1901

# THE BUILDER

**A**N : ILLUSTRATED : WEEKLY  
MAGAZINE : FOR : THE  
ARCHITECT : ENGINEER : ARCHÆ-  
OLOGIST : CONSTRUCTOR : SANI-  
TARY-REFORMER : & : ART-LOVER

CONDUCTED BY

H. H. STATHAM,

FELLOW OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

"EVERY man's proper mansion-house, and home, being the theater of his hospitality, the seat of self-fruit, the comfortablist part of his own life, the noblest of his sonne's inheritance, a kind of private princedome, may, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned." ♦ ♦ ♦ ♦ ♦

"Architecture can want no commendation, where there are noble men, or noble mindes."—SIR HENRY WOTTON. ♦ ♦ ♦

"OUR English word TO BUILD is the Anglo-Saxon Býlban, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen, and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PURLEY.

"ALWAYS be ready to speak your mind, and a base man will avoid you."—WILLIAM BLAKE. ♦ ♦ ♦ ♦ ♦

### The Genius of Inigo Jones.

HERE is a strange contrast between the conviction we feel as to the genius of Inigo Jones and the comparatively small basis of a accomplished work which can

be cited to justify this conviction. There is a certain analogy in this respect between his position and that of Leonardo da Vinci. No one can doubt that da Vinci was one of the greatest artistic intellects of the Italian Renaissance; yet his fame practically rests on only one work of the highest importance, now unhappily nearly faded away; on a few smaller paintings some of which are of doubtful authenticity; and a number of miscellaneous sketches and studies, full of a marked and almost defiant originality, though of the most mixed and fragmentary character. Inigo Jones has also his one great work, but with the unfortunate difference that it exists only as a scheme on paper and not as an executed work. What the "Last Supper" is to da Vinci's fame, however, the design for the Whitehall Palace is to Inigo Jones's; it is the one architectural conception on a great scale which can be positively affirmed to be his; and with the exception of the one corner of it which has taken shape and substance in masonry, it has to be judged entirely by a set of rough and inadequate drawings. Yet these alone are enough to prove that Jones was one of the

world's great architects, one of those who had the power to conceive and plan a great building which should be a stately and impressive whole, embodying a grand idea; not a mere picturesque collocation of parts with no necessary relation to each other. And considering how much we have heard lately in contempt of architectural drawing and designing, and that an architect is a man who builds and not one who makes drawings, and so on, it is rather significant that the fame of our greatest architect—for such Inigo Jones potentially must be held to be—rests more than anything else on a design of which only a small fragment ever got beyond the stage of drawings.

As far as the drawings go, it is mainly in the plan that Inigo Jones's genius is manifest, partly because the drawings of the elevations, like other drawings by him (or attributed to him) and by other architects of the period, give but an inadequate idea of the manner in which the detail would have been carried out, and partly because the greatness of the whole conception resides more in the plan than in what is sometimes mistakenly called the "architectural treatment," as if that were something separate from plan. Inigo Jones had strongly imbibed the lessons of the Classic school of architecture, and regarded a large building as a thing to be grouped in symmetrically designed masses arising out of the main divisions of the plan, not as an opportunity for seeking adventitious effect by the aid of unexpected and picturesque features unconnected with the main design of the plan. Consequently, there is nothing startlingly original in the suggested detail; it exhibits the usual mate-

rials of Classic architecture of the Renaissance—rustication, orders, architraves and cornices to the windows, &c. For the architectural effect we should have had to look, had it been completed, to the masses, to the balance and symmetry and to the great scale of the whole, not to anything especially original in the design of the details; though the Banqueting House suffices to show with what refinement and scholarly feeling these would have been worked out. Still, architectural invention is not specially displayed here. The invention is in Jones's magnificent plan, the finest plan for a royal palace, perhaps, ever made; at all events the finest of which we have any record. The two most striking points in it, besides the immense scale of the central court (which must have been impressive, one may almost say, whatever were the details), are first, the fine contrast between the square state court on the one side of the great quadrangle and the circular court on the other side; the two occupying a symmetrical position on the axis of the plan, so as not to disturb the stately effect of the quadrangle, yet offering such a piquant contrast in architectural line and effect; and secondly, the mere idea of using a great circular gallery as the State approach to the Royal apartments. It is possible that many who know the plan in a general way have not fully realised this feature, and the effect which it would have had in execution. No such approach to the presence of Royalty has ever been devised in any palace of which the plan is preserved. The entry is first into a large square hall with four columns in the centre, dividing the area into nine squares, as it were;

then up one or other of the great staircases on either side, landing in a similar hall on the first floor; thence access would be had to the great circular gallery, round the whole semi-circle of which the visitor must proceed to the opposite portal, whence he would have emerged into a long and wide gallery which formed the ante-room to the two "Royal closets," rooms of oval shape, susceptible of very fine decorative treatment, entered through doors near each end of the gallery. Architecturally these private rooms of the Sovereign are decisively emphasised in the exterior design, the blocks in which they were situated forming decorative projections from the front, crowned with cupolas. To have kept up a suite of royal galleries and approaches on such a scale would have been as much beyond the purse of an English sovereign of the period as would have been the erection of the palace to begin with; and if Charles I. had got together the money to build the palace, he would never have been able to occupy it with a state and splendour in keeping with the spaciousness and dignity of the plan. But one can imagine, under such a monarchy as that of Louis XIV., for instance, what a scope such a plan as this would have afforded for the display of a sumptuous retinue, what opportunities for processions and other attributes of state in royal receptions. It was truly a great conception. Versailles is but a piece of commonplace compared with what Inigo Jones's palace would have been.

The British Museum print-room contains a portfolio of plans and elevations of the palace, mostly on tracings mounted, some of which are claimed as being Inigo Jones's own drawings. Mr. Blomfield doubts whether there are any drawings of the palace which can with certainty be said to be from the hand of Jones himself; he takes the Worcester College drawings for illustration of the design. It is quite certain, however, that some of the British Museum drawings are more like originals than others; at least there are obvious copies which reflect a kind of *per contra* authenticity on the others. In those which are classified as genuine at the Museum, there is a freedom in the sketching in of the sculpture which is in their favour; and there is one decorative detail, that of scrolls or consoles with a head placed on the scroll, which occurs in two or three places, and is so much of the nature of an Italian Renaissance fancy as to give the impression of coming from a draughtsman who had studied Italian work at first hand. There is a considerable use of decorative sculpture in the shape of nude figures lightly sketched in to fill up spandrels, in a manner which looks more like original work than like a copy. Along with these is an elevation for the north front of the Palace, with this inscription at the foot:—

"The incomparable architect Inigo Jones having in the year 1639 presented those his Designs for the Building of White Hall to King Charles 1<sup>st</sup> First: which through y<sup>e</sup> Iniquity of y<sup>e</sup> Times could not be put in Execution. It has unfortunately happened y<sup>e</sup> (as one Evil is often the Cause of more) that y<sup>e</sup> North Front of this Design having been lost — I have to y<sup>e</sup> best of my Judgment Erected this Front, from y<sup>e</sup> Original Plan of Mr. Jones, in his stile, to make y<sup>e</sup> Designs Compleat. W<sup>m</sup>. Emmett of Bromley in y<sup>e</sup> County of Kent: An<sup>o</sup> 1717."

The worthy Mr. Emmett has, however, hardly given probability to his design by

adopting, in the recessed portion of the elevation, a long row of round-arched windows in the upper story, similar to those introduced in the centre of the pavilions in the elevations which claim to be original. Considering the general symmetry which prevails throughout the design as shown in the latter, it is not likely that Jones would have materially varied the north front by introducing as a repeating feature a form of window which in the other elevations is only used as accentuating the design in the pavilions. There are other elevations in the British Museum portfolio much neater in execution than the so-called originals, though at the same time tamer and more timid, and which are obviously a draughtsman's copies. In these drawings the form and finish of the cupolas differs from that given in the Worcester College drawings and followed by Kent, and is on the whole superior to the latter. If we are to suppose that there are any drawings of the Whitehall elevations by Jones's own hand extant, we should be disposed to think that there is considerable internal evidence in favour of those claimed as original in the British Museum set. They have not the finish and care, nor the timidity, of a draughtsman's copies; there is a freedom about them which suggests the hand of the original designer. In the same portfolio is a set of elevations of a long façade of a classical building of somewhat the same proportions as the Whitehall Palace; a design with a large Corinthian order and two stories of windows between; the whole of a very *rococo* character and profusely ornamented with scrolls and masses of carved festoons, &c. It is evident that these had at one time been regarded by some one as elevations for an alternative design of the Palace, as there is a half-obliterated pencil memorandum on one of them referring to this belief and stating that they are not such, but something else which is illegible. Whoever these are by, there is a great deal of force and vigour about them of an exuberant character, but they are unlike the generally reticent and reserved quality of Jones's designs for buildings, and the terminal figures on the balustrade are clumsily sketched in, and these and the terminal vases are out of scale with the whole. On the other hand, they have some of the character of Jones's sketches for Masque architecture, in which he is a great deal more exuberant and *rococo* than in any of his known designs for permanent architecture. They are of some interest at all events, whether original or not. The British Museum also possesses some free and bold pen studies of figures and heads attributed to Inigo Jones, of which the principal example is much more in the style of Rubens than in that of the Italian masters with whom Inigo Jones should have been more familiar. An interesting sketch is one for some piece of architectural sculpture introduced in panels with plain piers between them; the sculpture is roughly but forcibly sketched in, a figure in each panel, and again with the rounded contours belonging rather to Flemish than Italian art. If these figure studies are genuine, they show that however Inigo Jones had been imbued with the Italian Renaissance taste in regard to architectural detail, his ideas of figure drawing were of a ruder and less refined school.

Apart from his great design for Whitehall

Palace, which in its general lines and its magnificent plan is at least authentic (though even here we are left in doubt as to the authenticity of the actual drawings), the work of Inigo Jones in English architecture is represented to us in the present day, in great measure, by scattered fragments of designs; portions of buildings which are probably his but of which much of the original work has disappeared or been altered; a front here, a gateway there, a staircase or a room happily preserved, show the traces of his powerful hand. The impression we get of him is somewhat like that of the last appearance of the wizard in the "Lay of the Last Minstrel":—

"Some saw an arm, and some a hand,  
And some the waving of a gown."

We have to piece things together to arrive at a conception of his powers. Hence Mr. Inigo Triggs and Mr. H. Tanner have done an admirable and most useful piece of work in collecting together in one volume illustrations of various designs by him which may be considered to be authentic.\* Kent, no doubt, has put on record quite a long series of plans and elevations of houses attributed by him to Inigo Jones; but how much of this collection is Kent and how much is Inigo Jones it is not very easy to conclude; a good many of them at all events were probably merely worked up by Kent from rough sketches which had come into his possession. Some of the plans, though unpractical from the point of view of the present day, are fine as suggestions in architectural arrangement; but the elevations for the most part give no impression of that peculiar power and freedom in the handling of the *matériel* of Classic architecture, by which Inigo Jones put his own stamp on everything he carried out. As Mr. Blomfield observes in the chapter on Inigo Jones in his "History of Renaissance Architecture in England," it is probable that a building carried out under the great architect's superintendence took a different character and gave a different impression from anything which even his own drawings would convey. Mr. Triggs and Mr. Tanner have inverted the process; instead of drawings of what Inigo Jones might have carried out and put his own impress on, we have carefully prepared drawings of what he actually or probably did carry out; we proceed not from the drawing to the building, but from the building to the drawing.

The remarkable thing about Inigo Jones's genius is the power which he seemed to possess of putting his own life and vigour and originality into the use of architectural features which in one sense can hardly be called original, seeing that there was Classic precedent for their use, but which became stamped with originality from his bold manner of using them. Unlike Wren, who started as an admirable constructor and an original thinker in the way of plan, and became an artist as it were by degrees and by dint of practice and development, Inigo Jones was a born artist. In architecture he may be compared to Michelangelo in sculpture: on everything he touched he seemed to leave the impress of his powerful hand;

\* Some architectural works of Inigo Jones: a series of measured drawings and other illustrations; together with descriptive notes, a biographical sketch, and a list of his authentic works. By H. Inigo Triggs and Henry Tanner, Junr.; Associates of the Royal Institute of British Architects. London: B. T. Batsford; 1901.

he could do nothing in a weak or commonplace manner. One of the most remarkable instances of this, perhaps, is that which is so familiar to us in Covent Garden church; for though it is difficult to say how much of the original construction, which has twice passed through the fire, is now left,\* there can be no doubt that we have the design in its original form; it tells its own story as far as that goes; nowhere else can we find such an impression of power produced by such simple means; it is difficult to analyse in what it is that the effect consists, but the impression is unmistakable. In the treatment of design of a less severe character, again, one cannot but be struck with the remarkable shaping and modelling power possessed by Inigo Jones. The conventional resources of architectural ornament, such as scrolls and festoons, seem to gain a kind of new life under his hand; he seems to have modelled a building as a sculptor models a figure; and in this respect he certainly shows a notable example of that influence of individuality in the architect which some modern critics would persuade us is the bane of the art. Of this power a very good instance is the comparatively simple design of Raynham Hall, a building which we quite agree in regarding as bearing the stamp of authenticity as one of Inigo Jones's designs. There is no detail in this which can be said to represent a new idea for the period, yet there is a marked originality about it as a whole. Regarding this as one of the most interesting of the buildings which are Inigo Jones's design, we have given reduced reproductions of the two detail elevations, both as illustrations to this article and as examples of the class of illustration to be found in the book before us. In the use of that fine source of architectural expression, rustication, which Ruskin so unnecessarily scoffed at, Inigo Jones again shows always a remarkable power; he never uses it in a commonplace manner; a rusticated gate-pier becomes in his hands a work of architectural expression.

Among the works illustrated in the larger plates in the book, the authors have given measured drawings, both general and detail elevations, of the Banqueting House; of Castle Ashby; details from West Woodhay and Kirby; elevations, detail elevation, and elaborate interior details from Wilton House, including also an elevation of the stable buildings; a perspective drawing of Ashburnham House staircase; elevations and details of Coleshill House and Forde Abbey, with photographs of two of the ceilings from the latter; and an elevation and plan of what is perhaps one of the most interesting things in the book, the small garden-house at Beckett Park, a simple but boldly-treated building which proclaims the hand of the master as unmistakably as the front of St. Paul's, Covent Garden. They give also reproductions of the elevations of the Whitehall Palace, which, though never carried out, could hardly be omitted in any book of illustrations of Inigo Jones's work; it is besides necessary to explain properly the design of the Banqueting House; but the plan should also have been given to the same scale, not only to explain the elevations, but because, as already remarked, it is in

the plan that the real greatness of the design consists.\* The biographical and critical notice is also illustrated by numerous sketches and photographs of great interest. We reproduce, to a reduced size, two of the smaller ones, a shield from Kirby Hall, and the windmill at Chesterton; this is only "traditionally assigned to Inigo Jones," and we should rather question its authenticity; but whoever was the designer, it is an interesting example of an attempt to give architectural effect to a windmill.

Windmill at Chesterton.

The literary portion of the book is well written, without any attempt at more than giving a summary of the facts of the architect's life, and a brief description of the principal buildings illustrated. The execution of all the drawings is very good, and the make-up of the book does every credit to its well-known publisher.

To Inigo Jones's contemporaries a great part of his popular fame evidently rested on his fertile invention in designing built-up scenery for the elaborate masques which were a favourite form of entertainment of the time; a class of design no doubt most fascinating to a man of architectural genius, allowing him to give full scope to his inventive faculties without being hampered by any practical or economic restrictions. Could we have drawings of all the designs of this kind made by Inigo Jones, we should have probably a new impression of his genius, and a better understanding of the light in which he was regarded by his contemporaries. It would seem that while in the design of actual buildings Inigo Jones leaned towards a classic severity of style, in his masque designs he, not unnaturally, allowed a much more free licence to his fancy. Mr. Blomfield has published one very clever and interesting illustration, apparently from a rather highly finished drawing of somewhat fantastic design. The Institute of Architects' library possesses a few sketches of this kind, one of which, too slight and rough to reproduce from, shows a very fine conception; we seem to see one side of the scene in perspective, with a row of massive projections one after the other, treated some of them with cornices and columns or pilasters, one apparently as a circular tower with a cupola; one can easily imagine that a very fine built-up scene could be made out of this.

\* A small scale illustration of the plan is given in the ext of the work.

While welcoming the publication of the book of illustrations of Inigo Jones's work

A Shield from Kirby Hall.

which has been partly the occasion of these remarks, and which is one that every architectural library should possess, we may add that we hope those who possess or consult it, younger architects especially, will make the right use of it—not in attempts to reproduce Inigo Jones's style, but in endeavouring to catch that spirit of largeness and dignity of design, and power in the treatment of detail, which may be equally exemplified in other styles besides that in which our great architect worked.

NOTES.

Architects' Benevolent Society. THE Annual Report of the Architects' Benevolent Society gives the result of the special appeal which was made by the President of the Institute to the profession in a circular letter in June last. The result was not very encouraging, amounting to an increase of annual subscriptions to the extent of 987. 9s. 6d., with donations to the amount of 1517. 17s. 0d.; the cost of issuing the appeal having been 387. 8s. 8d. A second and less formal appeal made by Mr. Emerson at the last annual meeting of the Society was, however, more successful, and has led to some very liberal donations from Mr. Macvicar Anderson, the late Mr. Brydon, Mr. Emerson himself, Mr. H. L. Florence, Mr. E. E. Grayson, Mr. Gruning, Mr. E. T. Hall, Mr. G. T. Hine, the Liverpool Architectural Society, the Nottingham Architectural Society, Mr. Norman Shaw, Mr. Aston Webb, and others. One cause of the difficulty in obtaining adequate subscriptions is, no doubt, that the architectural profession as a whole is a poor one, and that many do not like sending a subscription of a few shillings only, and do not feel that they can afford more. On the other hand, the number of applications for assistance is increasing. Perhaps the best thing to advise is to suggest to members of the architectural profession that a small assistance is better than none, and that 5s. each from 5,000 persons (the number to whom Mr. Emerson's first special appeal was issued) would have meant 1,250*l.*, instead of the much smaller result named above. But it is quite comprehensible that some people would regard the publication in a subscription-list of so small a sum as a confession of poverty which they do not like to make. But we do urge the profession to take into consideration the important claims of the Architects' Benevolent Society, and make an effort to assist in increasing its resources.

\* So also with the front of the Banqueting House, of which it is not generally known that scarcely any of the original facing masonry is left; it has been pieced at different times owing to the decay of the stone, but the work of repair must have been very conscientiously done.

**The L.C.C. Works Department.** THE half-yearly return of works completed by the Works Department of the London County Council, which was submitted by the Finance Committee at Tuesday's meeting of the Council, shows that most of the works have been carried out at what is called a profit, *i.e.*, at a cost slightly below the final estimate of the architect or engineer. There is reason to think that the Department would always be in this happy position if it dealt only with drainage and jobbing works and refused to undertake works of an architectural character, for the only cases in the present report where the cost has considerably exceeded the final estimate were the Redcross fire-station and Cobham buildings; the excess in these cases being 1,023% and 1,129% respectively. There is no doubt that under the new management the Department is doing better than in the early days of its existence, though it is hinted that there are some works now in hand that may not show "quite such good results" as those just reported. Probably before the best results are obtained, the Department will have to be reorganised and the cost of management, which is said to be excessive, reduced.

**Hampstead Heath and Tube Railway.** THE Hampstead Heath Protection Society have circulated a letter explaining their position in reference to the proposal to drive a tunnel railway under Hampstead Heath. In the course of this they say:—"We are not opposing the construction of the Tube Railway already sanctioned from Charing Cross to Hampstead, nor do we object to an extension of this railway outside the boundaries of the Heath in a northerly direction to Golders' Green. But the Society are very strongly opposing the present proposal to tunnel under the Heath. This proposal they consider to be absolutely wrong in principle. The suggestion that a tunnel under the Heath might be allowed provided no station were made within the precincts of the Heath is plausible but quite unworthy of support. No railway, either under or over the Heath, should be allowed. It should avoid the Heath altogether. The Commons Preservation Society and the National Trust for Places of Historic Interest or Natural Beauty write to us that they quite agree with us in thinking that the right principle is to give access at as many points as possible on the border, but to keep the Heath one undivided whole." We are entirely in agreement with this view.

**The Electric Corrosion of Pipes.** THE evidence given by experts before the Select Committee appointed by the House of Commons to report on the London United Tramways Extension Bill was most interesting and instructive. Sir William Preece said that there were always large electric currents flowing through the crust of the earth which had some connexion apparently with sun spots and auroral disturbance. It was suggested that currents measured by the opponents of the Bill might possibly be due to natural causes, and that wherever rails and pipes were laid they might be found. Professors Ayrton and Perry, however, described tests they had made in Clapham-road. In the afternoon when the traffic was slack in the City and South London Electric Railway,

the current in the pipe tested was ten amperes, but in the evening about seven o'clock it rose to fourteen amperes. This is an extraordinary result, seeing that there are many other pipes in the same road, and that the electric railway is enclosed in an iron tube 50 ft. below its surface. It was noticed that the pipe was eaten away on the side next the generating station, where the current would naturally leave to get back to the dynamo. We think that this experiment, and some of the others described to the Committee, prove beyond the possibility of a doubt that there are leakage electric currents, in some cases of great magnitude, in the pipes in the neighbourhood of electric tramways which do not use an insulated return. Londoners are to be congratulated that the London County Council, acting on the experience Dr. Kennedy gained by a visit to America, has adopted a system of insulated returns for its tramways. Dr. Silvanus Thompson calculated that a current of one ampere would produce in an iron pipe 15 grains of corrosion per hour, which works out to 14 lbs. a year. This is the maximum possible corrosion it could produce. If the pipe were in a dry conducting soil the corrosion would be much less. The water companies are to be congratulated on the evidence they brought before the Committee; for although their electrolysis clause was rejected, they have proved to unbiased electricians that even when an electric tramway with un-insulated return satisfies the Board of Trade regulations considerable damage may be done to neighbouring pipes by leakage currents. The question is bound to arise again, and as time goes on the evidence of the damage done will get stronger and stronger. In our opinion also, evidence will soon be forthcoming of damage done by leakage currents from three-wire direct current supply systems.

**The Baltic Merchantile and Shipping Exchange.** ON June 25 the Lord Mayor laid the foundation-stone of the buildings which are being erected for this company (formed in March, 1900), at an estimated maximum cost of 175,000*l.*, after the plans and designs of Mr. W. Wimple and Mr. T. H. Smith as joint architects. The site, a freehold area of 28,700 ft. superficial, was purchased from the City of London Exchange Syndicate, and has been cleared by the demolition of Nos. 26-S, St. Mary Axe, Nos. 22-4, Bury-street, and all the houses in Jeffrey's-square, together with the square as well. Some portion of the ground will be appropriated for the widening of Bury-street and St. Mary Axe. The new buildings will occupy 18,515 square feet of the total area, and it is calculated that they will provide ample accommodation for the members, 3,000 in all, of the Baltic Exchange in Threadneedle-street, and the London Shipping Exchange in Billiter-street. The new premises will comprise an exchange 152 ft. long, 94 ft. wide, and 30 ft. high, with a central dome 30 ft. in diameter; a general exchange having a total area of more than 15,000 ft.; reading, club, and arbitration rooms; some four hundred offices, and other accommodation, to yield an estimated net annual rental of 13,700*l.* The former South Sea House (1773-4), in Threadneedle-street, was vacated on September 29, 1900, by the Baltic Society, who, we understand, sold the premises and site for 350,000*l.* to the British

Linen Company Bank of Edinburgh for their proposed offices. In 1855-6 the South Sea House was bought for 55,700*l.* The Baltic Company migrated thither when the "Baltic" coffee-house in Sweeting's-rents had been demolished to give place to Tite's Royal Exchange. The City Corporation have formulated a scheme for widening Threadneedle-street, by setting back the frontage on that site at a cost of 14,400*l.* We should point out that the *earlier* South Sea House (at one time the *old* Excise Office), in Old Broad-street, was destroyed by fire in 1826; its site was then acquired for the buildings of the City of London Club, 1833-4, erected after the plans and designs of Philip Hardwick, R.A.

**The Fine Art Society.** ON Wednesday there was a private view, at the Gallery of the Fine Art Society in New Bond-street, of a collection of water-colour drawings by Mr. A. N. Roussoff, chiefly of scenes in Venice. As on former occasions, the artist appeared rather as a capable executant of topographical scenes in water-colour than as an artist in the higher sense; his drawings are very good, however, and he has an eye for the effect of colour in old buildings, and draws architecture well, which cannot be said sometimes of painters who take in other respects a higher line. In the Venetian scenes in which water is an element, the water seems rather neglected in some cases; it is a surface of colour without the effect of water, except what is gained by the rather easy expedient of reflections of special objects. "Morning on the Lagoon" (3) however, is a good effect; also "On the Lagoon" (6) with the coloured sails of the craft; but we like the architectural subjects best. Among these may be named "Entrance to the Canal Grande" (13) where S. Maria and the attendant buildings are brilliantly indicated in bright light; "Murano, Afternoon" (11); "Fallen Grandeur" (14), an old palace with the clothes of the present humble inhabitants hung out to dry from the windows; "Cortile behind San Giorgio dei Greci" (22) with the lantern of the campanile rising in bright light in the background; "Near the Giardini" (34), and "San Michele, near Murano" (37).

#### THE GROSVENOR ESTATE: AND PIMLICO, BELGRAVIA, AND MAYFAIR. 1801-1900.

IN giving a sketch of the history of this portion of London during the past century, we will first direct attention to three or four early plans of the Ebury, Audley, and Goring properties.—Amongst the Duke of Westminster's muniments is Henry Morgan's "mapp or plot of the Lordship of Eburie being situated in the Parish of St. Martins in the Fields, Mrs. Mary Dammison [*sic*] being Proprietress," 53 in. by 23 in., 1675. The lordship, fairly rectangular in shape, has the West Bourne for its western boundary with the road from Knightsbridge to Hyde Park-corner along its northern side. On the map are plotted "King-road," which now traverses Eaton-square as laid out in 1827 by Cubit in the Five Fields, the "Old Road" (Ebury-street), the "Road from Chelsey to Goring House" (Buckingham Palace-road), having the lordship house and garden at its southern end near where is now Eccleston Bridge, and the "Nete House" close to the south-western corner of Eccleston-square. In the boardroom of St. George, Hanover-square, Vestry Hall hangs a finely-executed plan of the parish, "surveyed and delineated in . . . 1725 by John Mackay, senr. and junr., mathematicians, of Saint James, Westminster." It is drawn, to a scale of 10 poles in an inch, upon

sheets of vellum, and was renovated ten years ago. A reduced copy of this map is given with the present issue (see lithograph). With that survey may be usefully compared Rhodes' plan of the parish, 1761, and the drawn plan in the Craze collection of the Grosvenor (Mayfair) estate, as in the year 1723, with the intended streets around Grosvenor-square. The parish of St. George, taken out of that of St. Martin-in-the-Fields, was so constituted on March 25, 1725.

The sub-manors of Eyebury or Ebury (the modern Pimlico and Belgravia), Hyde (Mayfair and Hyde Park), and Neyte (Kensington Gardens) constituted the ancient manor of Eia, computed at the time of the Domesday survey to extend over ten hides, or about 890 acres. Eia, comprising the Bulunga fen (Ebury) in Ossulston hundred of King Edgar's reputed charter, 971, to Westminster Abbey, was at one time held by Asgar in virtue of his office as the King's stallier or Master of the Horse and standard-bearer. William I. gave a grant of all the lands held *ex officio* by Asgar to Geoffrey de Magnavilla, ancestor of the De Mandevilles, Earls of Essex. Geoffrey, by one account, hestowed Eia upon the Collegiate Church of St. Peter at Westminster, in return for his burial there. We hear of Eyebury farm, covering 430 acres of meadow and pasture, *comf.* Queen Elizabeth, who leased it at 21l. per annum to one Whashe. The Ebury property was subsequently brought in marriage by Mary, only child and heir of Alexander Davis (or Davies) of Ebury to Sir Thomas Grosvenor of Eaton, third baronet—they were married in 1676, in St. Clement Danes Church. Alexander Davis had inherited much of his property here from his elder brother, Sir Thomas Davis, a bookseller in St. Paul's Churchyard, and Lord Mayor in 1676-7. Thomas Davis—"my old schoolfellow at Paul's," writes Pepys—was grand-nephew and co-heir of Hugh Audley, or Awdeley, a member of the Inner Temple, who died "great" by repute and "infinitely rich" on November 15, 1662. He had acquired by usury real property estimated, at his death, to be worth 400,000l. His will, made on November 4, and proved on November 24, 1662, is rehearsed in vol. vi. (1871) of J. G. and R. C. Nichols' "Herald and Genealogist." We may observe that the will, which occasioned forty years' litigation, relates to his personal property only: he had settled his landed property upon his relations in his lifetime, subject to his own life interest therein. His third sister, Elizabeth, had three co-heirs, one being Sir Thomas Davis mentioned above. Audley's land in London was fairly co-terminous with the latter Mayfair.

The story of Mary Davis's life is a sad one. Her father, a scrivener, who married Mary, daughter of Dr. Richard Dukeson, Rector of St. Clement Danes, died intestate in his thirtieth year, on July 3, 1665, leaving a widow (who soon married again) and an infant child. He was buried in the churchyard of St. Margaret, Westminster. When Mary Davis was but ten years old a private Act, 17 Car. 11., was passed to vest her inheritance in trustees; in the following year she was married to Sir Richard Grosvenor, who was scarcely nine years older than herself. Her husband died in his forty-fifth year; his widow died in 1730, having passed the latter thirty years of her life demented and under restraint. Bourdon House, the traditional home of her childhood, yet remains in Davies-street; it is one of the oldest houses on the estate, and contains some finely-carved woodwork apparently of early eighteenth-century date.

Thus the two estates ultimately passed to Sir Richard Grosvenor, Bart., who succeeded his father, Sir Thomas, the third baronet, in 1700. Sir Richard Grosvenor laid out Grosvenor-square in or before 1716; before his death (1732) he had approved of plans for laying out further portions of his estate, chiefly around Grosvenor-square, upon lines which—in Mayfair—had suffered but little change until about thirty years ago. His nephew, Sir Richard, seventh baronet, elevated Baron Grosvenor of Eaton, 1761, and advanced Viscount Belgrave and Earl Grosvenor, 1784, was father of Robert, second Earl, advanced Marquis of Westminster, 1831.

**Bondaries.**—The Mayfair portion of the Grosvenor estate is bounded on the west by Park-lane from Oxford-street to South-street; on the south side of Berkeley-square; on the east by Avery-row (see also "Pimlico and Belgravia") and South Molton-lane that mark

the course of the Av Brook or Tyburn separating it from the Maddoks property; on the north by Oxford-street which in the plan of 1723 is named "Worcester-road." The Ebury portion is bounded on the north by the high road between Albert Gate at Knightsbridge and Hyde Park-corner; on the east by Grosvenor-place, Lower Grosvenor-place, and by a line along the Tyburn between Carlisle-place and Vauxhall Bridge-road, then along Tachbrook-street, and so between Bessborough-place and the Gasworks to the Thames; the western boundary, being identical with the course of the West Bourne and the boundary of St. George's parish, runs almost due south from Albert Gate, behind the east side of Lowndes-square, behind the east side of Cadogan-place, along the east side of Sloane-square, down Holbein-place, then by a curve around Wellington Barracks and the site of Ranelagh to the junction of Chelsea Bridge and Commercial roads, and so to the Thames at the Victoria Pier. From those confines should be excepted a small spoon-shaped portion, the Lowndes property, between Lowndes-square and Wilton-crescent; and there should be added the outlying site of Peterborough, or Belgrave, House and grounds, now traversed by Page and Grosvenor streets within the angle formed by the junction of Horseferry and Grosvenor roads, bought by Alexander Davis of Ebury.\*

MAY FAIR.

The manifold changes that have been made within the last thirty years or so in this quarter of the town, and for their greater portion upon the Grosvenor Estate, comprise an extensive demolition, with rebuilding, of house property in Park-lane, North and South Audley-streets, Park, Duke (Grosvenor-square), Davies, South Molton, Green, Brook, Mount, Aldford (until 1888 Chapel), Down, and Curzon-streets, Grosvenor-place (1767), Charles-street, Grosvenor-square (renamed Carlos-place), the south side of Oxford-street between Park-lane and South Molton-street (including Herford-gardens), North-row, and Shepherd's-market, together with a large number of news, minor thoroughfares, and so on, whose sanitary condition had become unsatisfactory. Chesterfield-garden absorbs most of the garden of Chesterfield House (Isaac Ware, 1748), of which the colonnades on either side are now closed in. Sir Michael Arthur Bass, Bart., elevated Baron Burton in 1886, bought the house from Charles Magniac, M.P., in 1885, when it was rehabilitated under Mr. R. W. Edis's superintendence. In the autumn of 1896 were pulled down Nos. 94-104, Park-street (east side), between Green-street and Lees-mews, together with Nos. 55-9, Green-street (south side), between Park-street and Hampden House, the Duke of Abercorn's, and premises in the rear abutting upon Lees-mews and Shepherd's-place-buildings. The whole, two houses at its west end excepted, of Mount-street has been rebuilt. Of the new premises we may mention the shops at the corner of South Audley-street, 1893, by Mr. A. T. Bolton, and No. 54, at the corner, north, of Park-street, by Mr. Fairfax B. Wade for Lord Windsor. The old St. George's Vestry Hall (1789), rebuilt at a cost of 15,362l., the site costing 11,624l., was opened on April 23, 1887. The architects were Messrs. Ernest George & Peto, who designed also the adjoining block of chambers and shops [May 15, 1886].† St. Mark's Church, North Audley-street, by Peter John Gandy Deering, R.A., who took the Erechtheum as his model, was built in 1825-8, and cost 5,600l. In South Audley-street, Nos. 61-2-3 are by Mr. W. Lambert, 1890; Nos. 69-70-1 were built in 1809 by Mr. Lovatt, who contracted for 12,500l., Mr. Howard Chafeld Clarke being the architect; the Public Library in Chapel-place North, near the Grosvenor Episcopal Chapel, and opened on July 1, 1895, is by Mr. A. T. Bolton; Audley Mansions, North Audley-street, are by Mr. Wimpert. We may mention, too, in Green-street, No. 32, Lord Ribblesdale's, by Mr. Sidney R. J. Smith, and a block of residential flats by Messrs. Henry S. Legg & Son, 1896, Messrs. Bywaters & Sons being the contractors for 12,847l.; the Coburg Hotel in Carlos-place (as widened) and a house by Messrs. Isaacs and Florence, 1895-6; No. 3, Hertford-street, by Mr. W. Flockhart; a block of five houses in South-street [Decem-

ber 11, 1897], built by Mr. Willett, the architect being Mr. J. J. Stevenson; and the two sets of three-story stables on the south side of North-row, Park-street, by Mr. Sidney R. J. Smith (1898). Messrs. W. Cubitt & Co. built the block of six houses on the east side of Park-street, between Green-street and the "Herford Arms," in 1896, from Mr. H. O. Creswell's designs. A. Salvin (*obit* December 17, 1881) prepared the plans and designs of No. 9, Chesterfield-gardens, distinguished by its fine staircase, for the late Lord Leonfield, but advancing years compelled him to relinquish its completion. In 1835 Salvin carried out extensive alterations at Grosvenor (formerly Gloucester) House, to which T. Cundy added the Roman Doric colonnade or screen facing Upper Grosvenor-street in 1842, and the west wing, or picture gallery, facing Park-lane; the garden wall along Aldford (formerly Chapel) and Park streets was rebuilt in 1895-6. In 1889 the parish burial ground, 1½ acres, lying between Mount and South streets, was opened to the public.

**Farm-street.**—The church of the Immaculate Conception, 1846-9, the first erected in London for the Order of Jesuit Fathers, is by J. J. Scoles [June 2, 1849]. Clutton added the chapel of the Blessed Sacrament in 1858-9. The high altar given by Miss Monica Tempest, of Broughton Hall, Yorkshire, at a cost of about 1,000l., was designed by A. W. Pugin; the window above it is by Wailes. It is believed that Scoles based his design for the early fourteenth century south front upon that of the south front of Beauvais Cathedral. Of the Fathers' adjoining residence we published Messrs. Goldie, Child, and Goldie's original designs, modified in the building, on July 10, 1886. Last year Mr. Romaine-Walker began an enlargement, with a new aisle, of the church to cost about 15,000l. For the rebuilding of the United Steuart and St. George, Hanover-square, Parochial Schools [December 17, 1898] a tender of 13,675l. by Messrs. Dove Brothers was accepted in June, 1897. By reason of the exigencies of the site Mr. P. A. Robson's planning is unique after its kind. The playgrounds are sunk, and extend beneath the main building, whilst the cookery school is entered from the girls' playground, beneath the teachers' houses, the latrines being arranged in a tower between the houses and the schools. Mr. Robson's original plans, placed first in a limited competition in 1896, were not carried out by reason of certain revised requirements on the part of the late Duke of Westminster, who contributed a considerable sum besides the site. A new scheme was accordingly designed.

**Park-lane and Hamilton-place.**—In pursuance of their Park-lane Improvement Act, 1869 (32 and 33 Vic. c. 134), the late Metropolitan Board of Works extended Hamilton-place, built upon Crown lands in 1805, northwards into Park-lane, and at the same time increased its width from 30 ft. to about 60 ft. E. Thirst and W. Webster were the contractors for the improvement, the net cost being 110,968l. The new thoroughfare was opened in June, 1871. Londonderry (formerly Holderness) House was designed by Samuel Wyatt (*obit* 1807) and his nephew, B. Dean Wyatt (*obit* in or about 1850). In 1812 Sir John Soane designed No. 18, Park-lane. On the three-sided site at the corner of Deaney-street, near Stanhope Gate, and facing southwards, stands Dorchester House [August 28, 1852], built in 1848-57 by W. Cubitt & Co. for the late R. S. Holford, M.P., from the plans and designs of Lewis Vulliamy (*obit* 1871). The house contains some of the finest domestic work of Alfred Stevens who died in 1875, especially the fixed furniture and the chimney-piece of the dining-room, of which latter one figure is illustrated—after a drawing by Mr. W. R. Lethaby—in our number of April 21, 1894. In December, 1892, were demolished the seven houses between Aldford and Mount streets; the Office of Woods and Forests sold the materials of Nos. 7-10 and of No. 13, Grantham-place on April 25, 1900. Mrs. Brown presented the drinking-fountain at the junction with Hamilton-place; it commemorates the Fathers of English Poetry, and is the work of Thomas Thornycroft, 1875. No. 1, Park-lane is by A. Peebles (*obit* May 21, 1891), Breadalbane House, 1818-24, by Wm. Atkinson (*obit* May 22, 1839), and a recent block of houses by Mr. Sidney R. T. Smith. At the corner of Aldford-street is No. 26, built in 1895-6 of Portland stone by

\* See our article "Westminster, Old and New," in *Builder* of January 12, 1901 (p. 36).

† Dates within square brackets relate to illustrations in the *Builder*.

road.—In the spring, 1900, James-street was renamed Buckingham-gate. Turning to Salway's survey of 1811, we see that the houses between James-street and Charlotte, now Palace-street, form Stafford-row, next (south) are Queen's-row extending to Prince's-row, opposite the "Bag o'Nails" and the "Goat" in Arabella-row, and then Dukes-row and the road "to Battersea-bridge." Stafford-row was named after Sir William Howard Viscount Stafford, beheaded in 1680, the second son of Thomas, Earl of Arundel, Surrey and Norfolk, for whose wife, Bletheia, was built by Nicholas Stone, wife adjacent Arundel-house, latterly known as Tart Hall, pulled down in or about 1720. On the site of the "White Horse" at the corner of James-street and Stafford-row is the office of the Duchy of Cornwall, by Sir James Pennethorne [November 3, 1855], built instead of the former office in Somerset House in terms of an Act passed in 1854 (17-8 Vic., c. 93) with a sum of 16,880*l.* voted by Parliament. The opposite park gates are by E. Blore. At the corner (south) of Stafford-place stood until 1857 one of the famous old Pimlico taverns and tea-gardens, the "Gun," having a field-piece for its sign (see lithograph); Buckingham Palace Hotel stands on a portion of the site. The Grosvenor Hotel was built by Mr. Kelk in 1860-1 upon his own land at a cost of about 100,000*l.*, from the design of J. T. Knowles [June 1, 1861]. The exterior carving is by Dayman. The fabric measures 262 ft. by 75 ft. in depth, and rises 150 ft. to the top of the roof. The London, Brighton, and South Coast Railway Company framed a scheme in 1898 for an enlargement of their terminus from 6½ acres to 14½ acres, with extended platforms for eighteen instead of only eight trains by taking all the property between their existing boundary and the south-east side of the main road between Ebury Bridge and the station. Mr. Morgan, their engineer, has estimated that the project will cost 1,088,000*l.*; the hotel, bought by the railway company in 1899 for, it is said, 240,000*l.*, has undergone extensive structural alterations under the supervision of Mr. Alfred Waterhouse, R.A., and Mr. Morgan. Continuing southwards we reach Buckingham Palace-gardens, built upon the Grosvenor estate by Mr. Willett about seven years ago after Mr. J. J. Stevenson's plans and designs [December 30, 1893; and two of the porches February 9, 1895]; St. George, Hanover-square, Public Library opened on July 7, 1894, and Public Baths erected on the site of the old Baths, Nos. 80-90 (even), by Messrs. J. Mowlem & Co., at a cost of about 30,000*l.* after Mr. F. J. Smith's designs, and opened on May 7, 1890. The St. Peter's Institute and Gymnasium, 1890, is by Mr. E. F. C. Clarke; the National Training School of Cookery, originally established at South Kensington by the late Sir Henry Cole, was built in 1888-9 from Mr. Purdon Clarke's designs at a cost exceeding 8,000*l.* T. Cundy was the architect of St. Barnabas Church and Schools, 1850, which mark the site of the Orange Tea-gardens. At the end of Five Fields-row stood the "Star and Garter," famed for its equestrian exhibitions and fireworks. Holy Trinity, in Bessborough-gardens, is the first church built in London by J. L. Pearson, R.A.; it was erected at Archdeacon Bentinck's cost, and consecrated on May 25, 1852. Of the east window the central light is by Wailes, the six other lights are by Gibbs; the organ is by Walker.

The Waterworks, "Jenny Whim's" the Neat Houses, and (old) Millbank.—The lease for ninety-nine years of 89 acres in (old) Millbank to the Chelsea Waterworks Company expired on Lady Day, 1823. John Mackay's plan, 1727, is entitled "Plan of the Estate belonging to Dame Mary Grosvenor, let to the Chelsea Waterworks, near Millbank, on the River Thames"; Dame Mary was Sir Thomas Grosvenor's widow. Peter Potter drew a plan of that estate in 1815; in the fourth edition, 1819, of "Horwood's Survey" are marked "the cuts to supply Chelsea Waterworks and Pimlico Wharf." A "fire engine" stood at Pimlico Wharf on the south side of Shaftesbury-terrace, where is now the forecourt of Victoria Station; compare J. V. Wallis's map of 1823. Chelsea (Ebury) Bridge (see lithograph), situated between the "Monster" tavern and Stone Wharf at the south-western end of Bridge-row (Buckingham Palace-row) crossed the cuts at the north end of St. George's-row, latterly absorbed in Sutherland-terrace; see "Horwood's

Survey," 1795 and 1819\*. At the south-east end of the wooden bridge was the popular resort known as Jenny Whim's (or Jenny's Whim) tea-gardens and tavern, near the Flask. Next, northwards to Stone Wharf lay Avery Farin-row (see also "May Fair"), now Ebury-square, and the Dwarf tavern and gardens, afterwards New Spring-gardens, opposite the north-eastern end of Ranelagh-walk (or grove). The Waterworks Company, incorporated in 1722-3, had built their first engine-house at the Ranelagh oster beds, using the stones of St. Martin-in-the-Fields church pulled down two years previously. In 1812 they acquired about twenty acres for new works and an engine-house on the western side of Turpentine-lane (Westmoreland-street), which separated them from the Neat House Gardens; in 1829 their filtering-beds, which that Company first adopted, were at Thames Bank. In 1726 they purchased for 400*l.* the undertaking of the Millbank Water Company (1673); their reservoir, latterly known as the Queen's Basin, and often, but erroneously, cited as Rosamund's Pond, in the north-east corner of Green Park, was filled up in 1842; the reservoir (1725) in Walnut Tree-walk, Hyde Park, near the Duke of Gloucester's riding-house—where is now the enclosed round garden—remained, together with the engine-house, until 1835.

An excellent map published in 1836 for the Society for the Diffusion of Useful Knowledge delineates the Neat Houses as extending along the riverside between Millbank Distillery (west) and the southern end of old Grosvenor (since Belgrave) road (east), where is now St. George's-square. To the north of them lies Cross-lane, since Lupus-street; to the south are the present Pimlico Pier, the Royal Army Clothing Department, and All Saints' Church, Grosvenor-road, 1871 (T. Cundy, *obit* 1895). The Distillery, afterwards Cook's, was established about ninety years ago at the south-western corner of Baker's-lane, since Caledonia-street. Neat House Gardens, until Basevi and Cubitt laid out that part of the estate, covered the three-sided area bounded by the present canal, Vauxhall Bridge-road (about 1810), and the later Grosvenor-road; Willow-walk, since Warwick-street, traversed their northern portion, and just beyond were the Osier Beds, which have since become the site of Hugh-street and Eccleston-square. The Neat Houses formed a settlement of cowkeepers and market gardeners. The Neate, formerly owned by the monks of St. Peter, and contained within the sub-manor of Ebury, is often confused with the equally ancient sub-manor of Neyte, now represented by Kensington Gardens.

Robert, second Earl of Grosvenor, advanced Marquis of Westminster in 1831, bought the Five Fields in 1825 for, it is said, 30,000*l.*, and forthwith began to build upon the land, overlying the marshy soil and filling up the many water-cuts of southern Pimlico with soil from the excavations for St. Katharine's Docks by the Tower; his chief builder was Thomas Cubitt. In 1825-9 George Basevi, the younger, planned and designed Belgrave-square, 684 ft. by 637 ft. the detached houses at the angles being by Hardwick and H. E. Kendall. Sir John Soane designed the gallery, with its lantern, of Chantry's house in Eccleston-street. Lowndes-square, named after the ground landlord, W. Selby Lowndes, and built in 1837-9, stands on the site of the "archery and rural castle" plotted, 1819, by Horwood, who shows all vacant ground between Grosvenor-place and the West Bourne; on the square's southern side are seven houses, after the Italian style, by Lewis Cubitt. In Eaton-square, 1,637 ft. by 371 ft. is the church of St. Peter, 1824-7, by Henry Hakewill (*obit* 1830), and rebuilt after its destruction by fire in 1836 by his son James from his father's original drawings. Some alterations of the interior were made in 1894 at a cost of about 2,100*l.* by Sir Arthur Blomfield (*obit* 1899), who also designed the chancel screen and its gables.

St. George's Hospital and Grosvenor-place.—In the Foundling Hospital is Wilson's picture, 1746, of St. George's Hospital, formerly Lord Lansborough's "country house," which was

\* The position of the old bridge is shown on the St. George's Parish map in the present issue, at the head of the basin marked "Chelsea Water-works Canal."

† In "The Story of My Life" (1900), Mr. Augustus J. C. Hare says that the Court wished to buy the land, because it lay so close to Buckingham Palace, but though the sum asked for was too much, and that Cubitt afterwards offered a ground-rent of 60,000*l.*

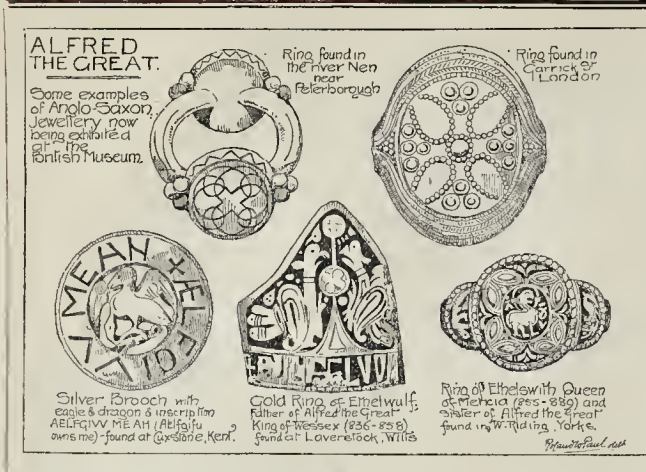

leased in 1733-4 by a committee for purposes of an infirmary. To the house, which faced Hyde Park, they added two wings, after I. Ware's designs as shown in his own contemporary print, 1733. The old hospital also is seen in the paintings of Hyde Park-corner, presented by Miss Emily J. Wood to the National Gallery in 1886. One picture is labelled "Unknown—Eighteenth Century (3)," the other "By James Holland—b. 1800, d. 1870." W. Wilkins (*obit* 1839) rebuilt the hospital in 1828-30. Some extensive reparations were carried out in 1850. In 1859 an upper story and in 1868 a new wing were added by Arthur P. Mee (*obit* 1868), and in 1896 Mr. H. Percy Adams added a suite of rooms which embraces the large (east) operating theatre as remodelled by him, the small (west) theatre, which is new, together with nurses' rooms, offices, &c.; the new southern block overlooks the sites of Tattersall's-yard with the "Turf" tavern at the yard's upper end (Grosvenor-crescent), and the former Lock Hospital. Richard Tattersall, the Duke of Kingston's stud-groom, began business there in or about 1778. George Tattersall built the subscription-room and the counting-house. In 1865 Tattersall's migrated to Knightsbridge, where on a site of two acres on the west side of the Green, new subscription-rooms, stables, an auction-yard, &c., had been built by Holland & Hannen from Charles Freeman's plans and designs. The Lock Hospital, of which the chapel (1764) gave a name to Chapel-street, was established in 1746, and forty years afterwards the Rev. Thomas Scott, the commentator on the Bible, founded the Asylum; the institution was removed to the Harrow-road, near Westbourne-green, where a new hospital for sixty patients had been erected, 1842-3, after L. Vulliamy's designs. Salway's survey of 1811 plots the "3rd Regiment of Guards Hospital" at the corner (north) of Osnaburgh-row, now Hobart-Place, and then southwards, Grosvenor-street West, with the "King's-road" (Ebury-street) along its northern side. Next are Ranelagh-street, Arabella-row (Lower Grosvenor-place) and the "Bag o' Nails"—its sign being a corruption of Ben Jonson's Bacchanals—which is now No. 6, Buckingham Palace-road, and was greatly altered in 1890 by Mr. H. I. Newton. T. Cundy was the architect of the St. Michael's, the St. Peter's, and the Ebury-square Schools, of Belgrave Mansions, and of most of the houses in Upper and Lower Grosvenor-gardens, Grosvenor-place, Grosvenor-crescent, and Wilton-crescent.

Notabilia.—Churches: St. Paul, Wilton-place, 1842-3—T. Cundy; chancel enlarged and refitted, 1870—Withers. St. Saviour, St. George's-square, 1863-4—T. Cundy. St. Michael, Chester-square, 1844—T. Cundy; chancel extended, 1874-5. St. Gabriel, Warwick-square, 1853—T. Cundy; enlarged, 1897—Mr. Arthur Baker, of Messrs. Baker & Turrill; east window—Mr. Kempe; the church-house, hall, and clubrooms in *Glasgow terrace*—Mr. W. Campbell Jones. St. John the Evangelist, Wilton-road, 1873-4—Sir Arthur Blomfield. St. Mary, Graham-street, 1873-4—Withers. St. Philip, Buckingham Palace-road—Messrs. Demaine & Brierley [September 17, 1887]. Belgrave Chapel, Halkin-street, about 1825—Sir Robert Smirke (*obit* 1867). St. Saviour, reredos, font, chancel screen, corona, and decorations—Mr. Romaine-Walker; the Sir John Tilley memorial window—Mr. C. E. Kempe. St. Barnabas, reredos—Messrs. Bodley & Garner.

House for Earl Brownlow, Belgrave-square, and house for the Earl of Oxford, Halkin-street—Sir Robert Smirke. No. 1, Grosvenor-crescent, the smaller drawing-room; and the drawing-room, 29, *Chelsea-place*, 1896-7—Professor Aitchison. Lord Radnor's Conference Hall, Eccleston-street—W. A. Boulnois (*obit* 1893). Nos. 1 and 12, Belgrave-square, 1899—Mr. P. A. Todd. Block of residential flats, North-street—Mr. E. J. Sadgrove, a tender of 60,000*l.* from Messrs. Stephens, Barstow, & Co., of Bristol, accepted in February, 1897. Police-station, Gerald-road, Eaton-square, 1893—Mr. J. Dixon Butler. Pimlico Literary Institution, Ebury-street, 1836—P. J. Gandy-Deering. Pantechnicon, *Motcombe-place*, 1830, rebuilt after the fire 1874. Hudson's fireproof depositories, near Victoria Station, 1896-8, Mr. H. B. Gammon, contractor, 5,681*l.* Messrs. W. H. Cross & Kewick. Park Lodge and improvements and gates, *Bridge-walk*—D. Burton. Westminster (or Grosvenor) House, for Sir E. Antrous—Sir G. G. Scott.

Buckingham Palace-road.—Soldiers' Home, altered and enlarged, 1898—Mr. Robert Curwen; block of residential flats—T. Pilkington (*obit* 1898); shops and houses for the Grosvenor Hotel Company, 1894—Mr. W. A. Large. Buckingham Gate.—No. 20, James-street—Mr. R. T. Blomfield (the carved brick frieze by Mr. Harry Pegram) [August 8, 1896]; Buckingham

Palace Mansions, built by Mr. J. J. Hall, of Dover, 21, 2001.—Mr. C. J. C. Pawley, Old Westminster Chapel (1840)—John Tarring (obit 1875). Palace Chambers—Messrs. Martin & Purchase [plan, January 26, 1901].

Dr. Dodd's Chapel in Charlotte (now Palace) street, converted, 1880, into St. Peter's, a chapel-of-ease to St. Peter's, Eaton-square. Flank-roof re-named Semley-place, Ebury-street.

Ebury-square Garden leased (1884) at a peppercorn rent to the Metropolitan Public Gardens Association by the late Duke, who gave (1885) a general consent to the opening during the autumn months to the public of the square gardens, and of Lower Grosvenor Gardens under the Association's supervision.

#### SAXON ORNAMENTS OF THE TIME OF ALFRED THE GREAT.

IN connexion with the Millenary of Alfred the Great, a number of objects of Anglo-Saxon date are now being exhibited in the Central Saloon of the British Museum. In four cases are arranged examples of jewellery and coins, also MSS., charters, literary works, and laws of King Alfred. Some of the specimens of jewellery are of great interest; in more than one instance they have belonged, if not to the King, to one of his relatives, as is shown by their inscriptions, and the workmanship is in many cases remarkable for its extreme delicacy. In the centre is a careful copy by Messrs. Payne, of Oxford, of the famous jewel found in Somersetshire, between Athelney and Bridgewater, and now in the Ashmolean Museum at Oxford. Hardly less interesting are two rings—both of which we illustrate—one a gold ring which belonged to Ethelwulf, King of Wessex (836-858), father of King Alfred, and the other a ring of Ethelwulf, Queen of Mercia (855-889), sister of Alfred. The first is of gold filled with niello, and the front is in the form of a mitre, the design being a tree (?) surmounted by a cross with a bird on either side. Below is an inscription, ETHELVVLF R<sup>x</sup> (Rex). This remarkable ring was found in 1780 in the parish of Laverstock in Wiltshire, and sold by a labourer to a jeweller at Salisbury for 3s. It is a good deal out of shape, as will be seen by the drawing. The second ring is also of gold and niello, with a bezel in the centre, ornamented with the Agnus Dei and the letters A and D on either side. The shoulders at the side have a dragon and a grotesque animal. "On the back of the bezel is scratched in three lines +EADLE SVID REGNA (Regina), showing that the ring once belonged to the sister of Alfred the Great, who married Burhred, King of Mercia, in 855. She died abroad, and was buried at Pavia." This ring was ploughed up in the West Riding of Yorkshire, between Aberford and Sherburn.

Of ten other rings in the collection, one is of agate, one of bronze, and the rest of gold. Of these we illustrate two, a fine gold ring found in Garrick-street, London, and a curious example found in the River Nen near Peterborough. The example from Tipperary was originally filled with slabs of garnet. A gold finger ring with a "pearled" edge bears the name of its owner, Ethred, and its maker,

Eanred, the inscription being on a nielloed ground; and a very fine example of a ring, evidently once belonging to an ecclesiastic, found on the bank of the Trent in North Lincolnshire, with a cross *foliot flechee*, and a beaded or "pearled" ornament similar to the example found in Garrick-street.

Two very beautiful brooches are shown, one of gold and enamel said to have been found in Scotland, the other in Thames-street, London. The workmanship and design are wonderfully delicate. There is also a brooch from Canosa, Southern Italy. Among the objects of simpler character are the bronze seal of Ethelwald, Bishop of Dunwich (c. A.D. 850), found at Eye, in Suffolk; a silver cross with a central blue stone surrounded by gold filigree, and a circular silver brooch (illustrated) with a marginal inscription, AELFGIVV ME AH (Aelfgifu owns me), the centre having a bird standing on a dragon. This was found in Kent, at Caxstone, near Chatham, in 1822. A trial-piece of lead is also exhibited "on which the moneyer Eadulf impressed his die for the silver penny of King Alfred"; this was found in St. Paul's Churchyard in 1841.

In another case are a great many Anglo-Saxon coins.

The MSS. include a very fine book of the gospels of early eleventh century date, with good illuminated letters.

In the illustrations given the rings, &c., are shown about their actual size.

#### THE BLUE COAT HOSPITAL COMPETITION, LIVERPOOL.

THE competition for the new Blue Coat Hospital at Liverpool has been conducted on somewhat different lines from those commonly adopted. No doubt the trustees decided that it should be limited to local architects, but to Mr. W. D. Carö, who has throughout acted as the assessor, must be attributed the careful instructions which reduced the labour of the competing architects to the smallest possible amount. The competition was in two stages—preliminary and final. In the former the drawings were limited to a block plan (without drains) drawn to a scale of 32 ft. to an inch, and to plans of the several floors and a sufficient number of elevations and sections to explain the designs, drawn to 16-ft. scale. The drawings were to be in pencil, on drawing or tracing paper, tinted in a simple specified manner, and not mounted. Perspectives were expressly forbidden.

Twelve firms were asked to take part in the preliminary competition, and nine sets of designs were, we understand, received, from which the four best were, in accordance with the conditions, selected by the assessor. The authors of these were invited to take part in the final competition, but care was observed that the names of the authors of the respective designs were not made known either to the assessor or the trustees, nor were the designs of one architect shown to the other competitors, or to any one except those directly concerned in the conduct of the competition. Additional

drawings were required in the second competition, but, with the exception of the detail drawings and the designs for the dining-hall, the original scales were adhered to. Each firm taking part in the final competition was promised a fee of 150*l.*, and in addition to this the authors of the successful design were to be remunerated in accordance with the schedule of charges adopted by the Royal Institute of British Architects.

The four designs (numbered 1, 4, 5, and 9) received in the final competition were exhibited last week in the newsroom of the Liverpool Exchange, and we think that even the unsuccessful competitors will admit that the selected design is undoubtedly the best, both as regards plan and elevation. Mr. Carö's report has not been published, but we understand that the design selected by the trustees for execution is that which he placed first. This is as it ought to be, and both Mr. Carö and the trustees deserve the thanks of the competing architects for having conducted the competition so ably and honourably.

The existing hospital is set back from Lord-street, close to the cathedral, and is built in a simple type of English Renaissance around three sides of a forecourt, the two wings being connected by a wall and lofty railings with the entrance-gates in the middle. Competitors were informed that the trustees, "while not wishing to curb individual choice of style," were "desirous of recalling the architectural character of the front of the existing buildings." This desire has been borne in mind by all the four competitors, although with varying degrees of success, but only Messrs. Grayson & Old have adopted the same type of plan as that of the existing hospital.

The accommodation required includes recreation-rooms and dormitories, together with all necessary conveniences, for 250 boys and 150 girls, classrooms for 300 boys and 200 girls, joiner's shop and cookery school (each for twenty-four scholars), rooms for the resident staff of masters, mistresses, and servants, common dining-hall, central hall with an area of not less than 3,600 square ft., kitchen department, gymnasium about 70 ft. by 35 ft., two lodges, clock tower, and a detached sanatorium with adjacent administrative block. The administrative department of the schools was to include an office and boardroom, ante-room for applicants and relatives, two small rooms for the medical examination of applicants, and a ladies' committee-room. A chapel to seat 800 and a swimming-bath 60 ft. by 30 ft. were to be shown on the drawings, but not included in the estimates. The cost, exclusive of the chapel and swimming-bath and of laying-out and fencing the grounds, was in the preliminary competition limited to 70,000*l.*, but this was increased in the final to 90,000*l.*

The new site is a large oblong, slightly wider at one end than the other. The long sides adjoin Prince Alfred-road on the west and Church-road on the east, and the ground rises from the latter to the former. Competitors were instructed that the main front must be towards Prince Alfred-road, but that the principal entrance might be in either road. This appears to have presented a difficulty. Church-road is by far the more important thoroughfare; it is wider than the other, and is also a tram-route, and would therefore appear to be the more convenient for the approach to the principal entrance. On the other hand, there is a large expanse of open ground on the opposite side of Prince Alfred-road, 95 that the buildings will be seen for a considerable distance on this side. The proper solution of the problem consists in giving to both fronts a satisfactory architectural treatment. Unfortunately for some of the competitors, they have been so concerned with the frontage to Prince Alfred-road that the Church-road front has been left to take care of itself, and, in one case at least, even the plan has been sacrificed to the dignified treatment of the principal front.

The successful design (No. 4) is by Messrs. Briggs & Wolstenholme, Hobbs and Arnold Thornely, who were recently successful in the competition for the great Liverpool Dock offices. In their design the buildings form a hollow rectangle, with the central area bisected by the central hall (under which is the dining-room). The buildings fronting Church-road consist in the main of one story and a basement, with the chapel at the extreme left, the gymnasium and swimming-bath at the extreme right, and the principal entrance and clock tower in the centre. The principal entrance is

on the first or upper ground floor, and leads into a hall about 17 ft. square, above which rises the tower. A corridor 14 ft. wide leads directly from the entrance hall to the east end of the central hall, which is on the same level, and measures 76 ft. by 47 ft. exclusive of crush lobby and platform. The platform is at the west end of the hall and on each side of it a wide flight of eleven steps leads down to the level of the first or upper ground-floor corridors in the west block. Opposite these stairs are the two staircases (for girls and boys respectively) leading down to the lower ground floor and up to the second floor of the west block fronting Prince Alfred-road. This block is three stories high, and contains on the lower ground floor the four classrooms for girls and the boys' recreation-rooms; over the girls' classrooms are the matron's and headmaster's rooms, sewing-room, &c., on the first floor, and one of the girls' dormitories on the second floor. Over the boys' recreation-room are two stories of boys' dormitories. The girls' recreation-rooms are on the lower ground floor in the south range of buildings, and girls' dormitories and other rooms are placed on the floors above. The six boys' classrooms are on the lower ground floor in the north range, but overlooking the "male staff quadrangle" so as to have a south aspect. This quadrangle measures 169 ft. by 96 ft., and is therefore of ample size. The corresponding quadrangle on the opposite side of the central hall is divided into two unequal parts by a one-story range of buildings (parallel with the two principal fronts), the larger part forming the female staff quadrangle and the smaller the kitchen court, from which access is obtained to the kitchen department, a one-story block between the dining-room and the basement under the principal entrance.

The block fronting Church-road has a corridor 9 ft. wide running from the chapel on the left to the galleries of the gymnasium and swimming-bath on the right. The frontage is occupied towards the left of the entrance by the boardroom, medical examination-rooms, applicants' ante-room, girls' and applicants' entrance, and the chapel; and towards the right of the entrance by the office, ladies' committee-room, boys' entrance, gymnasium, and swimming-bath. The two portions are not symmetrical and the effect will be less satisfactory in perspective than in elevation.

The sanatorium is a detached two-storied building fronting Church-road, to the north of the swimming-bath. It is well planned and is raised on a terrace behind which is the playing-field. This is only two acres in extent, but can easily be increased by omitting an unnecessary cloister which runs from east to west at a distance of about 36 ft. from the north front of the main buildings.

The chapel is a circular building, with four projecting arms, forming a cross. The north arm forms the entrance, the south is occupied by the organ, and galleries are placed in the two transepts. The central area is covered by a low dome, and the building is well designed both for internal and external effect. A flight of stairs close to one corner of the chapel leads down to the lower ground floor, near the girls' recreation rooms, and the approach for the boys is along the main corridor on the upper ground floor, so that the boys and girls cannot meet till they reach the vestibule of the chapel. This is a point which has been overlooked by some of the other competitors. Speaking generally, the planning of this design is admirable. The architectural treatment of the chapel and tower is also excellent, but more character might, with advantage, be given to the Prince Alfred-road front. Both as regards plan and style it is undoubtedly the best of the four designs.

Design No. 1, by Messrs. Woolfall & Eccles, has the principal entrance in Prince Alfred-road, the main block being set back so that the sanatorium and chapel can be placed in front of it. The dining-room is in the middle of the main building and on the same level as the entrance, and is approached through an inner hall and corridor. The kitchen department is in the rear of the dining-room, and is connected to it by a service corridor. The boardroom, office, &c., are near the principal entrance. The girls' and boys' schools form on the ground floor two complete quadrangles to the north and south respectively of the central block, and are connected with it by a corridor running right and left from the back of the inner hall. The ground floors of the

schools are ten steps above the dining-room, principal entrance and administrative rooms; this arrangement, while giving the necessary increase of height to the dining-room, allows the first floor, including the central hall over the dining-room, to be on one level. The two quadrangles are of large size and are used as playgrounds, and covered playgrounds are shown on the sides forming the ends of the whole group. The gymnasium is placed over the boys' covered playground, and is therefore as far from the girls' school as possible; this is surely one of the rooms which ought to have been conveniently accessible from both schools. The swimming-bath is also too far from the girls' school. In both schools the classrooms are on the east side of the quadrangles, and therefore in the Church-road front, and the recreation-rooms on the west side, and therefore in the Prince Alfred-road front; the lavatories and wardrobes are on the sides nearest the central block. The classrooms are rather too far from the recreation-rooms.

There are many good points about the planning of the main buildings. The arrangement of the rooms on the two sides of the central block is practically symmetrical, and the general grouping of the rooms can be easily grasped, but the buildings are lacking in compactness. The sanatorium is the most unsatisfactory feature. It is placed in the north-west corner with one end towards Prince Alfred-road, and has two wings in which the conveniences are placed projecting northwards from the rear; the administrative block is wedged between the wings, leaving a space of only 13 ft. at each end of the block and of only 10 ft. between the block and the sanatorium itself. The principal frontage of the administrative building is towards the north, so that altogether this building would be very dreary, and would also render the sanatorium far from satisfactory. The playing-field is L-shaped, and therefore contrary to the instructions. On the whole, however, the planning is good and next in merit to that of the selected design.

The external treatment is somewhat bald and uninteresting. The upper dormitories are lighted on the fronts by circular windows 3 ft. 6 in. in diameter, and the effect would have been greatly improved if the main cornice had been placed below those windows. At the same time it must be confessed that such windows are, for sanitary reasons, unsuitable for dormitories. The Church-road frontage is not satisfactory, and would be still worse if the swimming-bath were erected in the position shown.

Messrs. Grayson & Ould, in design No. 5, have sacrificed too much for the sake of the Prince Alfred-road frontage. If the details had been as good as the general conception, this frontage would have been the best submitted. As already stated, the authors have taken their cue from the existing hospital, and have arranged the front portion of the buildings around three sides of a large forecourt. The dining-room and the central hall over it are placed lengthways to form a central projection in the recessed portion. At each corner of the projection there is a large bay, rather more than semi-octagonal in plan, rising nearly to the main cornice. This central feature is perhaps the best part of the design, although the flat roofs of the bays are far from happy. The girls' school is in the north part of the recessed portion and in the north wing, and the boys' school in the south. An ornamental garden extends from the road to the dining-room, and access to the garden is obtained by a door (without vestibule or porch) in the centre of the dining-room front and a flight of ten steps. The playgrounds are to the right and left of the garden.

The principal entrance, if such it can be called, is in the Church-road front, and from it access is obtained to the central hall over the dining-room by means of a corridor about 140 ft. long and for the most part 6 ft. wide, in which occur three flights of stairs, having seven, five, and four steps respectively. This alone is sufficient to throw the design out of court, but it is not by any means the only defect. To reach the chapel without leaving the building, the girls must go through the dining-room (or along the service corridor), and then along the boys' corridor, past two boys' recreation-rooms, boys' lavatory, three boys' classrooms, and the boys' workshop. To reach the gymnasium and swimming-bath, both boys and girls must apparently travel along the service corridor past the kitchen and pantry

doors. The dormitories have three rows of beds. The sanatorium is badly designed, the very elements of hospital planning being ignored.

The arrangement of the Prince Alfred-road frontage was undoubtedly a happy idea, but unfortunately it has been allowed to spoil the other parts of the building.

Messrs. Richard Holt and J. B. Hixons have undoubtedly produced a striking design (No. 9). Both the main frontages have been duly considered, and both would be effective, although the architectural details are chiefly either crude or commonplace. The authors certainly have eyes for planning a large building like this in a monumental way. The principal elevation is towards Prince Alfred-road, and has a forecourt in the middle; a lodge is placed in the middle of the front of the forecourt, and is connected to each wing portion of the building by a colonnade. At the back of the forecourt three entrances lead into a corridor or loggia, behind which the dining-room is placed. The Church-road frontage has the chapel for central feature, and around this an elaborate semi-oval drive and cloister leads (alas! that we should have to say it) to the kitchen vanway. This grand entrance is at the vertex of the curve; the girls' and boys' entrances are on either hand. Beyond the north cloister entrance is the administrative block of the sanatorium, and this is balanced on the south by the boardroom and office building.

The general planning is, however, less satisfactory. In addition to the forecourt there are two quadrangles used as playgrounds, four smaller courts, and three areas for light. The corridors are not well designed. The different parts of the main building are fairly connected on the lower ground floor (to a great extent by cloisters), but on the upper ground floor there are practically ten disconnected buildings in addition to the tower. This renders it necessary to provide a great number of staircases. On the upper ground floor plan we counted twenty flights, besides emergency stairs. The classrooms are on the upper ground floor, as are some of the dormitories, while the recreation-rooms are on the floor below. It would be an exceedingly difficult task for the masters to supervise such a building and for the servants to attend to it. The dormitories have three rows of beds, and some of the recreation-rooms are L-shaped. Only one lodge is provided, and the central hall is rather too small. To get over the difficulty of placing a single gymnasium in a convenient position for both boys and girls, the authors have provided one for each sex. The instructions, therefore, have not been completely carried out.

As regards cost, this design would undoubtedly be the most expensive and would certainly exceed the stipulated sum. Messrs. Grayson & Ould's design would be the cheapest, while the selected design would probably come next. In conclusion, we may state that the order of merit of the unsuccessful designs has not been given to the public. Perhaps, as the premiums are equal, the assessor did not consider it necessary to state his opinion as to their relative merits.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The following have passed in the Royal Institute of British Architects June examinations:—

Preliminary.

- W. H. Bagot, Aldgate, South Australia;
- A. F. Benjamin, London; P. U. Billings, Sale;
- S. Birkett, West Didsbury, Manchester; A. Booth, Barnsley; H. L. Bown, Harrogate;
- A. G. Bray, Bolton; T. H. Brook, Holmfürth, near Huddersfield; F. H. Bulmer, Woolwich;
- J. H. R. Burbage, Southampton; M. J. Burke, Dolphin's Barn, Dublin; H. Cartwright, East Finchley; A. Chamberlain, Newcastle-on-Tyne; J. H. Chandler, Eastbourne; R. H. Cheate, Burford, Oxon; H. Clay, Gainsborough; W. Clifford-Smith, Poole; W. Clissold, Edgehill, Minchinhampton; G. B. Cobbett, Addlestone; A. F. Collins, Windsor; C. S. Cooper, Gainsborough; H. R. Crabb, Exeter; N. Culey, Huddersfield; R. B. Curwen, South Woodford; J. L. S. Dahl, Liverpool; G. V. Davidson, Paisley; V. A. G. Day, Old Aberdeen; N. A. Dick, Edinburgh; H. E. Dicks, Cheltenham; E. J. Dod, Birkdale, Southport; R. Donnelly, Holywood, co. Down;

H. B. Downs, Guiseley; A. McLachlan Duncan, Perth; C. C. Durston, Weston-super-Mare; C. W. Eaton, Leicester; S. A. Edwards, Manor Park, Essex; T. M. Ellis, Hull; L. S. Fifoot, Penarth, Cardiff; G. McL. Gibson, Horsa; C. L. Gill, London; J. H. Gott, Margate; G. H. B. Gould, Ipswich; R. F. Gutteridge, Southampton; G. J. Gwynne, Boscombe, Hants; S. A. Hall, Muswell Hill, N.; J. T. Halliday, Stonehouse, Plymouth; F. J. W. Hart, Brondesbury, N.W.; R. E. Hastewell, Hallwhistle; F. R. Hedges, Wisbech; H. W. Higson, Smithills, Bolton; S. W. Hill, London; H. D. Hird, Halifax; A. A. Hodges, Wimbeldon Park; H. D. Holland, Pemberton, near Wigan; A. P. Holmfeld, Hull; H. G. Holl, Bolton; R. M. F. Huddart, Bayswater; R. C. Hunter, Edinburgh; W. S. Iron, Clapton, N.E.; W. Jackson, Hitchin; S. Jaques, Stratford, E.; D. S. Jennings, Hammersmith; W. H. Johnson, Great Yarmouth; F. H. Jones, Leicester; P. C. Jones, Leicester; W. J. Joynes, Bristol; T. Rosenheim Kerr, Inverness; H. P. Keys, Wood Green, N.; T. W. F. Körner, Sunderland; A. P. Lambert, Bristol, S.W.; C. S. Langham, Leicester; A. H. Le Gassie, Plympton; H. R. Linnell, Leyton; J. W. Lloyd, Taunton; A. G. Lyham, Bristol; D. A. Macdonald, Muir of Ord, Ross-shire; A. C. Mac George, Westbourne Park, W.; A. L. Macmillan, Southport; E. J. Mac Rae, Edinburgh; F. Marshall, Stockport; J. Matley, Oldham, D. Mitchell, London; J. Mitchell, Edinburgh; W. H. Mitchell, Sale, Manchester; G. Morland, Croydon; H. S. Morran, Plumstead, Kent; G. C. Murray, Stoke Newington; R. H. Murray, Norbury; P. G. Newton, Kingstown, Co. Dublin; J. H. Noël, Wakefield; V. J. O'Connell, Dublin; W. Paice, Egham; E. W. Pearson, Bradford; E. S. Petch, Wakefield; R. A. H. Phipp, Rowde, Devizes; C. R. Pissent, London; R. R. Prentice, London; E. L. Pryor, London; A. Purslove, Heaton Moor, near Stockport; H. T. Rainger, Cheltenham; J. B. T. Reid, Dalmarock, Glasgow; A. Rigby, Manchester; K. D. S. Robinson, London; C. K. Roe, London; P. J. Kowe, Marlow-on-Thames; P. S. M. Saunders, London; A. T. Scrivener, Epsom, Stoke-on-Trent; J. Smith, Alnwick; W. J. Smith, Richmond; A. L. Snow, Chislehurst; W. J. Stenner, Bristol; A. W. Street, Birkenhead; A. D. Sturgess, London; C. S. N. Taylor, Prestwich Park, near Manchester; C. S. Thomas, Forestpath, Swansea; H. Thomas, Swansea; P. E. Thomas, Penarth; J. O. Thompson, Poppleton, near York; R. W. Thorp, Headingley, near Leeds; C. Thunder, London; W. I. Travers, London; C. A. S. Vardy, Maidenhead; N. Vaux, Sydenham; E. A. J. Vincent, Chertsey; A. Wagstaff, Glasgow; E. G. Walker, Upper Norwood, S.E.; F. H. Walker, Windermer; W. B. Walton, Blackpool; F. H. Webster, Norwich; J. G. West, Cardiff; E. L. Wilson, Southport; G. A. Wood, Gillingham, Bradford; R. S. Woodcock, Aldeburgh-on-Sea; E. L. Wren, Leicester.

#### Intermediata.

The following have passed the Intermediate Examination, the names being given in order of merit as placed by the Board of Examiners:—P. B. Dannatt; J. S. Brocklesby; Baxter Greig; E. G. H. Gunn; A. C. Maitland, Tain, N.B.; W. Greenwood, Blackburn; J. H. Belgrave; R. T. Longden, Burslem; E. P. Archer; Edgar Quiggin, Liverpool; Herbert Ryde, Newcastle-on-Tyne; C. F. Callow, St. Leonard's-on-Sea; Herbert Black; T. F. Amery, Sheffield; W. E. A. Brown; J. A. Fletcher, Leicester; W. J. Delbridge; Sydney Bridges; H. P. Gordon; H. E. Rider; G. E. Elkington; Richard Wylie, Gateshead; G. M. Page, Lincoln; H. M. Pritchard, Cardiff; J. O. Raymond, Tring; G. S. Salomons, Manchester; Jordan Green, Birmingham; P. G. Newton; F. J. Toop, Lincoln; W. E. Brooks; H. Dru Drury; E. H. Walker; F. J. Lucas; R. J. Archibald, York; A. F. Warth, Birmingham; W. P. Watson, Coventry; J. A. Hossack, Banff, N.B.; A. N. Campbell; Joseph Boyle, Bolton; H. F. Buckley, Halifax; F. J. A. Corfield; Bertram Drummond, Fleetwood; E. F. M. Elms; F. J. Forster, Darlington; E. T. Goff, Lowestoft; L. A. Loads, Alorpeth; H. J. Mauchip, Bristol; Stanley Salisbury, Harpenden; J. H. Shearer, Exeter; W. H. Watkins, Bristol.

#### The Final.

The following have passed the Final Examination, qualifying for Associate R.I.E.A.:—John Percival Bishop, London; W. Mac-

kerth Dean, Gravesend; Lionel Gordon Detmar, London; Leonard W. Ensor, Huddersfield; C. H. Gage, London; Leolin C. Gregory, London; John Percy Hall, London; Sidney Joseph Halse, London; Alex. G. R. Mackenzie, Aberdeen; Clement Stretton, Leicester; Edgar John Pullar, London; Raymond Cyril Wrinch, Ipswich; F. Dare Clapham, London; W. Bruce Dawson, London; Ernest Godfrey Page, London; Cyril E. Power, London; T. Wilson, Aldwinckle, London; C. H. E. Bridgen, London; Dean John Brundrit, Cheshire; H. Gayley, Cambridge; H. D. Day, Godalming; T. Norman Dinwiddie, Greenwich; K. Gammell, London; G. R. C. Harding, London; C. Llewellyn Hall, Lancashire; Abraham Holstead, Alnwick; E. Vincent Kings, South Shields; Arthur Pickup, Blackburn; Louis E. Pryke, Surliton; Arthur Henry Roe, London; R. Bertie Rowell, London; John G. Walker, Wakefield.

#### THE ARCHITECTURAL ASSOCIATION.

The Architectural Association Travelling Studentship has been awarded to Mr. J. E. Forbes; Mr. L. G. Detmar receiving the second prize, value 5l.

The work executed in the School of Design and the Studio during the past Session will be exhibited at 50, Great Marlborough-street, W., from August 1 to August 10 (inclusive) between the hours of 9.30 a.m. and 7 p.m. (Saturdays, 1 p.m.).

So many members and non-members have, during the past few months, applied to the Secretary requesting his assistance in obtaining introductions to others desirous of sharing or letting offices, requiring pupils, partnerships, mutual assistance in return for share of offices, &c., that it became necessary for the Committee to consider the advisability of making a charge for these special services. The Committee has therefore resolved to establish a new Register for such purposes, for which a fee of 10s. 6d. and 21s. will in future be charged to members and non-members respectively.

The alterations which have been in progress for some time at 50, Great Marlborough-street, are completed, and the new common room is now open to members. The alterations have been carried out by Messrs. Shuffrey & Co., under the supervision of the President. The common room, office, and library will now be lighted by electric light.

The late President, Mr. George H. Fellowes Prynne, has consented to carry on his editorship of the "Association Notes" for another year. Mr. Satchell is the sub-editor.

The annual excursion will take place this year from July 22 to 27, and hotel accommodation having been found, the headquarters are now fixed at Cirencester. Most of the visits are now arranged, and include the following:—Northleach, Stowell Park, Chedworth, with its Roman Villa and Museum, Edgeworth Manor, Wisnanger Manor, Lyptall Park, Doughton, Malmsbury Abbey and Trow, Charlton Park, Beverstone Castle, Chavenage, Tetbury Town, with its quaint Market Hall and old houses, Bibury Court, Abington Manor, and other places in the vicinity. Intending excursionists should send in their names to either of the hon. secs., Mr. W. Talbot Brown, The Square, Wellingborough; or Mr. A. W. Hennings, 9, Ely-place, E.C.

#### COMPETITIONS.

SCHOOLS, ALDERSHOT.—The First Premiated Design in this competition was sent in by Messrs. Coggin & Wallis, 15, York-buildings, Adelphi.

QUARRYOWNERS' ASSOCIATION.—The annual general meeting of the United Kingdom Granite and Whinstone Quarryowners' Association has just been held in Aberdeen, under the presidency of Mr. A. F. Manuelle, of London, Leicester, Guernsey, and Aberdeen. The accounts for the year showed a very favourable balance. Mr. Manuelle was re-elected President, and Mr. John Fyfe, quarryowner, Kenmoy, &c., as vice-president. After lunch in the Imperial Hotel, Rubislaw Quarries, the Aberdeen Granite Works (Constitution-street), the new electric tramway to the Links, and the Corporation's sea-bathing station were visited and inspected with interest. On the second day the members had an excursion to Balmoral Castle, and dined together in the Invercauld Arms Hotel, Ballater, those from a distance leaving Aberdeen next morning for their homes.

#### THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

The annual meeting of the members of the Association of Municipal and County Engineers was held in the Council Chamber of the Town Hall, Leicester, on Thursday, June 27. Mr. E. G. Mawbey, President, occupied the chair, and among those present were Messrs. C. H. Lowe, Hampstead; J. P. Barber, Islington; W. Weaver, Kensington; W. N. Blair, St. Pancras; J. M. Knight, Mile End; J. P. Norrington, Westminster; O. E. Winter, Poplar; J. E. Wilcox, Birmingham; J. Price, Birmingham; J. T. Eayes, Birmingham; J. Lobley, Hanley; J. Lemon, Southampton; F. J. C. May, Brighton; E. R. S. Escott, Halifax; A. M. Fowler, Westminster; A. E. Collins, Norwich; A. Creer, York; A. T. Davis, Shrewsbury; A. D. Greatorex, West Bromwich; E. P. Hooley, Nottingham; J. Paton, Plymouth; S. S. Platt, Rochdale; C. F. Wike, Sheffield; R. J. Thomas, Aylesbury; J. S. Fiskering, Nuneaton; J. Hall, Cheltenham; T. Cole (Secretary), Westminster; and others.

The inaugural address of the President (Mr. E. G. Mawbey) appeared in our issue of last week. In continuation of the report of the proceedings,

Mr. W. Howard Smith, Assoc.M.Inst.C.E., Westminster, read a paper on "Permanent Way for Electric Tramways." He contended that a well-designed track which was the outcome of practical experience would probably have a life double or treble that of one badly conceived. Each year added to the life meant not only a saving of the proportion of capital cost and interest thereon, but also the postponement of the inevitable loss of revenue during reconstruction; every possible means should therefore be taken, at reasonable expense, to ensure that the permanent way should be perfect in design and construction, and its standard of stability of the highest. Though the experience in this country of the wearing effect of electric traction on tramways had been comparatively short, it had been sufficient conclusively to demonstrate that it was much more exacting in its demands for perfection of permanent way than was found necessary under horse, cable, or steam traction. This was primarily due to heavier cars being run at much faster speeds and with much greater frequency. A loaded electric car weighed from 10 to 12 tons as against 3 to 4 tons for a horse or cable car, while the maximum speed was generally fixed at eight miles per hour on urban and suburban roads, and fifteen miles per hour on inter-urban lines.

Mr. A. D. Greatorex, West Bromwich, moved a vote of thanks to the author of the paper.

Mr. A. H. Campbell, East Ham, suggested that the Association should endeavour to obtain a practical result by being represented before the Standards Committee as to the adoption of a standard rail. If a standard rail could be adopted in this country, it would prove of great economy in tramway construction.

Mr. S. S. Platt, Rochdale, referring to the absence of fishplates on the Blackpool tramways, said he did not know whether that had had anything to do with the trouble met with there. He would certainly hesitate to dispense with fishplates.

Mr. Blair, St. Pancras, condemned the use of chilled iron blocks to prevent rutting by the side of the tram track. These blocks wore at a less rapid rate than either wood or granite, and gave out a continuous clatter, so much so that the Tramways Committee in his district called upon the Tramways Company to withdraw them.

After some further discussion, the vote of thanks was accorded, and Mr. Howard Smith briefly replied to questions put by the various speakers.

Mr. E. Manville, London, then read a paper on "Methods of Safety for the Overhead Electric Trolley System." He said it was most important that the overhead trolley system, when installed, should be of such solid construction and excellence of design that with a comparatively limited amount of inspection there should be the smallest possible liability to breakage of the "live" conductors, or of parts carrying these, and of the entanglement of the trolley wheel with the "live" conductor, the guard wires, and their fittings. It was originally the custom to use 1/0 B. & S. trolley wire of hard copper, but the numerous accidents occurring from the use of so small a wire had gradually caused the

introduction of larger sizes of trolley wire having a higher breaking strength. In other respects the installations had been strengthened with a view to eliminating as far as possible the chances of accident.

Mr. J. Lemon, Southampton, moved a vote of thanks to the author of the paper.

Mr. J. Lobley, Hanley, who seconded, remarked upon the unanimity with which the overhead system was now accepted in this country.

Mr. Gammage, Dudley, said though the public of his borough were up in arms against the overhead system when it was proposed, since it had been working there had not been a single accident and the public were quite satisfied.

Mr. Manville, in reply, said he did not think there was any difference in the way of safety between the span-wire and bracket systems; both were equally safe, but the span-wire system was the best in working because it formed the easiest passage for the trolley wheel to pass over.

Mr. W. Worby Beaumont, M.Inst.C.E., London, then read a paper on "The Wear of Roads by Horse Haulage and Motor Traffic." He urged that good roads and ample means of easy and quick transport upon them were among the first of all necessities. To gain anything like a true knowledge of the effect of the average bad road surface in the destruction of vehicles, it was only necessary to take a run in a light motor carriage with 30-in. wheels and solid rubber tyres at twelve miles an hour. It might be just possible to retain one's mental integrity at that speed, but at anything like a sufficient speed to avoid a charge of wasting time on the road it would be necessary to have spine and teeth of indiarubber. A motor carriage made an excellent road inspector. It experienced all the badness, and said nothing. They must have better roads for the high speeds that modern lines demanded; more men and more money at the disposal of engineers and surveyors. Considering the lighter class of motor vehicles, such as those which carried from one to two tons, at speeds which meet modern requirements, it might be confidently expected that the wear of the roads by them would be from 20 to 40 per cent. less than by horse-hauled vehicles, and that it would, therefore, pay to spend more money at first in following out the best possible construction, and afterwards in maintaining a trained body of repairers constantly at work, so that these vehicles might be profitably used.

Mr. R. J. Thomas, Aylesbury, who proposed a vote of thanks to the author, contended what he described as the prevailing impression that nothing had been done to improve the roads.

Mr. McBair, Lincoln, who seconded, considered that rubber-tyred motor cycles had the effect of disintegrating macadam roads, and he would be very glad to see them taken off the roads altogether.

Mr. Norrington, Westminster, contended that in London wood paving was allowed to go for years without any repair, and then the whole road had to be taken up and relaid.

Mr. E. P. Hooley, Nottingham, said he had never heard a more ridiculous statement than that the Local Authorities cut down their expenditure on the roads without consideration of the condition of the roads.

Mr. J. P. Barber, Islington, said they were unable in many cases to get men to repair their roads with skill and intelligence. He had the greatest difficulty in selecting six men from 200 who could spread a single load of broken stone efficiently and economically. They seemed to get men in London who had failed at nearly everything else, and who thought all they had to do was to help the surveyor to do his work. He hoped Mr. Beaumont would not go away thinking there was no one there who did not lament the decadence of the skill and intelligence of the workman.

Mr. Paton, Plymouth, considered that the bad condition of macadam roads in London was due to indiarubber-tyred vehicles, which tended to disintegrate macadam. The roads were in better condition than ever before.

The vote of thanks having been passed,

Mr. Beaumont, in reply, said if ever it was known how to make a road, and to maintain it, it was to-day; but it required men and money to carry out their knowledge, and that was what they had not got for 60 per cent. of the whole of the roads of the country.

Mr. T. H. Yabbicom, C.E., Bristol, read a paper entitled "Notes of Experiments made on

the Purification of Sewage by means of Stoddart's Improved Sewage Filter at Knowle, Bristol." He explained that the sewage was dealt with in a covered tank and a filter having a depth of 6 ft. made of rough clinkers of not less than 2½ in. gauge. The tank effluent was distributed over the surface of the clinker by a contrivance invented by Mr. Stoddart, which was described by the inventor as follows:—

"The distributor consists of a number of narrow gutters arranged at right angles to the supply channel, and resting upon its margin and upon suitable support at the distant end. Each section of the distributor abuts against a casting embedded in the margin of the supply channel, so arranged that the tank effluent, on flowing over the margins of the distributor, passes into the gutters of the distributor. Along the lowest part of the under surface of each gutter is placed a series of vertical points.

The sewage or tank effluent, entering the gutters by way of the supply channel, flows over the margins, and on reaching the under surface, falls from each of the vertical points in a series of fine drops.

It will be seen that there are no fine perforations to become clogged, and that the action of the distributor does not in the least depend upon the subdivision of the sewage by fine apertures or tubes, but that there is a perfectly free passage for the sewage from the supply channel to the filter itself. There are also no moving parts, or indeed anything that by any stretch of the imagination can be considered likely to get out of order."

Mr. Lacey, Oswestry, moved a vote of thanks to the author for his paper.

Mr. W. J. Dibdin, London, said he did not wish to speak in criticism, but the filter appeared to him to all intents and purposes to be absolutely identical with Colonel Ducat's filter. Colonel Ducat had a bed of filtering material 10 ft. deep, and he had a number of methods of distributing the sewage on to the bed by perforated pipes, V-shaped troughs, and so on, and wherein this constituted a difference from Colonel Ducat's method he would like to have explained. The results obtained by the Stoddart method seemed to have been good, but not remarkable.

Mr. Yabbicom, in reply, said he was not there as an advocate, but Mr. Dibdin could not expect him to give Mr. Stoddart away by admitting that this filter was precisely the same as any other filter.

The meeting then became special to consider proposed alterations in the by-laws of the Association, which were considered in private.

In the evening the annual dinner of the Association was held in the Mayor's room at the museum, the President (Mr. Mawbey) presiding over a large company.

The proceedings of the annual meeting were resumed in the Council Chamber of the Town Hall on Friday, June 28, Mr. Mawbey in the chair.

A paper on rifle ranges by Mr. J. W. Bradley, City Engineer of Westminster, in the absence of the author, was taken as read.

Mr. E. P. Hooley, Nottingham, proposed a vote of thanks to Mr. Bradley for his paper, though he thought it more a matter for the consideration of the House of Commons than for that Association.

Mr. A. D. Greatorex, West Bromwich, seconded the vote of thanks.

Mr. W. J. Dibdin, London, suggested that landowners might assist in this matter by giving permission to Volunteers to shoot over their land.

Mr. F. W. Mager, Walsall, read a paper on "The Liabilities of Local Authorities under 38 & 39 Vict., cap. 55, sec. 24."

On the proposition of Mr. A. Collins, a hearty vote of thanks was accorded to the author for his paper.

The members then proceeded in brakes to visit the Nedham-street refuse destructor and the West Humberstone destructor and steam-raising plant, after which they proceeded in a special train to Loughborough to inspect the extensive Falcon Works of the Brush Electrical Engineering Company, Limited. The whole of the workshops were thrown open to the inspection of the members, who, before leaving, were entertained to luncheon by the company. The remainder of the day was devoted to visits to Messrs. J. Ellis & Sons, Limited, Portland Cement Works, the Mountsorrel Granite Quarries, and the Groby Granite Quarries, and Patent Victoria Stone Works.

The proceedings of Saturday, June 29, were

devoted to a motor-car journey, on cars kindly provided by the members of the Automobile Club of Great Britain and Ireland, and its Nottingham and Midland branches, to visit the various improvements in the Borough of Leicester, the Beaumont Leys Sewage Farm and Experimental Works, the Enderby and Stoney Stanton Granite Company's quarries, where luncheon was provided, and the Croft Granite Company's Works. The journey was a most enjoyable one, beside affording a very severe test of the travelling capacity of the cars, an ordeal which they came through very successfully. The complete enjoyment of the day was marred by an accident, which occurred late in the afternoon to one of the cars, and by which two members of the Association received slight injuries. Apart from this the meeting was one of the most successful in the annals of the Association.

GLASGOW ROYAL INFIRMARY RECONSTRUCTION SCHEME.

The Glasgow Institute of Architects have written and circulated the following letter addressed to the Executive of Contributors to the Infirmary Reconstruction Scheme:—

"115, St. Vincent-street,  
Glasgow, June 25, 1901.

To the Executive Committee of the Contributors to the Royal Infirmary Reconstruction Scheme.

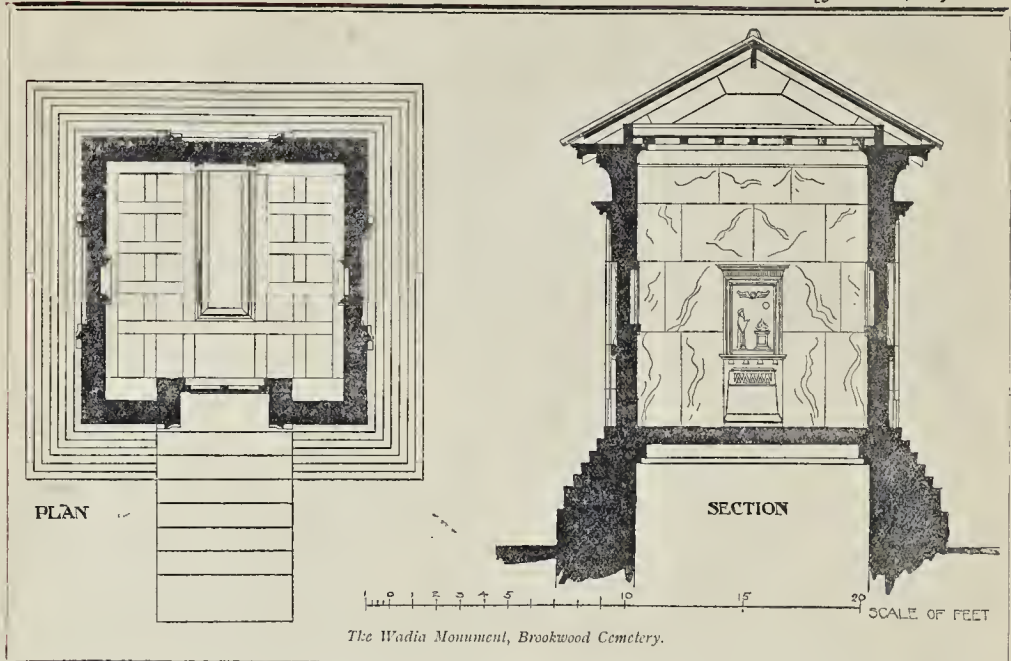

GENTLEMEN.—I duly received your letter of 18th ult., which has already been acknowledged, and am instructed to state that the Glasgow Institute of Architects regrets that no more explicit reply has been vouchsafed to its protest and appeal, by the Managers and the Executive, than what is contained in the official statement issued to the public. Nothing in that statement in any way answers or refutes the objections previously raised by the Institute. The statement, indeed, rather confirms them; and the Institute therefore remains of the opinion that the plans as adopted 'are in many vital particulars inadequate and out of date'; that their distribution on the site, particularly with regard to the 'Jubilee Block,' facing Cathedral-square, is bad; and that in consequence, if the reconstruction is proceeded with according to those plans, 'the infirmary will not conform to the most modern standards of design in this class of building.'

The criticisms of the Institute on the previous occasion were chiefly concerned with (1) the manner in which the competition was conducted, according to which solutions of the problem other than those put forward by the Managers did not receive unbiased and adequate consideration; and (2) the insistence on the Jubilee Block as an integral part of the scheme. Such a block the Institute considered to be objectionable, because (a) it would shut out from the rest of the buildings the sun and air from the southern and most open part of the surrounding area, and (b) it would dwarf and irremediably injure the external appearance of the cathedral.

With regard to the first of these two points, while the Managers in their letter refer to the block-plans which they had prepared with much time and labour as being 'suggestive and illustrative only,' and this is repeated in the statement and appeal of the Executive, one learns also from this letter that when the final selection was made the Executive Committee fixed on a plan which most closely conformed to the sketch-plans—i.e., those drawn up by the Managers. As further reason for the adoption of this particular plan the Executive give a list of special characteristics in respect to internal arrangements which they consider to be essential or desirable features; yet these were all contained in other designs submitted, which were at the same time free from the radical defects referred to.

As to the Jubilee Block, the Managers now state as their sixth conclusion:—'That the new hospital, and not a section of it, should be regarded as alone worthy of the City of Glasgow, and as a fitting memorial to the sixty-three years' illustrious reign of the Queen.' This is exactly the position adopted by several of the competitors and by the Institute, while objecting, from practical reasons already stated, to its inclusion as part of the scheme. With reference to the cathedral, it is, therefore, quite beside the point for the Executive to state that 'the buildings must be lofty if the hospital requirements of the public are to be adequately met,' for, while the buildings must be lofty, on other portions of the site (if that site is to be retained) there is no necessity for their being lofty in the direct alignment with the cathedral, nor, indeed, for there being any buildings at this point at all, as was shown in one or more of the plans submitted. The Institute does not admit that the injury to the cathedral is a question of architectural style; it is one of comparative height and scale. As regards these, the plan adopted is especially objectionable in that not only is the block itself seven stories high, but it has in addition a lofty spire which would further and quite unnecessarily

assist to dominate and destroy the effect of the cathedral.

The Institute of Architects feel it to be their duty, in the interests of the public (for whom they speak as a body of technical experts in such matters), to thus repeat and emphasise their protest, and to again most earnestly urge the Executive, before committing themselves and the public to the erection of any portion of the building, as designed, to have the plans submitted to one or more independent hospital authorities of recognised and outstanding position for consideration and report. Further, should the Executive object to the outline involved in such a course, the Institute would be prepared to arrange for it and to meet the cost provided the Report did not bear out their contention, while submitting beforehand the name or names of the experts proposed, on obtaining the necessary facilities from the Executive.—Yours truly,  
C. J. MACLEAN, Secretary."

### Illustrations.

#### PULPIT, SAN MINIATO, FLORENCE.

**T**HE pulpit and the screen that supports it on one side are beautiful examples of Romanesque workmanship in inlaid marble. The devices of men and winged monsters on the screen, and the short squat figure with the eagle supporting the lectern, add a touch of quaintness to the design.

The whole is in a fair state of preservation, nothing being damaged but the capitals of the slender columns and the mouldings here and there. The rude way in which the pulpit butts into the columns of the choir suggests that it was not originally intended for its present position, but of this there is no certainty. The drawing was made entirely upon the spot.  
W. CURTIS GREEN.

#### THE WADIA MONUMENT, BROOKWOOD.

The Wadia Monument has been erected at Brookwood, on the land used as the Parsee burying place, as the tomb of Mr. N. N. Wadia, a Persian gentleman who lived in Bombay as a subject of the Indian Empire, but who died in England. The tomb is the design of Mr. T. E. Colclutt.

It is built of Portland stone, the roof being covered with blue ribbed glazed tiles. The door is of teak covered with plates of bronze, and bronze panels with inscriptions are set into the recesses on each side of the building. The interior is lined with a dado of Verona marble, the upper part of the walls being

covered with alabaster. The ceiling is divided by teak beams, which are gilded, the panels being coloured a pale blue.

The sarcophagus is constructed of alabaster inlaid with red and green marbles and lapis lazuli, the top having a band of carving in low relief, with the crest of the late Mr. Wadia—a separate panel.

The ruins of the tomb of Cyrus at Passargada, illustrated in the volume on Persian art, by Messrs. Perrot and Chipiez, have been followed so far as the general outline of the building would admit.

The beautifully worded inscriptions on the outside of the building were composed by Sir George Birdwood, and can be read on the reproductions in our plate, from photographs taken from the bronze plates before fixing. The lithograph shows a view of the tomb, from a perspective sketch lent by the architect. The plan and section are given in the text.

#### RAYNHAM HALL, NORFOLK.

The two detail elevations of this house, the design of which is attributed, with every probability, to Inigo Jones, are reduced reproductions of two plates in Mr. Triggs' and Mr. Tanner's new illustrative volume of "Some Architectural Works of Inigo Jones," to which more special reference is made in the first article in this issue.

#### MAP OF THE PARISH OF ST. GEORGE, HANOVER-SQUARE.

**T**HIS, as stated on the title of the plate, is a reduction from an old map in the possession of St. George's Vestry, and is given in connexion with the article published in this issue on the Grosvenor Estate, Pimlico, &c., and shows the state of the district as it still existed, for the most part, at the commencement of the nineteenth century.

The proper scale for the reproduction is that outside the border, which has been reduced with it; the inscriptions on the old scales inside the border—a scale of 165 ft. to an inch &c., are of course incorrect in this reduced form.

#### OLD SITES AND BUILDINGS, ST. JAMES'S PARK AND PIMLICO.

**T**HESSE views, reproduced from drawings in the Grace collection, are also given in illustration of the article above referred to, pages 4, 5, 6 and 7. The view of St. James's Park from

the courtyard of old Buckingham House shows the old long canal-like pond, parallel with Birdcage Walk, which preceded the present irregularly-shaped lake.

The view of the "Jenny's Whim bridge," or "Jenny Whim's bridge" (for it was put both ways), which stood where the street now called Ebury bridge crosses the railway at the end of Victoria station, shows the aspect of that locality as late as 1825, giving some idea of the extraordinary changes which the last century witnessed in this part of London. The water which the bridge crosses was the reservoir of the old Chelsea Waterworks.

The Ranelagh does not, strictly speaking, come within the scope of the article in the present issue, but it touches closely on the borders of the Pimlico district, and is a relic of great interest in itself. The Ranelagh and its gardens were situated at or close to the angle at the present junction of Chelsea Embankment and Chelsea Bridge-road. The Rotunda was a well-known fashionable promenade, frequently referred to in the light literature of the latter half of the eighteenth century. There was a bandstand and an organ, at the latter of which no less a person than "Mr. Handel" occasionally entertained the company with a concerto.

#### THE LONDON COUNTY COUNCIL.

The usual meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

**Loans.**—On the recommendation of the Finance Committee, it was agreed to lend Lewisham Borough Council 6,500*l.* for extension of offices; Battersea Borough Council, 4,060*l.* for provision of accommodation at the Town Hall; Shoreditch Borough Council, 10,000*l.* for extension of offices; Kensington Borough Council, 16,417*l.* for street improvement; Hampstead Borough Council, 2,500*l.* for erection of library; and the Managers of the Metropolitan Asylums District, 100,000*l.* for various purposes.

**The Works Department.**—The Finance Committee submitted their half-yearly return of works completed by the Works Department. During the half-year ended March 31 last twenty-five works had been completed, but the total gave no indication of the turnover of the department during that period, because some of the expenditure on those works occurred previous to the half-year in question, while, on the other hand, a large part of the expenditure

during the six months was upon works which were still unfinished. The approximate expenditure on estimated works for the half-year was 155,000*l.* On the total amount of the work comprised in the statement, viz., 83,924*l.*, there was a balance of cost under final estimate of 301*l.*, or 05 per cent. Most of the works had been carried out at a cost somewhat less than the final estimates, as certified by the chief engineer or architect. There were six cases in which the cost had exceeded the final estimate, but in only two was the excess considerable. Those were both architectural works, and in the first case the excess of estimate was 9 per cent, and in the other 10 per cent. The jobbing works for the half-year showed that on 1,214 works there was a balance of cost below schedule value of 857*l.*, or 69 per cent. At the present time the department had twenty-nine works in progress (exclusive of jobbing works), representing a total estimated cost of 733,350*l.*, in respect of which work to the cost of 346,507*l.* had up to May 31 been executed. There were also thirteen other works not begun, the estimates for which amounted to 124,983*l.*

Mr. Bruce, chairman of the works sub-committee of the Finance Committee, observed that had this report been laid before the Council last week some of the criticisms of the department which were then made would probably not have been put forward. Although, however, this was a favourable report, there were some works now in hand which might not show quite such good results, but at present those results could not be exactly estimated. Much was said last week as to the reorganisation of the department. He did not think it was feasible to put the department directly under the architect or the engineer, inasmuch as both those officers had their hands very full already. The sub-committee consisted of men of great experience, some of whom might indeed be called experts; and watching the department week by week, they were probably able to form a better idea of the strong and weak points of the department than could be formed by an outside commission such as had been proposed. There was little doubt, however, that what he might call the municipal idea, viz., that the workman would work better for the municipality than for a private contractor, had not altogether been a success. It was to him an important matter that they should see whether some form of co-operation could not be instituted which would give some direct interest to the men, and induce them to put their backs into their work.

Mr. Campbell thought it would perhaps be better for them to go back to the Works Committee. The members of the sub-committee who deal with works really knew nothing about them.

Mr. H. Clarke considered it inconvenient at that stage to discuss Mr. Bruce's proposals. He thought the hon. member should explain himself more fully. Did he mean that the men were to share in the profits or losses, or to do piecework?

Mr. Howell Williams said they wanted the master's eye on the work done. If the department had gone about the work in the right way, the department would have been a magnificent success. Instead of the Finance Committee dealing with such a gigantic institution as the Works Department, he thought it would be better to reinstate the Works Committee.

The report was received and adopted, and the necessary excess votes were passed.

**Resignation of the Engineer.**—The General Purposes Committee reported the resignation of the Council's Engineer, Sir A. Binnie, who desired to devote himself to the private practice of his profession. The Committee recommended the acceptance of the resignation, to take effect at the end of the year, and referred to the works which had been carried out during Sir A. Binnie's eleven years' service.

Several members of the Council expressed their high appreciation of Sir A. Binnie's services, and their regret that the Council was about to lose him.

The recommendation was agreed to.

**Fire Insurance.**—The joint committee on fire brigade expenditure brought up a report with reference to contributions by fire insurance companies towards the cost of the Metropolitan Fire Brigade. They recommended that the municipal authorities of the principal cities and towns of the United Kingdom should

be asked to express their opinions on the general subject.

This was agreed to. The same committee proceeded to submit a scheme of municipal insurance, and recommended that effect should be given to it by inserting clauses in the Council's General Powers Bill next year.

After a short discussion the scheme was approved, and it was decided to communicate with the Local Authorities of London to obtain their views on the matter.

**Streets and Street Traffic.**—The General Purposes Committee reported as follows, the recommendation being agreed to:—

"On February 10 last the General Purposes Committee reported to the Council the resolutions passed at the conference with representatives of the City Corporation and the Local Authorities, on the subject of street traffic and the cleansing of streets. Among the resolutions were the following:—

(a) That, in the opinion of the conference, all streets paved with asphalt, wood, or granite setts, should be well washed, after first sweeping off and removing all the rough dirt and cleaning the channels, the Local Authorities providing properly-constructed catch-pits.

(b) That, in the opinion of the conference, greater supervision of the scavenging is absolutely essential to ensure the efficient cleansing of the roads and footways of the metropolis, and that the surveyor to the Local Authority should have sole responsibility for, and unrestricted control over, all labour employed.

(c) That, as a general proposition, where they can be suitably employed, machine brooms are to be preferred to hand labour.

(d) That, in the opinion of the conference, it is desirable that Local Authorities should provide sweepers for specified areas for the systematic sweeping of the crossings of main thoroughfares.

(e) That, in the opinion of the conference, the sprinkling of roads should be done by vans or carts, and that, having regard to the various considerations which apply, it is preferable to water the sides of the roads and channels as frequently as necessary to lay the dust, and the centre of the road at less frequent intervals, with the idea that the road shall not be all wet at the same time.

In the report it was recommended that the resolutions above quoted should be communicated to the Corporation of the City of London, the Metropolitan Borough Councils and the Council of the City of Westminster. The Main Drainage Committee, however, raised objection to resolution (a), and on February 26 the series of resolutions (a) to (e) were referred to the Main Drainage Committee for report. On April 2 that Committee reported as follows:—

Having regard to the duties of the Council as the main drainage authority for London, and to the importance of keeping at all times the main sewers as free as possible from detritus, especially in times of rainfall, when the unobstructed flow of sewage and storm water may be essential to prevent the flooding of property, we do not see our way to concur in the opinion expressed in resolution (a). The result of our experience during past years confirms our belief that the adoption of the resolution would be detrimental to the Council's interests, and we therefore omit it from our recommendation. As regards the remaining resolutions (b) to (e) we have no observations to offer, and accordingly recommend—

"That the above resolutions, (b) to (e) inclusive, be communicated to the Corporation of the City of London, the Metropolitan Borough Councils, and the Council of the City of Westminster."

The report, however, was at our suggestion withdrawn, with a view to the Main Drainage Committee stating more fully their reasons for desiring resolution (a) to be omitted. We have been in communication with the Main Drainage Committee and have further considered the matter.

The question of cleansing the streets appears to us to be one of paramount importance, and we do not see that this can properly be done unless the streets are well washed. The Main Drainage Committee appear to be of opinion that if the resolution of the conference is adopted by the Council the result will be that the detritus in the sewers will be considerably increased, and the sewers prevented from taking away the sewage and storm water with sufficient rapidity. We would, however, point out that there is a proviso in the resolution in question that the streets are first to be properly swept, and we think that if the sweeping were performed to the satisfaction of the Council's Engineer, the objections on this score would be met. We recommend—

"That resolutions (a) to (e) be communicated to the Corporation of the City of London, the Metropolitan Borough Councils, and the Council of the City of Westminster, but that in forwarding the resolutions the attention of the Local Authorities be drawn as regards resolution (a) to the necessity for the streets to be thoroughly swept before being washed, the arrangements made for such systematic sweeping being subject to the approval of the Engineer of the London County Council."

**By-laws as to the Drainage of Buildings.**—

It was agreed that copies of the drainage by-laws made by the Council, and approved by the Local Government Board, be placed on sale at the price of 2d. per copy. The Board has confirmed the by-law made by the Council for the purpose of repealing the last paragraph of By-law 3 and the whole of By-law 4 under Section 39 of the Public Health (London) Act, 1891, in relation to soil-pipes and the ventilation of the traps of water-closets. Corresponding provisions to those repealed are contained in the new drainage by-laws, Nos. 11 to 17.

**Improvements.**—The Improvements Committee recommended, and it was agreed, that, subject to the necessary statutory consents to the proposed tramway from the Marble Arch along Edgware-road to the county boundary at Cricklewood being obtained from the Local Authorities concerned, and subject to the Councils of the Metropolitan Boroughs of Paddington and Hampstead agreeing to contribute between them one-third of the net cost of the necessary street widenings and subject also to one-third of the net cost of the street widenings being charged to the account of the improvement, the remaining third being charged to the tramways account, which will also be charged with the whole cost of laying down and paving the tramway track, parliamentary powers be sought in the session of 1902 to enable the Council to widen Edgware-road, High-road, Kilburn, and Shoot-up Hill, in general accordance with the plan approved by the Improvements Committee.

**Theatres, &c.**—The following proposals were agreed to:—

A room in the basement of the Bermondsey Town Hall, Spa-road, Bermondsey, for use as a dressing and refreshment-room by the persons engaging the public hall (Mr. R. J. Angel).

Certain alterations which it is desired to make to Drury Lane Theatre (Mr. P. E. Filditch).

Chinese encampments at the London Exhibitions, Earl's Court (Mr. A. O. Collard).

Re-arrangement of the seating in the pit and stalls of the Oxford Music-hall, Oxford-street (Messrs. Wylson & Long).

**Office Accommodation.**—On the recommendation of the Establishment Committee it was agreed

"(a) That the resolution of the Council of March 26, 1901, authorising an expenditure of 8,000*l.* in connexion with a scheme for connecting the premises Nos. 25, 26 and 27, Cockspur-street with the main building be rescinded.

(b) That the estimate submitted by the Finance Committee be approved, and that the expenditure of a sum not exceeding 3,500*l.* be authorised for carrying out alterations for the purpose of connecting the premises Nos. 26 and 27, Cockspur-street, with the main building, and further that the expenditure of a sum of 1,000*l.* be authorised for certain repairs, removal of fittings, &c., in connexion with the same work; and that the work be carried out by the works manager as a jobbing work."

**Tramway Questions.**—Mr. Benn, Chairman of the Highways Committee, in answer to questions, said that the Highways Committee, feeling that the creation of the generating station would delay the adoption of electric traction in South London, had inquired made in the district, and it was found that they would be able to obtain power there at an earlier date, so that, without being unduly optimistic, within eighteen months they would have electric cars running in South London.

The Committee recommended, and it was agreed—

"That the operation of No. 200 of the Standing Orders of the Council, relative to retention moneys under contracts of less than 100,000*l.* be suspended as regards the contracts for the supply of (a) the continuous-current plant, and (b) the three-phase plant required for the electricity generating station to be established in connexion with the electrical working of the London County Council Tramway; and that, in place thereof, it be provided in those contracts that 50 per cent. of the value of the machinery be paid to the contractor upon its being delivered at the site, 30 per cent. after the machinery shall have been erected in position, 10 per cent. after its having been taken over, and 10 per cent. after it shall have been maintained by the contractor for twelve months."

The Council, having transacted other business, adjourned.

## METROPOLITAN ASYLUMS BOARD.

The usual fortnightly meeting of this Board was held on Saturday at the Board's offices, Thames Embankment.

The Finance Committee reported that the Works Committee had forwarded an estimate for erecting, fitting-up, and furnishing the proposed receiving house for children at the Tooting Bec Asylum. The estimate, which amounted to 16,670*l.*, included 11,566*l.* for structure of the building, 1,000*l.* for drainage, and 1,120*l.* for furnishing. The committee recommended, and the Board approved, that an application be made to the Local Government Board for an order authorising the managers to expend the sum stated, such expenditure to be defrayed by a loan spread over thirty years.

On the recommendation of the Hospitals Committee it was agreed to accept the tender of Messrs. R. Ballard, Limited, of Child's Hill, in 985*l.*, for the repair of roads at the Northern Hospital. The other tenders were H. Benham & Co., Streatham Hill, 1,072*l.*; Thos. Adams, Wood Green, 1,071*l.*; Neston & Hale, Harlesden, 1,120*l.*; Robert Borrowdale, Enfield, 1,280*l.*; Myers, Gilson, & Rose, Hornsey, 1,985*l.*

The Works Committee formally reported the terms of the settlement in the case of the managers and Messrs. Kirk & Randall. Amongst the clauses which the Board were recommended to draw were two for 392*l.* and 30*l.* 12s., being the amount respectively of Mr. Tatham's expenses in connexion with the defence of the action and the costs of the arbitrator's award.

On the recommendation of the Works Committee, the plans of stables proposed to be built at the Tooting Bec Asylum were approved and ordered to be transmitted to the Local Government Board.

## APPLICATIONS UNDER THE 1894 BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

## Lines of Frontage and Projections.

**Lewisham.**—An extension of the period within which the erection of buildings on the southern side of an extension of Manor Park, Lee, was required to be completed, be granted (Messrs. Johnson & Aldridge).—Agreed.

**Lewisham.**—A fire-brigade station on the north side of Perry Vale, Lewisham, at the corner of Woolstone-road (O. Fleming for the Fire Brigade Committee of the Council).—Consent.

**Hackney, Central.**—One-story shops in front of Nos. 480, 491, and 493, Kingsland-road, Hackney (Mr. J. Hamilton for Mr. J. Dyke).—Consent.

**Hackney, North.**—An addition at the east end, and a porch on the north side, of the Congregational Church, Stamford Hill, to about upon Portland-avenue (Mr. W. W. Baldwin for the Rev. J. M. Gibbon).—Consent.

**Hammersmith.**—A block of flats, with shops on the ground floor, on the site of Nos. 156 and 158, Uxbridge-road, Hammersmith (Mr. A. H. Hart for Mr. C. Tarrant).—Consent.

**Hampstead.**—Wood and tile pent roofs over the entrances to six semi-detached houses on the north side of Rondou-road, Edgware-road, Cricklewood (Mr. J. Phoenix for Messrs. Bridge & Neal).—Consent.

**Islington, North.**—Retention of a studio addition at the rear of No. 214, Seven Sisters-road, Islington, abutting on Coleridge-road (Mr. R. Midwinter for Mr. J. Fortescue).—Consent.

**Marylebone, West.**—A building over the stable-yard of No. 3, Finchley-road, St. John's Wood (Messrs. Durrans & Groves for Mr. D. F. Hannay).—Consent.

**Wandsworth.**—Five one-story shops on the south side of Lower Richmond-road, Putney, westward of Martyr's Waterman's School (Mr. F. A. Powell for Mr. A. C. Ballard).—Consent.

**Wandsworth.**—A one-story shop on part of the forecourt of No. 2, Ashlone-terrace, Lower Richmond-road, Putney (Mr. J. G. Warner for Messrs. J. & R. Bally).—Consent.

**Marylebone, East.**—Retention of a bicycle shed on the forecourt of No. 85, Park-road, St. Marylebone (Mr. F. Perks, for Mrs. C. F. Gordon).—Consent.

**Lewisham.**—That the Council do make no order with respect to the application of Mr. H. Bender for permission to retain an iron and glass illuminated sign at the Talma public-house, No. 108, Wells-road, Sydenham, in advance of the general line of buildings in Coombe-road.—Agreed.

**Clapham.**—Buildings on the east side of Park-hill, Clapham, on part of the site of Nos. 122 and 124, Clapham Park-road (Mr. A. Southam, for the Council of the Metropolitan Borough of Wandsworth).—Refused.

**Clapham.**—Three houses with shops on the north side of Battersea-rise, Battersea, at the corner of Limberg-road (Mr. G. E. Nield, for Mr. W. J. Volkes).—Refused.

**Lewisham.**—An addition to a porch at the side of No. 119, Burnt Ash-hill, Lee, to about upon Corona-road (Mr. E. Patters, for Mr. S. C. Joyce).—Refused.

**Wandsworth.**—A block of residential flats on the south-east side of Oakhill-road, Upper Richmond-road, Putney, on the site of Burlington House (Mr. A. Blackford, for Mr. E. Messiter).—Refused.

**Westminster.**—A one-story shop on the forecourt of No. 286, Vauxhall Bridge-road, Westminster (Mr. S. Nixon for Mr. T. W. Smith).—Refused.

**Woolwich.**—Houses, with one-story shops on the ground floor on the eastern side of Woolwich-road and south-eastern side of Greenvale-road, Eltham (Mr. G. F. Logsdail for Mr. A. Cameron Corbett, M.P.).—Refused.

## Width of Way.

**Fulham.**—That the application of Mr. W. L. Eves for an extension of the period within which the rebuilding of Nos. 9 and 11, Fane-street, North End-road, Fulham, was required to be commenced, be granted.—Agreed.

**Hackney, South.**—A boundary fence in front of stables at Ash-grove Works, Sheep-lane, Hackney (Mr. J. Hamilton for Messrs. W. J. Bush & Co., Limited).—Consent.

**Peckham.**—Stable buildings at the rear of Nos. 89 and 90, Old Kent-road, Peckham (Mr. J. H. Waterworth for Mrs. M. A. Chalk).—Consent.

**Southwark, West.**—An addition to a block of dwelling-houses, to be inhabited by persons of the working class, on the north side of Summer-street, Southwark (Mr. F. Bailey for the City of London Electric Lighting Company, Limited).—Consent.

**Hackney, North.**—A one-story addition to No. 1, Tyssen-pavement, Dalston-lane, Hackney, at less than the prescribed distance from the centre of Hartwell-street (Mr. F. McCann).—Refused.

## Width of Way, Lines of Frontage and Projections.

**Camberwell, North.**—Buildings and boundary walls at the Camberwell Infirmary, Havill-street, Camberwell, at less than the prescribed distance from the respective centres of Havill-street, Brunswick-road, and Brunswick-square (Mr. E. T. Hall for the Guardians of the Parish of St. Giles, Camberwell).—Consent.

**Bermondsey.**—Warehouse buildings on the site of Nos. 31 to 51 (odd numbers only, inclusive), Long-lane, Bermondsey (Messrs. G. Harding & Sons).—Consent.

**Haggerston.**—A new wing to the North-Eastern Hospital for Children, on the north side of Hackney-road, Bethnal Green, at the corner of Goldsmith's-row (Messrs. Marshall & Vickers for the Committee of Management of the Hospital).—Consent.

**Marylebone, East.**—An open portico and a one-story bay-window in front of No. 6, Duchesse-street, Portland-place, St. Marylebone (Mr. L. A. Hayes for Mr. W. Tebb).—Consent.

**Hampstead.**—A laboratory building at the rear of a house known as Danecourt, Hollycroft-avenue, Hampstead, to about upon Platts-lane (Mr. W. G. King for Mr. A. G. Green).—Refused.

## Line of Frontage and Construction of Building.

**Hackney, South.**—The retention of a covered way between the basement entrances of Nos. 8 and 10, Southwold-road, Hackney (Mr. J. Hamilton for the executors of the late Mr. C. Butters).—Refused.

## Width of Way and Construction of Building.

**Hammersmith.**—A wood and iron workshop in the yard at the rear of No. 21, Eyoat-gardens, Hammersmith, at the corner of Homefield-passageway (Mr. H. J. Carline).—Refused.

## Space at Rear.

**Holborn.**—A building on the site of No. 66, Theobald's-road, at the corner of Emerald-street, Holborn, with a portion of the building on the open space required to be provided at the rear (Mr. R. L. Cox for Mr. M. Boyce).—Consent.

## Formation of Streets.

**Woolwich.**—That an order be issued to Mr. J. O. Cook, sanctioning the formation or laying out of a new street for carriage traffic to lead from Macomac-road to Ennis-road, Plumstead (for Mr. H. W. Grant).—Agreed.

**Deptford.**—That an order be issued to Mr. A. J. Glock refusing to sanction the formation or laying out of streets for carriage traffic to lead out of the north side of Knoyle-street, Deptford.—Agreed.

**Dulwich.**—That an order be issued to Mr. C. J. Bentley refusing to sanction the formation or laying out of a new street for carriage traffic to lead out of the north-west side of Overhill-road, East Dulwich, into a lane leading from Goodrich-road (for Mr. H. G. Leonard).—Agreed.

## Dwellings for the Working Classes.

**Whitechapel.**—Two blocks of intended dwelling-houses, to be inhabited by persons of the working class, and proposed to be erected, not abutting on a street, on a site between Brady-street-dwellings, Salomon's-alms-houses, and the Jew's dispersed Burial-ground, Brady-street, Whitechapel (Mr. G. E. Parkes for the G.E.R. Company).—Consent.

## Buildings for the Supply of Electricity.

**Greenwich.**—An addition on the south side of the Blackwall and Greenwich District Electric Lighting Company's, Limited, generating-station and works, Blackwall-lane, East Greenwich (Messrs. Bramwell & Harris).—Consent.

**Woolwich.**—Deviation from the plans sanctioned on May 20, for the construction of an electricity generating-station and works on the east side of White Hart-road, Plumstead Marshes, so far as relates to the construction of a chimney-shaft at such works (Mr. F. Sumner for the Council of the Metropolitan Borough of Woolwich).—Consent.

## Means of Escape from Top of High Buildings.

**City of London.**—Means of escape in case of fire on the top story of No. 124, Fenchurch-street, City (Mr. G. D. Martin, for Mr. E. G. Marshall).—Consent.

**Marylebone, East.**—Means of escape in case of fire on the fifth floors of four blocks of residential flats on the site of Harley House, on the north side of Marylebone-road, at the corner of Brunswick-place (Messrs. Boehmer & Gibbs, for Mr. C. J. Hinsley).—Consent.

## Dwelling Houses on Low-Lying Land.

**Woolwich.**—That the solicitor do prepare a licence under Section 122 of the Act to Mr. J. Bailey, for the erection of a dwelling-house on land situated on the north side of Bostall-lane, Abbey Wood, Plumstead (Mr. T. J. Young for Mr. Bailey).—Consent.

**Greenwich.**—That the Council do make no order upon the application of Mr. E. Crosse on behalf of Messrs. Edwards & Edwards for the Council's licence in respect of dwelling-houses erected on low-lying land situated in Acol-street, Christchurch-street and Bellot-street, East Greenwich.—Agreed.

The recommendations marked † are contrary to the views of the Local Authorities.

## Correspondence.

## To the Editor of THE BUILDER.

## THE SAFETY OF ST. PAUL'S CATHEDRAL.

SIR,—You have several times in your columns called attention to the great danger which threatens the structure of St. Paul's Cathedral should the newly-projected railways be permitted to burrow too near its foundations.

It does not seem to be generally known that the building is already cracked from top to bottom, and that in several places. Movements of a serious nature have taken place and have increased.

Sir Christopher Wren was well aware that the subsoil on which he had to place the structure was not very good. He knew that the hard clay lay about 40 ft. below, but we may fairly say that it was out of the question with the means at his disposal to carry down the footings of this vast structure to such a depth. He found that the old cathedral had stood on a layer of "pot earth," as he describes it, varying from 6 ft. to 4 ft. thick, which lay over a bed of sand and shingle. This layer he knew to be not very solid in itself, but unless attacked, as it now has been during the last century, by deep drains, underground railways, &c., it was sufficient. He spread the footings of the church to a very great extent, evidently in view of the nature of the ground. The old cathedral was an excessively heavy building. Its central tower was nearly as large in all dimensions as the Victoria Tower, and on it was a spire as tall as the tower. What had supported this (and no doubt it had but imperfect foundations) Wren considered to be sufficient to carry his dome with very broadly spread footings.

Notwithstanding his precautions the ground yielded a little, consolidating under the great weight of the dome and its supports. The arches of the nave, choir, and transepts which abut on the dome piers have all been dislocated. Had the subsoil been left undisturbed, we may fairly suppose that no further movements would have taken place. At the bottom of the sandy stratum and over the clay water is found, and this no doubt, was soon tapped

as the business of the city increased. A source of great danger to the fabric of the cathedral was thus established.

About 100 years since great ties of iron were put into the cathedral half way up the walls. The transepts were tied back to the dome piers, and were also tied together their fronts in the direction from east to west.

Since that time the south transept has shown strong indications of an inclination to slide southwards down the hillside towards the Thames. And not only is there movement towards the south, but the wall has opened from east to west. This enormous wall, 8 to 10 ft. thick, 130 ft. wide, and of an equal height, is at this moment showing a tendency to move as above stated; and the movements are such that the breakage is evidently caused, not by the thrusting of arches, but by the actual subsidence of the soil beneath.

When we reflect that there are now between the church and the river not only deep drains, but the Underground Railway beneath Queen Victoria-street, and the Waterloo and City line beneath that, it is evident that the subsoil on which the ponderous masses of masonry rest has been seriously attacked. The west front, with its heavy towers and bells, has also subsided.

I must not take up more of your space but to say a word on the masonry of the cathedral. The church is faced externally with Portland stone. The hearting of the walls is entirely of rubble, a mixture of Caen and Oxfordshire stone, procured from the old cathedral, neither hard nor tenacious. The interior is faced with the same Oxfordshire stone, Portland only being used for projections.

Wren knew what stone he had to deal with. He built his piers of sufficient dimensions. There is nothing to show that he made mistakes in his calculations; but he did not anticipate that the support of his foundations would be sapped. The more one is intimately acquainted with this superb building the more one is lost in admiration at the forethought, the ingenuity, and the resourcefulness of "the incomparable Doctor Wren." Let us hope that the much-needed facilities for locomotion will at least respect so magnificent a monument.

SOMERS CLARKE.

PERSHORE ABBEY TILES.

SIR,—For your notice of my book, "The Benedictine Abbey of SS Mary, Peter, and Paul at Pershore" I have to thank you; but I think in justice to myself you will allow me to say, concerning the drawings of the tiles to which you take such emphatic objection, that they are, as stated on them, facsimile reproductions; they are by no means completed sketches of their original condition, as I take it, those of Mr. R. W. Paul in your issue of October 2, 1897, are, but are illustrations of them as they now are, worn and more or less obliterated.

It may be a matter of opinion as to which is the better form of record, but it seems from your statements that, because I have not attempted to restore the flowing and graceful lines of their designs, I am charged with carelessness and lacking appreciation of their form and beauty. This is not so; and I think you will allow me in this explanation that the criticism was the result of a misunderstanding of my purpose.

FRANCIS B. ANDREWS.

P.S.—As a matter of fact, they each were very carefully traced, and from the tracings, by photographic process, the reduced facsimiles were prepared for the book.

DESIGNING IRONWORK. Second Series. Part II. by Henry Adams, M Inst.C.E. (Published by the Author.)

DICKSON MEMORIAL HALL, LAURENCEKIRK, KINCARDINE.—The Dickson Memorial Hall, Laurencekirk, has just been opened. The building consists of a main hall, with a subsidiary classroom, retiring-rooms, &c. The hall, which will accommodate an audience of about 300, is 62 ft. in length by 24 ft. in width inside, with side walls 12 ft. 6 in. high from the floor to the eaves, and is covered by an open timber roof, the apex of which is about 33 ft. above the floor level. A feature of the building is the timber fleche, which rises to a height of 18 ft. above the ridge of the roof. The roofs are covered with slate from Precelly. The mason work was done by Mr. Alexander Watt, builder, Laurencekirk. The architect was Mr. William Kelly, Aberdeen.

The Student's Column.

GAS AND GAS FITTINGS.

I.—INTRODUCTION.

THE gas industry was founded by the Scotch engineer, William Murdoch, in the last decade of the eighteenth century. Prior to that period no gasworks of any description existed in any part of the world, although it had long been known that inflammable gas could be obtained from coal and certain other substances by distillation, and could be led through a pipe and consumed at its open end.

Claims of priority of discovery of the fact that gas obtained by the distillation of coal could be used for lighting purposes have been made for certain Continental experimentalists, but the fact that Murdoch was the first to establish gas manufacture as an industry, and the first to erect gasworks for lighting purposes on a comparatively large scale, is beyond dispute.

During the nineteenth century the industry rapidly developed into one of the foremost importance. Gas-producing plants were erected in every civilised country, and gas securities took rank with those of water and railway undertakings. The introduction of electricity and of cheap oil caused fluctuations in the value of gas shares, but did not cause any diminution in the world's rate of gas production. Not only is the consumption of gas at the present time greater than at any previous period, but extensions of existing plants are in course of erection in numberless districts. At the close of the century 1,614 separate gas undertakings were in existence in the United Kingdom alone, and these collectively manufactured gas at the rate of 156,665,260,000 cubic feet per annum.

In the early part of the nineteenth century all the gas undertakings were controlled by private owners or by companies, but throughout the last half century Local Authorities have evinced an increasing desire to obtain control of the works supplying gas to their respective districts. In spite of the fact that gas properties have become so valuable that high prices have always to be paid for them, we find on reference to the "Gas World" Year Book for the current year that 265 gas undertakings in the United Kingdom are already in the hands of the Local Authorities, and included in this list of localities supplied with municipal gas are the towns of Aberdeen, Belfast, Birkenhead, Birmingham, Blackburn, Edinburgh, Leeds, Leicester, Nottingham, and Manchester.

At first gas was manufactured exclusively from coal and was used almost solely for lighting purposes, but as time progressed and the art of gas-making was more closely studied by chemists and engineers, it was found that inflammable gas could be economically manufactured from a number of other materials, and that illumination was but one of a great number of purposes for which gas was eminently suited. Certain kinds of sawdust and timber yield very good gas, and even sewage has its advocates as a gas-making material. In certain parts of the world, notably in the United States, America, vast subterranean accumulations of so-called "natural gas" have been discovered, and these have been tapped and distributed in the neighbouring towns as a substitute for coal-gas. An accumulation of inflammable gas has recently been discovered in this country, at Heathfield, in Sussex, and the gas has been employed for lighting the local railway station by the incandescent gas-light system. The gas in these storage chambers is, of course, all consumed sooner or later, as the formation of gas, if still proceeding, proceeds at a very slow rate. Sometimes, however, the quantity of natural gas discovered is very large, and is sufficient to supply a town for many years. In the neighbourhood of coalfields natural gas had been discovered long before Murdoch was born, but no successful attempt had been made to utilise it for lighting purposes. During the last few years acetylene gas, produced from calcium carbide, has also been extensively used, but at the present time the only gaseous rivals which are being used to a formidable extent as a substitute for coal-gas are water-gas and the diluted form of water-gas commonly termed "fuel-gas" or "producer-gas."

By blowing steam through strongly-heated coke or other form of carbon a non-luminous gas can be manufactured which possesses

about half the heating value of coal-gas, and which can be produced in many localities at much less than half the cost. If illuminating gas be required, the non-luminous gas can be mixed with oil-gas or enriched in some other manner, and thus be made to resemble coal-gas in illuminating power. Carburetted water-gas, as the mixture of oil-gas and water-gas is termed, is, however, inferior in some respects to coal-gas of equal illuminating power. The difference between the two varieties of gas will be explained in a succeeding paper.

It is obvious that the solution of the question as to whether coal-gas, water-gas, or carburetted water-gas is the most suitable for the supply of a specific district is dependent upon the local prices of gas-coal, coke, and oil, and upon the purposes for which the main proportion of the gas is required. In some districts cheap gas of a low illuminating value is the most suitable; but in districts in which good gas-coal is abundant and cheap, coal-gas of comparatively high illuminating value remains the most economical supply.

As coke is one of the residuals obtained from the distillation of coal, it frequently happens that a mixture of coal-gas and carburetted water-gas may be economically supplied. As a matter of fact, carburetted water-gas *per se* is very largely used in America, while in London, north of the Thames, and in many other British towns, a mixture of coal-gas with carburetted water-gas is used. In factories where the gas is used for driving engines cheap non-luminous fuel-gas is largely used, the consumption of Mond gas at the works of Brunner, Mond, & Co., in Cheshire, for example, being about a million cubic feet *per hour*.

The manufacture of gas of different composition, specific gravity, illuminating power, and calorific value in different localities has rendered it necessary for a purchaser of gas appliances to take into consideration the district in which the appliances are to be fitted, if they are to be used under the most favourable conditions. The satisfactory use of gas is, moreover, made difficult by fluctuations in the pressure of the gas supplied. In London the tests made by the gas examiners appointed by the London County Council show that the pressure in the street mains varies from about 1.4 in. to 3.8 in. of water, and in buildings the pressure sometimes fluctuates to a yet greater extent owing to defects in the fitting of the local service-pipes, and the height to which the pipes are carried. The pressure in buildings in London seldom exceeds 3½ in., but it often falls to 1 in., and at the latter pressure many gas appliances fail to work in a satisfactory manner. Gas governors may be used to reduce the pressure to any desired point, but are useless when trouble is caused by insufficient pressure. An "atmospheric" gas fire which will burn satisfactorily with coal-gas supplied at 1½ in. pressure will not burn so well with a mixture of coal-gas and water-gas of the same illuminating power supplied at the same pressure, because water-gas, whether plain or carburetted, has a higher specific gravity than coal-gas, and having a different composition, requires a different proportion of air for its combustion. This fact is recognised by some of the gas-fir makers, who supply a special fitting for use with water-gas mixtures.

Where gas is supplied of uniform composition and at a uniform pressure appliances can readily be devised to consume the gas in a satisfactory manner, whatever may be its composition or the pressure (above 1½ in.) at which it is delivered from the mains; but in London north of the Thames, and in certain other localities, much trouble has been caused by frequent fluctuations in both composition and pressure.

For the incandescent gas-light system non-luminous gas is as serviceable as illuminating gas, provided it possesses the same heating power, and recent experiments by Dr. Strache appear to prove that water-gas, having only one-half the heating value of coal-gas and being quite devoid of illuminating power, may be as efficient for lighting purposes by this system as the coal-gas. If illuminating gas is to be used for incandescent gas lighting, it must be mixed before reaching the point of ignition with sufficient air to cause it to burn with a non-luminous flame; otherwise the mantle will become coated with soot and cease to emit light. In view of the recent statement of Mr. George Livesey, Chairman of the South Metropolitan Gas Company, that 50 per cent. of the gas sold by that company is used for purposes other

than lighting, and of the fact that throughout the country the ratio of gas used for heating to that used for lighting (other than incandescent lighting) is already large and is increasing at a rapid rate, it is apparent that the commercial value of gas is now dependent upon its calorific value rather than upon its illuminating power.

In practical gas manufacture it is found that the higher the illuminating power of the gas the greater is its heating power; but no inflexible law simultaneously controls the two factors, and it is possible to produce two gaseous mixtures, the one giving a non-luminous flame and the other a flame having a certain illuminating power, of which the non-luminous flame shall be capable of yielding more light with the incandescent mantle than the illuminating gas. It has, moreover, been found that the increase in heating power of a so-called "high quality" gas is often very far from being proportionate to the increase in the cost of manufacture; and in Styria the town of Pettau has been brilliantly lighted with non-luminous water-gas and incandescent mantles in preference to employing the more costly coal-gas. The water-gas is made and purified by the "Strache" process, the fuel employed being a low-quality brown coal.

During the last fifteen years the number of purposes to which gas has been applied has increased to a remarkable extent, and has, of course, been accompanied by a corresponding increase in the variety of gas appliances manufactured. The penny-in-the-slot prepayment meter has also been introduced within that period, and has proved so popular that there are already about 800,000 of them in use in the United Kingdom alone. Since the introduction of the slot meter the use of the ring burner for boiling water has become general in all large towns, even in the workman's tenement or cottage, and prepayment gas fires have become extensively employed for hotel bedrooms.

These facts sufficiently indicate the importance to all gas consumers, and especially to students of building construction, of a knowledge of what is being done at our great gas factories, of the facilities which exist for using gas for domestic purposes and in the various arts and crafts, and of the concessions which are now being granted by many gas companies, under the spur of competition, and in recognition of the more extensive requirements of gas consumers of the present day. In the present series of papers these matters will be discussed, and a description will be given of modern burners and various appliances for the use of gas, while the concluding papers will be devoted to acetylene gas and the apparatus employed for its generation and consumption.

Much has yet to be discovered before the highest possible efficiency in light, heat, or power can be obtained from inflammable gas, but a large number of the complaints which from time to time are made against the public gas supply are due to ignorance, and result either from misuse of the gas or from its avoidable deterioration after manufacture. Sometimes the gas manufacturer is at fault; but more frequently the consumer who consumes the gas in unsuitable burners, or the architect who approved the internal fittings of the building and the contractor who supplied them, are really responsible for the fact that the gas fails to perform its legitimate duties. The causes which lead to many of these complaints, and the precautions which must be observed in order to obtain satisfactory results from the gas, will be discussed in subsequent chapters.

#### OBITUARY.

MR. W. L. SUGDEN.—We regret to announce the death, on June 18, at Leek, Staffordshire, of Mr. William Larner Sugden, aged 50 years, of Leek and Hanley. Mr. Sugden was elected a Fellow of the Royal Institute of British Architects in 1892, and for some years past had been surveyor to the Stoke-upon-Trent Rural District Council. Mr. Sugden was the son of William Sugden, of whom he was partner, and upon the death of his father in September, 1862, he succeeded him in his professional practice. The firm of Messrs. William Sugden & Son carried on a large practice in the northern large manufacturing towns of Staffordshire, and in parts of the counties adjacent. The firm of Messrs. William Sugden & Son, conjointly with Mr. John Blood, Mr. W. H. Sugden, and Messrs. Chapman & Snape, were architects of the new Public Buildings, Newcastle-under-Lyme, of which we published their own, and the modified designs, as accepted, with eleva-

tions and plans, on April 24 and May 1, 1886, and May 4, 1889. Of the other more important works that were entrusted to the firm we may mention the following:—The Congregationalists' New Tabernacle Church Buildings at Hanley (July 7, 1882\*); their first premediated designs for a model village, Aintree (August 25, 1888, with ground plan, as laid out by them\*); the house, Wyndate, at Scarborough (October 17, 1888\*); and the enlargement of the house, Woodcroft, at Leek (December 12, 1891, elevation, hall-room, and plan\*); also, we believe, the police station and the District Bank at Leek. In January, 1890, the firm gained the first premium in the limited competition for the New Liberal Club House at Crewe, and in July, 1889, they won the first premium in the competition in respect of extensive alterations and improvements, comprising new heating and ventilation arrangements, for the Town Hall at Congleton. In 1889-90 they carried out the conversion of the old Mechanics' Institute, Hanley, for purposes of the North Staffordshire Technical Museum. As Surveyor to the Hanley Town Council, Mr. W. Larner Sugden superintended the planning and construction of the Abbey Hulton section of the Backnall sewerage scheme, and as Surveyor to the Stoke-upon-Trent Rural District Council he acted in a similar capacity in respect of the pumping-station buildings and other works at Backnall. Of Mr. Sugden's architectural work during the nine years since he succeeded his father, we may cite two houses at Rugby, one being for Mr. T. Hunter (October 24, 1897\*); and Hillmorton House, for which the designs were exhibited in the Royal Academy, London, in 1897; "Maison Rouge," at Buxton (for Mr. Smallman (December 4, 1897\*)); "One Ash," at Woodthorpe, near Loughborough; a residence at Quorn, Leicestershire, and a bathhouse at Rudyard. In October, 1898, Mr. W. Larner Sugden was appointed architect for the new Technical Schools and the "William Carr" Gymnasium at Leek, which constitute an extension of the Nicholson Institute, as previously planned and designed by the firm of Messrs. William Sugden & Son. He was the architect of the Congregational Manse at Leek (1898); the new head offices, stores, assembly and hall-rooms, bakery, &c., for the Leek and Moorlands Co-operative Society; of the new school buildings, &c., at Kingsley, Staffordshire (1894); and, conjointly with Messrs. Mosley & Anderson, gained the second premium—ten sets of designs being submitted—in the competition for the new market buildings at Leeds (1895). Mr. Sugden succeeded Mr. Bradford upon the retirement of the latter as Surveyor to the Stoke Rural District Council, and in 1899 prepared a scheme, which the Council adopted, for a sewage farm, for irrigation, drainage, and other works on forty acres of land, an Adams' sewage lift, pumping station at Backnall, together with main sewers for the whole of the township.

#### GENERAL BUILDING NEWS.

ST. EUNAN'S CATHEDRAL, LETTERKENNY, IRELAND.—The new St. Eunan's Cathedral, of the diocese of Raphoe, at Letterkenny, was opened on the 16th ult. The cathedral stands on an elevated site overlooking the town of Letterkenny. The building, says the *Irish Independent and Nation*, is cruciform in shape, and at the intersection of the nave and transepts there are four arches resting on four square columns, ornamented with panels carved in high relief with subjects of religious history in Donegal. The aisles are divided from the nave by an arcade of five arches in each side, supported on clustered columns, with carved capitals and bases. The choir is in the form of an apsidal ending with nine sides, in each of which is an acutely pointed arch, communicating with the ambulatory. The ambulatory is lighted by nine lancet windows, and above the chancel arcade are thirteen windows, filled with stained glass, representing incidents in the life of our Lord. The great western door is a high-pointed arch, deeply recessed and richly moulded. Above it is a seven-lighted window with rose tracery. Similar windows of smaller size light the transepts. The tower stands at the north-eastern angle. It will be surmounted by a spire, the whole rising to a height of 240 ft., the tower measuring 120 ft., and the spire 120 ft. The cathedral is 200 ft. long, 100 ft. wide across the transepts, and 66½ ft. across the nave and aisles. There is a departure from the pointed style in the entrance to the transepts, the doors being in the Hiberno-Romanesque, with characteristic Gaelic ornamentation. On the columnar supports of the arches at the intersection of the nave and aisles the figures in alto-relievo in the panels are very interesting. Many striking incidents in the life of St. Columille are depicted in a series of panels on the left-hand side of the Adamant Column devoted to illustrations of incidents in the life of the founder of the church and diocese of Raphoe. Figures of the Trinity and other subjects ornament the arch-tops, and the great west door is a high-pointed arch, cast by Mr. Mather Byrne, Dublin. The sanctuary lamp, the tabernacle door, the altar gates, and the lighting appliances

have been executed by Messrs. John Smyth & Sons, of Dublin. The following are some of the other contracts:—High altar, Mr. Sharpe; pulpit and sanctuary railings, Mr. Pearce; Lady altar and St. Columba's altar, Mr. Ryan; "Theology" for the Sacred Heart, Mr. Clarke; holy water fonts, Mr. Smith; Bishop's throne and choir stall, Messrs. Beakey; confessionals, Messrs. Noonan; oak seats and case for organ, Messrs. Dovey & Mullaly; oak porch, Messrs. Sharp & Emery; baptismal gates, Messrs. Fagan & Co.; candlesticks and vases, Messrs. Kane & Gunning; stained glass window in baptismal chapel, Mr. Clarke; ornamental gates and railing of enclosure, Messrs. McDonoghlin. In April, 1891, the tender of Mr. M. Clary was accepted for the work, and the foundation-stone was blessed on September 6. Following on the death of Mr. Hague, the architect, whose plans were chosen for St. Eunan's, his place was taken by Mr. M. Namara. Side by side with the erection of the cathedral were provided residences on an adjoining hillwork for the Bishop and the priests.

NEW CHURCH OF ST. COLUMB, BAYSWATER.—The new Church of St. Columb, Lancaster-road, was consecrated recently by the Lord Bishop of London. Mr. Hodgson Fowler, F.S.A., of Durham, was the architect. The builders were Messrs. Godson & Sons, of Kilburn.

SCHOOL CHURCH, NETHER GREEN, SHEFFIELD.—A school-church was opened at Nether Green on the 20th ult., for the Methodist New Connexion body in Sheffield. The premises consist of a school-room, to be used as a school and chapel, and a lecture-room, which will accommodate forty persons. The upper apartments are capable of seating 200 worshippers. The building is completed, with Ashlar stone dressing, and the architect is Mr. J. C. Ince.

MISSION CHURCH, LYNN.—The Lord Bishop of Norwich recently consecrated the new mission church of St. Michael and All Angels, which has been erected on the Saddlebow-road, in All Saints' Parish, near South Lynn. The church has a nave 66 ft. long by 35 ft. wide, a chancel 30 ft. by 17 ft., with a choir aisle, organ-chamber, and two vestries. The building is composed of ear-stone and red bricks, and the roof, an open timber one, is covered with red tiles. It has seating accommodation for some 300 people. Adjoining the church is an infants' school, with accommodation for about 170 children. The architect was Mr. L. F. Eggleton, and the builder Mr. R. Dye.

HIGHER GRADE SCHOOL, ILFORD.—The Park Higher Grade School, situated in Melbourne-road, Ilford, was opened recently by the Bishop of Barking. Mr. C. J. Dawson, the architect, explained that the new building was designed on the central hall and classroom principle; it comprised three stories, and provided accommodation for 300 boys and 300 girls. Besides the central hall, which was 68 ft. by 30 ft., there were lecture and classrooms and all the accommodation required for the teaching staff and scholars. The classrooms would be heated with open grates, and the central hall, cloak-rooms, corridors, laboratories, lecture-rooms, &c., with hot-water radiators and pipes. The contract price was 16,710*l.*, and the total cost, with furniture, &c., would be 19,600*l.*

FIRE STATION, WEST HAMPESTEAD.—On the 24th ult., Mr. J. D. Gilbert, Chairman of the Fire Brigade Committee of the London County Council, said the new fire station, which had been erected by the Council in West End Lane, West Hampstead. The station is to be built on land fronting the old village green of West End. The site cost 1,756*l.* 9*s.* 10*d.*, and has an area of 16,000 square feet. The cost of the building will be about 11,375*l.* The plans have been prepared by Mr. W. E. Riley, Architect to the Council.

WESLEYAN CHURCH, TANFIELD, BEDFORD.—A new Wesleyan church was opened on the 21st ult., at Tanfield, Bedford, the architects being Messrs. W. J. Morley & Son, of Bradford. The building is of stone, in the Decorated Gothic style, with tower and spire. The interior woodwork of pews and of the open wagon-headed roof is of pitch-pine, and the tracery windows are filled with leaded lights, a special feature being a figure window in the transept, which is the gift of Mr. George Bolton, of Bradford. Accommodation is provided for about 205 persons, and there are vestries for the choir and for the minister. From the minister's vestry access is gained to the pulpit. A band room is also provided at the rear of the church, and the old chancel adjoining the new premises will be used as a school.

BALTIC MERCANTILE AND SHIPPING EXCHANGE, LONDON.—The foundation-stone was laid on the 25th ult. of the new building in Jeffreys-square, E.C., of the Baltic Mercantile and Shipping Exchange. The new building will have two frontages, one in St. Mary-axe of 86 ft. and the other in Bury-street of 72 ft. The Exchange and offices connected therewith will occupy the whole of the ground floor, the principal entrance being in St. Mary-axe, and consisting of an outer arched vestibule 32 ft. by 16 ft., and an inner hall 40 ft. long and 24 ft. wide, on either side of which there will be the secretarial offices and boardroom. The Exchange will be 72 ft. long, 94 ft. wide, and 30 ft. high, with a central dome 50 ft. in diameter. On one side of the Exchange there will be a semi-circular bay, containing a staircase leading to the

\* Illustrated in the *Builder*.

hasement and the members' cloakrooms, lavatories, &c., and on the other side a similar bay containing twenty telephone boxes. The end of the Exchange will be a semi-circular apse, from which there will be access to Bury-street and entrances to postal and telegraph offices and members' reading-rooms. The basement will be arranged as a lanchon and smoking-rooms for the members, with extensive lavatory accommodation, auction and arbitration-rooms, kitchen and offices, and below this there will be a sub-basement, which will be fitted up with the different machinery for the electric light installation, heating, ventilating, pumping, &c. Above the Exchange there will be four floors of offices—about 200 rooms in all—approached by three staircases and electric lifts, two of these to be connected with entrances in St. Mary-axe and one with the entrance in Bury-street. Externally the front facing St. Mary-axe will be in polished granite up to the first floor level, and above this in Portland stone, with polished granite columns. The contractors are Messrs. G. Trollope & Sons, and the architects are Messrs. T. Smith and W. Wimble.

SANITARY AND ENGINEERING NEWS.

**KIRKLEE BRIDGE, NEAR GLASGOW.**—On the 13th ult. the new bridge which has been erected across the Kelvin to connect Kelvinside with the rapidly-developing district of North Kelvinside was opened. The new bridge was designed by Messrs. Formans & M'Call, engineers, and constructed by Mr. Wm. Wilson. Its erection began in the end of 1898. The bridge is an elliptical arch with a span of 86 ft. and a rise of 31 ft. 9 in., the soffit of the arch rising to a height of 36 ft. above the bed of the river. The main arch is flanked by two semi-circular arches of 18 ft. span, supporting the approach roads, and the openings afforded by these arches are made use of for carrying the ornamental walks formed in connection with the Botanic Gardens along both sides of the river. The bridge is built at such an elevation as to form a level roadway between Montgomerie-street, in North Kelvinside, and Kirklee-road. The total length of the new connecting roadways is 250 yds., including the bridge. Throughout the bridge and its approaches the carriageway is 30 ft., with a footway on either side of 10 ft.—50 ft. in all. The masonry of the bridge is of Dumfriesshire red sandstone. Polished granite columns are introduced in the pilasters supporting the entablature which carries the polished granite bases of the lamp pillars. The latter, which are not yet in position, are being made of wrought iron. The parapet is also formed of the same polished red granite from the Ross of Mull. The spandrel walls are enriched by the introduction of the city arms carved in relief. In building the wing walls the masonry has been dressed with a rock face, and the slopes dressed off. Apart from the land acquired from the Kelvinside Trustees, the bridge has cost 20,000*l.*, of which the Caledonian Railway Company have given 10,000*l.* The ground in the neighbourhood of the bridge is being laid out as public gardens.

**ELGIN WATER SUPPLY.**—Mr. Fraser, C.E., Inverness, has recommended a scheme for new water supply for city of Elgin, the high-level works to cost 12,680*l.*, and the low-level works 9,790*l.*, together 22,470*l.* Elgin Town Council, however, has resolved that no action be taken on the report, but that negotiations be reopened for a permanent right to the present Blackhills water supply, which is considered ample for all requirements of Elgin.

**SEWERAGE, KINGSBURY, MIDDLESEX.**—Mr. H. P. Boulnois, Inspector of the Local Government Board, held an inquiry at the Urban District Council's offices on the 19th ult. into the application of the Council to borrow 10,500*l.* for works of sewerage and sewage disposal. Mr. S. Slater Grimley, the Consulting Engineer to the Council, explained the various details of the scheme and the mode of treatment to be adopted at the outfall works, and stated that his scheme was designed for a population of 5,000 and for double-contact bacteria filters after the sewage had been screened and allowed to deposit in tanks, with subsequent filtration through land. The bacteria filters (except the storm water filter) and the tanks were, for financial reasons, omitted from the present application, but five acres of land were proposed to be drained and prepared for irrigation and lateral filtration until the population of the district increased, when the scheme could be completed by the construction of such filters and tanks as designed. At the close of the inquiry the Inspector viewed the proposed outfall works and the routes of the proposed sewers.

FOREIGN.

**FRANCE.**—The municipality of Ivry (Seine) has just erected an "Ecole Maternelle," the expense of which is estimated at 108,000 francs.—The municipality of Amiens has voted the sum of 315,000 francs for the building of schools.—A new Hotel de Ville by MM. Defresne and Roussettel has just been inaugurated at Neuilly-en-Thelle (Oise). The General Council of Civil Buildings has approved of the plan for the future Municipal Casino at Cannes, the expense of which is estimated at over 2,000,000 francs.—The town of Boulogne-sur-Mer has been authorised to vote a sum of 320,000

francs for the building of a school establishment.—The Municipal Council of Bordeaux has approved the project presented by MM. Dalou & Fournig for the monument to be erected to the memory of Gambetta in the Allées de Tournay. Gambetta is represented as standing leaning against a tribune. The pedestal which supports the statue is ornamented with two groups. To the right Wisdom is supporting dying Liberty; to the left a young child is protecting the "Patrie." Palms, garlands, and warlike attributes decorate two sides of the pedestal. The groups of sculpture are to be carried out in marble.—A sum of 400,000 francs has been voted by the town of Avignon for the construction of barracks, which, let us hope, will ensure the protection of the celebrated palace of the Popes from further injury, and allow of it being put to a better use than it is at present.

**GERMANY.**—A statue of the Emperor Frederick by the sculptor Johann Boese was unveiled at Oels in Silesia, on the 27th ult., in the presence of the Duke of Trachenberg, the President of the Province. The statue, about 17 ft. in height, is mounted on a granite pedestal, and represents the late German Emperor in the uniform of his Silesian dragoons.

**INDIA.**—The large bridge over the Musi River, at Hyderabad, which has taken nearly three years to construct, was opened recently by the Nizam. It is 100 yards in length, and cost 1½ lakhs of rupees.—The Government of India has sanctioned the installation of the Jessal system of filtration in connection with the water supply for the civil and military station of Bangalore.—Plans are being prepared for new offices of the Public Works Department, proposed to be built in Colombo, Ceylon.—The Government of India has decided to build a new Foreign Office in Calcutta in close proximity to the new Military Secretariat now under construction.—Extensive additions to the waterworks of the city of Jammu have been sanctioned by the State Council of Jammu and Kashmir. The plans have been prepared by the State Engineer, Mr. H. S. Wildeblood.—The Eastern Bengal State Railway is making very large additions to its terminal accommodation, and have sanctioned important extensions to the railway station at Naibati.

MISCELLANEOUS.

**PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.**—Messrs. Barnes, Williams, Ford, & Griffin, architects, of 24, Railway Approach, London Bridge, S.E., have taken city offices at 30, Coleman-street, E.C., the two offices being in communication by telephone.—Messrs. Easton & Co. (late Easton, Anderson & Goodlen) have appointed Mr. F. A. Porter, of 13, Queen's-square, Belfast, and 35, Parliament-street, Dublin, as their sole agent for Ireland.—Mr. Silvester Sparrow, artist in stained glass, has changed his address from 2, Talgarth-road, West Kensington, to 43, St. Peter's-terrace, Ravenscourt Park, W.

**ASHBURTON MONUMENT, CHARTERHOUSE SCHOOL.**—Mr. Howard Ince, the architect of this monument, illustrated in our last issue, would like us to mention that the illustration was from a photograph by Mr. Fry, of Brighton.

**HOUSING OF THE WORKING CLASSES (LONDON).**—The Royal Architectural and Industrial Dwellings Company are about to erect dwelling-houses, having front shops on the ground floor, on the west side of High-street and the south side of Victoria-road, Stoke Newington. The Metropolitan Association for Improving the Dwellings of the Industrial Classes will also erect similar dwelling-houses at the rear of Gibson's Buildings, Northwood-road, in the same parish. In the North Lambeth and Kennington districts the London and South-Western Railway Company have undertaken to provide accommodation for the inhabitants to be dispossessed by their new works in the vicinity of Waterloo terminus by the erection of three blocks of industrial dwelling-houses upon a site lying between Burdett-street and Gloucester-street, together with two more blocks on the north and south sides respectively, of those two thoroughfares. The railway company have also prepared plans for the erection of a block of dwellings upon the site of the storeyard in Great College-street, Camden Town.

**THE LABOUR MARKET IN THE COLONIES.**—According to the July circular of the Emigrants' Information Office (31, Broadway, Westminster), this is the best season of the year for emigration to Canada. There is a good demand for coal and other miners, more especially in British Columbia and Cape Breton, Nova Scotia. There is a fair demand for general labourers, and for certain mechanics, such as carpenters, blacksmiths, and iron and steel workers, but not at St. John, New Brunswick, or at Winnipeg, Manitoba. In New South Wales the dispute in the coal trade has been settled. A report from Sydney states that trade continues good, more especially for plumbers and builders,

and the engineering trade has perhaps never been so busy. There is plenty of opening for good artisans in the engineering and general building trades, as well as for general handy men. In Victoria there is practically no demand in Melbourne or the other towns for more mechanics or labourers, unless they are specially skilled, and bring a little money with them. Many unemployed have been provided with work during the last few weeks on railway construction. The Government have decided to spend 10,000*l.* on irrigation works in the Malay, which will benefit the local farmers, and at the same time provide work for those out of employment in Melbourne; about 300 men are now engaged on piecework at 8*d.* to 10*d.* per yard. In South Australia there is practically no demand for more mechanics in the towns, but a skilled hand such as a mason, bricklayer, engine fitter, blacksmith, joiner, or carpenter can generally find employment after looking about for a little. Owing to drought and scarcity of employment emigrants (other than female servants) are not recommended to go to Queensland at present, unless they receive nominated passages or take a little money with them. In Western Australia, according to the official labour return for the first quarter of 1901, there is no demand for miners anywhere. At Perth and Fremantle and Katanning there is a demand for mechanics in the building and other trades, good men getting constant employment at Perth; but elsewhere the supply is either sufficient or, as at Coolgardie, in excess of the demand. At Jarrahdale there is a steady demand for sawmill hands and fellers. In Tasmania the supply of labour is, generally speaking, equal to the demand. In New Zealand, with the exception of a few places such as Dunedin, where some carpenters and boiler-makers have been out of employment, the building and engineering trades have been busy everywhere. In Natal a few guards, engine-drivers, firemen, cleaners, and platelayers are wanted on the railways. Candidates must apply to the Agent-General for Natal, 26, Victoria-street, London, S.W., stating age, height, and experience, and enclose testimonials. Otherwise all persons are again warned against going to South Africa at present in search of professional or manual work unless they have ample private means to meet the very high cost of living. They will not, as a rule, be allowed to proceed up country.

**FOWEY HALL, CORNWALL.**—Messrs. Artow-smith & Co. ask us to mention that the solid rich oak floors throughout the above-named house (illustrated in our last issue) were laid and polished by them.

**CONFERENCE ON THE HOUSING QUESTION.**—A conference of members of the London County Council and delegates from the London Borough Councils was held on the 28th ult. to consider their respective spheres of action under Part III. of the Housing of the Working Classes Act, 1890, as amended last year. Mr. Torrance, Chairman of the L.C.C., presided at the conference, which was held at the County Hall, Spring-gardens. Mr. Waterlow, Chairman of the Housing of the Working Classes Committee of the London County Council, said they would gladly welcome any assistance from the Borough Councils, at whose request the conference was convened. Their object was to avoid all clashing between the various public bodies who had prepared plans under the Act. If judiciously used, their new powers ought to mean some solution of the housing problem, but there were certain risks. The first was that each body would leave its neighbours to do the work, but he believed the public opinion of the metropolis was so roused on the housing question that the risk of falling between thirty different stools might be disregarded. More serious was the risk of several public authorities seeking to acquire the same area of land, and thus putting up the price. He hoped the conference would find a means of avoiding that danger. Then it was said that if all the Councils started building there would be too many houses, but he did not think that was likely to occur for ten years at least. There was an immense demand for working-class houses, and he hoped and believed the Borough Councils were prepared to do all they could to supply that demand. His committee would be glad to give any information, gained by their experience, to assist Borough Councils in putting up dwellings. No doubt the cost of these dwellings was great, and at first there must be a charge upon the rates; but they would have a valuable asset in the land, which would always be worth its price, and at the expiration of the sinking-fund there would be the reversion of a freehold property, producing a large income. There were an immense number of cases of overcrowding, as shown by the census returns, which spoke of five or six, and even ten or twelve, persons living in one room.—Mr. Dickinson moved, as an amendment to a previous resolution:—"That, with a view to obviate any possibility of overlapping or clashing as between the various authorities in London charged with the duty of erecting houses for the working classes under Part III. of the Housing of the Working Classes Act, 1890, as amended by the Housing of the Working Classes Act, 1900, it is expedient that when either the London County Council or any metropolitan Borough Council contemplates acquiring land for the above purpose such Council shall, at the earliest moment consistent with the

public interest, communicate its intention to the Borough Council within whose area the land in question is situated, and to the London County Council." The amendment was carried and became the substantive motion. It was sharply criticised and eventually defeated. An Islington scheme was accepted as follows:—"That it is desirable, with a view to avoiding dual control and overlapping expenditure, that no scheme for the housing of the working classes in any metropolitan borough should be promoted by either the London County Council or the Council of any metropolitan borough, pursuant to Part III. of the Housing of the Working Classes Act, 1890, except after due consultation between the two Councils (a) as to the desirableness of the scheme, and (b) in order that the cost of such scheme may be fairly apportioned between the county and the particular borough." Two suggestions from Westminster, proposed by Sir J. Wolfe-Barry, and seconded by Mr. Henry Tozer, were agreed to. They were:—"That, in order to ascertain the immediate responsibility of each Borough Council, a simultaneous special inquiry be made by each Council as to the number of the working classes that it may be necessary, by the conditions and circumstances of their employment, to house within the area of each borough," and "that reasonable modifications of the existing building laws and regulations are essential in order to facilitate the further erection of industrial dwellings." The conference was adjourned.

**SOCIETY OF ARTS.**—The Society of Arts held their annual conversation this year, on Friday, the 28th ult., as a garden party at the Botanic Gardens, instead of going as usual to the South Kensington Museum. The night was fine and the affair was a complete success, and a very agreeable variation from the usual programme. The gardens were illuminated in a most liberal and effective manner, the trees appearing to bear a new fruitage of sparkling lights, in addition to the usual array of Chinese lanterns, &c., along the walks. A concert of instrumental music was given in the conservatory at 9, by the string band of the Royal Artillery, and at 10.30 the band of the Grenadier Guards gave a performance on the west lawn, the commencement of which was a little delayed owing to a want for the moment of sufficient lights for the players—a point to be borne in mind on future occasions. A vocal and instrumental concert was given at intervals in the club-house by the Royal Criterion Handbell Ringers and Glee Singers, which was so attractive that the room was filled all the evening and there was an overflow audience round the windows. Refreshments were supplied in the café attached to the club-house, and in marquees on the lawn. Entertainments of this kind are of course so entirely dependent on the weather, that there is always a certain risk in undertaking them; but the result on this occasion was so satisfactory that the Society's guests will probably hope that the risk will be taken again.

#### CAPITAL AND LABOUR.

**GLoucester BUILDING TRADE.**—A special meeting of the Master Builders Association for Gloucester and district was held recently at the New Inn Hotel, to consider a letter received from the Secretary of the Builders' Labourers to the effect that unless something further was done to meet the men's demand for an increase of wages and suggesting arbitration "he was afraid that extreme steps will be taken." The President (Mr. G. O. Estcourt) presided. As the result of their deliberations the following resolution was carried:—"That this meeting adheres to the resolution passed at the meeting held on December 17 last, thus leaving nothing to refer to arbitration." The resolution reads as follows:—"That the present state of trade does not warrant any increase or promise of increase in the rate of wages of builders' labourers."

**TEESIDE AND HARTLEPOOL JOINERS' STRIKE.**—A meeting of the Teeside Master Builders' Association was held at the Y.M.C.A., Stockton, on the 26th ult., to take into consideration the joiners' strike. It was reported that there had been a meeting of the executive of the Northern Centre of the Employers' Federation and the Amalgamated Society of Carpenters and Joiners at Leeds, when the employers had offered to increase the joiners' wages from 9d. to 10d. per hour, whilst amongst other things agreeing to pay the actual out-of-pocket lodging expenses of the workmen when on jobs outside their own town. The men had, however, held to their claim of 9d. per hour, though they had expressed their willingness to accept actual out-of-pocket expenses as an amendment to rule 5, at the same time stating that an adjustment of the Hartlepool's working time might be arranged by a joint local committee as agreed by the employers. After a lengthy meeting the Teeside employers agreed to abide by the offer of the farthing advance made at Leeds by the executive committee, whose action they confirmed.

**SCARBOROUGH STONEMASONS' DISPUTE.**—Early this year the operative stonemasons gave six months' notice to the Scarborough Master Builders' Association for an increase of wages from 8d. to 9d. per hour, and alterations in working rules. The Builders' Association considered the matter, but, taking into consideration the state of the

building trade in Scarborough, they decided to offer the operative masons a reduction of 1d. per hour. A deputation from the Master Builders' Association considered the matter in dispute, an arrangement was arrived at, the result being that the wages remain as at present, and certain modifications in the working rules were made. This agreement was signed by the two deputations.

