442,968
Total Federal Reserve net deposits Oct. 15, 1920	1,694,130,000
Federal Reserve notes in circulation Oct. 15, 1920	3,351,271,000
Total reserves Federal Reserve Banks Oct. 15, 1920	2,154,911,000
Ratio of reserves to F. R. net deposit and note liabilities Oct. 15, 1920, 42.7 per cent, 4.3 per cent above the legal requirements	
Gold cover of the Federal Reserve dollar note in circulation Oct. 15, 1920	46.6c.
World's gold production 1915, $469,000,000; 1920 (estimated)	$325,000,000
World's gold production decline 1915-1920	$144,000,000 or 30 per cent
U. S. gold production 1915, $101,000,000; 1920 (estimated)	$50,000,000
U. S. gold production decline 1915-1920	$51,000,000 or 50.5 per cent
Gold sold by U. S. Mint for consumption in manufactures and the arts, 1919	$76,837,600
Usual estimated gold coin destruction	3,500,000
Total gold sold and coin destroyed for use in manufactures and the arts, 1919	80,337,600
1919 production fails to equal gold consumed in manufactures and the arts by	21,848,000
Old gold received by New York Assay Office and returned to manufacturers, 1919	20,359,613
Gold sold by U. S. Assay Office, New York, for consumption in the manufactures and the arts Jan. 1 to March 31, 1920	20,037,317

	1918	Per Cent	1919	Per Cent	1918-19 Per Cent
U. S. siliceous ore gold output	$42,284,130	63.7	$38,209,508	66.8	Decline 9.6
Placer gold output	15,673,424	23.6	14,918,468	25.8	Decline 4.7
Base ore by product output	8,454,282	12.7	5,847,359	9.9	Decline 30.8
U. S. gold production, 1920 (estimated)			$40,000,000	to	50,000,000
Estimated failure of gold production to meet 1920 requirements of manufactures and the arts			$30,000,000	to	40,000,000
Estimated income from excise of 50c. per pennyweight based on 1919 domestic consumption of gold in manufactures and the arts (excludes imported jewelry, a new additional source of revenue)					43,000,000
Estimated premium cost based on 1919 gold production					29,000,000
Balance in favor of U. S. Treasury					14,000,000

In imposing the excise of 50c. a pennyweight, which is equivalent to $10 an ounce, for the gold contained in manufactured articles, the McFadden Bill enables the industrial consumer to pay more nearly the anticipated cost of production during the forthcoming five-year period, an amount which when paid to the producer of new gold will re-establish the purchase power of the ounce of its status of 1914, and will therefore insure the normal production of gold in the United States.

The gold production of the United States for 1920 will be between $40,000,000 and $50,000,000, less than 50 per cent of the 1915 production; and unless some

*In part abstracted and in part condensed from original manuscripts

remedy, as is provided for in the McFadden Bill, is expedited, the production for the ensuing years will rapidly approach the vanishing point, as the gold mines of the country continue to shut down. By reason of the monetary necessity for maintaining the normal gold production of the United States, especially during this period of credit and currency contraction, of protecting the monetary gold reserve from further industrial depletion and of safeguarding the gold standard itself, Congress should provide a remedy without delay in the interest of national security.

Gold-Mining Industry in California

By Fletcher Hamilton

DURING the last six weeks I made an automobile trip through various counties in California, traveling about 4,000 miles. In that time I did not cover one-half of the state, but only reached the points where I thought some good could be done, and some education started along the lines which would bring the business people, the bankers as well as the miners of California, to the point where they would realize that the gold situation not only of California but of the United States was at a critical point. We know the conditions confronting the gold-mining industry, the high cost under which mines are operating. The industry is confronted by a condition unlike that of any other industry, and that is a fixed price for its product.

In making my trip, I wanted to familiarize myself with the conditions, and I can say to you, coming from a gold-producing state—the primary gold state of the nation—that it is a shame to see the mining camps and the mines themselves forced to close down because of the unnatural conditions which prevail at this time. In Trinity County there were three stamps operating, where in the past there had been a hundred stamps in operation. In Amador County, where there were from 500 to 600 stamps in operation, today the number is equivalent to sixty stamps. In Calaveras County, in 1914, there were 494 active stamps, and today fifty. In Tuolumne County, where there were 300 active stamps, today there is not a stamp in operation in the county. In Kern County, the Yellow Aster, which had 100 stamps, is not operating. So it goes throughout the state, and it does not mean only that stamps are not dropping, but it means that the population of the mining counties of California is dropping off. For example, in Calaveras County the decrease shown by the census of 1920 is 40 per cent. I take it that this condition pertains as well to the other gold-producing states.

The relief that we are working for is provided by the McFadden Bill. It seems to me that every business organization in this country should take action on a measure which so vitally affects the business of the country. There has been some opposition to the McFadden Bill by the jewelers, who based their opposition on the grounds that paying the gold producer a premium of $10 per ounce would be granting a subsidy to that industry at the expense of the jewelry trade. The gold consumer is being subsidized by the United States because of the very fact that he is supplied with his raw product at a fixed price. There is no economic formula which will vitalize an industry in a period of rising costs if it must sell its product at a fixed price.

There has also been opposition by bankers stating that there is too much gold in the country. In the same breath they say that the gold problem is an international question, but they do not say in the same breath that there is too much gold in the world. It is merely that there is too much in the United States. So the problem is the distribution of the gold, and not the fact that no new gold is necessary.

We have had opposition from people who say that the principle of the McFadden Bill is wrong. I state to you that the government of France has had for many years a sumptuary tax upon the use of gold as a commodity, or the use of gold in the arts and trades. In June of this year the French passed an additional sumptuary tax, or an excise tax upon the use of gold as a commodity. You did not find at the time that there was any change in the monetary value or the exchange rate on the franc, and it was proved that such a tax did not affect in any way the monetary value of the gold.

In answer to the statement that other governments are not giving relief to the gold miner, I quote the following from a report by Sir Evelyn A. Wallace, president of the Transvaal Chamber of Mines:

> Since the 24th day of July, 1919, we have been able, under the new agreement with the Bank of England, to market our gold not indeed to the best advantage, since the government of India is reserving the best for its own operations, but to considerably increase advantage. The result of this has been that during the last five months of 1919 we obtained about three million pounds more than we should have obtained had we been restricted to the standard price Beginning at approximately 16 per cent, the premium has varied up to 44 per cent, the average up to the latest date of which we have advice being 26¼ per cent, and the last cable states that the premium is approximately 33⅓ per cent.

I should like to see the American Mining Congress make a stronger effort to bring about relief to the industry. I believe that the gold-mining industry, as well as the nation itself, should give to H. N. Lawrie, who has sacrificed his personal affairs to study this question, the support which would carry this legislation through to a successful conclusion. It is right and it is just, and I believe it is necessary for the maintenance of our financial position.

The Gold Producer in Colorado

By George E. Collins

IN THE five years from 1915 to 1919, the production from the gold mines of Colorado steadily declined, from $22,500,000 to $9,750,000 in round numbers. In 1920 the production, assuming that November and December will continue at the same rate as the rest of the year, will be less than $7,250,000. The first year's drop was 15 per cent, the second nearly 17, the third 20, the fourth over 23, and this year nearly 26 per cent. The decrease has been steady and continuous. If present conditions continue, the production in 1921 will decline to $5,000,000.

What does this involve? In the first place it involves the depopulation of thriving communities: homes broken up, the savings of a lifetime sacrificed; families parted. Typical gold-mining towns such as Cripple Creek and Central City are almost deserted. Houses are being torn down, and the lumber shipped away. Mining railroads, such as the Cripple Creek Short Line,

the Boulder & Northwestern, and the Gilpin Tramway, have gone out of business, and in some cases have already been scrapped. Mines are being abandoned, and their workings are caving or filling with water. Most of the men who used to work in the mines have left and gone into other employment.

Why has Colorado, as a gold-producing state, suffered so much more than California? The reason is, I think, largely because California produces gold principally in the form of bullion, whereas our production consisted to a greater extent of gold contained in ores and concentrates which were shipped to the custom smelters and treatment plants. The figures supplied to me by individual producers show that the falling off in the case of the mines and districts which produce gold as bullion was not as serious as in those which shipped to smelters. This is confirmed by the fact that from 1915 to 1919 the gold from Colorado mines deposited in the Denver Mint fell from $14,304,980 to $7,648,044, or 46½ per cent, whereas the gold from Colorado purchased by the smelting plants dropped from approximately $6,846,320 to $2,175,745, or over 68 per cent.

When a mine reduces its own gold the treatment costs are under its control. To some degree employees, and especially the skilled and permanent employees, of treatment plants, are influenced in their demands, and in the character of the work which they produce in return for a given wage, by what they know to be the surplus available from which to pay them. Such men, usually more intelligent than the mine employees, and often possessing comfortable homes, are disinclined to destroy the enterprise by which they live. Actual figures show that in two of the largest and most representative treatment plants in the state, both producing gold almost entirely as bullion by the cyanide process, in districts widely separated and physically very different, the treatment costs from 1915 to 1919 increased respectively 8 per cent and 60 per cent. In the same mines, during the same period, the mining costs increased respectively 98.8 per cent and 160 per cent. According to my experience this tendency is universal. Costs of mining have advanced more than costs of treatment at the mine.

In the case of mines which ship ores and concentrates to the smelters, this is not true. I cannot give you the figures from all mines, but I feel confident that the costs of smelting have advanced at a greater ratio than the costs of milling or cyaniding; and I am still more sure that the smelting charges, including deductions, show a still greater increase. In the case of one mine, which was once among the principal gold producers of the state, and where the nature of the ore renders it entirely dependent on the smelters, the freight increase has been 57 per cent, and the smelting costs have doubled. Freight and smelting are a first charge on the value of the ore shipped. The miner does not share the proceeds of the ore with the railroads and the smelting plant. He receives the balance after their charges have been deducted. They have not the same incentive to temper the wind to the shorn lamb which may be supposed to influence the men employed in a mine treatment plant. To the worker in the smelter, his employer is a great and wealthy international corporation; he does not realize that his compensation really comes from mines which are struggling to make both ends meet, usually without success. The increased cost can be, and is, passed on to the miner.

Nor is this the entire story. If you increase the limit at which ore becomes workable from $5 to $10, you are certain to reduce the quantity of available ore by more than one-half. Without going further into detail, I may say that the minimum value of workable smelting ore, excepting certain districts, is now from $20 to $30. The minimum value of workable concentrating ore has similarly increased in about the same proportion. The result is that most of what was ore in Colorado in 1915 has ceased to be ore in 1920, and will continue worthless until all costs have come back to the 1915 level.

Meantime, the ores which were of higher grade, or cheaper to handle, have been mined out in the struggle for bare existence, and in almost every instance development work has been curtailed or suspended. It is clear that, while the proposed bonus of $10 per ounce on gold will prevent a further decline in the gold output, no increase in production will be possible unless, in addition to the bonus, a considerable reduction in working costs is effected.

Many mines have managed to stave off the evil day by the use of various expedients.

The acute danger of the situation is that mines are getting down to where they can no longer resort to such temporary expedients. A large proportion of the gold mines in the state which are still in operation are reduced to a situation where they must spend more on development and maintenance, must have new stocks of supplies, must purchase new plants of machinery, etc., or go out of business altogether.

Gold-Mining Conditions in Alaska

By Milnor Roberts

ALASKA is principally a mining country. The development of its settlements and routes of transportation took place under the pressure of mining needs. The upbuilding of nearly all its cities, except the fishery centers, accompanied the opening of its mines. Although some of the coast towns existed as fishing and trading ports prior to the finding of gold in the Klondike on Aug. 17, 1896, their real growth took place after that date, along with the opening of the territory as a whole. Juneau, the capital of the territory since 1906, attained early importance through the Treadwell mines, which were in regular operation in the early 80's. Seward, another part, was founded and developed as the coast terminus of a railway (now owned and being completed by the Government) to be built to reach near-by mining districts and the gold fields of the interior. Cordova also is a railway terminus and ore-shipping point. All the cities, towns, and camps of interior Alaska without exception grew up either as mining centers or as stopping places on routes to the mines. It seems clear that no cause has yet arisen in Alaska that would have served to develop the country in any degree as mining has done.

The current life and activities of the territory, as distinguished from the causes of its settlement, are likewise mainly dependent on mining. The exceptions to this statement are easily noted and can be segregated for the purpose of considering the condition of the mining industry. The only prominent exception consists of the fishery interests, and these are confined to the coast. The fur trade involves a comparatively small number of persons, and the same may be said of farming. Indeed, the farming industry depends

upon either the mines for disposal of its products, or upon other lines of industry which in turn serve mining. The basic industry of the territory as a whole is mining. The one metal that far outranks all others, except copper, which is mined along the coast and on the Copper River, is gold. Therefore, it may be said that whatever influences affect gold mining have a bearing also on most other industries in Alaska.

Gold mining has suffered a great decline in the North during the last few years, a period in which it has been dwindling elsewhere in the United States. In 1905, the gold production for Alaska reached a value of $15,630,000, and in the following year rose to its record figure of $22,036,794. These two totals served as limiting figures for the output during the next ten years. At the close of that period, in 1916, the production was $17,241,713. Since this latter figure corresponds closely to the average for the twelve-year period of which it marks the end, evidently no falling off in production had taken place up to 1916, but thereafter the gold output decreased rapidly. In 1919 it was about $9,000,000, while for the present year (1920) the estimated total is far less.

The first probable cause for existing conditions is the war. At the outbreak of the war in 1914, many British miners in Alaska, together with those from the adjacent Yukon Territory of Canada, hastened to their country's aid. As the need for men became more imperative, they were followed by others. America's entry into the war caused most of our young men to enlist, but even then there remained a good proportion of the older and more experienced miners. When the demand for men to carry on war industries in the States became pressing, another outpouring took place. On hearing from "the outside" of the ever-increasing wages in the copper mines and the fabulous earnings (so-called) being made in shipbuilding and other industries in the Pacific Northwest, the miners, being accustomed to adapt themselves to various kinds of work, were quick to take advantage of the opportunities open to them. Thus the war drew upon the man power of Alaska both directly and indirectly.

The statement is occasionally made that the mines of Alaska have run out and that the decreased production of gold is due to this cause alone. Such a theory would postulate the simultaneous failures of practically all mines distributed over an area one-fifth the size of the United States proper. To believe that under the varying conditions that exist in Alaska's gold-producing districts Nature's numerous stores of gold all came to an end at once, requires a great stretch of the imagination. The flooding of three of the four Treadwell mines in 1917 is also pointed out as a prominent factor in the lessening of production. Yet in place of the Treadwell there are two other low-grade properties in the Juneau gold belt, the Alaska Gastineau and the Alaska Juneau, which have been yielding gold steadily, although not profitably, and the Chichagoff, a remarkable mine of high-grade ore situated near Sitka.

Elimination of the factors that have had only a minor part in diminishing the output of gold from Alaska brings us to the most direct cause, namely, high wages and the high cost of materials and supplies used in mining. The increased wages in the States reached during the war not only drew men away from the North, as already stated, but since then have held them here, the high scale having in general remained in effect on the Pacific Coast. Why should men pay the high rates of fare to distant points in the North, only to receive less wages there than they can obtain here? In order to attract miners to Alaska, rates of pay higher than those prevailing in the coast states must be offered them. In the Puget Sound region today common labor receives $5 to $6 per day, the higher rate being paid for heavy work comparable to mining. Carpenters, machinists and blacksmiths are paid $7 and up. At the same time the Alaska Gastineau near Juneau is offering millmen, laborers and oilers $3.50, cranemen, carpenters and blacksmiths $4 to $5.50, mine laborers $3 to $3.75, and machinemen $4, although contract miners are enabled to earn $5 to $10 per day. This is the highest wage scale this gold mine can pay and still make both ends meet, regardless of a profit. Meanwhile the copper mines to the westward can offer shovelers $5.25 to $5.75, miners $5.75 to $6.25, or, including contractors, an average of $6.75, and millmen $5.60 to $7.10. Inasmuch as the cost of boarding men has fully doubled, and the wages are exactly double, it will be seen that the whole item of labor has doubled.

Materials and supplies have increased in cost even more than wages. Ordinary lists showing former and present prices of numerous commodities are not wholly applicable when considering the particular needs of the Alaska miner, who cannot afford to ship goods of doubtful quality to his distant camp. On this point there should be no confusion. Prices in the coast states for the good grades of materials needed for the mining trade in the North are far above those prevailing before the war—approximately double, in round numbers. To mention a few items, dynamite has advanced 70 per cent; caps and fuse 100 per cent; drill steel 110 per cent; tool steel 125 per cent over pre-war prices. California crude oil has greatly advanced and gasoline has doubled in price.

While the large operations in Alaska are carried on with the aid of engineers and office forces, many small mines are worked by the individual owners with small crews. Such operators do not need a complicated system of accounting to show them whether they are making money or losing it. A pocket notebook and a pencil have often sufficed for working out an estimate of cost for the proposed season's work and for summing up the results, while many a million in fat pokes has come out of the North unchaperoned by even that much bookkeeping. Yet the owners knew how they stood on the season's operations and the miners had their pay from bedrock. Today the consensus of opinion is that gold mining, except in rich ground, does not pay. In a recent letter the Alaska Bureau of Publicity at Juneau states that in pre-war days the average cost of mine operation was $6 per man-day, including wages, materials, supplies and overhead expenses, while the average today is $11.

Ordinarily, in the fall our Alaskan friends call at the Mines Building, University of Washington, to compare notes on the past season's doings and to discuss plans for the coming year. Some of them attend the winter session given for mining men at the College of Mines and make use of the laboratories for experimenting on their ores. Many such men are letting their gold claims lie idle while they turn their attention to other metals. The high cost of operation has not only lessened the actual mining, but has also discouraged prospecting for new ground and the development of finds already made. A grubstake nowadays represents a small fortune. Under present conditions prospecting is not justified.

South Dakota Gold Mining

By B. C. Yates

PERHAPS the best way to show what failure to obtain an increased price for newly produced gold means to South Dakota is to present the actual condition of the gold industry of the state, with the more apparent causes which have brought about this condition. Briefly stated, the gold industry of the Black Hills of South Dakota is in a state of disintegration, not because the mines are becoming exhausted, but because the gold taken from the mines does not have sufficient value to pay the cost of production.

The Black Hills do not comprise a very large area, about 100 square miles, and the gold-producing section is only a small part of the whole. In this limited area, four years ago, there were from ten to twelve regular producers, and there were other mines being developed, some of which were producing a considerable amount. Only two, the Trojan and the Homestake, have survived the war period. These properties have been operated during this period to keep their mines and treatment plants in working condition and their organization intact, with the hope that, in the near future, conditions will be such that some profit may be had from their operations. Prospecting is at a standstill, and only two or three mines in the development stage show any signs of activity.

The population of the two largest mining towns of the Hills, Lead and Deadwood, has decreased from 12,045 in 1910 to 7,416 in 1920, and Lawrence County, which is the principal mining section, has now 6,665 fewer people than ten years ago. Practically all of this decrease has occurred during the last three years. In every mining community of the Hills are to be found idle mills, empty houses, and deserted prospectors' cabins.

The joint reports of the U. S. Geological Survey and the Bureau of the Mint give the average yearly production of gold in the Black Hills, from 1912 to 1917 inclusive, as having a value of $7,436,000, in 1918 $6,699,400, in 1919 $5,289,700; and from the report of the State Mine Inspector for the first six months of 1920, it is estimated that the total for this year will not be much over $4,000,000. This is a reduction of approximately 45 per cent in three years. The annual reports of the State Mine Inspector give the average number of men employed in the gold mines of the district from 1912 to 1917 inclusive, as 3,063, for 1918 and 1919 as 1,933, and for the first six months of 1920 as 1,681, with very little if any increase to date. These figures do not indicate a very healthy condition of the gold-mining industry in this district. They do tell us, in language which cannot be misunderstood, that something must be done to improve the situation.

The prices of supplies and labor which have prevailed during the last few years, and which still prevail, make the cost of production almost prohibitive at the fixed price for which the gold miner is forced to sell his product. Wages have increased from 40 to 50 per cent, cyanide 52 per cent, dynamite 92 per cent, drill steel 138 per cent, and all other supplies used in mining operations show similar increases. No figures are available which will accurately give the increased cost of producing an ounce of gold in the Black Hills mines. The producing mines of the Hills are fortunate enough to have had a large amount of ore broken down and remaining in the mine, as well as ore which could be mined at a low cost, which has thus far tided them over the high-price period. It is needless to say that these favorable conditions will not last. Calculations based on normal operations show an increase of approximately 30 per cent in the cost of producing an ounce of gold, without taking into account interest on investment or depreciation of mine and plant due to deferred development and repairs. It is difficult to estimate how much should be added to operating costs to cover the last two items, but they will certainly be reflected in future balance sheets. Should cost of labor and supplies be reduced to pre-war normal in the near future, it will still be necessary to pay more for our gold, because of the depreciated physical condition of our mines, and this is true whether they have been kept running or were closed down.

You no doubt will consider this an extremely pessimistic report. It is, gentlemen. The gold industry is face to face with a grave crisis—a crisis brought about by a world war and the short-sighted policy, adopted by the Government, of bleeding without feeding an industry essential to the life of any civilized nation.

When our Government decided to take an active part in the great European conflict, the producers of metal, gold included, were urged to speed up production. Gold producers, trying to respond to this patriotic call, found themselves confronted with indifferent governmental executives, loss of labor, high prices of supplies, an ever-increasing difficulty in getting supplies at any price, and a fixed price for their product, based on pre-war conditions. For the gold mines to keep up production during this period of rising cost it was necessary to reduce expenses, and this could be done only by cutting off development, prospecting and plant repair, as the price of labor and supplies was continually rising. Increased costs for the future is only a natural consequence. As a concrete example, the Homestake mine, under normal conditions, excavates yearly 17,500 ft. of tunnels for the purpose of developing known orebodies and prospecting virgin ground. During 1918 and 1919 this was reduced to 8,600 ft. From this it may be readily seen that the company will have to spend many thousands of dollars, in the very near future, to bring the mine up to its normal working condition. What is true at the Homestake is undoubtedly true at other producing gold mines, and the situation is far worse in those mines that were forced to close down.

Gold-Mining Conditions in Oregon

By Henry M. Parks

FOR A FEW years prior to 1916, Oregon produced annually about $2,000,000 in gold. This annual production has continually decreased since 1916, and with increasing rapidity. The greatest decrease has taken place during the year 1920. This is due to the fact that some of our most important quartz properties, which have been holding on for the last year or two, hoping against hope, have at last exceeded the elastic limit of their holding-on power. Three of these important producers have recently closed down and pulled their pumps. As a result Oregon's 1921 gold production will probably be not more than one-fourth of the output in 1916.

The conditions which have brought this blight upon

the gold-mining industry of Oregon and of the United States are due naturally to the unavoidable expedient of enormous inflation or expansion of the currency of the country. Necessarily it required more and more of this diluted currency to satisfy. All the real money of the country (gold) vanished from circulation almost over night. The only gold in sight during the last four years has been that produced under great difficulties by the gold miner, and he had no alternative but to take diluted currency in exchange for his gold. Is there any wonder that the gold production of the country is rapidly diminishing?

The surprising thing to my mind is, not that these conditions, with their natural results, obtain, but that so little national concern is in evidence because of the existence of such unfortunate conditions. I am surprised that $50,000,000 can be lopped off from our country's annual gold production without commanding more interest and concern on the part of our statesmen and financiers.

A very logical plan is proposed in the McFadden Bill, which is intended only as a temporary relief measure to tide over this crisis and to save, if possible, the life of a fundamental industry. It seems incredible that there should be any opposition to the reasonable plan of throwing out a life line to the gold-mining industry. The opposition to the measure that has arisen in certain of the industrial arts and trades seems short-sighted. By such opposition there is grave danger of "killing the goose that lays the golden egg."

The commission of the Oregon Bureau of Mines and Geology, at its regular meeting in Portland on Oct. 22, 1920, discussed the McFadden Bill at considerable length. The measure was introduced in the House of Representatives on March 22, 1920, by Congressman Louis T. McFadden and is designed to stimulate the production of gold in the United States for use directly as money or indirectly as a base for the issuance of currency. The interesting fact was brought out in a prolonged discussion of the bill that during the year 1919 gold to the amount of $20,000,000 in excess of the entire gold production of the country for that year was purchased from the United States Mint for uses other than coinage.

The conclusion of the commission by unanimous vote was as follows: (1) That the bill is carefully drawn and can be successfully administered without difficulty. (2) That if enacted it will greatly stimulate the production of new gold, the annual output of which is now less than one-half that of 1915. (3) That the excise tax on manufactured gold will produce revenue sufficient to meet the requirements of the act. (4) That the benefit accruing to the gold producers is justly due them and is in no sense a bonus. (5) That the act, when in operation, will not in the slightest degree alter or affect the monetary system, except that the increased production of gold will, by adding to the supply of gold currency, permit a reduction of paper currency already issued in excessive amounts, thus tending away from unsound money in the direction of sound money. (6) That after a careful study of the bill and the need therefor the commission unqualifiedly indorses the same and is confident that no one, after seriously reading the provisions of the measure, will do otherwise than indorse it; and that such opposition as has arisen is due to failure to read and study the bill and not the result of mature judgment as to the effects of the proposed act. (7) That other agencies interested in sound currency and the maintenance of the gold production be advised of our action and urged to work to the end that the bill may become a law.

Gold Mining in Arizona

By W. B. Phelps

GOLD MINING in Arizona is almost entirely confined to the Oatman district. The gold produced in other parts of the state is won as a byproduct from copper ores. Gold mining in Arizona is languishing under the heavy burden of conditions over which it has no control, and which have grown worse instead of better, year after year. The producing mines are becoming depleted, and there is no incentive to find new gold mines. The prospector has forsaken the hills. The discovery of ore that could be mined at a fair profit a few years ago does not interest him today; nor can capital be interested to pursue the development of ore-bodies where there is no hope of any return on the investment. Unless some measures of relief are afforded the gold-mining industry, it is my belief that it will be only a question of time until gold mining will be a thing of the past.

Those who use gold for industrial purposes ever object to paying the cost of production. They buy their gold today for the same price as they did five years ago, $20.67 an ounce. Five years ago, before the dollar had diminished in purchasing power, gold could be produced at a profit, and normal gold production was maintained, but now the purchasing power of the gold ounce is less than half what it was then.

Gold mining is not an ordinary business. In fact, it is unlike any other business. As an example, the Tom Reed company has been in operation for over twelve years and represents an investment of over $3,000,000. It will not cost us much to close down—but what will it cost to stay closed down, and what will it cost to reopen? A shutdown for any length of time would mean destruction and ruin to the mine and its investment. It is not so much the visible as it is the invisible loss. Our mill and surface equipment can be repaired or replaced, but there are miles of underground work which would be flooded, caved in, and destroyed. Work that was done and carefully protected at enormous expense would be ruined. Would that mine ever be reopened and would its possible ore output warrant the tremendous cost, even if it was?

The case of the Oatman district, which I represent, is typical. Powder for which we paid $13.25 now costs us $24; fuse once $38.40 costs today $81; caps were $11.50 and are now $21; steel rails were $65 and now cost $115; timber that we paid $24 for is now $71; oil and coal have more than doubled in price. Boarding-house supplies are about 90 per cent higher, and the cost of labor has increased $2 per shift per man. The gold-mining industry alone has been called upon to bear this increased cost of production without any increase in the price of the metal produced.

It has been stated that we are now in a downward market and that prices are dropping. That may be the case in other parts of the country, but, gentlemen, I can assure you that we have not been confronted with any such "serious" predicament in Oatman. If certain small items have been reduced in price, the reduction means nothing in comparison with the recent increase in electric power and freight rates.

Practical Mining Course at Copper Queen

An Opportunity Afforded to Ambitious Workers To Increase Their Knowledge and Obtain Advancement by Systematic Study Under the Leadership of Men in Direct Charge of Operations—Weekly Classes Covering a Wide Range of Practical Subjects

By George J. Young
Written for *Engineering and Mining Journal*

Apart from the direct problems which present themselves to the management of a large mining property, there are others of a less direct nature, but important, in that their successful solution establishes a foundation upon which the industry makes substantial advance. A management broad in spirit will not fail to see the importance of these indirect factors. It is, of course, a debatable point as to how far a management can go, and there are practical reasons why a small mine cannot undertake what might be easily done by a large mine. Nevertheless, both the small mine and the large one can contribute their quota in advancing the practical knowledge of the individual miner.

Skilled miners, well versed in their craft, accustomed to handling mechanical equipment, and willing to cooperate with the superintendent and foremen, are, needless to say, an asset to the industry. With a given number of such workers, greater tonnage, fewer accidents, better timbering, cleaner mining, and lower unit costs can be obtained than with mixed crews. It is from this group that foremen, shift bosses, and bosses are drawn. These sergeants and corporals of industry are fully as important as skilled miners and of great practical importance under existing conditions.

BISBEE FROM SACRAMENTO HILL

Percentage of Well-Trained Workers Small

A cross-section taken of the rank and file of the operating crew of a mine will show, in most instances, only a relatively small proportion of well-trained workers and a large proportion of less-skillful and poorly informed workers. The direct result is that the number of workers may be largely in excess of that required, were they all to reach a proper standard. In a small mine, it is possible to make a drastic selection and to obtain a majority of skilled workers. In a larger mine, the process of selection is not so easy. It is highly probable that there is not a sufficient number of skilled workers to satisfy the needs of all of the metal mines in this respect. There thus remains, as an alternative, the task of raising the average grade of miner, shift boss, and foreman by systematic instruction.

Probably every mine does a certain amount of unsystematic instruction and training. The well-managed mine, where the overseeing is well done, contributes in no unimportant way its share in developing skilled miners. The large labor turnover operates to reduce in the aggregate the regular training which a miner would get were he to remain a longer time in a good mine. The cumulative experience that is gathered by the itinerant miner has a certain value, it is true, but not nearly as much as would be the case were he to grow up with a mine. There is no general organization that is actively directing its attention to the task of developing skilled miners. Evolution acts to some extent, but for the most part the mine superintendent takes what he can get and does with it the best he can.

Raising the Grade

Raising the grade of the average miner is a real problem confronting the mining industry. Efforts made along these lines are worth the study of mine managers. The most important example that has come to my attention recently is the practical mining course offered to its employees by the Copper Queen Branch of the Phelps Dodge Corporation at Bisbee, Ariz. By creating an atmosphere stimulating the individual to make an effort to better his knowledge and position, and by making the actual leaders of the men in their everyday tasks the leaders in the educational work, a unique and highly commendable organization has been built up.

An Educational Department, under S. C. Dickinson as director, conducts the practical mining course. The attendance for the first two years is given in Table I. As might be expected, the foremen and shift bosses were more assiduous in their attendance than miners and muckers. To a school superintendent the total attendance might be looked upon as relatively small when compared to the total number of underground employees, averaging approximately 1,000. Due regard must be given to the inertia shown by the average miner as well as to the fact that attendance is voluntary. The proportion of really ambitious men who are prepared to make some sacrifice to advance themselves is not large

Advantage of Man-to-Man Contact

The effect of the work, however, is not measured by attendance alone. The man-to-man instruction that receives its primary stimulus from those who attend the practical courses cannot be evaluated, but it is, in my opinion, an important element in raising labor standards and making the work as a whole effective with respect to a goodly proportion of all the workers. A small proportion of men actively working to advance themselves

will leaven a much larger number who come in contact with them.

Apart from these general considerations, there is much that is worth while examining in the practical course. Arthur Notman, superintendent of the Mine Department of the Copper Queen company, states the objectives in the following:

"The object of the company in establishing the Educational Department and providing this course is twofold: first, to determine who are the ambitious men among you; second, to provide ways and means for developing such men as are ambitious to such a point that they will be competent to fill positions of greater responsibility. Those of you who have succeeded in the past and those who will succeed in the future are the men who have the determination to take advantage of every opportunity. This is such an opportunity."

TABLE I. ATTENDANCE AT PRACTICAL MINING COURSE

	1919-20	1918-19
Per cent of foremen attending one or more lectures	100 00	...
Per cent of night foremen	100 00	.
Per cent of shift bosses	94 4	
Per cent of miners	44 7	
Per cent of muckers	39 2	
Per cent of others, underground	4 0	
Per cent of attendance total underground (using average attendance)	13.3	
Per cent attendance total underground (using total attendance at class)	30 6	
Average attendance for the year	136	166
Number attending this year who did not attend last year	352	
Number attending 22 or more lectures (half)	94	118
Number attending one lecture (total attendance)	659	821
Number attending each and every lecture	2	6
Average number of employees underground	1,021	1,003

Mr. Notman, speaking directly to ambitious men in his organization, says:

"Your chance to fit yourself for the place ahead, to place yourself on the salary list instead of the day wage list, to gain the necessary knowledge to improve your opportunities, is right here in this mining course. It is a part of the Copper Queen Branch just the same as the Mines, Safety Department, the Employes' Conference Committee, etc., are parts of the same branch. It is not connected with any other educational institution or association in the district. The course is designed solely to give men the opportunity to better themselves.

"Men who have attended thirty-five or more different lectures will be examined and rated by an Examining Board, and those passing, whenever possible, will be given preference in future appointments. Merely passing the course, however, does not signify that a man has all the necessary qualifications to be the broad and sympathetic type of boss that the company desires; the ability to handle men figures largely in the preferred list. Completing the course successfully does not necessarily mean immediate promotion, but rather promotion as vacancies occur."

The specific rules governing the course are as follows:

RULES GOVERNING THE COPPER QUEEN MINING COURSE

1. To be eligible to take the examination the applicant must have attended thirty-five different lectures. Credit for absences is to be allowed if accompanied by a doctor's certificate.

2. The Examining Board shall consist of the superintendent of the Mine Department, the assistant superintendent of the Mine Department, two mine superintendents, the master mechanic and three miners appointed by the Employees' Conference Committee.

3. "Skilled Miner" certificates are to be issued to men who satisfactorily pass the examination, provided that they have had at least two years' underground experience as a miner.

4. "Knowledge of Practical Mining Operations" certificates are to be issued to those who pass the examination satisfactorily but have not had the necessary experience. Such certificates are to be exchanged for a "Skilled Miner" certificate when the holder has had the necessary experience. Optional.

5. All oral questions are to be answered correctly either by the applicant or the board at the time of the examination.

6. Correct answers to the written questions are to be furnished by the department upon request.

7. Foremen are to be allowed to appoint emergency shift bosses who do not hold certificates, the understanding being that they will not be appointed regular shift bosses until they pass the examination.

8. Credits in the examination are to be as follows:

Oral examination	20
Written examination	20
Experience	25
Ability to handle men	25
Attendance	10
Total	100

Seventy per cent of the total required to pass.

9. Full credit is given in "experience" to a man who has had five years' experience as a miner.

10. The foreman and shift boss of each applicant for examination shall submit to the examining board a written report on his ability to handle men, such report to be used by the examining board in determining points to be credited under "Ability to Handle Men."

11. Experience is to be graded as shown in the following table:

1. In no case shall a man receive more than 25 points.

2. Outside experience to be accompanied by documentary evidence in proof of service.

Years		1	2	3	4	5
Occupation	District	Year	Years	Years	Years	Years
Timberman	1	4	9	14	20	27
	2	4 5	10	15	21	28
Repairman	3	5	11	16	22	29
Shaftman	1	3 5	8	13	19	26
	2	4	9	14	20	27
	3	4 5	10	15	21	28
Stopeminer	1	3	7	12	18	25
	2	3 5	8	13	19	26
Stopeman	3	4	9	14	20	27
Driftminer	1	3	7	12	18	25
	2	3 5	8	13	19	26
Raiseminer	3	4	9	14	20	27
Timber rustler	1	2	4 5	8.5	13 5	20
	2	2 5	5	9	14	21
Mucker	3	3	5 5	9 5	14.5	22
Group "A"	1	1 5	3 5	6.5	10.5	15
	2	2	4	7	11	16
	3	2 5	4 5	7 5	11 5	17
Group "B"	1	1	2 5	5	9	14
	2	1 5	3	5.5	9 5	15
	3	2	3 5	6	10	16
Foreman	1	7	16	27		
	2	8	17	28		
	3	9	18	29		
Shift boss	1	5	14	25		
	2	6	15	26		
	3	7	16	27		

(Subject to Revision)

Group "A"
Skipmen
Pipemen
Nippers
Trackmen
Powdermen
Cagers
Timber swamper

Group "B"
Motormen
Swampers
Loaders
Carmen
Drivers

12. After each examination the three miners on the Examining Board to be replaced by three others who hold certificates.

13. Compensation for miners on the Examining Board shall be the existing scale of wages.

14. Each candidate shall answer a set of questions as to training and experience, answers to be presented to the examiner when the candidate presents himself for written examination.

15. The examination proper shall consist of oral and written questions, conducted in the English language, and shall be of such a nature so as to determine the competency and qualifications of the applicant.

16. The oral examination shall be had separately, and candidates will be called alphabetically in so far as this can be done. There shall be from twelve to twenty questions.

17. All candidates, being assembled for the written examination, shall be assigned to separate desks, provided with writing material and a list of printed questions required to be answered. Also a printed card, numbered, on which to write his name and address. This card will be inclosed in a sealed envelope and passed to the person keeping the records of the examination, together with the answers to the printed questions. The candidate's examination paper will be marked by the number which appears on the card.

18. Questions for examination shall be uniform and shall be selected by the Examining Board.

19. All applicants who shall receive a grade of 70 per cent and shall be otherwise competent and adjudged competent shall be granted a certificate signed by the Examining Board and the manager of the Copper Queen Branch.

20. The board shall have the right at any time to add to or modify these rules in any way.

A man can start to take the course at any time. Meetings are held in Bisbee every Wednesday, an afternoon session at 1 o'clock and an evening session at 7 o'clock. The instruction consists of a series of articles or lectures prepared for the most part by members of the engineering staff, superintendents, foremen, and other employees. The lectures are given by the individual preparing them, and thus there is the important principle of contact between the leader and his men in the highly desirable relationship of instructor and student. The advantage is a double one, for the leader must definitely organize his subject and must look at it from the point of view of his men. He is thus under the necessity of reviewing and visualizing his own work.

The subjects presented the second year, together with the lectures, were as follows:

1. Mucking and Mine Tools, by J. T. Marshall, foreman, Lowell.
2. Breaking Ground, by F. D. Lane, efficiency engineer.
3. Shaft Sinking, by T. N. Jewell, foreman, Calumet and Cochise.
4. Breaking Ground in Drifts, by James McGarry, foreman, Dallas.
5. Timbering and Repair Work in Drifts, by Jack Radcliffe, foreman, Sacramento.
6. Raises, Breaking and Timbering, by J. S. Stewart, foreman, Holbrook.
7. Track and Road Maintenance, by Lou Moon, night foreman, Holbrook.
8. The Selection of a Mining Method, by Gerald Sherman, consulting engineer.
9. Horizontal and Inclined Top Slicing, by J. W. Scott, foreman, Czar.
10. Square-Setting, by J. W. Toland, underground superintendent.
11. Horizontal and Inclined Cut and Fill, by J. F. Sinclair, underground superintendent.
12. Caving Methods, by Gerald Sherman, consulting engineer.
13. Steam Shoveling, Open-Cut Mining, by George Mieyr, superintendent, Sacramento Hill, and A. Livingston, statistician.
14. Accident Prevention and Safety, by W. W. Gidley, safety inspector.
15. Explosives, by F. D. Lane, efficiency engineer.
16. Sampling, by Leon Fuchere, chief sampler.
17. The Importance of Metallurgical Considerations in Mining, by William B. Boggs, chief metallurgist, Copper Queen smelter.
18. Ventilation of Metal Mines, by C. A. Mitke, mining engineer.
19. Fire Prevention in Metal Mines, by C. A. Mitke, mining engineer.
20. Mathematics, by C. S. Heislar, construction engineer.
21. Drifting Machines, by Fred Doscher, drill-repair man.
22. Stopers and Pluggers, by Fred Doscher, drill-repair man.
23. Standards, by Al Cromer, foreman, Gardner.
24. Electricity, by Charles Bear, chief electrician.
25. Air Compression and Transmission, by Frank Duval, assistant master mechanic.
26. Hoisting and Haulage, by O. N. Alvin, master mechanic.
27. Pipes, Pipe Fittings, and Hose, by J. S. Maffeo, mechanical engineer.
28. Discipline, by G. H. Dowell, manager, Copper Queen Branch.
29. Drainage, by O. N. Alvin, master mechanic.
30. Map Making, Reading, and Interpretations, by H. Ziesemer, chief engineer.

BISBEE FROM THE TRAIL TO HIGGINS MINE

31. General Geology, by J. B. Tenney, consulting mining geologist.
32. Geology of the Warren District, by J. B. Tenney.
33. Chemistry and Ores of Copper, by C. H. Compton, chief chemist.
34. Mine Time-keeping and the Segregation of Mine Labor, by E. A. Crocker, cost department.
35. The Purchasing, Distribution, and Handling of Supplies, by F. S. Davenport, superintendent, supply department.
36. Methods of Compensation, by E. B. Rider, chief efficiency engineer.
37. Organization, by H. C. Henrie, chief clerk.
38. Efficiency Engineering, by Arthur Notman, superintendent, mine department.
39. Economics of the Mining Industry, by Gerald Sherman, consulting engineer.
40. The Employment of Men, by C. W. Moon, employment manager.
41. The Duties of a Shift Boss, by R. R. Boyd, assistant superintendent, mine department.
42. Company Policies, by G. H. Dowell, manager, Copper Queen Branch.

The lectures are printed in the form of pamphlets and are placed in the hands of the men. I have examined practically all of these pamphlets, and have found the subject matter interesting and practical. There has been conscientious care in their preparation, and as a whole they reflect great credit upon both the individuals preparing them and the management broad enough to initiate this work.

It is worthy of note that a similar school was started by the Cleveland-Cliffs Iron Co. in 1915. Its purposes

are much the same as the Copper Queen school, and, like it, it began in a small way. C. S. Stevenson described this school in a paper presented at the twentieth annual meeting of the Lake Superior Mining Institute in September, 1915. In the State of Nevada, a miners' instruction class was formed a number of years ago at Virginia City, and has continued up to the present. It was organized by certain mine superintendents and school men. With the assistance of the University of Nevada, it obtained a fair start. Since then other schools have been organized at Tonopah and Ely. Each of the schools is under the direction of a technically trained man, and though the attendance has been relatively small, good work has been done. The Nevada work is of special interest, in that it represents the welding together of the state educational system and local initiative. Unlike both of the examples quoted before, it is directly in charge of the University of Nevada.

The Nerve of Mr. Hoover!

By Mark R. Lamb

Written for *Engineering and Mining Journal*

LATELY Mr. Hoover has been discussing WORLD problems. These problems require executives. Mr. Hoover thinks that the engineer, speaking generally, would be best equipped for the task. He gives his reasons. Poor engineer!

"Hoover held that engineers were best qualified to undertake the great task he outlined, inasmuch as they had no special economic interests for themselves in a constructive solution of the problems, their only interest being in creating a working force for public service."

In other words, the engineer is not financially interested, and is therefore more or less in the position to be impartial and fair—like a preacher.

It is only natural that Mr. Hoover was mistaken, and at least let us be charitable and accuse him of nothing worse. Anyone knows that Mr. "X," with the big oil company, has shares and is a millionaire. That he is still a practicing engineer does not mean that he has "no economic interest" in the British control of all the oil in Mesopotamia. Mr. "Y," the famous copper man, after many years' faithful labor in building up a famous company with mines all over the world, is surely heavily interested in shares in mines in Chile, Russia, and Africa. Mr. "Z," the flotation expert, with many victories to his credit, is certainly a heavy holder of stock in his company, and interested financially in the free development of mines in all protected territories.

A list like this would include most of the membership of the Institute, and on behalf of the Institute I protest against the base insinuation that engineers have no "economic interest" in anything in the world. It sounds too much like "living with his wife's folks" (see "Lamb's Formula") and is sure to hurt the engineer's feelings.

Mr. Hoover should also remember that he and I are not the only ones who have escaped the drudgery of engineering by broadening activities into commerce and finance and becoming comparatively wealthy. Hardly an engineer in these days but knows intimately the intricacies of "common and preferred," the many types of bonds; how to borrow at the bank, and all about notes and acceptances, bills of exchange, and trust receipts; whereas, only a few years ago, an engineer was more or less proud of his ignorance of such things, and talked in a self-satisfied way of being "purely (and poorly) technical."

Not a few engineers lately have deliberately worked with bankers and financiers for a time with no other purpose than to broaden their experience and value and to improve their financial standing. Most of these have substantial "economic interests" in all parts of the world, and Mr. Hoover is unfair in putting them on the economic rating of an elevator starter.

If Mr. Hoover sends me on such an economic errand to Europe, I want it distinctly understood that I am just as much entitled to an "economic interest" in Rumanian oil fields as any other engineer-financier like Mr. McAdoo, Morgan, Sörensen, Van Law, Butters, Bosqui, Jackling, Hoover, and thousands of others.

Of course, if Mr. Hoover had in mind those merely civil engineers, I have nothing to say. They are a sad lot. Always talking about the railroad *they* built in Brazil or China, totally forgetting the financier in New York who *really* built the railroad. They are poor fish! If they built the railroad or the bridge or the port works or the office building, why does someone else own it? And why, immediately after completing the job, is it so vitally important for a C.E. to get another?

The electrical engineers are worse. They don't know a banker's acceptance from a wedding invitation: They labor over (someone's else) drawing board, improving (someone's else) machinery, building (for someone else) beautiful, efficient power plants.

Whoever heard of a C.E. or an E.E. doing anything big *for himself!* Whoever heard of one who had even an "economic interest" in the house he lives in, much less in world matters?

Now, as to things political, Hoover must grant that mining engineers are enthusiastic students of political economy and are constantly being elected as congressmen, senators, governors and mayors and are frequently given cabinet portfolios. Some of them actually vote occasionally. Who can say that a wealthy mining engineer with shares in mines, steamship lines, banks and commercial organizations has no "economic interest" in the economic development of Europe, the benighted?

Please make Mr. Hoover retract.

Silica Brick Production Decreased In 1919

The quantity of silica (refractory) brick produced in the United States in 1919, according to an estimate made by the U. S. Geological Survey, was the equivalent of 216,363,000 9-in. brick, and was valued at $11,798,000, a decrease of 120,199,000 brick and of $8,190,000 from 1918. The average price per thousand decreased from $59.39 in 1918 to $54.53, in 1919. The output in 1919, though much smaller than that in 1918, was much larger than that made in any year prior to 1916.

Mexican Onyx

When waters charged with carbonate of calcium derived from limestone are allowed to evaporate they deposit masses of the carbonate, some of which are of great beauty. This process can be observed at many warm and "petrifying" springs and also in limestone caverns where stalactites and stalagmites are being formed, according to the U. S. Geological Survey. Mexican "onyx" is formed in this way. Its variations in color and texture, which make it attractive and valuable as an ornament, are commonly produced by oxide of iron, or even by mud and clay.

Picturesque Mining Experiences—VI

A Slight Unpleasantness

By W. H. SHOCKLEY
Written for *Engineering and Mining Journal*

ON JULY 26, 1899, my pack train started from Yao-tzu-po at 4 a.m. Riding with my interpreter, Wang, my official companion (wei yuan) Yeh, and a few servants, we soon left the pack train behind. At the walled village of Ku Cheng we found the central square jammed by a holiday crowd watching a temporary stage whereon brilliantly clad performers were enacting a battle between imperial and rebellious forces. The Emperor's troops, led by his slender daughter, were winning, but suddenly her shrill cries rose to a shriek of agony, and she fell on the stage in convulsions. Her suffering was pitiful to see, but my Chinese friends seemed to find the scene amusing, and smilingly explained that the lady general was in the throes of approaching maternity. As a result of her incapacity, the rebels won the battle.

Seeing that the attention of the crowd was directed as much to us as to the play, we rode on to Ho-chin-hsien, the residence of a district magistrate, an official who personally attends to those duties that are divided among our county officers. The people call him "the father-mother official." We arrived at Ho-chin at 2 p.m., and expected the mules within a couple of hours, but late in the afternoon a muleteer brought word that four of our servants had been beaten and the mules impounded by the villagers. This was startling news, for all our goods, except the thin clothes we wore, were

THE AUTHOR IN CHINA, ACCOMPANIED BY INTERPRETER AND GUIDE

with the pack train. We told Yeh that he must at once ask the officials to help us, but he said that he could not call on the magistrate because he had no cards and no proper clothes. His objections being speedily overruled, he visited the magistrate and came back in half an hour, telling us that ten cavalrymen had been sent to the village. Late that night we received word that the pack train would arrive in the morning. Worrying about the safety of our servants and our goods, and suffering from the heat, I passed a wretched night trying to sleep on some boards in the upper story of a temple.

Accompanying the pack train in the morning came our servants—dirty, haggard, and blood-stained. I had prepared hot water for them, and was much surprised when they unanimously declined a bath. They wanted to look as miserable as possible until after the visit of the coroner (wu tsoa), an official whose business it is to examine into assaults and murders. He proved to be a keen little man of sixty-odd. He looked over the servants, who were stretched out on improvised couches, and almost too weak to talk. The cook's case was the worst; he gave no sign of life when questioned. But when the coroner told the bystanders that the four

TEMPLES ON THE YELLOW RIVER AT YU MEN K'OU

The Yellow River leaves the mountains at Yu men K'ou and is the boundary between Shansi on the right and Shensi on the left. This break in the mountains was, so the priest told me, made by the Great Yu, when he was controlling the floods of China, about B. C. 2278. The Shansi temple was lately (1895?) redecorated, and one of the principal pictures represents nine states paying their respects to Yu. Among the crowd are representatives of various nations—a big, hirsute, fur-clad Russian, a Frenchman leading a bear by a string, a Salvation army lass in short skirts, a middle-aged Englishwoman with projecting front teeth, a man bearing a banner on which is written B. Furth, Vienna. These foreigners are probably taken from some comic paper or advertisement; I think, Austrian. Mixed up with these nations are various monsters: the man with the head in the middle of his adbomen; the man with a hole through his body; the egg with six legs and four wings; a bird with a Frenchman's head, hair nicely parted. The whole excellently well done

bloody wounds on the cook's head were knife-cuts, the cook spoke up quite vigorously: "No, they were made by a stone." At this answer the coroner smiled in a relieved manner, for he had found out that the cook was shamming. After the coroner left the servants consented to wash themselves, and in a few minutes made a marvelous recovery. Meanwhile, I had gone over the baggage and found everything intact. Our 3,000 ounces of silver, which must have been a temptation, was untouched.