**STRIKE OF MASONS AT BURTON.**—The masons at Burton-on-Trent struck work on the 1st inst. for an advance of 1d. per hour. The present wages are 8 1/2d.

#### LEGAL.

##### ACTION BY QUANTITY SURVEYOR AGAINST ARCHITECT.

THE case of Michel v. Day came before Mr. Justice Ridley, sitting without a jury in the King's Bench Division on the 26th ult. It was an action brought by Mr. Emile Benjamin Michel, a quantity surveyor, residing at Casewick-road, West Norwood, against the defendant, Mr. R. Philip Day, an architect, to recover 185*l.* 10*s.* for preparing bills of quantities for proposed additions to St. Paul's Church, Thornton Heath, and a perspective view and specification.

The statement of claim alleged that the defendant, in June, 1900, on behalf of himself, or, alternatively, as agent for and on behalf of principals whom he did not disclose to the plaintiff, and who were unknown to the plaintiff, requested him to prepare bills of quantities for proposed additions to St. Paul's Church, Thornton Heath, and to prepare a perspective view and specification, and in compliance with such request the plaintiff prepared the bills of quantities, perspective view and specification, and sent them to the defendant, who accepted the same, and upon them obtained tenders from builders to execute the work. The lowest tender was one of 68*5*l.* 10*s.* 6*d.* from Mr. D. Furniss, of Peckham. The plaintiff also, at the request of the defendant, made various alterations in the quantities, and made out a reduced account with additions and omissions, and wrote many letters and paid many visits to the defendant and the church in question. The plaintiff alleged that the usual and proper remuneration for bills of quantities was a commission of 1 1/2 per cent upon the accepted tender, or the lowest tender, plus out of pocket expenses and remuneration for extra work done.*

The defendant, by his defence, denied that he had ever requested the plaintiff to prepare the bills of quantities or to do any of the other work mentioned in the statement of claim for himself (plaintiff), and alleged that in all dealings in reference to the church, the defendant acted as the agent for the Vicar and Building Committee of the church, and in no other capacity, as the plaintiff well knew. He also alternatively pleaded that if he was under any personal liability to the plaintiff, the plaintiff's quantities were incorrect and excessive, whereby the tenders were 100*g.* high, which caused him (defendant) to employ another quantity surveyor to prepare correct bills of quantities, and the defendant further traversed the other allegations in the statement of claim, and alleged that it was verbally agreed between the plaintiff and himself that if a tender based upon the plaintiff's quantities was accepted the plaintiff should receive as remuneration 1 1/2 per cent commission on the amount of the tender, together with out of pocket expenses, to be paid by the builder whose tender should be accepted; but that if no such tender was accepted, the plaintiff should be entitled to out of pocket expenses only. No such tender, in fact, was ever accepted. The defendant, whilst denying liability, paid 30*l.* into court as being sufficient to satisfy the plaintiff's claim.

Mr. Arthur Powell appeared as counsel for the plaintiff, and Mr. Disney for the defendant. His lordship, after hearing evidence and the addresses of counsel, in giving judgment said that the only question he felt he had to decide was whether the architect had made himself liable for the employment of the plaintiff as quantity surveyor in the matter in question. The question was, did the defendant as architect contract with the plaintiff without naming his principals? His lordship thought he did not. He thought the true state of things was that when the plaintiff came to Mr. Day he was told by Mr. Day that he was to be employed for the church, and he gave him the name of the vicar for whom he was acting. According to the ordinary rule, the architect was not the employer of the quantity surveyor. The architect was simply case where an architect was employed he was entitled to engage a quantity surveyor. Sometimes it was not necessary, the work not being of a sufficiently important description to require it. In the present case the nature of the work was such that quantities were necessary, and from the evidence it was clear that the Building Committee knew that the architect was employing a quantity surveyor. His lordship considered that the plaintiff had no case against the architect, and therefore, judgment ought to be for the defendant,

with costs. He was not able on the other branch of the case to give an opinion as to what should be paid to the plaintiff for his work if the Court of Appeal held that he was in the circumstances entitled to recover from the defendant. If the Court of Appeal should be of opinion that there was a liability on the part of the defendant, then there must be a new trial to ascertain the amount due to the plaintiff, unless the parties could agree to the amount.

His lordship accordingly gave judgment for the defendant on the main point, with costs, and granted a stay of execution pending an appeal to the Court of Appeal.

##### ACTION BY ELECTRICAL ENGINEERS UNDER A CONTRACT.

THE case of Foote & Milne v. Silcock came before Mr. Justice Ridley in the King's Bench Division last week, it being an action by the plaintiffs for 100*l.*, the amount of an unpaid bill (with interest) which had been given by the defendant in connection with some electrical work carried out at the Star and Garter Hotel, Putney, and flats adjoining. The defendant pleaded that the plaintiffs had not completed the work under their contract, and that consequently consideration for the bill failed. The signature on the bill being admitted.

Mr. Thos. Terrell, K.C., for defendant, said Mr. Silcock was building the hotel in question and a considerable block of flats. Originally tenders had been sought for engines, dynamos, wiring, and, in addition, a complete installation, but the proposals were modified, and the plaintiffs on June 13, 1900, by letter contracted to supply all the necessary mains, distribution boards, switching, wiring, &c., for 450 lamps for 475*l.*, or, if they were to do the cutting away, 485*l.* The terms of payment by the contract were to be by acceptances at three months, to be given when work of that value was completed; and it was further provided that for the purpose of calculating the value of the work done the branch wiring should be taken at 10*s.* per light. What the plaintiffs had not done was: (1) They had not put in the distribution boards to go with the mains, the value of which was estimated by defendant's electrical engineer at 51*l.* 2*s.*; (2) they had not put in seventy-six lights, which had a work value of about 8*l.* 18*s.* to be done. Other parts of the work not absolutely completed would cost 7*l.* 10*s.*, and there was a switchboard for the assembly-rooms which would cost 3*l.* Also there were the arc lamps, with brackets and fixing, which would cost 57*l.*, and the wiring and boards for the same, 6*l.* 8*d.* to be put in. What the plaintiffs had done under the contract was to put in extra lights which alone would amount to 53*l.* 4*s.* Taking the balance of the account, the plaintiffs had actually work done representing 34*l.*, and they had already been paid 380*l.*, not counting the 100*l.* on the bill now sued on and in respect of which his case was that they had not done the contract work which alone made the money due.

Mr. J. F. P. Rawlinson, K.C., for the plaintiffs, said that the fallacy in his learned friend's argument was that the work was not complete. The plaintiffs were ready and willing to complete the entire work as soon as they had been paid, as under the contract was 10*s.* in respect of the branch wiring of each light. They had put in 470 lights, on each of which the payment of 10*s.* was due.

His Lordship: Unless you can show, Mr. Terrell, that the work has not been done I do not see that you have any answer to the case.

Mr. Terrell pointed out that the mains were not complete or the distribution and switchboards. Was he to pay the entire contract price which this 10*s.* per lamp worked out to when the work had been only half done, merely because the plaintiffs had put in the branch wiring?

His Lordship: Yes, that is what the contract says. You may have made an improvident bargain, but there it is.

Mr. Terrell argued that the construction his Lordship was putting on the contract was an improper one, and gave the plaintiffs right to payment for the entire contract, though they had completed only a part of it.

His Lordship: I think they are entitled to say, "We have done the branch wiring of so many lights. Therefore you must give us the full amount."

Mr. Terrell: That means I have got, in your Lordship's view, no defence.

His Lordship: That is so. The case was therefore decided on the point of law on the construction of the contract, and his Lordship entered judgment for the plaintiffs for 100*l.* and costs.

In a second action in respect to a bill of exchange for 30*l.* judgment was also given for the plaintiffs. Execution was stayed with the view to an appeal on the defendant bringing the money into court.

**CONSECRATION OF KILBOURNE CHURCH, IRELAND.**—The consecration of Kilbourne Parish Church took place on the 25th ult. The new sanctuary is from the design of Mr. William Henry Hitch, Cork. It is built of limestone.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

4,053.—APPARATUS FOR DOORS AND GATES: *J. P. O'Neil*.—The apparatus for automatically closing and opening the gates and doors of lifts, wells, railway crossings, and so on comprises a hollow sleeve, with ball bearings that project from the cage between brackets, in which are squared holes wherein will slide a rectangular shaft about which the sleeve freely turns. Two side-studs on the shaft engage with two grooves cut in the sleeve, and a spring is inserted between the lower bracket and the enlarged end of the shaft. When the cage has reached a floor it is struck with a foot, which, as it pushes the shaft upwards, causes the sleeve to turn, and so opens the door; but with the ascent of the cage the door becomes closed as the spring presses the shaft downwards again. For gates at railway crossings and elsewhere is devised a rod having spiral grooves that engage with a sleeve which lifts will lower and raise.

4,062.—A LIFTING-DOG FOR USE WITH CRANES: *T. B. Mackenzie*.—The inner ends of levers that are pivoted upon a frame are linked to a block in which are pulleys, around which the lifting-ropes are passed; a rope that opens and shuts the dog joins the frame to a pulley, and a third rope from the winding-drum is passed around that pulley, one end of it being secured to another drum which lifts and lowers the pulley for opening and closing the dog.

4,084.—AN APPLIANCE FOR A MITRE PLANING MACHINE: *R. Connor and T. Connor*.—Fences that may be clamped with set-screws receive the mouldings of which the ends are worked with a plane fitted with two irons that are set so as to cut in both directions, a power-driven crank and connecting rod reciprocate the plane.

4,088.—A BAND-SAW SETTING AND SHARPENING MACHINE: *O. C. Pendleton*.—Two spiral files which will sharpen and set the teeth of band-saws at one time are rotated in opposed directions with hand-turned bevel-gearing, as the saw is held at the sides with a pivoted frame, and at the back with an adjustable groove piece. Cams upon the axis move two pivoted arms which set the teeth, and when one pair of teeth have been filed and set the movement of an inclined plane upon the teeth feeds the saw another step forward.

4,102.—WELL-DOORS OF LIFTS: *H. Kuntzig*.—As the cage approaches a landing in its ascent a spring at its top engages with a catch that projects from the sliding door, which is thereby lifted. With the continued ascent of the cage the catch is forced out of its engagement into a recess in the door, so that the door will fall through its own weight. For the descent of the cage a sliding catch which is fastened to the door with a rope passed around pulleys will engage with a catch underneath the cage.

4,114.—AN ARTIFICIAL STONE FOR BUILDING-BLOCKS, &c.: *A. Denayer*.—A compound is made of ground sand, gravel, asphalt, lava, granite, porphyry, calcareous stones, sandstone, and similar mineral or organic substances, mixed up with colloidal calcium silicate, which is obtained by the double decomposition of some alkaline silicate with calcium hydrate or chloride, &c.

4,163.—AN ELLIPSOGRAPH: *A. E. Holtchiss*.—In this instrument, which is adapted for both drawing and cutting ellipses, an arm that has two fixed points which will slide along slots cut at a right angle carries the pencil or cutter; a protractor that turns the instrument, to one side, together with the handle, of the ellipse, and the other side joins the slotted arms. In one shape the extended describing-arm is graduated in both directions from the zero-pivot, in order that when the holder is shifted from one side to the other one may describe ellipses having their principal axes at 90 deg. For describing circles a screw can be depressed into a recess cut in the zero-pivot, and for cutting glass a wheel, or a curved blade, can be fixed to a support; the wheel and two supporting wheels may be mounted upon castor-hangers.

4,166.—A COATING OR MATERIAL FOR FIRE-PROOF AND ACID-PROOF PURPOSES: *E. W. Engels*.—Carborundum, produced with an electrical furnace, is combined with the Diasa stone, firebrick, or other body which is to be treated by means of either rubbing the carborundum into the moulded, but unbacked, articles, or applying it, together with boric acid, water-glass, and so on, to the articles when finished, baked, or dried. For binding purposes the carborundum should be made up with the dolomite, clay, or other materials out of which the bricks or blocks are moulded. (See also No. 24,378 of 1898.)

4,172.—FEED MECHANISM FOR CIRCULAR SAWS: *J. Gruban*.—The side of the wood is pressed against by the feed-roller, which is carried upon the lower end of a vertical axis that is turned with bevel-gearing, and an axis passed through a radial arm from another vertical axis carried by a pedestal attached to the saw-bench and driven with toothed gearing and a belt from the saw spindle. A screw serves for adjusting the length of the radial arm, whilst the axis that is passed through the radial arm slides lengthwise in a pinion. The feed-roller can be set anglewise by turning it about that axis.

4,181.—AN ADJUSTABLE HINGE FOR GATES, DOORS, &c.: *H. A. Eckley and J. Frankham*.—Two pieces constitute that part of the hinge which is clamped on to the foot of the gate-post, and sliding cross-pieces are clamped together in position with a bolt for the adjustment at any distance desired of the jaws which clamp the gate-post. Slotted holes in the jaws admit of the gate being lifted after it has dropped, and there are slots in the jaws and post through which the bolt is passed. In some instances the upper hinge may also be rendered adjustable in the manner described.

4,220.—PIPE-WRENCHES AND SIMILAR TOOLS: *J. H. Condy*.—The jaws are fashioned in one piece with the handles, that are pivoted together with bolts inserted through plates and with a lug that engages with a notch, whilst a sliding-piece fitted with a set-screw holds the handles asunder; a projection from the one jaw fits into a groove cut in the serrated piece, and in one shape the serrated piece or jaw becomes wedged into its place more firmly by means of the action of the projection, which is formed dovetailed in section and tapered lengthwise. The invention includes other modes of keeping the jaws held in position.

4,237.—A COMBINED STRAIGHT-EDGE AND RULE: *T. Berry*.—The two portions of the rule are hinged together so that they can form a square by being set at a right angle, a spring at the hinge keeping them in the position desired; upon one of the arms is mounted a level protected with a shield.

4,244.—THE HARDENING OF BLOCKS MADE OF ARTIFICIAL STONE: *R. Fineman*.—The hardening chambers are mounted upon trolleys that run upon rails, and clamps secure their removable ends; the pierced steam-pipe is affixed beneath the table upon which the blocks are stacked, and the exhaust steam is conducted from the dome to another hardening chamber; the chambers are run away upon rails while the process is being completed.

4,288.—DRAWING COMPASS: *E. Baden*.—Screws are used for pivoting the legs in a forced socket, and links join them to the handle which slides within the socket, space being given for the links by means of recesses cut in those parts of the compasses.

4,453.—JUNCTIONS FOR DRAIN AND OTHER PIPES: *J. J. Robins*.—For facilitating the joining of lengths of pipes they are fashioned with flanges (to be fastened with rivets or bolts) that are formed on to a flared-out portion at one end and on to the socket at the other end; the flange at the spigot end of the adjacent length fits into a recess, and the joint is tightened with caulking.

4,460.—ALARMS—FIRE AND BURGLARY: *F. W. Skinner*.—A liquid is filled into the upper one of two divisions of a reservoir which is carried upon trunnions so that it shall retain a check pawl in gear with the clockwork. With a reduction of the air-pressure in the other and lower division, the liquid will flow through a siphon from the upper division into the lower one, and as the reservoir thereby turns into a vertical position, it liberates the check pawl and sets the clockwork in motion and causes it to turn the arms, upon which are mounted two spring-supported balls which forthwith strike the alarm bell. For the bell may be substituted an electrical bell and the clockwork can be arranged for closing circuit. For a fire-alarm, the pressure in the lower compartment of the reservoir is reduced by means of a piston which a cylinder will draw down as the contained volatile liquid becomes heated, whilst for a burglary-alarm a rod, that is joined to a door or window, is adopted for drawing down the piston.

4,470.—CUTTERS FOR WORKING STONE: *H. Koch*.—By this convenient and stone-cutting machine cutter can be ground upon the machine; bearings upon the cutter-frame hold a shaft upon which are mounted the grinding disc and its pulleys, a holder and blocks or brackets on the table hold the cutter which the table feeds beneath the grinder.

4,405.—COVERINGS FOR WALLS AND CEILING: *J. R. Nesbitt*.—Raised ribs that will register with one other as the sheets are laid side by side are embossed or otherwise formed upon sheets of some ornamental material, the ribs have recesses at the joinings of the sheets which take ornamental one-shaped plugs or buttons to which pins or spikes are affixed.

4,498.—BUTT-AND-FLANGE JOINTS: *A. Barr*.—The invention relates to a coupling for pipes of metal and articles of some such fragile substance as pottery or glass; an india-rubber or other soft piece is fitted on to the pipe or nozzle which is swelled out at its ends, the flanged pipe is joined by drawing the glands or collars together with bolts, one collar may be secured to the flanged pipe, and a separate packing ring can be used between the pipe ends.

4,510.—PARQUETRY FLOORING: *C. Schultze and A. Hartmann*.—Boards or planks, having the annual growth-rings or end-grain exposed for the wearing surface, are made by fastening battens and cubes together; the boards are steeped in linseed oil, and are either secured in position with spikes or loosely laid down upon the girders or joists.

4,533.—A MACHINE FOR PLANING OR FRENCH-POLISHING WOOD: *W. Kerr*.—A slide, which is reciprocated by a crank-disc and a connecting-rod, takes the wood between its two stops; in the case of planing, the wood, as it is moved in one direction, is planed with a hand-plane which is held against a stop-bar; for French polishing the stop-

bar is discarded and the workman presses the polishing pad against the board as it is being reciprocated; a radial slot serves for the necessary adjustment of the crank-pin.

4,537.—A BASCULE LIFT-BRIDGE: *J. P. Cowling*.—The axle of each span is adapted to turn in bearings secured to a very strong framework which rests either directly upon the pier or upon a cradle; on the bearing surface of the cradle is a set of rollers, and the larger portion of each roller receives the pressure of the bearing surface of the span; side-plates join the rollers, which are also guided by flanges on the back that is allied to the bearing surface and is worked with a pinion; a counter-weight is supplied, and an adjustable piece secured to the cradle takes the lower part of the span.

4,552.—JOINTS FOR PIPES: *S. R. Dresser*.—In the case of a spigot and socket joint one section of the pipe is flared at its end in order that it may take a bead upon the other section. The coupling-ring that fits against the bead is tightened with bolts to another ring, whilst a recess in the coupling-ring receives the packing-ring. In a variant shape both the pipes have beads, and coupling-rings bolted together keep a sleeve and the packing-rings in position. For wrought-iron pipes the coupling-rings are not split, and when they have been put around the pipes the beads are spun or formed upon the pipes.

4,567.—A CRAMP FOR WOOD-WORKERS' USE: *J. W. Phillips*.—Two jaws that slide between parallel bars are fixed to cross-bars, one jaw is adjusted with a screw and the other jaw with a pawl that engages with teeth upon the middle bar or otherwise; the base of one jaw is passed underneath the middle bar, bearing against it as pressure is employed, so as to relieve the strain upon the pawl and other portions of the tool.

4,570.—AN APPLIANCE FOR USE WITH CRANES: *W. H. Vaughan and T. Foster*.—For the automatically stopping apparatus of overhead cranes worked with electricity a single-toothed pinion is mounted upon the axle of the barrel of the crane, so that it shall drive a wheel, of which the projecting pin and roller will impinge against and work the cut-out lever in the event of the rope being overwound.

MEETINGS.

SATURDAY, JULY 6.

*Institution of Junior Engineers*.—Visit to the Staines Reservoirs Works, under the guidance of the joint engineers, Messrs. Walter Hunter and R. E. Middleton, Mill Inst. C. E. Train leaves Waterloo (South-Western Railway) at 1.25 p.m.

*St. Paul's Ecclesiastical Society*.—Visit to the Church and Ancient Rectory House of Southfleet. Train leaves Holborn at 2.25 p.m.

*Northern Architectural Association*.—Annual excursion, Edinburgh.

MONDAY, JULY 8.

*Clerks of Works Association*.—(Monthly meeting, Carpenters' Hall), 7.30.

TUESDAY, JULY 9.

*British Association of Waterworks Engineers*.—Annual general meeting, to be held at Birkenhead.

WEDNESDAY, JULY 10.

*British Association of Waterworks Engineers*.—Annual general meeting (continued).

THURSDAY, JULY 11.

*British Association of Waterworks Engineers*.—Annual general meeting (continued).

FRIDAY, JULY 12.

*British Association of Waterworks Engineers*.—Annual general meeting (concluded).

SATURDAY, JULY 13.

*Architectural Association*.—Visit to Madmenham Abbey, &c., and "Danesfield." Great Marlow, by permission of the architect, Mr. W. H. Romaine-Walker. *Institution of Junior Engineers*.—Visit to the Mill-wall Lead Works. 3 p.m.

SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses. Any communication to a contributor to write an article is given subject to the approval of the article, when written by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and sent to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.] \* Denotes accepted. † Denotes provisionally accepted.

### Portland Cement Testing.

THE more one comes in contact with those who have to do with the using of cement, the more one is struck with the want of knowledge of the characteristics of

it, and the points to be observed in so using it, that its good qualities are not killed or impaired in the using. It is not at all an uncommon thing to see a large heap of cement gauged, and, after using a portion of it, the remainder allowed to rest for periods amounting sometimes up to perhaps twenty-four hours; then being worked up again with more water and used in the work in a sort of blissful or innocent expectation that, although the cement has been killed, and therefore rendered nearly useless, it will somehow harden and do the work it has to do. This is, of course, as a rule done in ignorance. Such killed cement may, and probably does, harden to a certain extent in course of time, but if it has to carry what it has to carry in a very short time, a grave risk is run of its failing and probably entailing a large amount of damage and cost. Again, in talking to engineers, surveyors, &c., if the question is asked as to whether they test the cement they use, the answer is frequently given that it is not necessary, as they only buy an approved cement. This answer is of course given through ignorance of the amount of care and trouble that must be taken to ensure good quality, and that the failure or neglect on the part of any one of a considerable number of men may result in a cement of bad quality.

The quality of Portland cement depends on three or four conditions in the process of manufacture, as follows:—

First, the raw materials must be mixed in such a proportion that when the cement is finished it shall contain about 61 or 62 per

cent. of lime; and although the arrangement as to proportions of the different raw materials may be in the hands of reliable and responsible men, the actual weighing, measurement, or mixing of them is nearly, if not quite, always in the hands of the ordinary day labourer. Should there be any fault in this mixing, what may be the result? Supposing that the mixing is irregular, the proportion of lime may vary 5 or 6 per cent., or even more, with the result that some of the cement may be over-limed to a dangerous extent, while some of the other may be under-limed to the same extent. The question then rises as to how this affects the work, and points to the necessity of the user testing all the cement he has to use. Instead of the irregularity mentioned, it may be that the cement is by accident or neglect regularly over-limed for a considerable time, and this over-limed cement reach the hands of the user. If it is not tested by him before using, but is put into its work either in concreting or plastering or the jointing of brickwork, the tendency that it has to swell and crack through its being over-limed must necessarily in all cases lead to trouble, cost, and probable danger, which could all have been prevented had the user tested the cement, as every user, whether of large or small quantities, should do. Through this want of testing one hears of such things as concrete swelling or rising up after a large amount of brickwork has been put on it, necessitating not only the concreting being done again, but the pulling down and rebuilding of all their brickwork. One hears of walls of buildings being pushed over by concrete floors swelling, which also could have been prevented had the cement been tested by the user. Probably this testing is often neglected through the user having the idea that in order to test the cement it is necessary to have an elaborate plant and fine laboratory, and that it needs an expensive tester to carry out such tests. This, however, is not so. With proper plant, which at the most need only cost say under 20l., an office boy or labourer

with ordinary common-sense can do all that is necessary, and the cost of the plant would naturally be saved if only one job was prevented from being spoilt by its use. If this cost is more than the user wishes to go to, it can be very considerably cut down by leaving out some of the testing plant and putting up with such testing apparatus not being so complete. This, of course, would not be so well, but could at any rate be complete enough to prevent such damages as mentioned above. There are also one or two simple tests that can be made practically without apparatus to prove the soundness of cement, viz., its not being over-limed. Cement mixed with water to about the consistency of treacle is poured into a bottle, such as a medicine bottle, and shaken until it overflows. This bottle is then placed on one side. If the cement is over-limed, or even if the proper grinding and amalgamation of the raw materials has not been made, the cement in the bottle will, after a length of time, varying according to how much that cement is over-limed or how badly ground and mixed, split the bottle. If, on the other hand, the cement is under-limed, the cement in the bottle will contract and become loose in it. This shrinkage is, of course, not so bad a fault as the expansion of it from over-liming, but for all that it is most undesirable, seeing that it is a sign of a weak cement and, as a rule, is of a bad colour. There is also another easy test for this, viz., as follows:—

Cement is mixed with water as before, but instead of placing it in a bottle it is put upon a shovel or piece of thin sheet iron, which in its turn is placed upon a fire, top of a boiler, or anywhere where the water can be quickly evaporated from it, care being taken not to have it hot enough to boil the water out. If the cement is a sound one it will remain solid and harden to a certain extent, but if over-limed or badly mixed, it will crack more or less, according to how bad it is. Another simple test is to gauge up a little cement to a very stiff paste, and put it, in the form of a pat, with its surface smoothed, upon some non-absorbent material

such as glass or slate. This should be allowed to set or harden in the air, after which a very good idea may be obtained as to its soundness by dipping the finger in water and passing it quickly over the pat in such a way as to leave some water on it, or a little water may be dropped upon it. If the cement is overlimed the water will be sucked in instantly; if it is about right it will be sucked in more gradually, taking, say, from three to six seconds to be absorbed, and if underlimed will take a correspondingly longer time to be absorbed. This pat may then, in order to obtain a more definite proof as to its soundness, be placed in water, where, if overlimed, and in a time varying according to how much overlimed, the pat will crack, and if bad enough, fall to pieces. These are simple ways of testing the cement that, as we said before, may be carried out by anyone, and yet will, if used, prove the most important point as to whether the cement may be used in work. If the complete plant is obtained for testing cement in the ordinary way, the test for soundness is made at the same time as the test for tensile strain.

The testing of the tensile strain is looked upon generally as the most important test, of all. In order to make this test, cement is gauged with water to a stiff paste and placed in a mould, where it is allowed to set. It is then taken out, and twenty-four hours after being gauged is put into water, where it remains for six days more. If it has not expanded, cracked, or fretted, it is then placed in machines for the purpose, and pulled apart, this giving the strength it is capable of showing. The usual test for cement is that it must show a tensile strain of not less than 350 lbs. or 400 lbs. per square inch, the 1 in. square being now the usual section tested. There is another system sometimes used for making these moulds, which is known as the Arnold system. In this test the proper quantity of cement necessary for making the briquette is weighed, and is put into a mould of twice the depth of the briquette required. A die of one-half the depth of the mould is then placed upon the top of the cement in it, and is forced down by a powerful screw until it presses it to the 1 in. depth needed in the finished briquette. The mould altogether is then placed under water, and the cement takes up whatever water is necessary. The briquette is then taken out and treated in exactly the same way as the hand-gauged briquette. This test, although brought out much later than the hand-gauging, has not become very popular, although, looking at it generally, it obviates a number of faults that are found with the hand-gauging. For instance, different operators with hand-gauging make a very large amount of difference in the test a briquette will stand, as the hand-gauging is more or less thoroughly done. It also shows in one-third of the time any sign of cracking, and therefore the proof as to the cement being sound or unsound is much sooner arrived at. In addition to this test for soundness there is also another, which, however, has so far not become popular or common, probably because there are so many ways of carrying it out, and no agreement as to a standard arrangement of it. This arrangement consists of gauging the cement and putting it into water for a certain time, the temperature of

this water being increased to anything between 160 deg. Fahr. and boiling point. Another arrangement is to place the cement sample, after gauging, in water at 110 deg. for twenty-four hours, when, if unsound, it will show signs of cracking; and still another is to put the pat or briquette in cold water, raise it gradually to boiling point, and keep it there for two or three hours.

The above deals fully with the checking of the mixing of the raw materials and thorough amalgamation of them, and also as to whether the proportions are correct; and, as mentioned earlier, as ordinary labourers have the control to a very large extent of this part, as well as the rest, of the process, it is of no use whatever relying upon the name of any firm as a guarantee that the work has been thoroughly done; and the need is again emphasised of all cement being tested by the user before it is put into the work, instead of trusting blindly to the fact of its having been supplied by a good maker as a proof that it is a sound cement.

The second point on which the quality of the cement depends is as to whether it is properly burnt—or, in other words, whether all the carbonic acid gas has been driven off and the resulting mixture brought to the state of semi-vitrification necessary.

This is rather a difficult matter to prove. Until the present fineness in grinding was arrived at, the weight per bushel of the cement, the measure being filled in a particular way, was the accepted test; but, seeing that this weight per bushel varies, even with the same cement, to an enormous extent, by difference in grinding, it is of little use. That this difference exists may be understood when it is noted that, taking the ordinary cement as 100, impalpable flour of the same cement would weigh only about 60, and residue about 130. Provided the percentage of lime is not raised to a dangerous figure, the presence of a small amount of cement that is not thoroughly burnt does not do much harm; but if the percentage of lime is high, the cement will have a tendency to crack and swell through the presence of this under-burnt. The tests already given will, however, be to a certain extent a guide as to this burning being perfect enough.

The third and last condition as to the quality of the cement is that of the grinding, and this, although it does not affect the question of the soundness, has quite as great a bearing in the matter of the cement giving the strength and hardness for which it is calculated and placed in position.

There are a number of different grinding machines used by different cement makers, and each of these machines has its own effect in the reduction of the cement clinker to the marketable form. It is, however, generally admitted that practically the only part of the cement as bought that is of any value in the hardening and holding together in the work, is that part that has been reduced to such a size and form, viz., that of impalpable powder, as to be soluble or capable of being acted upon by the water. The part that is not so capable of being acted upon, which in the trade is usually known as "residue" from the fact that it is what is left upon the fine sieves when cement is tested on them, consists of small pieces of clinker, and as a proof that the residue is valueless and is not affected by water when

in the form of residue it has been stated that briquettes made with neat cement and tested and stored away for months, have on being reground (such regrounding probably reducing some of the residue contained in the original cement, which was evidently unaltered in the original gauging to its flour or cementitious form), and without reburning, have stood, when gauged a second time, a very considerable tensile strain, approaching very closely to what the briquette originally stood. This agrees perfectly with the results as shown by the new method of testing cement for fineness, which proves that cement as sold on the market varies in proportion of flour or cementitious matter from 50 per cent. down to as low as 20 per cent. The residue, although inert, as long as it remains in the form of residue, or small clinker, is of very little more value than sand, and is not influenced or altered in any way by being brought in contact with water, or even if soaked in it, as shown above. If, however, this residue is ground down to impalpable flour it probably constitutes the best of the cement.

The old test for fineness was to put a certain quantity of cement through a certain sieve of known mesh, usually one of 2,500 holes per square inch or 5,800, and the usual percentage of residue left on these sieves was 2 or 3 and 5 to 8 per cent. respectively.

It has been perfectly understood that this testing of the size of residue as a proof of perfection of grinding did not meet the case, as, even with the finest sieve procurable, a very large proportion of the matter that went through with the flour was only residue, and practically of no more value than the larger residue that would not pass through the sieve, and hence this proportion left on the sieve was not a guide as to the proportion of cementitious matter or impalpable flour that it contained, and its consequent value.

There is also no doubt that although the tensile strain and soundness tests are of the most important in testing cement, the test for proportion of flour is also a very important one, especially seeing that it governs to a very large extent the tensile strain, and a low tensile strain may often be explained by the fact proved by the Flourometer test that the cement is deficient in flour, viz., has not been ground sufficiently well to reduce the necessary proportion to an active state, and is therefore no better than a cement that has been very heavily adulterated, this disadvantage being emphasised by the fact that the adulterant has been paid for at the full cement price instead of the few shillings per ton ordinary sand (which would be quite as valuable) would cost.

In one of the new systems of burning, about which a great deal has been said and a great deal prophesied, it is rumoured that the resulting clinker, which comes out in small nodules, and apparently in a very advantageous shape and size for grinding, is really so hard that it is almost impossible to get the proper proportion of flour, as the grinding efficiency of machines generally used for this is reduced by some 50 or 60 per cent, and even with that reduction in output of grinding plant the cement that is put into the warehouse from it is so deficient in flour that the tests are very much lower than they should be.

Without this fineness test it is, therefore, seen that the manufacturer may be blaming

the proportion of lime contained in the cement as the reason for the low test, when it may be that this is perfectly correct, but that the fault is in imperfection of grinding. In the same way the user may put the cement down as being inherently weak cement when, after all, its failure is only due to the fact of the large proportion of residue contained in it, such residue being the same as a common adulterant. A cement that contains only 20 per cent. is naturally worth not nearly so much as a cement containing, as it should do, 40 per cent. or more, and it is suggested that all buyers should take particular care to see that this condition as to the proportion of flour should be taken into consideration with the price.

To sum up the whole of this article, what is intended to be advocated is that the old principle of trusting to a cement maker to send good cement is played out, and that although at times it may be necessary to send cement to some professional testers to confirm a test, as a rule it is absolutely necessary for any engineer who puts in work with cement, or any user who has to depend on the quality of the cement being right, to keep clear of damages and trouble, and, in fact, every one who is interested in the using or buying of cement, to test it more or less systematically for themselves before they use it; and it is hardly necessary to point out that there are a number of engineers and contractors who have had trouble and cost through cement not being so tested, the loss of money on one such job often having been large enough to pay the entire cost of such testing for a lifetime, even leaving out the fact that the engineer's or contractor's name must necessarily be damaged to a certain extent by his being associated with work that has failed or given trouble through the material not having been of good quality.

NOTES.

A GOOD deal of unreasonable outcry has been made about the temporary Education Bill which occupied the House of Commons on Monday and Tuesday last. It might have been more businesslike if the Government had been satisfied to pass a short Act leaving the School Boards to continue their higher work during the winter without reference to the Local Authorities. But School Boards, as every one knows, were created to manage elementary and not technical education, which has for some years been part of the business of Local Authorities. Nor can we think that School Boards, where they carry on higher or technical education, for the next few months are likely to have a real difficulty in making satisfactory arrangements with local authorities. The main point, which all interested in education now desire, is a good system of secondary and technical education, and that is a task which it is to be hoped the Government will take up next Session. We fear, however, that the present Parliament has no real interest in the subject.

The View from Richmond Hill.

SIR WHITTAKER ELLIS is doing a good work in trying to preserve the view from Richmond Hill, and to prevent what is known as the Marble Hill Estate from being built over. No effort should be spared to preserve these

open spaces and fine views—they can never be replaced—and very often the way in which open spaces are being lost is scarcely appreciated. Not long since the estate in question could have been purchased for 70,000*l.*, and the London County Council had the question of a contribution under consideration. Meanwhile Sir Whittaker Ellis appealed for assistance towards the sum of 7,000*l.*, upon payment of which sum the owner was to keep the property of the market until further notice, but this undertaking seems now to be withdrawn. It would be a reasonable and patriotic thing for some rich man to purchase the whole estate and present it to the public, but English millionaires are less liberal than the American, who positively vie with one another in their efforts to spend money for public uses.

The Electrification of the Underground.

THE passing of the preamble of the Metropolitan District Railway Bill by a Parliamentary Committee brings us within measurable distance of electric traction on the Underground. It was stated by counsel that the District Company were losing 800*l.* a week and the Metropolitan 1,000*l.* a week by the competition of the Central London Railway. It is not to be wondered at, therefore, that they have at last recognised the necessity of adopting electricity as their motive power. Unfortunately each of the companies favours a different system. Whilst the District Railway wants to adopt the Ganz method of utilising high pressure three-phase alternating currents, the Metropolitan Company desire the ordinary third rail 500-volt system. One of the reasons apparently why the latter company wish to adopt the lower pressure is that they believe that the Board of Trade is not prepared to sanction the Ganz system until it has been experimentally tried on the Metropolitan Railway, and this cannot be done in the time at their disposal. We are glad that a proviso has been inserted in the Bill that in the event of the two companies failing to come to an agreement within one month, then the Board of Trade is to appoint a special tribunal to decide the question. Major Cardew, who was at one time electrical adviser to the Board of Trade, has made a careful inspection of the experimental line at Buda-Pesth constructed by the Ganz Company, and has reported most favourably on it. This system is to be used on a full-gauge railway 110 miles long in the North of Italy, most of which has now been constructed. The current is generated at 20,000 volts and is conveyed at this pressure to the power stations along the line, which are ten miles apart. It is then transformed to 3,000 volts at which pressure the two trolley wires are charged. The current is collected from the wires by two sliding shoes which are pressed against them by the trolley pole, and the three-phase motors on the locomotives work directly at this high pressure. The first cost is small and the efficiency of the whole arrangement is very high. The motors will work both in series and parallel equally economically, and hence the trains can run economically at all speeds. Also if they require to stop suddenly, energy can be restored to the line. If electricians can manage to cage in the high pressure so as to make it almost absolutely safe, then the Ganz system would be an admirable one.

Curious Effect of Lightning.

A LETTER by "L. H." in Wednesday's *Times* describes the somewhat disastrous effects produced by a lightning discharge in earthenware sewer and drain-pipes during a thunder-storm at Camberley on June 29. Some of the discharge got access to the sewer by an ordinary wrought-iron ventilating column surmounted on the top by the usual galvanised wire balloon. The drain-pipes from a neighbouring man-hole to the ventilating shaft were blown to fragments and several yards of the sewer and of two pipes draining into it were destroyed. The walls of the man-hole which was 3 ft. deep were completely shattered and it had to be rebuilt. "L. H." raises the question of whether ventilating shafts are a source of danger. That they are a possible source of danger this accident proves, and it may be worth while taking precautions against lightning in special cases. The path of least resistance of the discharge to earth was down the iron ventilating shaft into the sewer, and then along the water in all directions, apparently even branching off into drain pipes. The discharge obviously decomposed some of the water, and the gas caused an explosion, either by its sudden generation or by its ignition, or probably by both. We have noticed in a thunderstorm at sea that where the lightning struck the sea a narrow column of water or steam several feet high seemed to rise, not unlike the splash made by a gannet when diving. As the discharge in this case could distribute itself throughout the immense volume of a good conducting liquid, and yet on impact caused some kind of explosion, it will be obvious that when confined in narrow drains it could easily do great damage. The accident at Camberley would probably not have happened if the thunderstorm had not been preceded by a long spell of dry weather, making the earth round the pipe a very poor conductor. If the ventilating column had made good contact with earth, or if it had been connected by a wire rope to a water-main, this would not have occurred. It might even be advisable in very special cases to use an earth plate like a lightning-conductor. If galvanised iron were used the cost would be very small.

St. John's (Parish) Church, Hackney.

THE repair of the fabric of St. John's (Parish) Church, this church is about to be undertaken, the eight bells and the belfry will be put in order, and electric light is to be installed. The erection of the church was begun on the north-east side of the earlier and later graveyards, from Spiller's designs, in May, 1792. Soon after its consecration on July 13, 1797, the old church, originally dedicated to St. Augustine, of which the nave and chancel had been rebuilt in 1517 by Sir John Heron and the Rector, Christopher Urswick, was pulled down—with the exception of the fourteenth-century tower and Sir Henry Rowe's Chapel (1614). The present church is remarkable for its square plan, having a projecting face, 21 ft. in depth, to each elevation, as well as for the large area at the cross, 63 ft. square. A pediment surmounts the projecting face on each elevation; the windows and doors are set in arched recesses; around three sides of the interior, which measures 105 ft. each way, is a gallery carried by Doric columns. In 1812-3 were added the steeple and five entrance porticos.

Messrs. DOWDESWELL have at their Gallery in New Bond-street a collection of "Pictures

by Old Masters" the property of a Parisian gentleman who is, we presume, disposing of them. They represent rather out-of-the-way "Old Masters," and the majority of them are more curious than beautiful. There is however an undoubted Rubens, one of those monochrome studies with the general style of one is familiar; and this one is a Bacchanalian subject; and there is a half-length portrait by Goya, of his son; also a full-length portrait of an Alcalde of Madrid attributed to Goya, but which, though a good picture, is more hard in texture and less free and broad in style than is usual with that painter. A hard but brilliant flower-piece by Adriaenssen is of some interest, as also two large paintings by Guardi, "The Marriage of the Adriatic" and "The Return from the Festival," in the latter of which are some bits of architecture in Guardi's best manner. A far more interesting collection, however, is that in the front room, of the water-colour paintings by Miss F. Fortescue-Brickdale, exhibited under the collective title, "Such stuff as dreams are made of." These are somewhat mystical paintings and contain, for works of art, too much of what is sometimes called the "literary element"—pictures with a moral which requires in most cases the explanation of the catalogue, and as a mere matter of design few of them can be called beautiful; but they have another element of beauty, that of colour, in a very high degree, and in many of them there is a great deal of intellectual interest and power in the manner in which a satire or a moral is conveyed. Among these may be mentioned especially "Riches" (15), a poor man and woman with their infant—a fine composition too; "Yesterday" (7) a figure who takes off a comic mask and looks back with a solemn expression—this also is one of the best in a pictorial sense, and is a very striking composition; "I have married a wife and therefore I cannot come" (9); "With the bean-flower's boon" (16), a study of a girl seated under trees amid flickers of sunlight; "If I say, peradventure the darkness shall cover me" (27), a cloaked ruffian crossing a bridge by night with a dagger, and startled by the supernatural light emanating from a crucifix; "The Friend" (29); "The Reward" (39), and "Thou fool, this night thy soul shall be required of thee" (44). These latter three, besides their power of execution, are very keen satires on life, the text to No. 44 being given a quite new and startling signification, a puzzle evidently to some of the visitors; we will not give the explanation; it ought to be obvious. We regret that owing to accident we neglected earlier to notice this rather remarkable exhibition, which closes to-day (Saturday); those of our readers who see this in time may be recommended not to omit a visit to the collection before it closes.

"GILLOW'S," OXFORD-STREET.—Some extensive alterations of their premises have been carried out by the representatives of this old established firm, including the incorporation into one of the two houses in Oxford-street which, together with the factories, were built from the plans and designs of Thomas Little (1802-50). The firm was established more than one hundred years ago as decorators and house furnishers, and, we believe, possess the original drawings by the Brothers Adam, Hepplewhite, Sheraton, Chippendale, and others whose designs they have used during that period.

#### LETTER FROM PARIS.\*

The general meeting of the thirteenth Congress des Architectes Français was held on June 29 in the banquets of the Ecole des Beaux-Arts at Paris, and the Société Centrale des Architectes Français distributed the various awards which each year are devoted to architects and others connected with architecture, art, and construction. The Ministers of Commerce and Public Instruction and Fine Arts were duly represented.

MM. Boileau and Poupinel read the Annual Report and distributed the awards, of which the following are a few:—The Gold Medal of Honour was awarded to M. J. Martenot, architect, of Rennes; the Silver Medal for Domestic Architecture was awarded to MM. E. Bruneau, architect (of Paris); J. Hermant, architect (Paris); and Mellet Frères, architects (Rennes). The Medal for Archeology was handed to M. E. Pontremoli, architect (Paris); that for Jurisprudence to M. A. Goualt, architect (Paris); the Medal for the Ecole de France at Athens was awarded to M. Mendel, student of the Ecole at Athens. M. Chaussepied of Quimper, carried off the Medals for Studies of French Monuments; M. G. Lefort, pupil of MM. Guadet and Paulin, took the Medal of the Ecole des Beaux-Arts, and MM. Wielhorski and Faure the medal given to students of the private schools of architecture. Medals were awarded to several employees of architects and the building trade, to pupils of the various schools of industry and art, and a large number of silver medals to various workmen and others who have called for special remark in their work on various buildings. A brilliant banquet, presided over by M. C. Moyaux, President of the Société, and assisted by the representatives of the Ministers of Commerce and Fine Arts, took place in the evening at the Hotel Continental.

The competition called "Concours des Façades" is now open amongst architects and owners of houses erected at Paris in 1900. The owners of the six premiated houses will be exempt from half the street dues pertaining to these houses, a gold medal will be awarded to each of the architects, and a bronze medal to each of the builders. The jury will be composed of five members of the Municipal Council, M. Bouvard, the director of the Service of Architecture, the city architect, and two architects to be chosen by the competitors.

The various works sent from Italy by the Prix de Rome students of the Ecole des Beaux-Arts were exhibited at the Ecole until July 6. M. Chafilot, a student of the second year, sends in some very complete and remarkably well-drawn studies: a fragment of the facade and the interior decoration of the Villa Medicis, a Mosque at Kairouan, the interior decoration of the villa of Pope Julius II. at Rome, and the actual state of the Trajan column at Rome. M. Garner (second year) exhibits drawings of the actual state of the Roman Forum and a scheme for an industrial agglomeration. M. Duquesne (third year) sends an interesting set of drawings of the Thermes of Caracalla. Among the sculpture exhibits were some works of a high order and of considerable individuality. The bas-relief by M. Vermare, entitled "Le Rhône et la Saône," deserves praise, since its author has kept himself free from commonplace and conventionality. The group by M. Champel entitled "Printemps de la Vie" is a graceful and well-executed piece of sculpture. We may mention also the "Temps Consolateur" by M. Grégoire. Among the paintings the most remarkable is certainly the "Poème d'Amour," being the legend of Orpheus and Eurydice, by M. Moulin, who has under this title exhibited a series of fourteen subjects arranged on either face of a large drawing-room screen. The forms are good, the conception poetic, and the author, without losing sight of the great traditions of the art, has endeavoured to show by his arrangement that the official instruction of the Ecole des Beaux-Arts may very well lend itself to applied art of a decorative or industrial character. Generally speaking the collection, notwithstanding some weaknesses pardonable in young artists, is very satisfactory.

We must mention, however, that one of the sets of drawings sent in by M. Tony Garnier, and entitled by him "Cité Industrielle," a rather clever design for a group of industrial

buildings, with studios, workshops, offices, and small buildings for housing the workmen, since the opening day of the exhibition disappeared from amongst the other drawings exhibited on the walls of the Salle Melpomène. This withdrawal was made by the orders of the Académie des Beaux-Arts, which looks with a very unfavourable eye on any attempts of the students to contribute any designs having a modern tendency as regards programme and construction. In fact the rules of the Académie allow the acceptance of works of archaeological interest only, such as measured drawings of old buildings or restorations of ancient or Renaissance monuments. Last year M. Duquesne, having sent in from Italy a design for a "Maison du Peuple," was severely reprimanded, and therefore did not contribute this year. The remainder of his studies for his design above mentioned. The matter has stirred up considerable party feeling at the Ecole, and a large number of the students strongly criticise the action of the Académie.

The Commission appointed by the Minister of Public Instruction and Fine Arts for the purpose of studying the question proposed by M. Stanislas Ferrand, M.P., concerning the creation of district schools for the study of architecture, has decided on the necessity for such schools, and the principle of their creation in the larger towns of France has been voted unanimously.

The Congress of the Société Française d'Archeologie has just taken place at Agen under the presidency of M. Lefèvre Pontalis. MM. Lucas, A. Besnars, and Guillard were sent as the delegates from the Société Centrale des Architectes. Interesting excursions were made to various parts of the district.

As a result of the campaign which has been made by certain syndicates against the employment of white-lead in the composition of painting materials, the Minister of Public Works has issued a circular to architects and engineers connected with his department instructing them to henceforth forbid the use of white-lead in all public painting work, and prescribing the employment of zinc-white in its stead. The Société Centrale des Architectes has, however, as far as it is concerned, informed architects and engineers generally that in the question of the employment of zinc-white in the place of white-lead is entirely left to their discretion, at the same time pointing out that, owing to certain dangers to workmen employing lead colours it would be well to favour the use of zinc-white in every case where there is no obstacle to its employment.

The decoration of the Grand Palais des Champs Elysees will shortly be completed by the addition of two quadrags of hammered copper, the work of M. Recipon, sculptor. M. Deglane, the architect of the Palais, has erected at the southern extremity of the building an immense scaffolding, by the aid of which the weighty pieces of the first of these groups will be raised to the roof. The mounting of the two groups, "Fame passing Time," and "Apollo as the God of Arts and Harmony, vanquisher of Discord," cubing over 200 ft. each, will take about three months, each piece having to be raised and put together separately.

The competition for the interior decoration of the Mairie of Asnières has resulted in the prize of 600l. being carried off by M. Bouvet, who is also entrusted with the execution of the work. Mentions were awarded to MM. Darrien and Schmitt.

The State has purchased the work exhibited by M. Chauvet in the section of Architecture at the Salon des Artistes Français, a series of measured drawings of the frescoes decorating the old Manor of Chaillat.

M. Pascal, the architect of the new portion of the Bibliothèque Nationale, intends placing the magnificent clock, which has been designed by the well-known sculptor, M. Barrias, on the portion of the building forming the angle of the Rues Colbert and Vivienne. The model from which the sculptors will work is quite ready and will be executed at once. The design has been already described in the *Builder*.

The sentence in the case of the responsibilities for the accident to the footbridge leading to the Globe Celeste at the late Exhibition, has been rendered as follows:—M. Galeron, architect, grantee of the Globe Celeste and general contractor for the footbridge; M. Tedesco, consulting engineer to the Globe

\* Unavoidably postponed from last week.

Celeste; M. Maltrai, manager of the Société du Bâton Armé, were all declared responsible for the fall of the construction, and were condemned, for homicide and injuries by imprudence, to two months' imprisonment with reprieve and 241 fine each. The Société du Bâton Armé was declared civilly responsible. The judges, when rendering the sentence, added that no aspersion was thrown on the perfectly honourable character of the three gentlemen. Appeal has been made from the sentence.

The Société des Beaux-Arts, under the presidency of M. Carolus Duran, has elected in the section of architecture MM. Louis Bigot, Jean Besnard, Gerard, and Sorel as Associates, and MM. Théodore Lambert, Sauvage, and Pierre Selmersheim as members.

The bust of the celebrated architect, Robert de Cotte, has just been placed in the large vestibule of the Bibliothèque Nationale. The bust, of white marble, is the work of the sculptor, Eugène Sollier. Robert de Cotte was official architect in 1708 to 1735. He undertook nearly all the important work of the time, and under the Regency prepared the transformation of the old Hôtel de Nèvers into the Bibliothèque du Roi. The fine building opposite the large courtyard of the Bibliothèque Nationale and the beautifully decorated small library on the first floor, as well as the large vaulted gallery devoted to engravings, are specimens of some of the best work of this architect.

The two Salons have closed their doors, and the architects of the Grand Palais are now at liberty to complete the final work on their monument. It is the same with the Petit Palais, where the "Exposition de l'Enfance" is also finished, and M. Girault will now be at liberty to carry out the installation of lighting, warming, and interior arrangements generally. The Municipal Council, before this session is over, is to give its long expected decision in regard to the future use of this fine Palace, so appropriate to the purposes of an artistic museum. The Council intend to purchase the fine group in gilt bronze, by Frémiet, of St. George and the Dragon, and to place it in the centre of the principal gallery, which is to be decorated with allegorical paintings and tapestries, and to receive the collection of sculpture belonging to the city. If the Council agrees before separating to use the building as the Art Museum of the City of Paris, the inauguration of the Museum may take place by the end of next year.\* The Champs Elysees is now restored to its normal condition; and the Cours la Reine, which was so laid waste by the great exhibition, is now getting put in order again, the flower-beds laid out anew, and the trees replaced. The Administration will take advantage of the occasion to form a large aquarium in the gardens of the Trocadero.

The Municipal Council will also have to decide shortly on the position of the monument which a public subscription Committee wishes to raise to the memory of Pasteur. This monument, entirely of marble, was left unfinished by Falguière. M. Victor Peter has completed it, under the direction of M. Paul Dubois. The seated figure of Pasteur is placed on a pedestal, decorated with various allegorical groups of fine character, though of great simplicity of design. It is probable that this monument to the illustrious savant will, according to the wish of the committee, be placed at the intersection of the Boulevard de St. Michael and the Rue Medicis, on the axis of the Rue Soufflot; that is to say, in the very centre of the scholastic quarter, near to the Sorbonne and to the scientific establishments where Pasteur taught, and opposite to the Pantheon, where his remains would have been laid had he not formally expressed a wish to repose in the institute which he founded in Rue Dufot, and where M. Girault has built a fine crypt decorated by M. Olivier Merson.

The Municipal Council is in some difficulty about the monument to Alphonse Daudet, which it has been proposed to erect in the Champs Elysees. The Parc Monceau, which had been thought of, is already full of commemorative monuments, which are half hidden by the shrubbery. But the Champs Elysees, already encumbered by pavilions, cafés, and establishments of all kinds, does not lend itself well to monuments of the illustrious dead

placed between two music halls. Besides, it would be regarded as a precedent which would give a new impulse to the prevalent "statuomania." The proper site for a monument to Daudet is obviously the garden of the Luxembourg, along with Leconte de Lisle, Murger, Théodore de Banville, and other authors whose monuments have made this site a veritable poets' corner.

We have to record the death, at the age of eighty-seven, of the painter Alexandre Lafond, one of the few survivors of the school of artists formed by Ingres. This venerable artist, who was an excellent portrait painter, had exhibited at the Salon for more than sixty years, and had been "hors concours" since 1863. He had taken part along with Lehmann in the decoration of the old Hôtel de Ville.

MAGAZINES AND REVIEWS.

The *Art Journal* devotes an article to an Italian artist, Signor Luigi Nono, to whom a special room was devoted in an exhibition at Venice. From the illustrations he appears to be a charming painter of modern rural life, as far as character and design are concerned; of colour one can of course form no estimate from the engravings; colour is often not the happiest element in modern Italian art. The artist has, it is said, a habit of signing his work "Luigi IX.," a play on his name "Nono," which the writer of the article thinks has militated against his name becoming known. A short article is devoted to the clever French painter M. J. Jacques Rousseau (not to be confounded with Théodore Rousseau, the landscape painter), and Mr. Claude Phillips has an article on "The Spanish pictures in the Wallace Collection," which is of importance to those who wish to study the collection from a critical point of view. Important also is Mr. Heywood Sumner's illustrated article on "A Forgotten Craft," that of flat incised wood-carving with the incisions filled in with a stopping; in Mr. Sumner's case a melted wax and other materials. He gives illustrations from a cypress-wood chest in the South Kensington Museum, and one or two illustrations of works of his own produced with the intent to revive this lost form of work, of which the *modus operandi* is fully described.

In the *Magazine of Art* the series on "Artists' Studios, as They Were and as They Are," becomes very interesting. In some of the interiors illustrated we seem to read over again the tendencies of the artist's work and the favourite effects of his pictures. This is especially the case with Benjamin-Constant and Gerôme; the former's studio, but for the figures, looks like one of his own pictures of Oriental subjects. The author (Mr. W. Goodman) remarks at the close of the article that the studio, in more ways than one, very much assists in the making of a picture, and that had Millet, who was often obliged to paint in the open air "not from choice," possessed in his early days a fairly-appointed studio, it might have made all the difference in his success, in one sense at least of the word.

The *Artist* contains an article with a good many illustrations of the charcoal drawings of Mr. Frank Wasley, an artist unknown to us before, and which are well worth illustration and attention. Mr. Wasley seems, to judge from these reproductions, to have got the true perception of what can be done best with charcoal. His "Shipping at Sunset" and "Shipping in a Calm" are admirable sketches. The "Scheme for Decoration of a Room" by Mr. A. H. Baxter, is a repetition of forms and effects which have become an aesthetic fashion, but which owe a good deal of their effect to mere novelty. When, or if, they come more generally into use, they will cease to be admired so much. There is interest and piquancy in this school of interior decorative treatment, but it wants elevation of style and refinement of line, and has not the elements of permanency. In the same number the remark, in an article on "The Paris Salons," that in the sculpture at the Salons "all interest centres on Rodin's Victor Hugo," that half figure rough-hewed out of part of a block, is an instance of the curious perversity and lunacy which has come over critics (or those who act as such) in regard to the work of this eccentric and wayward man of genius. To talk about all interest centering on this piece of bravado, when there was such a work as Boucher's "Ancient et Moderne" not many yards from it in the adjoining salon, is sheer perversity.

The *Studio* (June 15) contains an article on "Recent Etching and Engraving," by Mr. Wedmore, whose ideas on art are always worth attention, and who illustrates his subject by two remarkable city studies—"Siena," by Mr. D. Y. Cameron, and "Montmartre," by M. Béjot. An illustrated article on "Recent Examples of the Jeweller's Art in France" is of interest for the illustrations. Mr. W. Shaw Sparrow contributes what comes too near to being what might be called a "puif" of Miss Fortescue-Brickdale and her paintings, mentioned in a Note on another page of this issue. This kind of personal exploitation of new artists is in very bad taste, and does not conduce to well-balanced or thoughtful criticism. Miss Fortescue-Brickdale is a very clever and original artist, but not all that is said about her here, and this sort of trumpeting does we believe no real service to an artist.

The *Berlin Architektur-Welt* gives several examples of recent street architecture, including part of the façades of two houses in the Bamberger-strasse, illustrating the new method in which an almost entire absence of moulding is supplied by flat surface ornament produced apparently in cement or *sgrafitto*, round or between the windows. It is a poor and trumpy kind of treatment of street architecture. The Berlin Mörtelwerke at Charlottenburg, by Herr Perret, is a fair specimen of warehouse architecture.

In view of the recent terrible colliery catastrophe, the article on "Colliery Management" in the *Engineering Magazine* seems to come at the right time. The article is by Mr. W. Blakemore. He cannot suggest that there is at present any satisfactory method of dealing with the danger from coal-dust, but attempts to damp the dust have met with some degree of success. In regard to the power to be used in working a mine he sums up as follows:—

"The transmission of power for all purposes below ground is an important matter and one which at the moment is showing the most interesting development. The manager has a choice of wire ropes, steam, compressed air, and electricity as a motive power. All have their votaries, and under special conditions each one possesses some advantage. To generalise, it may be said that wire-rope transmission is cheaper than any other up to one mile; after that electricity takes the lead. Within that radius compressed air is capable of doing very good work, being safe, easy to apply, and helpful to the ventilation. On the other hand, it is at least 20 to 25 per cent. dearer to instal than electricity, the greatest feature of the latter being the facility with which it can be adapted to various uses, its high efficiency, and its greater safety in the absence of gas. Bulkiness of pipe connections is a constant source of danger and inconvenience which does not exist in the case of cables. On the other hand, the use of electricity is limited, and in fact determined, by the element of danger which pertains to it; and to overcome this is the task of the electrical engineer of the future. It is being used where there is no gas, but there is a growing indisposition to take the cables into the working face whenever gas has been seen. At present its greatest use is for hauling and pumping, as these operations can be carried on as a rule sufficiently far from the working faces, where the greatest danger exists."

In *Fellden's Magazine* Mr. F. Hope-Jones writes an article on the fascinating and yet highly practical subject of electrically driven clocks, *i.e.*, clock faces with little more behind them but a single wheel, a lever, and an electro-magnet, "the whole constituting an electrical step-by-step movement which revolves the hands half a minute at a time in response to impulses sent out from the one controlling pendulum." The advantage in economy of cost and labour in having to make only one highly finished piece of clock-work to drive a number of dials in different places—with the further advantage that they all keep precisely the same time, which no two clocks can be got to do, at all events for long—is of course too obvious for any need of argument. Mr. Hope-Jones shows that there have been difficulties in regard to the method of contact employed. "A stud and a spring are commonly used, one member being permanently fixed while the other is brought against it. The duration of this contact has always been arbitrarily decided by guesswork, and is sometimes so short that the more sluggish of the dials will not respond to it. More often the contact is many times longer than is necessary, and as 1,051,200 of them are required in every year the waste of energy is considerable." In Mr. Hope-Jones's central clock, which has no dial and hands but is only a driving power for the dials subordinate to

\* Since the above was written, we are glad to learn that it has been finally decided that the Petit Palais is to become the Fine-Art Museum of the Paris Municipality. The building could not be put to a better or more suitable use.

is an automatic electrical switch governed by a pendulum:—

"In this switch the duration of the contact is dependent upon an electro-magnet placed in series with all the magnets it has to control, and its length is therefore governed by the time constant of the entire circuit; so that at the exact moment when each dial magnet has developed sufficient electro-magnetic energy to do the work required of it, the supply of current is instantly cut off. Thus if electric-light supply is used to operate a time circuit (through an incandescent lamp as working resistance) the switch automatically proportions its supply to the requirements of the circuit by breaking contact at the moment when the lamp filament has become warmed up sufficiently to reduce its resistance and allow the necessary current to pass. And in circuits operated by primary batteries the duration of the contact will, within reasonable limits, adjust itself to the condition of the cells. If the voltage is high and the internal resistance low, the dials will work safely with a short impulse, and will receive it. When the cells are getting old the duration will increase."

It is to be hoped that it will not be long before London has a time-system municipally controlled from a centre, instead of our finding clocks telling a slightly different time in every street.

The *Pail Mall Magazine* contains an article by Professor James Geikie on the question, "How Long Will Our Coal Last?" The first part of it might interest a schoolboy so far as it imparts any science, though there is certainly a little elementary political economy thrown in. It is stated that "Every one knows that the value of an estimate depends on the accuracy of the data employed"—yet farther on we find the astounding statement that "The extent and structure of those (coal) basins are now well known, and the number of workable coal seams has long been ascertained." If the latter statement could only be borne out by the facts, we agree it would not be difficult to answer the question at the end of the article. Our mind travels over large tracts of ground to the east of the Somerset coalfield, and to several other localities in England where the nature and extent of the coal-seams have not been proved at all. However, we will give that in, as we find later on in the article the author himself contradicts his former statement. "Many still feel, that in all such calculations (i.e., the duration of our coal supply) there are many elements of uncertainty, and that in the very nature of things a definite answer . . . is impossible." Again, "It is still a moot question whether any concealed coal-bearing strata occur within the wide regions occupied by the Cretaceous and Tertiary deposits of eastern England." We quite agree with Professor Geikie that mining operations in our coalfields need not be limited to a depth of 4,000 ft.—the limit usually assigned—as we have experience in that direction in other countries. The author arrives at the conclusion that even if our supplies are as great as the Coal Commission (1871) supposed, they cannot at an increasing rate of consumption last for more than two or three hundred years. The same issue contains an article on "Glasgow—the Second City," which is rather *couleur de rose*—Glasgow is a great and enterprising city, but hardly a beautiful one; and another on "Stowe" as one of the "stately homes of England." The article is accompanied by various illustrations of this fine house and its surroundings, but the writing is entirely of the popular family history order; there is not only no art criticism, but not even a statement of the names of the eminent architects—Vanbrugh, Kent, and others, who were variously concerned in the works from time to time.

Harper contains an article on "Municipal Art in Paris" by Mr. C. M. Robinson; an article which we recommend to the attention of our London County Council men and other persons interested (or who ought to be interested) in the amenities of the capital city. It will show how it is that Paris ranks as a beautiful city in a sense in which London does not—that it is not only clearer air and plentiful supply of beautiful building stone that work the magic, but the determination of the conscript fathers that it shall be a beautiful city, as far as they can make it so, and that no care and pains, and we may almost say no expense, shall be spared to that end.

Scribner contains a long and most interesting article by Mr. Rufus B. Richardson, the Director of the American School at Athens, on "A Tour in Sicily." He takes the reader to Girgenti and Segeste and Selinonte and Taormina, with many illustrations from photographs, and the

fresh impressions of an archaeological scholar on visiting these sites, as we gather, for the first time. Two of the photographs give a vivid impression of the utter ruin of the temples C and G at Selinonte—nothing but heaps of drums of columns tumbled together in inextricable confusion.

The *Century* contains a short article by Mr. F. Keppel on "A Notable Masterpiece by Millet" (inadvertently given as "Millett" in the index), which is really written to accompany a frontispiece illustration of "The Wood-sawyers." He mentions that Mr. Jomies had both this picture and the "Angelus" offered to him simultaneously, the former for 500*l.*, the latter for 800*l.*, and that on the advice of Mr. Legros he purchased the "Sawyers," the Slade Professor assuring him that it was the greater picture of the two. Considering the tendency of Mr. Legros' own art, we can quite understand his thinking so, but we are not quite sure that he was right. Mr. Cole, for the series of "Engravings of Old English Masters" gives us one from Constable's "Hamstead Heath," a kind of work, however, which can hardly be done justice to by line engraving on a small scale, though the engraver's style is as good as ever.

The *Idler* contains an article by Mr. F. W. Skinner on "Bridge-building" which, in a popular manner, gives a very good account, with some illustrations, of the great problems of modern bridge-building. In speaking of the especially novel character of bridge-building in the present day, however, it should not be forgotten that although the application of cantilever constructions on a great scale is new, the cantilever principle itself is one of the oldest in its application to bridges.

In the *Gentleman's Magazine* Mr. Arthur Ransom has a short article on "The Antiquated Security of Timber." We do not know that it is "antiquated" but it is certainly, as he argues, a not very remote possibility unless more systematic means are taken to promote and ensure the growth of new plantations on an extensive scale. As Mr. Ransom points out, it is not only a question of want of timber for constructions, but of the effect on the earth's climate which the removal of trees would have.

The *Home Counties Magazine* contains an interesting article on "London Windmills," the former sites of some of which are still commemorated by such names as "Windmill-street," &c.

We have received *Knowledge*, the *Revue Générale*, and the *Quarterly Bulletin* of the American Institute of Architects.

#### ROYAL ARCHÆOLOGICAL INSTITUTE.

At the general meeting on the 3rd inst., Mr. Emanuel Green, Hon. Director, in the chair, Mr. F. G. Hilton Price communicated a paper on "Clay Tobacco Pipes of the Seventeenth Century," found at Bristol during recent excavations, and exhibited specimens presented to him by Mr. John E. Pritchard, F.S.A. The pipes bear upon the heel either the names of the makers or their initials, and these have been identified with the names of several burgesses, such as members of the Hunt family, who were admitted freemen of the City of Bristol in the middle of the seventeenth century. Together with the pipes were found Bristol farthing tokens of 1652, a piece of Delft pottery dated 1647, and a brass seal-top spoon, all corroborating the dates of the pipes.

Mr. J. McAndrew read a paper on the early churches of Asturias, which was illustrated by lantern slides prepared from drawings and photographs by Mr. J. C. Stenning. The following is a *résumé* of the paper:—

After the defeat of the Visigothic King Roderick by the Moors on the banks of the Guadalete, A.D. 711, and the subsequent withdrawal of the Christian leaders to the mountains of Asturias, a period of about fifty years elapsed before the dynasty was re-established at Oviedo. The first building of which any trace remains is the Cámara Santa, or Holy Chamber, in the cathedral of that city, built for the reception of the relics which were carried northwards after that battle—and probably only the sanctuary is of that early date. Almost simultaneously, the Church of Santullano, on the outskirts of the city, was founded by King Troila (757-68), and remains very much as he left it, with the exception of some modern additions. Externally it is cruciform, high in proportion to its area, having flat buttresses, and windows of which the

upper half displays elaborate wheel tracery. Internally, the church is a basilica, the transepts being shut off. The east end is square. The church of San Salvador de Val de Dios, some eighteen miles from Oviedo, was consecrated in 895. This church is also a basilica on plan, and has a cloister running along the south side of the nave. The windows, both of the church and cloister, have tracery similar in feeling to that already described.

San Salvador de Priesca, consecrated A.D. 915, is similar in plan and ornamentation to the preceding two. It has a vestibule with closed chambers on either side, and the nave consists of three bays. A low screen of grey jasper emphasises the high altar. The length and breadth of this church are in better proportion than those of the others, and there is evidence of progress in architectural knowledge. These three churches may be taken as forming a group distinct from others coeval with them.

Sta Maria de Naranco, close to Oviedo, is *sui generis* a parallelogram on plan having the entrance from a porch on the north side, with arches carried all round the building, and the east and west ends screened off by an open arcade make it questionable whether it was originally designed as a church. The columns are clustered in groups of four, with a cable or twist pattern, and the figures have figures of animals, birds, and men in low relief on their front enclosed in scrolls, and on the sides (facing east and west) they are enclosed in cable patterns of W shape. Overhead is a plain bold cornice, with bands supporting the semi-circular or ribbed vaulting, from which medallions or shields depend, each with a different design between two arches. Externally, the church is much blocked up by a modern sacristy and the priest's house. The date, according to an inscription, is A.D. 848. Close by is the Church of San Miguel de Lino, erected almost simultaneously, which also lends weight to the theory that Sta Maria may have been originally constructed for secular purposes) a great contrast to its neighbour. It is high and narrow, complicated in plan, cruciform, having flat buttresses, ornamented with very shallow flutings, round-headed windows displaying very complicated geometrical patterns in the upper half, and borne on rude columns with foliated capitals. The entrance at the west is flanked by square piers with very rude figures enclosed in panels of leafage and circular flowers—it leads into a vestibule, on either side of which, approached from the transepts, is a chamber and staircase leading to a western gallery; over these chambers are two others, the access to which is closed entirely. The uses of all of these is uncertain, though Morales says that the lower ones held the books and other accessories to the church service. The transepts are reached between pillars 12½ ft. high, having arches of 3 ft. in height, and there are evidences of a screen having crossed the building to the eastward of them. The east end is low, and apparently has been rebuilt.

A few miles from Oviedo is Sta Cristina de Lena, dating from ninth century; it is cruciform, with many buttresses externally. The entrance at the west-end has a gallery over, approached from the north side of the nave. The transepts are closed except that a low circular archway gives access to them. Eastward of these arches are flights of steps, between which is the lower altar; they give access to the raised east end, approached through an arcade similar to those at Sta Maria de Naranco, and the centre arch has a low screen (or reredos to the lower altar) carved with a rude honeysuckle and circular flowers in panels. The capitals of the pillars are very similar to those at Sta Maria. It is very difficult to convey an idea of this church by description, and the only views available to us fall to show the reduced size of the building owing to its many parts. The wall of this church are said to be only 1 ft. 9 in. thick.

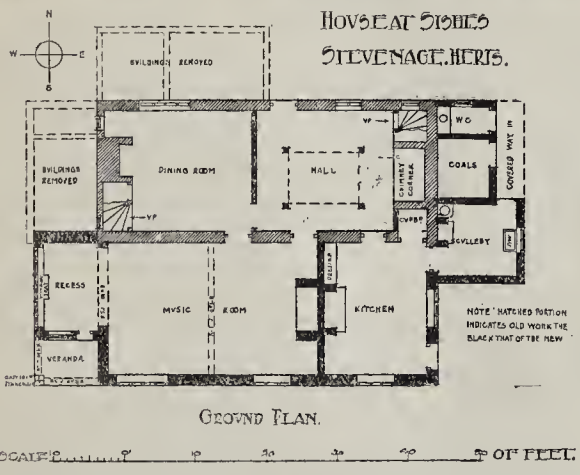

The Latin influence throughout all these buildings is very interesting and curious: the first three are basilicas in plan, without any divergence, and Dr. A. J. Caveda, in his *Ensayo Histórico* (Madrid, 1848), points out the close analogy between these little buildings and the churches of Rome and Ravenna. Traces of work of eighth and ninth century may be found in many other churches throughout this mountainous and most picturesque region.

Mr. Bunnell Lewis read a paper on the Antiquities of Toulouse. After a brief notice of the history of the city, he proceeded to describe some of the most important monuments still existing there. Of the inscriptions one is far more remarkable than the rest. It belongs to the republican period and consulate of Futius, a colleague of Vatinius, against whom Cicero spoke an oration, and commemorates the erection of a temple, and mentions the attendant priests who superintended the work. The words "Basis" seem to mean a pedestal and sundial, others with more probability, a foundation wall and terrace. The Museum of Toulouse contains a collection of local antiquities richer than any other to be seen in France: most of these come from Martres, near St. Gaudens, and during the years 1897,

HOUSE AT SISHES  
STEVENAGE, HERTS.

closet, box room, dark room on first floor; and on ground floor, music room (about 30 ft. by 16 ft.), dining-room, hall, kitchen, &c. A special feature is the extensive attic accommodation.

In addition to the foregoing there are coach-house and stables.

The whole of the building, together with the drainage, rain water storage tanks, cess pit, &c., have been carried out by Mr. W. J. Spratt, builder, Stevenage, from the plans, and under the superintendence of Mr. K. Gammell, architect, London.

ARCHAEOLOGICAL ACTIVITY IN  
CYPRUS.

VERY little has been done of late years in Cyprus—the treasure-house of every variety of ancient art from pre-historic cave-dwellers to the refinements of the Italian Renaissance—to care for or study the monuments which are so thickly strewn over the once-favoured land. Once more, however, the diggers have been at work searching for the buried treasures of human art and industry beneath the gradually accumulating earth heaps of a ruined Turkish town. This time an added note of interest consists in the fact that the buried treasure in question is of mediæval and not classic date. Wherever one digs in this most historic of islands classic antiquities come to light almost as a matter of course, but the remains of the interesting little Lusignan kingdom founded by our King Richard Cœur de Lion, which are, perhaps, of an even more unique character, have hitherto attracted a comparatively small amount of public interest in England.

Some three years ago a monumental book on the mediæval antiquities of the island, written by M. Enlart, of Paris, and published at the expense of the French Government, gave the art world of Europe some idea of the singular interest attaching to that little-known dependency of the British Crown, Cyprus.

M. Enlart has been again visiting the island with the intention of supplementing his great work by some discoveries regarding the old royal palace of the Lusignans at Nicosia. The

1893, and 1899 many discoveries rewarded the efforts of the explorers. The paper was illustrated by many engravings from the Album des monuments du midi de la France and by a series of photographs which Monsieur Leon Jouin most kindly contributed.

"LOCAL LONDON"—This is a cheap and useful little work, published by Messrs. P. S. King & Son, Great Smith-street, Westminster. It claims to be a municipal directory for the metropolis and its suburbs, and it contains much information as to the several corporations, Councils, and Boards within the County and City of London and of sixty adjoining areas of the counties of Middlesex, Surrey, Kent, Essex, and Hertford, and also the principal legal, educational, charitable, and other institutions therein. Considering the size of the book, it is astonishing how much information it contains.

HOUSE AT SISHES, STEVENAGE,  
HERTS.

THIS house, recently completed, consists of alterations and additions to what originally was the convalescent home for the district of Stevenage, a brick building about 150 years old.

The old part has been entirely gutted, and a roomy hall with an open gallery over on the first floor has taken the place of the old kitchen, but the large old-fashioned fireplace has been retained.

The building stands in extensive well-wooded grounds on the slope of a hill facing due south. The new parts have been built of local brick with hollow walls rough-cast, and roofed with Broseley tiles. The house contains, together with the old part, five bedrooms, bath, water-

French Government has again shown its liberality in the cause of research, and commissioned an investigation of the site generally considered to have been occupied by this building. The site in question has, however, proved to be nothing more than a mound of ruins—once probably a church built by the Vefetians, and afterwards turned to the use of a Turkish battery during the famous siege of 1570. Little of interest was found here beyond the plan of the ancient conventual church (apparently of the Franciscan Order), with three tombs still covered with the usual sculptured tombstones occupying the centre of the nave before the entrance of the choir. The carving on the tombstones is of the ordinary sixteenth-century Italian style, and the ancient floor of the church, laid bare from earth and debris, reminds one of some old church in Italy, and marks how in former ages the characteristics of a race survived under the changed conditions of climate and surroundings in a comparatively distant colony.

The results of the present investigation have not proved very great, but still a certain amount of interest attaches to the effort, in as far as it proves that archaeological interests in the Levant are not quite extinct. Fifty years ago the studies made by De Vogie, Rey, Texier and Pullan, and a number of other savants aroused a great deal of interest in Europe; but since then the nearer East has been comparatively neglected, and as a consequence the monuments, whose history is second in interest to none, are disappearing, forgotten and uncared for, the natural prey of the unscrupulous speculator or ignorant native. All honour to the French Government, which still recognises the importance of historical memorials, and sends its students to prosecute their study in distant and alien lands.

#### THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

**Loans.**—On the recommendation of the Finance Committee it was agreed to lend the Finsbury Borough Council 1,175*l.* for alterations to the town hall; the Fulham Borough Council 23,000*l.* for an extension of the town hall; the Stepney Borough Council 9,257*l.* for street improvement; the Woolwich Borough Council 2,000*l.* for a site for municipal offices; the Stepney Borough Council 6,938*l.* and 9,914*l.* for paving works; and the Strand Guardians 3,800*l.* for the purchase of land.

**Fire Station, Euston-road.**—The Fire Brigade Committee reported as follows, the recommendation being agreed to:—

"We have had under consideration the tenders, referred to us by the Council on February 29, 1901, for the erection of the proposed Euston-road station. From the gross amounts of the tenders it is necessary to subtract the totals of addenda bills (in respect of work originally contemplated, but which it was subsequently determined should not be executed) attached to the bills of quantities. The result is as follows:—

	Gross Amount.	Net Amount.
Messrs. Stimpson & Co. ....	£15,000	£14,352
" Holloway Bros. ....	15,500	14,663
" Martin, Wells, & Co. ....	15,835	14,952
" J. Willmott & Sons. ....	16,975	15,951
" Foster Bros. ....	17,475	16,598

We may remind the Council that its decision of January 29, 1901, to invite tenders by public advertisement for the work was come to in consequence of our having reported that the manager of works had expressed himself as not satisfied of the sufficiency of the architect's estimate of 13,764*l.* We reported to the Council on March 19 that we considered that quantities of the work should be taken out afresh. This has been done, but, having had before us a report by the architect on the subject and given full consideration to the case, we think that the first set of quantities should be adhered to, and that the lowest tender based on those quantities, viz., that of Messrs. Stimpson & Co., should be accepted. This firm has recently intimated that it is prepared to abide by its tender of February 29 last, subject to the time allowed for the execution of the work being extended by two months in view of the circumstance that the roof will not be on before the winter months, as would have been the case had operations been commenced last March. We agree with the architect that this request is reasonable. Messrs. Stimpson & Co. have in the past executed for the Council and its predecessors a considerable amount of work, including the erection of several fire stations. The Architect has pointed out that there are two

slight errors in the moneying out of items in the bills accompanying Messrs. Stimpson & Co.'s tender, and that after allowance is made for these the net amount of the tender is 14,377*l.* 2*s.* 6*d.* The estimate of 15,200*l.* approved by the Council on January 29, includes a sum of only 13,764*l.* in respect of the erection of the building, and it is therefore necessary to ask the Council to approve of a supplemental estimate of the difference (in round figures 620*l.*) between this amount and Messrs. Stimpson & Co.'s tender. We recommend—That the supplemental estimate of 620*l.* submitted by the Finance Committee in respect of the erection of the proposed Euston-road station be approved; that the tender of Messrs. Stimpson & Co. to execute for 14,377*l.* 2*s.* 6*d.* the work of erecting the station be accepted. . . .

**Electric Traction in South London.**—In connexion with the electrical working of the London County Council, the Council decided to enter into an agreement with the South London Electric Supply Corporation, providing that (a) the company should permit the Council to erect a temporary building at the company's electricity generating station near Loughborough Junction, and to place therein two 2,000 h.p. continuous-current sets of electricity generating plant and auxiliaries, and also to place therein temporarily two Stirling boilers; (b) that the generating plant referred to should be worked by a staff in the employ of the Council; and (c) that the company should be paid by the Council at the rate of 1*d.* per unit of electric current used for working the tramways.

**The New Street from Holborn to the Strand.**—Mr. H. Smith asked if the Improvements Committee had yet decided on the name of the new street from Holborn to the Strand.

Mr. W. Davies said the Committee had been overwhelmed with suggestions, both wise and otherwise. Next week the Committee would consider the names.

**The View from Richmond-hill.**—Replying to a question by Mr. Dickinson, Lord Monkswell said it was a fact that the landowner had commenced to cut the trees at Richmond-hill, and there was a danger, if it was continued, that the view from the Star and Garter would be seriously imperilled, if not destroyed. He had seen a letter to the effect that the landowner was not willing to sell, but if he could do anything to assist in opening up negotiations between the landlord and the Council he would be extremely happy to do his best in the matter.

The Council adjourned shortly before seven o'clock.

#### APPLICATIONS UNDER THE 1894 BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

##### Lines of Frontage.

**Greenwich.**—Three houses, with shops on the ground floor, on the north-east side of Blackwall-lane, East Greenwich, near the entrance to Blackwall Tunnel (Mr. E. Petters for Mr. W. Timms).—Consent.

**Fulham.**—Projecting shop fronts to five houses in course of erection on the east side of Stephendale-road, Fulham, northward of Lindrop-street (Mr. W. C. Poole for Mr. J. Wilson).—Refused.

##### Width of Way.

**Kennington.**—New school buildings and boundary fence-walls at less than the prescribed distance from the respective centres of Randall-road and Randall's-row, Lambeth (Messrs. Beasley & Burrows for the London and South-Western Railway Company and the Managers of the St. Saviour's Salamanca School).—Consent.

**Hackney, South.**—Three-story dwelling-houses on the south-west side of Middlesex Wharf, Lea Bridge-road, Hackney, at less than the prescribed distance of the centre of Middlesex Wharf (Messrs. J. G. & H. G. Needham for Mr. T. Marvell).—Refused.

##### Line of Frontage, Width of Way, and Projections.

**Marylebone, East.**—A porch at the entrance to No. 4, Albany-terrace, Marylebone-road, St. Marylebone, at the corner of Albany-mews (Mr. E. R. Robson for Mr. S. Lee).—Consent.

##### Width of Way and Construction.

**Marylebone, West.**—A deviation from the plans approved for the erection of a block of buildings,

to be inhabited by persons of the working class, on the east side of Ashland-place, St. Marylebone, to abut also on Paradise-street, so far as relates to a reduction in height of the front wall of the block of buildings and the erection of three sham gable ends and of an iron, concrete, and slate screen on the flat roof of such block of buildings (Mr. T. H. Watson for the Portland Industrial Dwellings Company, Limited).—Consent.

##### Deviation from Certified Plans.

**St. George, Hanover-square.**—A deviation from the plans approved for the erection of club chambers, with shops on the ground floor, on the site of No. 5, White Horse-street, Piccadilly, and stabling at the rear, so far as relates to the arrangement of the front portion of the ground floor of the building, by the omission of the proposed shops and the substitution of a breakfast-room, and an alteration in the position of the staircase and entrance hall (Mr. E. Howley Sim for Mr. G. H. Tod-Healy).—Consent.

##### Means of Escape from Top of High Buildings.

**City.**—Means of escape in case of fire, proposed to be provided in pursuance of Section 63 of the Act, on the attic story of an extension of the Great Eastern Hotel, Liverpool-street, City (Mr. T. Holloway, of Messrs. Maple & Co., Limited, for the Great Eastern Railway Company).—Consent.

##### Formation of Street.

**Bow and Bromley and Hackney, South.**—That an order be issued to Messrs. Wigg, Oliver, Hudson, & Co., refusing to sanction the formation or laying out of a street for carriage traffic out of the north side of Carpenter's-road, Hackney Wick, Hackney (for the trustees of the late Viscount Eversley).—Agreed.

##### Buildings for the Supply of Electricity.

**Hackney, South.**—A generating station and works on the north side of Millfields-road, Hackney (Messrs. Gordon & Guntton for the Council of the Metropolitan Borough of Hackney).—Consent.

##### Cubical Extent.

**Hoxton.**—The erection of Block D of a warehouse building on the north side of Scrutton-street, Hoxton, to exceed in extent 250,000, but not 450,000 cubic feet, and to be used only for the purposes of the trade of a printer and lithographer (Messrs. Gordon & Guntton for Messrs. Waterlow & Sons, Limited).—Consent.

The recommendations marked † are contrary to the views of the Local Authorities.

#### TRADE CATALOGUES.

The Luxfer Prism Syndicate send us an illustrated catalogue of their copper-electro glazing as employed in decorative designs in stained or white glass. As in the case of the Luxfer prism glass, the copper frame-work is practically welded to the glass by deposited metal under an electric process. The result is a window both stronger and lighter than a window of leaded glass of the same area and the same proportion of metal framing; and the use of saddle-bars can be dispensed with. The copper framing is used in two forms, either in a very small bar section with a groove for the glass, or in a strip or ribbon form, the ribbon standing up at right angles to the plane of the glass, and forming the constructive core to be subsequently covered by the electro-deposited metal which gives it its final form and binds the glass to it. As to the strength of the glazing thus treated we have satisfied ourselves by examination of the work. To have got rid of the saddle-bar is in itself a very important practical advantage; saddle-bars to stained windows can only be regarded as, in the case of leaded windows, an unavoidable evil. Artistic effect is another question. Both the dark colour and the wider proportions of the leading in the usual form of stained glass window unquestionably add to the effect of the colour in the glass, and give to stained glass windows the peculiar character which we have long associated with them. The copper framing of the new process appears, in comparison, both too thin and too bright; but we do not know that any attempt to get the copper strip or section made wider would be desirable. To have it made more bulky than is actually necessary for stability would be unpractical and wasteful of material, and therefore out of character; and the bright surface of the copper, also, would have quite a different effect from that of the sombre lead. The best thing seems to be to admit that glass fixed in this way must be designed in a manner of its own and for its own special effect, in a style distinct from that of stained

glass of the Mediæval school. Considered in that light, the system, an important improvement in a practical sense, may come to have its own artistic character. For the treatment of white glass in small squares and in geometrical designs it is exceedingly well adapted.

The Fireproof Plate Wall Company send us a pamphlet describing and illustrating their form of partition, which we have before mentioned in connexion with the Building Trades' Exhibition. This is a partition composed entirely of plates or slabs of fire-resisting material, jointed together by intersected passages. In the centre of each plate there is formed a vertical through passage, and on each side of this a number of air chambers, which do not extend the whole height of the plate. Each plate is filled on the top edge and grooved on the bottom edge, and each vertical edge has a semicircular groove; these grooves, when the plates are placed in rows to break joint, form a vertical passage in line with the central passage in the rows above and below. As each row is placed in position the plates are jointed with cement, and liquid cement is poured down the vertical passages, filling up those which are open, ascending those which are closed, so far as the compressed air will allow, and filling up the horizontal joints in their entire length. This is continued course by course until the wall is completed and formed into one sheet as though cast in a large mould. It is claimed that great strength is given to the wall by the cement columns formed in the whole of its height. Walls up to 13 ft. long by 11 ft. high may be erected with plates only; but where larger walls are required, or for the purpose of giving extra stability, iron tubes or rods are cemented into the vertical passages, extending through the whole height of the wall, at such distances as may be considered desirable according to the requirements. These tubular stays render it practicable to build walls of several hundred feet area without other supports. The work can also be done very fast, without interfering with its efficiency. The system appears to be one of the best of the modern methods of forming party-walls that has come under our notice.

Messrs. W. A. S. Benson & Co. send a pamphlet describing their pavilion at the Glasgow Exhibition, which appears to be of considerable interest; it was perhaps, like some other things, not finished at the time of our visit. An illustration is given of a form of window which consists of casements and panels of decorative design, cast throughout in iron, and built up, according to size, into sections which are supplied ready for erection. "The circular uprights permit of the construction of bays of any angle, and the panels and casements with their attendant sills are designed in graduated sizes so that they can be accommodated to a wide range of openings. This window being supplied complete with mullions does away with the work of stonemasons and joiners, the sections merely requiring to be screwed up." This may be a convenient form of window to employ where a certain decorative appearance is to be produced in a short time, but we cannot say that the illustration of it recommends it very much to us as a matter of design; it is not simple enough and looks too much like an effort to be ornamental. The pamphlet also draws attention to a mode of construction used in the pavilion, and which is called "Teyxl," the basis of which is cement applied to corrugated sheet iron in such a manner as to form an absolute bond of great tensile and bearing strength. "Its employment, whether for roofs, partitions, or temporary buildings, permits of much economy in structure. In the case of roofs it dispenses with all need for the common rafter, and occasionally of everything beyond the main framework. The sloping roof of the Pavilion, 19 ft. long, is carried upon a central ridge, the walls, and the gable rafters, with only a stiffening piece between it and the coving ceiling beneath. A good method of tiling which Teyxl renders possible is here illustrated as well, the tiles being bedded flat in cement instead of overlapping. A roof constructed thus takes only one-third the quantity of tiles used in an ordinary tiled roof, and is at the same time very much more durable and weather proof." In regard to the last named point, it all depends on the cement. It is very desirable to have a means of using tiles as a roof covering flat and bedded in cement, in some situations, as for instance on the exterior of a dome; but, as we

say, the durability and weathertight quality entirely depend on the cement, and where an ordinary sloping roof is to be visible the tiling with lap and snowing the edges has a better effect.

An interesting catalogue, entitled "Types of Sewage-Disposal Works," has been compiled by Mr. S. H. Adams, A.M.Inst.C.E., managing director of the Adams' Patent Sewage-Lift Company. The fittings described and illustrated include timed siphonic apparatus for automatically filling and emptying filter-beds, siphons arranged to discharge automatically and simultaneously, sewage-screens, automatic sewage-lifts, and other apparatus required in connexion with sewage purification by bacteriolytic, as well as ordinary flushing siphons, &c. In addition to the illustrations of the fittings themselves, views and geometrical drawings are given of sewage-purification works, with the different apparatus *in situ*. The views represent actual installations carried out for private individuals and for public authorities, and are, therefore, of interest both to the architect and engineer. The geometrical drawings include works of various sizes, suitable for villas, mansions, asylums, villages, and towns, and cannot fail to be of service. The special features of the siphonic apparatus are the automatic action and the absence of moving parts. By the air-controlled feed and the timed siphonic apparatus it is possible to work a series of filter-beds automatically, the beds being filled in succession and emptied in the same order, any desired length of contact being obtained by the regulation of the tap through which filtrate passes to the siphon. By these means more uniform results are obtained than with apparatus controlled by hand, and the cost of working the beds is also reduced. The sewage-lift is particularly ingenious; it is automatic, and has only one moving part—a plain inlet flap-valve. A word of praise must be given to the draughtsman and photographer who have prepared the admirable illustrations, and to the printer who has reproduced them so well; the paper and type are also excellent. The catalogue is one to keep, not to throw into the waste-paper basket.

The Acetylene Corporation of Great Britain send us a catalogue of appliances for the generation and use of acetylene. The generator made by this Corporation is that known as the "Auto-Simplex," in which water is automatically supplied to carbide as the gas in the gas-holder made from the preceding charge is withdrawn for consumption. It is stated that all fire insurance companies allow an Auto-Simplex installation to be introduced without extra premium, and the Acetylene Corporation undertake to get any fire policy endorsed to that effect before erecting the acetylene plant. The Corporation undertake for a small annual payment periodically to examine and maintain in good working order any installation introduced by them, provided that the carbide, burner, and purifying material are always supplied by them. We should not recommend any acetylene consumer to bind himself to such conditions, since the prices charged by different firms for carbide of the same quality vary considerably, and it would be foolish to undertake not to use any better burners or purifying system which may possibly be introduced at some future period, and which may not be approved by this particular Corporation. The price of carbide, when purchased in quantities of not less than 1 cwt. and delivered to stations in England, is quoted at 2½d. per lb., which is equivalent to 237. 6s. 8d. per ton. The Auto-Simplex apparatus has been introduced into a number of country houses, factories, and business premises, and is also employed for generating the acetylene used for lighting the Church of St. Mary, at Great Massingham.

The Van Kannel Revolving Door Company send us a descriptive and illustrative pamphlet of their revolving doors, about which a question was asked by a correspondent in our columns the other day. Many of our readers are no doubt acquainted with it, though it appears that some are not. The typical form of the door is one with four arms at right angles, with a common centre, and with segmental jambs so arranged that the passage of air is always closed by one or other of the arms; when any one enters by pushing the arm before them, that behind him closes the entrance before the other one clears it for his passage. This is, of course, a most efficient way of avoiding draughts from doors opening and shutting in places such as public dining-rooms and restaurants,

where there is a constant passage of people in and out. For certain occasions the wings can be folded flat and form a centre division between an ingoing and outgoing crowd. In the ordinary use of the revolving door there is the objection that those going in may not be quite in accord with those going out as to the speed at which the door is to be turned. Nor can we quite agree that this form of door lends itself especially to architectural effect. But for certain classes of buildings its advantages certainly far outweigh its disadvantages.

We have received from Messrs. Atkinson's Testing Works, Cardiff, a catalogue of their dead-beat ammeters and voltmeters. These instruments are specially adapted for use in connexion with electric motors. They give the means of telling whether the motor is overloaded, and they also enable the consumer to check the meter bill. The ammeters are for use with continuous current, and are made of all sizes. The scale is vertical, and can be read at a distance of many yards. They are unaffected by external magnetic fields, and every instrument possesses an adjustable indicator to show the proper working point on the scale. The price of all sizes of ammeters is only 11. 3s. 6d., and the voltmeters are only slightly dearer.

We have received from the General Electric Company of Queen Victoria-street a leaflet describing some of their latest novelties. The "Robertson" low voltage traction lamp has been specially made to withstand vibration and is the one used on the Central London Railway. The balancing coils they make for running one eighty-volt enclosed arc lamp from a 200-volt alternating current circuit are very cheap and ought always to be used in preference to the so-called 200-volt enclosed arc lamps which are very inefficient. They now enclose batteries for bell work in boxes made of leather board which are said to be both lighter and cheaper than the ordinary wooden boxes.

M. George Averly (Lyons) sends a catalogue with description and illustration of his electric pottery blocks, which have a lifting mechanism driven by electricity. It is claimed that by means of these blocks one man can lift and manoeuvre weights of from 1 to 20 tons with ease and without risk. They are in fact pulley blocks with an electric motor connected with the pulley wheel and supplied with power by a wire. Mr. Thomas Veasey is the London agent for the Averly electric pulley blocks.

Messrs. Shipham & Co. (Hull) send an illustrated catalogue of their joints for expansion and contraction in steam-pipes. These consist principally of wrought copper insertions between two lengths of steam pipe, in different forms: There is the "bellows" expansion joint, in a bulbous form capable of drawing out or flattening, and several forms of loop joint or flattening. The company also make stuffing-box expansion joints in cast iron.

Messrs. Julius Sax & Co. send us a sheet giving illustrations and description of their desk fans and ceiling fans, for continuous or alternating current; the ceiling fan being a horizontal one working round a vertical axle suspended from the ceiling.

Mr. Howard W. Meredith sends us a very extensive catalogue of builders' hardware. Of the decorative character of the chimney-pieces the less said the better, for the most part; there are a few on pages 26 and 54 to 56 which are better than the rest, but there does not seem to be any consistent effort to produce the best class of design, such as we fortunately now see made by some firms. The bulk of the catalogue, however, deals with practical things; and in this respect it is a most extensive and important one, including apparently everything that can be required in the fitting-up of a house.

Messrs. Dunkerley & Co., Manchester, send a conveniently small book containing a list of their constructional iron-work always in stock, including rolled-iron and steel joists, compound and rivetted girders, stanchions, &c., with sections given; iron flats, angle tees, sheets, &c.; with some useful statistical tables of weights.

CHURCH RESTORATION, HAMPSTHWAITE, YORKSHIRE.—The corner stone of the new south aisle of the old parish Church of Hampsthwaite was laid recently. Some twelve months ago Mr. Hodgson Fowler, F.S.A., of Durham, was consulted respecting the reconstruction of the church, and on his report it was decided to rebuild a portion of the sacred edifice at an estimated cost of 2,400l.

Interiors in New Public Library, Keighley, as proposed.

### Illustrations.

#### THE JEAN MACÉ MONUMENT, PARIS.

**T**HE illustration of this fine monument is from the model of it which was set up in its intended position in the middle of the Square Armand Carrel, Paris, in order to study the effect in position. The finished work, with marble steps and pedestal and bronze figures, formed one of the most prominent central objects in the sculpture court of the Old Salon this year, and was specially noticed and described in the article on the Salon in our issue of May 25. We regret to add that since that date the accomplished sculptor, M. Paul Arthur Massoulié, is dead. A short notice of his life and work appeared under the head of "France" in our Foreign column in the issue of June 29. The architectural portion of the monument is designed by a young architect, M. Charles Blondel.

The late M. Jean Macé was a Professor of History who had done much to popularise his study by writing books for children, and also exercised a great deal of influence in procuring the foundation of many schools and public libraries. Having these facts in view, the significance of the figures on the monument is obvious enough. The figure above holds up the open book as a symbol of intellectual progress and liberty of thought; the two children below are encouraged in their course by the genius of Education. The eager and bright-looking boy, pressing forward in his walk, is a charming and most significant figure.

The medallion portrait of Jean Macé is seen on the central block, which forms the architectural centre of the monument. This affords a good illustration of that favourite treatment of personal monumental design among the French, in which the portrait of the person commemorated is merely represented by a bust or a medallion, and the sculptor is relieved from the necessity of realistic representation of the figure, and is left free to indulge his fancy in allegorical and imaginative treatment. In England, a monument to a man who assisted in founding schools and libraries would only too probably take the form of a full length and perhaps colossal statue of a gentleman in frock coat, trousers, and boots, with a book in his hand.

#### KEIGHLEY FREE LIBRARY.

This design was placed first by the assessor, Mr. Leonard Stokes, in a recent competition in which 146 designs were submitted, and is now to be carried out with some slight modifications.

The disposition of the plan is explained by the fact that on the south side of the site sufficient land was provided for future extension; the principal rooms were consequently placed on this side.

Accommodation is provided as follows: (Ground floor) newspaper reading-room for 150 readers, separate ladies' room; lending library space for 40,000 volumes; (first floor) reference library for 40,000 volumes; patent library 2,000 superficial feet; store for valuable books; rooms are provided for the staff (both sexes), workroom and store-rooms on the ground and basement floors.

The building will be faced with local freestone and the roofs covered with green Westmoreland slates.

Internally the walls will be plastered down to dado, which will be of dull glazed tiles—the floors of the principal rooms are to be of wood block on concrete and those of the halls of marble mosaic; the ceilings of plaster panelled in simple forms; the woodwork generally of pine stained a suitable colour and varnished.

The buildings will be heated by hot water at low pressure and lighted by electricity. The estimated cost of the buildings is £20,000.

Messrs. McKewan & Swan, of Birmingham, are the architects.

#### PROPOSED NEW NAVE AND CHANCEL, ST. GEORGES, FORDINGTON.

This design was made as a proposed substitute for a north aisle erected in 1830, in the style which may be supposed from the period, and in order to avoid pulling down the existing chancel, a good piece of Georgian work, but too small for the present purposes of the church. No decision, however, has as yet been come to in the matter.

The drawing was exhibited at the Royal Academy of 1900. Mr. W. D. Caröe is the architect.

#### VILLAGE CLUB, PENSHURST.

This picturesque little country club was built from the designs and under the superin-

tendence of Mr. Maxwell M. Smith, architect.

The ground floor contains entertainment hall, reading-room, lavatory and two bath rooms, with a room for bicycles, and the living room and kitchen of a small residence, with bedrooms above. On the upper floor is a billiard room, the remainder of the space (except the upper floor of residence) being occupied by the upper portion of the entertainment room and a gallery at one end of it. The entertaining room block is the rear one in the illustration.

The building is constructed of local stone, brick and timber, oak being mainly used, and built by local labour.

In the entertainment hall the swinging lights are arranged so that their reflectors can throw the light either on to the stage or into the room, as desired. Over the proscenium is a relief in plaster, of St. George and the Dragon, modelled by Mr. Michael Murphy.

The total cost has been about £4,350.

#### FERRY WORKS, QUEEN'S FERRY, CHESTER.

THESE buildings were carried out for Messrs. Willans & Robinson, makers of water-tube boilers, from the design of Mr. H. B. Cresswell, architect, of Rugby.

The plan is of no special interest; the buildings are essentially vast covered sheds to work under.

We illustrate them because they represent a highly creditable attempt to give a certain amount of character to a practical structure of this kind, in a manner naturally arising out of structure, and without any introduction of superfluous and unmeaning ornament.

The following is the architect's description of the work:—

"The design attempts to give candid architectural expression to engineering workshops. The buildings lie seven miles west of Chester, between the London and North-Western Railway Company's main line and the river Dee, and have been laid out by Messrs. Willans & Robinson, Limited, for the construction of Niclausse water-tube boilers.

The building on the left hand of the drawing is the packing and forwarding shop, the next combines erecting and machine shops, the building with the tower is to contain the machinery for providing hydraulic and electric

power for the works, and the large block on the extreme right is where the tube drawing and drum making processes will be carried out.

The shops are arranged in 50-ft. bays, with C. I. stanchions, spaced 20 ft. apart, carrying the girders on which the travelling cranes run, and the wood 'bow string' roof covered with boarding and felt. The buildings are faced with Buckley purple brinded bricks; the strings and copings are of hard vitrified purple brick ware, made also in the Buckley district. The piers have a batter of about one in fifteen and the lower portions have heartings of concrete. The door and window lintels are of cast-iron with shaped feathers at intervals, and the usual coverstone is elaborated with brick corbelling and with piercings which go right through the wall and serve for ventilating purposes. The windows are cast-iron; the window-sills and door jambs of hard purple brick. The tower attached to the power station was to contain, as here shown, fire hydrant service and other water tanks, and a lift for coal trucks; but it has since been enlarged and redesigned to enclose the hydraulic accumulators for the tube-drawing processes.

The works are being carried out under contract by Messrs. Foster & Dicksee of Rugby and Chelsea. The glazing of the roofs is by Messrs. Helliwell's system, and the roofing has been supplied by Messrs. Anderson & Son, of Belfast.

HOUSE, CONNECTICUT, U.S.A.

THIS is an example of a modern American house, built in Connecticut, from the designs of Mr. F. R. Constock, architect, of New York.

The exterior is of granite, with plinth and dressings of buff-coloured pressed brick. The roofs are slated.

The plan illustrates some of the characteristics of American planning in small dwelling houses.

GAS AND GAS FITTINGS:

2.—MANUFACTURE OF COAL GAS.

MURDOCH made his earliest experiments with gas as an illuminant in 1792 at Redruth, in Cornwall, and subsequently at Old Cumnock, in Ayrshire, the place of his birth. But it was after his removal to the works of Boulton, Watts, & Co., at Soho, near Birmingham, in 1798, that his most important work in gas-lighting was carried out. At the Soho works he collaborated more or less with James Watt, of steam-engine fame, and was allowed to erect a gas-making plant, which satisfactorily supplied a portion of the works of this celebrated firm with the new illuminant.

The early history of the gas industry is replete with interest and not devoid of humour, for many of the sensational claims made for gas by a popular lecturer and company promoter of the period named Winsor, and by other enthusiasts less cautious than the industrious Murdoch, appear very ludicrous in the light of present knowledge regarding the properties of coal-gas. It is interesting to observe that before inflammable gas was successfully employed for lighting purposes, efforts had been made to use it as a source of power. In 1801 Philippe Lebon, a French experimenter, in amending his patent of 1799, claimed the use of motive power obtained by the explosion of inflammable gas mixed with air; and in this country, as early as the year 1791, John Barber obtained a patent for "a method of using inflammable air for the purposes of procuring motion and facilitating metallurgical operations," which consisted partly in successively

exploding mixtures of air and coal-gas. It is, however, necessary to here confine our attention to the study of the gas industry as it exists at the present time, and those desirous of tracing its development during the nineteenth century will find the subject exhaustively treated in King's "Treatise on Coal-Gas."

Although inflammable gas may be manufactured from so many different carbonaceous substances, coal is still used more extensively than any other material for the purpose of gas manufacture.

**Coal.**—The coals most largely employed in this country for gas manufacture are the bituminous coals of Durham and the neighbouring counties. The cannel coals of Scotland, Wales, and Northumberland yield the largest volume of gas, and the gas is of the best quality. At one time it was the common practice to mix a certain proportion of cannel with the bituminous coal in order to produce a gas of higher illuminating power than could be obtained from the bituminous coal alone, but about ten or twelve years ago the quantity of available cannel coal became so small, and its price so high, that it ceased to be used to any large extent in the southern counties of England, and the carburetted water-gas which was then introduced as a substitute for gas from cannel coal is now being used not merely as an enriching agent, but to a certain extent in many districts as a substitute for ordinary coal-gas itself. Anthracite and the various classes of steam coal are not used for coal-gas manufacture, because they yield very little gas, and are valuable for steam-raising purposes.

The quality and quantity of the gas yielded even by coals of the same class vary considerably, but as an indication of the results commonly obtained it may be said that ordinary bituminous coal should yield not less than 10,000 cubic feet of 15-candle gas per ton, while cannel should yield not less than 11,000 cubic feet of 28 or 30 candle gas.

**Coke.**—The average yield of coke from ordinary gas-coal is 1,360 lbs. per ton. The coke should be of good quality and not yield more than about 4 per cent. of ash when burnt. The average yield of coke from cannel coal is somewhat less, and, owing to the large quantity of ash it yields, the coke has no commercial value.

**Retorts.**—To obtain coal-gas from coal the coal is placed in cylindrical chambers called "retorts," from which air is excluded, and which are heated to redness in a furnace. At first the retorts were made of cast-iron and were placed in a vertical position, but they are now almost universally made of fireclay and fitted either in a horizontal position or inclined at an angle of 30 to 33 deg.

The retorts may be round, oval, or  $\Delta$ -shaped in cross-section, the latter shape being the most common. The internal diameter of the retort is usually about 21 in. by 15 in., and the length of a "single" retort is 10 ft., or of a "through" retort, having a mouthpiece at both ends, is 20 ft. The retorts now commonly used may be divided into three classes—

- (1) Singles, or retorts having only one mouthpiece;
- (2) Doubles, or "through" retorts, having a mouthpiece at both ends;
- (3) Inclined retorts, in which the coal is introduced at the upper end and the coke withdrawn from the lower.

Retorts with one mouthpiece only (fig. 1) are now seldom used except in small gasworks. The coal is introduced at one end only, the opposite end being closed with a fireclay back. In large works "through" retorts (fig. 2) are usually employed. These are double the length of the so-called "single" retorts, and are usually made in three pieces, jointed together. A mouthpiece is provided at each end of the retort, and coal is simultaneously introduced through each mouthpiece. Each mouthpiece is provided with a gas-tight lid or door. Inclined retorts or "slopers" (fig. 3) are usually  $\Delta$  shaped and about 15 ft. in length. The angle of inclination is about 32 deg. The coal is fed into the upper end of the retort and distributes itself by gravitation over the inclined floor; and when the distillation is completed the coke is allowed to slip out from the lower end, the coke being stirred, if necessary, with a long rake. Inclined retorts may be charged and "drawn" with much less expenditure of manual labour than horizontal retorts, and when the coal to be carbonised is of uniform quality they may be used with success. When, however, the coal to be used varies greatly in quality and specific gravity, trouble is often

caused by the coal failing to spread itself properly over the floor of the retort, and imperfect carbonisation, resulting in excessive agglomeration of the pieces of coke and a low yield of gas occurs. To break the force of the stream of coal as it is shot into the inclined retort, baffle plates have in some cases been adopted, and other devices have been proposed to make inclined retorts a greater practical success. Many gas engineers are now using them in great number, while others claim that for ordinary working conditions the horizontal retorts are better than any others.

**Retort Settings.**—The retorts are set in brick-work having joints made with fire-clay mortar. A number of retorts are grouped together over one furnace, and form a "bed." The number set in one bed varies in different works from three to twelve, but seven or nine laid in three tiers is the number most commonly adopted. The retorts are supported by the front flaps of the bed, and by a number of walls erected within the setting. A number of beds built side by side in one block form a "bench" of retorts.

**Heating the Retorts.**—The retorts may be heated by direct firing from beneath, but this method of heating is rapidly being superseded by the so-called regenerative system. By the regenerative system the retorts are more uniformly heated, and their life is prolonged, while a higher heat efficiency is obtained from the fuel consumed. The regenerative system consists essentially in the conversion of the solid fuel into inflammable gas, the combustion of this inflammable gas in the chamber or furnace in which the retorts are fitted, and the utilisation of the heat of the products of this combustion as they leave the furnace for heating the air (called the secondary air) admitted to the furnace for the purposes of combustion. The generator in which the solid fuel is converted into gaseous fuel is usually situated beneath the charging floor of the retort-house. It is filled with coke heated to incandescence, and a carefully regulated current of air (termed the primary air) is allowed to pass up through the carbon of the coke combines with the oxygen of the air to form the inflammable gas, carbon monoxide. This carbon monoxide together with the nitrogen of the air admitted passes from the upper part of the generator into the overhead furnace in which the retorts are located. Here the carbon monoxide meeting with hot secondary air burns to carbon dioxide with the evolution of heat, which maintains the retorts at the required temperature.

The inflammable gas from the generator should contain about 30 per cent. of carbon monoxide; the remainder of the gas is mainly atmospheric nitrogen which will not burn, and which acts solely as a diluent which abstracts heat from the flame of the carbon monoxide. A small proportion of carbon dioxide is also always present in the generator gas owing to the imperfect control of the reaction between the oxygen and the heated coke; and small quantities of hydrogen and methane are usually present owing to the decomposition in the generator of a certain quantity of steam from the ash pans beneath the generator. The products of combustion which escape from the furnace flues to the main flue and thence to the shaft which terminates above the roof of the retort-house, should consist almost wholly of nitrogen and carbon dioxide. The channels which admit the secondary air to the furnaces are formed in close proximity to the furnace flues, so that the escaping products of combustion serve to heat the incoming air before they escape into the atmosphere. Sometimes the blue flame produced by carbon monoxide when it burns to carbon dioxide may be seen at the top of the shaft of the retort house. The presence of this flame shows that the current of secondary air admitted to the furnaces is not being properly regulated, and that the whole of the heat obtainable from the generator gas is not being utilised in the furnaces.

**Ash Pans.**—A pan containing water is placed under the furnace bars of each generator. The heat from the incandescence of fuel and from the falling cinders vapourises a certain quantity of the water, and the steam passing up through the furnace bars tends to keep them cool and to retard the rate at which they wear away.

**Charging and Drawing.**—When the retorts are charged by hand the coal is placed in a long semi-circular scoop, having a capacity of about 1½ cwt. of coal. Three men raise the scoop and thrust it into the retort, the man

Fig. 1.—Single Retorts; showing (A) Retorts, (B) Ascension Pipes, (C) Hydraulic Main.

Fig. 3.—Inclined Retorts; showing (A) Retorts (B) Ascension Pipe, (C) Hydraulic Main.

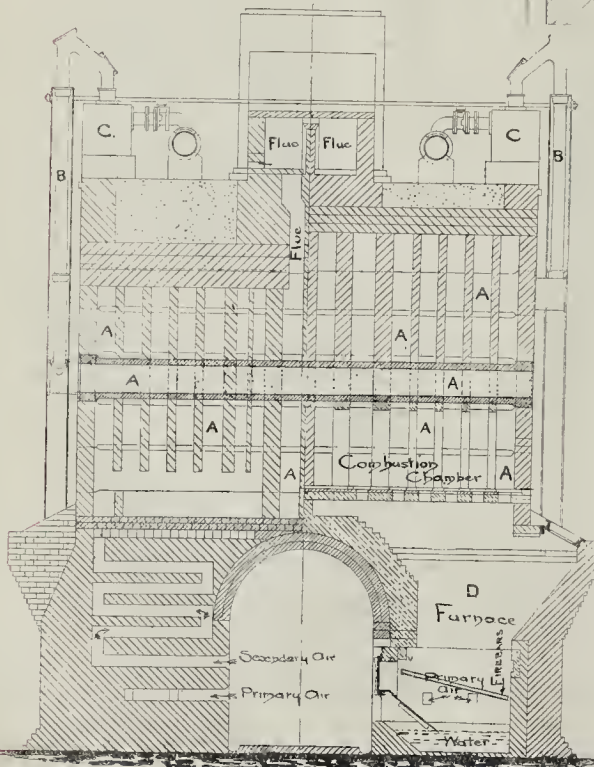

Fig. 2.—Section through Retorts in Regenerative Setting; showing (A) Retorts, (B) Ascension Pipe, (C) Hydraulic Main, (D) Generator.

having charge of the handle at the back of the scoop turns the scoop round and then withdraws it. A second scoop-charge is immediately added through the same mouthpiece. If "through" retorts are employed, another gang of men simultaneously charge the opposite end of the retort, for the scoops extend only to one-half the length of the retort. Consequently the charge taken by each "through" retort is about 6 cwt., or 3 cwt. per mouthpiece. Immediately the charging is completed the mouthpieces are closed. After the coal has been in the retort for four, five, or six hours, as the case may be, the mouthpieces are again opened, and the residue in the form of coke is withdrawn by means of a long-handled rake. The red-hot coke is cooled with the aid of water, or is taken in its hot condition to feed the generators. The charging and drawing is now commonly performed by machinery, instead of by manual labour.

**Retort Carbon.**—Some of the hydrocarbons evolved from the coal under the influence of heat are decomposed before they can escape from the retort, and a hard, dense deposit of carbon, known as "retort carbon" or "scuff," accumulates on the sides of the retorts. The deposit forms less rapidly when there is a slight vacuum in the retorts instead of a slight pressure. By the use of an "exhauster" the gas pressure in the retorts can be maintained approximately at atmospheric pressure, but the variations in the rate at which the gas is expelled from the coal render fluctuations unavoidable. When the deposit has attained a thickness of one or two inches it must be removed, as it lessens the capacity of the retort and diminishes its heat conductivity. It is usually removed with chisel bars at intervals of about six months.

**Clinker.**—"Clinker" is produced by the partial fusing of the mineral matter left as ash from the fuel upon the heated fire-bricks, a kind of slag being formed. This clinker is extensively used for "rockwork" in ferneries and for garden purposes. The fire-brick rubbish, together with the clinker, is some-

times pulverised and mixed with sand or sharp grit and used in concrete.

**Ascension-pipes.**—The gas and vapour expelled from the coal in the retorts passes up a vertical pipe, called an ascension-pipe, which rises from each mouthpiece to a short distance above the retort stack. The ascension-pipes usually have an internal diameter of about 5 in.

**Bridge-pipes and Dip-pipes.**—The upper end of each ascension-pipe is joined to a short bridge-pipe which extends horizontally back towards the retorts. The other end of each bridge-pipe is connected to a short dip-pipe which extends vertically downwards into the hydraulic main, where it terminates in an open end dipping just below the surface of the liquid in the main.

**Hydraulic Main and Foul Main.**—The hydraulic main is a pipe not less than 18 ins. in diameter. It may be  $\square$ -shaped, square, oblong, or round in cross section, and is preferably constructed of mild steel plates. The hydraulic main is frequently supported on standards placed on top of the retort bench. All the dip-pipes along one side of the bed dip into the same main, being sealed by the liquid, which is maintained at a constant level in the main. The gas as it enters the hydraulic main is laden with tarry matter in the form of fine spray, which gives it the appearance of a brown vapour, but the greater portion of the tar condenses out before the gas leaves the main. The tar sinks to the bottom of the main and is covered with an aqueous ammoniacal liquid, which also is condensed from the gas coming from the retorts. Frequently a second large main called the "foul main," which runs the whole length of the retort house, is provided at the back of the hydraulic main, and the gas leaving the hydraulic main passes into the foul main.

OBITUARY.

MR. R. WILSON.—We have to announce the death, on July 1, of Mr. Robert Wilson, architect to the School Board for Edinburgh. After following his profession for a while in London, Mr. Wilson succeeded to his father's practice in his native city. As architect to the Edinburgh School Board he prepared the plans and designs of the following more important board schools:—In Broughton-road, on the site of Blackfield House, 1835, for 1,358 children; in Dalkiel-road, 1836-7, the Industrial School at St. John's Hill, on the site of the old Holyrood Free Church Manse, 1837-8; the enlargement of the North Canon-gate School for about 750 additional children with central hall, gymnasium, &c., on the site of the old New-street School, 1860-1900; and the Craigleithon Schools at Ashley-terrace, North Merchiston, upon a site of 1 1/2 acres having for their main feature central halls upon the ground and first floors, with twenty-seven classrooms, a gymnasium, and a combined workshop and cookery classroom, for 1,550 scholars, for which he completed the plans in April of this year. Mr. Wilson also prepared, in 1898, the plans for the new school buildings, with boardroom and other rooms and offices, together with those for an enlargement of the Anderson Institute School for the Leith School Board, Shetland; the Edinburgh Royal Blind Asylum, No. 50, Nicholson-street, Edinburgh, as just completed; the recent additions to the High School at Portobello; and some business premises in Colson-street, Edinburgh. Mr. Wilson was a prominent member of several philanthropical societies and institutions, Vice-President of the Baptist Union of Scotland, and during a long period was director and organiser of the Edinburgh Free Breakfast Mission.

GENERAL BUILDING NEWS.

**WESLEYAN CHURCH, SHEFFIELD.**—On the 17th ult. a new Wesleyan church was opened in Shethfield Park district, at the junction of Stafford-road and Fitzwater-road. The new buildings consist of a church with two vestries, a church parlour, and a school block, with assembly-room and seven classrooms. The church is cruciform in plan, measuring 97 ft. interior extreme length, including chancel, 41 ft. 6 in. wide across the nave, and 59 ft. 6 in. wide across the transepts. It has an end gallery only. There is seating accommodation for 640 adults, or a mixed congregation of 800 persons. At the corner there is a tower terminating with a spire 124 ft. high. The front of the church has three doorways leading to the ground floor and gallery, and the centre doorway has over it a four-light traceried window. The other windows throughout have pointed heads, and the chancel has a circular traceried window which is filled in with stained glass, the gift of the architect. The organ is a three-manual one, and has been built by Messrs. Brindley & Foster. The pulpit is made of

alabaster, resting upon polished granite pillars, with a foundation of Caen stone. The school block is built on the central hall plan, with classrooms around it, some of them opening into the hall. The length of the room inside is 50 ft., and it is 20 ft. wide. The classrooms are of varying sizes, there being two large ones for adult classes, and one large one for infants. The rest are of smaller size. Accommodation is provided for 500 scholars. The architect is Mr. John Mills, of Derby, Linton, and the builder is Mr. James Fidler, of Lockington. The estimated total cost of site, church, and schools is 10,200l.

**CONGREGATIONAL CHURCH, ENDCLIFFE, SHEFFIELD.**—A Congregational school-chapel was opened at Endcliffe, Sheffield, on the 25th ult. The present building consists of a room 48 ft. by 33 ft. On the ground floor are two classrooms, one 19 ft. by 13 ft. and one 13 ft. by 11 ft.; a vestry 13 ft. by 12 ft., which can be used as a classroom; and an infants' schoolroom 21 ft. by 17 ft. On the first-floor are three classrooms, one 16 ft. by 11 ft., and two each 11 ft. by 10 ft. opening on a gallery. These last three rooms, as well as the large classroom on the ground floor, are separated from each other and from the large room by revolving shutters. In the basement are a kitchen, heating chamber, and store-room. The buildings are of brick, the roofs slated, and the floors are of wood blocks. The following are the contractors: Mason and bricklayer, Mr. H. Turton, Sheffield; joiner, Mr. W. Candler, Sheffield; slater, Messrs. Pickles Bros., Leeds; plasterers, Messrs. Carr, Unwin, & Sons, Sheffield; plumbers, Messrs. Braithwaite & Co., Sheffield; painters, Messrs. A. Jubb & Son, Sheffield; wood block floors, Mr. Roger Lowe, Bolton. The heating is by hot water on the low-pressure system, and is being carried out by Messrs. Truswell & Son, of Sheffield. The ventilation is by Messrs. Bedford & Co., Halifax. For the purpose of worship, the building will accommodate about 320 on the ground floor, and by utilising the classrooms on the first-floor 100 more can be accommodated. The architects are Messrs. Hemson & Paterson, of Sheffield.

**WESLEYAN NEW CHURCH, MORTHOE, NORTH DEVON.**—At Morthoe, near Ilfracombe, the foundation-stones were laid recently of the new Wesleyan Methodist church. The church is to be built of local stone, the dressings, arches, windows, and door openings being of Bath stone. The nave will be about 54 ft. by 31 ft., and lighted by four windows, east and west, and three side windows in the nave. On the right is to be a transept, divided from the nave by Gothic arches in Bath stone. The seating accommodation of the nave will be for 170 persons, and that of the transept for 70. There is to be a tower about 50 ft. high, with a short pinnace. The architect is Mr. W. H. Gould and the builders Messrs. Brittons & Pickett, of Ilfracombe.

**ST. MICHAEL'S CHURCH, BROMLEY, E.**—Messrs. J. E. K. and J. P. Cutts have been appointed architects for the reparation of the fabric of this church, which will cost 2,500l. The repairs will comprise the renovation of the roof, renewal of the stonework, cleaning and re-pointing of the brickwork, re-heating, re-glazing, and so on. The church was built in 1865, after the plans and designs, we believe, of J. W. Morris.

**HOSPITAL OF ST. JOHN AND ST. ELIZABETH.**—In our issue of October 22, 1898, we gave a view and plan of this hospital as proposed to be rebuilt at St. John's Wood, from the design and under the superintendence of Mr. E. Goldie. On Monday next the new hospital is to be opened by the Lord Mayor of London and the Lady Mayoress. The original hospital was in Great Ormond-street, adjoining the hospital for sick children; the rebuilding is on a site between Grove End-road and Circus-road. The chapel attached to this hospital in Great Ormond-street, which was erected some thirty-seven years ago at the expense of the late Sir George Bowyer from the designs of the late Mr. George Goldie, has been re-erected at St. John's Wood, the facade being the actual one removed from Great Ormond-street. As much also of the interior of the original structure as could be removed has been re-erected, while the general internal appearance of the original building has been adhered to as far as possible in every particular, including altars and all other fittings. This chapel forms the central feature of the new building. Right and left are two blocks containing respectively, to the west on the ground floor, nearest to the chapel, two sanctuaries or vestries, beyond which are two isolation wards. The temporary wards are to be removed, close by which an exit is provided. Above these are four private wards, while on the floor above are provided one private ward, an operating-room, with additional top-light, and a retiring-room for the patient for the administration of anaesthetics. The corresponding block on the other side of the chapel, comprises on the ground floor pharmacy, boardroom, medical officer's room, a private entrance, and with a way up to the latter's sitting-room and bedroom above. The first and second floors are taken up by four private wards on each, with bathrooms, &c. There are thus thirteen private wards in all. Right and left of the chapel are public entrances into the hall, off which is a reception parlour. From this hall at the back of the chapel is the main staircase, in the well of which is a large hydraulic lift, and from which there is communication on the basement, ground floor, and

first floor with the adjoining nursing sisters' convent, which is in practice the administration building of the hospital. The two wings parallel to the chapel to the east and west are similar in plan; on the ground, first, and second floors are wards for seventeen beds, each 75 ft. long by 25 ft. 6 in. wide, by 12 ft. 6 in. high. Attached to each are the usual small kitchen, bath-rooms, &c., and a staircase from basement to roof, each furnished with a large lift. The building is built of picked stones. All stonework is Portland. Window quoins, heads, &c., are of red rubbers. Floors and stairs are fire-resisting, laid with teak. Walls and ceilings are finished in Keen's cement, sashes in mahogany. Heating and ventilation are treated as simply as possible, the former supplied by open fires and low-pressure hot water, and the latter by controllable inlets and outlets, the foul-air extract being worked in connexion with the stacks in the centre of wards. The roof, an asphalted flat with a parapet, which can be reached both by stairs and lifts, will be used as a promenade by the patients and nurses. The architect is Mr. E. Goldie, of Kensington, and the contractor Mr. C. J. Hinshley, George-street, Manchester-square, W. The fireproof floors are by Messrs. W. Lindsay & Co., of Westminster; the heating and hot water by Mr. J. Metcalf, Freston; the electric lighting by Mr. J. Sperati, London; and the lifts by Messrs. Waygood & Co., London.

**BUSINESS PREMISES, LIVERPOOL.**—Messrs. Crane & Sons, Limited, have taken new premises at the junction of Paradise-street with Church-street, and facing Whitechapel, Liverpool. A sum of over 4,000l. has been expended on the alteration of the premises, the various works having been carried out by Messrs. Waring & Gillow, Messrs. Haigh & Co., and Messrs. Muir & Cubley, from designs and under the superintendence of Mr. Huon A. Mearns.

**DISPENSARY, EXMOUTH.**—A new dispensary has been erected in Church-street, Exmouth. It contains vestibule, hall, waiting-room, 22 ft. by 15 ft., consulting-room 15 ft. by 14 ft., dressing-room, dark room, dispensary, and caretaker's rooms. The building was designed by Mr. E. Ellis, and built by Mr. J. Lacey.

**FIRE STATION, FOREST HILL.**—The foundation-stone of a new fire station, to be erected between Forest Hill and Lower Sydenham, was laid by Mr. J. D. Gilbert, the Chairman of the Fire Brigade Committee of the London County Council, on the 4th inst. The new building will occupy a site at the junction of four roads, and, converging on Perry Vale, will be erected under the direction of Mr. W. E. Riley, at a cost of about 11,000l.

**SAILORS' REST, CARDIFF.**—A new Sailors' Rest is to be built at Cardiff at a cost of about 8,000l. Separate meeting-rooms will be provided for the different nationalities, and a ball to accommodate 500. In addition there will be a floral hall, in which men may sit and smoke and read. The architects are Messrs. Jones, Richards & Ebdgen, Cardiff. It is proposed at once to pull down 180 and 170, Bute-street, as the site of the new structure, and the committee have obtained the owner's sanction to call it the "John Cory Sailors' Rest."

**MECHANICS' INSTITUTE, FORRES, ELGIN.**—The foundation-stone has just been laid of a new facade for the Forres Mechanics' Institute. The new front is designed by Mr. Forrest, architect, Forres, and will, along with some internal alterations, cost about 1,200l.

**COTTAGE HOSPITAL, SOUTHWOLD.**—The foundation-stone has just been laid of a new cottage hospital, Southwold. The new hospital, the plans for which have been prepared by Mr. E. N. Cubitt, architect, of Brentwood, provides for ten beds, there being two large and two small wards, besides kitchen, operating, medical officer's, dispensary, matron's, secretary's, nurses', and out-patients' rooms. The building, which is to be of red brick and tile, will have a frontage of 80 ft. It is proposed to arrange for flat roofing over the wards, in order that the roofs may be used as a sort of promenade for convalescent patients.

**HOSPITAL, ABERGAVENNY.**—The foundation-stone has just been laid of buildings for the amalgamated Cottage Hospital and Dispensary Institutions at Abergavenny as a memorial to Queen Victoria. The site is on the Hereford-road, adjoining Bailey Park. The hospital, which will consist of the wards, accommodating seven beds and two cots, the dispensary, and all offices in connexion therewith, will be on the ground floor. Externally the building will be of pressed brickwork, the roof being of Broseley tiles. The contract, amounting to 1,025l., has been let to Messrs. J. G. Thomas & Sons, Abergavenny. The design is by Mr. E. A. Johnson, of Abergavenny and Merthyr.

**PARISH HALL, ROUNDHAY, LEEDS.**—A new parochial hall has been erected on the Lidgett Park Estate, Roundhay. It is of local stone, and is in the Tudor style. The building is 75 ft. by 30 ft., and 24 ft. in height. The new hall has been designed by Mr. W. Carby Hall, architect, of Leeds.

**AGRICULTURAL EDUCATIONAL BUILDINGS, GARTFORTH, YORKSHIRE.**—New educational buildings have been erected at the Manor Farm, Gartforth, by the East and West Ridings Agricultural Council. The buildings are intended to serve a double purpose; in the first place, they contain lecture-rooms and laboratories for students taking the course of instruction given in the Agricultural Department of the Yorkshire College; and secondly, they provide

a practical dairying school. The buildings, designed by Messrs. Smith & Tvededal, architects, Leeds, have been carried out in red pressed brick, with stone dressings, the roofs being covered with red tiles.

**BATHS, PORTOBELLO, EDINBURGH.**—New baths have been erected at Portobello at a cost of 20,000l., from plans and under the direction of the City Architect, Mr. Robert Morham. The front of the baths is towards the promenade, the side of the men's swimming pond flanking Melville-street. The front entrances for both sections are approached by a flight of stone steps which extend all the length of the central portion of the facade. In the centre of the building on the ground floor is placed the pay-box. To the east of this office is the ladies' entrance, and to the west the gentlemen's. From either entrance a vestibule is reached, divided into two parts by columns and entablature of the Doric order. From the inner vestibule there rises a staircase leading to the upper floors. On the left and right of the men's and women's entrances. These are arranged on the principle of one bath to two dressing-boxes, with a side first-class bath, and in the female side four. The baths can be filled either with fresh or with salt water, and the first-class bath will have full control of the lead pipes, as well as being in electrical communication with the attendants. From the entrance hall access is gained to the large roomed hall. This hall contains the swimming pond, which has a water area of 75 ft. by 35 ft., the water being 7 ft. deep at one end and 3 ft. 6 in. at the other. The dressing-boxes, to the number of fifty-six, are placed along the sides of the hall. The hall is divided longitudinally by means of ornamental columns with moulded capitals. These columns in turn support the gallery and the roof, which terminate in a range of vertical lantern lights. Surrounding the three sides of the pond hall is the gallery, staged and seated for spectators. At the south end of the hall there is provided a gymnasium, 32 ft. by 30 ft. Adjoining the Melville-street, an apartment has been set aside for the resuscitation of apparently drowned persons. The women's pond is somewhat similar to the men's, but is not so large, and is restricted to one story in height. One feature at the end of the women's pond is the projecting ornamental oriel, which enables those occupying the reading-room on the first floor to overlook the swimming pond. Situated between the men's and women's ponds are the second-class baths. These are similar to the first-class baths, but are simpler in general treatment. The centre of the south portion of the establishment is occupied by the Turkish bath, accessible from two hot rooms, where the temperature will range from 200 deg. to 210 deg.; the sudatorium at a temperature of about 100 deg.; and the tepidarium. Adjoining the sudatorium, but entered by a disconnecting porch, is the steam-bathing room. A Russian vapour bath also adjoins the sudatorium. Between the sudatorium and tepidarium is the cold plunge bath, 16 ft. long by 5 ft. wide. The tepidarium is fitted up with a series of lounges. On the first floor of the building towards the promenade a series of rooms for the use of visitors has been provided. In the centre portion of the front is a refreshment-room, 28 ft. by 22 ft. This is fitted up with a counter and buffet, and is in connexion with the kitchen in the flat above by means of lifts. Beyond the reading-room at the front towards the sea is a smoking-room. A feature of the first floor level, access to which is gained by means of casement windows from the various rooms. The pediment over the men's entrance represents the City Arms, and that over the women's entrance represents the old Portobello Burgh Arms. The building is of Dumfriesshire red stone.

**HALLS AND BATHS, KINNING PARK, GLASGOW.**—The foundation stones have just been laid of new baths and halls for the burgh of Kinning Park. The plans show buildings involving an expenditure of from 20,000l. to 25,000l. The halls, which are situated on the north side of West Scotland-street at Smith-street, have a frontage to Smith-street, showing three light Romanesque windows over the main entrance, with a niche in which is placed the Goddess of Harmony to be placed. The principal entrance is by a flight of steps to a vestibule, which leads through glass doors to a crush hall, 65 ft. by 12 ft. Of the crush hall there are retiring-rooms and the stair leading to the gallery of 1,200 persons. The hall will accommodate 1,200 persons. There will be a separate entrance to the platform from West Scotland-street, which can also be used as an entrance to the lesser halls and library. Behind the platform of the large hall there will be a four manual hydraulic organ. The lesser hall will accommodate between 400 and 500 persons. The baths are being built in West Scotland-street almost opposite the halls. The swimming-pond is 75 ft. by 37 ft., being 6 ft. 9 in. deep at the springboard end and 3 ft. 6 in. at the other. The interior will be lined with white brick, and the floor and passages with Italian mosaic, having panelled borders. Over the swimming-pond there will be a gallery for spectators. Mr. Donald

Bruce, of Messrs. Bruce & Hay, Glasgow, was the architect of all the buildings.—*Glasgow Evening Times.*

**EXTENSION OF POPULAR HOSPITAL.**—The Bishop of London recently opened the new wing, the gift of the Drapers' Company, which has been added to the Popular Accident Hospital. The addition has been erected at a cost of about 14,000l., and is situated on the eastern side of the surgical ward out-patients' department, and an addition of three medical wards and quarters for the staff. The basement is devoted to the out-patients' department, in which surgical and medical cases are separated, with waiting, examining, and dressing-rooms for each department, the former out-patients' department being converted into a general waiting-room. Upon the ground, first, and second floors are the three wards (41 ft. long by 28 ft. 6 in. wide), for ten medical cases each. The wards are approached through the old surgical wards, but have, in addition, their own staircase and outside escape stairs, with ward scullery, bathroom, sinkroom, and other sanitary accommodation in spurs at the east end, the sisters-room at the west end, and dayrooms at the ground and first floors. Each ward has a wide balcony upon the south front overlooking the docks and river. The floors are laid in a mental terrazzo mosaic in panels and borders, the walls and ceilings being plastered. The third floor provides accommodation for the nursing staff, and includes a nurses' sitting-room (32 ft. by 12 ft. 6 in.), besides linen storage and the necessary sanitary accommodation. The sitting-room faces the east and south-east. The fourth and fifth floors are occupied by servants' bedrooms and a broad flat for recreation, a portion of which is covered with a shelter roof. The builders are Messrs. Harris & Rowland Plimbe, of Fitzroy-square, the architect of the hospital.

**BUILDING IN LEEDS.**—Property owners and house agents in certain parts of the city are asking whether Leeds is being over-built, many dwellings, including a large number of the cottage class, being at present without tenants. This is so on Armley. An agent in that suburb states that he has on his books no fewer than fifty empty houses, whereas the number in normal times has not been more than twelve. Inquiries of other agents show that there are now four times the number of "to lets" than there were a year or so ago. And it is said that cottages in Armley township are from 6d. to 1d. per week cheaper than similar accommodation in the Roundhay road and Kirksalton districts. In Bramley township the proportion of empties is rather larger than in Armley. A year ago new property in Bramley was let before its completion. Messrs. Yates, Limited, of the Vellington Mills, in Broad-lane, have erected seventy-eight first-class cottages opposite their works, and these have been readily let to their own and other workers. This, it is said, has caused numerous empties amongst poorer-class property. There are at present in Town-street and Back-lane cottages to let which have not remained empty for any length of time during the past fifteen years. At Swinnow empty houses can be seen in many streets. It is expected, however, that the extension of the tramways will have a beneficial effect in this district. In Holbeck new cottage property lets are being put, but regarding some parts of Hunslet and on the Bank complaints about empty houses are to be heard.—*Leeds Mercury.*

#### SANITARY AND ENGINEERING NEWS.

**BRIGHTON WATER SUPPLY.**—The Mile Oak pumping station, in connexion with the Brighton water supply, was recently opened by the Mayor of Brighton. The site for the new pumping station was selected in February, 1896, and in the following April some 200 acres of land, known as Mile Oak Farm, were purchased, and subsequently a further 70 acres of land immediately joining the western boundary of Mile Oak Farm. In May, 1899, the contract for sinking the two pumping wells was let to Mr. A. E. Nunn, of Tenterden, and later, as the progress of the works would allow, further contracts were entered into for the permanent pumping engines, boilers, &c., with Messrs. Fleming & Ferguson, of Paisley; the engine and boiler houses, coal stores, &c., with Messrs. J. Longley & Co., of Crawley; winding shaft and headings, &c., with Mr. A. E. Nunn; and for the erection of the foreman's house, workmen's cottages, and boundary wall with Messrs. R. Cook & Sons, of Crawley. The underground works at the present time comprise two pumping wells, each 187 ft. deep, and joined by two sets of headings, one winding shaft, 6 ft. in diameter and 190 ft. deep, and some 1,200 ft. in length of headings, which vary in height from 30 ft. to 6 ft. 6 in., and are 5 ft. 6 in. wide. The pumping engines are of the marine type, but adapted for this class of work. They are on the triple expansion principle with slide valves and surface condensers, and are each capable of delivering from the bottom of the wells into the centre of Brighton six million gallons of water per day. The maximum speed of the engines is seventy-five revolutions per minute, and they are geared through helical wheels so as to drive the

deep well pumps at twenty-five revolutions per minute. There are three Lancashire boilers made of mild steel, each 30 ft. long and 7 ft. 6 in. diameter, and working at a pressure of 140 per square inch, and a Green's economiser, consisting of 120 tubes, each 9 ft. long and 4 1/2 in. in diameter. The engine-room is 28 ft. long and 30 ft. wide and 36 ft. high to the top of the lantern ventilators. Beneath the engine-room is the basement, entrance to which is obtained down a flight of stone steps from the engine-room and also from the front of the building. In this basement the condensers, air pumps, feed pumps, and the various pipes and valves connected with the engines and pumps are situated. On the west of the engine-house is a room furnished for the use of the members of the Waterworks Committee, and on the east side is the workshop, in which the ordinary repairs of this station will be carried out. The boiler-house is 65 ft. long and 51 ft. wide. The coal store is entirely underground and immediately adjoining (on the west side) the boiler-house. It is 50 ft. long and 50 ft. wide. The chimney-stack is situated to the east of the boiler-house and is 100 ft. in height. Within the boundary wall of the pumping station, which comprises two acres, are a foreman's house, and immediately to the south of the works two cottages for the use of the workmen employed on the west side. The total cost of the pumping station up to the present has been about 50,000l. Mr. J. C. May is the Borough Engineer and Surveyor, and Mr. Johnston, C.E., the waterworks engineer.

**WIDENING OF QUAY, ABERDEEN.**—On the north side of Provost Matthews Quay a new deep-water wharf, 200 ft. long, has just been constructed by the Harbour Commissioners (on the west side) according to plans by Mr. R. G. Nicol, Harbour Engineer. The new wharf extends 12 ft. in front of the old one, and is substantially constructed.

**NEW WORKS FOR FISHING INDUSTRY ACCOMMODATION, ABERDEEN.**—Aberdeen Harbour Commissioners have resolved that instead of going on with the construction of the whole of the wharf on the north side of Point Law and Albert Basin at a cost of 16,350l., as formerly recommended to them—they will proceed with a portion only, 375 ft. in length, the estimated cost being 9,420l. It has also been resolved to remove the east end of Point Law and to place a quay wall there, the expense being estimated at 12,500l. The plans are by Mr. R. Gordon Nicol, Harbour Engineer.

**EXETER WATERWORKS EXTENSION.**—Mr. A. A. G. Mallet, A.M.L.C.E., held a Local Government Board inquiry at Exeter, on the 4th inst., relative to the application of the City Council for leave to borrow 15,000l. for water extension works. The original estimate was 35,000l., but owing to the increased cost of material, increased price of labour, extra work, and other causes, the cost has risen up to 49,000l. Mr. Donald Cameron, City Surveyor, explained the details of the scheme and how the increased cost arose.

#### MISCELLANEOUS.

**PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.**—Mr. Robert H. Johnson has been appointed the London agent of the brick and concrete department of Henry Dennis, Ruabon (the Ruabon Coal & Coke Co., Ltd.).

**HOUSING QUESTION AT WOLVERHAMPTON.**—A special meeting of the Wolverhampton Town Council was held on the 1st inst. for the purpose of discussing a report prepared by the Housing of the Working Classes Committee, in moving the adoption of the chairman of the committee, in moving the adoption of the report, said that in the East district there were 228 back-to-back houses, 518 single houses, and 142 through houses, of which 61 per cent. were more or less damp or dilapidated or both. The population of these houses averaged 377. With regard to the density of population, he pointed out that, whilst in the cottage tenements proposed to be erected by the committee there would be a maximum number of 225 persons per acre, in the court houses in the whole of the East End there were 384 per acre, in back-to-back houses 302 1/2, in common lodging-houses (week days) 426 1/2, in the houses registered to accommodate 648 per acre. The site adopted for the experiment of erecting houses for the poor was 4,000 yards of land in Green-lane, the property of Lord Barnard. The price was 28. 0/ per square yard, and upon the land it was proposed to erect twenty-five houses of two rooms and twenty-five houses of three rooms at a cost of 4,682l. It was expected that the Corporation would be allowed forty years in which to repay the amount expended on the buildings, but if sixty years were allowed it might make it possible to reduce the rents 4d. per week, or give better outside accommodation. The rentals proposed to be charged were 23. 8d. per week for the two-roomed houses and 28. 0/ per week for the three-roomed houses. There was no town where the poor were housed in such a way at less rent unless the scheme was subsidised by the rates. Mr. Shepherd seconded the motion, which was carried unanimously.

**TENDERS FOR THE NEW MARKET HALL, LEEDS.**—At the last meeting of Leeds City Council the Markets Committee recommended the acceptance of tenders for the works required in the erection of

the new market hall and shops, amounting to 101,390. Alderman Knowles, chairman of the committee, mentioned that Mr. S. Macfarlane, whose tender of 1,701l. 5s. 3d. for concrete's work, had been provisionally accepted, had intimated that he had made an error. Under the circumstances he proposed that the tenders should be accepted, with the exception of that for concreting, and that the committee be authorised to accept a tender for that work. This was seconded by Alderman Carter. An amendment was moved by Mr. Peate to the effect that the recommendation of the committee, so far as the acceptance of the tender of Messrs. William Nicholson & Sons, of Leeds, of 20,790l. for carpenter's work was concerned, be not approved, but that the letting of the carpenter's work be referred back to the committee for further consideration. He said that in committee the voting rested between Messrs. Nicholson, for whom five voted, and Messrs. James Taylor & Sons, of Yeading and Guiseley, who received four votes. Messrs. Taylor's tender was for 20,860l. or 212l. less than that recommended for acceptance, and he urged that the Corporation were not justified in accepting the higher tender merely on the ground that Messrs. Nicholson were a Leeds firm. Other members of the Council contended that the contract should have been given to Messrs. William Mason & Sons, who were a Leeds firm and whose tender was lower than the other two, namely, 20,517l. Eventually the amendment was carried.

**NEW BURIAL GROUNDS FOR THE CITY OF WESTMINSTER.**—In pursuance of certain provisions contained in the Burial Acts, 1852 to 1885, as amended by the Burial Act, 1900, and in the London Government Act, 1899, an Order in Council has been made for vesting in the Council of the City of Westminster powers to provide requisite places of burial for the inhabitants of the parishes of St. James, St. Martin-in-the-Fields, St. Clement and St. Mary Abchurch, in the City of London, and the Liberty of the Rolls, the Savoy Precinct, and the Close of the Collegiate Church of St. Peter, Westminster, under the provisions of the Burial Act, 1854. By that statute the Town Council of any borough may petition for an Order in Council for powers to the effect above stated, when all or any of the burial grounds of parishes within, or partly within, the borough have been closed by Order in Council with the resultant difficulty or inconvenience in providing (under the Burial Act, 1853) requisite places of burial for the resident parishioners.

**"PAPIRSTEEL" CONDUIT.**—The General Electric Company, of Queen Victoria-street, have sent us a leaflet describing their new "papiersteel" conduit for electric wires. They rightly say that what is wanted for electric wiring is an inexpensive, light, strong, and durable material. The "papiersteel" tube is of wire casing, while often convenient in wiring old houses, ought never to be used in new houses. The proper time to conceal tubes in the walls and floors is while the house is being built. If purely metallic conduits like gas-barrel, "compo" pipe, or enamelled close-joint conduit are used, then very special precautions have to be taken to prevent moisture condensing inside the tube. The "papiersteel" tube is made of steel and is lined inside with a highly insulating paper, which is impervious to damp. It is much cheaper than insulated steel or gas barrel tubes, and affords the same mechanical protection from nails, &c. The various lengths of pipe are "stoved" together, but lengths with screwed joints can be supplied at a slight additional cost. This system has the great advantage, from both the consumer's and the company's point of view, of increasing the insulation resistance of the wiring in the building.

**ART EXHIBITION, SHEFFIELD.**—The private view of the Summer Exhibition at the Howard Fine Art Gallery, Sheffield, took place on Wednesday, the 10th inst. It includes original drawings and reproductions of Cecil Aldin's work; pictures by Messrs. Dudley Hardy, George Haité, Edward Stott, and other artists; and a series of pictures of Irish scenery by Mr. Owen Bowyer.

**A BUILDING TRADES' EMPLOYERS' YEAR BOOK.**—The "Building Trades' Employers' Federations and Master-Builders' Year-book and Diary for 1901-2" is issued in connexion with the Lancashire, Cheshire, and North Wales Building Trades' Employers' Federation, and is compiled by Mr. R. Hall, builders' surveyor, of Bury. It contains all information as to the trade associations included in this Federation, with copies of forms of contract and sub-contract adopted by the Federation, and various tables of useful statistics for builders.

**SPITALFIELDS MARKET.**—Lord Harris's Select Committee of the House of Lords have ordered to be reported to the House for third reading the Bill promoted by the London County Council for the purchase of Spitalfields Market from Mr. Horner, the present lessee. A clause has been inserted in the Bill which will enable the Stepney Borough Council within whose area the market is situated, to exercise the option within six months after ten years from the passing of the Act to lease or purchase the market and the land. The London County Council are prepared to take steps for purchasing more land around the market and widening the streets. It is stated that the market is let to Mr. Robert Horner upon an eighty-four years lease from 1882 at a yearly rent of 5,000l., and that the

purchase money amounts to 176,750l., together with 1 per cent. for agreed costs of the vendors of the freehold.

**NEW ELECTRIC TRAMWAY, ABERDEEN.**—The Corporation of Aberdeen has just opened a new electrical tramway from Castle-street to the sea-bathing station. The portion across the Links is on the third-rail principle. The line has received only temporary sanction from the Board of Trade, whose expert has not yet had an opportunity of visiting and inspecting the same, and objections are to be made against a double track in streets so narrow as Justice-street and Park-street.

**NATIONAL REGISTRATION OF PLUMBERS, ABERDEEN.**—The eleventh annual general meeting of the registered plumbers of Aberdeenshire, Kincardineshire, and Banffshire was held last week in Aberdeen. Professor M. Hay, Medical Officer of Health for the City of Aberdeen, and President of the District Council, occupied the chair. It was reported that the registration movement had made a great advance, and that four masters and forty-one journeymen had lately been added to the number of registered men within the district. Allusion was also made in the Council's report to the Birmingham resolution to establish two grades of registration. Dr. Hay was re-elected as president; Mr. A. R. Robertson, plumber, as vice-president; and Mr. C. R. Worling, plumber, as one of the auditors. Other office-bearers were appointed and the vacancies in the District Council filled up.

**NATIONAL FEDERATION OF BUILDING TRADE EMPLOYERS.**—The members of the National Federation of the Building Trade Employers of Great Britain and Ireland took part in several engagements in Glasgow on the 3rd inst., commencing with a reception by the Lord Provost and ex-Baillie Shearer in the morning in the City Chambers, at which they were joined by members of the Institute of Builders. The contents of the reception were acknowledged by Mr. King, London, on behalf of the Institute, and Mr. A. Krauss, Bristol, on behalf of the Federation. Subsequently the half-yearly meeting of the Federation was held in the Windsor Hotel, at which several matters affecting the interest of the building trade were discussed, among them being the restrictions imposed by the operatives' trade unions throughout the Kingdom in regard to the fixing of ready-made joinery and worked stone which had been prepared in places other than those in which they were to be fixed. Mr. A. Chambers, Leicester, Mr. Dickinson, Derby, and others gave instances of operatives refusing to fix material which had been prepared in other districts, notwithstanding that the rates of wages in those districts were higher than in the districts in which the material was intended to be used. A resolution was passed expressing the opinion that the restrictions were not only harsh in regard to their application to employers, but hurtful to the general welfare of the trade. The Scottish Federation then entertained the members to lunch, and in the afternoon a supplementary reception was given in the City Chambers by ex-Baillie Shearer; afterwards the company were conducted over the City Chambers by ex-Baillie Shearer, who gave a history of and described the buildings.

**THE CARPENTERS' COMPANY'S EXAMINATION.**—This Company's annual examination in carpentry and joinery, &c., was held recently at their hall in London Wall. Among the gentlemen who kindly helped the Company by acting as examiners were Professor T. Roger Smith (Master of the Company), Mr. John Slater, Sir Philip Magnus, Mr. Seth Smith (President of the Architectural Association), Mr. Jas. Bartlett, Mr. Barter, of the London School Board, and the President of the Clerks of Works Association. The following is the list of successful candidates arranged in order of merit:—*First Class.*—1. Jas. Sandham, silver medal; 2. H. T. Barnes, bronze medal; 3. Frank Turner, 4. W. J. Stone, 5. G. W. Filby, and F. E. Glover (equal). *Second Class.*—H. O. Armstrong, C. F. Parsons and F. W. Spring (equal), H. Searle, W. G. Pack, E. C. Durnford, F. H. Sharp, H. E. Pack, W. R. Peirce, Wm. Court, W. G. Brookes, W. H. Gardner and R. Pierson (equal).

**THE ARCHITECTURAL ASSOCIATION.**—Mr. Arthur T. Bolton, A.R.I.B.A., has been appointed Master of the Architectural Association Day School, which will be opened at 56, Great Marlborough-street, W., in October next. There could not be a better appointment.

**CAPITAL AND LABOUR.**

**STRIKE OF PAISLEY MASONS.**—About 100 operative masons went on strike on the 2nd inst. at Paisley against the proposal of the masters to reduce their wages by 3d. per hour. The Paisley masters, in intimating the reduction, state that they are only following the lead of Glasgow, which rules the district. It is expected that more Paisley operative masons will strike. Several small employers are, however, continuing at the old rate of 9d. per hour.

**BRADFORD BUILDING TRADES DISPUTE: CORPORATION CONTRACTS.**—A deputation from the Bradford Trades and Labour Council waited upon the Finance and General Purposes Committee of the Bradford Corporation on the 4th inst., for the purpose of requesting them to review the decision

arrived at some time ago when a deputation of operative masons and joiners met them in connexion with the present dispute in the building trades of the city. On that occasion the deputation called the attention of the Finance Committee to the fact that men were being employed on public works at a reduced rate of wages, works which they contended had been contracted for under the fair contracts clause. They requested that these works should be stopped unless the standard rate of wages were paid. After consideration the Committee arrived at the conclusion that the Corporation could not interfere between contractors who were doing Corporation work and their employees. The matter was reported to the Trades and Labour Council, who then appointed the deputation which waited upon the Committee. The deputation put their case, and afterwards withdrew in order that the members of the Committee might consider what should be done. Alderman F. W. Jowett moved the following resolution:—"That the Council be recommended not to allow any works under any Corporation contracts to proceed except at the standard rate of wages last mutually agreed upon between masters and workmen." A lengthy and heated discussion followed, and Alderman W. Willis Wood (the Deputy-Chairman of the Committee, who presided) declared that the resolution meant that the Corporation were to be called upon to interfere between the employers and employed. Alderman Jowett remarked that that was not a fair way to put the matter, and accused the chairman of showing partiality. The Chairman replied that if he was to be accused of unfairness he would no longer remain in the chair. He thereupon left the room, and several other members of the Council followed him. Mr. J. A. Godwin was then elected to the chair, and eventually the resolution was passed. Before the committee rose the fair contracts clause was considered in its various aspects, but nothing definite with regard to it was decided upon.

**SCARBOROUGH BUILDING TRADES DISPUTE.**—In January last the operative stonemasons of Scarborough gave six months' notice to the Master Builders' Association for an increase of wages—from 8½d. to 9d. per hour—and alterations in working rules. The Builders' Association, taking into consideration the state of the building trade in the town, decided to offer the operative masons a reduction of ½d. per hour—from 8½d. to 8d. A deputation from the Builders' Association recently met a deputation of the Masons' Society, and after due consideration of the matter came to an amicable settlement. The result is that the wages remain as at present—8½d. per hour—with certain modifications in the working rules.

**MASONS' STRIKE, BURTON-ON-TRENT.**—At the commencement of the year the journeymen masons of Burton, who are at present in receipt of 8½d. per hour, gave six months' notice for an increase of 1d. per hour, intimating that if it were not conceded they should cease work. Communications have proceeded between the employers and men, but as the former have held out against granting the increase the men have come out on strike.

**LEGAL.**

**DISTRICT SURVEYORS SUCCESSFUL APPEAL UNDER THE LONDON BUILDING ACT, 1894.**

The case of Dicksee v. Hoskins came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Vaughan Williams and Stirling, on the 8th inst. on the appeal of the District Surveyor from the decision of a Divisional Court of King's Bench consisting of the Lord Chief Justice of England and Mr. Justice Lawrence affirming the decision of a Metropolitan Police magistrate allowing an appeal under the London Building Act, 1894, from a notice of objection to a proposed building served by the District Surveyor, the appellant, upon the respondent, a builder. The proceedings before the Divisional Court were reported in the issue of the *Builder* of May 4 last.

The question to be decided was whether the proposed building came within Section 71 (2) of the Act of 1894. Sub-section 2 of the section runs as follows:—"In every building exceeding ten squares in area used in part for purposes of trade or manufacture and in part as a dwelling-house, the part used for purposes of trade or manufacture shall be separated from the part used as a dwelling-house by walls and floors constructed of fire-resisting materials, and all passages, staircases, and other means of approach to the parts used as a dwelling-house shall be constructed throughout of fire-resisting materials." The building in question was No. 87, Old Kent-road, and was the re-erection of an old beerhouse called the Horseshoe. It was when erected to exceed ten squares in area, and a public-house intended to contain in the basement beer and wine cellars; on the ground floor a bar, public lobby, saloon-bar, private-bar, parlour, and a public-room; on the first floor a sitting-room, three bedrooms, and a kitchen; and on the top floor attic. The old house was, and the new when created was to be, used for the sale of wine and beer to be consumed on and off the premises. The trade was to be carried on in the basement and ground floor, and the licensee

and his family were to reside in the upper floors of the building, and the whole of the building was to be covered by the Justices' certificate and Excise licence. The floors separating the ground floor from the first floor and the staircase leading to the first floor were not intended to be constructed of fire-resisting materials, and the magistrate found that if Sub-Section 2 of Section 71 of the Act applied to the building, the provisions of that section would be contravened. He also found, as a fact, that the basement and ground floor of the building were intended to be used for the purposes of the trade of the beerhouse, and that the part above the ground floor was intended to be used as a dwelling-house for the licensed occupier, but held that the case was governed by the decision in "Carritt v. Godson," and allowed the appeal, overruling the objection of the District Surveyor. From this decision the District Surveyor appealed to the Divisional Court, when the Lord Chief Justice and Mr. Justice Lawrence held that the Section was intended to apply to buildings part of which were used for trade and manufacture and the other part as a dwelling, and that it was not intended to apply to a building certain rooms of which were used as a dwelling; and the Court therefore dismissed the appeal. Hence the present appeal of the District Surveyor.

At the conclusion of the arguments of counsel, the Master of the Rolls, giving judgment, said that, although he did not agree with the findings of fact found by the magistrate, he was bound by them. His Lordship thought that the magistrate had been inconsistent in his finding, and also holding that the case was governed by the decision in "Carritt v. Godson." But inasmuch as the Court had to accept the findings of the magistrate, he was of opinion that the appeal must be allowed.

The Lords Justices concurred, and the appeal was accordingly allowed without costs.

Mr. Horace Avory, K.C., and Mr. Rowsell appeared for the appellant (the District Surveyor), and Mr. Danckwerts, K.C., and Mr. Craies for the respondent (the builder).

### RECENT PATENTS:

#### ABSTRACTS OF PATENTED INVENTIONS.

4,590.—APPLIANCES FOR WINDOW-SASHES: *S. Burton*.—In the upper sash is mounted a tapped plate into which is screwed a screw that retains the two sashes when they are closed; in the lower sash is a plate through which the stem of the screw is passed, a second screw is passed through another tapped plate upon the lower sash for engagement with a spring upon that sash, which becomes pressed outwards as one turns the screw whereby the sashes may be secured at any required height.

4,614.—A METHOD OF DRYING SEWAGE, &c.: *A. Wenck*.—Streams of gas bubbles are impelled through the fluid matter which will then serve for manure. The fluid residues are passed from a reservoir through concentrators and then through another reservoir into a mixing-chamber containing acid and powdered chalk supplied from other reservoirs; as gas is evolved in the fluid it dries the material, and drying-chambers will complete the operation.

4,615.—A PRODUCT FOR USE IN MAKING JAPANS, VARNISHES, &c.: *E. Schaal and M. Schaal*.—The inventors use colophony or resin for making a substance that will have the properties of gum copal or amber; after the colophony has been pulverised and heated, it is exposed to a current of air or oxygen in order to raise its melting point to the degree desired, the resultant product, being of an acid kind, will combine with metallic oxides, or can be formed into ester-like compounds in the same manner as that in which resin is treated.

4,632.—A LIFTING-JACK: *C. Willeit*.—Instead of being cast upon the rising hydraulic cylinder, the foot is screwed on to it and is secured with a key, in order that its relative height may be readily adjusted.

4,640.—INSTRUMENTS FOR USE IN TOPOGRAPHICAL SURVEYING: *A. F. Mocker-Ferriman*.—The invention applies to portable boards with rulers, and to boards for facilitating the drawing of sighting-rays; the board is strapped over the observer's shoulders, and on the underside of the top surface is a metal pivot-plate wherein is cut a key-hole slot for engagement with the neck of a central pivot-pin, near either end of the ruler are two metal eyes through which is threaded a piece of string for sighting purposes.

4,683.—MEANS OF FASTENING BRISTLES IN BRUSH-HANDLES: *L. Roth and M. Israelski*.—The inventors affix the bristle-tufts to the edges of two frames and to crossbars that are hinged or otherwise joined to one of the frames. The stock consists of the frames which will slide into one another, and should be hinged together at their junction with the handles.

4,691.—VALVES FOR WATER-SUPPLY: *H. G. Bedell and J. Welsby*.—The hollow stem of the lift-valve operates over a spindle that is attached to a grating, and has at its top a cup-leather, a spring (which, however, may in another form of the appliance be discarded) being placed between the valve proper and the leather, with a timescrew at the top of the stem which covers the spring; the

spring presses the lifted valve on to its seating whilst leakage of water regulates the time; a float-valve that will fall just before the flush has ceased and admit air into the discharge-pipe closes, under normal conditions, the end of an air-pipe.

4,708.—AN ELECTRICAL SWITCH FOR INCANDESCENT LAMP-HOLDERS: *J. Lightfoot*.—Insulating walls that envelope the terminals are fashioned upon the base of the switch; the other two terminals are bridged with a contact-lever, the spring of which will impart a quick break. A slot in the casing provides for the motion of the handle.

4,709.—A JUNCTION-BOX (ELECTRICAL): *G. H. Niblett*.—The portions of two-part junction-boxes are bolted together when the sheathed cables have been inserted into them. Of the three interior chambers the two at the ends are filled with some elastic material as a setting for the sheathed cable, whilst the middle one takes the coupling; glands are used for closing the openings in the end-chambers and a soldered copper strap for connecting the sheathing to the bus.

4,721.—FITTINGS FOR MEASURING RULES: *R. Webster and A. G. Thornton*.—In order that a wire and plate gauge may be combined with the rule the central plate of the hinge has a projection in which the gauge is cut, and the hinge may be graduated so as to serve for a protractor.

4,737.—A CONTRIVANCE FOR PURPOSES OF VENTILATION, &c.: *D. DeLeon*.—Flattened elbows are fashioned upon the outer and inner vertical surfaces of a ventilation or similar pipe so as to terminate near the roof through which the pipe is put, and are joined to a flattened section that constitutes two hinge-joints, with holding-pins, in order that it may rest at 90 deg. with the slope of the roof. The two subsections of the connecting-section are bolted together and joined with wide surface, that covers the aperture in the roof; the cap (if any) which covers the ventilation-hole of the collar may be lifted with a screw and an endless cord around a pulley.

4,745.—MEANS OF CLEANSING TUBES AND PIPES: *A. M. Turner*.—A cylinder, of which the two ends are tapered, has a nozzle or connection at one end, and a stop-cock and a connection at the other end. The cleansing material is charged into the cylinder through an opening fitted with a screwed plug, and a portable block is provided with feet that carry the cylinder.

4,788.—A TOOL FOR USE BY PAPER-HANGERS: *T. E. Moffitt*.—As the paper is drawn from a roll, it is passed around guiding rollers and a smoothing roller, and so to the wall or other surface. A split tube, which is joined to a reservoir with feed-pipes fitted with stop-cocks, affords an automatic supply of paste to the back of the paper. Grooves in a rectangular frame carry loosely the ends of a roller, and springs force one of the guiding rollers downwards.

4,812.—A METHOD OF FASTENING FLOOR-BOARDS: *T. Potter*.—For concealing the means whereby floor-boards are secured to wooden joists or to concrete, they are fashioned with grooves which, when the boards have been screwed or nailed in place, are to be filled with strips of wood, the adjacent boards being rebated together. Instead of using the strips, the boards can be glued down. Other modifications are also specified.

4,813.—DANCING-FLOORS: *E. W. Baché*.—By way of limiting the depression of resilient dancing-floors the inventor arranges the springs between the flanges of the cores or stops, which may be either solid or tubular in form of a material that may be either resilient or rigid.

4,835.—TEETH OF CIRCULAR CROSS-CUT FRAME, AND OTHER SAWS: *J. M. Whison*.—Between the ordinary teeth of a saw, and at suitable intervals, other teeth are interposed which are bevelled in opposed directions, for the purpose of scribing the wood whilst the ordinary teeth carry away the sawn material.

4,870.—THEATRICAL STAGE CONSTRUCTION: *B. H. Jacobson*.—To facilitate the moving of the stage sideways or backwards it is mounted upon wheels that run upon rails. Pivoted arms, which may be folded up against the walls sustain the middle portion of the stage; bevel, worm, or screw gearing moves the wheels vertically, in order that either set of them may be worked, and short rail-pieces are pivoted so that they can be turned in the desired direction at the crossings of the rails, which are formed of angle or channel iron, the flanges being cut away at the crossings. For shifting the stage from one set of rails to another set at an angle therewith ordinary turntables can be employed, and a water basin is constructed beneath the stage.

4,924.—A CIRCULAR-SAW GUARD: *J. Bradbury, J. Bradbury, T. Bradbury, and G. E. Bradbury*.—Two pieces, which are adjustably attached to a horizontal bracket with set-screws that work in slots, carry the back and front shields which constitute the guard. Stops upon a transverse horizontal arm at the end of which the bracket is pivoted will hold the bracket in either a vertical position (when access to the saw is required) or in a horizontal position. A pillar at the back of the bench supports the arm, and is to be lifted or lowered by means of a nut and a screw. The various adjustments render the guard available for differently-sized saws.

4,950.—PAVILION WORK: *W. Dörlein*.—The inventor's object is to dispense with the use of glue,

to allow for the expansion or contraction of the panels, and to provide means for the passage of air behind the panels so as to prevent dry-rot, warping, and other defects. He constructs a framework with openings in it by halving flanged bars together, on which he lays a veneering-board which is pierced correspondingly with the apertures in the frame, and then he lays solid veneering boards in the holes against the flanges of the bars. Nailed mouldings hold the solid boards in their places, whilst affording space for contraction or expansion, and a nailed upright moulding covers the joints of the boards, the cornice, brackets, and plinth being secured with nails.

4,993.—FITTINGS FOR WATER-CLOSETS: *M. J. Adams*.—The basin and a slab are formed as one piece. The slab is affixed to the wall, and the force of the flush is increased by the placing of the discharge valve of the flushing cistern in a well which is put low down.

5,009.—A HINGE FOR DOORS AND WINDOWS: *J. C. A. Markham*.—In order to facilitate lubrication the socket is fitted over the pin which is affixed to the one plate, and the socket is affixed to the other plate; the stopper of the socket can be removed when the lubricant is to be applied.

5,011.—DOOR-CLOSING APPARATUS: *E. C. Hoffman*.—The spring hinge is intended for holding the door partly opened and for closing it. It comprises a spring which a crossbar and a pivot secure to the door whilst a cam of the door-frame is pressed by the free end of the spring. As soon as the cam has turned beyond a certain point its periphery becomes concentric with the hinge-pivot, so that the friction of the spring will thereupon keep the door open; for raising the door from its hinges a wire is passed through a hole, and will relieve the cam of the pressure of the spring.

5,018-23.—FIRE-PROOF CONSTRUCTION: *New Jersey Wire-Cloth Company*.—The inventions relate to the adoption of grooved fire-proof blocks, sheets of wire-netting or expanded sheet-metal lathing, metallic lathing, transverse metal beams, curved metal rods, flat bars or joists which have notches for engagement with slotted clips on the upper edges of the beams, and concrete filling in the construction of fire-proof ceilings and floors.

5,034.—VALVES FOR WATER-SERVICE PIPES: *W. E. Hinsdale*.—Two nozzles are severally joined to the service and flushing-pipes; of the two pistons a hollow piston-rod of one acts against a spring, and the other serves to control the discharge; at the opening of an auxiliary starting-valve one of the pistons is pressed towards the left side, and so opens the valve, but when the full of a weighted handle has again closed the starting-valve, the spring slowly returns the piston towards the right side, whilst a time-passage and screw regulate the time of closure. The end of the valve has two cylinders, one of which slides within the other, so that the valve may be adjusted to meet differences of pressure in the supply-pipe.

5,036.—AN ELECTRICITY METER: *A. Wright and Reason Manufacturing Company*.—The inventors provide a registering mechanism which operates through gravity for mercury voltmeters. In one form of the appliance a small glass dish, which is affixed on the end of the tube is of a pointer anode. On the upper end of the tube is a cathode, which hangs from a helical spring and traverses a stationary scale. A platinum wire in the glass tube makes electrical connexion with the anode, which is hung within a vessel that holds the electrolyte and a mercury cathode at the bottom. The anode comes lighter, and the pointer rises, with the flow of the current. Other parts of the tube and a conical apparatus may be joined as a cathode, and a conical coil of platinum wire or a porous carbon block may provide the cathode surface, the anode being mercury in an annular trough above the cathode. Various other forms of adaptation are specified.

### MEETINGS.

FRIDAY, JULY 12.  
*British Association of Waterworks Engineers*.—Annual general meeting (concluded).

SATURDAY, JULY 13.  
*Architectural Association*.—Visit to Medmenham Abbey, &c., and "Danesfield," Great Marlow, by permission of the architect, Mr. W. H. Komaine-Walker.  
*Association of Junior Engineers*.—Visit to the Mill-wall Lead Works. 9 p.m.

WEDNESDAY, JULY 17.  
*Builders' Foremen and Clerks of Works' Association*.—Half-yearly meeting of the members. 8 p.m.

THURSDAY, JULY 19.—WEDNESDAY, JULY 24.  
*British Archaeological Association*.—Annual Congress, to be held at Newcastle.

### SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.	
June 25.—By S. & G. KINGSTON (at Spalding).

PRICES CURRENT (Continued).

STONE.

Table listing stone prices for Ancaster in blocks, Bath, Fairleigh Down Bath, Beer in blocks, etc.

SLATES.

Table listing slate prices for 10x10 best blue Bangor, 10x10 best Bute, etc.

TILES.

Table listing tile prices for Best plain red roofing tiles, Best Broseley tiles, etc.

WOOD.

BUILDING WOOD.—YELLOW.

Table listing building wood prices for Deals: best 3 in. by 11 in. and 4 in. by 9 in., etc.

JOINERS' WOOD.

Table listing joiners' wood prices for White Oak: First yellow deals, 3 in. by 11 in., etc.

PRICES CURRENT (Continued).

WOOD.