From our servants we learned that they had stopped in the village after tiffin and watched the play. While there, one of the villagers stepped on the foot of my number one boy, and to his remonstrance replied: "If your foot had been where you ought to be, and that's at home, there would have been no trouble." On this a row started, and my men were driven away. Going back to their inn, they seized staves and, returning, drove everyone out of the square. On this the villagers shut the gates, rang the alarm bell, came in force, captured

the servants, beat them, tied their hands behind them around the columns of the temple and their cues tight above their heads. In this position they remained for several hours, insulted, jeered at, and tortured by swarms of flies.

With the pack train had come as prisoners several elders and the head man of the village. After abjectly apologizing they were led away. I appealed to the magistrate to let them off lightly because of their honesty, but I heard that they were given 650 blows—a very severe punishment.

Mining Activities in the Potosi District, In Bolivia

Several Important Tin Operations Being Carried On Which Are Revivals of Ancient Mines—Both Old and Modern Methods Used

THE Potosi district of Bolivia, according to Trade Commissioner Schurz, is essentially a mining region. The mining industry centers about the famous Cerro de Potosi, although there are less important mines at other points outside the immediate radius of the city of Potosi. Silver and tin are the principal products of the Potosi mines, though copper, lead, antimony, and other minerals are also produced. Exports from the district during 1918 amounted to the following totals:

Mineral:	Kilos
Tin:	
Barilla (concentrate)	4,639,530
Bars	582,050
Wolfram	1,990
Silver	22,840
Copper	31,000
Bismuth	18,360

The Cerro de Potosi is a cone-shaped mountain about 2,000 ft. high, situated on the outskirts of the city of that name. The Spaniards began to work its rich deposits of silver ore in about 1545, and during the colonial régime the enormous quantities of silver taken out of the Cerro, variously estimated at from $1,000,000,000 to $2,000,000,000, formed the principal basis of the mineral industry of the old viceroyalty of Peru. However, the Spaniards not only ignored the tin and other metals existing in the Cerro, but the inadequate methods used in mining and smelting prevented them from securing the full benefit of their labors, so that the dumps left from their workings still contain a very appreciable quantity of metal. During the past few decades there has been a marked revival of mining in the Cerro, the present operators being comparative newcomers.

Important Mining Interests in the Region

The most important interests in the Cerro are those belonging to Luis Soux, of French birth, who operates several mines in the Cerro and owns a smelter, the only one in Bolivia, which was built about twenty-five years ago, and in which he makes bars containing about 95 per cent tin. He also sends out large quantities of tin concentrate (barilla) and silver ore. About 1,000 people are employed in all his workings. The second most important interest in the district belongs to the Bebin brothers, also of French origin. These men have recently installed a new concentration plant, where the tin ores from their mines in the Cerro are prepared for shipment in the form of concentrate. The equipment of this plant, which is the most modern of its kind in Bolivia, is of American manufacture. About five tons of barilla which runs from 55 to 60 per cent tin are turned out a day. Probably 400 employees are on the payrolls of the Bebins. Third in importance are the interests of the Anglo-Bolivian Mining Syndicate, Ltd., which is controlled by the Aramayo Francke Mines, Ltd., with important tin, silver, and bismuth mines in southern Bolivia near Atocha. This company works, among other mines, the old "Real Socavon," which dates from early colonial times. Of secondary importance are the mining interests of Benavides, Cabrimonte, and Medinaceli.

Antiquated Methods Employed

Numerous small operators work one or two galleries with the aid of a few Indians and sell their ore to the larger miners or to the regular buyers of ores. In 1919 there were 742 bocaminas, or mine entrances, in the Cerro. The mountain is, in fact, honeycombed with galleries, which are connected throughout its interior. Conflicting claims have given rise to a great mass of litigation, not only because of disputes over original ground claims, but also because of the survival of a peculiar old Spanish law, now only applicable to the Cerro, whereby any miner must cease working on encountering the gallery of another miner, or must divert his own gallery in another direction in the hope of striking another vein of ore. Mining methods are still generally antiquated, being for the most part in the pick-and-shovel stage, with little use of power drills or mechanical equipment of any kind. The laborers are Indians or "cholos," few of whom can be called expert miners. The ore is carried down the mountain to the concentrating plants on the backs of burrows, though an "andarivel," or cable way, is used also in one instance.

Among mines outside the radius of the city of Potosi are those of Porco, which are situated along the railway between Potosi and Rio Mulato. It is believed that these deposits of tin are now nearing exhaustion. Another mining company controlled by British interests, which was formed for the purpose of working the alluvial tin deposits in the bed of a river for a few miles from the city of Potosi, installed two powerful dredges, one at Aroifilla and the other at Chaca. The material taken out of the river bed contained about 20 per cent tin. The Aroifilla dredge produced for a time upward of 110 tons of barilla per month, running from 60 to 63 per cent tin, and the Chaca dredge produced 30 to 38 tons of barilla per month. However, the burning of both of these dredges, which represented an investment of about £100,000, paralyzed the work of this company.

Importance of Burmese Gems

Burma is said to be the world's chief source of supply of rubies and of one kind of jade. The quantity of jade exported during the year 1918-19 was 2,763 hundredweight, as against 3,108 hundredweight in 1917-18. Most of this trade is with Hongkong. In addition to this export by sea, 571 hundredweight went across the frontier to China during 1918-19, as against 500 hundredweight during the preceding year. No record is kept of the exports of rubies, sapphires, and spinels, as most of these articles go out as personal effects. The value of the trade, however, must be several hundred thousand dollars a year.

Metallurgists of Note

Galen H. Clevenger

GALEN H. CLEVENGER'S career as a metallurgist is the result of hard luck. Otherwise he would have been a miner. Thus, by this same hard luck the mining fraternity lost an excellent human prospect. When Mr. Clevenger was sixteen years old an old miner in the Black Hills of Dakota considered him such a good man that he contracted with him to drive a tunnel on a prospect, for which work he was to receive a one-half interest in the expected mine. Clevenger drove the tunnel single-handed. Ore, however, was absent, so that although he received the physical one-half interest as promised, his mental interest in mining quickly declined to a much smaller fraction than this, and caused him to take up metallurgy, which offered a greater opportunity for experimentation and research. At this time he was a student in the South Dakota School of Mines. This was the natural school for him to attend, for he had lived in that state since 1882, when, at the age of three, he helped his parents move from their old home in New York State. From the age of fifteen, he was obliged to earn his own living. While a student at the mining school Clevenger began experiments upon the cyanidation of an accumulation of chlorination tailings. For the purpose he built a 200-lb. demonstration plant out of what were known in those days as whiskey barrels, these being plentiful at that time and place. The operation of this small plant convinced him that the tailings could be treated profitably; he not only assayed his feed and tailings but actually recovered the gold and silver in the form of bullion. However, to others there were all sorts of reasons why chlorination tailings could not be cyanided, the chief being the familiar one that if it were economically possible it would have been done before, it being assumed that young Clevenger did not know more than all the prominent metallurgists that had preceded him. Finally a woman loaned him a few hundred dollars, and this, together with credit extended by a foundry whose owner was not particular as to whom he extended credit, enabled him to proceed with the construction of a thirty-ton plant. This was a success from the start, and Clevenger was able to pay all his obligations by running the plant well into a Dakota winter, which was not particularly pleasant for an outdoor plant. Following this practical demonstration by a youngster, many thousands of tons of chlorination tailings were treated profitably by Western mining companies. After being graduated from the South Dakota School of Mines, Mr. Clevenger accepted the position of assayer and chemist to the Dakota Mining & Milling Co., of Deadwood, which had the first wet-crushing cyanide plant of any importance in the United States. Later he traveled through the West, from Mexico to Alaska, and prospected unsuccessfully for a season in the district around Skagway. On the way back he decided that the best way to advance in the art of metallurgy was to take a post-graduate course at Columbia University. His chief trouble that fall, he says, was to find a bank which would take care of his money for him, a $200 balance being about the minimum accepted by New York banks, and to persuade some of the professors that he had been properly prepared to take their courses. After securing his Columbia degree, Mr. Clevenger returned to the scene of his endeavors and was engaged as research metallurgist with the National Smelting Co., when he rediscovered the Pearce process of recovering gold from matte, which was a secret known only to the Argo smelter at Denver. Since then, Mr. Clevenger has had wide practical experience, and for a time taught at Stanford University. With Charles Butters he did a great deal in developing the silver metallurgy of the Cobalt district by devising a process for the local treatment of the ores. With the co-operation of H. W. Gepp he solved some of the problems connected with the recovery of zinc from Broken Hill concentrates by the electrolytic process, discovering the deleterious effect of traces of cobalt in this connection.

GALEN H. CLEVENGER

Mr. Clevenger is now consulting metallurgist both to the U. S. Smelting, Refining & Mining Co. and to the U. S. Bureau of Mines, as well as holding responsible positions in the National Research Council and the A. I. M. E. His home is in Boston.

HANDY KNOWLEDGE

How To Cut Belts Square

BY F. D. RICH

Cutting the ends of a belt as a preliminary to fastening them seems such a simple operation that often the belt man does not give it the consideration necessary to insure the best results, and much of the difficulty with otherwise good belts is due to their not being cut and joined accurately. It is as easy to make a belt joint which will run the same as an endless belt as it is to make a poor one by careless rule-of-the-thumb methods.

When a belt runs "wobbly," or races back and forth across the pulleys, it is not giving its best service, nor can it have its longest life. A belt that is repeatedly jumping off the pulleys is costing about twice as much as it should, because its life is being shortened and power is lost. Provided that its ends are cut square, and it is joined with care, a belt can be made to run as straight as an arrow if the pulleys are lined up true.

If a square is not used, one or both of the ends will be cut unevenly or irregularly, which prevents smooth running. Even the use of a straightedge does not assure the perfect results obtained by using a square, for the slip of a fraction of an inch will bring the belt ends together at an angle, as shown in Fig. 1. This results in the belt "shimmying" on the pulleys, which impairs its service, for, as it moves from side to side, the line of direct pull, "*A-B*," moves from one side of the belt to the other, imposing shifting and irregular strains, which no belt can be expected to stand indefinitely.

For belts up to 15 or 18 in. wide the ordinary square is used. It is pressed firmly against the edge of the belt and the knife held vertically when cutting. See Fig. 2. A sharp knife is essential. The point of the knife should be wet. When a number of belts have to be cut, a good arrangement is to drive two nails in a large block of wood, and against these set the edge of the belt and the edge of the square, as shown in Fig. 3. This prevents either the belt or the square slipping. A slip of leather or a piece of old belt is often tacked on the end of the block to protect the point of the knife as it comes through the belt.

Wide belts are more difficult to square accurately, and the difficulty is often increased by slight variations in width, which throws the square out. To avoid this and assure perfect results, the following method has proved to be the best: At any point near where the belt is to be cut, measure across and find the center as at "*A-A*," Fig. 4. At any distance back of this, two or three feet, find the center again as at "*B-B*." Between these two center points draw a clean, sharp line. This marks the center axis of the belt. As shown in Fig. 5, the square is placed against the center line, and the end of the belt trimmed off. Two small nails driven in on the center line will prevent the square from slipping.

In cutting the other end of the belt, the center line is found in a similar manner as that just described. At any point on this line other than where the belt clamp will come, a point "*C*" is taken—Fig. 5. By using the square, a line "*D-C-E*" is drawn at right angles to the axis, and all the way across from edge to edge. It is sometimes easier to draw this line by marking the points "*D*" and "*E*" and then placing a straightedge through the points "*D-C-E*" to draw the line. See Fig. 6. The straightedge should be straight. The line "*D-C-E*" is

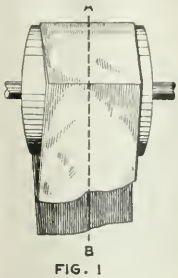


FIG. 1

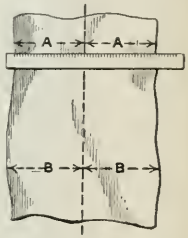

FIG. 4

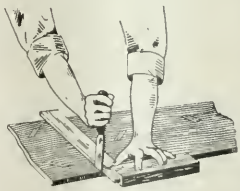

FIG. 2

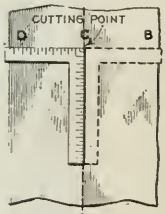

FIG. 5

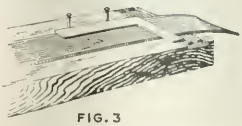

FIG. 3

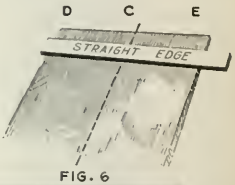

FIG. 6

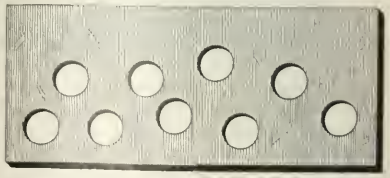

FIG. 7
DETAILS OF BELT CUTTING

used as a "base line" to measure from after the belt is in the clamps.

Where the ends are to be cut is determined after clamps have been put on and the belt brought into position. By measuring from the line "*D-E*" an equal distance on each side of the belt, a new cutting line can be established. Calipers are convenient for making this

measurement over the belt clamp. As a matter of convenience, one end of the belt is always cut square and ready for making the joint before putting the belt into the clamp.

It is no uncommon thing to see, in journeys through plants, laced belts in which from 40 to frequently more than 70 per cent of the cross-section of the belt is removed in punched holes. See Fig. 7. Many types of metal fasteners are in common use, which from an engineering standpoint are but slightly if any more satisfactory than lacing methods, for several reasons: First, because many of them sever the lengthwise, power-carrying fibers. Second, because others place all the strain in a straight line comparatively close to the end of the belt. Third, because some make a joint which is so stiff and hard that they pound on the pulleys and cause the belt to break back of the joint. Fourth, because many put metal in contact with the pulleys, which causes noise and wears and weakens the metal, so that such joints must be constantly watched, both to prevent danger to workmen and to detect failure of the joint.

The ideal belt joint is one which would run the same as an endless belt, without the drawbacks or difficulty in making and later shortening to take up stretch. Belting manufacturers themselves estimate that only a very small percentage of belts need to be made actually endless. Their estimates range from one-half of 1 to 2 per cent as the proportion of belts which it is necessary to make endless. The qualifications of a belt joint, by which any engineer can check up the comparative efficiency of his own methods, are as follows: The joint must maintain the maximum strength of the belt and it must avoid destruction or weakening of the lengthwise, power-carrying belt fibers. The joint should prevent breaking the belt back of the joint. It must not hammer on the pulleys, and it must not be subject to wear or to weakening through shock. The joint should insure continuous, uninterrupted operation without supervision; should hug the pulleys tightly, and insure full transmission of power. It should run silently, the same as endless. Joints should be so made that they can be easily taken apart for removing or shortening the belt; they should be safe against accidents or breakdowns, must be easily and quickly made without special equipment, and should last for the life of the belt.

Repair of Leaching Vats

By C. Flury

The bottom of a 5½ x 22 ft. circular cyanide leaching vat constructed of iron was pierced with numerous holes. Some parts were so badly worn that a needle could have been pushed through without effort. Previously, the leakage was stopped by means of plugs made from coal-tar-soaked cotton waste. Ths method, however, proved to be inefficient. A two-inch cement bottom was laid on the inside of the vat; but pressure variations during charging and discharging broke the cement layer in a short time. This result led those responsible for operations to devise a more flexible bottom, which was built in the following way: Over the whole defective iron bottom was laid an asphalt layer, one-quarter inch thick. This was covered with a layer of canvas (old filter leaves removed from a Butter's vacuum filter). Care was taken that the canvas was placed while the asphalt was still hot. The canvas was then covered with an asphalt layer one-quarter inch in thickness. After twenty-four hours the tank was put under water pressure for seventy-two hours. The water was then discharged and the tank filled again. It was left for seventy-two hours. During the experiment the vat was closely observed, but not the smallest leak could be found. The repair cost amounted to approximately $92, whereas a new tank was quoted at $750. To put in a new bottom was impossible, as the bottom ends of the mantel pieces would not stand new riveting.

Protection of Eyes in Using Arc-Welding Apparatus*

By Dr. C. R. Kindall

Recently thirty men were viewing the demonstration of a new portable electric arc-welding outfit. A few hours later seventeen of the thirty men reported to the doctor for treatment. They were suffering from traumatic conjunctivitis. In two cases the pain was severe. Only two men of the thirty were not affected in some way from this exposure. These two men wore thick-lensed orange-colored glasses. Several of the men wore orange-colored glasses with thin lenses, but the latter were not heavy enough to afford protection against an exposure as long as that which took place. The distance of the eye from the arc also influences the possibility of injury. Conjunctivitis is an inflammation of the conjunctiva. The conjunctiva is the mucous membrane covering the inside of the eyelids and part of the eyeball. Traumatic conjuctivitis is caused by foreign bodies in the eye, exposure of the eyes to high winds, dust, smoke, intense light from electric arc lamps, and from electric welding apparatus. In the instance mentioned, the inflammation was due to the ultra-violet rays. The ultra-violet rays lie beyond the violet rays in the spectrum and are visible to the eye. In some cases the effect is so severe that, in addition to conjunctivitis, an inflammation of the skin is produced.

The symptons of conjunctivitis caused by intense light or by the ultra-violet rays are abnormal intolerance to light, excessive secretion of tears, intense smarting of the lid, contraction of the pupil, sometimes swelling of the lid, and small ulcers developing on the eyeball or cornea. Unless properly treated by a physician immediately, chronic inflammation of the conjunctiva, cornea, iris, or retina, and possibly blindness, may result.

Under proper treatment most cases get well in a few days. All treatment should be under the direction of a physician. That usually advised is to place ice packs on the patient's eyes three or four times daily. The pack should be left on from fifteen minutes to an hour. The eyes should be irrigated with normal salt solution (a teaspoonful to a quart of sterile water) or a saturated solution of boric acid several times daily. If there is a discharge of pus, a few drops of a 25 per cent solution of argyrol or a 5 per cent solution of protargol should be placed in the eyes three to six times daily. The patient should be confined to a darkened room until his condition improves, in order to avoid complications. These treatments will reduce the swelling, give the patient comfort, and prevent the development of chronic conjunctivitis.

*From *Reports of Investigations*, U. S. Bureau of Mines, October, 1920

BY THE WAY

A Fruitless Reformation

"Tha trouble these 'ere pro'ibitin' h'enforcement h'officers do be 'avin in makin' h'all o' we min' their laws," said Cap'n Dick, "remin's me o' tha night that Dicky Truscott an' Jan Richards tried for to cure Tom Trezise o' tha drinkin' 'abit. Tom did dearly love a drop o' beer or a noggin o' whiskey. Scoores 'pon scoores o' times I've 'eard 'im say, 'I've 'ad lots o' beer in my time an' I've never yet 'ad no *poor* beer.' Tha night o' w'ich I do be speakin' h'all three boys wuz drinkin' daown to 'Arry James 'Drain Tunnel' saloon. Wuzn't long afor' Tom, 'oo couldn't 'old much drink, any'ow, wuz maudlin' drunk, so h'out 'e gaws to tha back room an' fell asleep in a cheer. Dicky an' Jan then an' there decided that they should try for to cure Tom o' tha drinkin' 'abit. So they took Tom, poor h'ol chap, an' lifted un h'into a cart an' 'auled 'im h'out to tha graveyard. There they puts un daown by a new-dug grave—an' Tom a-sleepin' all the w'ile. Then they 'id theyselves be'ind a bush an' waited. 'Baout a' 'our Tom wakes h'up an' looks aroun'—wil' h'eyed like. 'Is 'and slips h'over tha hedge o' tha grave, an' 'e sez, 'W'ot bloody shaf' is this?' Then 'e sees tha 'eadstone an' 'e h'asks, 'W'ere am I to?' So Dicky h'up an' speaks, 'Thee's in 'ell, m'son, an' close to one o' its pits.' "Ow long 'as I been 'ere?' sez Tom. 'Thee's been 'ere a week,' h'answered Dicky. "Ow long you been ere', h'asks Tom. 'I been 'ere two weeks,' sez Dicky. 'Well,' sez Tom, 'thee's naw tha bloody place better'n I do. 'Ere's a shillin' for to gos' h'out an' get a quart o' beer for we.' An', m'son, never h'again did they try for to cure Tom o' tha drinkin' 'abit."

The Latest in Ideas

We take the following from the New York *World*:

Laborer Gets $150,000

Anaconda, Mont., Nov. 28.—From a laborer's task at the Washoe smelter to the possession of $150,000 was the realization here recently of Claude Sheumaker, who received a telegram from an eastern broker advising him that he had realized this fortune on the sale of oil stock. Sheumaker immediately drew his earnings, purchased a railroad ticket and started east. Sheumaker conceived the idea of buying oil stock while in the army. While serving overseas with the Twenty-third Division he was wounded. His original investment was $300 of back army pay. He intends purchasing a ranch in Oregon, he said.

As an Idea Conceiver we cannot rate Claude better than one-half of 1 per cent, but for plain bull-headed luck we should grant him at least a plus.

Volcanism in Pennsylvania

"The Fayette mine of the Lowber Gas & Coal Co., three miles from Fayette City, Pa.," said the New York *Times* recently, "is on fire and burning fiercely. Investigation so far made lends color to the belief that the fire was caused by volcanic eruptions of mild intensity, which, according to engineers, have been responsible for the breaking out of flames in two other mines in this region in the last four weeks."

Murderer's Bar

Murderer's Bar in the Middle Fork of American River is described in Hittel's "History of California" as it was in July, 1851, at which time it was perhaps at its best for activity and yield. According to Hittel, an eye-witness said: "A turn in the road presented a scene of mining life as perfect in all its details as it was novel in its features. Immediately beneath us the swift river glided tranquilly, though foaming still from the great battle which a few yards higher up it had fought with a mass of black obstructing rocks. On the banks was a village of canvas that the winter rains had bleached to perfection and round it the miners were at work at every point. Many were waist-deep in the water, toiling in bands to construct a race and dam to turn the river's course; others were intrenched in holes like grave diggers, working down to the bedrock. Some were on the brink of the stream washing out 'prospects' from tin pans or wooden 'bateas'; and others worked in company with the long tom by means of water sluices artfully conveyed from the river. Many were 'coyote-ing' in subterranean holes, from which from time to time their heads popped out, like those of squirrels, to take a look at the world; and a few with drills, dissatisfied with nature's work, were preparing to remove large rocks with gunpowder. All was life, merriment, vigor, and determination, as this part of the earth was being turned inside out to see what it was made of."

A Scientific Geologist

The common or garden geologist has produced some thrilling literature; but now comes the upper crust, the "scientific geologist"; and his work is certainly far finer and more full of pep. We publish a sample of it, taken from a prospectus designed to sell stock in the Frio County, Tex., oil fields. We may pause to warn the intending investor (who, according to the prospectus, will be everyone who is "not a piker") that Frio means cold, and, in the slang of our youth, it may be a very cold day for him if he yields to the seduction.

Geological Survey

Gentlemen:

The State of Texas contains a volume of unwritten history, wrapped in the confines of geologic ages. With this there is an unwritten law, for the genius of man to unfold, and understand.

Well equipped, he can open this book of nature, and read, even to its lowest foundation, seeking the blessings therein concealed, which are so necessary to the comfort and pleasure of the human family.

In our present age oil is the most anxiously sought for, among the world's greatest commodities. You are greatly favored in the selection of the property, west of the town of Moore, on the I. & G. N. R.R., about forty miles southwest of San Antonio. This tract of land—3,327 acres, on the Brown holdings—is indeed a veritable treasure house of oil, of the best grade known to commerce.

It is located on one of the largest rivers of the Carboniferous Age; one of the western rivers of the great Mississippi Valley. These rivers of the Carboniferous Age are the oil depositories of the world.

The deposit under your lease is a very large pool on an anti-clinal dome. This dome was formed by an internal uplift, which constructed a true oil-structure.

There are many interesting features connected with this valuable property, which I can assure you is one of the very best in the district.

134-acre Miller lease, northwest of the Kimball well, is situated on the same great oil-channel.

In about the 300-ft. level you will strike sufficient gas to run all of your machinery, and about the 600-ft. level you will strike lubricating oil in paying quantities. In about the 2,000-ft. level you will strike gusher oil.

Sincerely yours,

J. V. KIMBALL, M. E. and
Scientific Geologist.

Oct. 13, 1920.
San Antonio, Tex.

CONSULTATION

Spanish Pyrites

"I am seeking some information regarding the consumption of Spanish pyrites in this country. In how large a quantity is this material ordinarily imported? I would also like to know if the domestic pyrites deposits can compete successfully with the Spanish product. The statement has been made that the Spanish pyrites deposits supply about two-thirds of the world's production, so that their importance is apparent to anyone; but I would like to know the especial importance of Spanish pyrites in supplying United States demands. Any further information you may supply, such as market prices and grades, will be greatly appreciated."

The extensive pyrites deposits of Spain and Portugal are the most important source of pyrites in the world, and account for over two-thirds of the world's production. Although practically a unit, Spain supplies 90 per cent of the output of the district and Portugal the remainder. About two-thirds of the output contains copper in recoverable quantities. The higher-grade copper ore (containing over 5 per cent copper) is smelted locally. A lower grade of copper ore containing 1½ to 5 per cent copper is shipped to European countries for the recovery of its copper, sulphur, and iron content. Ores containing about 1½ per cent copper are customarily treated locally for their copper content, and the residue, or "washed ore," containing pyrites, is exported to the United States. The lowest grade of ore, as judged by copper content, is shipped solely for its sulphur content.

The treatment of the 1½ per cent copper ore is a leaching process utilizing water and atmospheric oxidation that extends over a period of three years.

According to A. E. Wells, two of the companies selling Spanish pyrites in this country dispose of part of their copper-bearing unwashed ores under a contract by which the sulphur content alone is paid for, the pyrites cinder reverting to the dealer. These companies have plants for treating the cinder for the recovery of copper by a chlorination and lixiviation process, after which the residue is sintered and shipped to the iron furnace.

The sulphur content of the Spanish pyrites imported to the United States varies between 45 and 50 per cent, the lump varieties usually running higher than the fines. A little arsenic may be contained in the ore. Most of the imported ore enters the country by way of New York, Philadelphia, and Baltimore, although the southern ports of Charleston, S. C., Savannah, Ga., New Orleans, La., Norfolk, Va., Jacksonville, Fla., and Wilmington, N. C., are also important domestic points of entry.

The Spanish ore comes in two principal grades, recognized by the trade as furnace size and fines size. Most of the ore of furnace size finds its way to the South, where furnaces for treating this sort of material almost exclusively are situated. The fines are consumed by the acid plants in the north. The price of the two grades ordinarily shows a differential of about 2c. per unit in favor of the furnace grade. This is due, as may be surmised, to the objectionable character of the extremely fine ore which the "fines" grade may contain. The fine dust tends to clog the flues and towers and interfere with the process to a harmful degree.

Incidentally, one of the objections to the use of domestic pyrites is the fact that the ore when mined frequently produces more fines than lumps. An average proportion as stated by Wells is about two-thirds fines to one-third lump. As the greater portion of the Southern acid plants are equipped to handle furnace ore, this interposes some difficulty in manipulation. Sulphuric-acid manufacturing equipment in the north consists principally of fines burners. Concentration is frequently necessary, to make the ore sufficiently high grade to treat. The average eastern domestic pyrites, lump, fines, and concentrates, runs about 40 per cent sulphur, which is lower than the imported Spanish grades, and is usually very low in phosphorus and arsenic. A small percentage of copper is frequently present. Domestic fines and concentrates have the advantage of usually being easier to roast than the Spanish fines.

As given in the market report, Spanish fines are quoted at 12c. per unit, c.i.f. Atlantic ports; domestic fines, 12@14c., f.o.b. Georgia mines. The prices of domestic and foreign material do not vary widely. Other quotations are referred to in the market report. As the Spanish product is a convenient ballast, it has an important transportation advantage.

Ever since 1891 the total yearly imports of pyrites from all countries has been greater than the domestic production. During the greater part of this period imports have been more than twice the domestic output, indicating clearly the important part played by importers in the pyrites industry. It has only been in the last few years, in 1918 and 1919, that imports have taken a decided downward slump, so that domestic production and imports nearly balance. The decrease in imports was largely due to the difficulty of obtaining ships for the transportation of the pyrites from Spain. Unless a tariff or governmental restriction is imposed upon the importation of Spanish pyrites, imports will likely increase; but the ready availability of crude sulphur for acid manufacture tends to compete and restrict the rate of former importation.

A comparison of domestic production and total imports of pyrites from figures given by the U. S. Geological Survey follows:

	Domestic Production (Long Tons)	Value	Total Imports (Long Tons	Value
1910	241,612	$977,978	803,551	$2,748,647
1911	301,458	1,164,871	1,006,310	3,788,803
1912	350,928	1,334,259	970,785	3,841,653
1913	341,338	1,286,084	850,592	3,011,137
1914	336,662	1,283,346	1,026,617	4,797,326
1915	394,124	1,674,933	964,634	4,817,977
1916	439,132	2,038,002	1,244,662	6,726,318
1917	482,662	2,593,035	967,340	5,581,457
1918	464,494	2,644,515	496,792	2,741,676
1919	380,000	2,500,000	388,973	2,176,565

(a) Containing more than 25 per cent sulphur

The largest domestic pyrites production occurred in 1917. Since then, output has dropped to a little above the pre-war rate.

THE PETROLEUM INDUSTRY

Oil Shale and the Engineer

The Mining, Retorting, Refining, and Marketing of Shale and Its Products Can Best Be Developed by Those Familiar With Similar Operations in Established Fields—Problems To Be Solved Before the Industry Can Be Made Commercially Successful

By David Eliot Day
Written for *Engineering and Mining Journal*

THE subject of oil shale and shale oil has received considerable publicity in the last two years; perhaps too much for its own good. It is a new and exceedingly interesting topic, about which little is definitely known, and it has inspired numerous contributions to both the technical and the popular press.

One of the effects of this publicity has been to stimulate the sale of stock in numerous oil-shale companies. That any of this stock will ever achieve a value in excess of that of the property which it represents is exceedingly doubtful. In all probability the work of commercially developing oil shale will be done by companies already established and successful, notably oil or mining corporations, and these companies will have no stock for sale. This may seem undesirable, but it is certainly logical.

To be successful in a new enterprise of this sort, the operating company must be financially sound. It must have sufficient capital to carry on a long, expensive campaign of research, experiment, and construction. It must have an experienced staff of high-grade engineers. The established mining or petroleum corporation possesses these qualifications. Furthermore, each of these institutions has had long and valuable experience in some of the operations which will be included in the oil-shale industry. Thus the mining company, although unfamiliar with the detailed technology of petroleum, is experienced in developing and mining ore, and in roasting ore after mining, a process which, as closely as any other, approaches the operation necessary for the retorting of oil shale. The oil company, on the other hand, although not as familiar with the preceding operations, has had long experience in refining, transporting, and marketing petroleum products.

Essential Prerequisites to Successful Exploitation

It is not my intention to attempt to dissuade the earnest, capable operator from entering this field, but he must fully appreciate the problems which will be encountered. He must realize the futility of attempting to operate without sufficient capital, without the entire confidence and understanding of his stockholders, and without the benefit of capable technical advice. He should be determined to secure all possible data before he begins operations.

Such data may be grouped under three main heads: (1) Information concerning the property, (2) facts concerning the process to be adopted, and (3) data concerning the oil produced.

The exploration of an oil-shale property, to be of permanent value, should produce certain concrete facts. The most important of these are:

a. The tonnage of commercial shale on the property.

b. The amount of recoverable oil that this tonnage represents.

c. The number of units of shale which must be mined and treated to produce one unit of oil.

d. The attitude and thickness of the commercial beds, together with other data governing mining conditions.

e. The relation of the property to selection of a plant site, to economical mining, to dumping facilities, transportation, water conditions, and other operating and marketing conditions.

Advantages of Core Drilling

These facts may be readily obtained by an experienced mining engineer with the aid of a systematic method of sampling. Except in the preliminary examination of a property, before acquisition, in which careful hand sampling may be justified, the only trustworthy method of completely sampling a property is that of core drilling, the advantages of which are many. It is the only method by which acceptable samples may be recovered from beds which do not outcrop on the property. The core forms an accurate record of the beds encountered and furnishes a complete continuous sample which may be rapidly and accurately subdivided into samples of retorting size. The samples obtained are at depth, where the actual mining will be done; not at the surface, where samples may or may not represent what will be encountered below.

Cost of Prospect Investigations

Many data concerning water conditions, hardness of formations, and mining methods employable are obtained at no extra cost. Although core drilling is considerably more expensive than haphazard hand sampling, the tonnage proved by this method, together with the results obtained, will more than offset the initial cost. In Colorado and Utah, the rich shale layers lie nearly flat, and as the oil content of any one bed does not vary greatly in a horizontal distance of less than half a mile, a series of three drill holes should prove 160 acres each, or about 500 acres in all. Assuming that in going to an average depth of 500 ft. these holes encounter a total thickness of 100 ft. of commercial

shale, roughly 126 million tons will be proved by this method. At a cost of $5 per foot for drilling, or $7,500 for the three holes, this development work will cost about 0.005 of a cent per ton. By analyzing samples representing every five feet of the core, and arranging the results obtained on a chart, it is possible to express graphically the number of commercial shale beds, the thickness of these beds, their attitude with regard to overburden and other mining conditions, the total tonnage of rich shale, and the total recoverable oil which may be expected from this tonnage. With these data in his possession, if they be favorable, the conservative operator is justified in proceeding with his development work, building roads, preparing his plant site, and making ready for the installation of his process.

Exploratory Observations of Value to Subsequent Operations

If the analysis of the drill cores has been performed in a careful and intelligent manner, a considerable quantity of data will have been obtained concerning the reactions of this particular type of shale under retorting. For example, much should be known about the temperature most suited to economical retorting, the rate at which the retorting should progress, the advantages of employing steam or vacuum during the process, and other similar matters. This evidence will be of great service in choosing the type of retort which can be best adapted to the treatment of the particular shale under consideration.

To date, considerable time and money have been spent in the United States in experimenting with processes for oil-shale distillation, but no process has been put into true commercial operation, nor do many of those which have been so far devised show much promise of ever becoming commercially important. The reasons for this lack of success are various. In the first place, the majority of these processes lack sound technical fundamentals. Not only have they been designed without the services of competent engineers, but the experiments made with them have been so sporadic and so poorly correlated that the results have yielded little of either positive or negative value. In the second place, the inventors responsible for these processes have striven rather for a good patent than for a sound process. The attempt usually has been to produce something radically new, rather than to adapt or improve some furnace already proven and operating in an analogous field.

Neglected Sources of Information

The cement industry, the byproduct coke-oven industry, and the practical methods of gas production have been neglected by the inventor of shale processes. None of the apparatus used in the above industries could be applied without change to retorting oil shales, but a vast amount of pertinent information is obtainable from them. Furthermore, there are a number of companies in this country which have successfully built and operated drying and roasting furnaces for many years. Seemingly the engineering departments of these companies would be the best source of information for the shale operator, but comparatively few such firms have been approached. Finally, most of the effort spent in experimenting with shale processes has been directed along non-essential lines. The vital need is to produce a retort of large capacity, low operating cost, and sound, permanent construction, not the possibility of producing 1 per cent more oil per ton, nor oil worth a fraction of a cent more per barrel. Oil-shale retorting presents a problem which is no more difficult than many already solved in metallurgy. It will only be solved by the methods applied in metallurgy: intelligent research, mechanically sound design, and careful, correlated experimentation.

Shale-Oil Products Differ From Those of Petroleum

A vast amount of hocus-pocus has been written by so-called experts on shale oil. Some claim that the products from shale oil far excell those produced from ordinary petroleum. Others state that shale oil cannot be refined without tremendous refining losses, and for that reason is relatively worthless. As a matter of fact, the products from shale oil are different from but not greatly superior or inferior to, those from ordinary petroleum. Paraffin from shale oil is undoubtedly of a better grade than the petroleum variety. Shale-oil lubricants, although satisfactory for many purposes, cannot fill the place of certain high-grade petroleum products, notably steam cylinder oil. The quality of gasoline is a matter of refining and blending. Shale gasoline may be better or worse than the petroleum product, according to the method of distillation and treatment.

The high percentage of unsaturated hydrocarbons in gasoline has been the subject of much unfavorable discussion. These products are removed by ordinary acid and soda treatment and cause a large refining loss. In all probability, by the time that shale gasoline is on the market in large quantities, the shortage of gasoline of any sort, and its high price, will have largely removed the trade prejudice against an unsaturated product. Gasoline from "cracking" plants is high in unsaturated, but there is no slackening in the development of "cracking" plants for that reason. Furthermore, methods of treatment which will produce a marketable product without exorbitant loss are being perfected, and will undoubtedly be applied to shale gasoline in some stage of its production.

Refining problems deserve as thorough technical and economic treatment as do any others connected with oil shale. The form in which the product should be marketed to produce the highest net return, refining methods and economies, production and treatment of particularly valuable fractions—all of these matters will play a prominent part in determining the success of the enterprise, and should be given full and technical consideration.

Those closely in touch with the economies of petroleum have no doubts as to the ultimate development of oil-shale resources. Many conservative men believe that, as the process of putting the oil-shale industry on a commercial basis will involve a long period of research, experiment, and construction, the time has already arrived to begin acquiring essential data. The future therefore promises a great advance in the technology of the subject. The time for promotion schemes has passed. So many investors have already lost money in such schemes that shady promotion is becoming more and more difficult. In the expansion of industry which will accompany a return to normal financial conditions, oil-shale development should prosper. No field offers greater opportunities to the engineer, and the engineer is indeed essential to the successful development of this field.

NEWS FROM THE OIL FIELDS

Merger of Producers and Refiners Planned in Wyoming

From Our Special Correspondent

A merger of all the companies operating in the Warm Springs district, Wyoming, into a $10,000,000 corporation is planned. The merging companies would include the Singers Securities Co., Alliance Oil Co., Woods Petroleum Co., Wyoming Premier Co., and others, together with the new refining plant of the Alliance Oil Co. at Thermopolis, of 3,500 bbl. daily capacity. It is stated that there are fifty-three producing wells in the district, most of them producing from the shallow sand. Many of the wells are now being drilled to the deeper and more productive sand.

The Mountain Producers' Co. declared its initial dividend of 2 per cent payable Jan. 3 to stockholders of record on Dec. 15.

Deepest Texas Well Proves Dry

From Our Special Correspondent

The deepest drill hole in Texas was abandoned recently at 5,908 ft. The hole was dry, or a "duster," in oil-field parlance. It is on the Roy Henderson ranch, Crockett County, and was drilled by J. A. Pope for the Ryan Petroleum Corporation. The hole was started 22 in. in diameter and finished 5⅝ in. in diameter. From 3,590 ft. down the well was uncased.

Production in north Texas continues to decline. Stephens County is now making only 115,000 bbl. per day. Few new wells have been completed recently. The best are the No. 4 Ackers, of the Cosbrook Petroleum Co., northwest of the town of Breckenridge, making an initial production of 800 bbl.; and the No. 2 S. M. Moore well, of the Gulf Production Co., north of Necessity, making 2,000 bbl. after having been heavily shot. These wells are in proved territory, and add no new acreage to their respective fields. In Wichita County the Burkburnett and Iowa Park districts continue to decline in production also, and Electra, with several good producing wells completed recently, is probably holding its own. In the Kemp-Munger-Allen section of this county the test on the Munger No. 6 well, of the Kemp-Munger-Allen Oil Co., at 1,800 ft., is being watched with interest. It is making a small amount of oil by pumping.

An epidemic of fires has visited the north Texas fields recently. In and around Wichita Falls fires have caused a property loss of $125,000. At Breckenridge a fire was started in the heart of the business district by one of the wells, and a loss estimated at $200,000, resulted.

Johnson County, Ky., Promises Good Production

From Our Special Correspondent

In the Gullett Branch neighborhood in Johnson County, Ky., the Big Paint Creek Oil Co. has three good wells, the Eastern Imperial Oil Co. one, and there is an encouraging showing of oil on the properties drilled by the Kentucky Counties Oil Co. and the Pitts-Yeo Oil Co. The Kentucky Counties Oil Co. struck oil in the Big Injun sand, which flowed over the top. Later some salt water developed, but the well looks to be a substantial producer. The Wheeler-Watkins well on the O. T. Rule lease was struck in the shallow sand and is making 50 bbl. at a depth of 250 ft.

The Big Boone Oil Co. reports a gusher at 410 ft. on the Tarrants lease, Davenport pool, Warren County. This well came in flowing and is said to have produced over 400 bbl. the first twenty-four hours.

No. 3 well on the Mose Wall lease, Simpson County, which was drilled in recently, is one of the largest producers yet struck in either Logan or Simpson counties and is being estimated at 500 bbl. per day.

The Cumberland Pipe Line Co.'s runs for the week ended Nov. 27 totaled 69,769 bbl., which is an increase of 13,000 bbl. over the previous week. This company serves only the eastern part of the state.

Californians To Prospect Stanislaus County

Among land owners east of Modesto, Cal., who have signed leases to the Montgomery-Jennings-Keller oil syndicate of Los Angeles, co-operating with the latter to prospect the Stanislaus County field for oil, are: Douglass F. Mullin, T. H. Kewin, Mrs. Abe Johanson, H. W. Voight and W. H. Van Near. The plan is to lease 12,000 acres before beginning active operations and over half the amount required has already been subscribed. It is expected that $100,000 will be spent in development work. The bulk of the leases lie in and about Waterford, Heckman, La Grange and Denair.

First Well in South Dakota Brought In

From Our Special Correspondent

Edgemont—The first oil well in South Dakota was brought in last week, two miles southwest from Edgemont, when French and Rossiter, drilling on the Slocum lease, struck oil at a depth of 700 ft. in the Lakota sand. This new well is fifteen miles east from the Mule Creek field of Wyoming and is in South Dakota.

Another Well in Chinampa Field Shows Salt

From Our Special Correspondent

The Thompson well No. 3, on Lot 114, Chinampa, which came in on Nov. 21, went to salt water on the following Tuesday. In drilling this well the drillers decided that they would just pierce the "pay strata" and thus delay the appearance of the salt. On piercing the line the well flowed under heads at intervals of one-half hour. It was while they were trying to get the well to flow steady that it blew itself in, due to the high pressure. The salt water appeared at once.

The Nicklos well No. 1, on the same lot, was brought in on Nov. 29. The oil was encountered in this well at a depth of 1,953 ft., but the flow was only about 10,000 bbl. It was decided to drill deeper to increase the production. An oil saver was put on the well and five more feet were drilled, when the production was increased to about 30,000 bbl. per day. The oil has been contracted for by the Metropolitan Co. On the same day the Aguila Co. brought in its well No. 15, in the Naranjos field. This well affects the International Co.'s well at Lot 252, Amatlan. The oil was shot fifty feet over the top of the derrick, owing to the high pressure and large percentage of gas. The estimated flow of the well is about 50,000 bbl. daily.

The Zacamixtle country is building up rapidly, and each day sees a new derrick or two springing up. The wildcats spread over a wide breadth, and are fairly well spaced, and as they will all be deep enough to define the pool by the end of the year, great concentration can be expected by March of next year, and the pool will probably have a short life.

The first expedition of oil prospectors to the Mackenzie River district left Edmonton, Alberta, Can., on Nov. 25. The party comprised Dan Darough, A. H. Schwier, Tony Nels and J. A. M. Rankin, all experienced northerners. They were given a clearance by the mounted police. It will take them about forty-five days to make the trip to Fort Norman, a distance by the winter trail of nearly 1,200 miles.

A great rush has set in for oil leases in the country on the Pouce Coupe River near its confluence with the Peace River, Alta., where the first in the field was a geologist representing the interests of the Imperial Oil Co., who secured leases covering approximately 10,000 acres. Several thousand acres were filed at the land office at Grand Prairie by other claimants during two days. It is reported that drilling operations will start soon.

ECHOES FROM THE FRATERNITY

A. I. M. E. Organizes the Mining Engineers of the Lake Superior District

Bradley Stoughton, secretary of the American Institute of Mining and Metallurgical Engineers, recently returned from his campaign among the mining men of the copper and iron districts of the Lake Superior region. Mr. Stoughton's efforts to consolidate the engineering men of those districts were quite successful.

At Duluth, Minn., he was the guest of honor at a subscription dinner held by the local members of the A. I. M. E. At the dinner there was discussion of the scheme to form a whole unit of the Institute for the Minnesota ranges, to be composed of four sub-units, viz., the Mesabi Range, the Vermillion Range, the Cuyuna Range, and the Duluth district. Each of these four sub-units later met separately and elected two representatives, who held a joint organization meeting on Dec. 4. At this joint meeting bylaws were adopted for the northern Minnesota section, and a list of nominations for officers was prepared. The annual meeting of the section will be held in February and officers elected. A separate section for Minneapolis-St. Paul is now forming, the committee on organization being W. R. Appleby, chairman, C. E. Juhlin, and Lloyd D. Cooper.

In the Upper Peninsula of Michigan Mr. Stoughton met the Institute members at Ironwood, Iron River, Iron Mountain, Ishpeming, and Houghton, and after full discussions at each point it was decided that each locality should appoint representatives, who should meet and organize into one or two local sections for the Peninsula. Sub-units will be formed at the different points, just as has been arranged for the northern Minnesota district.

Mr. Stoughton spent Nov. 28, 29, and 30, in Houghton, Mich., where he addressed a meeting of mining engineers at the Houghton Club. At this meeting the advisability of forming a Houghton or Copper Country chapter was discussed and an informal organization was established at Houghton under Professor Sperr.

During his stay Mr. Stoughton addressed the students at the Michigan College of Mines, emphasizing the many advantages offered to the student and alumnus by membership in a national organization of mining engineers such as the A. I. M. E. He also expressed the opinion that a large proportion of the mining engineers of the future would have to find employment in foreign countries, such as South America, Siberia, and Africa, inasmuch as it is quite certain that the larger mining enterprises of the future would be situated not in the United States but in these countries.

Freight Rates Affect Utah's Industries

Walter Fitch Declares Mines Could Not Survive Proposed Increases

The question of transportation, especially as regards the effect of increased freight rates on Utah industries, was discussed at the regular weekly luncheon of the Salt Lake Commercial Club on Nov. 25. Mention was made also of certain improvements, such as the increase in the number of cars available, obtained through the efforts of the Salt Lake City traffic bureau. These betterments were outlined by H. W. Prickett, of the bureau, who pointed out that it had been possible, through efforts at Washington, to secure a division of the territory just east of the Rocky Mountains, so that the increase in rates east of that line was 35 per cent and that west which includes Salt Lake City—25 per cent.

Walter Fitch, of the Chief Consolidated, Eureka, was the first speaker representing the mining industry. Mr. Fitch said that though all were of the opinion that the advance of 25 per cent in freight rates is reasonable, there were some spots that could not stand it, and that the mining industry was one of them. He held that the Public Utilities Commission of Utah had performed a wonderful service to the state when it declined to allow the railroads to advance their rates. Mr. Fitch spoke, among other things, of William G. McAdoo having made a gift of $1,000,000,000 to the railroad men, for which benevolence all must pay. C. F. Solomon, traffic manager of the J. G. McDonald Chocolate Co., also spoke. H. N. Byrne presided. An unusually large number of engineers and mining men were present.

Engineers' Club of Northern Minnesota Holds Annual Meeting

The public library at Hibbing, Minn., was the scene of the annual meeting of the Engineers' Club of Northern Minnesota on Nov. 26. The slate of officers for the coming year was presented by the nominations committee, as usual, but excited some discussion. The members in attendance finally rejected the committee's designations and the following new slate was prepared: For president, W. R. Van Slyke, Eveleth, or P. F. Chamberlain, Virginia; for vice-president, H. J. McInnis, Virginia, or Bert St. Vincent, Hibbing; for secretary-treasurer, Robert H. Ely, Eveleth, or M. W. Coleman, Virginia; for directors, Ed Loye or Walter Pohl, Hibbing; Howard McAdams, Eveleth, W. B. Bushnell or A. H. Krogdall, Virginia; H. H. Angst or A. Tancig, Chisholm. The balloting will be by mail.

New York Section, A. I. M. E., Devotes Evening to Gold and Silver

The New York section of the American Institute of Mining and Metallurgical Engineers held its regular meeting at the Machinery Club on the evening of Dec. 8. E. P. Mathewson presided. The speaker of the evening, George E. Roberts, vice-president of the National City Bank, made an interesting address on the bankers' view of the McFadden Bill. Mr. Roberts qualified for the subject by stating that he had received his mining education at Nome, where he had invested in a company started by Charles D. Lane. The company, known as the Wild Goose Mining & Trading Co., took out $1,000,000. Subsequently, although $8,000,000 was taken out, the accumulated debts overbalanced this sum, and Mr. Roberts sold his interest at a loss.

Mr. Roberts next discussed the American Bankers' Association report on the McFadden Bill. He stated that he was not entirely in sympathy with the bankers' view and considered it based on theoretical arguments which ignored a very serious and oppressive condition. In his opinion, the gold standard was essential, but could not be maintained without a gold-mining industry. As to the McFadden Bill, Mr. Roberts did not like it, but he did not see anything fundamentally wrong about it. He was not, however, prepared to say that he favored the bill.

C. W. Handy, secretary of Handy & Harmon, was next introduced, and presented an analysis of the silver market in particular, showing the cumulative causes which produced peak prices in 1920 as well as the conditions which operated to bring silver down to present prices.

George F. Kunz presented the jewelers' argument against the McFadden Bill. Briefly, his points were that the jewelry business is already heavily taxed, that it has troubles of its own, that rich people were buying platinum jewelry, and consequently the tax would be paid by poor people. "Things are coming down," he said, and if the gold miners would only have patience there would be no occasion for the excise tax.

C. W. Wheelock gave an historical summary of the gold and silver market. Mr. Chang, of the China Commercial Co., spoke about precious-metal hoarding in China. H. Emerson made some interesting comments on how silver first depreciated in price relative to gold. E. P. Mathewson adjourned the meeting after calling the attention of the members to the program of the next meeting, at which Robert Linton would present moving pictures of the operations of the North Butte Mining Co.

MEN YOU SHOULD KNOW ABOUT

O. R. Whitaker has returned to Denver from a trip to Mexico.

W. S. Bayley has completed a study of North Carolina iron ores.

Philip N. Moore, of the War Minerals Relief Board, was in New York City Dec. 8.

Pentecost Mitchell, vice-president of the Oliver Iron Mining Co., will spend the winter in California.

W. A. Harrod, mining engineer, of Golden, Col., examined mining property in southern Arizona recently.

C. W. Botsford, mining geologist, of Phoenix, Ariz., is in Magdalena, N. M., examining S. S. Lang's holdings there.

M. E. Merrill, mining engineer, is chief engineer for the Cia. Minera "La Constancia," Sierra Mojada, Coahuila, Mexico.

W. P. Chinn, general manager, and W. A. Rose, chief mining engineer, of Pickands-Mather & Co., are in Cleveland, Ohio.

P. K. Lucke, mining engineer, of Mexico City, who left for Europe on Oct. 19, writes that he has returned to Mexico City.

J. Morrow Campbell, mining geologist, left England for Burma late in November. He is on the staff of Steel Bros., Rangoon.

Raymond B. Ladoo, of the Bureau of Mines, and **Benjamin LeR. Miller,** of Lehigh University, Bethlehem, Pa., were in New York City on Dec. 10.

President **Frank P. Knight** and Vice-President **J. Judson Dean** of Iron Cap Copper Co., are in Globe, Ariz., to inspect late progress on the company's property.

Charles F. Williams, mining engineer, of Socorro, N. M., is at Batopilas, Chihuahua, Mexico, making a survey and report on the properties of the Batopilas Mining Co.

J. M. Callow, of Salt Lake City, Utah, president of General Engineering Co., consulting engineers, has returned to Salt Lake City after a month's visit at the New York City office of the company.

W. W. Shelby, mining engineer, recently at Charcas, S. L. P., Mexico, has been appointed assistant superintendent of the Cia. Minera "La Constancia," at Sierra Mojada, Coahuila, Mexico.

W. C. Teagle, president of the Standard Oil Co. of New Jersey, and a number of the officials of that company were in Houston, Tex., recently. They were making a tour of inspection of the oil fields.

W. J. Olcott, president, **John H. McLean,** general manager, and **John Uno Sebenius,** chief mining engineer, of the Oliver Iron Mining Co., inspected the company's properties on the Mesabi Range recently.

Mining Men Recently in New York City included H. C. E. Spence, of Mount Royal, N. M.; J. P. McCulloch, of Newville, Pa.; E. A. Holbrook, of U. S. Bureau of Mines, and Stanly A. Easton and R. S. Handy, both of Kellogg, Idaho.

Max Söhnlein, mining and metallurgical engineer, of Santiago de Chile, Chile, is spending a month visiting the Western States. He expects to return to South America from New York City about the end of December.

HERBERT M. WILSON

A party of Phelps Dodge officials, including **Walter Douglas,** president, **Arthur James,** vice-president, and **P. G. Beckett,** general manager, is visiting the corporation's mining and reduction plants in Mexico, New Mexico and Arizona.

T. H. Jenks, mining engineer, who has been in Colorado on professional work all summer, is in Denver, Col., completing work in Gilpin County. Before returning to Los Angeles, Cal., he will examine properties in New Mexico and Arizona.

Justice F. Grugan, mining engineer, who has been with the Suffern company, New York City, is on his way to the Transvaal to reorganize the affairs of an outcrop mine on the Rand, owned by the Langlaagte Proprietary company (the late Jacques Lebaudy).

F. A. Malins, formerly superintendent of El Cedro mill, Cia. Minera "Las Dos Estrellas," El Oro, Mexico, has been appointed consulting metallurgist to the company. **W. B. Rhodes** succeeds him as superintendent of El Cedro mill. **T. Skewes Saunders** is general manager of the company.

T. F. Cole, of New York; **Thomas Hoatson,** of Calumet, Mich.; **Walter Congdon,** of Duluth, Minn.; **George A. Newett,** of Ishpeming, Mich.; **William B. Mershon,** of Saginaw, Mich.; and **John C. Oliver,** of Pittsburgh, Pa., directors of the Calumet & Arizona Mining and the New Cornelia Copper companies, are visiting the holdings of the two companies in Arizona and New Mexico. They are accompanied by **John C. Greenway,** general manager, and **Ira B. Joralemon,** assistant general manager.

OBITUARY

Capt. Richard Webb, who represented the fee interests of M. H. Alworth on the Mesabi Range, died recently at his home in Hibbing, Minn. He opened the Cary mine, on the Gogebic Range, and was one of the pioneer mining men of the Lake Superior district. The remains were taken to Ironwood, Mich., for burial.

Christopher P. Russell, mining engineer, of Salt Lake City, a graduate of the University of Utah, was struck and fatally injured by a street car in that city on Nov. 24. He died without regaining consciousness on Nov. 25. Mr. Russell served abroad with the 115th Engineers and later with the army of occupation. He was a native of Salt Lake City and was only thirty-seven years old.

Herbert M. Wilson, the first president, later secretary, and one of the earliest proponents of the American Mine-Safety Association, died at Hartford, Conn., on Nov. 25, after a brief attack of pneumonia. Mr. Wilson was selected by Director C. D. Walcott as the chief assistant to J. A. Holmes when in 1907 the latter was appointed the first chief of the newly created technologic branch of the Geological Survey, which has since grown to the Bureau of Mines. Mr. Wilson will be remembered as the first engineer in charge of the Pittsburgh station of the Bureau; but yet more gratefully, and by a wider circle, for his great services and active interest in the mine-accident investigations whose headquarters were placed at Pittsburgh in 1910 by authority of Congress.

Mr. Wilson was born of English parents in Glasgow, Scotland, on Aug. 23, 1860, but came to the United States when a few months old and grew up in Plainfield, N. J., living there until he was graduated from the Columbia School of Mines in 1881. For two years he was in railway engineering in Mexico, but from 1882 to 1909 he served on the corps of the Geological Survey as topographer, irrigation engineer, geographer, and chief engineer of the technologic branch. From 1910 to 1914 he was engineer in charge of the Pittsburgh station, Bureau of Mines, resigning Government work to become director of the department of inspection and safety of the Associated Insurance Companies, Hartford, Conn. He subsequently became general manager of the companies.

THE MINING NEWS

The Mining News of ENGINEERING AND MINING JOURNAL is obtained exclusively from its own staff and correspondents, both in the United States and in foreign fields. If, under exceptional conditions, material emanating from other sources is published, due acknowledgment and credit will be accorded.

LEADING EVENTS

Minerals Separation Fails on Appeal in Miami Case

Court Affirms Ruling Dismissing Applications for Supplemental Bills—No Injunction Issued

The decision of the Circuit Court of Appeals, in its opinion which was rendered in Philadelphia on Dec. 9, affirms the rulings of dismissal of certain applications for supplemental bills, which were made by Minerals Separation, Ltd. for the purpose of finding the Miami Copper Co. in contempt of court for the use of its present flotation processes, and also sought to enjoin that company from the continued use of its processes.

The opinion of the Circuit Court of Appeals goes to considerable length in order "to quiet the controversy" as to several of its phases, and in its determination as to whether the trial judge had "rendered his judgment upon a wholly wrong comprehension of the facts or the law of the case," and whether, accordingly, he had abused his discretion in this respect. The only respect in which an appellate court will disturb such an order states that "to this end we have read and carefully studied the entire record." More than once the opinion states that the Judge writing the Circuit Court of Appeals' opinion would himself have ruled exactly as Judge Morris had done in the case of the orders which had been brought up upon appeal, the opinion of the Circuit Court of Appeals concluding as follows:

"Stress has been laid on a reference made by the learned trial judge to embarrassment because of his lack of familiarity with the facts of the case due to his coming into the case after it had gone to an accounting. To allay any unrest that might arise from this situation and to avoid the appearance of affirming the court's decree upon the negative quality of a finding that we discern no error in its order, we go farther and say, that, having made the law of the case we are presumed to know what it is, and that, applying the law to the facts, which, on the defendant's motion to dismiss are regarded most favorable to the plaintiffs, we would have made the same disposition of the case had we been sitting in the District Court when the application for a supplementary injunction was made." (See *Engineering and Mining Journal*, Aug. 14, 1920, p. 328, where the full text of Judge Morris' opinion, handed down on July 29, is given.)

WEEKLY RÉSUMÉ

The time in which the 1920 assessment work on mining claims may be performed will be extended to July 1, 1920, it is reported, if the House accepts the bill passed by the Senate as is anticipated. A permanent interdepartmental committee to study Alaskan problems has been appointed by the President with G. A. Parks as chairman. Tariff hearings on metal imports are to be held next month before the House Ways and Means Committee. Marion E. Rhodes, of Missouri, is the new chairman of the House Committee on Mines and Mining. J. H. Means is talked of for the position of chief engineer of the War Minerals Commission.

Both the Montana Legislature and that of Arizona, it is said, will be asked at the coming sessions to take steps in the direction of licensing engineers. Minerals Separation has failed on its appeal in the Miami case, the higher court affirming the ruling dismissing the application made for supplemental bills and refusing to enjoin the copper company. At Butte, Anaconda has closed the Leonard mine, which act will bring its copper production to 50 per cent of normal. In the Coeur d'Alenes Marsh Mines Consolidated has decided to continue its action against Hecla in spite of the latter's agreement with the Federal company. In the Black Hills, labor is reported to be more plentiful. The decrees quashing indictments in the Bisbee deportation cases have been sustained by the U. S. Supreme Court

Possibility of Wage Decrease Considered at Cobalt

The drop in the price of silver, combined with the difficulties caused by power shortage, has created a situation at Cobalt, Ont., which renders it impossible for some of the smaller producers to continue operations profitably unless mining costs can be reduced. This can be done only by a reduction in the rate of wages, which are now on the basis fixed when silver was bringing $1.30 per oz. In view of the general decrease of wages in other lines of industry, including lumbering, which has been the strongest competitor of the mining operators in the labor market, the question is receiving much attention. It is thought that when the men realize that a reduced rate of pay is the only alternative to a closing down of many mines for the winter they will accept a lower wage scale.

Washington B. Vanderlip Arrives in New York

Sketches His Career for "Engineering and Mining Journal"—Claims To Have Important Concessions

Washington Baker Vanderlip, whose reported success in obtaining important concessions in northeastern Siberia from the Soviet government for

WASHINGTON B. VANDERLIP

American interests has caused so much discussion on both sides of the water returned to this country on the S. S. "Aquitania," arriving in New York on Dec. 11. According to Mr. Vanderlip, his concessions embrace coal and oil lands and fishing rights. In speaking to the representative of *Engineering and Mining Journal* of his efforts to interest capital in the development of this Siberian oil field, he said that in 1903 he was introduced to John D. Archbold by his cousin Frank A. Vanderlip and endeavored to get him to finance an expedition for oil. Mr. Archbold, however, finally concluded that "there was too much oil in the world," and informed Mr. Vanderlip that they had no market then for their gasoline. This was at a time when the automobile was comparatively new.

About ten years ago, continued Mr. Vanderlip, he succeeded in interesting Ralph Arnold in the same matter, and Mr. Arnold had endeavored to finance the proposal in London and New York,

but failed. Later, said Mr. Vanderlip, Seeley W. Mudd and Philip Wiseman had tried to do the same thing during the war, but, Russia being in the throes of revolution, they could not make any progress. Mr. Vanderlip then suggested to Franklin D. Roosevelt, Assistant Secretary of the Navy, that if he would land him and members of the U. S. Geological Survey on the Siberian coast, he (Vanderlip) would show them the oil field, and made the proposition that the U. S. Government should obtain possession in order to forestall Japan. Mr. Roosevelt replied courteously that he was interested, but said that this was a mercantile proposition which the U. S. Government could not consider. Mr. Vanderlip then made the same proposal to the British Admiralty through the British Consul at San Diego, and received the usual polite acknowledgment of his letter—but no more. A few months ago Mr. Doheny brought the news to Los Angeles that he had been sought by an ex-officer of the British Navy to assist in financing the development of a wonderful oil field in northern Siberia. "We knew then," said Mr. Vanderlip, "that our secret was no longer a secret and that it was time to get busy. The result was the concessions that I have obtained."

Mr. Vanderlip was requested to give a brief biographical sketch of himself for the *Engineering and Mining Journal*. First, he said, he was not a university graduate. He had received his academic education at the Orchard Lake Military Academy, in Michigan, under Major-General Strong, and was preparing for West Point, but changed his mind and went to Arizona, where for a time he followed the cattle business. At the age of nineteen, he said, he found the Bright Angel Trail to the bottom of the Grand Canyon while prospecting for minerals, which happened to be his very first experience along mining lines. He then purchased a three-year course in mining engineering at the International Correspondence School at Scranton, Pa. This he followed with a year of study under Professor Falkenau, of San Francisco, who instructed him in mining geology, chemistry and allied subjects.

Following this, he worked as miner and assayer in various camps in California. Later, he met Leigh Hunt and went to Korea. From there he was given charge of exploration work in northeastern Siberia for a Russian-English company. His experiences at this time, said Mr. Vanderlip, are set forth in his book entitled "In Search of a Siberian Klondyke," which was published by the Century Company in 1903, but is now out of print. In 1900 he went to the Philippines as a partner of Mr. Hunt. Here he explored the islands, at times with the assistance of American troops, in the course of which work he discovered the placer deposits on the Paracale River, which were afterward worked for several years by several dredges and yielded many millions. From the Philippines, continued Mr. Vanderlip, he was engaged by Sir Ralph Moore through Arthur Pierce, a mining engineer of London, to explore Nigeria. He found nothing, but had the misfortune, he said, to pass on the opposite side of the range to that on which the famous Nigerian tin deposits were later found. Sir Ralph Moore, it seems, had obtained a piece of gold quartz the size of his thumb which had come down the Niger River with a load of oil nuts, and it was for the purpose of finding where this piece of quartz came from that he was selected to explore the interior, said Mr. Vanderlip. The latter traced the piece of quartz from tribe to tribe, at times passing through stretches where he was the first white man the natives had ever seen, until he located the ledges, but found them too low in grade to be commercially valuable. For this work Mr. Vanderlip said King Leopold offered him the then unheard of salary, all things considered, of $25,000 a year, together with full charge of the exploration of the Tanganyika Concessions. This, said Mr. Vanderlip, was prior to the amalgamation of the Thomas Ryan and Beatty interests with those of Leopold. On being examined, however, by a commission of the King, to determine his fitness for the work, the physicians stated that he was worn out physically and that if he returned to Africa he would die. Mr. Vanderlip said he then returned to America and went to Honduras for the New York & Honduras Rosario Mining Co. He contracted a tropical complaint at San Juancito, and was forced to return to this country, being carried to the coast on a litter.

On returning to New York Mr. Vanderlip met D. M. Riordan, then in charge of the mining department of the General Electric Co., who had known him since boyhood, and who engaged him as his assistant in the work of examining mining properties for the company. He was with the company for three years, and during this period was instructed to find deposits of rutile in this country. Knowing nothing about this mineral, he said, except that it was a mineral, he went to Washington, where Frank Hess and others of the U. S. Geological Survey informed him that no known veins of rutile existed on the American continent, but that small pieces of the mineral had been found from Georgia to Nova Scotia. He went South, and, beginning at the Tiffany mine, instituted a systematic search for rutile. By a process of elimination and with the aid of Mr. Hess and Dr. Watson he settled on Nelson County, Va., as the most likely place for operation. He prospected Nelson County thoroughly, panning every stream, and finally found the only two veins of rutile known to exist in the United States.

When the General Electric Co. ceased its mining operations Mr. Vanderlip was engaged by F. Augustus Heinze to examine mining and oil properties in Alaska. After leaving Alaska he went to Oakland, Cal., from which place he made various trips from time to time through the West on examination work. He then went to Los Angeles, he stated, on account of his wife's health, and has remained there ever since, making reports from time to time through the West and in Mexico.

Mr. Vanderlip stated that he was at one time a member of the A. I. M. E. and was made a fellow of the Royal Geographical Society for his work in Siberia and elsewhere.

His recent trip to Siberia, from which he has just returned, was started on July 10 this year, and it is just about thirty days since he left that country to return to the United States. Long interviews with Mr. Vanderlip in regard to his concessions were published in all the New York Sunday papers of Dec. 12. In these Mr. Vanderlip said he had been more or less correctly quoted and could add nothing to what he had already said.

The list of the capitalists associated with him is given in one of these interviews as follows: Harry Chandler, proprietor of the *Los Angeles Times*; O. F. Brandt, vice-president Title Trust Co.; W. G. Stewart, president Union Oil Co., Los Angeles; E. L. Whittier, oil operator; J. F. Sartori, president Security and Savings Bank Co.; T. E. Gibbon, retired, capitalist and attorney; H. Jevne, president Jevne company, wholesale grocers; T. W. Braun, president Braun company, wholesale druggists; Mr. Helman, vice-president Helman Banks; Lee Phillips, vice-president Pacific Mutual Life Insurance Co.; and E Fishburn, president Merchants' National Bank.

Bisbee Cases Dismissed

Supreme Court Sustains Federal Court Decrees

The Supreme Court on Dec. 13 sustained Federal Court decrees quashing indictments brought against twenty-five defendants who were charged with participating in the deportation of 221 alleged undesirables from Bisbee, Ariz., into New Mexico in July, 1917. Chief Justice White rendered the opinion of the court. The lower court in dismissing the indictments held in effect that the proceedings interfered with the state police powers, and that although the indictments sufficiently charged conspiracy to deport forcibly and against their will citizens of Arizona the Federal statute did not apply.

Price of Mine Explosives Cut in Cœur d'Alenes

Effective Nov. 29, the Dupont Powder Co., which has practically a monopoly of the powder business in the Cœur d'Alene district, made a cut of 50c per 100 lb. in the price of 40 per cent gelatin and 17 per cent stumping powder, or $10 per ton. This makes the local price of 40 per cent powder $25.15 per 100 lb. in ton lots, and $25.65 per 100 lb. in less than ton lots. The cut does not apply to 60 per cent gelatin, the local price of which remains $28.65 per 100 lb. in ton lots, and $29.15 per 100 lb. in less than ton lots.

Mexico Would Avert Shut Down of Mines

Presidential Decree Reducing Freight Rates and Taxes and Removing Import Restrictions Expected

"With approximately one-third of the republic's 3,500 silver and copper mines closed down because of the low market price of those metals," says an Associated Press dispatch from Mexico City dated Dec. 12, "the Government this week will take emergency measures to prevent complete paralysis of the industry with the consequent throwing out of work of more than 500,000 laborers, according to a Treasury Department statement.

"The action is expected to take the form of a Presidential decree reducing freight rates and Federal taxes and annulling laws restricting the importation of materials such as steel, powder, acids and tools.

"During the past week, President Obregon has conferred with the Governors of Guanajuato, Zacatecas and Durango and has met delegations from the States of Hidalgo, Chihuahua and Coahuila, all of whom described the situation as grave, with the possibility that mine owners would be forced to close down all their properties.

Governor Madrazo of the State of Guanajuato declared here today that silver and copper mines in his state pay 700,000 pesos in taxes annually, and expend more than 4,000,000 pesos annually, and if forced to suspend operations the heads of 5,000 families would be without work.

"Representatives of large mining interests have asserted that the present market price of silver of 58 cents per troy ounce renders operation of the mines impossible except at a loss of approximately 22 cents on each ounce, although Federal aid in the form of reduction of freight rates and taxes would make possible at least partial operation until the market ascends.

"A delegation of miners from Pachuca, the most important mining city in Mexico, arrived in Mexico City last night bearing a manifesto which will be presented to President Obregon today, asking the Government to take over all the mines and operate them.

"Reflecting on the delicate situation is the refusal of Mexico City bankers yesterday to accept silver deposits of more than 20 pesos. The Government is known to be coining only small amounts of silver."

Indians' Revenue from Zinc Land Greater in 1920

Greatly increased revenue from lead and zinc mining in the Joplin-Miami district for Indian owners of land is indicated in the annual report of the board of Indian commissioners. Only forty-one Indians have received the great bulk of this revenue, the figures for which are given as follows: 1917, $84,772.03; 1918, $384,679.41; 1919, $496,523.75; and 1920 (5 months only), $379,473.53.

Marsh Mines To Continue Apex Litigation Against Hecla

Refuses $100,000 Offered by Federal Company for Surrender of Lease—Stockholders Assessed

The directors of Marsh Mines Consolidated, operating in the Cœur d'Alene district, Idaho, have formally announced through a letter to stockholders that preparation is being made to continue the litigation against the Hecla Mining Co. to establish the claim of the Marsh to the "east orebody" of the Hecla. Marsh has a lease on the Russell and Mono Fraction Claims secured from the Federal Mining & Smelting Co., and which contain the alleged apex of the "east vein." The Federal company instituted suit against Hecla, but before the case came to trial a settlement was made out of court through which Hecla purchased the Russell and Mono claims and secured release from all claim for trespass, details of which were published in *Engineering and Mining Journal* in the issue of Nov. 27.

The settlement was made subject to the Marsh lease, which runs until July, 1926, the Federal agreeing to endeavor to make a settlement with the Marsh. In pursuance of this agreement the Federal company offered Marsh $100,000 for the surrender of its lease. This offer was promptly declined, following which the directors say action was immediately taken to continue the litigation to a conclusion. The directors say that it will be necessary to continue the Russell winze, now down 375 ft., to a connection with the Hecla workings, an estimated distance of 680 ft. This, with the extension of the Russell tunnel, from which the winze is sunk, 700 ft. to the east end line, is stated to be the only development work of importance that will have to be done before proceeding to trial. The directors have levied an assessment of 1c. per share, which they estimate will bring $20,000 into the treasury, and this, with $4,500 on hand, is expected to be sufficient to meet all preliminary requirements of the litigation. In this connection the directors say that "plans are now being considered which may result in securing such substantial financial assistance as to make it possible to take the major part of the burden off the stockholders."

Watchman Charged With Burning Oklahoma Concentrator

G. W. Hill was arrested on Dec. in the Joplin-Miami district on a charge of arson and two other men were held on a charge of conspiracy by Deputy Fire Marshal Bert Foster, of Oklahoma City. The charges grew out of the burning of the Georgia Mining Co.'s concentrator on Nov. 15. It burned early in the morning after having been on fire twice the day before. Hill was the night watchman at the property. Preliminary hearing has been set for Dec. 21 at Miami, Okla.

Greene-Cananea produced 3,350,000 lb. copper in November.

Bill for Licensing Engineers in Arizona To Come Before Next Legislature

Before the approaching session of the Arizona Legislature is to be placed a bill, prepared by a committee of members of the southwestern district of the American Association of Engineers, calling for examination and investigation of all applicants who may apply for permission to practice in the state as mining or technical engineers or geologists, assayers, surveyors or architects. Creation of a board of engineering examiners, appointed by the Governor, to serve without pay, is suggested. This board's work is to be supported by an initial registration fee of $25 and by renewal fees of $5 annually. Fines are to be provided for failure to observe the provisions of the act.

Propose Licensing of Engineers in Montana

Mining engineers of Montana are taking steps to preserve mining engineer positions for mining engineers. The State Legislature, which convenes in January, will be asked to impose a license, it is said, upon such positions in order to lift them out of the category of the ordinary job, according to sentiment heard in Butte mine engineering circles.

Recent Production Reports

Calumet & Arizona produced 3,486,000 lb. coppr in November, of which 2,236,000 was available for the company.

United Verde Extension produced 2,642,812 lb. copper in November against 3,864,756 in October.

North Butte produced 1,312,029 lb. copper in November compared with 1,390,829 in October. The November silver output was 52,211 oz. and that of gold 76 oz.

Shipments of specified Alaskan products to the United States in November as reported by the Department of Commerce were as follows: Copper ore, matte, etc., 16,720 gross tons (copper contents 12,802,696 lb.); tin ore and concentrates, 26,052 lb.; platinum, 28 oz.; palladium, 103 oz.; gold ore and base bullion, $250,230; gold bullion, 42,737 oz.; silver ore and base bullion, $137,425.

New Cornelia produced 2,670,000 lb. of copper (cathodes) in November.

Inspiration produced 5,350,000 lb. copper in November.

United Verde Extension produced 2,642,812 lb. copper in November.

Utah Copper's output for November was 9,120,000 lb., as against 8,000,000 in October.

Chino Copper produced in November 4,000,000 lb. as compared with 3,933,435 in October.

Ray Consolidated's November output was 3,975,000 lb., compared with 3,990,800 in October.

Nevada Consolidated produced 3,950,000 lb. copper in November, compared with 3,850,000 in October.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Six Months Grace Probable for 1920 Assessment Work

Senate Committee Against Further Suspension But Favors Extension of Time

The opening of Congress saw the introduction of bills by a large number of Representatives and by several Senators, looking to the suspension of assessment work for the year 1920.

There is considerable opposition to these resolutions, on the ground that many have gone ahead and have done their 1920 assessment work and that the requirement of this assessment work would make for more activities in mining regions.

On the other hand, the main argument is that the Government should relieve the mining industry of this burden at a time when the industry is especially unable to bear it.

The time in which the 1920 assessment work on mining claims may be performed will be extended to July 1, 1921, if the House of Representatives accepts a bill so providing that has been passed by the Senate. It is expected that the House will accept the bill promptly. Failure to do so would result in no legislation and would require all assessment work to be completed by the end of this month. The text of the bill as passed by the Senate is as follows:

"That the period within which work may be performed or improvements made for the year 1920 upon mining claims as required under Section 2,324 of the Revised Statutes of the United States is hereby extended to and including the 1st day of July, 1921, so that work done or improvements made upon any mining claim in the United States or Alaska on or before July 1, 1921, shall have the same effect as if the same had been performed within the calendar year of 1920. Provided that this act shall not in any way change or modify the requirements of existing laws as to the work to be done or improvements made upon mining claims for the year 1921."

The Committee on Mines and Mining of the House reported favorably a bill which would relieve claim owners of the necessity of doing this assessment work for 1920, but the Senate Committee does not favor the suspension of the work for another year and decided on the extension of the time in which the work may be done, as stated above.

An amendment to the assessment work statute has been introduced by Senator Smoot, of Utah, which would change the assessment work year to the fiscal, rather than the calendar, year. This would include Alaska.

Only 97 War Mineral Claims Remain

Awards totaling $75,631.56 were recommended during the week ended Dec. 4, by the War Minerals Relief Commission. The awards were as follows (the name of the claimant, the mineral, the amount recommended and its percentage relationship to the amount claimed are shown): Kershaw Mining Co., pyrites, $57,011.07, 50 per cent; Sig. Salomon, chrome, $206.28, 15 per cent; F. J. Abbott, tungsten, $2,615.17, 20 per cent; Farmer & Walsh, chrome, $2,770.82, 53 per cent; L. M. Mining Association, pyrites, $9,606.98, 40 per cent; Colorado Manganese Mining Co., manganese, $2,989.95, 80 per cent.

In addition, revised action was taken in three claims. In the case of Charles M. Tucker the full amount of his claim, $770, was allowed. In the claim of F. R. & E. E. Smith an award of $1,944 was recommended. The claim previously had been disallowed. In the claim of Ott and Thompson an additional $400.48 was allowed. Previously the award had been for $280.

Only ninety-seven claims remain to be acted upon.

Tariff Hearings Scheduled for Next Month

Tariff revision on metal imports will be the subject of hearings before the Committee on Ways and Means of the House of Representatives on Jan. 12, 13 and 14. The hearings on chemicals will be had on Jan. 6, 7 and 8, and on earths on Jan. 10 and 11. The free list is to be taken up at hearings on Feb. 11, 12 and 14.

It is not the intention to attempt the general revision of the tariff at this session of Congress. Advantage is to be taken of this time, however, to complete the hearings, so that a bill can be framed and introduced at the extra session, which is expected to be called before April 1.

Heads of Experiment Stations To Meet at Berkeley

Superintendents of the five western experiment stations of the U. S. Bureau of Mines have been instructed by Dorsey A. Lyon, the supervisor of stations, to report at Berkeley, Cal., Jan. 24, for a two-day conference on matters pertaining to future work and its co-ordination. The conference will also be attended by the deans of the five schools which are co-operating in the conduct of the experiment stations of the Bureau.

George A. Parks Heads Permanent Alaska Committee

Chairman Is Representative of Interior Department—Body To Enter Upon Its Work Immediately

As a further step toward providing more intelligent government for Alaska, and in an effort to stimulate further its industries, the President has given special authority to make permanent the interdepartmental committee which will deal with Alaskan problems. The committee is to be headed by George A. Parks, a mining engineer who has resided for thirteen years in Alaska, and who has made a special study throughout that time of the questions which will confront the interdepartmental committee. The President, in his letter to the Secretary of the Interior, said:

"In view of the work of the different departments in dealing with Alaskan affairs and the wisdom of co-ordination, I approve the formation of an interdepartmental committee to consist of a representative of the War, the Post Office, the Navy, the Interior, Agriculture, and Commerce departments; the Shipping Board; and the Federal Power Commission; the Governor of Alaska to be ex-officio a member.

"Each of the departments, the Shipping Board, and the Power Commission, is to appoint one member. The function of the committee is to co-ordinate and bring together facts and suggestions touching matters affecting Alaska, and to make recommendations for definite action to the department charged with the particular function, to the end that duplication may be prevented and efficiency secured.

"While the work of the committee is advisory, it is believed that by bringing together all available information and providing for an exchange of views by representatives of the different departments, much of the difficulties now experienced in dealing with Alaskan affairs will be obviated, and speedy and intelligent co-operative action secured.

"It is important that the committee have permanency. It will be well, therefore, that the representative of the Interior Department be the chairman, and that office space for the committee be there provided."

The personnel of the committee, in addition to Chairman Parks, is as follows: War Department, Maj. Clarence O. Sherrill, Corps of Engineers; Post Office Department, James B. Corridon, superintendent of railway adjustments; Navy Department, Capt. W. C. Cole, U. S. N.; Department of Agriculture, E. A. Sherman, associate forester; Department of Commerce, Dr. Hugh M.

Smith, Commissioner of Fisheries; Shipping Board, H. Y. Saint, staff assistant, office of director of operations; Federal Power Commission, O. C. Merrill, executive secretary, Federal Power Commission; Governor of Alaska, Thomas Riggs, Jr., member ex officio.

The committee will take up its work immediately, and among other things will give consideration to the recommendations made by the Alaska Advisory Committee in its report of June 11, 1920, to Secretary Payne. This committee consisted of representatives of the Department of Agriculture, Post Office Department, U. S. Shipping Board, and the Interior Department. Its report dealt with many matters affecting the growth and development of industries in Alaska, including mining, fisheries, farming, stock raising, timber, reindeer, transportation, road building, water power, etc. The organization of the present interdepartmental committee is in accordance with one of the recommendations of this Advisory Committee.

Dome Mill Capacity Reduced to 600 Tons—Power Shortage and Drop in Silver Cause Further Curtailment

Porcupine—The Hollinger has declared a dividend of 1 per cent, payable Dec. 31, to shareholders of record Dec. 15. This makes a total of $2,214,000 for the year and $13,360,000 to date. Large supplies of coal are being rushed to the property to permit of the auxiliary steam plant being used to offset the shortage in hydro-electric power. The year's production is expected to reach a total of $6,000,000.

On account of breakdowns to both the underground and mill crushers, the Dome mill capacity has been reduced to about 600 tons per day. It is understood, however, that the grade is very satisfactory, and the production for the year should be approximately $2,000,000. The power shortage is still acute, and may cause further curtailment in milling, but should not interfere with underground operations.

Cobalt—A considerable decline in the price of silver has caused further curtailment of operations in the Cobalt district.

The Mining Corporation has stopped treating tailings in the Buffalo mill, and operations in other departments will be still further curtailed. It is understood that the Dominion Reduction will close its mill altogether. The operation of the high-grade plant for the treatment of flotation concentrates will be continued until toward the end of January, by which time all the concentrates on hand at the end of the clean-up and those concentrates from outside customers will be put through.

The Kerr Lake, which sends all its ore to the Dominion Reduction Co. plant, will also close. Kerr Lake is going ahead with its Utah property, and is now treating 100 tons of silver-lead ore a day. According to an official statement made last April, 87,000 tons were blocked out, averaging 18 oz. in silver and 80c. gold per ton. By the time the purchase price is completed, the property will represent an investment of about $500,000.

La Rose has stopped work at its Violet property, and the underground operations at the Bailey mine have been suspended.

The Ontario Department of Mines has just issued a report showing the output of the mines and smelters for the first nine months of 1920. The report shows a total production of $35,920,418, which is an increase of $6,000,000, as compared with the corresponding period of 1919. Practically all of the different metals covered by the report showed substantial increases, but the shortage of power and the low price for silver, as well as the curtailment of operations in the nickel field, will show a loss for the final three months as compared with the last three months of 1919. The report states, however, that on account of the drop in the price of commodities and the surplus of labor which now exists, this should prove specially advantageous to the gold-mining industry.

British Columbia

Trail—Shipments received at the Consolidated M. & S. Co.'s smelter during the week ended Nov. 30 totaled 12,502 tons. Shippers were as follows:

Mine	Location	Net Tons
Bluebell	Riondel	203
Canada Copper	Allenby	80
Horn Silver	Chopaka	53
Josie	Rossland	281
Knob Hill	Republic	56
North Star	Kimberley	173
Silver Cup	Gerrard	14
Velvet	Velvet	28
Company Mines		11,614

CALIFORNIA

Allison Ranch Starting New Exploratory Crosscut—Strike at Finnegan Mine Reported

Grass Valley—A new crosscut has been started in the Allison Ranch mine. This starts from the 600 level and will extend southwest into the Crocsus and Keystone claims, where a system of ledges and pay-shoots is believed to exist. The crosscut from the 1,200 level into Hartery ground has so far failed to develop pay-streaks, although a strong ledge has been discovered. A 400-ft. raise has been driven, and drifting both ways on the ledge is now in progress.

The tunnel of the Placer Gold-Lead mine, near North Bloomfield, is now in approximately 170 ft., and it is expected that the gravel channel rim will be cut within 150 to 200 ft. more. Two shifts are employed, and 30 ft. advance is being made per week.

J. Wesley Gebb, state mine inspector, has been devoting considerable attention to the new and reopened drift gravel mines of the Grass Valley district. In some of these properties bad ground has been encountered and the greatest care is necessary to avert accidents.

Angels Camp—There is a gravel mining boom developing and considering the number of undeveloped channels and gravel mines it has a chance of rivaling that of quartz. Since the reopening of the Victor, the Slab Ranch and the Sanguinetti gravel mines and the prospecting in the Rough Diamond gravel mine, much interest is being taken in working the old channels.

The discovery of a rich body of ore in the Finnegan mine at Carson Hill, south of Angels Camp, is considered encouraging. Several of the officials came from San Francisco in response to a telegram notifying them of the strike.

Knights Ferry—The Yankee Hill gold dredge, which started Nov. 19, is now running at capacity. At present it is situated about the middle of the Dan Mann and Sol Morris mining claims along the river. It will work two miles up stream from the starting point and two miles down stream, in accordance with present plans. Fifteen men are employed.

NEVADA

Reduced Railroad Rates Benefit Ely and Pioche

Ely—On Dec. 3 a new rate of $3 per ton became effective on all ore of a value not exceeding $15 per ton and consigned to Utah Smelting plants, adjacent to Salt Lake City from East Ely. This rate is a reduction of approximately $1.25 per ton on the tariff recently instituted. The new rate will encourage a number of the low grade shippers. According to S. B. Elbert, who is in charge of the mining operations at Ward, 50 tons of ore will be shipped daily to the Utah smelters. The Jennie A mine in the Hamilton section near Ely is shipping ore which is being hauled to Kimberley at a total cost of $19 per ton.

The Nevada Consolidated operating at about one-half normal capacity during the quarter ending Sept. 30, 1920, milled 671,063 dry tons as against 691,095 dry tons concentrated in the preceding quarter. The average copper assay of the ore milled was 1.5 per cent as compared with an average of 1.47 per cent during the preceding quarter. Cost of production was 16.04c. per lb. of copper.

Pioche—Ore shipments for the week ended Dec. 2 showed a large increase over the recent average, being 3,495 tons. Shippers were as follows: Prince Con., 1,865 tons; Virginia Louise, 950; Combined Metals, 305; Bristol Silver mines, 240; Black Metals, 50; Hamburg mines, 45, and Fairview Lease, 40.

Divide—The management of the Tonopah Divide has reported that its southeast drift on the 800 level is in $35 ore for the last 80 ft. and that the face is in ore of the same grade with only one wall exposed. The ore is harder and more siliceous than on the upper levels and shows sulphides.

NEW MEXICO

Great Eagle Fluorspar Co. Incorporated

Lordsburg—The total shipments of crude ore from this district for November amounted to 91 carloads, 4,445 tons, of an approximate value of $66,675.

The Great Eagle Fluorspar Co. has been incorporated with a capital of $100,000 by Merton W. Wentworth and Cyrus G. Goodrich, of Battle Creek, Mich., and Alford Roos and R. S. Spann, of Lordsburg, N. M. A large warehouse with ore platform, bins and track scale will be built at once.

Steins Pass—McGee Bros. have been carrying on development work quietly for the last three years upon their zinc property three miles south of town. They now have enough ore blocked out to justify a 100-ton mill, which will be built at an early date. A steam power plant of 300 hp. will also be put in. Water will be developed in the Animas Valley and pumped to the mill, a distance of 2½ miles, with a head of 400 ft. The orebodies opened up are large, and about 20,000 tons of lead-silver-zinc ore is in sight. The main shaft is down 300 feet and core drilling has been done to a depth of 600 ft., showing heavy lead sulphides.

COLORADO

Portland No. 2 Shaft Now Deepest in District

Cripple Creek—Shaft No. 2 of the Portland Gold Mining Co. has reached a depth of 2,450 ft., and is now the deepest shaft in the district. The collar of the shaft is at an altitude of 10,244 ft., and the new shaft station is being cut at an elevation of 7,794 ft. As soon as this is completed, development will be started on this level to determine the downward continuation of the big oreshoot opened on the 21st and 23d levels. The hoist from the Granite mine, which was recently purchased by the Portland company, will be installed at Shaft No. 2. A new screening plant is being installed to reduce the amount of hand labor on the surface.

MONTANA

Anaconda Closes Leonard Mine—Barnes-King Operating Shannon Only

Butte—The closing of the Leonard mine of the Anaconda Copper Mining Co. last week, rendering 400 men idle serves further to emphasize the depression into which the copper market has fallen. With the Leonard down, Anaconda's production is reduced to about 40 per cent of normal. Officials of the Anaconda declined to discuss the probability of a further reduction in output or whether or not wages would be cut, but from the pessimism prevailing in producing circles the belief obtains there will be a wage reduction from $5.75 to $4.75. Development work in such properties as are being operated is being conducted practically on a normal basis. Fireproofing has been halted until market conditions improve and no more money is being expended other than that which is necessary.

With the surplus of labor rapidly increasing in the Butte district, applications for silver leases are increasing, the price of the metal under the Pittman Act offering to the miner about the only hope at the moment. Efficiency of the miners still at work is showing a marked increase and for the first time in years there is a total absence of any radical talk, with no mention whatever of the I. W. W. being heard.

The directors of the Barnes-King have decided to make no effort to reopen the Piegan-Gloster property until improvement in the gold situation is in evidence. But one mine is now being operated by the company, the Shannon in the Marysville district. The North Moccasin is being worked by lessees.

WASHINGTON

Mineral Creek Copper Co. Shuts Down—American Refractories Co. Increasing Magnesite Shipments

Seattle—Unless the present sagging copper market takes a turn for the better several copper properties now operating in Washington will be forced to shut down, it is stated. It costs the small producers of Washington an average of about 15c. a pound to produce copper and several of them are now losing money. It is expected that the Sunset Copper Co. operating near Index will suspend operations in a short time. Their mine and mill are in excellent physical shape.

Cle Elum—The Mineral Creek Copper Co., operating a property at the head of Little Lake Kachess, has closed down for the winter season but expects to resume operations early in the summer if market conditions are then favorable. During the past summer they erected a small mill with a Forrester rod mill, Wilfley tables and Ziegler flotation cells. The property is developed with 2,000 ft. of tunnels and a large mineralized zone of chalcopyrite replacing granite along shatter planes has been developed.

Valley—The American Refractories Co. of Pittsburgh, which are operating the Double Eagle magnesite deposit, are increasing their shipments of calcined magnesite. The 14-mile truck road between the quarries and Valley is being repaired and the number of auto trucks increased to a three-shift basis.

SOUTH DAKOTA

Labor Becoming More Plentiful in Black Hills District—Golden Crest Property Sold

Deadwood—James Hardin, of Deadwood, and associates in New York City have purchased the Golden Crest property in the Two Bit district, and work has already started to place the mine in shape for operation. The property is equipped with a complete treatment plant as well as all machinery for mine development. This will be added to and overhauled and it is expected that active work will be started early next year. The new management states that all work will be pushed, that arrangements for placing the treatment plant in commission will also be completed early and that production of bullion will be made in 1921. The property has been idle for a number of years, but during the years of operation a good grade of milling ore was developed and a large amount of underground work completed. This mine work together with the equipment has cost to date over $300,000. James Hardin, of Deadwood, will have charge of the work and it is expected that an active producer will be added to the list of Black Hills mines.

Deadwood—New pumps and equipment have arrived at the property of the Cutting company, and are being installed to handle the large amount of water that necessitated the suspension of work in October. The company is making the necessary installations and active work will again be started soon after the first of the year.

Lead—The Monroe mill of the Homestake company at Terraville has been placed in commission and a total of 920 stamps are now dropping. There remain 100 stamps that are as yet idle, but these will be used early in 1921. Labor is becoming more plentiful and it is expected that a normal production will be reached early in the next year. Good progress is being made with improvements, and the Ellison hoist, which is being changed from steam to electric power, will be ready for use during the coming summer. The cages in this shaft will be replaced by skips. Most of the equipment required for the change has been received.

JOPLIN-MIAMI DISTRICT

Oklahoma-Kansas-Missouri

McCullough and Associates Sue for Loss Through Trespass on Fish Land Lease

Miami, Okla.—Suit was filed here Dec. 8 by W. P. McCullough, B. E. Beth, and Thomas F. Phillips for recovery of damages in the amount of $155,000, which they claim from Wesley M. Smith, the Quebec Mining Co., C. H. Plumb, E. R. McClelland, J. S. Mabon, the Tri-state Mining Co., and others. The plaintiffs allege that the McCullough lease to certain portions of the Fish estate in the Picher mining field is the legal lease and that the lease of Wesley M. Smith is not legal, and on this ground they ask the return to them of $125,000 paid in royalties by the Quebec Mining Co., and $30,000 paid as a bonus. They also ask $100,000 damages for loss through similar trespass on other sections of the Fish land lease, which they assert rightfully belongs to McCullough. The suit is ancillary to another tried in the Federal Court for the eastern district of Oklahoma in which McCullough's claims were upheld.

Joplin—It is rumored here that the Metals Extraction Corporation of America, which has been operating a zinc-oxide plant, employing a new process at Galena, Kan., is about to be absorbed by large eastern interests.

MINNESOTA

Mesabi Range

McKinney's Stevenson Mine Down—Rogers Brown Ore Co. To Have Fire-Proof Shaft

Virginia—The new shaft being sunk by Coates & Tweed Co. at the Julia mine is rapidly nearing completion. The company expects to be able to stock ore from it this winter.

Hibbing—Seven state owned properties report for the week ended Nov. 27 a total shipment of 72,485 tons.

The Stevenson mine of the McKinney Steel Co. has closed down and indications are that it may not operate next shipping season. The company has offered to send its several hundred employees to its coal mines in Kentucky.

The Rogers Brown Ore Co. has decided to put in steel sets instead of wood or concrete for its new shaft timbers. The shaft will be approximately 335 ft. deep and the only wood used will be the skip guides, which will make the shaft practically fire-proof. There will be five compartments with inside dimensions of 17 ft. 2 in. by 10 ft. The compartments will be as follows: Cage, 5 ft. 8 in. by 10 ft.; two skip compartments each 5 ft. by 6 ft.; and a ladder and pipe compartment 5 ft. by 3 ft. 7 in. respectively. The wall and end plates will be of 18-inch I-beams and the dividers will be 9-in. I-beams. The studdles will be 3½ by 3½ by ⅜-in. angle irons. There will be three sets of bearers besides the surface ones, spaced approximately 85 ft. apart and made of 12-in. I-beams 20 ft. long. The surface bearers will be of 18-in. I-beams 27 ft. long. The shaft lining will consist of reinforced concrete slabs for which the American Bridge Co. has designed special forms to conform with their design.

Vermillion Range

Ely—The Chandler Mining Co., operating the North Chandler and South Chandler mines, shipped a total of 133,000 tons of ore this season. The South Chandler reports 58,000 tons and the North Chandler 75,000 tons. It is reported that the mines will curtail their operations this winter and only work at one-half normal.

ALABAMA

Republic Company's Spalding Mines Shut Down—Production of Pig Held Back

Birmingham—Brown ore development in the next twelve months in Alabama promises to be on a big scale. Investigations are being made by representatives of financial interests of the Middle West and elsewhere that hold out great promise. Brown ore fields in the vicinity of Russellville, around Goethite and on the Alabama-Tennessee state line are receiving attention. The Republic Iron & Steel Co. is preparing to build a washery in its brown ore field around Goethite, Bibb County.

The Republic company has shut down its Spalding red ore mines, and will make no effort for further output there until the pig iron market is better and a large accumulation of ore has been consumed. The Republic company has only one out of three of the blast furnaces in this district in operation and the needs of ore are being supplied from the Raimund red ore mines and the brown ore mines. Dave McDaniels, who has been superintendent at the Spalding mines, has been transferred to the Raimund mines and W. H. Jobe, superintendent there, who came to Alabama from the Wisconsin-Michigan fields a few years ago, will take a position with another company.

The site has been purchased and the Federal Government will shortly begin construction of a coal-storage plant at Mobile, to handle coal being shipped from the Birmingham district down the Warrior River for export and to coal ships touching at the port of Mobile. The plant will have a compartment that will permit the handling of ore, regular shipments of manganese ores from Brazil and other countries for use in the Birmingham district being promised. The river transportation facilities of the Government are now handling a shipment of 6,500 tons of manganese ore from Brazil and one furnace of the Tennessee Coal, Iron & RR. Co. is on ferromanganese iron altogether. It is expected that the storage plant will be completed by May 1 next and then the imported ore can be brought with greater frequency and, awaiting barges to handle it on the Warrior River, can be stored at Mobile.

Chronology of Mining November, 1920

Nov. 1.—Interstate Commerce Commission opened hearings in Salt Lake City, Utah, concerning increases in intrastate freight rates on coal and ore. —Copper Queen at Bisbee, Ariz., laid off 350 steam-shovel men on Sacramento Hill.—Temiskaming Mine Managers' Association restored flat-rate wage scale.—United Verde Copper Co. reduced its force by 30 per cent.

Nov. 2.—Walker Copper Co., Quincy, Cal., laid off most of its miners.

Nov. 3.—Officials of British coal miners declare off the the general British coal strike.

Nov. 4.—New Idria Quicksilver mine, Cal., closed its larger plant.—Judge S. L. Pattee, Bisbee, Ariz., dismissed the 206 deportation cases pending due for trial Nov. 8.

Nov. 6.—Fire found burning in magazine on 300-ft. level of Fairview Fluorspar & Lead Co.'s mine.

Nov. 8.—Tom Read Gold vs. United Eastern apex suit came to trial before Mohave County, Ariz., superior court.

Nov. 10.—U. S. Court of Claims dismissed claim by American Smelting & Refining Co. against United States for additional payment of $512,515 on 33,069 tons copper taken at 23½c. per lb. during war.—Quincy Mining Co., Hancock, Mich., started up new 6,000, hp. Nordberg hoist.

Nov. 11.—American Engineering Standards Committee met in New York City.

Nov. 12.—Apex suit between Federal Mining & Smelting Co. and the Hecla Mining Co. officially announced to have been settled.

Nov. 13.—A circuit of mines in Grass Valley, Cal., district was served by airplane carrying supplies.

Nov. 15.—American Mining Congress' 23d annual session opened at Denver, Col., closing on Nov. 19.

Nov. 16.—Calumet & Hecla reduced all wages and salaries 15 per cent, closed down Osceola branch, and reduced forces at other mines; 1,500 men affected.

Nov. 17.—Nenzel Crown Point Mining Co.'s holdings sold at public auction.

Nov. 18.—American Metal Co.'s coal mines in Monclova district, Coahuila, Mexico, seized by striking Mexican coal miners; Americans warned out of the district.

Nov. 19.—American Engineering Council of Federated American Engineering Societies organized at Washington, D. C.; Herbert Hoover elected president of F. A. E. S.

Nov. 26.—Suit against J. F. Robinson and Commerce Mining & Royalty Co. for $200,000 damages and recession of land abruptly thrown out of court by Judge E. F. Laster, Miami, Okla.

Nov. 30.—Last ore carrier cleared from the Missabe docks at Duluth and Superior.

THE MARKET REPORT

Daily Prices of Metals

Dec	Copper N Y net refinery* Electrolytic	Tin 99 Per Cent	Tin Straits	Lead N Y	Lead St L	Zinc St. L
9	13.50@13.75	32.50	35.75@36.00	4.90@5.00	4.75@5.00	6.10@6 25
10	13.50@13.75	31.50	34.50@35.00	4.85@5.00	4.75@5.00	6.10@6 20
11	13.50@13.75	31.50	34.25@34.50	4.80	4.75@5.00	6.00@6.10
13	13.50@13.75	31.00	33.00@33.50	4.60@4.75	4 75	5.90
14	13.25@13.50	30.50	33.00@33.50	4.50@4.75	4.75	5 85
15	13 25	31.50	34.00@34.50	4 50	4 60@4 75	5 70

*These prices correspond to the following quotations for copper, "delivered": 13.75@14, 13.75@14, 13.75@14, 13.75@14, 13.50@13.75, and 13.50.

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for deliveries constituting the major markets, reduced to the basis of New York, cash, except where St. Louis is the normal basing point, or as otherwise noted. All prices are in cents per pound. Copper is commonly sold "delivered," which means that the seller pays the freight from the refinery to the buyer's destination.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. Tin is quoted on the basis of spot American tin, 99 per cent grade, and spot Straits tin.

London

Dec.	Copper Standard Spot	Copper Standard 3 M	Copper Electrolytic	Tin Spot	Tin 3 M	Lead Spot	Lead 3 M	Zinc Spot	Zinc 3 M
9	79¾	79⅜	90	228	232	26	26⅜	31½	33¼
10	77¾	77½	89½	223	226	25¾	26½	30¼	31¾
11	...	....	...	....	....	....	...	...	...
13	76¾	76½	87½	215	218	24⅜	25	28½	30
14	75¾	75½	87½	212½	216	23	24⅛	28	29¾
15	75½	75½	87	217¼	228	22½	23¾	25¾	27½

The above table gives the closing quotations on the London Metal Exchange. All prices in pounds sterling per ton of 2,240 lb.