Table listing wood prices for Dry Wainscot Oak, Dry Mahogany, Honduras, Tabasco, etc.

JOISTS, GIRDERS, &c.

Table listing joists and girders prices for Rolled Steel Joists, ordinary sections, Compound Girders, etc.

METALS.

Table listing metal prices for Common Bars, Staffordshire Crown Bars, Mild Steel Bars, etc.

LEAD, &c.

Table listing lead and zinc prices for Lead—Sheet, English, 3 lbs. & up, Pipe in coils, etc.

PLASTER, &c.

Table listing plaster prices for Coarse Plaster, Fine do., Robinson's Fireproof Cement, etc.

ENGLISH SHEET GLASS IN CRATES.

Table listing glass prices for 15 oz. thirds, 11 oz. fourths, 21 oz. thirds, etc.

PRICES CURRENT (Continued).

OILS, &c.

Table listing oil prices for Raw Linseed Oil in pipes, Turpentine, etc.

VARNISHES, &c.

Table listing varnish prices for Fine Elastic Copal Varnish, Best Elastic Copal Varnish, etc.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications.

TENDERS.

[Communications for insertion under this heading should be addressed to 'The Editor,' and must reach us not later than 10 a.m. on Thursdays, N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

BALLYNATRAV (Ireland).—For building and other improvements to Ballynatrav House, for Colonel Hilroy Smith & Messrs. W. H. Hill & Son, architects, 28, South Mall, Cork: Murray & Son, Joughal, co. Cork £675

BARKING.—For alterations and additions to the Stag Beer House, Ripple-road, Barking, for Mr. T. W. Glenny, The Brewery, Barking. Mr. Theodore Gregg, architect, 1A, St. Helen's-place, E.C.7: Barrett & Power, £875; G. L. Kirby, Holloway, £750; J. Bentley, 765 way\* £753.

CHESHUNT.—For the erection of three shops and dwellings, Goffs Oak, Cheshunt, Herts, for Mr. A. W. Birt. Mr. John Parrish, architect and surveyor, Clapton Park, N.1: Lawrence & Sons, £1,449; Edwards, £1,350; Knight Bros., 1,371; Jennings & Grenfell\*, 1,295

COLCHESTER.—For the erection of a Freemasons' Hall in Abbey-gate-street, Colchester, for the Trustees. Mr. Chas. E. Butcher, architect, 3, Queen-street: Harris & Rome, £2,494; W. Chambers, £2,180; J. Grimes, £2,400; G. Dobson & Son, £2,180; A. E. Diss, 2,300; T. J. Ward, 2,165; R. Myall, 2,279; R. Beaumont, 2,117; A. Diss, 2,250; J. McKay, 2,995; F. Dugart & Co., 2,247; Everett & Son, Col. E. West, 2,222; cbeater, 2,050

DAGENHAM.—For alterations to the Chequers public-house, Rainham-road, Dagenham, for Mr. T. W. Glenny, The Brewery, Barking. Mr. Theodore Gregg, architect, 1A, St. Helen's-place; Milburn & Brothers, G. L. Kirby, £597; 0; Goodall & Son, 364; 0; Romford\*, £379; 12; Barrett & Power, 343; 0

HOLT (Norfolk).—For the erection of the new Gresham's School and headmaster's house, for the Governor, Mr. Howard Chatfield Clarke, architect, 63, Bishopsgate-street Within, London, E.C.4: Hall, Biddall, & Co., £53,443; Parnell & Son, £48,657; Lawrence & Sons, 51,577; F. S. Halliday, 48,327; Cornish & Gaymer, 51,557; G. Riches, Cromer, 45,980; Colls & Sons, 51,223; Modified and accepted, 4

KILNACREHAN.—For addition, including plumbing and sanitary arrangements to dwelling-house, Kilnacrenan, for Mr. Neil Coyle, J.P. Mr. J. McIntyre, architect, Letter Kenny: W. Wilson, £171; 0; W. J. Mooney, D. M. Caffrey, 157; 3; 10; Bishop's-Derey, £129; 10

[See also next page.]

**KIRKCALDY.**—For the erection of tenements in Harriet-street, Sinclairtown, for Mr. Colin Cummings, Mr. D. Forbes Smith, architect, Kirkcaldy:—

*Masonry.*  
Henry Masterton, Sinclairtown\* ..... £775 0

### Building Estates and the Easement of Light.

cannot but fear that the man who is not a lawyer will find himself in a mental fog in regard to the law as to the easement of light in connexion with building estates. This is the more to be regretted because the subject is one of practical and increasing importance, and might be made clear and settled by a very small amount of legislation, though in these days the legislative machine drives so heavily that it is almost impossible to secure the passing of any reforms.

That cardinal principle of law, that a man cannot derogate from his own grant, is perfectly well known to most of our readers, and the youngest student should be aware that if a man grant a piece of land on which the grantee erects a house, neither the grantor nor his heirs and representatives can afterwards obstruct the light of such house, unless the grantee's rights have been limited in the first instance.

In addition to the exception to the general right founded upon express agreement, there has been added by judicial decision another, namely, that when the parties intended that there should be a limitation, then the Courts of Law will not enforce the grantee's right. In some cases such a limitation is obvious. There is, for example, the leading case of a railway company which, having by legislative power to take land for the purpose of its undertaking, disposed of a portion of the surplus land, together with a house, and subsequently in the course of its business erected an embankment and obscured the light of the house. Here it was plain that the grantee had no right to unobscured light. He knew when he purchased the property that the vendors were intending to make a railway, and it would have been contrary to the most elementary commonsense could the grantee have interfered with their undertaking.

When, however, we come to the case of building estates we find ourselves in a difficulty. That the buyer of a plot of land on a building estate, who clearly knows that houses will be erected around that which he is going to build, ought not to complain of a limitation of his right, appears obvious. It is certain also that the law recognises this exception. Unfortunately, however, there appears to be no rule deducible from the decisions which will enable the layman without difficulty to know what are the respective rights of grantors and grantees. The leading case in favour of the exception is that of the Birmingham Banking Company v. Ross, which was decided by Mr. Justice Kekewich and by the Court of Appeal in 1888. In that case the predecessors in title of the plaintiffs obtained from the Corporation of Birmingham a house looking over a passage 20 ft. wide on to some low buildings. These were subsequently pulled down and higher buildings erected in their place by a person to whom the Corporation had demised the land, and these new buildings obstructed the plaintiff's lights. *Prima facie* this would clearly have been a case in which the plaintiff was entitled to have his lights protected by the law. But, said Mr. Justice Kekewich, "Mr. Daniell, under whom the plaintiffs claim, must be taken to have known that the Corporation of Birmingham had made large purchases of land for the purpose of constructing a new and important thoroughfare, and that this could properly be done and that they could recoup their expenditure only by selling or letting the land for building purposes. He must be taken to have known what class of buildings were likely to be erected in a broad street in a commercial town." It is clear that whilst the general character of the Corporation's building scheme was shown on a plan, no details were given as to the actual size of the houses to be built on the land. But Mr. Justice Kekewich is entitled to say that there was evidence of a proposed building scheme. "If," said Lord Justice Cotton in the Court of Appeal, "the contention of the plaintiffs is right, it would entirely prevent the Corporation from utilising the land in any way except by putting up a low building." The result, therefore,

was that this Court also held that there was no implied obligation on the vendors not to obstruct the light of this house.

When we look at the recent case of Pollard v. Gare, also decided by Mr. Justice Kekewich in the present year, it becomes obvious that the intention of the parties must be looked at very closely; and even this—if misunderstood by each other—will not help us much. In that case, two owners of land at Staines, fronting the Thames and the towing-path, were proposing to let or sell it in plots having each a frontage to the towing-path of about 66 ft. and extending backwards for about four times the length. The plaintiff's predecessors took two of these plots on lease, agreeing to build on them a house of a specified character. This they did, and it stood a short distance from the boundary of another plot. The adjoining plots were subsequently sold to the defendant, who, in order to test his right, erected a hoarding for the purpose of obscuring the light of the plaintiff's house. But Mr. Justice Kekewich decided that the plaintiff had a right to his light without obstruction. "It was urged on behalf of the defendant that there was to the knowledge of Mrs. H. at the date of her agreement a building scheme affecting the land, the subject of that agreement, and the adjoining land. What that building scheme was nobody pretended to say, and it is clear that there was no building scheme as the phrase is generally used and understood. The estate was marked out on the plan, if not on the ground, in building lots, and there was also a building line marked on the plan, so as to extend through all the lots; but these are just the facts which in Broomfield v. Welham were held insufficient to restrict the application of the doctrine. The right to build remains, but there is nothing from which it can be inferred that the grantors were entitled to build so as to interfere with the access of light."

Broomfield v. Williams, to which in the above quotation reference is made, was a decision of the Court of Appeal. The facts in that case showed that the plaintiff knew that it was intended to build on the adjoining land, that he had in fact

taken part of a building estate. But, said Lord Justice Lindley, "it was quite possible to build on that adjoining land without darkening the windows of the house conveyed." In other words it would appear that the Court did not perceive any knowledge on the part of the purchaser that, by the carrying out of the building scheme, his windows would be darkened. On the contrary, it appears to have been in the contemplation of both parties that the defendant would not build a house higher than that of the plaintiff. In the later case of *Pollard v. Gare*, there do not appear to be any indications of any implied agreement that all the houses would be of a certain height; and that being so, and as the plaintiff likewise knew that the adjoining plot would be built on, it is not altogether easy to see how the plaintiff could properly object to some obscuration of light. It seems not to be unreasonable that if a man purchases a plot of land on a building estate, he should be prepared to have his light obscured, unless he makes a definite agreement with the vendor in order to protect himself, or assures himself by means of plans and elevations that there is a limitation under the scheme to the size of the houses to be erected. To some extent, a man who takes possession of a plot of building land must expect some kind of obscuration to his light. In the last case, that of *Pollard v. Gare*, the purchasers of the plot adjoining that of the plaintiff might very well have assumed that they were at liberty to build as they liked, from the very fact that there was no apparent restriction in the manner of building.

One thing, however, is clear, that it is desirable for owners of building estates, before selling plots of land for building purposes, to make the scheme so systematic that these disputes will not arise. A surveyor can always formulate conditions as to the character of the houses to be erected which, while possibly taking away the full light to all rooms, will not so obscure such rooms as to make them disagreeable for habitation. What is needed is a certain amount of give and take between the owners of the separate plots, but this object cannot be satisfactorily attained unless in the first instance some kind of uniform scheme is planned by an architect. Otherwise the owner of the first plot which is disposed of may be in a position seriously to hamper the development of the rest of the estate, and the respective rights of the several occupiers are left in an uncertain and unsatisfactory state.

#### ANCIENT CHURCHES OF FAMAGUSTA.

**T**HE famous old city of Famagusta—where three hundred years ago a handful of Italians managed to keep at bay the innumerable hordes of savages of the Ottoman army during a long year's siege—has recently been the scene of some most interesting excavations.

After the complete disappearance of the Christian population of Famagusta, all the former Italian residents having been killed, tortured to death, or carried away slaves to Constantinople, the fortress was placed in a state of repair, and confided to a Mohammedan garrison. Several slight alterations were made in the disposition of the defences, and certain loopholed walls were built on

to the cannon embrasures for musketeers, the Turks evidently not employing so many big guns as the Italians. In this way the old Italian work is in some places quite masked and covered over. The interior of the city would appear to have been almost abandoned to a very small population; the hordes which had been attracted by the Turkish generals with promises of loot, came merely to plunder and ravage the island, and probably returned to their native countries on the mainland immediately this object was attained.

During the twenty years of the British occupation of the island the city of Famagusta has suffered more than at any earlier period of its history. It has been turned into a quarry of building stone for Port Said (which may be considered a Famagusta *redivivus*) and other places in the Levant. At the present day very little in the way of domestic architecture remains, and where the houses once stood are patches of rough ground, browsed over by goats and donkeys. The churches have to some extent escaped the fate of the domestic buildings, and it is the ecclesiastical architecture which has afforded M. Enlart so much material for his book on the mediæval antiquities of Cyprus, referred to in our last issue.

In prosecuting his studies, M. Enlart obtained the consent of the English officials to allow him to excavate some of these old churches, and to remove the masses of debris encumbering their interiors. Only those churches which had suffered the most from the Turkish bombardment afforded an opportunity for finding anything interesting; those which still retain their vaulted ceiling have, of course, lost all traces of their ancient furniture and tombstones, since they were always turned into stables or grain-stores by the Turks. The beautiful fourteenth-century cathedral was the only church turned into a mosque, a sufficient proof that since the Mohammedan conquest the population of the city must have shrunk considerably.

The churches investigated by M. Enlart are the Carmine, S. Francisco, and the old Orthodox Greek Cathedral of St. George. All these suffered very much at the bombardment; their vaultings were destroyed and crushed down into the naves and side chapels; they seem to have been abandoned as they fell. In the case of the side chapel which M. Enlart has unearthed at S. Francisco, when the excavators arrived at the level of the ancient tombstones constituting its floor, they found human remains which had evidently been crushed beneath the weight of the falling vaults. In the case of the Carmine church, the cannon balls and other signs of the bombardment show that the place has not really been touched for more than three hundred and thirty years.

It is difficult to imagine the ruin of these strongly and scientifically built vaults being due to the comparatively small iron cannon balls of the period, which may be picked up by hundreds still in Famagusta. It is not, perhaps, improbable that the Turks employed for the purpose of destroying a town the enormous stone shot which are so often found stored wherever during the fifteenth to seventeenth centuries they have left traces of their presence. These enormous masses of stone pitched into a town by means of mortars would do terrible execution on both the buildings and the inhabitants, as they

split into a thousand pieces at the moment of impact.

The [excavations at St. George of the Greeks], will probably prove of the very greatest interest; the debris is full of fragments of stained glass, and probably many curiosities may remain at the level of the pavement. Unfortunately M. Enlart is obliged to leave within a few days, as the length of time for his visit granted by the French Government is coming to an end, and the object for which he was specially commissioned has been attained—namely a supplement to his great book on the architecture of the Lusignan period in the island.

Considering the great interest attaching to Famagusta and the fact that these remains are found in so remarkably perfect a condition, it seems the greatest of misfortunes from an archaeological point of view that the whole matter should not be carried out in a more systematic and conservative manner. In any other country such "finds" would be carefully protected by hoardings or walls, and it is greatly to be feared that if something of this kind is not done immediately these interesting discoveries will quickly disappear, sacrificed to the wanton pleasure of idle Anatolian peasants. The wonderful series of tombstones covering the graves of French and Italians, which owe a great part of their interest to being *in situ*, will be broken up or stolen; and many of them have a perhaps unique interest in relation to the history of costume.

#### NOTES.

Lord Wemyss and the Government Offices. LORD WEMYSS has obtained a large majority in the House of Lords in favour of his proposal for making models of the two blocks of Government Offices before the buildings are proceeded with. It is not often that either Chamber shows sufficient interest in art to take any decisive line on a subject of that kind, and we presume that the noble lords who voted for the models have some vague idea that they are thereby furthering the cause of public architecture. We do not see, however, that the expenditure will now result in anything beyond affording a little show for the public; they do not understand drawings, and they will be interested to see exactly what the two new buildings will look like. Lord Wemyss seems to have an idea that there is some mysterious influence in the mere fact of making a model of a building, and that this alone is wanted to revive English architecture. We have the highest opinion of the value of models, not however as toys for the public amusement, but as a means for an architect testing the lines and composition of his own design, for which purpose a rough model during the earlier stages of a design is of far more value than a finished model at a later stage. The money which would have to be expended on the proposed models is, relatively, a trifling matter; but it will involve a loss of time in proceeding with the new buildings, and for no good purpose, for we suppose it is not contemplated to alter the two architects' finished designs after their death—in do so would be a great injustice and unkindness to their memory.

We entirely sympathise with "New Art" the protest which has been made in the *Times* by four South Kensington architects against the acquisition and exhibi-

tion at the Victoria and Albert Museum of specimens of furniture of what is absurdly called "L'Art Nouveau." We have noticed from time to time in these columns the prevalence recently, in German and French furniture work, of the employment of eccentric twists and curves, as if the object were to surprise one by working the legs of tables and chairs into unexpected and contorted forms, and inserting vagaries of detail which have no relation to structure. This is a new fashion only, not a new art; it does not surpass that name; but it appears that a Mr. G. Donaldson has been anxious that this country should be inoculated with the same folly, and has accordingly bought and presented to the Museum a selection of these furniture vagaries out of the Paris Exhibition, which are placed at the inner end of the tapestry-room at South Kensington. It is a gift of worse than doubtful value. Hitherto the modern English school of furniture design has kept free from these extravagances, and has been notably superior in style and in pure taste to any continental school. Now the examples of the bad and tawdry stuff which is called "New Art" furniture receive the *imprimatur* of the National Art Museum; are put there to be studied and copied, to the detriment of the taste of our own artisans; and (worse still) are, we are told, to be sent round to the provinces, so that the taste of the provincial art-workman may be alike corrupted. This is not what the South Kensington Museum was founded for; it was to be a storehouse of the best art, not a show-room for vagaries in design.

It appears doubtful if the Bill introduced by the Lord Chancellor in the House of Lords to amend the Judicature Acts will in the press of business in the House of Commons become law during the present session. One portion of that Bill transfers appeals under the Workmen's Compensation Act from the Court of Appeal to a Divisional Court of the King's Bench Division. It cannot be said that the judgments of the Court of Appeal in this Act have been satisfactory, but that has not a little been due to the vague phraseology and bad drafting of this statute. The Court of Appeal has taken a narrow and technical view of the Act; the House of Lords, under the guidance of the Lord Chancellor, a wider and more liberal view. But taken as a whole the decisions of a Divisional Court are less likely to be regarded as satisfactory than are those of the Court of Appeal, and there will be many who would prefer to leave the appeals as they now are. Should the measure become law its efficiency will depend on the action of the Lord Chief Justice with whom will rest the composition of the Divisional Court. Some judges of the King's Bench Divisional Court are notoriously bad lawyers though able men, others are capable lawyers as well as acute men of the world. If these appeals are to go before a Divisional Court it should be carefully composed of judges conspicuous both for common sense and legal knowledge.

Two gas bills of considerable importance to gas consumers in general, and which have already passed the House of Commons, and been discussed in previous issues of the

*Builder*, were last week considered by Committees of the House of Lords. The preamble of the South Metropolitan Bill was found proved, subject to the exclusion of the proviso in the transfer clause that "all moneys which the Gas Light and Coke Company shall receive from any Local Authority for public lighting in excess of that which the said Gas Light and Coke Company would have been required to charge but for the transfer of the said undertaking shall be applied to a reduction of the price of gas supplied to the private consumer." The important condition that the South Metropolitan Company shall not be allowed to purchase the property and rights of the Gas Light and Coke Company on the south side of the Thames until the latter company have obtained power from Parliament to raise additional capital, remains in the Bill. The second Bill, known as the Mond Gas Bill, which is to sanction the supply of cheap fuel gas throughout a large area in Staffordshire already supplied with coal gas, was also approved, the preamble being reported proved by the Committee, subject to certain slight alterations being made in the Bill. The Mond scheme is a new departure in gas supply in this country, although in America an attempt to supply cheap low-grade gas for fuel purposes was made some time ago, but did not prove a financial success. Should the Mond scheme meet with success, there is little doubt that throughout the country the public demand for gas of high illuminating power, which is necessarily costly, will be superseded by a demand for cheaper low-grade gas.

On the 17th inst. a new railway communication with connecting Austria, Bosnia, and Herzegovina with Dalmatia was opened. The new line branches from the Metkovic-Mostar railway near the latter place, and ends near Castelnuovo, in the Bocche di Cattaro. We went over part of the line last autumn, and have no hesitation in saying that it is a triumph of engineering. It passes for the most part through barren, mountainous country, which presented many difficulties. Although the new railway is doubtless primarily intended for strategic purposes, to assist in the fortification of the new Austrian naval arsenal at Teodo, in the Bocche di Cattaro, it will be hailed with great satisfaction by those archaeologists and students of the Balkan peninsula who have hitherto been practically compelled to keep to the coast for the want of conveyance, and by others who have had to perform the tedious sea journey from Trieste to Cattaro. Like its new branch line from Hum to Trebinje, this railway will enable Montenegro to be opened up, if ever the independent Montenegrins can be got to assent to it. There is, however, one cause for regret: the Bocche di Cattaro, with the road up the mountains to Cetinje, is one of the most beautiful pieces of scenery in Europe; the "tourist" has already made his appearance; and though the railway through it will fortunately never succeed in climbing the heights to Montenegro, it will popularise the Bocche, and from interesting Dalmatian villages we shall see the places transformed into modern holiday resorts.

The problem of the best system of brakes for electric cars is one which has been exercising the ingenuity of inventors for

several years. The regulations issued last year by the Paris police show the severity of the tests to which the brakes are subjected. Every car has to be provided with brakes sufficiently powerful to stop it in 20 metres (21.8 yards) on a down gradient of 2 per cent, when running at a speed of 20 kilometres (12.4 miles) per hour. They also stipulate that every car must have two independent brakes acting on all the axles. At the Edinburgh meeting of the Municipal Electrical Association, Mr. Fell, the tramway engineer to the Sheffield Corporation, read a valuable paper on this subject. The main classes of brakes discussed were hand brakes, friction brakes, slipper brakes, pneumatic brakes and electro-magnetic brakes. Slipper brakes are extensively used in England. They consist simply of wood blocks which are pressed down on the rails by means of levers. They are so designed that it is impossible for them to lift the car off the rails. Where there is a steep gradient they, in conjunction with other brakes, are nearly always used. They are specially advantageous on single lines, for the descending car cleans the rails for the ascending one. The electro-magnetic brake is the most powerful. It consists of two cast-iron discs, one of which is fixed to the motor and has a coil of wire wrapped round it, the other is keyed to the axle. On turning the handle the motors act as generators which in itself produces a very powerful retarding force on the car and send a large current through the disc coil. The discs are thus strongly magnetised and put a powerful drag on the axles. The braking action is so strong that the wheels will at once skid unless a plentiful supply of sand is available. Mr. Fell recommends that hand and slipper brakes be ordinarily employed, and that the electro-magnetic brake should be kept for emergencies as the wear and tear caused by it is excessive. Pneumatic brakes were spoken of disparagingly, but they are used successfully in France. In Paris the Compagnie Générale des Omnibus use the following brakes: (1) a pneumatic brake applicable by the driver; (2) an automatic compressed air brake for both driver and conductor; (3) a hand brake for both driver and conductor; and (4) an electro-magnetic emergency brake for the driver. It may fairly be questioned whether this tendency of tramway engineers towards a multiplicity of brakes is advisable. It seems to us that it gives the driver too much to do on an emergency.

DR. WHEATON'S Report to the Local Government Board on the sanitary condition of the Bishop Auckland Urban District reveals a state of things about as bad, in a sanitary sense, as it can well be. Everything seems to be in a bad state—dwellings, roads, water supply, sewerage, and scavenging. There are a number of back-to-back dwellings without means of through ventilation. In the northern and old part of the town there are collections of dilapidated old dwellings fronting the streets, having between them narrow passages leading to courts in their rear. The dwellings fronting the street have been built in a very irregular manner so as to obstruct lighting and ventilation. They have no curtilage, or have only a very small yard approached by a passage. This yard is often almost entirely

filled by a midden privy of the most unwholesome type, often used in common by the inhabitants of two or more dwellings. In other cases the yards are paved with cobble stones, and are often badly drained, so that the water stands in pools after heavy rainfall, and soaks into the ground in the neighbourhood of dwellings. In some yards there are long open channels of cobble stones or brick into which liquid refuse is thrown, and from which a great part of such refuse escapes by percolation into the ground before reaching the gullies in which the channels terminate. The water supply is obtained from the river Wear as it passes the town. The waterworks are the property of the Urban District Council, and date from the year 1856. The water is collected by open-jointed pipes laid in the river bed and conveyed by a collecting pipe to a filter, from which it passes to a well, whence it is pumped by a force-pump driven by turbines to the reservoir in the town. Owing to floods and to the comparatively small capacity of the town reservoir, viz., 375,000 gallons, unfiltered water is from time to time supplied to the town, and the Report adds that there is no doubt that this river is grossly polluted, and that to supply such water in an unfiltered condition is an absolutely unjustifiable proceeding. In regard to sewerage, the Council have not caused plans to be made and kept up, and the position of some of the sewers is in consequence not known to the officers of the Council. Property owners have from time to time connected the drains of new dwellings to the sewers, apparently without supervision. The sewers, which were mainly constructed about the year 1850, have not all a sufficient fall, nor are they laid in straight lines, and in some instances the fall is in the opposite direction to that which was originally intended. The majority of the sewers are constructed of tiles, in a manner which renders them practically identical with what is known as a rubble drain. Excrement disposal is mainly effected by midden privies, and scavenging is performed partly by the District Council, partly by a contractor:—

"The method is most unsatisfactory, and is such as to directly favour the spread of enteric fever. The contents of midden privies having been emptied into the road, street, back street, or yard by men in the employ of the Council, it is the business of the contractor to remove the heaps of earth into carts and convey it out of the district. As the result of this system the ground of the streets, roads, back streets, yards, and passages in the town is polluted by filth, which, owing to the endemic prevalence of the disease in the town, must often contain the infective matters of enteric fever."

We have not space to quote further, but what follows in the Report is still more unpleasant reading. When it is added that the condition of many of the public streets is such that they are almost impassable, while "many of the back streets are sloughs of filth and refuse, mixed with mud many inches in depth," this picture of a market town in the twentieth century becomes delightfully complete.

DR. E. P. MANBY'S Report to the Local Government Board upon an outbreak of typhus fever in the Urban District of Hexham, states that the town has a good public water supply, derived from springs in the millstone grit at Alleudale Common, about ten miles to the south, and the system of sewerage

and house drainage appears to be not unsatisfactory. The only part of the town where poor class tenement property prevails is in a small low-lying area adjacent to Gillesgate. In this locality many of the houses are old and crowded together, and typhus fever, if introduced into Hexham, had in this neighbourhood special opportunity for spreading. The most specially unhealthy portion appears to be a block of houses called "The Mystery." This consists of ten houses, side by side; four of them three-story and the remainder two-story. The tenements on the upper two floors of the four large houses are approached from a back yard, unevenly laid with cobble stones except for a paved strip adjoining the houses, and shut in by a 10-ft. brick wall and by other houses, so as to render free circulation of air almost impossible. Through ventilation in some of the houses is also very badly provided for. "The Mystery" was only erected some twenty-four years ago, and it appears that the Medical Officer of Health expressed at that time his disapproval of the plans submitted. If this be so, a heavy responsibility, as Dr. Manby observes, rests on those who allowed the building to proceed.

THE fine old gabled manor house at Hollingbourne will be offered for sale by auction next week. It stands close by the ancient British road, since known as the Pilgrims' Way, as it passes eastwards from Aylesford along the southern slopes of the north range of chalk downs, overlooking the fertile valley below. It is believed that the manor house occupies the site of one which Athelstan bought from his father, Ethelred II., and bestowed, 980, upon Christ Church, Canterbury, and that the greater part of it, as built by the Colepeper family in the earlier half of the sixteenth century—the north wing has been pulled down—encases the fourteenth century house. The end wall of the Elizabethan hall embodies an Early English doorway. Many of the original features have been preserved, including the oaken doors, panelling, and beam ceilings, the open stone fireplaces with high chimney-pieces and fire-backs, and the six-turn staircase with newels carved in oak, which leads to the gallery, 60 ft. long, and the rooms on the upper floor; an ivy-clad parapet wall encloses the beautiful old garden. In the church, which was restored by Sir G. G. Scott, and for which a new vestry is being built from Mr. W. D. Caröe's designs, are monuments of the Colepepers of Hollingbourne and the neighbouring Leeds Castle. An extension made in the latter half of the fifteenth century of the north aisle has been converted into the "Colepeper" chapel, the floor being raised and the walls faced with flintwork. The name of the parish is said to be derived from the holly trees, which, together with the yews, and the thorns at Detling and Thurnham on the west, mark the track of the now almost deserted Pilgrims' Way, formerly the main road through the South-East of England.

THE Allan-Fraser Art College, Arbroath. THERE will shortly be opened at Hospital-field House, which stands upon the site of the hospice of the Abbey of Arbroath, the Art College endowed by the late Patrick Allan-Fraser. The bequest provides for the

gratuitous maintenance and instruction of a limited number of fully qualified students, who do not enjoy private means, in sculpture, architecture, painting, wood-carving, and engraving, landscape-painting, and drawing from the life, during a course of four years, for the cultivation of the home-farm, travelling studentships, lectures upon art and science by outside lecturers, prizes, and kindred benevolences. The trustees have appointed Mr. George Harcourt, of Bushey, as resident governor of the college, for which some studios have been erected, and which is to be opened next October for the reception of Scotch, English, and Irish students who purpose to make art their profession.

THE Fine-Art Society have on view four oil paintings by Mr. MacWhirter, being views of the Yarrow and Newark Tower; Moray Firth and the Findhorn; the Pass of Killiecrankie; and what in the catalogue is incorrectly called "Ridpath Castle, on the Tweed." There is no such castle; what is painted is the well-known and picturesquely situated Neidpath Castle. This is the finest picture of the four, and has much less of the artist's usual mannerism and signature of the white birch-stem. In the same room are a number of large and powerful water-colour drawings of scenes in Kashmir, by Colonel Strahan, R.E., who we presume must take rank as an amateur, but an amateur of unusual qualifications. These are to some extent topographical pictures; their illustrative quality was perhaps the first consideration; but they give powerful impressions of the barren rocky scenery of the Kashmir ranges, with some studies of native architecture and of Ganges scenery here and there, and make a collection which is well worth a visit. In the middle room is a small collection of etchings, &c., by Mr. Herbert Dicksee, mostly original, some of them after pictures by other artists. The two ploughing scenes, numbered 1 and 2, are among the best of the works, and are finely conceived little pictures, and the studies of tigers and lions are very interesting.

#### MUNICIPAL BUILDINGS COMPETITION, HEREFORD.

THE designs for the proposed new Municipal Buildings for the City of Hereford were on view to the public on Saturday and Monday last in the Shire Hall. The scheme is not a very extensive one, and forty-six designs have been received, some of which are of very considerable merit.

The site is a good one, and is situated in the wide thoroughfare of St. Owen-street. Some existing buildings are in the rear which it is proposed to retain, and finally to incorporate them with the present proposed scheme. The site has a frontage of 99 ft. by about 180 ft. in depth.

Provision was to be made for an Assembly Hall seating about 400 persons upon the first floor, and to be in the front; the council chamber was also to be on this level, a stipulation being that ample means of egress was to be provided—an important condition which a large number of competitors do not seem to have fully realised.

Three premiums were offered with the usual stipulations, which we think without reason, as to certain limitations in the ultimate choice by the Corporation. We have pointed out before, and it is necessary to do so from time to time, that while premiums are necessary, and should as far as possible be upon a liberal scale, yet architects do not compete for these, for they might be more advantageously employed, but rather for the commission of carrying out the proposed building.

Among the large number of designs hung are some very interesting and pleasing proposals, and it would be possible to indicate several which, with a few modifications in plan and taken all round as architectural compositions, might be esteemed to be far superior to the three premiated designs and to the three further designs "reserved" for consideration by the committee.

The assessor, Mr. Thomas Blashill, has placed first the design under Motto "1,002" (No. 3). The plan is divided by two corridors from front to back. The entrance hall uniting these has the principal staircase; the lavatories behind on a central area, which also lights the corridors. Another entrance hall is provided at the right-hand corner of the front, which gives the second important staircase. Between this entrance and the principal one has been placed the rates office. Whether this is accidental or designed is immaterial; but it meets the local necessities; as in Hereford a discount is allowed on the rates, and a last day comes, and with it a great crowd of ratepayers, so that an entry and exit close on the street are essential. This in the premiated design is fully secured. On the other side of the principal entrance the town clerk has a good room (24 ft. by 19 ft. 9 in.), with his clerks' office, a room 15 ft. 6 in. by 16 ft. 6 in., behind; this room is beneath an archway, and the lighting to it is very bad indeed. The first floor is well and adequately considered; the assembly-room is in front, with the two large staircases affording separate exits. The assembly hall has its platform well contrived, with retiring-rooms and lavatories, and seems to be the only one in the competition with an adequate green-room. The mayor's parlour is placed on the right side, half way between the hall in front and the council chamber behind, his robing-room adjoining the latter apartment and the rooms arranged *en suite*. The authors say that the design has been planned so that the municipal department may be used separately or conjointly with the public.

The architectural character of the design is very indifferent and un-municipal, and may be described as a front with an acute pediment at either end, some pilasters and arches in brick and stone, and a ventilator in the roof. It is unrecognisable as a town hall, and the perspective is a poor production. A plan may be modified and improved, but no amount of tinkering by a draughtsman could make this design appear externally as an adequate building for its purpose, though the plan is not without considerable merit.

The second premium goes to "Camelot" (No. 10). This design also is well arranged in regard to the rates office, but the inspector of nuisances has the best place in front, while the town clerk is pushed to the back, which order should have been reversed. The upper floor is, however, better in arrangement; the hall is in front, the council chamber at the back; the arrangement of seating should be reversed, so that the mayor has easy access thereto. The committee and other rooms on the right are *en suite*. The front is of Bath stone, in what, for lack of a better term, may be called erratic Ionic, the desire, according to the report, being to get a "well balanced composition, worthy of a town which contains such a beautiful cathedral"—a proper aspiration, which we regret the elevations do not exemplify. The perspective does not improve the qualities of the design.

The third premiated design is that signed "Hope" (No. 7). The design has good points in the plan, not unlike the first; the elevations are in black and white and are very uninteresting; an elaborate perspective is shown in hot yellow stone or terra-cotta. The general character of the design, with segmental arches and small ornamental turrets, is of a type which was popular thirty years or more ago. The small sketch perspective of the staircase might well have been omitted.

The next three designs to be noted are those "reserved for consideration." Of these, No. 21 (photo of perspective on report) has a powerful sepia perspective which seemed to attract considerable admiration, and one instinctively was reminded of that assessor who, once upon a time, on entering the room filled with drawings, said, with horror, "Please cover up all the perspectives with brown paper." It undoubtedly suggests what it is—too much so, perchance; his municipal type, the author "is of opinion, would equal that of any other edifice in the county." The plan is not, however, without

good points. The staircase is a semicircle on plan in the centre, the council chamber is up three flights, and the surveyor placed on a mezzanine. The sections are poorly rendered and the decoration has a cheap appearance, but the whole get-up betokens competition fever haste.

The second "reserved" design is "Simplicity" (No. 28). We confess our inability to see any reason for this design to be reserved, and we venture to think that lack of both knowledge and experience of the subject is shown in the plan. The front is composed of curved bows, a porch extends right over the pavement, the great columns of which have no entasis, while the columns of the inner arch have an exuberant bulge. The perspective is the best part of "Simplicity's" exhibition on nine strainers.

The remaining reserved design is that under the motto "Fortis in arduis" (No. 29). The interior of the plan is well lighted, but there is little evidence of scientific study; the drawings are in sepia line and of indifferent character; the front, an elaborate terra-cotta one, is seen to better advantage in the ink line perspective.

We turn now to some of the more interesting designs exhibited. The one distinguished by the device of a rose in a square is a fine design and a good plan, which, although possessing great merit, is not entirely free from defects. The centre of the building is occupied by a court, 40 ft. by 27 ft., with two staircases, one on either side; but, as far as exit is concerned, these meet. The rates office is at the rear, and but slight modification would be necessary to make this amenable to local usage. To an orderly plan is added a dignified elevation, monumental and municipal in character. The design is for execution in stone and is Classical in type, and the author is to be heartily congratulated upon the general refinement of character in the whole work. The assembly room is well marked externally by long windows and the Ionic order. The gabled window to the left is heavy in detail, and the figures in the curved pediment have a rather crowded and uncomfortable look. This design, however, is in the main of a high order, and is well illustrated by a fine perspective view coloured by Mr. J. J. Joass.

Another very interesting design is that by "Quex," which has many excellent points. The building is somewhat sacrificed to a fine loggia, the wings are kept down and are masked by great plain ramps; the first floor has a series of pedimented windows, the architraves looking somewhat thin. Between these windows upon the red brick wall are large pendant bunches of foliage, rather out of scale with the other detail. The detail of the sections is too elaborate for the cost. The design is somewhat over-weighted by the roof turret. The draughtsmanship is excellent, with some fine, vigorous, figure sculpture; the elevations are projected in shadow. There is one of the most brilliantly-executed perspectives in pencil and colour we have seen of late years.

"Civic" is a commendable effort by a local firm; the plan, however, is not fully considered. The elevations are of a florid Renaissance character, inked in and touched up with charcoal. The large perspective is a characteristic piece of work, executed with soft pencil, and has a rather woolly effect. The sections are very undesirable in detail.

The plan of "English Renaissance" shows the principal entrance at the side; a single corridor runs from front to back. The front elevation is a decided success, well-balanced and broad, with rustic base, corniced windows to the first floor, with curved pediments over, surmounted by entablature and balustrade. The drawings are well executed, but the perspective does not do the design justice.

"Hiram" has the most pretentious production in the exhibition, with good elements in the plan. The front is flanked by curved pediments, and the centre crowned with a young "Oratory" dome. The perspective, in pencil, does not benefit the design much.

"4,321" is a very able and compact design, economical in lay-out, and with knowledge of working. A fine, vigorous perspective in colour is shown; the defect seems to be want of sufficient consideration of exits, as but one public staircase is provided. The elevations are in a pleasing yet simple and thoroughly English style. The front elevation is divided up by grooved stone piers enclosing circular-headed windows to the assembly-room,

the ground story being divided in each of these bays into three compartments by Doric columns. The central feature is a pediment and coupled Ionic pilasters, a magnificent projecting clock, and a very picturesque balcony over the columned entrance. The roof is overweighted by a great turret, and the chimneys are grouped at either end. Dignity without elaboration has been thoroughly attained, and the whole looks what it is meant for—a town hall for a cathedral town. The drawings are of a high order of excellence.

"Red Star" is an elaborate and expensive proposal, with plenty of carved friezes and without either restraint or repose. The plan has many extravagant features. This is a very contrived effort, and, looking at this and others, it is wonderful to think to what lengths ingenuity without purpose will go.

"Hallpenny Stamp in Circle." Entrances are provided on either side. The front has pediments at the ends with finicking figure friezes, but the whole composition requires tying together and shows to better advantage in the monochrome perspective. The character of the back elevation is, however, distinctly interesting.

"One in Green Wreath." This is a very able design, with an excellent plan in which all the difficulties seem to have been met—a fine dignified staircase, with an ample second staircase for the assembly hall, other smaller staircases being conveniently disposed to give abundant access. The rates office is at the side close to an entrance, and a lobby would make this fully meet the local uses. The elevation is dignified and restrained—Renaissance without fussiness. The façade occupies the whole frontage, with large arches at either end. The whole design would altogether make a very satisfactory building, as it thoroughly, by its plan and elevation, expresses its purpose. A pencil and wash perspective is shown.

"Utility" has an excellent plan marred by inattention to exits. The front elevation shows a broad and dignified treatment, but the façade is broken rather by the entrance not being in the centre, and this is emphasised by a curved pediment above it and a clock, the remaining portion of the front being treated in a different manner. The drawings are excellent and show considerable skill, and there is a fine, freely executed perspective, strongly shown in pencil and tinted in lamp black, the whole being thoroughly municipal in character. This is, as far as we observed, the only design with isolated lavatories on the outside.

"Architecto" has a hot colour scheme on the plans, in vivid contrast to the plain, thick ink lines of the elevations and sections. This shows the plans and scheme at a glance, which has been well and architecturally considered. The principal elevation is a heavy lined drawing, and looks like a magnified plate out of "Vitruvius Britannicus." The perspective, which is a large one, is in ink and of up-to-date manner, but does not better the elevation in character; the sections are very suitably treated. "Architecto" has a firm hand in the printing line, as some of his down strokes are quite a quarter of an inch wide.

Among the remaining sets, "Ionic" may be mentioned as a civic-looking design somewhat in the manner of Colchester, of a monumental character and shown in a fine water-colour perspective. "Mercia" looks like a Venetian palace flanked by two great flag posts; the drawings are very good and complete and full of suggestion. "Hereford" shows some good and pleasing work, but he has put the assembly hall at the rear; the elevations have merit, and there is a fine line perspective. "A.D. 1901" is the only competitor who has ventured on a tower, which was not asked for; but the design has an important appearance. "Coningsby," "Rex" and "Wye," are designs which show good points.

It is worth note, as an instance of the manner in which competitions are gone into now, that as many as six perspectives are, if we mistake not, from the hand of one draughtsman.

The awards in this competition we cannot profess to understand, and it is not surprising that they seem to have excited both surprise and anger among some of the competitors. The selection by the Corporation of three other designs, with the view of considering them as in opposition to those selected by the assessor, is a most irregular proceeding. The whole thing appears to have been much mis-managed, and the best designs, in an archi-

textural sense, to have been entirely passed over, both in the premediated and "reserved" list.

Since the above notice was written, we have received the following list of the names of the authors of the premediated and "reserved" designs:—

First premium: Messrs. Macintosh & Newman (London).

Second premium: Mr. H. T. Fowler (Barrow-in-Furness).

Third premium: Mr. G. H. Stanger (Wolverhampton).

The three "reserved" designs are by Mr. H. T. Cheers (Twickenham); Messrs. James Brooks, Son & Gossell, (London); and Messrs. W. J. Morley & Son (Bradford).

#### GLASGOW INTERNATIONAL EXHIBITION.

##### SANITARY FITTINGS, &c.

THE sanitary exhibits at the Glasgow Exhibition are scattered throughout various parts of the Industrial Hall, Grand Avenue, Machinery Hall, and in some of the detached pavilions, and are therefore not to be found without some difficulty. The most important group is in the south-east court of the Industrial Hall, and merits first attention. At stand No. 80 a working model of the Septic Tank system of sewage treatment is shown, including a new automatic alternating gear for the filters. We have already described the principal features of this system and need only draw our readers' attention to the small pamphlet (which can be obtained at the stand), containing numerous photographs of installations for towns, barracks, private houses, and other buildings.

The next exhibit (No. 81) is that of Messrs. Shanks & Co., and consists of sanitary fittings and model bathrooms. Among the lavatories we noticed one with a porcelain basin and a beautiful Mexican onyx slab, and another, known as the "Treviso," with the basin and top in one piece of porcelain, the top being oval-fronted and supported on a simple framework of round nickel-plated brass tubes. In both these fittings the new "Perfecto" siphonic waste is used. This appears to be an admirable contrivance, but we had not the opportunity of seeing it in action. It consists of a tube with a metal flange about 1½ in. from the bottom, the flange having a rubber collar under it to seat tightly against the circular pottery outlet of the basin. This outlet is flanged at the bottom, so that a lead or brass trap with flanged inlet can be bolted to it. The tube forms a standing waste arrangement, which differs from the ordinary arrangement in having an inverted cup or dome over the top, with a small airhole through the crown. This cup forms with the tube a siphon of the dome type, and if the taps are left running when the waste is closed, the water rises to the top of the tube and overflows in the ordinary way; but if the supply is greater than the overflow can thus discharge, the water continues to rise in the basin till a sufficient head is obtained to start siphonic action; this rapidly discharges the water down to the normal level. The tube is fitted to the back of the basin in a simple manner, and can be easily removed. The same form of waste and overflow, but on a larger scale, is fitted to a white porcelain-enamelled iron bath. Excellent baths of vitreous-enamelled iron and porcelain-enamelled fireclay are also shown.

The fireclay baths are decorated outside, and one of them has a combined supply fitting, operated by a handle, which can be turned around a dial-plate from "shut" to "cold," "tepid," and "hot." Cold water must therefore be turned on first. The valves are non-convulsive, and the fitting is well adapted for public baths and other buildings. In one of the model bathrooms an iron plunge-bath with white enamelled zinc hood is shown. The body of the bath has a wide roll of ordinary shape, but around the foot of the bath a splay takes the place of the roll, and the hood is fixed within the splay in such a manner that there is a clear space between the hood and the bath, while splashing is prevented. In the other bathroom there is, in addition to a porcelain plunge-bath, a tubular needle-bath (comprising wave, spray, and shower) fixed on a dished marble slab with brass outlet-grate. In this bathroom there is

also a lavatory basin with an oval white marble slab standing clear of the wall. Among the sinks we noticed a butler's sink of white glazed fireclay with two compartments, fitted with simple standing wastes and overflows, which can be easily removed. Water-closets of the wash-down and siphonic types are shown; one of the latter has a three-gallon flushing cistern fixed immediately above the seat, the cistern having a floating valve and 2-in. outlet. The "Aqua-jet" cistern is a siphonic cistern of novel type, requiring a remarkably gentle pull and being almost noiseless in action; for fixing immediately above the basin, it is made to hold three gallons, and has a 2½-in. outlet. Among the other fittings are an enamelled iron sitz bath, a bidet, towel rails, and other bathroom accessories. The simpler of the two model bathrooms has a mosaic floor and tiled walls, and the more elaborate has the walls faced with slabs of white statuary marble with dividing strips and frieze of light greenish marble, the frieze having a key border of Venetian gold mosaic. The exhibit, taken as a whole, is most interesting, and well worthy of the reputation of the firm. Messrs. Shanks & Co. have generously fitted up all the lavatories, urinals, and water-closets throughout the Exhibition grounds, as well as the lavatories in the Royal Reception Rooms. These fittings are of various types, and are well worthy of inspection, as they can be seen in actual use.

At the next stand (No. 82) Messrs. Charles Buick & Sons, of Alloa, have a varied assortment of sanitary fittings, drain-pipes and traps, terra-cotta ridges and finials, flower-pots, &c. Perhaps the most notable fitting is a range of stall-urinals in amber glazed fireclay; each stall has the base, curved back, and perforated flushing-rim in one piece. The front pillars and capping are of white glazed fireclay. Another range is on similar lines, but with white glazed stalls and marbled pillars and capping. We noticed also a good flushing-rim siphon-hopper with back and sides 16 in. high to prevent splashing, and a range of three school lavatories bolted together so that two pedestals serve for the three basins; the basins have rubber waste-plugs and large overflows protected with nickel-plated brass grates, each of which can be removed after taking out one screw. Among the other fittings are a siphonic water-closet, a large white glazed fluted inorganic slab, three wash-tubs, and three enamelled fireclay baths, one of these having a side outlet.

Messrs. Doulton & Co. have a large and interesting exhibit of faience, sanitary fittings, glazed-ware fireplaces, tiles, &c., at stand 83. The baths include vitreous-enamelled cast-iron plunge and sitz baths, nickel-plated tubular bath comprising wave, spray, and shower, and fixed on a vitreous-enamelled iron dish, and a plunge bath with hood for spray and shower. These are all well made with smooth and perfect surfaces, but do not possess any particularly novel features. The asylum bath fittings with special regulator for cold scalding are decidedly ingenious. The valves are non-convulsive, and are operated by a loose key which can be fitted on the end of the spindle passing between the valves. From this spindle two levers or arms project over the pressure-buttons on the tops of the valves and work on eccentrics in such a manner that as the key is turned one lever is gradually depressed on to the cold valve, thus starting the cold supply; a further turn of the key brings the second lever down on to the hot valve, so that tepid water is supplied; and as the turning of the key proceeds, the hot lever is gradually depressed still more, while the cold lever is gradually withdrawn, so that at last only hot water is supplied. The fitting works very smoothly, and is well made; it is protected by a metal case with a key-hole opposite the spindle. A somewhat new departure is the employment of cast-iron for wash-tubs; one of these finished with white vitreous-enamel measures 2 ft. 11 in. by 2 ft. 1 in. by 16 in., and has a 2-in. vulcanite plug, loose vitreous-enamelled iron back 11 in. high, and enamelled-iron supports. There is also a neat porcelain lavatory with basin, top, back, elbows and frieze in one piece, and supported on T-iron brackets concealed by the side friezes; it measures 27 in. by 19 in. and has a vulcanite plug and open-top overflow protected by a hinged grate. A massive lavatory in white glazed fireclay, supported on enamelled iron legs, appears to be almost unbreakable; it has an open-top overflow and safety-plug, and is fitted with a loose back of

white glazed fireclay. A strong oval-fronted operating lavatory in glazed fireclay measures 2 ft. 7 in. by 2 ft. 11 in., and has an open-top overflow and treadles for the hot and cold supplies. The most elaborate lavatory has an onyx slab and back, and nickel-plated legs, and is a very satisfactory piece of work. Stall urinals in glazed ware, and others in glazed ware and marble, are shown, with distributing nozzles for the flush.

A range of siphonic trough-closets is fitted with a small chamber containing a float-valve which rises with the usage of the closets and ultimately starts the siphonic action of the flushing cistern. The recurrence of the flush is thus automatically controlled by the usage of the closets. Strong stoneware wash-down closets for factories, &c., are shown, and valve and siphonic closets for buildings of a better class. The valve-closet has a marble seat and enclosure, and the flush is actuated by a pressure-button (push and let go). One of the siphonic closets has a similar pressure-button, the flush being obtained through a regulating valve instead of the usual cistern. The latest type of hospital bed-pan sink, known as the "St. Thomas," is a well-designed fitting of massive character. It measures 21 in. by 16 in. inside the flushing-rim, and is supported on a simple enamelled cast-iron bracket shaped like a man-hole step, the ends of which are built into the wall. The hopper has a flanged outlet, to which a P-trap is bolted, and the trap has a lead socket on the outlet for connexion to the lead soil-pipe. The bedpans can be cleaned by means of a jet worked by a treadle, and the same action starts the flushing apparatus, so that the contents of the pans are at once removed. There is also a siphon-hopper suitable for houses and hotels; a brass grating is ingeniously contrived to protect the front roll, and is hinged so that both grating and roll can be thoroughly cleaned. The hopper has a pottery outlet-grid, and above this is a large loose brass grating with rubber buffers which serves as a stand for utensils which are being washed or filled with water.

The last stand in this group is No. 84, and is occupied by the large exhibit of Messrs. Twyford, Limited of Hanley. One of the most conspicuous objects is a three-compartment sink in one piece of enamelled fireclay, measuring 7 ft. 4½ in. by 2 ft. by 15 in. deep, the back being 9 in. higher. This is a fine example of the potter's skill. The "Ruchil" sink, used in the Ruchil Hospital at Glasgow, is of fireclay white-enamelled inside and outside (except underneath), and supported on pedestals of the same material. The "Brentford" siphon-hopper and sink is in one piece of enamelled fireclay, but the hopper is only 9½ in. in diameter inside the flushing-rim. The new form of the "Middlesex slip bed-pan and scalding sink" for hospitals is made in one piece (instead of two as formerly), and measures 4 ft. 3 in. by 22½ in.; the hopper has a perforated flushing-rim and the sink has a simple gun-metal lift-out standing waste and overflow. The "Birmingham" siphon-hopper and drain is also in one piece, but of simpler design, a draining slab taking the place of the scalding sink. The hopper is square at the top, and has a circular brass grate at the outlet; a pipe rises from the slab and curves over the hopper to form a bedpan nozzle. A siphon-hopper for houses has a perforated flushing-rim, brass outlet grate, hinged brass grating with rubber buffers (for supporting utensils), and an inserted wood rim along the front. A group of four lavatories arranged in the form of a square forms an excellent independent fitting; a shower-rose is attached to a pipe rising from the centre and swivelled so that the shower can be turned over each basin. The "Hydro" is a new form of lavatory standing waste, somewhat similar to this firm's "Neros" waste, but fixed clear of the back of the basin. An enamelled fireclay bath with ridged bottom (to prevent splashing) is also shown; it has a wood rim along the front, and a shelf along the back in one piece with the bath. Among the bath-fittings we noticed a set for asylums, so arranged that the hot spindle is covered until the cold spindle has been turned, and also a set of fittings with mixing chamber and thermometer for regulating the temperature of the water. The firm's well-known siphonic closet is shown, and we noticed also a "detachable" closet outlet joint; in this joint a brass collar (screwed outside) is attached to the pottery outlet of the closet, and the joint is completed by a brass union and tail-pipe after the manner of the ordinary lavatory unions.

"Adamant" urinals in straight and hexagonal ranges are also shown, together with a new design, in which the base, back, front pillars, and capping are in one piece of glazed fireclay, measuring 5 ft. 6 in. by 2 ft. 6 in. by 1 ft. 9 in. A horizontal groove is formed around the curved back for the reception of the copper sparge pipe, which is fixed by a single nut in the centre.

The next important exhibit of sanitary fittings will be found at Stand 85 on the right-hand side of the Grand Avenue, and is owned by Messrs. T. B. Campbell & Sons, of Glasgow. The principal feature is a bath-room suite made by the Standard Sanitary Manufacturing Co., of Pittsburg, U.S.A. Two baths are shown—plunge and sitz—both being of white-enamelled cast-iron, excellently finished; the lavatory basin is of porcelain, and has an oval white marble slab 2 in. thick with roll edge and dished around the basin; the combined waste-and-overflow is of the standing type and is placed in a metal cylinder behind the basin. The siphonic water-closet has a jet in the bottom of the basin after the manner of Twyford's siphonic closet, and the cistern is placed immediately above the seat and is started by pressing a button; the cistern is of white glazed pottery, with marble top and the closet seat and lid are of wood enamelled white with good effect. Cassel's patent "Clarifit" lavatories are of Scottish manufacture, and are well adapted for schools. They are of the constant-stream type, and basins in ranges can be supplied with water, either separately or simultaneously. For separate supply the water issues from the tap or taps into a small compartment at the back of the slab, from which it rises into a shallow circular bowl in the centre and overflows thence into a channel between the bowl and the rim of the slab. The water escapes from the channel through a grid into a conduit passing under the central bowl to the waste-outlet under the small inlet compartment. An indiarubber ball plug is used to close the bottom of the inlet compartment when the basin is in use. A slightly different arrangement is adopted for ranges, the channels of the several basins communicating with each other, so that one waste-pipe serves for the whole range. The basins are made in enamelled fireclay or cast-iron, and in various sizes. Other designs than those described are now made, but all have the same inner basin with the water welling up from the bottom, and carrying away the soap and dirt immediately and continuously. Among the other exhibits at this stand are a stack of lead pipes from 1/2 in. to 8 in. in diameter, and a number of taps and other fittings in brass, copper, German silver, &c. Sheets of "Mezzotile"—white enamelled zinc—are used for lining the walls and ceiling of the American bathroom, and have a smooth, hard, and clean surface, practically free from joints.

Messrs. W. Stevenson & Co., of Glasgow have a good display of brass, copper, and drawn-lead pipe at Stand No. 86, and at No. 87 the Bourtrechill Coal Company has a very good miscellaneous assortment of drain-pipes and traps, sinks, garden vases, terra-cotta statues, and other burnt-clay goods. Hutchinson's patent drain-pipe has a double socket, the inner one being eccentric to the pipe and having the invert of the spigot-pipe resting on it to exactly the same level as that of the socketed pipe. Peddie's "Special" drain-pipe has a large tapering socket, so designed that when the pipes are pushed home they are exactly concentric. The socket for a 4-in. pipe is 3 in. deep, 7 1/2 in. internal diameter at the outer end, and 5 1/2 in. at the inner. Egg-shaped pipes are also shown. All the pipes are brushed over inside with some composition before firing in the salt-glazing kiln, the result being a greenish-yellow glaze of great smoothness. Among the other sanitary exhibits are the "Turret" and Fulton's grease-traps, Armstrong's "Iron" inspection-junctions, and white glazed manhole channels.

At No. 88 Mr. Wm. Sturrock, of Glasgow, shows manhole-covers, pipe-joints, gullies, &c., manufactured by the Ames Crossta Sanitary Engineering Company. Some good drain-pipes from 4 in. to 24 in. in diameter are shown at No. 89 by the Glenboig Union Fireclay Company, Limited; the pipes are of a dark purple-brown colour and are true in shape. The Gartercraig Fireclay Company has (among other goods at No. 90) a small exhibit of drain-pipes, and at the next stand Messrs. Peter & Mark Hurl show some drain-pipes, traps, and

sinks of ordinary forms, and a fireclay siege-block for a plate-glass furnace, weighing 19 1/2 cwt., and said to be the largest solid block ever made in Great Britain. In the main avenue of the Industrial Hall two stands (Nos. 185 and 186) are occupied by exhibits of sheet-lead, lead pipes, &c., made by Messrs. Locke, Blackett, & Co. of Newcastle-on-Tyne, and Messrs. Alexander Fergusson & Co., of Glasgow, respectively; the latter firm has the more imposing display.

In the Machinery Hall one of the most important sanitary exhibits is that of Messrs. Mather & Platt, Limited, Manchester, at No. 6ro. Reeves's patent "single constant pressure filter" and "compound gravity filter" are shown, and are suitable for town and village supplies, and also for mansions and factories. The filtering material is pure quartz sand suitably graded, and simple arrangements are adopted for cleansing this. The gravity system is recommended for domestic purposes, and appears to have given good results at many places in this and other countries. A model of filter-beds for sewage with a special distributing apparatus is also shown. Other sanitary exhibits in the Machinery Hall which deserve at least passing mention are the following—No. 431 (Messrs. Glenfield & Kennedy, Limited, Kilmarnock), penstocks and flap-valves for sewers, including a penstock for an oval sewer 36 in. by 24 in. with worm gearing and balance weight, and an ingenious apparatus for cleaning water-mains without disturbing the pipes except at certain points; No. 470 (Messrs. F. Braby & Co.), copper boilers, galvanised iron cisterns, &c.; No. 523 (Messrs. McDowall, Steven, & Co., Ltd., Glasgow), enamelled iron baths, porcelain lavatories, and glass-enamelled iron bends for drains; No. 527 (Messrs. Stewart & Menzies, Ltd., Glasgow), iron and steel pipes, and a 4-in. inscribed Roman seamed lead pipe of the first century with a joint like a modern copper-bit joint; No. 530 (Muntz Metal Co., Ltd., Birmingham), drawn copper, brass, and Muntz's metal tubes, coils, rods, bolts, &c.; No. 555 (Messrs. Thos. Bradford & Co., Manchester), laundry machinery and fittings for public and private laundries, and cooking and bathing appliances; No. 570 (Messrs. J. Stott & Co., Oldham), water-heaters for public and private baths; No. 584 (Messrs. D. & J. Tullis, Limited, Clydebank) and No. 601 (Mr. James Ritchie), laundry machinery and fittings of various kinds. At No. 519 Messrs. Walter Macfarlane & Co. have an excellent exhibit of glass-enamelled cast-iron drain-pipes and traps, all cut in half longitudinally and fitted together, so that the metal and glaze can be thoroughly examined. There is a 3-in. trap with junction and grate at one end of the drain, followed by a 3-in. to 4 1/2-in. increasing pipe, after which 4 1/2-in. pipes are fitted and three different traps of the same size, one of these being designed for a brick inspection chamber and another for fixing under an inspection cover in the iron drain. The metal is about 3/8 in. thick and is perfectly sound, and the glaze is smooth and flawless.

Stable fittings merit a short notice. Messrs. Walter Macfarlane & Co. show stand No. 519 two stalls, one having blue-grey tiles at the head and the other sheet-iron enamelled to imitate marble. The fittings are of porcelain enamelled cast-iron, the drinking-trough in one stall being pivoted like a tip-up lavatory basin. The floor of one stall has an iron channel and grate of ordinary type, while the other has an iron floor-plate 5 in. wide with a groove 3 in. wide and about 5 in. deep along the middle. The "ornamental" cast-iron work in the upper part of one of the stalls, with a galloping horse in it, had better have been omitted, and would prejudice many persons against the work. This might have passed as artistic cast-iron work thirty years ago, but architects (and even some of their clients) have got beyond this kind of thing now. Plain but good workmanship is preferable to bad ornament, more especially in practical constructions of this class. The same firm has fitted up the stables and cowhouse in the Model Farm Buildings (No. 12) erected in the grounds by Messrs. Speirs & Co., of Glasgow; these are of a strong, plain character as befits their situation. At stand No. 523 in the Machinery Hall, Messrs. McDowall, Steven, & Co., Limited, Glasgow, exhibit a good range consisting of two stalls and a loose-box with porcelain-enamelled iron fittings (including tip-up drinking-trough), hard-grooved buff paving-bricks, iron floor-grates, and greenish-grey tiles at the

heads of the stalls. At No. 80 in the Irish Pavilion Messrs. Musgrave & Co. exhibit a model of a range of three stalls and two loose boxes. The Carron Company's exhibit is No. 909 in the Lighting and Heating Pavilion, and includes two stalls paved with adamantine clinkers and iron floor-grates and channels; one stall is fitted with three porcelain enamelled iron pots with a polished bronze top and front roll in one piece. A silent troy chain is shown, the special feature being that the ring which slides up and down the metal rod fixed under the manger is of leather instead of metal. Teak boarding is used in one of the stall-divisions.

The Carron Company also exhibits at the same stand some cast-iron baths, porcelain enamelled and metallic enamelled, of good quality, but without any novel features. At No. 895, in the Lighting and Heating Pavilion, Messrs. Thos. Robertson & Co., of Glasgow, show their bath-heaters; these are rectangular, and therefore different from the usual type of geyser. In the same pavilion there are also several exhibits of gas water-heaters, including those of Messrs. Wilsons & Mathiesons, Dobbie, Forbes & Co., and Fletcher, Russell, & Co. On the second floor of the art galleries some of the exhibits illustrating "Technical Education" will be of interest to plumbers, showing what is being done by students in Glasgow and London.

BRITISH ASSOCIATION OF WATERWORKS ENGINEERS.

THE sixth annual conference of the British Association of Waterworks' Engineers has just been held in Birkenhead. The conference has to have spread over four days, the mornings of the first three being occupied with business and the discussion of papers, while the afternoons and the whole of the fourth day were to have been devoted to visits to various water pumping-stations and other places likely to interest the visitors. The headquarters of the Association were at the Birkenhead Town Hall. The members were received on the 9th inst. by the Mayor (Alderman Thomas Cook), who extended a cordial welcome to the visitors. The retiring President, Mr. C. H. Priestley (Cardiff), proposed a vote of thanks to the Mayor. Mr. Watts (Sheffield) seconded the motion, which was carried.

The retiring President then introduced the President-elect, Mr. W. A. Richardson, M.Inst.C.E., Waterworks Engineer to the Corporation of Birkenhead.

The new President, on taking the chair, thanked the Association for the honour conferred upon him, and moved a vote of thanks to Mr. Priestley for his services as President during the past year. This was seconded by Mr. Swindlehurst (Bolton) and adopted.

Mr. Priestley having responded, the President delivered an inaugural address, which embraced a detailed description of the waterworks of Birkenhead. He pointed out that Birkenhead is wholly dependent for its water supply upon deep wells sunk in the red sandstone of the district. There are five pumping-stations—Spring Hill, Flaybrick Hill, Borough-road, the Ford, and Mount-road. The last-named works are in progress, and pumping operations are about to be commenced to test the yield of the borehole. Spring Hill works were opened in 1841, and subsequently passed through the hands of the Birkenhead Improvement Commissioners to the Birkenhead Corporation, coming under the control of Mr. Richardson when he was appointed Water Engineer to the Corporation in December, 1881. At various dates the boreholes were deepened, and now the yield is 8,500,000 gallons per week. There are seven shafts (six being 5 ft. diameter) and eight boreholes from 3 in. to 18 in. diameter, the deepest being 678 ft. below the surface; and a covered service reservoir with a capacity of 800,000 gallons. The Flaybrick Hill works date from 1861, and in 1881 the yield was 14 1/2 million gallons per week, but this by 1891 had decreased to 7,000,000. However, by sinking a borehole 700 ft., the yield had been increased to 8,000,000 gallons per week. At Flaybrick there is a large covered service reservoir, with a capacity of 4,562,600 gallons, and a 50 ft. tower and tank, the latter carrying 104,000 gallons. The Borough-road works also date from 1861, at which time Mr. Richardson was the resident engineer there. The original yield was 2 1/2 million gallons per week, but by lowering the

well from time to time the supply was increased to 10,000,000 gallons in 1893; but in 1897 the yield had fallen to 8,000,000, and at present is 6,000,000 gallons per week. There are here two covered reservoirs and a tank, with a total capacity of 1,557,242 gallons. The Ford borehole was completed in 1896, and an old horizontal engine and pumps working at full capacity yielded at the rate of 9,500,000 gallons per week, lowering the water 145 ft. Air-lift pumping plant in duplicate is being put in position, each set capable of lifting 45,000 gallons per hour, and the first set is expected to be at work in August. At Mount-road a borehole 850 ft. deep was completed last year, but the yield has not been ascertained. Birkenhead supplies a population of 108,721, with an average daily pumping over a period of ten years of 2,637,000 gallons. Wallasey supplies a population of 51,000, with 1,394,471 gallons; Hoylake and West Kirby a population of 12,000, with 386,300 gallons; Neston a population of 4,000, with 82,102 gallons; the Mersey Tunnel pumps 2,400,000 gallons (about one-third being fresh water); and the Wirral and West Cheshire Company supplies a population of 32,109, with 953,884 gallons. Thus within an area of 25,167 acres in that part of Wirral 207,800 people and all trade requirements are supplied with water pumped from the new red sandstone from the wells and boreholes at the rate of 7,853,840 gallons per day, or 54,976,880 gallons per week.—On the motion of Mr. Hamlet Roberts (Ipswich), seconded by Mr. Sainley (Windsor), a vote of thanks was accorded to the President for his address.

Messrs. W. J. Ware (Maidstone) and J. W. Lewis (Farnham) were elected auditors for the ensuing year, and the President announced the results of ballot for new members and associates.

Mr. W. E. Plummer, astronomer to the Mersey Docks and Harbour Board, then contributed a lecture on "Rainfall, the Cycle of Precipitation." A vote of thanks was passed to Mr. Plummer, on the proposition of the President, seconded by Mr. Whittaker (Croydon).

Subsequently the visitors were entertained by the Birkenhead Corporation Gas and Water Committee to luncheon, served in the Mayor's rooms.

During the afternoon the visitors were conveyed in wagonettes on a tour, which embraced visits to the Borough-road, Spring-hill, and the Flaybrick pumping stations. Leaving Flaybrick, the party visited Bidston Observatory, and then crossed the Wallasey Pool Bridge and inspected the Poulton and Liscard pumping stations of the Wallasey District Council, thence driving back to the Birkenhead Town Hall.

On the 10th inst., the first business was the reading of a paper by Mr. William Watts, M.Inst.M. and M.E., F.G.S. (Sheffield), on "Detecting and Preventing the Pollution of Public Water Supplies," which we print on this page.

The President opened a discussion on the paper, condemning iron pipes because of the corrosion which took place, and recommending the use of lead pipes for domestic supply. Mr. D. M. F. Gaskin (Liverpool) also condemned the use of iron pipes, observing, however, that water engineers ought not always to be judged by results, as in many cases they were bound to do what their corporations thought to be cheapest. Mr. Priestley (Cardiff) agreed generally with the paper, except as regards the use of iron pipes, believing lead pipes were better and safer. He said most towns were miserably provided with storage accommodation. Mr. Price (Worcester) urged that it would be cheaper to filter the water in the town rather than to buy up large areas of gathering ground, which might possibly be contaminated. Mr. C. E. Jones (Leyton, Essex) said it had been proved in the Thames Valley that flood water was not nearly so polluted as the normal flow, and, as for iron pipes, they were a nuisance in a thousand ways. Lead pipe with a tin lining was an ideal pipe for house service, but it was not popular on account of its expense.—Several others contributed to the discussion, general dissent being expressed to the use of iron pipes for house services.—In reply, Mr. Watts said he was not in favour of iron pipes if they could get a metal proof against the solvent power of water causing lead poisoning, and he hoped some such metal would be introduced.—On the motion of the President, seconded by Mr. Priestley (Cardiff), a hearty vote of thanks was accorded to Mr. Watts for his paper.

The conference would have been resumed on the 11th inst., but owing to the fire which occurred the previous night at the town-hall, it was decided to abandon the sitting. Before rising on Wednesday, Mr. William Ingham, Waterworks Engineer of Torquay, read a paper on "The Design, Construction, and Cost of Service Reservoirs," and the discussion upon this was adjourned and also the reading of a paper by Mr. A. G. Cloake, of London, on "The French Practice in the Manufacture of Cast-Iron Pipes."

Mr. Ingham, in the course of his paper, explained that he had been collecting the materials for it for some years. The chief points to be considered in connexion with the design of service reservoirs were: (1) the greatest daily variation in the supply; (2) the length of time necessary to repair any defect either in the trunk main, pumping engine, or other machinery between the storage reservoir or well and the service reservoir; (3) the maximum requirements in case of fire or the bursting of water pipes, as in 1895, due to frost; and (4) utilising the reservoir to equalise the variation due to intermittent pumping. Where there was only a single main for the storage to the service reservoir the latter should be large enough to supply the district for from three to four days—if in duplicate from one to two days' supply would be found sufficient. For pumping schemes where the machinery was duplicated a two days' supply was generally sufficient. The depth of the service reservoirs was generally between 9 ft. and 18 ft., the most economical depth, considering all things, probably being within the limits of 12 ft. and 14 ft. For covered reservoirs the economical depth to be excavated under the original surface of the ground might be taken at from 30 to 50 per cent. of the height of the wall. If the soil could be excavated by machinery it would pay to do it if the quantity exceeded 30,000 cubic yards, the cost then being from 9d. to 1s. per yard. Mr. Ingham proceeded to discuss the question of reservoir fittings and the materials used in constructing service reservoirs, and remarked that where coal, salt, or other mines were worked, special attention should be directed to possible disturbances due to their presence. The covering of reservoirs, he said, was a matter upon which there was much difference of opinion amongst engineers and the medical profession. Whether there was any necessity for covering them depended upon the character of the water and the purity of the atmosphere in the neighbourhood. Generally speaking, it would be found necessary to cover all reservoirs wherein hard waters were stored, but in some instances only where soft waters were stored, though in large manufacturing districts it might be necessary to cover them, whether the water be hard or soft. As to the cost, he submitted that circular reservoirs were from 20 to 40 per cent. cheaper than rectangular ones.

The members visited Warrington on the 11th inst., and inspected the Corporation waterworks at Winwick and Hill Cliff. They were driven to the two places, which are respectively on the north and south of the town, and were conducted over the works by Mr. James Deas, the Corporation Water Engineer. The Corporation are making a big extension in their waterworks system at a cost of 247,000l. The domestic supply is obtained at Winwick, and the new works there comprise an entirely new pumping station at Delph-lane. The water from the well will be lifted through one mile and a half of 20-in. cast-iron rising main to the Winwick reservoirs. The service reservoir accommodation is being increased by a new reservoir 215 ft. by 109 ft. and 20 ft. deep, with a capacity of 41 million gallons. At Appleton, from which water is supplied for trade purposes, two new filters and a service reservoir are being constructed, and the existing filters will be reconstructed.

After inspecting the works the members proceeded to Norton Tower, which is 100 ft. high. The capacity of the tank is 600,000 gallons, and the weight when full is 3,000 tons. It is 82 ft. in diameter and 30 ft. 7 in. deep.

TRINITY CHURCH, WEST HAMPTSTEAD.—A faculty will be issued from the Consistory Court of London for the building of a mission hall, having a capacity of 325 persons, upon a site adjoining that of the church, and for the placing in the church of a stained-glass window in memory of the Rev. Henry Sharpe, the late incumbent. The church was built in 1872-3 after Mr. Legg's plans and designs.

## DETECTING AND PREVENTING THE POLLUTION OF PUBLIC WATER SUPPLIES.\*

The following remarks are intended to apply exclusively to water from moorland drainage areas, as the author considers this subject is sufficient in itself to furnish matter for one paper.

Public water supplies are often taken from sources where it is difficult to detect and prevent pollution, owing to the conflicting interests involved in the ownership of the property taken or affected.

Local authorities often select their sources of supply solely with a view to securing water at a cheap rate, and without much regard to the condition of the land through which it flows. It requires no little experience either to discover watersheds yielding water naturally wholesome and in sufficient quantity, or to deal with supplies which are contaminated.

Water may appear pure and bright and yet be objectionable for domestic uses. Too much care, therefore, cannot be taken in the selection of a drainage area from which domestic water supplies are intended to be drawn. Quality, rather than quantity, should be sought after, in which respect consumers would sooner learn the value of economy in the use of it.

The selection of water supplies generally should be left in the hands of trained engineers, chemists, and geologists, whose professional training qualifies them to give opinions based upon experience and free from local bias, and the selection of the site for works is generally safer left in such hands.

Pollution is a word often used in reference to water supplies, but its meaning has a wide range, because the elements of pollution have not been clearly defined by chemists and bacteriologists, nor understood by the public in general. Bacteria in water are looked upon as objectionable by some scientists and as an aid to purification by others, and while this doubt exists in the minds of specialists, the ordinary consumer will naturally be perplexed.

Water falling on the earth is not chemically pure, and it is questionable whether absolutely pure water is more wholesome than a well-guarded mountain stream containing the impurities common to this class of water. The fouling of moorland waters by ordinary denudation can be prevented by the adoption of the methods described in this paper, and which for many years the author has adopted on the works entrusted to him.

The purity of moorland water can be maintained to some extent by keeping up a constant change and circulation in the supply reservoir. The in- and out-flows require to be evenly balanced, and the water should not be allowed to remain too long at one level, but should be lowered and raised as frequently as possible, especially in the spring of the year, when it swarms with the lower forms of aquatic life. The ova at this time deposited on the sides of the reservoirs are destroyed, together with the vegetation which finds shelter and support in the shallow water. Exposure and change bleach discoloured water, and frequent decanting is generally beneficial. The water stagnant in the bottom of a reservoir does not appear to rise to the surface, and thus the benefits of oxidation and purification by exposure are lost; and such water should never be used for domestic supply, but be drawn from as freely as possible when in wet seasons the supply is plentiful, and be given as compensation water. It frequently happens, especially in new reservoirs, that water drawn from the higher level is clear and inodorous, whilst the bottom valve is discharging water offensive both to smell and taste. Too much importance cannot, therefore, be attached to the placing of draw-off valves at different levels in the valve well. Purification begins at the surface, and much time is required for the suspended matter to pass through the lower layers of water and reach the bottom.

Flood water should not be allowed to enter a reservoir from which the supply goes direct to the consumer, unless it be subsequently filtered. Even then it is better to keep it out and supply water derived only from the streams in a normal condition of flow; the flood water being collected and stored in a separate reservoir, whence it can be drawn off when sufficiently clarified. This

\* A paper read by Mr. William Watts, M.Inst.M. and M.E., at the recent meeting of the British Association of Waterworks Engineers at Birkenhead.

method, besides providing a purer and greater supply of water, enables the suspended matter to be deposited where it can be removed without interfering directly with the town supply. Heavy floods do not occur more than two or three times a year, and seldom last long. While the volume discharged is great, flood water is not necessarily the most dangerous water flowing from a drainage area. Unless flood-water courses be provided, separation is impossible; moreover, if flood-water is allowed to enter a reservoir at the head of the works, it has a tendency to drive the clean water over the waste weir.

Of course, land drains connected with dwelling-houses and farm buildings should not be allowed to discharge into the lateral feeders of a reservoir; and when the physical features of the land do not admit of a system of drainage being carried out, intercepting wells or cess-pits should be constructed so as to arrest the sewage, which should thence be regularly carted away from the drainage area, or be spread on permeable substrata, where it would be effectually filtered and rendered harmless. The safest plan, however, is to purchase the drainage area, and remove all possible sources of contamination.

Some reservoirs are, in a measure, protected by the reservation of a narrow strip of land between the top-water level and any adjacent fields likely to be manured. Manure so placed upon land is, however, liable to be washed off, and so get into the reservoir during heavy rain, especially in frosty weather, and where the ground slopes steeply towards the reservoir. Attention should also be given to the land drains discharging into the streams which feed the reservoir, which naturally occupies the lowest position in the valley.

Water plants should not be allowed to grow in the shallow margins of a reservoir, and constant weeding is necessary in the spring of the year to keep them down. To prevent and to further check their growth the sides should be pitched with stone, and the water drawn down as frequently as possible, in order to destroy the roots as well as any ova deposited upon the vegetation and stone pitching.

The shallows of a reservoir afford suitable spawning ground for frogs, which, with the opening of spring, appear in great numbers, and render the appearance of the water very offensive. This spawn should be collected as soon as it appears, and be buried in lime and soil some distance away. Frogs are not found in deep water or running streams.

Fish should not be allowed to multiply too freely, and care should be taken to exclude all but the cleaner kinds, of which *Salmo fario* are the best, but unless they have a running stream in which to spawn, they do not thrive or multiply, and when confined too long in deep water they grow lank and sometimes become blind. *Fario* will not live long either in a reservoir set apart for the storage of flood water, or of water selected in the manner suggested, as the food supplies are intermittent. Fish act simply as scavengers, and as such their presence in reservoirs is beneficial, but they do not otherwise purify the water. They, no doubt, devour the ova and larvae, and many forms of life which exist in water, and the objectionable "limnæ," found in some reservoirs, are reduced by them, and it is also alleged that fish destroy the "cyclops," but the evidence on this point is not well authenticated. In the author's opinion, these crustaceans are too small for fish to notice as food unless their powers of sight are exceptional; these "cyclops," moreover, are harmless, and probably even more beneficial to the water than the fish, as they feed on the minute organisms which are known to carry infection to the consumers. On the other hand, it may be, generally speaking, taken for granted that the fewer the forms of life in water the purer it is; but whether it is therefore more wholesome is an open question.

Trees, although objects of beauty in a landscape, are not always desirable. They prevent evaporation and a free flow of water off the land, and consequently springs are more abundant where forests exist. They should not be allowed to remain where falling leaves can find their way into drinking water; in fact, vegetable matter of every kind should be kept out of streams and reservoirs used for domestic supplies. Such vegetable matter may not be actually unwholesome in itself, but as it provides food and shelter for aquatic life which is objectionable, it is better kept out of the water.

The sources of pollution hitherto referred to may be prevented either by the purchase of the gathering ground, by the proper construction and arrangement of the works, or by good management; but pollution, which it is not easy to detect or remove, is sometimes found to exist on a watershed—such as that occasioned by denuding agencies, and the erosion of the exposed surface of the land, by the solvent power of the water, by objectionable mineral springs, the decay of vegetation, road washings, and matter from dwellings, which cannot very well be removed. By purchasing the drainage area some of these sources of contamination may be removed, and others rendered less injurious; but pollution of some kind will nearly always exist in spite of every reasonable precaution.

The purity of moorland water depends very much upon the character of the streams from which it is derived or conveyed to the reservoirs, and to prevent disintegration the main feeders should be pitched with rubble stone, and the adjacent springs and swampy ground be drained direct into them. Water from peat beds is also very much improved by draining, especially those higher areas from which most of the water is derived. A few leading drains will suffice if opened out and carried deep enough in the right direction. Where stone is not available, open cuttings answer very well, but in a spongy sub-soil the sides require support and protection.

Intercepting or wreck lodges placed across a stream will arrest coarse debris, and prevent much silting up of the reservoir. These require cleaning out from time to time when dry weather permits. All that is required is a strong rubble embankment, with a draw-off pipe at the bottom, and a bypass to be used while the cleaning out is in progress; they need not be watertight, or deeper than from 6 ft. to 9 ft., but the level of the streams will in all cases determine the depth. The author has made many with complete success, and can testify to their value.

The collecting and storing of a town's water supply should be carefully attended to at its very source, whether it be afterwards filtered or not. The streams, drains, and springs are too often neglected, and because of their distance away are visited only at long intervals. Floods sometimes bring down dead sheep, roots and branches of trees, bracken and tufts of hay, all of which are liable to block up the stream in narrow places. To guard against this the principal feeders should be examined directly after a flood, and every obstruction removed. In pitching the drains and feeders, care should be taken to improve their lines as far as possible, and to keep the sections proportionate to the quantity of water they have to carry. This enables it to flow to the reservoir much quicker than otherwise, and it is a decided advantage when, in hot weather, the flow is reduced.

With regard to the action upon lead of certain waters, several methods for preventing this have been suggested, but no effective plan, has, so far, been introduced whereby the acidity of the water is entirely removed so as to satisfy engineers and chemists. Peaty water does not of itself appear to be injurious to health, but the acid it contains acts powerfully upon lead, and may dissolve sufficient to cause lead-poisoning. The remedy which finds most favour with engineers is to pass the water through a layer of chalk or limestone chip-pings, placed among the coarser material of the filters below the sand. Soft water when brought into contact with limestone liberates carbonic acid gas and causes a deposit of carbonate of lime to form on the surface of the lead, which prevents any further solvent action taking place; but whether this coating is sufficient permanently to resist the action for all time it is impossible to say, and it is obvious that if this coating goes on accumulating, the pipes must become seriously reduced in size.

There is a need for a metallic service pipe which, while equal to lead in ductility and strength, would have, in addition, the power of resisting the solvent action of water charged with peaty and other acids. New piping is more readily acted upon than old, and probably a baser metal than lead—if one can be discovered—is all that is required.

In recent years iron piping has come into more general use, and there is no reason why it should not be even more extensively used, as there is no doubt but that lead pipes and cisterns are dangerous to health when used in the storage or conveyance of soft water.

The time has arrived when spun yarn should cease to be used in making the joints of socket pipes, and cold lead rings substituted. The fibre of the yarn is vegetable material, and in the course of time decays and pollutes the water. Some engineers have dispensed with it, and I see no reason why others should not do likewise. The cost of solid lead joints is a little more than a yarn and lead joint, and the surface of lead brought in contact with the water can be reduced to a minimum. It has occurred to the author that these cold lead rings could be forced in by hydraulic power, and thus save the expense of firing, making joint holes, and setting-up, as in the case of molten lead joints; the sockets could be shortened, and the amount of lead required reduced.

The standardising of pipe sockets, too, is a thing greatly needed, and which would simplify and probably cheapen the manufacture of pipes generally.

No water supply from such sources as have been indicated can be considered as sufficiently pure for domestic use unless it is filtered immediately before it passes into the supply mains, for while it may be potable and wholesome without filtration where arrangements exist for effective decanting, yet cyclops and other low forms of life are liable to go with the water into the mains, and thus find their way to the consumers.

Screening the water through fine gauze is sometimes substituted for filtration, but it is neither satisfactory or so effective as the latter.

The deposition of sediment in the supply mains is also a common cause of complaint, and is intensified every time the water is turned off. Even in the best supplies of filtered water, fine sediment will accumulate in the pipes, and is not all due to the matter in suspension in the water, but partially to peroxide of iron from the metal of the pipes, and is deposited in the form of barnacles, especially when the water is often withdrawn or air gets to them. To remove this, more frequent flushing of the mains is required, the velocity of the water being such as to give an effective scour in the pipes. The districts of supply should not be too large, and although they may be supplied from one common source, each should work independently. Dead ends should not be allowed, and complete circulation of the water should be ensured, as it is not improved by being kept too long in the mains, whereby the benefit of oxygenation is lost.

The author trusts the subject of the pollution of supplies from wells and other sources will be brought before the Association upon a future occasion, so as to make the subject more complete.

A NEW TEST FOR THE FINENESS OF CEMENT.

CEMENT is a material of so much importance to the architect and the engineer that the cost and trouble involved in systematic testing is amply repaid by the knowledge thereby obtained. It is generally admitted that the improvement of quality evidenced during recent years has been largely due to the pressure exerted upon manufacturers as a result of the information acquired in testing operations. Various properties must form the subject of examination if the constructive value of a cement is to be reliably determined. These properties are (1) colour, (2) completeness of burning, (3) activity, (4) soundness, (5) fineness, (6) strength. The new form of test now to be mentioned is connected only with the property of fineness, which is almost entirely a matter of economy. Much of the improvement in the quality of cement during the last decade has resulted from the discovery that the coarse particles have no setting power whatever, and, indeed, for practical purposes they may be regarded as so much sand. This circumstance escaped observation for a long time because tests of strength were nearly always made with neat cement, which, if of good quality, will permit the addition of a certain proportion of inert matter without noticeable loss of strength. Ultimately, when the practice was adopted in Germany of testing cement mixed with sand in the proportion used in practice, it was seen that finely-ground samples exhibited considerable advantage over those less carefully prepared. Hitherto, it has been usual to ascertain the degree of fineness by weighing the percentage of cement incapable of passing through

sieves with a specified number of meshes to the square inch. Formerly a cement was regarded as finely ground if the residue on a 50-sieve was within 10 per cent, but it is now frequently demanded that the residue shall not exceed 5 per cent of the original quantity. It would, of course, be possible to pursue the practice of grinding until the material became reduced to the condition of an impalpable powder. In such a case the cost of grinding would be prohibitive, and it may be said that the practical limit is reached when the cost of using a larger proportion of cement is less than that of additional grinding.

The essential thing is to know accurately what percentage of the material possesses actual cementitious value, and it is for this class of enquiry that a new form of testing apparatus—known as the Goreham Flourimeter—has recently been devised. This appliance is extremely simple in construction, consisting of four parts:—(1) A conical glass into which the sample of cement is placed; (2) a brass tube having a serrated end passing through the cement, and resting on the bottom of the glass; (3) a sheet metal tube to whose lower end the test glass is secured by suitable clamps and whose upper end has an air-tight cap through which passes the top of the brass tube, whilst from the upper portion of the tube a branch pipe of equal diameter projects downwards at an acute angle; and (4) a cylindrical settling chamber, receiving the branch pipe through its side. The settling chamber is covered by a closely fitting lid, and all the joints of the apparatus are made air-tight. In addition to the above-mentioned parts, an aerometer is generally employed for the provision of air at a definite pressure, the air being conveyed from the aerometer to the brass tube by means of an india-rubber pipe.

The method followed in the course of a test is also very simple. In the first place, a weighed sample of the material to be tested is placed in the glass vessel, which is then clamped to the end of the metal tube; a stopcock on the air tube is next opened, and as air issues from the serrations of the brass tube it carries away the impalpable portion of the cement, which passes up the sheet metal tube and through the branch pipe into the settling cylinder. When no more cement flour is given off, or after the lapse of a specified time, the glass is removed, and the residue is weighed. It is then quite easy to determine the proportion of active material taken over by the air. Mr. Goreham, the inventor, states that he has made a number of tests with different samples of commercial cement, and in these the proportion of flour was found to vary from 20 to 50 per cent, the residuum being therefore from 80 to 50 per cent. In a sieve test the proportion of comparatively fine material passing the meshes would, of course, be much greater, but it is worthy of note that when samples of the same cements were thus tested for the purpose of comparison, the variation was not more than 1 per cent. Although we are not able to verify these statements from personal experience, we have examined the working of the apparatus itself, and believe it is fully capable of doing all that is claimed for it by the inventor.

As we have previously remarked, the condition of fineness is almost entirely a matter of economy. This is especially the case in undertakings where cement has to be transported considerable distances, for no one can desire to pay freight on 80 per cent, or even on 50 per cent, of inert material. Sometimes it may be that the cost of extra grinding will exceed that of freight, but even then the Flourimeter test is equally important, for the architect or engineer responsible for the stability and strength of the works under his charge must be exactly acquainted with the value of the cement, if he is to determine the proper proportion of sand or other diluting material with any degree of confidence. The Flourimeter test for fineness is not intended to supersede recognised tests for other properties of cement, but so far as it can be expected to extend we believe it will be found in every way reliable.

WESLEYAN INFANT SCHOOL, TONBRIDGE.—The memorial stones have just been laid of a new Wesleyan infant school in Danvers-road, Barden-road, Tonbridge. The contract for the building is 1,075*l.* and the work is being carried out by Messrs. Martin & Co. The building, which was planned by Mr. John Fagg, consists of a room measuring 46 ft. by 21 ft., a classroom, entrance hall, and cloakroom. It provides accommodation for 157 scholars

### THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. Torrance, Chairman, presiding.

**Loans.**—On the recommendation of the Finance Committee, it was agreed to lend Battersea Borough Council 990*l.* for contributions to street improvements and 10,051*l.* towards electric lighting purposes; Hampstead Borough Council, 88,570*l.* to repay a loan for electric lighting and 27,807*l.* to repay a loan for wood-paving; Southwark Borough Council, 2,500*l.* towards the cost of acquiring an extension of Brockwell Park; Wandsworth Borough Council, 4,000*l.* for wood-paving works and 1,300*l.* for pipe sewer works; Woolwich Borough Council, 1,270*l.* for paving works; Stepney Borough Council, 18,703*l.* for an electric light installation; Hampstead Borough Council, 3,865*l.* for wood-paving works; Camberwell Guardians, 4,000*l.* for the erection of a relief station and 3,320*l.* for purchase of premises; Hampstead Guardians, 3,375*l.* for various purposes; and St. George's Guardians, 14,040*l.* for the erection of homes for children.

**Theatres, &c.**—The following applications were agreed to:—The conversion of a room situated on the roof of the Frascati Restaurant, Oxford-street, formerly used as a carpenter's shop, into lavatories and ladies' cloakroom (Mr. C. H. Worley).

**Windows in the stage roof of the Hackney Empire, Mare-street, Hackney (Mr. F. Matcham).**

An arrangement of the electric lighting circuits at the St. Pancras Baths, Prince of Wales-road, Kentish Town (Messrs. Dolby & Williamson).

Alteration proposed to be made to the St. Peter's Institute, Buckingham Palace-road, with a view to rendering the premises suitable for a music and dancing licence (Messrs. Chambers & Son).

**District Surveyor for North Battersea.**—The Building Act Committee recommended—

"That consent be given to Mr. H. J. Hansom, the District Surveyor under the London Building Act, 1894, for the district of North Battersea, appointing as his deputy Mr. R. D. Hansom, of No. 8, College-gardens, Dulwich, to perform all the duties of such district surveyor, as from July 11, 1901, during the pleasure of the Council; such consent being subject to the condition that Mr. H. J. Hansom shall not, without the previous consent of the Council to be signified in writing under the hand of the clerk of the Council, act as district surveyor or revoke the appointment of Mr. R. D. Hansom as such deputy, or in any way interfere with the performance by Mr. R. D. Hansom of his said duties."

Mr. Radford moved to refer the recommendation back. He thought that some other arrangement should be made.

Mr. J. Burns, M.P., seconded, and the Chairman of the Committee agreed to take the paragraph back.

**The Chief Assistant Architect.**—The Establishment Committee recommended, and it was agreed—

"That a retiring allowance . . . be granted to Mr. John Hebb, the Chief Assistant Architect, as from August 20, 1901."

**The Architect's Department.**—The same Committee recommended:—

(a) That Mr. J. Briggs be promoted to the position of Chief Assistant Architect. . . .

(b) That Mr. F. S. Capon be appointed Assistant Architect. . . .

(c) That Mr. R. Robertson be promoted to the position of Assistant Architect. . . .

(d) That Mr. R. M. Taylor be promoted out of the first class to the position of unclassified officer. . . .

(e) That the above resolutions (a) to (d) inclusive do take effect as from August 20, 1901.

(f) That authority be given for the appointment in the Architect's Department of an additional assistant in the first class at the commencing salary of 200*l.* a year."

The recommendations were agreed to.

**Paving Works, Millbank Estate.**—On the recommendation of the Housing of the Working Classes Committee, it was agreed—

"That the plans, specification on, and bills of quantities for the paving with York stone of the footways and with asphalt of the roadways of Herriek and Erasmus streets and portions of Duncional, Bulling, East, and Aterbury streets, on the Millbank Estate, be approved; that the work be carried out by the Council without the intervention of a

contractor; and that the plans, specification, quantities, and estimate of 12,700*l.* be referred to the manager of works for that purpose."

**Street Improvement.**—The Improvements Committee recommended, and it was agreed, that a final payment of 1,686*l.* be made to the Carpenter's-road Improvement Committee, in respect of the contribution promised by the Council on March 14, 1899, towards the cost of the widening of White Post-lane and the reconstruction of White Post-lane Bridge.

**Subways.**—Replying to questions, Mr. Benn said that the provision of subways under the streets was under the consideration of the committee, but at present there was no power to compel the Post Office, telephone companies, and others to place their mains in the subways. They would consider the question of applying to Parliament for powers to compel the companies to use the subways. There were subways in Queen Victoria-street, but the Post Office authorities chose to tear up that street instead of using the subways.

**Richmond-hill.**—Replying to Mr. Burns, M.P., Lord Monkswell said he had seen the owner of the property at Richmond-hill, who met him in a very friendly spirit, and he would have several proposals to make to a conference to be held on Friday.

The Council adjourned about half-past seven o'clock.

### APPLICATIONS UNDER THE 1894 BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

#### Lines of Frontage and Projections.

**Clapham.**—Retention of a wood, tile, and brick verandah in front of a detached dwelling-house on the east side of Thurlough-road, Wandsworth Common, southward of Ramsden-road (Mr. H. Bignold for Mr. S. J. Tavener).—Consent.

**Clapham.**—Retention of an iron and glass covered way on the forecourt of No. 2, Ravenslea-road, Wandsworth Common (Mr. A. Boon).—Consent.

**Greenwich.**—A one-story addition to the Electric Cable Works, Victoria-road, Charlton (Messrs. Johnson & Phillips).—Consent.

**Hackney, North.**—Houses on the east side of Mount Pleasant-lane, Upper Clapton, between Baker's-hill and No. 121, Mount Pleasant-lane (Mr. G. R. Woodruff).—Consent.

**Hampstead.**—Porches, with bay windows over, in front of Nos. 7, 5, and 7, Clorance-gardens, Flats-lane, Hampstead (Mr. R. W. Hart).—Consent.

**Lewisham.**—Four houses, with one-story shops in front, upon part of the site of The Priory, High-street, Lewisham (Messrs. Norfolk & Prior for Mr. C. C. Storey).—Consent.

**Lewisham.**—An iron and glass hood over the entrance to Nos. 7, 5, and 7, Clorance-gardens, Flats-lane, Hampstead (Mr. R. W. Hart).—Consent.

**Lewisham.**—A wood and tile pent at the entrance to a dwelling-house on the west side of Blagdon-street, Lewisham, northward of Medusa-road (Mr. E. West).—Consent.

**Islington, East.**—That the Council do not accede to the request of Mr. J. R. Quilter, for Mr. T. Lee, for permission to retain the two show-cases on the pilasters of Nos. 412 and 414, Holloway-road, Islington.—Agreed.

**Hammersmith.**—A house on the west side of Paddenswick-road, Hammersmith, adjoining Ravenscourt-park (Mr. L. Lickis for Mr. J. W. Lickis).—Refused.

**Fulham.**—A shop front, with projecting roof and fascia, in front of No. 141, Greyhound-road, Fulham (Mr. E. Avern for Messrs. S. Langston & Sons).—Refused.

**Lewisham.**—Three one-story shops on the north side of Stanstead-road, Forest Hill, westward of No. 129 (Mr. R. E. Crossland for Mr. E. Paul).—Refused.

**Peckham.**—A one-story shop on part of the forecourt of No. 24, Gibbon-road, Nunhead (Mr. J. Sykes for the trustees of the late Mr. W. Beasley).—Refused.

**Strand.**—The retention of a projecting signboard in front of the Windsor public-house, No. 427, Strand (Messrs. J. & H. Coles, Limited, for Messrs. Worthington & Co.).—Refused.

**Strand.**—A wrought-iron and copper trade sign to project from the *Building News* newspaper office, on the east side of Clare-market, Strand (Mr. M. B. Adams for the Strand Newspaper Company).—Refused.

**Strand.**—That the Council do not accede to the request of Mr. J. E. Chivers, for permission to retain an iron and glass projecting sign at the first-

floor level in front of the Savoy Palace public-house, Savoy-street, Strand.—Agreed.

**Strand.**—That the Council do not accede to the request of Messrs. Wyllson & Long, for Messrs. Antiss & Sons, for permission to retain a projecting illuminated sign at the third-floor level in front of No. 45, Strand.—Agreed.

**Wandsworth.**—A one-story shop and gateway entrance, northward of No. 3, Sunnyside-road, Wandsworth (Mr. C. M. Quilter for Messrs. Dowsett & Jenkins).—Refused.

**Westminster.**—Iron and glass inclosures to a portion of a covered way in front of No. 24, Albert-gate, Hyde Park (Messrs. Coils & Sons for Mr. C. Jacoby).—Refused.

**Width of Way.**

**Finsbury, Central.**—A building on the east side of St. John's-lane, Clerkenwell (Mr. C. R. Baker King for the Grand Priory of the Order of St. John of Jerusalem in England).—Consent.

**Kennington.**—A staircase at Cumberland Works, Wigton-place, Milverton-street, Kennington (Mr. A. Parnacott for Messrs. T. & W. Judge).—Consent.

**Poplar.**—The retention of a one-story workshop on the north side of Wharf-road, Millwall, Poplar (Mr. A. G. Langdon for Messrs. J. Fraser & Son).—Consent.

**Woolwich.**—A greenhouse at the rear of No. 225, Burrage-road, Woolwich, and the retention of the boundary fence in front of such greenhouse, at less than the prescribed distance from the centre of Church-passage (Messrs. Church, Quick, and Whitcop for Mr. H. W. Kier).—Consent.

**Hammersmith.**—A shed in the garden at the rear of No. 1, Applegarth-road, Brook-green, Hammersmith, with the boundary fence in front of such shed at less than the prescribed distance from the centre of Augustin-road (Mr. E. J. Wilson for Mr. E. F. Bowen).—Consent.

**Hackney, South.**—The rebuilding of Nos. 56, 58, and 60, High-street, and No. 1, Bridge-street, Homerton, at less than the prescribed distance from the respective centres of those streets (Mr. J. Hamilton for Mr. W. E. Stevens).—Refused.

**Whitechapel.**—A warehouse building and the retention of a boundary fence at less than the prescribed distance from the centre of Vine-court, Whitechapel-road, Whitechapel (Mr. J. R. Smith for Mr. A. W. Brown).—Refused.

**Width of Way, Lines of Frontage, and Projections.**

**Bethnal Green, North-East.**—That the application of Messrs. Francis & Caley, for an extension of the periods within which the erection of buildings on the site of the Arabian Arms public-house, Nos. 222 to 232 (even numbers only), Cambridge-road, and Nos. 2, 4, 6, and 8, Bishop's-road, Bethnal Green, was required to be commenced and completed, be granted.—Agreed.

**Limehouse.**—A building on the site of Nos. 680, 680A, and 680B, Commercial-road East, and Nos. 3 and 5, Gill-street, Limehouse, at less than the prescribed distance from the centre of Gill-street, and with two projecting turrets and an oriel window next Commercial-road East (Messrs. Niven & Wigglesworth for Mr. A. Scrutton, Mr. T. Mason, and the Rev. E. W. Matthews).—Consent.

**Southwark, West.**—A steel and concrete gangway across New Park-street, Southwark, to form an approach from Southwark Bridge-road to buildings proposed to be erected on the west side of New Park-street (Messrs. Hubbard & Moore for Mr. H. Ward).—Consent.

**Clapham.**—A fire brigade station on the east side of Old Town, Clapham, to abut also upon Graf-ton-square (Mr. O. Fleming for the Fire Brigade Committee of the Council).—Consent.

**St. George, Hanover-square.**—An iron and glass shelter at the entrance to the Bath Club, No. 16, Berkeley-street, St. George, Hanover-square (the Right Hon. Herbert J. Gladstone for the Bath Club Company).—Refused.

**Bermansley.**—A one-story shop on part of the forecourt of No. 127, Long-lane, Bermansley, at the corner of Rippling-street (Messrs. Jarnes-Williams, Ford, & Giffin for Mr. P. Tyrer).—Refused.

**Deptford.**—A one-story shed on the west side of Charles-street, Deptford (Mr. S. E. Musgrove).—Refused.

**Space at Rear.**

**Fulham.**—An addition on a portion of the open space at the rear of No. 331, Lillie-road (Mr. G. Trotman for Mr. D. Thompson).—Consent.

**Camberwell, North.**—A three-story dwelling-house, adapted to be inhabited by persons of the working-class, on the east side of Crown-street, Wyndham-road, Camberwell (Mr. E. J. Stevens for Mr. R. Knight).—Refused.

**Hammersmith.**—A block of flats on the west side of Queen-street, Hammersmith, at the corner of Sussex-place (Mr. H. G. Brace for Mr. F. Messiter).—Refused.

**Wandsworth.**—A modification of the provisions of Section 41 of the Act with regard to open spaces about buildings, so far as relates to the proposed erection of four blocks of two-story residential flats on the south side of Coverton-road, Tooting, without an open space at the rear, and of a fifth block at the corner of Condy-road, with an irregular open space at the rear (Mr. W. C. Poole for Mr. A. Heaver).—Refused.

**Formation of Streets.**

**Lewisham.**—That an order be issued to Messrs. H. and G. Taylor and Mrs. M. A. Clark sanctioning the formation or laying out of new streets for carriage traffic out of Laleham-road, Catford, on the site of the Catford Sports Ground.—Agreed.

**Woolwich.**—That an order be issued to Messrs. Farebrother, Ellis & Co., sanctioning the formation or laying out of two new streets for carriage traffic on the Bowwater estate, Trinity-street, Woolwich-road, Woolwich, for the trustees of the Bowwater estate. That the names Yateley-street (in continuation) and Westfield-street be approved for the new streets.—Agreed.

**Lewisham.**—That an order be issued to Mr. W. H. Dawson, refusing to sanction the formation or laying out of new streets for carriage traffic on part of the Forster estate, on the east side of Bromley-road, Catford, at the corner of Sangley-lane (for Mr. H. W. Forster).—Agreed.

**Lewisham.**—That an order be issued to Mr. G. F. Logsdail, refusing to sanction the formation or laying out of a new street for carriage traffic out of the west side of Torrindon-road, Hither Green, on the St. Germans estate (for Mr. A. Cameron Corbett, M.P.).—Agreed.

**Buildings for the Supply of Electricity.**

**Haxton.**—A steel framed tower, to be used as a coal elevator (Messrs. Kincaid, Waller & Manville, for the Council of the Metropolitan Borough of Shore-ditch).—Consent.

The recommendations marked † are contrary to the views of the Local Authorities.

**Books.**

*Hints to Young Valuers: a Practical Treatise on the Valuation of Property.* By ANTHONY RICHARD CRAIGS, assisted by J. R. V. MARCHANT, Barrister. Second Edition. London: The Land Agents' Record, Limited. 1901.

WE are glad to find that the title of this voluminous volume of 1,074 pages has not been altered, because, important and almost indispensable as this work is, it is yet primarily a work rather for young practitioners than for those who have gained much experience in their profession. On the other hand, the title scarcely does justice to the immense quantity of ground covered by this volume. It is far more than a guide-book for valuations. It is rather in the nature of a handy encyclopædia, dealing with a variety of subjects which fall within the professional work of a land agent, a surveyor, or an architect. The new chapter, for example, on building contracts, which contains an excellent but somewhat too short sketch of the subject, has nothing to do with valuations, and of that on the power of sanitary authorities as to sewers, streets, and buildings the same may be said. We consider, however, that the authors do well to add these and other chapters, because they now place in the hand of every professional man a work of more general usefulness than one on valuation alone could be.

An important new chapter is that devoted to the subject of artificers' work on new erections, adjustment of builders' accounts, restorations, alterations, and repair of buildings. "The valuation of buildings and builders' works is work which frequently claims the attention of the valuer, and therefore it has been thought advisable to treat the subject separately. Such work is often of much importance, and it is frequently of a very complex character. It needs a practical knowledge of almost every class of material and workmanship required in connexion with the erection or upholding of buildings under a variety of conditions." We entirely agree with all this, but we are irresistibly reminded of what Bacon said of himself, that he took all knowledge for his province.

The valuer would seem to be a person who possesses a vast and accurate knowledge of the business of a number of professions. There are few architects who would care to stake their reputation on an accurate valuation of the details of buildings, such work being rather that of a quantity surveyor, for in the chapter to which reference is now being made the work there indicated is that of a quantity surveyor. This fact does not take away from the value of this portion of the book, but it suggests that the young valuer, if he has to go into questions of quantities, would do well to engage the services of one whose profession it is to take out quantities. If, on the other hand, he is to make an esti-

mate of the value of a building, larger views must necessarily be taken than those which would commend themselves to a person taking out quantities, although some general knowledge as to the original cost of a building may doubtless be desirable. Included in this chapter are the regulations issued by the Manchester Society of Architects for the guidance of practitioners in the preparation of bills of quantities, with notes showing any differences between the Manchester and the London practice. We are of opinion that the code, with its notes, would have been more appropriately placed in the appendix.

In the chapter on fixtures the Luton Hoo tapestry case is placed in a preliminary errata, but apart from that case we are inclined to think that the authors take too pessimistic a view of legal decisions from the point of view of the executor. "The tendency of the Courts has been to prefer the heir to the executor." This statement seems to be rather too broadly put. In another edition it would be desirable to lay down the principles which certainly now govern ornamental fixtures, namely, that such things as are not, so to say, incorporated with the building, belong not to the heir, but to the executor. Certainly the Luton Hoo case must be considered, as pointed out previously in our columns, to have liberalised the law on this point.

In the chapter on the conduct of an arbitration, we wish the authors had said something on the expensive and unbusinesslike practice of arbitrators practically acting as advocates, the umpire being the real judge. "A convenient course," it is said, "to save expense is for the umpire to sit with the arbitrators and hear the evidence with them, and give his decision if the arbitrators disagree." In other words, the umpire is to be called in not when, but before, the arbitrators disagree. In our opinion, the appointment of two arbitrators is altogether wrong. It is much more economical and much more satisfactory to refer a dispute to one competent person. When two are appointed, a decision is often a matter of compromise, which might have been attained without the cost of an arbitration. Where there is one arbitrator only, the sense of responsibility is also greater, and the business is frequently carried through with much greater expedition.

We have sufficiently indicated in what manner this work has been enlarged, and what its general character now is. So comprehensive a volume necessarily has its shortcomings, but as it is, it appears to be one of the most useful books that can be found on the practitioner's shelves. There is a great convenience in having in a book, which, though not very large, contains a general mass of information on nearly every point which concerns the architect and surveyor, whether, for the time being, he is or is not a valuer. For, after all, the valuation of property for any purpose is but a limited part of the surveyor's business, and must always be based, to a very great degree, on an almost intuitive power of forming an opinion on a number of often conflicting elements.

*Designing Ironwork.* Second series. Part II. By HENRY ADAMS, M.Inst. C.E., M.I.Mech.E., F.S.I. Published by the Author. London. 1901.

THIS pamphlet contains notes, formulae and calculations, and working drawings for a built-up detached steel stanchion, 30 ft. high, to carry a dead load of sixty tons. At the outset, the author points out that a difficulty arises in designing a stanchion or other compression member, that does not occur in connexion with other parts of a structure. As he says, "We cannot by a single calculation proportion the sectional area to the load by taking a factor of safety upon the ultimate strength," for if the length and load be already settled, as is usually the case, the diameter and sectional area have to be determined together with the form of the proportional dimensions of the member. Moreover, the safe stress intensity cannot be decided unless the ratio of length to diameter be already settled, as is governed by the sectional area necessary to provide for the safe stress intensity. Before proceeding to show how the difficulties engendered by this series of complications may best be overcome, Professor Adams gives some brief notes upon various forms of section, rivets, and strength of material. These remarks are concise and useful as far as

they go, but readers of the student class should certainly supplement the information they convey by the aid of a suitable treatise. Coming next to a consideration of the difficulties mentioned above, the author suggests a solution by the process of "trial and error," expediting the operation by using an approximate formula for safe load on an assumed diameter. In an example of this method an approximate sectional area is settled by the assistance of the approximation mentioned and Gordon's formula is applied to test the sufficiency of the proposed section, with the result that it is shown to be inadequate. An increase of the section appears to be unsatisfactory, but further consideration is deferred until the reader has followed the calculation of strength by some fourteen different rules. All these give extremely diversified results, and Fidler's formula is next explained, this equation being recommended, as the most reliable one available at the present day, for the purpose of checking the approximate sectional area and the calculation of strength by Gordon's rule. If the application of Fidler's formula should reveal deficiency of strength the area of the stanchion is to be increased until correct proportions are attained. The mode of procedure recommended by the author can readily be followed, even by those having little knowledge of mathematics, but it is necessarily rather tedious and lacking in scientific precision. We do not wish to imply that Professor Adams is responsible for the latter disadvantages. He has discussed the matter carefully, and has selected two of the most reliable and most easily applied rules for use by his readers. It is true that there are some newer formulas which permit computations to be made in more exact form, but they have not at present come into very general use, and for a work of the kind under review the author is perhaps wise in keeping to the beaten track. When speaking of "reliable strength," Professor Adams appropriately quotes the words of Professor Claxton Fidler that "the strength of columns cannot be defined by any hard-and-fast rule . . ." and "must be represented by an area, within which the results of individual experiments may be expected to place themselves at haphazard." In such an area the results suggested by various formulas would be represented by different curves, and the most reliable formula must necessarily be that which passes near the greatest number of experimental results.

The remainder of the volume is devoted chiefly to a series of notes upon the safe dead load on foundations, the distribution of load on foundations, concrete filling, fire-resisting treatment, concrete in foundations, and American high buildings. We are pleased to observe, however, that reference is made to the effect produced by a non-axial load, by side thrust, and by foundations that are not central. These points are of much importance, but they too seldom receive attention from writers on the subject of column design. Part II. of the series is eminently practical, the whole of the information it contains being carefully chosen and clearly expressed.

*The Cathedral Church of Ely.* By REV. W. D. SWEETING, M.A. George Bell & Sons.

The last issue of Messrs. Bell's small and useful series of cathedral churches is that of Ely, written by Rev. W. D. Sweeting, an ecclesiologist of some deserved repute. It is a good compilation, much use having been made of Dean Stubbs' "Historical Memorials of Ely" and the same writer's handbook. A full critical history of the fabric yet remains to be written, but such a work would require much original investigation, and we have no right to expect it in a book of some 130 pages, a large proportion of which is taken up by a series of upwards of forty good photographic reproductions. The cathedral church of Ely, the longest Gothic church in Christendom, contains fine examples of each successive style; as the exact date of nearly every portion of the fabric is known, this noble building is of the first importance to the student and lover of architecture. A handbook such as this, with its wealth of illustration, forms indeed a useful primer for the beginner. We could wish that Mr. Sweeting had been fuller in his descriptions in some parts, and spared us rather tedious and commonplace calendar of the lives of all the Bishops of the See, which is too scrappy to be of any real value. For instance, the description of the large and unique fourteenth-

century Lady Chapel is disappointingly meagre; an intelligent visitor with this book as his guide will be surprised to find that it gives no help with regard to the wonderful mutilated series of sculptures of the life of Our Lady all round the chapel. If Mr. Sweeting did not feel competent for the task, leave should have been sought to quote in abstract from Dr. Montagu James's work on the iconography of the chapel. Dr. James's admirable lecture on these sculptures was the great feature of the Cambridge meetings of the Royal Archaeological Institute in 1892.

Mr. Sweeting deals tenderly with the prolonged and costly process of restoration that this fabric has sustained. Much of it was good and eminently necessary, but the original coloured decorative work of the vaulting of the octagon suffered much in 1879. There was one very queer incident of the restoration begun in 1862 which it would have been well to have named. The choir half of the chigies between the choir and the choir aisles were cleaned up, polished, and renovated, whilst the half on the aisle side were left untouched in their decayed condition. The old couplet, slightly altered, was then applied to this quaintly mean method of effigy restoration:—

"They brightened up the monuments within the ancient alabaster,  
But, thinking to deceive the Lord, they left the aisle side shabby!"

*The Cathedral Church of Bristol: a Description of its Fabric and a Brief History of the Episcopal See.* By H. J. L. MASSÉ, M.A. London: George Bell & Sons, 1901.

This is a further addition to Messrs. Bell's series, and, like the other volumes already noticed, is excellent in matter and illustrations. The majority of the latter are from photographs by Messrs. Bolas & Co. and the author. Particularly interesting are those of the curious tomb in the Berkeley Chapel on page 35, the skeleton vaulting in the vestibule to it, and the heraldic work now in the cloister, formerly on the destroyed choir screen. Two plans are given, one facing page 37 from "Britton's Cathedrals," showing the extent of the church in 1828, before the rebuilding of the nave; the other at the end of the book shows the building as completed. The deviation of the choir from the line of the nave, which is a marked feature of the interior, does not appear to have been noted, and the value of the plan would have been improved by the completion of the cloister, showing the position of the beautiful doorway excellently illustrated from a photograph by the author. The view on p. 46, taken from "Storer's Cathedrals," is not the north transept but the south. All the interesting architectural features are well and clearly described, and, like most others of the series, the work is a capital handbook to the cathedral.

*The Abbey Churches of Bath and Malmesbury and the Church of St. Laurence, Bradford-on-Avon.* By Rev. T. PERKINS, M.A. London: George Bell & Sons, 1901.

UNIFORM in size and style with the Cathedral Series, this volume illustrates three buildings, all of strongly marked character and difference in date, and lying in the same district not many miles apart. The smallest of the three and the earliest is the Saxon church at Bradford, capably illustrated by a series of views from photographs by the author. The ground plan has no scale, however, neither have the larger plans at the end of the book of Bath and Malmesbury. Malmesbury, a picturesque mixture of Norman and Decorated, has recently undergone some repair, and some of the illustrations have been, apparently, taken during the progress of the works. Among many excellent photographs are two good views of the south side of the church (facing pages 65 and 75), a view of what remains of the "crossing" and two interior views of the north side of the nave.

Bath, though placed first in the book, is now a building of Late Perpendicular character. A good many fragments, however, remain of the Norman columns under the floor of the nave and choir; these, though noted in the letterpress, have been ignored in the plan. As in the other buildings, the illustrations are from photographs by the author. One of Prior Bird's Chantry in the choir and the Montague and Waller tombs striking on pp. 22-23 are, perhaps, the most striking of an interesting series.

*The French Stonehenge; an Account of the Principal Megalithic Remains of the Morbihan Archipelago.* By T. CATO WORSFOLD. London: Birmose & Sons.

This is an interesting popular account of the stones at Carnac, with comparisons between them and the relics of the same class at Avebury and Stonehenge, and a brief summary as to the various popular and archaeological beliefs in regard to these Breton monuments. It does not go further than this, and makes no attempt to throw new light on the subject of the origin and purpose of these collections of stones; but it is an interesting illustrated account of them.

The author draws attention to two important distinctions between Carnac and Stonehenge; one is, the partial shaping of the blocks and the formation of the mortise and tenon joints between the uprights and the lintels at Stonehenge; the other, the fact that at Stonehenge; no human bones have been found at any time—so, at least, he states.

*Early Defensive Earthworks.* By J. CHALKLEY GOLD. Bedford Press.

This pamphlet of thirty pages gives the substance of two papers read before the British Archaeological Association in 1899 and 1900, and is worth reproducing. Mr. Gould has no particular theory to advocate as to dates and origin of the early defensive earthworks of England; but in his desire to increase interest in them and to aid in their preservation, he writes pleasant and intelligent accounts of some of the more remarkable examples, such as the Carl's Wark and Main Tor, Derbyshire; Maiden Castle and Hod Hill, Dorset; and Ambresbury Banks, near Epping. Plans and illustrations add to the value of this reprint.

*A Brief Sketch of the History of Ipswich School.* By NINA F. LAYARD. Ipswich: W. E. Harrison, 1901. 1s.

THIS is mainly a history of the school foundation, but it has a certain archaeological interest in connexion with the ancient buildings in which the school was successfully housed. Down to 1763 the school was held in the chapel of the ancient Black Friars Monastery, the buildings of which were made over to the use of the school about 1355-66. From 1763 to 1842 the school was held in a fine room with a hammer beam roof over the Rectory. Part of the lower portion of the building is still standing, and forms the boundary wall of the girls' endowed school in Foundation-street. In 1842 the school was removed to a new building in Lower Brook-street, and in 1852 to the present building in Henley-road. Views of the various old buildings are given, as well as of the recent ones, as also a plan of the buildings on the site of Black Friars.

*Weights and Measurements of Sheet Lead.* By JAMES ALEXANDER. London: E. & F. N. Spon, 1901.

THESE are simply tables giving the area of lead for widths from 6 in. to 7 ft. 10 in. and for many various lengths. They are compiled for the use of lead rollers, plumbers, builders, and architects, &c., to save time in arriving at the estimated weight of a given length and breadth of sheet lead, at so many pounds to the square foot. Thus, we can see at a glance that a piece of 6½ lbs. lead 26½ ft. long weighs 10 wt. 3 qr. 2 lbs. It is a conveniently small book, and is calculated to save a good deal of trouble.

THE WORKMEN'S COMPENSATION ACTS, 1897 AND 1900. By W. Adlington Willis, Barrister-at-Law. (Butterworth & Co. and Shaw & Sons.)

A BRIEF SKETCH OF THE HISTORY OF IPSWICH SCHOOL. By Nina Frances Layard. (W. E. Harrison, Ipswich.)

THE FRENCH STONEHENGE. By T. Cato Worsfold, F.R.Hist.S., &c. (Birmose & Sons.)

A DICTIONARY OF ARCHITECTURE AND BUILDING: edited by Russell Sturgis. Vol. II.: F-N. (Macmillan & Co.)

WESLEYAN CHURCH, HELMSLEY, YORKSHIRE.—The Wesleyan Methodists of the Helmsley Circuit intend to rebuild their place of worship. Messrs. Hornsey & Monkman, York, are the architects.

LONDON BUILDING ACT, 1894.

TRIBUNAL OF APPEAL CASE.

THE Tribunal of Appeal under the London Building Act met at the Surveyors' Institution on Tuesday to hear an appeal by Mr. R. Langton Cole, on behalf of the Metropolitan Association for Improving the Dwellings of the Industrious Classes, against the disapproval of and the refusal of the London County Council to sanction the plans of a block of intended dwelling-houses to be inhabited by persons of the working class, and proposed to be erected, not abutting upon a street, on a site at the rear of houses on the south side of an unauthorised street, known as Gibson Buildings, Northwood-road, Stoke Newington. The members of the Tribunal were Messrs. J. W. Penfold (Chairman), A. J. Hudson, and E. A. Grüning.

Mr. Cole conducted the appellants' case in person, and Mr. Andrews and Mr. Godfrey, of the London County Council solicitors' department, were for the Council.

Before Mr. Cole opened the case for the appellants Mr. Andrews remarked that they were so very near each other in agreeing that it did not seem desirable to prolong the proceedings by producing unnecessary evidence. The Association sent plans to the Council showing their proposals, and the Council were bound, under Section 42 of the Act, to refuse or approve them within a certain time. They refused to sanction the plans because they wanted certain conditions, and at his (Mr. Andrews') suggestion they wrote to Mr. Cole proposing that he should see them and discuss the points with the Council. He could assure the Tribunal that the Council was very anxious not to retard or stand in the way of the erection of working class dwellings by a responsible Association such as the appellants on well-considered lines, and it seemed probable that the Council would be able to meet Mr. Cole and to come to some arrangement which would obviate the difficulty which the Council felt would ensue by their not passing the plans. Practically, it had come to this: Mr. Cole was prepared to give the amended plans as suggested to him, and in view of that fact it would be for the Tribunal to make an order registering them. But even if the scheme, if it remained as it now stood, could not be considered in any way undesirable by the Council, it was more on the *quintessence* principle—looking forward to what might happen in regard to the adjoining ground—that they acted.

Mr. Cole: I take it that the County Council would agree to the plans as they now stand were it not for the possible alteration in the adjoining buildings? The plans of the building as at present produced are in accordance with the section.

Mr. Andrews: I do not say that we are not entitled to refuse even on the plans.

Mr. Cole replied that if, without going so far as that, the Council would consent to the plans, they might subsequently get over the difficulty with the adjoining owners. He contended that on the plans he was entitled to a decision in his favour.

Mr. Andrews said that clearly the County Council were entitled to act on their discretion; on the other hand, they were prepared practically to concede, so far as they were able, their objections in regard to the plans.

The Chairman said that as he understood it, the Council would not object to the plans if some arrangements were come to with the adjoining owner.

Mr. Andrews assented.

Mr. Cole pointed out that he had an interview with Mr. Andrews as suggested, and the net result was that the Council would not object to the plans, provided that the District Surveyor passed them. He applied to the District Surveyor on May 6, and he at once said that he would not pass them, and must throw the responsibility upon the Council. On May 22 he forwarded the plans to the Council under Sections 41 and 42, and the result was the refusal to approve unless arrangements were made with the owner of the adjoining land, by which he would agree not to raise the height of his buildings inside his line. It was obviously impossible for them to comply with that. The owner, unfortunately, was only the leaseholder, and any arrangement as to the future height would necessarily take considerable time, and involve more expense to the Association than they could afford to spare. Under the circumstances the Association decided that their proper course was to appeal. If the Council required as a *sine qua non* that this condition should be exacted from the adjoining owner, it was apparent that the appellants could not insist on the terms suggested. They would rather suggest some modifications of the plans by which possible difficulties might be surmounted. He ventured to suggest that it was unreasonable for the Council to refuse the plans of buildings which entirely complied with the Act on the ground that in the future something might happen which was beyond the Association's control.

Mr. Andrews said there were many points in the plans which would entitle them to refuse sanction. For instance, there was the question of access. If they fought the appeal out there were other points, but they were small. If the adjoining owner would say that he was not going to raise his buildings at present on what they called the dairy premises, the Council would be satisfied. It was possible if the

adjoining building was heightened, the living rooms, particularly the kitchens, of the proposed dwellings would become, so far as they abutted on each floor, unhealthy. If the suggested terms could not be come to, then possibly some modifications could be made in the plans.

The Chairman said the Tribunal had no power to make such conditions.

Mr. Cole said he did not wish to fight the case out in a spirit of hostility, but his clients felt that the Tribunal should decide, as they believed they would, that the plans complied with the Act.

After further discussion the Tribunal allowed the appeal and approved the plans on certain conditions—namely: (1) That the cottages on the north-west side of the proposed new buildings shall not be added to or raised; (2) that no building be erected on the area between the adjoining dairy buildings and the proposed building; (3) that a sufficient access of not less than 3 ft. in width be provided between certain points, and that the access at the eastern end of the site be by a slope and not by steps.

Illustrations.

ST. MARY WOOLNOTH.

THE plan and the two sections of Hawksmoor's remarkable church, which has with difficulty been saved from destruction at the hands of a railway company, are reproduced from measured drawings made by Mr. Alfred C. Bossom. The perspective view of the west front was specially drawn for the *Builder* by Mr. W. Curtis Green.

A church of St. Mary Woolnoth is cited as early as the year 1274 (see Dr. Sharpe's Calendar of Wills, proved and enrolled in the Court of Husting, Part I, 1886) under an entry whereby Geoffrey Godard devises to the church half a mark annual rent for arrears, and to his eldest daughter, Johanna, his capital house in the parish. Some maintain that Woolnoth is a corruption of "Wulnoth"; others that it is a corruption of "woollen hithe"; though the wool hithe, or wharf, we may observe, was situated in Lower Thames-street, near the Tower. It also asserted that the name of the former neighbouring and daughter church of St. Mary Woolchurch Haw (or Ulunorh) was derived from the haw, or garden, appertaining to "Whotmaricherche" cited in a deed of 1191—*test*: Mr. J. H. Round in the *Athenæum* of March 31, 1888. Note, or *scath* signified "business" or "traffic"; the connexion of St. Mary Woolchurch Haw (which stood where are now the Saloon and the Venetian and Long Parlours of the Mansion House) and of St. Mary Woolnoth with the wool trade obtains general acceptance. Stow says that the former was "so called of a beam placed in the churchyard which was thereof called Woolchurch Haw of the tonnage or weighing of wool there used."

However that may be, a church was standing on the present site (supposed, though erroneously, to have been that of a Christian church, previously dedicated as a temple of Concord), in the earlier years of the thirteenth century for a parish taken, with others, out of that of St. Mary Aldermary. That church was rebuilt about two hundred years afterwards, a chapel and a steeple being added by Hugh Brice, or Bruce, who was elected Lord Mayor in 1485, and died in 1466. The church was again rebuilt in 1620.

After the great fire Wren repaired the north side of the church in 1677, but a "case" presented to Parliament in the reign of Queen Anne sets forth that "the east end, adjoining her Majesty's post-office, with the south side, west end, and tower thereof, were not rebuilt," and that the north side had become ruinous and dangerous, inasmuch so that the parishioners feared to attend Divine service. An Act of Queen Anne appropriated a certain sum to be raised by a tax upon coal for the new church, which, according to an inscription upon the front of the former organ-gallery was completed in 1727, from the design of Hawksmoor. Twenty of Hawksmoor's working drawings are preserved in the British Museum. The rectory house was built after Sir Robert Smirke's designs. On May 28, 1802, we published a lithograph from a monochrome water-colour drawing by Miss A. Fooks, showing (in part) the interior as it was remodelled in 1875-6, by Mr. Butterfield, who removed the galleries but happily retained their fine carved fronts by fixing them as an architectural feature around the walls, where they plainly tell the history of the change. In 1868 the organ, against the north wall (by Smith, 1681), was rebuilt by

Messrs. Gray and Davison; in 1875 it was moved to the east end.

During some months in 1886 the church remained closed by reason of the insanitary condition of the vaults underneath the floor. Under Mr. F. C. Penrose's directions the under surface of the vault arching was covered with iron joists, and concrete was overlaid with two 3-in. thicknesses of asphalt. In November, 1892, a faculty was granted by the Consistory Court for the removal, at a cost of 2,000*l.*, of all the human remains from beneath the church, the untoward condition of which, in that respect, it had been foolishly contemplated to remedy by pulling the entire building down.

The church was again threatened with demolition by the promoters of the extension line to Islington of the City and South London Railway Company. In the result the church was closed during a period of three years, 1897-1900, whilst it was in temporary possession of the railway company for the construction of a station in the place of the crypt, of which the walls were found to be built for the most part, of chalk. In that interval the interior of the church was renovated and re-decorated under the superintendence of Mr. A. R. Stenning, the decorations being carried out by Messrs. Heaton, Butler, & Bayne, with an electric light installation by Mr. Sclater. The church was re-opened in May, 1900. The four Corinthian columns and the north, south, and west walls now rest entirely upon steel girders six or more feet deep which extend from end to end of the structure; the whole floor was relaid with wooden blocks; the vestry was rebuilt and remodelled, and its floor raised to the level of that of the church, by the railway company, and so far, as we gather, no trace of settlement has been discovered. We may add that this is the first City church that was opened for daily prayer; that the chancel chairs are made from a pile of old London Bridge; and that the remains of John Newton, the rector and Cowper's friend, were removed from the crypt to Olney in January, 1893.

On the north wall is a mural monument to the memory of Henry Fourdrinier (1730-1799), stating that "in his character were combined the kind husband, good father, and sincere friend." This Fourdrinier was the son of Paul Fourdrinier, the well-known engraver of architectural subjects, whose name is found in the corner of a good many of the plates in Kent's book of Inigo Jones's designs, and in other publications of the period; and he was the father of that Henry Fourdrinier who expended his large fortune in perfecting the paper-making machine, and the great-grandfather of the present publisher of the *Builder*.

The following are some notes on the construction, made by Mr. Bossom while measuring the work:—

"The accompanying drawings show a few peculiarities in the construction of the church; there are also a few noteworthy points that the drawings do not show—for instance, the main entablature is partly composed of a wood bressumer, which sags slightly in the middle. The cornice of this entablature is a casing supported partly by a 9-in. by 3½-in. iron joist, to which it is connected with iron straps, and partly by the bressumer. The upper entablature is composed of plaster, and the walls also have had a thin coat of it on them, but this is not thick enough to obliterate the stone joints. The walls of the clearstory do not follow centrally over the capitals of the columns below, but are slightly on the inner side.

The small turrets on the tower are partly carried on the external walls and partly on a stone lintel (halved as though it were of wood) which extends across the inside of the tower at the level of the capitals outside.

The roof is constructed of wood as shown on the sections. The horizontal portion of the construction is a very complicated arrangement, the members varying between 10 in. by 11 in. to 3½ in. by 2 in. Lead forms the outer covering.

All the lower windows facing King William-street are double and have a space of 11½ in. between the two leaves.

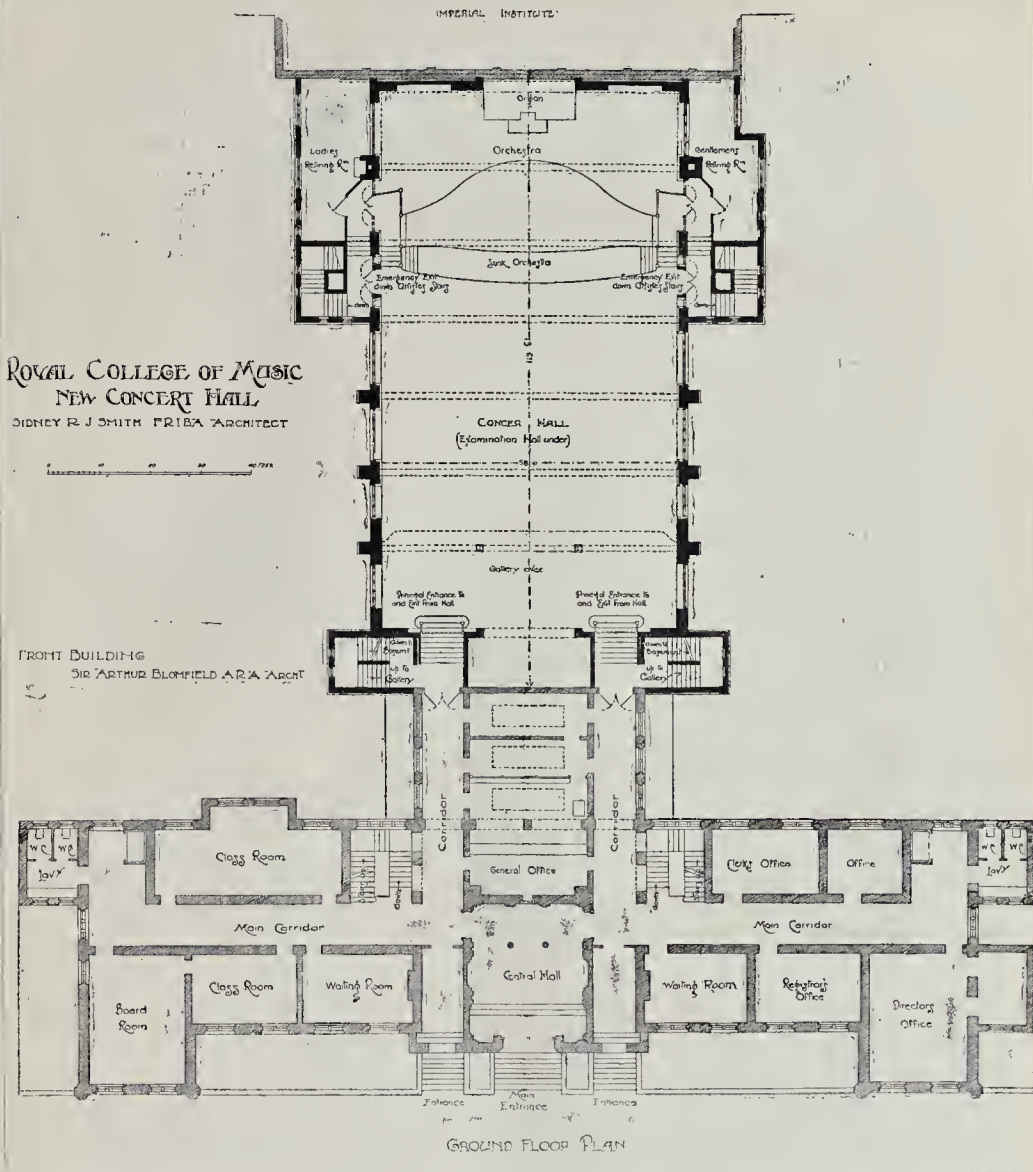

The wood panels and door that are shown in the north section on the wall, form the remains of a gallery that once extended along each side of the church.

The work generally seems to be in a very good state of preservation, the interior especially, as it has only recently been thoroughly

renovated, at which time the colour decoration on the walls was done away with."

The west front of the church is a notable example of Hawksmoor's originality of style, and, for its scale, is one of the most remarkable and powerful bits of architecture in London. It is instructive as showing how it is possible to be original without the invention of new architectural details. The forms of columns, pilasters, cornices, &c., are such as are familiar to us and are all to be found in books; yet the whole thing is a distinctly new conception, resembling no other classic building.

**NEW CONCERT HALL, EXAMINATION HALL, &c., ROYAL COLLEGE OF MUSIC.**

THE design for this building was selected in competition, Mr. Belcher, A.R.A., being the assessor, and Mr. Sidney R. J. Smith's design was placed first and he was instructed to carry it out.

The new buildings are at the rear of the college, and comprise the large concert-room, 119 ft. long by 58 ft. wide and 43 ft. high, with

a gallery at one end, the seating capacity of the whole being 900, while the orchestra will accommodate a band and chorus of at least 230 performers. On the east side of the hall at the orchestra end are artists' rooms on three floors, and beneath the hall is a spacious examination-room, 78 ft. long, 58 ft. wide, and 16 ft. in height; there are also large storerooms, heating-chamber, and hydraulic engine and bellows room for blowing the large organ.

The roof is constructed of iron with fibrous plaster soffit, elliptical in shape, and heavily moulded in panels, there being a passage-way through roof for ventilation, electric wires, &c. The room is faced internally with Parian cement and a wooden dado all enamelled white. Externally the building is of red brick and green slates to roof. There are spandril figures (different subjects) internally over each window emblematic of "Music," modelled by Mr. Wheatley. The lighting is by electricity, concealed lights being placed all along main cornice, while a few brackets below give light at other places necessary.

The orchestra, under the direction of the director, Sir Hubert Parry (who presented the organ to the college), has been very carefully

considered, and is said to have worked extremely well at the opening concert. Part of it can be extended by means of rollers, or if a smaller orchestra is required it can be reduced by running it under the fixed parts.

The building was erected by Messrs. G. H. & A. Bywaters; Messrs. L. D. Berry & Sons did the warming; Messrs. Spagnoletti & Co. the electric lighting; Messrs. Dennett & Ingle the ironwork; Mr. J. Stone the iron casements and doors; and Messrs. Shuffrey & Co. the stoves.

We give a plan of the additions, with a section and part elevation of the interior of the hall, from drawings kindly prepared for us by the architect.

**CHURCH, SMETHWICK.**—The new Church of St. Chad's at Cape Hill, Smethwick, was consecrated on the 1st inst. The building provides accommodation for 600 worshippers. The interior is faced with red brick dados and quoins to all windows, the remaining portions of the walls being plastered. The open-timbered roof is of pitch-pine and red deal. The building, which cost 5,250l, was erected by Messrs. J. Harley & Son from the designs of Mr. F. J. Gill.

## AMERICA AND THE CEMENT INDUSTRY.

In view of the extraordinary development of the cement industry in the United States, which does not appear to have been receiving from British manufacturers the amount of attention it deserves, Mr. Bell, the British Commercial Agent in the States, has been at some pains to collect and summarise the available information on the subject. From his exhaustive Report we gather that during the nine months ended March last, out of 5,417,011,557 lbs. of cement imported, the United Kingdom only supplied about 21 per cent. The previous year the British cement imported amounted to 975 per cent of the total, whilst in 1899 it was more than 15 per cent. In 1891 only 132 per cent. of the cement used in the United States was of American manufacture, while in 1899 this percentage had risen to 73.9. This increase of output of American-made cement is, however, barely doing more than keeping pace with the increase in demand; consequently the imports do not show the decrease that might be expected. So many new factories are being built that in time the increase in supply will exceed the yearly increase in demand, and the amount imported will decrease in proportion. It will nevertheless be many years before the importation of cement will cease entirely. There has been for long a great prejudice among contractors and engineers against the home product, but this is fast disappearing. Mr. Bell thinks in time it will disappear entirely, and that the United States will be able to produce sufficient to supply all its home markets, together with a surplus for export. It is a very sore point with the American cement manufacturers that there are still engineers who specify for imported Portland cement exclusively, notwithstanding the fact that many of the best brands of the home product are established a reputation for high quality, and the manufacturers are willing to offer substantial guarantees. The manufacturers maintain that the domestic product is at least equal in quality to the German, and is from 50 c. to 1 dol. cheaper. Of foreign cements, the German has the largest sale in the United States. During the nine months ended March last, Germany supplied 46 per cent. of the total amount imported; in 1900, for the corresponding period, 54 per cent.; and in 1899, 49 per cent. Belgian cements come next with 24 per cent. in 1901, 30 per cent. in 1900, and 32 per cent. in 1899. The price of German cement imported during the nine months ending March averaged a little over 43 c. per cwt. The Belgian averaged nearly 35 c. and that from the United Kingdom about 33 c. per cwt. The previous year the German cement averaged 40 c., the Belgian about 33 c., and the British over 44 c. per cwt. These figures would indicate that the Belgians are able to do their business on account of the low price of their product, notwithstanding its acknowledged inferiority, while the Germans are practically underselling the British, it being conceded that there is not much difference in the quality of the best brands of the two countries. In 1898 there were thirty-one works in the United States, producing 3,002,284 barrels of Portland cement, valued at 5,979,773 dols. and in 1899 there were thirty-six works, producing 5,052,266 barrels, valued at 8,074,371 dols. That is to say, there was an increase of 53 per cent. in quantity, but only 35 per cent. in value. The Lehigh Valley region in Eastern Pennsylvania and Western New Jersey is the seat of the first successful establishment for the manufacture of Portland cement, and has from the first produced more than the rest of the States combined. This is due to the occurrence there of an immense deposit of clay limestone, belonging to the calciferous formation which has nearly the composition of a Portland cement mixture. There are two works in the district said to be larger than any other works in the world. One is producing 8,000 barrels per day and is increasing its capacity still further. Owing to the keen competition in the States, a sharp fall of prices may be anticipated as far as the domestic product is concerned, and there may also be a decrease in the demand in the course of the next few months; the result will be the shutting-down of many of the smaller and less favourably situated works, owing to over-production. In modern American cement plants, as in nearly ever other works in the United States, the notable feature is the substitution of fuel and power for labour. Manufacturers understand the necessity of reducing the cost to a minimum. Machinery is substituted wherever possible to eliminate labour. Crude petroleum and natural gas are used when possible for fuel, and the latter is sometimes used to drive the engines. In some of the modern works electric power is used for driving the machinery as well as for lighting purposes. In the best arranged works the rock, from the time it is loaded into trucks in the quarry to the time it is packed as finished cement ready for shipment, is not once moved by hand. The only manual labour employed in the mill proper is that necessary for operating the machinery. The main idea is to make the plant as nearly approaching automatic as possible. Every known mechanical device for rapidly and efficiently handling the materials is introduced wherever possible. This is often done at considerable cost, and the apparatus is duplicated as far as possible in order to avoid delays should any part

become broken. This is considered as of considerable importance in the manufacture of cement, where the wear and tear is so great. In addition to Portland cement, large quantities of natural rock cement are manufactured. This is chiefly made in the States of Indiana and New York. In the year 1899 there were seventy-six works, producing 9,808,179 barrels, valued at 1,814,777 dols. The total consumption of imported Portland cement during the same year was 1,038,000 barrels, and of the domestic Portland 5,052,266 barrels, bringing the total consumption of all kinds of cement up to 17,628,833 barrels. In endeavouring to ascertain the reason why the German and Belgian cements are sold so much more largely than the British product, Mr. Bell found that a considerable difference of opinion prevailed, but he considers that the various points of view are comprehended and explained in the following three opinions which he quotes textually, and neither of which, he points out, is favourable to the British manufacturer:—1. The representative of an important importing house, handling three German brands, two British, and one Belgian, says: "The falling-off in the sale of British Portland cement in this country which took place some five or six years ago was partly due to the fact that the German cements proved so much more satisfactory as to quality, and Belgian cements of fair quality selling so much cheaper, while British makers were unwilling to make any improvement in the quality of their product. Notwithstanding, there continued to be a limited sale for the British brands in view of the last few years British makers had such a demand for their cement at home and from other foreign parts that it enabled them to obtain a higher price for their cement elsewhere than in the United States, so that they did not care to make any concession to the American trade, and this led to a further decline in the sale of British cement in this country, especially in the Eastern and the Western States is at present very unimportant. On the Pacific Coast, where the British makers have the advantage of very low freight rates, their cement is still sold in considerable quantities." 2. An American cement expert expressed the following view: "British cement at one time almost the only Portland cement in our market. German cement rapidly replaced it, however, owing to the superior quality of the German product. No doubt some brands of British cement are now much better than formerly, and probably equal to the best German. However, there is an immense number of German makers in this country who prefer the German product and will use no other. The Belgian cement gained a foothold in consequence of its low price, and has been preferred to the American Portland on account of being an imported article. It is certainly generally inferior in quality. The low price of American cements has nothing to do with quality, but is due to senseless competition among American manufacturers. Tests made by a multitude of competent engineers show that the best American cements are superior to all other brands. In my judgment, the only reason why any cement is imported is that the American product has until lately been insufficient in quantity, and also that there are many consumers who are willing to pay a higher price for an imported article, regardless of tests." 3. The editor of the leading cement trade journal writes: "Our own idea of the subject is that the German cement manufacturers are more thoroughly represented in the United States and make a greater effort to obtain orders in the interior than do the British manufacturers. German cements are more thoroughly advertised, and when making contracts with cement brokers they have the contract read that said brokers shall employ travelling salesmen to secure orders. In our opinion, the British cements imported into the United States are fully equal to the German product, as the makers of the poor British grades find no market here. The German manufacturers obtained a strong foothold in the United States owing to their first introducing cements adulterated with 2 per cent. or less of gypsum, which controls the setting of the cement, and for this reason they have maintained their prestige among certain consumers."

ST. CUTHBERT'S CHURCH, SHEFFIELD.—The foundation-stone of St. Cuthbert's Church, Fifth Park-road, Sheffield, has just been laid. The building forms part of a church extension scheme, which was inaugurated about two years ago, and it will be the centre of a new parish formed of parts of Ecclesfield, Grimsthorpe, and Pitsmoor. The contract has been signed for 3,500l., but the church will cost about 3,000l. more to complete. The building will be erected on a site between Barnsley-road and Fifth Park-road. It will be in the Early English style, and will be built of stone. The present contract is for the chancel, organ chamber, and vestries, a part of the nave, and the corresponding portions of the transepts. The church has been designed to accommodate a congregation of about 700; but the portion of the edifice which will be completed under the present contract will only afford accommodation for half that number. Mr. J. D. Webster is the architect for the church, and Messrs. George Langdon & Son are the contractors.

## Correspondence.

To the Editor of THE BUILDER.

## PORTLAND CEMENT.

SIR,—The article in your last issue is very interesting, and so is a recent illustrated "Note" on the chemical action involved in the setting of the cement.

What architects particularly want is not so much great strength in cement as freedom from expansion and contraction. Recently it has been my experience, as well as that of others engaged in similar practice, that in the construction of floors of coke breeze concrete, freely exposed underneath and covered with a wood floor above, there has occurred at intervals of ten to twenty months after setting an expansion, in long floors, sufficient to cause fractures in the walls. These walls are internally plastered and examined, so that it is known that the expansion does not take place earlier. It is not the expansion due to slaking or setting, nor can it be said to be due to the temperature of the set and solid mass, as it has been observed in concrete which was set at the initial atmospheric temperatures of 40 to 75 deg. Fahr. Some that was set at 40 deg. expanded that long time after at 75 deg.; while some that was set in the hot weather expanded in the cold. The cement was cooled by aeration and tested for soundness before use, but not for strength.

If your scientific contributors could throw any light on this mysterious subject they would do great service to many of your readers. My own impression is that the future tendency will be towards the separation and exclusive use of the "flour" of the cement, and the rejection of all residue. CEMENT USER.

## The Student's Column.

## GAS AND GAS FITTINGS:

## 3.—PURIFICATION OF COAL GAS.

**C**ONDENSERS.—The temperature of the gas as it leaves the main is usually about 130 deg. Fahr., or as it leaves the foul main about 125 deg. Fahr., and in order to cool it to atmospheric temperature the gas is led from the foul main through the condensers. These may be either vertical or nearly horizontal (fig. 4) pipes. They are exposed to the open air, and if of the horizontal form, may be cooled in hot weather by being sprinkled with water. The condensers in use vary greatly in size and form, but are all provided with means for drawing off the tar and ammoniacal liquor which condenses in them. Very rapid cooling is found prejudicially to affect the quality of the gas, and no attempt is made to cool it below the atmospheric temperature.

**Exhausters.**—The gas leaving the condensers usually passes next to an exhauster. The exhauster is a description of pump which draws the gas through the hydraulic main and condensers from the retorts, and prevents the gas from accumulating under pressure in them; while the gas as it passes through the exhauster is so compressed that it issues from the outlet at a pressure sufficient to enable it to force its way through the washing and purifying apparatus and station meter, and to lift the bell of the gasholder.

**Washers and Scrubbers.**—After removing the condensable matter from the gas by passing it through the condensers, the gas as it leaves the exhauster is led to the washers and scrubbers where it is washed and scrubbed in order to remove as far as practicable all the soluble impurities.

The term "washer" is usually applied to a rectangular tank in which the gas bubbles through the liquid washing agent, while the term "scrubber" is applied to the vertical tower in which the gas filters through a bed of material having its surfaces maintained in a moist condition. The term "washer-scrubber" is applied to an apparatus in which both washing and scrubbing are effected. The three terms are, however, sometimes used indiscriminately.

In the washers the gas is washed in the ammoniacal liquor obtained from the hydraulic main and condensers, as this liquor may be made to retain a further quantity of the impurities remaining in the gas. To this liquor

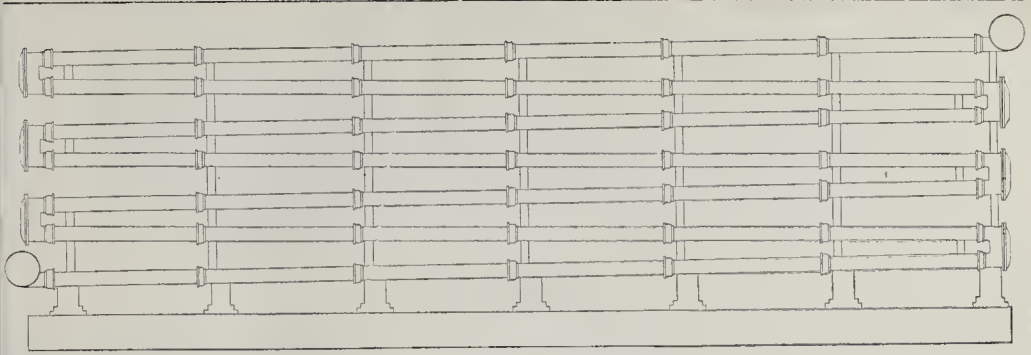

Fig. 4.—Horizontal Condenser.

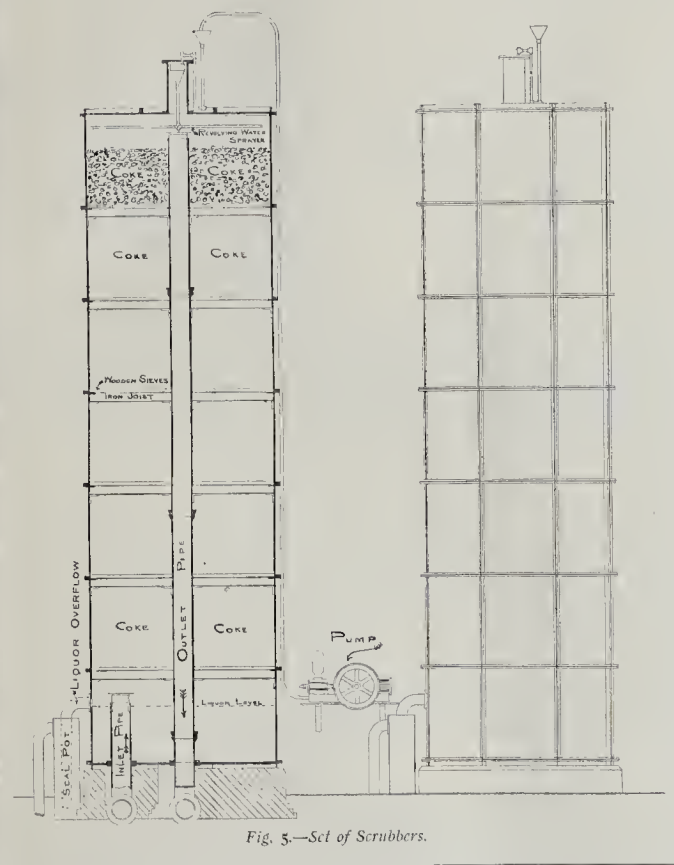

Fig. 5.—Set of Scrubbers.

may be added the weakest liquor from the scrubbers. The washers used in many works are rectangular tanks fitted with a number of perforated trays immersed in the ammoniacal liquid. The volume of gas is broken by being admitted through perforated tubes and by contact with the trays, and rises in small bubbles through the liquor. In the washers the remaining portion of tar is extracted from the gas, hence the washers are sometimes termed "tar extractors." In other cases a specially constructed "tar extractor" is put in action before the washers. From the washers the gas passes to the scrubbers, where with the aid of weak ammoniacal liquor and finally of clean water the ammonia still remaining in the gas together with a quantity of other soluble impurities is removed.

The scrubber towers (fig. 5) are usually filled with coke down which water is allowed to trickle. The gas flowing upwards meets the descending water and parts with its ammonia.

In more modern scrubbing appliances washer-scrubbers having circular brushes or a series of perforated discs attached to a central shaft are made to revolve at a slow speed and cause the water to come into intimate contact with the gas. The object of all washing and scrubbing devices is to remove the ammonia from the gas with the use of as little water as possible, for the greater the quantity of ammonia in the "gas liquor" obtained, the greater is its value for the purpose of manufacturing sulphate of ammonia.

**Purifiers.**—After leaving the scrubbers the gas still contains a certain quantity of sulphuretted hydrogen, carbon dioxide, and carbon bisulphide, which should be removed.

The carbon dioxide (commonly called carbonic acid) is abstracted by passing the gas through slaked lime, carbonate of lime being formed (fig. 6). The sulphuretted hydrogen may also be removed by slaked lime, but the sulphur in the lime compound produced cannot

readily be recovered, and the compound itself possesses such an obnoxious odour that its production in large quantity in any residential neighbourhood is liable to be resented. The sulphuretted hydrogen is therefore now usually removed by passing it through hydrated oxide of iron to which sawdust has been added to render the oxide more porous. The sulphide of iron produced is decomposed when allowed contact with air into oxide of iron and free sulphur, and before being permanently put out of action the oxide is several times turned out of the purifiers and exposed to the atmosphere for revivification. The free sulphur can be employed without difficulty for the manufacture of sulphuric acid, and is therefore a residual of considerable value. The "spent oxide," as it is called, has also the advantage of emitting a less objectionable odour than lime which has been saturated with sulphuretted hydrogen.

The carbon bisulphide has no affinity for slaked lime, but slaked lime which has been saturated with sulphuretted hydrogen readily abstracts it from the gas. The carbon bisulphide is therefore removed by passing it through lime which has been "sulphided" on the works.

The scheme usually adopted for the dry purification is the following:—The gas from the scrubbers enters a set of purifiers containing slaked lime spread in layers upon wooden grids. The carbon dioxide and the sulphuretted hydrogen are at first both abstracted by the lime, a mixture of carbonate of lime and hydroxyhydrosulphide of lime being formed. But carbon dioxide is able to decompose hydroxyhydrosulphide of lime [CaOHSH], driving out the sulphuretted hydrogen and itself combining with the lime to form carbonate of lime. When, therefore, the gas containing both carbon dioxide and sulphuretted hydrogen does not meet with sufficient free slaked lime to readily satisfy all the carbon dioxide, the carbon dioxide begins to attack that portion of the lime which has been combining with the sulphuretted hydrogen, and turning out the sulphuretted hydrogen, sends that impurity forward again with the gas, and itself combines with the lime. The carbon dioxide is therefore retained in the first set of lime purifiers, while the gas still containing sulphuretted hydrogen, but not carbon dioxide, passes forward to a second set of lime purifiers. Here the sulphuretted hydrogen is able to combine with the lime undisturbed by the presence of carbon dioxide. When the second set of purifiers is sufficiently charged with sulphuretted hydrogen these purifiers are employed to purify the gas from carbon bisulphide, while the sulphuretted hydrogen which still continues to come forward is removed by passing the gas through a third set of purifiers containing hydrated oxide of iron. In some cases, after the sulphide purifiers have been prepared, the purifiers containing oxide of iron are brought into action between the carbonic acid purifiers and the "sulphide" vessels, so that the gas passes first through the lime purifiers, which remove the carbon dioxide, then through the oxide of iron purifiers, which remove the sulphuretted hydrogen, next through the sulphide purifiers, which remove the bisulphide of carbon, and, finally, through another oxide of iron purifier, termed "the check box," which removes the small quantity of sulphuretted

Fig. 6.—Section through Purifier.

Fig. 6a.—System of Connecting Pipes for a Set of Purifiers.

hydrogen which is evolved from the sulphide purifiers.

Many years ago "milk of lime" was used for gas purification, and the waste product acquired great notoriety under the name of "Blue Billy" on account of its horrible odour. Owing partly to the difficulty of disposing of the waste material, the liquid paste has long been superseded by the comparatively dry hydrate of lime, which when "spent" has a somewhat less foul odour, and can be re-burnt on the works and used again for purification, or, after long exposure to the air, can be carted away for agricultural purposes without attracting undue attention by its perfume.

Many gas manufacturers do not purify the gas so thoroughly as it has to be purified in London. In many cases no attempt is made to remove the carbon bisulphide, but by Act of Parliament all gas supplied to consumers must be free from sulphuretted hydrogen, and consequently this impurity is, as a rule, removed as completely as possible. The carbon dioxide is also usually more or less completely removed, because it prejudicially affects the illuminating power of the gas. One per cent. of carbon dioxide in the gas reduces its illuminating power about 4 per cent.

**Mixing Air with the Gas.**—When consumers of gas make the discovery that air is being deliberately added to the gas passing into the purifiers, they in many cases imagine that the air is being added to serve as an adulterant. Now the presence of 1 per cent. of air in the purified gas diminishes its illuminating power by about 6 per cent., 4 per cent. of air reduces the illuminating power 25 per cent., and 45 per cent. of air causes the gas to burn with a non-luminous flame. It is evident, therefore, that air cannot in practice be used as an adulterant, for its presence in any appreciable quantity would be at once apparent even to the untrained eye when the gas was used as an illuminant.

The fact is that a quantity of air not exceeding 3 per cent. of the gas purified is in some works let into the purifiers to oxidise the sulphur compounds of lime or iron which are formed there, but the atmospheric oxygen is all abstracted by the material in the purifiers before the gas passes from them. The atmospheric nitrogen passes forward with the gas, but is too small in quantity to exert much influence. Usually the proportion of air admitted is limited to a maximum of 13 per cent.

In oxide of iron purifiers the oxygen of the air attacks the sulphide of iron formed by the action of the sulphuretted hydrogen on the iron oxide, and re-converts it into oxide of iron, while the sulphur displaced by the oxygen is

found in a free state mixed with the oxide. The admission of air makes it possible to use the oxide for a longer period before it is necessary to turn it out and expose it to the atmosphere for more complete reactivation. In fact the oxide need not be reactivated in the open air until some 25 per cent. of its weight consists of free sulphur. The use of air in the purifiers also diminishes the odour emitted by the spent material when first exposed to the open air.

In lime purifiers air is often admitted when the scheme adopted for purification from sulphur compounds is different from that previously described. About 1½ per cent. of air is admitted to partially sulphidated lime purifiers, the oxygen oxidises the sulphur compounds of lime, and free sulphur often amounting to 10 per cent. is found in the spent lime. Spent lime from purifiers to which air has been admitted creates less nuisance than spent lime from sulphide purifiers from which air has been excluded.

Other schemes and other substances have been adopted for gas purification, but lime and hydrated oxide of iron used in a manner more or less approximating to the system here delineated are employed more extensively than any other materials.

#### GENERAL BUILDING NEWS.

**CHANCEL RESTORATION, HALES CHURCH, NORFOLK.**—The ancient Church of St. Margaret, Hales, has recently undergone further restoration, the chancel having just been restored. The old box pews have been removed, and oak benches with carved panels have been erected, and the floor has been raised and relaid with black hordered tiles. A new oak prayer desk has also been provided, and the pulpit at in the west gallery, which formerly accommodated in the new seats in the chancel. The seats were supplied by Mr. C. W. Brown, of Norwich, and the structural work was carried out by Messrs. Chaston & Grimson, of Loddon, and Mr. A. W. Ferrit, of Long Stratton, was responsible for the stonework. The whole of the work was carried out under the direction of Mr. H. J. Green, diocesan architect.

**HOLY TRINITY CHURCH, ISLINGTON.**—In response to a petition made by the vicar and churchwardens of Holy Trinity Parish Church, in Cloudeley-square, to the Consistory Court of London, Dr. Tristram, K.C., Chancellor of the Diocese, has agreed to issue a faculty for effecting some extensive improvements and alterations of the interior of the church. It is proposed to remove the high-backed pews; to take down the north and south galleries, enlarge the west gallery, and substitute open pews throughout; to raise (by 7 in.) the east end with the choir and chancel, so as to

make one step for the Communion-table; to instal electric light, with certain other minor changes, at an estimated cost of 3,000l., towards which sum 1,000l. is already provided. The church was built in 1820-7, after Sir Charles Barry's designs, of brick with stone dressings and tracery in the rather Late Gothic style that was prevalent at the time.

**NEW CHURCH, DURRUS, CORK.**—A new church was recently dedicated at Durrus. The plan of the church consists of nave, chancel, aisles, side chapels, porches, baptistry, sacristy, and organ gallery. The principal dimensions are, in the interior—length of nave and chancel, 101 ft.; breadth of nave and aisles, 45 ft.; height to ridge of nave, 40 ft. The aisles on either side are separated from the nave by five bays, forming the main arcades, which are carried by limestone pillars, with moulded caps and bases, and pointed arches, above which is the clearstory cinque foil lights. The chancel is divided from the nave by a chancel arch, springing from polished marble columns, and Bath-stone corbels and caps, all carved and moulded. The aisles are buttressed on the exterior, and are lighted by three-light pointed lancets, arranged in groups, to each bay. The roof of the nave is in pitch-pine. The chancel roof is divided into several panels by moulded ribs and the panel spaces are plastered to admit of future decoration. The porches leading to the aisles on either side and the sacristy are gable-roofed. The work has been carried out from the plans of Mr. M. A. Hennessy, architect, Cork, and the main contract was by Mr. D. Donovan, of Bantry. The high altar is by Mr. Davis, sculptor, Cork; the lead lights by Messrs. Watson, of Youghal; and the iron work by Messrs. McGlothin, of Dublin; the iron work by Byrne, of Dublin.

**WESLEYAN CHAPEL, STAPENHILL, BURTON.**—The trustees of the Wesleyan Chapel at Stapenhill have accepted the estimate of Messrs. Thos. Lowe & Sons at 2,200l. for the erection of a new chapel and school buildings in Ferry-street. The chapel, which is designed in the Early English style, provides accommodation for 400 adults, and consists of a central aisle and two transepts, with entrance vestibules. The north transept is designed to accommodate the organ. The school will contain 300 children, and in connection therewith are cloak-rooms and lavatories. At the back of these buildings are provided vestry, kitchen, and heating chamber, &c. The work will be executed in red brickwork and white stone dressings, the main feature of the chapel front being a large four-light tracery window. The whole of the roof timbers inside will be of pitch pine and will be exposed, being stained and varnished. The architect is Mr. Thomas Jenkins.

**CATHOLIC CHURCH, SITTINGBOURNE.**—The foundation-stone has just been laid of a new Catholic church, to be known as the Church of the Sacred Heart of Our Lord Jesus Christ, the site being adjacent to the Presbytery, in West-street. The tower will be open within the nave, on one tall and two short arches; the rest of the area will be quite free from all obstruction. The chancel is to be divided by an arch, and will be apsidal in form. A small vestry is also included in the plan. The northern entrance will receive full enrichment, and on either hand and above it is proposed to place statuary in niches. The architect is Mr. W. Leonard Grant, of Sittingbourne.

**ENLARGEMENT OF GOVAN SCHOOL.**—An addition has been made to Albert Road School, Pollokshields, for the Govan Parish School Board. Accommodation is provided on the ground floor of the new building for a chemical laboratory, lecture-room, and also a physical laboratory and manual workshop. On the upper floor are art rooms. There are also a cookery-room and some other rooms, which will be used in the work of the school. There are separate cloak-rooms and lavatories. The school is heated by low-pressure hot water, with radiators, and fitted throughout with electric light. The Board has under consideration a proposal to erect a small astronomical observatory on the roof, in which a large telescope, the gift of a member of the Board, will be fitted up. The school was built from plans prepared by Messrs. H. & D. Barclay, architects Glasgow, under the supervision of Mr. Samuel Preston, the Board's master of works.

**BOARD SCHOOLS, GLYN-NEATH, WALES.**—The foundation-stone of new Board schools was laid at Glyn-Neath recently. The new building will provide accommodation for 230 children, and it comprises a central hall and five classrooms with board-room and teachers'-room on the first floor. It is intended to be used as a mixed school, and the cost is 3,479l. The building is of brickwork, faced with Morrison pressed bricks and relieved with strings of blue brick and Bath stone dressings. The floors are of pitch pine wood blocks with matchboarding dados. The contractor is Mr. David Davies, of Cardiff; the architect, Mr. J. C. Rees, of Neath; and the clerk of works, Mr. D. Richards, of Glyn-Neath.

**SCHOOLS, BRECON.**—Two intermediate schools in the borough of Brecon—one for 80 girl students and the other for 100 boys—were opened recently. The schools have been erected, furnished, &c., at a cost of 6,715l., the architects being Messrs. Phillips & Baldwin, of Cardiff and Abergavenny, the builder Mr. E. G. Groom, Llandovery, and the clerk of the works Mr. J. J. Large, Brecon.

**INFECTIOUS HOSPITALS FOR RADCLIFFE AND DISTRICT, LANCAESHIRE.**—Mr. S. W. Wheaton, an inspector of the Local Government Board, held an inquiry at the Assize Courts, Manchester, on the 9th inst., under an application made by the Lancashire County Council for sanction to the borrowing of 40,000l., for the provision by the Radcliffe, Ramsbottom, Wythfield, and Bury Joint Isolation Hospital Committee of an infectious diseases hospital and a small-pox hospital on land at Ainsworth. Dr. Sergeant, Medical Officer to the County Council, said it was proposed to erect two hospitals on one site at Ainsworth. The site was about fifty acres in extent. There would be fifty-six beds in the infectious diseases hospital and thirty-two in the small-pox hospital. Mr. H. Lord, architect, of Manchester, said the estimated cost was 34,161l., the amount allowed for contingencies was 2,107l., architect's charge (which included clerk of works), 2,420l., making a total of 40,000l. There would be bedrooms for eleven nurses in the infectious diseases hospital, and eight bedrooms for nurses in the small-pox hospital, with dining-room, &c., and offices. There was no opposition to the scheme.

**BATHS, WANDSWORTH.**—New public baths were recently opened at Wandsworth by the Mayor. The requisite bath accommodation has been provided on the ground floor. Separate entrances have been provided for the men's and women's baths, the ticket office being placed between each. There are six first-class private baths for men, and six of the second-class; four first-class private baths for women, and eight second-class. Each of the four sets or groups has a waiting-room, lavatory, &c., and is complete in itself. The first-class bath is the amount allowed for contingencies was 2,107l., architect's charge (which included clerk of works), 2,420l., making a total of 40,000l. There would be bedrooms for eleven nurses in the infectious diseases hospital, and eight bedrooms for nurses in the small-pox hospital, with dining-room, &c., and offices. There was no opposition to the scheme.

**NEW HOTEL, HUNSTANTON.**—A new hotel has been erected at Hunstanton, from designs by Mr. H. Green, of Norwich, and built by Messrs. Giddens & Perrin, of St. Ives.

**SAILORS' HOME, LONDON.**—The foundation-stone of the new headquarters for the British and Foreign Sailors' Society was laid recently. It will be situated at the junction of four main highways—East and West India, Commercial, and Burdett-roads. On the ground-floor there will be the main entrance, suitably fitted as a sailors' temperance restaurant, and smoking and attendant's-rooms adjoining. In the basement are the kitchen and store-room departments. The first-floor (reached by the main staircase) will be for the general offices, board-room, library, and literature departments. The second-floor flat will comprise officers' and apprentices' rooms, with parlour, sleeping accommodation, and bath-room. The next floor will contain navigation-room, leading up to the observatory, with rooms for the superintendent and workers. The main entrance will lead through a corridor into the Albert Victor Sailors' Rest in the Gill-street side of the home. Above the hall, with another entrance from Gill-street, are dormitories for seamen, with bath and lavatories complete. Messrs. Niven & Wiggesworth, are the architects.

**IMPROVEMENTS AT THE THEATRE ROYAL, SHEFFIELD.**—At the summer closing of the Sheffield Theatre Royal some alterations and improvements are to be made. The stage is to be enlarged by taking in a good deal of space at the back. The electric light is to be introduced. New dressing rooms, also, are to be built. The alterations are being made under the superintendence of Mr. Frank Matcham.

**NEW PIER PAVILION, DOVER.**—On the 15th inst. the new Pavilion on the Promenade at Dover was opened to the public. It consists of a concert hall, 85 ft. by 50 ft. with seating accommodation for about 950 persons. Dressing rooms, refreshment bars, shop, and pier master's room are also provided in the building. The hall is roofed in one span with semi-circular steel trusses carried down to the pier girders, and there are no columns to obstruct the view of the platform. The cost of the scheme, which includes the revising and strengthening of the

understructure of the pier, has been about 6,600l. The work was executed in seven months by Messrs. Anthony Fahey & Son, of Leytonstone, from the plans and under the superintendence of Mr. M. Noel Ridley, engineer, and Mr. Robert J. Beale, architect, whose joint design was selected in competition.

**PARISH CHURCH HALL, ST. ANDREWS.**—It is proposed to erect a parish church hall at St. Andrews. It will have a frontage to the south and will have a vestibule at the south end, with a staircase to a gallery over, and a platform at the north end. The adjuncts consist of a classroom for bible class, minister's-room, retiring-rooms, and a kitchen for use at social meetings, with the usual lavatory accommodation. The height of the hall will be 15 ft. to the wall heads and 26 ft. to the ceiling. The exterior walls will be of local freestone, and the roof will be covered with green Scotch slating. The hall will provide accommodation for over 400 scholars. Messrs. Gillespie & Scott, St. Andrews, are the architects, and the following are the contractors:—Mason work, Mr. Thomas Liddell; joiner work and seats, Mr. Andrew Cunningham; slater work, Messrs. Rintoul & Mackie; plumber work, Mr. Thomas Peebles; and plaster work Mr. A. R. Macpherson—all of St. Andrews.