Silver and Sterling Exchange

Dec.	Sterling Exchange	Silver New York Domestic Origin	Silver New York, Foreign Origin	Silver London	Dec	Sterling Exchange	Silver New York, Domestic Origin	Silver New York, Foreign Origin	Silver London
9	344	99½	60⅜	39¾	13	344½	99½	62⅜	40⅞
10	344	99½	59¼	38⅞	14	344	99½	62¼	40⅝
11	344	99½	61¾	40½	15	346½	99½	66	42⅝

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Metal Markets

New York, Dec. 15, 1920

Several times this year firmness in the local metal market has been killed by declines in London, which have not only a sentimental effect here but also have threatened the importation of European metal into this country. That has been the case the last week. As we mentioned on Dec. 8, the feeling here was much better and prices were tending to advance slightly. Beginning with Thursday, Dec. 9, however, the declines in the London market have been regular and violent, with no promise of their being at an end, deflation in general there not having progressed as far as in this country. Local interests have been quick to accord with the movement, and sharp price cutting has been in evidence. Some producers refuse to do any business whatever at the current figures. The price of metals in London will, without doubt, dominate the local markets for the next few weeks.

Copper

Some of the larger producers continue to hold for 14c. delivered, and on Thursday and Friday did a satisfactory business at that figure. On Tuesday, however, the price declined, and this week, with copper being freely offered at 13½c. delivered, it is probable that holders at the 14c. price are doing little or no business. Sales have been scattering and not of large individual volume. Consumers in general are willing to buy only small lots. If a large order should come into the market, there is no doubt that some very attractive prices, considerably under the current low levels, would be quoted.

Although metal for December or January can be obtained at the prices we quote, a premium of about ⅛c. for each succeeding month is being asked. Almost no metal is being booked for these forward deliveries.

Reports from the League of Nations conference at Geneva indicate that some plan for financing the sale of copper until it can be fabricated may be decided on. Just what effect this will have on the market remains to be seen. If a workable plan can be agreed upon a great deal of good may come from this movement.

Lead

Lead prices held up manfully to the 5c. level on Thursday and Friday, and quite a few small orders were taken at that price, though on somewhat larger business the price was shaded 10 or 15 points. Many of the sales were made to jobbers. On Monday, however, the London influence could no longer be withstood, and the 5c. price became purely a nominal one. Today metal for any delivery and in any quantity could be obtained at 4.50c., New York. Even at this price it will be profitable to fill orders with lead imported from Germany or Spain. There has been no rush on the part of consumers, and it seems that they do not care for the metal at any price.

In St. Louis, the lead business is exceedingly dull. There are practically only two sellers, and they are not now reported as offering anything at as low figures as now prevail in New York. With the New York price being influenced by the cost of importation, the tendency will again be for the Western price to be higher than at the seaboard.

Zinc

The pronounced upward movement recorded last week was of short duration. With the violent declines abroad, the price has again dropped below 6c. and is still heading downward. Today zinc can be bought in Europe and delivered here at a profit at any price over 5c., so the possibility of improved prices, even with a further curtailment of domestic production, is not alluring. Zinc can now probably be obtained at the same price in New York as we quote for St. Louis, and possibly less. With business at practically a standstill, prices are largely nominal. On orders of any size there is little doubt that today's figure of 5.70c. could be shaded, particularly for New York delivery.

Tin

As would be expected, with the unsettlement abroad, this metal has been weak and irregular. Straits has sold as low as 31c. for spot metal, that be-

ing the settlement price of a 25-ton lot sold at auction on the New York Metal Exchange yesterday. This auction, however, was a fluke, as such sales are likely to be these days, with no demand. One sale of electrolytic tin of fairly satisfactory size was made on Thursday at approximately the price for spot Straits.

Straits tin for future delivery: Dec. 9th, 36.75@37c.; 10th, 36@36.25c.; 11th, 35@35.50c.; 13th, 34.25@35c.; 14th, 35@35.50c.; 15th, 35.50@36.50c. Demand fairly good.

Arrivals of tin in long tons: Dec. 11th, London, 80; 13th, Straits, 375.

Silver

Since our last week's report there has been some improvement in the market price of silver. This advance was a natural reaction from the sharp declines which have occurred over a considerable period. It is only reasonable to expect that at some point there would be a reaction, and as the impression prevailed that any further material decline would result in the closing up of foreign mines, operators have taken advantage of the situation to cover short sales, and there has been buying for speculative account and China operations. The market is very sensitive, and it is difficult to predict the immediate future.

Mexican Dollars—Dec. 9th, 46⅜; 10th, 45½; 11th, 46⅜; 13th, 47⅜; 14th, 47⅜; 15th, 50⅜.

Gold

Gold in London: Dec. 9th, 119s.; 10th, 118s. 2d.; 13th, 118s. 9d.; 14th, 118s. 7d.; 15th, 117s. 10d. Five million dollars in Australian gold is being taken by a local bank. The Australian government allows only current mine output to be exported.

Foreign Exchange

With foreign business exceedingly dull and with scarcely any speculation in foreign exchange, the market has been dull and narrow. On Tuesday, Dec. 14, francs were 5.85c.; lire, 3.44c.; and marks, 1.34c. New York funds in Montreal advanced to a premium of 16¼ per cent.

Other Metals

Aluminum—For 50-ton lots: ingot, 99 per cent and purer, 33c.; 98@99 per cent, 32c. Outside sales reported at as low as 22c.

Antimony — Chinese and Japanese brands, 5½@5⅝c.; market very quiet; W.C.C. brand, 6¼@6½c. per lb. Cookson's "C" grade, 11@12½c. Chinese needle antimony, lump, nominal at 4½c. per lb. Standard powdered needle antimony[1] (200 mesh), 7¼c. per lb.

White antimony oxide, Chinese, guaranteed 99 per cent Sb_2O_3, wholesale lots, 7c.

Bismuth—$2.40 per lb., 500-lb. lots, and $2.42 per lb., 100-lb. lots.

Cadmium—Nominal, $1.40 per lb.

Cobalt—Metal, $6 per lb.; black oxide, $4.10 per lb.; sulphate, $1.60.

Iridium—Nominal, $350@$400 per oz.

Magnesium—Crude, 99 per cent or over pure, $1.75 per lb. for 100-lb. lots and over, f.o.b. Niagara Falls.

[1]**Molybdenum Metal** in rod or wire form, 99.9 per cent pure, $32@$40 per lb., according to gage.

Nickel—Ingot, 43c.; shot, 43c.; electrolytic, 45c., f.o.b. Bayonne, N. J.

Monel Metal—Shot, 35c.; blocks, 35c., and ingots, 38c. per lb., f.o.b. Bayonne.

Osmium—Open market, $70@$80 per troy oz.

Palladium—$85 per oz.

Platinum—Firm at $85 per oz. Nominal.

Quicksilver—Nominally $50 per 75-lb. flask, with second-hands selling as low as $47 per 75-lb. flask. San Francisco wires $50@$55. Market dull.

[1]**Rhodium**—$200@$225 per troy oz.

Ruthenium—$175@$200 per troy oz.

[1]**Selenium**—Black powdered, amorphous, 99.5 per cent pure, $2@$2.25 per lb.

[1]**Thallium Metal**—Ingot, 99 per cent pure, $20 per lb.

[1]**Tungsten Metal**—$35@$60 per kilogram, according to purity and gage.

Metallic Ores

Chrome Ore—Guaranteed 50 per cent Cr_2O_3 foreign ore with a maximum of 6 per cent silica, 55@60c. per unit, New York. California concentrates, 50 per cent Cr_2O_3 and upward, 60@65c.

[1]**Manganese Ore**—45@50c. per unit, seaport; chemical ore (MnO_2) $60@$65 per gross ton, lump; $75@$80 per net ton, powdered.

Molybdenum Ore—85 per cent MoS_2, 55@60c. per lb. of contained sulphide, New York.

[1]**Tantalum Ore**—Guaranteed minimum 60 per cent tantalic acid, 45c. per lb. in ton lots.

[1]**Titanium Ores**—Ilmenite, 52 per cent TiO_2, 1½@2c. per lb. for ore. Rutile, 95 per cent TiO_2, 15c. per lb. for ore, with concessions on large lots or running contracts.

[1]**Tungsten Ore**—Scheelite, 60 per cent WO_3 and over, per unit of WO_3, $4@$4.50, f.o.b. mines; wolframite, 60 per cent WO_3 and over, per unit of WO_3, $4@$4.25, in New York.

Uranium Ore (Carnotite)—Ore containing 1½ per cent U_3O_8 and 5 per cent V_2O_5 sells for $1.50 per lb. of U_3O_8 and 75c. per lb. of V_2O_5; ore containing 2 per cent U_3O_8 and 5 per cent V_2O_5 sells for $2.25 and 75c. per lb., respectively; higher U_3O_8 and V_2O_5 content commands proportionately higher prices.

Vanadium Ore—$1.50 per lb. of V_2O_5 (guarantced minimum of 18 per cent V_2O_5), New York.

[1]**Zircon**—Washed, iron free, 5c. per lb.

[1]**Zirkite**—According to conditions, $80@$90 per ton, carload lots. Pure white oxide, 99 per cent, is quoted at $1.15 per lb. in ton lots.

Zinc and Lead Ore Markets

Joplin, Mo., Dec. 11—Zinc blende, per ton, high, $36.75; basis 6 per cent zinc, premium, $33.50; Prime Western, $32.50; fines and slimes, $30 @ $27.50; calamine, basis 40 per cent zinc, $30. Average settling prices: Blende, $34.99; calamine, $30; all zinc ores, $34.90.

Lead, high, $67.85; basis 80 per cent lead, $65 @ $47.50; average settling price, all grades of lead, $60 per ton.

Shipments for the week: Blende, 6,515; calamine, 135, lead, 1,432 tons. Value, all ores the week, $318,050.

Fifty mills, or 45 per cent of the total number in operation in midsummer, are now idle, representing about 55 per cent suspension of output. An additional 10 per cent restriction is occasioned by curtailment in working forces at mines in operation. This cuts off around 3,750 tons per week from the midsummer producing capacity, and will reduce December production about 18,750 tons, 48,750 tons by the fifth of March.

Platteville, Wis., Dec. 11—No market here again this week. Mines continue to close. Shipments for the week: blende, 604; calamine, 17 tons. Shipments for the year: blende, 59,885; calamine, 2,551; lead, 452; sulphur ore, 1,242 tons. Shipped during week to separating plants, 1,538 tons blende.

Non-Metallic Minerals

Asbestos—Crude, No. 1, $2,000@$3,500; No. 2, $1,400@$2,000; spinning fibres, $400@$1,000; magnesia and compressed sheet fibres, $325@$500; shingle stock, $110@$150; paper stock, $60@$75; cement stock, $17.50@$30; floats, $8.50@$15, all per short ton, f.o.b Thetford, Broughton, and Black Lake mines, Quebec, Canada; 5 per cent to be added as Canadian royalty export sales tax.

Barytes—Crude, 88 to 94 per cent barium content, $10@$12 per net ton; ground (white) $24@$30 in bags, carload lots; (off-color) $22@$26 in bags, carload lots; all f.o.b. Kings Creek, S. C. Crude, 88 to 94 per cent, $23; ground (white), $45; ground (off color) $30@$32 per net ton, less than carload lots, f.o.b. New York. Crude, first grade, $10 per ton, f.o.b. cars, Missouri; floated, $28 per ton in bbls.; $26.50 per ton in 100-lb. bags; extra charge for bags, f.o.b. St. Louis.

Chalk—English, extra light, 5@5½c.; light, 5@6c.; dense, 4½@5c. per lb., all f.o.b. New York.

China Clay (Kaolin) — Crude, $8@$12; washed, $12@$15; powdered, $18@$22; bags extra, per net ton, f.o.b. mines, Georgia; crude, $8@$12; ground, $15@$40, f.o.b. Virginia points. Domestic lump, $10@$20; powdered, $25@$30; imported lump, $25@$35; powdered, $30@$35, f.o.b. New York.

Feldspar—Crude, $8@$14 per gross ton, f.o.b. Maryland and North Carolina points; $7.50@$10, f.o.b. Maine; ground, $27@$30, car lots, f.o.b. Baltimore; ground, $17@$21, f.o.b. North Carolina points; $17@$21 per ton, No. 1 ground, f.o.b. New York State; $21@$23 per ton, ground, f.o.b. Maine. Crude spar very scarce.

Fluorspar — Gravel, guaranteed 85 per cent calcium fluoride and not over 6 per cent silica, $25 per ton, f.o.b. Illinois mines, and $25.50, f.o.b. Kentucky; ground, suitable for acid, chem-

[1]Furnished by Foote Mineral Co., Philadelphia.

ical or enameling purposes, $60; lump, $17.50, f.o.b. Tonuco, N. M. In Canada 85 per cent calcium fluoride sells for $20 per ton, f.o.b. Madoc; output limited. Canadian price generally $18 (Canadian currency) per ton, f.o.b. mines; market inactive.

Fuller's Earth—$16 per ton, carload lots, f.o.b. New York.

Graphite—The 90 per cent crucible grade is held in Alabama for 9c. per lb. and 85 per cent grade, 7@9c. Lubricating grade commanding the best price is a fine flake, passing a 100@120 mesh, and running higher than 96 per cent carbon. Linotype machines use a flake passing 90 mesh and standing on a 120 screen, with 90 per cent carbon, retailing at 75c. to $1 per lb. and selling to jobbers at 11@40c.

Gypsum—Plaster of paris in carload lots sells for $4.25 per 250-lb. bbl., alongside dock, New York. Raw crushed rock, $3.50@$4.50; calcined stucco, $9; f.o.b. works, Illinois.

Kaolin—See China Clay.

Limestone—Dolomite, 1@2 man size, $1.60@$1.65; 2@8 in., $1.55@$1.65 per net ton, f.o.b. Plymouth Meeting, Pa.; fluxing, $1.65@$1.75 per net ton, f.o.b. Howellville, Pa.

Magnesite, Calcined — High-grade caustic calcined, lump form, $35@$40 per ton, carload lots, f.o.b. California points. In Chicago district, $57.70; Atlantic seaboard, $61@$63.

Dead-Burned — $38 per net ton, Chewelah, Wash.; $58@$64, Chester, Pa. Austrian grade, $55@$60 per ton, f.o.b. Baltimore. (Magnesite brick—See Refractories.)

Mica—India block mica slightly stained, per lb.: No. 6, 50c.; No. 5, $1.20 @$1.40; No. 4, $2@$3; No. 3, $4.25@ $5; No. 2, $5.50@$7; No. 1, $8. Clear block; No. 6, 55c.; No. 5, $1.75; No. 4, $3.25; No. 3, $5; No. 2, $6.50; No. 1, $8; A1, $10; extra large, $25; all f.o.b. New York; ground, $150 per ton, Philadelphia. Domestic, uncut, f.o.b. Franklin, N. C., as follows: Scrap, $45 @$50 per ton; punch, 10c. per lb.; circle, 15@25c.; 1½ x 2 in., 75c.; 2 x 2 in., $1.15; 2 x 3 in., $1.65; 3 x 3 in., $2.10; 3 x 4 in., $2.50; 3 x 5 in., $2.75; 3 x 6 in., $3.75; ground 165 mesh, $150 @$170 per ton; ground roofing mica, $60; mica washers, 75c.@$2 per lb.; 1¾-in. disks, No. 1, $1.40 per lb.; No. 2, $1.25. The foregoing domestic prices obtain also in the Chicago district.

[1]**Monazite** — Minimum of 6 per cent thorium oxide, $30 per unit, duty paid.

Phosphate Rock—Per long ton, Florida ports: 77 per cent tricalcium phosphate, $13; 75 per cent, $11.50; 75@74 per cent, $11; 70 per cent, $8.35; 68 per cent, $7.85; 68@66 per cent, $7.60. Finely ground Tennessee rock sells for $8.50 per net ton for 13 per cent phosphorus content, agricultural application; for acid-making, 14 per cent, $9; both prices being f.o.b. Centerville, Tenn.

Pumice Stone—Imported, lump, 4@ 50c. per lb.; domestic lump, 6c.; ground, 4@7c., all f.o.b. New York.

Pyrites—Spanish fines, per unit, 12c., c.i.f. Atlantic seaport; furnace size, 17c.; Spanish lump, 14@16c.; domestic fines, f.o.b. mines, Georgia, 12@14c.

Quartz—(Acid tower) fist to head, $10; 1¼ to 2 in., $14; rice, $17; all net ton, f.o.b. Baltimore; lump, carload lots, $5@$7.50 net ton, f.o.b. North Carolina mines.

Sand (Glass)—Dry glass sand, $4 per net ton, f.o.b. cars Mapleton, Pa. Sand, f.o.b. Ottawa, Ill., is $3 per ton; $2.50 on annual contracts. Sand at Klondike, Gray Summit and Pacific, all in Missouri, is $2.50 on contract; some outside sales have been made at $4. St. Louis, open market, at $3.50; contract price on large quantities, $2.50; on small quantities, $3.

Sulphur—$18 per ton for domestic; $18@$20 for export, f.o.b. Texas and Louisiana mines. Market quiet.

Talc — Paper making, $12@$22 per ton; roofing grades, $9.50@$15; rubber grades, $12@$18; all f.o.b. Vermont. California talc, $20@$45, talcum powder grade. Southern talc, powdered, carload lots, $12@$15 per ton; less than carload, $25, f.o.b. cars; freight to New York $5.25 per ton, carload lots; less than carload lots, $9.25. Imported, $60 @$70; Canadian, $20@$40 per ton.

Mineral Products

Arsenic—White arsenic, 12@12½c. per lb.; sulphide, powdered, 15@15½c. per lb. in carload lots.

Sodium Nitrate—$3 per cwt., ex vessel, Atlantic ports. Market quiet.

Sodium Sulphate—For 95 per cent material, $22 per ton, f.o.b. mines, Idaho and Arizona, spot and six months' contract.

Potassium Sulphate—Domestic, $225 @$250 per net ton, basis 90 per cent, f.o.b. New York.

Ferro Alloys

Ferrocarbontitanium—For 15 to 18 per cent material, $200@$225 per ton, f.o.b. Niagara Falls, N. Y.

Ferrocerium—Per lb., $12@$15.

Ferrochrome—Carload lots, spot and contract, 60 to 70 per cent chromium, 6 to 8 per cent carbon, 16@17c. per lb. of chromium contained; 4 to 6 per cent carbon, 17@18c., f.o.b. works.

Ferromanganese—Domestic 76 to 80 per cent, $150, freight allowed; $145, f.o.b. seaboard bases; English, $135@ $140, c.i.f. Atlantic seaports. Spiegeleisen, 18@20 per cent, $60@$65, f.o.b. furnace.

[1]**Ferromolybdenum**—Standard grades, carrying from 50 to 60 per cent molybdenum metal, with low sulphur, phosphorus, and arsenic, $2 per lb. of contained metal, f.o.b. works.

Ferrosilicon—For 10 to 15 per cent, per gross ton, f.o.b. works, $60@$65; 50 per cent, $78@$80; 75 per cent, $160.

[1]**Ferrotungsten**—Domestic, 70 to 80 per cent W, 65@75c. per lb. of contained tungsten, f.o.b. works. Foreign, 65c.

[1]Furnished by Foote Mineral Co., Philadelphia, Pa.

Ferro-uranium—35 to 50 per cent U, $7 per lb. of U contained, f.o.b. works.

[1]**Ferrovanadium**—Basis 30 to 40 per cent, $6.50@$7.50 per lb. of V contained, according to silicon content, f.o.b. works.

Metal Products

Copper Sheets — Current New York price, 23½c. per lb.; wire, 18c. Even lower quotations are heard.

Lead Sheets—Full lead sheets, 9½c.; cut lead sheets, 9¾c. in quantity, mill lots.

Nickel Silver — Unchanged at 34¾c. per lb. for 18 per cent nickel.

Yellow Metal — Dimension sheets 21½c.; sheathing, 21½c.; rods, ⅝ to 3 in., 18½c.

Zinc Sheets—$11.50 per 100 lb., less 8 per cent on carload lots, f.o.b. smelter; zinc plates, 10½c. per lb.

Refractories

Bauxite Brick—56 per cent alumina. $160 per 1,000, f.o.b. Pittsburgh.

Chrome Cement—40@45 per cent Cr_2O_3, $55@$60 per net ton, and $65 in sacks, carload lots, f.o.b. eastern shipping points.

Fire Brick—First quality, 9-in. shapes, $55@$60 per 1,000, Pennsylvania, Ohio and Kentucky. Second quality, $45@ $50.

Magnesite Brick — 9-in. straights, $110 per net ton; 9-in. arches, wedges and keys, $120; soaps and splits, $130.

Silica Brick—9-in., per 1,000: Chicago district, $65@$70; Birmingham, Ala., $56@$61; Mount Union, Pa., $55 @$60.

Iron Trade Review

Pittsburgh, Dec. 14, 1920.

The rate of steel-ingot production in November may be estimated at 36,000,000 tons a year, against a 42,000,000-ton rate during the preceding ten months. The Steel Corporation's output is even greater now than formerly, but the independents seem to be well below 50 per cent, the divergence being due to the difference in price policy. The independents are now down to the Steel Corporation prices, except on pipe, but did not get down soon enough to accumulate orders, and there is now no buying.

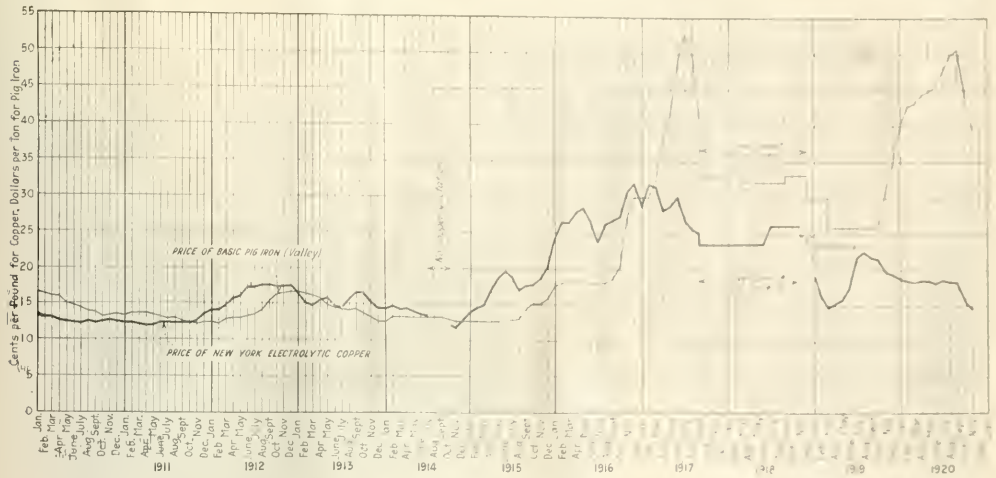
Pig Iron—Foundry iron is quotable at $35, Valley, or $2 decline, bessemer and basic remaining at $35 and $33 respectively. There is no demand, and additional furnaces are going out of blast.

Semi-finished Steel—A large independent having outstanding contracts to furnish sheet bars at $65, but lacking specifications, has revised the contracts to the Steel Corporation price of $47, which is now the market. Billets have not developed a market.

Charcoal and Coke

Charcoal—Willow, 7c. per lb. in bbls.; hardwood, 5½c. per lb., in 250-lb. bbls. Barrel charge is 35c. additional.

Connellsville — Furnace, $10@$12; foundry, $8@$10.



FLUCTUATIONS IN MONTHLY AVERAGE PRICE OF ELECTROLYTIC COPPER AND BASIC PIG IRON, 1910-1920

A Comparison Between Copper and Pig-Iron Prices

An Analysis of Price Curves Shows That Pig Iron Is Strikingly Less Sensitive Than Copper in Acknowledging a Major or Minor Market Trend

THE curves illustrated above show the fluctuations in the monthly average price of electrolytic copper at New York and the price of basic pig iron at Valley furnaces. Basic pig iron has been selected from the various pig-iron grades because it represents by far the greatest production of all classes of pig iron traded. The vertical scales of the curves have been so chosen that in pre-war years the curves of metal prices are placed closely together, admitting of easier comparison. It should be noted that a fluctuation of 1c. in the price of copper is relatively equivalent to a fluctuation of 100c. in the price of pig iron.

An inspection of the curve will show that there are both major and minor movements in the prices of each of these commodities. The major movement is shown by a definite upward or downward trend over a period usually several years long, whereas a minor movement records merely a temporary setback or recession in the general trend of a major movement.

For the period covered by the graph there are three well-defined "major" peaks in the copper and pig iron curves. The first occurred in the summer of 1912 for copper, and the winter of 1912 for pig iron; the second just prior to the assumption of governmental price control—in the winter of 1916-1917 for copper, and in the summer of 1917 for pig iron; the third, which is commonly called the peak of post war inflation, occurred in the summer of 1919 for copper, and the fall of 1920 for pig iron. In each case there was a decided lag on the part of pig iron to reach its peak price as compared with copper, the time of lag varying from four to thirteen months.

A glance at the behavior of these metals during major declines in the market will show a similar lag for pig iron. The first major decline for the period under discussion occurred during 1910 and the early part of 1911. Copper reached bottom in April and May of 1911; pig iron continued its decline until November of the same year. The next major drop began in the fall of 1912 and the winter of 1913, extending well into 1914, and being the immediate effect of the depression that resulted from the declaration of hostilities in Europe. Copper ended its decline in November, 1914, and started on an upward climb that was to take over two years; pig iron reached its major low point at practically the same time as copper in this major downward movement.

The third major decline in the ten-year period covered by the graph took place a few months before the institution of governmental price control of both metals, and, although the fluctuations in prices were arbitrarily controlled by governmental authority for an extended period thereafter, the price declined upon the removal of price restriction, both copper and pig iron reaching a major low point in March of 1919. The pig iron price fixed by the Industrial Commission of the Department of Commerce ruled the pig-iron market for several months immediately after the low of March, 1919, but copper quickly rose in price under the stimulus of post-war speculation and inflation.

The next major decline, or what will undoubtedly become such, began in August of 1919 for copper, and September of this year for pig iron—an interval of thirteen months. Copper, as can readily be seen from the curve, has receded a pre-war price level; pig iron has still to take a great fall before it reaches the pre war plane.

In the minor movements of these two metals the same tardiness of pig iron to respond to market conditions is apparent. The curves speak for themselves, and detailed examination of instances where this condition has prevailed is needless.

The conclusion is warranted that for the past critical and important ten years pig iron has strikingly failed to "sense" the metal market as compared with copper, and that it has been and is consistently tardy in its acknowledgment of a change in the market. This property of pig iron may be ascribed to various causes, not the least of which is the greater concentration of the iron and steel industry in the hands of one large and overshadowing producer, whereas the copper-producing interests are more evenly distributed, with greater competition than in the iron and steel trade.

MINING AND MILLING SUPPLIES

HOSE—

	FIRE	50-Ft. Lengths
Underwriters' 2½ in		$0 75 per ft
Common, 2½-in		40c

	AIR		
	First Grade	Second Grade	Third Grade
¾-in. per ft	$0.50	$0 30	$0 25

STEAM — DISCOUNTS FROM LIST

First grade.....30% Second grade.....40% Third grade..... 50%

LEATHER BELTING—Present discounts from fair quantities (½ doz. rolls):

Light Grade	Medium Grade	Heavy Grade
30–10%	30	25%

RAWHIDE LACING—For cut, best grade, 35c., 2d grade, 40c. For laces in sides, 63c. per sq.ft.; 2d, 62c. For semi-tanned cut: 25c.; sides, 65c. per sq ft.

MANILA ROPE—For rope smaller than ¾-in. the price is ½ to $0.07 extra while for quantities amounting to less than 600 ft. there is an extra charge of $0.01. The number of feet per pound for the various sizes is as follows: ¼-in. 8 ft., ⅜ in., 6; ½-in., 4; ⅝-in., 2½-in., 2 ft. 10 in.; ¾-in., 2 ft. 4 in. Following is price per pound for ¾ in. and larger, in 1200-ft. coils:

New York	$0 27	Kansas City	$0.30½
Cincinnati	0 37	Seattle	0 28
Chicago	0 27½	St. Louis	0 26½
Minneapolis	0 27½	Denver	0 30
San Francisco	0 25	Los Angeles	0 28

PACKING—Prices per pound:

Rubber and duck for low-pressure steam	$1 00
Asbestos for high-pressure steam	2 00
Duck and rubber for piston packing	1.20
Flax, regular	1 20
Flax, waterproofed	1 70
Compressed asbestos sheet	1 00
Wire insertion asbestos sheet	1 50
Rubber sheet	50
Rubber sheet, wire insertion	.70
Rubber sheet, duck insertion	60
Rubber sheet, cloth insertion	.30
Asbestos packing, twisted or braided and graphited, for valve stems and stuffing boxes	1 50
Asbestos wick, ¼- and 1-lb. balls	1 10

RAILWAY TIES—For fair size orders the following prices per tie hold:

Material	7 In. x 9 In. by 8 Ft. 6 In.	6 In. x 8 In. by 8 Ft.
Chicago—Plain	$2 00	$2 25
Chicago—Creosoted	2 25	2 50
San Francisco—Douglas fir, green	1 35	.96
San Francisco—Douglas fir, creosoted	2.50	1.92

Prices per 0 at Missouri mills; St. Louis prices about 25c. higher:

Untreated A Grade White Oak 6x8x8		Untreated A Grade Red Oak 6x8x8	
No. 1	$0 80	No. 1	$0 60
No. 2	90	No. 2	70
No. 3	1 00	No. 3	80
No. 4	1 25		

FLOTATION OILS—Prices of oils for flotation, in cents per gal. in bbls.:

	New York	Chicago— In. Bbl.	Carloads
Pure steam-distilled pine oil, sp.gr. 0 93-0 94	$1.75	$1 90	$1 85
Pure destructively distilled pine oil	1.65	1.90	1 85
Pine tar oil, sp.gr. 1 025-1 035	.48	.34	.32

Lenine and Washington B. Vanderlip

THE mystery surrounding Washington B. Vanderlip, the reputed mining engineer who stirred London, on his passage from Petrograd to New York, by his triumphant announcement of having negotiated immense mining concessions in Siberia, has been somewhat cleared up by the reports of interviews with him printed in the New York dailies, and by our own exclusive interview published in our news columns of last week. It now becomes fairly easy to valuate Mr. Vanderlip, his financial achievements, and his possible political significance.

First impressions from the cables sent from London were that Mr. Vanderlip might be a four-flusher and a drawer of the long bow; and that his stories of hobnobbing with Lenine and Trotzky, and their having figuratively turned the Soviet government inside out to please him, might turn out to be imaginary or a fabrication. But no such denial comes from Russia. Apparently all happened exactly as Mr. Vanderlip says it did. He was cordially treated, and in a most friendly and intimate way, by Lenine and Trotzky; they staged for him carefully selected glimpses of Russian conditions, and imparted to him the "true" orderly and prosperous condition of Russia, and the lamblike and ambitionless purposes of the Russian rulers, in order that he might take the boat for America and enlighten our ignorance in those matters.

It is a most dramatic episode. We all know Lenine and Trotzky, from the time they were "Reds," the former active in various cities of the Continent and the latter in New York, till the present. We know their madness, their fanaticism, their matchless cleverness, their immense ignorance and stupidity, their facility in governing by the lash the Russian ex-serfs, and their smooth facility in slipping from an impracticable communistic government to an old-fashioned military autocracy like that to which their countrymen were accustomed, without losing their own power. So we have been chiefly curious to know about the American actor in the drama. The recent revelations show him to be sober and serious, a correspondence-school "mining engineer," and a scout of experience for mineral properties. He has seen much of the world; yet his record and interviews indicate that he is neither clever nor brilliant, but, indeed, straightforward, ingenuous, and simple minded.

With all the makeshifts of changing forms of government in Russia, the colossal economic blunders of the upstart dictators have reduced that country to an industrial desert and to absolute want. The loss of all those advantages which mark civilization has been unbelievably rapid. Russia's railroads are all but gone; her cities half abandoned; her factories mainly closed; her industrial production is a mere shadow. Without assistance and new supplies produced under the "capitalistic" system of other countries Russia cannot expect to long withstand a complete collapse, and a relapse into a state of anarchy.

There are two ways for the Jolly Roger pirates to obtain the necessary plunder from abroad—by conquest or by trade. The former has been successfully prosecuted, and the spoils derived from Trotzky's many victorious campaigns have kept his vast army in those supplies which Russia can no longer produce. Had the Polish campaign finally resulted in the annihilation of Poland, as at one time seemed probable, we should have heard nothing from Petrograd concerning a resumption of trade or concessions to "capitalism." From Petrograd at that time came insolent proclamations of Russia's intention to conquer the world, including America. With Poland in Russia's hands, Germany would have revolted from the Allied terms, and Russia could have pushed forward on all her frontiers. As it is, she is resting very briefly on her arms for a new campaign against Poland in the spring, after having disposed of all her other armed enemies.

Meanwhile Russia needs further supplies, military and civil: someone must furnish her the sinews of existence and war which she has lost the power to provide for herself. With France she can do nothing. France knows clearly that Russia is a menace as dangerous as Germany was, and is frankly on the defensive. But with Russian secret agents and troops invading Asia throughout the Continent, expelling the British from Baku and threatening Mesopotamia and India, and with England's internal political and industrial troubles, Lenine sees an opportunity to force a resumption of trade with England, and so replenish his supplies. This looks expedient, even necessary, to Lloyd George, but he is bargaining hard to make the best terms he can for England. He is not going to come into close quarters with the "bear that walks like a man" without the proper safeguards.

Negotiations drag. At this time along comes the honest Mr. Washington B. Vanderlip, not a brilliant financier like the other Vanderlip, but a plain and ordinary American concession-hound. The astute (yet not sufficiently astute) Lenine, considers him attentively, as to whether he can use him. Possibly, he thinks, he can. The name suggests financial standing and influence. Lenine's political wisdom is Machiavellian; he exists, as Abdul Hamid did in Turkey, by studying the jealousies of other nations and preventing them from working together. Americans, he reflects, like the British, the French, the Germans, and the rest, are a greedy and stupid race: he does not know how much will buy them, but they can be bought. Anyhow, it will stampede Lloyd George if he thinks that the United States is going to beat England to the exploitation of Russia; so he puts one of his biggest worms on the hook. He courts the simple-minded Mr. Vanderlip, and gives him, not a

paltry concession of the ordinary variety, but a monopoly of coal, oil, and fisheries for an empire—Eastern Siberia and Kamchatka! Only, Mr. Vanderlip, you must reopen trade between Soviet Russia and the United States, which you can easily do with your Mr. Harding, now that Mr. Wilson's star has set. Explain to Americans how much money they can make by trading with Russia! And you, yourself, shall in addition have the handling of millions of dollars' worth of orders from Russia for American goods, and in these vast transactions you can let as much stick to your fingers as you think best!

Small wonder Mr. Washington B. Vanderlip's imagination was inflamed, and his hat band became uncomfortable for his temples. The spectacle (which Mr. Vanderlip reports) of Vanderlip in all seriousness reviewing in person a detachment of the Russian army is one worthy of being perpetuated in some masterpiece of painting.

So Vanderlip is sent, glorified and expansive, to America. He tarries just long enough in London to inform the world of what he has done, as Lenine had planned. Lloyd George, he states, telephoned him for an interview, but he could not bother, as he had to catch his boat. Now that he is in America, it will be an easy matter to make the necessary little arrangements with Mr. Harding, preparatory to entering in upon his commercial empire.

There is just one difficulty, or maybe there are two or three troubles, with Mr. Vanderlip's concession. It is big enough, to be sure, and rich enough. No fault to find with that. But it is not held at present by Soviet Russia nor even by the shadowy Siberian Republic, which is vaguely supposed to be independent of Soviet Russia: it is dominated by Japan. So the little detail comes in that Mr. Harding must take it away from Japan. Of course, any intimation to that effect would mean a bitter-end war between the United States and Japan (and we would not blame her), but that is a trifling detail.

Another detail is that many large and well-conducted British mining enterprises in Siberia have been confiscated by the Soviet government, and many of the officials held in prison, as hostages; and in this situation Lenine turns over the commercial empire, with all old concessions wiped out, to the United States. Of course, that means not only the necessity of the United States twisting the British lion's tail, but of cutting it off; but your friend Mr. Harding would not mind doing that to have the United States get $3,000,000,000 worth of orders! What would a war, or at least a bitter estrangement, between England and America signify, if you beat England to trading with our vast and rich country, Mr. Vanderlip? And remember, you get the concession.

We are vastly diverted by this really stupendous tragedy-farce; but we must give the verdict that Lenine is crafty but crude; and that Vanderlip is an unconscious pawn bedecked by Lenine in the tinsel and hardware of a potentate. We are relieved to know that Mr. Vanderlip is only a correspondence-school mining engineer, as he apparently is of the correspondence-school variety of world-politician; and we suggest to Mr. Lenine that he send for Mr. Hoover next time he wants to talk concession, if he wants to run up against a real mining engineer, whom we will recommend to him for an examination and a report.

Two Methods of Increasing Our Exports

THE copper and zinc industries in this country will not flourish until the European demand shows considerable improvement. This will not happen until either money is furnished by us, or Europe can ship goods to this country to pay for the metal which we export. The first solution of the problem has recently been suggested by Mr. Hoover, and he recommends that American capital be invested largely and permanently in European enterprises, especially in undeveloped fields. "If we are going to maintain the productivity of the United States," he told Mr. Harding, "there has got to be a readjustment, and we have got to put our excess capital into industries abroad. To enter this foreign field successfully there must be a defined Government policy for the protection of American individuals and interests abroad."

The alternative, of course, is, as mentioned above, the importation of European products, and this might mean the closing of American factories if sufficient imports arrived to balance entirely the export trade which we would like to have. Investment in foreign securities would seem to be the logical thing for capitalists in this country to do under the circumstances. Still, there is bound to be an effort in some business quarters to prevent the new administration from imposing any tariffs so high as to be prohibitive. Some of the firmly intrenched business interests, such as the automobile, cash register, and typewriter industries, have a world-wide market. They have little to fear from a low tariff, and much to gain, for the money which foreign interests obtain by exporting their products to this country makes those foreigners more able to buy the products which we export. If the tariff is low enough to allow large imports we would be pretty sure, normally, to have a big export business also.

We anticipate some interesting arguments when the new Congress comes to the tariff question. Big business will certainly not be unqualifiedly in favor of a stone-wall tariff, as has been the case to a large extent in the past. As Mr. Hoover has pointed out, we could have a good export business merely if we would invest enough money abroad, but we are not used to doing this, and it will take time to educate the investing public. Moreover, before we would be fully justified in doing this, we must have the safeguards which he proposes, and these can be provided only by the Government.

The Divining Rod From Germany

THE *Iron Age*, that highly respectable and reliable journal of the iron and steel industry, printed in its issue of Dec. 9 an article by Herman A. Holz, entitled "New Process for Locating Mineral Deposits," with the subheadings "The Divining Rod Made Efficient by a German Invention," "Remarkable Results," "Prospecting Revolutionized."

Mr. Holz is a maker of instruments of precision, such as metallurgical microscopes and the like, in New York. Therefore, we read with interest his announcement that "practical means have been developed to a high state of perfection for definitely locating mineral deposits—solid, liquid, and gaseous—in the earth, from above ground; for accurately determining the position, depth, width, thickness of each deposit, and for differentiating between the various materials forming the deposit."

Certainly there is nothing further to be wished in

these specifications! Mr. Holz further observes that "if the apparatus is adjusted for lead, it is actuated only by lead; if set for oil, it is acted upon only by oil. The apparatus can be adjusted for practically all useful materials found in the earth, such as all ores, salts (potash, etc.), coal, sulphur, asbestos, oil, natural gas, various clays, precious stones, (diamonds, etc.), mineral water, spring water, etc."

Again, there is nothing lacking in the specifications for a complete and reliable finder. Mr. Holz does not mention whiskey, hidden treasure, and buried evidence of crime, but there is no doubt whatever that this infallible little scout would nose them out, as capably as do the experts in those lines whose letters to us announcing their gifts we have from time to time published. In these purely American cases the gift was psychical: but the German invention is a tangible one, and we infer that anybody can use it who has the price to pay for it.

Mr. Holz states that some of the rays given off from mineral deposits are detectable "at a distance of fifty miles from the deposit, indicating its presence and general direction already from such a large distance." The writer himself has tested the instrument, and located in Germany a large lead-zinc-silver field "right near the American occupied territory."

Mr. Holz is not at all unconscious of the importance of his announcement of this discovery, which seems, according to him, to be well known in Europe, although the enlightenment of America as to what was going on abroad was delayed till Mr. Holz took the steamer to return to New York, bringing us the news from the centers of civilization.

"It is hardly necessary," he says, "to dwell upon the tremendous value of this invention; it is bound to revolutionize mining methods." Quite so; but go on, Mr. Holz. "It will reduce the speculative element in mining and drilling operations to a minimum; it will render great help to geologists in valuation reports, in laying out extensions to shafts(!), in relocating ore veins which have shifted in the earth, and in profitable exploration of mineral fields consisting of discontinuous orebodies. It will increase efficiency in mining all around. There is no more need of wildcat drilling for oil; the indications of the process are accurate to a depth of 7,000 ft." Yes, indeed: and it will do still more. It will revolutionize industry and the history of the world, incidentally putting out of business the mining geologist and the drill man.

Mr. Holz offered a similar manuscript to us, but we have hesitated to publish it. We come from Missouri, not Germany; and though we have great scientific credulity, we are skeptical of anything that comes from Germany at the present, whether it be marks or divining rods. We have learned to look at both sides of a German article, bite it, then decline to accept it. We understand that none of these machines have arrived in the country as yet: the way is evidently being paved for them, or possibly for the stock of the company that manufactures them. But if the inventor has one of these machines, he would be mad to sell it or divulge the secret, for his is the situation of the man who can turn base metal into gold. He has only to guard his secret, and go around gathering unto himself the vast mineral wealth of the globe. The offering for sale of a machine or "rod," or the offer of stock in the enterprise, will demonstrate the statements of Mr. Holz as at least exaggerated, and probably absolutely unfounded.

Mr. Holz has one chance in ten million, perhaps, of making good, but there is a sickening probability that he has joined the ever present army of dreamers that cannot produce.

Position of Domestic Silver Producers

THE present price situation in silver is a subject of serious concern to the domestic silver producer, even though he is temporarily in a protected position through the operation of the Pittman Act. Just what the policy of the domestic producer should be under present conditions could be determined with more or less accuracy were the trend of the world silver market known. Are present prices going to continue for several years or not? Is the present low price due to sympathetic reaction downward following the sagging in prices of copper, lead, and zinc? Undoubtedly to some extent, we would say with reference to the second question; but the first question is dependent upon conditions so far in the future as to defy anything more than speculation.

For the immediate future, C. W. Handy, at the last meeting of the New York section of the A. I. M. E., said that there was not any great strength to the silver market. Without much doubt silver prices will move in accordance with supply and demand. Before the war period and for a number of years silver prices were low. It should therefore be reasonable to expect that with an approximate return to normal economic conditions silver would be in much the same position as prevailed before the war. There would, however, be this difference: The several years of curtailed copper production will result in a definite decrease in the supply of silver produced from the treatment of certain copper ores. There will also be less silver produced from the reduction in the quantity of silver-lead ores. New producers of silver are not numerous. Mexico at present is curtailing the operation of silver mines, owing to the existing low price of silver. It would therefore appear certain that the supply of silver this year and next would be less than formerly. Future prices, other things being equal, should be higher than those prevailing before the war. We are inclined to be cheerful about the resumption of the world's industry after the prevailing deflation has run its course. We feel that industry will be accelerated and commodity prices will advance from the ebb prices which are undoubtedly upon us at this time and for probably some time in the future.

Viewing the position of the domestic silver producer more in detail, it appears to us that somewhat lower supply costs and increased efficiency of operations are in course and will become more pronounced as time goes on. The per-ounce cost of silver production should show a steady decline with a constancy in grade of ore and size of orebody. Looked at in another way, a greater tonnage of low-grade ore should become available for mining. It is a well-recognized principle in mining that the rate of production should be kept at a maximum in order to reduce unit costs to a minimum. Needless to say, a minimum unit cost would mean a maximum return on the basis of the fixed price now existing. It would therefore appear to us that domestic silver producers other than those who are producing silver as a by-product of some other metal should attain a production rate that would insure this minimum cost of production as speedily as possible. There should also be persistent effort to secure the maximum operating and administrative efficiency.

WHAT OTHERS THINK

The Causes of Gold-Mining Depression

In the Dec. 4 issue of *Engineering and Mining Journal*, referring to the Gold Conference, you write:

"Many of the speakers recited the decay of gold mining in various districts . . . without analyzing how far this decay was due to the exhaustion of ore reserves by mining."

This is correct, but is it to the point?

Excepting in special cases, it is not possible to ascertain how far lessened production is due to exhaustion of reserves. But such exhaustion of reserves, when it is uniformly apparent throughout an entire state which includes many districts in which conditions are radically dissimilar, is itself due, largely if not entirely, to depreciation in value of product. I have elsewhere shown conclusively that when mines are faced by increasing costs the management is compelled to try to keep expenses below receipts by lessened outlay in development, direct and indirect, which inevitably tends to exhaust the mine. It can stave off the evil day for a few years, but it is done at the expense of the ultimate yield. Moreover, the same conditions which eliminate the profit and reduce the life of an operating mine discourage prospecting and exploration in search of new orebodies, so that none are found to take the place of those which are exhausted.

It may be true, in a state whose production comes from relatively few mines, and where the output has fluctuated greatly, that reduced output is due to the exhaustion of ore reserves. But in the case of a state like Colorado, where the gold production for the ten years ending in 1916 was so nearly uniform, and where the number of mines and districts contributing to the total is so great, it is fair to assume that the falling off in production was not due to exhaustion of the reserves excepting in so far as such exhaustion was itself caused by the reduced value of the product.

Nor do I think you are justified in saying:

"That any call was ever made that influenced the policy of gold producers in the least is not true," or that reference to such an influence is necessarily "bunk" or "unconscious hypocrisy." Let me quote the actual words of the Secretary of the Treasury in 1918:

"At no time has this country so much required the largest possible production of gold as at present. Next to food and ammunition, gold is one of the most needed war essentials. . . . The man or the community that maintains or increases its production of gold in the face of difficulties and discouragement is performing a patriotic service which deserves recognition no less than the more obvious but not less useful services that are more in the public eye."

I think the *Journal* forgets. Perhaps gold producers did not take these words quite literally; and perhaps no man or organization deliberately faced ruin in producing gold solely for patriotic motives. No doubt other reasons, such as unwillingness to see their organizations scattered and their properties damaged by abandonment, influenced them to an equal or even to a greater degree. But to say that gold producers (equally with producers of chrome, manganese, or other "war minerals") were not influenced "in the least" by such authoritative appeals to their patriotism is to make a statement which itself, to my knowledge, is more than the truth, and is hardly worthy of the *Journal*.

GEORGE E. COLLINS.

Denver, Col.

In Opposition to the McFadden Bill

The McFadden Bill, as I understand it, is intended to impose a tax, or excise, on such gold as may be used in the arts; and, from the money so raised, a bonus of 50c. per pennyweight of gold produced is to be paid to the miners or producers of that metal. Of course, any sums so collected from the makers of jewelry and other commercial consumers of the metal would be paid back to such makers by the purchasers of such manufactures of gold. It is my firm belief that a bill of that sort would be a form of class legislation, and, therefore, it would be harmful.

Both gold and silver are commodities, as well as are copper, iron, wheat, wool, cotton, and other commercial products. And if a bonus is paid to the producers of either of them, the producers of all the other commodities may rightfully demand similar bonuses for their products; all of which means taxation beyond the ability of the public to pay. This, in itself, should be sufficient to justify the condemnation of any such legislation as is proposed in the McFadden Bill.

Again, a special committee, consisting of Messrs. Albert Strauss, Edwin F. Gay, Raymond T. Baker (Director of the Mint), Emmet D. Boyle (Governor of Nevada, and, at first, an ardent supporter of the bonus proposition), and Pope Yeatman, was appointed by ex-Secretary McAdoo on Nov. 2, 1918, "to investigate the present conditions in the gold-mining industry and study the problem carefully and thoroughly with the view of definitely ascertaining all the difficulties confronting gold production and submitting suggestions of sane and sound methods of relief." Surely the committee's instructions were sufficiently comprehensive.

This committee's report is dated Feb. 11, 1919, and it seems unnecessary to quote from it any more than the two sentences following:

(a.) "Under these circumstances there is, in our opinion, no special need for artificial stimulation of gold production; and

(b.) "It is therefore the judgment of this committee that no steps should be taken by the Government to stimulate or promote the production of gold."

As is noted above, Governor Boyle at first was an ardent advocate of bonus legislation in some form; consequently, he must have had the error of his ways pointed out to him very convincingly before he signed the report of the special committee.

And now comes the recent meeting of the American Mining Congress, at Denver. One of those present at the National Gold Conference of the American Mining Congress is reported to have proposed the following (threatening?) resolution:

"Resolved, That the directors of the American Mining Congress immediately take such measures as may be necessary, in the event of the failure of passage through the forthcoming short session of Congress of the McFadden Bill, to organize the gold producers of the United States and* Alaska for the following purposes:

"A. To deposit the gold produced by them in the mint and to demand coined gold in exchange therefor."

It doesn't seem necessary to quote any more of the proposed resolution because his first "purpose," "A," seems to indicate that he was ignorant of the fact that what he proposed is simply free coinage of gold, and free coinage of gold is in existence now in these United States and has been for many years!

However, it is greatly to be regretted that persons like the foregoing "proposer" do not take the trouble to study the subject sufficiently to inform themselves correctly regarding present conditions, before advocating measures for relief.

There are some persons now living who recall the great controversies regarding free silver and bimetallism of nearly a generation ago. As measured in gold, the commercial value of silver had fallen considerably, and the producers of the latter metal sent up a howl so loud and far-reaching that, compared with it, the present cry of the gold producers is but as a plaintive bleat! Many kinds of artificial stimulation were proposed, and two or three of them, which seemed sound and feasible to the free-silverites, were tried by the Government, but without success. The reason they failed in their object was because such acts of Congress were not in conformity with Nature's laws.