**ASSURANCE COMPANY'S NEW BUILDINGS, PERTH.**—The new buildings in Perth which have been erected by the General Accident Assurance Corporation Limited, occupy the site of the old post office. The principal entrance is from High-street, and leads into the general office, which occupies nearly the whole area of the ground floor. The office is seated for about 100 clerks. On this floor there are also assistant manager's room, rooms for the heads of the departments, telephone room, and post office. Marble pillars support the second floor. At the back of the general office is a service stair running from the basement to the top floor, with electric lift for the stairs. The clerks' entrance is from Tay-street. On the mezzanine floor the lady typists' room is situated. From the general offices rises the grand staircase. It is constructed of Sicilian marble and wainscot oak. At the foot of the stair is a marble arch, with two modelled bronze figures. The windows on the stair are by Messrs. Ballantine & Gardiner, Edinburgh. They represent England, Scotland and Ireland, with the conventional treatment of the rose, the thistle, and the shamrock. In the centre are the arms of the City of Perth, supported on either side by those of the Chairman and Sir R. D. Moncreiffe. On the first-floor landing is the fire department, seated for between forty and fifty clerks. The general manager's room, board-room, and ante-room are situated on the same floor; but are cut off from the main staircase by a private entrance and lobby. There is also the manager's house of three apartments. The top flat is used for storage purposes. There is an extra clerks' room on the second floor seated for about sixty clerks, and a clerks' luncheon-room. In the basement are storerooms and packing-rooms, heating chamber, workshop, and three fire and burglar proof safes, which are reached by a stair from the general office. The following were the contractors:—Masons, Messrs. R. Brand & Sons, Perth; joiners, Messrs. J. Hay & Son, Perth; plasterer, tiles, and paving, A. McRitchie, Dundee; plumber, James McLeish, Perth; slaters, Messrs. J. Buchan & Son, Perth; painters, Messrs. Stalker & Boyd, Perth; special decorators and furnishers, Messrs. Cowton & Sons, London; heating and ventilation, Messrs. James Simpson & Co., London; electric lights, Messrs. Westwood & Co., Perth; electric lighting, Messrs. Frew, Watson, & Co., Perth; marble work, Mr. Thomson, Princess-street, Perth, and Messrs. Galbraith & Winton, Glasgow; stone-carver, William Sheriff, Glasgow; wood-carver, John Crawford, Glasgow; iron work, Messrs. Mather & Son, Edinburgh; glaziers, Messrs. G. R. Douglas & Son, Perth; electric hoist, Messrs. A. & P. Steven, Glasgow. The architect was Mr. G. P. K. Young, of Perth; and the inspector of works, Mr. G. Henderson, Perth.

**WORKMEN'S HOME AND CLUB, LIVERPOOL.**—According to the *Liverpool Post*, buildings are being erected in Liverpool by Mr. B. W. Levy out of the moneys of the David Lewis Trust Fund. The object to be achieved is the provision of a Workmen's Home and Club and Public Hall, somewhat on the lines of the People's Palace in London. The site is the land upon which old St. James's Market stood, and it has its main frontage in Great George-place, its side fronting to Nile-street, and its back in Rathbone-street. The cost, it is stated, will run to close on 50,000l. Mr. J. Francis Doyle is the architect, from whose designs and under whose superintendence the building is being erected. The main frontage to Great George-place will extend to 174 ft. The side frontage in Nile-street will have a length of 146 ft. In all, the site of land embraces 220 ft. by 176 ft., and the buildings will set back from the boundary some 27 ft. The materials used in the facing of the main outer walls will be of special brick and terra cotta, with green slates on the roof. The main entrance to the public hall and clubroom will be from Great George-place, and will be 12 ft. wide. This means of ingress will have a hall 50 ft. by 20 ft., arched and finished in tiles and faience. In regard to the public hall, which will be 90 ft. by 42 ft. and 35 ft. high, it will be in the centre of the building, and will accom-

modate upwards of 800 persons. It will have a separate stage entrance from Rathbone-street, stage boxes, gallery, and green-rooms for both sexes. All the staircases and floors will be fireproof. Respecting the social club, it is arranged that this shall consist of a number of large rooms—a billiard-room, 67 ft. by 30 ft.; two committee-rooms, three social clubrooms, each 50 ft. by 26 ft., and also a special clubroom and toilet facilities for females. To the south of the clubroom, on the same site, space is left open for the subsequent erection of a gymnasium, 132 ft. by 54 ft. The Home will be approached and entered through Nile-street, off Great George-street, through turnstiles. Just over the threshold the visitor will find himself at the office, and adjacent to this will be the master's house. The reading-room will be 50 ft. by 20 ft. In a central position between this room and the dining-room, with an area of 20 ft. by 15 ft., will be the provision shop. There will be lifts connecting the shop with the kitchens in the basement. The dining-room will be 80 ft. by 41 ft. The kitchens, sculleries, pantries, and stores will be in the basement. In the basement will also be lockers, and storerooms for the accommodation of the things belonging to the boarders at the Home. On the upper floors, approached from the large main staircase by three independent gangways, will be the sleeping cubicles. These will be arranged in groups for easy working and control. There will also be two other stone staircases for exit in cases of necessity. The number of cubicles for which arrangements have been made in the designs is 381. Over the billiard-room will be a flat roof, which it is intended shall be for the use of the men who sleep in the Home. The work of erection has been entrusted to Mr. Isaac Dilworth, the clerk of the works being Mr. J. W. Gilling.

**HOTEL, SOUTHWOLD.**—The Grand Hotel, Southwold, was opened on the 10th inst. The site chosen is at the extreme end of the town, in close proximity to the pier, which was opened to the public last summer. The hotel consists of a main block, nearly 140 ft. in length and of five stories in height. The building was designed by Mr. C. H. M. Mileham, of Lincoln's Inn-fields. The contractors were Messrs. Kerridge & Shaw, of Cambridge.

FOREIGN.

**FRANCE.**—The Municipal Council of Paris has approved of the erection of a statue of the Empress Josephine, by M. Vital Dubray, on the rond-point of the Cours-la-Reine; and also a statue to Verlaine in the Square des Batignolles.—The Council has also decided on the erection, on the Place Duplex, of a large building for the accommodation of workmen's syndicates, under the name of the "Palais du Travail." M. Philippin is the architect, and the cost will be about 675,000fr.—M. Ferret, Departmental Architect at Bourg, has been appointed President of the Société Regionale of Architects of the Saône.—Important public works, at an estimated cost of 388,000 fr. are to be undertaken at Montauban. They include the clearing away of the houses round the church of Saint Jean, and the restoration of the Hôtel de Ville and of the Hôtel Bonnevace.—A sum of 26,000,000 fr. is to be applied on the enlargement of the port of Dunkerque.—Before separating at the close of the session, the Council of Paris passed a vote for the purchase of works from the two Salons. Among these are the "Reveil," by M. Jacques Blanche; a portrait, by M. Aman Jean; "La Terre Antique," by M. Ménard; "Devant la Mer," by M. Jean Boucher; "L'Enigme," by M. Monod; a bronze lion, by M. Cordier; works in pewter by M. Patier; a fine cameo by M. Tonneller, &c. The total value of the purchases amounts to 114,200 fr.—M. Germain, the sculptor, has just completed the models for four electric candelabra which are to complete the decoration of the facade of the Opéra Comique. These consist of heavy columns of red Scotch granite, adorned with bands and olive branches of hammered bronze. These carry four branches, each with three electric globes.—In the Section of Architecture, at the Académie des Beaux-Arts, M. Batigny, architect, of Lille, has been appointed a corresponding member in place of the late M. Revoil.—The Paris Council has decided to continue the large intercepting sewer from Clichy, which now ends at the Place de la Trinité, as far as the Rue des Petits Champs. The operation will cost about 1,370,000 fr.—The death is announced, at the age of seventy-one, of M. Edouard Krug, painter, author of numerous religious and allegorical pictures. He exhibited, a few years ago, an immense canvas in which were grouped all the persons, Norman and Bretonne, who are members of the Society called "La Pomme." He obtained medals in various salons, and a bronze medal in the great exhibition of 1889.—M. Albert Alexandre Vergnon, architect, of Paris, has died at the age of fifty-four. He was a pupil of the atelier Andre.

**GERMANY.**—A monument erected to the memory of the late Emperors William and Frederick was recently unveiled at Soran, in Silesia. It consists of two statues of the emperors mounted on pedestals; they are represented as being in the uniforms of Prussian generals. The monument is about 20 ft. in height.—A tower erected to the memory of Prince Bismarck, at Coburg, was recently unveiled

in the presence of Princess Beatrice and the Prince Regent of Saxe-Coburg and Gotha.

AUSTRIA.—A statue representing the late Empress of Austria was unveiled at Salzburg on the 15th inst. in the presence of the Emperor and several other members of the Austrian Royal Family. The statue, of white marble, is by Professor Hellmer, and depicts her late Majesty when in her prime. It stands on a low pedestal, the front of which bears the simple inscription, "Elizabeth, Empress of Austria," whilst the sides are adorned with verses by the Austrian poetess, Marie Ebner von Eschenbach.

ITALY.—It is reported from Rome that in the course of the restoration work in the Palace of the Duke of Massa Carrara, at Carrara, there have been discovered two magnificent frescoes by Raphael. These frescoes fill two large spaces of the wall in an apartment in the building.

#### SANITARY AND ENGINEERING NEWS.

NEW SEWERAGE WORKS, LONDON COUNTY COUNCIL.—The London County Council propose to acquire by compulsory sale thirty-six acres of land in the parishes of Erith and Plumstead for the construction, as part of the main drainage and sewerage of the Metropolis, of two outfall sewers, one of them to be below ground and the other above ground covered with an earthen embankment, so as to provide for the increasing flow of sewage from the area lying on the south side of the river Thames.

PLUMBERS' REGISTRATION.—The House of Lords has given a first reading to a Bill introduced by Lord Glenesk entitled "An Act for the Registration of Plumbers." It was set down for second reading on Thursday, and there was no notice of opposition. This measure, of which Lord Glenesk is taking charge, is similar in substance to those read a second time in the House of Commons in 1892 and 1897 and reported on by a Select Committee and the Standing Committee on Trade in those years respectively. The object, of course, is to establish a system under which plumbers can, if they please, be registered. No privilege is proposed to be given by the Bill to registered plumbers, but a plumber is prohibited from calling himself a registered plumber unless he is registered under the Bill. It will be necessary for a plumber before he is registered to be qualified to the satisfaction of a council approved by the Local Government Board. This will enable persons employing plumbers to satisfy themselves, if they desire to do so, that the persons they so employ have given evidence of their qualification for the work. The control of the registration system and the selection of qualifying examinations will be in the hands of a general council constituted under a scheme to be framed by the Local Government Board, and consisting of members representing master and operative plumbers, Local Authorities, and various sanitary associations. Sub-section 5 of Clause 3 provides that "Any scheme made under this Act shall be laid before both Houses of Parliament as soon as may be after it is made, and if, within the next subsequent forty days on which either House sits that House presents an address to His Majesty praying that any such scheme may either in whole or in part be annulled, His Majesty in Council may annul the same either in whole or in part as the case may require, and the scheme or part annulled shall thenceforth become void without prejudice to the validity of any proceedings taken under the same in the meantime." If the first scheme framed by the Local Government Board is so annulled, the Local Government Board shall within \_\_\_\_\_ months frame a further scheme, and so on as occasion requires."

#### MISCELLANEOUS.

FERRY WORKS, QUEENSFERRY.—Mr. Bulkeley Creswell, the architect of this building, illustrated in our last issue, writes to ask us to correct the spelling of his name, which we gave as "Cresswell." We may say, what applies to this and other cases, that mistakes as to the spelling of a name often arise from correspondents not taking the trouble to write their signature clearly.

ST. MARY CHURCH, HARROW.—A faculty has been granted by the Consistory Court of London in respect of the parish church, Harrow-on-the-Hill. The faculty authorises the re-building and enlargement of the organ that is now in the north chapel, the making of a new window (to be filled with stained glass) in the clear-story above the archway (inserted at the end of the thirteenth century) that opens from the north aisle into the north transept, similar to the seven other clear-story windows, and the refitting and reglazing of the lancet windows in the south side of the chancel, five of which were found and restored during the recent remodelling of the east end of the church. The faculty will also provide for the shifting of some of the monuments and memorial tablets, amongst them being the monument erected in 1609 to William Gerard and his sister. For particulars of the clear-story and of the Early English windows in the chancel, see our leading article of January 26, 1895.

ST. GILES'S CHURCH, CRIPPLEGATE.—A faculty has been granted by the Consistory Court of London for carrying out some alterations of the church, to include the erection of a porch and the setting up at the east end of the north aisle of the reredos formerly in the church of St. Bartholomew, Moor-lane, which is now being demolished. In the reredos are panels with the Ten Commandments upon them; for these will be substituted a picture of the Presentation of Christ in the Temple, and the Ten Commandments will be put at the west end of the church, there being no space for them in the customary place, which is occupied with monuments.

BRISTOL MASTER BUILDERS' ASSOCIATION.—The annual summer excursion organised under the auspices of the Bristol Master Builders' Association took place on the 9th inst. Saloon carriages conveyed the party to Chippenham, which was reached soon after ten o'clock, and breaks were in readiness to take the party to Woodrow Park. The drive through the richly-wooded country was very pleasant, and the seat of the Marquess of Lansdowne was much admired. The drive was continued to Avebury, with its historic stones and ditch, though these were left until luncheon had been partaken of. The drive to Lacock was very enjoyable, and through typical Wiltshire scenery the visit to Lacock Abbey proved very interesting. A four miles journey brought the party back to the Angel Hotel, where the dinner was held. Mr. E. Walters presided, and the vice-chairs were taken by Messrs. G. Wilkins and G. Humphreys. After the usual toasts, Mr. W. Brown proposed the toast of "The National Federation of Building Trade Employers of Great Britain and Ireland," and said he had to associate with it the names of the well-known builders, Mr. A. Krauss and Mr. Frank N. Cowlin. The former was President of the National Federation, while Mr. Cowlin was the energetic treasurer of the South-Western Federation. Such associations as the National Federation and those in their trade, and they also provided them with enjoyable outings like they had had that day. Mr. A. Krauss, in reply, gave some particulars of the recent meeting of the Federation at Glasgow. It was his good fortune, as President of the Federation, to be received by the Lord Provost at the Exhibition, and he gave their Federation a hearty welcome. They were also shown over the municipal buildings, and there they saw a magnificent structure, such as they could not hope to have in Bristol. One result of the Glasgow meeting was that a fresh effort would be made to amalgamate with kindred associations, so that they should have a united body representing the United Kingdom. Some of those present mentioned the idea of a committee to go into that question, and he relied upon their loyal support. As they knew, there had been a call on behalf of the National Association, to which the North of England contributed 100l., and he was very glad to have a cheque from Mr. Cowlin on behalf of the South-Western Federation for 60l.—Mr. F. N. Cowlin also responded, and said it gave him great pleasure to be treasurer of the South-Western Federation. That organisation had had a great many difficulties, but these had been surmounted, and he felt certain that in the future the Federation was going to be of great benefit to the trade in their district. When they regarded the comprehensive nature of the organisation of their employers, the necessity of such a federation as theirs was apparent. He looked forward to the time when their organisation would be so strong that they would be able to refer the regulation of various trades connected with their business to a joint committee of the employers and the trade-unions, and under those circumstances he believed such a thing as a strike would be unknown. Such a body would be the solution of the difficulties which at present existed between capital and labour, and it would tend to restore English work to its proper place in the competition with the world. Mr. Geo. Wilkins proposed the toast of "The Visitors." Mr. G. H. Perrin and Mr. W. H. Jelly (Bath) replied to the toast. Mr. Geo. Humphreys proposed the toast of "The Chairman," and Mr. Walters made a fitting reply. The party returned by the 8.35 train from Chippenham, arriving in Bristol just before ten o'clock.—*Bristol Times.*

THE WEST FRONT OF PETERBOROUGH CATHEDRAL.—The funds for the memorial of the late Dean of Peterborough have come in so satisfactorily that the Cathedral Restoration Committee have given an order for the work of completing the restoration of the west front to be proceeded with forthwith. This includes the repair of the great central arch and gable, the two turrets flanking the same, and also the pointing pinnacles of the bell tower. It is hoped, therefore, that the scaffolding which has for more than four years disfigured the beauty of the grand old edifice will soon be removed. About 500l. are still needed.—*Daily News.*

TUSCAN COPPER AND LEAD: RESUMPTION OF WORKINGS.—Some highly important mining operations in lead and copper ores have recently been begun at Lanzi, near Campiglia, in the south of the province of Pisa. It is not a case of the discovery of new ores, for these mines were known to the Romans, as is witnessed by abundant tracings of their workings all along the copper veins, and they have also been somewhat fitfully worked under different owners during the present century. But

the surprisingly rich and valuable nature of the mines has only now fully come to light. The property, which is some 1,350 acres in extent, was recently acquired by a London syndicate, and is now owned by a company styled "The Etruscan Copper Estates, Limited." The geological conformation of the estate is clay slate, overlain by a bed of marl of the average thickness of 30ft. The metallic resources of the property consist of five fissure lodes of phenomenal proportions, one of lead (sulphide of lead and zinc blende) and four of copper (sulphides and copper). Each one of the lodes is over 100 ft. wide, the lead lode being 110 ft. and one of the copper lodes as much as 130 ft. in width. This fact alone is sufficient to show that the quantity of ore available must be enormous. The lead and zinc ore is now being raised in considerable quantities and has the appearance of being rich in metal, but it is too early yet to give an estimate of the metallic contents of the vein, as the work so far has only progressed to a short depth. It is evidently the intention of the present owners to develop the mines on a large scale. New hands are being put on every week as room is made for them in the workings, and the engineer estimates that he will have 1,000 men at work in three months' time. None of the ores will be exported, but he has decided to erect large smelting works and thence to reduce the ores to metal. The company's exports will all have to pass through Leghorn, the nearest convenient port of importance, and it is expected that that city will eventually benefit largely by this latest venture of British enterprise and energy in the Peninsula.

#### CAPITAL AND LABOUR.

BRADFORD BUILDING DISPUTE.—At the meeting of the Bradford City Council on the 9th inst., a recommendation of the Finance and General Purposes Committee was submitted that no works should be allowed to proceed under any Corporation contracts except at the standard rate of wages last mutually agreed upon between masters and workmen. Ald. Ratcliffe moved the adoption of the Finance Committee minutes, but reserved his right to vote against that portion given above. Ald. Good seconded, with a similar reservation. Mr. Threlkeld then moved an amendment to the effect that the minutes be adopted, with the exception of the resolution alluded to, which Ald. Poplewell seconded. On a vote, the amendment referring the resolution back was carried by 43 votes to 22.

MASONS' STRIKE, BURTON.—The strike of the stonemasons of Burton was brought to a termination by the men resuming work on the old terms. In the early part of the strike the men gave six months' notice for an advance in wages from 83d. to 93d. per hour, and certain alterations in the rules of working. As these were not conceded, they came out on strike at the commencement of the month. Negotiations have since been going on between the employers and the men. The masters held the men in a state of trade did not justify any concession being made. The masters' society received a letter on the 6th inst. stating that at a meeting it had been decided to resume work on the rules of July 1, 1897.

TEES-SIDE JOINERS' DISPUTE.—A settlement has been effected in regard to the dispute between the Tees-side and Hartlepool Master Builders and the Tees-side and Hartlepool District of Carpenters and Joiners over the question of wages. The ceased work about two months ago because the employers declined to advance their wages from 9d. to 10d. per hour. The masters offered 3d. per hour at the time, but the men refused to accept this. Since then there have been repeated negotiations between the two parties, with the object of coming to a settlement. Finally the masters advanced their offer to 3d. per hour, conditionally upon the men agreeing to an alteration of the rules, stipulating that the rules in force in the Sunderland district should be adopted. This arrangement has been agreed to and a settlement has been effected. About 300 men altogether have been affected, the district comprising Stockton, Thornaby, Middlesbrough, and the Hartlepoons.

#### LEGAL.

##### POINT UNDER THE LONDON BUILDING ACT, 1894.

THE case of the London County Council v. Ellis came before a Divisional Court of King's Bench, consisting of Justices Darling and Phillimore, on the 12th inst., on a motion on behalf of the defendant calling upon Mr. d'Eyncourt, the Metropolitan Police Magistrate, to show cause why he should not state a special case for the opinion of the High Court. It appeared that the Council had issued two summonses against the defendant for alleged contravention of the London Building Act, 1894, in erecting a building beyond the general line of buildings. The defendant Ellis had an old building at the place in question, and he started to erect two other buildings, but the Council took objection to this on the ground that, if he erected them as a separate structure, he would commit a contravention of the Act by building beyond the building line. The defendant then seemed to have made an

extension of the old building but the magistrate found as a fact that there were really two buildings and ordered the demolition of the new one. It was said that if it was an extension of the old building, its erection was not a contravention of the London Building Act. Mr. d'Eyncourt refused to state a case on the ground that the point was a frivolous one. Hence the present motion on behalf of the defendant.

Mr. Justice Darling considered that no ground had been shown for ordering a rule and that the magistrate was right in holding that the point was a frivolous one.

Mr. Justice Phillimore concurred and the application was accordingly refused.

Mr. R. Cunningham Glen appeared in support of the application.

On Monday, the 15th inst., Mr. Glen in the Court of Appeal composed of the Master of the Rolls and Lords Justices Vaughan, Williams, and Stirling, moved, *ex parte*, on behalf of Mr. Ellis for a rule *nisi* calling on the magistrate to show cause why he should not state a case for the opinion of the High Court. The learned counsel having stated the facts,

The Master of the Rolls asked if the learned counsel contended that this was an appealable matter.

Mr. Glen said the rules laid down that when an *ex parte* application was made to the Divisional Court and refused, a similar application could be made *de novo* to the Court of Appeal.

The Master of the Rolls: You did not think fit to come here in the first instance? You tried first the Divisional Court?

Mr. Glen replied that the proceedings were in the nature of a mandamus, and an application could be made to the Court of Appeal *de novo* when refused by the court of first instance.

The Master of the Rolls: Why did the Divisional Court not grant you a rule?

Mr. Glen: Because they agreed with the magistrate that the application was frivolous. The points of law were raised before the magistrate, and he, having taken three weeks to consider those points, afterwards decided they were frivolous. I submit they are not frivolous. It is a very serious matter to the applicant because he will have thrown away 2,000*l.* if he has to demolish these buildings.

After further discussion the Master of the Rolls said he thought the best plan would be for the Court to grant a rule *nisi* calling upon the magistrate to show cause why he should not state a case because the matter was of great importance to Mr. Ellis, as it involved the pulling down of a building which had been erected in the order stood. It must be understood by the Court granting a rule that the Court considered the points of law taken on behalf of Mr. Ellis were not frivolous. The magistrate might be able to satisfy the Court that the points of law taken were frivolous, and then the order *nisi* would be set aside. In these circumstances, he thought the application should be allowed, and that the costs of this application had better stand over until the matter was decided.

The Lords Justices concurred.

Order accordingly.

CASE UNDER THE LONDON BUILDING ACT, 1894.

LONDON COUNTY COUNCIL v. GARDINER: BAD MORTAR.

At the Woolwich Police court on the 5th inst., before Mr. d'Eyncourt, the magistrate, Frederick Gardiner, of 21, East Hill, Plumstead, was summoned by the London County Council for using mortar in the erection of a building in Grosmount-road, Plumstead, not composed in accordance with the by-laws of the London County Council; he was also summoned by Mr. Batterbury, District Surveyor for Plumstead and Eltham, for non-compliance with notice to amend certain irregularities committed on such buildings in Grosmount-road.

Mr. Andrews (solicitor) prosecuted for the London County Council; and Mr. Tyrrell, instructed by Mr. Lewellyn Davies, appeared for defendant.

Mr. Batterbury gave evidence to the effect that on March 4 he took samples of mortar from between the bricks of the walls and another from the mortar bed. All samples were found to contain an insufficient quantity of lime and to contain earthy matter. The Council's by-law required that the mortar should be composed of one part lime to three parts sand or grit. Notice was served on the defendant to take down the wall built with the bad mortar, but he did not comply with that notice, nor with a second one served later on, but went on carrying up the walls of the building. The mortar in question was rotten and would never bind the bricks. A portion of the wall was blown down. The composition of the mortar used by the defendant was such as to render the wall weak and unsafe.

Mr. E. W. Knight and Mr. Conder, District Surveyor of Woolwich, also gave evidence.

Mr. Grimwood, Chief Assistant Chemist to the London County Council, spoke as to the analysis of seven samples of the mortar, showing that they contained from 64 to 120 of earthy matter, from 20 to 99 of carbonate of lime, from 68.8 to 70.0 of

grit, and from 27 to 66 of lime (CaO), and that the proportion of commercial lime (of 80 per cent. CaO) to sand and grit by volume varied from 1 of lime to 5.2 of grit, &c., to 1 of lime to 10.9 of grit, &c., and stated that none of the samples were in accordance with the Council's by-laws.

For the defence, it was urged that the mortar, although dark in colour, was sound. As it was difficult to get sand, sifted gravel which contained a good deal of grit—obtained in the neighbourhood—was used in its composition.

Some workmen were called to speak as to the good quality of the mortar, one of whom caused great merriment by stating that he had seen better mortar, and then, when questioned, candidly admitted that he had never seen worse.

Mr. Tyrrell asked the Court not to adopt the drastic course of ordering the demolition of the building.

Mr. Andrews pointed out that it was the defendant himself who had brought about his present position by going on with the work after he had received notice then and there to remedy what had been complained of. But he would consent to an adjournment, if the defendant would undertake to give every facility for the District Surveyor to take samples of the mortar from those portions of the walls built after the notices had been served upon him to ascertain whether the mortar used in those portions was of any better quality than the mortar complained of.

The defendant having given the undertaking stipulated, Mr. d'Eyncourt adjourned the summonses *sine die*, but with the understanding that the case must be entered within two months.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

5,065.—JOINTS FOR DRAIN AND OTHER PIPES: *J. A. Reid.*—Additional annular recesses are fashioned at the socket and spigot ends respectively of the pipes, which can be more readily laid by resting them upon chairs, jointing material is then filled in the spaces between the pipe-ends.

5,080.—A MICROSCOPE GAUGE: *W. H. Lock and H. Asherwood.*—A ram mounted upon a screw-threaded spindle, and certain screw-threaded tubular parts, constitute the gauge. A feather prevents the ram from rotating. The advance or retirement of the ram is effected by turning a thimble, and the rate of that movement will be in ratio to the sum of the pitches of the right and left handed screw threads, but the movement of the ram will become due to the difference of the pitches when another thimble is turned. To the former thimble is screwed a spring-bar, of which the nose will engage with a slot cut lengthwise in the hub whereby the thimble will be locked so that its index mark shall be in line with a scale graduated upon the hub that gives the largest readings, another scale gives medium readings, whilst a scale upon the latter thimble gives the smallest readings.

5,083.—SCREW FANS FOR USE IN MINES: *C. P. Kay.*—The inner ends of the radial arms that carry the blades of screw fans are fastened with set screws and the blades are spread out at their peripheries with screw bolts for reducing their pitch, whilst a ring engages with recesses cut in the outer faces of the blades. Beams sustain the fan within the shaft, and eddies near the axle are obviated by means of a hanging cone.

5,098.—PRESS OF MORTAR BRICKS: *Hall & Bauhinian & Hall.*—The bricks are impelled from the cutting-table or machine on to sliding sections or blocks, from which they are separated with levers, and are then forced from the sections on to a pallet and conveyed to the drying-bed. The blocks or sections, which slide upon guiding-roads, are joined to levers with cranked arms, the parallel levers being joined to links, and their lengths being extended from the middle outwards, so that the outer blocks shall acquire an increased rate of speed. Instead of the last-mentioned arrangement, however, the blocks can be set so as to slide outwards at each side of a fixed section, and to slide all together in one direction from a block fixed at their end.

5,112.—AN APPARATUS FOR CALCULATING THE SECTIONS OF BEAMS, COLUMNS, GIRDES, &c.: *W. Dobson.*—A frame, to the centre of which a radial arm is attached, is formed of a base and a semi-circle; the T-head of an index-rule slides along the base, and screws clamp the radius-arm and the indicating rule; scales for I-beams, together with other scales, are provided.

5,119.—A SCARIFIER FOR MACADAMISED ROADS: *W. Lambert.*—For an improvement upon the machine specified under No. 28,970 of 1897, the inventor mounts the frame upon two sets of ballast and steering wheels; the latter are carried by forked steering-shafts joined to the draw-bar with nuts and toggle-levers in order that the machine shall when propelled, repose upon one set of wheels, but, when drawn, upon the other set. When it is not being used the tines are fixed with stops; the tine-holder, or tumbler, is worked with a connecting-rod that engages with the draw-bar. For purposes of steering check-rods are inserted into holes in the steering-rod, and of which the forked ends embrace the steering-shafts.

5,161.—A TRIPOD STAND FOR SURVEYING INSTRUMENTS, &c.: *C. de Rodan.*—For reducing the adjustable top to small compass it is made of four frames, which are hinged to one another at different sides in such a manner that the top which carries the instrument may be levelled with screws; on the base-board are three brackets, to which the legs are joined with pins passed through holes in the brackets, and in projections from plates that are secured by means of bayonet joints to the legs; each leg is formed of an elastic band wound helix-wise, and has a point which is fixed in a hard-wood block fastened to the metal band; for increasing the stability of the tripod a cord from the middle of the base-board is secured in the ground with a fork.

5,160.—A MACHINE FOR LAYING BRICKS AND MORTAR: *J. H. Knight.*—A telescopic shoot or endless band feeds the bricks to the machine (see No. 21,823 of 1899), whilst an upper weighted or spring roller, together with side rollers, either mounted upon telescopic spindles or lowered for laying the ground course with spindled extensions, press the bricks together in their places; a bevel and spur gearing drives the rollers at a rate faster than that of the machine, and can be inclined for raising the bricks over the mortar; a spring draws the rollers inwards, or one of them may be mounted upon a pivoted arm which a spring draws inwards, and the other may be attached to a fixed spindle; the spur gearing has a friction-clutch that will slip as soon as the rollers have pressed a brick into position; as the handle of the machine is turned, a sprocket-wheel will run upon a chain which is secured to a girder that is held up with struts and brackets, and is vertically adjusted with wheel-nuts and screws; rubber rollers, pneumatic tyres, or endless bands prevent the mortar from escaping from the joints, and a scraper takes away the superfluous mortar.

5,179.—A TOOL FOR USE IN MAKING PIPE JOINTS, &c.: *J. G. White.*—A tool for compressing the joints of leaden pipes, the sheathing of electrical cables, and so on. The surfaces, being coated with mercury, have dies that are attached loosely with pins (which are passed through slots) to recesses cut in the pivoted arms. In another shape, tubular dies are set around the amalgam-covered flanges of the pipes, and are split with tapered outside surfaces which similar surfaces will force into the recesses of the pivoted arms. The method of jointing is specified in No. 5,176 of 1900.

5,193.—TREATMENT OF WOOD: *G. F. Lebiada.*—The apparatus is devised for impregnating the fibre of tree trunks, railway sleepers, and timber in general, with dyeing, fireproofing, preserving, and similar solutions. A closed container, having a sized end, receives the logs into the end, which are forced cups, having sharp edges, by hydraulic pressure. Tubes join the cups to a chamber, and the interior of each cup is joined to another chamber. Pressure into the inner chamber draws out the cups. When the cups have been forced into the timber ends, the casing is charged with a solution under great pressure, and the residue is then drawn away. The solution may be afterwards forced through the wood in the reversed direction.

5,210.—BURNERS FOR VAPOUR AND GAS: *J. Sala.*—The gas or oil feed-tube is inserted through the base of the casing of the burner (which can be used with gas) and its connecting-piece joins the burner to the lamp, heat-conductors are passed through a gauze cover of the top of the burner and inside the burner-tube which has a double outer casing that, for the use of liquid fuel, is heated with a small lamp which starts the burner, when the liquid fuel becomes vaporised and the hot air and vapour ignite over the gauze.

5,253.—MEANS OF FLUSHING AND DISINFECTING DRAINS: *J. E. Lewis.*—For flushing purposes a tipping-tank is placed within a chamber that communicates by a passage with the drain, the discharge from the tank that contains the disinfectant is controlled with a cylinder around which are pockets that, as the cylinder revolves, will fill and discharge alternately into the flushing tank. For rotating the cylinder is arranged a float that moves in guides and has a rack for engagement with a pinion and pawl upon the shaft of the cylinder which is thereby worked by only the ascent of the float.

5,271.—A CIRCULAR SAW MACHINE FOR CUTTING LATHS AND STRIPS: *B. Lehmann.*—The wood to be sawn into thin laths or strips is clamped on to a slide worked with a rack and pinion that run loosely upon the shaft, and which a clutch throws into engagement as a roller upon the slide in its movement backward strikes an inclined plane upon the clutch-lever, a shoulder upon a spring-lever locks the end of the clutch-lever, and the slide and wood are fed forwards until a stud has pressed the spring-lever back, thereupon a weighted lever sets the clutch free and a weight returns the slide, which is provided with stops for moving a lever which keeps the wood away from the saw during the return stroke. As soon as all the wood has been sawn, a spring that forces it against the fence strikes a stop for permanently disengaging the clutch, another inclined plane forces back the laths as they are cut off the wood.

5,270.—BALL-AND-FLOAT VALVE: *J. W. Dickinson.*—This apparatus is adapted for a high-pressure service; at the end of the float-arm is a forced extension-piece pivoted on to a casing that slides

and on to two swinging arms which are pivoted on to the supply-pipe; the valve is sustained by the casing which slides upon the end of the supply-pipe, whilst the leverage exerted by the float forces the valve firmly against the supply-pipe.

5,285.—EXPANDING GIRDER. H. E. Janies.—The inventor has devised an expanding girder for use in the construction of roofs, piers, bridges, fire-escapes, elevators, &c.; and in window-cleaning, lamp-lighting, and so on. The girder consists of pivoted bars, joined with cross-rods to parallel bars in the form of a "lazy tongue"; the lower ends of the upper bars are secured to a platform, and move a slider upon it, respectively. On the platform is a hand wheel for turning a screwed rod that works the slider; in another form the lower ends of the lower bars roll in guides upon the support, their ends being attached to spring or hydraulic power regulated pistons, or for the cross-rods may be substituted cross-levers, disposed in the "lazy-tongue" fashion, and the guides for the ends of all the bars are set diagonal-wise; for bridges a girder after the kind specified is expanded from either bank horizontally, the opposite platforms being fastened together.

5,288.—PAPER SEAT-GUARDS FOR WATER-CLOSETS: D. Grant and Sons.—Underneath the seat pan of a water-closet, a small disc, is fastened a ring of paper, and upon a hanging strip are made pockets which the flush will fill with water, the used guard being thus washed away. A wire spring frame holds down the cover, and the front edge of the seat is clipped by the frame so that when the closet is used the middle part of the cover becomes burst open. Tags serve for drawing the guards from their holder, which is secured to the wall.

5,290.—AN APPLIANCE FOR SCREW-DRIVERS: F. Gude.—The spindle to which the blade is affixed has a cross-handle and screw-head which engages with the head that is mounted upon three legs rising from a base; the legs and the head are joined by means of spring bolts. The workman stands by the base and inserts the blade into the pick of the screw as he slackens the nuts and raises the spindle.

5,297.—MEANS OF STRENGTHENING CEMENT AND SIMILAR PIPES: G. H. F. E. M. Drenckhan and C. H. A. C. Sudhoff.—The top and side walls of the pipes are thickened, or by inserting some such resistant material as hoop iron, wire, &c., in the section of the pipe that it may lie near the inner wall at the crown and sole but near the outer wall at the sides, and strengthening metal pieces are placed lengthwise within rib-shaped crossbands.

5,417.—SIPHONICAL DISCHARGE: T. W. Woodhouse.—A reduced opening which is formed by fitting the upper edge of the well either wholly or partly with a flange, takes the lower portion of the bell which (for starting the flush) is firstly lifted and then allowed to fall, or the flush may be started with the pull-chain if the bell is counterpoised in the lifted position. In another shape the bell is provided with an additional concentric flange, the well being built up upon the bottom of the tank.

MEETINGS.

THURSDAY, JULY 18—WEDNESDAY, JULY 24. British Archaeological Association.—Annual Congress to be held at Newcastle.

MONDAY, JULY 22, TO SATURDAY, JULY 27. Architectural Association.—Annual excursion; headquarters at Cirencester.

By C. C. & T. MOORE.

Table listing various properties and their details, including location, area, and other specifications. Includes entries like Buckhurst Hill, Rotherhithe, Forest Gate, etc.

PRICES CURRENT (Continued). BRICKS, &c.

Table listing prices for various building materials such as bricks, tiles, and slates. Includes items like Two Sides and one End, Spalls, Chamfered, etc.

PRICES CURRENT (Continued). WOOD.

Table listing prices for various types of wood, including Yellow Pine, Kauri Pine, and other species. Includes details on dimensions and grades.

PRICES CURRENT OF MATERIALS.

\* \* \* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table listing prices for various materials like Hard Stocks, Rough Stocks, Facing Stocks, etc.

BUILDING WOOD.—YELLOW.

Table listing prices for yellow building wood, including deals, battens, and various sizes of timber.

LEAD, &c.

Table listing prices for lead, zinc, and other materials, including sheet lead, pipe, and solder.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors.

We cannot undertake to return rejected communications.

Letters or communications (beyond new items) which have been duplicated for other journals are NOT DESIRED.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory.

The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHERS, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

**"The Builder" Student's Series.**

Books sent from the Office, POST FREE, on receipt of remittance.

**7/6 LAND SURVEYING AND LEVELLING.** By ARTHUR T. WALMSLEY, M.I.C.E., F.S.I., F.R.C.S.L.,  
 Hon. Assoc. R.I.B.A. With 141 Illustrations.  
 A useful book for a student, containing not only the usual instruction given in a Text-book on this subject, but valuable  
 additions from the author's own experience, and an extensive chapter on the Principles of Surveying.

**6/- FIELD WORK AND INSTRUMENTS.** By ARTHUR T. WALMSLEY, M.I.C.E., F.S.I., F.R.C.S.L.,  
 Hon. Assoc. R.I.B.A. With 24 Illustrations.  
 Gives the Student a practical knowledge of the construction and handling of surveying instruments, and how to deal with their  
 application in the field for setting out work.

**7/- STRUCTURAL IRON AND STEEL.** By W. N. TWELVEBTRES, M.I.M.E.,  
 With 234 Illustrations.  
 In this elementary Treatise, the author has endeavored to present in a regular sequence some of the more important details  
 relative to iron and steel as applied to structural work.

**5/- STRESSES AND STRAINS; THEIR CALCULATION AND THAT OF THEIR RESISTANCES, BY**  
 FERDINAND RICHARD FARROW, F.R.I.B.A. With 95 Illustrations.  
 A Handbook for Students, particularly those preparing for the examinations of the R.I.B.A. and arranged and intended especially  
 for those whose knowledge of mathematics is limited.

**3/6 SPECIFICATIONS FOR BUILDING WORKS, AND HOW TO WRITE THEM.** A Manual for  
 FERDINAND RICHARD FARROW, F.R.I.B.A. Architectural Students.  
 Shows the Student how he should write a specification, so that when he has learnt the method and general principles, he may apply  
 them to the particular exigencies of any building he may design.

**3/6 QUANTITIES AND QUANTITY TAKING.** By W. E. DAVIS. (2nd Edition.)  
 A valuable Handbook for the Student, pure and simple, the scope being limited to the method of procedure in the production of a  
 good Bill of Quantities. The examples given, whilst intentionally simple, will be found to cover almost every phase of the subject.

**5/- CARPENTRY AND JOINERY:** A Text-book for Architects, Engineers, Surveyors, and Craftsmen.  
 By BANISTER F. FLETCHER, A.R.I.B.A., and  
 H. PHILLIPS FLETCHER, A.R.I.B.A., A.M.I.C.E. With 124 Illustrations.  
 Intended for those entering for the examination of the City and Guilds' Institute, the Carpenters' Company, and the Institute of  
 Certified Carpenters, &c. Also for the examination in these subjects by the R.I.B.A. and the Surveyors' Institution, &c.

**5/- ARCHITECTURAL HYGIENE; or SANITARY SCIENCE AS APPLIED TO BUILDINGS.** By BANISTER  
 F. FLETCHER, A.R.I.B.A., and  
 H. PHILLIPS FLETCHER, A.R.I.B.A., A.M.I.C.E. With 393 Illustrations.  
 A concise and complete Text-book, treating the subject in all its branches, and intended to be of use to those entering for any  
 examination in Sanitary Science.

London: DOUGLAS FOURDRINER, "Builder" Office, Catherine Street, W.C.

**R.I.B.A. SOCIETY OF ARCHITECTS,**  
 SURVEYORS' INSTITUTE, and CIVIL SERVICE TECH-  
 NICAL EXAMINATIONS. Preparation by correspondence or  
 residence. Private lessons in Stresses, Land Surveying, &c.  
 MIDDLETON & GARDNER, 19, Craven-street, Strand, W.C.

**PURSUANT to an Order of the Chancery**  
 Division of the High Court of Justice made in the matter of  
 the Estate of JESSIE HONEYHURST deceased between MARY  
 MARY LEWIS PLAISTER and EDWARD HENRY TOWNSEND and  
 CHARLES LEWIS PLAISTER the creditors of Jessie Honeyhurst  
 late of No. 2 Highfields-lane in the County of South  
 London who died in or about the month of APRIL 1899 are  
 or before the 1st day of OCTOBER next to be met, and  
 to PRECY JAMES NICHOLLS of 25 Finsbury-lane in the City  
 and Charles Lewis the executors of the deceased their co-judges and  
 surrogates addresses and descriptions the full particulars of which  
 claims a statement of their accounts and the nature of the securities  
 (if any) held by them or in default thereof they will be promiscuously  
 admitted from the benefit of said order.  
 Every creditor holding any security is to produce the same  
 before Mr. Justice Byrne at his Chambers, The Royal Courts  
 of Justice London on the 24th day of OCTOBER 1901 at TWELVE  
 o'clock noon being the time appointed for adjudication on the claims.  
 Dated this 16th day of July 1901.  
 J. J. CHAPMAN,  
 No. 4 Gray's Inn-square, W.C.  
 Plaintiff's Solicitor.

**ADVERTISER, an Architect, shortly**  
 returning to Cape Town, is open to TAKE UP AGENCIES  
 in SOUTH AFRICA for British or foreign manufactures.—Box 134.  
 Office of "The Builder."

### Architecture Considered as a Business.

HE question whether an architect's place of work is to be regarded as an "office" or a "studio" is closely linked to the other and larger question whether archi-

ture is a "profession" or an "art." Which is the view adopted by the owner or tenant of the rooms one can judge pretty well at first glance on entering them. In the purely professional architect's "office" we shall see rows of drawers or other receptacles neatly labelled with clients' names and with the classified subjects of trade catalogues, and walls decorated with plans of estates and neat perspectives or photographs of desirable villas built on them. In the art-architect's "studio" one is likely to find, it must be admitted, less of order and regularity but more of variety and interest; models of various decorative details, treasured bits of wood-carving and mosaic and stained glass; perhaps a statuette or relief presented by a brother artist; and so on. The one regards himself as entrusted with the investment of other people's money in building, and the carrying out of buildings so that the client shall get the best commercial value for his money; the other regards himself as commissioned to produce something which shall be a work of art, and does not concern himself much with routine or system of work provided the result be satisfactory from an artistic point of view. He may perhaps waste some of his client's money and of his own time, but this is forgotten if he produces a building of permanent beauty and interest. The "office" architect is probably much more punctilious both as to giving the client value for his money and getting value for his own time; he has everything cut and dried, and can account for every hour of his and his clerks' time; and his architecture is cut and dried also.

We are supposing examples of the two extremes. There may be modifications; but only we think on one side. An architect whose great concern is to produce artistic and beautiful buildings may nevertheless be methodical and businesslike in his habits;

it is better that he should be so, and there is no reason in the nature of things why he should not. But we doubt if the architect whose first thought is order and method and punctiliousness ever gets beyond orderly architecture. As Crabbe says, after describing how "The Learned Boy" lettered and arranged his books before beginning to read them—

"The love of order—I the thing receive  
From reverend men, and I in part believe—  
Shows a clear mind and clean, and whose needs  
This love, but seldom in the world succeeds;  
And yet with this some other love must be.  
Ere I can fully to the fact agree."

We do not see much indication of the "other love" in the book on office management which has mainly suggested these remarks.\* Mr. Kaye Parry, who we see is a member of the Institution of Civil Engineers, as well as a Fellow of the Institute of Architects, writes his book "for architects and engineers;" judging from the whole tone of it, he evidently regards architecture purely as a business; and in truth we do not see that any man who gave so much attention to the elaboration of system in business routine would be likely to have much thought to spare for the higher side of the pursuit of architecture. At the same time there is the other side of the truth hinted at by Crabbe, that people without order and method seldom succeed in life; and to those who have not realised the desirability of method Mr. Parry's book may afford valuable suggestions, without their thinking it necessary to follow the author into all the details of his system.

If architecture is to be carried on as a business, the author's suggestions in the first chapter in regard to office organisation and the keeping by every assistant of a diary of his work are admirably to the point. On his system, as he says, the principal will always know what fees he ought to charge for any out-of-the-way and miscellaneous professional work; and where architecture is pursued with the end of pocketing fees this is no doubt most desirable. It may even conduce not only to a definite judgment on the fee to be charged, but to expansion of the fee itself. We heard it said once of an eminent and very business-like architect (long

since dead), that he would come down to make a survey of buildings for alterations with four assistants; two of them measured, two looked on, and the principal talked to the client, and charged for his own time and four assistants. But this was in the good old days. To say that there are some people who would rather name a round sum, even a little under the mark, than be troubled with these book calculations, would no doubt seem to Mr. Parry a painful example of human weakness and wrongheadedness. But if it is desired to keep this accurate record, the form of "Every Hour Diary" recommended by the author, and issued by a Dublin publisher, has the great merit of simplicity. And we quite concur with the author's advice to have an "Engagements" diary always in the pocket; engagements should be entered on the spot and at the moment, or it is not certain that they will be entered correctly, if at all; and whatever view our readers take of the architect's calling, we hope they will all be of one mind in considering that punctuality in keeping appointments is a virtue absolutely required from every member of the human society. A man who is not punctual to his appointments is not only his own enemy—as he will discover in the light of a fading practice—he is the enemy of the human race; he wastes the time of blameless fellow-men who have taken him at his word. The first steps towards this vice should be resisted. As De Quincey well says, a man who has once committed murder will not stop there; he will take to burglary; you will next hear of him as a drunkard and a Sabbath-breaker, till he finally sinks into procrastination and unpunctuality. Against such a fate a handy pocket engagements book, duly used, is at least the human means of salvation; and we agree as to the form of it; it should consist chiefly of dated blank pages for writing in, not burdened and made cumbersome for the pocket by the addition of many pages of printed matter which the bearer does not need, at all events, while travelling about.

On the question of regularity in office hours we are a good deal in sympathy with Mr. Parry. He asserts, however, that there is a great laxity in many offices as regards office hours; and if in this sentence he refers, as apparently he does, to the staff, we cannot judge whether he is right or not,

\* Office Management: a Handbook for Architects and Civil Engineers. By W. Kaye Parry. London: E. & F. N. Spon. 1901.

as we have no means of knowing, and we cannot understand how Mr. Parry knows, unless he makes it part of his business to call at early hours at other men's offices and find out whether the clerks have arrived. For our own part, we have rather a conviction that in the main architects' assistants are a great deal more regular in hours of attendance than their principals. As a rule we are inclined to think that the young men who are articulated pupils of architects, or who, from having been articulated pupils, have soared—if it be soaring—into the position of paid assistants, are a very conscientious race in regard to their duties towards their master or employer; few or none more so. The principals are, no doubt, on different lines, equally conscientious men; but it is very difficult (and here we have some experience to go upon) to catch them at their offices. Unless you have made an appointment with him, we do not know that there is any kind of professional man (if he is "professional"—there we go round the circle again) whom you are so unlikely to find at his office as a London architect of any standing. Almost the stereotyped answers are either that "Mr. — is not in, and we cannot say when he will be," or that "he will not be here to-day." In comparison with some other professions, this is of course to a certain extent comprehensible. An architect who takes interest in his work goes about a good deal to inspect it; and an architect who gives thought to his designs finds he can best elaborate them at home, where no one can interrupt him. Still, we cannot but think that architects would be wise to have, more often than most of them seem to have, a definite time when they are to be found at their offices, God willing and weather permitting. With the recommendation that the principal will best ensure regularity of attendance by himself keeping the same hours as his staff we are very much in sympathy; there is a wholesome and honest ring about it, and at all events we think it should be followed in regard to the time of arriving at the office. There is nothing better for the progress of work, and (proverbially) for the health of the worker, than an early start. Whether the doctrine is to be pushed to the length of keeping the same hours altogether is another matter. It is one of the dearly-bought privileges of a man who has struggled into a good position in his profession, to be able to feel that he is the master instead of the servant of his time. If he chooses to go off on a bicycle run on a fine afternoon, and make up for it by working at night, he has earned the right to do so. But he should remember that his pupils and assistants, who have not yet gained the pinnacle, have a right to definite hours of leaving off as well as of commencing work. That is their standard of liberty, with which his own must not interfere.

With the author's remarks and recommendations as to the orderly conducting of correspondence we are entirely in agreement, and especially with the recommendation that the day's letters should be opened and the replies dictated before any other business is entered on. And here comes in one of the great advantages of early hours on the part of the principal. Quality and style of letter-paper too, as Mr. Parry observes, is not without its importance, as unknown correspondents judge of a man's status to some

extent from these indications. Heading the letter-paper with the architect's name is a frequent practice, but in our opinion not "good form," nor can we call to mind any architect of the highest position who adopts it. The omission of the printed name, however, renders it incumbent on the architect to sign his name legibly and not in a cryptic style; a matter in which men in many professions besides architecture are culpably careless. Then they write unreasonable complaints that their names are wrongly spelt in a paper or a document—the fault lying with themselves.

In regard to the conducting of the correspondence the author remarks—

"It is most unwise to entrust any one with the responsible task of opening letters addressed to the firm or to the individual professional man. It is scarcely necessary to add that it is destructive to discipline to permit either a client or contractor to address a letter to any member of the staff on any business matter. This must be put down at once, with much firmness, if the principal is to be the master.

Some professional men allow their confidential clerks to receive letters relating to office matters, but it is a practice which cannot be too strongly condemned."

We are inclined to think it is a not uncommon practice in large offices, but we entirely concur in the condemnation of it. It is not only a question of discipline as regards the principal's position in his own office; there are also the rights of the correspondent to be considered. A correspondent may write a letter to the principal which, without thinking it necessary to mark it "private," he nevertheless would not have wished one of the clerks to read; and it may be a considerable annoyance to him to find that the privacy of his communication has been invaded.

Questions of businesslike procedure with regard to an architectural practice may be divided into those which only concern the internal economy of the office, and those in which the interests of outsiders are implicated. The question of the disposal of drawings of works in progress, and still more of those which are completed, and which accumulate to such a formidable extent in a large office, is a serious one which perhaps is not very often dealt with as systematically as it should be. Mr. Parry makes one very simple but really invaluable suggestion, to the effect that each new work, as soon as drawings of it are commenced, should be distinguished by a number, which should be affixed to or imprinted on every copy of drawings or specification referring to that work. There is an immediate convenience in the saving of a great deal of long title-writing on each drawing; but this is doubly apparent when the drawings have to be stocked for preservation and for possible future reference. No system of storage ought to be considered as satisfactory which requires drawings to be either rolled or folded into creases. In a year or two such drawings, if they have to be taken down for use for alterations or additions, have acquired a "set" which renders them very difficult and irritating to deal with. The author contemplates that such drawings may be rolled and pigeon-holed, but he also suggests a better method, viz., binding them with brown paper along the left-hand margin, and letting them lie over one another flat, on shelves, which must be pretty numerous and close together, otherwise

the weight of the mass will make it difficult to extract the lowest layer from the shelf. And here comes in the value of Mr. Parry's system of *opus* numbers, for each bound parcel can have its number written large size on a card or label to be fixed to the outer left-hand corner of the parcel, and as the consecutive order of the numbering should always be preserved, the drawings under any number can be found and produced at once. The system would probably take up a little more cubic space than rolling or folding and pigeon-holding, but its increased convenience and readiness should more than compensate for this. Another excellent suggestion of the author's is the keeping of a book of tear-out forms for the requisition of drawings asked for by contractor or client. Contractors frequently have cause to complain that they are kept waiting for detail drawings which they require, and then there comes the chance that no one in the office admits to knowing of the request. Mr. Parry's system is that it should be the duty of any assistant, or of the principal, immediately on being applied to for a drawing, to fill up and date a requisition form for it, giving the *opus* number of the work and the definition of the drawing required. This is to be handed to the head draughtsman, who files it till the drawing is made, and returns it with the drawing and with the date of its being furnished filled in. Until the drawing required is furnished, the requisition order on the file is a standing reminder of it.

On the other hand, the author's chapter dealing with what some people will be disposed to call "the catalogue nuisance" is a great deal too serious. He seems to regard it as a necessary part of a well-conducted practice to file and index every trade catalogue sent in, and has an elaborate system by which any one of them can be turned up at a moment's notice. He is even sarcastic at the expense of those who do not see this:—

"For those architects who prefer to muddle along anyhow, and whose lofty souls will not stoop to such trifles as the mere arrangement of catalogues, these observations will have no attractions, and the writer has neither the desire nor the power to win converts from such a class."

That such catalogues as the architect judges it worth while to keep by him should be themselves catalogued, or arranged on such a system that any one can easily be found when required, or replaced by a new edition from the same firm, is of course a mere matter of common-sense; but when the author offers his elaborate system for enabling the users of catalogues "to reduce their brain-worry and actually lengthen their days," it may be suggested that a more direct way of achieving this end would be to drop three-fourths of such catalogues into the waste-paper basket. Any architect with his wits about him can judge from a momentary inspection whether a catalogue sent to his office is likely to be of use to him, or to offer him anything better than he has previously had from other firms in the same line of production. If not, it is much better thrown away. There is nothing more unwise than changing from one firm to another for the mere sake of change, or to "give another firm a turn," or even (a reason that seems to be hinted at by the author) to impress your client with your all-round knowledge of everything that is in the market. An archi-

tect who has once found a firm turn out perfectly good and reliable articles in any special line, will be wise to keep to that firm, and will probably do best for his clients in doing so. And if he goes on that system, a very moderate stock of catalogues will serve his requirements.

In regard to some of the more important points of business procedure in which the interests of others than the architect himself are concerned, Mr. Parry, whose views on questions of this kind are of the soundest kind, refers among other things to the great importance of the architect commanding the full confidence of contractors tendering. As the author puts it, "the higher the character which the architect has for honest straightforward dealing, the better value he will get for his clients. On the other hand, if contractors or business firms fear that the architect may exercise favouritism, they will certainly protect themselves by putting on an extra 5 or 10 per cent." It is also indubitably true that the more complete the drawings and specifications are, the closer will be the tendering. There is, however, another possible explanation of great differences in tendering, besides the two which Mr. Parry names—ignorance on the part of the firms tendering, or ambiguity of plans and specifications. Firms occasionally tender high because they do not want formally to refuse an invitation, but have reasons for not wishing to undertake that particular work. From a further passage in this chapter ("Estimates") we gather that Dublin practice differs a good deal from London, and that the quantity surveyor is not so all-pervading on the banks of the Liffey as on those of the Thames. Under the heading, "Information for Competitors," we read:—

"When no bills of quantities are prepared, each competitor should be furnished with a complete set of copies of the plans and a complete copy of the specifications. These they should be permitted to retain until they send in their tender.

When the tenders are sent in, the plans and specifications should be returned at the same time in a separate envelope suitably endorsed."

The system under which the plans are sent out, with a form attached to them and an envelope for their return, is described; the author does not mention on what system the copies are made. On a previous page of the book he recommends the tracing of drawings in ink from the pencil originals, as more expeditious than putting the latter into ink, and observes that these tracings can be copied by photography for contractors; so they can, as line drawings, but what becomes of distinctive colouring for showing different materials? However, if the drawings were all traced or copied and coloured in several editions, the cost to the client would be much less than that of the quantity surveyor's fee, and the advantage of the system is that it compels the contractor to acquire a personal acquaintance with the drawings of the building he is to carry out, which on the London system he may waive altogether, tendering on the quantities only, and not even knowing what the building is like. Of course the *mot d'énigme* of the situation is that in London profits have been cut so close in competition that builders do not consider it worth their while to tender at all unless they have the quantities cut and dried; but the Dublin system as described by Mr. Parry is a sounder one—provided always that the plans and specifications are

full and accurate in every particular; it all turns on that.

Mr. Parry's chapter on "Certificates," which necessarily enters a good deal into the relations of the architect both with client and contractor, is in the words of wisdom from beginning to end, and we recommend its perusal to all young architects. They could not have better advice towards avoiding difficulties with, and doing their duty to, both parties, between whom the architect is properly and naturally an arbitrator, whose duty it is to protect the contractor as well as the building-owner from injustice, although the author mentions that an irate client once stated the case thus—"I pay you, and therefore you should side with me"; an argument which was not, however, allowed to be valid. It is seldom put as crudely as that, but perhaps represents a vague misconception to which the client mind is from time to time liable. The author's advice to the architect, to take every means to let his client have as clear an understanding as possible of what the plans mean, what he is to expect from the building and what he is not to expect, should be duly weighed by the young architect. Clients often feel disappointment and dissatisfaction on the completion of a building from not finding something which they expected, and as to which they might have been enlightened at an earlier stage of the work.

To those who regard architecture mainly as a business to make money by, we should imagine that Mr. Kaye Parry's book would be a kind of professional bible, unless they may possibly consider that some of the items of office administration described are, like the system of catalogue-keeping, more complicated than they are quite worth. To those who regard architecture as an art to be practised for higher ends than mere pecuniary success, a good deal of the book will probably appear to be concerned with matters which are no part of an architect's business at all, and only calculated to burden the mind with details which would interfere with more important considerations. Yet we advise these also to look through the book, for they will find valuable suggestions in it on some important practical considerations which those who pursue architecture as an art and not as a business are sometimes too apt to overlook.

NOTES.

ON Tuesday night, in the House of Commons, Mr. Whitmore elicited from the First Commissioner of Works, in answer to a question in regard to the carrying out of the design of the late Mr. Brydon for the Government offices in Great George-street, the statement that it had been definitely decided that Mr. Brydon's building, "all the plans of which are in my possession," shall be carried out by the officers of the Office of Works Department. In answer to a question from Lord Balcarras, as to what would be done with the balance of the 26,000*l.* allotted for the architect's fees, it was replied that it was hoped that thereby "a considerable saving would be effected." Every one who knows the ways of English political life knows what this means. The Treasury wants to get the balance of the money, and the architect having unhappily died, it is supposed that any further expenditure on architect's

The New Government Offices.

fees may be saved. This may be merely stupidity; but if so, it is a degree of stupidity which, in the case of any one holding the position of First Commissioner of Works, is really culpable. Mr. Akers-Douglas says he has got all the drawings, *ie.*, he has got the general plans and elevations; but has he got the detail drawings? And is he so entirely ignorant of architecture as not to know that the very life of such a building, architecturally, consists in the manner in which the details are worked out by the architect? There is not the slightest chance that the building will be properly carried out by the Office of Works; we know only too well what sort of work they will turn out. The only right thing to do is to appoint the best and most scholarly man in Classic architecture to design the detail of Mr. Brydon's building as he might have designed it himself had he lived. If this is not done, the building on which half a million or so is to be spent will infallibly be spoiled to save a few paltry thousands. If any such procedure were proposed in France in the case of a great building of which the architect had died, it would be considered a public scandal; and we do not believe it will be allowed to pass, even in this ignorant country, without a very decided protest from the minority who do know something about architecture.

The Small Art Palace at Paris.

THE Municipal Council, Paris, as mentioned in a footnote to our last "Letter from Paris," have decided on the use of the smaller Art Palace on the Champs Elysees as an Art Museum for the city, and it will henceforth be known as the "Palais des Beaux-Arts de la Ville de Paris," and will receive the collections of works of art which are at present scattered in various places—at the Hôtel de Ville, in other municipal buildings, and in the Magasins des Beaux-Arts at Auteuil. The "Chef de Service des Beaux-Arts" of the Municipality, who will be charged with the arrangement of the new Art Museum, proposes to supply one thing that is wanting at the Luxembourg, by forming a special architectural gallery, in which, along with the principal architectural drawings executed since 1870, will be placed the models of the Hôtel de Ville, the new Sorbonne, the Vaudeville Theatre, the churches of La Trinité, St. Joseph, and other buildings. The lofty gallery along the principal front will be reserved for sculpture, and will have, as its central object, M. Frémiet's group of St. George and the Dragon. The semi-circular gallery around the central garden, which is top-lighted, will be reserved for paintings, and the outer concentric gallery, lighted from the side, will be devoted to engravings, drawings, and special exhibitions. The rooms in the basement will serve for meetings, and committees, and lectures, and for storing sculpture models and casts, and may also be of use for various temporary exhibitions. Under these circumstances M. Girault's beautiful building will probably prove, to lovers of art, one of the attractive places in Paris.

Mr. Long on the Housing Question.

WE wish very much that responsible politicians would deal less in generalities. Mr. Long, the President of the Local Government Board, made a speech last week in which he figuratively laid his hand on his

heart and expressed the importance with which he regarded the housing question. But not one single practical remark did he make. He said nothing definite about future legislation, nothing about the action of the Local Government Board in putting pressure on local authorities, nothing as to the working of the Act of last Session by which District and County Councils were under certain circumstances to improve the housing accommodation in rural districts. Mr. Long was satisfied to utter semi-platitudes. Every one appreciates the importance of the subject, and unless a Cabinet Minister has something authoritative to say on this question he had much better hold his peace. From Mr. Long's speech we should judge that the Government has no intention of legislating on this subject; perhaps it is as well they should not bring in a Bill, for they would hardly have the energy to pass it into law.

**Trades-Unions and Corporations.** THE decision of the House of Lords this week in what is known as the Taff Vale Railway case is one of far-reaching importance. By that decision the House of Lords have overruled the judgment of the Court of Appeal and have restored that of Mr. Justice Farwell, who held that the Amalgamated Society of Railway Servants could be sued as a corporate body. It is clear that if such a body is liable to be sued, it may become responsible for damages for libels, and its action may be restrained by injunctions from the High Court. Its activity may thus in times of labour disputes be considerably curtailed. This development of the law appears to be entirely in accord with common sense. It would be absurd for combinations of persons, whether artisans or capitalists, to be at once powerful and irresponsible. It is a remarkable and a satisfactory feature of English law that it is constantly accommodating itself to the changes of modern society. There are some who, rightly enough, complain of its want of form, but its very want of symmetry enables it to conform to changing circumstances.

**Piccadilly and the Green Park.** In view of the Coronation ceremonies next June, the widening of Piccadilly along its southern side, by the taking of a strip out of Green Park and the setting back of the railings, will soon be put in hand. Some plans prepared at the Office of Works provide for an increase of the width of the thoroughfare which varies from 68 ft. to about 100 ft. between Walsingham House and Hyde Park-corner, so as to vary from 72 ft. at Walsingham House to 90 ft. at Park-lane, 120 ft. at Hamilton-place, and 170 ft. at the western end by Hyde Park-corner. We understand that whilst the Office of Works will defray the cost of altering the levels of the ground and paths within the park railings, the London County Council will be asked to pay a sum estimated at nearly 30,000*l.* for the widening of the roadway and of making a new pathway, 24 ft. wide, along the outside of the park railings in their new position. The Ranger's Lodge, by Robert Adam, 1768, was pulled down in 1820, and when Lord Duncannon was First Commissioner for Public Works the Queen's Basin, a reservoir of the Chelsea Waterworks, at the north-eastern corner and Cowford Pool, fed by the Tyburn,

in the valley of the Park, were filled in (1842).

**The New York Elevated.** THE electrical equipment of the Manhattan Elevated Railway has been practically completed. As it has 75 miles of line and the 200 trains operating on it carry about 200,000,000 passengers per year, it has been a gigantic undertaking, and the American engineers are to be congratulated on the skill with which they have carried out a daring design. Engineers in this country were inclined to think Mr. Parshall rash when he recommended 1,200 horse-power dynamos for the power-station of the Central London Railway and pointed out the stresses that there would be on a rotating armature weighing 43,000 pounds. These machines are, however, dwarfed by the eight alternators erected in the Manhattan Power Station. Each of these is 7,000 h.-p., and each armature weighs 370,000 pounds, *i.e.*, 165 tons. The efficiency of these machines is guaranteed by the makers to be 97 per cent. at 25 per cent. overload. It will be seen that there is not much room for effecting economies by improving the electrical efficiency of a dynamo. As on the Central London Railway, the third rail system is employed, and to protect workmen from accidental shock and to guard against short circuits by accidental contacts, wooden guard strips 2 in. higher than the rail are fixed on each side of it. This simple precaution might be adopted with advantage on several of the electric railways in this country. The electric current leaves the three-phase alternators at a pressure of 11,000 volts and excites ordinary transformers at the sub-stations. From the low tension terminals the alternating current at 390 volts passes into rotary converters and comes out as direct current at 625 volts at which pressure the third rail is maintained. The power required at this rail is 60,000 h.-p. during "rush" hours and 5,000 h.-p. for the remaining period, the average being about 30,000 h.-p. Unlike the Central London Railway the stations are not elevated above the mean level of the track; and hence the saving of power at the start on the down gradient and the reduction of the braking force required to a minimum on the up gradient, cannot be effected. It is stated that the saving effected by this means on the locomotive working expenses of the Central London Railway is thirty per cent.

**Sanitary Work in Liverpool.** THE Annual Report of the Medical Officer of Health for Liverpool is of course largely occupied with matters of purely medical administration. There is evidence, however, that the Liverpool authorities are persevering in their efforts to improve the sanitary condition of dwellings. The courts and alleys continue to decrease in number, owing to the demolition of low class property for the extension of business premises, or to the removal of insanitary property by the Housing Committee. During the year all courts and alleys having covered entrances were specially washed down and hosed by the scavengers (this appears to be done out of the rates). On the other hand one must regret to see that a most useful clause inserted in the Liverpool Corporation Bill of 1898 to enable the Corporation to make by-laws in regard to the lighting, ventilation, drainage, and general

construction of stables, which was confirmed by the unanimous vote of the City Council, was thrown out at the town's meeting, "by persons who gave no reason for their objection to it." The reason could indeed hardly have been a good one. Private, domestic, and office drains are flushed by the City Engineer's staff twice a year; this is a practical recognition of the fact that fouled or impeded drains are a danger to public health, and do not concern only the owners of the drains. Under the head of "insanitary property" we learn that during the past ten years an approximate average of ninety-seven courts, or 679 houses (of an insanitary character), have disappeared annually, somewhat more than half of these having been demolished under the order of the Insanitary Property Committee (now called the "Housing Committee"), the rest having been removed in other ways—some few under the order of the Building Surveyor as being unsafe, but most have been taken down to make room for business buildings. In regard to the provision of dwellings for persons turned out of property which is thus demolished, the Medical Officer remarks:—

"In advocating the desirability of re-housing the people near to their work, the opinion is from time to time expressed that the same number of people who have been displaced must be re-housed upon the sites from which the insanitary property has been removed. No consideration is given to the fact that if this is done the congestion of the people will be as bad as ever it was, nor is it taken into account that in many instances the sites themselves are wholly and entirely unsuitable for the working classes by reason of surrounding warehouses and lofty buildings which shut out the sun, or by reason of the low-lying situation of the sites. Another circumstance which is lost sight of is the fluctuating character of the work, thousands of labourers and their families shifting from place to place and following the work of the contractors at one time at one part and another time at another part of the city. At present the tendency is to locate in the neighbourhood of the Queen's Dock, where extensive works are about to be carried on. Indeed, as the result of a careful inquiry taken in one of the most densely populated labourers' streets, it was found that considerably more than 50 per cent. were engaged in work from a mile and a half to two miles away from their place of residence. These facts prove the practicability of providing for some at least of the dispossessed tenants in the less crowded parts of the city, but within easy access of tram and train."

**Unfavourable Conditions in St. James's.** UNDER this heading Dr. Edmunds, in his Report as Medical Officer of Health to the City Council of Westminster, draws attention to the need for doing something to provide more residences or else more transport for the large number of employees in establishments in Bond-street, Piccadilly, and Regent-street. He says that a vast and growing retail trade for fine goods has encroached upon the neighbourhood of Bond-street, Piccadilly, and Regent-street, while the workers in connexion with it have never been provided with facilities for access to the suburbs, in which they ought to live. Imprisoned, under these circumstances, by the exigencies of their work in St. James's, and by the want of cheap, rapid, timely, and comfortable transport to the suburbs, the cost of lodgings has become insupportable. Also that fashionable tailors, court dressmakers, and other retail trades, which have centred themselves in St. James's, employ a vast army of specialised and highly skilled workers. "If these workers are not to crowd into the

hinterland of St. James's, they must be provided with morning and evening transport between their work-places and their homes—at such hours as will suit their business purposes, so rapid as not to waste time, so cheap as not to encroach too largely upon their wages, and so comfortable as not to fatigue them unduly." From other passages in the Report, we gather that the Medical Officer regards the new form of tube railway as specially suited for the provision of cheap transit to lodgings or dwellings on the outskirts of London. Referring to the congeries of narrow streets east of Regent-street, we quite concur in the opinion that a new street driven through this quarter, parallel to and east of Regent-street, would have a most beneficial effect, increasing the value of sites and leading by degrees to a rebuilding of the whole of this disorganised and labyrinthine area.

**THIS** property, comprising about 1,320 acres, with the Manor of Otterburn, has been placed in the market. It is situated on the north bank of the River Rede. The "Tower," upon the east side of the burn, retains some portions of the earlier stronghold during the Tudor period of the Hall family, which was forfeited at the attainder of John Hall who suffered execution of sentence at Tyburn for his share in the "15." In the Otterburn Ward of Elsdon, at the meeting of the Otterburn and Rede, is the site of the battle fought on August 10, 1388, between the Earl of Northumberland and his son, Sir Henry Percy, Warden of the Marches, and an invading army of Scots led by the Earls of Douglas, Moray, and Dunbar. As they were returning to Jedburgh from Newcastle the latter forces entrenched themselves at Greenchesters, where their camp may yet be traced. Froissart describes the encounter, and upon the old ballad is founded the modern one of "Chevy Chase." The property was withdrawn from sale, at 24,000*l.*, on Tuesday, at the Mart.

**WE** learn that Mr. W. S. Hicks has been appointed as architect for the proposed restoration, at an estimated cost of about 20,000*l.*, of the parish church of Wymondham. The fabric embodies the nave of the church of the abbey which, having been valued at 72*l.* 5*s.* 4*d.* per annum, was granted at the Dissolution by Henry VIII. to the Earl of Surrey. The abbey, as so constituted in 1448, had been originally a priory of Black monks founded by William D'Albini, or Daubenev, in 1130, as a cell to St. Alban's, and largely endowed by Henry I. The western tower, with octagonal buttress turrets, was built in 1445-76 by the parishioners to whom the nave and north aisle were assigned in 1349, the choir and chapels being reserved for the conventual church of SS. Mary and Alban; the choir, north lady-chapel, and transepts have become ruined.

**IT** is a matter of constant surprise that every year the summer sunshine finds the householder little better prepared to alleviate its drawbacks. During the hot weather of the present month any number of people have been inconvenienced and work and pleasure prevented by the want of sun

blinds. With a good sun blind a room can be kept a number of degrees cooler and neither work nor pleasure is prevented, as they must be in a room with an abnormally high temperature. To be sure, in many London houses there are inside sun blinds. These, however, are the most useless of all contrivances. The glass behind them gets ever hotter and hotter, and in the winter they are no protection against wind and cold. Wooden sheets, whether plain or rayed, are the simplest of all these systems, and it is surprising that in country districts they are not more utilised. It is positively melancholy to see rows of suburban villas being so baked in a sunshine which is prized under favourable conditions, that the unfortunate occupant longs for the days of cloud and rain. We do not say that sun blinds obviate all the inconveniences caused by a hot sun, because too many English houses are built so that they are useless with a low or a high thermometer. But the universal use of sun blinds would do much to make life more agreeable in the dog-days.

THE ANNUAL EXCURSION OF THE ARCHITECTURAL ASSOCIATION.

THE headquarters of the Architectural Association for the annual week's study of English architecture in the field have been fixed at the ancient town and Roman settlement of Cirencester, a town hitherto unvisited by the Association, but forming an excellent centre for covering ground left beyond the radius of previous excursions from neighbouring centres as Cheltenham, Oxford, and Bath.

The official arrangements, followed by a large proportion of the members, made the departure from London on Saturday last by reserved carriages on the 3.15 p.m. train from Paddington, and the party thus travelling had, spite of the exalted state of the thermometer, a pleasant journey. The advance guard were joined by various detachments throughout Saturday and Sunday in readiness for the grand attack on Monday morning.

Sunday was spent, as is the invariable custom, quietly, a drive being taken by some of the party in the afternoon to the interesting Church of Northleach, dedicated to SS. Peter and Paul. This is a fine large church, with nave and aisles of five bays, a long chancel with north and south aisles, western tower, and south porch. From internal evidence the tower and south porch appear to have been added to an earlier church, possibly of thirteenth century date, at the beginning of the fifteenth century, and later on towards the end of the century, probably about 1480, the date carved on one of the corbels, the nave and aisles were rebuilt. The tower and porch are of vastly superior design to the remainder of the church, and admirable amongst the best examples of perpendicular wall, the porch having the additional interest of the readily decipherable iconography of the original sculpture.

Internally, there is much worthy of notice: an original stone pulpit and font; the mutilated remains of a stone reredos to the altar in the south aisle, still bearing clear traces of colour; a stone altar now in the vestry, which is hardly likely to be its original position, but which is more probably that of the south aisle. There are also the original roofs of the nave and aisles, flat in shape, moulded and carved, but not very richly; a triple sedilia of pleasing design in the chancel; stair to the rood loft on the north aisle wall; numerous brasses of wealthy traders and wool staplers. The piers of the nave arcade furnish one of the somewhat uncommon examples of concave-faced octagonal shafts. Some curious corbels on the second bay of the north nave arcade, which in detail reproduce the sections of the pier caps, afford a good opportunity for speculation and conjecture, which did not appeal to the architect members of the party to the extent that it might have done had they been archaeologists. But on an excursion of the Architectural Association, archaeology, pure and simple, is at a discount, design and building are the objects

of study, beauty and truth the objects of admiration.

Returning, a short halt was made at Coln St. Denys for a glance at the exterior of the small but picturesque church, where a small central Norman tower has formed the stock on which the remainder of the construction has been subsequently grafted at various dates.

**Monday.**—Fortunately for the excursionists the intense heat of last week was at the start of their hard work moderated by a cloudy sky and north-west wind, whilst occasional bursts of sunshine prevented undue dulness of weather.

Starting eastward, the first halt was made at Ampney Crucis, where the church was the objective provided for study. This is somewhat small, but with considerable interest, commenced evidently at the very end of the twelfth century, with Transitional chancel arch, but mainly Early English, with Decorated and Perpendicular insertions and additions. The plan is cruciform without aisles, with south porch and western tower of sturdy proportion and simple battlemented skyline. The porch is of Perpendicular date, as is also the sanctus-bell cot over the chancel arch. Within the church, amongst the points of interest are some thirteenth-century colour decoration in fair preservation; a piscina with credence shelf in the north transept; Perpendicular nave roof of flat pitch with colour decoration; remains of stair to rood loft on the south side of chancel arch; some late monuments, particularly that of the Floyds or Lloyds, whose name appears amongst the earliest entries in the parish registers, which date from 1566. In the churchyard is a good example of a churchyard cross, which has been judiciously repaired, or rather re-erected, with clear indication by absence of moulding or decorative treatment of what is new and what is old. There is also in the village the relief of another cross, from which the place takes its name rather than from the churchyard cross, for these are in this part of the country too frequent to differentiate one village from a neighbour.

Adjacent to the church is the manor house, the drawing-room in which is the chief architectural interest, possessing a fine moulded plaster ceiling, wood panelled walls, and a remarkable chimney-piece with allegorical sculptured panel representing the Christian man's victory over the world, the flesh, and the devil, and enclosed in excellent architectural design. Thus the whole room is a perfect example of seventeenth-century work.

Proceeding still eastward the members then drove to Fairford, the small but ancient town whose chief attractions are the well-known stained-glass windows and the trout-fishing in the Colne river. The prosperity of Fairford commenced with the purchase of the manor from Henry VII. by John Tame, a wool merchant, whose business ability was more advantageous to the town than the regal possession of the Kings of Mercia in the ninth century or of Queen Maud at the time of the Domesday survey. The glass is said to have been obtained by the somewhat piratical enterprise of John Tame who, in trading to Italy about the year 1492, is said to have captured a Flemish vessel bound to Rome with a quantity of stained glass on board, and this was utilised for Fairford Church, the erection of which was commenced by John Tame in 1493, and completed by Sir Edmund Tame after his father's death in 1500. How much of this story is true and how much allegorical legend of the Whittington type we cannot pretend to determine, but there is no doubt that the glass is Flemish work of the latter end of the fifteenth century, a time when commerce with Flanders was at its zenith and Fairford in the centre of the wool stapling industry. The church itself is well worthy of study as an example of the latest phase of Perpendicular, the central tower in particular being very clever in design, with that especial cleverness that is not absent altogether from the work of some of our younger prominent church architects of to-day, the cleverness whose effort is apparent rather than felt. This central tower is noticeable both internally for its lantern treatment and externally for its complication of plan and features. The chancel is enclosed by some exquisitely carved screens, and contains the original choir stalls with western seats *in situ*, misereres, and carving complete and perfect. Tombs, monuments, brasses, and colour decoration are all worthy of study, despite the overpowering attraction of the stained glass

Photographed by J. W. Gardner.

Fairford Church.

From Fairford a forty minutes' drive brought the excursionists to Kempsford, a church restored by the late G. E. Street, simple in plan, consisting originally only of nave and chancel, with tower between them and north and south porches towards the west end of the nave. These porches enclose fine examples of Norman doorways, north and south of the nave, which is in origin of Norman date, whilst the chancel is thirteenth century. The tower, treated internally with fifteenth-century groining, adorned with heraldic insignia of John of Gaunt and other Plantagenets, and with large windows, has one of these filled with stained glass by Mr. Kempe, of which one need say no more than the artist's name to imply that it is admirable. In the chancel is a canopied tomb of fifteenth-century date to an unknown Canon Regular, whose effigy is in fair preservation, though sculptured subjects above in the canopy have been wantonly mutilated. The design is clever and peculiar. Street added a south aisle to the chancel.

The last item on the programme for the day was Down Ampney, on the borders of Wiltshire and Gloucestershire, and the property of the Hungerford family from the time of Richard II. to that of Charles I. Of their residence, the gatehouse, said to have been built by Sir Anthony Hungerford, stands extremely complete; the mansion, of which

the great hall bears date 1537, is much diminished, altered, and mutilated. Near the house is the church, cruciform in plan, the nave with aisles, the transepts and chancel without. The tower is at the west end, the porch on the south side. The nave arcade is transitional, the tower Early English with a perfectly plain decorated spire. There are monuments of interest, the richest that of Sir John Hungerford, the earliest said to be that of Sir Nicholas de Vilers or Valers, whose effigy is in chain armour. Adjoining is a canopied wall tomb with female effigy, said to be that of the wife of Sir Nicholas de Vilers or Valers. This family held the manor before the Hungerfords, and the monument is supposed to be of the date 1293. In the chancel on the north side is another wall tomb, with the slab bearing only a floriated cross of rich design. Amongst the most interesting things in the church are the examples of modern woodwork and carving in the rood screen, reredoses, and north transept screen, the last incorporating some remains of the old gallery front with the name and arms of Sir Anthony Hungerford.

On the return a half of two minutes was made at Latton, on hearsay evidence that there was a good Norman doorway. The evidence was correct, but the remaining interest of the church was infinitesimal.

Tuesday.—Still cloudy and with promise of

rain; the cooler temperature, however, fully compensated the members for the lack of sunshine, and rendered work possible. The day commenced with a train ride to Stroud, then a long ascent from the valley made the first part of the carriage excursion a pedestrian effort for the majority of the party, until Lypiatt Manor House was reached. This, though a sixteenth century house, has been so much altered and added to at different periods, and particularly at the beginning of the last century, that picturesqueness and variety of grouping are the main characteristics of the exterior. On the garden side particularly, subsidiary buildings, chapel, dovecote, and flowers make up a piquant composition. Internally the charm of the house is not in its architecture, but in its collection of pictures and bric-a-brac, a collection not so extensive as to be in the foremost rank amongst those of the mansions of England, but such as may be found in many a country house—a Paul Veronese, a Murillo, and so on in variety of selection; representative works of many artists rather than a striking series of any one master. The greatest charm of Lypiatt to the visitor lies rather in the gardens and their arrangement, their connection with and correlation to the house and the remaining buildings—the garden architecture, in fact, and above all the charming views of Cotswold hills and combs amongst which the house is placed. Historically Lypiatt is said to have belonged to the Whittingtons in Plantagenet times, then to the Wyes, and by purchase, in 1610, to Thomas Stephens, a view of whose house and estate by Kip is preserved, and assists one in judging how much of the existing is original. Lypiatt had a small share in the Parliamentary war, being occupied by the Roundheads and taken by the Cavaliers. A cannon shot mark is still shown. Lypiatt is also one of the traditional houses in which the Gunpowder Plot was hatched, but the wide experience of Architectural Association excursionists in country houses leads them to be sceptical about the Gunpowder Plot, the number of places in which it was traditionally concocted bidding fair to run a close second to the sleeping places of good Queen Bess.

From Lypiatt the carriages were accompanied rather than occupied over steep and rough by-roads, with a pause on the way to examine a stone slate quarry, still a going concern, until the midday halt was made at a farmhouse not on the programme, Lower Throgtham, a charming example of domestic work in the Cotswolds, seventeenth century in date, notable for a stone rain water-pipe with head and shoe complete, but delightful from its grouping of gables and mullioned windows, house and dovecote and its colour of weather-toned rubble, ashlar, and stone slate.

Leaving Lower Throgtham with pleasurable regret, the pedestrians, slightly assisted by their vehicles, journeyed to Wishanger, where a short stay only was made at the manor house, formerly the home of the Partridge family—a farm inferior in general charm to that last seen, but possessing some detail; fourteenth-century windows of small cusped form, and seventeenth-century porch with eighteenth-century sundial.

Then over hill and dale the party, on their way back to Cirencester, reached Edgeworth, where first of all the church was visited under the guidance of the rector, the Rev. Mr. Shaw, a nephew of Philip Hardwick and John Shaw, and therefore architecturally sympathetic.

The little church at Edgeworth, consisting merely of nave and chancel, and south porch with western tower, has many points of interest. The east window is a thirteenth-century uncusped three-light lancet with cusped curtain arch, and below is a single-light small window, also with a "restored" cusped curtain arch. This is conjectured to have been the chancel window of an older building, the floor of which is 2 ft. 9 in. below the present. One window in the chancel—a single light—has a good piece of fourteenth-century glass, which, though not entirely old, has the entire figure of an archbishop, completely vested, with cross, and hand uplifted in benediction. An original stone altar slab is still used for its proper purpose, though carried on modern supports. On the south side are an interesting single sedile and piscina, partly restored from castings of fragments of the original. At the west end are some old pews ends, more quaint than beautiful, which have served as the model for the modern benches.

The old stairs to the roof-loft remain on the north side, and a modern roof-loft and screen of modern but fairly creditable design has been added to fit them.

After visiting the church the final walk of the day was the inspection of the house, originally built about 1700 by Nat. Ridler, but now just fresh from the hands of Mr. Ernest George, as an example of whose work it was therefore regarded as an example both of what he has added and what he has left. Mr. George has apparently had a free hand, has not been stinted in expense, and the work, therefore, is characteristic. The return to Cirencester was made through Lord Bathurst's famous and extensive park.\*

BRITISH ARCHEOLOGICAL ASSOCIATION:

CONGRESS AT NEWCASTLE-UPON-TYNE.

The fifty-eighth Congress of the Association was commenced on Thursday, the 18th inst., under the patronage of the Duke of Northumberland, K.G., Dr. Hodgkin, LL.D., F.S.A., being President.

At eleven o'clock the members assembled at the Council Chamber of the Town Hall and were welcomed and formally received by the Mayor and Corporation. After the usual ceremonies, the Corporation plate and insignia, or what remains of them, were inspected. Previous to the establishment of the Reformed Corporation under the Act of 1835 Newcastle was rich in ancient plate and earthenware and other objects of antiquarian value and interest, but in 1836 most of them were sold by auction. Amongst those which remain and were laid out for exhibition were a handsome silver loving cup and salver dated 1681, a mace of the same period, and a seal of James I. One of the most valued treasures now possessed by the Corporation is a finely chased and gold-mounted, two-handed state sword, of the time of Richard II. A description of this sword, by Mr. St. John Hope, F.S.A., was read by Mr. Patrick, hon. Secretary. Newcastle possesses some thirty charters, and three of these, which were produced by the Town Clerk, were of considerable interest. One granted in the sixteenth year of Charles II.'s reign contains a portrait of the monarch, which was contrasted with another portrait of the same monarch upon a second charter granted some twenty years later. The charters are on vellum, and were richly illuminated originally. The Town Clerk explained that as the Corporation was engaged in litigation, no reading of the charters was permissible. After the President, Dr. Hodgkin, had duly acknowledged the Mayor's welcome, a move was made to the Cathedral Church of St. Nicholas, the first place to be visited in the perambulation of the city, to which the remainder of the opening day was devoted, the presidential address being deferred to the evening. Through some misapprehension there was no one present to describe the building. Canon Southwell, however, received the party, and expressed his regret that he, having only just come into residence, was a stranger himself to the history of the church, and was unable to attempt its description. Mr. Thomas Blashill, a V.P. of the Association, thereupon pointed out briefly the more prominent features of the edifice, and sketched in outline its history. The church was consecrated in 1001 by Osmund, Bishop of Salisbury, nephew of the Conqueror; but the original building was destroyed by fire in 1216. The present edifice dates from about the middle of the fourteenth century. A thirteenth century capital enclosed in the wall on the north side internally, and *in situ*, apparently is the only relic left of the earlier church. The nave and choir arches have no capitals, all the work is very plain, but a dignity and repose in the design of the church is agreeable to the eye. The choir is of the second half of the fourteenth century. The famous Lantern Tower crowned with its graceful "steeple" is the great glory of St. Nicholas. There are some six or seven examples in all of this form of steeple, but none are equal to that of Newcastle. It was erected in the middle of the fifteenth century by Robert Rodes, who is said to have been a Prior of Tynemouth, but he is also said to have been a lawyer and a receiver of customs of the Port. When the town was besieged by the Scots in 1644 this beautiful

steeple was threatened with destruction by the Earl of Tereen, if it did not surrender, but the brave defender, Sir John Marley, was equal to the occasion. He placed the Scotch prisoners in the lantern of the tower and told the Earl that if he destroyed the beautiful structure he would at the same time bathe his hands in the blood of his own countrymen who were placed there on purpose, "either to preserve it from ruin or to die along with it." There are some fine Jacobean monuments to members of the Maddison family and an effigy of a knight, which, from the style of the hauberk and surcoat, Mr. Blashill considered to belong to the early part of the reign of Edward II. It is not known to what family the knight belonged, but Edward II. is recorded to have paid for the funeral services of one Peter-le-Marechal, who was shield-bearer to Edward I., so it is likely this effigy represents that individual. In the Eastern chapel is a fine painting, said to be by Tintoretto, the subject being the "Washing of the Disciples' Feet." In the vestry is preserved a beautifully-written and illuminated Bible, the work of one of the monks of Hexham some 700 years ago.

St. John's Church was next visited, and Mr. Chas. Lynam, F.S.A., pointed out the chief features of the building. A twelfth-century window head in the north wall of the chancel indicates that the church is older than any part of the cathedral, but its actual date is unknown. The tower is at the west end, and is an engaged tower, as at St. Nicholas. The transept aisles are on the west side, and there were no eastern chapels.

After luncheon, the party assembled in the great hall of the castle keep, where Mr. Cadwallader J. Bates told the history and dates from 1172-1177. The members next wended their way to the Black Gate, not far from the castle, wherein are most carefully preserved the fine collection of Roman altars, inscriptions, and other antiquities belonging to the Newcastle Society. The Black Gate is said to derive its name from Patrick Black, who lived in 1017. It was the main entrance to the castle, and is considered to be the work of Henry III. about 1247. Leaving the castle, the party proceeded, under the guidance of Mr. Olive Heslop, one of the Secretaries of the Newcastle Society of Antiquaries, to the Trinity House, noticing on the way the south postern, a bit of the old castle said to be the only remaining Norman postern in England. In the chapel of the Trinity House, which is said to date from 1490, are some good carved bench ends. Mr. Heslop then conducted the party round the west walls, and pointed out the various features. Notwithstanding the destruction which, in the last fifty years, has taken place, owing to the march of modern improvement, Newcastle still retains a considerable portion of its old walls with their towers and gates, and in some parts its embrasures and parapets are intact and in very fair condition. A thunderstorm put an end to the perambulation of the city, and the party returned to the hotel to prepare for the conversazione at the Durham College of Science to which the Congress was invited by Sir Benj. C. Browne and Dr. Hodgkin, and where the President delivered his address, of which we take the following *résumé* from the *Newcastle Daily Leader*:-

Dr. Hodgkin, in the course of his address, welcomed the representatives of the British Archaeological Association, and said he had a firm belief in the advantages which learned societies both conferred and received by these itinerating visits to different parts of England. In considering what should be the subject of his address to them that evening, he had thought that a paper entering in detail into some one special subject would not so efficiently serve the purposes of the congress as a more general survey of the history of the county, prepared with some special reference to the scenes to which each day's excursions would conduct them. At the risk of being considered utterly superficial and of insulting a learned audience by the repetition of facts which "every schoolboy knows," he would give a slight outline sketch of the history of Northumberland. He thought they had to confess that, as compared with some other districts of England, they were not rich in pre-historic remains. They had some well-marked British villages or but circles. They had many barrows, containing evidences of methods of disposing of the dead—both by sepulture and cremation. They had also some

remarkably fine specimens of those mysterious cup markings incised on rocks which had aroused so much interest among antiquaries, and which, whatever might have been their purpose—religious, epigraphic, or simply artistic—might, he supposed, be safely stated to be the oldest remains of any kind to be found in Britain. But as they did not propose to make any of these prehistoric monuments the goal of their pilgrimage during the ensuing week, he would not longer dwell upon them, nor invite them to discuss the interesting question whether they were to be assigned to the earliest inhabitants of our island, or rather to their better known Celtic conquerors. For convenience' sake, the year of our Lord 100 should be their starting point, and he would divide the eighteen centuries which had since glided by into six periods of 300 years each, and describe as briefly as he could the leading features of each of these six periods. The Roman period lasted, roughly, from A.D. 100 to A.D. 400. In these three centuries the history of Northumberland was practically the history of the great Roman Wall, and of the Roman roads which ran either along it from sea to sea or across it from the river to the mountains. Dr. Hodgkin then sketched the principal events of the period—the work of the Roman soldiers, the ravages of the Caledonians, and, finally, the Roman exodus. There could be no difficulty, he continued, in deciding which of the excursions arranged for their party best illustrated the period he had thus summarily delineated. On Monday they were invited to visit the two finest camps on the line of the Wall—Chesters, once known as Cilurnum, overlooking the lovely glen of the North Tyne and Housesteads, or Borcovicus, seated on the crest of a high basaltic wave, commanding a wide view of Northumbrian moorlands. The former of these camps they knew to have been garrisoned by a troop of Asturian cavalry from the North of Spain; the latter by a cohort of Tungriens from the country which we now call Belgium. But though the Roman Wall was a military work, and the camps which they would visit were camps and not graceful cities, he prayed them not to let their imaginations repeople them only with scenes of war and bloodshed. In the centuries of Roman dominion there were undoubtedly long intervals of comparative tranquility. So large a force of fighting men—not less than 10,000—with all their camp followers, wives, and children settled on the narrow neck of land between Tyne and Solway, must have exerted a powerful influence on the economic condition of the country. He had sometimes startled visitors by suggesting that the middle region through which the wall runs was far more populous, and possibly more prosperous, in the second century after Christ than it is at the present day. His next period must be called "Chaos, and the Northumbrian Kingdom." For the first century and a-half after the departure of the Romans nothing is known with any certainty as to the history of Northumbria. The pall was partially lifted for us when Ida, the Anglian chieftain, first of Northumbrian kings, builds his wooden burgh on the high basaltic rock of Bamburgh. And yet even then, though they heard something of the succession of kings, and of wars with the Britons of Redesdale, there was for us no history of living interest till the year 617, when Edwin of Deira began his too short, but glorious, reign. Edwin, Oswald, Oswy—these three Christian kings of Northumbria, whose reigns covered the better part of the seventh century (617-670), seemed likely to found a dynasty, which would extend its rule over the whole of Southern Britain. But for some obscure and unexplained events in the eighth century, Bamburgh might have been the London, or at any rate the Windsor, of our island. And if Bamburgh was the Windsor of that great Northumbrian dynasty, Holy Island might fitly be called its Westminster. Having referred to St. Aidan and St. Cuthbert, Dr. Hodgkin said the death of the latter saint brought them to the year 687—very near the end of his second period, but he must be excused a little overlapping, for the kingdom of Northumbria lasted for a century longer, and that closing century, the eighth, though in many ways less glorious than that which preceded it, was illumined by the sanctity and genius of the man who should always be placed in the first rank of English scholars—the Venerable Bede. With what existing edifices did they associate the memory of that great man? The answer at once rose to their lips—With the two churches of Monk-

\* To be concluded next week.

wearmouth and Jarrow. He feared they would see both places grievously changed from that quiet loveliness which they may have worn on a spring morning when Bede thus vibrated between them. "Sweet Jarrow" especially was now overhung with smoke, and resounded to the ringing blows of the sons of Tubal Cain. The chapter of Northumbrian greatness must be considered closed, at latest, in the year 793, when Holy Island was ravaged by the terrible Danish pirate, Ragnar Lodbrok. Dr. Hodgkin next dealt with the subject of the Danish devastations in Northumbria, suggesting that at the present day the ordinary Northumbrian inhabitant was a different being from what he would have been if, during two critical centuries, Northumberland had not been overshadowed by the ghastly-flapping wings of the Danish raven. For after the Danes came the awful wasting of the lands north of the Humber by the order of William the Bastard, and then, at no great interval, the Border wars with Scotland. A people who for so many centuries had much ado to live at all could hardly be expected to develop the arts that adorn life—poetry, music, and painting—like their more fortunate brethren of the South. The world little knows what it may have lost when Holy Island was ravaged by the Danes, and when Jarrow and Monkwearmouth were given to the flames. Proceeding to give briefly the story of the migration of the body of St. Cuthbert until it reached Durham, Dr. Hodgkin said they had now accomplished half of their review, but the remaining three stages would be more rapidly traversed. He had purposely lingered a little over these 900 years in order to remind them and himself of the fact which, though well known, was ever strange and difficult to apprehend, that the Norman Conquest came somewhere more than half-way down in the history of our country—that there was really a longer interval from Julius Agricola to Canute, the Dane, than from Canute to his present Majesty King Edward VII. Let them, then, take their stand at the year 1000, that fateful year which, as men deemed, was to be the end of the world, and see what were the characteristics of the new era upon which they now entered. Though not the end of the world, it was potentially the end of the old order of things in old Saxon England. Ethelred the Unready was now contracting that close alliance with Normandy which caused him to seek a refuge in that land from the victorious Danish King which caused his son Edward the Confessor, son of a Norman mother, to be more Norman than English in heart, and which led by no doubtful chain of causes and effects to the great Norman Conquest of 1066. The Normans came, and whatever other thing they might have left unchanged on our island, they certainly changed the character, as well as enormously increased the number, of its fortresses. He believed it was generally admitted that the pre-Conquest fortresses, the Saxon Burghs, had consisted chiefly of a high mound of earth, surmounted by a wooden palisade, without masonry. The Normans introduced the massive rectangular keep, or its sister, the lighter shell keep. He thought he might term that, their fifth period, the age of castle building, remarking at the same time that here, too, he was not able to avoid a certain overlapping of periods, as the year 1300, which should end his castle building age, marked instead the transition from the old Norman type of the solitary and massive keep to the later concentric type of castle, with barbican, gatehouse, curtain wall, postern, and all the other appliances for combined and converging defence, with which an inspection of almost any fourteenth century castle made them familiar. Now, for that period no excursion could be more instructive than that which they would take the following day, when they would visit, under the most competent guidance, the two great castles of Alnwick and Warkworth, the visible memorials of the greatness of the feudal barons of the house of Percy. But, moreover, the "New Castle" which gave our city its name, and which they had visited that day, erected by Henry II., the nearly contemporary castle of Bamburgh, which, he trusted, they would visit on Tuesday, and the Castle Palace College of Durham which would be the goal of their pilgrimage on the day following, would, he trusted, be considered by them not unworthy specimens of that triumph of defensive architecture (in the days

previous to the introduction of villainous saltpetre), the keep of the masons from Normandy. Of course, while emphasising the military character of most of the Norman remains in our district, he had not altogether forgotten their ecclesiastical glories. To mention the great minster of Durham and the daughter-mother abbey church of Holy Island was to call up the remembrance of some of the noblest and most daring of Norman church builders. His fifth period (1300 to 1600) he would call the period of the Border wars. And here, at last, they came to a time in which there was none of what he had called overlapping. In 1292 John Baliol did homage to Edward I. for the crown of Scotland. By 1296 the lord had goaded his new vassal by countless insolences bereft body of the patriot Wallace was displayed at Newcastle-on-Tyne. Scotland was changed, happily not for ever, from a friendly neighbour into a bitter and vindictive enemy. The era of the Border warfare, with all its romance and all its misery, with all its deeds of heroism and all its squalid lawlessness, with its ballads, its poverty, its sharpening up of international dislikes, jealousies, contempts, this strange wild archaic era had begun, and was to endure for three centuries, till it was ended in the spring-tide of 1603 by that auspicious journey by which James Stuart of Scotland, great grandson of Henry VII. of England, crossed the Border amid the acclamations of his new as well as of his old subjects. It was on April 9 that he entered our town, when the mayor and aldermen knelt before him and presented him with that pleasant and testimonial, a purse of gold, the tradesmen and their apprentices, the flatcaps rendering the air meanwhile with such vociferous huzzas that James, with unwonted modesty, whispered to one of his Scottish lords, "By Ma sou, these men are eneuch to spoil a guid King." He (the speaker) had now brought his hearers to the happy ending of these three centuries of feud, but he asked them to think what they must have meant practically to the daily life of the dwellers in Northumberland and the sister county of Cumberland. Not as it was to the rest of England, one great, solemn military expedition every ten or twenty years, with its chances of glory or plunder to be won on the other side of the Tweed, but one unceasing, monotonous story of raids and petty plunderings; for the herdsmen would not appear in his valley and drive off the best of his cattle; for the townsman the irksome duty of manning guard on the town walls, the occasional agony of seeing his dwelling wrapped in flames and the accumulations of a lifetime destroyed by the ravages of the Scots. To illustrate the romantic, but unhappy, Border time, the secretaries had arranged an excursion for the 25th inst., when he hoped to have the honour of conducting them over the ever-memorable battlefield of Flodden. And now, for the last three hundred years (1600-1900) what could they call them but, notwithstanding some interruptions from civil war and from two soon-suppressed rebellions, on the whole an era of peace and prosperity. For them he could only use the hackneyed quotation, "Si monumentum queris circumspice." The wilderness of houses in the midst of which they met, the bridges, the factories, the ironfoundries, the long lines of dual streets, lined with grim classical architecture, the smoke, the clangour, the Central Railway station—that maelstrom of man—or nearly all of this busy world has sprung into existence since the Mayor of Newcastle-on-Tyne knelt to James Stuart, and to most of these there is no corresponding ray in the archaeological spectrum. Only, since the beginnings of all mighty changes should have an interest at any rate for the historian, he would ask them when on Monday they were travelling westward by the Newcastle and Carlisle railway to get their guide to point out to them a little inconspicuous house on the north bank of the Tyne between Ryton and Wylam. There lived for some years, and not far from it was born, the man who, by a simple mechanical invention, had revolutionised both worlds, that of commerce and that of war, the only man he thought they might say, who had been the cause of such changes in the surface of our globe, as with telescopes such as we possess, might be seen from the nearest planet—the inventor of the locomotive, George Stephenson. He (Dr. Hodgkin) would gladly

have described to them at some length what archeology had achieved and suffered during that most changeful period, how some of our most interesting monuments had fallen victims to what was called architectural or industrial "improvement," and how, on the other hand, a noble succession of students—Horsley, Hodgson, Bruce, and their living successors (whom he named not, though he trusted they would soon make their personal acquaintance)—had carried on the work of Camden and of Colton. In conclusion, he expressed the hope that the arrangements for the survey of the county might be successfully carried out, and that their visit to Northumberland might be in the retrospect not the least agreeable, nor the least interesting, of the memoirs of the Archeological Association.

#### BUILDERS' BENEVOLENT INSTITUTION: ANNUAL MEETING.

THE fifty-fourth annual meeting of the Builders' Benevolent Institution was held on Thursday, July 18, at the offices, 35, Southampton-row, Bloomsbury, W.C. Mr. J. T. Holding presided, supported by Messrs. C. Bussell, E. V. New, Thos. Stirling, T. Stirling, jun., J. Carmichael, and other friends of the charity.

The Secretary (Major R. A. Brntton) read the Annual Report, which stated that when the unprecedented pressure of the times upon all classes of society was remembered, and how the great charities of the Metropolis had suffered, it was a subject of congratulation that this Institution had not been more seriously affected. At the same time, the falling-off had been chiefly in the annual subscriptions, which must always be the mainstay of the charity. It was, therefore, hoped that those gentlemen who already subscribed would use their influence with any friends who had not done so. The Institution owed a debt of gratitude to the President, Mr. John Greenwood, C.C., for his efforts in making the Annual Dinner such a financial success. The Committee had again been able to elect all the eligible candidates this year, and it was a source of thankfulness that the members seeking election had not been sufficiently numerous to entail the necessity of a contested election. It was, however, expected that the number of applicants would be greater in the future, in consequence of Rule III, Section I, altering the age of candidates from sixty to fifty-five, having been sanctioned at the last general meeting. Only three deaths amongst the pensioners had occurred during the year, all of whom were men; while five pensioners had been elected. The annual dinner would be held at the Carpenters' Hall, on Thursday, November 14 next, when Mr. James Carmichael, of Wands-worth, who had consented to be President, would be in the chair.

Mr. Thomas Stirling moved the adoption of the report and accounts, adding, that so long as they were on the right side, and elected all the applicants, he believed the subscribers would be well satisfied.

Mr. New seconded the motion, which was unanimously agreed to.

Mr. C. Bussell proposed a cordial vote of thanks to the retiring president, Mr. John Greenwood, for the valuable services rendered to the charity during his year of office. It must be a satisfaction to Mr. Greenwood to leave the Institution in a somewhat better position than when he took office, and he would move that he be requested to become a member of the Committee.

Mr. T. Stirling seconded the motion, which was carried by acclamation.

Votes of thanks were also passed to the Vice-Presidents, the Trustees, the Treasurer (Mr. J. Howard Colls), the Committee (the retiring members being re-elected), and to the hon. auditors (Messrs. J. T. Holding and R. J. Ward).

The Chairman next proposed the election of Mr. James Carmichael as President, and congratulated the meeting on being able to get so well-known a man connected with the building trade to take the post.

Mr. Stirling seconded the resolution, which was agreed to *nem. con.*

Mr. Carmichael replied, and announced his determination to do his utmost for the Institution.

A vote of thanks to the Chairman closed the proceedings.

A SHOP FRONT, KENSINGTON.

THESE premises, forming No. 27, High-street, Kensington, have recently been erected, and consist of a music shop and practising-rooms on the ground floor, the upper floors being occupied as flats.

The front has its boundaries recessed in the upper portion, and a bay window taken up for three stories, thus forming a balcony on either side. The return walls have been treated with

A Shop Front, Kensington.

glazed tile panels representing famous musicians, by which means a certain amount of colour and interest is given to the facade.

The materials used are Lawrence's red bricks and Kedon stone, and steel casements fitted with leaded lights for glazing. The builder was Mr. A. H. Bird, and the works were designed and carried out under the superintendence of the architects, Messrs. Banister Fletcher & Sons.

**PALESTINE EXPLORATION FUND**—At the recent annual meeting of the Fund, Mr. J. D. Crace was unanimously elected Hon. Secretary vice the late Sir Walter Besant. Dr. Bliss and Mr. MacAlister are preparing a detailed and illustrated description of their excavating work at Tell-es-Safi and in the vicinity, to form a companion volume of the "Memoirs" of the survey of Western Palestine. It is anticipated that the Sublime Porte will grant a renewed firman for the continuance of operations at Tell-es-Safi.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A MIDLAND Counties district meeting of the members of the Association of Municipal and County Engineers was held at Swadlincote on Saturday, July 20. On arrival at the Council chambers from Church Gresley Station the members were received and welcomed by the Chairman and other members of the Council. The President (Mr. E. G. Mawbey, C.E., of Leicester) presided, and amongst those present were Messrs. J. Price (Birmingham), C. F. Wike (Sheffield), G. Hodson (Loughborough), W. T. Creswell (Weedon), T. W. A. Hayward (Sudbury), G. F. Lynam (Burton-on-Trent), S. S. Platt (Rochdale), P. O. Fell (Norwich), A. D. Greatorex (West Bromwich), J. T. Eayrs (Birmingham), and others.

Mr. J. H. Stevens, Chairman of the District Council, offered the members a hearty welcome to what he described as practically a new district.

The President, having acknowledged the welcome accorded to the Association, moved a vote of sympathy with the three members of the Association—Messrs. J. S. Pickering (Nuneaton), F. S. Yates (Waterloo), and Coates (Market Harborough)—in the motor accident they met with at Leicester, with sincere wishes for their recovery.

Mr. T. Kidd, A.M.Inst.C.E., surveyor and waterworks engineer, read a paper on the "Public Works of Swadlincote." He said that "Public Works of Swadlincote" was looked upon as the largest sanitary-pipe producing district in the world, and that day they would have the pleasure of visiting one or two of these typical works through the kindness of Messrs. J. Woodward, Limited, and Messrs. T. Wragg & Sons, Limited, who had consented to keep open their works so that the members present might have an opportunity of witnessing the actual manufacture of the appliances now so common to municipal and sanitary engineers. There were also splendid seams of fireclay from which the large Sheffield steel and iron firms were supplied with firebricks, which spoke as to the quality of these for withstanding intense heats. The finer kinds of crucible clay were mixed similarly to coal and were in great request by steel-smelters, both in England and abroad, and had even been purchased by the progressive Japanese. A later industry was the manufacture of glazed bricks. Swadlincote had a large export trade with France, Germany, Belgium, and other Continental countries, also with India, Africa, South America, Australia, and elsewhere. The district, considering the nature of the employment, might be looked upon as healthy, the death-rate for 1900 being 14.46 per thousand. The population, which was 4,094 in 1851, was 18,014 in 1901. The main sewerage system was designed and carried out by the late Mr. Marshall at a cost, including the purchase of land, of 30,770l. The ventilation of the sewers by open gratings at the street level had been in many instances a source of constant complaint owing to the stench, therefore a system of ventilation by means of cast-iron shafts with air inlets had been adopted and, where carried out, had given every satisfaction. The sewage was delivered by gravitation on to the sewage farm, 64 acres in extent, laid out in beds with distributing carriers and chambers, and was underdrained 5 ft. to 6 ft. deep, by 9-in. pipes laid herring-bone, 66 ft. apart; the crops grown thereon being rye grass, ozers, mangolds, turnips, carrots, cabbages, celery, potatoes, &c., part of the produce being consumed on the farm and the remainder sold. The cost of working the farm for the year ended March, 1900, including rates and taxes, was 578l. 7s. 10d., and the receipts for produce sold 557l. 9s. 2d., leaving a balance of 20l. 18s. 8d. to be provided by the rates. The water supply was derived from the Milton Watershed, and after being pumped into Woodville reservoir gravitated into the district, the consumption being equal to an average of about 10 gallons per head per day. The gasworks were purchased by the Urban District Council, the cost, with extensions, being 47,833l. 10s. 11d. In the making up of private streets the Council had in every case assisted the property owners where the streets had been in existence any length of time and built up, by paying the whole cost of storm-water sewers, gullies, branch drains, street lighting, &c. The average amount charged to the owners had been about 20s. per yard

lined on a 30-ft. street. The joint waterworks at Milton were designed by Messrs. G. & F. W. Hodson to supply a population of 27,000 persons at 20 gallons per head per day; the hardness of the deep-seated water being 20.12 deg. before boiling and 6.64 deg. after, while the water from the upper gravels was only 15.89 deg. before boiling and 4.69 deg. after. In order to reduce the hardness it was decided to adopt the Archbutt-Deeley softening process, the hardness being principally due to carbonates and not to the sulphate of lime. The works for abstracting the water were of the simplest nature, and consisted of a series of Abyssinian tube wells distributed over the site in such a manner as to intercept the upland water, and of the construction of filter tunnels through the adjoining lands. The well was 20 ft. internal diameter, and was sunk through the gravel, which was 23 ft. in thickness, down to the red marl. Filter tunnels were constructed and formed by excavating close-timbered trenches down to the marl, and all undulations were cut through so as to allow a true gradient of 1 in 300 throughout. The water, after being treated and softened, was pumped through a 12-in. rising main to the Woodville reservoir. Two sets of 9½ in. by 15 in. treble ram pumps were provided, and when working together were capable of delivering 45,000 gallons per hour to a vertical height of 420 ft. through the rising main. Since the works were brought into full operation the water had undergone a change, the hardness being now not less than 26 deg., and besides being very hard contained in solution a certain amount of iron, which precipitated on exposure of the water to light and air. The iron was successfully and completely removed, and the hardness of the water reduced from 26 deg. to an average of 9 deg. The mechanical operations involved with the softening and purification of hard water by the Archbutt-Deeley process included the preparation of the reagent, the mixing of it with the hard water, the separation of the precipitate, and the subsequent bicarbonating of the softened water. The apparatus and process employed were of the simplest possible character compatible with efficiency, and were applicable to the removal of both temporary and permanent hardness. The precipitate, by lying at the bottom of the tank, became segregated into coarse flakes, which, when stirred up and allowed to settle again, carried down the fine particles of fresh precipitate so rapidly that in less than thirty-five minutes the water cleared itself to such an extent that the suspended matter remaining, even at a depth of 6 ft. from the surface, did not exceed 1 grain per gallon. The apparatus was designed to treat 45,000 gallons per hour, which was easily softened and purified in four tanks 10 ft. 6 in. deep, each having a working capacity of 27,000 gallons, being three-fourths of its depth, about 2 ft. 6 in. of water and mud being allowed to remain when the water was drawn off, while a margin of 6 in. at the top was left in filling, which was done by means of a supply-pipe from the hard-water tank. The reservoir, which had a capacity of over one million gallons, was situate to the north-east of Woodville, at an elevation of 550 ft. above O.D. The total cost of the works was 30,502l. 9s.

Mr. J. Price, Birmingham, moved a vote of thanks to Mr. Kidd for his paper. It referred to a district which had been nicely progressive—no great jump, but still steadily increasing in population. It was evident the District Council, since the amalgamation, had been successful—at any rate the death rate seemed to show that, because in 1894 they had a death-rate of 17.57, and in 1900 it had dropped to 14.46, which pointed to useful sanitary work. That the District Council had not been behindhand in facing expenditure they could see by the spending of 30,000l. on sewerage and sewage disposal—work which came out at 2l. per head of the population, which was considered rather heavy. On looking through the tabulated statement of the gasworks they could not help noticing the very large apparent leakage, equal to 23 per cent. of the make, if he read the figures correctly.

Mr. C. F. Wike, Sheffield, who seconded, said, with respect to Urivale-street works, he had experienced great difficulty in Sheffield with the dedication of streets. He had eighty miles of undedicated streets, and they had proposed almost every kind of construction to meet the owners who had to pay the cost.

But whatever kind of construction they adopted it was always unsatisfactory unless it was done for nothing. They had made rebates to owners, with the result that they were running close to being the highest rated town in England.

Mr. J. T. Eayrs, Birmingham, also called attention to the enormous amount of gas unaccounted for. He remembered when he was a public officer the leakage at West Bromwich was between 6 and 7 per cent., and that was a mining district which might fairly be compared with Swadlincote.

Mr. A. D. Greatorex, West Bromwich, said the recent report of the Gas Committee showed a loss from leakage of 4.36 per cent. For the loss at Swadlincote there must be some reason, and it would pay the Council to find it out and remedy it.

Mr. S. S. Platt, Rochdale, said as to the price of sewerage and sewage disposal he thought the Council ought not to consider the price excessive; 2l. per head was not excessive when dealing with a small population. He congratulated Mr. Kidd upon the good results of the sewage farm, for to work the farm and get a good effluent with a loss of only 20l. a year was doing very well indeed.

Mr. Lynam, Burton-on-Trent, expressed his surprise at the small cost of construction of streets and the small quantity of water consumed per head of the population.

The President having closed the discussion, a hearty vote of thanks was accorded to Mr. Kidd for his paper.

Mr. Kidd, on replying, said the county medical officer (Dr. Barwise) had said the effluent from the Swadlincote sewage farm was the best in the county of Derby. With respect to the cost of private street works, they had all the underbedding given them and had only to cart it. With reference to the loss of gas, the district was subject to mining operations and in one part was really pulled to pieces, which was the reason for the loss of 23 per cent.

The members then visited the sanitary and glazed brickworks of Messrs. James Woodward, Limited, and the sanitary pipeworks and claypits of Messrs. T. Wragg & Sons, Limited, and were afforded an opportunity of seeing all the process of manufacture of the various productions of both firms. They then drove in brakes to Bretby Park, the residence of the Earl of Carnarvon, where they were entertained by the two firms previously mentioned to luncheon in the park. Mr. T. Wragg presided, and after luncheon several toasts were honoured. Following the luncheon the members visited the pumping station and witnessed the process of softening the water by the Archbutt-Deeley process. The meeting was in every respect a most successful one.

#### THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

**Loans.**—On the recommendation of the Finance Committee, it was agreed to lend Fulham Borough Council 5,875l. for acquisition of and laying-out Pryors Bank as an open space; Hackney Borough Council, 8,000l. for the purchase of land for an electric lighting station and destructor, and 31,200l. for electric light installation and dust destructor; Hammersmith Borough Council, 1,900l. for the purchase of electric light meters; Kensington Borough Council, 16,400l. for contribution to street improvement; Lambeth Borough Council, 10,800l. for paving works; Poplar Borough Council, 5,980l. for paving and channelling works; Southwark Borough Council, 20,900l. for paving works; Stepney Borough Council, 12,000l. for the purchase of a wharf; and Woolwich Borough Council, 20,000l. and 27,805l. for electric light works, street lighting, and meters; Battersea Borough Council, 7,860l. for street improvement; Hampstead Borough Council, 9,625l. for electric light installation; Islington Borough Council, 2,500l. for the same purpose, and 2,018l. for the purchase of electric light meters; and Lambeth Borough Council, 2,348l. for paving works.

**The Chief Engineer.**—It was decided to advertise for a new chief engineer at a salary of 2,000l. to fill the vacancy caused by the resignation of Sir Alexander Binnie.

**Tramways.**—The Highways Committee reported that difficulties had arisen in regard to

the projected generating station at Camberwell, for the purposes of which it had been intended to acquire property at a cost of 80,000l. They therefore recommended an alternative scheme at Greenwich which would involve only 30,000l. cost as to land, but in regard to which there was the disadvantage of distance from the centre of the tramways system and consequent leakage of current.

It was agreed to apply for Parliamentary powers next session to acquire compulsorily the land required at Greenwich.

The meeting was made special for the consideration of resolutions to acquire compulsorily certain portions of the tramways owned by the South London Tramways Company at Wandsworth and Battersea, and by the Woolwich and South-East London Tramways Company at Woolwich and Plumstead.

The purchase resolutions were adopted without discussion.

**The Tooting Housing Scheme.**—The Housing of the Working Classes Committee recommended a vote of 20,000l. for paving and sewer works on the Tootingdown Fields Estate, Tooting, which is in course of laying out for the erection of industrial dwellings.

The recommendation was agreed to.

**The Widening of Piccadilly.**—In connexion with the proposed widening of Piccadilly between Hyde Park Corner and Walsingham House, the Improvements Committee brought up a report and the following recommendation:—"That the working drawings, specification, and estimate of the cost—29,100l.—of the paving and other works connected with the widening of Piccadilly between Hyde Park Corner and Walsingham House, by the addition to the public way of the strip of the Green Park in question, be referred to the Manager of the Works Department, with a view to the work being carried out without the intervention of a contractor."

Mr. W. H. Dickinson said the widening proposed would not do away with the traffic difficulties, and he moved, as an amendment, to preface the recommendation by the following words:—"Provided that the plans be so amended as to provide for the retention of the greater number of the trees at present proposed to be cut down." He pointed out that the cutting down of trees was a serious matter, and he suggested that the trees might be left standing in the road.

Lord Monkswell seconded the amendment, and said every effort ought to be made to get the Government to retain the trees.

On a division there was a tie, 56 for and 56 against the amendment, and the Chairman declared the amendment not carried.

On the motion of Mr. Cornwall, it was agreed that the Improvements Committee again confer with the Office of Works, with a view to saving more of the trees than now contemplated.—As thus amended, the recommendation was agreed to.

**Strand Widening.**—The Improvements Committee recommended that the Council should vote 50,000l. towards the cost of widening a portion of the Strand to 80 ft. at Nos. 89, 99, and 94, to 101, east of the Hotel Cecil, which was proposed to be carried out by the Westminster City Council. The Committee reported that it might be possible at an early date to deal with three other properties.

The recommendation was agreed to.

**The View from Richmond Hill.**—Replying to Mr. Burns, M.P., Lord Monkswell said he had received a letter on behalf of the owners of the Richmond Hill property, offering to sell the property in question to the Council for 70,000l. The conditions attached to the offer were that a deposit of 3,500l. should be paid down on the signing of a formal contract, which should be forfeited if the Council did not complete the purchase by December 31 next. The balance of the purchase money was to bear interest at the rate of 4 per cent. The owners, on their part, agreed to stop all development work until December 31. That letter would be considered by the Parks Committee on Friday.

**New Technical Institutions.**—The following recommendations of the Technical Education Board were agreed to:—

(a) That the plans, specifications, and quantities in respect of the Poplar Technical Institute be approved; that, in the event of the manager of the Works Department being prepared to carry out the work in connexion with the buildings at the amount of the architect's estimate, the Technical Education Board be authorised to refer the same to him, and that in the event of his not being so prepared the Board be authorised to invite tenders for the work.

(b) That the plans, specifications, and quantities in respect of the Brixton Technical Institute be approved; that, in the event of the manager of the Works Department being prepared to carry out the work in connexion with the buildings at the amount of the architect's estimate, the Technical Education Board be authorised to refer the same to him, and that in the event of his not being so prepared the Board be authorised to invite tenders for the work.

**Hampstead Fire Station.**—The Fire Brigade Committee recommended, and it was agreed, that the estimate of 1,736l. submitted by the Finance Committee be approved; that the Council do sanction an expenditure of 1,620l. for adapting for the use of the brigade the premises erected on plot 45, Holly-hill, Hampstead; that the work be executed by the Council without the intervention of a contractor; and that the drawings, quantities, specification, and estimate be referred to the manager of works for that purpose.

**Shallow Underground Tramways.**—A report was submitted by the Highways Committee to the effect that the electrical engineer and the tramways manager be authorised to visit America at the expense of the Council, to inquire into the system of shallow underground tramways, and also as to the latest system of tramway traction in America. The matter arose in connexion with the suggestion to make a shallow underground tramway from Westminster to Finsbury-pavement, via the Strand, Fleet-street, and Chapside.

Replying to Captain Swinton, Mr. Benn said the officers could pay attention to the developments in motor-cars in America if they had the opportunity.

**Victoria Embankment.**—It was agreed to expend 5,660l. for remodelling the carriageway of Victoria Embankment.

**Rebuilding No. 17, Fleet-street.**—On the recommendation of the Historical Records and Buildings Committee it was agreed that the work of rebuilding the rear portion of No. 17, Fleet-street, and of executing such works as may be required to the front portion, be carried out without the intervention of a contractor, and be entrusted to the Works Department upon the basis of the Department being allowed the prime cost plus the usual percentage for use and waste of plant and establishment charges, and in addition, at the discretion of the Historical Records and Buildings Committee, a further allowance to represent contractor's profit.

**Holborn to Strand.**—The Improvements Committee recommended, and it was agreed—

(a) That the working drawings, specification, and estimate of the cost (28,000l.) of the paving and other works in connexion with the widening of the Strand between Catherine-street and a point to the west of St. Clement Danes Church, be referred to the manager of the Works department, with a view to the work being carried out without the intervention of a contractor.

(b) That the Improvements Committee be authorised to engage at the weekly wages of 3l. 13s. 6d. a clerk of works in connexion with the widening of the Strand.

**Old-street and Goswell-road.**—The same Committee recommended and it was agreed—

(a) That the working drawings, specification, and estimate of the cost (8,500l.) of the paving and other works in connexion with the Old-street and Goswell-road improvement be referred to the manager of the Works department, with a view to the work being carried out without the intervention of a contractor, it being understood that the works will be proceeded with by night as well as by day.

(b) That the Improvements Committee be authorised to engage at the weekly wages of 3l. 13s. 6d. a clerk of the works in connexion with the Old-street and Goswell-road improvement.

**Tenders.**—The following tenders were accepted:—

Grease separator at Crossness outfall: Messrs. W. B. Haigh & Co., 105l. Repair of delivery trough, Deptford Pumping Station: Messrs. Fletcher, Son, & Fearnall, 138l. Tar paving materials, Plumstead Common: B. S. Jones, bottoming, 19s. per ton; topping, 17. 2s. 6d. per ton; dust, 19s. per ton; and spar 1l. 10s. per ton.

Having transacted other business, he Council adjourned.

**BRITISH MEDICAL ASSOCIATION.**—For the sixteenth annual meeting of the British Medical Association, which will be opened at Cheltenham on Tuesday next, Mr. J. Hall, A.M.Inst.C.E., has made plans for the renovation, at a cost of 10,000l., of the Winter Garden, in which the annual exhibition and museum will be held.

Musicians' Gallery, Adel Towers, Leeds. Messrs. Bromet & Thorman, Architects.

**MUSICIANS' GALLERY, ADEL TOWERS, LEEDS.**

THE Musicians' Gallery, here illustrated, formed part of some alterations and additions recently carried out at Adel Towers. It is constructed entirely of pencil-cedar, to correspond with the remainder of the woodwork in the house. Mr. Ralph Hedley, of Newcastle-on-Tyne, was the carver. Messrs. Bromet & Thorman, of Tadcaster and Leeds, are the architects.

A NEW DOCK (PORT OF LONDON).—Lord Morley's Committee of the House of Lords have ordered to be reported to the House for third reading the Bill promoted by the London and India Docks Company. The measure, which has passed the House of Commons, will confer powers for raising further capital to the extent of 2,000,000*l.*, with the usual power to borrow a third as much more, for the construction of a large new dock at West Ham in view of the rapid growth of trade in the Port of London.

**COMPETITIONS.**

NEW BATHS AND WASH-HOUSES, OLD KENT-ROAD.—Mr. A. Saxon Snell has been appointed assessor in the competition in respect of designs for the Public Baths and Wash-houses which the Camberwell Borough Council propose to build upon a site in Old Kent-road.

SCHOOL, RANMOOR, YORKSHIRE.—The Building Committee of the Sheffield School Board, having received a report from Mr. Robson respecting the seven sets of competitive plans for a school at Ranmoor, recommended:—“That the plans submitted by Messrs. Holmes & Watson be accepted and adopted for the above-named school, subject to the conditions set forth in the instructions for the guidance of architects and to any modifications which may be deemed necessary, subject also to the approval of the Board of Education. That premiums of 15*l.* each be awarded to Mr. H. I. Potter and Messrs. Hemsoll & Paterson, whose plans are adjudged to stand second and third in the order of merit.” Plans submitted

by Messrs. Holmes & Watson for the erection of a senior mixed department in connexion with Tinsley Park-road school, to accommodate 750 children, have been adopted.

**BOOKS RECEIVED.**

## MALMESBURY ABBEY.

**A**LTHOUGH the foundation of the abbey at Malmesbury is said to date from the time of Aldhelm, in the seventh century, nothing in the existing part of the Benedictine church is older than the Norman period. Much of it is transitional in character, and the clearstory and some other details are of Decorated work of the fourteenth century. The presbytery and the two towers (western and central), the north transept, and the monastic buildings on the north side have disappeared. Of the nave of nine bays, six are vaulted, and form the parish church. The remaining three are more or less in ruins. There are five Norman doorways on the south and west (the latter a mere fragment), some curious Decorated window tracery in the south aisle, and the lower part of the "pulpitum" or rood-screen, now against the present east wall under the western arch of the "crossing." Three out of the four piers that supported the central tower are still standing, with the north and west arches of the "crossing," and the west wall of the south transept to a considerable height. Most of the features already noted are shown in the view from the south-west now published. In the *Builder*, March 2, 1895, a ground plan of the existing building was given; also a view from the south side, the nave arcade, the south porch, and a descriptive article and illustrations of the details of the rood screen, and the tomb generally known as that of King Athelstan. The abbey church has recently undergone some repair, and many of its external details that had become dangerous have been strengthened.

## SKETCHES WITH THE ARCHITECTURAL ASSOCIATION EXCURSION.

THESE sketches, made especially for this occasion by Mr. W. Curtis Green, illustrate some of the places visited by the members of the Architectural Association during the first days of their excursion in Gloucestershire this week.

An account of the excursion and of the places visited will be found on another page.

## ARCHITECTURAL SOCIETIES.

**WOLVERHAMPTON AND DISTRICT ARCHITECTURAL ASSOCIATION.**—This is a new association, just formed under the above title, with the following objects as stated under Rule 2 in its prospectus:—(a) The fostering of a feeling of brotherhood and mutual respect and intercourse between local qualified architects. (b) The consideration of any matter affecting the interests of the profession in the town and neighbourhood; (c) to endeavour to maintain the established code of professional practice and charges as laid down by the R.I.B.A. The Association is to consist of Members, Associates, and Honorary Members. Members being duly qualified architects who have been in actual practice for at least two years; Associates, shall be architects who are not eligible as Members; and Honorary Members, who shall be gentlemen eminent for distinguished attainments, or who have rendered special services to the Association or profession. The entrance fee for Members and Associates is to be one guinea, payable on election, and the annual subscription for Members, 15s.; and for Associates, 10s. 6d. The following is the list of officers:—President—Mr. J. Lavender, F.R.I.B.A.; Vice-President—Mr. G. H. Stanger, F.R.I.B.A.; Council—Messrs. F. Hunter Lyles, A.R.I.B.A., T. H. Fleeming, and S. H. Eachus (London); Hon. Treasurer—Mr. J. Harrison Weller; and Hon. Secretary—Mr. W. Edwards (25, Darlington-street, Wolverhampton).

**THE ROYAL ACADEMY SOIREE.**—The annual soiree of the Royal Academy was held on Wednesday evening at the galleries at Burlington House at 9 p.m. The guests were received at the entry to the octagon room by the President, Sir E. J. Poynter. There was the usual large attendance of people of artistic and social eminence, and the whole entertainment was much as usual. The Royal Artillery band played beautifully, in the Lecture-room, during the greater part of the evening, and conversation, the pictures, and the refreshments furnished the remainder of the evening's amusement.

## APPLICATIONS UNDER THE 1894 BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

## Erection of Buildings in Norwood-road.

**Norwood.**—A public hall, and houses with shops, on the west side of Norwood-road, Norwood, (but also upon York-road, Uleswater-street, and Harpenden-street (Mr. J. S. Quiller for the freeholders).—Consent.

## Lines of Frontage, and Projections.

**Bermondsey.**—A building, to be used as a girls' school, on the north side of New Kent-road, South-west, next Buckingham-square (Mr. W. C. Jones for the Governors of St. Saviour's and St. Olive's Foundation).—Consent.

**Kensington, North.**—A bay window in front of No. 79, Ladbroke-road, Notting Hill (Messrs. Hukins & Mayell for Colonel Fanshawe).—Consent.

**Bow and Bromley.**—A covered way over the stairs leading to the northern platform at the Wellington Station, Bow-road, Bow (Mr. C. A. Prereton for the Whitechapel and Bow Railway Company).—Consent.

**Kensington, North.**—Buildings, to be used as shops, on the forecourt of a building known as the Norland Castle, Queen's-road, Kensington, at the corner of Norland-road North (Mr. A. Gordon for the Salvation Army).—Consent.

**Leicester.**—The enlargement of two bay windows in front of No. 107, Ringstead-road, Rushey-green, at the corner of Laleham-road (Mr. A. L. Guy for Mr. C. Fookes).—Consent.

## Width of Way.

**Poplar.**—Two buildings, to be used as a doctor's house and dwellings for female officers respectively, on the south side of High-street, Poplar, at less than the prescribed distance from the centre of a roadway leading to Poplar workhouse (Messrs. J. & S. F. Clarkson for the Guardians of the Poplar Union).—Consent.

## Width of Way and Construction of Building.

**Poplar.**—That the Council's resolution of April 30, 1901, sanctioning the erection of an open iron shed at the Regent Dry Dock, West Ferry-road, Millwall, with the forecourt fence at less than the prescribed distance from the centre of Regent Dock-road, be modified by the omission of words.—Agreed.

## Formation of Streets.

**Wandsworth.**—That an order be issued to Messrs. Farebrother, Ellis, & Co., sanctioning the formation or laying-out of a new street for carriage traffic on the Mount Clare Estate, to lead from Roehampton-lane to Priory-lane, Roehampton (for Mr. H. C. Smith).—Consent.

## Means of Escape from Top of High Buildings.

**St. George, Hanover-square.**—Means of escape in case of fire on the top story of the southern portion of a block of residential flats on the west side of Harewood-place, on the site of No. 14, Hanover-square, St. George, Hanover-square (Mr. P. Hoffman, for Mr. H. Lovatt).—Refused.

## Correspondence.

## To the Editor of THE BUILDER.

## PORTLAND CEMENT TESTING.

SIR,—I considered the article on "Portland Cement Testing," in your issue of 13th Inst., very interesting. I agree that a very large number of engineers, architects, and surveyors would get very much better results, and often prevent unnecessary expense and trouble, if they made it a rule to have the cement tested.

The article very clearly states that it is very possible for unskilled labourers to mix the raw materials in a faulty manner at the cement works, and that the testing would at once find the mistake.

But when the statement is also made that "with proper plant, which at the most would cost say under 20l., an office boy or labourer with ordinary common sense can do all that is necessary," &c., I entirely disagree.

It is pointed out, and rightly so, that the tensile test is generally looked upon as the most important of all, and I do not think any one with a practical knowledge of cement would be willing to trust the office boy or a labourer to make the briquettes, which must be well made for the test of 400 lbs. per square inch.

Then I do not see anything in the article as to the coolness of the cement.

I have tested some hundreds of tons recently, and from various makers, and one case with which I had

to deal was very curious, seeing that I was able to pass a large consignment of cement one month after I had condemned it, and during that time the cement had been turned over and properly aerated and cooled, and its tensile strength increased from an average of just over 200 lbs. to nearly 500 lbs. to the square inch.

The reason was the works were turning out such large quantities of cement that this consignment was new and hot.

In conclusion I would only advocate that experienced people test cement.

ROBERT H. REED.  
County Bridge Works, Forndingbridge, Hants.

## "TENZYL" ROOFING.

SIR,—Permit me to thank you for the courteous notice of our Glasgow Exhibition pavilion in your recent issue. Much fully endorsing what you say about the importance of the cement used in a composite roofing material such as "Tenzyl," I should like to say that this system has now undergone a practical test for some years past, being constructed by country builders with ordinary Portland cement. At a house near Uxbridge a large pitched roof and flat, with tiles bedded paving-wise in the cement, was erected in 1896. The surrounding roofs of the same house, built about the same time, have the usual overlapping tiles, and whilst these occasionally occur in need of repairs and new tiles the "Tenzyl" roof has required none, but is perfectly sound at the present time, though the flat is liable to be used as a balcony promenade. The enclosed section of the pitched roof will show you that the

Roof-span and Gutters in "Tenzyl" Roofing.

gutters are continued in the same material instead of being flashed with lead, and these also have answered expectation perfectly. In addition to roofs, Mr. Benson (whose partner I am in this matter) has built a water-tower at Uxbridge mainly of "Tenzyl" throughout—viz., corrugated sheets stiffened and coated with cement bedded by his patented method. The exterior effect is white plaster or stucco, but it can be varied to any extent, as is shown by the little half-timbered pavilion now at Glasgow.

H. C. MARILLIER.

## LOAN EXHIBITION OF ECCLESIASTICAL ART.

SIR,—You have been good enough in previous years to allow me space for a few lines for a reminder of the approach of the time for sending in the list of loans to the Ecclesiastical Art Exhibition. As the time is now drawing near, I hope you will kindly allow me to say that if any of your readers intend assisting the Exhibition by the loan of articles of interest I shall be very glad to hear from them at once.

The collection will, as before, embrace every kind of gold- and silversmith's work, art metal work, tapestry, needlework, carvings in wood and ivory, MSS., paintings, and articles of ecclesiastical and archaeological interest.

For church plate and embroidery we are always particularly grateful.

JOHN HART.  
Malttravers House, Arundel-street, Strand.

## The Student's Column.

## GAS AND GAS FITTINGS:

4.—STATION METERS, GAS HOLDERS, STATION GOVERNORS, DISTRIBUTION.

**STATION METERS.**—The gas leaving the purifiers usually passes next to the "station" or "works" meter (fig. 7), in order that the total quantity of gas made may be ascertained and recorded. The meter case is usually rectangular for large meters and cylindrical for those of smaller capacity. Sometimes a separate meter is provided for one of the variety known as "wet" meters, in which a drum revolves in a chamber partly filled with water. The drum has three or four internal compartments of equal capacity.

The meter is filled with water to a level a little higher than the axle on which the drum revolves. The gas entering one of the chambers causes it to slowly revolve. As the chamber becomes filled with gas its inlet passes beneath the water level, and the inlet to the next chamber at the same time rises above the water level, and allows gas to enter and continue the revolving motion of the drum.

Fig. 7.—Rectangular Station Meter.

Fig. 8.—Three-Lift Gasholder: shoring Tank.

The capacity of the chambers of the drum is dependent on the level of the water; when the water level is too low the gas capacity of each chamber is increased, and the meter registers a smaller quantity of gas than has in reality passed through it, and when the water level is too high the gas capacity of each chamber is decreased and the meter indicates a larger consumption than the correct amount. It is necessary therefore to maintain the water at a constant level, and this is accomplished by supplying the meter with a small but continuous stream of water, and a siphon overflow pipe which prevents the water from rising above the proper water line.

**Gasholders.**—From the station meter the gas passes into the gasholder (fig. 8). The gasholder is often called a "gasometer" by those not connected with gas undertakings, but the term has long been discarded by gas engineers. The gasholder still remains a gasometer inasmuch as it is possible to estimate roughly the quantity of gas in the gasholder by counting the number of riveted plates (of known dimensions) in a vertical line above the water level in the tank. From the height of the holder above the water, and from its diameter, it is

easy to calculate the contents of the holder; but the introduction of the station meter has rendered the use of the gasholder as a meter unnecessary. The gasholder consists of a cylindrical bell which is free to rise and fall in a tank containing water. It is maintained in equilibrium by suitable supports, and has its lower end, which is open, always immersed beneath the surface of the water. The holder may be single or telescopic, the bell which contains the gas being technically known as a "lift." A telescopic holder may have several lifts, but the dome of the top lift serves for all the other lifts, which are merely telescopic cylinders. In a telescopic holder the lower edge of the smaller upper lift is turned outwards and upwards to form an annular trough or "cup," which is filled with water and which receives the turned-over upper edge of the larger cylinder. A gas-tight seal is produced, and when the inner cylinder is filled with gas and continues to rise, its cup is caught by the turned-over edge of the lower and outer cylinder, which is then drawn up out of the water tank without breaking the water seal in the cup. The pressure on the gas within the holder may be as great as

12 in. of water, but varies with the weight of the holder.

The largest gasholder in the world is that erected by Mr. Livsey at the East Greenwich works of the South Metropolitan Company. This holder has six lifts, is 300 ft. in diameter, rises when filled to a height of 180 ft., and has a capacity of 12 million cubic feet. The two topmost lifts ascend above the top of the framing.

The gasholder tank is usually a circular excavation walled with concrete, brick, or stone; a circular or conical mound termed the "dumpling" or "cone" being commonly left in the centre of the tank. Modern gasholder tanks are sometimes constructed in steel and built above ground. Leakages in such tanks are more readily stopped than in those of brick or concrete. Steel tanks are cheaper than brick or concrete tanks, and are said to be almost as durable.

**Station Governor.**—After leaving the gasholder the gas passes to the station governor (fig. 9), which enables the pressure of gas passing forward to be reduced and regulated to any desired point. The governor most commonly employed consists of a cast-iron water

tank, through the bottom of which the gas from the gasholder is conducted up by a pipe which terminates in an open end just above the surface of the water. Within the tank is a floating bell which covers the gas inlet and outlet pipes, and from the crown of which a conical or parabolic valve with its apex upwards is suspended. When the bell rises

Fig. 9.—Station Governor.

this valve is drawn up with it, and partially blocks the passage through which the gas flows into the bell, and thus diminishes the volume of gas admitted to it. When the bell descends, the cone also descends, and a larger volume of gas can enter the bell. The bell rises when gas is entering at a greater rate than it is being withdrawn by the consumers, and descends when the consumers are withdrawing the gas at a greater rate than it is entering the bell. Thus the varying requirements of the consumers are automatically satisfied without changing the gas pressure. The pressure of the gas at the outlet of the governor is controlled by increasing or decreasing the weight of the bell, which is supported by one or more chains passing over pulleys, each chain terminating in a rod furnished with removable weights. In addition to this governor, a governor is usually fitted to the throttle steam valve of the exhaust engine to control the speed of the exhaust, and sometimes governors are provided in different parts of the district to control variations of pressure produced by the supply of gas over rising ground.

**Distribution.**—The term "main" is commonly applied to the principal pipe in each street, while "main-service pipes" are those which convey gas from the main to the consumer's meter. The "service pipes" are those which convey the gas from the meter to the point of consumption. Sometimes, however, the main-service pipe is called the service pipe, and the service pipes within the building are spoken of as "fittings."

**Mains.**—From the gasworks the gas is usually distributed over the district under a pressure of from 1 in. to 4 in. of water. The mains were formerly almost universally made of cast-iron, but wrought-iron and steel mains are now frequently employed. The loss by leakage is much less than it was a few years ago, although higher pressures are now used. The leakage is, however, still too large, and that it is possible in practice to secure gas-tight mains is demonstrated by the fact that at Royersford, near Philadelphia, 20-candle carburetted water-gas is being distributed under a pressure of 20 lbs. to the square inch through wrought-iron mains tested and found gas-tight under a pressure of 60 lbs. to the square inch. From the high-pressure mains the gas is distributed into low-pressure mains, and the former, in which the pressure is allowed to vary, play the part of gasholders. A number of consumers are, however, served direct from

the high-pressure mains, house governors being interposed on the main-service pipes. The mains should be so connected that the gas is always in circulation, for gas which is allowed to stagnate in "dead ends" often deteriorates considerably. Mains in level ground are laid with a slight inclination, and provided at the lowest point with a siphon or drip box to collect the liquid which condenses from the gas. The condensed liquor is pumped out of these boxes periodically.

**Discharge of Gas Through Pipes.**—Tables giving the volume of gas in cubic feet which will pass through pipes of different lengths and different diameters under different pressures, will be found in "Hurst's Surveyor's Handbook," and in most other books dealing with gas supply. The rate of flow diminishes as the length of pipe increases, and varies also with the specific gravity of the gas. The following is the formula deduced by Dr. Pole for calculating the quantity of gas which will pass through pipes of different sizes:—

$$Q = 1,350 d^3 \sqrt{\frac{h \times l}{s \times l}}$$

Where Q = quantity of gas passed in cubic feet per hour.

- d = diameter of pipe in inches.
- l = length of pipe in yards.
- h = initial pressure in inches of water.
- s = specific gravity of the gas.

The following figures from the tables of Newbigging and Barlow, which have been calculated from Pole's formula, will serve to indicate the effect of increasing the length of pipe upon the rate of flow of the gas (sp. gr. 0.4), the retarding influence exerted by friction between the side of the pipe and the flowing gas being considerable:—

Diameter of Pipe 1 in.

Length of pipe in yards	10	20	30	50
Cubic feet of gas delivered under initial pressure of 1 in. ....	675	476	389	301
Cubic feet of gas delivered under initial pressure of 1.2 in. ...	738	522	427	329

Diameter of Pipe 3/8 in.

Length of pipe in yards	1,000	5,000	10,000
Cubic feet of gas delivered under initial pressure of 1 in. ...	530,000	234,000	166,000
Cubic feet of gas delivered under initial pressure of 2 in. ...	741,000	332,000	234,000

In practice, however, the actual discharge is considerably less than the theoretical quantity, especially in the case of small pipes. The smaller the pipe the greater the friction per unit of gas delivered. Hurst gives a table based on actual experiments showing the gas (sp. gr. not quoted) discharged through small service pipes of various lengths, from which we take the following:—

Diameter of Pipe 1/2 in.

Length of pipe in yards	10	20	30	50
Cubic feet of gas delivered under initial pressure of 1 in. ....	337	233	190	148
Cubic feet of gas delivered under initial pressure of 1 1/2 in. ....	368	260	212	164

It will be seen that the discharge of gas obtained at the burners from small service pipes is only about one-half the volume that should, according to Pole's formula, pass through the pipes if perfectly straight and horizontal.

Even for larger pipes the volumes of gas discharged quoted by Hurst are much smaller than those given by Newbigging, as will

be seen from the following comparative figures:—

Diameter of Pipe 1 1/2 in.

Length of pipe in yards	500	1,000
Cubic feet of gas delivered under initial pressure of 1 in. (Hurst) .....	33,255	23,515
Cubic feet of gas delivered under initial pressure of 1 in. (Newbigging) .....	47,433	33,631
Cubic feet of gas delivered under initial pressure of 2 in. (Hurst) .....	47,030	33,255
Cubic feet of gas delivered under initial pressure of 2 in. (Newbigging) .....	67,262	47,433

In practice it is better to adopt the figures quoted by Hurst, for the introduction of angles and curves in the pipes, and the accumulation in them of liquid or solid matter tends to diminish their delivering capacity. The smaller the pipes the greater their liability to become blocked with naphthalene, tarry matter, rust, or water. The present tendency in gas supply is to distribute it at a considerably greater pressure than 1 in. The delivering capacities of the pipes vary approximately directly as the square root of the pressure and inversely as the square root of the length. If the pressure is increased four times the volume of gas delivered is doubled. If the length of pipe is increased four times the quantity of gas delivered is halved.

**Main-service Pipes.**—The main-service pipes should be of wrought iron, unless the employment of this material be prohibited by the corrosive action of the soil. Cast-iron pipes are often used, but are apt to have leaky joints, and lead pipes are apt to become distorted owing to subsidence of the ground in which they are buried. The diameter of the service-pipe required is dependent upon the description and number of the appliances to be supplied. It is usual to assume that each burner requires 5 cubic feet of gas per hour, but as most consumers use a large proportion of the gas consumed for purposes other than lighting this rule is now of little service. Domestic gas fires commonly consume over 30 cubic feet per hour, ring burners from 12 to 15 cubic feet, while cookers and water heaters use an indefinite quantity but require a comparatively large volume for a short period. The capacity of the pipes required should not be calculated upon the average hourly consumption, but upon the consumption when every gas-consuming appliance in the building is in use at the same moment, and at the lowest pressure permitted by Act of Parliament. As a rule, the gas manufacturer provides and fits the main service-pipe and meter; and, owing to the comparatively heavy cost of pipes of large diameter, frequently supplies a pipe barely large enough for the duty required from it when the gas is first connected to the building, and as additional fires and stoves are usually introduced from time to time after the service-pipe has been laid, it frequently happens that the pipe is not sufficiently large for the work it is expected to perform. The consumer obtains a very low efficiency in light or heat per unit of gas consumed, and naturally concludes that the manufacturer is supplying "bad gas," and regards it as an additional injury that his gas appears to be worst just at the time he most urgently needs an ample supply (as on a cold, foggy day), and all his neighbours are simultaneously drawing heavily upon the supply. The fact that the gas bill is a little less heavy does not in any way compensate for the fact that the gas fails to perform its legitimate duties.

Fig. 6a.—A correspondent asks, in reference to our last week's article, why valves and by-passes are provided in the connecting pipes to a set of purifiers, as shown in fig. 6(a), published in the issue of last week. They are provided to enable the gas to be sent in any order of rotation through the purifiers, and to enable any purifier to be disconnected from the other purifiers in the set without putting the whole set out of action. Our illustration shows the connexions for a set of three purifiers, Nos. 1, 2, and 3, and it will be seen that with the arrangement of pipes and valves there figured it is possible to send the gas in the

order of rotation Nos. 1, 2, 3, or Nos. 3, 1, 2, or to cut off No. 2 for recharging, and allow the gas to continue to be purified by passage through Nos. 1 and 3. Any number of purifiers may be placed in circuit in a set, and several sets may be connected together; but provision must always be made for continuous purification. A clean purifier must always be in readiness to be put into action immediately the gas at the outlet of the last purifier in use begins to come through "dirty." In London the gas companies are liable to a penalty of 50l. per day if even an infinitesimal trace of sulphuretted hydrogen be found in the gas supplied to consumers, and great care has to be exercised to prevent any unpurified gas escaping into the mains.

OBITUARY.

MR. H. YEVILL THOMSON.—The death of Mr. H. Yevill Thomson, formerly of Birmingham, and whose name is well known as the architect of the Municipal Buildings and Art Gallery in that city, took place last week at his house at 9, Observatory-gardens, Campden Hill, London. From a notice in the Birmingham Daily Post we learn that Mr. Thomson belonged to an old Birmingham family, and his grandfather, Sir Edward Thomson, held the position of High Bailiff before the incorporation of the Borough, and was a manufacturer who was also interested in art. Mr. H. Yevill Thomson was born in Edinburgh in 1826. When it was decided that he should follow architecture as a profession, he was articled to a Birmingham architect, Mr. Charles Edge, and subsequently became manager of the architectural department in the Borough Surveyor's office. Subsequently he travelled a good deal and made a study of architecture in Italy. Before he was engaged on public buildings he was chiefly occupied in designing private residences in Edgbaston and other suburban districts of Birmingham, from 1840 to 1870. Among important buildings which he carried out may be mentioned the Aston Workhouse (about 1865), one of the largest works on which he was engaged; the Acocks Green Congregational Chapel; the Birmingham District and Counties Bank, in what may be described as a neo-classic style—it is one of the best of the larger street fronts of Birmingham; the Birmingham Daily Mail offices; and the Birmingham Daily Gazette offices. Among manufacturing works and warehouses which he carried out were the Atlas Works for Messrs. Horace Woodward; a block of offices and shops for Messrs. Thos. Hope Fross, at the corner of New-street and Cannon-street (Birmingham); the large establishment of Messrs. Lewis, the first concrete and iron building erected in Birmingham, and his last large executed work, completed in 1886, after which he retired from practice. The Municipal buildings of Birmingham, part of which forms also the Corporation Art Gallery, a very large building in a grandiose style, will keep his name in memory in that city, where it seems to have given every satisfaction to his municipal clients. Mr. Thomson considered that his arrangement of the seating in the Council Chamber at Birmingham had furnished a model for the arrangement of several subsequently erected Council rooms. Though Mr. Thomson adopted the Gothic style in some churches and in some of his houses, his preference was always for classic architecture, and he was a great admirer of Wren. During his many years' residence and practice in Birmingham Mr. Thomson took no part in public affairs, his interest being entirely absorbed by his professional work, and he continued after his retirement from practice to take an interest in everything connected with architecture and architectural work.

Mr. Thomson was elected a Fellow of the Institute of Architects in 1862. We gave illustrations of the Municipal Buildings and of the Union Club House in connexion with the article on Birmingham architecture in the issue of our Large Provincial Towns in the Builder of November 27, 1897.

GENERAL BUILDING NEWS.

CHAPEL, KING'S NORTON.—The foundation-stone has just been laid of a new Wesleyan chapel at King's Norton. The architect is Mr. Ewen Harper. The building is to be built of red brick with York stone dressings, and will consist of a nave and aisles divided by granite columns. Immediate provision is to be made for 480 sittings, and the plans permit of further accommodation being secured when necessary by the addition of transepts and a chancel. The main entrance is to face Middleton Hall-road, and the porch consists of a moulded stone archway with pinnacles and pediment. There is a second entrance from the front, in the tower, by which access is gained to the gallery. The builders are Messrs. Bentley & Son, of Snettisham.

CATHOLIC CHURCH EXTENSION, WITTINGTON.—The foundation-stone was laid recently of additions that are being made to the Church of St. Cuthbert, Wittington, Manchester. Messrs. Goldie, of London, are the architects.

ADDITIONS TO CONGREGATIONAL CHURCH, WALLSALL.—The memorial-stones have just been laid in an enlargement of the Wednesbury-road Congregational Church, Wallsall. The architects are Messrs. Crouch & Butler, Birmingham, and the designs include the addition of a chancel, and about 200 additional sittings to the church.

WESLEYAN METHODIST CENTRAL HALL, BIRMINGHAM.—On the 16th inst. the foundation-stones were laid of a new central hall for the Birmingham Wesleyan Methodists. The site of the new building is nearly opposite the Assize Courts. It covers an area of 2,766 square yards, and the building will have frontages to three streets—to Corporation-street, which is the main elevation, measuring 324 ft., to Ryder-street 113 ft., and to Dalton-street 276 ft. In the centre of the building is a tower, rising to a height of 180 ft. On the ground floor are fifteen shops, with basement shops, together with sale rooms, warehouses, and other offices for commercial purposes. One basement, capable of accommodating 500 children, will be retained by the mission as a ragged school, and will be fitted up with cooking arrangements for the feeding of the poor in time of need. On the first and second floors are the large hall, synod hall, and other rooms for Methodist purposes. The main entrance under the tower leads into a hall, where two staircases lead to the first floor landing. Here, by turning to the left, access is gained to the synod hall and church house, and by turning to the right and ascending two steps the level of the great hall is reached at the platform end. The corridors which run round the great hall give access on the outside to twelve committee-rooms; and on the inside are frequent entrances to the great hall. The hall is 140 ft. long, 90 ft. wide upstairs, and 48 ft. high, with seating accommodation for 2,300 persons (300 being on the orchestra and 2,000 in the auditorium). There are 80 seats under the gallery. On the lower or left-hand side of the tower is the church house. The corridor leading from the stairs already mentioned is on its left (or Corporation-street side) a committee-room and the synod hall, which will seat 500 persons; and on the right another committee-room and the Sunday-school. Along the corridor are two rooms, the library and the ladies' parlour, which look out on Ryder-street. On the floor above are twelve club and classrooms. There are in all five entrances. The chief material employed in the facade is red terra cotta. The entire cost of the scheme is estimated at from 60,000l. to 65,000l. The plans were prepared by Mr. Ewen Harper, and the contractors are Messrs. John Bowen & Sons.

CHURCH, EAST KIRKBY, NOTTS.—A new church is being erected at East Kirkby. The building will consist of a nave 78 ft. long and 27 ft. wide internally, with aisles (merely passages 4 ft. wide), a chancel 30 ft. long and 21 ft. wide, vestries for clergy and choir, with heating chamber under, and bell turret at the west end. The principal entrance will be at the west end facing Lowmoor-road, the highway between Nottingham and Mansfield, and an internal porch will be formed by a screen and swing doors. The church is planned to accommodate about 300 adults, and to admit of lateral extension by increasing the width of one or both the aisles according to future requirements. The nave and aisles are divided into five bays, with octagonal stone columns and moulded arches springing from the piers without capitals. The chancel arch will be enriched with carving. The roofs will be of open timber construction, with hammer-beam trusses, the wood being stained dark walnut colour. The floor under the seats will be of wood blocks, and in the passages, &c., of terrazzo and marble mosaic. The walls will be of brick, with red facing and stone dressings externally, and plastered and distempered internally, except where stonework is used. The windows will be of stone, the arched heads being filled with tracery. The glazing will be of leaded cathedral glass, in small panes. The roofs will be covered with red tiles, and the turret roofs with lead. The heating will be by means of hot water on the low-pressure system. The architect is Mr. Louis Ambler.

CHURCH, PONTARDULAS.—The new Church of St. Michael and All Angels, Pontardulas, was opened by the Lord Bishop of St. David's recently. The architect of the church was Mr. E. M. Bruce-Vaughan, Cardiff, and the contract was entrusted to Messrs. John Thomas & Sons, Pontardulas. There are 302 sittings. The church consists of a nave, chancel, vestry, and organ chamber. The walls are of grey stone, and the roof is covered with green slates. The nave and organ chamber and vestry walls are pierced with two-light traceried windows, the west wall of the nave with a five-light, and the east wall of the chancel with a three-light window. The window and door dressings, as well as the copings to gables, are all executed in Box ground stone. The double bell-cote surmounting the chancel arch is chiefly built of Box ground stone. The roof of the chancel is waggon-shaped. The nave and chancel seats are in pitch pine.

CHURCH, SPARKBROOK, BIRMINGHAM.—The new Church of St. Agatha, at Sparkbrook, was dedicated by the Bishop of Worcester recently. St. Agatha's Church, says the Birmingham Post, has cost 15,000l., and this amount will be paid out of the proceeds of the sale of Christ Church, which was for many

years a well-known landmark in the centre of the city. The original foundation-stone of the old church has been built into the base of the tower of the new structure, and among other things taken to Sparkbrook from New-street are the font and communion-table; the single bell, bearing the inscription "John Rudhall, Gloucester, Feb. 1813"; and a quantity of the mahogany panelling of the old pews of Christ Church, which has been used in the new baptistry and in the clergy vestry. The church occupies a site adjoining the Board Schools in the Stratford-road, and has been erected from the designs of Mr. W. H. Bidlake, and under his superintendence. "It is in the late decorated Gothic style, with an original interpretation of traditional forms," and accommodation is afforded for more than 1,000 worshippers. The materials employed are buff brick facing within, and red and blue brick without, with Hollington stone and Bath stone dressings. The roofs are covered with grey-green Whitland Abbey slates. The tower is 120 ft. high to the top of the parapet, and is surmounted by a fleche rising 40 ft. higher. From the base of the tower projects a semi-octagonal baptistry, over which is the west window, which is in turn surmounted by sculpture in canopied niches, representing Christ in majesty, supported by the angels of Justice and Pity, and surrounded by angels. On the north and south sides of the tower, and forming with it a symmetrical facade, are porches, whose tympana are filled with sculpture illustrative of the martyrdom of St. Agatha; whilst the arch mouldings are decorated with cherubs' heads. The interior consists of a nave 120 ft. long and 29 ft. wide, separated from wide aisles by arcades of Hollington stone arches. Projecting shafts rise between the arches, and terminating at the cornice level in corbels of leaf sculpture, carry transverse timber arches supporting the timber ceiling, which is partly decorated in colour. The clerestory, and, indeed, the church generally, is punctuated by traceried windows, nearly every window being of different design. The chancel is also terminated with a traceried window, which it is hoped may be filled with painted glass. The chancel is separated by arcades from a choir transept, over which is the organ chamber on the north side, and from an ambulatory which communicates with the vestries on the south. The choir seating is of fumigated oak, that of the nave being of sequoia wood. The pulpit, also of fumigated oak set on a stone base, is the gift of Mr. A. M. Chance. The builders were Messrs. John Bowen & Sons.

EXTENSION OF ST. ANDREW'S SCHOOLS, WIGAN.—The foundation-stone of an extension of St. Andrew's Schools, Wigan, was recently laid. The architects for the work are Messrs. Heaton, Ralph, & Heaton, whilst the new premises will be built by Alderman C. E. Holmes.

EXTENSION OF U.F. CHURCH TRAINING COLLEGE, ABERDEEN.—A scheme of extension is in contemplation in connexion with the United Free Church Training College, Aberdeen. Some time ago Mr. Wm. Kelly, architect (of Messrs. W. & J. Smith & Kelly), prepared plans of a new practising school which it is proposed to build on a site of what is known as Hector's building yard, with the frontage to John-street. These plans are at present being considered.

BUILDINGS IN ABERDEEN.—The Plans Committee of the Town Council have approved of the plans of the following new buildings in Aberdeen: Alterations and additions in connexion with premises No. 54, Skene-square, per Mr. R. G. Wilson, architect; addition to Carden House, Carden-place, per Mr. R. G. Wilson, architect; two houses on the north-west side of Welford-terrace, per Mr. Alexander Cheyne, builder, per Mr. A. H. L. Mackinnon, architect; additions to stonecutting sheds on the south side of Froghall-lane, for Mr. James Forbes, sculptor; alterations in connexion with premises No. 3, McCombie-court, per Messrs. W. & J. Smith & Kelly, architects; re-roofing of workshop on the north side of Huntly-street, for the Royal Fire and Accident Co. Ltd., per Mr. John Milne, architect; alterations in connexion with premises Nos. 43-44, Castle-street, per Mr. William Ruxton, architect; dwelling-house on the north side of Kubislaw Den South, per Mr. R. G. Wilson, architect; workshop at the rear of No. 56, Hutcheon-street; nine dwelling-houses on the west side of King-street and south side of University-road, per Mr. William Ruxton, architect; addition to premises on the east side of Old Ford-road, per Messrs. Brown & Watt, architects; fishmonger premises at North Esplanade, per Mr. Alexander Craigen, draughtsman; alterations in connexion with Robert Gordon's College, for the governors, per Messrs. Jenkins & Marr, architects; alterations in connexion with sheds on the east side of Regent-road, per Messrs. W. & J. Smith & Kelly, architects; two dwelling-houses on the south side of Elmbank-road, per Mr. John Cameron, architect; dwelling-house on the west side of Hoburn-street, per Mr. John Cameron, architect; church on the east side of King-street, at its junction with Uroghart-road, for the Deacons' Court of the Commerce-street U.F. Church, per Messrs. D. & J. R. McMillan, architects.

MUNICIPAL LODGING HOUSE, ST. PHILIP'S, BRISTOL.—With regard to the proposed municipal lodging-house to be erected in St. Philip's, the Health Committee recommend that the house shall

contain 120 beds instead of 102, as originally intended. The site selected is at the junction of Wade-street and River-street. The building will be of brick, the only freestone ornamentation being at the main entrance at the angle formed by the junction of the two streets. It will consist of basement and four floors, and the roof will be of Bridgewater tiles. The clear height from floor to ceiling on each floor will be 11 ft., except the basement, which is 10 ft. 6 in. The plans have been prepared in the City Engineer's office. The basement will contain a series of lockers for the use of the lodgers, a laundry, 2 lavatory, linen store, baths, boiler house, and other offices. The ground floor will comprise entrance lobby, vestibule, and corridor leading to a large reading-room, 27 ft. 6 in. by 14 ft. 6 in., beyond which will be situated the dining hall. On the right of the hall will be the main staircase, of pennant stone, leading to the floor above. There will be a lodgers' kitchen, 31 ft. by 16 ft., in which the lodgers will do their own cooking, and the arrangements will also include wash-up sinks and other requisites, while at the rear of the building there will be a large open paved yard. The residence of the superintendent will be on the ground floor, and this will be provided with a separate entrance. The main entrance will be fitted with turnstiles. On the first, second and third floors the accommodation in each will consist of forty cubicles, 8 ft. by 5 ft., approached by corridors, 4 ft. 3 in. in width. Each cubicle will have a separate door and window, and screen walls will form the partition. The estimated cost of building, including site, but exclusive of furniture, is 7,100.—*Western Press.*

**NEW BRIDEWELL, DUBLIN.**—A new central Bridewell for Dublin is being built at the west side of the Police-courts. The building has a frontage of 170 ft., and is 30 ft. high and 45 ft. deep. It will provide accommodation for upwards of 130 prisoners, in fifty-two cells. In many cases each cell will be occupied by only one prisoner. There are, however, a number of cells—about thirty—each of which will contain more than one inmate, one of them having as many as six beds. The single cells are 13 ft. 9 in. long by 6 ft. 8 in. wide, and 9 ft. 6 in. high, while the largest of the common cells is 38 ft. long by 13 ft. 9 in. wide. On the ground floor there will be accommodation for nineteen men and fifteen women, while on each of the two floors higher there will be cells for seventeen women and thirty men. There are 122 beds altogether. In addition to the cells there are apartments for an inspector, offices, dayrooms, male and female warders' rooms, men's and women's receiving-rooms, escorts' offices, &c. The roof is a flat concrete and asphalt one, while the centre of it will be covered with glass in order to light the corridors beneath. On the top of the building is a studio and darkroom for photographing the prisoners and developing the photos. The whole building will be heated with hot air on the Plenum system. The floors are of concrete and expanded metal. The building will be connected with the police-courts by an underground passage. The contractors for the works are Messrs. John Lowry & Son, Belfast, and the architect is Mr. J. H. Pentland, of the Board of Works.

**HALL AND BRANCH PUBLIC LIBRARY, EDINBURGH.**—The plans of the new Nelson Hall and Branch Library in Leith Walk are now before the Dean of Guild Court. The front buildings towards Leith Walk have been made three stories high, and those towards M'Donald-road two stories. The Nelson Hall and the Library, which are behind, are kept one story. The two upper flats towards Leith Walk contain a house for the librarian and for a caretaker, entering by a separate stair from Leith Walk. The upper floor, towards M'Donald-road, contains a large hall, which it is proposed to fit up as a gymnasium. It measures 53 ft. by 30 ft. wide, and retiring-rooms and lavatories have been provided. The corner has been emphasised with an octagonal and round tower. The main entrance is placed near the corner in M'Donald-road, and leads into a large entrance hall, from which access is obtained to the library and halls. On the plan, right in front of the entrance is the lending library—36 ft. by 30 ft.—where accommodation is provided for 20,000 volumes. To the left of the library, occupying the frontage to Leith Walk, is the reading-room, measuring 55 ft. by 21 ft. It is separated from the library by a row of columns and arches. The lower part of the tower is formed into a large corner oriel window. This room will be supplied with newspapers, weeklies, magazines, &c. The Nelson Hall measures 78 ft. long by 50 ft. wide, and is divided by two rows of columns and arches, which in turn carry the open roof. The main part of this hall will be lighted from the roof, but the front portion will have large mullioned windows to the front. The whole of the building will be heated with hot water and lighted with electric light. The architect is Mr. H. Ramsay Taylor (of Lessels & Taylor).

**HOME FOR CRIPPLES, BANGOR, CO. DOWN.**—The Mrs. Stewart Memorial Home for Cripples, Bangor, was opened recently. The builder was Mr. James Kidd, and the sanitary fittings were by Messrs. John Dowling & Sons. The plans for the structure were prepared by Mr. W. J. W. Roome, of Belfast.

**WESLEYAN CHAPEL, WALKHAMPTON, DEVONSHIRE.**—The foundation-stones were laid recently

of a new Wesleyan church at Walkhampton. The new building is to be erected by Messrs. Hoop & Sons, of Horrabridge, from designs by Mr. H. J. Snell, of Plymouth. The building is to be of local stone, with brick dressings, and a slated roof.

**ISOLATION HOSPITAL FOR HANDSWORTH.**—Mr. W. E. Fletcher, M.B., inspector of the Local Government Board, held an inquiry at the Woodhouse Endowed School recently into the application of the South Rotherham, Handsworth, and Kiveton Park Isolation Hospital District Committee, to borrow a sum of 16,000, for the purchase of a site and erection of a hospital at Augbton. Mr. H. L. Parry said that the site was contiguous to the Rotherham and Plesley-road, and there was easy communication by road to all parts of the district. The altitude was 325 ft. The number of beds proposed to be provided was thirty-two, and the estimated cost of the buildings was 14,301, made up as follows: Administrative buildings, 3,300; laundry, mortuary, and stables, 1,000; lodge, 207; scarlet fever block, 2,807; enteric fever block, 1,455; isolation block, 1,267; boundary walls and entrances, 800; roads and laying-out grounds, 504; drainage, 210; architect's commission, 620; furnishing wards, 640; furnishing administrative block, 450; total, 14,301. Mr. J. W. Webster, (Sheffield), the architect for the hospital, explained the plans at some length.

**THE EXTENSION OF LEEDS PUBLIC HOSPITALS.**—The Sanitary Committee of the Leeds City Council, at a special meeting on the 18th inst., had under consideration the policy to be adopted in the letting of the contracts for the extension of the Searcroft, until lately known as the Manston Hospitals. The subject was introduced by a deputation representing the master plumbers, plasterers, slaters, and painters of the city. They requested the Committee to let the work for the extension of the hospitals, when the time came, to the separate trades, instead of, as is frequently done at present, to a general contractor. One reason for the change, they urged, was that at times they were liable to the loss of their money. The Committee decided to let the work in one contract, subject, however, to these conditions:—(1) That the contractor should have power to sub-let such master tradesmen as might be approved of by the Committee; and (2) That a clause should be inserted requiring the chief contractor to produce to the architect a receipt for the payments to sub-contractors before he himself should be paid by the Council. The meeting was presided over by Mr. E. E. Lawson (chairman), and Mr. J. T. Hall, the architect of the new scheme, was in attendance. The extension scheme, which has already received the sanction of the Council, will cost about 200,000.—*Yorkshire Post.*

**PARISH HALL, CLAPTON.**—The Countess of Shaftesbury laid the foundation-stone recently of a parish hall to be erected on the south-west side of St. James's Church, Clapton, on a portion of the ground which forms the freehold of the vicar. Mr. W. D. Carle is the architect.

**BUILDING TRADES' EXCHANGE, SHEFFIELD.**—The Sheffield Building Trades' Exchange Company, Limited, have recently purchased from the Corporation land in Upper Charles-street and Cross Burgess-street, containing about 263 square yards, and upon it are erecting premises for the formation of an exchange and club, with large salesshop under. The exchange has its entrance front in Cross Burgess-street. The entrance porch is 17 ft. wide, with an arched outer opening with wrought-iron gates, and with inner doors leading into a circular hall 16 ft. diameter with columns all round it. The exchange-room opens directly from the inner hall by six doors, and is an apartment 40 ft. long, 30 ft. wide, and 18 ft. high. The secretary's office, also opening from the inner hall, and commanding a view of the exchange-room, is 14 ft. 9 in. by 14 ft. 6 in. There is ample cloakroom accommodation and a telephone boxroom. The staircase is to be of stone, 4 ft. 6 in. wide, leading up to the committee-room, 38 ft. by 14 ft. 6 in., and 14 ft. high, which will also be used for arbitration cases. A little further up the staircase is a billiard-room the same size as the exchange-room below, and a refreshment bar. In the upper floors are a committee-room, a kitchen, and a caretaker's house. There is a back staircase and a hoist from top to bottom of the building for communication from the kitchen to each floor. The salesshop is in Upper Charles-street, and is below the exchange-room. The elevations to the two streets are in brick, with stone dressings. The contractors for the work are B. Powell & Son, masons and bricklayers; J. S. Teanby, joiner; Inman & Hayhurst, plumbers; W. Proctor, slater; Hudson & Dore, plasterers; Smith & Snape, painters; T. W. Ward, ironfounder; and the architects are Messrs. Gibbs & Flockton.

**AGRICULTURAL COLLEGE, WYE.**—New buildings have been erected at the South-Eastern Agricultural College, Wye, and these have just been opened by the Rt. Hon. R. W. Haubury, M.P. The new buildings and alterations to the college were begun early in 1900 and finished at Easter, 1901. Mr. E. Colcutt being the architect, and Mr. J. J. Wise, of Deal, the contractor. The work consisted of the extension of the quadrangle, begun in 1894, as far as the boundary of the college property, and the addition of a further wing, together with additions and rearrangements in the kitchens and other

domestic buildings. The biological laboratory has hitherto been also used as a subsidiary lecture-room; this is now discontinued, a second laboratory bench has been made running down the middle of the room, so that there is now working space for thirty students. Opening from this laboratory a smaller one has been built for the professor of botany. A third laboratory has been built for the special work of the lecturer in zoology and economic entomology. Adjoining these laboratories is the museum. The adjoining lecture-room is also new. The drawing office occupies one corner of the new quadrangle; it is 33 ft. long, and provides working space for twenty-four students. The eastern side of the new quadrangle is completed by the principal's offices and a common room for the students. The chemical laboratories occupy the ground floor of the new wing, which runs to the eastward of the main block of buildings. The general students' laboratory measures about 45 ft. by 30 ft., and gives working space for thirty students, besides other benches for special work. Separated from the main laboratory by a glazed partition is the balance room and laboratory for the special laboratories for analytical work and research; adjoining this comes a smaller room reserved for gas analysis, &c., and lastly there is a small room for furnaces, a drying chamber and space for ether extractions and other operations. The building, formerly used as a laboratory, has now taken into the domestic offices. On the first floor of the new buildings additional students' rooms have been built, so that there is now accommodation within the college for fifty students and two members of the staff.

## FOREIGN.

**FRANCE.**—M. Puché, the sculptor, has completed the model for the monument to Jules Simon to be erected in the Place de la Madeleine. It has represented Simon as standing, with arms folded, by the side of a tribune. The pedestal is adorned by two bas-reliefs, one of them representing Simon, at the Collège de France, protesting against the *coup d'Etat* of 1852; the other shows him surrounded by figures symbolising his philanthropic work.—M. Daumet, the architect of the Palais de Justice, has found in the cellars of that building four ancient tapestries which formed part of the famous "Chancelleries" collection. They have been sent to the Gobelin manufactory for repair.—The General Council of the Seine has decided on the creation, at Paris, of a school of Arts et Métiers, to be built on the site of the old abattoirs at Villejuif.—There is talk of the formation of a "Commission Archéologique" to search for and preserve antiquities in the Department of the Seine.—The city of Lyons is about to open a competition for a new fire brigade barracks.—The exhibition of works in painting executed by the candidates for the Prix de Rome has been opened at the Ecole des Beaux-Arts. The subject given was "Christ Healing the Sick, at Evening, before the Gate of a Town." Among the competitors M. Clément Gontier, a pupil of M. J. P. Laurens, has produced a very good work. The award is not yet made.—At Lyons a building is to be erected as a conservatoire of music together with a concert hall and an art exhibition gallery.

**WEST INDIES.**—The supervising architect of the Treasury has invited the leading American architects to submit plans for the new building for the Department of Agriculture.—Judging from the progress made in constructing the rapid transit subway from the New York Post Office to Kingsbridge, this important work will be finished and opened for traffic in the autumn of 1903.—Plans are being prepared for a new subway in Brooklyn, the preliminaries having been approved by the city authorities.—The War Department has approved the plans for the North River bridge, from Fifty-ninth-street to Weehawken, New York. The bridge is estimated to cost sixty millions of dollars.—The foundations of the public library building in Bryant Park, New York, are completed, and the contract for the superstructure awarded. The building will occupy the greater part of a city block, and will be built of marble throughout.

**INDIA.**—The platform and other improvement works at Lahore Railway Station have now been practically completed.—We learn that it has been decided to roof in all drinking water reservoirs connected with cantonments in India, and the work is to be taken in hand as funds become available. The object is to reduce the possibility of contamination from dust.—The Secretary of State has sanctioned the expenditure for doubling the section of the main line of the Bombay, Baroda, and Central India Railway between Dahanu and Sachin, a distance of eighty miles.

**OPEN SPACES (LONDON).**—The Leyton-square public garden, Peckham Park-road, has been recently opened. The freehold was acquired for 3,000, and the London County Council and the Camberwell (old) Vestry contributing one-half of that sum respectively. The Metropolitan Public Gardens Association laid out the ground at a cost of about 600.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. Lincoln & Co., of Glasgow, manufacturers of fireclay goods and sanitary ware, have opened a London office at Broad-street House, New Broad-street, E.C., and have appointed Mr. Edward Huxley as their London representative.—Mr. S. G. Thacker, surveyor, has changed his address from 23, Montague-street, Russell-square, to 90, High Holborn.

INCORPORATED CHURCH-BUILDING SOCIETY.—This Society held its usual monthly meeting on the 18th inst. (being the last for the present session) at the Society's house, 7, Dean's-yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, viz.—Building new churches at Badshot Lea, St. George, near Farnham, Surrey, 75*l.*, for the first portion; Bristol, All Hallows, 200*l.* in lieu of a former grant of 150*l.*; and towards enlarging or otherwise improving the accommodation in the churches at Albury, St. Michael and All Angels, near Shrewsbury, 15*l.*; Clapham, St. Peter, Surrey, 70*l.*; Claverley, All Saints, near Bridgforth, Salop, 30*l.*; Fletton, St. Margaret, near Peterborough, 20*l.*; Hoq, All Hallows, near Rochester, 10*l.*; Landulph, St. Dilpe and St. Leonard, near Hat, Cornwall, 50*l.*; Stepney, St. Faith, Middlesex, 100*l.*; Tetbury, St. Mary, Glos., 10*l.*; Ticehurst, St. Mary, near Hawkhurst, Kent, 20*l.*; and Tremaine, near Egloskerry, Cornwall, 15*l.* Grants were also made from the special Mission Fund towards building mission churches at Cowper Quay, near Blyth, Northumberland, 20*l.*; and Walthamstow, St. Luke, Essex, 50*l.* The following grants were also paid for works completed.—Carlisle, St. Aidan, Cumberland, 1,000*l.*; Douglas, St. Matthew, Isle of Man, 150*l.*; Eastleigh, Church of the Resurrection, Hants, 200*l.* on account of a grant of 250*l.*; Notting Hill, St. Colum, Middlesex, 220*l.* on account of a grant of 250*l.*; Horden on the Hill, Peter and St. Paul, Grays, Essex, 25*l.*; and Bishopwearmouth, St. Gabriel, Sunderland, 50*l.* In addition to this, the sum of 134*l.* was paid towards the repairs of thirteen churches from Trust Funds held by the Society.

CHARTERED INSTITUTE OF PATENT AGENTS.—In terms of the Register of Patent Agents' Rules, 1889-91, will be held next autumn a final qualifying examination of candidates for certificates entitling them to be entered in the Register of Patent Agents. The examination is open to pupils or assistants during seven consecutive years of registered patent agents, solicitors of the Supreme Court of Judicature in England or Ireland, or law agents of the Court of Session in Scotland, and to persons who have passed certain preliminary examinations at our Universities, the entrance examinations for Woolwich or Sandhurst, the Civil Service Examinations for first class clerkships, or for the Indian Civil Service, to Whitworth scholars or exhibitioners, Associates of King's College, London (Engineering and Science Department), to Bachelors of Science of Durham University, &c. The scientific portion of the examination extends to applied mechanics; electricity, chemistry, and heat; and mechanical drawing; and candidates will be examined in the law and practice relating to patents, trademarks, and designs, foreign patent law, and practice, case law, the preparation and interpretation of specifications, and manufacturing processes.

THE NEW PUBLIC BUILDINGS.—In the House of Commons, on the 18th inst., Mr. Lewis asked the Secretary to the Treasury whether he could state the remuneration fixed by the agreements entered into with the architects for the new War Office, Whitehall, the new Public Offices, Westminster, and the Science and Art Buildings, South Kensington, and whether such remuneration had been fixed as a lump sum or by way of commission on the total cost; if so, at what rate per cent., and whether the commission was subject to variation in respect of additional, substituted, or abandoned works; and could he say who were the architects appointed under the agreements, and what was the amount of commission payable to each, assuming that the work was carried out on the present plan.—Mr. Austen Chamberlain: I am informed by my right hon. friend the First Commissioner of Works that the amounts in each case were fixed by agreements with the architects as follows:—For the new War Office, 23,750*l.*; for the new Public Offices, Westminster, 20,000*l.*; for the Science and Art Buildings, South Kensington: (a) Victoria and Albert Museum, 25,000*l.*; (b) Royal College of Science, 10,000*l.* total, 35,000*l.* These lump sums were arrived at by taking a percentage of 5 per cent. by way of commission on an agreed total estimated cost, and they are subject to variations as stated by the hon. member. If more details are desired the First Commissioner will be bappy to show the agreements to any hon. members who may wish to see them. The architects were in each case respectively the late Mr. W. Young, the late Mr. J. M. Brydon, and Mr. Aston Webb, A.R.A.

THE RICHMOND HILL J.M.—On Friday last week at the County Hall, Spring-gardens, a conference of representatives from the London, Surrey, and Middlesex County Councils, and various public bodies, was held to consider what steps could be taken to preserve from threatened disfigurements the view from Richmond Hill. Mr. A. Torrance,

Chairman of the London County Council, presided. The proceedings were conducted in private. Eventually the following resolution was unanimously passed:—"That, in the opinion of this conference, it is vitally necessary that the view from Richmond Hill be preserved, and that with that object it is expedient that those present or invited to this meeting form a general committee, with power to add to their number, for the purpose of considering what steps are necessary and practicable to attain the object desired. The general committee to have power to appoint an executive committee to prepare a scheme and report."  
WIDENING OF HAMSTEAD ROAD.—The St. Pancras Borough Council have agreed to contribute 28,125*l.* towards the cost of widening the southern end of Hamstead-road. The total cost will be 225,000*l.*

TAPE INDICATOR MAP OF LONDON.—Messrs. C. Smith & Son, of Charing Cross, have issued a new edition of their useful indicator which enables one to find any street on the map of London at once.  
DIRECTORIES OF THE WORLD'S PRESS.—Mr. Henry Sell's Dictionary of the World's Press for 1901 is the "coming of age" issue of a useful and well-arranged work. The present edition has been compiled with the care which has characterised previous issues. Besides apparently exhaustive lists of newspapers and magazines published in the British Isles, and lists of foreign and colonial papers, the Dictionary contains several articles of special interest to journalists and others. There are articles dealing with newspaper and journalists of the old and new centuries; journalism and the South African War; the Institute of Journalists; American railway advertising; tariff charges of the United States and Canada, &c., &c. The work contains many portraits of journalists, and the present issue, which numbers nearly 1,000 pages, has as a frontispiece a photograph of the late Queen.

DIRECTORY OF THE ENGINEERS AND IRON AND METAL TRADES.—We have received from Kelly's Directories, Limited, the ninth edition of their excellently-arranged and clearly-printed Directory of the Engineers and Iron and Metal Trades and Colliery Proprietors. It comprises, according to the interesting preface, complete lists of all the various trades connected with metal, or having any connexion with engineering. It includes places, grouped under their respective countries, in England, Ireland, Scotland, Wales, the Channel Islands, and the Isle of Man, with the names of persons carrying on business in each arranged alphabetically in counties or towns; lists of trades arranged alphabetically, in London and suburbs, England, Scotland, and Wales, and Ireland, and several useful indices. The Directory also includes useful facts as to population of places and early closing and market days, and the information it contains is, as far as we are able to tell, up to date and reliable.

PROPERTY SALES.—On Tuesday next, at the Mart, Avery Hill, Eltham, which was during many years the residence of the late Colonel J. T. North, popularly known as the "Nitrate King," for whom some extensive alterations, with enlargement, of the house were carried out under the superintendence of, as we read, Mr. T. W. Cutler. The interior of the house was fitted and decorated at a lavish expense. The principal apartments include a picture gallery and ballroom, a sculpture gallery, and a Turkish bath. There was also a winter garden 100 ft. square, a large fernery, and a stus farm.—On Thursday next, New Grove House, in The Grove, Hampstead, formerly occupied by the late George Du Maurier, who, in 1894, removed thence to No. 17, Oxford-square, W., where he died on October 8, 1896; and the adjacent premises consisting of the Holly Bush tavern and the Hampstead Constitutional Club, which, with the large garden and the three adjoining cottages in The Grove, cover a building site of nearly 10,000 ft. superficial, with frontages to Holly-hill and Holly-mound. In October, 1796, George Romney, who first took lodgings at Hampstead in 1788, bought the copyhold of the old red-brick house on The Mount, in Heath-street. In 1799 he removed to some premises in the rear, which he had built for himself on Holly-hill, facing Holly-mound, comprising a large gallery for pictures and statues, at a cost of nearly 3,000*l.* In 1808, six years after Romney's death, his residence at Holly-hill was taken by the Committee of the Assembly, or New Subscription, Rooms. The premises, of Romney's time, now constitute the tavern and the clubrooms, the large timber-framed clubroom, upon a brick basement, being his studio or gallery, as converted for purposes of the assemblies; the parlour, kitchen, and offices of the club were, it seems, added about eighty-five years ago, by means of a fronting for the enlargement of the Assembly Rooms. We published a view of the tavern and the club premises in our number of July 23, 1898.

FIRE PREVENTION.—Count Kamarowsky, President of the International Fire Council, which held its Congress at Berlin last month, is now on a visit to London. The International Council proposes to form a Technical Research Committee on the Continent, with objects not unlike those of the British Fire Prevention Committee, and it was with the view of deciding on the preliminary arrangements that Count Kamarowsky made a careful inspection of the London Committee's Testing Station, and several public buildings in which fire preventive

measures have been applied. Facilities were also accorded him to view the stations of the Metropolitan Fire Brigade and the London Salvage Corps.

TESTIMONIAL TO A BOROUGH SURVEYOR.—As a result of the London Government Act, 1899, the District Board of Works Office at Putney has been abolished, and the Council of the new Borough of Wandsworth have awarded the former surveyor, Mr. J. C. Radford, a liberal retiring allowance which he takes with him into private practice, after twenty-five years' public service. The ratemakers of Putney have also subscribed for a valuable service of plate to be presented to Mr. Radford.

ARBITRATION CASE.—The award of the arbitrators has been made in respect of work done in the erection of a house in Vernon-road, Edgubron, by Hiram Wilcox, late of Bradford-street, builder, for Mr. Charles Sharp Smith, architect, of Cannon-street. The work was done under contract on an estimate based on quantities supplied by the architect, who measured up the variations and claimed a balance of 66*l.* 0*s.* 10*d.* in his own favour, based on a claim for penalty for alleged delay and other matters. The builder's statement on a valuation by his surveyor showed a balance due to him of 25*l.* 16*s.* 8*d.* The arbitrators, who awarded 27*l.* 5*s.* due to Mr. Wilcox, were Messrs. Anthony Rowse and J. Kirkham Dale. Mr. O'Connor appeared as solicitor for Mr. Wilcox, and Mr. Tanner for Mr. Sharp Smith.—*Birmingham Daily Gazette.*

CAPITAL AND LABOUR.

THE PENRYHN QUARRY.—As has already been stated, the Penryhn Quarry was reopened on the 11th ult. with something under 600 men, or rather less than a quarter of the usual number. The output during the first quarry month (four weeks) was over 2,000 tons of slates, and every week, we are informed, some fresh men and boys resume work, about eighty having gone in during the past six weeks. The workmen now employed held their first meeting on pay Saturday, the 20th inst., and passed the following resolution:—"We, the workmen in the Penryhn Quarry, wish to tender our hearty thanks to Lord Penryhn for the generous bonus of 5 per cent. given to us this month in addition to the 5 per cent. rise given to us voluntarily by Lord Penryhn in January, 1896. We also avail ourselves of this opportunity to acknowledge gratefully the constant kindness of his Lordship towards us as workmen and neighbours at all times, but especially in time of sickness and distress. Yet more do we wish to place on record our warmest thanks for the relief the funds of our Benefit Club have had by his Lordship generously taking upon himself the expenses of the hospital and the doctor's salary. Also for the help given in a quiet and unobtrusive way to the sick during their convalescence by sending them, and for other their expenses in convalescent homes, and for other gifts we know of well enough." The above resolution has been acknowledged by Lord Penryhn's chief agent.

SETTLEMENT OF A LEEDS BUILDING TRADE DISPUTE.—A little more than six months ago the slaters and slaters' labourers in Leeds sent in an application to the employers for an advance of wages and an alteration of rules, to date from July 1. The district officials of the Gasworkers' and General Labourers' Union met the employers a few evenings ago and reported the result of their interview to a meeting of men on the 19th inst. The slaters' labourers did not seem very pleased, and it was only after a long discussion, in the course of which it was pointed out that the masters had consented to fix the minimum wage for this kind of labour at 6*d.* per hour, that the meeting passed a resolution not to strike.—*Yorkshire Post.*

TEE-SIDE BRICKLAYERS.—A ballot of the members of the Tee-side and District Master Builders' Association was taken a few days ago in regard to the Hartlepool bricklayers' dispute, when it was decided to look out all bricklayers working on Tee-side. At a subsequent meeting, however, it was agreed to defer the lock-out for a week so that a conference might be arranged with the men's executive.

LEGAL.

SOUTHWARK BUILDING DISPUTE.

THE case of Davis v. Gibbs and another came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Vaughan Williams and Stirling, on the 22nd inst., on the appeal of the defendants in the action from an order of Mr. Justice Bucknill in chambers obtained by the plaintiff giving him leave to sign summary judgment under Order XIV.

Mr. Bassett Hopkins appeared for the appellants (defendants), and Mr. Norman Craig for the respondent (plaintiff).

It appeared from the statement of Mr. Bassett Hopkins that the plaintiff was the trustee in the bankruptcy of a builder named Ham, and he claimed 74*l.*, the balance certified as due by the labour done under a building contract for work and labour done at the Gibraltar public-house, St. George's-road, Southwark. The defence, which was in the nature

of a counter claim, was that, under the agreement, if the work was not completed by a given day a penalty of 10*l.* a week was to be paid by the builder until the work was completed. The work, by the contract, was to have been finished in twenty-two weeks from its commencement in September, 1900, namely, in February, 1901, whereas the final certificate of the architect was not given until March, 1901, so that the delay had gone into over a year. The Master had given the defendants leave to defend the action if they brought the whole amount of the claim into Court. Mr. Justice Buckley, however, varied the order, and leave to defend was given if 45*0*l.** was brought into Court. The learned counsel contended that the defendants were entitled in the circumstances to unconditional leave to defend. The business had to be carried on by the publicans during the whole time that the house was being rebuilt, and that, apart from the liquidated damages for delay and inconvenience, they had also suffered a very great loss to business from the time the work had been about. He submitted, therefore, that there was a distinct cause of action raised by the counter claim, apart from the question of liquidated damages, and that unconditional leave to defend ought to be given.

The Master of the Rolls asked the cause of the delay.

Mr. Bassett Hopkins said that his witness attributed it in no small measure to the impetuosity of the builder. The publicans had faithfully paid as and when the architect gave his certificates.

The Master of the Rolls: It seems that you have made out a good case. These were licensed premises, and I can only very well understand that the publicans suffered damage far in excess of 10*l.* a week.

Mr. Norman Craig, for the plaintiff, said that there was no defence that the sum claimed was due. What the defendants said was that their counter-claim came to more than the claim, but, extra work having been ordered, the penalty clause for non-completion by a certain date became void.

Lord Justice Vaughan Williams asked the learned counsel what evidence he had of extra work having been ordered.

Mr. Norman Craig read an affidavit by the builder to the effect that he could not get on with the work for several days, owing to the defendants not having obtained the necessary sanction of the local authority.

The Master of the Rolls: Even supposing that the statements in the affidavits were proved at the trial, the defendants would still be entitled to damages sustained to their trade. Besides, there is nothing there about extra work being ordered.

Mr. Norman Craig said that if the contract had not been a good one, the Receiver would never have brought the action, for it would have been a loss instead of a gain to the estate. If the counter-claim were not struck out, the result of it would be that the builder had done some 744*l.* worth of work on the public-house, and the damages for non-completion would wipe out the bill—and more, possibly.

In the result the Master of the Rolls, in giving judgment, said that the appeal must be allowed. In his opinion, having regard to the fact that the premises were licensed premises and business was being carried on during all the time the rebuilding was in process, there was a substantial and not a nebulous defence. He thought the defendants were entitled to unconditional leave to defend. The order appealed against would therefore be set aside and the issue go to trial in the ordinary way.

The Lords Justices concurred. Order accordingly.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

5,617.—A BOILER FOR HOT-WATER APPARATUS: *G. Newsum and F. Neesum*.—The boiler, which is adapted for apparatus for heating buildings, has a wagon-shaped and corrugated fire-box with an arched crown; a hopper serves for the introduction of fuel, and openings are provided for the escape of the products of combustion.

5,632.—CONTRIVANCES FOR USE IN ROOF-GLAZING: *R. White*.—The lower edges of the glass sheets are supported at the ends of the bars with clips or stop pieces fashioned out of metal rods, strips, or wires bent crosswise around the bars and fastened with bolts, or the ends of the rods and wires may be bent or twisted through holes in the bars; in one shape a bolt beneath the bar clips a flanged stop-plate to the notched end of the bar, the plate being provided with drainage holes.

5,650.—MANUFACTURE OF CEMENTS, CONCRETES, &c.: *W. Wright*.—The inventor seeks to furnish means of improving the setting and working properties of Portland, Roman, and other cements with concretes and artificial stone compounds, particularly those that contain chalk, which are made up in the shapes of paving bricks and slabs, window-sills, and similar goods. In preparing the cement he mixes carbonate of potash or some other alkali with the water, or combines sulphur with a strong alkali, and after the material has become set he hardens it with sulphuric acid.

5,664.—METAL COLUMNS: *R. Raw*.—For enhancing the strength of long columns and for ornamenting their exterior a sheath is cast around a tubular wrought-iron core and is left to form part of the finished column; water, or saturated steam or air, is circulated through the core in order that it may not become too heated, and its temperature may then be increased, before the process of casting, by the admission of hot air or superheated steam.

5,670.—FEED MECHANISM FOR CIRCULAR SAWS: *N. Talby*.—In this contrivance, which constitutes an improvement of the mechanism specified in No. 24,807 of 1896, upon the axis of the main roller is pivoted an auxiliary arm, at the end of which is mounted a supplementary roller which a weight, hanging from a cord, forces against the wood, whilst the roller presses the wood upon the fence between the saw and the main feed-roller so as to serve especially for the sawing of short lengths of wood.

5,671.—AN APPLIANCE FOR USE WITH LADDERS: *A. Warburton*.—At the top of the ladder is affixed a tray or shelf for holding tools, &c., by means of side rods sliding in guides, the notched and flanged end of each rod will engage with another eye-piece or guide at the back of the ladder.

5,700.—EARTH-CLOSET APPARATUS: *M. F. Adams*.—It is contrived that the casing, which should be made of sheet iron, shall further serve as a receptacle. A handle works the earth-box, which is placed under and behind the seat.

5,704.—A FASTENING FOR SCAFFOLD-POLES, &c.: *F. Seabourne*.—For fastening the poles together in a line or angle-wise the inventor has devised U-shaped bolts or straps, which he inserts through holes cut in a squared plate and tightens with nuts when they have been put over the poles.

5,706.—A CIRCULAR-SAW GUARD: *R. Halkes*.—The front and back of the saw are covered with two shields that are hinged on to a socket mounted upon the squared end of a bracket. A slotted stay sustains the front shield so that the wood may pass freely beneath it, whilst the wood as it is passed forwards will raise the back shield. A collar in which is clamped the vertical portion of the stay holds up the bracket for being turned (with a set-screw) in a bearing which is secured with bolts to the back of the bench, and so one can swing the shields away from the saw.

5,710.—AN ELECTRICAL CURRENT METER: *P. J. S. Tildeman*.—For indicating the extent of exhaustion of the separate cells of a storage battery, each of them is connected with a separate electro-magnet which under normal conditions will sustain an armature lever, but will allow the lever to fall should the cell pressure be reduced to less than any limit required, each of the levers being either hinged below the corresponding electro-magnet or suspended from a pivot. Numbered openings in a front plate register with the several indicating plates of the levers, and each lever may be caused to close the circuit of an electric bell by means of contact with a stop.

5,725.—A HINGE FOR SLIDING WINDOW SASHES: *G. H. Parker*.—The hinge, which is intended for temporary use when it is desired to swing the sash forwards, comprises two discs that are mounted upon a rod and two other discs that will turn freely upon the rod. To both the top and bottom of the sash are secured a pair of headed pins, and another pair are secured to the jamb of the window; the dovetailed slots of the discs mounted upon the rod take the heads of the pins so that after the removal of the stop-head upon the opposite side one can turn the sash outwards.

5,743.—APPARATUS FOR FIRE ALARMS: *E. H. Griffiths, W. C. D. Whetham, and Cambridge Sentinel Manufacturing Company*.—In order to indicate when a certain limit of temperature has been reached, a container is filled with fusible metal, or alloy, of some similar material, which will melt when the limit of temperature is attained, whilst by means of the action of a spring or gravity the alloy is caused to close an electrical circuit for the sounding of a bell alarm, and so on. In one modification the alloy that is laid within a metal cup; in another form the alloy is laid in a tube which is inclined at its base and can be turned upon a lug for purposes of resetting; the alloy, as it melts, effects contact with an insulated wire that is inserted through an insulating plug at the upper end of the tube.

5,747.—A CONTRIVANCE FOR USE WITH DRAWING COMPASSES: *E. T. Boden*.—The insertions or removable points of half-sets of mathematical compasses are adjusted and secured by means of a slotted flat piece which is fixed between the sides or jaws of a grooved arm; grooves are made in the flattened ends of the insertion pieces and will correspond with the solid portions of the strips which have grooves that will fit over the solid flattened portions of the removable points; in some cases the entire shank of the pin-point may be flattened.

5,755.—AN ELECTRICAL INSULATING MATERIAL: *C. Jung, A. Brecher, and A. Kitch*.—Castor, rape, or linseed oil is mixed and kneaded with casein; the sulphur may be added, and gutta-percha or some other suitable substance is then added to the mixture.

5,758.—A CIRCULAR SAW: *G. Schlegelmich and F. A. Mann*.—The main shaft will drive a chain placed in gear with the teeth of a chain-wheel on to

which the saw—which has internal teeth—is bolted, and a screw controls the fall of a radial arm upon which the saw is mounted; provision is made for holding the work angle-wise, and several saws with distance-pieces can be clamped together when it is required to cut off an amount of about six pieces.

5,758.—TRIFOD STANDS: *A. H. Dupleyron*.—The tubular legs of a telescopic stand are binged on to two top, and when the stand has been extended, two projections which a spring presses into apertures in one section will fasten that section to the next one, the inclined edge of one of the projections will be pressed inwardly as the upper section is forced down upon it, so that the leg can be shut up by only pressing inwards the catch of the top section; a disc that may have a ball-and-socket joint on the top of the tripod has a screw at its centre on to which the instrument is secured.

5,790.—APPLIANCE FOR TESTING DRAINS: *F. Barrow*.—The bell-cover works within an annular chamber formed by the concentric walls of a combustion chamber, and, as it is being worked, air will be admitted through a pipe inlet fitted with non-return valves, and, being charged with the smoke of a combustible laid upon the grating, passes away through the outlet into which is screwed a short length fitted with a non-return valve and a pressure gauge.

5,791.—A FASTENER FOR WINDOWS, &c.: *E. F. Hill and H. King (F. Hill & Co.)*.—For holding fanlights and air or concentrated gas at an angle, the inventors mount the fanlight upon the pins of arms that are worked with screws in such a manner that one can withdraw the pins from engagement if it is desired to remove the fanlight. Spring catches upon the fanlight engage with holes or recesses cut in the quadrants, and a catch at the top of the fanlight will retain it when closed. For a fanlight having butt-hinges the catch catches are placed near its top, and the sash can be lowered (for purposes of cleaning it) beyond the quadrants by turning the nut or turn-buckle which fastens the pivoted flange of each hopper or quadrant.

5,820.—MANUFACTURE OF ARTIFICIAL STONE: *F. E. de Noeyer*.—Small quantities of powdered asphalt or tar, or concentrated gas, are mixed with pulverised coal-cinders together with sulphate and aluminate of soda, are mixed up with dry sand and cement or lime, and there may be added an admixture of quicklime and powdered coal-cinders. The moulds containing the compound are treated with boiling water, and then with super-heated steam at a pressure of six or seven atmospheres.

5,843.—BRICKS AND BLOCKS FOR BUILDERS' USE: *W. Wright*.—The blocks and bricks are fashioned with plain, ornamented, coloured, or glazed tile faces. In the case of outside work the faces may be weathered or inclined, and the faced bricks may be made in the shape of ornamental weather tiles.

5,852.—CONTRIVANCE FOR CLOSET-SEATS: *H. H. Green*.—In order to provide adjustment for different heights and the unevenness of the floor-level, the inventor devises screw feet for the brackets or standards that support the seat.

6,073.—A DISCONNECTING COUPLING FOR FLUSHING-PIPES: *E. H. Burgess*.—Flushing-pipes are connected to the horns of closet-basins with an indiarubber ring set in a rounded flange that is pressed against the horn by a screwed sleeve, which is made fast with a set-screw, and is fitted upon a ring which is attached to the inlet-pipe.

MEETINGS.

SATURDAY, JULY 27.

Builders' Foremen's Association (Memorial Hall, Farringdon-street).—Quarterly meeting. 7.30 p.m.

MONDAY, JULY 29.

Institution of Junior Engineers.—Visit to Electric Lighting and Tramway Installation of the East Ham District Council, Nelson-street, East Ham. 6.30 p.m.

SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.

July 6.—By G. S. ANDREWS (at Norwich).	
Old Buckenham, Norfolk.—The Hall Farm, 232 a. 0 r. 26 p. f. and c. ....	£3,800

Table of real estate listings with columns for property description, price, and agent. Includes entries for Old Park Orchard, Little Clacton, Watlington, Harrow, Marlborough-hill, etc.

Contracts used in these lists.—F.g.r. for freehold ground-rent; l.g.r. for leasehold ground-rent; l.g.r. for

Improved ground-rent; g.r. for ground-rent; r. for rent; f. for freehold; c. for copyhold; l. for leasehold; a.r. for estimated rental; u.t. for unexpired term; p.a. for per annum; yrs. for years; st. for street; rd. for road; sq. for square; pl. for place; ter. for terrace; cres. for crescent; yd. for yard.

PRICES CURRENT OF MATERIALS.

\* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

BRICKS, &c.

Table listing prices for various types of bricks and building materials, including Hard Stocks, Rough Stocks, Gizzles, Facing Stocks, Shippers, Flattons, Red Wire Cnts, Best Fareham Red, Best Red pressed Rubicon Facing, Best Blue Pressed Staffordshire, Do., Bullnose, Best Stourbridge, Fire Bricks, Glazed Bricks, Best White and Ivory Glazed Stretchers, Headers, Quoins, Bullnose, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Spalls, Chamfered, Squints, Best Dipped Salt Glazed Stretchers and Headers, Quoins, Bullnose, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Squints, Chamfered, Spalls, White and Dipped Salt Glazed, Thames and Pit Sand, and various types of Portland Cement.

STONE.

Table listing prices for various types of stone, including Ancaster in blocks, Bath, Farleigh Down Bath, Best in blocks, Grinshill, Brown Portland in blocks, Darley Dale in blocks, Red Corshill, Red Mansfield, Hard York in blocks, and Hard Work 6 in. sawn both sides.

SLATES.

Table listing prices for various types of slates, including in. in., 20 x 10 best blue Bangor, best seconds, 16 x 8 best, 20 x 10 best blue Portman, 16 x 8 best blue Portmadoc, 20 x 10 best Eureka, fading green, 16 x 8, 20 x 10 Permanent green, and 16 x 8.

TILES.

Table listing prices for various types of tiles, including Best plain red roofing tiles, Hip and valley tiles, Best Broseley tiles, Hip and valley tiles, Best Rubicon Red, brown or brinded Do., Do. ornamental Do., Hip tiles, Valley tiles, Best Red or Mottled Staffordshire Do., Hip tiles, and Valley tiles.

PRICES CURRENT (Continued). WOOD.

Table listing prices for various types of wood, including Deals, Battens, Deals seconds, Battens seconds, Foreign Sawn Boards, Fir timber, Second yellow deals, Battens, Do., White Sea and Petersburg, White Pine, and Pitch pine.

Table listing prices for various types of wood, including Fir timber, Second yellow deals, Battens, Do., White Sea and Petersburg, White Pine, and Pitch pine.

Table listing prices for various types of wood, including Fir timber, Second yellow deals, Battens, Do., White Sea and Petersburg, White Pine, and Pitch pine.

Table listing prices for various types of wood, including Fir timber, Second yellow deals, Battens, Do., White Sea and Petersburg, White Pine, and Pitch pine.

JOISTS, GIRDERS, &c.

Table listing prices for various types of joists and girders, including Rolled Steel Joists, Compound Girders, Angles, Tees and Channels, and Flat Plates.

METALS.

Table listing prices for various types of metals, including Common Bars, Staffordshire Crown Bars, Staffordshire "Marked Bars", Mid Steel Bars, Hoop Iron, Sheet Iron, Galvanised, Ordinary sizes, Sheet Iron, Galvanised, Flat, ordinary quality, and Ordinary sizes.

PRICES CURRENT (Continued). METALS.

Table listing prices for various types of metals, including Sheet Iron, Galvanised, Flat, best Ordinary sizes, Galvanised Corrugated Sheet, Best Soft Steel Sheets, and Cut nails.

LEAD, &c.

Table listing prices for various types of lead and other materials, including Lead-Sheet, Zinc-Sheet, Vieille Montagne, Silesian, COPPER, Strong Sheet, Copper nails, BRASS, Strong Sheet, TIN-English Ingots, SOLDIER-Plumbers, Tinmen's, and Blowpipe.

PLASTER, &c.

Table listing prices for various types of plaster and other materials, including Coarse Plaster, Fine, Coarse Keenes and Parisian cement, Robinson's Fireproof Cement, and Whiting.

ENGLISH SHEET GLASS IN CRATES.

Table listing prices for various types of English sheet glass in crates, including 15 oz. thirds, 21 oz. thirds, 21 oz. fourths, 26 oz. thirds, 31 oz. fourths, Fluted sheets, and Hartley's Rolled Plate.

OILS, &c.

Table listing prices for various types of oils and other materials, including Raw Linseed Oil, Boiled, Turpentine, Genuine Ground English White Lead, Red Lead, Dry, and Stockholm Tar.

VARNISHES, &c.

Table listing prices for various types of varnishes and other materials, including Fine Elastic Copal Varnish, Best Elastic Copal Varnish, Best Hard Oak Varnish, Best Extra Hard Church Oak Varnish, Best Hard Copal Varnish, Best Hard Copal Varnish for inside work, Best Hard Copal Varnish for inside work, Extra Pale Paper Varnish, Best Japan Gold Size, Best Black Japan, Oak and Mahogany Stain, Brunswick Black, Berlin Black, Knottling, and Best French and Brush Polish.

TO CORRESPONDENTS.

M. & C. (Amounts should have been stated). NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses. Any communication to a contributor to write an article is given subject to the approval of the editor, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays, N.B.—We cannot publish tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.

\* Denotes accepted. † Denotes provisionally accepted.

BARNSELY.—For the erection of three houses, Long-car-lane, Messrs. Wade & Turner, architects, 10, Pitt-street, Barnsley.—
Masonry.—G. Haigh, Sheffield-road\* £30 0 0
Joinery.—Turton Bros., Pontefract-road\* 95 0 0
Plumbing and Glazing.—B. Denison, Back Regent-street\* 12 10 0

### The Victoria Memorial.

One will be surprised to hear that Mr. Aston Webb's scheme has been selected for the memorial to Queen Victoria. The laying out of the ground on an effective plan was an important element in the design, and of the five architects who were selected to compete, Mr. Webb is the one who, in his previous works, has shown most perception of plan, and who has had the most experience in laying out plans on a large scale. What the other competitors have made of it in this sense we shall know when the public exhibition of the designs, which has at last been promised, takes place; but we should expect to find that, as far as plan and general conception are concerned, the selected design will justify the choice of the Committee; though we are still of the opinion that the choice should have been made from a much larger list of competitors, and that the competition should either have been a public one or should have included many leading architects of the day who were practically shut out. As far as this event is concerned, the matter may be considered as settled; but we urge the point again in view of possible future competitions of the same kind. For a great public work there ought to be as large and unrestricted a competition as possible, if justice is to be done to artists, and if those of the public who care about such matters are to feel satisfied that the best has been done that was possible.

The perspective views and plans of Mr. Webb's design, together with a small and very rough clay model of the central memorial by Mr. Brock, were exhibited at the Foreign Office last week to those who received the invitation of the Secretary of the Office of Works. It is a curious

example of the manner in which this important work has been hurried through by the Committee, and the total want of ordinary common-sense in artistic matters which distinguishes the English official mind, that Mr. Webb (and, we presume, all the other architectural competitors) had to make his design without any knowledge of the form and proportions of the sculptural monument which was to form the central feature. Our attention was drawn to this by noticing that Mr. Webb's perspective drawing showed only a roughly sketched outline of the central monument, which differed from the outline of the sculptor's model. On remarking on this, we were informed, as if it were quite a matter of course, that naturally it was so, as Mr. Webb had never seen the model. Could there be a more typical example of English fatuity about public works of art? Here is a great work in which the architecture is to form the *encadrement* to a sculptural memorial, the sculptor of which has been selected, and the architects are asked to make their design without having seen any model or sketch of the monument which is to form the centre of their work. It seems almost incredible: it would be, anywhere but in England.

Mr. Webb's design for the treatment of the site in front of Buckingham Palace has some resemblance to that suggested in fig. 3 accompanying the article on the subject in our issue of April 13: it includes at all events the idea of a semicircular architectural screen in front of the Palace, of ornamental parterres and fountains within the barrier, and of the curved roads diverging towards Constitution Hill and Buckingham Gate, and following the curve of the screen. The central monument also occupies the same place as suggested in our sketch plan, in the centre of the outside line of the semicircular screen, and facing the Mall. It is perhaps needless to say that Mr. Webb has not adopted our idea of the central canal facing the monument—it would have been of no use to have suggested such an idea in such a competition; first, because the instructions being to make a

triumphal road of the Mall, the design would probably have been ruled out on the ground that a canal was not a road; secondly, because in an English architectural competition it is useless to suggest anything too bold or too original, or too much out of the common way; however beautiful might be the effect promised, it would be sure to be officially condemned as eccentric and extravagant. English people do not like anything to be suggested to them which has never been done before. It may be very well for an Oriental palace, we should be told, but we do not want such things in London.

Neither of course, has Mr. Webb suggested the rebuilding of the front block of the palace, which would also have put him out of court, as suggesting what was not asked for and what there were no funds provided for. But he has endeavoured to bridge over the gulf between the dingy palace front and the new screen and monument by interposing between them a rectangular forecourt following the lines of the present forecourt, and bounded by an architectural screen with gate-ways, pretty nearly if not precisely on the line of the present front railing. From the extremities of this screen, as a base, springs the more dignified and ornate semicircular screen, which consists of double colonnades forming a quadrant on each hand, stopped by pavilions at each end, and with an intermediate pavilion in the centre of each quadrant, which on the side towards the forecourt affords an occasion for the placing of an important piece of sculpture and for a fountain discharging into an ornamental basin. Where the two quadrants meet is to stand Mr. Brock's monument, projecting beyond the line of the screen, facing the central road of the Mall, and with the entrance and exit gates on each side of it. Thus, by the interposition of the rectangular forecourt, the principal architectural screen is kept a little separated from the palace, and the two are not brought into such harsh contrast as they would otherwise be, nor is the principal monument backed so closely up to the Palace front. The general

architectural treatment of the screen is suitable and dignified. On the south side the quadrant roadway outside of the screen, in consequence of the low level of the St. James's Park ground at that point, will form a terrace road with a lofty retaining wall and a balustrade, and this will add to the picturesque and monumental effect of the whole.

The Mall is treated very much in the manner which has been proposed by the Committee from the first; the centre lines of trees are to be removed and replaced by trees spaced at regular distances and alternating with pedestals for sculpture, with some larger erections at two points, where it is proposed eventually to place sculpture groups representing Canada and Australia on one hand, and India and Africa on the other; but these we take it must be regarded as subsequent additions rather than as integral parts of the memorial scheme. One striking point however Mr. Webb has made, and such as has not been before suggested, in taking the Mall through into Whitehall. The Mall, if carried on in a straight line, would strike the Whitehall roadway at an oblique angle. There are different ways of getting over the unsymmetrical effect of this junction, but Mr. Webb has suggested the best, that of making a large monumental circular *place* there, surrounded by trees and with a monument or fountain in the centre. The circle, of course, serves to mask the irregularity of the junction, while providing a new and dignified feature at the entrance to the Mall. It is a tolerably obvious way of getting over the difficulty of lines, but it is not every architect who perceives the obvious way in such cases. Unfortunately the effect of this circular *place* will be very much marred by the fact that it will directly abut upon, and open up more decidedly to view, the wretched building recently erected as the new Admiralty. But that is a misfortune for which the architect of the scheme is not to blame.

Mr. Brock's clay sketch for the monument shows no details, but it composes well as a whole. It makes a generally pyramidal composition, with a thickly-proportioned stele or obelisk in the centre, at the base of which, on the east side, is the seated statue of Queen Victoria. The other three sides are occupied by figures representing, we are informed, Justice, Truth, and Charity. The stele is crowned by a figure of Victory, grouped with figures at her feet representing Constancy and Courage. The base of the whole is a platform, with steps flanked by lions. The whole promises well, but there ought to be a larger and more complete model of it seen before the final commission is given. In France that would be a matter of course. In England art is not of sufficient importance to go to that trouble and expense.

Considering, however, the manner in which the whole scheme has been hurried up, the result seems likely to be much more successful than could have been hoped. But we wish to repeat, most emphatically, our conviction that the refacing of Buckingham Palace with an architectural façade worthy of the situation ought to be an integral portion of the scheme. Whatever effort the architect has made to separate his design from the Palace, and to draw off attention from it, the proposed monumental road is a road up to Buckingham Palace,

and the State gateways are State entrances to the Palace. And when we come to the Palace itself we are met by a miserable anticlimax. Nothing can get over or disguise that fact. Give the Palace a new front, or the whole thing is lame and incomplete.

#### NOTES.

The State  
and Art.

SIR E. POYNTER'S admirable letter in the *Times* of July 30, in reference to the refusal of the House of Lords to accept Lord Stanmore's motion for the formation of a Royal Commission similar in character to the Fine Arts Commission of 1842, will perhaps not be without some effect in the long run. It at all events serves to point out, from the position of a writer who speaks with authority on art, what a deadening effect the indifference and parsimony of the State authorities produces upon art and artists in this country. We have really gone backward in this respect during the last half century. Mistakes were made, no doubt in the frescoes with which the Houses of Parliament were decorated—mistakes both of decorative style and technical method; but at all events, the attempt to do something great was made, and, as Sir E. Poynter implies, it was not by any means so unsuccessful as it is the fashion to think now. And a government, by commissioning decorative paintings on a large scale, does something important for the promotion and encouragement of art. As Sir E. Poynter says, "the mere fact that an artist, especially if he be young, receives a commission from the State, gives a stimulus to his energies which no lesser form of patronage can supply." There can be no doubt that some part of the energy and vigour of French art is due not merely to the inherent genius of the French for art, but to the fact that French artists receive constant and substantial support from their Government in the shape of commissions for and purchases of large works; while in England, when any proposal is made to spend money in that way, it seems to be the first effort of the Treasury Department to oppose and suppress it as a useless expenditure. The formation of a Fine Art Commission with a certain defined power of annual expenditure on art would do something to get rid of a state of things which is discreditable to the country, and would ensure to artists some chance of earning distinction in public work. It is to be hoped the idea will not be allowed to drop.

The New  
Government  
Offices.

THE reply given by the First Commissioner of Works the other night, in answer to a fresh question in regard to the carrying out of the Government Offices in Great George-street, however it may satisfy the public, will not satisfy architects, nor those few others who know anything about the conditions of carrying out architectural work. The First Commissioner was pointedly asked whether he had detailed drawings by the late architect (a question arising, we fancy, out of a suggestion in these columns), and admitted that he had not "except," he said "for the woodwork." If this is reported right, we do not understand it; it seems in the highest degree unlikely that Mr. Brydon should have prepared all the

details for the woodwork at that early stage. The First Commissioner continued to the effect that the Office of Works had engaged Mr. Brydon's former principal draughtsman to assist in getting out the details. This looks to us very like a tactical arrangement entered into with the object of satisfying the public criticism which has arisen and is likely to arise in regard to this matter. We do not know how much Mr. Brydon ever left to his draughtsman; we have little doubt that he originated all his own details; and in any case what security have we that any weight will be given, in the Office of Works, to the judgment of the late architect's draughtsman? It is merely an attempt to provide some kind of answer; and it is an answer that will not be accepted. We must see an architect of learning and reputation appointed to carry out the building.

Theatre  
Regulations of  
the L.C.C.

THE new schedule of regulations for the construction and arrangement of theatres just issued by the London County Council differs from their previously existing regulations mainly in the amplification of instructions on one or two special points. In place of requiring that any one proposing to erect a new theatre should first make an application in writing to the Clerk of the Council, it is now also required that he should make public his intention by exhibiting a notice-board on the proposed site, or by advertisement in three newspapers circulating throughout the county. A more important amplification is comprised in Section 10, which supersedes the Section under the same number in the previous regulations. In place of the general requirement of two separate exits for each tier, an additional exit is now required where the number of persons accommodated in the tier is over 500. The width of the exit doors is also specified in relation to the numbers of the audience, and an important and very wise addition is that in reckoning the numbers "standing space from which a view of the performance can be obtained" is to be reckoned in, as well as the seating accommodation. Under "corridors, passages, &c.," it is stated that, where possible, inclines should be used instead of steps, the gradient of such inclines being limited to 1 in 10. An attempt was made to defer the adoption of the new requirements until the Council could take the opinions of the leading theatre architects, but this was not carried. It would have been better had this course been taken; but in the main the alterations appear to be in the right direction.

The Widening  
of Piccadilly.

THE widening of Piccadilly from Hyde Park Corner to Devonshire House will, no doubt, facilitate the progress of traffic in that particular part of this thoroughfare. It is quite certain, however, that it will increase the block between Albert Gate and Hyde Park Corner, and from Piccadilly Circus to Devonshire House. The tendency of constructing a wide thoroughfare will be to bring a larger quantity of traffic into it which will be stopped at the two narrow ends. When traffic also can move quickly along the broadened thoroughfare, it will come in larger masses in the two termini. It is obvious, therefore, that the widening of Piccadilly must necessitate what has long been

urgent, the widening of the thoroughfare from near Albert Gate. Fortunately, this is but a short piece of street, and undoubtedly this work should be carried out at once. The question will then arise, How is Piccadilly East, as we may call it, to be dealt with? The answer appears to be that opportunities for the traffic to be carried out of this part must be increased. One form of relief which would be easy and inexpensive would be the construction of a carriage thoroughfare from Piccadilly to the drive in the Mall, through Green Park, by the side of the walk in front of the Arlington-street and other houses which now look into the Green Park at its east end. Distasteful, also, as it might be to the frequenters of the Pall Mall clubs, there can also be no doubt that some of the omnibuses which now run in Piccadilly might be turned into Pall Mall for the purpose of relieving the traffic between Devonshire House and Piccadilly Circus.

A Proposed  
Technical  
Dictionary.

THE German Society of Engineers (*Verein Deutscher Ingenieure*) has undertaken the

arduous and we fear rather thankless task of compiling a trilingual dictionary of technical terms and phrases, in German, English and French. It is to be issued in three volumes, respectively arranged as (I.) German-English-French, (II.) English-German-French, (III.) French-German-English. Dr. Hubert Jansen, who has a reputation as a lexicographer, has been engaged as general editor. The system pursued has been to write to a number of scientific and technical societies in the three countries and ask them to appoint or recommend members of their respective bodies to take up certain special subjects in each language, and to each of those who have consented to act a prepared list of questions has been sent, the object of which is to get the work systematically arranged and subdivided. We have no doubt such a dictionary, if adequately carried out, would be very useful; but it is rather a question whether it is not practically an impossible task. In the first place, the work must be so extensive and complicated that it is difficult either to fulfil it entirely or to set any logical boundaries to it; in the second place, it is exceedingly difficult to get two men of different nationalities who will be able to say positively what term in the one language is the exact correlative of any term in the other language. The only sure way seems to be having either objects or drawings of them before a trilingual committee, when each can state what is the name for it in his language. There are many technical terms, however, which cannot be represented by objects or drawings, as they only define processes. However, if the attempt is carried through, we hope (but do not expect) that technical terms in architecture will receive due attention. We have already on our shelf a trilingual technical Dictionary in three volumes, German, French, and English, on exactly the lines now proposed—a large work of 800 to 900 double-column pages in each volume, published some few years ago. We have occasionally consulted this for the meaning of architectural terms in French or German publications, and have never in any case got any information from it—the words used were not in the Dictionary. Works of this kind are usually compiled by people who are familiar with engineering and workshop

terms, but know nothing of architectural phraseology.

Electro-  
Chemical  
Industries.

MR. J. W. SWAN'S presidential address to the Society of Chemical Industry at Glasgow

last week is well worth reading, not only by scientists but also by all who are interested in technical education and its bearing on the commercial welfare of the country. Chemical industries are peculiarly liable to change, and the commercial methods universally employed to-day may in a year or two be abandoned. In 1880 the Clyde, the Mersey, and the Tyne were the supply markets of the world for alkali. Owing to the great development of the electrical industries abroad this state of things no longer exists. If we are to win back our commercial supremacy we must be able to manufacture electrical power cheaply. There is no hope from primary batteries, for even if we got zinc for nothing it would still be cheaper to use dynamos. Mr. Swan says that there is some hope of getting electricity direct from coal. Inventors generally try to make a carbon consuming cell. Mr. Swan suggests that they should invent a gas-consuming cell like a Grove's battery, and this seems to us excellent advice. At present the most practical method is the making of cheap gas by means of producers for use with gas engines. Mr. Swan exposes the fallacy that water-power is necessarily cheap. He points out that the capital outlay per horsepower developed is often prohibitive. In Switzerland it is sometimes under 3*l.* 10*s.*, whilst at Lyons it is 8*l.* In Norway there is one place where water-power is generated at a cost of 1*l.* per horse-power per year, but there are places where it costs ten or twenty times this amount. In the United Kingdom the cheapest steam power is about 5*l.* per horse-power per year, and is produced where coal costs 5*s.* per ton. Mr. Swan makes some caustic remarks on the neglect of higher technical education in England and Ireland. It is little use giving to the working classes a "disjointed smattering of miscellaneous science." It is an absolute necessity for our manufacturers and our technical chiefs to have a "scientific training of university standard." We agree with him in thinking that scientific research should be endowed largely from the public funds. It is humiliating to think that our electricians have to send to the German Reichsanstalt for their standards of light.

The National  
Art Competition.

THE exhibition of drawings

and models made by the students of the schools of art throughout the country under the Board of Education is now open in one of the iron buildings at South Kensington. The exhibition this year is below the average in interest owing to the unaccountable exclusion of the work done by the students in training at South Kensington for art masters. Hitherto these advanced students have received honorary awards in the annual competition, and have carried off the majority of the high awards. Their exclusion is most noticeable among the advanced designs for applied art, and in drawing and modelling from the life. Every year there is a fluctuation of interest from one class of work to another; one year it has been applied design, latterly it has been rather in the direction of book illus-

tration, and this year it may be fairly claimed that the most consistently good work is among the measured drawings of ancient buildings. Year by year the architectural exhibits have been as a whole most unworkmanlike, and the architectural design this year is even worse than usual; the measurement drawings, on the other hand, show very marked improvement. Mr. Garnet J. Hands has produced a valuable illustration of the Priory Church, Great Malvern, in a fine set of drawings which receive a gold medal, and a similar award has been made to Mr. F. E. Collington, of Nottingham, for his drawings of the well-known sedilia in the chancel of All Saints' Church, Hawton. Amongst other well-chosen subjects that have been measured are the Customs House, King's Lynn, the Parish Church, Wrexham, and portions of Kirby Hall. The designs for wall-papers, hangings, jewellery, and metal-work are not so good as in previous years. A feature of the present exhibition is some excellent colour prints from Lambeth. Miss M. B. Keighly, of Plymouth School, has won a gold medal with some fine figure designs for embroidery. The designs for stained glass are also good, notably those of Miss Geraldine Morris and Miss E. M. K. Richards.

DR. THEODORE THOMSON'S Report to the Local Government Board in regard to the sanitary

circumstances and administration of the Holsworthy Urban District gives evidence of a most unhappy state of things both in regard to the quality and quantity of the water supply. The supply is obtained from shallow wells sunk in the limestone rock on which the town stands—wells for the most part un-steined, and therefore subject to pollution. There are six public wells, but they all go dry in summer except the "Waterloo" well. The local Medical Officer of Health gives, in one of his reports, the following distressing account of what he calls the "annual water famine":—

"By the second week in May (1899) very little water remained in any of the wells, and in June the large water barrel had to be requisitioned to supplement the supply. During the months of July and August a large number of the inhabitants of the town were entirely dependent on this barrel of water, which was brought into the town, sometimes twice, but generally only once a day. The advent of the barrel into the market square was the signal for a rush of applicants for drinking water, which was soon exhausted, late comers having to return empty-handed to beg or borrow from their more fortunate neighbours."

It seems almost incredible that such a state of things should exist in a district under sanitary authority in this country.

THE SANITARY INSTITUTE.—At an examination in practical sanitary science, held at Liverpool on July 12 and 13, 1901, three candidates presented themselves, one of whom, Mr. F. W. Tomlinson, was awarded a certificate.

ST. MARTIN-IN-THE-FIELDS TOWN HALL.—Mr. John Murray has been appointed architect for the alterations and additions to be carried out with a view to converting the present structure for purposes of a Town Hall for the City of Westminster Council. Messrs. Patman & Fotheringham's tender of 24,593*l.*, which includes 1,720*l.* for certain extra interior decorations, has been accepted. The Town Hall was built in 1890-1, by Messrs. John Mowlem & Co., who contracted for 23,200*l.*, after the designs of K. Walker, *obit.* 1896. The site, being that of Nos. 113-4-5, St. Martin's-lane, and a portion of Henning's-row, was formerly that of the Swan Close and the parish pond. It was acquired by the (old) Vestry from the Marquis of Salisbury and the late Metropolitan Board of Works.

## LETTER FROM PARIS.

The question of the fortifications of Paris, for a long time in suspense, has recently passed into a new phase, and seems now in the way to be definitely settled. Hitherto the State and the City authorities have not been able to agree as to the utilisation of the land which the demolition of the fortifications will leave free. If the arrangement now proposed is carried out the City authorities will undertake all the cost of the new roadways, and of the circular boulevard which should form the new boundary of Paris; this will amount to about 50,000,000 fr. All the rest of the land will remain the property of the State and will be offered for sale, the City reserving the right to acquire those portions which it considers necessary for the erection of certain hospitals and other public institutions. This practical scheme puts an end to the idea of forming around Paris a great circle of trees and gardens; but at all events the city will by this means, at a comparatively small cost, get rid of a useless line of bastions and ditches.

The municipal administration has at last finished, in the thirteenth arrondissement, the artesian well of the Butte aux Cailles, after operations which have been going on for thirty-eight years. This work, commenced in 1803, was a serious blunder on the part of the municipal engineer's department, for the new well, which has been both difficult and costly to carry out, furnishes less water than the old one. In fact it is evident that for the water-supply of Paris, a system of artesian wells is entirely a Utopian idea, and that it is much better to keep to the system of storing water from the surrounding rivers, unless the administration decides to consider seriously the proposal to tap the lake of Geneva, which has been suggested by certain engineers.

The Commission which has in hand the study of the important scheme of the Canal des Deux Mers to cross a large portion of France, has appointed a sub-committee to visit the various important canal works abroad. This committee, presided over by M. Gerville Réache, will first visit Liverpool and study the canal from Liverpool to Manchester, proceeding from thence, via Hull and Hamburg, to the Kiel canal, returning, via Henschenschburgh, to examine the ship lift from the Dortmund canal to the Elbe, where the difference of 50 ft. between the level of the two waters is worked in a most economical manner, and will probably serve as a model for the lift necessary for the proposed canal at a difficult point near Naurouze.

The text of the resolution passed by the Commission of twenty-two members nominated by the Minister of Public Instruction and of Fine Arts, to study the creation of special schools of architecture in the provinces is as follows:—"There is urgent necessity for the creation of a certain number of regional schools of architecture in some of the important centres, especially university towns already possessing a certain programme for teaching the three arts. These regional schools of architecture should be constituted in a manner similar to that of the Ecole Nationale des Beaux Arts at Paris section of architecture, with the difference that the future schools shall not possess any of the official ateliers d'architecture. The terms of admission and the system and programme of studies shall be alike and common to all the various new schools. The Higher Commission of the Ecole Nationale des Beaux Arts at Paris shall form the general central commission for the future schools in order to assure an equitable control over the provincial teaching." It is expected that the new law will be brought up before Parliament at its next session and rapidly passed.

There is certain trouble with regard to the application of the system of the *lout à l'égout* at Paris, the recent law for which constrained all householders in certain quarters to install this system in their properties by a certain fixed date. About 800 house-owners have not yet done their duty in this respect, and have been arraigned by the Prefect of the Seine before the courts of law. Ten landlords have been called up for the purpose of deciding the case, but the house-owners bring forward in defence that the Town has not given satisfaction itself with regard to the terms of the law of 1894, notably as regards the supply of the quantity of water necessary for this system of drainage, and the necessary pressure for giving

a proper supply of water to the upper stories of the buildings, adding also that the spreading grounds outside Paris have not yet been extended to the superficies necessary for the proper disposal of the sewage from the *lout à l'égout* system. The matter has been adjourned to the first week in August.

A Museum of Health and Sanitation will shortly be installed on the Quai des Celestins, and will contain, in the form of documents, drawings, and models, the history of dwellings in France from the twelfth century. An important section of the museum will be given up to plans and details of systems of irrigation, elevatory machines, drainage apparatus, and the various apparatus employed on the sewage farms. Another section will comprise everything relating to heating, ventilation, and the proper sanitation of dwellings.

The number of buildings entered this year for the competition called Concours de Maisons at Paris is considerably less than that of the previous competitions. The competitions of 1888 and 1889 comprised each about sixty houses; that of this year will comprise thirty-nine only, and this falling off may be attributed to the fact that very few houses comparatively were erected in 1900, the year of the Exhibition.

The rather daring liberty taken by M. Tony Garnier, one of the Prix de Rome students at present going through his course of studies in Italy, in sending as his share of the students' contributions a scheme for a "Cité Industrielle" (as mentioned in the last letter), seems not unlikely to lead to a reconsideration of the whole subject of architectural study. M. Tony Garnier annexed to his drawings the following drastic piece of criticism:—"Like all architecture based on false principles, ancient architecture is an error. Truth alone is beautiful. In architecture, truth is the result of calculations made to satisfy known necessities with known methods." M. Stanislas Ferrand, the Chief Editor of *Le Bâtimeur*, and Member of Parliament, proposes to bring up the matter at the next discussion of the Budget of Fine Arts.

The City of Paris is entering into negotiations with the view of establishing in the capital a National School of Arts and Trades. France possesses at present four national schools of this kind—at Aix, Angers, Chalons-sur-Marne, and Lille. The proposed school will be erected on a piece of ground measuring 20,000 square metres, at present occupied by the slaughter-houses of Villejuif. The école will be constructed by the Department of the Seine, which will bear three-quarters of the cost, the State undertaking the remainder of the expense.

M. Adrien Mithouard is about to organise a Commission Archéologique for the Seine Department. This Commission will undertake the duty of making searches in the whole of the Department de la Seine—Paris excepted—for all vestiges of ancient art, and is then to class these remains, examine their present state, and do what is necessary to preserve them, and follow up the researches and excavations which may be made in view of bringing further remains to light. The Commission will be divided into four sections, each section comprising ten members chosen from amongst well-known local archaeologists.

The monument to the late M. Charles Garnier, architect of the Opera House at Paris, is at present being erected within the courtyard of the Opera, just in front of the rotunda of the Bibliothèque, under the direction of M. Pascal, architect, and an old friend and colleague of Charles Garnier. The State wishing to participate in the homage done to the late architect, has offered to contribute a portion of the granite and marble for the construction of the monument, and has allowed M. Pascal to choose and select any blocks of stone he desired from the State deposit of marbles on the Quai d'Orsay. It appears that M. Pascal has chosen a certain number of the large blocks of granite which were ordered from Corsica in 1806 by Napoleon for the construction of the pedestal of the Vendôme column at Paris.

M. Eugene Guillaume, Director of the Academie de France at Rome, has just renitted to the Academie the further twenty inscriptions from the ruins of Palmyra sent him by M. Bertone, late Prix de Rome student in Italy, who carefully explored the ruins of Palmyra in 1895, and sent home a large number of interesting inscriptions, which he intends forming into a complete work very shortly, a work which promises to be of very great interest to archaeologists.

The election of a new corresponding member of the Academie des Beaux-Arts to take the place of the late M. Revoil, was the subject of a keen competition between M. Batigny, architect, of Lille, and M. Beltrami, of Milan, resulting in the election of M. Batigny, whose best known works of architecture are in the north of France, notably the Ecole des Arts et Métiers at Lille.

The Institute has awarded to M. Jacques Defrance, pupil of MM. Bonnat and Alber Maignan the Grand Prix de Rome in painting. In sculpture the subject given was "Edipus and his daughter Antigone leaving Thebes pursued by the maledictions of the people." M. Henri Bouchard, to whom the principal prize has been awarded, has shown both dignity and pathos in his treatment of the subject. The young sculptor, who is already an accomplished artist, is a pupil of M. Barraix. The prize in architecture is not yet awarded. The Academie des Beaux-Arts has also given its award for the Troyon prize for a cattle and landscape subject, for which there have been sixty-four competitors; the prize has been awarded to M. Jacques Camarey. The Academie has elected as corresponding members, in the section of painting, MM. Sorolla and Bastida, of Valencia, and in the section of sculpture M. Constantin Meunier, a Belgian sculptor, and Mr. Onslow Ford of London.

The five scholarships of 48l. each, awarded each year by the Conseil General de la Seine to young artists without means whose work shows promise of great talent, were given this year to MM. Louis Bilou, painter; Auguste Cornu, sculptor; Jules Baucour, architect; Louis Collin, sculptor; and François Flament, sculptor. The mention accompanying the award to M. Baucour was most flattering to the assiduity and talent of the young architect.

The Prix Houleuvreigne of a value of 200l., destined to recompense the author of a remarkable work in one of the arts produced during the past four years, has been awarded to M. Humbert, painter, for his decorative paintings in the Pantheon at Paris.

On the occasion of the annual national fête, the Government conferred on M. Harguignes the rank of "Commandeur" in the Legion of Honour. The venerable artist, who is now eighty-two years of age, was created "Chevalier" in 1875, and "Officier" in 1883. He is one of the glories of the French School of Art, and has pursued an unbroken career of success, never falling below the high standard which he has marked out for himself, and is still painting with all the freshness and power of a young artist. Four years ago the Société des Artistes Français awarded him the medal of Honour of the Salon, as the last and highest recognition of his genius and of his sustained greatness of style as a landscape painter. He made his first appearance at the Salon in 1853, and has regularly exhibited every year since then.

## COMPETITIONS.

FROGNAL PRESBYTERIAN CHURCH (CORNER OF FINCHLEY-ROAD AND FROGNAL-LANE).—The committee of this church invited a limited number of architects to submit competitive designs for this church, and three premiums of 50l., 30l., and 20l. were to be paid to those architects whose designs were placed respectively first, second, and third by the assessor. The committee appointed Mr. J. Macvicar Anderson, F.R.I.B.A., of London, as their professional adviser and assessor. Mr. Anderson has now made his report, and has awarded the premiums to the following competitors, namely:—First place and premium of 50l. to Messrs. William A. Pite and R. S. Balfour, London; second place and premium of 30l. to Mr. A. O. Breeds, architect and surveyor, London; third place and premium of 20l. to Mr. W. Gilibee Scott, London.

THE CITY CREMATORIUM.—The City Engineer, Mr. D. J. Ross, has at the request of the Sanitary Committee prepared plans for a crematorium at Ilford. The plans provide for a chapel, having an entrance porch and one catafalque. The cremating chamber, which will be at the rear of the chapel, will admit of two cremating furnaces being erected. The building will have a flat roof with stone parapet. The furnace flue will be arranged in the centre of the tower, which will form a feature in the buildings, and will be about 80ft. in height. The crypt or columbarium under the chapel will be fitted up for the reception of the urns, and the various monuments can be attached to the walls on niches. The estimated cost will be about 10,500l.

## THE ANNUAL EXCURSION OF THE ARCHITECTURAL ASSOCIATION.\*

Wednesday.

The clouds of the preceding days, which had then proved grateful rather than otherwise, on this morning developed into rain, which continued practically for almost the whole of the day. The places which were to be visited lying at some considerable distance from headquarters, the railway was taken to Tetbury station, where carriages were entered, and a short drive brought the party to Doughton, which must be credited as one of the triumphs of the organising secretaries of the excursion, Mr. H. Talbot Brown and Mr. A. W. Hennings, for here was found a delightful and almost unknown manor house and farm, as well as other interesting houses. The manor house is a typical seventeenth century Gloucestershire example of not very great size, but exceedingly picturesque, stone built, with numerous gables, of which, indeed, there is almost—a to be critical—a superabundance for a perfect design. The house appears to be seventeenth century in date, and although the interior has been considerably modified and, to a certain extent, spoilt, there still remain a handsomely paneled room with very good chimney-piece on the ground floor, now used as the kitchen, but probably originally a parlour, and on the first floor above this room an equally interesting bedroom or chamber. Both of these rooms, which are at one end of the house, have bay windows, which add to the picturesqueness of the exterior. Not only is the house in itself abundantly worth study, but an enclosed garden in front with well-designed entrance piers towards the road, and another enclosed garden at the back with the remains of stone summer-houses or gazebos, and a yew arbour are still sufficiently in evidence to mark out the original scheme. The farm buildings around the house are many of them contemporary with it and picturesque and quaint beyond the actual utilitarian necessities of their functions. Such a treat as this house proved to be fired the enthusiasm of the members, many of whom braved rheumatism and other ills by sitting out sketching in the pouring rain—in fact, the majority of the members spent so much time at the manor house that they were unable to visit the less important but more artistically satisfactory seventeenth-century house near by with front towards the street, with its three gables and projecting bay over a domed porch, combined with millioned windows, old weather-stained, rough-cast, and steep-pitched slate stone roof, forming a combination which on a sunshiny day would send into ecstasy any sketcher with a colour-box and the time to use it. Nor did this house exhaust the wealth of the village of Doughton, for opposite the last-mentioned house is another, inferior, no doubt, in interest, but with an eighteenth-century door that is not unworthy of some attention.

From Doughton, to the accompaniment of more rain, the excursionists proceeded to Malmesbury, whose ancient abbey was, of course, the chief attraction with its remarkable doorway, of which we gave a two-page illustration last week. The abbey of Malmesbury has been fully described and illustrated in our series of the abbeys of England, and we need not, therefore, repeat the particulars we then gave. Not the least entertaining of the incidents at Malmesbury was the explanation of the west doorway given in quaint Wiltshire brogue by the verger, one of the freemen of the ancient town, amongst whom is divided the estate of 800 acres given in perpetuity by King Athelstan, and known as the Common of King's Heath, in recognition of the bravery of the men of Malmesbury and the valuable assistance they rendered him in gaining a victory over the Danes.

A visit was also paid to the Elizabethan house built on the substructure of part of the abbey buildings, which may possibly have been the abbott's house, and of which the crypt still remains. Within this building is a good paneled room of the early seventeenth century, with an earlier fireplace and stone arch. The house is now being carefully adapted as a modern residence under the direction of Mr. George H. Selby.

The final visit in Malmesbury was made to the market house, erected in the time of Henry VII., octagonal in form, with angle piers

and buttresses, and rib and panel vaulting internally of good design.

From Malmesbury the party proceeded to the final visit of the day, Charlton Park, now the property of Lord Suffolk, one of the notable examples of the Early Renaissance in England of which the oldest part was built by Sir Thomas Knivet in the time of James I. The west front, illustrated by us last week, is attributed to Inigo Jones. The east front was added in 1773 by Henry Lord Suffolk, Secretary of State in the time of the American war, and at the same time the hall was probably erected or modified into its present form by the enclosing of the internal courtyard. The long gallery remains intact, but the greater part of the interior has been modernised, and its chief attraction, therefore, now consists in the fine collection of pictures contained in the house.

Thursday.

Another wet morning, with the rain continuing nearly the whole day, made the proceedings decidedly uncomfortable. The railway was again taken to Tetbury station, whence the first drive was to Beverstone, where the church and castle were visited and studied. The church, dedicated to St. Mary, consisted of a nave and south aisle, chancel, north transept or chapel, south porch, and western tower, and is principally of transitional date, with an excellent arcade between the nave and aisle, but unfortunately the church was "restored" without discretion some sixty years ago. As an example of the manner in which this "restoration" was effected, the architect's description of the treatment of the Norman font is instructive; he describes it as having been "squared into neatness." This is a correct account, and naturally all character has been lost. Another exploit of the same worthy was the removal of the rood screen and the construction therewith of summer-houses in the rectory garden; needless to say in such a situation it fell into lamentable decay, but has been admirably repaired and replaced in its proper position under the direction of Mr. Waller, of Gloucester. The date of the screen is very late, probably between 1490 and 1510. There were formerly many wall paintings in the church. The records of most have been lost, but a sketch of one, dated probably between 1390 and 1400, which was formerly in the chancel has luckily been preserved, and apparently represents the entombment and the vision of Pope Gregory justifying the doctrine of transubstantiation.

There are several monuments in the church worthy of notice, and an organ by Father Smith, whose tone the visitors were enabled to appreciate by the skill of one of their number.

The castle is a beautiful ruin, the remains of a stronghold erected by Thomas Lord Berkeley in the reign of Edward III., which after repeated sieges was taken and burnt in the early part of the Parliamentary war. The last stand of the defenders is said to have been made at the entrance to the priest's oratory, the proof of which tradition is supposed to be furnished by what certainly do appear to be very like sword-cuts in the stone jamb.

This oratory has also interesting features in the hagioscopes which open into a larger room, said to be the guard room, and a smaller chamber said to be that of the officers. In addition to this oratory there is also in very fair preservation the chapel, with two sedilia and piscina of good design. The chapel is vaulted in one square compartment and a waggon-vaulted bay, which forms the sanctuary.

The south side of the chapel has a curious cusped-headed shallow niche which puzzles antiquaries, and which, it is suggested, was occupied by a life-size figure or painting representing the Virgin.

From Beverstone the President walked across the fields, whilst the rest of the members drove by a longer route along the road to Chavenage, halting on the way for a few minutes to glance at the famous barn at Calcot, which, however, has architecturally lost the greater part of its interest by being reduced to little more than half its original size, and by the fact of its having been burnt, as an inscription records, on October 9, 1728, after which it was repaired, at the expense of T. Estcourt, Esq., by John Pill, carpenter, who finished the work on October 17, 1729.

The Manor House at Chavenage was originally built in 1576 by Edward Stephens, but was apparently considerably modified in 1684

by Richard Stephens, and since his time by other members of the Stephens and the Chaplin families, so that now it is rather a jumble that does not do justice to the original design. Many insertions that appear to have been made by Richard Stephens are clearly from an earlier building, and probably bits from Horsley Priory. The shield over the front door is also most likely imported from some other situation, whilst the screen in the hall was, there can be little doubt, made up of imported materials at some date subsequent to the original erection. Apart from the hall, the room now used as a dining-room is the richest part of the interior, the walls being paneled, with a good chimney-piece. Amongst the collections which go to make up the interest of the house may be especially mentioned the tapestry, particularly that in what is called Oliver Cromwell's room, and numerous fragments of stained glass, principally Dutch. The little church adjoining the house has a picturesque tower, but otherwise is not of great interest, and the date of its erection appears to be a matter of considerable doubt. An excellent and judicious paper by Mr. W. H. Seth Smith, the President of the Association, has been published in the transactions of the Bristol and Gloucestershire Archeological Society.

From Chavenage the excursionists returned to Tetbury, where sufficient time was allowed them to wander round the town and sketch some of the many picturesque old houses therein contained, and especially the market hall, with its sturdy Doric columns and upper chambers. The church, which from a distance appears to be a striking feature of the town, was built in 1781, and on a near inspection presents a hideous instance of the ignorant handling of Gothic detail. The tower and spire have been recently somewhat improved in this respect, but the main body of the church still remains an awful example, which, however, judging from the effects of time on its shoddy construction, is destined at no very future date to completely collapse unless rebuilt. When one, however, realises that the cost of the erection was only £6,000, it is a matter for wonder that so much snow and so large a cubical capacity were obtained for the money.

From Tetbury the members returned by train to their headquarters at Cirencester.

Friday.

Friday morning broke fine with a promise of fairer weather for the day, a promise, however, which was not completely fulfilled, being marred by an echo of the remarkable thunder-storm that had visited the metropolis on the previous day. The first village visited was Barnsley, where a short stay was made at the little church and picturesque village. Like many of the churches in the district, this is evidently of an early date as evidenced by the transitional chancel arch, and by the remains of still earlier work which have been incorporated in the modern vestry, and which appear to be of eleventh century workmanship prior to the Norman invasion. The corbel course in the eaves of the chancel is also an indication of the early date of the fabric. The church is small, suited in that respect to the village over which it stands, but in its picturesqueness thoroughly in keeping with the surrounding cottages and small houses. The main point in the composition of the church is its small western tower, being merely some 14 ft. or 15 ft. square at the base and without buttresses, but with a distinctly evident balustrade, and surmounted by a parapet and four small gables of Elizabethan date.

Leaving Barnsley, the excursionists proceeded to Bibury, where the greater part of the day was spent, the church being first of all visited. This is of considerable size, particularly for the early date at which it was evidently erected. The chancel is very long, early English in date, and what may possibly be an Easter sepulchre rather than an ambry is to be seen on the north side. The nave arcades are of Transitional character, whilst the chancel arch is one of those interesting examples which by the character of their carving show the maintenance of Celtic tradition even to the end of the twelfth century, a point which is still further emphasised by the noticeable narrowness of the chancel arch, which even now is only 9 ft. wide, although opening into a chancel 15 ft. wide and a still wider nave. The appearance of the jambs and particularly of the mutilated carving, seems to indicate that

\* Concluded from last week.

ARLINGTON ROW  
AND  
PACK BRIDGE AT SUNSET

the width of 9 ft. is an enlargement from the original dimensions. The church possesses north and south aisles, with a piscina and arches for wall tombs in each. That in the south aisle still possesses a tomb with floriated cross, although much mutilated. There are many eighteenth century wall tablets and insertions made in Decorated and Perpendicular times. The tower of this church is in a somewhat unusual position at the west end of the north aisle.

From the church the excursionists passed on to the adjoining house, known as Bibury Court, which was probably originally erected by the Cresswells in 1633. The original house, however, has been considerably altered by subsequent additions, of which the period is presumably indicated by the date of 1759 on

the lead rainwater heads of the south front. Internally the house does not possess a great deal of interest, but its exterior setting, with the picturesque river Coln and the wonderful background of trees on rising high land, make Bibury in the sunshine one of the most charming spots it is possible to conceive. With Bibury were included in the day's programme the adjacent Tythings of Arlington and Abington. Arlington for its picturesqueness, Abington for its Manor House, erected at the close of the sixteenth century, as it would appear from the following inscription which remains over the front door:—"Plead. Tho | v. my cause. | O. Lord, by | Jhon. Cox | wel. Ano | Dorney | 1590."

The house was originally a very small one, and has only been made of a passable size by

the enclosure of the court yard between the originally projecting wings. This was filled in in the eighteenth century. Internally, the charm of the house rests rather with the collection of seventeenth century furniture, engravings, pewter, and other domestic bric-à-brac.

Abington completed the day's programme, and the members returned to their headquarters at Cirencester, where in the evening was transacted the usual formal business of electing the committee for the ensuing year, and the discussion of possible centres for the next excursion.

Saturday.

The only work done on this, the last morning excursion, was a visit to the beautiful and highly-interesting church of St. John the

STONE PULPIT  
CIRENCESTER CH.  
PARTLY COLOURED  
IN RED AND GOLD

Evangelist, a fifteenth century building with several chapels, and much that is worthy of study, old glass, wood-carving, colour decoration, particularly a beautiful St. Christopher, an original stone pulpit and ancient needle-work, in addition to the more strictly architectural work. The remarkable parish-room, over the south porch, which is so striking a component in the grouping of the church, was rebuilt, according to a tablet within, at the early part of the nineteenth century, but this rebuilding was remembered by the parents of still living townsmen, and consisted of the taking down, numbering, and re-erecting, stone for stone, of the upper part of the building, which, therefore, is the original work.

DOORWAY CIRENCESTER.

THE REBUILDING OF THE OLD BAILEY.—Mr. Ross, the City Engineer, replying to questions at the meeting of the Corporation of London on the 25th ult., said nothing further had been done in reference to the rebuilding of the Central Criminal Sessions House, and no steps had been taken towards widening Newgate-street to a thoroughfare 60 ft. wide.

THE ROYAL ARCHÆOLOGICAL INSTITUTE AT NOTTINGHAM.

FOR the first time in an existence of nearly sixty years the Royal Archæological Institute has this year selected Nottingham as the place of its annual meeting. Though not now of much interest from an archæological point of view, Nottingham is of great importance historically, while the country round teems with buildings of antiquarian value.

That the selection of Nottingham was a popular one is shown by the fact that over one hundred members of the Institute have taken part in the meeting.

The proceedings opened on Tuesday, July 23, in the Exchange Hall, when the Mayor, Mr. F. R. Radford, wearing his gold chain of office, welcomed the Institute to Nottingham, and spoke of the many interesting and historical associations of the city and neighbourhood. Lord Hawkesbury, F.S.A., as President of the meeting, then delivered an address on the history of the numerous religious foundations in Nottinghamshire and of their fate at the Suppression, temp. Henry VIII. Sir Henry Howorth, K.C.I.E., F.S.A., in a few appropriate words proposed a vote of thanks to the mayor and to Lord Hawkesbury, and the proceedings then terminated.

After luncheon the party reassembled in St. Mary's Church, a fine cruciform structure, with massive central tower, mostly of the opening years of the sixteenth century, though the chancel may be somewhat earlier. The history and chief features of the building were pointed out by Mr. W. Stevenson, who was of opinion that the date of erection was about 1380. The church has

undergone several "restorations," with the result that no old fittings remain, but two ancient monuments have been spared, probably from their being out of the way against the end walls of the transepts. The one consists of a late fourteenth century alabaster effigy of a civilian beneath a rich stone canopy of the date of the church. The other is a slab with the matrix of a brass, resting on a fifteenth century alabaster tomb with figures of saints and blank shields, also beneath a rich stone canopy. In a glazed recess in the chancel wall is a small sculptured panel of alabaster representing an archbishop doing homage to a pope.

The church of St. Peter was next visited, under the guidance of Mr. Robert Evans, F.R.I.B.A. The chancel here has been rebuilt, but the nave has arcades on the south of good thirteenth century work, while that on the north is a century later. A curious division in the south arcade, which consists of three arches, and two others to the west, is suggestive of the latter having formed part of the old north arcade used up again to lengthen the nave when the present north arcade was built. The aisles, clearstory, and the western tower and spire are all late fifteenth century. The flat nave roof is of good character with armorial bosses with the arms of the Strelley family and others. The south doorway, now disused, retains an ancient door with traceried panelling.

A move was next made for the castle, where Mr. Emanuel Green, F.S.A., read a paper on its history from the earliest times down to its destruction in 1651. Of the ancient castle little else is left than the outer gatehouse, a wreck of a fine Edwardian example, and one of the drum towers of the lower bailey. The present "Castle," as is well known, is the fine mansion begun by the Duke of Newcastle in 1674, and burnt by the mob during the Reform Riots in 1831. It has since been acquired on a long lease by the city, and converted into an art gallery and museum.

After a visit to the caves in the Hermitage Grounds the proceedings terminated.

In the evening a meeting was held in the Exchange Council Room, when the chair was taken by Dr. Gow, the headmaster elect of Westminster School, and Mr. Arthur F. Leach, M.A., F.S.A., gave an interesting account of the ancient schools of Nottinghamshire, with special reference to those of Southwell, Newark, and Nottingham.

On Wednesday a special train conveyed the party to Southwell. Here the remains of the ancient palace of the Archbishops of York were first visited, under the guidance of the Rev. R. F. Smith, who as vicar-choral is the last surviving member of the old Chapter of Southwell. The present hall, which was restored under the direction of Mr. Bodley by the late Bishop Trollope, and presented by him to the See, is a fine example of the fifteenth century, with a good open roof of four bays. This hall seems to have formed the great chamber at the north end of the great hall of the palace, some remains of which were pointed out by Mr. Smith, including one of the window jambs and the doorways at the south end opening from the screens into the kitchen, buttery, and pantry. Of the buildings forming the other three sides of the quadrangle only the much-ruined outer walls are left.

This noble minster\* was next inspected under the direction of the Rev. G. M. Livett, who first led the party to the west of the church and pointed out the chief features of interest of the west front with its two Norman towers, the Norman north porch, &c. There might be differences of opinion, he said, as to the recent restoration of the timber and lead spires on the western towers, but it was difficult to justify the substitution of sham Norman windows in the lowest stories for the fourteenth-century windows that preceded them, especially since it was unlikely that there were any windows there originally. Sir Henry Howorth, as President of the Institute, commented on the tendency of architects to alter the forms of buildings which they restored, with the result that all sorts of falsities and incongruities were perpetrated. Archæologists, he said, did not complain of the taste or good intentions of restorers, but they asked that during restoration ancient buildings should not be altered, but simply repaired, in order that they might be preserved in their beautiful entirety to posterity. A further illustration of Sir Henry Howorth's remarks was

\* A plan and description of Southwell Minster appeared in the *Builder* for July 2, 1892.

seen on entering the church, the former flat and appropriate wooden ceilings having been replaced by incongruous open timber roofs, and Bernasconi's rich plaster stall-canopies destroyed to make way for mean wooden panelling. In the north transept Mr. J. T. Micklethwait described the curious alabaster effigy, formerly in the presbytery, of Archbishop Sandys, one of the straitest of the Puritan faction, who died in 1588. Nevertheless, he was shown wearing a cassock, a girded albe, and a chasuble with a long train behind, which was no doubt carried by a page, and over all a doctor's hood. The head was modern. Mr. C. R. Peers also contributed a few remarks on the supposed Saxon carving over the turret door, which is actually a re-used Norman tympanum shortened at one end. In the choir a discussion took place as to the original eastern termination, which has been generally assumed to have been square, from the discovery during the last restoration of a massive foundation between the central pair of pillars. No effort seems to have been made to search for a possible apse east of this, and Mr. Brakspear contended that the present evidence was insufficient, since the foundation uncovered might be merely a sleeper-wall to carry the gable. The inspection of the building was completed by a visit to the incomparable chapter-house, where a cordial vote of thanks was accorded to Mr. Livett for his instructive explanation.

After luncheon the members went in brakes, amidst a discomforting shower of rain, to Thurgate Priory, where the history and remains of the buildings were described by the Rev. J. Standish. The priory was founded about 1150 by Roger Deincourt for Augustinian Canons, but nothing is left of the first buildings, the remaining portion being three bays of the nave arcades and the northern of two western towers, all of the first half of the thirteenth century. Under the house that adjoins the church, rebuilt in 1777, is a range of groined cellarage of the same age as the nave, that anciently formed the sub-vault of the western range of the priory buildings. The church was brought to its present state in 1854, when the chancel was rebuilt, partly out of old work, and an aisle added to the nave on the north side. Three of the old stalls with misericords are used as sedilia, and the altar slab is the old one restored to use. After a few remarks by Mr. Hope on the constitution of the priory, the party re-entered their conveyances and drove home to Nottingham.

At the evening meeting the Rev. A. D. Hill read a paper on some ancient carvings in Calverton Church, Notts., now built into the tower. Mr. Hill showed from casts and rubbings that the stones were a set of vousoirs of an arch which could be identified. Mr. W. H. St. John Hope followed with a paper on the early working of alabaster in England, in which he dealt with all the documentary matter on the subject down to the middle of the sixteenth century. From a comparison of a large number of photographs and engravings he showed that there were several groups of effigies which certainly emanated from a common centre and that many of the knightly figures with ortles round the basinet were probably the work of Thomas Prentys and Robert Sutton, of Chellaston, "Kervers," who made the fine Green tomb at Lowick, Northants, in 1410. The same craftsmen seem also to have wrought the Arundel tomb at Arundel and that of Henry IV. and his queen at Canterbury. Mr. Hope submitted as a working theory that the majority of the early alabaster monuments in this country were wrought at Chellaston, in Derbyshire, where the principal medieval alabaster pits were, but that the smaller statues and sculptured panels of which so many examples are known both in England and abroad were the work of the "alabastermen" of Nottingham and York, whose fame, so far as regards the former place, had spread abroad as early as the end of the reign of Edward III.

Thursday, the 25th, was devoted first to an expedition to Wollaton Hall, where the members were graciously received by Lord and Lady Willoughby. After an examination of the principal apartments the party assembled in the Great Hall, where Mr. J. A. Gotch read the following paper on the house:

"Wollaton Hall is sometimes quoted as a typical example of the work of the English Renaissance. Those who are in sympathy with that phase of domestic architecture point to it as a magnificent specimen of an Eliza-

bethan palace. Those who are out of sympathy direct the finger of scorn to its extravagancies and its pretentiousness. As a matter of fact, it cannot be called a typical example. In its chief characteristics it stands by itself, namely, in its lofty central hall and its four-corner pavilions. In its extreme regularity of treatment, and in the far more of conscious effort in design than the majority of houses built at that period. The interesting question is: Who was responsible for the design of Wollaton? So little is really known from actual records of the architectural designers of that period, or of their method of work, that the field of conjecture is a vast one, and offers scope for manoeuvres on a large scale. But there are one or two facts connected with this house which help us to a certain extent. We know from the inscription over the garden door that it was built by Sir Francis Willoughby, constructed with uncommon art, and left as a precious possession to the Willoughbys. It was begun in 1580 and finished in 1588. We also know that in John Thorpe's collection of drawings in the Soane Museum there is a ground plan of the house and half the front elevation. We also find in Wollaton church a monument to Mr. Robert Smythson, gentleman architect and surveyor unto the most worthy house of Wollaton and divers others of great account, who died in 1614, at the age of seventy-nine. Lastly, we learn from Cassandra Willoughby, Duchess of Chandos, who wrote an account of the house in 1707, that Sir Francis Willoughby sent for the master workmen who built the house out of Italy, and also for most of the stone figures which adorn it. Here, then, we have apparently a number of conflicting claims. No one, however, contests with Sir Francis Willoughby the honour of having built the house, in the sense of having ordered and paid for it. Nor is its date in question. But there are three claimants to the honour of having designed it, namely, John Thorpe, Robert Smythson, and the master workmen out of Italy. First, as to the latter. There has long been an idea very prevalent that the houses of Elizabeth's time owed their special characteristics to Italy and to Italian workmen; and so, in a way, they did, because Italy influenced more or less directly the work of the Renaissance in all other countries. But, as a matter of fact, it is extremely difficult to trace anything but a very small amount of English work to actual Italian hands. The whole tendency of recent inquiries goes to show that it was English hands which executed most of the work which has an Italian appearance. The tales of models having been sent for from Italy for English houses are, I think, apocryphal, because the plan of an English house differed widely from that of an Italian; and although I am not prepared to say that Cassandra the Duchess was wrong, still the master workmen who were sent for out of Italy could have had very little to do with the designing of Wollaton. The chief credit for that performance I am inclined to give to John Thorpe, and I reconcile his claims and those of Robert Smythson by regarding the latter as the chief workman and clerk directly the surveyor. It must be remembered that, although the same terms are used now as were used then, the meaning of them has changed. We find a number of men described as 'architectus' or 'architect,' who were what we should regard as master masons, and that is what I think Mr. Robert Smythson was. But it must also be remembered that the relation of the master mason to the architect was then very different from what it is to-day. The architect to-day designs everything himself; in those days he seems only to have given a general idea of what he wanted, leaving the detail to be developed by the master mason. The latter might, therefore, well take credit to himself, or his sorrowing family for him, as being the architect to a house like Wollaton. The actual origin of the idea of the house I attribute to Thorpe. He claims nothing for himself, he only leaves certain drawings behind him. The full chain of reasoning would be too long to bring before you now. I will only say that the two drawings in question are by Thorpe's hand, and that being very like Wollaton as we see it to-day, and yet not exactly like it, the most reasonable conclusion to come to is that these sketches of his were altered somewhat in the course of execution. But there is one point in connexion with them which bears forcibly upon the question we are now dealing with, namely, the source whence

the ideas which underlay our English Renaissance came. There was a tolerably widespread desire in Elizabeth's time to benefit by what was being done in foreign lands. A young architect, John Shute, was sent by the Duke of Northumberland to study architecture in Italy. Lord Burgley made more than one inquiry for books on architecture recently published in France, and John Thorpe himself, as his drawings show, studied both Italian, French, and Dutch books. One of the French books to which he devoted considerable attention was Androuet du Cerceau's 'Les plus Excellents Bastiments de France,' published in 1576. And in that book are a few plans with corner pavilions such as those at Wollaton. The disposition of Wollaton is so unusual that it is quite possible Thorpe may have put into practice here some of the ideas he gleaned from Du Cerceau's book. Some of Du Cerceau's plans he copied into his own MS. book, but in doing so he adapted them to English uses, and it was much the same with Wollaton. The plan is not a direct copy, it is only the general idea which, if I am right, was derived from the French source. Thorpe having designed the plan and elevation, may be presumed to have handed them over to Robert Smythson who, with the help of the master workmen from Italy, carried the work out. Such a course of procedure would at any rate reconcile the claims of the various parties. But leaving the question of who designed the house, a few words must be bestowed upon the structure itself. Its plan, although of foreign origin, was so contrived as to comply with old-established English habits. The central position of the hall rendered it not altogether easy of access in the usual way, that is into the passage at the end called the 'screens.' The most direct way from the front door to the hall is that which now exists, but this leads into the middle of the side, not into the screens. Thorpe, therefore (for I will assume that Thorpe was the designer), kept his hall floor above the level of his front door, and led the visitor, not directly into the hall, but round to the right, and so, by way of a flight of steps, up to the end of the hall and delivered him into the screens in the usual way. The spare space not occupied by the stairs he devoted to the porter's rooms. A further reason for keeping the hall floor raised was that, contrary to the prevailing custom, he put his kitchen and servants' rooms down in a basement. This was almost a necessity of the design, for, being of a pretentious nature, it was obliged to be grand on every side, and the kitchen and inferior premises had to be hidden away in a basement in order not to spoil the symmetry of the four show-sides of the house. The disposition of the house, with a central hall surrounded by rooms two stories high, necessitated an unusual height for the hall, which is over 50 ft. high. Its window-sills also had to be above the roof of the surrounding rooms, and they are some 35 ft. from the floor. The upper floor of these adjacent rooms on the east side was devoted to the long gallery, but modern alterations, necessitated by constant use, have not only divided this up into a number of small rooms, but have effectually obliterated from the interior of the whole house all its Elizabethan character, except what remains in the basement and in the great hall. The fine stone screen remains here, and also the original roof, which is an excellent specimen of Elizabethan work. It has this peculiarity, that, though fashioned like an open hammer-beam roof, it supports in reality the floor of a large room over, called the prospect-room, which occupies the upper part of the central block that forms so conspicuous a feature of the house. It only remains to say that the house was entirely new from its foundations and that it occupied eight years in erection. There was apparently no building here before it, although very frequently we find Elizabethan houses enveloping remains of a humbler predecessor. The Willoughbys had lived at Wollaton for some generations previous to the building of the mansion, but their home was a house somewhere near the church. It has been suggested that the central block is earlier in date than that which surrounds it, but reflection shows that the hall must necessarily have been built in relation to the lower buildings round it. There is nothing to indicate any alterations of an older building; the detail of the central block, although different, is contemporary with that of the rest of the house, and the whole of it is shown on Thorpe's

drawing. Everything, therefore, tends to prove that the whole house was built at the same time. Duchess Cassandra tells us that the stone was brought from Ancester, and that the same pack-horses which brought it took back Sir Francis's coal in exchange. Notwithstanding that he got his stone for nothing, she says, and that labour was much cheaper in those days, the house cost Sir Francis 80,000*l.* The external treatment is of pronounced classic character, with plenty of pilasters and bold cornices. There are a number of circular niches, containing busts of classic personages, such as Virgil, Plato, Aristotle, and Diana. The master workmen out of Italy were presumably familiar with these celebrities, and so might have been Mr. Robert Smythson, gent., but the ordinary English workman must have been rather puzzled by them, and perhaps secretly relieved when he heard that a shipload of them had gone down, an accident that is said to account for some of the niches being empty. But, pace Duchess Cassandra, a good deal more assistance in English houses came from the Dutch than the Italians in the time of Elizabeth, and it would not be surprising if the building accounts, which are some day to be published, showed that Holland rather than Italy was the source whence some of the lower work was derived (in spite of the gondola rings which adorn the bases of some of the pilasters), as it certainly was the place where the curly gables of the pavilions had their origin.

Sir Henry Howorth returned thanks to Lord and Lady Middleton on behalf of the Institute in a graceful little speech, and to Mr. Gotch for his excellent paper, and, after an inspection of the outside of the Hall, the journey was resumed to Wollaton Church. This was described by the rector, the Rev. H. C. Russell, who pointed out the tablet in the south aisle to Robert Smithson, the "architector and surveyor" of Wollaton, referred to by Mr. Gotch. Mr. Hope followed with some remarks on the fine tombs to (1) Sir Richard Willoughby (ob. 1471) and wife, with brasses and a cadaver, in the north wall of the chancel, and (2) that on the south side of Sir Henry Willoughby (ob. 1528), with collar of SS, and knots, and small figures of his four wives. This tomb also has a cadaver beneath. The alabaster memorial of Matilda, wife of Sir John Dabrichcourt, K.G., who died in 1405, and described by Thoroton, has been destroyed. In the south chapel is an eighteenth century marble altar slab, supported by good wrought ironwork, brought from the almshouse chapel at Cossal, but believed to have originally been removed from Wollaton Church, where the elaborate altar-piece to which it might have belonged remains. Mr. Peers pointed out that the peculiarity of the west tower, which is built on arches close up to the road, was for the passage of processions that otherwise could not get round the church.

A move was next made for Sandiacre, where after luncheon the church was examined under the guidance of Mr. W. H. St. John Hope. It consists of a Norman nave with a small doorway, a large single window on each side, and a rich chancel arch. The western tower and spire are of the thirteenth century. The chancel is of fine and rich fourteenth century work, perhaps built by Roger de Norbury, Bishop of Lichfield 1322-1359, who held the prebend of Sandiacre from 1342 to 1347. All the window tracery and the parapets, &c., are new, but are believed to be copies of the old, which were "restored" in 1864. The sedilia are good examples, with rich canopies. A large early fourteenth century window has been inserted in the south wall of the nave to light the nave altars, and in the sixteenth century a low clearstory was added. The font is an ornate one of the fourteenth century. Mr. Hope referred to a scheme which has been proposed for enlarging the church by adding an aisle or aisles; but, while admitting the necessity for making room for the parishioners, he suggested as an alternative the building of a new church nearer to the town.

And a drenching rain, the journey was resumed to Strelley, a brief halt being made on the way to examine the remains of the cross at Stapleford, a monolith pillar covered with Saxon knotwork and carving. At Strelley the chief features of the church were pointed out by Mr. Hope. The lower part of the western tower, of the thirteenth century, is the oldest portion, the remainder of the church, consisting of a lofty nave of three bays, and a chancel with north and south transept-like chapels,

having been all rebuilt about 1356, perhaps at the cost of Sir Samson Strelley, whose alabaster tomb with effigies of himself and lady stands in the middle of the chancel. Early in the sixteenth century a clearstory was added, and the tower raised a stage. The church retains a fine late rood-screen with the coving and rafters that carried the rood-loft. On the north of the altar is an alabaster tomb, with effigies, to Sir John Strelley, ob. 1501, and wife, Sanchia Willoughby, beneath an elaborate stone canopy from the same hand as one in Wollaton Church. In the chancel floor are several alabaster slabs and a brass to Sir Robert Strelley (ob. 1487) and his wife Isabel, sister of Cardinal Kemp.

At the evening meeting, Mr. C. R. Peers, M.A., F.S.A., read a paper on the "Saxon Churches of the St. Pancras (Canterbury) Type," which was illustrated by a comparative series of plans. Mr. W. H. St. John Hope also submitted a new reading of the Arms of Colchester and Nottingham, which he thought represented the ragged Cross of Our Lord pierced by three nails, each surmounted by a crown. This would explain the encircling of the cross by the third or lowest crown, even when, as in the Nottingham arms, the nails were now omitted. At Colchester the present arms have been used since at least the reign of Henry V., but for those of Nottingham there seems to be no earlier authority than the Visitation of 1599.

#### BRITISH ARCHÆOLOGICAL ASSOCIATION:

CONGRESS AT NEWCASTLE-UPON-TYNE.

(Continued).

Friday, July 19.

The intense heat of yesterday, to which some of the party almost succumbed whilst perambulating the streets of Newcastle, was only slightly mitigated by a thunderstorm in the evening, and to-day the weather was very oppressive, as the archaeologists travelled by train to Alnwick. At Alnwick station brakes and landaus were waiting to convey the party through the lovely park to Hulne, where the Carmelite Priory was described by Mr. George Patrick, A.R.I.B.A., hon. secretary. With the aid of a large plan spread on the grass, which every one could see whilst seated on the ruined walls, Mr. Patrick pointed out all the features of the church and monastery, and after relating the history of the order and its foundation at Hulne, preceded the party round the building. Hulne Priory is particularly interesting, owing to its remains being in a far more perfect condition than those of any other house of the Carmelite order in England. Its position is said to have been selected by the founders from the resemblance they fancied it bore to Mount Carmel in Palestine, from which the Order derived its name. About the year 1238, William de Vesci, Lord of Alnwick, and Sir Richard Grey, when in Palestine, visited Mount Carmel, where, to their surprise, they found countrymen of their own dwelling as Eremites, and among them a Northumberland man named Rodolphus Fresborn, whom they prevailed upon, with the leave of the superior, to return to England with them, upon the understanding that he should introduce the Carmelite order into this country. William de Vesci gave some twelve or thirteen acres in his park of Hulne for the site of the monastery, and, irrespective of the resemblance they fancied it bore to that of Mount Carmel, it is very probable the defensive capabilities of the situation commended themselves to the judgment of the warrior founder, for it is situated upon the summit of a lofty hill, with the river Alne flowing at its base and woods and forests surrounding it. The foundation of the monastery dates from about 1240. Fresborn became the first Prior, and Hulne is considered to be the earliest English house of the Carmelites, or "White Friars," as they were called, from the white scapulary they wore. The first general chapter of the order was held at Aylesford in 1245. The choir consisted of a long and narrow nave and choir, without any structural division between them. Only the foundation remains of the north wall, which has a curious thickening inside about the middle of its length, where was a doorway opposite to the existing door leading into the cloister. This thickening measures 26 ft. in

length, and is about 1 ft. wide, and the doorway is not in the middle, the greater length being to the westward. The late Prebendary Walcott speaks of a lady chapel being upon that side, but nothing remains above ground to identify it. There are remains of a foundation-wall at right angles to the north wall just at this spot, and it is possible this unusual thickening may indicate the position of a north porch and entrance to the lady chapel. There was no west door, and the lay folks and strangers must have had some way of access to the nave. The stone bench upon which they sat remains across the west end and returns along the south wall and on part of the north wall, where it is a foot or two above the ground. The west and south walls remain to their full height, the former having one long lancet window and a vesica-shaped window in the gable. The south side has three single-light trefoil-headed windows high up in the wall on account of the cloister roof, and there is an elegantly proportioned Early English sedilia of three-stepped bays. The sacristy retains the two stone corbels which supported the altar slab with an ambury on the north side. There are two narrow square-headed windows over the altar, and in the south wall a plain pointed and chamfered piscina and a widely splayed square-headed window. In this wall there is a recess with a small flue running up, apparently into a larger one above. This recess the late Mr. Walcott considered to be an oven for baking the sacred wafer. Over the sacristy was a chamber with a window looking into the church and a fireplace in the south wall. It was approached from the sacristy by wooden stairs, the east gable of this room has a single lancet window. The chamber was for the use of the sacristan or his deputy. The chapter house is a fine apartment retaining the foundations of the Prior's seat and of the benches round the walls. It opened to the cloister through a vestibule, on either side of which was, northward, a parlour, and southward the calefactory. Both these rooms have remains of fireplaces, also another at right angles to the latter, which was probably the scriptorium, has the remains of the fire opening and a large ambury or locker for books. The dormitory extended over the whole length of these buildings, and the bottom steps of the staircase leading from it to the cloister are *in situ*. The number of friars at Hulne is not stated, so far as we have been able to discover, but by taking the dimensions of the dormitory, by subdivision we find there was space for seven cubicles or cells, ranged along the cloister side, with a passage width of 4 ft. on the eastern side to the staircase. The sub-prior having his cell at the end over the room we call the scriptorium. The guest house and chapel are fairly entire and are now used as a dwelling-house; they stand detached at the south. Remains of other buildings which may, perhaps, be identified as the kitchen, the infirmary, the brew-house, &c., now used as stores, and sheds are attached to the enclosing or curtain-wall. This wall is intact in the whole of its circuit, it was embattled and had semicircular projecting turrets at the angles, parts of which remain together with some portions of the parapets. The stone steps up to the "alure," or walk behind the parapets exist, in several places, and the original entrance gateway tower is also nearly perfect.

The architecture of the church and buildings is plain and simple in character, without ornament of any kind, the whole forming a most interesting example of a fortified monastic establishment. There is a massive square tower at the west end of the church, but detached from it, which was erected as a refuge in times of danger in 1488, which was seemingly connected with the prior's lodging, whose chambers extended along the west side of the cloister over an undercroft devoted to the use of the cellarer, whose hall was probably situated on the site of the present dwelling-house. Resuming the carriage, the party proceeded to Alnwick to view the remains of the Praemonstratensian Abbey, which were excavated some years ago under the supervision of Mr. St. John Hope, F.S.A. By some misdirection, however, only a few members reached the spot where Mr. Charles Lynam, F.S.A., was awaiting them. He had prepared a ground plan of the whole of the buildings, and explained them to those present. Nothing above ground remains but the Abbey gatehouse, but the foundations of the church and all the buildings have been recovered

and are marked out in the grass in asphalt. The party then proceeded to Alnwick to Luncheon by the invitation of the Duke of Northumberland, the patron of the Congress—and afterwards viewed the celebrated castle which was described by Mr. Cadwallader J. Bates. Alnwick Castle, owing to the extreme irregularity of its plan, with open keep and clustered towers, is exceedingly picturesque, and although it was almost entirely rebuilt under Mr. Salvin's direction, the rebuilding was carried out with the most conservative care and judgment. All that admitted of preservation of the old work was scrupulously retained. The site of Alnwick Castle from its commanding position would seem likely to have been occupied as a stronghold from the earliest times, but it was the Norman baron, Eustace de Vesci, who built the first masonry castle on this site in the first half of the twelfth century. The Barons de Vesci became extinct by the death of the seventh Baron in 1297 when the castle and barony became the property of Antony Bec, Bishop of Durham, of warlike fame. He sold them to Henry de Percy, the first of the renowned family to occupy Alnwick, and laid out the castle on its present lines. Although the plan is Norman most of the remaining work belongs to the fourteenth and nineteenth centuries. A complete account of this castle as it now appears was published in the *Builder* in 1869 after its restoration by Mr. Salvin. Leaving Alnwick in a thunderstorm the archaeologists drove on to Warkworth, but owing to the storm and the shortness of time the castle could only hastily be viewed, and the Hermitage, the Bridge Tower, and church were obliged to be abandoned. Mr. Bates conducted the party over the remains of the magnificent castle. The precincts of the castle were entered by a postern door in the west curtain wall, and as the visitors entered the quadrangle they were astonished by the vastness of the ruins and the richness of the architecture; for this castle, although it has stood many a siege and successfully resisted all attacks, does not present the appearance of a rugged and stern fortress, but rather of a palace-home of luxury and hospitality. Like Alnwick, the site must always have been occupied as a defensive position, but the first stone castle was built early in the twelfth century. In 1173 William the Lion, of Scotland, destroyed the castle, which was not strong enough to offer much resistance. Robert Fitz-Roger rebuilt the castle upon the general plan as now remaining, and obtained from King John a confirmation of the grant of the castle and manor made to his father. King John was himself at Warkworth in 1213. In 1327 the Scots attacked Warkworth but were badly beaten, and later in the same year Robert Bruce laid siege to the castle, but the garrison were able successfully to repulse him. Edward III. granted the castle and dependencies to the second Lord Percy of Alnwick. The earliest recorded instance of the use of cannon in warfare is connected with this castle, for in July, 1405, Henry IV., after reducing Prudhoe Castle attacked Warkworth, the owner, the Earl of Northumberland, having joined in Archbishop Scrope's conspiracy, and in person directed the operations of his siege train, and the royal cannon, or bombards, caused so much damage to the walls that after the seventh discharge the defenders surrendered at discretion. Leaving Warkworth with reluctance, the party returned to Newcastle by train, and in the evening attended a meeting in the committee-room of the Literary and Philosophical Society, kindly placed at their disposal, for the reading of papers. Mr. Thomas Blashill, V.P., presided, and the first paper was read by the Rev. Cesar Caine on "The Archbishop Mint at York." Mr. Caine exhibited a great many impressions and facsimiles of the coins dealt with in his paper, and traced the coinage from the earliest records down to the period in which reference was made to the coinage of the see in the indictment against Cardinal Wolsey. The title "Peter Pence" was Saxon, and had no reference to the tribute paid to the Pope, but only to the coins issued by the Mint at York, St. Peter being patron of the Church of York. An impression of the coinage of Archbishop John Kemp, 1426 to 1450, was exhibited, but, Mr. Caine said, there is no coin of that Praelate in the British Museum.

An interesting paper was also read by the Rev. F. S. Colman, M.A., on some little-known "Earthworks at Barwick-in-Elmet, Yorks," which were admirably illustrated by large

diagrams and by hand-sheets distributed amongst the company.

Saturday, July 20.

The members of Congress left Newcastle about 9.30 by train for Jarrow and Monkwearmouth. At Jarrow they were met by the Rev. Canon C. H. Savage, who explained the special features of the church and monastery in a most sympathetic spirit. Bede, the Venerable, is the chief glory of Jarrow. There he, the earliest English scholar, passed the whole of his industrious and useful life; there he died, and was buried on the north side of the church in 745. Canon Savage, in describing the ancient Saxon church, which now forms the chancel of the parish church, said that like all early Saxon religious settlements the church and buildings at Jarrow were protected by water, at least on three sides, but the river Don, up which the Danes are said to have sailed, had now degenerated into little better than a sewer—the mud and sludge being deep and extensive. The remains of a Scandinavian ship had been discovered buried some 10 ft. beneath the present surface. The church and monastery were commenced in 683, and were for ten priests and twelve laymen. The dedication stone is carefully preserved and bears the actual date upon it, 684. This and the numerous remains of Saxon work in baluster shafts, &c., preserved in glass cases in the porch of the church, were examined with much interest. In looking at these, undoubted relics as they are of early Saxon days, one was struck not only with the elaborate and delicately worked decoration of these shafts, but by the absence of capitals and bases formed on Roman models such as are found imitated elsewhere in Saxon works. The tower is of unusual form, measuring 20 ft. from north to south, by 13 ft. from east to west, and has an opening high up in the east wall looking into the church, which seems evidence of there having been an upper chamber. At the east end the wall shows traces of an opening to a square presbytery, the position of which is now occupied by a vault. The foundations of the original west end were discovered some years back against the tower wall. The church was burned in 1049. Several of the ancient Saxon windows remain in the south wall. An interesting item in the comparative value of money is a window which was inserted in the south wall of the chancel close to the tower in 1350, which is recorded to have cost 23s. 10d.; the same window if executed now is estimated to cost 49l. 10s. Some parts of the monastic buildings still remain of early date, and it is said that vast numbers of scholars attended here for instruction from all parts—over 700 at one time. In the choir stalls and bench ends there is some elaborate carving of flamboyant character; it is thought to have been brought from the shrine of Jesus altar at Durham. The emblem of Prior Castell, a heart pierced by a sword, is to be seen on one of the bench ends. Leaving Jarrow the party proceeded to Tyne Dock Station for train to Monkwearmouth, and at the church were met by the vicar, the Rev. D. S. Boufflower, M.A., who gave a description of the building and its history. The foundation of the Abbey of Wearmouth is somewhat earlier than that of Jarrow. Benedict Biscop founded a monastery at Wearmouth in 675 in honour of St. Peter. The King of Northumbria, Ecgfrith, gave him a site, and helped him in the work, according to the evidence of the Venerable Bede. Bede also goes on to say that Benedict went over to France for stone-masons, who could build him a church of stone after the manner of the Romans, which he greatly admired. He also sent to Gaul for the workers in glass to fill the windows of the church, the porches, and the upper chambers; and from these workmen the English learned the art of glassmaking. He seems to have made several journeys to France and Rome for fittings, sacred vessels, vestments, and decorations, although such as he could get he procured in England. It appears to be generally recognised nowadays that the west porch and west wall of this church are really the work of Benedict Biscop's masons, but the upper parts of the tower are considered to be of later Saxon date, between 807 and 1070. We refer the inquirer to the second paper on "Pre-Conquest Architecture in England," by Professor Baldwin Brown, published in the *Builder* in October, 1895. After luncheon at Sunderland the train was taken for South Shields, where some time was given to the inspection

of the Roman remains in the Free Library and Museum previously to departing by the ferry from the pier for Tynemouth. During the visit to Tynemouth Priory the "tripper" was excluded from the ruins by the consideration of the Mayor-Commandant of the castle and the Members of Congress were enabled to listen to the account given of the Priory by Mr. H. A. Adamson in comfort, and to Mr. Charles Lynam's description of the architectural features without interruption, which was much appreciated. Mr. Adamson said the history of the monastery is an eventful one and carries us back to the time when Edwin, the first Christian king of Northumbria, was converted to Christianity through the efforts of Paulinus, the Roman missionary. Edwin was married to a Christian princess, Etheburga, daughter of Eadbald, King of Kent, and was baptised on Easter eve in 627, at York. The first church at Tynemouth is stated to have been built of wood by Edwin in 626, but as he was not baptised until the following year, it is likely the church would not be erected until after his baptism. In 634, Oswald ascended the throne on the death of Edwin and between that date and 647, when he was slain, he built a church of stone at Tynemouth. Oswald succeeded Oswald and was murdered in 651 at Gilling, near Richmond, in Yorkshire. His body was brought to Tynemouth and buried in the oratory of the Virgin Mary, and it is from this king and martyr that Tynemouth obtained its great reputation as a place of pilgrimage. The monastery from its foundation until Norman times had an independent existence and was not subject, as it became in later years, to any other religious house. The monastery suffered greatly at the hands of the Viking hordes who constantly made descents upon the coast of Northumbria. It was plundered by them in 788, 794, and in 800. In 865 the church and all the monastic buildings were destroyed by fire in an incursion by the Danes, and the ruins of St. Hilda at Hartlepool who had taken refuge in the church were all massacred. In the year 1065 the relics of St. Oswin were discovered, and in consequence Earl Tosti, King Harold's brother, commenced rebuilding the monastery. The independent life of the monastery came to an end in 1075, when the church was given, together with the body of St. Oswin, to the prior and brethren of Jarrow, and the relics were removed there, but were afterwards brought back and placed in the shrine. Robert de Mowbray, who had come over with the Conqueror, was created Earl of Northumberland, and he completed the church commenced by Tosti. The church consisted of nave, transepts, and choir, terminated by an apse, the foundation of which was uncovered a few years back. The beautiful Transitional or Early English choir, built between 1190 and 1200, is the crowning glory of Tynemouth. The east end and nave to the south wall are the principal portions remaining. Malcolm Canmore, King of Scotland, and his eldest son, Edward, were slain in an expedition to attack Alnwick in 1093, and were buried at Tynemouth, and tradition asserts that the body of the king still lies there in some unknown spot.

Tynemouth Priory is illustrated in an article in the *Builder* series of Abbeys published in 1895. At the conclusion of Mr. Horatio Adamson's historical sketch of the priory, the party was conducted round the ruins by Mr. Chas. Lynam, F.S.A., who pointed out all the chief architectural features. At the evening meeting the Rev. H. J. Dukinfield Astley, M.A., the hon. editorial secretary, read a valuable paper entitled "The Resemblance between the Religious and Magical Ideas of Modern Savage Peoples and those of the Pre-historic Non-Celtic Races of Europe," in which he attempted to show from recent discoveries of prehistoric remains in Scotland that in Neolithic times the inhabitants of that country, and probably of the whole of these islands, were in a state of spiritual and mental development similar to that of the present day Australian aborigines. Referring to the rock drawings, implements, weapons, and armlets discovered at Dumbaie on the Clyde, he said they exactly resembled similar rock drawings found in South America, whilst the other relics had been compared with similar ones found later in Australia; he contended, therefore, that those found in Scotland were genuine, and belonged to the Neolithic stage of Scottish history. Mr. Andrew Oliver gave an account of "Flemish Brasses in England" with special

reference to the brass at All Saints', Newcastle, which covered the altar tomb of Roger Thornton and his wife, dated 1429.

*Monday, July 22.*

After the Sunday's rest and attendance at the Cathedral service, the members of Congress were prepared for a long day's work, and set forth by train for Bardon Mill, whence carriages were taken for a drive along the line of the Roman wall, under the guidance of Mr. J. P. Gibson, of Hexham, and Mr. R. H. Forster, of London. Journeying northwards, in ascending Barcum Hill, a distant view of Willemotwyk Castle was obtained. It is an old Border keep, and was the birthplace of Bishop Ridley. Vindolana, the ninth station from the eastern end of the wall, was pointed out; and near to its north-east corner, on the line of the Stangate, a Roman road, is a Roman milestone, still standing in its original position. A halt was made on General Wade's road, and the majority of the party followed Mr. Gibson over the moorland to Borcovicus, the next camp to the eastward of Vindolana. The turf and long grass were very wet after the thunderstorm of the previous night and the rain then falling, but, taking their stand upon the Roman stones, the members listened to Mr. Gibson's description. He said all these moorlands were covered with Roman camps, called summer camps; there were thousands of them—some only 30 ft. or 40 ft. square, but near the wall they had to be larger. It was curious to notice the difference between the earlier and later work of the several occupations. When the Romans returned after being beaten back by the Caledonians they at once built upon the sites of their old camps, they smoothed down, as it were, the surfaces and built anew, and in some places there are three different levels, and it is by difference in workmanship that we know many years must have elapsed between the occupations. The masonry and mortar differ, the oldest being the best; in the early mortar there is no brick, the later mortar and materials evince "ferry" building and are much inferior. The gateway at Borcovicus is of the early type, with two outer and two inner portals, and on each side a guard chamber; each face of the camp had four towers, the remains of which are clearly discernible. This camp was garrisoned by Tungrians. In the prætorium at Borcovicus were found over 1,100 iron arrow heads, some with pieces of wood still adhering to them, and amongst the bases of the columns which once adorned the prætorium was one that had been turned upon a lathe. The pivot holes for the gates and the stop stone in the middle, against which they shut, together with the bolt holes, are still quite perfect, and on the stone threshold may still be seen the ruts made by the wheels of chariots and ox carts. On the left of the road leading up to the camp stood temples to Jupiter and Mars, and a little beyond them, to the eastward, was pointed out an underground chamber, in which were found many altars and inscribed stones dedicated to Mithras, the Persian sun god.

The external walls and the four gateways of this camp are still standing from five to six feet in height. During 1898 the prætorium was thoroughly excavated, and sufficient of the camp cleared out to enable a complete plan of it to be made. Returning to the carriages, the party proceeded eastwards along General Wade's road, noticing the murus on the left climbing the summits of a range of basaltic hills, while the vallum takes an easier route along their southern slopes. Procolitia was next reached, a camp which was garrisoned by the first Batavian cohort. Just outside its western rampart is the site of the votive well, dedicated to the goddess Coventina, which, when cleared out in 1878, yielded over 20,000 coins, twenty-six votive altars, and many other interesting objects. At Limestone Bank a halt was made in order to inspect the ditches of the vallum and murus, which are cut through the solid trap rock for a considerable distance. In going down the Bank a long piece of the wall was seen about 5 ft. high on the left of the road, and upon it the remains of a wall turret, Cilurnum, the sixth camp from the east end of the wall, was inspected. This camp had six gateways instead of four, as was usual, in order that the ala of Spanish cavalry stationed there might be able to issue out on the flanks with rapidity. The wall comes up to the west gateway. Both here and at Borcovicus the remains are very complete, and the streets and lodgings of the garrison can be readily

traced, the streets are very narrow and the buildings small. After inspecting this camp the visitors walked to the remains of the Roman villa between it and the river, the North Tyne, and saw the situation of the Roman bridge and the remains of the abutment in the river bed. The bridge was defended by a tower upon the further side of the river. The villa was probably the residence of the officer commanding the station and, like all others on the wall, was constructed with a view to security. No tessellated pavements or wall decorations are found in them, and but few indications of luxury. Strength and hardness are their main characteristics. Beneath the walls of this villa were discovered the evidences of the tragedy which marked its destruction, for, only slightly covered with earth, were found the skeletons of thirty adults, several children, a horse, and a dog. They had all doubtless perished in one massacre in the last incursion of the Caledonians which destroyed the station. The site of the cemetery was pointed out some little distance away along the river bank, where many Roman memorial stones, some with very touching epitaphs, have been unearthed. After a long and particularly interesting excursion the party drove into Hexham to dinner, as Newcastle could not be reached until very late and there could be no evening meeting.

*Tuesday, July 23.*

To-day the archaeologists made a pilgrimage to Lindisfarne, proceeding from Newcastle to Beal by train, thence driving across the long stretch of wet sand, which can only be crossed at certain hours owing to the tide, in one-horse carts. On arrival at Holy Island, the party at once proceeded to the remains of the famous Priory, where the Rev. H. J. Dakinfield Astley, M.A., the hon. editorial secretary, read a paper upon the early history of the island. The history of Lindisfarne, he said, commenced with the year 635 A.D., and its associations were wholly religious and ecclesiastical. When St. Aidan, on the invitation of Oswald, King of Northumbria, left his other island home, Iona, he chose this spot for the centre of his mission work amongst the heathen Angles of the Northumbrian Kingdom. When he came to Lindisfarne, he came to a country in which the seeds of Christian teaching had already been planted but had been almost uprooted by a fierce outburst of heathen resentment. Oswald, on ascending the throne, was desirous of re-introducing Christianity, and turned for aid, not to the Roman mission, but to the Celtic branch of the Catholic Church, and applied to the Irish Mission of St. Columba at Iona. The first brother sent was quickly disgusted with the rude manners of the half-heathen Northumbrians and returned. Then St. Aidan set forth and went to Oswald at his fortress city of Bamborough. Oswald gave himself with whole-hearted zeal and devotion to the work of helping Aidan; he accompanied him on his journey and interpreted for him. They were both beautiful characters, and it was an ill day for Northumbria when Oswald was slain in battle against Penda, the heathen King of Mercia, in 642. Of Aidan's buildings on Lindisfarne there are no records whatever; they were all destroyed by the Danes in 875. Fifteen successors in unbroken line sat on the throne of Lindisfarne, but St. Cuthbert was the greatest of the Bishops. He died in his lonely retreat on Farne Island after holding the See for only two years, but those two years were sufficient to establish his undying hold upon the sturdy hearts of Northern England. No other of the Bishops of Lindisfarne were renowned like Aidan and Cuthbert; the monastery produced a writer like Bede, but the monks continued to live the saintly life and to act as teachers to all the surrounding districts until the terrible scourge of the all-devouring Northern came, and attacks which for nearly 200 years were to vex the coasts of Britain commenced with the sack of Lindisfarne, and, the year following, of Jarrow. The island recovered from this disaster, but the Vikings waxed bolder and bolder until, in 868, came the great incursion which wiped out for ever the Lindisfarne of Aidan and Cuthbert, and left the island desolate for 200 years. After luncheon the party again assembled in the ruins of the grand old Priory, and listened to Mr. Astley's description of the buildings. He went on to say that the structure was Norman, and was modelled on Durham Cathedral. It was a Benedictine Priory of the latter half of the eleventh and

early part of the twelfth centuries, and showed exactly what a Benedictine church of the twelfth century was, as it retained its original character more than any other Benedictine church known. In 1082 a cell of Benedictine monks set out from Durham to possess themselves of the mother cell at Lindisfarne. For ten years they nursed their strength and then, in 1093, they commenced on the very spot where the charred remains, grass grown and almost indistinguishable, of the former structure stood, to rear the perfect building now in ruins. It was completed, dedicated, and opened about 1120. The monastic buildings were on the south side and can easily be traced, also the bath, the threshing floor, and the school with its stone benches round the wall. A stone coffin was found embedded in the thickness of the wall against the great oven, and in close contact with a couple of drains. Whoever was interred in such a position had evidently sinned grievously against the rules of the order, and was buried with the utmost indignity. Owing to the uncertainty of the hour of return to Newcastle there was no evening meeting.

*Wednesday, July 24.*

To-day was devoted by the Congress to a visit to Durham, which was reached about 10 a.m. Proceeding to the Cathedral, the party was met by the Dean, the very Rev. Dr. Kitchin, who conducted the members first round the exterior of the edifice, where, on a plinth stone on the east end of the Chapel of the Nine Altars was pointed out the name of the master mason, Thomas Moses, in 1230. The crypt under the Priors Chapel and the great kitchen, date 1380, were visited, the Dean mentioning that food for sometimes 300 persons had to be provided in one day. The present drawing-room of the deanery was the Prior's solarium. (In what was the Prior's refectory there is a great deal of fine carved wood panelling of the date of 1502. Passing through the several rooms of the deanery forming parts of the old Prior's lodgings, the party were conducted to the library of the dean and chapter, formerly the dormitory of the monks, where Dr. Kitchin drew attention to a valuable possession of the library, a Bede Roll, beautifully illuminated, 19 ft. in length, for prayers for the souls of Prior Ebechester, who died in 1456, and Prior Burnaby, who died in 1468. The relics of St. Cuthbert found in his tomb are preserved here, consisting of his pectoral cross, a beautiful piece of Anglo-Saxon enamel work, his portable altar, and the embroidered mantle and stole given to him by King Athelstan in 934, also his comb and other relics. Dr. Kitchin then read a valuable paper upon "The History of the Cathedral Statutes," which are unique and date from 1259. After luncheon the Dean again accompanied the party to the Cathedral and pointed out the chief objects of interest internally, and gave an historical sketch of St. Cuthbert, &c., &c. A visit was afterwards paid to the Castle, formerly the chief residence of the Prince-Bishops of Durham, but now the University. At the concluding meeting in the evening a paper by the Rev. C. H. Evelyn White, F.S.A., upon the "Galilee as a place of Sanctuary," was read by Mr. Astley, and one on "Canterbury's Ancient Coinage," by Mr. S. W. Kershaw, M.A., F.S.A., was read by Mr. Patrick.

*Thursday, July 25.*

The Congress proper closed last night with the usual votes of thanks to authorities and others, but two extra days are included in the programme, the excursion to-day being to Flodden Field, under the guidance of the President, Dr. Hodgkin, F.S.A., who has made the battle and its site a subject of special study. The weather, unfortunately, was not propitious, continuous rain preventing walking over the field to the various positions of the contending armies, as was intended. The distance from Newcastle is considerable, and it was nearly one o'clock before the party arrived at Coldstream and took carriages for the drive. The weather being wet, the President gave a general outline of the positions of the respective forces and the several aspects of the battle, aided by a large scale map of the locality at the inn at Coldstream, before departing for Flodden, his description being full of interest. Flodden was the last great border battle between England and Scotland, and is memorable, not so much for the numbers slain, as for the high rank of many of the victims, including the Scottish king. The

President, at intervals during the drive, stopped the carriages and pointed out the chief places of interest. Ford and Etal Castles, both connected with the history of Flodden, were also visited; at the latter Sir James and Lady Laing kindly refreshed the party with tea and other comforts. Afterwards the drive was continued to the quaint old Border town of Berwick-on-Tweed, which still retains a great portion of its ancient walls, whence train was taken for Newcastle.

Friday, July 26.

This, the last day of the meeting, was occupied by a visit to Hexham and the locality. The morning was given to the grand old Abbey Church under Mr. Gibson's guidance. There is no lack of books and descriptions of this grand church, and the *Builder* has included it in its "Abbey Series," published in April, 1899, so we need say but little about it. Mr. Gibson described the building. He said also that it was a sanctuary in Saxon times. One mile round the church was the boundary within which any criminal was safe. There were four crosses, one erected at each boundary. In digging a grave in the churchyard in 1827 a little metal vessel was found containing over 9,000 Saxon coins, called "styca" coined only in Northumbria. Austin Canons were established at Hexham in the twelfth century. In 1159 lead mines were being worked. In the "Black Book of Hexham" are preserved many curious customs, and from it we get an explanation of the use of candles at excommunication; at a certain part of the ceremony they were lit and trodden under foot. The Saxon crypts were carefully inspected, and, as many wax tapers and candles were provided by Mr. Gibson, the Roman materials of which it is exclusively built were examined with the greatest interest and ease. On the roof of the north passage is a Roman inscription, partly broken, but showing the absence of the name Geta, being one of those cases in which the name of Publius Septimius Geta was erased after his murder by his brother Caracalla. In the chancel is preserved the ancient Saxon "Frith Stool," or Chair of Sanctuary, with strap work ornamentation and the knot of the Trinity, about the year 670 in date. One of the most interesting possessions of the abbey is the fine oak rood screen, the only wooden solid screen said to be remaining in any monastic church in England. The remains of the cloisters and monastic buildings were inspected, also the Moot Hall, and the Norman keep. After luncheon the majority of the party accompanied Mr. Gibson on a drive to Aytton Castle, and Corbridge, where they inspected the Vicar's Pele, and to Dilston, and returned to Newcastle about seven o'clock. The Congress was generally agreed to have been one of the most successful and enjoyable, as well as instructive, which the Association has held.

#### CONGRESS OF THE ROYAL INSTITUTE OF PUBLIC HEALTH.

MANY hundreds of delegates from Municipal Corporations, County, Borough and District Councils, and learned and professional bodies throughout the United Kingdom, assembled at Eastbourne on Thursday, the 25th ult., on the invitation of the President (Professor W. R. Smith) and the Council of the Royal Institute of Public Health. The Duke of Devonshire gave the presidential address.

On Friday morning the first of the sectional sittings of the Congress was held. The sections were four in number, namely—A, Preventive Medicine and Vital Statistics; B, Municipal Engineering and Surveying; C, Bacteriology and Chemistry; and D, Municipal and Parliamentary Hygiene. The sections having been constituted, the sectional discussions commenced.

In Section D, over which Sir T. D. Pile presided, several papers of interest were read. The President of the section, in his inaugural address, laid great stress upon the duty of public authorities to provide sanitary dwellings for the very poor. The rent to be paid by the very poor should not exceed from 1s. to 2s. per week, and with such rents there must either be a deficit to be met by local taxation, or the repayment of loans for sites and buildings must be greatly extended—say, to 100 years.

In a paper read subsequently by Mr. Rowland Plumble, F.R.I.B.A., the subject of the

"Housing of the Working Classes" was further developed. He showed plans of and described three well-known classes of workmen's dwellings, namely, suburban cottages, block dwellings divided into self-contained flats, and associated block dwellings having offices in common. We print Mr. Plumble's paper on another page.

The discussion was opened by Dr. Berry (Wigan). He said it was impossible to devise a scheme that would fit all districts. Each locality required its own scheme. They could not in Wigan do what could be done in Liverpool or Manchester. In Wigan they tried first to build under Part I. of the Act, but found people could not pay the rents they were compelled to charge. Lancashire poor people could not pay 5s. and 6s. a week. Some progress was subsequently made under Part II. They had come to the conclusion that rents must be supplemented by an allowance from Poor Law Guardians (or some other source) of 2s. or 3s. per week.

Councillor Godbold (West Ham), said working men in West Ham were asked to pay 9s. 6d. per week for four small rooms and a scullery, but they had many people in that locality who could not pay more than 2s. 6d. a week for rent. If in Liverpool they were able to let houses at 1s. per room, why not in London?

Alderman Huddart (Saltord) said a great deal had been done by Saltord in a quiet way to get rid of insanitary dwellings by adopting drastic measures with the owners of slum property. In one scheme they had replaced 6,000 insanitary houses by 1,200 sanitary ones. They found in the Greengate district, where some years ago death rates of 100 and 102 per 1,000 prevailed, a fairly low average rate. If it reached 32 per 1,000 they marvelled, but a short time ago it stood at 13 per 1,000. They never paid a penny of compensation to the owners of slum property. These men were the greatest opponents to improvement. They got a better rent for their slum houses than was paid in the best districts.

Councillor Mallinson (Edinburgh) said they had tried the experiment of closing slum property in the central parts of the city, but they found that the people displaced did not occupy the new houses, because they were too costly. They had now got powers to try another scheme, in which they could get rid by a summary process of slum owners, and build rapidly with a view of getting the people dispossessed quickly back to their old localities. Owners had to show cause why their property should not be closed. They were given a little time to reconstruct, and if that were not promptly done the Authority took the property without giving any compensation, and proceeded to reconstruct it. They could do all that within three or four months, and so rapidly that the people had not time to get into other localities to form other slums. They had obtained power to spread the repayment of loans over fifty years.

Alderman Purcell (Liverpool) said Liverpool had had considerable experience in this matter. They got an Act which enabled them to proceed in a summary manner. The Housing Committee felt determined to house only the people that had been unhouseed and those earning casual wages of from 8s. 6d. to 15s. and 1l. per week. Instead of 1s. per room, they now built at from 1s. 2d. to 1s. 4d. per room. In some cases they could provide three rooms for 3s. 6d. per week, and in others for 4s. 6d. The Committee would not cater for the better class of artisans, but would rather keep the dwellings empty until persons who had been dispossessed applied for them. The Council proposed to spend 1,250,000l. on rehousing schemes and to provide for 7,000 persons. The plan adopted was to provide dwellings for those to be dispossessed before the old homes of the people were demolished.

In closing the discussion, Sir T. D. Pile said the Corporation of Dublin had an insanitary area of 500 houses to deal with, and they felt that if these were closed they would but drive the people to other slums. They had in some single rooms four, five, and six persons, and in one of such rooms there had been a great row because one of the six occupants wanted to take in a lodger. The Local Government Board had refused to give them (in Dublin) any extension of time for the repayment of loans; but if Edinburgh had got such an extension, Dublin would not be long in asking for it.

Mr. Rowland Plumble, in replying, said his

paper was on the housing of the working classes, not on the housing of the very poor. The mechanic was not a poor man. From what had been said that day it was clear that there was hope for the very poor, and they would see what they could do for them in London.

Sir C. A. Cookson read a paper entitled "A Smokeless London" in his position as delegate of the "Coal Smoke Abatement Society," which the lecturer said was started in 1898 by the enthusiasm and energy of Sir Wm. Richmond, R.A. The object of the paper was to show that the remedy for the smoke evil which afflicted London was less desperate than it had been deemed. The Chairman of the London County Council had stated that it was now "an exceptional thing to find a shaft creating a nuisance for any length of time." That picture might be a little premature, but the time was not far distant when Local Authorities would act promptly on the reports of their inspectors, and offenders against the law would be given no rest. Legislation, if its enactments were properly administered, seemed sufficient to cope with manufacturers' smoke, but it did not touch the nuisance so far as it was due to domestic fires, which formed the most difficult part of the problem. Two conditions must be fulfilled by any proposed solution, (a) it must be applicable to any open grate, (b) it must not increase the cost of the domestic fire. They were thus thrown back on the use, in some form, of smokeless fuel, the chief practical objection to which was the greater difficulty of ignition. This difficulty could be overcome in either of two ways, (a) by laying the foundation of the fire in a bed of ordinary coal, kindled as usual by wood, or (b) by placing a perforated pipe lit by a Bunsen gas burner underneath the grate, and connected with the gas service of the house.

The second alternative was that recommended in the paper. Coke and anthracite were smokeless fuels. If the supply of the latter could not be indefinitely increased, there would be no difficulty in multiplying our supplies of coke. It was possible, but not probable, that some increase in the price of fuel might result; but what would that be when set against the gain from the abolition of the smoke nuisance? The gain in money alone would be enormous. It had been calculated that the loss from injury done by London's smoke to external paint and internal decorations, to hangings, carpets, and clothes, together with the cost of extra washing and cleaning, was not less than 3,000,000l. a year—a sum nearly equal to the cost of half the coal used there for domestic purposes. Add to this the deleterious atmosphere which affects the health, happiness, and morals of the greatest city in the world, and the destruction of the beauty of its buildings, works of art, parks, and gardens, and who would hesitate to pay for all these evils even, if that should prove necessary, by the introduction of a law, which, once it had been shown that the creation of smoke nuisance from the domestic hearth was as preventable as that from the trade furnace, would render both equally liable to legal control?

Messrs. B. Hodgetts, Kidson, Gordon, Sir C. Cameron, and Alderman Huddart took part in the discussion, and Sir C. A. Cookson replied.

The section subsequently adjourned until Monday, as did all the other sections, in order to give opportunity to the members to attend the address given in the afternoon by Professor Koch, of Berlin, on "Malaria;" to attend the garden party given by the Duke and Duchess of Devonshire, and the excursions arranged for Saturday to Battle, to Normanhurst, to Arundel Castle, and to the Isle of Wight.

The section resumed the discussion on housing on Monday upon the reading of a paper by Bailie Steele, of Glasgow, showing what had been done in Glasgow in connexion with improved and healthy dwellings for the working classes; the discussion on the paper being followed immediately by another opened by Dr. H. Mansfield Robinson (Shoreditch) as to the question of extending the period for the repayment of debt for erecting model dwellings.

In opening the discussion on Bailie Steele's paper, Dr. Mansfield Robinson said the "family home" described in it was its most interesting feature, and the numerous questions put by the Doctor, Town Clerk of Shoreditch, and by Mr. Alderman Purcell (Liverpool), the Mayor of Southend, Councillor

Morris (Liverpool), Mr. Alderman Huddart (Salford), the President of the section, and many others who took part in the discussion, proved that the whole section coincided with this opinion.

Dr. Mansfield Robinson subsequently opened a discussion on the question of the period for the prepayment of loans for erecting dwellings for the poor.

A series of resolutions submitted by Dr. Mansfield Robinson for the purpose of remedying the evils were discussed, and after some verbal amendments were unanimously adopted by the section. The first resolution embodied an emphatic protest against the persistent ignoring by the Local Government Board of the recommendations of London and provincial municipal authorities, passed unanimously at many different conferences, and which the Congress now urgently reiterated. The second resolution declared that the present conditions of repayment inflated the charge for rent beyond the means of the poorer workers and crippled and frustrated the efforts of municipal authorities, and the third appealed to the Government to adopt and pass immediately the Bill now before the House for securing the extension of housing loans to a maximum of 100 years.

At the final general meeting of the Congress, which was held on Tuesday last, these resolutions (with others passed by the sections) were received and adopted, and a promise was made that they would be carefully considered by the Council of the Institute.

#### THE HOUSING OF THE WORKING CLASSES.\*

At the request of the Institute, I have pleasure in reading a short paper on "The Housing of the Working Classes and the Erection of Modern Dwellings for the same in large Towns."

No similar subject seems to me to have received so much consideration or to have been so much discussed as this; still there are many points which require elucidation.

One point on which much deliberation has taken place is this, viz.:—To what extent should houses for the working classes be provided by the Municipal Authorities, and whether, if such is done, they should provide for the whole of the actual wants of the district, it being held that the action of the municipality practically stops ordinary speculating builders from building this class of property. For instance: In London it is generally thought that the action of the London County Council in building vast blocks of buildings, has checked that inclination to build working-class dwellings that formerly existed on the part of the speculator, and which, if encouraged, would probably have resulted in a still larger provision of houses of this class.

Of course, it is very difficult to prophesy, but seeing that now the most advanced boroughs in London are following in the footsteps of the London County Council, it seems to me that the housing movement is in good hands and likely to improve.

Probably the most difficult point still remaining to be settled is the housing of the poorer working classes, a large number of whom do not earn more than a pound a week. What proportion of their earnings can they spare for rent? Shall we say 2s., or at most 2s. 6d. per week? Clearly, this will not even pay for a single room, but the problem must not be given up. It is met at present mostly by this class clubbing together and taking single rooms in old houses, so that they are overcrowded and unsanitary in addition to the other many evils that arise.

Glasgow, by its Buildings Regulations Bill, appears to be contemplating the building of single-room dwellings. The experiment will, no doubt, be most interesting. It is possible that one-roomed blocks might be arranged somewhat on the plan of Lord Rowton's buildings, with a common kitchen and single bedrooms in lieu of cubicles, but the difficulties would be great, as all buildings would have to be open all day.

Modern workmen's dwellings as at present built may be divided into three classes (leaving out the single-room blocks):—(a) The suburban cottage; (b) the block dwelling divided into self-contained flats; (c) associated block dwellings having offices in common.

\* A paper read by Mr. Rowland Plumbe, F.R.I.B.A., at the Public Health Congress, Eastbourne

Seeing the many manifest advantages that are enjoyed by the tenant living in his own cottage, it is strange that so little has been done in this direction by the many companies and municipal bodies engaged upon this work.

What can be more desirable for the wife and children than to live in pure country air with the use of their own gardens and drying grounds? What more advantageous than for the working man himself to spend his hours of rest, Sundays and weekdays, among the healthy surroundings of his home in the model village in the country? Possibly you ask, where can this be done? In a paper I read at the International Congress of Hygiene and Demography, and published in the "Transactions" of the Sanitary Institute, I fully described a village of this sort which exists, and, moreover, the London County Council are, I believe, about to commence a similar undertaking in the immediate neighbourhood.

On the estate in question a cottage is built on a plot of land 60 ft. by 13 ft. wide, containing a little front garden, a front living-room, kitchen in rear, small washhouse outside, and two bedrooms over; there is also a back garden or drying ground. The rental of this house to original tenants is about 6s. per week, but since taxation has gone up it has been necessary to increase the rent to new tenants.

There are on this estate other classes of houses each larger than the other at increased rentals. The houses are built with every precaution and full attention to sanitary construction, and I venture to lay upon the table drawings of these buildings; on the London block scale they would be worth 12s. per week.

I should also like to bring before your notice another cottage scheme, but this is in flats, two stories high and two sets wide, so that there are four sets of rooms, each having living-room and two bedrooms and scullery. These could be let at 7s. 6d. per set. The London block rate would be 9s. 6d. per set.

With regard to suburban cottage dwellings, the great difficulty is one of conveyance, and in order to develop the same it will be necessary to give much greater facility of access than now exists.

The railway companies generally profess that it is impossible to give passengers third-class monthly tickets for local traffic, although the Midland have done so for years. Apart from the granting of workmen's tickets by a few early trains in the morning, a third-class passenger actually pays as much for one suburban journey backwards and forwards a day as the first-class and second passenger season ticket holder who travels as often as he likes, including Sundays. Some great improvement must be made in this system. No doubt the general use of the bicycle does something to facilitate traffic as well as the improved system of tramways. After all that can be said in favour of cottage suburban dwellings, however, there remains a vast population of the working classes who must be housed in fairly close proximity to the work they have to do, hence the urgent necessity of making adequate provision for their accommodation.

This brings us to the consideration of the second part of our subject, namely, the housing in block dwellings.

Undoubtedly the most desirable form of such a building is the self-contained flat, in the planning of which great ingenuity and great variety have been displayed.

I venture to lay on the table plans of dwellings I have erected for the Council of the Borough of Shoreditch in Moira-place and Plumber's-place. The tenements are quite self-contained, and consist of a living-room 167 ft. in area, looking, in every case, on to the street, and fitted with a well-ventilated food cupboard, dresser with pot-board under, a 2-ft. 6-in. self-setting range with open and close fire, a scullery, 9 ft. by 6 ft., approached from the living-room and overlooking the courtyard, fitted with sink and draining-board, with coal bunk for 2 cwt., under same; a six-gallon copper, and a 2-ft. open cottage range, so that the scullery can be used as a kitchen if the tenants so wish. There are no dust shoes, but a galvanised dust-pail is provided for each tenement. These will be put out on the landings by the tenants twice a week, and the refuse removed by the vestry's dust contractors. The bedrooms are approached direct from the living-room, and in the case of the three-room tenements, one bedroom has an area of over 120 ft., and the other over 96 ft. The two-room tenements have a bedroom of

an average area of 127 ft. Each bedroom is fitted with a mantel register stove. The height of the rooms is 8 ft. 6 in. throughout. The living and bed room walls are plastered and distempered in fancy tints with a darker dado and separating line. The scullery walls are in Fletton bricks. Each tenement has its own water-closet, disconnected from the rooms by a short lobby. The water-closets are well lit and ventilated and look on to the courtyard.

The tenements are approached direct from the staircases (there being no corridors in the building) two tenements on each floor from a staircase, the entrance to a tenement being through an iron railing and gate into a lobby, having the living-room door on the one side and the lobby leading to the water-closet on the other. The lobby is well-lit and ventilated from the staircase and by a fanlight over the water-closet door. The object of the iron railing is to allow of the water-closet being inspected without going into the rooms of the tenant.

The staircases, approached through an open archway from the courtyards, are of good width, easy, and well lit and ventilated, having a large window to every floor, and an extra casement window which can be left permanently open for ventilation at the highest point. The staircases are finished with a glazed brick dado and Fletton bricks above.

The construction of the buildings is non-combustible throughout, all internal walls being of brick and the floor composed of iron joists embedded in concrete. Staircases and landings are of granolithic. The sanitary arrangements have been most carefully studied with due regard to cost. Each scullery and water-closet is fitted with a gully discharging into a rain-water head outside the building, so that both can be sluiced out with water or in case of mishap with the water fittings the tenements would not be flooded.

The water-closets are fitted with "Oatley patent overflow soil and anti-syphonage pipe junction," so that should one water-closet become blocked the others will not be put out of action, nor water-closets at a lower level than the one used be flooded. See plan. The rain water and sink wastes discharge into gullies having cleaning caps, so that all short lengths of drain can be cleaned and manholes are placed on the main drains at all bends and junctions. The whole of the water used is stored in Alexander's patent self-cleaning airtight cisterns, placed in the roof space and easily accessible. The staircases and tenements are lit by electric light, the latter being supplied at a weekly rental. The elevations are carried out with a brown glazed brick plinth for one story and yellow stock brick-work above picked out with red quoins and bands and a small amount of brown Portland stone in the gables. The roofs are constructed on the mansard principle and covered with green slates.

In this class of building, the plan is of necessity the first consideration, but in the external design of the dwellings, the monotonous repetition of small windows has been overcome by the introduction of boldly massed gables of distinctly picturesque outline, obviously influenced by the remains of ancient brickwork to be found in the old towns of East Anglia. The rents charged for tenements are 8s. 6d. for the three-room and 6s. 6d. for the two-room sets, and there are in the buildings, five cupboards which are let to the tenants at 3d. per week. The total annual rental for the three blocks amounts to 1,530l. 15s. This rental, taking the total cost of erecting the buildings and the value of the two plots of land at 22,917l., and allowing for all rate, lighting, supervision and collection of rents, empties and losses, insurance and sinking fund to reproduce the total outlay at the termination of sixty years at 2½ per cent., repairs and incidental outgoings, will produce an interest of 3½ per cent. on the total outlay.

The question of the tenants purchasing an interest in the dwellings has been reported on by me, taking as I do some considerable interest in the question. I find if tenants will pay an extra shilling per week, they can practically purchase a long leasehold interest in their houses in the space of thirty years. They would, of course, still have to contribute towards the rates and taxes and the keeping up of the premises, but this could all be provided for, the Vestry keeping that in their own hands and also charging for the work done in administer-

ing the estate. Nothing has yet been done as there are difficulties in the way.

I also submit some varieties of plans carried out for the London Council Council. There are many varieties of arrangements adopted in the planning of these self-contained flats. Sometimes one staircase is made to serve four sets of rooms instead of one, but that, however, mostly entails building the rooms back to back without through ventilation, a scheme which our advanced sanitarians hardly advise.

A not uncommon method of approaching these blocks of flats is by means of a verandah going all round the building with approach staircases at intervals as shown on the plan submitted. It is thought that the projection of this verandah takes light and air away from the rooms below. It also, of course, involves the whole of the traffic passing the windows and doors on all floors, so that less privacy is given to this class of building than is the case with other designs.

There is yet another type of block building to be described, viz.: the Associated Dwellings, a plan of which I venture to lay before you. Here it is seen that central corridors are provided, with as many sets of rooms opening from them as can be obtained. The rooms are provided with a certain number of closets in open lobbies, dust shoots are provided for the dust, sinks for water, and bathrooms all used by the tenants more or less in common.

I doubt whether this method of planning is much more economical than the self-contained system. There is a much larger area of corridor and the blocks of the building are necessarily very much wider. The want of privacy is, I think, dearly paid for by any supposed advantage. There is greater risk of spread of disease, greater risk of annoyance from undesirable and noisy tenants, and a general absence of the quiet and repose which a man gets who enters his own street door from an ordinary staircase and not from corridors held in common.

Another variety of these Associated Dwellings may, I think, be found interesting. In this case the central staircase is more or less well lit by passages to the sinks. Two sinks and a water-closet are provided, a general washhouse on each floor, and a bathroom on the ground floor. The staircases lead to four sets of rooms, which are, however, back to back. I think, on the whole, that this shows the most desirable form of Associated Dwellings.

In conclusion, I cannot help referring once more to the question of dwellings for the very poor in London. I fear nothing efficient can be done for them except to build largely dwellings for the thrifty and working classes and by so doing to leave a much greater number of old buildings for the use of the poor who cannot afford the accommodation provided in the buildings just described. It is a very poor alternative, and one which I trust the constant efforts of men who are taking an interest in such work will change for the better.

I have not enlarged upon the financial requirements of these schemes, as I understand that my friend Dr. Robinson will refer more particularly to that branch of the subject. Generally, however, the land which is taken for the purpose of building artisans' dwellings cannot be used at a price which represents more than a rental of from 2d. to 3d. per foot super. Capitalised at twenty-five years' purchase this would be 4s. 2d. and 6s. 3d. per foot for freehold, and where the London County Council and Parochial Authorities build, they are expected to give a net return of 3 per cent., and in addition to provide a sinking fund which will pay off the total cost of the building in six years. The sinking fund, of course, puts a heavy burden upon the undertaking, but on the other hand, the investment is a good one for any Corporation, as in sixty years the property reverts to the promoters, who will then enjoy the full income derived.

**CHURCH, WATH-UPON-DEARNE, YORKSHIRE.**—The foundation-stone has just been laid at Wath-upon-Dearne of a mission church. The new church will be a Gothic building, consisting of nave, chancel, organ recess, vestry, baptistry, and two porches. There will also be a large parish-room at the west end, which can, if the requirements of the district demand, be added permanently to the nave, thereby raising the sitting accommodation from 255 to 350. The building will be faced inside and out with dark red Thurstonsland bricks, with dressings of stone and terra-cotta. Mr. E. Isle Hubbard, of Rotherham, is the architect, and Mr. Fuller, of Wath, the contractor.

## Illustrations.

### STOWELL PARK, GLOUCESTER-SHIRE.

**H**IS work of Mr. Belcher's was to have been visited by the Architectural Association this year during their annual excursion, and it was for this special reason that we inserted an illustration of it under this date, Mr. Belcher having kindly lent the drawing for the purpose. At the last moment, however, the programme was altered and the visit to Stowell Park was abandoned.

Our illustration is from a fine drawing of Professor Pite's, made some years ago while the work was in progress. Stowell Park was an old house from which Lord Stowell, the brother of Lord Chancellor Eldon, took his title. It is finely situated on a hill overlooking Chedworth Woods. Until the present Lord Eldon put it in Mr. Belcher's hands, it was used as a farm. Mr. Belcher disturbed the old place as little as possible, simply linking the buildings together by additions similar in character to the old work; he had the Georgian sashes taken out and the stone mullions replaced. On the left is the Parish Church and the old tithe barn, the latter now intended for use as a billiard or hall room. At the back are new stable buildings, laundry, &c.

### INTERIOR, EDGEWORTH MANOR.

This is a part of the addition made to this house by Messrs. Ernest George & Yeates a year or two since. The house was visited by the Architectural Association on their excursion this year, and some reference to it in this connection will be found at the close of our last week's article on the excursion.

The exterior of the new portion of the house was shown in a plate in our issue of May 19, 1900.

### SKETCHES WITH THE ARCHITECTURAL ASSOCIATION EXCURSION.

THE two pages of illustrations of places visited by the Architectural Association in the course of their annual excursion, which is reported on another page, are from sketches specially made on the spot by Mr. W. Curtis Green.

The first shows the fine late mediæval tower hall, with the church in the rear, the entrance porch to the church being on the ground floor of the Town Hall building. The second sheet shows sketches from various places visited, and which are referred to and described in our article.

### THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

**Loans.**—On the recommendation of the Finance Committee, it was agreed to lend Poplar Borough Council 1,500l. for the purchase of electric light meters; Southwark Borough Council 700l. and Hampstead Council 2,810l. for the same purposes; Hampstead Borough Council 19,529l. for electric light installation, electric light meters, &c.; Stepney Borough Council 3,000l. for the purchase of electric light meters; Chelsea Borough Council 1,200l. for works at public library; Greenwich Guardians 68,540l. for erection of schools; St. Pancras Guardians 5,200l. for the purchase of property; and Chelsea Borough Council 5,800l. for paving works.

**Tramways.**—The Highways Committee recommended, and the recommendation was agreed to, an application for Parliamentary powers to construct new tramways along Victoria Embankment; along Elgin-avenue to Harrow-road; Trafalgar-road, Greenwich; and from Woolwich to Eltham.

**Proposed Improvements.**—The Improvements Committee recommended the widening of a portion of the Hampstead-road, on condition that the St. Pancras Borough Council should contribute one-eighth of the net cost, and should also consent to a tramway from Hampstead-road terminus, across Euston-road, and along Tottenham Court-road. The Committee also submitted proposals for the widening of High-street, Eltham, and High-street, Fulham, in connexion with the proposed new tramways.

The Finance Committee reported that the total estimated cost of the tramway and street improvement proposals for next year was 2,674,518l. It was anticipated that the proportion of the net cost of the street improvements which would fall upon the county rate would be 564,551l.

The reports were adopted.

**Housing.**—The Housing of the Working Classes Committee recommended votes of 15,000l. for foundations of blocks of dwellings on the Reid's Brewery site, to accommodate 2,022 persons; 8,745l. for dwellings to accommodate 200 persons at Swan-lane, Rotherhithe, in connection with the tunnel rehousing scheme; 17,552l. for Sydney and Melbourne buildings, Ann-street, Poplar, to complete accommodation for 630 persons, as against 261 displaced.

In regard to Reid's Brewery site,

Mr. R. Williams called attention to the fact that the Council was gradually decreasing the floor space given in working-class dwellings, and he moved as an amendment "That the recommendation be referred back to the Committee with instructions to so amend the plans for this site that not more than 500 persons to the acre be housed thereon."

Mr. Wightman seconded the amendment.

Mr. Hunter said that if the amendment was carried they could say good-bye to houses for the working classes in London.

Mr. H. Smith said they were bound by the standing orders to make the buildings pay, and if they were to put less people on the land they could not make the scheme pay.

Mr. Waterlow said the whole matter was ruled by the cost of the land. If the land was cheap, they put fewer on the land. In the block of Guinness's dwellings opened last week there were 838 persons to the acre.

The amendment was defeated by a large majority.

The dwellings at the Swan-lane site will consist of twenty two-roomed and twenty three-roomed tenements, and will provide accommodation for 200 persons. The architect's estimate for these dwellings is made up as follows:—Building estimate, 8,143l.; architect's expenses, quantity surveyor's and other fees, provision for articles to be purchased direct and for first year's contingencies, 600l.

In regard to Sydney and Melbourne Buildings, Ann-street, Poplar, the committee reported as follows:—

On June 18, 1901, the Council authorised us to issue an advertisement for tenders for the erection of Sydney and Melbourne Buildings for the accommodation of 440 persons under the Ann-street scheme, Poplar. In response to the advertisement five tenders were received and referred by the Council to us on July 16, 1901, as follows:—

	With alternative prices.
F. & T. Thorne	£14,072 17 .....
Martin Wells & Co.	£15,074 12 4
B. E. Nightingale...	16,293 0 .....
H. L. Holloway...	16,745 0 .....
Marsland & Sons...	17,729 0 .....
	16,943 11 10
	17,188 3 2
	17,688 9 0
	18,441 0 6

An informal tender from Messrs. Herbert Brothers, amounting to 14,130l. (14,037l. 2s. 2d., with alternative prices) was also received. All firms tendering were requested to give an alternative price for which they would be prepared to use red facing bricks and compo mortar, and to comb grain the internal woodwork. On this basis it will be seen that Messrs. Thorne's tender amounts to 15,074l. 12s. 4d. as against the Architect's estimate of 16,648l. 15s. 6d. . . . The building of these dwellings will complete the provision of accommodation under the Ann-street scheme for 630 persons as against 261 displaced. This is a result which we cannot but view with satisfaction. We recommend that the working drawings, specifications, and bills of quantities, together with the estimate of 17,552l. 15s. 6d. submitted by the Finance Committee in respect of Sydney and Melbourne buildings, Ann-street, Poplar, be approved; that the tender of Messrs. F. & T. Thorne for the erection of the building, amounting to 15,074l. 12s. 4d., be accepted.

The recommendation of the Committee in each case was agreed to.

**Waterlow Park.**—The Parks Committee recommended an application to Parliament for compulsory powers to purchase Fairseat House and grounds for the improvement and enlargement of Waterlow Park, at an estimated cost of 9,000l. It was suggested that there was no precedent for the compulsory acquisition of property for mere pleasure purposes, but in view of recent decisions of Parliament there was a prospect of a successful issue.

The recommendation was adopted.

**Theatres, &c.**—The following applications were agreed to:—

Alterations under back part of stage at the Garrick Theatre (Messrs. Horne & Birkett).  
New theatre at the corner of St. Martin's-lane and St. Martin's-court, to seat 1,030 persons (Mr. W. G. R. Sprague for Mr. A. D. Peckham).

Alterations to the dressing-room block at the Oxford Music Hall, Oxford-street (Messrs. Wyllson & Long).

**List of Streets and Places Within the Administrative County of London.**—The Building Act Committee reported as follows:—

"The list of streets and places within the administrative County of London, ordered by the Council to be printed, is now practically completed, and the volume will probably be published during the summer recess. The volume is, as far as possible, a complete index to the names now in use of streets and places within the area of the Council's jurisdiction, and contains the following information:—The names of all streets and places (including a large number of artisans' dwellings, mansions, &c.), their locality, postal district, parish, city or metropolitan borough, county electoral and parliamentary divisions, ordnance sheet number, and, where a street has been renamed or renumbered, the date of the order and the abolished subsidiary names, and other useful information. We have had 2,000 copies of the book printed, and they will be put on sale at the price of 10s. 6d. per copy."

**District Surveyor for North Battersea.**—The same Committee recommended:—

"That consent be given to Mr. H. J. Hansom, the District Surveyor under the London Building Act, 1804, for the District of North Battersea, to appoint as his deputy Mr. R. D. Hansom, of No. 8, Colledge-gardens, Dulwich, to perform all the duties of such District Surveyor, for a period of six months from July 11, 1901; such consent being subject to the condition that Mr. H. J. Hansom shall not during such said period without the previous consent of the Council to be signified in writing under the hand of the Clerk of the Council, act as District Surveyor or revoke the appointment of Mr. R. D. Hansom as such deputy, or in any way interfere with the performance by Mr. R. D. Hansom of his said duties."

It was reported in this connexion that the whole question of the District surveyors' districts was engaging the constant attention of a sub-committee, and the Building Act Committee hope to be in a position to report fully upon the matter shortly after the summer recess.

The recommendation was agreed to.

**Office Accommodation.**—It was agreed that an expenditure of £2,010 be incurred for the provision of furniture, fittings, &c., electric lighting, and the re-construction of the drains at Nos. 26 and 27, Cockspur-street, in connexion with the removal to those premises of portions of the Engineer's department.

**Heating at Central Offices.**—The tender of Mr. Edward Deane, amounting to £139, for additional heating at the central offices, was accepted.

**Electric Lighting at Fire Stations.**—The Fire Brigade Committee reported as follows, the recommendation being agreed to:—

"An opportunity is afforded of lighting the Manchester-square, Bishopsgate, and Brompton stations by electricity, and by our directions the chief engineer invited several firms to tender for the necessary wiring and fittings. The tenders received are as follows:—

	Manchester-square.	Bishopsgate.	Brompton.
Forest & Son	£236 10	0 2208 15	0 4132 10
Brake & Goshall	243 15	0 220 15	0 128 0
Glover & Co.	245 0	0 220 0	0 143 0
The Lighting Corporation, Ltd.	256 9	6 233 12	6 147 6
C. Eason	259 0	0 215 0	0 125 10
Coleby & Co.	295 10	0 273 12	0 105 18

Allen & Co.	312 16	0 274 10	0 161 15
J. Sperritt	378 0	0 313 0	0 136 0
Wells & Co.	470 0	0 410 0	0 230 0

"We recommend: "That subject to the result of enquiries to be made by the solicitor proving satisfactory, the tenders of Messrs. G. Forrest & Son to execute for 236l. 10s., 208l. 10s., and 122l. 10s. the wiring and supply the fittings for electric light installations at the Manchester-square, Bishopsgate, and Brompton stations respectively be accepted."

**Paving and Sewer Work. Totterdown-fields Estate.**—On the recommendation of the Housing Committee, it was agreed, "That the expenditure of a sum not exceeding 7,725l. in respect of the sewer and temporary paving works on section A of the Totterdown-fields

estate be sanctioned; that the chairman of the Housing of the Working Classes Committee be authorised to accept the lowest satisfactory tender within that amount . . ."

**Brickmaking at Norbury.**—The same committee recommended, and it was agreed:—

(a) That the estimate of 4,000l. submitted by the Finance Committee for the making of bricks on the Norbury estate during the year 1901-1902, be approved, and that the work of making the bricks by the employment of direct labour be undertaken by the Council.

(b) That the Housing of the Working Classes Committee be authorised to appoint a foreman brickmaker under the architect on the Norbury estate, at the wages of 3l. 3s. per week, with such bonus as will bring those wages up to 4l. 10s. a week, on condition that he turns out suitable bricks at a cost not exceeding 25s. per 1,000, and to take all necessary steps for the purchase of such plant and materials and the payment of such wages as may be required during the brickmaking season of 1901-1902.

**Cottages, Totterdown-fields Estate.**—The following recommendation by the same Committee was also agreed to:—

"That the working drawings, specification, and bills of quantities in respect of three representative rows comprising cottages of the four classes, and the estimate of 74,003l. submitted by the Finance Committee, in respect of the erection of all the cottages to be built on Section A of the Totterdown-fields Estate, Tooting, be approved; and that the Housing of the Working Classes Committee be authorised to invite tenders for the erection of the three representative rows, the tenders to be subject to the condition that the successful contractor shall undertake the construction of the remaining cottages on section A at the same schedule of prices and upon bills of quantities to be prepared and supplied as the work is required to be carried out."

**Widening Piccadilly.**—With respect to the proposed widening of Piccadilly between Hyde Park Corner and Walsingham House, as to which a long discussion on the question of saving the trees took place at last week's meeting of the Council, the Improvements Committee informed the Council that a conference had been held with the Secretary of his Majesty's Office of Works, and it was believed it would be possible to save eleven of the existing trees.

Replying to Captain Swinton, Mr. Davies said of fifty-seven trees affected by the improvement, only eight would be actually cut down.

**Holborn to the Strand Street—Gaiety Theatre, Gaiety Restaurant, and Messrs. Short's premises.**

—The Improvements Committee reported as follows, the recommendation being agreed to:—

"The London County Council (Improvements) Act, 1809, authorises the construction of the new street from Holborn to the Strand, and the improvement is now being undertaken. The Act makes provision for the reinstatement of the Gaiety Theatre, Gaiety Restaurant, and Messrs. Short's premises on the western horn of the new crescent site at its junction with the Strand, and we have had before us a design for the elevation of the new buildings. It should here be mentioned that Mr. Runtz, the architect engaged by the owners of the premises in question, submitted to the Council some time ago plans and sections for the interior of the new theatre, and these plans were reported upon by the Theatres Committee and sanctioned by the Council on December 18, 1900. Subsequently Mr. Runtz, who, it will be remembered, was one of the eight architects invited by the Council to prepare sketch designs for the elevations of the buildings to be erected in connexion with the Holborn to the Strand improvement, submitted a design for the elevation of the new Gaiety Theatre, Gaiety Restaurant, and Messrs. Short's premises. Upon receiving this design we decided, upon Mr. Runtz's suggestion, to ask Mr. K. Norman Shaw, R.A., if he would assist us in deciding whether the design was such as the Council could be advised to approve, having regard to the extreme importance of the site upon which the new Gaiety Theatre would be erected, and the probable effect of the new buildings upon the architecture of other buildings to be erected in connexion with the improvement. Mr. Norman Shaw readily placed his services at our disposal and spared no pains in examining into the whole matter. He had several conferences with us upon the subject, and after the fullest consideration we formed the opinion that the particular design was not of such a character as we could advise the Council to approve for the site in question. Subsequently Mr. Runtz had a conference with Mr. Norman Shaw upon the subject with the result that they both attended before us, and Mr. Norman Shaw very kindly made suggestions for the architectural treatment of the buildings in question and produced a sketch design in illustration of his suggestions. Mr. Runtz at once accepted Mr. Norman Shaw's

suggestions, and proceeded to prepare a complete design based thereon. We have now received this complete design and a perspective view of the buildings. After full consideration of this design, and having received further advice from Mr. Norman Shaw thereon, we are of opinion that it is such as may well be sanctioned, and we have therefore decided to advise the Council to give its formal approval thereto. We desire to take this opportunity of acknowledging our indebtedness to Mr. Norman Shaw for the very valuable services he has so readily placed at our disposal during our consideration of the important and difficult question of the elevations of the buildings in the improvement in question. We recommend—That, in connexion with the Holborn to the Strand improvement, the approval of the Council be given to the design submitted to the Improvements Committee on July 24, 1901, by Mr. Ernest Runtz, and based upon Mr. Norman Shaw's sketch design, for the elevation of the new Gaiety Theatre, Gaiety Restaurant, and Messrs. Short's premises, proposed to be erected on the western horn of the new crescent site at its junction with the Strand."

**The View from Richmond Hill.**—The Parks Committee advised the Council to agree to pay 3,500l. by way of deposit in order to secure the option until December 31 of acquiring the Marble Hill estate, and thus preserving the view from Richmond Hill, for the sum of 70,000l.

The recommendation was adopted without discussion.

**A Motor Fire-engine.**—The Fire Brigade Committee reported that in the near future it would be expedient to adopt some more rapid method of traction than was afforded by horse-power. They recommended that an expenditure of 400l. be sanctioned for the building, in the brigade workshops, of a motor fire-engine; the necessary parts to be purchased outright, and to be put together under the chief officer's supervision. This was regarded as a more satisfactory and economical arrangement than buying an experimental engine from a firm. The recommendation was agreed to.

**Tenders.**—The following recommendations of the Parks Committee were agreed to:—

"That the tender of Messrs. R. Taylor & Sons to supply, at a cost of 225l., a Cornish boiler for use at Battersea Park, be accepted."

"That the tender of the Acme Wood Flooring Company, Limited, to supply wood paving in connexion with the formation of new gymnasium at Kennington Park at a cost of 12s. 9d. per square yard, and that of Messrs. Rowland Brothers to supply certain new oak pale fencing and to refix the existing fencing for the sum of 113l. be accepted."

"That the offer of Mr. T. Crawwsy to supply gymnastic apparatus for the new children's gymnasium in Kennington Park for the sum of 117l.; of Messrs. Hill & Smith to provide the necessary fencing around the swings for the sum of 20l.; and of Messrs. W. E. Constable & Co. to supply certain tar-paving materials, viz., bottoming at 19s. 6d. per ton; topping, 22s. 6d. per ton; dust, 12s. 6d. per ton; quartz, 30s. per ton, be accepted."

After transacting other business, the Council adjourned for the summer recess.

METROPOLITAN ASYLUMS BOARD.

THE fortnightly meeting of this Board was held on Saturday, Mr. Henson presiding.

The Works Committee submitted a series of recommendations with regard to several works in progress. In connexion with the Joyce Green Hospital, the Committee had authorised certain variations in Messrs. Leslie's contract, and at the North Eastern Hospital they had authorised certain extra works on Messrs. McCormick & Son's contract. They also authorised certain extra works on the laundry building contract to meet the requirements of the Engineer to the Board.