Let me quote from one who wrote about free silver and bimetallism in those days, December, 1891:

"Silver, in 1874, fell to $1.27 an ounce. In 1875, to $1.24 an ounce. In 1876, to $1.15. *Then, and not until then,* began to be heard the cry of the "Conspiracy of 1873.'" [It might be said in explanation that the free-silverites and the bimetallists claimed that silver had been demonetized secretly by a Congressional clique; and they termed the act "The Crime of '73."] "Silver has been struck down, but not by the bill of 1873, nor by any bill concocted by man. The hand which struck down silver is the hand which will strike all of us down in time, the hand which nothing can withstand, the irresistible hand of Nature. Silver has been struck down by one of the natural forces, by the great law of demand and supply."

And yet the writer of the lines just quoted professed to be a bimetallist! But he could have been a bimetallist only because he failed to understand, to realize, how absolutely impossible it is, because of the natural forces to which he referred, to so regulate the world's output of both gold and silver that they will always be produced in exactly the same relative quantities, and, at the same time, to maintain the demand for them in precisely the same relative proportions.

It seems almost unnecessary to add that the late war prevented so very much production and caused such an immense quantity of destruction that the world's business is still greatly demoralized. Gradually, however, it is reshaping itself, and, when it becomes more nearly normal and deflation will have been brought about, gold will come into its own.

To find ample proof of the fact that the exchange value or purchasing power of gold is enhancing, one has only to note in the daily press the fall in prices of commodities and sundry investment securities, as well as the opposition by labor organizations to wage reductions.

But the law of supply and demand is reasserting itself, and unless another great calamity again brings about unnatural conditions, causing the world once more to resort to artificial methods for carrying on its trade, gold will sooner or later resume its normal functioning with reference to general exchange.

New York City. W. DEL. BENEDICT.

*Why does he segregate Alaska from the United States?

When Is a Lode Not a Lode?

In your editorial comment on the Bingham decision, in the Nov. 13 issue, you ridicule the contention of the Utah Consolidated Mining Co. that either or both of the limestone beds carrying the ores in dispute are broad lodes. I doubt very much if your correspondent furnished you a copy of Judge Johnson's decision, or you would have noted that at least one of the beds, the Highland Boy-Jordan limestone, has been, to a certain extent, judicially designated a lode. In the Lawson case, the Supreme Court of the United States declared the entire thickness of the Jordan limestone to be a lode. Judge Johnson, in the Leadville case, finds that the Jordan and Highland Boy limestones are "part of the same bed," meaning along the strike, "probably mineralized from the same source," and that, up to a certain dike, the Highland Boy limestone constitutes a lode.

The real issue in the Leadville case became whether or not the lode extended as far west as the Leadville country, in which area the ore occurs in the same limestone bed. Mr. H. V. Winchell, in his testimony for the Utah Consolidated, based his definition of a lode, to which you take exception, upon the long-established precedent that any area is to be legally judged to be mineral in character if the miner will expend his time and energy in prospecting it in the expectation of finding ore therein. And you will note that Mr. Winchell has limited this in his definition, to an "experienced miner, or prospector of judgment."

If the Highland Boy-Jordan limestone, 250 ft. thick, is a lode from "underlying quartzite to overlying quartzite," the thickness of the Yampa limestone, 280 ft., would not, of itself, bar the limestone from coming under the same classification. A. E. ROBINSON.

Tooele, Utah.

Should Claim Assessments Be Postponed?

If there is anything you can do to prevent the passage of the bill to suspend the annual assessment work on mining claims I wish you would do it. I was employed by a copper company until the first of the month. Yesterday I met an acquaintance on the street, and I said, "Have you done your assessment work yet?" Said he, "No, I cannot get men to do it; miners are so scarce." So I said, "I will go to work for you, and I will get you all the men you need." "Well," said he, "I will wait. I think they will pass a bill so we won't have to do the annual work, and then I can go to California on that money and spend the winter there."

Now, this is just what has killed mining and prospecting. The claim hogs hold the country and won't develop and won't let any one else have the ground. The country is full of unemployed miners. Kindly do the best you can to save the mining and prospecting game.

WESTERN MINER.

Moving Pictures in the Mining Industry

The article, "Moving Pictures in the Mining Industry," which appeared in *Engineering and Mining Journal* of Dec. 4, is very timely. It could be broadened to include what the infernal Germans did in promoting sales of mining and electrical machinery before the war. I have seen beautiful films of the Krupps plant, with plentiful pictures of "modern mining machinery" which would not compare with the products of any Colorado foundry for strength and practicability. The films were supplied gratis to the moving-picture man. If it is remembered that in Santiago, Chile, practically every man of financial importance is a shareholder and director in a tin mine, the possibilities of this film propaganda will be appreciated. No films were available from the Colorado Iron Works, Chalmers & Williams, Hardinge or Allis-Chalmers, and the latter alone made twenty times as much mining machinery as Krupp, and it was four times as good. Even Humbolt, in Germany, sent out films.

Of course Siemens-Shuckert had frequent new films; and the General Electric and Westinghouse, both of which make *reasonably* good and *fairly* large quantities of electrical machinery, were noticeable by their absence.

Recently I have sent out a number of moving-picture machines to mines situated away from towns. The equipment with spares costs about $600. It seems like a stiff price to pay for entertaining such rough-necks as miners and mining engineers, but let us examine the matter in a little detail.

One of the mines is a day's journey from the railroad. It employs 2,000 men, mainly Bolivians, with a sprinkling of Chileans and a score or more Europeans. As there are no theatres, churches, or ball games, the majority pass evenings and holidays in the usual pastimes of mining camps—wine, women, and noise. Of course they *should* all be taking correspondence courses in order to become mining engineers, but they do not. Even booze and women get monotonous (especially the same women), and this accounts for much of the exasperating labor turnover.

In such a camp, a moving-picture machine is a big asset for the company. An admission is charged, which more than pays expenses of operative and film rent, and the hall is packed every night. The show closes early, so the men will get plenty of sleep and be on the job in the morning, and this is far better than allowing them to fall into the hands of designing saloon keepers, gamblers, and beautiful (?) women. It has proved possible, as a result of providing amusement for odd moments during the day and evening, to persuade the laborers to save part of their wages and even to invest it in shares of the company.

I know of one company which has such a machine. The company is planning a large new mill for tin concentration which will cost about £100,000. If I were a manufacturer of concentration tables, I certainly would send that company a film of my wonderful tables in operation. The miners might not get much from the film, but the manager, the mill foremen, and the shift men would immediately feel acquainted with my table.

The enterprising salesman of the enterprising manager of the enterprising company making a certain shovel once had the nerve to bring two shovels to my office and test them before my eyes on my own nice Wilton rugs. I must not tell you the name of the shovel, because advertisements are not allowed in these columns, but you all know the color of the edge of the shovels.

Well, the test consisted of using two different makes of shovels alternately as axes, chopping each other on the edges. The result was a revelation of steel quality. Whenever I see two shovels near each other now, I want to chop them together. Once, in France, this salesman's detachment was digging a trench in frantic haste when it occurred to him to investigate the quality of the shovels in his neighborhood. The development of the idea made a fine story, which the captain tells to this day. If this test and the two other tests invented by this same manager were filmed and loaned to the mining companies, the market not only for their shovels but for all shovels would be greatly increased.

Not long ago, a film was made showing underground and surface coal-handling equipment for the special education of French engineers, in the hope that their increased knowledge would assist them in choosing the best mining equipment. They got the education, but the resulting business barely paid for the picture. This was not the fault of the pictures, the idea, or the Frenchmen, but the blame lies with the Germans, who have deceived the poor French nation into thinking that they (the Germans) will repair all the damage done in the coal fields, at German expense with French machinery.

No machine films better than a pneumatic drill. A few feet of film cut out here and there, but judiciously, turns an ordinary drill into a wonder and gains for it a rapturous round of applause from the miners.

Smoke precipitations would make a spectacular film and would be of interest to smelters everywhere, but the smoke people are so very very scientific and so very very uncommercial that the suggestion simply wastes paper.

Hoisting, track, and standing rope is hard to sell because so many rope makers make good rope. A film showing a modern rope walk would surely gain friends and business and would differentiate one manufacturer from all the others.

The Holt company is going to have a fine opportunity this winter to film about fifty of its tractors which the City of New York has purchased to push snow.

All such films should make the circuit of all the mining towns of the world. A little patient investigation on the part of the *Engineering and Mining Journal* would provide a list of every mining-town picture machine. The *Journal's* subscribers would be glad to send the addresses, and these could be supplied to your advertisers as a Christmas present without annoying your advertising department. MARK R. LAMB.

New York City.

About 120 Grams of Radium Produced

Since Mme. Curie discovered radium, in 1898, the total amount of radium that has been produced is about 120 grams, and supplies are steadily increasing, according to the *Journal of the Röntgen Society*. The total output of the Standard Chemical Co. (Pittsburgh Pa.) up to 1920 is reported to be 50 grams of radium element, and although its present output is only 18 grams per year, the company is said to be preparing to produce 50 grams of radium element yearly, should the demand justify it. Since 1913 three new radium factories have been started in America and several in France, where an average of 18 grams of radium per annum was produced during the war.

THE COPPER QUEEN SMELTER OF THE PHELPS DODGE CORPORATION, DOUGLAS, ARIZ.

The Power of Copper

By Graham John Mitchell
Written for *Engineering and Mining Journal*

A FEW YEARS AGO the average citizen was likely to derive his conception of the value of copper mainly from the stock-market reports, the metal itself as a commodity meaning little to him. Then, with the coming of the war, he learned to think of copper in its use as a great destructive mineral, through lack of which Germany was greatly handicapped in her military campaign, whereas the United States had enormous supplies and large producing mines which could continually replenish her supply. But now, in the days of reconstruction, he must readjust his point of view and think of copper not in the light of its destructive uses but in its decidedly constructive significance. Practically all of the communities where it is mined have been established by the copper industry. Few of them would be in existence were it not for the mines around which they have been built.

Take, for example, the copper centers of Arizona, the state which leads in the production of this mineral. In 1919, Arizona produced 536,515,368 lb. of copper, which was 40.9 per cent of the total output in the entire United States for that year. If one were to attempt to picture the present mining centers of Arizona before the mines were discovered, the result would resemble the many familiar paintings of "The Arid Southwest" which adorn nearly all art museums. There would be a rattler devouring a jack rabbit, with a gila monster looking enviously on, and cacti and sage brush with stretches of desert waste would complete the picture. How different is the present-day panorama, with its modern cities and thriving communities built because of the copper mines!

No better single illustration of the effect of the copper industry in developing a district can be found than the city of Ajo, in southern Arizona. Eight years ago what is now a model town was a sand and sage brush covered flat, dotted here and there with occasional miners' cabins. Copper was mined at Ajo as early as 1854 by the Arizona Mining & Trading Co., which, however, could work merely the high-grade ore, as only such ore could stand the cost of transportation to the nearest point for shipment. After all the high-grade had been extracted, the mines were closed down, and as short a time ago as 1912 the old site of Ajo was practically deserted. To reach it one was forced to drive over a long, hot fifty-mile stretch of desert, the town of Gila being the nearest rail station.

An almost unbelievable transformation has been wrought during the last few years. Today a branch railroad runs directly to the town, and the visitor alights at a beautiful modern station. Ajo is a "company town" in the broadest sense of the word. It is laid out not merely to exploit the mines but on the theory that ideal working conditions and attractive surroundings do much to draw the highest type of workmen and to promote a spirit of harmony and satisfaction among them.

The general type of architecture of the company buildings is Spanish mission. There is a central park or plaza, with the stores and public buildings grouped around it. Farther back are the homes of the employees, and beyond are the "hills of copper," where steam shovels load the ore into cars which transport it to the extraction plant. Modern mining and metallurgical methods, backed by executive and engineering ability, have developed a system whereby the low-grade ore could be worked profitably, and, as a result, Ajo, one of the most unique copper-producing plants in the world, was built and a new and thriving community added to Arizona. The town and the New Cornelia Copper Co.'s mines stand as a tribute to the foresight and ability of Col. John C. Greenway, who was largely re-

sponsible for adding this new unit to the copper industry of the state.

A traveler over the El Paso & Southwestern R.R. from Chicago to California could pass through the diminutive station of Osburn, and, unless informed, would never suspect that eight miles north, nestled in the bottom of Mule Canyon, is the picturesque city of Bisbee, known throughout mining circles as one of the famous camps in the country. With it will always be associated the name of the late Dr. James Douglas, through whose efforts the Copper Queen Consolidated Mining Co. was developed. In later years this company became a part of the larger Phelps Dodge Corporation, which has taken a prominent part in Arizona's progress, under the leadership of Walter Douglas.

Millions of dollars are invested in Bisbee by Phelps Dodge and its sister producers, the Calumet & Arizona Mining Co. and the Denn-Shattuck Mining Co. These organizations have made possible a modern city in the heart of an otherwise desolate region. The El Paso & Southwestern R.R., from El Paso to Tucson, would never have been built were it not for the need of an outlet for the products of these mines. This road, which is surpassed by none from a standpoint of railroad construction, forms the present westernmost link in what will some day be a through rail system between Chicago and southern California.

A short distance east of Bisbee is Douglas, known in the southwest as the "Smelter City," chosen as the location of both the Copper Queen and Calumet & Arizona smelters, and it is around that branch of the copper industry that the city has grown. North to Miami are the Inspiration Consolidated and Miami properties, two

A VIEW OF MIAMI, ARIZ.

large low-grade copper mines. In this section of the state are also Ray Consolidated, at Ray, and the mines at Globe, both leading copper producers.

To the east of the Miami district are the Clifton-Morenci mines. Farther north at Jerome are the United Verde and United Verde Extension, the former having been developed by ex-Senator W. A. Clark and associates and the latter largely due to the efforts of James Douglas. These mines have, like those at Bisbee and Ajo, been the keystone in the growth of their respective communities.

The part copper has played in the development of Arizona has its parallel in various other states, such as Michigan, Montana, with its rich mines at Butte, and Utah, where are situated the famous Bingham Canyon deposits.

There is a thrill of romance about copper mining districts—the tales of early prospectors, of their successes and failures, and the final locating of the "pay-streak," the early boom days, and the mushroom growth of the camps. But always, with the history of each one of them, has been associated the name of some man with brains and vision, who, realizing the great significance of copper as a national resource, has builded both thoroughly and scientifically, not for the present alone, but with an eye to the future.

And so the story of copper is not that of the gold rush to Alaska, not the spectacular dash to be the first on the ground, but an even, steady growth, backed always

THE PLAZA AND SCHOOL AT AJO, ARIZ.

by a capable organization working with perseverance to build up a permanent industry.

The importance of copper has hardly yet been realized. Its possibilities are so great that they can scarcely be listed in so brief a presentation. Probably its most important work will be in connection with the increasing use of electrical power. No other agent has been found which can approach it as a suitable conductor of electricity, the motive power which will move the world during coming generations.

Because of the vital necessity of copper in world industry, the present depression in the copper industry can, at the most, be only temporary, and, after the period of readjustment, it is safe to predict that the demand for copper will be greater than ever before.

Bahia as a Mineral and Precious Stone Producer

Bahia, Brazil, is an important South American trade center, and is situated in a region rich in minerals and oil-shale deposits which have not as yet been developed. Diamonds and carbonados, monazite sand, manganese, and chrome ore are some of the minerals exploited and exported. Bahia is the only region in the world where the carbonados ("black" diamond) are found. They are harder than white diamonds, are used in diamond drills, and are worth almost as much as those of the finest white variety.

Exports of minerals to the United States in 1918 and 1919, according to Consul Thomas H. Bevan, follow:

	1918		1919	
	Quantity	Value	Quantity	Value
Chrome ore (tons)	13,200	$709,224	1,000	$56,719
Manganese (tons)	53,053	2,409,546	7,330	297,176
Bortz (carats)	738	9,232	375	2,026
Carbonados (carats)	10,752	475,505	10,859	530,170
Rough diamonds (carats)	10,366	318,525	10,684	471,181
Industrial diamonds (carats)	.....	.....	126	3 853
Tourmalines, etc. (carats)	.....	.....	133,475	8.599

A Mining Engineer in Honduras

Impressions of a Brief Visit—Country's Wealth, If Any, Not Readily Apparent—Transportation Facilities Poor and Population Scanty—Customs of Inhabitants Primitive—Native Dairy Hygiene Offers Hope of Progress

By Paul T. Bruhl
Written for *Engineering and Mining Journal*

PASSENGERS between New Orleans and Puerto Cortes are conveyed by steamers operated under the Honduran flag by the Cuyamel Fruit Co. Shortly before the tug which was to convey us upstream from the landing to the fuel-oil station arrived on the scene, a tanker, in avoiding a ferry, crashed into the steamer moored at a wharf just ahead of us. Considerable damage resulted.

Early Sunday morning we got under way, but an hour later engine trouble developed, which caused a short delay. The stretch of the Mississippi between New Orleans and the sea is 110 miles long and from three-quarters to one mile wide. The water was unusually high, and in some places, indeed, it seemed as if only a few buckets more would cause the river to inundate the adjoining lands. It is a curious sight to see houses along the levee standing below the river level so that one can look in at the upper windows.

The scenery is rather monotonous—vast flat fields or wide expanses of tangled undergrowth. Vessels ahead, following the sinuous course of the stream, present the optical illusion of seeming to be at a higher elevation.

At the lower pilot station, situated eighteen miles from the mouth, a change of pilots is made. At this point the channel narrows down to about 300 yards. A few miles out at sea one crosses a clean-cut line of demarkation between the muddy river water and the soiled green of the Gulf.

Early on Tuesday morning the first land was sighted. It was the Island of Contoy, off the low-lying mainland of Yucatan. On the evening of the following day we made Puerto Cortes, where after a perfunctory medical and customs examination we went to a hotel. The town partially encircles the bay and consists of bungalows on either side of the railroad track. The vegetation is tropical. The ground, marshy in places, is rendered beautiful at dusk by swarms of fireflies. The south side of the bay is bordered by fairly high well-wooded hills. The entrance to the hotel is given over to a bar, the sight of which to the newcomer from the United States is, as it were, a lifting of the veil which shrouds the past.

In the patio the chickens and turkeys lead their precarious lives, and their early morning bickerings make an alarm clock unnecessary—at first, at any rate.

TEGUCIGALPA, CAPITAL OF HONDURAS

I left Puerto Cortes in the Ferrocarril Nacional de Honduras, a line which I understand has been taken over by the fruit company. The track is not in the best condition at present, as the roadbed consists of tamped earth. It is said that formerly the passengers were obliged to wear spurs so as to secure a good grip under the seat when the train was in motion.

The boiler is wood fired. The engine made curious spasmodic spurts as if the engineer realized at intervals that he was not running on time and wished to remedy the situation.

We passed at first through banana plantations and by heavily wooded hills, but further along the vegetation became less dense and the foreground was dominated by the stately and beautiful native palm.

At San Pedro Sula, a thriving town of about 4,000 inhabitants, I changed trains for Potrerillos, the end of the line, thirty-five kilometers further on. Potrerillos is a typical village with a few whitewashed houses, either thatched or covered with home-made tiles; a place of no interest whatsoever to the passer by, and noticeable chiefly for the want of any distinguishing feature.

Al-Fresco Accommodations

Owing to a late start, due to the failure of the *mozo* to put in an appearance at daybreak, I stopped for the night at Rio Blanco, about twelve miles away, and obtained hospitality at the ferryman's very modest habitation. The yard was in full possession of an

intimate group of children, goats, monkeys, poultry, and pigs. I passed the night in a hammock slung out-of-doors, and the mosquitoes saw to it that my rest was broken and fitful. I rose at daybreak and paddled a canoe downstream in an endeavor to whet an appetite for the inevitable beans and tortillas. The river, which was in fact no wider than a brook, was overhung by trees, through the leafy branches of which the sunlight struggled with difficulty. It was too sombre to be

THE COW SPECIAL

entirely enjoyable, and I was glad to return to the breakfast that was now in course of preparation.

The kitchen stove was made of stone and clay, and as there was no chimney the smoke curled lazily to the roof, where, caught in little eddies, it was hurried into the outer air through the many crevices in the thatch. The beds were of the simplest design—one-inch poles laid lengthwise on crosspieces, with a mat inadequately serving the purpose of a mattress. Alongside the bed was a hammock cradle just a few inches above the floor. One could not help feeling sorry for the baby, exposed as it was to the inquisitive nose of every wandering pig.

I got away at 6 o'clock and traveled along a fairly good road, occasionally rocky, that made a gradual ascent to the small town of Santa Cruz. The hills at first appear to be a jumble of peaks, but gradually they straighten themselves out into some semblance of order, and one can trace out the various ranges. Some good cattle can be seen along the wayside, but owing to the dry season they seemed to be suffering from lack of nourishment.

After lunch I rode a further twenty miles over some very rough ground to the resting place for the day. In the early night a thunderstorm awakened the echoes of the surrounding hills and obliged me to sleep *en famille* with my hosts. One is, of course, in complete privacy when the light is turned off, but as there was no light at all, not even a splinter of pine or a guttering candle, the privacy one enjoyed might even be said to have exceeded 100 per cent!

HONDURAN LEAGUE A VARIABLE QUANTITY

The next day I reached Cuevas, distant about thirty-two miles. Here I may remark upon the elasticity of the Honduran league. The Irishman, we know, rejoiced that he was at least keeping up with the place. In Honduras at times one's objective actually seems to get away from one. It is a little discouraging to ride for an hour on a none-too-attractive mule only to find that the next village has increased its lead by a league or two. In Chile, the traveler on asking the distance to his destination is told "*Dos horas mas*," or "*Tres horas mas*." In Bolivia, the Indian usually replies "*Quien sabe*." Both terms are preferable to the Honduran "*legua*," which is too much subject to purely local interpretation.

Some of these *leguas* unraveled their uncertain length through woods redolent with the scent of pine. The country, although still sparsely inhabited, appeared to have more frequent patches under cultivation with sugarcane and corn. There was, however, no organized work, and as the people cannot raise with certainty more than suffices for their personal needs, their existence must be one in which ready money plays but an inconspicuous part.

Cuevas, a village, is the proud possessor of a church, a whitewashed structure with an impossible pair of plaster angels reclining over the main entrance. Cows are used for "snaking" logs. There is a brotherhood existing between the men who snake logs. My Spanish is not fluent, but I am positive that the sentiments that the man was endeavoring to express were identical with those held by the man I met last summer in the pine woods of Georgia.

DR. DARLINGTON'S INFLUENCE FAR FROM HOME

In the evening I saw a woman sit down to milk a cow. She was about to begin without any of the preparations considered necessary by the Board of Health, but at the last moment, her soul nudged, perhaps, by the spirit of some hygienic ancestor, she wiped the udders—with the tuft at the end of the animal's tail! She did not do it furtively but with an

MILL OF NEW YORK & HONDURAS ROSARIO MINING CO.

earnest deliberation. Yet we say that half a loaf is better than no bread.

The next day, an eight-hour ride along a trail that clung to the rocky edge of precipices or followed the grassy banks of a stream brought me to the town of Comayagua, which years ago enjoyed the distinction of being the capital. It is not a large town nor a busy one, and the inhabitants spend, I think, a few moments

of each day in wondering why the seat of government was removed to Tegucigalpa. There are two large churches belonging to different ecclesiastical orders. The cathedral fronting the plaza is inclosed by a fence made out of the barrels of old Spanish muskets. The high altar within is prettily, if a little garishly, decorated. At the other church there used to be a valuable Murillo. Its genuineness was unfortunately recognized by some unprincipled collector.

Wayside Crosses Frequent

I left Comayagua by automobile at 1 o'clock the following afternoon, and followed the valley till we came to the range that had to be crossed. The road winds up the mountain side through pine woods where the air is cool and invigorating. All the bridges, a few of them of stone, were in good condition and well cared for. One could not but be impressed by the number of crosses, each marking the resting place of the party of the second part in some wayside difference of opinion. I am informed, however, that every cross does not necessarily indicate a violent end—some of the departed may have met death as the result of a perfectly legitimate illness. However, that may be, I think that the custom of erecting these crosses creates an erroneous opinion in the minds of foreigners as to the degree of culture of the natives. A similar custom adopted in some other towns I know would cause a radical change in the scenery.

The men in Honduras go about armed either with a revolver or with a machete. I cannot see the need for so lavish a display of artillery, but I am told it is advisable, inasmuch as it discourages the acquisitive tendencies of a certain class. The high cost of marriage fees causes the marriage ceremony to be dispensed with in many instances, so that mutual consent is regarded as an adequate substitute for the blessing of the Church.

From what I have seen of Honduras it is not as yet in fact a rich country, whatever its potentialities may be. The great lack of transport facilities and the paucity of numbers of the inhabitants are two obstacles in the way of financial progress. I am indebted for the photographs to Mr. S. Weld.

Numerous Mineral Deposits in the Malaga District, Spain

The western district of Malaga, Spain, contains the Serrania de Ronda mining field, in which nearly all kinds of mineral deposits may be found, such as lead, copper, zinc, antimony, nickel, gold, and platinum, according to *Commerce Reports*. During the last four years the Spanish government did not permit prospecting, and concessions could not be obtained. Only lately has this district been opened to prospectors, with the result that a number of mining companies have sent their engineers to investigate and report.

The northern part of the Province of Malaga is rich in red oxide of iron ore; the mines of Salinas, Archidona, and Rio Frio are well known. The ores found in this district are exported for use in the manufacture of paints. The eastern district of Malaga contains lead, iron, and zinc mines which are north of the town of Nerja and extend into the Province of Granada, where, east of Nava Chica, altitude 1,831 meters, many undeveloped lead, zinc, molybdenum, and vanadium concessions are located. The southern and central districts of Malaga, northeast and southwest of Santa Pitar, altitude 1,020 meters, also contain a number of lead, zinc, and copper deposits, most of them not yet sufficiently examined or developed.

The lack of proper transportation facilities and good roads is a drawback to the development of these mining districts. In many instances the ore has to be hauled to the railroad station in ox- or mule-drawn carts, or carried on muleback, for a distance of three to twenty-five miles at a cost of $2 to $10 per ton. Many of the mineral deposits in Spain are far from being exhausted, and only await the necessary capital, machinery, and aggressive action to make them successful investments.

In these districts there should be favorable opportunities for the sale of American motor trucks and tractors, to be used in overcoming the present difficulties in transportation, due to the lack of railroad cars and equipment. American mining machinery and supplies should also find a ready market, as, on account of the difficulties in obtaining machinery during the last few years, many mines have run short of equipment.

Decline in United States Gold and Silver Production

Final figures showing the production of gold and silver in the United States were recently issued by the Bureau of the Mint and the U. S. Geological Survey. They show that the production of gold in the United States during the calendar year 1919 totaled 2,918,628 fine ounces. The silver production was 56,682,445 fine ounces. The figures are as follows:

	Gold		Silver	
State or Territory	Fine Oz	Value	Fine Oz	Value(a)
Alaska	481,984	$9,963,500	690,151	$773,520

(a) Valued at the average New York price of fine silver, $1.12087 per oz.

Compared with 1918 production these figures indicate reduction in gold output of $8,313,300, and in silver output, 11,127,694 oz.

Federated Malay States Tungsten Exports

The total export of tungsten ores from the Federated Malay States, as shown by the customs returns, was 355.41 tons in 1918, as against 761.31 tons in 1917, according to the Bureau of Foreign and Domestic Commerce. Of this total wolfram accounted for 244 tons and scheelite the remainder. Export duty on tungsten ores was not exacted, and free prospecting licenses continued to be granted.

Mining Experiences in Idaho in the Nineties

Narrative of Difficulties and Happenings at an Old Gold Mine—Transportation Over High Mountain Ridges—Isolation in Winter—Novel Method of Packing In an 8,400 ft. Wire Cable

By G. L. SHELDON
Written for *Engineering and Mining Journal*

THE Yellow Jacket Mine, in Lemhi County, Idaho, was purchased by friends of mine in October, 1892, and shortly after I was sent in to take over the property and start work. Ketchum, Idaho, on a branch from Shoshone on the main line of the Oregon Short Line, was the nearest railroad point. From Ketchum it was eighty miles by stage to Challis; thence by horseback, over a trail sixty miles long, across three mountain ranges from 9,000 to 10,000 ft. in altitude, to the milling plant of the property on Yellow Jacket Creek, at an altitude of 8,000 ft. The mine was on the mountain 1,200 ft. higher. The ten-stamp mill on the property had been put in by J. B. Haggin in 1866. The former owners, after working two weeks in cleaning up the mill, turned it over to us. In four days we cleaned up $3,000 from around the batteries.

In summer the ore was hauled from the mine to the mill by wagons and in winter by sleighs, at a cost of $2.50 per ton. It was decided to erect a Swem aërial tramway, the buckets to carry 125 lb. of ore each. No packer would contract to deliver the ¾-in. wire cable required in its construction. The company's pack train brought in the cable, 8,400 ft. in length, in three trips. Being too stiff to coil for individual coils on each mule, it was strung out upon the main street of Challis, six or seven runs on a side being tied together. The mules were placed in the center, with the cables lashed to each side, the loop at either end swinging clear of the leading and the end mules. Nearly all the inhabitants of the county were on hand to see the pack train start. They had plenty of excitement and fun. It took two men to manage each mule for the first few days. On uneven ground the individual loads would vary in weight. In a hollow the rope would lift the center mule off its feet. On a ridge or knoll one mule took the load of three. One wall-eyed cuss bucked and tore around on a ridge, throwing the whole pack train of twenty-two mules down the mountain 150 ft. into the timber in a tangled, twisted condition. It took two days to cut them out, no serious damage being done.

Owing to the stiffness of the several cables bound together the pack train could not make short turns, and a temporary straight trail, regardless of grades, was therefore made. Eventually the mules became accustomed to the novel loading, and the entire cable was delivered without serious mishap. The tramway reduced the transportation cost for delivery of the ore from mine to mill to seven cents per ton.

HARD SLEDDING

During the following January I went in again as confidential man, cashier, and bookkeeper. At the time snowshoes were required. I used the long six-foot Canadian web shoes. Along the route there was a cabin with provisions every fifteen miles. It was the hardest four days' work I ever did; but afterward, when I learned to use skis, I found them much easier.

Early in the spring of '93 our provisions began to run low. Supplies had been purchased for fifty men, but the superintendent often had a hundred. There were finally only potatoes, oatmeal, and some rusty "sowbelly" that had been in the warehouse for five years. I have never been able to eat "sowbelly" since.

The trail over the Yellow Jacket Divide was shoveled out to permit the pack train to get through. Before it reached the divide a "chinook" blew for two days and cut all the snow out. Clearing the trail had cost $1,200. We went over into the Basin, where deer wintered, and shot some. That helped out our larder.

Before the next winter it was known exactly how much sugar, butter, flour, baking powder, and other provisions were necessary per day per man, and supplies were purchased accordingly. The provisions for seven months had to be laid in by Nov. 25 of each year. This applied also to every article needed at the mine and mill, even to window glass and tacks.

PAYING UNDER DIFFICULTY

Early in June of '93 (the year of the panic) trouble began over certain checks upon which payment had been protested. I went to the railroad and, by telegraphing, secured by express from New York a few thousand dollars in currency. Under the terms of the purchase contract of the property, all of the gold bullion produced had to be deposited in the Wells Fargo Bank at Salt Lake within a certain time each month, and credited on the balance due upon purchase price of the property. Unless this had been done the property would have been forfeited.

Upon returning to the mill, I found that the superintendent had held the bullion, hoping to make sure of his own and his friends' pay. I paid him in full and discharged him. A man on horseback, together with another horse upon which the bullion was packed, was dispatched with instructions to proceed to Salt Lake without delay. The bullion reached the bank upon the last day of the forfeiture period, after banking hours. The bank being advised by wire, received it, and saved the mine. The owners were wired about the incident and informed me that I was in charge. I remained as superintendent until the mine again changed hands in May, 1895.

The old cam shaft on the stamp battery had been in use so long that key seats had been cut all over it, and there was room for no more. A new shaft was purchased. This weighed 625 lb. Jesus Urquida, a Mexican, was the only packer who would bring it in. He secured the largest mule in the locality. He then made two tripods the height of the shaft when loaded. These were packed on another mule. The big mule was led with the load, one, two or three hours, depending upon the condition of the trail. Urquida would then stop and set up the tripods just behind the loaded mule. Four men would next slide the shaft back onto the tripods. The mule was then allowed to rest and feed for a short time and the procedure repeated.

The mill was operated by a Leffel water wheel, which was connected to a penstock forty-two feet in length. A ditch, about 1,500 ft. long, conveyed the water from a six-foot dam on Yellow Jacket Creek. Anchor ice that formed on very cold nights in the creek would sometimes, when the temperature rose suddenly, break loose and in the form of a fine, slushy material, before we knew it, fill the penstock full of ice, stopping the water wheel. It took two days to dig it out. The ditch on the hillside would often break, causing many shutdowns.

During the winter of '93, logs were cut and two-inch plank was sawed from them for a flume. To cut a groove in the edges of the planks, an old broken saw blade was cut to about seven inches in diameter. Teeth were filed in it. It was wedged at a slight angle on a shaft, thus enabling a groove three-eighths of an inch wide and of the same depth to be cut in the edge of the two-inch plank. Small tongues were sawed out for the grooves. The primative tongue-and-groove joint thus made was practically leak-proof.

The following May the mill was shut down. Part of the mine force was brought down to put in the new flume. The weather was dry and windy. The roof of the mill had been in place twenty-seven years, and the shakes that covered it had become worn and frayed. When it was seen that the flume would be completed within the day, the mill men put on new shoes and dies. It had been customary to fasten on the shoes with wedges made from hard wood obtained from plug-tobacco boxes. The shavings and refuse from making the wedges were burnt in a large heating stove in the mill, and under the prevailing conditions of wind the sparks resulting set fire to the shakes. The fire spread the length of the roof almost instantly. The mill was lost. The flume at the time lacked two plank lengths of completion. At the suggestion of Tom Kelley, boss carpenter, a force of men was sent to throw in the two plank lengths, weight them down with rocks and place side boards. The water was turned in and the flume and penstock were saved.

Changes in Power Plant and Construction of New Mill

The dam was deepened to about twelve feet and a plank apron twenty-four feet wide on a fifteen degree pitch into the water was constructed. The crest of the apron was six inches lower than the rest of the dam. This spillway was effective in carrying off the anchor ice.

The flume was four feet high and six feet wide and covered with loose one-inch boards. It received the water from the bottom of the dam. A sawmill was put up, and during the summer a half million feet of lumber were cut for a new mill. On Oct. 4, 1894, the plans for the new mill were received. The building was 75 x 150 ft. It was double sheathed with building paper between the boards and battens outside. Twenty new stamps and the ten old ones that went through the fire were used. Some of the stems of the old battery were badly bent, but our mechanic, George Ferguson, made a contrivance and then heated and straightened them in the blacksmith shop. The freight route was changed to Pedrock, on the Butte branch of the O. S. L. R.R., thence by wagon road to Salmon City and Leesburg, over the first divide. This cut the packing over the trail to a distance of about thirty-odd miles. Contracts were made with the packers at 2½c. per lb. They agreed to see the job through, even if it took all of the winter.

The water supply for the batteries was obtained from a spring about 2,000 ft. up the gulch on the road to the mine. It was brought to the mill in a 4 x 4 in. wooden box made of 1-in. lumber. The box was covered with earth, thus keeping the temperature of the water in the battery and upon the plates about 56 to 58 deg. This water was used for hydraulicking soil and gravel on the hillside at the mill site. Gold being found in the excavated material, sluice boxes and riffles were put in, and some gold was recovered. Snows came the last of November. The trail became icy. Occasionally a mule was lost. Hay for the mules had to be packed in. Feeling that trouble was brewing, we went outside and purchased a pack train of thirty mules, hiring the former owner to handle it. Along in December, all of the packers came to the office and struck for more pay. Asked if their contract required them to pack all of the freight in at the agreed price, even if it took all winter, they replied, "Yes, but we can't do it." "Is this your last word?" we asked. "Yes," was the reply. Our answer was that the company would pack the freight if the contract was broken. We had been constructing additional road, so that the packing distance was then not over twenty-two miles. The packers stuck and delivered the freight.

Record Made in Constructing Mill

The twenty new stamps began dropping on ore in 110 days from the time the plans were received, a record when the transportation conditions are taken into consideration. The work was expedited, as the bill of lading showed numbers and exact contents of each box. Box contents were checked at the factory by three separate checkers. We never found a bolt or nut missing, and it often became necessary to send a man and a mule out on the trail until he found a certain numbered box which was needed. The machinery was purchased from Fraser & Chalmers.

The Leffel water wheel contained an important hardwood bearing. During the winter of '93-'94 sand cut out the bearing. No hard wood was available nearer than Salt Lake, the round trip thereto requiring over two weeks. Some of the boys recalled that during the previous autumn, while hunting on the Middlefork, they had seen some mountain mahogany, which at that altitude often grows a knurly knob just at the grass roots. Two of the men sent out on snowshoes came back on the second day with several of the knurly knobs. Twenty-four hours later the mill was running on a better bearing than the original white-oak bearing that had been replaced.

The men were charged $1 per day for board. When the company took over the property board cost 98c. per day per man. By judicious buying and discounting all bills the cost was cut to 68c. per day. No complaints were made. In fact the table had the best reputation in Idaho. Fat beef cattle were driven in as late as possible and killed at the mill. The dressed quarters were hung in a cool, dry place, and kept all winter.

During the '93-'94 winter there were twenty-four cases of pneumonia in the camp. The nearest physician was sixty miles away and had to make the trip on snowshoes. A man was put with each case as a nurse. Our medicines were limited to quinine, cathartic pills, and nitric acid from the assay office. Hot corn-meal poultices were used, being changed in the early stages of

the pneumonia every twenty minutes. Only one case was lost, and this was due to the patient's disobeying orders.

The sawmill was on the hillside on the tramway level. All lagging was cut ready for use from slabs and poor lumber and sent up on hooks on the tram to the mine. This situation placed the sawmill about 75 ft. vertically above the penstock and a similar distance to one side. A quarter-turn belt from the vertical waterwheel shaft drove a pulley on a horizontal shaft. A grooved cast-iron pulley lined with rubber was placed on this shaft and a pair of similarly lined pulleys at the turning point. On the saw shaft was another pulley of the same kind. Power was transmitted by a §-in. wire cable. A traveling pulley was placed on the power cable at the saw level and a weighted box took up the slack of the cable.

Pitch as a Substitute for Rubber Lining

During the winter of '94-'95, when lumber was still required, the hard rubber linings cut out. New ones could be obtained only from Chicago. Men on snowshoes, with axes and sacks, were sent into the hills to cut pine pitch wherever found. The pitch was placed in a five-gallon can, and the can placed in a larger kettle filled with water. By applying heat the pitch was melted. A single strand from an old manila rope was wound into the groove of the wheel, and, as the wheel was turned slowly, the hot pitch was poured in. This gave even better results than the rubber lining, and only two days were lost by the delay.

The years covering the experiences here detailed were during the troublous period in the Cœur d'Alenes. Many miners drifted into Yellow Jacket from there. Although they had a union affiliated with the Western Federation of Miners, we had no trouble and always had sufficient workers.

The ore was free milling and averaged just under $10 per ton. The original ten-stamp battery that Haggin put in was made by the Union Iron Works, of San Francisco. The battery was a double discharge one, but only one side was used. An extra set of silver-plated copper plates was put in, and both discharges of the battery were used, better results in tonnage and extraction being obtained. In the new mill the plate surface was doubled by placing a full-sized table below the apron plates, a sharp drop being left between the two sets of plates. Small pieces of copper plates were cut and put in the launders clear out to the tailings pond. These were cleaned up once a month, with satisfactory results. With the new mill the tailings assays were cut to between 40 and 50c. per ton.

Downward Extension of Vein Lost

The vein was first discovered and worked on the top of a ridge. It was high grade and was stoped 50 ft. wide, 90 ft. deep and about 200 ft. along its course. It was cut by a fault and picked up lower down upon the ridge on rather flat ground. Here the vein material was a hard, white quartz 48 ft. in width. Much of the intervening ground from grass roots down to between 50 and 60 ft. in depth was fine, erosional material containing bunches of white quartz. All of this milled from $7 to $10 per ton. The ground was heavy. Square sets were used, the red fir posts being from 12 to 15 in. in diameter.

A crosscut about 200 ft. vertically below the lowest workings was begun prior to the change of management. I understand that considerable crosscutting has since been done to the south in endeavoring to find the vein, but the work was unsuccessful. I have often wondered if a reverse fault had not thrown the vein north of the original discovery. The country rock is porphyry and is broken. The new management, succeeding our control, contrary to competent advice, doubled the mill, water power and tramway. It is known that $72,000 was spent and $68,000 won. The mine has been idle since that time.

Gold, Bauxite, and Quicksilver in Dutch Guiana

The production of gold in Dutch Guiana shows a steady decline, according to Consular Agent James S Lawton in *Commerce Reports*. No new discoveries were made in 1919, although there has been a revival of interest in the old Sara Creek mining district, principally by small lessees. Total gold production for the year 1919 was valued at $357,027, and of this $144,083 worth was produced by one company, working entirely by hand, in the Marowyne district. On this same river, an American company continued prospecting with a view toward dredging. Results are reported as having been satisfactory.

A law now provides conditions under which exploitation of the bauxite deposits of the colony may be undertaken. Some of the chief features of this ruling are: Concession may be granted for any length of time not exceeding fifty years. No company or individual may hold at one time more than 125,000 hectares (1 hectare = 2.47 acres). The taxes on the bauxite land are as follows: For the first year, 10c. Dutch currency per hectare (1.6c. American currency per acre); for the second year, 20c. per hectare (3.2c. per acre); for the third year, 50c. per hectare (8c. per acre); for the fourth year, 75c. per hectare (12.1c. per acre); for the following years the tax is 1 guilder per hectare (16.2c. per acre).

Every concession holder is bound to mine yearly during the five years, commencing from the date of the concession, twenty tons on each 100 hectares or part thereof held. After the fifth year the minimum mined shall be ten tons per 100 hectares, and on each ton mined a royalty of 25c., Dutch currency (10c. American currency), shall be paid to the government. Corporations holding concessions now know under what conditions they must work, and preparation to mine and export bauxite are going forward rapidly.

Prospecting has continued, in a small way, for quicksilver ores, float of which has been found in a number of places near the Marowyne River, and it is reported that quicksilver has been found in place on one concession. The government, in connection with a Dutch company, continued to explore large areas of ground said to contain high-grade iron-ore deposits.

Spectroscopic Analysis of Gold

Nine standard samples of gold alloyed with silver, copper, and iron have been examined spectroscopically to establish a method for making quantitative analyses of mint gold from spark spectra, according to the Bureau of Standards, Washington. As a result of this work, it appears that the common impurities of gold can be estimated in the range of 0.0001 per cent to 1 or more per cent, with a probable error of not greater than a few hundredths of 1 per cent.

THE PLANE SURVEYOR IN MEXICO

Metallurgists of Note

E. A. Cappelen Smith

THE Chicago World's Fair in 1893 was more of an aid to progress in American metallurgy than has been generally thought. To see that exposition, E. A. Cappelen Smith came to this country from Norway, where he was born, at Trondhjem, twenty years before. Then, being offered a job with Armour & Co. at $40 per month, he decided to stay awhile, and is still with us. When Mr. Cappelen Smith accepted the post of assistant chemist in the stockyards the application of chemistry to the meat-packing industry was comparatively unknown. Practically no byproducts were manufactured, and he was one of the first to show that a lot of things besides meat could be obtained from livestock. He still believes that food chemistry offers even more opportunities for profitable research than does metallurgy. A year and a half later, a position with the old Blue Island Works of the Chicago Copper Refining Co. offered almost double the salary, so was accepted. This was really more in line with the training which he had received at the Technical College of Trondhjem. The Blue Island plant had a small sample of almost every kind of furnace and apparatus used in treating copper ores in those days, and therefore gave Cappelen Smith an excellent opportunity to become familiar with many different operations. Although employed as chemist, he took a great interest in picking up practical knowledge from the workmen, and he considers this one of the most important essentials to success. It is not necessary, Mr. Cappelen Smith thinks, actually to work up as a laborer from the bottom, but one with only theoretical knowledge should unquestionably become familiar with actual operating through close observance and friendly discussions with the foremen and others who conduct the work. The value of this knowledge was proved a short time after Mr. Cappelen Smith had further progressed to Anaconda. After hanging around the refining furnaces for awhile, Pat Shea, the foreman, one day threw up his hands just at the point when a charge was about ready to be poured and intimated that with so much technical ability around his services certainly were not required. To Pat's amazement Mr. Cappelen Smith took the furnace, carried the refining to the proper point and successfully cast the charge; they were firm friends thereafter. Pat said that he had played that trick on a good many others, with unfortunate results. Mr. Cappelen Smith's ability had been gained, not by actually doing the work, but by close observation, questioning and common sense. Leaving Anaconda in 1901, where he had been superintendent of the electrolytic refinery, the Baltimore Copper Smelting & Rolling Co. proved a fertile field for metallurgical research during the next nine years. In this time Mr. Cappelen Smith developed the process of basic converting and, with W. H. Peirce, patented the Peirce-Smith horizontal basic converter. He was also the first to use magnesite brick in reverberatory construction and to blow air into the molten bath of copper-refining furnaces. "We burned up miles of pipe," says Mr. Cappelen Smith, "and finally I tried a water-jacketed pipe." "Jim, I want you to put this pipe in that bath of copper," he told the furnace operator, "but first I want to tell you what it is." Its construction having been explained, Jim said, "You want me to put that water pipe in that copper?" "Yes." "Where are *you* going to stand?" "Right here." "All right, if you are willing to stand there, I will." There and then the problem was solved, and with a leaky jacket too, for the thread on one of the nipples had given way and a stream of water was spouting out when the pipe was removed.

E. A. CAPPELEN SMITH

Mr. Cappelen Smith's more recent activities in the art of hydrometallurgy are well known. Devising the leaching process used at the Chuquicamata deposit in Chile was all pioneer work, but it has been most successful. Through his genius the largest copper deposit in the world, heretofore thought of no economic importance, is being profitably treated. The first unit has a capacity of over 15,000 tons of ore per day.

Mr. Cappelen Smith is a member of many engineering clubs and societies, acts in a consulting capacity for several interests and is a director of several mining and financial companies. His headquarters are now with the Guggenheim Bros., in New York.

HANDY KNOWLEDGE

Repairing Lips and Bottoms of Steel Ladles

Owing to the smelting process followed at the Nickelton, Ont., plant of the British American Nickel Corporation, the slag obtained sometimes runs high in matte, the action of which is destructive to steel ladles, tending to corrode the steel at the point of contact and injure the kettle beyond further practical usefulness. The company has recently been reclaiming such ladles by means of thermit welding. In making repairs, pieces of steel were forged and welded into the ladle by an in-between casting of thermit rather than by completely filling the burnt or holed area by a thermit steel casting. By this method excessive strains were minimized.

FIG. 1. LADLE WITH THREE BOTTOM PATCHES IN PLACE BEFORE APPLYING WAX COLLARS TO PATCHES

In repairing a ladle with holes in the bottom, three patches were made owing to the irregularity of the holes and the greater ease of making three patches than one irregular patch. In lining up the patches, approximately one inch was provided at the edges for the entrance later of thermit steel. These patches were surrounded by a yellow wax pattern, and the usual thermit welding practice then followed. Riser patterns were used both inside and outside, the ladle resting on its side, one coming off at the high point and two others placed about half-way down on the wax. These latter two served to take care of the shrinkage of metal.

In making welds on the sides of kettles care must be taken not to put too much metal in the "collar" of the weld, as otherwise there would be a tendency to interfere with the clearing or "skulling" of the ladle. In applying the wax collar the wax should be from $\frac{1}{8}$ to $\frac{1}{4}$ in. fuller than the finished shape, to allow for shrinkage during contraction.

In forging a lip patch, the blacksmiths followed the outline of the cut ladle, cutting and shaping the patch to provide a peripheral space of about one inch width. It was no small job to shape the patch, and it is believed that in future repairs of this kind time can be saved by cutting away the kettle to a square shape, as shown by Fig. 3. The lower portion will not then lend itself readily to melting down during the pre-heating operation. It may also be preferable to cast the lips of steel, rather than to forge them.

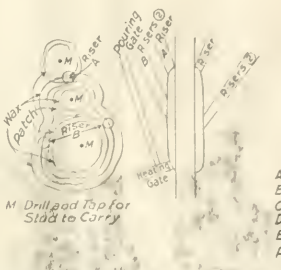

FIG. 2. PLAN AND SECTION, WITH PATCHES AND RISERS

FIG. 3. SKETCH SHOWING A LIP PATCH

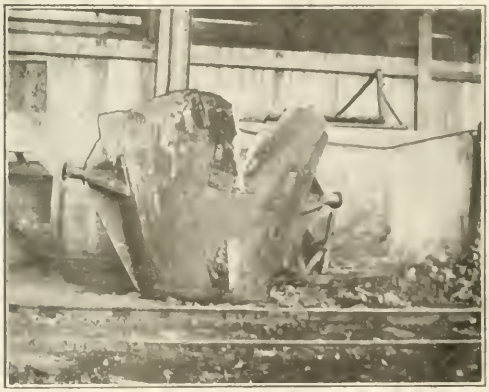

FIG. 4. LADLE SHOWING EXTENT TO WHICH LIP IS CUT OR CORRODED AWAY BY STREAM OF HOT MATTE

Preventing Accidents From Overhead Traveling Cranes

In the Nov. 22 and 29 issues of the *National Safety News* two methods for preventing accidents from overhead traveling cranes are shown. The method ordinarily used is a street-car warning gong placed on the floor of the crane cab and operated by the craneman as occasion requires. Both of the suggested methods are better than the one described. In one case the "crane hitcher" is required to walk a few yards ahead of every moving crane load and to clear the way of workmen. In the other, an electrically operated horn or an electrically operated gong is placed as near to the moving load as possible. The best position is immediately above the crane hook, and the device is operated by a push button in the cab.

Drilling Frozen Chunks With a Steam Jet

Written for *Engineering and Mining Journal*

On the Mesabi iron range of Minnesota the work of stripping or removing of overburden at the open-pit mines is carried on during the winter months. Some stripping is done in the summer also, but as this season is the period for shipping the ore by Lake boats,

APPLICATION OF STEAM JET DRILLING FROZEN CHUNKS IN IRON MINING

the steam shovels are employed principally in loading iron ore into cars for shipment to the docks.

In ordinary practice the ground in front of the shovel is loosened by means of blasting, and in this procedure holes are first drilled, either by means of jumper drills or steam jets, loaded with dynamite, and then fired. It frequently happens that large masses of earth are overcast by the shovel and occupy positions above the shovel cut, where they are not only a source of danger, but are of such size that they cannot be conveniently handled by the steam-shovel dipper. In this event the chunks are drilled and then blasted.

The accompanying illustration shows a large frozen chunk being drilled by means of a steam jet. A length of steel pipe is sharpened at one end and the other is placed in a steam hose. Steam is obtained from the steam-shovel boiler, and in some instances several lines of hose are supplied. When the steam is turned on, the operator forces the point of the drill into the frozen ground, turning it as he does so. A steel plate, which may be seen in the cut, is placed on the pipe in such a manner as to protect the operator from the steam or pieces of earth that may be blown out of the drill.

Sampling Hot Gases

Written for *Engineering and Mining Journal*

In sampling the gas in a roasting or reverberatory furnace, or a converter, considerable care must be taken not to have misleading results. One thing which must be prevented is any reaction between the sample tube and the gas. An ordinary iron pipe cannot be used in a hot furnace, for example, even though the temperature is below the melting point of iron, for any oxygen in the gas may react with the iron, and then the analysis will erroneously show absence of oxygen. The proportions of the other gases present will of course also be incorrectly reported. The sample pipe should be thoroughly water-cooled, or, better, a fused silica tube should be used. The rubber tubing must be carefully tested for leaks and all joints wired and shellacked. Atmospheric air must be completely expelled before taking the sample.

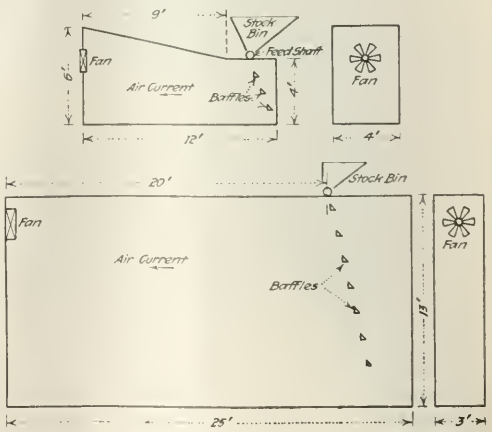
Another point not to be overlooked, especially when taking samples in flues, is that the gas stream is not homogeneous. Near the wall free oxygen will often be found, whereas at the center of the flue the gas composition may be entirely different. Also, the gas is usually changing from minute to minute, and to get a true average a large number of samples must be intelligently taken.

Air Classification in Ore Dressing

Written for *Engineering and Mining Journal*

Air classification is used in most graphite refining plants, and forms an important step in the refining process. The accompanying cut shows sketches of air classifiers usually made at the plant. So far as is known no experimental work has been done by the large majority of operators with a view to determining the most efficient proportions and shape for this device.

In principle, an air suction created by a fan at the back of each chamber is applied to a falling stream of graphite ore or concentrate. The heavier material, which is made up of quartz grains with attached graphite, is practically unaffected by the air suction, and falls into a hopper furthest from the fan. The lightest particles are drawn closest to the fan, which draws the finest dust into the atmosphere. When this



TWO TYPES OF AIR CLASSIFIERS

apparatus is used on crude concentrates, the middlings —which include the heaviest flake—form No. 1 flake stock, going to the No. 1 buhr mills, whereas the finer material closest to the fan is screened to remove as much finished No. 1 flake as possible.

By The Way

Greek Meets Greek

The War Minerals Relief Commission has been advised of a case of profiteering in commissions. An award was made recently in the neighborhood of $40,000 on a certain claim. Despite the frequent intimation, on the part of members of the commission, that claims could be handled without the intervention of lawyers, the claimant in this instance employed an attorney, to whom a power of attorney was given. This specified that he was to collect any award made on the claim. He made the collection, took one-half of the amount for his fee and deducted a liberal expense account from the remainder before forwarding the claimant his share.

An Unsuitable Fit

"W'en Tom Pengilley firs' h'arrived from Camborne, m'son," said Cap'n Dick, "'e went to work daown to tha h'Ophir mine, w'ere 'is cousin, Sam Treloar, wuz shifter. One day tha chap 'oo druv tha mule on tha ten 'underd main 'aulage laid h'off without reportin', so Sam sez, 'Gos' 'long do, Tommy, an 'itch up they gert grey mule an' drive un for tha shif'. Naow, Tom 'ad never put 'arness h'on a mule or a 'orse in 'is 'ole bloody life, but not wishin' to h'appear h'ignorant 'e gaws forth, not sayin' a word, to carry h'out tha boss's h'orders. In baout a hour, w'en no cars 'ad come to tha station, Sam went in to see w'ot's tha matter, an', dam-me, 'e meets Tom commin' h'out tha level with tha mule's collar in 'is 'and. 'Wot's tha matter 'ere naow, Tommy? 'Are'nt thee put 'arness to that mule yet.' sez Sam. 'So I 'ave,' sez Tom. 'I put un h'on right away; h'all 'cept this ere gert leather gasket w'ich 'pears to me to be too bloody small to pass h'over tha gert h'ears of un.'"

Africa for the Africans

Permission to sell 100,000 shares of stock at par "to colored people only" has been asked of the Arizona State Corporation Commission by the Comobabi Consolidated Mines Co. The promoters and all stockholders are said to be negroes. The company's property is in the Comobabi district of Pima County. This is bad business. In the promotion end of the mining game all questions as to creed and color should be forgotten. The one thing needful is to get rid of the stock before the condition of the "mine" becomes known to the public. Then again, what if other promoters should retaliate and refuse to let colored people in on the ground floor of some of their matchless propositions. Besides, discrimination of the sort mentioned is likely to stir up racial strife, and Arizona has been happily free from this so far. Imagine the envy that will be aroused if Comobabi comes through a winner. The Corporation Commission will do well to consider these things carefully before coming to a decision.

Annual Assessment Abolishment

Things were quiet in the old mining town. There was the sting of winter in the air. A snarl of the wind and a rattle of gravel against the worn front of the little hotel gave place to a moment of silence. The faint tolling of a bell was heard. Old Birdseye Porphyry stirred uneasily in his worn leather chair and said to Phenocryst Jones, his close-by neighbor: "What's that?" Phenocryst shifted his tobacco and said: "Haven't you heard? It's old Ground Mass Murphy. Died of starvation." "Died of starvation! How's that possible?" said Birdseye Porphyry. Phenocryst stretched himself and hunched back into his chair, saying: "You are very much behind the times, Birdseye. Haven't you heard what those law makers have done over there in Washington? No! Well they've abolished the mining assessment law again. This makes the third year of the annual abolishment of assessment. Old Ground Mass used to pick up a few dollars every year by doing the assessment on the ten claims of the Wild Gallop Mining Co. up in Depravity Gulch, on the other side of Pick Handle flat. He did the work for $40 a claim, and laid in enough grub to last him over the winter. Now those 'cheap skates' have found a better way. They just write to their Representatives and Senators and say, 'Have a law passed cutting out the assessment work. We're up against it again and can't pay our bills, and we must have the claims.' Of course those 'birds down at Washington' want to be accommodating, and they just press a button and summon their secretaries and direct them to 'shoot the law through.' But they did it this time. Poor old Ground Mass got thinner and thinner. He had a desperate struggle each winter. Where have you been? Haven't you seen him getting gaunter and leaner? Well, he borrowed from all of us; but, you know, he had pride. When he heard that the assessment was to be abolished again he just kind of disappeared, and Magmatic Segregation went over to his cabin yesterday and found him all cashed in. It beats all, don't it? Well, of course, those fellows down at Washington don't know how they are interfering with the living of fellows like us. I have half a mind to write to the *Engineering and Mining Journal* and ask them to call off these abolishments and get things back to normal, or this old town is going right to smash. We've had the gilt-edge taken off of two winters, and now this is the third, and it's getting almost personal."

"Have you read the last *Journal?*" said Birdseye, as he rubbed one shoe over the toe of the other and pressed his tobacco down into his pipe. "No, by heck, I haven't," said Phenocryst. "What does it say?" "Well!" said Birdseye, "it says that the Senate has put the 'kibosh' on the original bill by changing it to six months' grace." Phenocryst moved closer and waving a finger at Birdseye he said, "How in heck is that going to help Ground Mass?"

No Gold for Santa

Those in banking circles will doubtless be as much surprised at the recent request of the Treasurer of the United States that they should not distribute gold coins for holiday purposes as they will be relieved to have a further excuse for refusing to pass out gold through the paying teller's window. Their surprise will be but natural with the recent utterance of their Bankers' Association committee still in their recollection that "no national emergency exists calling for special treatment of the gold-mining industry." This admonition from Treasurer Burke must seem as needless to them as the passage of the McFadden gold bonus bill would be. But they will heed it and hang on to their gold. Indeed, their tenacious grasp makes one suspect that they value gold beyond its intrinsic worth.

CONSULTATION

Manganese Bronze and the Dry Cell

"Will you be kind enough to give me an answer to the following questions?

"What is manganese bronze, how made and its uses?

"Where can I get information as to the manufacture of dry-cell batteries?

"Are carbonated gases made from manganese dioxide and by whom?"

Manganese bronze is an alloy designed to develop a maximum resistance to corrosion by ordinary mine and sea water and at the same time have strength and toughness, with light weight similar to a mild steel. These essential characteristics are secured by many alloy combinations, actual or proposed, the most popular of which is manganese bronze. This is a brass to which have been added small quantities of aluminum, iron, and manganese to strengthen and render the alloy dense and close grained. An important consideration in the quality of the alloy produced is the amount of lead present, as it is a deleterious impurity and should be kept below 0.03 per cent. The composition of manganese bronze as given by W. C. Phalen is ordinarily about as follows:

	Per cent
Copper	57.00-59.00
Zinc	38.00-40.00
Iron, manganese, aluminum and tin	.25- 1.00
Lead	.10- .50

From which it can be seen that a relatively small proportion of manganese enters into the composition of this bronze. The amount of manganese used in the bronze, according to J. L. Jones, of the Westinghouse Electric & Manufacturing Co., should not exceed 0.05 per cent, and many of the best manganese bronzes show on analysis only a trace of manganese. However, some manganese bronze of good quality has been made containing about 4 per cent manganese, particularly the grades first produced. As a source of manganese consumption the manufacture of the alloy is relatively unimportant; in fact, its name is rather misleading in point of manganese content.

Manganese bronze is widely used, particularly in marine construction or in machinery where corrosion is counteracted (mining machinery), and it has gained in popularity because of its advantageous physical properties. Hence its use in propeller blades, where resistance to the action of sea water, strength, and toughness are highly essential.

The object of the manganese is to serve as a carrier of the iron necessary to insure the proper strength, and it serves but one purpose, which is to introduce the iron, for without the presence of manganese the iron would not alloy with the copper. Ferromanganese may be used as the medium for introducing the manganese.

The alloy can be made either from a pure brass to which aluminum, iron, manganese, and tin is added, or it can be made from low-grade scrap material, skimmings from the brass foundry, zinc, iron recovered from galvanizing plants, aluminum turnings, and other byproducts. It is necessary, however, to use a reverberatory or other furnace in which it is possible to accumulate a bath of considerable volume, so that refining is facilitated. Details of the operation will be found in a paper by P. E. McKinney published in the *Transactions* of the American Institute of Mining and Metallurgical Engineers, Vol. LX (1919) pages 374-385.

Bulletin 173 of the U. S. Bureau of Mines, entitled "Manganese Uses, Preparation, Mining Costs, and the Production of Ferro-Alloys," is a valuable publication on the subject, and contains several pages upon the manufacture and operation of the dry cell. The dry cell consists essentially of a zinc container holding a central carbon electrode and packed with a chemical depolarizing mixture.

The use of manganese in the dry cell is confined to the chemical mixture or "mix," which is placed around the centrally located carbon electrode about one inch from the top of the container and is a depolarizing mass. It is essentially a mixture of ground carbon (calcined petroleum coke and graphite), manganese-dioxide ore, and the electrolyte (ammonium chloride). The manganese dioxide serves as a depolarizing agent and oxidizes the hydrogen evolved during the operation of the cell which would ordinarily polarize the chemical reaction.

The rigorous physical and chemical characteristics required of manganese are suitable for use in dry cells and have been enumerated in an article in the consultation department in the issue of Aug. 14, 1920, to which reference should be had.

The *Engineering and Mining Journal* does not know of any attempt to produce carbonated gases from manganese ore, although no doubt it can be obtained from the carbonate. Limestone is much cheaper for the purpose.

Oil-Shale Information

"Can you advise me where I can look for authoritative information on the method now in use for the distillation of oil shales?"

A publication of the Bureau of Mines of the State of Colorado, entitled "The Oil Shales of Northwestern Colorado" (Bulletin No. 8), which can be obtained from the department at Denver, gives a valuable bibliography on the subject of oil shales and contains an excellent résumé of the oil-shale industry in this country up to the middle of last year, and, although written with particular reference to Colorado's deposits of oil shale, the text applies equally well to shale formations of other states.

The U. S. Bureau of Mines at Washington, D. C., has published from time to time brief papers on the oil-shale industry in this country, and it might be a good plan to communicate with the Bureau in order to obtain a set of these recent special investigation papers.

The *Engineering and Mining Journal* has also published articles upon the subject, particularly during the last year, and reference should be had to the files of the publication.

THE PETROLEUM INDUSTRY

The Burkburnett Field—A Lesson to Oil Men

Operations Conducted in Texas District Represent Needless Extravagance and Emphasize the Viciousness of Stock Schemes Promoted by Adventurers—A Plea for More Careful and Systematic Exploitation*

By R. E. COLLOM
Petroleum Technologist, Bureau of Mines

THE development of the Burkburnett oil district, Wichita County, Tex., took place in three stages over a period of eight years. In June, 1912, a well was completed on the Schmoker farm, about three miles southwest of the town of Burkburnett. This well was drilled to a depth of 1,847 ft. by the Corsicana Petroleum Co. Its initial production was 75 bbl. of oil per day. This was the beginning of what is now known as the Old Burkburnett pool.

During the two years following the discovery, considerable drilling was done in the pool. Adverse marketing conditions caused a slump in drilling operations during 1915, but toward the end of that year there was an improvement, and active drilling, both in proved and wildcat areas, was resumed. The total production of 1916 was a little more than 2,000,000 bbl.

During 1917 and 1918 the Old Burkburnett pool reached the height of its development. The productive limits of the field were determined by the drilling of numerous "dry" holes on the edges of the pool. A shallow pool, of small producers, lying in the south central part of the field, was also developed. Some of the wells in Old Burkburnett pool showed high initial productions. Two wells on the Serrien farm came in at an initial production of 2,500 bbl. daily. A number of wells were reported as having initial production of 300 to 750 bbl.

EARLY DEVELOPMENT OF FIELD WITHOUT SPECULATION

These productions are as high as those which caused the country-wide excitement, comparable only to the old-time rushes for gold, in the later drilling of Burkburnett Townsite and Northwest Extension pools. Old Burkburnett was never known by the speculating public. Apparently, during the development of this pool the psychological moment for speculation had not arrived. Then, too, the properties were in large tracts, owned and operated by experienced oil companies. Drilling was carried on in a businesslike manner, and the fortunes of exploration, whether gushers or "dusters," were accepted as part of the day's work. There was little opportunity for the stockjobber to get a foothold in the development of Old Burkburnett.

The development at Sunshine Hill, about six months before the discovery of Burkburnett Townsite pool, gave a preliminary test of the public's speculative temper. A forty-six-acre tract at Sunshine Hill was plotted into lots twenty feet square, and these were sold at $10 each.

The first well drilled on the track struck a good-looking oil sand at a depth of 580 ft. In a short time the lots were covered with derricks and drilling machines. By the end of April, 1918, there were seventy-five producing wells in the pool, and in many cases two wells were drilled on a 20-ft. lot. In a little over two years 245 wells were drilled on a tract of about 500 proved acres. The average production, in June, 1920, was two barrels per well daily.

Among the prospectors seeking oil in north Texas was a group of individuals known as the Fowler Oil Co., who pooled $12,000 to drill a test well on the northern edge of the townsite of Burkburnett. This well was known as Fowler No. 1. The nearest producing wells were in Old Burkburnett pool, three miles to the southwest. A dry hole had been drilled one-fourth mile north of the well, and the Roswell Oil Co. drilled a 2,450-ft. hole some distance southeast of the well without getting oil. During the last week of July, 1918, the drill in Fowler No. 1 entered an oil sand at 1,718 ft. The well came in flowing 2,200 bbl. of oil per day.

This was a big gusher for Wichita County. It was drilled near land, such as the Burkburnett Townsite, which had not been acquired by oil operators. The Fowler well started a town-lot boom in Burkburnett. Drilling for oil became anybody's game, and town lots were sold for $1,000 each.

Three weeks after the Fowler well came in there were fifty-six strings of tools running in Burkburnett Townsite. The larger operating companies were doing some development work but not crowding the holes like the town-lot speculators.

OIL GAMBLING BECOMES RIFE IN BURKBURNETT

Speculators and lease brokers flocked into Burkburnett. Leases were divided into acre and half-acre tracts—even drilling sites—and became the physical basis for the organization of stock companies. Burkburnett and near-by towns were crowded with people, a small proportion of whom were oil operators. The gambling spirit ran high. Adventurers, tender from the cities of the east, as yet to see their first oil well, milled about in the hotel lobbies in search of oil. They overflowed into the streets. Barrels were set on end and used, in lieu of desks, for transacting "oil" business. The rotary table became the "wheel," and the "numbers" to be played were shown on the checkerboard map of the townsite. Each successive gusher was a signal that some new number had won.

Drilling activity in Burkburnett Townsite continued until well into the spring of 1919, at which time the

*Published by permission of the Director of the Bureau of Mines.

pool had lost most of its glamour, owing to a rapid decline in production. About the middle of April, 1919, the Ryan Petroleum Co., wildcatting 3½ miles northwest of Burkburnett Townsite, brought in a gusher in the northeast quarter of Block 84 on the R. M. Waggoner farm. This well started producing at the rate of 2,000 bbl. per day, and was the beginner of an intensified drilling campaign in the Northwest Extension or Waggoner pool.

By the end of June, 1919, the Northwest Extension was producing 16,000 bbl. of oil daily. It was estimated that if all producing wells in Burkburnett district could be connected to gathering lines, the daily production would show in excess of 110,000 bbl.

There were no town lots in the Northwest Extension to facilitate the division of the pool into small holdings. However, many properties were divided into tracts of five acres, two acres, or less. It was a common custom to drill four wells on a five-acre tract.

When intensive drilling operations first started in the Northwest Extension, one of the larger pipe-line companies warned operators that unless drilling activities were retarded production would soon exceed storage and transportation facilities. This warning was not seriously heeded. Much oil was wasted because stock promotion companies insisted upon immediate completion of test wells, regardless of whether or not there was adequate storage to take care of the oil. Oil, as a commodity, they did not desire. A big flow of oil, regardless of what was done with it after it gushed from the well, boomed the value of the stock. In many cases, however, these values were transitory and the final holders of stocks learned that their "play" could never be interpreted in terms of investment or dividends. Many companies had tracts in favorable areas, but were delayed in getting a well drilled to the sand. When the well was finally drilled it was found that neighboring wells had literally taken the oil away from under their properties. As a result of these conditions, flow tanks were full and running over at a number of wells. Wells were permitted to flow because it was claimed that a well, if once shut in, would not produce as strongly again. When storage failed the oil was wasted into the ground or turned into the Red River.

Overproduction, lack of storage, railroad embargoes, and continuous overdrilling all contributed to the congested conditions in Burkburnett. In an attempt to relieve this congestion, a producers' committee was selected to go to Austin to request the Railroad Commission of Texas to issue orders to close down flowing wells, stop swabbing and suspend drilling for a period of thirty days. It was hoped that such an order would give pipe lines a chance to make storage space and, by cessation of drilling activities, the railroads could clear the congestion in their yards. A five-day shutdown was finally attempted. This met with considerable opposition, and many concerns allowed their wells to continue to flow and waste oil in spite of the necessity for conservation.

Productive Limits of Field Reached Early in 1920

In October, 1919, development of the General, or River, pool in the bed of the Red River northwest of the Northwest Extension and, later, the George pool, on the westerly edge of the Northwest Extension, helped to maintain the average daily production per well for the district. Except for the contributions from the George and General pools, the productive limits of the Townsite and Northwest Extension pools had been determined early in the spring of 1920.

Both the Northwest Extension and Townsite pools are practically surrounded by dry holes. Owing to the dispute between Oklahoma and Texas, drilling in the Red River on the northern boundary of Northwest Extension was somewhat curtailed. There is not much probability, however, that the productive area of Northwest Extension will be greatly increased beyond its present northerly limits.

As a result of speculative operations in the Burkburnett Townsite pool, 885 wells were drilled in a proved area of 1,265 acres. This is an average of 1.4 acres per well. The drilling in the Townsite proper averaged slightly less than one acre per well. It is probable that a normal development program for this pool, considering depths of holes, would be one well for every five acres. In other words, 250 wells, or one-third of the number actually drilled, should have been suffcient to economically drain the pool. Up to the end of June, 1920, about 13,000,000 bbl. of oil had been credited to Burkburnett Townsite pool. This does not include wasted oil and gas. The present average daily production per well is about 25 bbl.

In the Northwest Extension pool, at the end of June, 1920, there had been 1,251 wells drilled in a proved area of 2,440 acres. This is an average of 1.8 acres per well. This does not include the George and General pools. Up to the end of June, 1920, the Northwest Extension had produced 20,000,000 bbl. of oil. The average daily production, fourteen months after discovery, was 45 bbl. per well.

The average production, per acre, of the Townsite pool up to the end of June, 1920, was 10,275 bbl. and for Northwest Extension it was 8,200 bbl. Using an average sand thickness of 21 ft. for Northwest Extension and 28 ft. for Burkburnett Townsite and an assumed porosity of 15 per cent, the original oil content of the two pools is estimated at 24,070 bbl. per acre for Northwest Extension and 32,097 bbl. per acre for the Townsite pool. This would indicate a higher expectation for the Townsite pool than for Northwest Extension. Production decline curves indicate, however, that the Northwest Extension can be expected ultimately to produce at least as much again per acre as it has produced to date, but the Townsite pool will do well to produce half again as much oil as it has produced to date. This would give an ultimate recovery of 16,400 bbl. per acre for Northwest Extension and 15,400 bbl. per acre for Townsite pool.

One Well to Five Acres Constitutes Normal Drilling Plan

It has been stated that one well to each five acres would have been a normal program for oil men to follow if the field had been left to them to develop, instead of to speculators. In getting oil out of the ground there are naturally two extremes which can be followed. The wells can be drilled as close together as possible and the oil quickly removed, or, theoretically, one well, drilled near the center of a pool, should ultimately exhaust the pool.

Even with one well to five acres there will be interference. Each well, and its future behavior, becomes affected by its neighbors. As the gas pressures, which drive oil into the wells, drop, productions of old wells decline. Gushers stop flowing and are put to pumping. Presently there is not sufficient pressure to force oil

into the hole, and vacuums are placed on the wells. Close drilling aggravates all of these conditions. In June, 1920, the fluid level had dropped so low in the Burkburnett Townsite pool that oil would only rise, in the hole, half way up through the sand. Because of close drilling and marked interference of wells, the productive history of Burkburnett Townsite and Northwest Extension is practically a duplicate of the productive history of any oil well of either pool. The result of this interference was that in the Burkburnett Townsite pool, for example, within six months after the discovery well was drilled, the average *initial* productions of wells had dropped to 300 bbl. in the first twenty-four hours, and, in July, 1919, in this same field, which a year previous had boasted of 2,000-bbl. gushers, the average initial production of new wells was 36 bbl. per day.

Naturally, it seems that where so much oil was produced and sold, a profit must have been made. A rough accounting, as between costs of development and receipts from production up to June, 1920, for Burkburnett Townsite and Northwest Extension, not including George and Central pools, shows that much oil must yet be produced to show a profit on the venture as a whole. As it stands, many concerns have undoubtedly operated at a profit and still many more are represented by stock certificates with only a historical value. In addition, there are many dependent operations of a magnitude almost as great as oil production. These include oil and gas pipe lines, tank-car transportation systems, refineries and casing-head gasoline plants.

The following are items of cost of development, production, and losses compared with the sales value of oil produced to date:

COSTS

Wells and equipment within proved acreage—2,136 wells (Estimated at $18,000 per well, including drilling, buildings, tanks and production equipment)	$38,448,000
Acreage:	
3,705 proved acres at $7,500	27,787,500
1,665 contiguous barren acres at $1,000	1,665,000
"Dry" wells—226 wells at $15,000 (Dry wells surrounding two pools, junked and abandoned)	3,390,000
Cost of production—33,000,000 bbl. at 20c. per bbl.	6,600,000
Losses:	
Lightning, fire and wind	1,020,000
Oil (660,000 bbl. at $2.25)	1,485,000
Total	$80,395,500

SALES OF OIL

33,000,000 bbl. of oil at $2.25	74,250,000
Deficit	$6,145,500

The above account is not given as a valuation, as it is by no means a complete statement of expenditures, losses, and gains in the Burkburnett speculation. It simply shows costs of putting holes into the ground to take oil out of the ground up to the time the two pools had passed into the depleted class and were, therefore, of no further interest to the speculator. There were two other phases of the speculation not entirely dependent upon the basic receipts from production—(1) expenditures in the promotion and sale of stock and (2) bartering in royalties. If all of the wells had been gushers and all of the oil had been turned into the Red River most of this business would have gone merrily on.

In setting an estimated cost of $18,000 per well for development, the costs of cleaning out with cable tools, buildings, tanks and all equipment necessary for the operation of a producing property are included. It is thought that this is a conservative figure and that it is probably low.

A value of $7,500 per acre is given for proved acreage. It is probable that, as an average, this figure is also low. Some acreages started off at a low figure, and much trading was done in acreage, with profit. After the trading was all over, however, the then holders of acreage had to look to sales of production for a profit on their investment. Many wells on small tracts in Northwest Extension were still waiting, six months or more after discovery of the pool, to be drilled into the sand. The owners of these tracts could hardly hope to get sufficient production to pay for the investment.

The 1,665 contiguous barren acres represent narrow strips on the edges of the pools in which "dry" holes were drilled, thus proving the productive limits of the pools. These are justly chargeable against the venture, because in most cases stock was sold and wells were drilled with the promise and expectancy of being classed among the winners.

The cost of those "dry" wells is set at $20,000, and $5,000 per well is allowed for junk value, making an average net cost per well of $15,000. Many of these were deep holes and cost much more than $20,000 to drill.

Pumping Expenses Consumed Fuel Oil

The cost of production is set at 20c. per barrel. This is thought to be a reasonable figure, although probably low. Many wells were swabbed during the first thirty to ninety days of their productive life at a cost of $100 or more per day. As the wells declined, production costs rose, and in single-unit steam pumping plants, using 12 to 18 bbl. of fuel oil daily, operators were literally burning all the oil they produced to keep the wells pumping.

Under losses, the estimated losses owing to the destruction of property by lightning, fire, and wind, as reported by various oil-trade journals, are summarized. Undoubtedly there were other losses which did not come to my attention. The hazard of loss by fire was greatly aggravated by the way buildings, boilers, derricks and oil storage were crowded together.

It is known that a great deal of oil was lost through willful wastage, through seepage and evaporation. Two per cent of total production is the quantity used for this item. Losses owing to evaporation alone would more than cover this amount.

Against all of the above costs are set the receipts for 33,000,000 bbl. of oil sold at an estimated average price of $2.25 at the well. That is, up to June 20, 1920, $74,250,000 had been returned, from oil, on expenditures and losses amounting to more than $106,000,000.

Enterprise Represents Extravagance

The two pools could have been developed economically with 740 wells, which would be sufficiently rapid and close drilling on 3,700 acres of land in two years' operations. These wells at $18,000 each would have cost $15,380,000, as against the cost of $38,448,000 for the wells actually drilled. The pool would have been developed by oil operators, and because of the smaller number of wells there would have been no need to employ hundreds of workers inexperienced in either drilling for or producing oil. There would have been less congestion and therefore less hazard from losses owing to lightning, boiler explosions, and accidental fires. Wells would have been operated in larger groups and production costs correspondingly lowered. More careful drilling would have possibly proved the presence of shallow productive sands which, there is good reason to believe, exist.

NEWS FROM THE OIL FIELDS

The Situation of Austria's Petroleum Industry

From Our Vienna Correspondent

Vienna, Nov. 28, 1920—The two great world-embracing oil concerns, Standard Oil and the Dutch-English group, continue their struggle for the dominant power in all the producing and consuming territories. There is no sign of any relaxation of the compulsory rationing (Zwangbewirtschaftung) among Central European consumers. In the past few weeks the supplementary supplies (Zuschübe) were very satisfactory because the wares delayed in Poland by previous military conditions could now be forwarded and the oil boats on the Danube loaded during the summer also arrived from time to time. The previous shortness in petroleum products has now given way to heavy offerings of benzine, gas oil, and lubricating oil. On the other hand, the supplies of illuminating oil are far from meeting the need.

The Austrian situation has also been slightly improved, because the shipments of the last few weeks seem to have been sufficient with existing supplies to meet needs up to the end of January. The persistent shortage in illuminating oil is due to the lack of tank cars on the railways and the extraordinary low stage of the Danube, so that the purchased supplies have not been able to materialize in sufficient volume just at this season of maximum consumption. However, the supply of illuminating oil already stored in Austria, together with the amount on the way, permits the domestic ration to be increased beyond that of November, and also an increase in the supplementary reserves assigned for distribution by the government. The latter will probably be able to increase the quotas for factory and house industrials. Appropriate quantities are also assured for agricultural premiums offered for grain deliveries. In the face of this apparently favorable situation one cannot suppress a fear that traffic disturbances, such as are all too frequent in the winter, and an over early closing of Danube navigation may again interrupt supplies. It therefore seems necessary to continue the existing economic measures, particularly in the case of illuminating oil.

The rise in Polish exchange, which continued into the first days of November, and the sudden rise in Rumanian values have further increased prices, and no fall may be expected until existing stocks, purchased under high exchange, have been disposed of. Petroleum stations would have held the oil price at its former level while raising prices for benzine and other products.

Wyoming Districts Produce in Excess of Handling Facilities

From Our Special Correspondent

The Standard Oil Co. of Indiana is adding 135 high-pressure stills to its plant at Casper. The number now in operation is 100.

One of the largest wells in the Salt Creek field was completed a short time ago by the Salt Creek Consolidated Oil Co. on Sec. 31-39-78. The well is making 3,500 bbl. daily.

During October 38 wells were completed in the state. Of these nine were failures, four were gas wells, and the others made a combined production of 2,415 bbl. daily. On the first of November 385 rigs were in operation.

Production in the Wertz and Ferris districts has reached the stage that pipe lines are no longer able to handle the oil. Several wells have been drilled to the producing sand and must wait, while some producing wells have been shut in. In a few cases the gas pressure is too great to permit the wells to be shut in without injury and the oil is run into earthen tanks.

Oil, together with a great deal of water, has been struck in a well being drilled at the Centennial Valley Oil Co. near Centennial. An attempt will be made to case off the water. The well is located in T. 15 R. 7, in the Laramie region.

Increase in Kentucky Production

From Our Special Correspondent

A total of 7,147,089 bbl. of oil was produced in Kentucky during the ten months ended Oct. 31, according to the report of E. E. Loomis, secretary of the Kentucky Oil Men's Association, made at the annual meeting in Lexington on Dec. 11. This is an average monthly production of 714,708 bbl. The production in October was 746,819 lb., which shows that there has been a gradual increase during the current year.

An influx of oil operators is expected in Edmonson County following the recent discovery of oil near the Warren County line. This is new territory. Late reports from Johnson County show that the initial well of R. A. Chiles and the Cumberland Petroleum Co., recently brought in on Keaton's Fork, is one of the best in that territory, the first day's production amounting to 135 bbl.

Work on the test well on the Burchett farm, Logan County, is progressing favorably. The test is now down over 200 ft.

Drilling operations in the Lawrence County field have been suspended by the Ohio Fuel Oil Co. and some of the other companies.

Texas Notes

From Our Special Correspondent

Fire at Baytown on Dec. 8 destroyed the Humble Oil & Refining Co.'s unloading dock and trestle, together with several empty oil tank cars. Total loss was about $250,000.

It is reported that Stone & Webster have acquired a controlling interest in the Simms Oil Co. The general office will be moved from Houston to Dallas.

Some wells of considerable interest have been completed recently in the Gulf Coast region. In the old, nearly dormant field of Markham, Matagorda County, the No. 1 Meyers well was completed by C. G. Hamil et al. and came in flowing 500 bbl., with the bailer stuck in the hole. Later report states this flow has materially increased. The well is on the northeast edge of the dome, and is 1,590 ft. deep. The salt in this dome is 2,800 ft. deep, and all wells so far have made their production from strata immediately above the cap rock.

At Goose Creek the No. 1 Adey well of the International Oil Co. came in flowing 800 to 1,000 bbl. per day. This well is only 2,100 ft. deep and is west of the creek. Both the depth and location are new for Goose Creek.

The Sinclair Oil Co.'s No. 10 Masterson well, at Damon Mound, came in making an initial flow of 5,000 bbl. from 3,140 ft. This well extends the field somewhat farther to the east around the south end of the dome.

The big wells of the north extension at West Columbia are showing a little less basic sediment in their flow. The percentage of water in these wells is as yet small. The Humble Oil & Refining Co. recently completed its No. 27 Japhet well in this field, with an initial flow of 14,000 bbl. from 3,395 ft.

Louisiana Court Decides Lessee Liable If He Fails To Drill

From Our Special Correspondent

In the suit between Oliver S. Pendar and the Empire Gas & Fuel Co., Pendar has been awarded $60,000. The Empire Co. had promised to drill on Pendar's land and failed to carry out its agreement. This suit has been watched with interest, as it indicates that the lessee, contracting to drill a well and pay the lessor a certain amount out of the proceeds from sales of oil from the well, is liable to the lessor for the consideration promised if the well is not drilled.

The coastal fields have been quiet. The only completion at Vinton recently was the Texas Co.'s No. 14 Gray well, now producing 75 bbl. by pumping from 2,275 ft. Vinton field is producing about 3,600 bbl. daily.

Book Reviews

A Student Reverie: An Album of Saxony Days. By Frederick Gleason Corning, E.M., L.L.D. Cloth; pp. 69; 7½ x 10¾. New York, 1920. Published privately.

This is a charming and unusual volume, written in an instructive yet leisurely and at times whimsical mood, which plainly it was a recreation to the writer to pen. The book will be a treasured memorial for his friends. An old Freiberg man, he sends his thoughts back to the picturing of the famous old mining school which produced so many great American engineers, in the days before our own mining schools had grown to full stature. He pictures Freiberg from the educational, mining, social, and sentimental side, with delightful leisurely reminiscences of old-time friends, like "Jack" Hammond (John Hays), Franklin Guiterman, R. W. Raymond, and others. To illustrate his freedom from strain, it may be noted that the author, happening to touch on the charms of Saxon girls in those good old days, digresses for a couple of pages to comment humorously on the extremely elevated skirt of the present-day fashion.

As a record of a notable period in the history of American mining education, with a group of distinguished engineers who did so much to develop mining in this country and the rest of the world, this book has real historic value.

In these days of poor paper and indifferent typography, the book is also surprising, for it is a modest "edition de luxe" and the details of paper, type, and illustration have evidently been attended to with artistic and loving care. The volume is dedicated by the author to his wife. J. E. S.

The Mining Laws of the British Empire and of Foreign Countries, Vol. 1, Nigeria. By Gilbert Stone. Cloth; pp. 254; 6½ x 10. Published by H. M. Stationery Office, Imperial House, Kingsway, London W.C.2. Price, 15s.

The author of this book worked under the advice of the legal committee of the Imperial Mineral Resources Bureau, assuring comparative accuracy and correctness in its preparation. He had little or nothing to guide him, having to gather his materials from various sources, so the difficulty of his task may be appreciated.

With the union of Northern and Southern Nigeria, in 1914, into a single British Protectorate, all former mineral ordinances and regulations were repealed, their place being taken by the Minerals Ordinance of 1916, as amended by the Minerals (Amendment) Ordinance of 1918, and, so far as mining for mineral oil is concerned, by the Mineral Oil Ordinance of 1914.

Various regulations have been issued under the Minerals Ordinance of 1916. Other ordinances, concerned in part with mining law, or relating to collateral subjects, such as land registration, stamps, master and servant, surveys, explosives and leaseholds, are considered. Being a British colony, the English common law, the doctrines of equity and the statutes of general application of Great Britain in force in England on Jan. 1, 1900, are in force in Nigeria, subject to the terms of any Nigerian ordinance.

The author has arranged the matter into two parts, the first being a general analysis of the country's mining law, and the second devoted to an orderly statement of the ordinances and regulations, notices and forms. A detailed index adds much value to the volume. As yet there is no case law in Nigeria except that applied from outside decisions.

Mining engineers and executives, prospectors, and financiers may depend more on their own knowledge of the mineral law of Nigeria by making use of this book. W. G.

Technical Papers

Marble—U. S. Geological Survey Bulletin 682 (price 30c. from the Superintendent of Documents, Washington, D. C.) is a 118-page pamphlet entitled "Marble Resources of Southeastern Alaska." It is a very practical treatment of the subject, describing the deposits not only from the standpoint of the geologist and miner but also devoting many pages to commercial considerations. Many excellent photographs showing the uses of marble are included, as well as colored plates of attractive specimens.

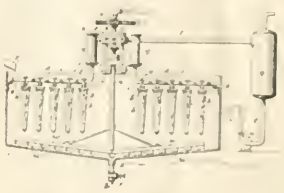
Oklahoma Oil Map—The Petroleum Station of the Bureau of Mines, in cooperation with the Bartlesville Chamber of Commerce, has issued a map of the Hewitt oil field, Carter County, Okla. This map is drawn to the scale of 1 in. equals 1,000 ft. and shows locations of all rigs, drilling wells, producing wells and abandoned holes in Township 4 south, Range 2 west, up to the date of Nov. 1, 1920. Copies may be obtained from the Bartlesville, Okla., Chamber of Commerce for 35c. each.

Talc—"Talc Mining in New York" is the subject of the Bureau of Mines *Reports of Investigations*, Serial No. 2,171, obtainable upon request from the Bureau at Washington. This pamphlet of fifteen pages is confined largely to brief descriptions of the mines and mills of four companies. Flow sheets are given in each case.

British Columbia—The Geological Survey of Canada, Ottawa, has published as Memoir 117 a seventy-three-page bulletin on the geology and ore deposits of the Ainsworth mining camp, in British Columbia. The valuable metals are lead and silver. The Consolidated Mining & Smelting Co. and the Florence Silver Mining Co. are actively interested in the district.

Recent Patents

Thickener—No. 1,359,162. A. L. Genter, Salt Lake City, Utah. A modification of the earlier design of Genter thickener, in which the filter elements



are suspended in a tank as shown in the illustration. A vacuum is maintained inside of the filter elements.

Classifier—No. 1,359,105. R. H. Richards, Jamaica Plain, Mass. A method of separating granular matter from the colloidal material in slimes, which consists in feeding diluted slime to a circular table the surface of which is inclined sufficiently to cause the forward movement of colloids, but insufficiently to permit a substantial forward movement of granular material.

Hydrometallurgy of Copper—No. 1,358,619. N. C. Christensen, Salt Lake City, Utah. The process patented consists in lixiviating the ore with a solution of SO_2 and precipitating the copper from the pregnant solution as a cuprocuprie sulphite by adding Cu_2O. By means of the process outlined in another patent, No. 1,357,952, Mr. Christensen precipitates the copper in the same form by adding metallic copper.

Roasting Copper Ore—No. 1,358,293. W. H. Corbould, Selwyn, Queensland, Australia. The process described embodies roasting in a furnace of special design in which the ore is alternately subjected to pressure and vacuum during the calcining operation.

Flotation Process—No. 1,357,556. D. F. Haley, Wallace, Idaho. By this process the ore pulp is circulated through a pipe which terminates somewhat above the pulp level in the cell. The air is entrained as the stream of pulp strikes the surface of pulp in the cell, somewhat in the manner of the cascade system of flotation.

Hydrometallurgy of Copper—No. 1,357,495. W. E. Greenawalt, Denver, Col. The copper is dissolved from the ore by acid, resulting lean and rich solutions being kept separate. The rich solutions are electrolyzed, the salts of the elements with a variable valency being raised to a higher valency. From the lean solution the copper is precipitated as the sulphide, the resulting copper sulphide, along with SO_2, being used in treating the rich solution.

Amalgamator—No. 1,351,497. Francis M. Lewis, Seattle, Wash. A new design of amalgamating plates.

Oil-Well Controller—No. 1,354,694. Charles E. Sage, Rochester, N. Y.

COURT DECISIONS IN MINING CASES

By Wellington Gustin

Government Recovers Kern County, Cal., Oil Lands

Companies' Claims, Resting on Conveyances and Contracts, Found To Be Void—Fixtures and Improvement's Revert to Public

A decision of the U. S. Circuit Court of Appeals denying a rehearing in the case of the United States against the Chanslor-Canfield Midway Oil Co., the Recovery Oil Co., Fred H. Hall and others, re-establishes the right of the Government in certain public mineral lands in Kern County, Cal. This land came with the area of the Presidential withdrawal order of Sept. 27, 1909. It had been located as an oil placer mining claim in 1903 by Hall, in the names of two members of his family and seven of his neighbors. These neighbors were ignorant of this action, and when subsequently advised thereof declined to pay any of the expenses incident thereto, or to ratify what had been done; but they did execute a deed to one of Hall's family for his benefit, conveying what interest they might have, if any. About five years later the family holdings were conveyed to Hall, who in 1909 made the development contract under which the Midway Oil Co. entered in possession. By this contract Hall retained one-half of the quarter section, which half was conveyed to the Recovery company in 1910.

The United States brought suit to restrain waste and depletion of the oil from the lands, to enjoin defendants from asserting title or interest in the lands, from trespassing thereon, for the appointment of a receiver and for an accounting. The District Court found that, although there was no previous agreement between Hall and his neighbors that the location made in their names should inure to Hall's benefit, and no conscious intent to violate the law, the manifest effect of the transaction, if valid, was to enable Hall to acquire more land by one location than the law permits, and would therefore be invalid. The rule of law is quoted:

"Any scheme or device entered into whereby one individual is to acquire more than that amount (twenty acres) or proportion in area constitutes a fraud upon the law, and consequently upon the Government, from which the title is to be acquired, and any location made in pursuance of such a scheme or device is without legal support and void."

The Circuit Court of Appeals is satisfied that the locations were wholly invalid, that Hall gained nothing by taking the deed from the named locators to a member of his family, and thereafter from this party to himself. Therefore he had no right or interest to convey and conveyed nothing.

Another point contended for by the companies was that by the Pickett Act, the act of Congress of June 25, 1910, they were given the right to continue in possession of the lands and prosecute their work to a discovery, and thereupon to have patent to said lands, thereby to that extent abrogating whatever effect the Presidential withdrawal order of 1909 had on the lands; that the entry of the lands and the development thereof was pursuant to invitation of the United States under its policy established long before the withdrawal order. But the court found the facts did not show such diligent prosecution of work for discovery on the lands at the date of withdrawal as to take them out of the operation of the withdrawal order. It was admitted that there was no work on the lands at that time, or for months afterward, but it was claimed that the companies were then making preparations by assembling material and employing labor for future development. The companies owned or controlled many claims in the neighborhood, some of which were being operated and developed, but it did not appear that any work or preparation therefor was intended for the development of the particular lands in question, as distinguished from the company's other undeveloped holdings. The court said the law contemplates and requires something more to bring an occupant or claimant within the saving clause of order of withdrawal on the Pickett Act (Comp. Sts. 4523-4525).

Again, it was contended that because the agents of the Government had full knowledge of the situation, and not only refrained from advising people but induced them to proceed and expend money in good faith, the United States is estopped to enforce its claims. But the court said the law on this proposition is that the United States is neither bound nor estopped by acts of its officers or agents in entering into an arrangement to do or cause to be done what the law does not sanction or permit; neither is laches or neglect of the United States, as a general rule, on the part of officers of the Government a defense to suit by the Government to enforce a public right or protect a public interest.

The District Court gave the United States judgment in damages for $76,751 and decreed that all fixed improvements upon the lands belonged to the United States and should be turned over, together with the lands, free of all claims of the companies or others. The Circuit Court of Appeals modified this decree so as to allow 7 per cent interest to the Government upon the value of the oil from date of its conversion.

Osceola Lead & Zinc Co. Loses Appeal

Missouri Supreme Court Upholds Circuit Court in Sustaining Lien of Forest City Lumber Co.

The Osceola Lead & Zinc Mining Co. has lost its appeal to the Supreme Court of Missouri from judgment against it in the Jasper County Circuit Court in favor of the Forest City Lumber Co. Damages were claimed by the latter because the mining company had removed two steam boilers, an engine, and other pieces of machinery and appliances used in carrying on lead and zinc mining, upon which the lumber company held a mechanic's lien, from Newton County to Jasper County. The lien had been filed against the Sleepy Hollow Mining & Development Co., in Newton County. The articles of equipment and machinery had been in Jasper County before the lien claim was filed, and had been taken from Jasper County to Newton County by the Sleepy Hollow company after it had acquired title to them by purchase from their original owner, the Leroy Mining Co. To secure payment of the purchase price the Sleepy Hollow gave a deed of trust on the articles in favor of the Leroy Mining Co. The Sleepy Hollow company moved the property to Newton County and the deed of trust was recorded in this county. The mechanic's lien of the lumber company was established in this county. Later the property was sold under the deed of trust and purchased by the Osceola company, which moved it back to Jasper County.

The lumber company established its lien as prior to defendant's lien under its deed of trust in the Newton Circuit Court; and in the Jasper Circuit Court it obtained a judgment against the defendant Osceola Mining Co. for the latter's removal of the property. The appeal of the Osceola company from the judgment in the Jasper Circuit Court has been dismissed by the Supreme Court.

Colorado Court Holds Contract Power Rate Valid

The Supreme Court of Colorado has handed down a decision favorable to the Golden Cycle Mining & Reduction Co. in each of two suits brought by it to secure modification of an order of the Public Utilities Commisson requiring the mining company to pay a greater rate for electric current than that stipulated under a contract with the Colorado Springs Light, Heat & Power Co. The order from which appeal was made in one case required the mining company to pay about $10,000 a year more than its contract price. The court held the rate was fixed without authority.

ECHOES FROM THE FRATERNITY

New Mexico's Legislative Commission Recommends Repeal of Mine Taxation Laws

The commission appointed at the last session of the New Mexico Legislature to investigate and report on proposed changes in the laws and methods of administration of the state recently issued additional portions of its report.

In the chapter on mine taxation the report brands the whole system of the law as inexact and arbitrary in its methods of arriving at market value, and as inequitable both as between mines and other classes of property, and as between different mining properties within the class.

Concerning the "contiguous property" clauses, the report regards them as lacking an adequate excuse for their existence. It recommends that, whatever method of taxing mines is adopted, only such reserves shall be allocated to producing mines as are reasonable from an engineering and economic point of view.

As to the new plan the report continues: "In our opinion the only proper way to arrive at valuations of mineral reserves is to vest the State Tax Commission with power to fix the values and to provide them with professional assistance. Any attempt to impose arbitrary limitations is apt to result in under-assessment and is certain to result in inequality. In case of over-assessment there is always resort to the courts, and since properties of this type are usually held in large blocks that resort will not be closed because the expense of appeals is out of proportion to the amounts involved."

Specific Recommendations

The specific recommendations are:

"1. That all legislation providing for special procedure in connection with the taxation of mines, including the contiguous property clause, be at once repealed.

"2. That new legislation be passed specifying that all mining property shall be valued on precisely the same general principles as other real estate.

"3. That power to assess all mines and mineral property be vested in the State Tax Commission as reorganized in accordance with our recommendations made elsewhere in this report.

"4. That the tax commissioner be supplied with the necessary professional assistance."

The sum of $25,000 is named as necessary to make the initial valuation. It is further recommended that an engineer of national reputation be engaged to undertake the work; that it would be highly desirable to retain one of the principal assistants in the original valuation as a permanent employee of the Tax Commission at a salary of about $4,500.

Le Roy Memorial Scholarship Needs More Funds

At a smoker held by members of the British Columbia University Service Club in Vancouver, B. C., last month, Dean R. W. Brock of that university outlined the present standing of the Le Roy Memorial Scholarship and expressed confidence that no difficulty will be experienced in raising the $10,000 required to place the fund on a secure basis. Major Brock explained that "the scholarship, which is in memory of comrades killed in the late war, is for the purpose of enabling a returned soldier student at the British Columbia University to commence or complete a degree course when, through wounds or other disability, he could not afford to do so. The first scholarship award, made last spring, was of the value of $250, for which a capital sum of $3,000 had been raised; but this sum was quite inadequate to meet the expenses of a beneficiary. The scholarship is named in honor of the late Capt. O. E. Le Roy, who commanded the British Columbia detachment of the Western Universities Battalion, and who was killed while serving with the 46th Battalion in front of Passchendaele." Three hundred members of the club were allotted to two teams to make a "drive" to raise the needed money. The late Captain Le Roy was one of the geologists of the Geological Survey of Canada, and did much geological field work in mining districts of British Columbia for a number of years.

Secretary Payne Would Improve Alaskan Steamship Service

Discussing Alaska's needs the Secretary of the Interior in his report to Congress has the following to say:

"At the threshold of Alaskan development is the subject of transportation. Adequate steamship service with reasonable rates for passengers and freight from the Pacific Coast to Alaska is imperative; now the service is inadequate. The Alaska Steamship Co., under the same control as the Copper River Railroad and the copper interests in Alaska, and the Pacific Steamship Co., operate a more or less regular service. There is not enough business for both companies. Ordinarily the boats run about 50 per cent capacity, while during the spring and fall, peak-load seasons, persons and freight are compelled at times to wait weeks for space. The Alaska Steamship Co. has a strong position in that its copper ores mined in Alaska furnish return cargoes for its boats.

"A simple solution of the problem would be to consolidate the two companies, and reduce expenses by taking off unnecessary boats during ordinary times. This would give a reasonably full cargo at all times. Then secure from the Shipping Board, if need be, additional boats to meet peak load demands which come uniformly in the early spring and early fall, the Shipping Board to see that a substantial reduction in rates and fares results. The board has ample power to do this. Efforts have been made to accomplish this result but so far without success, the Alaska Steamship Co. refusing to sell.