The same Committee reported in favour of a continuation of the services of a temporary assistant draughtsman in the Surveyor's department; and in connexion with Tooting Bec Asylum authorised certain variations in the contract, including the fixing of two hydrants in the laundry, at a total cost of 97l. The net extras previously reported amounted to 798l. 1s. 5d.

In connexion with the buildings at White Oak School, the Works Committee reported that the proposals of the architects, Messrs. Newman & Newman, were to heat the day-rooms and dormitories in the double cottages by means of radiators, in addition to open

fireplaces; the two large schoolroom halls and classrooms by radiators on the low-pressure system; the infirmary by means of open fireplaces, supplemented by radiators in the ward and corridors, and the administration block generally by means of open fireplaces supplemented by radiators in the corridors and by hot-water pipes in the cubicles of the domestic staff. The Committee counted the instructions they had given, and stated that the financial result generally would be that, whilst in the case of the High Wood School an additional expenditure of 400l. would be entailed, in the case of White Oak School a saving, which could not yet be definitely ascertained, but which they had reason to believe would more than counterbalance the additional expenditure on the High Wood School, would be effected.

On the recommendation of the Asylums Committee the tender of Mr. Mark Batchelor, of Maidstone, in 58*l.*, was accepted for providing and fixing new sanitary fittings and converting certain windows into doorways at the pavilions at Darenth Asylum, and that of Mr. W. Rogers (Colchester), in 115*l.*, was accepted for cleaning, painting, and disempering work required at the female attendants' home at the children's department at the same establishment.

#### KNIGHT'S BRICKLAYING MACHINE.

ON Tuesday last, July 30, we were present at a demonstration of the capabilities of this machine, which was given at Barfield, near Farnham. In getting ready for work two iron pillars are placed at the end of the wall that is to be built, intermediate pillars being used when necessary. Fixed to these uprights is a light girder capable of being raised as the work proceeds; on the top of this runs the machine. This machine has a pinion which gears into a chain stretched along the girder, and by turning this pinion by a winch handle the machine travels backwards and forwards. The bricks are fed by hand to the machine, and by means of a lever, and by revolving rollers, the bricks are caught and pushed home up against the last laid bricks. Guide rollers at the side keep a "face" on the work; other rollers on top press the bricks down on the mortar.

It has been arranged that the latter shall be run out by a hopper worked by hand, but on the day of our visit the mortar was laid on in front of the bricks to be set, by trowels in the usual way. The pressure of the rollers alluded to, together with that promoted by the bricks as they are being squeezed into position by the machine, drive the mortar into the spaces of the work. It is stated that the machine worked by two men and a lad will lay 500 to 600 bricks an hour. We may notice, however, that to attain to that speed the machine will have to be worked a great deal quicker than when we saw it on Tuesday, when four men were employed. We refrain from giving particulars as to cost of working, profit per day as compared with hand laying, and the like, as the machine is confessedly only in the experimental stage at present, and all such particulars must, therefore, be regarded as being more or less theoretical.

In regard to the quality of the work done, we can only speak of what we saw, and it was stated that the men employed were unaccustomed to the machine. Frankly, we did not think much of the quality of the brickwork in the short length of wall we saw erected. The bond was not kept very true, the spaces between the bricks varied a great deal in size, some bricks being pressed close together whilst others were nearly  $\frac{1}{2}$  in. apart. The "face" was not remarkable for its finish, here and there a header slightly projected from the wall, and in other places it was pressed slightly inwards. The spaces as seen in the "face" were sometimes full of mortar, and sometimes not. However, in spite of these obvious drawbacks, practically all of which could be easily remedied by the employment of men who understand the working of the machine, we believe that for rough walls it will be found serviceable—and that is all that is claimed for it at present. It is obvious that where the mortar is fed by hand much care must be exercised to see that it is laid on equally and evenly. Even as we saw it, we have no doubt that the wall would stand well enough; the iron pillars alluded to act as the plumb line, whilst the horizontal light girder assists in keeping the "face," so the

wall is upright. When it is made a little heavier, and the experimental stage is passed, we believe that Knight's bricklaying machine will prove to be exceedingly useful, especially where long stretches of walling are to be erected. We are glad to have had an opportunity of seeing it.

#### APPLICATIONS UNDER THE 1894 BUILDING ACT.

AT the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

##### Murphy Memorial Hall, Walworth.

A one-story building on part of the forecourts of Nos. 92 and 94, New Kent-road, Walworth (Mr. A. S. Taylor for the Committee of the Murphy Memorial Hall).—Consent.

##### Wooden Pediment at Entrance to Building, New Kent-road, Walworth.

A projecting wooden pediment at the entrance to a building on the site of Nos. 128 to 132, New Kent-road, Walworth (Mr. L. A. Withall for Messrs. R. Thwaites & Co.).—Consent.

##### Lines of Frontage and Projections.

**Lewisham.**—A deviation from the plan approved by the Council on May 8, 1900, for the erection of twelve houses with shops on the south side of Brownhill-road, Catford, so far as relates to the erection of a building, with gateway under, in place of one of the houses with shops approved by the Council (Mr. A. J. Glock).—Consent.

**Hackney, South.**—A building, to be used as a technical institute, on the corner of Terrace-road (Mr. P. Kirk for the Governors of the Hackney Institute).—Consent.

**Hampstead.**—Buildings with shops on the ground floor, and of buildings with porches and bay-windows, on a site bounded on the north and west sides by West-end-lane and on the east side by Honeybourne-road, Hampstead (Messrs. Boehmer & Gibbs for Mrs. E. J. Cave).—Consent.

**Bow and Bromley.**—A one-story workshop on the north-east side of Armagh-road, Old Ford, next No. 172 (Mr. A. P. Stokes for Messrs. J. Deaton & Sons).—Consent.

**Hackney, North.**—Buildings on the east side of Upper Tooting-road, Tooting, northward of Letchworth-street (Messrs. Walton & Lee for Mr. G. S. Miller).—Consent.

**Chelsea.**—Buildings, to be used as public baths and washhouses, on the south side of King's-road, Chelsea, at the corner of Manor-street (Mr. T. W. E. Higgins for Council of the Metropolitan Borough of Chelsea).—Consent.

**Brixton.**—A two-story bay window in front of No. 207, Brixton-road, Brixton (Mr. H. G. Assiter for the Ecclesiastical Commissioners).—Consent.

**Dulwich.**—One-story shops on part of the forecourts of Nos. 76 and 78, Church-street, Camberwell (Mr. W. A. Murphy).—Consent.

**Finsbury, Central.**—One-story additions in front of No. 180 (the Lord Vernon Almshouse) and No. 182, Pentonville-road, Clerkenwell (Messrs. Richard Clarke & Parkes for Mr. T. R. Grimwood).—Consent.

**Finsbury, Central.**—A three-story oriel-window in front of a proposed warehouse building on the north side of Rosebery-avenue, Clerkenwell, at the corner of Rosoman-street (Mr. W. H. Winder for Mr. J. Milroy).—Consent.

**Greenwich.**—A two-story workshop on the site of No. 17, Colomb-street, Trafalgar-road, Greenwich (Mr. J. J. Faulkner).—Consent.

**Greenwich.**—Wood, iron, and glass pentas at the entrances to Nos. 198 to 208 (even numbers only, inclusive), Victoria-road, Charlton (Mr. W. Elviss).—Consent.

**Hammersmith.**—A brick and tile porch to St. Saviour's Parochial Buildings, Hartswood-road, Shepherd's Bush (Mr. J. S. Alder for the Rev. A. C. Holt-house).—Consent.

**Hampstead.**—A dwelling-house on the north side of Arkwright-road, Hampstead, to abut upon Frogna (Mr. A. C. H. Watkin for Mr. M. Davis).—Consent.

**Hampstead.**—A brick, wood, and tile porch at the entrance to a house known as Castlewood, Wadhams Gardens, Hampstead (Mr. A. F. Faulkner for Mr. W. Willett).—Consent.

**Lewisham.**—One-story shops on the forecourts of Nos. 113 and 115, Loampit Vale, Lewisham (Messrs. Hodson & Whitehead for Mr. W. Nevins).—Consent.

**Islington, West.**—A four-story building on the site of a one-story shop in front of No. 559, Holloway-road, Islington (Mr. F. S. Hammond for Mr. A. J. Hone).—Refused.

**Paddington, South.**—A covered way in front of No. 7, Bayswater Hill, Paddington (Mr. T. P. Bullivant).—Refused.

**Clapham.**—School building on the site of Nos.

62 and 63, Clapham Common, South side, Clapham (Mr. J. O. Smith for the Girls' Public Day Schools Company, Limited).—Refused.

**Hackney, North.**—A block of residential flats, with one-story shops, on the north side of Manor-road, Stoke Newington, on the site of No. 4 (Messrs. Gordon & Guntton for Mr. F. Matthews).—Refused.

**Hammersmith.**—A porch and buttresses in front of a proposed building, to be known as the People's Hall, on the west side of Latimer-road, Hammersmith (Messrs. Fleetwood, Son, & Everden for Mr. W. H. Winterbotham).—Refused.

**Hampstead.**—A detached house, with bay-windows, and a stable building, on the west side of Frogna, Hampstead, southward of No. 33 (Mr. A. C. H. Watkin for Mr. M. Davis).—Refused.

**Lewisham.**—Three houses on the north side of Tredown-road, Sydenham, to abut upon Homecroft-road (Mr. W. Cooper).—Refused.

##### Width of Way.

**Limehouse.**—A building on a yard at the engineering works, Batson-street, Three-Cool-street, Limehouse, at less than the prescribed distance from the centre of the street (Mr. A. T. Bolton for Mr. G. S. de Ritter).—Consent.

**Marylebone, West.**—A one-story addition to the Abbey Tavern, Violett Hill, St. John's Wood (Mr. A. Dixon for Messrs. Whitbread & Co. Limited).—Consent.

**Fulham.**—A two-story stable building at the rear of No. 99, Claybrook-road, Fulham Palace-road, Fulham, at less than the prescribed distance from the centre of Lurgan-avenue (Mr. J. Hook for Mr. J. Hunt).—Refused.

**Finsbury, East.**—Warehouse buildings on the north side of Great Arthur-street and south side of Bayer-street, Golden-lane, at less than the prescribed distance from the respective centres of those streets (Messrs. N. S. Joseph, Son, & Smithem for Mr. S. H. Beddington).—Refused.

**Kensington, South.**—A two-story studio at the rear of No. 46, Campden Hill-square, Notting Hill, with the forecourt fence at less than the prescribed distance from the centre of Aubrey-road (Messrs. Batten & Co. for Mr. F. T. Battam).—Refused.

##### Lines of Frontage, Width of Way, and Projections.

**Camberwell, North.**—An extension of the period within which the erection of buildings and boundary-walls at the Camberwell Infirmary, Havill-street, Camberwell, at less than the prescribed distance from the respective centres of Havill-street, Brunswick-road, and Brunswick-square, was required to be completed (Mr. E. T. Hall).—Consent.

**Clapham.**—One-story shops on the south side of Crescent-lane, Clapham, eastward of Elms-road (Mr. J. H. Swan for Messrs. Lync & Smith).—Refused.

**Hackney, North.**—A block of dwellings on the north side of Stamford-terrace, Stamford Hill, Hackney (Mr. C. G. Smith for Messrs. Mitchell, Goodman, Young, & Co., Limited).—Refused.

**Kensington, South.**—An additional story to an existing studio, Cl. No. 3, Putnam-street, South Kensington (Mr. A. Seward for Mr. W. J. Donne).—Refused.

**St. Pancras, West.**—A one-story stable building at the rear of No. 31, Princess-road, Regent's Park, to abut upon St. George's-road and Calvert-street (Mr. W. C. Pepper for Mr. G. H. Iltter).—Refused.

##### Space at Rear.

**St. Pancras, East.**—A modification of the provisions of section 41 (1) (vi) of the Act with regard to open spaces about buildings, so far as relates to the proposed erection of five blocks of dwelling-houses for the working class, on the east side of Great College-street, at the corner of King's-road, St. Pancras, with an irregular space at the rear (Mr. C. Barrett for the Council of the Metropolitan Borough of St. Pancras).—Consent.

##### Deviations from Certified Plan.

**City of London.**—Deviations from the plans certified by the District Surveyor, under Section 43 of the Act, so far as relates to the proposed erection, on the site of a one-story building, of an addition at the rear of the Talbot public-house, Nos. 64 and 65, London Wall, City (Messrs. Lewcock & Calcott for Mr. T. E. Davies).—Consent.

##### Width of Way, Space at Rear, and Projections.

**Bermondsey.**—A building, with bay-windows, to be inhabited by persons of the working class, on the east side of Tower Bridge southern approach, Bermondsey, with portions of the forecourt fence at less than the prescribed distance from the respective centres of Abbey-street and Long-walk (Messrs. Humphreys-Davies & Co. for the South Eastern Railway Company).—Consent.

##### Line of Frontage and Space at Rear.

**Wandsworth.**—Dwelling-house on the south side of Ormerley-road, Balham, to abut upon Laitwood-road (Mr. W. E. Johnson for Mr. G. E. Treves).—Refused.

##### Line of Frontage and Temporary Structure.

**Hackney, South.**—Retention of a wood and canvas shelter on a portion of the forecourt of

No. 19, Lea Bridge-road, Hackney (Mr. J. Perkoft).—Consent.

**Width of Way and Construction.**

*Finsbury, East.*—The retention of a temporary wooden bar-room on the site of the King's Arms public-house, No. 18, Moreland-street, City-road, at less than the prescribed distance from the centre of Cross-street (Messrs. W. Ansell & Co.)—Refused.

**Formation of Streets.**

*Brixton.*—That an order be issued to Mr. A. E. Mullins sanctioning the formation or laying out of two new streets for carriage traffic to lead out of Coldharbour-lane and Vaughan-road, Brixton, respectively (for Mr. J. Pearman).—Consent.

*Woolwich.*—That an order be issued to Messrs. Logsdail & Beale refusing to sanction the formation or laying out of a street 40 ft. wide for carriage traffic to lead from Footscray-road to Southwood-road, New Eltham (for the executors of the late Mr. R. C. Davis).—Agreed.

**Buildings for the Supply of Electricity.**

*Southwark, West.*—A sub-station at Vine-yard, Marshalsea-road, Southwark (Mr. C. Thompson for the London and Brush Provincial Electric Lighting Company, Limited).—Consent.

**Cubical Extent.**

*Hackney, North.*—A factory-building in Tysser-street, Dalston-lane, Hackney, with one division to exceed in extent 250,000 cubic feet, and to be used only for the purpose of erecting a cabinet and joinery works (Mr. E. O. Sachs for the Shannon, Limited).—Refused.

**Dwelling-houses on Low-lying Land.**

*Woolwich.*—One hundred and six buildings in Marnadon-road, and eight buildings in Churchmanorway, Plumstead (such buildings to be used wholly or in part as dwelling-houses, and to be situated on low-lying land) (Mr. J. O. Cook for Mr. T. H. Driver).—Consent.

The recommendations marked † are contrary to the views of the Local Authorities.

**Books.**

*A Dictionary of Architecture and Building.* By RUSSELL STURGIS, A.M., Ph.D.; and other writers. In three volumes. Vol. II.: P—N. New York; The Macmillan Company: London; Macmillan & Co. 1901.

THE second volume of Mr. Russell Sturgis's "Dictionary" keeps up the promise of the first one, and moreover has been produced with commendable punctuality. It is too often the case that a dictionary hovers for years in progress; but the rate at which this "Dictionary" is appearing argues a very business-like method, and we may hope to have the complete work at no distant date.

The second volume includes the two very large subjects "Gothic Architecture" and "Grecian Architecture" (we prefer the more usual form "Greek Architecture"), but the editor, who contributes the former article himself, has resisted the temptation to allow such articles to be expanded into a lengthy treatise, and has preserved the concise form proper to a dictionary of this kind. Mr. Sturgis rightly says that the essence of Gothic architecture is in the vaulting, and he illustrates the peculiar advantage of the employment of the independent vaulting-ribs on which the vaulting surfaces are built, in a rather unusual and very convincing manner, by instancing the case of the vaulting of an apsidal aisle on a semi-circular plan, and showing how impossible would be any satisfactory roofing of this by the mere intersection of round-arched vaulting surfaces, one of which, the radial vault, would necessarily be a kind of diminishing funnel; while by designing and building the ribs first the curves can be laid out so as to produce a symmetrical construction, and get over all the practical difficulties which the plan would otherwise present. The manner in which the structure of the vault gradually influenced and developed all the main characteristics of the architecture is succinctly but clearly described. As there is only one plan given with the article, it would have been preferable to give a more typical one than that of Noyon Cathedral, with its very short choir and apsidal transept ends—the latter no doubt a fine and picturesque feature, but unusual, and therefore not well chosen as a representative Gothic plan.

The article on Grecian architecture is by Mr. Allan Marquand. The up-to-date character of the article is shown by the author commencing with the consideration of the

prehistoric and Mycenaean age, which in fact hardly belong to Greek architecture in the purely architectural sense. The description of the Dorian and Ionian Greek style, or what we usually call Greek architecture, is satisfactory but a little too much pervaded by a desire to make points. It seems hardly necessary to trace the employment of a plinth to the necessity for a solid base to the Mycenaean brick buildings, still less to suggest that the regular coursing of stone in Greek architecture is a reminiscence of the Mycenaean brickwork. The desire of the Greeks for perfection of execution would be quite enough to account for this careful sizing and laying out of the masonry. No plan of a temple is given, and while some profiles of mouldings are given, there is no special mention of the frequent use of conic section curves in profiling them, which is an important point. In regard to the more delicate and, in the case of the Parthenon, we may almost say cryptic curves made use of in the lines of the building and of the columns, the remark is made, and we think not without reason, that it is difficult to decide what was the motive for this, and whether or not it was, as Vitruvius thought, to correct optical illusions. If we were to take the Parthenon alone, we believe that that very refined example correction of optical defect was the object, but we cannot accept this explanation in reference to such an example as that of Corinth, where the bulge of the columns is prominently visible and is a feature in the design. Visible curves and what we may call cryptic curves in Greek architecture must probably be considered from a different point of view. Mr. Longfellow writes the succeeding article on "Grecian Roman Architecture." He is disposed to defend the Romans from modern criticism of their architecture as employing the Greek Orders in a false and illogical manner—at least he seems to see no harm in it. We consider the current criticism on Roman architecture as perfectly sound; it was a clumsy and false school compared with that of the Greeks; we agree that its scope was much wider and its achievements more various, but in a constructional rather than in an "intellectual" sense.

In the brief remarks on "Hagioscope" it is suggested that it "is not certain that they were originally intended" for the purpose of affording a view of the altar. Considering that they are always sighted towards the altar, there can hardly be any doubt about the purpose; what is doubtful (which is not referred to) is what persons or class of persons were specially intended to benefit by them. A very good article on "India" is supplied by Mr. A. D. F. Hamlin, longer than the average, but concise enough nevertheless; and a good one on "Iron Construction" by Mr. W. R. Hutton. The great subject of "Architecture of Italy" is divided into fourteen sections, some of them written by Mr. J. Safford Fiske, others by Mr. A. L. Frothingham, Jun.; by dividing the subject into short sections in this manner a very good and useful synopsis of the subject is obtained. Under "Metal Work" the editor gives a very short article for a subject of such varied interest, and the illustrations both of old and modern work are nearly all French—the modern ones by no means admirable, and the example of a bronze altar railing in Brunswick Cathedral is really a flagrant instance of metal being treated in masonic forms, a mistake also made in the balustrade of the new bridge at Paris. Such an article should have offered illustrations only of true and typical metal work.

Among other important articles are one on the architecture of Mexico, by Mr. Thornton F. Turner; on "Monastic Architecture" by the Editor; a brief and rather inadequate treatment of so great a subject, "Moorish Architecture," by the same contributor, also curiously short in comparison with the length of some articles on less important and interesting subjects; "Mosaic," by Mr. Crowninshield; and "Mural Painting" by the Editor.

We shall hope before long to see the final volume of the dictionary.

*The Works on Architecture of Robert and James Adam.* Reprinted and published by A. Thézard fils.

THIS is the fourth book of M. Thézard's facsimile re-issue of "Works in Architecture." It includes the section of the Edinburgh Registry Office, the design for a screen to Carlton House, two, or three fine drawings of decorative detail for that now extinct mansion, two

admirable designs for chimney-pieces, and some other fine decorative work, including an interesting design for a harpsichord. In regard to the execution of the plates, and the whole make-up of the book in regard to paper, type, &c., we have already expressed the highest commendation.

*Gillow's: Its History and Associations.* London: Harrison & Sons. 1901.

ALTHOUGH this thin but handsome quarto, which appears without any author's name, may be presumed to be in reality a kind of superior form of advertisement, it contains enough matter of general interest to claim notice as a book. The fact of one firm having been occupied in the same class of work for two centuries, with constantly increasing prosperity, is in itself one which the present representatives of the firm have a right to be proud of. The book gives the history of the house of Gillows, with notes on some of the celebrated people whose names appear as customers in their books. Amongst those mentioned are Warren Hastings, Clive, and Reginald Heber. It is not generally known that the original foundation of the firm was made in Lancaster, by Robert Gillow, a joiner at Great Singleton, who removed to Lancaster, started business there as a carpenter, and became a freeman of the city. Some entries from the old shop books are given; one in 1731, which includes—

To a Boofet making glew and nails to wood for the Boofet	... ..	£2 0 0
To making mahogany dining table and oak wood linings and screws	... ..	0 12 6

Prices have gone up since then. The commencement of the London establishment does not seem to have been earlier than about 1765, when premises were erected on the present site, now part of Oxford-street, then called by the name of "Tyburn Lane," of unhappy association. The furniture for the London house was made at Lancaster, and sent to London by sea, the voyage taking from ten to fourteen days. The members of the family who went up from time to time to look after the business, rode from Lancaster to London, attended by an escort on account of the dangerous state of the roads. The journey occupied fourteen days. This reminds one of Frank Osbaldistone's ride in "Rob Roy." Gillow's furniture, it may be observed, is still made in Lancaster, where they have a large factory.

Gillow's made many pieces of furniture from original designs by Adam, Sheraton, and others of the old English furniture designers, whose drawings are still in their possession. Among the stories related is that of a nobleman who asked the price of a table to which he had taken a fancy, and being told it was 80*l.*, replied "That is a devil of a price," to which the then Mr. Gillow replied, "But, my lord, it is a devil of a table."

If Messrs. Gillows wish to retain their hereditary position, however, there is one move which they will probably have to make, to keep with the times, viz., to go to first-class artists for designs, and to give names and the individual credit to the designers. Hitherto, if we are not mistaken, they have gone upon the old system of putting out furniture as the design of the firm and not of individual artists; a system which, for the highest class of work, is doomed.

*A Price Book for Architects and Engineers.* By T. E. COLEMAN, F.S.I. London: E. & F. N. Spon, Limited, 125, Strand, 1901.

THIS handy volume is really an extended edition of the same author's "Price Book for Approximate Estimates," and we think he would have been well advised if he had retained this title. The very nature of the work is such that the prices cannot be considered anything but approximate. This same remark applies in a greater or lesser degree to all price books; but in this case, where the items are generally of a somewhat comprehensive nature, it applies rather in a greater than a lesser degree. In spite of this fact this little work is one of the most useful that have been issued for some time.

The author commences with a very complete chapter on "The Preparation of Estimates," giving the various proportions of the value of the labour and material in the various trades, and also the average proportion of each trade to the total cost of the building with a comprehensive wage table and some

very pertinent remarks as to the rise in the cost of building during the past few years.

We are glad to see in his notes on the preparation of approximate estimates that the author advocates the use of "rough quantities" rather than those very delusive methods of "cubing," "per square," and "per unit." The delusive nature of these latter methods, except in exceptional cases, will be fully appreciated by those having experience in the preparation of preliminary estimates. We should prefer to see a still further extension of the system, e.g., instead of including the doors and windows in the price per foot saper of the walls they might be taken separately. With very little extra work, these could be numbered, and an "extra cost" of each added; similarly with roof trusses instead of including them with the price per square of the roofing. We dwell more on this portion of the work than we otherwise should, as it is in the preparation of approximate estimates that this work will more particularly apply.

The prices given both under the heading of "Average Cost" and that of "Actual Cost" are of a very miscellaneous and diverse nature, both in substance and form, as, mixed up with "Railways per Mile," "Canal Locks, complete, each," and "Town Halls, per foot Cube," we get "Limewhiting, one and two Coats," and "Architrave Mouldings," 2 in. by 1½ in., 2 in. by 1½ in., 3 in. by 1½ in., and 3 in. by 1½ in., a such items as chimney-pieces, tilany desks, and pulpits might certainly be left out altogether, as there can be no standard of price for these. There are, however, many useful priced items throughout the book, and the prices generally are reliable and appear to be the result of experience. We really cannot see the value of such an item as No. 660, "Extra for Bays and Chimney-flues, each;" as certainly the size and character is a factor to be reckoned with. This appears to have been ignored by the author.

There is an interesting collection of "actual cost" prices at the end of the book. We say "interesting" advisedly, as without further particulars, date, &c., a good many of them would not be of much practical value—e.g., the cost of roofing Charing Cross and Cannon-street stations would hardly apply at the present day. With the date of erection given, it might be possible to arrive at a percentage of variation. A few more examples of leading items, such as "Drainage" would be useful, but we suppose the difficulty of obtaining this information must be a valid excuse for the paucity of these.

Cross referencing, which to a limited extent is commendable, is carried in this work to an irritating extent; so that although the "Average Cost" section numbers 727 items, actually the number priced would not reach more than from 200 to 250.

The general get-up of the work is good, and it is the handy pocket size, for which Messrs. Spon are well known. It will be found useful, but generally more in the preparation of approximate estimates than for those of a more detailed nature. A work of this kind has not hitherto made its appearance, so that the one under notice will supply a want. With a little careful rearrangement and amplification it could be made even more useful.

*Transactions of the Society of Engineers for 1900.* Edited by PERRY F. NURSEY, Secretary. London: E. & F. N. Spon, Limited, 1901.

In addition to papers on mechanical engineering this volume contains a considerable amount of matter more particularly interesting to our readers. The presidential address by Mr. Henry O'Connor deals principally with recent improvements in the manufacture of coal-gas, special reference being made to the various processes of enriching coal-gas which are now so largely adopted. Mr. O'Connor falls foul of the "would-be clever people" who object to the use of carburetted water-gas for this purpose. "The one fact," he says, "which they have failed to grasp is that, while water-gas, *per se*, has no smell, carburetted water-gas has, if possible, a stronger and more penetrating smell than coal-gas." He admits that carburetted water-gas contains more of the dangerous carbon monoxide, but does not think it likely that this "will cause any greater number of accidents through escapes." He does not speak of acetylene gas with much enthusiasm, for two reasons,

the high price of carbide of calcium and the dangerous nature of the gas itself. A point in its favour is the great simplicity of manufacturing it on a small scale. As a gas engineer he speaks highly of the Welsbach incandescence light, and considers that it "has done more for the extension and retention of gas lighting than any other invention of the last twenty years," although further improvement is necessary, as the mantles are still too fragile. The paper by Mr. R. F. Grantham, on "The Closing of Breaches in Sea and River Embankments," deals with the methods adopted by the author in closing some of the breaches in the sea and river walls of Essex and Kent, caused by the disastrous inundation of November 27, 1897, and also passes in review some earlier cases, including Captain Perry's work at Dagenham in 1717-1719. The methods adopted by the author at Northey Island, Essex, and at Iwade, near Sittingbourne, Kent, are fully described. In each case Mr. Grantham formed an "inset wall" on the landward side of the breach, instead of attempting to connect the broken ends of the embankment by a new straight wall. The walls were in the main constructed with bags of clay and ballast kept down by stakes, and were about 3 ft. or 4 ft. wide at the top, with slopes of 1 in 2. The great Maidstone epidemic crops up again in the next paper, which deals with the methods adopted by Dr. G. Sims Woodhead and Mr. W. J. Ware for disinfecting the water-mains of that town. Chloride of lime was the disinfectant used. "The Economical Disposal of Town Refuse," by Mr. B. D. Healey, deals principally with the utilisation of the heated gases obtained by the cremation of refuse, and passes in review the most important types of furnace and boiler now in use. Mr. Henry C. H. Shenton is the author of a valuable paper on "Recent Practice in Sewage Disposal," written from the engineer's point of view; it is somewhat marred by a number of mis-statements, but as most of these were corrected in the discussion, they cannot do much harm. An index to the Transactions of the Society from 1857 to 1900 concludes the volume, which is altogether one of great interest.

*Land Area Tables.* Compiled by WILLIAM CODD. London: E. & F. N. Spon, 1901.

This is a small folding-chart for facilitating calculations in regard to areas of land. One table shows the acreage represented by any number of square inches on a map for five different scales. There is also a table of square yards reduced to acres, roods, and perches, and one of decimal fractions of an acre converted into roods and perches. The chart ought to be very useful in simplifying the calculation of areas of land.

*The Workmen's Compensation Acts, 1897 and 1900, with Notes.* By W. A. WILLIS, Barrister. Seventh Edition. London: Butterworth & Co. and Shaw & Co., 1901.

WHEN a book has reached a seventh edition the function of the critic may be regarded as pretty well concluded, and it becomes little more than necessary to note the publication of the new edition. The book contains legal propositions which are stated clearly and briefly. We will give one example:—"When the statute requires that the building shall exceed thirty feet in height, that limit must be actually reached at the time when the accident happens, and it is immaterial that the building is intended to, and will when finished, exceed the statutory limit."

*The Parish Churches of Northamptonshire: illustrated by Wills, temp. Henry VIII.* By the Rev. J. CHARLES COX LL.D., F.S.A. London: Harrison & Sons, 1901.

This is only a pamphlet, reprinted from the *Archæological Journal*, but it contains in a compressed form a good deal of valuable historical information. The idea has been to collect memoranda of bequests from wills of the period, made for the assistance of specified work on churches. This is of course most reliable evidence in regard to the fact of such work being in progress or in immediate contemplation. A curious bequest is one at Rushden (1533); after mention of a bequest to the "Hye Roode," there follows one to the "Grene Rode." The different spelling "Roode" and "Rode," in the same will, is of course only the characteristic carelessness of

the period in spelling. As to what the "Green Road" was the author has no suggestion to offer.

#### TRADE CATALOGUES.

THE New York and Franklin Air Compressor Company, of New York, send us a copy of their catalogue, relating to air compressors suitable for being actuated by steam, belt, gearing, electricity, water power, or any other source of power supply. The Company has recently commenced operations in new works at Franklin, Pennsylvania, designed, built, and equipped exclusively for the manufacture of air and gas compressing appliances. Part of the catalogue refers to the general designs and details of construction adopted by the firm, and mention is also made of the increasingly numerous adaptations of compressed air as a means of transmitting power.

The General Electric Company, of Queen Victoria-street, have sent us their revised catalogue of "Geeko" telephones. The great merit of these telephones is that they can be used in conjunction with existing electric bells. Their fitting up requires no special skill, and full instructions are issued with each complete set. The "sick-room" set, for establishing immediate communication between two compartments, ought to prove specially useful in cases of infectious illness, enabling the patient to call up the nurse or converse with friends. "Geeko" telephones are also made suitable for long-distance work, and they are much cheaper than the ordinary telephone sets.

The General Compressed Air House Cleaning Co. (St. Louis, U.S.A.) send us an illustrated pamphlet of their method of cleansing carpets and walls by compressed air, by which means also, as we gather from the illustrations, the dust is collected into a receptacle as blown out from the wall or carpet, and removed. It is claimed that carpets can be thoroughly cleansed by this means without removing them from the floor, and that one man with the apparatus can clean from eight to twelve rooms a day. This is no doubt a great saving of time and labour, but we think most English housekeepers would prefer the removal of the carpets from the floor. The compressed system may be useful for cleansing them when removed.

Messrs. Jonas Smith & Co., timber merchants, send us a catalogue of the timber in stock at their depots at Barking, Liverpool, Newcastle-on-Tyne, Hull, and Bristol, under date July 25.

HYDRAULIC AND OTHER TABLES FOR PURPOSES OF SEWERAGE AND WATER SUPPLY.—By Thomas Hennell, M.Inst.C.E. (E. & F. N. Spon.)

#### Correspondence.

To the Editor of THE BUILDER.

#### PORTLAND CEMENT TESTING.

SIR,—I should like to say a word or two with reference to the points raised by Mr. Reed in his letter.

I say in the article that with proper plant, &c., an office boy or labourer can do all that is necessary in testing. I say this advisedly, seeing that, with a very long experience of testing cement, the whole of my testing has been done by men of this class, and, as a rule, cement makers throughout the kingdom do the same thing in testing their cement, only very few of them keeping chemists for analytical work, which I do not consider as being part of the testing in the ordinary sense.

The tensile strain depends, as Mr. Reed suggests, upon the gauging entirely, and two men will make up briquettes of the same cement, and get very different results, and hence, as I said in the article, the Arnold system of gauging is altogether preferable to hand gauging, as with it the variation mentioned does not exist as long as due care is taken. In the hand gauging the question of whether a man is getting the maximum test from a cement appears not so much to depend upon whether he is a labourer as upon whether he has gauged long enough to have obtained the necessary experience and skill.

It has always been a wonder to me that cement users have not taken up the Arnold system more than they have done, seeing that, had they had the seven years' experience I had in gauging a large number of briquettes by the two systems side by side and with the same cement, I am certain they would think, as I do, that hand gauging is a system that should be given up.

With regard to the cooling of cement, I have not spoken of this in the article on testing for the fol-

lowing reasons—In my opinion, which is based upon long experience, if the raw materials are thoroughly ground and amalgamated in their proper proportion, the resulting mixture properly burnt and thoroughly ground so as to contain its proper percentage of flour, no cooling is necessary with ordinary English cement, although I would advocate the laying of cement down for two or three months as strongly as anyone, not because the cement ought to need it, but as a safeguard against possible shortcoming in one or the other of these three things. Even in the hot weather, when, as a rule, there is more chance of trouble with cement, if these three conditions are carried out, there is no absolute need for long storage, and, further, if the cement is tested as soon as received systematically, it will most certainly show whether such cooling is necessary or not.

THE WRITER OF THE ARTICLE.

SIR,—As sole local concessionaire of the National Opalite Glazed Brick and Tile Syndicate, I use Portland cement, also Robinson's No. 1 fireproof cement for filling Opalite. Can you or any correspondent tell me how and at what cost I can get a sample of Portland cement here in Birmingham or time does not admit of personally attempting such investigations. Doubtless many of your readers, who are interested in the prevention of loss through cement swelling after time has elapsed, would be glad of similar information.

I sincerely wish there were facilities in this forward city for a trader or operative to learn all about the chemistry of cements at small expenditure of time and money.

CHARLES A. LINE.

Birmingham, July 29.

\*.\* Has not the Midland Institute a department of Technical Chemistry?—ED.

TILE GLAZING.

SIR,—We have been asked by a correspondent abroad whether there exists any kind of glaze which can be applied in a dissolved state to wain-scotting and fire-place tiles made of cement and sand, the glaze being transparent and unaffected by hot or cold water.

If any of your readers should know of a preparation of this kind, we would feel greatly indebted for any information on the subject.

WM. REID & CO.

TRADE UNIONISM OR OFFICIAL TYRANNY.

SIR,—I hope you will give me space to bring to the notice of your readers the case of twenty-eight members of the National Association of Plasterers who worked at the Earl's Court Exhibition previous to its opening. They were asked to work two hours extra each day for two weeks from the opening, and were ready to agree to all rules of the National Association of Plasterers re working overtime. Permission was asked from the District Committee to work two hours extra each day, but we were told the Committee did not meet for thirteen days, and we could get no answer till then. The Exhibition Company, not feeling inclined to postpone the opening, decided to canvass and whitewash the ceilings and walls, as the plasterers could not finish in time for opening day.

The plasterers working there, seeing this, decided to work, and informed their District Committee of their intention to do so. The reply of the District Committee was that each member was fined 5s. This was appealed against to the Arbitration Committee, who, to their everlasting credit, heard both sides of the question and reversed the decision of the District Committee. The District Committee appealed to the Executive Committee, who decided to reverse the decision of the Arbitration Committee.

I will leave it to your readers to say whether it is in accordance with common fairness for a committee, who have heard both sides of a question, to be overruled by those who have only heard one side, and that their own; and is it reasonable to think that work is going to be stopped until a committee of plasterers think fit to meet and decide whether London shall move or stand still?

COMMON-SENSE.

WOOD PAVING.—The new pavement of Water-wood Road, Paddington has just been completed. It was finished under seven weeks, the area being 5,220 superficial yards, 246,000 5-in. Jarrah blocks being used, supplied by the Acme Wood Flooring Company at 12s. 17s. 5d. per 1,000. The roadway in question being an old granite road, it had to be broken up for a depth of nearly 15 in., the excavation carted away, and 6 in. to 8 in. of concrete foundation laid for the reception of the blocks, which were driven up quite tightly every sixth course; then two coats of hot tar and pitch were poured over the wood and well rubbed into the joints with squeegees; afterwards a wash of Portland cement grouting was well rubbed in to fill up all interstices, and the roadway was then finished off with fine Thames shingle.

The Student's Column.

GAS AND GAS FITTINGS.

5.—WATER-GAS; CARBURETTED WATER-GAS; PRODUCER-GAS.

**W**ATER-GAS is produced by passing steam through incandescent coke. The oxygen of the water vapour unites with the carbon of the coke to form the inflammable gas, carbon monoxide, while the hydrogen of the water vapour is left in an uncombined condition. Water-gas therefore consists essentially of a mixture of the two inflammable gases, carbon monoxide and hydrogen; it contains other gases in small quantities, but the whole of these should never amount to 10 per cent. of the total volume of the gas.

Water-gas has no odour, and burns with a non-luminous flame, while its heating power is about one-half that of coal-gas. It is sometimes called "blue water-gas" to distinguish it from carburetted water-gas which burns with a bright luminous flame instead of with the blue non-luminous flame of plain water-gas. Water-gas is more poisonous than coal-gas because it contains a larger proportion of carbon monoxide, the most poisonous constituent present in appreciable quantity in coal-gas. To diminish the danger attendant upon the use of a poisonous gas devoid of odour, the water-gas when used alone is usually impregnated with mercaptan or carbonylamine, very small quantities of which will give a penetrating odour to large volumes of the gas.

*Carburetted Water-Gas* is a mixture of water-gas with oil-gas. The water-gas is passed through the heated chamber in which the oil is decomposed, and the mixture of water-gas and oil-gas is then passed through a superheater to make the gas more permanent. Carburetted water-gas has an odour quite as penetrating as that of coal-gas, and burns with a luminous flame. Its heating and lighting value varies with the proportion of oil-gas it contains, but compared with coal-gas of equal illuminating power the heating value of carburetted water-gas is about 10 per cent. less than that of coal-gas.

*Producer-Gas*, sometimes called "fuel-gas," is produced by passing a current of air, or of air and steam, through incandescent coke or other carbonaceous matter. About one half of the total volume of the gas is non-combustible nitrogen, while the other half consists mainly of carbon monoxide and hydrogen. The gas has so low a combustible power that in some cases, where the nitrogen exceeds 60 per cent., it is necessary to use the gas in a hot condition as it comes from the producer to prevent the gas from becoming incombustible. Some of the better class producer-gases, such as Mond gas, can be used whether hot or cold, but they are all of very low heating value. In most cases the producer-gas has a heating value of about one-half that of water-gas, or one-fourth that of ordinary coal-gas. Producer-gas is largely used for industrial purposes, because it can be made very cheaply and from almost any description of carbonaceous matter. Dowson gas, Siemens gas, Wilson gas, and Mond gas must all be classed as producer-gases. A great number of producers have been devised both in this country and abroad, but the gases produced always consist mainly of a mixture of carbon monoxide and hydrogen largely diluted with atmospheric nitrogen.

Water-Gas Manufacture.

"European" Process.—Water-gas is made by heating a bed of coke to incandescence with the aid of a blast of air, then cutting off the air and sending a current of steam through the heated coke. The products of combustion obtained when the coke is subjected to the air blast are not allowed to mix with the gas produced by the action of the steam on the coke. Producer-gas is the term given to the products of combustion obtained when the air is in use, and in the "European" process the producer-gas formed can be used for heating the oil for carburetting the water-gas or for other purposes. The producer-gas contains sufficient carbon-monoxide to render it, while hot, capable of combustion with the evolution of heat. While the steam is passing through the coke, the coke is rapidly cooling down, and it soon becomes necessary to stop the flow of steam and again raise the temperature of the coke with the aid of the air-blast. By the old method of working the European process the

"blow" was in operation for nearly ten minutes, and the steam for four or five minutes, but it has since been found possible to shorten the time of the blow considerably.

"Dellwik-Fleischer" Process.—In 1896 Mr. Carl Dellwik introduced the method of making water-gas now known as the "Dellwik-Fleischer" process. In this process the coke is heated to the temperature necessary for the manufacture of water-gas in a much shorter time than by the older process. The bed of coke is made less deep and is maintained at a constant level, and a more powerful air blast being used ensures that air is always present in excess. The result is that carbon dioxide instead of carbon monoxide is formed in the producer. Also by passing the steam alternately first from the bottom upwards and then from the top downwards through the heated coke the temperature throughout the bed is equalised, and the brick lining of the generator is not worn away more rapidly at one point than at another. Carbon monoxide is first produced as in the older "European" process, but owing to the larger ratio of air to coke in the Dellwik producer this carbon monoxide is immediately oxidised to carbon dioxide. Now, 1 lb. of carbon when burned to carbon monoxide evolves 4,350 British thermal units, while the same quantity of carbon when burned to carbon dioxide evolves 14,500 B.T.U. The coke in the producer is therefore raised to the necessary temperature more quickly when the coke is converted into carbon dioxide instead of into carbon monoxide. Working on this system the time occupied by the "blow" has been reduced to less than two minutes, and the time during which water-gas is made has been prolonged to ten minutes, and over 70,000 cubic feet of water-gas can be made per ton of coke in place of the 34,000 cubic feet made by the "European" process.

On the other hand, owing to carbon dioxide instead of carbon monoxide being formed, the producer gas from the Dellwik plant is not combustible, and cannot, therefore, be used for heating the oil used for carburetting the gas when an illuminating gas has to be manufactured. The value of the combustible producer-gas does not, however, approach that of the additional yield of water-gas obtained with the Dellwik plant.

The specific gravity of Dellwik water-gas has been found by Professor Lewes to be 0.5365, and the composition of the gases obtained by the two processes to be as follows:—

	"European" Process.		"Dellwik-Fleischer" Process.	
	Inflammable Producer Gas.	Water Gas.	Non-inflammable producer Gas.	Water Gas.
Hydrogen .....	2.88	51.54	—	51.76
Carbon monoxide ..	39.33	39.98	1.40	38.58
Carbon dioxide ..	4.75	5.61	18.35	4.73
Oxygen .....	—	—	1.20	0.81
Nitrogen .....	63.64	2.87	79.05	4.12
	100.00	100.00	100.00	100.00

The following analysis of Dellwik water-gas, showing the small quantities of hydrocarbons commonly present, has been published by Professor Lunge:—

	Dellwik Water-gas.
Hydrogen .....	50.80
Methane .....	.82
Ethylene .....	.05
Carbon monoxide ..	39.65
Carbon dioxide ..	4.65
Oxygen .....	.20
Nitrogen .....	3.83
	100.00

The accompanying drawings (figs. 10 and 11) show a Dellwik-Fleischer water-gas plant in vertical section and plan. The gas-producing capacity of plant of the dimensions here shown is 40,000 cubic feet per hour.

*Carburetted Water Gas Manufacture*.—The apparatus most commonly used in this country for the manufacture of carburetted water-gas is a modification of the Lowe plant so extensively used in the United States. The plant consists of three main parts, the generator, the carburettor, and the superheater (fig. 12); and as the gas is made by an intermittent system, the sets are usually erected in duplicate.

Fig. 10.—Section.

The Deltwik-Fleischer Water-Gas Plant.

Fig. 11.—Plan.

Fig. 12.—Lowe Carburetted Water-Gas Plant.

In the generator, plain water-gas is made in the manner previously described. The carburettor is a chamber of about the same height as the generator, say, 18 ft. in height, and 10 ft. in diameter, and is packed with small fire-bricks arranged in chequer form. The hot producer-gas from the generator is led into the upper part of the carburettor, where it meets with a blast of air and is partially consumed, the heat evolved by the combustion serving to heat the bricks in the carburettor. The products of combustion, together with the gas not yet consumed, pass into the superheater, which is a chamber about 6 ft. higher than the carburettor and is likewise packed with bricks. In the superheater the gases meet with another blast of air, the combustion is completed, and the temperature of the bricks is thereby raised. The products of combustion escape into the open air through a shaft. The generator, carburettor, and superheater having been raised to the required temperature, the supply of air is cut off and steam is admitted to the generator. Water-gas is immediately produced and passes to the carburettor, where it meets with heated oil which is being pumped in at the top of the carburettor, and which is dispersed in the form of spray. In the carburettor the oil is converted into gas, and mixes with the water-gas, which carries it forward to the superheater. The mixture of oil-gas and water-gas leaving the carburettor is not of a permanent character, the rich hydrocarbons being liable to partially condense and to separate from the water-gas as the temperature of the mixture decreases. By passing the mixture through

the superheater the hydrocarbons are still further decomposed, and a carburetted water-gas is produced which is more stable under ordinary atmospheric conditions than coal-gas. The gas is subsequently purified by a series of operations very similar to those employed for the purification of coal-gas, but as the gas contains very little ammonia or bisulphide of carbon it does not urgently require purifying from these impurities. The tar obtained in the manufacture of carburetted water-gas frequently contains 50 to 60 per cent. of water, or more, and this must be removed before the tar can be distilled.

According to Butterfield, the composition of carburetted water-gas of 26 c.p. (sp. gr. 0.02) made by this process is approximately:—

Hydrogen .....	34.0 per cent.
Methane .....	15.0 "
Hydrocarbons absorbable	12.5 "
by fuming sulphuric acid	33.0 "
Carbon monoxide.....	0.5 to 5.0 "
Nitrogen .....	

The oil commonly used for carburetted water-gas manufacture is that known as "solar distillate," having a specific gravity of about 0.870, and a flashing point of about 170 deg. Fahr., but the oils which it is possible to use vary greatly in composition, gravity, and flashing point. In practice about 45 lbs. of coke and 34 gallons of oil are used for every 1,000 cubic feet of 22-candle gas produced.

Carburetted water-gas has been used in America since about 1898, its popularity there being due to the abundance and cheapness of petroleum. The first plant used in this

country was erected in London in 1891. By the end of the year 1900 carburetted water-gas plant had been erected in the United Kingdom by eighty-one companies or Local Authorities, the total gas-producing capacity of the plant being 134,370,000 cubic feet per day.

From time to time objections have been raised to the public supply of carburetted water-gas, and in 1899 a Departmental Committee was appointed to inquire into the use of water-gas and other gases containing a large proportion of carbon monoxide. After hearing many experts, the Committee recommended that when water-gas is supplied a maximum limit for carbon monoxide should be fixed; that where such limit is fixed some person should be appointed to test for carbon monoxide; and that, before any kind of water-gas is distributed in any place, due notice should be required to be given.

The recommendations of this Committee have apparently been completely ignored by Parliament and the Government Departments up to the present time, while the desirability of introducing a statutory calorific standard has not yet been discussed by Local Authorities or by Parliament, although Professor Lewes in his Report to the Birkenhead Corporation (1897) and Dr. Harold Colman, of the Birmingham Gasworks, have both shown that carburetted water-gas has a lower heating value than coal-gas of equal illuminating power. The answer to the question as to whether the use of carburetted water-gas should be allowed should depend mainly upon the relative prices likely to be charged for coal-gas and carburetted water-gas, and the terms of the contract made. If a standard price has been fixed for 16-candle coal-gas, an article of less value is being obtained if 16-candle carburetted water-gas is being supplied, and, therefore, the standard price should be slightly lowered.

NORWEGIAN TIMBER TRADE.

It is notorious that the United Kingdom is Norway's largest customer, and this is particularly the case in regard to timber and timber goods, the annual value of the export of which to this country is more than 2,000,000l. The details of this trade for the year 1900 are now accessible, and reports upon them have been received from the Hon. Charles Dundas, British Consul-General, and the Vice-Consul at Fredrikstad and other ports concerned in the business. From these various documents it is to be gathered that the past year gave the Norwegian timber exporters very good profits, and also the workmen good wages and steady employment. The total quantity exported did not differ greatly from that of the two previous years, but prices throughout maintained an unusually high level. Towards the close of the year, however, a downward tendency appeared to be impending. The entire export amounted to 2,000,243 cubic metres in 1900, as against 1,955,029 cubic metres in 1899, thus:—

	1900	1899
	Cub. Metres.	Cub. Metres.
Planned timber .....	574,214	580,388
Sawn " .....	534,283	501,706
Heewn " .....	101,255	106,294

	1900	1899
	Cub. Metres.	Cub. Metres.
Round „	603,261	510,939
Staves, &c.	86,671	81,501
Laths	102,589	114,331

It will be observed that while planed and sawn timber decreased as regards the quantity exported, the opposite was the case in round timber. The United Kingdom took about double the quantity of all other countries put together. From Christiania and the export of sawn deals to the United Kingdom amounted to 237,087 cubic ft. Fredrickstad maintained its position as the centre of the Norwegian flooring trade, the quantity shipped from that place being over 55 per cent. of the whole of the Norwegian export. The total of flooring boards sent from this port was 315,722 cubic metres, of which 196,059 went to the United Kingdom. By the commencement of last year shippers had already sold a considerable proportion of their production for spring and summer shipment at a basis price of 9/ per nominal standard for the usual dimensions, 1 in. by 7 in. mixed white c.i.f. to cheap ports on the British west coast. They were, therefore, in no hurry to sell at the opening of the season, the result being that prices for floorings kept on hardening during the spring and summer months, especially for colonial stuff, for which there was a good demand. Owing largely to the scarcity of tonnage and the consequent rise in freights, prices for fresh sales rose during the autumn to 1/5s. and 10/., which prices, however, buyers but very reluctantly accepted, and then only in case of need. At that period, it should be explained, stocks were smaller than they had been for several years. On the whole the shippers did very well, although some of the sales gave poor results in consequence of having been made in advance without calculating on the considerable rise in freights. The available supplies for f. o. w. and summer shipment this year are considerably below the average, and, according to shippers' opinions, hardly exceed what buyers will need to fill their early requirements. As they have consequently been holding out for higher prices than buyers can afford to pay, comparatively few sales have been effected yet for early shipment. A few contracts are said to have been closed at about 9/ 10s. for mixed white c. i. f. to good ports on the west coast, and the price obtained for redwood boards may be put down at about 12/ c. i. f. to similar ports.

Reporting from the Skienfjord district (including Langsund, Balvig, Porsgrund, and Skieni), Mr. Franklin writes:—The timber trade of 1900, although good, has not given the profits generally believed to be the case. The highly-inflated first cost of logs, added to high wages and exorbitantly high freights, have necessarily resulted in smaller net proceeds to the exporters than one is led to imagine when judging from the high sale prices. At the present moment the demand is slack at reduced prices all round, and as the supply seems to be somewhat in excess of the demand, there is in consequence a weakness prevailing which does not augur well for 1901 business. But, of course, all will depend upon the turn things take in the United Kingdom and other large consuming countries in the immediate future. Very divergent views are expressed even by the well-informed as to the prospects ahead. The production and export of all kinds of wood goods from this district in 1900 has been larger than usual, but it is of interest to note that the stocks of planed goods for export from Norway on December 31, 1900, were about 8,500 standards less than on the same date 1899, and as much as 19,000 standards less than on the same date 1898, according to figures lately rendered by the Norwegian Planed Goods Association. No figures are available giving such information as to other kinds of wood goods. Skienfjord ranks fourth in the quantity of wood exported from Norway. It is on record that as far back as 1500 to 1600 Langsund—the outer part of Skienfjord—was the most important timber exporting port in Norway, several hundred cargoes being shipped yearly, the wood being brought down from Skien and other places far up country. But things are long since altered, each town in the fjord loading up its cargoes within its own precincts, principally from Porsgrund. The direct line from Skien up through Telmarken is one of the best, if not the best, canalised in Norway, whereby timber can pass in rafts at great distances. The loughs are so commodious that local passenger and goods steamers can pass also, thus creating a considerable traffic. In the latter part of 1899 a sharp rise made itself felt in the values of timber of all kinds for deliveries during 1900; this kept up until the autumn of 1900, when the downward tendency set in and things have not rallied since.

**WESLEYAN CHURCH, ERDINGTON, WARWICK.**—The foundation stones were laid recently of a new Wesleyan Church at Erdington. The new church will be built in front of the existing building, and will be of brick with stone dressings. The main front will be to the Station-road. The seating accommodation is for 650 persons. Provision is made in the design for a tower with spire, and also by the addition of transepts for additional accommodation. The architects are Messrs. Ewen Harper & Brother, of Birmingham, and the builder is Mr. Isaac Langley, of Tyburn. The cost is estimated at nearly 3,000.

**OBITUARY.**

**MR. LOPTHOUSE.**—We have to announce the death, at his residence, The Croft, Linthorpe, near Middlesbrough, in his fifty-sixth year, of Mr. Robert Lophouse, F.S.I. Mr. Lophouse, a native of Westleydale, was senior member of the firm of R. Lophouse & Sons, of Middlesbrough, in which town he established himself in practice as an architect and surveyor in or about 1875. Some five or six years ago he took his two sons—Mr. J. A. Lophouse and Mr. T. A. Lophouse—into partnership. Mr. Lophouse was a financial valuer under the Act to the Middlesbrough Town Council and an Ecclesiastical Surveyor for the Diocese of York. Of recent architectural works carried out by him and his firm we may mention the following:—A house at Linthorpe, illustrated in *The Builder*, November 25, 1899; premises in Middlesbrough for Messrs. Dickson & Benson, 1895-6; the Children's Hospital and Porter's Lodge, Broadlands, Linthorpe, for the Middlesbrough Board of Guardians, 1897-8; All Saints' Vicarage House, Middlesbrough, illustrated in our columns of July 10, 1897; the Overseers' Offices; the Conservative Club in Corporation-road; and the Offices of the *North Eastern Gazette*, Middlesbrough. Mr. Lophouse was a founder and for some time President of the Cleveland Naturalists' Club. As a member of the Yorkshire Archaeological Society, and skilled in the use of both brush and pencil, he prepared many drawings and views for the illustration of Canon Atkinson's "History of the Cleveland District." Mr. C. W. LEE.—We have to announce the death, at Hastings, on July 28, of Charles Williams Lee, F.S.I., formerly of the firm of Messrs. Lee Brothers & Pain, of London, architects and surveyors. Mr. Lee had a considerable practice as a rating surveyor and in compensation cases, and also laid out and supervised the development of several building estates in the neighbourhood of London. Mr. Lee had retired from the firm for some years prior to his decease.

**GENERAL BUILDING NEWS.**

**CHURCH, CULTS, N.B.**—The members of the Aberdeen U.F. Church Presbytery met at the vestry of the St. Paul's U.F. Church on the 15th ult. Mr. D. McMillan, architect, was present, and submitted to the presbytery the plans and specifications of the new U.F. Church to be erected at Cults. The building, Mr. McMillan said, was designed to accommodate 614 persons. The end gallery was not at present so large as it might be, but could be extended afterwards and at very little cost. The hall was suited for about 275 persons. There is also a work-room or ladies' room, besides accommodation for forty-five persons, and provision is made for an organ. It is expected the church will be lighted with electricity. The estimated cost of the building is 4,500.

**PRIMITIVE METHODIST SUNDAY SCHOOLS, CHESTERFIELD.**—The foundation-stones have just been laid of an extension of the Sunday School premises at the Holywell Cross Primitive Methodist Chapel, Chesterfield. The cost of erecting and furnishing the building will be about 1,000/, exclusive of the cost of the site. The architect is Mr. W. C. Jackson, of Chesterfield, and Mr. W. Forrest, of Chesterfield, is the builder.

**CHURCH, REDHILL.**—The foundation-stone of a new Presbyterian church was laid at Redhill recently. The design is by Mr. George Lethbridge. The accommodation will be at present 500, with 100 extra in a gallery, which is not at the moment being proceeded with. The pews in the transept and half-way back in the nave are arranged in circular form, with the pulpit at centre. The contract price is about 5,500/, and the contract is in the hands of Messrs. Willmott & Sons, of London and Hitchin.

**TRINITY CONGREGATIONAL CHURCH, LEEDS.**—The memorial-stone of Trinity Congregational Church, Leeds—the building now in course of erection at the junction of Hillary-place and Woodhouse-lane which is to take the place of the demolished East Parade Chapel—was laid on the 20th ult. The building, a Gothic structure, has been designed by Mr. G. F. Danby, of Leeds. The lecture-hall and classrooms will be ready for opening in the autumn, but it will probably be another year before the church itself, which will provide accommodation for about 800 worshippers, is completed. For the site between 8,000/ and 9,000/, has been paid; the buildings will cost about 15,000/.

**CHURCH, GOOLE.**—A church, dedicated to St. Paul, has been erected in the North Ward, Goole, and the completed portion—a nave and aisles—was consecrated on the 25th ult. The church will, when completed, hold 730 people, and will consist of nave and aisles, chancel, with north aisle; the south aisle is occupied by the organ-chamber and vestry accommodation. At the present time only the nave and aisles have been built. The style is Early Decorated, and the building is externally huilt of red brick, with red terra-cotta dressings to the windows and doors, the roofs being covered with red tiles. The windows in the aisles are of three lights, with simple tracery, the remaining windows being lancet lights. The arcades and chancel arch are of stone. A small temporary chancel has been formed for present use. The architects for the work

are Messrs. Brodrick, Lowther, & Walker, of Hull and Bridlington; the builders were Messrs. Jackson & Dimberline, of Goole; the terra-cotta being supplied by Mr. J. C. Edwards, of Raunton.

**UNITED METHODIST FREE CHURCH AND SCHOOLS, WESTCLIFF-ON-SEA.**—The design submitted (in a recent competition) by Messrs. George Baines & Reginald Palmer Baines, architects, Clement's Inn, Strand, W.C., for this church have been adopted by the committee, and the first portion of the scheme, including church, vestries, &c., is to be proceeded with at once.

**ST. CUTHBERT'S, WITHINGTON.**—Messrs. Telford Gunson & Son, architects of Manchester, write to say that they are the architects for the additions to this church, and not Mr. Goldie, as stated in our last. Messrs. Goldie were the original architects for the church, but are not carrying out the additions.

**SLATING WORK AT ASYLUM NEAR ABERDEEN.**—The Aberdeen City District Lunacy Board has accepted the offer of Messrs. Adam & Co., Aberdeen, to execute the slating work of the new asylum at Kingsseat, Newmachar, for about 2,500/. Mr. A. Marshall Mackenzie, A.R.S.A., Aberdeen, is architect.

**GUINNESS TRUST BUILDINGS IN FULHAM PALACE-ROAD.**—New buildings have been erected in Fulham Palace-road by the Guinness Trust. The buildings form the eighth group of workmen's dwellings erected by the Guinness Trust, and occupy a site at the Hammersmith end of Fulham Palace-road. The site has a frontage to Fulham Palace-road of 190 ft. and a depth of 330 ft., with a total superficial area, including the extension in the rear, of 79,250 ft. The buildings consist of four parallel blocks, and three smaller blocks are to be put up in the rear, divided into 364 tenements, all of the type known as associated—not self-contained. There are six floors. Hard-pressed red Leicester bricks have been used in the erection of the buildings, with dressings of artificial stone of a pale buff tint. The mansard roofs are covered with Portland-cement slates, and the dormer windows are faced with zinc. A bright appearance is given to the staircases and landings by the use of dados of white tiles. The floors throughout are of fireproof construction, the iron and concrete flooring of Messrs. Homan & Rogers being used, and Wright's fireproof partitions are adopted between the staircases, lavatories, &c. The paving of the staircases, landings, and yards is of granolithic material. The buildings, when completed, will contain 767 rooms, divided into 364 tenements, as follows:—69 one-room tenements, weekly rents, 2s. 6d. to 3s. 3d.; 191 two-room tenements, weekly rents, 4s. to 5s. 6d.; 100 three-room tenements, weekly rents, 5s. 3d. to 6s. 3d.; 104 four-room tenements, weekly rents, 6s. 3d. to 6s. 6d. These rents include chimney sweeping and the free use of venetian blinds, baths, clubroom, and hot-water supplies. All the rooms are fitted with venetian blinds. Each living room is supplied with a close range fitted with removable oven, a food cupboard with ventilating bricks, a coal bunker and dresser. The windows have special arrangements for ventilating when closed, and above the tenement doors are ventilating fanlights, so as to secure a thorough draught from the staircases and lobbies, all of which are lighted by windows opening directly into the streets and playgrounds between the several blocks. The bath-rooms, thirteen in number, are in the basement of the third and clubroom blocks, and each is fitted with a solid white glazed earthenware bath, supplied with hot and cold water. The baths are free to tenants at days and hours separately allotted for males and females. There is a clubroom. The room, which is supplied with newspapers, games, &c., will be open free to tenants every evening and for one hour in the morning. The urnroom is fitted with copper kettles, from which boiling water will be served at breakfast and tea times. Adjacent to the urnroom is the drying-room, for the purpose of drying tenants' clothes, if desired, at a very small charge. Next to the drying-room is the boiler-room, fitted with a horizontal independent boiler, which supplies heat to the drying-room and clubroom, and hot water to the baths and the permanent hot-water service taps. Beneath the clubroom is a coal store for the sale of coal to tenants at practically cost price. At the east end of the site a number of lock-up sheds for perambulators or cycles will be provided and let to tenants at a weekly rent of one penny. In each of the three areas is a shelter, provided with seats, and with clock, placed so as to be visible from most of the rooms overlooking the areas. Flowers and shrubs are arranged where possible in the areas, and garden seats at intervals. The buildings are illuminated by the electric light. The cost of the land and buildings erected and in course of construction is estimated at 75,000/, and the rents are adjusted to a scale that will, it is expected, after providing for depreciation, give a net return on the expenditure of 2 per cent. per annum. Over 100 applications have already been received for rooms in the completed blocks. The dwellings have been erected from the designs of Messrs. N. S. Joseph, Son, & Smithem, of Finsbury-pavement, the builder being Mr. H. L. Holloway, of Deptford. Mr. T. Bailey officiated as clerk of the works, and Mr. A. E. Ackerman as general foreman. The following contractors have been employed on the works:—

Foundations, Mr. H. J. Greenham; fireproof floors, Messrs. Homan & Rodgers; artificial stone, plastering, and grano work, Mr. J. Bickley; sanitary fittings, Messrs. Shanks & Co. and Farnley Iron Company; ranges, stoves, mantels, and iron railings, Messrs. Yates, Haywood, & Co.; tiling, Messrs. Wedgwood & Co.; hot-water work, Messrs. Rosser & Russell; zinc dormers, Messrs. Ewart & Co.; fireproof partitions, Connah-Wright Partition Syndicate; electric light wiring, Messrs. Russell & Russell; electric light fittings, General Electric Company; carving, Mr. Gilbert Seale; venetian blinds, Fuller's Manufacturing Company.

**NEW HOSPITAL, CONSTANTINOPLE.**—Mr. H. Percy Adams, of London, has been commissioned to design the new British Hospital at Constantinople. The buildings will be on a somewhat extensive scale, and stand on a site adjoining the Consulate. The existing prison and hospital buildings are to be taken down to make room for the new hospital.

#### SANITARY AND ENGINEERING NEWS.

**THE EAST LONDON WATERWORKS.**—Considerable progress has been made with the construction of two new reservoirs at Walthamstow, and the works were inspected on the 23rd ult. by the chairman and directors of the East London Water Company. The existing storage reservoirs are situated at Walthamstow, and are ten in number, having a total area of 310 acres, and a total capacity of 1,200,000,000 gallons. The two new reservoirs will, when completed, practically double this capacity, not so much by area as by depth. Their combined area will be about 180 acres, but as a result of their greater water depth will be about 1,200,000,000 gallons, thus bringing up the previous figures to just upon 500 acres area and 2,400,000,000 gallons capacity. The water supply for the existing reservoirs is taken from the River Lea just above Chingford pumping-station, where it passes either through the Chingford culverts at a high level or through the feeder canal at a low level. The quantity of water passing down the River Lea in one day in winter is often sufficient to provide the entire supply of the East London Water Company for forty days. The new reservoirs are placed on the marsh land between Ferry-lane and Chingford Mill. They are bounded on the west side by the River Lea navigation, and on the east by Higham-hill. Between the two reservoirs is a plot of land about 25 acres in extent, which site has been given by the Company to Tottenham for a recreation ground. As the new reservoirs interfere with the existing course of the River Lea and the feeder canal, it has been necessary to divert both the latter. The new cut for the river is very nearly 1½ mile in length, for the greater part of which the sides are formed of concrete walls faced with Kentish rag stone. In place of the old feeder a new aqueduct has been built, which starts at Chingford Mill with a width of 36 ft. It will take in the water from the river Lea, and will feed not only the new reservoirs but the old also. Owing to the difference in levels, however, for the last 13 ft. of the length the new reservoirs will have to be lifted by pumps. The width of the aqueduct is reduced to 20 ft. after passing the site of the proposed new pumping station, and it finally discharges into the High Maynard reservoir, which is one of the existing group. The 36-ft. aqueduct will convey 180 million gallons of water per day up to the intake of the new pumping station, where it is intended to pump 100 million gallons per day, when the river is in good flow, into one of the two new reservoirs. The remainder of the water will pass along the 20-ft. aqueduct as before described. The motive power for actuating the pumps will be at Chingford Mill, and will consist of two engines and dynamos combined, each of 250 horse-power. The reservoirs have been constructed by excavating the land and forming the soil thus removed into the surrounding embankment walls. The level of the bottom of the reservoirs varies in depth from 8 ft. to 12 ft. below the original surface of the land, and the embankments are raised so as to give a depth of about 30 ft. of water. The slopes of the embankments are 2 to 1 inside and 2½ to 1 outside the reservoirs. To render the reservoirs watertight, a puddle wall is enclosed within the embankments throughout. A trench was first excavated down to the London clay, which, in the deepest part, is about 60 ft. below the ordinary ground level. This trench is filled with puddle, which is well leaved into the existing clay, and is brought up to the top of the embankment. Consequently, the whole of the water in the reservoirs will be contained inside a puddle wall, the entire reservoir being watertight. The two reservoirs will be connected by a tunnel about 550 yards in length. There is also a short tunnel for discharging the water into the canals leading to the filter-beds, which are situated at Lea Bridge. The works are being carried out under the supervision of Mr. Bryan, the company's engineer, by Messrs. S. Pearson & Son, of Westminster, the contractors. The work of construction is being pushed on, and there is every reason to expect that in the spring of next year the reservoirs will be ready to store water for the summer's use. On account of the rapid increase of the population in the company's district it was decided some time ago to make a very large addition to the existing storage and to

that which will be completed in 1902. The company therefore introduced a Bill into Parliament in 1899 for the construction of 5,000,000,000 gallons additional storage, higher up the valley of the Lea. This Bill was rejected by Parliament; but an identical Bill was introduced in 1900, and was passed. The scheme, as sanctioned, involves the purchase of upwards of 1,000 acres of land on which to construct the reservoirs and other works, and the bulk of this land has already been acquired.

—Times.

#### MISCELLANEOUS.

**PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.**—Messrs. James Brooks & Son, 15, Wellington-street, have entered into partnership with Mr. G. H. Godsell, of Hereford, and the firm will henceforth bear the title of "James Brooks, Son, & Godsell." Mr. Brooks, for considerations of health, will to a great extent retire from active practice, but will continue to supervise the work of the office. Messrs. Esau, Nicol, & Goodman, architects, Birmingham, have removed their offices from 8, Newhall-street, to Colmore House, 21, Waterloo-street, Birmingham.

**ABERDEEN TOWN AND COUNTY HALL.**—At their annual meeting on July 25, the Aberdeen Town and Municipal Buildings Commissioners, in accordance with a report by Mr. William Kelly, architect, Aberdeen, resolved that the Corporation Town Hall should be redecorated and that the electric light should be introduced in place of gas.

**THE HOUSING PROBLEM, MANCHESTER.**—Mr. W. O. E. Meade-King, C.E., attended on the 23rd ult. at the Manchester Town Hall on behalf of the Local Government Board to hear evidence for or against the proposal of the Corporation to borrow £60,000 for the purpose of building houses at Blackley in place of those which have been or will be demolished by street improvements in the centre of the city. There was no opposition to the scheme in principle, but Mr. Tom Cook, architect, submitted that the houses proposed to be built should be placed east and west of the north and south streets, else be semi-detached, so that the sun's rays might have free access to the living-rooms during some portion of each day. The Deputy Town Clerk (Mr. Hudson) explained the scheme in detail. The Corporation, he said, were under obligations to provide house accommodation for the labouring class in place of the dwellings which had to be demolished because of the Rochdale-road, Fairfield-street, and Long Millgate improvements. In respect of the Rochdale-road improvement seventy-two houses had to be demolished, providing for 346 persons; in Fairfield-street the number of houses affected was fifty-nine, and of persons 210; and as to Long Millgate the number of houses was eighty-eight and persons 320. Altogether the number of houses taken down was 140, and of persons displaced 659. In order to make up for this demolition and removal, the Corporation proposed to erect upon their estate at Blackley 150 cottages, affording accommodation for 750 persons. At the same time they proposed to erect fifty-three houses accommodating 266 persons to meet demands arising from the operations of the Sanitary Acts. Access to the new houses would be gained by means of the electric trams and the Lancashire and Yorkshire Railway Company's new line. The rental of the houses taken down averaged 58.9d., and it was intended to give at Blackley better accommodation and a small garden for 58. 6d. a week. Under these circumstances the Corporation desired that they might be allowed to borrow the money for the longest period allowed by law—sixty years.

**NEW BUILDING BY-LAWS AT MIDDLESBROUGH.**—It was reported at a recent meeting of the Plans Committee of the Middlesbrough Corporation that a deputation had seen Mr. Grant Lawson, M.P., the Parliamentary Secretary of the Local Government Board, in his rooms at the House of Commons, with reference to the objections to the new building by-laws for Middlesbrough. Mr. Grant Lawson said that the only point that need be discussed was the question of paving back passages. The by-law required that all back passages not exceeding 12 ft. should have 6 in. of concrete foundation. Mr. Grant Lawson argued that there was no necessity for it in towns like Middlesbrough, and he gave them to understand that there was no chance, if they stood out for a concrete foundation in narrow back streets, of the new by-laws being sanctioned by the Local Government Board, and as they wanted them approved and in operation as soon as possible they gave way, and a few days afterwards the new by-laws obtained the consent of the Local Government Board. The changes in the by-laws had since been communicated to all the builders and architects in the town.—Councillor Baker wished to know how back passages were now to be made. The Deputy Town Clerk (Mr. Hudson) replied that there was no alteration of the old by-law save the omission of the six inches of concrete foundation. After further discussion, Councillor T. Baker moved that all plans sent in before the new by-laws received the approval of the Local Government Board be passed. This was seconded by Councillor Briggs, and carried.—*Yorkshire Herald.*

**COMMONS AND FOOTPATHS PRESERVATION SOCIETY.**—A meeting of the Executive Committee of

the Commons and Footpaths Preservation Society was held on Thursday, the 25th ult., at 1, Great College-street, Westminster, under the presidency of the chairman, the Rt. Hon. G. J. Shaw Lefevre. It was reported that the Society had received a number of objections to the enclosure of Stonehenge, and to the proposed diversion of the right of way running through the remains. Letters from Professor W. M. Flinders Petrie and others were readuring that steps should be taken to secure the protection of free public access to the stones, and opposing any alteration of the existing roadway. It was resolved to approach the local authorities on the subject, and to make full inquiries as to the effects of the enclosure and proposed alteration. It was stated that projected light railway schemes would injure various commons in the counties of Middlesex and Suffolk, and the Society decided to take such steps as might be necessary to protect the public rights involved. The secretary, Mr. L. W. Chubb, reported that the Society had assisted in securing the insertion of clauses for the preservation of common land, rights of way, or open spaces in the following among other Bills during the current session—London, Brighton, and South Coast Railway (various powers), Barrow-in-Furness Corporation, Leeds Corporation Water, Fournemouth Corporation, Christ's Hospital (London), Manchester Corporation, and the Corporation of Bedford. Exception was taken to the Portlandoed Beddgelert, and South Snowdon Railway Bill, which would, it was feared, seriously interfere with the amenities of the Snowdon district. It was stated that it is proposed to run an electric railway from Portmadoc to the foot of Llyn Gwynant, and in connection with the railway it is sought to claim the right of way over the Llyn Gwynant. There are two well-known lakes lying on the eastern slope of Snowdon. The overflow, which forms the river Glaslyn, would be conducted in pipes through the romantic ravine known as Cwm Dyll, and the water would be utilised at a large electric power station to be erected near the foot of the mountain. The promoters of the scheme to oppose this and several other Bills, unless satisfactory terms could be come to with the promoters. Grants were made towards the protection of an open space near Mithurst, and the regulation of Leagrave Common, Bedford. A provisional arrangement for the preservation of Goodwick Moor and Hill, Pembroke, was approved. Under the scheme a considerable portion of the commons will, it is hoped, be vested in the Parish Council, with the object of protecting them from further encroachments. It was reported that over fifty fresh cases of enclosure of common land and roadside waste, or obstruction of rights of way, had been referred to the Society for assistance during the past month, and that the committee were at present dealing with upwards of 100 cases, thirty-six different counties being affected.

**MEMORIAL TABLET IN CHURCH NEAR ABERDEEN.**—On the 24th ult. there was unveiled in Maryculter Parish Church a memorial tablet erected in memory of the late Rev. George Duncan, who was minister of the church from 1842 to 1897. The tablet was designed by Mr. Macgregor Chalmers, architect, Glasgow, and is formed of alabaster with glass mosaic centre, the picture in the latter representing Christ enthroned.

**BUILDING BY-LAWS, SOUTH SHIELDS.**—The building trade in South Shields is seriously hampered at present, owing to the delay in getting the new building by-laws, which came into operation early this year. Certain amendments to the by-laws were suggested by the Corporation, and the Local Government Board inserted various clauses, one of which was with reference to lateral space. It provided that such space should be 20 ft. between the staircase, or any building, and the wall of the back-yard. Conferences have taken place on several occasions, between the builders of the town and the Corporation, and the former contend that, given 10 ft. from the centre of the back lane to the staircase, they could continue erecting the class of houses most required by the people of South Shields. An effort will be made, understand, to amend the by-law, so that the 20 ft. lateral space should be taken as from the centre of the back street, for there is no building estate in South Shields laid out in accordance with this provision of the by-laws. The crisis is having a serious effect upon the labour market in the town, and building operations have come to almost a standstill.—"ELFIN" in the *Newcastle Chronicle*.

**BOW CHURCH AND THE CENTRAL LONDON RAILWAY.**—A claim for compensation for damage to Bow Church, Cheapside, done and apprehended from the construction of the Central London Railway came before the Common Serjeant and a special jury at Guildhall a few days ago. The jury having adjourned to view the church, it was announced on their return that the case had been settled for 1,000, and costs.

**THE NATIONAL MEMORIAL TO QUEEN VICTORIA.**—The following letter has been received from Lord Esher:—

H.M. Office of Works, Stores, July 12, 1901.  
Westminster, S.W., July 12, 1901.

Dear Sirs,—In further reply to your letter of May 7 last, forwarded by the resolution passed at a special general meeting of the Royal Institute of

British Architects, I now have the honour to inform you that in accordance with the desire of the meeting this resolution has been laid before the Executive Committee appointed by H.M. the King. I am instructed to say that the Committee see no reason to depart from their original decision, taken after careful and due deliberation.—I have the honour to remain your obedient servant,  
 ESHER,  
 The Secretaries.

Royal Institute of British Architects.  
 The resolution referred to, which urged upon the Executive Committee the desirability of inviting designs for the memorial from all British architects in open competition, was passed on April 29 at a special general meeting convened on the requisition of twelve subscribing members.—*Journal of the R.I.B.A.*

WHITE STONE LIME.—We have tested a sample of lime sent to us by Messrs. C. E. Hillman & Co., of Tunbridge Wells. It is a remarkably pure calcium oxide, there being but few traces of siliceous spicules or foreign matter present. It "slacks" vigorously, rapidly disintegrating, and the lumps break up quickly, enabling the sand as used for mortar to be readily incorporated. Practically none of the sample sent has proved to be inert. This lime, in mortar, sets firmly and hard. An experiment shows that two stock bricks joined together by this lime made into mortar with sharp builders' sand, and placed in the open for five weeks, could with difficulty be broken apart by repeated blows with a hammer. Some of the mortar still adhered to the bricks, and portions of the bricks themselves were broken, coming away with some mortar. Our opinion is that this is a first-class lime.

ST. MARY WOOLNOUTH.—We should have mentioned that the measured drawings of this church by Mr. A. C. Bossom, published in our issue of July 27, gained for the author the Royal Academy's first silver medal and books prize for measured drawings in December of last year.

BATTERSEA POLYTECHNIC INSTITUTION.—The Battersea Polytechnic are intending to extend their day technical courses for next session (commencing in September), to include a course suitable for lads entering the offices of architects, quantity surveyors, sanitary and municipal engineers. The course will be arranged to extend over two years, and will include the subjects required for the preliminary examination of the Royal Institute of British Architects, in addition to instructions in more distinctly technical subjects and workshop practice. The course will be intended for boys proposing to take the more professional and higher parts of the work as distinct from the existing artisan courses in building, which are intended to give lads some technical and practical training before entering builders' workshops.

### CAPITAL AND LABOUR.

BRICKLAYERS' STRIKE, HARTLEPOOL.—The bricklayers' strike at the Hartlepool, which has lasted twelve weeks, was settled on the 24th ult., at a meeting of the Teesside Master Builders' Association and the men. The men asked for a penny per hour advance, and have accepted a halfpenny, upon concessions in regard to rules being made on both sides.

### LEGAL.

#### ACTION BY A CARPENTER AND BRICK-LAYER FOR PERSONAL INJURIES.

The case of Holman v. Moore & Son came before Mr. Justice Kennedy and a special jury in the King's Bench Division on the 25th ult., an action brought by the plaintiff, George Holman, a carpenter and bricklayer, residing at Adlestone, against the defendants, Messrs. Moore & Sons, millers, of Adlestone, for compensation for personal injuries sustained through the negligent driving of a carman in the defendant's employ. The defendants admitted liability, and the only question for the jury was what amount of damages the plaintiff was entitled to.

It seemed that on September 28 last the plaintiff was returning home from work in the evening when the defendants' two-horse van, in order to get in front of another van, was driven on to the footpath, with the result that the plaintiff was forced against some railings and thrown down, one of the wheels passing over him and severely bruising and injuring him. The plaintiff had to keep to his bed for six weeks, and for several more weeks was unable to follow his occupation. The medical evidence was to the effect that the injury the plaintiff had suffered might be permanent.

In the result the jury awarded the plaintiff 140*l.* damages.

Judgment accordingly.

#### HEAVY CLAIM FOR DAMAGES AGAINST THE BRADFORD CORPORATION.

MR. JUSTICE JOYCE, in the Chancery Division on the 29th ult., concluded the hearing of the case of Ambler & Sons, Limited, v. the Bradford Corporation, an action in which the plaintiffs claimed an injunction restraining the defendants from obstructing the flow of water in the Bradford Beck and

from allowing out and in sluice-gates already erected by the defendants across the Beck to remain. The plaintiffs also claimed 33,794*l.* for damage caused to their premises on July 12, 1900, by the obstruction of the Beck on the part of the defendants. The defendants, by their defence, alleged contributory obstruction on the part of the plaintiffs by placing pipes across the Beck where covered by their buildings, and they further denied obstruction of the kind complained of, and set up that the damage caused was the result of a major. Sir Edward Clarke, K.C., Mr. Hughes, K.C., and Mr. Kenyon Parker, appeared for the plaintiffs; and Sir R. T. Reid, K.C., Mr. E. Tindal Atkinson, K.C., Mr. Younger, K.C., and Mr. Waugh for the defendant Corporation.

It appeared from the opening statement of Sir Edward Clarke that the question to be determined was whether the damage done to the plaintiffs' premises in July of last year was caused by the interference by the defendants with the Bradford Beck which passed under the plaintiffs' works and which, at the end of the year 1860, was as the plaintiffs alleged obstructed by the defendants in the erection of sluice gates across the Beck. The Bradford Beck rose at Thornton, came through the City-receiving tributaries on the way and eventually ran into the river Aire. In the year 1864 the plaintiffs purchased a piece of land of about 4,600 square yards in area which was occupied by an old warehouse, and the purchase carried with it the ownership of half the Beck. In 1869, upon a portion of the purchase, a mill was erected. In the year 1875 the plaintiffs purchased 3,808 square yards of land to the north of the previous purchase. The purchases were on both sides of the Beck and therefore included the Beck, and in 1876 buildings were erected over the Beck and the plans of these buildings were lodged with the Corporation. Mr. Ambler, the head of the plaintiff firm, was then Chairman of the Bradford Corporation. The plans were passed and the buildings were erected. In 1885 the plaintiffs purchased another 16,300 square yards of land and a strip that ran along the middle of the Beck, and so they became possessed of the whole of the Beck; and immediately after that purchase a building called the new warehouse was erected. In 1888 there were some exchanges of land between the defendants and the plaintiffs in a matter of arranging frontages. Before the end of the year 1890 the plaintiffs had placed across the Beck certain pipes for the purposes of their business, which was that of mohair and worsted spinners, and the defendants' case was that this formed an obstruction of the Beck, and reduced the sectional area of the Beck as it passed under the plaintiffs' premises. In 1895 the defendants gave notice to the plaintiffs to remove those pipes, but that notice was not complied with, the plaintiffs claiming to put the pipes there. In the year 1899 the defendants, at a distance of about 210 yards below the plaintiffs' premises, put across the Beck certain sluices—about 24 ft. below Lionel-street Bridge. These works were put in by the defendants in connection with electric lighting works which they were authorised to carry out by Act of Parliament. There was one sluice put across the Beck and two at the side close by the two sluices at the side supplying water to ponds in connection with Corporation works. On July 12, 1900, during a thunderstorm, the Beck, in which there was usually from 6 in. to 12 in. of water, was flooded. The water rose very rapidly. It rose over the top of Lionel-street Bridge, and flooded over the top of the sluice to the extent of 24 ft. The sluices held up the plants and pieces of wood which came down the Beck and the place was blocked. The water was thus headed back to the plaintiffs' premises and did damage to the extent of 33,000*l.*

Mr. R. E. Middleton, C.E., of Westminster, gave evidence for the plaintiffs to the effect that if the water had been going down the Beck on July 12, 1900, at the level it would have gone down had there been no sluices, the water would not have risen to the height of the pipes crossing the Beck beneath the plaintiffs' premises.

Other evidence having been given.

Sir Robert Reid, for the defendants, asked the learned Judge to hold that the damage to the plaintiffs' property was in no way the result of any action of the slaves.

Evidence having been given on behalf of the defendants by Mr. H. J. C. M. Inst. C.E., the City Surveyor of Bradford, and other witnesses, his lordship reserved judgment.

#### FIREPROOF CONSTRUCTION.

AT Southwark police-court on Saturday last, before Mr. Paul Taylor, a long-standing dispute as to the rebuilding of the Horseshoe beer-house, Old Kent-road, was finally settled.

Mr. Andrews appeared for the London County Council and Mr. Percy Gates was for the defendants, Mr. Hoskins, a builder, and the New Westminster Brewery Company, the owners of the premises.

Mr. Andrews stated that there was an appeal to Mr. Kennedy, some time ago, under Section 130 of the London Building Act, against a notice of objection, which had been served by the District Surveyor, Mr. Dicksee, at the request of the London County Council, to the rebuilding of the Horseshoe

beerhouse without fireproof separation between the lower part, which was to be used for trade, and the upper part, which was to be used as a dwelling. Mr. Kennedy allowed the appeal of the builder against the notice of objection, but agreed to state a case. In stating the case Mr. Kennedy found as a fact that the lower part of the premises was to be used for trade and the upper part for habitation. The Divisional Court comprising the Lord Chief Justice and Mr. Justice Lawrence, dismissed the appeal of the London County Council on the case stated, and the Council then took the matter to the Court of Appeal. The Court of Appeal held that as the magistrate had found as a fact that the lower part was to be used for trade purposes and the upper part as a dwelling-house, they were bound by that finding, and they therefore allowed the appeal of the Council. At the same time they intimated that if it had been open to them to find the facts they would have found them differently. In the meantime the district surveyor served a notice of irregularity on the builder, under Section 161, and had the decision of the Court of Appeal been entirely in the Council's favour on the merits, they would have been entitled to require compliance with the regulations as to fireproof separation. The notice was not complied with, and a summons was obtained so as to be within the statutory period of six months, but it was adjourned pending the result of the appeal. The appeal having now been decided, he (Mr. Andrews) was instructed to say that as the building was erected on the faith of Carritt v. Godson, which decided that fireproof separation did not apply to public-houses, the Council did not feel justified now in proceeding any further on that summons, and he therefore asked leave to withdraw it accordingly.

The Magistrate: Very well, let it be marked withdrawn.

The summons was then marked withdrawn.

### RECENT PATENTS:

#### ABSTRACTS OF PATENTED INVENTIONS.

6,085.—AUTOMATIC SPRINKLERS, ALARMS, &c.: F. Grinnell.—The object of the invention is to sound an alarm when the sprinklers are at work, but to prevent the alarm from being sounded by fluctuations in the supply pipe. Water is admitted through a valve (when lifted) in the supply pipe into another pipe, which is in communication with a container, whence a pipe extends to a diaphragm chamber so as to complete a circuit which will sound an electrical or other alarm, or the water may be caused to work a water-motor. In the case of a fluctuating flow of water through the valve in the supply pipe it will escape through an outlet, but when the working of the sprinklers will induce a continuous flow, the differential accumulation in the container operates a diaphragm which is joined with springs to a valve that hastens the sounding of the alarm and shuts the outlet. Various other modifications of the apparatus are specified.

6,008.—A LAVATORY BASIN: M. J. Adams.—A basin, rectangular on plan, is fastened with lugs to be built into the wall. The overflow is put on one side; on the other side is the inlet. The discharge pipe has apertures for purposes of cleaning, and for an overflow a hollow nylonite plug is adopted.

6,131.—METAL PLATES FOR BUILDERS' USE: Count von Golden-Egmond von Arden and Baroness I. Liebman.—To render the plate stiff in any direction its sides are bulged outwards; the bulges may have various cross sections, and are disposed, if desired, in symmetrical patterns.

6,142.—A CIRCULAR-SAW GUARD: C. T. Burgess and W. B. Burgess.—The guard is supported by a bar which is set parallel to the sabb of the saw and is held up with a bracket fixed at the back of the bench and with an arm secured to the back of the bar; a bar is pivoted a plate (made in two parts) which serves as a shield for the back of the saw and also a casting, in the guide way of which a front shielding plate is adjustably mounted; to the latter plate, and also to sustaining links, are pivoted other plates, which shield the sides of the saw. By another arrangement the plate which shields the back of the saw is rendered applicable for differently sized saws by being mounted on a pivot on the casting and being clamped with a slotted stay.

6,188.—CONDUITS FOR CONDUCTORS (ELECTRICAL): J. B. Bouillier and W. B. Hunter.—Metal tubes have a lining of asbestos, which is fitted in a spiral shape by being rolled upon a rather smaller mandrel that is turned so as to expand the spiral in position, where it may be secured with cement, inside the tube.

6,189.—A PIPE-WRENCH: O. Olsson.—A grip is provided by means of a fixed jaw upon the handle of the wrench and a movable jaw upon a stem pivoted to a piece and forced with a spring towards the fixed jaw. The head of a screw which adjusts the piece upon the handle will engage with a notch in the handle and its middle pin will enter a hole under the fixed jaw.

6,200.—SPIGOT AND SOCKET PIPE-JOINTS: A. A. Knudson.—The joints and electrical bonds of street pipes and mains are devised to obviate the shunting of currents around the joints. In the case of a leaded spigot-and-socket joint a leaden packing

encloses the metal contacts which are separated from the jute packing, whilst each of them has a circular metal, or a coiled wire, washer. For the rivet contact may be substituted a screwed plug having a wire washer, or a single piece retained with a channel pin, or a metal plug only.

6,222.—APPARATUS FOR LIFTS AND HOISTS: *Parker & Ayer Co.*—Air is supplied under pressure to the opposite ends of a pneumatic cylinder, and a three-way cock is inserted in a pipe that joins the ends of the cylinder; if the cylinder ends are opened to one another and at the same time closed to exhaust, the piston will descend by reason of the greater pressure exerted upon the greater upper surface; in the case of the premature descent of the load (if air should leak past the cylinder) the end of a lever which is fastened on to a friction collar will lift and open a relief valve.

6,234.—WATER SUPPLY FOR DOMESTIC PURPOSES: *W. McCallum, J. Blakey, and C. R. Bartlett.*—The inventors provide means whereby the turning on of any hot-water tap shall light the heater and so afford a supply of hot water. A valve in a chamber of the gas-supply pipe prevents under normal conditions the gas from flowing to the discharge nozzle, mixer, and burner, its position being controlled by that of a leaky piston within the water chamber, which is connected with the water-supply pipe, whilst a tube conveys the water from the chamber around the heater coils to the hot-water taps, the piston and valve being rigidly connected with the process burner, its flexible diaphragm. When a hot-water tap is opened the pressure upon one side of the piston becomes lessened, whilst the pressure upon the other side presses back the piston and valve so as to open the gas supply, a by-pass from the chamber lighting the gas.

6,238.—MANUFACTURE OF WHITE CEMENT: *Terranova Industrie, C. A. Kappeler & W. Schlenning.*—As a modification of 1879, and in substitution of natural feldspar, are employed certain equivalent non-ferrous artificial elements, composed of acid silicates frittings and glass, of alkalis or alkaline earths, with silica and clay.

6,242 and 6,243.—APPARATUS FOR AUTOMATICALLY LOCKING THE WHEEL-DOORS OF LIFTS: *J. C. Eckhells.*—A weight that slides upon a rod closes from left to right a gate, after the "Bostwick" kind, and the gate is then locked with a spring which keeps in place pivoted bell-crank levers that are linked together. As the cage reaches the floor the lower ends of the levers are moved by a striker attached to the cage, and a spring-nose upon one of the levers is lowered for the unlocking of the gate. A catch keeps the opened gate in position, and as the cage is moved away the catch falls, whereupon the gate is shut, and a spring-nose upon the other lever locks it again.

6,244.—For a vertically sliding door a lever having hinged spring-noses is pivoted in a casing at the top of the door, the lower end being pressed inwards with a spring for locking the closed door. With the arrival of the cage one of the noses becomes disengaged through the forcing upwards of a lever, whilst the other nose is forced forward into engagement with the raised door.

6,245.—For well doors after the portcullis kind, the doors, each of which has an angle-iron frame, slide in continuous angle-iron guides in the shaft, and are joined with ropes so that the lower one descends as the upper one ascends. The upper door will overbalance the lower one, and the doors are therefore self-supporting.

6,251.—METAL TIE-BARS: *E. Schild and F. Lorey.*—For fastening beams to one another or to walls are devised slotted tie-bars or strips of metal, which may have their ends split or turned outwards at a right angle, the slots being sufficiently large to take cross-dowels (in the case of stonework) or slotted anchoring-bars, and bolts or cramps fasten the bars to the beams or woodwork. The contrivance is described as being applicable also for use with stone blocks, trussed girders, arches, temporary buildings, and so on.

6,255.—A WINDOW FASTENER: *J. R. Charlesworth.*—To the top meeting-rail of the lower sash is secured a sleeve in which will slide a bolt or catch of which the nose engages with a set of recesses cut in a rack-plate upon a side rail of the upper sash; the bolt is normally held in its working position with a spring, and has a knob for its handle.

6,295.—A VENTILATOR: *W. E. Aldous and F. D. Aldous.*—The ventilator, which is intended for houses, churches, factories, schools, sewers, and other structures, has openings for the entrance of fresh air in its upper part and a central passage down which the air flows for escape through a divided cone to an annular space within the shaft. The fresh and vitiated current of air become mingled in the space, and the vitiated air ascends through passages at the side of the shaft to escape beneath the hood or screen at the top of the shaft. Inlets are provided that will draw impure air to the ventilator from remote portions of the building.

6,318.—THE CONSTRUCTION OF ROOFS: *C. Loch.*—The inventor seeks means of discarding the use of intermediate internal columns and girders. He constructs each plane section of the roof framework of timber, concrete, or iron, strutted and braced as a girder so that it shall be

self-supporting. The steep sides of the roof are glazed and may be pivoted windows. For a sector-shaped or circular roof he strengthens the slopes with radial concrete beams or struts and curved horizontal iron rods, and fits the steep side with windows inside the line of pressure of the concave structure.

6,331.—AN APPLIANCE FOR FIRE-ESCAPES: *H. W. Racey.*—The lowering apparatus is provided with a brake that will control the rate of its descent. The suspending rope acts as an automatic brake when the person who is making his escape, which also presses a pulley, upon a radial arm, against the rope. A hand-wheel supplies additional brake-power.

6,338.—THE MOULDING OF BUILDING-SLABS, BLOCKS, PANELS, &c.: *F. E. von Hedemann and R. von Habelmann.*—For the manufacture of slabs, panels, blocks of plaster of Paris or concrete, and so on, is devised an apparatus consisting of a cruciform mould, in four sections, which is mounted upon a base-plate, the size of the cast slabs being altered at will by the insertion of loose end-pieces into the sections. Vertical iron plates moved with screwed shafts constitute the mould, in the centre of which is a base-plate carrying a tubular core; for casting separate slabs a four-sided core is placed around it; for casting chimney-tops and similar goods an annular mould is made, with two concentric tubes in the middle portion of the mould; and in the case of corner blocks the aperture made by the tubular core will afford space for carrying an iron strengthening-bar through the block.

6,343.—A CHIMNEY-TOP AND COWL: *H. Pollard, J. T. Pollard, and J. T. Pollard.*—Over the mouth of an up-take pipe is fitted a headpiece, which has side openings and is carried upon ball bearings on a bracket that will serve for air inlets. On to the bracket is cemented a bevelled channel-rod, which forms a ball race. In the socket of the headpiece overlapping the bracket is cemented another bevelled channel-rod. An oblique rod set in a screw-clamp carries a vane, and the settlement of soot upon the bearings is obviated by means of a flange inside the headpiece.

6,375.—AN ANTI-FOULING COMPOSITION: *R. Kopp.*—For coating metallic structures is prepared a film of coal oil, to which is applied without delay an anti-corrosive paint made up of equal parts of red lead, French zinc (oxide of zinc), and Portland cement mixed with oil and a dryer. For marine purposes arsenic is added to the paint, after which is applied an anti-barnacle coating compounded of equal parts of red lead, verdigris, zinc dust, French zinc, with oil and a dryer.

MEETINGS.

WEDNESDAY, AUGUST 7.

*Builders' Foremen and Clerks of Works Institution.*—Ordinary meeting of the members.

SOME RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

Table listing property sales with columns for date, location, and price. Includes entries for Bigham, Cumberland; Broomley Common, Kent; Chelsea; Dalston; Hammersmith; Kentish Town; Wandsworth; Tottenham; and Piccadilly.

Table listing property sales with columns for location, description, and price. Includes entries for Kensington; Navestock; Little Dunmow; Thakeham; Dukes' Rough; East and West Common Fields; Wagners and 1 a. 1 r. 20 p.; Pulborough; Kenish Town; Oxford-st.; Stoke Newington; Childingford; Tisbury; Houghton; Cammersdale; Higher Small Heath; Brierfield; Sage Hill Farm; Cliviger; Manor Park; Gray's Inn; Streatham; Pimlico; Kilburn; Bromley Common; Chelsea; Palmer's Green; Green Lanes; Enfield; Dalston; Hammersmith; Pimlico; Kentish Town; Wandsworth; Batters; Staveley Lanes; New Barnet; Station-rd.; City of London; Falcon Hotel; Acton; Rodwell, Dorset; Binchevaerd, &c.; and Binchevaerd, &c.

CONTRACTS AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, &c., Supplied by, and Tenders to be delivered. Lists various construction projects and their contractors.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, and Application to be in. Lists public positions and their details.

Those marked with an asterisk (\*) are advertised in this Number. Competitions, p. iv. Contracts, pp. iv. vi. viii. x. & xli. Public Appointments, pp. xix. & xli.

PRICES CURRENT (Continued).

Table of prices for wood, including items like Danzig and Steetin Oak Logs, Wainscot Oak Logs, and various types of flooring.

PRICES CURRENT (Continued).

Table of prices for wood and joists, including Prepared Flooring, Rolled Steel Joists, and various types of girders.

PRICES CURRENT (Continued).

Table of prices for metals, including Sheet Iron, Cast Iron Columns, and various types of bars and plates.

PRICES CURRENT (Continued).

Table of metal prices including Sheet Iron, Galvanized, flat, best quality, and various sizes of galvanized corrugated sheets.

Table of lead and brass prices, including Lead Sheet, English, 3 lbs. & up, and various sizes of brass sheet.

Table of plaster prices, including Coarse Plaster, Fine, and various types of finishing plaster.

Table of English sheet glass in crates, listing various sizes and thicknesses.

Table of oil prices, including Raw Linseed Oil in pipes and barrels, and Turpentine.

Table of varnish prices, including Fine Elastic Copal Varnish for outside work and various types of wood varnishes.

TO CORRESPONDENTS.

W. S.—J. S. M. (Amounts should be stated). J. B. R. (Below our limit). C. G. B. (Next week). NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the author.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

ADDESTONE.—For the erection of a new school to accommodate 300 boys for the Addestone School Extension Committee. Mr. Horace C. Fread, architect, Molesey, S.W.— J. W. Young... £2,870 0 0

BARKING (Essex).—For the erection of entrance lodge, tool-house, &c., at the recreation ground, Longbridge-road, for the Urban District Council. Mr. C. F. Dawson, Surveyor, Public Offices, Barking.— J. Chamberlain... £1,370 11 0

BERKHAMSTEAD.—For alterations and additions to the Bull for Benskin's Watford Brewery, Limited. Mr. Percival C. Blow, architect, St. Albans and Harpenden.— J. Smith... £302 15 1/2

BLACKBURN.—For extensions to electricity works, Jubilee-street, Blackburn.— Mr. A. S. Giles, engineer, John Knowles... £16,550 0 0

BURSLY.—For the erection of a cottage, Edgefields estate, Stockton-Brook, for Mr. Wm. Heath. Mr. W. H. Walley, architect, Queen-street, Burdum. Quantities by architect.— C. Frost... £790 11 0

COVENTRY.—For additions, &c., to Park Fields, Alseley, for Mr. J. Mayfield. Mr. F. Foster, architect, Hertford-street, Coventry. Quantities by architect.— J. Worwood... £1,767 0 0

DOVER.—For supplying and laying water-mains, Glenfield-road, &c., for the Town Council. Mr. H. E. Stilgoe, C.E., Town Hall, Dover.— H. H. Green... £701 13 9

EAST STONEHOUSE (Devon).—For the erection of lodge and lavatories, Victoria Park, for the Joint Committee of Plymouth, Devonport, and Stonehouse. Mr. A. W. Debnam, architect, Town Hall, East Stonehouse.— Wakeham... £1,624 0 0

GILLINGHAM (Kent).—For the supply of Cherbourg granite, Kentish ragstone, &c. (6,000 tons granite, 100 yards ragstone), for the Urban District Council of Gillingham (Kent). Mr. C. Candler, Surveyor.— S. Burford... 11 4

GLOUCESTER.—For the erection of four cottages, &c., at the docks, for Messrs. G. and W. E. Downing. Mr. W. B. Wood, architect, 12, Queen-street, Gloucester.— John Leat... £2,556 5 11

HARPENDEN.—For the erection of a pair of villas, West Common, Harpenden, for Mr. C. B. Dobson. Mr. Percival C. Blow, architect, St. Albans and Harpenden.— W. Sharps... £1,675 11 0

HASLEMERE (Surrey).—For alterations, &c., to the town hall, for the Parish Council. Mr. J. Howard, surveyor, Lower-street, Haslemere.— J. W. Eale... £450 12 8

HASLEMERE.—For building two bacteria beds at the sewage works, for the Hambleton Rural District Council. Mr. J. H. Howard, surveyor, Lower-street, Haslemere.— T. Wonnacott... £510 0 0

HULL.—For the erection of two houses, Withernsea, for Rev. Robert Harrison, Wilberforce-street, Hull. Mr. T. Becroft Atkinson, architect, 11, Trinity House-lane, Hull.— Building—W. H. Carr, Withernsea... £610 0 0

LLANTARNAM.—For Board school for girls, Cwmrtan, for the Llantarnam School Board. Messrs. B. Lawrence & Son, architects, Newport.— Mainwaring Bros... £4,455 0 0

LONDON.—For erecting a factory, Woodfield-road, Paddington, for Messrs. Fridly & Hale, Limited. Mr. Percival C. Blow, architect, St. Albans and Harpenden. Quantities by Mr. H. Riley, Victoria Mansions, S.W.— Lawrence & Sons... £8,554 0 0

LONDON.—For the new police station, Lee-road.— Credits— C. Ansell... £10,243 0 0

LONDON.—For additions to the Convent of Notre Dame, St. George's-road, Southwark. Mr. J. C. Radford, architect. Quantities by Mr. H. F. Williams.— Holloway Bros... £10,577 0 0

LONDON.—For decorative and sanitary repairs and electric-light installation, 38, Warwick-road, Earl's Court, S.W. Messrs. J. W. Morley & Co., surveyors, 185, Earl's Court-road, S.W.— Holdstock & Mould... £328 0 0

PONTYPOOL.—For additions, &c., to intermediate school, for the managers. Messrs. B. Lawrence & Son, architects, Newport, Mon.— L. R. Lucas... £1,083 0 0

RUSHDEN (Northants).—For the erection of workshops, stores, &c., Newton-road, for the Urban District Council. Mr. W. B. Madin, C.E., Vestry Hall, Rushden. Quantities by surveyor.— H. Sparrow... £910 0 0

ST. ALBANS.—For residence, Clarence, St. Albans. Mr. Percival C. Blow, architect, St. Albans and Harpenden.— J. Hunt... £1,744 0 0

ST. ALBANS.—For the erection of villa, Selby-ave, for Mr. Walter Lewis. Mr. Percival C. Blow, architect, St. Albans and Harpenden.— W. Coolefield... £434 0 0

STEVENAGE (Herts).—For the supply of granite road metal, for the Urban District Council.— Enderby & Stoney Stanton... 11 10

[See also next page.]

**LONDON SCHOOL BOARD TENDERS.**

At the last meeting of the London School Board, the Works Committee submitted the following lists of tenders. Mr. T. J. Bailey is the Board's Architect.—

*Exterior Painting.*

The exteriors of the following schools will be painted between September 23 and October 26, 1901.—

**BERNER-STREET:—**

Johnson & Co. .... £217 0	J. T. Robey ..... £268 10
Corfield & Co. .... 315 0	R. S. Buckridge ..... 254 0
Vigor & Co. .... 305 0	D. Gibb & Co. .... 249 0
A. W. Derby ..... 290 0	J. F. Holliday* ..... 235 0

**BRECKNOCK:—**

Balfour & Co. .... £430 3 4	Stevens Bros. .. £279 0 0
Wall & Co. .... 290 0 0	R. S. Buckridge 210 0 0
Marchant & Hirst ..... 282 0 0	Bristow & Eastwell* ..... 195 0 0

**BROMLEY HALL-ROAD:—**

Vigor & Co. .... £194 10	J. Haydon ..... £158 0
A. W. Derby ..... 192 0	J. F. Holliday ..... 154 10
D. Gibb & Co. .... 189 0	Corfield & Co.* ..... 148 0
J. T. Robey ..... 173 16	

**CRAMPTON-STREET:—**

Garrett & Son ..... £602	W. V. Goad ..... £473
Rice & Son ..... 512	W. Downs* ..... 449
Sayer & Son ..... 497	

**CREDON-ROAD:—**

H. Line ..... £209	Holliday & Green-wood, Ltd. .... £248
G. Britain ..... 206	H. J. Williams ..... 246
W. Downs ..... 270	Johnson & Co.* ..... 235
Garrett & Son ..... 249	

**DAUBENEY-ROAD:—**

C. Willmott ..... £190	Silk & Son ..... £183

### The London Sewage Problem.

THE third report by Dr. Clowes and Dr. Houston on the "Bacterial Treatment of Crude Sewage" has recently been published by the London County Council, and is a comprehensive "red-book" of seventy-eight pages, with four full-page plates and nine coloured diagrams. It contains much new matter in addition to summaries of the experiments previously recorded, and affords food for thought to those who have claimed to purify crude sewage by simple filtration. The three reports and supplement taken together contain records of a very large number of tests, both chemical and bacteriological, which have been made with crude London sewage, and with effluents from primary and secondary filter-beds, and show clearly that, while filtration of crude sewage effects a considerable, though not satisfactory degree of chemical purification, it is of little use in destroying bacteria whether pathogenic or otherwise. Obviously a process of purification which depends for its success on the purifying action of bacteria must provide a suitable soil for their multiplication, and in the preliminary stages of the process the absence of any reduction in the number of bacteria need not be regarded with any feeling of dissatisfaction, but such a feeling may well arise when the final effluent is proved to be (bacteriologically) practically identical with crude sewage slightly diluted. The same kinds of bacteria and spores are present, the only difference being, as a rule, a slight reduction in numbers.

The report is entitled "Bacterial Treatment of Crude Sewage," but this is, perhaps, somewhat misleading. The attempts which were made to filter crude sewage proved unsuccessful, as the filter-beds were rapidly choked by particles of straw, chaff, cotton, and woollen fibres, &c., and, as we pointed out in our issue of April 7, 1900, the result of these experiments might be regarded as

"a confirmation of the usual method of bacterial purification, which includes sedimentation and initial purification in tanks before the sewage is passed on to the filters." In the more recent experiments, a rough process of sedimentation was adopted, and has proved of great service in preventing the choking of the beds. Various methods have been tried, including (1) passing the sewage through tanks, and (2) letting it flow along troughs in which cross-divisions were fixed from the bottom to about half the height of the flow. In the supplement to the second report, it was stated that the experiments with the sedimentation-troughs were to be continued, but this does not appear to have been done; perhaps the authors of the experiments came to the same conclusion as ourselves—namely, that they were not likely to prove of much value. Instead of the troughs, tanks have recently been used, the flow being continuous, but in one series of experiments the tank remained nearly full during the emptying and aeration of the bed, and fresh sewage was passed continuously into it only during the filling of the bed. In these cases—to quote the words of the third report—"probably most of the liquid which passed into the coke-bed was therefore settled stale sewage, which was displaced by the incoming sewage." It is admitted that "some anaerobic (septic) bacterial action undoubtedly took place in this settling tank," and that there was "a considerable evolution of inflammable gas," but it is somewhat strange that the advantages accruing from the use of the tank are not fully stated. This omission we will attempt to supply.

The filter-bed was of coke, and had an area of 26½ square yards, a depth of 13 ft., and an initial liquid space equal to 51 per cent. of the total contents of the bed. In all filter-beds a certain amount of settlement takes place, and the loss of liquid capacity in the bed under notice must in part be ascribed to this. When unsedimented sewage was used, the liquid capacity decreased from 51 per cent. in February, 1899, to 34 per cent. in June, and 28 per cent. in October. A wooden tank was then placed on the top of the bed, and the crude sewage was pumped into this and allowed

to overflow. "The result of this rough settlement," we are told, "was that by January 12, 1900, the liquid capacity had increased from 28 per cent. to about 33 per cent." This conclusion is scarcely warranted, as the bed was not filled from December 22, 1899, to the date on which the liquid capacity was measured, and the increase of capacity was probably due to the three weeks' rest which intervened. We venture to think that the utmost which can be claimed for the wooden tank is that it checked to some slight extent the rate of choking of the bed. This view is supported by the continuation of the experiments from January 15 to April 5, 1900. On the latter date "the coke was . . . seriously clogged upon the surface, and . . . the bed had to be stopped in order to give time for the collection of matter in the upper part to become removed by bacterial action."

A rest of four weeks was therefore given to the filter, and on May 2 work was again commenced, but the crude sewage was passed through a brick settling tank in the manner already described, instead of through the wooden tank. The capacity of the brick tank was about 8,000 gallons; the liquid capacity of the filter on June 16 was 6,000 gallons (about 33 per cent. of the total capacity). This series of experiments was continued till July 28, and "no clogging of the upper parts of the coke has been noticed, and the liquid sinks readily into the coke-bed as soon as it is allowed to pass upon the surface." When the wooden tank was used, the bed was filled on the average 10.3 times per week, and the degree of chemical purification effected was 52.5 per cent. When the brick quasi-septic tank was used, the bed was filled on the average fifteen times per week, and the degree of chemical purification effected was 56.1 per cent. The brick tank therefore prevented choking, and improved the effluent of the bed, even though the rate of filtration was increased 50 per cent.

It is somewhat surprising, therefore, that further experiments with a proper septic tank have not been carried out. This thought appears to have struck Dr. Houston. He thinks it conceivable that the bacterial

processes now in operation, which "aim at allowing certain bacteria or groups of bacteria to gain the ascendancy by a natural process of selection," might be improved by adding to the sewage "pure cultures in large amount of selected microbes," and suggests that experiments to this end might be divided into two stages—"the first aerobic, or semi-anaerobic, the bacteria used belonging to the class of putrefactive aerobes and facultative anaerobes; and the second stage purely anaerobic, the micro-organisms involved in the process being those of nitrification, or, *preliminary to the above, and as an initial stage, anaerobic bacteria might be employed.*" The words we have printed in italics are very suggestive.

We need only state briefly some of the more important conclusions which may be drawn from the chemical analyses. The experiments with the 13-ft. bed lead Dr. Clowes to the conclusion that "there is no reason why a deep bed should not give as good results as a shallow bed, provided that it is as well aerated during the periods when it is empty." This proviso is the crux of the problem, and he therefore adds that experiments have proved that "even the bottom of the 13-ft. bed was well supplied with oxygen." Experiments were made with primary coarse beds and secondary fine beds. The average purification effected with crude sewage was as follows:—

Primary bed, coke .....	22.5 per cent.
" ragstone.....	20.6 "
Secondary bed, coke .....	63.2 "
" ragstone.....	49.1 "

The materials used in the primary beds were passed through a 4-in. mesh and rejected by a  $\frac{1}{2}$ -in. mesh. The pieces were therefore of large size, and a further series of experiments with pieces which had passed a 2-in. mesh and had been retained by a  $\frac{1}{2}$ -in. mesh, increased the average purification effected by primary beds to 43.8 per cent. In this series, however, the filtering material was 9 ft. 9 in. deep, against 5 ft. in the first series. Of the secondary beds of this increased depth, the "coarse" bed ( $\frac{3}{8}$ -in. to 2-in. pieces) produced an effluent with an average purification (calculated on the crude sewage) of 62.5 per cent, while the "fine" bed ( $\frac{1}{16}$ -in. to  $\frac{1}{2}$ -in. pieces) yielded an average of 76.2 per cent. These experiments show clearly the advantages of double contact. The filtration of the effluent from the chemical precipitation tanks, however, effected an average purification of slightly over 80 per cent., calculated on the crude sewage.

The second division of the report is by Dr. Houston, and deals with the bacteriological part of the question. We need not describe in detail the various experiments which he carried out. The broad facts are that the effluents from the filter-beds contained large numbers of bacteria and spores of bacteria of the same species as those found in the crude sewage. Particular stress is laid on the enumeration of *Bacillus Coli* and the spores of *B. enteriditis sporogenes*. The former is an organism abundant in the intestinal discharges of animals, and, although not classed as pathogenic, serves as an index of the possible presence of more dangerous organisms from the same source. The second bacillus is also found in excremental matters, and appears to be the cause of

acute diarrhoea. Both these microbes were found in large numbers in the effluents, even when primary and secondary beds were used. Special search was also made for streptococci, and Dr. Houston considers this series of tests to be of "extreme value" for four reasons, which may be thus stated:—

1. Streptococci are as a class among the most pathogenic of the bacteria yet known.
2. They are delicate germs, and very readily lose their vitality and die.
3. They are present in the intestinal discharges of animals.
4. They are absent from water and soil, unless these have been recently contaminated.

Dr. Houston's experiments showed that "there did not appear to be any significant alteration in the number of streptococci as the result of the bacterial treatment of the raw sewage."

Some mice inoculated with broth cultures of streptococci from the effluents died in a few days; others were apparently unaffected. It is clear, however, that many of these delicate but dangerous organisms survived the rough process of sedimentation, and single and double filtration, and Dr. Houston now throws doubt on his previously expressed opinion that "some, at all events, of the pathogenic organisms are crowded out in the struggle for existence in a nutritive medium containing a mixed bacterial flora, their vitality being weakened or destroyed by the enzymes of the saprophytic species." The final "biological conclusion" at which he arrives is undoubtedly startling, and shall be stated in his own words:—"In view of these results, only one conclusion seems possible, namely, that however satisfactory the process may be from the chemical and practical point of view, *the effluents from the bacterial beds cannot be reasonably assumed to be more safe in their possible relation to disease than raw sewage slightly diluted but otherwise unaltered in its bacterial composition.*"

It must not be forgotten that the bacterial treatment adopted in these experiments differs in some important particulars from the methods generally recommended, but Dr. Houston appears to think that, no matter what known bacterial process is adopted, the effluent will be biologically unsatisfactory. It is strange, he says, that "many still consider the effluents from coke beds and in general from bacterial processes non-pathogenic." We may here point out that the results obtained in these London experiments are much less satisfactory than others obtained at Exeter and elsewhere. Dr. Houston himself has shown that the number of spores of *B. enteriditis sporogenes* present in crude sewage (1,000 to 10,000 per c.c.) was reduced by the Ducat filter to 10 per c.c. In the London experiments, the number in the effluent was "usually less than in the corresponding samples of crude sewage," but "the reduction was not very well marked, and was not, moreover, a constant feature." The actual number remaining in the effluent from the 13-ft. coke bed was usually at least 100, but less than 1,000 per c.c. The unsatisfactory nature of the London effluents, both chemically and bacteriologically, is to a large extent due to the faulty method of treatment and to the makeshift apparatus, and it is scarcely fair to use these experiments in wholesale condemnation of all bacterial processes. The London experiments were made with

the specific object of discovering a rapid process of treatment which would produce an effluent sufficiently free from impurities to be discharged into the tidal waters of the Thames without creating a nuisance. A high standard of purity is, under such circumstances, unnecessary.

More thorough treatment is clearly required for inland towns, and this can be obtained by initial purification in a tank, followed by double or even treble filtration as recommended by the Manchester experts, or by the still more differentiated system of filtration adopted by Mr. Scott-Moncrieff at Caterham. In exceptional cases it may even be necessary to precipitate the sewage or to sterilise the filtrate by means of chemicals, but even those present no insuperable obstacles. Dr. Houston's report will be of service in drawing attention to the difficulties and possible dangers of bacterial treatment, but need not be regarded as by any means an unanswerable condemnation of it. Indeed, Dr. Houston himself recommends that the bacterial process should be adopted for London sewage in lieu of chemical treatment; "it would be idle to deny its value or attempt to minimise its usefulness simply because it falls short of a standard of absolute perfection."

#### NOTES.

WE reprint on another page the letters which have appeared in the *Times* from three members of Parliament—Mr. Soames, Mr. Whitmore, and Lord Balcarres—protesting against the carrying out of the new Government Offices by the Office of Works. Every one who is interested in our public architecture ought to be grateful to these Members of Parliament for taking the trouble to raise the question, though we fear they are in a very small minority in the House of Commons, where such subjects are mostly considered of no account. It is noticeable also that the *Times*, which could afford a leading article on the subject of the widening of Piccadilly in support of the views of its correspondents, has nothing to say on this more important subject. The *Times* is a faithful representative, in these matters, of the spirit of the English public, which can get up a great deal of ardour on the subject of a street improvement and the cutting down of trees, but can take no interest in the question of the adequate carrying out of a great work of architecture. However, we hope the subject will not be allowed to drop just yet.

The Widening of Piccadilly.

THE objections which we were the first to make to the proposed widening of Piccadilly by taking a strip off the Green Park, as involving the sacrifice of trees without any real relief to the pressure of traffic at the two ends of the widened portion, have been followed up by numerous correspondents in the *Times*, who have given expression to the same opinions. Sir E. J. Poynter, in a letter at once practical and artistic in its spirit, observes that the trees along the Green Park margin of Piccadilly give a peculiar charm to that portion of the street; "they are the survival of a time when London was a less hideous Babel than it now is, and linger there as a reminder of a past and more tranquil condition of life"; and the promise

that eleven of them will not be cut down will not, he is sure, satisfy the public. The scheme is altogether an absurd one, which will spoil that part of London and at the same time be of no avail whatever in removing the real block of the traffic, which occurs at the west end of the Green Park where north traffic crosses Piccadilly from Park-lane. In respect of this part of the question, Sir J. Wolfe Barry, in a letter in Thursday's *Times*, revives the proposal for a sunk road under Piccadilly, and this is the only way in which the block of the traffic near Hyde Park Corner can be relieved. This proposal for a sunken road was made many years ago by the present Editor of this journal, in a letter which was published in the *Builder*, accompanied by a plan, at the time when the ill-advised removal of the Constitution Hill arch was first proposed. It was there shown that the arch might be retained in its original position, and a road taken under Piccadilly and under Constitution Hill into Grosvenor-place. This would have done all that was wanted, without destroying the perspective of Piccadilly by removing the arch and making the present shapeless and inconvenient open space.

**The Housing Problem in Parliament.**

THE discussion of the Estimates on Monday gave an opportunity for some desultory remarks on the subject of the housing of the working classes. There was on the part of the Government another indefinite suggestion that a Bill should be brought on to improve the existing law, and on the part of the public, represented by Sir J. Dickson-Poynder, the complaint that the time for the repayment of money borrowed by Local Authorities should be extended. The Government, though willing enough that posterity should pay for the war, are very stringent guardians of the rights of posterity in the matter of local loans, and we do not for a moment expect to see the period over which the repayment of local loans is spread increased. A suggestion by this same member that when railway companies take land for improvements, and have to re-house a number of the working classes, they should, instead of building themselves, hand a lump sum over to the Local Authorities for this purpose, is well worth considering. Railway companies have their own special business to manage, and it would certainly seem more reasonable from every point of view that the rehousing should be done by the Local Authority, who are accustomed to deal with this matter.

**The Improvement of English Roads.**

MR. LONG's reply to the deputation which he received last week on the subject of the improvement of roads was not very sympathetic. But in truth the proposal of the deputation that the Central Government should take over the main roads was not practical. In theory there is a good deal to be said for it. But in this country the care of the highways has, from time immemorial, been a local business, and at present the desire of every one is to decentralise as far as possible. Therefore, to discuss the question of a Governmental control of the highways is a mere waste of time. What is desirable is that the County Council should become the sole highway authority in each county. In some

counties they have, by a stretch of the meaning of main roads, obtained almost complete control of the highway system. A short Act of Parliament, by which they would be constituted the only highway authority, would be a decided, and at the same time a practical, step towards the continued improvement of English roads. Mr. Long was quite justified in saying that the condition of the rural roads had lately improved, but it is by the existence of the County Councils rather than of the District Councils.

**The Leeds Churches Bill.**

THIS measure has been finally passed through all its stages by the two Houses of Parliament. It provides for the redistribution of certain ecclesiastical parishes and districts within the borough, and for the building of a new parish church—to replace St. Edmund's—on the borders of Roundhay and Moortown, and of a new parish church, instead of St. Paul's, in the present parish of St. Luke, Beeston-hill. The last-named church, together with the vicarage house, and those of St. Stephen, Burmantoft, and St. Philip, are to be pulled down; the proceeds of the sale of the sites and materials will be devoted to the purposes of the new churches and their endowments. St. Stephen's Church was built in 1853-4, at a cost of 3,000*l.*, after the plans and designs of J. Dobson. The architect of St. Philip's Church (1846-7) was R. D. Chantrell. The fabric, which cost about 5,000*l.*, has a nave of five bays with clear-story and aisles; on the south side is a tower with an octagonal ribbed spire; the nave and chancel have hammer-beam roofs. St. Paul's Church, standing in Park-square, was built of stone, in 1791-3, for 1,175 sittings, at a cost of 10,000*l.*, upon a site given by Dr. Christopher Wilson, who was Bishop of Bristol in 1783-92. At the west end is a portico consisting of a Classical order of four Ionic columns with a pediment. From above it rises a light tower in three stages. The interior was renovated fourteen years ago.

**Municipal Telephones.**

THE recent public opening of a municipal telephone system at Tunbridge Wells is a notable event in the history of telephony in this country. Several electricians have taken a gloomy view of this new development of municipal trading, and have prophesied that it will be a financial failure. Judging, however, from the enthusiasm with which the ratepayers are supporting the new municipal venture it promises to be a success. The Corporation have powers to supply over an area of about 200 square miles, and they have already obtained 330 subscribers. In Tunbridge Wells the trunk mains are underground, so that the exchange is on the ground floor instead of in the top of the building as usual. The final distribution is done by short spans of wire supported by distributing poles. The system has been well designed and contains many novel departures from ordinary practice, most of which are due to the consulting engineer, Mr. A. R. Bennett. The charges are most moderate when compared with those ordinarily made by the National Telephone Company. For an unlimited day and night service the charge is 5*l.* 17*s.* 6*d.* per annum, or if the client desire he can pay a fixed rental of 3*l.* 10*s.* with a toll of 3*d.* per outward call, or a fixed rental of 2*l.* 10*s.* with a toll of 1*d.* per outward call. Some

years ago the National Telephone Company whose charge was 10*l.* was asked to reduce it to 7*l.* The reason given for not acceding to this request was that to work at less than 10*l.* meant working at a loss. However, they have now stuck up notices offering to give any one an unlimited service for a rental of 4*l.* These tactics were successful at Dundee where they first of all reduced their price from 10*l.* to 5*l.*, and then bought up the local company. It will be interesting to see how they answer with the Corporation of Tunbridge Wells. In Glasgow the municipal telephones, although the opening ceremony has not yet taken place, are proving a success, and there are upwards of 1,000 telephones in operation, whilst there are 5,400 names on the books. In Guernsey what is practically a municipal telephone system has been in operation three years, and they are making a profit on an annual charge of only 3*l.* 5*s.* One of the consequences of cheap telephones in Guernsey is that the number of inhabitants per telephone (forty-four) is less than in any other part of the United Kingdom. Of course, there are many places abroad where the number is very much smaller; in Stockholm, for example, there is one telephone for every eight people. It will be seen that there is plenty of room for enterprise in this direction.

**Water for Domestic Purposes.**

THE recent decision of Mr. Justice Buckley in what will henceforth be known as the Barnard Castle case has an important bearing on the charge for the supply of water. The question was raised whether the supply of water to a swimming-bath at a school could be considered as supply for domestic purposes, or whether the Local Authority were entitled to charge an extra sum for the amount of water so used. The decision of the Judge was that this water was used for domestic purposes. This decision seems to have a broader bearing than many other judgments, because it appears to enlarge the meaning of the phrase "domestic purposes." The decision of Mr. Justice Buckley was based on the reasoning that the swimming-bath was part of the domestic apparatus of the school; that the bath itself was not kept for the purposes of trade. There is no doubt a growing feeling in the community in favour of the largest and most unlimited and cheapest supply of water possible. Nothing is more paradoxical than that medical and sanitary experts should be continually preaching the need of cleanliness in habitations as a protection against disease, and yet that in this immense metropolis the cost of water should make its complete use almost a luxury.

**St. Helen's, Isle of Wight.**

FROM a Report to the Local Government Board upon the sanitary circumstances and administration of the urban district of St. Helen's, Isle of Wight, by Dr. H. Timbrell Bulstrode, it appears that the supply of water is procured under very unsatisfactory and unsafe conditions. On St. Helen's Green there are numerous wells sunk, presumably in the gravel. Some of these wells have pumps attached thereto; others are furnished with means for lowering and elevating a bucket.

"The pumps were at the date of my visit out of order, and the water supply of St. Helen's was being largely drawn from these wells, the covers to which were off in every instance, and thus the well

water was not protected against surface pollution. Moreover, there was no means of reaching water from these wells other than by the use of private buckets, the introduction of which into the water was to be condemned, seeing that they might have previously been utilised for undesirable purposes or have been brought from houses wherein was infectious disease. It did not appear to me that the District Council had taken proper precautions to prevent the continuance of this dangerous practice, which had clearly been in vogue for a very considerable period."

Dr. Bulstrode's Report also states that the drainage system is in an unsatisfactory and backward state, a great deal of it being taken by clay-jointed pipes, and many of the water-closets being without flushing apparatus, and having to be flushed by hand. As the Report says, "There is still a large amount of work to be done in the St. Helens Urban District before that district can lay claim to have modernised itself in a sanitary sense."

It is to be hoped that the opening of the piece of the Broad Sanctuary on which Canning's statue stands and the placing of seats there, which has been promised by the Commissioner of Works, will be done without delay. It will not only form an agreeable and shady spot in the present hot weather, but the removal of the railings will give a sense of space and freedom which the interesting space at present lacks. A great change in the character of the railings which surround many of the open spaces of London is much needed. In too many instances they have a prison-like character which is far from pleasant. The removal of the heavy rails on the drive of Hyde Park from the Marble Arch to Apsley Gate has greatly added to the spaciousness of that part of the Park. No one who has compared the confined look of St. James's-square, with its high and unsightly railings and its dense mass of unflowering shrubs, with the more open character of Berkeley-square, cannot but regret that more freedom is not given to the open spaces of London.

CONCURRENTLY with some changes that are being effected of the number and status of the King's chaplains and with a reduction of the ecclesiastical establishment of the Court, the German services at the Chapel Royal, St. James's, have been discontinued, the final service at the Lutheran Hofkapelle having been celebrated on Sunday, 4th inst. The present building, which stands on the east side of Friary-court, had its origin in the Roman Catholic chapel which Charles I. established at St. James's Palace for Queen Henrietta Maria, and which was afterwards appropriated for the uses of Charles II's consort, Katharine of Braganza. Soon after the Restoration, Cardinal Philip Howard, the Queen's lord-almoner, installed a community of Portuguese Capuchin friars in a new building adjacent to what was then known as the Queen's Chapel, wherein, as Pepsys records, Queen Katharine attended mass for the first time on September 21, 1662. Pepsys also describes a visit he made to the friars and their new buildings in January, 1667. After King William III. had ascended the throne the chapel was assigned, by name of the French Chapel Royal, to a congregation of Huguenot

refugees; and then, during the following reign, it was taken for the Lutheran services established at St. James's by Queen Anne and her consort, Prince George of Denmark. An interesting survey of the palace and convent which is appended to the rare pamphlet entitled "A Full Answer to the Depositions . . . concerning the Birth of the Prince of Wales. The Intreague thereof detected . . . London, 1689," shows "a burying place" where is now the open space of Friary-court, the "cloisters" abutting against the east end of the chapel, and "Friary Garden" lying between the cloisters and the wall of St. James's Park; on the north of the chapel are the dormitories and the entrance into the convent. The "Great Yard next St. James's Park" on the south side of the chapel and the "Friary Garden" are now covered by the garden of Marlborough House. In August, 1708, the Duchess of Marlborough's trustees obtained, for a payment of 2,000*l.* and a yearly rent of 5*s.*, a fifty years' lease of the Friary and its grounds; in 1709 that lease was cancelled in favour of another one, which included two acres (with the aviary) then known as the Royal Garden. Vardy removed the remaining conventual buildings in 1748, and about one hundred years afterwards was laid out the road which opens out of Pall Mall, passing Friary Court and the chapel, into the Mall, St. James's Park.

THERE is a common saying that a man who is his own lawyer has a fool for his client.

We are inclined to think that this might even apply to the person who is his own architect. A good example of the foolishness of amateur advice appeared in the *Daily News* of Saturday last. In a special article on the keeping of houses cool, which contained much sensible and much needed general advice, it was stated that the best external means of keeping a house cool was a verandah; the next, outside shutters or blinds. But there is a fatal objection to a verandah or any permanent protection from the sun in this country, because it keeps away light at all seasons of the year. A room to which a verandah is attached in England nearly always is disagreeably dark and gloomy and often damp, while the verandah itself requires constant painting, and unless covered with creepers is usually unsightly. Modern architects, whatever their shortcomings may be, have rightly appreciated that verandahs are objectionable, and they are now seldom seen except in houses of the end of the eighteenth and beginning of the nineteenth centuries. If the writer had dwelt, as we recently did, on the paramount importance of outside shutters, whether solid or rayed, and of outside blinds, he would have done more good than by referring to the exploded verandah.

OPEN SPACES.—Now that the garden of Finsbury-circus has been opened to the public by the City Corporation it is proposed that they should similarly acquire the enclosure of Finsbury-square, which was laid out by Dance the younger, who built the houses in the interval 1777 (west side)—1791 (south side). The garden of Finsbury-circus, which extends over one-and-a-half acres, is remarkable for the number and variety of its trees and shrubs; amongst them are walnut, apple, and mulberry trees, limes, planes, elms, the Indian bean tree, several kinds of poplars, acacias, and birches, together with lilacs and laburnums, the bladder senna tree, golden privets, garden willows, the sophora japonica, yuccas, and the eucalyptus.—On July 28th was opened a public park, thirty-two acres in area, at Tipton, which has been acquired at a cost of 10,000*l.* as a recreation ground.

## THE ROYAL ARCHEOLOGICAL INSTITUTE AT NOTTINGHAM.

(Continued.)

THE morning of Friday, July 26, was devoted to the annual business meeting of the Institute, which was held in the Exchange Council Room under the presidency of Sir Henry H. Howorth. The Secretary read the annual report, which showed that both financially and in other respects the Institute was in a flourishing condition. Various suggestions were made as to the place of next year's meeting, Worcester, York, and South Wales being advocated amongst others. Eventually the selection was left to the Council. On the proposal of the President a resolution was passed pointing out the desirability of printing the Chartularies of Rufford and Welbeck Abbeys and of the Priory of Newstead.

At the conclusion of the proceedings the party journeyed by train to Mansfield on a visit to Hardwick Hall. Immediately after luncheon at Mansfield a tremendous downpour of rain prevented a start being made, but eventually the journey was resumed only a little after time. On arrival at Hardwick Hall the party was most graciously received by Lady Louisa Egerton in the great hall, after which Mr. J. H. Gatch, F.S.A., read a paper on the history of the building. "Hardwick Hall," he pointed out, "is a building of considerable interest to the student of English domestic architecture, inasmuch as it is a good example of one manner of the Elizabethan designers, and it has undergone no very serious alterations since it was built. It has suffered, like most houses of that time, from age and from the changing fashions of its inhabitants; but such changes as it has experienced have been in comparatively small matters; so that in the general disposition of its plan, and in its external appearance, it remains to-day very much the same as when the eye of its founder, Bess of Hardwick, last fell upon it. This Bess of Hardwick was a notable personage, a woman of great ability and strong will; and being possessed of considerable wealth, she left her mark upon the times in the shape of several large houses, of which this is one, and the only one surviving, the others being Chatsworth (which has been rebuilt) and Okeover. She was the daughter of John Hardwick of Hardwick, and was born in the old hall, of which the ruins still remain in front of this house, and near the brow of the hill. That she was a woman of great ability and personal attractions is sufficiently proved by the fact that she married four husbands and survived the last. Her first husband was Robert Barley of Barley. Her second was Sir William Cavendish of Chatsworth, ancestor of the present Duke of Devonshire, the owner of Hardwick. Her third was Sir William St. Loe, and her fourth was George, Earl of Shrewsbury. It was after her marriage to the last named that she built Hardwick Hall, since her initials, E.S., and a coronet form a conspicuous part of the ornamental balustrade on the towers. The date usually assigned to the house is 1576. There is a chimney-piece in one of the bedrooms dated 1588, another in the dining-room dated 1597, and the door of the room called after Mary Queen of Scots is dated 1599. The new hall and the old hall stood side by side, and both were in use for many years. The old hall is, indeed, not much older than the new. Much of it has disappeared, but judging by what remains its general disposition was symmetrical, its windows, as can be seen, are mullioned and have rectangular lights; its whole appearance points to a date about the middle of the sixteenth century. Tradition gives this house as the birthplace of Bess in 1520, and perhaps a careful search might reveal indications of a building of that date. But if anything of it still survives, it certainly would seem as though the old house had been modernised during the second half of the sixteenth century, an additional proof being the remains of a plaster frieze, with figures modelled in relief, of the same character as the frieze in the presence chamber of the new house. Having been thus brought up to date, the old house was not left to immediate decay in consequence of the erection of its rival, for we learn from the ingenious Mr. Collins, who quotes Bishop Kennet's memoirs of the Cavendish family, in his 'Peerage,' that one room was of such exact proportion and such convenient lights, that it had been thought fit for a pattern for a room in Blenheim House. This,

Verandahs.

The German Chapel Royal, St. James's Palace.

therefore, brings us well into the eighteenth century before the old house fell to ruin. It is not unlikely that the older house was the more comfortable of the two, for Hardwick Hall can hardly be considered as a model of convenient planning. It belongs to that species of house of which a large number were built in Elizabeth's days: a house designed as an exercise in symmetry rather than as a dwelling. True, it contains the apartments which were then considered essential, but they are arranged with less than the usual care to secure comfort and convenience. What must strike every one who first sees Hardwick is the great size and number of the windows. This has given rise to the well-known jingle, 'Hardwick Hall, more glass than wall.' It is a fault common to many of the houses of the time, and one which Lord Bacon protested against in his oft-quoted complaint that 'You shall sometimes have fair houses so full of glass that one cannot tell where to become to be out of the sun or cold.'

The fact that windows were so large and plentiful is one of considerable interest and significance, for it emphasises the complete change which had come over house-planning in the space of a few years. Thirty or forty years earlier windows were somewhat jealously introduced, especially on outer walls, for the necessity for defensive precautions had then hardly ceased. Here at Hardwick, however, no thought of defence is apparent, everything is done to procure the largest amount of light and air. The windows, in fact, are overdone; they make the circuit of the walls with relentless symmetry; and not a few of them have been blocked up inside in order to render the rooms habitable. Some of them were shams from the outset, and have fireplaces against them, and not a few of them are crossed by floors, so that the lower lights belong to one story and the upper to another. That is what comes from trying to carry out a preconceived idea, namely, that of absolute symmetry, instead of making the convenience of the house the first consideration.

The room called after Mary Queen of Scots, which is situated high up on the second floor in one of the projecting turrets, has three of its sides on the exterior filled with windows; on the inside, however, only one side is lighted, the fireplace occupies the second side and the bed the third. The room is called after Mary, and has the arms of Scotland over the door, but there is no record of the exact length of her residence in semi-captivity in this house. She was for seventeen years under the care of the Earl of Shrewsbury and Elizabeth his wife, and towards the end of that time her attractions bade fair to rival those of the redoubtable Bess herself, so that, according to old Fuller, when Queen Elizabeth inquired of the Countess how her guest did, that lady replied: 'Madam, she cannot do ill while she is with my husband, and I begin to grow jealous, they are so great together.' Fuller adds that in consequence of this intimation Elizabeth, who disliked anything approaching to a friendship between Mary and so great a peer, gave her into the custody of others. Mary was behaved in 1587, and as the door of her room is dated 1590, the probability is that it was adorned in her memory, evidently not for her own proper delectation. But leaving the gossip of history, let us look a little more closely into the architectural character of the building. Attention has already been called to the symmetrical character of the plan. The house consists of a large oblong with two projecting turrets on each of the long faces and one on each of the short faces. The door, as usual, is in the middle of one of the long sides, but the hall into which it gives access is not disposed in the fashion which had been customary up to this period, and which still prevailed in most Elizabethan houses. That fashion is followed in the halls of colleges; it placed the hall lengthways with the building; at the entrance end a strip was cut off by a screen and became a passage, called the 'screens'; the front door was at one end of this passage, the doors of the hall were in one side of it, and the doors to the buttery and kitchen department were in the other. The hall was lighted by windows along the sides, and at the opposite end from the screen was the dais with its bay window, and beyond this end were the family rooms. Here, at Hardwick, the hall, instead of being placed lengthways with the building, goes across it from side to side. Instead of it being lighted down the sides, it is lighted at the ends; the front door, instead

of being in the end of the 'screens,' is in the middle of one side of them, while at the ends were the doors to the servants' department and also the buttery hatch, all of which are now built up. This unusual disposition may not seem of much importance, and it may be said that although the hall lies differently in relation to the house, yet all the usual features are there, the screens, the buttery hatch, and so forth. But the difference of arrangement nevertheless is indicative of a momentous change, and one which distinguishes mediæval houses from modern. Up to Elizabeth's time, and even James I., the hall was the centre of the family life; it lay between the family rooms and those devoted to the servants. The dais end, with its bay-window, was reserved for the family, and there they dined; adjacent to this end were the parlour and the staircase leading to the bedrooms and other principal chambers. But already the custom of dining in the hall was falling into desuetude, the family sought smaller and more private rooms. With their withdrawal the character of the hall changed, and it tended to become no longer a living-room, but an entrance-hall or vestibule for passing traffic. This alteration of character became thoroughly established in the time of Inigo Jones, and has remained to the present day.

One of the tests of the age of a house is the disposition of its hall; in mediæval times it was a living-room, in modern times it is a vestibule. The hall at Hardwick, owing to its plan, is leaving the mediæval type and approaching the modern. It may have had a dais, but probably not. Even if it had, that end had not the snug feeling of the old-fashioned arrangement, with its bay window and the fireplace fairly close to the seats of the chief personages. It must have been somewhat uncomfortable, as on each side of that end is a passage leading to a principal staircase. I have said 'staircase,' but indeed Hardwick may be said to have no 'staircase'; it has, instead, long flights of steps. By 'staircase' is meant a special feature, either of wood or stone, such as is the pride of most Elizabethan houses. There were very few stone staircases in English houses of this period; Burghley House has, so far as I know, the only good example. But there are hundreds of splendid wooden staircases, and in a house of the pretensions of Hardwick one would have expected to find a particularly fine specimen. But throughout the house the detail is disappointing; everything is large and coarse, including chimney-pieces and doorways. It is rather in its general disposition and the size of its rooms that Hardwick is interesting. When one comes to examine the work closely there is an absence of that fancy and fertility of design which distinguishes the better class of work of that period. But although the means of getting upstairs are not very interesting, there are some fine rooms to go to. There seem to be no family rooms on the ground floor, unless they have been turned from their original purpose. All the principal apartments are on the upper floors, and as each story is unusually lofty, the whole height of the building is much greater than was commonly the case. The hall itself is two stories high, and the only access from one half of the house to the other on the first floor lies across the gallery over the screens. The principal rooms on this floor are those now called the dining and drawing-rooms; in addition to these there are a few bedrooms and various small apartments, contrived to meet modern requirements. The finest apartments, however, are on the second or top floor, where we find the presence chamber and library and the long gallery, besides a fine bedroom and the room named after Mary Queen of Scots. Above these rooms, and partly in the roof, are a number of subsidiary bedrooms. The presence chamber is a large and lofty room, with a very deep frieze of modelled and coloured plasterwork representing hunting scenes. The quality of the work is not very high compared with what was being done in Italy and France at the same time, but it has considerable vigour, and imparts a fine and stately character to the room. Over the chimney-piece in the library adjoining is an alabaster panel of very considerable merit, representing Apollo and the Muses. The long gallery occupies the whole length of the east side of the house, and is a lofty and handsome room. It is the only apartment which retains its original ceiling, and as the ceilings of

Elizabethan houses exhibited some of the most original and attractive work of the period, Hardwick suffers much from their absence. This particular ceiling, however, has no special claim to admiration; it is one of the plainest and least interesting with which I am acquainted. In this respect it is only in keeping with the rest of the detail of the house. The long gallery was one of the characteristic features of our Elizabethan house. The longer the better, designers of the day used to think, and although this is of considerable length, being 166 ft. long, there were several houses in which the gallery was longer still, reaching to as much as 200 ft. and 250 ft. The rigid symmetry of the external treatment has already been referred to. It is as complete in its way as that of Wollaton, but the latter house derived more than symmetry from the classic proclivities of the day. It also obtained the pilasters and niches with which its walls are adorned. Hardwick has none of these, and is an example of the fact that they were by no means necessary, although they were a very constant ingredient in the design of the period. The treatment of the windows here resembles in some degree that employed at Wollaton, or, rather one should say, Wollaton followed Hardwick to a certain extent. In both places there is a projecting moulding or architrave which makes a framework round the window, and rests at the bottom upon a projecting sill, which is supported by small brackets. The mouldings of the jambs, mullions, and transoms, however, differ in the two examples. The cornices which divide the various floors have only a general resemblance, and the balustrade which crowns the walls is as meagre in the one house as the other. The finish of the turrets here is not so ambitious as at Wollaton, as instead of an elaborate curly gable, there are only the Countess's initials and coronet supported by a Dutch flourish, a humble member of the same family which is so conspicuous on the towers at Wollaton.

There are here valuable accessory features which are now wanting at Wollaton, as well as at most of the houses of that time which have come down to us. I mean the garden walls and lodge. The lodge was almost as much a part of an Elizabethan home as the great hall and long gallery, but being of small size and detached from the main building, it has in the majority of cases been swept away in favour of some kind of landscape-garden effect. Happily, it has escaped in this instance, and remains, together with its supporting walls, as an example not only of the manner of laying out the approach to an Elizabethan house, but also of the quaint and sometimes unworkmanlike way in which artificers treated their materials. In looking at the laying out of Hardwick the visitor must beware of confusing the original arrangement with the excellent garden laid out by Lady Louisa Egerton on the south side, which, by the lapse of time, has assumed an appearance admirably in keeping with the house. In conclusion, I desire to leave the domain of architecture for an instant to call attention to the great amount and excellent preservation of the tapestry which clothes the walls, and vividly illustrates this method of decorating them, and also to the interesting furniture which survives in considerable quantity. These two things reconcile us to the absence of fascinating architectural detail, and help to make Hardwick one of the fine examples of a large Elizabethan house.

After a cordial vote of thanks to Mr. Gotch for his excellent paper, the party was conducted over the house by Lady Louisa Egerton, who pointed out the chief of the many features of interest, such as old pieces of furniture, the pictures, and the priceless series of tapestry hangings. The long gallery is now the only room retaining its original moulded plaster ceiling; but Mr. Mickethwaite was of opinion that the "presence chamber" once had one to match the moulded and painted plaster frieze, despite the absence of a cornice. The question of the nationality of the alabaster panel in the library, representing Apollo and the Muses, was referred to Mr. Hope, who thought that the cartouche with the initials "E. R." and the treatment of the Royal arms, pointed to an English origin. After a hurried glance at the fast-crumbling ruins of the old hall close by, the return journey was made to Mansfield, and thence by rail to Nottingham.

At the evening meeting in the Exchange Council Room, Mr. E. W. Brabrook, C.B., F.S.A., read a paper on "Robin Hood," an ever-popular hero, whose history existed principally

in ballads. Some denied that Robin Hood had any real history, but Mr. Brabrook dissented from the view that he did not exist in the flesh. There was a strong English flavour about the ballads, and he did not see why it should be doubted that they had some foundation in fact.

Early on Saturday, the 27th, a special train conveyed the members to Newark, where the ruins of the castle were first examined, under the guidance of Mr. John Bilson, F.S.A. It was first built, he said, by Alexander, Bishop of Lincoln, 1123-1147, but of his work only the gatehouse, a good example of unusual size, now remains on the north, and a small portion of the west wall. Half the front towards the river formed part of the great hall, the fine cellar of which still exists in a very perfect state. It is of late twelfth-century work, with an unribbed vault carried by a central row of pillars. Of the keep and other buildings there is nothing left to indicate their site.

The party next drove to Hawton Church, which was described by Mr. W. H. St. John Hope. The western tower, he said, was the work of Sir Thomas Molineux, of Sefton and Hawton, who died in 1491, and whose arms, with those of his second wife, were in the spandrels of the west doorway. To him was also probably due the clearstory and upper parts of the aisles, together with the wooden roofs, but the arcades and aisle walls were of the thirteenth century. The quoins of the Norman nave remain against the tower. But the glory of the church is the beautiful chancel of three bays, with its splendid sedilia, Easter sepulchre, and founder's tomb and effigy, all of richly carved work, built by Sir Robert Compton, lord of Fenny Compton and Hawton, who died in 1530. Some discussion took place concerning the Easter sepulchre, which Mr. Micklethwaite thought might also have been used as a "sacrament house" after the Scottish manner. Mr. Hope also called attention to the rood screen and the old benches in the nave. On the motion of Sir Henry Howorth, a sincere vote of sympathy was passed to the rector, the Rev. R. Washington, who was prevented from being present owing to the death of his wife on the previous day.

After luncheon at Newark a move was made for the Town Hall, where the Mayor, Mr. W. Atter, welcomed the Institute to Newark, and exhibited the municipal insignia and the church plate. Mr. Cornelius Brown read some notes on the history of the plate, which was also described by Mr. Hope, who called special attention to the wails' badges, a good example of a Monticith of 1693-4 with movable rim, and a set of thirteen silver beakers with one common cover, made in 1688-9, in their original leather case. Mr. Bell added some remarks on the church plate.

A visit was next paid to the fine parish church of St. Mary Magdalene, which was lucidly described by Mr. John Bilson. The church of Newark, he said, was one of those given by Robert de Chesney, bishop of Lincoln, 1147-67, to his new foundation of the Gilbertine Monastery of St. Catharine, near Lincoln, and important works were soon after undertaken, of which fragments remain that possibly represent a complete rebuilding on a larger scale.

These fragments included the crypt beneath the old east end, now consisting of two bays, forming an interesting study of mid-twelfth century vaulting. The piers of the crossing, which formerly carried a central tower, were also of the same date. The present western tower was begun in 1230 and was designed on a grand scale, but during the work the design was altered, and the tower, which was originally intended to stand clear of the aisles, had aisles carried up to the western face. Mr. Bilson went on to point out the gradual growth of the church, coming to the early part of the fourteenth century when the south aisle was erected and the upper stages of the tower and spire. There was documentary evidence with regard to the south aisle, for in 1312 Archbishop Greenfield granted a licence to Henry of Newark to remove a chantry chapel in the churchyard and to convert the materials to the use of the church, and "the fabric of a certain aisle, which it was proposed to construct anew." This proved the intention in 1312 to build a new aisle, but he thought the work was of a somewhat later character, though it was exactly in line with the extremely fine fourteenth century work found in South Lincolnshire, and especially in the neighbourhood of Boston and Sleaford. The aisle was set out the same width as the nave, designed

for a pitched roof, and was probably only just completed before the Black Death of 1349. The effect of the Black Death in Newark might be seen by a licence to enclose a new churchyard. Of the later rebuilding after the plague they had the nave, the north aisle and transept, and a chancel. There was little difference in detail in the work here, in fact, none in the north side until they came to the extreme east end, where there was a slight difference in the mouldings which might indicate a somewhat later date. Documents showed that in 1460 payments were made for church work, and in 1483 Nicholas Cuyser bequeathed money to the new building of the chancel "in case it should be built anew."

The fourteenth and fifteenth century builders modelled the church into a harmonious whole, working round the parts of an earlier date. The preservation of the early pillars was probably due to the fact that the work was undertaken in sections, and the pillars afforded a convenient point around which it could be carried out. Mr. Bilson went on to speak of the large number of chantries which existed and of the adornments of the church, noticing the reredos, which was completed by Thomas Drawswerd, of York, carver, in 1508, the chantry chapels, the screen, and other features of interest.

After some remarks by Mr. A. R. Bax on the monumental brasses, notably the large Flemish one to Alan le Fleming, 1301, a cordial vote of thanks was passed to Mr. Bilson for his paper.

The party next drove to Holme, where the church was described by the Rev. A. F. Sutton. It consists of a chancel with south chapel, a nave with south aisle and porch, and a western tower with low spire. The greater part of the church was rebuilt late in the fifteenth century by John Barton, merchant of the Staple of Calais, who died in 1491. His tomb, with effigies of himself and wife, with a cadaver under, remains on the south side of the altar, and a rich band of shields of his arms and of other members of his family is carved over the porch. The original screenwork and pews remain throughout the church, though now sorely decayed and whitened with age. Some of the old painted glass is also left, including portions of figures of saints turned upside down to mollify the wrath of the Puritans against superstitious images. The Barton chapel, south of the chancel, has two good niches on either side the east window. Mr. Micklethwaite criticised the staring black mortar with which the north wall of the nave had been pointed after being stripped of its proper coating of plaster. After thanking Mr. Sutton for his remarks, the members returned to Newark and by train to Nottingham.

Monday, the 20th, was devoted to an expedition to Worksoop and Blyth. On arrival of the train at the former place, carriages were in readiness to convey the party to Worksoop Priory Church, which was described by the Vicar, the Rev. H. T. Slodden. It consists of a fine rich Norman nave of eleven bays, with triforium and clearstory, and two western towers, all of which owe their preservation to the fact that the nave was the parish church. The eastern portion, which was the church of the Priory of Austin Canons founded here in 1103, has entirely disappeared, with the exception of a ruined thirteenth-century chapel, that formerly opened out of the south transept. Some remains of the western range of the monastic buildings are left, and the vaulted outer parlour now forms the vestry. All the old fittings of the church have disappeared, and as were headed windows in the south aisle, that lighted the parish choir and altar, were "restored" away by Sir Gilbert Scott in 1845. An alabaster effigy of a lady and two other mutilated figures of William Lord Furnival (ob. 1383) and Sir Thomas Nevil († 1406) lie on the floor in the western part of the nave, and might be taken better care of. A move was next made to the fine fourteenth-century gatehouse, a very complete example, with the "casual ward" for the lodging of tramps on the first floor. On the south side of the entrance a small and richly decorated chapel of curious construction has been added to contain some image of peculiar veneration. From existing sculptures of the Annunciation and of the Adoration of the Three Kings, the image was, perhaps, one of Our Lady. Other images of St. William († St. Cathbert), and the Holy Trinity adorn the front of the gatehouse, before which stand the steps and part of the shaft of a cross.

After lunch the journey was resumed in carriages to Blyth, where the church was described by Mr. W. H. St. John Hope. It originally, he said, like the churches at Thurgarton and Worksoop, formed part of a monastic church founded for Benedictine monks in 1088 by Roger de Bulli as a cell of the Abbey of St. Catharine at Rouen, and owed its preservation, as in the other cases cited, to the fact that it served as the parish church, which was given as part of the endowment of the priory. The monastic part of the church had been utterly destroyed, but the nave and its aisles of seven bays remained, together with a western tower of later date. The nave and north aisle formed part of the first church of 1088, but a slight pause had occurred in the building since the lower part of the north wall indicated a setting out that was not eventually followed, and the bays of the aisle were now oblong instead of square, as first planned. The early character of the work, in arcades, triforium, and clearstory, was pointed out, but the original flat ceiling of the nave had given place to a thirteenth-century quadripartite vault. The early Norman unribbed vault is left in the north aisle. The south aisle was replaced by another of greater width about 1290, with a wooden roof only, and to it the parish altar seems to have been transferred. The south porch was of the same date. Late in the fourteenth century a new tower was begun within the last bay of the nave, after the manner of that at Furness Abbey, but Mr. Hope said he could see no reason for its being so built here unless the old western boundary of the cemetery had then been close up to the church. The tower seems to have been slowly built by stages and not finished until well in the fifteenth century. Of the fittings the old wooden transverse screens remained, with painted figures of saints, and there were some good seventeenth-century pews at the west end. Several interesting floor slabs remain, and an early Purbeck marble effigy of a knight in flat topped helm with a lozenge shield and surcoat, perhaps a Fitzwilliam.

After a thorough inspection of so interesting a church the party returned to Worksoop and thence by train to Nottingham.

In the evening the concluding meeting was held under the presidency of Sir Henry Howorth, when cordial votes of thanks were passed to all those who had contributed to the conspicuous success of the meeting of 1901.

Tuesday, the 30th, was devoted to the final expedition of the meeting. Leaving Nottingham by train at 9.25 a.m. for Aslockton, the members walked thence to Whatton church, where Mr. Montagu H. Hall, in the absence of the vicar, read a descriptive paper by the late vicar, the Rev. T. K. Hall. The church, which is dedicated in honour of St. John of Beverley, now consists of a chancel, central tower and spire, and nave with north and south aisles and porches. A south transept was destroyed in 1808, and the chancel was rebuilt in 1848 and the tower in 1870. The remainder of the building is chiefly fourteenth-century work. There are no old fittings except the font, which is of a curious local type, and dated 1662. The church contains some interesting monuments, which were described by Mr. Hope. The earliest is the effigy of Sir Richard de Whatton, known to antiquaries from the engraving by Stothard, but since restored. The next is an early fourteenth-century canon of Welbeck under an arch in the north aisle wall, and a third is a fine alabaster tomb with shields of arms in low relief (partly restored) and effigy of a knight of the Newmarc family circa 1380. There is also an incised slab to Thomas Cranmer, father of the Archbishop, who died in 1501. Some interesting fragments of the early effigies of another knight and his lady and of a fourteenth-century village cross with figures of saints are preserved in the north aisle.

The journey was next continued to Bottesford, past the village cross and the stocks and whipping post, to the parish church, the architectural history of which was described by Mr. E. B. S. Shepherd. It was, he said, a building with a complicated story, and appeared to have been built up by degrees in the fourteenth and fifteenth centuries round an earlier church, which it gradually replaced. The chancel had been rebuilt early in the thirteenth century with side chapels of two bays, which had since been destroyed. The fine and lofty tower and spire were of the fifteenth century. Mr. Hope described at length the unrivalled series of

tombs filling the chancel, consisting of (1) a small Purbeck marble effigy of a knight that commemorated the heart burial of Robert Lord Ros at Croxton Abbey in 1285, (2 and 3) the alabaster tombs and effigies of William Lord Ros, K.G. (ob. 1414), and his son, John Lord Ros (ob. 1420-1), brought here from Belvoir Priory at its suppression; and (4 to 11) the monuments and effigies of the first eight Earls of Rutland and their countesses. There are also two good brasses to former rectors in the floor. The present rector, Canon Jackson, also contributed some historical remarks.

After luncheon the party drove on to Langar Church, an interesting building planned in the thirteenth century, though little of the original work remains. The chief features were described by Mr. Harold Brakspear, F.S.A., and Mr. Hope contributed some observations on the Choworth and Scrope tombs.

The party then journeyed on to Wiverton Hall, on the kind invitation of Mrs. Chaworth Musters, where Mr. Bailey described the ancient gatehouse incorporated in the modern house, all that remains of the mansion built in the reign of Henry VI.

Subsequently the party left for Bingham station and thence by train to Nottingham.

It will be seen that, although the great modern mansions in the Dukeries were not included in the meeting, nor the old home of the Byrons at Newstead Priory, most of the principal ecclesiastical buildings in Nottinghamshire were visited, and a special endeavour was made to include a typical series of the lesser-known churches which are apt to be overshadowed by the greater glories of the minster or ruined abbey. Owing to the dearth of old domestic work, Wollaton Hall was the only important Nottinghamshire house visited, Hardwick Hall being in Derbyshire. The most striking features about the churches are the late character of undoubted fourteenth-century work, and the abundance of monumental effigies, most of which are admirable examples of mediæval sculpture. The near proximity of the homes of the Chellaston "kervers" and the later "marblers" at Burton accounts for the large predominance of alabaster work.

#### THE CAMBRIAN ARCHÆOLOGICAL ASSOCIATION.

This society held its fifty-fifth annual meeting at Newtown, Montgomeryshire, during the week ending the 3rd inst. There was a smaller gathering of members, and the local residents participated less actively in the excursions than usual. Both circumstances, however, contributed to render the meeting more pleasurable and profitable to the antiquaries who were present, and minimised the difficulties that in practice always crop up in the management of an unwieldy party.

Newtown and neighbourhood for twenty miles round cannot be said to contain any single object of antiquarian interest of the first order, and, indeed, the same may be said of the county of Montgomery generally. Yet there exist within easy distance a number of minor objects that, by reason of their diversity, make the district an eminently suitable one for the operations of an archaeological society; and it must be noted that these antiquarian delights are situated amid natural beauties hardly to be equalled, and certainly not surpassed, by those of any other district in the kingdom. The entire county consists of hills and dales, the former growing ever more imposing and the latter ever more romantic as the traveller passes onward from east to west. The Severn pursues a devious course through its central districts from its source upon the slopes of Plynlimmon to its disappearance as a Welsh stream a few miles beyond Montgomery, and wherever it is met between these extreme points its beauties are as fresh as they are varied. Then the woods of Montgomeryshire, what antiquary could resist their charm? Not collected here and there to constitute one of the distinctions of a nobleman's demesne, but scattered broadcast over the whole shire, and clustering most thickly along the slopes of the hills, they are a never-ending source of delight to the tired eye of a town resident. These manifold natural attractions are in many spots around Newtown disposed in such exquisite and harmonious combinations that the historical student is altogether tempted to forget the influence these physical features have exerted upon the rise

and fall of tribes and races, and in the gradual evolution of the England and Wales of our own day. In no part of this island can the study of historical geography be more fruitfully followed than in the county of Montgomery.

The visitors commenced operations on Tuesday, July 30, by a drive to a spot now known as Gro Tumps, a short distance to the north-west of Newtown. This is an excellent specimen of the kind of defensive position formed of an artificial mound of earth, the base of which was surrounded by a deep moat. These mounds were, no doubt, crowned by wooden structures which the destructive agencies of lime and man have effectually removed. The moats were flooded when a stream could be conveniently adapted for the purpose, or were left dry when water was not at hand. To these strong but circumscribed holds was attached a flat piece of ground varying in extent as the surface permitted, and surrounded by an earthen wall. The example seen by the archaeologists at the outset of their journeyings was the signal for the outbreak of strong differences of opinion, which found frequent expression during the meeting, as to the builders of these structures and the consequent period of our history to which they belong. The late Mr. G. T. Clark examined many of them, and described most of those in the region around Newtown in an able paper, entitled "The Moated Mounds of the Upper Severn," printed in Vol. X. of "Montgomeryshire Collections." From both the architectural and the historical evidence, Mr. Clark came to the conclusion that this class of fortress was constructed by the Teutonic tribes whose amalgamation produced the general terms "England" and "English," and his conclusion has been received without hesitation as having the balance of probabilities in its favour. When advanced by the Ven. Archdeacon D. R. Thomas in an excellent paper upon the fortified posts of the district, read the evening after the visit to the Gro Tumps, Mr. Clark's conclusions were vigorously assailed by Colonel W. E. Morgan, R.E., of Swansea, author of "The Prehistoric Antiquities of Gower," and formerly Director of the Ordnance Survey of Wales, and by Mr. Romilly Allen, F.S.A. Both gentlemen argued ably in favour of the post-Norman origin of these structures. It is clear that the term "Saxon burh," which is frequently applied to them, conveys an inaccurate impression of their builders, for they are found in districts into which Teutonic tribes never penetrated in times to which the structures themselves may be considered as probably belonging. But it by no means follows that they must, therefore, be the work of the first Normans, though their easy adaptability for short sieges, and their usually favourable situation, would, no doubt, cause them to be utilised by that eminently practical people. The mound of Gro Tumps is 40 ft. in diameter at the summit, about 50 ft. in height, and between 140 and 150 yards in circumference at the base. The outer side of the moat was defended by an earthen wall. This earthwork is situated upon the Severn, whence water for the moat was drawn by means of a cross-cut. The bridging of the moat in these fortresses is not always easy of explanation owing to the absence of stonework, but the example seen by the party on this occasion seemed to offer a solution by the presence of a small mound on the outer side of the moat, upon which trunks of trees probably rested. The church of Bettws was the next point of call, and introduced the visitors to a typical example of a Powysland edifice. The churches of the district have for the most part been so ruthlessly restored within quite or comparatively recent periods that it is difficult for a visitor, without further evidence, to judge whether the restoration has followed and preserved the mediæval characteristics of the edifices. The general plan is of the simplest—an aisle and chancel marked off, in most instances, by no architectural division, and a squat western tower. This latter is most usually crowned by a short oaken structure, which in many instances follows and continues the external line of stonework, and is finished by a low roof; in other cases a little diversity is produced by imposing upon the first wooden structure a smaller one, also of oak, forming a true belfry. The exceeding plentifulness of wood and the relative absence of stone is the explanation of these peculiarities, but it is rather strange that greater elegance and grace were not reached in the external use of timber. These towers have, in the main, resisted the

restorer; their great strength has kept them uninjured, and their want of height has preserved them from the accidents to which taller and more elaborate towers are subject. Though the church is dedicated to St. Beuno, a Celtic saint of the sixth century, the name Bettws marks it as having been once annexed to one of the great military orders—in this instance that of St. John of Jerusalem, which had a hospital at Halston on the Shropshire border. The church contains a brass commemorative of a former vicar, Sir John ap Meredyth, of Powys, who erected it in 1531, during his own lifetime. It is of poor character, but worthy of note as the only memorial of its kind in the entire county. Sufficient of the ancient glass has been worked into the modern windows to prove the superiority of the workmen of old. The parish chest, now inside the tower, has been made from a single oak; it is an example of the magnificent timber for which Montgomeryshire has always been famous, and of the absence of all artistic feeling in its maker. Upon a steep height commanding splendid views over a great stretch of country stands the ruins of Dolforwyn castle. The natural strength of the position no doubt caused it to be selected for the erection of a castle which should form an effective protection to the rich district between this spot and the Salopian plains. Possibly a castle may have risen here soon after Earl Roger of Montgomery had fastened his hold upon the district, but the ruins now visible are those of a fortress of the early thirteenth century. The ability and success of Llewelyn ap Iorwerth, the ablest political chieftain that Wales ever produced, and one of the signatories of Magna Charta, compelled the English barons on the marches, from the mouth of the Dee to the mouth of the Severn, to look to their strongholds. Earlier and more primitive castles, that had hitherto sufficed against the simple methods of warfare of the Welsh, were not sufficient defences against the modes of fighting which they soon learnt from their enemies. It is to this period that we must assign the construction of Dolforwyn Castle, of Dinas Bran near Llangollen, of Tretower, lower down the marchland, and of Grosmont and Skenfrith at the southern end of the Welsh border. During the reign of Henry the Third the Welsh made great advances in their struggle against the English. The latter had to fight hard to keep their ground, and it is to this reign therefore that the construction of the baronial castles along the border is to be attributed. The subjugation of the Welsh by Henry's son, the building of great concentric fortresses from Flint to Harlech, which were centres of political administration as well as impregnable seats of military power, and the growth of the royal resources coincidently with the decline of the baronial power, all contributed to the gradual decline in importance of the strictly baronial holds, and they seem to have been completely dismantled at an early period. Thus in 1387 this castle of the Mortimers is returned as "worth nothing," and in 1398 as "in ruins." So effectual has been the destruction that it is impossible to make out with any degree of certainty the principal parts of the edifice; nevertheless, it should not be missed by a visitor to Powysland.

Tregynon Church has been restored without taste or discretion, and may pass without further comment. Gregynog Hall, the residence of Sir James Joicey, M.P., who has recently acquired it from Lord Sudeley, is a fine residence containing in the dining-room, the only one seen by the party, some beautiful oaken carving, the old portion of which bears the date 1636 upon three heraldic shields. Llanwnog Church is of the usual Montgomeryshire type. Its claim to consideration arises from its possession of a rood screen and loft of beautiful workmanship. The church is undergoing restoration, so that it was difficult for the visitors to inspect this object with the care and attention it deserves. The carving is rich and executed with the greatest delicacy. The west front differs from the eastern face, but the whole is of the same period. It is a very fine example of good Perpendicular work. The window that about a century ago occupied the chancel is now in the north wall; the glass is of the late fifteenth century, and bears a representation of the patron saint attired as a mitred abbot, and with the inscription S'te Gwennoc. From this church the party proceeded to an interesting specimen of Montgomeryshire domestic architecture called Maesmawr, the residence of the now extinct

family of Blayney. Owing to some misunderstanding the visitors were not admitted inside, but were forced to content themselves with admiring the exterior. Powysland is full of similar examples of black-and-white houses, and so many did the archaeologists see that one whose *indifer* lay in another direction expressed himself as sick of them. Their general plan is an adaptation to a timbered district of the Jacobean style of residence, the effect of the immense oak beams which are painted black, and the intermediate spaces, which are filled with rubble and plastered white, being exceedingly pleasant.

On Wednesday the party made a toilsome journey to the scene of a defeat inflicted upon Henry III. by the Welsh at a spot called Cwm y Ddalfa, the glen of the capture, when William de Breos, one of the most turbulent barons of his day, was seized. The celebrated Hubert de Burgh, the Justiciar of England, started the erection of a strong fortress in the neighbourhood to curb the Welsh, but, according to the story told by Matthew Paris, was soon obliged to relinquish his design; whence King Henry III. satirically christened the half-built fortress Hubert's Polly. After climbing to the supposed site of the castle, called Pen y Castell, the tired archaeologists unanimously agreed with the king. Continuing their walk they arrived at the spot termed the Moat, in the immediate vicinity of Kerry Church. This is a fine example of the moated mound, and produced a recrudescence of the discussion of the preceding day. Kerry Church is the scene of one of the most interesting incidents of mediæval ecclesiastical life of which we have authentic information, namely, the contest in 1176 between the Bishop of St. Asaph on the one hand and the celebrated Geraldus Cambrensis for his diocese, the Bishop of St. David's, on the other, for the right of visitation and patronage. The full story of the mutual excommunications pronounced by the respective dignitaries upon the other, the triumph of Geraldus, which he celebrated by ordering the ringing of the bells, "*simul omnes trine intervallo*," whatever that may precisely mean, are they not related at length in the works and words of the victor? Time and the spirit of compromise have so far adjusted the matter that the church is now attached to the diocese of St. Asaph, though the more solid advantages of appointment still lie with the Bishop of St. David's. The very edifice that was the occasion of the quarrel may be traced in the larger building of to-day. The church consists of nave and chancel and north aisle, divided by eight rounded arches. The four westernmost piers of this arcade are of the Norman period of architecture; the arch springs directly out of the pier and has a simple chamfer. At a later period the church was lengthened to the eastward by the construction of other arcades. The piers of these arches are octagonal, and are finished off with cushion capitals; the third pillar from the eastern end also bears the ball-flower ornament, and the mouldings of the capitals of the two easternmost piers are more elaborate than the rest. The round arch of the earlier arcade was confined in the later enlargement. The chancel consists of the four easternmost bays of the south aisle, and in the south wall is a piscina of the period of this addition to the original church. The font, which is also of the same date, is octagonal in shape and bears upon its several faces the emblems of the Passion. The windows are modern. There is a western tower, with the usual timbered belfry, and buttresses of the Late Decorated period, but these have been much altered in character at a considerably later period. One of the bells bears the inscription "*Sancte Egevir ora pro nobis*," though the church is dedicated to St. Michael. The patron saint of Penstrowed, originally believed to have been the mother-church of Kerry, is Gwrie, and it was suggested by Archdeacon Thomas that the form upon the bell is derived from that of the original saint of the entire district. The parish registers commence in 1609. There are monumental slabs to various members of the allied families of Herbert and Long, from the latter of which is descended the Right Hon. Walter Long, who was born at Dolforrgan in this parish. After luncheon the party proceeded by train to Welshpool to visit Powis Castle, the Castell Coch or Red Castle of the Welsh chronicles. Architecturally Powis Castle was so completely altered in the seventeenth century that its original features are now confined to the

western towers which guarded the entrance into the mediæval castle. There are a few good pictures, and the view from the terrace is superb. Welshpool Church is a spacious edifice, and, though restored within recent years, it still retains the side galleries so dear to the eighteenth century. The nave is of great width, the chancel arch not reaching the northern angle by many feet. A south aisle was added about two centuries ago, no doubt when the galleries were erected. The western tower is heavy and poor in character. Welshpool possesses a small but interesting museum which is now undergoing arrangement by Professor Boyd Dawkins. It contains several carved capitals of Early English design from the dismantled abbey of Strata Marcella a few miles distant, but its principal treasure is an early sanctus bell of what is known as the Celtic type which once belonged to the church of Llangwstenin. The controversy on the pre-Norman or post-Norman date of the moated mounds broke out afresh on a visit to the Tomen (mound), a fine mound, the base court of which has been transformed into a most perfect and restful piece of green turf on which the game of bowls is played.