"Unless some such plan is effected the necessity for a genuine development of Alaska may make it necessary for the government to operate its own line of steamships to Alaska, even at a loss, and provide an adequate service at reasonable rates."

Engineering Standards Committee Adds New Member Bodies

Twenty-four Organizations Now Represented—Officers and Executive Committee Elected at Annual Meeting

The American Engineering Standards Committee has recently been enlarged by the representatives of the following four additional member bodies: Department of Agriculture, Department of the Interior, Gas Group, consisting of American Gas Association, Compressed Gas Manufacturers' Association, International Acetylene Association, and the American Electric Railway Association.

There are now forty-seven members of the committee, representing seventeen member bodies in all. Twenty-four organizations are represented on the committee, as three of the member bodies are groups of organizations.

At the annual meeting of the committee held in New York City on Dec. 4 A. A. Stevenson, of the American Society for Testing Materials, was re-elected chairman for 1921 and George C. Stone, of the American Institute of Mining and Metallurgical Engineers, was re-elected vice-chairman.

The following were also elected to represent the respective member bodies on the Executive Committee: Comfort A. Adams, American Institute of Electrical Engineers; Martin Schreiber, American Society of Civil Engineers; Fred E. Rogers, American Society of Mechanical Engineers; A. H. Moore, Electrical Manufacturers' Council; Dana Pierce, Fire Protection Group; A. Cressy Morrison, Gas Group; N. A. Carle, National Electric Light Association; Albert W. Whitney, National Safety Council; Coker F. Clarkson, Society of Automotive Engineers; Thomas H. MacDonald, Chief of Bureau of Public Roads; E. B. Rosa, chief physicist, Bureau of Standards; O. P. Hood, chief mechanical engineer, Bureau of Mines; F. J. Cleary, Navy Department, and J. H. Rice, War Department.

MEN YOU SHOULD KNOW ABOUT

Harris & Ewing, Photo.
MARION E. RHODES

Quite contrary to the usual order, the new chairman of the Committee on Mines and Mining of the House of Representatives, **Marion E. Rhodes**, is intimately familiar with the mining industry. Mr. Rhodes comes from Potosi, Mo., and represents in Congress the Thirteenth Missouri district, which includes the counties of Bollinger, Carter, Iron, Jefferson, Madison, Perry, Reynolds, St. François, Ste. Genevieve, Washington, and Wayne. These counties in 1919 produced 92 per cent of the lead output of Missouri, the prime lead-producing state of the union for twenty years past. When the census of 1910 was taken Mr. Rhodes' Congressional district was a large contributor to the state's output of zinc and barytes, in whose production the state also led at that time. Washington County, Mo., the new chairman's home, produces 75 per cent of Missouri's output of barytes; and Madison County is the only point in the United States where cobalt is continuously produced.

Mr. Rhodes will resign his place on other committees that he may give his undivided attention to the Committee on Mines and Mining. In conversation with the correspondent of the *Engineering and Mining Journal* Mr. Rhodes stated that he has noticed the great zeal of the chairman of the Committee on Agriculture, and the chairmen of other committees, to be intensely active to better the conditions surrounding the industries with which their committees have to deal. It is his intention to do exactly that thing for the mining industry. In his opinion the mining industry today as never before needs encouragement, when lead, zinc, copper and other metals are selling at prices entirely out of proportion to the costs of their production.

Immediately after the first of the year Mr. Rhodes plans to begin a series of hearings on various measures which are before his committee. In addition, he expects to make inquiry into some of the economic phases of the mining industry, in an effort to determine what steps are possible to provide for the stimulation of mining.

George I. Adams has accepted the chair in geology at the University of Alabama.

E. C. Harder has returned from a trip to South America in the interest of the Aluminum Company of America.

J. P. Dunlop is making a tour of the mines in the Middle West in connection with mineral-resources statistics.

F. W. McNair, president of Michigan College of Mines, Houghton, Mich., was a recent visitor in New York City.

H. G. Palsgrove has been appointed superintendent of mines for the Smuggler Union Mining Co., Telluride, Col.

John White, field engineer for American Metals Co., Ltd., is making examinations in the Lordsburg, N. M., district.

W. Motherwell, who has been running a series of flotation tests at Allenby, B. C., has returned to San Francisco, Cal.

James P. Porteus, superintendent of the Bonney mine at Lordsburg, N. M., will be in San Francisco until the first of the new year.

Ross B. Hoffmann, mining engineer of Oakland, Cal., is in New York City, and expects to sail for London on professional business Dec. 28.

F. Leslie Ransome is engaged in geologic work on the ore deposits of the Oatman district of Arizona. He is being assisted by **M. G. Gulley**.

"Pat" Sweeney, mill superintendent for the Kennecott Copper Co., and **William Clulow**, assistant engineer, have resigned those positions and are now in Seattle.

Max G. F. Söhnlein, consulting mining engineer, of Santiago, Chile, was in New York City this week. He sailed for Chile on the "Essequibo," on Dec. 21.

W. J. Loring and **James F. Callbreath, Jr.**, president and secretary, respectively, of the American Mining Congress, were in New York City last week.

Edward J. Maney, general manager of mines on the Mesabi Range, Minnesota, for the Shenango Furnace Co., has gone East to attend to business matters.

E. S. Larsen, of the Geological Survey, has completed an examination of certain contact-metamorphic tungsten deposits in New Mexico, California, and Oregon, and has returned to Washington, D. C.

Charles N. Bell, of Telluride, Col., has resigned as superintendent of mines for the Smuggler Union Mining Co. to accept an appointment with the Mines Exploration Co. Hereafter his headquarters will be in Denver, Col.

W. J. Olcott, president of the Oliver Iron Mining Co., and **F. E. House**, president of the Duluth & Iron Range R.R., are in New York attending a meeting of the presidents of the subsidiary companies of the U. S. Steel Corporation.

Dr. Eugene F. R. Haanel has retired from the position of Canadian Director of Mines in accordance with the provisions of the superannuation act. Dr. Haanel became superintendent of mines in connection with the Interior Department at Ottawa in 1901, and was appointed Director of Mines in 1907, when that department was organized. On Dec. 14, 1920, he was presented with an appreciative farewell address from forty of his recent associates in the Department of Mines, testifying to the value of his scientific work and his personal worth.

SOCIETY MEETINGS ANNOUNCED

The American Society of Mechanical Engineers announces that the Waterbury, Conn., branch meeting in the Chase Company Office Building, will be addressed on Jan. 3, 1921, by Capt. Harry George, who will describe "Mining Experiences of a Prospector." On Jan. 10 the Hartford, Conn., branch will be addressed, at the City Club, by Carl L. Lesher, editor of *Coal Age*, on "The Responsibility of the Coal Buyer."

On Jan. 14 the "Story of Petroleum" cinema, by the Bureau of Mines, will be shown before the meeting of the Columbus, Ohio, section of the A. S. M. E. at the Engineers' Club in the Southern Hotel, that city.

On Jan. 25 the Atlanta, Ga., section of the A. S. M. E. meets with the local section of the A. S. C. E. in the Carnegie library building. B. M. Hall will speak on "Water Power Development." Mr. Hall, who is now with the Georgia Railway & Power Co., was a supervising engineer with the U. S. Reclamation Service and organizer and chief engineer of the Porto Rico Irrigation Service from 1908 to 1910.

OBITUARY

Capt. George Brewer, of Bessemer, Mich., died suddenly of heart failure on Dec. 14, while answering a summons to appear as a talesman at the courthouse. Capt. Brewer was seventy-eight years old, and one of the oldest mining captains on the Gogebic Range. In 1885 he opened the Aurora mine, near Biwabik, Minn., one of the oldest properties on the Mesabi Range, and since that time had been directly affiliated with the mining industry. He was generally in the employ of the Oliver Iron Mining Co.

THE MINING NEWS

The Mining News of ENGINEERING AND MINING JOURNAL is obtained exclusively from its own staff and correspondents, both in the United States and in foreign fields. If, under exceptional conditions, material emanating from other sources is published, due acknowledgment and credit will be accorded.

LEADING EVENTS

WEEKLY RÉSUMÉ

The number of mining companies that have been compelled to reduce wages, and to curtail or suspend production altogether, owing to market conditions, is steadily increasing. Prominent in the list of camps so affected is Butte, where a reduction of $1 per day, affecting all miners, has been announced. Charles Butters has proposed in a letter to E. P. Earle, president of Nipissing, that all copper and silver producers shut down, the quicker to bring about a better market. The Consolidated M. & S. Co., at Trail, is said to be refining custom ore except where the shipper is prepared to finance the carrying or marketing of the bullion. In Arizona, a receiver has been appointed for the Tennessee and Schuylkill mining interests. At Douglas the Apache Powder Co. is erecting a fuming acid plant at the C. & A. smelter. In California, a friendly suit for a receiver has been brought against the New Idria Mining Co. In Nevada, the Prince Consolidated and Virginia Louise mining companies are both planning to increase their capitalization. Drilling by the Nevada Consolidated at Ruth has indicated the presence of a new ore-body.

In Washington both Senate and House favor the plan requiring assessment work on mining claims to be done in 1920, but allowing six months' grace for doing this work. Mineral export tariff bills are likely to be held over until next session.

Cananea's Suspension Postponed

The Cananea Consolidated Copper Co. of Cananea, Sonora, Mex., has decided to postpone until Jan. 15 the suspension of operations that had been announced for Dec. 15. No new men are being engaged and the operating force is now at a minimum. Five furnaces are being operated.

Canada Copper Mill Shuts Down

The new 2,000-ton concentrator of the Canada Copper Corporation at Allenby, British Columbia, has shut down owing to the condition of the copper market. This mill was placed in operation on Oct. 18 of this year, since when twenty-five carloads of copper concentrates, running from 40 to 50 tons per car, have been shipped to the smelter of the Consolidated Mining & Smelting Co. of Canada at Trail.

Control of American Smelting & Refining Co. Assailed By Karl Eilers

Guggenheims Disregard Stockholders' Interests and Operate Company for Own Ends, Says Former Vice-President—Asks Writ of Mandamus To Inspect Stock Books

Asserting that access to the stock books of the American Smelting & Refining Co. had been denied him, Karl Eilers, formerly a director and officer of the company and who was defeated for re-election as vice-president at the last annual meeting, has asked the New York Supreme Court to issue a writ of mandamus requiring the company to permit him to inspect the books. In his petition Mr. Eilers alleges that the management of the smelting company is directing its affairs to further its own personal and selfish ends, in disregard of the company's interest, thereby retarding its development and causing it to lose millions of dollars. His purpose in seeking the writ, he states, is to enable him to communicate with other stockholders relative to a change in management at the annual meeting next April. In his personal and representative capacities, Mr. Eilers states, his total holdings of the company's stock are 3,538 shares, a greater number than held by all the officers and directors of the company combined. The petition reads in part as follows:

"In or about 1907 the holdings of stock of the Messrs. Guggenheim, except for a very small portion, were sold by them. As I am informed and believe, such sale was forced upon the Messrs. Guggenheim by reason of business reverses. From that time the Messrs. Guggenheim apparently ceased to regard the interests of the corporation and sought to employ it solely to serve their own ends. In spite of the fact that they no longer held stock in the corporation to an amount which gave them any substantial interest in its affairs, they continued their membership on its board of directors and insisted upon dominating that board and the affairs of the corporation.

"Early in 1919 the said Solomon R. Guggenheim resigned from the board; the said Messrs. Isaac, Daniel and Murry Guggenheim remained upon the board, and the said Simon Guggenheim became president of the company. By that time the Messrs. Guggenheim had so perfected their domination of the company that they did and could with confidence presume the acquiescence of a majority of the directors. When in January of that year they decided that Mr. Simon Guggenheim should become president of the company, Mr. Daniel Guggenheim, the then president, announced this in a circular letter to the stockholders as "the expressed wish of the board of directors." The board of directors had not in fact been notified, much less consulted, in respect of the proposed change in the presidency of the company; they had been given no opportunity to express any wish in the matter. The board met the expressed wish of the Messrs. Guggenheim and elected Mr. Simon Guggenheim their president.

"During all the time aforesaid, from 1907 to 1920, while I was a director and officer of said corporation, I found it impossible for me, or any of my associates on the board of directors, to secure the adoption of any plan for the operation of the company against the opposition of the Messrs. Guggenheim. The majority of the members of the board of directors were controlled absolutely by the orders of the Messrs. Guggenheim and were in fact merely dummies representing the Guggenheim interests. . . .

"About 1910 the board of directors on the orders of the Messrs. Guggenheim and over the protest of myself and Mr. Morse adopted a resolution that the salaries of officers, directors and employees should be fixed by a so-called salary committee, of which Mr. Murry Guggenheim was then made chairman. At this time Mr. Daniel Guggenheim and Mr. Sol Guggenheim had been drawing salaries ranging from $25,000 to $50,000 per annum, while they were devoting almost their entire time and attention to business matters not connected with the affairs of the company. This was a cause of irritation among the other officers and directors. From that time the board of directors had no power to fix the salaries of the officers and directors of the company, and the board of directors could obtain no information from the Messrs. Guggenheim or from those directors who acted in concert with them as to the amount paid to the officers and directors of the company.

"About 1910 Mr. Newhouse and Mr.

Stewart reported an opportunity to enter the business of tin mining in Bolivia. The company with the consent of the Messrs. Guggenheim expended considerable money in a thorough investigation of this proposition. Upon the report of such investigation coming in, the Messrs. Guggenheim opposed any action relative to the proposition. Thereafter the sons of Messrs. Murry and Daniel Guggenheim, representing Guggenheim Brothers, the Messrs. Guggenheim's co-partnership, were permitted to examine the report of the investigation on file with this company, and thereupon Guggenheim Brothers sent representatives to Bolivia and have since engaged in large tin mining operations there. A demand by certain of the directors of the company that it be allowed to share in such operations was refused by the Messrs. Guggenheim.

Company Acquires Interest in Premier Mine

"In 1919 Mr. Guess, managing director of mines for the company, advised the board of directors that he had secured an opportunity to purchase a one-fourth interest in the Premier Silver & Gold Mine in British Columbia at a price which would be most advantageous to the company. A majority of the members of the executive committee of the company to which the matter was referred were in favor of accepting this offer, but Mr. Simon Guggenheim, a member of the executive committee, and Mr. Murry Guggenheim, a director, objected and opposed its acceptance. It later developed that the sons of Messrs. Murry and Daniel Guggenheim, representing Guggenheim Brothers, desired to purchase one-half of such one-fourth interest. Upon an arrangement being effected which permitted Guggenheim Brothers to purchase one-half of said one-fourth interest, Messrs. Simon and Murry Guggenheim withdrew their objection to a purchase by the company of the remaining half of such one-fourth interest.

Company Formerly Sold Metal as Fast as Refined

"The business of the company is the purchase and smelting of ores of various kinds, and the sale of metals, copper, lead, silver, etc., thus produced. The prices paid by the company for the various ores are based on the current New York quotations for the metals in such ores. The company learned from bitter experience that if losses from fluctuations in the prices of metals were to be avoided, metals must be sold as fast as smelted and refined, and only to the quantity smelted and refined; no sales substantially in advance of production could be made. Prior to the domination of the company by the Guggenheim interests this was the established policy of the company.

"In respect of sales of copper, this policy was abandoned as soon as the Messrs. Guggenheim secured predominating influence in the company's affairs. In copper, under the direction of Mr. Murry Guggenheim, futures were dealt in by the company; that is to say, the company made sales for future delivery against ore to be purchased and copper to be produced therefrom. I believe the Messrs. Guggenheim were influenced to this change in policy in respect of copper sales by their interests in various copper companies. I know that through the Messrs. Guggenheim contracts were entered into making this company selling agent for such copper companies. In 1915 I was informed by a Mr. Willard Morse, one of the company's directors, that as the result of this method of selling for future delivery the company was losing on copper at the rate of $1,000,000 per year. A statement prepared by a Mr. F. W. Hills, the comptroller of the company, disclosed losses from this source for the seven years 1912-1919 to aggregate over $5.000,000.

"My fellow directors, Mr. Morse, Mr. Brush, Mr. Newhouse, as well as myself, protested against this policy, but Mr. Murry Guggenheim insisted upon it and its continuance. Mr. Murry Guggenheim attempted to justify these losses upon the ground that the company, through sales for future delivery, was enabled to retain the business of selling for the group of copper companies with which it had entered into the aforesaid contracts to act as sales agent; that this company could thereby retain 1 per cent selling commission from such copper companies. . . . The copper companies to which I refer are the Utah, Nevada Consolidated, Kennecott, Braden, Chino and Ray Consolidated.

"In 1920 the Messrs. Guggenheim carried their policy of gambling in metals further. At this time the copper market showed a tendency toward a sharp decline in prices. Having made the mistake of selling for future delivery in a rising market, the Messrs. Guggenheim now withheld copper from sale in a falling market. In April, 1920, as the result of this policy, the company had on hand approximately 160,000 tons of refined copper. In the meantime the price of copper had declined at least 5c. per lb. ($100 per ton) with a consequent loss, traceable to the Guggenheim influence, of at least $15,000,000 to the stockholders of the companies concerned, the copper companies and this company.

Loss on Lead Much Smaller—Gain on Silver

"In the company's purchase and sales of silver and lead, Mr. Brush continued to follow the policy, previously followed in sales of copper, of selling currently instead of for future delivery. . . . Under Mr. Brush's policy the company made a profit on its transactions in silver, and the company's losses from fluctuation in prices of lead were held down to the comparatively small sum of $465,060.71 for the period 1904-1918. For the same period, under Mr. Murry Guggenheim's policy, the company's losses in sales of copper, according to a statement by Mr. F. W. Hills, amounted to $4,638,934.85. The Messrs. Guggenheim were not so largely interested in silver or lead producing companies as in copper companies.

"Of the directors of the company, Messrs. Prosser, Newhouse, Stewart, Morse, McGowan and I were those who were outspoken in expressing their views relative to the business and policies of the company. . . . At the time when Mr. Simon Guggenheim was elected president of the company, Mr. Newhouse was made chairman of the board of directors. It is significant that immediately after the annual meeting in April, 1920, when I was forced from the board, to which I shall hereafter refer, Mr. Prosser was promoted to the position of vice-president and at the same time three new vice-presidencies were created and three other directors were placed in those offices. The opposition . . . was silenced.

"Immediately after his election as president, Mr. Simon Guggenheim informed Messrs. Stewart and Morse that their services were no longer required, and demanded their resignations. Mr. Stewart ceased to be a director. . . . Mr. Morse was allowed to continue as a director of the company but in a position of no influence and at a greatly reduced salary. At this time Mr. McGowan declined to continue as a director of the company under Mr. Simon Guggenheim and resigned from the board of directors.

"In March, 1920, a few days prior to the regular annual meeting of the stockholders of the company, I received from Mr. Simon Guggenheim a letter informing me that because of the difference in our views relative to the management of the company, I must sever my connection with the company (Mr. Eilers says he refused to resign). In the next month (April) I failed of re-election as a director."

Copper and Silver Producers Should Shut Down, Says Charles Butters

Maintains in Letter to E. P. Earle Drastic Action Will Bring Readjustment More Quickly

The following letter has been sent by Charles Butters to E. P. Earle, president of the Nipissing Mining Co., of Ontario:

"My dear Mr. Earle:

"Shall we run or shall we close down? Every copper and silver mining company in the world today is asking itself this question. Every board of directors and every manager is debating whether or not it is best to go on. I have had this question up with our mines for the last six weeks. At the mines they naturally feel that if they can keep on going without a loss or without too much loss it is better to keep running, because they are keeping their organization together. From the point of view of the people employed at the mine and the mercantile community whose life depends upon the running of the mine so long as the mine keeps running everything is all right; but from the owner's point of view things look very different. His capital is invested in the mine, and although the mine can be kept running and paying expenses he sees no interest return on his capital, and meanwhile his ore reserves are being steadily depleted.

"I think it is far better to keep the ore in the mine than it is to go on and knock the price of silver by producing on such a market as we have at the present time. Selling conditions are in no way bettered by the production of copper or silver at the present time. I cannot see the object of increasing the supply of metal, even if the supply is withheld, in the face of such an extremely light demand. It will be very difficult to get the price back on silver if we let it sink to 50c. or 60c., which it can do with perfect ease if we keep on producing in the face of no demand, because every time we offer we get a little less. If we are going to have low-price silver in the future the quicker we stop and wait for cheaper supplies and for labor to readjust itself the better off we are. We are all standing in our own light producing silver on the down-grade. It isn't as if we were producing clothing, food or any necessity. We are doing no public service. On the contrary, we are hurting the whole of the Chinese and the Indian market and reducing their ability to buy by making our offerings of fresh silver in the face of the low demand. Instead of benefiting the world we are hurting hundreds of millions of people by trying to force silver on a market already surfeited and unable to absorb the smallest amount without lowering the price.

"I urge every silver and copper mining company to close down definitely for either six months or a year, making a definite period in which they will not reopen and staying closed even longer if it is necessary. I know this is a hard thing for any mine to do, but I feel that we all ought to face it, and the more of us who face it together the quicker readjustment will take place.

"Sincerely yours,
"CHARLES BUTTERS."

Wages Cut at Butte

Miners To Receive Dollar Less per Day; Craftsmen's Wages 50 to 75c. Lower—9,500 Men Affected

Mining companies in the Butte district, Montana, announced on Dec. 16 that miners' wages will be reduced from $5.75 to $4.75 per day. The various craftsmen employed by the companies will receive from 50c. to 75c. less per day than they have been getting. The unions have received a thirty-day notice of the termination of existing contracts. In all about 9,500 men at Butte, Anaconda and Great Falls are affected. According to the operators this reduction was decided upon as an alternative to shutting down the mining industry in Montana altogether.

Copper mining is at the lowest ebb in a number of years in the Butte district. It is stated in producing circles that a sufficient number of inquiries as to copper have been received within the last year to give hope for the future. The Anaconda company is now operating upon a 40 per cent basis and it is hinted that a further reduction to 25 per cent is not unlikely, unless there is an immediate improvement in the outlook. The company now apparently has in mind a minimum of operation consistent with the maintenance of its organization. The present wage scale, it is pointed out, is one predicated upon a rise in the price of copper, but the schedule does not take into reckoning a possible drop in price. Instead the scale is pegged at $5.75.

It must be said to the credit of the Butte companies that a far more drastic curtailment could have been put into effect months ago, but in the hope that the copper situation might show an improvement, development and repair work has been carried on. Incidentally, this program has put the mines of the Anaconda in excellent shape.

Wages Cut by Arizona Copper Companies

Practically all the copper mining companies of Arizona have made reduction of wages on an average of $1 a day per man, with 20 per cent reduction on the office and supervisory salary accounts. The only declared opposition was at Globe, soon stilled by suggestion that the only alternative was the closing of the mines and works. Miners will continue to receive over $5 a day for about seven hours net work. The new adjustment has been somewhat different in such low-grade concentrating camps as Clifton, Morenci, Ray and Ajo, where the labor largely is Mexican.

Miners' Wages Cut in Missouri

From 9 to 20 Per Cent Less in Lead Belt—Decrease $1 Per Day in Joplin District

With the severe shrinkage from 10c. to 5c. per lb. in the price of lead in four months the operators in the lead belt of southeast Missouri have notified the miners that after Jan. 1 there will be a cut of 20 per cent in the wages of all men receiving over $4 a day and 9 per cent for those receiving under $4, with a minimum of wage of $3.

In the Joplin zinc district a horizontal cut of $1 per day has been made.

Apache Powder Co. Erecting Acid Plant at Douglas Smelter

A fuming acid plant is to be erected at the Calumet & Arizona smelter at Douglas, Ariz., by the Apache Powder Co., which is building a large explosives plant at Land Station in the San Pedro Valley, seven miles south of Benson, Ariz. The local plant, which will not be of large size, will be entirely distinct from the large Calumet & Arizona sulphuric acid works, which now supply the acid used in the leaching operations of the New Cornelia company at Ajo. For the making of powder there will be required a relatively high grade of acid.

Arizona's Income From Mines To Be Less This Year

Following the approaching tax assessment, it is expected that the average Arizona taxpayer will have better appreciation of the part the mines of Arizona have in support of the rather expensive state government. Mining tax assessments are based upon the average mine production for a period of five years, this period set to equalize any fluctuation in the value of the product. For a number of years copper has been high, with its peak price reached during the early period of the war. But for two years, and especially during 1920, the mine profits have been low, or have been non-existent. At the time of the last assessment the drop of value and of product had its effect upon the five-year average, and the gross mine tax assessment went down $24,000,000 in Arizona. At that, the mines paid on a valuation of $454,000,000 in a total state assessment of $884,000,000. When the coming assessment is made with two lean years figured in with the three good years, the drop in the mine assessment may reach 15 per cent additional. Naturally, to keep up the same state income there must be a material increase in the tax rate, with possibly 60 per cent collected from the assessment on city property, farm lands, live stock and general industry, including railroads. The state has an official organization on a broad scale, with equipment of offices and commissions that probably would serve for the administration of thrice its population of 330,000.

German Iron Prices To Go Lower

Effect of November Cut Disappointing —Buyers Holding Off—Dealers Forestalling Foreign Bids

Vienna, Nov. 19—The expectation that the average decrease of 400 marks per tonne in German prices for iron, which went into effect Nov. 1, would bring greater activity in sales has not been realized. When it became known in October that the companies proposed to make a further reduction in prices, the consumers cancelled a very considerable amount of ordered materials in order to be able to take advantage of the anticipated lower prices. On the other hand, the works insisted that materials ordered be accepted and paid for at the contract prices, so that considerable material was delivered. The uncertainty of the whole economic situation is causing consumers to hold back. Purchases indicate the immediate needs, because most buyers are not stocking up. Relying on the present ability of the plants to make prompt deliveries and encouraged by the whole state of the market, consumers feel that there is and will be no lack of iron and that they need not buy for future needs. Since the price cut did not bring the hoped-for results consumers are already counting on a further cut by Jan. 1, and accordingly are buying very cautiously. Uniform prices have wholly disappeared from the market. Both works and dealers are very accommodating to customers, for it is feared that as the foreign exchange falls, the foreign iron markets that are also suffering somewhat will cut in on German markets more strongly. Therefore discounts from official minimum prices are readily allowed when one can thereby secure larger orders for early delivery.

Broken Hill Miners Resume Work

Melbourne, Nov. 22—After a struggle lasting over eighteen months, the Broken Hill mines in Western Australia have been reopened, and work has been resumed under the terms of the award made by the tribunal over which Justice Edmunds presided. Since the reopening of the mines, engineers, carpenters, joiners, and boilermakers have applied for a reduction of hours similar to that awarded to miners. The companies have therefore offered the unions concerned a 43-hour week, on the understanding that the fortnight's holiday yearly on full pay, as previously arranged, would not obtain under this arrangement.

Arizona Chapter of Mining Congress Elects Officers

Robert E. Tally, of the United Verde Copper Co. at Jerome, Ariz., has been elected governor of the Arizona Chapter of the American Mining Congress. The vice-governors are T. H. O'Brien, of Globe; G. M. Colvocoresses, of Humboldt, and John C. Greenway, of Warren. J. E. Curry, of Bisbee, is retained as secretary and H. J. McClung, of Phoenix, as treasurer.

Norwegian Nickel Company Seeking Loan

It is stated in the Norwegian press that Minister Sam Eyde and Captain D. Vogt left Norway recently for London to confer with the British interests in the British America Nickel Corporation, operating in the Sudbury district of Ontario, on behalf of A. S. Kristiansands Nickel Raffinerings Verk. The object of the conference is assumed to be the securing, through the medium of the board of trade, of a favorable loan. As previously referred to in the *Engineering and Mining Journal* of Feb. 7, 1920, the Norwegian company is strongly interested in the Canadian undertaking at Nickelton, Ont., its shares in the latter being book entered at over 16,500,000 kroner.

Pessimistic as to Swedish Iron Industry's Future

A Swedish engineer, A. Walberg, is by no means optimistic in his views on the future of Sweden's iron industry. In a statement, reproduced in the Swedish press, he points out that foreign competition in the near future will be very severe and even in the internal market foreign wares will compete with advantage with Swedish iron and steel. The enormous increase in fuel costs will burden the Swedish industry far more than that of foreign competitors who would reap additional advantage from the existing conditions of exchange values. So far as export conditions are concerned the position is far worse. During the war a large number of those consumers who had previously used Swedish pig iron and steel were compelled to resort to their own country's products. At first these home products were considerably inferior in quality to pre-war Swedish goods, but as the war progressed the quality (especially in the electric refining branches) improved in a very high degree. These disabilities, quite apart from the depression prevailing in all quarters, will make it especially difficult for the Swedish iron industry to recapture the old export market that it formerly had.

Old Copper Mines in Norway Close Down

The ancient copper mines of Röros, Norway, have recently been closed down, and will probably not be operated again until the period for the compulsory increase in wages fixed by the Arbitration Court expires in 1922. The reasons given by the press for this step are the increase above referred to and the steadily rising cost of all working materials. The Röros Mines were opened on Aug. 28, 1644, and have been in continuous operation ever since. They comprise the three chief mines of Storvarts, Kongen, and Muggruben, and five auxiliary workings. The output from 1644 to 1911 is stated at about 80,000 tons of copper and 400,000 tons of export pyrites.

New Idria Receiver Asked

Friendly Suit Brought To Preserve Assets Until Re-financing Plan Can Be Worked Out

Application has been made for the appointment of a receiver for the New Idria Quicksilver Mining Co., of California, in order to preserve the company's assets and property until some plan of re-financing can be formulated and carried out. In a circular to stockholders president Andrew Adie says that the suit instituted for this purpose is a friendly one with the company consenting. The causes of the present condition of the company's finances are: Excess cost, overestimates of rebuilding the company's plant after the fire of last June; the loss of production during reconstruction; and the decreased price of quicksilver caused by dumping of surplus war stocks on the market.

Katanga To Try Pulverized Coal in Blast Furnaces

Arrangements have been made by the Union Minière du Haut-Katanga, operating in the Belgian Congo, with the Garred-Cavers Corporation, of New York, for the use of the latter's process, whereby pulverized coal is used to replace coke in blast furnaces. The Katanga company has placed orders for a 42-in. Fuller mill and a Fuller-Kenyon pump for the coal preparation plant which will be used in connection with the process at its copper smelter.

Licenses were secured from the Garred-Cavers Corporation some time ago by the Cerro de Pasco Copper Corporation, the International Nickel Co., and the Tennessee Copper Co., for the use of this process at their various smelters.

Recent Production Reports

Cie. du Boleo, Baja California, produced 771,680 lb. copper in November as against 617,120 in October.

Calumet & Hecla produced 7,326,763 lb. copper in November compared with 7,943,502 in October. November's output by subsidiaries was as follows: Ahmeek, 1,840,600; Allouez, nothing; C. & H., 4,227,099; Centennial, nothing; Isle Royale, 768,684; La Salle, 22,700; Osceola, 436,280; Superior, nothing; Tamarack, nothing; and White Pine, 31,400.

Greene-Cananea produced 3,350,000 lb. copper in November, the same as in October.

East Butte produced 1,658,860 lb. copper in November, as against 1,626,980 in October.

Chile Copper produced 8,859,984 lb. copper in November, compared with 9,420,000 in October.

The Rand's gold output for November was £2,740,250, compared with £2,813,500 in October.

The output of silver from the Kongsberg mines in Norway for October was 1,408 kg. with an addition of 134 kg. of coarse silver from the Gabe Gottes workings.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Assessment Work Compromise Accepted by Both Houses

House Votes in Favor of Senate Bill for Six Months' Grace for Claim Holders

After some discussion but without the necessity for a rollcall, the House of Representatives passed the measure already approved by the Senate for extending the period for doing assessment work on mining claims until July 1, 1921. There was some objection to the measure on the ground that it had been stated when the assessment work was suspended for 1919 that no further requests of that character would be made. It was pointed out, however, that while individual members of Congress had made such statements, the owners of mining claims faced much more difficult conditions than in 1919. Instances were cited where labor was absolutely unprocurable. During the discussion of the measure it was intimated that prior to July 1, further legislation would be asked extending still further the period for doing the 1920 assessment work. It was stated that the snow does not leave the mountains in many areas until the middle of June, leaving insufficient time to complete the work prior to July 1. Owing to the shortness of the time available, the bill had to be passed in exactly the same language as that contained in the Senate bill. The President is expected to sign the bill promptly.

In a letter to Representative Rhodes Secretary Payne said:

"House joint resolution 396 is similar in language to the act of November 13, 1919, and would extend relief to mining claims in the United States, including Alaska. I recommend that this or similar legislation be adopted."

Sentiment in the Senate, however, was strongly opposed to further relief from assessment work, despite the fact that most of the members from mining states were in favor of its being excused in 1920. The majority, however, was against any such proposal, but there was no objection to extending the time for performing this work.

Provides Tariff on Imports of Asbestos Manufactures

In a bill introduced in the House of Representatives by Representative Watson of Pennsylvania provision is made for high import duties on the manufactures of asbestos. The bill provides that unmanufactured asbestos is to be admitted free of duty.

Although emergency tariff legislation probably will be enacted at this session of Congress placing high import duties on several agricultural products, live stock and wool, there is little chance that the list will be extended to include any of the minerals. It is very doubtful if the dyestuffs bill can be passed at this session. This means that the various tariff measures on minerals which are now before the Senate are likely to wait for general tariff revision that will take place at the extra session which will probably be called.

Means Appointed Chief Engineer of War Minerals Commission

Secretary Payne has appointed John H. Means to be chief engineer of the War Minerals Relief Commission. Mr. Means has been acting in this capacity since W. R. Crane resigned.

Awards totaling $8,924.45 were recommended by the War Minerals Relief Commission during the week ended Dec. 11. The awards were as follows (the name of the claimant, the mineral, the amount recommended and its percentage relationship to the amount claimed are shown): Liberty Mining Co., chrome, $3,352.25, 41 per cent; Atlantic Manganese Co., manganese, $3,309.64, 15 per cent; W. Michelini, chrome and manganese, $2,182.54, 43 per cent.

George Otis Smith Defines Noble Minerals

Speaking at a recent meeting of the Portland Cement Association Dr. George Otis Smith, the director of the U. S. Geological Survey, said:

"We are apt not to pay enough honor to the humble but useful things of life. The dominant position of our country in a world of industry and commerce is due largely to our wealth in the essential minerals, and the statistical record of the growth of our mineral industry shows how the baser metals have taken the leadership from gold and silver. Indeed the non-metals, once of subordinate rank, now far exceed the metals in value of annual output. To make a more specific comparison, the three building materials, cement, stone and clay products, reached last year an output valued at $500,000,000 and exceeded the total value of all the metals except iron. The annual output of your own product, cement, exceeds in value that of any two of the metals except iron and copper. The noble minerals of today are the mineral fuels, the metals, iron and copper and the structural materials. Upon these the daily life of our industries depends."

Brass cartridge cases to the extent of 56,250,000 lb. are to be sold by the Director of Sales. Bids are to be received until noon Jan. 5.

Process for Making Phosphoric Acid Improved

Bureau of Soils Has Devised Method Involving Briquetting and Smelting —Cottrell Plant Used

After comprehensive experiments officials of the Bureau of Soils are convinced that a method has been devised which offers advantages over the present process for extracting phosphoric acid from phosphate rock. The rock is briquetted with sand and coke and smelted in a fuel-fed furnace. In addition to the laboratory work which has been done the method has been tested on a commercial scale at a plant built for the purpose by the Bureau.

Since it has been possible to make in a small plant a product which could be sold in competition with the product of the large plants using the sulphuric acid process, it is regarded as practically certain that a large scale plant could make even a better showing. The development not only means cheaper fertilizer, it is believed, but will make possible the extension of the life of the rapidly diminishing phosphate deposits. In handling the Florida material by the old method one of the most troublesome impurities is the clay. This clay is particularly gluey in character. Advantage has been taken of this property, which forms a splendid binder for the briquettes. Due to the difficulties of keeping the fuel in direct contact with loose material, results of an encouraging nature were not obtained until the briquetting plan was worked out. Sufficient sand to furnish the required silica also occurs in the deposits as an impurity. The only needed materials which are not right at hand are coke and fuel oil, but the Florida phosphate deposits are splendidly situated in regard to those materials. Coke is made in large quantities in the Alabama coal fields, and fuel oil may be brought directly across the Gulf from the Mexican oil fields. Under the present methods of handling phosphate rock elaborate screening and washing must be done to separate the rock from the impurities. This led to the waste of some two-thirds of the rock. In the experimental runs the Bureau of Soils chemists were able to recover a 64 per cent phosphoric acid, which is equal to 47 per cent P_2O_5.

It is predicted at the department that the new method will revolutionize the fertilizer trade. It is possible that it will have a decided bearing on the plans of Western smelters to ship superphosphate into the Middle West.

The work on this problem was begun by the Bureau of Soils five years ago under the direction of Dr. W. H. Ross.

His experiments were confined almost entirely to the use of the electric furnace and the Cottrell precipitator. Dr. Ross succeeded in getting a very concentrated product, but the costs were considerably higher than those of the sulphuric acid process. J. N. Carrothers, one of the bureau's electrochemists, continued the work begun by Dr. Ross and in co-operation with the R. B. Davis Co. experimented on a semi-commercial scale. He reduced costs to the point where they were almost identical with the sulphuric acid method, but the general conclusion was reached that the electric furnace could not be used except in cases where an exceptional high-grade product is required.

Early in 1918 W. H. Waggaman was placed in charge of the work and began experiments with fuel instead of the electric arc. Many obstacles had to be overcome, some of which had to do with furnace construction. Finally a sort of combined blast and open-hearth furnace was devised. By using fuel oil and the briquetting process it soon became evident that the major problem was solved. There still remain some mechanical details which must be worked out. Complete success of the process is anticipated.

NEWS BY MINING DISTRICTS

Special London Letter

Public's Lack of Confidence Makes Financing Difficult—Santa Gertrudis' Notes at Discount—Little Mine Development Reported

BY W. A. DOMAN

London, Dec. 7—In these days when the financial position has got upon people's nerves, confidence in the immediate future seems to have received a nasty blow. Perhaps it is not to be wondered at. Deflation and the consequent fall in commodity prices are making themselves felt. Trouble is reported in the produce markets, and in the various trade directions; metals have tumbled to an alarming extent, and there is talk of assistance having to be given to firms in Mincing Lane, Liverpool, and, it is whispered, the Stock Exchange. With tin below £209, a drop of something like £59 in a month; with lead at about £25 10s., copper at £77 10s., and spelter under £30, base-metal companies are experiencing a drab time. Investors are selling in all directions, and mining shares cannot exempt themselves from the influence. Fortunately tin, copper, and lead companies never reckon upon a stable price for the metal, so that there is always a margin; the position at the moment, however, is far from pleasant. Gold has fallen to 117/1d. per oz. and silver to 46¾d., so that the whole gamut of mining descriptions is affected. From the standpoint of mining operations no one cares to take a lead, partly because of the virtual impossibility of doing so. Where so many companies need money, and where the demand for their products has fallen off, the public cannot be induced even with big baits to assist at the moment. Sound as the notes offered by the Santa Gertrudis were regarded as being, the times are unpropitious, and subscriptions did not roll in as they would have done normally. Yesterday for the first time dealings took place, and it was a disappointment to all to find that the notes were quoted at £10 discount. Not a satisfactory beginning by any means. But Santa Gertrudis is not solus in this respect. Large industrial corporations that will live long after Santa Gertrudis is wound up have the mortification of seeing their notes, even better secured, knocking about at a discount. Companies must have money, it is true, if their operations are to be continued. The Buena Tierra, a Mexican undertaking, is asking for £66,000 in five-year notes, carrying 10 per cent interest cumulative, and redeemable with a bonus of 25 per cent. This offer is at the rate of one note to every five shares held. The notes have a prior lien on all the profits, and as the issue is small, the security, though it cannot be divorced from the speculative, is nevertheless of its kind quite good, and the management and the 25 per cent bonus would get the money readily ordinarily. Some of the American mining companies directed from this side have in the past proved very successful in financing on some such lines.

Strangely enough—or perhaps it is not strange — new mining companies report much in the way of developments in these days. It is so noticeable that after a spell of dullness quite a number of companies find something to announce, and as sometimes from 50 to 100 ft. of driving are mentioned it is pretty obvious that the news has been saved up.

If emphasis were needed upon the parlous condition of many of the gold mines on the Witwatersrand it could be found in the speech of Lord Harris at the annual meeting of the Consolidated Gold Fields. This finance company has the misfortune to be interested in several mining areas where nature has been rather parsimonious in distributing the gold. No one can blame the company, for the claims were acquired when the belief obtained that the deep levels of the Rand would prove as profitable as the outcrops, and when boring at great depths had indicated the continuity of the Main Reef series of reefs. The metallic content, however, is so low that there would be no surplus of revenue over expenditure were it not for the existence of the gold premium. Recognizing that the prospects are far from hopeful so far as the Central Rand is concerned, the Gold Fields has altered its constitution somewhat and will in future pay greater attention to industrial enterprises. It has already invested fairly substantial sums in South Africa, in England and in America, as regards the last named in power undertakings and the American Trona Corporation. Several of these, especially in South Africa, have yet to be developed, but the change is a sign of the times.

During the war all South African mining shares held by enemies were placed in the hands of either the Public Trustee in this country or with the Custodian of Enemy Property in South Africa. Some of the mining and finance companies have purchased such holdings and issued them at low rates to the other shareholders. There are still remaining, however, shares to the value of about £6,000,000, mainly held in South Africa, which the two officials mentioned are endeavoring to realize. The finance corporations here would be only too pleased to take the shares but there seems to be considerable difficulty in coming to an arrangement.

A Rhodesian mine, the Lonely Reef, in which Rothschilds were interested in a way at its inception, has more than borne out the estimates then made. It is one of the brilliant exceptions of the country, and although it has been in existence ten years its ore reserves at September 30, just announced, stood at 207,912 tons of an average assay value of 21.39 dwt. Three months earlier the quantity was 198,341 tons and the value 22.2 dwt. Not many mines can maintain an average exceeding an ounce. There is another, the Globe & Phoenix, which has more than surprised its management. What seems like a new reef has been discovered at the 14th level and capital values are shown, i.e., 51 dwt. over a stoping width. In the 15th level the first assays exceed 5 oz. over a stoping width. The interesting problem at the moment is whether this reef will junction with one previously worked.

AUSTRALIA

Queensland Government Secures Yampi Sound Iron Ore

From Our Special Correspondent

Brisbane, Nov. 5—Notwithstanding that London financiers turned down the State Premier's request for a loan, a part of which was for establishing a

government iron and steel works, the Minister for Mines has just stated that it is intended to go on with the enterprise, and with this end in view to buy the large and rich iron ore deposit at Yampi Sound that has been under offer for the past four months. This iron and steel works project is, on account of its magnitude, mixed up with the political situation of Queensland more prominently than any other state schemes which the present government has in hand. When the British refused the loan it was decided by the Queensland government to appeal to the country to show that the people approved of its policy, and the result of a general election which was brought about six months before the term of the old parliament would otherwise have expired is that the government has come back to power with a small (and very much reduced) majority of members, but with a considerable majority of the people as a whole against them if all the other parties in the new House are numbered against them. The government now announce that they are going to carry on, and that they intend to get the money for the proposed iron and steel works at Bowen as well as for other purposes. As a matter of fact they have closed with the Yampi Sound iron ore deal and are paying the £30,000 which is the price in debentures. A sum of £3,000 had previously been paid for the option to purchase.

The ore deposit is on Cockatoo Island, belonging to Western Australia, on the northwestern coast of the continent, 250 miles north of Broome, 1,500 miles from Perth, W. A., and nearly 2,000 miles by sea from the port of Bowen, Q., on the east coast. The Minister for Mines describes the deposit as one of the best if not the very best in the world, and it certainly is a good one. Borings carried out by the Queensland government show that the ore contains 69.6 per cent of metallic iron, with only 0.1 per cent of silica, 0.1 per cent phosphorus and 0.005 per cent sulphur. The quantity of ore on the island has been officially estimated at 20,750,000 tons above sea level, with an unknown quantity below the level and large supplies that have been shed into the deep water of the foreshore from its precipitous slopes.

The principal Queensland iron ore deposits are in the Cloncurry district, 600 miles by rail from Bowen. This ore runs only 50 per cent metallic iron, and, as it is high in silica, it is proposed to blend it with the Yampi Sound ore in the manufacture of iron and steel at Bowen.

The coal for these works is to come by rail from the Bowen River, 60 miles inland. From this coalfield an almost unlimited supply of good coal will be available as soon as the railway to that place is finished, probably in twelve or fifteen months. In addition to the State colliery three coal leases are being opened up by a private company, and it is officially estimated, as the result of extensive borings, that when the two mines are properly developed they will be capable of producing a million tons of first-rate coking coal per annum for over a hundred years, and that in addition to meeting the bunker requirements of oversea steamers calling at Bowen they will very soon be able to supply the needs of the whole of North Queensland at a reduction of 33 per cent in price compared with that paid for coal at present obtained from the south.

The only large iron and steel works at present in Australia are those of the Broken Hill Proprietary Co. at Newcastle, and these are doing so well that it is intended to add to the existing plant at once. These works are supplied with iron ore from South Australia, and this ore, which runs 61.70 per cent iron, has to be conveyed 35 miles by rail and about 1,300 miles by water. On the other hand, the coal used at the works is mined right on the spot at Newcastle, and the climatic conditions are all in their favor as compared with Bowen, which is within the tropics.

CANADA

British Columbia

Labor Abundant in Kootenays—Consolidated M. & S. Co. Refuses Custom Ore Unless Shipper Can Finance Marketing Bullion

Nelson—Abundant labor is now available for mining operations throughout the Kootenays, and in some cases a surplus even in the more skilled lines in contradistinction to the condition prevailing a few weeks ago. This change has been brought about largely through depression in the lumbering industry, releasing hundreds of men formerly employed in the woods, and by an influx of miners from across the line, who have been laid off. The One Big Union strike, which practically paralyzed the Slocan silver-lead mining industry during last summer and fall, is in consequence at an end.

Silversmith Mines, Ltd., operating the Silversmith mine (formerly the Slocan Star) at Sandon, B. C., has declared a dividend of 1c. per share. This will be the only dividend paid by Slocan companies during 1920. Silversmith, a silver-lead property, appears to be the only Slocan property in a position to operate profitably under present conditions.

The Blue Bell mine of the New Canadian Metal Co. on Kootenay Lake and scene of the earliest lode mining operations in this section continues operations, but with a reduced force, preference in employment being given, it is stated, to men with families who have been with the company for several years.

Complaint by the Associated Boards of Trade of Eastern British Columbia that charges for coal and coke used in smelting operations are excessive is resulting in an inquiry being made into costs of production and distribution of Crow's Nest Pass coal and coke products.

A further curtailment in Kootenay mineral production must inevitably follow notice served on shippers by the Consolidated Mining & Smelting Co. of Canada, Ltd., that no custom ore can be taken care of until further notice unless shippers are in a position to finance the carrying or marketing of the bullion themselves.

The Consolidated M. & S. Co. has sharply curtailed all new construction operations around the Trail smelter, following banking advices that no additional advances on metal stocks on hand or accumulating could be looked for. It is stated that following the curtailment order men employed on purely constructive work were laid off to the number of about 300 or 400. This may be taken to indicate that construction of the proposed concentrator, designed for handling lower grade Rossland ores, will be inevitably postponed for several months at least.

Victoria—Reference has been made to the incorporation of the Coast Range Steel, Ltd., an organization said to be backed by British capital to the extent of $15,000,000 and whose plans are to establish in British Columbia an iron and steel industry capable of taking care of all the requirements of northwestern America and as well of securing a large share of the foreign transpacific trade. It was said, too, that another British syndicate has had its engineers in the field in British Columbia investigating its natural resources with a view to starting a similar enterprise. A third announcement has been made in this connection which is of interest. It is that the Industrial Department of the provincial government has undertaken to loan $250,000 to finance the amalgamation of the Port Moody, Eburne and Tudhope electric plants, the new company to be known as the B. C. Steel Works, Ltd. No official confirmation, however, is available of the assistance said to be promised by the government.

Britannia Beach—The Britannia M. & S. Co. has shut down its mill and ceased shipments owing to the condition of the copper market. Mine development is being continued. The July, 1919, schedule of wages is again in force.

Ontario

Power Outlook Improving—Kerr Lake To Stop Production

Cobalt—The outlook as regards the supply of electric power is becoming more favorable, owing to increased rainfall and the continuance of open weather causing a rise in the level of the lakes and river.

It has been decided to discontinue production at the Kerr Lake mine for the present, but as many men as possible will be retained and employed in development work. Operations at the Dominion Reduction plant, which was running chiefly on ore from the Kerr Lake, will be considerably curtailed.

Porcupine — Development work on the Clifton Porcupine has been suspended. A circular issued to the share-

holders states that under the financial conditions prevailing during the last few months it has been found impossible to dispose of treasury stock in sufficient quantity to provide funds needed to carry on development on an adequate basis. It was therefore thought advisable to conserve the funds now in the treasury until such time as it is found expedient to resume work. The results of the work so far done give reason to believe that the property can be made a profitable producer and it is intended to seize on the first favorable opportunity to complete the financing of the company and proceed with development.

At the McIntyre the new vein system lying about 400 ft. south of the No. 5 shaft has been opened for about 225 ft. on the 1,375 level with highly favorable results, the vein showing a width of 20 ft., with gold content stated to average higher than in the main vein system.

Boston Creek—A find of almost pure chalcopyrite has been made in the west crosscut at the 500-ft. level of the Miller Independence. It occurs in the form of a small solid vein lying alongside a vein of calcite. Assays in bulk show 32.48 per cent copper, with $2.80 in gold and 1.3 oz. silver per ton. A copper-bearing vein on the surface has been traced for a considerable distance, assays from which seldom exceeded 3 and 4 per cent, indicating that mineralization is increasing at depth.

Gowganda—At the Trethewey property the drift on the "office" vein is in over 100 ft. with high grade showing all the way. A shipment of high-grade ore is being prepared.

The Miller Lake-O'Brien with a production of 708,872 oz. last year paid taxes on profits of $451,000.