Thursday saw a visit to another moat, this example being upon the slope of the hills in the parish of Llandinam. It is peculiar by reason that in addition to the usual base court it has a larger enclosure opening out of the first court. This may have been a British camp to which a subsequent race of invaders added one of their own type of structures. To antiquaries desirous of studying this branch of archaeology no better example can be chosen than the one here referred to, and it has the merit of accessibility, being only a few minutes walk from the railway junction to which it has given its name of Moat-lane. With the exception of the edifice which occupied its summit, it must be in almost the same condition as when it was first constructed; the moat is well defined and still contains some water, and the base court and outer enclosure are easily traceable. Llandinam Church has been so thoroughly restored as to present in its structure few objects of interest to the ecclesiastical antiquary. The ancient font, which has found safety in a retired corner, though terribly mutilated, bears sufficient evidence of its Late Norman date. A carved wooden reredos of sixteenth century workmanship is preserved in the church. It is divided into five compartments, the centre panel representing the temptation of Adam and Eve, and the remaining panels having respectively on the left the angel and the lion, and on the right the bull and the eagle, the figures emblematic of the Evangelists. Llandiloes church, which was next visited, burst with the effect of a revelation upon the astonished visitors. Here, in a retired district of Wales, is a parish church that must always have been far too large for the population. Not only so, but the edifice internally is one of the most beautiful in the Principality. It consists of a nave of five bays, a finely proportioned chancel, and a north aisle. The great feature of the building is the imposing arcade of Late Transitional work, developing at the western end into pure Early English, which divides the nave from the aisle. The piers are clustered and have the keel moulding, and were it not for a certain stiffness in the carving of the capitals might be considered a little later in date than they probably are. There has long existed a tradition that this arcading was brought from the Cistercian abbey of Cwmhir about 20 miles distant, at or soon after the dissolution of that monastery in 1536, and after a careful comparison of the fragments still remaining at that place with the work at Llandiloes church, the late Mr. S. W. Williams, F.R.I.B.A., felt no hesitation upon the matter. The timbered roof is also said to have come from Abbey Cwmhir, but as the spans of the two buildings varied considerably this conjecture is certainly erroneous. It is more probable that the people of Llandiloes, having acquired a beautiful arcading for their church, determined to renew the building at the time when the arcades were erected. The beams are terminated by large shields, one of which bears the date 1512, which would fit in with the hypothesis just advanced. The church is under the invocation of St. Idloes. The north aisle was once decorated with mural paintings, of which not a trace now remains. The corbels supporting the wall-plates are formed of three conjoined billets, but the westernmost four are of exquisitely carved foliage. The east window is a good example of the Perpen-

dicular period; the windows on the northern side are later, and chiefly square-headed. The tower, as is customary, is at the western end, and is of the local type crowned with a wooden belfry. It batters considerably, and is buttressed at the angles. The string course is carried round the west door as a label. The tower may have been higher than the usual Montgomeryshire examples, indications of a second stage being visible about 6 ft. from the top of the present stonework. The arch leading from the interior into the nave is lofty and pointed. The font, after having been missing for many years, was discovered not long ago in a heap of rubbish and placed upon a modern base; it is octagonal in shape and ornamented with four circles within a larger circle upon each face. It is of the Early English period. A helmet of the sixteenth century is supported on a bracket fixed to the western end of the nave. The time occupied in the examination of the church compelled the party to give only a cursory glance at the old Town Hall, a black-and-white structure of the early seventeenth century. On the homeward journey a stiff climb was undertaken to the summit of a hill called Cefn Carnedd, upon which are the remains of a fine British camp. The surrounding wall of the camp follows the outline of the hill, the area enclosed being about twenty acres. There were no remains of dwellings within the camp, as is usually the case in the stone enclosed camps of which Carn Goch and Tre'r Ceiri are notable examples, nor were there any indications of the presence of water. It would appear, therefore, that these camps were only used as posts to which a tribe could, with its cattle, retire when attacked by a superior force. The final halt upon a long and fatiguing day was called at Caersws, said to be the site of a Roman station. Though no mention of such a station occurs in the Itinerary, there can be little doubt of the presence of the Romans at this spot. Traces of a square enclosure with rounded corners are plainly visible close to the present railway station, and it is said that during the construction of the railway buildings a quantity of Roman pottery and tiling was discovered. Fringing excavations were made about half a century ago with similar results, and small finds are frequently reported. Influenced by the projected visit of the Cambrian Archaeological Association to the neighbourhood of Caersws, the Powysland club determined to make a few trial diggings under the direction of Dr. E. Davies Kees, but the spots were ill chosen, or the fates were unpropitious, for nothing has yet been discovered. Simultaneously, however, with this work, the digging of the foundations for a new house, distant about 100 yards from the line of the camp, was proceeding, and here a large quantity of broken Samian and Upchurch ware was unearthed, together with broken amphoræ and other unmistakable signs of Roman occupancy. Several coins turned up, one of the reign of Vespasian. In the centre of the excavated space a well was discovered completely choked with rubbish. The walling of the well is inferior to that of genuine Roman work, and the greater probability is that it is the construction of the British tribe which entered upon the Roman heritage after the withdrawal of the legions. Caersws seems to be the point of convergence for four or five roads having Roman characteristics, and commands the entrance to several valleys. But the absence of inscriptions forbids the idea that the camp, if it ever really existed, was anything more than a temporary fortification thrown up most probably during the operations against the Ordovices, and abandoned as a military post after the submission of that tribe. On the other hand, there seems no room for doubt that a small colony of Roman civil officials had been planted and continued to reside here until towards the close of the Roman domination. The neighbouring lead mines of Trefglwys would be almost certainly known to them, and they were much too practical to neglect their development. Cambrian antiquaries cannot be expected to be experts upon the Roman period. The Roman stations in Wales, with the exception of Caerleon, were few and insignificant, and their destruction in subsequent times appears to have been so complete that little has been left to reward the labours and widen the knowledge of the Welsh archaeologist. It would therefore appear to be desirable that such an authority as Mr. Haverfield should be consulted upon the finds already brought together by Dr.

Davies Rees before further excavations are attempted.

On Friday the party made an excursion round Newtown, proceeding first to the ruins of the old parish church, beautifully placed on the banks of the Severn. The eastern and western ends, the southern wall, and the western tower are still standing, and sufficiently proclaim it to have been another instance of the local type. It appears, however, to have dated in part from an earlier period than most of the neighbouring churches, and it may well have been the pattern from which surrounding parishes derived their form of edifice. Richard Owen, the social reformer, was born at Newtown, and lies buried here. The very name Newtown postulates the existence of an older community, and history informs us that this earlier settlement was called Llanfair in Kedewen. The town became subject to the great border family of Mortimer, successive members of which fostered its progress by granting important municipal privileges to it at various times. These, most probably, called a new town into existence after complete quietness had been assured upon the Welsh border by the power of Edward I., for we find in a Charter of that King of the year 1321 the style changed into "the new town in Kedewen." The old church just mentioned had possessed a beautiful oaken screen, which, upon the desecration of the church about thirty years ago, fell upon evil days. After much hacking about, part of it was re-erected in the new edifice that had been built at the other end of the town, where it proved offensive to the aesthetic taste of the parishioners. It was again removed, and relegated to a cellar in the vicarage, whence it was disinterred for the inspection of the visitors. The modern church is by the late Mr. Penson. The party next started upon the drive to Montgomery. The Severn is here a gently-murmuring stream, having the highway as companion through the beautiful low-lying ground. Several places of historic fame were passed in the course of the drive, such as the Ford of Rhyd Whiman, a favourite spot for the solemn settlement of disputes between the English kings and the Welsh princes; and, further on, the Ford of Rhyd-y-Gors, the scene of a great Saxon defeat by Gruffudd ap Llewelyn, in 1037, concerning the locale of which Mr. Freeman has made a sad error in his "Norman Conquest." The party soon crossed Offa's Dyke, which in this neighbourhood is easily traceable, and at Chirbury found themselves on English soil. Chirbury is the site of an Augustinian priory, of which almost every vestige has vanished except the nave of the priory church, which, being parochial, was consequently saved from the general destruction. The work of obliteration was so effectively performed at Chirbury that there are now no church records, no parochial terrier, and, so the visitors were informed, scarcely any documents relating to the priory in the British Museum or Record Office. The modern parish council finished what their forbears had accidentally spared, for upon the establishment of the first council and the handing over of the parish books, they were ordered to be destroyed as worthless. The present building consists of nave and aisles, being without doubt the priory church cut off short of the crossing. The period is Early English. The original east window, which is placed in a shallow chancel erected in the eighteenth century, is formed of three plain lancets, and at the western end of the south aisle is a pair of lancets of plain but effective work. The piers of the nave are much out of the perpendicular, but the roof timbers have been secured by iron ties. There is a fine western tower crowned by a timber balustrading. The font is curious; it is circular in shape, with two projections on opposite sides which appear to have been intended as handles; at equal distances between these projections are two others of different character. The chalice, dated 1595, is a very good specimen of the communion service of the period; the cup is of enormous size, of much later date, and the paten is of the late seventeenth century. Portions of the dismantled priory are built into the churchyard walls, and the lower part of a beautiful clustered column, which appears to remain *in situ*, would probably be found to mark the northern transept of the conventual church. A number of mediæval tiles discovered at various periods have been fixed in the porch of a neighbouring house, but though pro-

ted by a mat, they should be removed from the many chances of destruction which beset them. A fine library of chained books, which may possibly have been formed in the latter years of the priory, and which was certainly enlarged by the early Protestant vicars, is now at the vicarage. Chirbury is, of course, forever associated with the sainted Lord Herbert. Lymore is a house about a mile from the town of Montgomery of interest to antiquaries as presenting an example of seventeenth-century black-and-white domestic architecture which has escaped internal renovation or alteration. It has been described and illustrated in an early volume of "Montgomeryshire Collections." Several of the rooms still contain the tapestry with which their walls were covered when the house was in the heyday of its glory. It is the property of Lord Powis, and is maintained as a shooting-box. Montgomery possesses attractions for all sorts and conditions of antiquaries, its stock of show places being so varied as to present examples of the fortified structures of three distinct epochs. Its strategical importance early recommended it to the race which, for better name, we may continue to call the Ancient Briton. The people who built the camps on the tops of the rounded hills of this district and enclosed them with earthen walls must have recognised the suitability of the height now called Flridd Faldwin for the purposes of a defensive post. They accordingly established one there, whence its masters must have long dominated the surrounding country. Later on came the people whose chieftain favoured the conical mound, the deep enclosing trench, and the outer courtyard. This structure is on a gentle eminence, far below the Briton's breezy camp, yet with a prospect extending many miles in each direction that would remove the danger of a surprise. Next came the builder of the strong stone tower and the scientifically constructed stone wall. Disdaining the sites of his predecessors, he fixed upon a hill intermediate in height between the two. Montgomery appears in Domesday (A.D. 1086) as a castellum. Does this refer to the moated mound, or had Earl Roger of Shrewsbury already commenced operations in masonry? Could we but answer this apparently simple question, we should have gone far towards the settlement of the much-debated problem of the period of the moated mounds. We can at any rate say with confidence that if Earl Roger had selected the site of the present castle and had built his keep ere Domesday was compiled, one of his successors or vassals started afresh in the reign of Henry III. at the structure, the ruins of which exist at this day. The restricted space at the top of the hill was levelled and enlarged by the construction of walls of solid masonry on the sides where the hill fell sharply away. The entrance to the castle was to the north-west, the only direction from which it could be attacked, and a strong keep rose on the northern scarp a few yards from the gateway towers. Beyond this it is impossible to make out the features of the structure, there remaining little else than immense mounds of broken and shapeless masonry. Traces of the outer defences can be observed following the slope of the ground. The final object of the visitors' attention was the church of Montgomery, which must have been erected coterminously with or directly after the castle. It consists of nave, chancel, and north and south transepts. The work is of the early thirteenth century, and, though plain, exceedingly good of its kind. A single-light window in the south transept is especially noteworthy, it having light and graceful shafts with capitals, whereas all the other windows of the same period have only the usual rounded and unbroken moulding. The eastern window is good perpendicular. There is a screen of very good workmanship which is said to have come from Chirbury Priory. The tower is at the crossing, and is of the massive Llanbadarn Fawr type. Two effigies are preserved within the church, one of a knight of about the close of the thirteenth century, the other a knight of about a hundred years later. There is also the tomb of a Herbert who died in 1600, in the monstrous style of that period. Small as was the attendance, the present year's meeting was one of the most interesting of the Society's recent fixtures. The programme of work was found too long, and items had to be sacrificed each day. This is so common a fault in the arrangement of such gatherings that expostulation seems useless; it has the humanitarian excuse that it spares the

long-suffering horses, and brings the travellers back to dinner at reasonable hours. The address of the president for the year, Lieut.-Col. E. Pryce-Jones, M.P., was a model of what such occasions should produce from gentlemen who do not profess to be themselves learned in the archaeology of their district. Nothing could exceed the courtesy of the local honorary secretaries, Mr. R. Williams, F.R.Hist.S., and Mr. Pryce Wilson Jones, nor the general excellence of their management. The hospitality of the gentry of the county of Montgomery is well known to every visitor to the county; it was displayed to an even greater extent than usual towards the party of antiquaries, and was accompanied by such genuine kindness and consideration as to double the gratification of its recipients. Three papers were presented to the evening meetings, one by the Ven. Archdeacon of Montgomery upon the camps and fortified posts of the county, which produced the interesting discussion already referred to; the second by Mr. R. Williams, F.R.Hist.S., on "Dolforwyn Castle"; the third on "Wanten Dyke," by Mr. J. M. E. Lloyd. Perfect weather accompanied the party throughout, and contributed not a little to the complete success of the meeting. There is but one subject upon which a grumble is fairly admissible, and for which the permanent officers of the Association are solely responsible. The members who make it a point of attending the annual meetings are occasionally presented with a programme of the particular district in which they happen to meet that is not only a guide to the antiquities of the district and a compendium of information respecting hotels, trains, postal business, and the like, but is of permanent value to the inhabitants. At other times they receive nothing beyond a meagre list of the places to be visited. The present occasion happened to be the turn for one of the latter productions. Members visiting Newtown for the first time had to find out as best they could the names of hotels, and a few of them who had been unable to procure this local information were doomed to wander from house to house in search of shelter. The programme was accompanied by a sketch-map which was worse than useless, for it was not furnished with a scale of distances. Such a programme is unworthy of the committee of the Association, and, it is to be hoped, will never be repeated.

SANATORIA FOR CONSUMPTIVES.

STATED shortly, the *raison d'être* of a consumptive sanatorium is to provide a centre constructed on the latest hygienic principles, where advantage is taken to the fullest extent of sun and air, to teach the temporary occupants to adequately appreciate these blessings, and so to regulate their lives that they may go forth as apostles of health, carrying their knowledge into their various family circles.

The movement for what is called the open-air treatment of tuberculosis patients has been extensively practised in Germany for many years. As long ago as 1859 a sanatorium was erected in Silesia, at Gorbersdorf, and since then the various German States and insurance boards have actively entered into the scheme, and numerous sanatoria have been erected. Some are in the nature of hospitals, adopting as *part* of their treatment open-air living. Others are in the nature of homes where patients in the earliest stages of consumption are received, and open-air living is the *primary* treatment, seconded by regular discipline in hours of rising from bed, of eating, and retiring to rest, by bathing, by graduated exercise—in short, by living on hygienic lines.

It may be convenient to lay down the main lines on which a sanatorium should be constructed, and in this connexion it is to be borne in mind that it is recognised by nearly all medical men that to get anything like satisfactory results, patients should be admitted in the first stage of the disease. In fact, cures appear to be an inverse ratio to the duration of the disease. We will, therefore, assume that patients enter the sanatorium when first attacked. They are not then incapable of moderate exercise, nor are they expected to be confined to their beds. Of course it may be that temporarily they are weak, and that rest in bed may be necessary for a time.

First as to site. A sandy soil should be selected, so that rain may be readily absorbed.

\* A paper read at the recent meeting of the British Congress on Tuberculosis, by Mr. Edwin T. Hall, F.R.I.B.A.

Clay is relatively impervious, and a soil with clay not far from the surface gets waterlogged. Evaporation creates ground mists or fogs, which are very bad for consumptives. Again, a low-lying site on sand or gravel is bad, because the subsoil water percolates through the subsoil, and renders the earth moist and cold. This percolation also forces outwards ground air or air charged with carbonic acid gas, a slow poison. The site should, therefore, be elevated, but not on the summit of a hill. The ideal site is the southern slope of a hill sheltered from north and east winds by trees. On sandy soil the trees will generally be some species of pine, the resinous exudation from which is health-giving, imparting a clean and brisk flavour to the air. It is sometimes held that the near presence of sheets of water is objectionable; but that, I think, only applies to ponds and semi-stagnant waters. A rapid river may be beneficial, owing to the exchange of air to which its movements give rise. Witness the case of Nordrach in the Black Forest, where the Harnerbach, coming from the higher lands, passes through the village, close to some of the buildings of Dr. Walther's Colony; or again Harlachang, near Munich, standing on a hill above the torrential Eiser. The life and movement of such waters has a bracing and enlivening influence on humanity, whether sound or sick.

Given, then, a site on sandy subsoil amid pines, the next thing is to place the sanatorium in an elevated position. It is not good to put it on a flat plain. Shut in by woods, with a strictly limited prospect, the influence on a patient is bad. There is a sense of confinement most depressing to all nervous temperaments. Hohenhof, not far from Cologne, is high up the mountain, with beautiful and very extensive views of and beyond the Rhine. Nuremberg-Engenthal, in Bavaria, commands a wide stretch of scenery. From Falkenstein, in the Taunus mountains at Cronberg, near Frankfurt, the panorama is only limited by power of sight. Dr. Walters' Sanatorium at Crookesbury Ridges, in Surrey, has in a less elevated position also extensive views. Again, there should be a wide clearing on the south side of the building, and in a less degree on the other sides. Admit to building and to gardens plenty of sunlight. The curative value of sunlight, with its germ-destroying power, is immeasurable. The clearing, too, gives the sense of freedom and lack of restraint. The charm of the seaside is largely the gratification of this sense. Another point of great value is to set the building well away from a high road, and in a sandy district this is of especial importance. Dust of any kind is, of course, very bad for affections of the throat or respiratory organs, and the dust from a high road, laden, as it is liable to be, with faecal matter, and carried about by high winds, is worse than all. Of course, a good water supply is essential. Where a public service is not available, a well should be sunk on the higher side of the sanatorium. It will there not be in danger of contamination from sewage, and, also, once raised to the surface, the water will flow by gravitation to the building—a great saving in expense of maintenance.

Sewage purification and disposal are important matters. I found among the South German institutions—both sanatoria and general hospitals—that it was the common practice to treat the sewage with an infusion of sulphur earth, a natural product of which, I believe, there are considerable deposits near Cologne. The mixing was a very simple process. At Falkenstein the mixture was contained in a closed vessel placed in the outlet chamber of a divided sewage receiving tank. The inlet chamber received the sewage, from which by a screen or tray, paper, &c., was separated. This chamber, at a certain level, emptied itself by a siphon. To the top of this siphon a small pipe from the mixture vessel was attached, and as the sewage passed it drew a charge of the mixture by suction. The effluent was then conveyed from the second chamber to another receiving tank at a distance divided into two chambers, and ultimately to four settling tanks, used in rotation, and after a period ranging from two to four weeks, the liquid was discharged on to the land.

At the Nuremberg General Hospital, which is quite new, a more elaborate apparatus is used. The main drains discharge into a cesspool or receiver, with an outlet branch at the level of the inlet pipe. This trough discharges on to a species of water wheel contained in the central of three open brick tanks. The two

side tanks contain the sulphur earth mixture, kept in a state of agitation to prevent precipitation. The rotation of the wheel is arrested as the bucket comes into position under the trough and is filling. While the filling is going on two small streams of the sulphur earth mixture flow in from the sides. The treated sewage then passes over a weir to a channel, with an iron screen over it to catch foreign substances, and thence to two large circular settling-tanks, intended to be used alternately, with funnel-shaped bottoms about seven metres deep in all. Suction-pipes are fixed to near the bottom of these tanks, and the heavier deposit is pumped up to a hydraulic press when the sewage is formed into cakes to be carted away for manure. The liquid from the tanks passes away.

At Harlachang, after similar treatment with sulphur earth, the sewage passes into the rapid Eiser, and I am told all the sewage of Munich passes into the river without ill effects, owing, I suppose, to the tremendous current.

A Nordrach the sewage goes into the ordinary closed cesspool. When this gets full it is emptied by means of a portable enclosed apparatus, probably known to many officers of health and sanitary engineers. Briefly described, this is a cylindrical closed tank, mounted on cart wheels, with a long flexible suction-hose. When the suction-pipe has been let down to the bottom of the cesspool, a charge of chemical explosive expels the air from the cylinder through a valve, and the vacuum is immediately filled with sewage. This is carted away and spread over the land.

I did not hear of any case in South Germany where a septic tank treatment was adopted. In the new sanatorium at Wokingham, in Surrey, there is a septic tank with two or three settling tanks attached, and from these the effluent passes on to the land. Where the sewage can be delivered into a public sewer there appears to be no medical objection to its doing so without treatment. In London the sewage of the large scarlet fever and diphtheria hospitals so passes, and no evil results follow, as was conclusively proved by a Local Government Board Commission.

The great danger from consumption appears to arise from bacilli contained in sputum. When the moisture evaporates these bacilli are blown about and become a source of danger. In all sanatoria provision should be made for dealing with sputum by cremation. At Nordrach each bedroom is fitted with a pair of lavatory basins—one for washing, the other for spitting. It seems to me the waste pipes of the latter must become contaminated, and in any case I do not like the idea of sputum passing into a pipe.

We have now dealt with these general features, coming to a consideration of typical sanatorium buildings.

It will be noted that all that I submit to your notice differ radically in planning. Unless otherwise mentioned, all the German institutions have double casement windows, are heated by low-pressure steam radiators, and are electrically lighted. In some of the latest institutions, as Harlachang and Krailing, the administrative buildings are separate and distinct from those containing patients, but not so in others nor in earlier ones. For example, at Falkenstein, which is the first institution I propose to describe, the kitchens, larders, &c., are in the basement of the block. It must, however, be borne in mind that this institution commenced in what had been a private house, and although by additions it is now a large place, the original house remains part of it. The staff, except the medical men, live in the block.

It will be seen by the general plan that there are detached blocks. Engine and boiler houses, stables for horses and cows, workshops, laundry, &c. The main building, containing a basement and three floors above, one of which is in the roof, consists of a centre block facing E.S.E., with two symmetrical wings at a slightly obtuse angle, enclosing on three sides a terrace garden. To the N.E. is a very large dining-hall opening on the S.E. to a wide verandah continued in a N.E. direction to the chief doctor's house, and forming a covered promenade about 65 metres, or, say, 200 ft. long. On the south side a long annex, with an enclosed verandah or gallery facing west, leads to another doctor's house containing the consulting-rooms, &c. On the east side of the gallery are the gardener's house, mortuary, &c. The total frontage in a straight line measures about 1,000 ft. The sanatorium has accommodation for one hundred and twenty patients of either

sex, with seventy single and twenty-five double bedrooms, generally of a large cubic capacity. There are three main staircases. The staff consists of a medical superintendent with three assistants, a managerial staff of four. The total staff, male and female, indoor and out, is ninety-two. There is one waiter to eight or ten patients. There is no regular staff of nurses and no separate accommodation for them. They are only taken in if required by patients. The patients' rooms generally face south or east, but others north and south-west; the majority are in single file on one side of a corridor, but there are several rooms on the other side. There are two slipper baths for patients and a douche-room in the basement. The water-closets are contained in the building. The floors of bedrooms are covered with linoleum; the walls are plastered. There are no rounded angles. The ventilation is by the windows.

The *liegehallen* are attached to the building, forming wide verandahs on the three sides of the terrace at the level of the basement floor, which is above ground on this side. In the grounds there are large open pavilions and smaller summer-houses containing couches, and all fancifully and luxuriously appointed, and in the building are winter garden, reading, writing, billiard, and music rooms. Altogether this is a high-class residence, medically conducted, where wealthy patients may live cheerful lives in beautiful air and glorious scenery. It may be worth noting that each patient's serviette is kept in a linen envelope—claimed as a very sanitary arrangement.

Ruppertsheim, a few miles distant, near Königstein, is modern, is for poorer patients, and is more strictly a sanatorium. It is on a plan a flat crescent three stories in height, above a basement with two short wings, and accommodates 122 patients—ninety male, thirty-two female. There are no separate administrative buildings, but the kitchen is in the west wing, on the ground floor. There are eighteen rooms with one bed, seventeen with four beds, and six with six beds, of a cubic capacity per patient, for men, of 20 to 30 metres, and for women, of 30 to 40 metres. The staff consists of the medical superintendent, with two assistants, a secretary, and a lady superintendent or matron. There are three female and two male nurses, and twenty-four male and female servants. There are two main staircases from bottom to top. The patients' rooms face south and are in single file, with a corridor on the north side. There are nine slipper baths for the patients and one douche for each sex, all in the body of the building. The floors of bedrooms are of plain uncovered deal boards; the walls and ceilings are of plaster. In the older portion of the building there are no concave angles to the rooms, but in that most recently built all angles are concave except at the floor, where they are most needed. At the ends of the building there are two-storied *liegehallen*, about 12 ft. wide. There are no fireplaces, and the ventilation is by the windows and doors. One of the medical officers, who courteously showed me over the institution, was of opinion that wards with as many as six beds were not so good as those with only two or three. He thinks a few balconies to bedrooms, large enough to take beds, are desirable.

The Nürnberg Heilstätte, Engenthal, a few miles from Heintfeld, is a modern building—a parallelogram consisting of basement, three other floors and ten rooms on the gables. There is no separate administrative block of buildings. It affords accommodation for fifty patients in seventeen rooms, two containing five beds, two with one bed, the others having three beds each. The cubic capacity per patient is 40 metres. There is one staircase, which is not sufficient for so high a building with so many residents. All patients' rooms face south, and have a corridor on the north side. Dr. Bauer is the medical superintendent, and has no assistant. There are three female nurses and seven female servants. There are two slipper baths and three douches, all in the body of the building. There are six water-closets for patients, similarly placed. A handsome dining-room faces south, and is served from the kitchen in the basement. The floors are of uncovered deal boards. Walls and ceilings are of plaster and have concave angles, except at floor, which omission the doctor laments. The plastered surfaces are artistically decorated, a feature which I commend to the notice of our hospital authorities. The *liegehallen* are quite detached, one being on the

terrace at the south-west of the sanatorium, the other in the woods. Ventilation is by windows and doors. Dr. Bauer thinks it better not to have more than three beds in a room.

I should like to mention the great attention paid to the details of furnishing in this institution. The bedsteads are simple in manufacture, having footboards of iron covered with linoleum, with spring mattresses. The bed mattress is filled with Kapock, an Indian fibrous material of which Dr. Bauer speaks well. The bedside tables are of zinc, enamelled, with glass tops, and zinc drawers, having rounded ends for cleanliness. In these the soap trays, tooth brushes, &c., are kept. The centre tables in the wards have ash tops unvarnished, and the legs and framework are of varnished deal. There are no drawers to them.

The next building I propose to describe is one of quite another type of plan.

The Sadtisches Sanatorium at Harlaching is a few miles' drive from Munich, on the top of a hill, in a fir forest. This building may be described as a hospital. It is primarily for consumptives, but a few other cases of non-infectious character are received. They also make a speciality of dental surgery, and the dental operating room is fitted with every kind of the most modern dental appliances. Accommodation is provided for 212 patients, half of each sex, but the ultimate scheme is to add buildings so as to accommodate 600 patients. Dr. Hermann is the medical superintendent, and there are three assistant medical officers. The remaining staff consists of a manager, a legal clerk, a clerk, and one matron. There are twenty-one female nurses (members of a sisterhood), two male attendants. Of servants there are nine female and eight male, including engineering staff. The hospital is a building E-shaped on plan, three stories in height, with, I am glad to say, no basement rooms. Its main entrance frontage is towards the north. There are twenty-eight wards, six with twenty beds, six with twelve beds, twelve with single beds, and eight isolation rooms, each with one bed, but I think some of these last-named are appropriated for three-bed wards. The cubic capacity per patient is 36.76 metres. There are four staircases, two in the centre and one at each end, and one lift. The windows reach nearly to the ceiling. There are twelve slipper baths and three douches, two slipper and one douche at each extreme angle, all contained in one room divided by partitions. There are eighteen water-closets for patients, badly arranged, each group of three with a slop sink being placed in one room, in the body of the building, with only one window. It is surprising to find such an arrangement in these modern buildings—an arrangement which the medical superintendents all condemn and lament.

The aspect of the wards is as follows:—The twenty-bed wards are axially east and west, with windows north and south. On the south side of the wards, three stories high, are the *liegehallen*, about 12 ft. wide. Dr. Hermann thinks these are very conveniently placed, but too wide, and owing to the fact that they are of solid masonry, arched on each floor, they keep off too much sun. Had they been 9 ft. wide with pillar construction they would, he thinks, have been admirable. There are other *liegehallen* in the grounds. The twelve-bed wards are north and south, with windows east and west. The single-bed wards face east or west respectively, the isolation rooms north. The floors of the wards are of concrete covered with linoleum. Walls and ceilings are plastered. No angles are rounded, a fact of which the doctor complains. Ventilation, when windows are closed, is by means of warmed air inlets and by outlet shafts. Time is too short to allow me to describe these in detail. The fresh air is warmed by passing through a case containing a steam radiator, but Dr. Hermann complains that the air so heated is too dry. To me this statement was interesting, because I have always had this objection to steam radiators for heating such inlets. The same result does not arise when hot water is used.

The lighting is by electricity, and all the clocks are electric. The day accommodation for patients is excellent. There are two adjacent dining-rooms in the centre for each sex, looking into the large quadrangles, and a reading-room to the south of these. There are two handsome chapels, one for Roman Catholics, one for Protestants.

The administrative block is north of the sanatorium. It is said to be sufficient for the

ultimate scheme. The plan is very complete and admirable. There are, however, two points I venture to criticise, and these are:—(1) placing the linen drying-rooms over the washhouse and finishing-room; (2) placing the disinfectant in the basement of the main block. The plan of the whole is a hollow square surrounding an open quadrangle. The south block contains the doctor's and priest's residences. On the south-west is the laundry; on the south-east are the kitchen, with dining-rooms attached, for female staff, the residences of the assistant-matrons and nursing sisters. The west side contains the residence of the manager, servants, and engineer; and to the north of these the cow and pig stables, poultry house, &c., with fodder-lofts above. The east side contains the stables, coachhouse, &c. The boiler-house and engineer's department are in the centre of the quad. The rest of the basement contains heating apparatus, disinfectant, and very extensive cellars. The cow-stable is a regular feature at most of the sanatoria, and those I have seen are beautifully kept. The importance of pure milk is evidently fully recognised. I quit the description of this institution with regret. One of the most modern consumption hospitals visited by me, I found it to be full of interest in all kinds of detail, and the many hours Dr. Hermann kindly gave up to explaining everything are amongst my most pleasant recollections.

We turn to yet another type of plan in the Volkshelstatte Krailling, about half an hour's walk from Planegg, in Bavaria. The whole district is a forest, principally of pines, and the Volkshelstatte is beautifully placed, and seems the ideal abode of rest and seclusion. This is strictly a sanatorium for open-air treatment of men only. It receives 120 patients. Dr. Krebs is the chief medical officer. He has two assistants. The matron does the correspondence, otherwise the institution is managed from Munich. There are twelve nursing sisters and three male attendants. There are twenty-one servants in all, male and female. The sanatorium contains a basement and three other stories. It consists of a central block with two wings at widely obtuse angles, and at the south-east and south-west intersections there are pretty chapels for Roman Catholics and Protestants respectively. There are three patients' rooms containing 100 beds; thirteen rooms have single beds, fourteen have two beds, six have three beds, two have four beds, six have five, and two have six; but 120 patients can be accommodated if necessary. The cubic space in single bedrooms is fifty metres, in other rooms from thirty to thirty-three metres per patient. There are two staircases. The doors have fanlights, but not to the ceiling. All patients' rooms face south, and in the multi-bedded rooms there are four with side windows. There is an unobstructed corridor on the north side of the rooms. The kitchen is in the basement of the central block, the dining-room being on the ground floor on the south side, with a sitting-room adjacent. There are four slipper baths in one room on the ground floor, divided by curtains, and one douche room. There are eighteen water-closets, in groups of three, arranged on each floor in one room in the heart of the building with only one window. There is on each of the upper floors a room fitted with lavatory basins on both sides, in all there are thirty basins, the best accommodation I have seen in any sanatorium. The floors of all rooms are covered with linoleum. The walls and ceilings are of plaster, with concave angles, except at floors, the omission of which is, of course, complained of.

The patients' bedrooms are all on the first and second floors. The northern side of the ground floor of the west wing contains the matron's and nurses' rooms; that of the east wing the consulting room, lavatory, doctors' bathroom and the patients' baths. On the south of these are corridors, and south of these again are the *liegehallen*, about three metres wide. These form a structural arched verandah beneath the patients' bedrooms. There is also a *liegehalle* seventy-eight metres long in the woods, fitted with eighty couches. The ventilation of the patients' block is by the window and by a central turret. The medical officer's rooms are on the north side of the central block, with a committee-room on the first floor.

At some distance east of the sanatorium is an administrative block connected by a subway. This block consists of basement and three other stories. It contains the boiler and

engine houses, disinfectant, accumulator-room, laundry, stables for cows and horses, and residences for the remaining staff and female servants.

I conclude the description of German Sanatoria with that of the Nordrach colony in the Black Forest, nine miles from the little station of Biberach. To describe this colony one must picture the locality. The road from the railway ascends, and for some miles follows the river Hammerbach. The scenery is beautiful. On either side the hills covered with trees slope up from the river, sometimes gently, sometimes in bold escarpments. In the grey distance they rise to small mountainous heights dotted everywhere with trees, save for patches of greensward. In the midst the rapid river sparkling in the sun, which on the day of my visit also glistened on the snow-clad trees. Rising ultimately to a height of about 1,500 ft. above the sea, we passed through Nordrach, where a sanatorium of the hotel type has just been erected, and some half-mile or more beyond we come to Dr. Walthers' famous colony for consumptives. Here there is no sanatorium proper, but many small buildings dotted about the hill-side. We alight at one containing the office and kitchens, with a long dining-room for patients attached. A wooden structure, simple enough in character, with windows on both sides and a gravel terrace on one side. High up the hill to the left is the largest building of three stories, containing rooms for twenty patients. It consists of a long centre, with two short wings at obtuse angles of some 100 deg., so that they face to the S.S.E. and S.S.W. At the intersection of the angles are hexagonal turrets. There are two staircases. In this building, as in the others, each patient has a separate bedroom of about fifty cubic metres capacity. All have single casements with fanlights, which latter are hung at the top and open outwards. There are balconies to some of the rooms. The ventilation is by the windows and doors. Each bedroom is fitted with a douche bath, supplied with hot and cold water. There are only two slipper baths altogether, and these are solely used for medical purposes. There is only one water-closet for every ten patients, placed within the building. The floors are of wood, covered with linoleum. The walls and ceilings are of narrow boards, beaded not only at the edges, but on the solid parts, and there is a moulded wooden cornice. There are no concave angles. It is strange that all canons of smooth surfaces and rounded angles are here set at naught. The explanation probably is that there is no dust in the place. I have before noted that each bedroom is fitted with two lavatory basins, one for washing, one for sputum. There are no *liegehallen*. Dr. Walthers objects to them. He says: "You should not make patients lazy, but active." There are a few ordinary summer-houses in the grounds. Another building of two stories is provided for sixteen patients, and the rooms are only about 8 ft. high. It is not only electrically lighted, but heated by electric radiators of the doctor's own manufacture. The medical staff consists of Dr. Walthers and another physician of equal standing as the doctor was careful to tell me. There is a secretary. There are no nurses as such, the doctor holding that nursing, as we know it, "ought to be done by the medical men." There are two female servants to every ten bedrooms. In parentheses it may be interesting to know that Dr. Walthers strongly objects to the plenum system of ventilation, about which we lately heard a good deal, of which he has had experience.

There are various other buildings forming the colony dotted about here and there. Among them is the doctor's house, with the sitting-room made so that in the summer the external wall or enclosure can be completely removed. It will be seen from the foregoing that Nordrach has nothing of the structural sanatorium about it. It is a hamlet on a mountain side, "far from the madding crowd." Nature provides varied refreshment for the body and mind. For the rest, it is a little world where patients place themselves under a medical man of strong, masterful personality, who orders their being generally. To live in such a position a life of simplicity under hygienic rules, to have no cares, and to be interested in to be, as nearly as our mortal frame will permit, free of disease. We have, however, to deal not with an ideal place and life, but with the workaday world. For ordinary mortals, and specially for those of our poorer brethren, we must bring to their aid everything that sanitary know-

ledge of building can give. Before leaving this part of my subject I wish to express my indebtedness to the following medical gentlemen, who extended to me the most courteous hospitality and gave me in the readiest way every information and assistance in my investigations:—Dr. Hess of Falkenstein, Dr. Curschemann of Ruppertsheim, Dr. Bauer of Nürnberg, Dr. Hermann of Nürnberg, Dr. O. Pischinger of Krailing, and Dr. Walther of Nordrach.

It may now be of interest to briefly describe one or two modern English institutions. I have had the pleasure of visiting the sanatorium near Crookesbury Ridges under the direction of Dr. J. Rufenacht Walters. Dr. Walters is too well known as the author of an admirable book on sanatoria to need any other introduction here. His sanatorium is a small one, for twelve patients, but I am glad to learn it is about to be doubled. The sanatorium consists of twelve single bedrooms on one floor, all with French casement windows facing south and opening on to a verandah, canvas covered, for reclining couches. A corridor runs the whole length behind. There is one nurse, and she lives in the building. The cubic capacity of the rooms per patient is about 1,100 feet. The floors are of wood covered with linoleum. The walls and ceilings are of plaster, with slightly concave angles, except to floor—a regretted omission. The ventilation is by the windows, by inlet tubes, and by shafts at ceiling level across the corridor to the north. In the new block there will be fanlights to the doors, so that all the room may be scoured with air. There is a room with one slipper bath and one earth closet, both opening from the corridor. In the new block these will have disconnecting lobbies. The dining-room is attached, and also opens from the corridor, and beyond it are the kitchen and offices. The heat is by hot water radiators. The lighting is by electricity.

It might be here opportune to consider the question of the best position for *lieghallen* or reclining verandahs. There is some difference of English medical opinion on the subject. It is held by some, and it seems to be a sound doctrine, that if patients are so delicate that they must lie down the greater part of the day, they should be as near to the medical man and to their own bedrooms as possible, so as to save the strain of even a short walk. In three of the five typical German buildings described, the *lieghallen* form verandahs to the actual buildings, and the convenience of these is approved by the medical chiefs of all, the only complaints being in regard to excessive width and solidity of building. In one of the other there are reasons of planning why this cannot be done. At Crookesbury Ridges the same verandah scheme is adopted and approved, and is to be repeated in the new block. In the perspective view shown by me as a design for a sanatorium, I have adopted this arrangement with a balcony over for half the building, and it will be seen the width and construction is such that the German objections do not apply. Dr. Hermann thought this arrangement very satisfactory.

A larger institution is that called Pinewood, at Wokingham, designed by Mr. F. Jones, who has kindly lent me a plan. This has accommodation for sixty-four patients, each in a single bedroom of an average cubic capacity of 1,100 ft. The institution consists of a central block of three stories, containing the consulting-rooms, offices, and dispensary, with residences for the medical staff above. Detached from this on either hand is a patients' block of two stories, containing thirty-two single bedrooms. These blocks face S.E. and S.S.W., and each has a corridor on the inner or northern side. There is one staircase. The ground floor walls are of brick; the first floor is enclosed by wood framing covered with boards and tiles. There is one resident nurse in each block. The douche and slipper bathrooms and water-closets are on the north side of the corridor, and open directly from it. The windows are single casements which do not reach the ceiling. The doors have no fanlights. The floors are boarded and covered with linoleum. Walls and ceilings are of plaster. There are concave angles, except to floors, where angle fillets are fixed. The heating of rooms is by open fires, that of corridors by hot water radiators. Ventilation is by windows and doors. Lighting is by electricity. The administrative block is detached to the north, it contains a handsome dining-room, with service and nurses' rooms attached. Kitchen

and offices, with female staff bedrooms over, and other rooms adjacent. There is a laundry block with disinfectant, an engine-house, stables, &c.

I may now perhaps describe a sanatorium which the Brompton Consumption Hospital is about to erect at Frimley, in Surrey, from my designs. It is to accommodate one hundred patients, and, unlike the others, it is for non-paying inmates. There are fifty-two single bedrooms, twelve with two beds and eight with three beds. Every patients' room will face S., S.S.E., or S.S.W. Outside the central block is a wide paved terrace. It will be noted that, unlike the German Sanatoria, we have provided a large number of single bedrooms. By some it is held that for the poor, rooms with more than one bed are best, as patients like company. On the other hand, others—among them Dr. F. R. Walters—hold that it is better for the patient's recovery, be he rich or poor, to have a bedroom to himself. It must be remembered we contemplate that only first stage cases (with exceptions) will be admitted, and every inducement should be given to make patients get out into the open air as much as possible, the bedroom only being used at night. Of course, there are cases where it may be desirable for two or three to be together, as where bleeding is likely to occur, when one can help the other. We have therefore effected a compromise, fixing our maximum at three beds. Many of the German doctors with whom I have discussed the question favour this as the maximum when it can be adopted.

The sanatorium proper, or patients' block, is two stories in height, and consists of a central block with four radial wings or pavilions, all built of brick, the upper story tile hung on the brick. By this arrangement any one floor of the two sides of the four wings may be appropriated to women, leaving the others for men; and each group is self-contained, with its separate sanitary conveniences. It also affords much greater facilities for classification than could be found in one building of the ordinary type. The main entrance hall is in the centre, and behind it is a day room facing south, with two three-bed wards at the sides. East and west of the hall are the consulting and matron's rooms, dispensary, and sister's duty-room. The first floor has similar patients' and sisters' accommodation, a residence for the matron, and a bedroom for the housekeeper. Overhead, in the roof, are bedrooms, &c., for female servants. The pavilions are connected to the centre by enclosed corridors having windows on both sides. Each wing contains twenty-two beds. The corridor on the north side has no obstruction whatever to light and air. Opposite every room door there will be a window in the corridor, and as all doors will have fanlights carried, like the windows, to the ceiling, we shall get thorough ventilation, and even on hot sultry days the cooler air on the north side of the building will induce a current to the hotter south side. The windows will be casements, those on the ground floor open to the floor, so that, if necessary, beds may be wheeled out. The casements are so constructed as to keep out rats and other vermin while the windows may remain wide open. On the first floor there will be outside jalousie shutters, which can be closed either to exclude rain or intense sun heat, the windows remaining open. On the ground floor, rolling canvas blinds, like those over shops, will effect not only the same purpose, but will shelter beds or couches outside. By this means we get the advantages of a verandah. On each floor are two large linen rooms, and on the ground floor are boot-cleaning rooms.

Between each pair of pavilions is a sanitary tower, detached except for a cross-ventilated lobby. This contains all the patients' water-closets, baths, lavatories, and housemaids' closets. I have provided no urinals in the building. They are filthy things at best, and with lifting closet seats are unnecessary. For the nursing staff on duty, separate lavatories and water-closets are provided on both floors. There are two main staircases, and at the outer end of each pavilion a fire-escape staircase. The heating generally will be by hot water, throughout the building by electricity. The floors will be of wood covered with linoleum, and all walls and ceilings will be of plaster with concave angles everywhere. To the north of the sanatorium proper, and reached by a glass-covered way for wet weather, are the two patients' dining-rooms

and a general assembly hall. Behind are the kitchen block, female servants' hall and men's room, &c. At the east end is the nurses' home, to the west the medical officers' residence. Nearer the main road will be the laundry, boiler, and electrical engine houses, ambulance, mortuary, and gate lodge. There are two laboratories. The plans have received the most careful consideration of the medical staff, and I have particularly to express my indebtedness to Drs. Theodore Williams and Fowler, who, with the sub-committee, have gone minutely into every detail of the scheme.

In conclusion, may I be permitted to refer to the new Camberwell Infirmary in course of erection from my designs. There will be 800 beds in the institution. My reason for mentioning it here is, that the Board of Guardians have on the advice of the Medical Superintendents, Dr. Keats and myself, made special provision for treating tubercular patients. We have three large wards of twenty-four beds each, in which practically the whole length of the walls or enclosures on three sides are made to open, so that the patients may be said to lie in the open air, and above the wards are flat roofs with easy access, so that the patients can actually in the open air all day long.

As far as I am aware, this is the first Poor Law institution in the kingdom where this has been done, and we hope it may be the means of bringing open-air treatment to the poor at their own doors in a practical way.

#### THE NEW PUBLIC OFFICES IN PARLIAMENT-STREET.

The following letters on the above subject appeared in the *Times* of Saturday and Monday last:—

“To the Editor of the *Times*.”

Sir,—I fear that there is grave danger that the public offices about to be erected in Parliament-street will be spoiled by the action which the Government propose to take.

It will be within the recollection of your readers that the architect, Mr. J. M. Brydon, who had been selected for the work, unfortunately died before his drawings were completed. It now appears that, from motives of false economy, the Government intend to entrust the completion of the designs to the Office of Works instead of following the precedent which was set on the death of Mr. G. E. Street before the completion of the Law Courts, when Sir Arthur Blomfield was appointed to superintend the completion of the building. It is true that the First Commissioner of Works proposes to add Mr. Brydon's chief assistant to his staff for this purpose, and I have not a word to say against this gentleman, not against the permanent staff, who no doubt are thoroughly competent for their own special work; but that work is not the erection of vast buildings of national importance.

The character of Mr. Brydon's design is such that its effect when completed will depend far more than it is easy for the public to realise, upon the proportions of the cornices and mouldings, and the design of window doorways, and innumerable other minor parts of the building. Mr. Brydon was unable to complete the drawings for these details, and if, therefore, this important mass of buildings is to be carried out in a manner creditable to the country it is of the utmost importance that an architect of the first ability should be appointed to complete the designs of one who had been selected with much care from among the foremost members of his profession.—I am, Sir, yours faithfully,

ARTHUR W. SOAMES.

House of Commons, July 30.

Sir,—I think that some one who is not an architect should support Mr. Soames's appeal to the Government to appoint an architect of distinction to finish Mr. Brydon's incomplete drawings of the details of the new public offices. My excuse for joining in his appeal and for writing this letter is that I was a member of the Select Committee of the House of Commons that inquired into and reported in 1897 upon the sites for the proposed new government offices. In the general proposals which they laid before that Committee the Government showed an unusual liberality and a large appreciation of the importance of adding to the dignity and beauty of Central London. And Mr. Akers-Douglas, as Chairman of that Committee, and since then in his conduct as Chief Commissioner of Works, has displayed the most sincere and successful execution of this great scheme, and a constant desire to consult the best architectural opinion.

It is the more remarkable, therefore, that the Government and he should now hesitate to take a step which common sense would seem to dictate. It is possible, no doubt, that satisfactory effect may be given to Mr. Brydon's designs by the officials of the Office of Works, as directed by Mr. Brydon's chief draughtsman. But who is there outside the walls of that office who is not convinced that it is in-

initely more likely that these details will be satisfactorily and artistically worked out if their execution be entrusted to some architect of note?—  
Yours faithfully,  
75, Cadogan-place, S. W.,  
August 3.  
C. A. WHITMORE.

STR.—May I support the plea put forward by Mr. Soames that further steps should be taken by the Office of Works to complete the new public buildings in harmony with the intentions of the late Mr. Brydon? There is no financial difficulty, as ample provision was made by the Treasury for the architect's fees; 26,000l. was allotted for the Westminster buildings, and I understand that of this amount not much more than 10,000l. was spent during Mr. Brydon's lifetime. A very large balance, therefore, remains, and, while we all applaud the wisdom of Mr. Akers-Douglas in appointing Mr. Brydon's chief assistant to continue as draughtsman, I feel strongly that the money ought not to be intercepted by the Treasury.

The site is one of the finest in London, and it would be deplorable if we save a few thousand pounds and thereby imperil the dignity and refinement of our new Government buildings.—I have the honour to be your faithful servant,  
74, Brook-street, August 3. BALCARRES.

#### MAGAZINES AND REVIEWS.

The *Magazine of Art* contains an article giving, under the title of "The Home of the Royal Cambrian Academy," an account and illustrations of the fine old house called Plas Mawr, at Conway, built in the sixteenth century by Robert Wynne, and now the premises of the Cambrian Academy of Arts. The writing and illustrations—the latter very good—are both by Mr. E. W. Haslehurst. Stephan Sinding, a Danish sculptor whose work is the subject of an article, appears to be one of the modern school of mystics in sculpture; his "Terra Mater" and "Man and Woman" suggest the influence of Rodin. An illustration is also given of a remarkable Kashmir shawl (modern work) worked with a plan of the city of Sringer. The execution is said to be so fine as to give at first sight the impression of stamped work.

The *Art Journal* describes Taormina under the title "A Suburb of the Sun," the illustrations being by Mr. C. Kingwood, and Mr. Arthur Tomson illustrates Dorchester with pen and pencil; and yet again there is another descriptive and illustrative article of the same kind, on Rothenburg, by Mr. James Douglas. There is a fine illustration of M. Debat-Ponsan's charming picture, "En Plcin Air," as a frontispiece to the number.

In the *Studio* we come again on the Topographical article; Tréport being the subject. "Something too much of this," Mr. Alexander Fisher's article on "The Art of Enamelling" (continued from last issue) is really valuable, for it gives practical instruction in the technique of this fascinating branch of art.

In the *Artist* Mrs. Chance's paper on old and new furniture and on furnishing is very good in many of its remarks, especially as to the bad influence of fashion in turning out good designs and bringing in bad ones, but some of the illustrations, which we presume are supposed to be what we ought to like, are both poor and clumsy, and really not better than some of the despised trade furniture, only they are less hackneyed. Simplicity in furniture design need not descend into awkwardness and want of style.

The *Architectural Record* (New York) contains an article by Mr. Frank Fowler on "Mural painting and a word to architects." Mural painting appears to be receiving great attention in the United States, and Mr. Fowler's object in writing is partly to urge that the artist should be given his best chance by being entrusted with the colour-scheme and the decoration of a whole apartment. He instances (and justly) the serious mistake made in the Pantheon at Paris, by parceling out the interior among a number of painters of totally different styles. As he says, if Puvion de Chavannes had only had the whole, we might have seen a great work in enhanced instead of destroying the architectural unity of the interior. To the same number Mr. Caryl Coleman contributes an article on the rather new subject of "Episcopal Thrones and Pulpits." An article on "New York Apartment Houses" by Mr. C. H. Israels, with a number of plans, may interest the builders of London apartment houses, though they may not think they have anything to learn from it, New York requirements in the way of plan

and arrangement differing considerably from ours. The article on the "New York Stock Exchange," in its present edition a piece of ancient classic architecture designed by Mr. Post, is of value on account of the plans and the detailed description of the construction and arrangement.

The *Architectural Review* (Boston) in No. 6 of its eighth volume, gives a number of interesting designs of memorial gateways erected at Harvard University; all, apparently, designed by Messrs. McKim, Mead, & White. A gateway is a very suitable form of memorial erection, and the examples given here, though they are all rather simple and unpretending in form for memorial gateways, are in the best possible taste, and show at the same time a great deal of variety. Besides those given in the plates, there are several other examples in the text, accompanying an article on the subject by Mr. W. D. Swan. The number includes another article, with some small illustrations, on "Recent Buildings at Harvard University," by various architects. They all seem to affect a very quiet and decidedly English style. This may be called a Harvard number of the *Review*.

The illustrations in the Berlin *Architekturwelt* show a curious collection of examples of the eccentric cleverness of modern German architectural and decorative design. There are views of a restaurant by Herr Reimann, which, except on the entrance or business-front, looks rather like a country chateau. There is a charitable institution in brick, with semi-Gothic details of a rather wiry character (Herr Diestel). Then we come on an effectively treated apartment house by MM. Schilling and Wiehe, a very nice piece of street architecture; followed by a large country house that looks like a church. Then we come to what are, let us hope, the examples of imaginary architecture only, for anything more rampant in its eccentricity than the "Landhaus" from the Berlin art exhibition of the year it would be difficult to find; it is a kind of nightmare. Messrs. Schulz & Schlichting's Casino (also an exhibition drawing) is something more reasonable; and Herr Reuters's competition design for the Dresden Rathhaus is a more sober and indeed somewhat heavy architectural conception; the same architect's sketch for a church is an almost lunatic design; on the other hand his sketch for a "Bismarck-Thurm" is rather fine, though the finish at the top is very ugly. Herr Reuters represents one type of German architectural design of to-day, in which the object seems to be to reduce everything to masses of wall and round stumpy columnar effects; it looks like an utterly unpractical school of architecture, suitable only for monumental towers and the like. The new school of furniture has its turn in the illustrations, and there are some examples of ceiling design of various degrees of eccentricity; that by Professor Seliger, with a figure with the feet pointing to each angle, and a symbolical representation of the sun and the starry heaven, is rather fine. Whatever may be said about the uncertainty of aim among English architects of to-day, we seem really to be very sober and collected in our aspirations in comparison with the Germans, if we may take the medley of this present periodical as typical.

The *Edinburgh Review* contains an article on the at present especially interesting subject of "Temporary Stars," for the appearance and disappearance of which no definite explanation is brought forward, though various suggestions are made; but the article is an able one by a competent hand. Another article which we may mention in the same number is that on "The Spectacular Element in Drama," in the main a defence of spectacular effect, which the writer thinks supplies the relief, for the less educated, in the absence of this resource, was fain to supply by the introduction of "comic business." It is rather curious to note that in following out this line of argument the writer of the article comes round (though without appearing conscious of the coincidence) to Voltaire's condemnation of the vulgarities of the porter in "Macbeth," as being quite out of keeping with the general spirit of the play.

In the *Quarterly* a paper on "The Dawn of Greece" reviews the recent discoveries in Early Grecian archaeology, especially in Crete.

The *Monthly Review* contains a long article by "Julia Cartwright" (Mrs. Ady) on the Castello di Milan, which has been in process

of repair and restoration (we hope not of too drastic a character) during the last eight years, under the direction of two architects, Signor Beltrami and Signor Gaetano Moretti. A plan of the castle is given (it is something rather new in England to find a literary review condescending to give plans of buildings), and a sketch of its history, together with photographs of paintings in which some of the former owners of the castle are introduced, or which are connected with its history.

In *Blackwood* the writer of the generally witty and thoughtful "Musings without Method" has a good deal to say, with which we are entirely in agreement, in regard to the neglect of old buildings of interest, and the indifference with which people in this country will allow an interesting old building to be pulled down, or a fine view to be spoiled by buildings of no charm. He speaks well and eloquently in regard to the subject of Hogarth's house, and of the view from Richmond Hill. But he falls into the common and vulgar error of attributing these vandalism to architects, who are in fact the strongest opponents of them. He must needs indulge in the usual easy sneer at the English architecture of the day. "The architecture of modern England is oddly suited. It buys its windows in Italy, its round towers in France, its tiles in Lambeth, and its decorations everywhere." This is of course a parody of a well-known speech in Shakespeare—Porcia's description of one of her suitors; but there is no point in it. Where are the round towers that are "bought" from France, or the windows from Italy? The prevalent tendency of English architecture lately has been to become decidedly English—to take the detail of our own classical buildings as a model. The sentence is therefore nonsense, and suggests that the writer has paid no attention to recent architecture. What follows is still more absurd, and in fact worse than absurd: "moreover, our architects have too often shown so keen a desire for a job that they have condemned as unsafe walls which, having stood the storms of centuries, were prepared to endure the centuries yet unborn." That is an utterly unpardonable libel on architects, who, as a fact, are almost always on the side of conservatism in dealing with old buildings; and in cases where an architect does condemn walls as unsafe, it is not possible that he is a much better practical judge of the matter than a literary man? It is not creditable to a magazine of the standing of *Blackwood* to publish such nonsense; but on these subjects, unfortunately, the editors of literary magazines are as ill-informed as their contributors.

In *Scribner* Mr. Frank Fowler, under the heading of "The Field of Art," asks what is the best heritage of the art of painting from the nineteenth century. In an American magazine we know the answer before we read. It is the latest school of France which is the heritage; beginning with Troyon and Rousseau and ending with Millet and Monet. We are shown that the revolt of Delacroix and Géricault against the Academic School was only half a revolt; that they still retained a convention of their own, and did not come into close enough contact with nature. That is true; Delacroix was thought a dangerous radical in his own day; we now see that he was nothing of the kind. We can also see—that Troyon and Rousseau were no more "natural" artists than Delacroix. They translated nature into an art of their own, they did not imitate her. It is now asserted that the latest school of all—Monet and the other impressionists, are the people who have led us into the true path in painting. So it seems to many people now; but how will it seem fifty years hence? Will there not be critics then who will find out that the Impressionists had not got hold of the real thing, just as Mr. Fowler can now see that in the case of Delacroix? In the same number is an interesting topographical article on "Rural New York"—the picturesque and rural element on the outskirts of New York, with illustrations showing what very primitive and very English-looking cottages and farms are to be found around the outskirts of New York.

In the *Century* Mr. Cole's "English Masters" series of engravings is represented this month by a very good translation of Turner's well-known work "A Frosty Morning," one of the finest of the works of his middle period. The frontispiece forms No. 6 of "Examples of American Portraiture," a portrait of a lady by

Mrs. Adelaide Cole Chase, an artist who is a native of Boston, and has studied under M.M. Jean Paul Laurens and Carolus Duran. The portrait is one with a good deal of original character. "Venice Gardens" is what may be called an ornamental article on this charming subject, by Mr. Lee Bacon, and is decorated with a profusion of ornamental borders and sketches by Mr. H. McCarter. An article on "Photographing by the Light of Venus," by Mr. W. R. Brooks, gives some surprising examples of photographs obtained, on a highly sensitive plate, from the light of Venus, without the interposition of any lens or magnifier. "What a Train-despatcher Does" may be of interest in giving us an insight into American railway working; we have nothing to learn from them in that way. It is amusing to read some of the specimens of telegrams—"Engine 309 leaking, and could not handle full train from Piedmont," &c. That is what comes of the American system of building locomotives cheaply to last only ten years, till the next new model comes up.

In *Harper* "The Birth and Death of the Moon," by Dr. E. S. Holden, is an admirable popular *resumé* of what astronomical science can tell us in regard to the past and probable future history of the moon and its mechanical relation to the earth.

The *Pall Mall Magazine*, under the title "Napoleon at Play," gives the history and some illustrations of his Consular house at Malmaison, now (through the munificence of M. Osiris) preserved as a Napoleonic museum. "Over a hundred miles an hour—the story of the Monorail," by Mr. Wayland Smith, jun., is a paper on the subject of the projected monorail line from Liverpool to Manchester, with illustrations of the railroad and carriages. The writer sees everything *concolor de rose* in regard to his favourite system of railway, and we can by no means accept all his conclusions, which still want the practical test of experience, but the subject is likely to be of increasing interest. In support of the argument that high speeds are safer and more practicable on a monorail than on the ordinary double track, Mr. Smith cites, what certainly seems to be to the purpose, the superior flexibility and safety of the bicycle in turning corners at speed, as compared with the tricycle. But then the bicycle rider brings his bodily balance into play, leaning over to the inner side of the curve as he turns, to neutralise the centrifugal force. Is any similar action contemplated or possible with the monorail electric railway?

The *Westminster Review* contains an article by Mr. E. H. Selby Lowndes on "The Rural Exodus," an endeavour to arrive at the causes of the continual migration from rural districts to London and other large towns. Mr. Lowndes has a new theory to account for this, which may be correct. He thinks the causes are to be found in the dulness of country life and in the awakened ambition of the present better educated race of labourers, rather than in any housing or labour problem. An agricultural labourer who has had a temporary town berth and returns to his native fields, does so in a spirit of superiority of which he makes no secret. He has seen life, and his rural compeers are ambitious to see it also. There may be a good deal of truth in this. If so, what is the remedy? Perhaps the solution is suggested in the epilogue to Tennyson's "Princess." Let the influential and wealthy country gentlemen exert themselves to put more life and interest into their neighbourhoods.

In the quarterly *Journal of the Sanitary Institute*, the only important sessional paper is that by Drs. Kenwood and Butler on "Sewage Purification and Standards of Purity." The authors believe that the biological method of sewage purification is not only the most rational, but also the most effective, and that what may be termed percolating filters are much more effective than filters which are allowed to stand full for a time. They are also in favour of preliminary tank-treatment, although rather for the purpose of simple sedimentation than for any gain in purification effected by anaerobic bacteria. In the discussion Dr. Kideál insisted on the necessity of anaerobic treatment for the purpose of hydrolysing fat, celluloid, straw, vegetable fibres, &c. The authors' contention that the ordinary standards of chemical analysis are quite untrustworthy as an index of the character of an effluent appeared to meet with general approval, as did also their definition of a good effluent as one that will "not undergo offensive decomposition under any circumstances to which it is likely to be

subjected before finally reaching the sea." In a contributed article, Mr. Douglas Archibald draws attention to some of the defects of the biological treatment of sewage, particularly the small degree of purification effected, and suggests that chemical precipitation in tanks followed by filtration, will give much better results at little or no extra cost.

*Feilden's Magazine* contains an important article by Mr. Milton P. Higgins, on the possibility of getting a higher standard of general education among machinists, by a system of half-time school and half-time working extending over four years. The moral is of course that we can get the best work from the best educated machinists, those who combine intellectual education with familiarity with practical work. Among the other contents of the number are an article on "Modern Ice-making and Refrigerating Plants," and one, the first of a series, on "How Great Britain is Meeting Foreign Competition," this article dealing with the subject of electric traction. In the course of the article it is mentioned that some American managers computed that they could get as much work from English workmen in a fifty-hours' week as from American workmen in a sixty-hours' week. This is not what we generally hear, and is so far satisfactory. The writer considers that it is from the want of capital and enterprise rather than from any deficiency in the manual labour that England is losing her foreign trade.

In the *Engineering Magazine* is an article on "The American Locomotive as a High-speed Machine," in which the writer makes the damaging admission (which we are not in the least surprised at) that the nature of a large proportion of the railroads in America renders high speeds impossible, even with the best constructed engines. "There is no object in building higher-powered locomotives to drag trains up steep hills, and round short curves, or upon gradients more or less heavy, by brute force. There it is merely burning the candle at both ends, for it increases the expense of maintenance without improving the service." The criticism, it will be observed, is purely from the commercial point of view; the question of the safety of the passengers does not come in. A long article on "Great Electric Installations of Italy," by signor Bignami, will probably be of interest to English electrical engineers.

In the *Essex Review* (quarterly) an article on "The Dykes of the Thames" gives a *résumé* of a subject of both practical and picturesque interest, about which even Londoners, who live so near the lower Thames, for the most part know very little. It is interesting to find that some of the first dykes made to keep the Thames water within bounds were constructed by Dutchmen, brought over here in consequence of their national familiarity with the problem.

The *Church Builder* (quarterly) contains No. 8 of Mr. Micklethwaite's series of "Occasional Notes on Church Furniture," in which he is sarcastic (and not without reason) on the mischief done by "the practical man" who undertakes to carry out small repairs in the church from time to time without troubling the authorities to call in the architect.

We have received also the *Revue Générale*, the *Gentleman's Magazine*, and *Knowledge*.

### COMPETITIONS.

MALLOCK MEMORIAL, TORQUAY.—The result of this competition has now been published. The successful competitor is Mr. Donkin, F.R.I.B.A., of Bournemouth. The number of designs submitted was 79. Mr. Hine, architect, of Plymouth, assessed the designs on behalf of the Committee, and his recommendation of Mr. Donkin's design was accepted by the Committee.

NEW BRIDGE, WHITBURCH.—The wooden bridge that crosses the Thames between Whitchurch and Pangbourne is to be replaced with one constructed of steel, and with abutments of brick and screw piles; the new bridge, having a total length of 270 ft. in four arches, has been designed by, we understand, Messrs. Joseph Morris & Son, of Reading.

THEATRE, LOWESTOFT.—Lowestoft Theatre in the Marina has been rebuilt and renovated. The plans were prepared by Messrs. Ernest Runtz & Co., of London. The building contract has been carried out by Mr. George Eisey, of Kirkley. The building has cost between 6,000l. and 7,000l., and will seat 1,300 persons.

## Illustrations.

### COMPETITION DESIGN, HEREFORD MUNICIPAL OFFICES.

HIS design was submitted in the recent unsatisfactory competition reviewed in the *Builder* of July 20, the illustrations showing an attempt to provide the accommodation required in a convenient, workable, and architectural manner.

The street façade was to be executed in Portland stone, and the roof covered with stone slates.

The authors, Messrs. Bateman & Bateman and Mr. Alfred Hale, of Birmingham, submitted the drawings under the device of a figure within a green wreath.

We give the perspective view, section, and two plans.

### NEW COLLEGE, SCARBOROUGH.

We give the perspective view and two plans of this building, the architects of which are Messrs. Hall, Cooper, & Davis, of London and Scarborough, whose design was selected in a competition.

The building is to be constructed of local material faced with local red pressed bricks and stone dressings, the roofs being covered with red Ruabon tiles. The main entrance has a southern aspect, and the main road to the college is planned from Fley-road. Care has been taken to arrange the block so as to sever the master's house from the school and dormitories, and yet make the whole one building, the connecting link between the two being the kitchen. The arrangement of rooms on the south of the building comprises the main entrance, with inquiry office and entrance hall. To the east of this is the master's common-room and boarders' recreation and reading room, which is 29 ft. by 17 ft., and is fitted up with bookshelves and specially arranged so that the pupils may have its advantages for night study in lieu of the schoolroom. To the west of the entrance is the secretary's office and boardroom (the latter being adaptable to other requirements), and master's study, which is carefully arranged in order that the master may have access to the school apart from his residence. The dining-hall is to the north of the principal staircase on the first floor, and is capable of dining 100 scholars, the tables being arranged so that all the boys face the centre table. The plans show the room to have two spacious bay windows overlooking the sea. To the west of the dining hall is the servants' room, and adjoining is the kitchen and scullery. The servants' hall, china closet, &c., adjoin the kitchen. The master's house is at the south-west angle of the building, having a separate entrance, with convenient dining-room and drawing-room overlooking the south front, and adjoining the study.

The schoolroom is entered from the main entrance corridor, which corridor runs the whole block of school buildings, and could be extended with any future extension of classrooms. The schoolroom is 52 ft. by 24 ft., and is capable of assembling 200 boys. It is to be heated with hot-water radiators, and the plans show two large open fireplaces at each end in addition. To the west and south are arranged three classrooms, properly lighted, fitted with dual desks, heated with radiators and open fires, and arranged to accommodate ninety-six boys, in addition to which classes could be taught in the schoolroom and lecture-hall. To the north and east of the schoolroom is arranged the day scholars' entrance with vestibule porch. The chemical laboratory is planned to accommodate twelve boys at practical work at the same time, and is to be fitted with the latest chemical arrangements, working tables, &c., in accordance with the regulations of the Science and Art Department. The lecture-hall is to be fitted with desks, seats, and a demonstration table. To the west of the school arrangements are made for lavatories, clothes drying-room, and boarders' locker-room, fitted with a separate locker for each boarder, and provided with a lobby entrance from the grounds, by which the boys can reach their lockers and drying-room after football and other sports without using the main entrance. The first floor is reached right and left of the main staircase, and a spacious landing is planned with head assistant master's room overlooking it, to the right of which are the dormitories. Two dormitories

have seventeen beds each, and one dormitory nine. Each dormitory is overlooked by an assistant master from his bedroom. In the master's house there are five bedrooms, bathroom, &c., and the servants' bedrooms are immediately over the master's house, and completely cut off from the other part of the building. On the third floor is the nurses' bedroom, sick day-ward, and a sick night-ward, specially isolating any sickness from the other rooms. Here also is an extensive boxroom, fitted with box racks, and connected with a lift direct from the main hall. Five servants' bedrooms are shown, but the architects state that these can be extended when required. The whole building is to be warmed by open fires and steam radiators under low pressure. The ventilation will be by means of automatic or natural ventilation.

The contractors for the work are:—For bricklayers', masons', and plasterers' work, Messrs. Overton & Son; for carpenters' and joiners' work, Mr. Geo. Scates; for plumbers' and glaziers' work, Mr. G. F. Wells; iron-founder and smith, Messrs. Appleby & Brogden; tilers' work, Mr. Joseph Hargreaves; painting, Mr. Thos. Fidler. Mr. R. Dove was clerk of works.

Mr. H. C. Fehr has modelled a symbolical sundial with figures over the main entrance on the south front.

The school furniture and chemical laboratory and lecture theatre fittings are by Messrs. C. White & Co., London.

#### PROPOSED COUNTRY HOUSE, NORTH DEVON.

This is a design for a small house made by Messrs. Baillie Scott & Seton Morris, who however we believe are no longer in partnership.

The plan shows more attention to the differing requirements of aspect in dining-room and drawing-room than we sometimes find in small house plans. The drawing-room has its chief window west; the dining-room (which in so small a house would also be the breakfast-room) has its chief window east, but a small bay, out of the main line of lighting, gives the opportunity for a south outlook when desired. The kitchen is, we presume, top-lighted.

#### ADDITIONS, ROWLEDGE, NEAR FARNHAM.

This illustration is from a coloured drawing by Mr. John Fulleylove, R.I. It represents additions made to a small cottage having a large garden. The materials were local red brick and Portland stone. The work was carried out by Messrs. Thompsett & Kingham, of Farnham, from the designs of Mr. Thomas Batterbury, architect, of London.

#### ARCHITECTURAL SOCIETIES.

**ULSTER SOCIETY OF ARCHITECTS**—A special general meeting of the members of this Society was held in the rooms of the Society, 16, High-street, Belfast, on the 22nd ult. The chair was taken by Sir Thomas Drew, R.H.A. (President). The minutes of last meeting having been read by the honorary Secretary (Mr. N. Fitzsimons) were confirmed. Messrs. Craig, Jackson, and Tulloch were appointed to open ballot-papers for new members, and having handed in their report, the chairman declared the following to be duly elected, viz.:—As Member—Mr. W. J. W. Roome. As Associates—Messrs. R. Donnelly and J. V. Johnston. As students—Messrs. W. A. Douglas, E. R. Kennedy, and J. M. McGlade.—Sir Thomas Drew, in an address, congratulated the members on the rapid progress made by the Society since its formation, and expressed the hope that in a short time all the respectable architects of Ulster would be members and would be working together as harmoniously as the architects of Dublin and other large cities in the kingdom.—The Vice-President (Mr. W. J. Gilliland) made a statement on behalf of the Council as to the business transacted since the general meeting, held on May 28, and as to the prospects of the Society generally. He mentioned that seven meetings of the Council had been held, and, in addition, meetings of sub-committees for special purposes. Two representatives had been appointed to represent the Society on the council of the Royal Institute of the

Architects of Ireland, and the Royal Institute of British Architects had been officially informed of the inauguration of the Society, and had entered into official communication with it. The first appointment of architects, since the formation of the Society, for work of a public nature in the district—that of Messrs. Græme-Watt & Tulloch, for the new asylum buildings at Purdyburn for the Belfast Corporation—was considered, and the details of the terms, which were placed before the Society at the request of the Council, were discussed, and were reported as unsatisfactory. A resolution had been forwarded to the Town Clerk on June 12 complaining of this unsatisfactoriness. The points objected to were that no travelling expenses were intended to be paid, that the remuneration was under that recognised in the profession, and that there were various other conditions as regards approval of plans and arbitrary rejection of same on account of disapproval by the Asylum Committee, or, in case they exceed the architect's approximate estimate by more than 10 per cent., without his having the opportunity to recast them to bring the proposed buildings within the permitted cost limit. The opinion was expressed that when the Asylum Committee understood that the proposed conditions were unfair and unreasonable, the majority, at least, who only wished to be equally fair to the ratepayers and to those whom they employed, would at once make the modifications which were suggested, as, of course, it was entirely against the interests of the ratepaying community that any services, especially those requiring great care and skill—the absence of which in architectural work was so disastrous in result—should be inadequately remunerated.—A communication had been received from the Belfast Master Builders' Association in reference to the framing of a common form of conditions of contract, and as to other matters which they thought it would be to the mutual benefit of architects and contractors to discuss, and, if possible, settle. It was reported that sub-committees had been appointed by the Council of the Society and the Master Builders' Association to have a conference with this object, and also that communications should be opened with the Royal Institute of Architects of Ireland, so that these matters should be settled to apply all over the country, instead of merely locally. The technical instruction of architectural students had also been considered, and application had been made to the Technical Instruction Committee of the Corporation for representation on the No. 1 Consultative Committee of the Technical Institute, and the Corporation had agreed to co-opt two members out of four names to be submitted by the Society. It was felt that those members elected on the Consultative Committee would be of service in advising as to the art instruction of architectural students, and that the experience gained on the committee would enable the Society to decide at a later date the question of the advisability of the promotion of classes in the new Technical Institute specially for architectural students. A recent competition, which was unsatisfactory in its results, was referred to, and the hope was expressed that now when a professional Society was in existence to watch over the interests of its members, such would not occur again. The attention of the members was called to two resolutions of the Royal Institute of British Architects, passed on March 5, 1900, which read as follows:—1. "That it is not derogatory to the profession for an architect to sign his buildings in an unostentatious manner, similar to that adopted by painters and sculptors." 2. "That it is undesirable for architects to place their names on boards or hoardings in front of buildings during course of construction for purposes of self-advertisement." It was reported that the prospects of the success of the Society were of the most encouraging character, and it was expected that within a very short time the membership would include every respectable architect resident within the district. The members were urged to support the exertions of the Council by utilising their services in every possible way, especially by calling their attention to any matter of professional interest which came under the notice of any member. It was hoped by the individual endeavour of each member to support the objects of the Society as set out in its constitution, that the larger proportion, if not all, of the disadvantages and grievances under

which in the past the profession in the district had laboured would be ultimately removed.—On the motion of Mr. McDonnell, the action of the Council in renting and furnishing rooms was confirmed.—Mr. McDonnell moved "That the following four names be submitted to the Technical Instruction Committee, viz.:—Messrs. W. J. Gilliland, W. J. Fennell, H. Seaver, and N. Fitzsimons."—Mr. Tulloch seconded the motion, which was unanimously agreed to.

**LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY**.—The Leeds and Yorkshire Architectural Society recently made an excursion to Giggleswick, to inspect the new chapel now being erected at the Grammar School. The donor is Mr. Walter Morrison, and the architect Mr. T. G. Jackson, R.A. The visitors were entertained by the head master (Rev. G. Style), and were conducted over the chapel by Mr. R. Evans (clerk of the works).

#### APPLICATIONS UNDER THE 1894 BUILDING ACT.

At the meeting of the Building Act Committee of the London County Council, held on July 29, being the day before the Council adjourned for the summer recess, the proceedings were governed by the clause in the Order of Reference, which empowers the Committee at certain seasons to act on behalf of the Council in relation to matters included in the Order of Reference. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

##### *Proposed New Street out of High-street, Portland Town.*

That an order be issued to Mr. F. J. Stevenson, refusing to sanction the formation or laying out of a street for carriage traffic to lead out of the north-east side of High-street, Portland Town, St. Mary-le-bone (for Lord Howard de Walden).—Agreed.

##### *Lines of Frontage and Projections.*

**Strand**.—Retention of a projecting illuminated sign at the third-floor level in front of No. 45, Strand, extending beyond the general line of buildings in that street (Messrs. Wyson & Long for Messrs. Antiss).—Consent.

**Finchley-road**.—An iron and glass hood over the entrance to a house known as "Kidderepore," Finchley-road, Hampstead (Messrs. W. E. & F. Brown for Mr. G. A. Dunn).—Consent.

**Levisham**.—Ten houses, with shops on the ground floor, on the west side of Perry Hill, Catford, southward of the Two Brewers public-house (Mr. F. H. James).—Consent.

**St. George, Hanover-square**.—A wooden oriel window at the ground floor level, in front of No. 11, Stratton-street, St. George, Hanover-square (Mr. W. Woodward for Lord Welby).—Consent.

**Clapham**.—Three houses, with shops on the ground floor, on the north side of Battersea-rise at the corner of Limburg-road (Mr. G. E. Nield for Mr. W. J. Vokes).—Consent.

**Clapham**.—A one-story addition at the rear of the Prince Alfred public-house, Haines-street, Battersea, to abut upon Tweed-street (Mr. M. P. Saunders for Messrs. Watney, Combe, Reid, & Co., Limited).—Consent.

**Deptford**.—Fixing of two lamps at the White Hart public-house, Grove-street, Deptford, to overhang the public way in New-street and Grove-street (Messrs. Humphreys-Davies & Co. for Messrs. Style & Winch, Limited).—Consent.

**Fulham**.—Extension of the period within which the erection of one-story shops upon part of the forecourts of Nos. 19 to 26 (inclusive), Effie-road, Walham Green, was required to be completed, be granted (Mr. T. J. Evans for Mr. T. Davies).—Consent.

**Kennington**.—A one-story addition to the drill hall, No. 76, Lower Kennington-lane, Kennington, to abut upon Reedworth-street (Mr. G. A. Lansdown for the Commanding Officer of the 3rd Middlesex Volunteer Artillery).—Consent.

**Mile End**.—A railway station building on the north side of Mile End-road, Stepney, at the corner of Globe-road (Mr. C. A. Brereton for the White-chapel and Bow Railway Company).—Consent.

**Mile End**.—A railway station building on the south side of Mile End-road, Stepney, at the corner of Brantridge-street (Mr. C. A. Brereton for the Whitechapel and Bow Railway Company).—Consent.

**St. Pancras, West**.—An iron and glass shelter over the entrance to No. 13, Cumberland-terrace, Regent's-park (Messrs. W. H. Lascelles & Co. for Miss A. Curtis).—Consent.

**Woburn**.—Retention of two one-story shops (numbered 98B and 98C respectively) on the south side of High-street, Plumstead, abutting upon Mineral-street (Mr. A. L. Guy for Mr. W. H. O. Ainslie).—Consent.

**Newington, West.**—An extension of the period within which the erection of five projecting arc-lamps on the parapet wall in front of the Princess of Wales Theatre, Kennington Park-road, Kennington, was required to be commenced, be granted (Messrs. H. Greene & Sons, Limited).—Consent.

**Strand.**—A factory building on the east side of Martlett's-court, Drury-lane, at the corner of Crown-court (Mr. H. O. Ellis for Mr. L. Upcott Gill).—Refused.

**Hackney, South.**—A two-story cottage on the east side of Durrington-road, Clapton-park, Hackney, to abut upon Ashenden-road (Mr. H. M. Wakley for Mr. R. H. Barnes).—Refused.

**Lewisham.**—A house, with a shop on the ground floor, on part of the forecourt of No. 4, Belmont-hill, Lee (Mr. W. C. Banks for Mr. C. E. Banks).—Refused.

**Wandsworth.**—A block of residential flats on a site at the south-east angle of Franche-court-road, Earsfield (Mr. G. F. Grover for Mr. T. Hailstone).—Refused.

#### Width of Way.

**Woolwich.**—Buildings at the rear of No. 1, Beresford-square, Woolwich, at less than the prescribed distance from the centre of Beresford-street (Mr. A. E. Farnell for Mr. M. Barnett).—Consent.

**Southwark, West.**—A warehouse building on the east side of Pontypool-place, Valentine-place, Southwark (Messrs. J. Hoare & Son for Messrs. J. Pascall, Limited).—Consent.

**Whitechapel.**—Two blocks of dwelling-houses on the south side of Finch-street, Spitalfields, at less than the prescribed distance from the centre of Hope-street, and to exceed in height the width of that street (Mr. J. L. Williams for Mr. H. J. Brown).—Consent.

**Islington, West.**—A two-story building, to be inhabited by persons of the working-class, at the rear of Nos. 42 and 44, George's-road, Holloway, at less than the prescribed distance from the centre of George-street-mews (Mr. S. Allen).—Refused.

#### Width of Way, Lines of Frontage, and Projections.

**Strand.**—Retention of an iron and glass sign at the Savoy Palace public-house, Savoy-street, Strand, extending beyond the general line of buildings in that street (Mr. J. E. Chevers).—Consent.

**Chelsea.**—An addition on an existing porch and entrance lobby at the side of No. 123, Church-street, Chelsea, at less than the prescribed distance from the centre of Elm Park-road (Mr. F. G. Knight for Mr. F. Moscobles).—Refused.

#### Width of Way and Space at Rear.

**Whitechapel.**—A cottage and stables on the south side of Winthorpe-street, Whitechapel, next the East London Railway, with the forecourt fence at less than the prescribed distance from the centre of the street, and with an irregular open space at rear (Mr. J. Woodard for Messrs. Harrison, Barber, & Co., Limited).—Consent.

#### Line of Frontage and Construction of Building.

**Dulwich.**—A wood and iron office to adjoin Dulwich railway station, Thurlow Park-road, Dulwich (Messrs. Marten & Carnaby).—Refused.

#### Formation of Streets.

**Woolwich.**—That an order be issued to Mr. H. O. Thomas sanctioning the formation or laying out of a new street for carriage traffic to form a continuation of Roydene-road, Plumstead (for Messrs. G. E. Arnold & Co.) That the name Roydene-road (in continuation) be approved for the new street.—Agreed.

**Lewisham.**—That an order be issued to Mr. J. W. Webb, refusing to sanction the formation or laying out of new streets for carriage traffic on part of the Crofton Park Estate, Crofton Park-road, Lewisham.—Agreed.

#### Buildings for the Supply of Electricity.

**City.**—An addition to the distributing station Nos. 82 to 84, Fenchurch-street, City, (Messrs. Clifton, Son, & Hope for the Charing Cross and City Electric Company, Limited).—Consent.

**Westminster.**—A temporary iron chimney shaft at the company's generating station, Millbank-street, Westminster (Mr. C. Stanley Peach for the Westminster Electric Supply Corporation, Limited).—Consent.

#### Height of Buildings.

**Hoxton.**—A warehouse building on the south-east side of Vestry-street, Hoxton, to exceed in height the width of that street (Mr. A. Keen for Mr. J. Kent).—Consent.

**Strand.**—A building on the east side of Martlett's-court, Drury-lane, at the corner of Crown-court, to exceed in height the width of Martlett's-court (Mr. H. O. Ellis for Mr. L. Upcott Gill).—Refused.

#### Cubical Extent and Construction.

**Lambeth, North.**—A one-story addition to a building on the south-west side of Walnut Tree-walk, Lambeth, which building and addition together will exceed in extent 250,000, but not 450,000, cubic feet, and which addition will be used only for the pur-

poses of a standing place for motor cars and omnibuses and a blacksmith's shop (Mr. C. Barker for the Motor Traction Company, Limited).—Consent.

#### Separation of Building.

**Bermondsley.**—The formation, on the ground floor of an opening in the party wall between Nos. 219 and 221, Borough High-street, without making the buildings in conformity with Sections 74 (2) and 77 of the said Act (Mr. T. W. Willis for Mr. F. H. Barker).—Consent.

#### Dwelling-houses on Low-lying Land.

**Greenwich.**—That the solicitor do prepare a licence under Section 122 of the Act to Mr. E. Patters, for the erection of three dwelling-houses on low-lying land at Black-wall-lane, East Greenwich.—Agreed.

The recommendations marked † are contrary to the views of the Local Authorities.

## Correspondence.

To the Editor of THE BUILDER.

### BUILDING LAW.

SIR,—I think it time that architects, builders, and owners concerned should have opportunity of protest and correction against the growth of positive law, in contra-distinction to negative law in respect to building.

The perfect maze which building law has now assumed is a standing menace to the future production of property, and is acting as a weapon not only to destroy all individualism, but is forcing design and invention into such narrow ways as to entirely destroy all good work, artistic taste, and novelty. We were once controlled by Statutory Law constructed with full consideration and consultation of practical men, and which was no "hole and corner" institution. Now, by some means of doubtful power by the public bodies, a whole host of exact and positive clauses are made, all of various fads and ideas as may suit the guiding direction as it may come from one district or another.

The whole question is an irritating evil, because much of it is not based upon experience. Many of us who have spent our lives in the trade have learned and proved certain axioms of work which, after years of test, we are compelled to cast to the winds, simply to satisfy exact and positive law in any particular district. If I am compelled against my own experience and judgment to do bad work, what is more irritating?—especially when you retain an interest in the property affected. As an instance, every practical man knows of the absurdity of the 1894 Act of the London County Council in regard to the composition of plastering; the result has been of the worst possible character, for there are very few sound ceilings done under that positive direction; they are resonant, brittle, "alive" for years, and caustic to such a degree as to be for some work absolutely useless. Hard, and unyielding, the least shrinkage does them damage. If I can produce a better ceiling in my way, it is monstrous that the London County Council should exact that it is to be positively done in their way.

It is true that to prevent bad work legislation may be necessary; but let it be fairly constructed and of a negative character, so that genius and experience may get fair and full exercise.

Then, again, some district by-laws are clausured with positive directions as to timber sizes—a monstrous stupidity—often not stock sizes. Houses of a certain class should be required to carry over so many square feet of floor space a certain load without extreme flexure, leaving the size and skill of the construction to the operator. At present your house may conform to the law and yet be a bad building.

Then, again, I notice some by-laws now in print, which have not passed the scrutiny and the signature of the Home Secretary with the statutory six weeks' delay for objections, but are now signed as allowable by the Local Government Board under the authority of their general order of May 26, 1877, whatever this may mean.

Now, sir, here is perhaps drastic positive law, possibly stupid to a degree, emanating from the brain of some insignificant jack-in-office in an Urban Council, signed by a Mayor and a Town Clerk, and with the above dubious official concurrence a copy is banded over as a guide and counsellor to a man who perhaps built good houses before the author was born, and is asked to construct his own houses against his experience and conviction of rectitude in a way as though public bodies were the owners and not himself.

What I contend is that as the statutory law exists, no by-law should be signed unless oral examination has taken place of architects and builders concerned in equal proportion; so many according to the population or area affected.

Very much more could be written upon this very important matter did space and time permit.

EXPERIENTIA

### PENALTIES IN BUILDING CONTRACTS.

SIR,—In a contract under the usual terms and under agreement providing penalty for delay on non-completion, and where it is proposed to enforce this: (1) In issuing certificates should this amount be considered as a deduction from the amount of contract and pending the final certificate be so deducted, by not issuing certificates for the full amount of contract? (2) Is an architect liable to his client if he issued certificates and took no account of the penalty if he thought the contractor had used fair diligence, and could the amount be recovered from the architect? ENQUIRER.

\*\* The deduction for penalties should be made on the final certificate, which should reserve a sufficient amount to leave a margin for penalty deductions, if enforced. It is very seldom that the contractor is without some kind of more or less logical defence in regard to delays, which ought at all events to be heard and considered. To attempt to deduct in proportion on each certificate would be raising the question two or three times over instead of settling it once for all at the final settlement of the account, and the architect would certainly not be "responsible to his client" for leaving the penalty deductions over to the final settlement. If the client attempted to make him so, he would take a very foolish and, in our opinion, untenable position.—ED.

### THE PROPOSED WIDENING OF PICCADILLY.

SIR,—In your last issue a road is suggested leading from Piccadilly to the Mall along the back of the houses in Arlington-street. This formed part of my scheme for laying out the ground around the Queen Victoria Memorial, which you did me the honour of publishing in your issue of April 27 under the undersigned motto.

I was about to suggest that Pall Mall be continued on through Cleveland-square to the Park, but have been anticipated by a writer in the *Times*. This, in addition to being an improvement from the traffic point of view, would add very much to the effect of Pall Mall, bringing the entrance front of Bridgewater House in line with it, and provide an open space in front of St. James's Palace.

"PLAN THE BASIS OF DESIGN."

### PORTLAND CEMENT TESTING.

SIR,—Referring to the letter signed "The Writer of the Article" in your last issue, it does not follow that an office boy or labourer can do all that is necessary in testing Portland cement because the writer's tests were carried out by labourers, as it is obvious from his own letter they must have been skilled men, and doubtless worked under his direction.

I quite agree that two men will make up briquettes of the same cement and get very different results, and I shall prove this by getting an ordinary labourer to make one lot and a skilled labourer who has been taught to make another lot. I did not suggest a chemist was required for the testing.

Also, in reference to the writer's observation that "it appears not so much to depend upon whether he is a labourer as upon whether he has gauged long enough to test Portland cement because the experience and skill!" I should like to say that in nearly every consignment I test, the cement varies a good deal, and the quantity of water required for gauging one lot would be altogether unsuitable for another lot.

I am glad the writer of the article advocates laying down the cement in bulk for a month or two, not because it is necessary but as a safeguard, as he puts it.

My experience has taught me that when not absolutely necessary, placing the cement in bulk on a wooden floor and occasionally turning it during three or four weeks will improve it very considerably, and this is proved by the higher tensile strain obtained.

But, in conclusion, I would suggest that it would be very poor policy for labourers to test cement to detect its improper mixing, burning, and grinding by labourers, as an experienced tester should do the testing.

County Bridge Works,  
Fordingbridge, Hants.

ROBERT H. REED.

SIR,—Referring to Mr. Line's letter last week, if he has any difficulty in getting his cement tested in Birmingham, and would prefer having an operative to test cement for himself, he could probably get the address of some one who would give such training or recommend a tester already trained, if he applied to firms supplying the necessary apparatus, such as Messrs. Townson & Mercer, 21, Cannon-street, E.C.

"CEMENT."

SIR,—We notice a letter from Mr. Charles A. Line, local concessionaire of the National Opaline Glazed Brick, in which he indicates, who is making enquiries about the use of Portland cement for fixing Opaline. If he will apply personally to the Adamant Co.,

Ltd., Commercial-street, Birmingham, or the British Opat Wall Glazing Co., Ltd., 12, Warkmouth-street, London, he will find they can fix Opalite without Portland cement or Robinson's, and guarantee it not to swell and displace the opal, a process which, however, has not been secured in the cheap manner he indicates, but at great cost of both labour and money.

Large quantities of this work have been executed in Birmingham and elsewhere. J. WILKINSON.

"GILLOW'S."

Sir,—We are greatly obliged to you for the flattering notice of our little book contained in your journal of the 3rd inst.

With reference to the concluding paragraph, viz:—

"If Messrs. Gillows wish to retain their hereditary position, however, there is one move which they will probably have to make, to keep with the times, viz., to go to first-class artists for designs, and to give names and the individual credit to the designers. Hitherto, if we are not mistaken, they have gone upon the old system of putting out furniture as the design of the firm and not of individual artists; a system which, for the highest class of work, is doomed."

We desire to say that in our studio we possess artists of exceptional ability, a fact you would readily admit if you will favour us with a visit to our galleries. There is no concealment of an artist's name; on the contrary, in the case of any important work, we invariably introduce him to the client. It may, perhaps, be interesting for you to know that many of the most successful designers of the present day have passed through our studios.

GILLOW & CO.

The Student's Column.

GAS AND GAS FITTINGS.

6.—PRODUCER-GAS MANUFACTURE, MOND GAS, OIL-GAS, AIR-GAS, ENRICHMENT WITH LIGHT OILS.

**PRODUCER-GAS MANUFACTURE.**—The description of producer-gas obtained by blowing air through heated coke has already been described as a by-product in the old process of water-gas manufacture. Instead of separately making a high-class water-gas and a low-class producer-gas by alternately blowing air and steam through the heated fuel, a higher class producer-gas, consisting of water-gas and the producer-gas previously described, may be made by passing a regulated mixture of steam and air through the fuel, the heat evolved by the combustion of the carbon with the atmospheric oxygen being made to balance the heat absorbed during the decomposition of the steam. An excess of air has to be used to compensate for loss of heat through unavoidable causes. A large number of generators or producers have been invented to manufacture gas of this description, and the gas produced is usually known by the name of the inventor of the plant—e.g., Mond gas, Siemens gas, Dowson gas, &c.

In some producers anthracite or a more bituminous fuel is used instead of coke, as, for instance, in the Mond producer, in which cheap coal slack is employed; and the hydrocarbon gases evolved from the fuel enrich the producer-gas to a certain extent, and increase its value. The tar may be recovered by cooling and washing the gas, or may be destroyed by passing the gas through a sufficient thickness of heated coke.

The following table shows approximately the composition and relative heating values of natural gas and of the gases most commonly used in this country for lighting, heating, and motive power; but it must be remembered

that in every case the composition of the gas is variable:—

	London Coal-Gas	Natural Gas of U.S.A.	Water- Gas.	Mond Gas.	Dowson Gas.	Siemens Gas.
Hydrogen .....	52.78	20.62	49.17	24.8	18.76	8.6
Methane .....	33.88	73.28	31	2.3	0.31	2.4
Unsaturated Hydrocarbons .....	3.07	4.30	nil	nil	0.31	nil
Carbon monoxide .....	5.34	1.00	43.75	13.2	25.07	24.4
Carbon dioxide .....	nil	0.80	2.71	12.9	6.37	5.4
Nitrogen .....	3.96	nil	4.05	46.6	48.98	59.4
	100.00	100.00	100.00	100.00	100.00	100.00
Gross Caloric value, B.T.U. per cubic foot.	624	700	374	155	150	135

The difference between the heating value of coal-gas and carburetted water-gas of similar illuminating power is shown by the following figures published by Dr. Colman:—

	Coal-Gas.	Carburetted Water-Gas.
Illuminating power .....	17.31	17.46 candles.
Heating value (gross) .....	158.9	142.51 calories per
" (net) .....	145.7	132.91 cubic ft.
To convert the calories into British thermal units multiply by 4 (or, more correctly, 3.968).		

The table (see below) given by Bryan Donkin in his book on "Gas Engines" is interesting as showing the variations in the composition of the coal-gas supplied in different localities. The analysis of London gas supplied by the Gas Light and Coke Company needs revision, as the carbon monoxide now commonly amounts to 9 or even 12 per cent., owing to the addition of large proportions of carburetted water-gas.

**Producers.**—In the older forms of producer the fuel usually rested on firebars through which the air supply entered. In order to make the draught sufficiently powerful to carry the producer-gas forward an overhead cooling tube was provided. The gas ascended to this tube, and after being cooled was allowed to descend, the weight of the cold descending gas being sufficient to create a "pull" on the hot gas ascending through the fuel, and to thus increase the current of air drawn through the firebars. In these "open" producers the rate of manufacture is slow owing to the slow speed of the air draught, and the small quantity of steam permissible. Better results are obtained by closing the ashpit and admitting regulated currents of air and steam under pressure. The air and steam are supplied together. A jet of steam is blown into a tube, and owing to the force of its impulsion draws air into the tube with it, and the steam and air pass together into the producer. The size of the jet is adjustable, so that the proportion of air to steam can be varied as required. By using a hollow jet of steam instead of the so-called "solid" jet formerly used, a given quantity of steam can be made to draw in a larger volume of air.

**Mond Gas.**—Hitherto producer-gas has in this country been manufactured on the works on which it is to be used, and is usually consumed while still hot. The promoters of the Mond scheme propose to supply a large area in Staffordshire, including several important towns, with Mond gas for power purposes. The maximum price is to be 3d. per 1,000 cubic feet, when not less than four million cubic feet per quarter are used, and 4d. per 1,000 cubic feet for smaller quantities. It is proposed to distribute the gas in steel mains

under an initial pressure of 7 lbs. per sq. in. in order to limit the size of the mains required. The difference between this pressure and that of 1 in. to 4 in. of water under which coal gas is commonly supplied is shown in the following table:—

Weight of a column of water in lbs. per square inch. (Water at maximum density at 39 deg. C.)

1 1/2 in. water =	0.00361 lbs. per sq. in.
1 in. " =	0.00301 " "
27.7 in. " =	1.0 " "
104 in. " =	7.0 " "
554 in. " =	20.0 " "

According to Sir F. Bramwell, the gas is to be sent out under an initial pressure of about 7 lbs. per sq. in. from the distributing stations, and at the point of delivery to the consumers it is to be reduced to about 2 lbs.

Mond gas is a producer-gas made with the aid of an unusually large quantity of steam, about 2 1/2 tons of steam being blown into the fuel for every ton of coal slack consumed. A large quantity of ammonia is present in the gas produced, and this is recovered and subsequently converted into sulphate of ammonia, the sale of which is expected to almost cover the cost of the coal slack.

**Oil-Gas.**—Instead of being used for the manufacture of carburetted water-gas, oil may be directly decomposed into a gas very rich in illuminating hydrocarbons. The oil-gas may be used without admixture with other gas, or may be used for enriching gas of poorer quality.

**Pintch's System and Pope's System.**—The oil-gas produced by these systems is extensively used for lighting railway carriages, lighthouses, and buoys. Even after compression it has an illuminating power of about 7 1/2 candles per cubic foot when consumed in the ordinary railway carriage-lamps. A gallon of oil, such as Russian Salar Distillate or Scotch gas oil, yields about 82 cubic feet of 50-candle gas. The gas is stored for use in steel cylinders under a pressure of about ten atmospheres (150 lbs. per square inch). When subjected to this compression about 1 gallon of tarry liquid, known as "hydrocarbon," condenses from every 1,000 cubic feet of gas compressed, and the illuminating power of the gas is reduced from 50 to about 38 candles per 5 cubic feet rate.

The oil-gas is manufactured by vaporising and decomposing the oil in specially constructed retorts heated to a cherry red heat. It is now a common practice to mix about 20 per cent. of acetylene with the oil-gas before compression, the illuminating power of this mixture being double that of the plain oil-gas.

**Peebles Process.**—By this process, the invention of Messrs. Young & Bell, oil or tar is converted into gas and coke, the gas being washed with oil or tar, which is itself subsequently decomposed into gas and coke. One ton of tar from Durham coal is said to yield 15,000 cubic feet of 25-candle gas and 15 cwt. of good quality coke; and one ton of Scotch gas oil to yield about 22,000 cubic feet of 90-candle gas, the illuminating power being calculated from the enriching value of the gas when mixed with low quality gas. About 5 1/2 cwt. of hard graphitic coke is obtained per ton of oil.

Oil-gas is so rich in heavy hydrocarbons that it burns with a very smoky flame in burners which are suitable for coal-gas, and has therefore to be consumed in burners with very small orifices, such as the No. 0 or No. 00 Bray burner, and at a rate of about 1 cubic foot per hour. Professor Lewes gives the following as the composition of oil-gas as

Chemical Composition of Coal-gas in Various Cities and Towns in Percentage by Volume. (Donkin's "Gas, Oil, and Air Engines.")

**Air Gas.**—In America, illuminating gas is often made by passing air at ordinary temperatures over light petroleum spirit. This is, however, a crude and wasteful method of using the oil, and many accidents have occurred owing to an explosive mixture of air and petroleum vapour having been formed in some part of the apparatus.

**The Kilsen Light.**—This light is produced by heating a large mantle to incandescence by means of an oil flame rendered non-luminous by causing the oil vapour to draw in by its injecting action the necessary volume of air just before it enters the burner. The mantle is similar to that used for the Welsh incandescent gas light, but is larger. The oil is placed in a cylinder, and air is then pumped into the cylinder. The pressure of air in the cylinder (about 50 lbs. per square inch) forces the oil up a pipe of very small bore, and injects it into the lamp, where it passes through a tube located a short distance above the mantle and heated by the waste combustion products, is vaporised. The compressed air is not used for combustion of the oil. The apparatus is compact, and has the advantage of not requiring any distributing pipes. It is, therefore, useful for lighting works not supplied with gas, or for works of a temporary nature where a powerful light is required without incurring the expense of laying gas service-pipes. The hissing noise made by the lamp makes it unsuitable for most indoor work. The illuminating power of the light is about 1,000 candles, and the estimated cost of the oil used is about 1d. per hour.

**Enrichment of Gas with Light Oils.**—Instead of decomposing heavy oil into a rich gas and using it to enrich low quality gas, the gas may be passed over liquid light oil, or brought in contact with oil which has been vaporised, but not decomposed, with the aid of steam. These light oils are mostly distillates from American petroleum, and are sold under fancy names. *Carboline* has a boiling point of about 70 deg. C. and a specific gravity of about 0.68. *Gasoline* has a boiling point of about 40 deg. C. and a specific gravity of about 0.65. *Petroleum Spirit* a boiling point of about 95 deg. C. and a specific gravity of about 0.70. Commercial *oil per cent. benzol* contains, according to Butterfield, about 70 per cent. benzene and 25 per cent. toluene, and has a boiling point between 82 and 112 deg. C., while its specific gravity varies from 0.882 and 0.885.

The process of enriching gas with oil vapour is termed "carbureting." In Germany, benzol is largely used for carbureting plain water-gas. The gas may be carbureted with light oils at atmospheric temperatures, but in this country it is usual to vaporise the oil by steam heat. In London, all gas supplied north of the Thames is required by Act of Parliament to have an illuminating power of not less than 16 candles when consumed in a standard argand-burner at a rate of 5 cubic ft. per hour. The gas from the coal used in London has an illuminating power of 14 to 15 candles, and it is therefore necessary to raise it to about 16½ candles by carbureting it with light oil or by mixing it with rich carburetted water gas. Mr. H. Leicester Greville states that 1 gallon of petroleum spirit vaporised in a Price carburetor is capable of enriching 10,286 cubic ft. of coal gas from 16 to 17 candle-power.

NORWEGIAN GRANITE AND STONE.

THE export of hewn granite from Norway last year was somewhat less than in 1899. The same may be said of the selling price, which, both in and out of the country, was somewhat lower. The quantity exported in 1900 from the Smaaleen granite quarries was 86,370 tons, of which 48,291 tons were shipped at Fredrikstad, 29,343 tons at Fredrikshald, and 8,805 tons at Sarsborg. In addition to these totals there were exported from the Drammen Fjord 8,604 tons, from Christiania 4,163 tons of so-called Labrador, from Laurvig 4,635 tons, and a little from other places. The greater part goes to the United Kingdom. In recent years Germany has taken but little, preferring, it is said, to develop her own quarries. The largest Norwegian exporters have formed an association for the export of kerb-stones only. There exists also a workmen's association, called the Granite Exporters' Association, to control labour, employing about 3,500 men on the east side of the Christiania Fjord, but less than half of these work north of the Swedish frontier, the rest over the frontier, in Sweden. Two strikes, each of two and a half months' duration, occurred in 1900. The total value of the granite exported is about 115,000l. The quarrying of soapstone is reported on the increase. Nearly all of it is used in Christiania for building and decorative purposes, as also for fireplaces, stoves and for fireplace stone. The export of soapstone has also begun to increase. It was shipped 1,250 tons last year. Very little marble was reported to have been quarried in 1900. The bulk of the Norwegian exporters of kerbstone have formed an association under the style of "The Norwegian Kerb Company," with a head office in Christiania. The object of the company is to regulate the production of kerb in accordance with the demand, and also to control all sales of same, which are now effected through the company's office. The annual report of Mr. Berentsen, British Vice-Consul at Stavanger, includes the following laconic passages:—"The Stavanger Stenhuuggeri, mentioned in my last report as working paving stones and stones for house-building purposes, has delivered some paving stones in this town, and as far as I know it proved a success. If any town or Corporation in the United Kingdom is in want of paving stones I would recommend them to apply to the above address. The brick-stone manufactories have been working very hard at Sandness, near here. If brick-stones are required anywhere in the United Kingdom, I recommend application to the Sandness factories. Addresses, samples, and prices may be had on application to the Vice-Consulate."

GENERAL BUILDING NEWS.

**RESTORATION OF ST. MARY'S, CARDINGTON.**—The demolition of the old tower, together with the old tower, has been made necessary by the unsafe condition of much of the masonry in the south, east, and west walls of the south aisle. It was at first intended to rebuild the tower on its old site, but the soil had been so honeycombed by interments that this was considered inadvisable, and it was then decided to throw the tower-site into the nave, and to add a new tower to the west end, a north aisle being also added. The old vault of the Whitbread family, north of the old tower, was filled up, and a north transept—forming a memorial chapel—was erected over it, for the reception of the principal Whitbread monuments. The old windows in the chancel have been reconstructed in a precisely the same position as before, with the old materials. A number of large and vigorously designed ancient gargoyles have been introduced into the external cornice of the chancel; and a few of the old leaden water pipes—bearing the dates, "S.W. 1701," "S.W. 1780,"—have been again used round the chancel roof. Internally, the large Norman arch, which divided the old tower from the nave, has been removed to the west end of the nave; which opens into the new tower. It has been most carefully reconstructed stone by stone, the only change effected in it being the recessing of the edges, converting the arch into one of a double order. The new tower rests on a bed of concrete, 45 ft. square by 11 ft. thick. The work of the tower foundation, as well as that of the foundations of the four nave pillars, was carried out from plans prepared by Mr. James Briggs, M.Inst.C.E., Derby. In the construction of all portions of the church the best and most durable materials have been employed. The stone for the walls is from Tansley Moor, Mallock and is laid in random-coursed work; all the new dressings are of Ketton stone (Rutlandshire), the base on which the eastern pulpit stands is from Beggar's Well, Staffordshire; the steps on which the font stands are of stone from Hollington, Staffordshire, while the font itself is of hard white Mansfield stone. No ordinary mortar, nothing but the best cement, has been used anywhere in the building. The outer roofs and waterpipes are of copper, and the locks are of gunmetal. A whole of the work of plans and designs—including new tower superstructure, north aisle, transept, and south porch, and all new architectural features and details—has been entrusted to Mr. George Highton, architect. In the belfry stage are eight bells, which have

been recast by Messrs. Taylor, of Loughborough, with the ancient and rather curious inscriptions. On the south side of the tower is the sundial erected by Samuel Whitbread in 1782, with the legend "Our days upon earth are as the dew." A few feet below this dial is a smaller one, discovered in the south wall of the churchyard, and which is a rare and well-preserved example of an Anglo-Saxon sundial. The gnomon is wanting, but the dial is in a comparatively good condition, and at one point bears a small cross indicating the chief Saxon hour of prayer.

**VAGRANT WARDS, LEEDS.**—The foundation-stone of the proposed vagrant wards at the Leeds Workhouse was laid on the 22nd ult. The new buildings, which will probably cost about 10,000l., are being erected by Mr. J. T. Wright, from designs of Messrs. Thomas Winn & Sons. They will stand in the lower part of the workhouse grounds, near to Gledhow-road, and will be of brick, with stone dressings, and glazed brick inside. There will be thirty sleeping cells for the men and twenty stone-breaking cells on that floor, together with twenty sleeping cells for females, as well as lavatories, bathrooms, &c.

**TECHNICAL INSTITUTE, CLEETHORPES.**—The foundation-stone of the new Technical Institute for Cleethorpes was laid on the 23rd ult. The building is being erected by Mr. W. Ion, and will, it is estimated, cost 2,000l. It is to include classrooms, laboratory, and other necessaries to meet the demands of the times. It will be a stone structure, 40 ft. high. Mr. F. Croft is the architect.

**WORKHOUSE INFIRMARY, DORKING.**—The new infirmary which has been erected for the accommodation of the sick poor in the Dorking Union was opened a few days ago. The building, which has been erected at a cost of over 10,000l., is situated at the rear of the workhouse buildings, in which up to now the sick have been nursed in a series of sick wards. The structure, which is of red brick with stone dressings, is of a total length of 185 ft. and of varying depths, its deepest part extending to 38 ft. The centre part is carried a story higher than the two side wings. On the ground floor, which is approached by a vestibule and entrance hall, are situated male and female wards, bathrooms, &c., those for females being situated on the left hand side and for males on the right. The first floor is approached by two staircases. Here the wards are divided into two blocks, one for males and the other for females, there being also separate wards for patients of both sexes in acute suffering, each set of wards being provided with its own bathrooms and sanitary annexes. The second floor is devoted to the nurses' bedrooms, sitting-rooms, bathroom, &c. Altogether there is accommodation in the new building for about sixty patients—thirty male and thirty female. In addition there is a living-ward on the ground floor at the rear of the main building, at each end of which is a tower forming the sanitary offices. The largest wards are those on the first floor, which measure 36 ft. by 24 ft., those on the ground floor being about 24 ft. by 24 ft. Mr. Percy Adams, of London, was the architect, and Messrs. Kerridge & Shaw, of Cambridge, the builders.

**ENLARGED HOSPITAL, MIDDLESBROUGH.**—The Marchioness of Zetland opened, on the 20th ult., a new wing which has been added to the North Ormesby Cottage Hospital, Middlesbrough, at a cost of over 4,500l. In the interior, the original passage entrance has been enlarged into a hall, the floor of which is covered with a marble mosaic pavement, and the hall gives access to corridors branching to the right and to the left. In addition to new wards on the first floor, there are seven rooms for the use of the nursing staff as sitting and bedrooms, and above these seven other rooms for the use of the large staff of servants. A part of the original building has been converted into a temporary operating-room. Mr. J. Mitchell Bottomley, of Middlesbrough and Leeds, the architect to the institution, has superintended the work; the contractor being Mr. King, of North Ormesby. Mr. E. Jones, of Middlesbrough, has acted as the clerk of works.

**FIRE STATION AT HOMERTON.**—Mr. J. D. Gilbert, Chairman of the Fire Brigade Committee of the London County Council, recently laid the memorial stone of a new station now being erected at High-street, Homerton. The site cost 1,750l., and the estimate of the architect, Mr. W. E. Riley, was 8,000l. Messrs. Martin, Wells, & Co. undertook the contract for 8,120l.

**CHADWELL LUNATIC ASYLUM.**—The plans for this asylum, which was officially opened on the 1st inst., were originally prepared in 1864 by Mr. Lewis Angell, the then Borough Engineer for West Ham; but were not finally approved by the Commissioners of Lunacy until May, 1897. The foundations for the buildings were constructed and the east entrance lodge erected by Messrs. Gregar & Son, builders, Stratford, between July, 1897, and July, 1898, at an expenditure of 13,728l. 0s. 8d. On August 3, 1898, the foundation-stone of the first portion of the buildings, for which the tender of Messrs. Leslie & Co., Ltd., contractors, Kensington, in the sum of 200,531l. had been accepted by the committee, was laid. The buildings cover an area of about ten acres, and have a width of about a quarter of a mile from east to west, and one-eighth

of a mile from north to south, the main corridors being about a mile in length. They provide accommodation for 800 patients with the necessary staff, and consist of administration block, forming the centre of the village, containing the offices of the chief medical officers, steward and clerk's offices, committee-rooms, waiting-rooms, dispensary, laboratories, museum, library, billiard-room, and apartments for assistant medical officer, and the matron's rooms. Behind these, forming the centre of the block, is the recreation hall, with floor space 80 ft. by 40 ft., and a stage 40 ft. by 21 ft., and the rooms for male and female attendants, the kitchen, servery, sculleries, dairies, vegetable, meat, and general stores, bakery, with flour store over, sewing-room, and other offices. At the rear are the laundries, boiler and dynamo houses, water tower, and workshops for various trades. The patients' quarters are built on both sides of the administration block, to which they are both connected by extensive corridors. The accommodation is similar on both sides, and includes sick and infirm, acute, epileptic, and chronic blocks. Large dayrooms and dormitories, baths, and sanitary accommodation are provided in each block. The dayrooms vary in size from 90 ft. by 27 ft. to 36 ft. by 20 ft., and the dormitories from 45 ft. to 80 ft. long by 28 ft. wide. In addition to the above, an isolation block has been erected with male and female wards, convalescent-rooms, attendants' rooms, kitchen, scullery, sanitary offices, &c. The officers' residences are erected some little way from the main buildings, and consist of detached houses for medical superintendent, steward, chief attendant, and engineer; eight detached cottages for married attendants, and lodges at the north and south entrances. The church is situated in the centre of the site, about 120 yards from the front of the administration block, and has seating accommodation for 600 persons. The water supply for the domestic purposes of the asylum is obtained from an artesian well in the base of the water tower. In sinking the well, chalk was reached at a depth of 210 ft., and the boring was continued 140 ft. into the chalk, making a total depth of about 350 ft. The normal level of the water is about 70 ft. below the ground surface, and it is first raised by a compressed-air plant, driven by electric motors, into a tank with a capacity of 11,000 gallons in the base of the water tower, and from thence again raised by an electrically driven three-throw pump a height of about 90 ft., into the large storage tank, capable of containing 32,000 gallons, at the top of the water tower. From this tank a "circuit main" is run round the whole of the buildings, in each block of which a galvanised iron tank is fixed with connections to the "circuit main." From these tanks, branch mains and services are taken to supply all the various fittings, fire hydrants being fitted throughout the buildings and in the yards. The fire installation is arranged on the "ring main" principle, and the pressure in the pipes is maintained by means of a large steam fire-pump in the engine-room. In case of failure of this pump, the pressure in the water-tower can be placed on the main, and the supply obtained from the water company to meet cases of emergency. A considerable proportion of the rainwater from the roofs of the buildings will be collected for laundry purposes by a separate system of drainage, and discharged into a covered reservoir, 91 ft. by 30 ft. by 13 ft., with a capacity of 200,000 gals. From thence the water passes through filters and is raised by an electrically-driven pump into tanks in the laundry blocks capable of holding 18,000 gals. The buildings are heated throughout on the low-pressure hot-water system. A multiburner heater (Messrs. Z. D. Berry & Sons' improved pattern), supplied with steam from the main boilers, is fixed in the heater-room of each block for generating the necessary hot water. Flow and return mains are taken from the heaters and connected up with the various radiators fixed throughout the buildings. The boilers are constructed to work at a pressure of 120 lbs., and they were supplied by Messrs. Spurr, Inman & Co. of Wakefield. A Green's Economiser of 100 tubes is placed at the rear of the boilers. The electrical installation, including the wiring of the buildings and the telephones, has been carried out under the superintendence of Mr. J. K. Bock, Borough Electrical Engineer. The number of lights wired for is over 3,000, the work being carried out by the Council's own workmen. From the main switchboard in the engine-room, a separate concentric lead-covered, paper-insulated cable is run to a distribution board in each block, and also a distribution board in each detached building. From these boards the branch circuits to supply the lights are taken, the wires being drawn into steel tubing, so arranged with joint boxes, pulling-in boxes, &c., that, in the event of any failure in the circuit, the wires can easily be replaced without disturbing any plaster or woodwork, &c. In every case the rooms and corridors depend on more than one circuit for their supply. Hot-water supplies are provided for all baths, sinks, stop sinks, &c., from multiburner heaters fixed in the heater-rooms of each block. The heaters are of similar type to those used for the heating apparatus. The laundries are fitted with five washing machines, four hydro-extractors, soaking and rinsing tanks, boiling coppers, washing troughs, three box mangles, ironing machines, ironing stoves, &c. The

drying closets contain seventy-eight drying horses, all heated by steam, the horses being constructed on the "over-carried" principle. The machinery and shafting throughout is driven by electric motors. The work in connexion with the heating apparatus, hot and cold water mains and services, steam and condenser mains, laundry machinery and apparatus, cooking apparatus, kitchen fittings and bakery, fire installation, &c., has been carried out by Messrs. Z. D. Berry & Sons, the Albion Works, Westminster; and the artesian well and compressed-air plant in the water tower by Messrs. C. Isler & Co., Bear-lane, Southwark. The total cost of the whole of the works when completed is estimated at 300,000l.

**CORNWALL COUNTY ASYLUM, PROPOSED EXTENSIONS.**—Additions are to be made to the present County Asylum buildings at Bodmin, Cornwall, comprising separate detached blocks for sick and infirm, recent and acute, chronic epileptic, and other classifications of patients, together with assistant medical officer's residence, waiting-rooms, recreation and dining-hall, kitchens, offices, staff-wards, workshops, stores, boiler-house, &c. Mr. Silvanus Trevor, of Truro, is the architect, and the tender of Messrs. Pethick Bros., of Plymouth, has been accepted at 87,973l.

**PUBLIC BATHS, LATIMER-ROAD, WIMBLEDON.**—The site of this building has a total frontage of 200 ft. and a depth of 100 ft. Of this 140 ft. have been occupied by the present buildings, leaving 60 vacant site with 60 ft. frontage for extension, it is required. Separate entrances are provided for men and women under the control of a central ticket office leading to waiting rooms for each sex. By this arrangement it will be possible, by locking respective doors, for men to use their slipper baths when women are using the swimming bath, and vice versa, with perfect privacy. The swimming bath hall is 120 ft. long and 58 ft. wide and the pond has a water area of 100 ft. by 20 ft., with a depth of water varying from 6 ft. 0 in. to 3 ft. 1 in. The water is warmed by the injection of steam. A shower and foot bath are provided for bathers using the swimming bath. There are sixty-seven dressing boxes ranged round the swimming pool, over which a gallery is provided to enable the public to view swimming entertainments. During the winter months the pond will be floored over, and the hall will be available for meetings, dances, concerts, &c., with seating accommodation for 700 on the ground floor and 300 in the gallery. In connexion with this arrangement an additional entrance is provided with ticket office at the south end of the building, to avoid any interference with the working of the slipper baths, which will be open throughout the year. Thirty slipper baths are provided, viz., twenty men's and ten women's, approached from the respective waiting rooms. The superintendent's office is placed between the men's and women's entrances. The establishment laundry is connected with the various departments by means of a covered way. It is fitted with the most approved steam appliances, worked by an engine in the basement, for washing the towels, bathing dresses, &c., used in the building. The whole of the building is warmed by steam pipes and radiators, and steam is also used for heating the water used in the slipper baths and laundry. There are two boilers fixed in the basement, viz., a 22 ft. Lancashire and a 15 ft. Cornish; the former is capable of supplying the whole of the steam required, and the latter will be held in reserve. The whole of the building is fitted with the electric light, and the current is supplied from the Wimbledon Urban District Council's mains. Mr. R. J. Thomson, Hill-road, Wimbledon, is the architect.

**WESTINGHOUSE WORKS, TRAFFORD PARK, MANCHESTER.**—The Lord Mayor of London recently laid the corner-stone of the Westinghouse Works at Trafford Park, Manchester. The works are situated on a portion of the old Trafford Park estate, a site covering about 130 acres having been acquired for the purpose. The buildings run almost due north and south; the northern ends are permanent and brought up into line; the other ends might be termed temporary, as it is from here that the buildings will be extended and increased in length as required. The works proper are located in six buildings, all of rectangular form. On the extreme east is the iron foundry, 170 ft. wide and 580 ft. long, where plant will be installed capable of turning out and handling the huge castings required in the largest sizes of electric power machinery. Next to the iron foundry are the smaller brass foundry, malleable iron foundry, pattern shop, steel foundry, and forge. The two last are built end to end, forming a building 170 ft. wide by 580 ft. long. The next building is the machine shop. It is 430 ft. wide by 900 ft. long, and will be equipped with the most modern machine tools, large and small, all electrically operated. It is divided longitudinally into bays. The side bays are arranged with two stories, and are arranged for the machining and finishing of the smaller parts of machinery; the centre bay is arranged for the machining of large parts and the erection of the largest plant manufactured. In addition to the six buildings which have been mentioned, there are two others—one the office building, 50 ft. wide by 250 ft. long, set in front of the

machine shop; and the other, box factory and stores, 60 ft. wide by 270 ft. long. The office building will accommodate the clerical staff, shipping department, drawing offices, and also have certain fireproof departments in which the works records will be kept. Houses for the workmen are being built by the Trafford Park Dwellings Company, Limited, who have acquired some 120 acres of land, whereon will be erected some 1,100 dwellings. About 300 of these are completed, and 300 more are being rapidly pushed forward. Arrangements are also being made for the erection of some better-class cottages for the use of foremen, for the erection of a large hotel to accommodate commercial travellers, also schools, clubs, and recreation grounds. In all there will be some 5,000 workmen employed, the works being mainly devoted to the manufacture of gas engines, dynamos, motors, converters, transformers, &c. The engineer and architects are Mr. Thomas Rodd, of Pittsburg, U.S.A., and Mr. Charles Heathcote, architect, Manchester. Mr. Charles Heathcote is also architect for the dwellings referred to.

## FOREIGN.

**FRANCE.**—The Municipality of Pau has protested so strongly against the retention at the Louvre of the four tapestries sent from Pau to the exhibition at the Petit Palais, that the Government has felt compelled to give way and restore them. This will probably be a precedent for provincial bodies to make similar protests. It seems quite unreasonable that the Government should endeavour to rob local museums of their Louvre collection more complete.—A statue of Paul de Kock, of all people, is to be inaugurated at Romainville, a suburb of Paris. In England such a writer would hardly have been thought worth a monument. A statue to a very different order of personage, Victor Considérant, was inaugurated on the 4th inst. at Salins.—A new boulevard maritime, or sea promenade, has been opened at Dieppe.—The municipality of Algiers has under consideration and embellishment of the city.—The jury in the competition for a new covered market at Auxerre, have awarded the first premium to M. Dumé (engineer) and M. Cavé (architect).—M. Foucault, architect to the Third Section of Paris Municipal Architectural Department, has been appointed architect to the central administration, in place of the late M. Ulysse Gravigny.—A large group of school buildings has been completed at Bondy. The architect is M. Ancian, a former student of the Ecole de France at Rome.—M. Canille Lefèvre, the sculptor, has just completed his model for a fine bas-relief in stone intended for the Mairie of Issy-les-Moulineux. The subject is the Republic crowned by France.—The Government has authorised the execution of the works required for the completion of the new basin at the port of Fécamp. The estimated cost is 625,000 francs.—We have to record the death, at the age of fifty-nine, of M. Georges Dalbin, architect, a former pupil of Hippolyte Lebas and of M. Ginain. He carried out numerous works in domestic architecture, and in 1887 obtained, in collaboration with Carrier-Belleuse, the third premium in the competition for the monument to Lamartine at Macon.—We have to record also the death, at the age of 50, of M. F. Kaheun, architect, and inspector of the Louvre Palace. He was an architect of talent, but chiefly known in private practice.—We have also to announce the death, at Tallard (Hautes Alpes), of the well-known etcher, Eugène Champollion. He had etched several of the leading pictures of the day for reproduction. He made the illustrations for "Salambo" and for "Daphnis and Chloe," and the etched portraits of Sarah Bernhard and Chevreul. He died at the age of fifty-three.

**AUSTRALIA.**—The buildings for the Victorian Gold Jubilee Exhibition, Bendigo, Victoria, have been commenced.—A Roman Catholic church is to be erected at Galong, New South Wales, in accordance with designs by Messrs. Sheerin & Hennessy, architects, of Sydney.—The festivities in connexion with the Royal visit have seriously affected building operations in Sydney and suburbs, but there are now signs of a revival.—A new Central railway station is to be built in Devonshire-street, Sydney.—The design of Mr. J. White, of Sydney, has been accepted for the West Australian Fallen Soldiers' Memorial. The monument will be erected on Mount Eliza, in Perth Park. The selected design shows a granite base surmounted by a group of statuary, depicting an Australian volunteer defending with his bayonet at the "ready" a wounded comrade who is quenching his thirst from a water-bottle. Bronze tablets are to be affixed to the four sides of the base.—To supply water in certain arid districts in New South Wales, the Government has sunk upwards of ninety bore holes. The most expensive one is at Dolgely, and it cost about 10,000l.—Extensive improvements are about to be made in the ground surrounding the Roman Catholic cathedral at Bendigo.

## MISCELLANEOUS.

KING'S COLLEGE, LONDON.—The following is the result of the examinations in the evening department in Architecture and Building Construction.—Silver Medal and 3*l.* in books, Mr. F. J. Jones; Bronze Medal and 2*l.* in books, Mr. G. H. Briggs; 1*l.* in books and Certificate of Distinction, Mr. G. Thompson. Certificate of Distinction, Messrs. P. Luker, J. J. Crowe, P. J. Black, H. F. Berry, W. Fenn, and J. H. H. Iker. Certificate of Merit, Messrs. H. A. Alexander, F. Davies, J. N. Horsfield, and J. A. Melkic. *Structural Drawing*.—3*l.* in books and Certificate of Distinction, Mr. W. Nicholls; 2*l.* in books and Certificate of Distinction, Mr. A. J. Melkic; 1*l.* in books and Certificate of Distinction, Mr. E. L. Hampshire; Certificate of Distinction, Messrs. A. Gomme, H. H. Iker, A. Bale, and H. Berry; Certificate of Merit, Messrs. J. J. Crowe, A. E. Bowles, P. J. Black, and G. H. Briggs. *Quantities*.—3*l.* in books and Certificate of Distinction, Mr. F. J. Jones; 2*l.* in books and Certificate of Distinction, Mr. F. Davies; 1*l.* in books and Certificate of Distinction, Mr. H. Berry; Certificate of Distinction, Messrs. J. Black and J. N. Horsfield; Certificate of Merit, Messrs. F. Hartnoll, H. A. Alexander, and E. L. Frost. THE MANCHESTER SHIP CANAL.—(Sir George Faudell, Phillips's Medal not awarded.) *History of Architecture*.—Silver Medal and 3*l.* in books, Mr. E. L. Hampshire; Bronze Medal and 1*l.* in books, Mr. A. E. Brooker; Certificate of Distinction and 1*l.* in books, Mr. S. A. Melkic; Certificate of Merit, Messrs. J. A. Gillett, W. Fenn, G. W. Rogers, H. Jyron. *Architectural Sketching Class*.—Bronze Medal and 1*l.* in books, Mr. A. E. Brooker. *Architectural Studies*.—Gold Medal and 3*l.* in books, Mr. E. L. Hampshire; Silver Medal and 2*l.* in books, Mr. A. E. Brooker. *Wood-Carving*.—Scholarship for one year and Silver Medal, Mr. R. Toms; Scholarship for two terms and Bronze Medal, Mr. H. S. Jones; Scholarship for one term, Mr. M. S. Mathers.

"GREAT EASTERN RAILWAY TOURIST GUIDE."—The sixpenny tourist guide to the Continent issued by the Great Eastern Railway Company, is intended as a companion to a holiday trip by their route. It contains a good deal of information, many illustrations, and plans of Brussels and Amsterdam. The general folding map at the beginning has been put in so that it opens upside down, an inconvenience which should be avoided in future issues. PROPOSED IMPROVEMENTS, HALIFAX.—A Local Government inquiry was held at the Halifax Town Hall recently, before Mr. E. A. Sanford Fawcett, A.M.I.C.E., with respect to an application for powers by the Halifax Corporation to borrow 7,825*l.* for the new police-station, 105,722*l.* for street improvements, 3,710*l.* for gas department, 15,026*l.* for sewerage works, 1,272*l.* for the purchase of a site at Skircoak for the purpose of a refuse destructor, a total of 134,464*l.*

BRICKMAKING IN FORMOSA.—This industry is growing, according to a recent consular report, and in late years the Japanese have encouraged the use of kiln-burnt bricks in place of the sun-dried mud bricks, of which nearly all the one-story buildings had been erected by the Chinese. The mud bricks are usually made in the vicinity where a building is being erected. The kiln-burnt bricks used by the Japanese are made from clay, which is good and abundant on the island. The material is mixed in a pit consisting of a circular roadway sunk in the ground a half foot or so, around which tramps an ox. Water is added to the sand and clay, and the mixture is trodden by the ox till it reaches the right consistency. As a rule, for the ordinary building brick, three parts sand to seven parts clay are used. The green bricks are formed in suitable wooden moulds operated by hand. An ordinary workman can mould 500 to 800 a day, and some operators, exceptionally expert, run as high as 1,200. These workmen are paid 7 to 150 yen (50 to 75 c.) a thousand. The majority of the Japanese factories have well-built, permanent kilns, each with an average monthly capacity of about 100,000 bricks. Formosa coal, at about 4 yen (2 dols.) a ton, is used as fuel. The finished brick is in demand at 7 to 11 yen (5.50 to 5.50 dols.) a thousand. Occasionally there is an order for some special shape or quality, and these bricks will bring as high as 20 yen (10 dols.) a thousand. The chief demand, however, is for a good quality building brick at about 10 yen (5 dols.) a thousand. The labour employed is chiefly Chinese; Japanese are utilised only as overseers, &c. Chinese day labour receives from 30 to 40 sen (15 to 20 c.) and Japanese 30 yen (15 dols.) a month and upwards. At present there are two large permanent factories owned or controlled by Japanese, with a total monthly production of about 2,500,000 bricks. In addition, there are forty or fifty native factories producing brick, roofing, and floor tiles. Among the largest firms are the Samejima Shokai (head office, Daiitoei, North Formosa), with factories at Kentan, Daiichokoku, Hokuseiko, Sharyo, and Borvo, North Formosa.—*Engineering and Mining Journal, New York.*

PLUMBERS' REGISTRATION BILL.—In the House of Lords on the 9th inst., Lord Glenesk, in moving the second reading of this Bill, said the object was to establish a system under which plumbers can, if

they please, be registered. No privilege was given to a registered workman, but he could not call or represent himself to be a registered plumber unless he was so registered under the Bill. The main object of the measure was similar to the Bills read a second time in 1892 and 1893, and introduced by committees in those years. He thought the Bill would be acceptable to their lordships, as it was approved by the opinion of the public.—Lord Kenyon said no doubt the object aimed at was to register plumbers so as to make them as efficient as they could be made. As the Bill now stood it cast on the Local Government Board the formation of a scheme which that Board did not want to undertake. If the promoters of the Bill would prepare a scheme and make it part of the Bill, then it could be introduced next year in a complete form. He had no objection to the Bill being read a second time.—The Bill was read a second time.

PUBLIC IMPROVEMENTS, BLACKPOOL.—On behalf of the Local Government Board, Colonel A. G. Durnford held an inquiry at Blackpool recently into an application made by the Corporation for sanction to borrow 2,000*l.* for works of sewerage, and 2,232*l.* for the formation of so much of a proposed new road from Marton Green to New House Farm as will be within the borough, including the sewerage of the same.

THE MANCHESTER SHIP CANAL.—The Canal Company have obtained powers of compulsory purchase of the ground belonging to the Manchester Racecourse Company. The latter sent in a claim for one million sterling, but the result of the arbitration was that Mr. Robert Vigers, the arbitrator, awarded the sum of 262,500*l.* as the price to be paid by the Canal Company for the property. The decision of the Court of Chancery has been upheld by the Court of Appeal. The Act giving the Company power to take the Racecourse provides that possession must not be taken until the end of this year without the consent of the Racecourse Company, and they will not be ready to vacate the property before that date. The report of the engineer to the Canal Company (Mr. W. H. Hunter) states that the depth of water in the canal and docks has been maintained throughout, although it is to be regretted that, comparing one year with another, no diminution whatever of the quantities of sludge and detritus carried down and deposited in the canal and docks has been experienced. The spare steel gates for the 65 ft. locks have been completed and are now being worked in place of the intermediate gates at Barton Locks, which are under repair. The erection of the new offices at Trafford-road has proceeded; the offices are approaching completion, while those at the end of No. 4 dock have been completed and are in use for traffic purposes. Considerable progress has been made with the dock and railway extension works authorised by the Act of 1900. The western portion of the through line of railway has been completed, and a length of the main road on the northerly boundary of the company's property has also been completed and is in use. A portion of the permanent fencing and gates has been erected, the levelling of the portion of the ground purchased from Captain Clowes, which is to be employed for storage purposes, has been completed and is being brought into use. Additional railways and service roads are in course of construction. The embankments and slopes of the canal generally are in good condition.

AUSTRALIAN TIMBER AND TIMBER-GETTING.—The timber resources of the Australian Parent State, although largely wasted in the past, are yet of a most extensive character, and under a proper system of conservation would become as valuable as any in the world. In a report by the Queensland Inspector of Forests, descriptive of a visit to New South Wales, that official states that on the Murray River, dividing New South Wales from Victoria, are situated the far-famed Murray River gum forests, the area of forests extending a distance of about 200 miles on the frontage of that river, but with occasional breaks, and running back from the river on an average of from one to six miles. New South Wales has an area of about 140,000 acres reserved for this timber, most of this country being liable to floods and densely timbered with gum, from the matured tree to the sapling and small plant. As showing the extent of the timber trade in the district it may be mentioned that during the season December, 1900, and April, 1901, the quantity of timber obtained was 5,593 logs, containing an average of 1,150 superficial feet per log, equal to 6,431,950 ft. of timber, on which royalty is payable of 3.047*l.* 0*s.* 5*d.*, at 1*s.* 3*d.* per 100 superficial feet. The greater portion of this timber was cut on behalf of a Victorian company, and is stacked in depots on the higher banks of the Murray River, pending a rise of water, when it is removed by pontoons and punts, towed by small steamers to Echuca (Victoria), where it is cut into sleepers, mining timbers, and for bridge and building purposes.

THE HOUSES OF PARLIAMENT.—In the House of Commons on the 5th inst., on the vote to complete the sum of 28,000*l.* for the House of Commons buildings, Mr. Dillon said he did not want any of any kind in the House of Commons, but he thought they were entitled to have the conditions under which they had to live there made as little insanitary and deadly as possible. They heard a great deal of insanitary dwellings, but the House of Commons

was as insanitary a dwelling as they could find anywhere except in the very purlieus of the city. He was informed by the Kitchen Committee, too, that the accommodation provided for the servants would be a disgrace to any private house. He would be glad to hear from the First Commissioner of Works to a statement as to the steps he proposed to take to improve the ventilation and increase the accommodation in the House.—Mr. O'Mara said he joined in the representations of his friend as to the lack of proper accommodation for members and for the servants of the House.—Mr. W. Redmond agreed that the arrangements made for the accommodation of members of the House were very defective, and he hoped the recommendations of the Committee would be carried into effect as quickly as possible.—Mr. Akers-Douglas agreed that the accommodation for members was very defective. There was dining accommodation only for 140 members, yet one night recently as many as 300 members had to obtain their dinners in the building. The accommodation in the smoking-room was equally defective, and in the winter months it was often impossible to obtain a seat after waiting for hours. He was very anxious to see these things remedied, but it was even more necessary to improve the apartments in which officials of the House worked. The conditions under which the telegraph operators worked was a source of complaint, and a feeling in the House that too much was done for guests and not enough for working members of the House. When the existing accommodation was provided it was not intended that members should give dinners for fourteen or sixteen people constantly during the Session and crowd out those who wished to use the House for business purposes. He would endeavour to see whether that particular portion of the Report which related to the proper provision for the working members and officials of the House could be undertaken this year.—Mr. Malcolm called the attention of the First Commissioner of Works to the want of ventilation in the Committee-rooms.—Mr. Dillon said the state of the Committee-rooms was perfectly poisonous.—The vote was agreed to.

## LEGAL.

ZOARS V. HARBROW.

This was an action for breach of contract originally tried before Judge French at the County Court, and referred by the King's Bench to the City of London Court. It came before Mr. Pitt Lewis, K.C., Deputy Judge, Mr. Holloway was for the plaintiff, and Mr. Deney for the defendant.

The latter, finding that he had underestimated the work, declined to proceed, giving as his reason that the structure was a special one under Section 82 of the London Building Act.

Mr. H. Lovegrove, District Surveyor, gave evidence and his reasons for allowing the tank to be encased, and his view was also taken by Mr. Edward Power, District Surveyor. The defendant called Mr. A. W. Tanner and Mr. H. Parsons.

The Judge decided that the work in question came under Section 61, and not under 82, and ordered the defendant to pay the difference between the amount of his tender and that of Messrs. Mattock, who eventually carried out the work, with costs of the previous trials.

## PLUMBERS AND OVERTIME.

At the Westminster Police-court, on the 31st ult., Messrs. Trollope, builders, and contractors, of Grosvenor-road, S.W., were summoned, before Mr. Francis, by John Randall, a plumber in their employment, who sought to recover 1*l.* 4*s.* 10*d.*, claimed to be due for overtime.

Mr. W. M. Thompson supported the summons, and Mr. Duckworth appeared on behalf of the defendants.

The complainant said he was sent to the City to do certain work at the office of a stockbroker. Owing to the noise a complaint was made, and he had to do the work at night. Prior to commencing he had some conversation with the defendants' foreman as to terms, and said he should expect to be paid in accordance with the rates laid down in the book of rules generally adopted by plumbers. This laid it down that overtime commenced at eight o'clock, and carried time and a half up to eleven o'clock, and double from then until seven in the morning. He had not been paid at these rates. His contention was that he was entitled to overtime rates, even if he did not work at all during the day. Mr. Duckworth said this was the only point at issue.

Mr. Francis (looking at the book of rules handed up) said he noticed that one of the rules set forth that in the event of there being any dispute between employer and employee arising out of the rules, the matter should be decided by a board of conciliation, whose decision should be final. The whole thing rested on the interpretation of the rules. Provision had been made for disputes being referred to a certain tribunal. Had that course been adopted? Mr. Thompson said the book of rules had no statutory effect, and did not hold good in a court of law. It had not yet been shown that the com-

plaintain had consented to be bound by the rules produced.

Mr. Francis: But his whole contention is that he is entitled to so much by these rules. I shall adjourn the case *sine die*.

Mr. Thompson: Do I understand that your worship declines jurisdiction?

Mr. Francis: I do. This man founded his case on this book of rules.

Mr. Thompson submitted that the rules had nothing to do with the case. The court took no notice of the tribunal mentioned in the book of rules. His worship was asked to adjudicate in a claim under the Employers and Workmen Act.

Mr. Francis: I may be wrong, but I shall adjourn the case *sine die*. You must take what course you deem proper.

His worship was prepared to state a case for a superior court.—*Morning Advertiser*.

#### CASE UNDER THE LONDON BUILDING ACT.

AT Westminster Police-court recently, William Rose Pickard, of City-road, E.C., was summoned by the London County Building Act, 1894.—Mr. Chivers, who supported the summons, said the defendant was the builder of St. James's Court, Buckingham-gate—very lofty mansions—and he had permitted them to be occupied without having obtained a certificate from the Central Authority, showing that they were provided with the necessary means of escape for the residents in case of fire. Plans were sent to the Council last August, added Mr. Chivers, but no alternative means of escape were furnished apart from the usual entrance and exit, and they were not considered satisfactory. In spite of this the buildings were occupied. Mr. Francis imposed fines of 4l. and 4l. 5s. costs.

#### SHEFFIELD BUILDING BY-LAWS CASE.

THE Stipendiary (Mr. E. M. E. Welby) gave judgment at the Sheffield Police-court on the 30th ult. in the case in which the Sheffield Corporation charged Thomas Nuttall, of Siln-street, Walkley, with certain breaches of the building by-laws. The point was whether certain old tramcars which defendant had bought and erected on a piece of land at the corner of South-road and Highton-street, Walkley, were new buildings within the meaning of the by-laws. Four summonses were taken out against the defendant, one of which—charging him with neglecting to give notice to the City Surveyor of intention to erect—was dismissed by the Stipendiary on the first hearing of the case. The other charges had reference to the roof and walls of the "buildings," and defendant's failure to construct them of incombustible material, as provided by the by-laws.

The Stipendiary, in giving judgment, said the puzzle was to know whether two old tramcars had become new buildings, within the meaning of the by-laws; secondly, whether they had become domestic buildings; and if they had, and were not within the exemptions—which they appeared not to be—all their external walls ought to be constructed in accordance with the rules given in By-law No. 17. The complaint made was that the external walls had not been so constructed. As to whether or not the cars had become new buildings there had been several cases decided by the Queen's Bench Division of the High Court, which more or less bore upon the question, and of these Richardson (appellant) against Brown (respondent), decided in February, 1885, and the combined cases of the Mayor of Southend-on-Sea (appellant) against Archer (respondent) and Romani (respondent), seemed most to bear on it. The case of Richardson against Brown appeared nearer to fit the circumstances of the two tramcars, and as the article in question in that case was held to be a new building, he held these two cars to have become new buildings within the meaning of the by-law. If the Southend-on-Sea case had seemed nearer, he should have held that they had not become new buildings, because the articles expressed in that case were held not to be. As to whether the two tramcars had become two new "domestic" buildings, it appeared that one of them was going to be used as a meat shop if all had gone well, but the other car would have been a warehouse for oilcloth and lineum. He held that neither of them had actually become "domestic" buildings within the meaning of the by-laws. Although he held that there had been an infringement of the other by-law, the offences committed, owing to the great obscurity in the term "new building," were so trifling, that it was inexpedient to inflict more than a nominal punishment, and so the order would be to pay 2s. and costs on each of the two summonses upon which conviction was made.

#### LANCASHIRE BUILDING DISPUTE.

THE case of Rowson v. Harrison came before the Court of Appeal, composed of Lords Justices Vaughan Williams and Stirling, on the 6th inst., on the appeal of the defendant from an order of Mr. Justice Bucknill at the Manchester Assizes on the 24th ult. referring the case for trial before an

special referee if the parties could not agree on a special referee.

Mr. Mellison, in support of the appeal, said that the writ in the action was issued on October 18 last year. The statement of claim was delivered on December 14 last. On January 21 an order was made by consent that the case should be tried by a jury. The plaintiff did not seem to be in a hurry to get the case before a jury, because it was not until the present Manchester Assizes that the case came on for trial. The list at the assizes was a very long one, and there were sixty-two cases for trial. The case came on for trial before Mr. Justice Bucknill and a jury, and in the result his Lordship said he should refer the case, and did so refer it. The defendant now appealed from this order, and said it was eminently a case for a jury to try, and that the learned judge had no jurisdiction to refer the case, and even if he had jurisdiction he had exercised his discretion wrongly. The plaintiff's claim was for damages for alleged obstruction of light and damage to his house in the course of some rebuilding. The claim for light was not a certain agreement, and the plaintiff further said that the defendant, in making alterations to his house, damaged his (the plaintiff's) house. The defence was that the defendant built under a builder and architect nominated by the plaintiff, that the plaintiff had the plans and specifications, and, so far as the light was concerned, the plaintiff consented to everything, and so far as the damage was concerned, the defendant pleaded a denial. The claim for the damage principally rested not on negligent building, but on trespass in underpinning. The learned counsel contended that it was a proper case to be tried by a judge and a jury, and if the jury had a view of the *locus in quo*, there would be absolutely no difficulty in it. The case could not last a long time.

Mr. Hudson, for the respondent on the appeal, contended that it was a proper case to be tried before an official referee.

At the conclusion of the arguments Lord Justice Vaughan Williams, in giving judgment, said there was nothing on the face of the proceedings which suggested that the case involved a long inquiry. He thought in the circumstances that it was a proper case for trial before a judge and jury.

Lord Justice Stirling concurred, and the appeal was accordingly allowed, and the order of the learned judge in the court below set aside.

#### CASE UNDER THE LONDON BUILDING ACT, 1894.

##### LONDON COUNTY COUNCIL v. GARDINER: BAD MORTAR.

AT the Woolwich Police-court, on the 26th ult., before Mr. d'Eyncourt, Frederick Gardiner, 21, Bostall Hill, Plumstead, appeared to answer an adjourned summons by the London County Council for not putting together the brickwork of a building in Grosvenor-road with mortar composed in accordance with the Council's by-laws. He was also summoned for neglecting to comply with the notice of the District Surveyor to remedy such irregularity.

The London County Council were represented by Mr. Andrews, while Mr. Tyrrell appeared for the defence.

At the outset it was explained that the case had been adjourned in order that fresh samples from other parts of the building might be taken and analysed.

The District Surveyor, Mr. Thomas Batterbury, submitted diagrams showing the positions from which he took samples.

Cross-examined by Mr. Tyrrell, Mr. Batterbury said nothing appeared to be wrong with the house, and, with the exception of the mortar, the house was properly constructed.

By Mr. d'Eyncourt: The case had been taken up because the mortar in its present state would be affected by the damp and crumble away.

Re-cross-examined: The District Surveyor said he could not say how long the house would last.

Mr. Grimwood, before whom the samples had been placed, produced the result of his analysis, showing the respective proportions of lime and sand in the mortar, and said that the general result of the analysis of the further samples was that they were more or less earthy, and that, in fact, none of the samples were in accordance with the by-laws.

Re-examined: Mr. Grimwood frequently received samples from other districts to analyse. The earthy matter in one of the specimens was 9 per cent., and it should not exceed 1½ per cent.

For the defence, Mr. Stevens, architect and surveyor, of Walthamstow, said he was of opinion that the mortar had set well, was hard, and perfectly good enough for the work. It was quite suitable for speculative building generally.

Mr. d'Eyncourt: In speculative building is the very best mortar used?

Witness: I don't say so.

Mr. d'Eyncourt: Do you say the second best?

Witness: I won't say that.

Mr. d'Eyncourt: Or the third best?

Witness: Nor the third best. He knew of a building at Clapham Junction built with similar mortar which, to his knowledge, had lasted twenty-three years, and was still in good condition.

Mr. d'Eyncourt said the question he had to con-

sider was the condition of the mortar. He was loth to make an order to demolish the building until he was thoroughly satisfied that the building was bad throughout. There had been brought before them the definition of speculative building of such a type that the London County Council was anxious to forbid. He convicted the defendant on the summons under the by-laws in respect of the improper mortar, and fined him 1l. and ordered 2l. 2s. for costs. On the summons for failing to comply with the notice of irregularity, he made an order on the defendant within fourteen days to take down the brickwork put together with the improper mortar, and ordered the defendant to pay 5l. 5s. for costs.

#### RECENT PATENTS:

##### ABSTRACTS OF PATENTED INVENTIONS.

6,403.—A SPARK-ARRESTER: *A. F. Willon*.—A wider conical cap is put upon the top of the chimney-pipe, and around it is placed a hopper (having a flange turned inwards at its rim) fitted with spiral vanes and joined with tubes to a discharging-pipe.

6,414.—DOOR-BOLTS: *F. J. Cope*.—A pin passed through a semi-circular slot joins the bolt-tail to the knob which may be turned for readily working the bolt, but cannot be forced backwards; the pin may be provided with a roller, and, in another shape, the bolt is connected with a lever upon the spindle of the knob.

6,455.—ROOFING AND OTHER SLABS: *L. Hatschek*.—The slabs are composed of an artificial stone, in which consists of a mixture of asbestos, or some other fibrous substance, hydraulic lime, and cement, of which thin plates are formed in a cardboard-making machine, the plates being then subjected to a high pressure for their shapes and surfaces.

6,458.—A SPANNER: *A. R. Upward*.—A plate that can be turned and fixed to the handle has several jaws or openings cut around it, its squared stem will fit between jaws upon the handle, and a pin inserted through a flange upon the stem and into the handle locks the plate, or the plate may be locked by means of a bolt.

6,464.—A COMBINED CHIMNEY COWL AND VENTILATOR: *R. M. Pancaost*.—A set of outer plates is hung from a top cover so as to cover openings into a space above the neck of the cowl; overlapping inner plates are arranged between the vertical edges of the outer plates, and in some cases the several plates are flared or curved; the contrivance is available for a continuous series of skylight ventilators affixed to a roof.

6,497.—A FITTING FOR LAVATORY BASINS: *G. Smith*.—The inventor's object is to furnish means of obtaining a supply of water when the main pipe is not available for that purpose. He provides an auxiliary tank at the back, with a tap that projects over the basin.

6,524.—A WALL-TIE: *F. D. Johnston*.—The wall-tie or plate is fashioned of open-work sheet-metal, in a double V-shape on plan, with ears at the sides, middle webs, and pierced lugs or ears at the ends, which are to be nailed in position or turned up at a right angle to as to enter joints in the brickwork.

6,536.—A CHIMNEY POT: *F. Marchant*.—Vertical wind-passages are fashioned in the chimney-pot, which communicate upwards with inlet openings, and have fans fitted upon their bell-mouths. The spindles of the fans carry vanes outside the passages.

6,576.—A JOINT OR STOP FOR TUBES: *C. W. Schuch*.—The joint is devised for tubes and tube terminals, and also for stopping tube ends. A collar of soft metal or alloy, to be cut into and displaced as the joint is being screwed up, is fitted either upon an interior screwed liner or ferrule, or upon the screw which is threaded in the tube bore, the liner being screwed internally. The joint is specified as being adapted for tee-pieces, for screw plugs, and for closing sockets.

6,595.—HATCHING OF ROOFS: *R. W. Spurray*.—After the straw has been pressed between perforated plates (which are disposed parallel-wise) with an end-rammer, it is made secure with wire pins between galvanised wires or waterproofed strings, to the ends of which rings are firstly fastened, the pins being inserted through the holes in the pressing-plates. For providing a continuous length of straw matting, the wires or strings are unwound from rollers. The ends of the pressing-plates have guide-notches that take the wires.

6,620.—CALLIPER GAUGES: *E. Capitaine*.—The two legs are made in two parts, so that a sliding gauge may be approximately set to the measurement required. When the parts have been clamped together, the calliper points are finely adjusted with a screw that operates upon the vernier arm against the pressure of a spring. In the case of large work, the two legs may be pivoted on to clamps upon a cross-bar, and the ends of one leg and the vernier arm are joined in the same manner, whilst a nut and a right-and-left-handed screw serve to shorten and lengthen the cross-bar.

6,625.—MANUFACTURE OF GAS: *G. Othermann & Co. and V. Loos*.—A fire-clay retort, which has a stirring-blade, and is heated to from 700 deg. to 800 deg. C., is charged with waste products, refuse sweepings, &c. The resultant gases are conveyed into a second fire-clay retort similarly heated, and

being dissociated as they pass over red-hot paper ashes, or some other neutral material, and over heated coke, are passed through a container which is charged with a red-hot admixture of carbon and alkali carbonates, or an admixture of potash, carbon, and ground iron or iron oxides, so that the nitrogen becomes retained as cyanogen compounds. The combustible gases are then conveyed (out of the second retort) to a hydraulic main, and so to condenser. It is stated that they are practically free from carbonic oxide.

6,706.—A METHOD OF HEATING BUILDINGS: A. G. Paul.—The invention, which is more particularly applicable for the system of heating specified in No. 21,423 of 1867, furnishes thermostatical means for automatically regulating the supply of the heating fluid and for working a valve in the air-exhaust pipe or in an air-buie; it embodies various modified forms, by one of which a thermometer, clipped on to one of the radiator pipes, provides for the closing of the supply pipe when the electrical circuit is effected and an armature is attracted by a coil in opposition to a spring. In another form it is arranged that the thermometer shall, by means of an electro-magnet, regulate a valve in the air-pipe, an exhauster, in the shape of a jet of steam or water being affixed to the end of the pipe; or an electro-magnet which attracts an armature is set over a damper that will admit cold air to cool the radiator as soon as a certain temperature has been attained and electrical current has been made.

6,737.—FENCES AND FENCING: N. B. Riddle.—The post has its lower portion made of glass in concavo-convex shape and its upper portion of wood, the two parts being fastened together with bolts and cushions, and inserted between the springs between the bolt-nuts and the lower part of the post; the cushions are intended to prevent the upper part from becoming decayed, as they allow air to circulate around, and the springs will minimise the effects of shocks upon the glass arising from strain upon the wire runners.

6,739.—A METHOD OF BALANCING WINDOWS: W. Sutch and G. Hoff.—A groove in each sash stile carries a screw having a rapid pitch between dove-tailed bearing plates and working in a U-shaped threaded sleeve. A screwed plug secures one end of the upper pivoted plate to the screw, whilst to the other end is secured a coiled spring. To the top and bottom rails of the sash are fixed recessed plates in which the bearing or pivot plates will slide. Lubricating oil runs from a cup upon the upper pivot down inside a hollow screw, and so through the pierced plug and lower pivot; in a variant shape screws are rotated by threaded sleeves or nuts which are secured to the sashes so as to wind up the springs as the sashes are being lowered. The lower end of the screw is joined with a screwed coupling, and to the spring rod carried by a conical bearing block. Its upper end is mounted upon a fixed slotted bearing plate, and to an adjustable sleeve, of which the ratchet teeth will engage with the teeth of the bearing block is secured the lower end of the spring.

6,745.—A CHART FOR PLOTTING REGULAR FIGURES: J. M. B. Thompson.—The inventor has devised a mathematical chart wherewith regular figures and patterns may be plotted; from a common centre he describes a series of equidistant circles, and for setting out the angle-points of regular polygons he draws radial lines inclined from a common starting-point at the angles desired; the lines end upon different circles; those for instance, for the pentagon, octagon, and so on upon the first circle, those for the square, octagon, and so on upon the second circle, and they are numbered at their outer ends 20, 5, 20, 10, 20, 5, . . . 4, 32, 16, 32, 8, 32, 4, . . . The circles are marked with the numbers of the sides of the polygons to which they severally appertain, and with the letters a, b, c, . . . the space outside the remotest circle is divided into squares, with their diagonals marked; the sides of the squares are equal to the distances between the pairs of adjacent circles; tangents to the circles, lines at right angles intersecting at given points, and other lines may be drawn by means of the squares and their diagonals, and measuring scales are marked around the entire diagram.

6,793.—AUTOMATIC SWITCHING APPARATUS (ELECTRICAL): F. S. Tolcher.—The voltmeter will close the one or the other of two relay circuits when the current varies from the limits determined; motors that will work a switch for cutting in or out battery cells are connected with the relays; a series of switch arms which carry contacts that dip into mercury cups is engaged by a series of discs having recesses set in a helical curve and mounted upon a shaft; rollers of the arms repose upon the discs, so that one switch only can be "on" at one time; the contacts, which are connected through a resistance, are shaped so that the main circuit cannot be completely broken, nor a cell be short-circuited; the motors at either end of the switch have, a piece, an electro-magnet with an armature that will turn a shaft; on the armature shaft is a rod which, as it engages the ends of a horn, will break the motor circuit when the movement of the armature is completed and one cell has been cut in or out.

6,819.—AN INSTRUMENT FOR SURVEYORS USE: M. Baumer.—The instrument is adapted for measuring distances and horizontal or vertical angles, or

the co-ordinates of distant points, and for plotting them on paper. A disc fitted with a vernier moving over a scale upon another disc affixed to the column is approximately adjusted with an arm fitted with a set-screw, for the finer adjustment a tangent screw is set in engagement with a pin that projects from a bracket upon the former disc, to which are fastened the bearings of the horizontal axis and a bracket; the bracket carries a worm which works a sector upon the axis and is fitted with a scale and a vernier. A foot to which the distance meter is secured is clamped by V-grooves cut in a plate mounted on arms upon the shaft, and its two telescopes are set at a fixed distance the one from the other. The horizontal vernier having been adjusted at zero the fixed telescope is fixed upon the distant object, and as the other telescope is then directed on to the object its distance may be ascertained from the vernier reading; the height of the object and its horizontal distance are then read by the adjustment of a vertical rod that slides upon a horizontal scale attached to the disc with a scale upon the shaft, a pencil-point upon a slide at the bottom of the vertical rod plots upon a drawing-board each point as it is surveyed.

MEETINGS.

WEDNESDAY, AUGUST 14.

Institute of Sanitary Engineers.—Examination and Literary Committee at 3.0 p.m. General Purposes and Finance Committee at 4.0 p.m. Council Meeting at 7.0 p.m.

AUGUST 12 TO 17.

Institution of Junior Engineers.—Summer Meeting, Plymouth and Devonport. Visits to H.M. Dockyard, Devonport. H.M.S. Cambridge (gunnery ship) and H.M.M. Diamond (nautical school ship). Keyham Dockyard Extension Works; Cayham Steam Yard and Royal Naval Engineering College; Royal William Victualling Yard; Saitash Tubular Bridge; and other works and places of engineering interest in the neighbourhood. The Summer Dinner of the Institution takes place at the Hotel Continental, Plymouth, on Friday, August 16.

SOME RECENT SALES OF PROPERTY:

Table listing property sales with columns for date, location, and price. Includes entries like 'July 16.—By ED. PARTRIDGE (at Bideford). Shebbear, Devon.—Caute and Trickey's Farm, 85 a. 0 r. 22 p. f. £1,650' and 'July 25.—By W. R. NICHOLAS & CO. Orpington, Kent.—Glenworth and nearly 3 a. f. 3,000'.

Table listing property sales with columns for location, details, and price. Includes entries like 'Greenwich.—44 and 46, Haddost, u.t. 96 yrs, g.r. 84. £400' and 'Wimbledon.—44, 46, and 50, Russell-rd, f. 1,100'.

Wimbledon.—Worplesd., f.g.r.'s 25f. reversions in 69, 88, and 98 yrs. . . . .	£270
Peppers-rd. (near), two freehold plots. . . . .	300
New Southgate.—Boves-rd., Devanha House, f. 1500 . . . . .	2,390
Flower Hill.—15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000	5,600

TO CORRESPONDENTS. A. W. B.—G. R. (Amounts should have been stated). NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses. Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS. [Communications for insertion under this heading should be addressed to 'The Editor,' and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.] \* Denotes accepted. † Denotes provisionally accepted.

ABERDEEN.—For new wing to complete extension of Blair's Catholic College, near Aberdeen. Mr. R. G. Wilson, architect, Aberdeen. Masonry.—Jas. King. Joinery.—Jno. Henderson. Slating.—Forbes Morrison. Plastering.—Bannochie & Sons. Plumbing.—Thorn & Strachan. Painting.—Edward Copeland. [All of Aberdeen.] Schedules by architect. Total of accepted tenders, about £12,000.

Table listing tenders for Cleethorpes, including Waterman, C. Lewis, Wade, Limited, etc.

See also next page.

DEWSBURY.—For the erection of four houses, &c., Thornhill-road, for the Pioneer Industrial Society, Limited. Messrs. Holton & Fox, architects, Corporation-street, Dewsbury:—

Table listing contractors and costs for Dewsbury houses, including Messrs. G. Broadbent, Ravens-thorpe, T. B. Bailey, West Town, Dewsbury, J. Stead, Bailey Carr, etc.

FRITH (Kent).—For the execution of private street works, Grosvenor-road, &c., for the Urban District Council. Mr. A. W. Jennings, Surveyor, Council Offices, High-street, Frith. (Quantities by Surveyor):—

Table listing contractors and costs for Frith street works, including H. C. Soan, W. H. Wheeler, T. Adams, Fry Bros, etc.

HERTFORD.—For sewer works. Mr. J. H. Jevons, Borough and Waterworks Engineer and Surveyor:—

Table listing contractors and costs for Hertsford sewer works, including Messrs. Meston & Hale, G. F. Poultonson, etc.

LITTLEHAMPTON.—For the construction of reservoir, house, cottage, &c., Batworth Park. Mr. H. Howard, Engineer, Town Offices, Littlehampton. (Quantities by Mr. C. F. A. Poland, John-street, Bedford-row, W.C.):—

Table listing contractors and costs for Littlehampton reservoir, including Linfield & Son, A. Burrell, etc.

LONDON.—For Tollington School, Tetherdown, Mus well Hill. Mr. Alfred Conder, architect, Palace-chambers, Westminster:—

Table listing contractors and costs for Tollington School, including Messrs. W. Akers & Co., etc.

NENAGH (Ireland).—For the erection of business premises, Castle-street, and St. Peter's-street, for Messrs. Hodgins & Co. and F. Day. Messrs. W. H. Hill & Son, architects, 28, South Mall, Cork. Quantities by Mr. William Butler, Dublin:—

Table listing contractors and costs for Nenagh business premises, including Thomas Williams, Callen Bros, etc.

NORWICH.—For extensive additions to the city asylum, Hellesden. Mr. A. F. Collins, C.E., Guildhall, Norwich:—

Table listing contractors and costs for Norwich asylum additions, including Messrs. Coulson & Loft, Downing & Son, etc.

C. B. N. SNEWIN & SONS, Ld.

MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and TIMBER MERCHANT, Nos. 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, & 17, BACK HILL, HATTON GARDEN, and 29, 30, & 31, RAY STREET, FARRINGTON ROAD, E.C.

THE LARGEST STOCK OF ALL KINDS OF WOODS IN EVERY THICKNESS, DRY, AND FIT FOR IMMEDIATE USE. Telephone, No. 274 Holborn. Tele. Address: "SNEWIN, London."

PATELEY BRIDGE (Yorks).—For the erection of minister's house, for the Primitive Methodist Trustees. Mr. Amos Chippindale, architect, Harrogate:—

Table listing contractors and costs for Pateley Bridge minister's house, including David Lauson, Pateley Bridge, etc.

STOKE-UPON-TRENT.—For the erection of three shops and warehouse, High-street, for Mr. J. H. Irwin. Messrs. R. Scrivener & Sons, architects, Hanley, Staffs.:—

Table listing contractors and costs for Stoke-upon-Trent shops, including Messrs. Brain & Smith, R. E. James, etc.

WATFORD.—For additions, &c., to Watford Field (girls') School for the School Board. Mr. C. P. Ayres, architect, Hurvale, Watford. Quantities by architect:—

Table listing contractors and costs for Watford school additions, including General Builders Co., A. F. Wilson, etc.

WOODFORD (Essex).—For repairs, repainting, and cleansing works in connexion with the Churchfield Schools, Woodford. Mr. Edward Tidman, C.E., Architect to the Board, Connaught Mansions, Westminster:—

Table listing contractors and costs for Woodford school repairs, including H. Wells, Osborne, etc.

For Similar Work at Woodford Green Schools.

Table listing contractors and costs for similar work at Woodford Green Schools, including H. Wells, Osborne, etc.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom, at the rate of 19s. per annum (25 numbers) PREPAID. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, &c., at 25s. per annum. Remittance payable to DOUGLAS FOURDRINIER should be addressed to the publisher of "THE BUILDER," Catherine-street, W.C.

### The Architect as Arbitrator.

IT is to the honour of the architectural profession—and in this, for the purposes of this article, we may include surveyors and engineers—that they have by degrees become invested with an actually judicial character in regard to part of their business. This result has been produced by recent judicial decisions, which, at first giving forth an uncertain sound, have gradually become more and more clear, until at length, by the decision in the present year of the Court of Appeal in the combined cases of *Chambers v. Goldthorpe* and *Restell v. Nye*, the question has been placed beyond a shadow of doubt. "I think that the effect of the architect agreeing to act under Clause 20 as to the granting of certificates was that he undertook the duty towards both parties of holding the scales even and deciding between them impartially as to the amount payable by the one to the other. . . he was in the position of a person who had to exercise functions of a judicial character as between two parties." These words of the Master of the Rolls state definitely the position of the architect, surveyor, or engineer when the duty is cast upon him of deciding on the rights of the building-owner and the contractor, and they settle a question which has been in an uncertain state for the last twenty years. It is therefore with some surprise that in a book which specially deals with the engineer or architect as arbitrator between the employer and the contractor\* these important cases before the King's Bench Division are not dealt with.

It is certainly very important that the difference in the several functions of the

engineer or the architect should be clearly understood, for in one position he is simply the agent of his employer, in the other he is a judge between two parties. We are all accustomed to see architects and surveyors appointed as arbitrators, but they are usually so appointed, to use a legal and a diplomatic expression, *ad hoc*, for a special purpose at a special time. But the architect as arbitrator under an ordinary contract is appointed by the contract between the employer and the contractor. Unlike an ordinary arbitrator, he is not in a sense an impartial person; he has been and still is acting as the agent of one of the parties. The fault of the book to which we have already referred is, in our judgment, that it confuses the two characters of the architect. For example, it is usually stipulated in a contract that the contractor shall not do any extra work, or deviate from the agreement, without the written instructions of the architect. In giving these written instructions the architect is simply and solely the agent of the employer. But when the contract comes to an end, and he has to give his final certificate, he becomes a judge—unless the certificate is given the contractor is not paid. "The complete separation of the functions of directing the contractor as to the work to be performed, and of approving work after it has been performed, enables the former to be regarded as functions of the agent of the employer, and the latter as those of an arbitrator, not in the sense of one who adjudicates on remedial rights arising by law upon a breach of contract, but in the sense of one who is called upon to determine whether the contract undertaken has, or has not, been fulfilled" (p. 68). But whatever the exact form in which the functions of the architect as arbitrator are clothed, he is essentially for the time being a judge, one who has to exercise judicial functions, who should approach the matter before him with absolute impartiality, and whose decision cannot be set aside unless it is vitiated by fraud or gross misconduct.

The author of the work in question might well have said something upon what may be called the legal morality of this

question. It is not an easy thing for any man, however fair-minded, suddenly to have to put off a feeling of protection for his employer in order to come to a decision which may even involve a certain condemnation of himself. For instance, extras, according to a contract, are not to be undertaken without an order in writing. But over and over again this clause is neglected. Some extra has to be done. "Shall I go on with it?" asks the builder. "Yes," replies the architect, in a hurry to catch a train. Presently comes the final settlement and the final certificate, without which the builder cannot obtain a penny of the final amount. Difficulties arise in regard to these particular extras; the employer is a man tenacious of his rights, the architect is placed, as a matter of fact, in the position of sitting in judgment on himself as well as of deciding the respective rights of contractor and employer. In one case at any rate, that of *Kemp v. Rose*, decided so long ago as 1853, the Court held that it was entitled to reverse the decision of the architect because he had not approached this part of his duty with an unbiased mind. "As a matter of fact, he had given an assurance to the employer that the cost of the works would not exceed a certain amount. By the contract he was constituted sole arbitrator as to the measurement of extras, or any accounts for extras, and as to the allowance of such claims, and all other matters.\* This fact, in the opinion of the Court, caused him to have a biased mind, since he had a very strong motive to cut down the claim of the contractor so as to bring it within the amount which he had mentioned to the employer. Though this is a useful illustration of a practical difficulty, it must not be taken that this case would now be followed, since the tendency of the courts seems rather to be to assume that the architect is, as it were, suddenly clothed with new functions, and one may almost say, a new frame of mind; that he is capable of exercising a kind of duality of functions, and will proceed to act fairly and judicially the moment he begins to exercise his

\* "The Engineer or Architect as the Arbitrator between the Employer and the Contractor and his Other Functions under Building Contract." By Charles Currie Gregory. London: William Clowes & Sons. 1901.