NICARAGUA

Nicaragua Mining Co. Near Profit-Earning Stage After Nine Months' Work

Pis Pis District—The Nicaragua Mining Co. has developed between $500,000 and $1,000,000 worth of ore averaging about $22 per ton at the Neptune mines. A large tonnage of manta and disintegrated vein rock running $3 to $14 per ton has also been located. Operation of the first 3-stamp unit of the amalgamating mill was begun on Nov. 1. A $4 per ton profit is estimated with $12 mill heads and 60 per cent recovery. It is expected that the mill will be handling 100 tons daily this month. With nine stamps dropping the capacity, it is figured, will be 120 tons per day and the profit at least $10,000 per month. Barry Searle, consulting engineer and general manager, finds that the Neptune vein contains three paystreaks, one along the footwall, one along the hanging and one in between. These chutes in places come together to form a pay chute 35 ft. wide averaging better than $15. As developed thus far these chutes have an estimated length of 450 ft. with faces still in pay ore. Granville S. Borden has been appointed general superintendent in place of William B. Daniel, resigned.

The Eden Mines tunnel toward the Hidden Treasure vein is showing good stringers of ore which do not appear on the surface. The company hopes to cut the Hidden Treasure vein about Jan. 1.

MEXICO

Coahuila

Torreon Smelter Down Until Spring

Torreon—Persons arriving here from the Mapimi camp report that the smelter of the Penoles company and the Penoles mines have been closed down. The miners and outside laborers have been discharged and many of them are leaving with their families. A few of the Americans, heads of departments, are being retained in camp. Others have been sent to Monterrey or Aguascalientes.

The smelter at Torreon remains idle and the management does not anticipate the resumption of work until after March. They have notified all shippers that no more ores will be received until further notice.

Rafael Bustamante, a prominent rancher of this district, has filed on the vacant ground contiguous to the famous Buena Ventura and Cuatro de Julio mines in the Velardeña mining district. The A. S. & R. is still operating its smelter in this camp here.

Saltillo—Local mining men of this city are opening up some promising veins of lead and zinc ores in the Jaquez de Ferniza mountains near by. Their group of mines is composed of 26 pertenencias which are being thoroughly prospected and developed.

The Esperanza and Placeres mining companies with headquarters in this city have called for a general meeting of stockholders to be held the latter part of this month, at which time assessments will be levied in order to carry on development work until ore shipments can be resumed.

Guanajuato

New Ore Found at Melladito Group

La Luz.—Development work is being carried on in the Melladito Group of mines of the United Mines Co. This work has resulted in the finding of a new body of good milling ore. The company's 15-stamp mill at this property was shut down about a month ago and will remain down until conditions warrant a resumption of operations. Joseph MacDonald, Jr., is superintendent in charge of mines.

ARIZONA

Copper Queen and C. & A. To Cut Wages Jan. 1—May Resume Operations at Hardshell

Bisbee—The Arizona Bisbee Copper Co. has suspended operations indefinitely.

The Copper Queen and the Calumet & Arizona have posted notices advising a cut in wages effective Jan. 1, 1921. For all employees whose wages are $5.35 and above the reduction is $1 per day. For those receiving less than this amount the reduction is 80c. per day. For all salaried men there is a reduction of 20 per cent on the base rate of pay. The service bonus is to be discontinued.

The Shattuck mine and mill have been closed down. About 40 men are still retained at the mine to do the necessary repair work and continue some development work.

The Wolverine & Arizona are not now shipping. A few men have been retained doing some development on the 300 level.

Courtland—Shipments of ore have been discontinued at the Great Western Copper Co.'s property, at Courtland.

Patagonia—H. K. Welch is on his way to Patagonia from New York. Upon his return it is reported operations will be resumed at the Hardshell mine, of which he is general manager. The new shaft will be unwatered and the drift continued on the 500 level until it cuts the orebody. Operations have been suspended since last May.

The Mowry mine has resumed shipping lead-silver ore to the El Paso smelter.

The present campaign of diamond drilling has been completed at the Three R mine. Neither the future plans or the results of the diamond drilling have been announced. The property belongs to Magma Copper interests. Representatives of the Three R have been examining the Blue Nose mine.

Fred Kohlberg and C. C. Allen have taken a lease on the Flux mine and are milling lead carbonate ore. Several shipments of concentrates have been made recently.

Work in the tunnel of the Andes mine, which belongs to R. R. Richardson, is progressing and has now reached a point where the vein cut by higher workings is expected.

The Grey Brothers are doing some exploration work in the tunnel in which they encountered grey copper ore recently.

Duquesne—At the Duquesne and Washington camps owing to the slump in the price of copper most of the mines and leases have been shut down. Some lead-silver ore is still being shipped, which is mostly produced at the Kansas mine.

At Rosemont in the Santa Rita Mountains all mines are idle, operations having been suspended recently.

Silverbell—In its report for November, the management of El Tiro Leasing Co. will submit plans for financing an extensive development campaign during the period of market depression. Salaried employees have voluntarily accepted a 20-per cent cut in salaries.

Chloride—George N. MacBean, a Holbrook druggist, has been made receiver for the Tennessee and Schuylkill

mining interests of Chloride, in a hearing of corporation troubles lately held at Holbrook, before Superior Judge J. E. Crosby. Application had been made by Frank A. Garbutt, of Los Angeles, for foreclosure of a $300,000 mortgage held by him on the property, which, according to statement in court, has a value approximating $10,000,000. The application was denied, with some reference to the fact that Garbutt, while sole manager, had failed to make the mines pay. The receivership was asked by Charles A. Burke and associates, who have taken over the Garbutt mortgage. Announcement was made that production would be resumed soon at the mines, which have been the main support of Chloride, shipping silver-lead ores.

Jerome—The stockholders' fight has been suspended within the Jerome Superior Copper Co. till after the Arizona State Corporation Commission has investigated the books of the company. The bulk of the stock is held in Los Angeles, where allegations of mismanagement were made against Manager George Mitchell and President M. P. Frazier.

NEW MEXICO

Operations in Lordsburg District

Lordsburg—Shaft sinking is being continued at the Eighty-five mine. A station is being cut on the 1,050-ft. level. A sump, 10 x 10 x 28 ft., will be cut and an electric triplex pump installed with a capacity of 175 gal. per min., to pump direct to surface. Drifts are being carried both east and west on the vein on the 900-ft. level.

The Co-operative mine is sinking the main shaft at the rate of about 3 ft. per day.

Tyrone—A test run of the new cyanide mill on the Cora Miller mine has been completed with satisfactory results. Harry Wheeler, for many years with the Socorro Mines, at Mogollon, is mill foreman.

CALIFORNIA

Cyanide Installation at Juniper Mine Complete

Rough & Ready—It is reported here that the Old Black Bear mine, once owned by County Assessor Henry Schroeder and recently worked by Eastern interests, will be refinanced and operated under the name of the Kansas mine. William Buholz is promoting the deal. New equipment will be purchased if the transaction is consummated.

A. R. Archibald, of the same district, is at present in Omaha seeking to finance a company that will reopen the old Osceola mine.

Hayden Hill—Installation of the 40-ton cyanide plant and other machinery at the Juniper mine at Hayden Hill is now complete. Supplies for the winter's run are on the ground. The main shaft is down 386 ft. and still in pay ore. Two stopes have been cut and another will be started.

Sonora—Announcement has been made that Carson Hill Gold's new mill will be ready Jan. 15. The number of stamps dropping will be doubled and the mill capacity will thus be brought to 15,000 tons of ore monthly.

Amador City—The Bunker Hill company has resumed mining on the 1,750 and 2,800 levels. Sinking of the deep winze has been temporarily suspended but will be resumed when conditions are favorable.

NEVADA

Market Improved for Virginia Louise Ore—Nevada Con. Drills Into New Ore

Pioche—Virginia Louise stockholders met at Pioche on Dec. 20 to act upon a proposal to amend the articles of incorporation so as to permit an increase in the capital stock from 1,000,000 shares of $1 per value to 1,500,000 shares of the same par value. The principal reason for this is that the market for Virginia Louise fluxing ore has improved. From Sept. 10 to Nov. 15 the company had a market for only 75 tons daily delivered to the U. S. Smelting R. & M. Co. and the freight rate was 25 per cent higher than formerly. On Dec. 4 the old freight rate was restored. Additional contracts have also been made under which the A. S. & R. will take 100 tons daily and the International Smelting Co. from 50 to 250 tons daily. Shipments under this latter contract are to begin as soon as the requirements of the International demand it. Thus the company expects to be able to market about 400 tons daily. A larger hoist must be installed as well as better facilities for handling the ore between shaft and loading bins. New underground development is also planned.

Increase of the capitalization of the Prince Consolidated Mining & Smelting Co. was approved unanimously at the stockholders' special meeting held at Salt Lake City on Dec. 11, at which meeting a total of 850,000 shares out of 1,000,000 was represented.

An amendment to the articles of the company was passed providing for increasing the capital stock from 1,000,000 to 1,500,000 shares, and decreasing the par value of the stock from $2 to $1 per share. The 500,000 shares of capital stock increase is to be put in the treasury of the company.

Ore shipments from the Pioche district for the week ended Dec. 9 decreased, being 2,255 tons. Shipments were: Prince Consolidated, 1,110 tons; Virginia Louise, 855; Bristol Silver, 195; Black Metals, 45; and Combined Metals 50.

Ely—At the Ruth mine of the Nevada Consolidated, at a point about 600 ft. northeast of the Ruth shaft and 500 ft. from the orebody recently opened up, drilling has demonstrated a body of copper ore 150 ft. thick and considerably above the average in copper.

Both the Nevada Consolidated and the Consolidated Copper Mines have announced that no further reductions will be made in the working forces.

UTAH

Utah Apex Shuts Down—Utah Operators To Cut Wages

Wage decreases have been decided upon by Utah operators to go into effect Jan. 1. Silver-lead producers will make a cut of 75c. per day and copper producers a cut of $1.

Eureka—Ore shipments from the Tintic district for the week ended Dec. 10 amounted to 179 cars as compared with 199 cars the week before.

Park City—Shipments for the week ended Dec. 10 totaled 2,000 tons of ore and concentrates against 2,137 tons the week before.

Bingham Canyon—Utah Apex has suspended operations on account of market conditions.

COLORADO

Hidden Treasure Near Camp Bird Bought by Company Headed by Benedict Crowell

Ouray—The Hidden Treasure Mining Co., a new incorporation, of which Benedict Crowell is president, has purchased the Hidden Treasure property, located not far from the Camp Bird mine, from Mrs. Evelyn Walsh-McLean. The new company plans to advance the Hidden Treasure tunnel about 3,000 ft. and do considerable laternl development. Second-hand equipment has been purchased from the Silver Mountain Mining Co. at Ironton and will be moved to the Hidden Treasure property and installed as soon as possible. E. R. Bauer will be local superintendent.

Camp Bird has shut down indefinitely. This is the first time in years that the famous old mine has been absolutely idle. The reason given out was the high cost of operating. It is believed that the mine will resume work early in the spring.

Montezuma—The Bell mine, once a producer of high-grade silver ore, which has been idle for about 20 years, has been optioned to George H. Short, of Salt Lake City, who plans to organize a development company.

Leadville—Lessees who have been developing the Lillian property have opened a promising body of zinc ore, which assays 30 per cent to 35 per cent zinc. The tunnel has been advanced 400 ft. to a total distance of 700 ft. A raise from the tunnel cut the ore at a height of about 100 ft. The development work is not yet sufficient to determine the size of the ore shoot. Ore bins have been built at the portal. The ore will be shipped to Canon City for treatment.

Telluride—Shipments of concentrates during November were as follows: Tomboy, 50 cars; Smuggler-Union, 40; Liberty Bell, 12; total, 102.

Paradox—The Cummings Chemical Co. has discontinued operations on its carnotite properties temporarily, in view of unsatisfactory developments in the market for vanadium bearing minerals.

IDAHO

Coeur d'Alene District

Gold Hunter Shuts Down; Other Producers May Follow—Wage Cut Expected Soon

Wallace—Development work at the Interstate-Callahan since production was suspended on Oct. 1 has yielded gratifying results bearing on the continuity of the orebody at great depth. A short time before the shutdown the shaft had been completed to the No. 10 level and crosscutting started to the vein. This level is 1,250 ft. below the main working tunnel and probably 3,000 ft. from the surface. The crosscut disclosed over 4 ft. of high-grade zinc-lead ore and drifting is now progressing with every indication that the ore showing will be fully as good as on No. 9, 200 ft. above, where the shoot is 300 ft. long. After drifting to whatever extent deemed necessary, the company will sink another 200 ft. and open up No. 11 level. This and other developments work is making steady additions to the company's proved ore reserves and insures maximum production when a profitable zinc market comes back.

Gem—The Black Bear Mines Co. has suspended development operations after doing much preliminary work which has placed the property in excellent condition for future operations.

WASHINGTON

Washington Producers Forced To Curtail

The depression in the metal market is seriously effecting producers in Washington. The Electric Point mine in the Northport district, the major lead producer of the state, has reduced its crew to twenty-five men. These will be employed on development. All ore necessarily mined will be stored. The Sunset Copper mine in the Cascades its putting its mine and mill in shape and expects to close down some time this month. The United Silver-Copper at Chewelah has decreased its force. The copper ore in this last property is heavily "sweetened" with silver and the favorable silver market may encourage the continuation of operations.

Colville.—The Old Dominion mine, a bonanza twenty years ago, has been reopened. After a year's development work the lessees report that they have developed shipping ore. The ore is high-grade silver-lead occurring as replacement chimneys in limestone and the erratic occurrence of the ore makes development uncertain.

ILLINOIS

Cave-in-Rock Fluorspar Co. Buys Julia F. Mines

Elizabethtown—Winfred Ledbetter, of Rosiclare, Ill., underground foreman at the Rosiclare Fluorspar & Lead Co.'s mine, was run down by a mine motor on Dec. 11 and killed. It is reported that he was walking down the drift without a light.

MINNESOTA

Cuyuna Range

Only Six Mines Now Operating on Range

Crosby—With the closing of the open pit mines for the winter and the recent shutdown of several of the underground properties the Cuyuna Range is left with but six mines actively operating, and only five of these are producing ore at the present time. These are the Kennedy and Meacham mines, Rogers-Brown Ore Co.; the Croft mine, of the John A. Savage & Co.; the Armour No. 2 mine, of the Inland Steel Co.; and the Bonnie Belle mine, of the Liberty Mining Co. The Maroco mine at Trommald is developing an open-pit property of washable iron ore which is expected to be an active shipper with the opening of navigation in the spring.

Shipments from the Cuyuna through the Lake ports for the season of 1920 amounted 2,127,168 tons as compared with a total shipment of 1,819,935 tons last season. In addition to the above Lake shipments about 50,000 tons has gone forward by all-rail shipment to furnaces this season, chiefly from the Bonnie Belle, Sagamore and Arko mines. The bulk of the rail shipments were made to the Zenith Furnace Co., Duluth; smaller shipments went to the South Chicago plant of the Steel & Tube Co. of America.

Cuyuna—The Biwanago Mining Co., diamond drill contractors, is operating two drills underground at the Kennedy mine, drilling from upper levels to block out ore ahead of development on the new 362-ft. level.

Ironton—Installation of an electric hoisting plant and transfer of other surface equipment into new quarters at the Feigh mine of the Northwestern Improvement Co. is nearly completed and the operators plan to resume underground mining early next month.

Whitmarsh Mining Co. has begun exploring with two drills on lot 5, section 9-46-29, known as the Huntington mine. This property, operated as an underground mine in 1918 and 1919, has since been idle. The orebody may now be stripped and worked by steam shovel.

Riverton—It is reported that Williams, Carlson, et al., fee owners of the Rowe mine, recently closed down, will institute proceedings against the Pittsburg Steel Ore Co. to recover damages for alleged loss of several hundred thousand tons of ore in mining operations carried on by that company.

Mesabi Range

Construction of Mesabi Iron Co.'s Plant Progressing

Nashwauk—Due to a mud slide in La Rue pit, a shovel working on stripping was overturned, killing one man. Two were caught in the wreckage but one was recovered after a short duration of time.

Babbitt—Construction of the main mill and adjacent buildings comprising the plant of the Mesabi Iron Co. for the treatment of low-grade magnetic iron ore is in progress and it is estimated that the plant is 40 per cent complete. It is anticipated that under ordinary conditions the plant will be running by the first of the summer.

MICHIGAN

Marquette Range

Trumbull-Cliffs Furnace Stock Offered To C.-C. I. Employees

Ishpeming—Employees of the Cleveland-Cliffs Iron Co. are being offered stock of the Trumbull-Cliffs Furnace Co. on an installment basis. The stock is 8 per cent cumulative preferred and is guaranteed by the Cleveland-Cliffs. The par value is $100 and each employee has the privilege of subscribing to ten shares, making payments of 10 per cent per month for ten months. Many have already availed themselves of the offer, which expired on Dec. 20. The Cleveland-Cliffs Iron Co. is now being reorganized under the laws of Ohio instead of West Virginia, and the capital stock is being increased.

Negaunee—The first cut in wages on the Marquette Range has been announced for the Rolling Mill mine, operated by Clement K. Quinn & Co. The reduction amounts to 25 per cent and took effect Dec. 16. The only other mining company in the iron ore district to announce a new scale of wages is the Charcoal Iron Co. of America, operating the Yale mine on the Gogebic Range. It is expected that other companies will make cuts after Jan. 1.

Gogebic Range

"G" Pabst Shaft Has Two Accidents

Ironwood—The Oliver company has received eight electric mine locomotives which will be distributed among its several mines on this range. Several will be sent to the Tilden mine, where a rotary converter has been installed. They will be used on the stockpile trestles as well as underground.

There were two hoisting accidents in "G" shaft of the Pabst mine last week. On Dec. 3 a wheel came off one of the skips and when the skip came up into the shaft house the front end wedged between the rails, smashed some of the bracing in the shaft house and turned upside down. The damage was not so great but what hoisting could be resumed the next shift, however. On Dec. 8 when the cage was coming up with a load of men a broken rail caught on the bottom plates, tearing them and checking the cage. Then the rail was snapped off and the cage jerked upward, throwing all the men off their feet and bruising them severely, but fortunately causing no more serious injury. The cage continued to surface and the hoisting engineer did not know that anything had gone wrong.

At "H" shaft of the Pabst the skips have been run through the shaft for the first time. This is the fifth electrically equipped shaft which the Oliver company has fitted out in the past two years.

THE MARKET REPORT

Daily Prices of Metals

Dec	Copper, N. Y. net refinery* Electrolytic	Tin 99 Per Cent	Tin Straits	Lead N. Y.	Lead St. L.	Zinc N. Y.	Zinc St. L.
16	13.00@13.50	31.00	33.75@34.25	4.50	4.60@4.75	5.65@5.75	
17	13.00@13.50	31.00	34.00@34.50	4.50	4.60	5.65@5.75	
18	13.00@13.50	31.00	34.00@34.50	4.50	4.50	5.65@5.75	
20	12.85@13.35	30.75	33.50@33.75	4.50	4.50	5.65@5.75	
21	12.85@13.35	30.50	33.00@33.50	4.50	4.50	5.65@5.75	
22	13.00	30.00	32.50@32.75	4.50	4.50	5.65@5.75	

*These prices correspond to the following quotations for copper, "delivered": 13.25@13.75, 13.25@13.75, 13.25@13.75, 13.10@13.60, 13.10@13.60, and 13.25c.

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for deliveries constituting the major markets, reduced to the basis of New York, cash, except where St. Louis is the normal basing point, or as otherwise noted. All prices are in cents per pound. Copper is commonly sold "delivered," which means that the seller pays the freight from the refinery to the buyer's destination.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. Tin is quoted on the basis of spot American tin, 99 per cent grade, and spot Straits tin.

London

Dec.	Copper Standard Spot	Copper Standard 3 M	Copper Electrolytic	Tin Spot	Tin 3 M	Lead Spot	Lead 3 M	Zinc Spot	Zinc 3 M
16	75½	75½	86½	215	218	21½	23	25½	27½
17	74¼	74¼	86	211	215	22½	24	25¾	27¼
18	...	...	...	...	...	...	...	...	...
20	74	74¼	85	207½	211¼	23¼	24½	26	27⅝
21	73½	73½	84	205¼	210	22½	23½	25¼	26⅞
22	73	73¼	83	202	207½	21¼	22½	24	25⅞

The above table gives the closing quotations on the London Metal Exchange. All prices in pounds sterling per ton of 2,240 lb.

Silver and Sterling Exchange

Dec.	Sterling Exchange	Silver New York, Domestic Origin	Silver New York, Foreign Origin	Silver London	Dec	Sterling Exchange	Silver New York, Domestic Origin	Silver New York, Foreign Origin	Silver London
16	348½	99½	64¾	41⅞	20	348¼	99½	62	40
17	352½	99½	64	41	21	352½	99½	62½	40
18	349⅜	99½	63⅝	41	22	351½	99½	63¼	40½

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Metal Markets

New York, Dec. 22, 1920.

To those who have so kindly cooperated with us by furnishing confidential information; and to those who have accepted our report of the metal market as being honest and as accurate as may be: Greeting. May the coming year bring a return to normal conditions, which will mean the utmost of prosperity and happiness to us all!

Possibly in no week this year has business been more stagnant in the metal market than in the one just passed. There has been an utter lack of demand and also of pressure to sell on the part of producers, many of whom continue off the market at present prices. Under these conditions, our quotations are largely nominal. More interest is being taken in the internal affairs of the American Smelting & Refining Co., discussed on pages 1229 and 1230 of this issue, than in selling.

Transatlantic freight rates to England continue at the figure set by the conference, that is, $13 per ton for copper and $12 for lead, but rates from ports in the Hamburg area are quoted as low as $5 and $6. Transpacific rates to Hongkong and Kobe are given as $11.25 per ton.

Copper

Large producers continue to hold for 14c. delivered, and we have no reports that indicate that they are cutting under this figure. Smaller producers have offered copper during the week at 13.50@13.75c., and at least one large outside interest is willing to sell at 13.125@13.25c. delivered. Some business has been reported at each of these levels, but the total volume is insignificant. The dullness is incident to business conditions, as well as the season, and includes export as well as domestic demand.

The firm of Guggenheim Bros. announces that on and after Jan. 1, 1921, it will act as a sales agent for the sale of metals. This agency will sell the entire production of copper of Utah Copper Co., Chino Copper Co., Ray Consolidated Copper Co., Nevada Consolidated Copper Co., Chile Copper Co., Braden Copper Co., and Kennecott Copper Corporation. The sale of metals through this agency will be under the management and executive direction of Joseph Clendenin, who is now vice-president in charge of sales for the American Smelting & Refining Co. Hamilton M. Brush will take charge of the smelting company's copper sales. The copper smelting and refining contracts between the American Smelting & Refining Co. and the other companies mentioned will remain unaffected.

Lead

On Monday, Dec. 20, the A. S. & R. reduced its official price of lead from 5c. to 4.75c., New York and St. Louis.

Inquiries have been fairly numerous and well distributed during the last week. They have been for prompt delivery and have resulted in few sales, a fact which leads to the thought that they are made in many cases to establish a basis for inventories. Sellers of lead on contract report that such deliveries are being accepted fairly well at current prices, and most of the producers will go into the new year with little unsold lead on their hands. Demand for futures has been slack, however, and unless business picks up after January first, stocks are likely to accumulate rapidly, despite curtailed production.

Demand is utterly lacking in St. Louis.

Zinc

The price of zinc has remained stationary, with practically no business. It would seem that European zinc could be imported profitably, but it probably could not be sold except at markedly lower prices than the nominal ones which we quote. Also, domestic consumers, in general, demand a better quality than the Belgian product, which contains up to 2.5 per cent lead and 0.25 per cent iron.

Tin

Practically no business has been done in tin since our last report. Even an inquiry for a 25-ton lot is provocative of a great deal of noise and much tele-

phoning. We understand that the Straits government has advanced the price to be paid for the tin production of that country to an equivalent of £236 c.i.f. London. When this tin is finally sold, it will prevent any sudden rise in the price, although it will no duobt be marketed carefully.

Straits tin for future delivery: Dec. 16th, 35.50@36c.; 17th, 35.50@36c.; 18th, 35@35.50c.; 20th, 34.50@34.75c.; 21st, 34@34.50c.; 22d, 33.75@34c.

Arrivals of tin in long tons: Dec. 14th, Australia, 125; China, 10; 20th, Straits, 300.

Silver

Referring to our comments in last week's report, the market for the last week has justified these remarks, as prices have ruled at a slightly higher level than for the preceding week. The disposition to sell appears to be growing less, and at times considerable inquiry at current prices springs up. Buying for account of the Indian bazaars has been reported of late at the recent low points, which has added strength to the market. It would seem as if silver had steadied, at least for the present, at about current figures.

Mexican Dollars—Dec. 16th, 49¼; 17th, 49¼; 18th, 48½; 20th, 47⅞; 21st, 47⅞; 22d, 48¼c.

Gold

Gold in London: Dec. 16th, 117s. 6d.; 17th, 116s. 2d.; 20th, 117s. 5d.; 21st, 115s. 9d.; 22d, 116s. 6d.

Foreign Exchange

Sterling and most other foreign exchange has shown an upward tendency during the last week, owing to year-end settlements and Christmas remittances. On Tuesday, Dec. 21, francs were 5.89c.; lire, 3.41c.; and marks 1.365c. New York funds in Montreal have advanced to the highest point in many years, and were quoted at 19⅞ per cent premium.

Other Metals

Aluminum—For 50-ton lots: ingot, 99 per cent and purer, 33c.; 98@99 per cent, 32c.; nominal list prices. Sales reported as low as 22c.

Antimony — Chinese and Japanese brands, 5¾c.; market quiet. W.C.C. brand, 6¼@6½c. per lb. Cookson's "C" grade, 11@12½c. Chinese needle antimony, lump, nominal at 4½c. per lb. Standard powdered needle antimony (200 mesh), 7¼c. per lb.

White antimony oxide, Chinese, guaranteed 99 per cent Sb_2O_3, wholesale lots, 7c.

Bismuth—$2.40 per lb., 500-lb. lots, and $2.42 per lb., 100-lb. lots.

Cadmium—Nominal, $1.40 per lb.

Cobalt—Metal, $6 per lb.; black oxide, $4.10 per lb.; sulphate, $1.60.

Iridium—Nominal, $350@$400 per oz.

Magnesium—Crude, 99 per cent or over pure, $1.75 per lb. for 100-lb. lots and over, f.o.b. Niagara Falls.

[1]**Molybdenum Metal in rod or wire** form, 99.9 per cent pure, $32@$40 per lb., according to gage.

Nickel—Ingot, 43c.; shot, 43c.; electrolytic, 45c., f.o.b. Bayonne, N. J.

Monel Metal—Shot, 35c.; blocks, 35c., and ingots, 38c. per lb., f.o.b. Bayonne.

Osmium—Open market, $70@$80 per troy oz.

Palladium—$75 per oz.

Platinum—Firm at $75 per oz.

Quicksilver—Nominally $50 per 75-lb. flask, with second-hands selling as low as $47 per 75-lb. flask. San Francisco wires $45. Market dull.

[1]**Rhodium**—$200@$225 per troy oz.

Ruthenium—$175@$200 per troy oz.

[1]**Selenium**—Black powdered, amorphous, 99.5 per cent pure, $2@$2.25 per lb.

[1]**Thallium Metal**—Ingot, 99 per cent pure, $20 per lb.

[1]**Tungsten Metal**—$35@$60 per kilogram, according to purity and gage.

Metallic Ores

Chrome Ore—Guaranteed 50 per cent Cr_2O_3 foreign ore with a maximum of 6 per cent silica, 55@60c. per unit, New York. California concentrates, 50 per cent Cr_2O_3 and upward, 60@65c.

[1]**Manganese Ore**—45@50c. per unit, seaport; chemical ore (MnO_2) $60@$65 per gross ton, lump; $75@$80 per net ton, powdered.

Molybdenum Ore—85 per cent MoS_2, 55@60c. per lb. of contained sulphide, New York.

[1]**Tantalum Ore**—Guaranteed minimum 60 per cent tantalic acid, 45c. per lb. in ton lots.

[1]**Titanium Ores**—Ilmenite, 52 per cent TiO_2, 1½@2c. per lb. for ore. Rutile, 95 per cent TiO_2, 15c. per lb. for ore, with concessions on large lots or running contracts.

[1]**Tungsten Ore**—Scheelite, 60 per cent WO_3 and over, per unit of WO_3, $4@$4.50, f.o.b. mines; wolframite, 60 per cent WO_3 and over, per unit of WO_3, $4@$4.25, in New York.

Uranium Ore (Carnotite)—Ore containing 1½ per cent U_3O_8 and 5 per cent V_2O_5 sells for $1.50 per lb. of U_3O_8 and 75c. per lb. of V_2O_5; ore containing 2 per cent U_3O_8 and 5 per cent V_2O_5 sells for $2.25 and 75c. per lb., respectively; higher U_3O_8 and V_2O_5 content commands proportionately higher prices.

Vanadium Ore—$1.50 per lb. of V_2O_5 (guaranteed minimum of 18 per cent V_2O_5), New York.

[1]**Zircon**—Washed, iron free, 5c. per lb.

[1]**Zirkite**—According to conditions, $80 @$90 per ton, carload lots. Pure white oxide, 99 per cent, is quoted at $1.15 per lb. in ton lots.

Zinc and Lead Ore Markets

Joplin, Mo., Dec. 18—Zinc blende, per ton, high, $36.40, basis 60 per cent zinc; premium, $32; Prime Western, $30; fines and slimes, $27.50@$25. Calamine, basis 40 per cent zinc, $30. Average settling prices: Blende, $34.80; calamine, $30; all zinc ores, $34.72.

Lead, high, $58.50; basis 80 per cent lead, $55@$47.50; average settling price, $53.70 per ton.

Shipments for the week: Blende, 8,225; calamine, 153; lead, 835 tons. Value, all ores the week, $335,770.

Sellers were expecting continued favorable market conditions until Friday, when news of the metal trade of Germany with England was received. Sellers realized then that $30 was the best that could be expected, and a number marketed their ore. Purchases, however, were only 5,200 tons. Production practically balanced the shipment.

Platteville, Wis., Dec. 18—Three cars of blende was sold Monday at $37 base. Only thirteen producing mines remain operating. Shipments for the week: Blende, 456; lead, 39 tons. Shipments for the year: Blende, 60,341; calamine, 2,551; lead, 4,562; sulphur ore, 1,342 tons. Shipped during the week to separating plants, 1,182 tons blende.

Non-Metallic Minerals

Asbestos—Crude, No. 1, $2,000@$3,500; No. 2, $1,400@$2,000; spinning fibres, $400@$1,000; magnesia and compressed sheet fibres, $325@$500; shingle stock, $110@$150; paper stock, $60@$75; cement stock, $17.50@$30; floats $8.50@$15, all per short ton, f.o.b. Thetford, Broughton, and Black Lake mines, Quebec, Canada; 5 per cent to be added as Canadian royalty export sales tax.

Barytes—Crude, 88 to 94 per cent barium content, $10@$12 per net ton ground (white) $24@$30 in bags, car load lots; (off-color) $22@$26 in bags carload lots; all f.o.b. Kings Creek S. C. Crude, 88 to 94 per cent, $23; ground (white), $45; ground (off color) $30@$32 per net ton, less than carload lots, f.o.b. New York. Crude, first grade, $10 per ton, f.o.b. cars, Missouri; floated, $28 per ton in bbls.; $26.50 per ton in 100-lb. bags; extra charge for bags, f.o.b. St. Louis.

Chalk—English, extra light, 5@5½c.; light, 5@6c.; dense, 4½@5c. per lb., all f.o.b. New York.

China Clay (Kaolin) — Crude, $8@$12; washed, $12@$15; powdered, $18@$22; bags extra, per net ton, f.o.b mines, Georgia; crude, $8@$12; ground $15@$40, f.o.b. Virginia points. Domestic lump, $10@$20; powdered, $25@$30; imported lump, $25@$35; powdered, $30@$35, f.o.b. New York.

Feldspar—Crude, $8@$14 per gross ton, f.o.b. Maryland and North Carolina points; $7.50@$10, f.o.b. Maine; ground, $27@$30, car lots, f.o.b. Baltimore; ground, $17@$21, f.o.b. North Carolina points; $17@$21 per ton, No. 1 ground, f.o.b. New York State; $21@$23 per ton, ground, f.o.b. Maine. Crude spar very scarce.

Fluorspar — Gravel, guaranteed 85 per cent calcium fluoride and not over 6 per cent silica, $25 per ton, f.o.b. Illinois mines, and $25.50, f.o.b. Kentucky; ground, suitable for acid, chem-

[1]Furnished by Foote Mineral Co., Philadelphia, Pa

ical or enameling purposes, $60; lump, $17.50, f.o.b. Tonuco, N. M. In Canada 85 per cent calcium fluoride sells for $20 per ton, f.o.b. Madoc; output limited. Canadian price generally $18 (Canadian currency) per ton, f.o.b. mines; market inactive.

Fuller's Earth—$16 per ton, carload lots, f.o.b. New York.

Graphite—The 90 per cent crucible grade is held in Alabama for 9c. per lb. and 85 per cent grade, 7@9c. Lubricating grade commanding the best price is a fine flake, passing a 100@120 mesh, and running higher than 96 per cent carbon. Linotype machines use a flake passing 90 mesh and standing on a 120 screen, with 90 per cent carbon, retailing at 75c. to $1 per lb. and selling to jobbers at 11@40c.

Gypsum—Plaster of paris in carload lots sells for $4.25 per 250-lb. bbl., alongside dock, New York. Raw crushed rock, $3.50@$4.50; calcined stucco, $9; f.o.b. works, Illinois.

Kaolin—See China Clay.

Limestone—Dolomite, 1@2 man size, $1.60@$1.65; 2@8 in., $1.55@$1.65 per net ton, f.o.b. Plymouth Meeting, Pa.; fluxing, $1.65@$1.75 per net ton, f.o.b. Howellville, Pa.

Magnesite, Calcined — High-grade caustic calcined, lump form, $35@$40 per ton, carload lots, f.o.b. California points. In Chicago district, $57.70; Atlantic seaboard, $61@$63.

Dead-Burned — $38 per net ton, Chewelah, Wash.; $58@$64, Chester, Pa. Austrian grade, $55@$60 per ton, f.o.b. Baltimore. (Magnesite brick—See Refractories.)

Mica—India block mica slightly stained, per lb.: No. 6, 50c.; No. 5, $1.20 @$1.40; No. 4, $2@$3; No. 3, $4.25@ $5; No. 2, $5.50@$7; No. 1, $8. Clear block; No. 6, 55c.; No. 5, $1.75; No. 4, $3.25; No. 3, $5; No. 2, $6.50; No. 1, $8; A1, $10; extra large, $25; all f.o.b. New York; ground, $150 per ton, Philadelphia. Domestic, uncut, f.o.b. Franklin, N. C., as follows: Scrap, $45 @$50 per ton; punch, 10c. per lb.; circle, 15@25c.; 1½ x 2 in., 75c.; 2 x 2 in., $1.15; 2 x 3 in., $1.65; 3 x 3 in., $2.10; 3 x 4 in., $2.50; 3 x 5 in., $2.75; 3 x 6 in., $3.75; ground 165 mesh, $150 @$170 per ton; ground roofing mica, $60; mica washers, 75c.@$2 per lb.; 1¼-in. disks, No. 1, $1.40 per lb.; No. 2, $1.25. The foregoing domestic prices obtain also in the Chicago district.

Monazite — Minimum of 6 per cent thorium oxide, $30 per unit, duty paid.

Phosphate Rock—Per long ton, Florida ports: 77 per cent tricalcium phosphate, $13; 75 per cent, $11.50; 75@74 per cent, $11; 70 per cent, $8.35; 68 per cent, $7.85; 68@66 per cent, $7.60. Finely ground Tennessee rock sells for $8.50 per net ton for 13 per cent phosphorus content, agricultural application; for acid-making, 14 per cent, $9; both prices being f.o.b. Centerville, Tenn.

Pumice Stone—Imported, lump, 4@ 50c. per lb.; domestic lump, 6c.; ground, 4@7c., all f.o.b New York

Pyrites—Spanish fines, per unit, 12c., c.i.f. Atlantic seaport; furnace size, 17c.; Spanish lump, 14@16c.; domestic fines, f.o.b. mines, Georgia, 12@14c.

Quartz—(Acid tower) fist to head, $10; 1½ to 2 in., $14; rice, $17; all net ton, f.o.b. Baltimore; lump, carload lots, $5@$7.50 net ton, f.o.b. North Carolina mines.

Sand (Glass)—Dry glass sand, $4 per net ton, f.o.b. cars Mapleton, Pa. Sand, f.o.b. Ottawa, Ill., is $3 per ton; $2.50 on annual contracts. Sand at Klondike, Gray Summit and Pacific, all in Missouri, is $2.50 on contract; some outside sales have been made at $4. St. Louis, open market, at $3.50; contract price on large quantities, $2.50; on small quantities, $3.

Sulphur—$18 per ton for domestic; $18@$20 for export, f.o.b. Texas and Louisiana mines. Market quiet.

Talc — Paper making, $12@$22 per ton; roofing grades, $9.50@$15; rubber grades, $12@$18; all f.o.b. Vermont. California talc, $20@$45, talcum powder grade. Southern talc, powdered, carload lots, $12@$15 per ton; less than carload, $25, f.o.b. cars; freight to New York $5.25 per ton, carload lots; less than carload lots, $9.25. Imported, $60 @$70; Canadian, $20@$40 per ton.

Mineral Products

Arsenic—White arsenic, 12@12½c. per lb.; sulphide, powdered, 15@15½c. per lb. in carload lots.

Sodium Nitrate—$3 per cwt., ex vessel, Atlantic ports. Market quiet.

Sodium Sulphate—For 95 per cent material, $22 per ton, f.o.b. mines, Idaho and Arizona, spot and six months' contract.

Potassium Sulphate—Domestic, $225 @$250 per net ton, basis 90 per cent, f.o.b. New York.

Ferro Alloys

Ferrocarbontitanium—For 15 to 18 per cent material, $200@$225 per ton, f.o.b. Niagara Falls, N. Y.

Ferrocerium—Per lb., $12@$15.

Ferrochrome—Carload lots, spot and contract, 60 to 70 per cent chromium, 6 to 8 per cent carbon, 16@17c. per lb. of chromium contained; 4 to 6 per cent carbon, 17@18c., f.o.b. works.

Ferromanganese—Domestic 76 to 80 per cent, $150, freight allowed; $145, f.o.b. seaboard bases; English, $135@ $140, c.i.f. Atlantic seaports. Spiegeleisen, 18@20 per cent, $60@$65, f.o.b. furnace.

Ferromolybdenum—Standard grades, carrying from 50 to 60 per cent molybdenum metal, with low sulphur, phosphorus, and arsenic, $2 per lb. of contained metal, f.o.b. works.

Ferrosilicon—For 10 to 15 per cent, per gross ton, f.o.b. works, $60@$65; 50 per cent, $78@$80; 75 per cent, $160.

Ferrotungsten—Domestic, 70 to 80 per cent W, 65@75c. per lb. of contained tungsten, f.o.b. works. Foreign, 65c.

Ferro-uranium—35 to 50 per cent U, $7 per lb. of U contained, f.o.b. works.

Ferrovanadium—Basis 30 to 40 per cent, $6.50@$7.50 per lb. of V contained, according to silicon content, f.o.b. works.

Metal Products

Copper Sheets — Current New York price, 22½c. per lb.; wire, 18c. Even lower quotations are heard.

Lead Sheets—Full lead sheets, 9½c.; cut lead sheets, 9½c. in quantity, mill lots.

Nickel Silver — Unchanged at 34½c. per lb. for 18 per cent nickel.

Yellow Metal — Dimension sheets, 21¼c.; sheathing, 21¼c.; rods, ½ to 3 in., 18¼c.

Zinc Sheets—$11.50 per 100 lb., less 8 per cent on carload lots, f.o.b. smelter: zinc plates, 11½c. per lb.

Refractories

Bauxite Brick—56 per cent alumina, $160 per 1,000, f.o.b. Pittsburgh.

Chrome Cement—40@45 per cent Cr_2O_3, $55@$60 per net ton, and $65 in sacks, carload lots, f.o.b. eastern shipping points.

Fire Brick—First quality, 9-in. shapes, $55@$60 per 1,000, Pennsylvania, Ohio and Kentucky. Second quality, $45@ $50.

Magnesite Brick — 9-in. straights, $110 per net ton; 9-in. arches, wedges and keys, $120; soaps and splits, $130

Silica Brick—9-in., per 1,000: Chicago district, $65@$70; Birmingham, Ala., $56@$61; Mount Union, Pa., $55 @$60.

Iron Trade Review

Pittsburgh, Dec. 21, 1920

The steel market is stagnant as regards most independents. The Steel Corporation is booking a fair amount of business from its regular customers, and has received at least one important order from a consumer of long standing, but not formerly a Steel Corporation customer.

The independent market remains, in general, on the level of the Steel Corporation prices, except that independent pipe prices are still $7 to $10 a ton above those of the Corporation. Shading is fully expected to develop in some products. An important inquiry just out, for 16,000 tons of sheets for first half, may test the situation with respect to sheets. Western mills are shading the Pittsburgh basis in some lines.

Pig Iron—The market remains stagnant, with prices nominal at $35 for bessemer and foundry and $33 for basic, Valley. Lower prices are likely next month.

Charcoal and Coke

Charcoal—Willow, 7c. per lb. in bbls.; hardwood, 5½c. per lb., in 250-lb. bbls. Barrel charge is 35c. additional.

Connellsville—Furnace, $7.00; foundry, $6.00.

[1]Furnished by Foote Mineral Co., Philadelphia, Pa

The Decline in Sulphur

SULPHUR is used principally in the paper, powder, chemical, fertilizer, and kindred trades, and the world now obtains its requirements chiefly from the United States, Sicily, and Japan. The presence of sulphur in the Gulf section of this country was discovered in boring for petroleum. It is found about 1,000 ft. below the surface of the earth, impregnated in limestone, and is recovered by the Frasch apparatus, which consists of a series of concentric pipes, through which superheated water is forced, melting the sulphur *in situ*, after which it is raised to the surface by air pressure, deposited in a bin, and readily solidifies after exposure to the atmosphere.

The three principal operating companies in the United States are the Union Sulphur Co., the Freeport Sulphur Co., and the Texas Gulf Sulphur Co., the last named being organized during the war, but did not begin to produce until after the armistice was signed.

It is estimated that the combined possible production of the three companies mentioned exceeds the normal domestic demand for sulphur. The pre-war consumption of sulphur in the United States amounted to about 350,000 tons, but in 1918, at the time the armistice was signed, owing to the extraordinary demand for war purposes, the United States was using at the rate of 1,350,000 tons per annum, and even now the consumption is still much larger than before the war, owing to the fact that the fertilizer companies are utilizing this mineral instead of pyrites in making sulphuric acid.

The United States must also supply the deficit abroad, as Sicily is turning out only about half of the quantity mined in pre-war days. The lack of labor in Sicily has reduced the output, and the cost of production has increased, owing to higher wages; in fact, the price at Sicilian mines is much higher than present quotations here.

The Japanese output, during the first half of 1920, was estimated at 21,000 tons, most of which was used locally. The price there is also much dearer than in the United States. It is interesting to compare the present prices of sulphur, with pre-war figures, inasmuch as this mineral today is relatively the cheapest heavy chemical. Prior to the war, the price was $20 per long ton at the mines, and $22 at eastern seaboard, say New York, Philadelphia, and Baltimore; whereas present quotations are $16 at the mines, and $20 to $22 at seaboard. When the current value of the dollar is considered, sulphur today is selling at practically half of its pre-war price.

Twenty-three Uses of Sulphur and Sulphuric Acid

For those whose interest in the uses of sulphur is extensive, the following comprehensive list will be informative: 1—Manufacture of sulphuric acid for a wide variety of uses. 2—Sulphurous acid. 3—Chemical reduction of wood in the pulp mills. 4—Warfare gases, gunpowder, and other explosives. 5—Fuses and matches. 6—As a fumigant, fungicide, and germicide. 7—Fertilizers. 8—Bleaching. 9—Rubber manufacture. 10—Drugs. 11—Making various colors. 12—Vulcanized oil. 13—Used by malt companies. 14—As a preservative for beef. 15—For evaporating apples. 16—Used by glue and photographic-film companies. 17—In certain processes of smelting and precipitation. 18—For the bedding of heavy machinery. 19—For the manufacture of strong acid for storage batteries, and for preparing rubber for insulation. 20—Carbon disulphide. 21—Sulphur chloride. 22—Carbon tetrachloride. 23—Manufacture of other chemicals.

Chart of New York Stock-Market Fluctuations for the Last Three Years

COMPANY REPORTS

Alaska Gastineau Mining Co. Continues Operating at a Loss

Gold; Alaska

A summary of results of mining and milling of the Alaska Gastineau Mining Co. for the third quarter of the fiscal and calendar year 1920, together with comparisons of the principal items for the previous quarters, follows:

	Third Quarter 1920	Second Quarter 1920	First Quarter 1920
Tons milled	436,103	537,754	625,890
Gross value	$0 89	$0 85	$0 84
Yield	0 71	0 68	0 66
Tails	0 18	0 17	0 18
Extraction per cent.	79 82	79 39	79 16
Value recovered	$0 71	$0 68	$0 66
Operating expenses, less miscellaneous income	0 89	0 79	0 79
Loss per ton	$0 18	$0 11	$0 13

During the quarter, 488,103 tons of ore was broken in the mine and 435,931 tons trammed to the oreways, as compared with 646,327 tons broken and 535,874 tons trammed during the previous quarter. Of the amount trammed about 32.7 per cent represented excess ore drawn from the caved stopes. Various stopes on the 8th, 9th, 10th and 11th levels were mined during the period. Stoping was completed on the 11th level, and Nos. 1 and 2 West on the 9th level. A large tonnage of broken ore is therefore available in these stopes. A total of 716 ft. of development work was done.

Owing to the scarcity of labor and small tonnage of ore delivered, the mill was operated on a two-shift basis in the coarse- and fine-crushing departments throughout the quarter, the concentrating department being operated on a three-shift basis. A total of 436,103 tons of ore was milled, as compared with 537,754 tons for the previous quarter.

The company's generating stations and transmission lines operated without interruption during the quarter. Very little power was supplied to other industries in the district, owing to the abundance of water power during the summer months, which was available to these industries. The gross value of ore delivered to the mill during the quarter averaged $0.89 per ton, or an increase over the second quarter of $0.04. Operating expenses, less miscellaneous income, amounted to $0.89 per ton, as compared with $0.79 per ton for the previous period. The miscellaneous income showed a net loss of $8,156.18, the loss sustained in the operation of the company's boarding houses having been in excess of the amount received from the sale of power.

The following statement compares the operating results of the third quarter with those of previous quarters:

REVENUE

	Third Quarter 1920	Second Quarter 1920	First Quarter 1920
Gross value of bullion and concentrates produced	$308,799.79	$364,866 48	$413,246.04

EXPENSES

Ore production and transportation	$202,827.84	$237,696.86	$285,406.01
Milling	137,606.97	150,980.00	172,441.83
Shipping and smelting charges	13,495.49	15,339.45	17,572 48
Administration and general expense	27,772.34	22,520.62	22,410.60
Total operating expenses	$381,702.64	$426,536.95	$497,830 92
	(a) $72,902.85	(a) $61,670.45	(a) $84,584 88
Miscellaneous income	(a) 8,156.18	(a) 10.67	2,966 94
Operating loss	$81,059 03	$61,681.12	$81,617 94

(a) Loss.

Included in costs in the above statement are prepaid development items representing costs of breaking and preparing ore in previous periods, which have been carried on the books as deferred charges. Consequently, although the above operating statement shows a loss of $81,059.03 after including these charges, the actual cash receipts and disbursements for the period reflect a cash loss of only $17,693.84.

Nevada Consolidated Copper Co. Increases Deficit

Copper; Nevada

A statement of production and the result of operations of the Nevada Consolidated Copper Co. for the third quarter of the fiscal and calendar year 1920 shows that during the three months ended Sept. 30 there was produced 13,297,364 lb. of copper, as compared with 13,063,667 lb. for the preceding three months. Operating at about one-half normal capacity during the quarter, a total of 671,063 dry tons of Nevada Consolidated ore, an average of 7,294 tons daily, was milled, as against 691,095 dry tons, an average of 7,595 tons per day, concentrated during the preceding quarter. The average copper assay of the ore milled during the current quarter was 1.50 per cent, as compared with an average grade of 1.47 per cent copper for the preceding quarter.

Of the total tonnage milled 74 per cent was shipped from the steam-shovel pit and 26 per cent from the underground workings of the Ruth mine. In addition to the tonnage of concentrating ores treated, there was smelted 1,692 tons of a higher grade of ore from the Ruth mine.

The cost of production for the quarter, including the fixed charges to cover depreciation of mine, mill and smelter plants, and equipment, and all administrative and general expenses, and after crediting miscellaneous earnings, including gold and silver values, was 16.04c. per lb. of copper, as compared with a cost, similarly computed, of 15.56c. per lb. for the quarter ended June 30, 1920.

The result of operations for the quarter is herewith presented in comparison with the financial outcome of the two preceding quarters of the current year. The costs include, as above stated, the customary monthly charges for depreciation of plant and equipment and all overhead expenses:

	Third Quarter 1920	Second Quarter 1920	First Quarter 1920
Operating profit or loss	(a) $434,043.58	$47,276 49	$132,529 28
Miscellaneous income	350,863.99	336,723 69	83,053 86
Net gain or loss	(a) $83,179.59	$384,000.18	$215,583 14
Distribution to stockholders	499,864 25	499,864 25	499,864 25
Net deficit	$583,043 84	$115 864 07	$284 281 11

(a) Loss

The operating loss as shown for the current quarter is based upon an average carrying price of 15.417c. per lb. of copper, as compared with a basing price of 18.50c. for the second quarter and 22.66c. for the first quarter. The miscellaneous income includes credits for the precious metals recovered and Nevada Northern Ry. Co. dividends. A quarterly distribution of 25c. per share to stockholders was made Sept. 30.

Davis Daly Copper Co.

Copper: Montana

The report of the Davis Daly Copper Co. for the quarter ending Sept 30, 1920, shows that 20,974 tons were mined, producing 2,486,806 lb. of copper and 107,023 oz. of silver. The average assay of the ore shipped was 6.51 per cent copper and 5.63 oz. of silver per ton. Cash and quick assets on Sept. 30, 1920, amounted to $568,899.06. Receipts and disbursements follow:

Ore returns	$308,869 15
Miscellaneous revenues	77,516.58
Total receipts	$386,385.73
Development	$57,867 26
Mining cost	176,165 82
Equipment	13,203 28
Butte general expense	56,200 24
Boston expense	13,645.51
Total disbursements	$317,082 11

Total development for the quarter was 1,268 ft.