\* Gregory, p. 307, Roscoe's "Digest of Building Cases," p. 6.

judicial functions. It is obvious that a mere statement to an employer, somewhat vague, that a building will not cost more than 1,000*l.* or 2,000*l.* as the case may be, does not in reality create a greater bias in the mind of an architect than many circumstances which may arise in the course of a contract. For example, in an American case it appeared that the architect had to decide whether certain work was work within the meaning of the contract, this same work having apparently been necessitated by his own error in furnishing working plans. In fact, the more the question of the two functions of the architect and engineer is carefully considered, the more important and far-reaching appears to be the result of recent judgments which have so greatly developed what may be termed the judicial theory in regard to an architect's functions. How difficult the position in which the architect is placed has become, and how much more trying it is than when he is called on to act as arbitrator between parties with whom he has had no previous connexion, is well shown in the following passage from Mr. Gregory's work:—

"An arbitrator, in the strict sense in which the term is used as a person to whom, alone or in conjunction with others, a right of action is referred for arbitration instead of to a court, can no more make a valid determination without granting the parties an opportunity of presenting their respective sides of the case, in the presence of each other, at a formal hearing, than a court can do so.

But where in a contract it is provided that the engineer or architect to be appointed by the employer for the direction and superintendence of the work shall certify the completion of the work, or the amount to be paid to the contractor, or the fulfilment or measure of any other contract undertaking, the intention is not that he shall, before so certifying, be required to afford the parties an opportunity of a formal hearing. It is his own knowledge and skill, and his own observation and that of his subordinates, that it is intended he shall act upon, and not upon facts to be established by the evidence of witnesses, nor upon the opinions of expert witnesses."

This statement strikingly shows the difficulty of the position, for not only has the architect to shake himself free from all bias, he has also to decide without the assistance of the parties. In the above extract there is a remark which, however, requires notice—"that of his subordinates." In the case of *Clemence v. Clarke*, decided in 1880, and strangely omitted from Mr. Gregory's book, it was ruled that a total delegation of work to a subordinate might vitiate a final certificate, which is, in a sense, an award. "If, indeed," said Mr. Justice Grove, "the architect had delegated the whole of his duty to another person; if he had taken another person and paid him a smaller sum of money than probably he would be entitled to; if he had taken a man of inferior station to supervise and look over all the work instead of himself, and had abdicated his functions wholly in favour of another person, that would have been a ground for setting aside the certificate, because in that case it would have amounted to misconduct." In that particular case, his conduct was impugned because he had had the work measured up by a quantity surveyor, but the partial delegation was considered to be justifiable, because an architect need not and could not in some cases go personally into all the details of the work. This case, however, is illustrative of the various small practical

difficulties which may arise. And, indeed, it is not unworthy of notice that the whole dispute arose, as it would seem, from the unfortunate wording of the final certificate:—"I hereby certify that A B is entitled to receive the sum of £— to balance account of works, as certified by the measuring surveyor to be the final amount due thereon, executed by him at— (Signed) C D, Architect." Had the words which we have italicised been omitted the point would never have been raised; showing that an architect should simply and solely certify what amount is due to a contractor. In addition, however, there are larger and more theoretical questions, to which allusion has already been made, which may arise during the time that the architect is acting as arbitrator, not under a formal submission by two strangers, but under a contract between two parties, the contractor and the employer, by which, strange as it may seem when nakedly stated, the contractor binds himself to accept the award of the agent of the person for whom he is to work, and who during the course of the contract must necessarily—except in this particular instance—look only to the interests of the employer.

#### COLONIAL ARCHITECTURE IN AMERICA.

**ABOUT** the architecture of the Georgian period in America, commonly spoken of in the States as "colonial architecture," or that of the buildings erected by the colonists before the Union, there is a great deal of interest both from its resemblance to and its difference from the architecture of the same period in the mother country. In the general aspect and style of the colonial buildings the resemblance is very strong indeed; it is the same style carried out on foreign ground. The principal differences arise from the influence of new circumstances, of which the most powerful is obviously that of material. The architectural forms carried out in England with brick and stone, or brick with stone columns and other accessories, was carried out in the American colonies to a great extent in wood, as the most plentiful and most easily worked material of the new country. Hence arose new proportions in the orders employed in porches and doorways. The classic column was elongated into tall and slender proportions quite logically expressive of the difference in the quality of the material; and the pro-

Monumental Church, built 1811.

Fig. 2.

[See next page.]

portions which would have appeared bad, because practically fragile, in a stone column, appear quite satisfactory and in good taste in a wooden one. The extensive use of wood also gave rise to a good deal of special elaboration of wooden detail. In England the wooden balusters of stair-railings, though often much thinner than anything that could be made in stone, preserve for the most part the simplicity of character of the stone baluster. The colonial joiner indulged himself with fancies in corkscrew work, as in the newell from Hubon House, Salem (fig. 1), making one spiral design appear to run the contrary way through the centre of another; a device not admirable in itself, but amusing as showing the workman making the most of his skill in handling the chief constructional material available.

The large collection of measured drawings and other illustrations published in a series of articles in an American architectural journal, and since issued in portfolios as a separate publication,\* brings within the reach of English architects a complete survey of this class of American work, so closely connected in history and association with English architecture. An introductory essay, with a number of small sketch illustrations, gives an analysis of the varieties found under different dates and in different neighbourhoods.

In the domestic architecture the treatment of the doorway closely follows that of the English precedent; as in the typical

Georgian country house in England, the general building is a plain parallelogram, the small amount of architectural embellishment being concentrated on the porch, where, as already observed, the decorative column often assumes the long proportions of woodwork, but otherwise closely follows English precedent. It is noticed, however, that in Pennsylvania houses the columned porch is commonly omitted, and the reason given for this (whether rightly or wrongly) is a curious one; it is that the Pennsylvania settlers had gone through so severe a fight against the primeval forest, having to clear every piece of building ground from tree trunks, that they had had enough of shade and of anything approaching to the shape or reminiscence of a tree-trunk, and wanted no more of it. The explanation seems, however, a little too far-fetched.

In the southern provinces the influence of timber seems to have been less preponderant than in the north. "The aristocratic cavaliers who settled there differed in much from the Puritans." The great tobacco-planters loved the solitude of large country-houses; a solitude all the more complete in a country where the roads were mere bridle-paths. Many of these settlers were sons of prominent English noblemen, and had an inherited taste for comfortable and substantial houses. "They were the first among the American settlers to introduce glass for the lighting of rooms;" a passage we do not quite understand. Is it implied that the more northern houses at the early period of settlement were without glass in their windows? "Perhaps the inherited desire of the Virginia settler to live in dignity and splendour can best ex-

plain his preference for brick, in a country where wood was the most natural material, and where it was everywhere abundant." The rivers being the only safe and practicable highways, "each planter sought to have his own river-front, with a little dock to which the small English and Dutch vessels could come for barter." These characteristics seem to convey to the mind a vivid idea of the general style and surroundings of the old Virginia homestead.

The first illustration in the book, from a photograph of the Culver Homestead, in Monroe County, is characteristic enough of the influence of wood on classic architectural forms. We see a plank-faced house with a modillion cornice, and a large porch with Roman-Doric columns 14 diameters high, a wide boarded pediment over it, the flat return behind the cornice over the outside columns making a great shelf on each side, of no use for anything but to hold dust. It is a curious example of the tyranny of architectural precedent, for no one would have thought of building a wooden porch in this way but for the influence of masonic architecture. Turning over the plates, we come, in the illustration of the Fairbanks House, Dedham (Mass.), to an interesting example of the early framed house (this one was built in 1636), all of wood except the one lump of brick or stone in the centre of the plan, which takes the fireplaces and chimneys. This is a dwelling racy of the soil, but the examples of its furniture shown in the succeeding plate might all have been made in England. The wooden cornices from some of the old houses in Boston, largely founded on classic detail, have however a certain amount of novelty

\* "The Georgian Period," a collection of papers dealing with "Colonial" or eighteenth century architecture in the United States. Boston; the American Architect and Building News Company; 1895-1900.

and variety of treatment. In the Philpse Manor house, New York (about 1745), we seem to see a Wren house done into wood, with its rows of prim windows all alike, with small square panes, and its two columned porches breaking the line of the ground-floor front. One of these porches occupies the natural position as a screen to the main entrance into hall and staircase; the other, exactly similar in treatment and importance, stands in front of a door opening straight into the kitchen. This house shows also a feature which occurs occasionally in English buildings, but which seems a special favourite with the colonial architect—a balustrade erected at the top of the slope of the hipped roof, and presumably surrounding a flat on the top (there is no section of the house given). The interior contained a good deal of rather elaborate carved ornament, a gracefully treated balustraded staircase, and a drawing-room ceiling diversified with symmetrical knots of foliage, and with two decorative panels enclosing portrait heads in relief. Three pages are given to designs of fanlights and glazed panels from Baltimore—whether that city was peculiarly addicted to this kind of decoration, or whether it happened only in this particular to have attracted an illustrator. The fanlights are much of the same type as we see in Harley-street and elsewhere in London houses of early nineteenth century date, only they seem to show rather more variety, and also occasionally more ambitious attempts in decorative glazing.

A good many of the churches—not those of the very earliest period—are curiously English in appearance, and the steeples, often very graceful, are obviously inspired by Wren. We give an illustration of one which is somewhat less English in character, what is called the "monumental church" at Richmond, Virginia (1811); a church with, as will be seen, a fine octagon plan with bays on the alternate sides, which owes part of its local character to that feature of the balustrading round the upper portion of the roof, already noticed. In this case one may suppose that the balustrade surrounds a skylight in the centre of the dome (here again there is no section); in that case it could have no practical use in such a position, and must have been regarded as an ornamental finish. The same feature occurs in the Pennsylvania Hospital, Philadelphia; a building which, but for this feature, might safely be presumed to be English.

The mantelpieces in many of the old houses show great refinement and delicacy of design and (if we may trust the indications in the drawings) of execution; they are all more or less on the Adam model, but with an occasional interesting novelty of detail. One of the most refined and graceful is that making part of the design of one side of the parlour in an old house, No. 1,234 in Washington-street, Boston, the illustration of which we reproduce.

This large collection of drawings illustrating the colonial architecture of the States is of great value as a record of a class of structures of great interest, many of which are from time to time being destroyed in the process of modern "improvements," or are becoming too dilapidated to be kept up any longer. American architects will no doubt use them as sources of inspiration in cases where it is intended to revive the colonial style; to English architects they can hardly

have that kind of value, for notwithstanding the interest of these reproductions of Georgian architecture on a new soil, they are not equal to the originals in England, except in regard to some of the ornamental details of fireplaces, &c. And though they form a highly interesting chapter in architecture, one cannot but regret that the pioneer settlers on the other side of the Atlantic should have given themselves over so much to English precedent, and should not, after they had begun to get beyond the mere practical requirements of shelter and housing, have endeavoured to think for themselves a little more, and to have treated their stock material, timber, in a natural and unfettered manner, instead of following the forms of stone architecture so much. The writer of the introductory analysis, Mr. O. Z. Cervin, seems indeed to have had some such idea in his own mind, for he heads his essay with a quotation from one Eggleston (a novelist, we believe) to the effect that "Men can with difficulty originate even in a new hemisphere;" a dictum which the architecture of the "good old colony days" seems certainly to confirm.

## NOTES.

**The New Government Offices.** MR. LEONARD STORES, writing in *Thursday's Times* as one of the executors of the late Mr. Brydon, gives a clear and authoritative statement of the case in regard to the state in which Mr. Brydon's drawings were left. The drawings handed over to the Office of Works were but incomplete drawings of the carcass of the building, for the first contract, leaving all finishing for a second contract. "A number of 1/2-in. scale detail drawings," he adds, "are in existence, but many of these were hurriedly made to help the quantity surveyors to obtain a tender, and Brydon himself would have been the first to admit that these drawings required very careful reconsideration and revision." This statement renders the necessity for the appointment of an architect of the highest class, to carry out the building, even clearer and more decisive than before. A few days previously Professor Aitchison made an attempt to call attention to the importance of engaging an eminent architect to carry out the late Mr. Brydon's design, in a letter to the *Times* which is full of enthusiasm for architecture, and in the course of which he says—what in one form or another he has often said before—that there is no reason why we should not have as perfect an architecture as the Greeks, if we cared as much about it and took as much trouble to obtain the best architects. We should agree entirely with this gospel of hope if only one could get English people to care about it, but that is just the difficulty; and we fear that to the perceptions and sympathies of the average Englishman such a letter as that of Professor Aitchison will be addressed in vain. He makes, at the conclusion, a definite proposal that Dr. Rowand Anderson should be invited to carry out Brydon's work, as one who "has a name for being the best classic architect in the United Kingdom." We have not before heard this special and unique position attributed to Professor Anderson, but there could be no one better, except for the fact that he lives in Edinburgh, and it would be more convenient to have an architect living in London.

We have, however, little hope that any one will be appointed, for the simple reason that the general public care nothing about it, and the Members of the Legislature still less. The Treasury have seen their way to effecting a small economy; and in comparison with that a question of the architectural treatment of a great building is, in their eyes, not worth considering.

**The Easement of Light.** In the recently reported case of *Greenhalgh v. Brindley*, decided by Mr. Justice Farwell, which is to be found in the current number of the "Law Reports," the conclusion arrived at by the Judge was obvious. Still, decisions such as this prevent future litigation. Of course a grantor cannot derogate from his own grant but a grantor can give no rights over the land of other people in regard to the easement of light. In the present case a purchaser discovered that the vendor had made an agreement with the owner of adjoining land that no right of light should accrue to the vendor's property. On these grounds the purchaser objected to fulfil his contract. But as without this agreement the dominant tenement had not yet obtained a right to light, and as without this agreement the owner of the servient tenement could interrupt the light of the dominant tenement, the Judge held that the contract must be performed. All that was lost by the agreement was a vague possibility of obtaining a right to light at some future time. At the same time the Judge would not allow the vendor the cost of the litigation because in fairness he ought to have informed the purchaser before the contract of his covenant in regard to light, and left him to judge for himself whether it was or was not so detrimental to the property as to cause him not to buy it.

**The London School Board Building Sites.** THE unseemly dispute over a site in the Borough of Stepney for a site for a new school is at length ended. It is a curious instance of the difficulties with which the London School Board has to contend. The experts of the Board selected a site in Blakesley-street which was approved by the Inspector and was then scheduled in the Bill of the School Board. The Bill passed in ordinary course through the House of Lords and also a first and second reading in the House of Commons. Suddenly a small group of anti-educationalists, led by Lord Hugh Cecil, discovered that the site for the new school was an improper one, and asked that the Bill should on this point be referred to a Committee. This was done, and the Bill was passed by this body. Thereupon the opponents of the Bill said that it should have been referred, not to a small "Private Bill Committee," but to that larger body a "Select Committee." This demand was acceded to by the Government, and last week the Bill was again approved. The Borough Council of Stepney was represented by counsel, but there was no real opposition to the site, it only being said that the Blakesley-street site was too good for a Board school, whereas one would think that the better the site in such a district as Stepney, the more suitable it was for a school. As a matter of fact, no site can be chosen which pleases all parties, and if the School Board is to be harassed in future sessions by unreasonable objections

to sites, the building operations will be greatly hindered.

MR. JOHN G. T. WEST, of the Free Grammar School, Abingdon, has prepared plans and designs for the additions that are about to be made, at a cost of nearly 6,000*l.*, to the Grammar School at Abingdon. The charity was founded in 1563 by John Roysse, citizen and mercer of London, who endowed it with two houses in Birchin-lane, on a site latterly occupied in part by the London Assurance Company. Subsequent benefactions conferred upon the scholars a preferential right to election on to the foundation at Pembroke College, Oxford. A view of the old school buildings will be found in No. 940 of *The Mirror*, March 16, 1839. Thirty-two years ago the premises were rebuilt after Mr. Edwin Dolby's designs, which comprised five classrooms, two science-rooms, studies, and an infirmary. In 1897 a hostel for three assistant masters was erected, Mr. H. Redfern being the architect. The proposed additions will include a block of classrooms, laboratories, lecture-rooms, an art-room, a chapel, and a gymnasium.

WE hear that the project has been revived of building a theatre on a site between Jermyn-street and Charles-street, Regent-street. The ground was formerly occupied by St. James's Market, built in 1666 for Lord St. Albans, of which a part was taken for the improvements carried out by John Nash and begun in 1813, under the provisions of the Act 53, Geo. III., c. 120. During the eighteenth century the market, which has latterly fallen into decay, enjoyed a high repute. The upper portion of the market-house was used by Nonconformist preachers, Richard Baxter being one of them. The Mitre Tavern was the home in her youth of Nance Oldfield, the actress. In the eastern corner house, on the south side of the poultry market, in Market-lane, leading into Pall Mall, lived the parents of Hannah Lightfoot, the Quakeress. Whilst residing there she first attracted the attention of the Prince (afterwards George III.) as he walked to and fro between Leicester House and St. James's Palace.

THE prizes offered to students by the Architectural Association have attracted a larger number of competitors than usual, nine designs being submitted for the Architectural Association medal, while six competitors tried for the Banister Fletcher Bursary. The subject set for the medal competition was a private school for fifty boys. The award has been made to the design under the title of "Pat McKann." The fault of this design is the inadequate lighting and ventilation of the stairs and corridor, which is not atoned for by the evident care that has been taken with the important details of school accommodation. Light, and the prevention of stagnant air accumulating, are far the most important considerations in a subject of this kind. The design under the device of a halfpenny stamp is, in our opinion, the best plan submitted, although it is on too small a scale throughout to be successful—*e.g.*, the kitchen is far too small to turn out dinners for fifty boys. In this respect, perhaps, the conditions for competitors might have been

more clearly defined. The Banister Fletcher Bursary has been won by Mr. T. F. Green, with drawings of Morden College, Blackheath; the south porch of St. Margaret's Church, Ipswich; and the Brewers' Hall, Adlestree. Morden Hall is the subject of a capital set of drawings. Mr. Bosson's drawings of St. Mary Woolnoth, which we recently published, are here, besides some others of Gothic work. Mr. A. R. Conder sends some measured drawings of Gothic work that carry us back to the careful mechanical draughtsmanship of many years ago, such as we see in the Gothic text-books. Some windows are well chosen, but an unfortunate note saying that "the design for the glazing is original" shows how little effect measuring old work has on some students, who can thus combine so much labour with such trifling. The works executed in the Studio are also on view. We notice throughout a too studied attempt at originality, and too little of those more trying academic exercises which, in our opinion, enable a student to master the principles of reasonable design.

#### BUILDING AND ORNAMENTAL STONES AT THE GLASGOW EXHIBITION.

BUILDING stones are not well represented in the Exhibition, except in so far as Ireland is concerned. This is to be wondered at, seeing that the stone industry is one of the principal industries in Scotland. The numerous excellent sandstones found in Dumfries, near Edinburgh, and near Glasgow are practically unrepresented. Scotch granites are in evidence on one or two stalls, but the best exhibit of them, presently to be described, includes also some foreign stones, which seem to be rather out of place. English building stones are conspicuous by their absence.

The Irish building and decorative stones are grouped together in the Irish pavilion. Messrs. George A. Watson & Co., Ltd., of Tower-buildings, Liverpool, exhibit a very fine grained sandstone of grey tint from near Inislison, on the West Clare railway. It is specially employed for paving purposes, including flagstones for footwalks, stairs, landings, station platforms, kerbing, channelling, and crossings, also as sets and cubes for streets, passages, &c. Cubes, kerbing and a slab are shown. The ports of shipment nearest the quarries are Liscahor and Kilrush. Mr. S. G. Fraser shows a dark grey stone slab from his Donegal quarries. One of the most serviceable stones exhibited is the fine-grained light blue granite by Lt.-Col. B. Gael, from Glendoan quarry. It is not unlike the well-known blue-grey Aberdeen granite. To bring out the appearance of the material under varying conditions, a slab has been prepared the upper portion of which is polished, the central fine-axed, and the lower part left with a rough surface. We like this stone very much, though it would be still better if the minerals were not disposed in rough foliations; the rather large crystals of orthoclase felspar here and there impart a porphyritic aspect to the material, which takes an excellent polish. The Benduff and Free Slate Company, Eastview, Glendore, co. Cork, exhibits blue-black slates having a fine, even, and straight cleavage. The slate beds are said to outcrop over a hill of 900 acres in area and more than one mile in length. The nearest railway station to the quarries is Skibbereen, and the shipping port is Glendore. Some Valentia slates are shown, but at the time of our visit we could obtain no information respecting them. They are blue-black in tint; the specimens on view were not remarkable for their perfect cleavage, though the slate itself looked serviceable enough. The Killaloe Slate Company, Limited, of Nenagh, co. Tipperary, exhibits several blue-black slates of several sizes and of fairly even surface. The quarries are situated at Corbally, and are worked in strata of Lower Silurian age. They lay open a vertical section of over 400 ft. and produce slates from 10 ft. square downwards. The Valentia slates, which are quarried in the Devonian series, are rather greener in tint

than those from Killaloe. The Arigna Mining Company, Limited, Ballinamore, co. Leitrim, have some large cubes of grey stone. The Earl of Leitrim exhibits some large, grey granite cubes. One is of a grey tint speckled with black biotite in minute crystals; another is also greyish, but speckled with biotite and a green mineral resembling hornblende. Both cubes are very fine grained, and are useful granites. They, apparently, come from Milford, co. Donegal.

The Congested Districts Board for Ireland have granite from Barna, co. Galway, not unlike Shap granite in that the phenocrysts of orthoclase are pink in a finer-grained ground-mass of lighter-coloured orthoclase, and dark green hornblende. The Barna granite is represented by one small slab and a thin column. The Board also exhibits some granite from Shantallow, co. Galway. This is composed of mottled pink and light-coloured orthoclase with black specks. It is of fine grain and when polished is handsome. There is also a small polished column of Connemara marble and some others not described, on the stall. The agents for all these are Messrs. J. Miller & Sons, Marble Works, Galway.

The most attractive part of the Irish stone exhibits is the series of large polished slabs mounted along the top of the stand. They may be described as follows:—Castlegar, a black and greyish limestone from co. Galway; the central part of the slab is raised and polished, whilst the margins are fine-tooled and dulled. Middleton red marble, co. Cork. This is a crushed and foliated marble brecciated throughout, the angular pieces being lighter in tint and ornamentally disposed. The whole is veined with very small white calcite veins mostly running in one direction. Chimney-pieces, panels, pilasters, and slender shafts for buildings have been formed of it. "Irish green," from co. Galway, forms another pretty slab. It is a deep green serpentine, and for the purposes of this exhibit the slab has been cut down the centre and the two halves have been laid side by side, producing an effective pattern. Castleisland "red," from co. Kerry, is a reddish-brown breccia, the larger fragments being lighter in tint than the cementing material which forms the background; this marble is of sombre hue, and suitable for subdued effects. Another slab called "Irish green" is an ophalcicite; it is more contorted than the deep green already mentioned, and bears considerable resemblance to some of the Eozoon limestones from Canada. The Irish serpentines from Galway are nearly all ophalcicites—that is to say, they are not true serpentines in that they contain much calcite. From the point of view of effect they are probably the better for that, and another result is that larger slabs are produced than would be possible with true serpentine. They are known by the generic term "Connemara marble," and have been employed for many years for ornamental purposes. The ophalcicites in West Galway occur in irregular beds, amongst metamorphic schists and quartzites. There are two varieties, according to the observations of Professor Hull. One variety from Letterfrack is of a dense, opaque, and uniformly deep green colour, and appears to be derived from the metamorphism of a hornblende rock. The other variety, which is regarded as of higher value, is derived from dolomitic limestone. It occurs in the form of bands and laminae, often twisted and tangled, of varying shades of green, and interlaced with bands of white calcite or crystalline dolomite. The principal quarries are at Lissoughter Hill, Ballynahinch, and the neighbourhood.

To continue with the description of the polished slabs: "Cork red," similar to that from Middleton already alluded to, but the pattern has a more fragmentary appearance and there are no small white veins. Another slab is composed of the celebrated "Galway black," which takes a good polish. It is quarried along the shores of Lough Corrib, and blocks of 12 ft. to 14 ft. in length, and even larger, 4 ft. to 5 ft. wide, and about 1 ft. in thickness have been raised. Rooska limestone, county Galway, is a deep black-grey crinoid stone, the crinoids showing conspicuously in section. An inspection of this stone reminds us that Ireland is extremely rich in carboniferous limestone marbles. They have much to recommend them, for none are of gaudy tints, all being grey and blue-grey, merging into black, and for the most part relieved by innumerable sections of crinoid

stems which impart a pleasing but unobtrusive pattern. They closely resemble the Derbyshire "fossil" marbles, and some from Devonshire and the Isle of Anglesey. Another slab shown in the Irish pavilion is "Erne fossil" marble, county Fermanagh, which is light grey in tint and crowded with crinoids, some of which are of light pink tint, which gives a unique appearance to the stone. An occasional light calcic vein runs through the whole. The pink tint is doubtless due to the presence of a small quantity of limonite. Another slab from Middleton, county Cork, is a red and light blue mottled marble, with parti-coloured unobtrusive veins, except for some of the larger veins, which are white, with traces of light pink. From Moncen, co. Westmeath, comes a dark grey-black marble, with light grey straggling patches variegated with darker parts. The next slab mounted on the stand is again from Middleton; it is a metamorphosed limestone, with large straggling light and dark pink pieces; the background is variegated, mostly yellowish grey in tint, with traces of light pink, the whole veined in lighter tints of the same character. Another crinoid marble is from Clonowen, King's County; in this the fossils are very large, and the stone is so much like the dark large-patterned Derby marble that they might be readily mistaken for each other. Ebdony limestone, co. Kildare, is a dark grey, very fine-grained speckled marble. The whole of the marble slabs just described are exhibited by Messrs. E. & S. Glanville, of Dublin. They are the most characteristic of Irish marbles, though they are not so well known to English architects as they might be, except the blacks and greens, which have been employed in the United Kingdom for many decades. They are worthy of careful inspection, though the visitor will find that the officials in charge know nothing about them—at least that is what we experienced—and the stones must perforce be left to tell their own tale. A little handbook would be extremely useful.

Passing from this general exhibit, we may notice the column of Kilkenny shell marble exhibited by Mr. Richard Colles, of the Irish Marble Company, Kilkenny. This marble, known all over Europe and America, is deep black, with occasional white sections of calcite shells. These latter, however, are not always conspicuous, and enormous blocks are raised which are perfectly black—a great rarity in marbles. The Kilkenny marble takes a beautiful polish, and when first cut is quite black. Professor Hull says that the organic matter to which its blackness is due gradually passes off. We can hardly agree with this, however; for the writer has had specimens of this marble for nearly twenty years in his possession, and they are as black now as ever they were. Perhaps they came from other horizons than those referred to by Professor Hull. In any case, the excellence of this black marble will not be disputed by those architects who have used it, even though the white shell-marks will occasionally appear on the best slabs and columns.

Other Irish stones exhibited are a slab and column of Shantallow granite, which is very fine grained, has pink and greenish orthoclase, not much black mica, and a little hornblende. There is a round polished slab of green igneous rock from Lambay Island, called porphyritic andesite on the sample. It closely resembles the *vert antique* of the ancients, and the rock has attracted considerable attention for some years. The ancient green porphyry of Greece, with large pale green crystals of plagioclase feldspar, is technically a diabase-porphyrityte; and the Irish rock now alluded to from Lambay Island, near Dublin, is of similar character. Connemara marble is again represented by a large flat table top mounted on a pedestal. Soapstone is represented by specimens from near Dungloe, co. Donegal; they have been sent by the Donegal Soapstone Syndicate, Limited, of Manchester. They are said to have been obtained from "Dungloe quarry"; as a matter of fact they have no doubt come from Crohy Head, where the soapstone has been dug from a vein running up the side of a precipitous cliff. The last time we visited the locality a tunnel had been driven in, and attempts made to mine the material.

We cannot close these observations on the building stones exhibited in the Irish pavilion without expressing our appreciation of the careful manner in which thoroughly representative stones only have been brought together.

We could wish that more actual building stones (as distinguished from those used for decoration) had been shown also, but we presume it was thought that the most suitable materials for an exhibition outside of Ireland would be those which, for the most part, were of an attractive character. At the time of our visit many of the specimens were not very effectively displayed, and some were, we are sorry to say, labelled with the wrong names and localities. We have reason to believe, however, that that has now been put right.

Scotch granites and stones are present mainly on one stall or enclosure out in the grounds, and the exhibitors are Messrs. Alexander Macdonald & Co., Limited, of Aberdeen. If the exhibit is not an extensive one, it at least has the merit of showing some of the best known Aberdeen granites. It suffers from not having any description, however, and the visitor is left to his own knowledge as to what the stones really are, or where they come from. At least, that is what we found when visiting the grounds. Amongst the finished granite monuments, &c., we noticed a rustic cross in fine-axed red Peterhead, which was remarkably uniform in tint. There is also a basin with ornaments rising from the centre of a pedestal of the same stone polished. The use of Peterhead hornblende granite is again exemplified by a tall polished column, with turned cap and base. There is a polished tombstone of blue-grey Aberdeen granite, which has dog-toothed ornaments round the margins, the pattern being brought out by part being sunk. That part is dull, and the remainder polished, except for the base on which the upper part of the stone rests. There is also an ornamental carved 'ombstone surmounted by an urn, all dull or fine-axed, and light grey in tint. This presents the appearance of Kemnay stone. Close by in the same exhibit is a large cross mounted on a massive square base with sunk surfaces. It is polished, and is of a very deep red tint, the orthoclase present being fine and uniform. This is doubtless a Scandinavian stone. Another object is a pedestal having square mouldings and sides on a square base. The whole is of polished, light, coarse-grained Laurvikite; the feldspar phenocrysts have a conspicuous pearly lustre. This is also a Scandinavian stone, much used on account of its attractive appearance. It is sometimes called "labradorite" in the market, but it is in reality an augite-syenite—if a scientific term is to be used in connexion with it for trade purposes. The stone is closely allied to certain nephelite-syenites, and occurs amongst the Devonian intrusions of the Christiania district. Alkali feldspars make up the bulk of the rock, and are often intergrown with one another. Lying on the ground within Messrs. Macdonald's enclosure are several short lengths of polished granite columns, such as red Peterhead, grey Aberdeen, and some Swedish varieties.

Not far away, also in the grounds north of the river Kelvin, Messrs. Davies & Sneade, of Liverpool, have some French burr-stones, used for milling, doubtless from La-Ferté-sous-Jouarre, in the Paris basin. This is a breccia, the fragments being almost entirely of a siliceous character and bound together by a hard siliceous matrix. Another stone on the same stand resembles millstone grit, and a third variety is a coarse brown sandstone.

The Moreau Marble Company, Limited, of Chelsea, has a large assortment of artificial marbles, chiefly made up in various forms, in the grand avenue. There is a mantel and chimney piece, partly inlaid with different colours. In the centre of the stand is a font of a deep brownish yellow colour, supported by small black pillars on a yellow base. Close by are some large slabs of the marble in various tints, also a clock stand, urn, columns, &c. There is one tall fluted column in yellow, with cap and base, the latter being brown veined, and the former deep brown. The stand also includes green-veined blocks, a large table top, and specimens of the stone from which the marble is produced. The average crushing strength of the stone before conversion is stated to be 2,667 lbs. to the square inch, and 4,108 lbs. for the same after treatment. Other experiments have shown that the average crushing strength before being subjected to the process is 2,926 lbs. to the square inch, and 4,050 lbs. afterwards. It is evident, therefore, that the alteration of the soft limestone employed into marble enormously increases the strength of the material.

Messrs. F. R. & C. H. Luke & Co., of West George-street, Glasgow, have a stand in the grand avenue, on which are displayed a number of building materials. There were samples of light and dark Shap granite; a baluster and column of the light-coloured stone shows the phenocrysts of pink orthoclase very conspicuously set in a lighter tinted background. A polished column of Ross of Mull granite of deep red tint is also shown. Several specimens of Scagliola marble are exhibited, including a tall red, fluted column, a green pillar having dark streaks, light green baluster, small slab samples of brecciated serpentines, &c. There are many samples of American slates of blue, grey-green, and olive-green colours; the turrets mounted on the top of the stand are covered with them. Some are fixed in such a manner as to show the method of using these slates in roofing and walling. Some peculiar terra-cotta slate slabs are also shown. The blue slates (called "Arfon") are quarried at Arvon, in Virginia, others come from Slatington, and from Granville, New York. The roof of a house in the garden is covered with the terra-cotta slates.

In the same avenue, but at the opposite end, Marmor, Limited, of Finsbury-square, E.C., exhibit specimens of Greek marbles, fixed to the wall of the building. Prominent ones are a kind of green cipollino, some apparently serpentines and ophalcites, light and dark green in colour, fine and coarse breccias, and red and pure white marbles. There is one large slab of white and red breccia, the red being mostly very bright and vivid, with blue streaks here and there; this breccia is very coarse and is suitable for decoration on a large scale. Some Greek marbles from Skyros, exhibited by the same firm, will be found on a wall of the Royal reception rooms; they are of several colours and appear to be chiefly metamorphosed limestones.

Some building stones are shown in the section devoted to Rhodesia, including red sandstone from Helenvale quarry, near Bulawayo; there is a fluted column and carved cap in fine-grained white sandstone, also from Bulawayo. Messrs. Sherriff & Burgbacher, of the same place, have a specimen of light greyish yellow sandstone of very fine grain, and cubes of red and white stone, all quarried near the town.

#### RAILWAY COMPANIES AND REBATES.

ONE of the most interesting and important cases which have been before the Railway Commissioners—involving the question of rebates to large customers—was decided last week against the railway company concerned. The applicants were the well-known firm of coal merchants, Messrs. Charrington, Sells, Dale, & Co., who complained that their trade rivals, Messrs. Rickett & Co., had been granted an undue preference by the Midland Railway Company, in the shape of a rebate of 1½ per cent. on all their traffic, provided it amounted to not less than 140,000l. per annum. This arrangement was kept secret—a fact which weighed largely with the Commissioners in giving a verdict against the railway company. Their defence was somewhat weak and unconvincing, and as they had already terminated the arrangement complained of, it would appear that they had not much faith in their case. They could hardly have expected the Court to agree that the course they had pursued was "in the interests of the public." For, as the Commissioners remarked, the rebate assisted to establish Messrs. Rickett in a prominent position, and such arrangements must inevitably tend towards the monopoly of trade by the more powerful firms. This would be contrary to the main intention of Parliament in legislating against undue preference, and it will also be remembered that the Act of 1888 made it obligatory upon the companies to publish all their rates. The chairman remarked at the half-yearly meeting that the agreement with Messrs. Rickett was made in good faith, and it was considered that the enormous traffic put on the line by them entitled them to some discount on their very large bill. The judgment of the Court was that the arrangement had not been sufficiently disclosed to satisfy the requirements of the Act—though not a fraudulent concealment—and as the company have to refund the applicants 1 per cent. on the amount of their traffic for the past six years, it will take a good many small economies, such as the railway companies are just now seeking to effect, to

enable the Midland Company to rectify their mistake.

A singular feature of the case was the sanction given by the Commissioners to an allowance of one-quarter per cent. in consideration of the volume of Messrs. Rickett's traffic. This appears to be a weak spot in the judgment. The allowance is a mere trifle—equal to ¼d. per ton on a tonnage rate of 8s. ¼d.—but it apparently admits the principle of a rebate (or discount) to large customers after all. Looked at in another light, the Midland Company erred on the side of generosity, and allowed Messrs. Rickett five times as much as, in the judgment of the Commissioners, they were entitled to allow. The judgment does not fix the amount or volume of traffic below which no allowance is legal. The Railway Commissioners have always had a knack of finding some justification for a fractional proportion of charges which are called in question; and although it can hardly be said that a compromise has been effected in the case under consideration, there is certainly just a flavour of compromise about the judgment.

There are so many other merchants who will consider themselves prejudiced by the ¼ per cent. rebate, that the Midland will find it a very costly affair, and will possibly endeavour to get the decision modified. The chairman told the shareholders at Derby that he was not prepared to say that the directors would accept the decision of the Court as final; but, as has been said, their case seems a rather weak one, and they may be content to console themselves with the reflection that they can quote this case as a sufficient ground for declining to entertain any applications for concessions of this nature in future.

#### ARCHÆOLOGICAL SOCIETIES.

KENT ARCHÆOLOGICAL SOCIETY.—The forty-fourth annual gathering of members of the Kent Archæological Society was recently held at Maidstone. The business meeting was held at the Old Palace, under the presidency of Earl Stanhope. The Council, in their forty-fourth annual report, state that the Society is in a flourishing condition. It was incidentally mentioned that this was the third time the Society had met at Maidstone after an interval of nineteen years. During the past twelve months several valued members had been removed by death and other causes. Thirty-two new members had been added to the Society, whilst twenty-four awaited election. The Council embraced that opportunity of referring to the great public spirit shown by Mr. F. S. W. Cornwallis, late M.P. for Maidstone, in recently purchasing the ancient college at Maidstone, at a cost of £3,800, for the sole purpose of preventing its being acquired for commercial uses or threatened with destruction. In the last volume of the Society's "Archæologia" a paper was contributed by the Rev. G. M. Livett, on the remains of an early Roman building existing between the east end of All Saints' Church and the Palace at Maidstone. It was necessary to draw the special attention of the trustees of the Palace to this, the earliest masonry at present known to exist in the town. The report was adopted, on the motion of the Rev. Fairman, seconded by the Rev. Woodruff. At the conclusion of the business, Mr. Hubert Bensted conducted the members over the Palace, and read an interesting paper on its history. Afterwards the company adjourned to All Saints' Church, where the Rev. P. C. Joy read a paper on the historic edifice. In the afternoon, the party were conveyed in brakes to Leeds Castle, the route being through Mote Park. The beautiful grounds and ancient castle were shown to the visitors by Mr. and Mrs. Wylkeham Martin. Mr. F. V. James, curator of the museum, read a short paper on the castle. He remarked that he would refer to it with regard to its position as an example of the military architecture of the Middle Ages, and of its strong position as a fortress. The castle stands upon three rocky moles, of which two are islands in a lake, and the third occupies the central part of the artificial bank, by which the walls are or were retained. Dealing with the chronological aspect, he said that in the Saxon period the keep was believed, on strong evidence, to have belonged to that period. Its construction at that time, in accordance with others of a like character, was a large truncated conical mound, surrounded by a deep ditch, on the inner edge of which a stout palisade of timber was placed, equal in defence to a wall,

and strengthened by turrets and towers. The Normans took the Saxon forts as they found them, and Norman shell keep was the name given to them by changing Saxon buildings of wood into fabrics of stone. The earliest masonry represented by a vaulted cellar was believed to be the work of Robert Crevecoeur, who founded Leeds Priory in 1119. The lower portion of the old castle, and the chapel, with its windows of geometrical tracery, are assigned to the period of Edward I, and belong to the Early English style, A.D. 1280. Extensive alterations did not take place till the time of Henry VIII., when the upper story of the old castle and the Maidens' Tower were built. Tradition supposes this tower to have been built for the Maids of Honour, but a later conception is that the appellation is a corruption of the word main or principal tower. While in possession of the Smith family of Strangford ancestry, an Elizabethan mansion was erected in the seventeenth century at the north end of the large island, and in 1822 the present mansion was erected, and during the progress of the work many of the remains of the former building were discovered.—Leeds Church was also visited, and described by Mr. Payne. The Vicar, the Rev. A. P. Morris, gave a short address. When he was appointed Vicar in 1877 the chantry was called the washhouse, as the water came through the ceiling. There were the old square pews, and when the galleries were taken away a fine old Norman arch was discovered. One of the old brasses found was in memory of one Catherine Lambe, who it was believed was the mother of the founder of the Co-operative Schools.—The banquet was held at the Town Hall, under the presidency of Earl Stanhope, who, in reply to the toast of the Association, said he hoped that the membership of the Society would soon reach 1,000. The members of the Society and a large number of townspeople were present at a reception held by the Mayor and Mayoress, Councillor and Mrs. F. G. Oliver, at the Museum. Following the reception, Mr. Hubert Bensted, in the Benthil Art Gallery, read an interesting paper on "Houses of Old Maidstone." On the following day Boxley Abbey was visited, the archæologists being allowed by Mr. R. A. Hamilton Seymour to inspect the discoveries made there quite recently. A vote of thanks having been proposed by Mr. Collyer Fergus to Mr. Seymour for his kindness in allowing the visitors to inspect the Abbey, the party returned to pick up those who came by train, and then proceeded to Sutton Valence, where lunch was provided in a marquee on the Recreation Ground. Sutton Castle, East Sutton House and Church were inspected, and description given of them.—*Kentish Courier.*

#### WANTED—A TOWN.

BY THE REV. RICHARD FREE.

FIVE o'clock in the evening, and a fine drizzle falling. Gusty, too; so that if you are not sufficiently clad you will soon know it in a certain clamminess about knees and elbows. A riverside rain and a riverside wind, penetrating and searching, doing their deadly work very thoroughly. So empty is the street that, were it not for its sudden curve as it follows the course of the river, you could send the proverbial cannon-ball whizzing down the middle of it without hitting a single living thing—provided you shot straight. For, despite the steady drizzle, little children, their hair and clothes wet and lank, are playing at the open doors of the barrack-like dwellings; a few loiterers hang about the public-houses, waiting for a Heaven-sent drink; and a knot of women at a corner, bare-headed and eager, are discussing the iniquitous proceedings of the new Board School visitor who has brought them to book in very summary fashion for the truancy of their offspring. Otherwise the street is deserted. No carts, no trolleys, no vans, no drays! For the day's work is all but over.

Hark! The silence is broken by the clang of factory bells and steam-whistles, filled with dire suggestions of tolling for the dead and the cry of lost souls over lost opportunities; and then, into the West Ferry-road, crowding it from end to end, swarms a motley throng of humanity. Do you see these women, with shawls over their heads and whitened hair? They have been toiling all day in an atmo-

sphere thick with pernicious dust—that is where they got their powdered hair; and now, having earned the magnificent sum of 1s. 6d. for their long day's work, they are hastening homeward along the curving street. Those boys, black as chimney-sweeps, too tired to give us more than a nod as they pass, are gliding in the opposite direction; they, too, are homeward bound. The surging mass of factory girls, pale-faced, red-eyed, and bedraggled, yet as good-looking and cheerful as factory girls can be—and that is saying a great deal—have just turned out of yonder huge building in their hundreds; they are homeward bound also. And the stream of begrimed men, somewhat roughly but withal good-naturedly hustling us as they press on, has only one aim and end—to get home as quickly as possible.

Pleasant pictures come to these hardworking folk as they hurry along; the kettle singing merrily on the hob; the good thick hunch of bread (buttered, pocket and larder permitting), the pennyworth of hot fried fish straight from the shop. If any people in this mighty, throbbing, human machine called East London deserve their tea hot, strong, plentiful, and *à l'once*, surely these brave Millwallers do. Yet few of them will get it for an hour or more. See that girl, the pale thin one, with the old, old face. Sixteen; not a week older! She lives a good three miles from here. Her father is a drunkard, her mother an invalid; she is going to walk every inch of the way home. Look at her shoes. Poor little lass; there is more bare flesh than leather on the ground, as she trudges through the slush and slime. What a shawl! She will be soaked to the skin before she is half-way home.

"What does it mean?" Well, it means that there is nowhere for this girl to live hereabouts; and her case is but typical of thousands. Go down to Greenwich Ferry any evening about this time, and you will find the boats overloaded with workpeople leaving this district for their homes over the water. Cross the dock bridge, and you will find the little omnibus that plies to and from the West India Dock Station crowded with the few who can afford to ride, the narrow, serpentine street thronged with the many who must needs walk. Our people live anywhere but here where they ought to live—at Stepney, Poplar, Deptford, Greenwich, Canning Town, Silvertown, East and West Ham. Think of the hardship imposed on these poor folk. They must rise at five in the morning to reach their work by six, be an hour late in getting to bed at night after their long tramp, waste shoeleather, enrich the railway companies, add unnecessarily to their physical wear and tear, and run the risk of cold, consumption, and death. Believe me, a night like this sends many a one to his long home.

"And the reason for these people living so far from their work?" The reason is the strangest, the most incredible. It is not that there is no room for them to live; there are acres of barren land here, on which could be built pretty, commodious houses (not hideous, uncomfortable flats) capable of accommodating 10,000 people. It is not that there are no builders who will undertake the job; there are a dozen men in London who would be willing to start to-morrow if they could see their way clear to a fair profit on the transaction. But they cannot; and that is why they will not build; and that is why these honest folk are compelled to travel to and from their work by road, by river, by train, and by "shanks' pony." "And why cannot they build?" Because the price of the land hereabout is prohibitive. Landholders are asking 6,000l. an acre on the other side of the island, where land is scarce; and even here, where it is plentiful, they want an average of 1,250l. an acre—not freehold, mind, only a ninety-nine years' lease. Then guess what our rating is in Poplar. Over 9s. in the pound; the highest, so they say, in the whole of London! And a more desolate and forsaken place than this—badly lighted, badly scavenged, badly policed—the whole of London could not show. "Slums?" No, we have no slums. We are a hard-working and law-abiding folk, for the most part; there are no criminals among us. And that is the shame of it. Perhaps, if we had made London ring with our sins, we should be better looked after; as it is we are shockingly neglected.

You will see at once how any ordinary building scheme should fail of success under the circumstances; and so the factory, like the huge greedy monster it is, has it all its own

way, and, spreading hither and thither, lays waste the homes of the workers. When I first came to this district four years ago, I could not get so much as a single room to live in; and I had to wait for three months before I could secure such a house as the one I now inhabit, which is by no means a palace. The other day a newspaper man came to see me, and he roamed up and down the West Ferry-road for ever so long before he found me. "I kept on looking at this house," he explained, when he was at last seated in my study, "I kept on looking at it, and saying to myself, 'The parson can't live *there*, surely!'"

The house famine is much more acute to-day than it was four years ago. Year by year, almost month by month, the dwellings of the poor are sacrificed to the factory-monster. The row of houses is suddenly doomed, and notice to quit served on the inhabitants; in a few weeks another vacant space is added to the acres of emptiness around; in a few more weeks a huge chimney belches out thick black smoke, shot with tongues of living fire. No effort is made to house the evicted. That is not the business of the up-to-date employer of labour. Women, dragging little children along, tramp the streets for miles; men toss through sleepless nights wondering what is going to become of them; lads and girls are ruthlessly thrown out of good employment because they can find no lodgment near enough to their work. It is a real thing and a terrible, this same house famine. Hereabouts you may walk till you drop, and you will not find so much as a single room "to let." As for houses—but I will give you an instance. There was a house about to be vacated a short time ago, and it got about, as such a rare event always does in this neighbourhood, and long before the tenants were out the agent had fifty-three applications for that house. Yes, the dwellings of the workers are being perpetually sacrificed to the gluttony of the factory, and the workers are being driven farther afield, to their detriment in health and wealth. What is wanted is a philanthropic builder, who will be satisfied with 4 per cent. in money on his outlay and 100 per cent. in the blessings of a host of happy people. For this Isle of Dogs is, without doubt, the healthiest part of the East End, and, for that matter, as healthy as any part of London. "A dreamer?" Well, I suppose I am; and in my dream I see neat artisans' dwellings, where now are dirt and desolation; a playground for the young and a resting-place for the old, where now are heaps of filth and refuse; trees whose growth shall be grateful to weary eyes, where now are miles of unsheltered pavement; electric light, where now are fitful gleams of remote lamps unworthy of the countriest of country towns; clean, well-paved roads, where now are dust in summer, mud in winter, and defilement always; a prosperous town, in short, where now are forlorn streets and wretched houses. That is my dream for Millwall. I wonder whether it will ever come true?

St. Cuthbert's Lodge, Millwall.

COMPETITIONS.

WORKHOUSE, WIGAN.—At a meeting of the Wigan Board of Guardians recently some discussion ensued on the minutes of the Estates Committee, and it was ultimately resolved that the minutes should be confirmed, with the addition that Messrs. Heaton, Ralph, & Heaton, of Wigan, should be put in the list of architects who could compete for the work of making plans and sending in specifications for the new workhouse. The list of architects, as altered, contains the names of Mr. W. Owen, of Nottingham; Mr. Morton; Messrs. Chas. Smith & Sons, of Reading; Mr. Arthur Marshall, of Nottingham; Mr. E. Kirby, of Liverpool; and Messrs. Heaton, Ralph, & Heaton, of Wigan.

STONE WINDOWS.—A Consular Report to hand from Germany mentions that in a new building attached to some boiler works in Upper Silesia a novelty in windows has been tried. Light is introduced through stone windows. The ordinary panes of glass were impracticable on account of the nearness of the works to the railway lines, so pneumatic glass stones have been used instead. From the outside the appearance is the same as the so-called "Butzen" panes. They are translucent, and at the same time as strong as the stone wall in which they are set; they will withstand any pressure or blow that the walls will withstand.

THE CEMENT TRADE.

A REPORT has been received at the Foreign Office from Mr. Pelly, British Vice-Consul at Seattle, Oregon, in which he writes:—"Cement in large quantities has been used in building operations of all kinds. The year 1900 witnessed a large increase of building, and cement was in heavy demand. The great tunnel of the Great Northern Railroad through the Cascade Mountains consumed a large quantity. The cement came largely from Belgium and England. The prospect for the current year is a large demand. The quotation by the jobber to the consumer on imported cement has ruled from 138. 2½d. to 145. 5d. per barrel."

Reporting on the commerce, &c., of Portland, Oregon, Mr. Consul Laidlaw says that the cement trade there has largely gone to Germany and Belgium, and this year China and Japan have entered as competitors. Some of the Chinese brands of cement are reported to be of good quality, and well up to the best brands, but the Japanese cement is not favourably reported upon. Writing from Tacoma, in the same State (Oregon), Mr. Vice-Consul Alexander observes that a feature of interest in the statistics is the import of barrels of "Portland" cement manufactured in Hong Kong. The indications are that Hong Kong will make constantly increasing shipments to the Pacific coast of this article, which has been subjected to Government and railway tests with excellent results.

Mr. W. Moore, British Acting-Consul at San Francisco, forwards the following table of the cement imported in his consular district during the last two years:—

	Quantity.	
	1900.	1899.
	lbs.	lbs.
Belgium .....	122,182,290	59,234,000
Germany .....	75,412,551	27,005,200
United Kingdom .....	69,442,000	37,541,000
China .....	2,094,146	—
Japan .....	981,200	—
Total .....	270,092,187	123,780,200

Imports (Mr. Moore remarks) were unusually heavy in 1900, the amount received being more than double that of the year preceding. A large and fairly satisfactory business was done for the first six months, but afterwards prices declined owing to the heavy arrivals and the competition of domestic producers. The stock in hand at the close of the year was very large, and added to that contracted for and on the way, is quite sufficient for a year's requirements. Prices closed irregular, concessions having to be made to induce buyers to transact business. Not many years ago British cement had almost a complete monopoly of this market, but last year the importations fell from second to third place, as may be seen by reference to the table. The state of affairs is attributed to the manufacturers who refused to regard the advice and warnings of importers, who urged them to produce a finer article, which they neglected to do until the Continental makers had firmly established themselves in the business. The British cement now sent here meets the requirements in quality and price as compared with the Continental article, but has lost the prestige that it formerly held, and no longer commands the sale it used to enjoy. The competition that was threatened by the Chinese and Japanese manufacturers did not turn out to be of a serious nature, only a small amount having been received from those countries. These imports are sent here by steamer, while the cement from Europe comes by sailing vessels, and the difference in the cost of transportation is said to offset the advantages they possess in cheapness of production. Competition of a more serious character has arisen through the manufacturers of the State of Utah, who are forwarding consignments to this market on a large scale, and who recently secured a contract of 10,000 bags in competition with the agents of European brands. They have since secured several contracts from the United States naval and military authorities at a price of 2 dols. 35 c. (98. 8d.) per bag (a bag contains 480 lbs. and is equivalent to the contents of a barrel) laid down where the work is proceeding; and although some prejudice exists against this mode of packing, no serious complaints have arisen. All the cement that came in during the last six months of 1900, and that which has arrived since, shows a serious loss, as with present prices and rates of freight the European article cannot be landed here for less than 2 dols. 60 c. (108. 8½d.) to 2 dols. 75 c. (118. 4d.) per barrel. Several local companies for the manufacture of cement have been incorporated, and one of them, possessing extensive properties at the town of Tesla and backed by large capital, is expected to commence operations by the end of the current year. Those that can produce a good article and are situated within a radius of fifty miles from this city have excellent prospects of success, as the transportation charges will not preclude the consignment of their product to this market. Some of the conservative business men here express the opinion that the entire needs of the State will be supplied from local sources in the near future.

In an official Report received from Germany it is

announced that the Prussian Minister of Public Works has issued new regulations for the testing of cement. The railway authorities have therefore established a department for that purpose in their technical bureaux. No particular technical knowledge is necessary for the testing operation; only experience is wanted. In cases of dispute the last appeal is to be made to the Royal Mechanical Technical Experiment Institution (Department for Building Materials) at Charlottenburg. The judgment of experts at this institution is always called into requisition when large quantities of cement are delivered for important buildings. The cement trade (adds the Report) has been in a very bad state for some time, owing to over-production and underselling. Since the principal works have formed a trust the outlook has become brighter. The trade would benefit considerably if the great Midland Canal were to be built.

Illustrations.

S. ANDREW, STOKE DAMERALL CHURCH AND RECTORY.

THE rectory shown upon the drawings was erected last year. It is built of the rough local rubble, with rough-cast exterior, rough stone base and chimneys.

The fashion of the place is to neatly cement the houses, and line them out, with the result that the town is quickly acquiring a thoroughly mean and temporary character.

Stoke is the mother parish of Devonport. The old church in its present form is constructed largely of ships' timbers, and has a curiously ramshackle aspect. The tower and one of the porches belong to the early sixteenth century, and have a pleasing but decrepit local character, but there is nothing else of interest save a few architectural fragments.

The graveyard was picturesque, but has recently been spoilt by a Corporation road-widening and a prodigious official wall and railing.

It is proposed—as the church must be rebuilt—to erect the new building upon a fine site adjoining the rectory, some few hundred yards from the old one. The plan has been specially schemed to suit the peculiarities of the new site. It is proposed to use local elvan externally and Beer stone internally, and to give the building a thoroughly west-country character.

The tower of the old church will be preserved. W. D. C.

NEW PREMISES, COWCROSS STREET.

In the street front here shown the lower story is of West of England granite, unpolished. The upper portion is of Lawrence's red brick and Bath stone (Monk's Park). The frieze, modelled by Mr. Pomeroy, is to be carved in Portland stone.

The builders are Messrs. Kilby & Gayford, and the clerk of works Mr. J. Brady. The electric lifts are by Messrs. Waygood & Co.; the iron and steel work by Messrs. Jones & Co.; the electric light wiring by Messrs. Wenham & Waters; and the fittings of the still house by Messrs. Bennett Shears & Co. Mr. E. W. Mountford is the architect.

"MUNSTEAD ROUGH," NEAR GODALMING.

THE walls of this house are covered with Portland cement rough-cast, and it is roofed with Westmorland slate. The dining-room is panelled with oak, the hall with some very beautiful English cedar.

The builders were Messrs. Kingerlee & Son, of Oxford. The garden was laid out by Miss Jekyll. Mr. E. W. Mountford is the architect.

SOME EXAMPLES OF MODERN LEADWORK.

ONE of the signs of the increased attention now paid to the artistic treatment of detail is to be noticed in the revival of the old taste for the decorative treatment of leadwork, even when used only for such practical purposes as gutter-heads.

Our sheet of illustrations shows several examples of work of this kind, nearly all designed by architects.

Fig. 1 is a rain-spout head designed by Mr. F. W. Troup and made by him and Mr. Dodds.

Correspondence.

To the Editor of THE BUILDER.

PURIFICATION OF SEWAGE.

SIR,—I have been much interested in your leading article of last week on the bacterial purification of sewage.

Eight years have passed since you quoted (August 12, 1893) the evidence given by Professor Sims-Woodhead before the Royal Commission on London Water Supply, when he referred to my early experiments, in which "animal and vegetable substances are rapidly broken down and brought into solution by the peptonising organisms which liquefy gelatine."

Following upon these experiments the further process of nitrification has been carried out so as to obtain 98 per cent. oxidation of the organic nitrogen in sewage. The first result is attained by the inherent putrefactive changes of the sewage itself, and the second change is arrived at by providing that amount of filtering surface and that amount of air necessary for the working of the nitrifying organisms which produce final mineralisation of the organic pollution.

When you say in your leading article, "The unsatisfactory nature of the London effluents, both chemically and bacteriologically, is to a large extent due to the faulty method of treatment and to the makeshift apparatus," you state, in general terms, what would have been equally true if you had said the London experiments have not made proper provision for utilising the inherent capacity of sewerage to liquefy its organic solids by a putrefactive change, and have not provided that amount of filtering surface and that amount of air which is necessary for the complete mineralisation of the organic pollution of the sewage. You would also have been justified in saying that the London results prove that the professional advisors of the Council do not know what amount of putrefactive change and what amount of filtering surface and air are necessary to purify the London sewage in terms of any given number of gallons per twenty-four hours. Their experiments should have been directed, in the first instance, to the sole object of obtaining this information, and their reports must necessarily be valueless until they possess it. The real difficulty lies in their attempt to arrive at reliable conclusions without having reliable data to go upon.

The apparatus necessary for obtaining reliable data has not been used, and the labour attending upon experiments made with inadequate appliances will be thrown away indefinitely if they continue to go on as they are doing.

It is on the face of it a waste of time and money and intelligence to investigate results obtained from faulty methods of treatment and makeshift apparatus.

I wish our journals and persons equally interested in public health and expenditure would hit the nail on the head as accurately as you have done.

W. D. SCOTT-MONCRIEFF.

WIDENING OF PICCADILLY.

SIR,—It is satisfactory to find that the condemnation of this ill-considered scheme which you and others have expressed seems to be leading to its withdrawal. It does not seem to be realised that the width of Piccadilly has not much to do with the matter. The real difficulty is the too great concentration at Hamilton-place of the north and south traffic where it crosses the east and west. Park-lane is practically the only north and south thoroughfare for ordinary traffic for a mile and a-half—that is between Berkeley-street and Exhibition-road, and it appears to me that the only real remedy will be to take some liberty with the parks. For instance, why should not cab traffic be allowed to enter the park at Hyde Park Corner and pass out at Marble Arch? Or what a corner would be cut off if cab traffic were admitted at Albert Gate and taken by a new road to join the park road already named at Grosvenor Gate? It

would perhaps be a pity to cut through this part of the park, but it seems to have become a necessity.

W. NIVEN

BUILDING LAW.

SIR,—Those who know anything of this subject will fully endorse the strictures of "Experientia" on the matter in your last issue, and the writer of this note (who had to criticise the new Bill before it became the Act of 1894) knows not only that "too many cooks" are permitted to take part in its preparation, but that many of them are unfit for the operation as the writer would be in the position of Lord Chancellor. Hence the "perfect maze of building law" to which your correspondent so cogently refers. But the practical question is, will it ever be otherwise under existing conditions? I throw not.

PRACTICAL.

PORTLAND CEMENT TESTING.

SIR,—Referring to Mr. Reed's second letter, in your last issue, on the matter of Portland cement testing, I thoroughly appreciate his criticism, as it has been most fair, and it appears to me that there is now no difference of opinion between us.

THE WRITER OF THE ARTICLE.

The Student's Column.

GAS AND GAS FITTINGS.

7.—BY-PRODUCTS AND THEIR USES.

THE residuals obtained in the manufacture and purification of coal gas and the articles of commerce made therefrom, are too numerous to be even enumerated here. The manufacture of coal tar products is of itself an industry of the first importance. The aniline colours, cresote, carbolic acid, pitch, coke, sulphate of ammonia, and nitrobenzene are among the products derived directly or indirectly from coal.

At the Beckton Gasworks, London, which are the most extensive in the world, tar distillation is carried on and many by-products are manufactured, but in most cases the tar is sold by the gas manufacturer to the manufacturer of chemicals or dyes. The principal products other than gas commonly sent out from a gasworks are coke, tar, sulphate of ammonia, spent oxide, and spent lime.

Coke.—Gas coke should consist almost wholly of carbon. It should never contain more than 5 per cent. of water nor yield more than 8 per cent. of ash. The amount of sulphur should not exceed 1 per cent. The statement that gas coke contains much more sulphur than household coal is, generally speaking, altogether erroneous. The coke as it leaves the retort is in pieces of too large a size to be convenient for domestic use, but it can now be obtained from the works broken to convenient size, and consequently finds a more ready sale for domestic purposes.

Tar.—About 10 gals. of tar are commonly obtained per ton of coal carbonised. The tar from Durham coal has usually a specific gravity of about 1.200. Butterfield gives the following as the results of an assay of a typical London coal tar:—

	Per cent. by weight.	Remarks.
Specific gravity at 15.5 deg. C=1.192.		
Aqueous ammoniacal liquor	3.53	
Light oils (distilling over below 170 C).....	1.99	Lighter than water. Include benzol, which is used for the manufacture of aniline.
Middle oils (distilling over between 170 and 270 C).....	18.46	Include naphthalene and carbolic acid.
Anthracene oils (distilling over above 270 C).....	12.20	From which alizarin is manufactured.
Pitch (medium).....	59.20	Used for paving, roofing, varnishes, patent fuel, &c.
Loss on distillation.....	4.62	
	100.00	

Tar Concrete and Tar Pavement.—Tar concrete is made of broken stones or shingle thoroughly mixed with tar, about twelve gallons of tar being used for every cubic yard of concrete. The tar should be heated and the solid matter dried before the two are mixed. Breeze, furnace cinders, broken clinker, and other materials are also often employed for mixing with the tar. For tar pavement Newbigging recommends the following treatment:—The solid ingredients are divided into three grades—1. Coarse material which will not pass through a sieve having bars 3/4 in. apart; 2. Riddlings which will pass this screen, but will

not pass through a 3/8 in. sieve; and 3. Fine material which passes through both sieves. The three grades are made hot and mixed with hot tar in the following proportions:—

1. Coarse material ..	1 part tar 9 parts solid	} or 24 gals. tar to 1 ton solid.
2. Riddlings.....	1 part tar 7 parts solid	
3. Fine material ....	1 part tar 6 parts solid	} or 36 gals. tar to 1 ton solid.

The footpath having been curbed, the upper edge of the kerb standing 3 in. above the solid bottom of the path, the coarse mixture is laid down 2 in. thick; then the medium mixture is laid 3/8 in. thick; and, finally, on top of this the finest material is laid about 3/8 in. thick. Each layer is rolled with a 10 cwt. roller before being covered with the succeeding layer. The surface of the pavement may be sprinkled with powdered Derbyshire spar or granite to improve its appearance.

Tar for making pavement should, according to O'Connor, be heated until converted into pitch that will harden on cooling; but if over-heated the tar will lose its tenacity and produce a pavement which will disintegrate rapidly. The tar should be heated in open boilers, at about 194 deg. Fahr., for from four to twelve hours.

Tar as a Paint for Iron.—Coal-tar contains substances of an acid nature, and these should be removed before the tar is used as a preservative paint for iron. When tar is distilled a neutral, solid, resinous pitch is obtained as a residue, and this pitch, when dissolved in benzene or petroleum, makes a better paint for iron than raw coal-tar. It should be applied while hot. Coal-tar or coal-tar pitch should not be used on iron exposed to the direct heat of the sun's rays, for tar paints so heated are liable to soften and run. Tar paints are valuable for painting pipes to be laid under ground and for sheet-iron flues. Tar is also suitable for protecting iron rivets and nuts. Tar in its raw condition always contains more or less water mixed with it, and this should be carefully removed before it is used as a paint.

Spent Oxide.—Spent oxide of iron, when discarded for further use in the purifiers, should contain not less than 50 per cent. of free sulphur. In large works this is sometimes converted into sulphuric acid to be used on the works for the manufacture of sulphate of ammonia, but the spent oxide produced in smaller works is usually sold to sulphuric acid manufacturers.

Gas Lime.—The lime used for gas purification should be flare lime, and as pure as possible. A good building lime would not be suitable for gas purification, for the power of "setting" indicative of a good building lime is a feature to be avoided in lime required for gas purifiers, and the impurities which often increase the value of the lime for building purposes always depreciate its value as a purifier. When the lime in the purifiers has become "spent" it is thrown out and exposed to the atmosphere for as long a period as possible, unless it is to be re-burnt to quicklime on the works. Exposure to the air causes oxidation of some of the unstable constituents, and diminishes the intensity of the odour evolved by the lime.

In large towns the gas manufacturer usually has to pay for the removal of the spent lime, but in country towns the farmers buy it for a small sum for agricultural purposes. Gas lime improves soils of a certain class, and checks certain plant diseases, but it should never be used until it has been exposed to the air for a long period. Dr. Voelker gives the following as the composition of gas lime which has been exposed to the atmosphere for a sufficiently long period to render it a safe manure:—

Composition of Gas Lime (Dried at 212 deg. F.)

	Per cent.
Water of combination and a little organic matter ..	7.24
Oxides of iron and alumina, with traces of phosphoric acid ..	2.49
Sulphate of lime ..	4.64
Sulphite of lime ..	15.19
Carbonate of lime ..	49.40
Caustic lime ..	18.23
Magnesia and alkalis ..	2.53
Insoluble silicious matter ..	.28
	100.00

**Sulphate of Ammonia.**—The ammoniacal liquor from the hydraulic main, condensers, washers, and scrubbers is collected in a well or tank, and subsequently used in the manufacture of sulphate of ammonia. The sulphate is principally used for agricultural purposes as a nitrogenous manure.

When the ammoniacal liquor is boiled, the carbonate and sulphide of ammonia it contains are decomposed and free ammonia is liberated. The ammonia, together with steam and other gases, passes forward to a baffle box, where the excessive moisture is removed, and from thence it passes to a vessel termed the "saturator," which contains diluted sulphuric acid, and in which solid sulphate of ammonia in the form of minute crystals is precipitated as the acid becomes saturated with ammonia. The sulphate is fished out with a perforated ladle and placed on a draining table. A small proportion of the ammonia in the ammoniacal liquor is present as chloride, sulphate, and other compounds of ammonia which are not decomposed when the liquor is boiled; the residual liquor remaining after the "free ammonia" has been removed by boiling is therefore heated with lime, which causes the "fixed" ammonia to be liberated, and renders it available for conversion into sulphate of ammonia.

A sample of ammoniacal gas liquor (sp. gr. 1.0207 at 22 deg. C.) examined by S. Dyson had the following composition:—

	Grammes per Litre.
Ammonium sulphide .....	3.93
" carbonate .....	39.16
" chloride .....	1.23
" thio-cyanate .....	1.80
" sulphate .....	0.10
" thio-sulphate .....	2.80
" ferro-cyanide .....	0.41

**Prussian Blue.**—Compounds of hydrocyanic acid (prussic acid) are present in small quantities in the unpurified coal gas as it leaves the retorts. These compounds are termed cyanides (ammonium cyanide and sulphocyanide), and several processes have been devised to recover the cyanogen in the form of sodium or potassium ferrocyanide for subsequent conversion into the cyanide of iron (Fe, Cy<sub>1.5</sub>) known as Prussian blue. The manufacture of Prussian blue is, however, carried on at very few gasworks in this country, and very few details relating to the method of manufacture, and the economy effected, have yet been published; and it is said that the Prussian blue obtained is not so pure as that manufactured from other sources. Prussian blue is always present in more or less quantity in oxide of iron which has been used for purifying the gas from sulphuretted hydrogen.

**Bisulphide of Carbon.**—Liquid carbon bisulphide has been recovered on a comparatively large scale by H. Leicester Greville from the spent lime discharged from the purifiers used for removing this impurity from the gas. The liquid bisulphide may be obtained by simple distillation of the spent lime with water. It was found that the spent lime yields about 1½ per cent. by weight of liquid bisulphide, and that the residue left in the boiler contained 50 per cent. of free lime, and could be again used for purification purposes. It was proposed to use the liquid bisulphide for dissolving the free sulphur from the spent oxide of iron produced on the works, the sulphur and bisulphide of carbon being subsequently separated by distillation, and the oxide of iron, after removal of the sulphur, being again used for gas purification. The scheme has not, however, been adopted, as it has been found more economical to burn the sulphur contained in the spent oxide into gaseous sulphur dioxide, and to subsequently convert it into sulphuric acid.

#### BOOKS RECEIVED.

**BOTTICELLI.** By Ernst Steinmann. Translated by Campbell Dodgson. (H. Grevel & Co.)

**MR. ALFRED WATERHOUSE.**—The condition of Mr. Alfred Waterhouse, R.A., who is suffering from indigestion at his residence in Berkshire, is, it is stated, happily not serious.

**STREET IMPROVEMENTS, MAIDSTONE.**—At the Town Hall, Maidstone, recently, Mr. W. A. Ducat, Local Government Board Inspector, held an inquiry respecting an application by the Urban District Council for a loan of 6,500l. for the purpose of street improvements in Mill-street. Mr. Bunting, Surveyor, explained the plan of the proposed improvements.

#### GENERAL BUILDING NEWS.

**SCHOOL EXTENSION, WORSLEY MESNES, LANSHIRE.**—The foundation-stone of a new infant school, in connexion with St. James's Church, Worsley Mesnes, was laid recently. The new school is being erected at a cost of about 1,500l. Messrs. Heaton, Ralph, & Heaton, of Wigan, are the architects of the new building, while Messrs. Hilton & Ince, of Ashton-in-Makerfield, are the builders.

**BAPTIST CHURCH SCHOOLS, SHEFFIELD.**—Extensions to the schools in connexion with Cemetery-road Baptist Church, Sheffield, have just been completed. The extensions are situated between the back of the church and Napier-street. There is a school-room, 58 ft. in length and 29 ft. across, which will principally be used as an assembly-room. There is a gallery at the back. In order to bring the building into line with the street, advantage has been taken of a narrow strip of space to provide an ante-room. On the ground-floor there are also a room which will be used for young men's classes, and an infants' room. Upstairs there is a room for ladies, and the minister's vestry has been doubled in size. The old schoolroom is to be partitioned into eight classrooms. Electric light has been provided throughout. The architect was Mr. J. Amory Teather.

**SCHOOLS, WRITHLINGTON, SOMERSETSHIRE.**—New voluntary schools have been erected in Green Parlour-road, for the education of the children of Writhlington and Foxcote. Mr. W. J. Wilcock of Bath, was the architect. The contract was secured by Mr. Joseph Bird, of Radstock. The new premises are built for a mixed school, and will accommodate 118 children. The building contains one large room, 57 ft. by 20 ft. There is also one classroom for thirty children, and a room for the use of the teachers. Each room opens out on to a hat and cloak lobby, one for girls and one for boys, and the other for boys, each containing a lavatory basin. The heating is by the ordinary open fire grates. The building, which has cost about 1,200l., is erected with native white lias stone with Bath stone dressings, the roof being covered with red Ridgewater tiles.

**NEW GODSTOWE SCHOOL, WYCOMBE.**—The foundation-stone has just been laid of a new preparatory school at Wycombe. The new building is intended to be a boarding-house for girls, and hereafter it is proposed to erect separate school buildings in the grounds, which cover an area of five acres. The site is situated on the brow of the Amersham Hill. The house will contain for the use of the girls a dining-room, a study, and a playroom. The dormitories are to be arranged on the cubicle principle, and bathrooms, &c., will be provided in connexion therewith. From the summit to the base of the building there is to be a fireproof staircase in addition to the ordinary staircase. Externally, the building will be faced with red bricks up to the first floor, and above that the walls are to be covered with rough cast. A tiled roof will be provided. The plans for the construction of the buildings have been prepared by Mr. W. Gillies Scott, of London, and the contract has been let to Messrs. Colls & Sons, of London.

**SCHOOL, EWOOD, BLACKBURN.**—The cornerstone of a new school extension at St. Bartholomew's, Ewood, Blackburn, was laid recently. The new school is expected to provide accommodation for 150 additional scholars. The architects are Messrs. Cheers & Smith, and Mr. John Boland, of Blackburn, is the builder.

**SCHOOL, BUSBY, LANARKSHIRE.**—The School Board of Busby have decided to rebuild the school recently burned, and, as the result of a competition, Messrs. Watson & Salmon's plans have been accepted by the Board. The school provides accommodation for 350 scholars, with a central hall, round which are grouped the classrooms.

**NEW GRAMMAR SCHOOL, LICHFIELD.**—The foundation-stone was laid on July 20 of the new buildings to be erected, at a total estimated cost of 9,000l., on Borrowcop-hill, Lichfield, after designs and plans made by Mr. T. Hillier-Pyke. The new buildings, which, it is hoped, will be enlarged hereafter, will provide, at present, for 125 boys and twenty-two resident scholars, and include residences for the head and assistant masters. The local Conduit Lands Trust contribute 4,500l., and the site extends over eight acres. It is stated that the Staffordshire County Council intend to make a grant in aid of the establishment of the scientific and technical departments of the foundation. A contract-tender of 7,082l. has been accepted from Messrs. Ward & Son, of Wolverhampton, subject to the approval of the Charity Commissioners and modification.

**HOME FOR SICK CHILDREN, NAUNTON PARK, GLOUCESTERSHIRE.**—New premises for the Home for Sick Children are being built on a site at Battle-down. It is intended to erect a building which, in addition to an administrative block, laundry, &c., will include two long wards capable of accommodating twenty-four children. The buildings will be of brick, the lower story pebble-dashed, the upper story of red hanging tiles; and there will be large verandahs running round the wards for the use of the young patients. Messrs. Prothero & Phillott are the architects, and the building contract has been entrusted to Messrs. Collins & Godfrey.

**WORKHOUSE, WEDNESFIELD.**—A new workhouse, situated at New Cross, Wednesfield, is being erected for the Wolverhampton Board of Guardians. Mr. A. Marshall, of Nottingham, is the architect, and Mr. Smyth is the clerk of the works. The total area of the sites is 50½ acres, about 40 acres being utilised as airing grounds or for cultivation. The cost of the land was 11,128l., while the contract for the buildings was placed with Messrs. Bees & Sons, of Nottingham, who are tender for the whole of the work which is valued 157,879l. The latter sum, however, is not inclusive of the cost of furniture, roadmaking, and the cost of the greater part of the boundary walls. Provision will be made for 1,112 officials and inmates, the former numbering sixty. The main buildings are set back from the road and parallel to it, in the centre of which will be found the administrative offices, dining-hall, stores, &c., and a little in the rear the engine-house, laundry, workshops, &c. The infirmary pavilions are some distance in the rear of the main building, while provision for a resident medical officer is to be found in the centre. The pavilions are connected on the ground floor by enclosed corridors, the roofs of which provide means of communication between the upper wards. Contiguous to the infirmary pavilion on the right is the nurses' home, which will contain messroom, sitting-rooms, library, &c., on the ground floor, and twenty bedrooms. An isolation hospital to accommodate two males and two females, and rooms for a nurse are placed near the boundary of the site on the right as farthest from the road.

**LIBERAL CLUB, NEWPORT, LANARKSHIRE.**—The foundation stone of the Newton Liberal Club was laid recently. The club includes an entrance porch and vestibule facing the main road, together with a secretary's office. Provision is being made in the vestibule for the storage of bicycles. To the right of the entrance are a cloakroom, lavatories, and staircase to the gallery. On the ground floor is the dining-hall, which is on the ground floor, is about 80 ft. long and 40 ft. wide, with a stage at the rear. On the left of this hall is the billiard-room, which can be so arranged as to form part of the main hall. A kitchen, with cooking ranges, is also being provided. At the rear of the building is the bowling club committee-room, ante-room, lavatory, cloak-room, and four bath-rooms. A verandah, 80 ft. long, runs down the western side of the building, overlooking the bowling green. The large hall and gallery will probably accommodate between 600 and 700 people. The structure is being made of bricks, with green slate roof. Mr. T. T. Rees is the architect, and Mr. J. Evans is the builder.

**HOSPITAL, NEWPORT, MON.**—The new Newport and Monmouthshire Hospital, which has been built on a plot of land of about ½ acres (given by Lord Tredegar), abutting on the Cardiff-road at Newport, was opened on the 5th inst. The new hospital has been erected on the pavilion principle—with central administrative block and pavilions stretching out on both sides at right angles. The building is Renaissance in style, and is faced with deep red bricks. The window dressings and horizontal bands are of Bath stone. Accommodation is provided for eighty-four patients, as follows:—A medical ward for twelve males, a similar ward for twelve females, two surgical wards for twelve males each, a surgical ward for twelve females, and a children's ward for twelve patients. Accommodation is also provided for twelve beds for isolation cases. The building was erected by Messrs. A. S. Morgan & Co., from designs by Mr. R. J. Lovell, of London. The plumbing and sanitary apparatus, electric light installation, electric bells, &c., were fitted by Messrs. R. Alger & Sons, Newport. The arrangements for the electric lighting were carried out under the direction of Messrs. Wallace-Jones & Dent, consulting engineers, Westminister.

**DORRIS HALL, LARBERT, STIRLING.**—The new hall at Larbert, built and presented to the district by Major Dobbie, was opened on the 5th inst. by the Duchess of Montrose. The building comprises both a large and a small hall. The latter is to the front, and has accommodation for about 300 persons. The main hall, which is lighted by ten large windows, accommodates 700 persons below and 300 persons in the gallery which runs round three sides of the building. There is a wide recessed platform at the end, framed in by an ornamental archway and flanking pillars. Adjoining the platform are retiring-rooms and other accommodation. To the right of the main entrance of the building there are also cloakrooms, ladies' retiring-rooms, and a kitchen with a lift to the service-room on the floor above. The architects were Messrs. A. & W. Black, Falkirk.

#### SANITARY AND ENGINEERING NEWS.

**SEWAGE DISPOSAL, CLAY CROSS.**—The Clay Cross Urban District Council have accepted a scheme of sewage disposal for their Urban District, prepared by Mr. Harry W. Taylor, A.M.Inst.C.E., of Newcastle-upon-Tyne and Birmingham. The sewage will be treated bacterially, the cost being 6,000l.

**BRIDGE, NEWCASTLE.**—A new steel bridge over the Tyne, between Newcastle and Gateshead, which has been completed at a cost of 80,000l., was opened on Tuesday. The bridge has been built on

the exact site of the bridge that existed there previously, and traffic has been carried on uninterruptedly during its construction. The new structure was built round about the old bridge, which was removed piecemeal. The engineers were Messrs. Sandeman & Moncrieff, Newcastle, and the contractors were Messrs. William Arrol & Co., Glasgow.

**LINCOLN WATER SUPPLY.**—The Corporation of Lincoln, having been advised by geologists as to the feasibility of obtaining an additional supply of water from the New Red Sandstone, consulted Mr. Percy Griffith, Assoc. M.Inst.C.E., F.G.S., of Westminster. Specifications having been prepared, tenders were invited for a boring 2,176ft. deep, lined with 30-in. tubes for a depth of 400 ft., and terminating not less than 12 in. diameter. Seven tenders were received for the work, and the Corporation, on the advice of their engineer, have now accepted that of Messrs. Charles Chapman & Sons, Limited, of Salford, amounting to 14,605*l.* The time allowed for the completion of the work is four years. The following is a list of the tenders received:—Thomas Matthews, Pendleton, 21,645*l.*; W. Hill & Co., Westminster, 10,620*l.*; Vivians Boring, &c., Company, Limited, Whitehaven, 18,471*l.*; British American Well Works, London, 18,000*l.*; Stourbridge Well Boring Company, Stourbridge, 17,947*l.*; Charles Chapman & Sons, Limited, Salford (accepted), 14,605*l.*; John Thom, Patricroft, 14,970*l.*

MISCELLANEOUS.

**PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.**—Messrs. W. Banks & Co., architects, have removed their City offices from 203, Gracechurch-street to 5, Adelaide-place, London Bridge, E.C.—Messrs. Harris & Wardrop, builders and contractors, of 10 to 14, Wallwood-street, Limehouse, E., have taken into partnership Mr. Clarence Gregory and Mr. James Wolfe King, who have assisted them for many years in the management of their business.

**THE HOUSING QUESTION IN LIVERPOOL.**—Dr. E. W. Hope, the medical officer of the city, has made in the following terms a representation to the Housing Committee of the Corporation concerning the buildings in the Hornby-street and 17-year Mann-street areas:—"In my opinion, within these areas there are certain houses, courts, and alleys which are unfit for human habitation, and that the narrowness, closeness, and bad arrangements and bad condition of the streets and houses, and groups of houses, within such areas, and the want of light, air, ventilation, and proper conveniences, and other sanitary defects, or one or more of such causes, are dangerous or hurtful to the health of the inhabitants, either of the buildings in the said areas, or of the neighbouring buildings, and that the evils connected with such houses, courts, and alleys, and the sanitary defects in such areas, cannot be effectually remedied otherwise than by an improvement scheme for the rearrangement and reconstruction of the streets and houses within such areas, or of some of such streets and houses." The Committee have adopted the appended resolutions:—"The Council be recommended to the Council that, having taken into consideration the official representation of the medical officer of health, dated July 19, 1901, and being satisfied with the truth thereof and of the sufficiency of their resources, the two areas described in such representation are hereby respectively declared to be unhealthy areas, and that an improvement scheme be made in respect of such areas." "That the Town Clerk be instructed to prepare a draft scheme and take all other necessary steps to carry the same into effect under and in accordance with the provisions of the Housing of the Working Classes Act, 1890, and that the surveyor prepare the necessary plans, particulars, and estimates." Other recommendations of the Committee are as follows:—"That the tender of Mr. William Hall, 60, Christian-street, Liverpool, for the erection of labourers' dwellings in Newsham-street, Kew-street, and Arley-street, for the sum of 20,686*l.*, be accepted." "That the members appointed by the resolution of the Housing Committee of July 19, 1901 (in addition to the Chairman and Deputy-Chairman), to visit various towns which have carried out schemes under the Housing of the Working Classes Act, 1890, visit London and Plymouth, that six other members be appointed to visit Manchester and Salford, and that six other members be appointed to visit Glasgow, and that the resolution of the Housing Committee of June 21, 1901, confirmed by the Council on July 3, 1901, be varied accordingly."—*Liverpool Mercury.*

**THE STRAND IMPROVEMENTS.**—On the 7th inst. at the Guildhall, Westminster, Mr. John Troutbeck, sitting as High Bailiff, and a special jury had before them the case of Diprose v. the London County Council, which was a claim for compensation for the compulsory acquisition of the claimant's premises in New Church-court and White Hart-street, W.C., for the purposes of the Strand improvement scheme. Mr. Edward Boyle, K.C., appeared for the claimant, a printer and bookbinder, and Sir Edward Clarke, K.C., and Mr. Edward Morten represented the London County Council. Mr. Boyle said the case was a very important one, involving as it did the total annihilation of his client's business. It had been agreed between the parties

that the average net profits amounted to 1,110*l.* per annum. Under the name of Diprose Brothers his client had been in business for a great number of years. In round figures they were claiming 17,700*l.*—Mr. Howard Martin, surveyor, of Chancery-lane, said the fresh claimant was worth at least 16,654*l.* From the average net profit of 1,110*l.* they had to deduct the rent, which left a clear profit of 590*l.* Putting that at two years' purchase it would bring the total amount of the claim up to 17,712*l.*, exclusive of the value of the fixtures and machinery, with regard to which the agreed price had been fixed at 3,000*l.* Mr. Pilditch, surveyor to Lord Salisbury and the Duke of Bedford, and Mr. James Green, of Chancery-lane, supported Mr. Martin's figures, and the claimant's case closed. Several surveyors, including Mr. Farmer (Debenham, Tewson and Farmer), Mr. Samuel Walker, of Moorgate-street, and Mr. Herbert Furber, of Warwick-court, Gray's-inn, estimated the total value of the claimant's property at 14,270*l.* The jury, after some deliberation, awarded the claimant 16,700*l.*, including the 3,000*l.* agreed upon for the machinery, &c.

**BUILDING IN CHRISTIANA** (according to a report dated last month, from Mr. Dundas, British Consul-General in Norway) has suffered a check, and the same stagnation has shown itself in the building trade as in the property market, only that it is, if anything, rather more marked. In the first half of 1900, 156 larger and 248 lesser buildings were reported as begun; during the latter half, 130 larger and 217 lesser, or a total for the year of 286 larger and 465 lesser buildings. The majority of these were dwelling houses. The building speculation set in in 1896, when 1,093 buildings of all descriptions were begun, and it attained its maximum in 1898 with 1,605, in 1899 it dropped to 1,398, and last year had fallen to 757—a relapse in two years to what Christiania was building in 1893. The decline of building has been followed by some decline in rents, which had risen considerably of late years.

**NORTH LONDON HOSPITAL FOR CONSUMPTION.**—An anonymous donor has contributed a sum of money to the funds of the hospital for the erection of a country branch and convalescent home for 100 beds, to which patients can be transferred for "open air" treatment from the hospital at Mount Vernon, Hampstead. The same donor has also undertaken to endow that branch with an income of 1,000*l.* per annum; thus his gift exceeds a capital sum of 100,000*l.* The Committee of Management have accordingly agreed to purchase for the new buildings a site of 60 acres lying upon sand and gravel at an altitude of about 350 ft. on the borders of Hertfordshire. The hospital buildings at Mount Vernon were begun in 1880 after Professor Roger Smith's plans and designs, which were chosen by the Committee in competition. The western block was then erected. In 1892-3 was added the central block for thirty additional patients, by Messrs. L. H. & R. Roberts, from designs prepared by Messrs. Roger Smith, Son, & Gale (since Roger Smith & Son), and illustrated in the *Builder* of December 31, 1892. The later extension comprises the chapel, dispensary, out-patients' department, two ward-floors, and an attic floor for the kitchens and rooms for the nurses and servants.

**KING'S COLLEGE, LONDON.**—The following is the list of the successful students in the Division of Architecture at this college:—*Architectural History* (third year): Silver Medal and Prize of 2*l.* in books, Mr. S. C. Ramsey. *Architectural Studio*: Silver Medal and Prize of 2*l.* in books, Mr. S. C. Ramsey; Bronze Medal and Prize of 1*l.* in books, Mr. G. W. Rogers; Bronze Medal and Prize of 1*l.* in books, Mr. L. K. Wright. *Architecture and Building Construction*: Silver Medal and Prize of 2*l.* in books (second year), Mr. A. H. Bristow; Bronze Medal and Prize of 1*l.* in books (second year), Mr. T. H. Vitty; Silver Medal and Prize of 2*l.* in books (first year), Mr. F. R. Fairman; Bronze Medal and Prize of 1*l.* in books (first year), Mr. S. C. Ramsey. *Architectural History*: the Professor's Prize for Best Note Books (third year), Mr. G. W. Rogers. *Building Construction*: the Professor's Prizes for Best Note Books (second year), Mr. L. Baldaano-y-Lopez; (first year), Mr. José P. Katigbak and Mr. Alfredo Rodriguez. *Cerificales: Building Construction* (second year), W. J. Marlow; O. C. Thompson; A. H. Imbert and E. A. Soames; J. Gardner and E. Karam; E. Woodward; R. M. Smith; G. P. Geert and H. Osmond; H. C. Swayne; (first year), R. V. Gregory; T. J. K. Klerman; J. H. P. Pibrough; G. H. Rutland; G. W. N. Rose; J. P. Katigbak. *Architectural History*: G. W. Rogers.

**SOCIETY OF ARTS.**—At the last meeting of the Council the following were appointed to form the Applied Art Section Committee for the ensuing year:—Sir William Henry Preece, K.C.B. (Chairman of the Council); Sir George Birdwood, K.C.I.E. (Chairman of the Committee); Thomas Armstrong, C.B.; Professor A. H. Church, F.R.S.; Caspar Purdon Clarke, C.I.E.; Alan S. Cole; Sidney Colvin, M.A.; Walter Crane; Lewis Foreman Day; Hunter Donaldson; Major-General Sir John F. D. Donnelly, K.C.B.; Arthur Evans, F.R.S.; Sir John Evans, K.C.B.; Hon. Sir Charles W. Fremantle, K.C.B.; J. Starkie Gardner; William Gowland,

\* Certificate of Distinction. † Certificate of Merit.

F.S.A.; Arthur Lasenby Liberty; Sir Villiers Lister, K.C.M.G.; T. Buxton Morrish; J. Hungerford Pollen; Sir Edward J. Poynter, P.R.A.; Sir Walter S. Pridaux; Sir W. C. Roberts-Austen, K.C.B., F.R.S.; Alexander Siemens; A. B. Skinner, F.S.A.; John Sparkes; R. Phene Spiers, F.S.A.; Hugh Stannus, F.R.I.B.A.; H. H. Statham, F.R.I.B.A.; Joseph William Swan, M.A., F.R.S.; Carmichael Thomas; John I. Thornycroft, F.R.S.; Sir Thomas Wardle; Henry B. Wheatley, F.S.A. (Secretary).

**PROPOSED MUNICIPAL LODGING-HOUSE, SHEFFIELD.**—The Sheffield Health Committee recommended the City Council at the meeting on Wednesday to proceed with the erection of a municipal lodging-house on the Crofts area, at an estimated cost of 27,000*l.* In a Report on the matter, prepared jointly by the City Surveyor and the Medical Officer of Health, it was stated that there are forty common lodging-houses in Sheffield. The plans of the City Surveyor (Mr. Wike) are for a lodging-house with 374 beds.

**BRADFORD CORPORATION AND THE BUILDING TRADE DEADLOCK.**—A deputation from the master builders of Bradford interested in the local dispute in the building trade had an interview on the 8th inst. with the Finance and General Purposes Committee of the Bradford Corporation. The workmen have already had interviews with the Committee. It was pointed out that the men had refused to agree to arbitration. The Town Clerk ruled that it would be illegal for the Committee to take any action in the matter. The position is therefore unchanged. At Tuesday's meeting of the Bradford City Council Mr. E. J. Smith moved the following resolution arising out of the dispute:—"That the resolution passed by the Council on December 13, 1898, with reference to the insertion in Corporation contracts of provisions as to the minimum standard rate of wages be rescinded, and that in lieu thereof provisions to the following effect be inserted in all future contracts:—Contractors shall undertake that in carrying out their contracts they will pay the rate of wages and observe the hours of labour recognised between the respective trades-unions and employers as current for the time being in the locality in which the work to which the contracts relate is to be performed. Contractors will also be required to give an assurance that for three months preceding the date of their tenders they have paid to their workpeople not less than the recognised rates of wages and have observed the recognised hours of labour. They must undertake that in the event of their giving false assurances that the sum equal to 5 per cent. on the whole of the work completed at the date when such false assurance was made."

CAPITAL AND LABOUR.

**BUILDERS' LABOURERS, SWANSEA.**—The strike of Swansea builders' labourers, which has lasted fifteen weeks, ended on Saturday last, the men agreeing to return to work at the old rate of wages, viz., labourers 5*½*d. per hour, and scaffolders 6d. per hour.

**NORTH DERBYSHIRE STONE TRADE.**—It is stated that the North Derbyshire stone trade strike has practically ended in favour of the masters. After twelve weeks' stoppage the men are resuming work. The fight has cost the union 1,200*l.* in strike pay, and the loss to the eight firms concerned is estimated approximately at 2,000*l.* The strike was for an advance of 1d. an hour.

LEGAL.

**RIVAL AUTHORS OF TIMBER CALCULATORS IN LITIGATION.**

The case of Greenwood v. Barker came before Mr. Justice Farwell in the Chancery Division on the 8th inst. It was an action by Mr. J. H. Greenwood, who claimed to be the author and registered proprietor of a pamphlet entitled "A Calculator of Prices of Small-sized Timber," and also of a book called "Greenwood's Timber Calculator"; also "How to Check a Timber Merchant's Invoice," "The Inch by Inch Method," &c. The defendant, Mr. J. R. Barker, recently published a book called "The Timber Merchants', Builders', and Contractors' Calculator," and the plaintiff claimed an injunction to prevent the defendant from the alleged infringement of his copyright. The defendant denied that he had infringed the plaintiff's copyright, and alleged that he had written and compiled his book independently and without any improper use of the defendant's works.

In the result his Lordship dismissed the plaintiff's action with costs.

**IMPORTANT POINT UNDER THE PUBLIC HEALTH ACT, 1875.**

The case of King's College, Cambridge, v. the Uxbridge Rural District Council came before Mr. Justice Byrne in the Chancery Division on the 8th inst., on an application by the plaintiffs, Lords of the Manor of Ruislip, and of a Mr. Deane,

an adjoining owner, to restrain the defendants from proceeding with the pumping station now being erected by them upon a strip of unenclosed land in the parish of Ruislip, on the north side of the high road from Uxbridge to London, belonging to the plaintiffs, and from otherwise trespassing on the said strip of land.

It seemed that the defendants intended to carry out a scheme for the disposal of the sewage of the parish of Ruislip, which included the town of Northwood, the hamlet of Eastcote, and the village of Ruislip, by which the sewage of the whole parish was to be conveyed to one common outfall for treatment. The sewage of Eastcote, owing to the levels, had to be lifted in order to convey it to the outfall site, and then pumped along a rising main from Eastcote to Ruislip, and for this a pumping station near the spot in question was necessary. The defendants alleged that the strip of land was part of the highway, but the plaintiffs claimed it, and considered that the proposed erection was calculated seriously to damage the adjoining land, which was now developing for building purposes, and the present action was commenced in order to stop the defendants going on with their works.

The defendants alleged that the pumping station was essentially a part of the sewage system of the district, as without such means it was impossible for the present system of sewerage to deliver the Eastcote sewage on to the outfall site. They further alleged that at the utmost it was only a question of compensation for any damage done and not a case for an injunction.

At the conclusion of the arguments of counsel His lordship, in giving judgment, said that, in his opinion the strip of land in question belonged either to the lords of the manor or to the adjoining owner, and for the purposes of the present application it did not matter to which, as both were joined as co-plaintiffs. The question to be decided was whether the defendants had any right, without giving any notice to the plaintiffs, to go on the land for the purpose of erecting the pumping station. His lordship thought they had no such right. A Local Authority had no right under the Public Health Act to carry a sewer under private property without notice. The further point was raised as to whether the pumping-station was a "sewer" at all within Section 16 of the Act. He did not think that a large building like this pumping-station was part of a sewer, but he did think that it came within Section 27 and was an apparatus "for the distributing or otherwise disposing of sewage" for which land could and would have to be purchased. For these reasons he thought that the plaintiffs were entitled to an *interim* injunction to restrain defendants from entering upon or taking the land in question otherwise than in accordance with their statutory powers not being powers under Section 16 of the Act.

Judgment accordingly.

Mr. Norton, K.C., and Mr. R. J. Parker appeared as counsel for the plaintiffs; and Mr. Levett, K.C., and Mr. Lushington for the defendants.

#### CASE UNDER THE LONDON BUILDING ACT, 1843:

THE DISTRICT SURVEYOR OF EAST HACKNEY (SOUTH) AND NORTH BOW v. J. BEHREND.

THIS was a case of reconstruction of roofs to dwelling-houses, neglecting to renew the outside of the old flues where passing through the roofs, and to afford facilities for inspecting the same by the District Surveyor. It was heard at Worship-street Police-court on the 8th inst., before Mr. J. R. W. Eros. Defendant, a builder of Cambridge-road, E., had completely reconstructed the roofs of three dwelling-houses without in every case renewing the outside of the flues where they passed through the roofs against which the roof timbers were placed, and had covered up the roofs so that they could not be inspected, though repeatedly asked by the District Surveyor to allow him to inspect them.

Defendant was ordered to execute the work and to open up the roofs for the inspection of the District Surveyor within three weeks: 12s., costs allowed in each of the three cases.

#### LONDON COUNTY COUNCIL AND ADVERTISEMENT BOARDINGS.

AT Worship-street Police-court, a few days since, Mr. Chilvers, solicitor, appeared in support of two adjourned summonses taken out by the London County Council against the Partington Advertising Company in respect of a boarding near the Great Eastern station at Bethnal Green.—Mr. Phillbrick defended. On the previous occasion the defendant company had given an undertaking through their solicitor, that the work required in the way of strengthening the boarding should be done within a week.—Mr. Chilvers explained that the summonses had been taken out under Section 83 of the London County Council Act for failing to remove a temporary structure when required under Section 200, Sub-Section 3, for retaining such a structure after due notice to remove. The facts and notices were admitted, and

the defendants' foreman (Henry George Townsend) was called to prove that the work had been done and that he had failed to get the certificate simply because the District Surveyor could not be found at his city office. Just at the moment Mr. Notley, the District Surveyor, entered the court, expressed himself satisfied with the work done on the boarding, and produced his certificate to that effect. Mr. Chilvers pressed for a penalty on the ground that the boarding had been kept up eighteen months after the licence had expired, and Mr. Phillbrick urged in reply that the London County Council were responsible for at least twelve months of the delay.—This Mr. Notley admitted, and in the end the magistrate imposed a penalty of 1s. and 23s. costs on the first summons and adjourned the other summons *sine die* to see whether the London County Council granted a new licence for the structure.—*Morning Advertiser.*

#### IMPORTANT ACTION UPON AN AWARD.

IN the King's Bench Division, on the 12th inst., Mr. Justice Lawrence delivered a considered judgment in the case of the Long Eaton Recreation Grounds Company, Limited, v. the Midland Railway Company. This was an action by the plaintiffs upon an award. The facts sufficiently appear from the following précis of the written judgment of His lordship.

The judgment stated that the defendants were the freeholders of land situate on the north-west of Springfield-avenue, Long Eaton, Derbyshire, which they purchased from grantees of the plaintiffs. The conveyances from the plaintiffs to these grantees contained covenants that they would not erect, or permit to be erected, any erection or building of any kind except a fence wall not more than 2 ft. high, with suitable iron palisades, nearer to Springfield-avenue than the line drawn on the plan annexed to their conveyance, and marked "building line," and would not erect any buildings on the land conveyed other than private dwelling-houses, with proper conveniences therefor, fronting Springfield-avenue, of a certain value, and would not carry on upon the land conveyed any trade or business of a noisy or offensive character. The defendants, when they purchased the land in question from these grantees of the plaintiffs, took with notice of these restrictive covenants. The defendants had constructed a railway embankment with a permanent railway on the land, and it was admitted that the embankment encroached beyond the building line. Instead of a 2-ft. fence wall they had erected a post and rail fence nearer Springfield-avenue than the building line, and defendants intended to run trains along the railway. In his lordship's opinion each of these specified acts, if done by a private purchaser of the defendants' land, would have been a breach of the restrictive covenant for which such a purchaser would be liable to be restrained by injunction. On defendants' behalf it was argued that a railway embankment was not a "building" within the meaning of the covenant, but his lordship held that it was a "building" within the meaning of the covenant, the object of which was to maintain a uniform range of buildings. The question to be decided was whether the land of the plaintiffs had been "injuriously affected" by the execution of these works within Section 68 of the Lands Clauses Act, 1845. His lordship held that there had been a physical interference by the defendants with the right of the plaintiffs to have no buildings other than those of a certain size and description, as specified in the covenant, erected on land which the defendants had taken. There had been a similar interference in the plaintiffs' right to have the building line regarded, and the brick wall built as provided, if built at all. And there had also been an interference with their right by express covenant that this land should not be used for any business of a noisy character. His lordship thought that all these rights were rights which the plaintiffs were entitled to make use of in connexion with their property on the east side of Springfield-avenue. They only existed for the purpose of maintaining and improving that property, and any covenant entered into with them must necessarily be entered into with a view to, and in connexion with, the land to which the plaintiffs were indebted for their name and existence. His lordship had no doubt whatever that the covenants by the defendants' predecessors in title gave an additional market value to the plaintiffs' property, and that, by reason of the defendants' interference, the plaintiffs' property, as a property, was lessened in value apart from the use to which they were at present putting it. The real question in this part of the case was whether the benefit of a restrictive covenant was matter for compensation if none of the land was taken for the benefit of which the restrictive covenant was imposed. His lordship thought that the claim for compensation was well founded under the Lands Clauses Act. He thought that upon all these claims the plaintiffs were entitled to compensation, and gave judgment for them for 650l., the amount of the award with interest.

Mr. Young, K.C., and Mr. W. H. Stevenson appeared for the plaintiffs; and Mr. Baggalay, K.C., Mr. W. J. Noble, and Mr. C. H. Sargent for the defendants.

#### THE ACTION AGAINST THE BRADFORD CORPORATION.

MR. JUSTICE JOYCE, in the Chancery Division on the 3rd inst., delivered a considered judgment in the case of Amblers & Sons, Limited, v. The Bradford Corporation. The case was reported in the issue of the *Builder* of August 3.

In this case the plaintiffs claimed an injunction against the defendants to restrain them from obstructing the flow of water in Bradford Beck and from allowing certain sluice gates already erected across the beck to remain. The plaintiffs claimed from the defendants 33,794l. for damage caused to them on July 12, 1900, by reason of the obstruction. Defendants alleged contributory obstruction on plaintiffs' part, denied obstruction of the kind complained of, and set up that the damages were the result of *vis major*. The action turned upon whether the damage done to the plaintiffs' premises was caused by the defendants' interference with the Bradford Beck, which passed under the plaintiffs' works, and which had so passed since the erection of the works in 1864. Various areas of land had been purchased by the plaintiffs since 1864, until they became owners of both sides of the beck. In 1899 defendants, at some distance below plaintiffs' premises, erected certain sluices in connexion with their electric lighting undertaking. On July 12, 1900, during a heavy thunderstorm, the beck, in which there was usually from 6 in. to 12 in. of water, was flooded and did damage to the plaintiffs' premises to the extent of upwards of 33,000l., which plaintiffs contended would not have happened if the flow of the beck had not been interfered with by the defendants' works.

His lordship dismissed the plaintiffs' action with costs, on the ground that the Corporation's works did not materially contribute to the damage caused by the flooding of the Bradford Beck.

#### RECENT PATENTS:

##### ABSTRACTS OF PATENTED INVENTIONS.

6,916.—AN APPLIANCE FOR THE GOVERNORS FOR GAS BURNERS: *J. Goodson*.—In the plug cock are passages for the gas which is admitted through a socket, and is then conveyed through one of the passages into a space over a floating diaphragm, and thence, through other ports, tubes, and a chamber, to the outlet, there is another passage that communicates with a space beneath the diaphragm; a recess in the cap throttles the upper opening of one of the latter tubes with the rising of the diaphragm, so that the governor will continue to operate when the flame has been lowered by means of the plug tap; modifications of the invention provide for those forms whereby the gas is conveyed through horizontal passages, or downwards through the governor which is after the kind specified in Nos. 24,293 of 1898, and 9,501 of 1899.

6,920.—CRANES: *A. E. Williams*.—The lifting-ropes is passed from the winding-drum over a pulley at the end of the jib, and so over a pulley upon a travelling carriage to the skip, the latter pulley being carried by a frame that rotates freely about an axis parallel to the jib. From a second drum upon the axle of the main drum a rope is passed around pulleys at the top of the crane, and thence to a balancing weight, and from the inner end of the travelling carriage a rope is passed to another drum, whence another rope is passed to a balancing weight, so that if there is no load the latter weight impels the carriage forwards along the jib, but a load will tend to overpower the action of the weight and to impel the carriage outwards along the jib, at the outer end of which it can be retained with a catch.

6,936.—ELECTRICAL SWITCHES: *E. F. Moy & E. F. Moy, Limited*.—As an improvement of the quick-break switch specified in No. 17,560 of 1890 the inventors fit a spindle-plate, which has two projecting stops turned upwards, upon the base and through the plate they insert the rigid spindle; one of the stops engages with a lug that projects downwards from one of two plates which hold the bridge-piece, a spring effects a quick break, and the handle which is disposed loosely upon the spindle has pins that work in slots in the other of the two plates for making contact. The contrivance is described as being available for single, throw-over, or double-pole switch.

6,951.—ELECTRICAL CURRENT METERS: *L. J. Steele*.—For use as an ammeter or volt-meter is devised a tapered iron core hung upon the arm of a horizontal bar that is carried only by the inner ends of flat spiral springs, of which the outer ends are clamped on to a support which a screw adjustably holds against a slotted back-plate; a pointer at one end of the bar traverses a graduated arc; a stationary coil acts upon the core from which an extension moves with slight friction in a pierced guide.

6,977.—A HINGE: *J. Riegg*.—The flaps of the hinge are cut away, whilst enough of them is left to prevent splitting of the screw-holes, and the flaps can be pressed into the wood without injury to it.

6,993.—DISINFECTING OF LAVATORIES, URINALS, &c.: *C. Fell*.—For purposes of disinfection the

supply cisterns are made so as to contain perforated vessels which have been charged with chloride of lime mixed with water to the consistency of mortar.

6,995.—WORKING OF WOOD: I. Chorlton and W. Wentworth.—The rotary cutters of a planing and moulding machine are mounted so as to give a progressive or slanting cut by setting the edge of each cutter angle-wise in reference to the axis of the imaginary cylinder which the edges cut out.

7,010.—AN APPLIANCE FOR DOMESTIC AND OTHER FIRES, &c.: F. Whitehead.—Air is conveyed through a cone-shaped tube, which should have a D-section, that is to be attached to the fire-bars; in one form of the tube it may be inserted between two bars, having upon it a projection of which the inclined surface will press against the upper bar, and a projection that will press against the lower bar.

7,018-9.—SAFETY APPARATUS FOR USE WITH LIFTS: F. Fletcher.—Side-plates on a cast-iron frame for the hoisting-shackle which is held with hooks that are pivoted upon an axis between the plates; the hooks are linked at their lower and outer ends to sliding-bars, and a roller at the outer end of each bar will—if over-winding occurs—strike a roller upon the shaft so as to drive the bar inwards and liberate the shackle. The lower ends of rods that carry the beam are inserted into boxes and have springs which the tension of the rope will press under normal conditions; the fall of the beam at the release of the rope will throw dogs into engagement with fixed sectional racks, of which the outer ones are plain and the middle one is toothed.

7,024.—A VENTILATING SHAFT TOP: W. H. Gaskell.—A flanged tier of louvres carries a pair of pyramids or cones having openings at their bases; in another form the outer and the lower louvres are discarded for a small ring of arches that rest upon the inner cone.

7,056.—TANKS FOR BUILDINGS: H. R. Vaughan.—The concrete top floor, which is supported with iron or steel joists, and the sides or parapet (being of brick laid in concrete) are coated with a roofing composition, and layers of roofing-felt are nailed on to the corner fillet and the wooden wall-plate, the space between the felt and a wall built within is filled with the composition; two half-rings clamp the felt bottom to a bottom flanged pipe, which is bolted to cross-joists and the pipe can be served at both its ends for ribbed washers which bear underneath the concrete and upon a washer.

7,064.—DRINKING TROUGHS FOR CATTLE: F. H. Hanson.—On the trough, for an automatic supply, is pivoted an inner vessel of which one side is pierced and the hinged cover is, under normal conditions, held horizontally with a spring, but as the animal drinks the cover is pressed downwards—the cover can be retained in either position with sliding bolts. For the supply a water vessel is placed in a water tank, or is joined to a service pipe, and a float in the vessel works a valve in a water pipe which is set in union with either a supply pipe or a discharge pipe that will empty the vessel and troughs by a three-way cock. A nut upon the float serves for the adjustment of the valve.

7,096.—ARTIFICIAL STONE: A. Grünberg.—For an artificial stone free from air the dry components are fed into a mixing chamber from which the air has been exhausted before water is admitted, then water—as free from air as possible—is circulated from a reservoir through a pump, the mixing-chamber, and the stirring-apparatus; the tubular vertical shaft of the stirring-apparatus is joined to hollow-bladed stirring-arms faced with perforated metal and clamping-rings stretch straining-cloths over the blades.

7,119.—CHIMNEY TOPS: F. Symington.—Horizontal tops are cut in the sides of the uptake, which is tapered slightly, and curved rising baffles or guide-plates are arranged behind the slots of which the tongues are bent outwards.

7,136.—PROCESS OF MOULDING BRICKS: W. Dinkelsberg.—A set of moulds are formed by clamping metal lining and partition plates together between side and end pieces with bolts so that the moulds may be taken to pieces; grooves cut in the side and end plates will take lugs or feathers upon the lining-plates which are fastened with melted sulphur, which may also be used for the packing-pieces between the ends and sides of the mould and the lining.

7,130.—MANUFACTURE OF PORTLAND CEMENT: E. H. Hurry and H. F. Scaman.—After the materials have been calcined and mixed with an excess of lime they are heated and fused, and then, when solidified, are pulverised. For purposes of fusion is devised a vertical blast furnace, having a sheet-iron shell and a lining of some refractory substance, and a chamber at its top in which the components are in the first place partially calcined. When the resultant fluid mass has been tapped into a car, it is there granulated with a water spray, a hoisting engine lifts the car, and its contents are discharged from the hopper and so to a grinding mill. (See also Nos. 23,145 of 1895, and 2,890 and 2,896A of 1898.)

7,164.—A SPANNER: C. Titus.—A head around a loose eye, with openings for two differently sized nuts, is attached at each end of the handle. The teeth of the eye take two spring pawls which are to be worked with a pivoted loop that engages with their tail ends for tightening up or loosening a nut; either one of the pawls is set into gear, and the handle is reciprocated.

7,182.—A METHOD OF GLAZING: H. F. C. Bates.—For glass houses are employed pitched and flanged triangular plates or clips which affix the panes to plain sash bars and rafters, the clips or plates being secured with screws or nails.

7,184.—A MACHINE FOR CUTTING DOVETAILS OF WOOD: L. M. Messinesi.—A rotating tool is fed sideways across one board, for cutting the mortises, whilst for cutting the tenons the recesses between them are cut out by the feeding lengthwise of another rotating tool (of which the adjustable blades are to be fixed with set-screws) against another board; the sides of the tenons and mortises will fit exactly, as they have the same degree of curvature; a tool having convex sides will cut the mortises of concealed dovetailed work; it is fed sideways into the end of one of the boards, so as to leave a portion of the board at the end of every mortise.

7,204.—MEANS OF REMOVING RUST FROM IRONWORK: Baron de G. F. C. M. Liehaber.—The girders, &c., are covered with a paste composed of free sulphuric acid and mixed with a base of china clay, lime, or plaster of Paris, or similar suitable substances; to concentrated sulphuric acid are added water, together with a small amount of common salt or calcium chloride, &c.; and carbonate of lime is stirred up with the mixture; or limestone may be treated with hydrochloric acid with the addition of sulphuric acid and nitrates; nitric acid may be applied to the cleaned surface, which can then be rubbed with agate or steel.

MEETINGS.

WEDNESDAY, AUGUST 21.

Builder's Foremen and Clerks of Works' Institution.—Ordinary meeting of the members. 8 p.m.

A Handbook for Students, particularly those preparing for the examinations of the R.I.B.A. and arranged and intended especially for those whose knowledge of mathematics is limited.
- 3/6 **SPECIFICATIONS FOR BUILDING WORKS, AND HOW TO WRITE THEM.** A Manual for ARCHITECTURAL STUDENTS. By FREDERICK RICHARD FARROW, F.R.I.B.A. Shows the Student how he should write a specification, so that when he has learnt the method and general principles, he may apply them to the particular exigencies of any building he may design.
- 3/6 **QUALITIES AND QUANTITY TAKING.** By W. R. DAVIS. (2nd Thousand.) A reliable Handbook for the Student, pure and simple, designed being limited to the method of procedure in the production of good Bills of Quantities. The examples given, whilst intentionally simple, will be found to cover almost every phase of the subject.
- 5/- **CARPENTRY AND JOINERY.** A Text-book for Architects, Engineers, Surveyors, and Craftsmen. By BANISTER F. FLETCHER, A.R.I.B.A. and B. PHILLIPS FLETCHER, A.R.I.B.A., M.I.C.E. With 431 Illustrations. 2nd Edition. Revised and corrected by the Authors. Intended for those entering for the examination of the City and Guilds' Institute, the Carpenters' Company, and the Institute of Certified Carpenters, &c. Also for the examination in these subjects by the R.I.B.A. and the Surveyors' Institution, &c.
- 5/- **ARCHITECTURAL HYGIENE; OR SANITARY SCIENCE AS APPLIED TO BUILDINGS.** By BANISTER FLETCHER, A.R.I.B.A., M.I.C.E. and B. PHILLIPS FLETCHER, A.R.I.B.A., M.I.C.E. With 205 Illustrations. A concise and complete Treatise, treating the subject in all its branches, and intended to be of use to those entering for examination in Sanitary Science.

London: DOUGLAS FOURDRINER, "Builder" Office, Catherine Street, W.C.

**UNIVERSITY COLLEGE, LONDON.**  
 THE SESSION OF THE FACULTY OF ARTS AND OF SCIENCE (including THE INDIAN SCHOOL) AND THE DEPARTMENTS OF ENGINEERING AND OF ARCHITECTURE will begin on WEDNESDAY, OCTOBER 3rd.  
 The Department of Fine Arts (SLADE SCHOOL) will open on OCTOBER 7th.  
 The courses in THE DEPARTMENT OF LAWS will begin on MONDAY, OCTOBER 21st.  
 The Prospectuses of the following Departments are now ready, and may be had on application to the Secretary.  
 Faculty of Arts and Laws.  
 Faculty of Science.  
 Faculty of Medicine.  
 The Indian School.  
 The Department of Fine Arts.  
 The Engineering Department.  
 The Department of Architecture.  
 The Department of Law.  
 T. GREGORY FOSTER, Ph.D., Secretary.

**SURVEYORS' INSTITUTION EXAMINATIONS.**  
 COMPLETE COURSES OF PREPARATION for these Examinations are given, either in class, by correspondence, or in office. Mr. RICHARD PARRY, F.S.I., A.M.I.C.E. &c. The SIX EIGHTER MONTHS' COURSE will commence on the 10th SEPTEMBER next. The following table shows the prices have been obtained by Mr. PARRY'S pupils at the last examination:  
 Institution Prize ... 1895 1896 1897 1898 1899 —  
 Special Prize ... — — — — — 1898 1899 1900  
 Driver Prize ... 1895 1896 — — — 1898 1899 1900  
 Penfold Silver Medal 1895 1896 — — — 1899 1900  
 Penfold Gold Medal — — — — — — — — —  
 Cramer Prize ... — — — — — 1898 — — —  
 NOTE.—In 1899 the "Cramer" Prize was divided between three unbracketed winners, one of whom was prepared by Mr. PARRY. The above table shows that of the 42 prizes awarded at the Seven Examinations, 23 were obtained by candidates prepared by Mr. PARRY, and 191 by candidates got prepared by him.  
 For particulars of the Courses of Work or for any advice respecting the Examinations, apply to Mr. RICHARD PARRY, F.S.I., A.M.I.C.E. &c. 24, Victoria-street, Westminster. Telephone Westminister 2107.

**SANITARY INSPECTORS' AND PRACTICAL SANITARY SCIENCE EXAMS OF THE SANITARY INSTITUTE.** Complete Courses of Instruction by correspondence for those and similar exams, conducted by Gentleman (Engineers, Surveyors, and Sanitary Inspectors), holding three Certificates from that Inst. 1st Class Honorary Medals in Hygiene, &c. Several hundred success. Classes for 1900 EXAMS, start commencing—Apply, for syllabus of subjects, testimonials, &c. to G.H.L. 28, Victoria-street, Westminster, S.W.

**R. I. B. A. EXAMS.—PREPARATION** normally or by correspondence, in three, six, nine, or 12 months' course. ARCHITECTURAL LENDING LIBRARY. Special three months' Enticing course.—For full particulars apply to Messrs. HOGWATE & BOND, Associates R.I.B.A. 115, G. street, W.C. close to the British Museum.

### The Housing Problem.

THE name of the late Mr. Sutton will soon be a household word, rivalling even that of George Peabody. The latter left a sum of 500,000*l.* to be devoted to the erection of wholesome dwellings for the poorer labouring classes; Mr. Sutton has left nearly two millions for the same purpose. Already under the Peabody Trust nearly a million and a half have been expended on land and buildings, and the end is not yet. A fund of this sort, under wise management, increases in value every year. Thanks to the munificence and philanthropy of Mr. Sutton, a new and ampler fund has been started on a career of usefulness. The bequest is not a parochial one, but can be applied to the erection of dwellings in some of the largest provincial towns as well as in London. This is a wise provision on the part of the testator, as the housing problem is as acutely felt and as difficult to solve in the provinces as in the metropolis. There is scarcely a large town or city which has not attempted to do something and which does not feel that more must be done, and the problem is already becoming acute in the smaller towns. We have before us as we write a short but useful Report by Dr. Armstrong, the Medical Officer of Health for Newcastle-upon-Tyne, entitled "Housing of the Working Classes," and containing brief descriptions (and in some cases plans) of tenement dwellings erected by municipal and other authorities in London, Liverpool, Manchester, Edinburgh, and Glasgow. The Report was compiled for the information of the Sanitary Committee of Newcastle, and might have been extended to include Birmingham, Leeds, Southampton, Hull, Nottingham, and many other cities and towns. Throughout the country the problem is forcing itself upon the attention of municipal authorities, and many indeed will be the applications which the trustees of Mr. Sutton's bequest will have to consider.

From whatever standpoint the housing question is considered difficulties present themselves. The *laissez-faire* economist, about whom Carlyle used to wax so wroth,

says that the modern method of dealing with the question is entirely mischievous; supply and demand and individual competition will accomplish all that is required, and although it may take a long time, the result will be infinitely better than any which can be attained by interfering with these so-called "laws." Certain it is that the palliation of one evil is often the cause of another. Thus it is quite within the range of possibility that the reduction of rents in subsidised houses may in time lead to a reduction of the wages of the whole class from which the tenants of these houses are drawn, and the last state may therefore be no better than the first. The employer of labour will argue that rates have been increased to provide cheaper and better dwellings for his workpeople, and that it is only fair that the increase in his rates should be counterbalanced by a reduction in wages. Further, the stress of competition among the lowest class of labourers tends always to reduce their earnings to a bare "living wage," and in the long run, therefore, there may be a reduction in wages exactly commensurate with the reduction in rent.

It may, of course, be argued that dwellings for even the poorest can be built to pay, and the evidence of private and public companies may be adduced in support of this view; but, on the other hand, it must be confessed that the rate of interest paid is, as a rule, very low, and that some of these companies, such as that of which Sir Sydney H. Waterlow has been chairman for so many years, are really philanthropic agencies and not money-making concerns. And it is also true that many of the dwellings erected by municipal and county authorities are, from a financial point of view, far from satisfactory. The returns are seldom sufficient to pay the interest and sinking fund, and in many cases there is a large initial loss due to writing down the original cost of the land to what is called "housing value." A private company proceeding on these lines would soon find itself in the bankruptcy court. To a certain extent, therefore, the labouring classes are being provided with houses at less than cost price, the rents being fixed partly according to the cost of the land and buildings, but partly also according to what the tenants are able to pay. Public and private generosity is employed in eking out the insufficient

wages earned by the tenants; the sweaters call the tune and the public pays the piper. The housing question thus considered is seen to be merely a part of the still larger labour question.

For these and other reasons many persons are of opinion that public authorities are acting unwisely in erecting buildings of this class. Let them by all means condemn insanitary houses. The owners of the houses have extracted the uttermost farthing of rent, and the onus of keeping the property in sound and wholesome condition rests on them. If they neglect their own interest as well as their duty, let them bear the loss. There is much to be said in favour of this view, but the problem is complicated by leases and other conditions, and especially by the number of small holdings which there may be in a given insanitary area, many of the holdings being so small that it is absolutely impossible to erect new houses on them in accordance with the building regulations of the district. To leave the plots vacant would be a hardship on the owners, and would permanently displace the tenants. It has been suggested that such plots should be pooled together, and sold by auction or otherwise in larger and more convenient areas, and the proceeds divided in some pre-arranged proportion among the owners. But this makes no provision for the erection of houses in lieu of those pulled down. As a way out of the difficulty the municipal authority sometimes purchases the whole of an insanitary area, and, as has been done at Leeds, sells the land at less than cost price so that houses can be profitably erected thereon by private enterprise. In other cases a few houses here and there in an insanitary area are purchased and demolished, so that the remaining houses may be less crowded and may have more light and air. But many authorities retain the land, and erect upon it blocks of dwellings of a character suited to the locality. Although there is much to be said against municipal authorities becoming landlords, there is also much to be said in favour of this step being taken. The dwellings are likely to be better built and more wholesome than if they are erected by persons whose sole object is to make a good profit, and they will also be kept in better repair. The erection of good buildings in place of insanitary areas reduces the sickness rate,

and thus reduces the amount of hospital accommodation required.

Into the moral aspect of the question we need not enter, although it is one which ought not to be forgotten, and is indeed probably the one which has had most influence in leading men to devote their time or fortunes towards a solution of the problem. Many men, however, have ceased to inquire whether the balance of argument is for or against municipal dwellings; the slums of a city are admittedly a menace to health and a disgrace to civilisation, and the practical man says—"Don't talk, but clear them away as quickly as possible and put something better in their place. Probably this is the view of the majority of the persons who have furthered municipal enterprise in regard to the housing problem.

In a paper read before the Association of House Factors and Property Agents in Glasgow, Mr. Peter Fyfe, Chief Sanitary Inspector of that city, deals with some of the common arguments adopted by property-owners against municipal interference. The paper, now issued as a pamphlet, is entitled "Back Lands and their Inhabitants," the term "Back Lands" being applied to houses or tenements erected in courts or areas in the rear of other buildings, which are usually loftier and of slightly better class. The three arguments commonly urged in favour of the retention of "back lands" are, according to Mr. Fyfe, the following:—

"First.—They are there, permitted by former laws and former authorities, and as such their owners have vested rights not to be lightly interfered with;

"Second.—They serve a certain class of the population which, on economic and social grounds, could not be equally served in front lands; and

"Third.—If they were destroyed, there are no houses in the city or its suburbs of equal size and rents in which their inhabitants could reside."

Mr. Fyfe considers the first argument mainly in regard to the provisions of the Housing of the Working Classes Act, 1890, and shows that the law "hedges an owner round with good weapons of defence." There is really no need to labour this question nowadays; the whole matter can be expressed in a sentence: Property has duties as well as rights, and neglect of the duties involves to some extent a loss of rights.

We may therefore pass on to Mr. Fyfe's reply to the second argument, and here we find some original matter of considerable interest. Under Mr. Fyfe's directions, the female inspectors of Glasgow visited 999 tenements in front properties, and 4,509 in back properties, and ascertained the particulars of rent, wages, and occupation of tenants, &c., in each case. The figures are given in two tables, from one of which the following extract is made; we have, however, inserted a column showing the average weekly earnings per head in the different classes of household:—

It will be observed that the average cubic space in the back tenements is slightly larger than in the front tenements, but that the rents are less. The difference in rent is, however, very trifling, being only 4d. a week for a single apartment and less than 3d. a week for two apartments. The difference in the earnings in the two classes of tenements is almost equally insignificant. The obvious conclusion is that, "in respect of rentals and earnings, there is little or nothing to choose between them." The figures we have added showing the average earnings per head take us a step further, and prove not only that there is practically no difference between the corresponding tenants in the front and back lands, but that the earnings *per head* in one-apartment tenements are almost identical with those in two apartment tenements. If we apply the same basis of calculation to the rentals of the front tenements, we find that the tenants of the single apartments pay 3d. a week more *per head* than those who occupy two apartments, and that the weekly rent of two front apartments *per head* is 1d. less than that paid for two back apartments. The respectability of the two classes of tenants, as judged by the inspectors, does not present any marked difference, nor does their nationality or religion, and Mr. Fyfe is "driven to the conclusion that, as between the two, there is no well-marked line which divides them either socially or from the point of view of economics," and adds—"Upon this second ground, therefore, I am bound to say there is no argument whatever for the necessity of a continuance of back lands in our city."

Of course, the figures to which we have drawn attention refer to Glasgow, and to a comparatively small portion only of that city, and cannot be regarded as applicable to other cities, where the conditions of labour and the cost of buildings may be vastly different; but they are undoubtedly a valuable contribution to our knowledge of the housing question.

The third argument is restated as follows:—"If the back lands were destroyed, there are no houses in the city of equal size and rents in which their inhabitants could reside." Mr. Fyfe considers this to be the slum-landlord's best argument for being left alone—"he is a public benefactor until the public build for the labouring classes." The words we have italicised show that Mr. Fyfe is strongly of opinion that private enterprise cannot, or will not, cope with the evil, and this is undoubtedly the general opinion.

But municipal interference is rendered exceedingly difficult by the unsatisfactory nature of the Act of 1890. It was pointed out at the time that the Act was vague and did not go far enough, and that the procedure prescribed by it was unnecessarily complicated, and these criticisms are now endorsed by nearly every one who has had

practical experience of its working. Some authorities absolutely refuse to put some parts of it into force because of the onerous burdens it lays upon them, and every authority desires that the period for the repayment of loans should be extended. The period of thirty years which is commonly enforced was apparently adopted originally on the ground that each generation should pay for the works carried out by it. We need not argue this question, but two points may be mentioned; *first*, that the average duration of life is now considerably more than thirty years; if we eliminate infants under one or two years of age, the expectation of life is now over fifty years, and it is only reasonable that the time for repayment should be extended accordingly; and *second*, the probable useful life of the buildings may also reasonably be taken into consideration, and no one will deny that, judging from existing buildings, this will in ordinary circumstances far exceed fifty years; at any rate, the land on which the buildings are erected may well be treated more favourably, and the term of repayment extended to eighty or a hundred years.

Much has been done during the last two or three years to educate public opinion on this subject, and it is certainly high time that pressure was brought to bear on the Government to amend the Housing of the Working Classes Acts in the light of recent experience. Public money is now being poured into the pockets of slum landlords by way of compensation, much of which is thoroughly undeserved. Every business man who is worthy of the name writes off the value of his premises every year a certain proportion for depreciation, and thus accumulates out of his profits a fund for repairs and for ultimate loss when the buildings become unfit for use, and if the owners of old houses fail to do the same, they deserve censure rather than pity. The composition of our legislative bodies is such that property-owners need not fear that they will be harshly treated; the burden of the complaint of sanitary reformers is that they are far too leniently dealt with, and that the public as a whole suffers in consequence both in health and pocket.

NOTES.

The New Government Offices.

THE President of the Institute of Architects has, in a letter in the *Times* of Saturday last, added his voice in favour of the employment of an eminent architect to carry out the late Mr. Brydon's building. That he has not done so earlier is of course due to any lukewarmness in the matter, but to the consciousness that the public in this country are so ready to attribute any demonstration of the kind on the part of the representative body of architects to self-interested motives. Mr. Emerson obviously refers to this stumbling-block in the concluding sentence of his letter:—

"I can unhesitatingly say that the architectural profession are awaiting the action of the Government in this extremely important matter with the greatest interest, coupled with some anxiety, not from the view of possible professional emoluments, but in the highest interests of the art of architecture."

Of the truth of the closing words there can be no doubt; the difficulty is to get the Philistines of our legislature to understand the existence of such a feeling, accustomed

as they are to regard architecture as a matter of no real consequence. The words "some anxiety" are in fact a great deal too mild to express the feeling aroused among architects by the proposal of the Government; "great surprise and indignation" would be a more adequate expression. Mr. Emerson uses the same arguments which have been already used by others, as to the importance of the detailing of an architectural design. Something might be added as to the respect due to the memory of the late architect, whose work certainly ought to be carried out by an architect of the same standing and ability as himself, if full justice is to be done to his intentions.

**The Widening of Piccadilly.**

THE result of an important deputation to the Office of Works of Members of Parliament and others interested in the question of the proposed widening of Piccadilly, last week, is that we have the undertaking of the First Commissioner of Works that nothing shall be done till after the recess of the London County Council, and that if there is not by that time a general consensus of opinion in favour of the scheme, he will feel it his duty to hold back the proposal till there could be an opportunity of further discussion in Parliament. It is satisfactory to find that, at all events, nothing will be done in a hurry. The letter of Mr. Davies, the Chairman of the Improvements Committee of the London County Council, which followed the report of the deputation in last Saturday's *Times*, certainly puts the matter in a rather new light. According to Mr. Davies's statement, this is not a mere scheme to widen a part of Piccadilly between two narrow points; it is one portion of a general scheme for widening the whole of the route eastwards into London, of which Piccadilly forms a portion. The London County Council, he says, obtained powers three years ago for widening Kensington High-street between Church-street and Cumberland-place; they have obtained powers for widening St. George's-place, Knightsbridge, between William-street and Wilton-place; and they have been in communication with the Office of Woods and Forests, who are the freeholders of most of the property on the northern side of Piccadilly between the Circus and Sackville-street, with a view to setting back the northern street line at this point as the leases fall in; but they have not so far succeeded in coming to any arrangement. Mr. Davies's argument therefore is that the widening along the margin of the Green Park is not an isolated improvement, but part of a great general scheme. The obvious commentary lies in the time-honoured stage-retort—"Then why didn't you say so at first?" This is only another example of the mistake that has been made for years in London improvements, of treating each proposed alteration as an isolated matter, instead of considering it as part of a large scheme and in relation to the whole. If the statements now made by the chairman of the Improvements Committee, as to the general and far-reaching nature of the scheme, had been made by the London County Council at the outset, there would probably have been less opposition to the Green Park alteration, and we should at all events have known the meaning of it. We are still of opinion that the part of Piccadilly skirting

the Green Park is not the part that wants widening, and that the disadvantages of the alteration would outweigh the advantages; but we willingly admit that Mr. Davies's statement of the case puts it in a rather different light from that in which we at first regarded it.

**The Prospects of the Building Trade.**

IT is to be feared that the prospects of the building and kindred trades are not very bright. Increased taxation causes a diminution of expenditure by individuals and by trading bodies, and this diminution is felt especially in such matters as building; an inconvenient shop is allowed to remain; the new drain system to a country house is postponed; and so on *ad infinitum*. The shrinkage of business appears to be evident in the Board of Trade Labour Returns for July, since we find that in the carpentering and joinery trade the proportion of unemployed is 3 per cent., as against 1.8 last year; in the furnishing trade 3.1 as against 2.6. In the country districts where there are small employers such intelligence as has reached us is to the effect that work is slack. These reports are not so much to be relied on as the figures of the Board of Trade. The coming months will, it is to be feared, be a hard time for many artisans, but history repeats itself, and there has never yet been a prolonged war and increased taxation which did not press heavily on the country.

**Appeals under the Workmen's Compensation Act.**

MR. BALFOUR announced last week that he had no hope of being able to proceed further this Session with the Supreme Court of Judicature Bill. This measure, as we stated when it was introduced into the House of Lords, proposes, among other things, to take away appeals under the Workmen's Compensation Act from the Court of Appeal and to hand them over to a Divisional Court of the King's Bench Division. This proposal is now at an end until next spring, at any rate. Meanwhile, there is visible the extraordinary spectacle of the appeals under this Act having been put on one side and allowed to accumulate by the Court of Appeal under the impression that next sitting, two months distant, they would be heard by a Divisional Court. It is obvious that some means of dealing with these arrears must be arranged, otherwise it will be a public scandal. It would not be difficult for a separate division of the Court of Appeal to be formed next sittings to hear these appeals. The Lord Chancellor, the Lord Chief Justice, the President of the Probate Division and Admiralty Division are all *ex-officio* members of the Court of Appeal. It would, therefore, be quite possible to arrange that such a Court should be constituted early next sittings to dispose of all the appeals under the Workmen's Compensation Act which are ready for hearing. Both employers and employed should bring pressure to bear on the Lord Chancellor to effect this object.

**The Grammar School, Holt, Co. Norfolk.**

THE plans and designs made by Mr. H. Chatfield Clarke have been adopted for the new school buildings by the governors of the trust, and a tender of 45,980*l.* has been accepted from Mr. G. Riches, of Cromer. The school was founded in 1554 under letters patent granted by Queen Mary to Sir

John Gresham, who endowed the foundation with estates and property situated in Norfolk, and in Barbican, Finsbury-place, Fore-street, Whitecross-street, and elsewhere in London. Gresham vested the management of the charity in the Fishmongers' Company, who are the present administrators of the trusts.

**Park Chapel, Chelsea.**

IT is stated that this old chapel is about to be pulled down and rebuilt at a cost of about 7,000*l.* The chapel was originally erected for a congregation of French Protestant refugees. The fabric, since enlarged to a capacity of 1,300 seats, was restored in 1880 under the superintendence of Mr. Sidney Bannister. It contains some stained glass windows by Messrs. Gibbs & Steward; the organ was built by Bevington. Of late years it has been known as "Gordon's chapel," as the late General Gordon sometimes conducted the services there.

**The Mechanism of the Electric Arc.**

THE able paper recently read by Mrs. Ayrton to the Royal Society on "The Mechanism of the Electric Arc" will be welcome to electricians, as it proves that all the main phenomena connected with the burning of the electric arc can be accounted for by the ordinary electrical laws. There is no need to make the supposition that the arc has a negative resistance or that it is the seat of an electromotive force. Mrs. Ayrton has found that the arc consists of three parts—a thin layer of carbon vapour issuing from the end of the positive carbon, a bulb of carbon mist joining it to the negative carbon, and a sheath of burning gases formed by the burning of the mist and the hot ends of the carbons and surrounding both. The flame was found to be practically insulating, so that the important result follows that the current flows through the vapour and mist alone. If we suppose that the resistivity of the vapour is much greater than the mist, then the high temperature of the crater would be explained. The pointed shape of the negative carbon is caused by the tip being protected by mist, and its sides are burned away by radiation from the vapour film. The theoretical explanations of the sudden drop of pressure in getting from the positive carbon to the arc, and also of the sudden drop in pressure when the arc begins to hiss, easily follow. Professor Ayrton, some four years ago, was one of the strongest supporters of the negative resistance theory, which his wife has now proved to be erroneous. Still, even an erroneous theory, when it has some foundation, may be valuable, as it may suggest new experiments and lead to valuable results. For example, the negative resistance theory, now proved to be wrong, led to the discovery of the musical arc and a commercial method of obtaining alternating currents of high frequency from the ordinary direct current mains.

**The Proposed Mono-Rail Railway.**

THE advocates of the new Mono-rail high-speed railway are trying to refer its opponents to the parallel case, as they consider it, of the opposition made to the first railways on the ground that it was dangerous and unhealthy for people to be hurried along at the rate of twenty miles an hour. But are the cases quite parallel? The objectors to the

twenty miles an hour railway were foolish even from the point of view of that day, for they might have reflected that people could ride a galloping horse at that speed without suffering from the effects. But the human body is, after all, a delicate machine, and there must be some limit to the speed of transport which it will endure without ill effects. We do not know how near we have come to the limit, but we know there must be a limit. Then there is also the balance of risks and advantages to be considered. However ingeniously the mono-rail railway may be planned and however carefully constructed, no human means can guard absolutely against the chances of accident from some unforeseen cause; and the consequences of an accident at the rate of speed proposed are fearful to contemplate. Is there any advantage in covering the ground at that speed which balances the risk? That is the point for future mono-rail travellers to consider.

In reference to a "Note" in our issue of the 10th inst., touching on the sanitary condition of the Urban District of St. Helen's, Isle of Wight, we have received a letter from the Clerk of the District Council in question, complaining that we have done them an injustice in not mentioning what was stated in Dr. Bulstode's Report, that "the Ryde water will shortly be in use over the whole of the St. Helen's district," and stating that the water main was, at the time of Dr. Bulstode's visit, being laid into the village of St. Helen's, and that many of the houses have since been connected. We are glad to hear it, as experience shows that in many such cases promises of this kind are very much delayed in execution. Our remarks were based on the expert Report to the Local Government Board, which may be taken to be an impartial document written only in the public interest; and it must be observed that in spite of the reference to the intention to lay on water to St. Helen's, the Report included, in a later paragraph, the sentence which we quoted, that much had to be done before the district could be said to be modernised in a sanitary sense; and in the same sentence it is added that "no time should be lost in dispensing with the very unsatisfactory source from which St. Helen's was supplied at the date of my visit. Efforts should be made to close the remaining shallow wells in the district." It is clear from this and from various other sentences which space does not allow us to quote, that the local Government Inspector considered the sanitary condition of the district very unsatisfactory, both in respect of circumstances and administration. Our object in quoting and referring to such Reports is not to cause annoyance to local officials, but to strengthen the hands of the Local Government Board in their contest against unsanitary conditions and slack administration.

**PUBLIC IMPROVEMENTS, SUNDERLAND.**—At the Town Hall, Sunderland, on the 16th inst., Mr. A. G. Malel, Inspector for the Local Government Board, held inquiries into the applications of the Sunderland Corporation for sanction to borrow 20,000l. for the purchase of the Victoria Hall and certain lands adjacent thereto, for the renovation and alteration of the hall, and for the erection of additional buildings in connexion therewith; 3,300l. for the purpose of electric lighting in certain public streets; and 11,000l. for the reconstruction and extension of the public baths in Hendon-road. The Town Clerk (Mr. F. M. Bowey) stated the case in each instance.

## GLASGOW EXHIBITION:

## FURTHER NOTES ON MATERIALS.

SCOTCH fireclay goods are well represented in the Exhibition. Messrs. Peter & Mark Hurl, of Gartlinton and Garnqueen Works, Glenboig, have a general exhibit of fireclay articles on a stall near the end of the Grand Avenue, not far from the Machinery Hall. These are all light brown in colour, with small specks of black; there is a good assortment of tiles, arch-bricks, perforated bricks and slabs. A special feature is a full-size gas retort, as used in the Glasgow Corporation gasworks; it is 9 ft. in length by 21 in. by 15 in. inside. An enormous siege block for a plate-glass furnace shown, has the following dimensions: 5 ft. 2 in. by 3 ft. 3 in. by 14 in. to 12 in. The chemical composition of the Glenboig raw fireclay, as given on this stall, is:—

## Chemical Composition of Glenboig Fireclay.

Silica	56.70
Alumina	38.52
Oxide of iron	2.15
Titanic acid	.76
Lime	.80
Magnesia	.19
Potash	.41
Soda	.47
	100.00

The above analysis is by Messrs. R. A. Tatlock Readman, & Thomson. Peculiar features are the small proportions of lime and alkalies, and the presence of titanic acid. The proportion of alumina to silica is much higher than in the majority of fireclays, and this, together with the physical structure of the raw earth, doubtless accounts for much of the excellence of the clay for making refractory goods. A raw sample of clay exhibited shows that the earth is blue-black in colour with a slight suspicion of green; it is exceptionally hard and compact.

Near the last stand is the exhibit of the Gart-craig Fireclay Company, Limited, 18, Charles-street, St. Rollox, Glasgow. It consists of fireclay goods and terra-cotta of light buff colour. A conspicuous part of the exhibit is some fluted column pedestals with vases, of the terra-cotta, which were nicely finished and very carefully burned. Other articles shown are chimney pots, bricks (plain and enamelled), glazed pipes, junctions, and sewer bends. There is also a sample of the raw clay, which is of a grey colour. The walls of this exhibit are lined with white, light and dark green, buff, blue, and deep-brown glazed bricks. We were struck by the remarkably uniform tint of all the goods displayed on this stall.

The Glenboig Union Fireclay Company, Limited, of 48, West Regent-street, Glasgow, have a stand in the same part of the Grand Avenue. It contains a good assortment of the company's well-known fireclay goods and glazed pipes. There are arch-bricks, ordinary fire-bricks, perforated slabs, and the like. All the fireclay goods are buff, speckled. The flooring of the stand is of diagonally-channelled blue paviers, all of good, uniform tint.

The Bourtreehill Coal Company, Fireclay Manufacturers, of Salkeld-street, Glasgow (Messrs. R. B. Stewart & Co.), have a large stall, also in the Grand Avenue, on which is arranged a good exhibit of fireclay goods, pipes, &c., including light buff-coloured vases on square pedestals and white enamelled garden tiles.

The North Devon Clay Company, Limited, in connexion with an exhibit of Messrs. Chubb & Sons' fireproof safes, show samples of "special hand" impervious stoneware bricks, manufactured at the Marland Stoneware brickworks. The bricks are hard, white, and smooth, slightly speckled, and are suitable for strong-rooms, vaults, &c. The samples exhibited are made up as sections of brick walls for strong-rooms.

Messrs. F. R. & C. H. Luke & Co., of West George-street, Glasgow, show, in addition to building stones mentioned in a previous article, red facing bricks made by the Huncoat Brick and Terra-Cotta Company, Limited, of Accrington, as well as panels, moulding bricks, &c. They are all of fine, uniform red tint. We are informed that about two millions of these bricks are being used in connexion with the Granton Gasworks contract, under the Edinburgh Corporation.

There are some samples of blue vitrified Staffordshire goods, such as blue glazed bricks,

channels, paviers, and stable bricks, made by Messrs. Peter Wood, Limited, of West Bromwich, Staffs. A chemical analysis of the raw clay employed is given as follows:—

## Chemical Composition of Clay, West Bromwich, Staffs.

Insoluble residue (quartz and felspar)	33.38
Combined silica	27.33
Alumina	10.73
Ferric oxide	0.57
Ferrous oxide	3.38
Manganous oxide	.34
Lime	.39
Magnesia	.86
Potash	.75
Soda	1.00
Combined water, organic matter, and loss	9.21
	100.00

The insoluble residue was found to be made up as follows:—

Quartz	27.96
Combined silica	3.77
Alumina	1.07
Lime	.05
Magnesia	.01
Soda	.52
	33.38

This analysis, by Messrs. Stanger & Blount, is one of the most complete quantitative results on a sample of clay we have ever seen. It enables one to judge at a glance the proportions of combined and uncombined silica as compared with alumina, and it separates the higher and lower iron oxides—very important points, guiding the manufacturer in getting the best results in the burning operations. The proportion of iron is rather high, but acts as a good flux to the silica and alumina; whilst the alkalies, though satisfactorily small in amount, are also to some extent fluxed in the same way. We learn that the bricks are burned at a temperature of about 2,372 deg. Fahr.

In the Machinery Hall several kinds of raw clays and finished bricks, both plain and glazed, are shown in connexion with brick-making machinery by Messrs. Thos. C. Fawcett, Limited, Hunslet-road, Leeds.

In the Irish pavilion there is some fireclay from Ballinamore, co. Leitrim, found in association with black clay. No particulars were forthcoming at the time of our visit.

In addition to the above clay-working exhibits, there are several other stands in different parts of the Exhibition, on which tiles, drain-pipes, &c., in connexion with sanitary goods, are shown; these have already been described (see p. 50 ante).

Cements in a raw state are not conspicuous in the Exhibition, and we have nothing to say concerning them, though we saw a few from Canada and elsewhere.

Timber is in evidence in various sections, especially in those devoted to British colonies. With few exceptions, however, they are in the nature of museum specimens, and refer to woods which are, at present, of more interest to botanists than to architects. In the Western Australia section the hard red woods of the country are admirably displayed, principally polished as table tops, balusters, &c., and the various objects are seen to better advantage than they were in the miserable little building at the Paris Exhibition, where rough and worked samples of the woods were also shown, though few were identical with those at Glasgow. Several specimens of Canadian timber are exhibited.

The principal woods are the white or Weymouth pine, formerly the principal kind of timber exported from the Dominion; the red pine, a rather resinous variety, and not so much in use as the preceding; the white fir, which does not grow to the same size as the pines, the black fir, red fir, white cedar, aspen, basswood, cypress, and the birch. The annual yield of the forests of Canada is upwards of 33,538,000 standard logs, each having 100 ft. board measure. The total value of the raw products of the forests is over eighty millions of dollars. Rhodesia contributes several interesting varieties of timber in the British South Africa section, which timber will doubtless prove more interesting to British architects as the country becomes more fully developed. There is a large building out in the grounds devoted to the exhibition of Russian timber and general forestry

works. Speaking generally, there is an absence of information in the Exhibition in regard to these extra-British timbers. It is not sufficient for practical purposes to merely give the Latin name and the locality whence the specimens come; that is all they do in most museums. An Exhibition is not a museum, and the visitor ought to be provided with sufficient information regarding specimens, either in connexion with the specimens themselves, or in the official catalogue. The latter, however, is practically a useless publication, except for the block plan of the exhibition it contains, and that would be better were it more detailed and on a larger scale.

#### RECENT PROGRESS IN ARCHITECTURAL DESIGN IN THE UNITED STATES.

The following paper was read by Mr. Walter Cook, F.A.I.A., at the thirty-fourth Annual Convention of the American Institute of Architects, and is printed in the report, which we have just received, of the proceedings of that Convention:—

"Another observation," writes Professor Langford Warren, in his very interesting little essay prefixed to the catalogue of the Boston Architectural Exhibition of 1899—"Another observation which has forced itself upon our attention during the last two or three years, is the marked growth of distinctive local character in the architecture of our principal cities. This may be regarded as decidedly a hopeful sign—a sign of wholesome and natural life and vigour. Chicago, New York, Boston, and Philadelphia, while all have improved, differ from each other in their architecture in a way they did not a few years ago." How true this observation is, I have had many occasions to remark; and any one who has had the opportunity, as most of us have had, to make flying visits to other centres of architectural activity than his own, must have been not only struck by the distinctively local character in the newer buildings of which Professor Warren speaks, but also by the slightly exotic appearance of some of them, which, on investigation, proves to have been conceived in other cities and under other influences than those of their State. It is these differences which make it dangerous for any one who has not been able to study them more carefully than I have, to speak on the progress of architectural design except from a local standpoint; and I must depend on others to correct me when any general conclusions have been unduly affected by the narrowness of my horizon.

In former times, writers on architecture have always endeavoured to explain changes of style from one period to another by referring them to general changes in the civilisation of the countries effected—by modifications in the lives of the people and their modes of thought—or by changes in the materials used or the constructions adopted. These are of course generally gradual although constant in their operation, and only to be seen distinctly when different centuries are compared. For instance, the Gothic development was largely the result of constructional necessities, as the architects of the day understood them, as well as of certain changed conditions in the lives of the people and their history; while the comparatively rapid development of the Renaissance in architecture was entirely coincident with the extraordinary revival and popularisation of Greek and Latin learning and of Classic ideas as they appeared to the Italian mind of that period, and was not all due to any new conditions of materials or structure.

In our recent development it is quite possible to see, even in the course of a very few years, the same kind of influences at work—the changes in the temper, the needs, and the desires of our clients, as well as the changes in the materials used and in the constructions adopted; and as our different cities do not advance on strictly parallel lines in other respects, it is quite natural that this should also be the case in their architecture. The unity of language and political institutions, the constant interchanging of our population will certainly prevent any great racial differences; but such variety as we see existing in Europe between two modern cities has already begun here, and bids fair to become with time more rather than less marked.

Any consideration, however, of the causes of our progress in design would be most incomplete which failed to take account of the direct

influence of the architects. The tendency of the historians of our art, more than any other, has been to consider the architect as the more or less unconscious agent in the general forward movement of the world, whose style was an inevitable consequence of some unseen power which urged him on in spite of himself. It is, perhaps, on account of this view that the names of so many of our great masters are quite unknown to the general public and far less known than should be the case even in our own ranks. Whatever the truth may have been in the past—and I am not now pleading the cause of individual genius—it is quite certain that to-day and in our country the style and character of a building often proceeds directly from the individuality, the traditions, and the education of the architect rather than from any general trend of the artistic and intellectual ideas which surround him. Never in our time has this been so true as it is at the present moment, and one is tempted to say that much of the architecture of the present day has been rather imposed upon the community by the architects than imposed upon the architects by the community. For instance, our domestic work in New York has broken radically away from the tradition of the high-stoop brownstone house, and this only because the architects took the initiative of a better plan, and persuaded the client that it was a better one.

All these causes, then, change in the general ideas and conditions, constructive necessities, and the initiative of the architects, are responsible for the recent advance in design. It is to the last-named and to the far better artistic education of the architects of to-day that is due a great and notable improvement in the study of both ensemble and details in most of our recent buildings. Nor is this true only of the work of the better-known men. In a great deal of the work where there is no real architect at all, the better influence is felt to some degree. Even those speculative structures which cast so much unmerited discredit upon us in the mind of the casual visitor to New York, even these are distinctly better than the same buildings were ten or fifteen years ago, and reflect, however dimly, quite unmistakably our real architectural work.

The tall building with its skeleton construction which some of us are fortunate enough to design, and the existence of which nearly all of us deplore, is the result of constructional necessity. Far be it from me to enter here into any discussion as to its future development. In no kind of work are we so much at sea. We try an excess of sincerity and are appalled at the resultant ugliness; we decorate our sincerity first at the bottom, then at the top, then all over, and are still wondering which is the best. We are confronted with the problem of a tower, mostly windows, with two or three blank walls which may be covered up any day by an adjoining building, and are tempted to say with the prayer-book that there is no health in us. Few of us think that an absolutely successful solution has been reached, and yet few buildings are more interesting to study on account of the many earnest and skilful attempts to solve the problem. Look at Mr. Sullivan's buildings, with their strong individuality and local character. One of them stands in New York and shouts tidings of Chicago to us as one preaching in the wilderness, and still we wonder and admire and are unconvinced. Then there is Mr. Reid's building in San Francisco, one of the most successful I know, and Mr. Bruce Price's and Mr. Eidlitz's, and a score of others. But as soon as we begin to talk about them we are involved in such a quantity of theories of all kinds and descriptions that we are apt to forget that after all material conditions are filled there is really only one paramount question—how far are they beautiful? Given the almost impossible conditions of the problem, and it seems to me that there has been a steady progress towards better and more harmonious compositions; and yet—and yet it is impossible to feel certain what is the true path. The temptation to the strange, to the unusual, to the grotesque even, is great; may it be that through much tribulation we may enter into the kingdom?

It is a comfort to turn to our domestic work, in which Americans have so long since achieved a large measure of success. In no field has this success been so well maintained as in our city and country houses, and this is apparent wherever you may go, east or west, in all its varied manifestations. The differences of development in different places is not only

very marked, but a constant source of entertainment and interest. I defy the architect from Boston or New York to see without lively pleasure and sense of novelty the work of the group of men who have done so much in Philadelphia for their city and their art; and this is only one example. Wherever we turn we find evidences of increased study, of greater ambition to do the good thing, of greater knowledge of the good traditions, and a more educated if less slavish adherence to them.

"Good Americans," said Dr. Holmes, "when they die, go to Paris." We have to some extent changed this. To-day a great many good Americans, a great many rich Americans, especially, come to New York to live long before they die; and so it has become not only the commercial metropolis of the East, but the abiding place of a large population, partly New Yorkers, partly from other States, who have plenty of money, plenty of leisure, and the chief business of whose life is amusement. In this life of leisure and amusement the house is the greatest element; receptions, dinners, dances, take place there, and it is the visible sign of the wealth, the social position or aspirations, and the tastes of the owner.

This, I think, why the New York house, that is the most *en vogue*, is the one planned with a special view to entertainments, and why our house architecture seeks to express it outside and inside. It is one of the cases where a change in the ideas and desires of the client has been the greatest influence at work; just as similar changes in ideas were instrumental centuries ago in determining the character of Venice. It is easy to see from this point of view why what is called the American basement plan has been almost universally adopted; for this plan, with all its other advantages, gives the greatest available space to the rooms devoted to entertainment, and yet originally it had to be almost forced upon the conservative clients, who could imagine nothing except the traditional high stoop.

Another thing which has influenced our particular city architecture has been the practical abandonment of the red pressed brick which used to be the conventional standard of respectability and elegance, and for whose disappearance we can hardly be too thankful, and the very general use of light-coloured stone, especially of Indiana limestone, which invites to a greater elaboration of design and detail.

These various determining causes have resulted in a great number of houses which are to me very full of interest. New York is becoming more cheerful, gayer, and brighter in its aspect, and there are more evidences of study and individuality in a single street to-day than in a whole quarter formerly. To those who know the city the neighbourhood of 54th Street, with the imposing building of the University Club as a centre, will serve as an example of what I mean.

It is, however, always useful to see ourselves as others see us, or even as one other sees us, and so, with apologies to Professor Warren, I will quote him once more:—

"In New York," he writes, "the influence of the Ecole des Beaux-Arts is paramount in much of the work, often even to the sacrifice, if not of local, of national character, so that many buildings look as if they had strayed from the Boulevards of Paris. Though we may regret this wholesale importation, on this direct imitation, with all its mannerisms, of a style which is full of bad taste and solecism in spite of the strength in plan and mass of its originators, it does seem to express New York, and it certainly has been acclimatised there and is affecting nearly all its work, while it has received but little welcome in other parts of the country, so that this direct Parisian influence has come to be peculiarly characteristic of New York and may possibly be the starting point of a local manner of building. Lavish display, richness of effect, characterise most of the work and express the luxury-loving New Yorker."

I confess to have read with mingled feelings this blast of doctrine from the precincts of ascetic Boston. Is it true that we have a wholesale importation of style which is "full of bad taste and solecism?" I think Professor Warren has allowed himself to draw too sweeping conclusions. It is a fact that the influence of the Ecole des Beaux-Arts and its pupils has been a strong one. But this influence has been principally felt in the methods of study, and not in the introduction of certain forms, and more powerfully in the study of plan than in any other way. It has done much

to persuade us that there is such a thing as beauty in its arrangement, and not merely convenience—to teach us that there is such a thing as a beautiful plan; and it is not so very many years ago since the idea that there could be such a thing was ridiculed.

As to the adoption literally of French motives, which Professor Warren characterises so frankly and with so much authority of tone, I think we need not be alarmed. It is rational and eminently proper that the young architect—and most of the Beaux-Arts men have that inestimable advantage—should pretty accurately reflect his teaching (if it has been good for anything) at the beginning of his career. Raphael in his first stage was a close imitator of Perugino. But as he progresses his individuality asserts itself, the changed conditions and surroundings exercise their unconscious influence, and he is himself in spite of it. It may be that the school work is to be the foundation of a special New York architecture; but it is certain that in that case the results will not be a series of copies.

Whatever may be the case, however, in the future, as yet the influence of the Ecole can hardly be called paramount in New York. McKim, Mead, and White, and their now numerous architectural progeny are not under the baleful spell, as Professor Warren considers it; Mr. Hardenbergh, Mr. Eidlitz, Mr. Robertson, and a host of others whom it would be too long to catalogue are untouched by the poison. It is a source of strength to us that our architects are divided into a number of separate groups by a process of natural selection, each working in different ways, each influenced unconsciously by the others, but preserving its own individuality. I imagine this to be the case in most of our architectural centres, and I hope it may never happen—I am sure it will never happen, that we shall all serve the same gods in our designs.

Before leaving the city house some mention should be made of the interiors, to which an increased care and study have been given of late, when they have not fallen into the hands of our common enemy, the commercial decorator. The best work which has been done in this field will, it seems to me, compare very favourably with any done in the world at the present time. There is still often too great a desire to conform to some given style; but the habit of making a house a sort of architectural encyclopedia, with an Empire room, an Elizabethan room, a Colonial room, a Moorish room, is on the wane, I think, and one is more often struck with appropriateness and beauty than with historic parallels.

It is hardly more than twenty-five years ago that we began to design country cottages by the seashore or in the mountains for the city family to spend two or three months in during the summer. At first they were cottages indeed, little more than a more convenient version of the farmhouse which preceded them, and following closely its simple style, with here and there a Norman or an English reminiscence added. As the taste for country life, or, perhaps, rather life in the country, spread, these cottages grew in size and importance year by year till it became quite ridiculous to call them cottages. Still the same traditions were potent, and we saw country houses, manors, chateaux—call them what you will—of great size, masquerading as overgrown cottages, with huge shingled gables, shingled towers, and an attempt at a certain elephantine picturesqueness.

This was the epoch when, Mr. Russell Sturges mournfully tells us, the only real American contribution to architecture was made, and when American architects still designed—the golden age between 1880 and 1890. Now, the *laudator temporis acti* has been a familiar figure ever since Nestor compared the besiegers of Troy to their mighty ancestors; and we are pretty well accustomed to hearing of the superiority of our father's deeds to our own in all the arts of war and peace. But it is a somewhat novel experience to hear how much better we, ourselves, were ten or fifteen years ago than in our present decrepitude; and it is worth while questioning whether we have really fallen short of the high standard we ourselves set.

Of course, there are many real country cottages still built, and in many of these Mr. Sturges's ideals are still followed, not less successfully than in the past, I think; with many interesting experiments in other directions, like Mr. Atterbury's semi-oriental houses on the south shore of Long

Island. But the country house of our day is continually assuming greater importance, not only in Newport and in Lenox, but all over the country. It is often a great establishment, rivaling, if not surpassing, in importance the town house, and lived in for half the year instead of a few summer months. For these houses we have drawn our inspiration from those of similar importance in our own and other countries. The large Colonial houses, especially those in the South, have been studied and freely imitated; England and Italy have furnished us types; but all of these have been so modified and changed that the result is in no way a literal imitation. We are in a fair way to have a great variety in our stately country places, and I, for one, do not fear they will suffer by comparison with their predecessors. The question of their setting and their surroundings becomes one of great importance, involving, as it does, all the problems of landscape gardening; and it is most necessary that the general designing of these features should be under the control of the architect, however useful it may be that he should take expert advice in certain details.

In our public buildings a new era has opened, thanks to the intelligent interests and sympathy which we have learned to expect from Secretary Gage, and to the general awakening of interest in good architecture all over the country. It is due to these causes that the custom-houses in New York and Baltimore and other of the more important Government buildings have been put into hands which may well assure us that they will be far in advance of their predecessors, and that the New York Public Library and the State Capitols of Minnesota, Rhode Island, and Washington have become objects of architectural rather than political interest. It is with impatience that the results of this new era will be awaited, for it is as yet too early to draw any general conclusions about tendencies in the matter of style. In the consideration of public buildings, however, it is of interest to note the beginnings of an idea of fixed types. The State capitol is beginning to be understood as a building with a dome; perhaps following the lead of the National Capitol at Washington. My attention was drawn to this by a criticism I heard of one of the designs submitted in the competition for the Providence Capitol—a non-professional criticism. The design in question had a cupola somewhat like that of the Paris Hotel-de-Ville, and my critic said quite decidedly that the building didn't look to him like the capitol of a State because there was no dome. I have heard the same thing since, and it would seem as though one feature of our State houses was in a way to be almost taken for granted.

I hardly know of any other instance of a fixed architectural type in this country, except, of course, the ecclesiastical one, which seems to be pretty firmly implanted in spite of some very notable exceptions. As a rule, the moment we turn our faces to the religious problem we become, or try to become, mediæval, and that without much regard to the traditions of the particular sect who are to worship in our temple. In much of this work there are abundant evidences of care and knowledge. The results seem to me generally more successful in the country than in the cities. But these results are so special in their character, so unconnected with the general architectural movement of the day in other fields, that they can hardly be considered with them, but should rather be the subject of a separate paper. In church building we express ourselves in a different architectural language than the one we use every day; as in the Catholic Church the service is in Latin, and not in a tongue "understood of the people."

The important buildings recently erected or projected for the University of Pennsylvania, Columbia, Yale, Princeton, and Harvard, as well as those designed for the University of California and Washington University in St. Louis, show quite varying tendencies in our college architecture. Harvard, in the Philip Brooks Building, the University Club and the Architectural Building, returns in a great measure to her own Colonial traditions, and most naturally and wisely. Elsewhere there seem to have been no local traditions powerful enough to influence architectural style. Accordingly at Columbia we find the strong personal note of the architects, dignified, correct, and, notably in the case of the library,

imposing. Princeton and the University of Pennsylvania are to be strongly reminiscent of certain of the English colleges, and St. Louis is to follow in their footsteps, while New Haven is to have a memorial hall which will be a total departure from anything there at the present time, and whose materialisation is to be awaited with the utmost interest. In California, where there are no traditions, except those of a population which has ceased to exist, the most important general scheme ever made for a university, the entire realisation of which neither we nor our immediate successors are to see, has been adopted, and is now in process of further study and elaboration by M. Bénard, who has all our best wishes; and it is indeed an epoch in our architecture when Berkeley and St. Louis both recognise that the random and haphazard arrangement of college buildings which has prevailed in the older colleges is not the ideal way to proceed to-day.

No survey of the current architecture of the time and its tendencies of style can be otherwise than an incomplete sketch, without far exceeding the limits of a paper to be read before you. But I have said enough to show you how hopeful I think the outlook is. It is true that many bad things—things which all of us, wherever we believe the truth lies, recognise as bad—are still built, and that what used to be known as the Peorian style (doubtless with great injustice to that city) is not yet entirely dead. But it is just to look at the best, the most representative buildings, rather than their weaker companions; and in these I see little that is not encouraging.

The newer architecture has, it is true, its foundations in a more complete knowledge, a more thorough comprehension of the best that has been and is done in other countries; but we are too longevous Yankees to be able to imitate blindly, even if we wished to do so; and I know few examples, if any, where the distinctly indigenous character is not apparent. To those who are impatient for novelty, who demand an American architecture as they used to demand an American novel, who proclaim with alliterative enthusiasm the doctrine of "progress before precedent," I would recall the sentence quoted by Thomas Bailey Aldrich in one of his essays—"Nothing but mediocrity is ever wholly original."

The paths taken by us are widely different, and yet, in a way, they all lead to Rome. We are as far as ever from being of a mind as to which is the only true one, although each of us is privately convinced that he knows it. In these individual convictions and differences lies much of our strength. Like the ship on the shield of the city of Paris, our architectural ship is rocked hither and thither, but never sinks—*Fluctuat nec Mergitur*.

#### ARCHITECTURAL SOCIETIES.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—On the 15th inst. an afternoon visit of this Society was made to Wheatfield Lodge and Castle Grove, Headingley (by permission of Mr. Joseph Nicholson and Mr. John Kirk, J.P.). Wheatfield Lodge, Wood-lane, has undergone alterations and additions from the designs of Mr. Butler Wilson, F.R.I.B.A., who was also responsible for the decoration, furnishing and upholstery of the following apartments:—The hall, the staircase, the gallery, the dining-room (28 ft. by 21 ft.), billiard-room (35 ft. by 21 ft.), and the stables, where accommodation for six horses and carriages is obtained, with hospital, harness-room, hay-chamber, and the necessary offices. At Castle Grove, Moor-road, Headingley, which was also visited, considerable enlargements have been made under Mr. Butler Wilson, who was also entrusted with the various schemes of decoration, furniture, and upholstery in the salon (31 ft. by 29 ft. by 26 ft. high), the dining-room (32 ft. by 20 ft. by 15 ft. high), the billiard-room (37 ft. by 18 ft.), the drawing-room (36 ft. by 15 ft.), and the staircase hall (16 ft. by 14 ft. by 45 ft. high).

STREET IMPROVEMENTS, LINCOLN.—On the 16th inst. Colonel A. J. Hepper, D.S.O., R.E., Government Inspector, held an inquiry at the Guildhall, Lincoln, on the subject of the application of the Lincoln City Council to borrow 4,500*l.* for purposes of street improvement. The Corporation was represented by the Deputy Town Clerk (Mr. W. T. Page), and amongst others present were the City Surveyor (Mr. R. A. Macbrair) and the Electrical Engineer (Mr. Clegg).

A NARROW FRONT  
IN THE STRAND.

T. BATTERBURY, FRIB. ARCHT.

A NARROW FRONT IN THE STRAND.

We published elevations and details of this bit of work as a plate in our issue of February 10, 1900, with a short description.

The perspective shows better the effect of the bay. The architect is Mr. T. Batterbury.

THE BUILDING TRADE AND THE HOUSING QUESTION IN GERMANY.

MR. CONSUL-GENERAL FRANCIS OPPENHEIMER, of Frankfort-on-Main, in a long special Report respecting the commercial set-back which is being experienced by Germany (a set-back which, though it may last some time, he thinks will not become sufficiently acute to terminate in a crisis), explains that in the middle of the nineties, when the general tendency of trade was rising, the rate of interest advanced, and reached in 1899 the abnormal height of 7 and 8 per cent. As at this juncture investments in Government stock proved unprofitable and even insufficient for those who wished to save money, the investors with their ready cash sought industrial values, and even sold Government stock, to effect a change in their investments. Such a step, of course, affected the quotation of Government stock, so that its holders, beyond an insufficient income from this source, experienced an actual loss of capital. In consequence, industrial values continued to increase in favour with the public, and for years so much money was devoted to industrial investments that industry was thereby enabled to extend itself considerably. When all available cash had been swallowed up by the industrial high tide, and loans on account of the increased risk could only be had of professional lenders at a higher premium, the high rate of interest which followed could not long be borne without serious consequences. The building trade was the first to suffer. Granted even that the need for extended accommodation in the towns still prevailed, builders were stopped in their activity by the impossibility of raising mortgages at a rate which would still leave them a margin for profit. This caused the first interruption in the continued industrial development. It affected in the first instance all works connected with the stone, sand, mortar, and cement trades, and further the iron, glass, and wood trades. It also put a stop to the extension and rebuilding of industrial works generally, which had been taken as an outward sign of the firmness of the industrial market, and by which industry had considerably increased the general demand as self-consumer. This first set-back was intensified by the high prices prevailing. They had been fixed during the days of unparalleled prosperity by the syndicates, who seemed most disinclined to grant any reduction. Contracts had been made over prolonged future periods, and consumers were bound to pay high prices in future in spite of the changed circumstances. People well qualified to form an opinion frankly declare that at this moment syndicates failed in practice to bestow all those benefits which for times of trouble had in theory been expected from them, and that their power and consequent influence on the market became for the time being an evil rather than a blessing. The scarcity of dwellings, which of late has become a very serious question throughout Germany, is undoubtedly due in the first instance to the rapid increase of the population and the temptation for peasants during times of industrial prosperity to flock into towns. The demand for dwellings was furthermore increased by the fact that the higher wages earned enabled different families, which had hitherto shared one dwelling, to separate. There were local reasons, too, which led to an increased demand. Thus, owing to the compulsory early closing on week-days and the closing of shops altogether on Sundays in many towns, families which had so far been satisfied with inferior accommodation, because the whole day and all days had been spent in the shops, desired better dwellings for their leisure hours. In some towns, again, there has been a decided slackness in the building trade, or a disinclination to build houses and small dwellings, because the excessive price of sites prevented such enterprises from being regarded as lucrative investments. The professional builder, moreover, knows that houses split up into small dwellings are difficult to manage and difficult to sell. This want of accommodation would undoubtedly have been felt even more acutely throughout Germany had not certain classes of the population been "housed" by their employers. Thus the Government has in some towns provided accommodation for those it employs (e.g., for railway officials); some municipalities have supplied accommodation for those employed in municipal works (e.g., gas factories). The proprietors of large factories have long since built workmen's dwellings in connexion with their factories. But even this system, it has been pointed out, is not altogether satisfactory when there exists a real want of small dwellings; for the scarcity of the dwellings certainly enhances the influence the employer can bring to bear upon his employee who is also his tenant. Among the lower classes of the population, no doubt, the artisans are best supplied with accommodation, but there are many of the same financial standing whose wants so far have
